## Deployment considerations

- Deployment options

- Comparison of cloud and on-premises features

- Cloud deployment

- System requirements for cloud deployments

- On-premises deployment

- System requirements for on-premises deployments

- Installation steps for Retail channel components in an on-premises environment

- Buy Finance + Operations (on-premises)

- Commerce Data Exchange implementation guidance

- Finance and Operations apps operated by 21Vianet in China

- Finance and Operations apps in France

## Get support

### Upgrade and N-1 support

- Upgrade and N-1 support for Commerce

- Phased Rollout (N-1) installation, configuration, and cutover

- Upgrade the Retail channel extension to the latest Retail SDK

## What's new or changed

- What's new or changed in Finance and Operations apps

- What's new or changed in Commerce

  - What's new or changed in Commerce home page

  - Commerce 10.0.17 (April 2021)

  - Commerce 10.0.16 (February 2021)

  - Commerce 10.0.15 (January 2021)

- Removed or deprecated features

  - Removed or deprecated features in Finance and Operations

  - Removed or deprecated features in Dynamics 365 Commerce

- AX 2012 features that were postponed

- End of mainstream support for Microsoft Dynamics AX 2009 and 2012

## Documentation resources

- Help system

- Connect the Help system

Commerce Data Exchange best practices

Commerce Data Exchange and commerce channel communications

Commerce Data Exchange troubleshooting

Modern POS architecture

Online store publishing architecture

Retail Channel Performance Power BI content

Payment Application Data Security Standards (PA-DSS) certification

Commerce capabilities available in on-premises deployments

Deployment and hotfixes

Synchronize self-service installers in Dynamics 365 Commerce

Commerce Scale Unit (self-hosted)

Configure and install Commerce Scale Unit (self-hosted)

Modern POS configuration and installation

Manage accounts and devices from headquarters

POS device activation

Help secure Cloud POS in shared environments

Retail Hardware Station configuration and installation

Mass deployment of self-service components

Commerce component events for diagnostics and troubleshooting

Apply a deployable package

Initialize seed data in new Commerce environments

Set up your channels

Channels overview

Channel prerequisites

Channel setup prerequisites

General prerequisites

Organizations and organizational hierarchies

Warehouse setup

Sales tax setup

Set up an email notification profile

Number sequences

Set up a default customer and address book

## Retail channel prerequisites

- Info codes and info code groups

- Create a retail functionality profile

- Create a new address book

- Screen layout overview

## Online channel prerequisites

- Create an online functionality profile

## Set up a retail channel

- Set up a retail channel

- Configure retail workers

## Modern Point of Sale (MPOS) and Cloud POS

- Choose between MPOS and Cloud POS

- Online and offline POS operations

- Device activation of a customized Modern POS

- Enable Azure Active Directory authentication for POS sign-in

- Product and customer search in the POS

- Search for products and product variants during order entry

- Cash management improvements

- Inventory lookup in the POS

- Suspend and resume transactions in the POS

- Offline POS functionality

- Shift and cash drawer management

- Cash out gift card balance

- Ship orders from another store

- Hide non-carrier delivery modes from POS shipment dialog

- Task recorder and Help for MPOS and Cloud POS

- Hardware peripherals

- Screen layouts

- Sales associates

- Device activation

- Create financial dimensions for POS registers and configure dimension values on registers

- Create POS permissions group

- Create POS visual profiles

- Configure and install Retail hardware station

- Receipts

- Set up and design receipt formats

- Send email receipts from Modern POS (MPOS)

- Reset receipt numbers

- Embed processor credit card receipts in customer receipts

- Create functionality profiles for sales representatives

- Create financial dimensions for retail channels and configure values on stores

- Set up an online channel

- Set up an online channel

- Set up a call center channel

- Call center sales functionality

- Set up a call center channel

- Call center catalogs

- Set up call center order processing options

- Configure call center delivery modes and charges

- Set up and work with fraud alerts

- Additional channel configuration

- Add a channel to an organization hierarchy

- Advanced auto charges

- Configure and use advanced auto charges

- Enable and configure auto charges by channel

- Prorate header charges to matching sales lines

- Manage continuity programs

- Set up continuity programs for call centers

- Define continuity schedules

- Retail store management

- Create and change store hours

- Commerce Scale Unit

- Call center management

- Configure and work with call center order holds

## Payments

Payment methods

Payment methods in call centers

Refund payment processing in call centers

Credit card setup, authorization, and capture

Configure cash denominations for the POS

Configure credit card processing

Skip "change due" dialog box in POS

Adyen payment connector

Saving online payment instruments with the Adyen connector

Strong Customer Authentication (SCA) using the Adyen connector

Dedicated payment terminals and prompts for a printer and cash drawer

Seamless offline switch for gift card and credit memo operations

Set up pay invoice scenarios

Duplicate payments prevention

Omni-channel payments overview

Omni-channel Commerce order payments

Process credit cards without a hardware station

Dynamics 365 Payment Connector for PayPal

Wallet payment support

Payments FAQ

Manage Bing Maps for your organization

Create and update time slots for customer pickup

## Merchandising your products and services

Categories, products, and assortments

Product information overview

Set up retail products

Product hierarchy

Commerce hierarchies

Create a new product hierarchy

Manage product categories and products

Change the sort order for merchandising entities

## Product dimensions

- Product dimensions

- Create a variant group

## Create a new product

- Create a new product in Commerce

- Manage product categories and products

## Product attributes

- Attributes and attribute groups

- Define channel attributes

## Channel hierarchies

- Create a channel navigation hierarchy

- Configure channel to use a channel navigation hierarchy

## Assortments

- Assortment management

- Set up assortments

- Manage assortments

## Bar codes

- Set up bar codes

- Set up bar code masks

## Warranties

- Create and configure extended warranties

## Pricing and discounts

- Discounts

- Sales price management

- Price adjustments and discounts

- Apply multiple discounts to a product

- Determine the optimal combination of overlapping discounts

- Define channel-specific discounts

- Options for preventing discounts for retail products

- Tender-based discounts

- Shipping discount overview

- Set up coupons

Show discounts in POS

Price reports

Create channel-specific trade agreements

Create trade agreements using category pricing rules

## Recommendations

Product recommendations overview

Enable Azure Data Lake Storage in a Dynamics 365 Commerce environment

Enable product recommendations

Personalized recommendations

- Enable personalized recommendations

- Opt out of personalized recommendations

Enable "shop similar looks" recommendations

Enable "shop similar description" recommendations

POS experiences

- Add product recommendations on POS

- Add recommendations to the transaction screen

Adjust AI-ML-based product recommendation results

Manually create curated product recommendations

Create recommendations using demo data

Product recommendations FAQ

## Ratings and reviews

Ratings and reviews overview

Opt in to use ratings and reviews

Manage ratings and reviews

Configure ratings and reviews

Sync product ratings

## Manage your inventory

Inventory

- Store inventory management

- Configure inventory buffers and inventory levels

- Work with serialized items in POS

- Push products from distribution center to store using buyer's push

Set up rules and parameters for cross-docking and buyer's push

Inbound inventory operation in POS

Outbound inventory operation in POS

Calculate inventory availability for retail channels

## Purchase orders

Purchase order overview

Create purchase orders

Product receipt against purchase orders

Approve and confirm purchase orders

Purchase order approval mobile workspace

Create product packages for purchase orders

## Manage your orders

### Customer orders

Customer orders in POS

Hybrid customer orders

Recall order operation in POS

Enable multiple pickup delivery modes

Process a customer order pickup in POS

### Sales orders

Create call center orders

Customize transactional emails by mode of delivery

Change mode of delivery in POS

### Distributed order management

DOM overview

Cost configuration

### Order fulfillment and processing

Store order fulfillment

Set up order fulfillment for stores

Show order notifications in POS

Sell continuity programs and process sales orders

### Returns

Linked refunds

- Sell and return products not included in a store's assortment
- Configure and process an exchange on a return order
- Restrict payment methods for returns without a receipt
- Return items across multiple customer orders and invoices
- Create and update a returns and refunds policy for a channel

## Manage your customers

### Clienteling

- Clienteling overview

### Loyalty

- Loyalty overview

- Define loyalty programs

- Define loyalty reward points

- Define loyalty schemes

- Process adjustments of loyalty reward points

## Manage your financials

### Statements overview

### Transaction consistency checker

- Disable rules in retail transaction consistency checker

### Edit and audit retail store transactions

- Edit and audit cash and carry and cash management transactions

- Edit and audit online order and asynchronous customer order transactions

- Edit financial dimensions for retail transactions

- Create an Excel workbook to edit retail transactions

- Add fields to an Excel workbook to edit retail transactions

### Trickle feed-based order creation for retail store transactions

- Create, calculate, and post statements for a retail store

### Financial reconciliation in retail stores

- Improvements to statement posting functionality

- Improved handling of batch tracked items

- Configure payment method settings that affect retail statements

- Configure and run a job to calculate statements

- Configure and run a job to post statements

Experimentation

Experimentation in Dynamics 365 Commerce

Identify a hypothesis and determine metrics for an experiment

Set up an experiment

Connect and edit an experiment

Preview and publish an experiment

Run and monitor an experiment

Promote a variation and complete an experiment

Review the status of an experiment

Error handling

Build custom response pages for 4xx/5xx status code errors

Fraud protection

Dynamics 365 Fraud Protection integration with Dynamics 365 Commerce

B2B e-commerce

Set up a B2B e-commerce site

Create org modeling hierarchies for B2B organizations

Manage business partner users on B2B e-commerce sites

Configure the customer account payment method for B2B e-commerce sites

Set product quantity limits for B2B e-commerce sites

Monitoring and analysis

Monitor sales and margin performance

Analyze sales trends and patterns

Assess sales performance by product

Assess customer and product profitability

Analyze store performance

Set up Recency, Frequency, and Monetary (RFM) analysis

## Globalization

Fiscal integration overview for Commerce channel

Set up fiscal integration for Commerce channel

User-defined certificate profiles for retail stores

## Austria

Fiscal registration service integration sample for Austria

## Brazil

Commerce localization for Brazil

## Eastern Europe

### Common

Advance invoices for Commerce for Eastern Europe

Petty cash management for Commerce for Eastern Europe

Retail channel performance

## Analytical workspaces

Analytical Workspaces (using Power BI Embedded)

Power BI Embedded integration

Customize embedded reports in Analytical workspaces

## Document reporting and printing

Document Reporting Services overview

Supported fonts

Configure SSRS for on-premises deployments

Printing

Document printing overview

Install the Document Routing Agent to enable network printing

Upgrade the Document Routing Agent

Install network printer devices in on-premises environments

Document generation, publishing, and printing in on-premises deployments

Run the Document Routing Agent as a Windows service

Available SQL Server Reporting Services reports

Install report design templates

Power user management tools

Power BI integration with Entity store

Resolve issues after Entity store maintenance

Configure the Power BI integration

Bring your own database

Preview PDF documents using a PDF viewer

Developer tools for creating and extending solutions

Analytics, aggregate measurements, and KPI modeling

Model aggregate data

Add financial dimensions to aggregate measurements

Create analytical reports using Power BI Desktop

Add analytics to workspaces by using Power BI Embedded

Help secure analytical workspaces and reports using Power BI Embedded

Create reporting solutions

Customize App Suite reports by using extensions

Expand Application Suite report data sets

Extend report menu items to redirect user navigation

Create custom designs for business documents

Help prevent long-running reports from timing out

Electronic reporting

Electronic reporting overview

## Configurations

- Create configurations

- Prepare components of the Electronic reporting solution

  - Design domain specific data model

  - Prepare application specific metadata

  - Test the prepared ER solution in the target application

  - Upgrade your format by adopting a new base version of that format

## Formula designers in Electronic reporting

- Formula designer

- Advanced formula designer

## Formula language and functions

- Formula language

- Functions

  - Date and time

  - List

  - Logical

  - Mathematical

  - Records

  - Text

  - Data collection

  - Other

  - Type conversion

- Manage ER model mapping in separate ER configurations

- Select data model definitions when you create formats

- Enhanced filtering options for finding configurations in the Global repository

- Generate reports by adding content as raw XML

- (ER) Cross-company data sources in Electronic reporting

- Design ER formats to generate outgoing electronic documents in various formats

  - (ER) Design a configuration for generating reports in OPENXML format

  - (ER) Design configurations to generate reports in Word format

  - Design configurations to fill out PDF templates

- Embed images and shapes

(ER) Embed images and shapes in documents that you generate

Example of embedding images and shapes

Design configurations to generate reports in Office formats that have embedded images

Review configurations to generate reports in Office formats that have embedded images

Generate reports in Office formats that have embedded images

Modify Electronic reporting formats by reapplying Excel templates

Define the dependency of ER configurations on other components

Design an ER solution to use financial dimensions

Design data models to use financial dimensions as data sources

Map models to use financial dimensions as data sources

Design reports to use financial dimensions as data sources

Run reports that use financial dimensions as data sources

Design ER formats to perform counting and summing by using information from generated output

Create formats to perform counting and summing

Configure format to perform counting and summing

Use computations to generate the output for counting and summing

Run formats to perform counting and summing

Dynamically add columns to Excel reports as horizontally expandable ranges

Design formats to dynamically add columns to Excel reports as horizontally expandable ranges

Run formats to dynamically add columns to Excel reports as horizontally expandable ranges

Use Document management files in format outputs

Prepare data models to use Document management files in ER outputs

Extend data models to use Document management files in ER outputs

Create formats to use Document management files in ER outputs

Run formats to use Document management files in ER outputs

Modify and run formats to use Document management files in ER outputs

Update application data using Electronic reporting

Generate electronic documents and update application data

Import configurations to generate documents with application data

- Design configurations to generate documents with application data
- Modify models and mappings to generate documents with application data
- Modify formats to generate documents with application data
- Generate documents that have application data

Import data from incoming files by using ER solutions

- Parse incoming documents in different formats
- Configure data import from manually selected files
  - Create configurations to import data from an external XML file
- Configure data import in batch mode from SharePoint located files
- Import files in XML format
  - Import files in XML format with optional attributes
  - Configure ER formats to import XML format files with optional attributes

Split generated XML files based on file size and content quantity

Support parameterized calls of ER data sources of Calculated field type

Configuration lifecycle

- Manage configurations lifecycle
- Upload configurations into lifecycle Services
- Import configurations from Lifecycle Services
- Download configurations from Lifecycle Services
- Import configurations
  - Download ER configurations from the RCS repository
    - Download configurations from the ER repository of the RCS type
  - Import configurations from RCS

Tutorials

- Use JOIN data sources to get data from multiple application tables
- Configure country context dependent ER model mappings
- Configure ER formats to use parameters that are specified per legal entity
- Set up the parameters of an ER format per legal entity
- Defer execution of ER format elements
  - Defer the execution of sequence elements in ER formats
  - Defer the execution of XML elements in ER formats

Use Electronic reporting solutions in Finance and Operations

Configure the framework

- Configure the Electronic reporting framework

- Back up and recover ER templates

- Create configuration provides and mark them as active

Destinations

- Destinations overview

- Destination types

- Configure destinations

Set up a reference to an ER format

Automatically validate generated reports

- Trace generated report results and compare them with baseline values

- Improvements in tracing results of generated ER reports and comparisons with baseline values

- Automate testing with Electronic reporting

Automate business processes by using Electronic reporting configurations

- Configure Electronic reporting to pull data into Power BI

- Generate printable free text invoice (FTI) forms

Trace execution of ER formats to troubleshoot performance issues

Business document management

- Business document management overview

- New document user interface in Business document management

- Add new fields to a business document template in Microsoft Excel

ER framework API

- Extend the list of Electronic reporting functions

- Electronic reporting framework API changes for Application update 7.3

- Specify a custom storage location for generated documents

Finance and Operations (Dynamics 365) mobile app

POS APIs

POS payment extension

Support for tipping in the POS payments SDK

Support for external gift cards

Create and apply branding to the Retail Experience app

Set up POS Hybrid app on Android and iOS

Override POS request handler

View POS extension package information

Test recorder and Regression suite automation tool for Cloud POS

Add custom fields to the POS Totals panel

Show custom notifications in POS

Sign MPOS with code signing certificate

Extend POS views to add custom columns and app bar buttons

Add custom controls to Modern POS transaction pages

Add custom columns to a POS transaction grid

Call POS APIs or operations from POS extensions

Modern POS (MPOS) triggers and printing

Add custom controls to non-screen designer-based POS views

Run the POS samples

Device management implementation guidance

POS Cart view events and handlers

Add custom buttons to the POS header bar

Hardware Station extensibility

Hardware Station and extensibility

Integrate POS with a new hardware device

Retail Server extensibility

Commerce Scale Unit customer and consumer APIs

Create Retail Server extension API (Retail SDK version 10.0.11 and later)

Create new Retail Server extension API (Retail SDK version 10.0.11 and earlier)

Retail Typescript and C# proxies

Consume Retail Server APIs in external applications

## Commerce Runtime (CRT) extensibility

CRT architecture and configuration

CRT services

CRT extension pattern

Manage secrets for Retail channels

CRT extensibility and triggers

Block transactions using triggers

Loyalty extension

Extension points for packing slips

Channel database extensions

Enable custom CDX synchronization via extension

Define and set order attributes

Customer attributes

CRT SDK samples

Log extension events to Application Insights

Create async Commerce (CRT) APIs in your business logic

Pre-extended columns in the channel database

Extend Commerce Data Exchange - Real-time Service

## Payment connector extensibility

Create a payment integration for a payment terminal

Implementing a payment connector and payment device (white paper)

Deploy payment connectors

Incremental capture for back-office invoicing

Create custom localized error messages for payment terminal extensions

Create Windows installers for payment connectors

Payment data use

Enable duplicate payment protection for payment connector

Create Commerce payment packaging for Finance and Operations deployment

## Third-party e-Commerce extensibility

Configure online stores

Configure authentication providers

e-Commerce platform SDK

Localize Commerce extension resources and label files

Finance and Operations apps development and administration

Dynamics 365 Finance

Dynamics 365 Supply Chain Management

# Commerce home page

2/18/2021 • 2 minutes to read • [Edit Online](#)

Dynamics 365 Commerce—built on the proven Dynamics 365 Retail capabilities—delivers a comprehensive omnichannel solution that unifies back-office, in-store, call center, and digital experiences. Dynamics 365 Commerce enables you to build brand loyalty through personalized customer engagements, increase revenue with improved employee productivity, optimize operations to reduce costs and drive supply chain efficiencies, ultimately delivering better business outcomes.

This release enables the creation of digital experiences using built-in web authoring and development tools to produce engaging and intelligent digital storefronts. A connected marketing and headless commerce platform further enable the seamless management of content, assets, promotions, inventory, and pricing across all channels.

- **Everything to build and run digital commerce:** Streamline your business and end-to-end commerce solution that scales to your needs across traditional and emerging channels. Built-in web authoring and development tools enable you to create engaging intelligent digital storefronts, while a connected marketing and headless commerce platform enables seamless management of content, assets, promotions, inventory, and pricing across channels.
- **Build loyalty and exceed customer expectations:** Use clienteling tools to gain a comprehensive view of your customer and respond to their needs at every level of engagement, based on customer profile, history, and preferences that flow across physical and digital channels. Empower your employees to foster lasting relationships through AI-driven recommendations, customer insights, and loyalty programs that elevate brand appeal.
- **Flexible and intelligent omnichannel experience:** Unify physical and digital commerce by providing consistent experiences to customers across cloud search and discovery, product reviews, wish lists, inventory, gift cards, and loyalty. Allow customers to purchase when, how, and where they want, on any device—while providing choice around modern payment methods and product collection or delivery.
- **Streamline operations using AI in the cloud:** Drive omnichannel commerce experiences and integrated, optimized back-office operations through ingrained, pervasive, and context-aware cloud intelligence. Use advanced merchandising, inventory management, distributed order management, and pricing and promotion to innovate and stay ahead of competition. Derive insights by visualizing and analyzing comprehensive and consistent data across all aspects of your business. Use AI-driven technologies to provide accessible websites, protect your business against payment fraud, and efficiently moderate user-generated content like ratings and reviews.

# Before you buy

2/18/2021 • 3 minutes to read • [Edit Online](#)

New to Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce? We've put together step-by-step guidance whether you're still evaluating or ready to make a purchase.

## Step one: Try out Finance and Operations free for 30 days

You can try Dynamics 365 for Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce for 30 days through a simple email signup. The trial version of Finance and Operations applications includes Getting started task guides that provide step-by-step instructions that allow you to view specific scenarios in action. The product is available to explore and exercise scenarios, but cannot be customized. Demo data is included to ease the use of the product and to make the experience more meaningful. A reminder email will be sent 3 days prior to the trial expiration. Get details at [Sign up for preview subscriptions](#).

## Step two: Choose a deployment option

You can now deploy Finance and Operations applications in the cloud or on-premises. Cloud deployments offer an ERP service that is fully managed by Microsoft, while on-premises deployments are deployed locally within a customer's data center.

The following considerations must be taken when you choose on-premises as a deployment option:

- Regulatory and compliance needs that are not available in the cloud certifications.
- Disconnected business process with intermittent internet connectivity required to access Microsoft Dynamics Lifecycle Services (LCS) for application lifecycle management.
- [Comparison of cloud and on-premises features](#).
- [System requirements for on-premises deployments](#).

### IMPORTANT

On-premises deployments are not supported on any public cloud infrastructure, including Microsoft Azure.

For more information, see [Deployment options](#).

## Step three: Buy and manage a subscription

To explore subscription options, go to the [Dynamics 365 pricing](#) page. This page includes several different plans to fit your organization's needs.

There are many ways to buy a subscription:

- Buy through a Cloud solution provider (cloud only).
- Buy through a partner, and use volume licensing (cloud or on-premises).
- Buy through a partner from the Dynamics price list (on-premises only).

### **Buy through a Cloud solution provider (cloud-only)**

A Microsoft Cloud Solution Provider can work closely with you to understand the needs of your business or organization. Use the [Microsoft Partner Center portal](#) to find a partner to fit your needs.

### **Buy through a Dynamics partner (on-premises)**

You must work with a partner to purchase Finance and Operations on-premises. For more information, see [Buy Finance + Operations \(on-premises\)](#).

### **Buy through volume licensing (cloud or on-premises)**

If your organization has 250 or more Dynamics 365 users, you may be interested in a [Volume licensing agreement](#).

In volume licensing, Finance and Operations applications are available through:

- Enterprise Agreement
- Enterprise Agreement Subscription
- Enrollment for Education Solutions (under the Campus and School Agreement)
- Microsoft Products and Services Agreement (MPSA)

### **Choose your support option**

Microsoft provides flexible, industry-leading support, services, and resources that enable users to quickly address technical issues and maximize return on your Dynamics 365 investment. Choose a plan that best meets your business requirements.

For additional resources, see:

- [Dynamics 365 Support](#)
- [Quick Start Guide for Microsoft Dynamics Cloud Service Support Benefits](#) (PDF)

## **Step four: Learn about FastTrack and plan your deployment**

Microsoft FastTrack for Dynamics 365 is our customer success service designed to help you move to Dynamics 365 smoothly and confidently, so you can realize business value faster. When you participate in the FastTrack program, you will receive guidance on best practices and how to plan for successful rollouts. You will also learn ways to enable new users and expand capabilities – all at your own pace. Additionally, you will have access to Microsoft engineering resources committed to make your experience with Dynamics 365 a success. For more information, see [Microsoft FastTrack](#).

## **If you are upgrading from Dynamics AX 2012 or migrating from AX 2009**

If you are a customer who is upgrading from Microsoft Dynamics AX 2012 or migrating from Microsoft Dynamics AX 2009, you may be eligible for a longer trial. Contact [daxcf@microsoft.com](mailto:daxcf@microsoft.com) for more information.

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# One Version service updates overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

The following set of topics provide information that is related to service updates for Microsoft Dynamics 365 for Finance and Operations version 8.1 (October 2018) and later. This is applicable for cloud releases only.

- [Service update availability](#) – This topic provides information about the release cadence and release process.
- [Software lifecycle policy and cloud releases](#) – This topic provides information about the service updates, availability, and end of service.
- [One Version service updates FAQ](#) – This topic answers questions about the update process, tools, planning, and Retail service updates.

The experience for service updates consists of four distinct steps:

1. Configure
2. Notice
3. Update
4. Validate

The rest of this topic describes each step and provides links to related topics.

## Configure

Customers can select a maintenance window, based on their business constraints. In Microsoft Dynamics Lifecycle Services (LCS), use the fields in the **Production environment update cadence** section on the **Update settings** tab of the **Project settings** page, as shown in the following image. A calendar of upcoming updates is available to help you plan ahead.

The screenshot shows the 'Project settings' page in Microsoft Dynamics Lifecycle Services. The 'Update settings' tab is selected. The page is divided into two main sections: 'SANDBOX UPDATE ENVIRONMENT' and 'PRODUCTION ENVIRONMENT UPDATE CADENCE'. In the 'SANDBOX UPDATE ENVIRONMENT' section, a dropdown menu shows 'app81servicingsb2 (Selected)'. In the 'PRODUCTION ENVIRONMENT UPDATE CADENCE' section, there are four dropdown menus: 'Cadence' (Second week (Selected)), 'Time Zone' (Eastern Time (UTC - 5) (Se...)), 'Day of the week' (Saturday (Selected)), and 'Time Slot' (4 AM to 7 AM (Selected)). Below these settings, there is a 'No' checkbox and a 'Save' button. A link to 'View the update calendar' is also present.

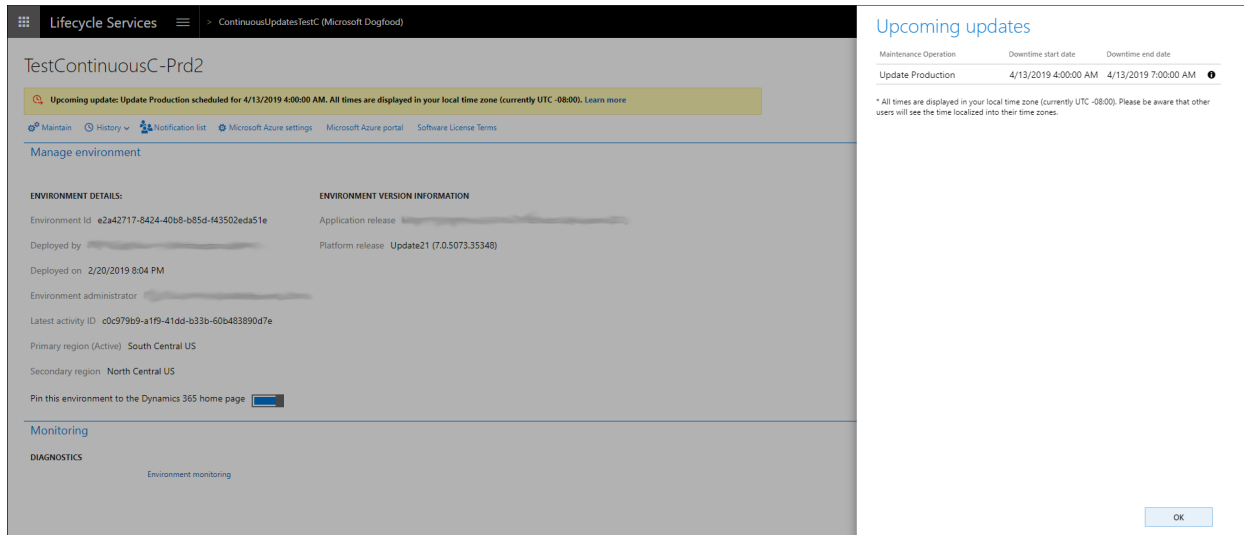

Users must opt in to new features and turn them on. All updates are applied first to the user acceptance testing (UAT) environment and then to the production environment. Therefore, customers have time to do any

validation that is required. Customers can select the environment that is updated. They can also pause an update for up to three months.

## Notice

[Release plans](#) will be available to help you plan ahead and understand what is changing. You can learn about upcoming features up to three months in advance. The [What's new](#) topics provide details about the updates for specific months.

Additionally, a notification email will be sent five days in advance, and a notification will appear in LCS just before an update, as shown in the following illustration.

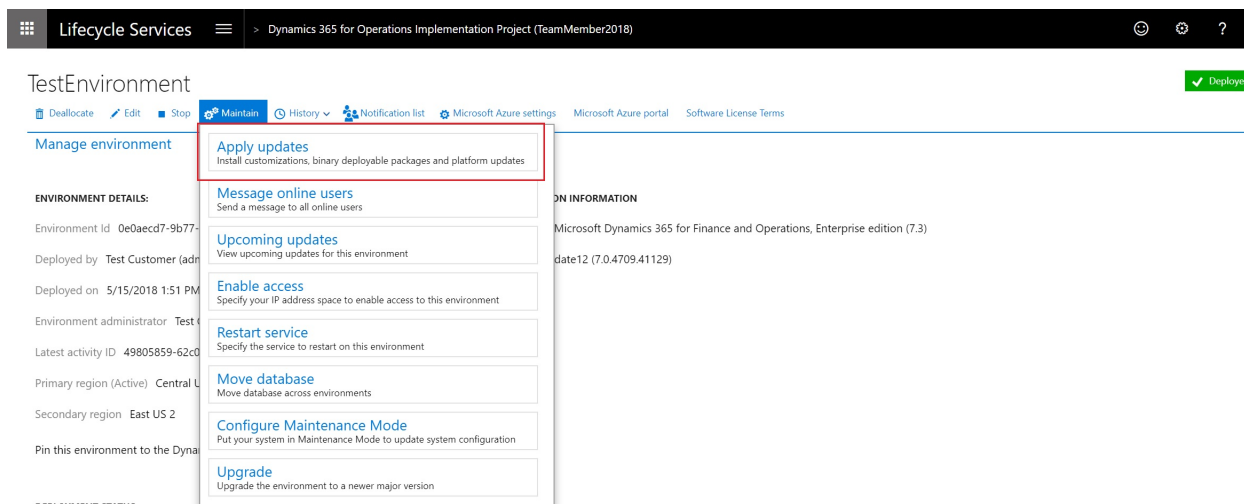

## Update

After notifications have been sent, Microsoft will apply the update (**auto update**) during the designated maintenance window. After this operation is completed, a notification email will be sent to indicate the status of the update. Customers will also be able to **self-update** by using the standard update experience in LCS. For more information, see [Apply updates to cloud environments](#).

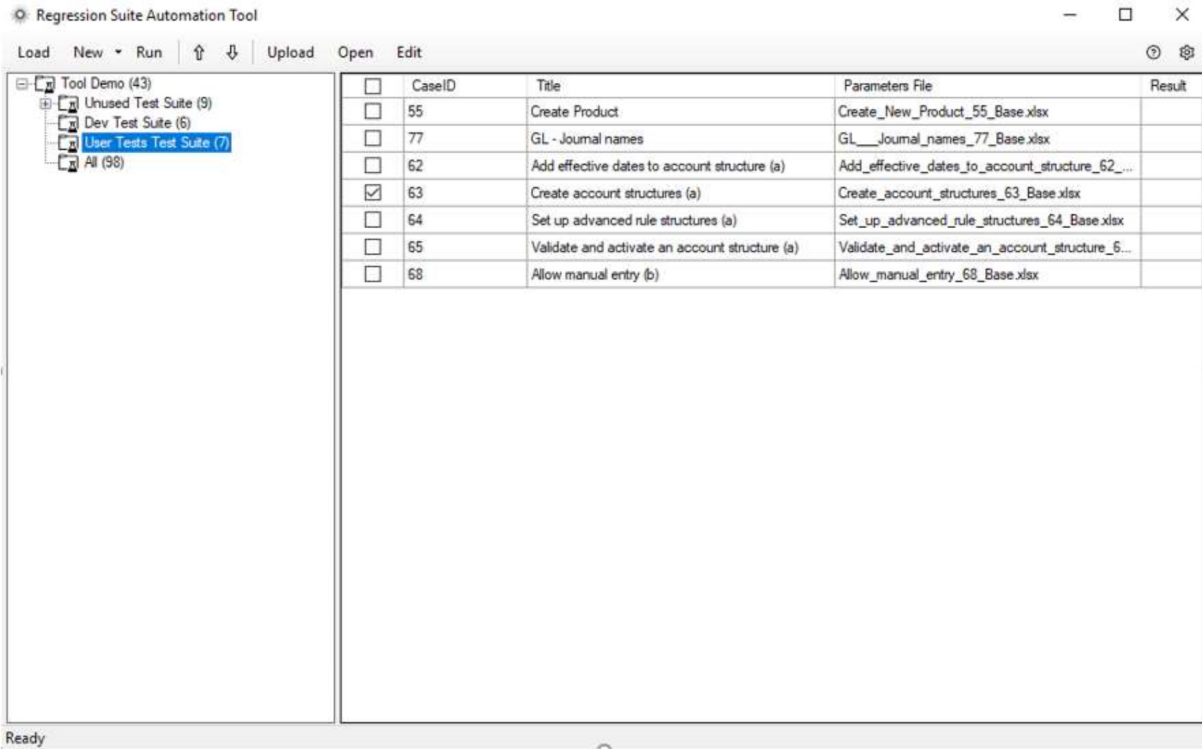

Customers who participate in the First release program will have an opportunity to update their sandbox environment and other environments early. To sign up for the First release program, go to <https://experience.dynamics.com>.

Customers will also be able to **self-update** by using the standard update experience in LCS, as shown in the following illustration.

# Validate

After an update is completed in the UAT environment, a basic business process test can be executed to validate the environment. To support this effort, a no-code automation test tool for business process testing is available, as shown in the following illustration. For more information, see [Create and automate user acceptance tests](#).

Some customers have both external data integrations and internal data integrations. We recommend that these customers use the [Data task automation tool](#) for testing.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# One Version service updates FAQ

2/18/2021 • 18 minutes to read • [Edit Online](#)

In July 2018 we announced a [change to the way we deliver Dynamics 365 updates](#) that will help you stay current in a consistent, predictable, and seamless manner. In June 2019, based on customer feedback we announced [New flexible service updates being made available](#). This FAQ is intended to provide clarity on the service updates, processes, and tools you can use to prepare for it. We will continue to add additional information to this topic as needed.

## Can the update be delayed, what is the policy?

Yes, the customer can pause, delay, or opt-out of an update via Update Settings in the Lifecycle Services projects. A customer can choose to pause up to 3 consecutive updates. The following is an example of a delayed update:

- The customer is currently on version 10.0.2.
- The customer can pause updates 10.0.3, 10.0.4, and 10.0.5.
- The customer must take the 10.0.6 update when it is available.

## With a release date in early April, when will the general availability package be made available?

Production updates for a monthly release will be scheduled for the first, second, and third weeks in of the month. Depending on the configuration that you set up in Lifecycle Services (LCS), you will receive updates during that specific week.

For the April 10.0 release, Microsoft will perform updates during the weekends of April 6, April 13, or April 20 based on the configuration that you set up in LCS. Sandbox updates will always be scheduled a week before the update. The configuration setup is available in LCS.

Customers can always choose to apply the update at an earlier time, or if there is a more convenient time than the suggested times in Lifecycle Services. If the customer is on the latest version the auto update will be canceled.

## Service updates

### What product versions are impacted by service updates?

VERSION	DESCRIPTION
8.1 and later	All customers on 8.1 and later will be scheduled for automatic monthly updates with a combined application and platform update starting November 2018. You will be required to be on an update that's no older than 4 months or 3 service updates. To pause an update, refer to <a href="#">Pause service updates</a> .
8.0	Customers on 8.0 can manually apply the monthly platform and financial reporting updates. You will be required to have an update that's no older than 4 months or 3 service updates. The 8.0 application lifecycle ends in April 2019. Customers on 8.0 must update by April 30, 2019 to stay supported. In order to be on a supported application, customers should follow the process to update to the latest version. For more information, see <a href="#">Update environments from version 8.0 to 10.0.X</a> .

VERSION	DESCRIPTION
7.x	Customers on 7.x can manually apply the monthly platform and financial reporting updates. You will be required to have an update that's no older than 4 months and 3 service updates. Customers on 7.x must update by April 30, 2019 to stay supported. If customer stays on version 7.3 past April 30 they will still receive automated platform updates every month. You are required to upgrade to 8.1 by April 2019 (unless extensions are not available). The only overlaid version in market will be version 7.3.

### What does the service update contain?

For release 8.1 and later, service updates will contain application (including financial, reporting, and Commerce) and platform changes that are critical improvements to the service including regulatory updates. New experiences will be configurable. The service updates are backward compatible. There will be a single version representing this update.

### What is a regulatory update?

A regulatory update is a new feature or an existing feature change required by law (usually for a specific country/region). The regulatory update is always required by a specific law enforcement date (LED) and should be enabled by this date or earlier.

### What's the upcoming schedule of updates?

Service updates are available since November 2018. You have the option to apply the update when it is convenient for you, or let Microsoft auto-apply the service updates based on the selected maintenance window. You are required to have an update no older than 4 months.

To see a targeted release schedule, see [Service update availability](#).

### Are there any major updates post 8.1?

There will be 2 major updates in April and October where new experiences can be enabled. Major updates will not require code or data upgrade. Breaking changes will be communicated 12 months in advance such that customers can plan accordingly. Such a change will only be introduced during a major update. The 10.0 release, which will be available in April 2019, will also be an update and not an upgrade.

### What does it mean when an update is backward compatible?

Backward compatibility covers binary and functional compatibility. Binary compatibility means that you can apply an update on any runtime environment without needing to recompile, reconfigure, or redeploy customizations. This also means that on a development environment at design time, X++ public and protected APIs and metadata are not modified or deleted. If Microsoft needs to break compatibility by removing obsolete APIs, it will be communicated 12 months in advance and follow a deprecation schedule. Functional compatibility is about user experience, all new experiences will be opt-in for a 12-month period.

Backward compatibility does not include non-X++/metadata APIs. Microsoft reserves the right to update versions of any dependencies the product uses, as well as remove dependencies without early warning. Microsoft does not commit to maintain backwards compatibility of dependent software libraries unless expressly stated.

For more information on deprecation guidelines and deprecated methods and metadata elements, see [Deprecation of methods and metadata elements](#).

### Can I apply a Platform service update to my existing 8.1 or later environments?

Customers on version 8.1 or later will only be able to apply the 8.1.x or v10.x Service updates. Platform only service updates cannot be applied to version 8.1.x or later. Platform service updates can only be applied to versions 7.x or 8.0.

### **Will Platform updates be able to be scheduled and delay/pause by customers?**

Yes, customers who are on version 7.3 are able to schedule platform updates directly in Lifecycle Services. A delay/pause experience is also available.

### **Service updates for on-premises deployments**

The policy and schedule for service updates are now the same for both cloud and on-premises deployments. This includes, for example, the option to delay applying up to 3 consecutive updates. How to apply each of these updates remains slightly different. For more information, see [Apply updates to on-premises deployments](#).

## Process

### **How will Microsoft ensure quality of releases?**

Ensuring quality of the release is a fundamental principle that's enabled through a series of progressive, rigorous, automated validations as described in [Service update availability](#).

### **Can I select the day and time to update?**

Customers can configure the day and maintenance time windows in LCS. The service update, which is based on your update settings, will start within 15 minutes. Email will be sent to customers who opt in to receive LCS notifications with instructions included on how to update. Customers will be able to select the designated tier 2/UAT sandbox for the update. Customers will have 7 calendar days for testing and validation.

Customers can optionally choose to apply the update earlier to all environments through LCS. The production-ready, deployable package will be made available to all customers via the Action Center in Lifecycle Services. Customers are responsible for deploying the update to any additional sandbox or developer/build (tier 1) environments. For more information, see [Configure service update](#).

### **A service update was applied to the environment, when looking at the tile in Lifecycle Services for this environment what does the number on the tile represent?**

The same service update will be auto applied to all customers by Microsoft. Microsoft will continue to service the latest update. The tile in LCS for that environment represents the cumulative number of hotfixes that are available to be applied to your environment. Because Microsoft will only auto apply the same version to all customers, you will be responsible for apply the cumulative hotfix package if it is required.

### **How do I update to the latest version?**

Users can update to the latest version using the tiles on the Environment details page in LCS. After the update is released by Microsoft, the tile will show the update available. Customers can choose to apply the update on their own by going through the update experience on their sandbox and production environments.

### **How do I update the production environment to the same version after Microsoft updates the sandbox environment?**

When Microsoft updates a sandbox environment, the package that is used for the update is saved in the project's asset library. The name of the package is prefixed by the words "Service Update." Because the package was already applied to the sandbox environment, you can mark this package as a Release Candidate. You can then go to the production environment and schedule to apply the package, just as you might schedule to apply any other update.

### **What is the expected downtime?**

The expected downtime for a successful update is 30 minutes to 1 hour. However, we ask for three hours of downtime in case issues occur while the update is applied. We are actively working to reduce the downtime that is required, and you should expect improvements in the next few months.

### **What's the process for deprecation?**

Before any feature is removed from the product, the deprecation notice will be announced in the product documentation 12 months prior to the removal.

For breaking changes that only affect compilation time, but are binary compatible with sandbox and production environments, the deprecation time will be less than 12 months. Typically, these are functional updates that need to be made to the compiler.

### **Can I delay an update?**

You can pause an update up to 4 months or 3 consecutive service updates by way of LCS configuration. After this period, an update will be scheduled and auto-applied by Microsoft. The update experience for a delayed update will incur additional downtime.

### **Can I delay an update for longer than 3 consecutive service updates due to seasonal activity or other business reason?**

No, service updates will be automatically applied to the sandbox, then 7 days later the update will be applied to the production environment if the environments are more than 3 service updates old. A customer can only pause up to 3 consecutive updates in a row. For example, if a customer on version 10.0 chooses to pause updates 10.0.1, 10.0.2, and 10.0.3 then service update 10.0.4 will be auto applied to the sandbox.

### **What if I find an issue during the sandbox update?**

If you find an issue when doing validations in a sandbox environment, you can request to skip the update through LCS directly by providing a valid support ticket number and a business justification.

### **What if I find a critical issue during sandbox testing and I am not able to pause the Production auto update?**

Critical issues should always be submitted to the support team via Lifecycle Services as soon as they are identified. The support staff will work with you on the resolution to the critical issue.

### **How much time do I get for validation?**

You will get 7 calendar days for validation after the update is applied to your sandbox environment. If you need more time, you can access the deployable package via the action center in Lifecycle Service and apply to your environments. This will provide you with additional time to test the update prior to a production roll-out.

### **What happens when the service update is complete?**

Once the service update is applied by Microsoft you will receive a notification if the update was successful or if it was not able to be applied. There can be several reasons an update was unable to be applied:

- Pending Package Sign-off - If a package is pending signoff, Microsoft will not apply the service update to production.
- Deployment Failure - If there was a deployment failure, the environment will be rolled-back to the original state.

### **If there is a failure, can I reschedule the update to be auto applied?**

You will not be able to reschedule the update per se, but you may apply the package when it is convenient for you, just as you might schedule to apply any other update.

### **Will critical hotfixes be automatically applied to my sandbox/ production environment during auto-update?**

The service update that will be made generally available, and auto applied to all customers will contain hotfixes and potentially new functionality. If a critical issue is reported after the service update has been applied, customers can pull that cumulative hotfix update from the tile in Lifecycle Services.

### **How will my ISVs stay current?**

Service updates to customer environments will be backward compatible and no action is required by the Independent software vendors (ISVs). ISVs develop on the minimum required platform release that their code depends on. Breaking changes will have a 12-month lead time to enable ISVs to include and validate. We recommend that the ISVs be part of our [Partner early access program](#), so that they can get early access to the platform bits and validate their solutions against the update before it's made generally available.

### **What about new features?**

All new features will be opt-in for a 12-month period and will not require any change management until you choose to enable the feature.

### **Are batch jobs suspended during a service update?**

Batch jobs are suspended during the maintenance windows and resume when the maintenance is completed.

## Tools

### **How can I get early access to non-released platform updates?**

You can join the [First release program](#), where Microsoft will keep your system always current with the latest updates. If you are not already a member of the Dynamics 365 Insider Program, you will need to:

1. Sign up for the Insider Program using this URL: <https://experience.dynamics.com>
2. Accept the terms and conditions to become a Dynamics 365 Insider.
3. After your application has been approved (approximately 24 hours) you can then sign back into the Insider Portal to find the different preview programs available for you to join.
4. Preview Early Access Program (PEAP) and First Release: The program requires that you accept additional terms and conditions to join. Please look for these programs within the Dynamics 365 Insider Program after your nomination has been accepted.

### **Is there tooling available to support testing the latest release?**

The [Regression Suite Automation Tool](#) is [available now](#). This tool significantly reduces the time and cost of user acceptance testing. User acceptance testing is typically required before taking a Microsoft application update or applying custom code and configurations to your production environment. It enables functional power users to record business tasks using the Task recorder and convert them into a suite of automated tests without the need to write source code. Test libraries are stored and distributed in Lifecycle Services using the Business Process Modeler (BPM) libraries and fully integrated with Azure DevOps for test execution, reporting, and investigation. Test data parameters are decoupled from test steps and stored in Excel data files.

### **How can I test and validate that the integrations continue to work?**

Data task automation lets you easily repeat many types of data tasks and validate the outcome of each task. You can also use automated testing of data entities by using task outcome validation. For more information, see the [Data task automation](#) topic.

### **How can I determine what's changed in a service update?**

The What's new or Changed documentation is the primary source for the details contained in each service update. The [Release plans](#) are the primary source of information for all new features and changes for a future release. Features will also include help topics in docs.microsoft.com as needed. An impact analysis tool will be available in LCS to help you better understand the impact on the features that you use.

### **How will I know if there is a deprecated feature that will impact me if I'm not doing active development/recompile my code?**

Deprecated features will be documented with each release. For more information, see [Removed or Deprecated features](#).

## Preparing for One Version

### **How can I log an extensibility request?**

Extensibility requests can be logged in LCS. Details are available in the [Extensibility requests](#) topic. Please note the following timelines to log and use the available extensions.

DATE	EXTENSIBILITY REQUESTS
January 2019	All extensibility requests must be logged by January 1, 2019. ISVs and customers are requested to analyze the code and make these requests by this time. We will not provide exceptions to stay on 7.3 after April 2019, if the request has not been filed by January 1, 2019.
December 2019	Extensions will be available on/ before December 31, 2019 for the requests logged by January 1, 2019. Customers using these extensions are required to move to current version by April 2020.

### **What does end of service mean?**

Microsoft will not provide any fixes to issues on versions that have reached end of service. Microsoft will also not investigate or troubleshoot any issue that you may encounter on a version that's older than 3 service updates. If you encounter an issue on a version that has reached end of service, you will be required to update to the latest update and report the issue if it persists.

All environments will continue to be operated by Microsoft. All automatic processes around your environments, such as monitoring or self-healing, will also continue as long as the environment is on a supported version.

### **Will individual hotfixes be supported?**

Individual hotfixes will not be supported after 8.1. Customers must update to the latest cumulative update available to apply the fix (such as 8.1.1). Critical fixes will also be cumulative and available through the LCS servicing experience.

### **Will you notify me about critical hotfixes released for the monthly update that I'm on?**

Customer reported issues are searchable via Lifecycle Services Issue Search. You can sign up to be notified when an open issue is resolved.

### **How can I upgrade to 8.x?**

Refer to the [Process for moving to the latest update](#) topic to learn how to upgrade to the latest application. Updating from [8.0 to 8.1](#) will not require any data upgrade and will be a self-serve update with much reduced downtime.

## Commerce service updates

### **What options are available to minimize impact to my Commerce cloud components?**

Commerce cloud components will require the same down time as your Dynamics 365 headquarters. In an upcoming release, the Retail Cloud Scale Unit (RCSU) will be available to reduce and further schedule updates to your deployment. Please refer to our published release information on our [documentation](#) and [release notes](#) sites for additional details on RCSU.

### **Will there be options to take individual hotfixes for my commerce solution components?**

All fixes and updates for commerce components will be cumulative.

### **What are the maintenance downtime requirements that may impact channel operations?**

For retailers with a business need for redundancy, Modern POS offline capability allows core POS operations to be available for use while disconnected from the internet or while the cloud environment is being updated. Stores operating with Commerce Scale Unit will also continue to operate with support for core POS operations during cloud maintenance windows. For more information, see [Online and offline point of sale \(POS\) operations](#).

### **When will I need to update my in-store components?**

All in-store components must be running released software that is less than one year old in order to maintain support. Customers are responsible for updating self-hosted components (such as components installed in stores or in privately managed datacenters) and ensuring that the installed versions of these components are actively supported.

### **Will there continue to be backward compatibility for the in-store components?**

Updates to components hosted in the cloud will continue to preserve backward compatibility with component versions self-hosted by the retailer (such as components installed in stores or in privately managed datacenters - Modern Point of Sale, Commerce Scale Unit, Hardware Station) for 12 months after the release date for that version. Self-hosted components do not need to be updated at the same time as cloud-hosted components and can be updated on a separate cadence allowing time to roll out updates to stores.

### **What options are available for updating in-store components across my organization?**

Customers can choose to update self-hosted components manually at each store or use mass update tools such as Microsoft System Center Configuration Manager, Microsoft Intune, etc.

### **What options do I have to slowly enable new functionality across my channels?**

Microsoft provides several mechanisms to progressively roll-out and enable functional enhancements across stores, devices, and users.

- **Screen layout designer** – Most visual elements in POS are configured and centrally managed by an administrative user in the customer organization. This means that new POS operations will not automatically be displayed on POS unless explicitly configured for inclusion in corresponding screen layouts. Screen layouts are configured using Screen layout designer and can be specific to a store or POS device. For more information, see [Screen layouts for the point of sale \(POS\)](#).
- **Functionality profiles, POS permissions, Commerce parameters** – Significant elements of functionality in POS are typically configurable by the user. This can be configured through functionality profiles, POS permissions, commerce parameters, or other controls which allow for device, register, store, or user-level functionality control in applicable scenarios.
- **Modern Point of Sale and Commerce Scale Unit** – Because Modern Point of Sale and Commerce Scale Unit are self-hosted by the retailer, topologies which include either of these components enable roll out of updates at a separate (and slower) cadence, and in a more granular fashion than with cloud-only topologies.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Manage Finance and Operations updates and your custom code lifecycle

2/18/2021 • 19 minutes to read • [Edit Online](#)

This topic describes application lifecycle use cases for Finance and Operations implementations. It's focused on the following scenarios:

- Managing your source code development branches
- Applying the next version of a Microsoft service update
- Applying a new version of your custom code

This topic applies to Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, Dynamics 365 Commerce, and Dynamics 365 Project Operations.

The main goal is to show how to complete the following tasks:

- Stay up to date and manage Microsoft service updates (or quality updates) for Finance and Operations apps (including Dynamics 365 Commerce) in incremental phases, independently of the lifecycle of your own customization. This approach simplifies the update process, and reduces the cost and risk of regressions that are associated with all-in-one upgrade projects.
- Take advantage of source code branches for version control of your custom code. By using version control, you can isolate the rollout of critical changes and hotfixes from the development of new features and capabilities.

This topic doesn't explain how to use the different tools in Azure DevOps and Microsoft Dynamics Lifecycle Services (LCS). Instead, it's focused on processes and best practices. The [Apply the next version of a Microsoft service update](#) and [Apply a new version of your custom code](#) sections contain both an overview of the phases and the steps of the process.

This topic includes the following sections:

- [Environments](#)
  - [Environments that run your current release](#)
  - [Environments that run the next version of your custom code](#)
- [Manage source code branches](#)
- [Apply the next version of a Microsoft service update](#)
  - [Backward compatibility of Microsoft updates](#)
    - [Runtime compatibility](#)
    - [Design-time compatibility](#)
  - [Phase 1: Update the Finance and Operations implementation](#)
    - [Track 1: Update your runtime environments](#)
      - [Update Test 1](#)
      - [Update UAT](#)
      - [Update Prod](#)
    - [Track 2: Update your development environments](#)

- Error situations
  - Case 1
  - Case 2
  - Case 3
- Phase 2: Update CSU to version 10.0.11
  - Phase 2 prerequisites
  - Track 1: Update your CSU runtime environments
    - Update Test 1
    - Update UAT
    - Update Prod
  - Track 2: Update your development environments
- Phase 3: Update POS to version 10.0.11
  - Phase 3 prerequisites
  - Update your Commerce development environment
  - Option 1: Store component updates that include only runtime changes
  - Option 2: Store component updates that include runtime and custom changes
  - Update Process
    - Update Test 1
    - Update UAT
    - Update Prod
- Apply a new version of your custom code
  - Create a hotfix of your code
  - Update your custom code from release N to release N+1
- Upload, update, and deploy store components

## Environments

This section describes the collection of Finance and Operations environments that the application lifecycle management (ALM) scenarios in this topic rely on. This configuration is typical for organizations that have implementations that rely on custom code (extensions). This custom code includes customizations that are provided by independent software vendors (ISVs).

### Environments that run your current release

The following environments are the environments in your current release:

- **Dev 1** – A development environment that runs the same version of Finance and Operations apps as the production environment. The Dev 1 environment uses Azure DevOps for version control of custom code. It's connected to the current release branch of your custom code. For more information, see the [Manage source code branches](#) section.
  - There are many options for development environments, both cloud and on-premises. For more information, see [Deploy and access development environments](#).
  - For build automation, use the new Azure DevOps Hosted Agents functionality. For more information, see [Build automation that uses Microsoft-hosted agents and Azure Pipelines](#).
- **Test 1** – A Tier-1 test environment that is used for functional and configuration testing. The Test 1

environment runs the same version of Finance and Operations apps as the production environment. It also runs the latest release version of your custom code extensions.

- **UAT** – A pre-production environment that is used for user acceptance testing. The UAT environment is a Tier-2 (Standard Acceptance Test) or higher environment. It runs the same version of Finance and Operations apps as the production environment. It also runs the latest release version of your custom code extensions. This environment is typically connected to a copy of the production database.
- **Prod** – Your live production environment that runs on your production database.

### Environments that run the next version of your custom code

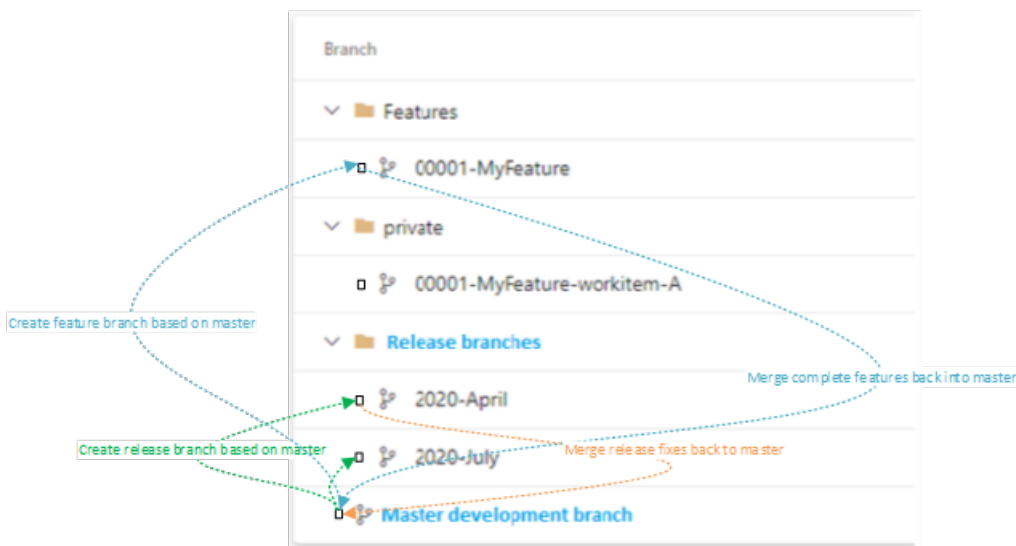

The following environments run the next version of your custom code:

- **Dev 2** – A development environment that is used for development of the next version of your custom code extensions. It uses Azure DevOps for version control of custom code. It's connected to the development branch (**main** branch) of your custom code. For more information, see the [Manage source code branches](#) section.
- **Test 2** – A functional test environment that is used for testing of the next version of your custom code extensions.

## Manage source code branches

It's important that you follow best practices as you manage branches of custom code. In this way, you help minimize cost, and ensure the quality of your releases and updates.

The **main** branch (development branch) contains the latest functioning version of the next release of your code.

When you work on new features, create a new feature branch out of the **main** branch. Then, when the feature work is completed, integrate the feature branch back into the **main** branch.

The release branches contain the code base of your official releases. In the preceding illustration, the assumption is that you have only one release branch, **release/2020-April**. **2020-April** isn't a build. It's a source code branch. Because you will probably create hotfixes for your release, you will make changes and produce builds out of this release branch.

- Don't use release branches to develop new features. Use them only for critical fixes or changes that are required in your live environment.
- After you've made a change in a release branch, integrate the branch back into the **main** branch. In this way, you ensure that your next release also contains the fix.
- Among the example environments that were described earlier, the Dev 1 environment will be connected to the **release/2020-April** branch.

When you're ready to release a new version of your custom code, create a new release branch that is based on the **main** branch. For this example, you will create a new release branch that is based on **main** and named **2020-July**.

You might have private branches that individual developers work in while they work on a specific work item that is based on a specific branch of your code. Private branches are merged back into their parent branch when the work is completed. For more information, see [Learn about branching strategies for Team Foundation Version Control \(TFVC\) and how to select an effective strategy](#).

## Apply the next version of a Microsoft service update

By using a phased approach, you help maximize the efficiency when service updates are taken. Each phase updates one component of your implementation.

### 1. **Phase 1** – Update your Finance and Operations environments.

Your current version of Commerce Scale Unit (CSU) and Point of Sale (POS) will work correctly with the new Finance and Operations update. For example, version 10.0.7 of CSU is compatible with version 10.0.11 of Finance and Operations apps.

### 2. **Phase 2** – Update CSU.

### 3. **Phase 3** – Update POS.

When you take a Microsoft update, you don't have to update your custom code to the next version. By taking

Microsoft updates without bundling them with custom code updates, you help simplify the update process. You also help reduce the cost and risk of regressions that are associated with all-in-one upgrade projects.

### **Backward compatibility of Microsoft updates**

It's important that you understand what Microsoft means by *backward compatibility of service updates*, so that you have context for the next sections of this topic. Service and quality updates are *runtime* backward-compatible. However, they aren't always *design-time (compile-time)* backward-compatible.

#### **Runtime compatibility**

All Microsoft updates are intended to be runtime backward-compatible. This compatibility covers both binary compatibility and functional compatibility. Runtime compatibility means that customizations that exist in production and sandbox environments will continue to work after Microsoft service updates are deployed to those environments. Those updates include service updates and quality updates. Runtime compatibility also means that Microsoft updates are backward-compatible with customizations that were compiled on an earlier platform.

Binary compatibility is backward only. You can compile a customization on an older application version and platform version, and deploy it to an environment that is running a later version. However, you can't deploy code to an environment that is running a version that is earlier than the version that the code was compiled on.

#### **Design-time compatibility**

Design-time (compile-time) backward compatibility means that developers can apply updates to their development environments and successfully compile their code without having to make any changes.

Microsoft aims for design-time compatibility. However, some updates might include changes that aren't compatible at design time, but that are binary-compatible. Therefore, after an update is applied, new errors or warnings might occur when your code is compiled. Here are some examples of these changes:

- Microsoft makes an enumeration extensible.
- Microsoft marks an API as obsolete or internal.
- Microsoft introduces a new compiler error to help prevent unsafe coding practices.

All these changes might require work on your solution. Design-time breaking changes that are binary-compatible don't require a 12-month deprecation notice. These breaking changes are documented for each service update. For more information, see [What's new and changed in Platform updates](#).

### **Phase 1: Update the Finance and Operations implementation**

This section summarizes the process that you use to update your Finance and Operations implementation to the latest service update. An update from version 10.0.7 to version 10.0.11 is used as an example.

This phase is divided into two tracks. These tracks can occur in parallel.

- **Track 1** – Update your runtime environments.
- **Track 2** – Update your development environments.

After you complete track 1, you will be live on version 10.0.11, unless you encounter one of the error situations that are described in the [Error situations](#) section.

#### **Track 1: Update your runtime environments**

By completing track 1, you essentially complete your Finance and Operations update to version 10.0.11, because your production environment will be live on version 10.0.11. You don't have to recompile your custom code as part of this track.

##### **Update Test 1**

The Test 1 environment is running version 10.0.7 together with the latest released version of your custom extension. Although an update of Test 1 isn't a prerequisite in this flow, it's recommended, because it adds another level of functional verification and predictability. This update should be completed before the UAT environment is updated. The sooner that you update Test 1 and validate on it, the more predictable your "real"

update (that is, the update of the UAT and Prod environments) will be.

1. Apply version 10.0.11 of Finance and Operations apps to Test 1.
2. Sign off on functional scenarios. You can use the [Regression Suite Automation Tool](#) to automate user acceptance testing on test and UAT environments.
3. If regressions are encountered, see the [Error situations](#) section.

#### Update UAT

The UAT environment is running version 10.0.7 together with a released version of your custom extension. (The UAT environment is the same as the Prod environment.)

1. Apply version 10.0.11 of Finance and Operations apps to UAT.

Your UAT environment might be configured so that it's automatically updated by Microsoft. However, you can always pull the update as soon as it's available.

2. Complete user acceptance testing, and sign off.
3. If regressions are encountered, see the [Error situations](#) section.

#### Update Prod

1. Apply version 10.0.11 of Finance and Operations apps to Prod.

Your Prod environment might be configured so that it's automatically updated by Microsoft. However, you can always pull the update as soon as it's available.

2. Sign off.

### Track 2: Update your development environments

The purpose of track 2 is to update the Dev 1 environment to version 10.0.11. Dev 1 is your **main** development environment that is connected to the current release branch of your custom code. It's running version 10.0.7 of Finance and Operations apps. By completing track 2, you ensure that Dev 1 runs version 10.0.11 together with your latest release, and that it's ready for any future hotfixes that are required for your code.

1. Apply version 10.0.11 of Finance and Operations apps to Dev 1.
2. Compile your custom code, and do testing.
3. Make any required changes to your custom code.
4. Check code changes in to the release branch.
5. If you have more than one development environment, follow these steps for each environment:
  - a. Apply version 10.0.11 of Finance and Operations apps to the development environment.
  - b. Sync and compile your latest custom code from the target code branch.

### Error situations

#### Case 1

During track 1, a bug is found that requires a Microsoft quality update. If Microsoft releases the update in a timely manner, use the new Microsoft update instead of the original service update to complete track 1.

#### Case 2

During track 1, a bug is found that requires a Microsoft service update. However, the update can't be released in a timely manner.

As a workaround for this issue, Microsoft proposes a change to your custom code.

1. Modify your code in Dev 1 (in the release branch), and test your updates.
2. Check code changes in to the release branch.
3. Create a new deployable package out of the release branch.

#### 4. Apply the new deployable package to Test 1 and/or UAT.

##### NOTE

Custom code that is compiled on version 10.0.7 can be deployed to any runtime environment that is running version 10.0.7 or later. Therefore, you don't yet have to update Dev 1 to version 10.0.11. However, you might already have done that update as part of track 2.

##### Case 3

During track 1, a bug is found that requires a change to your custom code. This bug might be in either your code or the ISV code.

1. Modify your code in Dev 1 (in the release branch), and test your updates.
2. Check code changes in to the release branch.
3. Create a new deployable package out of the release branch.
4. Apply the new deployable package to Test 1 and/or UAT.

### Phase 2: Update CSU to version 10.0.11

This section summarizes the process that you use to update your Commerce Scale Units to the latest service update. An update from release 10.0.7 (Commerce version 9.17) to release 10.0.11 (Commerce version 9.21) is used as an example.

#### Phase 2 prerequisites

Before you update your CSUs, you must update the Commerce headquarters environments (in the Finance and Operations app) to the same release or a later release. For this example, that release is 10.0.11.

This phase is divided into two tracks. These tracks can occur in parallel.

- **Track 1** – Update your CSU runtime environments.
- **Track 2** – Update your development environments.

After you complete track 1, you will be live on release 10.0.11 (Commerce version 9.21), unless you encounter one of the [error situations](#) that were described for phase 1.

#### Track 1: Update your CSU runtime environments

By completing track 1, you essentially complete your CSU update to version 10.0.11, because your production environment will be live on version 10.0.11. You don't have to recompile your custom code as part of this track.

##### Update Test 1

The software as a service (SaaS) components of Commerce aren't currently supported in Tier-1 environments (development/test environments). A copy of Retail Server runs locally in each Tier-1 environment, and the deployment of both Microsoft code for Retail Server and retail customizations will be done through the previous system, where application binary packages and retail deployable packages are applied against the infrastructure as a service (IaaS) instance.

##### Update UAT

The UAT environment is running CSU that corresponds to release 10.0.7, together with the same version of your retail extension that the production environment is running.

1. Update the Commerce Scale Unit. Select **9.21 (10.0.11)** as the target version. For more information, see [Phase 2: Update CSU to version 10.0.11](#)
2. Complete user acceptance testing, and sign off.
3. If regressions are encountered, see the [Error situations](#) section.

##### Update Prod

1. Update the Commerce Scale Unit. Select **9.21 (10.0.11)** as the target version. For more information, see [Phase 2: Update CSU to version 10.0.11](#)
2. Sign off.

## Track 2: Update your development environments

1. Get the latest version of the Retail software development kit (SDK).
  - a. Apply the Finance and Operations service update for release 10.0.11 to Dev 1.
  - b. Get the updated version of the Retail SDK from %ServiceDrive%\RetailSDK\Update\**<newest directory>**
2. In your **main** (development) branch, update the Retail artifacts from the new version of the Retail SDK.
3. Compile. The new version should be backward-compatible and should not require any changes to your code.
4. Commit the change that includes the Retail SDK update.
5. Make any required changes to your custom code.
6. Commit code changes to the target branch.
7. Optional: If you have more than one development environment, merge the latest changes from step 4, and compile the latest custom code.

## Phase 3: Update POS to version 10.0.11

This section summarizes the process that you use to update your store components, such as Modern POS and Hardware Station, to the latest service update. An update from release 10.0.7 (Commerce version 9.17) to release 10.0.11 (Commerce version 9.21) is used as an example.

Unlike updates for Commerce headquarters (in the Finance and Operations app) and CSU, updates for store components are delivered in the same packages. After you update Commerce headquarters and CSU, you have the following options:

- **Option 0 (no operation is required)** – Leave the store components in their previous release if the version is supported and in-policy.
- **Option 1** – Update the store components runtime (Microsoft code) so that it matches the same release as CSU.
- **Option 2** – Update the store components runtime (Microsoft code) and customization together.

In the rest of this section, the assumption is that you want or have to update the store components (option 1 or option 2).

After you complete this phase, you will be live on release 10.0.11 (Commerce version 9.21) for store components, unless you encounter one of the [error situations](#) that are described for phase 1.

### Phase 3 prerequisites

Phase 3 has the following prerequisites:

- The Commerce headquarters components (in the Finance and Operations app) were updated to the same release or a later release before the CSUs were updated. In this example, the version is 10.0.11.
- The CSUs were updated to the same release as, or a later release than, the store components. In this example, the release is 10.0.11.

### Update your Commerce development environment

Follow the steps in the [Track 2: Update your development environments](#) section.

#### Option 1: Store component updates that include only runtime changes

This option generates a new retail deployable package that contains your store components. It includes changes only from the Microsoft code.

1. Update your release branch, which has the code that is currently being used in the production environment, to the Retail SDK that matches your target release. In this example, the version is 10.0.11 (9.21). Follow the

steps in the [Track 2: Update your development environments](#) section.

2. Generate a new build for the retail deployable package. This build contains the same set of customizations that is currently in the production environment, plus version 10.0.11 (9.21) of the Microsoft code.

#### **Option 2: Store component updates that include runtime and custom changes**

This option generates a new retail deployable package that contains your store components. It includes changes from both the Microsoft code and customizations.

1. Update your release branch, which has the code that is currently being used in the production environment, to the Retail SDK that matches your target release. In this example, the version is 10.0.11 (9.21). Follow the steps in the [Track 2: Update your development environments](#) section.
2. Commit changes.
3. Update custom code for store components, or update references to ISV-updated components.
4. Generate a new build for the retail deployable package. This build contains updated custom code plus version 10.0.11 (9.21) of the Microsoft code.

#### **Update process**

##### **Update Test 1**

The SaaS components of Commerce aren't currently supported in development or test one-box environments. A copy of Retail Server runs locally in each development or test one-box environment, and the deployment of both Microsoft code for Retail Server and retail customizations will be done through the previous system, where application binary packages and retail deployable packages are applied against the IaaS instance.

The Test 1 environment is running version 10.0.11 of Commerce headquarters and a local version of CSU from previous phases. An update of Test 1 isn't a prerequisite in this flow. Because there is no CSU in this environment, this step is mostly for verification.

1. Upload, update, and deploy the store components. For more information, see the [Upload, update, and deploy store components](#) section.
2. Sign off on functional scenarios.
3. If regressions are encountered, see the [Error situations](#) section.

##### **Update UAT**

Clients that point to the UAT environment are running applications (for example, Modern POS) for release 10.0.7 (the same version that is currently running in the production environment).

1. Upload, update, and deploy the store components. For more information, see the [Upload, update, and deploy store components](#) section.
2. Sign off on functional scenarios.
3. If regressions are encountered, see the [Error situations](#) section.

##### **Update Prod**

1. Upload, update, and deploy the store components.
2. Sign off.

## Apply a new version of your custom code

This section describes the recommended flow for two use cases that require that you update your UAT and/or Prod environment with a new build of your custom extension.

#### **Create a hotfix of your code**

When a critical bug is found in the UAT or Prod environment, fix the bug in the release branch (not in the **main** or development branch), and use the standard process to apply a deployable package to UAT and Prod.

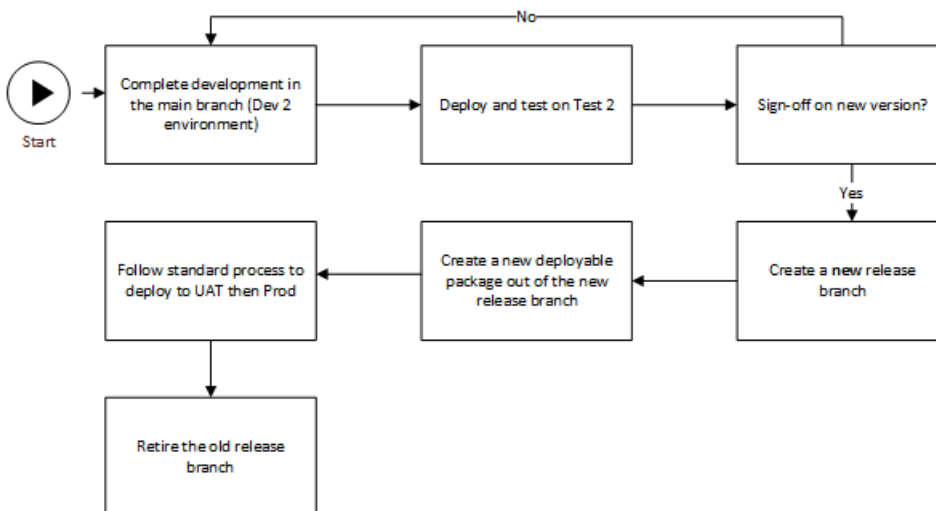

1. In Dev 1, make the code fix in the release branch. If the required fix is in ISV code, ask the ISV to send you a new build of the current release, not the next version of the solution.
2. Compile and test.
3. Create a new deployable package out of the release branch.
4. Deploy on Test 1, and sign off if sign-off is required.
5. Use the standard process to deploy custom code first to UAT and then to Prod.
6. Integrate the code fix with your **main** code branch.

### Update your custom code from release N to release N+1

When you're ready to release the next version of your custom code, use the following process to create and deploy the new release.

1. In the Dev 2 environment, or another environment that is connected to the **main** branch, complete development in the **main** branch.
2. Deploy and test on Test 2.
3. Repeat steps 1 through 2 until the new version is signed-off on.
4. Create a **new** release branch.
5. Create a new deployable package out of the **new** release branch.
6. Use the standard process to deploy custom code first to UAT and then to Prod.
7. Retire the old release branch.

## Upload, update, and deploy store components

1. Upload the retail deployable package to LCS.
2. Update Application Object Server (AOS) with the latest client.
3. Upload the retail deployable package to your Asset library:
  - Older deployments (earlier than version 10.0.11): Software deployable package
  - New deployments (version 10.0.11 and later): Retail self-service installers

4. Update Commerce headquarters with the new self-service installers for store components:
  - **Older deployments (earlier than version 10.0.11):** Deploy the retail deployable package to Commerce headquarters via LCS.
  - **New deployments (version 10.0.11 and later):** In Commerce headquarters, on the **Commerce parameters** form, on the **Channel deployment** tab, select **Check for package updates**. This update will bring in the packages that are available on the **Retail Self-service package** tab in the LCS Asset library.
5. Assign the client versions to your devices.
6. Download the installers for the desired client type and device.
7. Install in target device.
8. Test and validate.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Software lifecycle policy and cloud releases

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic outlines the lifecycle and support policies for the Finance and Operations online service.

## Modern Lifecycle Policy

The Finance and Operations online service is covered by the Modern Lifecycle Policy. The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For more information about this policy, see [Modern Lifecycle Policy](#). Licensed customers must stay current with updates to the Finance and Operations online service in accordance with the following servicing and system requirements:

- Customers purchasing subscriptions of Finance and Operations and operating on the following application versions will experience continuous updates of the Platform and Financial Reporting. Microsoft will continually update these components with the option to postpone up to 3 consecutive service updates.
  - Dynamics 365 for Operations version 1611 (November 2016)
  - Dynamics 365 for Finance and Operations, Enterprise edition (July 2017)
  - Dynamics 365 for Finance and Operations, Enterprise edition 7.3
  - Dynamics 365 for Finance and Operations, version 8.0 (April 2018)
- Platform versions maintain backward compatibility with the application versions that are supported at the time of the platform release within the application support lifecycle. For more information about platform versions, see [Cloud platform monthly updates FAQ](#).
- Critical fixes and non-critical updates are handled in the following way:
  - **Critical fixes** – Critical fixes include security fixes and any fixes that are required to adhere to the availability service level agreement (SLA) that the service supports. Critical fixes will be made available in the latest platform update version and in the latest service update for customers operating on version 8.1. In addition, to help protect the customer and the online service, Microsoft might apply critical fixes directly to a customer's environment. If a critical fix must be applied, Microsoft will notify the customer about the required downtime window (if there will be any downtime) and apply the fix to the applicable environment. The critical fix will update the system to the latest update version.
  - **Non-critical updates** – Customers operating on the following application releases must update to the most current Finance and Operations platform and financial reporter version to deploy non-critical updates.
    - Dynamics 365 for Operations version 1611 (November 2016)
    - Dynamics 365 for Finance and Operations, Enterprise edition (July 2017)
    - Dynamics 365 for Finance and Operations, Enterprise edition 7.3
    - Dynamics 365 for Finance and Operations, version 8.0 (April 2018)

Customers operating on release 8.1 must update to the most current service update to deploy non-critical updates.

## NOTE

Application and platform releases expire at the end of the month of their software lifecycle.

Microsoft will not provide any fixes to issues on versions that have reached end of service. Microsoft will also not investigate or troubleshoot any issue that you may encounter on an older version. If you encounter an issue on a version that has reached end of service, you will be required to update to the latest update and report the issue if it persists.

All environments will continue to be operated by Microsoft. All automatic processes around your environments, such as monitoring or self-healing, will also continue as is for supported versions.

## Dates and versions for application and platform releases

**Table 1: Continuous update releases**

For information about the new features included in each release, click the links in the **Version** column.

RELEASE	MAJOR RELEASE OR SERVICE UPDATE	VERSION	BUILD NUMBER	AVAILABILITY	END OF SERVICE
Dynamics 365 for Finance and Operations	Major release	<a href="#">10.0</a>	10.0.8	April 2019	Not applicable (continuously updated)*
Dynamics 365 for Finance and Operations	Major release	<a href="#">8.1</a>	8.1.136	October 2018	Not applicable (continuously updated)*

\* Indicates a major release is required to be updated through service updates. Service updates are cumulative in nature and may include updates for some or all of the following components: Platform, Application, Financial Reporting, Retail, and operating system updates. You will be required to have an update that's no older than 3 service updates. The 8.1.x version series will be replaced by version 10.0, which is targeted for release in April 2019. For more information, see [One Version service updates FAQ](#).

**Table 2: Application releases**

For information about the new features included in each release, select the links in the **Version** column.

RELEASE	MAJOR OR MINOR RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	END OF SERVICE
Dynamics 365 for Finance and Operations	Major release	<a href="#">8.0</a>	8.0.30	April 2018	April 30 2019
Dynamics 365 for Finance and Operations, Enterprise edition	Major release	<a href="#">7.3</a>	7.3.11971.56116	December 2017	April 30 2019*
Dynamics 365 for Finance and Operations, Enterprise edition	Major release	<a href="#">July 2017</a>	7.2.11792.56024	June 2017	April 30 2019

RELEASE	MAJOR OR MINOR RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	END OF SERVICE
Dynamics 365 for Operations	Major release	<a href="#">1611</a>	7.1.1541.3036	November 2016	April 30 2019
Dynamics AX	Minor release	<a href="#">7.0.1</a>	7.0.1265.23014	May 2016	June 2017
Dynamics AX	Major release	<a href="#">7.0</a>	7.0.1265.3015	February 2016	June 2017

\* All customers must be on the latest version of Finance and Operations by April 2019. However, we are making an exception for customers who have unfulfilled [extension requests](#) that have been submitted to Microsoft. Those customers who submitted extensibility requests by January 1, 2019, will be supported on version 7.3 until their extensibility requests are fulfilled. Customers are expected to upgrade to the latest version within 90 days of the extensibility request being fulfilled. For more information, see [One Version service updates FAQ](#).

### Table 3: Platform releases

For information about the new features included in each release, select the links in the **Release** column.

RELEASE	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE
<a href="#">Platform update 31</a>	7.0.5457	January 2020	N/A (Continuously updated)
<a href="#">Platform update 30</a>	7.0.5407	November 2019	N/A (Continuously updated)
<a href="#">Platform update 29</a>	7.0.5372	October 2019	N/A (Continuously updated)
<a href="#">Platform update 28</a>	7.0.5314	July 2019	N/A (Continuously updated)
<a href="#">Platform update 27</a>	7.0.5286	June 2019	N/A (Continuously updated)
<a href="#">Platform update 26</a>	7.0.5257	May 2019	N/A (Continuously updated)
<a href="#">Platform update 25</a>	7.0.5222	April 2019	N/A (Continuously updated)
<a href="#">Platform update 24</a>	7.0.5179	March 2019	N/A (Continuously updated)
<a href="#">Platform update 23</a>	7.0.5126	January 2019	N/A (Continuously updated)
<a href="#">Platform update 22</a>	7.0.5095	December 2018	N/A (Continuously updated / Retired)
<a href="#">Platform update 21</a>	7.0.5073	October 2018	N/A (Continuously updated / Retired)
<a href="#">Platform update 20**</a>	7.0.5030	October 2018	N/A (Continuously updated / Retired)
<a href="#">Platform update 15*</a>	7.0.4841	March 2018	N/A (Continuously updated / Retired)
<a href="#">Platform update 12</a>	7.0.4709	November 2017	November 2018
<a href="#">Platform update 11</a>	7.0.4679.35176	October 2017	October 2018

RELEASE	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE
<a href="#">Platform update 10</a>	7.0.4641.16233	August 2017	August 2018
<a href="#">Platform update 9</a>	7.0.4612.35162	July 2017	July 2018
<a href="#">Platform update 8</a>	7.0.4565.16212	June 2017	June 2018
<a href="#">Platform update 7</a>	7.0.4542.16189	May 2017	May 2018
<a href="#">Platform update 6</a>	7.0.4509.16180	April 2017	April 2018
<a href="#">Platform update 5</a>	7.0.4475.16165	March 2017	March 2018
<a href="#">Platform update 4</a>	7.0.4425.16161	February 2017	February 2018
<a href="#">Platform update 3</a>	7.0.4307.16141	November 2016	November 2017

<a href="#">Platform update 1</a>	7.0.4127.16103	May 2016	May 2017
<a href="#">Platform 7.0</a>	7.0.4030.16079	February 2016	January 2017

\*\* Platform updates 16, 17, 18, and 19 have not been made generally available.

\* Platform updates 13 and 14 have not been made generally available.

#### Table 4: Application updates

The application updates listed below consist of a small subset of application enhancements released on top of Finance and Operations versions 8.0, 7.3, and 7.2 (July 2017). These updates do not affect the support lifecycle of the release--support is in-line with the policies for each release.

Note that application updates are not cumulative. The individual packages only contain the enhancements that were included in that specific release. However, if there is a dependency between two packages, then both packages will be included.

For information about the new features included in each update, click the links in the **Version** column.

RELEASE	VERSION	BUILD NUMBER	AVAILABILITY

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Software lifecycle policy and on-premises releases

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic outlines the lifecycle and support policies for Microsoft Dynamics 365 Finance + Operations (on-premises) releases.

## Modern Lifecycle Policy

Finance + Operations (on-premises) software is covered by the Modern Lifecycle Policy. The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For more information about this policy, see [Modern Lifecycle Policy](#).

Licensed customers must stay current with updates to the Finance + Operations (on-premises) software in accordance with the following servicing and system requirements. This policy requires that the customer maintain Software Assurance (SA) or the Enhancement Plan, and deploy updates as noted later in this topic. Customers who want to use the Fixed Support Lifecycle Policy (5+5) must downgrade to Microsoft Dynamics AX 2012 R3. If a customer lapses on SA or the Enhancement Plan, the customer will be eligible only for the perpetual license rights to Microsoft Dynamics AX 2012 R3 and must uninstall Microsoft Dynamics 365 for Finance and Operations (on-premises) software.

## On-premises software update policies

The customer is in full control of its on-premises deployments and must follow this policy. The customer is in control of installing updates in its on-premises environments. Microsoft will support the Finance + Operations (on-premises) software through December 31, 2027, at a minimum, but only if the customer keeps the deployed software current according to this policy.

Critical fixes and non-critical updates are handled in the following way:

- **Critical fixes** – Critical fixes include security fixes and any fixes that are required to support reliability and availability. Critical fixes will be made available in the latest platform update version.
- **Non-critical updates** – Customers must update to the most current Finance and Operations platform and financial reporter version to deploy non-critical updates.

## Finance + Operations (on-premises) release dates

### Continuous service updates

As of November 2018, on-premises service updates are released continuously. For more information about version numbers and availability dates, see [Software lifecycle policy and cloud releases](#). For more information about One Version service updates, see [One Version service updates FAQ](#).

### Application releases

Application releases expire at the end of the month of their software lifecycle.

RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE	PRODUCT LIFE
<a href="#">Continuous service updates</a>	-	-	-	-	-

RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE	PRODUCT LIFE
Dynamics 365 for Finance and Operations (on-premises)	10.0	10.0.8	March 2019	June 2019	December 2027
Dynamics 365 for Finance and Operations (on-premises)	8.1	8.1.136	November 2018	April 2019	December 2027
Dynamics 365 for Finance and Operations, Enterprise edition (on-premises)	7.3	7.3.11971	March 2018	April 2020*	December 2027
Dynamics 365 for Finance and Operations, Enterprise edition (on-premises)	July 2017	7.2.11792	June 2017	April 2019	December 2027

\* All customers must be on the latest version of Finance and Operations by April 30, 2019. However, we are making an exception for customers who have unfulfilled [extension requests](#) that have been submitted to Microsoft. Those customers can be on version 7.3 until April 2020. For more information, see [One Version service updates FAQ](#).

### Platform releases

Platform releases expire at the end of the month of their software lifecycle.

RELEASE	BUILD NUMBER	AVAILABILITY	EXPIRATION	END OF LIFE
<a href="#">Continuous service updates</a>	-	-	-	-
Platform update 20	7.0.5030	November 2018	February 2019	December 2027
Platform update 15	7.0.4841	June 2018	September 2018	December 2027
Platform update 12	7.0.4709.41182	March 2018	June 2018	December 2027
Platform update 11	7.0.4679.35176	October 2017	April 2018	December 2027
Platform update 10	7.0.4641.16233	August 2017	April 2018	December 2027
Platform update 9	7.0.4612.35162	August 2017	April 2018	December 2027
Platform update 8	7.0.4565.1612	July 2017	April 2018	December 2027

**NOTE**

Platform releases are cumulative in nature. Any fixes, critical or non-critical, will require customers to take the latest available version of the platform.

**Downloadable virtual hard drive (VHD) releases**

Use of the VHDs is subject to the [Software license terms](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Service update availability

2/18/2021 • 5 minutes to read • [Edit Online](#)

Microsoft is committed to delivering predictable service updates. These service updates will be made generally available for self-deployment approximately 2 weeks prior to Microsoft automatically applying the update.

Customers will be able to take up to 8 service updates per year and are required to take a minimum of 2 service updates per year. Customers can choose to pause up to 3 consecutive updates at a time. Pausing a service update can apply to the designated user acceptance testing (UAT) sandbox, production, or both environments. After the pause window has ended and if the customer has not self-updated to a supported service update, Microsoft will auto-apply the latest update based on the configuration selection made available in Lifecycle Services (LCS). To learn more about how to pause service updates, see [Pause service updates through Lifecycle Services](#).

## NOTE

Service updates will not be provided during the months of March, June, September, and December.

## Targeted release schedule (dates subject to change)

## NOTE

Sandbox auto-update takes place 7 days prior to the production update. End of service indicates the date when no new cumulative service updates will be provided.

VERSION	PREVIEW AVAILABILITY (PEAP)	GENERALLY AVAILABLE (SELF-UPDATE)	AUTO-UPDATE SCHEDULE (VIA LCS UPDATE SETTINGS) PRODUCTION START DATE	END OF SERVICE

10.0.1/Platform update 25			May 1, 2019	June 10, 2019

#### NOTE

The [Software lifecycle policy](#) applies to customers enrolled in First Release and when the service update is made generally available.

Sign up for the PEAP program by joining the Insider Program available at <https://experience.dynamics.com>. After your nomination has been accepted, join the program.

Public previews are made available as a deployable package via the Shared Asset Library in Lifecycle Services. For more details, see [One Version service updates FAQ](#).

## Service update overview

Service updates are continuous, touchless updates that provide new features and functionality. They eliminate the need to do expensive upgrades every few years. The service updates maintain backward compatibility, which means there is no need to 'merge your code'. We recommend leveraging tools such as the Regression suite automation tool (RSAT) for regression testing.

You are in control and manage how your organization receives these updates. For example, you can sign up for the First Release program so that your organization receives updates first. You can apply the updates to any of

your environments manually (self-update) or remain on the default release schedule and receive the auto-updates when you schedule them using LCS.

Service updates contain both application and platform changes that are critical improvements to the service, including regulatory updates.

## Release processes

Each new release is designed and developed by the Dynamics 365 team. Any new release is first validated by the feature team, then by the Finance and Operations teams. During this time, extensive testing is done on various test topologies. A compatibility checker also runs tests to ensure backward compatibility. In addition, a [Release Validation Program](#) is available for customers to join. This program allows customers to share artifacts, such as databases and code, that is used for benchmarking and tested with automation to provide an additional layer of quality assurance.

Preview Early Access Program (PEAP) is available to partners, customers, and ISV's who opt in through the [PEAP Survey](#). As a participant in the PEAP program you will have first access and visibility into the preview for the upcoming service update. The preview service update is used to validate customizations, learn about new features, and provide feedback to Microsoft. During this phase, the service update must be deployed on a Dev/Test environment. This release cannot be used in production. To join the PEAP program, sign up via the [PEAP Survey](#).

The First Release program is open to all customers. Customers who join the First Release program will be the first, select group of customers to take the service update all the way to production. Microsoft will manage the deployment of this service update to a UAT sandbox and then 7 days later will auto-deploy the update to production. Customers participating in this program have the additional benefit of having dedicated Microsoft engineers closely monitoring the environments for any issues after updates have been applied. To join First Release, sign up via the [First Release Survey](#).

The service update will be made generally available using the action center in LCS. When the service update is available, it can be manually applied to all environments including production. If the service update has not been applied to the designated sandbox or production environment, Microsoft will auto-apply the update based on the Update settings for the LCS project. To learn more, see [Configure service updates through Lifecycle Services](#).

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Apply updates to cloud environments

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes how you can use Microsoft Dynamics Lifecycle Services (LCS) to automatically apply updates to cloud environments.

## IMPORTANT

Updates are applied using deployable packages. Applying updates causes system downtime. All relevant services will be stopped, and you won't be able to use your environments while the package is being applied. You should plan accordingly.

## Supported environments

All environments deployed through Lifecycle Services are supported.

## NOTE

If you have a build environment, you can only use LCS to apply Binary updates and Data upgrade packages. You can't use LCS to apply an Application Deployable package.

For other environments (listed below), you must use Remote Desktop Protocol (RDP) to connect to the environment and install from the command line. For information about manual package deployment, see [Install deployable packages from the command line](#).

- Local development environments (Downloadable virtual hard disk [VHD])
- Multi-box dev/test environments in Microsoft Azure (Partner and trial projects)

## Key concepts

Before you begin, you should understand *deployable packages*, *runbooks*, and the *AXInstaller*. A deployable package is a unit of deployment that can be applied in any environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. The AXInstaller creates a runbook that enables installing a package. For more details, see [Packages, runbooks, and the AXUpdateInstaller in depth](#) at the end of this topic.

## Supported package types

- **AOT deployable package** – A deployable package that is generated from application metadata and source code. This deployable package is created in a development or build environment.
- **Application and Platform Binary update package** – A deployable package that contains dynamic-link libraries (DLLs) and other binaries and metadata that the platform and application depend on. This is a package released by Microsoft. This is available from the **All binary updates** tile from LCS.
- **Platform update package** – A deployable package that contains dynamic-link libraries (DLLs) and other binaries and metadata that the platform depend on. This is a package released by Microsoft. This is available from the **Platform binary updates** tile from LCS.
- **Commerce deployable package** – A combination of various packages that are generated after the Commerce code is combined.
- **Merged package** – A package that is created by combining one package of each type. For example, you can

merge one binary update package and one AOT package, or one AOT package and one Commerce deployable package. The packages are merged in the Asset library for the project in LCS.

#### NOTE

A binary package and a Commerce deployable package can't be included in the same merged package.

For information about how to download an update from LCS and what you see in the tiles based on your environment version, see [Download updates from Lifecycle Services \(LCS\)](#).

If your environment is on an application version 8.1 and later, then the **Platform Update package** does not apply to your environment. Starting with 8.1 and later releases, **Application and Platform Binary update package** is the one that applies since application and platform will be combined into a single cumulative package and will be released by Microsoft. Also note that you will no longer be applying granular X++ hotfixes and will get all application and platform updates together. This means that on the environment details page, clicking on **View detailed version information** will not have details on the granular hotfixes or KBs applied as there is no way to apply them.

## Prerequisite steps

- **Make sure that the package that should be applied is valid.** When a package is uploaded to the Asset library, it isn't analyzed. If you select the package, the package status appears in the right pane as **Not Validated**. A package must pass validation before it can be applied in an environment by using the following procedures. The status of the package will be updated in the Asset library to indicate whether the package is valid. We require validation to help ensure that production environments aren't affected by packages that don't meet the guidelines.

There are three types of validations:

- Basic package format validations
  - Platform version checks
  - Types of packages
- **Make sure that the package is applied in a sandbox environment before it's applied in the production environment.** To help ensure that the production environment is always in a good state, we want to make sure that the package is tested in a sandbox environment before it's applied in the production environment. Therefore, before you request that the package be applied in your production environment, make sure that it has been applied in your sandbox environment by using the automated flows.
  - **If you want to apply multiple packages, create a merged package that can be applied first in a sandbox environment and then in the production environment.** Application of a single package in an average environment requires about 5 hours of downtime. To avoid additional hours of downtime when you must apply multiple packages, you can create a single combined package that contains one package of each type. If you select a binary package and an application deployable package in the Asset library, a **Merge** button becomes available on the toolbar. By clicking this button, you can merge the two packages into a single package and therefore reduce the total downtime by half.
  - **Make sure that the Application binary update package is applied to your dev/build environment before it is applied to your sandbox and production environment** - If the application binary package is applied directly to your Tier 2+ sandbox environment but is not applied on your dev/build environment, the next time you move an AOT package from dev/build box (which does not have the same application binaries as your sandbox environment) to sandbox, some of the application binaries will be overwritten with what is in your dev/build environment. This could result in a regression of the version of your sandbox environment.

# Apply a package to a non-production environment by using LCS

Before you begin, verify that the deployable package has been uploaded to the Asset library in LCS.

1. For a binary update, upload the package directly to the Asset library. For information about how to download an update from LCS, see [Download updates from Lifecycle Services \(LCS\)](#). For an application (AOT) deployable package that results from an X++ hotfix, or from application customizations and extensions, create the deployable package in your development or build environment, and then upload it to the Asset library.
2. Open the **Environment details** view for the environment where you want to apply the update.
3. Click **Maintain > Apply updates** to apply an update.
4. Select the package to apply. Use the filter at the top to find your package.
5. Click **Apply**. Notice that the status in the upper-right corner of the **Environment details** view changes from **Queued** to **In Progress**, and an **Environment updates** section now shows the progress of the package. You can refresh the page to check the status.
6. Continue to refresh the page to see the status updates for the package application request. When the package has been applied, the environment status changes to **Deployed**, and the servicing status changes to **Completed**.

# Apply a package to a production environment by using LCS

In a production environment, customers can schedule a downtime for when they want the update to be applied.

## IMPORTANT

An important prerequisite for applying a package to a production environment is that the package must be successfully applied to at least one sandbox environment in the same project.

1. After the update is successfully applied in a sandbox environment, go to the project's asset library. On the **Asset library** page, select the **Software deployable package** tab, select the package that you want to move to production, and click **Release candidate**. This indicates that this package is ready for production deployment.
2. Open the **Environment details** view for the production environment where you want to apply the package.
3. Select **Maintain > Apply updates** to apply the package.
4. Select the package to apply in your production environment, and then click **Schedule** to submit a request to apply it.

## NOTE

The list of packages includes only the packages that have been successfully signed off in the sandbox environment, and that have been marked as release candidates.

5. Specify the date and time to schedule the package application. Click **Submit**, and then click **OK** to confirm. Note that your environments will be unavailable to perform business while the package is being applied.
6. At the scheduled downtime, package deployment will start.
7. After the environment is serviced, you can monitor the status. The **Servicing status** field indicates the status of package application. Additionally, a progress indicator shows the number of steps that have

been run, out of the total number of steps that are available.

8. After the deployment is successfully completed, the **Servicing status** field is set to **Completed**.
9. If package application isn't successfully completed, Microsoft will investigate the issue. The **Servicing status** field will indicate that package application has failed. The environment will be rolled back to a good state.

## Troubleshoot package deployment failures

If package deployment fails, see the [Troubleshoot package application issues](#) topic.

## Applying updates and extensions

If you are updating a Tier-2 Sandbox or Production environment on application version 8.1.2.x or newer and have initialized Cloud Scale Unit, you will also need to update Commerce channel components. For more information, see [Update Retail Cloud Scale Unit](#).

If you're using components (such as Modern POS), after you've applied updates and extensions in your environment, you must also update your in-store components. For more information, see [Configure, install, and activate Modern POS \(MPOS\)](#).

## Packages, runbooks, and the AXUpdateInstaller in depth

Deployable packages, runbooks, and the AXUpdateInstaller are the tools you use to apply updates.

**Deployable package** – A deployable package is a unit of deployment that can be applied in an environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. Deployable packages downloaded from LCS or created in a development environment cannot be applied across product types. For example, a Finance deployable package cannot be applied in a Commerce app environment, and vice versa. If you have an existing customization for a Finance and Operations app that is compatible with the Commerce app, and you would like to apply it to a Commerce environment, you will need to re-package your source code in a Commerce development environment, and conversely if moving in the other direction.

**Runbook** – The deployment runbook is a series of steps that are generated in order to apply the deployable package to the target environment. Some steps are automated, and some steps are manual. AXUpdateInstaller lets you run these steps one at a time and in the correct order.

- **Generated based on topology of deployments with multiples VMs**
- **Contains step by step information for applying deployable package**
- **Provides sequence of steps across VMs in multi-box/ HA environment**
- **Integration for apply automation scripts at each step**
  - **Stop/ start AOS service, batch service**
  - **Report deployment, DB sync, ...**

```

**AXUpdateInstaller** – When you create a customization package from Microsoft Visual Studio or a Microsoft binary update, the installer executable is bundled together with the deployable package. The installer generates the runbook for the specified topology. The installer can also run steps in order, according to the runbook for a specific topology.

## Install deployable packages from the command line

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Apply updates to on-premises deployments

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic explains how to apply supported updates to Dynamics 365 Finance + Operations (on-premises). All updates to on-premises environments are done through Microsoft Dynamics Lifecycle Services (LCS).

## Search for and download updates

For more information about how to find the updates that you can apply to your on-premises environment, see [Issue search in Lifecycle Services \(LCS\)](#). For information about how to download updates from the tiles in the **Updates** section of the **Environment details** page in LCS, see [Download updates from Lifecycle Services \(LCS\)](#).

### NOTE

When you are updating an on-premises environment, always select updates from the update tiles on the **Environment details** page. If you select updates from another location, the updates might not work.

## Update an on-premises deployment

You can apply updates to an on-premises environment either during deployment or after the deployment is completed.

While an on-premises environment is being deployed, you can select to deploy a custom package in the **Advanced** settings. For more information about how to apply customizations or application X++ updates, see [Develop and deploy custom models to on-premises environments](#).

To apply updates to an on-premises environment after it has been deployed, in LCS, on the **Environment details** page for the environment, under **Maintain**, select **Apply updates**.

### NOTE

You can apply updates after deployment only on environments that have Platform update 12 for Finance and Operations or later. The environment must also have the latest version of the local agent available in LCS. For more information, see [Update the local agent](#). If you're on a platform version that is older than Platform update 12, you can reconfigure an environment that is already deployed to update the customizations or update to the latest platform release. For more information about how to redeploy an environment, see [Redeploy on-premises environments](#).

## Apply application or binary updates through LCS

The following steps can be used to apply X++, All Binary, or Platform binary updates.

### IMPORTANT

The application of updates requires downtime for your environment. Therefore, no business transactions can be performed in the environment during the update. When you complete the following steps, verify that the system isn't being used, and that an official downtime notice has been communicated to all system users.

## IMPORTANT

To move to the latest platform, always select the platform update from the **Platform Binary Updates** tile on the **Environment details** page. If you select updates from another location, the updates might not work.

### Prerequisites

- Before you begin, complete a full backup of the Management Reporter (MR), Microsoft Dynamics AX, and Microsoft SQL Server Reporting Services (SSRS databases). Although the code is restored through LCS, the database must be manually restored to help guarantee that there is no data loss.
- Update your environment to the latest build of Platform update 12.
- Update the local agent to the latest version. For more information, see [Update the local agent](#).
- Depending on the type of update, complete the following steps to generate a deployable package:
  - **Platform binary updates** – Download or save the update directly to the Asset library in LCS by following the steps in [Download updates from Lifecycle Services \(LCS\)](#).
  - **Application binary updates** – Download or save the update directly to the Asset library in LCS by following the steps in [Download updates from Lifecycle Services \(LCS\)](#).
  - **Application X+ + updates** – Download the required hotfix to your development environment, and then follow the steps in [Create deployable packages of models](#).
  - **Customizations** – Follow the steps in [Develop and deploy custom models to on-premises environments](#).

### Update a sandbox environment

1. In the LCS Asset library, upload the deployable package that was generated in the "Prerequisites" section of this topic to the **Software deployable packages** tab.
2. In LCS, open the on-premises implementation project, and then open the **Environment details** page of the environment to update.
3. Under **Maintain**, select **Apply updates**. A slider shows the updates that were uploaded to the Asset library. Note that only packages that are marked as **Valid** in the Asset library appear.

If you are on local agent version 2.1.0 and higher, complete the following steps.

1. Select the update, and then click **Prepare**. Clicking on **Prepare** will prepare your on-premises environment for servicing.

#### NOTE

During preparation, the environment state will be **Deployed** but the Deployment status field will show the progress of Preparation. Steps such as formatting the package and downloading the package are executed during preparation. The environment is not directly touched during preparation and hence there is no downtime during the preparation phase. Users can continue to use the system during preparation.

2. After the preparation is complete, you will see **Abort** and **Update Environment** buttons. To start applying the update, click **Update Environment**. If preparation fails, see the "Resolve a failed update application" section later in this topic.
3. In the confirmation message, select **Yes**. The servicing operation has started on this environment. This is the start of the downtime on your environment.
4. The environment state is changed from **Deployed** to **Deploying**.
5. After the update is completed, the environment state is changed back to **Deployed**. If application of the

update fails, the environment state is changed to **Failed**. For information about what to do if package application fails, see the "Resolve a failed update application" section later in this topic.

6. Open the **History** and **Environment details** pages to view the operations that were performed on the environment. You can also view a record of major actions that were performed on the environment, such as deployments, servicing, and rollbacks.

**If you are on local agent version lower than 2.1.0, complete the following steps.**

1. Select the update, and then click **Apply**.
2. In the confirmation message, select **Yes**. The servicing operation has started on this environment. This is the start of the downtime on your environment.
3. Environment state changes from **Deployed** to **Preparing**.

#### **NOTE**

During preparation, steps such as formatting the package and downloading the package are executed during preparation. The environment is not directly touched during preparation and hence there is no downtime during the preparation phase. Users can continue to use the system during preparation. However, we recommend that the downtime starts when the environment enters the **Preparing** state.

4. After preparation is complete, the environment state is changed from **Preparing** to **Deploying**.
5. After the update is completed, the environment state is changed back to **Deployed**. If application of the update fails, the environment state is changed to **Failed**. For information about what to do if package application fails, see the "Resolve a failed update application" section later in this topic.
6. Open the **History** and **Environment details** pages to view the operations that were performed on the environment. You can also view a record of major actions that were performed on the environment, such as deployments, servicing, and rollbacks.

### **Update a production environment**

Before you update a production environment, you must successfully complete the package application update on a sandbox environment.

1. In the project for the sandbox environment that you applied the package to, open the Asset library, and then, on the **Software deployable packages** tab, select the package, and mark it as a **Release candidate**.
2. On the **Environment details** page, under **Maintain**, select **Apply updates**. In the dialog box, only packages that are marked as a **Release candidate** are shown.
3. Select the Release candidate package to be applied to the Production environment.
4. The rest of the Update flow is the same as that of a sandbox environment. Your update experience will differ based on the version of the local agent running on your environment. We recommend that you always run with the latest version.

## Resolve a failed update application

When preparation fails, the environment state is **Deployed**. When the application of an update fails, the environment state is **Failed**. The first step is to determine why there is a failure. The location of the logs varies, depending on the stage where the failure occurred:

- **Preparation stage:** If the operation fails during the **Preparation** stage, the logs are uploaded to LCS. In the log files, select **Download logs** to download the log files. If the package has any merge issues, the error is included in the log file.
- **Deploying stage:** If the operation fails during the **Deploying** stage, the logs are located in the on-premises

environment. You must sign in to the environment, and then access the logs and event viewer.

For more information about how to use the troubleshooting logs, see [Troubleshoot on-premises deployments](#).

After you review the logs and determine the cause of the failure, complete one of the following operations to restore the environment to a healthy state. No actions can be performed on an environment that is in a **Failed** state. The environment must first be restored to a healthy state.

- **Retry failed operation** – If update application fails, select **Retry** to recover from the failed operation.
- **Abort failed operation** – Because there is no change made to the on-premises environment, if the preparation fails, you have the option to cancel the operation. Select **Abort** to cancel the preparation.
- **Roll back the update** – To roll back the update that failed, select **Rollback**. Before you start the rollback, you must restore the database to the last known good state. When you select **Rollback**, the environment is restored to the last known good state. The environment state is then changed to **Preparation**, then to **Deploying**, and then to either **Deployed** or **Failed**.

#### NOTE

The **Rollback** button doesn't roll back the database. You're responsible for restoring the database to the last known backup that was made before update application. This step is critical to help guarantee that there is no data loss.

- **Refresh the state** – If update application fails during the **Preparation** stage, the failure is on the LCS side, and update application hasn't yet started. Therefore, the on-premises environment is in a good state. To restore the LCS environment state to **Deployed**, on the project dashboard page, select **Refresh**.
- **Delete and redeploy an environment** – If the retry and rollback options don't work, you must delete and redeploy the environment. To delete the environment, on the project dashboard page, select **Delete**. You then see the option to configure the environment.

#### IMPORTANT

This option should **not** be used on a production environment. However, it can be used on a sandbox deployment to restore the environment to a healthy state.

Because this option requires that you do a fresh deployment of the environment, you lose any updates that were previously applied. Any customizations and binary updates must be reapplied to the environment.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure service updates through Lifecycle Services (LCS)

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Microsoft Dynamics Lifecycle Services (LCS), you can specify how and when you receive service updates from Microsoft for your environments.

## IMPORTANT

This feature is available only to customers who are using **version 8.1 and later** or are using **version 7.3**, and who are **not** part of the [First release](#) program. Microsoft is working to make the feature available to First release customers. For customers who are on version 7.1, 7.2, or 8.0, you can take the update manually using the regular servicing flows.

Only users (customers or partners) who are assigned to the **Project owner** role in LCS can configure updates. Additionally, updates can be configured only for **implementation projects**.

Follow these steps to change your update settings.

## NOTE

These settings apply only to service updates. They have no effect on the operating system-level security updates that are applied to your environments every month.

1. In LCS, in your implementation project, open the **Project settings** page.

This page has a new tab that is named **Update settings**.

2. On the **Update settings** tab, set the following configuration options as you require:

- **Update environment** – Select an alternate sandbox environment that should be updated before the production update.

By default, Microsoft first updates the Tier 2 Standard Acceptance Test (sandbox) environment that is included in the base offer. It then applies the update to the production environment. If you've purchased Tier 2 and higher sandbox add-on environments and want a different sandbox to be updated, you can use this field to change the default environment to an alternate environment.

## IMPORTANT

The environment that you select here will be updated seven calendar days before the update cadence that is selected for the production environment.

- **Production environment update cadence** – Select a recurring cadence for updates to your production environment. The sandbox environment that is selected in the **Update environment** field will be updated seven calendar days before the selected cadence. The following options are available:
  - **Select the cadence** – Select whether to receive updates in the first, second, or third week of the month.
  - **Select one of the three time-zones** – Select the time zone that the production environment

should be updated in: Eastern Time (UTC – 5), Hong Kong Time (UTC + 8), or Greenwich Mean Time (UTC + 0).

- **Select a day of the week:** Select the day in the week when you want to receive updates.
- **Select a time slot:** Select the time slot when you want to receive updates.

#### NOTE

Currently, only a few options are available for the day of the week and time slot options. Microsoft will add more options soon, such as weekdays for customers.

#### IMPORTANT

If the above time slots do not meet your needs, you always have the option to do a self-update at a time that is convenient to you by taking the update and applying it to your environments using the regular servicing flows.

3. When you've finished setting the configuration options, select **Save**.

After you set the update environment and update cadence, Microsoft generates an update calendar for the next six months. This calendar shows exactly when the configured sandbox and production environments will be updated. Therefore, you will know when to expect each update. To view the calendar, select the **View update calendar** link under the **Production environment update cadence** options.

#### IMPORTANT

After the settings are saved, you can change them at any time. However, if there is an ongoing rollout, the new settings won't be used to update the existing rollout timings. Instead, they will start to be used in the next rollout. An ongoing rollout is defined by the 14-day period between the date when the email notification about the update of the sandbox environment is sent and the date when the production environment is updated.

For more information about how to pause updates to configured sandbox and production environments, see [Pause service updates through Lifecycle Services \(LCS\)](#).

For more information about One Version and Microsoft-managed service updates, see [One Version service updates FAQ](#).

## Canceled updates

A scheduled update could be canceled for various reasons. Here are some of the common reasons that could cause a scheduled update to be canceled by Microsoft.

- An error was found during update preparation. The update preparation starts approximately 4 hours before the update to ensure that the environment is in a healthy state. If the environment was in a failed state or maintenance mode, the scheduled update will be canceled before it starts.
- An error was found while updating the environment. If there were issues during the update, the scheduled update will be canceled and the environment is rolled back to the previous state.
- The environment is already running on the latest version. There's no need to apply the update again, the scheduled update will be canceled before it starts.
- The target environment is not found. If the designated sandbox was deleted or the production environment has not been deployed, the scheduled update will be canceled before it starts.
- You're enrolled in the [First Release program](#). The First Release program has different release cadence so the previously scheduled updates will be canceled.

You can find the canceled updates via the **View recent canceled updates** in the update settings. It will show all canceled updates, if any, within the last 2 scheduled updates.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Pause service updates through Lifecycle Services (LCS)

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to pause updates to your sandbox and production cloud environments by using Microsoft Dynamics Lifecycle Services (LCS). This topic does not apply to on-premises environments.

## IMPORTANT

This feature is available only to customers who are using **version 8.1 and later** or are using **version 7.3**, and who are **not** part of the [First release](#) program. Microsoft is working to make the feature available to First release customers. For customers who are on version 7.1, 7.2, or 8.0, you can take the update manually using the regular servicing flows.

Microsoft updates your configured sandbox and production environments to the latest service update that Microsoft has released. Microsoft notifies you about upcoming updates to your environments via email and through notifications in LCS. At that point, if you can't proceed with the update for some reason, you can pause it through LCS.

For more information about how to change the configured sandbox environment and set the production update cadence, see [Configure service updates through Lifecycle Services \(LCS\)](#).

## Who can pause service updates?

Only users (customers or partners) who are assigned to the **project owner** role in LCS can pause updates. Additionally, updates can be paused only for **implementation projects**.

Staying current with service updates helps guarantee that customers always run on the latest set of fixes that Microsoft has released, so that they have the best service experience. Therefore, Microsoft doesn't allow updates to be paused indefinitely.

You can't use LCS to pause updates if you're three or more updates behind the latest update that Microsoft has released. For example, if the latest update that Microsoft has released is version 10.0.0, customers who are on version 8.1.3, version 8.1.2, and version 8.1.1 **can** pause updates. However, customers who are on version 8.1.0 **can't** pause updates, because they are more than three updates behind. Customers who are on version 7.3 can get only platform updates. For example, if the last platform update that Microsoft has released is Platform update 25, customers who are on Platform update 24, Platform update 23, and Platform update 22 **can** pause updates. However, customers who are on Platform update 21 **can't** pause updates.

## What can I pause?

If you decide to pause updates, you have two options:

- Pause updates only to your production environment.
- Pause updates to both your sandbox environment and your production environment.

You can pause a maximum of three continuous updates at a time. For example, if you're using version 8.1.3, you can pause update version 10.0.0, 10.0.1 and 10.0.2. However, you can't pause update version 10.0.3. In addition, in the month of June, you can pause the next three updates. However, you will not be able to pause updates scheduled for October, November, December and later. Similarly, for customers on version 7.3 for platform only updates, if you're using Platform update 23 then you can pause update 24, update 25, and update 26, but you

cannot pause update 27. We will be releasing 8 updates in a year. We require you to take at least two updates in a year.

#### **IMPORTANT**

There is no way to pause more than three updates, regardless of your industry or business schedule. If you are more than three updates behind and you find a critical issue during validations in your sandbox environment after the update, you can contact Microsoft Support to pause the update to your production environment. This is only required if you are more than three updates behind and you are unable to use the pause updates functionality available in LCS to pause the update to production.

If you pause updates to your sandbox environment, updates are automatically also paused for your production environment, because Microsoft always updates configured sandbox environments before production environments.

## How do I pause updates?

To pause updates, follow these steps.

1. In LCS, in your implementation project, open the **Project settings** page.  
  
This page has a new tab that is named **Update settings**.
2. On the **Update settings** tab, set the **Pause updates** option to **ON**.
3. Select **Edit settings**.
4. In the dialog box that appears, select whether you want to pause updates to your production environment only, or to both your sandbox environment and your production environment.
5. Select **Next**.
6. Select your reason for pausing updates. If you select **Issue found during validations**, you must enter a valid support ticket number. You can add any additional details that will help Microsoft understand why you want to pause updates.
7. When you've finished, select **Confirm**.

You can also edit an existing pause. You can either extend the duration of the pause, so that updates are paused for a longer time, or cancel it, so that updates are resumed. To edit a pause, select **Edit settings**. The limitations about the number of updates that you can pause still apply.

To cancel a pause and resume updates to your environments, set the **Pause updates** option to **OFF**.

Any time that you pause updates or edit an existing pause, a notification appears at the top of the **Update settings** tab. This notification shows what has been paused. An email is also sent to all stakeholders (the project owner and environment manager), to notify them that service updates for the selected environments have been paused. If someone cancels an existing pause and resumes updates, the notification disappears, and an email is sent to inform the stakeholders that updates have resumed.

#### **IMPORTANT**

You can pause updates through LCS until four hours before the start of the downtime window.

You can cancel a pause and choose to resume updates only 7 days prior to the start of the downtime date. If you are past that date then you will not be able to cancel a pause.

## What happens after the pause duration expires?

Cumulative service updates help guarantee that customers always run on the latest set of fixes that Microsoft has released, so that they have the best service experience. Therefore, Microsoft doesn't allow updates to be paused indefinitely.

There are two ways to cancel pauses, so that updates are resumed:

- Someone manually cancels an ongoing pause, as explained in the previous section.
- The duration that was set for the pause expires, and updates to the configured environments are automatically resumed.

In both cases, an email is sent to inform the stakeholders.

For more information about service updates, see [One Version service updates FAQ](#).

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Get notified about service updates through Lifecycle Services (LCS)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how you can stay up to date about service updates from Microsoft.

Microsoft uses service updates to update your configured sandbox and production environments to the latest released version. Microsoft notifies you about upcoming updates to your environments via email and through notifications in Microsoft Dynamics Lifecycle Services (LCS).

Here are the different types of notifications that you will receive:

- **Notification when an update is made available:** When a new release is made generally available, Microsoft surfaces a notification in your implementation projects' action center. You can then save that update in your projects' asset library, if you want to apply the update to your environments before Microsoft does an automatic update. When Microsoft does an automatic update, it also saves a copy of the update in your projects' asset library.
- **Notification that is sent five days before the update:** Microsoft notifies you five days before it updates your environment. After you've configured your update cadence, you will receive notifications about upcoming updates five days before they occur. These notifications take three forms:
  - **Email notification:** Project owners, environment managers, and users who are listed as additional stakeholders for an environment are notified by email about the upcoming update.
  - **Notification bar on the environment details page:** A notification that appears on the environment details page in LCS informs the customer about the upcoming update.
  - **Upcoming update reflects the update:** On the environment details page in LCS, select **Maintain > Upcoming Update** to open a dialog box that contains details about the upcoming update.
- **Notification that is sent one hour before the update:** One hour before the start of the downtime window, users in the application receive a notification. This notification asks users to save their work, because the environment will be taken down for an update.
- **Notification that is sent when the update is completed:** After Microsoft has finished updating your configured environment, it notifies you by email about the outcome of the update. This email is always sent, regardless of whether the update was successfully applied. It's sent to project owners, environment managers, and users who are listed as the additional stakeholders for the environment. If Microsoft can't start the update for some reason, the email includes a reason to explain why the update wasn't started.

After you receive a notification, if you can't proceed with the update for some reason, you can pause it. For more information about how to pause updates to configured sandbox and production environments, see [Pause service updates through Lifecycle Services \(LCS\)](#).

For more information about One Version and Microsoft-managed service updates, see [One Version service updates FAQ](#).

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Data task automation

2/18/2021 • 17 minutes to read • [Edit Online](#)

Data task automation lets you easily repeat many types of data tasks and validate the outcome of each task. Data task automation is very useful for projects that are in the implementation phase. For example, you can automate the creation and configuration of data projects. You can also configure and trigger the execution of import/export operations, such as the setup of demo data and golden configuration data, and other tasks that are related to data migration. You can also create automated testing of data entities by using task outcome validation.

## IMPORTANT

Data task automation isn't currently supported for on-premises environments. The user who executes data task automation must be in the same tenant as the application environment and LCS project.

We recommend the following approach for data task automation.

### 1. Identify the data-related tasks that will benefit from automation.

We recommend that implementation teams review their configuration management plan and data migration plan to identify potential data tasks for automation, and also to identify data entity test cases.

### 2. Define tasks.

Tasks are defined in an XML manifest. You can keep your manifest under source control as part of configuration management in your application lifecycle management (ALM) strategy.

### 3. Put the data packages that are related to data task automation in the Shared asset library of Microsoft Dynamics Lifecycle Services (LCS). You can also use a specific LCS project as you require.

Data task automation manager can consume packages from any sandbox and/or production environment that is related to the LCS project.

## IMPORTANT

- The user account that runs Data task automation manager must have access to LCS and to the LCS project that is referenced in the manifest for data packages.
- Although data task automation can be run in any environment in the cloud, we strongly recommend that you not run any import/export tasks that use integration application programming interfaces (APIs) in a production environment. Data task automation that involves integration APIs should be used only for automated testing.

### 4. Run the data tasks, and then review the outcomes.

Data task automation manager provides the success or failure outcome for each task. It also provides insights into the reason why a task failed.

## IMPORTANT

Although data task automation can be run in any environments in the cloud, we recommend that you not run any import/export tasks that use integration APIs in a production environment. Data task automation that involves integration APIs should be used only for automated testing.

The following video is a 55-minute TechTalk that walks you through an early release of Data task automation manager: [Task automation framework](#).

## Task manifest

A task must be defined in an XML manifest. This section describes the manifest. For guidance about how to name and design the manifest, see the "Best practices for manifest design" section later in this topic.

### Manifest root

The `<TestManifest>` element is the root of the manifest. All other elements are children of this element.

```
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
  <SharedSetup />
  <JobDefinition ID='ImportJobDefinition_1' />
  <EntitySetup ID='Generic' />
</SharedSetup>
<TestGroup />
</TestManifest>
```

ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	ATTRIBUTE DESCRIPTION
<code>&lt;TestManifest&gt;</code>	1..1	name	The <i>name</i> helps to identify the purpose of the manifest.

### Shared setup

The **Shared setup** section defines general task parameters and behaviors for all tasks in the manifest.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	ATTRIBUTE DESCRIPTION
<code>&lt;TestManifest&gt;</code>	<code>&lt;SharedSetup&gt;</code>	1..1	-	This element takes no attributes.

### Data files

`<DataFile>` elements define the data packages and data files that the tasks in the manifest will use. The data files must be either in the LCS asset library of your LCS project or in the Shared asset library.

```
<DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared' assetType='Data package'
lcsProjectId='' />
<DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS' assetType='Data package'
lcsProjectId='' />
<DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH' assetType='Data package'
lcsProjectId='' />
<DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB' assetType='Data package'
lcsProjectId='' />
```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	ATTRIBUTE DESCRIPTION
<SharedSetup>	<DataFile>	1..n	-	-
	<DataFile>	-	ID	
	<DataFile>	-	name	Name of the asset that represents the data file.
	<DataFile>	-	assetType	The asset type in LCS asset library that stores the data file. This is the asset type name as shown in LCS asset library.
	<DataFile>	-	lcsProjectId	The LCS project that has the data file in its asset library. If the project ID is specified as " " then, it indicates the Shared asset library.

### Data project definition

The <JobDefinition> element defines the data project definition. There can be more than one job definition in a manifest.

```

<JobDefinition ID='ImportJobDefinition_1'>
  <Operation>Import</Operation>
  <ConfigurationOnly>No</ConfigurationOnly>
  <Truncate></Truncate>
  <Mode>Import async</Mode>
  <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
  <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
  <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
  <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
  <SupportedDataSourceType>Package</SupportedDataSourceType>
  <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
  <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
  <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
  <LegalEntity>DAT</LegalEntity>
  <PackageAPIExecute>true</PackageAPIExecute>
  <PackageAPIOverwrite>false</PackageAPIOverwrite>
  <PackageAPIReexecute>false</PackageAPIReexecute>
  <DefinitionGroupID>TestExport</DefinitionGroupID>
  <PackageName>TestExportPackage</PackageName>
</JobDefinition>

```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
<SharedSetup>	<JobDefinition>	1..n	ID	The job definition ID is used in the tasks to reference the definition to be used for the data project.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
<JobDefinition>	<Operation>	1..1	-	The operation to be performed is specified by the following values: - Import - Export
	<Truncate>	1..1	-	This is a Boolean field with possible values of Yes or No. This is applicable only when operation is set to <i>Import</i> .
	<Mode>	1..1	-	The mode specifies the method using which the operation must be performed. The possible values are: - Import async - Export async - Recurring batch: This uses the enqueue API. Dequeue API is not supported yet. Package API supports both export and import.
	<ConfigurationOnly>	0..1	-	This is a Boolean field with possible values of Yes or No. This must be set to Yes if the task is only to configure the data project but not to perform the specified operation.
	<BatchFrequencyInMinutes>	1..1	-	This specifies the frequency in which the batch must be scheduled. This is applicable only when mode is set to <i>recurring batch</i> .
	<NumberOfTimesToRunBatch>	1..1	-	This is used to set a limit to how many times the scheduled batch should run. This is applicable only when mode is set to <i>recurring batch</i> .

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<UploadFrequencyInSeconds>	1..1	-	This is used to control the rate at which a file is uploaded to the recurring batch job for import. This must be used only for automated testing of recurring integrations in non-production environments. This is applicable only when mode is set to <i>recurring batch</i> and operation is set to <i>Import</i> .
	<TotalNumberOfTimesToUpload>	1..1		This controls the total number of times the file should be uploaded to the recurring batch. This must be used only for automated testing of recurring integrations in non-production environments. This is applicable only when mode is set to <i>recurring batch</i> and operation is set to <i>Import</i> .
	<SupportedDataSourceType>	1..1		This must be used to specify if a file is being sent to the recurring batch or a package. This is only applicable when mode is set to 'recurring batch'.
	<ProcessMessagesInOrder>	1..1		This is a Boolean field with possible values of Yes or No. This is applicable only when mode is set to <i>recurring batch</i> and operation is <i>Import</i> .
	<PreventUploadWhenZeroRecords>	1..1		This is a Boolean field with possible values of Yes or No. This is applicable only when mode is set to <i>recurring batch</i> and operation is <i>Export</i> .

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<UseCompanyFrom Message>	1..1		This is a Boolean field which can be set to Yes or No. This is applicable only when mode is set to <i>recurring batch</i> and operation is <i>Import</i> .
	<LegalEntity>	1..1		This is used to specify the legal entity in which the import/export job must be executed.
	<PackageAPIExecute >	1..1		Refer to package API documentation to understand this parameter. This is a Boolean field which takes 'true' or 'false'.
	<PackageAPIOverwrite>	1..1		Refer to package API documentation to understand this parameter. This is a Boolean field which takes 'true' or 'false'.
	<PackageAPIReexecute>	1..1		Refer to package API documentation to understand this parameter. This is a Boolean field which takes 'true' or 'false'.
	<DefinitionGroupID>	1..1		Refer to package API documentation to understand this parameter. This is a string field.
	<PackageName>	1..1		Refer to package API documentation to understand this parameter. This is a string field.

### Entity setup

The **Entity setup** section defines the characteristics of an entity that a task in the manifest will use. There can be more than one definition, one for each entity that is used by the tasks in the manifest.

```

<EntitySetup ID='Generic'>
  <Entity name='*'>
    <SourceDataFormatName>Package</SourceDataFormatName>
    <ChangeTracking></ChangeTracking>
    <PublishToBYOD></PublishToBYOD>
    <DefaultRefreshType>Full push only</DefaultRefreshType>
    <ExcelWorkSheetName></ExcelWorkSheetName>
    <SelectFields>All fields</SelectFields>
    <SetBasedProcessing></SetBasedProcessing>
    <FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
    <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
    <DisableEntity>No</DisableEntity>
    <SkipStaging>Yes</SkipStaging>
    <ParallelProcessing>
      <Threshold></Threshold>
      <TaskCount></TaskCount>
    </ParallelProcessing>
    <MappingDetail StagingFieldName='RoundingRulePrices' AutoGenerate='Yes' AutoDefault='No'
    DefaultValue='' IgnoreBlankValues='No' TextQualifier='No' UseEnumLabel='No'/>
  </Entity>
</EntitySetup>

```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
<SharedSetup>	<EntitySetup>	1..n	ID	An identification that will be used by tasks to reference an entity definition to be used.
<EntitySetup>	<Entity>	1..1	name	The entity element is identified by the entity's name. However, to facilitate easy manifest definition, this element also supports * as a wild card which will mean all entities being used in a task. This comes in very handy when using data packages with hundreds of entities in a task.
<Entity>	<SourceDataFormat Name>	1..1	-	This is the file format to be used for the entity.
	<ChangeTracking>	1..1	-	This is a Boolean field with possible values of Yes or No. It enables or disables change tracking on the entire entity.
	<PublishToBYOD>	1..1	-	This is a Boolean field with possible values of Yes or No.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<DefaultRefreshType>	1..1	-	This sets the default refresh rate on the entity. The possible values are <i>Incremental push only</i> or <i>Full push</i> .
	<ExcelWorkSheetName>	1..1	-	This is used to specify the worksheet to be used for the entity.
	<SelectFields>	1..1	-	This can be used to specify the fields to be included in the template for an export operation.
	<SetBasedProcessing>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable set based processing on an entity.
	<FailBatchOnErrorForExecutionUnit>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable failure at execution unit level on an entity.
	<FailBatchOnErrorForLevel>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable failure at execution level on an entity.
	<DisableEntity>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable an entity in a data project.
	<SkipStaging>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to skip staging table for an entity during exports.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<ParallelProcessing>	1..1	-	This is used to define the parallel processing set up for an entity. The task will delete these settings if already exists at the beginning of the task and it will delete the created settings at the end of its execution.
<ParallelProcessing>	<Threshold>	1..1	-	This specifies the threshold for the parallel processing rule.
	<TaskCount>	1..1	-	This is used to specify the number of parallel tasks to be used for parallel processing.
<Entity>	<MappingDetail>	0..n	-	Allows to configure the <i>auto generate</i> , <i>auto default</i> and other settings on the mapping for an entity.
	<MappingDetail>	-	StagingFieldName	This attribute is used to identify the entity column for which the settings are to be specified.
	<MappingDetail>	-	AutoGenerate	This is a Boolean field with possible values of Yes or No for enabling/disabling auto generate option.
	<MappingDetail>	-	AutoDefault	This is a Boolean field with possible values of Yes or No for enabling/disabling auto default option.
	<MappingDetail>	-	DefaultValue	This is the default value to be used if auto defaulting is enabled.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<MappingDetail>	-	IgnoreBlankValues	This is a Boolean field with possible values of Yes or No for enabling/disabling this option.
	<MappingDetail>	-	TextQualifier	This is a Boolean field with possible values of Yes or No for enabling/disabling this option.
	<MappingDetail>	-	UseEnumLabel	This is a Boolean field with possible values of Yes or No for enabling/disabling this option.

## Test groups

Test groups can be used to organize related tasks in a manifest. There can be more than one test group in a manifest.

```

<TestGroup name='Set up Financials'>
  <TestCase Title='Import shared set up data package' ID='3933885' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='SharedSetup' />
    <JobDefinition RefID='ImportJobDefinition_1' />
    <EntitySetup RefID='Generic' />
  </TestCase>

  <TestCase Title='Import financials for HQUS' ID='3933886' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='FinancialsHQUS' />
    <JobDefinition RefID='ImportJobDefinition_1'>
      <LegalEntity>HQUS</LegalEntity>
    </JobDefinition>
    <EntitySetup RefID='Generic' />
  </TestCase>

  <TestCase Title='Import financials for PICH' ID='3933887' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='FinancialsPICH' />
    <JobDefinition RefID='ImportJobDefinition_1'>
      <LegalEntity>PICH</LegalEntity>
    </JobDefinition>
    <EntitySetup RefID='Generic' />
  </TestCase>

  <TestCase Title='Import financials for PIFB' ID='3933888' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='FinancialsPIFB' />
    <JobDefinition RefID='ImportJobDefinition_1'>
      <LegalEntity>PIFB</LegalEntity>
    </JobDefinition>
    <EntitySetup RefID='Generic' />
  </TestCase>
</TestGroup>

```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	DESCRIPTION
<TestManifest>	<TestGroup>	1..n	-	-
	<TestGroup>	1..1	Name	This is the name for the group to identify its functional reason.
<TestGroup>	<TestCase>	1..n	-	The task is defined in this element. The task can refer to the shared set up to inherit task parameters and task behavior. The task can also override parameters and behavior at its level thus making the management of the manifest simple.
	<TestCase>	-	Title	This is the title for the task.
	<TestCase>	-	ID	This is the ID for the task. This can be alphanumeric with a max character limit of 10.
	<TestCase>	-	RepeatCount	This is a placeholder for a future functionality. However, this must be specified with a value of <i>1</i> .
	<TestCase>	-	TraceParser	This is a placeholder for a future functionality. However, this must be specified with a value <i>off</i> .
	<TestCase>	-	Timeout	This is the maximum duration a task will be monitored by the task automation manager. If the task is still active beyond the timeout specified, the manager will proceed to the next task in the manifest.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	DESCRIPTION
<TestCase>	<DataFile>	1..n	-	This element is used to define the file or data package to be used by the task. This can reference to an already declared file or a data package in the shared section of the manifest. A task can have more than one data file specified for recurring batch import scenarios only. For other scenarios, even if more than one files are specified, the first file is what will be used by the task.
	<JobDefinition>	1..1	-	This element is used to define the data project to be used by the task. This can reference to an already declared job definition in the shared section of the manifest. The task can override elements of job definition to a new value than what is defined in the shared set up.
	<EntitySetup>	1..1	-	This element is used to define the entity set up for entities used by the task. This can reference to an already declared entity set up in the shared section of the manifest. The task can override elements of entity setup to a new value than what is defined in the shared set up.

## Best practices for manifest design

You can define a manifest in many ways. Here are a few pointers that you should consider when you design a manifest.

### Granularity

We recommend that you determine the granularity of your manifest as a functional decision. Your team must

decide whether it wants to manage many manifests or manage changes in a single manifest.

- Start with as many manifests as your team thinks you logically need. Later, when the team actually starts to run the manifests, it might find that it uses fewer manifests than it expected, and it might want to merge them. In this case, you can merge manifests.
- Consider separation of duties. For example, you might have one manifest for the setup of demo data and another manifest for the setup of the golden configuration for your environment. In this way, you can make sure that team members use only the manifests that they are supposed to use.
- Consider user access to LCS. For example, larger and globally distributed implementation teams might have multiple instances of the application or multiple LCS projects.

### Inheritance

The manifest schema supports inheritance of common elements that will apply to all tasks in the manifest. A task can override a common element to define a unique behavior. The purpose of the **Shared setup** section is to minimize repetition of configuration elements, so that elements are reused as much as possible. The goal is to keep the manifest concise and clean, to improve maintenance and readability.

### Source control

Manifests that must be used by all the members of an implementation team should be stored in source control in the Application Object Tree (AOT). This approach not only provides the benefits of source control, but also enables a process to distribute or make manifests available to all users in a consistent manner. This approach also enables configuration management for data projects that are related to data management, if manifests are used for configuration.

### Number of job definitions and entity definitions

For most of the use cases, one job definition in a manifest should be enough, because inheritance can be used to change the behavior at the task level. This principle also applies to entity definitions.

## Validations

Data task automation manager performs validations, based on the setup of a task. If a task fails, you can quickly determine the reason for the failure by viewing the validations after the task is completed. The level of information that Data task automation manager provides is optimized to facilitate initial discovery. For detailed investigation, you must look at the corresponding data project and its execution details.

The following data validations are currently supported:

- **Job status** – This validation checks whether the job was successful.
- **Batch status** – This validation checks whether the batch was successful.
- **Message status** – If the test is about integrations, the message status is validated.
- **Truncation** – If truncation is enabled, this validation checks whether truncation occurred.
- **Skip staging** – If **Skip staging** is enabled on a test, this validation checks whether staging was skipped.

## Example 1: Configuration management for data projects

The `<ConfigurationOnly>` element can be used to create configuration tasks for data projects. When `ConfigurationOnly` is set to `Yes`, the data projects are only created but not executed. This allows for managing data projects across environments in an automated manner.

```
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
  <SharedSetup>
    <DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS' assetType='Data package'
```

```

lcsProjectId='' />
  <DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH' assetType='Data package'
lcsProjectId='' />
  <DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB' assetType='Data package'
lcsProjectId='' />

  <JobDefinition ID='ImportJobDefinition_1'>
    <ConfigurationOnly>Yes</ConfigurationOnly>
    <Operation>Import</Operation>
    <Truncate>No</Truncate>
    <Mode>Import async</Mode>
    <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
    <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
    <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
    <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
    <SupportedDataSourceType>Package</SupportedDataSourceType>
    <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
    <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
    <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
    <LegalEntity>DAT</LegalEntity>
  </JobDefinition>

  <EntitySetup ID='Generic'>
    <Entity name='*'>
      <SourceDataFormatName>Package</SourceDataFormatName>
      <ChangeTracking>No</ChangeTracking>
      <PublishToBYOD>No</PublishToBYOD>
      <DefaultRefreshType>Full push only</DefaultRefreshType>
      <ExcelWorkSheetName></ExcelWorkSheetName>
      <SelectFields>All fields</SelectFields>
      <SetBasedProcessing>No</SetBasedProcessing>
      <FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
      <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
      <FailBatchOnErrorForSequence>No</FailBatchOnErrorForSequence>
      <ParallelProcessing>
        <Threshold></Threshold>
        <TaskCount></TaskCount>
      </ParallelProcessing>
    </Entity>
  </EntitySetup>
</SharedSetup>

  <TestGroup name='Set up import jobs for Financials'>
    <TestCase Title='Set up import job for shared set up data package' ID='3933885' RepeatCount='1'
TraceParser='off' TimeOut='20'>
      <DataFile RefID='SharedSetup' />
      <JobDefinition RefID='ImportJobDefinition_1' />
      <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Set up import job for financials HQUS' ID='3933886' RepeatCount='1'
TraceParser='off' TimeOut='20'>
      <DataFile RefID='FinancialsHQUS' />
      <JobDefinition RefID='ImportJobDefinition_1'>
        <LegalEntity>HQUS</LegalEntity>
      </JobDefinition>
      <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Set up import job for financials PICH' ID='3933887' RepeatCount='1'
TraceParser='off' TimeOut='20'>
      <DataFile RefID='FinancialsPICH' />
      <JobDefinition RefID='ImportJobDefinition_1'>
        <LegalEntity>PICH</LegalEntity>
      </JobDefinition>
      <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Set up import job for financials PIFB' ID='3933888' RepeatCount='1'

```

```

TraceParser='off' Timeout='20'>
  <DataFile RefID='FinancialsPIFB' />
  <JobDefinition RefID='ImportJobDefinition_1'>
    <LegalEntity>PIFB</LegalEntity>
  </JobDefinition>
  <EntitySetup RefID='Generic' />
</TestCase>
</TestGroup>
</TestManifest>

```

## Example 2: Automated setup of demo data

The following manifest shows the setup of demo data for three legal entities when the demo data packages are stored in the Shared asset library. The difference in this example from the previous example is the actual execution of the data projects to set up the demo data. This is accomplished by not using the ConfigurationOnly option or setting it to No to use it for consistency of the manifest.

```

<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
  <SharedSetup>
    <DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB' assetType='Data package'
lcsProjectId='' />

    <JobDefinition ID='ImportJobDefinition_1'>
      <Operation>Import</Operation>
      <Truncate></Truncate>
      <Mode>Import async</Mode>
      <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
      <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
      <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
      <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
      <SupportedDataSourceType>Package</SupportedDataSourceType>
      <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
      <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
      <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
      <LegalEntity>DAT</LegalEntity>
    </JobDefinition>

    <EntitySetup ID='Generic'>
      <Entity name='*'>
        <SourceDataFormatName>Package</SourceDataFormatName>
        <ChangeTracking></ChangeTracking>

# Delivering ISV solutions using One Version

2/18/2021 • 17 minutes to read • [Edit Online](#)

Thanks to One Version, new updates are now automatically broadcast, downtime is minimal, and customers enjoy the benefits of staying current with recent features and fixes without having to go through expensive upgrades.

Feature management lets customers control when new features are applied. Therefore, as an independent software vendor (ISV) partner, you can innovate together with Microsoft to take advantage of new features without having to handle the waiting times that come with long release cycles. When all your customers run on current versions, you have fewer versions to maintain. You can focus instead on building quality into the solutions that you provide for your customers.

The process of servicing current versions is also more seamless and safer than it was in earlier versions. Previously, patching required that individual fixes be combined and merged into a customer environment.

Extensibility allows for deployment of side-by-side solutions that give customers more choices about how they configure their solutions.

In the One Version model, customer user acceptance testing (UAT) environments and production environments are updated every month. It's critical that updates not cause issues. However, Microsoft acknowledges that both technical issues and functional issues may arise when environments are updated.

- Technical issues include breaking changes in application programming interfaces (APIs) that customizations in your solutions use.
- Functional issues that customers experience can be caused by the untimely introduction of new features. Microsoft will put any new functionality that might affect existing processes under feature management. In this way, customers can control when new functionality is adopted. Therefore, they have time to validate, document, and train their users about the new features.
- Functional issues might also be unintended changes that cause functional regressions.

Prevention of technical and functional issues is difficult and requires close coordination between Microsoft and you as an ISV partner. The Microsoft goal is that you will adopt practices that resemble Microsoft practices. This topic explains how you and Microsoft can achieve this goal together. Over the next several months, Microsoft will release new practices and tools to help you. This topic will be updated as the tools and practices evolve.

This topic includes the following sections:

- [Servicing customers](#)
- [Compatibility](#)
  - [Runtime compatibility](#)
  - [Design-time compatibility](#)
- [Developing new releases](#)
  - [Designing for extensibility](#)
  - [Data upgrade](#)
  - [Feature exposure](#)
- [Branches and builds](#)
- [Testing](#)

- [Deploying updates](#)
- [ISV solutions as part of One Version automated deployment](#)
- [Should I release binaries or source code?](#)

## Servicing customers

Dynamics 365 Finance and Operations apps run on Microsoft Azure. Therefore, it's a solution that runs as a service. Microsoft services companies 24/7, either proactively from alerts that report unusual behavior, or from support tickets that are submitted by customers or their partners. Microsoft has a range of tools to help support the services that are running. These tools include usage data that is collected from the services. To help safeguard customer data, Microsoft is also careful about who can access customer systems.

When Microsoft analyzes an issue, it might determine that the issue is related to your ISV solution. Microsoft reports this type of issue to you, so that you can follow up offline.

Companies can opt out of updates for two consecutive service updates before the next service update is applied to their environments. Therefore, at any time, Microsoft can expect that companies will be running one of the last three monthly updates.

When Microsoft resolves an issue that requires a code fix, it generally includes that code fix in the next monthly update. However, very critical issues that are reported, such as production outage, might require that a fix be provided for the version that customers are currently running.

Similar policies apply to your ISV solution, and you might also have to provide a code update. For your solution to be binary-compatible with all your customers, it must be built on the oldest platform release that you want to support. All new updates that Microsoft releases are intended to be binary backward-compatible. This compatibility gives you the option of maintaining only one servicing version of your solution that is based on the oldest of the three most recent updates. Therefore, you must maintain just one released solution. You can then use that solution to update all your customers, regardless of which of the three most recent updates they are running. As your customers adopt new Microsoft updates, you can rebase your maintained solution to a newer release to remain current with the three most recent updates.

This recommendation applies to servicing and maintaining your released solution. You will use a different approach to develop new releases of your solution. For more information, see the [Developing new releases](#) section of this topic.

## Compatibility

Microsoft diligently tries to guarantee compatibility with existing customizations. To achieve this goal, Microsoft uses strict practices in its engineering processes, together with tool and automation support that helps identify API contracts that are unintentionally broken. Telemetry lets Microsoft engineers determine customizations that reference or extend a Microsoft API.

Updates to Finance and Operations apps that are applied to customer environments are intended to be functionally compatible and binary-compatible with existing customizations. This compatibility covers not only APIs, but also functionality and the user experience. Customers must explicitly opt in to all new experiences.

Any deprecation or breaking change in binary or functional compatibility will be announced 12 months in advance. Therefore, you will have enough time to align your customizations with an alternative design. You must pay attention to the monthly updates to Microsoft documentation, and you must review the APIs that are marked as obsolete (deprecated) or internal. In this way, you will be able to manage changes in a timely manner.

The following sections define and describe the aspects of backward compatibility: runtime compatibility and design-time compatibility.

## Runtime compatibility

All new updates are intended to be runtime backward-compatible. This compatibility covers both binary compatibility and functional compatibility. Runtime compatibility means that customizations that exist in production and sandbox environments will continue to work after new updates are deployed in those environments. These updates include both service updates and quality updates.

Runtime compatibility also means that changes made by Microsoft to the platform will be backward-compatible with customizations that were compiled on an earlier platform.

Binary compatibility is backwards only. You can compile a customization on an older platform, and deploy it to a customer environment that has been updated to a later version. You cannot deploy code compiled on a later version than the one running on the environment you deploy to.

## Design-time compatibility

Design-time backward compatibility (that is, compile-time compatibility) means that developers can apply updates to their development environments and successfully compile their code without having to make any changes.

You must be aware of how APIs in your solution are used in your customers' implementations, and how you can use these APIs without causing breaking changes. As part of this effort, you must pay careful attention to what is changed and rely on engineering best practices. For examples of changes that you should avoid, see [Breaking changes](#).

You should try to meet a bar that resembles the bar that Microsoft sets. In that way, both you and Microsoft can help avoid creating regressions.

All Microsoft updates are intended to be binary (runtime) compatible, and Microsoft also aims for design-time compatibility. However, there is one category of required changes that is **not** design time-compatible but remains binary-compatible. After an update is applied, new errors or warnings might occur when your code is compiled. Here are some examples of these changes:

- Microsoft makes an enumeration extensible.
- Microsoft marks an API as obsolete or internal.
- Microsoft introduces a new compiler error to help avoid unsafe coding practices.

All these changes might require work on your solution.

Design-time breaking changes that are binary-compatible don't require a 12-month deprecation notice.

## Developing new releases

Together, One Version and the fact that the Finance and Operations apps run as a service provides a great vehicle for collecting feedback. Feedback is useful, because it helps Microsoft decide which new features it should add to upcoming updates. Historically, the Microsoft approach has been to release major releases that include many new features. However, the new model encourages a different approach. Therefore, Microsoft has moved to a series of continuous updates that gradually build on the available capabilities of the system. In many cases, one update contains an initial small feature that Microsoft then enriches in later updates. In some cases, Microsoft must provide staging for new features, and must use feature exposure to hide the new features or control modifications to them.

We recommend that you follow a similar approach for your ISV solutions. You will benefit from quicker integration and extension of new standard features.

As the following illustration shows, the frequency of your new releases can be independent of Microsoft releases. You should consider adopting a strategy for source code branching, as described in the [Branches and builds](#) section of this topic.

What is essential is the quality of every update that is released. Although testing helps guarantee quality, quality must also be built in during the design and implementation phases. In the One Version model, there are some new dimensions to consider, as described in the following sections.

### Designing for extensibility

To design your solution for extensibility, you must consider now only how you will customize by extending the standard application, but also how you will enable customization of your ISV solutions by your customers and partners.

Make sure that customizations are additive instead of intrusive, and follow the guidance on the [Extensibility home page](#).

Don't be too creative about the way that you build your customization. Otherwise, you might extend an API that is questionable and increase the risk that later updates will break your solution. Instead, log an [extensibility request](#), and ask that Microsoft create a more explicit API that is more resilient to breakage.

Design solutions that are extensible. For inspiration, see [Write extensible code](#).

Design for backward compatibility to avoid breaking customer implementations. A good strategy is to be explicit about what you offer for hooking and wrapping extension code. The way that you decorate your methods gives you lots of control over which methods you enable extensions for. For more information, see [Attributes that make methods extensible](#).

### Data upgrade

The types of data upgrade jobs that existed in earlier versions are no longer supported. This change was made because Microsoft wants to provide minimum downtime while a production environment is updated.

Database synchronization is still run during upgrade, and it supports basic operations such as adding new tables, field, and indexes.

To prevent downtime, Microsoft is introducing new ways of driving data upgrade that are run asynchronously. For example, data upgrade will sometimes be triggered when a feature is turned on through a feature flag. This new approach for data upgrade differs significantly from earlier approaches and will become available in upcoming updates. Documentation resources will also be available.

### Feature exposure

In the One Version model, updates are managed by Microsoft and pushed to customer environments. Pushed updates should not require that customers adjust to functional changes, or that they train their users about new or changed features every month. Pushed updates also should not cause customers to delay updates to their environment.

Feature management is a new concept that puts customers in control of deciding when new or changed features are used. Customers can review, validate, and document new or changed features before they are adopted. They can also train users before new or changed processes are adopted, to reduce the impact on daily operations.

Feature management will be released in upcoming monthly updates.

You should consider using feature management with your ISV solution to let customers control when new features are adopted.

# Branches and builds

As an ISV, you should plan on a minimum of two source code branches: a servicing branch and a development branch.

## Servicing branch

The servicing branch is used to produce bug fixes for your ISV solution. As the ISV, you specify the frequency of releases from the branch and distribution of the releases. The expectation is that these releases from the servicing branch will be binary cumulative releases.

The base Microsoft version that you use to build your ISV solution should match the oldest version that customers use with the solution. In the One Version model, that version starts with version 8.1 and is a maximum of three months old.

## Development branch

The development branch is used to develop new capabilities for the ISV solution. As the ISV, you determine the frequency of releases from the development branch. You don't have to synchronize your releases with the monthly Microsoft releases. The best approach might be to decouple your release schedule from the Microsoft release schedule and deliver releases less often. A quarterly or biannual cadence is a good starting point.

The base Microsoft version in the development branch should be either the latest released version that is available or the released version that you plan to use for servicing when your new release goes out. The goals are that you innovate together with Microsoft by staying as current as is feasible, and that your development model allows for uptake of recent feature work.

# Testing

Microsoft has several checks and balances in its development process to help guarantee functional and binary compatibility. ISV solutions must be validated with each Microsoft release to help guarantee this compatibility. The expectation is that you will do this validation during the Partner Early Access Program (PEAP) phase of each release.

It's very important that you provide quick turnaround for feedback, so that you will have time to fix any issues before the monthly updates are deployed in customer environments.

Test automation is important for quick validation of new updates. Microsoft plans to release the test framework and libraries to support you as you build your test automation.

Microsoft has an extensive suite of tests that support our validation. The expectation is that you, as an ISV, will create your own suites of automated tests.

In addition to the SysTest automation framework that is aimed at developers, the [Regression Suite Automation Tool \(RSAT\)](#) enables automation of business processes without requiring that code be written. Functional users can use the RSAT to record their critical tests and automate part of their UAT. You can also use the RSAT as you start to build your test automation.

Recently, Microsoft released the [Acceptance test library resources](#) and accompanying libraries. This framework is aimed at developers and lets them build tests that are more comprehensive than unit tests. The libraries that accompany the framework help make it a seamless way to build suites of tests.

## Currently released products – Testing binary and functional compatibility

The currently released product that is maintained in the servicing branch should first be tested for binary and functional compatibility. Your suite of automated developer tests, automated functional tests, and manual tests for your ISV solution should be run on an environment that has the new version from Microsoft and your existing ISV solution. Because this test run is testing for binary and functional compatibility, the ISV solution should **not** be recompiled.

If the testing is successful, this step will validate that a customer installation of the current version of your ISV solution won't have to be updated when Microsoft broadcasts the new release to the customer.

If the testing isn't successful, you, as the ISV, must immediately notify Microsoft through the [PEAP communication process](#). This process uses Yammer and an issue notification process. The issue will require either a fix from Microsoft or a fix in your ISV solution. A fix in your solution might, in turn, require that customers be updated from the servicing branch. In both cases, Microsoft must know about the issue, so that it can become more proactive in its processes for future releases.

### **Currently released products – Testing design-time compatibility**

Next, the currently released product that is maintained in the servicing branch should be tested for design-time compatibility. To do this testing, you should compile the solution against a deployment of the new Microsoft release. Although the goal of Microsoft is to minimize design-time compatibility issues, they might occur in some situations. One example is when Microsoft makes an enumeration extensible, and the solution uses it in a manner that assumes an underlying integer representation (for example, it uses the enumeration value in a logical comparison or mathematical function). Although the code will continue to work in a customer deployment because the underlying values are maintained, a compiler error is generated and addressed in future releases. Another example of a design-time compatibility issue is when Microsoft introduces a new compiler error to protect against unsafe coding patterns. To learn about more categories of design-time compatibility issues, see [Breaking changes](#).

You should run your suite of automated developer tests, automated functional tests, and manual tests on an environment that has the new version from Microsoft and your compiled ISV solution.

If the testing is successful, this step will validate that your ISV solution won't have to be updated even if source code is supplied to the customer and the customer recompiles the ISV solution.

If the testing isn't successful, and the issue isn't one of the categories that are described in [Breaking changes](#), you, as the ISV, must immediately notify Microsoft through the [PEAP communication process](#). This process uses Yammer and an issue notification process. The issue will require either a fix from Microsoft or a fix in your ISV solution. A fix in your solution might, in turn, require that customers be updated from the servicing branch. In both cases, Microsoft must know about the issue, so that it can become more proactive in its processes for future releases.

### **Currently released products – Updating the base build**

As Microsoft updates your customers to new releases, you should periodically update the base build, so that it matches the oldest version that is used by customers who run your ISV solution.

### **Solutions that are in development**

You validate your new solution development on either the latest released version or the released version that you plan for to use for servicing when your new release goes out. However, in both cases, consider doing validation on the most current version. This validation will help with early discovery of issues or uptake work that you must do.

If an unexpected break occurs, then you, as the ISV, must immediately notify Microsoft through the [PEAP communication process](#). This process uses Yammer and an issue notification process.

## Deploying updates

For Microsoft standard platform and application updates, One Version servicing includes a process for automated updates of customer environments. However, this automation isn't currently available for ISV solutions. For more information, see [ISV's as part of One Version service updates](#).

ISV solutions are manually updated, and you control your release cadence. The binary backward compatibility allows for safe updates of the standard platform and application.

The update process includes database synchronization (for example, the addition of new fields and indexes).

## ISV solutions as part of One Version automated deployment

Although Microsoft doesn't currently plan to release ISV solutions as part of the One Version automated deployment process, this option might become available at some point. However, Microsoft must first align engineering processes to make this option feasible.

Here are some areas where alignment will be required:

- **Feature management** – The user must be able to control when a new feature is turned on.
- **Backward compatibility and compliance** – Compliance with API customization usage is required.
- **Feature deprecation** – Advanced notice about deprecation of features or APIs must be provided.
- **Test automation suite**
- **Testing during the preview phase**
- **ISV solution sign-off and upload**
- **Automated deployment scripts**
- **Zero downtime** – Deployment of updates must be instantaneous.
- **Data migration without downtime**
- **Support for on-call duty, for servicing of critical production issues**

## Should I release binaries or source code?

Binary compatibility is supported, provided that you don't recompile. We recommend that your ISV solution not be compiled in customer environments. Instead, you should deploy precompiled binaries that you've prepared and validated. Your solution binaries can then be created from your servicing branch, based on an earlier version, when this approach is practical.

If an implementation partner or customer compiles your solution in an updated environment, new warnings and errors might occur, as was mentioned in the [Design-time compatibility](#) section of this topic. Therefore, we recommend that implementation partners not compile your solution. However, this recommendation doesn't mean that you shouldn't share your source code to help support debugging, for example. You should just consider taking steps to avoid compilation of your code, so that implementation partners aren't exposed to design-time issues.

# Create and automate user acceptance tests

2/18/2021 • 8 minutes to read • [Edit Online](#)

You can use Task recorder and Business process modeler (BPM) to create user acceptance test libraries. Task recorder is a powerful tool to record test cases and organize them by business process using BPM. As a Microsoft partner you can use BPM to distribute test libraries to your customers via LCS and LCS solutions. If you are a customer, use BPM to author and distribute test libraries across different projects and team.

Because BPM can be synchronized with Azure DevOps (formerly known as Visual Studio Team Services), you can automatically create test cases (including test steps) in your Azure DevOps project. Azure DevOps can then serve as your test configuration and test management tool where you can create targeted test plans and test suites, manage the execution of tests and investigate results. For more information about testing with Azure DevOps, see [What are test plans, test suites, and test cases?](#)

This topic walks through the process of creating and executing acceptance test suites to be used for manual or automated testing.

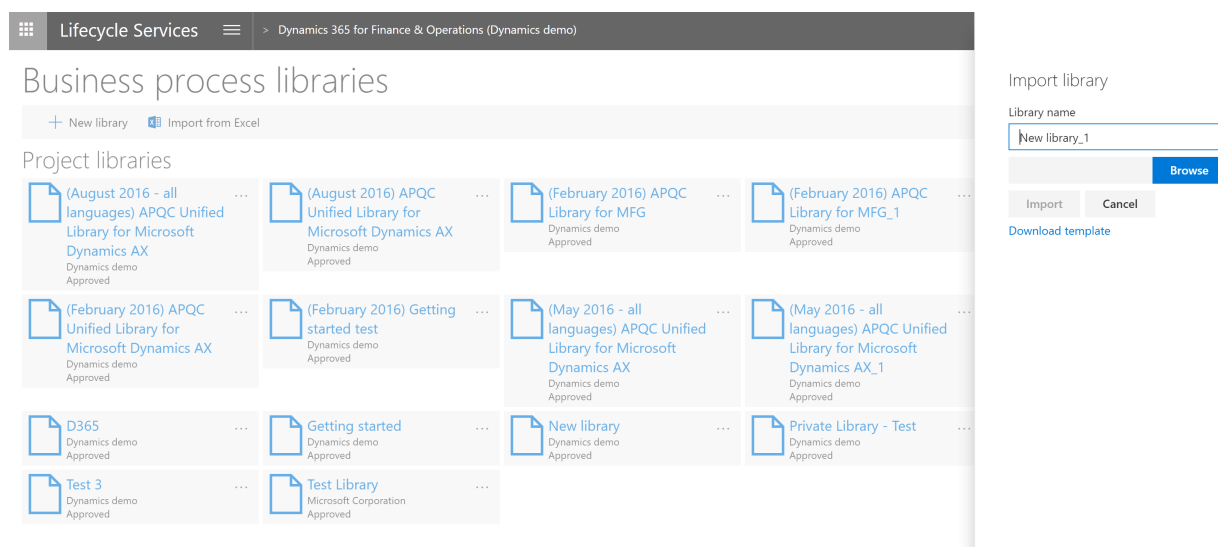

## Create a Scenario Acceptance Testing BPM library

BPM is a great LCS tool to describe a hierarchy of business processes and user tasks. LCS also allows Microsoft partners and customers to author and distribute BPM libraries across LCS projects via the Asset library. This section describes how to take advantage of BPM to define your acceptance test library.

### Create a BPM library

There are several ways to create a Business process modeler (BPM) library. For more information about how to create libraries in BPM, see [Create, edit, and browse Business process modeler \(BPM\) libraries](#).

For illustration purposes, this topic uses a library that contains common business processes, such as create an expense report and approve order requests. The library was created by using the Excel import functionality.

The screenshot displays the Lifecycle Services interface for Dynamics 365 for Finance & Operations. The main area shows a grid of 'Business process libraries' with various titles like '(August 2016 - all languages) APQC Unified Library for Microsoft Dynamics AX' and 'Getting started test'. On the right, an 'Import library' dialog is open, showing a text input field with 'New library\_1' and buttons for 'Browse', 'Import', 'Cancel', and 'Download template'.

### Record test cases and save to BPM

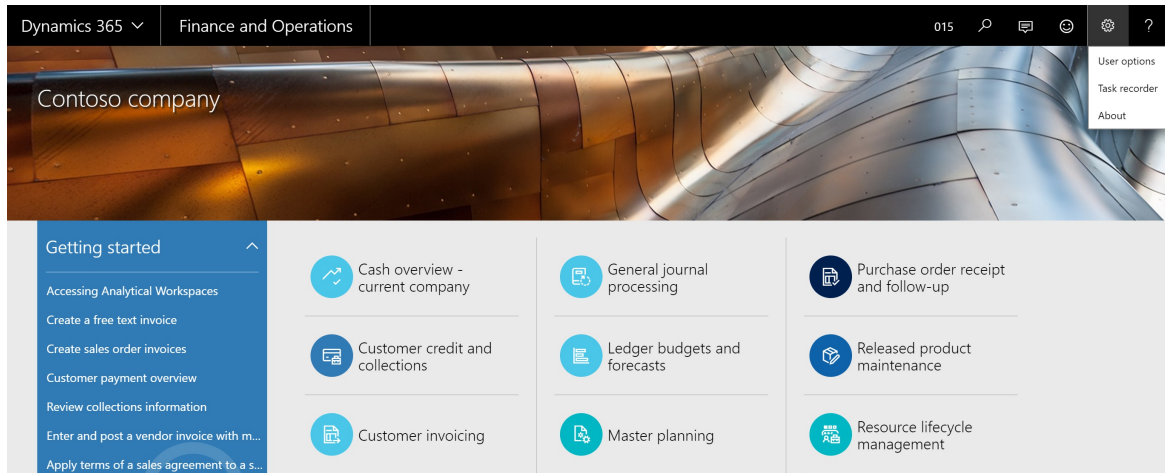

After you have created a BPM library, you'll need to use Task recorder to create your test cases and then upload the cases to BPM. There are several ways to do this.

If you're using a BPM library that already has all of the necessary task recordings (test cases) attached, you can skip this step. Otherwise, follow the instructions below to create new task recordings.

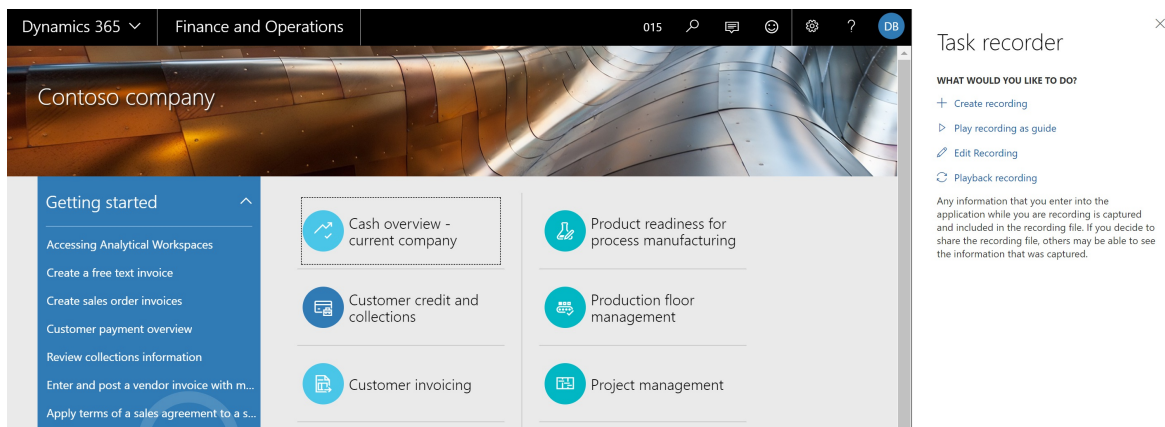

### Create and save a new task recording

1. Open the client and sign in.
2. Select the company that you want to use while recording.
3. Go to **Settings > Task recorder**.

4. Click **Create a new recording**.
5. Enter a name for the recording, and then click **Start**. Recording begins the moment that you click **Start**.
6. When the recording is complete, in the Task recorder pane, click **Stop**.
7. To save the task recording to an attached BPM, click **Save to Lifecycle Services**.

8. Select the library that you want to save the recording to, and then click **Save**. Otherwise, select **Save to Disk** and follow the steps in the next section, "Upload an AXTR file to BPM."

#### NOTE

To enable the effective execution of your tests using automation tools, make sure all of your task recordings start on the main dashboard of your application. For end-to-end processes that are performed by more than one user, we recommend that you divide your task recordings into user-specific tasks. This simplifies the maintenance of test cases and allows you to execute test cases in the context of security roles, which is a best practice.

### Upload an AXTR file to BPM

If you have saved your recordings (AXTR files) to disk, follow these steps to upload them to BPM.

1. In Lifecycle Services (LCS), in your project, on the **Business process libraries** page, select the library to upload the task recording to.
2. Click **Author and edit** and in the lines, locate and select the process to upload the task recording to.

3. In the right pane, click **Upload**.

(August 2016) APQC Unified Library for Microsoft Dynamics AX

The screenshot shows the APQC Unified Library interface. On the left, there is a search bar and a list of processes. The 'Develop Vision and Strategy' process is selected. On the right, there is a detailed view of this process, including its name, description, and metadata.

Process	Diagrams	Reviewed
Develop Vision and Strategy	18	0/4
Develop and Manage Products and Services	31	0/2
Develop and Manage Customer Experience	11	0/5
Market and Sell Products and Services	18	0/5
Market Products and Services	5	0/2
Deliver Products and Services	128	0/6
Merchandise Products and Services	9	0/2
Manage Customer Service		0/3
Deliver Products	6	0/4
Develop and Manage Human Capital	36	0/6
Manage Information Technology	13	0/7
Manage Financial Resources	267	0/10
Acquire, Construct, and Manage Assets	1	0/4
Manage Enterprise Risk, Compliance, and Resiliency		0/3
Manage External Relationships		0/5
Develop and Manage Business Capabilities	4	0/6

**Overview** Requirements

Name: Develop Vision and Strategy

Description: Develop vision and strategy establishes a direction and vision for an organ defining the business concept and long-term vision, as well as developing strategy and managing strategic initiatives. Processes in this category focus vision, a mission, and strategic objectives, which culminate in creating mea that the organization is moving in the desired direction.

Modified by:

Modified at: 08/30/2016, 2:09 PM PDT

APQC ID: 10002

APQC hierarchy ID: 1

Keywords:

4. Click **Browse** to find and select the file to upload, and then click **Upload**.

The screenshot shows the same APQC Unified Library interface as above, but with an 'Upload AXTR' dialog box open on the right side. The dialog box has a 'Browse' button and 'Upload' and 'Cancel' buttons.

**Save an existing task recording to BPM**

1. To attach an existing task recording, sign in to the client.
2. Go to **Settings > Task recorder**.
3. Select **Edit Task Recording** and attach the file by either saving directly to LCS or downloading the AXTR and then uploading to BPM.

**Guidelines for recording test cases**

Follow these guidelines when authoring and recording your test cases, especially if you are planning to automate test execution. The process and tools described in this article apply to business process acceptance tests. They are not meant to replace component and unit testing that is typically owned by developers.

- Author a limited number of test cases that, when combined, cover complete end-to-end processes.
- Focus on business processes that have been customized.
- An individual test case (recording) should cover one or two business tasks only, typically executed by one person. This simplifies task recording maintenance. Do not combine a complete end-to-end business process such as "Procure to Pay" or "Order to Cash" into one large task recording. For example, instead of having RFQ > Purchase Order > Product Receipt > Vendor Invoice > Vendor Payment as one test case, divide the process into three or four test cases. You will have the opportunity to combine these tests into an ordered

test suite later.

- A test case should have at least one validation. Try to validate critical fields that cover the impact of other fields. For example: Validation of totals on sales or purchase orders cover the unit price/quantity/discount/tax ...etc.
- Avoid printing a report in a test case. If a test case needs to print a report, it should be selected on screen.
- 80+% of test cases should be of transactions or source documents. Master data should be limited to up to 20% of test cases only.

## Synchronize and configure your test plan in Azure DevOps

An acceptance test library is your starting point. It typically contains all test cases (task recordings) of a particular application organized by business process. During a particular test pass, you usually do not need to execute all test cases. What test cases you select depends on the phase of your implementation or the nature of the update you are planning to apply to your production environment. Azure DevOps enables you to organize your test cases in test plans and test suites. A test plan contains one or more test suites (A subset of your test library); test cases can belong to more than one test suite.

Once you have selected your acceptance testing BPM library, synchronize it with Azure DevOps and create your test plan and test suites.

### Sync with Azure DevOps

Synchronize your BPM library with your Azure DevOps project. For more information, see [Synchronize BPM libraries with Azure DevOps](#).

After configuration is complete, synchronize the BPM library with a Azure DevOps project.

1. On the **Business process libraries** page, on the tile for the library that you want to synchronize, select the ellipsis button (...), and then select **Azure DevOps sync**.

You can also start Azure DevOps synchronization from the toolbar in a BPM library. Select the ellipsis button (...), and then select **Azure DevOps sync**.

2. After Azure DevOps synchronization is complete, select the ellipsis button (...), and then select **Sync test cases**.

# DemoLibrary

In addition to the test steps, the task recording XML file is attached to the Azure DevOps test case. This file will be needed if you want to automate test execution.

## Create a test suite in Azure DevOps

Next, you will need to create a test plan and test suite in Azure DevOps. This will allow you to execute an ordered suite of test cases and easily manage, investigate, and track the results.

1. Sign in to Azure DevOps and select the project and test plan that you want to test in.
2. On the toolbar, select **Test > Test Plans**.
3. In the left pane, select **+**, and then select **Static suite**.
4. Enter a name for the suite.
5. Click **Add existing** and query the tag **LCS:Test Cases**.
6. Click **Run > Add test cases**.

7. Select the test case to view details and the attached XML file.

#### NOTE

This example shows how to create one comprehensive acceptance test suite with all test cases added. Instead, you should create various test suites under the same test plan and then use custom queries to add specific test cases to a test suite. A test case can belong to more than one test suite.

## Execute your tests

### Run manual test cases

After you have a test suite, you are ready to use it for regression testing after updates have been made to your application in a sandbox or test environment. You can run the test cases in your test suite manually or play the task recordings that are part of the test suite and use Azure DevOps to mark the test cases as passed or failed.

Azure DevOps also provides a tool, **Test Runner**, to manage manual test case execution. For more information about using Test Runner, see [Run manual tests](#).

We recommend that you take advantage of Azure DevOps as it provides a rich set of management features not only for testing, but result management and mitigation.

### Run automated test cases

The platform for Finance and Operations provides developers with tools to author test cases based on task recordings and use Azure DevOps to manage the automated execution of these test cases.

Developers can use the build and test automation capabilities of **build and test** environments. For details, see the [Continuous delivery home page](#).

Functional power users can automate the execution of their test cases using the **Regression suite automation tool**. For more information, [download the tool](#) and read the [Regression suite automation tool](#).

### Investigate test runs

Once an automated run is complete, on the Azure DevOps toolbar, select **Test > Runs** (or **Test Plans > Runs**) to investigate your test run. Select the desired test run to investigate test case failures and errors. You can also go to your test suite in Azure DevOps to see the latest results associated with your test cases. For more information on testing and test management in Azure DevOps, see the [Azure DevOps documentation](#).

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Dynamics 365 Commerce evaluation environment overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic gives an overview of the Microsoft Dynamics 365 Commerce evaluation environment.

## NOTE

Commerce evaluation environments aren't generally available, and are granted to partners and customers on a per-request basis. For more information, reach out to your Microsoft partner contact.

## Overview

The Commerce evaluation environment is an optional end-to-end environment of Dynamics 365 Commerce that lets partners and potential customers try out the Commerce product.

Evaluation environments are partially preconfigured to reduce the required post-provisioning steps.

Aside from some minor limitations that don't affect features or functionality, the Commerce evaluation environment provides the complete Commerce experience, and can be used by customers and implementation partners to evaluate the product, provide feedback, and do fit/gap analysis.

## Limitations of the Commerce evaluation environment

Although the Commerce evaluation environment provides the full set of Commerce features and functionality, there are some minor limitations:

- Although the Commerce evaluation environment itself has no geographical limitations, components of the environment, such as the Retail Cloud Scale Unit (RCSU) and e-Commerce applications, should be provisioned only in the United States.
- Use of the Commerce evaluation environment is limited to 30 days from the date when e-Commerce is provisioned.
- The Commerce evaluation environment can be successfully deployed and initialized only in an environment that uses the demo topology, where all components of an environment are deployed on a single cloud-hosted virtual machine (VM). The main limitation of this topology is the number of concurrent users that the environment can support.

## Get started

To provision the Commerce evaluation environment, see [Provision a Commerce evaluation environment](#).

## Additional resources

[Provision a Dynamics 365 Commerce evaluation environment](#)

[Configure a Dynamics 365 Commerce evaluation environment](#)

[Configure BOPIS in a Dynamics 365 Commerce evaluation environment](#)

[Configure optional features for a Dynamics 365 Commerce evaluation environment](#)

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Provision a Dynamics 365 Commerce evaluation environment

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to provision a Microsoft Dynamics 365 Commerce evaluation environment.

Before you begin, we recommend that you take a quick scan through this topic to get an idea of what the process requires.

## NOTE

Commerce evaluation environments aren't generally available, and are granted to partners and customers on a per-request basis. For more information, reach out to your Microsoft partner contact.

## Overview

To successfully provision a Commerce evaluation environment, you must create a project that has a specific product name and type. The environment and Commerce Scale Unit (CSU) also have some specific parameters that you must use when you expect to provision e-Commerce later. The instructions in this topic describe all the steps that are required to complete provisioning and the parameters that you must use.

After you successfully provision your Commerce evaluation environment, you must complete a few post-provisioning steps to prepare it for use. Some steps are optional, depending on the aspects of the system that you want to evaluate. You can always complete the optional steps later.

For information about how to configure your Commerce evaluation environment after you provision it, see [Configure a Commerce evaluation environment](#). For information about how to configure optional features for your Commerce evaluation environment, see [Configure optional features for a Commerce evaluation environment](#).

## Prerequisites

The following prerequisites must be in place before you can provision your Commerce evaluation environment:

- You have been onboarded into the evaluation program and granted capacity for an evaluation environment.
- You have access to the Microsoft Dynamics Lifecycle Services (LCS) portal.
- You are an existing Microsoft Dynamics 365 partner or customer and are able to create a Dynamics 365 Commerce project.
- You have administrator access to your Microsoft Azure subscription, or you're in contact with a subscription administrator who can assist you if required.
- You have your Azure Active Directory (Azure AD) tenant ID available.
- You've created an Azure AD security group that can be used as an e-Commerce system admin group, and you have its ID available.
- You've created an Azure AD security group that can be used as a Ratings and Reviews moderator group, and you have its ID available. (This security group can be the same as the e-Commerce system admin group.)

Note that this list isn't exhaustive. If you experience any issues, reach out to your Microsoft partner contact for assistance.

# Provision your Commerce evaluation environment

These procedures explain how to provision a Commerce evaluation environment. After you successfully complete them, the Commerce evaluation environment will be ready for configuration. All the activities that are described here occur in the LCS portal.

## Create a new project

To create a new project in LCS, follow these steps.

1. On the LCS home page, select the plus sign (+) to create a project.
2. In the right pane, follow one of these steps:
  - If you're a partner, select **Migrate, create solutions, and learn**.
  - If you're a customer, select **Prospective presales**.
3. Enter a name, description, and industry.
4. In the **Product name** field, select **Dynamics 365 Commerce**.
5. In the **Product version** field, select **Dynamics 365 Commerce**.
6. In the **Methodology** field, select **Dynamics Retail implementation methodology**.
7. Optional: You can import roles and users from an existing project.
8. Select **Create**. The project view appears.

## Add the Azure Connector

To add the Azure Connector to your LCS project, follow the steps in [Complete the Azure Resource Manager \(ARM\) onboarding process](#).

## Deploy the environment

To deploy the environment, follow these steps.

### NOTE

You might not have to complete steps 6, 7, and/or 8, because pages that have a single option are skipped. When you're in the **Environment parameters** view, confirm that the text **Dynamics 365 Commerce - Demo (10.0.x with Platform update xx)** appears directly above the **Environment name** field. For details, see the illustration that appears after step 8.

1. On the top menu, select **Cloud-hosted environments**.
2. Select **Add** to add an environment.
3. In the **Application version** field, select the most current version. If you have a specific need to select an application version other than the most current version, do not select a version prior to **10.0.14**.
4. In the **Platform version** field, use the platform version that is automatically chosen for the application version you selected.

**Select application and platform version**

Application version  
10.0.11

Platform version  
Platform Update 35

5. Select **Next**.
6. Select **Demo** as the environment topology.

**Select environment topology**

Please select a topology to deploy

**DEMO**  
Deploy an environment for demonstration purposes.

**DEVTEST**  
Deploy an environment for development, test, build.

7. On the **Deploy environment** page, enter an environment name. Leave the advanced settings as they are.

## Deploy environment

Dynamics 365 Commerce (Preview) - Demo (10.0.6 with Platform update 30) v 76

Environment name

[Advanced settings](#)

---

Virtual Machine	Instances	Size
Demo	1	D13 v2 <span>▼</span>

---

Total deployments:  
1 x D13 v2

---

[By selecting this checkbox, you agree to the pricing and licensing terms below.](#)

[Microsoft Dynamics Software License Terms](#)

[Privacy Statement](#)

[Azure price list](#)

---

[Next](#) [Cancel](#)

8. Adjust the VM size as required. (We recommend VM stock keeping unit [SKU] D13 v2.)
  9. Review the pricing and licensing terms, and then select the check box to indicate that you agree to them.
  10. Select **Next**.
  11. On the deployment confirmation page, verify that the details are correct, and then select **Deploy**. You're returned to the **Cloud-hosted environments** view, and your environment should appear in the list.
- Your requested environment will appear as queued and then deploying. The environment workflows will take some time to be completed. Therefore, check back after approximately six to nine hours.

12. Before you continue, make sure that the status of your environment is **Deployed**.

### Initialize the Commerce Scale Unit (cloud)

To initialize the CSU, follow these steps.

1. In the **Cloud-hosted environments** view, select your environment in the list.
2. In the environment view on the right, select **Full details**. The environment details view appears.
3. Under **Environment features**, select **Manage**.
4. On the **Commerce** tab, select **Initialize**. The CSU initialization parameters view appears.
5. In the **Region** field, select the region that is the same or close to the region that you deployed the

environment to.

6. Leave the **Version** field as it is.
7. Select **Initialize**.
8. On the deployment confirmation page, verify that the details are correct, and then select **Yes**. The **Commerce management** view displays again, where the **Commerce** tab is selected. Your CSU has been queued for provisioning.
9. Before you continue, make sure that the status of your CSU is **Success**. Initialization takes approximately two to five hours.

If you can't find the **Manage** link in the environment details view, reach out to your Microsoft contact for assistance.

During the deployment process, you might receive the following error message:

Evaluation (demo/test) environments need to register the scale unit connector application <application ID> in headquarters.

If the CSU initialization fails and you receive this error message, make a note of the application ID, which is a globally unique identifier (GUID), and then follow the steps in the next section to register the CSU deployment application in Commerce headquarters.

### **Register the CSU deployment application in Commerce headquarters (if required)**

To register the CSU deployment application in Commerce headquarters, follow these steps.

1. In Commerce headquarters, go to **System administration > Setup > Azure Active Directory applications**.
2. In the **Client Id** column, enter the application ID from the CSU initialization error message that you received.
3. In the **Name** column, enter any descriptive text (for example, **CSU Eval**).
4. In the **User ID** column, enter **RetailServiceAccount**.
5. Retry the CSU initialization and deployment from LCS.

### **Initialize e-Commerce**

To initialize e-Commerce, follow these steps.

1. On the **e-Commerce** tab, review the evaluation consent, and then select **Setup**.
2. In the **e-Commerce environment name** field, enter a name. Be aware that this name will appear in some of the URLs that point to your e-Commerce instance.
3. In the **Commerce Scale Unit name** field, select your CSU in the list. (The list should have only one option.)

The **e-Commerce geography** field is set automatically.

4. Select **Next** to continue.
5. In the **Supported host names** field, enter any valid domain, such as `www.fabrikam.com`.
6. In the **AAD security group for system admin** field, enter the first few letters of the name of the security group that you want to use, and then select the magnifying glass symbol to view the search results. Select the correct security group in the list.
7. In the **AAD security group for ratings and review moderator** field, enter the first few letters of the name of the security group that you want to use, and then select the magnifying glass symbol to view the search results. Select the correct security group in the list.
8. Leave the **Enable ratings and review service** option set to **Yes**.

9. Select **Initialize**. The **Commerce management** view displays again, where the **e-Commerce** tab is selected. E-Commerce initialization has started.
10. Before you continue, wait until the status of e-Commerce initialization is **Initialization successful**.
11. Under **Links** in the lower right, make a note of the URLs for the following links:
  - **e-Commerce site** – The link to the root of your e-Commerce site.
  - **Commerce site builder** – The link to the site management tool.

## Next steps

To continue the process of provisioning and configuring your Commerce evaluation environment, see [Configure a Commerce evaluation environment](#).

# Configure a Dynamics 365 Commerce evaluation environment

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to configure a Microsoft Dynamics 365 Commerce evaluation environment after it's provisioned.

## Overview

Complete the procedures in this topic only after your Commerce evaluation environment has been provisioned. For information about how to provision your Commerce evaluation environment, see [Provision a Commerce evaluation environment](#).

After your Commerce evaluation environment has been provisioned end to end, additional post-provisioning configuration steps must be completed before you can start to evaluate the environment. To complete these steps, you must use Microsoft Dynamics Lifecycle Services (LCS) and Dynamics 365 Commerce.

## Before you start

1. Sign in to the [LCS portal](#).
2. Go to your project.
3. On the top menu, select **Cloud-hosted environments**.
4. Select your environment in the list.
5. In the environment information on the right, select **Log on to environment**. You will be sent to Commerce headquarters.
6. Make sure that the **USRT** legal entity is selected in the upper-right corner.

During post-provisioning activities in Commerce headquarters, make sure that the **USRT** legal entity is always selected.

## Configure the point of sale

### Associate a worker with your identity

To associate a worker with your identity, follow these steps in Commerce headquarters.

1. Use the menu on the left to go to **Modules > Retail and commerce > Employees > Workers**.
2. In the list, find and select the following record: **000713 - Andrew Collette**.
3. On the Action Pane, select **Commerce**.
4. Select **Associate existing identity**.
5. In the **Email** field to the right of **Search using email**, enter your email address.
6. Select **Search**.
7. Select the record that has your name.
8. Select **OK**.
9. Select **Save**.

### Activate Cloud POS

To activate Cloud POS, follow these steps in LCS.

1. On the top menu, select **Cloud-hosted environments**.
2. Select your environment in the list.
3. In the environment information on the right, select **Log on to Cloud Point of Sale**.
4. Select **Next** to open the **Before you start** dialog box.
5. Leave the **Server URL** field as it is. Select **Next**.
6. Sign in by using your Microsoft Azure Active Directory (Azure AD) account.
7. Under **Store name**, select **San Francisco**, and then select **Next**.
8. Under **Register and device**, select **SANFRAN-1**.
9. Select **Activate**. You're signed out and taken to the POS sign-in page.
10. You can now sign in to the Cloud POS experience by using operator ID **000713** and password **123**.

## Set up your site in Commerce

To start to set up your evaluation site in Commerce, follow these steps.

1. Sign in to site builder by using the URL that you made a note of when you initialized e-Commerce during provisioning (see [Initialize e-Commerce](#)).
2. Select the **Fabrikam** site to open the site setup dialog box.
3. Select the domain that you entered when you initialized e-Commerce.
4. Select **Fabrikam extended online store** as the default channel. (Make sure that you select the **extended online store**.)
5. Select **en-us** as the default language.
6. Leave the value of the **Path** field as it is.
7. Select **OK**. The list of pages on the site appears.

## Enable jobs

To enable jobs in Commerce, follow these steps.

1. Sign in to the environment (HQ).
2. Use the menu on the left to go to **Retail and commerce > Inquiries and reports > Batch jobs**.

The remaining steps of this procedure must be completed for each of the following jobs:

- Process retail order email notification
  - Product availability
  - P-0001
  - Synchronize orders job
3. Use the Quick Filter to search for the job by name.
  4. If the status of the job is **Executing**, follow these steps:
    - a. Select the record.
    - b. On the Action Pane, on **Batch job** tab, select **Change status**.
    - c. Select **Canceling**, and then select **OK**.

Optionally, you can also set the recurrence interval to one (1) minute for the following jobs:

- Process retail order email notification job
- P-0001 job
- Synchronize orders job

### Run full data synchronization

To run full data synchronization in Commerce, follow these steps in Commerce headquarters.

1. Use the menu on the left to go to **Modules > Retail and commerce > Headquarters setup > Commerce scheduler > Channel database**.
2. Select the channel that is named **scXXXXXXXXXX**.
3. On the Action Pane, select **Full data sync**.
4. Enter **9999** as the distribution schedule.
5. Select **OK**.
6. Select **OK**.

### Test credit card information to do test purchases

To perform test transactions on the site, you can use the following test credit card information:

- **Card number:** 4111-1111-1111-1111
- **Expiration date:** 10/20
- **Card verification value (CVV) code:** 737

#### IMPORTANT

Never, under any circumstances, try to use actual credit card information on the test site.

## Next steps

After the provisioning and configuration steps are completed, you can start to use your evaluation environment. Use the Commerce site builder URL to go to the authoring experience. Use the Commerce site URL to go to the retail customer site experience.

To configure optional features for your Commerce evaluation environment, see [Configure optional features for a Commerce evaluation environment](#).

## Additional resources

# Configure BOPIS in a Dynamics 365 Commerce evaluation environment

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to configure buy online, pickup in store (BOPIS) in a Microsoft Dynamics 365 Commerce evaluation environment after the environment has been provisioned.

## Prerequisite

Complete the procedures in this topic only after your Commerce evaluation environment has been provisioned and configured. For information about how to provision and configure your environment, see [Provision a Dynamics 365 Commerce evaluation environment](#) and [Configure a Dynamics 365 Commerce evaluation environment](#).

After your Commerce environment has been provisioned and configured end to end, you can use this topic to enable BOPIS scenarios.

## Configure the POS

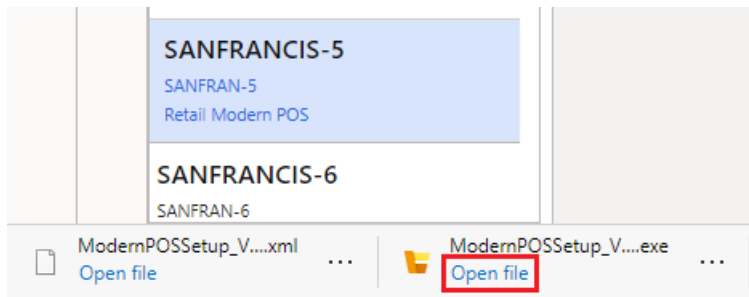

### Configure Modern POS

BOPIS scenarios that involve a credit card payment require a hardware station. The hardware station is built into Modern POS for Windows and Android clients. If you're using Cloud POS or Modern POS for iOS, the point of sale (POS) client must be paired with a shared hardware station. This topic explains how to configure BOPIS for Windows and Android clients. For information about how to set up a shared hardware station, see [Configure and install Retail hardware station](#).

1. Go to **Retail and Commerce > Channel setup > POS setup > Registers**.
2. Select register **SANFRAN-5**, and then select **Edit**.
3. Change the value of the **Hardware profile** field from **HW002** to **HW001**, and then select **Save**.
4. To synchronize the changes, go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
5. Select distribution schedule **1090**, and then, on the Action Pane, select **Run now**.
6. Select **Yes** and then **OK** to initiate data synchronization.

### Install Modern POS

1. Go to **Retail and Commerce > Channel setup > POS setup > Devices**.
2. Select device **SANFRANCIS-5**.
3. On the Action Pane, select **Download**, and then select **Configuration file**.
4. Select **Download**, and then select **Retail Modern POS**.
5. When download of the **ModernPOSSetup.exe** file is completed, select **Open file**.

6. Select **Next** to go through the installation process. When installation is completed, select **Close**.

### Activate Modern POS

1. On the Windows desktop, select the **Start** button, and enter **Retail Modern POS**.
2. Select the **Retail Modern POS** application to initiate activation.
3. Select **Next**. The **Server URL**, **Device ID**, and **Register number** fields should be preset by using information from the configuration file that you downloaded in the previous procedure.
4. Select **Activate**.
5. An authentication dialog box appears. Select the account that uses the email address that was previously associated with worker **000713 - Andrew Collette**.

#### NOTE

If you haven't yet associated a worker with your identity, activation will be unsuccessful. In this case, follow the steps under the "Associate a worker with your identity" section in the [Configure a Dynamics 365 Commerce evaluation environment](#) topic.

6. When you're prompted to let your organization manage the device, select **This app only**.
7. When activation is completed, select **Get started**.

### Enable BOPIS in Modern POS

1. Sign in to Modern POS by using **000713** as the operator ID and **123** as the password.
2. While the introductory walkthrough video is playing, select the two check boxes in the lower-left corner of the dialog box, and then close the dialog box.
3. If you aren't prompted to close the shift, scroll to the right on the **Welcome** page, select **Close shift**, and then sign back in to the POS.
4. After you're signed in, when you're prompted, select **Perform a non-drawer operation**.
5. On the **Welcome** page, scroll to the right, and select the **Select hardware station** operation.
6. Select **Manage**, set the **Use hardware station** option to **On**, and then select **OK**.
7. Sign out of the POS, and then sign back in.
8. After you're signed in, select **Open a new shift**, and then select **Drawer**.

## Complete a BOPIS scenario

### Create a storefront order for in-store pickup

1. Go to the URL that you specified in the [Initialize e-Commerce](#) step during environment configuration.
2. Select an item, and select **Add to cart**.
3. On the shopping bag page, select **Pick this up** for the order line that you just added.
4. In the **Select a store** dialog box, enter **San Francisco**, and then select the **Search** button.

- In the list of results, find the San Francisco store, and select **Pick up here**.
- On the shopping bag page, select **Checkout as Guest**.

#### **NOTE**

To continue with checkout, you must accept the cookie notice. This notice appears as a banner at the top of the checkout page.

- For the credit card payment method, enter the following details:

- **Cardholder name:** Enter any name.
- **Card number:** Enter 4111-1111-1111-1111.
- **Expiration date:** Enter 10/20.
- **Card verification value (CVV) code:** Enter 737.

#### **IMPORTANT**

Never, under any circumstances, try to use actual credit card information on the test site.

- Continue with checkout by entering details of the billing address, and then select **Save and continue**.
- When the order is ready to be placed, select **Checkout**.

### **Synchronize online orders to the back office**

For information about how to synchronize online orders, see [Posting of online sales and payments](#).

### **Pick up an order in the store**

- Sign in to the POS.
- On the **Welcome** screen, select **Order fulfillment**
- In the list of items for pickup, select the line from the order that was placed online.
- While the order line is selected, select **Pick up**.

The line item is added to the transaction screen, and **\$0.00** is shown as the balance that is due.

- Select the balance due of **\$0.00**, or select any payment method to conclude the transaction.

## Troubleshooting

### **Online orders that are retrieved in the POS have a non-zero balance due**

When an order is retrieved for in-store pickup, if the balance due isn't 0 (zero), make sure that Modern POS is being used, and that the hardware station is active. If Cloud POS or Modern POS for iOS is being used, make sure that a shared hardware station is active. Some form of active hardware station is required to retrieve payments that were made online.

### **General issues with payment capture**

For all general issues, you should always consult the Modern POS or Internet Information Services (IIS) Hardware Station event logs as a first step. You can find these logs under the following nodes in the Windows event log:

- Application and Services Logs > Microsoft > Dynamics > Commerce-ModernPOS
- Application and Services Logs > Microsoft > Dynamics > Commerce-Hardware Station

# Configure optional features for a Dynamics 365 Commerce evaluation environment

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to configure optional features for a Microsoft Dynamics 365 Commerce evaluation environment.

## Prerequisites

If you want to evaluate the transactional email features, the following prerequisites must be met:

- You have an available email server (Simple Mail Transfer Protocol [SMTP] server) that can be used from the Microsoft Azure subscription where you provisioned the evaluation environment.
- You have the server's fully qualified domain name (FQDN)/IP address, SMTP port number, and authentication details available.

## Configure the image back end

### Find your media base URL

#### NOTE

Before you can complete this procedure, you must complete the steps in [Set up your site in Commerce](#).

1. Sign in to the Commerce site builder by using the URL you made a note of when you initialized e-Commerce during provisioning (see [Initialize e-Commerce](#)).
2. Open the **Fabrikam** site.
3. On the menu on the left, select **Media Library**.
4. Select any single image asset.
5. In the property inspector on the right, find the **Public URL** property. The value is a URL. Here is an example:

```
https://images-us-sb.cms.commerce.dynamics.com/cms/api/fabrikam/imageFileData/MA1nQC .
```

6. Replace the last identifier in the URL (**MA1nQC** in the preceding example) with the string **search?fileName=**. Here is what the example URL looks like after this change is made:

```
https://images-us-sb.cms.commerce.dynamics.com/cms/api/fabrikam/imageFileData/search?fileName=
```

This URL is your media base URL. Make a note of it.

### Update the media base URL

1. Sign in to Commerce headquarters.
2. Use the menu on the left to go to **Modules > Retail and commerce > Channel setup > Channel profiles**.
3. Select **Edit**.
4. Under **Profile properties**, replace the value for the **Media Server Base URL** property with the media base URL that you created earlier.

5. Select the channel that is named `scXXXXXXXXXX`.
6. Under **Profile properties**, select **Add**.
7. For the property that was added, select **Media Server Base URL** as the property key. As the property value, enter the media base URL that you created earlier.
8. Select **Save**.

## Configure and test the email server

### NOTE

The SMTP server or email service that you enter here must be accessible from the Azure subscription that you're using for the environment.

1. Sign in to Commerce headquarters.
2. Use the menu on the left to go to **Modules > Retail and Commerce > Headquarters setup > Parameters > Email parameters**.
3. On the **SMTP settings** tab, in the **Outgoing mail server** field, enter the FQDN or IP address of your SMTP server or email service.
4. In the **SMTP port number** field, enter the port number. (If you aren't using Secure Sockets Layer [SSL], the default port number is 25.)
5. If authentication is required, enter values in the **User name** and **Password** fields.
6. Select **Save**.
7. Select **Refresh**.
8. On the **Test email** tab, in the **Email provider** field, select **SMTP**.
9. In the **Send to** field, enter the email address that the test email should be delivered to.
10. Select **Send test email**.

## Configure email templates

For each transactional event that you want to send emails for, you must update the email template with a valid sender email address.

1. Sign in to Commerce headquarters.
2. Use the menu on the left to go to **Modules > Retail and Commerce > Headquarters setup > Parameters > Organization email templates**.
3. Select **Show list**.
4. For each template in the list, follow these steps:
  - a. In the **Sender email** field, enter the sender email address.
  - b. Optional: In the **Sender name** field, enter the name that should be used as the sender name.
5. Select **Save**.

## Customize email templates

You might want to customize the email templates so that they use different images. Or you might want to update the links in the templates so that they go to your evaluation environment. This procedure explains how to download the default templates, customize them, and update the templates in the system.

1. In a web browser, download the [Microsoft Dynamics 365 Commerce Evaluation default email templates zip file](#) to your local computer. This file contains the following HTML documents:

- Order confirmation template
  - Issue gift card template
  - New order template
  - Pack order template
  - Pick order template
2. Customize the templates by using a text or HTML editor. See the list of [supported tokens](#) later in this topic.
  3. Sign in to Commerce.
  4. Use the menu on the left to go to **Modules > Organization administration > Setup > Organization email templates**.
  5. Expand the list on the left to see all the templates.
  6. For each template that you want to customize, follow these steps:
    - a. Select the template in the list.
    - b. Under **Email message content**, select the appropriate language version in the list. (The default language is **en-us**.)
    - c. Under **Email message content**, select **Edit**. The **Upload email template** pane appears.
    - d. Select **Browse**, and find the HTML file that has the customized content.
    - e. Select **Upload**. The template is uploaded into the system, and a preview is shown.
    - f. Select **OK**.
    - g. Optional: Customize the **Subject** property of the template.
    - h. Select **Save**.

### Supported tokens in the email template

When the email is rendered, these tokens are replaced with actual values that apply to the customer and the customer's order.

#### Sales order

The following tokens apply to the overall sales order.

NAME OF THE TOKEN	TOKEN
Order number	%salesid%
Customer's name	%customername%
Delivery address	%deliveryaddress%
Billing address	%customeraddress%
Order date	%shipdate%
Delivery mode	%modeofdelivery%
Discount	%discount%
Sales tax	%tax%
Order total	%total%

## Sales line

The following tokens are replaced with values for each product in the order.

### NOTE

Put the **Product list - start** token at the beginning of the HTML block that is repeated for every product, and put the **Product list - end** token at the end of the block.

NAME OF THE TOKEN	TOKEN
Product list - start	<!--%tablebegin.salesline% -->
Product list - end	<!--%tableend.salesline%-->
Product name	%lineproductname%
Description	%lineproductdescription%
Quantity	%linequantity%
Line unit price	%lineprice% (verify)
line item total	%linenetamount%
line discount	%linediscount%
Ship date	%lineshipdate%
Procurement method	%linedeliverymode%
delivery address	%linedeliveryaddress%
Sales unit of the line	%lineunit%

# Dynamics 365 Commerce evaluation environment FAQ

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides answers to frequently asked questions about the Microsoft Dynamics 365 Commerce evaluation environment.

## **Can we use the Commerce evaluation environment as an e-Commerce storefront for customers that currently implement Retail?**

No. The Commerce evaluation environment is only for evaluation. If you require an environment for a customer that implements Retail, contact Microsoft.

## **Can the Commerce evaluation environment be used to provision the e-Commerce features on top of an existing application/environment that implements Retail?**

No (mostly). The Commerce evaluation components are available only to environments that match the configurations that are specified in the prerequisites and provisioning guide. Additionally, the required base demo data won't be available in environments that were deployed with an initial release that is earlier than 10.0.8.

## **What costs are involved in deploying the Commerce evaluation environment on Microsoft Azure via Microsoft Dynamics Lifecycle Services (LCS)?**

A traditional Dynamics 365 Finance/Dynamics 365 Supply Chain Management/Dynamics 365 Commerce headquarters demo environment (virtual machine [VM]) will be hosted in your Azure subscription. You can use the [Azure pricing calculator](#) to estimate this cost.

Other components such as Commerce Scale Unit, Commerce site builder, and your e-Commerce site will be available as software as a service (SaaS) and hosted by Microsoft.

## **Which Azure geographies are currently supported for the Commerce evaluation environment?**

The Commerce evaluation environment can be deployed only in the North America geography.

## **Is there a downloadable virtual hard disk (VHD) that has the complete OneBox virtual machine (VM) option?**

Dynamics 365 Commerce and Commerce Scale Unit are completely software as a service (SaaS) and must be cloud-hosted.

## **How long can the Commerce evaluation environment be used?**

The Commerce evaluation environment has a 30-day time limit from the date when SaaS components such as Commerce Scale Unit, Commerce site builder, and your e-Commerce site are provisioned.

## **Can I extend the time limit for my Commerce evaluation environment?**

Extension of the time limit is an exception to the norm and is considered on a case-by-case basis. You should reach out to your Microsoft partner contact for assistance.

# Deployment options

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can deploy Finance and Operations apps in the cloud or on-premises. Cloud deployments offer an ERP service that is fully managed by Microsoft, while on-premises deployments are deployed locally within a customer's data center.

## IMPORTANT

On-premises deployments are not supported on any public cloud infrastructure, including Azure.

The following table provides a comparison of the capabilities provided by the two deployment options.

Dynamics 365 deployment options		
Capability	Cloud	On-premises
Infrastructure and data location	<ul style="list-style-type: none"><li>Full Microsoft managed cloud service</li><li>Microsoft managed data centers</li></ul>	<ul style="list-style-type: none"><li>Customer or partner managed infrastructure</li><li>Disconnected data center</li><li>Local data residency</li></ul>
Data trustee	<ul style="list-style-type: none"><li>Microsoft</li></ul>	<ul style="list-style-type: none"><li>Customer</li></ul>
Application lifecycle management (ALM)	<ul style="list-style-type: none"><li>Managed by Microsoft</li><li>Customer access to ALM and telemetry using Lifecycle Services (LCS)</li></ul>	<ul style="list-style-type: none"><li>Managed by customer or partner with cloud-based ALM and telemetry using LCS</li></ul>
Cloud capabilities	<ul style="list-style-type: none"><li>High availability and disaster recovery included</li><li>Sandbox environments</li></ul>	<ul style="list-style-type: none"><li>Automated deployment and telemetry using LCS</li></ul>
Intelligence and analytics	<ul style="list-style-type: none"><li>Author and publish Power BI reports</li><li>Ready-made Analytical workspaces</li><li>Pinning tiles and Reports from PowerBI.com</li></ul>	<ul style="list-style-type: none"><li>Author and publish PowerBI reports</li></ul>
Updates, health monitoring	<ul style="list-style-type: none"><li>Provided through LCS</li></ul>	<ul style="list-style-type: none"><li>Provided through LCS</li></ul>
Licensing	<ul style="list-style-type: none"><li>Subscription</li></ul>	<ul style="list-style-type: none"><li>License with Software Assurance/Business Ready Enhancement Plan, or subscription</li></ul>

## Why cloud

Cloud deployments provide a cloud service that is easy to scale up or down as needed, as well as data centers that are fully managed by Microsoft. The time spent implementing Finance and Operations apps can be significantly shortened, fewer customizations may be required, and the costs of IT hardware and infrastructure are lower.

Cloud deployments include high availability, disaster recovery, sandbox environments, and application lifecycle management combined with cloud-based systems of intelligence, infrastructure, compute, and database services in a single offering. When needed, data failover in the cloud, automated deployment and continuous updates, and elastic compute capacity are available. A cloud deployment also provides data aggregation, financial reporting, and intelligence.

The cloud service provides customers with the greatest value, the broadest range of functionality, the best application lifecycle experience, the easiest and broadest integration with Microsoft Azure services, the best option for business insights and intelligence, and the most value for customers' technology investments.

## Why on-premises

With an on-premises deployment, existing data center investments can be leveraged. Customers can also configure their enterprise preferences to meet the regulatory and compliance needs of their business, comply with data sovereignty rules in regions where there are no Azure Data Centers, or ensure business continuity in areas with limited public infrastructure.

A customer's business data and processes are disconnected from the cloud and are stored and run locally in the customer's or their partner's data center. Some connectivity is required for system management and updates which are enabled through Microsoft Dynamics Lifecycle Services (LCS), a cloud-based application lifecycle management service. Customer data that is related to the configuration and application customization may be stored in the cloud.

For customers who choose to run Finance and Operations apps in their own data center, the on-premises deployment option will have a similar user-interface and application functionality as other deployment options. However, customers must take on the following responsibilities:

- Stand up their own infrastructure.
- Configure their own high-availability and disaster recovery solutions.
- Stand up sandbox environments.
- Manage their infrastructure, including scheduling operating system updates.

The additional costs to deploy and manage these capabilities might lead to higher deployment costs and a greater Total Cost of Ownership (TCO). Tools for deploying the Finance and Operations apps and updates will be available to partners and customers via Lifecycle Services. Unlike the cloud deployment option, Advanced Analytics and Azure Machine Learning are not included in the on-premises deployment option.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Comparison of cloud and on-premises features

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic shows a comparison of features available in cloud vs. on-premises for the following applications:

- [Dynamics 365 Finance](#)
- [Dynamics 365 Supply Chain Management](#)
- [Dynamics 365 Commerce](#)
- [Dynamics 365 Human Resources](#)

Information about the [development and administration features](#) is included, as well.

The following tables list the application areas. Cloud and on-premises support is listed for the feature as a whole. Where specific features differ from the area overall, the features are listed on a separate line in the Feature column.

## Dynamics 365 Finance

AREA	FEATURE	CLOUD	ON-PREMISES
Compliance and certifications		Yes	Yes
	SOC 1 Type 1 certification	Yes	No
Data management and integration		Yes	Yes
	Export data to your own data warehouse	Yes	Yes
	Enable the export of incremental updates to a data entity	Yes	Yes
	Data integrations	Yes	Yes
Document management		Yes	Yes
Financial management		Yes	Yes
Help		Yes	No
Human resources		Yes	Yes
Intelligence		Yes	Yes
	Electronic reporting (ER)	Yes	Yes
	ER: Integration with LCS	Yes	No

AREA	FEATURE	CLOUD	ON-PREMISES
	ER: Integration with SharePoint	Yes	No
	ER: Integration with Regulatory Configuration Services (RCS)	Yes	No

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cloud deployment overview

2/18/2021 • 15 minutes to read • [Edit Online](#)

Working with Microsoft to deploy Finance and Operations apps in the cloud requires that you understand the environment and subscription that you are deploying to, who can perform which tasks, and the data and customizations that you need to manage. We recommend that you sign up for the Full Microsoft FastTrack for Dynamics 365 to help speed your deployment and implementation - it's a program that provides training and consulting to help you realize business value faster. For more information, see [Microsoft FastTrack](#). If you choose to use the Essentials FastTrack program instead, you will be using the Implementation Project Methodology in Lifecycle Services (LCS) to help you manage your implementation project.

## Customer lifecycle, subscriptions, and environment types

Microsoft assumes that all customers will follow a lifecycle similar to the following for all cloud deployments, and therefore need different environment topologies at each phase.

- Evaluate
- Develop customizations, if needed.
- Curate a "golden configuration" environment that contains only module configurations without master or transactional data. This is to be the baseline for your data migration testing and eventual go live.
- Install and test customizations and partner solutions on a tier-1 sandbox (Development or test environment).
- Test customizations, partner solutions and data configuration on a tier-2 sandbox environment.
- Deploy customizations and data configurations to a production environment with high availability.

At some phases of a project, you may have all of the environments live at once. For more information, about the default licenses and tiers that are available, see the [Dynamics 365 Licensing Guide](#).

You may notice the terms cloud hosted or Microsoft subscriptions. A *cloud hosted subscription* means that the customer or partner brings their own Azure subscription and deploys Finance and Operations apps to it, for evaluation and development purposes only. The customer or partner pays for the resources deployed to their Azure subscription based on the Azure price list. A *Microsoft subscription* means that the customer purchases Finance and Operations licenses, which will then allow them to deploy environments to an Azure subscription which is managed by Microsoft, therefore, the customer has no separate Azure billing.

With each Enterprise offer, two environments are included by default:

- One Tier 2 sandbox (multi-box environment) for user acceptance testing (UAT).
- One production environment with high availability (HA).

Additional environments may be purchased as add-ons. For information about licensing and what is included in Microsoft Dynamics 365, see the [Dynamics 365 Licensing Guide](#).

Here's how the lifecycle maps to the available environments. If you already have environments deployed in your Lifecycle Services project, you can find the Environment Type and Environment Sub type on each environment's details page.

LIFECYCLE PHASE	ENVIRONMENT TIER	SUBSCRIPTION	ENVIRONMENT TYPES	ENVIRONMENT SUB-TYPE
Evaluation and analysis	Tier 1 Sandbox	Cloud hosted	Customer Managed	Demo

LIFECYCLE PHASE	ENVIRONMENT TIER	SUBSCRIPTION	ENVIRONMENT TYPES	ENVIRONMENT SUB-TYPE
Customize	Tier 1 Sandbox	Cloud hosted or VHD	Customer Managed	Develop
Golden configuration	Tier 1 Sandbox	Cloud hosted	Customer Managed	Develop
User acceptance testing (UAT)	Tiers 2-5 Sandbox	Microsoft	Microsoft Managed or Self-service	Not applicable
Go live	Production	Microsoft	Microsoft Managed or Self-service	Not applicable

*Tiers 2-5 can be purchased to increase performance of the environment. The higher the tier, the more compute and database capacity is reserved for your use. For more information about Self-service environment types, check out the [Self-service deployment overview](#).*

### Environment lifecycle operations

Users with the Environment Administrator or Project Owner roles in Lifecycle Services can perform various lifecycle operations on their environments. These operations often involve downtime on the environment until the task is finished. Each of these operations are located under or next to the **Maintain** button on each environment details page.

LIFECYCLE OPERATION	DESCRIPTION	LEARN MORE
Apply software	Install Microsoft updates, ISV solutions, or your own customization packages.	<a href="#">Apply updates to cloud environments</a>
Enable access	Allow list your IP for Remote Desktop or database access	See the <a href="#">Remote Desktop</a> section later in this topic
Restart services	Ability to restart components of your environment	<a href="#">Restart environment services</a>
Move database	Full data lifecycle management	<a href="#">Database movement operations</a>
Maintenance mode	Ability to change configuration with only admin access	<a href="#">Maintenance mode</a>
Upgrade	Upgrade code and data from 7.x to the latest version	<a href="#">Process for moving to the latest update</a>
Deallocate	Ability to turn off an environment not being used, or to troubleshoot a failed action	Not applicable
Start	Ability to turn on an environment for use	Not applicable
Delete	Ability to delete an environment previously deallocated	Not applicable

## Security and compliance

Finance and Operations is PA-DSS 3.1 certified which means that all communications between components are secured out-of-the-box.

All Finance and Operations front-end virtual machines in Microsoft Azure are configured during deployment to only accept TLS 1.2.

#### **IMPORTANT**

Customers who have administrator access to Microsoft-managed sandboxes, including any add-on sandboxes purchased, must follow these guidelines:

- By default, automatic Windows update is enabled for all Tier 1 - 5 sandboxes and should NOT be disabled. This ensures that any time that Microsoft pushes security or critical infrastructure updates to your environment, your environment receives the latest set of updates and is updated each month with the operating system fixes that Microsoft releases.
- Admin passwords on these environments should NOT be changed. Environments that have admin passwords changed will be flagged by Microsoft. Microsoft reserves the right to, and will reset the admin password.
- Adding new user accounts to any Microsoft managed VM is NOT permitted. Microsoft reserves the right to, and will remove the newly added user accounts without providing notice.

Finance and Operations is not covered by a FedRAMP ATO at this time. If Finance and Operations is provisioned in the United States, all customer data at rest is stored in data centers located in the United States, as described in [International availability of Dynamics 365](#). Finance and Operations does not support any other Dynamics 365 US Government or Microsoft 365 GCC compliance attributes (for example, access by US screened personnel, and support for CJIS and IRS 1075).

## Remote Desktop

### **Microsoft-managed environments**

#### **WARNING**

Microsoft will be removing the use of Remote Desktop by customers and partners. Each environment will first have administrator access removed, but still allow non-administrator access to the virtual machines. After this, all access will be removed. For each step of this phased removal, an email notification will be sent to the Notification list setup for each environment. All Remote Desktop access will be removed by November 2020.

Customers are required to complete additional setup to connect to virtual machines (VMs) through Microsoft Remote Desktop (RDP). This additional setup applies to all Microsoft-managed environments, including Tier 1 through Tier 5 sandboxes and add-ons. In order to connect to Tier 1 through Tier 5 sandbox environments, you must explicitly enable access (safe list) from your organization's IP address space. This can be done by a Lifecycle Services (LCS) user who has access to the **Environment** page (**Maintain** > **Enable Access**) where they can enter the IP address space that will be used to connect to the virtual machines through Remote Desktop. Access rules are either a single IP address (example: 10.10.10.10) or an IP address range (example: 192.168.1.0/24). You may add multiple entries at once as a semi-colon(;) separated list (example: 10.10.10.10;20.20.20.20;192.168.1.0/24). These entries are used to configure the Azure Network Security Group that is associated with your environment's virtual network. For more information, see [Security rules](#).

### IMPORTANT

Customers need to ensure that RDP endpoints are secured through explicit IP safe list rules as mentioned above. The IP safe list rules must adhere to the following conditions.

- IP safe list rules must NOT use asterisk/zero.
- Wide IP address ranges must NOT be used.
- IP address ranges must restrict to the customer's CORPNET.
- If computers outside the customer's CORPNET (such as a home office) are used to connect to sandbox environments, only the specific IP addresses of the computers used to connect to the sandbox environments must be added.
- Azure Datacenter IP address ranges must NOT be added.
- Public IP addresses, such as a coffee shop location, must NOT be added.
- IP safe list rules should be removed when not in use. Periodic review of environment IP safe list rules is recommended.

Microsoft will run periodic tests on the Microsoft Managed environments validating that the environments are sufficiently restricted. Microsoft reserves the right to and will remove any IP Address safe list rules that violate the above guidelines, immediately without providing notice.

### Partner/Customer managed environments

By default, Remote Desktop is enabled for all non-Microsoft managed environments. We recommend that customers restrict access to any environments that belong to their subscriptions. This can be done by configuring Network Security Group rules on the environments directly in Azure Portal.

## Windows Remoting (WinRM)

Windows Remoting (WinRM) is disabled on all environments. Although you can enable WinRM on environments that belong to your subscriptions through Azure Portal, we strongly recommend that you do not do this.

### WARNING

Exceptions to enable WinRM will not be granted for any Microsoft-managed environments.

## Availability

The guaranteed uptime for Finance and Operations apps is 99.9%. Planned downtime occurs once a month and lasts no longer than eight hours. Because the work completed during the downtime doesn't always take eight hours, we will always communicate the estimated amount of time that your environments will be down. For more information, see [Get support for Finance and Operations apps or Lifecycle Services \(LCS\)](#).

### High-availability features

To ensure service availability, all production environments are protected by using default Azure high availability (HA) features. HA functionality provides ways to avoid downtime caused by the failure of a single node within a datacenter, and DR features protect against outages broadly impacting an entire datacenter. Azure availability sets are used to prevent single-point-of-failure events. For more information about Azure availability sets, see [Use availability zones to protect from datacenter level failures](#). High availability for databases is supported through Azure SQL. For more information, see [Overview of business continuity with Azure SQL Database](#).

### Disaster recovery features

Production environments are configured with Azure disaster recovery support that includes the following:

- Azure SQL active-geo replication is configured for the Finance and Operations database of the production

environment. For more information about SQL replication, see [Compare geo-replication with failover groups](#).

- Geo-redundant copies of Azure blob storage (containing document attachments) in other Azure regions. For more information, see [Azure Storage redundancy](#).
- Same secondary region for the Azure SQL and Azure blob storage replication.

Only primary data stores are supported by replication. The Financial reporting services and Entity store database use transformed data from the primary database and must be generated after the recovery site has been set up and the Finance and Operations service has started.

## Service availability in Azure Regions

Finance and Operations apps can be deployed into a subset of Microsoft Azure datacenters using Dynamics Lifecycle Services (LCS). Azure is generally available in datacenters and geographical locations around the world. With Finance and Operations apps, customers can specify the region or datacenter where their customer data will be stored. Microsoft may replicate data to other regions for data durability, but we will not replicate or move customer data outside the geographical location. For more details, see the [Service description white paper](#).

### IMPORTANT

Regardless of where customer data is stored, Microsoft does not control or limit the locations from which customers or their end-users may access it. For more information, see [International availability of Dynamics 365](#).

### Upcoming changes to region availability

Dynamics 365 solutions consist of a collection of multiple services. Looking across Dynamics 365 applications, the Power Platform and the Azure services that they both depend on, the required matrix of services is quite large and growing. We have locked on a strategy of selecting a subset of data center regions across the globe to simplify ensuring that we have availability of the full portfolio of required services. Our plan is to optimize to have minimal latency between the component services of a solution and as a result, we are focused on having the full portfolio of services available in each of the designated data centers.

Additionally, the Finance and Operations architecture is being enhanced to build on self-service for greater elasticity, stronger reliability, and more seamless maintenance. Customers gain material efficiency by having deeper self-service deployments in fewer data centers. This transition also benefits from selecting a subset of Azure regions. To that effect, the regional availability of Finance and Operations apps will now be **limited to East US, West US, and Central US in North America** for all new projects. For a list of the latest supported regions, see [International availability of Dynamics 365](#).

Support for East US2, West US2, West Central US, North Central US, and South Central US will continue to be available for projects and environments that currently have their data stored in those regions on Microsoft-managed environments.

### NOTE

Microsoft will work with customers to move them to an appropriate data center beginning October 19, 2020. This will happen in a phased approach. Select customers will receive advance notification before we migrate them to a supported region.

If there are other customer workloads that are not part of the Dynamics 365 or Power Platform family that also require proximity to the Dynamics 365 and Power Platform services, Microsoft will work with customers to coordinate a plan for the overall migration. For more information, see [Cloud deployment overview: Frequently asked questions](#).

# Frequently asked questions

## **Why does the status display 'Maintenance' on my environment in LCS?**

To provide the best experience and performance, Microsoft performs maintenance operations on your environment. During some of these maintenance operations, your environment status may display one of the following statuses:

- Preparing for maintenance
- Prepared for maintenance
- Maintenance in progress

While your environment is in this state and until the status returns to 'Deployed', you will not be able to perform any lifecycle operations, such as package applications. There will be no impact to Finance and Operations apps. Users can continue with normal operations without any service interruption. You will receive an email notification before any maintenance operation puts your environment in this state.

## **How do I connect to the SQL database on my Sandbox environment?**

To connect to the SQL database in your Sandbox environment, follow the steps in [Enable just-in-time access](#).

## **How do I access a development instance?**

For information about how to access development instances, configure on-premises development VMs, and find configurations settings for developers and administrators, see [Deploy and access development environments](#).

## **How do I deploy a demo environment?**

A demo environment includes only Microsoft demo data. You can use a demo environment to explore default features and functionality. For more information, see [Deploy a demo environment](#).

## **How do I move my customizations between environments?**

To move customizations from a development to a sandbox or production environment, see [Create deployable packages of models](#)

## **Can I bring my own domain name?**

You can bring your own domain name if it is running Azure Active Directory (AAD), and the administrator of your AAD instance has enabled the Finance and Operations apps within their AAD. This is usually done through the office email, after you buy a license. When you click the link to accept the offer, AAD is set up for you.

## **Can I add guest AAD accounts as users?**

You can add guest AAD accounts if you have correctly configured them within Azure Active Directory, and enabled the Finance and Operations apps within your AAD.

## **Why am I no longer able to see the Private AOS machines in one or more of my Tier 2 through Tier 5 Sandbox environments?**

The Private AOS VMs were part of your environment configuration as they were needed to secure communication between the AOS and BI machines in the past. With recent updates, all communication between AOS and BI machines are secure directly and no longer need the intermediary Private AOS machines. Therefore, we are in the process of rolling out removing the Private AOS machines. As we are removing the machines in batches, you may notice that only some of your environments have the Private AOS machines removed. This change will not impact functionality or security in any way and will be transparent to you.

## **Why am I no longer able to Remote Desktop into one or more of my Tier 1 through Tier 5 Microsoft managed Sandbox environments?**

Microsoft managed Tier 1 through Tier 5 sandbox environments require Remote Desktop management endpoints to be restricted to specific IP Address sets (safe list). Microsoft regularly validates that the environments are sufficiently restricted. Microsoft reserves the right to immediately remove any IP Address safe list rules that violate the above guidelines without notice. You may not be able to Remote Desktop into your

environment for one of these reasons:

- Your current IP address is not in the safe list.
- Your IP has changed from the IP address listed in the safe list.
- Microsoft deleted the rule containing your IP address from the safe list because it violated a guideline.

To regain access to the environment, you will need to add the IP address of the computer from which you are connecting to. To do this, complete the steps [Remote Desktop](#) section earlier in this topic.

### **When will the availability of reduced regions go into effect for new onboarding?**

Beginning August 1, 2020, new projects for Finance and Operations will be onboarded to the following regions:

- East US
- West US
- Central US

### **My environments are currently in the regions that will be deprecated. How will this change affect me?**

We will deprecate support for the following regions only for new projects that will be onboarded on or after August 1, 2020:

- East US2
- West US2
- West Central US
- North Central US
- South Central US

This will not affect any environments that have their data stored in the deprecated regions before August 2020. In the near future there is a transition plan to move customers in the deprecated regions into the reduced regions.

### **I'm unable to redeploy an environment after deleting it, the environment slot is missing.**

This is due to the license expiring, which means that you no longer have the minimum required licenses to obtain an environment slot. Please review your [subscription status](#) and then reactivate the expired license to enable the redeployment.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# System requirements for cloud deployments of Dynamics 365 Commerce

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic lists the system requirements for cloud deployments of the current version of Dynamics 365 Commerce. If this step is appropriate, before you install Commerce, you should verify that the system that you're working with meets or exceeds the minimum network, hardware, and software requirements.

## Supported web browsers

The web application can run in any of the following web browsers that run on the specified operating systems:

- Microsoft Edge (latest publicly available version) on Windows 10
- Internet Explorer 11 on Windows 10, Windows 8.1, or Windows 7
- Google Chrome (latest publicly available version)
- Apple Safari (latest publicly available version)

### NOTE

It is possible for the Safari browser to show an error during device activation of a Cloud POS device due to an Azure Active Directory token being unattainable. You can resolve this issue by utilizing the [Microsoft Enterprise SSO plug-in for Apple devices](#).

To find the latest release for each web browser, go to the software manufacturer's website.

### NOTE

- To enable Task Recorder to capture screenshots and include them in Microsoft Word documents that are generated, you must install a pre-release Chrome extension.
- The Workflow Editor and Report Designer for Financial reporting are started as ClickOnce applications. They require a 64-bit-compatible operating system. Only Microsoft Edge and Internet Explorer (on a supported version of Microsoft Windows) support ClickOnce applications out of the box. If you're using Chrome, you must install a ClickOnce extension, such as [Meta4](#) to use ClickOnce applications. If you use Chrome in incognito mode, make sure that the ClickOnce extension is also enabled for incognito mode.
- To preview PDF files, we recommend that you use browsers such as Microsoft Edge (latest publicly available version) on Windows 10, or Google Chrome (latest publicly available version) on Windows 10, Windows 8.1, Windows 8, Windows 7, or Google Nexus 10 tablet.

## Supported web browsers for Cloud POS

Cloud point of sale (POS) can run in any of the following web browsers that run on the specified operating systems:

- Microsoft Edge (latest publicly available version) on Windows 10
- Internet Explorer 11 on Windows 10, Windows 8.1, or Windows 7

### NOTE

Beginning with release 10.0.17, Internet Explorer will no longer be supported.

- Chrome (latest publicly available version) on Windows 10, Windows 8.1, or Windows 7

## Network requirements

- Commerce is designed for networks that have a latency of 250–300 milliseconds (ms) or less. This latency is the latency from a browser client to the Microsoft Azure datacenter that hosts Commerce. We recommend that you test network latency at [AzureSpeed.com](https://azure.microsoft.com/en-us/learn/azure-speed/).
- Bandwidth requirements for Commerce depend on your scenario. Most typical scenarios require a bandwidth that is more than 50 kilobytes per second (KBps). However, we recommend more bandwidth for scenarios that have high payload requirements, such as scenarios that involve workspaces or extensive customization.

In general, Commerce is optimized for the internet. The number of round trips from a browser client to the Azure datacenter is very small, and the whole payload is compressed.

### WARNING

Don't calculate bandwidth requirements from a client location by multiplying the number of users by the minimum bandwidth requirements. The concurrent usage of a given location is very difficult to calculate. Customers who are concerned about bandwidth requirements should use a preview version of Commerce.

## .NET Framework requirements

Commerce requires Microsoft .NET Framework 4.7.1 or later for all ClickOnce applications, such as the document routing agent. For installation instructions, see [Install the .NET Framework for developers](#).

## Supported Microsoft Office applications

The following Microsoft Office applications are supported:

- To run the Microsoft Excel and Word add-ins, you must have Microsoft Office 2016 for Windows installed. For more information about version requirements, see [Troubleshoot the Office integration](#).
- To view documents that are generated by the Export to Excel or Export to Word functionality, you must have Microsoft Office 2007 or later installed.

## System requirements for Commerce client components

It is critical to perform proper performance testing prior to going live in production. The following are considered minimum system requirements for applications to function. To achieve desired performance, consider concepts like data volumes, transactional load per hour, and customization impact. Proper performance testing both early into implementation and again prior to final testing will allow for any necessary performance improvements to be made and to validate that the base solution meets the expected operation times required.

[!WARNING] The Microsoft Windows 7 operating system is no longer supported for anything other than security-related fixes. As a result, while Dynamics 365 Commerce components may function on Windows 7, there will be no bug fixes that specifically relate to supporting this operating system. Workarounds may be required for components to function properly on Windows 7, so it is highly recommended to upgrade to a supported operating system.

## Modern POS for Windows requirements

#### NOTE

- If Modern POS will use an offline database, the computer must meet all system requirements for Microsoft SQL Server and the system must have no less than 10 GB of disk space available. It is recommended to have no less than 20 GB of disk space available. An offline database for Modern POS requires SQL Server 2014 with Service Pack 3 or later, SQL Server 2016 with Service Pack 2, SQL Server 2017, or newer. The SQL Server version used must have the Full-Text Search feature installed. We recommend that you always use the latest version that is available, and that you install all the latest service packs. By following these recommendations, you can help to ensure both compatibility and security.
- Starting August 1, 2019, Modern POS and other client-side components require that the Microsoft .NET Framework version 4.7.1 or later be installed. For installation instructions, see [Install the .NET Framework for developers](#).

### Supported Windows operating systems

- Modern POS is a 32-bit application, but it will run on both x86 and x64 architectures.
- Modern POS is supported on Windows Server 2016, Windows 10 Pro, Windows 10 Enterprise, Windows 10 Enterprise Long Term Service Branch (LTSB), and Windows 10 IOT Enterprise editions. At a minimum, the Windows 10 Anniversary Update (version 1607), build 14393, must be installed.
- It is not recommended to use Modern POS and other Commerce components on Windows 10 Pro unless within a domain as Windows 10 Pro doesn't allow for advanced management of updates to the operating system.
- It is not recommended to use Modern POS and any other Commerce component together on the same computer.

### Minimum system requirements

- The minimum supported effective resolution for POS Full layout (PCs and tablets) is 1,024 × 768 (recommended 1366 x 768 or greater)
- The minimum supported effective resolution for POS Compact layout (phones and small tablets) is 320 x 568 (recommended 360x640 or greater)
- The computer that Modern POS runs on must meet these requirements:
  - It must have, at a minimum, a dual-core processor that runs at no less than 2 gigahertz (GHz).
  - It must have, at a minimum, 3 gigabytes (GB) of random-access memory (RAM). When combining with SQL Server for offline, no less than 4 GB of RAM is required.
  - It must have internet access.

## Modern POS for Apple iPhone or iPad requirements

- iOS 11 or later

## Modern POS for Android phone or tablet requirements

- Android OS 6.0 or later

## Retail hardware station requirements

#### NOTE

Starting August 1, 2019, Retail hardware station and other client-side components require that the .NET Framework version 4.7.1 or later be installed. For installation instructions, see [Install the .NET Framework for developers](#). It is critical to note that this component utilizes a server certificate. Server certificates must be managed for expiration. By default, a certificate expires in one calendar year (365 days).

## Supported operating systems

- Retail hardware station is a 32-bit application, but it will run on both x86 and x64 architectures.
- Retail hardware station is supported on the following operating systems:
  - Windows 8.1 Update 1 Professional, Enterprise, and Embedded editions.
  - Windows 10 Pro, Enterprise, Enterprise LTSB, and IOT Enterprise editions.
  - Windows Server 2016 and Windows Server 2019.
  - It is not recommended to use Retail hardware station and other Commerce components on Windows 10 Pro unless within a domain as Windows 10 Pro doesn't allow for advanced management of updates to the operating system.

## Minimum system requirements

The computer must meet all system requirements for installing and using the following items:

- Microsoft Internet Information Services (IIS)
- Third-party hardware

## Commerce Scale Unit (self-hosted) requirements

### NOTE

Starting August 1, 2019, Commerce Scale Unit and other client-side components require that the .NET Framework version 4.7.1 or later be installed. For installation instructions, see [Install the .NET Framework for developers](#).

It is critical to note that this component utilizes a server certificate in addition to Azure Service to Service authentication. Both the generated Azure web application keys (formerly called *secrets*) and the server certificate must be managed for expiration. By default, a certificate and a generated Azure web application key expires in one calendar year (365 days).

Take note that the minimum system requirements listed below are the bare minimum necessary to get a Commerce Scale Unit to function in a test scenario. The following is not representative of a realistic production environment. It is critical to perform proper performance testing and validate that the hardware used will meet the needs of the users.

## Supported operating systems

- Commerce Scale Unit is a 32-bit application, but it will run on both x86 and x64 architectures.
- Commerce Scale Unit is supported on the following operating systems:
  - Windows 8.1 Update 1 Professional, Enterprise, and Embedded editions.
  - Windows 10 Pro, Enterprise, Enterprise LTSB, and IOT Enterprise editions.
  - Windows Server 2016 and Windows Server 2019.
  - It is not recommended to use Commerce Scale Unit and other Commerce components on Windows 10 Pro unless within a domain as Windows 10 Pro doesn't allow for advanced management of updates to the operating system.

## Minimum system requirements

### NOTE

The following are the minimum system requirements for Commerce Scale Unit. Both these and the recommended requirements are the minimum possible for testing and basic functionality. It is crucial to perform performance testing and validate that the hardware used for Commerce Scale Unit meets expectations.

- 4 GB of RAM

- 1.6 GHz i5 (or equivalent) minimum CPU speed per core (2 cores are the minimum).
- At least 15 GB of free space (the channel database can require a large amount of space).

### **Recommended system requirements**

- 6 GB of RAM
- 2.4 GHz i7 (or equivalent) minimum CPU speed per core (4 cores are recommended).
- At least 20 GB of free space (the channel database can require a large amount of space).

It would be in an organization's best interest to also take the following items into consideration when determining personal hardware needs:

- Number of physical network ports (more ports enhances throughput per second).
- SQL Server log flush size (this directly impacts SQL Server performance).
- Data read and write capabilities (this directly impacts SQL Server performance).
- Number of CPU(s) core, number of simultaneous threads per core, and speed per core (this impacts overall throughput of the system).
- Whether load balancing will be required.

## Connector requirements

### **Supported operating systems**

- The Connector for Microsoft Dynamics AX has two separate installers, one for Async Server Connector service and one for Real-time service for Microsoft Dynamics AX 2012 R3.
- Both components are 32-bit applications, but they will run on both x86 and x64 architectures.
- Both components are supported on the following operating systems:
  - Windows 8.1 Update 1 Professional, Enterprise, and Embedded editions.
  - Windows 10 Pro, Enterprise, and Enterprise LTSB editions.
  - Windows Server 2016 and Windows Server 2019.
  - It is not recommended to use Commerce components on Windows 10 Pro unless within a domain as Windows 10 Pro doesn't allow for advanced management of updates to the operating system.

### **Minimum system requirements**

- 2 GB of RAM (4 GB of RAM are recommended).
- 1.6 GHz peak CPU speed per core (2 cores are the minimum).
- At least 10 GB of free space (the channel database can require a large amount of space).

## Requirements for development on local VMs

For information about the requirements for development on local virtual machines (VMs), see [VM that is running on-premises](#).

## Database collation

The only supported collation for Commerce databases in the cloud is `SQL_Latin1_General_CP1_CI_AS`. Please ensure that your SQL Server and database collations in development environments are set to this. Also ensure that any configuration environments that are published to Sandbox have this same collation.

## Additional resources

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# On-premises deployment home page

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can deploy Dynamics 365 Finance + Operations (on-premises). When you choose an on-premises deployment type, the system requirements, hardware sizing, and functionality differ from a cloud deployment. This topic provides links to content that contains information specific to on-premises deployments.

## Get started

- [On-premises deployment overview](#)
- [Plan and prepare for on-premises deployments](#)
- [System requirements for on-premises deployments](#)
- [Hardware sizing requirements for on-premises environments](#)
- [Buy Finance + Operations \(on-premises\)](#)
- [Comparison of cloud and on-premises features](#)

## Onboard

- [Set up on-premises projects in Lifecycle Services \(LCS\)](#)
- [Set up and deploy on-premises environments \(Platform update 12 and later\)](#)
- [Install network printer devices in on-premises environments](#)
- [Configure SQL Server Reporting Services for on-premises deployments](#)
- [Develop and deploy custom models to on-premises environments](#)

## Work in your on-premises deployment

- [Configure document management](#)
- [Import Electronic reporting \(ER\) configurations](#)
- [Document generation, publishing, and printing in on-premises deployments](#)
- [Configure proxies for on-premises environments](#)
- [Set up technical support for Finance and Operations apps](#)
- [Client internet connectivity](#)
- [Apply updates to on-premises deployments](#)
- [Redeploy on-premises environments](#)
- [Reuse the same AD FS instance for multiple environments](#)

## Commerce

- [Commerce capabilities that are available in on-premises deployments](#)
- [Installation steps for Retail channel components in an on-premises environment](#)
- [Configure, install, and activate Modern POS \(MPOS\)](#)
- [Configure and install Commerce Scale Unit](#)

## Upgrade

- [In-place upgrade process for on-premises environments](#)

## Other resources

- [Troubleshoot on-premises deployments](#)
- [Scripts for resolving issues in on-premises environments](#)
- [Certificate rotation](#)
- [On-premises diagnostics](#)
- [Removed or deprecated features for Finance and Operations](#)
- [Software lifecycle policy and on-premises releases](#)

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# System requirements for on-premises deployments

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic lists the system requirements for the current version of Microsoft Dynamics 365 Finance + Operations (on-premises) deployments. Before you install, when this step is appropriate, verify that the system that you're working with meets or exceeds the minimum network, hardware, and software requirements.

## IMPORTANT

Dynamics 365 Finance + Operations (on-premises) deployments are not supported on any public cloud infrastructure, including Azure.

## Network requirements

Dynamics 365 Finance + Operations (on-premises) can work on networks that use Internet Protocol Version 4 (IPv4) or Internet Protocol Version 6 (IPv6). Consider the network environment when you plan your system, and use the following guidelines.

### Network response time

The following table lists the minimum network requirements for the connection between the web browser and Application Object Server (AOS), and for the connection between AOS and the database in an on-premises system.

VALUE	WEB BROWSER TO AOS	AOS TO DATABASE
Bandwidth	50 kilobytes per second (KBps) per user	100 megabytes per second (MBps)
Latency	Less than 250–300 milliseconds (ms)	Less than 1 ms (local area network [LAN] only). AOS and the database must be co-located.

- Finance + Operations is designed for networks that have a latency of 250–300 milliseconds (ms) or less. This latency is the latency from a browser client to the datacenter that hosts Finance + Operations.
- Bandwidth requirements depend on your scenario. Typical scenarios require a bandwidth of more than 50 KBps between the browser and the server. However, we recommend higher bandwidth for scenarios that have high payload requirements, such as scenarios that involve workspaces or extensive customization. The specific amount of bandwidth depends on use.

Deployments where AOS and the Microsoft SQL Server database are in different datacenters aren't supported. AOS and the SQL Server database must be co-located.

In general, Finance + Operations is optimized to reduce browser-to-server round trips. The number of round trips from a browser client to the datacenter is either zero or one for each user interaction, and the payload is compressed.

## WARNING

Don't calculate bandwidth requirements from a client location by multiplying the number of users by the minimum bandwidth requirements. The concurrent usage of a given location is very difficult to calculate. We recommend that you use a real-life simulation against a non-production environment as the best gauge of performance for your specific case.

### LAN environments

In LAN environments, Microsoft Remote Desktop in Microsoft Windows Server isn't required in order to connect to Finance + Operations. However, Remote Desktop might be required for servicing operations on the virtual machines (VMs) that make up the server deployments.

### WAN environments

In wide area network (WAN) environments, Remote Desktop in Windows Server isn't required in order to connect to Finance + Operations.

### Internet connectivity requirements

Finance + Operations doesn't require internet connectivity from user workstations. However, some features won't be available if there is no internet connectivity.

Browser client	An intranet scenario without internet connectivity is a design point for the on-premises deployment option. Some features that require cloud services won't be available, such as Help and Task guide libraries in Microsoft Dynamics Lifecycle Services (LCS).
Server	The AOS or Microsoft Azure Service Fabric tier must be able to communicate with LCS. The on-premises browser-based client doesn't require internet access.
Telemetry	Telemetry data might be lost if there are long interruptions in connectivity. Interruptions in connectivity to LCS don't affect the on-premises application functionality.
LCS	Connectivity to LCS is required for deployment, code deployment, and servicing operations.

## Telemetry data transfer to the cloud

Most telemetry data is stored locally and can be accessed by using Event Viewer in Microsoft Windows. A small subset of telemetry events is transferred to the Microsoft telemetry pipeline in the cloud for diagnostics. Customer data and user-identifiable data aren't part of the telemetry data that is sent to Microsoft. VM names are sent to Microsoft to help with environment management and diagnostics from the LCS portal.

## Domain requirements

Consider the following domain requirements when you install Finance + Operations:

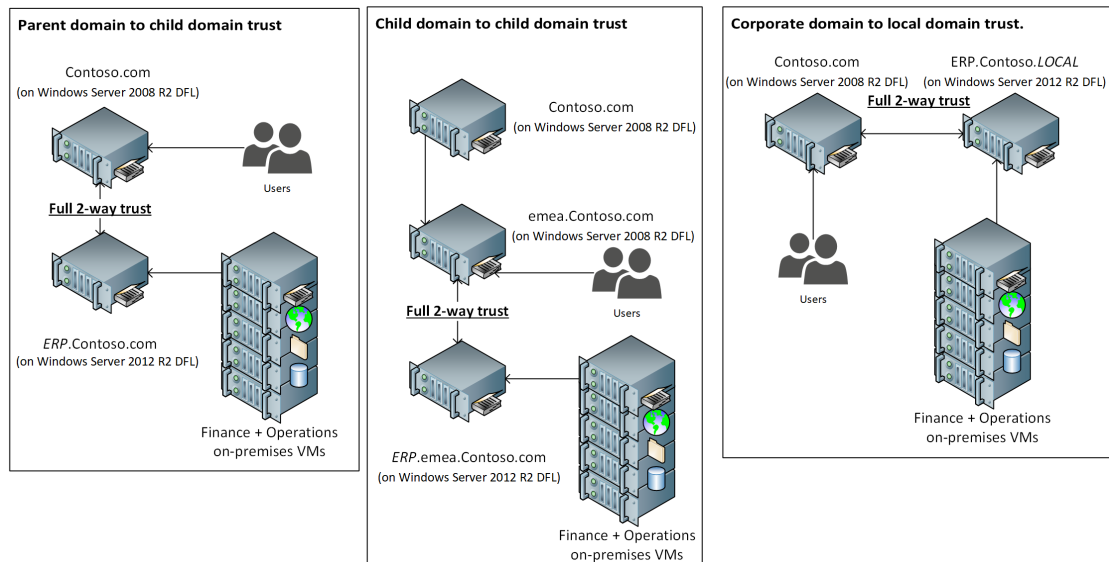

- VMs that host Finance + Operations components must belong to an Active Directory domain. Active Directory Domain Services (AD DS) must be configured in native mode.
- VMs that run Finance + Operations components must have access to each other. This access is configured in AD DS.
- The domain controller must be Microsoft Windows Server 2012 R2 or later, and the domain functional level must be 2012 R2 or more.

## Full 2-way trust

For compatibility with corporate domain controllers on Windows Server 2008 R2 domain functional level (DFL), a full 2-way trust between the Windows Server 2008 R2 DFL user domain and the Windows Server 2012 R2 DFL Finance + Operations service domain is supported in Platform update 33 and later.

This means that users of the Finance + Operations (on-premises) application will come from the Windows Server 2008 R2 DFL domain, and the resources and service accounts hosting the Finance + Operations (on-premises) infrastructure and services will come from the Windows Server 2012 R2 DFL domain.

Examples for a full 2-way trust setup could be.

### Known limitations with using the full 2-way trust setup

- Import of security groups from the Windows Server 2008 R2 user domain is not supported.

## Hardware requirements

This section describes the hardware that is required in order to run Finance + Operations.

The actual hardware requirements vary, based on the system configuration, the data composition, and the features that you decide to use. Here are some of the factors that can affect the choice of appropriate hardware:

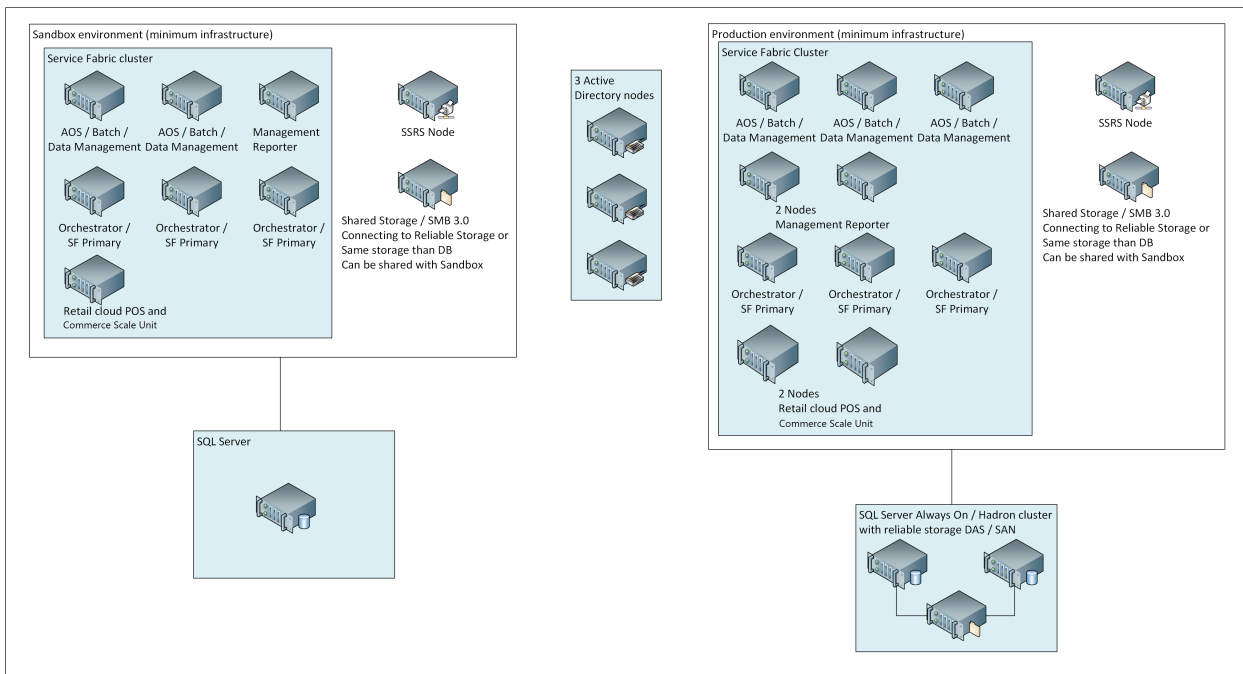

- The number of transactions per hour
- The number of concurrent users

## Minimum infrastructure requirements

Finance + Operations uses Service Fabric to host the AOS, Batch, Data management, Management reporter, and Environment orchestrator services.

SQL Server must have a high-availability HADRON setup that has at least two nodes for production use.

The following illustration shows the minimum number of nodes that is recommended for your Service Fabric cluster.

## Processor and RAM requirements

The following tables list the number of processors and the amount of random-access memory (RAM) that are required for each role that is required in order to run this deployment option. For more information, see the recommended minimum requirements for a Service Fabric standalone cluster in [Plan and prepare your Service Fabric cluster](#).

### NOTE

If other Microsoft software is installed on the same computer, the system must also comply with the hardware requirements for that software. If other server applications are installed on the same computer as AOS, we recommend that you limit those server applications 1 gigabyte (GB) of RAM.

### Sizing by role and topology type

TOPOLOGY	ROLE (NODE TYPE)	RECOMMENDED PROCESSOR CORES	RECOMMENDED MEMORY (GB)
Production	AOS, Data management, Batch	8	24
	Management Reporter	4	16
	SQL Server Reporting Services	4	16
	Orchestrator	4	16
	SQL Server	8	32
Sandbox	AOS, Data management, Batch	4	24
	Management Reporter	4	16

TOPOLOGY	ROLE (NODE TYPE)	RECOMMENDED PROCESSOR CORES	RECOMMENDED MEMORY (GB)
	SQL Server Reporting Services	4	16
	Orchestrator	4	16
	SQL Server	8	32

### Minimum sizing estimates for production and sandbox deployments

TOPOLOGY	ROLE	NUMBER OF INSTANCES
Production	AOS (Data management, Batch)	3
	Management Reporter	2
	SQL Server Reporting Services	1
	Orchestrator**	3
	SQL Server	2
Sandbox	AOS, Data management, Batch	2
	Management Reporter	1
	SQL Server Reporting Services	1
	Orchestrator	3
	SQL Server	1
<i>Summary for production and sandbox topologies</i>		<i>19</i>

\* The numbers in this table are being validated by our preview customers and might be adjusted based on the feedback from those customers.

\*\* Orchestrator is designated as the primary node type and will also be used to run the Service Fabric services.

### Initial estimates for the back-end SQL Server and AD DS

	ROLE	VMS/INSTANCES	CORES	TOTAL CORES	MEMORY PER INSTANCE (GB)	TOTAL MEMORY (GB)
Shared infrastructure	SQL Server*	2	8	16	32	64

	ROLE	VMS/INSTANCES	CORES	TOTAL CORES	MEMORY PER INSTANCE (GB)	TOTAL MEMORY (GB)
	File server/Storage area network/Highly available storage	The back-end storage must be based on solid-state drives (SSDs) on a runtime storage area network (SAN). Size and input/output operations per second (IOPS) throughput is based on the size of the workload.				
	Active Directory	3	4	12	16	48
<i>Summary for shared infrastructure</i>		5		28		112

\* SQL Server sizes are highly dependent on workloads. For more information, see [Hardware sizing requirements for on-premises environments](#). Separate SQL Server machines for sandbox and production environments must be used. However, SQL Server can be shared in all sandbox environments.

## Storage

- AOS – Finance + Operations uses a Server Message Block (SMB) 3.0 share to store unstructured data. For more information, see [Storage Spaces Direct in Windows Server 2016](#).
- SQL – The following options are viable:
  - A highly available SSD setup
  - A SAN that is optimized for online transaction processing (OLTP) throughputs
  - High-performance direct-attached storage (DAS)
- SQL Server and data management IOPS – The storage for both data management and SQL Server should have at least 2,000 IOPS. Production IOPS depends on many factors. For more information, see [Hardware sizing requirements for on-premises environments](#).
- VM IOPS – Each VM should have at least 100 write IOPS.

## Virtual host requirements

When you set up the virtual hosts for an environment, see the guidelines in [Plan and prepare your Service Fabric cluster](#) and [Describing a service fabric cluster](#). Each virtual host should have enough cores for the infrastructure that is being sized. Multiple advanced configurations are possible, where SQL Server resides on physical hardware but everything else is virtualized. If SQL Server is virtualized, the disk subsystem should be a fast SAN or the equivalent. In all cases, make sure that the basic setup of the virtual host is highly available and redundant. In all cases, when virtualization is used, no VM snapshots should be taken.

Finance + Operations falls under Microsoft's standard support policy regarding operation on non-Microsoft virtualization platforms – specifically VMWare. For more information, read [Support policy for Microsoft software](#). In short, we support our products in this environment, but if we are asked to investigate an issue, we may ask the customer to first reproduce the problem without the virtualization platform or on the Microsoft virtualization platform.

## Software requirements for all server computers

The following software must be present on a computer before any Finance + Operations components can be

installed:

- The Microsoft .NET Framework. See [Deployment setup](#) for version information.
- Service Fabric

For more information, see [Plan and prepare your Service Fabric cluster](#).

## Supported server operating systems

The following table lists the server operating systems that are supported.

OPERATING SYSTEM	NOTES
Microsoft Windows Server 2016 Datacenter or Standard	These requirements are for the database and the Service Fabric cluster that hosts AOS. Only en-US OS installations are supported.

## Software requirements for database servers

- Only 64-bit versions of SQL Server 2016 are supported.
- Only `SQL_Latin1_General_CP1_CI_AS` is valid for the server and database collation. For more information about how to select a collation for a SQL Server database, see the [SQL Server documentation](#).
- In a production environment, we recommend that you install the latest cumulative update (CU) for the version of SQL Server that you're using.

The following table lists the SQL Server versions that are supported for the databases. For more information, see the minimum hardware requirements for [SQL Server](#).

REQUIREMENT	NOTES
Microsoft SQL Server 2016 Standard Edition or Enterprise Edition	For the hardware requirements for SQL Server 2016, see <a href="#">Hardware and Software Requirements for Installing SQL Server 2016</a> .

## Software requirements for Application Object Server (AOS)

- SQL Server Integration Services (SSIS)

## Software requirements for Reporting Server (BI)

- SQL Server Reporting Services (SSRS)

## Software requirements for client computers

Users can access Finance + Operations by using the most recent versions of these popular browsers:

- Microsoft Edge (recommended: [Chromium-based Edge](#))
- Google Chrome
- Apple Safari
- Internet Explorer 11 (deprecated, not recommended)

#### NOTE

For optimal performance and an optimal experience, we recommend that you use the latest version of a modern browser, especially Microsoft Edge. Support for Internet Explorer 11 is deprecated. For more information, see the [Internet Explorer deprecation announcement](#).

## Software requirements for Active Directory Federation Services

Active Directory Federation Services (AD FS) on Windows Server 2016 is required.

The domain controller must be Windows Server 2012 R2 or later, and the domain functional level must be 2012 R2 or more. For more information about domain functional levels, see the following pages:

- [What Are Active Directory Functional Levels](#)
- [Understanding Active Directory Domain Services Functional Levels](#)
- [Full 2-way trust](#)

## Supported Microsoft Office applications

The following Microsoft Office applications are supported in on-premises deployments:

- To run the Microsoft Excel and Microsoft Word add-ins, you must have Microsoft Office 2016 for Windows (or newer) installed. For more information about version requirements, see [Troubleshoot the Office integration](#).
- To view documents that are generated by the Export to Excel or Export to Word functionality, you must have Microsoft Office 2007 or later installed.

## Hardware and software requirements for Commerce components

Currently, Finance + Operations doesn't include the Commerce components.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Installation steps for Retail channel components in an on-premises environment

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic covers the installation steps for Commerce channel components in an on-premises environment.

## Overview

Channel functionality, in an on-premises environment, is enabled exclusively via use of Commerce Scale Unit (self-hosted). For an overview, see [Commerce Scale Unit \(self-hosted\)](#).

Unlike a cloud deployment, an on-premises environment does not enable seamless, high-availability deployment of channel components via Lifecycle Services (LCS). The only way to use channel components is by installing Commerce Scale Unit (self-hosted).

## Prerequisites

Before you can start installation of channel components, you must first complete all prior installation steps for an on-premises environment. These steps are listed in [Set up and deploy on-premises environments \(Platform update 12 and later\)](#). In addition, version 8.1.1 must be installed in order for Commerce have full functionality. We recommend that you update to version 8.1.2.

### NOTE

It is critical to ensure that a secure network, that is not publicly accessible, is used to connect Commerce Scale Unit to Headquarters. You must also restrict network access to Headquarters, so access is only allowed to known Commerce Scale Unit devices via network filtering or other means. This means that a firewall must exist and using a safe list is highly recommended.

## Installation steps

1. On the previously created [Application share](#), (not the **LocalAgent** share folder), create a new folder called **selfservicepackages** in the root directory of the share location.
2. On each AOS computer, create an easily accessible directory, such as **C:/selfservicepackages**.
3. On one AOS computer (which one does not matter), run the following PowerShell script.

```
.\RetailUpdateDatabase.ps1 -envName '<Environment name>' -AosUrl 'https://<My Environment Name>.com/namespaces/AXSF/' -SendProductSupportTelemetryToMicrosoft
```

## IMPORTANT

The above steps apply to version 10.0 and later. For the original 8.1.3 release of Retail on-premises functionality, the original version of the script delimiters must be used.

```
.\RetailUpdateDatabase.ps1 -DatabaseServer '<Database server name for AOS database>' -  
DatabaseName '<Database name for AOS database>' -envName '<Environment name>' -  
RetailSelfServicePackages '<Local path of Retail self-service packages, such as  
**C:/selfservicepackages**>' -SendProductSupportTelemetryToMicrosoft
```

- The parameter **-envName** should be known based on creation when the environment is generated.
- The legacy parameters **-DatabaseServer** and **-DatabaseName** should be known based on the environment setup.
- The parameter **-SendProductSupportTelemetryToMicrosoft** is a required value to enable telemetry to Microsoft. This is critical to maximize support from Microsoft.
- This script will perform a variety of actions, including updating the Service user and role and updating registry keys.

4. On each AOS computer, run the following PowerShell script.

```
.\RetailUpdateDatabase.ps1 -RetailSelfServicePackages 'C:\RetailSelfService\Packages'
```

## NOTE

The parameter **-RetailSelfServicePackages** is the full path location created in the beginning of this step (C:/selfservicepackages).

5. Download the appropriate binary update from LCS to have the Commerce installers. For instructions, see [Download updates from Lifecycle Services \(LCS\)](#).
6. Extract the zip file and copy all self-service installers into the folder **C:/selfservicepackages** defined and created in step 2 in each of the AOS machines. The six self-service installers include:
- AsyncServerConnectorServiceSetup.exe
  - RealtimeServiceAX63Setup.exe
  - HardwareStationSetup.exe
  - ModernPosSetup.exe
  - ModernPosSetupOffline.exe
  - StoreSystemSetup.exe

## NOTE

Cloud environments can synchronize self-service installers through Headquarters from what is available in LCS ([Synchronize self-service installers in Dynamics 365 Commerce](#)). On-premises environments cannot utilize this functionality, however, these environments can still download from LCS. The SDK is available in the deployable package zip file. The self-service installers are available from the **LCS Asset library**. You can utilize the upload and download mechanism from within LCS, but the Headquarters synchronization functionality will not work.

7. Navigate to the AD FS machine, then go to the InfrastructureScripts folder. This is the same file directory where the previously run PowerShell script was located (**RetailUpdateDatabase.ps1**). Find the PowerShell script **Create-ADFSServerApplicationForRetail.ps1**.
8. On the AD FS machine that you're currently using, run this script in a new PowerShell window using the

command `.\Create-ADFSServerApplicationForRetail -HostUrl 'https://ax.d365ffo.onprem.contoso.com'`, where the `HostUrl` value can be found in Service Fabric. To find the `HostUrl` value, go to **Service Fabric > Application fabric:/AXSF > Details > Aad\_AADValidAudience**.

9. Access the newly generated Server application from the **Application Groups** in AD FS Management.
10. Edit the newly generated Server application and select **Reset the Secret**.

#### NOTE

It is an important security measure to run this script for each Commerce Scale Unit. This maximizes security and minimizes the workload in case of a security breach.

It is critical to keep this secret safe. This secret should only be copied once and never stored on the system. The Client ID and Secret generated will be used during the Commerce Scale Unit installer, so it is required to be used at a later time. You can always reset the secret again, but it must then be updated on any Commerce Scale Unit that used the previous secret.

11. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Connector for Microsoft Dynamics AX**.
12. Select **Edit** on the Action pane.
13. In the **Profile** field, enter the value **Default**. If needed, enter a description in the **Description** field.

#### NOTE

It is possible for the following fields in steps 12 through 14 to already have values. If this occurs, skip those steps and continue from there. What is important is to have a selectable profile title (default in this case).

14. In the **Web application name** field, enter **RetailCDXRealTimeService**.
15. In the **Protocol** field, select **https**.
16. In the **Common name** field, enter **AXServiceUser@contoso.com**.
17. Select **Save** on the Action Pane.
18. In Headquarters, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**.
19. Select the **Security** tab.
20. Under the sub-heading **Transaction service legacy properties**, select the **Real-time Service profile** field, and then select the newly created **Default** value.
21. Select the **Identity providers** tab.
22. On the **Identity providers** FastTab, select **Add**.
23. In the new **Issuer** row, enter the new Identity provider value <https://sts.windows.net/> in the field.
24. Select **Save** on the Action Pane.
25. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**.
26. On the **General** tab, select the **Initialize** link to configure seed data for Commerce functionality.

#### NOTE

The installers will not download from their relevant pages the first time a download is attempted. This is because the installers have only just been placed into the download location and the associated database values do not yet exist. In Headquarters, when the **Download** functionality is attempted (for example, Commerce Scale Unit or Modern POS), an error will display and then an automated upload functionality will be initiated to allow the installers to be downloaded the second time that the download is attempted. (Wait one minute before attempting to download the installer again).

The Peripheral Simulator (downloaded on the Hardware profile page in headquarters) will not be available until at least one Hardware profile has been created and is functional. After that point has been achieved, the following script can be run.

```
.\RetailUpdateDatabase.ps1 -envName 'LBDenv1' -UpdateRetailHardwareProfileSelfServicePackage
```

27. Follow the installation steps for installing the Commerce Scale Unit. For instructions, see [Configure and install Commerce Scale Unit \(self-hosted\)](#). At multiple locations in this document there will be notes referencing changes to the instructions for an on-premises deployment. It is important to note each of these changes.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Buy Finance + Operations (on-premises)

2/18/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Dynamics 365 Finance + Operations (on-premises) offers a variety of license types to best suit the needs of your organization. To better understand how Finance + Operations (on-premises) is licensed, please work with your partner, who can access the [Licensing guide](#) on PartnerSource. When you are ready to purchase licenses for your organization, work with your partner to follow the steps outlined in this topic.

## IMPORTANT

On-premises environments are not supported on any public cloud infrastructure, including Azure.

## Purchase client access licenses

To run on-premises environments, you must obtain the proper number of client access licenses (CALs) for your organization per the licensing guide. The CAL purchased for an individual user determines the functionality that the user has the rights to use. User CALs can be purchased from the [Microsoft Volume Licensing Service Center](#).

## Purchase server licenses

A server license is required for every server running Finance + Operations (on-premises). After purchasing your server licenses, work with your partner to download a license file from the [PartnerSource Business Center](#). Keep this license file handy, as the details it contains will be used when setting up your Lifecycle Services (LCS) project.

Partners can download a customer's Finance + Operations (on-premises) license file from the PartnerSource Business Center using these steps:

1. Log on to the [PartnerSource Business Center](#).
2. Enter the customer name or account number in the **Find A Customer** field, and then click **Search**.
3. Click the company name of the customer. This opens the **Customer Summary** page.
4. Under **Registered Products**, click **Registration Keys**.
5. Select **version 07** in the **Request and Display License Keys For Version** field.
6. Click **Display License Keys**.
7. On the **Request License Keys** page, select **Download Current License/Registration Key**.
8. Click **Save As** in the **File Download** dialog box, select the folder where you want to download the license file to in the **Save As** dialog box, and then click **Save**.

## NOTE

If you cannot see registration keys in PartnerSource Business Center, you will need to ensure that your PartnerSource Business Center Profile has **Can See Registration Keys** set to **Yes**.

## Get started with Lifecycle Services (LCS)

To purchase Finance + Operations (on-premises) you must have a Microsoft Online Services ID. The Microsoft Online Services ID is used to provision an LCS project that contains the necessary artifacts for on-premises environments. LCS is the service where on-premises environments will be provisioned, Business Process Model

created/uploaded, hotfixes are made available, support cases are entered and managed, license key serial number activation submitted, etc.

The Microsoft Online Services ID is required to provision and register Finance + Operations (on-premises) into entity-owned hardware and environment. See the Provisioning guide (linked to below) to complete the provisioning and registration process. If a Microsoft Online Services ID already exists, the process must be completed by the Global Administrator. If creating a Microsoft Online Services ID for the first time, the person initiating the process will be the Global Administrator.

If you have an existing Microsoft Online Services trial or paid subscription, you already have a Microsoft Online Services ID that was created at the time of sign-up. When you click a link below, choose to sign in with this account if you want to use this same Azure Active Directory (AAD) tenant for the on-premises environment.

Access to the Provisioning guide can be found here:

- [Provisioning guide on CustomerSource](#)
- [Provisioning guide on PartnerSource](#)

After you have logged into LCS, a project will be automatically provisioned for you. The LCS project will allow you to deploy an on-premises environment. For more details on getting started with your LCS project, see [Set up on-premises projects in Lifecycle Services \(LCS\)](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce Data Exchange implementation guidance

2/18/2021 • 16 minutes to read • [Edit Online](#)

This topic is intended for people who implement functionality that is related to data synchronization (Commerce Data Exchange, [CDX]) in a Microsoft Dynamics 365 Commerce environment. It gives an overview, implementation tips, and overall guidance that you should consider as you plan your implementation, in regard to pages, setup, configuration, best practices, and more.

## Overview

Proper configuration and synchronization of data is crucial to a correct implementation. Regardless of business requirements, IT infrastructure, and overall preparedness, if data isn't correctly synchronized, the whole environment is effectively useless. Therefore, a top priority is to understand what is required to configure, generate, synchronize, and verify data across the full implementation. This goes from Commerce headquarters through the Commerce Scale Unit to the brick-and-mortar stores that use Modern POS (With or without an offline database) and other in-store components. CDX is the Commerce functionality that replicates and synchronizes data across databases. However, CDX differs from typical data replication functionality because it also allows for filtering. Therefore, CDX helps minimize data sets by generating only data that is specific to the channels that were specified for selection, filtering specific tables from offline databases, and filtering expired records for data that is no longer used, such as expired discounts.

Before you go through this topic, it's important that you understand the concepts of a channel (store), registers and devices, and the Modern POS offline database. Therefore, we recommend that you review some of the resources at the end of this topic, such as the Device management implementation guide and the overview of the Commerce architecture.

### Important Commerce headquarters pages

- **Channel database** – Use this page to create, review, and edit the channel databases that are used in Commerce Scale Units (both Cloud and Self-hosted) and the offline databases that are used with Modern POS. Each database that you create here refers to a single, physical database (in other words, there is a one-to-one [1:1] mapping). A channel database or offline database must be associated with a channel database group. From this page, you can also create full synchronizations of a scheduler job for a selected channel database or offline database.
- **Channel database group** – Use this page to create, review, and edit channel database groups. Each group is associated with one or more channel or offline databases. The database group is responsible for gathering all the relevant data that is required by all the associated channel and offline databases, and that must be generated as part of CDX data synchronization.
- **Channel profile** – Use this page to create, review, and edit channel profiles. Each channel profile stores the URLs that are relevant to the network-based communication that is required within a channel. A channel profile typically has a Retail Server URL and a Cloud POS URL. Often, there is also a Media Server Base URL. This URL is the internet addressable location of images that are used by the POS, E-Commerce, and other Commerce channels. Although a channel profile is automatically generated for a Commerce Scale Unit (Cloud), it must be manually generated as part of the configuration and installation steps for a Commerce Scale Unit (Self-hosted).
- **Offline profile** – Use this page to create, review, and edit offline profiles. Each offline profile lets a user configure settings that are related to offline mode. For example, you can configure settings that let users manually switch to offline mode before they sign in, enable advanced offline switching, and pause offline

synchronization. These settings are discussed later in this topic and also in the related topics that are listed at the end of this topic.

- **Commerce channel schema** – Use this page to create, review, and edit channel schemas. By default, one schema that is named **AX7** is already created and available. The channel schema is required to define how the Commerce headquarters database should be read for Commerce data. It also includes a setting that lets you exclude customer-related data from data synchronization to offline databases. This setting is discussed later in this topic and also in the related topics that are listed at the end of this topic.
- **Distribution schedule** – Use this page create, review, and edit distribution schedule jobs. These schedule jobs determine which channel database groups run the associated scheduler job (see the next item in this list). A schedule job can be marked as active, and a single direction of data is associated with it. Typically, the direction is **Download**, so that data is sent down to the channels. By default, all Commerce-related jobs already exist and are ready to be used with any generated Commerce Scale unit (Cloud). From this page, you can also create delta synchronizations for a selected schedule job.
- **Scheduler job** – Use this page to create, review, and edit a selected job from the schedule job. This job has a series of associated subjobs. It's also associated with a channel schema (typically, the default **AX7** schema). A job can be excluded from synchronization to offline databases.
- **Scheduler subjob** – Use this page to create, review, and edit a subjob. A subjob is associated with one or more jobs, as shown on the **Scheduler job** page. A subjob is associated with a single table in the Commerce headquarters database. It shows the channel field mapping, which lists all the related fields that are used in the database table.
- **Download sessions and Upload sessions** – Use these pages to review and edit download or upload sessions that were created through the data packages that were generated via the previously described pages. These pages show how many rows of data must be synced, when the data was made available, and when it was synced. They also show the overall size of the data package. These pages let you manage and troubleshoot data packages to some extent. For example, you can view any errors that have occurred, and cancel or delete any jobs that are causing an issue. For more information, see [Commerce Data Exchange best practices](#).

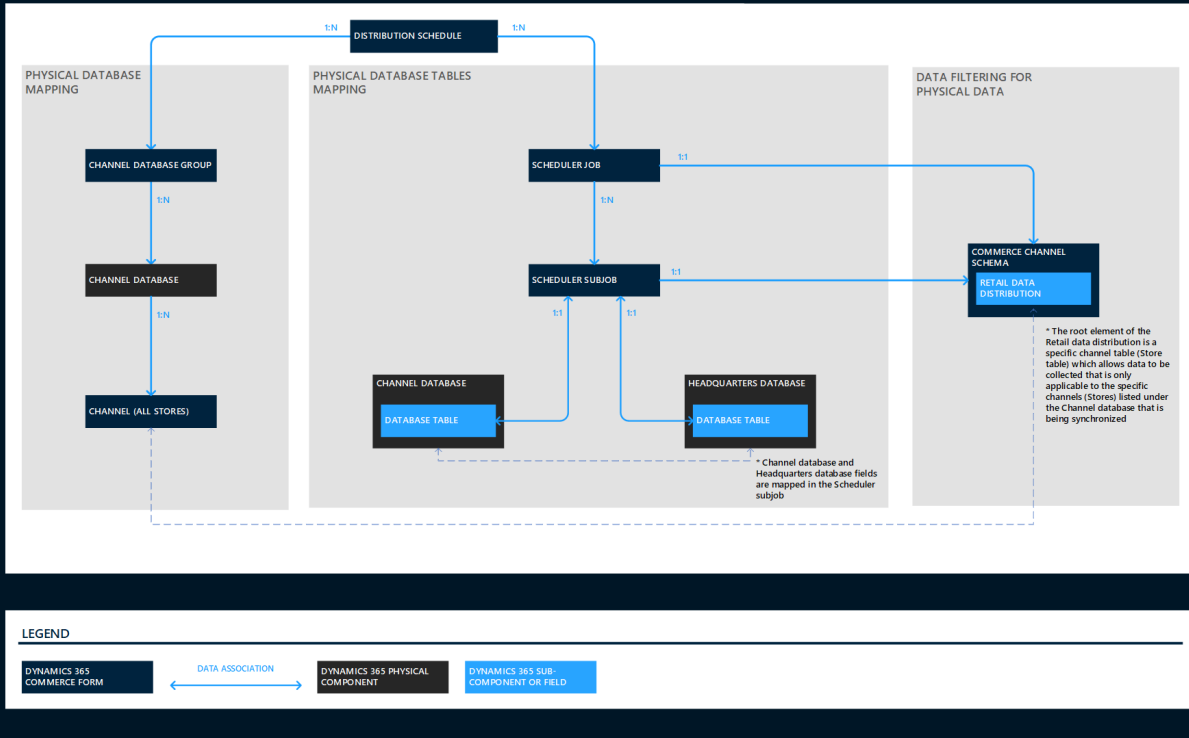

### **Data synchronization overview**

When a scheduler job is run, the channel database group selects, from the fields that are listed in the accumulated subjobs, the relevant data for all channel or offline databases that are associated with itself. The result of this data selection is a data package. A data package is a file or multiple files that are zipped together, and contains data that must be applied to one or more destination databases. This data is either all previously selected data or, typically, a selected delta of data. The destination databases can be either channel databases or offline databases.

Data is generated and flows in a specific direction (either download or upload). To understand how best to configure the timing and select data for synchronization, it's important that you understand how the various pages in Commerce headquarters are used and how data generation occurs. When data generation is done correctly, it helps increase performance and reduce Commerce headquarters utilization.

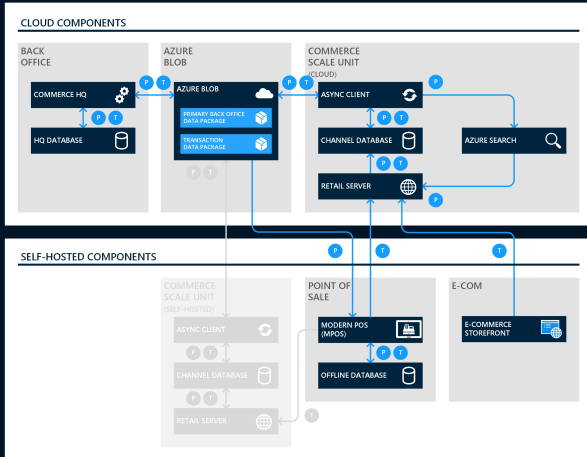

The following illustration shows the various pages in Commerce headquarters and how they are related to each another. (For descriptions of these pages, see the previous section.) CDX data generation can occur only if it's fully configured across all these pages. Data can be downloaded or uploaded. The data synchronization status is viewable on two different pages in Headquarters: Download sessions and Upload sessions. CDX data generation occurs through Headquarters and is synchronized down (download). Modern Point of Sale (POS) transactional data generated while offline requires the data to be synchronized up (upload).

### HEADQUARTERS FORMS AND COMPONENT ASSOCIATION

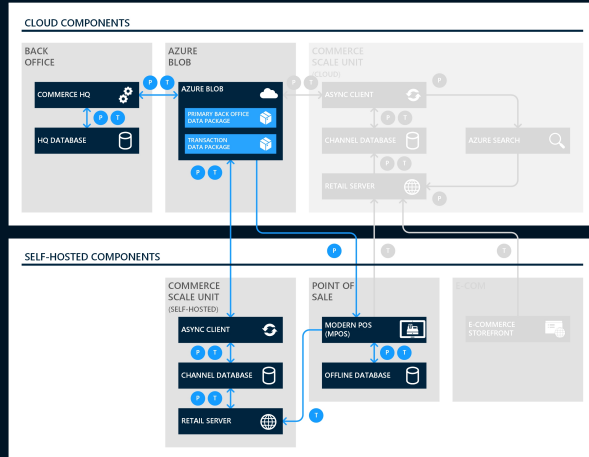

The following illustration shows the data flows for download and upload. Data packages that are generated through CDX flow downward. A generated data package can apply to the Commerce Scale Unit and to Modern POS offline databases, based on the channel database groups that are configured. Transactional data flows upward from the Modern POS offline databases to the Commerce Scale Unit channel database. All transactional data stores in the channel database is then uploaded to the Headquarters database.

### COMMERCE SCALE UNIT (CLOUD)

### COMMERCE SCALE UNIT (SELF-HOSTED)

### Overview of package management

As packages are created, they are processed and sent to Azure storage, where they are ready for download to a channel or offline database. During all stages from creation through full application, these packages can be viewed as a detailed list on the [Download sessions](#) page. In a similar way, as transactions are uploaded, there

is an **Upload sessions** page. On these pages, you can manage the packages to some extent during the various stages.

In general, packages automatically retry and take care of themselves. However, various scenarios can cause a package to become stuck in some way, so that it endlessly retries itself, but without success or outright failure. When you troubleshoot the package application process in these scenarios, the ability to delete or manually retry jobs can be valuable.

### Important CDX-related features

All these features are available in version 10.0.12 and later.

FEATURE NAME	DESCRIPTION
Advanced offline	This feature consists of a series of settings in the offline profile. These settings make additional offline switching scenarios available, give users the ability to switch to offline mode before they sign in to the POS, and allow for enhanced Commerce headquarters availability testing, so that you can switch to offline mode more often and more easily return to online status.
Offline data exclusion	This feature is also known as Data sizing improvements. It provides the ability to flag specific data that must be excluded from offline databases, and that must not be synced in the future. It's also used to fully remove all customer-related data from offline databases.
Forced Batch processing and inability to use recurrence with a Full sync	In version 10.0.11 and later, you can't perform the <b>Run now</b> command from the <b>Distribution schedule</b> page unless batch processing is used. This change was made because of performance issues that occurred if jobs were run during times when environments were most heavily used. In another change that was made as a part of this feature enhancement, recurrence can't be used when the <b>Full data sync</b> command (full job synchronization) is run from the <b>Channel database</b> page in Commerce headquarters. Only a single occurrence can be run.

#### Advanced offline

This feature can be configured in the offline profile. Three settings are related to it:

- **Allow manual switch to offline before sign in** – This setting lets Modern POS users switch to offline mode before they sign in to the POS. It's helpful in scenarios where time-outs might occur before sign-in is completed, or where atypical response codes from the Commerce Scale Unit (Cloud or Self-hosted) are occurring. When this setting is turned on, a Modern POS user who is using an offline database can access the **Settings** menu from the POS sign-in page. This menu includes a new option for switching to offline mode. By selecting this option, the user can sign in directly against the offline database instead of first having to sign in via a call to the Commerce Scale Unit.
- **Enable advanced offline switching** – This setting enables Modern POS to switch to offline mode more easily and more often. Typically, Modern POS tries to maintain its online status and switches to offline mode only when such a switch is required to continue functionality. When this setting is turned on, Modern POS can switch more often, especially in scenarios that involve sign-in and additional Commerce Scale Unit responses that might be considered a delay to POS operation. This setting is most valuable in scenarios where speed is a higher priority than maintaining availability of online-only features (for example, paying with a gift card, which requires connection to Headquarters).
- **System health check interval (mins)** – This setting works as a subfeature of the **Enable advanced offline switching** setting that was just described. Usually, when that setting is turned off, and Modern POS

is in offline mode, the POS waits a specific amount of time, based on configuration in the **Offline profile**, and then tries to reconnect to the Commerce Scale Unit during the next operation call that occurs. This advanced offline health check provides a more frequent, operation-independent method of checking online availability and switching more quickly as soon as online functionality is available again.

#### Offline data exclusion

This feature began to be released in version 10.0.11, and the full feature set was completed in version 10.0.12. This feature is intended to help reduce that amount of data that is synced to offline databases. On the **Scheduler job** and **Scheduler subjob** pages in Commerce headquarters, an option that is named **Exclude from offline databases** lets you exclude data (tables) when you sync data to the offline database.

- On the **Scheduler job** page, set the option to **Yes** to stop all generated data packages for the job from being synced to offline databases. If the **Full data sync** command is run for the excluded job from the **Channel database** page, the relevant tables in offline databases will be emptied (that is, all data that previously existed will be cleared).
- On the **Scheduler subjob**, set the option to **Yes** to stop the associated table for any job that contain the subjob from being synchronized to offline databases. For example, the channel database SQL table **DIRPARTYTABLE** is synchronized by three different scheduler jobs. Therefore, if you exclude the **DIRPARTYTABLE** table, you stop its data from being synced to offline databases by all three jobs. (We don't recommend that you exclude this example table (**DIRPARTYTABLE**) as it is critical for the staff related data it stores in the offline database).

This feature also represents the first step in row-level filtering. In Commerce headquarters, the **Commerce channel schema** page includes a new option that is named **Filter shared customer data tables**. (To open the **Commerce channel schema** page, go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database group**, and then, in the **Commerce channel schema** field, select a value. The default value is **AX7**.) By setting the option to **Yes**, you flag all customer data in shared tables. This setting works only for standard Microsoft-created tables (that is, tables that aren't custom-created tables). When you set this option to **Yes**, you receive a message that states, "This will remove customer data from the records in the channel data distribution only. All schedule jobs that contain customer data also need to be marked to skip offline synchronization." You can then select either **Yes** or **No**. This message is intended as a reminder that the **Exclude from offline databases** option must also be set to **Yes** for all customer data jobs. (By default, the only customer data job is the 1010 job.)

Here is an example of this filtering. The **DIRPARTYTABLE** table is used for both customers and employees. If you set the **Filter shared customer data tables** to **Yes**, all customer records at the row level are flagged to indicate that they should not be synced to offline databases. When the **Exclude from offline databases** option is also set to **Yes**, all customer data will be excluded from synchronization to offline databases.

## Implementation considerations

This section describes configurations that you should consider when you begin to plan your implementation. The features that are described here are related to data management and data configuration. Before you read the guidance that is provided here, we highly recommend that you read [Commerce Data Exchange best practices](#).

- **Create a Scheduler job calendar** – How often will each job occur? How many times per day will each job occur? Will large, non-critical jobs occur only during off-hours, when the overall environment isn't heavily used? By creating a calendar (either physical or virtual, as you prefer), you can learn the details about how jobs will intersect with other workloads that affect performance (for example, statement posting), hours of operation, batch processing for external data, and any customizations that push or pull data at specified times (or frequently throughout the day, just like a CDX job).
- **Pause offline synchronization** – As a retail organization expands, it should take advantage of this offline profile feature as fully as possible. Growth is good, but data generation should be managed to

help minimize the performance impact on the currently operating business. This feature enables the creation of channels, registers, and databases, but without requiring a massive, performance-affecting amount of data generation long before the registers are ever used.

- **Advanced offline** – The previously described advanced offline features can be helpful, but they should be used only if they suit the priorities and values of the retail organization. Although the advanced offline health check interval can help maximize online time, it will also be more forceful about pushing a register to offline mode if Commerce headquarters or the Commerce Scale Unit becomes unresponsive or unavailable for any reason. It can be valuable to maximize the performance of registers by quickly switching to offline mode instead of waiting for time-outs or repeated retry responses. However, this approach must be understood and managed against the standard seamless offline model that tries to stay online as long as possible, to allow for operations such as loyalty operations, additional payment methods, and customer orders.
- **Offline data exclusion** – In general, a small data set is typically faster than a large data set. It can be valuable to exclude data that isn't relevant to the functionality of the offline database when you want to reduce the overall database size (for example, SQL Express allows for databases of only 10 gigabytes [GB]), and also when you want to minimize the amount of data that the POS terminal queries as part of general operations while it's in offline mode.

This feature varies widely, depending on the business requirements of the retail organization. Therefore, it's crucial that you know what data is required for customizations to work, or even what data is required for standard day-to-day operations. For example, if a customer doesn't have to be attached to a transaction, customers can be excluded from the offline databases.

- **Channel database groups** – At a minimum, two channel database groups should exist: one for the initial Commerce Scale Unit (Cloud) that is used, and one for any or all offline databases that are used. Large retail enterprises might have multiple offline-focused channel database groups that are separated based on similarity of data in their associated channels (stores).

Additionally, it's helpful to have a "dummy" channel database group that can be used to configure new channel databases, registers that have offline support (in this case, offline databases will be created), and maybe even new but unused Commerce Scale Units (either Cloud or Self-hosted). Because this "dummy" group won't be associated with any distribution schedule jobs, no data generation will ever occur for anything that is associated with it. As time and the implementation progress, the associated entities (for example, channels [stores] and register offline databases) will be re-associated with the correct database group. A great alternative to this approach, and perhaps even an improvement, is to use the **Pause offline synchronization** feature that was described earlier.

# Dynamics 365 Finance and Dynamics 365 Supply Chain Management - operated by 21Vianet in China

2/18/2021 • 4 minutes to read • [Edit Online](#)

## NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

Microsoft Dynamics 365 online services operated by 21Vianet is designed to comply with regulatory requirements in China. The services are a physically separated instance of cloud services operated and transacted by a local operator, Shanghai Blue Cloud Technology Co., Ltd (“21Vianet”). This is a wholly owned subsidiary of Beijing 21Vianet Broadband Data Center Co., Ltd. located in mainland China.

Microsoft strives to maintain functional parity between our commercially available service and Finance and Operations apps operated by 21Vianet in China. However, there are notable exceptions to this, which are affected by dependent service or partner-solution availability, market priorities, or compliance regulations.

## Provisioning

Customers in China have two options from which to select how they want to access Finance and Supply Chain Management apps.

- Services operated by 21Vianet in China - 21Vianet operates and offers Finance and Supply Chain Management services in China. This option provides a consistent application experience that is the same as global offerings. This option also meets the demands of customers who prefer to use online services provided by a local company that stores their data within China. These services are subject to Chinese laws.
- Services operated by Microsoft – This option is for Finance and Supply Chain Management customers that prefer to use services managed and delivered by Microsoft. For all new customers and existing customers, if the customer purchases Microsoft Azure, Dynamics 365, and Office using an Enterprise Agreement, Microsoft 365 and/or Dynamics 365 can co-exist on the tenant.

For information on provisioning environments, see [Create and manage environments in the Power Platform Admin center](#).

## Features not available

Due to certain technical dependencies, the following features listed will not be available for general availability of the Dynamics 365 Services operated by 21Vianet. For information about future feature availability, see [Business applications and platform release plans](#).

- **Development, build, and testing of customizations** will be unavailable in **Azure DevOps** in

**Mainland China.** However, use of Azure DevOps on-premises will be available in China in April 2019. Also, Azure DevOps can be used in other regions. For more information, see [Developer guide for Azure China 21Vianet](#).

- [Set up and maintain vendor collaboration](#) will be unavailable due to Azure Active Directory limitations.
- Certain **mobile apps** (e.g., [Install and configure the Warehousing app overview](#) and [Project time entry mobile workspace](#)) will be unavailable due to the Google Play Store not being available in China; however, alternatives are being considered.
- The **mobile platform** will not be available because certain App store dependencies are unavailable in China.
- The following **Microsoft Dynamics Lifecycle Services (LCS)** features will have a different experience or will be unavailable due to the dependencies that are not available:
  - **APQC Business process modeler (BPM) Library** will be unavailable. However, base Business process modeler (BPM) functionality will be available for custom models in April 2019. Search functionality in the BPM will be unavailable in China.
  - **Electronic reporting (ER) overview assets** will not be available automatically, but can be manually uploaded from the LCS global asset library.
  - **Code upgrade** will be unavailable for upgrades from Dynamics AX 2012.
  - **Service and Support requests** will be available through LCS but 21Vianet is the service operator. For more information, see [Support for Dynamics 365 Finance and Operations apps operated by 21Vianet in China](#).
  - **Extensibility requests** will be unavailable.
  - Hotfix requests will be unavailable.
  - [Dynamics 365 Translation Service overview](#) will not be available.
  - **Embedded Power Apps** and connectivity to Microsoft Power Apps and Microsoft Power Automate will be unavailable.
  - [Data integration using Dataverse overview](#) will be unavailable.

#### **NOTE**

The Lifecycle Services URL for implementations operated by 21Vianet in China is [lcs.dynamics.cn](https://lcs.dynamics.cn).

- The following features will not be available due to certain **current Azure Active Directory limitations** in China:
  - The **System administration > Setup > B2B Invitation configuration** page will not be available due to business-to-business (B2B) being unavailable in Azure Active Directory in China. For more information, see [What is guest user access in Azure Active Directory B2B](#).
- **Conditional access** is an Azure Active Directory feature that is available for the Azure Active Directory Premium 2 SKU. This is unavailable in China.
- The Microsoft Dynamics 365 Payment Connector for PayPal is not available in China.

# Finance and Operations apps in France

2/18/2021 • 2 minutes to read • [Edit Online](#)

As of July 2019, Finance and Operations apps, Power Apps, and Power Automate are available in France's datacenters. This new deployment option serves customers in regulated industry and commercial organizations that do business with entities in France that require local data residency. Power BI has been available since March 2019.

The deployment of the Dynamics 365 services in France, are built upon the foundational principles of security, privacy, compliance, transparency, and reliability, offering French organizations a complete cloud infrastructure and platform, as well as familiar productivity and business application tools. All of this means that customer data stays resident within France.

Microsoft strives to maintain functional parity between our commercially available service and Dynamics 365 offerings in France. However, there are few exceptions affected by dependent service or partner-solution availability, market priorities, or compliance regulations. For more information about these exceptions or for questions about services in France, contact [Microsoft Dynamics Online support](#).

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Get support for Finance and Operations apps or Lifecycle Services (LCS)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to get help with Finance and Operations apps or Microsoft Dynamics Lifecycle Services (LCS).

TASK	MORE INFORMATION
Ask the community.	Go to the <a href="#">Dynamics 365 Community</a> page to get help with your questions from the Microsoft Dynamics community.
Get help with questions about licensing.	Contact your partner or a Microsoft sales representative.
Use the <b>Issue search</b> tool.	In <b>LCS</b> , use the <b>Issue search</b> tool to quickly search for Microsoft Knowledge Base (KB) articles, hotfixes, and workarounds for reported issues. You can see which reported issues are in the process of being fixed for a specific functional area, and which issues have already been fixed. For more information, see <a href="#">Issue search (Lifecycle Services, LCS)</a> .
Get in-app support.	Select the <b>Help</b> button (?) in the upper-right corner of the app, and then select <b>Support</b> . Issues are reported on the <b>Active issues</b> tab in LCS. There, admins can determine whether they should provide in-house support or submit the issues to Microsoft.
Open a support ticket with the Microsoft Support team.	In <b>LCS</b> , the <b>Support</b> tile opens a tool that helps you manage support incidents. To submit issues directly to Microsoft, select the <b>Support</b> tile in your LCS project. You can then submit issues in two ways: <ul style="list-style-type: none"><li>• On the <b>Active issue</b> tab, select your issue, and then select <b>Submit to Microsoft</b>.</li><li>• On the <b>Submitted to Microsoft</b> tab, select <b>Submit an incident</b>, and then follow the on-screen instructions to submit the incident. After you submit an incident, you will receive an email message from the Microsoft Support engineer who is assigned to your case.</li></ul>
Request new features and functionality.	Visit <a href="#">Dynamics 365 Application Ideas</a> to view, search, or vote for existing ideas, or to add new ideas.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Upgrade and N-1 support for Commerce

2/18/2021 • 2 minutes to read • [Edit Online](#)

Upgrade and N-1 support have been enabled in the July 2017 release of Microsoft Dynamics 365 Retail. N-1 support lets customers who have stores that run Microsoft Dynamics AX 2012 R3 Cumulative Update 10 (CU10) work with Headquarters after an upgrade. The main purpose of upgrade and N-1 support is to let AX 2012 R3 customers take advantage of the benefits of the cloud.

The following features let customers upgrade in a seamless manner:

- Users can now perform database upgrade from AX 2012 R3 to Headquarters through the upgrade process.
- Users can operate their stores by using the components of AX 2012 R3 CU10.
- Pre-upgrade and post-upgrade checklist validations are built into the upgrade process.
- The upgrade process has enhanced error handling and messaging, so that customers can quickly debug issues.
- Users can use tools to bring forward custom X++ code in their existing Headquarters to the upgraded version of the headquarters.

The upgrade procedure is largely the same as the procedure for upgrading Retail to the latest version. For details about upgrade in general, see [Upgrade overview: AX 2012 to Dynamics 365 Retail](#).

Planned downtime is required. Upgrade analysis is done first. The upgrade analysis runs against the Microsoft Dynamics AX 2012 database and is based on the Microsoft Dynamics Lifecycle Services (LCS) Diagnostic service. This step identifies tasks that can help make upgrade faster and less expensive. It also identifies the required SQL configuration, data headquarters cleanup, and deprecated features.

The actual data upgrade process then occurs. The AX 2012 database is moved to Microsoft Azure SQL Database, and then the data upgrade package is run as usual, through the runbook process. Upgrade validation is then done. A validation tool is run against the upgraded environment before it's used. This tool does an automated smoke test to verify that the service is running and accessible, row counts match, financials and inventory reconcile, and so on.

Most of the post-upgrade configuration for channels requires few manual steps. Customers can then use the pre-upgrade and post-upgrade checklists to learn about the tasks that must be completed. The post-upgrade tasks include initiating a full sync to the stores from the upgraded database, validating channels, registers, and devices against the upgraded database, validating transaction synchronization, and validating that N-1 support is in place.

For N-1 support, the customer must install the N-1 package in Commerce headquarters. No setup is required in the stores. This installation must be done during the upgrade window, after the N-1-related configuration has been completed.

After the Commerce headquarters upgrade and N-1 setup are completed, the N-1 store components can communicate with Commerce headquarters. No channel-side components must be installed for N-1 support. However, to enable the N-1 store to communicate with Commerce headquarters, cashiers must change their password the first time that they sign in.

For instructions for N-1 installation, see [Phased Rollout \(N-1\) installation, configuration, and cutover guide](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Phased Rollout (N-1) installation, configuration, and cutover guide

2/18/2021 • 29 minutes to read • [Edit Online](#)

This topic explains how to set up Phased Rollout (N-1) components so that your Microsoft Dynamics AX 2012 R3 channel components, such as Microsoft Dynamics AX for Retail Modern Point of Sale (MPOS) and Commerce Scale Unit, or Microsoft Dynamics AX for Retail Enterprise Point of Sale (EPOS), can work with Microsoft Dynamics 365 Commerce Headquarters.

## Key terms

TERM	DESCRIPTION
N-1 Async Server Connector Service	A component that is used to synchronize data packages between Headquarters and the AX 2012 R3 channel components.
N-1 Real-time Service	A component that supports real-time calls from the AX 2012 R3 channel components to Headquarters.

## Overview

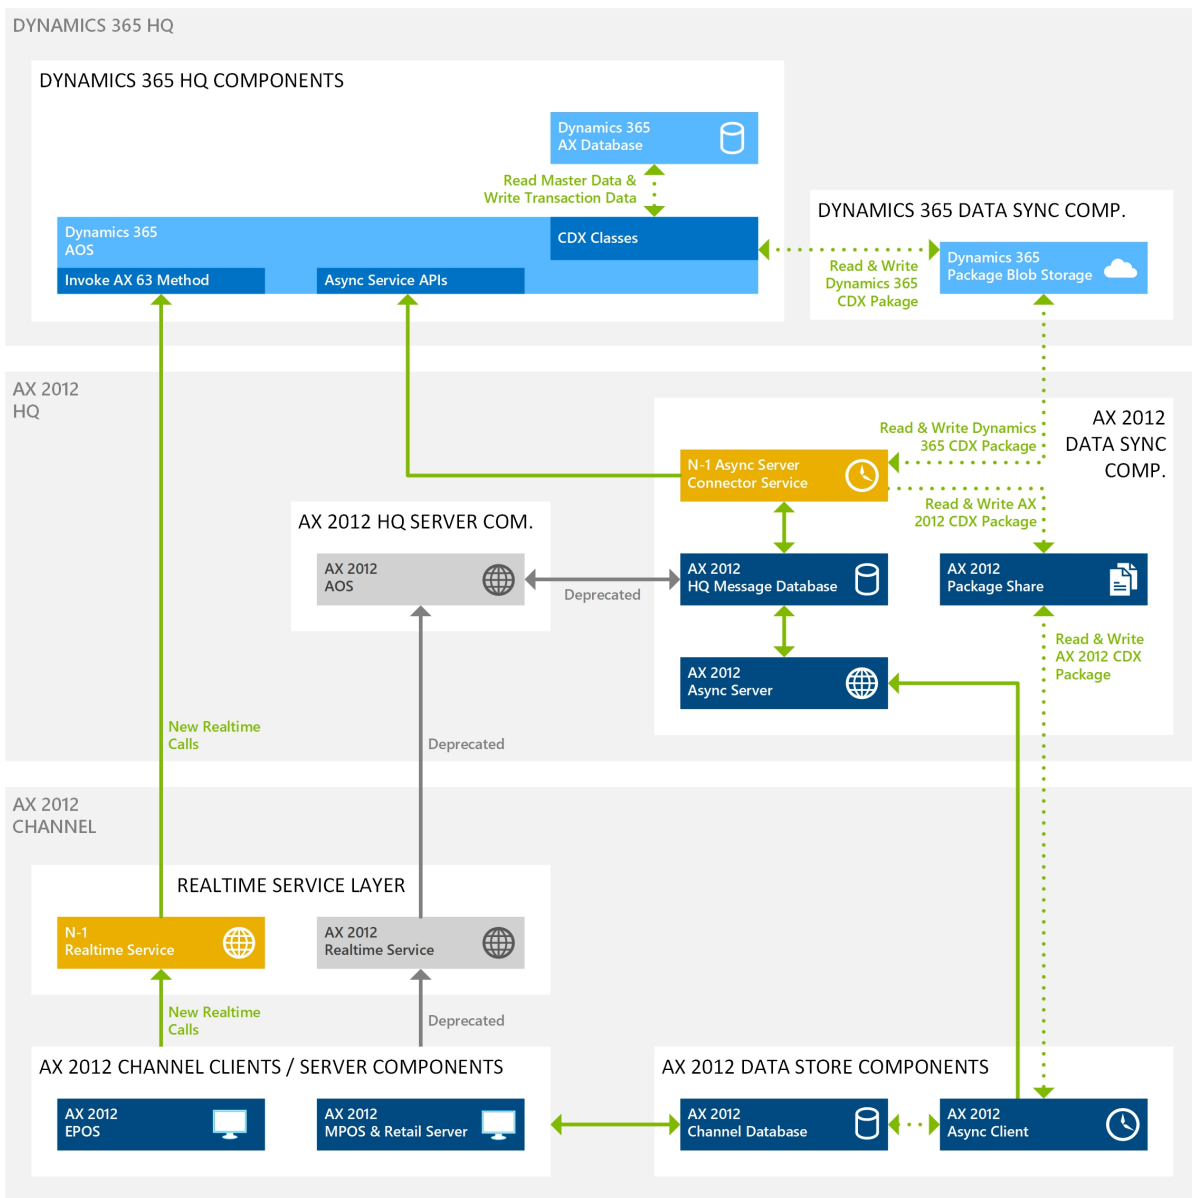

The sections in this topic describe the following steps, which you must complete to set up an environment with N-1 components. These steps assume that Headquarters is already deployed, and that an AX 2012 R3 environment is currently running.

- **Set up Azure AD accounts** – This section explains how to set up the Microsoft Azure Active Directory (Azure AD) accounts that the N-1 components use to connect to Headquarters.
- **Configure N-1 components** – This section explains how to configure the N-1 components in Headquarters.
- **Install N-1 components** – This section explains how to download and install N-1 components in the existing AX 2012 R3 environment.
- **Cutover steps to switch to N-1** – This section explains the how to use the new N-1 components to cut an existing AX 2012 R3 environment over from the AX 2012 R3 headquarters to the Dynamics 365 Headquarters.
- **Troubleshooting steps** – This section describes troubleshooting steps for typical issues.
- **Required KBs for N-1** – This section lists the Microsoft Knowledge Base articles (KBs) that are required in order to set up an N-1 environment.

### High-level architecture

The following illustration shows a high-level overview of the N-1 setup.

## Verify that the N-1 license key is turned on

Before you start to configure and install the N-1 components, make sure that the corresponding license key is turned on. This license key is automatically turned on during an upgrade from AX 2012 R3 to Microsoft Dynamics 365 Commerce. However, because the steps that follow require this key, you should verify that it's turned on before you continue.

1. Sign in to Commerce Headquarters, and go to **System administration > Setup > License configuration**.
2. On the **Configuration keys** tab, expand the **Commerce** key, expand the **Commerce scheduler** key, and verify that the check box for the **Retail Data Commerce Exchange backward compatibility** key is selected.

### NOTE

If the key isn't turned on, contact Microsoft Support for help turning it on.

## Set up Azure AD accounts

**IMPORTANT**

To help maintain a high level of security across the company, we strongly recommend that you create a new client ID and secret for this installation. This step requires a new Web App.

1. Generate an Azure Web App to create a client ID and secret for Connector for Microsoft Dynamics AX. For instructions, see the "Create an Azure Active Directory application" section in [Create an Azure Active Directory Application](#).
2. After you've finished creating the client ID and secret, the client ID must be accepted in Commerce. Go to **System administration > Setup > Azure Active Directory applications**. Enter the client ID in the **Client Id** column, enter descriptive text in the **Name** column, and enter **RetailServiceAccount** in the **User ID** column.

## Configure N-1 components

Follow the steps in this section to configure the N-1 components in Headquarters.

### Connector for Microsoft Dynamics AX

1. Sign in to Commerce Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Connector for Microsoft Dynamics AX**.
2. On the Action Pane, select **New**, and set the following fields.

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
Header	Profile	Enter a unique name for the N-1 profile that you're setting up. You should create one profile for each environment/server where the AX 2012 R3 Real-time Service is currently installed.	AXConnect
Header	Description	Enter descriptive text to help identify the profile.	Connector for AX2012
Connection	Server	Enter the name of the server where the N-1 Real-time Service will be installed. (This server is the same server where the AX 2012 R3 Real-time Service is currently installed.)	sampleserver.local
Connection	Port	Enter the port that the N-1 Real-time Service will use.	8017
Connection	Web application name	Enter the name to use for the N-1 Real-time Service in Microsoft Internet Information Services (IIS).	Real-timeServiceAX63
Connection	Protocol	Select the protocol that the AX 2012 R3 Real-time Service currently uses.	https

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
Connection	Common name	Enter the friendly name of the certificate that the N-1 Real-time Service uses.	samplecertificate.local
Connection	Passphrase	Enter the passphrase to use for the N-1 Real-time Service.	
Connection	Language	Select the language that is associated with the stores that are mapped to the N-1 Real-time service.	EN-US

3. When you've finished, select **Save**.

### Commerce shared parameters

1. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**.
2. On the **Security** tab, set the following fields.

FIELD	DESCRIPTION	SAMPLE VALUE
Real-time Service profile	Select the profile that you created on the <b>Connector for Microsoft Dynamics AX</b> page in the previous section.	AXConnect
TS password encryption name	Enter the algorithm that is used to connect to the transaction service. You should set this field to <b>SHA256</b> .	SHA256
Legacy device algorithm	Enter the AX 2012 R3 device algorithm.	AES

### Commerce scheduler parameters

1. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Parameters > Commerce scheduler parameters**.
2. On the **HQ Message Database** FastTab, set the following fields.

FIELD	DESCRIPTION	SAMPLE VALUE
SQL Server instance name	Enter the name of the Microsoft SQL Server instance that hosts the existing AX 2012 R3 HQ Message Database.	sampleinstance
Server name	Enter the name of the server that hosts the existing AX 2012 R3 HQ Message Database.	sampleserver
Database name	Enter the name of the AX 2012 R3 HQ Message Database. In AX 2012 R3, the default name was <b>HQMessageDB</b> .	HQMessageDB

- When you've finished, select **Save**.

### Working folders

#### NOTE

The field values that are described here are the default values that are automatically set when environments are upgraded from AX 2012 R3. However, you should verify that they are correct. These values must be manually entered for environments that haven't been upgraded from AX 2012 R3.

- Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Working folders**.
- Make sure that the following field values are set in the grid.

FIELD	DESCRIPTION	SAMPLE VALUE
Name	The name of the working folder.	File storage for N-1
Description	A description of the working folder.	File storage for N-1
Download path	The network path where the AX 2012 R3 Commerce Data Exchange (CDX) download packages are stored.	\\sampleserver\Download
Upload path	The network path where the AX 2012 R3 CDX upload packages are stored.	\\sampleserver\Upload

- When you've finished, select **Save**.

### Channel database group

#### NOTE

The field values that are described here are the default values that are automatically set when environments are upgraded from AX 2012 R3. However, you should verify that they are correct. These values must be manually entered for environments that haven't been upgraded from AX 2012 R3.

- Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database group**.
- For each physical channel database in the AX 2012 R3 environment, on the Action Pane, select **New**, and set the following fields.

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
Header	Name	Enter the name of the channel database group that is used for the AX 2012 R3 environment.	Default_AX63
Header	Description	Enter a description of the channel database group that is used for the AX 2012 R3 channel environment.	Default group for AX63 channel database

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
<b>General</b> FastTab	Channel schema	Select the AX 2012 R3 schema. This field must be set to <b>AX2012R3</b> .	AX2012R3
<b>General</b> FastTab	Working folders	Select the reference to the working folders record that is used for the synchronization of CDX data packages. You created this working folders record in the previous section.	workingfolder

3. When you've finished, select **Save**.

### Channel database

#### NOTE

The field values that are described here are the default values that are automatically set when environments are upgraded from AX 2012 R3. However, you should verify that they are correct. These values must be manually entered for environments that haven't been upgraded from AX 2012 R3.

1. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database**.
2. For each physical channel database in the AX 2012 R3 environment, on the Action Pane, select **New**, and set the following fields.

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
Header	Channel database ID	Enter a unique identifier for the physical channel database. This value should be derived from the AX 2012 R3 environment.	Default_AX63_Database
Header	Channel database group	Select the channel database group that the channel database is mapped to. This value should be derived from the AX 2012 R3 environment.	Default_AX63_DatabaseGroup
Header	Type	Select the type of the channel database record. This field must be set to <b>Channel database</b> .	Channel database
Header	Data sync interval	Select the interval at which to run the CDX data synchronization. <b>This field must be left blank.</b>	

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
Header	Username (Case Sensitive)	Enter the user name to use to connect to the AX 2012 R3 channel database.	channeluser
Header	Password	Enter the password to use to connect to the AX 2012 R3 channel database.	<i>passphrase</i>
Header	Database name	Enter the name of the AX 2012 R3 channel database.	SampleChannelDB
Header	Server name	Enter the name of the server that hosts the AX 2012 R3 channel database.	sampleserver
<b>Channel</b> FastTab	Channel	Select <b>Add</b> to add the list of channels for Phased Rollout (N-1) that are mapped to the channel database. The values should be derived from the AX 2012 R3 environment.	London

3. When you've finished, select **Save**.

### Channel profiles

#### IMPORTANT

This section applies only if the existing AX 2012 R3 environment uses Retail Server to interact with the channel database. If direct channel database access is enabled from the AX 2012 R3 MPOS, you can skip this step.

The field values that are described here are the default values that are automatically set when environments are upgraded from AX 2012 R3. However, you should verify that they are correct. These values must be manually entered for environments that haven't been upgraded from AX 2012 R3.

1. Sign in to Headquarters, and go to **Retail and Commerce > Channels > Stores > All stores**.
2. For each Retail Server that is hosted in the N-1 environment, on the Action Pane, select **New**, and set the following fields.

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
---------	-------	-------------	--------------

SECTION	FIELD	DESCRIPTION	SAMPLE VALUE
Header	Name	Enter a unique name for the N-1 channel profile that you're setting up. You should create one profile per environment/server where you currently have installed the AX 2012 R3 Retail Server. You should create one profile for each environment/server where the AX 2012 R3 Retail Server is currently installed.	Default_AX63_Profile
Profile properties	Property key	Enter the key for the Retail Server URL that is used in the AX 2012 R3 environment. This field must be set to <b>Retail Server URL</b> .	Retail Server URL
Profile properties	Property value	Enter the Retail Server URL that is used in the AX 2012 R3 environment.	http://localhost:35080/RetailServer/v
Profile properties	Property key	Enter the key for the Hardware Station URL that is used in the AX 2012 R3 environment.	Hardware Station URL
Profile properties	Property value	Enter the Hardware Station URL that is used in the AX 2012 R3 environment.	ipc://localhost

3. When you've finished, select **Save**.

### All stores

#### NOTE

The field values that are described will be set if the Headquarters environment was upgraded from the AX 2012 R3 headquarters.

1. Sign in to Headquarters, and go to **Retail and Commerce > Channels > Stores > All stores**.
2. For each store that is mapped to the N-1 environment, select the channel ID. Then, on the store details page, on the **General** FastTab, set the following fields.

FIELD	DESCRIPTION	SAMPLE VALUE
Live channel database	Select the channel database that you mapped the store to and set it up for earlier.	Default_AX63_Database
Channel profile	Select the channel profile that you mapped the store to and set it up for in the previous section.	Default_AX63_Profile

3. When you've finished, select **Save**.

### Initialize the AX 2012 scheduler

1. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Initialize AX 2012 retail scheduler**.
2. Select **OK**.

### Distribution schedule

#### NOTE

The field values that are described will be set if the Headquarters environment was upgraded from the AX 2012 R3 headquarters.

1. Sign in to Headquarters, and go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. In the left pane, select each distribution schedule that has the suffix **AX63**. Then, on the **Channel database groups** FastTab, make sure that the entries that you created earlier are mapped to the distribution schedule.

### Workers

#### NOTE

The field values that are described will be set if the Headquarters environment was upgraded from the AX 2012 R3 headquarters.

1. Sign in to Headquarters, and go to **Retail and Commerce > Employees > Workers**.
2. Select the name of each worker who will sign in to the AX 2012 R3 environment. Then, on the worker details page, on the **Commerce** tab, on the **Commerce** FastTab, set the **Password** field.

## Install N-1 components

Before you run the Connector for Microsoft Dynamics AX installers, make sure that the following requirements are met:

- The installer requires that the Microsoft .NET Framework version 4.5.1 be installed on the system.
- The installers install the Connector for Microsoft Dynamics AX applications only on the following operating systems. Before you install any component, you must update the operating system with all service packs and updates that are available for it.
  - Windows 7 Professional, Enterprise, or Ultimate edition (both x86 and x64 architectures). Home edition and embedded edition aren't supported.
  - Windows 8.1 Update 1 Pro or Enterprise edition (both x86 and x64 architectures). Standard edition isn't supported.
  - Windows 10 Pro or Enterprise edition (both x86 and x64 architectures). Home edition isn't supported.
  - Microsoft Windows Server 2012 R2 or Microsoft Windows Server 2016.

### Async Server Connector Service

The installer validates that all prerequisites are met. These prerequisites include SQL prerequisites, such as a local installation of SQL Server, or the alternative prerequisites, such as SQL Command Line Utilities and other required SQL connectivity installations.

To meet prerequisites, the SQL Server that is connected to must have Full-text search and, at a minimum, support for Transport Layer Security (TLS) 1.2. For Microsoft SQL Server 2012, Service Pack 3 must be installed, at a minimum. For Microsoft SQL Server 2014, Service Pack 2 must be installed.

If a system restart is required, the installer shows this requirement. Although the restart is recommended, the installer can continue without it.

When you're ready, follow these steps to download and install the component.

1. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Connector for Microsoft Dynamics AX**.
2. Select the connector that you created earlier.
3. On the Action Pane, on the **Download** tab, select **Async Server Connector service** to download the installer file, and then select **Configuration file** below **Async Server Connector service** to download the corresponding configuration file. Make sure that the configuration file is saved next to the installer file.
4. After the installer and configuration files are downloaded, double-click the installer file, and follow these steps:
  - a. Verify the Application Object Server (AOS) URL (the URL that is used to access Headquarters), and then select **Next**.
  - b. If a specific user is required, enter the user name and password that the service should run as. By default, the installer automatically generates a service account to use. This approach is more secure and is recommended, but it can't be used when the database is located on a separate computer. Select **Next** to continue.
  - c. Enter the application ID (client ID) and secret that are associated with this Connector for Microsoft Dynamics AX installation.
  - d. Select **Install**.

#### NOTE

- For information about how to correctly generate an Azure Web App to create a client ID and secret, see the "Basics of Registering an Application in Azure AD" section in [Create an Azure Active Directory Application](#).
- When you create the Web App, the initial URI and URL don't have to be any specific value. Only the application ID (client ID) and secret that are created are important.

5. After an application ID (client ID) and secret are created, the application ID must be accepted in Commerce. Go to **Retail and Commerce > Headquarters setup > Azure Active Directory applications**. Enter the application ID in the **Client Id** column, enter descriptive text in the **Name** column, and enter **RetailServiceAccount** in the **User ID** column.
6. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**.
7. On the **Identity Providers** tab, select the provider that has an **Issuer** value that begins with `HTTPS://sts.windows.net/`. The values on the **Relying parties** FastTab are automatically set, based on your selection.
8. On the **Relying parties** FastTab, select **Add**. Enter the application ID (client ID) that was created for this installation. Set the **Type** field to **Public** and the **UserType** field to **Worker**. Then, on the Action Pane, select **Save**.
9. On the Action Pane, select **Save**.

#### N-1 Real-time service

1. Sign in to Headquarters, and go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Connector for Microsoft Dynamics AX**.
2. Select the connector that you created earlier.

3. On the Action Pane, on the **Download** tab, select **Real-time service for Dynamics AX 2012 R3** to download the installer file, and then select **Configuration file** below **Real-time service for Dynamics AX 2012 R3** to download the corresponding configuration file. Make sure that the configuration file is saved next to the setup file.
4. After the installer and configuration files are downloaded, double-click the installer file, and follow these steps:
  - a. Verify the AOS URL (the URL that is used to access Headquarters), and then select **Next**.
  - b. Select a valid SSL certificate to use for HTTPS communication, and then select **Next**.

The certificate must use private key storage, and server authentication must be listed in the enhanced key usage property. Additionally, the certificate must be trusted locally, and it can't be expired. It must be stored in the personal certificate store location on the local computer.

- c. If a specific user is required, enter the user name and password that the application pool should run as. By default, the installer automatically generates a service account to use. This approach is more secure and is recommended, but it can't be used when the database is located on a separate computer. Select **Next** to continue.
- d. Verify the HTTPS port that should be used, and verify that the host name of the computer is correct. Select **Next** to continue.

The HTTPS port is listed in the Store system profile. To access the Store system profile, on the **Store details** page, on the **Store systems** FastTab, select the profile ID of the selected Store system. The installer automatically enters the host name. If, for any reason, the host name must be changed for the installation, change it here. The host name must be the fully qualified domain name (FQDN) of the system, and it must match the value that you entered on the **Connector for Microsoft Dynamics AX** page earlier in this topic.

- e. Enter the application ID (client ID) and secret that are associated with this Connector for Microsoft Dynamics AX installation. Then select **Install**.

This application ID and secret can be the same application ID and secret that you used in the Async Server Connector service installation. For information about how to correctly generate an Azure Web App to create a client ID and secret, see the "Basics of Registering an Application in Azure AD" section in [Create an Azure Active Directory Application](#). When you create the Web App, the initial URI and URL don't have to be any specific value. Only the application ID (client ID) and secret that are created are important.

## Cutover steps to switch to N-1

This section gives the recommended step-by-step instructions to switch an existing AX 2012 R3 channel environment from the AX 2012 R3 headquarters to the Commerce Headquarters. Note that these instructions are generic. Different implementations will likely have to deviate from these steps to accommodate specific business or technical requirements.

### Prerequisites

Follow these steps to prepare your environment for the cutover.

STEP	DETAILS	TIMELINE
1. Deploy Headquarters.	Headquarters is up and running. Cloud POS (CPOS) can be used to validate functionality in the environment.	Weeks or months before the cutover

STEP	DETAILS	TIMELINE
2. Install the Commerce application (X+ +) KBs.	Install the KBs that are listed in the <a href="#">Required KBs for N-1</a> section to make sure all issues that are related to N-1 are addressed.	Weeks or months before the cutover
3. Set up Azure AD accounts.	Follow the instructions in the <a href="#">Set up Azure AD accounts</a> section to create the accounts that are required for the N-1 components to authenticate against Headquarters.	Weeks or months before the cutover
4. Configure Headquarters.	Follow the instructions in the <a href="#">Configure N-1 components</a> section to configure all the settings for the N-1 components before they are installed.	Weeks or months before the cutover
5. Configure Headquarters.	Go to <b>Retail and Commerce &gt; Headquarters setup &gt; Parameters &gt; Commerce shared parameters</b> , select the <b>Security</b> tab, and change the value in <b>TS password encryption name</b> to "SHA256".	
6. Install the N-1 components.	Follow the instructions in the <a href="#">Install N-1 components</a> section to install the N-1 components. Note that the N-1 Async Server Connector Service component should be installed but immediately turned off to ensure that AX 2012 R3 and Dynamics 365 CDX packages aren't mixed.	Weeks or months before the cutover

## Preparation

Follow these steps to prepare a few days before the cutover is scheduled.

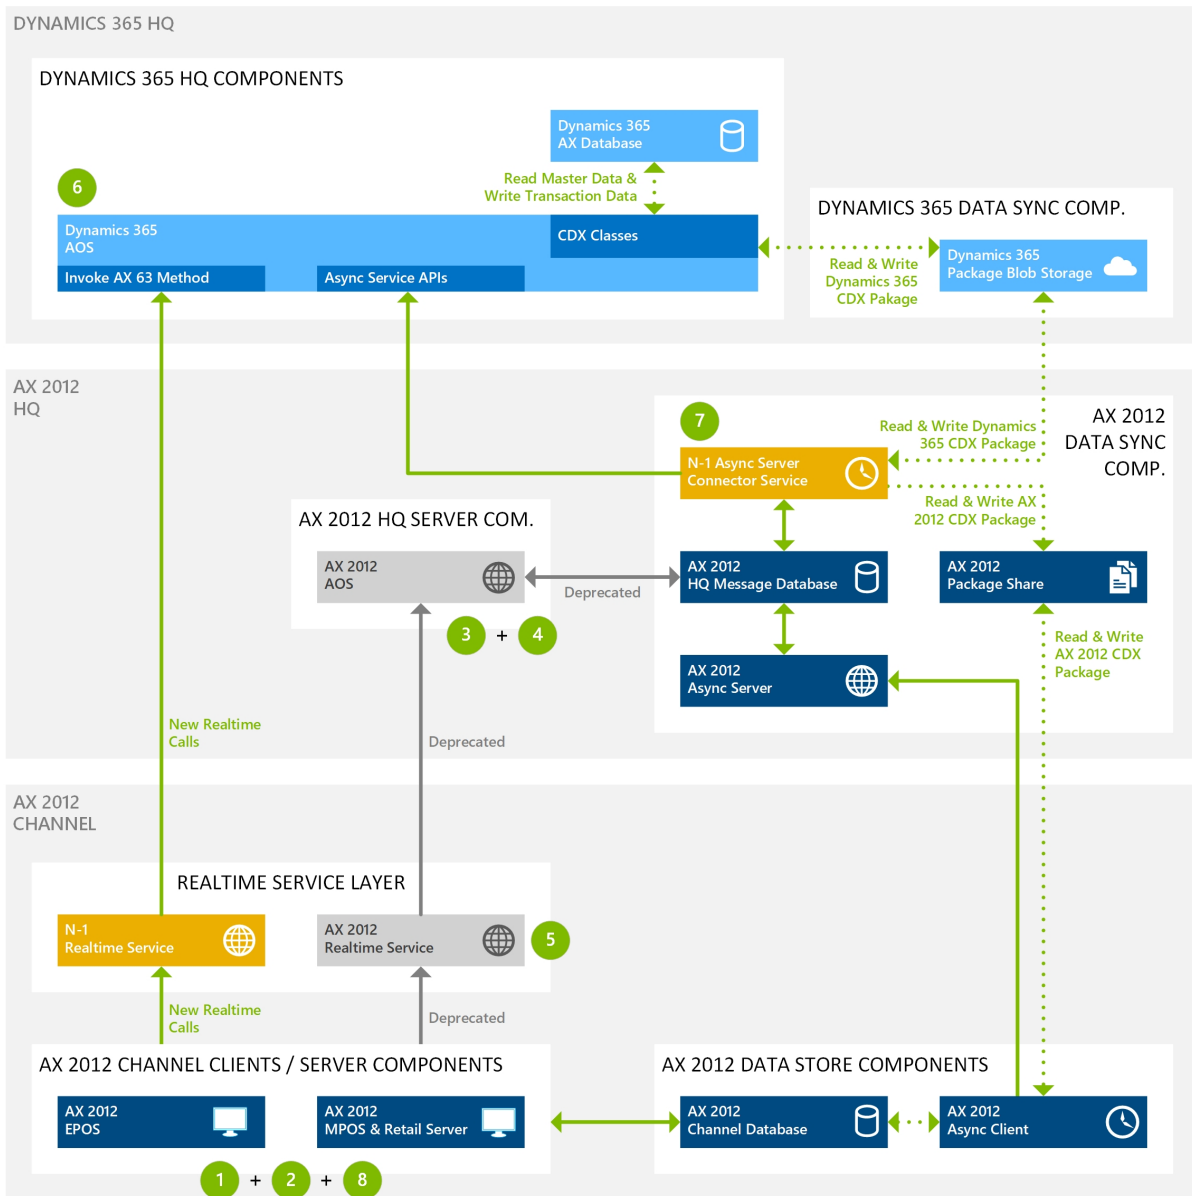

STEP	DETAILS	TIMELINE	HOW TO VALIDATE THAT THIS STEP IS DONE
1. Stop all AX 2012 R3 download jobs.	Make sure that all AX 2012 R3 download jobs are stopped in the AX 2012 R3 headquarters.	At least a couple days before the cutover	All packages in the AX 2012 R3 network share for upload jobs are processed, and no new packages appear.
2. Do a full synchronization of all AX63 CDX download jobs in Headquarters.	Run the CDX download jobs to make sure that the packages are generated and dropped in the Azure Blob storage blob, so that the N-1 Async Server Connector Service can consume them during cutover.	At least a couple days before the cutover	CDX download jobs are in the <b>Available</b> state on the <b>Download Sessions</b> page in Headquarters.

## Cutover steps

Follow these steps to do the actual cutover.

STEP	DETAILS	TIMELINE	HOW TO VALIDATE THAT THIS STEP IS DONE
1. Close all shifts.	Make sure that all shifts are closed.	After store closing	Manually validate with the stores that the shifts are closed.
2. Clean up any suspended transactions.	Make sure that all suspended transactions are cleaned up.	After the previous step	Manually validate with the stores that the shifts are closed.
3. Synchronize all transactional data.	Make sure that all transactional data is synchronized through the CDX upload jobs to the AX 2012 R3 headquarters.	After the previous step	All packages in the AX 2012 R3 network share for upload jobs are processed, and no new packages appear.
4. Disable AX 2012 R3 CDX upload jobs.	Make sure that all AX 2012 R3 upload jobs are disabled, so that packages are no longer being picked up.	After the previous step	Manually validate through the AX 2012 R3 headquarters UI that the CDX upload jobs are disabled.
5. Shut down the AX 2012 R3 Real-time Service.	Connect to the server that hosts the AX 2012 R3 Real-time Service, start IIS, right-click the AX 2012 R3 Real-time Service, and stop the service.	After the previous step	Manually validate in IIS that the service is stopped.
6. Run the <b>Reset metadata synchronization</b> command in Headquarters.	In Microsoft Dynamics AX, go to <b>Retail and Commerce &gt; Headquarters setup &gt; Commerce scheduler &gt; Connector for Microsoft Dynamics AX</b> , and select <b>Reset metadata synchronization</b> to reset the <b>HQMessageDB</b> database in the AX 2012 R3 environment for N-1 cutover.	After the previous step	Not applicable
7. Turn on the N-1 Async Server Connector Service.	Connect to the server that hosts the N-1 Async Server Connector Service, and enable the Microsoft Windows service.	After the previous step	The status of download jobs on the <b>Download Sessions</b> page in Headquarters changes from <b>Available</b> to <b>Applied</b> .

The following illustration is a visual representation of these steps.

## Troubleshooting steps

This section describes some typical issues that you might encounter, and the steps that you can follow to investigate or recover from them.

### Runtime

This section describes troubleshooting steps for errors that you might encounter during the runtime of the application.

#### Metadata synchronization fails

FIELD	VALUE
Event Log	Microsoft-Dynamics-Commerce-AsyncServerConnectorService/Operational

FIELD	VALUE
Sample Event Log Error Message	<p>Async server connector service encounters error in download timer tick. CorrelationId {4c9cd9a0-d4e3-43e5-80da-59ea2eb01acf}; Error details:  Microsoft.Dynamics.Retail.AsyncServerConnector.Service.Exceptions.SyncMetadataException: Failed synchronizing metadata. ---&gt;  Microsoft.Dynamics.Retail.AsyncServerConnector.Service.Exceptions.MessageDBOperationException: Failed updating metadata in HQ message DB. ---&gt;  System.Data.SqlClient.SqlException: A connection was successfully established with the server, but then an error occurred during the login process. (provider: SSL Provider, error: 0 - The certificate chain was issued by an authority that is not trusted.) ---&gt;  System.ComponentModel.Win32Exception: The certificate chain was issued by an authority that is not trusted</p>
Troubleshooting Steps	<p>This could have happened because the Synch service web.config connection string has the TrustServerCertificate set to false. To fix the issue browse the Sync service website and open the web.config. Find the connectionStrings section, update the TrustServerCertificate to True if it is false.</p>

#### Metadata synchronization fails

FIELD	VALUE
Event Log	Microsoft-Dynamics-Commerce-AsyncServerConnectorService/Operational
Sample Event Log Error Message	<p>Async server connector service encounters error in download timer tick. CorrelationId {73d9d0d3-4d12-42ca-ac65-3f1f947c7840}; Error details:  Microsoft.Dynamics.Retail.AsyncServerConnector.Service.Exceptions.SyncMetadataException: Failed synchronizing metadata. ---&gt;  Microsoft.Dynamics.Retail.AsyncServerConnector.Service.Exceptions.MessageDBOperationException: Failed updating metadata in HQ message DB. ---&gt;  System.Data.SqlClient.SqlException: Cannot open database "HQMessageDB" requested by the login. The login failed. Login failed for user 'localhost\RetailAsUser'.</p>
Troubleshooting Steps	<p>This could have happened because the user who runs the Async server connector service does not have access to the HQ message database. To fix the issue run services.msc, check the user who runs the Async server connector service. Provide this user access to HQ message database in SQL.</p>

#### Metadata synchronization fails, or CDX jobs are successfully downloaded but aren't applied

FIELD	VALUE
Event Log	Microsoft Dynamics AX Retail : Async Client SynchClientService

FIELD	VALUE
Sample Event Log Error Message	<p>Unable to communicate with server for download. Please check username/password, server and database connections. Error Details: System.ServiceModel.CommunicationException: An error occurred while making the HTTP request to <code>https://localhost:44300/SynchService/DownloadService.svc</code>. This could be due to the fact that the server certificate is not configured properly with HTTP.SYS in the HTTPS case. This could also be caused by a mismatch of the security binding between the client and the server. ---&gt; System.Net.WebException: The underlying connection was closed: An unexpected error occurred on a send. ---&gt; System.IO.IOException: Authentication failed because the remote party has closed the transport stream.</p>
Troubleshooting Steps	<p>This could have happened because of the following reasons.</p> <ol style="list-style-type: none"> <li>1) The user ID and password that we provide in async client does not match the channel database user ID and password that we provide in AX.</li> <li>2) The async service end point is not reachable. <code>https://localhost:44300/SynchService/DownloadService.svc</code>. It is critical to note that typically the user is in the form of <b>Contoso/Administrator</b> (domain/user). In the following steps, this has been known to cause errors (communication or inability to save) if the domain is utilized in the <b>AsyncClientConfigurationUtility</b> utility. We recommend that the user ID in this utility does not contain the domain prefix that is used in the server installation and configuration.</li> </ol> <p>To fix this issue:</p> <ol style="list-style-type: none"> <li>1) Launch the Async client configuration utility (AsyncClientConfigurationUtility.exe) from the async client install location. Under the <b>Async Server connection tab &gt; Authentication information (case sensitive) &gt; Update the Channel database ID, User name and Password</b> fields as per the values provided under N-1 channel database (<b>Retail and Commerce &gt; Headquarters setup &gt; Channel database</b>) in AX.</li> <li>2) Select <b>Test connection</b> in the utility. If the connection is successful, restart the Async client service. If the connection fails, go to N-1 channel database (<b>Retail and Commerce &gt; Headquarters setup &gt; Channel database</b>) in AX, update the Username and password, and then save. Go to <b>Retail scheduler parameters</b> in AX and select <b>Reset metadata synchronization</b>. This will populate the HQ message database with the new values. Repeat step 1 again.</li> <li>3) If the async server end point (<code>https://localhost:44300/SynchService/DownloadService.svc</code>) is not reachable, check the bindings of the service and make sure there is an associated certificate. If the issue still exists, check to be sure that the <b>Working folders</b> were specified for all the Channel database groups that were linked to <code>AX2012R3</code> retail channel schema.</li> </ol>

**CDX jobs are successfully downloaded but aren't applied**

FIELD	VALUE
Event Log	Microsoft Dynamics AX Retail : Async Client SynchClientService
Sample Event Log Error Message	Exception during DownloadAgent.Execute. Error Details: System.IO.FileNotFoundException: Could not load file or assembly 'Microsoft.Dynamics.Retail.StoreConnect.Request.Base, Version=6.3.0.0, Culture=neutral, PublicKeyToken=31bf3856ad364e35' or one of its dependencies. The system cannot find the file specified. File name: 'Microsoft.Dynamics.Retail.StoreConnect.Request.Base, Version=6.3.0.0, Culture=neutral, PublicKeyToken=31bf3856ad364e35' at Microsoft.Dynamics.Retail.SynchClient.Core.DownloadAgent.ApplySessionFileToClientDatabase(SessionManager sessionMgr, String fileName) at Microsoft.Dynamics.Retail.SynchClient.Core.DownloadAgent.ProcessDownloadSession(DownloadSession session) at Microsoft.Dynamics.Retail.SynchClient.Core.DownloadAgent.Execute()
Troubleshooting Steps	This could have happened because the AX63 store connect components were not installed on the environment. To fix the issue install the AX63 store connect components on the environment that is running the async client component.

#### N-1 Async Server Connector Service communication exception

FIELD	VALUE
Event Log	Microsoft Dynamics AX Retail : Async Client SynchClientService
Sample Event Log Error Message	Unable to communicate with server for download. Please check username/password, server and database connections. Error Details: System.ServiceModel.CommunicationException: An error occurred while making the HTTP request to <a href="https://localhost:44300/SynchService/DownloadService.svc">https://localhost:44300/SynchService/DownloadService.svc</a> . This could be due to the fact that the server certificate is not configured properly with HTTPSYS in the HTTPS case. This could also be caused by a mismatch of the security binding between the client and the server. ---> System.Net.WebException: The underlying connection was closed: An unexpected error occurred on a send. ---> System.IO.IOException: Authentication failed because the remote party has closed the transport stream.
Troubleshooting Steps	Make sure the HQ Message DB has data. Use the asyncClient configuration tool to validate the connection is successful.

#### AX 2012 R3 MPOS activation fails with an error on step 1

FIELD	VALUE
Event Log	Microsoft Dynamics AX Retail : Retail Server RetailServer

FIELD	VALUE
Sample Event Log Error Message	Microsoft.Dynamics.Commerce.Runtime.UserAuthenticationException: An error occurred during logon. ---> Microsoft.Dynamics.Commerce.Runtime.ConfigurationException: The published channel cannot be found in local database. Please make sure at least 1 retail channel is published to this DB through AX.
MPOS Error on Activation Screen	DA1002: A server side error occurred that prevents user from logging on. Please check the server log for detailed information or contact your IT support.
Troubleshooting Steps	Make sure the CDX download jobs ran successfully and the channel database has data.

#### AX 2012 R3 MPOS activation fails with an error on step 2

FIELD	VALUE
Event Log	Microsoft Dynamics Retail Modern POS
Sample Event Log Error Message	Dynamics-Error: LoginViewModel ActivateDevice Logon failed. ErrorMessage: ; ErrorCode: Microsoft_Dynamics_Commerce_Runtime_HeadquarterTransactionServiceMethodCallFailure;
MPOS Error on Activation Screen	DA2001
Troubleshooting Steps	Device you are trying to activate is already active. Please deactivate the device and try the activation.

#### AX 2012 R3 MPOS activation fails with an error on step 2

FIELD	VALUE
Sample Event Log Error Message	Exception occurred: [04/19/2018 19:26:51] Microsoft.Dynamics.Commerce.Runtime.UserAuthenticationException: An error occurred during logon. ---> Microsoft.Dynamics.Commerce.Runtime.StorageException: Failed to read from the database. See inner exception for details. DatabaseErrorCode: 0 ---> Microsoft.Dynamics.Commerce.Runtime.Data.DatabaseException: Invalid object name 'crt.EMPLOYEEPERMISSIONSVIEW'. ---> System.Data.SqlClient.SqlException: Invalid object name 'crt.EMPLOYEEPERMISSIONSVIEW'. at System.Data.SqlClient.SqlConnection.OnError(SqlException exception, Boolean breakConnection, Action`1 wrapCloseInAction) at System.Data.SqlClient.TdsParser.ThrowExceptionAndWarning(TdsParserStateObject stateObj, Boolean callerHasConnectionLock, Boolean asyncClose)
MPOS Error on Activation Screen	DZ1001
Troubleshooting Steps	Device you are trying to activate is already active. Please deactivate the device and try the activation.

#### AX 2012 R3 MPOS activation fails with an error on step 9

FIELD	VALUE
Event Log	Microsoft Dynamics Retail Modern POS
Sample Event Log Error Message	Dynamics-Error: LoginViewModel ActivateDevice Logon failed. ErrorMessage: Sorry, something went wrong with the encryption on your device. Please contact your system administrator.; ErrorCode: MICROSOFT_DYNAMICS_POS_DATAENCRYPTIONERROR;
MPOS Error on Activation Screen	DA3122: Sorry, something went wrong with the encryption on your device. Please contact your system administrator.
Troubleshooting Steps	Check the Real-time Service profile filed in the CDX Backward compatibility section of the store. This must be set to the RTS profile that you created for N-1.

## Required KBs for N-1

The following list describes all the KBs that are required for N-1 to work correctly.

### Dynamics 365 Retail – Microsoft Dynamics 365 7.2 headquarters

KB NUMBER	TITLE
4095190	Expose RetailSharedParameter's TransactionServiceProfileID in the RetailSharedParameters form as it is required to enable N-1 functionality when customer did not follow the official upgrade process to move data from 6.3 to Dynamics 365.
4095209	The Real-timeServiceAX63 N-1 component's webconfig contains an invalid authentication type name. This causes issue when the component tries to authenticate with the transaction service in Dynamics 365
4095189	RetailTransactionServiceProfile table's Protocol column is not being synced to the old version channel databases from the new version Dynamics 365 AX database.
4095191	The user is not allowed to set the retail server URL to be http based URL as only secured URLs are allowed. This prevents the user from connecting to old (6.3) version retail servers while running in backward compatibility mode.
4132456	[Upgrade & N-1][Designer] Number pad height should be extensible
4095926	Upgrade & N-1: Return order fails from 63MPOS as the transaction was not found on a N-1 non upgrade environment.
4095664	Allow Microsoft Dynamics AX 2012 clients connecting to AX7.2 HQ to create new customers.
4132454	N-1 version of 1070 fails due to duplicate record exception caused by the CompanyImage_AX63 subjob.

KB NUMBER	TITLE
4131243	When running Dynamics 365 Retail in N-1 mode, the user is not able to set the HardwareStationURL using the AX client hence may not be able to configure the 6.3 hardware station properly.
4338120	Async service connector installer should use provided HQ message db name instead of always using a default name regardless of the HQ message database name provided by the user.
4337834	When running Dynamics 365 in N-1 backward compatibility the N-1 (6.3)version MPOS may fails while adding or updating customer from MPOS due to missing methods in RetailTransactionService.
4337864	When running Dynamics 365 in N-1 backward compatibility the N-1 (6.3)version MPOS may fails during login or payment when attempting to load or use the hardware profile payment merchant property.
4132453	Running the N-1 version of the Product download job(1040_AX63) fails when moving data to the InventDim table in the 6.3 version channel database
4206905	POS reports throw errors when they are run in non-upgrade N-1 environment.
4133289	Running the N-1 version of the Product - Refunds from Journal or existing transactions failing
4161086	CDX table distribution ignores 'FieldValue' link types added on root table nodes and hence does not use that information for filtering the table using the provided condition (x++ fix)
4161099	CDX table distribution ignores 'FieldValue' link types added on root table nodes and hence does not use that information for filtering the table using the provided condition (Binary changes)

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Upgrade the Retail channel extension to the latest Retail SDK

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about how to upgrade to the latest update of the Retail SDK from earlier releases. The overall process and the supported scenario information are included, but this topic doesn't provide detailed instructions of every step in the process. This topic is applicable for Dynamics 365 Commerce and Dynamics 365 Finance.

The following sections will walk through how to manually move your extension to the new Retail SDK, however you can do this using any source control system like Azure DevOps or Git.

## Update the Retail SDK

If you deploy a new environment, the new Retail SDK is located in the services volume of the virtual machine (VM) or in the C drive of the downloadable VHD. When you update the Retail SDK by applying a new binary hotfix from Lifecycle Services (LCS), a new **Update** folder is created inside the existing RetailSDK folder and a copy of the new updated SDK is created inside the Update folder with name `{{Guid.RetailSDKUpdate.Date}}`. We recommend that you rename this folder using a shorter name otherwise when copying this folder you may get an error saying the path or file name is too long.

### Retail SDK components

The Retail SDK updates consist mainly of the following components:

- Assets: Configuration file changes related to extensions.
- Build tools: Customization package and versioning settings.
- Database: Extension DB scripts.
- Documents: Instructions to run the samples.
- Package: Deployment package.
- Payment externals: Payment packaging folders.
- Payment: Payment sample code.
- POS: Modern and Cloud POS App code and samples.
- References: All binary reference and commerce analyzer proxy tool.
- Sample extensions: Extension sample projects.

## Upgrade scenarios

Upgrade can be completed for one of the following scenarios:

- Update to a specific binary hotfix.
- Upgrade your custom code.
- Upgrade to the latest application release.

The process for SDK upgrade varies between versions. With version 7.3 and higher, we sealed all of the components and customizations must be completed only by using the extension points. This should result in an easier code upgrade experience. However, if you are upgrading from 7.0, 7.1, or 7.2 and if you have made inline changes, you must move the inline changes to extensions. This will require additional work.

#### NOTE

When upgrading to newer version, do not remove any of the existing Commerce Scale Unit, Commerce Runtime, Proxy, Hardware station, CDX, or Database extension code/APIs. Your POS client may depend on this code and removing it will cause runtime exception errors. If you want to remove it then during code upgrade, make sure that the client code is also updated to support this change, otherwise runtime failure will occur. As a best practice, extension code must be written in such a way that it is always backward compatible.

The following tables provide some high-level information about which version the code is sealed. If you are upgrading from an unsealed version to a sealed version, you should identify all of your customizations and move any inline customizations to extensions. To move the inline customizations, verify that you have all of the necessary extension points to do this. If you don't, submit an extensibility request.

#### NOTE

You might have to rewrite some of the POS inline changes that were completed in 7.1 when you upgrade to version 7.3 or higher.

APPLICATION VERSION	CRT SEALED	HWS SEALED	POS SEALED	DB SEALED	PROXY SEALED
Application release 8.1	Yes	Yes	Yes	Yes	Yes
Application release 8.0	Yes	Yes	Yes	Yes	Yes
Application 7.3	Yes	Yes	Yes	Yes	Yes
July 2017 release (Application 7.2)	Yes	Yes	Yes	Yes	No
Release 1611 (Application 7.1)	Yes	No	No	No	No
February 2016 release (Application 7.0)	No	No	No	No	No

## Upgrade the channel extension from 7.3 to a higher version

If you are completing a code upgrade, the following Retail SDK components must be upgraded. Each of these components are folders inside the Retail SDK.

#### NOTE

Code upgrade can be completed using a source control/merge tool. We recommend using a source control tool for this process so that you can track the changes and revert if required. If you are not using any source control, before you upgrade the code, be sure to make a back up of the old and new Retail SDK folder.

- **Assets:** If you have modified any of the following extension config files to include your custom assemblies, you must move those changes to the same config files in the new **Asset folder**.

- CommerceRuntime.Ext.config - CRT extensions.
- CommerceRuntime.MPOSOffline.Ext.config - CRT offline extensions.
- HardwareStation.Extension.config - Hardware station and payment extensions.
- RetailProxy.MPOSOffline.ext.config - Proxy extensions.
- **Build tools:** The **Build tools** folder contains the files related to packaging, build settings and pfx, and snk files. Merge or update the following files if you have made any changes in the older versions:
  - Customization.settings
  - Microsoft.Dynamics.RetailSdk.Build.props
  - Any custom pfx or snk files that you have created.
- **Database:** Copy and drop all your custom SQL scripts: ...\\RetailSDK\\Database\\Upgrade\\Custom
- **Online Store:** If you have an online store web project or online extension code, include it in this folder.

#### NOTE

Deployable package will not include online store code for packaging.

- **Payment externals:** Copy and paste all of your payment extension assemblies to the following **Payment assemblies** folders:
  - IPaymentDeviceAssemblies
  - IPaymentProcessorAssemblies
  - PaymentWebFiles
- **Payments:** Merge all of your payment extension projects into this folder.

#### NOTE

If you created a new payment extension project and did not modify anything in this folder, you can include it as part of the build and packaging process. Update **dirs.proj** in the **RetailSDK** folder to build your custom project. Next, update the **Customization.settings** file with the payment extension drop location so that during package creation your custom project is built. Make sure to include the extension as part of the packaging.

- **POS:** If you have any POS extensions, including the generated proxy, copy your POS extensions from ... \\RetailSDK\\POS\\Extensions to the new Retail SDK POS extension folder, *RetailSDK\\POS\\Extensions*. After you copy the extensions, update and merge the extension.json file inside the *POS\\Extensions* folder with the new POS extensions folder you copied.

For example, if you copied the **CustomExtension** folder, then you would update extension.json as shown below.

```
{
  "extensionPackages": [
    {
      "baseUr1": "SampleExtensions"
    },
    {
      "baseUr1": "SampleExtensions2"
    },
    {
      "baseUr1": "CustomExtension"
    }
  ]
}
```

You should also update `tsconfig.json` with the custom extension package so that the POS can compile the changes during build.

- **Reference:** Copy all of your extension output assemblies, such as **Commerce runtime**, **Hardware station**, **proxy**, and any external assemblies, to the reference folder. Include any assemblies that you want included as part of your deployment and packaging.
- **Commerce runtime (CRT) and Commerce Scale Unit extensions:** Copy all of your CRT and extension projects under the **Retail SDK** folder. Make sure to include the CRT and RS extension solution file details in the `dirs.proj` file under the **RetailSDK** folder so that during `msbuild`, all of the extension project is built and the output path for the project assemblies is set to the `RetailSDK\Reference` folder.
- **Hardware station (HWS) and payment extensions:** Copy all of your hardware station (HWS) and payment extension projects under the **Retail SDK** folder. Make sure to include the HWS and payment extension solution file details in the `dirs.proj` file under the **RetailSDK** folder so that during `msbuild`, all of the extension projects are built and the output path for the project assemblies is set to the `RetailSDK\Reference` folder.
- **Retail proxy extensions:** Copy all of your proxy extension projects under the **Retail SDK** folder. Make sure to include the proxy solution file details in the `dirs.proj` file under the **RetailSDK** folder so that during `msbuild`, all of the extension projects are built and the output path for the project assemblies is set to the `RetailSDK\Reference` folder.

#### NOTE

Run `msbuild` on the root of the Retail SDK folder. Use the Microsoft Visual Studio developer command-line tool to generate the deployable packages.

After you have upgraded all of the components, deploy the Commerce deployable packages, validate the deployment, and add the Retail SDK files to the repository.

## Upgrade the channel extension from 7.2 to a higher version

The steps mentioned in the previous section, **Upgrade the channel extension from 7.3 to higher versions**, will remain same for all the components except the Commerce proxy. In 7.2, you must have completed inline changes in the proxy project if you have CRT with RS extension and the typescript proxy was auto-generated based on the `customization.settings` file.

To upgrade your proxy to 7.3, complete the steps in the topic, [Typescript and C# proxies for Retail point of sale \(POS\)](#) and then move the proxy to the Retail SDK folder and then update the config file, `RetailProxy.MPOSOffline.ext.config`.

## Upgrade the channel extension from 7.1 to a higher version

In 7.1, you should have completed most of the POS and Proxy customizations inline. To upgrade to higher a application release, you should move all of your inline changes to extensions. If it is a binary hotfix upgrade, then you must perform a code merge with the new Retail SDK and then regenerate the package.

## Upgrade the channel extension from 7.0 to a higher version

In 7.0, you should have completed most of the customizations inline. To upgrade to higher a application release, you should move all of your inline changes to extensions. If it is binary hotfix upgrade, you must perform a code merge with the new Retail SDK and regenerate the package.

# Generate a deployable package for validation

Complete the steps in the topic, [Create deployable packages](#), to generate the deployable package for validation.

# Preview features in Dynamics 365 Commerce 10.0.17 (April 2021)

2/18/2021 • 3 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic lists features that are either new or changed in Microsoft Dynamics 365 Commerce 10.0.17. This version has a build number of 10.0.761 and is available on the following schedule:

- **Preview of release:** February 2021
- **General availability of release (self-update):** March 2021
- **General availability of release (auto-update):** April 2021

## Features included in this release

The following features are included in this release. The feature titles link to additional information on the [Release plans](#) site. Additional links point to additional documentation that is currently available for that feature. Most of these features must be enabled using [Feature management](#) before you can use them.

- [B2B e-commerce](#)
  - For more information, see [Set up a B2B e-commerce site](#).
- [Edit partially fulfilled customer orders in POS](#)
  - For more information, see [Customer orders in Point of Sale \(POS\)](#).
- [Improved POS ordering and fulfillment experiences for serialized items](#)
  - For more information, see [Work with serialized items in the POS](#).
- [Shop similar descriptions](#)
  - For more information, see [Enable "shop similar descriptions" recommendations](#).
- [Configure module properties to be shown based on context](#)
  - For more information, see [Configure module properties to be shown based on context](#).
- [GeoLookup connector](#)
  - For more information, see [Configure and enable connectors](#).
- [Dynamic e-commerce pages based on URL parameters](#)
  - For more information, see [Create dynamic e-commerce pages based on URL parameters](#).
- [Quick view module](#)
  - For more information, see [Quick view module](#).
- [Clienteling improvements](#)
  - For more information, see [Clienteling overview](#).
- [Omnichannel support for incremental payment capture](#)
  - For more information, see [Incremental capture for back-office invoicing](#).
- [Refactored payment processing in storefront checkout](#)
- [Email receipt improvements and new features](#)
- [Exclusive threshold discounts compete with exclusive non-threshold periodic discounts](#)
- [Improved user experience for pickup order processing in point of sale](#)

- For more information, see [Process customer order pickups in POS](#).
- [Independent deployment and installation packages for MPOS, CPOS, HWS, and CSU extensions](#)
- [Simplified Commerce SDK update and developer experience](#)
- [Commerce localization for Brazil](#)
  - For more information, see [Commerce localization for Brazil](#).
- [Digital signing of retail transactions for France based on the fiscal integration framework](#)
- [Dynamics 365 Commerce and Microsoft Teams integration – add org structure, stores, workers](#)
- [Synergize task management between Dynamics 365 Commerce and Microsoft Teams](#)

## Additional resources

### Platform updates for Finance and Operations apps

Dynamics 365 Commerce 10.0.17 includes platform updates. To learn more, see [Platform updates for version 10.0.17 of Finance and Operations apps](#).

### Bug fixes

For information about the bug fixes that are included in this update, sign in to Lifecycle Services (LCS) and view the [KB article](#).

### Dynamics 365: 2021 release wave 1 plan

Wondering about upcoming and recently released capabilities in any of our business apps or platform?

Check out the [Dynamics 365: 2021 release wave 1 plan](#). We've captured all the details, end to end, top to bottom, in a single document that you can use for planning.

### Removed and deprecated features

The [Removed or deprecated features in Dynamics 365 Commerce](#) topic describes features that have been removed or deprecated for Commerce.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature is not in active development and may be removed in a future update.

Before any feature is removed from the product, the deprecation notice will be announced in the [Removed or deprecated features in Dynamics 365 Commerce](#) topic 12 months prior to the removal.

For breaking changes that only affect compilation time, but are binary compatible with sandbox and production environments, the deprecation time will be less than 12 months. Typically, these are functional updates that need to be made to the compiler.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# What's new and changed in Dynamics 365 Commerce 10.0.16 (February 2021)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic lists features that are either new or changed in Microsoft Dynamics 365 Commerce 10.0.16. This version has a build number of 10.0.689 and is available on the following schedule:

- **Preview of release:** November 2020
- **General availability of release (self-update):** January 2021
- **General availability of release (auto-update):** February 2021

## Features included in this release

The following features are included in this release. The feature titles link to additional information on the [Release plans](#) site. Additional links point to additional documentation that is currently available for that feature. Most of these features must be enabled using [Feature management](#) before you can use them.

- [Leverage the Dynamics 365 Commerce pricing engine to create a sales quote in Dynamics 365 Sales](#)
  - For more information, see [Use the Dynamics 365 Commerce pricing engine with Dynamics 365 Sales](#)
- [Customize transactional emails by mode of delivery](#)
  - For more information, see [Customize transactional emails by mode of delivery](#)
- [Upload and serve static files](#)
  - For more information, see [Upload and serve static files](#)
- [Clear system discounts from a sales line or sales transaction](#)
  - For more information, see [Online and offline point of sale \(POS\) operations](#)
- [Enable multiple pickup delivery modes for customer orders](#)
  - For more information, see [Enable multiple pickup delivery modes for customer orders](#)
- [Restrict affiliation and loyalty discounts in stores](#)
- [Gift card purchase in e-commerce](#)
- [Improved point of sale ordering and fulfillment experiences for serialized items](#)
  - For more information, see [Work with serialized items in the POS](#)

# What's new or changed in Dynamics 365 Commerce 10.0.15 (January 2021)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic lists features that are either new or changed in Microsoft Dynamics 365 Commerce 10.0.15. This version has a build number of 10.0.644 and is available on the following schedule:

- **Preview release:** October 2020
- **General availability (self-update):** November 2020
- **Auto-update:** January 2021

## Features included in this release

The following features are included in this release. The feature titles link to additional information on the [Release plans](#) site. Additional links point to additional documentation that is currently available for that feature. Most of these features must be enabled using [Feature management](#) before you can use them.

- [Curbside pickup](#)
  - For more information, see [Process credit cards without a hardware station](#).
- [Support for closing lines in purchase orders during receiving in POS](#)
- [Experimentation in Dynamics 365 Commerce](#)
  - For more information, see [Experimentation in Dynamics 365 Commerce](#).
- [Commerce localization for Brazil](#)
  - For more information, see [Commerce localization for Brazil](#).
- [Improved inbound and outbound inventory operations in store](#)
  - For more information, see [Inbound inventory operation in POS](#).
- [Improvements to the recall order operation in point of sale \(POS\)](#)
  - For more information, see [Recall order operation in POS](#).
- [Ability to skip "Change due" dialog in POS when no change is due](#)
- [CSP support for inline scripts and styles, and enabling nonce](#)
  - For more information, see [Manage Content Security Policy \(CSP\)](#).

# Removed or deprecated features in previous releases

2/18/2021 • 51 minutes to read • [Edit Online](#)

## NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

## IMPORTANT

This topic is no longer updated. To see a current list of features that have been removed or deprecated from Finance and Operations apps, search for "**Removed or deprecated features**" content that relates to the app you're using.

This topic describes features that have been removed or deprecated from Dynamics 365 for Finance and Operations and previous releases of that product.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature is not in active development and may be removed in a future update.

This list is intended to help you consider these removals and deprecations for your own planning.

Detailed information about objects in Finance and Operations apps can be found in the [Technical reference reports](#). You can compare the different versions of these reports to learn about objects that have changed or been removed in each version of Finance and Operations apps.

## Finance 10.0.7 with Platform update 31

### Chinese voucher types without Account groups selection

Reason for deprecation/removal	Changed to the feature with account groups selection.
Replaced by another feature?	Yes
Product areas affected	Application
Deployment option	All
Status	Deprecated: By December 1, 2020, we plan to no longer support Chinese voucher types setup without Account groups selection. Find more details about new feature design in What's new in 10.0.7

# Finance and Operations 10.0.6 with Platform update 30

## DimensionHash.getHash(str\_message)

Reason for deprecation/removal	Windows is deprecating the use of SHA1, as documented in <a href="#">Windows Enforcement of SHA1 Certificates</a> .
Replaced by another feature?	Yes
Product areas affected	Application
Deployment option	All
Status	Deprecated: By April 1, 2020, developers must use the platform APIs found in the class <b>HasFunction</b> .

## Hash.ComputeSHA1Hash(string message)

Reason for deprecation/removal	Windows is deprecating the use of SHA1, as documented in <a href="#">Windows Enforcement of SHA1 Certificates</a> .
Replaced by another feature?	Yes
Product areas affected	Platform
Deployment option	All
Status	Deprecated: By April 1, 2020, developers must use the platform APIs found in the class <b>HasFunction</b> .

## FormDateTimeControl.setUtcString()

Reason for deprecation/removal	We are retiring the <b>setUtcString()</b> method, because a better replacement method is available.
Replaced by another feature?	Yes
Product areas affected	Platform
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the <b>setUtcString()</b> method. Developers should be using the <b>setUtcDateTime()</b> method instead.

Reason for deprecation/removal	Not legally required.
Replaced by another feature?	No
Product areas affected	Italian localization
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the <b>Blacklist report (IT) – Feature reference IT-00001</b> .

### Domestic tax report – Feature reference IT-00003

Reason for deprecation/removal	Not legally required.
Replaced by another feature?	No
Product areas affected	Italian localization
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the <b>Domestic tax report – Feature reference IT-00003</b> .

## Finance and Operations 10.0.5 with Platform update 29

### US Payroll tax updates

Reason for deprecation/removal	We are retiring tax updates for the US Payroll functionality due to low usage and enhanced functionality that is now offered via strategic integrations.
Replaced by another feature?	Yes
Product areas affected	Payroll
Deployment option	All
Status	Deprecated: By July 31, 2024, we plan to no longer provide tax updates to US Payroll customers. The functionality will remain in the product, but enhancements will no longer keep the functionality up to date, and any product defects will be evaluated on a case-by-case basis.

**NOTE**

This represents a change from the original discontinuation date of October 1, 2021. For more information, see [Tax updates being retired for US Payroll feature in Microsoft Dynamics 365 for Finance and Operations](#).

**Data management staging clean up**

Reason for deprecation/removal	Does not meet the core requirements that are needed for scheduling periodic cleanup.
Replaced by another feature?	Yes, the Job history cleanup feature is being added to meet the scenarios holistically.
Product areas affected	Data management
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is December 2020.

**Finance and Operations 10.0.4 with Platform update 28****France: FEC Accounting data export in XML**

Reason for deprecation/removal	Replaced by TXT format, <b>French FEC audit file</b> is available through <b>General ledger &gt; Periodic tasks &gt; Data export</b> .
Replaced by another feature?	Yes
Product areas affected	General ledger
Deployment option	All
Status	Deprecated. Target timeframe for the functionality to be removed is July 2020.

**Legacy navigation bar**

Reason for deprecation/removal	Header alignment with other Dynamics and Office products. For more details, see <a href="#">Updated navigation bar that aligns with the Office header</a> .
Replaced by another feature?	Starting in Platform update 24, a restyled navigation bar that features search was introduced.
Product areas affected	Web client

Deployment option	All
Status	Deprecated: Starting in April 2020, the legacy navigation bar will no longer be available. Until that point, customers can revert to the legacy navigation bar through the <b>Client performance options</b> page.

## Finance and Operations 10.0.2 with Platform update 26

### Legacy default action behavior

Reason for deprecation/removal	The legacy behavior for default actions in grids results in an unexpected column having the default action link after grid columns have been reordered via personalization. The new sticky default action feature corrects this. For more details, see <a href="#">Sticky default actions in grids</a> .
Replaced by another feature?	Starting in Platform update 21, a feature for "sticky default actions" was introduced. This feature can be enabled on the <b>Client performance options</b> page.
Product areas affected	Grids in the web client
Deployment option	All
Status	Deprecated: Starting in April 2020, sticky default actions will be the default behavior, without a mechanism to revert to the legacy behavior.

### Legacy "is one of" filtering experience

Reason for deprecation/removal	The "is one of" filtering experience went through a redesign in Platform update 22, with the plan for this to eventually be the only "is one of" filtering experience.
Replaced by another feature?	Starting in Platform update 22, an improved "is one of" filtering experience became available on the <b>Client performance options</b> page. For more information, see <a href="#">Optimized is one of filtering experience</a> .
Product areas affected	Web client
Deployment option	All
Status	Deprecated: Starting in April 2020, the improved "is one of" experience will be the default behavior, without a mechanism to revert to the legacy behavior.

### Parameter to enable sales orders with multiple project contract funding sources

Support for creating project-based sales orders where the project contract has multiple funding sources is

enabled with the **Project management parameters** setting **Allow sales orders for project with multiple funding sources**. By default, this parameter is not enabled.

<b>Reason for deprecation/removal</b>	The functionality will always be enabled after the parameter is removed.
<b>Replaced by another feature?</b>	No. The functionality to support project-based sales orders with multiple funding sources will always be enabled.
<b>Product areas affected</b>	The <b>Allow sales orders for projects with multiple funding sources</b> parameter will be removed. The following methods will be modified when the parameter is removed: <b>ctrlSalesOrderTable</b> method in <b>ProjStatusType</b> class, <b>validate</b> method for <b>ProjId</b> field, and <b>run</b> method in <b>SalescreateOrder</b> form. The following methods will be deprecated when the parameter is removed: <b>IsSalesOrderAllowedForMultipleFundingSources</b> in <b>ProjTable</b> table file, <b>IsAllowSalesOrdersForMultipleFundingSourcesParam Enabled</b> method in <b>ProjTable</b> table file, <b>AllowSalesOrdersForMultipleFundingSources</b> data field in <b>ProjParameters</b> form and <b>ProjParameterEntity</b> files, <b>IsAssociatedToMultipleFundingSourcesContract</b> private method in <b>ProjTable</b> table file.
<b>Deployment option</b>	All
<b>Status</b>	Deprecation is planned for the April 2020 release wave.

#### Legacy workflow reports for tracking and instance status

<b>Reason for deprecation/removal</b>	The legacy workflow reports for tracking and instance status are being deprecated because they are no longer referenced from the navigation. The report names are <b>WorkflowWorkflowInstanceByStatusReport</b> and <b>WorkflowWorkflowTrackingReport</b> .
<b>Replaced by another feature?</b>	The workflow history form can be used instead.
<b>Product areas affected</b>	Web client
<b>Deployment option</b>	All
<b>Status</b>	Deprecated: Target timeframe for the functionality to be removed is April 2020.

## Finance and Operations 10.0.1 with Platform update 25

### Deprecated APIs and potential breaking changes

Deriving from internal classes is deprecated

<b>Reason for deprecation/removal</b>	Before Platform update 25, it was possible to create a class or table that derives from an internal class/table that is defined in another package/module. This is not a safe coding practice. As of Platform update 25, the compiler will display a warning.
<b>Replaced by another feature?</b>	The compiler warning will be replaced by an error in Platform update 26. This change is backward compatible at runtime, which means that Platform update 25 or newer can be deployed on any sandbox or production environment without the need to modify custom code. This change only affects development and compile time.
<b>Product areas affected</b>	Visual Studio development tools
<b>Deployment option</b>	All
<b>Status</b>	Deprecated: The warning will become a compilation error in Platform update 26.

#### Overriding internal methods is deprecated

<b>Reason for deprecation/removal</b>	Before Platform update 25, it was possible to override an internal method in a derived class that is defined in another package/module. This is not a safe coding practice. As of Platform update 25, the compiler will display a warning.
<b>Replaced by another feature?</b>	This warning will be replaced by a compile error in Platform update 26. This change is backward compatible at runtime, which means that Platform update 25 or newer can be deployed on any sandbox or production environment without the need to modify custom code. This change only affects development and compile time.
<b>Product areas affected</b>	Visual Studio development tools
<b>Deployment option</b>	All
<b>Status</b>	Deprecated: The warning will become a compilation error in Platform update 26.

## Finance and Operations 10.0.0 with Platform update 24

### Renaming released products

<b>Reason for deprecation/removal</b>	When you use the <b>Rename primary key</b> function to change the ItemId of a released product, only direct foreign key references are updated. Any other references to the released product, such as from production orders, will retain the old ItemId. As a result, there could be inconsistent data that will eventually block business processes.

Replaced by another feature?	No.
Product areas affected	Product information management
Deployment option	All
Status	Removed as of Finance and Operations 10.0.0 with Platform update 24.

## Finance and Operations 8.1.3 with Platform update 23

### SQL Server Reporting Services ReportViewer Control

Customers can use the **Export** action provided by the embedded SQL Server Reporting Services (SSRS) ReportViewer control to download documents produced by Finance and Operations applications. This HTML-based presentation of the report offers users a non-paginated preview of the document.

Reason for deprecation/removal	The non-paginated nature of the HTML-based preview experience does <b>not</b> deliver fidelity with the physical documents ultimately produced by Finance and Operations. By fully embracing PDF as the standard format for business documents, users are able to take advantage of a modern viewing experience with improved performance when producing application reports.
Replaced by another feature?	Going forward, PDF documents will be the default format for reports rendered by Finance and Operations.
Product areas affected	This change does <b>not</b> impact customer scenarios where reports are distributed electronically or sent directly to printers.
Deployment option	All
Status	Deprecated: A removal date has not been set for this feature. The functionality to automatically preview application reports using an embedded PDF viewer is planned for the May 2019 Platform update.

### Client KPI controls

Embedded key performance indicators (KPIs) could be modeled in Visual Studio by a developer and further customized by the end user.

Reason for deprecation/removal	The native client controls used to define KPIs have low customer uptake and rely on a developer to add trackable metrics.

Replaced by another feature?	PowerBI.com service delivers world-class tooling for defining and managing KPIs based on data from external sources. In an upcoming release, we plan to enable you to embed solutions hosted on PowerBI.com in application workspaces.
Product areas affected	This update will prevent developers from introducing new KPI controls in Visual Studio designer.
Deployment option	All
Status	Deprecated: A removal date has not been set for this feature.

## Deprecated APIs and future breaking changes

### Field groups containing invalid field references

Reason for deprecation/removal	<p>It is possible for table metadata definitions to have field groups containing invalid field references. If deployed, this can cause runtime failures in Financial Reporting and SQL Server Reporting Services (SSRS). This issue is currently categorized as a <i>compiler warning</i> rather than an <i>error</i>, meaning that the deployable package creation and deployment can proceed without fixing the issue. To fix this issue:</p> <ol style="list-style-type: none"> <li>1. Remove the invalid field reference from the table field group definition.</li> <li>2. Recompile.</li> <li>3. Ensure any warnings or errors are addressed.</li> </ol>
Replaced by another feature?	This warning will be replaced by a compile error in the future.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning is a compile-time error with platform updates for version 10.0.11 of Finance and Operations apps.

#### Complete list

To access the full list of APIs that are being deprecated, see [Deprecation of methods and metadata elements](#).

## Finance and Operations 8.1 with Platform update 20

### Batch transfer rules for subledger journal account entries

The Synchronous transfer mode is being deprecated in the General ledger parameters. This mode is replaced by Asynchronous and scheduled batch only, which already exist as options for transfer. For additional information, see the [General Ledger Parameters – Batch transfer rules](#) blog.

<b>Reason for deprecation/removal</b>	We are removing the synchronous option due to performance impact to the system.
<b>Replaced by another feature?</b>	Asynchronous and scheduled batch are options to use in place of Synchronous.
<b>Product areas affected</b>	General Ledger, Accounts payable, Accounts Receivable, Procurement, Expense
<b>Deployment option</b>	All
<b>Status</b>	Deprecated: Target timeframe for the functionality to be removed is the 10.0 version.

### **Electronic reporting for Russia**

Feature for configuring .txt and .xml file formats of declarations.

<b>Reason for deprecation/removal</b>	Replaced with Electronic reporting.
<b>Replaced by another feature?</b>	Yes.
<b>Product areas affected</b>	General Ledger
<b>Deployment option</b>	All
<b>Status</b>	Removed as of Finance and Operations 8.1 with Platform update 20.

### **Financial reports generator for Russia**

A tool for setting up data collection for accounting and tax reports, and to export data to XLS and DOC report templates. Functional parts: Export data to XLS and DOC report templates, queries, fixed requisites are removed.

<b>Reason for deprecation/removal</b>	Removed parts are replaced with Electronic reporting.
<b>Replaced by another feature?</b>	Yes. Financial reports setup user interface should be used for setting up data collection rules by GL accounts or tax registers. Export data to various file types, fixed requisites and query-like data collection rules should be configured in Electronic reporting.
<b>Product areas affected</b>	General ledger.
<b>Deployment option</b>	All
<b>Status</b>	Removed as of Finance and Operations 8.1 with Platform update 20.

### **Integration with external providers for sending electronic reporting through communication channels for**

## Russia

Feature exporting generated electronic files of declarations to folder for further sending to official providers of electronic reporting as well as importing state back.

Reason for deprecation/removal	Replaced with electronic messages configurable feature.
Replaced by another feature?	Yes.
Product areas affected	General Ledger, Tax
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

### Profit tax register wizard

Feature for creating templates for new profit tax registers. This feature creates X++ objects for new registers, which are then created as templates with the appropriate calculation logic added in.

Reason for deprecation/removal	Feature is not compatible with the Finance and Operations extensibility model.
Replaced by another feature?	No
Product areas affected	Tax
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

## Finance and Operations 8.0 with Platform update 15

No features have been removed or deprecated with this release. Platform update 15 is cumulative and contains new or changed features from Platform update 13, Platform update 14, and Platform update 15.

## Finance and Operations, Enterprise edition 7.3 with Platform update 12

### Personalized product recommendations

Starting February 15, 2018, retailers will no longer be able to display personalized product recommendations on a point of sale (POS) device. For more information, see [Product recommendations overview](#).

Reason for deprecation/removal	We are removing the current version of the product recommendation service as we redesign this feature with a better algorithm and newer retail-oriented capabilities.

Replaced by another feature?	No. However, after Spring 2018, we plan to bring back this feature to leverage a new recommendation service.
Product areas affected	Personalized product recommendations in POS.
Deployment option	All
Status	Removed as of February 15, 2018. This affects customers running Dynamics 365 for Operations 1611 and later.

### Extension of the list of Electronic reporting (ER) functions

The possibility to introduce custom functions to be used in the ER expression builder (for more information, see [Extend the list of Electronic reporting \(ER\) functions](#)) is not supported any more. Due to changes of the ER APIs, the API to call built-in functions from the ER expression builder became internal and can't be extended any longer.

Reason for deprecation/removal	Code sealing initiative
Replaced by another feature?	<p>None. Whenever a new built-in function is needed, a new extension request must be addressed to the ER framework team.</p> <p>As a temporary work around while the requested function is under development by the ER team, the required logic can be programmed as a method of a custom application class. This method can be accessed in an ER expression as a property of the added ER data source of the <b>Application\Class</b> type that refers to that custom application class.</p>
Product areas affected	Electronic reporting framework
Deployment option	All
Status	Removed as of Finance and Operations, Enterprise edition 7.3.

### Inventory by item group and Inventory by inventory dimension aging reports

These two reports are no longer supported in Finance and Operations. Instead, the **Inventory aging** report can be used to improve the user experience.

Reason for deprecation	Duplicate functionality
Replaced by another feature?	Yes. The two reports have been replaced by the <b>Inventory aging</b> report.
Product areas affected	Inventory management, Cost management

Deployment option	All
Status	Deprecated: The menu items for the two reports have been removed in version 7.3. However, the code for the reports remains in the product. The plan is to remove the code in a future release.

### Power BI content packs available on AppSource

The **Cost management**, **Financial performance**, and **Retail channel performance** content packs, available on the [Microsoft AppSource](#) site, are deprecated as a consequence of product updates in Microsoft Power BI. System administration forms used to deploy these content packs to PowerBI.com are also being deprecated in Finance and Operations.

Reason for deprecation/removal	Product updates in Microsoft Power BI.
Replaced by another feature?	The <b>Cost management</b> , <b>Financial performance</b> , and <b>Retail channel performance</b> content packs, available on the <a href="#">AppSource</a> site, are being replaced by analytical applications which allow for solution integrations at the database level. For more information about analytical applications, see <a href="#">Embedded Power BI in workspaces</a> .
Product areas affected	Cost management, Finance, and Retail
Deployment option	Cloud only (Integration with PowerBI.com is not supported in on-premises deployments.)
Status	Deprecated: Target timeframe for the functionality removal is Q2 2018.

### Standard UI in data management workspace

The standard UI in data management is the legacy UI, which is the default UI presented to the users when they visit the data management workspace.

Reason for deprecation/removal	We are investing in providing new user experiences in the new UI.
Replaced by another feature?	The new UI called <i>Enhanced views</i> is replacing the old UI.
Product areas affected	Data management workspace
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is Q2 2018.

### Excise, Sales Tax, Service Tax for India

These taxes have been subsumed into Indian GST.

Reason for removal or deprecation	These taxes have been subsumed into Indian GST.
Replaced by another feature?	Indian GST
Product areas affected	Tax
Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

#### **File Validation Utility (FVU) for India**

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Indian withholding tax
Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

#### **TDS/TCS certificate for India**

Users can download this from the government portal.

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Indian withholding tax
Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

#### **Export/import (EXIM) incentive scheme for India**

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Import and export

Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

## Dynamics 365 for Retail 7.2

### Personalized product recommendations

Starting February 15, 2018, retailers will no longer be able to display personalized product recommendations on a point of sale (POS) device. For more information, see [Product recommendations overview](#).

Reason for deprecation/removal	We are removing the current version of the product recommendation service as we redesign this feature with a better algorithm and newer retail-oriented capabilities.
Replaced by another feature?	No. However, after Spring 2018, we plan to bring back this feature to leverage a new recommendation service.
Product areas affected	Personalized product recommendations in POS.
Deployment option	All
Status	Removed as of February 15, 2018. This affects customers running Dynamics 365 for Retail 7.2 and later.

## Finance and Operations, Enterprise edition July 2017 with Platform update 8

### Currency conversion for accounting and reporting currencies

Currency conversion for accounting and reporting currencies was introduced when the euro was introduced.

Reason for deprecation/removal	Limited usage and addition of the Copy legal entity functionality as a replacement.
Replaced by another feature?	No, but the Copy legal entity and Configurations features were added to make it easier to move to a company that has changing core requirements.
Product areas affected	Financial management
Status	Deprecated: A removal date has not been set for this feature.

### Warehouse mobile devices portal

Warehouse mobile devices portal (WMDP) was a standalone component that was intended for on-premises self-deployment. This component is no longer supported in Finance and Operations. A native app that improves the user experience has replaced the functionality of WMDP.

Reason for deprecation/removal	Duplicate functionality.
Replaced by another feature?	Yes. This feature has been replaced by Finance and Operations - Warehousing. For more information about setup and prerequisites, see <a href="#">Install and configure the Warehousing app overview</a> .
Product areas affected	Warehouse management, Transportation management
Deployment option	Warehouse mobile devices portal (WMDP) was a standalone component that was intended for on-premises self-deployment.
Status	Deprecated: Target timeframe for the functionality to be removed is Q4 2019.

### Advanced bank reconciliation matching rule for manual matching

A matching rule was used to select and mark a bank document when documents were manually matched in the reconciliation worksheet.

Reason for deprecation/removal	Limited usage.
Replaced by another feature?	No. Column filtering capabilities should be used to find documents for reconciliation.
Product areas affected	Cash and bank management
Deployment option	All
Status	Removed as of July 2017.

## Dynamics 365 for Operations 1611 with Platform update 3

### AEB payment formats for Spain

The Consejo Superior Bancario payment formats were used to send remittance files to the bank for customer payments and vendor payments. The content of these formats was determined by the Asociación Española de Banca. It covers Cuaderno 19, 32, 58, 34.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer and Direct debit payment formats for Spain
Product areas affected	Accounts payable, Accounts receivable

<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Bank payments transfer for Lithuania

Bank payment transfers were generated and printed by using the Payment transfer (LT) export format for Lithuania. The Lithuanian market began to use LITAS, the unified electronic banking system, in 2005.

<b>Reason for deprecation/removal</b>	The payment formats are no longer used.
<b>Replaced by another feature?</b>	Yes, ISO20022 Credit transfer payment format for Lithuania
<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### BBS Direkte Remitting payment formats for Norway

BBS Direkte Remitting payment formats include customer payment collection export (direct debit) and return message import.

<b>Reason for deprecation/removal</b>	The payment formats are no longer used.
<b>Replaced by another feature?</b>	The AvtaleGiro customer payment format for Norway can be used to generate direct debit messages. Return message import will be implemented in future releases.
<b>Product areas affected</b>	Accounts payable, Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Chart of Accounts tool for Spain

This tool is used when a chart of accounts in Spain requires major changes. Users can import a new chart of accounts in Microsoft Excel or text format, and can also import financial statements.

<b>Reason for deprecation/removal</b>	Limited usage
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	General ledger
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Dom80 payment format for Belgium

Legacy Belgian payment format for payment collection (direct debit).

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Direct debit payment format for Belgium
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

#### DTA/EZAG payment formats for Switzerland

DTA/EZAG formats are integrated into the ESR system, because they can carry on the reference number. Because the reference number isn't mandatory, these formats can be used to process any vendor payments. These formats are used by companies that have a bank account in a location other than "Postfinance."

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Switzerland
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

#### EDIFACT-DIRDEB payment format for Austria

EDIFACT-DIRDEB payment format for payment collection (direct debit).

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Direct debit payment format for Austria
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

#### EDIVAT for Belgium

EDIVAT is an obsolete Belgian standard for electronic declaration via secure mail. Dynamics AX 2012 retains the read-only solution to enable access to the historical data.

Reason for deprecation/removal	The functionality is no longer used.
Replaced by another feature?	No

<b>Product areas affected</b>	General ledger
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### **eGiro EDIFACT CREMUL payment import format for Norway**

eGiro is based on the international UN EDIFACT CREMUL (Multiple Credit Advice Message) standard that is used for automatic posting of customer payments. In Dynamics AX, eGiro is implemented as a customer payment import format.

<b>Reason for deprecation/removal</b>	The payment format is no longer used.
<b>Replaced by another feature?</b>	Yes, the ISO20022 Camt.054 notification import.
<b>Product areas affected</b>	Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### **External inventory for Poland**

Evidence of goods that are taken from a vendor for sales without purchase. Goods that are handled in external inventory don't affect standard inventory, and can be sold and then purchased automatically. This process creates real inventory movements.

<b>Reason for deprecation/removal</b>	Replaced by another feature
<b>Replaced by another feature?</b>	Yes, the core Inbound consignment functionality
<b>Product areas affected</b>	Accounts payable, Inventory management
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### **Financial reports generator for Eastern Europe**

A tool is used to set up data collection for accounting and tax reports, and to export data to XLS and DOC report templates.

<b>Reason for deprecation/removal</b>	Limited usage
<b>Replaced by another feature?</b>	No. The tool will be replaced by Electronic reporting configurations in future releases.
<b>Product areas affected</b>	General Ledger

<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Import of customer payment transactions for Finland

You can select an import format for Finnish payments to import customer payment transactions from an external file that the bank provides.

<b>Reason for deprecation/removal</b>	The payment format is no longer used.
<b>Replaced by another feature?</b>	Yes, the ISO20022 Camt.054 notification import.
<b>Product areas affected</b>	Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Import of payment transactions into a general ledger journal for Finland

A format that is specific to Finland is used to import accounting transactions into the general ledger.

<b>Reason for deprecation/removal</b>	The payment format is no longer used.
<b>Replaced by another feature?</b>	Yes, the ISO20022 Camt.053 bank statement import using Advanced Bank Reconciliation.
<b>Product areas affected</b>	Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Integration with Isabel synchronized (CIS) for Belgium

Isabel is the framework for electronic banking in Europe and is a de-facto standard in Belgium.

<b>Reason for deprecation/removal</b>	Integration with Isabel client has been discontinued.
<b>Replaced by another feature?</b>	No. The payment formats that are no longer used are replaced by ISO20022 Credit transfer payment format for Belgium.
<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Modifications in the chart of accounts and accounting rules for Spain

This feature is used for changes in the chart of accounts and accounting rules in Spain. It maps accounts to help

transform the old chart of accounts into the new chart of accounts, and compares the previous fiscal year with the new fiscal year, even if they were posted to different account numbers.

Reason for deprecation/removal	Limited usage
Replaced by another feature?	No
Product areas affected	General ledger
Status	Deprecated: A removal date has not been set for this feature.

#### **Pagamento Fornitori vendor payment format**

Legacy Italian payment format for credit transfers.

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Italy
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

#### **Payment export formats for Estonia**

The Telehansa and Teleservice formats are used for bank payment export.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Estonia
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

#### **Payment file archive for Norway**

When payment files are generated, the file archive automatically archives all files that are created, even files that were previously written or read.

Reason for deprecation/removal	Replaced by another feature
Replaced by another feature?	Yes, Electronic reporting archived jobs

<b>Product areas affected</b>	Accounts payable, Accounts receivable, Organization administration
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Payment import formats for Estonia

The Telehansa and TeleTeenus formats are used for bank payment import.

<b>Reason for deprecation/removal</b>	The payment formats are no longer used.
<b>Replaced by another feature?</b>	Yes, the ISO20022 Camt.054 bank notification import.
<b>Product areas affected</b>	Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Payroll information in Human Resources

Human Resources Payroll information

<b>Reason for deprecation/removal</b>	This functionality has been replaced by core Payroll and Human Resources pages.
<b>Replaced by another feature?</b>	<b>Benefits, Earnings</b> , and other related pages that were previously in US Payroll have been reconfigured, and are now part of the core Human Resources configuration to help support external payroll processing. This functionality is accessed by using the <b>Human Resources 1 &gt; Payroll</b> configuration key.
<b>Product areas affected</b>	Human Resources, Payroll
<b>Status</b>	Removed as of Dynamics 365 for Operations version 1611.

### Performance management goal workflow

Performance management includes goal management and integration with performance reviews.

<b>Reason for deprecation/removal</b>	Performance management was redesigned, and the number of goal pages was reduced to simplify the process.
<b>Replaced by another feature?</b>	No. Goals are visible to managers through the Manager Self Service portal, and can be changed and viewed by the manager.
<b>Product areas affected</b>	Human capital management

<b>Status</b>	Removed as of Dynamics 365 for Operations version 1611.

### Postgirot and Postgirot Utland payment formats for Sweden

Postgirot and Postgirot Utland payment formats for Sweden.

<b>Reason for deprecation/removal</b>	The payment formats are no longer used.
<b>Replaced by another feature?</b>	Yes, ISO20022 Credit transfer payment format for Sweden
<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Radio frequency identifier

Radio Frequency Identification (RFID) is a data-collection technology that uses electronic tags to store identification data and a no-line-of-sight requirement reader to capture the identification data.

<b>Reason for deprecation/removal</b>	Low customer usage and a limited feature set.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Inventory management
<b>Status</b>	Removed as of Dynamics 365 for Operations 1611.

### Report about state invoices numbering for Latvia

Latvian legislation provides specific rules about the numbering of sales invoices. The functionality lets you assign specific numbers to sales invoices, based on the user or user group. You can then generate a report or an XML file. You can also print a report about invoice numbers that are used.

<b>Reason for deprecation/removal</b>	The state invoice numbering no longer has to be maintained. The report about used invoice numbers is no longer required.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Set up the names of the manager and general accountant of a company for Lithuania

The names of the manager and the general accountant of a company can be specified in the company

information and used in different local report printouts.

<b>Reason for deprecation/removal</b>	Replaced by another feature
<b>Replaced by another feature?</b>	Yes, the setup of officials can be used for the same purpose.
<b>Product areas affected</b>	Accounts payable, Accounts receivable, Cash and bank management
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Shipping carrier interface

<b>Reason for deprecation/removal</b>	Duplicate functionality
<b>Replaced by another feature?</b>	Partially replaced by Transportation management
<b>Product areas affected</b>	Sales and marketing, Inventory management
<b>Status</b>	Removed as of Dynamics 365 for Operations version 1611.

### Telepay payment formats for Norway

Telepay payment formats include vendor payment export (credit transfer) and customer payment collection (direct debit).

<b>Reason for deprecation/removal</b>	The payment formats are no longer used.
<b>Replaced by another feature?</b>	Yes, ISO20022 Credit transfer payment format and AvtaleGiro customer payment format for Norway, as well as pain.002 and camt.054 bank notification return files import.
<b>Product areas affected</b>	Accounts payable, Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Vendor payment export formats for Finland

Two formats for exporting payments are available for Finland. LM02 (FI) is used for domestic payments, and LUM2 (FI) is used for foreign payments.

<b>Reason for deprecation/removal</b>	The payment formats are no longer used.
<b>Replaced by another feature?</b>	Yes, ISO20022 Credit transfer payment format for Finland

<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Warehouse management II

<b>Reason for deprecation/removal</b>	The Warehouse management II solution (WMS II) that was available in the <b>Inventory management</b> module duplicates functionality that is in the <b>Warehouse management</b> module that was released in Dynamics AX 2012 R3.
<b>Replaced by another feature?</b>	The <b>Warehouse management</b> module that was released in AX 2012 R3, Dynamics AX 2012 R3 CU8, and Dynamics AX 2012 R3 CU9 replaces the Warehouse management II features. The new module has more advanced features and more flexible warehouse management processes than Warehouse management II.
<b>Product areas affected</b>	Inventory management, Sales and marketing, Procurement and sourcing
<b>Status</b>	Removed as of Dynamics 365 for Operations version 1611.

### Worker reminders in Human Resources

Human Resources Payroll information

<b>Reason for deprecation/removal</b>	Low usage
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Human resources
<b>Status</b>	Removed as of Dynamics 365 for Operations version 1611

### Workflow for creating goals

A workflow for managing the creation of employee goals is one of several workflows that were available to help coordinate the performance management process.

<b>Reason for deprecation/removal</b>	Performance management has been completely redesigned in Finance and Operations.

Replaced by another feature?	The redesigned Performance management feature gives more control over the content of the goals, the measurements that are used to track progress, and the attachment of supporting documentation. Goals can be stored as templates and then reused. This feature can help you set up additional goals for your employees more quickly.
Product areas affected	Human capital management
Status	Removed as of Dynamics 365 for Operations version 1611.

## Dynamics AX 7.0

### Ability to cancel changes to a vendor invoice

Reason for deprecation/removal	Performance enhancement
Replaced by another feature?	No
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

### AIF, AxD, and AxBC integrations

In Application Integration Framework (AIF), data can be exchanged with external systems through business logic that is exposed as services. Dynamics AX includes services that are based on documents and .NET Business Connector (AxBC). A document is created by using XML. The XML includes header information that is added to create a *message* that can be transferred into or out of Dynamics AX. Examples of documents include sales orders and purchase orders. However, almost any entity, such as a customer, can be represented by a document. Services that are based on documents use the `Axd <Document>` classes.

Reason for deprecation/removal	The architecture of AIF and AxDs could not be scaled to a cloud service. There were performance issues around bulk import.
Replaced by another feature?	This feature is replaced by the Data Import/Export framework, which supports recurring bulk import/export. For AxBC, we recommend that you use the actual tables.
Product areas affected	AxDs, AxBCs, and AIF
Status	Removed as of Dynamics AX 7.0.

### Billing code rate scripts

Billing scripts were used to calculate billing rates for billing codes. This scripts required custom development in the C Sharp or Visual Basic programming language. In the current version of Dynamics AX, the **billing code rate scripts** are not supported.

<b>Reason for deprecation/removal</b>	The support for the custom C Sharp or Visual Basic scripts was not added in Dynamics AX 7.0.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Public sector, Accounts receivable
<b>Status</b>	Removed as of Dynamics AX 7.0.

### **BOMs without BOM versions**

When the **BOM versions** configuration key was disabled, bill of materials (BOM) versions were hidden in all forms, and the system forced a 1:1 relationship between released products and BOMs. In the current version of Dynamics AX, the **BOM versions** configuration key can't be disabled.

<b>Reason for deprecation/removal</b>	Using a configuration key to control BOM versions doesn't scale in a cloud environment.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Product information management, Inventory management
<b>Status</b>	Removed as of Dynamics AX 7.0.

### **Brazilian Bordero**

Specific method of payment for Brazilian companies

<b>Reason for deprecation/removal</b>	Support for the Brazilian Bordero method of payment has been discontinued from Brazilian localization
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### **Brazilian Sintegra statement**

Federal tax statement for ICMS tax

<b>Reason for deprecation/removal</b>	This statement is no longer applicable in some Brazilian states.
<b>Replaced by another feature?</b>	No. Users can use Generic Electronic reporting tool to configure the statement if required under specific situations.

<b>Product areas affected</b>	Fiscal books
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### **Brazilian SCAN contingency mode for NF-e**

(SCAN) contingency environment is used to generate, export, and import the status of a Nota Fiscal eletrônica (NF-e) when the environment of Secretaria da Fazenda (SEFAZ) is not available.

<b>Reason for deprecation/removal</b>	This method of contingency is no longer applicable in all Brazilian states
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Accounts receivable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### **Business Analyzer**

This mobile application let users review key business metrics.

<b>Reason for deprecation/removal</b>	This functionality has been replaced by another feature.
<b>Replaced by another feature?</b>	The Monitor financial performance content pack for Microsoft Power BI will include key financial metrics that were previously available in Business Analyzer.
<b>Product areas affected</b>	General ledger
<b>Status</b>	Deprecated: The use of Business Analyzer has been deprecated.

### **Business statistics**

The setup of business statistics inquiries that can help you analyze the performance of the organization

<b>Reason for deprecation/removal</b>	Legacy approach to business intelligence (BI), low customer usage, and a limited feature set
<b>Replaced by another feature?</b>	New BI solutions for the current version of Dynamics AX
<b>Product areas affected</b>	Procurement and sourcing, Accounts payable, Sales and marketing, Accounts receivable
<b>Status</b>	Removed as of Dynamics AX 7.0.

### Change document date function in Invoice approval journal

Reason for deprecation/removal	Low usage
Replaced by another feature?	Yes. The document date on the posted vendor transaction can be changed.
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

### ClieOp03 payment format for the Netherlands

Reason for deprecation/removal	The format is no longer applicable in the Netherlands, because it has been replaced by SEPA functionality.
Replaced by another feature?	SEPA payments export
Product areas affected	All modules
Status	Deprecated: A removal date has not been set for this feature.

### Compliance Center

The Compliance Center was an Enterprise Portal site for managing the documentation requirements for compliance initiatives that are related to the Sarbanes-Oxley law.

Reason for deprecation/removal	Lack of customer usage. Microsoft SharePoint includes the same capability that was available in the Compliance Center.
Replaced by another feature?	No
Product areas affected	Compliance and internal controls
Status	Removed as of Dynamics AX 7.0.

### Connector for Microsoft Dynamics

This tool was used to integrate key data from Microsoft Dynamics CRM to Dynamics ERP applications.

Reason for deprecation/removal	This functionality has been replaced by another feature.
Replaced by another feature?	Dataverse
Product areas affected	Connector for Dynamics

Status	Removed as of Dynamics AX 7.0.

### Container unit and multi dimension on-hand

Reason for deprecation/removal	Duplicate functionality
Replaced by another feature?	Yes. Since AX 2012, this functionality has been replaced by the consolidated batch orders feature set. This feature set includes the consolidated on-hand view.
Product areas affected	Product information management, Production control, Inventory management, Sales and marketing
Status	Removed as of Dynamics AX 7.0.

### Cue group metadata

Reason for deprecation/removal	Cue groups were used to display one or more Cues in the FactBox area. There was limited uptake, and there were also performance concerns, because a record change in a parent form caused one query per Cue in the Cue group.
Replaced by another feature?	No
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

### Cue metadata

Reason for deprecation/removal	Cue metadata was limited to count or sum information.
Replaced by another feature?	Tile metadata was introduced to provide more flexibility for modeling. For example, you can model current counts, navigation, and key performance indicators (KPIs). Count tile metadata is the direct replacement of the Cue metadata.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0

### Danish check format

--	--

<b>Reason for deprecation/removal</b>	Support for the Danish check format layout has been discontinued, and the report has been removed from DK localization.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	All modules
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Data partitions

Data partitions provide a logical separation of data in the Dynamics AX database.

<b>Reason for deprecation/removal</b>	Data partitions were introduced in Dynamics AX 2012 R2 to enable data isolation. In a common scenario, a company has subsidiaries, and the data from one subsidiary should not be visible to another subsidiary, even though both subsidiaries are managed by the same IT department. However, extra scripts and management overhead throughout the program were required in order to create new partitions and populate them with data, and to back up partition data. In the cloud, where we have access to platform as a service (PaaS) database services (Microsoft Azure SQL Database), it's much more efficient to use a database as the isolation container than to do isolation in the program. Regardless of whether data partitioning is required for subsidiaries, for multiple tenants, or just for scale, we believe that the scenarios can be handled better through multiple instances of Finance and Operations.
<b>Replaced by another feature?</b>	Customers using data partitions must use multiple instances of Finance and Operations if database level separation is a critical issue.
<b>Product areas affected</b>	All modules
<b>Status</b>	Removed as of Dynamics AX 7.0.

### Database and file share storage for attachments

Dynamics AX 2012 allowed storage of attachments in the database and in file shares. Both of those options are no longer supported.

--	--

<b>Reason for deprecation/removal</b>	Files share storage is no longer supported because cloud-hosted environments cannot communicate with local file shares. Database storage has been deprecated in favor of Azure Blob storage. Azure Blob storage is equivalent to storage in the database, as documents can only be accessed through Finance and Operations client forms. This provides the added benefit of providing storage that doesn't negatively affect the performance of the database. Blob storage is the default storage mechanism for Document Management and works immediately.
<b>Replaced by another feature?</b>	Database storage has been deprecated in favor of Azure Blob storage.
<b>Product areas affected</b>	All modules
<b>Status</b>	Removed as of Dynamics AX 7.0.

#### **Delimitation**

<b>Reason for deprecation/removal</b>	No use of the functionality was found.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Time and attendance
<b>Status</b>	Removed as of Dynamics AX 7.0.

#### **Desktop client**

<b>Reason for deprecation/removal</b>	The Dynamics AX client experience has been redesigned to improve usability across multiple platforms and devices.
<b>Replaced by another feature?</b>	The new web client is based on the desktop Form metadata and programming model that have been modified to provide a rich web platform.
<b>Product areas affected</b>	All modules
<b>Status</b>	Removed as of Dynamics AX 7.0.

#### **Direct database connection**

In Dynamics AX 2012 R3, Retail Modern POS could connect directly to the Channel DB in similar fashion to Enterprise POS. This was in addition to the standard communication method of Retail Modern POS communicating through Retail Server.

--	--

<b>Reason for deprecation/removal</b>	Direct database connectivity required lower security protocols and was primarily used to achieve the highest levels of performance. Due to the performance and security enhancements that have occurred in Finance and Operations, this functionality now causes more issues than it solves.
<b>Replaced by another feature?</b>	No. Only standard Retail Server communication is now supported.
<b>Product areas affected</b>	Channel DB/Retail Modern POS
<b>Status</b>	Removed as of Dynamics AX 7.0.

#### **Dutch SWIFT MT940**

<b>Reason for deprecation/removal</b>	Generic functionality is now used instead of localized functionality.
<b>Replaced by another feature?</b>	Yes, this functionality has been replaced by Advanced bank reconciliation functionality.
<b>Product areas affected</b>	All modules
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

#### **eBilanz (XBRL for Germany)**

This functionality provided eXtensible Business Reporting Language (XBRL) output that is intended specifically for the German eBilanz taxonomy.

<b>Reason for deprecation/removal</b>	Lack of customer usage
<b>Replaced by another feature?</b>	This feature hasn't been replaced by another feature, but multiple specialized XBRL packages that provide rich XBRL functionality are available for the German market.
<b>Product areas affected</b>	Management Reporter
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

#### **Enterprise Portal client**

<b>Reason for deprecation/removal</b>	A single client platform has been provided.

Replaced by another feature?	The new web client is based on the desktop form metadata and programming model that have been modified to provide a rich web platform.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

### Environmental sustainability

Reason for deprecation/removal	Low customer usage and a limited feature set
Replaced by another feature?	No
Product areas affected	Compliance and internal controls, Accounts payable
Status	Removed as of Dynamics AX 7.0.

### Form ActiveX and Managed Host controls

Reason for deprecation/removal	The ActiveX and Managed Host controls are based on the deprecated desktop client.
Replaced by another feature?	The extensible control framework supports building new controls that are based on HTML, CSS, and JavaScript, and is a first-class control in the Microsoft Visual Studio Tooling environment.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

### Generate prenotes by using a batch

Prenote generation can't be done by using a batch, but it can still be done by a user.

Reason for deprecation/removal	No form exists to persist and display the resulting prenote file when it's generated by using a batch.
Replaced by another feature?	Prenotes can still be generated, and the user has control over the location where the file is saved.
Product areas affected	Accounts payable, Accounts receivable, Cash and bank management
Status	Removed as of AX 7.0.

### German DTAUS payment export and account statement import (totals and transactions)

<b>Reason for deprecation/removal</b>	The format is no longer applicable in Germany, because it has been replaced by Single Euro Payments Area (SEPA) functionality.
<b>Replaced by another feature?</b>	Yes, this functionality has been replaced by SEPA payment export and advanced bank reconciliation functionality for importing account statements.
<b>Product areas affected</b>	All modules
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

#### **German DTAZV payment format in domestic Currency**

<b>Reason for deprecation/removal</b>	The format is no longer applicable in Germany, because it has been replaced by SEPA functionality.
<b>Replaced by another feature?</b>	SEPA payments export
<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

#### **German MT940 import**

<b>Reason for deprecation/removal</b>	Generic functionality is now used instead of localized functionality.
<b>Replaced by another feature?</b>	Yes, this functionality has been replaced by Advanced bank reconciliation functionality.
<b>Product areas affected</b>	All modules
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

#### **German XML EU Sales list**

<b>Reason for deprecation/removal</b>	The XML format for German EU Sales List reporting is no longer supported. Only the ELMA5 text file format can be used to submit the EU Sales List report to the German Tax Office.
<b>Replaced by another feature?</b>	No

Product areas affected	Tax
Status	Deprecated: A removal date has not been set for this feature.

### GL SSRS reports

Reports that include the following menu items have been removed: **Summary trial balance**, **Detailed trial balance**, **Chart of accounts**, **Audit trail**, **Balances**, and **Balance list**.

Reason for deprecation/removal	Financial Microsoft SQL Server Reporting Services (SSRS) reports have been replaced by Management Reporter capabilities and default reports.
Replaced by another feature?	Management Reporter (labeled <b>Financial reporting</b> in the current version of Dynamics AX)
Product areas affected	General ledger
Status	Removed as of Dynamics AX 7.0.

### InfoPart and FormPart metadata

Reason for deprecation/removal	InfoPart and FormPart metadata enabled the creation of FactBoxes for two different clients.
Replaced by another feature?	InfoPart metadata, which was a simplified form definition, is converted into a Form by upgrade tooling. FormPart metadata, which referenced a Form, is replaced by a more direct reference that is created by upgrade tooling.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

### Main account list page

A list of accounts for the legal entity and related balance information

Reason for deprecation/removal	Balance information is available on the <b>Trial balance</b> list page by account and dimension.
Replaced by another feature?	<b>Main accounts</b> contains the same list of accounts that the <b>Main account</b> list page contained. The grid view in <b>Main accounts</b> also shows an even smaller, grid-like view.
Product areas affected	General ledger

<b>Status</b>	Removed as of Dynamics AX 7.0.

### Malaysia and Singapore bank cash flow report

This feature let the user print a cash flow report that shows transactions and details of the cash inflows and outflows for a specific date range for selected bank accounts.

<b>Reason for deprecation/removal</b>	The same information can be obtained from the Inquiry bank transaction.
<b>Replaced by another feature?</b>	The Inquiry bank transaction
<b>Product areas affected</b>	Cash and bank management
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Mexican CFD electronic invoice

This feature enabled the generation of Mexican electronic invoices by using the Comprobante Fiscal Digital (CFD) method, where the company signs the invoice by requesting the related authorization from the government. This feature also provides a monthly report that includes all electronics invoices that were issued in the period.

<b>Reason for deprecation/removal</b>	The method is no longer applicable. The generation of electronic invoices by using the CFD method was deprecated by the tax authorities and replaced by the Comprobante Fiscal Digital a través de Internet (CFDI) method, where the signing is delegated to the third-party provider (PAC). The monthly report has been removed, and an inquiry option lets users inquire about historical transactions.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Account receivables, Project
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Mexico realized and unrealized VAT

Dynamics AX 2012 managed unrealized value-added tax (VAT) by using Mexico-specific functionality for unrealized tax.

<b>Reason for deprecation/removal</b>	Duplicate functionality
<b>Replaced by another feature?</b>	Yes, this functionality has been replaced by standard conditional sales tax functionality that is provided by Core.

<b>Product areas affected</b>	Tax
<b>Status</b>	Deprecated: A removal date has not been set for this feature.

### Microsoft Outlook integration

<b>Reason for deprecation/removal</b>	This functionality has been replaced by Microsoft Exchange Server integration.
<b>Replaced by another feature?</b>	Yes
<b>Product areas affected</b>	Sales and marketing
<b>Status</b>	Removed as of Dynamics AX 7.0.

### Private blocking of inventory and warehouse management journals

The inventory and warehouse journals no longer support the ability to mark a journal as private for a selected user. Only the process of blocking journals as private for user groups and blocking during editing is supported.

<b>Reason for deprecation/removal</b>	No use of the functionality was found.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Inventory management
<b>Status</b>	Removed as of Dynamics AX 7.0.

### Product builder

Product builder was used to dynamically configure items from a sales order, purchase order, production order, sales quotation, project quotation, or item requirement. Based on a product model that had modeling variables, the user could select values to meet the customer requirements and get a unique product variant that had a BOM and route.

<b>Reason for deprecation/removal</b>	Product builder exposed X++ code to end users and isn't supported in the current version of Dynamics AX. It has been removed to avoid duplicate maintenance efforts on overlapping, sizeable codebases.
<b>Replaced by another feature?</b>	Yes. The constraint-based configuration was introduced in Dynamics AX 2012 where the deprecation of Product builder in future versions was already announced. The constraint-based configuration technology is selected on the product masters to enable the configuration. To learn more, see <a href="#">Product configuration overview</a> .

<b>Product areas affected</b>	Product information management, Sales and marketing
<b>Status</b>	Removed as of Dynamics AX 7.0.

### Production Floor app

This is the app for tablet devices running Windows 8.1 RT and Windows 8.1 Pro.

<b>Reason for deprecation/removal</b>	With the change to a web-based client, it is possible to deliver similar functionality through the native Dynamics AX 7.0 client. The Job Card Device provides a production floor user interface that is optimized for touch and tablet form factors.
<b>Replaced by another feature?</b>	Yes. The Job Card Device, which is a native part of Dynamics AX 7.0.
<b>Product areas affected</b>	Production control
<b>Status</b>	Deprecated: A removal date from the Microsoft store has not yet been set for this feature.

### Rename product dimension

This feature let you change the name of one of the three standard product dimensions (size, color, or style) to a name that better suited your business requirements. Renaming included all the labels where the product dimension name was used.

<b>Reason for deprecation/removal</b>	The current version of Dynamics AX doesn't support label changes at run time.
<b>Replaced by another feature?</b>	No
<b>Product areas affected</b>	Product information management
<b>Status</b>	Removed as of Dynamics AX 7.0.

### Retail Server connectivity using HTTP

In Dynamics AX 2012 R3, the Retail Server could function using HTTP communication (non-secured). This was in addition to the standard communication using HTTPS.

<b>Reason for deprecation/removal</b>	Due to new security requirements, only secured communication using TLS 1.2 (or above, as available) is now supported. The self-service installer will automatically configure the computer for this communication.
<b>Replaced by another feature?</b>	No. Only standard HTTPS communication is now supported.

Product areas affected	Retail Server
Status	Removed as of Dynamics AX 7.0.

### Role Center pages

Reason for deprecation/removal	Role Center pages were built on the deprecated Enterprise Portal platform, which has been replaced by the new web client platform in the current version of Dynamics AX.
Replaced by another feature?	The new Workspace form pattern provides users with a process-centered design that provides easy access to commonly used tasks within that process.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0

### Sales tax jurisdictions

Reason for deprecation/removal	Low customer usage and a limited feature set
Replaced by another feature?	No
Product areas affected	US sales tax
Status	Removed as of Dynamics AX 7.0.

### Sites Services

Sites Services let you build websites that extend your business processes to the Internet without IT support.

Reason for deprecation/removal	The Microsoft Azure infrastructure that is used by Dynamics AX has new capabilities that can be used instead (for example, Azure sites).
Replaced by another feature?	No
Product areas affected	HR recruiting, Case management, Request for quotes, Vendor registration, Collaborative workspaces for opportunities and campaigns
Status	Removed as of Dynamics AX 7.0.

### SSAS demand forecasting strategy

<b>Reason for deprecation/removal</b>	The design of the feature cannot be supported in the new cloud architecture.
<b>Replaced by another feature?</b>	Azure Machine Learning demand forecasting strategy
<b>Product areas affected</b>	Master planning
<b>Status</b>	Removed as of Dynamics AX 7.0.

#### Vendor invoice pool excluding posting details

<b>Reason for deprecation/removal</b>	Low usage. This functionality has been replaced by the Invoice journal that has workflow functionality.
<b>Replaced by another feature?</b>	Workflow capabilities of the Invoice journal.
<b>Product areas affected</b>	Accounts payable
<b>Status</b>	Removed as of Dynamics AX 7.0.

#### Virtual company accounts

The virtual companies feature is no longer supported in Dynamics AX. The virtual companies feature let users set up tables that could be shared by a set of companies. For a description of the feature, see [Company accounts and Virtual company accounts](#). The feature works by grouping tables into collections that are assigned to virtual companies, which are groups of existing "real" companies. Queries are created so that all the companies in the virtual company can access the data in the tables of the associated table collections.

<b>Reason for deprecation/removal</b>	<ul style="list-style-type: none"> <li>- Virtual companies must be set up before data is stored in the tables. Retrofitting virtual companies onto an existing implementation is very difficult.</li> <li>- Because there has been so much data normalization in the current version of Dynamics AX, it has become difficult to know what to add to the table collections. For example, it's difficult to know which tables to share. All the tables referenced from tables that are in a virtual company must also added. Because of table normalization, even simple master data that is spread across multiple tables must be part of the virtual company. Any mistake that is made here will cause functional issues.</li> <li>- When a table is part of a virtual company, it loses information about the origin of the data, and only the virtual company is recorded.</li> </ul>
<b>Replaced by another feature?</b>	Global tables can be used to make tables accessible from all companies. Currently, there is no replacement.
<b>Product areas affected</b>	All modules

Status	Removed as of Dynamics AX 7.0.

### Windows 8 tablet app

The Windows 8 tablet app provided functionality for expense entry and approval.

Reason for deprecation/removal	Finance and Operations is compatible with tablets. The tablet app is no longer required.
Replaced by another feature?	No.
Product areas affected	Expense management
Status	Removed: This functionality is only available for Dynamics AX 2012 R3.

### Workplanner

Reason for deprecation/removal	Low usage
Replaced by another feature?	No, but the <b>Profile relation</b> page, which is opened from the <b>Profile groups</b> page, supports the same business scenario as the deprecated <b>Workplanner</b> page.
Product areas affected	Time and attendance
Status	The code has not been removed. However, the form, JmgWorkPlanner, was not migrated.

### X++ financial statements

Reason for deprecation/removal	This functionality has been replaced by another feature.
Replaced by another feature?	Management Reporter (labeled <b>Financial reporting</b> in the current version of Dynamics AX)
Product areas affected	General ledger
Status	Removed as of Dynamics AX 2012

# Removed or deprecated features in Dynamics 365 Commerce

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes features that have been removed, or that are planned for removal from Dynamics 365 Commerce.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature is not in active development and may be removed in a future update.

This list is intended to help you consider these removals and deprecations for your own planning.

## NOTE

Detailed information about objects in Finance and Operations apps can be found in the [Technical reference reports](#). You can compare the different versions of these reports to learn about objects that have changed or been removed in each version of Finance and Operations apps.

## Features removed or deprecated in the Commerce 10.0.17 release

### IMPORTANT

Version 10.0.17 is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

### Full dataset generation interval is deprecated

Reason for deprecation/removal	Beginning in this release, in the <b>Commerce scheduler parameters</b> form in Dynamics 365 headquarters, the <b>Full dataset generation interval in days</b> field will be deprecated. Also starting in this release, the field will be visually removed so that the value cannot be edited. This will stay as the value <b>0</b> .
Replaced by another feature?	No
Product areas affected	Dynamics 365 Commerce
Deployment option	All
Status	Deprecated. Do not use this field or change the value in it.

## Features removed or deprecated in the Commerce 10.0.15 release

### Internet Explorer 11 support for Dynamics 365 is deprecated

Reason for deprecation/removal	<p>Effective December 2020, Microsoft Internet Explorer 11 support for all Dynamics 365 products is deprecated, and Internet Explorer 11 won't be supported after August 2021.</p> <p>This will impact customers who use Dynamics 365 products that are designed to be used through an Internet Explorer 11 interface. After August 2021, Internet Explorer 11 won't be supported for such Dynamics 365 products.</p>
Replaced by another feature?	We recommend that customers transition to Microsoft Edge.
Product areas affected	All Dynamics 365 products
Deployment option	All
Status	Deprecated. Internet Explorer 11 won't be supported after August 2021.

## Features removed or deprecated in the Commerce 10.0.11 release

### Data action hooks

Reason for deprecation/removal	The data action hooks feature has been deprecated due to performance issues.
Replaced by another feature?	We recommend using <a href="#">data action overrides</a> to modify business logic in the data action layer.
Product areas affected	e-Commerce extensibility data actions
Deployment option	All
Status	Deprecated: As of release 10.0.11

### Retail SDK support for Visual Studio 2015, msbuild 14.0, and Retail SDK\Reference libraries and tools

Reason for deprecation/removal	Retail SDK support for Visual Studio 2015 has been deprecated and updated to support VS 2017, msbuild 15.0 and all the reference libraries and commerce proxy generator tools in the RetailSDK\References folder moved to NuGet packages to simplify the extension model and SDK upgrade process.
Replaced by another feature?	We recommend that you follow the information in <a href="#">Migrate the Retail SDK from Visual Studio 2015 to Visual Studio 2017</a> to update your system.
Product areas affected	Retail SDK extensions
Deployment option	All

Status	Deprecated: As of release 10.0.11
--------	-----------------------------------

### Retail Server Extension using IEdmModelExtender and CommerceController

Reason for deprecation/removal	Retail server extension using IEdmModelExtender and CommerceController has been deprecated to provide simplified extension model. The new implementation will have only the controller class without any additional IEdmModelExtender class implementation. This also avoids the dependency with a particular OData version (if the OData version is updated it may break extensions.)
Replaced by another feature?	We recommend that you use the IController class extension model by importing the NuGet (Microsoft.Dynamics.Commerce.Hosting.Contracts) package.
Product areas affected	Retail server extensions
Deployment option	All
Status	Deprecated: As of release 10.0.11

### Hardware station Extension using IHardwareStationController

Reason for deprecation/removal	Hardware station extension using IHardwareStationController has been deprecated to provide simplified extension model. The new implementation will have only the IController class without any additional class implementation and to avoid the dependency with core hardware station libraries, previously extension need to refer multiple libraries.)
Replaced by another feature?	It is recommended to use the IController class extension model by importing the NuGet (Microsoft.Dynamics.Commerce.Hosting.Contracts) package.
Product areas affected	Hardware station extensions
Deployment option	All
Status	Deprecated: As of release 10.0.11

## Features removed or deprecated in the Commerce 10.0.10 release

### POS operation 803 - Picking and receiving

Reason for deprecation/removal	Picking and receiving operations is being deprecated due to new operation redesign.
--------------------------------	---

Replaced by another feature?	Yes. It is replaced by two new POS operations: inbound operation (804) and outbound operation (805).
Product areas affected	Point of sale (POS) application
Deployment option	All
Status	Deprecated: As of release 10.0.10, the picking and receiving operation will no longer receive any new feature updates. Only critical bug fixes will be done for this operation in future releases. All customers are encouraged to move to the new <a href="#">Inbound operations</a> and <a href="#">Outbound operations</a> , which will continue to be part of our long-term product roadmap.

## Features removed or deprecated in the Commerce 10.0.7 release

### Commerce GetProductAvailabilities and GetAvailableInventoryNearby API's

Reason for deprecation/removal	New optimized APIs have been created to replace the GetProductAvailabilities and GetAvailableInventoryNearby APIs.
Replaced by another feature?	Yes: It is replaced by GetEstimatedAvailability and GetEstimatedProductWarehouseAvailability APIs.
Product areas affected	e-Commerce application SDK
Deployment option	All
Status	Deprecated: As of release 10.0.7, there will no longer be engineering investments made for GetProductAvailabilities and GetAvailableInventoryNearby. Organizations that use these APIs in their e-Commerce deployments should convert to the new GetEstimatedAvailability and GetEstimatedProductWarehouseAvailability APIs and enable the <a href="#">Optimized product availability calculation feature</a> .

## Previous announcements about removed or deprecated features

To learn more about features that have been removed or deprecated in previous releases, see [Removed or deprecated features in previous releases](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# AX 2012 features that were postponed

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic lists features of Microsoft Dynamics AX 2012 that were postponed. These features weren't implemented in Microsoft Dynamics AX 7.0. In the following table, the **Current status** column indicates whether the feature has been implemented since the AX 7.0 release.

For a detailed list of the release date for each version, see [Software lifecycle policy and cloud releases](#).

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
Absence management in Human resources	Functionality for entering absence transactions isn't included. Additionally, functionality for approving absence transactions as a manager isn't included. Setup capabilities that are required for integration with other modules are available through the <b>Human Resources 2</b> configuration key.	Implemented in Dynamics 365 Human Resources
Alerts	Alerts help users keep track of data changes in the system.	Implemented in Platform update 15
Bank payment order for Latvia and Lithuania	You can print a payment order for Latvia and Lithuania. This feature will be available in a future update.	Not implemented
Bankgirot AP return format for Sweden	The Bankgirot return format is used to import bank return messages. This feature will be available in a future update.	Not implemented
Client drag-and-drop	The web client controls have application programming interfaces (APIs) for drag-and-drop operations, but these APIs are based on the deprecated desktop client technology and they require a redesign so that they work on the new web client platform. APIs that support drag-and-drop operations will be reviewed for inclusion in a future update.	Not implemented
Client right-to-left (RTL) layout	RTL layout is now supported.	Implemented in Platform update 2

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
Cost accounting	The <b>Cost accounting</b> module is designed to meet the requirements of internal costs and profitability reports at multiple organizational levels. To define the cost object level, the module depends on a correct mapping of financial dimensions. The module lets you perform advanced allocations of cost origin from expenditures that are registered in the general ledger or budget. It also lets you compare realized costs and budgeted costs.	Implemented in version 1611
Customer self-service (CSS)	CSS lets you create approved customer records. It also allows users to view selected product catalogs, order items, and view the status of invoices. Additionally, CSS lets you create and follow return orders.	Not implemented
Customizable help topics	The ability to create customized help topics has not yet been implemented. Custom task guides and custom field help are available. This feature will be available in a future update.	Not implemented
Employee self-service (ESS)	ESS shows employees several tiles that have task-related and career-related information on a single page. Employees can view pending work items and click links that open pages where they can take action on their tasks. ESS pages also show employees the status of their certifications, when their next performance reviews are scheduled, skills, goals, and compensation information, and other information, such as balances for vacation and sick time. Employees can also access a company directory from their ESS page.	Implemented in version 1611
External questionnaire and recruiting functionality	Functionality for externally posting questionnaires and open jobs will be added to Human Resources in a future update.	External questionnaire functionality hasn't been implemented. Recruiting functionality is available in Microsoft Dynamics 365 Talent: Attract.
Fiscal printers for Poland	Integration with Polish fiscal printers enables the required information to be sent to the fiscal printer in the correct format during invoice posting. Examples of Polish fiscal printers include the Posnet Thermal and Elzab Omega printer types. This feature will be available in a future update.	Not implemented

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
General budget reservations	The General budget reservations document is sometimes referred to as a commitment. Public sector entities often use this document to set aside or earmark budgeted funds so that they aren't available for other purposes.	Implemented in version 8.1
<b>Graphics</b> tab on the <b>Fixed asset value model</b> and <b>Depreciation book profile</b> pages	The chart shows the depreciation, accumulated depreciation, and net book value over time. Users can click the <b>Data</b> tab to view more detailed information than the chart shows. This chart will be redesigned in a future update.	Not implemented
Intelligent Data Management Framework (IDMF)	IDMF is an add-on tool that lets system administrators optimize performance. IDMF assesses the health of the application, analyzes current usage patterns, and helps reduce database size.	Not implemented
Microsoft Project client integration	The Microsoft Project client is integrated with projects.	Implemented in version 7.2 (July 2017 update)
Procurement site	In previous versions, the Employee self-service procurement site lets you enter requisitions for employees, view the status of an order (created, received, or receipt confirmed), and request onboarding of a new vendor. You could configure different procurement catalogs to show on the site depending on policy. You could also design procurement catalogs by adding new nodes. In the current version, procurement catalog capabilities are reduced and are used only to limit the products that can be ordered for an organization. The structure is always based on the Procurement categories hierarchy. Additionally, on the procurement site the employee could approve a vendor invoice and confirm receipts in relation to the requisitions and derived purchase orders.	Not implemented
Secure global address book	The ability to help secure the global address book by legal entity and address book is not available. This feature will be available in a future update.	Not implemented
Specifications for Electronic reporting (ER) payment formats	Currently, you must enter the payment format specifications manually. In a future update, you will be able to select payment format specifications in	Not implemented

AX 2012 FEATURE THAT WAS POSTPONED

a list. The following payment specifications are currently supported per payment format.

CURRENT STATUS (AS OF FEBRUARY 2019)

[!NOTE] Values for these supported payment specifications are used as payment specification parameters on the **Payment specification** page for a selected method of payment.

O	Tax payments or other public services payments				
US Payroll	US Payroll provides gross-to-net processing for employees in the United States. In Payroll, you can set up, enter, and maintain all payroll records and transactions.		Implemented in version 1611		

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
Vendor collaboration (Vendor Portal)	<p>Dynamics AX 2012 provided vendor portal capabilities via Enterprise Portal. Financial and Operations also provides these capabilities. In version 7.1 (also known as Dynamics 365 for Operations 1611), a vendor could view and respond to purchase orders.</p> <p>In version 7.3, the vendor can view and respond to RFQs. Vendors can also view and edit selected information from the vendor record such as addresses, contact information, and contact persons, and they can upload documents in relation to their certifications.</p>	Implemented in version 7.3
Vendor requests - external request to become a new vendor	<p>Dynamics AX 2012 provided the ability for an anonymous user to sign up to be a vendor in the system, which could lead to a vendor request for adding a new vendor to the vendor master. In version 7.3, the anonymous request from a prospective vendor can be imported via an entity (Data Management/OData), which can lead to inviting the vendor - or the vendor's contact person - to register more details about the prospective vendor. The information provided is included in a new vendor request that can be reviewed and approved via a workflow process. An approval of the vendor request leads to creation of a new vendor account.</p>	Implemented in version 7.3
Vendor requests in general	<p>Dynamics AX 2012 had a concept of vendor requests that served various purposes related to updating vendor-related information, such as requesting new procurement categories for the vendor, internal employees requesting new vendors, or requesting to add a vendor to another company. Only the vendor's request of being added as a vendor has been implemented in version 7.3.</p>	Not implemented

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
[Russia] Tax registers	<p>Legal entities can use registers to disclose their revenues and expenses. The registers are used to track revenue and expense data from the time that primary documents, such as sales invoices and delivery notes, are first entered by using the calculation of cost prices for production. The data from the registers is used to confirm the declared profit of the legal entity. This functionality includes the following features:</p> <ul style="list-style-type: none"> <li>• Current period incomes</li> <li>• Tax expenses</li> <li>• Other expenses of current period</li> <li>• Unrealized expenses of current period</li> <li>• Other unrealized expenses</li> <li>• Accounts receivable debt – inventory</li> <li>• Bad debts reserve calculation</li> <li>• Bad debts reserve movement</li> <li>• Accounts receivable movement</li> <li>• Procedure for writing-off AR bad debts</li> <li>• Accounts payable debt - inventory</li> <li>• Accounts payable debt movement</li> <li>• Procedure for writing-off AP bad debts</li> <li>• Goods cost calculation</li> <li>• FA object information</li> <li>• IA object information</li> <li>• FA depreciation</li> <li>• IA depreciation</li> <li>• FA/IA sale</li> <li>• Depreciation bonus recovery</li> </ul>	Implemented in version 8.1.3
[Russia] Electronic export/import format for Client-Bank interface and reconciliation procedure	Electronic formats for export of outgoing payments, and import of incoming payments.	Implemented in version 8.1.3
[Russia] VAT declaration	Electronic format of VAT declaration.	Implemented in version 10.0.1
[Russia] Cash Flow Management	The functionality which obtains a cash flow forecast and performs an analysis, manages payments on a daily basis using payment schedule journals, controls the company's cash position, and maintains the company's cash flows with centralized control,	Implemented in version 10.0.1

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
[Russia] Accounting reporting format	Electronic format of the following accounting reports: BalanceSheet, IncomeStatement, CashFlow, EquityStatement, TargetUsageMoney	Implemented in version 10.0.1
[Russia] Assessed tax reporting	Assessed tax declaration.	Implemented in version 10.0.1
[Russia] Land tax reporting	Land tax declaration. Creation of Land tax declaration by separate divisions.	Implemented in version 10.0.1
[Russia] Transport tax reporting	Transport tax declaration.	Implemented in version 10.0.1
[Russia] Indirect tax return (VAT and Excise) on import of goods	Indirect (withholding) tax return (VAT and Excise) on import of goods from state members of Customs union.	Implemented in version 10.0.1
[Russia] Journal of Alcohol sales in Retail	Daily Alcohol journal.	Implemented in version 10.0.1
[Russia] Optional posting of transfer orders to General ledger	Option to post/not post transactions to General ledger when posting a transfer order.	Implemented in version 8.1.2
[Russia] Inventory owner	Inventory dimension used to track owner of inventory (consignment stock, bailment, tolling, etc.).	Implemented in version 10.0.1
[Russia] AP/AR - Third-party miscellaneous charges	Registration of third-party miscellaneous charges and allocation by the following regimes: Inclusion into cost of purchased goods (allocation to invoices lines from other vendors), and redrawing to other parties re-allocation to other expense accounts.	Implemented in version 8.1.1
[Russia] Goods in transit from vendor	Registering goods in transit from vendor by special posting profile with Item type "purchased items en route". Creating Act of inventory holdings en route. (INV-6)	Implemented in version 8.1.2
[Russia] Goods in transit - sales to customer with postponed passing of property	Post sales invoice with postponed property transfer: no customer debts posted, all outgoing taxes are posted, items are transferred to transit warehouse. Register passing of property with posting debts and items sale from transit warehouse.	Implemented in version 8.1.2
[Russia] Bailment - accounting at bailee side	Accounting of inventory receipt for bailment as required by the Law and generation of primary form MX-1. Accounting of inventory return from bailment and generation of primary form MX-3. Bailment costs calculation from bailee side.	Implemented in version 8.1.2

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
[Russia] Bailment - accounting at owner side	Accounting of inventory transfer to bailment and inventory return from bailment on goods owner side under bailment service contract.	Implemented in version 8.1.2
[Russia] Localization of Process Industries solution	Basic localization in two areas: correspondence of accounts for all new general ledger postings, and functional coexistence of Process Industries features and Russian country context (no issues when both Process Industries and Russian country context are enabled).	Implemented in version 10.0.1
[Russia] Alcohol sales declarations: Application 6, 7, 8 for wholesale. Applications 11, 12 for retail	Keeping track of alcoholic beverages types including producers, unit of measures, licenses for retail and wholesale trade. Preparing data for alcoholic beverages activities, including printing declarations and exporting them in XML format through e-reporting.	Implemented in version 10.0.1

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# End of mainstream support for Microsoft Dynamics AX 2009, Dynamics AX 2012, and Dynamics AX 2012 R2

2/18/2021 • 4 minutes to read • [Edit Online](#)

Mainstream support for Dynamics AX 2009 Service Pack 1 (SP1), Dynamics AX 2012, and Dynamics AX 2012 R2 ends on October 9, 2018. After that date, only security hotfixes will continue to be provided for these three versions through the extended support period that continues until October 12, 2021. For more information, see [support.microsoft.com](https://support.microsoft.com).

Mainstream support for Dynamics AX 2012 R3 continues through October 12, 2021. Microsoft will continue making security hotfixes, non-security hotfixes, and regulatory updates for Dynamics AX 2012 R3 throughout that mainstream support period. The source code for these non-binary, non-security hotfixes and regulatory updates will continue to be available for customers, and their partners, active on the Enhancement Plan or Software Assurance.

Dynamics AX 2009 SP1, Dynamics AX 2012, and Dynamics AX 2012 R2 customers can selectively integrate those changes as required. Customers and partners can get the source code from packages attached to relevant Dynamics AX 2012 R3 KB articles published on Lifecycle Services (LCS) and discoverable through Issue Search.

Customers are advised to upgrade to the latest version of Finance and Operations apps, such as Dynamics 365 Finance, Supply Chain Management, Retail, and Human Resources:

- Dynamics AX 2009 Service Pack 1 customers should use the [migration tool](#) that is available.
- Dynamics AX 2012 and Dynamics AX 2012 R2 customers should upgrade to Finance and Operations apps through Dynamics AX 2012 R3 using the upgrade tool that is available. Additional upgrade information is available in the [Upgrade from AX 2012 to Finance and Operations apps](#) topic.

## Frequently asked questions

### **When does the mainstream support for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 end?**

Mainstream support ends on October 9, 2018.

### **Was the information of the end date of the mainstream support for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 available before?**

Yes, it was always publicly available on the Microsoft Support Lifecycle site at [support.microsoft.com](https://support.microsoft.com).

### **Can customers on Premier Extended Hotfix Support or on Unified Support Advanced and Performance Levels get a non-security hotfix or regulatory update?**

No. Neither non-security hotfixes nor regulatory updates will be available for the Dynamics AX products during the Extended Support phase of the product lifecycle (Dynamics AX 2009 SP1, Dynamics AX 2012, or Dynamics AX 2012 R2).

While the ability to request a non-security hotfix for select products is included with Unified Support Advanced and Performance Levels, Microsoft has determined that non-security hotfixes cannot be provided with a *commercially reasonable* effort for these products. As a result, no requests for non-security hotfixes or regulatory updates will be accepted. However, Microsoft will continue making security hotfixes, non-security hotfixes, and regulatory updates for Dynamics AX 2012 R3 throughout that mainstream support period. The source code for these non-binary, non-security hotfixes and regulatory updates will continue to be available for

customers, and their partners, active on the Enhancement Plan or Software Assurance. Dynamics AX 2009 SP1, Dynamics AX 2012, and Dynamics AX 2012 R2 customers can selectively integrate those changes as required. Customers and partners can get the source code from packages attached to relevant Dynamics AX 2012 R3 KB articles published on LCS and discoverable through LCS Issue Search.

**I knew about the regulatory change before October 9, 2018, but it has the law enforcement date after October 9, 2018. Will I still get a regulatory update for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2?**

No, we will only provide regulatory updates for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 for regulatory changes with the law enforcement dates on or earlier than October 9, 2018.

**A customer or partner can already download a fix through LCS and inspect the code by installing it into a test Dynamics AX 2012 R3 environment. Is there any difference with the approach that you have proposed?**

No, there is no difference.

**What happens if a new bug is found by a customer in Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, or Dynamics AX 2012 R2?**

The bug must be reproducible in Dynamics AX 2012 R3. If it is reproducible and accepted, then a hotfix will be provided for Dynamics AX 2012 R3 and the customers can elect to integrate this hotfix in their version themselves, or work with their partners to integrate the changes.

**How are binary hotfixes handled for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2?**

If a hotfix is needed for a part of the system where Microsoft does not provide the source code and it is not a security bug, the hotfix will not be provided.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Help system

2/18/2021 • 6 minutes to read • [Edit Online](#)

Users of the following apps can access context-sensitive Help and other content that is based on the same Help system:

- Microsoft Dynamics 365 Commerce
- Dynamics 365 Finance
- Dynamics 365 Human Resources
- Dynamics 365 Supply Chain Management

In all these apps, you can access product-specific Help from the **Help** pane.

The screenshot displays the Microsoft Dynamics 365 interface. The main window shows a sales order for 'Contoso Retail San Diego' with a table of sales order lines. The Help pane is open on the right side, displaying a search bar and a list of help topics.

T...	Variant number	Item number	Product name	Sales category	CW quantity	CW unit	Quantity	Unit	Delivery type
		D0001	MidRangeSpeaker	Speakers			20.00	ea	Stock
		L0001	MidRangeSpeaker2	Speakers			29.00	ea	Stock
		P0001	AcousticFoamPanel				123.00	ea	Stock
		D0003	StandardSpeaker	Speakers			22.00	ea	Stock
		T0001	SpeakerCable / Speaker cable 10	Accessories			61.00	ea	Stock
		D0004	HighEndSpeaker / High End Spe...	Speakers			20.00	ea	Stock

		T0002	ProjectorTelevision	Television			37.00	ea	Stock
		T0005	TelevisionHDTVX59052 / Televisi...	Television			25.00	ea	Stock
		T0003	SurroundSoundReceive	Receivers			37.00	ea	Stock

The Help pane on the right contains a search bar and a list of help topics, including:

- Help
- Task Guides
- Showing help content for the current page
- Create sales orders (Publisher: Microsoft)
- Prospect to cash (Publisher: Microsoft)
- Generate and process customer rebates (Publisher: Microsoft)
- Credit card setup, authorization, and capture (Publisher: Microsoft)
- Confirm sales orders (Publisher: Microsoft)
- Working with serialized items (Publisher: Microsoft)
- Create a purchase order from a sales order (Publisher: Microsoft)
- Manage order holds (Publisher: Microsoft)
- RESOURCES
- Help
- Ask the community
- CustomerSource

## Help on docs.microsoft.com

The docs.microsoft.com site ([docs.microsoft.com/dynamics365](https://docs.microsoft.com/dynamics365)) is the default source for product documentation for the previously listed apps. This site offers the following features:

- **Access to the most up-to-date content** – The site gives Microsoft a faster and more flexible way to create, deliver, and update product documentation. Therefore, you have easy access to the latest technical information.
- **Content that is written by experts** – Content on the site is open to contributions by community members both inside and outside Microsoft.

You can find content on docs.microsoft.com by using any search engine. For the best results, we recommend that you use a site search, such as `site:docs.microsoft.com dynamics 365 "search term"`.

## Get notified about changes through an RSS feed

To subscribe to a Really Simple Syndication (RSS) feed of all updates that are to the content on docs.microsoft.com, use the following link:

[RSS feed](#)

## Leave us feedback

If you have feedback or questions about a topic, leave us a comment at the bottom of the page.

1. Select **Feedback** to get to the comments at the bottom of the page. Then, select either **Product feedback** or **Sign in to give documentation feedback**.
2. Start typing your comments, and then select **Submit feedback**.

## Feedback

We'd love to hear your thoughts. Choose the type you'd like to provide:

Our new feedback system is built on GitHub Issues. Read about this change in [our blog post](#).

Title

Leave a comment

### NOTE

If you want to submit documentation feedback, you must sign in by using a GitHub account. For more information, see [Setting up and managing your GitHub profile](#).

## Contribute to the documentation

You can contribute and make edits to the documentation. To get started, select the **Edit** button (pencil symbol) on a topic. The following video shows how you can contribute to our documentation.

The [How to contribute to the Microsoft Dynamics 365 documentation](#) video (shown above) is included in the Microsoft Dynamics 365 channel on YouTube.

For more information, see the [Docs contributor guide](#), which is published by the team that built the docs.microsoft.com site.

### NOTE

We only accept contributions to our English content at this time.

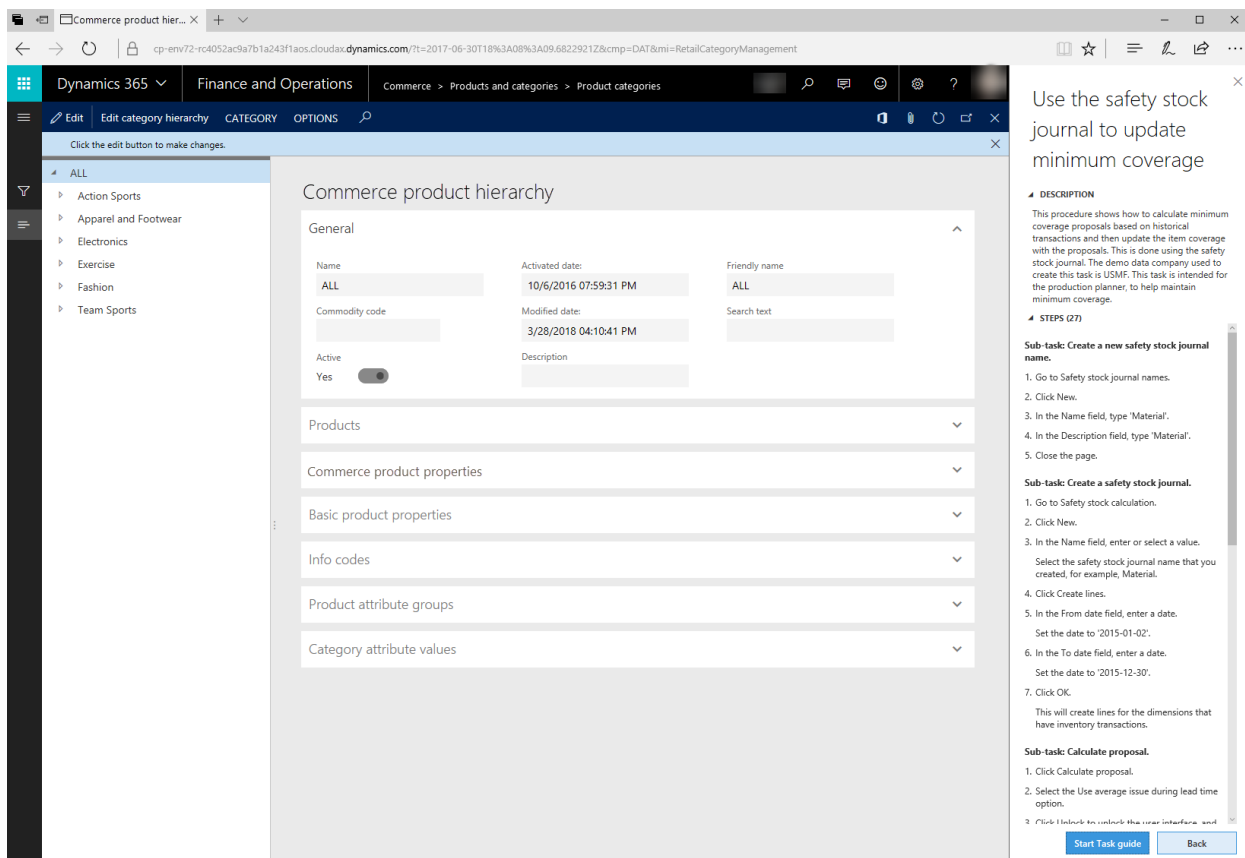

## Task guides

A task guide is a controlled, guided, interactive experience that leads you through the steps of a task, or business process. You can open (play) a task guide from the **Help** pane. When you first select a task guide, the **Help** pane

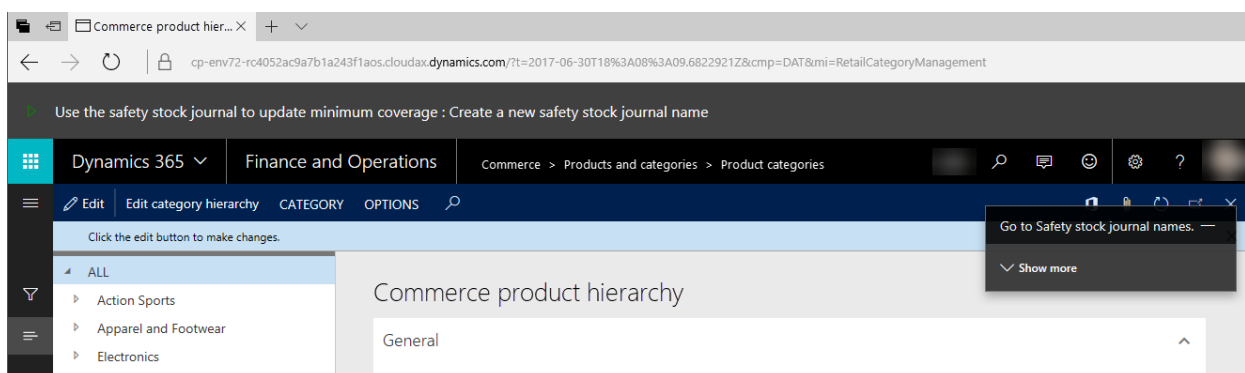

will show the step-by-step instructions for the task. Localized task guides are available.

Microsoft released task guide libraries for product versions through the December 2017 release of Dynamics 365 for Finance and Operations. The [Accessing task guides from the Help pane](#) section of this topic explains how to find the correct task guides for your product.

To begin the guided, interactive experience, select **Start task guide** at the bottom of the Help pane. A black pointer shows you where to go first. Follow the instructions that appear in the user interface (UI), and enter data as directed.

### IMPORTANT

The data that you enter when you play a task guide is real. If you're in a production environment, the data will be entered in the company that you're currently using.

You can use Task recorder to create your own custom task guides. For more information, see [Create documentation or training with Task Recorder](#).

## In-product Help

Some fields have field descriptions to help users get unblocked when they are uncertain about the data that the

field contains, for example. Additionally, the in-product **Help** pane provides context-sensitive access to content that can help users get started, get unblocked, and learn more.

To access Help content, select the **Help** button (?), and then select **Help**. Alternatively, press **Ctrl+Shift+?**. In both cases, the **Help** pane appears. From the **Help** pane, you can access conceptual topics or task guides that are relevant to the area of the product that you're currently in.

### Accessing Help topics from the Help pane

From the **Help** pane, you can access topics that apply to the client. When you first open the **Help** pane, the **Help** tab shows the topics that apply to the page that you're currently on. If no topics are found, you can enter keywords to refine your search. When you select a topic in the **Help** pane, it's opened on a new tab in your browser.

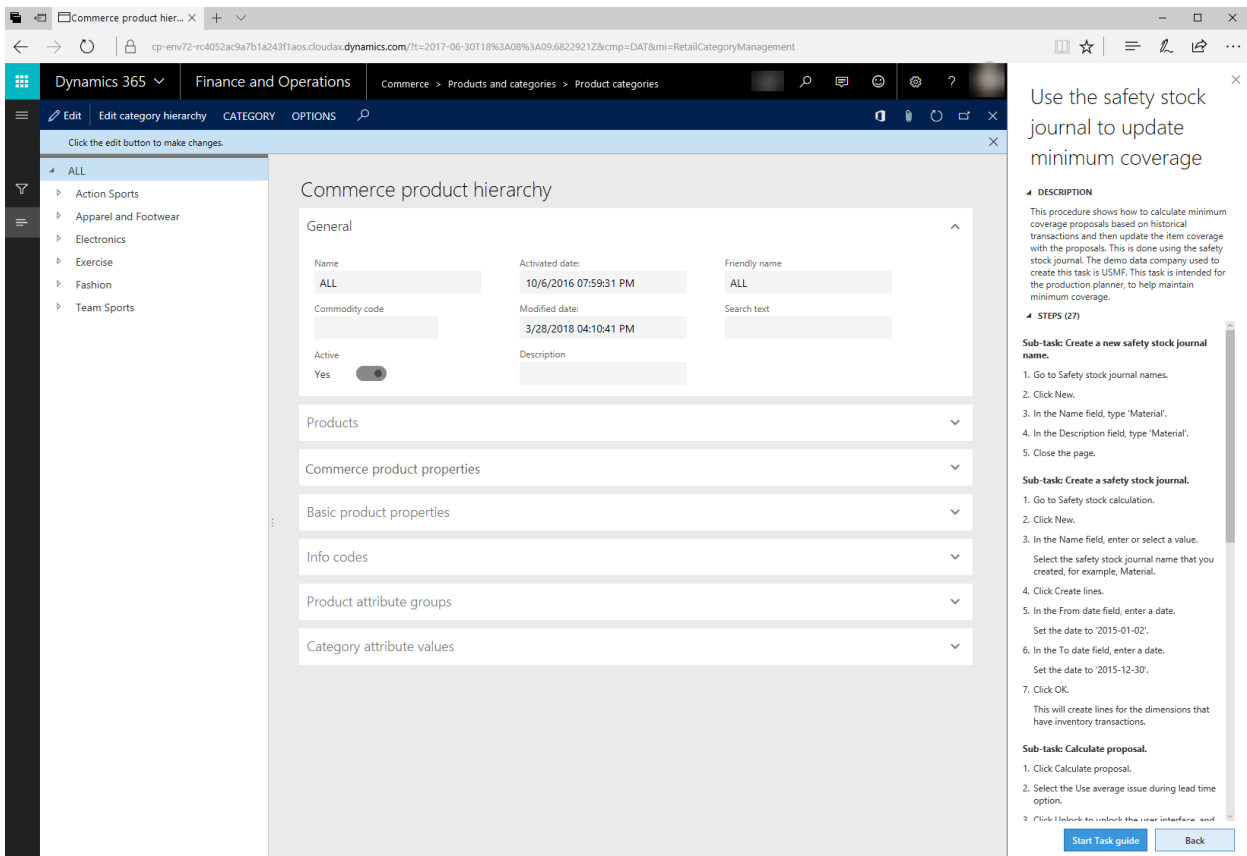

#### IMPORTANT

This section does not apply to Dynamics 365 Human Resources. The Help system for Human Resources is automatically connected to task guides for the product. Also, you cannot create custom task guides for Human Resources.

### Accessing task guides from the Help pane

Before you can access task guides from the **Help** pane, a system admin must configure some settings on the **System parameters** page in Finance, Supply Chain Management, or Commerce. For more information, see [Adding task guides](#).

After a System administrator has completed these steps, you can open the **Help** pane and select the **Task guides** tab. You'll now see the task guides that apply to the page that you're currently on. If no task guides are found, you can enter keywords to refine your search. After you select a task guide in the **Help** pane, the **Help** pane shows the step-by-step instructions, and you can play the task guide.

## Where are the translated task guides for Microsoft libraries?

Translated task guides are released in libraries that have "All languages" in the title. To view localized task guide Help, make sure that you're connected to an appropriate library. Each user can change the language that a task guide appears in by changing the language settings under **Options > Preferences**.

- If a task guide has been translated, when you open that task guide all the text of the task guide will appear in your selected language.
- If a task guide has not yet been translated, when you open it, only the text of the controls will appear in your chosen language.

## Creating custom Help

You can create Help for your users by creating custom task guides or connecting your own website to the **Help** pane. For more information, see the following topics:

- [Task recorder resources](#)
- [Custom Help overview](#)

## Additional resources

The following table lists our websites. Sites that have an asterisk (\*) next to the name require that you sign in by using an account that is associated with a service plan.

SITE	DESCRIPTION
<a href="https://docs.microsoft.com">Docs.microsoft.com</a>	This site hosts or links to all product documentation for Dynamics 365.
<a href="https://www.microsoft.com/learn">Microsoft Learn</a>	This site is the free Microsoft eLearning site.

SITE	DESCRIPTION
<a href="#">Microsoft Dynamics Lifecycle Services (LCS)*</a>	This site provides a cloud-based collaborative workspace that customers and partners can use to manage projects from pre-sales to implementation and operations. It's useful in all phases of an implementation.
<a href="#">Support blog</a>	This site provides tips and tricks that are posted by the Support team.
<a href="#">Docs.microsoft.com/previous versions</a>	This site hosts content from previous releases.
<a href="#">Dynamics Community</a>	This site hosts blogs, forums, and videos.
<a href="#">Microsoft.com/dynamics365</a>	This site provides evaluation and sales information.
<a href="#">CustomerSource*</a>	This site hosts training resources, downloadable reports, and white papers, and is the primary support site for service plan holders. Access to some resources on this site might require a service plan.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

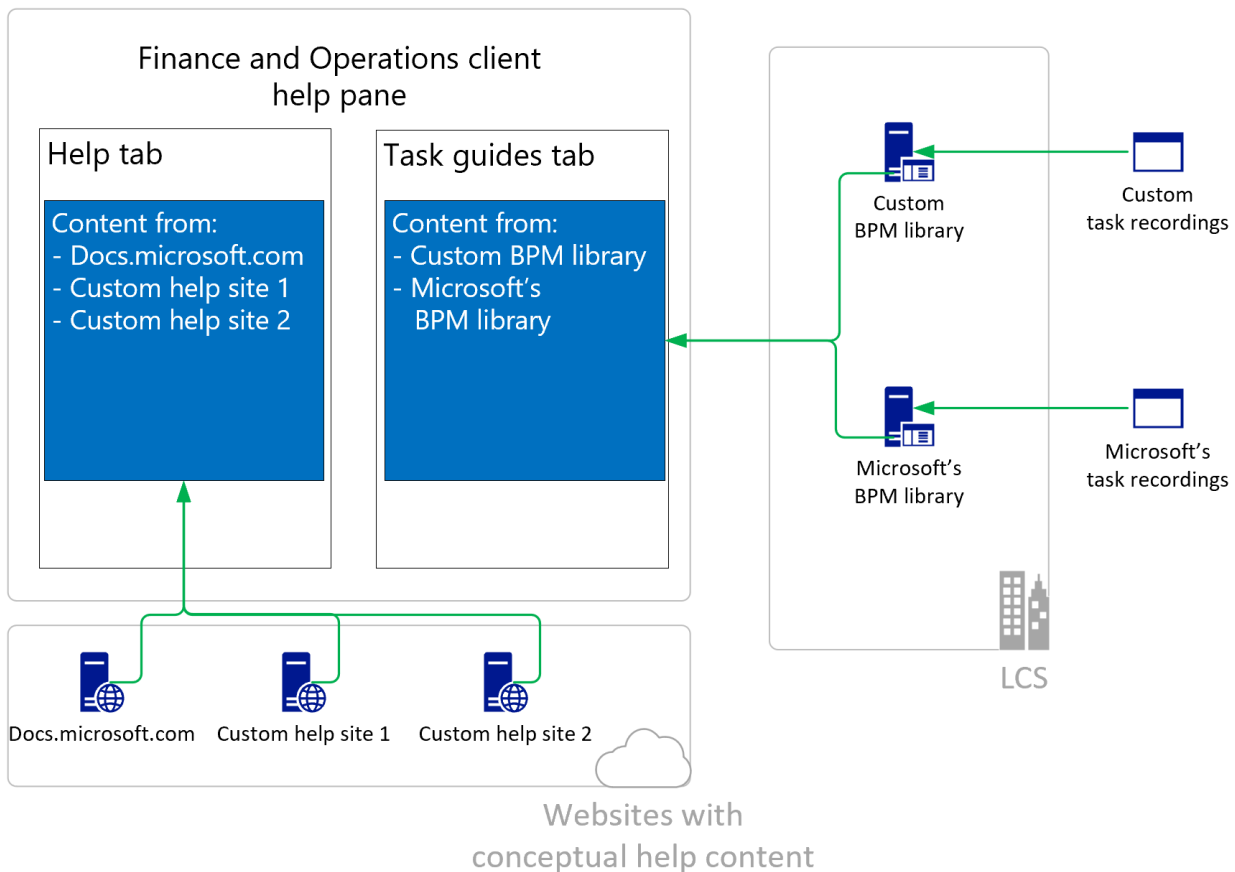

# Configure the Help experience for Finance and Operations apps

2/18/2021 • 4 minutes to read • [Edit Online](#)

In this topic, you will find an overview of the components of the Help system for Finance and Operations apps, such as Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, Dynamics 365 Commerce, and Dynamics 365 Human Resources. The topic also explains how to connect these components and provides a summary of the process for creating custom Help.

## Help architecture

Finance and Operations apps include conceptual overviews and other topics that are published to the <https://docs.microsoft.com/dynamics365> site. This content can then be accessed from the in-product **Help** pane. The following illustration shows the parts of the Help system.

The in-product Help system pulls articles from docs.microsoft.com and other connected websites. It also pulls in task guides that are stored in Business process modeler (BPM) in Microsoft Dynamics Lifecycle Services (LCS).

## Adding task guides

### NOTE

The **Task guides** tab isn't currently available in Human Resources or Commerce. However, the task guides in the Getting Started experience in Human Resources remain available to cover basic functionality. For both Human Resources and Commerce, procedural Help is available on the <https://docs.microsoft.com/dynamics365> site.

On the **System parameters** page, system admins can configure access to the relevant task guide libraries for an implementation.

**NOTE**

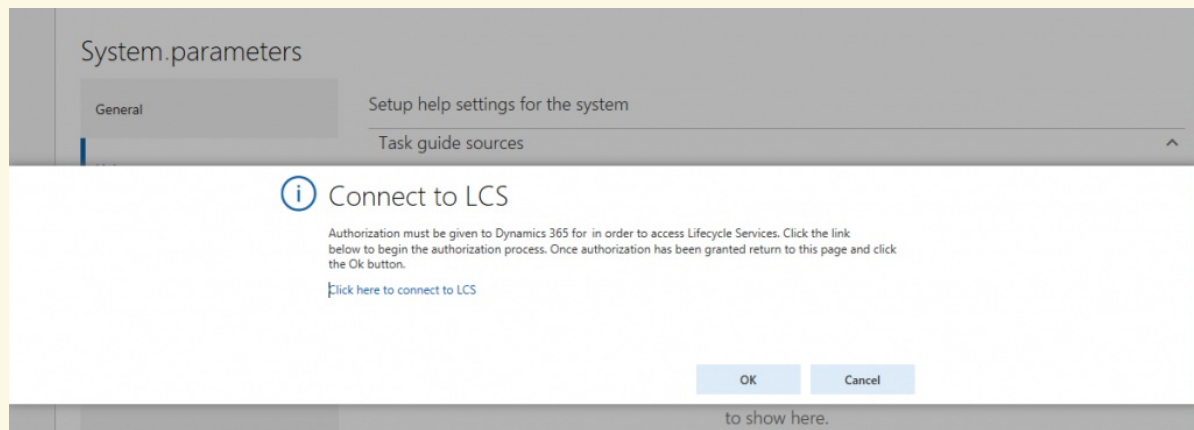

- To configure Help, you must sign in by using an account in the same tenant as the tenant where the app is deployed.
- An LCS library can't be connected from an instance of the app that is running on a local virtual hard drive (VHD).

To configure task guides for a solution, follow these steps on the **System parameters** page.

**IMPORTANT**

The first time that you open the **Help** tab, you must connect to Lifecycle Services. Be sure to select the link in the middle of the form, wait for the connection, close the dialog box, and then select **OK** to get to the **System Parameters** page.

1. Select the Lifecycle Services project to connect to.
2. Select the BPM libraries (within the selected project) to retrieve task recordings from.
3. Set the display order of the BPM libraries. The display order defines the order in which task recordings from the libraries will appear in the **Help** pane.

After you complete these steps, you can open the **Help** pane and select the **Task guides** tab. You'll now see the task guides that apply to the page that you're currently on in Finance and Operations apps. If no task guides are found, you can enter keywords to refine your search.

**Showing translated task guides**

Translated task guides were first released in the May 2016 APQC Unified Library and in the Getting Started library. To view localized task guide Help, make sure that your Dynamics 365 solution is connected to the May

2016 library. Users can change the language that a task guide appears in by changing the language settings under **Options > Preferences**.

#### **NOTE**

Although many task guides have been translated, the client doesn't currently show the translated task guide names. Additionally, in the May 2016 library, translations are available only for the task guides that were released in February 2016. Microsoft will release an updated library that includes additional translations.

- If a task guide has been translated, when you open that task guide all the text of the task guide will appear in your selected language.
- If a task guide has not yet been translated, when you open it, only some of the text (the text of the controls) will appear in your selected language.

## Adding custom Help

You can use task guides to create custom Help, or you can connect a custom Help website to the **Help** pane.

### **Create custom Help by using task guides**

You can create custom Help for the supported apps by creating task recordings that reflect your implementation and then saving them to a Business process library in LCS. You can't create custom task guides for Human Resources.

If you're a partner, and you promote a library to a corporate library and include it in a solution, it will be available to your customers. You can also make a copy of the APQC Unified Library, and then open the task recordings in the copy, edit them, and save your changes. For more information, see [Task recorder resources](#).

### **Connect a custom Help site**

Finance and Operations apps are rarely used in their out-of-box form. Instead, the solution is customized and extended to fit the organization's needs. You can also customize and extend the Help experience. For example, you can add custom Help to the in-product **Help** pane.

Microsoft has provided a toolkit to help you deploy and connect custom Help to the **Help** pane. For information about how you can set up a custom Help solution that is connected to the **Help** pane, see [Custom Help overview](#).

If you want to collaborate with Microsoft on tools and processes for customizing Help, fill in the form at <https://aka.ms/customhelpfeedback>.

## See also

[Help system](#)

[Custom Help overview](#)

[Task recorder resources](#)

[Create documentation or training with Task Recorder](#)

[Custom Help GitHub repository](#)

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Custom Help overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

Finance and Operations apps are often customized and extended to fit an organization's needs. If your solution is based on Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce, you can connect solution-specific and customer-specific Help content to the [Help pane](#) in the Finance and Operations client. This topic describes the main steps and decision points.

## NOTE

Users of Finance and Operations apps can create custom task guides to supplement conceptual content that describes the functionality of their solution. These conceptual descriptions are also referred to as Help and can be provided by Microsoft, partners, and an organization itself. For more information, see [Help system](#).

The following illustration, and this topic in general, use the term *Help* for conceptual descriptions that either include or exclude how-to guides. The term *task guides* refers to in-product task guides.

## Custom Help content

Custom Help content typically originates from one of three sources:

- Microsoft documentation repositories (repos)

You can use the [HTMLFromRepoGenerator](#) tool from the Custom Help Toolkit to clone content from any of the Finance and Operations repositories and generate corresponding HTML files. Those files can then be updated with content that is specific to your solution.

- Existing customized Dynamics AX content

You can [convert Dynamics AX custom Help content so that it can be used in Dynamics 365](#).

- HTML files that are created specifically for your solution

[Learn more about the metadata](#) that must be added to your HTML files for context-sensitive Help and search to work correctly.

## Process

The end-to-end process depends on the actual customer solution and the users' expectations. A typical process involves the following steps:

1. Create the custom Help content.
2. Publish the content on a website.
3. Index the content by using a search service.
4. Connect the custom **Help** pane to the website and the search service.

Microsoft provides a [toolkit](#) that can help you generate HTML files from the Microsoft Help repositories, generate JavaScript Object Notation (JSON) files for search services, and change the locale of HTML files so that it matches the locale of your solution.

You're welcome to share your knowledge by contributing to this documentation through the link at the bottom of the page or by joining the [Dynamics 365 community](#).

The following table outlines the main objectives that admins typically have for configuring the Help experience.

OBJECTIVE	LEARN MORE
I want to give my users a customized in-product Help experience that reflects their actual solution.	See the <a href="#">Custom Help websites</a> section of this topic and <a href="#">Create documentation or training with Task Recorder</a> .
I want to use the Microsoft Help content as a baseline for Help content that is specific to my solution.	See <a href="#">Custom Help Toolkit: The HtmlFromRepoGenerator tool</a> .
I want to contribute to the Microsoft Help content.	See <a href="#">Extend, customize, and collaborate on the Help</a> .
I want to reuse my existing Dynamics AX content.	See <a href="#">Convert Dynamics AX custom Help for use in Dynamics 365</a> .
I want to set up a website for my Help content.	See the <a href="#">Custom Help websites</a> section of this topic.
I want to add my content to the <b>Help</b> pane.	See <a href="#">Connect a custom Help website to the Help pane</a> .
Our technical writers want guidance that will help them convert our earlier content into Markdown so that it becomes easier for them to customize the Microsoft content.	See <a href="#">Moving to Markdown</a> .

## Custom Help websites

Before the product can connect to your Help content, you must customize the in-product **Help** pane so that it shows your content. The following conditions must be met:

- Your content must be available on a website.

You can deploy your content to an existing website, or you can set up a dedicated website to host your

content. The website can be private or public, but we recommend that users **not** be required to sign in to access your content.

- Your content must be indexed by a search service.

If you use the [AzureSearchCustomHelp](#) solution that is part of the [Custom Help Toolkit](#) for context-sensitive Help, the **Help** pane will generate a query that must be run against the search service's index. The query depends on specific metadata in the Help topics. For more information, see [Metadata requirements for custom Help topics](#).

The [Deploy custom Help to Azure](#) topic describes an approach for hosting content on Azure. It includes information about how to set up a search service that indexes your content so that it can be found by the in-product **Help** pane. If you don't have an [Azure subscription](#), create an account before you begin. You can start with a free account for 12 months. For more information, see [Create your Azure free account today](#).

# View and export field descriptions

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article describes how to view field descriptions and how to use the Field descriptions page to export descriptions.

Some of the more complex fields have field descriptions. These descriptions appear when you hover over a field. You can also view and export descriptions on the **Field descriptions** page.

Not all pages have field descriptions. We want to provide descriptions only for the more complex fields, not where the use of the field is obvious. Therefore, some pages don't have any field descriptions, some pages have a few descriptions, and some of the more complex pages, such as many of the parameters pages, have many descriptions.

If you have access to the development environment, you can add new field descriptions and customize existing descriptions. For example, you can add company-specific information to a field description. For more information, see [Customize field descriptions](#).

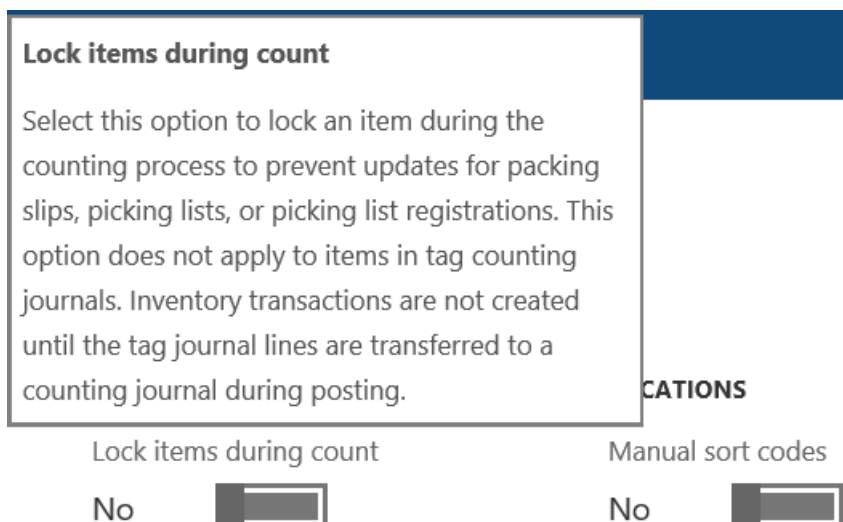

## See field descriptions in the user interface

You can view field descriptions by hovering over a field. If no description is available, you see the field name when you hover over the field.

### NOTE

In Dynamics AX 7.0 (February 2016), field descriptions can be viewed only on the **Field descriptions** page.

The following illustration shows the field description that appears when you hover over the **Lock items during count** field.

## Use the Field descriptions page to view and export field help

The **Field descriptions** page lets you view and export field descriptions. You can see the descriptions that are available for one page at a time.

**View the descriptions for a page**

To view the descriptions for a page, follow this step.

- In the **Select a page** field, type the name of the page. Alternatively, click the arrow to open a list of all the pages, and then browse or filter the list.

You can use either the name of the page that is shown in the user interface (UI) (for example, **Customers**) or the code name (AOT name) that's available when you right-click a page (for example, **CustTable**).

For information about the various ways to filter the list of pages, see the "Searching for a page" section later in this article.

If you set the **Include fields without a description** option to **Yes**, all the fields on the page are shown, even if they don't have a field description.

### **Export the descriptions for a page**

To export the descriptions for a page, follow these steps.

1. In the **Select a page** field, select a page.
2. Click the **Open in Microsoft Office** button in the upper-right corner, and then click **FieldDescriptionTmp**.

### **Searching for a page**

There are several ways to search for a page in the **Select a page** field. In many cases, you must click the arrow in the **Select a page** field to open the drop-down list, and then select from a filtered list of pages.

- Type part of the name, and then open the drop-down list to select from a filtered list of pages.
- Open the drop-down list, and then click either the **Page name** heading at the top of the list or the **Page AOT name** heading. A dialog box appears, where you can use advanced filtering options, such as **Page name begins with**.
- Type the full name of the page. When you use this option, it's best to open the drop-down list and see what else is in the list, even if field descriptions are shown.
  - If there is a single exact match to the name, the field descriptions for that page are shown.
  - If there is more than one exact match, no descriptions are shown. You must open the drop-down list and select the page that you want.
  - If the name that you typed is part of the name of another page, you see the descriptions for your page. However, if you open the drop-down list, you see additional pages that contain that name.

For example, no descriptions are shown when you type **Counting** in the **Select a page** field. You open the drop-down list, and see that there are two pages that have the name **Counting** and several pages that contain the word "Counting" in the name. If you select the page that has the AOT name **InventJournalCount**, the field descriptions are shown for that page. However, if you open the drop-down list again, you will see that the list now contains all pages that have "InventJournalCount" as part of their AOT name.

## **Troubleshooting**

This section provides information to help you troubleshoot issues that you might encounter when you use field descriptions.

### **I can't find a field description**

We're in the process of adding descriptions for the more complex fields. If you require help for a particular field, let us know by adding a comment for this topic.

### **The field description isn't helpful**

Let us know by adding a comment for this topic. If you can, describe the additional information that you require.

### **I can't find a field on the Field descriptions page**

To show all the fields on a page, set the **Include fields without a description** option to **Yes**. Click the **Select a page** field to verify that you've selected the correct page. If the name that you typed is part of another field name, you might have selected the page that has the longer name.

### **I can't find a page on the Field descriptions page**

For information about the various way to find pages, see the "Searching for pages" section earlier in this article. If you've typed the exact name of the page, the field descriptions might not be shown if more than one page has the same name. Click the arrow in the **Select a page** field to open a filtered list of the pages that are available.

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Task recorder resources

2/18/2021 • 33 minutes to read • [Edit Online](#)

This topic describes how to use Task recorder to record business processes.

## Overview

### Task recorder

Task recorder for Finance and Operations apps is a utility that lets users record business processes for several different use cases. Here are some examples:

- Step-by-step guided tours of a specific business process in the application itself
- Documentation of a business process as a Microsoft Word document that can optionally include screenshots
- Regression tests for a business process
- Automatic playback of a business process in the application

Task recorder for Finance and Operations apps boasts high responsiveness, a flexible extensibility application programming interface (API), and seamless integration with consumers of business process recordings. Task recorder is also integrated with the [Business process modeler \(BPM\)](#) tool in Microsoft Dynamics Lifecycle Services (LCS), so that users can continue to organize their recordings. However, users can no longer produce business process diagrams from recordings.

Task recorder can automatically generate application regression tests from business process recordings and play back previously recorded processes. These features also include test-specific gestures that let users take full advantage of Task recorder.

### Architecture

Task recorder can record user actions in the client with exact fidelity, because every control is instrumented to notify Task recorder about the execution of user actions. The control notifies Task recorder that an event has occurred and passes all the relevant information about the corresponding user action in real time. From this information, Task recorder can capture the type of user action (for example, a button click, value entry, or navigation) and any data that is related to the user action (for example, the input data value and type, form context, or record context). Task recorder persists the information with enough detail to ensure that a playback of the recording can run the recorded actions exactly as they were performed by the user.

### Basic configuration

Task recorder is included with every Finance and Operations app, and lets users begin to record business processes immediately after they open the client for the first time.

#### IMPORTANT

The **Task guides** tab is currently not available in Commerce or Human Resources. We are currently working to enable this functionality in a future release. Task guides in the Getting Started experience in Human Resources remain available to cover basic functionality. Procedural help is also available on the docs.microsoft.com site (<https://docs.microsoft.com/dynamics365/>) for both Commerce and Human Resources.

## Start a new recording

The following steps show how to use Task recorder to start a new recording.

1. Open the product, and sign in. It's a good practice to refresh the browser before each new recording. A refresh creates a new user session and restarts Task recorder. Therefore, it provides the most stable recording experience.
2. Select the company that you want to use while recording. If this is your first time using Task recorder, you can follow along as this tutorial creates a sample recording based on a Fleet Management business process. You will need to load the Fleet demo data to follow along:
  - a. Go to **Dashboard > Fleet Management > Fleet setup**.
  - b. Click **Load demo data**.
  - c. When the data is finished loading, click **Close**.
  - d. Go back to the **Dashboard** by clicking the product name in the navigation bar.
3. Go to **Settings > Task recorder**.
4. The **Task recorder** pane is opened. You can click the **Close** button (X) in the upper-right corner to close the **Task recorder** pane before you begin a new recording. You can reopen the pane by following the previous steps.
5. Click **Create recording**.
6. Enter a name for the recording and click **Start**. Recording begins the moment **Start** is clicked. For the Fleet example in this tutorial, we'll use the name "Create a new rental reservation."

While you're recording, you can click the **Close** button (X) in the upper-right corner to hide the **Task recorder** pane without stopping the recording. You can reopen the pane by clicking the **Task recorder** button that appears at the top of the page. This button appears only while recording is in progress.

#### NOTE

If the **Saved views** feature is turned on, recordings should be created by using either published views or the standard view, to ensure that recordings work reliably for users.

7. Task recorder enters **recording mode**. The pane shows information and controls that are related to the process of recording.

Now you're ready to record a business process using Task recorder. If you're following this guide as a first-time user, you may complete the following Fleet Management scenario as an example. Otherwise, you can record your own application scenario.

#### Record a Fleet Management scenario

1. In the **Task recorder** pane, click **Start sub-task**.
2. Set **Name** to "Create a new rental customer". Leave the **Comment** field blank.
3. Click **OK**. The task is added to the step list.
4. Go to **Dashboard > Fleet Management > Reservation Management**.
5. Go to **All customers** under the **Summary** tab.
6. In the Action Pane, click **New**.
7. Enter a first and last name for the customer.
8. Click **Save**.
9. In the **Task recorder** pane, click **End sub-task**.
10. Return to the **Reservation Management** workspace by clicking the browser back button twice.
11. In the **Task recorder** pane, click **Start sub-task**. Name the task "Rent a vehicle to the new customer". Click **OK**.
12. Click (+) **Rental** under **Summary**.

13. Under **Information**, select a "1975 Litware McKinley" as the vehicle.
14. Under **Information**, set the customer to the one just created.
15. Expand the **Discounts** section.
16. Click **Add** under **Discounts** and add the Frequent Customer discount. Click **OK**.
17. In the Action Pane, click **Start Rental**.
18. Set the return date to some date in the future.
19. Click **OK**.
20. In the **Task recorder** pane, click **End sub-task**.
21. Click **Stop** at the very top of the page.

## Recording a business process

After you've started your recording, you can perform your business process just as you would typically perform it by using the web client. As you interact with the product, new steps are added to the step list in the **Task recorder** pane. In this section, you will learn about other actions that you can perform while you're recording a business process, to take full advantage of Task recorder's capabilities.

### Stop

**Stop** is used to end the recording session. Before you click **Stop**, you should make sure that the recording is completed, because this action isn't reversible. When you click **Stop**, you're taken to the download options screen.

### Start/End sub-task

**Start/End sub-task** lets a user specify the beginning and end of a set of grouped steps in a recording. Click the **Start sub-task** button to add a "Sub-task" step to the end of the current list of recorded steps. The sub-task will include all steps that you perform from this point until you click the **End sub-task** button. When you click the **End sub-task** button, an "End sub-task" step is also added to the list of recorded steps.

#### NOTE

You must start a sub-task before you perform/record the steps that you want to include in the task. Then, after you've performed/recorded all the steps that you want to include in the task, you must end the sub-task.

Sub-tasks are purely an organization tool, and consumers of business process recordings can interpret the task groupings in useful ways. Because tasks can be nested inside other tasks, they provide the flexibility to organize very long and complex business processes.

### Delete/Restore step

**Delete/Restore step** enables a user to remove steps from the recording, or undo the removal of a step from the recording. You must first select the step in the Steps list that you want to delete/restore, and then click the **Delete/Restore step** button.

## NOTE

The behavior of the **Delete** button changes when you play back a recording. In playback mode, a deleted step can't be restored after playback has passed the point where it would have run the deleted step. For example, you load a recording that contains three steps, and then you delete step 2 before you start playback. You can restore step 2 only as long as playback hasn't run step 3. After you start playback, and playback has "skipped" step 2 (because you deleted it) and run step 3, you won't be able to restore step 2. Because step 2 wasn't run and therefore wasn't recorded, it can't be retroactively added back into the recording at its previous position.

## Add developer placeholder

**Add developer placeholder** lets the user add a placeholder step to the list of recorded steps. This placeholder step doesn't appear when the task guide is viewed, and it isn't run during maintenance of a recording. It's used only by the [Regression suite automation tool \(RSAT\)](#) or the X++ code generator that enables an X++ test to be created from a task recording. When the code generator creates an X++ test, it automatically adds a method stub to the generated code. The developer can then add X++ code into this method stub. The automated code will call the validation when the generated test is run at the point in the recording where this placeholder was added.

## Enriching steps in a recording

There are various options for enriching a step in a recording. For example, you can adjust the text that is associated with a step and add information about a specific step. This section describes the step enrichment capabilities that are available. To access these options, click the **Edit step** button on a specific step of a recording.

### Step instruction

The **Step instruction** is the primary text that is displayed for this step in the task guide. There are usually 2-3 alternative options for step instructions, and they appear in the following order when editing the annotation.

#### Step instruction

- In the First name field, type 'John'.
- In the First name field, type a value.
- In the First name field, { your example text }.

This image shows the annotation options for changing a step.

- **Preferred value instruction** This type of instruction will direct the user to enter the same data that was used when the step was recorded. *Example:* In the First name field, enter 'John'.
- **Example value label** This type of instruction will direct the user to enter their own data, indicating that the data that was used when the step was recorded was only *Example* data. *Example:* In the First name field, enter a value.

If users click the **See more** button on this step when they play the recording as a task guide, they will be able to see the data that was used when the step was recorded. This recorded data value will be labeled as an *Example* data value.

## NOTE

Steps that are not related to fields, such as clicking buttons, opening forms, or selecting records from a lookup, do not set *Example value label* as an option when annotating.

- **User-supplied value label** This step instruction contains placeholder text, which the author can fill in with their own text. For steps which have an **Example value label** option, the placeholder allows substituting the text which normally specifies the data to enter. This is useful for scenarios where neither the **Preferred value label** nor the **Example value label** sufficiently express the data that should be used for this step.
    - *Example label:* In the First name field, enter *{your example text}*.
    - *Example label after supplying the placeholder text:* In the First name field, enter the customer's name.
- For steps which do not have an **Example value label** option, the placeholder allows substituting all of the label text. Steps associated with buttons, for example, do not have **Example value labels**, so you may replace the entire label text with your own text.
- *Example label before replacement:* Click Post.
  - *Example label after replacement:* To post the order, click Post.

### Titles and notes

Titles and notes provide places for user-specified text to be associated with a step in a task guide.

- **Title** – The title lets you specify the text that appears above the step instruction for this step in the task guide. The title a good place to put text that you want users to read before they complete the action that is indicated by the step instruction.
- **Note** – You can use a note to specify text that appears in the expandable section of the pop-up for this step in the task guide. A note is a good place to put optional reading material or other information that might be useful to users, but that they aren't required to read to complete the action that is indicated by the step instruction.

### Change recorded values

Starting in version 10.0.12, you can adjust the values that are recorded in basic input controls (for example, simple text, numeric, date, and picklist fields), without having to re-record those steps. Note that lookup controls and reference groups aren't currently supported.

### Hide from task guide

The **Hide this step** option lets the author prevent specific steps from appearing in the task guide. This option is useful for hiding steps that are required for the task recording to run in playback mode, but that should not be seen by users. Examples of these steps include copy steps, system-generated steps, and data clean-up steps. If you hide a sub-task, all the steps that are recorded inside that sub-task will also be hidden.

## Using control gestures

The basic recording capability lets a user record an end-to-end business process by using Task recorder, but without adding overhead to the process. In some circumstances, more advanced recording features can be used to create even richer business process recordings. Each of the following gestures is found under the **Task recorder** option on the shortcut menu (also known as a right-click menu or context menu) for a control and causes a step to be added to the recording. If the gesture isn't supported for a control, it won't appear on the shortcut menu for that control.

### Copy

The **Copy** gesture lets you copy the value for the current control to the Task recorder "clipboard." That value can then be used later as part of a **Paste** or **Validate** gesture. Because values from multiple controls might have to be pasted, the Task recorder clipboard maintains a list of all control values that have been copied in the recording.

### Paste

The **Paste** gesture lets you paste a value from a previous **Copy** gesture in the same recording. The Task recorder

paste function works like the standard paste function that users might be familiar with, but it has an additional benefit when it's used during recordings. Because Task recorder will replay the recorded **Copy** and **Paste** commands during playback, if the copied control has a different value than it had during recording, Task recorder will paste the current value instead of the value that the copied control had during recording. This feature is useful in scenarios where the copied control has a value that can change between environments (for example, reclD values or number sequences).

There is an additional benefit from using the **Copy** and **Paste** gestures when test code is generated. For any control where the value is set via the **Paste** command, Task recorder doesn't have to create a parameterized input variable for that control's value, because it's set based on another control's value. This feature can be very useful in scenarios where an entity such as a customer is created, and an identifier for that entity is frequently entered during the recording. Instead of manually re-entering the customer name or ID throughout the scenario, and causing Task recorder to generate a parameterized input variable for each entry, the user can copy the customer name or ID one time, and then repeatedly paste it. In this case, Task recorder will generate a single parameterized input variable to represent the customer name or ID. This feature can make it much easier to change the input data for a generated test.

## Validate

The **Validate** gesture lets you insert a step that validates the value of the targeted control. This gesture always uses equality to validate the control value. *Validations aren't currently run during recording playback.* Instead, they are run only when the generated test code is run. Two kinds of validation are available:

- **Current value validation** will capture the targeted control's value at the time of recording and use it to generate an assertion in the test code. In the list of validation options on the shortcut menu, **Current value** is always first.
- **Reference value validation** will use the value of a previously copied control when generating an assertion in the test code. This allows creating assertions that are resilient to changes in the data, since the value is not hardcoded into the test code. In the list of validation options on the shortcut menu, **Reference value validation** follows the format [AOT name of copied control: current copied value].

Additional options are available in version 10.0.13 and later. Here are some examples:

- **Enabled/Disabled** validates that the targeted control's state is enabled (or disabled), and then uses that validation step to generate an assertion in the test code.
- **Read-only/Editable** validates that the targeted control's state is read-only (or editable), and then uses that validation step to generate an assertion in the test code.

## Add info step

The **Add info step** gesture lets you insert a step and supply your own text for it. This feature is useful primarily for creating task guides. An **informational step** (or **info step** for short) is a task guide step where the instruction text for the step is user-specified. Info steps are useful for describing actions that are a part of the scenario but must occur outside the client. For example, a scenario might require the user to search for item inventory or check an email for information.

You can specify where an info step should appear in the task guide. The info step can point to a control on the page, if the step is associated with the control. Alternatively, the info step can appear in the upper right of the page, if the step is external to the client, or if it's an explanation that applies to the whole page.

### NOTE

Because info steps are manually specified steps and are not automatically recorded by Task recorder when the user takes an action on a control, the info step does not have the capability to automatically progress when a user completes the step in the task guide. Because the info step is not associated with taking an action in the client, there is no action for a task guide to detect that the user has completed in order to automatically progress to the next step.

# Options after a recording is completed

After you click **Stop** to end your recording session, several options are shown so that you can save the files that are related to the completed recording. Select **Save to this PC**, and save the task recording package to your desktop. You will use this file later.

## Save to this PC

One option after you finish your recording is to download the task recording package (an .axtr file) to your computer. This file can be loaded later via the **Task recorder** pane, so that the recording can be played as a task guide or edited.

## Save to Lifecycle Services (LCS)

When you save your recording to an LCS library, it's published on the specified business process in a BPM library. If the selected LCS library is set as a Help library, you will be able to find the task guide for the recording by searching the **Help** menu.

### NOTE

To be able to save a recording to an LCS library, the user must be in the Azure Active Directory (Azure AD) tenant that the environment was deployed from.

## Export as Word document

The Microsoft Word document for your recording contains the recorded steps as well as any screenshots that were captured.

## Save as developer recording

The raw recording file (developer recording) is useful for developer scenarios, such as test code generation and scenarios where **RSAT** is used.

# Playing back a recording

The **playback** functionality of Task recorder can automatically run the steps of an existing recording by using the pages and values that were originally recorded. Playback mode can be used to update an existing recording if changes were made to the underlying application, and those changes altered the business process steps that are required for the scenario. It's important to remember that, in this mode, Task recorder simultaneously re-

records the steps and plays them back. When the playback is completed, a new recording is produced that reflects both the steps that were run from the existing recording and any new steps that the user manually performed. Any steps that aren't run either by the user or automatically by Task recorder aren't included in this new recording.

To play back an existing recording, follow these steps.

1. Refresh the browser tab.

#### NOTE

It's a good practice to refresh the browser before each new recording.

2. Open the **Task recorder** pane.
3. Click **Playback recording**.
4. Click **Open from this PC** to load a recording from a previously downloaded Task recorder package (.axtr file).
  - If you're reading this guide for the first time and following along, choose the "Create a new rental reservation" file that you downloaded previously.
5. Click **Start**.

When you play back a recording, additional actions are available in the **Task recorder** pane.

#### **Play next pending step**

**Play next pending step** runs the next step in the recording. This action is useful because it gives you more control over the playback speed when you want to analyze the effects of a single step. This action has a side-effect that it's important to be aware of. When you click **Play next pending step**, any open lookups, drop-down dialog boxes, or Action Pane tabs might be dismissed, because this action removes focus from those elements. For these situations, we recommend that you use **Play all pending steps** instead.

#### **Play all pending steps**

**Play all pending steps** begins sequential execution of the remaining steps in the recording, and continues until either playback is paused or all steps have been run. During playback, the **Play all pending steps** button is replaced by a **Pause** button that can be used to pause playback. If playback can't successfully run a step for any reason (for example, because it can't find a button that has been renamed), Task recorder will skip that step, and playback will automatically be paused. In this way, the user has an opportunity to replace the obsolete step by completing the new steps in the client. Task recorder will record the new steps and ignore the step that was skipped. The user can then click **Play all pending steps** to continue playback for the remaining steps. After the recording is completed, the user can download the updated recording. This recording will contain all the steps of the original recording, but will exclude any skipped steps and include any new steps.

#### **Play to selected step**

**Play to selected step** behaves like **Play all pending steps**, but it lets you play only a subset of the steps instead of all the steps. In the list, select the step that you want playback to stop at, and then click **Play to selected step**. Task recorder will begin to run the steps in the list and will stop when it has run the step that you selected.

## Editing a recording

Although you can edit a recording through the playback functionality, there is also a mode that lets you make simple edits to a recording without having to replay the whole recording. To access this feature, click **Edit recording** after you open the **Task recorder** pane. You can use this feature to make the following edits:

- Insert steps into a recording without re-recording the whole file.
- Move steps under a sub-task without re-recording the whole file.
- Adjust the name and description of the recording.

### Insert steps without re-recording the entire file

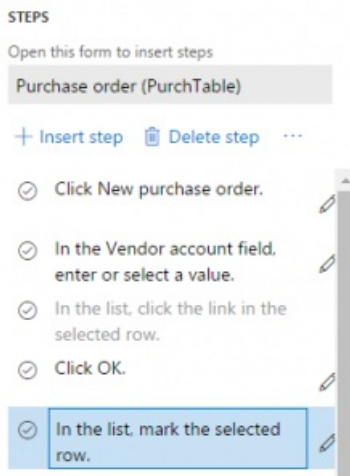

You can add a step anywhere in a task recording without playing back or re-recording the whole file.

1. Select the step after which you want the new step to be inserted. Make sure the step is highlighted.

In order for task recorder to insert a step, you must have the correct page open. The correct page is the page on which the new step occurs. Task recorder has a mechanism that determines what the active page is, and will disable the functionality if the correct page isn't open.

When you are on the correct page, **Insert step** becomes available.

2. Click **Insert step**.

When you click **Insert step**, Task recorder switches to recording mode. Any action that is performed in the user interface (UI) will now be recorded and inserted into the recording as steps.

3. Click **Stop**.

Recording mode is stopped, and you can now continue to edit the recording. For example, you can repeat this process to insert steps in other places in the recording, or you can move sub-tasks as described in the next section.

4. When you've finished editing the task recording, click **Done editing**, and then select one of the options to save or publish the recording.

### Move steps under a sub-task without re-recording the entire file

You can move steps under a sub-task without playing back or re-recording the entire file. You can also move the sub-task step or the end sub-task step if you want to group an existing block of steps.

1. Select the step or sub-task step that you want to move. Make sure that the step is highlighted.
2. Click **Move step after**. To access this command, you might have to select the ellipsis (...) button.

3. Select the step or sub-task step that you want to move the step or sub-task step after. Task recorder will move the step.
4. To move the end sub-task step, select it, click **Move step after**, and then select the step that you want the end sub-task step to be after.

If you want the first step in the task guide to be within a sub-task, create a sub-task step as the second step, and then move the first step into it. You can add or move as many steps or sub-tasks as needed.

5. When you've finished editing the task recording, click **Done editing**, and then select one of the options to save or publish the recording.

### Adjust the recording name and description

You can adjust values of the **Recording name** and **Recording description** fields. If you want to see more steps in the Task recorder editing pane, you can also collapse the section that shows the recording name and description.

## Playing a task guide

A **task guide** is a user-focused experience that lets the user follow a guided step-by-step set of instructions to complete a business scenario by using a task recording. The user is instructed to complete each step through an animated pop-up prompt that will move across the page and point to the UI element that the user should interact with. The prompt will also tell the user how to interact with the element. For example, it might state, "Click here" or "In this field, enter data." Each step that the user is instructed to complete is based on a step that was originally recorded in the task recording. Because the task recording file contains the data that describes the step that was originally recorded, the task guide can automatically determine when the user has completed the step as expected. It then automatically moves on to the next step.

### NOTE

One way that the task guide determines that a user has completed a step is by detecting when the value in a field has changed. Although the task guide doesn't require that a specific value be set, it does require that the field value be changed in order to determine that the step was completed. The user must change the field value, and then press the **Tab** key or click in an area outside the UI element. Only at that point does the client detect that the field value has changed, and it can then proceed to run any required application validation or business logic. Therefore, before the task guide can determine that the step was completed by the user, it relies on the client to detect that the field value has changed.

## What can a task guide allow a user to do?

When a user is completing a task guide, the client behaves in the same manner, with the same data, security, and validation rules as it does when the user is not completing a task guide. There is no difference of behavior in the client that would allow a user to take an action that they cannot otherwise take when they are not completing a task guide. When a user is completing a task guide:

- Any data the user enters is subject to the same data validation rules as when not playing the task guide.
- Any data the user enters may be saved, and the user may modify data according to the same restrictions and rules as when not playing the task guide.
- Any security mechanisms the user encounters behave the same as when the user is not playing the task guide.
- Any forms or controls the user accesses are subject to the same security and access mechanisms as when the user is not playing the task guide.

## The "On-rails" feature of task guides

By default, when a user begins a task guide, they are placed "on-rails". These "rails" prevent the user from *clicking* on elements other than the element the task guide is pointing to. When the user tries to click on something outside of the UI element that the task guide is pointing to, the task guide pop-up will animate to let the user know that they cannot progress until they complete the current step of the task guide.

While a user is prohibited from *clicking* on other elements, the user is not prevented from tabbing through the other controls on the form, and the user is not prevented from using keyboard shortcuts. This is by design, as the "on-rails" feature is designed for and targeted at first-time users, who are expected to primarily use the mouse as they become familiar with the application.

More advanced or experienced users can turn off the "on-rails" feature when they complete a task guide. At any point during the task guide, these users can turn off the rails by clicking the **Unlock** button that appears on the Task recorder toolbar at the top of the page. This button can also be used to restore the rails at any point during the task guide. In some situations, the task guide might automatically turn off the "on-rails" feature. When the rails are turned off, the user can click UI elements just as they do when the task guide isn't running. The "on-rails" feature might be automatically turned off in the following situations:

- The user is being directed to go to a page by using the navigation pane or navigation search.
  - Because the user can use either entry point, the task guide doesn't point to a specific entry point, and it doesn't prevent the user from using either entry point.
- The task guide enters an error state (see the next section for a list of error states).
- The task guide is showing an info step.

## Error detection

An *error state* occurs when the task guide is not able to point to the UI element that is associated with the current step because the UI element is not visible on the screen. When the task guide detects that the current step requires the user to interact with a UI element that is not visible, then the task guide pop-up will move to the upper-right side of the screen. These causes of an error state can be simplified into two categories.

### The control is not visible on the form

*This error state usually occurs when the user has opened or closed the incorrect tab, FastTab, collapsible section, FactBox, or pop-out menu.*

Because the UI element that is needed for the current step is somewhere on the current form, but it is not visible on the screen, the task guide pop-up will simply move to the upper-right side of the screen while displaying the same instruction that informs the user of the action they need to take.

Because the task guide can't find the UI element on the screen, the user must manually determine what is causing the UI element to be hidden and then make the element visible on the screen. The task guide pop-up will automatically detect that the UI element is visible and will reposition itself so that it's pointing at the now-

visible element.

#### **The control is not on the form**

*This error state usually occurs when the user has gone to the wrong form, either by navigating to the wrong form or by leaving the correct form.*

Because the UI element is not visible on the screen, the task guide pop-up will move to the upper-right side of the screen. In addition, when the task guide detects the user is on the wrong form, the task guide pop-up text will change to inform the user of the form they should navigate to.

In some cases, the task guide pop-up will not mention the form by name. This is because the user may need to navigate to a dynamic form. A dynamic form is a form that is not modeled, frequently known as a runtime-generated form. These sorts of forms do not have a proper name. Some examples of runtime-generated forms include simple and custom lookups. The way for a user to navigate to a lookup form is to re-open the lookup.

#### **Next step and Previous step**

The **Next step** and **Previous step** buttons appear in the task guide pop-up and let a user manually control the flow of the task guide. When these buttons are clicked, the task guide will go to the next or previous step. The task guide doesn't verify that the user has completed a step before it goes to the next or previous step.

The task guide **never** automatically completes any step for the user, even when the **Next step** and **Previous step** buttons are used. Use of these buttons can cause an error state if the previous or next step refers to a UI element that isn't on the current page. When the user is completing an info step, the only way to proceed is to use the **Next step** button. This action is required because an info step doesn't represent an action that was recorded on any UI element. Because no action was recorded in the task recording, the task guide doesn't have the necessary information to determine what action it should expect the user to complete.

#### **The See more button**

When the **See more** button is clicked, the task guide pop-up expands to show additional information that is related to the step. The additional information is often optional reading material that isn't required for the user to successfully complete the step. The following information might be included:

- **An Example value**
  - The Example value is the value that was originally used when the task recording was created.
  - Example values appear only for steps that use non-lookup fields. These fields include text fields, number fields, date fields, combo boxes, and check boxes.
- **A Note**
  - A Note may contain scenario-specific information that will help provide context to the user about the current step of the task guide.

## Taking screenshots in Task recorder

By using a **pre-release** Chromium browser extension that works for both the new (Chromium-based) Microsoft Edge browser and Google Chrome, Task recorder can take screenshots of the browser as a user records a business process. After the user completes the recording, Task recorder can use these screenshots to generate Microsoft Word documents. To turn on this functionality, follow these steps to install the pre-release Chromium extension that enables Task recorder to take screenshots during recording.

1. Download the **FMLabTaskRecorderScreenshot** folder that contains the extension from GitHub, at <https://github.com/Microsoft/FMLab>.
2. **On-premises deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace <hostname> with the base URL for your environment.

```

...
"content_scripts": [
  {
    "matches": ["https://*.dynamics.com/*", "<hostname>"],
    "js": ["screenshot.js"]
  }
]
...

```

3. **21Vianet deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace `.com` with `.cn`

```

...
"content_scripts": [
  {
    "matches": ["https://*.dynamics.cn/*"],
    "js": ["screenshot.js"]
  }
]
...

```

4. Open the latest Microsoft Edge browser or Google Chrome.
5. Select **Settings and more > Extensions** in Microsoft Edge (or **Customize and control Google Chrome > More tools > Extensions** in Google Chrome).

6. Select **Developer mode**.
7. Click **Load unpacked extension**.
8. Browse to the folder that contains the Task recorder extension by using the path **FMLab-master > FMLab > TaskRecorderScreenshot**, and then select **Select Folder**.
9. Make sure that **Enabled** is selected so that extension is turned on.
10. Restart the browser.

Task recorder will now take screenshots of the tab where the client is running. These screenshots are available for one week after the recording has been played. (If you're running a platform version that is earlier than

Platform update 16, the screenshots are available for only 15 minutes.) If the screenshots have expired, you can regenerate them by playing the task recording again.

Note that Task recorder **does not** capture screenshots from other tabs or of the user's desktop.

## Generating tests from a recording

After a business process recording has been completed by using Task recorder, a developer can import the raw developer recording file (.xml file) into Visual Studio to create an X++ test. The import tool generates a human-readable X++ test from the recording, and translates any control gestures, validations, or tasks into the appropriate test code.

### Import a recorded test

1. Open Visual Studio by using the Finance and Operations development tools.
2. Go to **Dynamics 365 > Addins > Import task recording**.
3. In the **Import task recording** menu, use the **Browse** button to locate a previously downloaded recording file.
4. Optionally, choose to have the generated test code be added to the startup project. This requires that a solution containing a project is set as the startup project. This will place the generated X++ test into the same model as the project.
5. If you're creating a new project, select the model for the project. The generated X++ test will be put in this model. For the generated test to be successfully built, the model must have references to the **TestEssentials** model.
6. Click **Import**.

7. In the **New Project** dialog box, provide a name for the project.
8. After the project is created, the user can open and inspect the generated code.
9. To run the test, build the project.
10. Go to **Test > Windows > Test Explorer**.

## Appendix

### Controls that are known to have incomplete support for Task recorder

- Table
- Filter pane, which is the filter that pops out from the left side
  - When adding filters to the filter pane, the steps are delayed. The steps do not get recorded until the user clicks "Apply" on the Filter pane.
- Enhanced previews
  - No planned support for recording gestures inside of enhanced previews. While recording, enhanced

previews will be disabled.

- No extensible controls are supported out of the box, except Segmented Entry.
  - Extensible control owners need to individually build support for Task recorder.

#### **Controls that can be recorded, but have limited support for the Copy/Paste/Validate gestures**

- Date/Time
  - Doesn't support copy/pasting "Never" as a value.
- Image
  - No ability to copy/paste/validate an image value.
- Filter pane
  - Copy/Paste works, but the UI will not show the pasted data. You can proceed as if it pasted correctly.
- Message box
  - You cannot validate the text in the message box.

#### **Controls that are known to have incomplete support for being used in a task guide**

- Quick Filter, which is the filter control that appears above lists
  - Does not support displaying a "generic value" during the task guide. Currently displays the value that was used during recording.
- Filter pane, which is the filter that pops out from the left side
  - The task guide does not point to the individual elements within the Filter pane that need to be clicked on.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create documentation or training with Task Recorder

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic explains what Task recorder and task guides are, how to create task recordings, and how to customize Microsoft task guides and include them in your Help.

## IMPORTANT

You can record your own task guides for Dynamics 365 Human Resources, but you won't be able to save them to a Business Process Modeler (BPM) library or open them from the Help pane at this time. You can save them locally or to a network location, and then open and replay them using Task recorder.

## Learn about Task recorder

Task recorder is a tool that you can use to record actions that you take in the product user interface (UI). When you use Task recorder, all of the events that you perform in the UI that are executed against the server—including adding values, changing settings, removing data—are captured. The steps that you record are collectively called a *task recording*. Task recordings can be used in many ways:

- **Task recordings can be played as task guides.** Task guides are an integral piece of the Help experience. A task guide is a controlled, guided, interactive experience through the steps of a business process. The user is instructed to complete each step by way of a pop-up prompt (or "bubble"), which will animate across the UI and point to the UI element that the user should interact with. The "bubble" also provides information about how to interact with the element, such as "Click here" or "In this field, enter a value." A task guide runs against the user's current data set and the data that is entered is saved in the user's environment.
- **Task recordings can be saved as Word documents.** This allows you to easily produce printable training guides.

You can create your own task recordings, play task recordings provided by Microsoft, or modify Microsoft-provided task recordings to reflect your configuration. For more information about Task recorder, see [Task recorder](#).

## Plan your task recording

Whether you're creating a new task recording or basing your recording on a Microsoft task recording, keep the following information in mind.

- Plan your recording like you would a video. Make all your decisions ahead of time.
- Walk through the business process once or twice without recording it to understand the steps.
- When you walk through the process before you record, notice where you use shortcut keys or the **Enter** key, so that you can avoid using them during the actual recording.
- Identify the following:
  - Do you want to group steps together into sub-tasks? Sub-tasks visually set apart sections of a process. For example, if you are creating a recording for "Creating and releasing a product," you may want to group together the steps that are required to create a product, and then group together the steps that are required to release the product. Sub-tasks also make longer processes easier to read.

- Do you want to add annotations, and if so, where? See "Understand the different types of annotations" below for more information.
- What values will you add in the various fields as you complete the steps of the business process? It is a good idea to know what you'll select or enter as you proceed so that you don't backtrack or fix mistakes as you're recording.

### **Write your description and annotations ahead of time**

- At the beginning of each task recording, there's a description field that allows you to enter an introduction to the recording. It is a good idea to write and save the description ahead of time in a separate document so you can copy and paste it into the task recording when you are recording. That way, you can spend time refining the text when you aren't in the process of recording. Cutting and pasting the text makes the recording process go more quickly and smoothly.
- For each step in a task recording, you can create annotations. During playback of a task guide, annotations appear in the "bubble" as notes above or below the text for the step. When viewed as text in the Help pane, annotations appear as text inline in the step. As with the description, it is a good idea to write and save your annotations in a separate document. When you're recording the task recording, cut and paste the annotations in from that document.

**Understand the different types of annotations** All annotations are optional. Only add them when they'll provide helpful information to the user.

- **Title:** A title annotation will appear before the step text that task recorder automatically generates. In the task guide, the title annotation appears above the automatically generated text. Use this type of annotation to explain why the user is doing the step or to give additional context.

This is the editing pane that you see when you add an annotation as you create your recording. Enter a title annotation in the **Title** box.

Task recorder ×

Hide from task guide  
No

Step instruction

Click OK.  
 { standard example text }  
 { your example text }

Title

Double-check the information before proceeding. You are about to commit the new product to the system.

Notes

This is what the title annotation looks like in the "bubble" in the task guide.

**New product**

Product type:  Product name:

Product subtype:  Search name:

**IDENTIFICATION**

Product number:  Retail category:

**CATCH WEIGHT**

No

Double-check the information before proceeding. You are about to commit the new product to the system.

Click OK.

[Previous step](#) [Next step](#)

- **Notes:** A notes annotation will appear after the step text that task recorder automatically generates. In the task guide it will only be visible if the user clicks the **Show more** link in the task guide bubble. Use this type of annotation to describe anything that a user needs to know to complete the step.

This is the editing pane that you see when you add an annotation as you create your recording. Enter a notes annotation in the **Notes** box.

Task recorder ✕

Hide from task guide  
No

Step instruction

- In the Product number field, ...
- In the Product number field, ...
- In the Product number field, ...

Title

Notes

The product number needs to be unique across all products in the system, whether the products have been released or not.

This is what the notes annotation looks like in the "bubble" in the task guide.

- **Info step:** These annotations are created by right clicking on a control or anywhere on a form < **Task recorder** < **Add info step**. Info steps appear as a numbered step at whatever point you insert it, even though no action was recorded in the UI. You can add a form-level info step or an info step associated with a control. When an info step is associated with a form, the task guide “bubble” will appear someplace on the form, with no pointer; when the task guide is played. When an info step is associated with a control, the task guide “bubble” will point to the control when the task guide is played. In the Help pane, an info step annotation will appear as a numbered step with whatever text you entered. Use info steps to prepare the user for the next steps, to describe steps that need to be done outside of the application, or to refer to other recordings (although you cannot create hyperlinks in annotations).

### Determine how long to make your recording

- The user will generally either read or play the recording from start to finish, so don't combine steps or tasks that are better done separately.
- Try not to record a long scenario that spans multiple sub-processes. For example, “Operate in-store customer service desk” is too broad; break it up into shorter tasks such as “Accept returns” and “Add to gift card.”
- If a task can be carried out as part of several different business processes, create a separate recording for it, and you can refer to it in the other recordings.
- If the process involves multiple tasks that the person likely does all at once, you can keep the tasks in one

recording, for example, "Set up and assign functionality profiles."

- If it is something someone does once (such as configuration) and then another task that they can do immediately afterward but may do repeatedly, and on its own, break them up into two task recordings.

**Decide where, in the UI, to start a recording** The page that you are on when you start recording a task recording affects which page the task guide is displayed for. For example, if you want your task recording to be listed in the Help pane when a user clicks Help on the General ledger parameters page, you must start your recording on the General ledger parameters page. **Save recordings as .axtr files** When you are done creating or editing a task recording, you are presented with several options for how you want to download, or save the recording. You can download the file as a task recording package (.axtr), download it as a raw recording file (.xml), download it as a Word document, or save the file to an LCS library. It is a good idea to always save your task recording as a task recording package file (.axtr). This will help make maintenance of the file easier if procedures or annotations need to change later. If you want to download the file as a Word document, also save it as a task recording package file.

## Create your task recording

For detailed walk-through steps, see [Task recorder resources](#).

## Copy and customize Microsoft's task recordings

You can download and edit Microsoft's task recordings to use them for your own Help documentation or training materials. To download a Microsoft task recording, follow these steps:

1. Open Task recorder. Task recorder is located in the **Settings** menu.
2. In the Task recorder pane, click **Maintain a recording**.
3. Under **Where is the recording**, click **It is in an LCS library**.
4. Click **Select the LCS library**.
5. Select the Microsoft global library.
6. In the tree, select the business process library node that the task recording is associated with.
7. Click **OK**.
8. Click **Start**.
9. At this point, step through the recording, changing any steps as you go to re-record it. **Note:** If you only need to change the text of a recording, you can open the recording in **Edit a recording's annotations** mode, and then save it.
10. After the recording has played to the end, click **Stop** in the task recorder bar at the top of the screen.
11. Choose how you want to save the task recording.

# Glossary

2/18/2021 • 15 minutes to read • [Edit Online](#)

This glossary defines key terms and concepts in Finance and Operations apps.

## A

accounting journal

A journal that is used to record the financial consequences of accounting events in an accounting system.

accounting rule

A rule in an accounting system that controls the principles, methods, and procedures for classifying, recording, and reporting the financial consequences of accounting events.

ACH (Automated Clearing House)

An electronic funds transfer system available in the United States that facilitates the transfer of funds between receiving party and originating party bank accounts.

actual quantity

The measured quantity that is input into or output from an activity.

address verification

The service that is provided by a credit card processor that validates that the billing address provided by a card holder matches the information on file with the issuing bank.

aging

The process of classifying time periods by age.

aging period

The number of days in a time period used to report an overdue customer payment balance.

## B

balance sheet

A statement of the financial position of an organization that reports the state of assets, liabilities, and equity on a specified date.

balance sheet account

An account that describes the changes in value reported on a balance sheet.

bank reconciliation

A practice of reconciling a ledger account that represents a bank account by matching ledger account entries to bank statement entries.

batch attribute

A product attribute of a process batch or a transfer batch.

best-before date

A recommended date for obtaining the optimum quality or characteristic of a product.

best-before period

The time period in which to obtain the optimum quality or characteristic of a product.

bill of exchange

A source document that documents an unconditional request for a third-party to pay a second party on demand.

blocking

The action of placing a document or product on hold.

BOM (bill of materials)

A list of products and their quantities that are required to produce one product.

budget control

A practice of authorizing expenditure only when budget funds can be reserved to meet future payment commitments.

budget control dimension

A combination of active financial dimensions values used to allocate budget funds to pay for planned activities.

budget control rule

The encoding of a business decision to check committed and actual expenditure against available budget funds allocated for detailed or aggregate activities defined by valid budget control dimension value combinations.

budget cycle time span

A time period specified as a number of fiscal calendar periods. The budget period can be different from the accounting period.

budget group

A set of financial dimension values in a budget dimension hierarchy that is used to calculate aggregate budget funds allocated to superordinate financial dimension values by summing budget funds allocated to subordinate financial dimension values.

budget model

A planning structure used to schedule budget fund allocations and expenditures.

bulk item

A formula item input into a product delivery activity.

bundle

The combination of a number of products for sale as one unit.

business unit

A semi-autonomous operating unit that is created to meet strategic business objectives.

## C

capacity load

The maximum amount of scheduled work that a work center can perform at a required capacity level.

capacity planning

A procedure for determining the resource capacity requirements that meet the demand of future output during specific time periods.

carry-forward budget

The budget that is transferred from one fiscal year to the next and that is reserved for open purchase orders in the new fiscal year.

cash-generating unit

The smallest group of classifiable assets that generates cash independently of other assets within an organization. These groups of assets are used to measure impairment losses that will be incurred.

catch weight

The actual or nominal weight of a sales item or inventory item.

chart of accounts

A list of main accounts.

COGS (cost of goods sold)

An accounting category used to sum the financial consequences of manufacturing products and carrying inventory.

contractor

A role assumed by a person who participates in a contractor-employer relationship with a legal entity.

co-product

An item produced jointly with another item.

cost center

An operating unit whose managers are accountable for budgeted and actual expenditures.

cost variance

The difference between an expected cost and an actual cost.

costing

The process of calculating, assigning, and allocating the cost of economic resources acquired, produced, or delivered by an organization.

CTP (capable-to-promise)

The portion of product output from available operations resources and available input product required to fulfill a specific customer requirement.

currency code

An alphanumeric identifier that represents a currency unit.

cycle time

The time taken to complete an activity.

## D

dashboard

The typical start page in Finance and Operations apps. On the dashboard, users see a section for each workspace that they have access to. Each section displays the tiles from the summary sections in the related workspace. The dashboard consists of a name and sections with tiles.

data entity

An information structure that represents the data characteristic of an entity.

delegate

A delegate is a type that represents references to methods with a particular parameter list and return type.

delivery note

A business document that documents the delivery of products between two parties.

demand forecast

A prediction of future product demand.

demand forecasting

A business process that estimates future demand and creates demand forecasts based on historical transaction data.

deployable package

The vehicle used for deployment on User Acceptance Test (UAT) and production environments.

designer

A Visual Studio tool that you used to create, update, and inspect your model elements.

dimension-based product configuration

A configuration technology used to create product variants by selecting values for product dimensions.

distinct product

A uniquely identifiable product.

document management system

An application service for storing and handling an organization's documents.

duty

In the security model, a set of application access privileges that are required for a user to carry out their responsibilities.

## E

EFT (electronic funds transfer)

A networked system for transferring funds from one bank account to another.

event

An event lets a class or object to notify other classes or objects when something of interest occurs.

EPE (Every Product Every)

A lean concept that is used to establish a regular repeating production cycle.

extension

Customizing an application by adding functionality to existing code.

## F

### financial dimension

A financial data classifier created from the parties, locations, products, and activities in an organization and used for management reporting.

### financial dimension value

A data element in the domain of a financial dimension.

### financial statement

A report that documents the financial information and financial position of an organization.

### fixed cost

A cost that does not vary with changes in product delivery throughput or output.

### fixed currency

A currency that has a fixed exchange rate in relation to another currency.

### fixed quantity kanban

A type of kanban that is used when the number of kanbans that are assigned to a kanban rule is constant.

### formula

A numeric relationship among production process inputs and production process outputs.

### formula item

An output of a batch process controlled by a formula.

## G

### general budget reservation

A document that is often used by public sector entities to set aside or earmark budgeted funds so that those funds are not available for other purposes.

### grace period

The time period beyond a specified date during which an obligation can be fulfilled without penalty.

### GST (goods and services tax)

A value-added tax levied in some countries/regions.

## I

### intercompany

Occurring between or relating two or more legal entities that are part the same organization that consolidates the accounts of all legal entities.

### invoice matching

A practice of matching vendor invoice prices and product quantities to purchase orders and product receipts.

### item allocation key

A product family grouping that is used for forecast and demand scheduling.

### item relation

A reference to the item allocation group or the item and its product dimensions in a kanban rule.

## K

### kanban

A signal that communicates a requirement for a quantity of product.

### kanban flow

Defines the sequence of activities that are performed for kanbans that are created for a kanban rule.

### kanban job

A process or transfer activity in a production flow that is triggered by a Kanban.

### kanban job consumption

The withdrawal of product components from inventory in order to complete the kanban production jobs.

### kanban rule

A rule in a lean manufacturing system that realizes material planning and replenishment policies by controlling

how process and transfer activities are coordinated in production flows.

## L

lean manufacturing

A philosophy in which manufacturing operations promote lean production flows and business activities.

lean schedule group

A way in which to aggregate items for production, for example, based on a setup group, shipping group, or transport group.

ledger account

A classifier created from the combination of main account value and other financial dimension values listed in a chart of accounts and used to classify the financial consequences of economic activity.

license code

An alphanumeric key that grants a party the right to use software or software components as prescribed in the terms of the license agreement, and that activates and inactivates software modules, software capabilities, and software functions.

liquidity

The ability of a party to use current assets to settle current liabilities.

## M

master scheduling

The process for generating a timetable for matching supply with demand.

model

A model contains code elements and reference metadata. It is created and inspected in Visual Studio.

model element

A model is a group of elements (source files and metadata) that constitutes a distributable software solution. The model is a design-time concept.

## N

NBV (net book value)

The value of a fixed asset calculated as the difference between the original cost of the fixed asset minus its accumulated depreciations.

## O

object permission

A permitted create, read, update, delete, or execute operation on a securable object.

operating unit

An organization that divides the control of economic resources and operational processes among people who have a duty to maximize the use of scarce resources, to improve processes, and to account for their performance.

output product

The physical products that result from an activity.

overlaying

A method of customizing source code by providing new source code that overrides the default source code.

## P

package

A package is a compilable and deployable unit of one or more models.

party

A person or organization that participates in economic activities.

pegging

The process of tracing the quantity of a required item to its source.

pegging event

A resource flow event that signals the demand for a product.

planned intercompany demand

Predicted demand for a product by a legal entity that assumes the role of a vendor. The planned demand is generated from planned demand for the product from a downstream legal entity.

post

To record the monetary value of an economic event in a specific account, or to summarize and reclassify general and subsidiary journal account entries into general and subsidiary ledger account entries.

preparer

The person who creates a source document to initiate a request for economic resources.

procurement catalog

A listing of product offerings that are grouped by procurement category. A procurement catalog is used to request products for internal use by an organization.

product dimension

The size, color, or configuration product attributes that are used for dimension-based product configuration.

product family

A unique grouping of items, services, or rights that either participates in the same production or delivery activities or that are offered to the same market segments. The grouping is represented by using a forecast allocation key.

product master

A standard or functional product representation that is the basis for configuring product variants.

product receipt

A source document that documents the receipt of products ordered, the receipt of products returned, or the receipt of products received on consignment.

product variant

A configuration of a product master.

production flow

A production process designed using Lean principles.

production flow model

A representation of the production capacity provided by a group of work cells in a production flow process.

production order

A source document that documents the requirements for producing items to meet a demand.

production schedule

A schedule to produce a specific item and item quantity at a specific time and by specific human and operational resources.

prospect

A participant that has the existing and potential ability to provide a service or probable future economic benefit to a legal entity.

purchase agreement policy

A policy that authorizes parties to modify purchase agreement terms.

purchase order policy

A policy that authorizes parties to modify purchase order terms and to control order processing.

purchase quotation

A source document that documents an offer to purchase a quantity of product for a specified price and by a specified date in response to a request for quotation in a procurement process.

purchase requisition

A source document that documents product requests so that they can be submitted for review and be used to authorize purchasing by a purchasing organization.

## Q

quantity variance

The difference between an ordered product quantity and a received product quantity when no more receipts are expected.

## R

receipt advice

A business document that documents a summary of the products a buyer receives from a vendor.

reconciliation

A practice of adjusting two or more accounts or statements so that the figures agree.

reduction key

A method that is used to increase or decrease forecast requirements in master planning, based on user defined percentages that are applied during specific periods.

register

A record that is used to record the operational, legal, and financial consequences of resource flow events in an accounting system.

RFQ (request for quotation)

A source document that documents an invitation to bid on supplying a quantity of product for a specified price and by a specified date.

requester

The person who requests the economic resources.

## S

sales agreement

A source document that documents an agreement between two or more parties based on an understanding that a selling party will commit to selling a specific quantity or value of product over a period of time in exchange for favorable prices and discounts.

sales agreement policy

A policy that authorizes parties to modify sales agreement terms.

sales order policy

A policy that authorizes parties to modify sales order terms and to control order processing and payment processes.

sales quotation

A source document that documents an offer to supply a quantity of product for a specified price and by a specified date in response to a request for quotation in a sales process.

security role

A defined set of application access privileges. The security role assigned to a user determines which tasks the user can perform and which parts of the user interface the user can view. All users must be assigned at least one security role in order to access the system.

segregation of duties

A design principle used to reduce the risk of fraud, irregularities, and errors that separates the recording, verification, authorization, custody of assets, and periodic review duties of people who participate in, document, or record the financial consequences of economic transactions.

sequencing

The order in which jobs are processed or operations are performed at a manufacturing facility to achieve objectives.

shared asset

An asset that is used by more than one cash-generating unit (CGU). An example is a distribution center that is used to store items before they are transported to different markets that share that same distribution center.

single use kanban

A type of kanban that is used with a fixed quantity kanban rule to meet exceptionally high demand. A single use kanban does not trigger a new kanban when it is discarded.

smart rounding

A marketing practice to use odd numbers that are marginally less than their nearest round number to set prices.

source requirement

The product quantity documented on a source document line that creates a pegging requirement.

statistical baseline forecast

An estimate of future demand that is created by applying a forecasting algorithm to historical transaction data.

## T

takt time

The time that it takes to produce one unit of a product.

Task guide

A controlled, guided experience through the steps in a Task recording. A Task guide leads the user through the experience that was recorded. All security, data, and application behaviors are the same when completing a Task guide as they are without the Task guide. The Task guide uses the same instrumentation as Task recorder to know when a user has completed the intended step, so that it can prompt the user to take the next step in the recording.

Task recorder

A tool that is pre-installed in Finance and Operations apps. When recording, it records all events that the user enters in the user interface that get executed against the server—including values added, settings changed, data removed, etc.

Task recording

A file that contains the actions and annotations that are captured when Task recorder is run.

three-way matching policy

A matching policy that requires one or more vendor invoice prices to match with one or more purchase order prices and that requires one or more vendor invoice quantities to match with one or more product receipt quantities.

transfer batch

The quantity of one or more items that is transferred or that can be transferred.

two-way matching policy

A matching policy that requires one or more vendor invoice prices to match with one or more purchase order prices.

## V

value stream

An operating unit that controls one or more production flows.

variant configuration technology

A method of modeling product masters and searching for product variant configurations.

VAT (value-added tax)

A tax on products at each stage of their production based on the value added during that stage.

vendor catalog

A listing of product offerings that are available for purchase from a vendor.

vendor invoice

A source document that documents a vendor payment request. A vendor invoice can refer to one or more purchase orders. When the vendor invoice is authorized, a payment can be made to the vendor.

## W

work cell

A resource group that participates in a production flow activity.

worker

A person who assumes the role of an employee or a contractor and is paid in exchange for services.

workspace

A page that provides an overview of one of the activities that the user performs. The page uses tiles, lists, and charts to display pending work and related data from multiple sources, and the page surfaces frequent tasks related to this data. Tiles shown in the summary section of the workspace are also displayed in the related section in the dashboard.

# Learning catalog for business and technical decision makers considering Dynamics 365 Commerce

2/18/2021 • 2 minutes to read • [Edit Online](#)

Do you decide whether to invest in new technologies?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know, so that you can choose the training format that best meets your needs.

For training about features shared with other Finance and Operations apps, see the [Dynamics 365 Finance Learning Catalog](#).

## Get started

CONTENT	DESCRIPTION	FORMAT	LENGTH
<a href="#">Learn the business value of Microsoft Dynamics 365 and the Power Platform</a>	This learning experience will take you on a journey that will begin by showing you how digital transformation and the power of business applications can transform your business. We will cover how Dynamics 365 and Power Platform help you make informed decisions based on your organization's needs and goals, through four building blocks of digital transformation—modern, unified, intelligent, and adaptable.	Free, self-paced online learning path	6.5 hours
<a href="#">Get started with Dynamics 365 Commerce</a>	Dynamics 365 Commerce, built on the proven Dynamics 365 Retail capabilities, delivers a comprehensive omnichannel solution that unifies back-office, in-store, call center, and digital experiences. Dynamics 365 Commerce enables you to build brand loyalty through personalized customer engagements, increase revenue with improved employee productivity, optimize operations to reduce costs and drive supply chain efficiencies, ultimately delivering better business outcomes.	Free, self-paced online learning path	2 hours

CONTENT	DESCRIPTION	FORMAT	LENGTH
<a href="#">Get started with Dynamics 365 Fraud Protection</a>	Dynamics 365 Fraud Protection is a cloud-based solution designed for e-commerce, brick-and-mortar stores and omnichannel merchants, to help protect their revenue and reputation by providing tools and capabilities to decrease fraud and abuse, reduce operational expenses and increase acceptance rates, while safeguarding user accounts from fraud exposure. # Learning catalog for Dynamics 365 Commerce solution architects

2/18/2021 • 2 minutes to read • [Edit Online](#)

Do you design solutions that meet your customers' needs and budgets?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know, so that you can choose the training format that best meets your needs.

For training about features shared with other Finance and Operations apps, see the [Dynamics 365 Finance Learning Catalog](#).

# User interface elements

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes the user interface (UI) elements used in the app. Before users can navigate the interface, it's important to know the names and functions of the elements that make up the interface.

## Overview

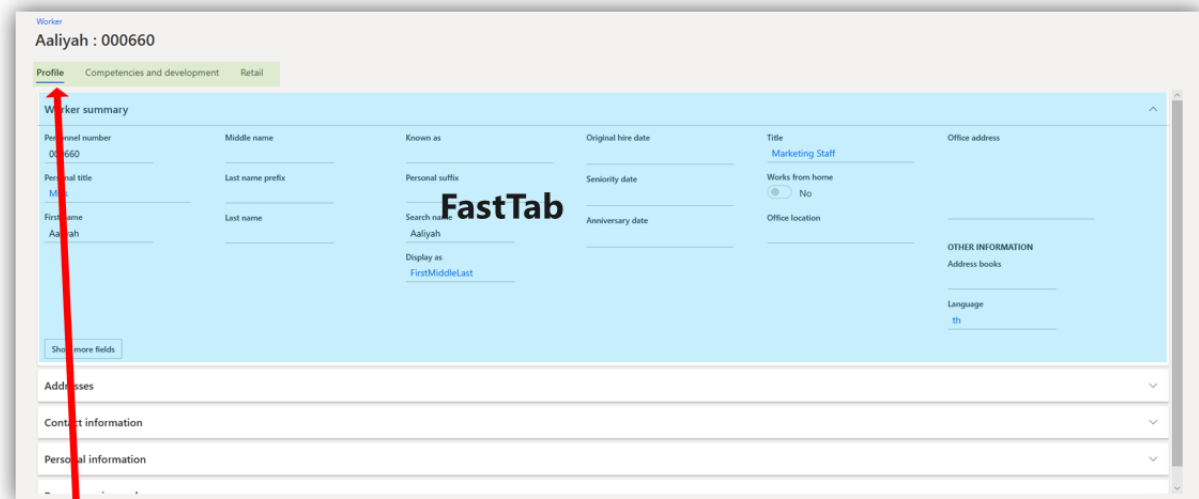

- **Action Pane** - The bar beneath the navigation bar. Here, you can select tabs to change records shown in the page. You can edit and save the records here.
- **FactBox** - You can see information and follow the activities of certain records in this pane.
- **FactBox pane** Here, you can scroll through different aspects of a record to view in the FactBox.
- **Filter pane** - On some pages, you can select **Show filters** to open this pane. It allows you to narrow the results visible to you on the page.
- **Navigation bar** - The bar at the top of the interface. It contains the **Dynamics 365 portal**, **Search**, **company picker**, **Action center**, **Settings**, **Help & Support**, and the user profile.
- **Navigation list** - On some pages, you can scroll through this pane to find a specific record. When selected, the details of the record will appear in the page.
- **Navigation pane** - The left-most pane. From here, you can find any page in the product.
- **Page** - The central focus of the interface. Selections made on the other UI components will affect what records are shown here.
- **Pane** - The right-most pane. This will open in some cases when aspects of a record need to be changed and saved.
- **Tab** - When referring to the Action Pane, it's a menu of options that appears when you select a given option in the Action Pane.

## Tabs, fields, and sections

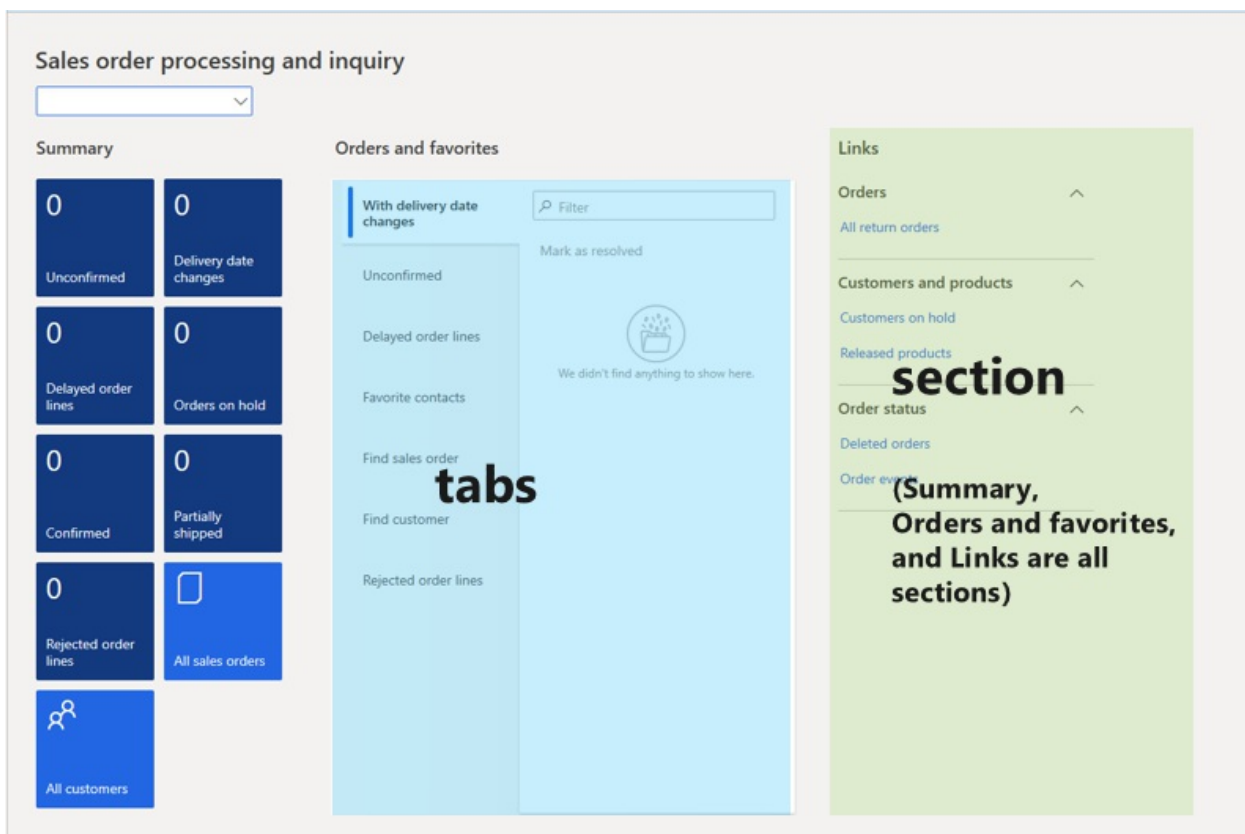

A *tab* is a selection made on the page that opens a different aspect of a record on the same page. Often, it will allow you to change certain *fields*, or UI elements that allow typed input.

A *FastTab* is a tab with the added benefit of allowing multiple tabs to be visible at the same. You can expand a FastTab by selecting the downward-pointing arrow on the right end of it.

**tabs**

A *section* is similar to a tab. The word "section" is often used to describe any area of a page that organizes a specific category of information. In the following image, Summary, Orders and favorites, and Links are all examples of sections.

## Dialog boxes and drop-down menus

A *dialog box* is a pane that opens when certain selections are made to change or create a record. Dialog boxes contain fields that allow you to enter typed input. Sometimes, a given field will allow you to select a downward facing arrow that opens a list of options to choose from. This is called a *drop-down menu*. In the following image, the **Type** and **Customer group** fields contain the option to open a drop-down menu.

In some cases, a dialog box will open near a given button when you select it. This is called a *drop-down dialog box*. In the following image, the **As of date** button was selected, which opened a drop-down dialog box.

## Notifications

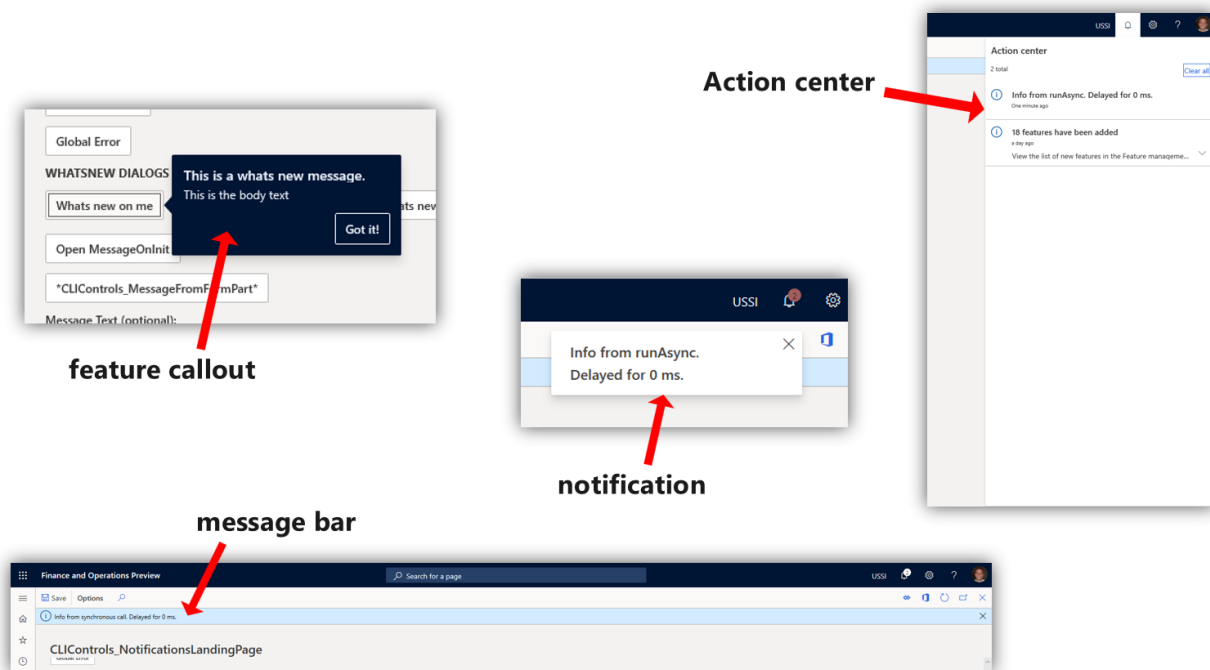

Certain changes to the objects you oversee will appear as *notifications*. Notifications may notify you when a specific customer's information has been changed, or it may alert you when the system can't accept inputs you've added in certain fields. You can learn how to customize what you receive notifications about in the [Alerts overview](#).

Notifications appear in a variety of ways.

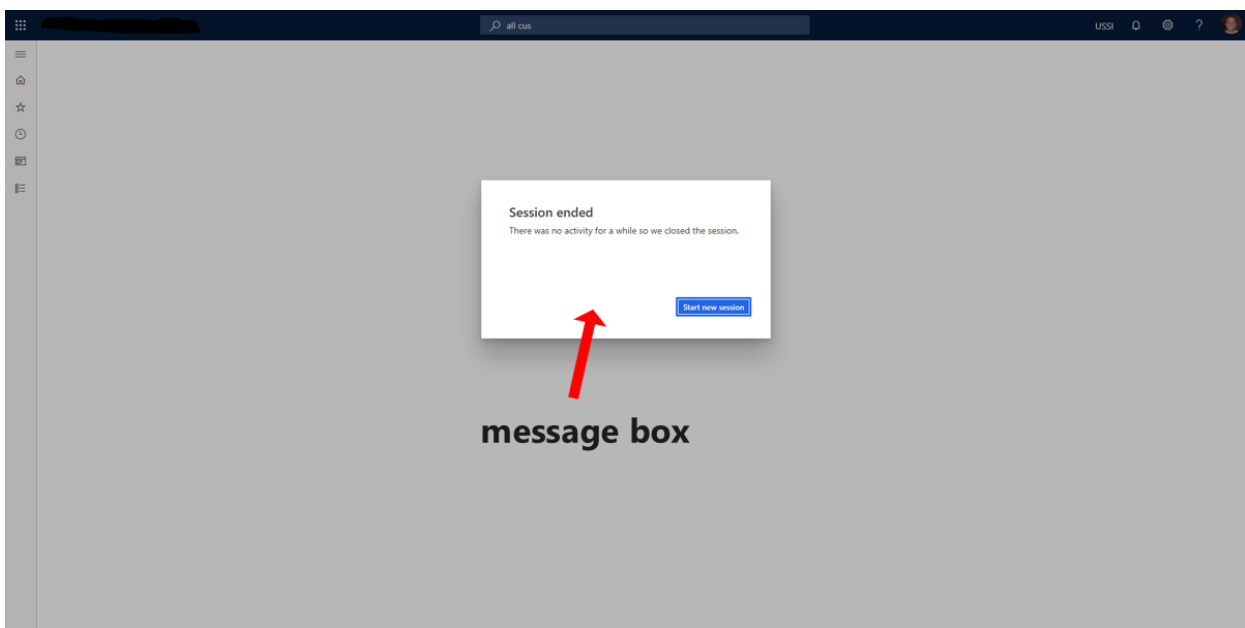

- **Feature callout** - This will appear next to a field, tab, or other button to offer an explanation of what the feature is used for.
- **Action center** - A box that contains the notification will appear next to the Action center button on the navigation bar. You can see details about the notification by selecting **Action center**.
- **Message bar** - This will appear beneath the Action Pane.

The following image shows examples of these types of notifications.

- **Message box** - This will appear over the interface and must be interacted with before you can continue to use the product.

## Toolbars, grids, and lists

A *toolbar* contains tools, such as the ability to add fields or remove records. Sometimes, a toolbar will appear on the page above a *grid*. This area, *grid*, is a name given to rows of records with various columns of data. Not all grids have toolbars above them.

A *list* is the name given to a collection of records that you can scroll through. You can bring these records into the page by selecting them. Often, this will open a grid.

toolbar

The screenshot displays the Dynamics 365 Finance and Operations Preview interface. At the top, there is a navigation bar with various tabs like 'NEW', 'MAINTAIN', 'PAYMENTS', 'COPY', 'VIEW', 'FUNCTIONS', 'ATTACHMENTS', and 'EMAIL NOTIFICATION'. Below this, a search bar and a filter are visible. The main content area shows a sales order for '000768 : Contoso Retail San Diego'. On the left, a list of sales orders is shown, with the selected order highlighted. The main grid displays the sales order lines, including columns for 'Item number', 'Product name', 'Sales category', 'Quantity', 'Unit', and 'Delivery type'. A red arrow points to the 'Warehouse' dropdown menu in the toolbar above the grid.

Item number	Product name	Sales category	Quantity	Unit	Delivery type
T0001	SpeakerCable / Speaker cable 10	Accessories	-58.00	ea	Stock
T0004	TelevisionMT2037 / Television ...	Television	-58.00	ea	Stock
T0002	ProjectorTelevision	Television	-35.00	ea	Stock
T0005	TelevisionHDTVX59052 / Televis...	Television	-23.00	ea	Stock
T0003	SurroundSoundReceive	Receivers	-35.00	ea	Stock

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Accessibility features

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the functionality that is designed to help users who have various disabilities use this app. For example, there are features for people who use sight-assistive technologies such as Microsoft Windows Narrator.

## Windows Narrator and keyboard-only access

Every field and control has a label and a description of applicable shortcuts. A screen reader can read the label and description.

## Shortcuts for the most frequently performed actions

For most users, everyday system use involves lots of data entry and keyboard interaction. To enhance the user experience, we have created shortcuts to help you "jump" around the screen and shortcuts for specialized actions. For more information, see [Keyboard shortcuts](#).

## Navigation search

Any page that is accessed by using the Navigation pane menu, the left-most pane, is also available from the Search box. Press Alt+G to move focus to the Search box, and then type the name or description of the page.

For more information, see [Navigation search](#).

### NOTE

You can navigate directly to top-level pages only. Secondary pages rely on information or context from their parent page.

## Action search for keyboard-only users or for heads-down data entry

Every action that is provided on a page can be accessed from a keyboard, via the tab sequence. Information about the tab sequence is provided later in this topic. To run actions more directly, you can use the action search functionality.

### Example

You want to run the **Email notification log** action that appears in the **Email notification** group on the **Sales order** tab on the Action Pane.

One option is to use your keyboard. Press Ctrl+F6 to move focus to the Action Pane, and then press Tab repeatedly to move through all the tabs and actions, until the **Email notification log** action has focus.

However, you can also run the action more directly. From anywhere on the page, press Ctrl+Apostrophe (') to show the search box for actions.

In the search box, type words that describe the action. The action is made available to you, and you can run it directly. For example, by typing **email**, **notific** (a partial word), or **log**, you can "jump" to the Email notification log functionality.

When you've finished, you can press Ctrl+Apostrophe again to return focus to the field that you were working with before you ran the action search.

For more information, see [Action search](#).

## Tab sequence

In everyday system use, not every field is required in order to perform typical tasks. Therefore, by default, the tab sequence is "optimized." Tab stops are set only on those fields that are essential for typical scenarios.

However, you might find that some fields that you often use to perform tasks aren't included in the default tab sequence. In this case, if you use Windows Narrator, you can use Windows Narrator's keyboard actions to access those fields and inspect their content. Alternatively, you can turn on the **Enhanced tab sequence** option on the **Options** page. This option makes all editable and read-only fields part of the tab sequence. You can then use page personalization to create a custom tab sequence and omit fields that don't have to be part of the tab sequence. For more information about personalization, see [Personalize the user experience](#).

### Accessibility

Enhanced tab sequence  
Yes

## Form patterns

Almost 90 percent of the pages in the app are based on a small set of patterns. These patterns are referred to as *form patterns*. Each form pattern is used to provide the actions that are most often performed on the page. A form pattern helps guarantee familiarity and ease of understanding, because frequently used actions and data are always presented in the same location on different pages. Because of the small number of form patterns, users can easily learn the system, regardless of the number of pages in it, and can confidently use it after they recognize the form patterns.

To learn more about form patterns, see [Form styles and patterns](#).

## Responsive layout

The product is designed to work on various devices and form factors, from the smallest screens to large screens that have the highest resolution. Our responsive layout engine lets users zoom in to a magnification level of 200 percent (or, in some scenarios, more than 200 percent).

On smartphones and other small screens, the controls and the form layout will responsively adapt to ensure that the core data is favored. These responsive behaviors can also include reducing the number of columns in groups and tabs to a single column, hiding shell elements, and collapsing the Action Pane.

## Guidance to help developers and customers incorporate accessible thinking in their customizations

To learn more about Microsoft best practices for enabling accessibility, see [Accessibility in forms, products, and controls](#).

### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Feature management overview

2/18/2021 • 13 minutes to read • [Edit Online](#)

Features are added and updated in every release. The Feature management experience provides a workspace where you can view a list of features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them.

## The Feature management workspace

You can open the **Feature management** workspace by selecting the appropriate tile on the dashboard. You will see a page that shows a list of features for all releases that are supported by the Feature management experience. Over time, Microsoft will enhance the Feature management experience so that it includes more functionality to help you manage features.

The feature list includes the following information:

- **Feature name** – A description of the feature that was added.
- **Enabled status** – A symbol indicates whether a feature has been turned on (check mark), hasn't been turned on (blank), is scheduled to be turned on (clock), is mandatorily turned on (lock), requires attention before you turn it on (warning), or can't be enabled (X). The setting that is shown is used for all legal entities. Note that even when a feature has been turned on, it's still controlled by security. Therefore, the feature will be available only to users who have access to it, based on their security role. It will also be available only in legal entities that the user has access to.
- **Enable date** – The date when the feature was turned on or is scheduled to be turned on.
- **Feature added** – The date when the feature was added to your environment. This date is automatically entered when you update your environment during the monthly release cycles.
- **Module** – The module that is affected by the new feature.

When you select a feature, more information appears in the details pane to the right of the feature list. At the top of the pane, you will see the feature name, the date when the feature was added, the module that is affected by the feature, and a **Learn more** link. Select this link to view the documentation for the feature. If documentation isn't available, you're taken to a temporary page. The details pane also includes a **Comments** field where you can add your own comments about the feature.

The **Feature management** workspace also has several tabs, each of which shows a list of features.

- **New** – This tab shows all features that have been added since the last monthly update. If you've skipped any monthly updates, the tab shows all the new features that have been added since the last time that you updated. The newest features appear at the top of the list. The total number of new features is also shown on a tile at the top of the page.
- **Not enabled** – This tab shows all features that haven't been turned on. The newest features appear at the top of the list. The total number of new features that haven't been turned on is also shown on a tile at the top of the page.
- **Scheduled** – This tab shows all features that have been scheduled to be turned on in the future. The features that have the earliest scheduled date appear at the top of the list. The total number of schedule new features is also shown on a tile at the top of the page.
- **All** – This tab shows all features. The newest features appear at the top of the list.

## Turn on a feature

If a feature hasn't been turned on, an **Enable Now** button appears in the details pane. You can use this button to turn on the feature.

- Select the feature to turn on, and then, in the details pane, select **Enable Now**. The feature is turned on.

Some features can't be turned off after you turn them on. If the feature that you're trying to turn on can't be turned off, you receive a warning. At that point, you can select **Cancel** to cancel the operation and leave the feature turned off. However, if you select **Enable** to turn on the feature, you won't be able to turn it off later.

Some features will display a message that provides additional information before you turn them on. These features are indicated by a yellow warning symbol. You should read the additional information carefully to better understand what will happen when the feature is enabled. However, you can still select **Enable** to turn on the feature.

Some features will display a message that the feature can't be enabled until an action is taken. These features are indicated by a red X symbol. You must take the actions described in the description before the feature is enabled. For example, if you can't use a feature until a configuration key is disabled, then you must disable the configuration key first and then return to Feature management to enable the feature.

After a feature is turned on, a message appears below the **Learn more** link in the details pane. This message either states that the feature was turned on or it indicates that the future date when the feature is scheduled to be turned on. It appears every time that you select the feature in the feature list.

Features that are scheduled to be turned on in the future appear on the **Scheduled** tab. A batch process will turn them on at midnight on the specified date, based on the time zone that is represented by the system date.

## Reschedule a feature

If a feature has been scheduled to be turned on in the future, a **Schedule** button appears in the details pane. You can use this button to change the **Enable date** value to a different date.

1. Select the scheduled feature to reschedule, and then, in the details pane, select **Schedule**.
2. In the dialog box that appears, in the **Enable date** field, specify the new date when the feature should be turned on.
3. Select **Enable** to reschedule the feature or **Disable** to cancel the schedule.

## Turn off a feature

If a feature has already been turned on, a **Disable** button appears in the details pane. You can use this button to turn off the feature. The **Disable** button isn't available if the feature can't be turned off after it's turned on.

- Select the feature to turn off, and then, in the details pane, select **Disable**. The feature is turned off, and the **Enable date** field is cleared.

After a feature is turned off, a message appears below the **Learn more** link in the details pane. This message states that the feature hasn't yet been turned on. It appears every time that you select the feature in the feature list. Features that haven't been turned on appear on the **Not enabled** tab.

## Features that must be turned on

Sometimes, a critical feature is delivered that must be turned on automatically when you do an update. These features will be turned on automatically on the date that is specified in the **Enable date** field. For these features, a message appears below the **Learn more** link in the details pane. This message either states that the feature was turned on or indicates the future date when the feature will be turned on. It appears every time that you select the feature in the feature list.

## Enable all features

By default, all features that are added to your environment are turned off. You can enable all features by selecting the **Enable all** button.

When you select **Enable all**, an option will appear where you need provide the following information:

- A list of all features that require confirmation before they can be enabled. If you want to enable the features in the list, select **Yes** for the **Enable features requiring confirmation** button.
- A list of all features that can't be enabled will be shown. Those features will not be enabled.

All features that can be enabled will be enabled. If a feature is already scheduled to be enabled in the future, the schedule will not change.

## Turn on all features automatically

By default, all features that are added to your environment are turned off, unless they are mandatory features. However, if you want to automatically turn on all new features, you can use the drop-down list under the workspace title to change what occurs when new features are added.

- Select `Enable new features automatically` to automatically turn on all new features when they are added to your environment.
- Select `Do not enable new features automatically` to default all new features to off when they are added to your environment.

When you enable all feature automatically, it will enable all of the features that would be enabled when you click the **Enable all** button. It will not enable the features that require confirmation or the features that can't be enabled until an action is taken.

## Check for updates

Features are added to your environment after each update. However, you can manually check for updates by clicking on the **Check for updates** button. Any feature that was added to the system after the update will be added to the list of features. For example, if a flighted feature is enabled after a release, then you can check for updates and the feature will be added to your list.

## Assigning roles

The **Feature management** workspace can be opened by system admins, and also by users who are assigned to the Feature manager role or the Feature viewer role. These two roles were created to support the Feature management experience. Users in the Feature manager role can turn any feature on or off. They can also update the **Comments** field for the feature. Users in the Feature viewer role can only view the **Feature management** workspace. They can't turn features on or off.

The Feature manager role and Feature viewer role don't override the existing security that a user has. They just control whether the user can turn features on and off. They don't provide access to the features themselves.

## Features that use configuration keys

If a feature uses a configuration key, but the configuration key isn't turned on, the **Feature management** workspace doesn't show the feature in the list of available features. After you turn on the configuration key, you must update the feature list by using the **Check for update** menu item. The feature then appears in the feature list.

If you turn off the configuration key, the feature isn't removed from the feature list.

## Data entities

A data entity that is named **Feature management** lets you export the Feature management settings from one environment and then import them into another environment. This entity updates only existing features. The business logic in the entity also helps guarantee that the same rules that are used on the **Feature management** workspace will be applied when the import is done. For example, you can't override a mandatory feature setting by removing the date during import.

The following examples describe what occurs when you use the **Feature management** entity to import data.

- If you change the value of the **Enabled** field to **Yes**, the feature is turned on, and the **Enable date** field is set to the current date.
- If you change the value of the **Enabled** field to **No** or leave the **EnableDate** field blank, the feature is turned off, and the **Enable date** field is cleared. You can't turn off a mandatory feature or a feature that can't be turned off after it's turned on.
- If you change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If you change the value of the **Enabled** field to **Yes** and change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If you change the value of the **Enabled** field to **No**, but you also change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If a feature is turned on, and you add an **EnableDate** field that is set to a future date, the feature remains turned on. To reschedule the feature, you must change the **Enabled** field to **No**.

## Feature management and flighting

Feature management lets you control the features that are delivered in each release. Flighting lets Microsoft teams release features to a limited number of customers, so that those features can be tested and validated without affecting all customers. Feature management doesn't control the flighting of any features.

## New features are optional for 12 months

When a new non-critical feature is installed, it will be optional for a 12-month period. This allows you and your organization time to plan ahead for when to uptake a feature and have it tested against your daily operations. For more information, see [One Version service updates FAQ](#).

## Using Feature management to turn on ISV features or custom features

Feature management is currently unavailable for features from independent software vendors (ISVs) and custom features. However, Microsoft is adding more functionality to enhance Feature management. After those enhancements are completed, Microsoft will make Feature management available to all features and provide instructions for updating your features to use it.

## Frequently asked questions (FAQ)

### **When are features added, removed, or changed?**

Features are added, removed, and changed through code changes. Environments need to be updated to receive those changes.

### **Does a feature become mandatory automatically?**

No, a feature becoming mandatory is not an automatic action. The product teams need to make a code change.

### **When do features become mandatory?**

The policy is that all new features will be opt-in for a 12-month period and will not require any change management until you enable the feature. The product teams can choose whether to make a feature mandatory after that period has ended.

### **Why isn't there a specific 'mandatory-enabled date'?**

Update release timing is variable, environment update timing is variable, and customers can opt to skip some updates. As a result, specific dates are difficult to determine.

### **Where's the documentation for features that are being made mandatory?**

This documentation comes from the application teams. Often, these will be mentioned in [Removed or deprecated features](#).

### **Is there an in-product notification or signal that a feature is going to be mandatory-enabled?**

A notification mechanism related to making a feature mandatory does not exist today.

### **Do features ever get enabled without the customer knowing about it?**

Yes, if features don't have a functional impact then they can be enabled by default.

### **What is feature flighting and how does it relate to feature management?**

Feature flights are real-time on/off switches that Microsoft controls. They are separate from the customer control provided by Feature Management.

- Private Preview features will not be listed in Feature Management until they are flighted on. In production, the customer needs to agree to be part of a special program for that to occur.
- Public Preview and Released (generally available) features will be listed in Feature Management unless they are flighted off. Flighting a feature off is considered a last resort option for product teams if a critical issue is found and would usually be a per-customer operation.

### **Do features ever get flighted off without the customer knowing about it?**

Yes, if a feature is impacting the functioning of an environment that doesn't have a functional impact then they can be enabled by default.

### **How can feature enablement be checked in code?**

Use the `isFeatureEnabled` method on the `FeatureStateProvider` class, passing it an instance of the feature class. Example:

```
if (FeatureStateProvider::isFeatureEnabled(BatchContentionPreventionFeature::instance()))
```

### **How can feature enablement be checked in metadata?**

The `FeatureClass` property can be used to indicate that some metadata is associated with a feature. The class name used for the feature should be used, such as `BatchContentionPreventionFeature`. This metadata is visible only in that feature. The `FeatureClass` property is available on menus, menu items, enum values, and table/view fields.

### **What is a feature class?**

Features in Feature Management are defined as *feature classes*. A feature class **implements** `IFeatureMetadata` and uses the feature class attribute to identify itself to the Feature Management workspace. There are numerous examples of feature classes available that can be checked for enablement in code using the `FeatureStateProvider` API and in metadata using the `FeatureClass` property. Example:

```
[ExportAttribute(identifierStr(Microsoft.Dynamics.ApplicationPlatform.FeatureExposure.IFeatureMetadata))]
internal final class BankCurrencyRevalGlobalEnableFeature implements IFeatureMetadata
```

## What is the IFeatureLifecycle implemented by some feature classes?

IFeatureLifecycle is a Microsoft-internal mechanism for indicating the feature lifecycle stage. Features can be:

- `PrivatePreview` - Needs a flight to be visible.
- `PublicPreview` - Shown by default but with a warning that the feature is in preview.
- `Released` - Fully released.

# Client FAQ

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides answers to frequently asked questions about the Finance and Operations client.

## Why aren't symbols loaded?

The security settings on your browser might prevent the symbols from being loaded correctly. To resolve this issue, try the following steps:

- If you're experiencing this issue in Internet Explorer, click **Tools**, and then click **Internet Options**. In the Internet Options dialog box, on the **Privacy** tab, click **Custom level**, and make sure the **Font download** option is selected.
- Otherwise, you might have to add the app site to the list of trusted sites.

## I miss the ribbon from Dynamics AX 2012. Can I keep Action Pane tabs open all the time?

We are planning to implement this feature soon. Users will then be able to choose to keep the tabs on Action Panes open all the time. Otherwise, the tabs will be collapsed when they aren't being used, to gain more screen space for the page.

## Why do I sometimes see different shortcut menus when I right click?

If you right-click in an editable field (or if text is selected), the browser's shortcut menu is displayed. This menu gives you access to the **Cut**, **Copy**, and **Paste** commands. We can't embed these commands into the shortcut menus because, for security reasons, browsers don't allow us to programmatically access the system clipboard.

If you right-click a field label or the value of a read-only control, you'll see the shortcut menu.

To make keyboard access easier, we plan to implement a keyboard shortcut in the future that will open the shortcut menu.

## Where is the View details functionality?

The **View details** option is available in a couple of ways:

- If a control has **View details** capabilities, and if the control has a value, that value is displayed as a hyperlink. You can click the hyperlink to open a page that contains additional details.
- **View details** is also an option on shortcut menus. For more information about when shortcut menus are displayed when you right-click, see the previous section.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

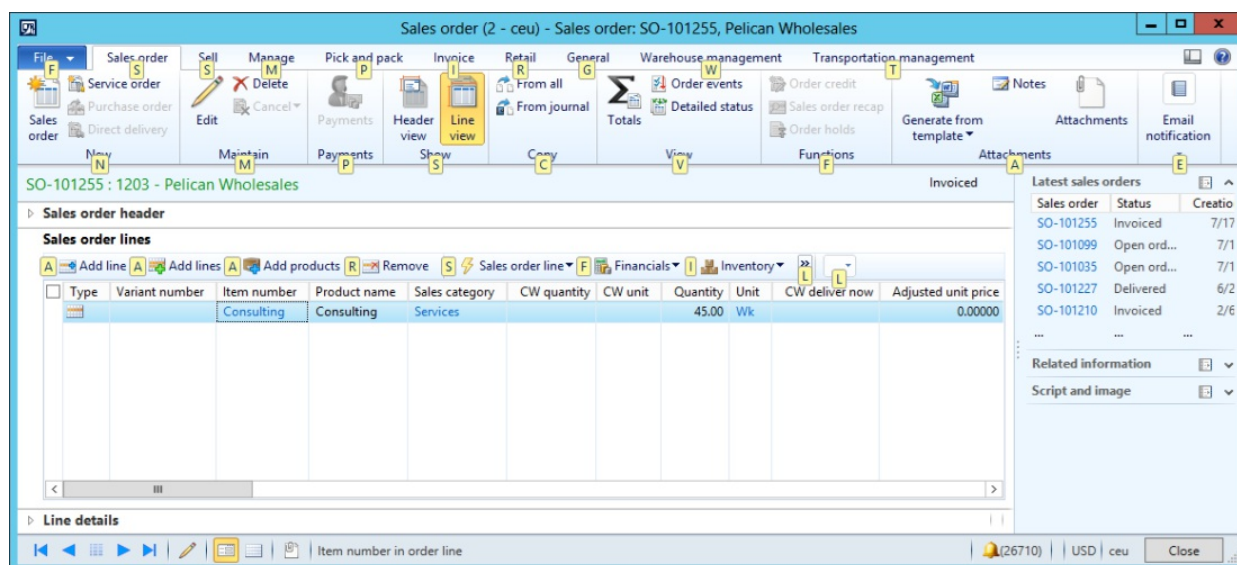

# Action search

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes the action search functionality. Action search will help you find and run actions on a page.

## Introduction

Pages primarily expose commands on Action Panes, both the standard Action Pane that appears at the top of a page and the toolbars that appear in various sections of the page. In previous versions, a Key Tips feature let you quickly access any button on an Action Pane by pressing the Alt key and then a series of letters.

The action search feature replaces Key Tips, which are no longer available. This new feature lets you quickly search for and run a button from any visible Action Pane.

## Using action search

To use the action search feature, follow these steps.

1. On the Action Pane, click in the **action search** field. (The **action search** field contains a magnifying glass icon.)
2. Type all or part of the name of the button that you want to run. You can also search by using words from the button's "path." (For more information, see the next section of this article.) Typically, a button will appear near the top of the results list after you've typed two to four characters.
3. Find and run the button in the results list (by using your mouse or keyboard).

After the button is run, the focus is returned to your last position on the page, so that you can continue to work.

You can also start action search by pressing Ctrl+/ or Alt+Q. Press the keyboard shortcut again to return the focus to your last position on the page.

# Understanding the results list

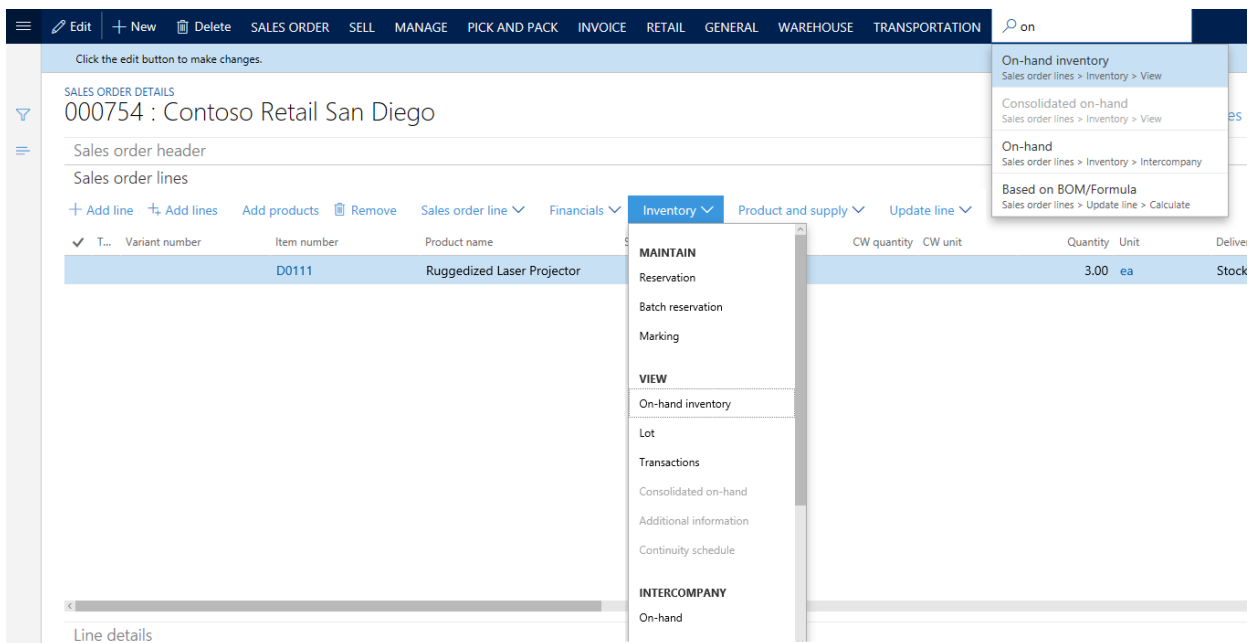

Often, you must know both the location and the context of a button to fully understand the purpose of that button. Therefore, the results list shows additional information to help you understand exactly which buttons appear in the list. In particular, the "path" of the button is shown. This path might include the labels of the following UI elements, as relevant:

- Action Pane tab
- Button group
- Menu button (if the button is inside a menu button)
- Menu separator (if the button is inside a named group inside a menu button)
- Group or tab on the page (for example, the name of a FastTab)

For example, you typed **tot** in the **action search** field and are now examining the results list. The first entry, for a button that is named **Totals**, is highlighted. A button path of **Sales order > View** is also shown. The **Sales order** part of the path corresponds to the **Sales order** tab on the Action Pane, and the **View** part of the path corresponds to the **View** group on that tab. Similarly, the path of the **Total discount** button (**Sell > Calculate**) informs you that this button is located in the **Calculate** group on the **Sell** tab of the Action Pane. Therefore, this information helps you understand exactly which button will be triggered by action search (if you select that button in the results list).

In the previous example, action search showed results from the standard Action Pane at the top of a page. However, action search also shows results from visible toolbars that are in other places on the page. For example, you're searching for the **On-hand inventory** button that is on the **Sales order lines** FastTab. In this case, the button path in the results list (**Sales order lines > Inventory > View**) informs you that this button is under the **View** heading on the **Inventory** menu button on the **Sales order lines** FastTab.

**NOTE**

There are some buttons that do not show up in Action search. These include drop dialog buttons and buttons from subforms.

## Action search vs. Navigation search

Whereas action search is intended to find and run actions on a page, there is a separate search mechanism for finding and navigating to pages. For more information about that feature, see the [Navigation search](#) article.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Advanced filtering and query syntax

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the filtering and query options that are available when you use the Advanced filter/sort dialog or the **matches** operator in the Filter pane or grid column header filters.

## Advanced query syntax

SYNTAX	CHARACTER DESCRIPTION	DESCRIPTION	EXAMPLE
<i>value</i>	Equal to the value that is entered	Type the value to find.	<b>Smith</b> finds "Smith".
! <i>value</i> (exclamation point)	Not equal to the value that is entered	Type an exclamation point and then the value to exclude.	<b>!Smith</b> finds all values except "Smith".
<i>from-value..to-value</i> (double period)	Between the two values that are separated by double periods	Type the from-value, then two periods, and then the to-value.	<b>1..10</b> finds all values from 1 through 10. However, in a string field, <b>A..C</b> finds all values that start with "A" and "B", and values that are exactly equal to "C". For example, this query won't find "Ca". To find all values from "A" <i>through</i> "C", type <b>A..D</b> .
<i>..value</i> (double period)	Less than or equal to the value that is entered	Type two periods and then the value.	<b>..1000</b> finds any number that is less than or equal to 1000, such as "100", "999.95", and "1,000".
<i>value..</i> (double period)	Greater than or equal to the value that is entered	Type the value and then two periods.	<b>1000..</b> finds any number that is greater than or equal to 1000, such as "1,000", "1,000.01", and "1,000,000".
<b>&gt;</b> <i>value</i> (greater than sign)	Greater than the value that is entered	Type a greater than sign (>) and then the value.	<b>&gt; 1000</b> finds any number that is greater than 1000, such as "1000.01", "20,000", and "1,000,000".
<b>&lt;</b> <i>value</i> (less than sign)	Less than the value that is entered	Type a less than sign (<) and then the value.	<b>&lt; 1000</b> finds any number that is less than 1000, such as "999.99", "1", and "-200".
<i>value*</i> (asterisk)	Starting from the value that is entered	Type the starting value and then an asterisk (*).	<b>S*</b> finds any string that starts with "S", such as "Stockholm", "Sydney", and "San Francisco".

SYNTAX	CHARACTER DESCRIPTION	DESCRIPTION	EXAMPLE
* <i>value</i> (asterisk)	Ending with the value that is entered	Type an asterisk and then the ending value.	<b>*east</b> finds any string that ends with "east", such as "Northeast" and "Southeast".
* <i>value</i> * (asterisk)	Containing the value that is entered	Type an asterisk, then a value, and then another asterisk.	<b>*th*</b> finds any string that contains "th", such as "Northeast" and "Southeast".
? (question mark)	Having one or more unknown characters	Type a question mark at the position of the unknown character in the value.	<b>Sm?th</b> finds "Smith" and "Smyth".
<i>value,value</i> (comma)	Matching the values that are separated by commas	Type all your criteria, and separate them by using commas.	<b>A, D, F, G</b> finds exactly "A", "D", "F", and "G". <b>10, 20, 30, 100</b> finds exactly "10, 20, 30, 100".
"" (two double quotes)	Matching a blank value	Type two consecutive double quotes to filter for blank values in that field.	Two consecutive double quotes ("" ) finds rows with no value for the current column.
(Finance and Operations query) (Finance and Operations query between parentheses)	Matching a defined query	Type a query as an SQL statement between parentheses using the Finance and Operations query language.	<b>((AccountNum LIKE "US*") &amp;&amp; (DirPartyTable.Name LIKE "Cont*"))</b>  as an example of syntax for a filter condition on a field from the root datasource as well as a field from a different datasource (for the All customers page)
T	Today's date	Type T.	<b>T</b> matches today's date.

SYNTAX	CHARACTER DESCRIPTION	DESCRIPTION	EXAMPLE
(methodName(parameters)) (SysQueryRangeUtil method between parentheses)	Matching the value or range of values that are specified by the parameters of the SysQueryRangeUtil method	Type a SysQueryRangeUtil method that has parameters that specify the value or range of values.	<ol style="list-style-type: none"> <li>1. Click <b>Accounts receivable &gt; Invoices &gt; Open customer invoices</b>.</li> <li>2. Press Ctrl+Shift+F3 to open the <b>Inquiry</b> page.</li> <li>3. On the <b>Range</b> tab, click <b>Add</b>.</li> <li>4. In the <b>Table</b> field, select <b>Open customer transactions</b>.</li> <li>5. In the <b>Field</b> field, select <b>Due date</b>.</li> <li>6. In the <b>Criteria</b> field, enter (yearRange(-2,0)).</li> <li>7. Click <b>OK</b>. The list page is updated and lists the invoices that match the criterion that you entered. For this example, invoices that were due in the previous two years are listed.</li> </ol> <p>See the table in the next section for additional details about SysQueryRangeUtil date methods, and several examples.</p>

## Advanced date queries that use SysQueryRangeUtil methods

METHOD	DESCRIPTION	EXAMPLE
Day (_relativeDays=0)	Find a date relative to the session date. Positive values indicate future dates, and negative values indicate past dates.	<ul style="list-style-type: none"> <li>• <b>Tomorrow</b> – Enter (Day(1)).</li> <li>• <b>Today</b> – Enter (Day(0)).</li> <li>• <b>Yesterday</b> – Enter (Day(-1)).</li> </ul>
DayRange (_relativeDaysFrom=0, _relativeDaysTo=0)	Find a range of dates relative to the session date. Positive values indicate future dates, and negative values indicate past dates.	<ul style="list-style-type: none"> <li>• <b>Last 30 days</b> – Enter (DayRange(-30,0)).</li> <li>• <b>Previous 30 days and next 30 days</b> – Enter (DayRange(-30,30)).</li> </ul>
GreaterThanDate (_relativeDays=0) GreaterThanUtcDate (_relativeDays=0)	Find all dates after the specified relative date.	<ul style="list-style-type: none"> <li>• <b>More than 30 days from now</b> – Enter (GreaterThanDate(30)).</li> </ul>

METHOD	DESCRIPTION	EXAMPLE
GreaterThanOrEqualTo ()	Find all date/time entries after the current time.	<ul style="list-style-type: none"> <li>• <b>All future date/times</b> – Enter (GreaterThanOrEqualTo()).</li> </ul>
LessThanDate (_relativeDays=0) LessThanOrEqualToDate (_relativeDays=0)	Find all dates before the specified relative date.	<ul style="list-style-type: none"> <li>• <b>Less than seven days from now</b> – Enter (LessThanDate(7)).</li> </ul>
LessThanOrEqualTo ()	Find all date/time entries before the current time.	<ul style="list-style-type: none"> <li>• <b>All past date/times</b> – Enter (LessThanOrEqualTo()).</li> </ul>
MonthRange (_relativeFrom=0, _relativeTo=0)	Find a range of dates, based on months relative to the current month.	<ul style="list-style-type: none"> <li>• <b>Previous two months</b> – Enter (MonthRange(-2,0)).</li> <li>• <b>Next three months</b> – Enter (MonthRange(0,3)).</li> </ul>
YearRange (_relativeFrom=0, _relativeTo=0)	Find a range of dates, based on years relative to the current year.	<ul style="list-style-type: none"> <li>• <b>Next year</b> – Enter (YearRange(0, 1)).</li> <li>• <b>Previous year</b> – Enter (YearRange(-1,0)).</li> </ul>

# Configure and filter workspaces

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides an overview about how to configure and filter workspaces.

## Configuring a workspace

You can change the appearance and behavior of some workspaces by updating settings that apply to the whole workspace. When a workspace can be configured, the Action Pane includes a button that instructs you to click it to make configuration changes. For example, in the following illustration, the button is named **Configure my workspace**.

When you click the button, a dialog appears, where you can modify the predefined settings for the workspace. The specific settings that you see in this dialog vary by workspace, and depend on the specific controls and business data that are available in the workspace.

Configure my workspace

[Restore default values](#) [View default values](#)

**WHICH DATA DO YOU WORK WITH?**

Show amounts

Organization hierarchy

Budget model

Active forecasting process

**WHAT INFORMATION WOULD YOU LIKE TO SEE IN THE DETAIL**

Expense dimension set

Expense budget threshold percent

Revenue dimension set

Revenue budget threshold percent

## Filtering a workspace

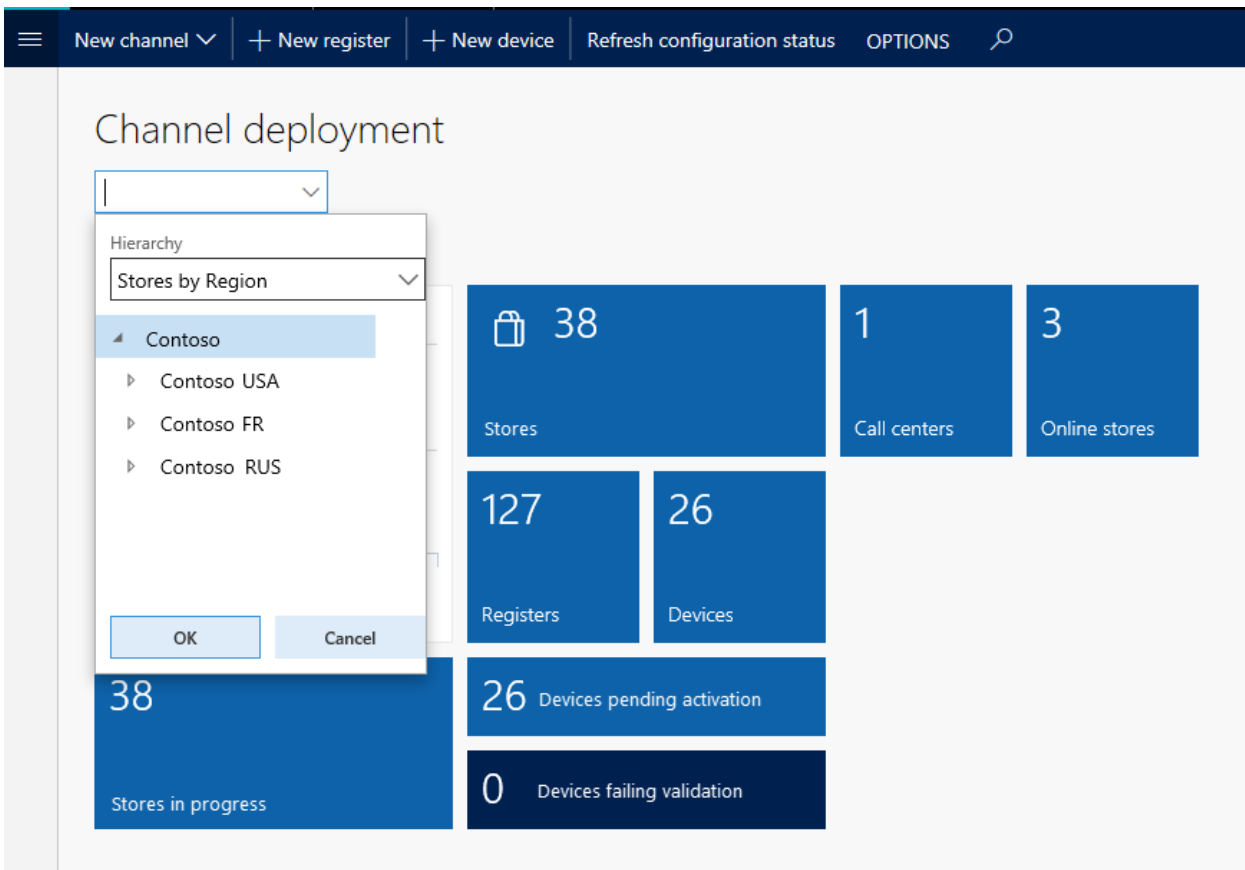

Many workspaces let you filter the content that appears in them. The controls that are available might let you filter all the content in the workspace or only the content in a specific section of the workspace. The filters on workspaces can be lookups, combo boxes, free-form text fields, or other types of controls. However, every type of filter has the same effects, as described in the following sections.

### Workspace-wide filters

You can filter the whole workspace by using a workspace-wide filter. A workspace-wide filter appears in the upper-left corner of the workspace. When you select a specific value in the drop-down list, the contents of the workspace are filtered based on that selection.

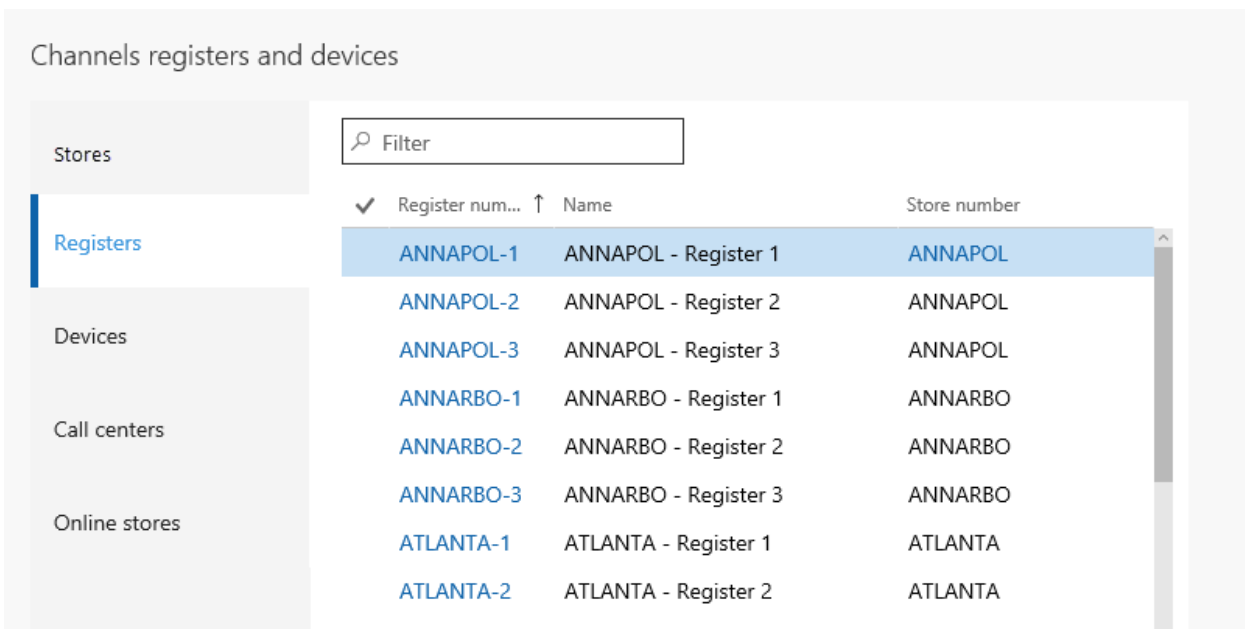

When you click to open the filter, you're presented with several options.

Select an option to filter the workspace based on that option.

### Workspace section filters

If individual sections of the workspace have filters, you can filter each section separately. In the following illustration, the filter (the field that contains the text "Filter") is an example of a free-form text field filter.

As with a workspace-wide filter, select or enter a value in the field to filter the contents of the section.

# Show pages side-by-side using the Open in new window feature

2/18/2021 • 2 minutes to read • [Edit Online](#)

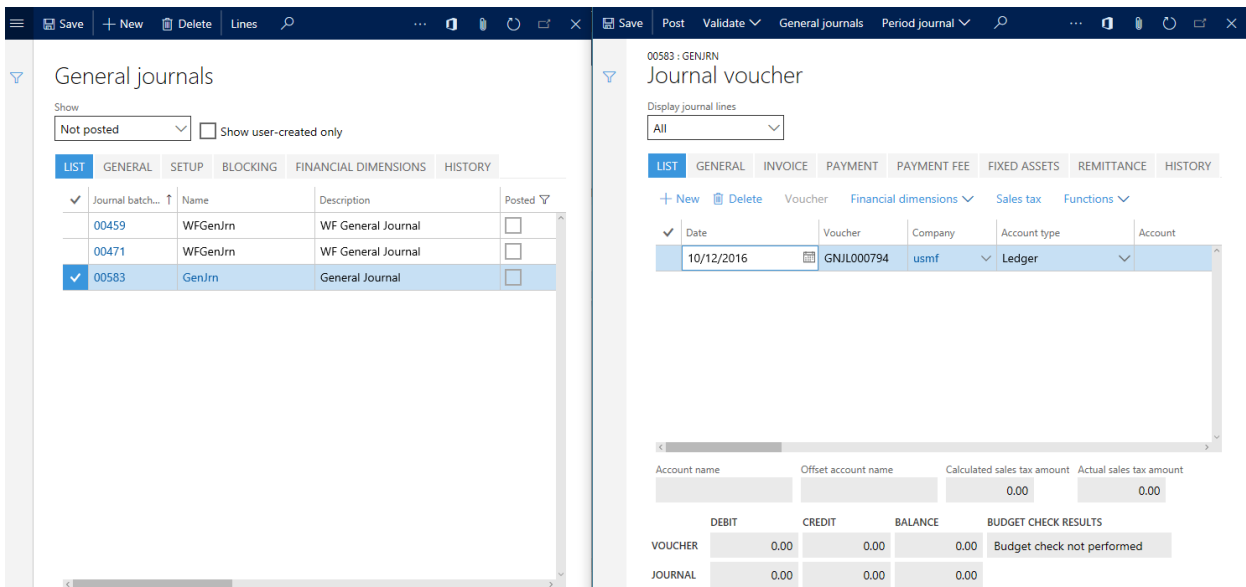

This article explains how to display pages side by side.

You may want to view multiple pages side by side to complete tasks quickly. As an example, you might want to validate or enter lines in more than one journal. Typically, to validate or enter lines in more than one journal, you would have to go back and forth between the page that displays a list of journals, and the page that displays lines for a given journal. However, the **Open in new window** feature enables you to display these pages side-by-side so that you can perform your tasks quickly.

Continuing with the example mentioned above, when viewing the lines, you can click the **Open in new window** icon.

Clicking the **Open in new window** icon opens the lines page in a new, pop-up browser, and then navigates the original browser back in history to the page that displayed the list of journals. You can then display both pages side by side. After viewing a journal, you can change the selected journal on the journal list page, and the lines page in the pop-up window will automatically display the lines of the newly selected journal.

The dynamic linking and refreshing happens due to the relations that exist between the data that is backing these pages. If the system is not aware of the relation between the data, the pop-up window will not refresh automatically in response to a change in the window it originated from.

Some pages have multiple views such as the Grid view, Header view, and Details view. The **Open in new window** icon causes the entire page to open in the new browser window. Therefore, you cannot keep two views of the same page side by side using the **Open in new window** feature. Almost all such pages have a

navigation list that you can use to switch between records and achieve a similar experience.

Before using the **Open in new window** feature, you should configure your browser's pop-up blocker to allow pop-ups from the URL of the site. As an example, you could allow pop-ups from "\*.dynamics.com".

The **Open in new window** feature is only available when there is more than one page open in the window. Also, the pop-up window automatically closes when there are no more pages open (that is, when you close the last page in that window). The system also closes open pages when you navigate to a different area in the application. Therefore, if you have pop-up windows open and navigate to a different area in the application, the pop-up windows close automatically because the system closed the pages in those windows.

The top bar in the pop-up windows displays information about the company the page was opened in and is read-only. The pop-up windows also rely on the main browser window. If the main window is closed or refreshed, all open pop-up windows will become read only. If this situation occurs, you can still view the information in these windows, but you will not be able to interact with it.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Keyboard shortcuts

2/18/2021 • 9 minutes to read • [Edit Online](#)

The following keyboard shortcuts can help you quickly and efficiently enter data in Finance and Operations apps

## NOTE

The keyboard shortcuts described here refer to the United States keyboard layout. Keys on other keyboard layouts might not correspond exactly to the keys on a US keyboard.

Some of the shortcuts on this page are *key chords*, meaning they require two consecutive sets of key combinations (separated by a comma) that need to be independently pressed to trigger the required action. For example, the shortcut "Alt+M,A" requires the user to first press "Alt+M", release the keys, and then press "A".

## Finding a shortcut

As of Platform update 11, users can discover currently available shortcuts directly from the user interface. Simply right-click on a control and select **View shortcuts**. This will open a dialog box showing the shortcuts you can use based on where you are on the page.

## Action shortcuts

TO DO THIS	PRESS
Open action search	Ctrl+' or Alt+Q
Move to the standard Action Pane	Alt+M,A or Ctrl+F6
Open a tab on the Action Pane or a menu	Enter or Space or Alt+Down arrow
Move to next/previous option in a menu	Down arrow / Up arrow
Close a tab on the Action Pane or a menu	Esc
Simulate a right-click	Shift+F10
Open the context menu	Ctrl+F10
Execute the default button on a form/dialog box	Alt+Enter
Click a button or tile	Enter or Space
View refresh information for a count tile	Alt+Up arrow
View currently available shortcuts	Alt+Shift+K

## Date picker shortcuts

TO DO THIS	PRESS
Open the date picker	Alt+Down arrow
Move between dates in the date picker	Ctrl+Arrow keys
Move to the next/previous month	Page down / Page up
Move to the next/previous year	Ctrl+Shift+Page down / Ctrl+Shift+Page up
Move to today	Ctrl+Home
Pick today's date	T
Clear the selected date	C
Pick Never (or the max date)	N

## FactBox shortcuts

TO DO THIS	PRESS
Open the FactBox pane (or move focus to the FactBox pane if it is already open)	Alt+M,B or Ctrl+F2
Close the FactBox pane (with focus in the FactBox pane)	Esc
Move to the next/previous FactBox (with focus in the FactBox pane)	Alt+Shift+Down arrow / Alt+Shift+Up arrow
Move to the <n>th FactBox (with focus in the FactBox pane)	Alt+<n> (<n> = 1-9)
Expand a FactBox (with focus on the FactBox header)	Space or Enter
Collapse the current FactBox	Alt+0

## Filtering shortcuts

TO DO THIS	PRESS
Open grid filtering for the current column	Ctrl+G
Close grid filtering for the current column	Esc
Open the Filter pane (or switch focus between the Filter pane and the main form if the Filter pane is already open)	Alt+M,F or Ctrl+F3
Close the Filter pane (with focus in the Filter pane)	Esc
Open advanced filtering/sort	Ctrl+Shift+F3

## Form shortcuts

TO DO THIS	PRESS
Create a new record	Alt+N
Delete a record	Alt+Del or Alt+F9
Save record	Alt+S or Ctrl+S
Revert (restore)	Ctrl+Shift+F5
Data refresh	Shift+F5
Move to the visible first field on the form	Alt+Shift+F
Toggle edit mode	F2
Attach a document	Ctrl+Shift+A
Export to Excel	Ctrl+Shift+E
Move to the previous record (outside a grid)	Ctrl+Up arrow
Move to the next record (outside a grid)	Ctrl+Down arrow
Move to the first record (outside a grid)	Ctrl+Home
Move to the last record (outside a grid)	Ctrl+End
Close the form (click Back)	Esc
Close the form with explicit save	Shift+Esc
Close the form discarding any unsaved changes	Alt+Shift+Q

## Form navigation shortcuts

TO DO THIS	PRESS
Move to the next/previous field	Tab / Shift+Tab
Move to the next/previous tab	Alt+Shift+Right arrow / Alt+Shift+Left arrow
Move to the <n>th tab	Alt+Shift+<n> (<n> = 1-9)
Move to the next/previous FastTab	Alt+Shift+Down arrow / Alt+Shift+Up arrow
Move to the <n>th FastTab	Alt+<n> (<n> = 1-9)
Move to the next/previous blade (vertical tab)	Alt+Shift+Right arrow / Alt+Shift+Left arrow

TO DO THIS	PRESS
Move to the <n>th blade (vertical tab)	Alt+Shift+<n> (<n> = 1-9)
Expand a FastTab (with focus on the FastTab header)	Space or Enter
Collapse the current FastTab	Alt+0
Switch to grid view	Ctrl+Shift+G
Switch to details view	Ctrl+Shift+D
Switch to header view	Ctrl+Shift+H
Switch to lines view	Ctrl+Shift+L

## Grid shortcuts

TO DO THIS	PRESS
Move to the next/previous column	Tab / Shift+Tab
Move to the next/previous row	Down arrow / Up arrow
Move to the next/previous row without selecting <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Ctrl+Up arrow / Ctrl+Down arrow
Select/clear the current row <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Ctrl+Space / Ctrl+Click
Add the next/previous row to the selected set <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Shift+Space
Add a range of rows to the selected set <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Shift+Click
Go to the next/previous page of data	Page up / Page down
Create a new row at the bottom of the grid	Down arrow (from the last row)
Move to the first record	Ctrl+Home

TO DO THIS	PRESS
Move to the last record	Ctrl+End
Select or clear all rows	Ctrl+Shift+M
Move to the first marked row	Alt+Shift+M, F
Move to the next marked row	Alt+Shift+M, L
Move to the previous marked row	Alt+Shift+M, P
Moved to the last marked row	Alt+Shift+M, N
Execute the default action in a grid  <div style="border: 1px solid gray; padding: 5px; margin: 5px 0;"> <p>[!NOTE] This shortcut is enabled when focus is on a cell containing a hyperlink and all cells in that column have hyperlinks.</p> </div>	Enter
Toggle focus between the selected row and the header row	Alt+Shift+H
Make the current column larger/smaller (with focus in the header row)	Right arrow / Left arrow
Open grid filtering for the current column (with focus in the header row)	Enter

## Input control shortcuts

TO DO THIS	PRESS
Open the hyperlink	Ctrl+Enter
Enter the session date in a date field	D
Enter the current date in a date field	T
Open lookup, combo box, date picker, drop dialog box	Alt+Down arrow
Close lookup, combo box, date picker, drop dialog box	Esc
Move focus into a lookup (when the lookup is already open)	Alt+Down arrow
Open the control's enhanced preview	Alt+Up arrow
Select text in the current field	Ctrl+A
Enter/leave the text area in an HTML editor control	Alt+Down arrow / Alt+Up arrow
Switch focus between the text area and the toolbar in an HTML editor control	F6

## Messaging shortcuts

TO DO THIS	PRESS
Go to the Message Center	Ctrl+Shift+F7
Go to the Message Bar	Ctrl+F7

## Navigation shortcuts

TO DO THIS	PRESS
Go to the dashboard	Alt+Shift+Home
Move to the navigation bar	Alt+M,N or Alt+Shift+F1
Move to the company picker	Ctrl+Shift+O
Search for a page	Ctrl+/ or Alt+G
Open the help pane	Ctrl+?
Open the trace parser	Alt+Shift+T
Move to the navigation pane	Alt+F1
Add/remove form as a favorite (with focus on a form in the navigation pane)	Shift+F
Move to the standard Action Pane	Alt+M,A or Ctrl+F6
Move to the Filter pane (which may include opening it)	Alt+M,F or Ctrl+F3
Move focus to the page content (with focus in the Filter pane)	Alt+M,M or Ctrl+F3
Move to the navigation list on Details form (which may include opening it)	Alt+M,S or Ctrl+F8
Move focus to the page content (with focus in the navigation list)	Alt+M,M or Ctrl+F8
Close the navigation list on Details form (with focus in the navigation list)	Esc
Move to the main page content (with focus in another pane)	Alt+M,M
Move to the FactBox pane (which may include opening it)	Alt+M,B or Ctrl+F2

## Personalization shortcuts

TO DO THIS	PRESS
Transition the page into personalization mode	Ctrl+Shift+P
Use the Select tool (when in personalization mode)	S
Open the selected control's quick personalization dialog box (when using the Select tool)	Space or Enter
Use the Move tool (when in personalization mode)	M
Select the current control as the one to move (when using the Move tool and no control has been selected to move yet)	Space or Enter
Clear the control to move (when using the Move tool)	Esc
Move to the next position for the selected control (when using the Move tool)	Tab or Right arrow or Down arrow
Move to the previous position for the selected control (when using the Move tool)	Shift+Tab or Left arrow or Up arrow
Use the Hide tool (when in personalization mode)	H
Switch whether the current control is visible or hidden (when using the Hide tool)	Space or Enter
Use the Skip tool (when in personalization mode)	K
Switch whether the current control is in the tab sequence (when using the Skip tool)	Space or Enter
Use the Edit tool (when in personalization mode)	E
Switch whether the current control is editable or read-only (when using the Edit tool)	Space or Enter
Use the Summary tool (when in personalization mode)	U
Switch whether the current control is a summary field in the current fast tab (when using the Summary tool)	Space or Enter
Use the Add tool (when in personalization mode)	A
Select the control whose container will be used to insert the new fields (when using the Add tool)	Space or Enter
Import a personalization (when in personalization mode)	I
Export a personalization (when in personalization mode)	X
Clear this page's personalizations (when in personalization mode)	Ctrl+C

TO DO THIS	PRESS
Move focus between the personalization toolbar and the page (when in personalization mode)	T
Exit personalization mode (when in personalization mode)	Esc

## Segmented entry shortcuts

TO DO THIS	PRESS
Open the drop-down list (when the drop-down list is closed)	Alt+Down arrow
Move focus into the input field for the current segment in the drop-down list (when the drop-down list is already open)	Alt+Down arrow
Close the drop-down list	Alt+Up arrow
Close/open the right portion of the drop-down list	Alt+Left arrow / Alt+Right arrow
Switch between "Show valid" and "Show all" modes	Alt+W
Select the value from drop-down list and move to the next segment	Enter
Move to the next/previous control on the page (when focus is in input control)	Tab / Shift+Tab
Move to the next/previous input field in the flyout (when focus is in the drop-down list)	Tab / Shift+Tab
Move up/down a row in the lookup	Up arrow / Down arrow
Move up/down a page in the lookup	Page up / Page down
Move to the top/bottom of the lookup	Home / End

## Task recorder shortcuts

TO DO THIS	PRESS
Stop the recording (while recording)	Alt+R,S
Toggle the visibility of the Task recorder pane (while recording)	Alt+R,T
Toggle Rails mode (while playing a task guide)	Alt+R,L
Go to the previous step (while playing a task guide)	Alt+R,P
Go to the next step (while playing a task guide)	Alt+R,N

TO DO THIS	PRESS
Toggle focus between the page and the animated pop-up prompt (while playing a task guide)	Alt+R,F
Expand/collapse the animated pop-up prompt (while playing a task guide)	Alt+R,C
Show more/less information in the animated pop-up prompt (while playing a task guide)	Alt+R,M

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Change the banner or logo

2/18/2021 • 2 minutes to read • [Edit Online](#)

The following procedure lists the steps that system administrators can use to update the banner or logo image that is displayed for a legal entity. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Organization administration > Organizations > Legal entities**.
2. In the list on the left, select the legal entity for which you want to update the banner or logo. If it is already selected, go to the next step.
3. Expand **Dashboard image** tab.
4. Select **Change**.

The ideal resolution for a banner image is 1920 x 281 pixels. The ideal width for a logo image is 350 pixels.

5. Select **Save**.
6. Go to **Navigation pane > Modules > Common > Common > Default dashboard**. You should see the new banner or logo image on the dashboard.

You may need to change your company, using the company picker, to the one you uploaded the banner for.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Navigation search

2/18/2021 • 2 minutes to read • [Edit Online](#)

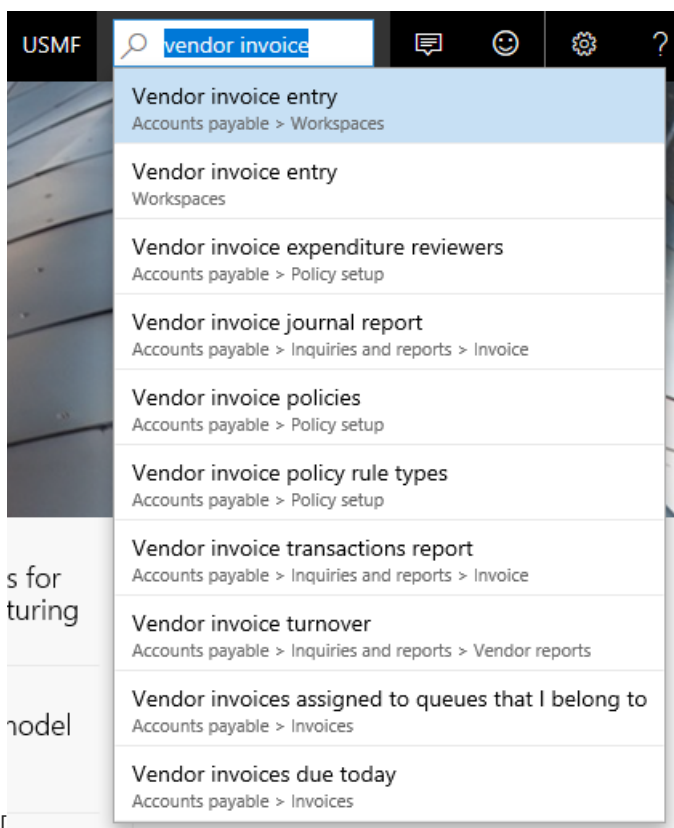

This topic explains how to use the search functionality to navigate to pages.

The application includes a number of areas and pages to help you perform various tasks. To quickly find the pages that you need to complete your tasks, use the navigation search feature.

To use this feature, click the **Search** icon to display the **Search** box. You can then type one or more words in the box. The system instantly searches for relevant pages in the application that match the words that you entered. For example, you could type "vendor invoice" as the input, and then the system displays results that match that input.

## NOTE

The **Search** box helps you find and navigate to pages. It will not help you find specific data or actions.

## Quickly navigate to a particular page

The navigation search feature also serves as a great way for you to quickly navigate to a particular page. For example, if you are an accounts payable clerk who frequently uses the **Payment journal** page, you could enter "payment journal" in the **Search** box. Because the input is an exact match for the page title, the page is listed at the top of the search results, and you can quickly navigate to it.

The search results list displays the page title as well as the navigation path. This shows the location of the page in the application. It also helps you differentiate between two or more similar pages in the results.

When you search for a page, your input is matched against the page title, as well as its navigation path. For

example, if you enter "receivable" in the **Search** box, you will see results for the pages available to you in the Accounts receivable area – even though the page titles do not include the word "receivable."

## Quickly navigate to a page based on the technical form name

The navigation search functionality also includes a much-requested feature for power users: the ability to quickly navigate to a page based on the technical form name. Many users are so familiar with the system that they know the exact form names they work with. If you are one of these users, you can enter **form:** followed by the name of the form you are looking for. For example, if you enter **form: vendinvoice**, the search results will show all pages where the form name starts with **vendinvoice**.

## Administration and security

From an administration and security perspective, the navigation search functionality only surfaces two types of results:

- Pages that are enabled in the current configuration (via configuration keys).
- Pages that the user has access to based on the user's role.

The list of search results is limited to 10 items. If you do not find what you're looking for in the results, you should try refining or updating the input.

## Development

From a development perspective, the navigation search functionality is easy to leverage because there is virtually no delay between the deployment of menu items and their ability to show up in search results. As long as the menu items are linked to from either the navigation pane or the dashboard, they will automatically become searchable.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Personalize the user experience

2/18/2021 • 22 minutes to read • [Edit Online](#)

This topic explains how you can personalize the app and covers the following subjects:

- **System-wide options** – These personalization options are made on a setup page and are available to all users. Examples include the color theme and time zone.
- **Restricted personalization access** – At this access level, user actions that are associated with typical page usage are automatically saved by the app and restored the next time that you visit the page. For example, the app stores the width of grid columns if you adjust them, and the expanded or collapsed state of FastTabs.
- **Full personalization access** – At this access level, users have access to all personalization capabilities in the app. In particular, they have access to the **Personalization** toolbar.
- **Sharing personalizations** – Users who have full personalization access can export their page personalizations and share them with other users.
- **Administration of personalizations** – Privileged users can access the **Personalization** administration page to manage all personalizations at an organizational level.

## System-wide options for the current user

The **User options** page contains several system-wide settings for the current user. These options are available to all users, even users who haven't been given any access to personalization. To open the **User options** page, select the **Settings** button on the navigation bar, and then select **User options**. The **User options** page has four tabs that contain various user settings:

- **Visual** – Select a color theme and the default size of elements on pages.
- **Preferences** – Select default values that are used every time that you open the system. These values include the default company, the initial page, and the default view/edit mode. (The view/edit mode determines whether a page is locked for viewing or opened for editing every time that you open it.) This tab also includes options for the language, the time zone, and date, time, and number formats. Finally, this tab includes several miscellaneous preferences that vary from release to release.
- **Account** – View or adjust your user name and other account-related options.
- **Workflow** – Select workflow-related options.

In addition to changing your user settings, you can also view and delete your usage data and personalizations from the **User options** page. To see your usage data, select **Usage data** on the Action Pane. On the **Personalization** tab, you can view and manage the personal changes that you've made to pages in the system. On this tab, you can also reset feature callouts (that is, the pop-up windows that introduce new system features). You will then be alerted again about previously encountered features.

### NOTE

If the [Saved views](#) feature is turned on, you can view and manage your personalizations by selecting **Personalization** on Action Pane on the **User options** page.

## Restricted personalization access (formerly implicit personalizations)

At the **restricted personalization access** level, user actions that are associated with typical page usage are automatically saved by the app and restored the next time that you visit the page. No explicit save action is required.

Here is a list of the actions that fall under typical page usage and are covered by restricted personalization access:

- **Grid column widths** – You can adjust the width of a column in a grid by selecting the sizing bar to the left or right of the column header, and then sliding it left or right until the column is the desired width. The app stores the width that you set for a column. Then, the next time that you open that page, the column will be resized to that width.
- **Grid footer and column totals** – (*Available only when the new grid control is turned on*) You can decide whether a total should be shown at the bottom of any numeric column in a grid, and whether the grid footer should be visible. The app stores these preferences and applies them the next time that you open the page. For more information, see [Grid capabilities](#).
- **FastTabs** – Some pages have expandable sections that are known as *FastTabs*. The app stores information about the FastTabs that you've expanded or collapsed. The next time that you open the page, the same FastTabs will be either expanded or collapsed, based on your last interaction with the page. In some cases, you can help improve system performance by collapsing a FastTab, because the app doesn't have to retrieve the information for FastTabs until they are expanded. As is explained later in this topic, you can also change the order of the FastTabs on a page.
- **FactBoxes** – Some pages have a **Related information** pane that shows read-only information that is related to the current subject of the page. Each section in the **Related information** pane is known as a *FactBox*. You can expand or collapse the **Related information** pane, and you can also expand or collapse individual FactBoxes. The app stores these preferences. The next time that you open the page, the **Related information** pane and the individual FactBoxes will be either expanded or collapsed, based on your last interaction with the page. In some cases, you can help improve system performance by collapsing the **Related information** Pane or a FactBox, because the app doesn't have to retrieve the information for FactBoxes until they are expanded.
- **Action Panes** – An *Action Pane* appears near the top of most pages. The Action Pane contains buttons for many of the actions that you can perform on the current page. These buttons are often organized on tabs. You can *pin* the whole Action Pane open, or you can have it collapsed by default. The next time that you open the page, the Action Pane will be either open or collapsed, based on your last interaction with the page. If you pinned the Action Pane open, the last tab that you were using will be shown.
- **QuickFilters** – A *QuickFilter* appears above many grids. The QuickFilter lets you filter the grid based on a single column that you select. The app stores the column that you filtered on. Then, the next time that you open that page, the grid will use that same column for filtering by default. However, you can still select a different column to filter the grid on.
- **Column header filters** – When you filter a grid by using *column header filters*, you can change the filter operator as you require to find the data that you want. For example, you can change the operator from **begins with** to **is exactly**. Every time that you use a column header filter and change the filter operator, the app stores the change. Then, the next time that you filter on that column, the filter operator will be restored.
- **Navigation pane** – You can open the *navigation pane* by selecting the **Expand the navigation pane** button in the upper left of any page. (This button is sometimes referred to as the **Menu button**, *hamburger*, *hamburger menu*, or *hamburger button*.) You can pin the navigation pane open, or you can have it collapsed by default. After you pin the navigation pane open, the app will keep it open until you collapse it.

## Full personalization access (formerly explicit personalizations)

At the **full personalization access** level, users have access to all the personalization capabilities that the app provides. Because different people and companies have different needs when they interact with the app, especially in terms of utilized fields, personalization provides tools that let users and organizations tailor the way that information is ordered and interacted with in the app. These capabilities are key to providing simplified, optimized experiences in the app that are tailored to you and your organization.

If the [Saved views](#) feature is turned on, an explicit save is required to persist these changes to the user

experience for a specific view. When the **Saved views** feature is turned off, these changes are automatically saved.

The following sections cover the extent of personalization capabilities that are available to users at the **full personalization access** level. Here are some of these capabilities:

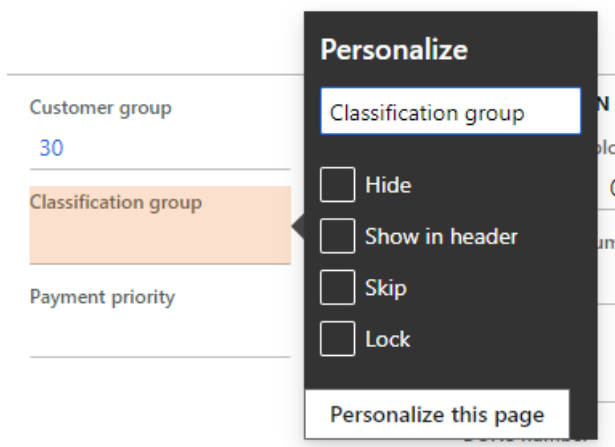

- Shortcut menu options
- The **Personalization** toolbar
- Adding tiles, lists, and links to workspaces
- Adding a summary from a workspace to a dashboard
- Personalizing the dashboard

### Shortcut menu options

Shortcut menus provide one way to change a page's interface so that it better meets your requirements or the requirements of your organization. (A shortcut menu is also known as a *right-click menu* or a *context menu*.)

Some of the most typical and important changes that can be made to a page are available directly as options on a shortcut menu. For example, if you want to add or hide columns in a grid, just right-click a column header, and then select **Insert columns** or **Hide this column**.

Additionally, the most basic types of personalizations are available by right-clicking an element and then selecting **Personalize**. (Note that not all elements on your page can be personalized.) When you use this personalization method, the element's *property window* appears.

You can use the property window to personalize an element in the following ways:

- Change the element's label.
- Hide the element so that it isn't shown on the page. The data in the field isn't deleted or modified. The information just isn't shown on the page any longer.
- Include the information in the FastTab's summary section (if the element is on a FastTab).
- Skip the field so that it never receives focus when you tab through the page.
- Prevent data in the field from being edited (for any record).
- Designate a field to be required for data entry. If no value has been entered in this field, it will appear with a red border and an asterisk to indicate this state. This option is only available starting in version 10.0.11 when the [Saved views](#) and **Designate fields as required using personalization** features are turned on.

The property window might include other personalization capabilities, depending on the element. For example, the property window for a tile might let you promote that tile to a dashboard, and property windows for elements on the default dashboard might let you create a new custom workspace.

### The Personalization toolbar

If you want to make multiple changes to a page, or changes that aren't available through other mechanisms (for

example, if you want to reorder elements), you can use the **Personalization** toolbar. To open the **Personalization** toolbar, follow one of these steps:

- Select **Ctrl+Shift+P** from any element on the page.
- Select **Personalize this page** in an element's property window.
- Select **Personalize this page** in the **Personalize** group on the **Options** tab of any page's Action Pane.
- Select the **Settings** button (the gear symbol) on the navigation bar, and then select **Personalize**.

### Navigating the page

When the **Personalization** toolbar is open, the underlying page is read-only (in other words, you can't edit data), but it's still interactive. Specifically, you can expand or collapse the **Related information** pane, switch tabs, and expand or collapse sections, just as you would usually perform those actions on the page. To apply a personalization to a collapsible section or tab (for example, to hide a FastTab), you just have to select the button that appears next to that section or tab when it gains keyboard focus or when you hover over it.

### Personalization tools

The following tools are available on the **Personalization** toolbar:

- Use the **Select** tool to select and change the properties of an element. To use this tool, select the **Select** button on the toolbar, and then select the desired element. The element's property window appears, where you can change any of the properties of that element. You can repeat the process for other elements that can be personalized on the page. Note that some personalization properties might not be available in some scenarios. For example, you can't lock a field that is required.
- Use the **Hide** tool to hide an element on the page. To use this tool, select the **Hide** button on the toolbar, and then select the element to hide. When you use the **Hide** tool, all elements that are currently hidden are made visible, but they are shown in a shaded container. You can then make an element visible by selecting it. To see how the page will look when elements are hidden, switch to another personalization tool or close the personalization toolbar.
- Use the **Add fields** tool to add fields to your page. When you use this tool, you can add only fields that are part of the page definition. For information about how to create new fields that aren't part of the current page definition, see [Create and work with custom fields](#). After you select the **Add fields** button on the toolbar, you must first select the grid or section where you want to add a field. A dialog box will show the list of fields that are related to the selected grid or section. In the dialog box, select one or more fields to add, and then select **Update**. To remove a field that you previously added, repeat the process, but clear the selection of the field in the dialog box.
- Use the **Move** tool to move an element to a different location in the current group of elements. Note that you can't move an element outside its parent group. To use this tool, select the **Move** button on the toolbar, and then select the element to move. When you select an element, the app determines the locations where the element is allowed to be moved. These locations are known as *drop zones*. As you drag the element around in the current group, each drop zone is shown as a colored, bold line next to the area where the element can be dropped.
- Use the **Skip** tool to remove an element from the page's keyboard tab sequence. When you select the **Skip** button on the toolbar, all elements that are currently skipped are shown in a shaded container. You can interactively remove or add fields to the tab sequence.
- Use the **Show in header** tool when you want a field to appear in the FastTab's summary section. When

you select the **Show in header** button on the toolbar, all fields that have been selected as summary fields are shown in a shaded container. You can interactively add fields to the FastTab summary and remove fields from the summary by selecting the fields.

- Use the **Require** tool to designate an element as required for data entry. When you select the **Require** button on the toolbar, all elements that have been personalized to make them required are shown in a shaded container. You can then make them not required again. This option is available in version 10.0.12 and later when the **Designate fields as required using personalization** feature is turned on.
- Use the **Lock** tool to mark an element as either editable or noneditable. When you select the **Lock** button on the toolbar, all elements that are currently noneditable are shown in a shaded container. You can then make them editable again. Note that some fields are required and can't be made noneditable. A padlock symbol appears next to those fields.
- Use the **Add an app from Power Apps** tool to embed an app that was created by using Microsoft Power Apps into the page. For detailed information about how to embed an app from Power Apps into a page, see [Embed apps from Power Apps](#). This option is available only when the [Saved views](#) feature is turned off.
- Use the **Add an app** button to embed an app, either one created from Microsoft Power Apps or a third-party, into the page. This option is only available when the [Saved views](#) feature is turned on.
- Use the **Clear** tool to reset the page to its default, installed state. All personalizations on the current page will be cleared. You can't undo this action. Therefore, use this tool only if you're sure that you want to reset the page. When the **Saved views** feature is turned on, this tool clears the personalizations for the current view.
- Use the **Import** tool to load a personalization from a file that you or someone else previously created.
  - When the **Saved views** feature is turned off, you can choose whether to add or replace your existing personalizations with the personalizations that are being imported for the page. You can't undo this action. Therefore, after you import personalizations, you must manually clear or undo any changes that you don't want.
  - When the **Saved views** feature is turned on, the imported personalizations will become a view on the page. If the view already exists, you will have the option to skip the import, replace the current view that has the same name, or rename the imported view.
- Use the **Export** tool to save your personalizations for the page to a file. You can then share your personalizations with other users. Those users just have to import the file that contains your personalizations for the page. When the **Saved views** feature is turned on, this tool saves your current view to a file for sharing.
- Select the **Close** button to close the **Personalization** toolbar and return the page to its previous interactive state.

Traditionally, when the **Personalization** toolbar is used, your personalizations take effect as soon as you make them. However, if the [Saved views](#) feature is turned on, you must explicitly save personalizations to a view that you choose.

In some cases, when you select a tool, a padlock symbol appears next to an element. This symbol indicates that you can't modify the element properties that are related to the selected tool, because changes to those properties will prevent the page from working correctly.

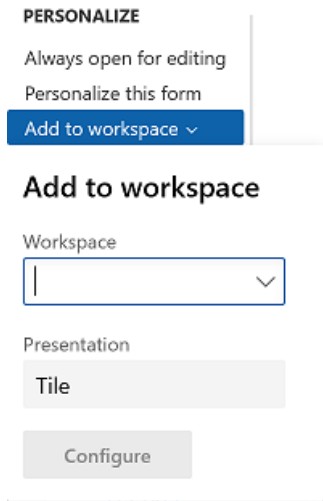

### **Adding tiles, lists, and links to a workspace**

For some pages that include lists, the **Add to workspace** personalization feature is available in the **Personalize** group on the **Options** tab of the Action Pane. This feature lets you push relevant information from the current list to a specific workspace. The information that appears in the workspace can be based on either

the whole list, or a filtered and sorted version of the list. You can also specify whether the information appears in the workspace as a list, a summary tile that can show the number of items in the list, or a link.

#### NOTE

If the [Saved views](#) feature is turned on, the content that you push to a workspace is directly linked to a view. The view's query is used to retrieve data into the workspace, and the corresponding tile or link in the workspace opens the page to that view, so that the view's query and personalizations are applied to it. If the view is updated, the corresponding workspace elements will be adjusted to the new view definition.

- To add a list to a workspace, first sort or filter the list on the page so that it shows the information as you want it to appear in the workspace. (If the **Saved views** feature is turned on, you can't continue until you save a view that has these conditions.) Then select **Add to workspace**. Select a workspace, and then, in the **Presentation** field, select **List**. After you select **Configure**, a dialog box appears, where you can select the columns that should appear in the list in the workspace. You can also specify the label that is used for the list in the workspace.
- To add a tile to a workspace, first filter the list on the page so that it shows the data that should be summarized or that you want quick access to. (If the **Saved views** feature is turned on, you can't continue until you save a view that has these conditions.) Then select **Add to workspace**. Select a workspace, and then, in the **Presentation** field, select **Tile**. After you select **Configure**, a dialog box appears, where you can specify the label that should be used for the tile in the workspace. You can also specify whether the tile should show a count. After the tile is added to the workspace, you can select it to open the current page from the workspace. You can then view the filtered list that is associated with the tile.
- To add a link to a workspace, first filter the list on the page so that it shows the data that you're interested in. (If the **Saved views** feature is turned on, you can't continue until you save a view that has these conditions.) Then select **Add to workspace**. Select a workspace, and then, in the **Presentation** field, select **Link**. After you select **Configure**, a dialog box appears, where you can specify the label that should be used for the link. You can also optionally specify a label for a new section that contains this link.

After you've added a list, tile, or link to a workspace, you can open that workspace and rearrange the elements in it as you want.

#### Adding a summary from a workspace to a dashboard

Some workspaces contain count tiles (that is, tiles that have numbers on them), and you might want those tiles to appear on your dashboard too. In a workspace, right-click a count tile, select **Personalize**, and then, in the tile's property window, select **Pin to dashboard**. The next time that you open and refresh the dashboard, the count will appear below the navigation tile for that workspace. You can select that count to go directly to the data that it represents.

## Personalizing your dashboard

The dashboard is often the first page that you see when you open the app. It can be personalized like any other page in the system, by using the same mechanisms that are described earlier in this topic.

### WARNING

Currently, when you hide content on the dashboard, it's important that you directly target a tile, not the space around it. If you hide the group around a tile, there could be unexpected results if more tiles are added later, or if the system is switched to a different language.

One unique personalization capability that is available on the dashboard is the ability to add tiles.

- If the **Full-page apps** feature is turned off, you add a new tile by right-clicking an element on the dashboard and then selecting **Add a workspace**. A new workspace tile is created at the bottom of the dashboard. You can rename this new workspace tile as you want. You can also add lists, tiles, and links to the workspace, as described in the [Adding tiles, lists, and links to a workspace](#) section of this topic.
- If the **Full-page apps** feature is turned on, you add a new tile by right-clicking an element on the dashboard and then selecting **Add an app**. In the dialog box, select whether you want to add a tile for a new workspace or a tile that has content from Power Apps or a website. Then follow the steps to configure the option that you selected. A new tile is created at the bottom of the dashboard.

## Sharing personalizations

After you personalize a page, you can share your personalizations with other users by exporting the personalized page. You can then ask other users to import the personalization file. Alternatively, you can give your personalizations to a user who has admin privileges. That user can then apply your personalization file to many users at the same time by using the **Personalization** administration page.

## Administration of personalizations

The **Personalization** page is the central hub for managing personalizations at an organizational level. The content and capabilities on this page depend on whether the **Saved views** feature has been turned on.

For customers who have turned on the **Saved views** feature, see the "Managing views globally" section in the [Saved views](#) topic.

For customers who haven't yet turned on the [Saved views](#) feature, this page has four tabs:

- **Apply** – You can import or select a personalization for one or more users. To apply a personalization to one or more users, first select a role and users who have that role. Then either select an existing personalization to apply to the selected users, or import a personalization file. The personalization is validated and will be applied to all the selected users the next time that they open the selected page.
- **Clear** – You can clear all personalizations for a page or workspace for one or more users. First select a page or workspace to see a list of the users who have personalized it. Then select the users who should have personalizations for that page or workspace cleared, and select **Clear**. All personalizations that the selected users have applied to the selected page or workspace are deleted. This action can't be undone. However, if a personalization was saved for the page or workspace, that personalization can be reimported.
- **Users** – Select a user to see a list of the pages that the user has personalized. You can then turn that user's ability to use personalizations for specific pages, or for the whole system, on or off. You can also import, export, or clear a personalization for the user. In addition, you can reset feature callouts for the user. In this case, if the user previously dismissed any pop-up windows that introduce new features, they will appear again the next time that the user encounters those features.
- **System** – You can temporarily turn off personalization for all users in the system. In this case, all

personalizations are deleted for all users, and all pages are reset to their default state. If you turn personalization back on later, all personalizations are reapplied. You can also permanently delete all personalizations for all users in the system. Personalizations that have been deleted can't be recovered. Therefore, before you perform this task, be sure to export any personalizations that you might want later.

## Personalizing inventory dimensions

When you personalize the setup of inventory dimensions on a page, consider the settings that have been created by using the **Display dimension** option. For example, you use personalization to hide a column for the Batch number inventory dimension, but the column appears the next time that the page is opened. This behavior occurs because the **Dimension display** settings control the inventory dimension columns that are shown. The **Dimension display** settings apply across all pages and override any personalized setup of inventory dimension fields on individual pages.

Therefore, in the preceding example, if you don't want the column for the Batch number inventory dimension to appear on a page, you must clear that dimension as part of the **Display dimensions** option for that page.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Saved views

2/18/2021 • 20 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [Service update availability](#).

## Introduction

Personalization plays an important role in allowing users and organizations to optimize the user experience to meet their needs. For more details on personalization, see [Personalize the user experience](#).

Traditional personalization let users have only one set of personalizations per page. The **Saved views** feature expands on personalization in several important ways:

- Views permit users to have multiple named sets of personalizations per form, which they can quickly switch between as needed. This allows a user to create multiple optimized views of a page, where each view has been tailored to fit the needs of performing a particular business task.
- Views created for particular page types can also include user-added filters or sorts, which allows users to quickly return to commonly filtered datasets. See the [What pages support views](#) section for more details.
- Views can be published to users in specific security roles and specific legal entities. Therefore, any user who has a specified role and access to a specified legal entity can access and use that view, even if that user doesn't not have permission to personalize. This publish capability lets organizations define corporate, standard views that are optimized for their business. For more information, see the [Managing personalizations at an organizational level with views](#) section.
- Unlike traditional personalization, views aren't automatically saved when a user performs personalizations or filters a list. Explicit saves are required to give users the flexibility to create a view before or after the changes that are associated with that view have been made. This requirement also ensures that view definitions aren't unintentionally changed by filters or personalizations that aren't intended for long-term use. Items that the system automatically stores as part of typical page usage (for example, column widths, or the expanded or collapsed state of sections) will be saved per view.
- Views can be added to workspaces as tiles, lists, or links. Therefore, a filtered data set can be surfaced in a workspace, and users can associate a set of personalizations that is relevant to that data set with a tile or link.

## Switching between views

After views have been made available for an environment, the top of any page that supports views will include a collapsed view selector control that shows the name of the current view.

There are two size variations to the view selector:

- **Large view selectors** – Pages that prominently feature a list will have a larger view selector for a few reasons. Most importantly, the larger view selector indicates the pages where the view can include user-defined filters. Because filters are included in the views, the larger selector size is also warranted as the view names will often be the best description of the data shown on the screen and the expectation is that users will switch between views more often on these page types.
- **Small view selectors** – All other full-screen pages (except workspaces and the dashboard) have a smaller view selector that appears next to the page caption. Views on these pages include only personalizations, not

user-defined filters. On these pages, the caption or record title is often the most important information at the top of the page. The smaller size of the view selector also reflects the lower frequency of view switching that is expected on these pages.

If you select the view name, the view selector is opened and shows the list of available views for the page.

- **Standard view** – The **Standard** view is the out-of-box view of the page, where no personalizations are applied.
- **Personal views** – The views without padlocks represent your personal views. These are views that either you have created or that an administrator has given to you.
- **Locked views** – Some views (such as the **Standard** view and any views that are published to your role) have a padlock symbol next to them in the view selector. This symbol indicates that you can't edit those views. However, changes that reflect page usage are automatically saved. These changes include changes to the width of a grid column, and changes to the expanded or collapsed state of a FastTab. Nevertheless, if you have personalization privileges, you can use the **Save as** action to make a personal view that is based on a locked view.
- **New views** – Published views that haven't yet been opened have a spark symbol to the left of the view name.

To switch to a different view, first open the view selector and then select the view that you want to load.

## Creating and modifying views

Unlike traditional personalization, views aren't automatically saved when a user personalizes the page, or when a user applies a filter to a list or sorts it. An explicit action is required to save these changes to a view. This requirement gives users the flexibility to create a view before or after the changes that are associated with that view have been made. It also ensures that view definitions aren't unintentionally changed by one-time filters or personalizations. Note that typical page usage items (for example, column widths, or the expanded or collapsed state of sections) are automatically saved to the current view, even for locked views.

To ensure that the current state of the view is known, when you start to change a view by personalizing or filtering it, an asterisk (\*) appears next to the current view name. This symbol indicates that you're looking at an unsaved, modified version of that view.

If you want to save those changes, follow these steps.

1. Select the view name to open the view selector.
2. To modify the existing view, select **Save**. Note that this action isn't available for locked views.
3. To create a new view:
  - a. Select **Save as**.
  - b. Enter a view name and (optionally) a description.
  - c. Select **Save**.

## Changing the default view

The default view is the view that the system tries to open when you first open the page. You should set the default view to the view that you expect to use most often.

### NOTE

There is a single, global default view across companies. If you change the default view, that view will be opened by default, regardless of the legal entity that you're currently in.

To change the default view for a page, follow these steps:

1. Switch to the view that you use as the default.
2. Select the view name to open the view selector.
3. Select **More** and then **Pin as default**.

Alternatively, when you create a new view (by using the **Save as** action), you can make that new view the default view by setting the **Pin as default** option before you save the view.

Note that, in some cases, the query that is associated with the default view isn't run when you first open a page. For example, if you open the page through a tile, the tile's query will be run, regardless of the query that is associated with the default view. Additionally, if you open a page that has a **Standard** view that already has a defined query, the original query will be run instead of the default view's query. In this case, you will receive an informational message when the view is loaded. If you switch views after the page has been loaded, the view query should be able to be run as expected. In version 10.0.10 and later, the informational message that you receive will have an embedded action that lets you load the default view's query directly.

## Managing personal views

The **Manage my views** dialog box gives you basic maintenance capabilities over your personal views and the order of views in the view selector. To open this page, select the view name to open the view selector drop-down menu, select **More**, and then select **Manage my views**.

For a list of available views for that page, the following set of actions are available.

- **Change the default view** – Use the **Pin as default** action to make the currently selected view the default view for this page.
- **Reorder your views** – Use the **Move up** and **Move down** actions to rearrange your views in a specific order.
- **Rename a view** – Use the **Rename** action to change the name of the currently selected personal view. This action is turned off for locked views.
- **Delete a view** – Use the **Delete** action to permanently delete the currently selected view from the page. There is no way to recover a view after you remove it.

Any changes made in this dialog box will take effect after you select the **Save** button.

## Managing personalizations at an organizational level with views

To help you understand how saved views help improve management of personalizations at an organizational level, this section describes some differences in personalization management with and without the **Saved views** feature.

Without views, administrators would apply a set of personalizations for a page to a user or a group of users via the Personalization page. If those users had personalization rights, the personalizations would be applied to that page. However, there was no ability to prevent users from further personalizing the page, which meant the organization could not ensure that its users had a consistent user interface. If any of those users didn't have personalization rights, the personalizations given to them by an administrator were not loaded. Further, if new users were hired into an organization, administrators needed to manually load a set of personalizations for the user. There was no automatic mechanism for specifying that a certain set of personalizations should be available for users in that role.

The **Saved views** feature makes organizational management of personalizations much easier, primarily because views can be published to groups of users. After a view has been published, any user who has one of the defined security roles and access to one the specified legal entities can see and use the view, even if that user doesn't have access to personalization. Although every user has a copy of the published view, where page usage

items are automatically applied, no user can save personalizations or query updates to a published view. In other words, published views are locked. Additionally, if new users are assigned to roles in legal entities that views were published to, they will automatically see the views that are associated with their roles and legal entities. No additional action is required by the admin. Likewise, if users change roles in an organization or are given access to different legal entities, they might no longer be able to access the views that were previously published to them. Again, no additional action is required by the admin.

Updates to a published view can easily be distributed to users by republishing the view to the appropriate security roles and legal entities.

The publish capability allows organizations to define corporate standard views that are optimized for their business, targeted at users in specific security roles.

## Publishing views

During the publishing process, views can be assigned to one or more security roles for one or more legal entities. Therefore, any user who has access to a legal entity and is assigned to one of those roles can access and use the views. However, the user can't edit the views. By default, system admins have access to the **Publish** action in the view selector drop-down menu. However, other trusted users in your organization can also be given access to view publishing via the new **Saved views administrator** role.

To publish a view, follow these steps:

1. Create and save a personal copy of the view that you want to publish.
2. With that view currently loaded, select the view name to open the view selector drop-down menu.
3. Select the **More** button and then select **Publish**. The Publish dialog box will open.
4. Enter a name for the view. The name that you enter is the name that users who receive this view will see in their view selectors. The names of published views for a page must be unique. No duplicate names are allowed, even if the list of roles or legal entities that the views are applied to differ.
5. **Update 10.0.17 or later:** If the **(Preview) Translation support for organization views** feature is turned on, you can add translations for your view name in as many languages as your organization requires by selecting the **Translations** button next to the **Name** field. The view name will then be shown to users in their current language. You can also set the default language to specify the translation that will be shown to users who are running languages that no translation is defined for.
6. Optional: Enter a description for the view, so that users who receive this view can better understand its purpose.
7. Determine whether the view should be published as the default view for the selected users. When a view is made the default view, users will see it the next time that they open the target page. The single, global default view of every targeted user will be changed. However, users can still change their default view after publishing has occurred.
8. Add the security roles that correspond to the users who are being targeted by this view.
9. Determine whether you want to publish the view to the child roles of each security role that is selected. If you do, select the **Include child roles** check box in the row for the appropriate security roles. Note that this check box isn't available for roles that don't have child roles.
10. Add the legal entities that this view should be available for.
11. Select **Publish**.

Note that in some environments, it may take some time (up to an hour) before users see the published view.

#### NOTE

Be aware of the following expectations when you publish a view to a legal entity, or when you publish a view as the default view.

- If you publish a view as the default view to all or some legal entities, you change the single, global default view of every targeted user. If a user has roles where multiple views are published as the default view, the last view that was published will be used as the user's default view.
- If you publish a view to a legal entity, but you don't publish it as the default view, users will initially see the view in the view selector only for the specified legal entities. However, after the view is loaded for the first time, it will always be in the user's view selector for that page, regardless of the legal entity.

## Modifying a published view

After you publish a view, you might find that you want to change it. Although you can't make live changes to a published view, because these views are locked for editing for all users (including publishers), you can republish a view to update it.

If the changes that you want to make to a published view only involve the publish parameters (the name and description of the view, or the security roles the view is published to), do the following:

1. Switch to the published view for the parameters that you want to update.
2. On the view selector drop-down menu, select **Republish**. If you're using version 10.0.12 or earlier, you must select **Publish** and then **Yes** to update the existing view.
3. Update the name, description, security roles, and legal entities for the view.
4. Select **Publish**. If you originally selected this published view as the default view, it will be the default view for users again after you republish it.

If the changes to the published view involve modifications of the personalizations or filters that are associated with the view, follow these steps.

1. Load the published view that you want to change.
2. Make the required changes to the local draft.
3. On the view selector drop-down menu, select **Republish**.
4. Select **Yes** to indicate that you want to publish the view together with its unsaved changes.
5. Adjust any publishing parameters that require adjustment, and then select **Publish**.

## Managing published views

Like managing personal views, the **Manage my views** dialog box gives users with publish privileges basic maintenance capabilities over that page's published views (in addition to their own personal views). To open this page, select the view name to open the view selector drop-down menu, select **More**, and then select **Manage my views**.

Although all users have a **My views** tab that show their personal views, users who have publish privileges also have an **Organization views** tab that shows all the published and unpublished views for that page. Because several users might be publishing views, it's important that you be able to manage the full list of published views, even if you aren't the user who published a given view.

For the list of all published views for the page, the following set of actions are available.

- **Republish** – Use the **Republish** action to republish a view after publishing parameters (name, description, security roles, or legal entities) are changed.
- **Publish** – Use the **Publish** action to publish a view that is currently unpublished.

- **Unpublish** – Use the **Unpublish** action to make a view inactive. The view will still be available in the system, but users won't see it in the view selector until the view is published again.
- **Save as personal** – Use the **Save as personal** action to create a personal draft copy of the published view. This capability can help you understand the contents of a view that wasn't published to you or that hasn't yet been published. You can also use it to edit and then republish a view.
- **Delete** – Use the **Delete** action to permanently delete a published or unpublished view. This action also removes the view for all users in the system. The removal of published views takes effect after the **Save** button is selected. After a view is deleted, it can't be recovered.

## Managing views globally

Although some management capabilities are surfaced on every page, as indicated in this topic, **system administrators** and **saved view administrators** can manage views more holistically for the system via the **Personalization** page. In particular, this page has the following sections and capabilities:

- **Published views** – This section lists all views that have been published for your organization. From here, you can republish a view after you adjust the security roles or legal entities that the view targets. You can also export, delete, or unpublish views. You can use the **Save as personal** action to create a personal copy of a view, so that you can update the view or gain a better understanding of its contents.
- **Unpublished views** – This section lists all the organization views in your system that aren't currently published. These views most often come into the system through the import capability. You can publish, export, or delete these views. The **Quick publish** action that was added in version 10.0.12 enables multiple views from this section to be published in one action, by using the existing security role and legal entity configurations. You can use the **Save as personal** action to create personal copies of these views, so that you can gain a better understand their contents.
- **Personal views** – This section lists all views that have been created by users in the system. From here, you can publish a personal view to the organization, or copy one or more of these views to other users. You can also export or delete these views as required.
- **User settings** – Select a user to view, or adjust the user's ability to use personalization either for the whole system or for specific pages that the user has visited. You can view and interact with the user's personalizations in the system. You can also delete all personalizations for that user or reset feature callouts for the user. If feature callouts are reset, any pop-up windows that introduced new features and that the user previously dismissed will appear again the next time that the user encounters those features.
- **System settings** – You can temporarily turn off personalization for all users in the system. In this case, no personalizations are applied for any user, and all pages are reset to their default state. If you turn personalization back on later, all personalizations are reapplied. You can also permanently delete all personalizations for all users in the system. Personalizations that have been deleted can't be recovered. Therefore, before you perform this task, be sure to export any personalizations that you might want later.

Users who have access to the **Personalization** page can also import personal or organization views by using the **Import views** button on the Action Pane. For organization views, you can select **Publish immediately** to make the views available to users without an additional explicit publish.

## Known issues

For a list of known issues with saved views, please see [Build forms that fully utilize saved views](#).

## Frequently asked questions

**How do I enable saved views in my environment?**

## NOTE

The **Saved views** feature requires the Personalization system in Finance and Operations to be enabled. If personalization is turned off for the entire environment, views will be disabled even if you follow steps below.

You can turn the **Saved views** feature on and off through Feature management in any environment. After it's turned on, saved views will be enabled in all subsequent user sessions.

### **What happens to existing personalizations when views are enabled?**

When views are enabled, any existing personalizations for a user and form are saved into a new view called **My view** that is automatically set as the default view. This is meant to ensure that there is a consistent user experience before and after views are enabled, except for the view selector control appearing on forms.

### **What pages support views?**

Views are available on most, but not all pages. Specifically, views are currently available on all full-screen pages except for dashboards and workspaces. Non-full-screen pages, which include dialog boxes, drop-down dialogs, lookups, enhanced previews, currently do not support views. View support for additional page types, such as workspaces and dialog boxes, may be considered for a future update.

### **Who is allowed to publish views?**

Only system admins and users who have been assigned to the **Saved views administrator** role have the rights to publish views.

### **Why am I not able to save filters with this view?**

There are a few reasons why a filter may not appear to save with a view:

- The page may not support saving filters as part of the view definition. Note that only pages with large view selectors allow personalizations and query modifications to be saved as a view. See the **Switching views** section for more information.
- The page in question may not properly support views, as it may ignore the view query completely or may operate on a temporary table whose data is not persistent.

### **What data will I see when I visit a page?**

For pages that have small view selectors (only personalizations can be saved to the view), you will see the same data as you always have when you visit the page.

For pages that have large view selectors (both personalizations and queries can be saved to the view), you will typically see the data that is linked to the query that is associated with your default view. There are two main exceptions:

- If you navigate to a page from a tile, the tile query will execute regardless of the query associated with the default view. If you created that tile after views have been enabled, selecting a tile will open the page with the view associated with that tile.
- If you navigate to a page and that entry point includes a query, the original query will execute originally in place of the default view's query. You should be alerted when this occurs via an informational message when the view is loading. You can also confirm by switching to this view after the page loads, as that should allow the view query to execute regardless.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Grid capabilities

2/18/2021 • 21 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [Service update availability](#).

The new grid control provides several useful and powerful capabilities that you can use to enhance user productivity, construct more interesting views of your data, and get meaningful insights into your data. This article will cover the following capabilities:

- Calculating totals
- Typing ahead of the system
- Evaluating math expressions
- Grouping tabular data (enabled separately using the **(Preview) Grouping in grids** feature)
- Freezing columns

## Calculating totals

In Finance and Operations apps, users have the ability to see totals at the bottom of numeric columns in grids. A footer section at the bottom of the grid shows these totals.

### Showing the grid footer

There is a footer area at the bottom of every tabular grid in Finance and Operations apps. The footer can show valuable information that is related to the data that appears in the grid. Here are some examples of this information:

- The number of selected rows in the table (when you select more than one record)
- Grand totals at the bottom of configured, numeric columns
- The number of rows in the dataset

This footer is hidden by default but you can turn it on. To show the footer for a grid, right-click on a column header in the grid and select the **Show footer** option. After you turn on the footer for a particular grid, that setting will be remembered until the user opts to hide the footer. To hide the footer, right-click on a column header and select **Hide footer**. (The placement of the **Show footer/Hide footer** action might move to a new location in a future update.

### Specifying columns with totals

Currently, no columns show totals by default. Instead, this is considered a one-time setup activity, similar to adjusting the widths of columns in grids. Once you specify that you want to see totals for a column, that setting will be remembered the next time you visit the page.

There are two ways to configure a column to show a total:

- Right-click in the column that you want to see a total for, and then select **Total this column**. This action causes three events to occur:
  1. The footer becomes visible.
  2. Your preference for seeing a total for this column is saved.

3. A calculation of totals is initiated for this column and any other columns that you previously configured to see totals for. The time that is required to show a total depends on the size of the dataset that you're totaling.
- After the footer is visible, select **Show total** in the footer area at the bottom of the column that you want to see a total for. If there are no configured columns, the **Show total** button will be available for all numeric columns.

After at least one column is configured for totals, the **Show total** buttons will be available only on hover or focus. The action of selecting **Show total** just saves your preference for seeing a total in this column, so that the preference is applied during future visits to the page. In the footer, this state is indicated by a dash that appears in the column. (Alternatively, if the dataset is small enough, a total is immediately shown.)

If you make a mistake and no longer want to see a total in a particular column, right-click on the column and select **Hide total** or select the **Hide total** button in the footer in that column. This preference will also be saved for future visits to the page.

### Calculating totals

When you come to a page with the footer visible and columns already configured for totals, totals may or may not be shown in the footer. The behavior is dependent on the size of the dataset on the page. If the dataset is sufficiently small, totals will be shown automatically, along with the number of rows in the dataset. If there are dashes in the footer under the columns you configured for totals, then the dataset is too large for the system to show totals immediately, and an explicit action is needed to calculate the totals. To do this, click the **Calculate** button in the footer, or right-click on a column you want a total for and select **Total this column**.

If the calculation is taking too long, you can cancel the operation by selecting the **Cancel** button. Sometimes, however, the dataset will be too large to calculate totals (a limit imposed by your organization), and you will instead be notified to filter your data more.

Totals will update automatically as you update, delete, or create rows in the dataset.

## Typing ahead of the system

In many business scenarios, the ability to quickly enter data into the system is very important. Before the new grid control was introduced, users could change data only in the current row. Before they could create a new row or switch to a different row, they were forced to wait for the system to successfully validate any changes. In an attempt to reduce the amount of time that users wait for these validations to be completed, and to improve user productivity, the new grid adjusts these validations so that they are asynchronous. Therefore, the user can move to other rows to make changes while previous row validations are pending.

To support this new behavior, a new column for the row status has been added to the right of the row selection column when the grid is in edit mode. This column indicates one of the following statuses:

- **Blank** – No status image indicates that the row has been successfully saved by the system.
- **Processing pending** – This status indicates that the changes in the row haven't yet been saved by the server but are in a queue of changes that must be processed. Before you take action outside the grid, you must wait for all the pending changes to be processed. Additionally, the text in these rows is italicized to indicate the unsaved status of the rows.
- **Invalid state** – This status indicates that some warning or message was triggered during the processing of the row, and it might have prevented the system from saving the changes in that row. In the old grid, if the save operation was unsuccessful, you were forced back into the row to fix the issue immediately. However, in the new grid, you're notified that a validation issue was encountered, but you can decide when you want to fix any issues in the row. When you're ready to fix an issue, you can manually move focus back to the row. Alternatively, you can select the **Fix this issue** action. This action immediately moves focus back to the row that has the issue, and lets you make edits inside or outside the grid. Note that the processing of subsequent

pending rows is stopped until this validation warning is resolved.

- **Paused** – This status indicates that processing by the server is paused because validation of the row triggered a pop-up dialog box that requires user input. Because the user might be entering data in some other row, the pop-up dialog box isn't immediately presented to that user. Instead, it will be presented when the user chooses to resume processing. This status is accompanied by a notification that informs the user about the situation. The notification includes a **Resume processing** action that will trigger the pop-up dialog box.

When users are entering data ahead of the place where the server is processing, they can expect a few degradations in the data entry experience, such as a lack of lookups, control-level validation, and entry of default values. Users who need a drop-down list to find a value are encouraged to wait for the server to catch up to the current row. Control-level validation and entry of default values will also occur when the server processes that row.

### Pasting from Excel

Users have always been able to export data from grids in Finance and Operations apps to Excel by using the **Export to Excel** mechanism. However, the ability to enter data ahead of the system enables the new grid to support copying tables from Excel and pasting them directly into grids in Finance and Operations apps. The grid cell that the paste operation is initiated from determines where the copied table begins to be pasted in. The contents of the grid are overwritten by the contents of the copied table, except in two cases:

- If the number of columns in the copied table exceeds the number of columns that remain in the grid, starting from the paste location, the user is notified that the extra columns have been ignored.
- If the number of rows in the copied table exceeds the number of rows in the grid, starting from the paste location, the existing cells are overwritten by the pasted content, and any extra rows from the copied table are inserted as new rows at the bottom of the grid.

## Evaluating math expressions

As a productivity booster, users can enter mathematical formulas in numeric cells in a grid. They don't have to do the calculation in an app outside the system. For example, if you enter  $=15*4$  and then press the **Tab** key to move out of the field, the system will evaluate the expression and save a value of **60** for the field.

To make the system recognize a value as an expression, start the value with an equal sign (=). For more information about the supported operators and syntax, see [Supported math symbols](#).

## Grouping tabular data

Business users often need to perform ad-hoc analysis of data. While this can be done by exporting data to Microsoft Excel and using pivot tables, the **Grouping in grids** feature, which is generally available in version 10.0.16/Platform update 40 and is dependent on the new grid control feature, allows users to organize their tabular data in interesting ways within Finance and Operations apps. Because this feature extends the **Totals** feature, **Grouping** allows you to get meaningful insights into the data by providing subtotals at the group level.

To use this feature, right-click the column that you want to group by, and select **Group by this column**. This action will sort the data by the selected column, add a new **Group by** column to the beginning of the grid, and insert "header rows" at the beginning of each group. These header rows provide the following information about each group:

- Data value for the group
- Column name (this information is especially useful when you have multiple levels of grouping)
- Number of data rows in this group
- Subtotals for any column configured to show totals

With [Saved views](#) enabled, this grouping can be saved by personalization as part of a view for quick access the next time you visit the page.

### Multiple levels of grouping

After you've grouped data by a single column, you can group the data by a different column by selecting **Group by this column** on the desired column. This process can be repeated until you have 5 nested levels of grouping, which is the maximum supported depth. At this point, you will no longer be able to group by additional columns.

At any point, you can remove the grouping on any column by right-clicking that column and selecting **Ungroup**. You can also remove the grouping from all columns by selecting **Grid options** and then **Ungroup all**.

Note, prior to version 10.0.16/Platform update 40, only one level of grouping is supported. In these versions, if the data is grouped and you select **Group by this column** for a different column, the original grouping is replaced.

### Expanding and collapsing groups

The initial grouping of data will have all groups expanded. You can create summarized views of the data by collapsing individual groups, or you can use group expanding and collapsing to assist in navigating through the data. To expand or collapse a group, select the chevron (>) button in the corresponding group header row. Note that the expand/collapse state of individual groups is **not** saved in personalization.

### Selecting and unselecting rows at the group level

In the same way that you can select (or unselect) all rows in the grid by selecting the check box at the top of the first column in the grid, you can also quickly select (or unselect) all the rows in a group by selecting the check box in the corresponding group header row. The check box in the group header row will always reflect the current selection state of rows in that group, regardless of whether all rows are selected, no rows are selected, or only some rows are selected.

### Hiding column names

When grouping data, the default behavior is to show the column name in the group header row. Starting in version 10.0.14/Platform update 38, you can choose to suppress the column name in group header rows by selecting **Grid options > Hide group column name**.

## Freezing columns

Some columns in a grid might be important enough for context that you don't want them to scroll out of view. Instead, you want the values in those columns always to be visible. In version 10.0.17, the **Freeze columns in grid** feature provides this flexibility to users.

To freeze a column, right-click in the column's header, and then select **Freeze column**. The first time that you complete this step, the selected column becomes the first column and will no longer scroll out of view. Any subsequent column that you freeze will be added to the right of the last frozen column. You can use the standard Move functionality to reorder frozen columns as you require. However, frozen columns can't be moved so that they appear among the set of unfrozen columns. Likewise, unfrozen columns can't be moved so that they appear among the set of frozen columns.

To unfreeze a column, right-click in the frozen column's header, and then select **Unfreeze column**.

Note that the row selection and row status columns in the new grid are always frozen as the first two columns. Therefore, when these columns are included in a grid, they will always be visible to users, regardless of the horizontal scroll position in the grid. These two columns can't be reordered.

## Frequently asked questions

## How do I enable the new grid control in my environment?

### 10.0.9 / Platform update 33 and later

The **New grid control** feature is available directly in Feature management in any environment. Like other public preview features, enabling this feature in production is subject to the [Supplemental Terms of Use Agreement](#).

### 10.0.8 / Platform update 32 and 10.0.7 / Platform update 31

The **New grid control** feature can be enabled in Tier 1 (Dev/Test) and Tier 2 (Sandbox) environments in order to provide additional testing and design changes by following the steps below.

1. **Enable the flight:** Execute the following SQL statement:

```
INSERT INTO SYSFLIGHTING (FLIGHTNAME, enabled, FLIGHTSERVICEID, PARTITION)
VALUES('CLIRectGridEnableFeature', 1, 0, 5637144576);
```

2. **Reset IIS** to flush the static flighting cache.

3. **Find the feature:** Go to the **Feature management** workspace. If **New grid control** does not appear in the list of all features, select **Check for updates**.

4. **Enable the feature:** Find the **New grid control** feature in the list of features, and select **Enable now** on the details pane. Note that a browser refresh is required.

All subsequent user sessions will start with the new grid control enabled.

## [Developer] Opting out individual pages from using the new grid

If your organization discovers a page that has some issues utilizing the new grid, an API is available starting in version 10.0.13/Platform update 37 to allow an individual form to use the legacy grid control while still permitting the rest of the system to utilize the new grid control. To opt out an individual page from the new grid, add the following call post `super()` in the `run()` method for the form.

```
this.forceLegacyGrid();
```

This API will be honored until the October 2021 release, when the new grid control becomes mandatory. If any issues require that this API be used, report them to Microsoft.

## [Developer] Size-to-available-width columns

If a developer sets the **WidthMode** property to **SizeToAvailable** for columns inside the new grid, those columns initially have the same width that they would have if the property were set to **SizeToContent**. However, they stretch to use any extra available width inside the grid. If the property is set to **SizeToAvailable** for multiple columns, all those columns share any extra available width inside the grid. However, if a user manually resizes one of those columns, the column becomes static. It will remain at that width and will no longer stretch to take up extra available grid width.

## Known issues

This section maintains a list of known issues for the new grid control.

### Open issues

- After enabling the **New grid control** feature, some pages will continue to utilize the existing grid control. This will happen in the following situations:
  - A card list exists on the page that is rendered in multiple columns.
  - A grouped card list exists on the page.

- A grid column with a non-react extensible control.

When a user first encounters one of these situations, a message will display about refreshing the page. After this message appears, the page will continue to utilize the existing grid for all users until the next product version update. Better handling of these scenarios, so that the new grid can be utilized, will be considered for a future update.

- [KB 4582758] Records are blurry when you change zoom from 100 to any other percentage
- [KB 4592012] Unexpected client error in IE11 when pasting multiple lines from Excel
  - Microsoft is not pursuing a fix for this issue

#### **Fixed as part of 10.0.16**

- [KB 4598335] Multi-line string controls do not respect their DisplayHeights in lists/cards
- [KB 4591891] Invoice proposal lines disappear when unmarking lines
- [KB 4592104] Unable to edit records after clicking "Fix issue" and moving to a different row without fixing the validation issue
- [KB 4594449] "Never" and "Clear" buttons missing inside the date picker
- [KB 4594448] Entering time is treated differently with the new grid
- [KB 4600059] Unexpected client error with email throttling
- [KB 4574584] Expense attachment preview not available when hovering over the receipt icon

#### **Fixed as part of 10.0.15**

- (Quality update) [KB 4594444] Unexpected client error with preview for segmented entry control
- [KB 4582723] Display options not showing when done later in the form life cycle
- [KB 4591988] Issues using the keyboard to select a value from a ReferenceGroup lookup
- [KB 4588958] Regression Suite Automation Tool (RSAT) test fails with error: TypeError: Cannot read property 'text' of undefined
- [KB 4591970] Unexpected client error when pasting from Excel was done immediately after clicking into the grid
- [KB 4591904] Data changes are not saved if after editing a control the user immediately clicked and opened the lookup of a different control
- [KB 4584752] Unexpected client error with Project invoice proposals page
- [KB 4584540] Unable to leave the grid after pasting a single row into a journal line
- [KB 4591908] When creating a new row, focusing is staying in the column you were in

#### **Fixed as part of 10.0.14**

- (Quality update) [KB 4584752] Unexpected client error with Project invoice proposals page
- [KB 4583880] Regression Suite Automation Tool (RSAT) tests fail on OpenLookup action with "Cannot read property RowIndex of undefined"
- [KB 4583847] Unexpected client error when navigating through lookups

#### **Fixed as part of 10.0.13**

- (Quality update) [KB 4584752] Unexpected client error with Project invoice proposals page
- (Quality update) [KB 4583880] Regression Suite Automation Tool (RSAT) tests fail on OpenLookup action with "Cannot read property RowIndex of undefined"

- [KB 4575233] Display options are not restored after moving to another row
- [Bug 477884] Lookups return wrong value/record if new grid control is activated
- [KB 4571095] Product receipt posting occurs when accidentally pressing Enter (correct handling of a page's default action)
- [KB 4575437] Lookups with editable controls close unexpectedly
- [KB 4569418] Duplicate line created in delivery schedule form
- [KB 4575435] Enhanced preview sometimes persists even when the mouse pointer isn't near the field
- [KB 4575434] Lookup isn't filtering when the field has been modified
- [KB 4575430] Values in password fields aren't masked in the grid
- [KB 4569438] "Processing has stopped because of a validation issue" displays after marking lines while settling supplier transactions
- [KB 4569434] Refreshing the Legal entities form results in fewer records
- [KB 4575297] Focus keeps moving to the task recorder pane when editing and tabbing through a grid
- [KB 4566773] Correction transactions not showing as negative on voucher transactions inquiry
- [KB 4575288] Focus resets to the active row when selecting the border between rows in a simple list
- [KB 4575287] Focus doesn't return to the first column when using the down arrow to create a new row in journals
- [KB 4564819] Cannot delete lines in a free text invoice (because the datasource ChangeGroupMode=ImplicitInnerOuter)
- [KB 4563317] Tooltips/enhanced previews aren't shown for images

#### Fixed as part of 10.0.12

- [KB 4558545] Table controls don't update the contents of displayed items.
- [KB 4558570] Items are still shown on the page after the record has been deleted.
- [KB 4558572] Styling that is associated with the List Panel **ExtendedStyle** isn't applied.
- [KB 4558573] Validation errors can't be fixed when the required change is outside the grid.
- [KB 4558584] Negative numbers aren't rendered correctly.
- [KB 4560726] An "unexpected client error" occurs after swapping between lists is done by using a List View control.
- [KB 4562141] Grid indices are off after a new record is added.
- [KB 4562151] The **Validate** and **Copy** task recorder options aren't available for date/number controls.
- [KB 4562153] Multi-select check boxes aren't visible on list/card grids.
- [KB 4562646] You sometimes can't click outside the grid after you multi-select rows in the grid.
- [KB 4562647] Focus is reset to the first control in the **Publish** dialog box after a new row is added in the security roles grid.
- [KB 4563310] The enhanced preview isn't closed after a row is changed.
- [KB 4563313] An "unexpected client error" occurs in Internet Explorer when a value is selected in a lookup.
- [KB 4564557] Lookups and drop-down menus won't open in Internet Explorer
- [KB 4563324] Navigation doesn't work after the **Personnel management** workspace is opened.

### Fixed as part of 10.0.11

- [Issue 432458] Empty or duplicated lines are shown at the beginning of some child collections.
- [KB 4549711] Lines in a payment proposal can't be removed correctly after the new grid control is enabled.
- [KB 4558374] Records that require a polymorphic selector dialog box can't be created.
- [KB 4558375] Help text isn't shown on columns in the new grid.
- [KB 4558376] List Panel grids aren't rendered at the correct height in Internet Explorer.
- [KB 4558377] Combo box columns that have **SizeToAvailable** width aren't rendered on some pages.
- [KB 4558378] Drill-through sometimes opens the wrong record.
- [KB 4558379] An error occurs when lookups are opened where **ReplaceOnLookup=No**.
- [KB 4558380] The available space in the grid isn't filled immediately after part of the page is collapsed.
- [KB 4558381] Negative numbers aren't rendered correctly / Users sometimes become stuck after validation issues are encountered.
- [KB 4558382] Unexpected client errors occur.
- [KB 4558383] Controls outside the grid aren't updated after the last record is deleted.
- [KB 4558587] Reference groups that have combo boxes for replacement fields don't show values.
- [KB 4562143] Fields aren't updated after a row change / Grid processing becomes stuck after row deletion.
- [KB 4562645] An exception occurs when a lookup is opened while Regression Suite Automation Tool (RSAT) tests are running.

### Fixed as part of 10.0.10

- [Issue 414301] Some data from previous lines disappears when new lines are created.
- [Bug 417044] There is no empty grid message for list-style grids.
- [KB 4539058] Some grids (typically on FastTabs) sometimes aren't rendered (but they will be rendered if you zoom out).
- [KB 4549734] Active rows aren't treated as marked if the marking column is hidden.
- [KB 4549796] Values can't be edited in a grid when it's in view mode.
- [KB 4558367] Text selection is inconsistent when rows are changed.
- [KB 4558368] Multi-select via the keyboard is allowed in single-select scenarios.
- [KB 4558369] Status images disappear in the hierarchical grid.
- [KB 4558370] A new row isn't scrolled into view.
- [KB 4558372] The new grid becomes stuck in processing mode if the number of columns in content that is pasted in exceeds the number of remaining columns in the grid.
- [KB 4562631] Time values aren't formatted correctly.

### Quality update for 10.0.9/Platform update 33

- [KB 4550367] Time values aren't formatted correctly.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create and work with custom fields

2/18/2021 • 7 minutes to read • [Edit Online](#)

While there is an extensive set of fields out-of-the-box for managing a broad range of business processes, sometimes there is a need for a company to track additional information in the system. While programmers can be used to add those fields as extensions in the developer tools, the custom fields feature allows fields to be added directly from the user interface, thereby allowing you to tailor the application to fit your business using your web browser.

The ability to add custom fields is available in platform update 13 and later. Only users with special permissions have access to this feature.

This video shows how easy it is to add a custom field to a page: [Adding custom fields](#).

## Creating custom fields

After you've identified additional information that you would like to track in the application, you can create the custom field on the appropriate table and expose that new field on a page.

The following steps describe the process for creating a custom field and placing that field on a form.

1. Navigate to the form where the new field is needed.
2. Because the end goal is to expose the custom field on a form, the entry point for creating custom fields exists inside the personalization experience. Open the personalization toolbar by selecting **Options**, and then **Personalize this form**.
3. Click **Insert** and then **Field**.
4. Select the region of the form where you want to expose the new field. After selection, the **Insert fields** dialog box will display a list of existing fields that can be inserted into the selected region of the form.
5. Ensure that the field you are interested in does not already exist in the list. If it does, you can simply select that field in the list and click **Insert**.
6. Click the **Create new field** button above the list to initiate the process of creating a custom field. This will open the **Create new field** dialog box.

If you do not see the **Create new field** button, you do not have the necessary permissions to use this feature.

7. In the **Create new field** dialog box, enter the following information.
  - a. Select the database table where this field should be added. Note that only tables that support custom fields will appear in the drop-down list. See the section below for technical details on supported tables.
  - b. Select the data type for the new field. The available data types are checkbox, date, date time, decimal, number, picklist, and text.
    - If you choose the text data type, you can also specify the maximum length of the text that can be entered in this field.
    - If you choose the picklist data type, you can also select the set of valid values for the field.
  - c. Provide a name, label, and help text for the field. The name corresponds to the physical field name

in the database, whereas the label and help text are the text used to represent this field in the user interface.

8. If this is the only field that you need to create for this form, click **Save**. If you need to create additional fields, click **Save and new** and go back to step 7. Note that there is currently a limit of **20 custom fields per table**.
9. Leaving the **Create new field** dialog box will return you to the **Insert fields** dialog box. Any custom fields that were just added will be automatically marked in the field list to be inserted into the form.
10. Click **Insert** to insert the marked fields into the selected region of the form.
11. **Optional:** Enable **Move** mode from the personalization toolbar to move the new fields to their desired location in the selected region. See [Personalize the user experience](#) for more information about how to use the various personalization capabilities to optimize a form for your personal usage.

## Sharing custom fields with other users

After you have created a custom field and exposed it on a form, you might want to provide this updated page view that includes the new field to other users in the system. This can be accomplished in two different ways using the personalization capabilities of the product:

- The recommended route is through the system administrator, who can push a personalization to all users or a subset of users. See [Personalize the user experience](#) for more details.
- Alternatively, you can export your changes (called *personalizations*), send them to one or more users, and have each of those users import your changes. The **Manage** option on the personalization toolbar enables you to export and import personalizations.

## Managing custom fields

Management of all the custom fields in the system can be accomplished through the **Custom fields** page in the System administration module. This page allows users access to many capabilities, including:

- Viewing a list of all custom fields in the system.
- Limited editing of existing custom fields.
- Deleting custom fields.
- Exposing custom fields on data entities.
- Providing translations of custom field labels and help text.

### Viewing all custom fields

The **Custom fields** page provides visibility to all the custom fields that have been defined in the system. Simply select the table that you are interested in, and the page will update to show a list of the custom fields associated with that table. Choosing a custom field from the list will allow you to view all the details about the field.

### Editing custom fields

After a custom field has been created, only certain pieces of information about the custom field can be modified on the **Custom fields** page.

You *can* modify these attributes:

- Label
- Help text
- Length, for Text fields

You *cannot* edit the following attributes:

- Field name
- Data type

Additionally, for picklist fields, the set of valid values for the custom field can be reordered, and new values can be added; however, existing values for the picklist field cannot be removed. Remember to click **Apply changes** when you are done editing fields for a particular table so the changes are saved.

### Exposing custom fields on data entities

It may also be important to allow custom fields to be visible on data entities. Data entities are utilized in the [Office integration overview](#) feature, as well as for data import/export scenarios.

Follow these steps to expose a custom field on a data entity:

1. Select the custom field on the **Custom fields** form.
2. Expand the **Entities** section to view the set of relevant entities.
3. Click the **Edit** button.
4. Modify the **Enabled** field to be selected for each entity that should expose this field.
5. Click **Apply changes** to save your selections.

### Allowing custom fields to be displayed in other languages

Because custom fields may need to be accessed by users in a variety of languages, the **Custom fields** page provides a mechanism to allow the label and help text for a custom field to be translated into other languages.

The following steps describe the process for translating custom fields in other languages:

1. Select the custom field on the **Custom fields** page.
2. Select the **Translations** button in the Action Pane. This will open a drop-down menu with existing translations for this field.
3. The **Language** drop-down menu shows the set of languages for which translations have already been provided.

If you want to edit an existing translation, select the desired language from the menu and modify the values for the label and help text.

Otherwise, click the **Add language** button, select the desired language from the menu, and then provide translated values for the label and help text.

4. Click **OK** when you are finished.

### Deleting custom fields

In some rare cases, you may decide that a custom field is no longer needed. When this occurs, a system administrator can choose to delete the field from the **Custom fields** page. To do this, ensure the correct field is selected, click **Delete**, click **Yes** to confirm the deletion, and finally click **Apply changes**.

#### NOTE

This action cannot be undone, and will result in the data associated with the field being permanently deleted from the database.

## Appendix

### Who can create custom fields?

As a safeguard to the system, only system administrators are able to create custom fields by default. However, those power users whom the organization deems necessary can be given rights to create custom fields by a

system administrator using the **Runtime customization power user** security role. Users without this security role will not be able to create custom fields, but will still be able to see and interact with custom fields added by other users in the system.

### **What tables support custom fields?**

For performance and technical reasons, only tables that meet the following conditions currently allow custom fields to be added.

- The table must be tagged as one of these groups:
  - Group
  - WorksheetHeader
  - Main
  - Miscellaneous
  - Parameter
  - Reference
  - TransactionHeader
- The table cannot extend another table.
- The table cannot be marked as a system table.
- The table cannot be a temporary table.

### **Can I reference custom fields from the developer tools?**

Custom fields can only be managed through the user interface and cannot be referenced by code.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Embed canvas apps from Power Apps

2/18/2021 • 8 minutes to read • [Edit Online](#)

Microsoft Power Apps is a service that lets developers and non-technical users build custom business apps for mobile devices, tablets, and the web without writing code. Finance and Operations apps support integration with Power Apps. Canvas apps that you, your organization, or the broader ecosystem develop can be embedded into Finance and Operations apps to augment the product's functionality. For example, you might build a canvas app from Power Apps to supplement a Finance and Operations app with information that is retrieved from another system.

To learn more about embedding Power Apps, watch the short [How to embed Power Apps](#) video.

## Adding an embedded canvas app from Power Apps to a page

### Overview

Before you embed a canvas app from Power Apps into the client, you must find or build an app that has the desired visuals or functionality. This topic doesn't include a detailed description of the process for building apps. If you're new to Power Apps, see the [Power Apps documentation](#).

There are two ways to access a specific canvas app on a page when you're ready to embed the app. You can choose whichever approach fits your scenario better. The first approach uses the **Power Apps** button that has been added to the standard Action Pane. Apps that you add by using this approach appear as items on the **Power Apps** menu button. When you select one of these items, a side pane that contains the embedded app appears. Alternatively, you can embed an app directly on a page as a new tab, FastTab, or blade, or as a new section in a workspace.

When you configure your embedded canvas app, you can select a single field that you want to send as context to the app. This step enables the app to be responsive, based on the data that you're currently viewing.

#### NOTE

You can't currently use this mechanism to embed modeled apps.

### Details

The following procedure shows how to embed a canvas app from Power Apps into the web client.

1. Go to the page where you want to embed the canvas app. This page will be the page that contains data that must be passed to the app as input.
2. Open the **Add an app from Power Apps** pane:
  - Click **Options**, and then select **Personalize this page**. Under the **Insert** menu, choose **Power Apps**. Finally, select the region where you would like to add the app. If you want to embed the app under the Power Apps menu button, choose the Action Pane. If you want to embed the app directly onto the page, choose the appropriate tab, FastTab, blade, or section (if you're on a workspace).
  - If the app will be accessed using the Power Apps menu button, you can alternatively click the **Power Apps** menu button in the standard Action Pane, and then select **Add an app**.
3. Configure the embedded app:
  - The **Name** field indicates the text shown for the button or tab that will contain the embedded app. Oftentimes, you may want to repeat the name of the app in this field.

- The **App ID** field indicates the globally unique identifier (GUID) for the canvas app that you want to embed. To retrieve this value, find the app on [make.powerapps.com](https://make.powerapps.com), and then look in the **App ID** field under **Details**.
  - For **Input context for the app**, you can optionally select the field that contains the data that you want to pass to the app as input. See the section later in this topic titled [Building an app that leverages data sent from Finance and Operations apps](#) for details on how the app can access the data sent from Finance and Operations apps.
  - Choose the **Application size** that matches the type of app that you're embedding. Select **Thin** for apps built for mobile devices, and **Wide** for apps built for tablets. This ensures a sufficient amount of space is allotted for the embedded app.
  - The **Legal entities** FastTab provides the ability to choose which legal entities the app is available for. The default is to make the app accessible to all legal entities. This option is only available when the [Saved views](#) feature is disabled.
4. After confirming that the configuration is correct, click **Insert** to embed the Power App on the page. You will be prompted to refresh the browser in order to see the embedded app.

## Sharing an embedded app

After you've embedded a canvas app on a page and confirmed that it's working correctly with any data context that is passed from that page, you might want to share the app with other users in the system. To share an embedded canvas app, follow these steps.

1. [Share the canvas app](#) with the appropriate users, so that they can access the app in Power Apps.
2. Make sure that the targeted users have the appropriate personalizations, so that the embedded app appears when those users view the page. You can use either of the following approaches:
  - Recommended: Use the [Saved views](#) feature to create and publish a view that includes the embedded app. This approach ensures that all users who have the security roles that are targeted by the published view will see the app in Finance and Operations apps.
  - If you don't have the Saved views feature turned on, you can have the system admin push a personalization that includes the embedded app to all users or a subset of users. Alternatively, you can export your page's personalizations, and send them to one or more users. Each of those users can then import the personalizations. The personalization toolbar has actions that let you export and import personalizations.

### NOTE

If the canvas app has been shared with external users, those users can't use the embedded app inside Finance and Operations apps. However, they can access the app directly inside Power Apps. External users include guests and users who don't belong to the Microsoft 365 Azure Directory where the Finance and Operations app is deployed.

See [Personalize the user experience](#) for more details about the personalization capabilities in the product and how to use them.

## Building a canvas app that uses data that is sent from Finance and Operations apps

When you build a canvas app that will be embedded in a Finance and Operations app, one important part of the process is to use the input data from that Finance and Operations app. From the Power Apps development experience, the input data that is passed from a Finance and Operations app can be accessed by using the `Param("EntityId")` variable.

For example, in the OnStart function of the app, you could set the input data from Finance and Operations apps to a variable like this:

```
If(!IsBlank(Param("EntityId")), Set(FinOpsInput, Param("EntityId")), Set(FinOpsInput, ""));
```

## Viewing a canvas app

To view an embedded canvas app on a page in Finance and Operations apps, just go to a page that has an embedded app. Remember that apps can be accessed by using the **Power Apps** button on the standard Action Pane. Alternatively, they can appear directly on the page as a new tab, or FastTab, or blade, or as a new section in a workspace. When users first try to load an app on a page, they will be prompted to sign in. This step ensures that the users have the appropriate permissions to use the app.

## Editing an embedded app

After an app has been embedded onto a page, you may need to make some changes to the configuration of the app. For example, perhaps you want to modify the label associated with the embedded app or a new version of the app has been created and you need to update the App ID to point at the latest.

Follow these steps to edit the configuration of an embedded app:

1. Go to the **Edit the app** pane.
  - If the embedded app is accessed through the Power Apps menu button, right-click on the Power Apps menu button and select **Personalize**. Select the app that you want to configure from the **Select an app** drop-down menu.
  - If the embedded app appears directly on the page, select **Options**, and then select **Personalize this page**. Using the **Select** tool, click the embedded app.
2. Make the needed modifications to the app configuration, and then click **Save**.

## Removing an app

After an app has been embedded onto a page, there are two ways to remove it if needed:

- Go to the **Edit an app** pane using the instructions from the [Editing an embedded app](#) section earlier in this topic. Confirm that the pane displays information for the embedded app that you would like to remove, and then click the **Delete** button.
- Because the embedded app is saved as personalization data, clearing your page's personalization will also remove any embedded apps on that page. Note that clearing the page's personalization is permanent and cannot be undone. To remove your personalizations on a page, select **Options**, and then **Personalize this page**, and finally the **Clear** button. After refreshing your browser, all the previous personalizations for this page will be removed. See [Personalize the user experience](#) for more information about how to optimize pages using personalization.

## Appendix

### [Developer] Specifying where an app can be embedded

By default, users can embed apps on any page, either under the Power Apps menu button or directly on the page as a tab, FastTab, blade or as a new section in a workspace. However, if required, developers can also configure this feature to only allow embedding of apps on certain pages by implementing the following methods:

- **isPowerAppPersonalizationEnabled** – If this method returns false for a specific page, then the Power

Apps menu button will not be shown, and users will not be able to embed apps anywhere on this page, including as a tab.

- **isPowerAppTabPersonalizationEnabled** – If this method returns false for a specific page, then users will not be able to embed apps directly on the page as a tab, FastTab, or panorama section. Users will still be able to embed apps through the Power Apps menu button if embedding is allowed on the page.

The following example shows a new class with the two methods needed to configure where apps can be embedded.

```
[ExtensionOf(classStr(FormRunConfigurationPowerAppsConfiguration))]  
  
public final class ClassTest_Extension  
{  
    public static boolean isPowerAppPersonalizationEnabled(str pageName)  
    {  
        var result = next isPowerAppPersonalizationEnabled(pageName);  
        return result;  
    }  
  
    public static boolean isPowerAppTabPersonalizationEnabled(str pageName)  
    {  
        var result = next isPowerAppTabPersonalizationEnabled(pageName);  
        return result;  
    }  
}
```

#### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Find information by using lookups

2/18/2021 • 4 minutes to read • [Edit Online](#)

Many fields have lookups that can help you easily find the correct or desired value. Several enhancements have been added to lookups that make these controls more usable and make users more productive. In this topic, you will learn about these new lookup features and will receive some helpful tips to get the optimal use out of lookups in the system.

## Responsive lookups

In previous versions, when interacting with a lookup control, a user would have to take an explicit action to open the drop-down menu. This may have been by typing an asterisk (\*) in the control to filter the lookup based on the current value of the control, clicking the drop-down button, or by using the **Alt+Down arrow** keyboard shortcut. Lookup controls have been modified in the following ways to better align with current web practices:

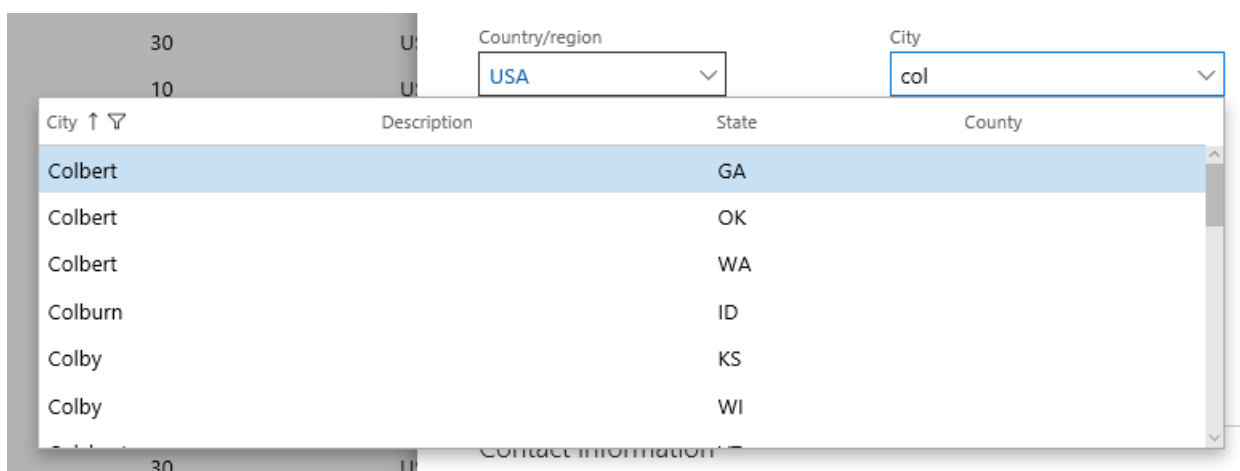

- Lookup drop-down menus will now open automatically after a slight pause in typing, with the drop-down menu contents filtered based on the lookup control's value.

Note that the old behavior of automatic opening of the dropdown after typing an asterisk (\*) has been deprecated.

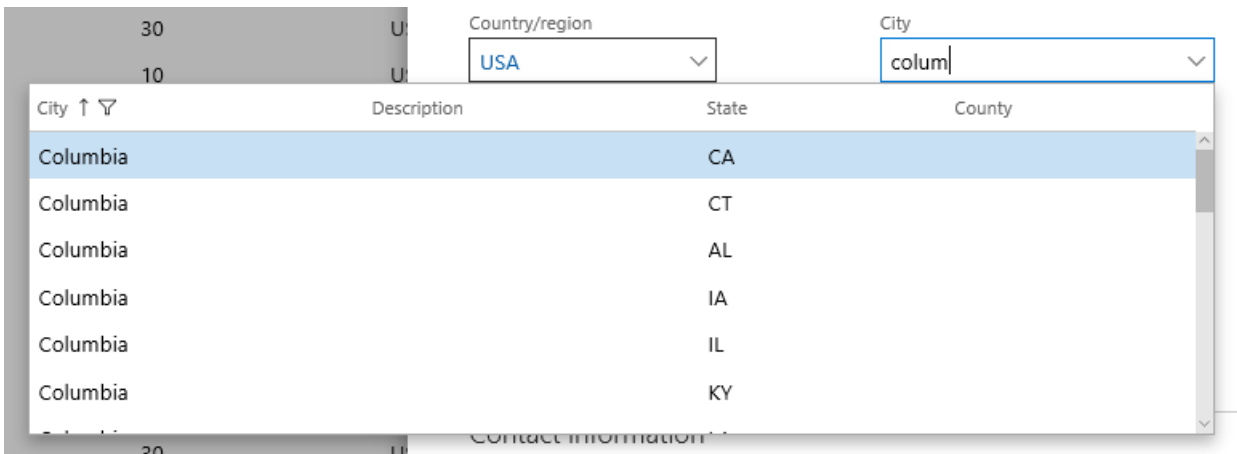

- After the lookup drop-down menu has opened, the following will occur:
  - The cursor will stay in the lookup control (instead of focus moving into the drop-down menu) so you can continue to make modifications to the control's value. However, the user can still use the **Up arrow** and **Down arrow** to change rows in the drop-down menu, and enter to select the current row in the drop-down menu.
  - The contents of the drop-down menu will adjust after any modifications are made to the lookup control's value.

For example, consider a lookup field called **City**.

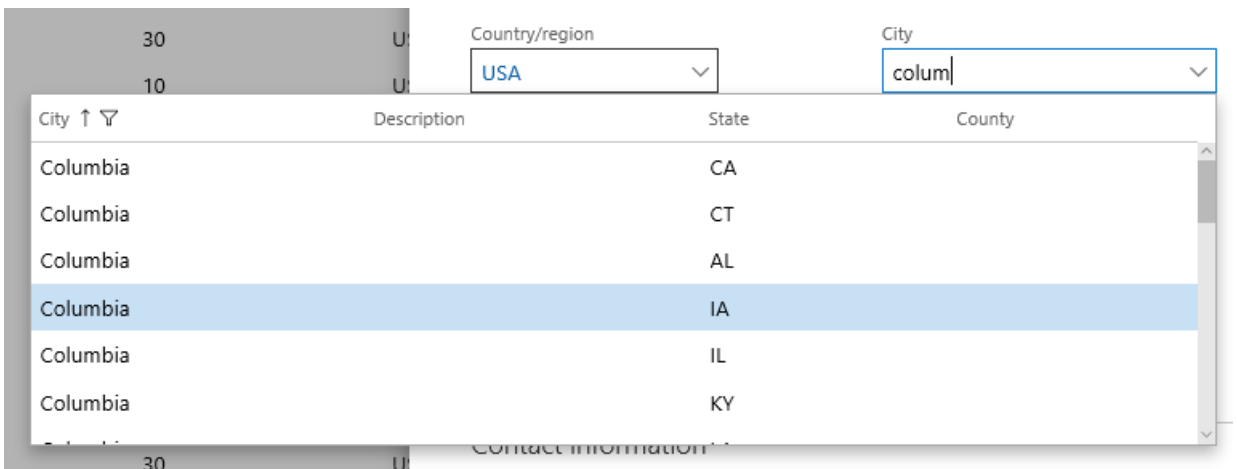

When focus is in the **City** field, you can start looking for the city that you want by typing a few letters, like "col." After you stop typing, the lookup will open automatically, filtered to those cities that begin with "col".

At this point, the cursor is still in the lookup field. If you continue typing so the value is "colum," the lookup contents adjust automatically to reflect the latest value in the control.

Even though focus is still in the lookup control, you can also use the **Up arrow** or **Down arrow** keys to highlight the row that you want to select. If you press **Enter** the highlighted row will be selected from the lookup and the control's value will be updated.

## Typing in more than IDs

When entering data, it's natural for users to attempt to identify an entity, such as a customer or vendor, in terms of the name rather than an identifier representing the entity. Many (but not all) lookups now allow contextual data entry. This powerful feature allows the user to type the ID or the corresponding name into the lookup control.

For example, consider the **Customer account** field when creating a sales order. This field shows the **Account ID** for the customer, but a user would typically prefer to enter an **Account name** instead of an **Account ID** for this field when creating a sales order, such as "Forest Wholesales" instead of "US-003."

If the user started to enter an **Account ID** into the lookup control, the drop-down menu would automatically open as described in the previous section and the user would see the lookup as shown below.

However, the user can also now enter the beginning of an **Account name** as well. If this is detected, then the user will see the following lookup. Notice how the **Name** column is moved to be the first column in the lookup, and how the lookup is sorted and filtered based on the **Name** column.

**CUSTOMER**

Customer account

Conto

Name ↑	Customer account	Account number
Contoso Europe	DE-001	
Contoso Retail Chicago	US-015	
Contoso Retail Dallas	US-011	
Contoso Retail Detroit	US-018	
Contoso Retail Los Angeles	US-002	
Contoso Retail Miami	US-028	
Contoso Retail New York	US-012	
Contoso Retail Portland	US-006	
Contoso Retail San Diego	US-001	

## Using grid column headers for more advanced filtering and sorting

The lookup enhancements discussed in the previous two sections greatly improve a user's ability to navigate the rows in a lookup based on a "begins with" search of the ID or **Name** field in the lookup. However, there are situations in which more advanced filtering (or sorting) is needed to find the correct row. In these situations, the user needs to use the filtering and sorting options in the grid column headers inside the lookup. For example, consider an employee entering a sales order line who needs to locate the right "cable" as the product. Typing "cable" into the **Item number** control isn't helpful, as there are no product names that begin with "cable."

Sales order lines

+ Add line + Add lines Add products Remove Sales order line Financials Inventory Product and supply Update line Warehouse

Instead, the user needs to clear the value of the lookup control, open the lookup drop-down menu, and filter the drop-down menu using the grid column header, as shown below. A mouse (or touch) user can simply click (or touch) any column header to access the filtering and sorting options for that column. For a keyboard user, the user simply needs to press **Alt+Down arrow** a second time to move focus into the drop-down menu, after which the user can tab to the correct column, and then press **Ctrl+G** to open the grid column header drop-down menu.

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Change the date for a session

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to change the date for a session. By default, the current date is used when entering and posting journal entries or source documents. You can change the date that is used for your current session. Use this feature to back-date journal entries or source documents, as necessary.

1. In the navigation pane, go to **Modules > Common > Common > Session date and time**.
2. In the **Date** field, enter a date.
3. Select **OK**.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set a user's preferred time zone

2/18/2021 • 2 minutes to read • [Edit Online](#)

The following topic explains how a user in the System Administrator role can set the time zone for a user.

1. Go to **Navigation pane > Modules > System administration > Users > Users**.
2. In the list, find and select the desired record.
3. Select **User options**.
4. Select the **Preferences** tab.
5. In the **Time zone** field, select an option from the drop-down list.
6. Select **Save**.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Lifecycle Services (LCS) for Finance and Operations apps customers

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic is intended for customers who have signed up for the current versions of Finance and Operations apps. Partners who are working with customers to help them move through the lifecycle of their Lifecycle Services (LCS) project will also find this information useful.

## LCS workspace for the current versions of the Finance and Operations apps

When you sign up for the current versions of Finance and Operations apps, your subscription includes an Implementation project workspace. After you activate the service, the tenant administrator must sign in at <https://lcs.dynamics.com> by using the tenant account. The project workspace is automatically created for your organization. The workspace includes the following elements:

- Enabled features, based on the offer that you selected
- Environments that are deployed and managed by Microsoft
- Guidance that is provided through the Action center to help you complete required actions
- A new methodology experience that includes tasks that lock as you move through the implementation
- A more complete history that specifies who completed each methodology phase and task
- Milestones that you can use to track critical project dates
- Various services to help you with your implementation

## Methodologies

As a customer, you must complete the steps that are outlined in the methodology to gain access to the production environment. Before a phase can be marked as completed, you must complete the specified mandatory tasks. Locked tasks, such as tasks 1.6 and 1.9 in the following screenshot, are unlocked after you've completed the required actions. To learn which actions must be completed before a specific task can be unlocked, click the lock icon for that task.

## Dynamics Demo Project

### ACTION CENTER

Created	Shefy Manayil Kare...	2/18/2016 7:10 PM

#### Description

After you have captured the business processes and requirements, a thorough analysis of the each requirement is required to assess if it can be met by the standard product.

In the case of prerequisites, after you complete the required tasks, you can mark the dependent tasks as completed. For example, in the following screenshot, tasks 1.6 and 1.9 depend on task 1.5. Because task 1.5 has now been completed, the two dependent tasks can be marked as completed.

## Milestones

High-level milestones must be defined for a project. Milestones can help you track the deliverables that must be completed and your progress toward the milestone goals. Color indicators help you quickly learn whether you're behind schedule. For example, in the following screenshot, the milestones are yellow. To enter or update the milestone dates, click the diamond shape in the methodology, and then click the Edit button (pencil icon). You can change milestone dates at any time.

Created	Shefy Manayil Kare...	2/18/2016 7:10 PM

Description

After you have captured the business processes and requirements, a thorough analysis of the each requirement is required to assess if it can be met by the standard product.

## Subscription estimator

You can use the Subscription estimator tool to evaluate your subscription requirements for the current versions of the Finance and Operations apps. To use Subscription estimator, download the usage profile, which is a Microsoft Excel workbook. Then, in the workbook, complete the following worksheets:

- Deployment details
- Instance Characteristics
- Retail & Commerce

After you've completed the worksheets, enter the data from the summary sheet into Subscription estimator by clicking + **New estimate**. You must make one estimate the active estimate. Make sure that the estimate that you mark as active is same as the offer that you bought through the VL or CSP channel.

## New deployment experience

To provision your environment, you must to complete a configuration checklist. As you make progress through the methodology, environments become available to you. Click **Configure** to add deployment information.

The screenshot displays a project management interface. At the top, a sprint timeline shows Sprints 2, 3, and 4, with dates 1/11/2016 and 2/21/2016. Below the timeline is a 'Task history' section with a 'Description' of project planning sessions. A 'Task history' dropdown menu is also visible. On the right side, there is a list of environments under the heading 'ENVIRONMENTS'. The environments listed are:

- PRODUCTION:** Environment Prod-1 is deployed (status: green checkmark). A 'Full details' link is present.
- SANDBOX: PREMIER PERFORMANCE TEST (ADD-ON):** Configuration button.
- SANDBOX: STANDARD PERFORMANCE TEST (ADD-ON):** Configuration button.
- SANDBOX: PREMIER ACCEPTANCE TEST (ADD-ON):** Configuration button.
- SANDBOX: PREMIER ACCEPTANCE TEST (ADD-ON):** Configuration button.
- SANDBOX: STANDARD ACCEPTANCE TEST:** Configuration button.
- SANDBOX: STANDARD ACCEPTANCE TEST (ADD-ON):** Configuration button.
- SANDBOX: DEVELOP AND TEST:** Environment kranthi is deploying... (status: green checkmark). A 'Full details' link is present.
- SANDBOX: DEVELOP AND TEST (ADD-ON):** Configuration button.

Because the information that you enter determines your experience, carefully review your input. After you've entered all the required information, sign-off is required for the deployment request. The user who completes the sign-off becomes the system administrator on the instance. Verify that the correct user completes the sign-off for the deployment. After the sign-off is completed, the Microsoft site reliability engagement team reviews the request. After the team has reviewed the information that you entered, it initiates the provisioning. If the information isn't correct, the team will contact you. After the provisioning is completed, the status is updated to indicate that the environment has been deployed, as shown in the following screenshot. If the provisioning takes longer than expected, the Microsoft site reliability engagement team reviews the status and takes appropriate actions. These actions might include contacting you. After the environment is provisioned, click **Full details** to open the **Detailed environment** page, where you can sign in to the system, view the monitoring status, or view relevant updates.

**SANDBOX: DEVELOP AND TEST**

✓ Environment DynDemoDevTest is deployed

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Finance and Operations application architecture

2/18/2021 • 4 minutes to read • [Edit Online](#)

The Finance and Operations application cloud architecture contains all the elements that are common to all Microsoft cloud offerings, as described in [Subscriptions, licenses, accounts, and tenants for Microsoft's cloud offerings](#). Beyond this, it also includes services that automate software deployment and provisioning, operational monitoring and reporting, and seamless application lifecycle management.

The cloud architecture consists of these conceptual areas:

- **Subscription** – A subscription to Finance and Operations apps gives you an online cloud environment (or multiple environments) and experience.
- **Licenses** – Customers must purchase subscription licenses (SLs) for their organization, or for their affiliates' employees and on-site agents, vendors, or contractors who directly or indirectly access Finance and Operations apps. These apps are licensed through Microsoft Volume Licensing and the Microsoft Cloud Solution Provider (CSP) program. For more information, download the latest [Microsoft Dynamics 365 Licensing Guide from Dynamics 365 pricing](#).
- **Tenant** – In Microsoft Azure Active Directory (AAD), a tenant represents an organization. It's a dedicated instance of the AAD service that an organization receives and owns when it creates a relationship with Microsoft (for example, by signing up for a Microsoft cloud service, such as Azure, Microsoft Intune, or Microsoft 365). Every AAD tenant is distinct and separate from other AAD tenants. For more information

about AAD tenants, see [How to get an Azure Active Directory Tenant](#).

A tenant houses the company's user information. This information includes passwords, user profile data, permissions, and related information. The tenant also contains groups, applications, and other information that pertains to an organization and its security.

The tenant is created when customers sign up for their first subscription to any Microsoft online service, such as Microsoft 365, Microsoft Dynamics 365, or Azure. Any later subscriptions to the same online services or other online services can be grouped within the same tenant.

An organization can have multiple AAD tenants. If there are multiple tenants, make sure that any subscriptions for Finance and Operations apps are associated with the correct tenant.

- **Azure Active Directory (AAD)** – AAD is the multi-tenant, cloud-based directory and identity management service from Microsoft that combines core directory services, application access management, and identity protection in a single solution. For more information, see [Azure Active Directory](#). Finance and Operations apps use AAD as the store for identity. Access to AAD is provided as part of a subscription to Finance and Operations apps.
- **Microsoft 365 admin center** – Microsoft 365 admin center is the subscription management portal that Microsoft 365 provides for administrators. It's used to provide management functions for users (AAD) and subscriptions. As part of these management functions, it provides information about service health. For more information, see [About the Microsoft 365 admin center](#).

#### NOTE

You don't have to have an Microsoft 365 license to deploy Finance and Operations apps. However, you might require a license for specific Office integration scenarios. For more information, see [Office integration overview](#).

- **Microsoft Dynamics Lifecycle Services (LCS)** – LCS is a collaboration portal that provides an environment and a set of regularly updated services that can help you manage the application lifecycle of your implementations. For more information, see [Lifecycle Services resources](#). After you purchase and activate a subscription for a Finance and Operations app, an **Implementation project** workspace is provisioned in LCS when the tenant administrator signs in for the first time.

#### NOTE

An implementation project is an LCS project for the cloud service. As a Microsoft partner, you can also provision non-implementation LCS projects for your own purposes. For more information, see [Lifecycle Services \(LCS\) for Finance and Operations apps partners](#).

- **Finance and Operations apps** – Finance and Operations apps are deployed through LCS. Various topologies are available: development/test/build, acceptance test, performance test, and high-availability production. For more information about the various topologies, download the [latest Microsoft Dynamics 365 Licensing Guide from Dynamics 365 pricing](#).
- **Microsoft Azure DevOps** – Azure DevOps is used primarily for code version control, development, and to deploy a build environment. Azure DevOps is also used to track support incidents, such as work items in Azure DevOps that are submitted to Microsoft through Cloud-powered support, and to integrate the Business process modeler (BPM) library hierarchy into your Azure DevOps project as a hierarchy of work items. Azure DevOps is also used during code upgrade.

"Under the hood," Finance and Operations apps use many features of the Azure platform, such as Azure Storage, networking, monitoring, and Azure SQL Database, to name just a few. Shared services put into operation and orchestrate the application lifecycle of the environments for participants. Together, Azure functionality and LCS

offer a robust cloud service.

**NOTE**

Although many features of the Azure platform are used, you don't have to have an Azure subscription to deploy Finance and Operations apps in the Microsoft-managed cloud. You must have an Azure subscription only if you want to deploy Finance and Operations apps cloud-hosted environments in your own Azure subscription.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Onboard an implementation project

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to onboard a Finance and Operations project by using Microsoft Dynamics Lifecycle Services (LCS).

## Microsoft 365 Admin Center

After your organization has purchased a subscription to Finance and Operations, it must be activated on your organization's Azure Active Directory (Azure AD) tenant by your Tenant Administrator, who completes the following steps:

1. Open an InPrivate/Incognito browser session and go to the [Microsoft 365 Admin Center](#).
2. Sign in with the Tenant Administrator credentials.
3. Go to **Billing > Products & services** and confirm that there is an active subscription for the application that you want to deploy.

### NOTE

If you do not see an active subscription, consult with your Licensing Partner to confirm the status of the subscription transaction as well as the tenant for the subscription. By default, all Microsoft Online Services should be running on the same Azure AD tenant.

4. If the subscription in question is shown as active, proceed to the next step by signing in to LCS to trigger the Implementation Project creation flow.
5. Open another private browser tab and go to [Lifecycle Services](#). Select **Login** to access LCS with your current Tenant Admin credentials.
6. Accept and confirm any other prompts displayed to complete the Implementation Project provisioning.
7. The Tenant Administrator is assigned the Project Owner security role in the provisioned Implementation Project.

### NOTE

If the Tenant Administrator will not be a participant in the implementation, at least one additional Project Owner must be assigned to the implementation project.

For an overview of LCS user management, including the security roles that can be assigned to users, see [Configure Lifecycle Services \(LCS\) security](#).

## LCS implementation project workspace

After the Tenant Administrator has completed the Finance and Operations subscription activation and added additional project owners as appropriate, those team members can access the **Implementation project** workspace.

The first step to be completed in LCS is **Project onboarding**. This step is required for all LCS implementation projects that are created **on or after August 22, 2019, PST**, prior to deploying any of the Microsoft-managed

environments. You can access the **Project onboarding** feature using the action center notification or the LCS Implementation project menu. You must be assigned to the Project owner security role to access **Project onboarding** in LCS.

To get started with LCS, see [Lifecycle Services \(LCS\) for Finance and Operations apps customers](#).

## FastTrack onboarding services

After the LCS **Implementation project** workspace is provisioned, the Microsoft FastTrack team will monitor your onboarding progress. If project onboarding is not completed within a few weeks after creating an LCS **Implementation project**, a reminder will be sent to the project team.

For more information about the FastTrack program and the services provided, see [Microsoft FastTrack](#).

For more information about LCS project onboarding, see [LCS project onboarding](#).

### NOTE

All onboarding-related emails from the FastTrack team will originate from Dynamics 365 Onboarding ([ond365@microsoft.com](mailto:ond365@microsoft.com)), so please ensure that any spam blocker/filter allows email from this address.

## Key data to keep current in LCS

We recommend that you add key project members (such as project managers) from the customer and partner teams to the LCS implementation project. Be sure to include each person's work email address. In this way, you help us work best with you and help ensure that project members don't miss important communication from us.

Be sure to keep the milestone dates in your LCS project current. In this way, you help us connect with you at different project stages. When you're closer to your go-live date, we will contact you for a project Go-live assessment before we deploy your production environment.

Milestone dates are stored in the LCS implementation methodology. For more information, see the [Methodologies](#) section of the "LCS for Customers" topic.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Environment planning

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic provides an overview of various aspects that you must consider while you plan for your project's environment. To help guarantee a successful cloud implementation, it's important that you discuss and plan your environment early in the project.

## Environment planning overview

To begin, here are a few important concepts:

- **Environment purpose** – The reasons why the environment exists. Examples include development, system testing, user acceptance testing (UAT), and operations.
- **Environment topology** – The composition of the environment and the purpose. Examples include **Develop** and **Build and Test** for Tier-1 environments.
- **Environment tier** – The type or category of the environment. Examples include Tier-1 environments and Tier-2 environments.

For more information, about the various environments and tiers, see [Cloud deployment overview](#) and download the latest *Microsoft Dynamics 365 Licensing Guide* from [Dynamics 365 pricing](#).

### Environment types

You can use the following environment types for your project:

- **Standard** – This environment is included in the standard offer and is managed by Microsoft in a Microsoft subscription. Standard environments include the production environment and a Tier-2 Standard Acceptance Test environment.
- **Add-on** – The add-on environments are in a Microsoft-managed subscription that the customer has purchased in addition to the standard offer. For example, an add-on environment might be an additional Tier-4 environment for performance testing.
- **Cloud-hosted** – Cloud-hosted environments are additional environments that are managed by the customer or partner in a customer or partner Microsoft Azure subscription. A cloud-hosted environment can include a Tier-1 demo environment.
- **Environment image (VHD)** – These additional Tier-1 environments are hosted on-premises by using a virtual hard disk (VHD) that can be downloaded from [Microsoft Dynamics Lifecycle Services \(LCS\)](#).

#### IMPORTANT

In a *customer or partner Azure subscription*, the customer or partner brings its own Azure subscription, and deploys environments to that subscription for evaluation and development purposes only. The customer or partner pays for the resources that are deployed to its Azure subscription. The amount that the customer or partner pays is based on the Azure price list. By contrast, in a *Microsoft subscription*, the customer purchases licenses that allow the customer to deploy environments to an Azure subscription that is managed by Microsoft. Therefore, the customer has no separate Azure billing.

### Tier-1 vs. Tier-2 and higher

TIER-1	TIER-2 AND HIGHER
Single-box environment	Multi-box environment

TIER-1	TIER-2 AND HIGHER
All components are installed on the same server. These components include Application Object Server (AOS), the database, Dynamics 365 Commerce, and Management Reporter.	Components are installed on multiple servers.
Microsoft SQL Server is used.	<a href="#">Azure SQL Database</a> is used.
The architecture differs from the architecture of the production environment to maximize efficiency and cost of the development team.	The architecture is the same as the architecture of the production environment, even though this type of environment has a different sizing and isn't enabled for disaster recovery.
The environment can be cloud-hosted, or it can be deployed as an environment image (VHD).	The environment can be deployed only as a standard environment or an add-on environment. It can't be cloud-hosted.
The environment isn't suitable for UAT or performance testing.	The environment is suitable for UAT and performance testing.

## Standard cloud offer

The standard cloud offer includes two environments:

- **Tier-2 environment: Standard Acceptance Testing** – One Standard Acceptance Testing (UAT) instance is provided for the duration of the subscription. This instance is a non-production multi-box instance that customers can use for UAT, integration testing, and training. Additional sandbox/staging instances can be purchased separately as an optional add-on.
- **Production environment** – One production instance is provided per tenant. The production multi-box instance includes disaster recovery and high availability. It will be provisioned when the implementation approaches the Operate phase, after the required activities in the Microsoft Dynamics Lifecycle Services (LCS) methodology and a successful go-live assessment are completed. Additionally, some file storage and database storage are included in the offer:
  - **File storage:** Every customer receives a certain amount of file/Azure blob cloud storage for files and binary data. Additional file/blob storage can be purchased.
  - **Database storage:** Every subscription includes a certain amount of Azure SQL Database storage per customer at no additional charge. Additional storage capacity is provided at no charge as an organization increases the number of user and device service licenses. For more information about the various environments and the various types of storage, as well as the currently included free file and storage capacity, download the latest *Microsoft Dynamics 365 Licensing Guide* from [Dynamics 365 pricing](#).

### IMPORTANT

Microsoft promises service and data high availability as well as minimal servicing downtime guarantees as part of the Dynamics 365 software license agreement (SLA) for production environments. The SLA goals do not apply to non-production environments.

### Provisioning of standard environments

The standard environments are provisioned at different times. The following table shows the suggested timing for the environments in the standard cloud offer.

ENVIRONMENT	WHEN DOES PROVISIONING OCCUR?	IS IT SELF-SERVICE?
Tier-2 Standard Acceptance Test	Immediately after project onboarding has been completed in LCS	Yes
Production	At production system readiness	A Go-live assessment must be completed prior to configuring the production deployment request in LCS.

### IMPORTANT

Always deploy environments by using an **unnamed** account. This account must be from the customer domain, such as `dynadmin@customer.com` or `dynadmin@customer.onmicrosoft.com`. We strongly recommend using the same dedicated environment admin account on all environments. ISV licenses must be issued to the domain of the account used for environment deployment, therefore using both `dynadmin@customer.com` and `dynadmin@customer.onmicrosoft.com` on different environments can lead to problems with ISV licenses.

### Production system readiness

The production environment can be deployed when the project is ready for the initial go-live. For more information, see [Prepare for go-live](#).

Production system readiness includes, but isn't limited to, the following conditions:

- An up-to-date subscription estimate is activated, as described in [Subscription estimator in Lifecycle Services \(LCS\)](#).
- Code, configuration, and data are ready for cutover.
- An engineering process is in place to manage critical fixes.
- The customer has signed off on the solution and UAT.
- A cutover plan is in place.

Customers should use the production environment to **operate** the solution, not build it. The production environment is sized to run your business. The sizing is based on the subscription estimate and diagnostic data from performance testing. After deployment, customers can and should do a mock cutover and a final round of validation on the production environment. Before the final cutover, customers can request a Point in time restore to restore the production environment to a clean snapshot (maximum 28 days in the past).

To select the appropriate data center for the production environment, consider the latency from the geographic locations where the business operates. Use tools such as [PsPing](#) and [Azure Speed Test](#) to test latency to Azure data centers.

The following illustrations shows the environment planning process.

## Additional environments

Additional environments can be purchased as add-ons, or they can be deployed as cloud-hosted environments. The following illustration shows a *sample* overview of standard and additional environments, based on the complexity of the implementation.

Environment purpose	Tier	Standard project	Medium complexity project	Complex project
Build	1	X	X	X
Test (e.g. system integration testing or UAT)	2	X	X	X
Production	Based on the <b>sizing</b>	X	X	X
Development	1	X	X	X
Golden configuration	1 or 2		X	X
Pre-production / data migration	2		X	X
Performance testing	4 or 5			X
Training	2 or 3			X
System integration testing	2 or 3			X
Other / ad-hoc	...			X

### IMPORTANT

Always deploy environments by using an **unnamed** account, such as `dynadmin@customer.com`. Assign the environments an owner who will be responsible for their status and maintenance. We strongly recommend using the same dedicated environment admin account on all environments. After go-live, if you plan to work on new releases, get an additional Tier-2 or higher environment to support production.

### Deployment considerations for development environments

For development environments, there are two deployment options:

- **Cloud-hosted** – The environments are managed by the customer/partner in a customer/partner Azure subscription.
- **Environment image (downloadable VHD)** – The environments are hosted on-premises.

### NOTE

You must allocate one development environment per developer.

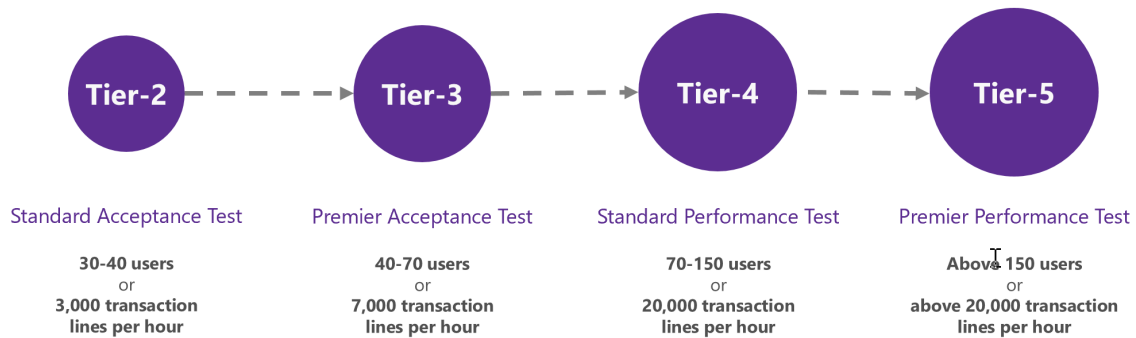

The following table compares the deployment options.

CAPABILITY	CLOUD-HOSTED	ENVIRONMENT IMAGE
Public URL	✓	Not supported
Integration development	✓	Extra setup is required. (For example, run the admin user provisioning tool.)
Azure DevOps	✓	Extra setup is required. (For example, rename the computer.)
Applying deployable packages from LCS	Automated	Command line runbooks (AxUpdateInstaller.exe tool)
Deploying data packages from LCS	✓	Not supported
Maintenance	Managed by the customer/partner	Managed by the customer/partner

CAPABILITY	CLOUD-HOSTED	ENVIRONMENT IMAGE
Cost model	Pay as you go (If the environment is on for eight hours, you pay for eight hours.). Cost is based on selected Virtual Machine size, disk size and settings, and premium storage settings	Hardware-related
Limitations	None. You have full control over VM specs, disk size and storage settings. You have administrator access to the VM.	None

### Selecting the correct Tier-2 or higher environment

It's important that you select the correct Tier-2 or higher environment, depending on the purpose of the environment. The guidance that is provided in the following illustration is a *baseline*. You must work with your implementation partner to adjust this guidance, based on your specific business scenarios and factors such as type of users, complexity, and volumes.

After a subscription estimate is activated, you can view transaction lines per hour in LCS, as shown in the following illustration.

Subscription estimator

What is subscription estimator?  
Subscription estimator provides an automated estimate of the subscription needed for your production instance. It uses the subscription licenses and transaction details to infer your subscription needs. While you can have multiple estimates, you need to mark one estimate as 'Active'.

The active estimate is currently locked because there is a production environment that is active or has been signed off for deployment. To mark a different estimate as active, please clear the signoff or contact support.

[+ New estimate](#) [Delete estimate](#) [Mark active](#) [Subscription\(s\)](#) [Sample usage profile](#)

Name	Estimated by	Created on
80	SA Solutions Architect	7/14/2018 1:25 AM

80

Specifications

The subscription license(s) are recorded at the time of an estimate's creation. If the subscription licenses have changed recently, please create a new estimate to refresh this data.

[Usage profile](#)

Operations user count: 32

Transaction lines per hour (Non-POS): 7327

### Purchasing add-on environments

If you want to purchase add-on environments, we recommend that you work closely with your Cloud Solution Provider or License Service Reseller. Consider the potential lead time that occurs between the time when the order is placed and the time when the environment is deployed.

The following illustration shows the process for purchasing add-on environments.

### IMPORTANT

If you have a Microsoft Volume Licensing agreement, you can subscribe to add-on environments on a monthly basis through the Microsoft Products and Services Agreement (MPSA) licensing program. Alternatively, you can subscribe to them through the Microsoft Cloud Solution Provider (CSP) program. For more information about the various environments and tiers, download the latest *Microsoft Dynamics 365 Licensing Guide* from [Dynamics 365 pricing](#).

## Environments plan

Create the environments plan early in your implementation.

1. Identify the project activities that require an environment. These activities include, but aren't limited to, development of customizations and maintenance of golden configuration data.
2. Determine the *activities lifecycle* to determine the *environments lifecycle*. Here are some examples of the questions that you should ask during this step:
  - When and for how long do you require the environment?
  - Do you require the environment before or after go-live?
3. Determine the type and topology of the required environments.
4. Summarize the list of required environments in a matrix.

After you've identified the environments, the environments plan can be used to structure the Application Lifecycle Management (ALM) flows. For example, after you finalize your environments plan, you can define the flows for building and moving the code and the data across environments.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

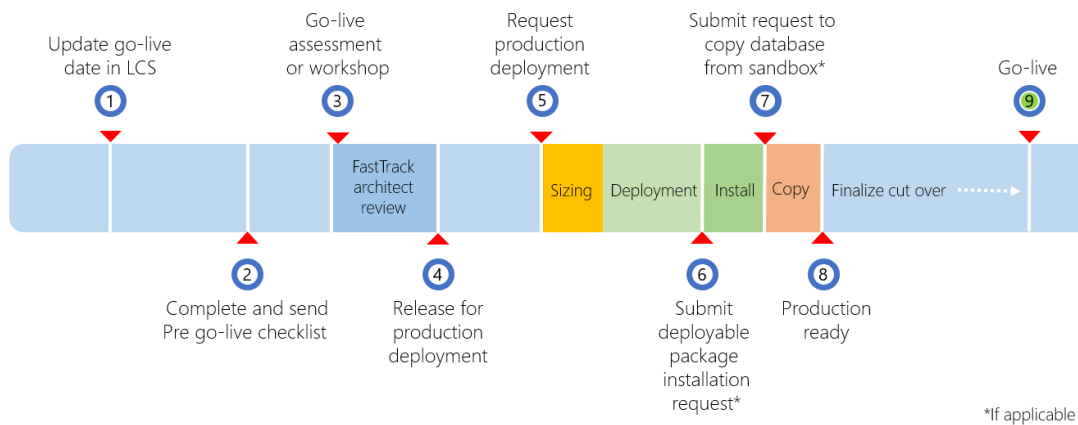

# Prepare for go-live

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes how to prepare to go live with a project by using Microsoft Dynamics Lifecycle Services (LCS).

Production and Sandbox can only be deployed in two different [types of environments](#): Microsoft Managed or Self-Service. Both follow the same preparation for go-live, but the service level agreements (SLA) and some of the process steps are different.

This graphic and the following table list the phases of the go-live process, the environment type to which each phase applies with the expected duration, and who is responsible to take the action.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
1	Update Go-live date in LCS	Both	At the latest 2-3 months in advance	Customer/Partner	The milestone dates should be kept up to date on an ongoing basis.
2	Complete and send pre go-live checklist	Both	After user acceptance testing (UAT) complete	Customer/Partner	Follow the instructions provided in the "FastTrack Go-live Assessment" section later in this topic.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHEE N	WHO	NOTES
3	Project Go-Live assessment (FastTrack Essentials)	Both	3-business days for initial report, plus additional time for mitigation, if required	Microsoft-FastTrack Solution Architect	Solution Architect delivers assessment after checklist is received and continues review until questions are clarified and mitigations are in place, if applicable.
	Go-live Assessment workshop (FastTrack)	Both	To coordinate with architect assigned	Microsoft-FastTrack Solution Architect	
4	Release for production deployment	Microsoft Managed	Immediate upon successfully completed assessment	Microsoft-FastTrack Solution Architect	Do not submit production request until the assessment is successfully completed.
		Self-Service	Immediate upon successfully completed assessment and <b>Configure</b> button is enabled	Microsoft-FastTrack Solution Architect	For Self-Service deployment, the <b>Configure</b> button remains disabled until the assessment is complete.
5	Production deployment request	Microsoft Managed	Self-service	Customer/Partner	The production deployment request should only be submitted after the FastTrack Architect has finished the assessment.
		Self-Service	Self-service	Customer/Partner	After the assessment is complete, the <b>Configure</b> button will be enabled and customer will be able to request the production deployment.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
	Sizing	Both	Immediate in case of automatic sizing. Could require further clarifications of the subscription estimate.	Microsoft-Dynamic Service Engineering (DSE)	Automatic sizing based on subscription estimate by default, manual sizing by exception.
	Deployment	Microsoft Managed	48 hours	Microsoft-Dynamic Service Engineering (DSE)	Status in LCS reflects the deployment progress. If there are any questions about your request, they will be posted as Comments on the service request.
		Self-Service	An average of 30 minutes	Microsoft-FastTrack Solution Architect	The deployment could take an average of 30 minutes after the assessment has completed and the production environment has been requested. For more information, see <a href="#">Deploy a new environment</a> .
6	Deployable package installation request	Both	Self-service	Customer/Partner	Follow the instructions in <a href="#">Apply updates</a> . The packages must contain all the models and binaries consolidated in an <a href="#">All-in-one</a> deployable package.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
	Package installation	Both	Minimum 5 hours lead time and 4 hours downtime	Microsoft-Dynamic Service Engineering (DSE)	Generally, 95% of updates are applied in less than one hour, however we still recommend that you provide a downtime window of four hours in case a rollback is required for any reason. When the package deployment succeeds, the environment will be available as soon as the package deployment has finished, which means that the longer downtime window does not have any negative effect on the availability of the system.
7	Database copy from Sandbox request (if applicable)	Both	Self-service	Customer/Partner	Follow the instructions <a href="#">Self-service database refresh</a> . If you have a golden configuration you can review <a href="#">Golden configuration promotion</a> .
	Copy database	Both	Five hours lead time and four hours downtime	Microsoft-Dynamic Service Engineering (DSE)	Generally, the database copy is completed in less than one hour. We still recommend that you provide a downtime window of four hours in case a rollback is required for any reason.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
8	Production ready	Both	After all previous steps have been completed	Customer/Partner	Customer can take control of the production environment.
	Cutover activities	Both	Depends on the project	Customer/Partner	
9	Go live	Both	Depends on the project	Customer/Partner	

## Completing the LCS methodology

A major milestone in each implementation project is the cutover to the production environment.

To ensure that the production environment is used for live operations, Microsoft will provision the production instance only when the implementation is approaching the **Operate** phase, after the required activities in the LCS methodology are complete. For more information about the environments in your subscription, see the [Licensing guide](#).

Customers must complete the **Analysis, Design and Develop**, and **Test** phases in the LCS methodology before the **Configure** button that is used to request the production environment becomes available.

### NOTE

For Self-Service environments, the **Configure** button will only become available after the Solution Architect has signed off on the assessment.

To complete a phase in LCS, you must first complete every required step in that phase. When all the steps in a phase are completed, you can complete the whole phase. You can always reopen a phase later if you must make changes. If you require more help, see [Lifecycle Services \(LCS\) for Finance and Operations apps customers](#).

The process of completing a step has two parts:

- Do the actual work, such as a fit-gap analysis or user acceptance testing (UAT).
- Mark the corresponding step in the LCS methodology as completed.

It's good practice to complete the steps in the methodology as you make progress with the implementation. Don't wait until the last minute. Don't just click through all the steps so that you can get a production environment. It's in the customer's best interest to have a solid implementation.

## UAT completion and solution sign off

During the UAT phase, you must test all the business processes that you've implemented, and any customizations that you've made, in a Sandbox, or Standard Acceptance Test, environment in the implementation project. To help ensure a successful go-live, you should consider the following as you complete the UAT phase:

- Test cases cover the entire scope of requirements.
- Test by using migrated data. This data should include master data and opening balances, even if they aren't yet final.
- Test by using the correct security roles (default roles and custom roles) that are assigned to users.

- Make sure that the solution complies with any company-specific and industry-specific regulatory requirements.
- Run the [Customization Analysis Report \(CAR\)](#) and resolve critical issues.
- Complete performance testing.
- Document all features, and obtain approval and sign-off from the customer.

Regardless of whether the environment is a cloud-hosted environment or a downloaded virtual hard disk (VHD), testing can't be considered complete when you test only in an environment that is a developer or demo topology. Here are the reasons:

- The topology of the Tier-1 environments differs from the topology of your production environment. It's important that you test all functionality on a Tier-2 or higher sandbox environment in the Microsoft-managed subscription. It's especially important that you test integrations, printing functionality, workflow functionality, and warehouse and commerce devices in the sandbox environment.
- System performance can't be measured when you do the UAT on local virtual machines (VMs) or VMs that are privately hosted.
- To prevent delays during the cutover process, it's important that the team experience the servicing in LCS during the implementation. This servicing includes the processes of applying deployable packages, creating service requests, and moving database between environments.

## FastTrack Go-live assessment

All customers must complete a go-live review with the Microsoft FastTrack team before their production environment can be deployed. This assessment should be successfully completed before you request your production environment. If you aren't familiar with Microsoft FastTrack, see [Microsoft FastTrack](#).

About eight weeks before go-live, the FastTrack team will ask you to fill in a go-live checklist.

You can download the checklist from [Dynamics 365 Community](#) on the [Go-live Planning TechTalk](#) page.

The project manager or a key project member must complete the go-live checklist during the pre-go-live phase of the project. Typically, the checklist is completed four to six weeks before the proposed go-live date, when UAT is completed or almost completed.

When you've completed the go-live checklist, email it to **Dynamics 365 FO Go-Live** [d365fogl@microsoft.com](mailto:d365fogl@microsoft.com). Always include a key stakeholder from the customer and the implementation partner on the email.

After the checklist is submitted, a Microsoft solution architect will review the project and provide an assessment that describes the potential risks, best practices, and recommendations for a successful go-live of the project. In some cases, the solution architect might highlight risk factors and ask for a mitigation plan. When the assessment is completed, the solution architect will indicate that you're ready to request the production environment in LCS.

For Microsoft Managed environments, if you request the production environment before the assessment is completed, the deployment will remain in the **Queued** state until the assessment is successfully completed. For Self-Service environments, the **Configure** button to request production will be only enabled after the assessment is completed.

You can cancel an environment deployment request while it is in a **Queued** state by following these steps:

1. Select **Queued**.
2. On the **Customer sign-off** tab, select **Clear sign-off**.

This will set the environment back into a state of **Configure** and allow you to make changes to the configuration, such as selecting a different data center or environment topology.

# Requesting the production environment

## NOTE

The production environment is used exclusively for running your business operations and shouldn't be used for testing. You will be able to perform the cutover, and if planned, to mock the cutover in production. To test the solution, you must use a UAT environment, which is designed with the necessary elements and services for testing.

After you've completed the analysis, design and develop, and test phases in the LCS methodology, and the go-live assessment has concluded that the project is ready, you can request your production environment.

We recommend that you select a service account, for example a generic user account, as the Admin user of the environments that you deploy. If you use a named user account, you might not be able to access an environment if that user isn't available. Here are some scenarios where the Admin user must access an environment:

- **First sign-in to any environment after initial deployment** – In this case, the Admin user is the only user who can access the environment.
- **First sign-in to a sandbox environment after a database refresh from the production environment** – In this case, all user accounts except the Admin account are unable to sign in.

Your production environment should be deployed to the same datacenter where your sandbox environments are deployed.

After you've signed off on the request for the production environment, Microsoft is responsible for deploying the production environment for you. For **Microsoft Managed** environments, the Microsoft service level agreement (SLA) for deployment of a production environment is 48 hours. The production environment can be deployed at any time within 48 hours after you submit the request, provided that your usage profile doesn't require additional information. For **Self-Service** environments, the deployment will take around 30 minutes after the production request has been submitted. You can view the progress of the deployment in LCS. Typically, the status of the production environment request remains **Queued** for a few hours before it's changed to **Deploying**.

When you submit the deployment request, a service request for the Microsoft Dynamics Service Engineering (DSE) team is automatically created. You can view this service request in the **Service requests** list in LCS. If the DSE team has questions that prevent them from deploying the production environment, they will add a comment to the service request. For example, the DSE team might ask that you update the subscription estimate or change the datacenter. In some cases, you might have to clear the sign-off from the production deployment request to make changes.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Go-live for implementation projects FAQ

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic lists frequently asked questions about how to go live with an implementation project.

## When can I configure and request my production environment?

Typically, a production environment is deployed after all customizations are code-complete, user acceptance testing (UAT) is completed, the customer has signed off on the solution, and there are no blocking issues for go-live.

When you're at this stage, the Microsoft FastTrack team will work with the project team to do a Go-live assessment/review.

## What are the prerequisites to deploy a production environment?

For a list of the prerequisites, see [Prepare for go-live](#).

## What is a Go-live assessment/review, and why is it required?

The Go-live assessment/review is part of the [Microsoft FastTrack program](#). During this review, a solution architect assesses whether an implementation project is ready for a successful cutover and go-live. This review is mandatory for every implementation project before you can request to go live in a production environment.

## I want to request my production environment. Who do I contact for a Go-live assessment/review?

If a FastTrack solution architect is assigned to your project, contact him or her directly. Otherwise, based on the go-live date that is specified in Microsoft Dynamics Lifecycle Services (LCS), you will receive an email that instructs you to fill out the Pre-go-live checklist and send it to [d365fogl@microsoft.com](mailto:d365fogl@microsoft.com) a few weeks before the go-live date. If you haven't received an email, and you're ready for go-live, you can download the checklist from [Dynamics 365 Community](#) on the [Go-live Planning TechTalk](#) page, complete it, and send it to [d365fogl@microsoft.com](mailto:d365fogl@microsoft.com).

## The Production button isn't available in LCS. How do I request my production environment?

The **Production** button in LCS is available only after you've completed the **Analysis, Design & develop**, and **Test** phases of the LCS implementation methodology. For more information about how to complete these phases, see [Lifecycle Services \(LCS\) for Finance and Operations apps customers](#).

### NOTE

Your production environment won't be deployed until the Go-live assessment/review has been completed.

My sandbox environment is currently on an update that is set to expire in two months. Can I request a production environment that has the latest update?

No. We will deny any request for a production environment that is on a different version than your sandbox environment. When you configure a production environment, the versions that you select must match the versions of the sandbox environment where you signed off on your solution. Therefore, you must first apply the latest update to your sandbox environment, test it, and sign off.

For more information, see [Software lifecycle policy and cloud releases](#).

## Our sandbox environments are deployed in the Central US datacenter, but we want our production environments to be deployed in the West US datacenter. Can I select West US as the datacenter in my production configuration?

No. We will deny any request for a production environment that is in a different datacenter than your sandbox environment. We require that all your environments reside in the same datacenter. If you want your production environment to reside in the West US datacenter, you must first redeploy your sandbox environments to the West US datacenter, test them, and sign off.

For information that can help you select the correct datacenter, see the [Network requirements](#) section of the "System requirements" topic.

## How will my production environment be sized?

Your production environment will be sized based on the current user license count and the information in the subscription estimate that is active when you request the production environment.

### NOTE

If you add additional users later, you must create a support ticket to activate a new subscription estimate. Your production environment might have to be resized, depending on the number of users, the type of user licenses, and the expected peak transaction volume. Downtime is required in order to resize a production environment.

## I submitted the request for a production environment, but I made a mistake. Can I still change it?

Yes. As long as the status of the production environment is **Queued**, you can clear the sign-off flag, make changes, and then sign off again.

## How long does it take to deploy my production environment?

After the Go-live assessment with the Microsoft FastTrack team is completed and the production request is submitted, deployment of the production environment should be completed within 48 hours.

## What level of access do I have in my production environment? Can I sign in to the VM?

No. Access to the production environment is limited. You can't access the virtual machine (VM) or Microsoft Internet Information Services (IIS). You also can't access the database through Microsoft SQL Server Management Studio.

## How often is my production database backed up?

Databases are protected by automatic backups. Full database backups are done weekly, differential database

backups are done hourly, and transaction log backups are done every five minutes. Automatic backups are retained for 35 days.

For more information, see [Learn about automatic SQL Database backups](#).

## Can I request a copy of the backup of my production database?

No. However, you can submit a database refresh service request to copy your production database to your Tier 2 and higher sandbox environment. After the copy request is completed, you can back up your sandbox environment.

## My golden configuration database is in a Tier 1 sandbox environment. How can I copy and restore it to my production environment?

To copy and restore your database, follow the instructions in the topic, [Golden configuration promotion](#).

### NOTE

If your golden configuration is in data packages, you must manually import the data packages to the production environment.

## After go-live, can I apply new code changes to the production environment?

Yes. In LCS, you can submit a service request to apply a deployable package to your production environment. Application of one deployable package to a production environment involves a lead time of five hours and downtime of approximately five hours.

For more information, see [Apply updates to cloud environments](#).

## What should I do if my production environment is down?

To report a production outage, follow the process described in the topic, [Report a production outage](#).

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Submit service requests to the Dynamics Service Engineering team

2/18/2021 • 7 minutes to read • [Edit Online](#)

A service request is a ticket that you use to request that the Dynamics Service Engineering (DSE) team perform a predefined set of tasks on your environments.

## NOTE

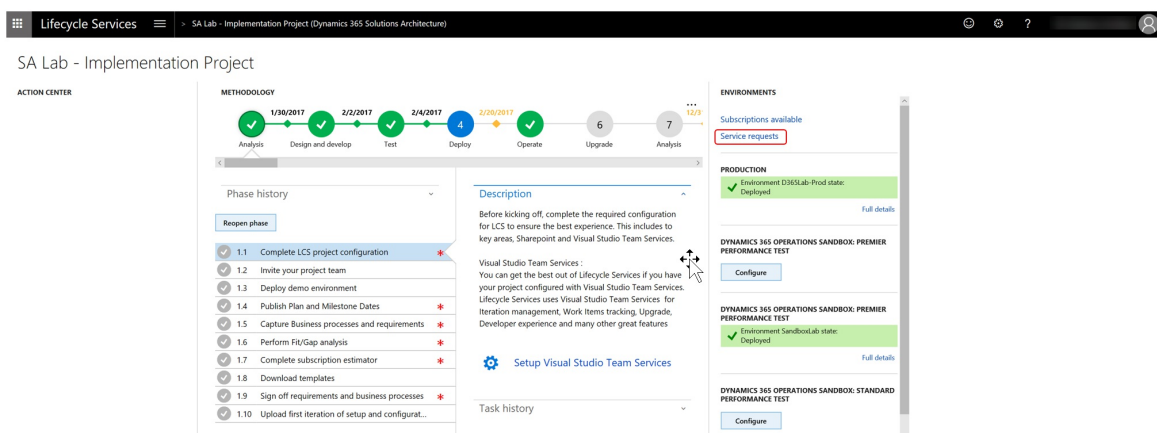

Don't use service requests for product issues. If you encounter a situation that doesn't fit into any of the tasks that are described in this topic, submit a support ticket instead. For more information about support tickets, see [Get support for Finance and Operations apps](#) or [Lifecycle Services \(LCS\)](#).

You can use Microsoft Dynamics Lifecycle Services (LCS) to submit service requests directly to the DSE team. You can also view which requests have been submitted, executed, and canceled for your environments.

## View service requests

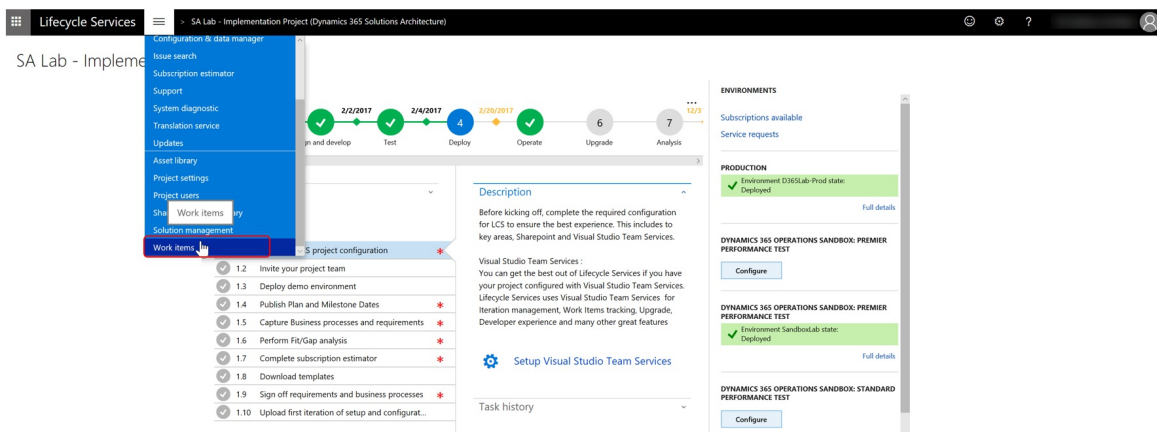

There are two ways to view service requests:

- On the project dashboard, in the **Environments** section, select **Service requests**.

The screenshot shows the Lifecycle Services interface for a project named 'SA Lab - Implementation Project (Dynamics 365 Solutions Architecture)'. The 'ENVIRONMENTS' section is visible on the right, with a 'Service requests' link highlighted in red. The main area shows a methodology timeline with steps: Analysis (1/30/2017), Design and develop (2/2/2017), Test (2/4/2017), Deploy (2/20/2017), Operate (4), Upgrade (6), and Analysis (7/12/23). Below the timeline is a 'Phase history' list with tasks like 'Complete LCS project configuration', 'Invite your project team', etc. A 'Description' box provides details about the configuration process.

- Select the **Menu** button and select **Work items**. On the **Work items** page select the **Service requests** tab.

This screenshot shows the same project dashboard as above, but with the 'Work items' menu open on the left. The 'Work items' option is highlighted in red. The 'ENVIRONMENTS' section on the right is still visible, showing the 'Service requests' link. The main area displays the methodology timeline and phase history.

By default, the **Service requests** tab on the **Work items** page lists all requests that are currently active and requests that have been denied. However, you can use the filter options to show canceled and finished requests too.

Work items

Open work items + Add View environment details Reschedule Cancel

24209	Upgrade environment	D36572PUAT	Request denied	Microsoft	3/20/2018 2:00:00 AM (UTC +02:00)	3/21/2018 2:00:00 AM (UTC +02:00)	SA Solutions Architect	SA Solutions Architect	1/3/2018 1:33 PM	3/2/2018 9:12 PM

After you submit a request, it has a status of **Requested**. Before the DSE team acts on the request, it might ask for clarification by entering a comment in the **Comment** field. For example, you might receive a comment from the DSE team if you request deployment of a production environment, but the data center differs from the data center where your sandbox environments are deployed. Carefully review the comments, and provide any required clarification in your own comment. To view the details of a specific request, or to submit comments for a service request, select the request ID.

If you signed up for LCS notifications, you receive an email when the status of a service request changes or a comment is entered.

If you submit a service request to the DSE team, and the action is outside the team's scope, the service request will be denied. In this case, the reason for the denial and suggestions for further action are provided. For some typical examples of service requests that the DSE team will deny, see the "Denied service requests" section later in this topic.

## Create service requests

There are two ways to create a service request: automatically and on demand.

- **Automatically** – A service request is automatically created when you request deployment of an environment, or an application of a package.
- **On demand** – A service request is manually created when you enter a request for a database point-in-time restore, and some other services.

### Automatically create a service request

- **Environment deployment** – To set up deployment options and submit a request to the DSE team to deploy a new environment, in the **Environments** section, select **Configure**.
- **Package application** – To apply a package to the production environment, on the **Environment details** page, select **Maintain**, select the package to apply, and then select **Schedule**. For more information, see [Apply updates to cloud environments](#).

## IMPORTANT

If your scheduled time overlaps with a [planned maintenance window](#), you will receive the following warning message.

 **There is a high likelihood that maintenance activity may be scheduled for this environment during this time. Overlapping environment operations with maintenance activity will cause issues and possibly cause extended downtime. Would you like to proceed with this operation?**

[Show diagnostic information](#)

Yes

No

If you choose to continue deploying the package, the package deployment operation will be rolled-back in the event of conflict, as planned maintenance takes priority.

This restriction is applicable to **Microsoft-managed IAAS environments** only.

## Create a service request on demand

Service requests that are created on demand aren't explicitly accepted by the DSE team. They will be addressed during the specified downtime window unless the DSE team has entered a comment in the request or has had to deny the request. For details, review the comments in the service request.

Microsoft frequently reviews all incoming service requests. By selecting the correct type of service request for your scenario, you help the DSE team handle the request in a timely manner.

1. On the **Work items** page, on the **Service requests** tab, select **Add**.
2. In the **Create request** dialog box, select the type of service request to create. The options on the page then reflect the specific type of request that you selected.
  - **Sandbox point-in-time restore request** – Select this request type to restore a *non-production* database to a specific point in time. For more information, see [Database movement operations home page](#).

### NOTE

If you need to restore a *production* database to a previous point-in-time during the cutover phase, select the **Production point-in-time restore request** type. If you need to restore a production database when you're already live in operations, submit a support ticket through LCS.

- **Database refresh request** – Select this request type to refresh a database from a production environment to a sandbox environment, or from one sandbox environment to another. For more information, see [Refresh database](#). *This request type is being retired on January 31, 2019.*

### NOTE

If you need to refresh a database from a sandbox environment to a production environment during the cutover phase, select the **Sandbox to Production** type.

- **Sandbox to Production** - Perform a database refresh of your configuration data to a production

environment during the cutover phase. For more information, see [Database movement operations home page](#).

- **Other request** – You need to use the **Other request** type exactly as described here. If you word a request in a way that isn't clear to the DSE team, the team will enter a comment to ask for clarification, and your request will be delayed. If you use the **Other request** type for any request that isn't listed below, the request will be denied. Select this request type to request that the DSE team perform one of the following actions:
  - Turn on maintenance mode in a production environment. For more information, see [Maintenance mode](#).
  - Tenant move of a live Production environment. Request the Microsoft Service Engineering team to move the Production database and Azure Blob Storage from the old tenant to the new tenant if you are moving tenant on a live Production environment. Make sure that you only request this service when you are ready with all prerequisites. For more details, see [Move LCS implementation projects to different Azure AD tenants](#).
  - Define explicit Internet Protocol (IP) safe list rules in a production environment.

**NOTE**

Support for explicit safe list rules is deprecated for self-service environments. For more information, see [Removed or deprecated platform features](#).

- Request that Microsoft Power BI Embedded be activated in a sandbox environment, Standard Acceptance Test environment, or production environment if you receive the following message: "Power BI embedded isn't enabled. Please contact your system administrator."

### Commonly denied service requests

Here are some typical examples of service requests that will be denied:

- You submit a request of the **Other request** type for one of the following actions, but you should have submitted a support ticket instead:
  - You want to activate a new subscription estimate after you're live in production or after you've requested a production environment.
  - You want to reset the Financial reporting data mart in a release that is earlier than Microsoft Dynamics 365 for Finance and Operations Financial reporting release 7.2.6.0.
  - You want to restore a production database after go-live.
  - You encountered an issue after the DSE team did an application upgrade.
- You submit a request of the **Other request** type for an action that you should have requested through a different request type. Examples include a database refresh in a non-production environment.
- You submit a request of the **Other request** type for an action that you should perform yourself. Examples include a database upgrade in a development environment.

## Service request types and SLAs

SERVICE REQUEST TYPE	APPLICABLE ENVIRONMENTS	REQUESTED SERVICE	LEAD TIME	DOWNTIME
----------------------	-------------------------	-------------------	-----------	----------

SERVICE REQUEST TYPE	APPLICABLE ENVIRONMENTS	REQUESTED SERVICE	LEAD TIME	DOWNTIME
Environment deployment	Any	Environment deployment	Service level agreement (SLA): within two business days	
Package application	Production	Deployable package application	Five hours	Five hours
Sandbox point-in-time restore	Any Tier 2 or higher sandbox	Database point-in-time restore	Five hours	Four hours
Production point-in-time restore	Production	Database point-in-time restore	Based on data volume	Based on data volume
Sandbox to Production	Tier 2 or higher sandbox to Production	Sandbox to Production	Five hours	Four hours
Other	Production	Maintenance mode	Five hours	Not applicable, because the customer indicates in the service request when the environment should be taken out of maintenance mode again
	Production	IP safe list rules	Five hours	Two hours
	Production	Power BI Embedded	Five hours	Two hours

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Subscriptions, LCS projects, and Azure Active Directory tenants FAQ

2/18/2021 • 3 minutes to read • [Edit Online](#)

When customers subscribe through a Microsoft Volume Licensing agreement or a Microsoft Cloud Solution Provider (CSP) agreement, they usually have one Microsoft Azure Active Directory (Azure AD) tenant, one Microsoft Dynamics Lifecycle Services (LCS) Implementation project and any number of sandbox environments that are deployed to one data center of the customer's choice, and one production environment. For more information about these core concepts, see [Finance and Operations application architecture](#). Although this setup works well for most projects, more advanced scenarios are sometimes required, or changes during the implementation lifecycle must be accommodated.

This topic provides answers to frequently asked questions about subscriptions and licenses, Azure AD tenants, and LCS Implementation projects.

For more information, see the following topics:

- [Move environments between data centers](#)
- [Move licenses between agreement types](#)
- [Move LCS implementation projects to different Azure AD tenants](#)
- [Multiple LCS projects and production environments on one Azure AD tenant](#)

## Do I have to move Azure AD tenants when I move from a CSP agreement to a Volume Licensing agreement?

No. You can keep the existing Azure AD tenant, but you must make sure that the Volume Licensing subscriptions are purchased against the same Azure AD tenant as the CSP subscriptions.

## Do I get a new LCS Implementation project when I move from a CSP agreement to a Volume Licensing agreement?

No. The LCS project remains the same.

## Can I keep the existing LCS Implementation project when I move to different Azure AD tenant?

No. A new LCS project will be created.

## How long does it take to move from a CSP agreement to a Volume Licensing agreement?

For a Volume Licensing purchase, it can take a few days for the order to be processed and the subscriptions to be activated. Redeployment of add-on environments has a service level agreement (SLA) of two business days. It takes a few hours to deallocate and delete old add-on environments.

## What if I forget to delete the existing environments before I suspend the existing subscription?

If you don't deallocate and delete the existing environments before you suspend the subscriptions, the environments will remain in a **Deployed** state. However, if you try to access the full details of these environments, you will receive an error message.

## Can I have a CSP agreement and a Volume Licensing agreement in parallel?

Yes. However, you must maintain the minimum required number of licenses under each program.

## How can I find the Tenant name and Tenant ID within LCS?

1. Go to project home page in LCS.
2. In the **Environments** section, select **Subscriptions available**.
3. On the **Subscriptions available** page, you will find the **Tenant name** and the **Tenant ID**.

## How can I find the subscription status?

1. Go to the project home page in LCS.
2. In the **Environments** section, select **Subscriptions available**.
3. On the **Subscriptions available** page, you'll find all **Service plans** available to the tenant.
4. The **Assigned date** indicates the date that service plan status was changed.

## How would the subscription status impact the environment?

Some of the environment's operations may be impacted by the subscription status:

- **Active** - Your subscription is in an operative state. You should be able to perform all environment operations.
- **In Grace Period** - Your subscription has expired, but is within the grace period. You should renew your subscription soon. The subscription status won't impact your license quantity, ability to deploy a new environment, or to perform environment operations.
- **Suspended** - Your subscription has expired beyond the grace period. This subscription status may reduce the license quantity, impact your ability to deploy a new environment, or impact your ability to perform environment operations.
- **Deleted** - Your subscription has been deleted. This will impact your ability to deploy a new environment or perform environment operations.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Move environments between data centers

2/18/2021 • 3 minutes to read • [Edit Online](#)

Occasionally, you must move environments that are managed by Microsoft to a different Microsoft Azure data center. Here are some scenarios where this move might be required:

- The data center that you planned to use wasn't available when the environments were originally deployed.
- The project creators didn't do enough research to determine the best data center before the environments were originally deployed.
- The customer moves the physical location of its operations, and the wide area network (WAN) connection is now closer to a data center that provides lower latency.

Microsoft asks that you keep all your environments in the same data center. When you move environments to a different data center, you should plan to eventually have all environments deployed in the same data center.

You can verify the data center that an environment is deployed to on the **Manage environments** page in Microsoft Dynamics Lifecycle Services (LCS).

To change the data center, you must redeploy all environments. The process differs for sandbox environments (sandbox standard acceptance test environments, and sandbox develop and test environments) and production environments.

## Move sandbox environments

Because this move is a self-service action, the partner and/or customer must move the existing sandbox environments without Microsoft involvement. Although this action requires little effort on the part of the partner or customer resources, completion of the end-to-end process might require a few days. To streamline the data movement between environments, you should develop a plan to determine the best sequence before you begin the move.

### Save data

Before you begin the move, you must save your data.

- **Tier 1 environment database that is based on Microsoft SQL Server:** Make a backup of the database.
- **Tier 2 and higher environments that are based on Azure SQL Database:** Choose one of the following options:
  - **Option 1:** Review the processes that are listed in the [Database movement operations home page](#) topic.
  - **Option 2:** If you have an Azure subscription, save a copy of the Azure SQL database under that subscription.
  - **Option 3:** If you have multiple Azure SQL database environments, redeploy one environment, leave the remaining environments in the old data center, and then request a database refresh between the environments.
  - **Option 4:** Save data as data packages, and then import the packages after the redeployment is completed.

### Move the environments

After you've saved your data, follow these steps.

1. Verify that all code packages have been uploaded to the Asset library in LCS.
2. For each environment, follow these steps:
  - a. In LCS, select **Full details**.
  - b. Stop the environment, and then, when the environment has stopped, select **Deallocate**.
  - c. After the deallocation is completed, select **Delete**.
  - d. After the environment is deleted, select **Configure** to redeploy the environment.
  - e. In the **Geography/location** field, select the data center to use.
  - f. After the environment is deployed, apply the code packages.
  - g. If the redeployed environment is used as the build environment, complete the required configurations that are described in [Deploy and use an environment that supports continuous build and test automation](#).
  - h. Restore the data.

#### NOTE

- The movement of files that are stored in Azure Blob Storage isn't supported in sandbox environments.
- Commerce customers should be aware that extra steps are required for components to work correctly after a move. For more information, see [Data management overview](#).

## Move production environments

If you already have a production environment deployed, you must open a Support request to move the production environment to another data center after you've finished moving all the sandbox environments. This scenario is rare, and there is no automated/self-service action to complete the move. In this scenario, files that are stored in Azure Blob Storage will also be moved. For information about the maintenance window and downtime that are required in order to move a production environment to a different data center, see [Service Description](#) and the related service-level agreement (SLA) documents.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Move licenses between agreement types

2/18/2021 • 3 minutes to read • [Edit Online](#)

Sometimes, a customer who originally purchased subscriptions through a Microsoft Cloud Service Provider (CSP) agreement decides to change to a Microsoft Volume Licensing agreement with Microsoft after the Microsoft Dynamics Lifecycle Services (LCS) Implementation project has been created. The customer can make this change even after the project has gone live in production.

Less often, a customer who originally purchased the subscriptions through a Volume Licensing agreement with Microsoft decides to change to a CSP agreement. In this case, the change must align with the renewal date of the Volume Licensing agreement.

The process of moving subscriptions from one type of agreement to another is primarily a commercial process. The technical implications for the LCS Implementation project are minimal.

## NOTE

The movement of subscriptions between agreement types isn't the same as the movement of an Azure Active Directory (Azure AD) tenant. If the contractual changes in the agreements require that an Azure AD tenant be moved, you must also follow the process that is described in [Move LCS implementation projects to different Azure AD tenants](#).

Subscriptions come with two standard environments: a production environment and a Tier-2 Standard Acceptance Test environment. These environments aren't affected by the movement of subscriptions between agreement types. Action might be required in LCS only if the customer has additional add-on environments. In this case, action that is related to the add-on environments requires minimal effort on the part of partner or customer resources. To streamline the movement of data between environments, you should plan in advance to determine the best sequence.

## The customer has only default environments

If the customer has only the two standard environments that come with the Microsoft-managed subscription, and didn't purchase any add-on environments through the original CSP agreement or Volume Licensing agreement, the activities that are required are purely commercial.

1. The customer places the order for subscriptions under the new agreement with the Volume Licensing reseller or the CSP.

## IMPORTANT

Make sure that the subscriptions are purchased against the same Azure AD tenant that is used on the original agreement.

2. The customer activates the subscriptions.
3. In Microsoft 365 Admin center, the customer verifies that both the new and subscriptions and the existing subscriptions are active.
4. When the new subscriptions are active, the customer requests that the Volume Licensing reseller or the CSP suspend the existing subscriptions. Typically, there is an overlap to help guarantee continuity and avoid disruption of service.

# The customer has add-on environments

If the customer purchased add-on environments through the original CSP agreement or Volume Licensing agreement, those environments should be redeployed.

## Prerequisites

Before you begin the move, you must complete the following tasks:

- Save the data from your existing environments. Follow one of the options described in [Database movement operations home page](#).
- Verify that all code packages have been uploaded to the Shared asset library in LCS.

## Commercial activities

1. The customer places the order for the subscriptions under the new agreement with the Volume Licensing reseller or the CSP. These subscriptions include the subscriptions for the add-on environments.

### IMPORTANT

Make sure that the subscriptions are purchased against the existing Azure AD tenant.

2. The customer activates the subscriptions.
3. In Microsoft 365 Admin center, the customer verifies that both the new subscriptions and the existing subscriptions are active.

## Deploy new environments

1. When the new subscriptions are active, additional add-on environments that you can configure appear in LCS. Deploy the add-on environments, and configure them as appropriate.
2. Apply the deployable packages, and restore the data.

## Delete environments under the obsolete agreement

Follow these steps for every environment that was deployed under the old agreement. After you've deleted the environments, don't use or redeploy them again.

1. In LCS, on the **Environment details** page, select **Full details**.
2. Stop the environment, and when the environment has stopped, select **Deallocate**.
3. When the deallocation is completed, select **Delete**.
4. When the environment has been deleted, select **Configure**.

## Update environments

1. The Volume Licensing reseller or the CSP suspends the existing subscriptions.
2. Any original add-on environments no longer appear in LCS.

### NOTE

Until physical redeployment of the add-on environments is completed, both existing subscriptions and new subscriptions must be kept in an active state.

- The movement of files that are stored in Azure Blob storage isn't supported in sandbox environments.
- Commerce customers should be aware that extra steps are required in order for components to work correctly after the move. For more information, see [Data management overview](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Move LCS implementation projects to different Azure AD tenants

2/18/2021 • 10 minutes to read • [Edit Online](#)

You can move your subscriptions and your Microsoft Dynamics Lifecycle Services (LCS) Implementation project to a different Microsoft Azure Active Directory (Azure AD) tenant. Here are some scenarios where this move might be required:

- Subscriptions were accidentally purchased against the incorrect Azure AD tenant.

## NOTE

If you're a cloud service provider, and you sell subscriptions for Finance and Operations apps to an existing customer, you must request a reseller relationship with that customer to put the subscriptions on the customer's existing Azure AD tenant. If you create a new customer record for the customer in Microsoft Partner Center, you create a new Azure AD tenant for the customer.

- The customer changes the structure of the Azure AD tenant after the subscription is purchased.

The process for moving your subscriptions and all related artifacts has four main steps, as shown in the following illustration.

## Activate subscriptions on the new tenant

Work with your cloud service provider or volume license reseller to activate the subscriptions against the new Azure AD tenant. All subscriptions for users, and for add-on environments, must be activated.

### Cloud service provider

If you're licensed through a Microsoft Cloud Solution Provider (CSP) agreement, purchase the required subscriptions against the new tenant from your cloud service provider. If the new tenant already exists, the cloud service provider must request a reseller relationship. Alternatively, in Partner Center, the cloud service provider must create a new customer that has the desired default domain name, \*.onmicrosoft.com (for example, contoso.onmicrosoft.com).

Ask the cloud service provider not to suspend the existing subscriptions at this time.

### Volume Licensing

If you're licensed through a Microsoft Volume Licensing agreement, you must call the [Volume Licensing support center](#) and ask that the subscriptions be remapped from the old tenant to the new tenant. You can contact Volume Licensing Support through Microsoft 365 Admin center. Request a grace period, when the subscriptions will be active on both tenants. Because of customer privacy concerns, this request must be made by the customer. You should have the following information available:

- Public customer number.
- Enrollment number.
- The current tenant domain that the subscriptions are currently provisioned on.
- The destination tenant domain that the customer wants the subscriptions provisioned under.
- A detailed explanation of why the customer must have its Volume Licensing subscriptions migrated to a different tenant.
- The total number of paid subscriptions that must be moved to the new tenant, together with the subscription type and seat count.

#### IMPORTANT

It's crucial that the subscriptions be active on both tenants in parallel for a few weeks, until you've finished decommissioning LCS on the old tenant.

## Configure LCS on the new tenant

On the new tenant, you will get a new LCS project that you must initiate and set up.

1. Complete the Project Onboarding wizard. For more information, see [LCS project onboarding](#). When completing the wizard, you must indicate on the **Project Overview** page that you are **Moving existing LCS project from another tenant** and provide the source LCS project ID.
2. Fully configure LCS. As part of this configuration, you must:
  - a. Upload and activate a subscription estimator. If you are already live in the source LCS project, you need to ensure that the estimates match.
  - b. Add your deployable package to the asset library.
  - c. Update your Business process modeler (BPM) library.

#### IMPORTANT

During this period, you will have two parallel LCS projects. You can verify the name and ID of the Azure AD tenant that is associated with an LCS project on the [Subscriptions available](#) page in LCS.

## Move your sandbox environments to the new tenant

1. Deploy the non-production environments in the new LCS project.
2. Apply the required code packages to the environments. Make sure that the target is running the same application version as the source. We recommend using [All-in-one deployable packages](#) and include any ISV licenses, if applicable.
3. Upload data to the environments. You can move the data through data packages or by restoring the database. If you restore the database, additional steps are required in order to remap some properties to the new tenant.
4. Update your user information.
  - a. Remove all user accounts except the admin user.
  - b. Fix the admin user record in USERINFO.

```
UPDATE USERINFO
SET SID='mysid', NETWORKALIAS='myalias/email', NETWORKDOMAIN='https://sts.windows.net'
WHERE ID = 'Admin'
...
```

5. Re-import all other users that have the correct security identifier (SID) and identity provider.
6. Run the following commands to update the tenant ID in the appropriate tables. You can verify the Azure AD tenant ID that is associated with an LCS project on the **Subscriptions available** page in LCS.

```
Update POWERBICONFIG set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update PROVISIONINGMESSAGETABLE set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update B2BINVITATIONCONFIG set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update RETAILSHAREDPARAMETERS set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
```

7. Fully configure the environments. As part of this step, configure the integration endpoints.
8. Perform smoke tests on the user acceptance testing (UAT) environment in the new LCS project. These tests should focus on user sign-in, integrations, workflows, printing, reporting, and similar processes that depend on configuration and user information.

Depending on your solution and scope, you might have to perform additional steps on the new Azure AD tenant. These steps might include registering applications (for recurring integrations and warehouse management), adding domains, and setting up directory synchronization to enable single sign-on (SSO).

Note that calls to web services are allowed only from the **home** tenant for the environment. For example, the original tenant was `companya.com`, and integration ran as `services\@companya.com`. In this case, when you switch tenants to `companyb.com`, you can no longer use `services\@companya.com` for web service calls, even if you update `userInfo.networkdomain` to `https://sts.windows.net/companyb.com`.

#### IMPORTANT

On your sandbox environments, you will lose any document handling attachments that are stored in Azure Blob storage. Blob storage will be moved by Microsoft only for production environments.

## Move your production environment to the new tenant

If you do not have a production environment deployed already on the old tenant, you can skip this section.

If you already had a production environment deployed on the old tenant, Microsoft will move your database and Azure Blob storage from your old production environment to the new one. As a pre-requisite, you must complete the additional steps below after you've finished moving all the sandbox environments and completed UAT. The process of moving a production environment to a new tenant requires a downtime.

Before requesting the production environment, ensure that all pre-requisites are completed:

1. Get all required licenses that are needed to correctly license all users on the production environment.
2. When the licenses are in place, upload a subscription estimator to the new LCS project. It should match the subscription estimator that is active in the source LCS project, and it must correctly reflect peak transaction volumes.
3. Send an email to Dynamics 365 FO Go-Live ([d365fogl@microsoft.com](mailto:d365fogl@microsoft.com)) stating that your new LCS project is ready for Microsoft to move your production database and Azure Blob Storage. To ensure that the process will run smoothly, provide the following details in the email. We suggest that copy the following list to your email, and then answer all of the information line by line.

## Lifecycle Services

- Provide the LCS IDs (number in the LCS project URL) for source and target LCS project.
- Confirm that the go-live date is set correctly in the target LCS project.
- Confirm that the update schedules are set in the target LCS project (**LCS > Menu > Project settings > Update settings**).
- Confirm if you are using Azure Blob Storage for document attachments.
- Confirm that your project is identified as a tenant move in the Project Onboarding wizard.

## Testing

- Confirm that the smoke testing is completed on the sandbox environment (Tier-2 or higher) in the target LCS project.

## Code Management

- Confirm that your deployable package is marked as a release candidate in the target LCS project.
- List the ISV solutions you are using.
- Confirm which version your old production environment is running on.
- Confirm that non-standard code to be applied in the new production environment will be exactly the same as the non-standard code present in the old production environment in order to prevent database copy issues.
- Confirm if there were any non-typical actions taken on your old production environment which need to be considered on the new production environment, like installation of a custom font or environment upscale.

## Environment

- Share which environment version you plan to deploy your new production environment.
  - Describe how you will conduct your cut over.
  - Confirm the dates when the source LCS environments and project will be deallocated and deleted.
4. The Dynamics 365 FO Go-Live team will reply to you within 2 business days and a FastTrack Solution Architect will work with you on the assessment of the project readiness for production deployment.
  5. When the tenant move assessment is successfully completed, the FastTrack Solution Architect will approve your production request for deployment.
  6. Create the production deployment request on the new LCS project.
    - It is not possible to select the same name for the new production environment, as it is in use for your old production environment. You will need to choose a new environment name so that a new URL will be generated.
    - Make sure you select the same application version that is used by your current production environment.
    - In the Production configuration wizard, select a generic user account, not a named user, as Environment Administrator.
  7. After the production environment has been deployed, verify that source and target environments have exactly the same code, otherwise migration will fail. If necessary, deployable packages must be installed on the target production environment.
  8. Request to copy database and blob storage from the old production environment to the new production environment.
    - **Cloud deployment to self-service deployment:** [Submit a service request](#) of type **Other** to request that the Microsoft Service Engineering team copy the database and blob storage, if applicable, from the old production environment to the new production environment. Be sure to include LCS IDs and environment IDs from source and target projects in the service request.

- **Both projects (old and new) are self-service deployments:** Submit a **support ticket** requesting a copy of the database and blob storage, if applicable, from the old production environment to the new production environment. Be sure to include LCS IDs and environment IDs from source and target projects in the support ticket.
  - a. This process will require interaction between Microsoft and the implementing project team. Ensure that you follow the email notifications or notifications directly in the service request.
  - b. After Microsoft has completed the activity and provided you with updated information, you will need to validate the new production environment.
  - c. If you encounter an issue after the migration, file a support ticket.

## Tear down the LCS project on the old tenant

After the new LCS project on the new Azure AD tenant is fully functional, you must stop, deallocate, and delete the environments on the old LCS project. When you've finished, the **Configure** button becomes available for each environment. If you already had a production environment on the old tenant, you must file a support ticket to have it deleted.

You should save any remaining artifacts from the Asset library that you might require later.

After all environments have been deleted and all artifacts saved, an Organization Administrator on the old tenant must delete the LCS project. Microsoft reserves the right to disable the customer's account and delete the customer data after the service has been suspended for an extended period.

## Suspend subscriptions on the old tenant

After all the environments have been deleted, and you've saved the LCS artifacts that you require, work with your cloud service provider or Volume Licensing Support to suspend all the licenses on the old Azure AD tenant.

- **Cloud service provider** - Suspend the existing subscriptions against the old tenant.
- **Volume Licensing Support** - Call Volume Licensing Support to confirm that you've completed the work and that the subscriptions can now be suspended against the old tenant.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Move LCS implementation projects from on-premises to the cloud

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how to move your Microsoft Dynamics 365 Finance + Operations (on-premises) environments that are hosted on your own infrastructure to the Azure cloud.

## Cloud subscription licenses

If you don't already have cloud subscription licenses, work with your cloud service provider or volume license reseller to get and activate the required subscriptions on your Azure Active Directory (Azure AD) tenant. All subscriptions for users and add-on environments must be activated.

## Configure LCS cloud implementation project

If no Finance and Operations cloud-named user subscription licenses have previously been activated on the Azure AD tenant, a new Microsoft Dynamics Lifecycle Services (LCS) cloud implementation project is automatically provisioned. Otherwise, you must open a support request to have an LCS cloud implementation project created. For more information, see [Multiple LCS projects and production environments on one Azure AD tenant](#).

After your LCS cloud implementation project has been created, you must fully configure it. As part of this configuration, you must add users, an Azure DevOps association, and subscription estimates, fill in the Asset library and Business process modeler (BPM), and more.

### NOTE

While you're onboarding your project, you must select **AX 2012 Upgrade** as the source system, so that a singleton Azure SQL database will be used for your sandbox instead of an elastic pool. Eventually, a more appropriate option will be available, such as **On-premises Finance and Operations**.

## Complete development and testing of updated integrations

You will probably have to make some changes to the integration design patterns that you used for interfaces with your Finance + Operations (on-premises) environment. These changes can be substantial, and a detailed discussion of them is beyond the scope of this topic. Nevertheless, you must evaluate all your interfaces and make the appropriate changes to them.

You should consider developing your updated interfaces in such a way that they can coexist in the same code base as the original interfaces. This approach will simplify code lifecycle management during the period of your transition from on-premises to cloud. If this approach isn't possible, you must manage a new development branch through your cloud go-live. To simplify management of this new branch during the transition period, we recommend that you freeze other code changes as much as you can. Additionally, in your detailed cut-over plan, you should carefully document the steps for inactivating your old interfaces and activating the new interfaces.

## Do a trial migration and resolve issues

1. Deploy a tier-2 environment.

2. Apply the same code package that is applied in your on-premises production environment (or, as appropriate, in the current build from the cloud integration development branch that was discussed in the previous section). This code package should be a single, complete deployable package that includes any independent software vendor (ISV) solutions and licenses.
3. In SQL Server Management Studio (SSMS), run the following Transact-SQL (T-SQL) commands against the sandbox database to preserve the current Admin account, Azure AD tenant ID information, and Data management framework (DMF) shared working directory in that database. Save the results.

```
SELECT SID,NETWORKKALIAS,NETWORKDOMAIN,IDENTITYPROVIDER from USERINFO WHERE ID = 'Admin'  
SELECT VALUE from SYSSERVICECONFIGURATIONSETTING where name = 'TENANTID'  
SELECT TENANTID from POWERBICONFIG  
SELECT TENANTID from PROVISIONINGMESSAGETABLE  
SELECT TENANTID from B2BINVITATIONCONFIG  
SELECT TENANTID from RETAILSHAREDPARAMETER  
SELECT SHARED_FOLDERPATH from DMFPARAMETERS
```

4. Copy the database from on-premises to online. The export and import process that you use is the same process that is described in the [Golden configuration promotion](#) database movement tutorial. However, in this case, the source database is the existing on-premises production SQL database, and you must use the sqlpackage.exe approach that is described for importing into a developer environment. If you use the LCS self-service database import option instead, some data won't be imported, as noted in the warnings about data elements that are cleaned up. The target database information that is available in the LCS environment details must be used instead of the placeholders that are shown in the following code.

```
SqlPackage.exe /a:import /sf:D:\BacpacToImport\my.bacpac /tsn:<Azure SQL database server> /tdn:  
<target database name> /tu:<axdbadmin user from LCS> /tp:<axdbadmin password from LCS>  
/p:CommandTimeout=1200
```

5. Restore the Admin account, Azure AD tenant ID, and DMF shared directory values. Also remove the SF schema and its tables, if they are present.

```
UPDATE USERINFO SET SID='<preserved SID>', NETWORKKALIAS='<preserved NETWORKKALIAS>',  
NETWORKDOMAIN='<preserved NETWORKDOMAIN>', IDENTITYPROVIDER='<preserved IDENTITYPROVIDER>' WHERE ID =  
'Admin'  
UPDATE SYSSERVICECONFIGURATIONSETTING set VALUE='<preserved VALUE>' where name = 'TENANTID'  
UPDATE POWERBICONFIG SET TENANTID='<preserved TENANTID>'  
UPDATE PROVISIONINGMESSAGETABLE SET TENANTID='<preserved TENANTID>'  
UPDATE B2BINVITATIONCONFIG SET TENANTID='<preserved TENANTID>'  
UPDATE RETAILSHAREDPARAMETER SET TENANTID='<preserved TENANTID>'  
UPDATE DMFPARAMETERS SET SHARED_FOLDERPATH='<preserved SHARED_FOLDERPATH>'  
DROP TABLE IF EXISTS SYNCLOG  
DROP TABLE IF EXISTS SYNCLOCK  
DROP SCHEMA IF EXISTS SF
```

6. Reimport all other users, and assign the appropriate security roles.
7. Direct printing in a cloud environment is done via the Document Routing Agent (DRA). Set up sandbox DRAs as described in [Install the Document Routing Agent to enable network printing](#), so that regression testing can include your printing scenarios.
8. Copy document handling attachments to the cloud. Document handling attachments aren't stored in the database. If they must be preserved, you must move them separately. For instructions, see the [Migrate document handling attachments to your sandbox](#) section later in this topic.
9. Run a complete regression test cycle. This cycle should include testing of integrations.

10. Resolve any issues that are discovered during testing. For each issue, document and keep track of the correcting adjustments that you make in the sandbox, and repeat them in the on-premises source. If any change must not be made in the on-premises environment, because it's incompatible with the correct functioning of that environment, we recommend that you create a DMF data package for it instead of manually applying it for each iteration of the migration process.
11. Repeat steps 2 through 10 until all tests have been passed, and no further changes are being made to code or the configuration.

## Repeat the migration to production

1. Deploy the new production environment. Note that the regular prerequisites apply. For example, you must have an active subscription estimator, complete the LCS methodology phases before the operate phase, and complete the FastTrack readiness review. For more information, see [Prepare for go-live](#).
2. Apply the final version of the software deployable package to production.
3. Stop making data changes to the on-premises production environment.
4. Repeat steps 3 through 6 in the [Do a trial migration and resolve issues](#) section to copy the final/up-to-date on-premises production database to the cloud sandbox.
5. Repeat step 8 in the [Do a trial migration and resolve issues](#) section to copy the final/up-to-date document handling attachments to the cloud sandbox.
6. Request a database refresh from sandbox to production. (The process is the same as the process that is used to promote a golden configuration database to production.)
7. Open a support request to have Dynamics Support Engineering copy the document handling attachments from the sandbox storage account to the production storage account and update the references in the production database's DocuValue and DocuDeletedValue tables. After the request has been completed, validate that the attachments are available for a sample of document handling records.
8. Set up DRAs for production. If you're reusing any of the DRAs that were previously installed as part of your trial migration, remember to update their configuration so that they connect to the production URL instead of the sandbox URL.
9. Reconcile your cloud and on-premises production environments, as detailed in your cut-over plan.
10. Obtain sign-off for the go-live.
11. Activate cloud production interfaces, batch jobs, and so on.
12. Start to transact in your cloud production environment.

## Migrate document handling attachments to your sandbox

Document handling attachments for Finance + Operations (on-premises) environments are stored in a file share. However, the cloud version doesn't support this file share. You can use the following procedure to copy the attachments to the Azure storage account for your sandbox environment and update the corresponding metadata in the database. For subsequent promotion to production, you can request that Dynamics Support Engineering copy the attachments from your sandbox to production.

1. Upload a copy of the document handling attachment files from the on-premises production file share to a temporary folder on one of the sandbox instances of Application Object Server (AOS). For example, you can upload a zip file of the attachments and unpack it on the target. If you don't have remote desktop access (for example, for a self-service environment), you can use a different virtual machine (VM) instead. For reasonable conversion performance, this VM should be in the same Azure datacenter as the target sandbox. If you aren't using the AOS instance, you must add the VM to an allow list for access to the sandbox's SQL database instance.
2. Open a support request to get the name of the sandbox Azure storage account and a time-limited shared access signature token for the documents container. Update the corresponding placeholders in the Windows PowerShell script that is run in the next step. Also update the placeholders for your temporary

folder, and for your Finance and Operations transactional database, by using the environment details in LCS.

3. Run the following Windows PowerShell script on the sandbox AOS instance or other VM to upload the document handling files to the storage account and create the required metadata for each file.

```
#Upload F&O on-prem document handling attachments to Azure storage account
#
$filePath = "<TEMP_ATTACHMENTS_FOLDER_PATH>"
$dbHostName = "<DATABASE_SERVER>.database.windows.net"
$dbName = "<DATABASE_NAME>"
$dbUsername = "<DATABASE_USER>"
$dbPassword = "<DATABASE_PASSWORD>"
$storageAccountName = "<STORAGE_ACCOUNT_NAME>"
$sasToken = "<SAS_TOKEN>"

[Reflection.Assembly]::LoadWithPartialName("System.Security.Cryptography") #Load crypto
$cryptoObj = [System.Security.Cryptography.SHA256]::Create()
$storageContext = New-AzStorageContext -StorageAccountName $storageAccountName -SasToken $sasToken
foreach ($file in Get-ChildItem $filePath)
{
    try
    {
        $blob = (Set-AzStorageBlobContent -Context $storageContext -Container documents -File
$file.FullName -Blob "$($file.Name)" -Force).ICloudBlob
    }
    catch
    {
        Write-Host "Could not upload $($file.Fullname) to blob"
        Write-Host $_
    }
    if($blob)
    {
        #Write-Host "Processing $($file.Fullname)..."
        #FileHash:
        $fileBytes = [System.IO.File]::ReadAllBytes($file.FullName)
        $hashBytes = $cryptoObj.ComputeHash($fileBytes)
        $encodedHash = [System.Convert]::ToBase64String($hashBytes)
        #FullFileName:
        $origFileName = (Invoke-Sqlcmd -Query "SELECT ORIGINALFILENAME FROM DOCUVALUE WHERE FILEID =
'$($file.Name)'" -ServerInstance $dbHostName -Database $dbName -Username $dbUsername -Password
$dbPassword).ORIGINALFILENAME
        if ($origFileName.Length -eq 0)
        {
            $origFileName = (Invoke-Sqlcmd -Query "SELECT ORIGINALFILENAME FROM DOCUDELETEDVALUE
WHERE FILEID = '$($file.Name)'" -ServerInstance $dbHostName -Database $dbName -Username $dbUsername -
Password $dbPassword).ORIGINALFILENAME
        }
        if ($origFileName.Length -eq 0)
        {
            Write-Host "Missing DOCUVALUE $($file.Name)"
        }
        else
        {
            $nameBytes = [System.Text.Encoding]::UTF8.GetBytes($origFileName)
            $encodedName = [System.Convert]::ToBase64String($nameBytes)
            #Write-Host "Base64 encoded original filename $encodedName."
            $blob.Metadata["FileHash"] = $encodedHash
            $blob.Metadata["FileSize"] = $file.Length
            $blob.Metadata["FullFileName"] = $encodedName
            $blob.SetMetadata()
            Write-Host "Uploaded $($file.Fullname)"
        }
    }
}
}
```

4. In SSMS, run the following T-SQL commands to update the DocuValue and DocuDeletedValue records so that they reference the target storage location.

```
update DOCUVALUE
set ACCESSINFORMATION = replace(ACCESSINFORMATION, 'file://<SOURCE_PREFIX>/documents/',
'https://<STORAGE_ACCOUNT>.blob.core.windows.net/documents/'), STORAGEPROVIDERID = 1
where STORAGEPROVIDERID = 4 --4 for LBD filesystem, 1 for Azure blob
and ACCESSINFORMATION like 'file://<SOURCE_PREFIX>/documents/%'

update DOCUDELETEDVALUE
set ACCESSINFORMATION = replace(ACCESSINFORMATION, 'file://<SOURCE_PREFIX>/documents/',
'https://<STORAGE_ACCOUNT>.blob.core.windows.net/documents/'), STORAGEPROVIDERID = 1
where STORAGEPROVIDERID = 4 --4 for LBD filesystem, 1 for Azure blob
and ACCESSINFORMATION like 'file://<SOURCE_PREFIX>/documents/%'
```

5. Test a sample of the document handling attachments to make sure that they can now be accessed in the sandbox environment.

# Multiple LCS projects and environments on one Azure AD tenant

2/18/2021 • 4 minutes to read • [Edit Online](#)

For any new cloud project, one Microsoft Dynamics Lifecycle Services (LCS) Implementation project is instantiated on a Microsoft Azure Active Directory (Azure AD) tenant that provides access to one production instance. In rare cases, to handle the requirements of a specific implementation, you might require multiple production instances that run in parallel. By creating multiple LCS projects against the same Azure AD tenant, you can have multiple production instances. Here are the most common scenarios where multiple production instances might be required:

- A global implementation's requirements for data residency, latency, or data volume can't be met by one instance.
- Different business units in an organization are implementing the product separately as independent applications.

Manual intervention by the Microsoft Dynamics Service Engineering (DSE) team is required in order to create additional LCS projects on a shared Azure AD tenant. This approach should be used only if a single-instance strategy truly isn't feasible. Before additional LCS projects can be created, customers must provide the business justification and confirm that they understand all the implications of the approach. This process should be started as early in the implementation lifecycle as possible. Customers who decide to proceed should inform the FastTrack solution architect who is assigned to their project that they require additional LCS projects. If no solution architect is assigned to their project, customers should open a support ticket.

## Licensing requirements

Every LCS Implementation project that runs on the same Azure AD tenant must satisfy the minimum licensing requirements. For example, if there are three LCS Implementation projects on the same Azure AD tenant, a customer must purchase no less than three times the minimum number of subscription licenses. Currently, the minimum license requirement is 20 full user licenses. Therefore, to run three LCS Implementation projects on the same Azure AD tenant, the customer must purchase at least 60 licenses.

Because the licenses are associated with the Azure AD tenant, the **Subscriptions available** page for every LCS project will show the total number of licenses, even though a given LCS project can use only the portion of licenses that has been allocated to it. This allocation of license to LCS projects must be documented outside the system.

Users who access multiple environments in parallel must be licensed separately for each environment. A user can only be assigned one license for each product for each Azure AD tenant. This allocation of licensing requirements for LCS projects for specific users must be documented outside the system. For additional information about licensing, download the [Licensing guide](#).

## Disadvantages of multiple LCS projects

There are some disadvantages to having multiple LCS projects. Here are some of them:

- Master data isn't shared.
- Intercompany transactions aren't supported.
- Integrations must be configured in each LCS project.
- Each LCS project requires a separate Bring your own database (BYOD) instance

- User acceptance testing (UAT) must be done on each instance, even if the code is the same. UAT is required on each instance, because differences can occur across the LCS projects, even if they share a code base. One source of differences can be the integration setup and BYOD configuration that must be done separately in each LCS project and therefore must be tested in each LCS project. Additionally, there might be data variations, different application configurations per region might affect functionality, and different data centers might support a different set of Azure services.
- Microsoft Azure DevOps must be configured in each LCS project. When customizations and code are shared, it makes sense to use the same Azure DevOps project.

## Advantages of multiple LCS projects

There are also advantages to having multiple LCS projects. Here are some of them:

- Data centers can be selected per LCS project to provide the best latency experience.
- Data centers can be selected per LCS project to satisfy statutory requirements for data residency.
- There is more flexibility to schedule servicing operations, such as code deployments and upgrades.

## Requesting multiple LCS projects on the same Azure AD tenant

If your solution requires multiple LCS projects on the same Azure AD tenant, all LCS projects except the original project must be provisioned on demand by the DSE team. You should inform the DSE team about this requirement as early as possible, ideally when the project is being onboarded. For more information, see [Onboard an implementation project](#). To request additional LCS Implementation projects, the customer must create a support request by using the Support portal in LCS. In this request, the customer must provide the following information:

- The business justification.
- The enterprise and project structure. This information includes the following details:
  - The name of the Implementation project
  - The breakdown of licenses per LCS project
- Confirmation that the customer understands the implications of multiple LCS projects on the same Azure AD tenant.

## Online deployments in China sovereign cloud

If your implementation includes China deployment/rollout, be informed that Dynamics 365 Finance online deployment became available in Mainland China starting in April 2019. For more information, see [Finance and Operations apps - operated by 21Vianet in China](#). This deployment is designed to comply with regulatory requirements in China and the services include a physically separated instance of a cloud service with a different tenant (Azure Active Directory) that is operated and transacted by 21Vianet.

This is a single organization in multiple clouds with different tenant (Azure Active Directory). The advantages and disadvantages of multi-Lifecycle Services projects or production environments described above are still applicable, but the licensing requirement and requesting procedure are different. Work with your Microsoft Account Executive or your implementation partners for any process assistance.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Implement Commerce projects

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides links to other topics that will help new implementers of Commerce projects with important aspects of the implementation process, so that they can avoid complications. The guidelines that are mentioned are best practices that have been collected during previous implementation projects. Therefore, implementers can focus on the actual feature work and not become bogged down by the procedures.

Some of the information in these topics can also be found on blogs and pages at other locations, such as [Development and administration for Finance and Operations](#) and <https://dynamicsnotes.com>. You can read those blogs and pages separately, or you can read this topic from beginning to end and review the linked documents within the subtopics as you require them during the implementation process.

The information focuses on implementations of Finance and Operations apps that include Commerce functionality.

# Set up new environments, Azure DevOps, and branches for projects

2/18/2021 • 18 minutes to read • [Edit Online](#)

Most environments for Microsoft Dynamics 365 Commerce projects are hosted in the cloud. They are either Microsoft-hosted on a Microsoft subscription or cloud-hosted on a customer subscription. By default, environments are Microsoft-hosted. You can use cloud-hosted environments to provide more control over a development or build environment. For more details, see the [Lifecycle Services \(LCS\) user guide](#).

## Development Tier 1 environments

Development environments are called Tier 1 environments. There are three options for hosting a development environment:

- The Commerce app comes with one Sandbox Tier 1 environment. (For details, see the [Microsoft Dynamics 365, Enterprise edition, Licensing Guide](#).)
- A cloud-hosted environment that you run on your own Microsoft Azure subscription. This type of environment is known as "cloud-hosted" in Microsoft Dynamics Lifecycle Services (LCS).
- A downloaded virtual machine (VM) that you host in a location of your choice.

If your implementation of Commerce includes code extensions, we recommend that you use a development environment where you have administrator privileges. If you don't have administrator privileges in your development environment, you won't be able to install programming tools or configure the operating system.

The hosting model that you choose has a financial impact. You can reduce some of the hosting cost by using a Tier 1 environment as a simple test environment or golden configuration environment. One Tier 1 environment is free with your Dynamics 365 subscription. Although this approach isn't ideal, it should work for most projects.

If you want to extend channel components, see [Prepare the development environment](#) to learn how to configure a development environment so that it's ready for development.

### NOTE

You can shut down cloud-hosted environments at any time. This capability helps reduce the hosting cost.

A hosting alternative is to download a virtual hard disk (VHD) from LCS and host it locally on a server. From a development perspective, VHD images have the same capabilities as a hosted VM. The only difference is that LCS deployments aren't supported on VHDs. However, command-line deployments are supported.

The following table shows the advantages and disadvantages of each hosting model. Use this information to evaluate the model that will work best for your project.

HOSTING MODEL	ADVANTAGES	DISADVANTAGES
---------------	------------	---------------

HOSTING MODEL	ADVANTAGES	DISADVANTAGES
Microsoft-hosted environment (in an LCS project, default or based on an add-on)	Your subscription includes one Tier 1 environment. We recommend that you use this environment as a build environment.  Telemetry data is collected and is available on the LCS diagnostics page.	Users can't perform administrative actions.  Users can't install any tools or certificates.
Cloud-hosted environment (in an LCS project, private subscription)	You have full administrative rights.  You can install tools and certificates.	There is additional cost. You can mitigate this cost by shutting down the environment.
Self-hosted downloaded VM	The experience depends on the host.  The experience can be much faster if the VM runs on a solid-state drive (SSD).	You can't deploy packages from LCS.

Tier 2 and higher machines are multi-box environments for multiple test and verification purposes. Production environments are hands-off, and the size of the environment is determined by the sizing process in LCS.

## Branches, build definitions, and environments

Branching is an important practice in software development. The [Branching and Merging Primer](#) topic describes the advantages of branching:

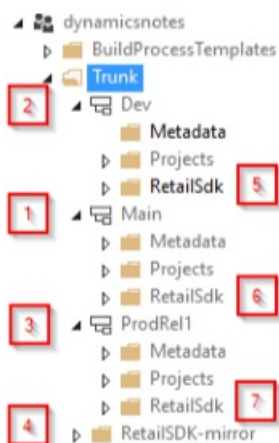

### NOTE

A branching and merging strategy involves a tradeoff between risk and productivity. You trade the safety of working in isolation for the increased productivity of working with other people. The productivity increases come with a cost—the additional effort required for merging software assets sometime in the future.

Using branches provides better isolation and control of individual software assets and increases productivity, because teams or individuals can work in parallel. However, using branches also requires an increase in merge activities and therefore risk, because you must later reassemble branches into a whole.

There is no single best strategy for creating branches. The strategy depends on the project and the size of the implementation.

The following illustration shows three code branches: Dev, Main, and ProdRel1. The numbers indicate the order of setup.

Here is an explanation of the setup. The numbers in brackets refer to the numbers in the preceding illustration:

- The **Dev** branch [2] is used for daily work that isn't ready for testing or might not be stable, but that must be shared with other developers. For larger teams, you might want to have multiple Dev branches for different features or purposes.
- The **Main** branch [1] is for changes that meet a certain quality bar and are ready for testing by other people. This testing might include user acceptance tests, performance tests, integration tests, and sanity tests after hotfixes. Deployable packages for this branch must be created by a build environment. As a best practice, you should not generate X++ packages in a Tier 1 environment and then deploy those packages into an official test or production environment. Otherwise, uncommitted source changes could be included. The correct approach is always to deploy packages that were built on official build environments.
- The **ProdRel1** branch [3] holds all source code exactly as it's deployed in a production environment at any given point. A build environment can be used but isn't required. If packages from the Main branch are deployed to a production environment, the code should be merged (from Main to ProdRel1) after a production deployment. By having a branch for production, you can generate official builds later if you require them.
- All three branches hold both X++ code (extensions and hotfixes in Metadata folders) and a copy of the Retail software development kit (SDK) in **RetailSdk** folders [5, 6, 7]. The Retail SDK includes base Microsoft code and code extensions. This base code and the code extensions can differ in each branch.
- The **RetailSdk-mirror** folder [4] is used to bring in Microsoft changes to the Retail SDK. It isn't used for development or build purposes. It should be updated only when a new version or hotfix is used. For a detailed description of the process, see this [cheat sheet](#).

For small projects, it's acceptable to have only two branches (Main = Dev branch). However, developers must be more disciplined, because any code submissions can immediately affect the quality of test builds.

You can build deployable packages out of multiple branches. In this case, you must have one build definition for each branch that can be built. The initial build definition is automatically created when a build environment is deployed (Main branch). You can make copies of the build for other branches. Note that you must make small additions to incorporate the Commerce code.

The following high-level steps are used to set up an environment so that development work can begin. For details about the numbers in brackets, see the previous illustration and the related information.

1. Deploy a build environment and an empty Main branch in Microsoft Azure DevOps [1].
2. Deploy a development environment.
3. Create the Dev branch and the release branch (for example, ProdRel1 in the previous illustration) [2, 3].
4. Add the Retail SDK [4–7].
5. Prepare the development environment.
6. Optional: Deploy a second build environment for a different release branch.
7. Prepare the build definitions.

After you've completed all these steps, your branches, environment, and builds will be ready.

The following sections explain each step in detail.

## Deploy a build environment and an empty Main branch in Azure DevOps

Use the LCS portal to deploy a new build environment. We recommend that you use a cloud-hosted environment, because you will have more options and capabilities if you have administrative rights. See the table about the various environment hosting models in the "Development Tier 1 environments" section, earlier in this topic.

Start by creating a new Azure DevOps project if you don't already have one. In your Azure DevOps account, select **New project**.

## Create new project

Projects contain your source code, work items, automated builds and more.

After you create the new Azure DevOps project, you must give Azure DevOps access to it. First, create a new personal access token on the Azure DevOps account. Then configure the LCS project with the correct URL and personal access token.

## Setup Visual Studio Team Services

**1** Enter the Visual Studio Team Services site  
Enter the Visual Studio Team Services site URL to allow Lifecycle Services to connect and manage resources.

**2** Select the Visual Studio Team Services project  
Choose the Visual Studio Team Services project in the selected site to link with this Lifecycle Services project.

**3** Review and save  
Review and save the Visual Studio Team Services settings for this Lifecycle Services project.

Enter a Visual Studio Team Services site URL to allow Lifecycle Services to connect and access resources.  
Example URL format accepted:  
<https://org.visualstudio.com/>

Create a personal access token for the Visual Studio Team Services site and allow all authorized scopes. Personal access tokens are used instead of a password to allow Lifecycle services access the resources stored in your account.  
To setup a personal access token, on the visualstudio.com site, click your name in the top right and select Security > Personal access tokens and create a new token for the Visual Studio Team Services account. You can get more information on how to create a personal access token at:  
<http://go.microsoft.com/fwlink/?LinkID=627398>

You will also need to choose a Visual Studio project. If you do not have a project, you can create one at  
<https://www.visualstudio.com>

Visual Studio Team Services site URL:

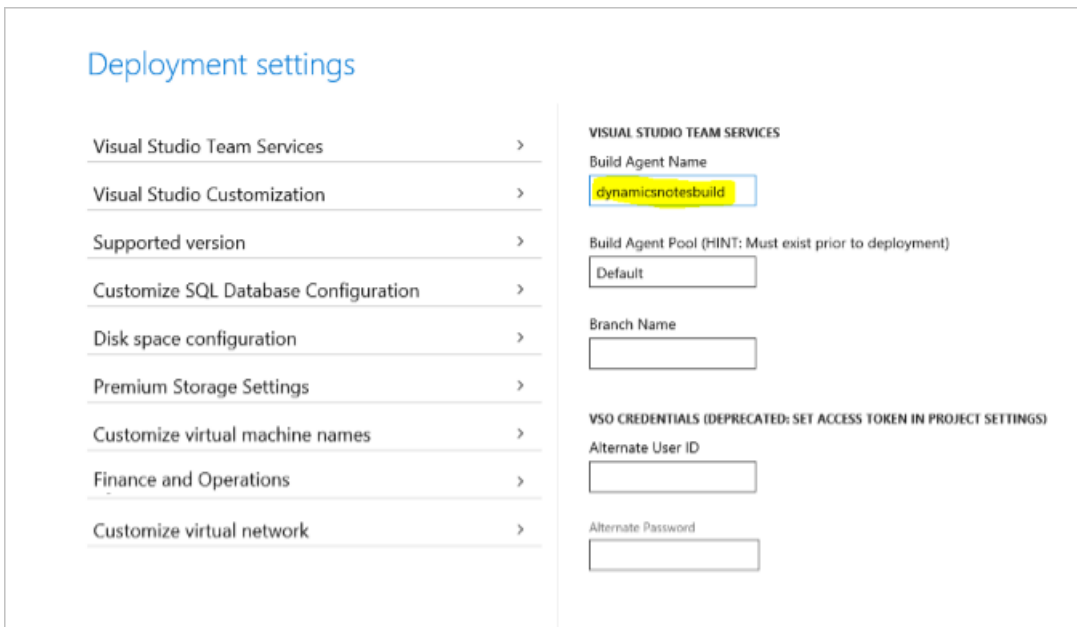

Personal access token:

[Privacy statement](#)

[Continue](#)

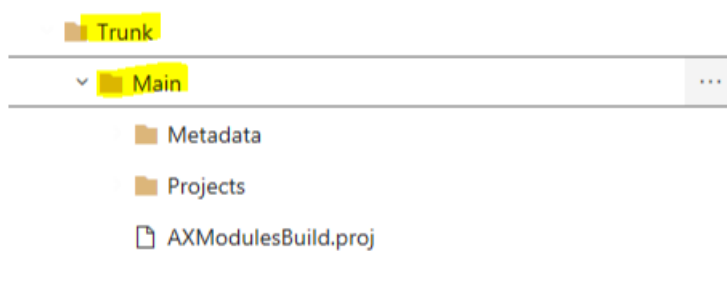

After the LCS project is linked to Azure DevOps, you're ready to deploy.

Add a new environment, select the version, select **DEVTEST** as the topology, and select a build environment. On the next page, enter a meaningful name for the environment. Then enter a similar name for the build agent.

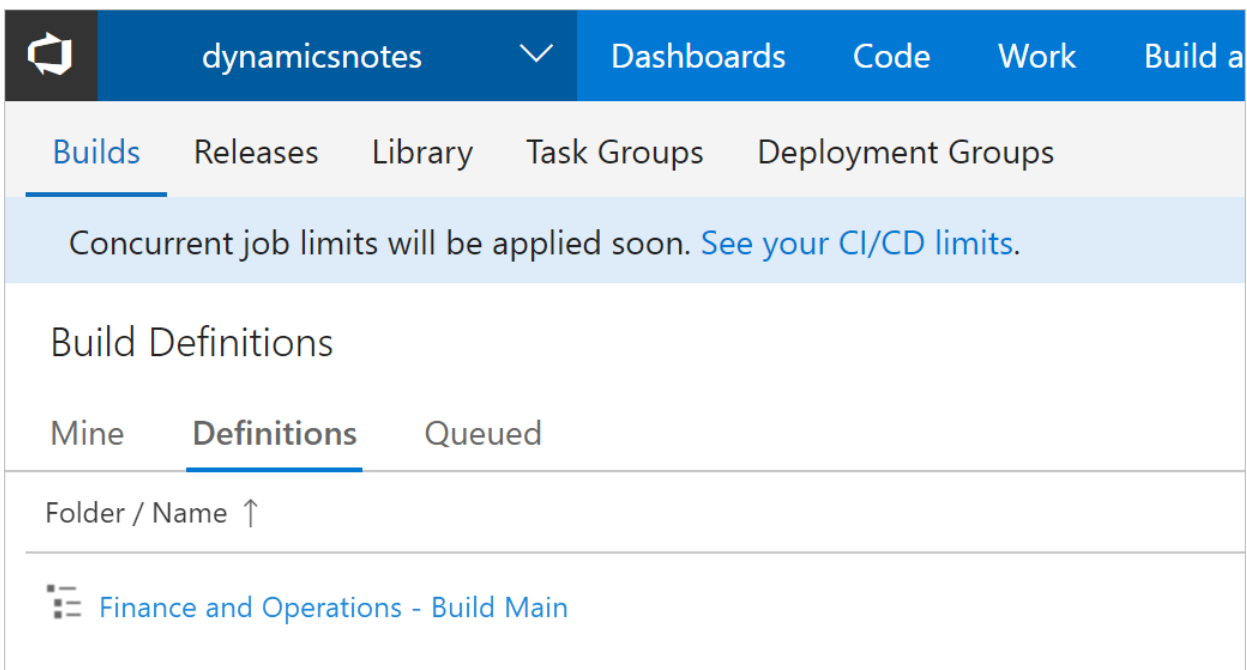

Next, under **Customize virtual machine names**, enter a unique name, and then deploy the VM.

The build box is deployed, and the build definition and Main branch are created, as shown in the following illustration. This process might take a couple of hours.

The build appears in the list of build definitions.

The build definition appears in the **Agents for pool Default** grid.

## Deploy a development environment

Use the LCS portal of your implementation project to create a cloud-hosted development environment.

1. Make sure that you're signed in to the correct user account. This user account is used to create the tenant of the development machine. For example, if you're signed in to LCS as `lily@pad.com`, the environment is set up for the `@pad.com` tenant and expects users from that tenant. Although other users can be added, point of sale (POS) activation must be done by a user from that tenant. In some cases, user accounts from different domains can be used, such as when customers, partners, or other parties use email accounts from different domains. In these cases, coordination is required during POS activation, because only the tenant that was used during deployment can activate users.
2. Select the correct version, select **DEVTEST**, and then select **DEV**. Enter a meaningful and unique name, and make sure that the machine name is also unique in the advanced settings. The process of preparing the machine might take a couple of hours.

Because there is currently no Dev branch, you can skip the process of mapping Azure DevOps to the local directories. However, you will have to complete that process later.

## Create the Dev and release branches

As previously mentioned, you must have a branch that holds changes that are often made but less often tested. You must also have a branch that holds the source code for production. The following illustration shows the expected hierarchy.

### Main Branch Hierarchy

Follow these steps to create the branches.

1. Sign in to a development environment.
2. Start Microsoft Visual Studio as an administrator. Use an account that has access to the Azure DevOps project.
3. In Team Explorer, connect Visual Studio to the Azure DevOps project, if this connection doesn't already exist.
4. Map the **Trunk/Main** folder to a local folder (if this mapping doesn't already exist). This mapping is temporary.
5. In Source Control Explorer, right-click the **Main** folder, and then select **Branching and Merging > Convert to Branch**.
6. Right-click the **Main** branch, select **Branching and Merging > Branch**, and name the new branch **Dev**.
7. Use **Pending Changes**, and submit this change to Azure DevOps.
8. Right-click the **Main** branch, select **Branching and Merging > Branch**, and name the new branch **ProdRel1**.
9. Use **Pending Changes**, and submit this change to Azure DevOps.

At this point, Source Depot Explorer in Visual Studio resembles the following illustration.

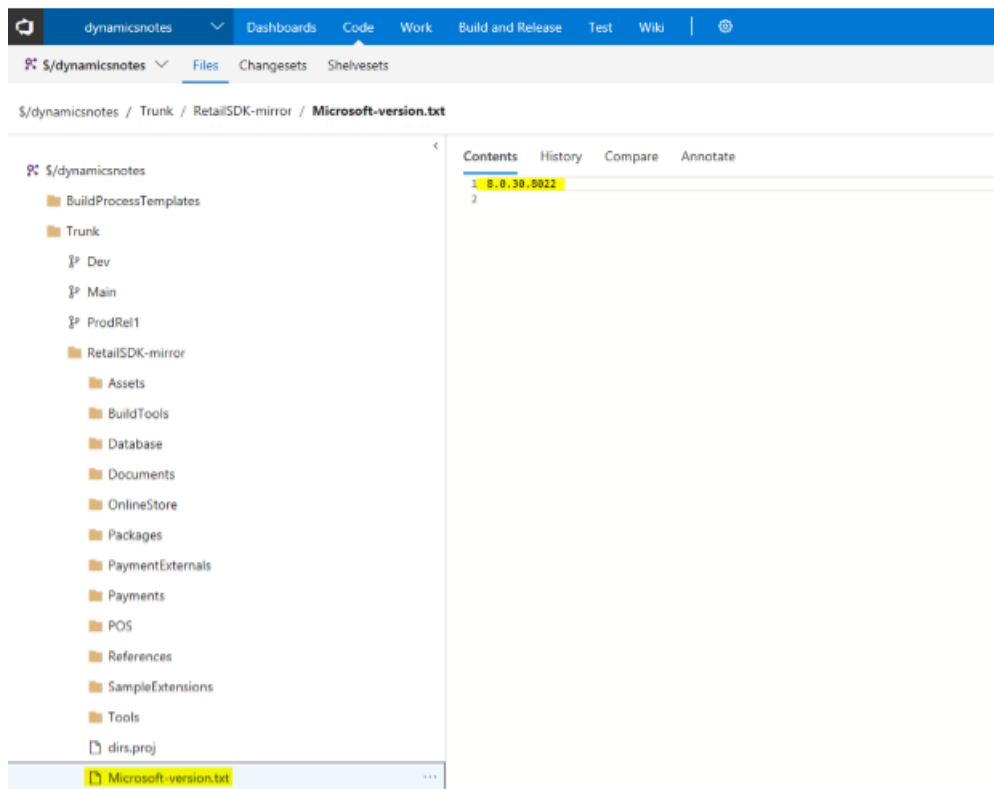

## Add the Retail SDK

Next, you must add the Retail SDK to each of the three code branches, so that code changes can be propagated from Dev to Main and eventually to ProdRel1. This step also enables separate changes between these branches, as for the X++ code. Therefore, we will have the Retail SDK in every branch, together with the X++ code.

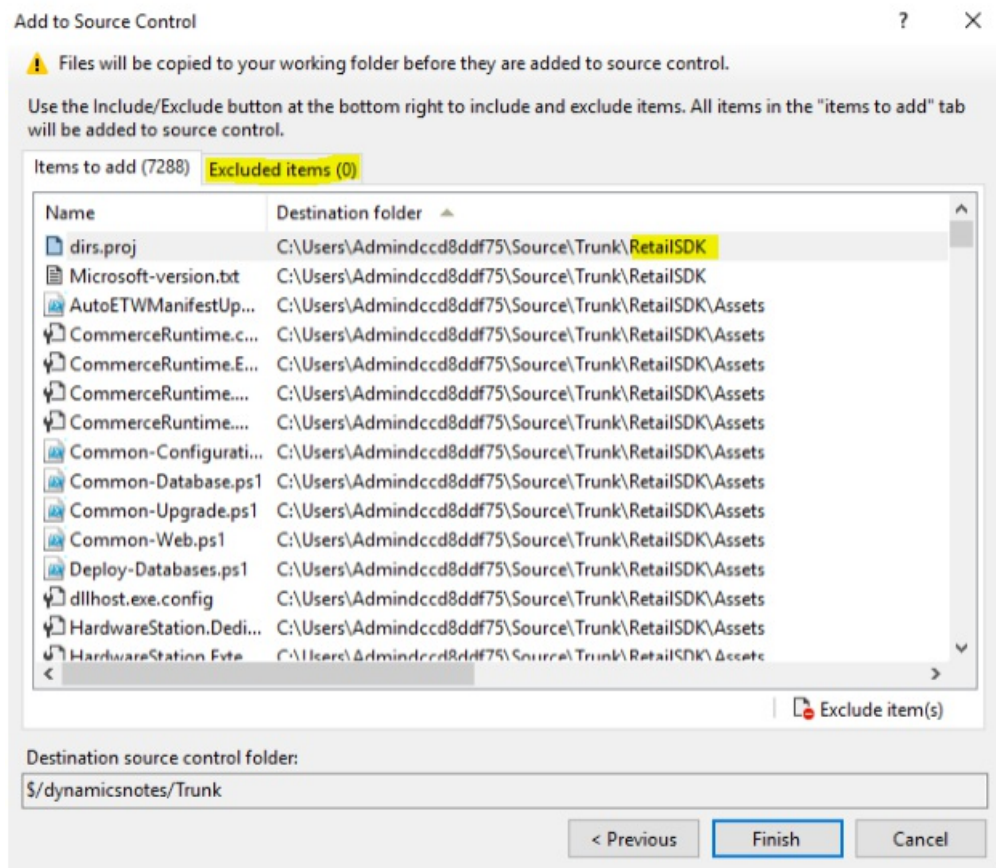

First, add the mirror branch. The Retail SDK mirror branch is required as a baseline for code merges when updates from Microsoft are imported. The process for taking updates will be explained later in this topic.

The mirror branch or folder is only required one time per project.

1. Find the unchanged Retail SDK that has the exact version that you want to start your development with. This Retail SDK can be found on every development machine on the service drive, or in every downloaded hotfix. You can uniquely identify a version of the Retail SDK by inspecting the Microsoft-version.txt file. This file should not be changed, except by an update to the Retail SDK mirror folder.

2. In Source Control Explorer, right-click the **Trunk** folder, and then select **Add Items to Folder**.
3. Select the top folder in the Retail SDK, and then select **Next**.
4. Visual Studio shows the number of files that will be added. Make sure that the **RetailSdk** folder is under the **Trunk** folder.
5. Make sure that there are 0 (zero) excluded items by selecting items and then selecting **Include items**.

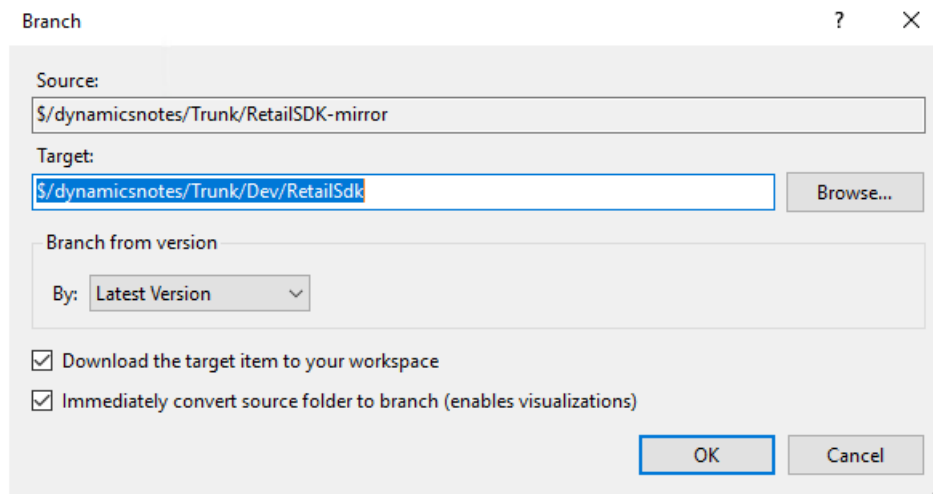

6. Select **Finish**. This process will take a few minutes.

7. When the process is completed, rename the folder **RetailSdk-mirror**.

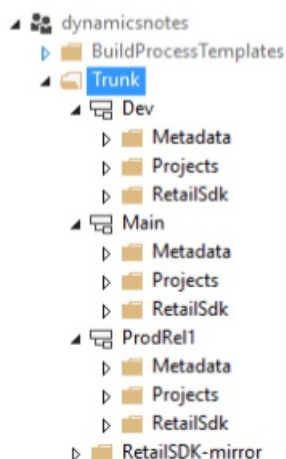

Next, you must branch to each branch. Follow the same path that the code changes will flow in: first to Dev, then to Main, and then to ProdRel1.

1. Select the folder for the mirror branch, right-click, and then select **Branching and Merging > Branch**.
2. Go to the **Dev** branch, append **/RetailSdk** to the name, and then select **OK**.

3. Use **Pending Changes**, and submit the changes.
4. Follow the same steps to branch the **RetailSdk** folder of the **Dev** branch to the **Main** branch.
5. Follow the same steps to branch the **RetailSdk** folder of the **Main** branch to the **ProdRel1** branch.

At this point, you have the code branches and code locations for the X++ and Commerce extensions setup. In Source Control Explorer, the file structure should resemble the following illustration.

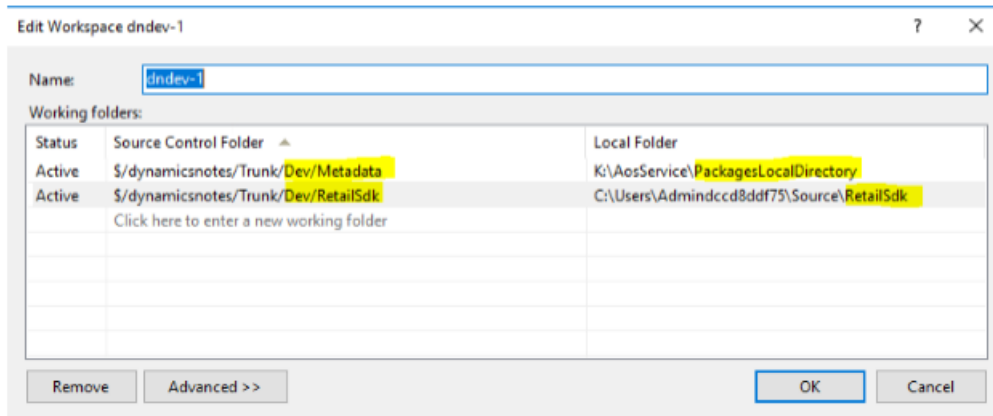

You should also change the version of the Commerce customization. This version should differ in the Dev, Main, and ProdRel1 branches. Either change the Customization.settings file, or add a new global.props file in the **RetailSdk\BuildTools** folder. For example, you can number Dev as 1.0.0.x, Main as 1.0.1.x, and ProdRel1 as 1.0.2.x.

## Prepare the development environment

You can now prepare the development environment for Commerce development tasks. The development environment will map the code locations for both X++ and the Retail SDK in the Dev branch to local folders. The Metadata folder (X++) must be always mapped to the PackagesLocalDirectory folder. The location of the RetailSdk folder must follow these guidelines:

- The location should be somewhere inside the local user's folder.
- The file path of any file is limited to 256 characters. Therefore, use a short path for the root of the Retail SDK. For example, you can use `c:\users\\Source\RetailSdk`.

To map X++ and the Retail SDK, you must edit the current workspace. Select **Pending Changes > Actions > Workspaces**, and update the current workspace so that it resembles the following illustration. As was previously mentioned, you should map the Metadata folder of the branch to the PackagesLocalDirectory folder and the RetailSdk folder to a short folder of your choice.

The download of the files can take a few minutes.

Regardless of whether there are customizations in the code branches, the following steps prepare your development box so that you can write and run code. Some steps are optional, depending on the customizations that are planned.

1. Install your favorite development tools. For information about one automated script, see [Auto-Installing most needed dev tools in 5 mins with Chocolatey](#).
2. To help reduce the compile time, exclude the code folders from Microsoft Windows Defender.
3. If there is already code in the **Dev/Metadata** folder, build all Commerce models. Select all the models, and then select **Database sync**.
4. To speed up the development experience, switch to Microsoft Internet Information Services (IIS). For instructions, see [MSDyn365FO. How to switch from IIS Express to IIS on development VM](#). This step can be done only on the Tier 1 VM where you have administrative privileges (cloud-hosted environment).
5. Optional: Restore a recent copy of a production database that has good data.
  - a. Rename the existing database **AxDB\_Orig**.
  - b. In Microsoft SQL Server Management Studio, restore the .bak file. (If a .bacpac file exists, follow the steps in [Copy a database from Azure SQL Database to a SQL Server environment](#).)
  - c. In Visual Studio, refresh the model store.
  - d. In Visual Studio, do a full build if the source and destination environments of the database are on different versions.
  - e. In Visual Studio, run a full database synchronization.
  - f. Make sure that the Batch service is running.
  - g. Run the Environment reprovisioning tool. (Find the latest version in the LCS Asset library, and deploy it by using the **Maintain** function.)
  - h. Verify that the tool succeeded. The following query should show the URLs of all local development

machines that were updated.

```
select * from dbo.RETAILCHANNELPROFILEPROPERTY where ISSYSTEMRECORD = 1
```

- i. In Commerce, run the **Initialize Commerce Scheduler** job to delete old data.
6. Make sure that you can sign in to Commerce by using your user account. If you aren't the Admin user in the production database, run the Admin provisioning tool to take ownership. (This tool is in the **PackagesLocalDirectory/bin** folder.)
7. Verify that Commerce Data Exchange (CDX) data synchronization works. In Commerce, go to **Download sessions**. You should see many applied sessions. If you don't see them, select job **9999**, and run it.
8. Install TypeScript version 2.2.2 from <https://www.microsoft.com/download/details.aspx?id=48593>.
9. Do a full build of the Retail SDK from a command prompt.
  - a. Open an MSbuild command prompt for Microsoft Visual Studio 2015 as an administrator.
  - b. Change the directory to the location of your Retail SDK on the local VM.
  - c. Type **msbuild**, and then press Enter. The build should succeed.
10. Add the development/sample Retail Modern POS (MPOS) certificate to the local machine's trusted root certificate store: ...\**RetailSDK\BuildTools\ModernPOSAppxSigningCert-Contoso.pfx**. Set the password to an empty string.
11. Install MPOS or MPOSOOffline by running the installer at ...\**RetailSDK\References\YourCompany\Contoso.ModernPOSSetupOffline.exe**. You must complete this step one time to deploy the ClientBroker files.
12. In Visual Studio, open **ModernPOS.sln** (as an administrator), and do a full rebuild.
13. Press F5 to start MPOS in the debugger.
14. In Commerce, open the **Channel profiles** page, and copy the Commerce Scale Unit URL for the default channel profile.
15. Open a browser window, and paste the URL into the address bar. You should be able to browse to your local Commerce Scale Unit.
16. In Commerce, add external user credentials to any worker (for activation), save the password, and don't allow a password reset on first sign-in.
17. In Commerce, run job **1060 (AX/Distribution schedule)**.
18. Activate MPOS by using the same Azure Active Directory (Azure AD) user that you added in step 16. Paste the Commerce Scale Unit URL, select a store and a register, and finish the activation.

You should now be able to run MPOS in the debugger from your local sources.

The process of preparing a development environment is now completed. At this point, any extension code (X++, Commerce runtime [CRT], Commerce Scale Unit, channel SQL, and POS) can be written, debugged, tested, and submitted to Azure DevOps.

## Optional: Deploy a second build environment for a different release branch

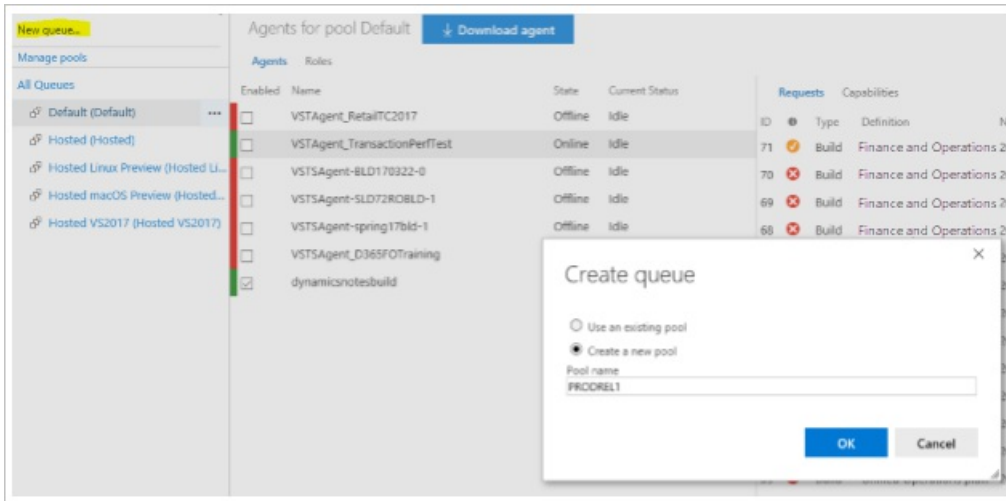

If you must maintain multiple releases at the same time, you must create deployable packages from different code branches (for example, Main2 or Main3, and/or ProdRel1 or ProdRel2).

The steps to set up a second build environment are the same as the steps for the first build environment. At this point, an Azure DevOps project, and the link between the LCS project and the Azure DevOps project, already exist.

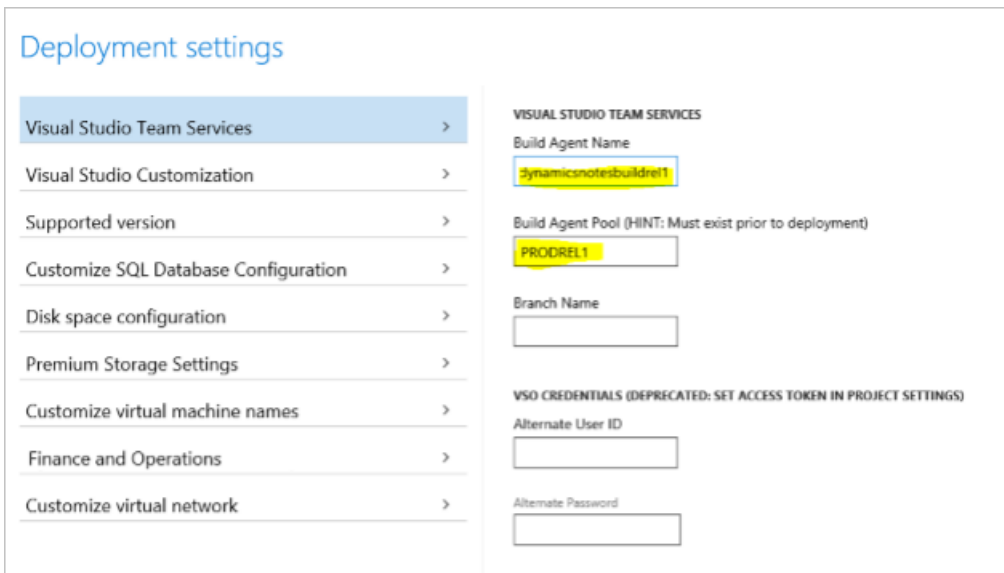

To separate the build environments, we recommend that you create a new Azure DevOps agent queue for the release branch. Although there are ways to share an agent queue (and its build environment) for multiple branches, this approach can be tricky.

Currently, the build environment must be on the same platform and binary hotfix version as the target environment during deployment. Otherwise, LCS might reject the deployable package because of version incompatibility.

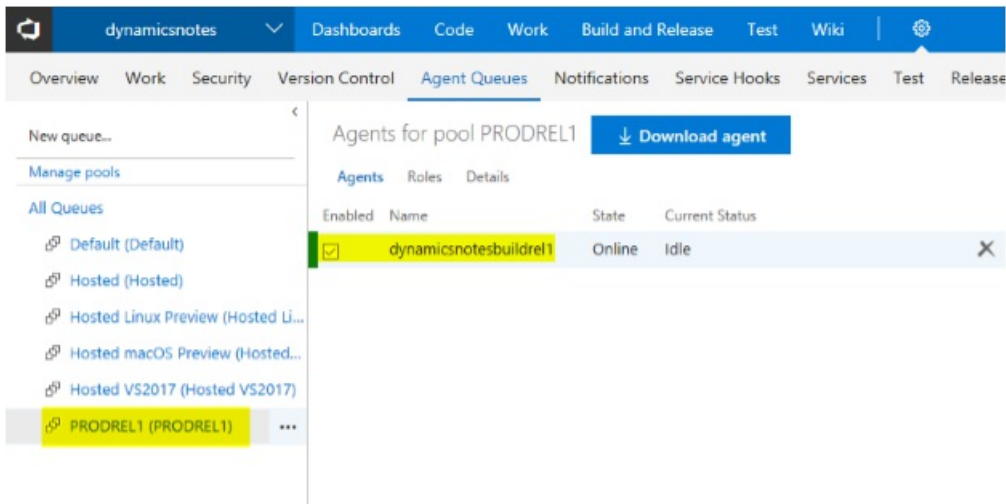

First, create a new Azure DevOps agent queue.

When you deploy from LCS, use **PRODREL1** as the name of the agent pool.

Next, on the **Customize virtual machine names** tab, enter a unique name, and then deploy the new build. The process of deploying a new build and creating a new agent queue can take a couple of hours.

## Prepare the build definitions

After you complete the steps earlier in this topic, you should have one build definition and two agent queues, and each agent queue should have one agent. To build different branches, you must configure the build definition differently. Therefore, you must clone the build definition.

However, before you clone the build definition, you must add the Retail SDK into the build, so that you don't have to complete this step twice. To edit the existing build definition, which is named **Unified Operations platform - Build Main**, follow the steps in [Integrate the Retail SDK with the continuous build system \(Azure DevOps\)](#) to integrate the Retail SDK into the metadata build of the Main branch.

If you had multiple build branches and environments, just clone the build definition, and name the new build definition so that it's clear which branch it's for. (The clone feature is available in the Azure DevOps portal). Select the new agent queue that you created, and change the following paths in any build steps or source mappings. (In the paths, change **Main** to **ProdRel1**.)

- Source mappings
- Retail SDK build step
- Retail SDK copy binaries step
- Build the solution step (X+ + build)
- Retail SDK copy packages step

## Tips

- You can speed up an official build by making these changes in the **Variables** section of the build definition:
  - Set **DeployReports** to 0.
  - Set **SkipSourcePackageGeneration** to 1.
- Change the version of the Commerce customization in each branch. The version should be different in the Dev, Main, and ProdRel1 branches. Either change the Customization.settings file, or add a new global.props file under the **RetailSdk\BuildTools** folder. You can use any kind of numbering for the file name. For example, you can number Dev as 1.0.0.x, Main as 1.0.1.x, and ProdRel1 as 1.0.2.x.
- For efficiency, shut down build or development environments when they aren't being used.
- If you're using cloud-hosted Tier 1 development environments (where you have administrative privileges), you can switch from IIS Express to IIS. Using IIS for running all web application is more robust, more performant, and avoids the switching. For details, see [MSDyn365FO. How to switch from IIS Express to IIS on development VM.](#)

- For prototyping purposes, a developer might want to change the Retail SDK on a development VM without using Azure DevOps source control. Always keep the original Retail SDK untouched, and make a copy that you can work in temporarily. In that way, you can take the unchanged Retail SDK into your mirror branch later, if it's required.
- Currently, a build environment must be on the same platform and binary hotfix version as the target environment.

# Update code and environments for Commerce projects

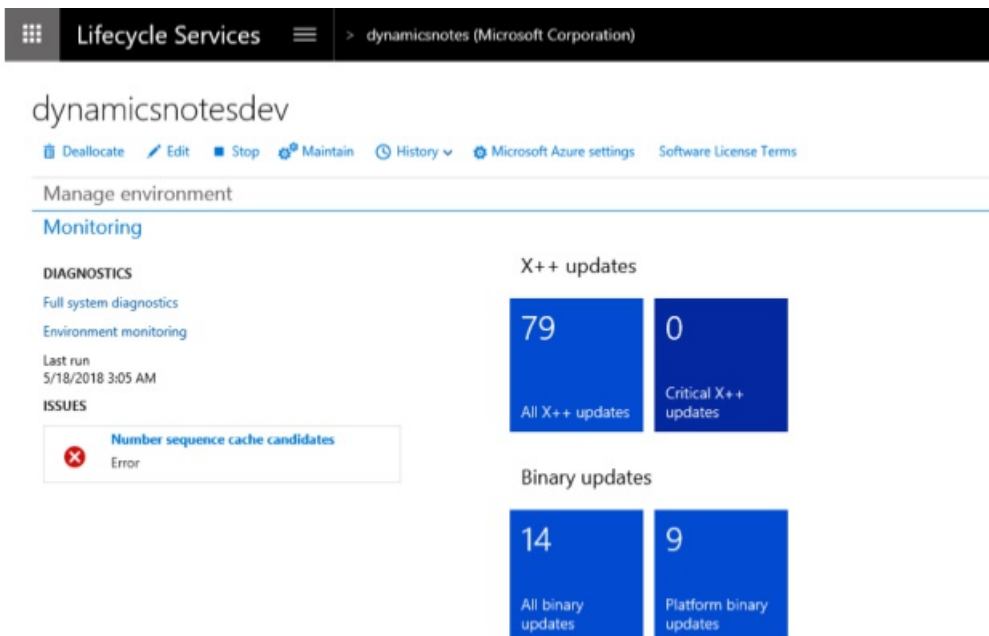

2/18/2021 • 12 minutes to read • [Edit Online](#)

An environment can be updated by updating either its data or its code.

There are multiple ways to update the data. For examples that show how to get data into an environment, see [Data entities and data packages](#).

When you update an environment, you should also consider moving the whole database. This approach lets you quickly and easily duplicate the data from one environment to another.

Other updates are code updates. The environment page in Microsoft Dynamics Lifecycle Services (LCS) tracks the updates that have been applied and the updates that must be applied. The following illustration shows an environment that has 79 outstanding X++ fixes, 14 outstanding binary updates, and nine outstanding platform binary updates.

Platform code is at a very low level, and no Microsoft Dynamics 365 Commerce features are implemented in the platform. Therefore, stand-alone platform binary updates don't require that you retest any Commerce-specific code. Examples of features that are implemented in the platform are the Data Import/Export Framework (DIXF) and the batch framework.

Binary updates or hotfixes include dynamic-link libraries (DLLs), scripts, and channel SQL schema changes. All channel-side hotfixes are released together as a binary update/hotfix. Because binary updates are DLLs, they are cumulative. For example, if you download a binary update on Friday, you automatically receive all binary hotfixes from Monday through Thursday.

If the code merge is done correctly, the version of a binary hotfix that you take matches the version of the Microsoft-version.txt file in the Retail software development kit (SDK). Typically, binary updates are also linked to the latest platform. Therefore, when you take binary updates, you must stay up to date with the platform. Platform updates help increase the stability of the platform, and they affect build environments and test efforts to some extent.

Application updates or hotfixes are delivered in X++ source code. Therefore, they aren't for the channel side but for the Microsoft Dynamics 365 side (they are either Commerce-related or not Commerce-related).

Note that some updates require both an application update and a binary update. For hotfix recommendations, see the next section.

Third-party packages resemble application packages, but they are developed by other people. For more information about how to use independent software vendor (ISV) packages, see [Manage Runtime Packages](#).

## Updating data by restoring the database

In one useful and typical operation, the whole database is moved from one environment to another. For example, you might move the production database to development environments when you're preparing to develop additional features. Alternatively, you might move the golden setup database to the production database as part of the go-live process.

For more details, see [Copy Database From Azure SQL to SQL Server](#). If source and destination environments don't have the same binary version, you should also do either a build and a database synchronization (for a development environment), or a deployment (for a sandbox or production environment).

Every time that a database that has been moved from a different environment is restored, specific links in the database can be broken. The Environment reprovisioning tool fixes all these broken links for the default database group, regardless of type of environment that is used. The general guideline is that if the database comes from a different environment, the Environment reprovisioning tool must be run.

In many cases, you should reset the Commerce scheduler after you update the database.

After you've restored the database, follow these steps.

1. Either do a build and a database synchronization, or deploy the deployable package.

### NOTE

If you have table extensions that include data, you must have the metadata for those extensions in the environment. Otherwise, you can lose data, because columns and tables might be dropped.

2. Make sure that the batch service is running.
3. Run the Environment reprovisioning tool. (Find the latest version in the global Shared asset library in LCS, and then deploy it by using the **Maintain** function.)
4. Verify that the tool succeeded, the Commerce channel profile is up to date with the correct URLs, and the data synchronization jobs for the Default data group succeeded.
5. In Commerce, run the **Initialize Commerce scheduler** job (select to delete old data). This step assumes that all Commerce Data Exchange (CDX) configuration changes are automated by using a resource file. If CDX configuration changes aren't automated, and if tables, subjobs, and jobs are manually created in the Commerce channel schema, don't select the option to delete the existing configuration. We recommend that you automate CDX configuration changes.

## Taking updates frequently

If your project is more than a few weeks from go-live or the final user acceptance testing (UAT), we recommend that you take all hotfixes (binary, X++, and platform) on a regular schedule. Specifically, we recommend that you take all hotfixes one time per month. The more often you perform this task, the fewer issues you should experience, because the code churn of the hotfixes is smaller. If you perform this task often, it will take significantly less than eight hours.

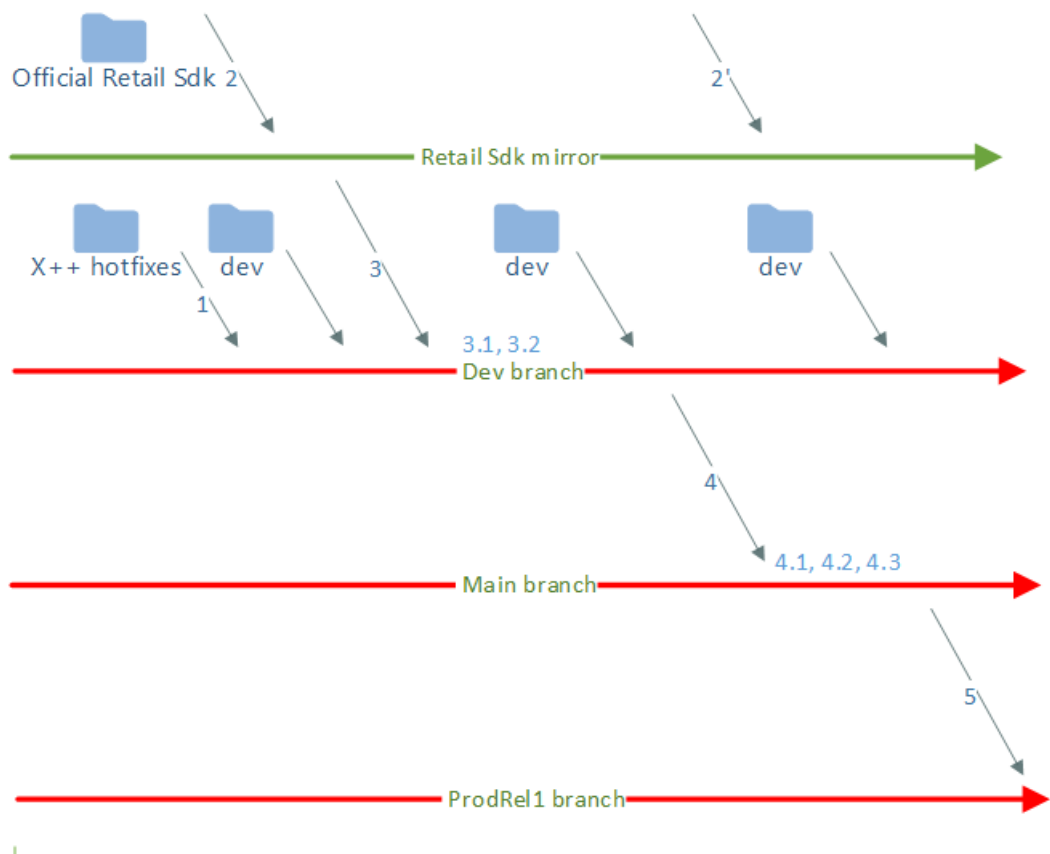

We recommend that you not pick and choose hotfixes, because this approach is more likely to cause errors and probably isn't worth your time. If you have 500 or 1,000 outstanding hotfixes, you should consider whether you're really ready to go-live. The quality of the product will be higher if the count on the update tiles in LCS is very low (fewer than 100 application fixes and fewer than ten binary fixes).

After you take new hotfixes, the results of a previous round of UAT become less meaningful. Therefore, it's crucial to retest again. The number of files that changed determines how extensive the testing must be. If hotfixes are frequently taken, especially during the implementation phase, the number of new files isn't very large, and the retesting effort is manageable.

Another approach is to take all hotfixes frequently and run only part of the UAT. Then, the next time that new hotfixes are taken, run a different part of the UAT. Run the different parts of the UAT in a circular manner. Before go-live, you should do a full UAT run.

## The flow of code changes through branches and environments

Just as the branching strategy is dictated by project, team, or other constraints, your project has flexibility about how the changes are propagated through the branches. The following illustration shows an example of the process. However, this example might be too simple for some projects and too complex for other projects. The important point is that a project should have a plan. Different persons in the team will have different responsibilities (development, deployment, code merges, sign-off, and so on), and the role ownership should be clearly defined.

- 1 ..... X++ developer gets and submits new X++ hotfixes
- 2 ..... Retail developer gets the Retail Sdk update from a binary update
- 3 ..... Retail developer code-merges the new Retail Sdk changes
- 3.1 ... Retail developer shares binary update and Retail package for other devs
- 3.2 ... other developers update their environments
- 4 ..... specific changes are merged from Dev to Main
- 4.1 ... deployable packages being build from Main branch, added to LCS
- 4.2 ... test environments are being deployed for testing
- 4.3 ... production is being deployed
- 5 ..... final code is merged to ProdRel1 branch

### Steps 1–3: Obtain and apply updates

For full details about steps 1 through 3 (taking updates), see the [hotfix and deployment cheat sheet](#). If the branches are set up in the same manner that is shown in the preceding illustration, you should do this work in the Dev branch.

### Steps 3.1–3.2: Keep development environments up to date

You don't have to have a build environment for the Dev branch. In fact, a build environment for the Dev branch isn't usually required. You just have to coordinate the packages that should be deployed to keep the version correct.

After you download binary updates and platform updates, you can deploy them via LCS package deployment.

For the X++ code, developers just synchronize the Metadata folder and do a full build and database synchronization.

If major new changes have been checked in by other members of the team (for example new files, configuration changes, or a new Retail SDK), it isn't enough to synchronize and build the new files. Remember that a few web applications that are installed on the developer machine won't be updated through a compilation. Those web applications must be deployed. Use the LCS package deployment to deploy the commerce package that can be produced at an MSBuild command prompt. For smaller code changes, new package deployments aren't

required in order to keep the dev environments in sync if the incremental changes are dropped to the install locations.

BIN_06202018	Platform and application binary package	6/20/2018 5:20 PM	6/20/2018 6:15 PM	Signed off

### Step 4: Move changes from the Dev branch to the Main branch

In this example, the Dev and Main branches have been separated to provide an opportunity to "leave some unwanted changes behind." Although this approach isn't required, it's a good option to have. Microsoft Visual Studio makes the process of moving the code from Dev to Main easy. You can select a range of changes, select all or individual changes, and merge those changes. To keep the process simple, you can have some type of a code freeze in the Dev branch. Then, when you're satisfied with the quality, you can merge all changes. There is no reason to treat X++ differently than the Retail SDK. They reside next together in each branch, because they are dependent on each other.

### Steps 4.1–4.2: Update test environments

Use your build environment to produce officially built packages from the code in the Main branch.

### Step 4.3: Deploy packages to the production environment

When all the required tests are passed, you're ready to deploy the same packages to production. After the packages have been deployed and validated in a Tier 2 or higher environment, you must mark them as Release Candidates in the LCS Asset library. You must then plan the deployment and submit it via the LCS environment page.

There are many considerations when you update a production environment, such as downtime, downtime mitigation, data migration, store updates, and mass deployment. It's very important that you have a plan of all the steps that are required for an update, because Commerce projects usually require more than just

deployment. For some additional considerations, see the "Tips" section of this topic.

It's assumed that the planning for go-live was started much earlier. For more details, see [Implementation lifecycle](#).

### Step 5: Merge the code from the Main branch to the ProdRel1 branch

Immediately after deployment to production, and before any new feature work is added to the Main branch, you should take a snapshot and move it to the ProdRel1 branch. The steps are the same as in step 4. You don't have to select individual changes. Instead, just merge all changes up to the last code change set that was submitted to the Main branch.

## Update build environments

You should always deploy binary updates and platform updates by using LCS package deployment.

Finance and Commerce customization packages should not be deployed to a build environment.

## Compare LCS tile counts

Environments that are used for work of the same release should also have the same LCS tile counts. Here are some reasons why the tile counts might differ:

- The same deployable packages haven't been deployed and applied. You can troubleshoot this issue by inspecting and comparing the LCS deployment history.
- The scheduled task that collects the version information from an environment hasn't been run yet. For development environments, you can force the "LCSDiagnosticsCollector" schedule task to run.
- The counts for the build environment's application updates don't match because X++ packages aren't deployed on build environments. Binary and platform counts should be correct.
- The difference might be intentional. For example, a developer might work with the next version, whereas the rest of the team is still working with a different release. Alternatively, one development environment might be kept on an older version in case a production hotfix must be developed, and that production environment uses an older version than current development environments.

Notice that after you've finished updating an environment, the tile counts for the available updates are significantly lower than they were when you started.

## Move to a new version

To upgrade to a new version (such as 7.2 to 7.3 or 7.3 to 8.0), you must deploy a new environment. You must also run a code upgrade and a database upgrade, if these upgrades are applicable. For more details, see [Code migration home page](#).

## Tips

- Decide on a good package naming convention for names in the LCS Asset library and for the names of zip packages that are downloaded. In this way, you can more easily determine what package you've deployed and where it came from. Avoid spaces in package names. Here is an example of a naming convention:
  - **Platform update packages:** PUXX\_MMDDYY, where XX is the number of the platform update
  - **Binary update packages:** BIN\_MMDDYY
  - **X++ update packages:** APP\_MMDDYY
  - **Built X++ deployable packages:** AX\_BRANCH\_VERSION, where BRANCH is an appropriate branch name, and VERSION is the Microsoft Azure DevOps version string
  - **Built Retail combined package:** RET\_BRANCH\_VERSION, where BRANCH is an appropriate branch name, and VERSION is the Azure DevOps version string
- Whenever you start a new item of work, use the **Get latest** option in the Visual Studio source code

explorer.

- Any code submissions should use correct and detailed comments that describe the change sets.
- Production go-live procedures are important. You should consider including the following items on your Go-live checklist. Verify your Go-live checklist in a mock go-live or UAT environment. This list isn't exhaustive.
  - After deployment, does LCS show the expected deployment history together with the correct package names?
  - After deployment, do the LCS environment page and Commerce show the correct and expected version numbers?
  - Can Modern Point of Sale (MPOS) offline mode be used during downtime of Commerce? Package deployments will cause downtime. If MPOS offline mode can be used, have you tested the procedure? (To test the procedure, go offline, deploy, go online, synchronize offline transactions, and update MPOS.)
  - Does the Environment reprovisioning tool have to be run (if a database has been moved)?
  - Batch jobs for CDX synchronization must be reenabled by setting them to **Waiting**.
  - The "Initialize Commerce scheduler" job should be run.
  - Does other data have to be set up in addition to the deployable packages (for example, screens, buttons, receipt layouts, the Microsoft Azure Active Directory setup, Commerce shared parameters, the tax configuration, other batch processes, and DIXF recurring jobs)?
  - Is a synchronization of the CDX data jobs required?
  - Is a full synchronization of CDX data jobs required?
  - Does a deployment require that store components also be updated?
  - If the store components had to be updated, do they show the new version numbers?
  - Are the correct experts available during the deployment (for example, partners, ISVs, and customers)?

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Testing and performance issues

2/18/2021 • 5 minutes to read • [Edit Online](#)

This document describes practices and tools that are related to functional testing, performance testing, and performance troubleshooting.

## User acceptance testing

The main purpose of user acceptance testing (UAT) is to verify that specific business scenarios work as you expect. The testing should include not only the customizations, but also out-of-box Microsoft functionality and non-happy-path testing. The goal is to catch anything that doesn't work correctly before you go to the production environment.

For the best results, the UAT environment should be a Tier 2 through Tier 5 environment, not a development environment (Tier 1).

If a development environment is used, there are scenarios where a developer who uses the same environment can cause errors (for example, uncommitted source changes or debugger attached errors). The switch between Microsoft Internet Information Services (IIS) Express and IIS can also cause issues. Additionally, because there is no way to know exactly what has happened on a development machine, Microsoft support for a Tier 1 environment is very limited.

A production environment can be used for UAT (for example, as a "dry run" for go-live). However, if you require access to the database for any reason, you must go through deployment support engineer (DSE) service requests. Therefore, this approach might not be efficient. Additionally, the production environment isn't available for a long period before the planned go-live date.

The UAT should be done after you deploy officially built deployable packages. It should not be done on packages that are manually built in Microsoft Visual Studio. The reason is that there is no way to prove what code changes were included in a manually built package. Only an official build system provides assurance and an audit trail of the exact changes that are in a specific build.

If you use Modern POS/Cloud POS, make sure that you use the correct user roles. You should test by signing in as both a manager and a cashier who has lower privileges.

## Performance

### Channel performance

In some cases, channel performance might not be as good as you expected. Poor performance is often caused by the following factors. This list is in order from highest to lowest impact.

- Additional custom calls to Commerce Scale Unit. If you extend the product with additional calls, performance often decreases significantly. Not only is there a possibility of additional processing, but the network latency must also be considered. We recommend that you try to avoid any additional Commerce Scale Unit calls. Often, you can accomplish the same tasks by using extension properties and extending existing Commerce runtime (CRT) handlers or triggers.
- Additional channel database extensions. Make sure that your custom SQL is efficient and uses correct indexes.
- Multiple runs of the same custom or built-in CRT SQL queries. If this approach is too expensive, caching in the CRT request handler can be applied, as appropriate.

For more details, see the [Commerce for IT pros and developers](#) topics.

When you investigate store performance, follow the suggestions in [Retail Channel performance investigations](#).

### Using telemetry data to find performance issues

If you must troubleshoot the performance (especially slow SQL queries or SQL deadlocks), the environment diagnostics page in Microsoft Dynamics Lifecycle Services (LCS) shows valuable telemetry data. You can use this data to find potential performance issues in code, configuration, or design. For more details, see [Monitoring and diagnostics tools in Lifecycle Services](#). That information should help you determine why some batch processes or form loads are slow.

### Performance testing

Typically, when you test the performance of a system, you should focus on components where there is competition for many shared resources. These resources might differ for different projects, customers, or requirements.

Here are some of the reasons why bottlenecks can occur:

- Resource-intensive calculations, such as statement posting, change calculations for channel data synchronization, warehousing operations that involve a large product assortment, and MRP (Material Requirements Planning) runs
- Complex business logic for multiple terminals or stores that run on a few Commerce Scale Unit
- Integrated third-party systems (integrated from either Commerce or Commerce Scale Unit)
- Real-time transaction services that are frequently called from Commerce Scale Unit.
- Non-standard or extended standard functionality (for example, extended statement posting that uses a custom WHS code)

In general, default and non-real-time POS operations aren't considered bottlenecks because they have their own dedicated resource: the computer that the POS is installed or running on. Performance issues are typically caused by the business logic or "chatty" calls to Commerce Scale Unit.

Ideally, performance testing should be done after some initial optimizations have already been completed by using the information earlier in this topic. If the system doesn't perform well for a single user or process, it won't perform well for concurrent users or processes. For more information, see [Retail Channel performance investigations](#). Additionally, in the Finance documentation, search for "PerfSdk" or "Trace parser."

Because every project is different, it's difficult to give a general answer about the exact performance tests that must be run. For example, if the count of transaction sales lines is low (less than 100,000 per day for all stores), and if no custom extension code has been added for statement posting, a performance test should not be required for posting. However, if the count of sales lines is substantially higher, or if major custom changes have been added, a performance test for posting is a good idea.

Usually, the hardware capabilities of every environment differ. However, performance issues can usually be reproduced in other environments if the code and data are similar. We don't recommend that you use a production environment for performance testing. A good practice is to use the same data in development, test, and production environments. The development environment can then be used to work on and verify a fix. Because many performance-critical code paths are data-dependent, the same issues might not be seen for a Contoso sample database.

After you've completed a performance fix, you should verify the fix in a test environment. Deploy an officially built package to the test environment, and if the issue is fixed, mark the package as a release package.

Any fix of a larger performance issue should be followed by a new performance test. Often, a large issue masks other smaller issues. After the top issue is resolved, the next issues can be found and worked on until the performance meets the customer's expectations.

# Dynamics 365 Commerce architecture overview

2/18/2021 • 13 minutes to read • [Edit Online](#)

## NOTE

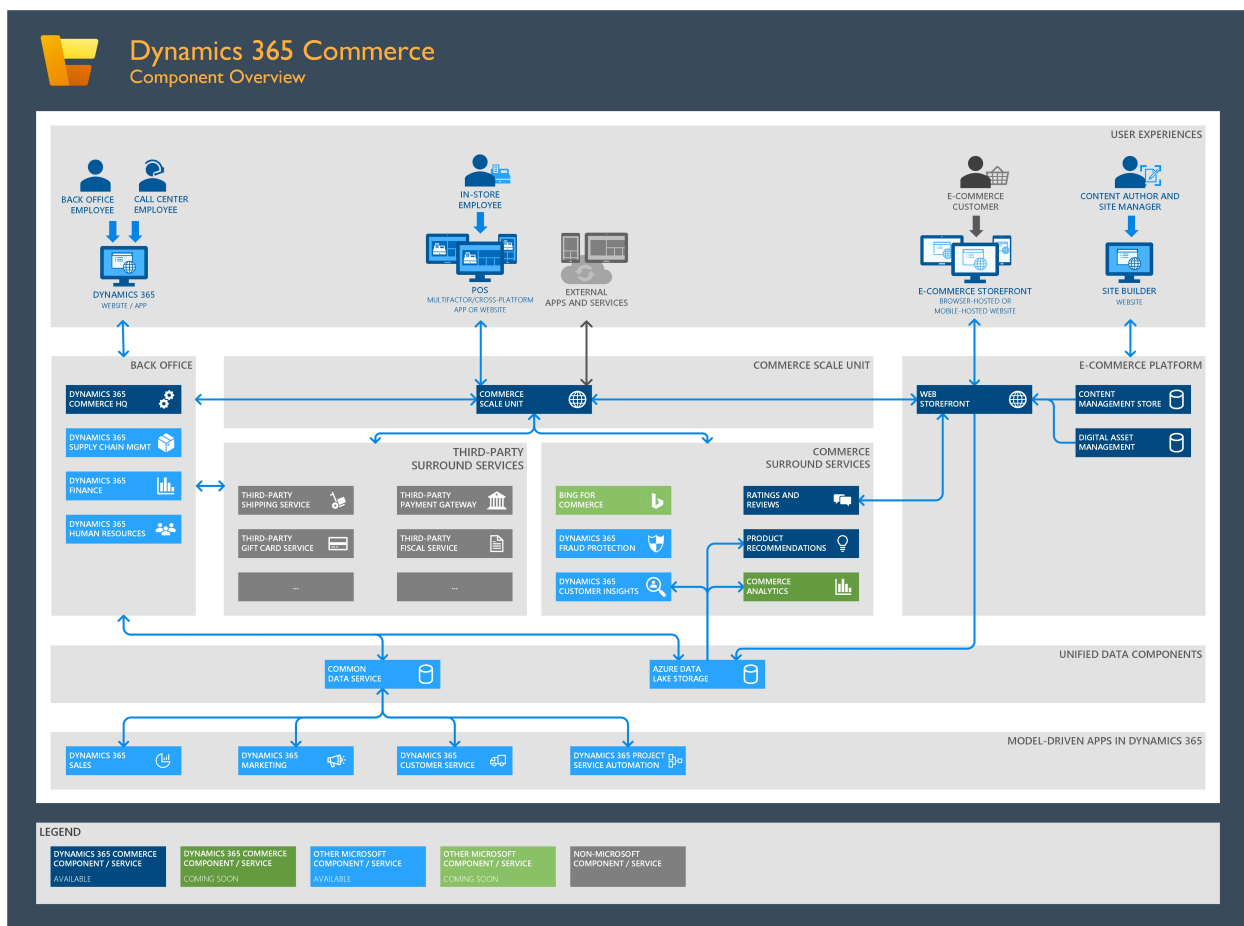

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

This topic provides an overview of all components in the Microsoft Dynamics 365 Commerce ecosystem, including integration points to the suite of Dynamics 365 products.

The following illustration shows an overview of Dynamics 365 Commerce components.

## Architecture benefits

### Omni-enabled headless commerce engine

The Commerce Scale Unit hosts the headless commerce engine. It serves as the central integration point for all commerce business logic, and powers a complete omni-channel solution across physical and digital stores. The Commerce Scale Unit is built by using a portable architecture, and allows for flexible hosting options across cloud, edge, and hybrid topologies.

The headless commerce engine powers all native Dynamics 365 Commerce channels, including in-store and e-commerce channels. It also serves as the single integration point for third-party channel solutions. Therefore, those solutions can take advantage of the power of Dynamics 365 Commerce business logic and integration with other commerce-related services that are provided by Microsoft and independent software vendors (ISVs).

### **Interconnected business processes**

The platform that is shared among the various Dynamics 365 business applications, such as Dynamics 365 Commerce, Dynamics 365 Supply Chain Management, and Dynamics 365 Finance, provides a set of interconnected business processes that users can immediately benefit from. All back-office capabilities across these applications are built on the same web experience and data stores. Therefore, there is a seamless flow of business processes across various functions in the organization, but custom integrations across applications and services aren't required. The out-of-box integration between the headless commerce engine and the back office further expands the coverage of these interconnected business processes across the back office and commerce channels.

### **Unified data**

Dynamics 365 Commerce provides a unified data solution through out-of-box integrations with [Dataverse](#) and [Azure Data Lake Storage](#). Integrations and data sharing across Dynamics 365 business applications such as Dynamics 365 Sales and Dynamics 365 Marketing are supported through Dataverse. Transactional data in Data Lake Storage is used to power various analytics and insight scenarios in the Dynamics 365 Commerce solution. However, it can also be used by any third-party software integration.

### **Powered by AI and analytics**

Because of the accessible, persistent, up-to-date, and unified organizational data that is available in Data Lake Storage, the whole organization has a "single source of truth" that analytics, artificial intelligence (AI), and machine learning (ML) can be applied on top of. In this way, the organization can derive insights and get key performance indicators (KPIs) that can be used to optimize and automate business processes across all channels.

## **Component overview**

### **User experiences**

#### **Dynamics 365**

Dynamics 365 is a collection of applications that together provide comprehensive and flexible enterprise resource planning (ERP) solutions for medium to large businesses. It provides an extensible framework and ecosystem that can be tailored to customer-specific requirements via an extensive set of partners. Dynamics 365 applications provide capabilities for their target business segments. They also take advantage of each other, and other Microsoft services and offerings, to provide solutions that help run customers' complex businesses.

#### **Modern POS**

Modern POS is a cross-platform (Windows, iOS, and Android), multi-form factor (desktop, tablet, and phone) solution for all in-store first-line workers, such as cashiers, sales associates, stock clerks, and store managers. It can be deployed as an app that has offline capabilities. Alternatively, it can be deployed in the cloud and accessed through a web browser. The application is role-based and fully configurable from headquarters. It's also highly customizable, and can be extended or integrated into third-party services by using the Retail software development kit (SDK).

In addition to standard "cash and carry" transaction processing, Modern POS includes features for assisted selling, clienteling, endless aisle, order processing/fulfillment, inventory management, cash/shift management, and reporting. For more information, see [Modern POS \(MPOS\) architecture](#) and [Choose between Modern POS \(MPOS\) and Cloud POS](#).

#### **E-commerce storefront**

The e-commerce storefront is the customer-facing website rendering system. It's built on the React.js framework, and uses a combination of server-side and client-side rendering to deliver responsive web

experiences for one or more online channels. Although the storefront has a rich set of out-of-box capabilities, it's also highly customizable, and delivers an efficient and scalable solution for online business. For more information, see [Online store overview](#).

#### **Site builder**

Site builder is the web-based authoring interface for the content management and storefront website rendering systems. Visual page builder in site builder is a what-you-see-is-what-you-get (WYSIWYG) editor for site managers and content authors who perform the day-to-day workflow tasks of managing and producing the marketing content for the e-commerce experience. In site builder, a marketer can provide more marketing detail for specific products to enhance the shopping experience for consumers. In addition, site builder includes integrated accessibility reporting, URL management, site map generation, and image focal point management, among other features. For more information, see [Online store overview](#).

#### **External services and apps**

The headless commerce engine that is exposed via the Commerce Scale Unit lets partners and customers take advantage of all the same channel-side capabilities and business logic that are used by the out-of-box e-commerce and point of sale (POS) components. Therefore, by tapping into the same data and business process capabilities, it allows for seamless omni-channel capabilities across out-of-box channel components and partner-provided/customer-developed services and applications. It also provides access to all out-of-box and ISV-developed surround services that are available through the Commerce Scale Unit.

#### **Back office**

##### **Dynamics 365 Commerce headquarters**

The Dynamics 365 Commerce application, which is often referred to as the Commerce headquarters component, provides back-office capabilities that enable the configuration of products, employees, business processes, and other functionality that is required for the business. It's also the application that call center workers use to provide assisted commerce-related workflows.

##### **Dynamics 365 Supply Chain Management**

[Dynamics 365 Supply Chain Management](#) provides functionality to help you manage your products throughout the supply chain lifecycle, from production, to inventory and warehouse, to transportation and distribution. For more information, see [Help resources for Supply Chain Management](#).

##### **Dynamics 365 Finance**

[Dynamics 365 Finance](#) provides functionality to automatically manage your global finances. For customers of the Dynamics 365 Commerce application, Dynamics 365 Finance offers an integrated experience for managing stores and e-commerce financial statements alongside the rest of their operations. For more information, see [Dynamics 365 Finance help resources](#).

##### **Dynamics 365 Human Resources**

[Dynamics 365 Human Resources](#) lets businesses get a comprehensive view of their employee resources and manage them in a unified way. It provides integrated experiences from the hiring process through workforce planning and employee time management. For more information, see [Dynamics 365 Human Resources help resources](#).

#### **Commerce Scale Unit**

Retailers are distributed organizations, where the business topography can be represented as a hub and spoke model. Dynamics 365 Commerce supports this model by having head-office capabilities (the hub), and also many distributed channel components (the spokes) that can be deployed and self-managed in-store or in nearby Microsoft-managed Azure datacenters. The spokes are referred to as Scale Units, because they represent physical isolation (a function of scale) and an atomic unit of update.

To facilitate cloud and edge computing scenarios, a Commerce Scale Unit is available both as a software as a service (SaaS) component that is managed by Microsoft (Commerce Scale Unit in the Cloud) and as a self-managed component that can be deployed locally (self-hosted). A single environment can have a mixture of Commerce Scale Units (cloud and self-hosted). Therefore, organizations can tune their investments in

operational overhead on a store-by-store basis by implementing network redundancy for poor connectivity. For more information, see [Select an in-store topology](#).

#### **Commerce Scale Units (cloud)**

Multiple Commerce Scale Units can be associated with each environment. Each Commerce Scale Unit can be independently serviced and updated, and each can serve one or more channels across one or more legal entities. Each Commerce Scale Unit can be deployed to any of the supported Azure regions, and multiple Commerce Scale Units can be deployed to the same region. The independent nature of each Commerce Scale Unit allows for phased rollout of updates across a collection of channels.

#### **Commerce Scale Units (self-hosted)**

The ability to bring the Commerce Scale Units to edge computing helps accommodate scenarios where internet connectivity is poor or unreliable. For retailers, this approach typically means having a physical footprint in their stores. By using a Commerce Scale Unit (self-hosted), retailers can bring the same business logic and capabilities that run in the Azure cloud into their stores. In these cases, although in-store connectivity is presumably more reliable, self-management of these components will involve additional overhead in terms of monitoring and updates. For more information, see [Select an in-store topology](#).

### **E-commerce platform**

#### **Content management system**

A fully featured content management system (CMS) is integrated directly into the e-commerce platform. In addition to rich indexing features, the CMS provides lifecycle management for marketing materials that supplement the product information that is managed by the headless commerce engine. It includes features for localization and multi-item publishing through releases. The system is built on top of a scalable, resilient Azure infrastructure that includes Azure Active Directory (Azure AD) and Azure Cosmos DB.

#### **Digital asset management**

Commerce digital asset management extends the content management store, and keeps track of images, videos, and file downloads that are served by the web storefront site. Its image resizer service optimizes downloaded images for different devices and contexts. In this way, it helps enhance performance while it also manages image quality. Digital asset management is also integrated with Azure Media Services for efficient playback of video streams.

#### **Web storefront**

The CMS stores its pages as a series of modules. The storefront web server assembles those modules into a rendered HTML page. The web storefront is composed of the rendering platform, the commerce data proxy, and the extensibility layer. Those components form a base that is supplemented by a set of modules that power a web-based commerce experience, the Dynamics 365 Commerce module library. The initial module library can be modified to meet each business's unique requirements. Alternatively, it can be supplemented by extensions and modules that are developed by a partner.

### **Commerce surround services**

#### **Dynamics 365 Fraud Protection**

[Dynamics 365 Fraud Protection](#) is integrated into the e-commerce checkout flows that are managed and processed through the Commerce Scale Unit. The connection to the service is automatically provisioned with the Commerce Scale Unit, and customers who sign up for Dynamics 365 Fraud Protection can enable and configure the integration in Commerce headquarters. The service can run either in "evaluate" mode, so that you can assess the effectiveness of the service, or in "protect" mode, so that you can catch fraudulent transactions by using configured business rules. For more information, see [Dynamics 365 Fraud Protection integration with Dynamics 365 Commerce](#).

#### **Dynamics 365 Customer Insights**

[Dynamics 365 Customer Insights](#) helps you gain a deeper understanding of your customers by connecting data from various transactional, behavioral, and observational sources to create a 360-degree customer view and generate insights. Dynamics 365 Commerce makes it easy for retailers to enable the integration with Dynamics 365 Customer Insights and show the generated insights at the POS. These insights include churn probability and

next best action, and they are valuable because they help sales associates have effective conversations with customers and deliver personalized shopping experiences to them. For more information, see [Dynamics 365 Customer Insights integration with Dynamics 365 Commerce](#).

### **Bing for Commerce**

[Microsoft Bing for Commerce](#) is integrated into Dynamics 365 Commerce to provide consistent product discovery and search experiences across all commerce channels that use the Commerce Scale Unit. In Commerce headquarters, retailers can configure boosting and sinking business rules for product discovery and search experiences. (For example, these rules can be used to boost product discovery for discounted products or remove items that are out of stock.) In this way, retailers can turn shopper frustration and site abandonment into active carts and converted sales. By taking advantage of an out-of-box capability that this integration provides, retailers can let customers use images to search for and discover similar products from a catalog without having to describe them.

### **Product recommendations**

Dynamics 365 Commerce can be used to show product recommendations on the e-commerce website and POS devices. These product recommendations are items that a customer might be interested in, and they are based on the purchase trends of other customers in online and brick-and-mortar stores.

Product recommendations let customers easily and quickly find products that they might want to purchase, and cross-selling and upselling can be used to help customers find additional products that they didn't originally intend to buy. When recommendations are used to assist with product discovery, they can help create more conversion opportunities, increase sales revenue, and enhance customer satisfaction and retention. For more information, see [Product recommendations overview](#).

### **Commerce analytics**

Dynamics 365 Commerce's prepackaged, business-managed commerce analytics solution provides retailers with intelligent insights across all points of the Commerce ecosystem by embedding Power BI reports in Commerce headquarters and POS systems. The commerce analytics solution provides a comprehensive set of out-of-box business and transactional reports, dashboards, and KPIs that take advantage of insights across all channels.

The solution standardizes data from various sources (such as transactional, behavioral, observational, or external data sources) into a unified data model that is hosted in Azure Data Lake Storage. Therefore, organizations can obtain a truly complete view of their business performance across channels. For example, they can analyze the performance of discount promotions, monitor web visits and activity, compare in-store visits and purchases with online purchases, track loyalty redemptions, or do customer recency, frequency, monetary (RFM) analysis.

### **Ratings and reviews**

The Commerce ratings and reviews solution lets online retail customers enter product reviews and ratings through the e-commerce storefront. Retailers can then show averaged ratings and review information across their e-commerce websites. Azure Cognitive Services offers automatic moderation of profane words in 40 languages, and because human approval isn't required, moderation costs are reduced. The system also offers moderator tools that can be used to respond to customer concerns, feedback, and take-down requests, and to address data requests from users. For more information, see [Rating and reviews overview](#).

### **Unified data components**

#### **Azure Data Lake Storage**

Customers who bring their own Azure Data Lake Storage accounts can take advantage of structured business data from back-office operations and clickstream data from the e-commerce storefront. This data flows back into intelligence services such as product recommendations, customer insights, and commerce analytics to power customer-centric business processes and user experiences. Those business processes and user experiences can then be embedded back into Dynamics 365 Commerce headquarters, the POS, and e-commerce storefronts. For more information, see [Make Entity store available as Data Lake](#).

## Dataverse

Dataverse is the unified data store that integrates the data from all your business applications. Dynamics 365 applications such as Dynamics 365 Sales, Dynamics 365 Customer Service, and Dynamics 365 Commerce use Dataverse to store business data. Therefore, Dataverse enables cross-business application scenarios, and can power new scenarios through Power Apps and Power Automate. For more information, see [What is Microsoft Dataverse?](#).

# Dynamics 365 Commerce authentication flows

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of the various authentication flows in Microsoft Dynamics 365 Commerce. Although the Dynamics 365 Commerce solution currently supports several authentication scenarios and flows, the core authentication infrastructure of the Commerce Scale Unit (also known as the headless commerce engine) is fully based on [OpenID Connect](#).

## Authentication methods

Access to each of the application programming interfaces (APIs) on the Commerce Scale Unit is natively restricted by one or more of the following roles:

- **Employee** – Access to APIs associated with this role requires point of sale (POS) device activation (a device token) and an authenticated employee.
- **Customer** – Access to APIs associated with this role requires an authenticated customer. E-Commerce sites generally use these APIs for operations such as retrieving order history and changing customer details.
- **Application** – Access to APIs associated with this role requires application-level authentication, such as Azure Active Directory (Azure AD) service-to-service authentication.
- **Anonymous** – APIs associated with this role are primarily used by e-Commerce sites without user authentication.
- **Customized APIs** – Access to APIs associated with this role can be restricted using any of the methods described above such as POS device activation, customer authentication, and anonymous authentication.

For the full list of Commerce Scale Unit APIs and their access restrictions, see [Commerce Scale Unit customer and consumer APIs](#).

## Supported authentication methods

The following table describes the set of supported authentication methods for APIs that require either POS device activation that generates a device token or user authentication that generates a user token.

API CATEGORY	SCENARIO	SUPPORTED AUTHENTICATION METHOD	REQUIRED SETUP	ADDITIONAL DETAILS
Employee	Dynamics 365 POS authentication flows*	Simple cashier user name and password	In Dynamics 365 Commerce headquarters, configure a user name and password for a worker.	<a href="#">Create a worker</a>
Employee	Dynamics 365 POS authentication flows*	Azure AD credentials	In Commerce headquarters, configure a worker that is mapped to Azure AD credentials.	<a href="#">Enable Azure Active Directory authentication for POS sign-in</a>

API CATEGORY	SCENARIO	SUPPORTED AUTHENTICATION METHOD	REQUIRED SETUP	ADDITIONAL DETAILS
Employee	Dynamics 365 POS authentication flows*	Extended sign-in credentials (for example, by using a bar code or a magnetic stripe reader [MSR])	In Commerce headquarters, configure a worker for extended sign-in.	<a href="#">Set up extended logon functionality for MPOS and Cloud POS</a>
Customer	Dynamics 365 Commerce authentication flows	Site user authentication by using Azure AD B2C	<ol style="list-style-type: none"> <li>1. Create an Azure AD business-to-consumer (B2C) application.</li> <li>2. In Commerce headquarters, add the Azure AD B2C application to the accepted list of identity providers.</li> <li>3. In Commerce site builder, configure the Azure AD B2C application.</li> </ol>	<a href="#">Set up a B2C tenant in Commerce</a> <a href="#">Set up custom pages for user sign-ins</a>
Customer	Dynamics 365 Commerce authentication flows	Site user authentication by using an external identity provider that supports OpenID Connect	<ol style="list-style-type: none"> <li>1. Create an Azure AD B2C application, and configure it to support external identity providers.</li> <li>2. In Commerce headquarters, add the Azure AD B2C application to the accepted list of identity providers.</li> <li>3. In Commerce site builder, configure the Azure AD B2C application.</li> </ol>	<a href="#">Set up a B2C tenant in Commerce</a> <a href="#">Set up custom pages for user sign-ins</a>
Customer	Third-party e-Commerce authentication flows	Site user authentication by using an external identity provider that supports OpenID Connect	In Commerce headquarters, add the external identity provider to the accepted list of identity providers.	<a href="#">Configure authentication providers</a>

API CATEGORY	SCENARIO	SUPPORTED AUTHENTICATION METHOD	REQUIRED SETUP	ADDITIONAL DETAILS
Application	Third-party app or service authentication flows	Azure AD service-to-service authentication/application authentication	In Commerce headquarters, add the external identity provider to the accepted list of identity providers.	

\* Sign-in to POS requires device activation for each terminal. For more information, see [Point of Sale \(POS\) device activation](#).

### Unsupported authentication flows

SCENARIO	UNSUPPORTED AUTHENTICATION METHOD	DETAILS
Dynamics 365 POS authentication flows	Authentication without device activation (that is, without a device token)	All POS-related Commerce Scale Unit APIs require a device activation token for authentication.

## Dynamics 365 POS employee authentication flows

The following illustration shows POS employee authentication flows in Commerce.

# Dynamics 365 Commerce

## Dynamics 365 POS Employee Authentication Flows

### POS DEVICE ACTIVATION

#### 1. GRANT DEVICE ACTIVATION PERMISSION

1.1. IT admin maps Azure AD user to worker in Finance and Operations apps to grant device activation permissions.

#### 2. ACTIVATE DEVICE

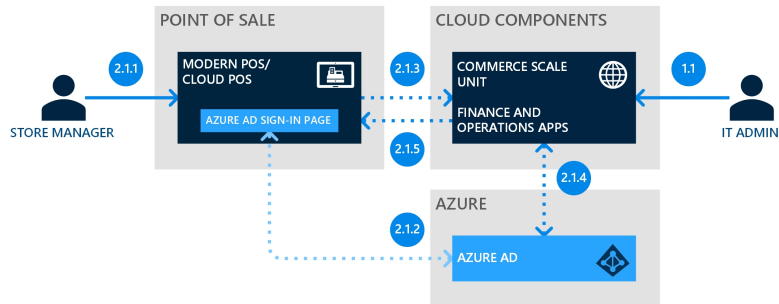

2.1.1. Cashier opens the POS application and signs in with Azure AD credentials.

2.1.2. Azure AD user token is generated via Azure AD.

2.1.3. Azure AD user token is passed to Commerce Scale Unit to activate the device.

2.1.4. Commerce Scale Unit validates Azure AD user token with Azure AD.

2.1.5. Commerce Scale Unit issues device token to the POS application for further authentication.

### POS CASHIER AUTHENTICATION USING SIMPLE USER NAME AND PASSWORD

#### 1. GRANT POS WORKER PERMISSION

1.1. IT admin grants worker permissions for POS sign-in, including worker ID and password.

#### 2. SIGN IN TO POS

2.1. Cashier opens the POS application and signs in with worker credentials maintained in Finance and Operations apps.

2.2. Commerce Scale Unit validates user input against user credentials entered in Finance and Operations apps.

2.3. Commerce Scale Unit generates and issues user token to the POS application for further authentication.

**NOTE:** All subsequent requests are authenticated using the device token and user token.

### POS CASHIER AUTHENTICATION USING EXTENDED SIGN-IN

#### 1. GRANT POS WORKER PERMISSION

1.1. IT admin grants worker permissions for POS sign-in, setting up extended logon capabilities.

#### 2. ENROLL IN EXTENDED SIGN-IN

2.1. Store manager signs in to the POS and enrolls cashier with extended sign-in credentials (for example, bar code or MSR).

2.2. Commerce Scale Unit stores hashed and encrypted authentication credentials.

#### 3. SIGN IN TO POS WITH EXTENDED CREDENTIALS

3.1. Cashier signs in to the POS using extended credentials (for example, bar code or MSR).

3.2. Commerce Scale Unit validates user input against user credentials entered in Finance and Operations apps.

3.3. Commerce Scale Unit generates and issues user token to the POS application for further authentication.

**Note:** All subsequent requests are authenticated using the device token and user token.

### POS CASHIER AUTHENTICATION USING AZURE AD

#### 1. GRANT DEVICE ACTIVATION PERMISSION

1.1. IT admin maps Azure AD user to worker in Finance and Operations apps.

#### 2. SIGN IN TO POS

2.1. Cashier opens the POS application and signs in with Azure AD credentials.

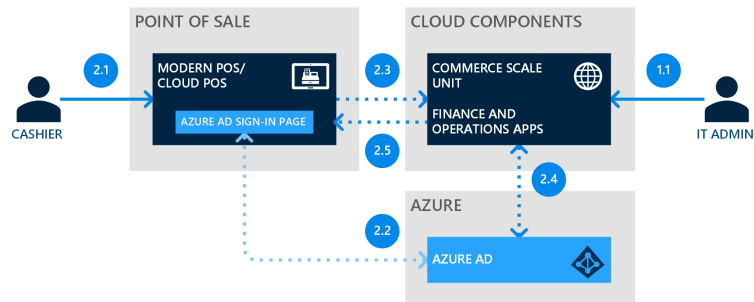

2.2. Azure AD user token is generated via Azure AD.

2.3. Call is made to Commerce Scale Unit to authenticate the user.

2.4. Commerce Scale Unit validates Azure AD user token.

2.5. Commerce Scale Unit generates and issues user token to the POS application for further authentication.

**Note:** All subsequent requests are authenticated using the device token and user token.

The following illustration shows e-Commerce customer authentication flows in Commerce.

## Dynamics 365 Commerce Dynamics 365 E-Commerce Customer Authentication Flows

### E-COMMERCE USER AUTHENTICATION USING AZURE AD B2C AS IDENTITY PROVIDER

#### 1. CONFIGURE AZURE AD B2C APPLICATION

1.1. IT admin creates a new Azure AD B2C application in Azure.

**Note:** Migration of existing customers to the Azure AD B2C instance is supported.

1.2. IT admin adds the Azure AD B2C application to the accepted identity provider list in Finance and Operations apps.

1.3. IT admin configures the Azure AD B2C application in Commerce site builder.

#### 2. SIGN IN TO E-COMMERCE SITE

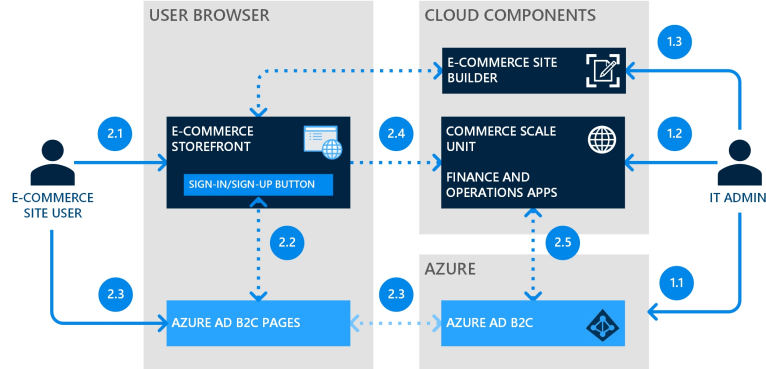

2.1. E-Commerce site user selects the sign-in/sign-up button on the e-Commerce site.

2.2. User is redirected to the Azure AD B2C sign-in/sign-up page.

2.3. E-Commerce site user signs in or signs up on the Azure AD B2C sign-in/sign-up page and receives user token.

2.4. Call is made to Commerce Cloud Scale Unit to validate the user.

2.5. Commerce Scale Unit validates Azure AD B2C user token and creates a new customer record if it does not exist.

### E-COMMERCE USER AUTHENTICATION USING EXTERNAL IDENTITY PROVIDER

#### 1. CONFIGURE AZURE AD B2C APPLICATION

1.1. IT admin configures single sign-on flows on the external identity provider.

1.2. IT admin creates a new Azure AD B2C application in Azure, including policies (for example, password reset), and enables additional external identity providers.

**Note:** Migration of existing customers to the Azure AD B2C instance is supported.

1.3. IT admin adds the Azure AD B2C application to the accepted identity provider list in Finance and Operations apps.

1.4. IT admin configures the Azure AD B2C application for the e-Commerce sign-in and sign-up flows through Commerce site builder.

#### 2. SIGN IN TO E-COMMERCE SITE

2.1. E-Commerce site user selects the sign-in/sign-up button on the e-Commerce site.

2.2. User is redirected to the Azure AD B2C sign-in/sign-up page.

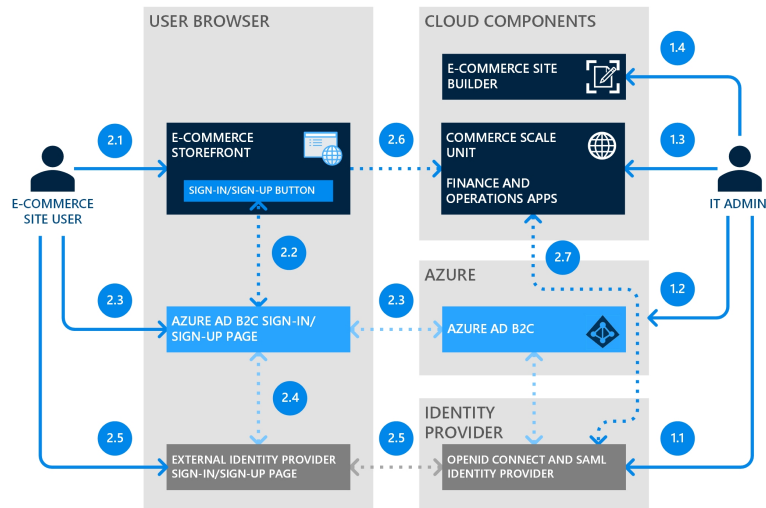

2.3. E-Commerce site user selects the button to be redirected to external identity provider for sign-in/sign-up.

2.4. User is redirected to external identity provider site for sign-in/sign-up.

2.5. E-Commerce site user signs in or signs up on the external identity provider sign-in/sign-up page and receives user token.

2.6. Call is made to Commerce Cloud Scale Unit to validate the user.

2.7. Commerce Scale Unit validates Azure AD B2C user token and creates a new customer record if it does not exist.

## Third-party e-Commerce customer authentication flows

The following illustration shows third-party e-Commerce customer authentication flows in Commerce.

## Dynamics 365 Commerce Third-Party E-Commerce Authentication Flows

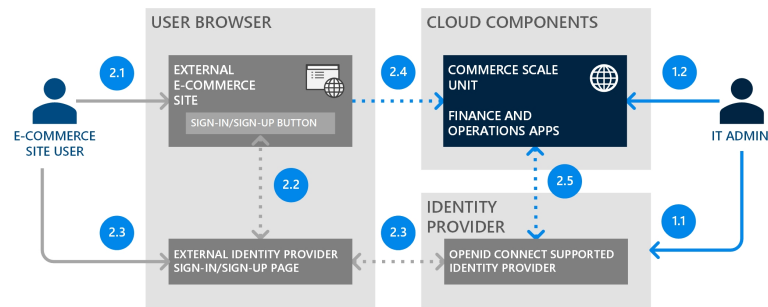

### E-COMMERCE USER AUTHENTICATION USING EXTERNAL IDENTITY PROVIDER

#### 1. CONFIGURE AZURE AD B2C APPLICATION

- 1.1. IT admin configures external identity provider.
- 1.2. IT admin adds the external identity provider to the accepted identity provider list in Finance and Operations apps.

#### 2. SIGN IN TO E-COMMERCE SITE

- 2.1. E-Commerce site user selects the sign-in/sign-up button on the external e-Commerce site.
- 2.2. User is redirected to the sign-in/sign-up page for the external identity provider.
- 2.3. E-Commerce site user signs in or signs up on the external identity provider sign-in/sign-up page and receives user token.
- 2.4. Call is made to Commerce Cloud Scale Unit to validate the user.
- 2.5. Commerce Scale Unit validates user token issued by external identity provider and creates a new customer record if it does not exist.

## Third-party application authentication flows

The following illustration shows third-party application authentication flows in Commerce.

## Dynamics 365 Commerce Third-Party Application Authentication Flows

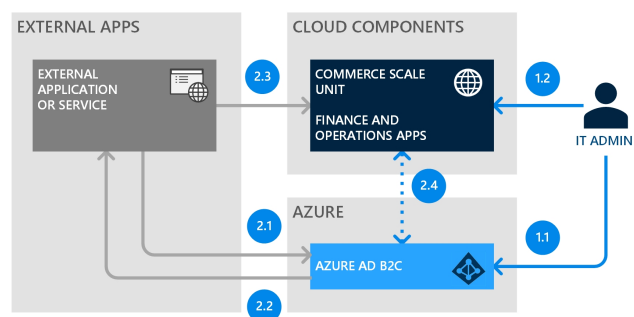

### EXTERNAL APPLICATION OR SERVICE AUTHENTICATION USING AZURE AD APPLICATION AND SECRET

#### 1. CONFIGURE AZURE AD B2C APPLICATION

- 1.1. IT admin creates a new Azure AD application in your Azure AD tenant, using a secret as the form of authentication.
- 1.2. IT admin adds the Azure AD application to the accepted identity provider list in Finance and Operations apps.

#### 2. SIGN IN VIA THIRD-PARTY APPLICATION

- 2.1. Authenticate with Azure AD using the application secret.
- 2.2. Azure AD issues an application token that can be used to authenticate with the Commerce Scale Unit.
- 2.3. Call is made to Commerce Scale Unit using the application token issued by Azure AD.
- 2.4. Commerce Scale Unit validates the Azure AD application token.

# Dynamics 365 Commerce component versioning requirements

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of the component versioning requirements and dependencies for all components in the Microsoft Dynamics 365 Commerce ecosystem.

## Overview

The following illustration shows an overview of Dynamics 365 Commerce components and corresponding versioning requirements and dependencies.

## Component dependencies

### Service updates

To ensure compatibility between all Commerce components that are serviced and deployed by customers and partners, you must follow several versioning dependencies during servicing updates. The following list describes all these dependencies.

- Commerce headquarters and Finance and Operations apps must be on the same version as, or a newer version than, Commerce Scale Unit (both cloud and self-hosted).

For example, if Commerce headquarters and Finance and Operations apps are on version 10.0.16,

Commerce Scale Unit must be on version 10.0.16 or earlier (for example, 10.0.15 or 10.0.14).

- **Commerce Scale Unit must be on the same version as, or a newer version than, Modern Point of Sale (POS), Hardware Station, and the Commerce software development kit (SDK) and associated local site configurations (such as modules, data actions, and themes).**

For example, if Commerce Scale Unit is on version 10.0.16, Modern POS, Hardware Station, and the Commerce storefront must be on version 10.0.16 or earlier (for example, 10.0.15 or 10.0.14).

- **Extension packages must be compiled against the same version as, or a newer version than, the target component that the extension applies to.**

For example, if the deployed Commerce Scale Unit is on version 10.0.16, the corresponding extension packages must be compiled against version 10.0.16 or earlier (for example, 10.0.15 or 10.0.14).

### Quality updates

During quality updates, no specific versioning requirements must be followed for each Commerce component, besides what is required for service updates.

## Current supported versions

The following table describes the current supported versions of various Commerce components as of **January 25, 2021**.

COMPONENT	LATEST AVAILABLE RELEASE (FIRST RELEASE AVAILABLE IN SANDBOX)	LATEST AVAILABLE COMPONENT VERSION NUMBER (FIRST RELEASE AVAILABLE IN SANDBOX)	EARLIEST SUPPORTED RELEASE	EARLIEST SUPPORTED COMPONENT VERSION NUMBER
Finance and Operations apps	10.0.16	10.0.16	10.0.12	10.0.12
Commerce Scale Unit (cloud-hosted)	10.0.16	9.26	10.0.12	9.23
Commerce module library	10.0.16	9.26	10.0.11	9.23
Commerce Scale Unit (self-hosted)	10.0.16	9.26	10.0.8	9.18
Modern POS	10.0.16	9.26	10.0.8	9.18
Hardware Station	10.0.16	9.26	10.0.8	9.18

## One Version requirements

Commerce components follow the same [One Version service updates](#) that were announced in July 2018, and also the subsequently published [flexible service updates for Finance and Operations apps](#) that were announced in June 2019. For more information, see [One Version service updates FAQ](#).

### Cloud components

Customers can pause up to three consecutive updates across the following components. (Three updates correspond to approximately six calendar months.)

- Commerce headquarters and Finance and Operations apps

- Commerce Scale Unit (cloud-hosted)
- Commerce SDK and associated local site configurations (such as modules, data actions, and themes)

For example, customers who are currently on version 10.0.2 can pause updates to versions 10.0.3, 10.0.4, and 10.0.5. However, they must then update to version 10.0.6. In this scenario, after version 10.0.7 becomes available, version 10.0.2 is no longer supported.

### **In-store components**

Customers can pause up to seven consecutive updates across the following components. (Seven updates correspond to approximately twelve calendar months.)

- Commerce Scale Unit (in-store hosted)
- Modern POS
- Hardware Station

For example, customers who are currently on version 10.0.2 can pause updates to versions 10.0.3 through 10.0.9. However, they must then update to version 10.0.10. In this scenario, after version 10.0.11 becomes available, version 10.0.2 is no longer supported.

- [Configure, install, and active Modern POS \(MPOS\)](#)
- [Configure and install Retail hardware station](#)
- [Package configurations and deploy them to an online channel](#)

### **Extensibility and packing**

For more information about serviceability for extensions, see [Create deployable packages](#).

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

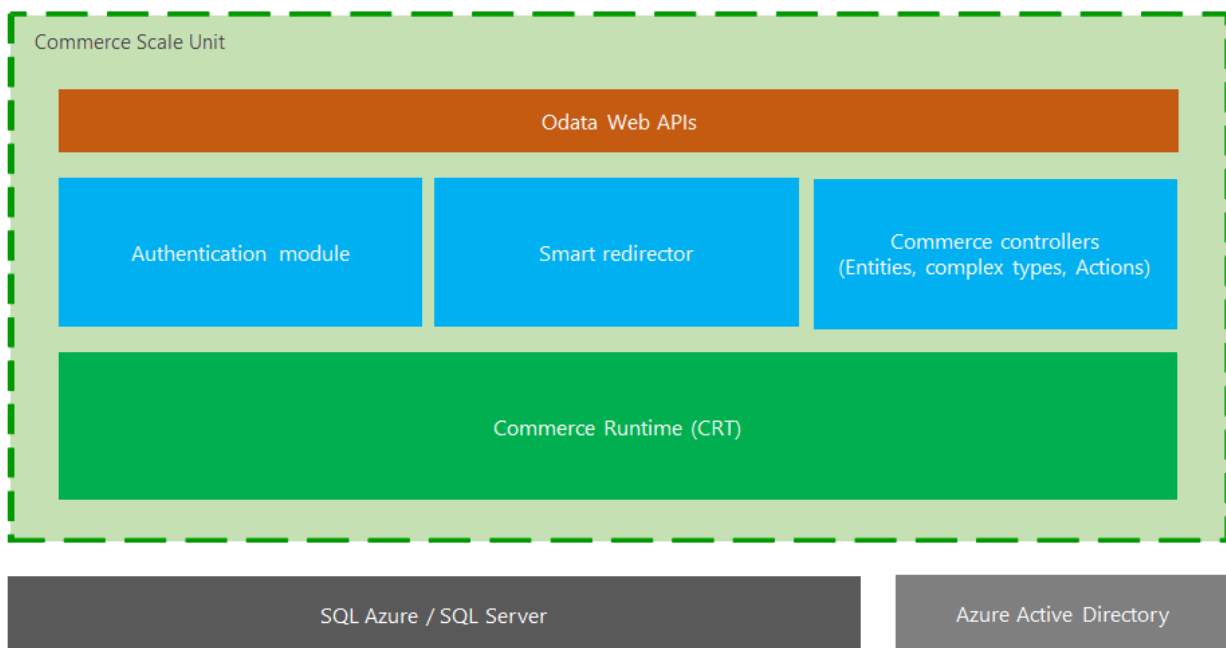

# Commerce Scale Unit architecture

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes the architecture of Commerce Scale Unit. Commerce Scale Unit provides stateless services and business logic for Modern Point of Sale (MPOS) and E-Commerce clients.

## Commerce Scale Unit architecture

The commerce runtime is wrapped in a Commerce Scale Unit layer. Commerce Scale Unit uses a web API and OData to support thin clients both in the store and online on tablets and phones. The commerce runtime communicates with Headquarters through Commerce Data Exchange services. The following diagram shows the architecture of Commerce Scale Unit.

Commerce Scale Unit uses the following concepts.

CONCEPT	DESCRIPTION
Entity type	An entity type is an entity that has a life cycle that you want to monitor. Each entity type has a key. An example of an entity type is <b>Customer</b> .
Complex type	A complex type is an OData concept that is designed to prevent duplication by grouping specific related properties. These related properties can be reused in multiple entities. For example, <b>Customer</b> is an entity type that has a customer address. This customer address is a wrapper that contains an address line, city, state, and ZIP/postal code. Therefore, <b>Customer address</b> is a complex type that can be reused by other entity types. For example, the <b>Order</b> entity type requires the same address information that is associated with the <b>Customer</b> entity type and therefore reuses the <b>Customer address</b> complex type.

CONCEPT	DESCRIPTION
Controller	<p>A controller is a mapping for an entity type that controls create, read, update, and delete (CRUD) behaviors and actions for the entity type. A controller is provided for each commerce entity. You can customize the following controllers:</p> <ul style="list-style-type: none"> <li>• Carts</li> <li>• Catalogs</li> <li>• Categories</li> <li>• Commerce</li> <li>• Commerce Lists</li> <li>• Composite Key Entity</li> <li>• Controller Assembly Resolver</li> <li>• Customers</li> <li>• Employees</li> <li>• Non-Bindable Action</li> <li>• Org Units</li> <li>• Picking Lists</li> <li>• Products</li> <li>• Purchase Orders</li> <li>• Sales Orders</li> <li>• Shifts</li> <li>• Stock Counts Journals</li> <li>• Transfer Orders</li> </ul>
Metadata	<p>Metadata defines the contract between the client and the server.</p>

You can create your own entity type or complex type, extend an existing controller, add a new controller, and customize the metadata. If you customize the commerce runtime, you must also customize various components in Commerce Scale Unit to expose those changes to your Retail Modern POS clients.

**NOTE**

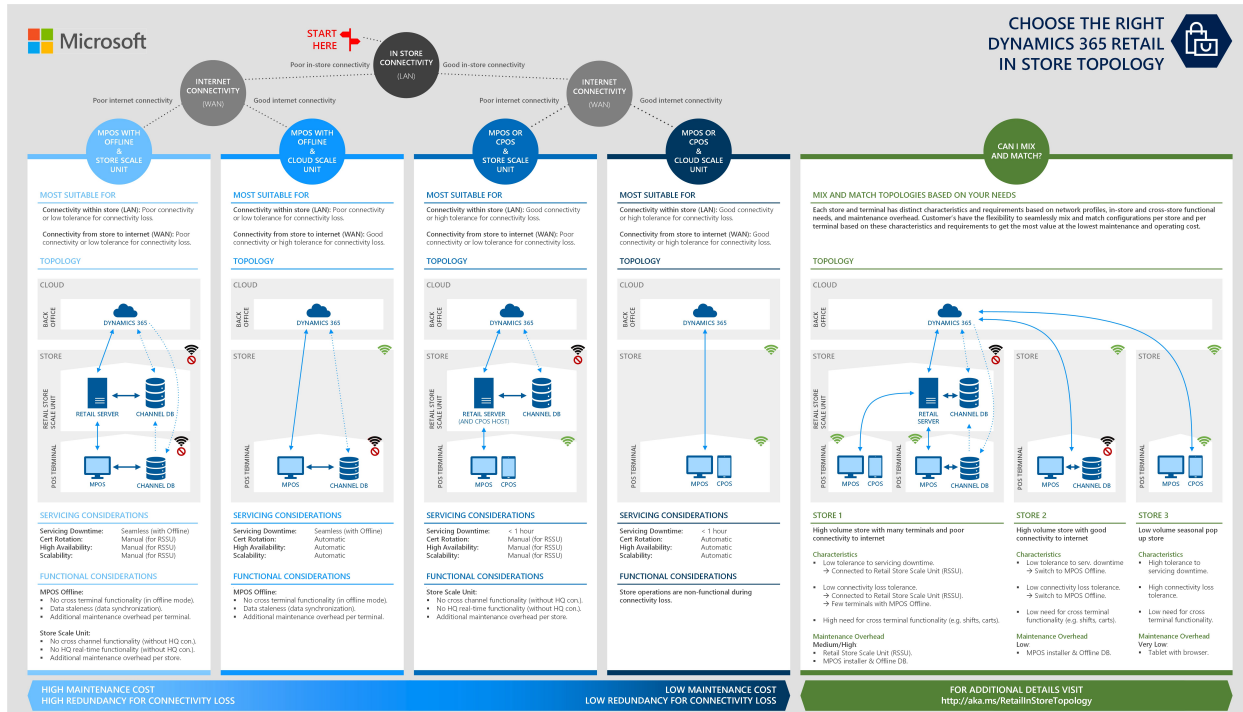

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Select an in-store topology

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of the various Dynamics 365 Commerce in-store topologies.

## Supported capabilities when connectivity is lost

OPERATION	WITHOUT CONNECTIVITY TO COMMERCE SCALE UNIT (IN MPOS OFFLINE MODE)	WITHOUT CONNECTIVITY TO HQ (COMMERCE SCALE UNIT (SELF-HOSTED))
Cross terminal shifts (such as view, suspend, resume, close)		✓
Cross terminal transactions (such as view, suspend, resume)		✓

## Supported operations when connectivity is lost

For a list of operations that are supported when the POS loses connectivity to the HQ, see [Online and offline point of sale \(POS\) operations](#).

## Supported deployment and maintenance capabilities

Mass deployment is supported in Modern POS, but not in Commerce Scale Unit. For more information, see [Mass deployment of self-service components](#).

## Deployed components

The following components are deployed through a single installer. This means that they do not need to be installed individually.

## Modern POS

DEPLOYED COMPONENT	COMPONENT TYPE	NOTES
Modern POS App	Universal Windows Platform (UWP) Application	The Modern POS application running on the register.
Modern POS Client Broker	COM Surrogate hosting native binaries for the Modern POS	Hosts the Commerce Runtime to support operations to execute in offline mode as well as Async Client Libraries needed to synchronize data between the Modern POS and the HQ.
Channel Database	SQL Database	Register specific Channel Database instance hosting data for the register.

## Commerce Scale Unit (self-hosted)

INSTALLED COMPONENT	COMPONENT TYPE	NOTES
Commerce Scale Unit (self-hosted)	IIS Web Service	Scale unit specific Commerce Scale Unit (self-hosted) instance used by one or more stores.
Channel Database	SQL Database	Scale unit specific Store specific Channel Database instance hosting data for one or more stores.
Async Client Service	Windows Service	Component to synchronize master record data from the HQ to the store and transactional data from the store to the HQ.
Cloud POS	IIS Web Service	Cloud POS application that hosts POS functionality through a web browser.

## Additional resources

### MPOS offline mode

For more information about MPOS offline mode, see:

- [Offline point of sale \(POS\) functionality](#)
- [Online and offline point of sale \(POS\) operations](#)
- [Mass deployment of self-service components](#)

### Commerce Scale Unit (self-hosted)

The Commerce Scale Unit (self-hosted) is a set of components that can be deployed in a customer environment, such as inside a store, that can support continuous operations if connectivity to the back office or headquarters (HQ) is lost.

For more information, see:

- [Configure and install Commerce Scale Unit \(self-hosted\)](#)
- [Commerce Scale Unit \(self-hosted\)](#)

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce Data Exchange best practices

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic is intended for people who implement functionality that is related to data synchronization, Commerce Data Exchange (CDX), in a Microsoft Dynamics 365 Commerce environment. It gives best practices advice for implementations.

## Overview

Proper data configuration and data synchronization are crucial to correctly functioning implementation. Regardless of business requirements, IT infrastructure, and overall preparedness, if data isn't correctly synchronized, the whole environment is effectively useless. Therefore, a top priority is to understand what is required to configure, generate, synchronize, and verify data across the full implementation from Commerce headquarters through the Commerce Scale Unit to the brick-and-mortar stores that use Modern POS with an offline database.

Before you go through this topic, it's important that you understand the concepts of a channel (store), registers and devices, and the Modern POS offline database. Therefore, we recommend that you review some of the resources at the end of this topic, such as the Device management implementation guide and the overview of the Commerce architecture.

The main content of this topic is organized into tables, where the first column includes lists of tag-like "associated areas" to help you more quickly find best practices that are related to your areas of concern. For new implementations, you might find it useful to copy these tables to a location where you can check off the various best practices as they are completed. In this way, you can help ensure that the implementation is prepared as well as possible before you move forward to production.

## Updating configurations

The following should be performed after every update to the Dynamics 365 environment.

ASSOCIATED AREAS	BEST PRACTICE
<ul style="list-style-type: none"><li>Parameters</li><li>Commerce scheduler</li><li>Initialization</li></ul>	Go to <b>Retail and Commerce &gt; Headquarters setup &gt; Commerce scheduler &gt; Initialize commerce scheduler</b> . You will be asked if you would like to proceed with initializing the base configuration data for Commerce scheduler. Performing this action after every update is key to maintaining functionality as it correctly sets the configuration data for new tables or columns. There is also a parameter to <b>Delete existing configuration</b> . Unless explicitly told to do so or working on a non-production environment where losing configuration will not create an impact, leave this set to <b>No</b> .

## Valuable configurations

ASSOCIATED AREAS	BEST PRACTICE
<ul style="list-style-type: none"> <li>• Parameters</li> <li>• Commerce scheduler</li> <li>• Retry</li> </ul>	<p>Go to <b>Retail and Commerce &gt; Headquarters setup &gt; Parameters &gt; Commerce scheduler parameters</b>, and set <b>Try count</b> to <b>3</b>. If the value of this field is too high, download sessions might fail during high-usage times. Additionally, verify (or set) <b>Full dataset generation interval in days</b> to <b>0</b>. This means full dataset generation will not occur unless required by something other than time. Setting these values allows CDX to function in a more expected manner while reducing possible error or performance issues.</p>
<ul style="list-style-type: none"> <li>• Functionality profile</li> <li>• Data retention</li> <li>• Return policy</li> </ul>	<p>Go to <b>Retail and Commerce &gt; Channel setup &gt; POS setup &gt; POS profiles &gt; Functionality profile</b>, and then, in the <b>Functions</b> section, set <b>Days transactions exist</b> to a value that is the same as, or close to the value that is defined for the return policy. For example, if the return policy states an item can be returned within 30 days, set this field to <b>30, 31, or 60</b> if special exceptions are allowed beyond the usual policy (this would be twice the usual policy, allowing for faster returns even beyond the usual policy limits).</p>
<ul style="list-style-type: none"> <li>• Channel database group</li> <li>• Distribution schedule</li> <li>• Offline profile</li> <li>• Pause</li> <li>• Data</li> <li>• Download</li> </ul>	<p>We highly recommend that you have either a "dummy" channel database group (that is, a group that isn't associated with any distribution schedule job) that you assign to the newly generated terminals, or a special offline profile where the <b>Pause offline synchronization</b> option is set to <b>Yes</b>. In this way, data generation can occur when it's required and when the system is most available to do it. (However, the system might pause multiple times as required.)</p>

## Practices that affect performance

ASSOCIATED AREAS	BEST PRACTICE
------------------	---------------

ASSOCIATED AREAS	BEST PRACTICE
<ul style="list-style-type: none"> <li>• Channel database group</li> <li>• Offline profile</li> <li>• Pause</li> <li>• Data</li> <li>• Download</li> </ul>	<p>Don't generate data for offline databases until that data is required so that an offline database can be used. The following scenario shows why this best practice is important.</p> <p>A new Modern POS offline database that has been added to the relevant channel database group inherits all existing download sessions since the last full database synchronization occurred. One hundred new Modern POS instances that have offline terminals are created, and a full synchronization hasn't occurred in two months. Only five scheduler jobs have actual changes every 20 minutes. (For example, these changes might involve prices and discounts, or customers, which can be updated often.) In this scenario, up to 2,000,000 download sessions are immediately generated and must be applied, regardless of whether the newly created terminals are activated and capable of applying this data.</p> <p>Even at the best times, this type of exceptional data generation is large and affects performance. At the worst (that is, busiest) times, it severely impairs the environment's performance. Therefore, we highly recommend that you either have a "dummy" channel database group (that is, a group that isn't associated with any distribution schedule job) that you assign to the newly generated terminals, or set the <b>Pause offline synchronization</b> option for the offline profile to <b>Yes</b>. By setting the <b>Pause offline synchronization</b> option to <b>Yes</b>, you stop data generation for anything that uses the offline profile. Therefore, data generation can occur only when it's required, instead of constantly, and only when the system is most available to do it. (However, the system might pause multiple times as required.)</p>
<ul style="list-style-type: none"> <li>• Distribution schedule</li> <li>• Scheduler jobs</li> <li>• Upload</li> </ul>	<p>No more than one P-job (upload batch job) should occur at any time. If multiple P-job upload batch jobs are created that might occur in parallel, table locking and delays (performance degradation) could occur while data of the uploaded transactions is being applied. The job doesn't have to occur multiple times at the same time. It can just occur frequently.</p>

ASSOCIATED AREAS	BEST PRACTICE
<ul style="list-style-type: none"> <li>Parameters</li> <li>Commerce scheduler</li> <li>Post database sync</li> </ul>	<p>Go to <b>Retail and Commerce &gt; Headquarters setup &gt; Parameters &gt; Commerce scheduler parameters</b>. Under the <b>Post database sync</b> sub-heading, there are two fields that can impact performance for different reasons.</p> <p><b>Clean up irrelevant master data after sync</b> performs the store procedure <b>Strip Master Data</b> after each CDX download session is executed. This step deletes unnecessary records that were included in package generation, but not necessary for the offline functionality for that specific device as a member of a specific store (channel). This feature assists in minimizing the data stored in the offline database. A smaller database can assist performance and minimize size issues if using an Express version of SQL. It is recommended to test this feature in Sandbox first as some custom SQL views could introduce dependencies between tables that this functionality is not aware of, resulting in errors in functionality.</p> <p><b>Optimize database statistics automatically</b> runs an update on the table statistics for each table in the CDX download session applied to the channel database. Outdated table statistics cause more performance issues than fragmented indexes. When enabled, it is also recommended to add a specific flag into the configuration parameters. If using this, go to <b>Retail and Commerce &gt; Headquarters setup &gt; Parameters &gt; Commerce shared parameters</b>, navigate to the <b>Configuration parameters</b> listing, and enter the new flag <b>CDX_ENABLE_UPDATE_STATISTICS_FOR_REQUIRED_T</b> <b>ABLE</b> with the value <b>1</b>. Note that in a future release this configuration parameter will be automatically added to all environments, but it is valuable to verify that it exists.</p>

# Commerce Data Exchange and commerce channel communications

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of Commerce Data Exchange and its components. It explains the part that each component plays in the transfer of data between Microsoft Dynamics 365 Commerce Headquarters and channels.

## Overview

Commerce Data Exchange is a system that transfers data between Headquarters and channels, such as online stores or brick-and-mortar stores. The database that stores data for a channel is separate from the Commerce database. The channel database holds only the data that is required for transactions. Master data is configured in Headquarters and distributed to channels. Transactional data is created in the point of sale (POS) system or the online store, and then uploaded to Headquarters. Data distribution is asynchronous. In other words, the process of gathering and packaging data at the source occurs separately from the process of receiving and applying data at the destination. For some scenarios, such as price and inventory lookups, data must be retrieved in real time. To support these scenarios, Commerce Data Exchange also includes a service that enables real-time communication between Headquarters and a channel.

## Async Service

Microsoft SQL Server change tracking on the Commerce database is used to determine the data changes that must be sent to channels. Based on a distribution schedule, Headquarters packages that data and saves it to central storage (Azure blob storage). A separate batch process uses the Commerce Data Exchange: Async Client library to insert this data package into the channel database.

## Commerce scheduler

Scheduler jobs are the mechanism for distributing data to and from locations. Jobs are made up of subjobs, which specify the tables and table fields that contain the data to distribute. Headquarters includes predefined scheduler jobs and subjobs that meet the replication requirements of most organizations. The following types of predefined jobs are created:

- **Download jobs** – Download jobs send data that has changed from Headquarters to channel databases. Modifications to records are tracked through SQL Server change tracking.
- **Upload jobs (P jobs)** – Upload jobs pull sales transactions from a channel into the Commerce database. P jobs upload data incrementally. When a P job runs, the Async Client library checks the replication counter for records that have already been received from a location. A record is uploaded only if its replication counter is

more than the largest value that is found. P jobs don't update data that was previously uploaded.

The distribution schedule is used to run the data transfer, either manually or by scheduling a batch job in Headquarters. A distribution schedule can contain one or more channel data groups, and one or more scheduler jobs. To ensure that the scheduler jobs are running smoothly, do not rename the "Default" database configured for the instance, and do not create a second database. All non-Commerce Scale Unit databases are managed by Microsoft, and only one default database is expected.

## Realtime Service

Commerce Data Exchange: Real-time Service is an integrated service that provides real-time communication between Headquarters and channels. Real-time Service enables individual POS computers and online stores to retrieve specific data from Headquarters in real time. Although most key operations can be performed in the local channel database, the following scenarios require direct access to the data that is stored in Headquarters:

- Issuing and redeeming gift cards
- Redeeming loyalty points
- Issuing and redeeming credit memos
- Creating and updating customer records
- Creating, updating, and completing sales orders
- Receiving inventory against a purchase order or transfer order
- Performing inventory counts
- Retrieving sales transactions across stores and completing return transactions

A predefined Real-time Service profile is created.

# Commerce Data Exchange troubleshooting

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic is intended for IT personas that are implementing functionality that is related to data synchronization (Commerce Data Exchange [CDX]) in a Microsoft Dynamics 365 Commerce environment. It provides information that will help you troubleshoot CDX in implementations.

## Overview

Data configuration and synchronization are crucial to correct implementation. Regardless of business requirements, IT infrastructure, and overall preparedness, if data isn't correctly synced, the whole environment is effectively useless. Therefore, it's crucial that you understand the process of troubleshooting any issue that is related to data synchronization, from Commerce headquarters, through the Commerce Scale Unit, to the brick-and-mortar stores that use Modern POS (either with or without an offline database) and other in-store components. This topic provides some general guidance about how to mitigate or fix some issues. It also provides information about the best time to create a support request and the most important data to provide if you want to speed up a support request.

Before you go through this topic, it's important that you understand the concepts of a channel (store), registers and devices, and the Modern POS offline database. Therefore, we recommend that you review some of the resources at the end of this topic, such as the CDX implementation guide and the overview of the Commerce architecture.

## Troubleshooting

If an error that occurs doesn't appear in the following table, create a support request, as required, so that Microsoft Support can help you fix the issue. This topic is focused on issues that you can work on directly, without the help of Microsoft Support, and issues that you can directly see but can't fix without the help of Microsoft Support.

ERROR	DESCRIPTION
You receive the following error message: "System.ArgumentNullException: Value cannot be null.Parameter name: connectionString at Microsoft.Dynamics.Retail.CommerceDataExchange.SqlTargetRequestHandler."	An error has occurred because of batch job statuses. (You can see the error in a failed download job on the <b>Download sessions</b> page.) Go to <b>System administration &gt; Inquiries &gt; Batch jobs</b> , find the data writing batch that is associated with the Commerce Scale Unit that the download job was supposed to be applied to, and change the batch job's status to <b>Withhold</b> . In environments that are earlier than version 10.0.12, we recommend that you also create a channel database group that is named <b>Legacy</b> , associate the <b>Default</b> channel database with this new group, and then exclude the new database group from all distribution schedules. CDX jobs should no longer be generated for the <b>Default</b> channel database in the <b>Legacy</b> group.

ERROR	DESCRIPTION
<p>You can't perform the <b>Run now</b> command from the <b>Distribution schedule</b> page unless batch processing is used.</p>	<p>This change was intentionally made in version 10.0.11 because of performance issues that occurred if jobs were run during times when environments were most heavily used. In another change that was made as part of this feature enhancement, recurrence can't be used when the <b>Full data sync</b> command (full job synchronization) is run from the <b>Channel database</b> page in Commerce headquarters. Only a single occurrence can be run. We don't recommend that you change this behavior. However, if you're in a development environment, you can change it by going to <b>Commerce shared parameters &gt; Configuration parameters</b> and setting a new name, <b>CDX_DISABLE_FORCESCHEDULEINBATCH</b>, that has a value of 1.</p>
<p>You receive the following error message: "Microsoft.Dynamics.Retail.CommerceDataExchange.SqlWriteRequestRunException: Failed to run SqlWriteRequestRunner for table AX.&lt;TABLE NAME&gt;."</p>	<p>An error has occurred because the length of one or more <b>DBO</b> tables has been extended, so that truncation of data was required. Therefore, a truncation failure has occurred. Generate a support request. For best practices, see <a href="#">Enable custom Commerce Data Exchange synchronization via extension</a>. These best practices include removing the extended data type (EDT) extension on the table field that is being edited and using the CDX extension table to store the long (full) value that is required.</p>
<p>The download session is failing. The error message states, "...tried too many times."</p>	<p>Go to <b>Retail and Commerce &gt; Headquarters setup &gt; Parameters &gt; Commerce scheduler parameters</b>, and set the <b>Try count</b> field to 3. If the value of this field is too high, download sessions might fail during high-usage times. After you complete this step, the job will set its status to <b>Canceled</b> and stop retrying itself. We recommend that you to read <a href="#">Commerce Data Exchange best practices</a>.</p>
<p>You can't cancel a running CDX job.</p>	<p>If this issue occurs in a production environment, sign in to Microsoft Dynamics Lifecycle Services (LCS), and create a request for immediate support. If the issue occurs in a non-production environment, create a support request.</p>
<p>You use LCS to copy a Commerce headquarters database between environments, but the target environment also uses Commerce Scale Unit (Cloud) (previously known as Retail Cloud Scale Unit).</p>	<p>Create a support request, and specify whether it's acceptable to delete and reprovision the Commerce Scale Unit (Cloud), or whether the Commerce Scale Unit must be maintained as it currently exists. In both cases, downtime will be required.</p>
<p>CDX or environment issues occur after you change the value of the <b>Days transactions exist</b> field in the functionality profile.</p>	<p>If the <b>Days transactions exist</b> value is reduced by a large amount, one or more tables might become locked while purging occurs. Before you reduce the value by a large amount, we recommend that you generate a support request. Microsoft Support can remove the data before the value is changed. In this way, the database impact of the change will be minimized.</p>

ERROR	DESCRIPTION
<p>After you add multiple POS terminals, download sessions take a very long time, or there is overall Commerce headquarters slowness.</p>	<p>When you create a new Modern POS offline database and add it to the relevant channel database group, it inherits all existing download sessions since the last full database synchronization occurred. Even at the best of times, the exceptional data generation that might occur can be too large and therefore affect performance. At the worst (that is, busiest) of times, it can severely impair the environment's performance. We highly recommend that you have either a "dummy" channel database group (that is, a group that isn't associated with any distribution schedule job) that you assign to the newly generated terminals or a special offline profile where the <b>Pause offline synchronization</b> option is set to <b>Yes</b>. In this way, data generation can occur when it's required and when the system is most available to do it. (However, the system might pause multiple times as required.) If it's too late to use this approach, create a support request.</p>
<p>Normal, incremental (delta) synchronization takes much too long, even though the number of affected rows is small.</p>	<p>This issue can occur when a new channel (store) is created, because all the data must be re-created for the new store. We highly recommend that you have a "dummy" channel database that is associated with a "dummy" channel database group, and assign it to the newly generated channel (store). In this way, data generation can occur when it's required and when the system is most available to do it. If it's too late to use this approach, create a support request.</p>
<p>The P-job fails to create an upload session, and you receive the following error message: "System.Data.SqlClient.SqlException (0x80131904): Violation of PRIMARY KEY constraint 'PK_UPLOADSESSION'. Cannot insert duplicate key in object 'crt.UPLOADSESSION'."</p>	<p>If this issue occurs in a production environment, sign in to LCS, and create a request for immediate support. If the issue occurs in a non-production environment, create a support request.</p>
<p>When you try to download an upload session package from the <b>Upload sessions</b> page in Commerce headquarters, you receive the following error message: "Record for Id - &lt;Number&gt; not found."</p>	<p>Create a support request.</p>
<p>CDX download sessions fail to be applied, and you receive the following error message: "Failed to get download session package URI."</p>	<p>If this issue occurs in a production environment, sign in to LCS, and create a request for immediate support. If the issue occurs in a non-production environment, create a support request.</p>
<p>No download sessions are applied, and no upload sessions are created.</p>	<p>If this issue occurs in a production environment, sign in to LCS, and create a request for immediate support. If the issue occurs in a non-production environment, create a support request.</p>
<p>Upload sessions fail, and you receive the following error message: "Infolog for task Default:P-0001 (...) Error when bulk inserting data. Target table: RetailListingStatusLog."</p>	<p>An error has occurred because the upload session package contains multiple records in the <b>RetailListingStatusLog</b> table. These records have the same <b>StatusDateTime</b> value between two or more. If this issue occurs in a production environment, sign in to LCS, and create a request for immediate support. If the issue occurs in a non-production environment, create a support request.</p>

ERROR	DESCRIPTION
When a cashier tries to switch to offline mode or is forced offline, the switch fails.	There are many possible causes. First, verify basic information: Does the computer have available hard drive space? If you're using SQL Server Express, is the size of the offline database at the 10 gigabyte (GB) limit? Are there pending download sessions for the register? (Pending download sessions indicate that the register is no longer up to date. Therefore, offline switching might temporarily be prevented.) Additionally, we recommend that you contact Microsoft Support. If this issue occurs in a production environment, sign in to LCS, and create a request for immediate support. If the issue occurs in a non-production environment, create a support request.

# Modern POS (MPOS) architecture

2/18/2021 • 2 minutes to read • [Edit Online](#)

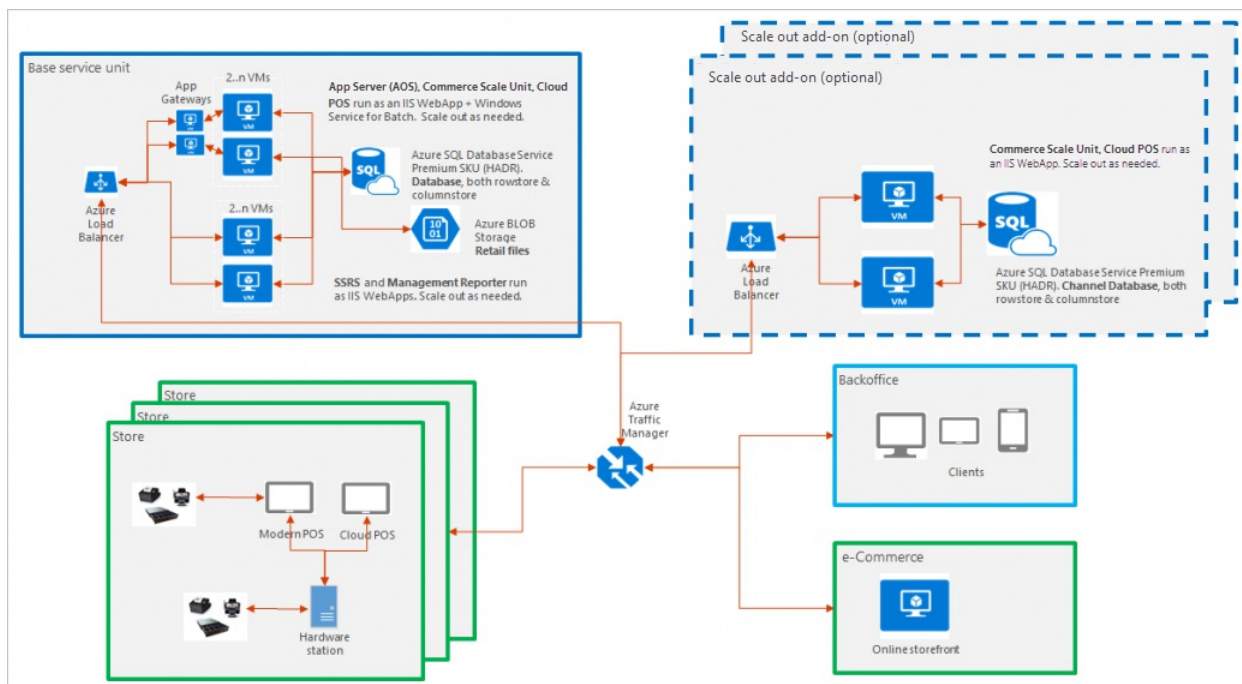

This topic describes the POS topology.

## Modern POS topology

Users of Modern Point of Sale (POS) can perform various tasks on supported laptops, tablets, and phones. These tasks include processing sales transactions, viewing customer orders, managing daily operations and inventory, and viewing role-based reports. Both MPOS and Cloud POS are available in Microsoft Dynamics 365 Commerce.

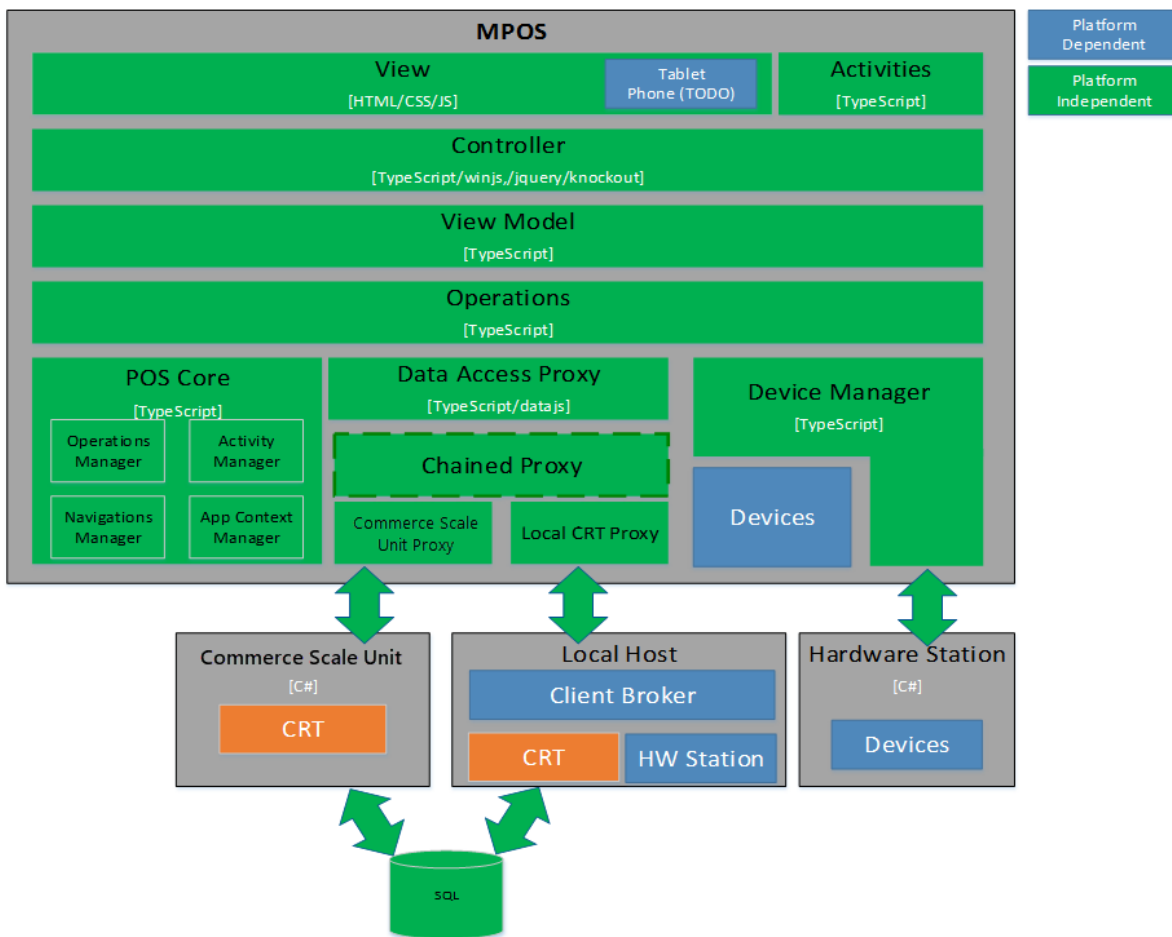

The Cloud POS is a hosted version of the POS app. Both the POS clients don't perform business functions or data processing. All business functions are provided by Commerce Scale Unit. Modern POS and Cloud POS clients can communicate with Commerce Scale Units. Modern POS client can also communicate with peripheral devices, such as cash drawers, credit card readers, and printers, by using Hardware Station. Hardware Station must be deployed in your store, and all Modern POS clients can connect to the same Hardware Station.

The following diagram shows the high-level topology.

## Modern POS architecture

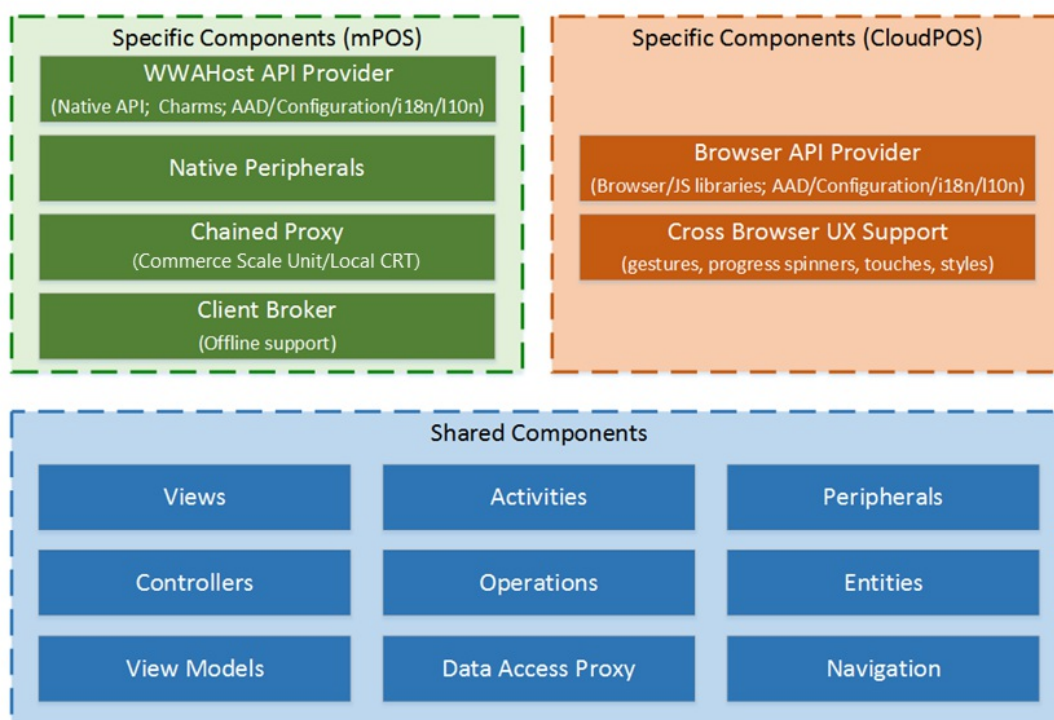

The view, view-controller, and devices layers depend on the operating system (for example, Windows RT) that you plan to deploy Modern POS on. The other layers are independent of the operating system. These layers use TypeScript classes and modules to implement Modern POS functionality such as workflows and entities. The following diagram shows the Modern POS technical architecture.

## Cloud POS and Modern POS architecture

Cloud POS is a hosted version of Modern POS, and varies only in the way that it is rendered on specific devices or in specific browsers. Additionally, Modern POS supports offline mode and therefore a local CRT. Other native peripheral support is also specific to Modern POS.

## CloudPOS v. mPOS. Shared and Specific Components

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Online store publishing architecture

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic contains conceptual information to help developers and system administrators understand how channels and catalogs are published from the commerce module to an online store in Microsoft SharePoint 2013 Products. Understanding the publishing process can help you develop, manage, and troubleshoot your online store.

## Publish an online store channel

When you publish a Commerce online store channel, you replicate the basic structure of your online store between Microsoft Dynamics 365 Commerce and Microsoft SharePoint. You create the basic structure of your online store channel in the **Commerce** module. Before you can publish an online store channel, you must complete the following setup tasks:

1. Add the online store to the organization hierarchy.
2. Create the online store and configure properties.
3. Configure the category hierarchy of your site.

After you've completed these steps, you're ready to publish the product schema to the online store.

1. You create the online store and publish it from the **Online stores** page. The status is changed from **Draft** to **In progress**.
2. Finances and Operations takes a snapshot of the category hierarchies (the Commerce hierarchy) and properties.
3. Commerce Data Exchange: Async Server reads information about the online store, hierarchies, and properties in the Commerce store database, and sends that information to the commerce runtime (CRT).
4. Async Server synchronizes the tables in the channel database.
5. The Commerce publishing job runs from the CRT application programming interface (API) and creates hierarchies for the site that you created in the online store.
6. Commerce Data Exchange: Real-time Service receives the status of the publishing job actions from the CRT API and publishes that status. The status is either **Published** or **Error**.

For the specific procedures to publish a channel, see [Set up an online store](#). After you've published the channel, you can publish a catalog.

## Publish an online store catalog

A product catalog lets you identify the products that you want to offer in your online stores. When you create a catalog, you identify the online stores where the products will be offered, add products, and enhance the product offerings by adding merchandising details. After the catalog is approved, you publish it to make products available in the online store. Before you can publish a product catalog, you must complete the following setup tasks:

1. Set up products, and configure hierarchies, assortments, and variants.
2. Set up product catalogs, and configure attribute groups and workflow.

After you've completed these steps, you're ready to publish the online store catalog.

1. Finances and Operations reads the product tables in the Commerce database.
2. Async Server synchronizes all products in the channel database.

3. The CRT/Publishing Connector creates a *listing*. A listing is an instance of a product for a channel at a given point in time. For example, you have a product that is named “jeans”, and this product has a variant that is named “red”. In this case, the system creates a listing for “red jeans”.
4. The system determines whether any new attributes were added for the listing. If new attribute were added (for example, if the “red jeans” listing includes a new attribute that is named **texture**, and this attribute is marked as **Included** at the channel level), the system creates a custom site column for that attribute. The system also creates a new rule for the list item and completes the process in SharePoint by creating a new row for the “red jeans” listing.
5. The CRT records the publishing status for the listing.
6. Async Server synchronizes the publishing status of the listing with all other publishing statuses. The status is either **Published** or **Error**.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Retail channel performance PowerBI.com solution

2/18/2021 • 3 minutes to read • [Edit Online](#)

## NOTE

This PowerBI.com solution has been deprecated as documented in [Power BI content packs available on AppSource](#).

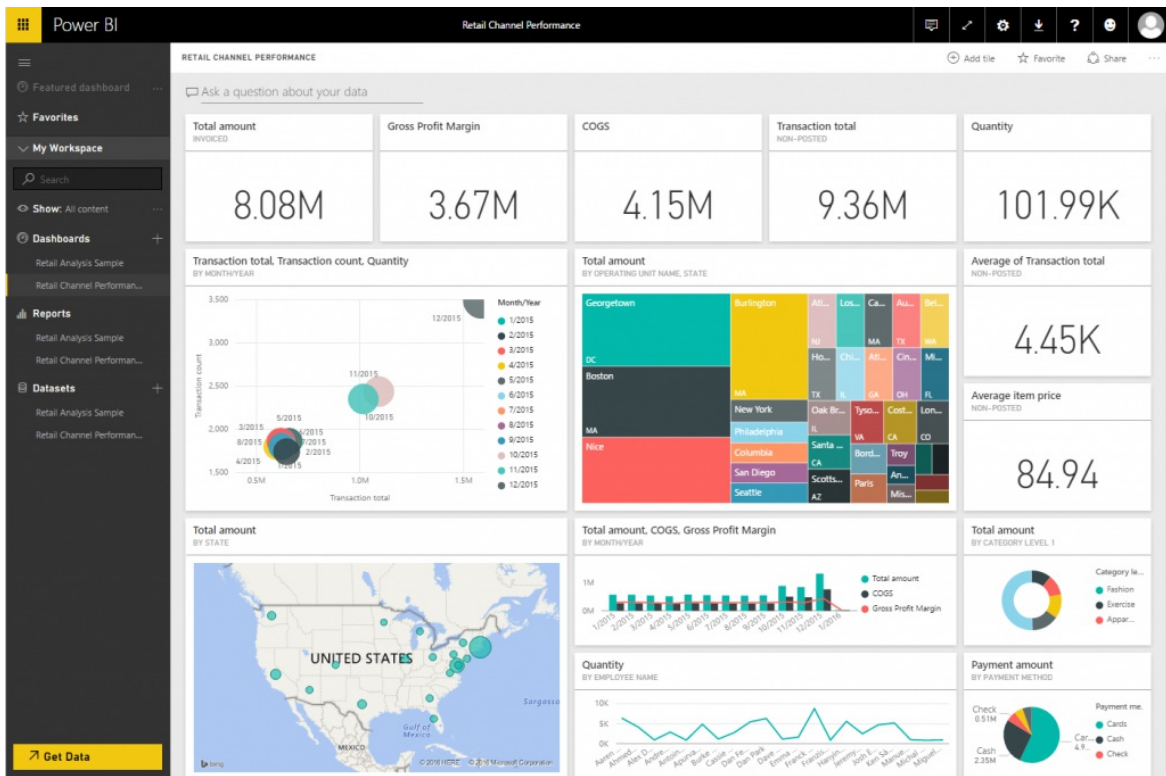

This topic provides information about the Retail channel performance PowerBI.com solution for Dynamics AX. This PowerBI.com solution lets channel managers quickly build channel performance analytics to predict trends and uncover insights, based on sales performance.

The Retail channel performance PowerBI.com solution lets you quickly build your channel performance analytics. The PowerBI.com solution is designed specifically for channel managers who focus on sales performance to predict trends and uncover insights. Its components draw directly from Retail and commerce data in the Dynamics AX database, and provide drill-down reports about organization-wide sales performance across global geography by employee, category, product, terminal, channel, and more. Power BI automatically creates reports and dashboards that give you a great starting point for exploring and analyzing your Retail and commerce data. This article includes the following information:

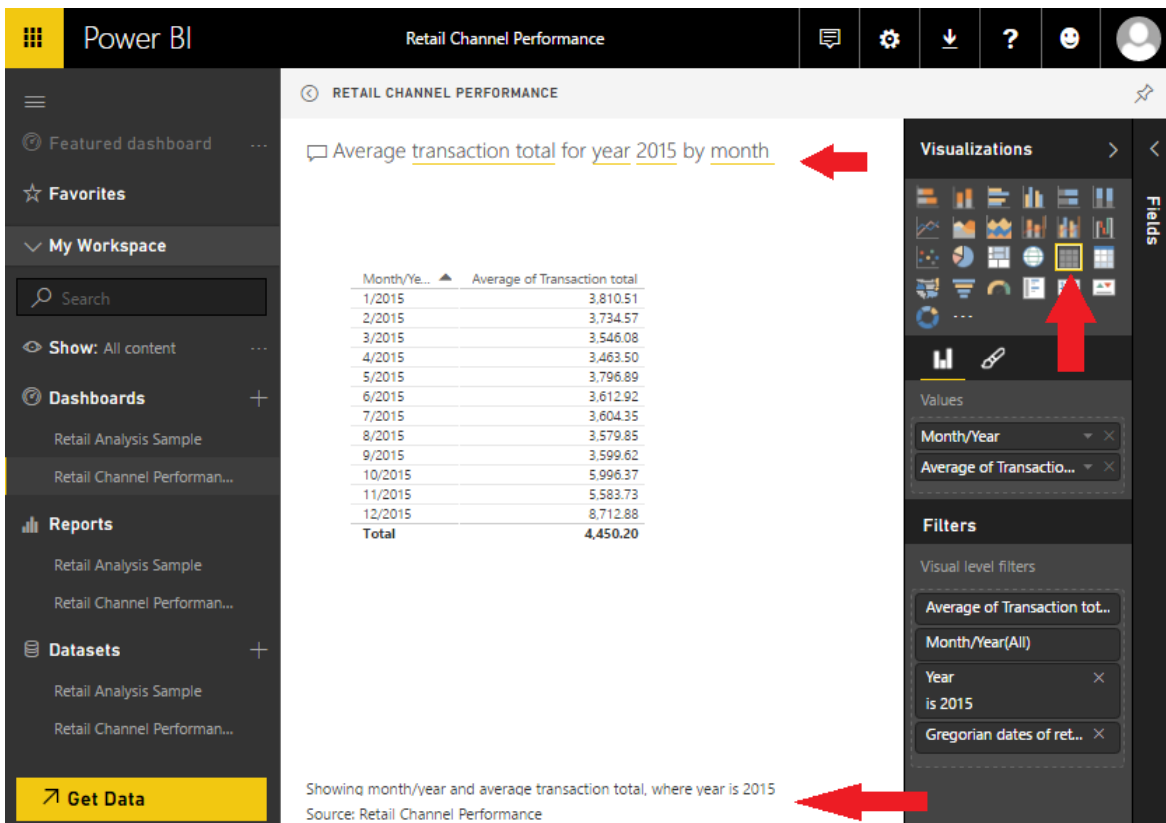

- Learn how to connect the Retail channel performance PowerBI.com solution to a Dynamics AX data source.
- View a list of reports that provide insights into retail channel performance.
- Learn how to modify an existing report in the PowerBI.com solution to make it self-authored.
- Get a glimpse of an actual data model that enables the whole experience in Power BI.

## Connect the Retail channel performance PowerBI.com solution to a Dynamics AX data source

1. Go to <https://www.powerbi.com>, and click **Sign in**. If you don't have an account, you can sign up to try the new Power BI Preview for free.
2. To sign in, enter a Microsoft 365 account that has a Power BI account.
3. If your workspace appears, click **Get Data** at the bottom of the left navigation pane.
4. In **Services** section, click **Get**.
5. Scroll or search to find **Microsoft Dynamics AX Retail channel performance**, and then click **Get it now**.
6. Enter your Dynamics AX URL in the following format: `https://<tenant>.cloudax.dynamics.com` (for example, `https://YourAOSTenant.cloudax.dynamics.com` ). Then click **Next** to pull data from Dynamics AX data storage into this Power BI dashboard.
7. Select **oAuth2** as the authentication method, and then click **Sign in**.
8. To sign in, enter a Microsoft 365 account that has permission to access your Dynamics AX environment.
9. After data is successfully pulled from Dynamics AX into Power BI, you can view your personal **Retail channel performance** dashboard in Power BI by clicking **Retail channel performance dashboard** in the left navigation pane.

10. You can then take advantage of the Q&A feature in Power BI to query your Dynamics AX sales data by using natural language.

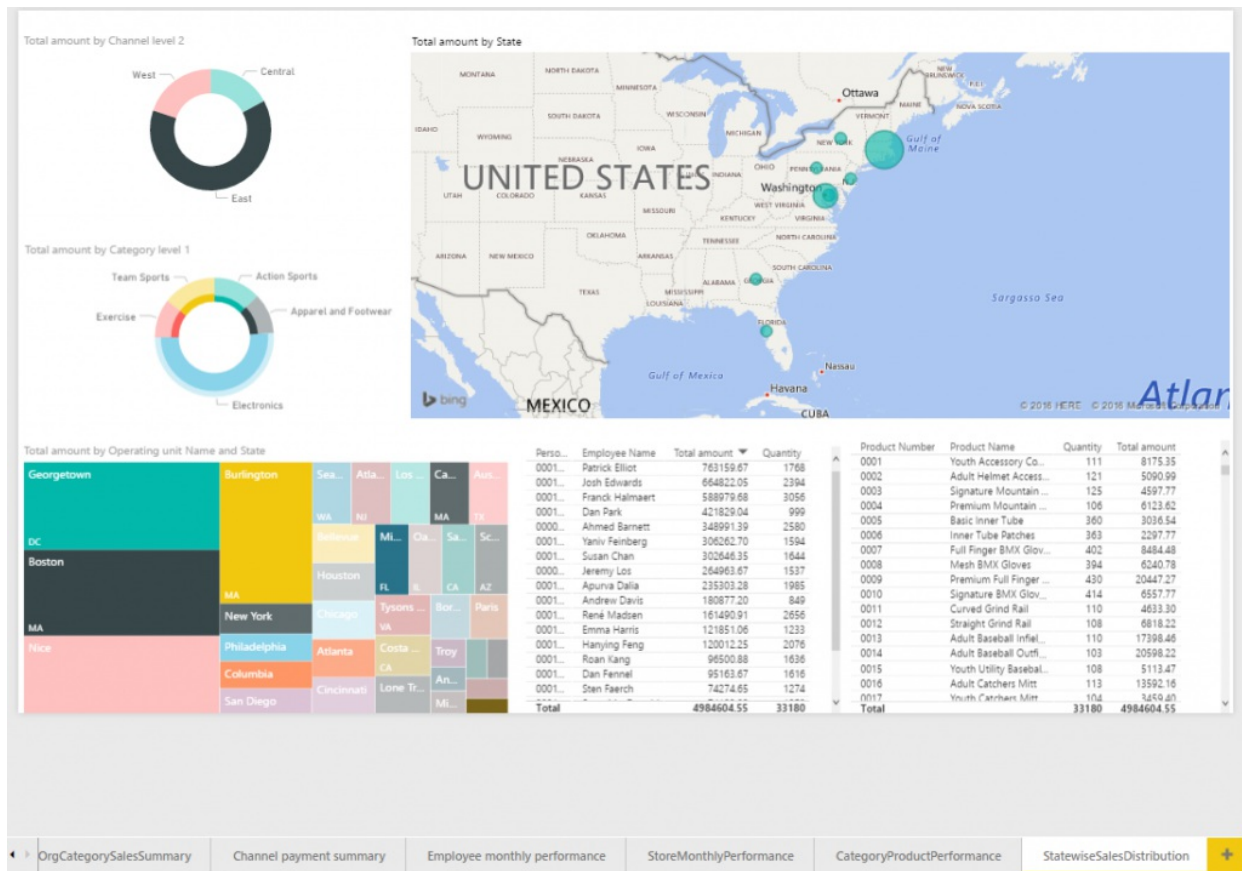

## View a list of reports

By clicking through any of the pinned tiles on the dashboard, you can navigate the following list of reports that provide insights into retail channel performance:

- Geographical sales distribution
- Category sales performance
- Sales summary by Tender type or payment method

- Employee monthly performance
- Store monthly performance
- Product sales performance for the given category in the given store

For example, you might want to do a deeper analysis of geographical sales distribution.

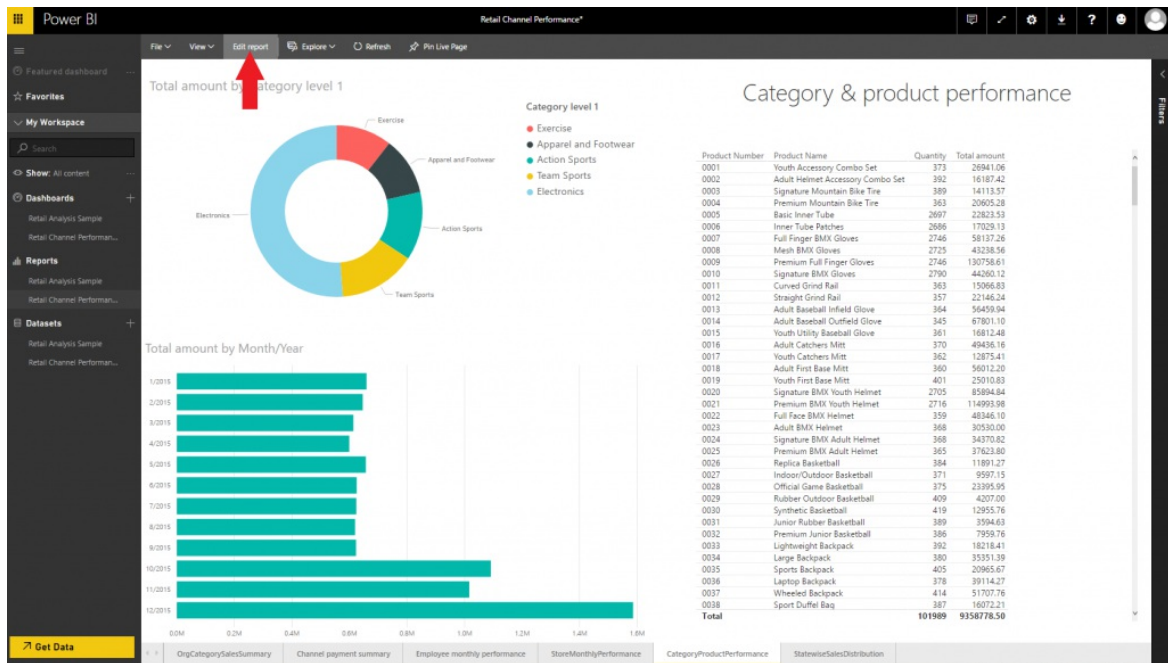

## Modify an existing report in the PowerBI.com solution to make it self-authored

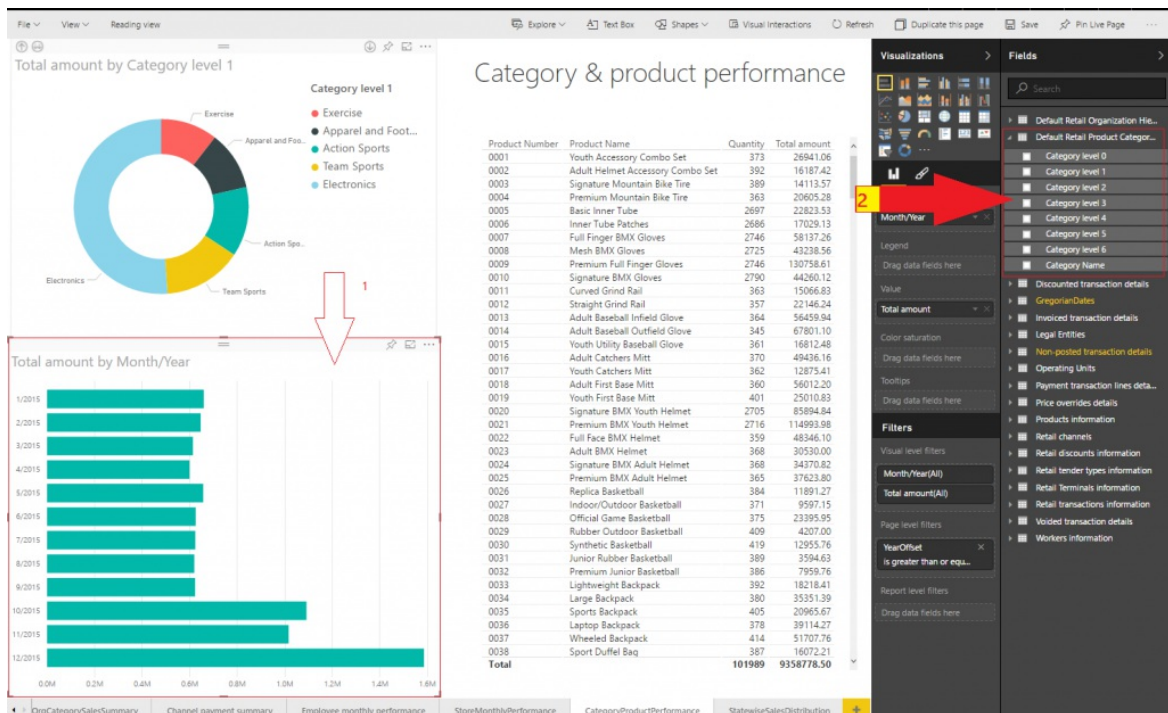

Here's an example that shows how easy it is to modify an existing report in the PowerBI.com solution to make it self-authored. In this example, we will modify an existing report that is named **Category & product performance** by adding **Category level 1** to the **Total amount by Month/Year** chart on that report.

1. Click the **CategoryProductPerformance** tab at the bottom of the window to open the **Category & product performance** report, and then click **Edit report**.

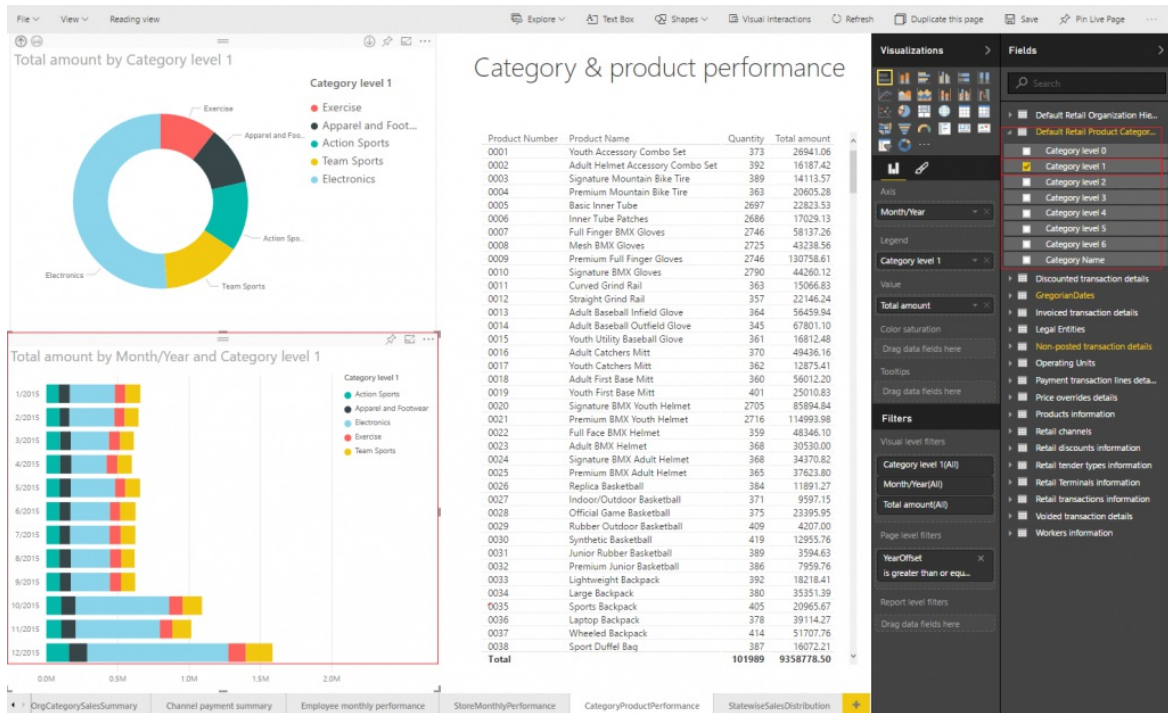

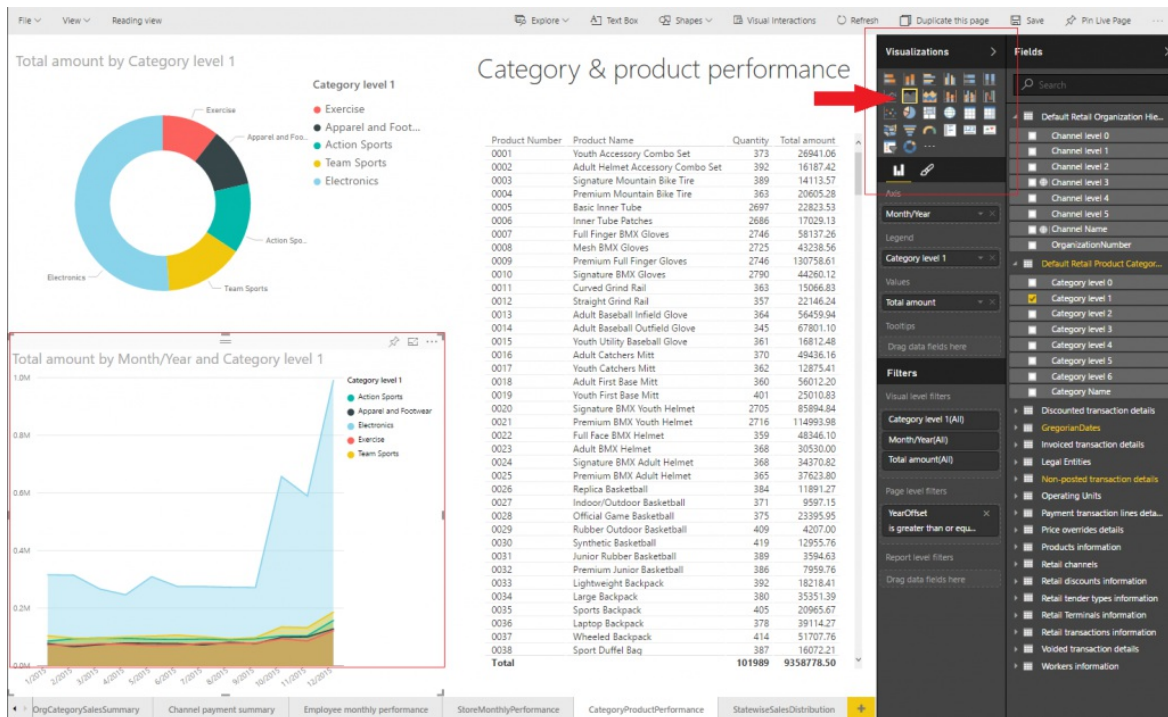

2. Select the chart that is named **Total amount by Month/Year**. Then, on the right side of the window, in the **Fields** pane, expand the **Default Retail Product Category Hierarchy** node.

3. In the list of category levels for this hierarchy, select **Category Level 1**. The name of the chart that you selected this attribute for changes to **Total amount by Month/Year and Category level 1**, and the chart now shows the share of sales in each category for each month.

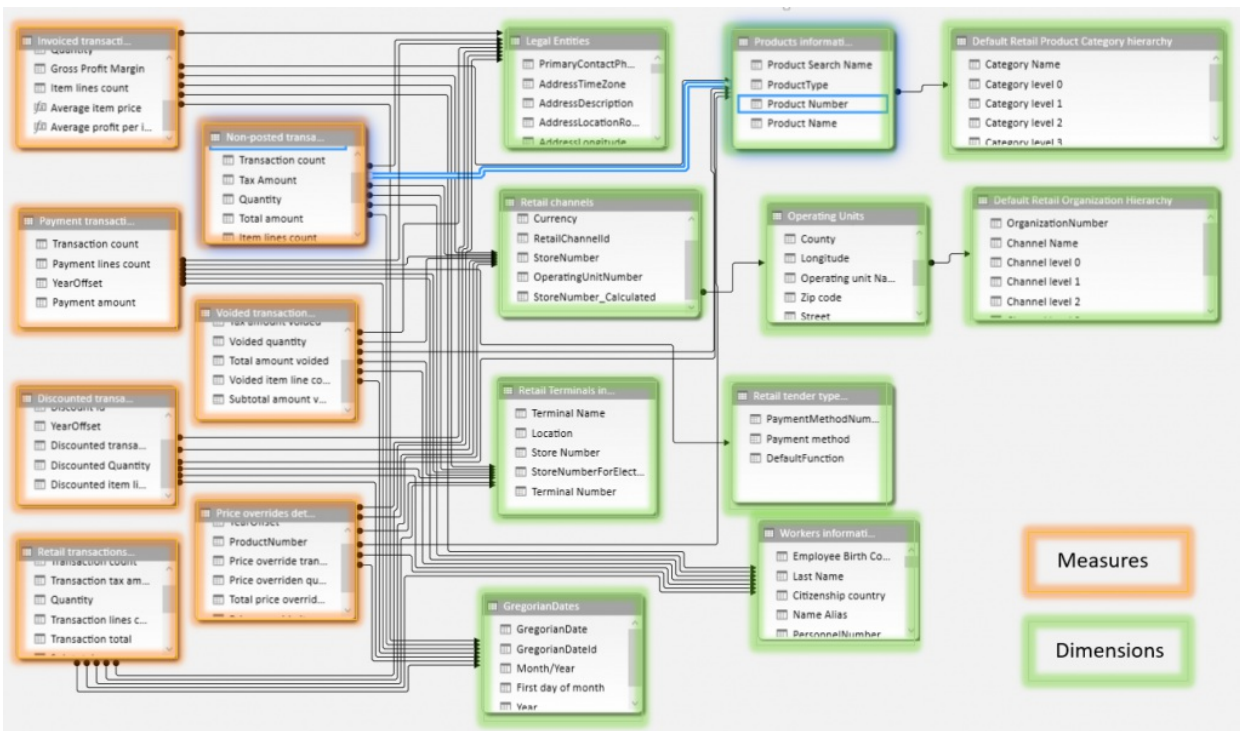

4. Finally, try to change the visualization itself. Select the **Total amount by Month/Year and Category level 1** chart, and then, in the **Visualizations** pane, click **Area chart** or **Stacked area chart**, and see the effect.

## Get a glimpse of the actual data model

The data model that is included in the PowerBI.com solution for the Dynamics AX data entities and aggregated data entities lets you slice and dice across various measures by using different dimensions.

## Additional resources

Features and services available through Power BI integration

Configure Power BI integration for workspaces

# Payment Application Data Security Standards (PA-DSS) certification

2/18/2021 • 2 minutes to read • [Edit Online](#)

## IMPORTANT

If a version of Microsoft Dynamics 365 is implemented and the PA-DSS certification has not yet been completed by Microsoft, there may be potential impact to the retailer's Payment Card Industry (PCI) audit and certification. Specifically, until the PA-DSS certification is complete for the associated version, PCI certification can become more difficult and involved as the Payment Application may come into scope of testing during the certification.

This topic explains the past, current, and pending listings of PA-DSS certification for Microsoft Dynamics 365. To view the current certifications, see [PCI PA-DSS certified payment applications](#).

PA-DSS implementation guides that are available are linked to in the **Version** column in the tables below.

## Past certification

RELEASE	VERSION	BUILD
Microsoft Dynamics AX	2012 R3	6.3
Microsoft Dynamics AX	7	7.0
Microsoft Dynamics 365 for Operations	1611	7.1
Microsoft Dynamics 365 for Finance and Operations, Enterprise edition	July 2017	7.2
Microsoft Dynamics 365 for Retail	July 2017	7.2
Microsoft Dynamics 365 for Finance and Operations	10.0	10.0

## Current certification

RELEASE	VERSION	BUILD
Microsoft Dynamics 365 Commerce	<a href="#">10.0.12</a>	10.0.12

## NOTE

# Commerce capabilities that are available in on-premises deployments

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic lists Commerce capabilities that are available in on-premises deployments.

For more information about on-premises deployments, see [On-premises deployment home page](#).

COMPONENT	ON-PREMISES STATUS
Cloud Point of Sale	Available
Retail Point of Sale	Available
Modern Point of Sale	Available
Commerce Scale Unit	Available
Channel database	Available
Hardware station	Not available
AX 2012 N-1 support	Not available

## Head office capability

### Channel management

The following table indicates which channel management components are available in on-premises deployments.

COMPONENT	ON-PREMISES STATUS
All stores	Available
Online stores	Not available
Call center	Available
Registers	Available
Devices	Available
POS permissions and permission groups	Available
Info codes	Available
Payment methods	Available

COMPONENT	ON-PREMISES STATUS
Email receipts	Available
Email notifications	Available
Sales tax overrides	Available
Functionality profiles	Available
Sales tax groups	Available

### Pricing and discounts

The following table indicates which pricing and discount components are available in on-premises deployments.

COMPONENT	ON-PREMISES STATUS
All discounts	Available
Price groups, price adjustments, category price rules	Available
Trade agreements	Available
Channel navigation category	Available
Affiliation price groups	Available
Commerce channel price groups	Available
Pricing priorities	Available
Price simulator	Not available

### Customer

The following table indicates which customer components are available in on-premises deployments.

COMPONENT	ON-PREMISES STATUS
Loyalty schemes	Available
Loyalty cards	Available
Loyalty points	Available

### Merchandising

The following table indicates which merchandising components are available in on-premises deployments.

COMPONENT	ON-PREMISES STATUS
Products by category	Available
Product categories	Available

COMPONENT	ON-PREMISES STATUS
Channel categories and product attributes	Available
Assortments	Available
Commerce catalogs	Available
Commerce product kits	Available
Commerce product files	Available
Variant groups (size, color, style)	Available
Attribute, attribute type, attribute groups	Available
Vendor catalogs	Available
Bar codes	Available

### Inventory management

The following table indicates which inventory management components are available in on-premises deployments.

COMPONENT	ON-PREMISES STATUS
Packing slip	Available
Fulfilment groups	Available
Cross docking and buyer's push	Available
Qty on hand	Available
Stock counts	Available
Inventory adjustment	Available
Models of delivery	Available
Return locations	Available
Distributed order management	Not available

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Synchronize self-service installers in Dynamics 365 Commerce

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains how to use the Asset library and Shared asset library in Microsoft Dynamics Lifecycle Services (LCS), and Dynamics 365 Headquarters, to upload and synchronize self-service installers so that they can be used with the standard self-service download mechanism.

## IMPORTANT

The earlier method of uploading self-service packages is currently still supported. However, it's obsolete and will be removed in the future.

## Key terms

TERM	DESCRIPTION
Shared asset library	In LCS, two types of asset libraries are available: the Shared asset library and the project-level Asset library. For more information about these libraries, see <a href="#">Asset library in Lifecycle Services (LCS)</a> .
Asset library	For more information, see <a href="#">Asset library in Lifecycle Services (LCS)</a> .
Self-service installers	Self-service installers are the Dynamics 365 Commerce components. For more information about the installers, see the links at the end of this topic.

## Overview

The **Retail Self-service package** subsection in the Shared asset library stores all monthly releases for self-service installers. These installers include Modern POS (which includes the offline version), Commerce Scale Unit (which was formerly known as Retail Store Scale Unit [RSSU]), and hardware station. You can also upload customized installers into both this library and the project-level Asset library. By using these locations, you can then synchronize the available installers in Dynamics 365 Headquarters. After synchronization is completed, all the installers that are available between these two libraries (and whatever previously existed in the environment) will be accessible for the standard self-service download processes that are described in detail in separate topics (see the links in the table of terms earlier in this topic).

The following illustration shows a generic example of the **Retail Self-service package** subsection in the Shared asset library (or Asset library).

## Shared asset library

**Select asset type**

- Asset type
- Business database (2)
- Commerce Cloud Scale Unit Extension (1)
- Configuration (0)
- Cortana intelligence application (2)
- Data package (10)
- Database backup (2)
- Deployment (0)
- Downloadable VHD (0)
- Dynamics 365 Retail SDK (0)
- e-Commerce package (0)
- GER Configuration (276)
- Localized financial report (0)
- Localized financial report 2012 (0)
- Marketing asset (0)
- Model (0)
- Model database (1)
- Model store (4)
- Nuget package (0)
- Power BI report model (2)
- Retail Self-service package (4)**
- Software deployable package (157)
- Solution package (1)

**Retail Self-service package files**

+ [Icons] PUBLISH PUBLISH AS GLOBAL VERSIONS

✓	Name	Valid	Version	Scope	Status	Modified date	Created Date
	10.0.10 - Commerce Scale...	✓	1	Global	Published	3/9/2020	3/9/2020
	10.0.10 - Modern POS	✓	1	Global	Published	3/9/2020	3/9/2020
	10.0.10 - Modern POS	✓	1	Global	Published	3/9/2020	3/9/2020
	10.0.10 - Commerce Scale...	✓	1	Global	Published	3/9/2020	3/9/2020

## Synchronize installers in Dynamics 365 Headquarters

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**.
2. On the **Channel deployment** tab, select **Check for package updates** to perform synchronization. The installers that are available for download (through standard self-service processes) are synchronized and updated, depending on which of the installers that are currently available in LCS apply to environment.

### IMPORTANT

Previously, the RetailSelfService table was used as the source that all installer information was pulled from. Information was entered in this table, based on the installers that had been uploaded into headquarters through the earlier package application method. The new self-service population methodology combines all values in the RetailSelfService table (the earlier self-service package upload method) with all available installers in the LCS Shared asset library. The self-service drop-down package selectors will show the options from this newly synchronized, combined source.

As noted at the beginning of this topic, the earlier self-service package upload method is obsolete but will continue to be supported until it's removed in the future.

3. On the same page, you can select default packages that will be used throughout headquarters in their relevant locations (**Devices, All stores, and Channel database**).
4. Perform standard configuration and installation flows for Modern POS, hardware station, or Commerce Scale Unit by using the links in the following table.

### NOTE

There are several installers. Modern POS, Modern POS with offline (note that this is a separate installer), Commerce Scale Unit (self-hosted, formerly named *Retail Store Scale Unit*), hardware station, and the less frequent installers (AX 2012 R3 support installers and the Peripheral Simulator).

COMPONENT	LINK
Modern POS	<a href="#">Configure, install, and activate Modern POS (MPOS)</a>
Hardware station	<a href="#">Configure and install Retail hardware station</a>
Commerce Scale Unit (formerly known as Retail Store Scale Unit)	<a href="#">Configure and install Commerce Scale Unit</a>

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce Scale Unit (self-hosted)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes Commerce Scale Unit (self-hosted) and when to use it.

## Overview

Commerce Scale Unit (self-hosted) is a set of features that supports selling products in a store that has inconsistent internet connectivity to a back office or headquarters (HQ). The Store Scale Unit is designed specifically for in-store operation, and enables cross-terminal transactions and shift operations despite poor internet service. By automatically connecting to the back office, when you do have internet connectivity, your store can seamlessly process credit card transactions, issue gift cards, and sync data with HQ. The Store Scale Unit is available for download in the standard HQ deployment.

## Is Commerce Scale Unit (self-hosted) right for you?

Before you begin setting up Commerce Scale Unit (self-hosted), take a moment determine whether this option is the right fit for your store. Commerce Scale Unit (self-hosted) is a deployment choice intended for retailers with store locations that have slow or intermittent internet connectivity, and who need the flexibility of the Commerce Scale Unit deployed on premises in each store. In scenarios where a stable internet connection is available and there is low latency to the cloud environment, then it is recommended to consider operating the store as Cloud only, without setting up a Commerce Scale Unit. Consider the following before you begin:

- Carefully choose the store topology configuration for each store to either operate with a self-hosted or cloud-hosted Commerce Scale Unit topology. Reconfiguring a live store from a self-hosted to cloud-hosted Commerce Scale Unit or vice versa may cause a service disruption.
- Commerce Scale Unit will support both MPOS and Cloud POS within the store.
- Commerce Scale Unit (self-hosted) can be set up in a one-box deployment topology on a single computer (recommended) or in a multi-box topology on different computers.
- If you choose the one-box option, most of the settings are pre-configured. For a multi-box topology, you will have to manually configure connections between components.
- With Commerce Scale Unit (self-hosted), users can perform cross-terminal scenarios across multiple POS devices, like suspend/recall transactions and shift operations, even with temporary network disruption to HQ.
- With Commerce Scale Unit (self-hosted), users cannot perform any real-time operations such as issuing gift cards, looking up products, or performing credit card transactions, unless there is internet connectivity to HQ or a payment provider. If most of your transactions involve real-time transactions, then you will always need internet connectivity to enable the connection to HQ or payment provider.
- Direct database connectivity from POS to the channel database is not supported in the Commerce Scale Unit. The POS devices always use the Commerce Scale Unit for performing operations.

### NOTE

It is critical to note that Commerce Scale Unit (self-hosted) does not replace offline. Currently, Retail Modern POS with an offline database is the only way to have offline capabilities.

## Get started with Commerce Scale Unit (self-hosted)

To get started, review the following topic on configuring the Commerce Scale Unit (self-hosted), [Configure and](#)

[install Commerce Scale Unit \(self-hosted\)](#).

## Additional resources

[Configure and install Commerce Scale Unit \(self-hosted\)](#)

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure and install Commerce Scale Unit (self-hosted)

2/18/2021 • 26 minutes to read • [Edit Online](#)

This topic explains how you can use self-service to configure a Commerce Scale Unit (self-hosted, previously called Retail Store Scale Unit) in Microsoft Dynamics 365 Commerce Headquarters, download it, and install it on one or more computers in a brick-and-mortar store. Commerce Scale Unit combines the Commerce channel database, Commerce Async Client, Retail Server, and Cloud point of sale (POS) components. A Commerce environment already provides these components in the cloud. However, you can now configure them so that they work locally in a store or datacenter, in either a single-computer setup (the default option) or a multiple-computer setup. This topic also explains how to uninstall and troubleshoot Commerce Scale Unit.

## IMPORTANT

A basic design principle to follow is that if you are not able to customize in a requested manner on a Commerce Scale Unit (Cloud), you should not customize this way with a CSU (self-hosted). It is critical to understand that direct database access is not supported and can easily cause breaks in customizations that use this concept. A CSU (self-hosted) is primarily forenabling cross-terminal scenarios, reducing latency or backup for poor WAN connectivity, and providing scale-out to spread the load of POS terminals across multiple CSU components.

It is critical to note that this component utilizes a server certificate in addition to Azure Service-to-Service authentication. Both the generated Azure web application keys (formerly called *secrets*) and the server certificate must be managed for expiration. By default, a certificate and a generated Azure web application key expires in one calendar year (365 days).

## Before you begin

### IMPORTANT

To help maintain a high level of security across the company, we strongly recommend that you create a new application ID (client ID) and key (secret) for each store that is created. This step requires a new Web app.

1. Generate a Microsoft Azure Active Directory (Azure AD) app registration to create an application ID (client ID) and key (secret). For instructions, see [Create an Azure Active Directory application](#). This topic reviews Azure user permissions and requirements, and explains how to generate an app registration.

### IMPORTANT

If you are installing Commerce Scale Unit for use with an on-premises environment using Active Directory Federation Services, instead of Azure, follow the instructions in the Commerce installation document for on-premises environments. For more information, see [Installation steps for Commerce channel components in an on-premises environment](#).

2. After an application ID (client ID) and key are created for Commerce Scale Unit, the client ID must be accepted in Commerce. Go to **System administration > Setup > Azure Active Directory applications**. Enter the application ID (client ID) in the **Client ID** column, enter descriptive text in the **Name** column, and enter **RetailServiceAccount** in the **User ID** column.

# Configure a new Commerce Scale Unit

To create a functioning Commerce Scale Unit, complete the procedures in all sections of this topic until the "Multiple-computer installation" section. To complete the configuration and installation, you must first do the initial configuration in Headquarters. Next, you must complete the installation. Finally, you must return to Headquarters to finish the configuration, so that Commerce Scale Unit works correctly.

## IMPORTANT

Channel functionality in an on-premises environment is enabled exclusively via use of Commerce Scale Unit (self-hosted). For an overview, see [Commerce Scale Unit \(self-hosted\)](#). Unlike a cloud deployment, an on-premises environment does not enable seamless, high-availability deployment of channel components via Lifecycle Services (LCS). The only way to use channel components is by installing Commerce Scale Unit (self-hosted).

For on-premises deployments, perform the following steps:

1. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database group**.
2. On the Action pane, select **New**.
3. In the **Name** field, enter **Default**. Enter a description in the **Description** field, if needed.
4. In the **Channel schema** field, select **AX7**.
5. In the **Working folders** field, select **File storage**.
6. On the Action Pane, select **Save**.

1. In Headquarters, go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database**.
2. On the **Channel database** page, on the Action Pane, select **New**.
3. In the **Channel database ID** field, enter a unique value.
4. In the **Channel data group** field, select the **Default** option. Select any option that has been created.

## IMPORTANT

For on-premises deployments, this value will be the **Default** value that was previously described in this topic.

5. In the **Type** field, leave the default value (**Channel database**) selected.
6. You can leave the **Data sync interval** field blank. Alternatively, you can select a value in this field. For example, in the demo data, the value **D60-U15** specifies a 15-minute synchronization interval.

The **Data sync interval** value determines how often the data is synchronized between the channel database (Commerce Scale Unit) and Headquarters. If no value is entered, the default interval that is set up in Commerce Scale Unit is used. This default interval is three minutes.

7. On the **Commerce channel** FastTab, select **Add**, and then, in the **Channel** field, select the appropriate store channel. Repeat this step to add all the channels that should use this database.

You can also add channels that don't use this database. In this way, you keep the data for those channels in the Commerce Scale Unit channel database. The channels that actively use this database can then access that data locally.

### IMPORTANT

For on-premises deployments, select the **Download** button on the Action pane and select **Commerce Scale Unit package**. This will cause a known error and initiate the upload logic so that the following step in this document can be correctly completed. Allow for at least one minute to pass while the upload logic completes.

8. On the **Commerce Scale Unit package** FastTab, in the **Package reference** field, select the appropriate Commerce Scale Unit package. Each environment generates a base Commerce Scale Unit package. Therefore, this field always contains at least one option.
9. On the Action Pane, select **Save**.
10. Go to **Retail and Commerce > Channel setup > Channel profiles**.
11. On the Action Pane, select **New**.
12. In the **Name** field, enter a unique name for the channel profile.

### IMPORTANT

For on-premises deployments, any value can be entered in this field, however, the value **Default** is common.

13. On the Action Pane, select **Save**.
14. On the **Profile properties** FastTab for the new channel profile, select **Add**.
15. In the **Property key** field, select **Retail Server URL**.
16. In the **Property value** field, enter the URL of the Retail Server that will be installed.

The standard format for the URL of Commerce Scale Unit is **https://<Computer Name>:<Port>/RetailServer/Commerce**. In this format, **<Computer Name>** is either the fully qualified domain name (FQDN) of the computer where Commerce Scale Unit is installed or, for systems that aren't joined to a domain, the full computer name. **<Port>** is the port number that should be used in the installation. The port number must be a value between 1 and 65535. If you're using the default HTTPS port (443), you don't have to specify the port number.

17. On the **Profile properties** FastTab for the new channel profile, select **Add**.
18. In the **Property key** field, select **Cloud POS URL**.
19. In the **Property value** field, enter the URL of the Cloud POS instance that should be installed for Commerce Scale Unit.

The standard format for the URL of Cloud POS is **https://<Computer Name>:<Port>/POS**. In this format, **<Computer Name>** is either the FQDN of the computer where the Commerce Scale Unit is installed or, for systems that aren't joined to a domain, the full computer name. **<Port>** is the port number that will be used in the installation. The port number must be a value between 1 and 65535. If you're using the default HTTPS port (443), you don't have to specify the port number.

20. On the Action Pane, select **Save**.

#### NOTE

If media is commonly used, it will be necessary to generate a **Media Server Base URL** for the profile. For testing and simplicity, the URL that exists for the **Default** Channel profile can be reused.

For on-premises deployments, the **Media Server Base URL** will be where all media is stored for POS devices.

21. Go to **Retail and Commerce > Channels > Stores > All stores**.
22. Select the channel ID for the store that will use the new channel database.
23. On the details page for the selected store, on the Action Pane, select **Edit**.
24. On the **General** FastTab for the store, in the **Live channel database** field, select the channel database that you created in step 3.
25. On the Action Pane, select **Save**.
26. On the **General** FastTab for the store, in the **Channel profile** field, select the channel profile that you created in step 12.
27. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel data group**.
28. Select the **Default** data group, and then, on the Action Pane, select **Full data sync**. In the **Select a distribution schedule** field, select job **9999**, and then select **OK**. In the dialog box that appears, select **OK** to confirm the full synchronization. All the data in the channel database is prepared for download.

#### IMPORTANT

For on-premises deployments, there is no **Default** channel data group. Create a new data group (and associate it to the channel database and distribution schedule jobs).

#### Download the Commerce Scale Unit installer

1. In Headquarters, go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database**.
2. In the list of channel databases on the left, select the channel database that you created earlier.
3. On the Action Pane, select **Download**.
4. On the drop-down menu, select **Configuration file**.

#### NOTE

To ensure that the Commerce Scale Unit installer correctly uses the configuration file (XML file), you must save the configuration file to the same location as the installer. If the configuration file is not the same file name as the installer executable, either the executable must be run using the command line to specify the configuration file or you need to rename the XML configuration file to have the same base name as the executable file name.

For on-premises deployments, the configuration file (at this time) requires manual editing:

- StoreSystemAosUrl should have the value used to access headquarters (AX). It is critical to keep a trailing slash at the end of this URL (for example, `https://myContosoURL.com/namespaces/AXSF/`).
- AADTokenIssuerPrefix should have the value `https://NOTUSED.microsoft.com`
- TransactionServiceAzureAuthority should have the value `https://<ADFS FQDN including .com>/adfs`.
- TransactionServiceAzureResource should have the base URL value of the **StoreSystemAosUrl** edited as shown above. For instance, based on the above example `https://myContosoURL.com` would be used as the value, removing the `/namespaces/AXSF/` portion of the URL.

5. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)

Browsers might block the download pop-up that is generated. Select either **Allow once** or **Options for this site > Always allow**. Then select **Download** again.

6. On the Action Pane, select **Download**.

7. On the drop-down menu, select **Commerce Scale Unit package**.

8. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)

The correct installation package is automatically selected for download, based on the Commerce Scale Unit package on the selected channel database.

9. After the setup installer has been saved, on the Notification bar, select **Run**. (This step might differ, depending on the type of browser.)

#### Run the Commerce Scale Unit installer

#### NOTE

Before running the Commerce Scale Unit (self-hosted) installer, verify that the configuration file is named the same as the installer executable. This would look like **ExecutableInstallerName.xml** and put both files in the same folder.

Alternatively, there is a command line delimiter to specify the configuration file manually. If you plan to install and use Retail Cloud POS, you must initialize the configuration the first time that you run the installer, as described in the following procedure.

Before you run the Commerce Scale Unit installer, make sure that all [system requirements](#) are met.

#### IMPORTANT

If you are installing Commerce Scale Unit for use with an on-premises environment, you must start it from a command line using administrator privileges as follows: `StoreSystemSetup.exe -UseAdfsAuthentication`

The Commerce Scale Unit installer first extracts the associated files. It then begins the installation.

1. On the first page of the installer, select the components to install. You can install the following components:

- Commerce channel database together with Async Client
- Retail Server
- Cloud POS

**NOTE**

- To install Cloud POS, you must also select and install Retail Server. If you will use only Modern POS in the store, clear the **Retail Cloud POS** check box, and continue with the installation process as it's described here.
- By default, the installer installs all components on one computer. To install the components across multiple computers, you must complete additional manual steps. For more information, see the "Multiple-computer installation" section.

After you've selected all the components to install, select **Next** to continue.

2. The installer validates that all prerequisites are met. If a valid version of Microsoft SQL Server isn't found, the installer downloads and installs Microsoft SQL Server 2014 Express with Service Pack 2 (This downloading feature is deprecated and it is critical to download and install the correct version of Microsoft SQL Server for your implementation).

**NOTE**

- To meet the prerequisites, SQL Server must have full-text search, and it must support, at a minimum, Transport Layer Security (TLS) 1.2. For Microsoft SQL Server 2014, Service Pack 2 must be installed. For Microsoft SQL Server 2016, Service Pack 1 is the minimum required. For Microsoft SQL 2017, manual installation of the CLR types must be performed. It is critical to install a supported version of Microsoft SQL Server.
- If a system restart is required, the installer will prompt the user. This prompt is based upon a Windows system registry key that tells all applications if a restart is required. While it is recommended to restart prior to continuing the installation, a restart is not mandatory and the installer can continue without restarting the computer.

3. Verify the URL for Application Object Server (AOS), and then select **Next**. (The AOS URL is the URL that is used to access Headquarters.)

**NOTE**

The Retail Server URL is automatically entered from the configuration file.

4. Select a valid Secure Sockets Layer (SSL) certificate to use for HTTPS communication.

The certificate must use private key storage, and server authentication must be listed in the enhanced key usage property. Additionally, the certificate must be trusted locally, and it can't be expired. It must be stored in the personal certificate store location on the local computer.

5. If a specific user is required, enter the user name and password that the application pool should run under. By default, the installer automatically generates a service account to use. This approach is more secure and is recommended.

#### NOTE

It is important to note that service accounts, out of box, still function under the same password policy that is defined for all other accounts. This means that the minimum password age policy still applies to the Retail Server service account and must be updated when necessary. By default, on Windows Server 2012 R2, this is typically 42 days. If the password does expire on a used service account, the Commerce Scale Unit components will fail to continue functioning until the issue is resolved.

6. On the next page, enter the user account and password for the Retail Server application pool and Async Client. By default, this account is automatically generated. However, you can manually enter the user account and password.
7. Enter the HTTPS port to use, and verify that the host name of the computer is correct. Then select **Next** to continue.

#### NOTE

- The installer automatically enters the host name. If, for any reason, the host name must be changed for the installation, change it here. The host name must be the FQDN of the system, and it must be entered in the **Host name** field for the selected Store system entry.

8. Enter the application ID (client ID) and key (secret) that are associated with this Commerce Scale Unit installation. Additionally, verify the channel database ID, which is automatically entered from the configuration file. Then select **Install**. If you will use Retail Cloud POS, make sure that the **Configure Retail Cloud POS** check box at the bottom of the page is selected. This configuration requests Azure AD sign-in and automatically generates all required information in Azure, so that Retail Cloud POS can be used on-premises. If you are installing Commerce Scale Unit for use with an on-premises environment, you must clear this option.

For information about how to create web applications in Azure, see [Create an Azure Active Directory application](#).

#### IMPORTANT

- When installing Commerce Scale Unit for use with an on-premises environment, Cloud POS does not require an Azure or AD FS application to be configured, so it is important to unmark **Configure Retail Cloud POS**.
- When installing Commerce Scale Unit for use with an on-premises environment, the Client ID (Application ID) and Secret (Key) used will be the values generated by the PowerShell script performed in the configuration steps performed in steps 6-8 in the [Installation steps for Commerce channel components in an on-premises environment](#) topic. (Step 6 creates the Client ID and step 8 resets the Secret to be copied.)

When you create the Web App, the initial URI and URL don't have to be any specific value. Only the application ID (client ID) and key (secret) that are created are important.

9. After the application ID (client ID) and key (secret) are created for Commerce Scale Unit, the application ID (client ID) must be accepted in Commerce. Follow the next procedure to finish the configuration in Headquarters.
10. After the installation is complete, the final health page appears. This page shows whether the installation was successful. It also shows the health of each component, based on basic connection tests, and the location of this topic. If the installation wasn't successful, the page shows the location of the log files. We recommend that you keep this final health page open until you've completed the configuration of Commerce Scale Unit and all components are working correctly (Requiring the completion of the

following section).

### Finish the configuration in Headquarters

The last steps require validation and verification that the Azure application ID (client ID) and key (secret) are correctly accepted in Headquarters, so that connections can be made between the environment and the new Commerce Scale Unit.

1. After the application ID (client ID) and key (secret) are created for Commerce Scale Unit and entered in the installer, the application ID (client ID) must be accepted in Headquarters.

In Headquarters, go to **System administration > Setup > Azure Active Directory applications**. Enter the application ID (client ID) in the **Client ID** column, enter descriptive text in the **Name** column, and enter **RetailServiceAccount** in the **User ID** column.

2. If Cloud POS is configured for use, a client ID is shown at the end of the installation. You must add this client ID to the **Commerce shared parameters** page in Commerce.

#### IMPORTANT

In an on-premises environment, this step is not required to be completed.

- a. In Headquarters, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**.
  - b. Select **Identity providers**.
  - c. On the **Identity providers** FastTab, select the provider that begins with `HTTPS://sts.windows.net/`. The values on the **Relying parties** FastTab are set, based on your selection.
  - d. On the **Relying parties** FastTab, select **Add**. Enter the client ID that is listed on the final health page of the Commerce Scale Unit installer. Set the **Type** field to **Public** and the **UserType** field to **Worker**. Then, on the Action Pane, select **Save**.
  - e. Select the new relying party, and then, on the **Server resource IDs** FastTab, select **Add**. In the **Server Resource ID** column, enter `https://retailstorescaleunit.retailserver.com`.
  - f. On the Action Pane, select **Save**.
3. In Headquarters, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**.
  4. Select **Identity providers**.
  5. On the **Identity providers** FastTab, select **Add**.
  6. In the new **Issuer** row, enter the URL of the newly installed Commerce Scale Unit. At the end of the URL, add **/auth**. The URL will resemble

`https://<My Case-Sensitive Computer Name>:<Port Number>/RetailServer/auth`.

#### NOTE

The URL described above is case sensitive. There will be a new identity provider line for each Commerce Scale Unit that is installed. Each will have a URL that resembles this URL.

7. In the **Name** column, enter a description for the store that the URL belongs to.
8. In the **Type** column, select **Open ID Connect**.

#### NOTE

This new row must be duplicated for every Commerce Scale Unit installation (that is, for every unique URL).

9. On the Action Pane, select **Save**.
10. On the **Identity providers** FastTab, select the newly created line. The values on the **Relying parties** FastTab are set, based on your selection.
11. On the **Relying parties** FastTab, select **Add**, and add the following two entries:
  - In the **ClientId** column, enter **Cloud POS**. Set the **Type** field to **Public** and the **UserType** field to **Worker**.
  - In the **ClientId** column, enter **Modern POS**. Set the **Type** field to **Public** and the **UserType** field to **Worker**.
12. On the Action Pane, select **Save**.
13. In Commerce, go to **Retail and commerce > Retail and commerce IT > Distribution Schedule**, and run CDX Job 1110.
14. When you've finished, return to the installer, and select **Finish**.

The final page of the installer includes valuable information that you can use to test and validate that all components work correctly. Keep this page open until you've completed the validation.

#### NOTE

If the installer doesn't show a check mark for Retail Server or Async Client, wait 10 minutes so that any cached values can be updated in the cloud. Then check again. If the installer still isn't fully successful, run a full synchronization on the new channel database that this installation uses.

If you followed all the steps correctly, your configuration should have these characteristics:

- In Azure, two web applications have been automatically generated through the installer:
  - Retail Store Scale Unit Cloud POS
  - Retail Store Scale Unit Retail Server for Cloud POS
- In Azure, a web application (that is, an App registration in the new Azure portal) has been manually created for each Commerce Scale Unit installation (for example, CommerceScaleUnitHouston). A key (secret) has been created that can be used in the installer, as described earlier.
- The application ID (client ID) of the manually created web application has been added to the **Azure Active Directory applications** page in Commerce, as explained in step 1 of the preceding procedure.
- The Cloud POS application ID (client ID) that was shown at the end of the Commerce Scale Unit installer has been added on the **Identity providers** FastTab, as explained in the final steps of the "Run the Commerce Scale Unit installer" section.

### Multiple-computer installation

Only advanced users should install Commerce Scale Unit across multiple computers. The following set of procedures explains how to install the Commerce channel database and Async Client on one computer, and Retail Server and Cloud POS on a second computer. The instructions assume that both systems are on the same domain, and that users for the services that will be installed have already been created on both systems. It's important that you do all configuration in Headquarters.

#### Installation on the first computer

On the first computer, run the Commerce Scale Unit self-service installer as described earlier in this topic, but

make the following changes.

1. Select only Commerce channel database and Async Client as the components to install. Then select **Next** to continue with the installation.

**NOTE**

You can use a generated service account for Async Client, because Async Client won't be accessed outside the computer that it's installed on.

2. Enter the client ID and key (secret). Keep these details available, so that you can use them again on the second computer.
3. After a client ID and key (secret) are created for Commerce Scale Unit, the client ID must be accepted in Commerce. Go to **System administration > Setup > Azure Active Directory applications**. Enter the client ID in the **Client ID** column, enter descriptive text in the **Name** column, and enter **RetailServiceAccount** in the **User ID** column.
4. When setup is successful, start SQL Server Configuration Manager.
5. Go to **SQL Server Network Configuration > Protocols** for the SQL Server instance.
6. Right-click, and then select **Properties**.
7. In the **Flags** section, change the value of **Set Force Encryption** to **Yes**.
8. In the **Certificate** section, select the SSL certificate on the drop-down menu. This SQL Server SSL certificate is the same certificate that is used in the installer.
9. Select **OK**.
10. Go back to **Protocols** in SQL Server Configuration Manager, and enable the following protocols:
  - Named Pipes
  - TCP/IP
11. Right-click the **TCP/IP** protocol, and then select **Properties**.
12. In the **IP Address** section, scroll down the list to **IPALL**.
13. Enter **TCP Port = 1433**.
14. Select **OK**.
15. Start Microsoft Windows Firewall with Advanced Security.
16. In Windows Firewall, create an inbound rule to open TCP port 1433.

For detailed information about SQL Server and Windows Firewall, see [Configure a Windows Firewall for Database Engine Access](#).

**Installation on the second computer**

On the second computer, run the Commerce Scale Unit Self-service installer as described earlier in this topic, but make the following changes.

1. Select only Retail Server and Cloud POS as the components to install. If only Retail Server must to be installed, don't select Cloud POS. Then select **Next** to continue with the installation.
2. Enter the domain user credentials (user name and password) that have permission to access SQL Server on the first computer. Then select **Next**.

**NOTE**

A generated service account can't be used, because Retail Server requires access to the SQL database on the first computer. You must use a domain account.

3. Enter the same Client ID and key (secret) that are used on the first computer.

**IMPORTANT**

It's critical that you add this Client ID to Commerce headquarters as described earlier.

4. Select **Configure Cloud POS**, and then enter Azure AD credentials that have the correct permissions to create Azure Web Apps.

For more information about Azure Web Apps, how to create them, and how to generate a new key (secret), see [Use portal to create an Azure Active Directory application and service principal that can access resources](#). Note that the sign-in URL and the App ID URI are not important.

5. When setup is successful, don't exit the installer.

**NOTE**

At first, the health check ping won't be successful, because the database isn't yet set up correctly. After you've completed the remaining steps of this procedure, you can test the health check again.

6. Start **Microsoft Internet Information Services (IIS)**, select the **Retail Server** website, and select the **Retail Server** web application.
7. Explore the working directory.
8. Open the Web.config file, and then, in the **connectionStrings** section, add **Server name**. **Server name** is the name of the first computer where you installed components. Save the file.
9. If the certificate that is used isn't a valid, trusted certificate from a trusted authority, open CERTMGR.MSC, and follow these steps:
  - a. Import the SQL Server SSL certificate that you created earlier, and add it to Trusted Root.
  - b. Open a **Command Prompt** window as an administrator, type **IISRESET**, and then press Enter.
10. If Cloud POS is configured for use, a client ID is shown. You must add this client ID to the **Commerce shared parameters** page.
  - a. In Commerce, go to **Retail and commerce > Headquarters setup > Parameters > Commerce shared parameters**.
  - b. Select **Identity providers**.
  - c. On the **Identity providers** FastTab, select the provider that begins with `HTTPS://sts.windows.net/`. The values on the **Relying parties** FastTab are set, based on your selection.
  - d. On the **Relying parties** FastTab, select **Add**. Enter the client ID that is listed in the Commerce Scale Unit installer. Set the **Type** field to **Public** and the **UserType** field to **Worker**. Then, on the Action Pane, select **Save**.
  - e. Select the new relying party, and then, on the **Server resource IDs** FastTab, select **Add**. In the **Server Resource ID** column, enter `https://retailstorescaleunit.retailserver.com`.
  - f. On the Action Pane, select **Save**.
11. In Commerce, go to **Retail and commerce > Headquarters setup > Commerce scheduler >**

**Channel database**, and follow these steps:

- a. Select the channel database that you created at the beginning of this topic.
  - b. On the Action Pane, select **Full Sync > Job 9999**. Full synchronization might require several minutes.
  - c. In the Commerce Scale Unit installer, retest to verify that all functionality is working correctly.
12. Start Cloud POS from the computer that you're using for POS operations. (This computer is a third computer that is separate from the Commerce Scale Unit systems.)
13. Activate the Cloud POS device that you're using for this computer.
14. Do a simple sale to verify full end-to-end functionality.

### Help secure Commerce Scale Unit

According to current security standards, the following options should be set in a production environment:

- You should completely disable SSL (v2 and v3) on the computer.
- You should enable and use only TLS version 1.2 (or the current highest version).

#### NOTE

By default, SSL and all versions of TLS except TLS 1.2 are disabled. To edit or enable these settings, follow these steps:

1. Press the Windows logo key+R to open a **Run** window.
2. In the **Open** field, enter **Regedit**, and then select **OK**.
3. In the **User Account Control** window, select **Yes** (if this step is required), and then, in the new **Registry Editor** window, go to **HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\SecurityProviders\SCHANNEL\Protocols**.
4. The following keys have been automatically entered to enable only TLS 1.2:
  - TLS 1.2\Server:Enabled=1
  - TLS 1.2\Server:DisabledByDefault=0
  - TLS 1.2\Client:Enabled=1
  - TLS 1.2\Client:DisabledByDefault=0
  - TLS 1.1\Server:Enabled=0
  - TLS 1.1\Client:Enabled=0
  - TLS 1.0\Server:Enabled=0
  - TLS 1.0\Client:Enabled=0
  - SSL 3.0\Server:Enabled=0
  - SSL 3.0\Client:Enabled=0
  - SSL 2.0\Server:Enabled=0
  - SSL 2.0\Client:Enabled=0

- No additional network ports should be open, unless they are required for known, specified reasons.
- You must disable cross-origin resource sharing, and you must specify the allowed origins that are accepted.
- You should use only trusted certificate authorities to obtain certificates that will be used on Commerce Scale Unit computers.

#### IMPORTANT

It's critical that you review security guidelines for IIS and the Payment Card Industry (PCI) requirements.

## Troubleshoot Commerce Scale Unit

Here is a checklist of things to verify:

1. Open the configuration file and verify that the Retail Server URL specified contains the suffix **/Commerce** and is correctly formed based on what is expected for the machine name and port used. Validate that there is no trailing or additional slash (the character **/**) in the URL or at the end of it.
2. In Commerce, on the **Commerce shared parameters** page, verify that the correct client ID has been added to the **Relying parties** FastTab. Additionally, verify that the correct `https://retailstorescaleunit.retailserver.com` entry has been added to the **Server resource IDs** FastTab.
3. In Commerce, verify that every client ID that was generated for each store exists on the **Azure Active Directory applications** page.
4. In Commerce, on the **Channel profile** page, verify that the URLs are correct. To do this, verify that the computer name in each URL is correct, the URL is correctly formatted, and so on.
5. In Commerce, on the **Channel database** page, verify that full synchronization correctly occurred for the new channel database.
6. Verify that the store is correctly configured to use the new channel database.

If the Retail Server stops functioning after a period of time, there are two simple things to verify:

- Verify if the password policy requires the service account that was generated to change the password (password expiration).
- Re-run the same installer over the current installation (idempotent), which will update a service account's password or allow the user to update the selected account's password.

## Uninstall Commerce Scale Unit

Use Control Panel in Microsoft Windows to uninstall Commerce Scale Unit components.

1. Press the Windows logo key, and then enter **Control Panel** in the search box. In the search results, select **Control Panel**.
2. In Control Panel, select **Programs > Uninstall a program**.
3. In the **Programs and Features** window, select **Microsoft Dynamics 365 Commerce Scale Unit**, and then, above the list of programs, select **Uninstall**.
4. Wait for the uninstaller to finish removing the program.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure, install, and activate Modern POS (MPOS)

2/18/2021 • 21 minutes to read • [Edit Online](#)

This topic describes how to configure, download, and install Modern POS on various platforms. It then describes how to activate Modern POS through device activation.

## NOTE

There are two Modern POS installers: Modern POS and Modern POS with offline (this installer also installs the offline database).

Starting in release 10.0.11, altering customized files that are stored in the ClientBroker folder could cause issues when installing a newer release. These issues might include the inability to go offline or a newer installer failing to complete successfully. A workaround is to remove the files in the ClientBroker folder in the Modern POS directory before performing the installation using the newer installer.

Starting in 10.0.15 release, customizations to files in the Client broker folder for Modern POS can cause an error when updating from a previous version. The known workaround is to delete all files from the Client broker folder prior to running the newer Modern POS installer. For automation, this can easily be scripted as a pre-step for the installer. All files in this folder must be deleted. When this error occurs, the newer installer will update the current installation correctly.

## Technology

The self-service process lets you download the appropriate version of the Modern POS installer and install it on the physical device that you want to use as the point of sale (POS) register. Device activation is the main onboarding step that ties the physical device to a register in Headquarters. Here are the main technical functions of this feature:

- Tie a physical device to a business entity (register).
- Provide enhanced security through Microsoft Azure Active Directory (Azure AD) and a device token/ID.
- Stop unauthorized remote use of Modern POS. (In other words, deactivate a device remotely.)
- Initialize settings for easy Modern POS functioning (number sequence, hardware profile, merchant information) as the first touchpoint of the POS.
- Comply with payment card industry (PCI) standards, and report on device information from Headquarters.

## NOTE

If you are installing Modern POS for use with an on-premises environment, Modern POS does not use Azure Active Directory credentials for device activation.

## Setup

Before you start the steps that are outlined in this topic, follow these steps.

- Verify that you have credentials to sign in to Headquarters.
- Verify that you have administrative or root access to install Modern POS on a device.
- Verify that you can access the Commerce Scale Unit from the device.
- Verify that the environment contains the Commerce permission groups and jobs in the **Human resources**

module. These permission groups and jobs should have been installed as part of the demo data.

## Download and install Modern POS

### Verify that the device is correctly configured

1. In Headquarters, go to **Retail and Commerce > Channels > Channel deployment**.
2. On the **Channel deployment** page, select the **Registers** tile.
3. On the **Registers** page, select a store register. The demo data thoroughly defines the Houston store and registers for self-service. To find the Houston registers, enter **Houston** in the filter at the top of the list of devices.
4. Select a register by selecting the register number in the **Register number** column. In the Houston store, register Houston-3 is well defined and is therefore useful as an example.
5. On the page for the register, under **General**, verify that the **Support offline** option is set to **No**. To use offline support, on the Action Pane, select **Edit**, and then set **Support offline** option to **Yes**.

### Download the Modern POS installer

1. On the **Welcome** page, use the menu in the upper left to go to **Retail and Commerce > Channels > Channel deployment**.
2. On the **Channel deployment** page, select the **Devices** tile.
3. Select a device.

#### NOTE

- The Houston devices are well defined. Houston-3 is useful as an example for a Microsoft Windows desktop or tablet. Houston-21 is useful as an example for a Windows Phone.
- When you select a device, the **Download** button on the Action Pane becomes available.

4. Select **Download**, and then select **Configuration file**. Note the following:
  - Browsers might block the download pop-up that is generated. You must select either **Allow once** or **Options for this site > Always allow**. Then, while the device is still selected, select **Download** again.
  - The configuration file must be saved to the same location as the Modern POS installer. For security reasons, delete this file after installation is completed. If the configuration file is not the same file name as the installer executable, either the executable must be run using the command line to specify the configuration file or you need to rename the XML configuration file to have the same base name as the executable file name.
5. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)
6. Select **Download**, and then select **Retail Modern POS**. Note the following:
  - Browsers might block the download pop-up that is generated. You must select either **Allow once** or **Options for this site > Always allow**. Then, while the device is still selected, select **Download** again.
  - The installation package that you must use varies, depending on whether you require offline support, and whether the device that Modern POS will be installed on is a Windows tablet or a phone device (such as a Windows Phone, an Android device, or an iOS device). The correct package is automatically selected for download, based on the register settings and the application type that is set for the device. If the offline package is selected for a Windows tablet, but Microsoft SQL Server isn't already installed

(or if it doesn't meet the requirements for the offline package), SQL Server is downloaded and installed silently.

7. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)
8. After the setup installer has been saved, on the Notification bar, select **Run**. (This step might differ, depending on your browser.)

### Before running the Modern POS installer

- Make sure that all [system requirements](#) are met.
- It is recommended to temporarily turn off antivirus applications. It has been noted that on aggressive antivirus solutions, the installation may stall due to the antivirus solution checking active files while in use.
- The installer will sideload a modern application. Therefore, a Group Policy entry must be set to allow for sideloaded applications. The installer will change the associated registry key as follows to allow for this installation:
  - **Path:** HKLM:SoftwarePoliciesMicrosoftWindowsAppx
  - **Property:** AllowAllTrustedApps
  - **Value:** 1
- If offline is used (an offline database created), then a default SQL Server instance must exist. If SQL Server instances exist, but none are set as the default, then the installer will fail to install the offline database.

If you are installing Modern POS for use with an on-premises environment, you must start the installer from a command line as follows:

```
ModernPosSetupOffline.exe -UseAdfsAuthentication
```

### Run the Modern POS installer on a Windows computer

The Modern POS installer first extracts the associated files and then starts the installation.

1. The installer validates that all prerequisites are met. Note the following:
  - If a system restart is required, the installer informs you about this requirement, but the installation can typically continue.
  - A sideloaded installation of Modern POS requires a Group Policy change. The installer informs you if this change is required and then makes the change automatically.
2. If you selected offline support, but a valid version of SQL Server isn't found, the installer downloads and installs Microsoft SQL Server 2014 Express with Service Pack 2 (SP2). To meet the prerequisites, SQL Server must have Full-text search installed. Additionally, a minimum of SP2 must be installed for Microsoft SQL Server 2014, or a minimum of Service Pack 3 (SP3) must be installed for Microsoft SQL Server 2012. Note the following:
  - The installer tries to download the correct language. However, if you require a specific language, we highly recommend that you manually install SQL Server. If the installer can't correctly determine the language, it installs the English version of SQL Server 2014 Express with SP2 by default. Typically, after the SQL installation is completed, the system requires a restart before the installation of Modern POS can continue.
  - This process might require a long time, depending on the speed of the computer and the Internet connection. If a prerequisite fails during this step, first retry the installer. If the installer continues to fail, see the [Troubleshooting](#) section of this topic.
3. The installer installs Modern POS.
4. On the page that states that installation was successful, select **Close** to exit the installer.

You can now start the program.

#### NOTE

This installation occurs only for the administrator user who ran the installer. For all other users, a desktop icon to install Modern POS is created. Every time that a user signs in, he or she must double-click this icon. The program will then be installed or updated, as required. If a user doesn't use the desktop icon after an update, the POS client will request that the user run from the desktop icon instead to update correctly prior to running.

### Run the installer on any other device (Windows Phone, Google Android device, or Apple iOS device)

1. If the application wasn't downloaded directly to the device, transfer the downloaded app file and the associated configuration file to the same folder on the device. Depending on the type of device, the app file will be an APPX, APK, or IPA file.

Note that this step can be done in various ways. For example, the files can be accessed through a shared folder, transferred via USB cable, or securely mailed to the user's device.

2. Use a file explorer on the device to browse to the app directory.
3. Tap the app to begin application installation. (If the configuration file was saved to the same location, the Commerce Scale Unit URL will be automatically entered when you start the application and begin device activation.)

Note that some devices require that you double-tap the file to begin application installation. Some devices might not notify you that an application has been installed. On those devices, we recommend that you look at the application list to verify that the application was correctly installed.

4. When the installation is completed, you should be able to start the application from the application list on the device. For example, after you install the application on a Windows Phone, you can start it from the home screen tiles list.

You can now start the program.

## Create a worker

For this topic, we have already created workers and assigned them to the Houston address book in the demo data that is provided. Therefore, this topic will use pre-generated data.

### Create a worker

1. Go to **Retail and Commerce > Employees > Workers**.
2. On the Action Pane, select **New** to create a new employee.
3. Enter the first and last name. For example, enter **John** as the first name and **Smith** as the last name.
4. Verify that the **Legal entity** field is set to **USRT**, the **Worker type** field is set to **Employee**, and the **Employment start date** field is set to the current date at 12 AM, so that the worker's employment starts immediately.
5. Select the **Assign a position** check box. Select position number **000544**, which is the Store manager position.
6. Set the **Personnel action type** field to **Hire Action** to hire a new employee immediately.
7. Select **Continue**.
8. On the Action Pane, select **Complete** to finish creating the new worker.
9. Return to the worker list. Search for the newly created worker (for example, John Smith). Select the worker's name to see the details of the new worker.
10. On the Action Pane, select **Edit**.
11. Verify that the language for the worker is **en-us**.

12. Under **Worker summary**, in the **Address books** field, select the **Houston** store.
13. On the **Commerce** tab, you can reset the POS password. For this tutorial, reset the password to **123**.
14. On the **Commerce** tab, under **Screen layout**, assign a screen layout. For example, select **F2MP16:9M (Fabrikam MPOS Manager (16:9))**.
15. On the Action Pane, select **Save**.
16. Go to **Retail and Commerce > Periodic > Distribution schedule**.
17. Select the **1060 – Staff** job, and then, on the Action Pane, select **Run now** to sync the worker data to the channel database.
18. After the new worker has been created and synced to stores, worker John Smith can sign in to any POS device that is used in the HOUSTON store that he is assigned to, and he can perform transactions on that device. However, the device must be activated first. The following section explains how to activate a device for a new worker.

### **Map an Azure AD account to a worker who has POS permissions for device activation**

You must complete this procedure before you activate Modern POS for a new worker.

1. In Commerce, from the **Worker** page, open the **Worker details** page for the worker that you created in the previous procedure.
2. On the Action Pane, select **Edit**.
3. On the **Commerce** tab, select the **POS permissions** link. Under **POS permission group**, verify that the value is **Manager**.
4. When you've finished, return to the **Worker details** page for the new worker.

To return to the **Worker details** page, select the **Close** button (X) on the right side of the Action Pane.

5. On the Action Pane, select **Commerce**, and then select **Associate existing identity**.
6. In the dialog box that appears, select the Azure AD account that is named **admin AX Admin**. (If an alternative administrator Azure AD account has been created, select that account instead.)
7. Select **OK**. In the demo data, the Azure AD account that is associated with the administrator account in Headquarters is your administrator Azure AD account.
8. On the Action Pane, select **Save**, and then refresh the page. The **External identity** section should be now updated with the new information.

Note that the **External identifier** field will remain empty. This behavior is expected. Therefore, you can ignore it.

This procedure should be completed before you activate Retail Cloud POS or Modern POS. For more information, see [Manage activation accounts and validate devices](#).

### **Run the Validate Devices for Activation check**

1. In Headquarters, open the **Device** page (**Retail and Commerce > Setup POS > Devices**).
2. Select the device to validate for device activation, and then select **Validate Devices for Activation**. For example, select device **HOUSTON-3**.
3. In the dialog box that appears, select the worker to validate the device for (that is, the worker that you mapped to the Azure AD account in the previous procedure). For example, select worker **000160**.
4. Select **OK**, and make sure that you receive the following message: "Pre-Activation validation completed for Device HOUSTON-3 and Staff 000160. Validation: Passed"

## Activate a device

## NOTE

It is possible for the Safari browser to show an error during device activation of a Cloud POS device due to an Azure Active Directory token being unattainable. You can resolve this issue by utilizing the [Microsoft Enterprise SSO plug-in for Apple devices](#).

1. Start Modern POS on your computer. Read the instructions on the **Before you start** page, and make sure that they are completed. Then select **Next**.
2. Select **Activate**. You're redirected to the Azure AD sign-in page.
3. Enter the Azure AD account that you mapped earlier, such as `admin@<MyCompany>.onmicrosoft.com`, and the password.
4. When activation is completed, select **Get Started**.
5. Sign in to Modern POS by using worker account **000160** and the password **123**.

The device should now be activated and ready to use.

## Update the Modern POS application

### NOTE

To learn more about deployable packages, see [Apply a deployable package](#).

1. After a Modern POS application is uploaded into the environment, the version of the package can be selected on the device. The package listings should include the new uploaded application.
2. To update the Modern POS application, follow the steps in the [Download and install Modern POS](#) section. To do an in-place update, just run the newer version of the self-service installer. Uninstallation isn't required or recommended. Device activation status will be maintained after the update.
3. The installer will use the currently installed configuration settings. If the configuration file has changed, because of various configuration changes in Commerce, an update won't change the Modern POS application settings.

## Troubleshooting

### Troubleshoot installation

- Your browser blocks the download pop-up that is generated.

**Solution:** Select either **Allow once** or **Options for this site > Always allow** (or the equivalent commands in the browser that you're using). Then, while the correct register is still selected, select **Download** again.

- The installation package that you must use depends on whether you require offline support. The correct package is automatically selected for download. For the offline package, SQL Server must be installed and must meet the requirements for the offline package.

**Solution:** No action is required. If SQL Server isn't already installed (or if it doesn't meet the requirements), it's downloaded and installed. The installer gives generic information about the download and installation of SQL Server Express 2014. This installation might require a long time.

- The installation occurs only for the administrator user who ran the installer, but not for any other users.

**Solution:** The installer generates a desktop icon that is used to install, upgrade, and run Modern POS. This icon is generated for every user on the computer. When a user who must install Modern POS double-clicks this icon, the program is installed. The user can then start to use Modern POS.

- SQL Server isn't successfully downloaded and installed through the self-service Modern POS installer.
  - **Solution 1:** A list of reasons shows the prerequisites that failed. If the list includes **SMO** or **SQL Management Objects**, first try to run the installer again. SQL Server Management Objects (SMO) are installed during SQL Server installation. Therefore, it's possible that the operating system didn't pick up the registration of the executable program that you used. When you run the installer a second time, the prerequisites are retested, and the prerequisite check should correctly verify the required executable program. If the installer continues to fail, restart the system to fully complete the registration of SQL Server, and then rerun the installer.
  - **Solution 2:** Manually download and install SQL Server (Microsoft SQL Server Express or another version) by using Advanced Tools. During installation, select **Full-text search** as an additional feature.
- The installation of Modern POS fails, because the registration of performance (perf) counters failed.

**Solution:** Follow these steps to fix this issue:

1. Open a **Command Prompt** window as an administrator.
2. Enter the following command.

```
lodctr /s:"perf_backup.txt"
```

3. Enter the following command.

```
lodctr /R
```

4. If the system doesn't rebuild the performance counter settings from the system backup, rerun the **lodctr /R** command.
  5. Rerun the Modern POS installer.
- If you're using a downloaded virtual hard disk (VHD) instead of a cloud-hosted environment, the downloader might fail.
    - **Solution 1:** In a downloaded VHD, the Azure Storage Emulator must be installed and must be running correctly. Otherwise, the self-service packages can't be downloaded correctly.
    - **Solution 2:** A failure might have occurred during the process of integrating the VHD into Microsoft Hyper-V. You must manually edit permissions before the packages can be downloaded correctly. Follow these steps:
      1. In File Explorer, browse to **C:\Microsoft Dynamics 365\70\Retail Server**.
      2. Right-click the **SelfServicePackages** folder, and then select **Properties**.
      3. On the **Security** tab, select **Edit**.
      4. In the **Permissions for SelfServiceDeployment** dialog box, select **Add**.
      5. In the **Select Users, Computers, Service Accounts, or Groups** dialog box, select **Locations**.
      6. In the **Locations** dialog box, select the first entry in the list (the local computer), and then select **OK**.
      7. In the **Select Users, Computers, Service Accounts, or Groups** dialog box, enter the name **IIS\_IUSRS**, and then select **Check names**. The object name should be changed to **IIS\_IUSRS**. Select **OK**.
      8. In the **Permissions for SelfServiceDeployment** dialog box, select the new **IIS\_ISURS** user. Under **Permissions for IIS\_IUSRS**, select **Allow** for the **Full control** permission. Select **OK**.
      9. In the **Open permission** dialog box, select **OK**.

- The latest iOS version does not support your self-signed certificate.

**Solution 1:** Utilize a domain and generate a proper domain-based certificate.

**Solution 2:** Download the open source OpenSSL library and perform the following after completing installation:

1. Using PowerShell, create a private key for the root Certificate Authority (CA) using a command such as `$ openssl genrsa -des3 -out rootCA.key 2048`. 2. You will be prompted for a password, which must be remembered for later usage. 3. Next, generate the root certificate using a command such as `$ openssl req -x509 -new -nodes -key rootCA.key -sha256 -days 1024 -out rootCA.pem`. There will be a prompt for the password entered previously and some basic certificate information.

#### NOTE

The number of days the certificate is valid for can be altered. In the above example this is 1024 days.

- d. Create a new `info.ext` file and enter the following details:
  - o `keyUsage = keyEncipherment, dataEncipherment - extendedKeyUsage = 1.3.6.1.5.5.7.3.1 - subjectAltName = @alt_names - [alt_names] - DNS.1 = <FULLY QUALIFIED DOMAIN NAME OF HOST COMPUTER>`
- e. Generate the signing request and private key using a command such as `openssl req -new -nodes -out server.csr -newkey rsa:2048 -keyout server.key`.
- f. Issue the certificate using the previously generated root certificate using a command such as `$ openssl x509 -req -in server.csr -CA rootCA.pem -CAkey rootCA.key -CAcreateserial -out server.crt -days 500 -sha256 -extfile info.ext`. There will be another prompt for the root key password and you will need to specify the number of days that the certificate is valid (500 days in this example).
- g. Generate the IIS certificate using a command such as `$ openssl pkcs12 -inkey server.key -in server.crt -export -out server.pfx`. This command will request a new password, which will be used later when the certificate is imported.
- h. Open `Certmgr.msc` and go to **Trusted Root Certificate Authorities**. Use the **Import** action to import the previously generated `rootCA.pem` root CA file.
  - i. In the same window, go to **Personal** and use the **Import** action to import the previously generated `server.pfx`.
  - j. Next, open the **IIS Manager**, select the `RetailHardwareStationWebSite` and select **Edit Bindings** from the right-most menu.
  - k. In the new window, select the HTTPS site binding, and the select **Edit**. In the final screen, select the newly installed certificate and select **OK**.
  - l. Verify the certificate is correctly being used. In a web browser, go to "https://<hostname>/HardwareStation/ping".
- m. Install the certificate on the iOS device:
  - o Copy the `rootCA.pem` file and rename the copy to `rootCA.crt`. - Using OneDrive or another file hosting location, upload the `rootCA.crt` and `server.crt` so that they can be downloaded onto the iOS device.
- n. On the iOS device, go to **Settings > General > Profiles** and select the downloaded profile for the `rootCA.crt`. Select **Install**.
- o. Validate that the profile status updates to **Verified**. Repeat the same process for the `server.crt` file.
- p. Go to **Settings > General > About > Certificate Trust Settings** and enable the installed

root certificate.

- q. On the iOS device, use the hardware station ping URL specified previously to verify that the certificate is trusted.
- r. Open the POS application in **Non-drawer mode** and pair to the hardware station as typically performed.

### Troubleshoot device activation for Modern POS

- The Microsoft account (Azure AD) sign-in page doesn't open.

**Solution:** The Azure AD endpoint might be unreachable. Wait a few minutes, and then try again.

- After you enter the Azure AD account, you receive an error message that states that the user isn't authorized.

**Solution:** Verify that the Azure AD user is mapped to a worker who has POS permission to activate devices. The **Manage device** permission for the worker should be set to **Yes**.

- Device activation isn't completed. It fails during one of the steps.

**Solution:** Follow this checklist to verify that all data is correct:

- Complete the Validate Devices for Activation check in Headquarters, and make sure that the device passes validation.
- On the client computer where you're activating the device, access the Commerce Scale Unit URL health check, and make sure that the health check is passed. Use the following format for the URL:  
`https://MyCompanyNameet.axcloud.dynamics.com/commerce/healthcheck?testname=ping`
- The worker must be mapped to an Azure AD account (under **External identity**).
- The Azure AD account that is mapped must belong to the same tenant.
- To map the worker to the Azure AD account, sign in to Headquarters by using the Admin account for Microsoft Dynamics Lifecycle Services (LCS).
- Make sure that the worker is set up as a Commerce user in the Manager role. (This item is checked by validation.)
- Make sure that the channel is published. (This item is checked by validation.)
- Make sure that the channel database has the synced data from Headquarters, and that download jobs are running.
- Set up the hardware profile under **Registers**. (This item is checked by validation.)
- Make sure that the register and store have a screen layout. (This item is checked by validation.)
- Make sure that a primary address is set up for the legal entity.
- Make sure that the language is set up for the Commerce Data Exchange: Real-time Service user profile (JBB in the demo data).
- Make sure that the Real-time Service profile has the correct access.
- Make sure that the electronic funds transfer (EFT) configuration value is present.

### Troubleshoot Modern POS connectivity

On a single-computer system, such as a developer topology or a demo environment, or when Commerce Scale Unit and Modern POS are installed on the same computer, Modern POS can't complete device activation.

**Solution:** This issue occurs because Modern POS can't make network calls to the same computer (that is, calls to itself). To mitigate this issue, you must enable an AppContainer loopback exception so that communications can occur to the same computer. Various applications will help enabling this loopback for Modern POS. For more information about loopback, see [How to enable loopback and troubleshoot network isolation](#).

## Additional resources

## Install the POS layout designer

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Manage activation accounts and validate devices

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how an IT Pro can set up Commerce activation accounts for workers to activate Modern POS or Cloud POS devices.

## Setting up a device activation account for a single worker

This procedure should be completed before you activate Cloud POS.

1. In Commerce, from the **Workers** page, open the **Worker details** page for the worker to assign AAD device activation privileges to. Click **Edit**.
2. On the **Commerce** tab, click the **POS permissions** link. Make sure that the worker is in the Manager Permission group, or that **Manage Devices** is set to **Yes** for the worker.
3. On the **Commerce** tab, under **External identity**, update the values for the following fields:
  - Alias
  - UPN
  - External identifier
4. You can update the **External identity** fields by using an existing AAD account or creating a new AAD account. To update the fields, access the **External identity** options from the **Commerce** main menu (**Commerce > Associate existing identity** or **Commerce > Create new identity**).
5. To use an existing AAD account, select **Commerce > Associate existing identity**. In the slider, click the AAD account that has the correct name, and then click **OK**. The AAD account that is associated with that name and alias is the user's Activation account for Modern POS.
6. Complete and save the changes on the **Workers** page, and then refresh the page. The section that contains external identity information should be updated with the new information. The mapped AAD account is now your Activation account for Cloud POS and Modern POS. This account is mapped to a worker for the required POS permissions. You can use this AAD account for Modern POS or Cloud POS activation.
7. The **Create external identity** feature creates a new AAD account for you by using the alias that you enter. To update the fields, access the **External identity** options from the **Commerce** main menu (**Commerce > Create new identity**).
8. You can either manually enter the alias to generate or use the **Reset to default** button. Then manually enter a strong password, and click **OK**.
9. If the worker is created successfully, you receive a message on the **Workers** page. The mapped AAD account is now the user's Activation account for Cloud POS and Modern POS. This account is mapped to a worker for the required POS permissions. You can use this AAD account for Modern POS or Cloud POS activation.

## Setting up device activation accounts for multiple workers

You can set up activation accounts for multiple workers in bulk. However, this functionality is supported only if you're creating new external identities, not if you're associating identities.

1. In the workers form, select the list of workers to set the activation account for.

2. Click **Commerce > Create external identity** to update the fields. Any AAD accounts that are associated with the workers appear in this pane.

#### **NOTE**

These accounts aren't device activation accounts until you map them by using the external identity flow options.

3. If you want to use the existing AAD accounts as activation accounts, you can't map them in bulk. Cancel the selection of those workers, and then map them individually by using **Use existing external identity**.
4. To create new AAD accounts and associate them with the workers, so that they can be used as activation accounts, update the **Alias** and **Password** fields, and then click **OK**. In the main worker form, you receive a message as activation accounts are created for each worker.

## Run the Validate Devices for Activation check at headquarters

Before handing an activation account to a worker, an IT Pro must run the Validate devices check for the devices assigned to the worker. This will help identify any potential failures of device activation in advance and fix it before it is given to the worker.

1. Open the **Device** page in HQ (**Retail and commerce > Channel setup > POS setup > Devices**).
2. Select the device to validate for device activation, and then click **Validate devices for activation**. For example, select device **HOUSTON-2**.
3. In the dialog box that appears, select the worker to validate the device for (that is, the worker that you mapped to the AAD account in the previous procedure). For example, select worker **000160**.
4. Click **OK**, and make sure that you receive a message similar to the following: "Pre-Activation validation completed for Device HOUSTON-2 and Staff 000160. Validation: Passed"

## Checklist to follow before activation

1. Complete the **Validate devices for activation** check in HQ, and make sure that the device passes validation.
2. On the client machine where you're activating the device, access the Commerce Scale Unit URL health check, and make sure that the health check is passed. Use the following format:  
`https://clxtestax404ret.cloud.test.dynamics.com/en/healthcheck?testname=ping`
3. The worker must be mapped to an AAD account (under **External identity**).
4. The AAD account to map must belong to the same tenant.
5. To map the worker to the AAD account, sign in to HQ by using the Admin account for Microsoft Dynamics Lifecycle Services (LCS).
6. Make sure that the worker is set up as a Commerce user in the Manager role (checked by validation).
7. Make sure that the channel data is present in the channel database.
8. Set up the hardware profile under **Registers > Register** (checked by validation).
9. Make sure that the register and store have a screen layout (checked by validation).
10. Make sure that a primary address is set up for the legal entity.
11. Make sure that the electronic funds transfer (EFT) configuration value is present.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Point of sale (POS) device activation

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article explains the new guided device activation for Cloud POS and Modern POS, and explains the client simplifications that help users easily activate devices without having to manually enter register and device ID information.

## Checklist to follow before activation

1. Complete the **Validate devices for activation** check in Headquarters (HQ), and make sure that the device passes validation.
2. On the client machine where you're activating the device, access the Commerce Scale Unit URL health check, and make sure that the health check is passed. Use the following format:  
`https://c1xtestax404ret.cloud.test.dynamics.com/en/healthcheck?testname=ping`.
3. The worker must be mapped to a Microsoft Azure Active Directory (AAD) account (under **External identity**).
4. The AAD account to map must belong to the same tenant.
5. To map the worker to the AAD account, sign in to HQ by using the Admin account for Microsoft Dynamics Lifecycle Services (LCS).
6. Make sure that the worker is set up as a user in the Manager role (checked by validation).
7. Make sure that the channel is published (checked by validation).
8. Make sure that the channel database has the synced data from HQ, and that download jobs are running. To check this, run the following command in the channel database for the store.

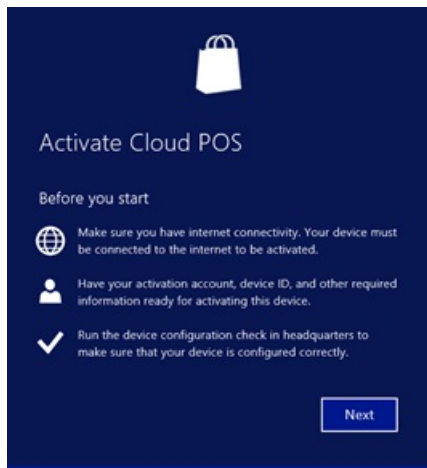

```
select * from crt.STORAGELOOKUPVIEW
```

Make sure that data is returned, and that the result isn't empty.

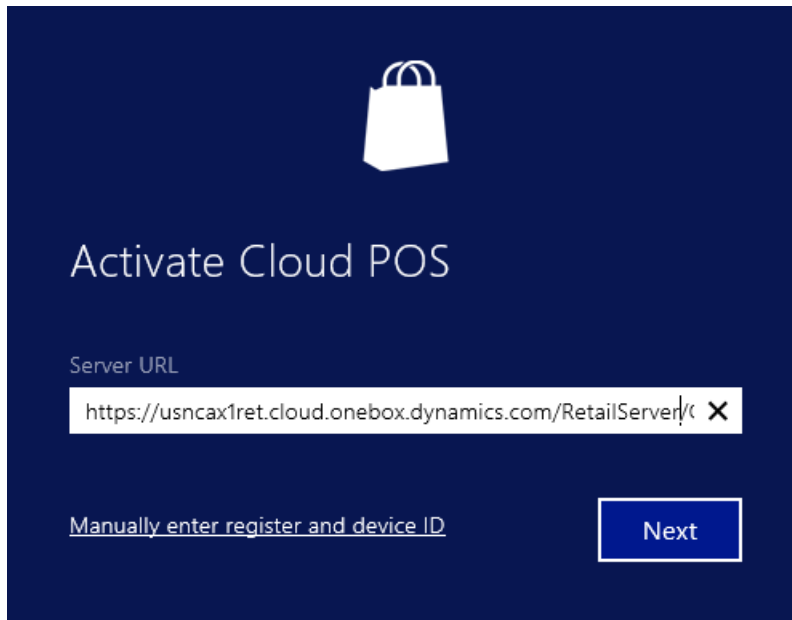

9. Set up the hardware profile under **Register** (checked by validation).
10. Make sure that the register and store have a screen layout (checked by validation).
11. Make sure that a primary address is set up for the legal entity.
12. Make sure that the language is set up for the Commerce Data Exchange: Real-time Service user profile (JBB in the demo data).
13. Make sure that the Real-time Service profile has the correct access.
14. Make sure that the electronic funds transfer (EFT) configuration value is present.

## Activate a Modern POS or Cloud POS device by using guided activation

1. Open the initial device activation page for Modern POS or Cloud POS. You're prompted to sign in.
2. On the **Before you start** page, follow the instructions, and then click **Next**.

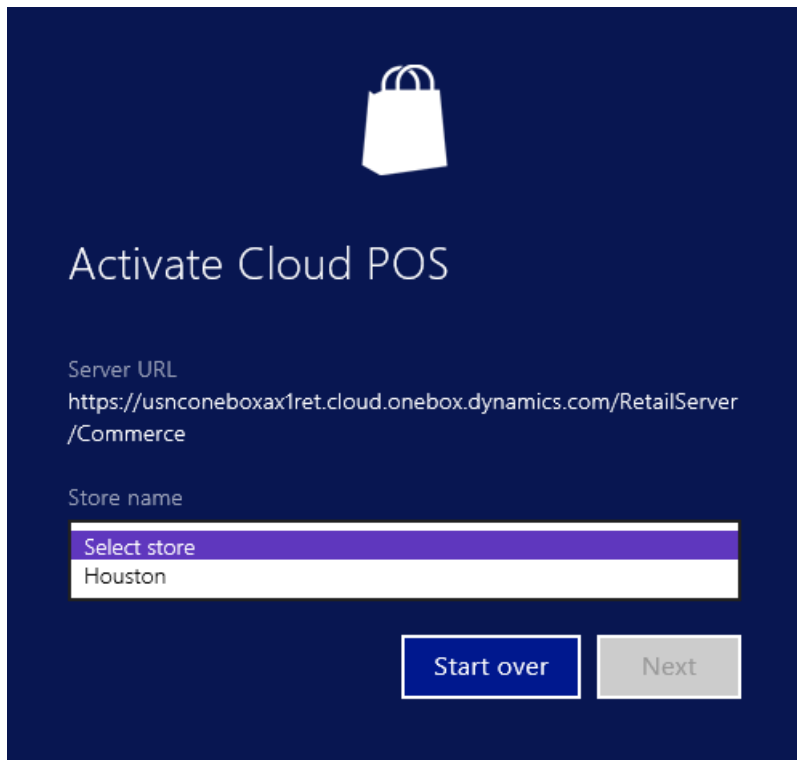

3. Start Cloud POS or Modern POS.
4. Use your AAD credentials to sign in. The AAD account must already be mapped. For instructions, see [Configure, install, and activate Modern POS \(MPOS\)](#). For Cloud POS, the server URL is automatically entered in the address bar. For Modern POS, you must copy and paste the server URL.

5. Click **Next** to populate the list of stores.
6. Select the correct store in the list.

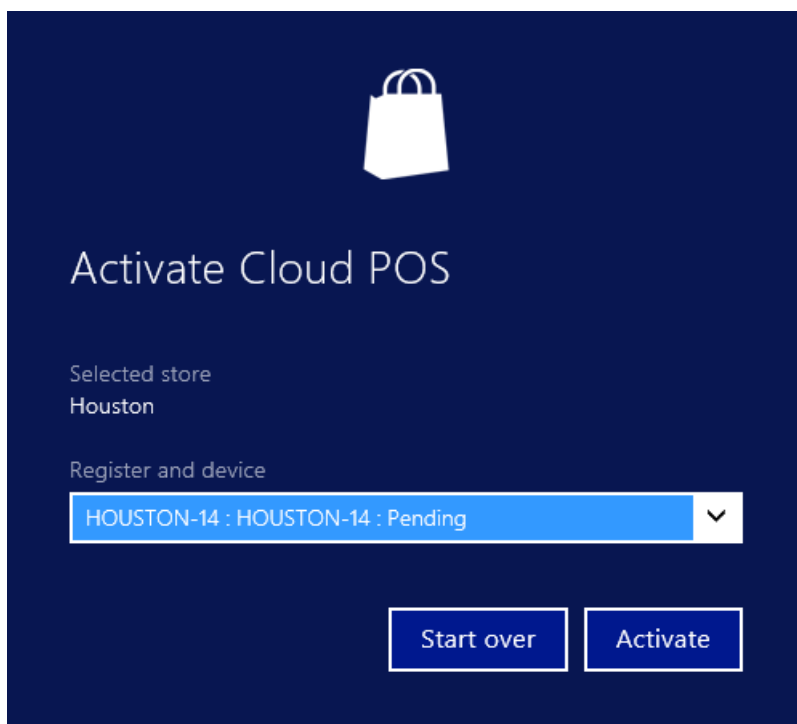

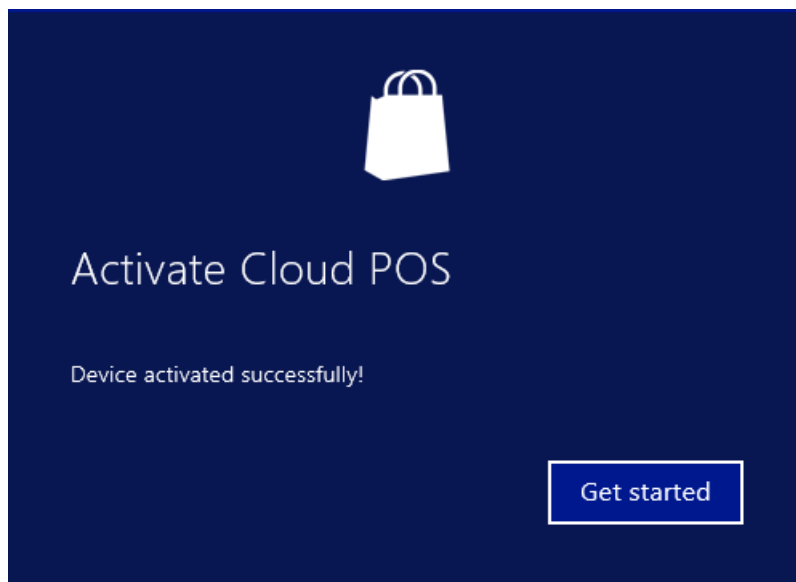

7. Select the correct register and device.

**NOTE**

The device can be **Pending**, **De-activated**, or **Activated**. Alternatively, if you turned on the HQ **Allow devices to be associated to registers from store setting**, you might see a list of registers that have no device associated with them.

8. Click **Activate**. The device should be activated.

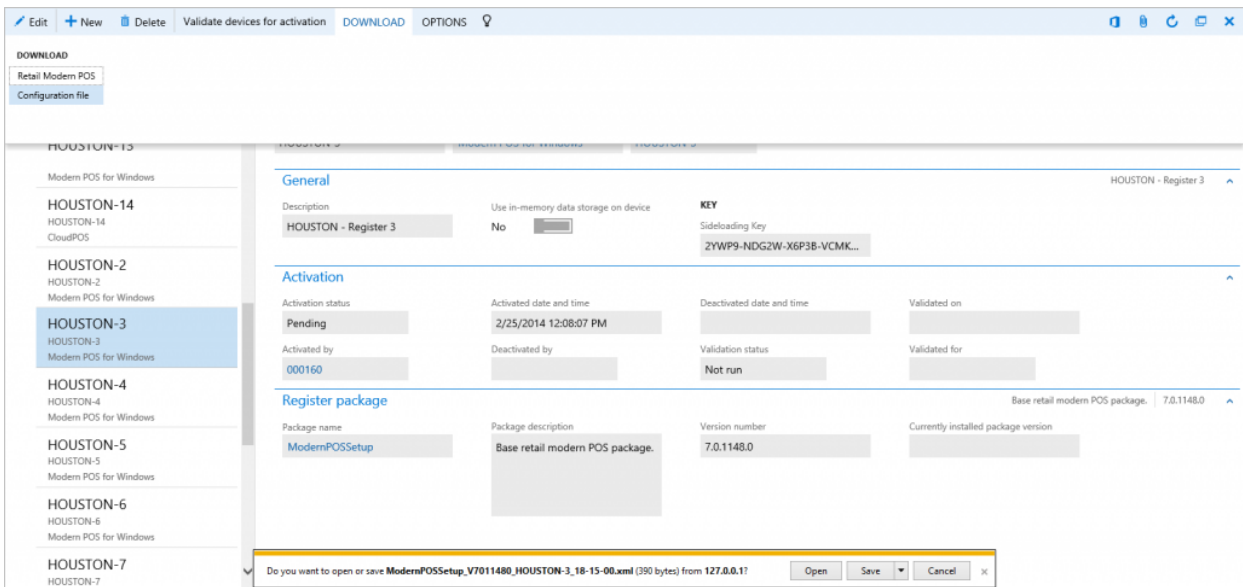

## Create a device ID from Modern POS and Cloud POS

We have added features to create a device (that is, automatically generate a device ID) from Modern POS or Cloud POS, so that the device can be associated with a register that doesn't yet have devices mapped to it. This functionality can be used in Modern POS only if you set the HQ settings as follows.

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters > General**.
2. Under **Devices**, set **Allow register association from device** to **Yes**.
3. In the Modern POS client, you can now add a device when you select a register that is listed as **No associated devices** in the guided activation flow.
4. After you select the register, you can either select a device that doesn't have register mapping or use the **Or, Add a Device** link.
5. Click the **Or, Add a Device** link, and then either enter the new device ID or select **Automatically create a new device ID for me**.
6. Click **Activate** to create a new device ID, associate it with the selected register, and complete the activation.

## Activate the device for Modern POS by using a configuration file

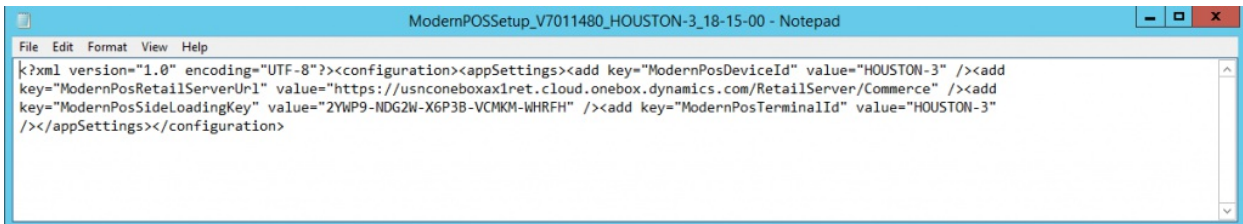

IT Pros can now easily configure device activation for Modern POS by using a configuration file that can be downloaded together with Modern POS. This file is now available on the **Devices** page for the appropriate Modern POS device (**Retail and Commerce > Channel setup > POS setup > Devices**).

The configuration file is used to enter the Commerce Scale Unit URL, device ID, and register number for device activation. During installation, the installer selects this file and populates the values for device activation.

**IMPORTANT**

The user must put the file in the same folder as the Modern POS self-service package and run the .exe file.

Modern POS starts in Manual entry mode, and the Commerce Scale Unit URL, device ID, and register ID are pre-populated for activation.

## Activate the device for Cloud POS by using syntactic sugar

IT Pros can now configure device activation for Cloud POS by providing the device ID and register ID as the part of the Cloud POS URL. The link is available in the **Cloud POS URL** field on the **Devices** page. (**Retail and Commerce > Channel setup > POS setup > Devices**).

Cloud POS starts in Manual entry mode, and the Commerce Scale Unit URL, device ID, and register ID are pre-populated for activation.

# Security best practices for Cloud POS in shared environments

2/18/2021 • 17 minutes to read • [Edit Online](#)

Retail Cloud POS is a web application that runs in the context of a browser. This topic provides recommendations that can help secure Retail Cloud POS in a shared environment.

## Background

Retail Cloud POS is a web application that runs in the context of a web browser. Therefore, it's vulnerable to attack when a user can run any script in the context of the web application. One requirement for such attacks is that the user must have physical access to the computer, either in person or by using Remote Desktop Connection. Vulnerability to attack is an existing issue in most browsers that provide developer tools, and that enable scripts to be run without sufficient privilege control. Because the web application will have little influence over its hosting environment, one way to mitigate security issues is to add defense-in-depth. The defense-in-depth can be built by taking advantage of the restrictive policies of both the browser and the operating system.

## Hardening instructions for a Retail Cloud POS computer

Here are some of the defense-in-depth recommendations for the operating system and/or browser that will have an activated instance of Retail Cloud POS. The settings should be enabled or set by a high-privileged account for the operating system. Retail Cloud POS should be used by a low-privileged account that can't override those settings. We recommend that you enable all the following settings. Otherwise, you could create a security loophole that will be prone to security exploitation.

- **Required** - Disable script execution in the browser's address bar.
- **Required** - Disable the browser's developer console.
- **Required** - Retail Cloud POS should be accessed by a low-privileged user.
- **Required** - Set up group policies to enable a kiosk session.
- **Recommended** - Set up a proxy to access only websites included in a safe list.

## Disable script execution in the address bar of the browser that runs Retail Cloud POS

### Internet Explorer

There is no option to disable script execution in the address bar in Internet Explorer. One alternative is to hide the address bar itself.

1. Create a shortcut for the Retail Cloud POS URL, and copy it to each store worker's Microsoft Windows desktop.
2. Run **regedit.exe** to change the registry to disable the Internet Explorer address bar.  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\Policies\Microsoft\Internet Explorer\ToolBars\Restrictions]  
"NoNavBar"=dword:00000001

### Microsoft Edge

By design, Microsoft Edge prevents script execution in the address bar. Therefore, no action is required.

## Disable the developer console in the browser that runs Retail Cloud

# POS

## Internet Explorer

Use Group Policy Editor to enable the following group policy to disable the Internet Explorer developer console:

\Administrative Templates\Windows Components\Internet Explorer\Toolbars\Turn off Developer

Tools="Enabled"

## Microsoft Edge

Run **regedit.exe** to change the registry to disable the developer console.

[HKEY\_LOCAL\_MACHINE\SOFTWARE\Policies\Microsoft\MicrosoftEdge\F12]

"AllowDeveloperTools"=dword:00000000

## Retail Cloud POS should be accessed by a low-privileged user

A point of sale (POS) user must be a non-administrative account that doesn't have privileges to change applied policies.

## Set up group policies to enable a kiosk session

We recommend that you apply the following restrictions for Retail Cloud POS users:

- Restrict access to the file system.
- Restrict access to Control Panel.
- Restrict access to removable drives.
- Restrict access to shells that run commands.
- Restrict access to the registry.
- Restrict access to application management.

The following table lists the group policies to enable kiosk mode. The set of policies requires that you start your browser at the sign-in script. These policies can be adjusted to your requirements. You should always assess any security implications or talk to a specialist.

SETTING	STATE	COMMENT	PATH
Enable screen saver	Disabled	No	\Control Panel\Personalization
Allow DFS roots to be published	Disabled	No	\Shared Folders
Allow shared folders to be published	Disabled	No	\Shared Folders

## Set up a proxy to access only websites included in a safe list

You can define a list of websites that a store worker (cashier) requires for normal operations, and set up an administrator-controlled proxy that has access only to these websites. Retail Cloud POS requires access to the following websites:

- Retail Cloud POS website
- Microsoft Azure Active Directory sign-in page
- Commerce Scale Unit website
- Bing Maps resources
- Media resources
- Credit Card Payment acceptance page (optional)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure and install Retail hardware station

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how to configure, download, and install Retail hardware station by using self-service. It also explains how to uninstall Retail hardware station.

## IMPORTANT

It is critical to note that this component utilizes a server certificate. Server certificates must be managed for expiration. By default, a certificate expires in one calendar year (365 days).

## Download Retail hardware station by using self-service

### Configure a new Retail hardware station

#### NOTE

If you're running the February 2016, non-upgraded version of Retail (Initial release), skip step 6.

1. Use your Azure AD credentials to sign in to the Retail trial.
2. On the **Welcome** page, use the menu in the upper left to go to **Retail > Channels > Retail stores > All retail stores**.
3. On the **All retail stores** page, select the retail channel ID of the desired store. The details view for the store appears.

#### NOTE

The Houston store is the most thoroughly prepared store in the demo data.

4. On the **Retail store details** page, on the **Hardware stations** FastTab, select **Add**.

#### NOTE

The Retail Server URL that is used for the selected store is read-only. This URL will be important during the installation of Retail hardware station.

5. In the **Hardware station type** field, select **Shared** to indicate that this hardware station is an Internet Information Services (IIS), installed hardware station that will be used by external point of sale (POS) systems.

#### NOTE

The value **Shared** signifies that the installation is a truly shared hardware station installation, and that it works through HTTPS communication. By contrast, the value **Dedicated** signifies that the hardware station is a part of Modern POS, and that it works through inter-process communication.

6. Select a hardware station profile.

7. Enter the host name of the computer that you're installing Retail hardware station on. Additionally, enter the electronic funds transfer (EFT) terminal ID that is associated with that computer for merchant account information.
8. To utilize the configuration file or initial installation using mass deployment, enter the certificate thumbprint that is to be used during the installation that's detailed in the next section.

#### Download the Retail hardware station installer

1. Use your Azure AD credentials to sign in to the Retail headquarters or Retail trial.
2. On the **Welcome** page, use the menu in the upper left to go to **Retail > Channels > Retail stores > All retail stores**.
3. On the **All retail stores** page, select the retail channel ID of the desired store. The details view for the store appears.

##### NOTE

The Houston store is the most thoroughly prepared store in the demo data.

4. On the **Retail store details** page, select the **Hardware stations** FastTab.

##### NOTE

The Retail Server URL that is used for the selected store is read-only. This URL will be important during the installation of Retail hardware station.

5. Select the hardware station to download, and then select **Download**.

##### NOTE

- Browsers might block the download pop-up that is generated. You must select either **Allow once** or **Options for this site > Always allow**. Then select **Download** again.

6. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)
7. If needed for mass deployment or command line deployment, repeat the above steps for the configuration file download, which is a button next to the **Download** button that you previously selected.

##### NOTE

- If the configuration file downloaded does not have the same base file name as the installer, either rename the XML configuration file to be the same base name or run the installer using the command line to specify the configuration file.
- Note that the configuration file is not required for the installation of Commerce hardware station.

8. After the files have been saved, run the installer. (This step might differ depending on your browser.)

#### Run the installer

##### NOTE

Before you run the Retail hardware station installer, make sure that all [system requirements](#) are met.

The Retail hardware station installer first extracts the associated files and then begins the installation.

1. The installer validates that all prerequisites are met. If a sideloading key is required, the installer requests it. This key is found on the **Devices** page for each device, under **General**.

**NOTE**

- If a system restart is required, the installer informs you of this requirement but can continue the installation.
- Before you can use hardware that is based on the Object Linking and Embedding for Retail Point of Sale (OPOS) standard, the OPOS Common Control Objects must be installed. If they aren't installed, the installer informs you of this requirement but can continue the installation.

2. Enter the Retail Server URL (for example, `https://MyCompanyNameret.axcloud.dynamics.com/Commerce`), and then select **Next**.

**NOTE**

You can find the Retail Server URL at the top of the **Hardware stations** FastTab on the **Retail store details** page.

3. Select a valid Secure Sockets Layer (SSL) certificate to use for HTTPS communication.

**NOTE**

The certificate must use private key storage, and server authentication must be listed in the enhanced key usage property. Additionally, the certificate must be trusted locally, and it can't be expired. It must be stored in the personal certificate store location on the local computer.

4. The next page requests the user that should be used for the IIS application pool. By default in version 1611 and later, the installer can automatically create and use a service account. If you're on a domain or require more specific controls, clear the check box, and then enter the user name and password that the application pool should run under.
5. Enter the HTTPS port to use.

**NOTE**

- You can find the HTTPS port in Retail. (See the configuration instructions earlier in this topic).
- The installer automatically enters the host name. If, for any reason, you must change the host name for the installation, you can change it here. The host name must be the fully-qualified domain name (FQDN) of the system, and it must be entered in the **Host name** field for the selected hardware station entry.

6. The installer installs Retail hardware station and then indicates whether the installation was successful.
7. When the installation is completed, the Install merchant information tool may start. This installer connects to the environment and installs the merchant account information (such as the EFT ID) for the selected hardware station.

#### NOTE

- If the hardware station that was installed won't be used for payment-related work, don't close the **Install merchant information** window without completing the remaining steps. The hardware station won't work unless this installation is successfully completed.

- For version 10.0.6 and above, the install merchant information tool is no longer used. Instead, the merchant information for the hardware station is set by the POS at the time of logon or when the hardware station is made active. If the retail server is not available when the hardware station is subsequently made active, the last known merchant properties will be used by until the connection to the retail server is re-established. If the POS client is not upgraded to version 10.0.6 at the same time the hardware station is upgraded, merchant properties will not be updated until the POS client is upgraded to an equal or later version.

8. The Install merchant information tool might request Azure AD credentials. Enter the Azure AD credentials of the user who is installing Retail hardware station.
9. The Retail Server URL is determined through the Retail hardware station installation and is entered automatically. The installer uses this URL to load the list of stores that the user is connected to via the address book.
10. Select the retail store that the hardware station was installed for.
11. Select the hardware profile that matches the hardware station that was installed on the current computer.
12. Verify that the host names and EFT terminal IDs are correct, based on the current computer and the Retail hardware station configuration that has already been completed in Retail. After you've verified this information, select **Install**.
13. When you receive a message that states that the merchant account information was installed correctly, exit the installer by selecting the **Close** button.

## Help secure Retail hardware station

Current security standards state that the following options should be set in a production environment:

#### NOTE

The hardware station installer automatically makes these registry edits as part of the installation through self-service.

- SSL should be disabled.
- Only Transport Layer Security (TLS) version 1.2 (or the current highest version) should be enabled and used.

## NOTE

By default, SSL and all version of TLS except TLS 1.2 are disabled. To edit or enable these values, follow these steps:

1. Press the Windows logo key+R to open a **Run** window.
2. In the **Open** field, type **Regedit**, and then select **OK**.
3. If a **User Account Control** window appears, select **Yes**.
4. In the new **Registry Editor** window, go to **HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\SecurityProviders\SCHANNEL\Protocols**.  
The following keys have been automatically entered to allow for TLS 1.2 only:
  - TLS 1.2\Server:Enabled=1
  - TLS 1.2\Server:DisabledByDefault=0
  - TLS 1.2\Client:Enabled=1
  - TLS 1.2\Client:DisabledByDefault=0
  - TLS 1.1\Server:Enabled=0
  - TLS 1.1\Client:Enabled=0
  - TLS 1.0\Server:Enabled=0
  - TLS 1.0\Client:Enabled=0
  - SSL 3.0\Server:Enabled=0
  - SSL 3.0\Client:Enabled=0
  - SSL 2.0\Server:Enabled=0
  - SSL 2.0\Client:Enabled=0

- No additional network ports should be open, unless they are required for known, specified reasons.
- Cross-origin resource sharing must be disabled and must specify the allowed origins that are accepted.
- Only trusted certificate authorities should be used to procure certificates that will be used on computers that run Retail hardware station.

## IMPORTANT

- Most common, lower-security software and services will stop working after all lower-security standards are disabled. To use them again, go to the preceding registry keys, and set the **Enabled** key from **0** to **1**.
- It's critical that you review security guidelines for IIS and Payment Card Industry (PCI) requirements.

## Troubleshooting

**Modern POS can detect the hardware station in its list for selection, but it can't complete the pairing**

**Solution:** Verify the following list of potential failure points:

- The computer that is running Modern POS trusts the certificate that is used on the computer that runs Retail hardware station.
  - To verify this setup, in a web browser, go to the following URL:  
`https://<Computer Name>:<Port Number>/HardwareStation/ping`
  - This URL uses a ping to verify that the computer can be accessed, and the browser indicates whether the certificate is trusted. (For example, in Internet Explorer, a lock symbol appears in the address bar. When you select this symbol, Internet Explorer verifies whether the certificate is currently trusted. You can install the certificate on the local computer by viewing the details of the certificate that is shown.)
- On the computer that runs Retail hardware station, the port that will be used by the hardware station is opened in the firewall.

- Retail hardware station has properly installed merchant account information through the Install merchant information tool that runs at the end of the Retail hardware station installer.

### **Modern POS can't detect the hardware station in its list for selection**

**Solution:** Any one of the following factors can cause this issue:

- Retail hardware station hasn't been set up correctly in Commerce headquarters. Use the steps earlier in this topic to verify that the hardware station profile and the hardware station are correctly entered.
- The jobs haven't been run to update the channel configuration. In this case, run the 1070 job for channel configuration.
- The hardware station isn't accessible from that computer. Verify that the hardware station URL ping test is accessible from a web browser. This URL can be found at the end of the hardware station installer and is in the following form: `https://<Computer Name>:<Port Number>/HardwareStation/ping`

## Uninstall Retail hardware station

You can use Control Panel in Microsoft Windows to uninstall Retail hardware station.

1. Press the Windows logo key, and then, in the search box, type **Control Panel**. In the list of search results, select **Control Panel**.
2. In Control Panel, select **Programs > Uninstall a program**. The **Programs and Features** window opens.
3. Select **Microsoft Dynamics 365 for Retail hardware station**, and then select **Uninstall** above the list of programs.
4. Wait for the uninstaller to finish removing the program.

# Mass deployment of self-service components

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how you can use self-service to do silent servicing updates and initial deployments. It also explains some aspects of special deployment. This topic will be updated as the feature is developed and more functionality becomes available. Currently, only the capability for silent servicing updates is available.

## Delimiters for mass deployment

The following table shows the delimiters that can currently be used in execution commands for mass deployment.

DELIMITER	DESCRIPTION
-S or -Silent	Silently run the installer. No graphical user interface (GUI) is used. The <b>-Q</b> and <b>-Quiet</b> delimiters have the same effect and can also be used.
-C or -Config	Specify the location and file name of the configuration file to use as part of this installation.
-FilePath	Specify a custom installation location. We don't recommend that you use this delimiter for a standard installation.
-LogFile	Specify a custom file location for the installation logs. We don't recommend that you use this delimiter for a standard installation.
-SkipPrerequisiteCheck	Skip the check for prerequisites and prerequisite installation. You should use this delimiter only for development and testing. We don't recommend that you use it for a standard installation.
-SkipSystemInfoCollection	Skip the process of collecting system information at the beginning of the installation. You should use this delimiter only for development and testing. We don't recommend that you use it for a standard installation.
-SkipMerchantInfo	Skip the installation of merchant account information at the end of the self-service installer for Hardware station. You should use this delimiter only for development and testing. We don't recommend that you use it for a standard installation.

DELIMITER	DESCRIPTION
-SkipAppxInstallation	Beginning in the October 2018 release of Dynamics 365, this delimiter will skip the installation of the APPX Retail Modern POS application. This delimiter is required to perform the application installation through the SYSTEM account or a service account (Any account that does not have a user profile).

## Silent servicing

### Before you begin

Note that silent servicing maintains all components that are currently installed. If any configuration is still required, complete it before you begin to follow the instructions in this topic.

### Examples of commands for silent servicing

This section shows examples of commands that are used for self-service mass deployment. These commands work for all the standard self-service installers, such as the installers for Modern POS (both the installer that has offline support and the installer that doesn't have offline support), Hardware station, and Commerce Scale Unit (self-hosted).

#### Silently update the current installation of Modern POS

The following command silently updates the current installation of Modern POS. This command has the standard command structure that is used for silent servicing of components that are currently installed. The structure uses the basic values of `<InstallerName>.exe` and the command for silent installation, `-S`. This command uses the configuration file that is located in the same file location as the installer, if a configuration file exists there.

```
ModernPOSSetup_V72.exe -S
```

#### NOTE

A configuration file is still required for Retail Store Scale Unit. However, the installer keeps all the values that are currently installed, whenever it can.

#### Silently update the current installation of Commerce Scale Unit (self-hosted)

The following command silently updates the current installation of Commerce Scale Unit (self-hosted) by using a specific configuration file. (This configuration file might not be in the same location as the executable file for the installer.) This command skips the prerequisite check and moves on to the installation steps. We recommend that you use this command only for testing and development purposes.

```
StoreSystemSetup_V72.exe -S -C "C:\Temp\StoreSystemSetup_V72_Houston.xml" -SkipPrerequisiteCheck
```

## Mass deployment of Modern POS

### Before you begin

To use this functionality, you must be using version 7.3 or later. It's assumed that the configuration of all stores, registers, and devices, and other configurations in the headquarters have already been completed. If any configuration is still required, complete it before you follow the instructions in this topic.

### Examples of commands for silent mass deployment

This section shows examples of commands that are used for self-service mass deployment of Modern POS, even Modern POS with offline and the installer without offline support. Examples of Windows PowerShell scripts are also included to help users do the installations.

#### Silently install Modern POS

The following command silently installs (or updates) Modern POS. It has the standard command structure that is used for silent servicing of components that are currently installed. The structure uses the basic values of `<InstallerName>.exe` and the command for silent installation, `-S`.

This command uses the configuration file that is in the same location as the executable file for the installer, if a configuration file exists there. It should not be used if multiple configuration files are available.

```
ModernPOSSetup_V73.exe -S
```

#### NOTE

A configuration file isn't required for Modern POS. However, the Modern POS application that is installed can't be activated in the appropriate manner unless the associated configuration file can be read from.

#### Silently install Modern POS by using a specific configuration file

The following command silently installs the current installation of Modern POS by using a specific configuration file. This configuration file might not be in the same location as the executable file for the installer, or multiple configuration files might be available.

```
ModernPOSSetup_V72.exe -S -C "C:\Temp\ModernPOSSetup_V73_Houston-3.xml"
```

#### Silently install Retail hardware station

#### NOTE

The `-SkipMerchantInfo` delimiter is required to install Retail hardware station. The Merchant Account Information Utility that is opened at the end of a GUI-based installation of Hardware station no longer has to be used. Because of feature functionality, when Modern POS is paired to Hardware station, it also pushes the latest merchant account information to the component.

The following command silently installs (or updates) Retail hardware station. It has the standard command structure that is used for silent servicing of components that are currently installed. The structure uses the basic values of `<InstallerName>.exe` and the command for silent installation, `-S`. It also uses the `-SkipMerchantInfo` delimiter to skip the download of merchant account information through the utility. This command uses the configuration file that is in the same location as the executable file for the installer.

```
HardwareStationSetup_V10.exe -S -SkipMerchantInfo
```

#### NOTE

A configuration file is required to silently deploy Retail hardware station.

#### Silently install Retail hardware station by using a specific configuration file

The following command silently installs the current installation of Retail hardware station by using a specific configuration file. This configuration file might not be in the same location as the executable file for the installer, or multiple configuration files might be available.

```
HardwareStationSetup_V10.exe -S -SkipMerchantInfo -C "C:\Temp\HardwareStationSetup_V10__20-19-35.xml"
```

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce component events for diagnostics and troubleshooting

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic explains where to find events from Commerce-specific components. To enable diagnostics and troubleshooting, Commerce components, which include self-hosted components such as the Retail Modern POS and cloud-hosted components, such as Commerce Scale Unit and E-Commerce modules, log their events locally to Event Viewer (or to the browser developer tools console such as F12). Events are also logged in the Microsoft Dynamics Lifecycle Services (LCS) log search experience.

## Viewing events in Event Viewer

You can use Event Viewer to view events for components that are installed on computers that run Microsoft Windows, if you have physical access to the computer where the events are logged. For more information about Event Viewer, see [Event Viewer](#) on TechNet. You can also use Event Viewer to view events remotely from computers that you have access to. For more information about how to use Event Viewer to view events remotely, see [Work with Event Logs on a Remote Computer](#) on TechNet. Typically, Event Viewer is used for troubleshooting in the following use cases:

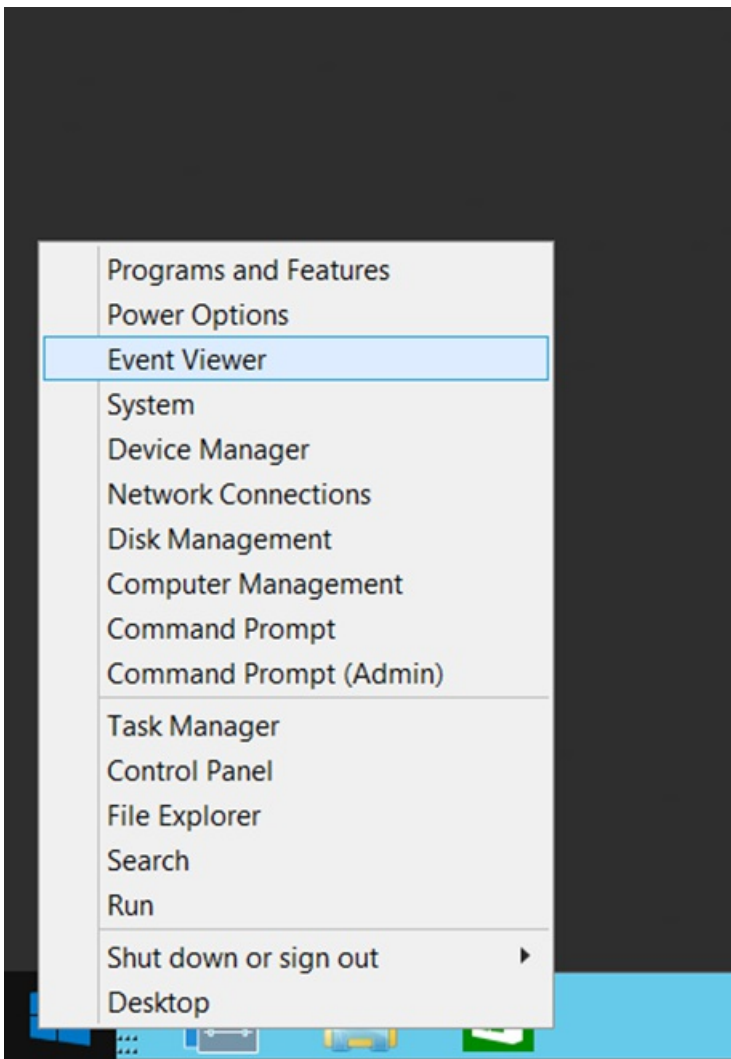

- Development on a developer topology or on a downloadable virtual hard disk (VHD) that provides access to Event Viewer.
- Client components, when you're running a conference room pilot and have access to Event Viewer for that computer.

However, for most other cases, and especially when you don't have access to Event Viewer for the computer, you can use Log Search on LCS. For E-Commerce modules, events are currently available only in browser developer tools (such as F12). Log Search is discussed later in this topic. This section applies to the following components:

- Commerce Scale Unit
- Retail Modern POS
- Retail Hardware Station

### Find Commerce-specific events in Event Viewer

To start Event Viewer on a computer, right-click the **Start** button, and then click **Event Viewer**.

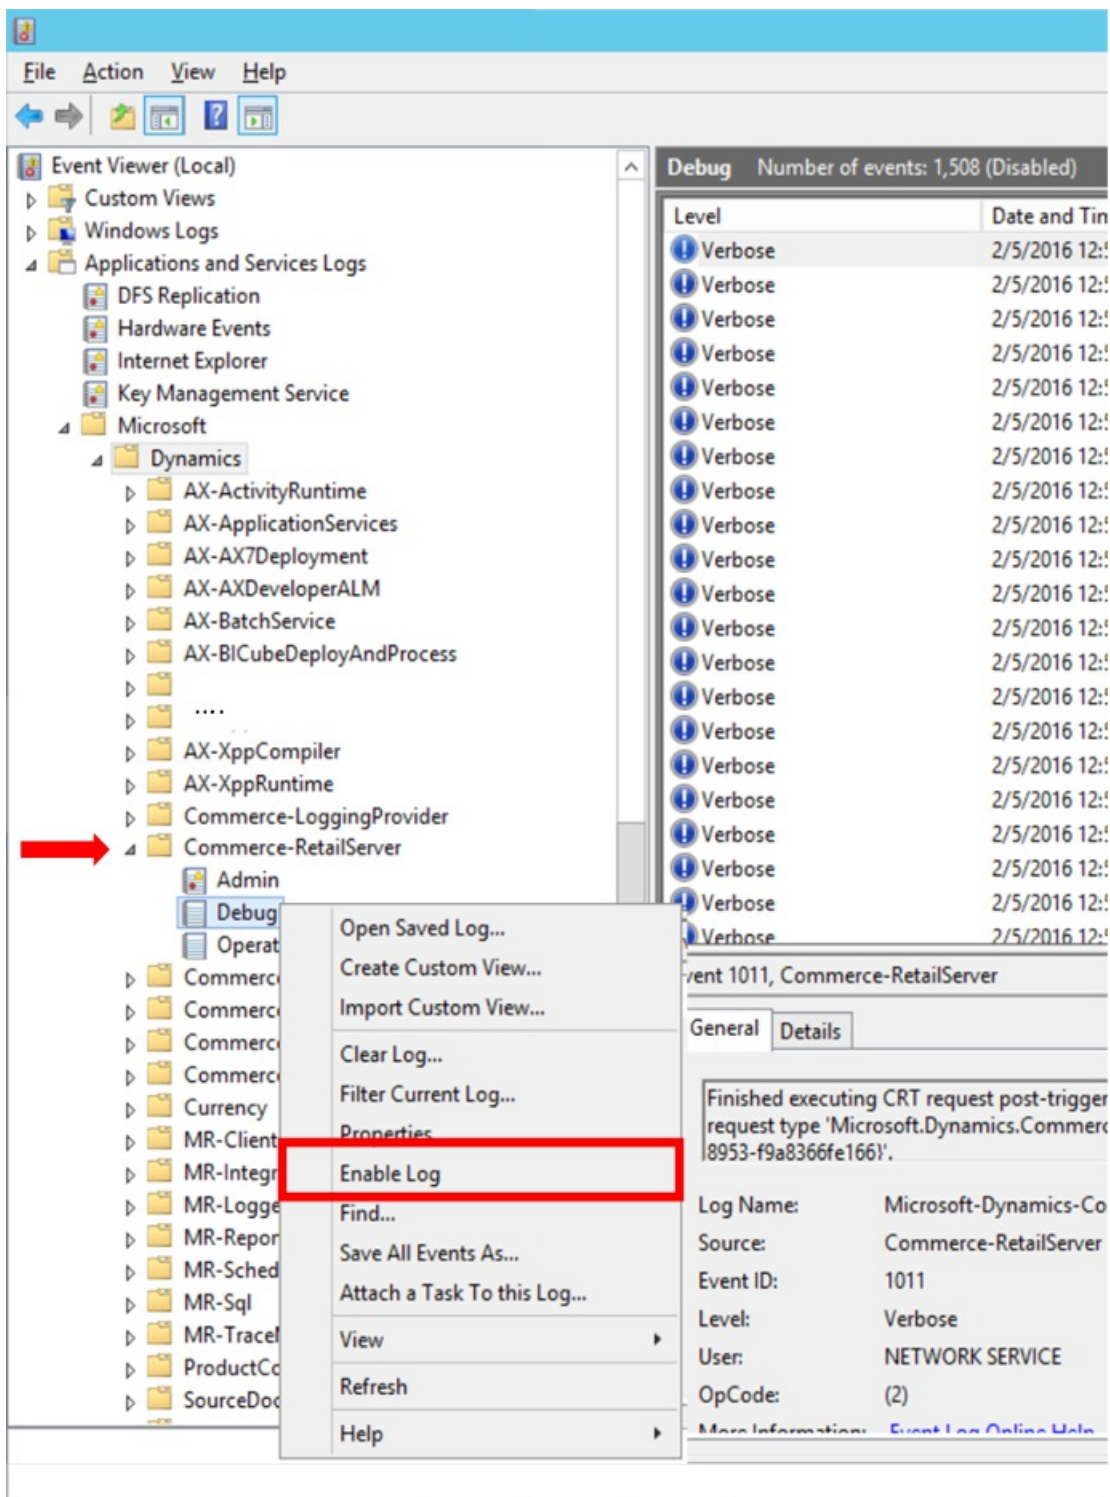

All Commerce-specific event logs can be found under the following path in Event Viewer: Application and Services Logs\Microsoft\Dynamics We provide the following Commerce-specific event logs:

- **Commerce-RetailServer** – This log contains events that are logged by the Commerce Scale Unit components.
- **Commerce-ModernPos** – This log contains events that are logged by Retail Modern POS. These events include events from the TypeScript and C# (CRT) layer.
- **Commerce-LoggingProvider** – This log contains events that are logged by all other Commerce components that aren't included in the list earlier in this article.

### **Enable debug event logs**

Currently, some of the events that are logged by various components are sent to debug event logs. These events are verbose events that are logged at very high rates and are useful only for detailed debugging scenarios. Follow this step to enable the debug event logs in Event Viewer.

- Right-click a debug log, and then click **Enable Log**.

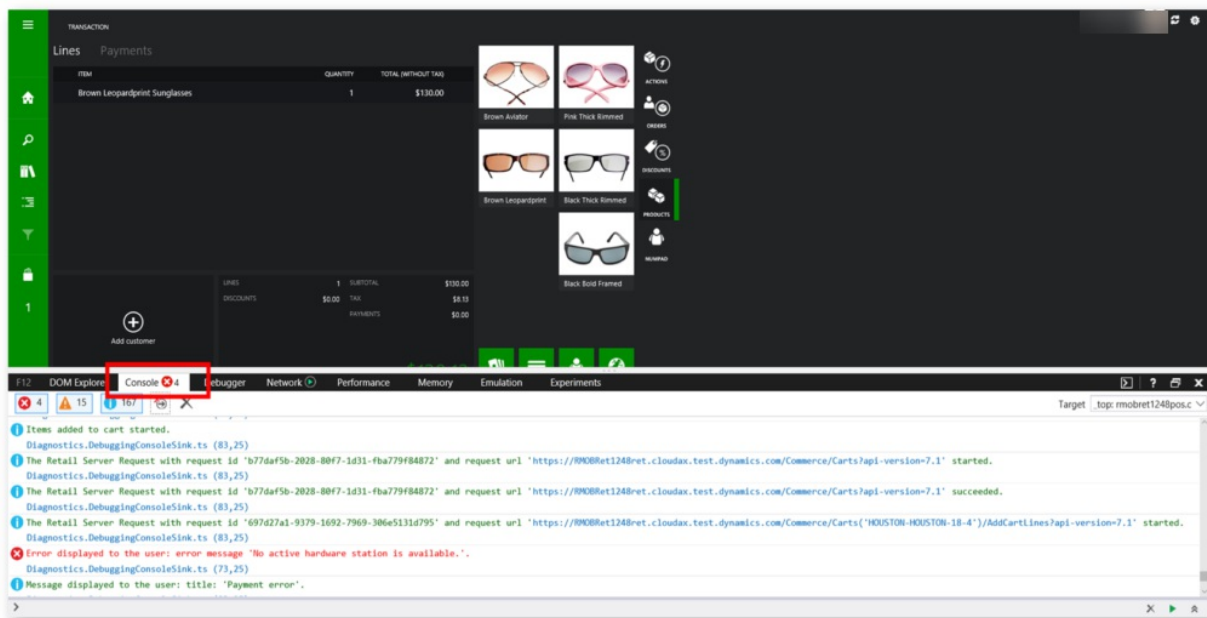

## Viewing events by using the (F12) browser developer tools console

Because Retail Cloud POS and E-Commerce modules are browser-based components, you can use the browser developer tools console to view events for it. For information about the Microsoft browser developer tools console, see [Using the Console to view errors and debug](#). To use the browser developer tools for Retail Cloud POS or E-Commerce modules, you must use a supported browser version.

### View events in the browser developer tools console

1. Start your browser, and navigate to Retail Cloud POS or your E-Commerce website.
2. Press F12, and then click the **Console** tab.
3. As you perform operations on Retail Cloud POS or on your E-Commerce website, events are logged in the console. You can filter by event severity to view events that have different severity levels.

## Correlating events

This section explains how to correlate events from various Commerce components.

### Data flow between a POS client and Commerce Scale Unit

The diagram that follows shows the data flow between a point of sale (POS) client and the Commerce Scale Unit.

#### POS client startup

When a user starts a POS client, a new AppSessionID is generated. The AppSessionID is used to log every event that is instrumented in the POS client. All events that are logged to Event Viewer and App Insights have this ID.

#### User sign-in

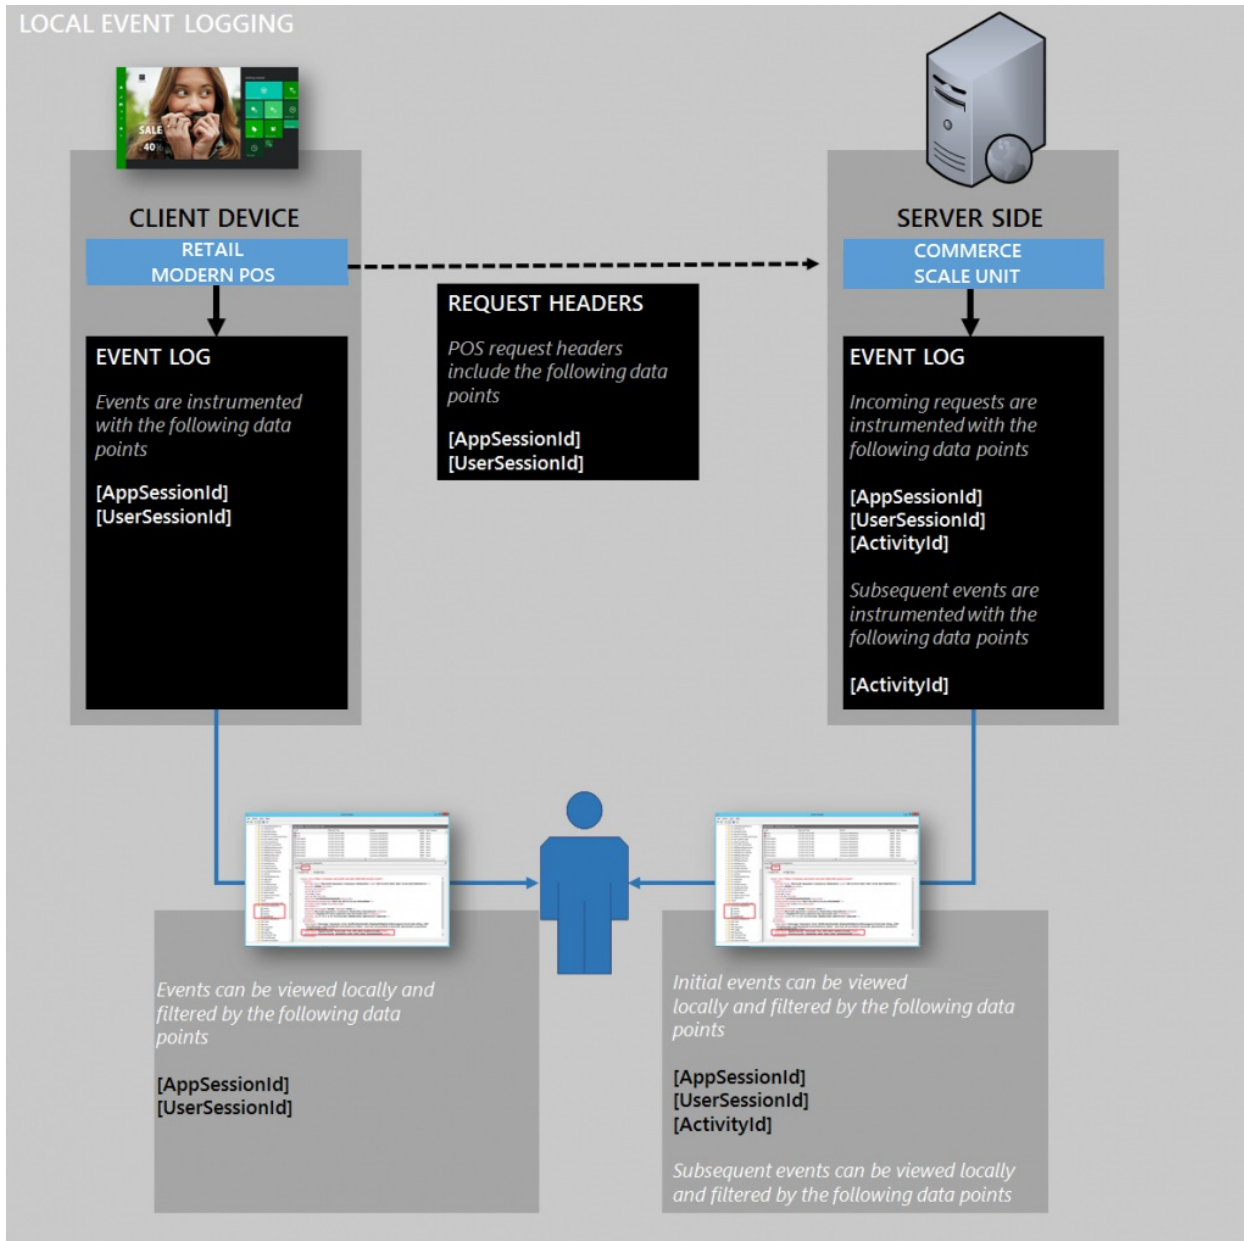

When a user signs in to a POS client, a new UserSessionID is generated. The UserSessionID is used to log every event that is instrumented in the POS client. All user events that are logged to Event Viewer have this ID. This ID is maintained for as long as the user is signed in. When the current user signs out and a new user sign in, a new UserSessionID is generated.

#### POS client calls to Commerce Scale Unit

Whenever a POS client makes a call to the Commerce Scale Unit, the AppSessionID and UserSessionID are sent as headers. The Commerce Scale Unit then logs an event for the incoming request (Event ID 5000). This event includes those two IDs and also an ActivityID. The ActivityID is then also used for all related events. The AppSessionID, UserSessionID, and ActivityID are available in the event log where Commerce Scale Unit is hosted. They are also available in LCS Log Search.

#### Request activity on Commerce Scale Unit

Every event that is logged as part of a Commerce Scale Unit request has the same ActivityID as the initial event that was logged for the initial incoming request event (Event ID 5000). These events are available in both Event Viewer and LCS Log Search.

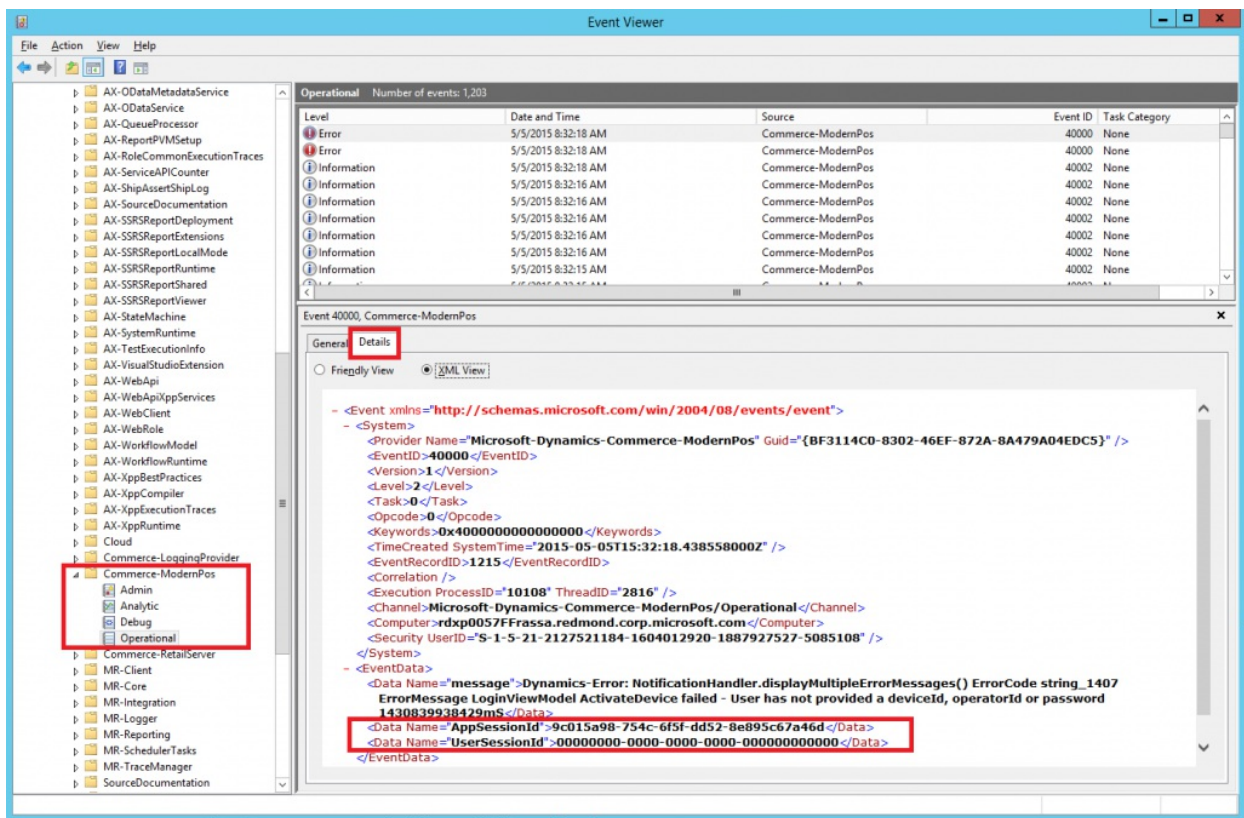

### Finding Retail Modern POS events in Event Viewer

Every event that is logged by Retail Modern POS includes the following data points:

- **AppSessionID** – A unique ID that is generated when the app is first started. It's included with every event that is logged.
- **UserSessionID** – A unique ID that is generated when a user signs in to Retail Modern POS. It's included with every event that is logged, for as long as the user remains signed in. When a new user signs in, a new UserSessionID is created.

You can find the AppSessionID and UserSessionID values on the **Details** tab in Event Viewer on the machine where Retail Modern POS is installed.

## Finding incoming Commerce Scale Unit request events in Event Viewer

To correlate data for incoming Commerce Scale Unit requests in Event Viewer, you must first enable the Analytic channel. To enable the Analytic channel, follow these steps.

1. In Event Viewer, in the left pane, select **Commerce-RetailServer**.
2. Click **View > Enable Analytic and Debug log**. A new node for the Analytic channel appears under the **Commerce-RetailServer** logging provider.
3. Right-click the **Analytic** node, and then click **Enable log**.

In Event Viewer, all incoming Commerce Scale Unit requests are logged to the Analytic channel of the Commerce-RetailServer source as event 5000. These events also have the AppSessionID and UserSessionID that were described earlier. Every event also has a unique ActivityID that is instrumented for every logged event for the same request.

## Using LCS Log Search

LCS Log Search lets you view data from all the components from a single portal. You can access events from both cloud-hosted components (such as Commerce Scale Unit) and in-store components (such as Retail Modern POS and Retail Hardware Station). Event data from all cloud-hosted and in-store components flows to LCS Log Search, where it's indexed and made searchable. Data is typically available within 5 minutes after it's logged. For POS clients and Retail Hardware Station, all events are locally queued in persistent storage and then uploaded in batches after the queue is filled. This behavior enables network traffic to be optimized. It also enables events to be saved even when there is no Internet connectivity. After connectivity is restored, all pending events are uploaded.

LCS Log Search is available for the HA production topology. It can be used for the following Commerce components:

- Retail Modern POS
- Retail Cloud POS
- Commerce Scale Unit (running on Retail Cloud Scale Unit)

LCS Log Search does not include logs from the following Commerce components:

- Commerce layout designer
- Commerce receipt designer
- Self-service installer for Retail Modern POS
- Self-service installer for Retail Hardware Station
- Commerce Scale Unit (running on Retail Store Scale Unit)
- Retail Hardware Station

### Access LCS Log Search

To access LCS Log Search, follow these steps.

1. Go to [Lifecycle Services](#).
2. Sign in by using the credentials that are associated with your project.
3. On the project page, select the correct project.
4. On the **Project details** page, select the correct environment.
5. On the **Environment details** page, click **Environment Monitoring**.
6. On the **Environment monitoring** page, click **View raw logs**.
7. On the **Log Search** page, select one of the following queries:
  - **Commerce client events** query, which includes events from Retail Modern POS, Retail Cloud POS, and Commerce Scale Unit (running on Retail Cloud Scale Unit)
  - **All logs** query, which includes data from Commerce Scale Unit, Commerce Data Exchange, and Commerce Data Exchange: Real-time Service

You can filter by the following criteria to refine your query:

- Start and end dates and times (in Coordinated Universal Time [UTC])
- Device ID
- POS user
- POS application session ID
- POS user session ID
- Severity level

The screenshot displays the 'Raw logs' section of the 'Environment monitoring' page in Lifecycle Services. The interface includes a search bar with the query name 'Commerce error events' and several filter options on the left, such as 'Start date (UTC)', 'End date (UTC)', 'Device ID', 'POS User', 'POS Application Session ID', 'POS User Session ID', and 'Filter Severity Logs'. The main area contains a table with columns for various identifiers and internal data. The table shows three rows of log entries, each with a severity level of 1.61. The first row's internal data includes fields like 'OfflineAvailability', 'Unknow', 'Tana-443d-5b3c', '885932ac220', 'Application', 'POS', 'UserSessionId', '00000000-0000-0000-0000-000000000000', 'DeviceNum', '917a-492e-86b3', 'e242e18726c9', 'TerminalId', '2cbe-f7d6-c560', '149fad12c789', 'UserId', 'Invalid parameter (at index 0) cannot be null or undefined.', 'errorUrl', 'https'. The second row's internal data includes 'Tana-443d-5b3c', '885932ac220', 'UserSession', '0000-0000-0000-000000000000', 'Application', 'POS', 'TenantId', '52bf87264-917a-492e-86b3', 'e242e18726c9', 'UserId', 'Invalid parameter (at index 0) cannot be null or undefined.', 'errorUrl', 'https'. The third row's internal data includes '1f781371-cbaa-11e5-ba36-1.61', '965a5a962867', 'EventSeverity', 'Error', 'App', 'Tana-443d-5b3c', '885932ac220', 'UserSession', '0000-0000-0000-000000000000', 'Application', 'POS', 'TenantId', '52bf87264-917a-492e-86b3', 'e242e18726c9', 'UserId', 'Invalid parameter (at index 0) cannot be null or undefined.', 'stackTrace', 'https'. The page footer shows 'Page 1 of 1' and 'View 1 - 5 of 6'.

## E-Commerce events

The following events are logged by the E-Commerce website, and can be consumed for troubleshooting directly in the browser, or programmatically by partner extensions for analytics, experimentation, or other purposes.

### Button and link clicks

Button and link clicks for the following types of elements on an E-Commerce website are logged as telemetry events.

- Header
  - Navigation hierarchy
  - Cart icon
  - Sign-in
  - Search icon
  - Wishlist icon
- Content block action links (This represents the hero, tile, and feature modules for marketing content.)
- Video player
- Product cards
- Footer links
- Breadcrumbs
- Promo banner
- Add to cart button
- Checkout button
- Place order button

The schema for **Click** action is:

```
Click
IPayload = {
  contentCategory: Name of element clicked on,
  contentAction: {
    pname: Name of page,
    mname: name of module,
    etext: Text of element clicked on,
    recid: Product ID if a product was clicked on,
    etype: 'click',
  }
};
```

### Page views

Page view events are logged for each page view operation.

The schema for a **PageView** action is:

```
PageView
IPageViewInfo = {
  title;
}
```

### Cart operations

The following **Cart** related events are logged.

- Add item to cart.
- Update item in cart.
- Remove item from cart.

- Checkout.
- Product Page view.

The schema for **Cart** events is:

```
/**
 * Defines the telemetry properties to track for a Cart object
 * @property products      {IProductInfo[]} - Array of product information
 * @property orderId      {string}         - ID for the order
 * @property cartId       {string}         - ID for the current cart object
 * @property cartVersion  {string}         - Version number for the current cart object
 */
export interface ICartInfo {
  products: IProductInfo[];
  orderId: string;
  cartId: string;
  cartVersion: string;
}
```

## Purchase

When an order is submitted, a Purchase event is logged. The schema for a **Purchase** event is:

```
/**
 * Defines the telemetry properties to track for a Purchase event
 * @property id           {string}         - Transaction ID
 * @property affiliation  {string}         - Origin of this transaction (e.g. Online Store)
 * @property revenue     {number}         - Revenue from this transaction
 * @property tax         {number}         - Tax amount
 * @property shippingCost {number}         - Shipping cost
 * @property products    {IProductInfo[]} - List of products in this transaction
 */
export interface IProductTransaction {
  id: string;
  affiliation?: string;
  revenue?: number;
  tax?: number;
  shippingCost?: number;
  products?: IProductInfo[];
}
```

## Product details

Product details are logged for **Cart** and **Purchase** operations. The schema for **Product** details is:

```
/**
 * Defines the telemetry properties to track for a Product object
 * @property productChannelId {string} - Product channel ID
 * @property productChannelName {string} - Product channel name
 * @property productCategoryId {string} - Product category ID
 * @property productCategoryName {string} - Product category name
 * @property productId {string} - Product ID
 * @property productName {string} - Product name
 * @property productSku {string} - Product SKU
 * @property productPrice {string} - Product price
 * @property productQuantity {string} - Product quantity
 * @property productCurrency {string} - Product currency code
 */
export interface IProductInfo {
  productChannelId: string;
  productChannelName: string;
  productCategoryId: string;
  productCategoryName: string;
  productId: string;
  productName: string;
  productSku: string;
  productPrice: string;
  productQuantity: string;
  productCurrency: string;
}
```

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Apply updates to cloud environments

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes how you can use Microsoft Dynamics Lifecycle Services (LCS) to automatically apply updates to cloud environments.

## IMPORTANT

Updates are applied using deployable packages. Applying updates causes system downtime. All relevant services will be stopped, and you won't be able to use your environments while the package is being applied. You should plan accordingly.

## Supported environments

All environments deployed through Lifecycle Services are supported.

## NOTE

If you have a build environment, you can only use LCS to apply Binary updates and Data upgrade packages. You can't use LCS to apply an Application Deployable package.

For other environments (listed below), you must use Remote Desktop Protocol (RDP) to connect to the environment and install from the command line. For information about manual package deployment, see [Install deployable packages from the command line](#).

- Local development environments (Downloadable virtual hard disk [VHD])
- Multi-box dev/test environments in Microsoft Azure (Partner and trial projects)

## Key concepts

Before you begin, you should understand *deployable packages*, *runbooks*, and the *AXInstaller*. A deployable package is a unit of deployment that can be applied in any environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. The AXInstaller creates a runbook that enables installing a package. For more details, see [Packages, runbooks, and the AXUpdateInstaller in depth](#) at the end of this topic.

## Supported package types

- **AOT deployable package** – A deployable package that is generated from application metadata and source code. This deployable package is created in a development or build environment.
- **Application and Platform Binary update package** – A deployable package that contains dynamic-link libraries (DLLs) and other binaries and metadata that the platform and application depend on. This is a package released by Microsoft. This is available from the **All binary updates** tile from LCS.
- **Platform update package** – A deployable package that contains dynamic-link libraries (DLLs) and other binaries and metadata that the platform depend on. This is a package released by Microsoft. This is available from the **Platform binary updates** tile from LCS.
- **Commerce deployable package** – A combination of various packages that are generated after the Commerce code is combined.
- **Merged package** – A package that is created by combining one package of each type. For example, you can

merge one binary update package and one AOT package, or one AOT package and one Commerce deployable package. The packages are merged in the Asset library for the project in LCS.

#### NOTE

A binary package and a Commerce deployable package can't be included in the same merged package.

For information about how to download an update from LCS and what you see in the tiles based on your environment version, see [Download updates from Lifecycle Services \(LCS\)](#).

If your environment is on an application version 8.1 and later, then the **Platform Update package** does not apply to your environment. Starting with 8.1 and later releases, **Application and Platform Binary update package** is the one that applies since application and platform will be combined into a single cumulative package and will be released by Microsoft. Also note that you will no longer be applying granular X++ hotfixes and will get all application and platform updates together. This means that on the environment details page, clicking on **View detailed version information** will not have details on the granular hotfixes or KBs applied as there is no way to apply them.

## Prerequisite steps

- **Make sure that the package that should be applied is valid.** When a package is uploaded to the Asset library, it isn't analyzed. If you select the package, the package status appears in the right pane as **Not Validated**. A package must pass validation before it can be applied in an environment by using the following procedures. The status of the package will be updated in the Asset library to indicate whether the package is valid. We require validation to help ensure that production environments aren't affected by packages that don't meet the guidelines.

There are three types of validations:

- Basic package format validations
  - Platform version checks
  - Types of packages
- **Make sure that the package is applied in a sandbox environment before it's applied in the production environment.** To help ensure that the production environment is always in a good state, we want to make sure that the package is tested in a sandbox environment before it's applied in the production environment. Therefore, before you request that the package be applied in your production environment, make sure that it has been applied in your sandbox environment by using the automated flows.
  - **If you want to apply multiple packages, create a merged package that can be applied first in a sandbox environment and then in the production environment.** Application of a single package in an average environment requires about 5 hours of downtime. To avoid additional hours of downtime when you must apply multiple packages, you can create a single combined package that contains one package of each type. If you select a binary package and an application deployable package in the Asset library, a **Merge** button becomes available on the toolbar. By clicking this button, you can merge the two packages into a single package and therefore reduce the total downtime by half.
  - **Make sure that the Application binary update package is applied to your dev/build environment before it is applied to your sandbox and production environment** - If the application binary package is applied directly to your Tier 2+ sandbox environment but is not applied on your dev/build environment, the next time you move an AOT package from dev/build box (which does not have the same application binaries as your sandbox environment) to sandbox, some of the application binaries will be overwritten with what is in your dev/build environment. This could result in a regression of the version of your sandbox environment.

# Apply a package to a non-production environment by using LCS

Before you begin, verify that the deployable package has been uploaded to the Asset library in LCS.

1. For a binary update, upload the package directly to the Asset library. For information about how to download an update from LCS, see [Download updates from Lifecycle Services \(LCS\)](#). For an application (AOT) deployable package that results from an X++ hotfix, or from application customizations and extensions, create the deployable package in your development or build environment, and then upload it to the Asset library.
2. Open the **Environment details** view for the environment where you want to apply the update.
3. Click **Maintain > Apply updates** to apply an update.
4. Select the package to apply. Use the filter at the top to find your package.
5. Click **Apply**. Notice that the status in the upper-right corner of the **Environment details** view changes from **Queued** to **In Progress**, and an **Environment updates** section now shows the progress of the package. You can refresh the page to check the status.
6. Continue to refresh the page to see the status updates for the package application request. When the package has been applied, the environment status changes to **Deployed**, and the servicing status changes to **Completed**.

# Apply a package to a production environment by using LCS

In a production environment, customers can schedule a downtime for when they want the update to be applied.

## IMPORTANT

An important prerequisite for applying a package to a production environment is that the package must be successfully applied to at least one sandbox environment in the same project.

1. After the update is successfully applied in a sandbox environment, go to the project's asset library. On the **Asset library** page, select the **Software deployable package** tab, select the package that you want to move to production, and click **Release candidate**. This indicates that this package is ready for production deployment.
2. Open the **Environment details** view for the production environment where you want to apply the package.
3. Select **Maintain > Apply updates** to apply the package.
4. Select the package to apply in your production environment, and then click **Schedule** to submit a request to apply it.

## NOTE

The list of packages includes only the packages that have been successfully signed off in the sandbox environment, and that have been marked as release candidates.

5. Specify the date and time to schedule the package application. Click **Submit**, and then click **OK** to confirm. Note that your environments will be unavailable to perform business while the package is being applied.
6. At the scheduled downtime, package deployment will start.
7. After the environment is serviced, you can monitor the status. The **Servicing status** field indicates the status of package application. Additionally, a progress indicator shows the number of steps that have

been run, out of the total number of steps that are available.

8. After the deployment is successfully completed, the **Servicing status** field is set to **Completed**.
9. If package application isn't successfully completed, Microsoft will investigate the issue. The **Servicing status** field will indicate that package application has failed. The environment will be rolled back to a good state.

## Troubleshoot package deployment failures

If package deployment fails, see the [Troubleshoot package application issues](#) topic.

## Applying updates and extensions

If you are updating a Tier-2 Sandbox or Production environment on application version 8.1.2.x or newer and have initialized Cloud Scale Unit, you will also need to update Commerce channel components. For more information, see [Update Retail Cloud Scale Unit](#).

If you're using components (such as Modern POS), after you've applied updates and extensions in your environment, you must also update your in-store components. For more information, see [Configure, install, and activate Modern POS \(MPOS\)](#).

## Packages, runbooks, and the AXUpdateInstaller in depth

Deployable packages, runbooks, and the AXUpdateInstaller are the tools you use to apply updates.

**Deployable package** – A deployable package is a unit of deployment that can be applied in an environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. Deployable packages downloaded from LCS or created in a development environment cannot be applied across product types. For example, a Finance deployable package cannot be applied in a Commerce app environment, and vice versa. If you have an existing customization for a Finance and Operations app that is compatible with the Commerce app, and you would like to apply it to a Commerce environment, you will need to re-package your source code in a Commerce development environment, and conversely if moving in the other direction.

**Runbook** – The deployment runbook is a series of steps that are generated in order to apply the deployable package to the target environment. Some steps are automated, and some steps are manual. AXUpdateInstaller lets you run these steps one at a time and in the correct order.

- Generated based on topology of deployments with multiples VMs
- Contains step by step information for applying deployable package
- Provides sequence of steps across VMs in multi-box/ HA environment
- Integration for apply automation scripts at each step
  - Stop/ start AOS service, batch service
  - Report deployment, DB sync, ...

**AXUpdateInstaller** – When you create a customization package from Microsoft Visual Studio or a Microsoft binary update, the installer executable is bundled together with the deployable package. The installer generates the runbook for the specified topology. The installer can also run steps in order, according to the runbook for a specific topology.

# Initialize seed data in new Commerce environments

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes the data that's created as part of the initialization process for Dynamics 365 Commerce.

After the Commerce solution has been deployed through Microsoft Dynamics Lifecycle Services (LCS), you must initialize the Commerce configuration to create the basic configuration data.

## IMPORTANT

Before you initialize the commerce configuration, make sure that you've specified a language and a postal address for each legal entity where you will set up stores. This step must be completed for each legal entity that you use for commerce.

To initialize the configuration, follow these steps.

1. Start the Commerce client.
2. Click **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**.
3. Click **Initialize**.

Initialization creates the following default configuration data:

- Commerce scheduler jobs and subjobs
- Commerce channel schema
- Commerce distribution schedules
- Default screen layouts, which include button grids, images, and themes
- Time zone information
- Point-of-sale (POS) operations
- POS permissions
- Channel reports
- Attribute metadata
- Entity validation templates
- Batch job to purge Commerce Data Exchange session history

Additionally, logging that is related to the payment card industry (PCI) is enabled for the Commerce database.

## NOTE

There is an option to separately configure the Commerce scheduler. This option lets you reset the Commerce scheduler configuration to its default settings.

After initialization is completed, you must configure additional commerce data. Here are some examples:

- Commerce parameters
- Commerce scheduler parameters
- Commerce channels
- Registers and devices
- Assortments

**NOTE**

# Channels overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic presents an overview of channels in Microsoft Dynamics 365 Commerce. It includes information about the tasks that you must complete both before and after you set up each channel.

## Types of Channels

Dynamics 365 Commerce supports three different channel types: retail, call center, and online channels.

### **Retail channels**

Retail channels represent standard brick-and-mortar stores. Each store can have its own point of sale (POS) registers, income and expense accounts, and staff.

### **Call center channels**

Call center channels represent call center order and customer management.

### **Online channels**

Online channels represent online e-Commerce storefronts. Once an online channel is created, a site must be created using the Microsoft Dynamics 365 Commerce Site Builder tool or other third-party e-Commerce solution.

## Channel setup basics

Channel set up is performed in the Commerce tool. Each channel can have its own payment methods, price groups, product hierarchies, assortments, and set of products. After you create a channel, you assign the products that you want it to carry and sell. Each channel type has a unique set of features that may need to be configured. For example, a retail channel needs assigned employees, registers, and customers. Once a new channel is created, it needs to be assigned to an organization hierarchy.

## Channel setup prerequisites

Before you can set up a channel, you must complete some prerequisite tasks based on the channel type. For more information, see [Channel setup prerequisites](#).

## Set up a channel

After you complete the prerequisite tasks, for further setup instructions, use the following links.

# Organizations and organizational hierarchies overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

An organization is a group of people who are working together to carry out a business process or achieve a goal. Organizational hierarchies represent the relationships between the organizations that make up your business.

## Organizations

You can define the following types of internal organizations: legal entities, operating units, and teams.

All internal organizations are types of the **Party** entity. Therefore, these organizations use the address book to store address and contact information. A party, which can be either a person or an organization, can belong to one or more address books.

### Legal entities

A legal entity is an organization that has a registered or legislated legal structure. Legal entities can enter into legal contracts and are required to prepare statements that report on their performance.

A company is a type of legal entity. Currently, companies are the only kind of legal entity that you can create, and every legal entity is associated with a company ID. This association exists because some functional areas in the program use a company ID, or DataArealD, in their data models. In these functional areas, companies are used as a boundary for data security. Users can access data only for the company that they are currently logged on to.

### Operating units

An operating unit is an organization that is used to divide the control of economic resources and operational processes in a business. People in an operating unit have a duty to maximize the use of scarce resources, improve processes, and account for their performance.

The types of operating units include cost centers, business units, value streams, departments, and commerce channels. The following table provides more information about each type of operating unit.

OPERATING UNIT TYPE	DESCRIPTION	PURPOSE
Cost center	An operating unit in which managers are accountable for budgeted and actual expenditures.	Used for the management and operational control of business processes that span legal entities.
Business unit	A semi-autonomous operating unit that is created to meet strategic business objectives.	Used for financial reporting that is based on industries or product lines that the organization serves independently of legal entities.
Value stream	An operating unit that controls one or more production flows.	Commonly used in lean manufacturing to control the activities and flows that are required to supply a product or service to consumers.

OPERATING UNIT TYPE	DESCRIPTION	PURPOSE
Department	An operating unit that represents a category or functional part of an organization that performs a specific task, such as sales or accounting.	Used to report on functional areas. A department may have profit and loss responsibility, and may consist of a group of cost centers.
Commerce channel	An operating unit that represents a brick and mortar store, an online store or an online marketplace.	Used for the management and operational control of one or more stores within or across legal entities.

### Teams

A team is an organization in which the members share a common responsibility, interest, or objective. Teams cannot be used in organizational hierarchies.

## Organizational hierarchies

Set up organizational hierarchies to view and report on your business from different perspectives. For example, you can set up a hierarchy of legal entities for tax, legal, or statutory reporting. Set up a hierarchy that is based on operating units to report financial information that is not legally required, but that is used for internal control. For example, you can create a purchasing hierarchy to control purchasing policies, rules, and business processes.

Each hierarchy is assigned a purpose. The purpose of a hierarchy determines the types of organizations that can be included in the hierarchy. The purpose also determines which application scenarios a hierarchy can be used in.

Organizations in a hierarchy can share parameters, policies, and transactions. An organization can inherit or override the parameters of its parent organization. However, shared master data, such as products and address books, applies to the whole organization and cannot be overridden for individual organizations. Creating organizations and hierarchies requires careful planning. For more information, see [Plan your organizational hierarchy](#).

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Plan your organizational hierarchy

2/18/2021 • 13 minutes to read • [Edit Online](#)

Before you set up organizations and organization hierarchies, make sure that you plan how your business will be modeled. The organization model has a significant effect on the implementation and business processes.

Organizational hierarchies represent the relationships between the organizations that make up a business. Therefore, the most important consideration when you model organizations is the structure of your business. We recommend that you define organization structures based on feedback from executives and senior managers from functional areas, such as finance and accounting, human resources, operations, purchasing, and sales and marketing.

When you are planning hierarchies, it is also important to consider the relationship between the organizational hierarchy and financial dimensions. You can set up multiple organizational hierarchies to represent different views of your business. By using financial dimensions, you can create reports based on these views. Work with your partner to create hierarchies that address both organizational and statutory reporting needs.

## NOTE

Although you can use financial dimensions to represent legal entities without creating the legal entities, financial dimensions aren't designed to address the operational or business needs of legal entities. The interunit accounting functionality is designed to address only the accounting entries that are created by each transaction.

## IMPORTANT

You shouldn't decide how to model organizations based only on the information in this article. This documentation is a guide. You can work with your Partner for additional guidance. Your Partner has gained experience in various industries and across the customer base.

## Decide whether to model internal organizations as legal entities or operating units

You must have at least one legal entity to represent your business. A legal entity can enter legal contracts and is required to prepare financial statements that report on its performance.

Legal entities can be used for transactional business or for consolidation. This means that a legal entity in Finance and Operations does not necessarily represent a real entity in your business. For example, a company that participates in transactions can own subsidiary legal entities. In this scenario, a legal entity is required for transactions, and a virtual legal entity is required to consolidate the results and balances of the subsidiary legal entities.

Internal organizations in your business, such as regional offices, can be represented as additional legal entities, or as operating units of the main legal entity. An operating unit is not required to be a legally defined organization. Operating units are used to control economic resources and operational processes in the business. For example, departments and cost centers are operating units.

Some functionality works differently depending on whether the organization is a legal entity or an operating unit. Carefully consider the functionality described below as you make your decision.

### Master data

**If the organization is modeled as a legal entity**

Some master data, such as customers, payment terms, tax authorities, and site-specific stock ordering, must be set up for each legal entity. Some master data, such as users, products, and most human resources data, is shared among all legal entities.

**If the organization is modeled as an operating unit**

Master data is shared among operating units.

**Module parameters****If the organization is modeled as a legal entity**

Parameters for modules, such as Accounts receivable parameters, Accounts payable parameters, and Cash and bank management parameters, must be set per legal entity. Because the module setup for legal entities is separate, each subsidiary can comply with local statutory requirements and business practices. For example, a professional services legal entity and a manufacturing legal entity can have different module parameters even though they report to the same parent company.

**If the organization is modeled as an operating unit**

Module parameters are shared among operating units.

**Data security****If the organization is modeled as a legal entity**

Most data is automatically secured by company ID. A company ID is a unique identifier for the data that is associated with a legal entity. A company can be associated with only one legal entity, and a legal entity can be associated with only one company. Users can access data only for the companies that they have access to. You do not need to customize to secure data by company ID.

**If the organization is modeled as an operating unit**

Data can be secured per operating unit by creating customized data security policies. Data security policies are used to limit access to data. For example, assume that a user is allowed to create purchase orders only in a particular operating unit. Data security policies can be created to prevent the user from accessing purchase order data from any other operating unit. The volume of transactions and the number of security policies can affect performance. When you design security policies, keep performance in mind.

**Ledgers****If the organization is modeled as a legal entity**

Each legal entity requires a ledger that provides a chart of accounts, accounting currency, reporting currency, and fiscal calendar. A balance sheet can be created only for a legal entity. Main accounts, dimensions, account structures, charts of accounts, and account rules can be used by more than one legal entity.

**If the organization is modeled as an operating unit**

An operating unit can't have its own ledger information. If your internal organizations do not require unique ledgers, you can model them as operating units. Ledger information will be set up for the parent legal entity in the hierarchy. Income statements can be created for operating units within a legal entity or for the parent legal entity.

**Fiscal calendars****If the organization is modeled as a legal entity**

Each legal entity has its own fiscal calendar. If your internal organizations use different fiscal years and fiscal calendars, you must model the organizations as legal entities.

**If the organization is modeled as an operating unit**

Operating units must share a fiscal calendar. If your internal organizations can use the same fiscal years and fiscal calendars, you can model the organizations as operating units.

**Consolidation****If the organization is modeled as a legal entity**

You must consolidate the financial results for regional offices into a single, consolidated company in order to

prepare financial statements.

**If the organization is modeled as an operating unit**

Consolidation is not required, because data is already shared among operating units.

**Centralized payments**

**If the organization is modeled as a legal entity**

Centralized payments must be set up so that invoices for all child legal entities can be paid to or from a single parent legal entity.

**If the organization is modeled as an operating unit**

Centralized payments are not required because all invoices are recorded in a single legal entity.

**Intercompany transactions**

**If the organization is modeled as a legal entity**

Intercompany sales orders, purchase orders, payments, or receipts can be applied to one another. You are not required to use journal vouchers. You can view intercompany transactions at the sub-ledger level (Accounts receivable, Accounts payable). The following examples illustrate how intercompany transactions are handled.

*Example 1: Headquarters provides services to regional offices and must charge the costs of those services to the regional offices*

If you model the regional office as a legal entity, you have the following options:

- Headquarters creates a journal entry to cross-charge the regional office for the expense. The transactions cannot be aged.
- Headquarters sends a purchase order for the services to the regional office. A sales order is automatically created in the legal entity for the regional office, with intercompany sub-ledger transactions.

*Example 2: Headquarters procures and pays for service that is delivered to a regional office*

If you model the regional office as a legal entity, you have the following options:

- The invoice and payment follow the regulatory requirements of headquarters. Headquarters can create a journal entry to cross-charge the regional office for the expense. The transactions cannot be aged.
- The invoice and payment follow the regulatory requirements of headquarters. Headquarters can create an intercompany sub-ledger transaction.

**If the organization is modeled as an operating unit**

Intercompany transactions among operating units are supported only through journal vouchers. An operating unit cannot issue or receive a purchase order, sales order, or invoice from another operating unit in the same legal entity. You cannot view intercompany transactions at the sub-ledger level (Accounts receivable, Accounts payable). The following examples illustrate how intercompany transactions are handled.

*Example 1: Headquarters provides services to regional offices and must charge the costs of those services to the regional offices*

If you model the regional office as an operating unit, headquarters enters an expense transaction and codes it to the regional office.

*Example 2: Headquarters procures and pays for service that is delivered to a regional office*

If you model the regional office as an operating unit, the invoice and payment follow the regulatory requirements of headquarters. The invoice can be coded to the regional office. On the income statement, use a balancing financial dimension to report costs for the regional office.

**Local tax requirements**

**If the organization is modeled as a legal entity**

A legal entity is subject to the tax laws of the tax authority in the country/region where the legal entity is registered. For example, a legal entity that is registered in Denmark is subject to Danish tax laws and regulations. A legal entity can belong to only one country/region. The country/region that you select for the primary address of the legal entity controls the country/region-specific features that are available to that legal entity. For example, if the primary address of the legal entity is in Denmark, features that are related to Danish tax laws and regulations become available. Therefore, if your organizations are in different countries/regions and require

different local tax options, you must set up the organizations as separate legal entities.

**If the organization is modeled as an operating unit**

Operating units use the country context of the parent legal entity. Operating units in the same legal entity cannot have different country/region-specific requirements. If your organizations are in the same country/region and use the same tax options, you can set them up as operating units.

**Statutory reporting for a country/region**

**If the organization is modeled as a legal entity**

For countries/regions that are supported, most statutory reports can be created. For information about which reports are available for each country/region, see the [Microsoft Dynamics Localization Portal](#). (A CustomerSource logon is required.)

**NOTE**

A posting layer in the general ledger allows you to make adjusting entries to a parent company that uses a different accounting standard than the child company. For example, for a company that uses generally accepted accounting practices in the United Kingdom (UK GAAP), you can make adjusting entries in the posting layer. These entries can be consolidated into a parent company that uses generally accepted accounting principles (GAAP) in the United States. The adjusting entries do not affect UK GAAP reporting.

**If the organization is modeled as an operating unit**

Statutory reports must be created by using another application. You must ensure that data is captured in Finance and Operations apps to support the requirements of each operating unit, where they differ from the requirements of headquarters.

**Currency**

**If the organization is modeled as a legal entity**

If your organizations must use different functional currencies, you must model the organizations as legal entities. Functional currencies are set up per legal entity. However, you can enter transactions in multiple currencies.

**If the organization is modeled as an operating unit**

If your organizations can use a single functional currency, you can model the organizations as operating units. Operating units must share a functional currency. However, you can enter transactions and create reports in multiple currencies.

**Year-end closing**

**If the organization is modeled as a legal entity**

If laws and accounting practices differ among the countries/regions where your organizations are located, you may require different year-end procedures per organization. This means that you must model the organizations as legal entities. Each legal entity has its own year-end procedures.

**If the organization is modeled as an operating unit**

If laws and accounting practices are the same among the countries/regions where your organizations are located, you may use a single set of year-end procedures. This means that you can model the organizations as operating units. All operating units must use the same year-end closing procedure.

**Number sequences**

**If the organization is modeled as a legal entity**

Number sequences for some references can be set up per legal entity. Some number sequences can be shared.

**If the organization is modeled as an operating unit**

Number sequences for some references can be set up per operating unit. Some number sequences can be shared.

## Products

### If the organization is modeled as a legal entity

Product definitions are shared, and they must be released to individual legal entities before they can be included in transactions. Each legal entity has its own set of released products that can be included in transaction documents. If your internal organizations must use different sets of products, you must model the organizations as legal entities.

#### NOTE

Even though product definitions are shared, in each legal entity where a product has been released, you can specify different sales, purchase, and stocking parameters for the item at each inventory site.

### If the organization is modeled as an operating unit

All operating units share the same set of products. If your internal organizations can share the same set of products, you can model the organizations as operating units.

## Inquiry and reporting

### If the organization is modeled as a legal entity

You must manually change companies to enter transactions and perform inquiries in multiple legal entities. Because of data security boundaries, consolidated inquiry and reporting can be resource intensive and time-consuming.

### If the organization is modeled as an operating unit

You do not need to change companies to access data from multiple operating units. Consolidated inquiry and reporting and individual regional inquiry is easier and faster.

## Best practices for modeling organizations and hierarchies

Consider the following best practices when you implement an organization hierarchy:

- Create a department to model the intersection between a legal entity and a business unit. You can then roll up data from a department to a legal entity for statutory reporting, and from a department to a business unit for internal reporting. Departments can serve as profit centers. If you use departments, you do not have to use legal entities and business units as dimensions in the account structure. You can use just departments as a dimension. However, you must use both cost centers and departments as dimensions in the account structure if cost centers are used only as cost accumulators, and departments are used for revenue recognition.
- Model multiple hierarchies for operating units if you have complex requirements for reporting profit and loss.
- In a single legal entity, do not model multiple hierarchies for the same hierarchy purpose.
- Do not create a hierarchy for every purpose. Usually, you can use one hierarchy for multiple purposes. For example, one hierarchy of operating units can be assigned to all policy-related purposes.
- Create balanced hierarchies. In a hierarchy, all nodes that are the same distance from the root node are defined as a level. In a balanced hierarchy, only one type of operating unit can occur at each level, and the distance from the root node to each level is consistent. If there are intermediate levels between a department and a legal entity or a business unit, placeholder organizations may be required to create a balanced hierarchy.
- Do not model a separate hierarchy of operating units if the structure for legal entities is also your operating structure. A mixed hierarchy of legal entities and operating units may serve both purposes.
- Before you model major restructuring scenarios, use the hierarchy's effective dates to perform an impact analysis and a validation test.
- Use draft mode to change a hierarchy before you publish a new version in a production environment.
- Limit the number of people who have permissions to add or remove organizations from a hierarchy in a

production environment. A smaller number reduces the chance that costly mistakes can occur and corrections must be made.

# Create legal entities

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create legal entities in Microsoft Dynamics 365 Commerce, which must be created and configured before creating channels.

## Overview

A legal entity is an organization that has a registered or legislated legal structure. Legal entities can enter into legal contracts and are required to prepare statements that report on their performance.

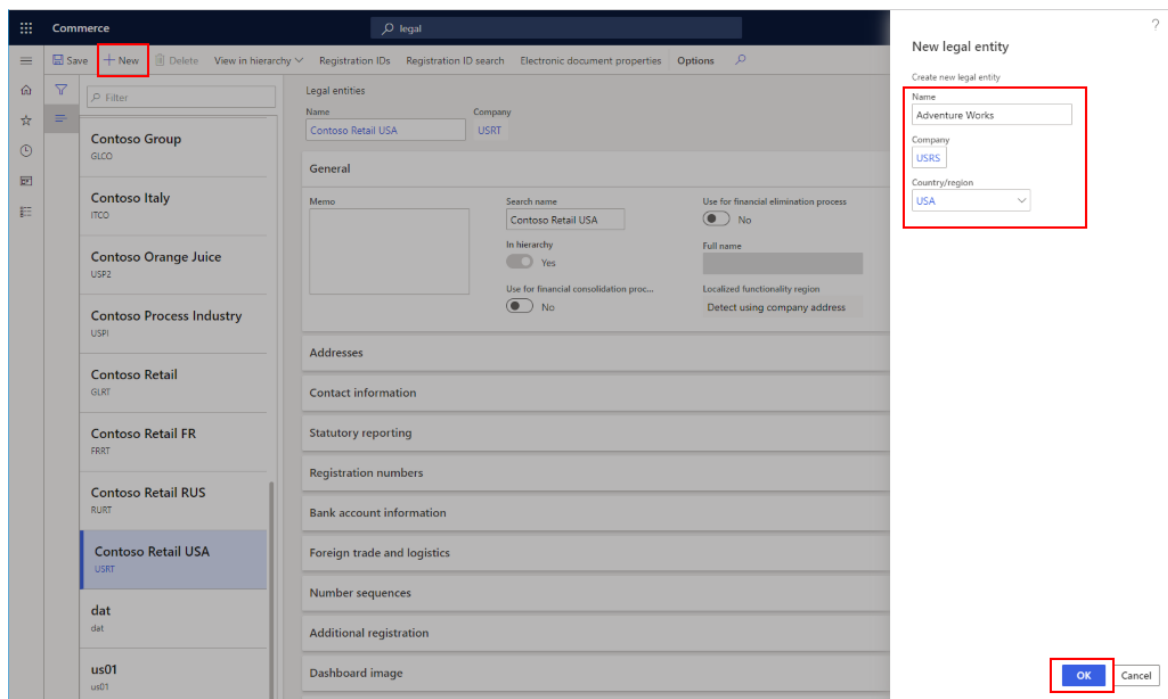

A company is a type of legal entity. Currently, companies are the only kind of legal entity that you can create, and every legal entity is associated with a company ID. This association exists because some functional areas in the program use a company ID, or *DataAreald*, in their data models. In these functional areas, companies are used as a boundary for data security. Users can access data only for the company that they are currently logged on to.

When creating a channel, you must specify which legal entity that channel belongs to.

## Create a new legal entity

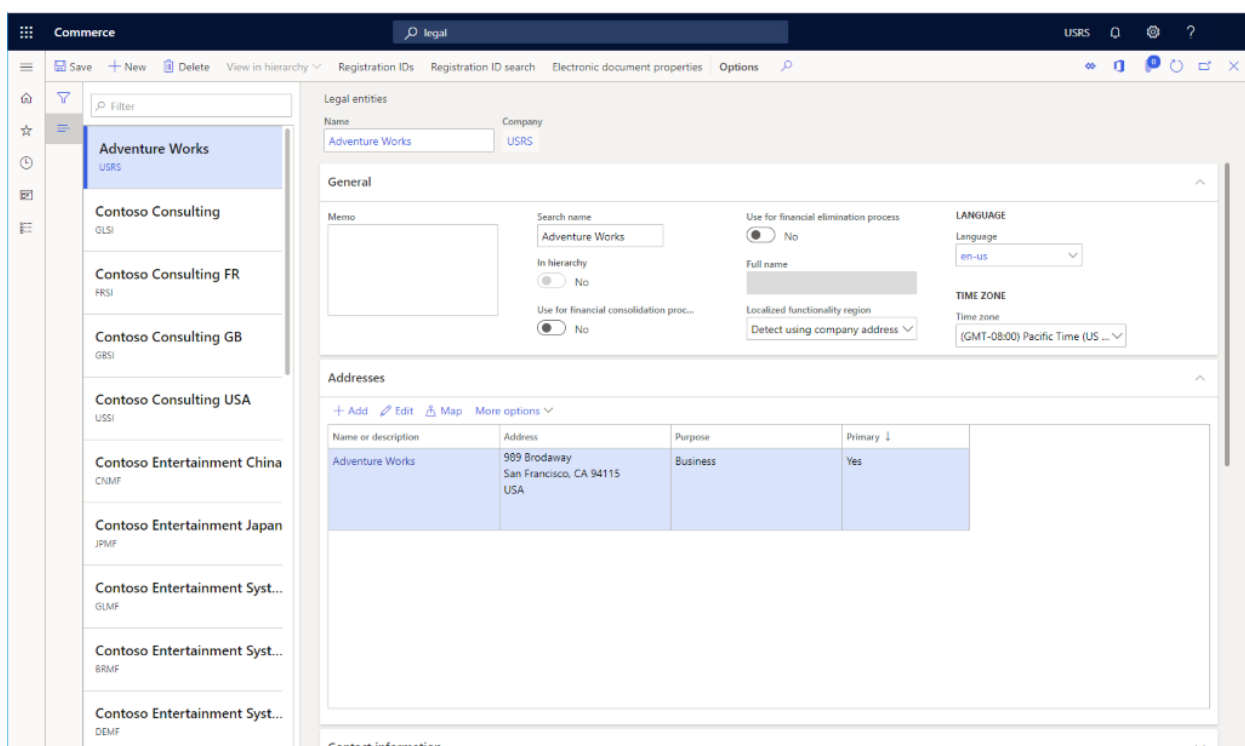

To create a new legal entity in Dynamics 365 Commerce, follow these steps.

1. In the navigation pane, go to **Modules > Headquarters setup > Legal entities**.
2. On the action pane, select **New**. The **New legal entity** pane appears on the right.
3. In the **Name** field, enter a value.
4. In the **Company** field, enter a value.
5. In the **Country/region** field, enter or select a value.
6. Select **OK**.

7. In the **General** section, provide the following general information about the legal entity:
  - a. Enter a search name, if a search name is required. A search name is an alternate name that can be used to search for this legal entity.
  - b. Select whether this legal entity is being used as a consolidation company.
  - c. Select whether this legal entity is being used as an elimination company.
  - d. Select the **default language** for the entity.
  - e. Select the **time zone** for the entity.
8. In the **Addresses** section, select **Edit** to enter address information, such as the street name and number, postal code, and city.
9. In the **Contact information** section, enter information about methods of communication, such as email addresses, URLs, and telephone numbers.
10. In the **Statutory reporting** section, enter the registration numbers that are used for statutory reporting.
11. In the **Registration numbers** section, enter any information required by the legal entity.
12. In the **Bank account information** section, enter bank accounts and routing numbers for the legal entity.
13. In the **Foreign trade and logistics** section, enter shipping information for the legal entity.
14. In the **Number sequences** section, you can view the number sequences that are associated with the legal entity. This will be empty to start with.
15. In the **Dashboard image** section, view or change the logo and dashboard image associated with the legal entity.
16. In the **Tax registration** section, enter the registration numbers that are used to report to tax authorities.
17. In the **Tax 1099** section, enter 1099 information for the legal entity.
18. In the **Tax information** section, enter tax information for the legal entity.
19. Select **Save**.

The following image shows details of an example legal entity.

# Set up organization hierarchies

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set up organization hierarchies in Microsoft Dynamics 365 Commerce.

## Overview

Before creating channels, you'll want to ensure you have set up your organization hierarchies.

You can use organization hierarchies to view and report on your business from various perspectives. For example, you can set up one hierarchy for tax, legal, or statutory reporting. You can then set up another hierarchy to report financial information that is not legally required, but that is used for internal reporting.

Before you create an organization hierarchy, you must create organizations. For more information, see [Create legal entities](#) or [Create operating units](#).

For more information, see the following topics.

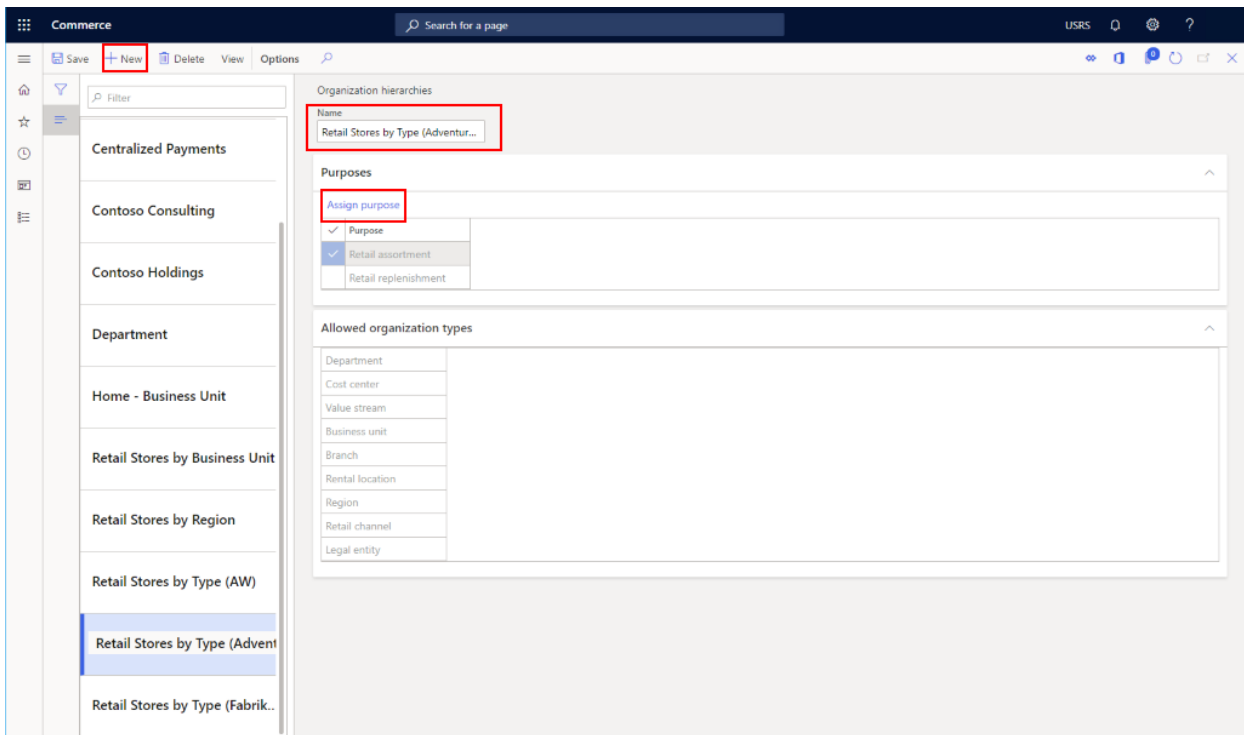

- [Organizations and organizational hierarchies overview](#)
- [Plan your organization hierarchy](#)
- [Create an organization hierarchy](#)

## Create an organizational hierarchy

To create an organizational hierarchy, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel Setup > Organization hierarchies**.
2. On the action pane, select **New**.
3. In the **Name** field, enter a value.
4. In the **Purpose** section, select **Assign purpose**.
5. In the list, find and select the desired record. Select a purpose to assign to your organization hierarchy.
6. In the **Assigned hierarchies** section, select **Add**.
7. In the list, mark the selected row. Find the hierarchy you just created.
8. Select **OK**.

The following image shows an example organizational hierarchy created for a fictitious "Adventure Works" set of stores.

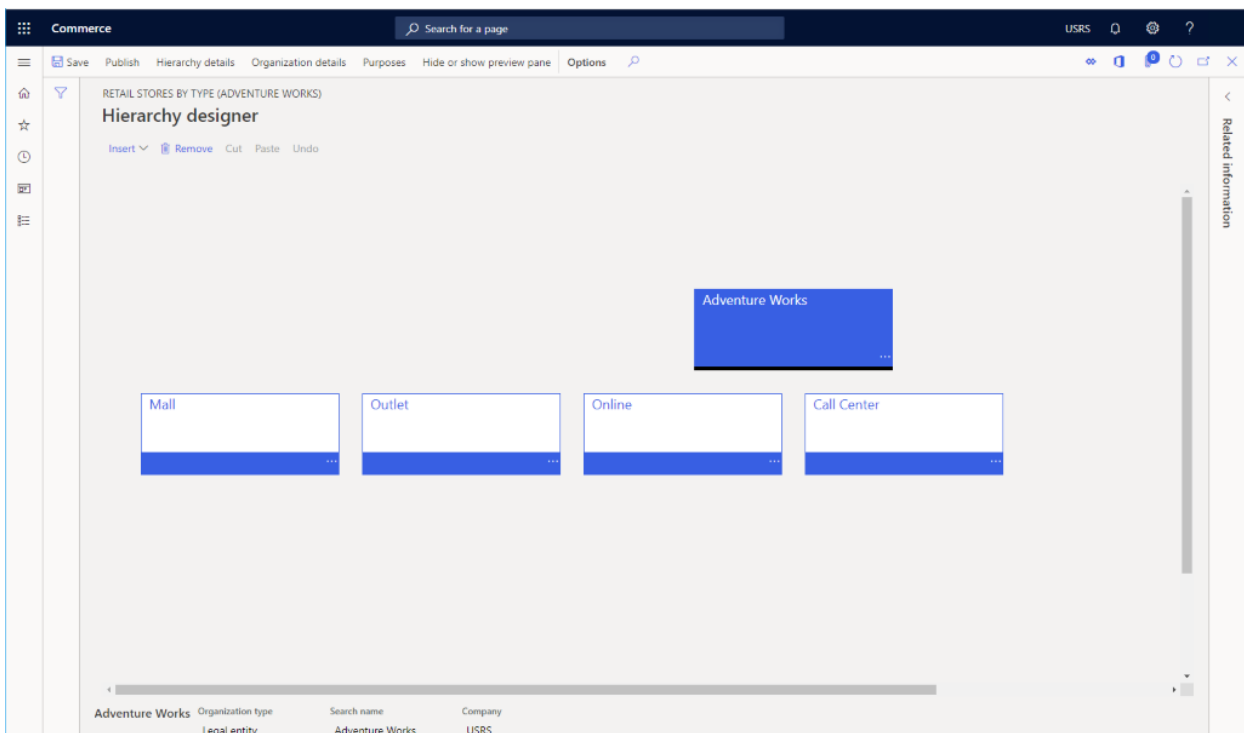

### Add organizations to a hierarchy

To add organizations to a hierarchy, follow these steps.

1. In the list, find and select the desired record. Select your hierarchy.
2. On the action pane, select **View**.
3. Add organizations, as necessary.
4. To add an organization, select **Edit** and then select **Insert**. When you are done making changes you can save a draft and publish the changes.

The following image shows a legal entity added at the hierarchy root with four cost centers added for "Mall", "Outlet", "Online" and "Call Center" channels. Various retail, call center and online channels can then be added to each.

# Create an operating unit

2/18/2021 • 2 minutes to read • [Edit Online](#)

An operating unit is an organization that is used to divide the control of economic resources and operational processes in a business. People in an operating unit have a duty to maximize the use of scarce resources, improve processes, and account for their performance. The types of operating units include cost centers, business units, departments, and value streams. Use the following procedure to create an operating unit. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Organization administration > Organizations > Operating units**.
2. Click **New** to open the drop dialog.
3. In the list, find and select the desired record. Select the type of operating unit you want to create.
4. In the list, click the link in the selected row.
5. In the **Name** field, type a value.
  - Expand the **General** section, if necessary.
  - Provide general information about the operating unit, such as an identification number, DUNS number, and manager.
  - Expand the **Addresses** section, if necessary.
  - Enter address information, such as the street name and number, postal code, and city. Click **Add** to enter a new address record, or click **Edit** to modify an existing address record.
  - Expand the **Contact information** section, if necessary.
  - Enter information about methods of communication, such as email addresses, URLs, and telephone numbers. To enter a new communication record, click **New**. To modify an existing communication record, click **More options > Advanced**.
6. Optionally, change the **Operating unit number** as needed. Note that this number is a unique identifier for the corresponding **Party** record and cannot be the same as any other operating unit.
7. Select **Save**.

## NOTE

# Design the relationships between organizational units

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through how to design the relationship between organizational units. You must create a new organization purpose before defining the relationship, or you can use the existing organization purpose. The demo data company used to complete this procedure is USRT. This task is intended for the administrator role.

1. Go to Organization administration > Organizations > Organization hierarchies.
2. Click New.
3. In the Name field, type a value.
4. Click Assign purpose.
5. In the list, find and select the desired record.
6. Click Add.
7. In the list, find and select the desired record.
8. Click OK.
  - You can select as many organization purposes as required for your organization.
9. In the list, find and select the desired record.
10. Click Set as default.
11. Close the page.
12. Click Save.
13. Click View.
14. Click Edit.
15. Click Insert.
16. Click Business unit.
17. In the list, find and select the desired record.
18. In the list, click the link in the selected row.
19. Click Insert.
20. Click Commerce channel.
21. In the list, find and select the desired record.
22. In the list, click the link in the selected row.
  - You can add as many organization units as is required.
23. Click Save.
24. Click Close.
25. Click Publish to open the drop dialog.
26. In the Effective date field, enter a date and time.
27. In the Effective date field, enter a date and time.
28. In the Describe changes field, type a value.
29. Click Publish.
30. Click Close.

# Warehouse set up

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to set up a warehouse to be used with a new channel in Microsoft Dynamics 365 Commerce.

## Overview

Each Commerce channel requires a configured warehouse to be associated with it. The following procedures provide the minimum configuration required to set up a warehouse for a Commerce channel. For more information regarding warehouse setup, please see the [Warehouse management overview](#).

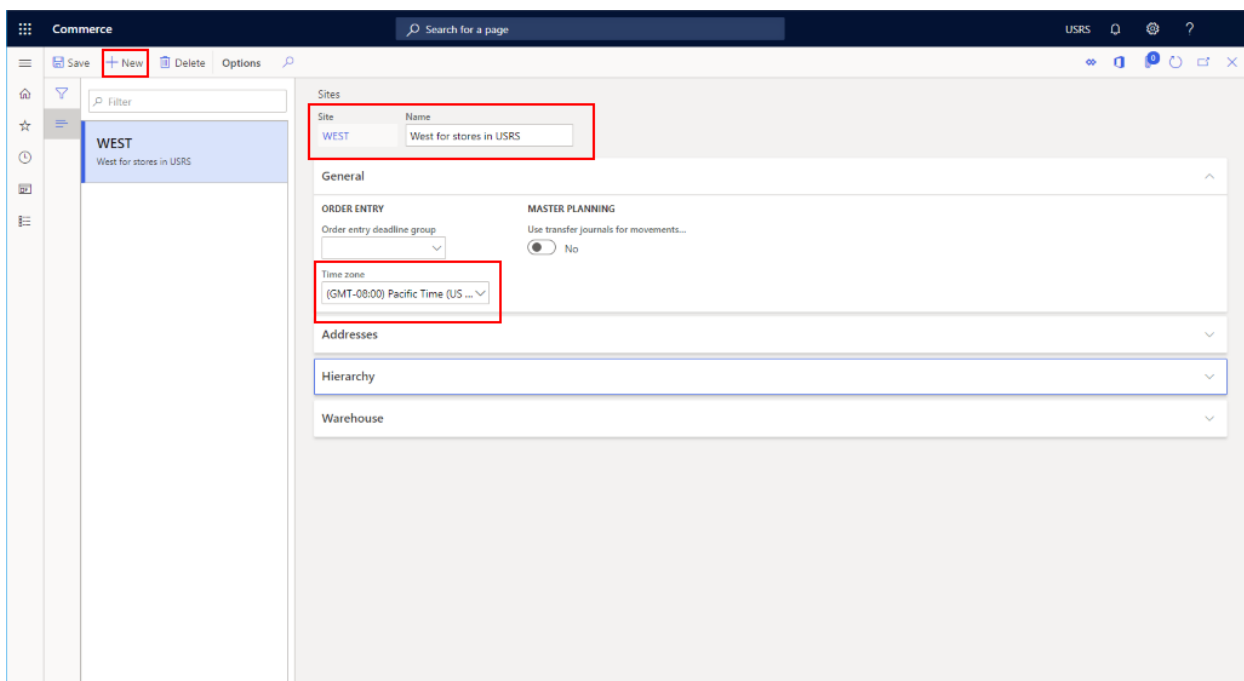

## Configure a warehouse site

Before setting up a warehouse, you need to configure a warehouse site.

To configure a warehouse site, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Sites**.
2. On the action pane, select **New**.
3. In the **Site** field, enter a value.
4. In the **Name** field, enter a value.
5. In the **General** section, set the appropriate **Time zone**.
6. In the **Addresses** section, enter an address.
7. On the action pane, select **Save**.

The following image shows an example warehouse site.

## Set up a warehouse

To set up a warehouse, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Warehouses**.
2. On the action pane, select **New**.
3. In the **Warehouse** field, enter a value. If this is a 1:1 mapping to a store, consider using the store name or the name of a regional distribution center.
4. In the **Name** field, enter a value.
5. In the **Site** drop-down list, select the warehouse site created previously.
6. In the **Type** field, select **Default**.
  - If you want to set a **Quarantine warehouse**, first you'll need to follow these steps to create an additional warehouse where the **Type** is set to **Quarantine**.
  - If you want to set a **Transit warehouse**, first you'll need to follow these steps to create an additional warehouse where the **Type** is set to **Transit**.
7. On the action pane, select **Save**.

## Set up inventory aisles

To set up inventory aisles, follow these steps.

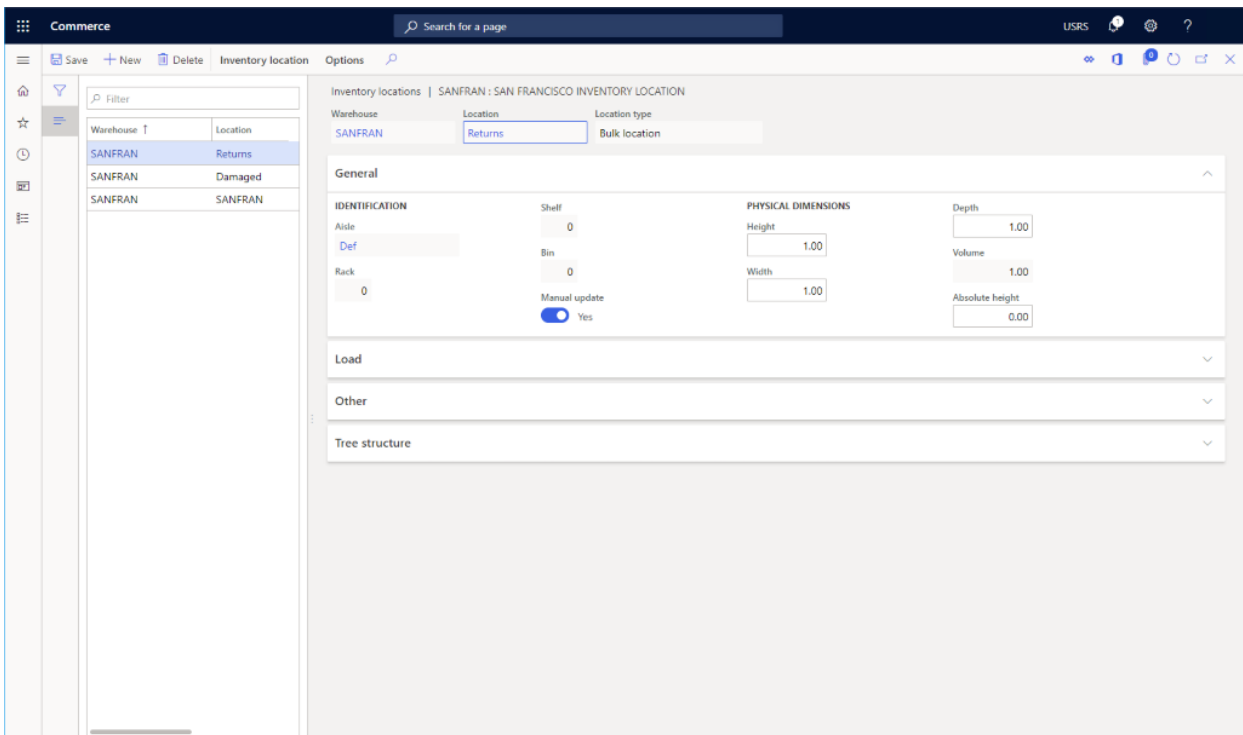

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Location setup > Inventory aisles**.
2. On the action pane, select **New**.
3. In the **Warehouse** drop-down list, select the warehouse created previously.
4. In the **Aisle** field, enter a name (for example, "Def").
5. In the **Name** field, enter a name (for example, "Default aisle").
6. On the action pane, select **Save**.

## Set up warehouse inventory locations

To set up warehouse inventory locations for standard, damaged, and returned inventory, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Warehouses**.
2. Select the warehouse you created previously.
3. On the action pane, select **Edit**.
4. On the action pane, select **Warehouse**, and then select **Inventory location**.
5. On the action pane, select **New**. The **Warehouse** drop-down list should default to your new warehouse.
  - a. In the **Aisle** box, enter the name of the aisle you specified earlier.
  - b. Set **Manual update** to **Yes**
  - c. In the **Location** box, enter the name of the warehouse.
  - d. On the action pane, select **Save**.
6. On the action pane, select **New**. The **Warehouse** drop-down list should default to your new warehouse.
  - a. In the **Aisle** box, enter the name of the aisle you specified earlier.
  - b. Set **Manual update** to **Yes**
  - c. In the **Location** box, enter "Damaged".
  - d. On the action pane, select **Save**.
7. On the action pane, select **New**. The **Warehouse** drop-down list should default to your new warehouse.
  - a. In the **Aisle** box, enter the name of the aisle you specified earlier.
  - b. Set **Manual update** to **Yes**
  - c. In the **Location** box, enter "Returns".
  - d. On the action pane, select **Save**.

The following image shows a San Francisco warehouse inventory location setup.

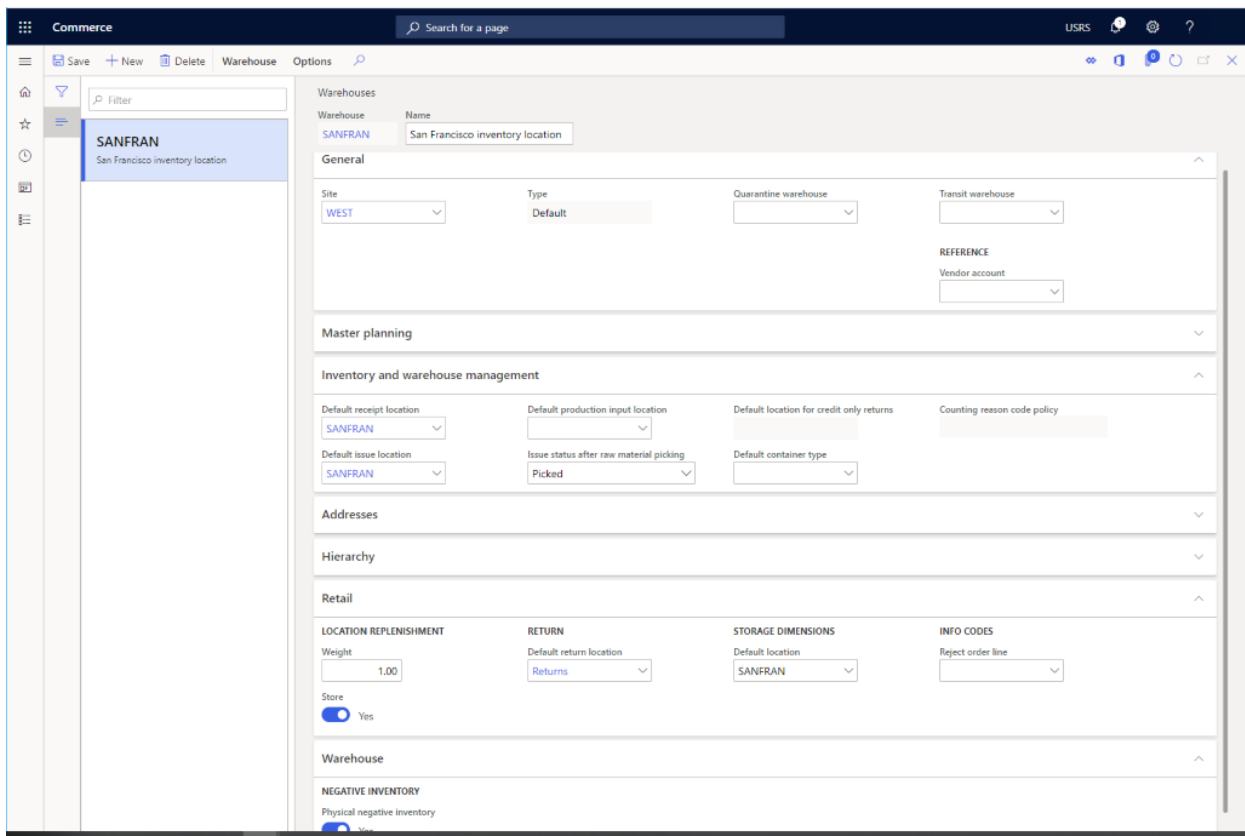

## Complete warehouse setup

To complete warehouse setup, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Warehouses**.
2. Select the warehouse you previously created.
3. On the action pane, select **Edit**.
4. Under **Inventory and warehouse management**:
  - a. Set **Default receipt location** to the default location created above.
  - b. Select **Default issue location** to the default location created above.
5. Under the **Addresses** section, enter a warehouse address.
6. Under the **Retail** section:
  - a. In the **Default return location** box, enter the returns location created previously.
  - b. Set **Store** to **Yes**.
  - c. Set **Weight** to **1.00**.
  - d. In the **Storage Dimensions** box, enter the default location created previously.
7. Under the **Warehouse** section, set **Physical negative inventory** to **Yes**.
8. On the action pane, select **Save**.

The following image shows details for a configured warehouse.

# Sales tax overview

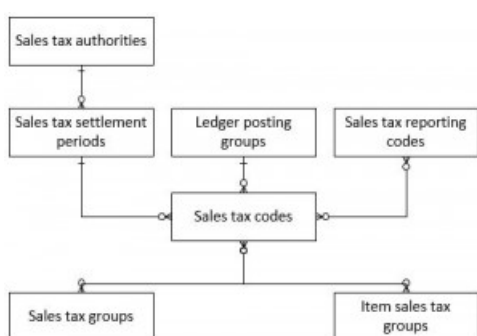

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides an overview of the sales tax system. It explains the elements of the sales tax setup and how they work together.

## Overview

The sales tax framework supports many types of indirect taxes, such as sales tax, value-added tax (VAT), goods and services tax (GST), unit-based fees, and withholding tax. These taxes are calculated and documented during purchase and sales transactions. Periodically, they must be reported and paid to tax authorities.

The following diagram shows the entities of the tax setup and how they are related.

For every sales tax that a company must account for, a sales tax code must be defined. A sales tax code stores the tax rates and calculation rules for the sales tax.

Every sales tax code must be linked to a sales tax settlement period. Sales tax settlement periods define the intervals at which sales tax must be reported and paid to the sales tax authority. Every sales tax settlement period must be assigned to a sales tax authority. A sales tax authority represents the entity that sales tax is reported and paid to. It also defines the layout for the sales tax report. Sales tax authorities can be related to vendor accounts. For more information, see [Set up sales tax settlement periods](#).

Every sales tax code must also be linked to a ledger posting group. A ledger posting group specifies the main accounts that amounts for the sales tax codes will be posted to.

Optional sales tax reporting codes can also be defined. These can be assigned on sales tax codes for the various amount types that are calculated for the sales tax code. The **Sales tax payment by code** report shows totals per sales tax reporting code for a given sales tax settlement period and interval.

Every transaction that sales tax needs to be calculated and posted for must have a sales tax group and an item sales tax group. Sales tax groups are related to the party (for example, customer or vendor) of the transaction, whereas item sales tax groups are related to the resource (for example, item or procurement category) of the transaction. Tax groups contain a list of tax codes. The tax codes that are present in both the sales tax group and item sales tax group for a transaction are the tax code that apply to that transaction.

The following table describes the entities and the sequence for the tax setup.

SETUP ACTIVITY	REQUIRED/OPTIONAL AND DESCRIPTION
Create main accounts.	Required. Before you can set up the sales tax functionality, the main accounts that the company uses to pay and record taxes must be created.

SETUP ACTIVITY	REQUIRED/OPTIONAL AND DESCRIPTION
Set up ledger posting groups for sales tax.	Required. Ledger posting groups define the main accounts for recording and paying sales taxes. For more information, see <a href="#">Set up Ledger posting groups for sales tax</a> .
Set up sales tax authorities.	Required. Sales tax authorities are the entities that tax must be reported and paid to. For more information, see <a href="#">Set up sales tax authorities</a> .
Set up sales tax settlement periods.	Required. Sales tax settlement periods contain information about when and how often sales tax must be reported and paid. They are related to a sales tax authority.
Set up sales tax reporting codes.	Optional. Sales tax reporting codes can be assigned to sales tax codes to report amounts for multiple sales tax codes under one sales tax reporting code. For more information, see <a href="#">Set up sales tax reporting codes</a> .
Set up sales tax codes.	Required. Sales tax codes contain the tax rates and calculation rules for each sales tax. Sales tax codes are related to a sales tax settlement period and a ledger posting group. For more information, see <a href="#">Set up sales tax codes</a> .
Set up sales tax groups.	Required. Sales tax groups contain a list of sales codes that apply for the party (customer or vendor) of a transaction. For a given transaction, the intersection of sales tax codes in the sales tax group and the item sales tax group determines the sales tax codes that apply to that transaction.
Set up item sales tax groups.	Required. Item sales tax groups contain a list of sales codes that apply for the resource (product, service, and so on) of a transaction. For a given transaction, the intersection of sales tax codes in the sales tax group and the item sales tax group determines the sales tax codes that apply to that transaction. For more information, see <a href="#">Set up sales tax groups and item sales tax groups</a> .
Set up sales tax parameters on the application parameter pages.	Required. Different areas, such as General ledger, Accounts receivable, and Accounts payable, must set up parameters for correct calculation of indirect taxes. Although most of these parameters have default values, they must be modified to fit each company's requirements.

## Sales tax on transactions

On every transaction (sales/purchase document lines, journals, and so on), you must enter a sales tax group and an item sales tax group to calculate sales tax. Default groups are specified in master data (for example, customer, vendor, item, and procurement category), but you can manually change the groups on a transaction if you must. Both groups contain a list of sales tax codes, and the intersection of the two lists of sales tax codes determines the list of applicable sales tax codes for the transaction.

On every transaction, you can look up the calculated sales tax by opening the **Sales tax transaction** page. You can look up the sales tax for a document line or for the whole document. For certain documents (for example, vendor invoice and general journals), you can adjust the calculated sales tax if the original document shows deviant amounts.

# Sales tax settlement and reporting

Sales tax must be reported and paid to tax authorities at regulated intervals (monthly, quarterly, and so on). You can settle tax accounts for the interval and offset the balances to the tax settlement account, as specified in the ledger posting groups. You can access this functionality on the **Settle and post sales tax** page. You must specify the sales tax settlement period that sales tax should be settled for.

After the sales tax has been paid, the balance on the sales tax settlement account should be balanced against the bank account. If the sales tax authority that is specified on the sales tax settlement period is related to a vendor account, the sales tax balance is posted as an open vendor invoice and can be included in the regular payment proposal.

## Conditional sales tax

Conditional sales tax is a sales tax that is paid proportionally to the actual amount that is paid on an invoice. Conversely, standard sales tax is calculated at invoicing time. Conditional sales tax must be paid to the sales tax authority when the payment is posted, not when the invoice is posted. When the invoice is posted, the transaction must be reported on the sales tax book report. However, the transaction must be excluded from the sales tax payment report.

If you select the Conditional sales tax check box in the General ledger parameters form, no sales tax can be deducted until you have paid the invoice. This is a legal requirement in some countries/regions.

### NOTE

When you select the Conditional sales tax check box, you must set up sales tax codes and sales tax groups, and also create ledger posting groups, to support the functionality. |

### Example

You settle sales taxes each month. On June 15, you create a customer invoice of 10,000, plus sales tax.

- The sales tax is 25 percent, or 2,500.
- The invoice payment is due July 30.

You typically would have to settle and pay 2,500 to the tax authority when the invoice is posted in June, even though you have not received the payment from the customer.

However, if you are using a conditional sales tax, you settle with the tax authority when you receive the payment from the customer on July 30.

### Postdated check

If you use postdated check as the payment method, when the payment is created, the bank account isn't cleared. In some countries, the VAT becomes 'realized' liability when the payment clears the bank, which means the postdated check is settled. You can enable it by selecting **Realize the conditional tax when postdated checks are drawn** in **Cash and bank management > Setup > Cash and bank management parameters > Postdated checks**.

For more information, see [Set up withholding tax](#).

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Sales tax calculation methods in the Origin field

2/18/2021 • 6 minutes to read • [Edit Online](#)

This article explains the options in the Origin field on the sales tax codes page and how sales tax is calculated based on the selected option for a sales tax code.

For each sales tax code that you create in the Sales tax codes page, you must select the method of calculation to apply to the tax base amount in the Origin field.

## Percentage of net amount

The Percentage of net amount calculation method is the default value in the Origin field. The sales tax is calculated as a percentage of the purchase or sales amount, excluding any other sales taxes.

### Example

The tax rate is 25%. The invoice line shows a quantity of 10 items at 1.00 each, and the customer is allowed a 10% line discount. Net amount:  $(10 \times 1.00) - 10\% = 9.00$  Sales tax:  $9.00 \times 25\% = 2.25$  Total amount:  $9.00 + 2.25 = 11.25$

## Percentage of gross amount

If you select the Percentage of gross amount method, the sales tax is calculated as a percentage of the gross sales amount. The gross amount is the line net amount plus all taxes and fees for the line except the one tax with Origin = Percentage of gross amount.

### Example

The tax authority has imposed special duties on an item. The duty amounts are added to the net amount before sales tax is calculated. Given the following sales tax codes:

- DUTY 1 = 10%, using the Percentage of net amount calculation method
- DUTY 2 = 20%, using the Percentage of net amount calculation method
- SALESTAX = 25%, using the Percentage of gross amount calculation method

If the net amount is 10.00, then DUTY 1 is 1.00 ( $10.00 \times 10\%$ ) and DUTY 2 = 2.00 ( $10.00 \times 20\%$ ). The amounts would be as follows: Gross amount: Net amount + DUTY 1 amount + DUTY 2 amount ( $10.00 + 1.00 + 2.00$ ) = 13.00 SALESTAX =  $13.00 \times 25\% = 3.25$  Total DUTIES and SALESTAX:  $1.00 + 2.00 + 3.25 = 6.25$  Total amount:  $10.00 + 6.25 = 16.25$

#### NOTE

Only one tax code with Origin = Percentage of gross amount can be used for a transaction. If more than one such tax code is determined for a transaction an error will be displayed that sales tax cannot be calculated.

## Percentage of sales tax

When you select Percentage of sales tax in the Origin field, sales tax is calculated as a percentage of the sales tax that is selected in the Sales tax on sales tax field. The sales tax that is selected in the Sales tax on sales tax field is calculated first. The second sales tax is then calculated based on the first sales tax amount.

### Example

Given the following sales tax codes:

- DUTY 1 = 10%, using the Percentage of net amount method
- DUTY 2 = 20%, using the Percentage of sales tax method, with Duty 1 in the Sales tax on sales tax field
- SALESTAX = 25%, using the Percentage of gross amount method

Net amount: 10.00 DUTY 1:  $10.00 \times 10\% = 1.00$  DUTY 2:  $1.00 \times 20\% = 0.20$  Gross amount:  $10.00 + 1.00 + 0.20 = 11.20$  SALESTAX:  $11.20 \times 25\% = 2.80$  Total DUTIES and SALESTAX:  $1.00 + 0.20 + 2.80 = 4.00$  Total amount:  $10.00 + 4.00 = 14.00$

#### NOTE

Multilevel tax on tax calculations are not possible. A tax cannot be calculated based on a tax which already is calculated based on another tax. Multiple single level tax on tax codes can be calculated on a transaction.

## Amount per unit

When you select Amount per unit in the Origin field, sales tax is calculated as a fixed amount per unit multiplied with the quantity entered on the document line. A unit has to be selected in the Unit field. The amount per unit is specified in the Sales tax code values page.

### Example

Sales tax code is set up as: USD 1.20 per unit = box On a sales invoice line 25 boxes of an item are sold Sales tax is calculated as  $25 \times 1.20 = 30.00$

#### NOTE

If the transaction is entered in different unit than the unit specified on the sales tax code, it is converted automatically based on the unit conversions that are set up in the Unit conversions page.

### Amount per unit, additional option

On the Calculation tab, you can select whether an amount per unit calculated tax is calculated before other tax codes and added to the net amount before other tax codes with Origin = Percentage of net amount are calculated.

### Examples

Assume we calculate 2 tax codes on a transaction:

- DUTY: Origin = Amount per unit and a sales tax, the value is set to 5.00 per unit = pcs
- SALESTAX: Origin = as shown in the examples below, the value is set to 25%

We sell 1 piece of an item at a unit price of 10.00

#### Example 1

SALESTAX: Origin = Percentage of gross amount method The Calculate before sales tax option has no effect, because SALESTAX is calculated as a percentage of the gross amount. DUTY:  $1 \times 5.00 = 5.00$  Gross amount:  $10.00 + 5.00 = 15.00$  SALESTAX:  $15.00 \times 25\% = 3.75$  Total sales tax:  $5.00 + 3.75 = 8.75$  Total amount:  $10.00 + 8.75 = 18.75$

#### Example 2

SALESTAX: Origin = Percentage of net amount The Calculate before sales tax option is not selected for the DUTY calculation. Net amount: 10.00 DUTY:  $1 \times 5.00 = 5.00$  SALESTAX:  $10.00 \times 25\% = 2.50$  Total sales tax:  $5.00 + 2.50 = 7.50$  Total amount:  $10.00 + 7.50 = 17.50$

#### Example 3

SALESTAX: Origin = Percentage of net amount The Calculate before sales tax option is selected for the DUTY calculation. Net amount: 10.00 DUTY:  $1 \times 5.00 = 5.00$  SALESTAX:  $(10.00 + 5.00) \times 25\% = 3.75$  Total sales tax: 5.00

+ 3.75 = 8.75 Total amount: 10.00 + 8.75 = 18.75

#### Example 4

The result of Example 3 and Example 1 is the same, because there is only one duty. Assume that you have two DUTIES, and only one of them is included in the net amount for the sales tax calculation: DUTY 1: 5.00, using the Amount per unit method, and the Calculate before sales tax option is selected DUTY 2: 2.50, using the Amount per unit method, and the Calculate before sales tax option is not selected Sales tax: 25%, using the Percentage of net amount method Net amount: 10.00 DUTY 1:  $1 \times 5.00 = 5.00$  DUTY 2:  $1 \times 2.50 = 2.50$  Net amount subject to sales tax:  $10.00 + 5.00 = 15.00$  SALESTAX:  $15.00 \times 25\% = 3.75$  Total sales taxes, including duties:  $5.00 + 2.50 + 3.75 = 11.25$  Total amount:  $10.00 + 11.25 = 21.25$  The 25% SALESTAX is calculated for the sum of the net amount (10.00) + DUTY 1 (5.00) = 15.00. DUTY 2 is added to the tax amount after the sales tax is calculated.

## Calculated percentage of net amount

The Calculated percentage of net amount handles tax calculation differently depending on the setting of the Amounts include sales tax parameter for the document or journal.

#### Example 1

Document / journal is set to Amounts include sales tax = Yes Transaction line amount: 10.00 Tax rate: 25% Sales tax: Transaction line amount x tax rate ( $10.00 \times 25\%$ ) = 2.50 Tax base amount (origin amount): Transaction line amount - Sales tax ( $10.00 - 2.50$ ) = 7.50

#### Example 2

Document / journal is set to Amounts include sales tax = No Transaction line amount: 10.00 Tax rate: 25% Sales tax:  $(\text{Transaction line amount} \times \text{tax rate}) / (100 - \text{tax rate})$  ( $10.00 \times 25\% / (100\% - 25\%) = 3.33$  Tax base amount (origin amount): Transaction line amount = 10.00

# Sales tax assignment and overrides

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to assign sales tax groups to commerce channels. It also walks through the process of creating a new sales tax override and assigning it to an existing sales tax override group. This procedure uses the USRT company in demo data.

1. Go to Retail and Commerce > Channels > Stores > All stores.
2. In the list, click the Channel ID link for "Houston."
3. Click Edit.
  - The "Sales tax group" field contains the list of sales tax groups for the current company. The currently assigned group is a generic "Texas" sales tax group. There are also sales tax groups for "Washington" and "Washington, King County." Sales tax groups can include applicable taxes for multiple municipalities.
  - The "Sales tax override" field is where sales tax override groups can be mapped to the channel. Sales tax override groups can be used to group together sales tax overrides that work for multiple stores. Rather than manually assigning sales tax overrides one by one, the group can be created and assigned directly to the channels to save time.
4. Click Save.
5. Close the page.
6. Go to Retail and Commerce > Channel setup > Sales taxes > Sales tax overrides.
7. Click New.
8. In the Sales tax override field, provide a name for your new override.
9. In the Description field, provide a description of the override.
10. Set the status to "Enable."
11. Expand or collapse the Override section.
12. In the Type field, select an option.
  - Item sales tax groups can be used to override taxes for specific items that belong to the group. For example, food items are typically taxed differently from hard goods, and would likely have their own sales tax group. Sales tax groups are groups of taxes that are applicable to a particular channel. For example, if a channel sells both retail and business-to-business, different items sales tax groups may be used. All the applicable taxes would be mapped to the sales tax group.
  - Now you can select the "From" and "To" taxes or "From tax group" and "To tax group" to create your sales tax override. The "From" field indicates the tax or tax group to be overridden. Overriding by Item sales tax group provides different options than overriding by sales tax group. Sales tax overrides can be set up to override taxes on entire transactions or on particular lines in the transaction.
13. Click Save.
14. Close the page.
15. Go to Retail and Commerce > Channel setup > Sales taxes > Sales tax override groups.
  - In this step you will assigned the newly created sales tax override to the sales tax override group assigned to the Houston channel.
16. Click Edit.
17. Expand or collapse the Setup section.
18. Click Add.
19. In the Sales tax override field, click the drop-down button to open the lookup.
20. Select the previously created sales tax override from the list.

21. In the list, click the link in the selected row.

22. Click Save.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Whole amount and Interval calculation options for sales tax codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains the options for the Calculation method field on sales tax codes and how sales tax is calculated for intervals and whole amounts.

You can set up a sales tax code to be calculated based on a whole amount or an interval amount. In the Sales tax codes page, use the Calculation method field on the Calculation FastTab to select how to calculate a sales tax code.

- Whole amount – The tax rate is applied to the whole taxable amount.
- Interval – The taxable amount is divided into parts, each of which falls in a range that has a specific sales tax rate. The part of the amount that falls in a given interval is taxed according to the tax rate for that interval. The sales tax is the sum of the tax amounts that are calculated for each amount interval.

## NOTE

The Interval option is available only when you select Line in the Calculation method field in the Sales tax area of the General ledger parameters page.

Intervals are set up in the Sales tax code values page by entering Minimum and Maximum limit amounts per tax rate. For taxes to be calculated on all taxable amounts, regardless of which calculation method is selected, intervals must follow these rules:

- The first interval must have a Minimum limit of zero.
- The last interval must have a Maximum limit of zero, which indicates infinity.
- The Maximum limit of an interval must be the Minimum limit of the next interval.

If an amount is the Maximum limit of the previous interval and the Minimum limit of the next interval, the sales tax rate of the first interval will be applied to the amount. If an amount falls outside the intervals that are defined by upper and lower limits, a sales tax rate of zero will be applied.

## Example: Whole amount method of calculation

In the Sales tax code values page, sales tax rates are set up in the following intervals:

Minimum limit	Maximum limit	Tax rate
0.00	50.00	30%
50.00	100.00	20%
100.00	0.00	10%

The sales tax is calculated on the whole taxable amount.

TAXABLE AMOUNT (PRICE)	CALCULATION	SALES TAX
35.00	$35.00 * 0.30$	10.50
50.00	$50.00 * 0.30$	15.00
85.00	$85.00 * 0.20$	17.00
305.00	$305.00 * 0.10$	30.50

## Example: Interval method of calculation

In the Values page, sales tax rates are set up in the following intervals:

Minimum limit	Maximum limit	Tax rate
0.00	50.00	30%
50.00	100.00	20%
100.00	0.00	10%

The sales tax is the sum of the tax amounts that are calculated for each amount interval.

TAXABLE AMOUNT (PRICE)	CALCULATION	SALES TAX
35.00	$35.00 * 0.30$	10.50
50.00	$50.00 * 0.30$	15.00
85.00	$(50.00 * 0.30 = 15.00) + (35.00 * 0.20 = 7.00)$	22.00
305.00	$(50.00 * 0.30 = 15.00) + (50.00 * 0.20 = 10.00) + (205 * 0.10 = 20.50)$	45.50

For more information, see [Sales tax rates based on the Marginal base and Calculation methods](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Calculation of tax exemption

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes functionality for tax exemption calculations in the point of sale (POS) and call center.

## Key terms

TERM	DESCRIPTION
B2B	An abbreviation for "business to business." It's used to indicate sales between businesses, as opposed to sales between a retailer and an individual.
VAT	Value-added tax that is included in the price of a product.

## Adjust prices for tax exemptions when the price includes tax

Microsoft Dynamics 365 Commerce version 10.0.13 and later includes a feature called **Enable tax exemption for the 'price includes sales tax' scenario**. When this feature is enabled, an option called **Calculate price inclusive tax exempt** appears on the **General** FastTab for store and call center settings. If this option is set to **Yes**, prices in tax-inclusive scenarios are adjusted when the transaction or specific taxes in the transaction should be exempted. When store-based taxes are used, you can apply these exemptions by using tax overrides. When customer-based taxes are used at the store, the exemptions are automatically applied based on the customer's tax settings.

This setting is also supported for orders that are created in the call center and stores.

The screenshot shows the 'Stores' configuration page for 'BELLEVU: Bellevue'. The 'General' tab is selected. The 'Calculate price inclusive tax exempt' option is highlighted with a red box and is set to 'Yes'. Other settings include 'Retail Channel Id' (000022), 'Name' (Bellevue), 'Store number' (BELLEVU), 'Operating unit number' (057), 'Legal entity' (usr), 'Warehouse' (BELLEVU), 'Shipping warehouse' (BELLEVU), 'Store time zone' ((GMT-08:00) Pacific Time (US ...)), 'Channel profile' (Default), 'Live channel database', 'Offline profile' (AX7), 'Sales tax group' (WA), 'Prices include sales tax' (Yes), 'Use destination-based tax' (No), 'Use customer-based taxes' (No), 'Sales tax override group' (Default), 'Customer address book' (RetailCust), and 'Employee address book' (Bellevue:USRTWest,...).

## Set up price reductions for tax exemptions

The following steps show how to test this capability in demo data scenarios. The setup steps for other data sets are similar.

1. Go to **Retail and Commerce > Channels > Stores > All stores**.
2. Select the **San Francisco** store. To open the store details, select the **Retail Channel Id** value for the store.
3. Select **Edit**.

4. On the **General** FastTab, set the **Calculate price inclusive tax exempt** option to **Yes**.
5. Set the **Price includes tax** option to **Yes**.
6. Select **Save**.
7. Enter **Sales tax groups** in the search field to open the **Sales tax groups** page.
8. Select **New**, and enter a name for the sales tax group.
9. On the **Setup** FastTab, select **Add**.
10. On the drop-down list in the **Sales tax code** column, select **RP\_CAST**, and then select the **Exempt** check box.
11. Select **Save**.
12. Enter **Sales tax overrides** in the search field to open the **Sales tax overrides** page.
13. Select **New**, and enter a name for the sales tax override.
14. Set the status to **Enable**.
15. In the **Override type** field, select **Sales tax group**.
16. In the **From** field, select **Any tax group**.
17. In the **To** field, select **Specified tax group**.
18. In the **From tax group** field, select **CA**.
19. In the **To tax group** field, select the sales tax group that created earlier.
20. Select **Save**.
21. Enter **Sales tax override groups** in the search field to open the **Sales tax override groups** page.
22. Select the **Default** group, and then select **Edit**.
23. Select **Add**, and then select the sales tax override that you created earlier.
24. Select **Save**.
25. Enter **Distribution schedules** in the search box to open the **Distribution schedules** page.
26. Select schedule job **9999**, and then select **Run now**.
27. When the jobs have completed synchronization, open the POS.

**NOTE**

Tax details for the channel might be cached. Then close the point of sale application and relaunch it to observe the changes after they have synchronized to the channel database.

28. Add item **91050** to a transaction.
29. Select **Tax overrides**, and then select **Override transaction tax**.
30. Select the sales tax override that you created earlier. The tax is reduced to 0 (zero), and the price for the line items is reduced to reflect the tax exemption.

Alternatively, you can set the **Use customer based tax** option for the store to **Yes** and then assign the sales tax group that you create directly to the customer. Then, when the customer is added to a transaction, the prices are

reduced to reflect that customer's tax-exempt status.

### Check customers for exemptions when tax is exclusive of price

Some retail verticals, such as liquor stores, sell goods to individuals and other businesses in cash-and-carry transactions. However, in many cases, transactions that involve different customer segments have different requirements for taxation purposes. For example, when a liquor store sells goods to some businesses, sales taxes that are usually associated with the items that are sold might be exempt for those specific businesses. However, in all other cases, regular sales tax should apply.

To support this scenario, set the **Calculate customer tax exempt** option for the store to **Yes**. Then, when a customer is added to a transaction, the POS checks the taxes that are applicable to that customer. If the customer's tax settings have a tax code that is marked as **Exempt**, but tax is applicable to the transaction, the tax is treated as exempt for the transaction and isn't added to the transaction.

The **Calculate customer tax exempt** option applies to stores where the price doesn't include tax. The exemption calculation is also supported if the **Use destination based tax** option for the store is set to **Yes**.

### Set up tax exemption calculations for customers

The following steps show how to test this capability in demo data scenarios. The setup steps for other data sets are similar.

1. Go to **Retail and Commerce > Channels > Stores > All stores**.
2. Select the **San Francisco** store. To open the store details, select the **Retail Channel Id** value for the store.
3. Select **Edit**.
4. On the **General** FastTab, set the **Calculate customer tax exempt** option to **Yes**.
5. Select **Save**.
6. Enter **Sales tax groups** in the search field to open the **Sales tax groups** page.
7. Select **New**, and enter a name for the sales tax group.
8. On the **Setup** FastTab, select **Add**.
9. On the drop-down list in the **Sales tax code** column, select **RP\_CAST**, and then select the **Exempt** check box.
10. Select **Save**.
11. Go to **Retail and Commerce > All customers**.
12. Select account ID **004009** for **Matthew Tolley**.
13. Select **Edit**.
14. On the **Invoice and delivery** FastTab, in the **Sales tax group** field, select the sales tax group that you created earlier.
15. Select **Save**.
16. Enter **Distribution schedules** in the search field to open the **Distribution schedules** page.
17. Select schedule job **9999**, and then select **Run now**.
18. When the jobs have completed synchronization, open the POS.
19. Add item **91050** to a transaction. The total that is due is **\$75.06**.
20. Add **Matthew Tolley** to the transaction. Taxes are recalculated to reflect this customer's exemption.

# Configure sales tax for online orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of sales tax group selection for different online order types.

Your e-commerce channel may want to support options like delivery or pickup for online orders. The sales tax applicability is based on the option selected by your online users. When a site customer chooses to buy an item online and gets it shipped to an address, the sales tax is determined based on the customer's shipping address tax group setting. When a customer opts to pick up a purchased item at a store, the sales tax is determined based on the pickup store's tax group setting.

## Orders shipped to a customer address

In general, taxes for online orders that ship to customer addresses are defined by the destination. Every sales tax group has a retail destination-based tax configuration in which your business can define destination details such as county/region, state, county, and city in a hierarchical form. When an online order is placed, the Commerce tax engine uses the delivery address of every line item in the order, and finds sales tax groups with matching destination-based tax criteria. For example, for an online order with a line item delivery address to San Francisco, California, the tax engine will find the sales tax group and sales tax code for California and then calculate tax for each line item accordingly.

## Customer-based tax groups

In Commerce headquarters, there are two places where customer tax groups are configured:

- **Customer's profile**
- **Customer's shipping address**

### **If a customer's profile has a tax group configured**

A customer's profile record in headquarters may have a sales tax group configured, however for online orders the sales tax group configured in a customer's profile will not be used by the tax engine.

### **If a customer's shipping address has a tax group configured**

If a customer's shipping address record has a tax group configured and an online order (or line item) is shipped to the customer's shipping address, the tax group configured in the customer's address record will be used by the tax engine for tax calculations.

#### **Configure a tax group for a customer's shipping address record**

To configure a tax group for a customer's shipping address record in Commerce headquarters, follow these steps.

1. Go to **All customers**, and then select the desired customer.
2. On the **Addresses** FastTab, select the desired address, and then select **More options > Advanced**.
3. Under the **General** tab on the **Manage addresses** page, set the sales tax value as needed.

#### **NOTE**

The tax group is defined using the delivery address of the order line and the destination-based taxes are configured at the tax group itself. For more information, see [Set up taxes for online stores based on destination](#).

## Order pickup in store

For order lines with pickup in store or curbside pickup specified, the tax group from the selected pickup store will be applied. For details about how to configure the tax group for a given store, see [Set other tax options for stores](#).

### NOTE

When an order line is picked up at a store, a customer's address tax settings (if set up) will be ignored by the tax engine and the pickup store's tax configuration will be applied.

# Set up an email notification profile

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create an email notification profile in Microsoft Dynamics 365 Commerce.

## Overview

Before creating channels, you'll want to set up a profile to ensure that email notifications can be sent out for various events, such as order creation, order shipping status, and payment failure.

For additional email configuration information, see [Configure and send email](#).

## Create an email notification profile

To create an email notification profile, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Headquarters setup > Commerce email notification profile**.
2. On the action pane, click **New**.
3. In the **Email notification profile** field, enter a name to identify the profile.
4. In the **Description** field, enter a relevant description.
5. Set the **Active** switch to **Yes**.

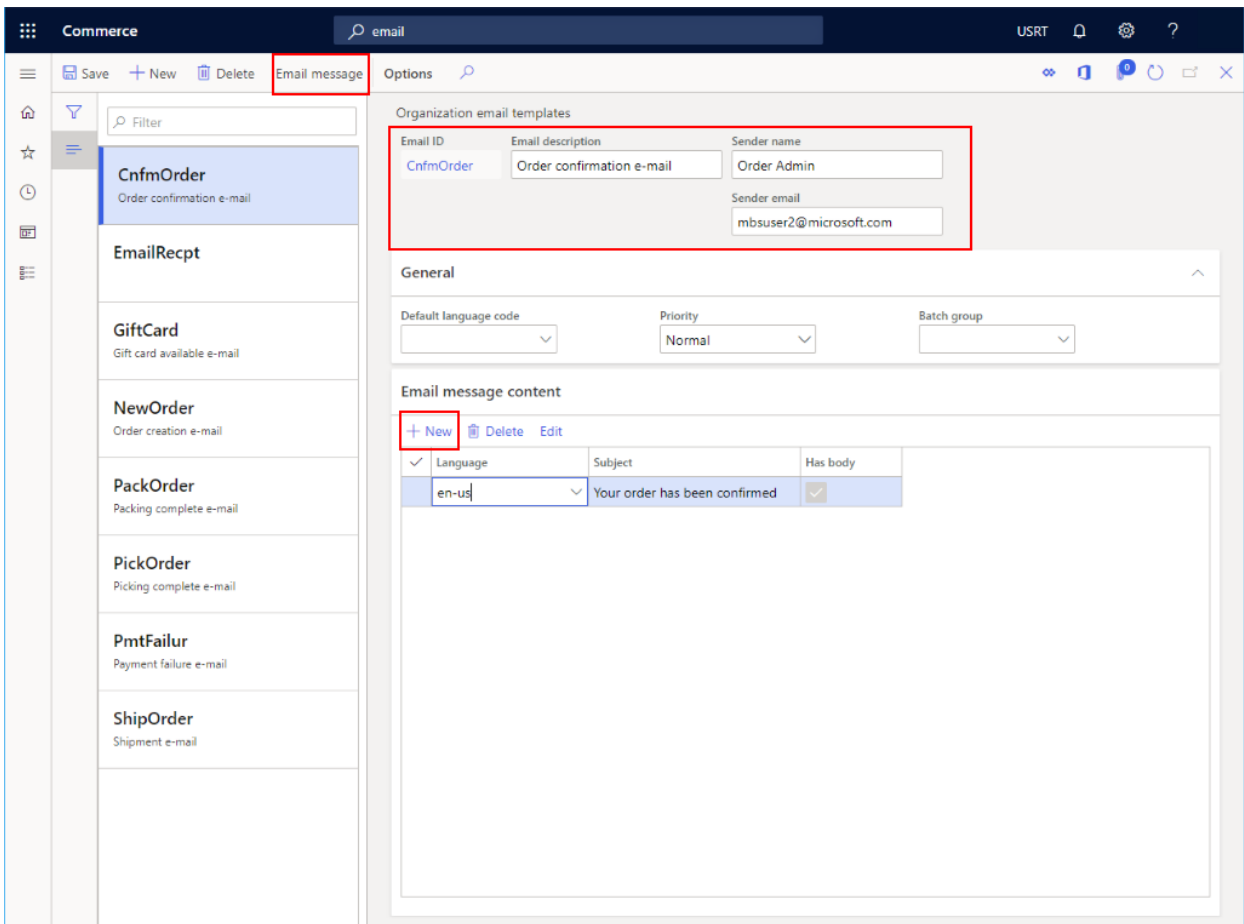

### Create an email template

Before an email notification can be created, you must create an organization email template which contains the senders email information and the email template.

To create an email template, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Headquarters setup > Parameters > Organization email templates**.
2. On the action pane, select **New**.
3. In the **Email ID** field, enter an ID to help identify this template.
4. In the **Sends name** field, enter the senders name.
5. In the **Email Description**, enter a meaningful description.
6. In the **Sender email**, enter the senders email address.
7. In the **General** section, fill out any optional information needed (such as the email priority).
8. Expand the **Email message content** section and select **New** to create the template content. For each content item, select the language and provide the email subject line. If the email will have a body, ensure that the **Has body** box is checked.
9. On the action pane, select **Email message** to provide an email body template.

The following image shows some example email template settings.

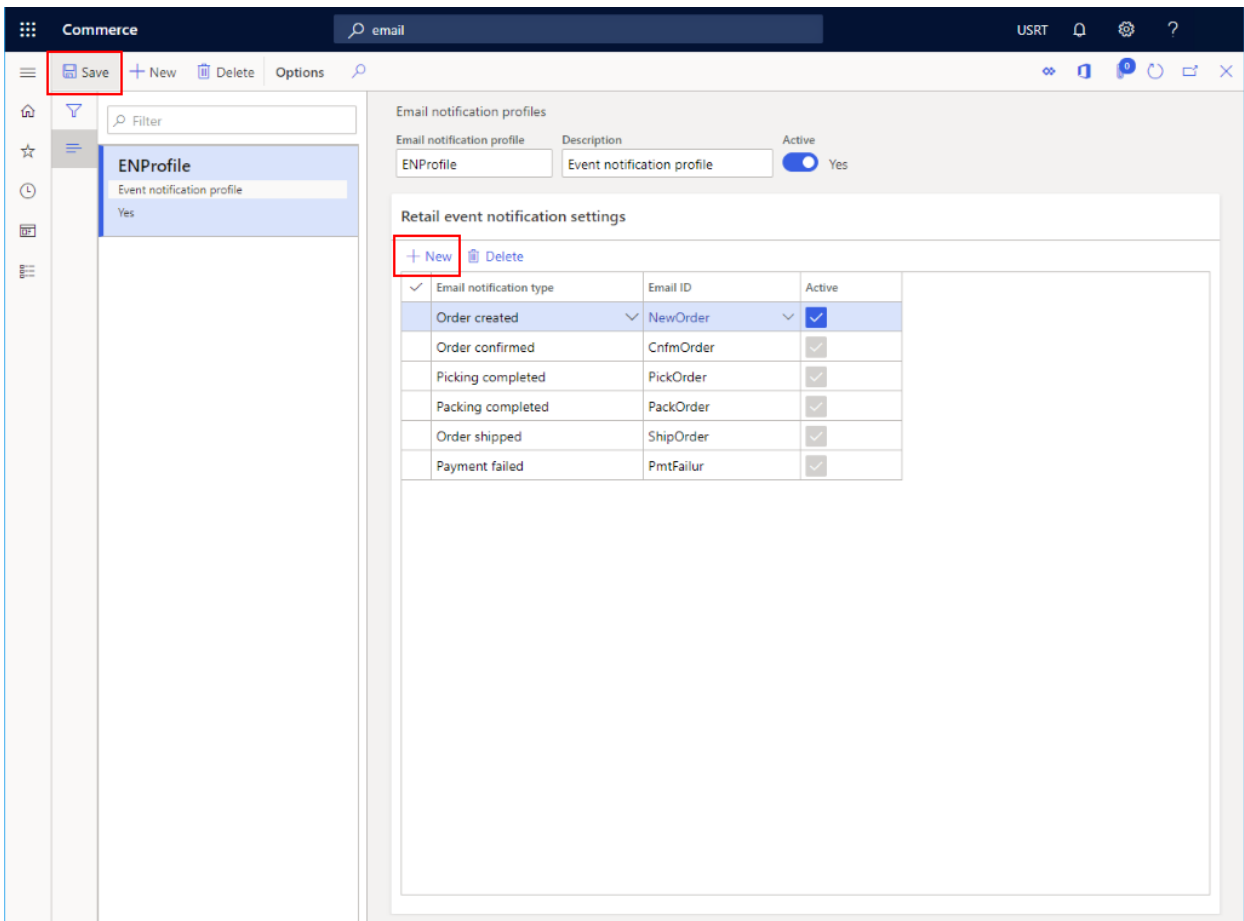

## Create an email event

To create an email event, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Headquarters setup > Commerce email notification profile**.
2. In the list, find and select the desired record.
3. Select the email template from the **Email ID** drop-down list.
4. Select the appropriate **Email notification type** from the drop-down list.
5. Select the **Active** check box.
6. On the action pane, select **Save**.

The following image shows some example event notification settings.

### Next steps

Before you can send mails, you must configure your outgoing mail service and set up a batch job. For more information, see [Configure and send email](#).

## Additional resources

[Configure and send email](#)

[Channels overview](#)

[Channel setup prerequisites](#)

[Organizations and organizational hierarchies overview](#)

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Number sequences overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require identifiers. A master data record or transaction record that requires an identifier is referred to as a *reference*.

Before you can create new records for a reference, you must set up a number sequence and associate it with the reference. We recommend that you use the pages in **Organization administration** to set up number sequences. If module-specific settings are required, you can use the parameters page in a module to specify number sequences for the references in that module. For example, in **Accounts receivable** and **Accounts payable**, you can set up number sequence groups to allocate specific number sequences to specific customers or vendors.

When you set up a number sequence, you must specify a scope, which defines which organization uses the number sequence. The scope can be **Shared**, **Company**, **Legal entity**, or **Operating unit**. **Legal entity** and **Company** scopes can be combined with **Fiscal calendar period** to create even more specific number sequences.

Number sequence formats consist of segments. Number sequences with a scope other than **Shared** can contain segments that correspond to the scope. For example, a number sequence with a scope of **Legal entity** can contain a legal entity segment. By including a scope segment in the number sequence format, you can identify the scope of a particular record by looking at its number.

In addition to segments that correspond to scopes, number sequence formats can contain **Constant** and **Alphanumeric segments**. A **Constant** segment contains a set of letters, numbers, or symbols that does not change. An **Alphanumeric** segment contains a set of letters or numbers that increment every time that a number is used. Use a number sign (#) to represent incrementing numbers and an ampersand (&) to represent incrementing letters. For example, the format #####\_2017 creates the sequence 00001\_2017, 00002\_2017, and so on.

## Number sequence examples

The following examples show how to use segments to create number sequence formats. In particular, the examples demonstrate the effects of using scope segments.

### Expense report numbers

In the following example, expense report numbers are set up for the legal entity that is titled **CS**.

- **Area:** Travel and expense
- **Reference:** Expense report number
- **Scope:** Legal entity
- **Legal entity:** CS

SEGMENTS	SEGMENT TYPE	VALUE
Segment 1	Legal entity	CS
Segment 2	Constant	-EXPENSE-

SEGMENTS	SEGMENT TYPE	VALUE
Segment 3	Alphanumeric	####

**Example of formatted number:** CS-EXPENSE-0039

You can set up a similar number sequence format for other legal entities. For example, for a legal entity that is named **RW**, if you change only the value of the legal entity segment, the formatted number is RW-EXPENSE-0039. You can also change the whole number sequence format for other legal entities. For example, you can omit the legal entity scope segment to create a formatted number such as Exp-0001.

### Sales order numbers

In the following example, sales order numbers are set up for the company ID CEU.

- **Area:** Sales
- **Reference:** Sales order
- **Scope:** Company
- **Company:** CEU

SEGMENTS	SEGMENT TYPE	VALUE
Segment 1	Constant	SO-
Segment 2	Alphanumeric	####

**Example of formatted number:** SO-0029

Even though a scope segment is not included in the format, numbering restarts for each company ID. If you use the same format for all company IDs, the same numbers are used in each company. For example, sales order number SO-0029 is used in each company. You can also change the whole number sequence format for other company IDs.

### Purchase requisition numbers

In the following example, purchase requisition numbers are organization-wide.

- **Area:** Purchase
- **Reference:** Purchase requisition
- **Scope:** Shared

SEGMENTS	SEGMENT TYPE	VALUE
Segment 1	Constant	Req
Segment 2	Alphanumeric	####

**Example of formatted number:** Req0052

Because the scope is **Shared**, the number sequence format is used across the organization. You cannot set up different number sequence formats for different parts of the organization.

## Performance considerations for number sequences

Consider the following information about how the configuration of number sequences can affect system performance before you set up number sequences.

## Continuous and non-continuous number sequences

Number sequences can be continuous or non-continuous. A continuous number sequence does not skip any numbers, but numbers may not be used sequentially. Numbers from a non-continuous number sequence are used sequentially, but the number sequence may skip numbers. For example, if a user cancels a transaction, a number is generated, but not used. In a continuous number sequence, that number is recycled later. In a non-continuous number sequence, the number is not used.

Continuous number sequences are typically required for external documents, such as purchase orders, sales orders, and invoices. However, continuous number sequences can adversely affect system response times because the system must request a number from the database every time that a new document or record is created.

If you use a non-continuous number sequence, you can enable **Preallocation** on the **Performance** FastTab of the **Number sequences** page. When you specify a quantity of numbers to preallocate, the system selects those numbers and stores them in memory. New numbers are requested from the database only after the preallocated quantity has been used.

Unless there is a regulatory requirement that you use continuous number sequences, we recommend that you use non-continuous number sequences for better performance.

## Automatic cleanup of number sequences

In case of a power failure, an application error, or other unexpected failure, the system cannot recycle numbers automatically for continuous number sequences. You can run the cleanup process manually or automatically to recover the lost numbers.

Carefully consider server usage when you plan the cleanup process. We recommend that you perform the cleanup as a batch job during non-peak hours.

# Set up number sequences on an individual basis

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up number sequences on an individual basis. Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require them. A master data or transaction record that requires an identifier is referred to as a reference. Before you can create new records for a reference, you must set up a number sequence and associate it with the reference. You can set up all required number sequences at the same time by using the **Set up number sequences** wizard, or you can create or modify individual number sequences by using the **Number sequences** page.

1. Go to **Navigation pane > Modules > Organization administration > Number sequences > Number sequences**.
2. Select **Number sequence**.
3. In the **Number sequence code** field, type a value.
4. In the **Name** field, type a value.
5. On the **Scope parameters** FastTab, select a scope for the number sequence and select scope values from the drop-down list. The scope defines which organizations use the number sequence. In addition, number sequences that have a scope other than **Shared** can have segments that correspond to their scope. For example, a number sequence with a scope of **Legal entity** can have a legal entity segment. For more information about scopes, see [Number sequence overview](#).
6. Expand the **Segments** section.
  - Define the format for the number sequence by adding, removing, and rearranging segments.
  - Number sequences of all scopes can contain *Constant segments* and *Alphanumeric segments*. Constant segments contain a set of alphanumeric characters that do not change. Use this segment type to add a hyphen or other separators between number sequence segments. Alphanumeric segments contain a combination of number signs (#) and ampersands (&). These characters represent letters and numbers that increment every time that a number from the sequence is used. Use a number sign (#) to indicate incrementing numbers and an ampersand (&) to indicate incrementing letters. For example, the format `#####_2014` creates the sequence `00001_2014`, `00002_2014`, and so on. At least one alphanumeric segment must be present. Scope segments, such as company or legal entity, are not required. However, if you do not include scope segments in the format, numbers for the selected reference are still generated per scope.
7. Expand the **References** section. Select the document type or record to assign this number sequence to. This step is optional for sequences that are defined for special application usage patterns. In these scenarios, a new number is generated by using the value of a number sequence code or ID, without using a reference. An example of a special application usage pattern is a voucher series that is used for specific journal names. However, we do not recommend that you use such patterns.
8. Expand the **General** section. On the General FastTab, specify whether the number sequence is manual, and continuous or non-continuous. In addition, enter the lowest and highest numbers that can be used in the number sequence. We do not recommend changing a non-continuous number sequence to a continuous number sequence. The number sequence will not be truly continuous. This change may also cause duplicate key violations in the database. In addition, continuous number sequences have a larger effect on performance.
9. Click **Save**.

# Set up number sequences using a wizard

2/18/2021 • 2 minutes to read • [Edit Online](#)

Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require them. A master data or transaction record that requires an identifier is referred to as a reference. Before you can create new records for a reference, you must set up a number sequence and associate it with the reference. This topic explains how to set up all required number sequences at the same time by using a wizard. The demo data company used to create this procedure is USMF.

1. Go to **Navigation > Modules > Organization administration > Number sequences > Number sequences**.
2. Select **Generate**.
3. Select **Next**.
  - On this page, you can modify the identification code, the lowest value, and the highest value. In addition, you can indicate whether the number sequence must be continuous.
  - Do not select the **Continuous** option if you must preallocate numbers for the number sequence. To add a scope segment to the format of a number sequence, select the format in the list, and then select **Include scope in format**. To remove a scope segment from the format of a number sequence, select the format in the list, and then select **Remove scope from format**. To exclude a number sequence from automatic generation, select the number sequence in the list, and then select **Delete**.
4. Select **Next**.
5. Select **Finish**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create a default customer

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a default customer to use when creating a channel in Microsoft Dynamics 365 Commerce.

## Overview

When creating a channel, you will need to provide a default customer. A default customer can easily be created after first creating the customer group and customer address book.

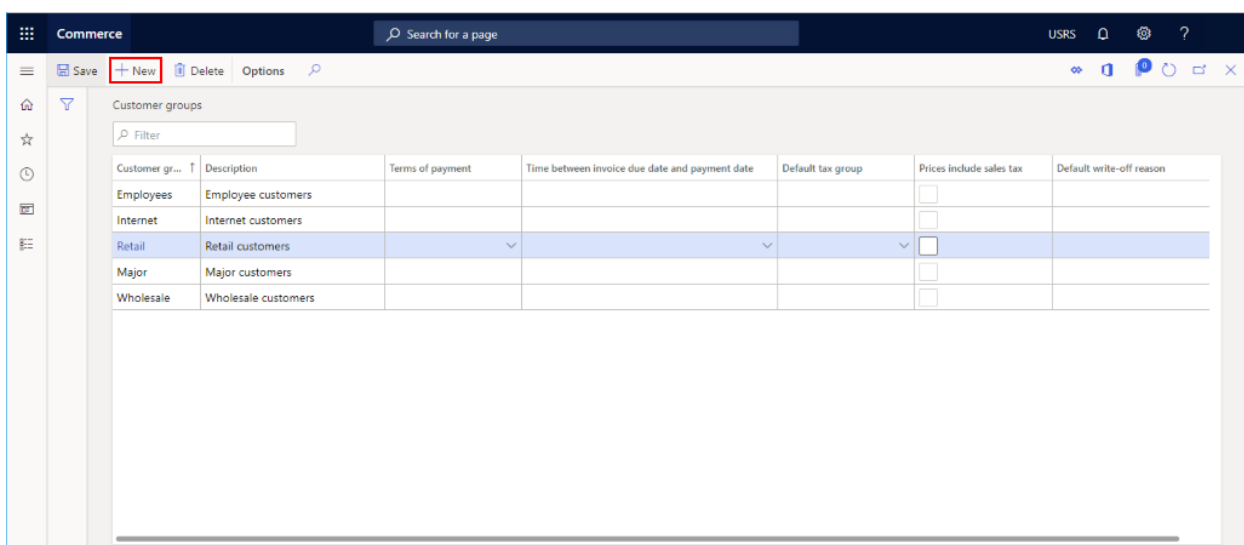

## Create a customer group

If no customer groups exist yet, you can create one. Examples may be groups to represent different customer groups, such as wholesale, retail, Internet, Employees, etc.

To create a customer group, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Customers > Customer groups**.
2. On the action pane, select **New**.
3. In the **Customer group** box, enter a customer group ID.
4. In the **Description** box, enter an appropriate description.
5. In the **Terms of payment** box, enter an appropriate value.
6. In the **Time between invoice due date and payment date** box, enter an appropriate value.
7. In the **Default tax group** box, enter a tax group if applicable.
8. Select the **Prices include sales tax** check box if applicable.
9. In the **Default write-off reason** box, enter an appropriate value, if applicable.

The following image shows several configured customer groups.

Customer gr...	Description	Terms of payment	Time between invoice due date and payment date	Default tax group	Prices include sales tax	Default write-off reason
Employees	Employee customers				<input type="checkbox"/>	
Internet	Internet customers				<input type="checkbox"/>	
Retail	Retail customers				<input checked="" type="checkbox"/>	
Major	Major customers				<input type="checkbox"/>	
Wholesale	Wholesale customers				<input type="checkbox"/>	

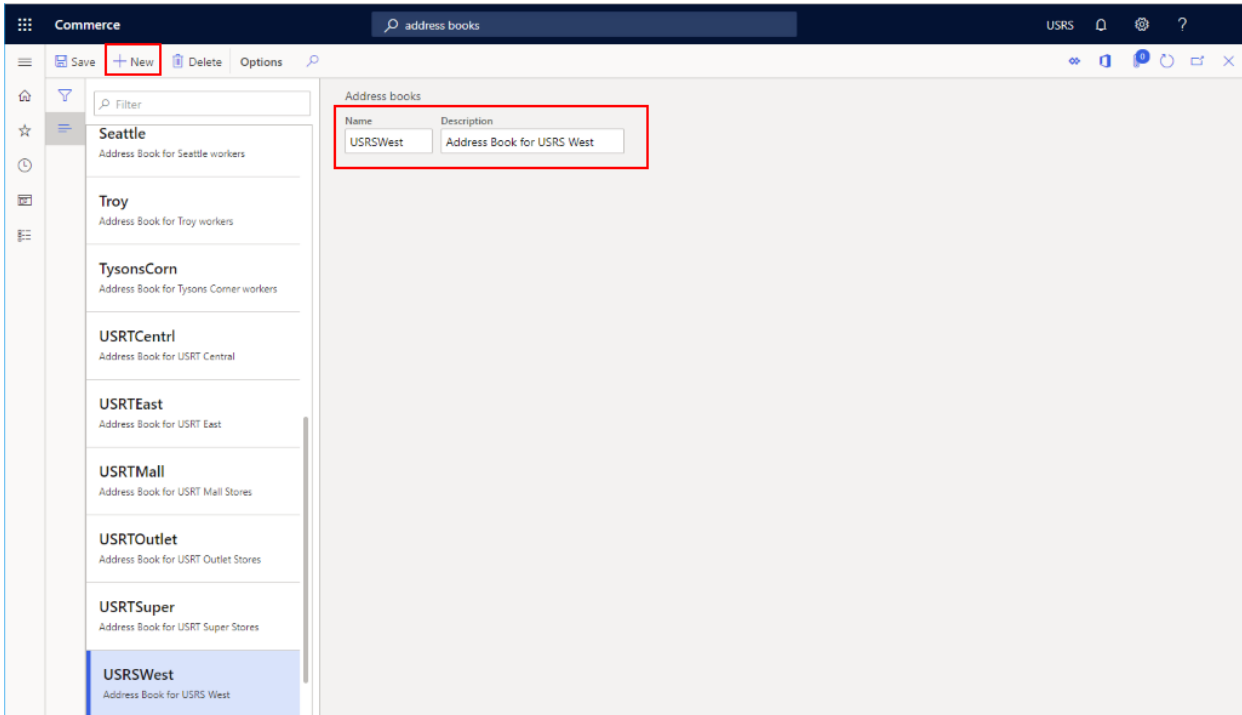

## Create a customer address book

A customer needs to be associated with an address book. If one has not yet been created, then you will need to create one.

To create a customer address book, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Address Books**.
2. On the action pane, select **New**.
3. In the **Name** box, enter a name.
4. In the **Description** box, enter a description.
5. On the action pane, select **Save**.

The following image shows an example address book.

## Create a default customer

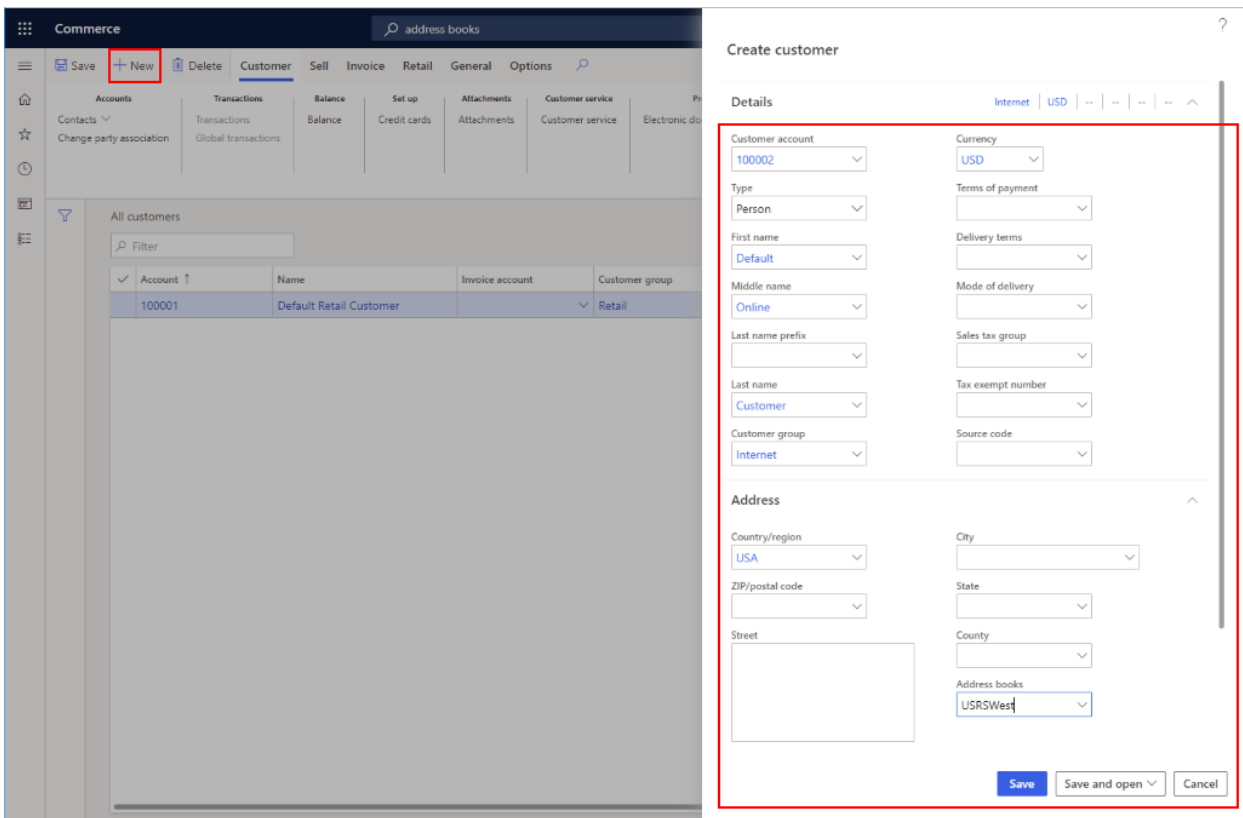

To create a default customer, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Customers > All customers**.
2. On the action pane, select **New**.
3. In the **Type** drop-down list, select "Person".
4. In the **Customer account** drop-down list, select or enter an account number (for example, "100001").
5. In the **First name** drop-down list, select or enter a name (for example, "Default").
6. In the **Middle name** drop-down list, select or enter a name (for example, "Retail").
7. In the **Last name** drop-down list, select or enter a name (for example, "Customer").
8. In the **Currency** drop-down list, select or enter a currency (for example, "USD").
9. In the **Currency** drop-down list, select the customer group created previously.
10. In the **Address books** drop-down list, select an existing customer address book.
11. Select **Save** to save and return to customer details screen for the new customer.

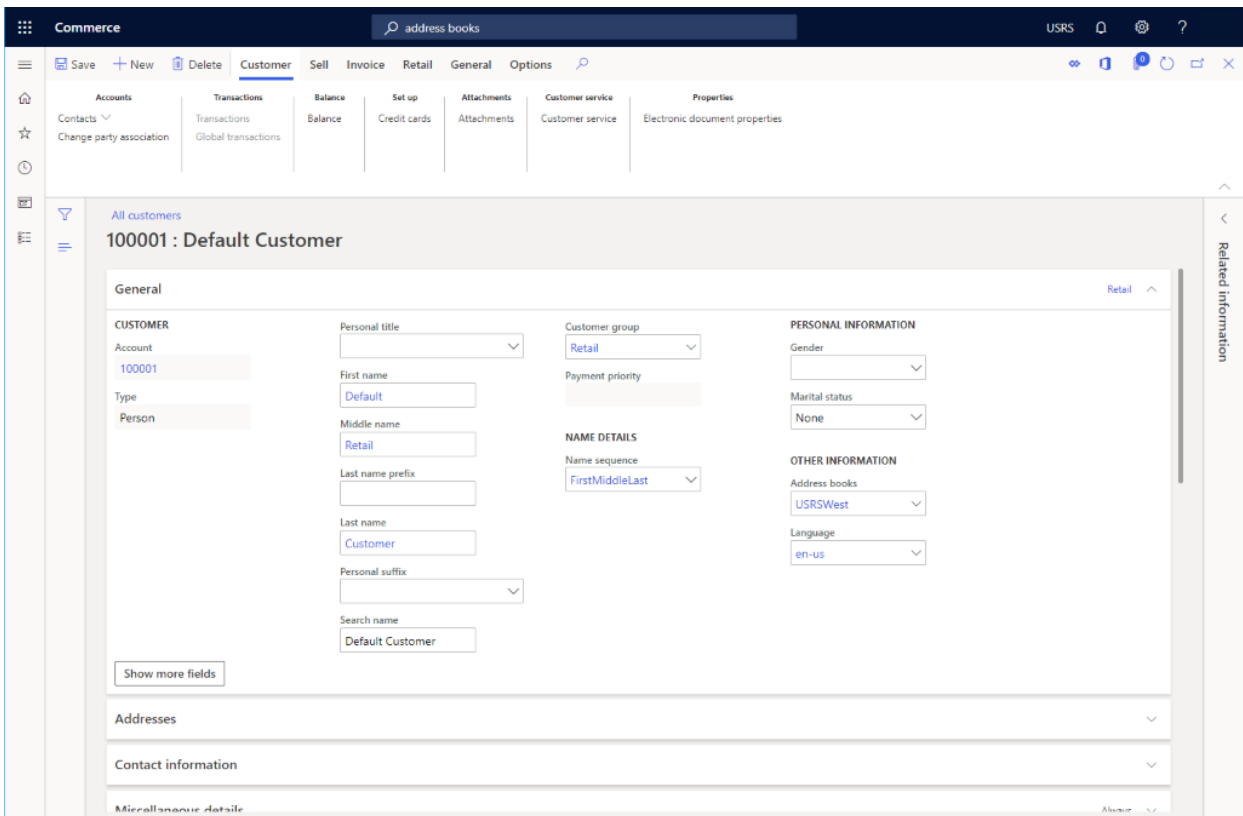

### NOTE

It is not necessary to add an address for a default customer.

The following image shows an example of customer creation.

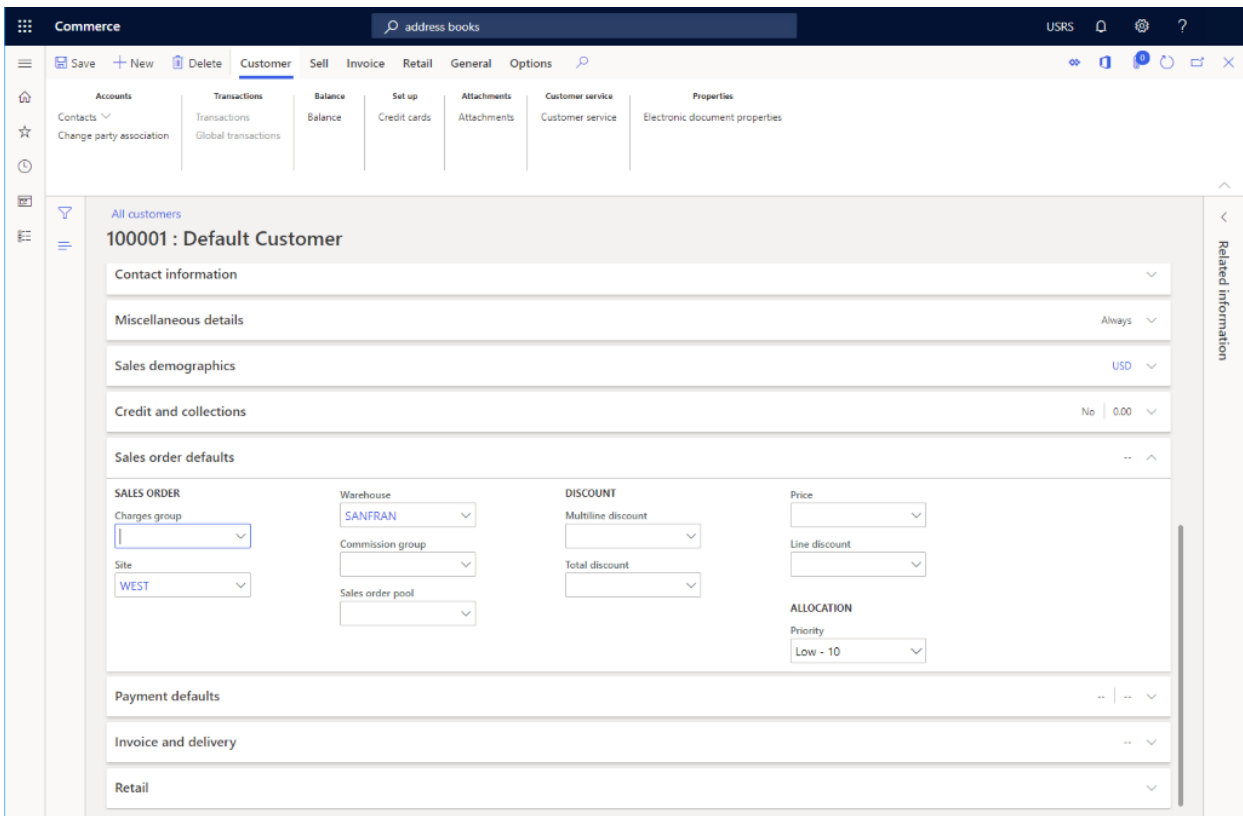

The following image shows a default customer configuration.

Most of the default values on the customer details screen can remain, but two values should be changed.

1. On the customer details screen, expand **Sales order defaults**.
2. In the **Site** drop-down list, select or enter a pre-configured site.
3. In the **Warehouse** drop-down list, and select or enter a pre-configured warehouse.

The following image shows an example customer configuration.

# Info codes and info code groups

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides an overview about info codes, info code groups, and how to use them.

Info codes provide a way for you to capture data at a point-of-sale (POS) register. You can use info codes to prompt the cashier to enter information during various actions at the POS, such as item sales, item returns, or selecting customers. Cashiers can select input from a list or enter it as a code, number, date, or text. You can assign info codes to predefined store actions, retail items, payment methods, customers, or specific point-of-sale activities. You can use info codes to do the following:

- Capture additional information at transaction time, such as a flight number or the reason for a return.
- Prompt the register cashier to select from a list of prices for specific products.
- Link a subcode to an info code to prompt the cashier for input when performing a specific activity. For example, when a customer returns a product, you can prompt the cashier to ask why the product is being returned. Then you can use subcodes to display a list of reasons that the cashier can choose from.
- Sell a product as a regular sale, discounted sale, or free product.
- Prompt the cashier to enter a value or select from a list of subcodes when the register drawer is opened without performing a sales operation.

## Info codes group

In Commerce, you can create groups of info codes. Info code groups add flexibility by enabling you to define fewer info codes and then use them in more versatile ways. You can use info code groups in the following ways:

- Define fewer info codes and easily re-use them. Info codes that are included in info code groups have no predefined dependencies on other info codes. You can include the same info code in multiple info code groups and then use prioritization to present the same info codes in the order that makes sense in any particular situation.
- Link info codes to other info codes or info code groups to gather information about a product or transaction without having to define a separate info code or linked info code for each scenario.

## Info code examples

### Example 1: Reuse info codes

You can link info codes so that when one info code is triggered, another info code is triggered immediately after it. For example, when you sell certain products, you can prompt the cashier to ask the customer if they want to purchase batteries and a product warranty. For other products, you can prompt the cashier to ask the customer if they want to purchase batteries and collect their postal code. If you create linked info codes for these scenarios, you must set up every variation of the info code so that the cashier is prompted to ask for the right information. If you use info code groups, common info codes, such as asking for batteries, can be set up once and then reused in multiple info code groups. You can also use prioritization in the info code groups to identify the order in which the prompts are displayed.

### Example 2: Link info codes to info code groups

When you sell certain products, for example mobile devices, you always want to collect a specific set of information, such as telephone number, mobile equipment identifier (MEID), and serial number. However, you also want to collect different information for a tablet versus a mobile phone. You can set up an info code group that includes prompts for the telephone number, MEID, and the serial number, and then link the info code group

to an individual info code. When the product-specific info code is triggered, the info code group can be triggered next to enable you to collect the common data without having to define multiple sets of linked info codes for each device.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create a retail functionality profile

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a functionality profile in Microsoft Dynamics 365 Commerce.

## Overview

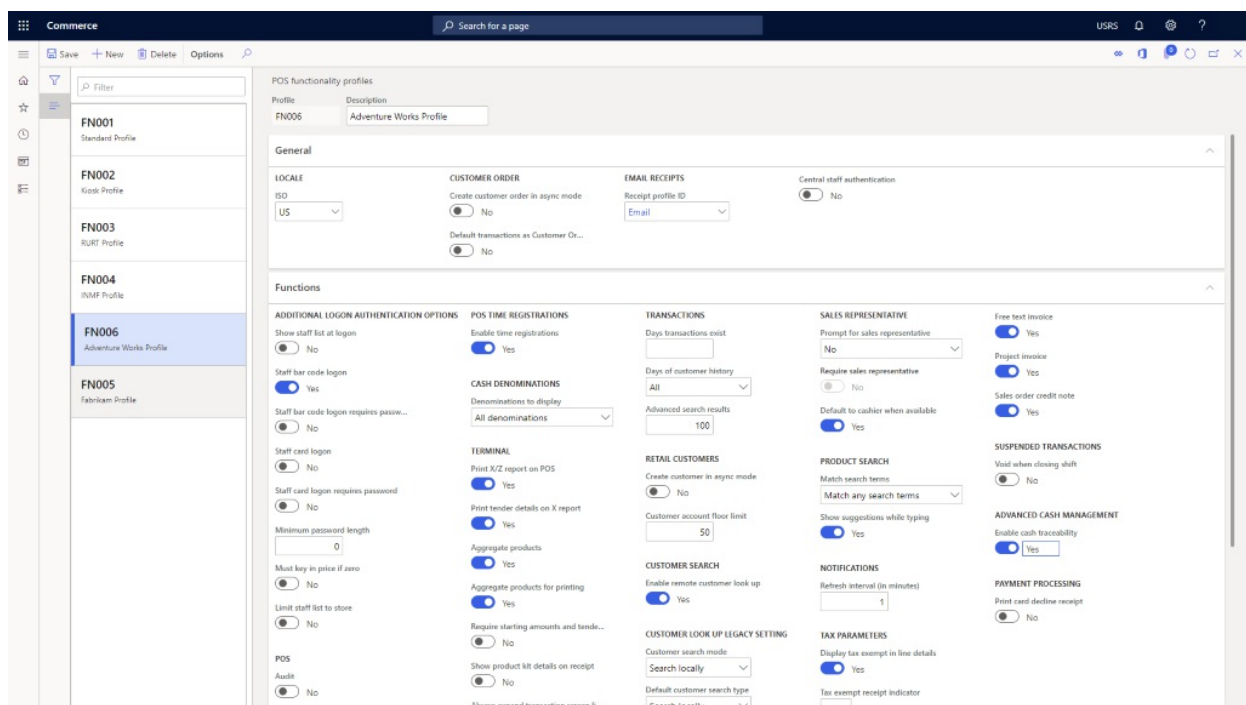

The commerce functionality profile provides various settings used for online channels. Each channel must specify a functionality profile.

## Create a functionality profile

To create a functionality profile, follow these steps.

1. In the navigation pane, go to **Modules > Channel setup > POS profiles > Functionality profiles**.
2. On the action pane, select **New**.
3. In the **Profile** field, enter an ID for the profile ("FN006" in the example image below).
4. In the **Description** field, enter a value ("Adventure Works Profile" in the example image below).
5. In the **General** section, select a country for the ISO locale.
6. In the **General** section, modify other settings, as needed.
7. In the **General** section, select a **Receipt profile ID** for email receipts.
8. In the **Functions** section, modify settings, as needed.
9. In the **Amount** section, modify settings, as needed.
10. In the **Info Codes** section, modify settings, as needed.
11. In the **Receipt numbering** section, modify settings, as needed.

The following image shows an example functionality profile.

# Create new address book

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a new address book in Microsoft Dynamics 365 Commerce.

## Overview

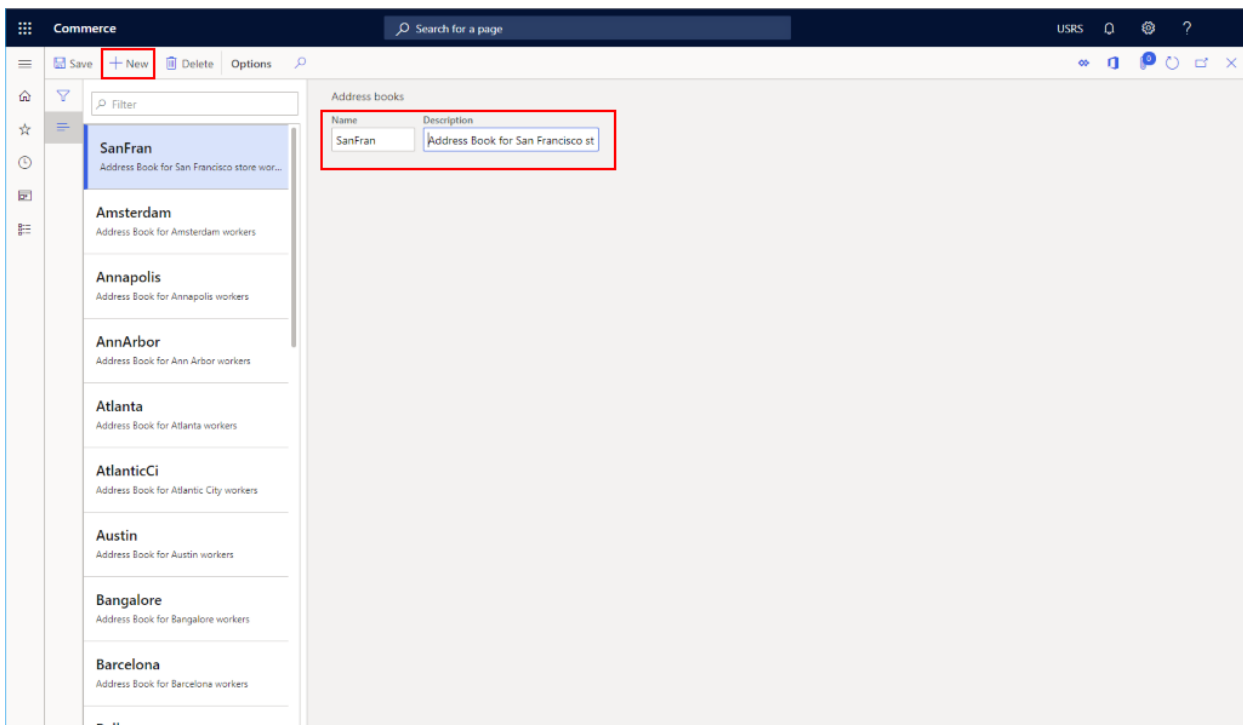

Address books are used in Commerce for various reasons including storing customer lists and employee lists for a channel. Address books can be used for a single channel or shared between channels.

## Create a new address book

To create a new address book, follow these steps.

1. In the navigation pane, go to **Modules > Channel setup > Address books**.
2. On the action bar, select **New**.
3. Enter name and description information.
4. On the action bar, select **Save**.

The following image shows the creation of an employee address book for a retail store.

# POS user interface visual configurations

2/18/2021 • 12 minutes to read • [Edit Online](#)

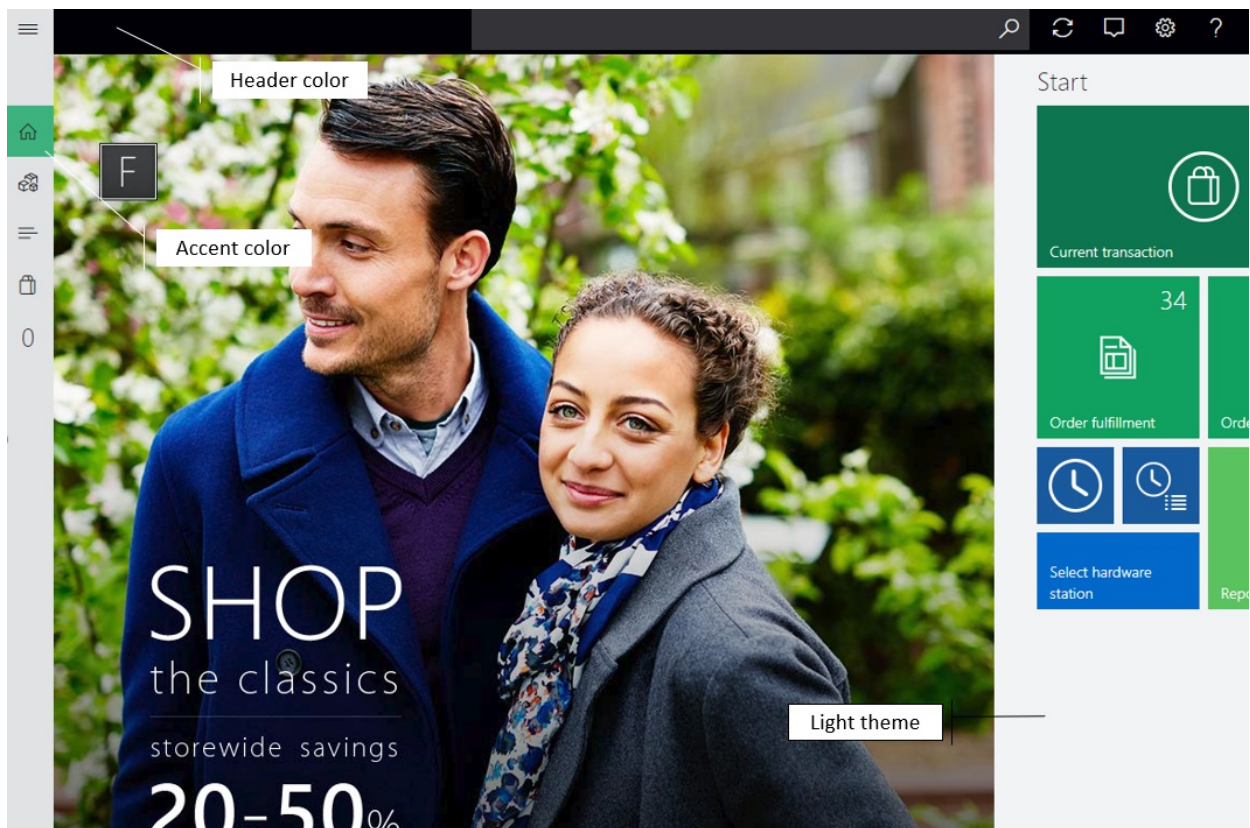

The user interface (UI) of the Microsoft Dynamics 365 Commerce point of sale (POS) can be configured by using a combination of visual profiles and screen layouts that are assigned to stores, registers, and users. This topic provides information about those configuration options.

The following illustration shows the relationships among the various entities that make up the configurable aspects of the POS UI.

## Visual profile

Visual profiles are assigned to registers, and they specify the visual elements that are register-specific and shared across users. Every user who signs in to the register sees the same theme, layout, colors, and images.

- **Profile number** – The profile number is the unique identifier of the visual profile.
- **Description** – You can specify a meaningful name that will help identify the correct profile for your situation.
- **Theme** – You can select between the **Light** and **Dark** application themes. The theme affects the font and background colors throughout the application.
- **Accent color** – The accent color is used throughout the POS to differentiate or highlight specific visual elements, such as tiles, command buttons, and hyperlinks. Typically, these elements are actionable.
- **Header color** – You can configure the color of the page header to meet the retailer's branding requirements.
- **Font scheme** – You can select between the **Standard** and **Large** font schemes. The font scheme affects the font size throughout the application. The default selection is **Standard**.
- **Always show application bar labels** – When this option is turned on, the label text is always visible under the application bar buttons.
- **Layout** – You can select between the **Centered** and **Right** layouts. The layout affects the alignment of the sign-in box on the sign-in screen. The default selection is **Centered**.
- **Show date/time** – When this option is turned on, the current date and time are shown in the POS header and on the sign-in screen.
- **Keyboard** – You can select between **Default to OS keyboard** and **Show number pad** to specify the default keyboard that is used for input on the sign-in screen. The number pad is a virtual keyboard that is used primarily for touch-based devices. The default selection is **Default to OS keyboard**.
- **Logo image** – You can specify a logo image that is shown on the sign-in screen. We recommend that you use an image that has a transparent background. The file size should be kept as small as possible, because application behavior and performance can be affected when large files are stored and loaded.
- **Login background** – You can specify a background image for the sign-in screen. The file size of background images should be kept as small as possible.
- **Background** – You can specify a background image that is used instead of the solid theme color throughout the application. As for background images for the sign-in screen, the file size should be kept as small as possible.

#### NOTE

The **Right** layout and date/time display don't apply to the sign-in screen in compact view.

You need to run the **1090 (Registers)** distribution schedule job to synchronize the latest visual profile

configurations to the channel database.

## Screen layouts

Screen layout configurations determine the actions, content, and placement of UI controls on the POS **Welcome** screen and **Transaction** screen.

The screenshot shows the Dynamics 365 Retail POS setup interface for screen layouts. The left sidebar lists various screen layout configurations, with 'F3MGR Fabrikam Manager' selected. The main area displays the configuration for 'F3MGR Fabrikam Manager', showing the default start screen as 'Welcome screen'. Below this, there are three sections: 'LAYOUT SIZES', 'Button grids', and 'Images'. The 'LAYOUT SIZES' section contains a table with the following data:

Name	Layout type	Width	Height
1024x768 - Full	Modern POS - Full	1024	768
1280x720 - Full	Modern POS - Full	1280	720
1366x768 - Full	Modern POS - Full	1366	768
1440x960 - Full	Modern POS - Full	1440	960
480x853 - Compact	Modern POS - Compact	480	853

The 'Button grids' section shows a table with the following data:

Layout zone	Button grid ID	Name
Welcome screen 1	F2W1M	Start
Welcome screen 2	F2W2	Products
Welcome screen 3	F2W3	Inventory
Welcome screen 4	F2W4M	Shift and drawer
Welcome screen 5	F2W5M	Operations
Transaction screen 1	F2T1M	Actions
Transaction screen 2	F2T2	Customer orders

The 'Images' section shows a table with the following data:

Layout zone	Image
Image 1	2506
Image 2	2507
Image 3	2508

Callouts in the image point to the 'Screen layout' (F3MGR), 'Layout sizes' table, 'Button grids' table, and 'Images' table.

- **Welcome screen** – In most cases, the welcome screen is the page that users see when they first sign in to the POS. The welcome screen can consist of a branding image and button grids that provide access to POS operations. Typically, operations that aren't specific to the current transaction are put on this screen.

The screenshot shows the POS Welcome screen. The background features a large image of a person climbing a rock at sunrise, with the text 'RISE & SHINE! Earlybird specials are back again 20-40% SAVINGS'. The top right corner shows the user's name '1 - SEATTLE-2'. The main content area is a 'Start' screen with several button grids. Callouts in the image point to the 'Welcome screen button grid' and the 'Welcome screen image'.

- **Transaction screen** – The **Transaction** screen is the main screen in the POS for processing sales transactions and orders. The content and layout are configured by using the screen layout designer.

- **Default start screen** – Some retailers prefer that cashiers go directly to the **Transaction** screen after sign-in. The **Default start screen** setting lets you specify the default screen that appears after sign-in for each screen layout.

### Assignment

Screen layouts can be assigned at the store, register, or user level. The user assignment overrides the register and store assignments, and the register assignment overrides the store assignment. In a simple scenario where all users use the same layout, regardless of register or role, the screen layout can be set only at the store level. In scenarios where specific registers or users require specialized layouts, those layouts can be assigned.

Depending on which level the screen layouts are assigned, you need to run the **1070 (Channel configuration)**, **1090 (Registers)**, and/or **1060 (Staff)** distribution schedule jobs to synchronize the latest screen layout configurations to the channel database.

### Layout sizes

Most aspects of the POS UI are responsive, and the layout is automatically resized and adjusted based on the screen size and orientation. However, the POS **Transaction** screen must be configured for every screen resolution that is expected.

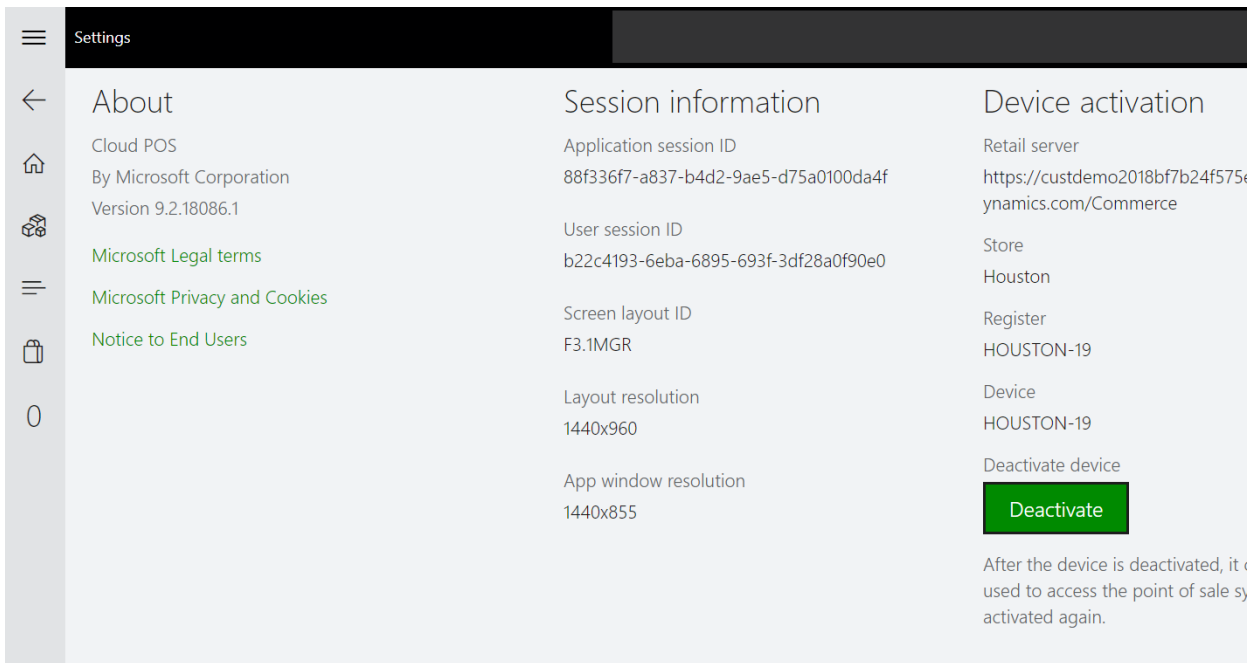

At startup, the POS application automatically selects the closest layout size that is configured for the device. A screen layout can also contain configurations for both landscape and portrait modes, and for both full-size and compact devices. Therefore, users can be assigned to a single screen layout that works across various sizes and form factors that are used in the store.

- **Name** – You can enter a meaningful name to identify the screen size.
- **Layout type** – The POS application can show its UI in various modes to provide the best user experience on a given device.
  - **Modern POS – Full** – Full layouts are typically best for larger displays, such as desktop monitors and tablets. You can select the UI elements to include, specify the size and placement of those elements, and configure their detailed properties. Full layouts support both portrait and landscape configurations.
  - **Modern POS – Compact** – Compact layouts are typically best for phones and small tablets. The design possibilities for compact devices are limited. You can configure the columns and fields for the receipt and totals panels.
- **Width/Height** – These values represent the effective screen size, in pixels, that is expected for the layout. Remember that some operating systems use scaling for high-resolution displays.

**TIP**

You can learn the layout size that is required for a POS screen by viewing the resolution in the app. Start the POS, and go to **Settings > Session information**. POS shows the screen layout that is currently loaded, the layout size, and the resolution of the app window.

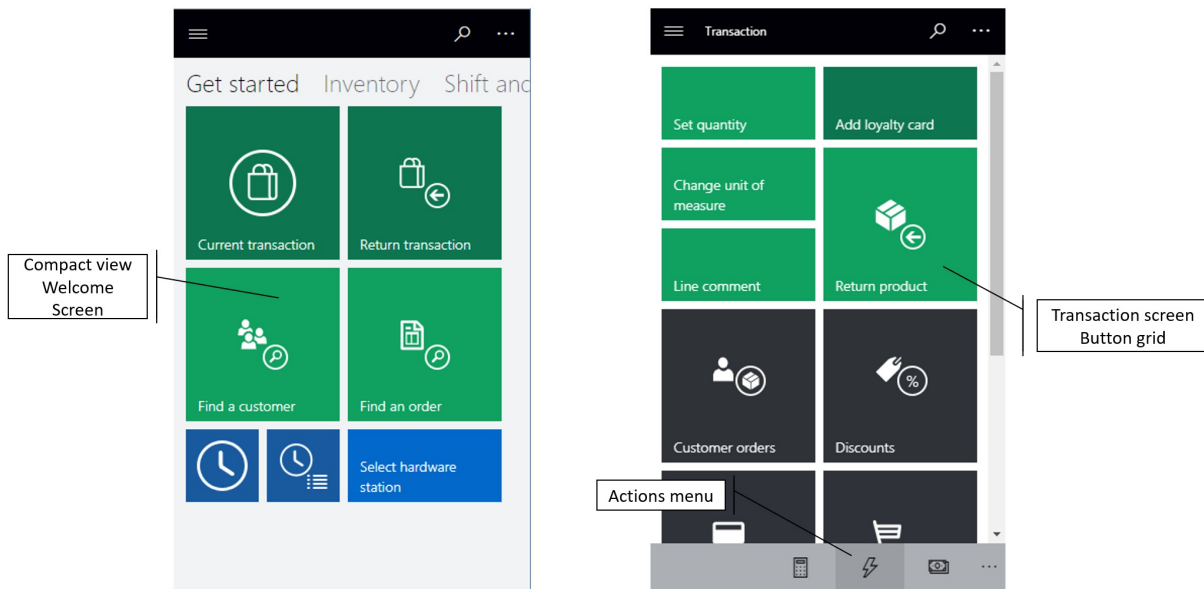

## Button grids

For each layout size in a screen layout, you can configure and assign button grids for the POS welcome screen and **Transaction** screen. Button grids for the welcome screen are automatically laid out from left to right, from the lowest number (Welcome screen 1) to the highest number.

In Full POS layouts, the placement of button grids is specified in the screen layout designer.

In Compact POS layouts, the button grids are automatically laid out from top to bottom, from the lowest number (Transaction screen 1) to the highest number. They can be accessed on the **Actions** menu.

### NOTE

The button sizes in the designer will scale to fit the size of the window, therefore they may not accurately reflect the actual buttons rendered in POS. To best simulate the button grid layout, adjust the designer windows to the same size as the POS.

## Images

For each layout size in a screen layout, you can specify images to include in the POS UI. For Full POS layouts, a

single image can be specified for the welcome screen. This image appears as the first UI element on the left. On the **Transaction** screen, images can be used as tab images or as a logo. Compact POS layouts don't use these images.

## Screen layout designer

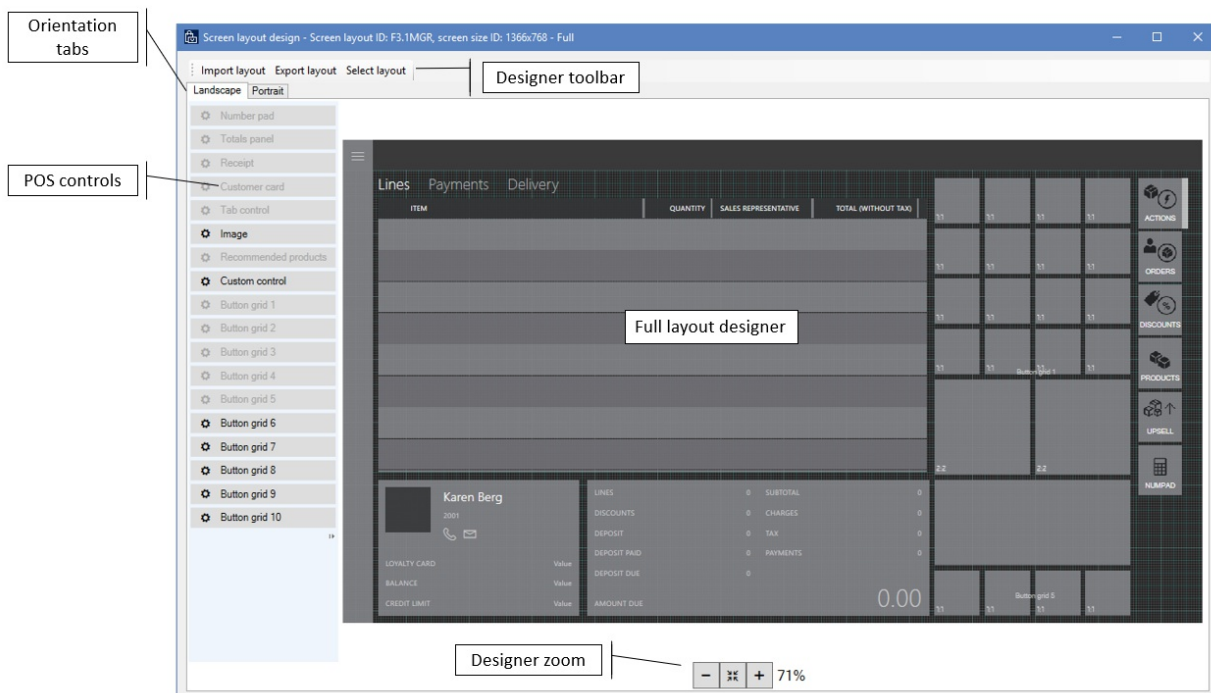

The screen layout designer lets you configure various aspects of the POS **Transaction** screen for each layout size, in both portrait and landscape modes, and for both Full and Compact layouts. The screen layout designer uses the ClickOnce deployment technology to download, install, and start the latest version of the application every time that users access it. Be sure to check the browser requirements for ClickOnce. Some browsers, such as Google Chrome, require extensions.

### IMPORTANT

You must configure a screen layout for each layout size that is defined and that is used by the POS.

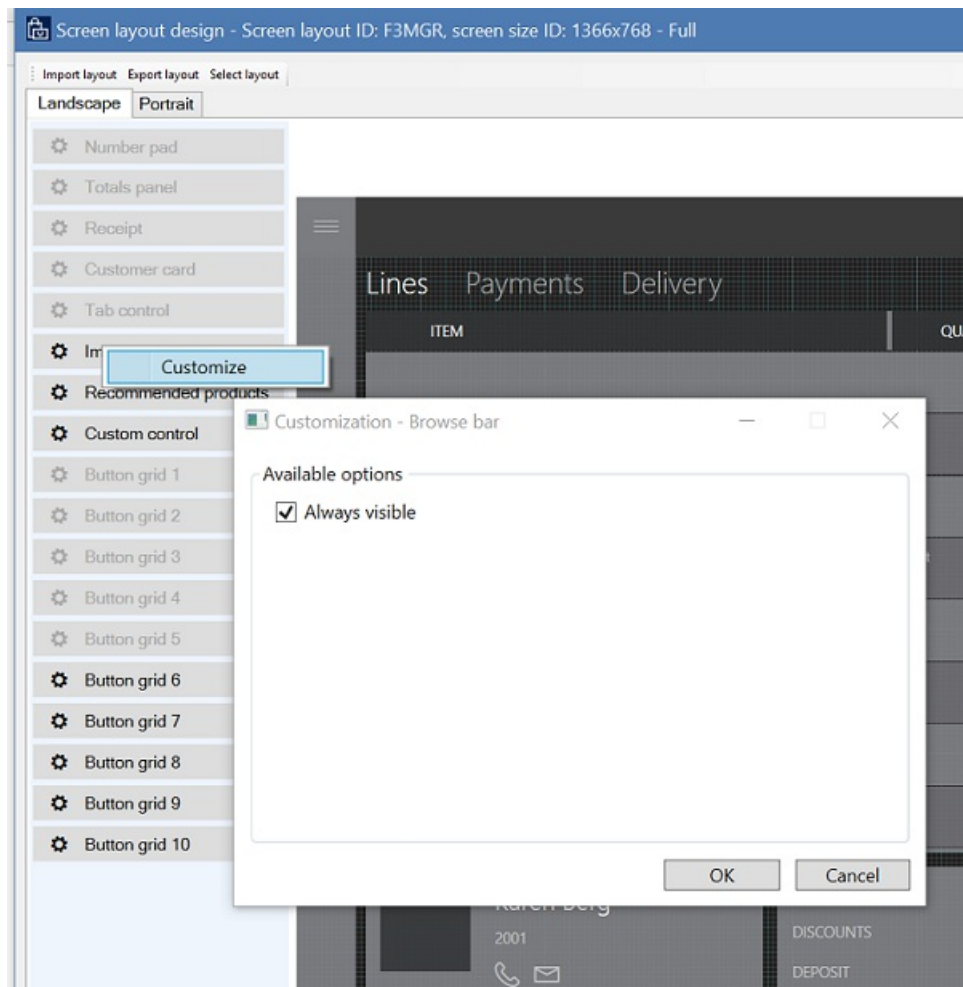

## Full layout designer

The Full layout designer lets users drag UI controls onto the POS **Transaction** screen and configure the settings of those controls.

- **Import layout/Export layout** – You can export and import POS screen layout designs as XML files, so that you can easily reuse and share them across environments. It's important that you import layout designs for the correct layout sizes. Otherwise, UI elements might not fit correctly on the screen.
- **Landscape/Portrait** – If the POS device lets users switch between landscape and portrait modes, you must define a screen layout for each mode. The POS automatically detects screen rotation and shows the correct layout.
- **Layout grid** – The POS layout designer uses a 4-pixel grid. UI controls "snap" to the grid to help you correctly align the content.
- **Designer zoom** – You can zoom the designer view in and out to better view the content on the POS screen. This feature is useful when the screen resolution on the POS differs greatly from the resolution of the screen that is used in the designer.
- **Show/hide navigation bar** – For Full POS layouts, you can select whether the left navigation bar is visible on the **Transaction** screen. This feature is helpful for displays that have a lower resolution. To set

the visibility, right-click the navigation bar in the designer, and select or clear the **Always visible** check box. If the navigation bar is hidden, POS users can still access it by using the menu in the upper left.

- **POS controls** – The POS layout designer supports the following controls. You can configure many controls by right-clicking and using the shortcut menu.

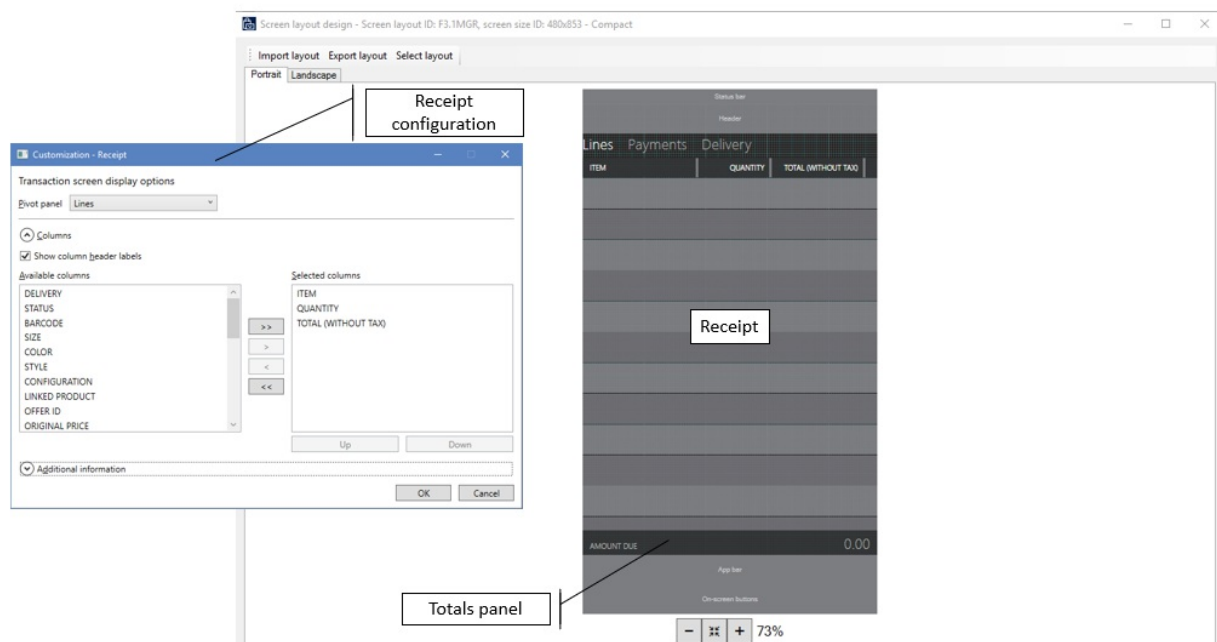

- **Number pad** – The number pad is the main mechanism for user input on the POS **Transaction** screen. You can configure the control so that the full number pad is shown. This option is ideal for touchscreen devices. Alternatively, you can configure it so that only the input field is shown. In this case, a physical keyboard is used for input. The number pad settings are available only for Full layouts.

For Compact layouts, the full number pad is always shown on the **Transaction** screen.

- **Totals panel** – You can configure the totals panel in either one column or two columns, to show values such as the line count, discount amount, charges, subtotal, and tax. Compact layouts support only a single column.
- **Receipt panel** – The receipt panel contains the sales lines, payment lines, and delivery information for the products and services that are processed in the POS. You can specify columns, widths, and placement. In Compact layouts, you can also configure additional information that appears in the row under the main line.
- **Customer card** – The customer card shows information about the customer who is associated with the current transaction. You can configure the customer card to hide or show additional information.
- **Tab control** – You can add the tab control to a screen layout, and then put other controls, such as the number pad, customer card, or button grids, in it. The tab control is a container that helps you fit more content on the screen. The tab control is available only for Full layouts.
- **Image** – You can use the image control to show the store's logo or another branding image on the **Transaction** screen. The image control is available only for Full layouts.
- **Recommended products** – If the recommended products control is configured for the environment, it shows product suggestions, based on machine learning.
- **Custom control** – The custom control acts as a placeholder in the screen layout and lets you reserve space for custom content. The custom control is available only for Full layouts.

## Compact layout designer

Like the Full layout designer, the Compact layout designer lets you configure the POS screen layout for phones and small tablets. However, in this case, the layout itself is fixed. You can configure the controls in the layout by right-clicking and using the shortcut menu. However, you can't use drag-and-drop operations for additional content.

## Button grid designer

The button grid designer lets you configure button grids that can be used on the POS welcome screen and **Transaction** screen for both Full and Compact layouts. The same button grid can be used across layouts and layout types. Like the screen layout designer, the button grid designer uses the ClickOnce deployment technology to download, install, and start the latest version of the application every time that users access it. Be sure to check the browser requirements for ClickOnce. Some browsers, such as Google Chrome, require extensions.

- **New button** – Click to add a new button to the button grid. By default, new buttons appear in the upper-left corner of the grid. However, you can arrange buttons by dragging them in the layout.

**IMPORTANT**

The contents of the button grid can overlap. When you arrange buttons, make sure that they don't hide other buttons.

- **New design** – Click to automatically set up a button grid layout by specifying the number of buttons per row and column.
- **Button properties** – You can configure button properties by right-clicking the button and using the shortcut menu.

**IMPORTANT**

Some button grid settings apply only to Enterprise POS, not to Modern POS or Cloud POS.

- **Action** – In the list of applicable POS operations, select the operation that is invoked when the button is clicked in the POS.  
For the list of supported POS operations, see [Online and offline point of sale \(POS\) operations](#).
- **Action parameters** – Some POS operations use additional parameters when they are invoked. For example, for the Add product operation, users can specify the product to add.
- **Button text** – Specify the text that appears on the button in the POS.
- **Hide button text** – Use this check box to hide or show the button text. Button text is often hidden for small buttons that show only an icon.
- **Tooltip** – Specify additional Help text that appears when users mouse over the button.
- **Size in columns/Size in rows** – You can specify how tall and wide the button is.

- **Custom font** – When you select the **Enable custom font for POS** check box, you can specify a font other than the default system font for the POS.

- **Custom theme** – By default, POS buttons use the accent color from the visual profile. When you select the **Use custom theme** check box, you can specify additional colors.

**NOTE**

Modern POS and Cloud POS use only the **Back color** and **Font color** values.

- **Button image** – Buttons can include images or icons. Select among the available images that are specified at **Retail and Commerce > Channel setup > POS setup > POS > Images**.

# Create an online functionality profile

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic presents an overview of setting up an online functionality profile for Microsoft Dynamics 365 Commerce.

## Overview

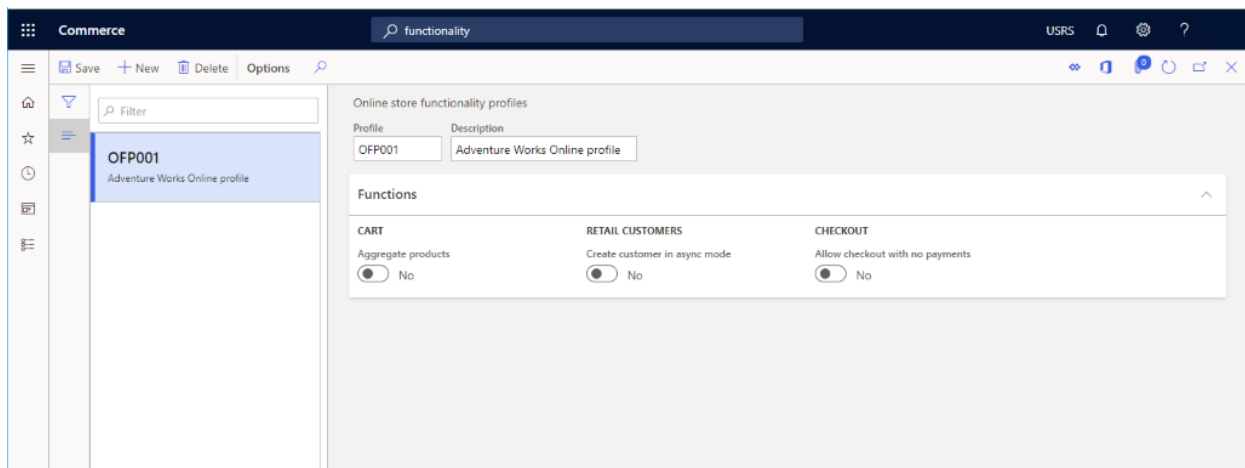

The online functionality profile provides various settings used for online channels. Each online channel must specify an online functionality profile.

## Create an online functionality profile

The following procedure explains how to create an online functionality profile from within Commerce Headquarters app.

1. In the navigation pane, go to **Modules > Channel setup > Online store setup > Functionality profiles**.
2. On the action pane, select **New**.
3. In the **Profile** field, enter an ID for the profile.
4. In the **Description** field, enter a value ("Adventure Works Profile" in the example image below).
5. In the **Functions** section, modify the **CART**, **RETAIL CUSTOMERS**, or **CHECKOUT** settings, as needed.
6. On the action pane, select **Save**.

The following image shows an example online functionality profile.

## Functions

- **Aggregate products:** When enabled, this function allows the cart to update quantity when the same item is added multiple times.
- **Allow checkout with no payments:** When enabled, this function handles the scenario when items added to cart have a price \$0.00.
- **Create customer in async mode:** This is a legacy setting applicable to third-party e-Commerce channels and is not applicable to the Dynamics 365 e-Commerce site.

# Set up a retail channel

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to create a new retail channel in Microsoft Dynamics 365 Commerce.

## Overview

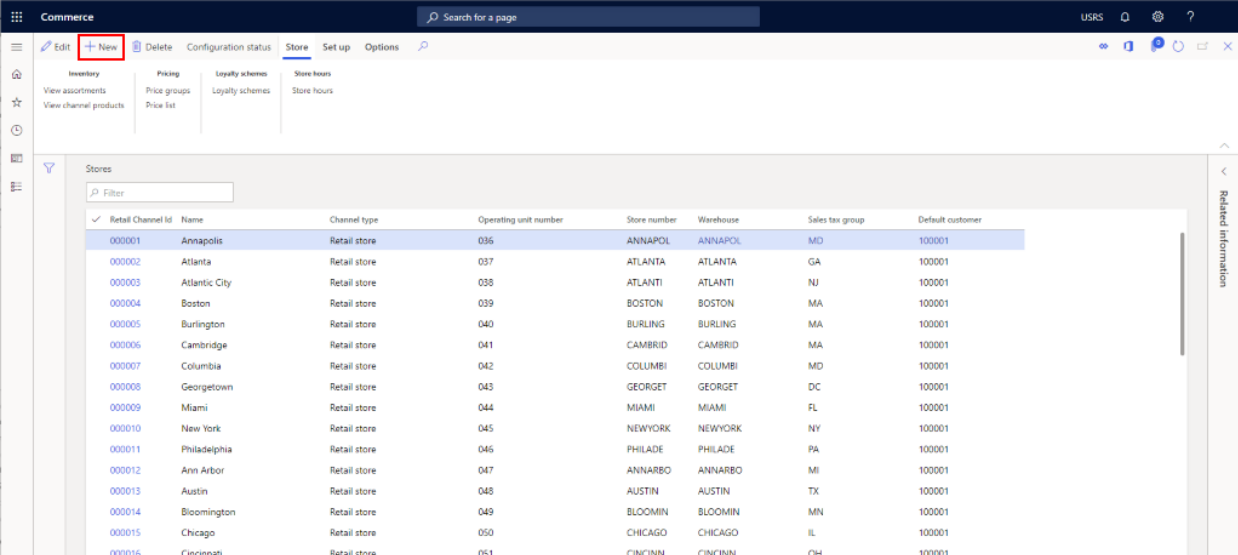

Dynamics 365 Commerce supports multiple retail channels. These retail channels include online stores, call centers, and retail stores (also known as brick-and-mortar stores). Each retail store channel can have its own payment methods, price groups, point of sale (POS) registers, income accounts and expense accounts, and staff. You must set up all of these elements before you can create a retail store channel.

Before a retail channel is created, ensure you follow the [channel prerequisites](#).

## Create and configure a new retail channel

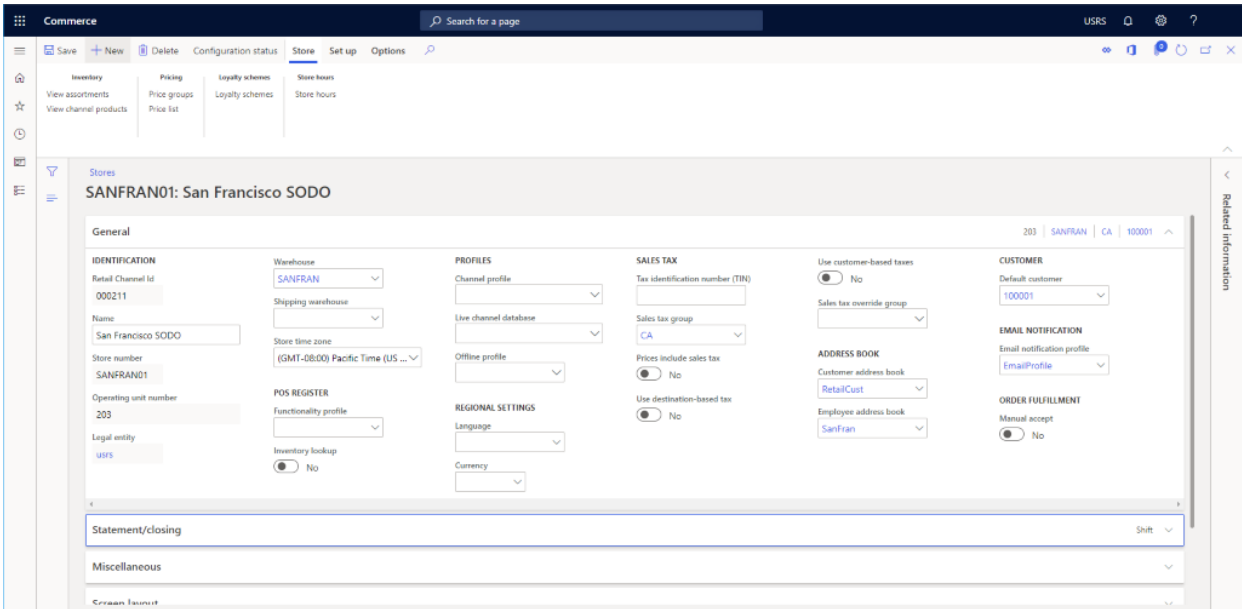

1. In the navigation pane, go to **Modules > Channels > Stores > All stores**.
2. On the action pane, select **New**.
3. In the **Name** field, provide a name for the new channel.
4. In the **Store number** field, provide a unique store number. The number can be alphanumeric with a maximum of 10 characters.
5. In the **Legal entity** drop-down list, enter the appropriate legal entity.
6. In the **Warehouse** drop-down list, enter the appropriate warehouse.
7. In the **Store time zone** field, select the appropriate time zone.
8. In the **Sales tax group** drop-down list, select an appropriate sales tax group for the store.
9. In the **Currency** field, select the appropriate currency.
10. In the **Customer address book** field, provide a valid address book.
11. In the **Default customer** field, provide a valid default customer.
12. In the **Functionality profile** field, select a functionality profile if applicable.
13. In the **Email notification profile** field, provide a valid email notification profile.
14. On the action pane, select **Save**.

The following image shows the creation of a new retail channel.

Retail Channel Id	Name	Channel type	Operating unit number	Store number	Warehouse	Sales tax group	Default customer
000001	Annapolis	Retail store	036	ANNAPOL	ANNAPOL	MD	100001
000002	Atlanta	Retail store	037	ATLANTA	ATLANTA	GA	100001
000003	Atlantic City	Retail store	038	ATLANTI	ATLANTI	NJ	100001
000004	Boston	Retail store	039	BOSTON	BOSTON	MA	100001
000005	Burlington	Retail store	040	BURLING	BURLING	MA	100001
000006	Cambridge	Retail store	041	CAMBRID	CAMBRID	MA	100001
000007	Columbia	Retail store	042	COLUMBI	COLUMBI	MD	100001
000008	Georgetown	Retail store	043	GEORGET	GEORGET	DC	100001
000009	Miami	Retail store	044	MIAMI	MIAMI	FL	100001
000010	New York	Retail store	045	NEWYORK	NEWYORK	NY	100001
000011	Philadelphia	Retail store	046	PHILADE	PHILADE	PA	100001
000012	Ann Arbor	Retail store	047	ANNARBO	ANNARBO	MI	100001
000013	Austin	Retail store	048	AUSTIN	AUSTIN	TX	100001
000014	Bloomington	Retail store	049	BLOOMIN	BLOOMIN	MN	100001
000015	Chicago	Retail store	050	CHICAGO	CHICAGO	IL	100001
000016	Cincinnati	Retail store	051	CINCINN	CINCINN	OH	100001

The following image shows an example retail channel.

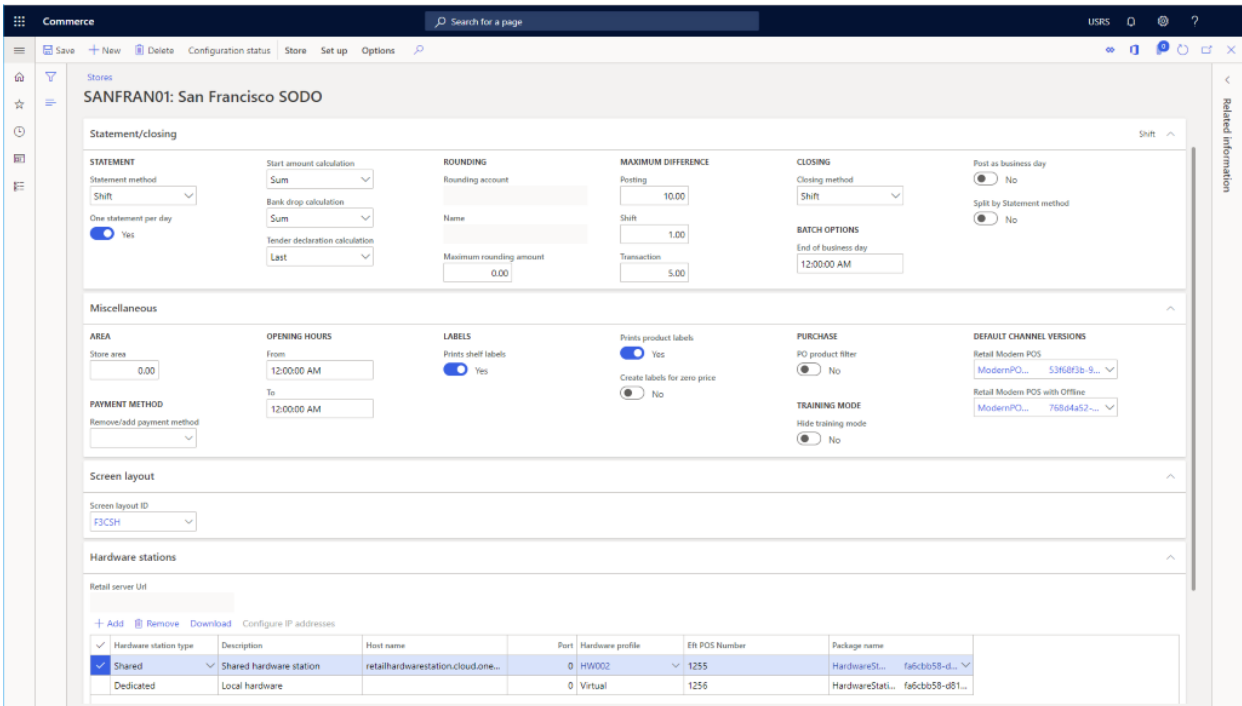

## Other settings

There are numerous other optional settings that can be set in the **Statement/closing** and **Miscellaneous** sections, based on the needs of the retail store.

In addition, see [Screen layouts for the point of sale \(POS\)](#) for information on setting up the default screen layout in the **Screen layout** section and [Configure and install Retail hardware station](#) for setup information about the **Hardware stations** section.

The following image shows an example retail channel setup configuration.

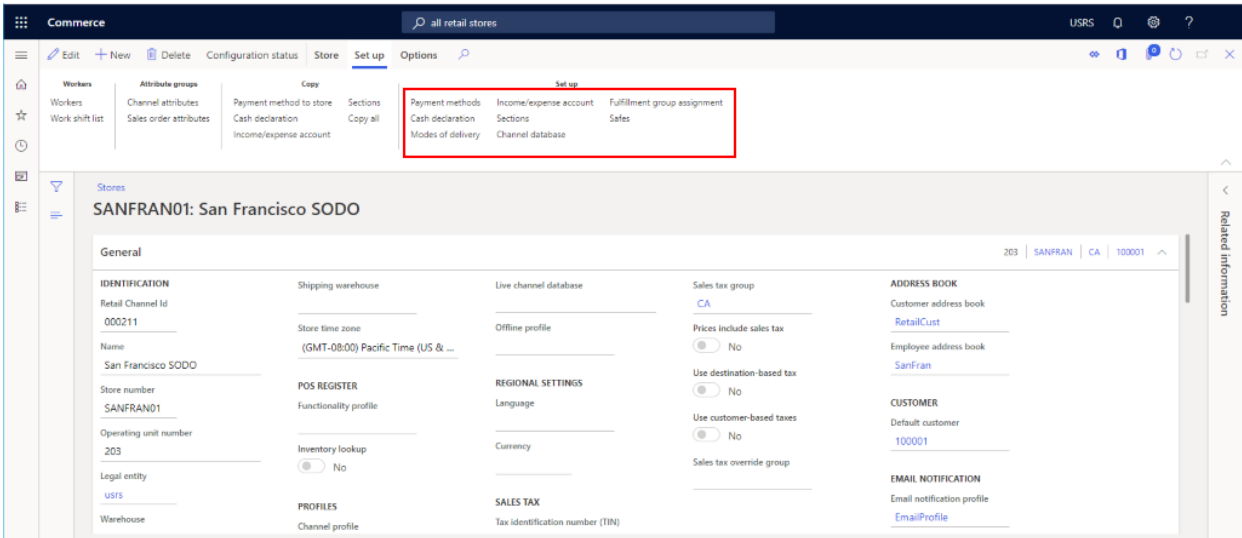

## Additional channel set up

There are additional items that need to be set up for a channel that can be found on the **Action** pane under the **Set up** section.

Additional tasks required for online channel setup include setting up payment methods, cash declaration, modes

of delivery, income/expense account, sections, the fulfillment group assignment, and safes.

The following image shows various additional retail channel setup options on the **Set up** tab.

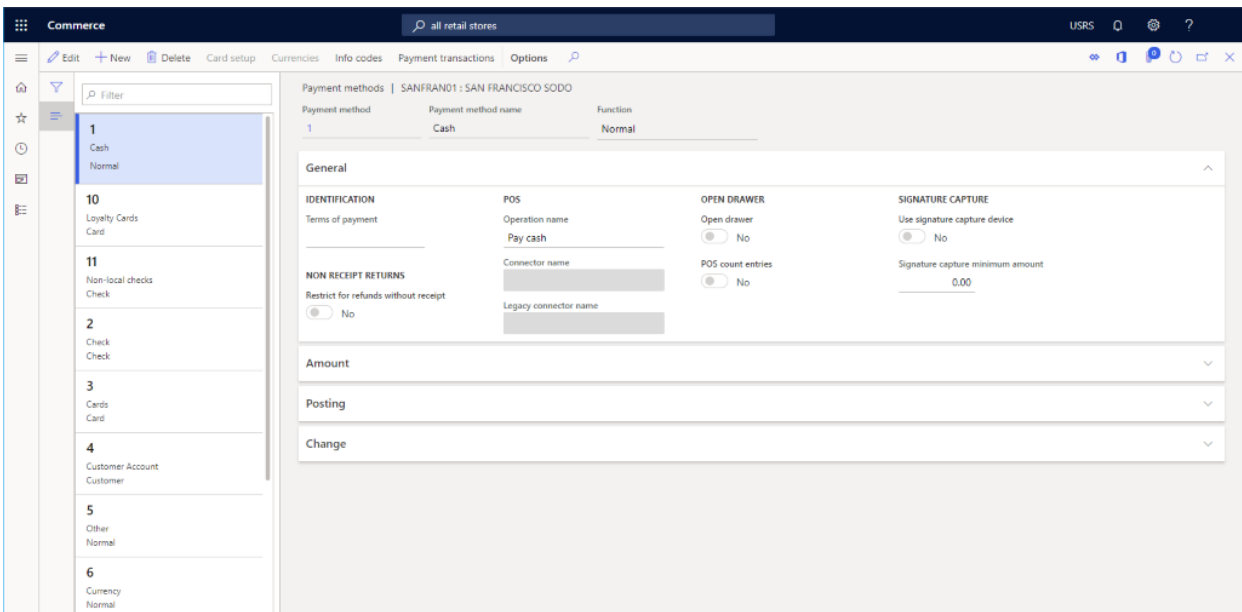

### Set up payment methods

To set up payment methods, for each payment type supported on this channel follow these steps.

1. On the action pane, select the **Set Up** tab, then select **Payment methods**.
2. On the action pane, select **New**.
3. In the navigation pane, select a desired payment method.
4. In the **General** section, provide an **Operation name** and configure any other desired settings.
5. Configure any additional settings as required for the payment type.
6. On the action pane, select **Save**.

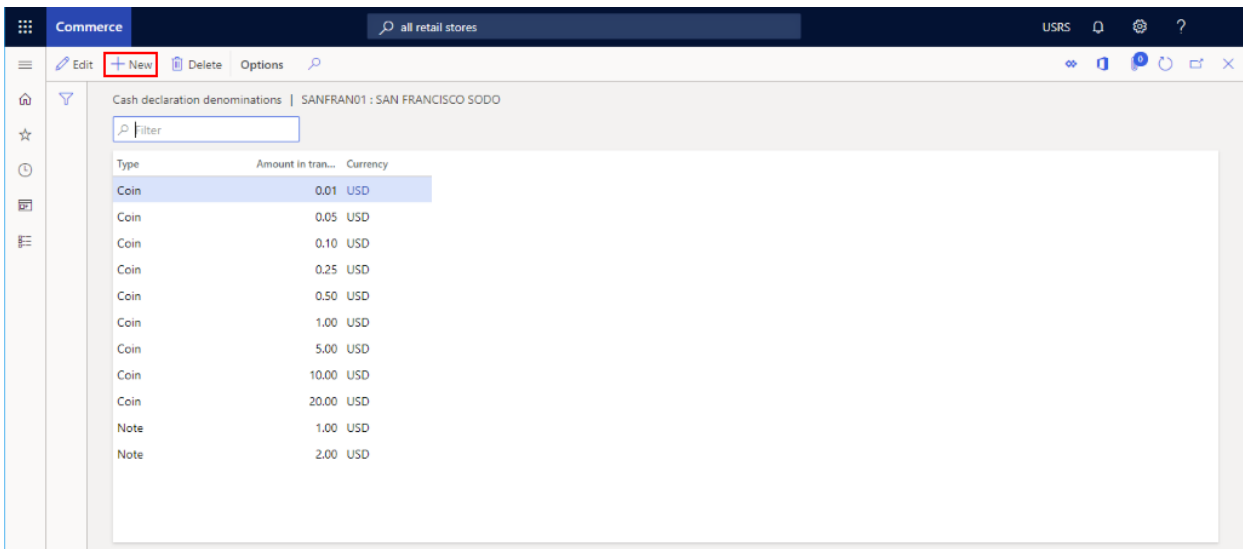

The following image shows an example of a cash payment method.

### Set up cash declaration

1. On the action pane, select the **Set Up** tab, and then select **Cash declaration**.
2. On the action pane, select **New**, and then create all **Coin** and **Note** denominations that are applicable.

The following image shows an example of a cash declaration.

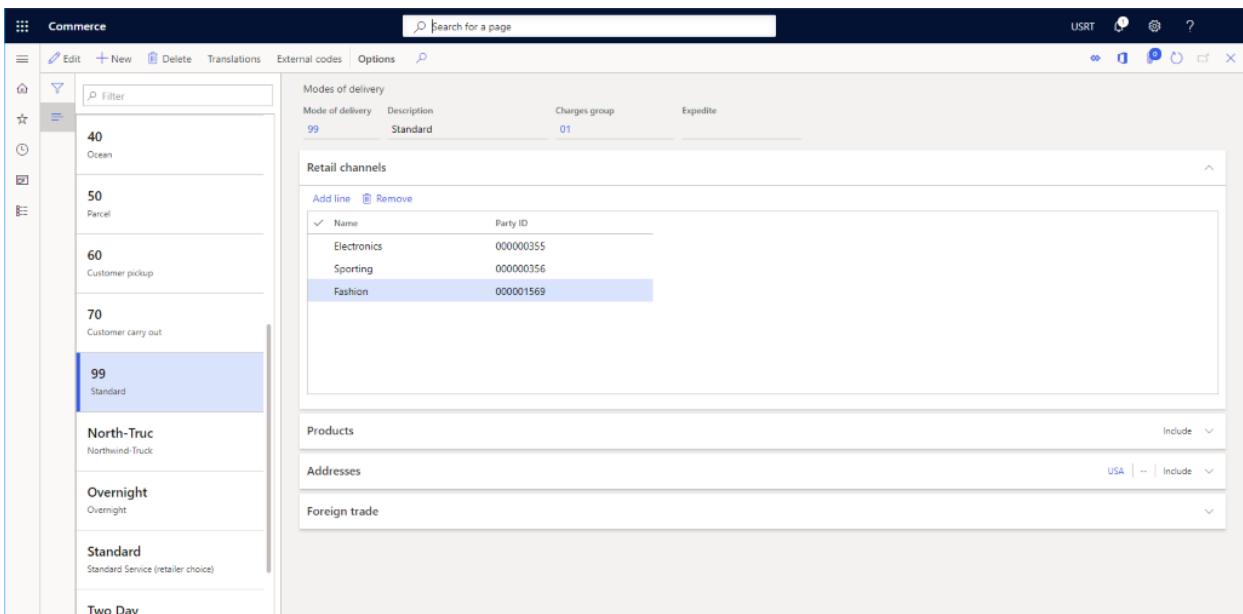

## Set up modes of delivery

You can see the configured modes of delivery by selecting **Modes of delivery** from the **Set up** tab on the **Action** pane.

To change or add a mode of delivery, follow these steps.

1. In the navigation pane, go to **Modules > Inventory management > Modes of delivery**.
2. On the action pane, select **New** to create a new mode of delivery, or select an existing mode.
3. In the **Retail channels** section, select **Add line** to add the channel. Adding channels using organization nodes instead of adding each channel individually can streamline adding channels.

The following image shows an example of a mode of delivery.

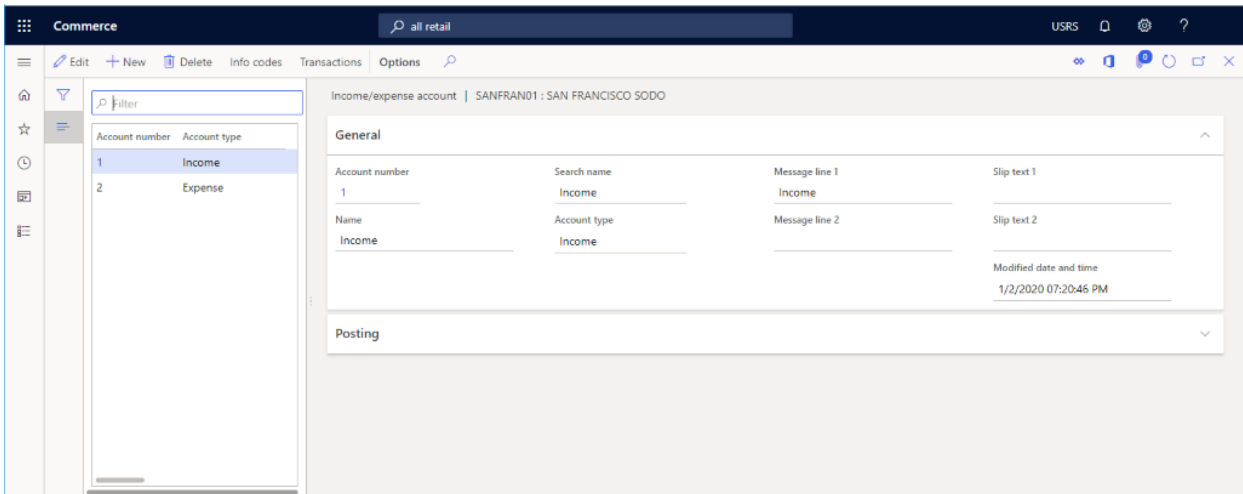

## Set up income/expense account

To set up income/expense account, follow these steps.

1. On the action pane, select the **Set Up** tab, and then select **Income/Expense account**.
2. On the action pane, select **New**.
3. Under **Name**, enter a name.
4. Under **Search name**, enter a search name.
5. Under **Account type**, enter the account type.
6. Enter text for **Message line 1**, **Message line 2**, **Slip text 1**, and **Slip text 2** as needed.

- Under **Posting**, enter posting information.
- On the action pane, select **Save**.

The following image shows an example of an income/expense account.

### Set up sections

To set up sections, follow these steps.

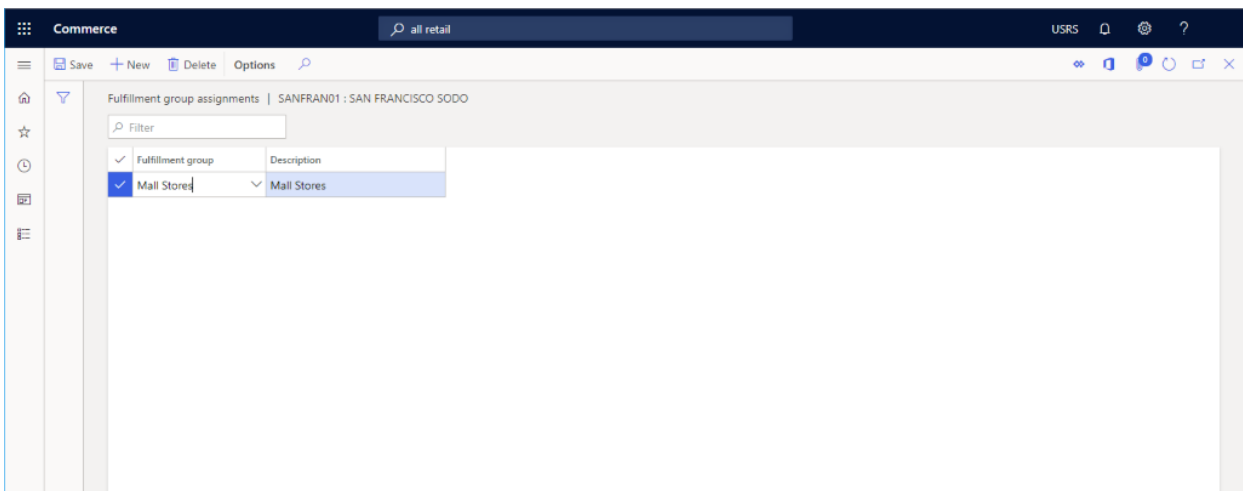

- On the action pane, select the **Set Up** tab and click **Sections**.
- On the action pane, select **New**.
- Under **Section number**, enter a section number.
- Under **Description**, enter a description.
- Under **Section size**, enter a section size.
- Configure additional settings for **General** and **Sales statistics** as needed.
- On the action pane, select **Save**.

### Set up a fulfillment group assignment

To set up a fulfillment group assignment, follow these steps.

- On the action pane, select the **Set up** tab, then select **Fulfillment group assignment**.
- On the action pane, select **New**.
- In the **Fulfillment group** drop-down list, select a fulfillment group.
- In the **Description** drop-down list, enter a description.
- On the action pane, select **Save**.

The following image shows an example of a fulfillment group assignment setup.

## Set up safes

To set up safes, follow these steps.

1. On the action pane, select the **Set Up** tab and click **Safes**.
2. On the action pane, select **New**.
3. Enter a name for the safe.
4. On the action pane, select **Save**.

# Configure a worker

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to configure a worker as a sales representative who is eligible for commission on sales in POS. This procedure uses the USRT demo data company.

## Create a commission sales group for the worker

1. Go to Sales and marketing > Commissions > Sales groups.
  - Workers can be assigned to one or more sales groups. In POS, you can choose any sales group that contains workers from the store's address book.
2. Click New.
3. In the Group field, type a value.
4. In the Name field, type a value.
5. Click Save.
6. On the Action Pane, click General.
7. Click Sales rep.
  - A sales group can contain more than one worker. Commissions can be split between workers based on how you define the commission share.
8. In the Name field, enter or select a value.
9. In the Commission share field, enter a number.
10. Click Save.
11. Close the page.
12. Close the page.

## Assign the workers default sales group

1. Go to Retail and Commerce > Employees > Workers.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click the Commerce tab.
  - A worker can be assigned to a default sales group. The default sales group will be automatically added to sales lines in POS if the option is enabled in the functionality profile for the store.
5. Click Edit.
6. In the Default group field, enter or select a value.
7. Click Save.

### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Choose between Modern POS (MPOS) and Cloud POS

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic gives implementers additional background, tips, and guidance for factors that they should consider when they deploy Dynamics 365 Commerce. By reviewing and following this guidance as part of the deployment process, implementers can avoid issues that might affect user satisfaction or performance.

## Insights

Commerce provides a wide range of deployment and topology options. Therefore, retailers can choose the components and configuration that best meet their business and technology requirements. One aspect of implementation that requires careful consideration is the choice of a platform and form factor for the point of sale (POS) component.

### POS platform and form factor considerations

Commerce supports the following POS options:

- Modern POS (MPOS) for Microsoft Windows
- MPOS for Microsoft Windows Phone
- MPOS for Apple iPad or Google Android tablet
- Cloud POS (CPOS), which supports the Microsoft Edge, Internet Explorer, and Google Chrome browsers

In all cases, the POS (MPOS and CPOS) shares the same core application code. This point is important for the following reasons:

- The user interface (UI) is consistent, regardless of the platform or form factor.
- Most of the functional capabilities are the same, regardless of the platform or form factor. However, there are some important differences. These differences are noted in this topic.
- In a given store, the POS variations can be combined and can run concurrently. For example, for its main registers, a retailer can use MPOS on computers that run Windows. However, the retailer can supplement those registers with browser-based terminals or mobile devices.
- Customizations and extensions can easily be used across platforms and form factors. Because the core application code is shared, most customizations can be implemented one time instead of multiple times.

### MPOS vs. CPOS

Although MPOS and CPOS are largely the same, there are some important differences that you must understand.

#### MPOS

MPOS on a Windows, iOS, or Android device is an application that is packaged, installed, and serviced on that device.

- **Windows** – The MPOS for Windows application contains all the application code and the embedded commerce runtime (CRT).
- **iOS/Android** – On these platforms, the application acts as a host for the CPOS application code. In other words, the application code comes from the CPOS server on Microsoft Azure or the Commerce Scale Unit. For more information, see [Commerce Scale Unit overview](#).

#### CPOS

Because CPOS runs in a browser, the application isn't installed on the device. Instead, the browser accesses the application code from the CPOS server. Therefore, CPOS can't directly access POS hardware or work in an offline state.

### Store deployment considerations

In addition to a platform and form factor, retailers must also choose a deployment option at the store. The following table shows the configurations that are available for each POS option.

POS APPLICATION	COMMERCE SCALE UNIT	AVAILABLE OFFLINE
MPOS for Windows	Cloud or RSSU	Yes
MPOS for iOS or Android	Cloud or RSSU	No
Cloud POS	Cloud or RSSU	No

#### Commerce Scale Unit

The Commerce Scale Unit is a component that hosts the CRT. The CRT contains all the business logic that the POS uses, and it provides access to the channel database. While they are online, all POS clients in the store use the Commerce Scale Unit. The Commerce Scale Unit can be deployed either in the cloud or in the store.

#### Offline mode

MPOS for Windows supports offline mode. In offline mode, the POS can continue to process sales even if it's disconnected from the Commerce Scale Unit. It can then be synchronized with the channel database when connectivity is restored. MPOS uses its own embedded instance of the CRT and temporarily uses its own local data source (offline SQL Server database). For more information about offline functionality, see [POS offline functionality](#).

#### POS peripheral/hardware considerations

Retailers must also consider how the POS will access devices and peripherals such as printers, cash drawers, and payment terminals. Only MPOS for Windows supports direct communication with these devices. MPOS for Windows Phone, iOS, or Android, and Cloud POS require a hardware station in order to access these devices. Hardware stations can be dedicated to a POS register or shared among the registers in a store. For more information about hardware stations, see [Configure and install Retail hardware station](#).

## Implementation considerations

Consider the following information as you plan your POS implementation in your stores:

- **Functional requirements** – The core business processes and capabilities are the same, regardless of the platform, form factor, or deployment topology. Therefore, most retailers don't have to consider functional requirements when they plan their implementation.
- **Connectivity** – Network availability (wide area network [WAN] and local area network [LAN]) is a major factor that requires careful consideration. Any benefits that a zero-footprint, cloud-hosted solution brings in terms of cost and simplicity are lost if the system isn't available for business-critical processes.

Unless the connectivity for a given device is very dependable and resilient, or unless a certain amount of downtime is acceptable to the retailer, we recommend one of the following options:

- Use MPOS in Windows, and enable offline mode.
- Deploy an on-premises Commerce Scale Unit.

These two options aren't mutually exclusive. For the most reliable topology, retailers can deploy a local RSSU to reduce the dependency on internet connectivity or Azure availability, and they can also deploy POS registers where offline mode is enabled if there is an issue with the local server or network.

- **Hardware devices/peripherals** – One important aspect of a Retail POS system is its ability to use POS peripherals such as printers, cash drawers, and payment terminals. Although all the available POS options can use peripheral devices, only MPOS for Windows supports them directly. For all other applications, one or more hardware stations are required. Although this approach adds flexibility, additional components must be deployed, configured, and serviced.
- **System requirements** – The system requirements for the POS application vary. Be sure to check the latest information before you make your choice. For example, because CPOS runs in a browser, it supports a wider range of operating systems. For more information about system requirements, see [System requirements for cloud deployments](#).
- **Deployment and servicing** – The complexity of the deployment and servicing requirements can vary, depending on the application and deployment choices. For example, for a cloud-hosted CPOS deployment, you don't have to install and update on every device. Therefore, this approach greatly reduces complexity and cost. However, if you deploy MPOS on every register and enable offline mode, and you also deploy shared hardware stations, you greatly increase the number of endpoints that must be managed.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Online and offline point of sale (POS) operations

2/18/2021 • 18 minutes to read • [Edit Online](#)

Most actions that user take in the point of sale (POS) are considered operations. Operations are configured and managed in the Dynamics 365 Commerce back office. Many operations can be added to buttons in the POS button grid. Users can then select the buttons to invoke the operations and perform their function. Other operations are part of the main POS application, and are invoked either from on-screen buttons or as part of other workflows or processes.

The following table provides details about the operations that are available in Modern POS and Cloud POS. The table also specifies where in the application the operations can be invoked, and whether they are available when the POS is in offline mode.

Some operations aren't currently available in Modern POS or Cloud POS. Some of these operations are either locale-specific operations that require additional extensions and configuration. Others are features from Microsoft Dynamics AX 2012 that aren't currently supported.

The following columns specify where the operations can be invoked:

- **Button grid** – The operation can be assigned to buttons in POS button grids, which are part of a POS screen layout.
- **Transaction screen** – The operation can be invoked from POS button grids that are configured on the POS transaction screen.
- **Welcome screen** – The operation can be invoked from POS button grids that are configured on the POS welcome screen.

## NOTE

The operations listed below apply to the latest version of Commerce. Some operations may have changed or may not be available in previous versions.

ID	OPERATION	DESCRIPTION	BUTTON GRID	TRANSACTION SCREEN	WELCOME SCREEN	AVAILABLE OFFLINE	LOCALE-SPECIFIC
707	Activate device	Activate the current device by allowing an authenticated user to provide connection information and assign a device and register ID.	No	No	No	No	No

ID	OPERATION	DESCRIPTION	BUTTON GRID	TRANSACTION SCREEN	WELCOME SCREEN	AVAILABLE OFFLINE	LOCALE-SPECIFIC
134	Add affiliation	Add a preselected affiliation to a transaction. Select the affiliation on the <b>Button properties</b> page.	Yes	Yes	No	Yes	No
135	Add affiliation from list	Add an affiliation to a transaction by selecting it in a list.	Yes	Yes	Yes	Yes	No
137	Add affiliation to customer	Add an affiliation to a customer on the <b>Customer details</b> page.	No	No	No	Yes	No
138	Remove affiliation from customer	Remove an affiliation on the <b>Customer details</b> page.	No	No	No	Yes	No
643	Add coupon code	Add a coupon by entering its code in the POS.	Yes	Yes	No	Yes	No
141	Add header charges	Add a misc charge to the order header.	Yes	Yes	No	No	No
141	Add line charges	Add a misc charge to a selected sales line.	Yes	Yes	No	No	No

ID	OPERATION	DESCRIPTION	BUTTON GRID	TRANSACTION SCREEN	WELCOME SCREEN	AVAILABLE OFFLINE	LOCALE-SPECIFIC
117	Add loyalty card	Prompt the user to enter a loyalty card number that will be added to the current transaction.	Yes	Yes	No	Yes	No

312	Reapply system discounts	Reapply system discounts on the transaction if they were removed using the <b>Remove system discounts from transaction</b> operation.	Yes	Yes	Yes	Yes	No

\* The operation is available in offline mode only when a customer order or sales quotation is being created, and only if offline creation of customer orders and sales quotations is configured in the POS functionality profile. The operation can't be performed when orders are created by using Real-time Service, or when orders are recalled or edited.

† The operation can be performed in offline mode only when the POS is configured to allow for offline creation of customers in the POS functionality profile.

‡ When the POS is offline, suspended transactions can be recalled only from the current register's offline database. Users can't suspend and recall transactions across registers.

§ When the POS is offline, only transactions in the current offline database can be recalled for return.

\*\* When the POS is offline, only transactions in the current offline channel database are shown in the journal.

# Device activation of a customized Modern POS

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic explains how to configure Microsoft Dynamics 365 Commerce Headquarters so that device activation works correctly when a customized Modern POS application is used. It describes the steps that are required in order to obtain the customized reply address and enter that value in Headquarters.

Modern POS is a client-side component for Microsoft Dynamics 365 Commerce. To use the POS, you must perform device activation. Device activation uses Microsoft Azure Active Directory (Azure AD) to authenticate users. Enhanced functionality in this area has modified the device activation flow to take better advantage of the Web Account Manager service. As part of this enhancement, there is now enhanced security for the authentication approval process. This enhanced security requires additional configuration in Headquarters when the POS is customized, because a specific, unique value is now required for the callback URI. (The callback URI is also known as the redirect URI.)

By default, Modern POS is already registered for this callback URI. However, when customized, the callback URI is changed. Therefore, it must be correctly configured so that it works again. This topic describes the steps that you must follow to complete this configuration. If this configuration isn't completed, you receive an error message when you try to perform device activation in the customized POS application. This error message resembles the following example:

```
AADSTS50011: The reply address 'ms-appx-web://Microsoft.AAD.BrokerPlugin/[...]' does not match the reply addresses configured for the application.
```

The reply address is dependent on the Modern POS package SID that is shown at the end of the above error message. This is a function of the Package Family Name (PFN), so it is dependent on a name and public key. This means that when you customize Modern POS and sign it with your company certificate, the SID will change. The change is based on the certificate and not the package version, so as long as the entire package is not different and the certificate remains the same (which can be renewed to keep the same signature), then the SID will remain the same.

## NOTE

We recommend that you try to use the customized Modern POS application one time before you configure Dynamics 365 headquarters. In this way, you can see what the error message looks like and more easily obtain the customized reply address.

## Setup

The following steps are required so that device activation works correctly when the customized Modern POS application is used. You will create two Azure AD applications: one for Modern POS and one for Commerce Scale Unit. The Commerce Scale Unit Azure AD application is required because the POS uses resources through Commerce Scale Unit. Therefore, both Azure AD applications are used when the POS is used. In this scenario, Commerce Scale Unit serves as the endpoint for protected resources that the POS requests.

### Create the Commerce Scale Unit Azure AD application

1. In a web browser, go to <https://portal.azure.com/>.
2. Sign in by using Azure AD credentials that have enough permission to create Azure AD applications.

3. Select **Azure Active Directory** from the list of Azure services, then select **App registrations** from the leftmost menu that appears.
4. Create the Commerce Scale Unit Azure AD application by selecting **New registration** and entering the following values:
  - **Name:** Enter **Customized Commerce Scale Unit**. You can enter any other unique value, but be sure to make a note of the name entered.
  - **Supported account types:** Select the value **Accounts in this organization directory only** unless this application registration will be used across multiple tenants, which would require the next value **Accounts in any organizational directory**. Note that this selection is not typical.
  - **Redirect URI:** This value can be left blank but you need to verify that the initial drop-down selection is set to **Web**.
5. Select **Register** at the bottom of the page. The page will change to the newly created Azure AD application.
6. Select **Application ID URI** where it has a link stating **Add an Application ID URI**. This page can also be reached from the left menu by selecting **Expose an API**.
7. On the tile that opens, select the **Application ID URI** value that states **Set**. Copy the value shown before selecting the **Save** button. You will paste this value into the DLLHost.exe.config file for POS in the next section.
8. Select **Save** to set this URI.
9. Select the **Add a scope** button.
10. In the slider that appears, enter the following values:
  - **Scope name:** Enter **AccessRetailServer**. You can enter any other unique value, but be sure to make a note of the name entered.
  - **Who can consent:** Select the **Admins and users** option.
  - **Admin consent display name:** Enter **AccessRetailServer**. For simplicity, make this value match the **Scope name** above.
  - **Admin consent description:** Enter **AccessRetailServer**. You can enter any value here. This is used noting the reason for the scope.
  - The fields **User consent display name** and **User consent description** will not be used.
  - **State:** Verify that **Enabled** is selected.
11. Select the **Add scope** button.
12. Select the **Overview** tab on the leftmost menu. Verify that the **Application ID URI** value matches what was copied back in step seven.

#### **NOTE**

Do not close the web browser window because you will use it again later in this topic.

### **Update the Modern POS configuration**

1. In File Explorer, go to **C:\Program Files (x86)\Microsoft Dynamics 365\70\Retail Modern POS\ClientBroker**. (This path assumes that the Microsoft Windows operating system on the computer is based on the x64 architecture.)
2. In File Explorer, select **File > Open Windows PowerShell > Open Windows PowerShell as administrator**.
3. In the Microsoft Windows PowerShell window that appears, enter **notepad DLLHost.exe.config**, and then

press the Enter key. (The Windows PowerShell window will already be pointed to the current file directory.)

4. In the Notepad window that appears, find the value that corresponds to the **AADRetailServerResourceId** key. (By default, this value is `https://commerce.dynamics.com`.) Then paste the App ID URI value that you copied in step 7 in the previous section.
5. Select **File > Save**.

#### NOTE

Don't close the Notepad window, because you will use it again in the next section. Another way to perform the above steps would be to use a script or a post-step installation customization.

### Create the customized Modern POS Azure AD application

1. Return to the web browser window where <https://portal.azure.com/> is open, and create the Retail Modern POS Azure AD application by repeating steps 3-5 in the "Create the Commerce Scale Unit Azure AD application" section. However, enter the following values this time:

- **Name:** Enter **Customized Retail Modern POS**. (You can enter any other unique value, but be sure to make a note of the name entered.)
- **Supported account types:** Select the value **Accounts in this organization directory only** unless this application registration will be used across multiple tenants, which would require the next value **Accounts in any organizational directory**. Note that this selection is not typical.
- **Redirect URI:** The initial drop-down value should be changed to **Public client/native (mobile & desktop)**. The value to enter for this type of Redirect URI is the value shown at the beginning of this topic in the Modern POS error message received. Enter the reply address (redirect URI) that corresponds to that error message. The value will start with **ms-appx-web://Microsoft.AAD.BrokerPlugin/[...]**.

#### NOTE

- You can also see the reply address (redirect URI) in Event Viewer in Windows, under **Microsoft-Dynamics-Commerce-ModernPos/Operational**. The event ID is 40619. The error message will start with the following text: "This UWP application was assigned the following callback URI to be used while interacting with Azure AD: ms-appx-web://Microsoft.AAD.BrokerPlugin/S-1-15-2-[...]"
- After the Azure AD application is created, you can specify additional redirect URIs as you require. If multiple packages that have different callback URIs have been generated for any reason, keep this single Azure AD application, and maintain all redirect URIs in it.

2. It is important to validate this value in the **Redirect URI** field. Then select **Create**, and wait until the operation is successfully completed. (If an error occurs, address it, and then try again.)

A tile appears that shows the details of the new customized Retail Modern POS Azure AD application.

3. Select **Register** at the bottom of the page. The page will change to the newly created Azure AD application.
4. Find the **Application (client) ID** field, and copy the value. Switch to the notepad you opened in the previous section (or follow the above section **Update the Modern POS configuration** to open the **DLLHost.exe.config** file) to navigate to the value corresponding to **AADClientId**. Paste in the value for this field that was copied at the beginning of this step and then save the file (as shown in step 5 of the same section).
5. Returning to the web browser, in the leftmost menu, select the **API permissions** option.

6. On the **API permissions** tile, select **+ Add a permission**.
7. On the slider that appears, first select the **My APIs** heading. Then select the API titled **Customized Commerce Scale Unit** or whatever value was entered as the name in step 4 at the beginning of this document.
8. Under the **Select permissions** sub-heading, select **AccessRetailServer** or whatever value was entered as the scope name in step 10 at the beginning of this document.
9. Select **Add permissions** at the bottom of the slider.
10. Select **Grant admin consent for <your AAD name>**. Select **Yes**. This grants consent and can be verified with the **Granted** displaying in the **Status** column in the **AccessRetailServer** row.

> [!NOTE]  
 > Granting consent is not required, but simplifies the process by consenting in advance for all users in your tenant (and you as the Admin). If this step is not completed, then each user will be asked for consent the first time that they try to activate Modern POS.

### Configure Dynamics 365 Headquarters

The previous steps were required so that the Modern POS application can be authenticated. You must now follow these steps to add the new Azure AD applications to the list of safe programs in Headquarters, so that the requests are authorized. (A list of safe programs is sometimes also referred to as a safe list.)

1. In a web browser, go to the Headquarters URL, and sign in by using Azure AD credentials.
2. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**.
3. On the **Identity Providers** tab, in the **Identity providers** section, select the provider that begins with `HTTPS://sts.windows.net/`. The values in the **Relying parties** section are updated, based on the provider that you selected.
4. In the **Relying parties** section, select **+ Add**, and enter the following values:
  - **ClientId**: Enter the value that you copied in step 3 in the previous section and then pasted into the `DLLHost.exe.config` file in step 13.
  - **Type**: Select **Public**.
  - **UserType**: Select **Worker**.
  - **Name**: Enter a description to help users understand what this entry references.
5. On the Action Pane, select **Save**. The relying party that you just created should remain selected.
6. In the **Server resource IDs** section, select **+ Add**, and enter the following values:
  - **Server Resource Id**: Enter the URL that you copied in step 4 in the "Update the Modern POS configuration" section. (You originally created this value in step 4 in the "Create the Commerce Scale Unit Azure AD application" section.)
  - **Name**: Enter a description to help users understand what this entry references.
7. On the Action Pane, select **Save**.
8. Go to **Retail and Commerce > Retail and CommerceIT > Distribution schedule**.
9. Select job **1110 (Global configuration)**, and then, on the Action Pane, select **Run now**. This job synchronizes the new data. However, there is a cache in Commerce Scale Unit that won't be updated for several minutes. Therefore, if you require an immediate update, the Commerce Scale Unit application pool must be recycled.

**NOTE**

For best results, verify that Modern POS is closed, and that no instances of DLLHost.exe exist in Task Manager.

**Perform Modern POS device activation**

Try to activate the Modern POS device. If you still experience issues, open Event Viewer in Windows, and view the logs that correspond to Modern POS. Look for warnings and errors that might help you determine which steps you missed in the previous sections.

**NOTE**

# Enable Azure Active Directory authentication for POS sign-in

2/18/2021 • 2 minutes to read • [Edit Online](#)

Many customers who use Microsoft Dynamics 365 Commerce also use other Microsoft cloud services, and they might use Azure Active Directory (Azure AD) to manage user credentials for those services. In those cases, the customers might want to use the same Azure AD account across applications. This topic explains how to configure the Commerce point of sale (POS) sign-in experience to use Azure AD authentication.

## Configure Azure AD authentication

To make Azure AD available as the authentication method for POS sign-in for a store, you must configure the settings of the store's functionality profile and then apply those settings to POS clients.

To configure a functionality profile, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**.
2. Select the functionality profile to change.
3. On the **Functions** FastTab, in the **POS staff logon** section, change the value of the **Logon Authentication Method** field from **Personnel ID and Password** to **Azure Active Directory**.

By default, all functionality profiles use **Personnel ID and Password** as the POS authentication method. Therefore, you must change the value of the **Logon Authentication Method** field if you want to use Azure AD. Every retail store that is linked to the selected functionality profile will be affected by this change.

To apply the settings to POS clients, follow these steps.

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Run the **1070 (Channel configuration)** distribution schedule.

### NOTE

Azure AD authentication requires an internet connection. It won't work when POS is in offline mode.

Currently, the **Manager override** function doesn't support Azure AD as an authentication method. An operator ID and password are required even if Azure AD is configured as the authentication method for POS sign-in.

## Associate an Azure AD account with a worker

Before a store worker can use an Azure AD account to sign in to the POS application, the Azure AD account must be associated with that worker.

To associate an Azure AD account with a worker, follow these steps.

1. Go to **Retail and Commerce > Employees > Workers**.
2. Open the details page for a worker.
3. On the Action Pane, on the **Commerce** tab, in the **External identity** group, select **Associate existing identity**.
4. In the **Use existing external identity** dialog box, select **Search using email**, enter an Azure AD email address, and then select **Search**.

5. Select the Azure AD account that is returned, and then select **OK**.

The **Alias**, **UPN**, and **External sub identifier** fields on the **Commerce** tab of the worker's details page will be filled in.

**NOTE**

After a worker record is updated, for example if a new Azure AD account is associated, a password is changed, or an employee address book is updated, it's recommended that you run **1060 (Staff)** distribution schedule to synchronize the latest staff information to the channel. That way, the POS application can fetch the correct data for user authentication and authorization check.

# Product search and customer search in the point of sale (POS)

2/18/2021 • 8 minutes to read • [Edit Online](#)

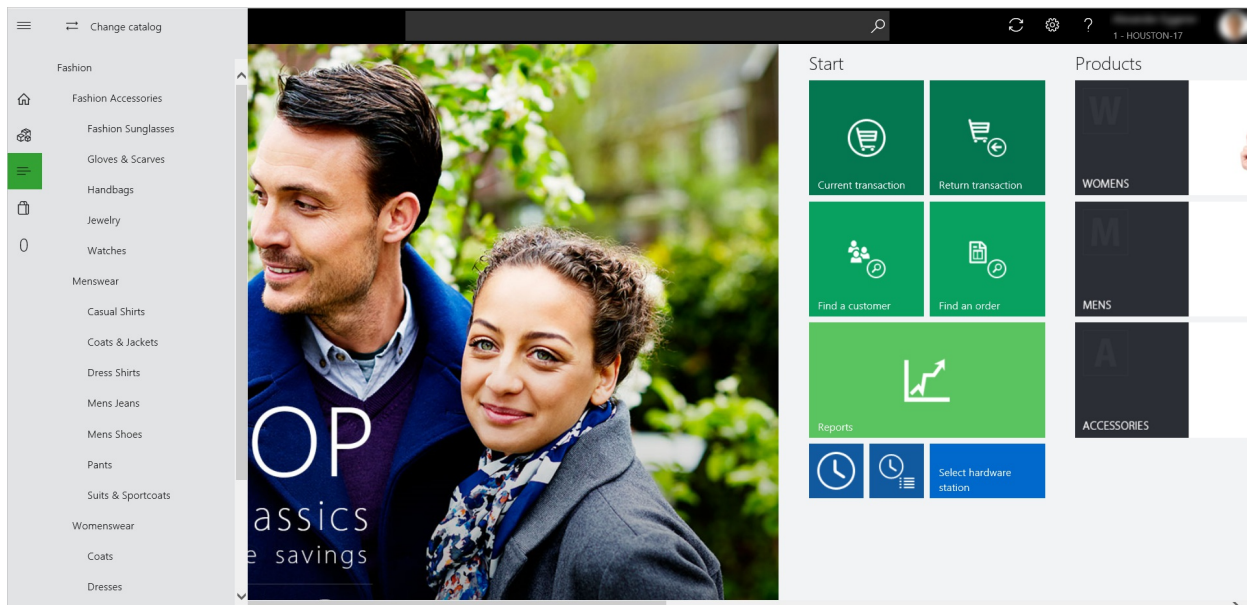

Modern Point of Sale (MPOS) and Cloud Point of Sale (CPOS) provide easy-to-use search functionality for products and customers. Because the search bar is always present at the top of the MPOS and CPOS windows, employees can quickly search for products and customers.

Employees can search for products in the assortments and catalogs that are associated with the current store. They can also search in the assortments and catalogs that are associated with any other store in the company. Therefore, cashiers can sell and return products outside the store assortment. Similarly, employees can search for customers who are associated with the current store or any other store in the company. Additionally, employees can search for customers who are associated with a different company in the parent organization.

## Product search

By default, product searches are done on the store assortment. This type of search is known as a *local product search*. However, employees can easily switch to any catalog that is associated with the current store, or they can search in a different store. This type of search is known as a *remote product search*. To change the catalog, select the **Categories** button on the left side of the page. At the top of the pane that appears, select the **Change catalog** button, and then select one of the available catalogs to browse it. The system will search the selected catalog for products.

On the **Change catalog** page, employees can easily select any store, or they can search for products across all stores.

A local product search searches in the following product properties:

- Product number
- Product name
- Description
- Dimensions
- Barcode

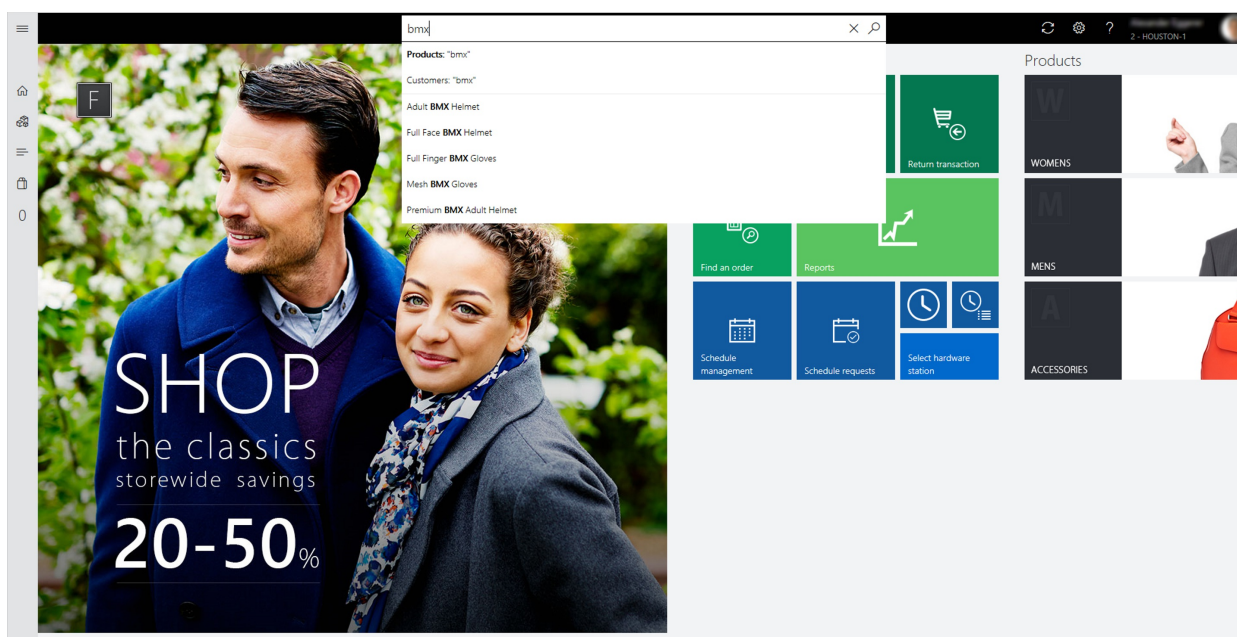

- Search name

### Additional local product search capabilities

- For multiple-keyword searches (that is, for searches that use search terms), retailers can configure whether the search results include results that match *any* search term or only results that match *all* search terms. The setting for this functionality is available in the POS functionality profile, in a new group that is named **Product search**. The default setting is **Match any search term**. This setting is also the recommended setting. When the **Match any search term** setting is used, all products that fully or partially match one or more search terms are returned as results. Those results are automatically sorted in ascending order of products that have the most keyword matches (full or partial).

The **Match all search terms** setting returns only products that match all the search terms (full or partial). This setting is helpful when the product names are lengthy, and employees want to see only limited products in the search results. However, this type of search has two limitations:

- The search is done on individual product properties. For example, only products that have all the searched keywords in at least one product property are returned.
  - Dimensions aren't searched.
- Retailers can configure product search to show search suggestions as users type product names. A new setting for this functionality is available in the POS functionality profile, in a group that is named **Product search**. The setting is named **Show search suggestions while typing**. This functionality can help employees quickly find the product that they are searching for, because they don't have to type the whole name manually.
  - The product search algorithm now also searches for the searched terms in the **Search name** property of the product.

## Customer search

Customer search is used to find customers for various purposes. For example, cashiers might want to view a customer's wish list or purchase history, or add the customer to a transaction. The search algorithm matches the search terms against the values that are present in the following customer properties:

- Name
- Email address
- Phone number
- Loyalty card number

- Address
- Account number

Among these properties, the name provides the most flexibility for multiple-keyword searches, because the algorithm returns all customers that match any of the searched keywords. The customers that match the most keywords appear at the top of the results. This behavior helps cashiers in situations where they search by typing the full name, but last name and first name were swapped during the initial data entry. However, for performance reasons, all the other properties preserve the order of the search keywords. Therefore, if the order of the search keywords doesn't match the order that the data is stored in, no results will be returned.

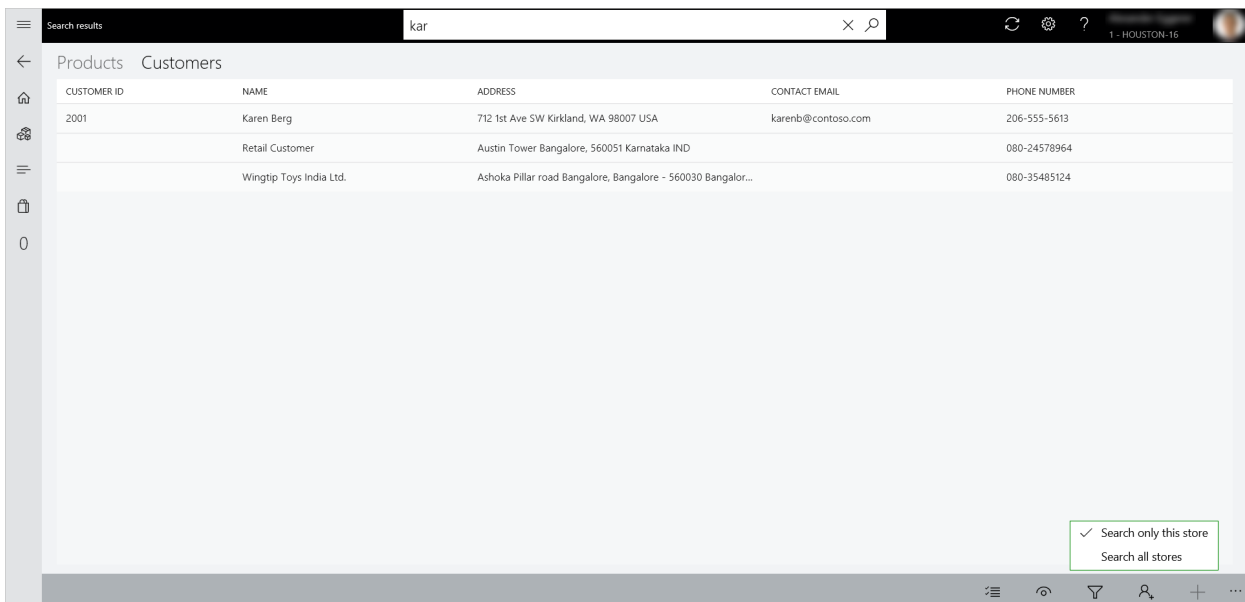

By default, a customer search is done on the customer address books that are associated with the store. This type of search is known as a *local customer search*. However, employees can also search for customers globally. In other words, they can search across the stores of the company and across all other legal entities. This type of search is known as a *remote customer search*.

To search globally, employees can select the **Filter results** button at the bottom of the page and then select the **Search all stores** option, as shown in the illustration that follows. In this case, not only customers are returned. All types of parties that are part of any address book in the headquarters are also returned. These parties include workers, vendors, contacts, and competitors.

#### NOTE

A minimum of four characters must be entered for a remote customer search to return results.

The customer ID isn't shown for customers queried from other legal entities, because no customer ID has been created for those parties in the current company. However, if an employee opens the customer details page, the system automatically generates a customer ID for the party and also associates the store's customer address books with the customer. Therefore, the customer will be visible in local store searches that are done later.

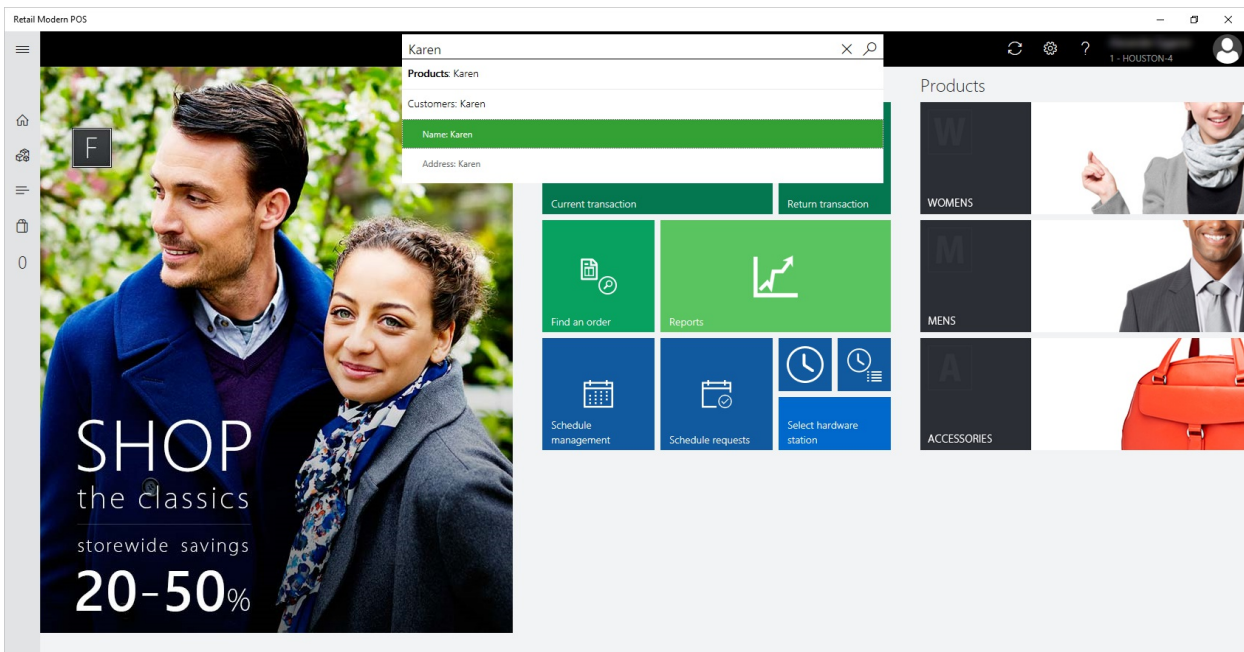

#### Additional local customer search capabilities

When the user searches for a phone number, the system ignores special characters (such as spaces, hyphens, and brackets) that might have been added when the customer was created. Therefore, cashiers don't have to worry about the phone number format when they search. For example, if a customer's phone number was entered as **123-456-7890**, a cashier can search for the customer by typing **1234567890**, or by entering the first few numbers of the phone number.

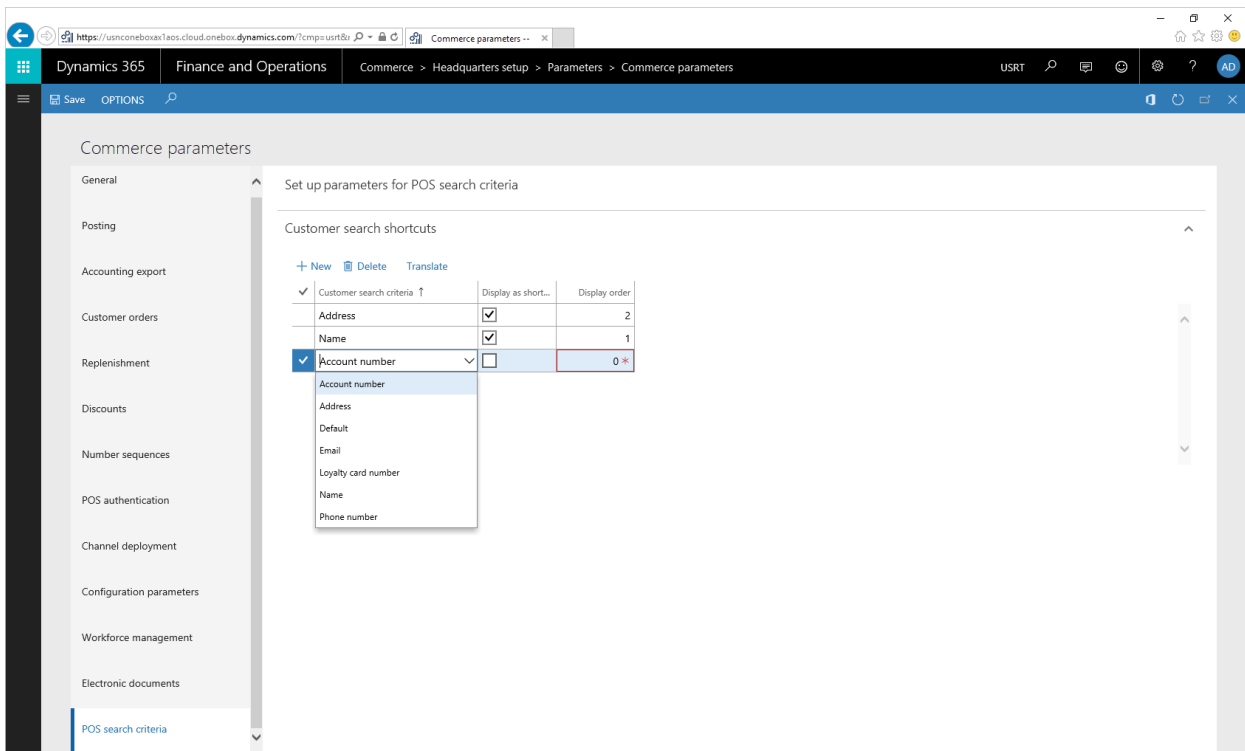

## NOTE

A customer can have multiple phone numbers and multiple emails. The customer search algorithm also searches through these secondary emails and phone numbers, but the customer search results page only displays the primary email and phone number. This may cause some confusion as the returned customer results would not show the searched email or phone number. In a future release we plan to improve the customer search results screen to show this information.

The traditional customer search can be time-consuming, because it searches across multiple fields. Instead, cashiers can search in a single customer property, such as name, email address, or phone number. The properties that the customer search algorithm uses are collectively known as the *customer search criteria*. The system admin can easily configure one or more criteria as shortcuts that will appear in POS. Because the search is limited to a single criterion, only the relevant search results are shown, and the performance is much better than the performance of a standard customer search. The following illustration shows the customer search shortcuts in POS.

To set search criteria as shortcuts, the admin must open the **Commerce parameters** page in Commerce, and then, on the **POS search criteria** tab, select all the criteria that should be shown as shortcuts.

#### NOTE

If you add too many shortcuts, the drop-down menu on the search bar in POS will become cluttered, and the employee's search experience can be affected. We recommend that you add only as many shortcuts as you require.

The **Display order** field determines the order in which shortcuts are shown in POS. The criteria that are shown are the out-of-box properties that the customer search algorithm uses to search customers. However, partners can add custom properties as search shortcuts. To add custom properties as search shortcuts, the system admin must extend the extensible enumeration (enum) that is used for the customer search criteria and then mark the partner's custom properties as shortcuts. Partners are responsible for writing the code to find results when their custom shortcuts are used for searches.

#### NOTE

A custom property that is added to the enum doesn't affect the standard customer search algorithm. In other words, the customer search algorithm won't search in the custom property. Users can use a custom property for searches only if that custom property is added as a shortcut, or if the default search algorithm is overridden.

Retailers can also set the default customer search mode in POS to **Search all stores**. This configuration can be helpful in scenarios where customers that were created outside POS must be searched immediately (for example, even before the distribution job is run). To do so, the retailer must turn on the **Default customer search mode** option in the POS functionality profile. Once it is set to **Yes**, every customer search attempt will then make a real-time call to headquarters.

To help prevent unexpected performance issues, this configuration is hidden behind a flighting flag that is named **CUSTOMERSEARCH\_ENABLE\_DEFAULTSEARCH\_FLIGHTING**. Therefore, to show the **Default customer search mode** setting the user interface (UI), the retailer should create a support ticket for its user acceptance testing (UAT) and production environments. After the ticket is received, the engineering team will work with the retailer to make sure that the retailer does testing in its non-production environments to assess the performance and implement any optimizations that are required.

# Search for products and product variants during order entry

2/18/2021 • 5 minutes to read • [Edit Online](#)

Use the **Item number** field to search for products and product variants when you manually create a sales order line or a purchase order line. This lets you quickly find product variants when you only have the configuration string or one of the product dimensions available.

Sometimes, having too much of something is not the best situation to be in, and this is especially true if you sell a number of products that are similar, and you are trying to remember item numbers or product search names in order to find the right product to put on a sales order. You can use the **Item number** field on a sales order line or a purchase order line as a search field. You can enter any part of a product name, number, or dimension and get a lookup that displays all the items that match the search word.

## How search works

When you search for products or product variants, it is important to understand how the search feature finds the products that match the text that you enter. The key search rules in delivering search results are:

- Search results will return any matching record, disregarding the field that the search text is entered in.
- The search text needs to be present in the matching record in its full length.
- A match will occur even if the search text is found in the middle of a text string in the matching record. It does not have to appear in the beginning of a text string.
- The search text is treated as a single text string even if it contains white space.

### Examples

The following examples use products and product variants to illustrate how search is handled in various scenarios. **Prerequisite:** Under **Sales and marketing > Setup > Search > Search parameters > Search type**, select the **Full match** option.

PRODUCT TYPE	PRODUCT NAME	DISPLAY PRODUCT NUMBER	ITEM NUMBER	CONFIGURATION
Distinct product	SpeakerMidRange	D0001	D0001	NA
Product variant	Active speaker	D0010:::Black:	D0010	000005
Product variant	Active speaker	D0010:::White:	D0010	White

If you type 'speak' in the **Item number** field, you will get all the products above as a result in the lookup. If you type 'black' in the **Item number** field, you will get the second product as a result, because it has the text 'black' in the display product number. These two examples illustrate that the search is not only at the beginning of the field, a match will occur even if the search text is found in the middle of a text string in the matching record.

If you type '05' you will only get the second product variant as a result, because it has '05' in the configuration. This illustrates that the search is across all the enabled fields on the **Search criteria** page.

If you type 'speak 05' you will not get any results. This is because the search looks for the full text that is entered. The search will not try to find 'speak' and then narrow the results to those containing '05'.

You can limit the number of search results by using the **Number of results** field on the **Sales and marketing**

> **Setup** > **Search** > **Search parameters** page. If you set this field to 0, all search results will be returned. If you set it to 10, for example, it will return a maximum 10 search results.

## Configure the product search

Before you can use the product and product variant search feature, follow these steps to configure the product search.

### Step 1: Include all the relevant product and product variant identifiers and dimensions in the search criteria

Examples of product and product variant identifiers and dimensions that you can search by are **Product name**, **Item number**, **Display product number**, **Configuration**, **Color**, **Size**, **Style**, **Search name**, etc.

Go to **Sales and marketing** > **Setup** > **Search** > **Search criteria** page. The **Search criteria** page allows you to define criteria for customer, prospect, and product search. Make sure you filter the page by using product search criteria. You can do this by switching to **Product** in the page's menu.

To add the display product number to the search criteria, click **New** in the page's menu. This will add a new record in the **Search criteria** grid. Open the **Field name** column lookup and chose **DisplayProductNumber**. To add the product's configuration to the search criteria, create a new record in the **Search criteria** grid and chose **configId** in the **Field name** column. In the same manner, create a record with **Field name** **InventColorId** for the color dimension, **InventSizeId** for the size dimension, and **InventStyleId** for the style dimension.

### Step 2: Populate the database table that is used for product search

In the **Search criteria** page, click the **Update search data** button. In the **Update search data** dialog box, make sure that **Source** is set to **Product**, and then click **OK**. The system will aggregate in one table all the selected search criteria specified in step 1. If you have a lot of products and product variants, this operation can be quite lengthy and you may receive a warning. We recommend that you schedule the search table population on the batch server at a time when the server is not too busy.

Until the table is populated, product search will not provide the correct results. If you do not get any search results, make sure that this table is populated.

The table only has to be populated when the search criteria is modified. Newly released products and variants are automatically added to the table. Deleted products and variants are automatically removed from the table.

### Step 3: Enable the lookup for product search on sales and purchase order lines

You can enable this functionality by going to **Sales and marketing** > **Setup** > **Search** > **Search parameters** and setting **Enable lookup for search** to **Yes** on the **General** tab.

For sales order line entry, the default behavior is to open the **Product search** page when you start typing in the **Item number** field, and then press the **Tab** key. The **Product search** page changes the context during order line creation and may be considered unnecessarily intrusive. If you prefer to get the search results in a lookup and not lose context during order line entry, you can use the search lookup instead. If you search for a product or product variant, but you don't select anything in the lookup and press the **Tab** key, the **Product search** page will display.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cash management improvements

2/18/2021 • 3 minutes to read • [Edit Online](#)

Cash management is a key function for retailers in physical stores. Retailers want their stores to have systems that can help them provide complete traceability and accountability of cash and its movement across the different registers and cashiers in a store. They must be able to reconcile any differences and determine accountability.

Microsoft Dynamics 365 Commerce has cash management capabilities in its point of sale (POS) application. However, in versions of Retail that are earlier than version 10.0.3, cash management functionality isn't robust enough to provide complete traceability of cash movements in stores. Although retailers can reconcile the cash for a store, they can't precisely determine accountability in the event of a cash discrepancy.

In Retail version 10.0.3 and later, retailers will gain traceability for cash handling. As part of this traceability, retailers will be able to define safes, make two-sided cash transactions, and reconcile cash management transactions.

## Set up traceability and define safes

To set up the new cash management functionality, follow these steps to configure the functionality profile for stores.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**, and select a functionality profile that is linked to the stores where you want to make the improvements for cash management available.
2. On the **Functions** FastTab of the functionality profile, under **Advanced cash management**, set the **Enable cash traceability** option to **Yes**.
3. To set up safes, go to **Retail and Commerce > Channels > Stores > All stores**, and select a store.
4. On the **Stores** page, on the Action Pane, on the **Set up** tab, in the **Set up** group, select **Safes**. By using this option, you can define and maintain multiple safes for a store.
5. Before the functionality can be used, you must run the **1070 Channel configuration** distribution schedule job to sync these configurations to the channel database.

## Additional cash management changes

In Retail version 10.0.3 and later, the following capabilities that are related to cash transactions are also provided:

- A user who is prompted to "declare start amount" must enter the source of cash. The user can search for the available safes that are defined in the store and select the safe that the cash is being taken out of so that it can be put into the register.
- A user who does a "tender removal" operation is prompted to select, in a list of open "float entry" transactions, the transaction that the operation is being done against. If the corresponding float entry doesn't exist in the system, the user can create a non-linked tender removal transaction.
- A "float entry" operation prompts a user to select, in a list of open "tender removal" transactions, the transaction that the float entry operation is being done against. If the corresponding tender removal doesn't exist in the system, the user can create a non-linked float entry transaction.
- A user who makes a "safe drop" is prompted to select the safe where the cash is being dropped.
- For safes that are defined in a store, users can manage operations such as declaring the start amount, doing a float entry, doing a tender removal, and making a bank drop.

- For users who have the appropriate user privileges, "manage shifts" operations show the cash balances of active, suspended, and blind closed shifts.
- To reconcile the cash transactions within a shift or across shifts, select the shift to reconcile, and then select **Reconcile**. The view that is opened shows the list of reconciled and unreconciled transactions on separate tabs. From this view, users can either select unreconciled transactions and reconcile them, or select previously reconciled transactions and unreconcile them.
- During reconciliation, if the selected transaction doesn't balance, the user must enter a description of the reason for the unbalanced reconciliation. Users can select a single transaction and reconcile it with the relevant reason description as they require.
- Users can continue to reconcile and unreconcile transactions until the shift is closed. After a shift is closed, the transactions can't be unreconciled.
- When a user chooses to close a shift, Commerce validates that there are no unreconciled cash management transactions in the shift. Users can't close a shift if there are unreconciled transactions.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

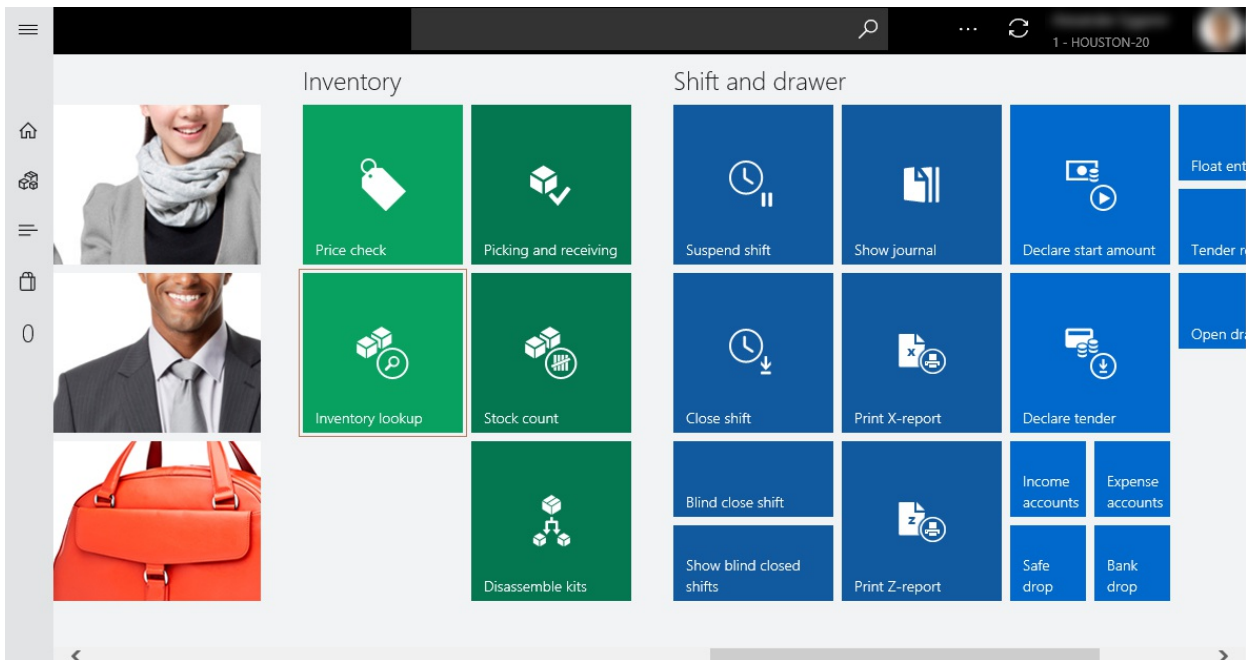

# Inventory lookup in the point of sale (POS)

2/18/2021 • 5 minutes to read • [Edit Online](#)

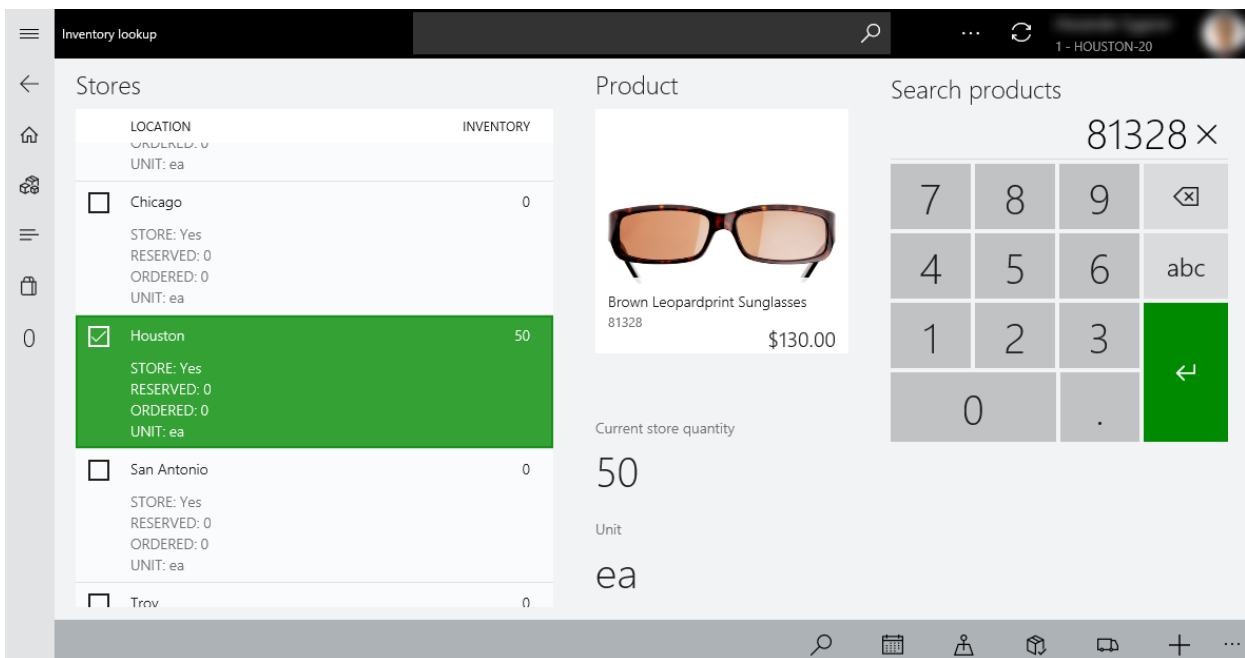

Inventory lookup in the point of sale (POS) helps retailers achieve real-time operational excellence and gain insights by connecting stores, the POS, and the back office. This functionality provides an accurate real-time view of product inventory across stores and distribution centers. It also helps retailers drive additional efficiencies and cost savings by improving inventory planning in real time.

An accurate real-time view of inventory across an organization helps store associates provide timely, superior customer service. The moment that matters most is the moment when the customer is ready to make a purchase decision. It's important that cashiers in the store have real-time inventory information at their fingertips, so that they can accurately promise product delivery and pickup.

You can open the **Inventory lookup** page from the **Retail Modern POS** workspace or the **Retail Cloud POS** workspace.

On the **Inventory lookup** page, you can use the numeric keyboard to enter a product number. You can then view the on-hand quantity for multiple stores and warehouses.

**Reserved** and **Ordered** quantities are also shown for each location.

- **Reserved** – This quantity refers to the **Physical reserved** value from the back office for the specified product number at the location.
- **Ordered** – This quantity refers to the **Ordered in total** value from the back office for the specified product number at the location.

## Locations that inventory availability information is shown for

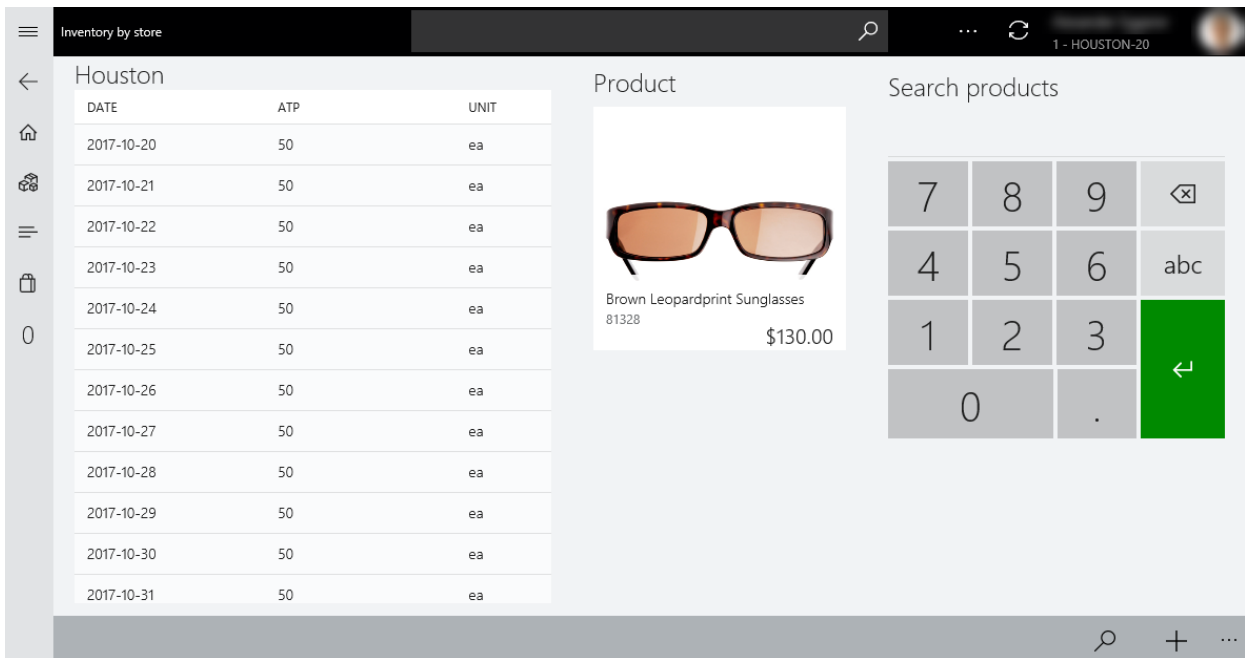

The list of locations includes two types of entities:

- **Stores** – The list shows stores that are configured by using the store locator group for the current store in the Headquarters.
- **Distribution centers** – Various types of distribution centers (such as warehouses) can be configured in Commerce. However, the list shows inventory availability information only for distribution centers of the **Standard** default type.

### NOTE

Inventory availability information isn't shown for warehouses of the **Transit**, **Quarantine**, and **Goods in Route** types for the POS.

On the **Inventory lookup** page, you can view available to promise (ATP) quantities for each store, in addition to the current on-hand quantities, reserved quantities, and ordered quantities. Select the store to view the ATP information for, and then select **Show store availability**.

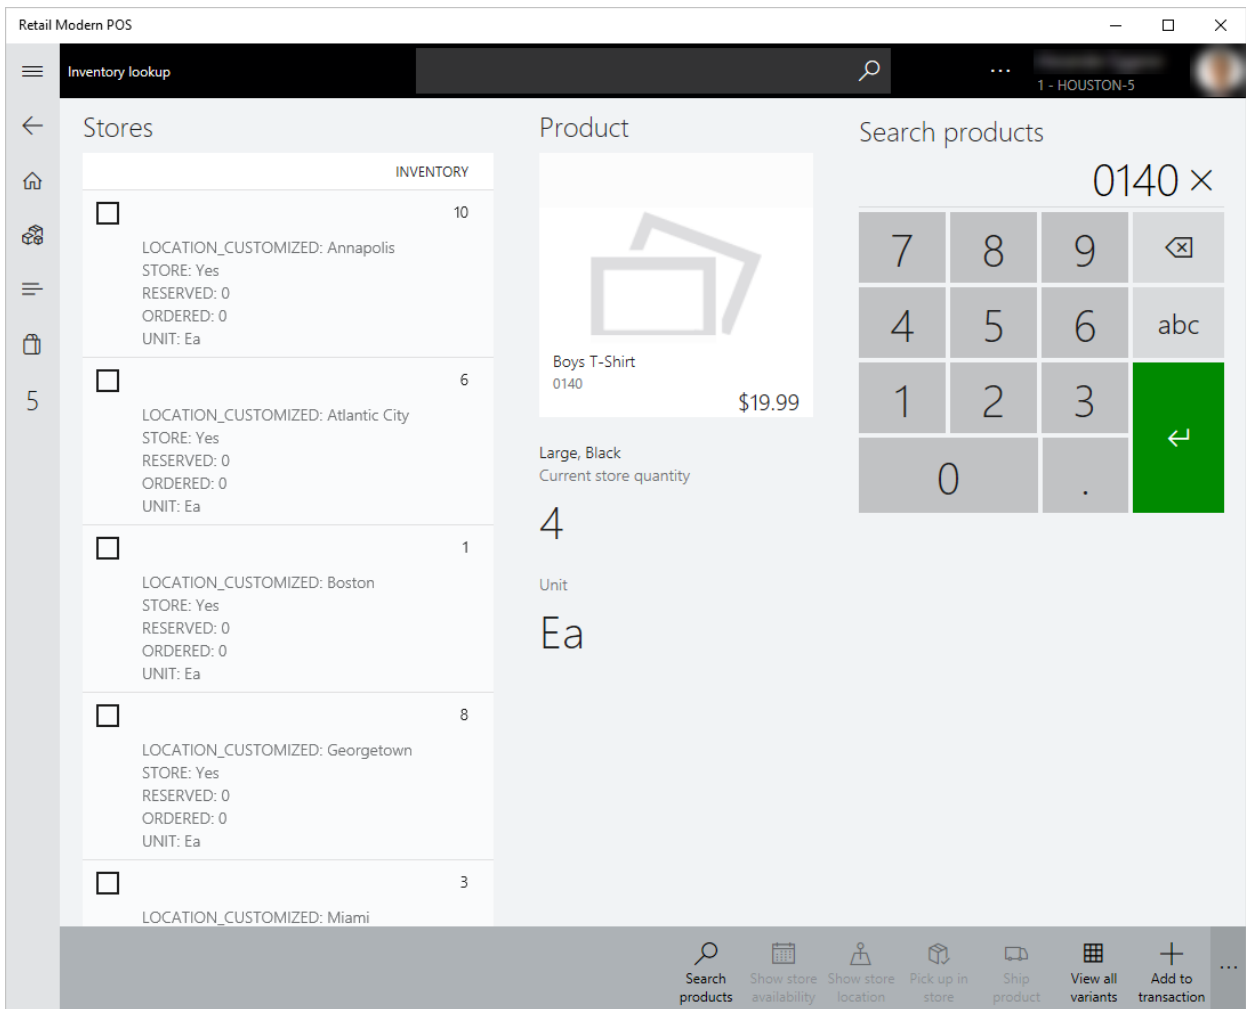

## Opening the Dimension based matrix view to show all variants

On the **Product details** page of a product master, or on the **Inventory lookup** page, select **View all variants** from the app-bar at bottom of the page. The **Dimension based matrix** view for the initial launch from these pages shows the inventory availability information for all variants of a product for the current store.

### NOTE

The **View all variants** button is available only for item product masters that have product variants. It isn't available for standalone products or kits.

Select **View all variants** on the **Product details** page of a product master, or on the **Inventory lookup** page, without selecting a location, to go to the **Dimension based matrix** view to view the inventory availability information for all variants of a product for the current store.

**NOTE**

In the preceding illustration, the display order of the dimensions is alphabetic, because the display order of dimensions wasn't configured for the selected product.

In the **Dimension based matrix view**, the cells for the product variants include an on-hand value in the lower-right corner. The following table explains the meaning of the various values.

ON-HAND VALUE	DESCRIPTION
Numeric value that is more than 0 (zero)	A variant has been released to the selected location, and you can perform additional actions in the cell. (These actions are described in more detail later in this topic.)
0 (zero)	A variant has been released to the selected location, but the item isn't available in selected location. However, you can perform additional actions in the cell. (These actions are described in more detail later in this topic.)
n/a or an inactive cell	A variant hasn't been released to the selected location, and you can't perform additional actions in the cell.

You can also change the pivot for dimensions by selecting the new dimension to use.

LARGE	RESERVED: 0 ORDERED: 0 6 EA	RESERVED: 0 ORDERED: 0 7 EA	RESERVED: 0 ORDERED: 0 6 EA	RESERVED: 0 ORDERED: 0 6 EA	n/a
XLARGE	RESERVED: 0 ORDERED: 0 6 EA	RESERVED: 0 ORDERED: 0 6 EA	RESERVED: 0 ORDERED: 0 6 EA	RESERVED: 0 ORDERED: 0 6 EA	n/a

**NOTE**

In the preceding illustrations, the display order of the dimensions for the selected product is custom (non-alphabetic). It's based on the dimension display order that is set in the back office.

Additionally, in the **Dimension based matrix** view, more actions can be performed to help boost a store associate's productivity. Here are some examples:

- Change the store location to look up the inventory availability of all product variants at other locations. These locations include other stores in the store locator group and distribution centers of the **Standard** default type.
- Sell an individual product variant to a customer by using cash and carry, in-store pickup, or shipment to an address.
- Provide the customer with ATP information for an individual product variant at a specific location.

**NOTE**

In the preceding illustration, the display order of the dimensions is alphabetic, because the display order of dimensions wasn't configured for the selected product.

The following table provides more information about the additional actions that are available.

ACTION	DESCRIPTION
Sell now	Add the selected item variant to the transaction, and redirect the user to the transaction screen. (This action isn't available when the selected location is a distribution center.)
Pick up in store	Create a customer order for the product variant that will be picked up from the selected location, and redirect the user to the transaction screen. (This action isn't available when the selected location is a distribution center.)
Ship product	Create a customer order for the product variant that will be shipped from the selected location, and redirect the user to the transaction screen.
Availability	Show the ATP information for the selected variant combination for the selected location.

ACTION	DESCRIPTION
Show all locations	Switch to the standard inventory lookup view, and highlight inventory availability information for the item variant across all stores in the store locator group, and also in distribution centers of the <b>Standard/Default</b> type.
View product details	Redirect the user to the <b>Product details</b> page of the associated product master.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Suspend and resume a transaction in the point of sale (POS)

2/18/2021 • 3 minutes to read • [Edit Online](#)

Point of sale (POS) users can suspend in-progress transactions, and then resume them later or on a different register. Transactions are often suspended to quickly free up a register for a different task without losing any progress on the current transaction. For example, a store associate starts to process a customer's transaction on a mobile device but must complete it on a register that has a cash drawer. In this case, the store associate can suspend the transaction on the mobile device, and then recall and resume it on a register.

## Configure suspend and resume functionality

### POS operations

Two [POS operations](#) let the POS support suspend and resume scenarios. You can assign these operations to [button grids](#) on the transaction page or the welcome page.

- 503: Suspend transaction
- 504: Recall transaction

### Receipt template

The POS can be configured to generate a printed slip when a transaction is suspended. That slip can then be used to quickly identify and recall the transaction later.

To enable the POS to print a slip, you must add the **Suspended transaction** receipt format to the store's receipt profile. You can design the receipt format so that it includes or excludes specific details about the transaction. For example, the format can include a barcode to support scanning.

### Receipt numbering

As for other POS transaction types that generate a printed receipt, you can define a number sequence for suspended transactions in the **Receipt numbering** section of the store's functionality profile.

### Void when closing shift

You can use the **Void when closing shift** option to require that users either complete or void any suspended transactions before they close their shift. During the **Close shift** operation, the POS will prompt users to either view or void any outstanding suspended transactions.

## Suspend and resume a transaction

### Suspend a transaction

Users who have sufficient privileges, and who have a screen layout that includes the **Suspend transaction** operation, can suspend a transaction so that it can be recalled later or on a different register.

Transactions can be suspended only if they do **not** contain the following types of lines:

- Active payment lines
- Gift card lines (either to issue a gift card or to add to the gift card balance)

A suspended transaction doesn't affect sales information or inventory availability information for the store.

### Resume a suspended transaction

Suspended transactions can be recalled and resumed in the same store by any user who has sufficient privileges, and who also has a layout that includes the **Recall transaction** operation.

To quickly and easily recall a suspended transaction, scan the barcode on the printed slip while you're viewing the list of transactions from the **Recall transaction** operation.

### Considerations for offline mode

- Any transaction that is suspended while the POS is in online mode can't be resumed in offline mode, because the data isn't synced to the offline database.
- If you suspend a transaction while the POS is in offline mode, you can recall it in offline mode, provided that the POS wasn't switched back to online mode at any time since you suspended the transaction. When the POS is switched back to online mode, data about suspended transactions is moved to the online database and removed from the offline database. Therefore, the transactions can be resumed only in online mode. If you switch the POS back to offline mode, you won't be able to resume those suspended transaction, because they have already been removed from the offline database.

### Void a suspended transaction

You can void suspended transactions either by recalling the transaction and then performing the **Void transaction** operation, or by selecting the transaction in the **Recall transaction** list and selecting **Void** on the app bar. Alternatively, the store can be configured to prompt users to void suspended transactions when they close their shift.

# Offline point of sale (POS) functionality

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about offline mode for Modern POS, in which POS devices automatically switch from the channel database to the offline database if the Commerce Scale Unit is unavailable. This article also includes general setup information for offline mode and explains the data synchronization that occurs between the offline database and the channel database.

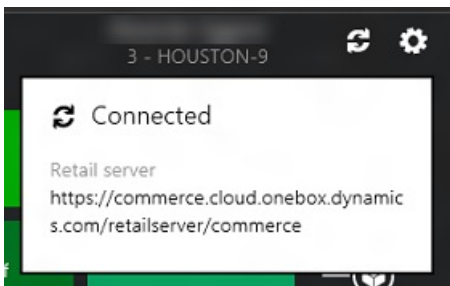

## Overview

In Modern POS, a point of sale (POS) device goes into offline mode whenever the Commerce Scale Unit is unavailable. Therefore, if the connection is lost, the POS automatically switches to the offline database.

During a sales transaction, if a data request doesn't succeed within the time-out interval that is configured in the offline profile, the POS automatically switches to the offline database and continues the sales transaction. While the POS device is in offline mode, Rail Modern POS tries to reconnect to the Commerce Scale Unit after the reconnection attempt interval that is configured in the offline profile. This reconnection attempt occurs only at the beginning of a transaction.

### Determining the connection mode of Modern POS

The status header in Modern POS indicates the current connection status, and the **Connection status** window shows the status of the last attempt to sync with the offline database.

### Creating a button to manually switch between online and offline modes

You can add a button to Modern POS to manually switch between online and offline modes. Create a button for POS operation 917 – **Database connection status**. The name of this button is **Disconnect** when the POS is connected to the Commerce Scale Unit and **Connect** when it is disconnected. You can use this button to view the connection, and to disconnect from the Commerce Scale Unit or connect to it.

1070 - Channel configuration	OK	08/12/2015 3:25 PM	36MB

## Setup

To enable offline support for a POS device (register), set the **Support offline** option to **Yes** on the **Register** page. A new channel database entity is created and added to the store's channel data group. Then run all the required distribution schedules to generate the data packages for the offline database. Next, install the offline version of Modern POS. The installation process creates the offline database. Additionally, install Microsoft SQL Server 2014 Express if it is required. Offline data synchronization starts after the first sign-in to Modern POS.

## Data synchronization

The Commerce scheduler is used to send master data to the offline database. By default, when a distribution schedule is run, data changes are sent to both the channel database and the offline database. Modern POS includes the async sync library, which downloads any available data packages and inserts them into the offline database. If any transactions are created offline, the POS uploads them to the Commerce Scale Unit, so that they can be inserted into the channel database. Offline data synchronization can occur only if Modern POS is running.

# Shift and cash drawer management

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how to set up and use shifts in Commerce point of sale (POS).

In Dynamics 365 Commerce, the term *shift* describes the collection of POS transactional data and activities between two points in time. For each shift, the amount of money that is expected is compared against the amount that was counted and declared.

Typically, shifts are opened at the start of the business day. At that point, a user declares the starting amount that the cash drawer contains. Sales transactions are then performed throughout the day. Finally, at the end of the day, the drawer is counted, and the closing amounts are declared. The shift is closed, and a Z report is generated. The Z report indicates whether there is an overage or shortage.

## Typical shift scenarios

Commerce provides several configuration options and POS operations to support a wide range of end-of-day business processes for the POS. This section describes some typical shift scenarios.

### Fixed till

Traditionally, this scenario has been used most often. It's still extensively used. In a "fixed till" shift, the shift and till are associated with a specific register. They aren't moved from one register to another. A "fixed till" shift can be used by a single user or shared among multiple users. "Fixed till" shifts don't require any special configuration.

### Floating till

In a "floating till" shift, the shift and cash drawer can be moved from one register to another. Although a register can have only one active shift per cash drawer, shifts can be suspended and then resumed later or on a different register.

For example, a store has two registers. Each register is opened at the start of the day when the cashier opens a new shift and provides the starting amount. When one cashier is ready to take a break, that cashier suspends his or her shift and removes the till from the cash drawer. That register then becomes available to other cashiers. Another cashier can sign in to and open his or her own shift on the register. After the first cashier's break has ended, that cashier can resume his or her shift when one of the other registers becomes available. "Floating till" shifts don't require any special configuration or permission.

### Single user

Many retailers prefer to allow only one user per shift, to help guarantee the highest level of accountability for the cash in the cash drawer. If only one user is allowed to use the till that is associated with a shift, that user can be held solely responsible for any discrepancies. If more than one user uses a shift, it's difficult to determine who made an error, or who might be trying to steal from the till.

### Multiple users

Some retailers are willing to sacrifice the level of accountability that single-user shifts provide and to allow more than one user per shift. This approach is typical when there are more users than available registers, and the need for flexibility and speed outweighs the potential for loss. It's also typical when store managers don't have their own shifts but can, as required, use the shifts of any of their cashiers. To sign in to and use a shift that was opened by another user, a user must have the **Allow multiple shift logon** POS permission.

### Shared shift

A "shared shift" configuration lets retailers have a single shift across multiple registers, cash drawers, and users. A shared shift has a single starting amount and a single closing amount that are summarized across all cash drawers. Shared shifts are most typical when mobile devices are used. In this scenario, a separate cash drawer isn't reserved for each register. Instead, all registers can share one cash drawer.

For shared shifts to be used in a store, the cash drawer must be configured as a "shared shift drawer" at **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles > Drawer**. Additionally, users must have one or both of the shared shift permissions (Allow manage shared shift and Allow use shared shift).

#### **NOTE**

Only one shared shift can be open at a time in each store. Shared shifts and stand-alone shifts can be used in the same store.

## Shift and drawer operations

Various operations can be performed to change the state of a shift, or to increase or decrease the amount of money in the cash drawer. This section describes these shift operations for Modern POS and Cloud POS.

### **Open shift**

The POS requires that users have an active, open shift in order to perform any operations that will produce a financial transaction, such as a sale, return, or customer order.

When a user signs in to the POS, the system first verifies whether an active shift is available for that user on the current register. If an active shift isn't available, the user can open a new shift, resume an existing shift, or sign in in "non-drawer" mode, depending on the system configuration and the user's permissions.

### **Declare start amount**

This operation is often the first operation that is performed for a newly opened shift. For this operation, users specify the starting cash amount in the cash drawer for the shift. This operation is important because the overage/shortage calculation that occurs when a shift is closed considers the start amount.

### **Float entry**

*Float entries* are non-sales transactions that are performed in an active shift to increase the amount of cash in the cash drawer. A typical example of a float entry is a transaction to add additional change to the drawer when it's running low.

### **Tender removal**

*Tender removals* are non-sales transactions that are performed in an active shift to reduce the amount of cash in the cash drawer. This operation is most often used in conjunction with a Float entry operation on a different shift. For example, because register 1 is running low on change, the user on register 2 does a tender removal to reduce the amount in his or her cash drawer. The user on register 1 then does a float entry to increase the amount in his or her cash drawer.

### **Suspend shift**

Users can suspend their active shift to free up the current register for another user, or to move their shift to a different register (in this case, the shift is often referred to as a "floating till" shift).

Suspension of a shift prevents any new transactions or changes to the shift until it's resumed.

### **Resume shift**

This operation lets users resume a previously suspended shift on any register that doesn't already have an active shift.

## **Tender declaration**

This operation is performed to specify the total amount of money that is currently in the cash drawer. Users most often perform this operation before they close a shift. The specified amount is compared against the expected shift amount to calculate the overage/shortage amount.

## **Safe drop**

Safe drops can be done on an active shift at any time. This operation removes money from the cash drawer so that it can be transferred to a more secure location, such as a safe in the back room. The total amount that is recorded for safe drops is included in shift totals, but it doesn't have to be counted as part of the tender declaration.

## **Bank drop**

Like safe drops, bank drops are done on active shifts. This operation removes money from the shift to prepare for the bank deposit.

## **Blind close shift**

*Blind-closed shifts* are no longer active but haven't been fully closed. Unlike suspended shifts, blind-closed shifts can't be resumed. However, operations such as Declare start amount and Tender declaration can be performed on them later or from a different register.

Blind-closed shifts are often used to free up a register for a new user or shift without first having to fully count, reconcile, and close the shift.

## **Close shift**

This operation calculates shift totals and overage/shortage amounts, and then finalizes an active or blind-closed shift. Depending on the user's permissions, a Z report is also printed for the shift. Closed shifts can't be resumed or modified.

## **Print X**

This operation generates and prints an X report for the current active shift.

## **Reprint Z**

This operation reprints the last Z report that the system generated when a shift was closed.

## **Manage shifts**

This operation lets users view all active, suspended, and blind-closed shifts for the store. Depending on their permissions, users can perform their final closing procedures, such as Tender declaration and Close shift operations for blind-closed shifts. This operation also lets users view and delete invalid shifts, in the rare event that shifts are left in a bad state after a switch between offline and online modes. These invalid shifts don't contain any financial information or transactional data that is required for reconciliation.

# Shift and drawer permissions

The following POS permissions affect what a user can and can't do in various scenarios:

- **Allow blind close**
- **Allow X-report printing**
- **Allow Z-report printing**
- **Allow tender declaration**
- **Allow floating declaration**
- **Open drawer without sale**
- **Allow multiple shift logon** – This permission allows the user to sign in to and use a shift that a different user opened. Users who don't have this permission can sign in to and use only shifts that they have opened.
- **Allow manage shared shift** – Users must have this permission to open or close a shared shift.

- **Allow use shared shift** – Users must have this permission to sign in to and use a shared shift.

## Back-office end-of-day considerations

The way that shifts and cash drawer reconciliation are used in the POS differs from the way that transaction data is summarized during statement calculation. It's important that you understand this difference. Depending on your configuration and your business processes, the shift data in the POS (the Z report) and a calculated statement in the back office can give you different results. This difference doesn't necessarily mean that either the shift data or the calculated statement is incorrect, or that there is a problem with the data. It just means that the parameters that are provided might be including additional transaction or fewer transactions, or that the transactions have been summarized differently.

Although every retailer has different business requirements, we recommend that you set up your system in the following way to avoid situations where differences of this type occur:

Go to **Retail and Commerce > Channels > Stores > All stores > Statement/closing**, and for each store, set both the **Statement method** field and the **Closing method** field to **Shift**.

This setup helps guarantee that back-office statements include the same transactions as shifts in the POS, and that the data is summarized by that shift.

For more information about statement and closing methods, see [Store configurations for Retail statement](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cash out gift card balance for a retail customer

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of the cash out gift card feature for the Dynamics 365 Retail Modern POS (MPOS).

The purpose of the cash out feature is to allow cashiers to cash out the remaining amount on a gift card. Retailers often need to exchange a low balance gift card for cash at the customer's request.

## Prerequisites

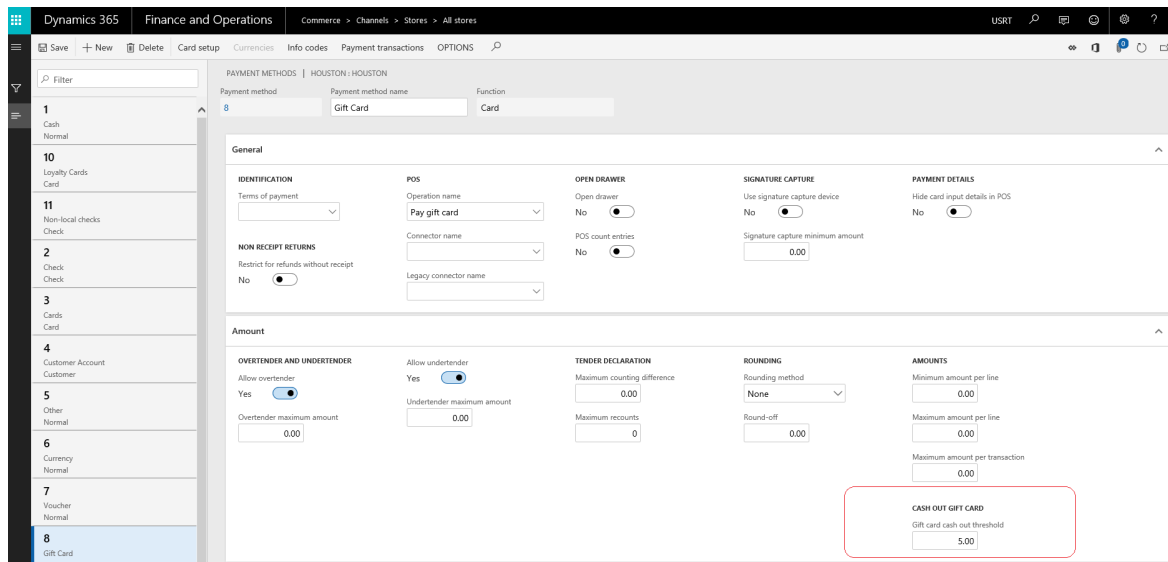

- The payment connector and corresponding payment gateway or processor must support the feature. The *payment connector* is an extension which facilitates communication between Dynamics 365 Commerce (and associated components) and a payment service. The connector described in this topic was implemented using the standard payments SDK.
- If the gift cards are external gift cards, the external gift card must be configured for both the Headquarters and the POS. Before the gift card can be configured, the retailer must have an account with an external gift card service provider.

## Scenarios

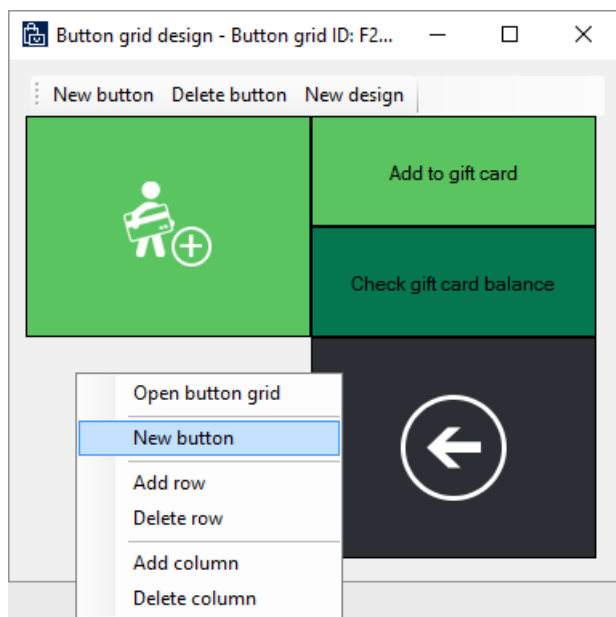

The cash out gift card feature is applicable to a scenario where, for example, in Washington state, the cash out threshold is \$5. Retailers in this case will have the option to set up an operation to cash out a gift card and set the gift card balance limits under which the cash out operation can be enabled.

## Configure Headquarters

1. Open the **All stores** page.
2. In the list, select the **Houston** store.
3. On the **Action Pane**, select **Set up > Payment methods**.
4. Search for **payment methods** to open the **Payment methods** page.
5. Select the **Gift Card** payment method, and then follow these steps:
  - a. In the **Amount** FastTab section, select the **Cash Out Gift Card** field.
  - b. In the **Cash Out Gift Card** field, enter the **Gift card Cash out threshold** amount.
  - c. Select **Save**.

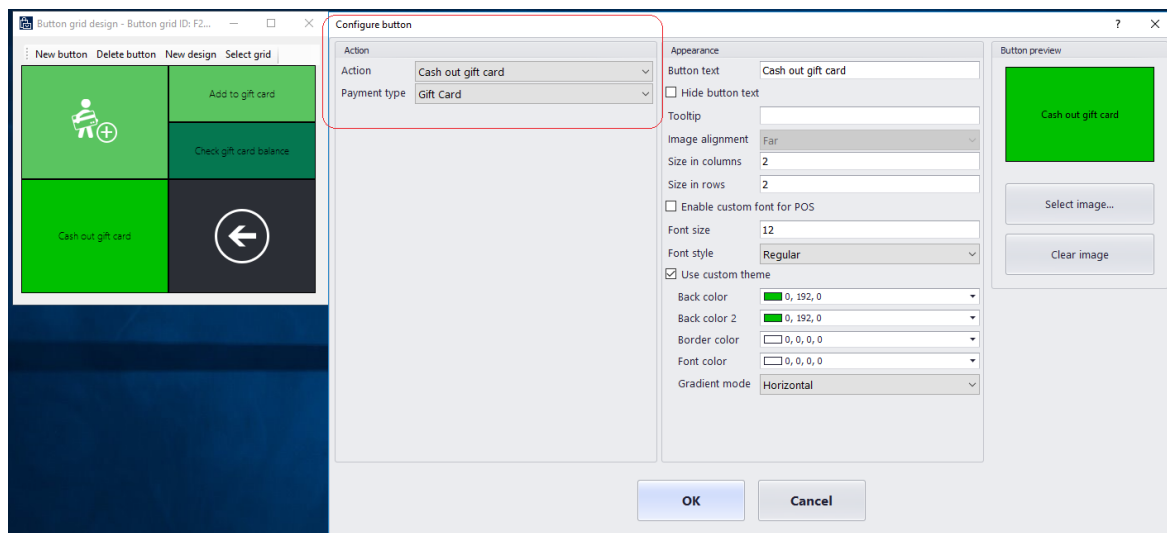

6. Open the **Button grid** page.
7. In the navigation bar on the left side of the page, search for **F2S1M**, and select the filtered option.
8. On the **Action Pane**, select **Designer** to download the button designer application.
9. When the grid designer appears, right-click on an empty (gray) area, and then select **New button**.

10. Right-click the new button, and then select **Button properties**.
11. Set the **Action**, **Cash out gift card**, and **Text on button** properties according to the following matrix.

ACTION	PAYMENT TYPE	TEXT ON BUTTON
Cash out gift card	Gift Card	Cash out gift card

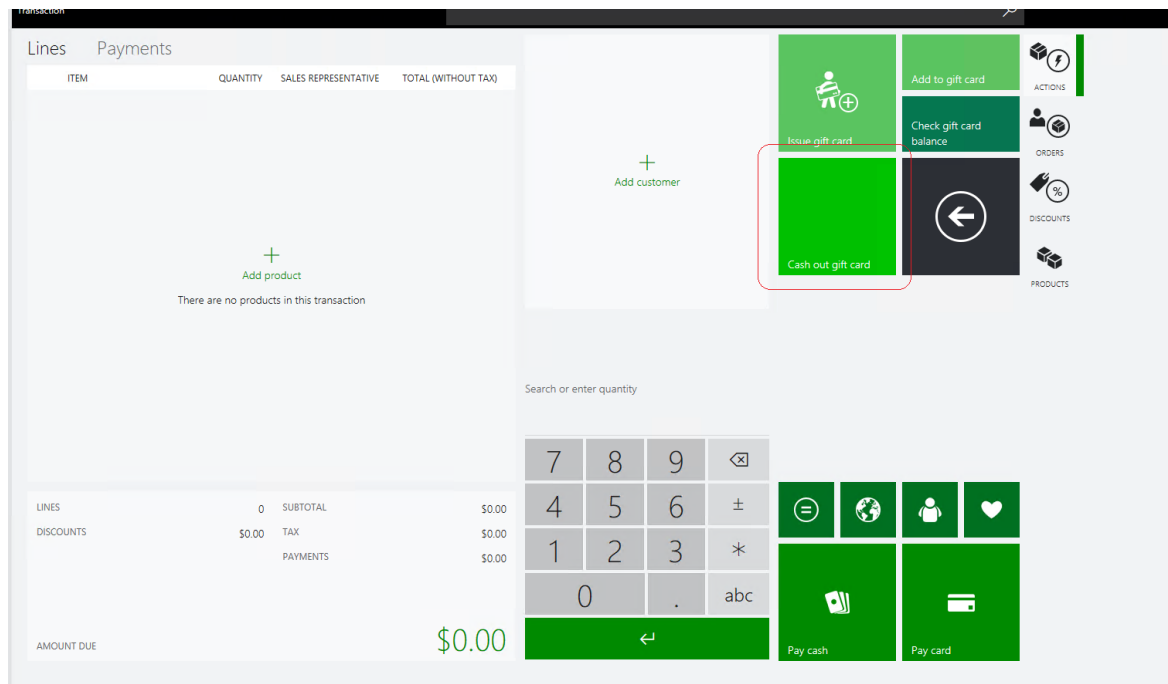

When you've finished, your button layout should resemble the following illustration.

12. Click **Ok** and close the designer.
13. Search for **Distribution Schedule**.
14. In the navigation bar on the left side of the page, search for **1090, 1115, and 1070**.
15. On the **Action Pane**, select **Run now**.
16. Check the status of the job by searching for **Download sessions**.
17. Wait until **Applied** appears next to all the jobs, and then close the browser.

## Configure and test Retail Modern POS

1. Start the Retail Modern POS (MPOS) application.
2. Sign in by using the standard credentials.
3. When you're prompted, select **Perform a non-drawer operation**.
4. On the main screen, select **Select hardware station**.
5. On the bar on the right side of the page, select **Manage**.
6. Turn on **Virtual Peripherals**, and then select **OK**.
7. In the **Available paired stations** field, select **Virtual Peripherals**.
8. You're prompted to either open a new shift or perform non-drawer operations. You can now open a new shift.
9. On the main screen, select **Current transaction**.
10. Select **Gift cards**.
11. Select **Cash out gift card**.
12. Enter or scan the gift number.
13. The line for **gift card cash out** will be added to the **Current transaction** for cash out.
14. Select the **Cash** payment method and the drawer will open when the transaction is completed.

## Troubleshooting

For all general issues, you should always consult the Modern POS or IIS Hardware Station event logs. The logs can be found under these nodes in the Windows event log:

- Application and Services Logs > Microsoft > Dynamics > Commerce-ModernPOS
- Application and Services Logs > Microsoft > Dynamics > Commerce-Hardware Station

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Ship orders from another store by using the Charge send feature

2/18/2021 • 2 minutes to read • [Edit Online](#)

With the Charge send feature in Commerce, customer orders can be placed in one store and shipped from another store.

Customer orders in the point of sale (POS) client support multiple fulfillment options. Some examples of fulfillment options include:

- Pick up from the same store on a different date.
- Pick up from a different store on the same date or a different date.
- Ship from the default shipping warehouse that is assigned to the store, and deliver on a specific date.

The Charge send feature uses the following POS operations: Ship all products and Ship selected products. This allows the store clerk to select the "ship from" location that the order or order line can be fulfilled from. By default, the "ship from" location is the shipping warehouse that is associated with the store. However, the store clerk can change this location and select any store that is defined in the store locator group that is assigned to the store.

The ability to select "ship to" addresses remains unchanged.

The shipping methods that can be used to fulfill the order line are based on the configuration of valid modes of delivery for products and addresses. Because the rules about valid of modes of delivery are maintained only in the Headquarters (HQ), the POS client makes a real-time call to fetch the valid modes of delivery for a ship line.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Hide non-carrier delivery modes from the shipping options in POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes a configuration option that is available for the point of sale (POS) application. This configuration option changes the behavior for the selection of a mode of delivery when shipment orders are created in POS.

When users create customer shipment orders in POS, they can select a mode of delivery for the shipment. This functionality is available regardless of whether the whole order is being shipped or only selected lines.

By default, the dialog box where a mode of delivery is selected shows all the valid modes of delivery for the combination of a channel, an item, and a delivery address. These modes of delivery are defined on the **Modes of delivery** page in Headquarters (**Sales and marketing > Setup > Distribution > Modes of delivery**). "Non-carrier" modes of delivery, such as **Carryout** or **Pickup**, might also appear for selection in the dialog box.

However, a feature has been added that lets you hide non-carrier modes of delivery in the dialog box. To turn on this feature, on the **Commerce parameters** page, on the **Customer orders** tab, set the **Show only carrier mode options for ship orders** option to **Yes**. After you turn on this feature and run the appropriate distribution jobs to sync the information to the channel database, non-carrier modes of delivery won't appear for selection during the process of creating shipment orders in POS.

## NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Task recorder and Help for Retail Modern POS (MPOS) and Cloud POS

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to use Task recorder in Retail Modern POS and Cloud POS.

## Overview

Task recorder in Retail Modern POS or Cloud POS is a new solution that was built with a focus on high responsiveness. It provides a flexible application programming interface (API) for extensibility and seamless integration with consumers of business process recordings. Additionally, Task recorder integration with the Business process modeler (BPM) tool on Microsoft Dynamics Lifecycle Services (<https://bpm.lcs.dynamics.com>) has been brought forward. Therefore, users can continue to produce rich business process diagrams from recordings to analyze and design their applications.

## Architecture

Task recorder can record user actions in the client with exact fidelity. Each control is instrumented to notify Task recorder about the execution of a user action. The control notifies Task recorder that an event occurred and passes along all pertinent information about the corresponding user action in real time. From this information, Task recorder can capture the type of user action (such as a button click, value entry, or navigation) and any data that is related to the user action (such as the input data value and type, form context, or record context). Task recorder persists the information with enough detail to help guarantee that a playback of the recording can perform the recorded actions exactly as the user performed them. (The playback feature isn't yet implemented at Retail modern POS or Cloud POS.)

## Basic configuration

To enable task recording in POS, follow these steps.

1. Click **Retail and Commerce > Channel Setup > POS Setup > Registers**.
2. Click the register to enable task recording on.
3. On the **Register** tab, on the **General** FastTab, set the **Enable task recording** option to **Yes**.
4. Click **Save**.
5. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
6. Select the **Registers (1090)** job, and then click **Run now**.

## Create a recording

Follow these steps to create a new recording using Task recorder.

1. Start Retail Modern POS or Cloud POS, and sign in.
2. On the **Settings** page, in the **Task Recorder** section, click **Open task recorder**. The **Task recorder** pane appears. You can click the **Close** button (X) in the upper-right corner to close the **Task recorder** pane before you begin a new recording. To reopen the pane, repeat step 2.

3. Enter a name and description for the recording, and then click **Start**. The recording session begins as soon as you click **Start**.

**NOTE**

If you click the **Close** button (X) in the upper-right corner while recording is in progress, the **Task recorder** pane is closed, but the recording session isn't ended. To reopen the Task recorder pane, click the **Help** button (question mark) at the top of the screen.

4. After you click **Start**, Task recorder enters recording mode. The **Task recorder** pane shows information and controls that are related to the recording process.
5. Perform the actions that you want to perform in the Retail Modern POS or Cloud POS user interface (UI).
6. To end the recording session, click **Stop**.

## Download options

After you end the recording session, several options are shown, so that you can download your recording.

Save to this PC

Export as Word document

Save as developer recording

Privacy statement: Any information that you enter into the application while you are recording will be captured and included in the recording file, Training document and BPM package. If you decide to share the recording file, training document or BPM package others may be able to see the information that was captured.

### Save to this PC

You can use the recording package to play a Task guide, maintain the recording, or edit the annotations in the

recording. (This feature isn't yet implemented in Retail Modern POS and Cloud POS.)

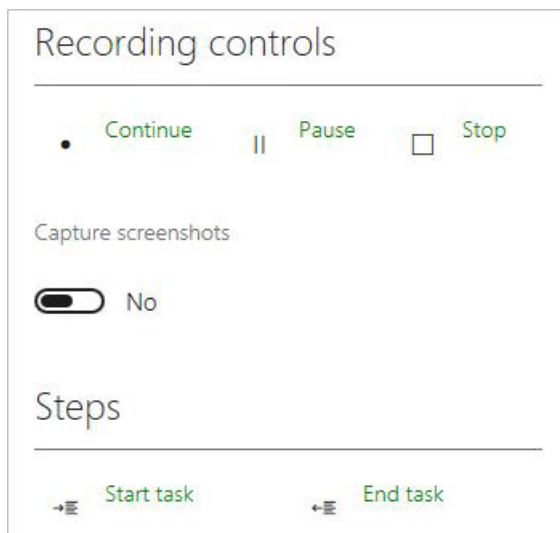

### Export as Word document

You can save the recording as a Microsoft Word document. The document will contain the recorded steps and the screenshots that were captured.

### Save as developer recording

The raw recording file will be useful for developer scenarios such as test code generation. (This feature isn't yet implemented.)

## Recording controls

### Stop

Click **Stop** to end the recording session. Note that you can't restart a session after you end it. Therefore, make sure that the recording is completed before you end it.

### Pause

Click **Pause** to temporarily stop (pause) the recording session and continue with the operation. Steps that you perform after you click **Pause** aren't recorded.

### Continue

To resume the recording session after you've paused it, click **Continue**.

### Capture screenshots

Task recorder can capture screenshots of the Retail Modern POS UI as you record a business process. To turn on the screenshot capture feature, set the **Capture screenshot** option to **Yes** and then make the recording. Once the recording is completed, click **Stop** and download the Word document. The document will contain the steps with relevant screenshots.

#### NOTE

Capture screenshot functionality is not supported in Cloud POS.

### Start task and End task

You can specify the beginning and end of a set of grouped steps by using the **Start task** and **End task** buttons. Click **Start task** to add a "Start Task" step, and then perform the steps that should be included in the group. After you've finished performing the steps for the group, click **End task**. Tasks help you organize your procedures. Tasks can be nested within other tasks. In this way, you can better organize very long and complex business processes.

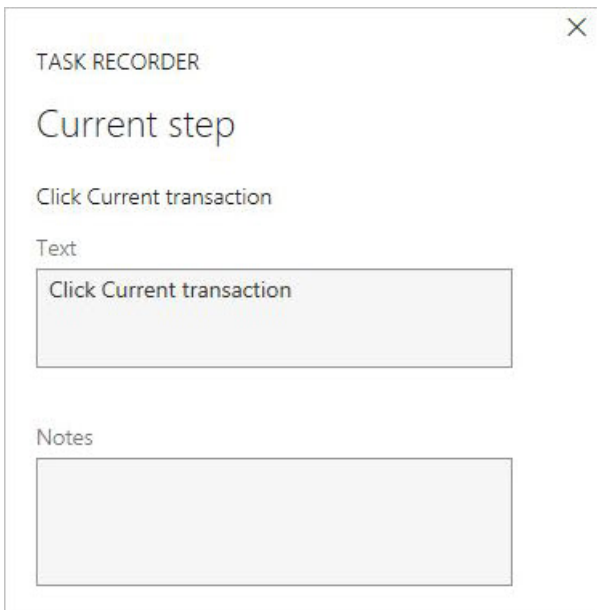

# Adding annotations

An annotation is additional text that you add to a step in a recording. For example, you can use annotations to give the user more context or instructions. You can add annotations before or after a step. You can add an annotation to any step by clicking the **Edit** button (pencil symbol) to the right of the step.

## Texts and notes

You can use the **Texts** and **Notes** fields to add text that should be associated with a step in a Task guide.

### Text

Text that you enter in the **Text** field appears *above* the step text in the Task guide. This location is appropriate for text that you want the user to read before he or she completes the step.

### Notes

Text that you enter in the **Notes** field appears *below* the step text in the Task guide. To read the note text, the user must expand the step text in the pop-up window. This location is appropriate for optional reading material or other information that might be useful to the user, but that the user doesn't require in order to complete the action.

# Help in Retail Modern POS and Cloud POS

To show your own custom task recordings in the Help pane of Retail Modern POS and Cloud POS so that they can be viewed as text, you must save your task recordings to your own BPM library, and then update your Help system parameters to point to your BPM library. For more information, see [Connecting the Help system](#). Retail Modern POS and Cloud POS Help searches LCS in real time. It searches across all the BPM libraries that are selected in the Commerce Help system parameters and shows the relevant results. To access the **Help** menu, click the **Help** button (question mark) at the top of the screen and then in the search box type your process name and hit the search button.

When you click a Task guide in the search results, you can either view the steps as a Help topic or export the

steps to a Word document.

**NOTE**

Help in Retail Modern POS and Cloud POS will not bring up task guides according to what form you're on or operation you're doing. You have to type the process name in the search box and then click **Search**.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Peripherals

2/18/2021 • 33 minutes to read • [Edit Online](#)

This topic explains the concepts that are related to store peripherals. It describes the various ways that peripherals can be connected to the point of sale (POS) and the components that are responsible for managing the connection with the POS.

## Concepts

### POS registers

Navigation: Click **Retail and Commerce** > **Channel setup** > **POS setup** > **Registers**. The point of sale (POS) register is an entity that is used to define the characteristics of a specific instance of the POS. These characteristics include the hardware profile or setup for peripherals that will be used at the register, the store that the register is mapped to, and the visual experience for the user who signs in to that register.

### Devices

Navigation: Click **Retail and Commerce** > **Channel setup** > **POS setup** > **Devices**. A device is an entity that represents a physical instance of a device that is mapped to a POS register. When a device is created, it's mapped to a POS register. The device entity tracks information about when a POS register is activated, the type of client that is being used, and the application package that has been deployed to a specific device.

Devices can be mapped to the following application types: Retail Modern POS, Retail Cloud POS, Retail Modern POS – Windows Phone, Retail Modern POS – Android, and Retail Modern POS – iOS.

### Modern POS

Modern POS is the POS program for Microsoft Windows. It can be deployed on Windows 10 operating systems (OSs).

### Cloud POS

Cloud POS is a browser-based version of the Modern POS program that can be accessed in a web browser.

### Modern POS for iOS

Modern POS for iOS is an iOS-based version of the Modern POS program that can be deployed on iOS devices.

### Modern POS for Android

Modern POS for Android is an Android-based version of the Modern POS program that can be deployed on Android devices.

### POS peripherals

POS peripherals are devices that are explicitly supported for POS functions. These peripherals are typically divided into specific classes. For more information about these classes, see the "Device classes" section of this topic.

### Hardware station

Navigation: Click **Retail and Commerce** > **Channels** > **Stores** > **All stores**. Select a store, and then click the **Hardware stations** FastTab. The **Hardware station** setting is a channel-level setting that is used to define instances where the peripheral logic will be deployed. This setting at the channel level is used to determine characteristics of the hardware station. It's also used to list hardware stations that are available for a Modern POS instance in a given store. The hardware station is built into the Modern POS programs for Windows and Android. The hardware station can also be deployed independently as a stand-alone Microsoft Internet

Information Services (IIS) program. In this case, it is accessed via network.

### **Hardware profile**

Navigation: Click **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**. The hardware profile is a list of devices that are configured for a POS register or a hardware station. The hardware profile can be mapped directly to a POS register or a hardware station.

## **Devices classes**

POS peripherals are typically divided into classes. This section describes and gives an overview of the devices that Modern POS supports.

### **Printer**

Printers include traditional POS receipt printers and full-page printers. Printers are supported through Object Linking and Embedding for Retail POS (OPOS) and Microsoft Windows driver interfaces. Up to two printers can be used at the same time. This capability supports scenarios where cash-and-carry customer receipts are printed on receipt printers, whereas customer orders, which carry more information, are printed on a full-page printer. Receipt printers can be connected directly to a computer via USB, connected to a network via Ethernet, or connected via Bluetooth.

### **Scanner**

Up to two bar code scanners can be used at the same time. This capability supports scenarios where a scanner that is more mobile is required in order to scan large or heavy items, whereas a fixed embedded scanner is used for most standard-sized items, to speed up checkout times. Scanners can be supported through OPOS, Universal Windows Platform (UWP), or keyboard wedge interfaces. USB or Bluetooth can be used to connect a scanner to a computer.

### **MSR**

One USB magnetic stripe reader (MSR) can be set up by using OPOS drivers. If you want to use a stand-alone MSR for electronic funds transfer (EFT) payment transactions, the MSR must be managed by a payment connector. Stand-alone MSRs can be used for customer loyalty entry, employee sign-in, and gift card entry, independently of the payment connector.

### **Cash drawer**

Two cash drawers can be supported per hardware profile. This capability enables two active shifts per register to be available at the same time. In the case of a shared shift, or a cash drawer that is used by multiple mobile POS devices at the same time, only one cash drawer is allowed per hardware profile. Cash drawers can be connected directly to a computer via USB, connected to a network, or connected to a receipt printer via an RJ12 interface. In some cases, cash drawers can also be connected via Bluetooth.

### **Line display**

Line displays are used to show products, transaction balances, and other useful information to the customer during a transaction. One line display can be connected to the computer via USB by using OPOS drivers.

### **Signature capture**

Signature capture devices can be connected directly to a computer via USB by using OPOS drivers. When signature capture is configured, the customer is prompted to sign on the device. After the signature is provided, it's shown to the cashier for acceptance.

### **Scale**

Scales can be connected to the computer via USB by using OPOS drivers. When a product that is marked as a "Weighed" product is added to a transaction, the POS reads the weight from the scale, adds the product to the transaction, and uses the quantity that the scale provided.

### **PIN pad**

Personal identification number (PIN) pads are supported through OPOS, but they must be managed via a payment connector.

## Secondary display

When a secondary display is configured, the number 2 Windows display is used to show basic information. The purpose of the secondary display is to support independent software vendor (ISV) extension, because out of the box, the secondary display isn't configurable and shows limited content.

## Payment device

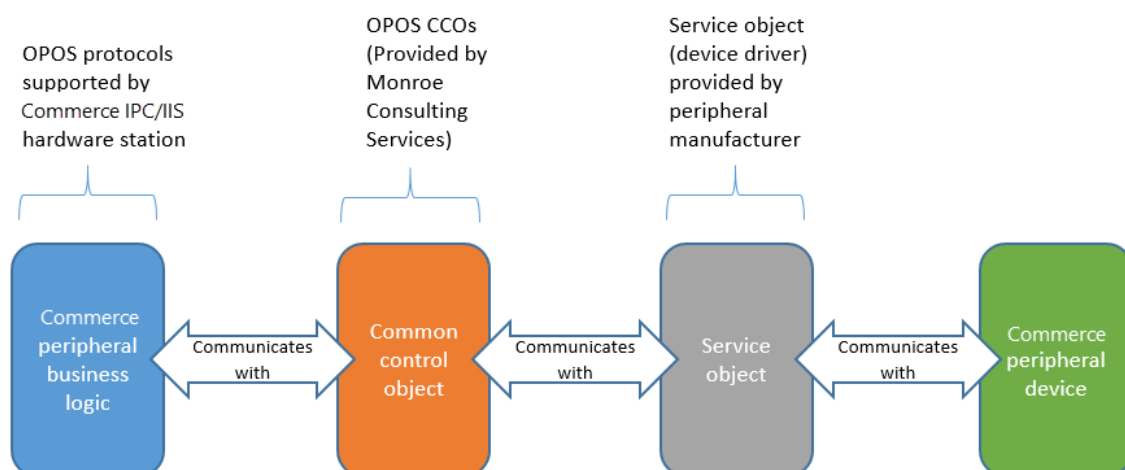

Payment device support is implemented through the payment connector. Payment devices can perform one or many of the functions that other device classes provide. For example, a payment device can function as an MSR/card reader, line display, signature capture device, or PIN pad. Support for payment devices is implemented independently of the stand-alone device support that is provided for other devices that are included in the hardware profile.

# Supported interfaces

## OPOS

To help guarantee that the largest range of devices can be used with Commerce, the OLE for POS industry standard is the primary peripheral device platform that is supported. The OLE for POS standard was produced by the National Retail Federation (NRF), which establishes industry-standard communication protocols for peripheral devices. OPOS is a widely adopted implementation of the OLE for POS standard. It was developed in the mid-1990s and has been updated several times since then. OPOS provides a device driver architecture that enables easy integration of POS hardware with Windows-based POS systems. OPOS controls handle communication between compatible hardware and the POS software. An OPOS control consists of two parts:

- **Control object** – The control object for a device class (such as line displays) provides the interface for the software program. Monroe Consulting Services ([www.monroeecs.com](http://www.monroeecs.com)) provides a standardized set of OPOS control objects that are known as the common control objects (CCOs). The CCOs are used to test the POS component of Commerce. Therefore, the testing helps guarantee that, if Commerce supports a device class through OPOS, many device types can be supported, provided that the manufacturer provides a service object that is built for OPOS. You don't have to explicitly test each device type.
- **Service object** – The service object provides communication between the control object (CCO) and the device. Typically, the service object for a device is provided by the device manufacturer. However, in some cases, you might have to download the service object from the manufacturer's website. For example, a more recent service object might be available. To find the address of the manufacturer's website, see your hardware documentation.

Support for the OPOS implementation of OLE for POS helps guarantee that, if the device manufacturers and

POS publishers implement the standard correctly, POS systems and supported devices can work together, even if they weren't previously tested together.

#### NOTE

OPOS support doesn't guarantee support for all devices that have OPOS drivers. Commerce must first support that device type, or class, through OPOS. In addition, service objects might not always be up to date with the latest version of the CCOs. You should also be aware that, in general, the quality of service objects varies.

## Windows

Receipt printing at the POS is optimized for OPOS. OPOS tends to be much faster than printing through Windows. Therefore, it's a good idea to use OPOS, especially in environments where 40-column receipts are printed and transaction times must be fast. For most devices, you will use OPOS controls. However, some OPOS receipt printers also support Windows drivers. By using a Windows driver, you can access the latest fonts and network one printer for multiple registers. However, there are drawbacks to using Windows drivers. Here are some examples of these drawbacks:

- When Windows drivers are used, images are rendered before printing occurs. Therefore, printing tends to be slower than it is on printers that use OPOS controls.
- Devices that are connected through the printer ("daisy-chained") might not work correctly when Windows drivers are used. For example, the cash drawer might not open, or the slip printer might not work as you expect.
- OPOS also supports a more extensive set of variables that are specific to receipt printers, such as paper cutting or slip printing.
- Windows printers are not supported through the IIS hardware station.

If OPOS controls are available for the Windows printer that you're using, the printer should still work correctly with Commerce.

## Universal Windows Platform

UWP, in the case of peripherals, is related to Windows support for Plug and Play devices. When a Plug and Play device is connected to a Windows OS version that supports that type of device, no driver is required for the device to be used as intended. For example, if Windows detects a Bluetooth speaker device, the OS knows that the device has the **Speaker** class type. Therefore, and it treats that device as a speaker. No additional setup is required. In the case of POS devices, many USB devices can be plugged in, and Windows will recognize them as Human Interface Devices (HIDs). However, it might not be able to determine the capabilities that the device provides, because the device doesn't specify the class, or type, of device. In Windows 10, device classes for bar code scanners and MSRs have been added. Therefore, if a device declares itself to Windows 10 as a device of one of these classes, Windows will listen for events from the device at the appropriate times. Modern POS supports UWP MSRs and scanners. Therefore, when it's ready for input from one of these devices, and a device that belongs to one of these classes is connected, the device can be used. For example, if a UWP bar code scanner is plugged into a Windows 10 computer, and bar code sign-in is configured for Modern POS, the bar code scanner will become active on the sign-in screen. No additional setup is required. Additional classes of point of service UWP devices are being added to Windows. These classes include classes for cash drawers and receipt printers. Support for these new device classes in Modern POS is pending.

## Keyboard wedge

Keyboard wedge devices send data to the computer as if that data were typed on a keyboard. Therefore, by default, the field that is active at the POS will receive the data that is scanned or swiped. In some cases, this behavior can cause the wrong type of data to be scanned into the wrong field. For example, a bar code might be scanned into a field that is intended for input of credit card data. In many cases, there is logic at the POS that determines whether the data that is scanned or swiped is a bar code or card swipe. Therefore, the data is handled correctly. However, when devices are set up as OPOS instead of keyboard wedge devices, there is more

control over how the data from those devices can be consumed, because more is "known" about the device that the data originates from. For example, data from a bar code scanner is automatically recognized as a bar code, and the associated record in the database is found more easily and faster than if a generic string search were used, as in the case of keyboard wedge devices.

### **Native printer**

Native (or "Device" as the type is named in the hardware profile) printers can be configured to prompt the user to select a printer that is configured for the computer. When a printer of the **Device** type is configured, if Modern POS encounters a print command, the user is prompted to select a printer in a list. This behavior differs from the behavior for Windows drivers, because the **Windows** printer type in the hardware profile doesn't show a list of printers. Instead, it requires that a named printer be provided in the **Device name** field.

### **Network**

Network-addressable cash drawers, receipt printers, and payment terminals can be used over a network, either directly through the Interprocess Communications (IPC) hardware station that is built into the Modern POS for Windows application or through the IIS hardware station for other Modern POS clients.

## Hardware station deployment options

### **Dedicated**

Modern POS clients for Windows and Android include **Dedicated** or built-in hardware stations. Those clients can communicate directly with peripherals using business logic that is built into the applications. The Android application only supports network devices. For more information on peripheral support for the Android, visit the [Set up POS hybrid app on Android and iOS](#) article.

To use the dedicated hardware station, assign a hardware profile to a register that will use the Modern POS for Windows or Android applications. Then create a hardware station of the **Dedicated** type for the store where the register will be used. Start the Modern POS in non-drawer mode and use the **Manage hardware stations** operation to turn on the hardware station capabilities, the dedicated hardware station will be active by default. Next, log out of the Modern POS, then log back in and open a shift and the peripherals configured in the hardware profile will be usable.

### **Shared**

Also sometimes referred to as the "IIS" hardware station, "IIS" implying that the POS application connects to the hardware station via Microsoft Internet Information Services. The POS application connects to the IIS hardware station via web services that run on a computer where the devices are connected. When the shared hardware station is used, the peripherals that are connected to a hardware station can be used by any POS register that is on the same network as the IIS hardware station. Because only Modern POS for Windows and Android include built-in support for peripherals, all other Modern POS applications must use the IIS hardware station to communicate with POS peripherals that are configured in the hardware profile. Therefore, each instance of the IIS hardware station requires a computer that runs the web service and application that communicates with the devices.

The shared hardware station can be used to allow multiple point of sale clients to share peripherals or can be used to manage a committed set of peripherals for a single point of sale.

When a hardware station is used to support sharing of peripherals between multiple POS clients, only cash drawers, receipt printers, and payment terminals should be used. You can't directly connect stand-alone bar code scanners, MSRs, line displays, scales, or other devices. Otherwise, conflicts will occur when multiple POS devices try to claim those peripherals at the same time. Here is how conflicts are managed for supported devices:

- **Cash drawer** – The cash drawer is opened via an event that is sent to the device. The only issue that can occur when a cash drawer is called occurs if the cash drawer is already open. In the case of shared hardware stations, the cash drawer should be set to **Shared** in the hardware profile. This setting prevents the POS

from checking whether the cash drawer is already open when it sends open commands.

- **Receipt printer** – If two receipt printing commands are sent to the hardware station at the same time, one of the commands can be lost, depending on the device. Some devices have internal memory or pooling that can prevent this issue. If a print command isn't successful, the cashier receives an error message and can retry the print command from the POS.
- **Payment terminal** – If a cashier tries to tender a transaction on a payment terminal that is already being used, a message notifies the cashier that the terminal is being used and asks the cashier to try again later. Usually, cashiers can see that a terminal is already being used and will wait until the other transaction is completed before they try to tender again.

Validation is planned for a future release, to detect whether unsupported devices are set up for a hardware profile that is mapped to a shared hardware station. If any unsupported devices are detected, the user will receive a message that states that the devices aren't supported for shared hardware stations. In the case of shared hardware stations, the **Select upon tendering** option is set to **Yes** at the register level. The POS user is then prompted to select a hardware station when a tender is selected for a transaction at the POS. When the hardware station is selected only at the time of tender, the hardware station selection is added directly to the POS workflow for mobile scenarios. As an additional benefit, the line display on the payment terminal isn't used for shared scenarios. If the payment terminal is used as a line display, other users might be blocked from using that terminal until the transaction is completed. In mobile scenarios, lines might be added to a transaction over a longer period. Therefore, the **Select upon tendering** option is required in order to ensure optimum device availability.

### **Network peripherals**

The network designation for devices in the hardware profile enables cash drawers, receipt printers, and payment terminals to be connected via a network connection.

### **Modern POS for Windows**

You can specify IP addresses for network peripherals in two places. If the Modern POS Windows client is using a single set of network peripherals, you should set the IP addresses for those devices by using the **IP configuration** option on the Action Pane for the register itself. In the case of network devices that will be shared among POS registers, a hardware profile that has network devices assigned to it can be mapped directly to a shared hardware station. To assign IP addresses, select that hardware station on the **Stores** page, and then use the **IP configuration** option in the **Hardware stations** section to specify the network devices that are assigned to that hardware station. For hardware stations that have only network devices, you don't have to deploy the hardware station itself. In this case, the hardware station is required only in order to conceptually group network-addressable devices according to their location in the store.

### **Cloud POS and Modern POS for iOS**

The logic that drives physically connected and network-addressable peripherals is contained in the hardware station. Therefore, for all POS clients except Modern POS for Windows and Android, an IIS hardware station must be deployed and active to enable the POS to communicate with peripherals, regardless of whether those peripherals are physically connected to a hardware station or addressed over the network.

## Setup and configuration

### **Hardware station installation**

For information, see [Configure and install hardware station](#).

### **Modern POS for Windows setup and configuration**

For information, see [Configure, install and activate Modern POS \(MPOS\)](#).

### **Modern POS for Android and iOS setup and configuration**

For information, see [Set up POS hybrid app on Android and iOS](#).

## OPOS device setup and configuration

For more information about OPOS components, see the "Supported interfaces" section of this document. Typically, OPOS drivers are provided by the device manufacturer. When an OPOS device driver is installed, it adds a key to the Windows registry in one of the following locations:

- **32-bit system:** HKEY\_LOCAL\_MACHINESOFTWAREOLEforRetailServiceOPOS
- **64-bit system:** HKEY\_LOCAL\_MACHINESOFTWAREWOW6432NodeOLEforRetailServiceOPOS

Within the ServiceOPOS registry location, configured devices are organized according to the OPOS device class. Multiple device drivers are saved.

## Supported scenarios by hardware station type

### Client support – IPC hardware station vs. IIS hardware station

The following table shows the topologies and deployment scenarios that are supported.

CLIENT	IPC HARDWARE STATION	IIS HARDWARE STATION
Windows app	Yes	Yes
Cloud POS	No	Yes
Android	Yes	Yes
iOS	No	Yes

### Network peripherals

Network peripherals can be supported directly through the hardware station that is built into the Modern POS for Windows and Android applications. For all other clients, you must deploy an IIS hardware station.

CLIENT	IPC HARDWARE STATION	IIS HARDWARE STATION
Windows app	Yes	Yes
Cloud POS	No	Yes
Android	Yes	Yes
iOS	No	Yes

## Supported device types by hardware station type

### Modern POS for Windows with an IPC (built-in) hardware station

SUPPORTED DEVICE CLASS	SUPPORTED INTERFACES
Printer	<ul style="list-style-type: none"><li>• OPOS</li><li>• Windows driver</li><li>• Device</li><li>• Network</li></ul>

SUPPORTED DEVICE CLASS	SUPPORTED INTERFACES

Line display	OPOS
Dual display	Windows driver
MSR	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• UWP (No setup is required.)</li> <li>• Keyboard wedge (No setup is required.)</li> </ul>
Drawer	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul> <p><b>Note:</b> Only one drawer can be set up if <b>Use shared shift</b> is configured on the drawer.</p>
Drawer 2	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul> <p><b>Note:</b> Only one drawer can be set up if <b>Use shared shift</b> is configured on the drawer.</p>
Scanner	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• UWP (No setup is required.)</li> <li>• Keyboard wedge (No setup is required.)</li> </ul>
Scanner 2	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• UWP (No setup is required.)</li> <li>• Keyboard wedge (No setup is required.)</li> </ul>
Scale	OPOS
PIN pad	OPOS (Support is provided through customization of the payment connector.)
Signature capture	OPOS
Payment terminal	<ul style="list-style-type: none"> <li>• Custom device support</li> <li>• Network (For more information, see the payment connector documentation.)</li> </ul>

### All Modern POS clients that have a committed "Shared" IIS hardware station

#### NOTE

When the IIS hardware station is "committed" there is a one-to-one relationship between the POS client and the hardware station.

SUPPORTED DEVICE CLASS	SUPPORTED INTERFACES
Printer	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul>
Printer 2	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul>
Line display	OPOS
MSR	OPOS
Drawer	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul> <p><b>Note:</b> Only one drawer per hardware profile can be set up if <b>Use shared shift</b> is configured on the drawer.</p>
Drawer 2	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul>
Scanner	OPOS
Scanner 2	OPOS
Scale	OPOS
PIN pad	OPOS (Support is provided through customization of the payment connector.)
Sig. capture	OPOS
Payment terminal	<ul style="list-style-type: none"> <li>• Custom device support</li> <li>• Network (For more information, see the payment connector documentation.)</li> </ul>

### All Modern POS clients shared an IIS hardware station

#### NOTE

When the IIS hardware station is "shared," multiple devices can use the hardware station at the same time. For this scenario, you should use only the devices that are listed in the following table. If you try to share devices that aren't listed here, such as bar code scanners and MSRs, errors will occur when multiple devices try to claim the same peripheral. In the future, such a configuration will be explicitly prevented.

SUPPORTED DEVICE CLASS	SUPPORTED INTERFACES
Printer	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul>

SUPPORTED DEVICE CLASS	SUPPORTED INTERFACES
Printer 2	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul>
Drawer	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul> <p><b>Note:</b> Only one drawer per hardware profile can be set up if <b>Use shared shift</b> is configured on the drawer.</p>
Drawer 2	<ul style="list-style-type: none"> <li>• OPOS</li> <li>• Network</li> </ul>
Payment terminal	<ul style="list-style-type: none"> <li>• Custom device support</li> <li>• Network (For more information, see the payment connector documentation.)</li> </ul>

## Configuration for supported scenarios

For more information about how to create hardware profiles, see [Define and maintain channel clients, including registers and hardware stations](#).

### Modern POS for Windows with an IPC (built-in) hardware station

This configuration is the most typical configuration for traditional, fixed POS registers. For this scenario, the hardware profile information is mapped directly to the register itself. The EFT terminal number should also be set on the register itself. To set up this configuration, follow these steps.

1. Create a hardware profile where all the required peripherals are configured.
2. Map the hardware profile to the POS register.
3. Create a hardware station of the **Dedicated** type for the store where the POS register will be used. A description is optional.

#### NOTE

You don't have to set any other properties on the hardware station. All other required information, such as the hardware profile, will come from the register itself.

4. Click **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
5. Select the **1090** distribution schedule to sync the new hardware profile to the store. Click **Run now** to sync changes to the POS.
6. Select the **1040** distribution schedule to sync the new hardware station to the store. Click **Run now** to sync changes to the POS.
7. Install and activate Modern POS for Windows.
8. Start Modern POS for Windows, and begin to use the connected peripheral devices.

### Modern POS for Android with an IPC (built-in) hardware station

**New for 10.0.8** - Epson network printers and cash drawers connected to those printers via DK port are now supported for the Modern POS for Android app. For details, visit the [Set up POS hybrid app on Android and iOS](#) article.

### All Modern POS clients that have a committed, shared IIS hardware station

This configuration can be used for all Modern POS clients that have a hardware station that is used exclusively by one POS register. To set up this configuration, follow these steps.

1. Create a hardware profile where all the required peripherals are configured.
2. Create a hardware station of the **Dedicated** type for the store where the POS register will be used.
3. On the dedicated hardware station, set the following properties:

- **Host name** – The name of the host computer where the hardware station will run.

#### NOTE

Cloud POS can resolve **localhost** to determine the local computer where Cloud POS is running. However, the certificate that is required in order to pair Cloud POS with the hardware station must also have "localhost" as the computer name. To avoid issues, we recommend that you list an instance of each dedicated hardware station for the store, as required. For each hardware station, the host name should be the specific computer name where the hardware station will be deployed.

- **Port** – The port to use for the hardware station to communicate with the Modern POS client.
  - **Hardware profile** – If the hardware profile isn't provided on the hardware station itself, the hardware profile that is assigned to the register will be used.
  - **EFT POS number** – The EFT terminal ID to use when EFT authorizations are sent. This ID is provided by the credit card processor.
  - **Package name** – The hardware station package to use when the hardware station is deployed.
4. Click **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
  5. Select the **1090** distribution schedule to sync the new hardware profile to the store. Click **Run now** to sync changes to the POS.
  6. Select the **1040** distribution schedule to sync the new hardware station to the store. Click **Run now** to sync changes to the POS.
  7. Install the hardware station. For more information about how to install the hardware station, see [Configure and install Retail hardware station](#).
  8. Install and activate Modern POS. For more information about how to install Modern POS, see [Configure, install and activate Modern POS \(MPOS\)](#).
  9. Sign in to Modern POS, and select **Perform non-drawer operations**.
  10. Start the **Manage hardware stations** operation.
  11. Click **Manage**.
  12. On the hardware station management page, set the option to turn on the hardware station.
  13. Select the hardware station to use, and then click **Pair**.
  14. After the hardware station is paired, click **Close**.
  15. On the hardware station selection page, click the recently selected hardware station to make it active.

## All Modern POS clients that have a shared IIS hardware station

This configuration can be used for all Modern POS clients that share hardware stations with other devices. To set up this configuration, follow these steps.

1. Create a hardware profile where the required peripherals are configured.
2. Create a hardware station of the **Shared** type for the store where the POS register will be used.
3. On the shared hardware station, set the following properties:
  - **Host name** – The name of the host computer where the hardware station will run.
  - **Description** – Text that will help identify the hardware station, such as **Returns** or **Front of store**.
  - **Port** – The port to use for the hardware station to communicate with the Modern POS client.
  - **Hardware profile** – For shared hardware stations, each hardware station should have a hardware profile. Hardware profiles can be shared among hardware stations, but they must be mapped to each hardware station. In addition, we recommend that you use shared shifts when multiple devices use the same shared hardware station. To set up a shared shift, click **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**. For each shared hardware profile, select the cash drawer, and set the **Shared shift drawer** option to **Yes**.
  - **EFT POS number** – The EFT terminal ID to use when EFT authorizations are sent. This ID is provided by the credit card processor.
  - **Package name** – The hardware station package to use when the hardware station is deployed.
4. Repeat steps 2 and 3 for each additional hardware station that is required in the store.
5. Click **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
6. Select the **1090** distribution schedule to sync the new hardware profile to the store. Click **Run now** to sync changes to the POS.
7. Select the **1040** distribution schedule to sync the new hardware station to the store. Click **Run now** to sync changes to the POS.
8. Install the hardware station on each host computer that you set up in steps 2 and 3. For more information about how to install the hardware station, see [Configure and install Retail hardware station](#).
9. Install and activate Modern POS. For more information about how to install Modern POS, see [Configure, install, and activate Modern POS \(MPOS\)](#).
10. Sign in to Modern POS, and select **Perform non-drawer operations**.
11. Start the **Manage hardware stations** operation.
12. Click **Manage**.
13. On the hardware station management page, set the option to turn on the hardware station.
14. Select the hardware station to use, and then click **Pair**.
15. Repeat step 14 for each hardware station that Modern POS will use.
16. After all the required hardware stations are paired, click **Close**.
17. On the hardware station selection page, click the recently selected hardware station to make it active.

#### NOTE

If devices often use different hardware stations, we recommend that you configure Modern POS to prompt cashiers to select a hardware station when they begin the tender process. Click **Retail and Commerce** > **Channel setup** > **POS setup** > **Registers**. Select the register, and then set the **Select upon tender** option to **Yes**. Use the **1090** distribution schedule to sync changes to the channel database.

## Extensibility

For information about extensibility scenarios for the hardware station, see [Hardware Station extensibility](#).

## Security

According to current security standards, the following settings should be used in a production environment:

### Hardware station installer

The hardware station installer will automatically make these registry edits as part of the installation through self-service.

- Secure Sockets Layer (SSL) should be disabled.
- Only Transport Layer Security (TLS) version 1.2 (or the current highest version) should be enabled and used.

### SSL and TLS

By default, SSL and all version of TLS except TLS 1.2 are disabled. To edit or enable these values, follow these steps: 1. Press the Windows logo key+R to open a **Run** window. 2. In the **Open** field, type **Regedit**, and then click **OK**. 3. If a **User Account Control** message box appears, click **Yes**. 4. In the **Registry Editor** window, navigate to **HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\SecurityProviders\SCHANNEL\Protocols**. The following keys have been automatically entered to allow for TLS 1.2 only: - TLS 1.2Server:Enabled=1 - TLS 1.2Server:DisabledByDefault=0 - TLS 1.2Client:Enabled=1 - TLS 1.2Client:DisabledByDefault=0 - TLS 1.1Server:Enabled=0 - TLS 1.1Client:Enabled=0 - TLS 1.0Server:Enabled=0 - TLS 1.0Client:Enabled=0 - SSL 3.0Server:Enabled=0 - SSL 3.0Client:Enabled=0 - SSL 2.0Server:Enabled=0 - SSL 2.0Client:Enabled=0

- No additional network ports should be open, unless they are required for known, specified reasons.
- Cross-origin resource sharing must be disabled and must specify the allowed origins that are accepted.
- Only trusted certificate authorities should be used to obtain certificates that will be used on computers that run the hardware station.

#### NOTE

It's very important that you review security guidelines for IIS and the Payment Card Industry (PCI) requirements.

## Peripheral simulator

For information, see [Peripheral simulator for Commerce](#).

## Microsoft-tested peripheral devices

### IPC (built-in) hardware station

The following peripherals were tested by using the IPC hardware station that is built into Modern POS for Windows.

#### Printer

MANUFACTURER	MODEL	INTERFACE	COMMENTS

## Troubleshooting

### Modern POS can detect the hardware station in its list for selection, but it can't complete the pairing

**Solution:** Verify the following list of potential failure points:

- The computer that is running Modern POS trusts the certificate that is used on the computer that runs the hardware station.
  - To verify this setup, in a web browser, go to the following URL: <https://<Computer Name>:<Port Number>/HardwareStation/ping>.
  - This URL uses a ping to verify that the computer can be accessed, and the browser indicates whether the certificate is trusted. (For example, in Internet Explorer, a lock icon appears in the address bar. When you click this icon, Internet Explorer verifies whether the certificate is currently trusted. You can install the certificate on the local computer by viewing the details of the certificate that is shown.)
- On the computer that runs the hardware station, the port that will be used by the hardware station is opened in the firewall.
- The hardware station has correctly installed merchant account information through the Install merchant information tool that runs at the end of the hardware station installer.

### Modern POS can't detect the hardware station in its list for selection

**Solution:** Either of the following factors can cause this issue:

- The hardware station hasn't been set up correctly in headquarters. Use the steps earlier in this topic to verify that the hardware station profile and the hardware station are correctly entered.
- The jobs haven't been run to update the channel configuration. In this case, run the 1070 job for channel configuration.

### Modern POS doesn't reflect new cash drawer settings

**Solution:** Close the current batch. Changes to the cash drawer aren't updated to Modern POS until the current batch is closed.

## Modern POS is reporting an issue with a peripheral

**Solution:** Here are some typical causes of this issue:

- Make sure that other device driver configuration utilities are closed. If these utilities are open, they might prevent Modern POS or the hardware station from claiming the device.
- If the peripheral is shared with multiple POS devices, make sure that it belongs to one of the following categories:
  - Cash drawer
  - Receipt printer
  - Payment terminal

If the peripheral doesn't belong to one of these categories, the hardware station isn't designed to enable the peripheral to be shared among multiple POS devices.

- Sometimes, device drivers can cause the common control objects (CCOs) to stop working correctly. If a device has recently been installed, but it isn't working properly or you notice other issues, you can often resolve the issue by reinstalling the CCOs. To download the CCOs, visit [http://monroecs.com/oposccos\\_current.htm](http://monroecs.com/oposccos_current.htm).
- If you make frequent peripheral changes during testing or troubleshooting, you might have to reset IIS instead of waiting for the cache to refresh itself. To reset IIS, follow these steps:
  1. From the **Start** menu, type **CMD**.
  2. In the search results, right-click **Command prompt**, and then click **Run as administrator**.
  3. In the **Command prompt** window, type **iisreset /Restart** and then press Enter.
  4. After IIS has restarted, restart Modern POS.
- While you're making frequent changes to peripheral devices, if you also frequently start and exit the POS client, the dllhost process from a previous POS session can interfere with the current session. In this case, a device might not be usable until you close the dynamic-link library (DLL) host that is managing the previous session. To close the DLL host, follow these steps:
  1. From the **Start** menu, type **Task manager**.
  2. In the search results, click **Task manager**.
  3. In Task manager, on the **Details** tab, click the column header that is labeled **Name** to sort the table alphabetically by name.
  4. Scroll down until you find dllhost.exe.
  5. Select each DLL host, and then click **End task**.
  6. After the DLL hosts have been closed, restart Modern POS.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Peripheral simulator for Commerce

2/18/2021 • 28 minutes to read • [Edit Online](#)

The peripheral simulator is a utility that Microsoft provides as part of Microsoft Dynamics 365 Commerce and as a standalone utility. The utility has two primary components, a *virtual peripheral simulator* and a *point of sale (POS) simulator*.

The virtual peripheral simulator is provided primarily to support testing of scenarios that usually require physical POS peripheral devices. The POS simulator is used to test the compatibility of physical peripheral devices without having to deploy the POS client.

## Install the peripheral simulator

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**.
2. Click **Download**, and then click **PeripheralSimulator**.

### NOTE

You must turn off pop-up blockers before you can download the peripheral simulator.

3. After the download is completed, open the **Downloads** folder, and double-click **VirtualPeripherals.msi** to start the installer.
4. Install the peripheral simulator by using the default settings.

Besides the peripheral simulator, you must install the common control objects from Monroe Consulting Services. Otherwise, the peripheral simulator won't work correctly. To download the common control objects, go to [http://monroecs.com/oposccos\\_current.htm](http://monroecs.com/oposccos_current.htm).

## Virtual peripheral simulator

The virtual peripheral simulator helps you set up, test, and troubleshoot peripheral devices. It can be used to streamline the testing of peripherals, and to isolate issues that are caused by incorrect setup or malfunctioning device drivers. The peripheral simulator includes a desktop program that features virtual versions of devices that Commerce supports. A section for each virtual device shows the interaction between the device and the POS. You can also use it to provide input that is valid for various POS scenarios. The peripheral simulator supports interaction between the POS and the following virtual devices:

- **Printer** – The virtual peripheral simulator can show receipts that are configured for a POS printer.
- **Line display** – You can configure a virtual line display to show activity on a physical line display.
- **Magnetic stripe reader (MSR)** – You can send simulated magnetic stripe events to the POS from the virtual peripheral simulator.
- **Drawer** – You can simulate a physical cash drawer.
- **Drawer 2** – By setting up a second cash drawer in the peripheral simulator, you can simulate scenarios that involve a single POS register that has two active shifts.
- **Scanner** – The virtual bar code scanner that the virtual peripheral simulator supports can issue bar code scan events.

- **Scale** – A virtual scale lets you simulate the interaction of weighed items with the POS.
- **Personal identification number (PIN) pad** – You can simulate PIN pad operations.

#### NOTE

You must implement support for a physical PIN pad through the payment connector.

- **Signature capture** – The virtual peripheral simulator includes a virtual signature capture device that you can set up to prompt for signatures that are required for some tenders, such as customer account payments.
- **Payment terminal** – A virtual payment terminal can be used in conjunction with a custom payment connector to test application programming interface (API) calls from the POS to a virtual payment device. To use the virtual payment terminal, you must implement a payment connector. For more information, see <Implementing a payment connector and payment device (white paper)>.

You can also use the virtual peripheral simulator to simulate keyboard wedge events that originate from a bar code scanner and MSR. The virtual peripheral simulator specifically supports Object Linking and Embedding for Retail POS (OPOS) devices.

### Key scenarios – Virtual peripheral simulator

#### Troubleshooting

You can use the peripheral simulator to troubleshoot device setup. If you don't have the peripheral simulator or a second device of the same class, it can be difficult to determine where issues originate. However, when you have the peripheral simulator, you can set up virtual devices, and run the same code paths and business logic that are used for physical devices. From the perspective of the peripheral simulator, the main difference between virtual devices and physical devices is the service object, or device driver. For physical devices, the service object is provided by the device manufacturer. By contrast, for virtual devices, the service objects are provided as part of the peripheral simulator. When the peripheral simulator is working correctly, if a device doesn't work correctly after the device name in the hardware profile is changed to the name of a real device, you can assume that there's an issue with the service object that the manufacturer provided.

#### Training

You can use the peripheral simulator to add a realistic layer to cashier training when a physical hardware setup isn't available. When the peripheral simulator is included in training scenarios, the cashier can more effectively interact with the POS by providing input such as product bar code scans and gift card swipes, and by observing which receipts are printed for a specific transaction.

#### Testing

You can use the peripheral simulator to test product bar codes, receipt formats, and so on, without having to deploy physical hardware in a virtual environment. Because physical hardware isn't required, and you don't have to deploy a POS client on a hardware station or a physical computer, you can more quickly test changes that are made in the back office.

### Set up the virtual peripheral simulator

#### Set up a hardware profile

1. To set up the peripheral simulator, go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**.
2. Click **New** to create a profile.
3. Enter values in the **Profile number** and **Description** fields.
4. Use the following table to set up the virtual devices that must be tested. Here is an explanation of the columns in the table:

- **Device** – This column gives the name of the FastTab where you set up the device.
- **Device type** – This column gives the value that you select in the field that is labeled with the name of the device.
- **Device name** – This column gives the exact value that you enter for the device name.

**IMPORTANT**

The device names that are given here are required, because the hardware station uses these specific names to address the devices. If you don't use the following specific names, the device won't be usable.

No specific setup in the hardware profile is required in order to simulate keyboard wedge events from the bar code scanner and MSR.

DEVICE	DEVICE TYPE	DEVICE NAME
Printer	OPOS	MockOPOSPrinter
Line display	OPOS	MockOPOSLineDisplay
MSR	OPOS	MockOPOSMSR
Drawer	OPOS	MockOPOSDrawer1
Drawer2	OPOS	MockOPOSDrawers
Scanner	OPOS	MockOPOSScanner
Scale	OPOS	MockOPOSScale
PIN Pad	OPOS	MockOPOSPinPad
Signature capture	OPOS	MockOPOSSignatureCapture

**Assign the hardware profile to a register**

1. After the hardware profile is created, go to **Retail and Commerce > Channel setup > POS setup > Registers**.
2. In the **POS registers** list, click the link in the **Register number** field for the register that should use the peripheral simulator.
3. Click **Edit**.
4. In the **Profiles** section, in the **Hardware profile** field, select the hardware profile that you created for virtual peripherals.
5. Click **Save**.

**Synchronize changes to the channel database**

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Select the **1090** distribution schedule.
3. Click **Run now** to synchronize changes to the POS.

After the data is synchronized, the new hardware profile and changes on the register are available in the channel database.

# Using the virtual peripheral simulator

To start the virtual peripheral simulator, click **Start** on your computer, type **Peripheral simulator**, and then select the app when it appears in the search results. After you start the peripheral simulator, click **Use virtual peripherals**. The supported devices will be listed as tabs on the left side of the window. To view a specific device, click the tab for that device.

## Line display capabilities

When the virtual line display is configured, it shows line items as they are scanned in the POS transaction. In addition to line items, the display shows the total that is due when a tender is selected at the POS. It also shows the balance that is due if a tender is entered but a balance is still due for the transaction. When the POS isn't being used, a message can be shown to indicate that the till is closed. You must configure the message on the **Line display** FastTab in the hardware profile.

## Cash drawer capabilities

When the hardware profile is configured to use virtual cash drawers, the POS opens the cash drawer for the active shift in response to drawer operations such as tender declarations. The POS also opens the cash drawer so that the cashier can make change or deposit cash during standard cash-and-carry transactions. The virtual cash drawers have the labels **Main drawer** and **Secondary drawer**. These labels represent Drawer and Drawer 2 in the hardware profile, respectively. When a drawer is closed, an image of a closed cash drawer is shown, and the button on the closed cash drawer is labeled **Open drawer**. If you click this button, the image is replaced with an image of an open cash drawer to indicate that the drawer is now open. The button on the open cash drawer is labeled **Close drawer**.

Several operations at the POS can cause the cash drawer to open. Most operations can't proceed while the cash drawer is open. The exceptions are some end-of-day procedures. If the POS user receives an error message that states that an operation can't be performed while the cash drawer is open, the user must close the virtual or physical cash drawer to proceed. If a cash drawer is marked as **Shared** in the hardware profile, the system doesn't verify that the drawer is closed before an operation. The operation proceeds as usual, even if the cash drawer is open. This behavior supports scenarios where cash drawers are shared among sales associates, and where one associate uses a cash drawer while another associate performs unrelated tasks on their own POS device. Changes that are made to the cash drawer aren't evident until the current shift is closed and a new shift is opened.

## MSR capabilities

The peripheral simulator provides robust support for virtual MSR operations by working in either OPOS mode or keyboard wedge mode. OPOS mode requires that the MSR be configured in the hardware profile to work as an OPOS device. Keyboard wedge mode just sends keyboard wedge data events to Microsoft Windows. Besides differences in setup, OPOS and keyboard wedge modes differ in the following ways:

- The POS client enables OPOS MSR devices for specific scenarios, such as scenarios that allow for magnetic stripe data for loyalty or gift card entry.
- In keyboard wedge mode, the peripheral simulator sends keyboard wedge data to the field that is active when the data is sent. This behavior resembles the behavior that occurs if the data is entered by using a keyboard. To use the MSR as a keyboard wedge, the user must switch to Modern POS (MPOS) to make sure that data is received in the correct field. Therefore, you can configure a delay, so that the user has time to make sure that the data will be sent to the correct field.

## Testing gift and payment card swipes

The virtual MSR that the peripheral simulator provides also lets you configure specific MSR data to test scenarios for gift and payment card swipes. To create a card, click the plus sign (+) button, and select the type of card. Then specify the card number or track data that should be sent to the POS, together with the expiration month and year for the card that you're defining. The value that you select in the **Type of card** field is just a label that can be mapped to a card. This label makes it easier to identify cards when they are swiped through the

peripheral simulator. You can select cards that have been configured in the peripheral simulator by using the left arrow (<) and right arrow (>) buttons above the image of the card. You can edit and delete cards by using the **Edit** and **Delete** buttons next to the plus sign (+) button.

### **PIN pad**

You can configure the PIN pad simulator to simulate an OPOS PIN pad. When an electronic funds transfer (EFT) transaction is performed at the POS and requires that a PIN be entered, the hardware station calls the PIN device to prompt for PIN entry. To work, the PIN pad in the peripheral simulator must support an EFT payment connector.

### **Printer**

The virtual peripheral printer just shows receipts as they are printed from the POS. If a print operation produces multiple receipts, you can scroll through the receipts.

#### **Configure receipt printing**

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**.
2. Select the hardware profile that you created for virtual peripherals.
3. On the **Printer** FastTab, click **Edit**.
4. In the **Receipt profile ID** field, select a receipt profile.
5. Click **Save**.

#### **Scale**

When a scale product is added to the POS transaction, and a scale is configured, the POS retrieves the weight from the scale. For both the virtual and physical scale, the product or weight should be specified before the product is added to the transaction. Before you add the scale product to the transaction, go to the scale in the peripheral simulator, and use the plus sign (+) and minus sign (–) buttons to adjust the weight that the scale should report. You can also enter the desired weight directly in the **Current value** field. You can adjust the units of weight for the scale by using the plus sign (+), **Edit**, and **Delete** buttons. In this way, units can be specified based on the products that are weighed or the locale where the scale is used.

#### **Configure a scale product**

1. Go to **Retail and Commerce > Products and categories > Released products by category**.
2. Open the product record.
3. Select the product to weigh.
4. On the **Retail and Commerce** FastTab, set the **Scale product** option from **No** to **Yes**.

#### **Synchronize changes to the channel database**

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Select the **1040** distribution schedule.
3. Click **Run now** to synchronize changes to the POS.

After the data is synchronized, when a scale product is added to the POS transaction, the POS checks the scale for the weight.

#### **Signature capture**

The virtual signature capture device prompts the user to provide a signature on the virtual signature capture pad when the tender that is used requires a signature. The user can accept the signature to show it at the POS. The cashier can then accept the signature. The signature is then saved together with the tender and is synchronized to the back office together with other transaction data.

#### **Set up a tender to require a signature**

1. Go to **Retail and Commerce > Channels > Stores > All stores**.
2. Select the store.
3. Click **Edit**.
4. Click **Set up**, and then, in the **Set up** section, click **Payment methods**.

5. Click **Edit**.
6. Select the payment method that requires a signature.
7. In the **General** section, under **Signature Capture**, set the **Use signature capture device** option to **Yes**.
8. In the **Signature capture minimum amount** field, enter the minimum amount that should trigger signature capture.

Synchronize changes to the channel database

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Select the **1070** distribution schedule.
3. Click **Run now** to synchronize changes to the POS.

After the data is synchronized, when a tender is used that requires a signature, and the amount meets the signature threshold, the POS prompts for a signature on the virtual signature capture device.

#### **Additional configuration**

You can edit the peripheral simulator's configuration file to more appropriately address the scenarios that you're testing. You can find the configuration file at C:\Program Files (x86)\Microsoft Dynamics 365\70\VirtualPeripherals\Microsoft.Dynamics.Commerce.VirtualPeripherals.Client.exe.config. The configuration file defines the units that are available for testing on the scale, the card types that are available for testing, and bar code types. For example, by modifying the text values in the configuration file, you can add a new card type or a new unit of measure that can be selected at runtime. The new values will appear after the app is restarted.

#### **Troubleshooting**

Activities for the peripheral simulator are logged in the peripheral simulator. You can find the log at C:\Program Files (x86)\Microsoft Dynamics 365\70\VirtualPeripherals\Microsoft.Dynamics.Commerce.VirtualPeripherals.Client.exe.config. The peripheral simulator also reports issues to the Windows event log, which you can access at **Application and Services Logs > Microsoft > DynamicsAX**.

If changes that you made to the hardware profile or other areas aren't evident when you use MPOS or the peripheral simulator, check the distribution scheduler jobs that you used to synchronize the data to the channel database. If the changes were synchronized but still aren't evident at the POS, restart the POS client.

Changes to configured cash drawers aren't effective until a new shift is created. Therefore, if you make changes to cash drawers, make sure that you always close the existing shift to test the new cash drawer setup.

Sometimes, if a manufacturer's driver is installed after the common control objects from Monroe Consulting Services, the driver can cause the common control objects to stop working correctly. In this case, you should reinstall the common control objects.

At install time, it's possible that certain assemblies related to the virtual peripheral simulator were registered incorrectly. This issue is often associated with an 'OPOS\_E\_CLOSED' error when attempting to use a virtual device. This can be corrected by running the Windows Assembly Registration tool. To register the assembly (called Microsoft.Dynamics.Commerce.VirtualPeripherals.ServiceObjects.dll), open a command prompt as administrator and run 'regasm /codebase "C:\Program Files (x86)\Microsoft Dynamics 365\70\Peripheral simulator for Retail\Microsoft.Dynamics.Commerce.VirtualPeripherals.ServiceObjects.dll"'.

## **POS simulator**

The POS simulator lets device manufacturers, independent software vendors (ISVs), and retailers test peripheral devices without having to deploy the POS. By using the same business logic for peripherals as MPOS and the standalone hardware station, the POS simulator can determine device driver compatibility with the POS as a standalone utility. Therefore, device selection can occur independently of POS setup and deployment.

The POS simulator is also provided as a standalone utility that is independent of Commerce. As a standalone utility, the POS simulator is primarily used to test peripheral device compatibility. Only devices that are tested by

using the POS simulator are acceptable for new deployments of the POS. Testing should be driven by the device manufacturers themselves. Parts of the POS simulator overview are intended to explain how the POS simulator is used for compatibility testing. Manufacturers that are interested in testing their devices for compatibility with the POS or standalone hardware station should send an email to [drpc@microsoft.com](mailto:drpc@microsoft.com) to request information about the program.

### Using the POS simulator

1. Click **Start** on your computer, type **Peripheral simulator**, and then select the app when it appears in the search results.
2. Click **Use virtual peripherals**. The supported devices will be listed as tabs on the left side of the window. To view a specific device, click the tab for that device.

The POS simulator supports the following devices:

- Line display
- Cash drawer
- MSR
- PIN pad
- Printer
- Scale
- Signature capture pad
- Bar code scanner
- Payment terminal

#### NOTE

A payment terminal requires that a payment connector be present. For more information, see [Create an end-to-end payment integration for a payment terminal](#).

Below the list of supported devices, there is a **Settings** tab. You can use the **Settings** tab to specify how the POS simulator should communicate with the devices that are being tested. If **Runtime** is selected, the method that the POS simulator uses to communicate with the device resembles the method that MPOS that has a built-in hardware station communicates. If **Win32** is selected, the POS simulator communicates directly with the device. This communication method resembles the method that a standalone hardware station communicates.

On the **Settings** tab, you can also provide details about the user who is performing the tests. These details are important for manufacturers that perform compatibility testing.

### Configuring the POS simulator

For each supported device class, the POS simulator lets you set up multiple devices. For example, several printers can be configured in the POS simulator. Then, on the **Printer** tab, the user can cycle through the configured devices and test them as required.

The setup parameters that are available for a device depend on the type of device. To set up a new device, select the class of device to test, and then click the plus sign (+) button. A menu of the available device parameters appears.

To edit a device that has already been created, use the left arrow (<) and right arrow (>) buttons to find the appropriate device, and then click **Edit**.

### Configure an OPOS device

1. Select **OPOS** as the device type.
2. Select the name of the device driver. This value is required. This list includes all the OPOS service objects that are installed on the local machine where devices are being tested. You can also manually enter the device driver name.

**IMPORTANT**

Before you can test OPOS devices by using the POS simulator, OPOS common control objects must be installed. These objects are separate from the service objects that the manufacturer provides.

3. Enter data in the rest of the required fields.

**NOTE**

When you configure devices for testing, all fields are required, so that the POS simulator can confirm compatibility with the POS.

4. When the device is configured to the level that is required for either casual testing or compatibility testing, click **Save device**.

**Configure a network device**

The POS simulator can be used to test network devices. The following network devices are supported out of the box:

- **Cash drawer:** APG Atwood
- **Receipt printer:** Star TSP650II
- **Payment terminal:** Although a payment terminal can be configured as network devices, any testing of a payment terminal requires a custom payment connector.

**NOTE**

No payment terminals are supported out of the box.

1. Select **Network** as the device type.
2. Enter data for the rest of the fields.

**NOTE**

The fields for the device driver name, model, and version can help identify the version of the device-specific implementation that is being tested. Because devices tend to have their own communication protocol over IP, custom implementations should be labeled with specific attributes.

3. When the device is configured to the level that is required for either casual testing or compatibility testing, click **Save device**.

**Windows devices**

The POS simulator can also be used to test Windows printers. The setup parameters are the same as the parameters for OPOS devices.

1. Select **Printer** as the device type.
2. Enter data in the rest of the required fields.

#### NOTE

When you configure devices for testing, all fields are required, so that the POS simulator can confirm compatibility with the POS.

3. When the device is configured to the level that is required for either casual testing or compatibility testing, click **Save device**.

### Testing devices

Each device class has unique testing capabilities. In addition to device-specific tests, each device has a **Self-test** function.

When you're testing a device for compatibility, set up the device, and then click the green arrow to begin the self-test. For each device, a different set of tests is performed to determine the device's compatibility with the POS (in **Runtime** mode) or the standalone hardware station (in **Win32** mode). For some devices, the test requires user interaction. For example, the self-test for a bar code scanner requires that a bar code be scanned. Therefore, the self-test will instruct the user to scan a bar code.

Results from each self-test and each manual operation are shown in the **Log** section of the device test page. You can clear the **Log** section, or you can export the results and save them to a file. For information about how the exported log results can be used for official compatibility testing, see the "Instructions for device manufacturers" section later in this topic.

To stop a self-test, click the red square. For example, you might have to stop a self-test if the device becomes non-responsive. The red square can be used only when a self-test is in progress.

### Device-specific settings to be aware of

This section lists settings that you might require some help to complete.

#### Line display > Settings tab

To view the values that are entered in a free text field, click **Lock and claim** to claim the device.

1. Click **Display text**, and view the text that was sent to the device.
2. Click **Clear text** to clear the text from the line display.
3. Click **Release** to release the line display, so that it can be used for other processes.

#### Line display > Advanced tab settings

- **Binary conversion** – Some line displays require that text be converted into binary format. To determine whether this conversion is required, see the device's documentation.
- **Character set** – The code page for the characters that are sent to the device. For the identifiers of specific code pages, see [https://msdn.microsoft.com/library/windows/desktop/dd317756\(v=vs.85\).aspx](https://msdn.microsoft.com/library/windows/desktop/dd317756(v=vs.85).aspx).

#### MSR

- **Open and claim MSR** – Prepare the POS simulator to receive data from the MSR.
- **Release and close MSR** – Close the MSR device when testing is completed.
- **Card info** – Data from the card that was scanned on the MSR device.

#### IMPORTANT

Actual credit cards should never be used for device testing. Even expired credit cards should not be used for testing.

### PIN pad

#### Settings that appear on both tabs

- **Lock** – Lock the PIN pad device so that it can be used only with the POS simulator.
- **Get entry** – Enable the POS simulator to receive PIN data.
- **Cancel operation** – Cancel the request that was sent to the PIN pad.
- **Release** – Release the PIN pad device.

#### Settings tab

- **Amount** – The amount to send to the PIN pad device for customer acceptance.
- **Account number** – Specify the account number, if it's required.
- **Encrypted PIN** – The encrypted PIN that is received from the device.
- **Additional security data** – Specify the cryptography that is used for the encrypted PIN.

#### Advanced tab

- **Timeout** – Specify the number of seconds to wait for a response from the device.
- **Exclusive** – Require that the PIN pad device be claimed before it can be enabled.
- **Override** – Override previous commands that were sent to device when the device isn't responding.

#### Scale

- **Timeout** – The time-out interval. Product should be put on the scale before the weight is read. If the scale doesn't respond within the specified interval, the request is canceled.

#### Signature capture

##### Settings tab

- **Form name** – Some signature capture devices require a form name when the signature request is sent.
- **Signature (in HEX)** – The hex value for the signature data that is received from the device.
- **Rendered signature** – The image of the signature that is received from the device.

##### Advanced tab

- **Timeout** – The time-out interval. If the signature capture device doesn't respond within the specified interval, the request is canceled.
- **Exclusive** – Require that the PIN pad device be claimed before it can be enabled.
- **Override** – Override previous commands that were sent to device when the device isn't responding.
- **Lock** – Lock the device and claim it for use by the POS simulator.
- **Get entry** – Request the signature from the device.
- **Cancel operation** – Cancel the signature request.
- **Release** – Release the device so that it can be used by other processes.

#### Bar code scanner

- **Open and claim scanner** – Open and claim the scanner. The POS simulator can receive scan events after this operation is completed successfully.
- **Release and close the scanner** – Make the scanner available for other processes.
- **Scanned information** – The data that was received from the bar code scanner.

#### Payment terminal

##### Settings that appear on every tab

- **Select an operation** – Select a specific operation to perform on the device. Options include **All**, **Pay by card**, **Refund by card**, and **Void payment**.
- **Lock and claim** – Prepare the device so that it can be used by the POS simulator.
- **Update line items** – Send specified line item details to the device.
- **Authorize payment** – Instruct the payment connector to request payment authorization.

- **Capture payment** – Instruct the payment connector to capture the previous authorization.
- **Release** – Release the device.

### Settings tab

The **Settings** tab contains properties that are sent to the device when a payment authorization is requested.

- **Invoice number** – Specify the invoice number that is generated at the POS.
- **Test mode** – A value that indicates that a test transaction is being performed.
- **Payment connector** – The name of the payment connector to use.
- **Debit cashback limit** – The maximum amount of cash back that can be requested on the device when a debit transaction is performed.
- **Locale** – The locale that is used. Locales are defined in the configuration file for the POS simulator.
- **Maximum amount allowed** – The maximum amount that can be processed for a given transaction.
- **Minimum amount allowed** – The minimum amount that can be processed for a given transaction.
- **Signature capture minimum amount** – The lowest amount that the customer is prompted to provide a signature for.
- **Terminal ID** – The terminal ID that is included in the transaction properties that the processor provided.

### Lines tab

The **Lines** tab contains data that can be sent to the device when it's used as a line display.

- **Description** – The product description for the transaction line to show on the device.
- **Discount** – The discount amount that is applied to the transaction line.
- **Extended line with tax** – The product line amount. This amount includes tax.
- **Line item ID** – The product ID for the transaction line.
- **Quantity** – The quantity for the transaction line.
- **Stock keeping unit** – The unit of measure to show on the device.
- **Unit price** – The selling price for the transaction line.
- **Universal product code** – The bar code that was scanned for the transaction line.
- **Is voided** – A value that indicates that the transaction line has been voided from the transaction.

### Advanced tab

The **Advanced** tab contains subtotal information that can be shown on the device.

- **Discount amount** – The total amount for discounts on the transaction.
- **Subtotal amount** – The subtotal for the transaction. This amount doesn't include tax.
- **Tax amount** – The tax amount for the transaction.
- **Total amount** – The total amount that is due. This amount includes tax and discounts.
- **Currency** – The currency that is used for the transaction.

### Payment info tab

The **Payment info** tab contains data that is received from the payment connector after an authorization has been processed.

- **Is approved** – A value that indicates whether the authorization request is approved.
- **Card number masked** – The masked card number that is provided by the device. Typically, only the last four digits of the card number are shown.
- **Card type** – The issue for the card that is used in the transaction.
- **Approved amount** – The amount that is authorized for the card payment.
- **Payment SDK data** – Additional data that the payment software development kit (SDK) can provide, such as

the authorization code and other data that the payment processor provides.

- **Signature data** – Hexadecimal signature data that is provided by the device.
- **Payment errors** – Any errors that occurred during the authorization request.

## Instructions for device manufacturers

To submit a device so that it can be listed for compatibility with Commerce, follow these steps.

1. On the **Settings** tab, specify all contact information that is requested. All fields are required. The personal contact information is for Microsoft internal use. It will be used only if there are issues with devices that have been submitted as compatible.
2. For each device, on the **Devices** tab, set up the device, and provide values for all fields. For each permutation, a new device must be specified. For example, if a given device mode is tested for USB and serial, two compatibility reports must be submitted. Any variance from one device to the next should be indicated. Then, when devices are listed for compatibility, very specific information can be provided to people who implement the devices. The more information that can be provided about device compatibility, the higher the success rate for implementations and the fewer support issues will be raised.
3. After you've entered the required information for devices and settings, test the device.
  - a. Clear the log for the device that you're testing.
  - b. Click **Self-test**.
  - c. When a test has been completed successfully, export the test results, and save them. Give the file a name that will make the test easy to identify. We suggest that you use an abbreviated form of the manufacturer's name and the device model as the file name.

The following example shows the data that is included in the exported file.

```

<?xml version="1.0" encoding="utf-8"?>

</Report>

```

Eventually, the data that is included in the report (except personal contact information) will be listed on a device compatibility website. It will also be listed in design and deployment tools that are used to manage customer environments.

Successful logs should be sent to [drpc@microsoft.com](mailto:drpc@microsoft.com). Include the manufacturer's name and the device model in the subject line.

For support if you're performing compatibility tests, and for other inquiries, send an email to [drpc@microsoft.com](mailto:drpc@microsoft.com).

## Additional resources

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Connect peripherals to the point of sale (POS)

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic covers how to connect peripherals to your Retail POS.

## NOTE

For specific installation instructions, see [Configure and install Retail hardware station](#) and [Configure, install, and activate Modern POS \(MPOS\)](#).

## Key components

Several components are used to define the relationships among a store, the point-of-sale (POS) registers or channels within the store, and the peripherals that those registers or channels use to process transactions. This section describes each component and explains how it should be used in a store deployment.

### POS registers

Navigation: Click **Retail and Commerce** > **Channel setup** > **POS setup** > **Registers**.

The POS register is an entity that is used to define the characteristics of a specific instance of the POS. These characteristics include the hardware profile or setup for peripherals that will be used at the register, the store that the register is mapped to, and the visual experience for the user who logs on to that register.

### Devices

Navigation: Click **Retail and Commerce** > **Channel setup** > **POS setup** > **Devices**.

A device is an entity that represents a physical instance of a device that is mapped to a POS register. When a device is created, it's mapped to a POS register. The device entity tracks information about when a POS register is activated, the type of client that is being used, and the application package that has been deployed to a specific device. Devices can be of two types: **Retail modern POS (MPOS)** or **Retail Cloud POS (Cloud POS)**.

### MPOS

MPOS is a POS client application that is installed on Windows 8.1 or a later PC-based operating system. If the **Retail modern POS** application type is mapped to a device, the download package can be specified for a particular device. The download package can be customized to include different versions of the installation package. The ability to deploy different packages provides flexibility in cases where different POS registers might need different integrations. MPOS is deployed together with a built-in hardware station.

### Cloud POS

Cloud POS is a browser-based POS. Because it runs in the browser, Cloud POS doesn't require Windows 8.1 or a later PC-based operating system. If the **Retail Cloud POS** application type is mapped to a specific device in Headquarters, that device can be used through the browser with no need to download or install a package. Cloud POS requires a hardware station to use hardware beyond keyboard wedge based bar code scanning.

### Hardware profile

Navigation: Click **Commerce** > **Channel setup** > **POS setup** > **POS profiles** > **Hardware profiles**.

A hardware profile identifies the hardware that is connected to a POS register or a hardware station. The hardware profile is also used to specify the payment processor parameters that should be used during communication with the payment software development kit (SDK). (The payment SDK is deployed as part of the hardware station.)

## Hardware station

Navigation: Click **Retail and Commerce > Channels > Stores > All stores**. Select a store, and then click the **Hardware stations** FastTab.

A hardware station is an instance of business logic that drives POS peripherals. A hardware station is automatically installed together with MPOS. Alternatively, the hardware station can be installed as a stand-alone component, and then accessed by MPOS or Cloud POS through a web service. The hardware station must be defined at the channel level.

## Hardware station profile

Navigation: Click **Commerce > Channel setup > POS setup > POS profiles > Hardware station profiles**.

Whereas the hardware station itself is specified at the channel level includes instance-specific information, such as the URL for the hardware station, the hardware station profile includes information that can be static or shared across multiple hardware stations. The static information includes the port that should be used, the hardware station package, and the hardware profile. The static information also includes a description of the type of hardware station that is being deployed, such as **Checkout** or **Returns**, depending on the hardware that is required for each specific hardware station.

## Scenarios

### MPOS with connected peripheral devices

To connect MPOS to POS peripherals in a traditional, fixed POS scenario, first navigate to the register itself, and assign a hardware profile to it. You can find the POS registers at **Retail and Commerce > Channel setup > POS setup > Registers**.

After you've assigned the hardware profile, sync changes to the channel database by using the **Registers** distribution schedule. You can find the distribution schedules at **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.

Next, set up a "local" hardware station on the channel. Click **Retail and Commerce > Channels > Stores > All stores**, and select a store.

Then, on the **Hardware stations** FastTab, click **Add** to add a hardware station. Enter a description, enter **localhost** as the host name, and then sync the changes to the channel by using the **Channel configuration** distribution schedule. You can find the distribution schedules at **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.

Finally, in MPOS, use the **Select hardware station** operation to select the **localhost** hardware station. Set the hardware station to **Active**. The hardware profile that is used in this scenario should come from the POS register itself. A hardware station profile isn't required for this scenario.

## NOTE

Some hardware profile changes, such as changes to cash drawers, require that a new shift be opened after the changes have been synced to the channel.

Cloud POS must use the stand-alone hardware station to communicate with peripherals.

### MPOS or Cloud POS with a stand-alone hardware station

In this scenario, a stand-alone hardware station is shared among MPOS and Cloud POS clients. This scenario requires that you create a hardware station profile to specify the download package, port, and hardware profile that the hardware station uses. You can find the hardware station profile at **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware station profiles**.

After you've created the hardware station profile, navigate to the specific channel (**Retail and Commerce > Channels > Stores > All stores**), and add a new hardware station. Map this new hardware station to the hardware station profile that was previously created.

Next, provide a description that will help the cashier identify the hardware station. In the **Host name** field, enter the host machine URL in the following format: `https://<MachineName:Port>/HardwareStation`. (Replace **<MachineName:Port>** with the actual machine name of the hardware station and the port that is specified in the hardware station profile.) For a stand-alone hardware station, you should also specify the electronic funds transfer (EFT) terminal ID. This value identifies the EFT terminal that is connected to the hardware station when the payment connector communicates with the payment provider.

Next, from the actual hardware station machine, navigate to the channel, and select the hardware station. Then click **Download**, and install the hardware station.

Next, from MPOS or Cloud POS, use the **Select hardware station** operation to select the hardware station that was previously installed. Select **Pair** to establish a secure relationship between the POS and the hardware station. This step must be completed once for every combination of a POS and a hardware station.

After the hardware station is paired, the same operation is used to make the hardware station active while it's used. For this scenario, the hardware profile should be assigned to the hardware station profile rather than the register itself. If for some reason a hardware station does not have a hardware profile directly assigned, then the hardware profile assigned to the register is used.

## Client maintenance

### Registers

POS registers are managed primarily through the registers themselves, and also through the profiles that are assigned to registers. Attributes that are specific to an individual register are managed at the register level. These attributes include the store where the register is used, the register number, the description, and the EFT terminal ID that is specific to the register itself.

## POS profiles

You can find the POS profiles at **Retail and Commerce > Channel setup > POS setup > POS profiles**. It's useful to manage many aspects of a register through profiles, because the profiles can be shared among many registers. Profiles can be mapped either to an individual register or, if a profile is effective on a store-wide basis, to the store. The following sections describe the POS profiles and how they are used.

### Offline profile

The offline profile is set at the store level. It's used to specify the upload settings for transactions that are performed on a POS register while that register isn't connected to the channel database.

### Functionality profile

The functionality profile is set at the store level. It's used to specify store-wide settings about the functions that can be performed at the POS. The following capabilities are managed through the functionality profile. These capabilities are arranged by FastTab.

- **General** FastTab:
  - International Organization for Standardization (ISO).
  - Create a customer in offline mode.
  - Email receipt profile.
  - Central staff logon authentication.
- **Functions** FastTab:
  - Management of logon and extended logon.
  - Financial and currency-related aspects of the POS, such as the ability to key in prices and whether decimals are required for minor currency.
  - Enabling time registration through the POS.
  - How products and payments appear in the POS and on receipts.
  - End-of-day management.
  - Channel database transaction retention parameters.
  - How customers are looked up and created from the POS.
  - How discounts are calculated.
- **Amount** FastTab:
  - Maximum and minimum prices that are allowed.
  - Discount application and calculation.
- **Info codes** FastTab:
  - All aspects of how info codes are managed at the POS. For details, see [Info codes and info code groups](#).
- **Receipt numbering** FastTab:
  - Specify receipt numbering masks, which might include segments for the store number, terminal number, constants, and whether sales, returns, sales orders, and quotations are printed in separate sequences, or whether they all following the same sequence.

### Receipt profiles

Receipts profiles are assigned to printers within the hardware profile. They are used to specify the receipt types that are printed at a specific printer. The profiles include settings for the receipt formats, and settings that determine whether the receipt is always printed, or whether the cashier is prompted to decide whether the receipt must be printed. Different printers might also use different receipt profiles. For example, printer 1 is a standard thermal receipt printer, and therefore has smaller receipt formats. However, printer 2 is a full-size receipt printer that is used to print only customer order receipts, which require more space.

### Hardware profiles

Hardware profiles are explained as a component for client setup earlier in this article. Hardware profiles are assigned directly to the POS register or to a hardware station profile. They are used to specify the types of devices a specific POS register or hardware station uses. Hardware profiles are also used to specify the EFT settings that are used to communicate with the payment SDK.

#### **Visual profiles**

Visual profiles are assigned at the register level. They are used to specify the theme for a specific register. The profiles include settings for the type of application that is used (MPOS or Cloud POS), the accent color and theme, the font scheme, the logon background, and the POS background.

#### **Custom fields**

You can create custom fields to add fields that aren't provided out of the box to the POS. For more information about how to use custom fields, see the [Working with custom fields blog post](#).

#### **Language text**

You can override default strings in the POS by using language text entries. To override a string in the POS, add a new language text line. Then specify an ID, the default string that should be overridden, and the text that should be shown at the POS instead of the default string.

#### **Hardware station profiles**

Hardware station profiles are explained earlier in this article. They are used to assign non-instance-specific information to hardware stations.

#### **Channel reports configuration**

You set up the reports that are available at the channel on the **Channel reports configuration** page. You can create new reports by providing the XML definition of the report and assigning the report to a specific permission group at the POS.

#### **Devices**

Devices are explained earlier in this article. They are used to manage the activation of a specific POS register. Devices are also used to specify the application that is used for a specific register and the installation package that should be used to install the MPOS client. Here are the device activation states:

- **Pending** – The device is ready to be activated.
- **Activated** – The device has been activated.
- **Deactivated** – The device has been deactivated either in Headquarters or through the POS.
- **Disabled** – The device has been disabled.

Additional activation-related information includes the worker who changed the activation status for the device, a time stamp for the activation, and whether the device configuration has been validated.

#### **Client data synchronization**

All changes to a POS client, except changes in the device activation status, must be synced to the channel database to take effect. To sync changes to the channel database, navigate to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**, and run the required distribution schedule. For client changes, you should run the **Registers** and **Channel configuration** distribution schedules.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Health check for POS peripherals and services

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the health check operation in the point of sale (POS).

## Overview

Retail stores can be complex environments where many applications and devices are used. As operations grow, it can become difficult to ensure that operations always run smoothly, because of dependencies on, for example, peripherals that can break or accidentally become unplugged over the course of a day. Troubleshooting for issues that are related to devices and services can be costly for larger merchants and equally frustrating for smaller operations.

Microsoft Dynamics 365 Commerce versions 10.0.10 and later include a health check operation that can help prevent some of this cost and frustration. This operation provides a method for testing devices directly from the POS outside of normal operations. Therefore, it can help retailers detect issues before they occur.

## Key terms

TERM	DESCRIPTION
Peripheral	Any device that the POS application uses to facilitate transactions and other operations in the store. Examples include cash drawers, bar code scanners, and payment terminals.
Service	In this topic, a service is an ancillary application that the POS application depends on to perform transactions and daily operations. Examples include apps that help with tax or shipping calculations.

## Health check operation

The health check operation is operation 717 on the **POS Operations** page in Commerce Headquarters. It can be used while the POS is in non-drawer mode. However, a hardware station must be active.

By default, the health check tests only devices that are configured in the hardware profile for the hardware station that is currently active for a register. If a register uses multiple hardware stations over the course of a day, to do health checks for all of them, it must connect to one hardware station at a time. There is no store-level health check. However, it's possible that this type of check can be done through Commerce Server extensibility.

### Out-of-box health checks

TYPE	CONNECTION	DETAILS
------	------------	---------

TYPE	CONNECTION	DETAILS
Printer	OPOS	<p>This check tests basic object linking and embedding for POS (OPOS) functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <b>Open &gt; ClaimDevice &gt; DeviceEnabled=True</b></li> <li>• Close: <b>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</b></li> </ul>
Line display	OPOS	<p>This check tests basic OPOS functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <b>Open &gt; ClaimDevice &gt; DeviceEnabled=True</b></li> <li>• Close: <b>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</b></li> </ul>
Dual display	Windows	<p>This check ensures that the operating system detects a second Windows display.</p>
MSR	OPOS	<p>This check tests basic OPOS functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <b>Open &gt; ClaimDevice &gt; DeviceEnabled=True</b></li> <li>• Close: <b>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</b></li> </ul>
Drawer	OPOS	<p>This check tests basic OPOS functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <b>Open &gt; ClaimDevice &gt; DeviceEnabled=True</b></li> <li>• Close: <b>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</b></li> </ul>
Scanner	OPOS	<p>This check tests basic OPOS functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <b>Open &gt; ClaimDevice &gt; DeviceEnabled=True</b></li> <li>• Close: <b>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</b></li> </ul>
Scale	OPOS	<p>This check tests basic OPOS functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <b>Open &gt; ClaimDevice &gt; DeviceEnabled=True</b></li> <li>• Close: <b>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</b></li> </ul>

TYPE	CONNECTION	DETAILS
PIN pad	OPOS	<p>This check tests basic OPOS functions. Here are some examples:</p> <ul style="list-style-type: none"> <li>• Open: <code>Open &gt; ClaimDevice &gt; DeviceEnabled=True</code></li> <li>• Close: <code>DeviceEnabled=False &gt; ReleaseDevice &gt; Close</code></li> </ul>
Payment terminal	Payments SDK	<p>This check tests basic payment terminal functions provided by the Payments SDK.</p> <ul style="list-style-type: none"> <li>• Lock</li> <li>• BeginTransaction</li> <li>• EndTransaction</li> <li>• ReleaseDevice</li> <li>• Close</li> </ul>

### Using the health check operation in the POS

When the health check operation is initiated in the POS, a pane on the right lists the configured devices and shows the status of each device. To do a health check for a single device, select the device, and then select **Test selected**. To do a health check for all devices, select **Test all**. The **Test all** function tests all the devices, one at a time, and updates the status of each device in the **Status** column.

The **Last check** column shows when the health check was last done for each device.

If the health check for a device passes (that is, if no errors are encountered), the device's status will be **OK**. If the health check fails, the status will indicate that there was an error. In this case, the pane on the right provides details that are related to the error, or it instructs the user to contact the system admin.

Some devices, such as the OPOS keylock, don't have out-of-box health check tests. If a health check test isn't detected for any device that is used, the status will be **Not supported**.

### Extending health checks

The out-of-box health check tests are configured to provide some user-friendly messages for typical errors. However, not all scenarios are covered. Through extensibility, merchants can map user-friendly messages to errors that might be specific to their environment.

Custom health checks can also be created to test devices that aren't supported out of the box, or to test any services that the POS depends on.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Support for network peripherals

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the support for and setup of network peripherals in the store.

## Key terms

TERM	DESCRIPTION
Register	The entity that is used to configure an instance of a point of sale (POS) register.
Device	A representation of the physical instance of a POS register and the Modern POS application that is assigned to it.
Dedicated hardware station	The hardware station business logic that is built into the Modern POS for Windows and Modern POS for Android applications.
Drawer kick (d/k) port	A traditional method for connecting a cash drawer to a receipt printer.
Network peripherals	Built-in support for network-enabled payment terminals, receipt printers, and cash drawers.
ESC/P	Epson Standard Code for Printers, also known as "Escape/P," is a printer control language created by Epson that is commonly used to send commands to point of sale printers.

## Supported POS clients and devices

Functionality for network peripherals is supported by the Modern POS for Windows and Modern POS for Android POS clients.

This functionality supports network-enabled payment terminals and receipt printers. You can provide cash drawer support by connecting the cash drawer to the network-enabled receipt printer via the d/k port.

Out-of-box support for this functionality is provided by the [Microsoft Dynamics 365 Payment Connector for Adyen](#). However, other payment connectors might be supported via the Commerce software development kit (SDK). Supported receipt printers include network-enabled receipt printers from Star Micronics and Epson.

Out-of-box support is provided for network protocols for Epson and Star Micronics receipt printers. Cash drawers that are connected to those printers via the d/k port are supported via ESC/P protocols.

## Set up network peripherals

### Adyen payment terminal

For information about how to set up an Adyen payment terminal, see the "POS payment terminal" section in [Dynamics 365 Payment Connector for Adyen](#).

### Epson or Star Micronics receipt printer and a cash drawer

#### Epson prerequisite

If your printer supports Epson ePOS-Print, see Epson's product manuals for information about how to access the Epson Printers Configuration Website and enable ePOS-Print. When ePOS-Print is configured, the printer will print a chit that shows its IP address after a power cycle.

#### Star Micronics prerequisite

Network-enabled Star Micronics printers that support Ethernet can be configured to use network protocols through the Star Micronics Printer Utility. For information about how to set up Star Micronics devices to support network printing, see the documentation that is provided by Star Micronics. When a device is correctly configured, the IP address of the printer can be obtained through the user interface (UI) of the printer utility.

#### Set up a hardware profile

1. In Dynamics 365 Commerce, search for **Hardware profiles**.
2. Select **New**.
3. Assign a hardware profile number, and then enter a description.
4. On the FastTabs for different device types, set up the following device types.

DEVICE	TYPE	DEVICE NAME	ADDITIONAL DETAILS
Printer	Network	Epson or Star	The device name is case-sensitive. Assign a <b>Receipt profile ID</b> .
Cash drawer	Network	Epson or Star	The device name is case-sensitive. Set the <b>Use shared shift</b> option to <b>Yes</b> if the cash drawer will be shared by multiple POS devices.

5. Select **Save**.

#### Set up Modern POS for Windows or Modern POS for Android clients that have built-in hardware station logic

1. In Dynamics 365 Commerce, search for **Registers**.
2. Select a register by selecting the register number, and then select **Edit**.
3. Assign the hardware profile that you just created to the register that should use a dedicated payment terminal. The device that is mapped to this register must use either the Modern POS for Windows application or the Modern POS for Android application.
4. Select **Save**.
5. On the Action Pane, on the **Registers** tab, select **Configure IP addresses**.
6. On the **Printer** FastTab, enter the IP address of the printer. Leave the field for the port number blank.
7. On the **Cash drawer** FastTab, enter the IP address of the printer. Leave the field for the port number blank.
8. Select **Save**.
9. Search for **All stores**.
10. Select a store by selecting its **Retail Channel Id** value, and then select **Edit**.
11. On the **Hardware stations** FastTab, select **Add**.
12. Set the **Hardware station type** field to **Dedicated**.
13. Enter a description, but don't specify a hardware profile or set any other values for this hardware station.
14. Select **Save**.
15. Search for **Distribution schedules**.
16. Select distribution schedule **1090**, and then select **Run now**.
17. Select distribution schedule **1070**, and then select **Run now**.

The Modern POS for iOS and Modern POS for Cloud applications don't have built-in hardware station logic. If you're using either of these applications, follow these steps.

1. In Dynamics 365 Commerce, search for **All stores**.
2. Select a store by selecting its **Retail Channel Id** value, and then select **Edit**.
3. On the **Hardware stations** FastTab, select **Add**.
4. Set the **Hardware station type** field to **Shared**.
5. Enter a description. This hardware station can be shared by multiple POS clients, including POS clients that have built-in hardware station logic.
6. In the **Hardware profile** field, use the drop-down arrow to assign the hardware profile for network peripherals to this hardware station.
7. Select **Save**.
8. While the hardware station for the receipt printer and cash drawer is still selected, select **Configure IP addresses**.
9. On the printer FastTab, enter the IP address of the printer. Leave the field for the port number blank.
10. On the cash drawer FastTab, enter the IP address of the printer. Leave the field for the port number blank.

#### **NOTE**

For detailed information about how to set up shared hardware stations, see [Configure and install Retail hardware station](#).

11. Select **Save**
12. Search for **Distribution schedules**.
13. Select distribution schedule **1090**, and then select **Run now**.
14. Select distribution schedule **1070**, and then select **Run now**.

### **Sharing network peripherals**

Network receipt printers and cash drawers can be shared by multiple POS devices. To share them, you can use a shared hardware station to broker the connection to the devices. Alternatively, if you're using Modern POS for Windows or Modern POS for Android, you can configure the same devices directly in the register properties.

Payment terminals can be shared only if a shared hardware station is deployed to broker the connection to the payment terminal. You can't share a payment terminal by setting the same payment terminal IP address directly at the register level. If you try to use this approach, issues will occur when individual POS clients try to lock and claim the device.

# Demo data screen layouts in Modern POS (MPOS) and Cloud POS

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides information about the screen layouts that are included with the demo data set for the point of sale (POS) experiences in Dynamics 365 Commerce.

## Overview

The sample screen layouts that are included with Commerce demo data provide content that is optimized for various retail segments, store worker roles, and devices. A single layout can contain several layout sizes and combinations of button grids, to help ensure coverage as store workers move between devices and stations. This topic highlights the differences between these layouts, the operations that they provide, and the overall experiences that they deliver.

## Anatomy of a screen layout ID

To find screen layouts, go to **Retail and Commerce > Channel setup > POS setup > POS > Screen layouts**.

Screen layout ID	Name	Layout type	Width	Height
F4MGR	Fabrikam Manager	Modern POS - Full	1024	768
1280x720 - Full		Modern POS - Full	1280	720
1366x768 - Full		Modern POS - Full	1366	768
1440x960 - Full		Modern POS - Full	1440	960
1536x864 - Full		Modern POS - Full	1536	864
480x853 - Compact		Modern POS - Compact	480	853

Screen layout IDs can have a maximum of 10 characters. The ID is a string that consists of three pieces of

information, in this order:

1. Company
2. Layout version
3. Persona

### Company

LETTER	COMPANY
A	Adventure Works
F	Fabrikam
C	Contoso

### Layout version

VERSION NUMBER	DESCRIPTION
3	The base version that supports multiple screen sizes for various devices and aspect ratios
3.1	The base version that has additional support for the <b>Recommended products</b> panel
4	The extended version for extended Fabrikam updated layout

### Persona

ABBREVIATION	PERSONA	CONTENTS
CSH	Cashier	Cashier layouts include all transaction-related operations, such as customer orders, returns, discounts, voids, and gift cards. These layouts also include daily tasks for inventory management, such price checks, inventory lookups, and stock counts. Basic shift management is also provided for start amounts, suspending shifts, and time clock.
MGR	Store Manager	Store Manager layouts include all transaction-related operations that are found in the Cashier layouts but also include tax overrides. These layouts also include daily tasks for inventory management, such as price checks, inventory lookups, and stock counts. Shift management is provided for starting, suspending, and closing shifts. Additionally, the layouts include drawer operations for entries, removals, tender declarations, and safe and bank drops. Finally, these layouts include access to performance reports, and enable X and Z reports to be printed.

ABBREVIATION	PERSONA	CONTENTS
--------------	---------	----------

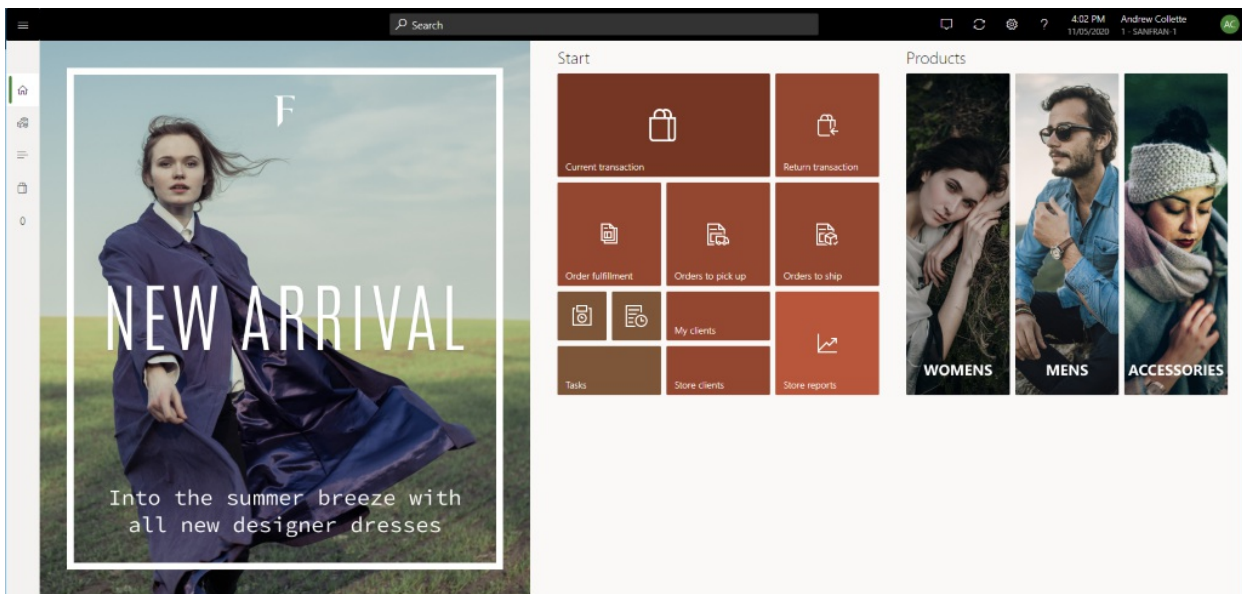

STK	Stock Clerk	<p>Stock Clerk layouts are optimized for inventory management. They include access to daily tasks for price checks, inventory lookups, picking and receiving, stock counts, and kit disassembly. These layouts also provide basic shift operations for time clock and suspending shifts. Although these layouts are intended mainly for back-office tasks, stock clerks have the same operations as cashiers for transaction screens.</p>
-----	-------------	---

### Example layout

Here is an example of a screen layout ID for the Fabrikam company, layout version 4, and the Store Manager persona:

F4MGR

The following illustration shows an example of the Welcome screen for a Fabrikam store manager.

### Layout sizes

## Full vs. compact layouts

A screen layout can have configurations for both full devices and compact devices. Therefore, a user can be assigned to a single screen layout that will work across various sizes and form factors in the store.

- **Modern POS - Full** – Typically, full layouts are best used for larger displays, such as desktop computer monitors or tablets. Users can select the UI elements that the layout includes, specify the size and placement of those elements, and configure their detailed properties. Full layouts support both portrait and landscape configurations.
- **Modern POS - Compact** – Typically, compact layouts are best used for phones or small tablets. Design possibilities are limited for compact devices. Users can configure the columns and fields for the receipt pane and the totals pane.

## Screen resolutions that are provided

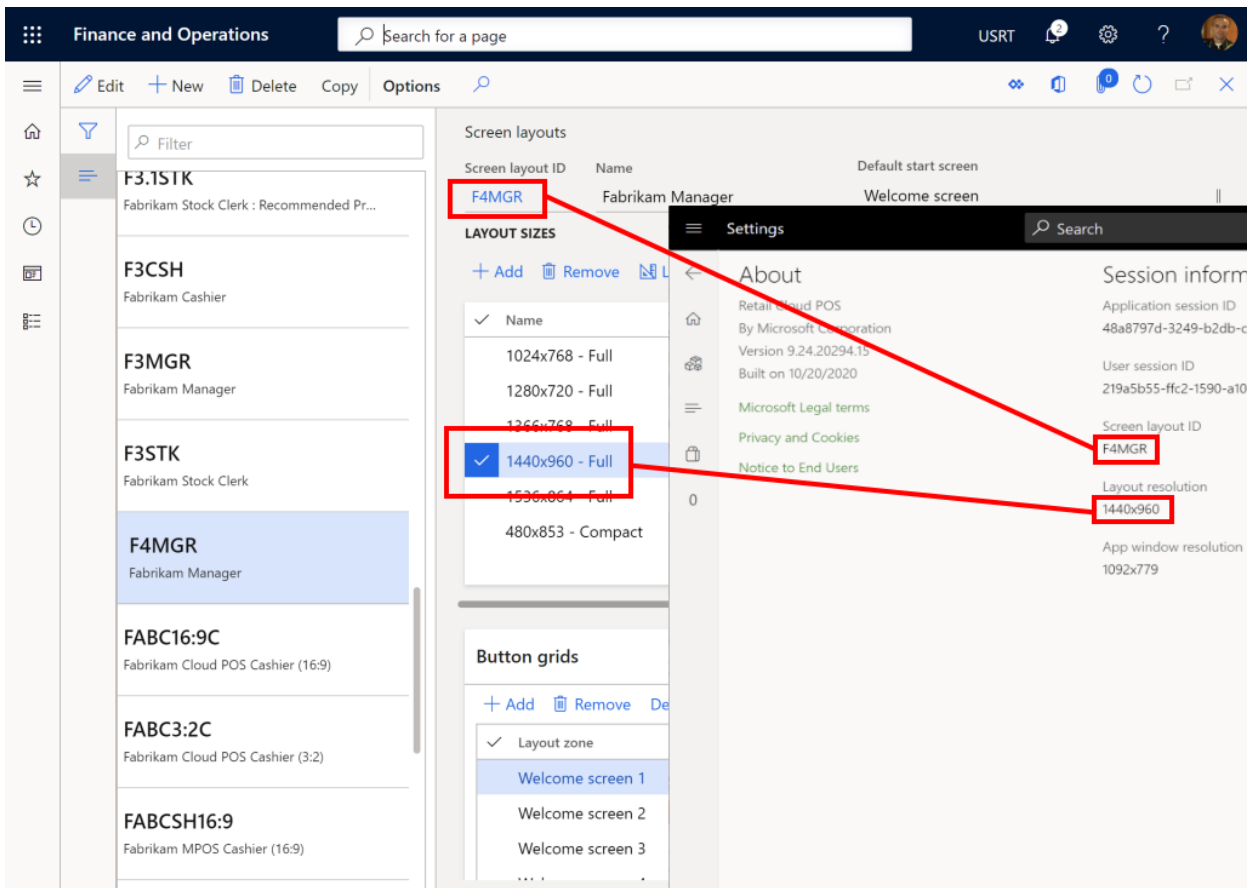

The following table shows the layout sizes that are provided for typical screen resolutions.

LAYOUT TYPE	RESOLUTION	ASPECT RATIO	TARGET DISPLAY
Compact*	480 × 853	16:9	Phones
Full	1024 × 768	4:3	Tablets
Full*	1280 × 720	16:9	Tablets
Full	1366 × 768	16:9	Tablets, larger screens
Full	1440 × 960	3:2	Tablets, larger screens
Full*	1536 × 864	16:9	Tablets, larger screens

\* These additional layout sizes are available only in Adventure Works and Fabrikam layouts.

### TIP

POS automatically selects layout sizes, based on the closest size that is available for the screen resolution of the current app window. To find the screen layout ID and layout resolution that are currently used, in Modern POS (MPOS) or Retail Cloud POS (CPOS), open the **Settings** page, and look in the **Session information** section. You can also see the actual window resolution for your current application or browser frame. After you have this information, you can find the source of the layout content by going to **Channel setup > POS setup > POS > Screen layouts**.

## Companies and brands

Each fictitious company is targeted to a different retail segment and includes product catalogs that are tuned for the company's market. Each company has a unique visual brand that accompanies its products. Branding elements include the accent color, dark or light theme, and accompanying photographs that provide realistic experiences.

### Company segment and visual characteristics

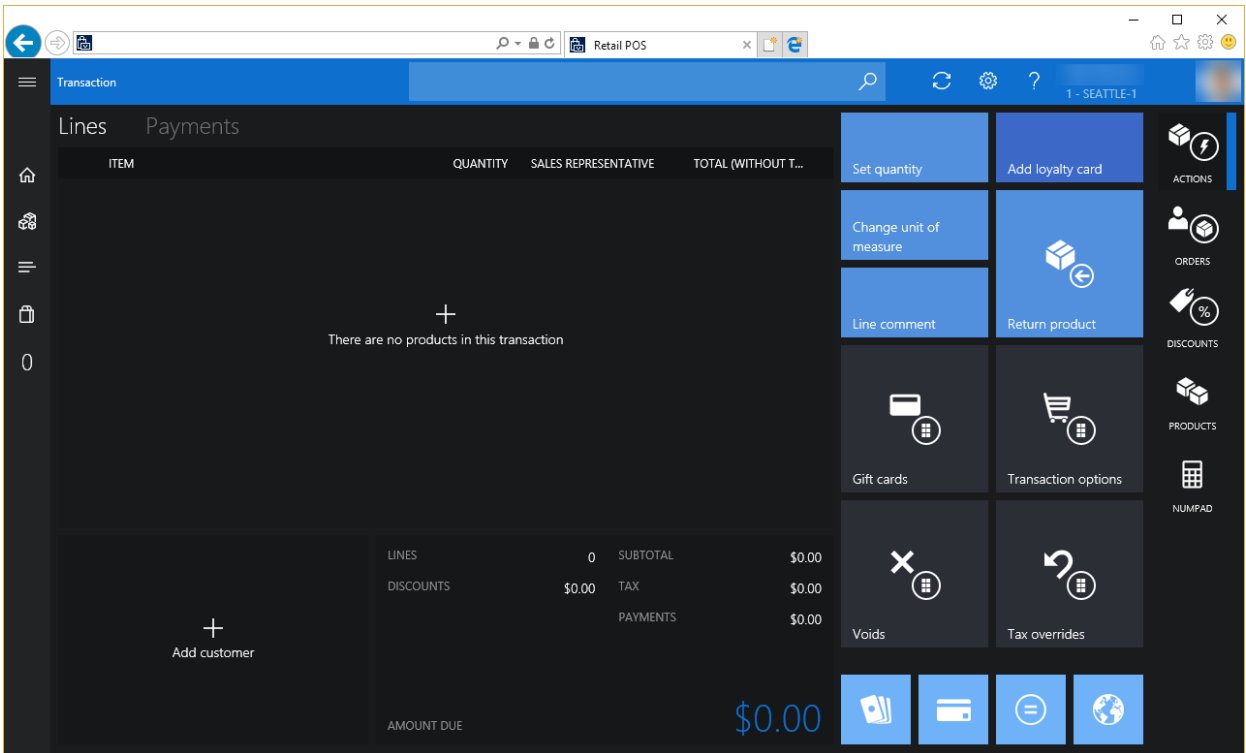

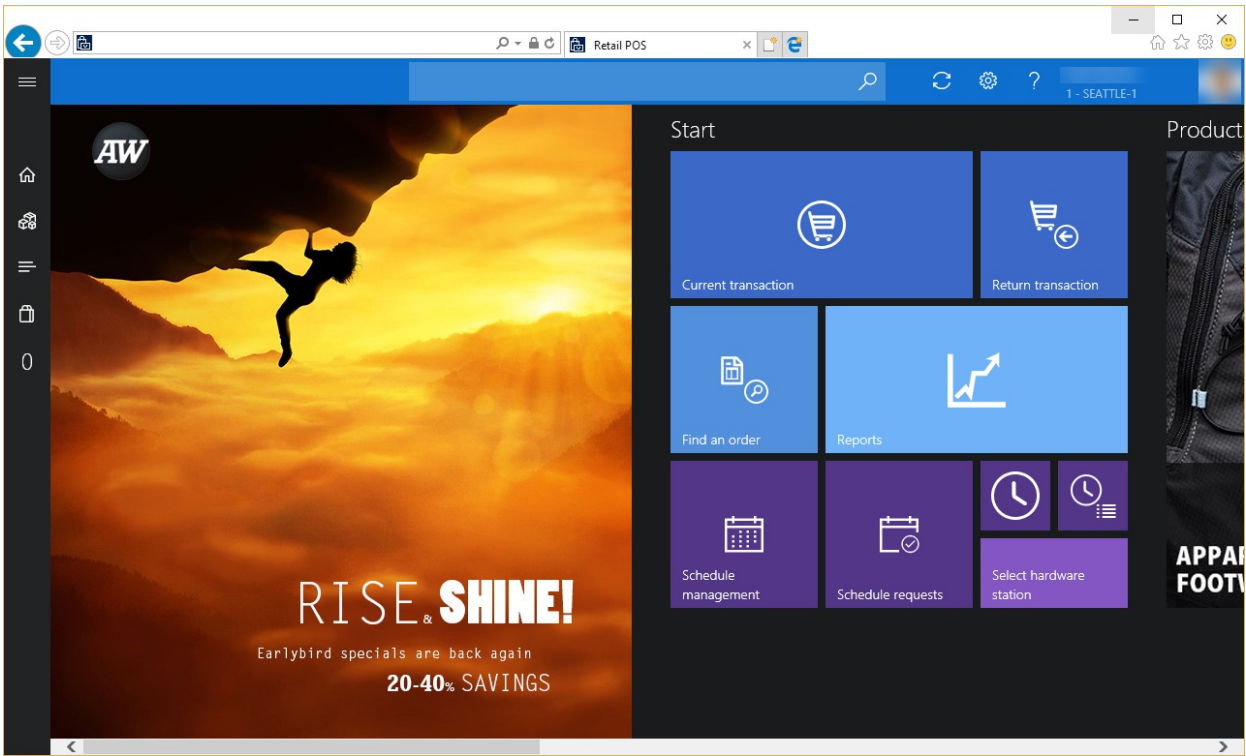

COMPANY	LOCATION	SEGMENT	ACCENT	THEME
Adventure Works	Seattle	Sporting Goods	Blue	Dark
Fabrikam	San Francisco	Fashion	Green	Light
Contoso	Boston	Electronics	Red	Dark

#### NOTE

Adventure Works and Fabrikam are the two flagship brands. Contoso is available, but not all layouts have been provided.

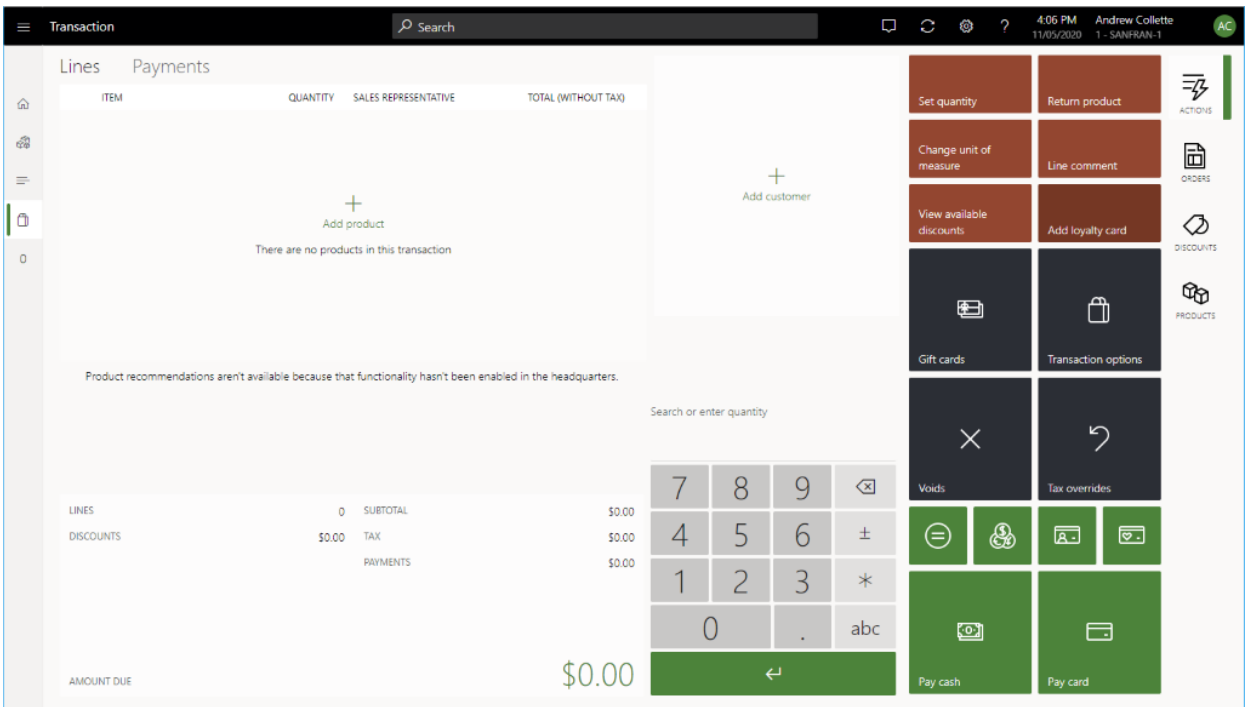

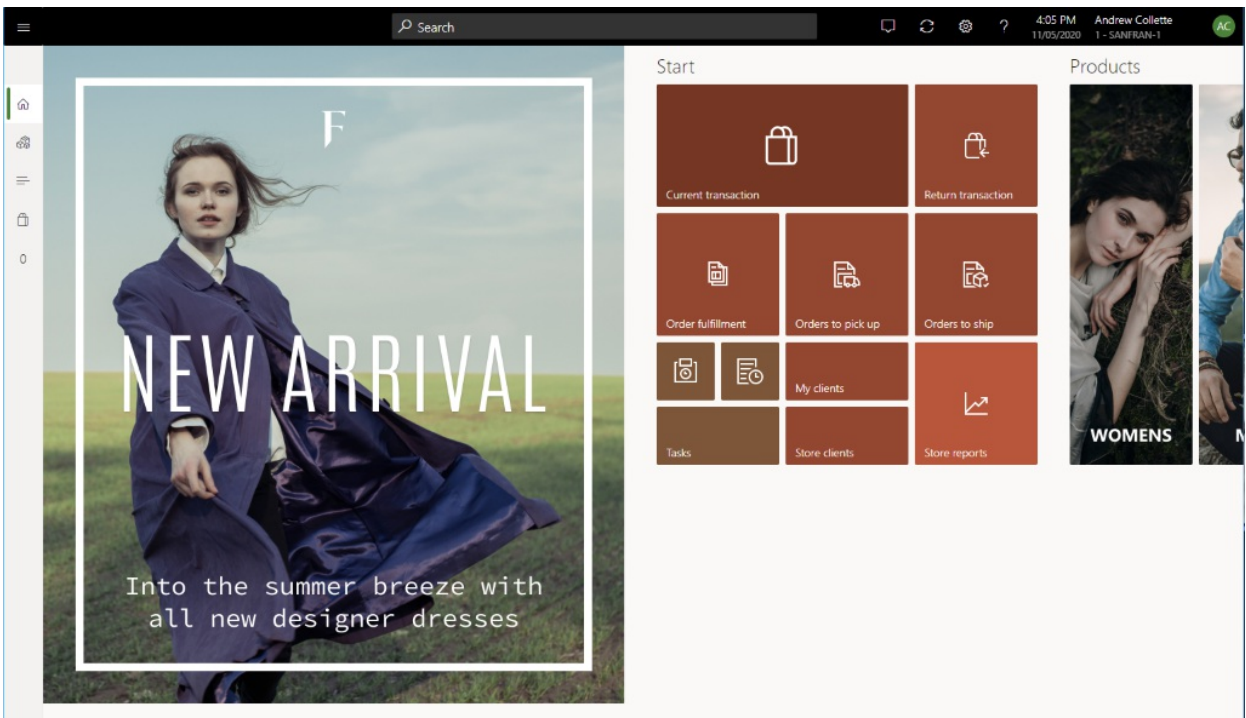

The following illustrations show examples of the welcome page and transaction page for the three fictitious companies.

### Adventure Works

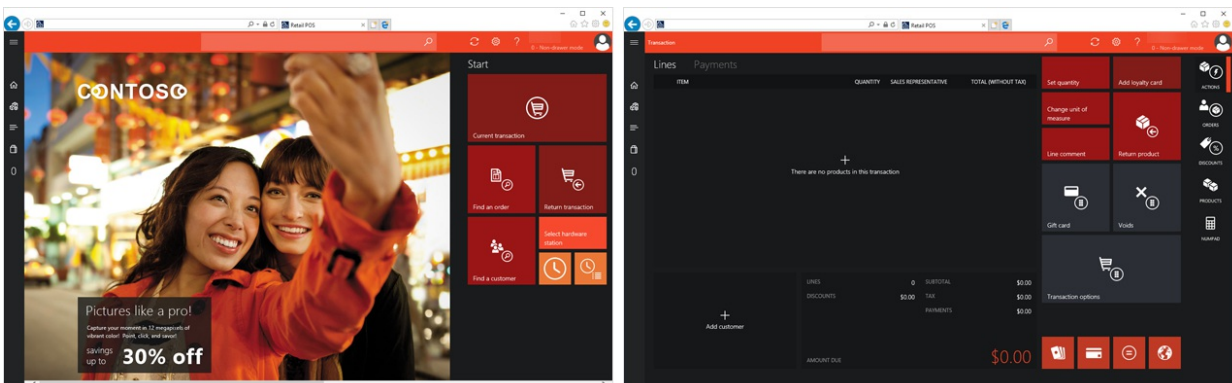

Fabrikam

## Contoso

## User sign in matrix

Users have been provided for the various screen layouts. By using the following table, you should be able to

access any of the screens. Just sign in by using an appropriate operator ID.

COMPANY	SCREEN LAYOUT ID	PERSONA	OPERATOR IDS
Adventure Works	A3MGR	Store Manager	000154, 000137, 000073
Adventure Works	A3CSH	Cashier	000150, 000175, 000165
Adventure Works	A3STK	Stock Clerk	000155, 000181, 000152
Fabrikam	F4MGR	Store Manager	000160, 000713
Fabrikam	F3CSH	Cashier	000161, 000113, 000114
Fabrikam	F3STK	Stock Clerk	000164, 000112, 000123
Contoso	C3MGR	Store Manager	000100, 000111
Contoso	C3CSH	Cashier	000110, 000120
Contoso	Not applicable	Stock Clerk	Not applicable

**TIP**

For best results, activate a register in the corresponding store location, and set the company to the company of the persona that you plan to use when you sign in. In this way, you help guarantee that the visual profile and branding images are aligned across the experience. For example, if you're interested in seeing a Fabrikam layout for a cashier, you should activate a register in the Houston store.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# POS user interface visual configurations

2/18/2021 • 12 minutes to read • [Edit Online](#)

The user interface (UI) of the Microsoft Dynamics 365 Commerce point of sale (POS) can be configured by using a combination of visual profiles and screen layouts that are assigned to stores, registers, and users. This topic provides information about those configuration options.

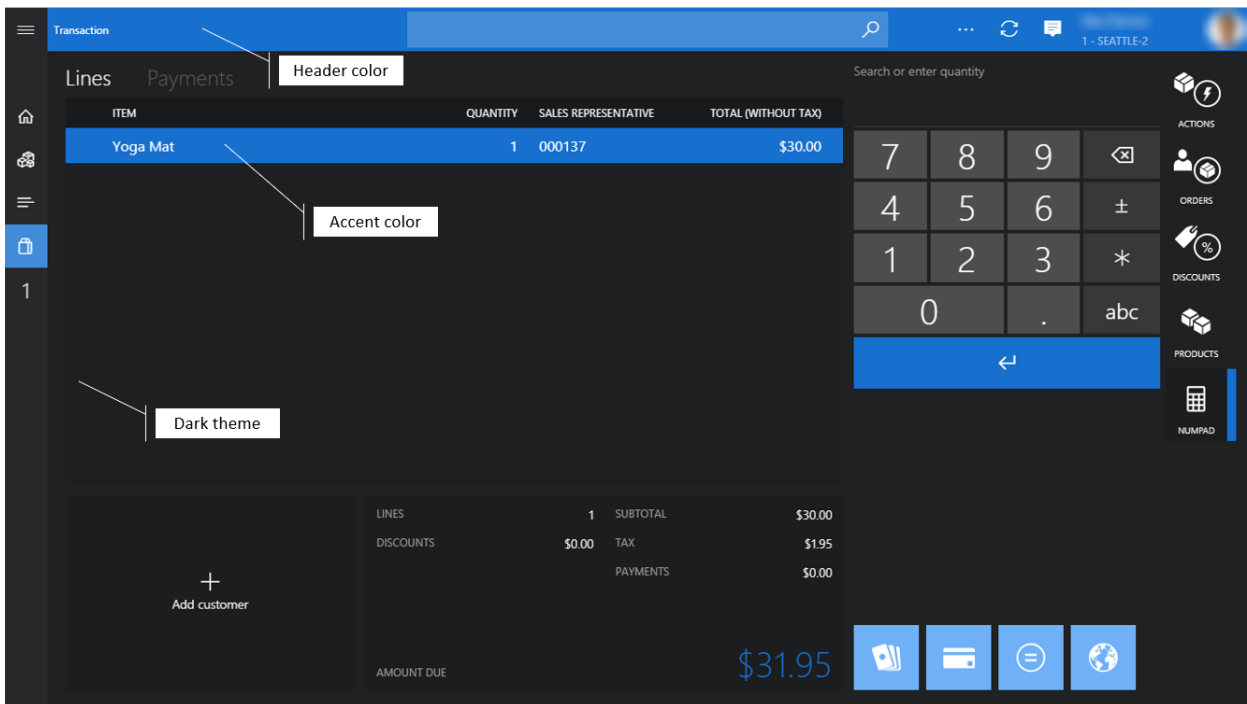

The following illustration shows the relationships among the various entities that make up the configurable aspects of the POS UI.

## Visual profile

Visual profiles are assigned to registers, and they specify the visual elements that are register-specific and shared across users. Every user who signs in to the register sees the same theme, layout, colors, and images.

- **Profile number** – The profile number is the unique identifier of the visual profile.
- **Description** – You can specify a meaningful name that will help identify the correct profile for your situation.
- **Theme** – You can select between the **Light** and **Dark** application themes. The theme affects the font and background colors throughout the application.
- **Accent color** – The accent color is used throughout the POS to differentiate or highlight specific visual elements, such as tiles, command buttons, and hyperlinks. Typically, these elements are actionable.
- **Header color** – You can configure the color of the page header to meet the retailer's branding requirements.
- **Font scheme** – You can select between the **Standard** and **Large** font schemes. The font scheme affects the font size throughout the application. The default selection is **Standard**.
- **Always show application bar labels** – When this option is turned on, the label text is always visible under the application bar buttons.
- **Layout** – You can select between the **Centered** and **Right** layouts. The layout affects the alignment of the sign-in box on the sign-in screen. The default selection is **Centered**.
- **Show date/time** – When this option is turned on, the current date and time are shown in the POS header and on the sign-in screen.
- **Keyboard** – You can select between **Default to OS keyboard** and **Show number pad** to specify the default keyboard that is used for input on the sign-in screen. The number pad is a virtual keyboard that is used primarily for touch-based devices. The default selection is **Default to OS keyboard**.
- **Logo image** – You can specify a logo image that is shown on the sign-in screen. We recommend that you use an image that has a transparent background. The file size should be kept as small as possible, because application behavior and performance can be affected when large files are stored and loaded.
- **Login background** – You can specify a background image for the sign-in screen. The file size of background images should be kept as small as possible.
- **Background** – You can specify a background image that is used instead of the solid theme color throughout the application. As for background images for the sign-in screen, the file size should be kept as small as possible.

#### NOTE

The **Right** layout and date/time display don't apply to the sign-in screen in compact view.

You need to run the **1090 (Registers)** distribution schedule job to synchronize the latest visual profile

configurations to the channel database.

## Screen layouts

Screen layout configurations determine the actions, content, and placement of UI controls on the POS **Welcome** screen and **Transaction** screen.

The screenshot shows the Dynamics 365 Retail POS setup interface for configuring screen layouts. The left sidebar lists various screen layout options, with 'F3MGR Fabrikam Manager' selected. The main area displays the configuration for the selected layout, including a table of layout sizes and a table of button grids.

Screen layout ID	Name	Default start screen
F3MGR	Fabrikam Manager	Welcome screen

Name	Layout type	Width	Height
1024x768 - Full	Modern POS - Full	1024	768
1280x720 - Full	Modern POS - Full	1280	720
1366x768 - Full	Modern POS - Full	1366	768
1440x960 - Full	Modern POS - Full	1440	960
480x853 - Compact	Modern POS - Compact	480	853

Layout zone	Button grid ID	Name
Welcome screen 1	F2W1M	Start
Welcome screen 2	F2W2	Products
Welcome screen 3	F2W3	Inventory
Welcome screen 4	F2W4M	Shift and drawer
Welcome screen 5	F2W5M	Operations
Transaction screen 1	F2T1M	Actions
Transaction screen 2	F2T2	Customer orders

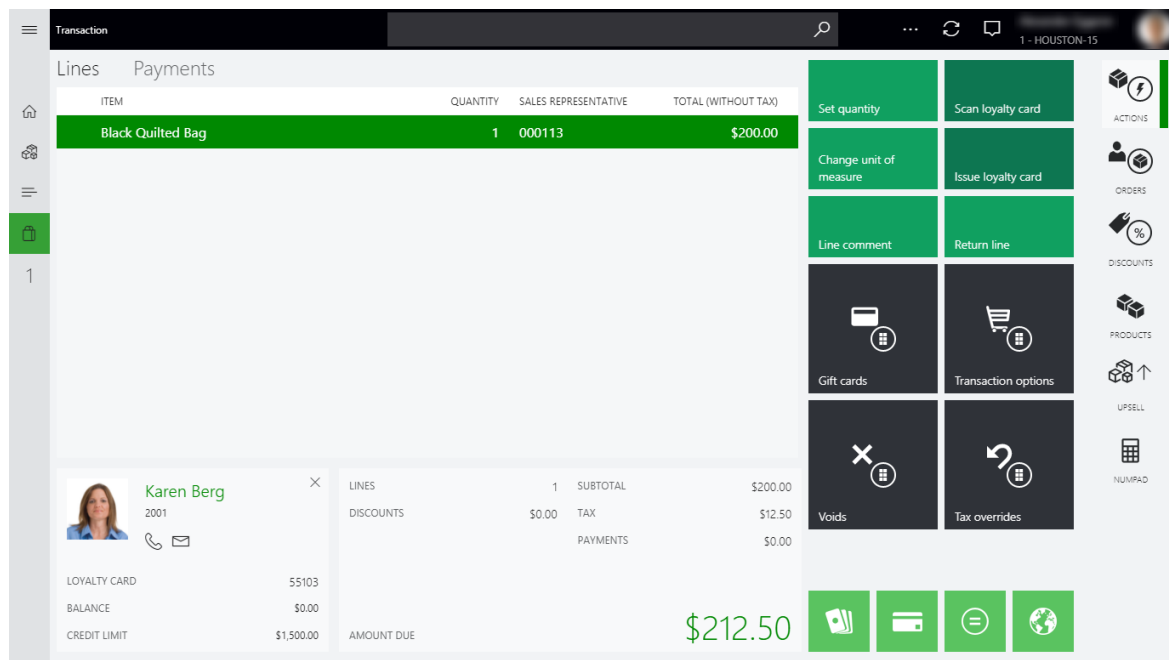

Layout zone	Image
Image 1	2506
Image 2	2507
Image 3	2508

Annotations in the image point to the 'Screen layout' sidebar, the 'Layout sizes' table, the 'Button grids' table, and the 'Images' table.

- **Welcome screen** – In most cases, the welcome screen is the page that users see when they first sign in to the POS. The welcome screen can consist of a branding image and button grids that provide access to POS operations. Typically, operations that aren't specific to the current transaction are put on this screen.

The screenshot shows the POS Welcome screen. The background features a large image of a person climbing a rock at sunrise, with the text 'RISE & SHINE! Earlybird specials are back again 20-40% SAVINGS'. The top right corner shows the user's name '1 - SEATTLE-2'. The main content area is a 'Start' screen with several button grids. The 'Welcome screen button grid' is highlighted, showing buttons for 'Current transaction', 'Return transaction', 'Order fulfillment', 'Orders to pick up', and 'Orders to ship'. The 'Welcome screen image' is also highlighted, showing the 'Select hardware station' and 'Reports' buttons.

- **Transaction screen** – The **Transaction** screen is the main screen in the POS for processing sales transactions and orders. The content and layout are configured by using the screen layout designer.

- **Default start screen** – Some retailers prefer that cashiers go directly to the **Transaction** screen after sign-in. The **Default start screen** setting lets you specify the default screen that appears after sign-in for each screen layout.

### Assignment

Screen layouts can be assigned at the store, register, or user level. The user assignment overrides the register and store assignments, and the register assignment overrides the store assignment. In a simple scenario where all users use the same layout, regardless of register or role, the screen layout can be set only at the store level. In scenarios where specific registers or users require specialized layouts, those layouts can be assigned.

Depending on which level the screen layouts are assigned, you need to run the **1070 (Channel configuration)**, **1090 (Registers)**, and/or **1060 (Staff)** distribution schedule jobs to synchronize the latest screen layout configurations to the channel database.

### Layout sizes

Most aspects of the POS UI are responsive, and the layout is automatically resized and adjusted based on the screen size and orientation. However, the POS **Transaction** screen must be configured for every screen resolution that is expected.

At startup, the POS application automatically selects the closest layout size that is configured for the device. A screen layout can also contain configurations for both landscape and portrait modes, and for both full-size and compact devices. Therefore, users can be assigned to a single screen layout that works across various sizes and form factors that are used in the store.

- **Name** – You can enter a meaningful name to identify the screen size.
- **Layout type** – The POS application can show its UI in various modes to provide the best user experience on a given device.
  - **Modern POS – Full** – Full layouts are typically best for larger displays, such as desktop monitors and tablets. You can select the UI elements to include, specify the size and placement of those elements, and configure their detailed properties. Full layouts support both portrait and landscape configurations.
  - **Modern POS – Compact** – Compact layouts are typically best for phones and small tablets. The design possibilities for compact devices are limited. You can configure the columns and fields for the receipt and totals panels.
- **Width/Height** – These values represent the effective screen size, in pixels, that is expected for the layout. Remember that some operating systems use scaling for high-resolution displays.

**TIP**

You can learn the layout size that is required for a POS screen by viewing the resolution in the app. Start the POS, and go to **Settings > Session information**. POS shows the screen layout that is currently loaded, the layout size, and the resolution of the app window.

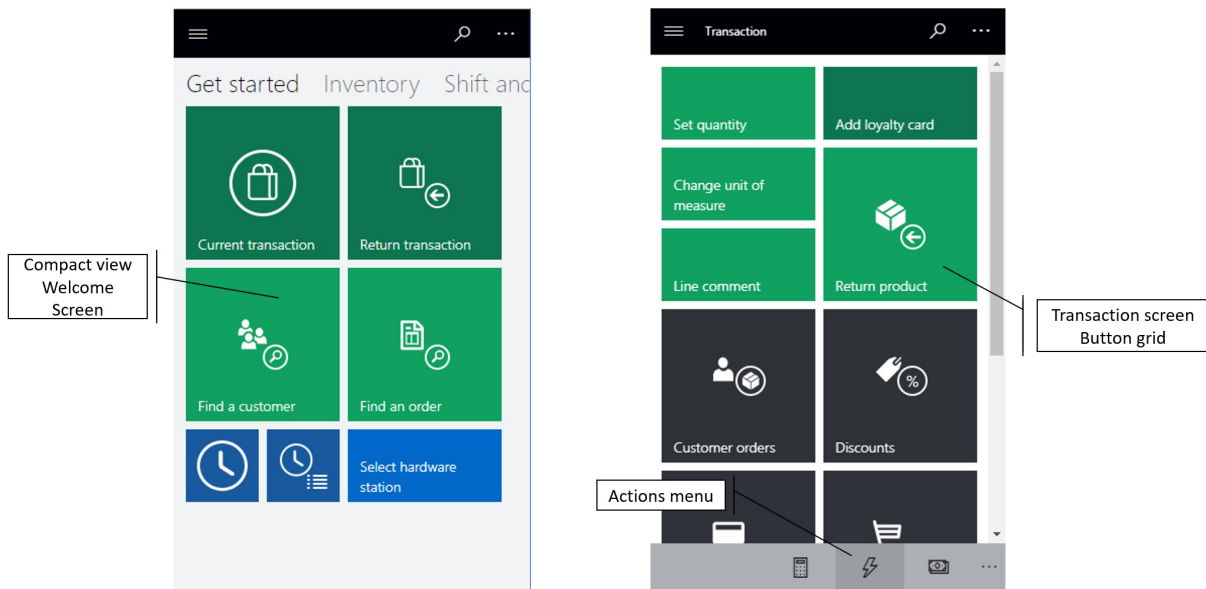

## Button grids

For each layout size in a screen layout, you can configure and assign button grids for the POS welcome screen and **Transaction** screen. Button grids for the welcome screen are automatically laid out from left to right, from the lowest number (Welcome screen 1) to the highest number.

In Full POS layouts, the placement of button grids is specified in the screen layout designer.

In Compact POS layouts, the button grids are automatically laid out from top to bottom, from the lowest number (Transaction screen 1) to the highest number. They can be accessed on the **Actions** menu.

### NOTE

The button sizes in the designer will scale to fit the size of the window, therefore they may not accurately reflect the actual buttons rendered in POS. To best simulate the button grid layout, adjust the designer windows to the same size as the POS.

## Images

For each layout size in a screen layout, you can specify images to include in the POS UI. For Full POS layouts, a

single image can be specified for the welcome screen. This image appears as the first UI element on the left. On the **Transaction** screen, images can be used as tab images or as a logo. Compact POS layouts don't use these images.

## Screen layout designer

The screen layout designer lets you configure various aspects of the POS **Transaction** screen for each layout size, in both portrait and landscape modes, and for both Full and Compact layouts. The screen layout designer uses the ClickOnce deployment technology to download, install, and start the latest version of the application every time that users access it. Be sure to check the browser requirements for ClickOnce. Some browsers, such as Google Chrome, require extensions.

### IMPORTANT

You must configure a screen layout for each layout size that is defined and that is used by the POS.

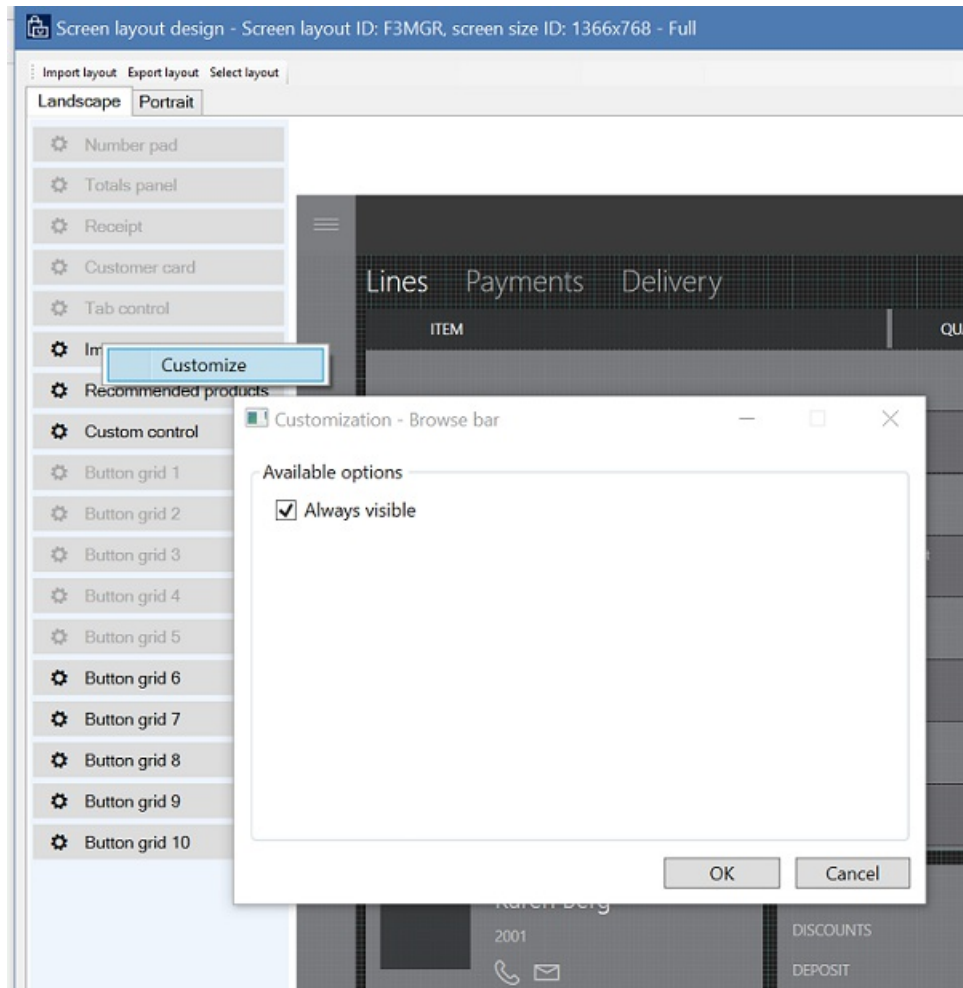

## Full layout designer

The Full layout designer lets users drag UI controls onto the POS **Transaction** screen and configure the settings of those controls.

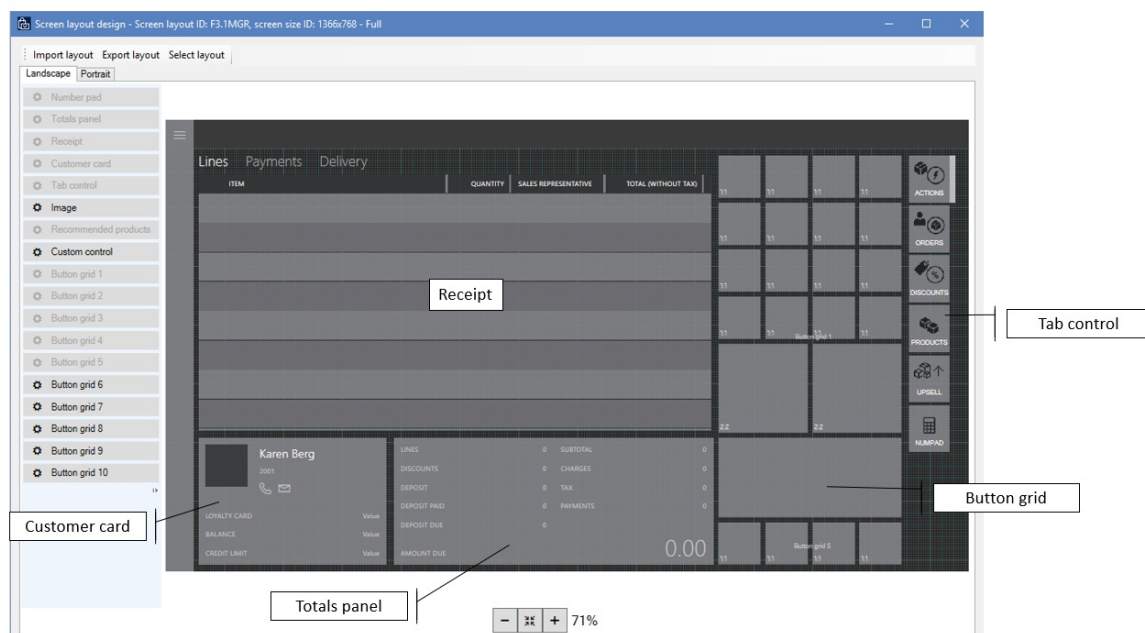

- **Import layout/Export layout** – You can export and import POS screen layout designs as XML files, so that you can easily reuse and share them across environments. It's important that you import layout designs for the correct layout sizes. Otherwise, UI elements might not fit correctly on the screen.
- **Landscape/Portrait** – If the POS device lets users switch between landscape and portrait modes, you must define a screen layout for each mode. The POS automatically detects screen rotation and shows the correct layout.
- **Layout grid** – The POS layout designer uses a 4-pixel grid. UI controls "snap" to the grid to help you correctly align the content.
- **Designer zoom** – You can zoom the designer view in and out to better view the content on the POS screen. This feature is useful when the screen resolution on the POS differs greatly from the resolution of the screen that is used in the designer.
- **Show/hide navigation bar** – For Full POS layouts, you can select whether the left navigation bar is visible on the **Transaction** screen. This feature is helpful for displays that have a lower resolution. To set

the visibility, right-click the navigation bar in the designer, and select or clear the **Always visible** check box. If the navigation bar is hidden, POS users can still access it by using the menu in the upper left.

- **POS controls** – The POS layout designer supports the following controls. You can configure many controls by right-clicking and using the shortcut menu.

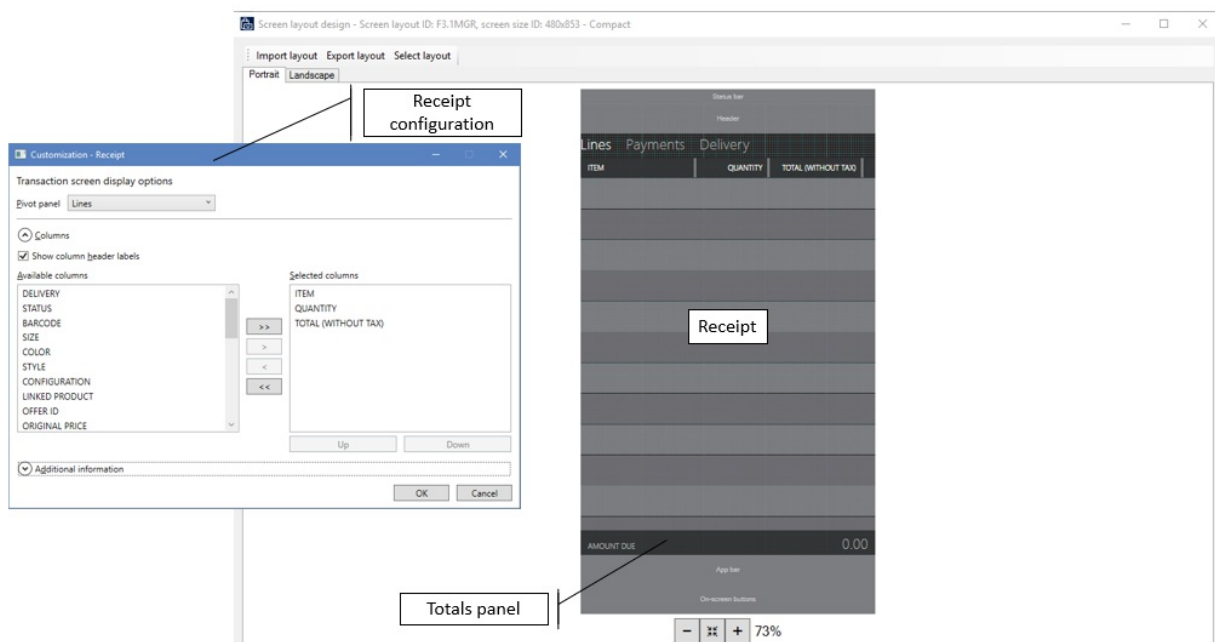

- **Number pad** – The number pad is the main mechanism for user input on the POS **Transaction** screen. You can configure the control so that the full number pad is shown. This option is ideal for touchscreen devices. Alternatively, you can configure it so that only the input field is shown. In this case, a physical keyboard is used for input. The number pad settings are available only for Full layouts.

For Compact layouts, the full number pad is always shown on the **Transaction** screen.

- **Totals panel** – You can configure the totals panel in either one column or two columns, to show values such as the line count, discount amount, charges, subtotal, and tax. Compact layouts support only a single column.
- **Receipt panel** – The receipt panel contains the sales lines, payment lines, and delivery information for the products and services that are processed in the POS. You can specify columns, widths, and placement. In Compact layouts, you can also configure additional information that appears in the row under the main line.
- **Customer card** – The customer card shows information about the customer who is associated with the current transaction. You can configure the customer card to hide or show additional information.
- **Tab control** – You can add the tab control to a screen layout, and then put other controls, such as the number pad, customer card, or button grids, in it. The tab control is a container that helps you fit more content on the screen. The tab control is available only for Full layouts.
- **Image** – You can use the image control to show the store's logo or another branding image on the **Transaction** screen. The image control is available only for Full layouts.
- **Recommended products** – If the recommended products control is configured for the environment, it shows product suggestions, based on machine learning.
- **Custom control** – The custom control acts as a placeholder in the screen layout and lets you reserve space for custom content. The custom control is available only for Full layouts.

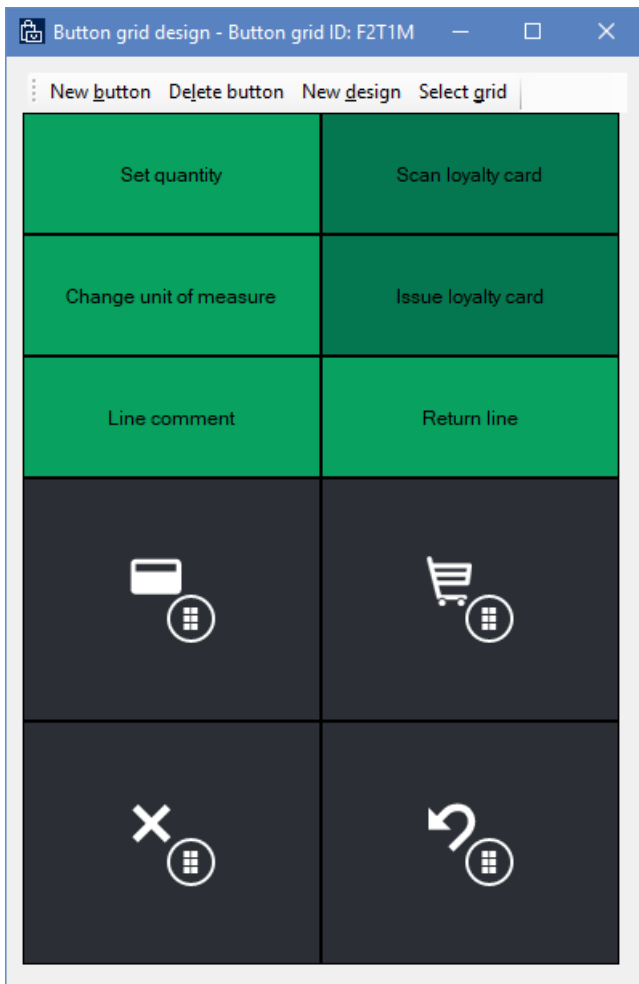

## Compact layout designer

Like the Full layout designer, the Compact layout designer lets you configure the POS screen layout for phones and small tablets. However, in this case, the layout itself is fixed. You can configure the controls in the layout by right-clicking and using the shortcut menu. However, you can't use drag-and-drop operations for additional content.

## Button grid designer

The button grid designer lets you configure button grids that can be used on the POS welcome screen and **Transaction** screen for both Full and Compact layouts. The same button grid can be used across layouts and layout types. Like the screen layout designer, the button grid designer uses the ClickOnce deployment technology to download, install, and start the latest version of the application every time that users access it. Be sure to check the browser requirements for ClickOnce. Some browsers, such as Google Chrome, require extensions.

- **New button** – Click to add a new button to the button grid. By default, new buttons appear in the upper-left corner of the grid. However, you can arrange buttons by dragging them in the layout.

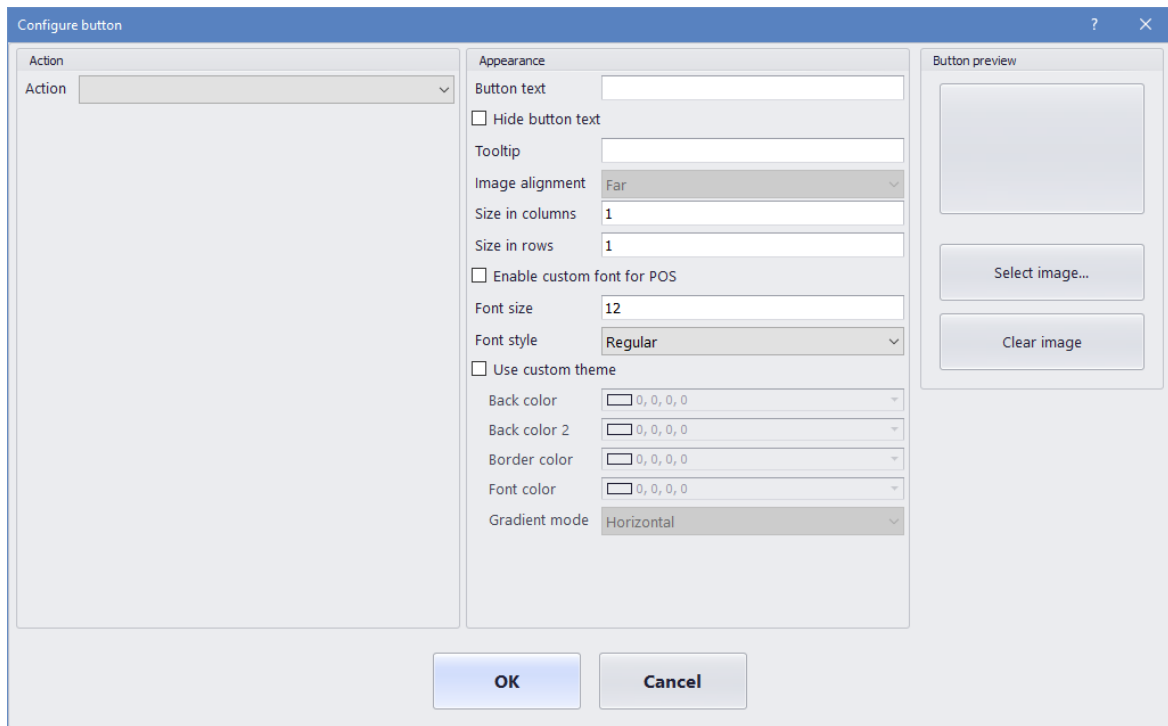

**IMPORTANT**

The contents of the button grid can overlap. When you arrange buttons, make sure that they don't hide other buttons.

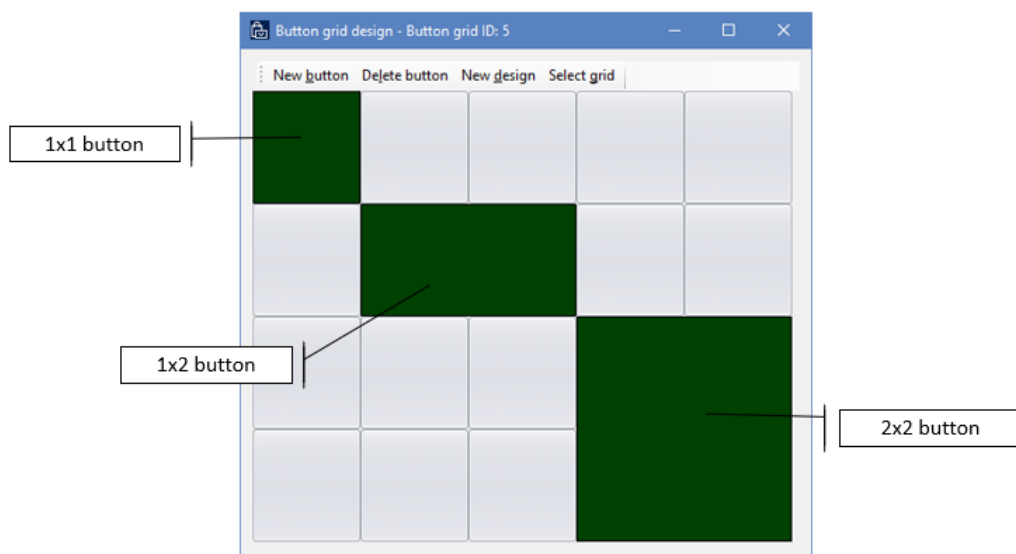

- **New design** – Click to automatically set up a button grid layout by specifying the number of buttons per row and column.
- **Button properties** – You can configure button properties by right-clicking the button and using the shortcut menu.

**IMPORTANT**

Some button grid settings apply only to Enterprise POS, not to Modern POS or Cloud POS.

- **Action** – In the list of applicable POS operations, select the operation that is invoked when the button is clicked in the POS.  
For the list of supported POS operations, see [Online and offline point of sale \(POS\) operations](#).
- **Action parameters** – Some POS operations use additional parameters when they are invoked. For example, for the Add product operation, users can specify the product to add.
- **Button text** – Specify the text that appears on the button in the POS.
- **Hide button text** – Use this check box to hide or show the button text. Button text is often hidden for small buttons that show only an icon.
- **Tooltip** – Specify additional Help text that appears when users mouse over the button.
- **Size in columns/Size in rows** – You can specify how tall and wide the button is.

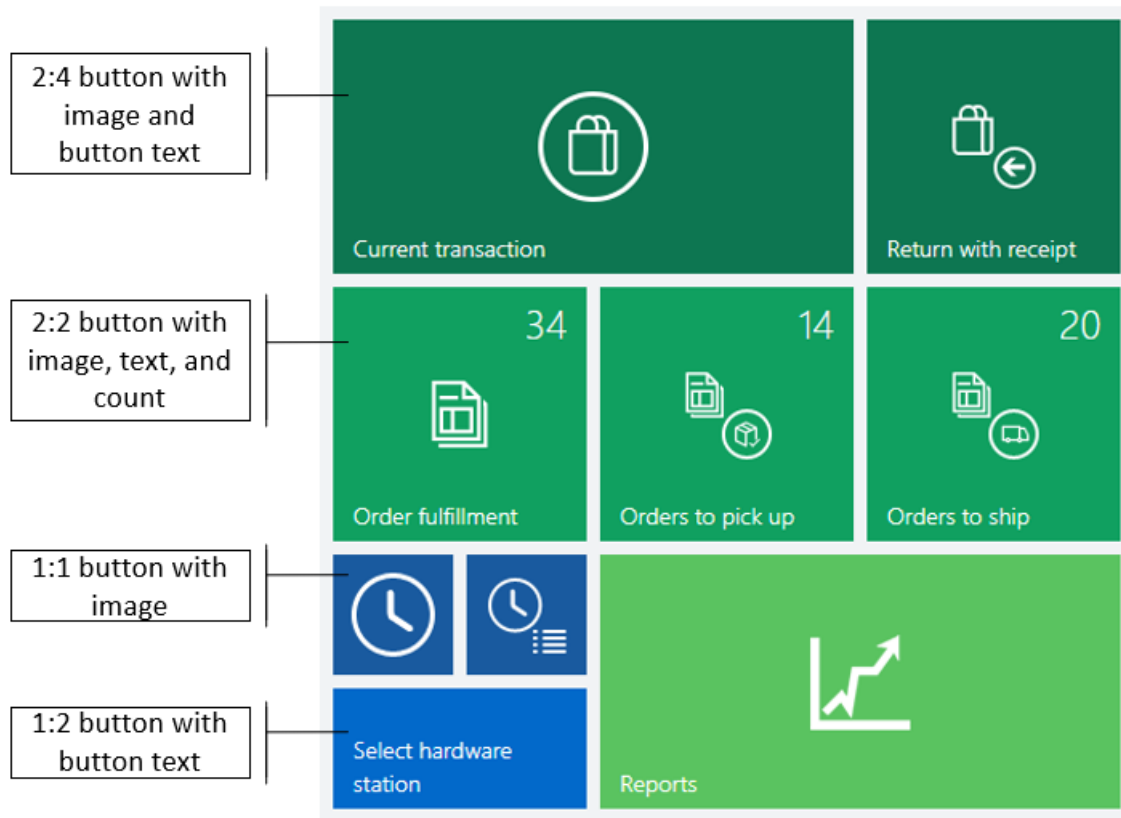

- **Custom font** – When you select the **Enable custom font for POS** check box, you can specify a font other than the default system font for the POS.

- **Custom theme** – By default, POS buttons use the accent color from the visual profile. When you select the **Use custom theme** check box, you can specify additional colors.

**NOTE**

Modern POS and Cloud POS use only the **Back color** and **Font color** values.

- **Button image** – Buttons can include images or icons. Select among the available images that are specified at **Retail and Commerce > Channel setup > POS setup > POS > Images**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Install the POS layout designer

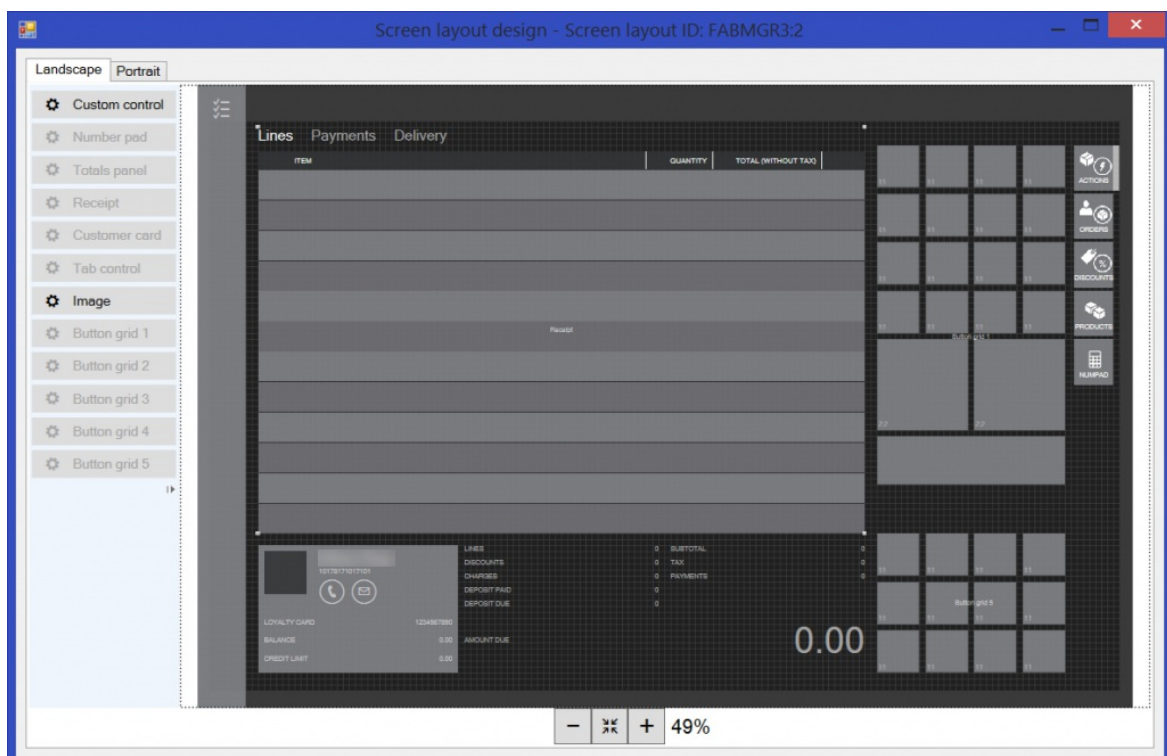

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use the one-click designer to design different Modern POS (MPOS) and Cloud POS layouts, in either Landscape mode or Portrait mode, for stores, registers, cashiers, and managers.

The graphical design interface for MPOS or Cloud POS is controlled by the till layout. A layout controls the position of various objects. Examples include the total layout, the item grid layout, the customer layout, the payment layout, and the layout of various menu buttons. Layouts also include the overall appearance of the sales interface that is presented to workers.

## Install the one-click designer

1. In Commerce, use the menu in the upper left to navigate to **Retail and Commerce > Channel setup > POS setup > POS > Screen layouts**.
2. Select any layout that has an application type of **Modern POS for Windows** or **Cloud POS**, and then click **Layout designer**.
3. On the notification bar that appears at the bottom of the Internet Explorer window, click **Open** to install the one-click designer. (The notification bar might appear in a different place in other browsers.)
4. In the **Application Run - Security Warning** message box that appears, click **Run** to install the Retail designer host. A progress indicator shows the progress of the installation.
5. After the installation is completed, on the **Sign in** page, enter your Commerce user name and password, and then click **Sign in** to start the designer.
6. After your credentials are validated and the designer starts, you can design your own layout or modify the existing layout.

## Troubleshoot the installation of the Layout designer

- When you click **Designer**, the prompt to download (or run) the installer doesn't appear, or your current security settings don't allow you to download the file.

### Solutions:

- In Internet Explorer, make sure that the pop-up blocker is disabled for this site. Click **Settings > Options > Privacy > Find Pop-up Blocker**, and change the setting, if a change is required.
- In Internet Explorer, add the Commerce URL to your trusted sites. Click **Settings > Options > Security > Trusted sites > Sites > Add**.
- The program doesn't start, and you're instructed to contact the vendor.

**Solution:** In Internet Explorer, add the Commerce URL to your trusted sites. Click **Setting > Options > Security > Trusted sites > Sites > Add**.

**Known issue:** The designer doesn't work correctly in the Google Chrome and Mozilla Firefox browsers. We are working to fix this issue.

## Additional resources

# Show order notifications in the point of sale (POS)

2/18/2021 • 5 minutes to read • [Edit Online](#)

In the modern retail environment, store associates are assigned various tasks, such as helping customers, entering transactions, doing stock counts, and receiving orders in the store. The point of sale (POS) client provides a single application where associates can perform all these tasks and many others. Because various tasks must be performed during the day, associates might have to be notified when something requires their attention. The notification framework in the POS helps by letting retailers configure role-based notifications. As of Dynamics 365 for Retail with application update 5, these notifications can be configured only for POS operations.

Currently, the system can show notifications only for order fulfillment operations. However, because the framework is designed to be extensible, developers will eventually be able to write a notification handler for any operation and show the notifications for that operation in the POS.

## Enable notifications for order fulfillment operations

To enable notifications for order fulfillment operations, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS > Operations**.
2. Search for the **Order fulfillment** operation, and select the **Enable notifications** check box for it to specify that the notification framework should listen to the handler for this operation. If the handler is implemented, notifications for this operation will then be shown in the POS.
3. Go to **Retail and Commerce > Employees > Workers >**, under Commerce tab, open the POS permissions associated with the worker. Expand the **Notifications** FastTab, add the **Order fulfillment** operation, and set the **Display order** field to 1. If more than one notification is configured, this field is used to arrange the notifications. Notifications that have a lower **Display order** value appear above notifications that have a higher value. Notifications that have a **Display order** value of 1 are at the top.

Notifications are shown only for operations that are added on the **Notifications** FastTab, and you can add operations there only if the **Enable notifications** check box for those operations has been selected on the **POS operations** page. Additionally, notifications for an operation are shown to workers only if the operation is added to the POS permissions for those workers.

### NOTE

Notifications can be overridden at the user level. Open the worker's record, select **POS permissions**, and then edit the user's notification subscription.

4. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. In the **Notification interval** field, specify how often notifications should be pulled. For some notifications, the POS must make real-time calls to the back-office application. These calls consume the compute capacity of your back-office application. Therefore, when you set the notification interval, you should consider both your business requirements and the impact of real-time calls to the back-office application. A value of 0 (zero) turns off notifications.
5. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**. Select the **1060 (Staff)** schedule to synchronize notification subscription settings, and then select **Run now**. Next, select the **1070 (Channel configuration)** schedule to synchronize the permission interval, and then select

Run now.

## View notifications in the POS

After you complete the preceding steps, the workers will be able to view the notifications in the POS. To view notifications, press the notification icon in the top right corner of the POS. A notification center appears and shows notifications for the order fulfillment operation. The notification center should show the following groups in the order fulfillment operation:

- **Store pickup** – This group shows the count of orders that have a delivery mode of **Pickup**, and that are scheduled for pickup from the current store. You can press the number on the group to open the **Order fulfillment** page. In this case, the page will be filtered so that it shows only the active orders that are set up for pickup from the current store.
- **Ship from store** – This group shows the count of orders that have the delivery mode of **Shipping**, and that are scheduled for shipment from the current store. You can press the number on the group to open the **Order fulfillment** page. In this case, the page will be filtered so that it shows only the active orders that are set up for shipment from the current store.

When new orders are assigned to the store for fulfillment, the notification icon changes to indicate that there are new notifications, and the count for the appropriate groups is updated. Even though the groups are refreshed at regular intervals however, POS users can manually refresh the groups at any time by selecting the **Refresh** button next to the group. Lastly, if a group has a new item, that the current worker hasn't viewed, then the group shows a burst symbol to indicate new content.

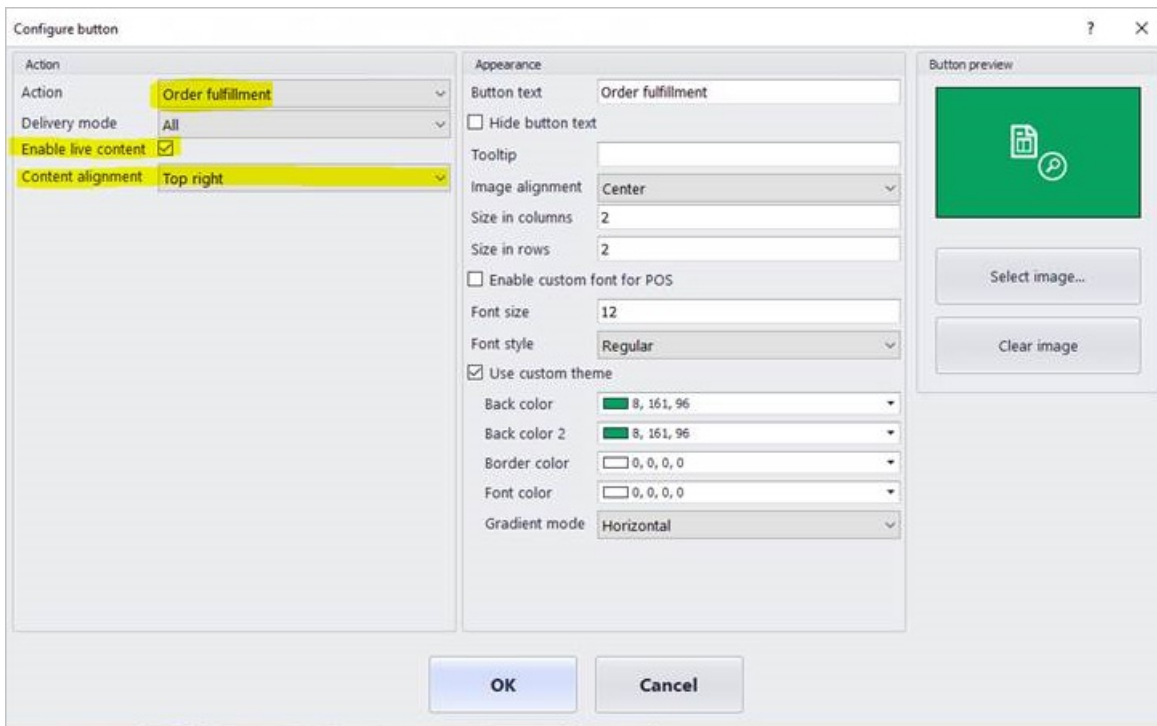

## Enable live content on POS buttons

POS buttons can now show a count to help workers easily determine which tasks require their immediate attention. To show this number on a POS button, you must complete the notification setup that is described earlier in this topic (that is, you must enable notifications for an operation, set up a notification interval, and update the POS permission group for the worker). Additionally, you must open the button grid designer, view the button's properties, and select the **Enable live content** check box. In the **Content alignment** field, you can select whether the count appears in the upper-right corner of the button (**Top right**) or in the center (**Center**).

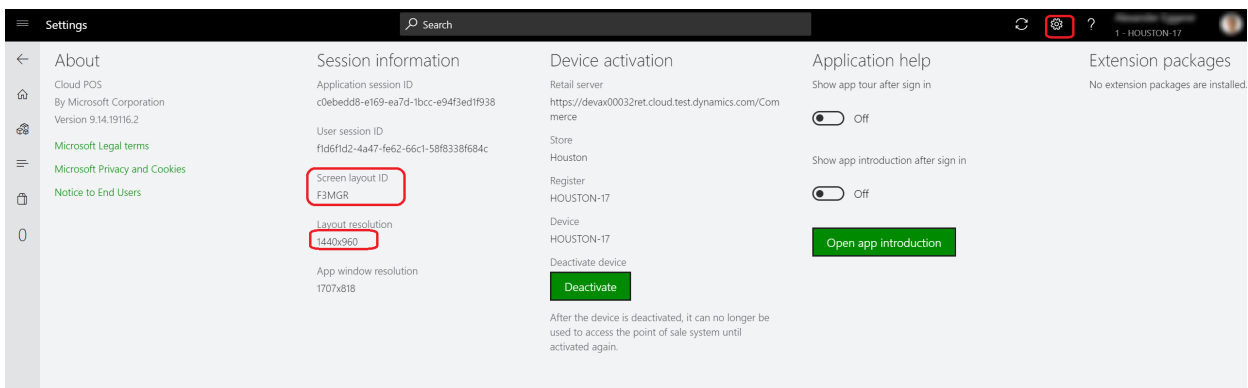

### NOTE

The live content can be enabled for operations only if the **Enable notifications** check box has been selected for them on the **POS operations** page, as described earlier in this topic.

The following illustration shows the live content settings in the button grid designer.

To show the notification count on a button, you need to ensure that the correct screen layout is being updated. To determine the screen layout that is being used by the POS, select the **Settings** icon in upper-right corner and note the **Screen layout ID** and **Layout resolution**. Now using Edge browser, go to the **Screen layout** page, find the **Screen layout ID** and **Layout resolution** identified above and select the **Enable live content** check box. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule** and run the 1090 (Registers) job to synchronize layout changes.

The following illustration shows the effect of selecting **Top right** versus **Center** in the **Content alignment** field for buttons of various sizes.

The image shows a Windows Start menu on the left and a Notifications window on the right. The Start menu features several tiles: 'Current transaction' (shopping cart icon), 'Return transaction' (shopping cart with arrow icon), 'Order fulfillment - ALL' (two tiles, each with a document icon and a count of 1), 'Order fulfillment - Pick Up' (calendar icon, count 1), 'Order fulfillment - Ship' (calendar with checkmark icon, count 0), and 'Select hardware station' (two small tiles, each with a count of 1). The Notifications window is titled 'Order fulfillment' and shows 'Last updated: 01/17/2018 5:43 PM'. It contains two sections: 'Store pickup' with a count of 1, and 'Ship from store' with a count of 0.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Point of sale (POS) application and user language settings

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to change language settings in Modern POS (MPOS) and Cloud POS.

## Overview

Modern POS (MPOS) and Cloud POS support environments where language settings and translations can vary between the store and user settings. For example, the store could be located in a region where English is most common for their customers, but some workers prefer to use the application with French translations.

## Data language

Regardless of the user's settings, MPOS and Cloud POS will always use the store's language settings to determine the translations used for data. This will ensure that all users and customers will have a consistent experience. Examples of data include:

- Products
- Attributes and values
- Category names
- Printed or emailed transaction receipts
- Payment method names
- Line display messages

The store's language will also be used for the main POS login screen, since the user is not known before logging in. If a translation is not available for the store's language, the POS will revert to the company's language.

### Configuring the store's language setting

The store's language setting is set from **All stores** on the **Store** page under **General > Regional Settings > Language**. Use the drop-down list to choose the language for each store.

## User interface language

The POS user's language setting determines the translations used in the application user interface. This includes all labels, menus, and lists that are not considered data. One exception is the text that is displayed on POS button grids. The button grids don't support translations, so they will always show the text as defined on the button. In order to support translated buttons, you'll have to copy and maintain separate button grids and assign them to the users as appropriate.

### Configuring the user's language setting

The POS user's language setting is set from **All workers** on the **Worker** page under **Retail and Commerce > Language**. It is not set on the main Profile tab. This setting is not used by POS. If the user's language is not set or it is set to a language where translations are not available, the POS will revert to the store's language.

	UI LANGUAGE	DATA LANGUAGE (PRODUCTS, RECEIPT FORMATS, LINE DISPLAY, ETC.)
Company	Default	Default
Store	Overrides company	Overrides company
User	Overrides store or company	Never

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up and manage images for Modern POS (MPOS)

2/18/2021 • 14 minutes to read • [Edit Online](#)

This article explains the steps that are involved in setting up and managing images for the various entities that appear in Modern POS (MPOS).

## Setting up the media base URL and defining media templates to configure the format for image URLs

The images that appear in Modern POS (MPOS) must be hosted externally, outside of Commerce. Typically, they are hosted in a content management system, content delivery network (CDN), or media server. MPOS then fetches and displays the images for the appropriate entities, such as products and catalogs, by accessing the target URL. To fetch these externally hosted images, MPOS requires the correct URL format for the images. You can configure the required URL format for the images by setting up the **Media base URL** value in the channel profile and using the **Define media template** functionality for each entity. You can also overwrite the standard URL format for a subset of entities by using the **Edit in Excel** functionality.

### IMPORTANT

In the current version of Commerce, you can no longer set up the URL format by using the **Image** attribute XML for MPOS in the **Default** attribute group for entities. If you're familiar with Microsoft Dynamics AX 2012 R3 and are now using the current version of Commerce, make sure that you always use the new **Define media template** functionality to set up images. Don't use or modify the **Image** attribute in the **Default** attribute group for any entities, including products. Changes that you make directly in the **Default** attribute group for images won't be reflected. This option will be disabled in a future release.

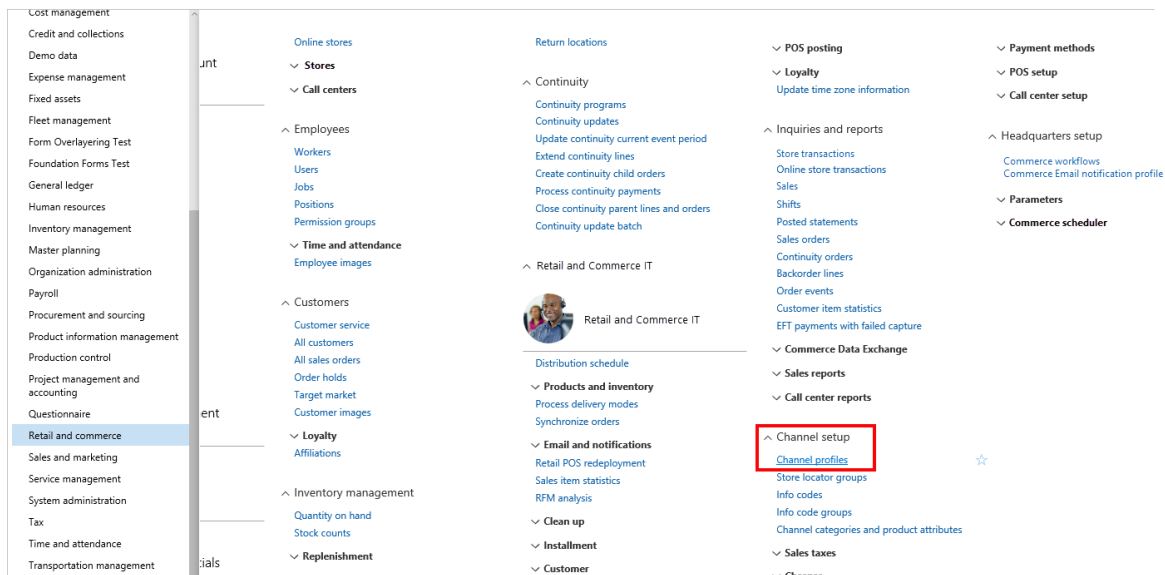

In the following procedures, images are set up for the Catalog entity as an example. These procedures will help guarantee that the correct image destination path is set implicitly for all catalog images that use a common path. For example, if you've set up a media server or CDN externally, and want the images to appear in MPOS for a given store, the **Define media template** functionality helps you set the path where MPOS can look up and retrieve the images.

### NOTE

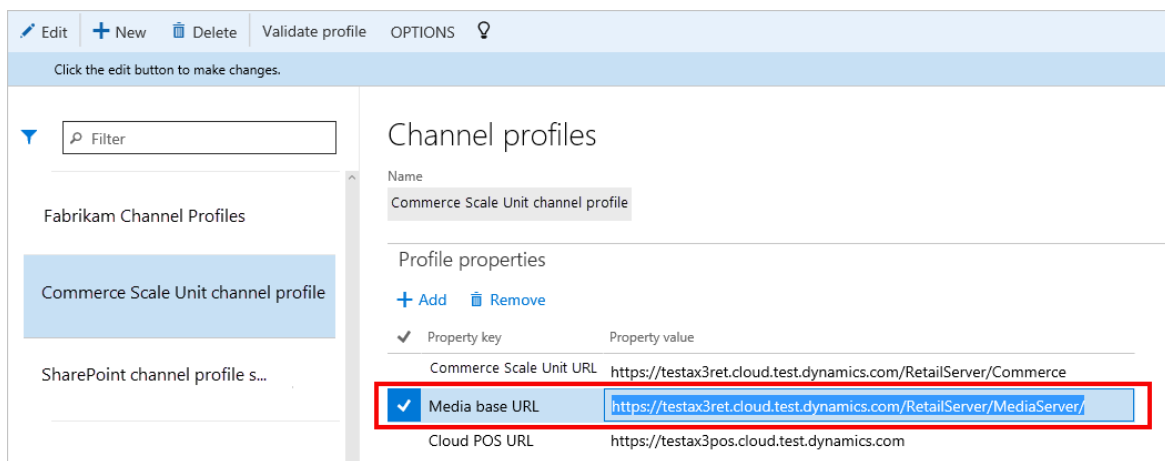

For this demo data example, the media server is deployed on the Commerce Scale Unit. However, you can have it anywhere outside Commerce.

### Set up the media base URL for a channel

1. Open the Commerce HQ portal.
2. Click **Retail and Commerce > Channel setup > Channel profiles**.

3. In the channel profile that your store uses for MPOS, update the **Media base URL** field with the base URL of your media server or CDN. The base URL is the first part of the URL that is shared by all image folders of different entities.

### Define the media template for an entity

1. Click **Retail and Commerce > Catalog management > Catalog images**.
2. On the **Catalog images** page, on the Action Pane, click **Define media template**. In the **Define media template** dialog box, in the **Entity** field, **Catalog** should be selected by default.
3. On the **Media path** FastTab, enter the remaining path of the image location. The media path supports **LanguageID** as a variable. For example, for the demo data, you can create a **Catalogs** folder for all catalog images under the media base URL for your media server ( `https://testax3ret.cloud.test.dynamics.com/RetailServer/MediaServer` ). You can then have a folder for each language, such as en-US or fr-FR, and copy the appropriate images under each folder. If you don't have different images for the various languages, you can omit the **LanguageID** variable from your folder structure and point directly to the **Catalogs** folder that contains the catalog images.

#### NOTE

The current version of Commerce supports the **{LanguageID}** token for Catalog, Product, and Category entities. (The **{LanguageID}** token isn't supported for Customer and Worker entities, according to the existing standard that has been effective since Microsoft Dynamics AX 6.x.)

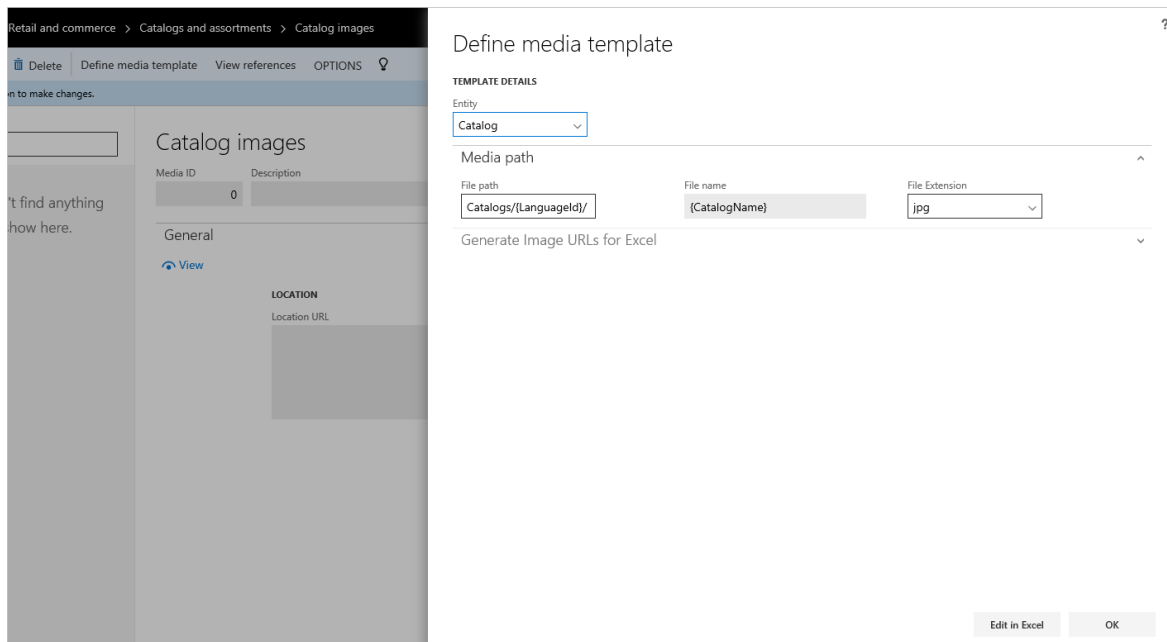

4. For images, the file name format is hard-coded to the catalog name and can't be changed. Therefore, rename your images so that they have appropriate catalog names, to help guarantee that MPOS handles

them correctly.

5. In the **File Extension** field, select the expected file name extension, depending on the type of images that you have. For example, for the demo data, the catalog images are set to the .jpg extension. (The image files are also renamed so that they have catalog names.)
6. Click **OK**.
7. To validate that the media template for images has been saved correctly, on the **Catalog images** page, click **Define media template** again. To validate the template without closing the **Define media template** dialog box, you can use the **Generate Image URLs for Excel** FastTab. Check the appearance of the image URL, and verify that the URL complies with the template standard that was mentioned earlier. The **Define media template** dialog box has now set the image path implicitly for all catalog images that use this common URL path. This URL path applies to all catalog images unless they are overwritten. The first part of the image path is taken from the media base URL that you defined in the channel profile. The remaining part of the path is taken from the path that you defined in the media template. The two parts are concatenated to provide the full URL of the image location. For example, a catalog in the demo data is named Fabrikam Base Catalog. Therefore, the image name must be Fabrikam Base Catalog.jpg so that it uses the catalog name and the .jpg file name extension that is configured in the template. In this case, after concatenation, the URL will be  

```
https://testax3ret.cloud.test.dynamics.com/RetailServer/MediaServer/Catalogs/en-US/Fabrikam Base Catalog.jpg
```
8. Run the synchronization jobs to push the new template to the channel database, so that MPOS can use the template to access the images.
9. To update the media template for catalog images on the channel side, be sure to run **Catalog Job 1150** from **Retail and Commerce IT > Distribution schedule**.

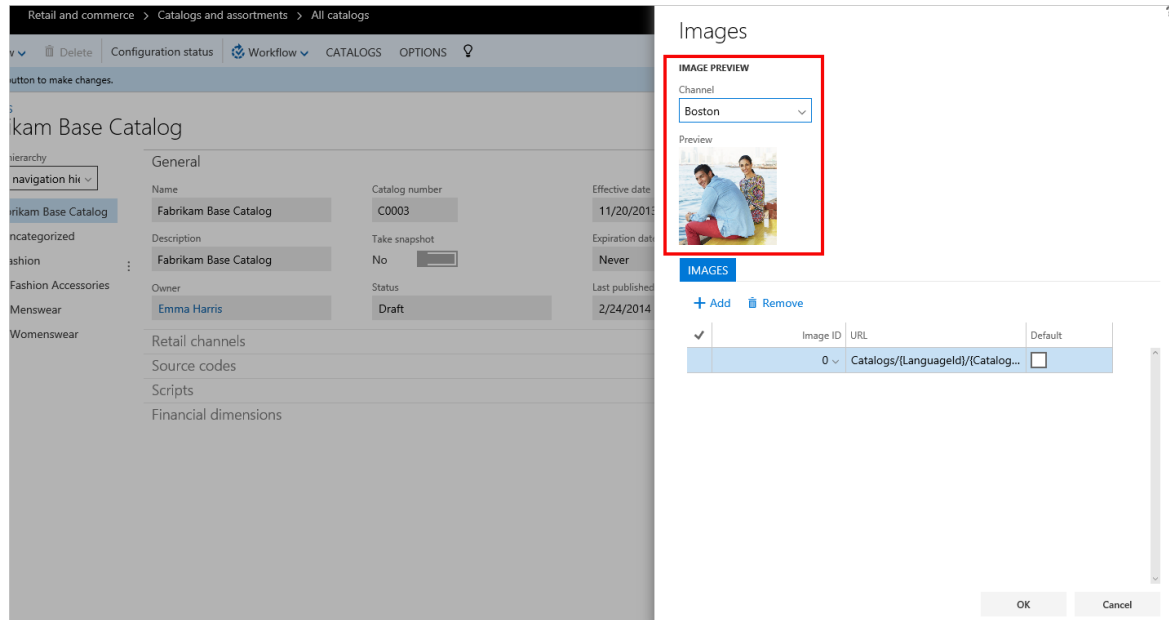

## Previewing an image from the entity level

1. From the page for the entity item in HQ, you can preview the image that uses the image URL that is derived from the media template. For this example, go to the appropriate catalog, and then, on the Action Pane, click **Media > Images**. Use the drop-down list to select different stores that might have different channel profiles.
2. To edit or remove the implicit media template, you must return to the **Define media template** dialog

box for the **Catalog images** page.

3. You can use the **Add** and **Remove** buttons to manually change the path that is based on the implicit template and used for a specific image. For more information, see the [Overwriting the media template for entity items](#) section later in this article.
4. After you've finished previewing an image and making any changes that you require, start the MPOS instance for the appropriate store, and see whether the catalog images are shown.

#### NOTE

You can use the same procedure for all the five entities that are supported: Worker, Customer, Catalog, Category, and Products. "Catalog Products" (products that are set at the catalog level) and "Channel Products" (products that are set at the channel level) use the media template that is set for the Products entity. For the Products media template, you can select the number of product images to show per product. You can also set the default image for a given product. In this way, you can prevent blank images in MPOS and help to control which image is used as the default image for a product item. In the following example, each product has five images, and the first image is set as the default image. Variant products are treated the same way as master products. The file name of the image file should be based on the product number. Some characters are also escaped while the file name is generated. Therefore, it's a good to verify the file name by using the [Generate Image URLs for Excel](#) section. See the [Overwrite by using Edit in Excel](#) section later in this article.

## Synchronization jobs to send a media template to the channel side

For all the five supported entities (Worker, Customer, Catalog, Category, and Products), whenever you update the **Define media template** dialog to set up an image, make sure that you run the Catalog job (1150) from **Retail and Commerce IT > Distribution schedule**. This job will enable the updated media template to be synced to the channel and used by MPOS. Run the Catalog job (1150) after you make any of the following changes:

- You update the Catalog image media template from **Catalog images > Define media template**.
- You update the Employee image media template from **Employee images > Define media template**.
- You update the Customer image media template from **Customer image > Define media template**.
- You update the Product image media template from **Product images > Define media template**.
- You update the Category image media template from **Category images > Define media template**. You must also publish the channel.

# Overwriting the media template for entity items

As you learned in the previous section, the media template for a given entity supports only one common path. This path is based on the media base URL that is configured and the media path that is defined. However, in many cases, a retailer wants to be able to use images from different sources for a subset of items in an entity. For example, a store uses the self-hosted media server for one set of catalog images but uses CDN URLs for another set. To overwrite image URLs that are based on a media template for entity images at the entity level, you can use the Edit in Excel and Manual edit functionality from the **Preview** page.

## Overwrite by using Edit in Excel

1. Click **Retail and Commerce > Catalog management > Catalog images**.
2. On the **Catalog images** page, click **Define media template**. In the **Define media template** dialog box, in the **Entity** field, **Catalog** should be selected.
3. On the **Media path** FastTab, notice the image location.
4. On the **Generate Image URLs for Excel** FastTab, click **Generate**.

### IMPORTANT

Whenever the media template is changed, you must click **Generate** before you can use the Edit in Excel functionality.

You now see a preview of the image URLs that were generated based on the last saved media template.

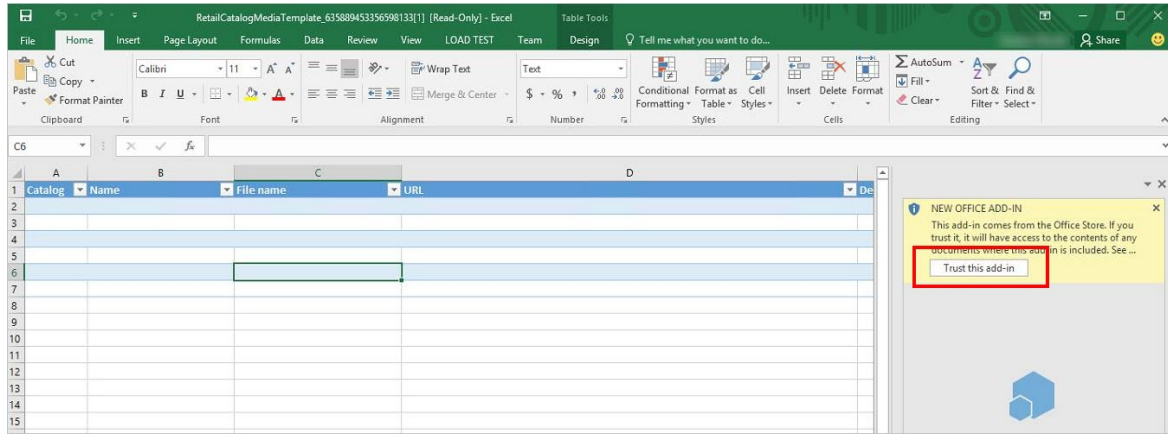

Name	File name	URL
Contoso Catalog	Contoso Catalog.jpg	Catalogs/(LanguageId)/Contoso C
Fashion Catalog	Fashion Catalog.jpg	Catalogs/(LanguageId)/Fashion ...
Fabrikam Base Catalog	Fabrikam Base Catalog.jpg	Catalogs/(LanguageId)/Fabrika...
Fabrikam Semi-Annual Sale	Fabrikam Semi-Annual Sale.jpg	Catalogs/(LanguageId)/Fabrika...
Contoso Appliance Catalog	Contoso Appliance Catalog.jpg	Catalogs/(LanguageId)/Contoso...
Contoso Base Catalog	Contoso Base Catalog.jpg	Catalogs/(LanguageId)/Contoso...

### NOTE

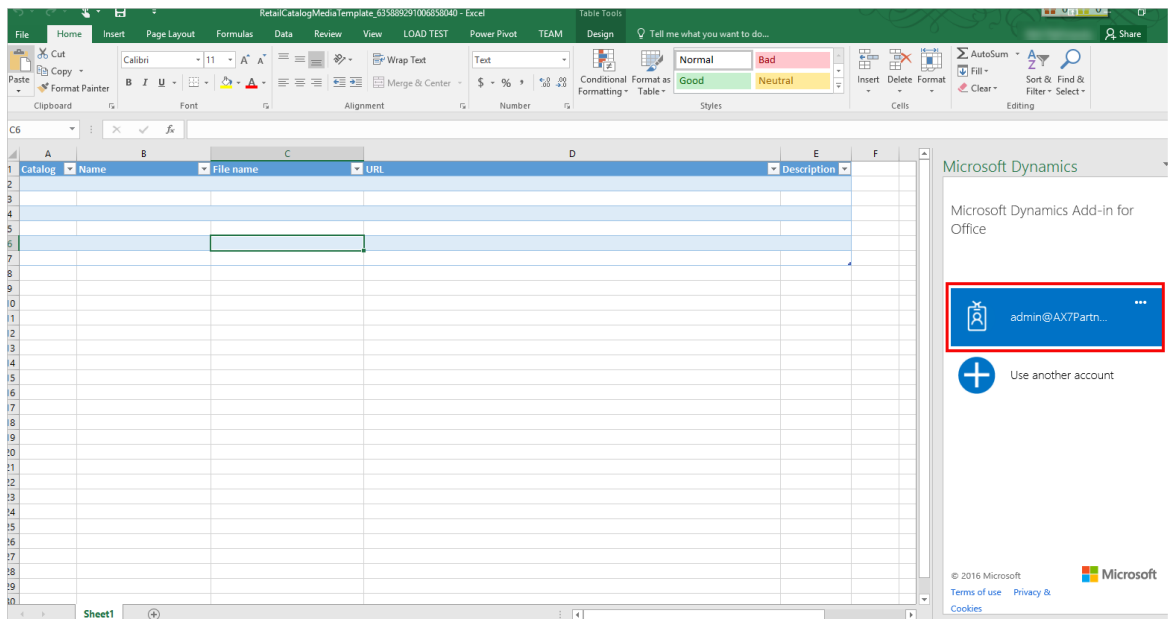

The URLs that are generated for Excel use the path and conventions of the media template that is defined. These conventions include the conventions for file names. The expectation is that you've set up the physical images outside Commerce, and the images can be retrieved from the URLs that are derived from the media template that you defined earlier. You can overwrite these derived URLs by using the Edit in Excel functionality.

5. Click **Edit in Excel**.
6. After the Microsoft Excel worksheet is opened, click **Enable edit** when you're prompted.
7. When you're prompted, click **Trust this add-in** in the right pane, and wait for the add-in to complete the

installation.

8. If you're prompted to sign in, enter the credentials that you used to sign in to HQ.

9. After you sign in, you should be able to see the list of image URLs for the various catalog entries.

10. You edit, add, and remove the image URLs for various entity items.

11. For all entities except Products, you can overwrite the image URLs. Modify the existing image URL, so that it uses the new destination URL of the image, and update the file name with the new file name for the image file. The file name must be unique to help guarantee that the record is unique.

Catalog	Name	File name	URL	Description
5637144576	Contoso Catalog	Contoso Catalog.jpg	www.microsoft.com/azure/machineLearning/POC.jpg	
5637145334	Fashion Catalog	Fashion Catalog.jpg	Catalogs/(Languageid)/Fashion Catalog.jpg	
5637145335	Fabrikam Base Catalog	Fabrikam Base Catalog.jpg	Catalogs/(Languageid)/Fabrikam Base Catalog.jpg	
5637145336	Fabrikam Semi-Annual Sale	Fabrikam Semi-Annual Sale.jpg	Catalogs/(Languageid)/Fabrikam Semi-Annual Sale.jpg	
5637145337	Contoso Appliance Catalog	Contoso Appliance Catalog.jpg	Catalogs/(Languageid)/Contoso Appliance Catalog.jpg	
5637145338	Contoso Base Catalog	Contoso Base Catalog.jpg	Catalogs/(Languageid)/Contoso Base Catalog.jpg	

#### NOTE

When you overwrite image URLs for Products entities by using the Edit in Excel functionality or the entity item page, MPOS always shows all the media template image URLs together with the overwritten image URLs.

- After you've finished making your changes, click **Publish in Excel** to create a new explicit association entry.
- Return to HQ, and click **OK**.
- Run the appropriate synchronization jobs for the entity, and check the preview on the entity page or in MPOS.

#### Creating new records

You can create new records in Excel. However, make sure that you provide the correct information. For example, to create a new entry for a catalog, make sure that the catalog ID and catalog name are correct, and also provide a unique file name. The unique file name is very important, because the uniqueness of records in Excel is validated during publishing. First copy the details from the catalog that you want to create a new record for, and copy the record. You just have to update the file name and URL, because the rest of the information will be same. To create new records for Product entity items, you use the same basic procedure. From the Excel worksheet, copy an existing record for the product that you to create a new record for, and then replace the image URL and filename. Make sure that the file name is unique.

#### Deleting an existing record

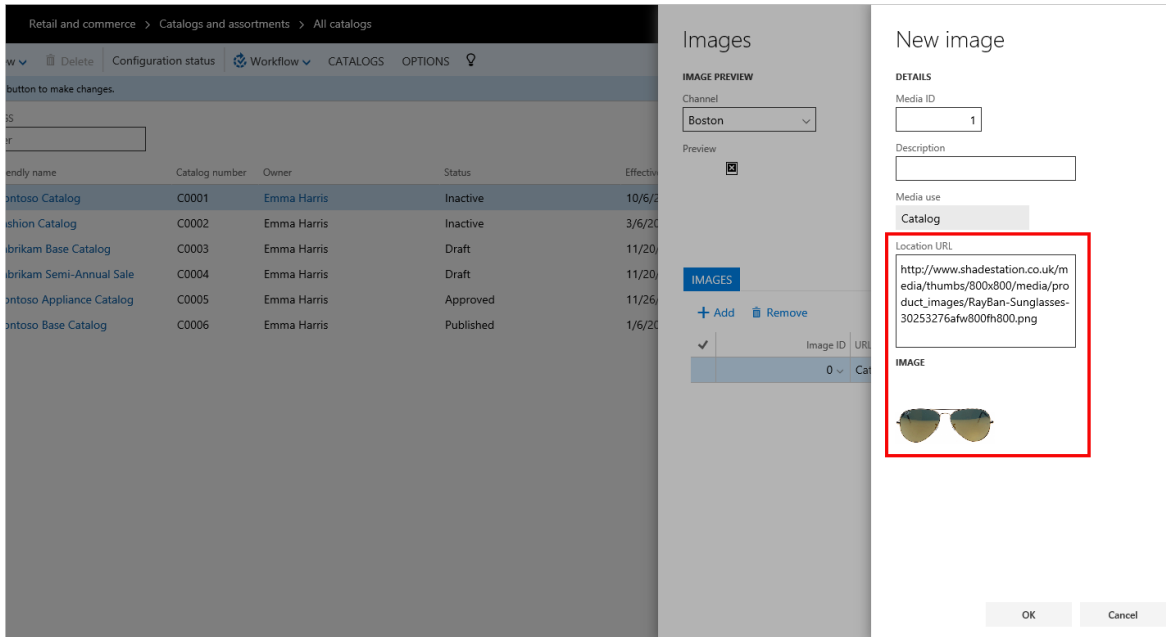

Only the overwritten image URL records can be deleted. After an image is deleted and synchronization is completed, the image will no longer appear on the **Preview** page or in MPOS. Image URL records that are derived from the media template can't be deleted, because these records are always derived from the media template every time.

#### Overwrite from the entity-level Preview page

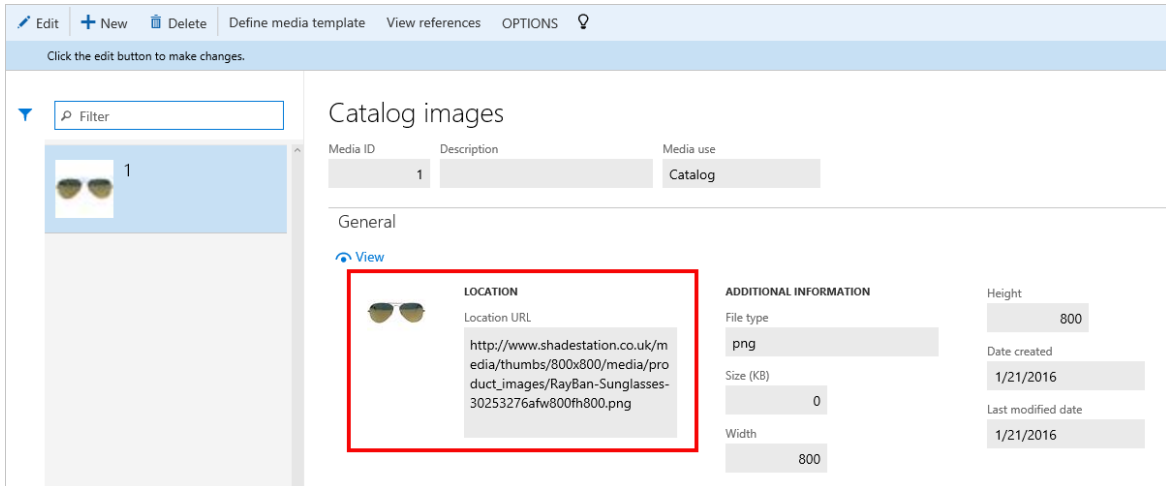

For all entities except Products, you can overwrite the image URL for a given entity item at the entity item level from the **Preview** page. For Products, you can use the "Catalog Products" entity page. This example shows how to overwrite a catalog image.

- Click **Catalogs > Media > Images**, and select the catalog image to update.
- Click **Add**, and enter the image URL to overwrite the media template URL.
- If you want this image to be shown in MPOS for the catalog, you can set it as the default image.

4. Click **OK**. The image URL is updated for this catalog image, and a preview is shown.

5. You can also see the image preview for all overwritten image URLs on the **Catalog images** gallery page.

#### NOTE

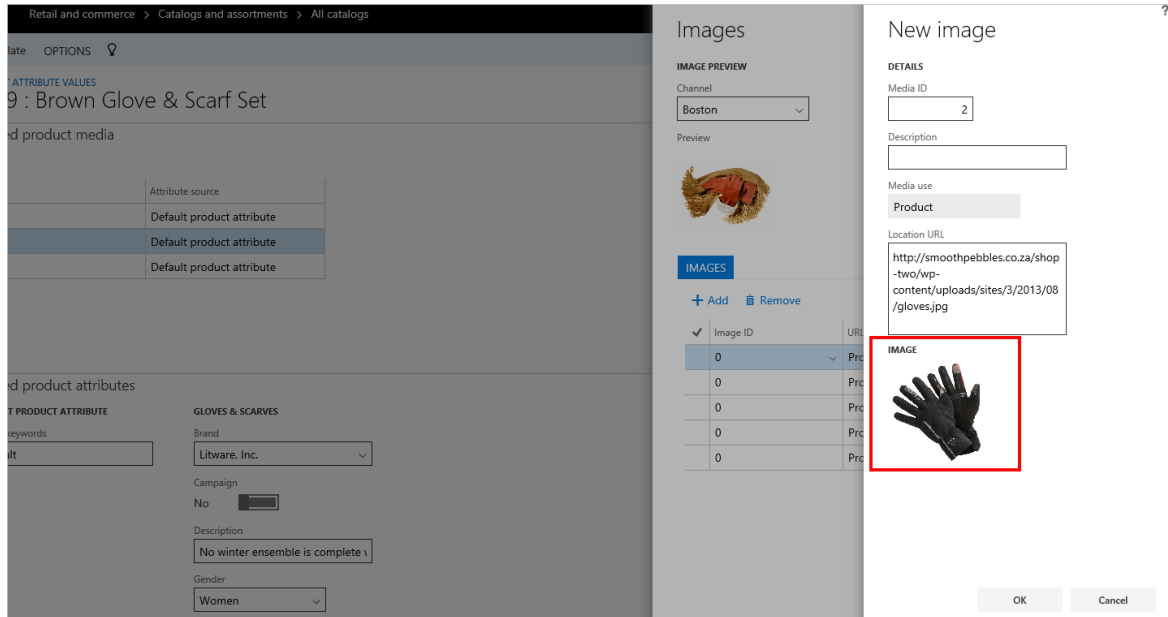

Currently, the gallery doesn't show image previews for media template image URLs. For Catalog, Worker, Customer, and Category entities, if the user explicitly provides a URL through this page, we recommend that you indicate which image is the default image, because Commerce Scale Unit clients show only one image per Catalog, Customer, Worker, and Category. If the user doesn't specify a default image, the system determines the default image and send it to the Commerce service caller (MPOS or Ecommerce).

### Overwrite the image URL for catalog product images from the Preview page

To overwrite image URLs for catalog product images, you must use the **Preview** page. You can't use the Edit in Excel functionality.

1. To overwrite product images at a catalog level, select a catalog, and then select the product to overwrite the image for.
2. Click **Attributes**.
3. On the next page, select **Image**, and then click **Edit**. The **Preview** page opens as a slider dialog box.
4. Click **Add**, and overwrite the image URL with a new URL.

5. Click **OK**. You now see the preview of the new image and can set it as the default image.

#### NOTE

After category image association, you must publish the channel and run the Channel job to help guarantee that the changes are published to the channel database.

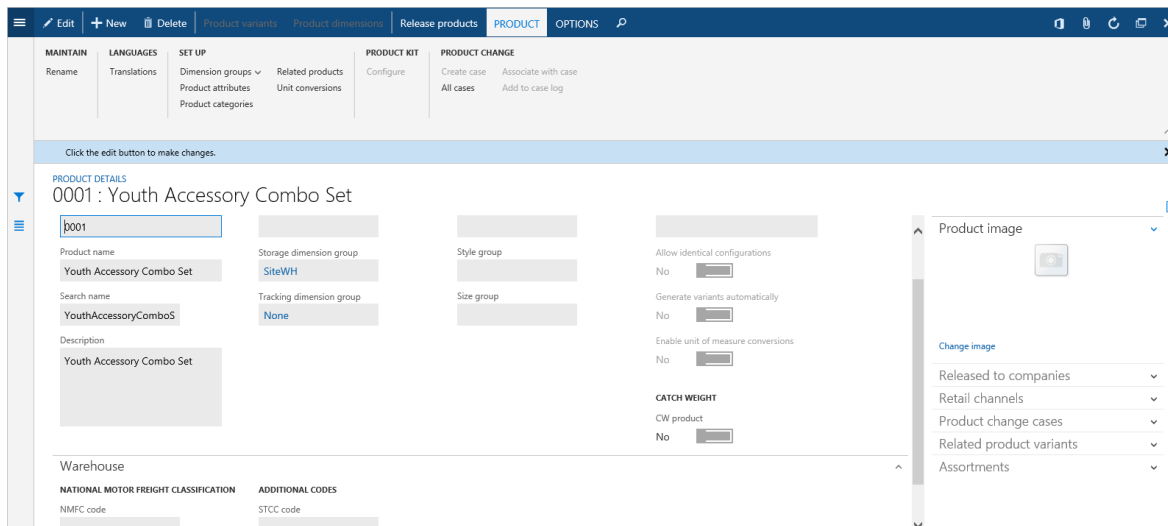

## Setting up images to appear in Offline mode for MPOS

MPOS can run in Online mode (when MPOS connected to Commerce Scale Unit) or Offline mode (when there is no Commerce Scale Unit or network connectivity, and transactions are stored in a local offline database). When MPOS runs in Offline mode, it can't get images from the external image server to display from Commerce Scale Unit, because connectivity has been lost. However, you can still set up images so that they are shown when MPOS runs in Offline mode.

### Set up product images to appear in Offline mode for MPOS

The product images that must be used in Offline mode can be set up by uploading the required physical image into the base product image.

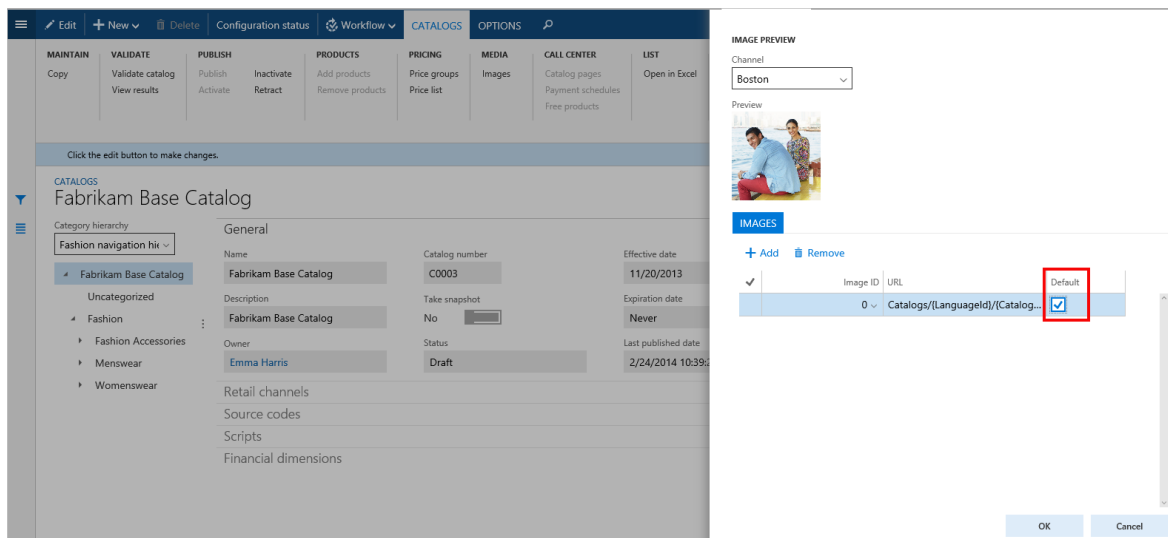

1. Click **Product information management > Products > Products**.
2. Select the product to set the offline image for.
3. Click **Edit**, and then click the arrow in the right corner to show the right pane.
4. On the **Product image** FastTab, click **Change image**, and upload the physical image to use for the selected product in Offline mode.
5. Save and close the page.
6. While MPOS is in Online mode, run the Catalog job in HQ, to make sure that the data is sent at least one time to the offline database.
7. Put MPOS into Offline mode. You should see the image that you uploaded for the specific product in HQ.

## Set up catalog, category, employee, and customer images to appear in Offline mode for MPOS

The catalog, category, employee, and customer images that must be used in Offline mode can be set up by adding the required image's destination link to the gallery and setting the image as the default image for the selected entity.

1. Go to the catalog, and then, on the Action Pane, click **Media > Images**.
2. Follow the steps in the [Overwrite from the entity-level Preview page](#) section to add the external image URL.
3. Mark this image as the default image for the catalog by selecting the check box against the Image listed in the grid.
4. Run the Catalog job. This image will now be used as the Offline image for that catalog in MPOS.
5. Follow a similar process for other entities, such as Category, Employee, and Customer.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Client images in POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic is intended for people who implement functionality related to point of sale (POS) client image management in a retail environment. It provides tips and guidance to consider when planning an implementation.

This guidance applies to both Cloud POS and Modern POS, and provides some general information about image file size handling and types of images that can be used to enrich the user experience with the store and support customer-focused scenarios like up-selling, cross-selling, and clienttelling. Welcome screen images, category images, and product images are examples of types of images that you can use.

## Implementation considerations

- **File size** - In order to maintain responsiveness of the POS client user interface (UI) and performance while loading different kinds of images, we recommend that you prepare your images to be an appropriate file size respective to the purpose of use. For example, product and category images in the Contoso demo data are sized at 500 x 500 or 580 x 580 pixels.
- **Image size** - The screens and displays of the POS devices will pre-determine reasonable image sizes (length and width). You should size the image as close to your intended screen size as possible. For an example, see the "Implementation example" section below.
- **Resolution** - An important parameter to consider is the dots per inch (dpi), or for screen resolution, pixel per inch (ppi). Because POS client images will not be printed, the common dpi setting for rendering images on the web is a good guideline (72 to 150 dpi). Contoso demo image files are typically rendered to 96 dpi. For high resolution devices, you should take operating system (OS) scaling into account and use the effective resolution, rather than the actual pixels.
- **File types** – You can use \*.png or \*.jpg image file types. In most cases, \*.jpg are smaller in size.

## Implementation example

To create a welcome screen image that covers two-thirds of the canvas on a common 18.5 inch POS display with a 1366 x 768 pixel resolution and a screen layout similar to Contoso demo data, choose an image with resolution that is not much higher than the length and width of the screen. In this example, 911 x 512 pixel resolution is sufficient. Selecting a relatively high resolution for length and width but keeping a low dpi setting will still result in reasonably small file sizes.

### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Track commissions in the point of sale (POS) by using sales groups

2/18/2021 • 4 minutes to read • [Edit Online](#)

It's a common retail practice to track sales by the associate who worked with the customer by—providing assistance, up-selling, cross-selling, and processing the transaction.

Tracking sales by sales representative is a measure of the associates selling abilities, while sales by cashier is a measure of speed and efficiency. Sales tracked by sales representative are also often used to calculate commissions or other incentives.

## Configuring a worker to be a sales representative in POS

When a worker is added to a sales group, they become eligible for commission and can be identified as a sales representative in the system. A worker who isn't in a sales group isn't eligible for commission and won't be listed as a sales representative in the point of sale (POS) application. In POS, the list of sales representatives is derived from all sales groups that contain at least one worker assigned to the store. The list is shown in POS as a combination of Sales group ID and Name (ID : Name). A default sales group can be assigned to workers to support scenarios where the retailer chooses to set the sales representative on POS lines automatically. Users can select from any sales group that the worker is a member of.

## Functionality profile settings

There are a number of functionality profile settings for a store that will determine the flow and process in POS that involve sales representatives.

PROFILE	DESCRIPTION
Default to cashier when available	If this option is enabled, POS will automatically populate transaction lines with the current cashier's default sales group. If a cashier doesn't have a default sales group specified, the value won't be set. A user could still manually set the sales group by using a POS button grid button.

PROFILE	DESCRIPTION
Prompt for sales representative	<p>This option has three possible values:</p> <ul style="list-style-type: none"> <li>• <b>No</b> – If this option is selected, the user won't be prompted to select a sales group. The value could still be set by using a cashier's default Sales group or manually by using a POS button grid button.</li> <li>• <b>Start of transaction</b> – If this option is selected, and either the <b>Default to cashier</b> option isn't enabled or the current cashier doesn't have a default sales group, the user will be prompted to select a sales group at the beginning of each transaction. Selecting a sales group from this prompt will default all subsequent lines to the selected sales group. A user could still manually set the sales group by using a POS button grid button.</li> <li>• <b>For each line</b> – If this option is selected, and either the <b>Default to cashier</b> option isn't enabled or the current cashier doesn't have a default sales group, the user will be prompted to select a sales group after adding each line. A user could still manually set the Sales group by using a POS button grid button.</li> </ul>
Require	<p>This option is only applicable when POS is configured to prompt for a sales representative. If enabled, the user will be required to choose a sales group before continuing. Otherwise, the user will be prompted, but can cancel and continue without making a selection. After the line is added, a user with sufficient permissions could still remove the sales group from the line. "Require sales representative" is not enforced in this situation.</p>

## Displaying the Sales representative information on the POS transactions screen

The POS transaction screen layout and contents are configurable using the screen layout designer and assigned screen layouts to stores, registers, or workers. The **Sales representative** field can be added to the Lines tab of the Receipt pane. This will display the ID of the specified Sales group for each line on the transaction screen.

## Adding Sales representative operations to POS button grids

POS allows users to configure button grids, which are included in screen layouts to provide access to POS operations. The following POS operations can be assigned to button grid buttons that pertain to Sales representatives.

OPERATION	DESCRIPTION
Set sales representative on line	This POS operation displays a list of eligible Sales groups (ID : Name) for the store. Selecting a Sales group from this list will set the value on the current transaction line.
Clear sales representative on line	This POS operation removes the current Sales group value from the current transaction line.

OPERATION	DESCRIPTION
Set sales representative on transaction	This POS operation displays a list of eligible Sales groups (ID : Name) for the store. Selecting a Sales group from this list will set the default value on the current transaction. Any existing lines without a sales group assigned will be set, as well as any subsequently added lines.
Clear sales representative on transaction	This POS operation removes the current default Sales group value from the current transaction. It does not impact any lines already existing in the transaction.

## Calculating commissions

Commission is calculated for the workers in the specified sales groups at the time of statement posting or sales order posting. The commission amount is determined based on the worker's commission share, as defined in the sales group and the associated commission calculation settings for the customer and/or products on the transaction.

# Configure, install, and activate Modern POS (MPOS)

2/18/2021 • 21 minutes to read • [Edit Online](#)

This topic describes how to configure, download, and install Modern POS on various platforms. It then describes how to activate Modern POS through device activation.

## NOTE

There are two Modern POS installers: Modern POS and Modern POS with offline (this installer also installs the offline database).

Starting in release 10.0.11, altering customized files that are stored in the ClientBroker folder could cause issues when installing a newer release. These issues might include the inability to go offline or a newer installer failing to complete successfully. A workaround is to remove the files in the ClientBroker folder in the Modern POS directory before performing the installation using the newer installer.

Starting in 10.0.15 release, customizations to files in the Client broker folder for Modern POS can cause an error when updating from a previous version. The known workaround is to delete all files from the Client broker folder prior to running the newer Modern POS installer. For automation, this can easily be scripted as a pre-step for the installer. All files in this folder must be deleted. When this error occurs, the newer installer will update the current installation correctly.

## Technology

The self-service process lets you download the appropriate version of the Modern POS installer and install it on the physical device that you want to use as the point of sale (POS) register. Device activation is the main onboarding step that ties the physical device to a register in Headquarters. Here are the main technical functions of this feature:

- Tie a physical device to a business entity (register).
- Provide enhanced security through Microsoft Azure Active Directory (Azure AD) and a device token/ID.
- Stop unauthorized remote use of Modern POS. (In other words, deactivate a device remotely.)
- Initialize settings for easy Modern POS functioning (number sequence, hardware profile, merchant information) as the first touchpoint of the POS.
- Comply with payment card industry (PCI) standards, and report on device information from Headquarters.

## NOTE

If you are installing Modern POS for use with an on-premises environment, Modern POS does not use Azure Active Directory credentials for device activation.

## Setup

Before you start the steps that are outlined in this topic, follow these steps.

- Verify that you have credentials to sign in to Headquarters.
- Verify that you have administrative or root access to install Modern POS on a device.
- Verify that you can access the Commerce Scale Unit from the device.
- Verify that the environment contains the Commerce permission groups and jobs in the **Human resources**

module. These permission groups and jobs should have been installed as part of the demo data.

## Download and install Modern POS

### Verify that the device is correctly configured

1. In Headquarters, go to **Retail and Commerce > Channels > Channel deployment**.
2. On the **Channel deployment** page, select the **Registers** tile.
3. On the **Registers** page, select a store register. The demo data thoroughly defines the Houston store and registers for self-service. To find the Houston registers, enter **Houston** in the filter at the top of the list of devices.
4. Select a register by selecting the register number in the **Register number** column. In the Houston store, register Houston-3 is well defined and is therefore useful as an example.
5. On the page for the register, under **General**, verify that the **Support offline** option is set to **No**. To use offline support, on the Action Pane, select **Edit**, and then set **Support offline** option to **Yes**.

### Download the Modern POS installer

1. On the **Welcome** page, use the menu in the upper left to go to **Retail and Commerce > Channels > Channel deployment**.
2. On the **Channel deployment** page, select the **Devices** tile.
3. Select a device.

#### NOTE

- The Houston devices are well defined. Houston-3 is useful as an example for a Microsoft Windows desktop or tablet. Houston-21 is useful as an example for a Windows Phone.
- When you select a device, the **Download** button on the Action Pane becomes available.

4. Select **Download**, and then select **Configuration file**. Note the following:
  - Browsers might block the download pop-up that is generated. You must select either **Allow once** or **Options for this site > Always allow**. Then, while the device is still selected, select **Download** again.
  - The configuration file must be saved to the same location as the Modern POS installer. For security reasons, delete this file after installation is completed. If the configuration file is not the same file name as the installer executable, either the executable must be run using the command line to specify the configuration file or you need to rename the XML configuration file to have the same base name as the executable file name.
5. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)
6. Select **Download**, and then select **Retail Modern POS**. Note the following:
  - Browsers might block the download pop-up that is generated. You must select either **Allow once** or **Options for this site > Always allow**. Then, while the device is still selected, select **Download** again.
  - The installation package that you must use varies, depending on whether you require offline support, and whether the device that Modern POS will be installed on is a Windows tablet or a phone device (such as a Windows Phone, an Android device, or an iOS device). The correct package is automatically selected for download, based on the register settings and the application type that is set for the device. If the offline package is selected for a Windows tablet, but Microsoft SQL Server isn't already installed

(or if it doesn't meet the requirements for the offline package), SQL Server is downloaded and installed silently.

7. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)
8. After the setup installer has been saved, on the Notification bar, select **Run**. (This step might differ, depending on your browser.)

### Before running the Modern POS installer

- Make sure that all [system requirements](#) are met.
- It is recommended to temporarily turn off antivirus applications. It has been noted that on aggressive antivirus solutions, the installation may stall due to the antivirus solution checking active files while in use.
- The installer will sideload a modern application. Therefore, a Group Policy entry must be set to allow for sideloaded applications. The installer will change the associated registry key as follows to allow for this installation:
  - **Path:** HKLM:SoftwarePoliciesMicrosoftWindowsAppx
  - **Property:** AllowAllTrustedApps
  - **Value:** 1
- If offline is used (an offline database created), then a default SQL Server instance must exist. If SQL Server instances exist, but none are set as the default, then the installer will fail to install the offline database.

If you are installing Modern POS for use with an on-premises environment, you must start the installer from a command line as follows:

```
ModernPosSetupOffline.exe -UseAdfsAuthentication
```

### Run the Modern POS installer on a Windows computer

The Modern POS installer first extracts the associated files and then starts the installation.

1. The installer validates that all prerequisites are met. Note the following:
  - If a system restart is required, the installer informs you about this requirement, but the installation can typically continue.
  - A sideloaded installation of Modern POS requires a Group Policy change. The installer informs you if this change is required and then makes the change automatically.
2. If you selected offline support, but a valid version of SQL Server isn't found, the installer downloads and installs Microsoft SQL Server 2014 Express with Service Pack 2 (SP2). To meet the prerequisites, SQL Server must have Full-text search installed. Additionally, a minimum of SP2 must be installed for Microsoft SQL Server 2014, or a minimum of Service Pack 3 (SP3) must be installed for Microsoft SQL Server 2012. Note the following:
  - The installer tries to download the correct language. However, if you require a specific language, we highly recommend that you manually install SQL Server. If the installer can't correctly determine the language, it installs the English version of SQL Server 2014 Express with SP2 by default. Typically, after the SQL installation is completed, the system requires a restart before the installation of Modern POS can continue.
  - This process might require a long time, depending on the speed of the computer and the Internet connection. If a prerequisite fails during this step, first retry the installer. If the installer continues to fail, see the [Troubleshooting](#) section of this topic.
3. The installer installs Modern POS.
4. On the page that states that installation was successful, select **Close** to exit the installer.

You can now start the program.

#### NOTE

This installation occurs only for the administrator user who ran the installer. For all other users, a desktop icon to install Modern POS is created. Every time that a user signs in, he or she must double-click this icon. The program will then be installed or updated, as required. If a user doesn't use the desktop icon after an update, the POS client will request that the user run from the desktop icon instead to update correctly prior to running.

#### Run the installer on any other device (Windows Phone, Google Android device, or Apple iOS device)

1. If the application wasn't downloaded directly to the device, transfer the downloaded app file and the associated configuration file to the same folder on the device. Depending on the type of device, the app file will be an APPX, APK, or IPA file.

Note that this step can be done in various ways. For example, the files can be accessed through a shared folder, transferred via USB cable, or securely mailed to the user's device.

2. Use a file explorer on the device to browse to the app directory.
3. Tap the app to begin application installation. (If the configuration file was saved to the same location, the Commerce Scale Unit URL will be automatically entered when you start the application and begin device activation.)

Note that some devices require that you double-tap the file to begin application installation. Some devices might not notify you that an application has been installed. On those devices, we recommend that you look at the application list to verify that the application was correctly installed.

4. When the installation is completed, you should be able to start the application from the application list on the device. For example, after you install the application on a Windows Phone, you can start it from the home screen tiles list.

You can now start the program.

## Create a worker

For this topic, we have already created workers and assigned them to the Houston address book in the demo data that is provided. Therefore, this topic will use pre-generated data.

#### Create a worker

1. Go to **Retail and Commerce > Employees > Workers**.
2. On the Action Pane, select **New** to create a new employee.
3. Enter the first and last name. For example, enter **John** as the first name and **Smith** as the last name.
4. Verify that the **Legal entity** field is set to **USRT**, the **Worker type** field is set to **Employee**, and the **Employment start date** field is set to the current date at 12 AM, so that the worker's employment starts immediately.
5. Select the **Assign a position** check box. Select position number **000544**, which is the Store manager position.
6. Set the **Personnel action type** field to **Hire Action** to hire a new employee immediately.
7. Select **Continue**.
8. On the Action Pane, select **Complete** to finish creating the new worker.
9. Return to the worker list. Search for the newly created worker (for example, John Smith). Select the worker's name to see the details of the new worker.
10. On the Action Pane, select **Edit**.
11. Verify that the language for the worker is **en-us**.

12. Under **Worker summary**, in the **Address books** field, select the **Houston** store.
13. On the **Commerce** tab, you can reset the POS password. For this tutorial, reset the password to **123**.
14. On the **Commerce** tab, under **Screen layout**, assign a screen layout. For example, select **F2MP16:9M (Fabrikam MPOS Manager (16:9))**.
15. On the Action Pane, select **Save**.
16. Go to **Retail and Commerce > Periodic > Distribution schedule**.
17. Select the **1060 – Staff job**, and then, on the Action Pane, select **Run now** to sync the worker data to the channel database.
18. After the new worker has been created and synced to stores, worker John Smith can sign in to any POS device that is used in the HOUSTON store that he is assigned to, and he can perform transactions on that device. However, the device must be activated first. The following section explains how to activate a device for a new worker.

### **Map an Azure AD account to a worker who has POS permissions for device activation**

You must complete this procedure before you activate Modern POS for a new worker.

1. In Commerce, from the **Worker** page, open the **Worker details** page for the worker that you created in the previous procedure.
2. On the Action Pane, select **Edit**.
3. On the **Commerce** tab, select the **POS permissions** link. Under **POS permission group**, verify that the value is **Manager**.
4. When you've finished, return to the **Worker details** page for the new worker.

To return to the **Worker details** page, select the **Close** button (X) on the right side of the Action Pane.

5. On the Action Pane, select **Commerce**, and then select **Associate existing identity**.
6. In the dialog box that appears, select the Azure AD account that is named **admin AX Admin**. (If an alternative administrator Azure AD account has been created, select that account instead.)
7. Select **OK**. In the demo data, the Azure AD account that is associated with the administrator account in Headquarters is your administrator Azure AD account.
8. On the Action Pane, select **Save**, and then refresh the page. The **External identity** section should be now updated with the new information.

Note that the **External identifier** field will remain empty. This behavior is expected. Therefore, you can ignore it.

This procedure should be completed before you activate Retail Cloud POS or Modern POS. For more information, see [Manage activation accounts and validate devices](#).

### **Run the Validate Devices for Activation check**

1. In Headquarters, open the **Device** page (**Retail and Commerce > Setup POS > Devices**).
2. Select the device to validate for device activation, and then select **Validate Devices for Activation**. For example, select device **HOUSTON-3**.
3. In the dialog box that appears, select the worker to validate the device for (that is, the worker that you mapped to the Azure AD account in the previous procedure). For example, select worker **000160**.
4. Select **OK**, and make sure that you receive the following message: "Pre-Activation validation completed for Device HOUSTON-3 and Staff 000160. Validation: Passed"

## **Activate a device**

## NOTE

It is possible for the Safari browser to show an error during device activation of a Cloud POS device due to an Azure Active Directory token being unattainable. You can resolve this issue by utilizing the [Microsoft Enterprise SSO plug-in for Apple devices](#).

1. Start Modern POS on your computer. Read the instructions on the **Before you start** page, and make sure that they are completed. Then select **Next**.
2. Select **Activate**. You're redirected to the Azure AD sign-in page.
3. Enter the Azure AD account that you mapped earlier, such as `admin@<MyCompany>.onmicrosoft.com`, and the password.
4. When activation is completed, select **Get Started**.
5. Sign in to Modern POS by using worker account **000160** and the password **123**.

The device should now be activated and ready to use.

## Update the Modern POS application

### NOTE

To learn more about deployable packages, see [Apply a deployable package](#).

1. After a Modern POS application is uploaded into the environment, the version of the package can be selected on the device. The package listings should include the new uploaded application.
2. To update the Modern POS application, follow the steps in the [Download and install Modern POS](#) section. To do an in-place update, just run the newer version of the self-service installer. Uninstallation isn't required or recommended. Device activation status will be maintained after the update.
3. The installer will use the currently installed configuration settings. If the configuration file has changed, because of various configuration changes in Commerce, an update won't change the Modern POS application settings.

## Troubleshooting

### Troubleshoot installation

- Your browser blocks the download pop-up that is generated.

**Solution:** Select either **Allow once** or **Options for this site > Always allow** (or the equivalent commands in the browser that you're using). Then, while the correct register is still selected, select **Download** again.

- The installation package that you must use depends on whether you require offline support. The correct package is automatically selected for download. For the offline package, SQL Server must be installed and must meet the requirements for the offline package.

**Solution:** No action is required. If SQL Server isn't already installed (or if it doesn't meet the requirements), it's downloaded and installed. The installer gives generic information about the download and installation of SQL Server Express 2014. This installation might require a long time.

- The installation occurs only for the administrator user who ran the installer, but not for any other users.

**Solution:** The installer generates a desktop icon that is used to install, upgrade, and run Modern POS. This icon is generated for every user on the computer. When a user who must install Modern POS double-clicks this icon, the program is installed. The user can then start to use Modern POS.

- SQL Server isn't successfully downloaded and installed through the self-service Modern POS installer.
  - **Solution 1:** A list of reasons shows the prerequisites that failed. If the list includes **SMO** or **SQL Management Objects**, first try to run the installer again. SQL Server Management Objects (SMO) are installed during SQL Server installation. Therefore, it's possible that the operating system didn't pick up the registration of the executable program that you used. When you run the installer a second time, the prerequisites are retested, and the prerequisite check should correctly verify the required executable program. If the installer continues to fail, restart the system to fully complete the registration of SQL Server, and then rerun the installer.
  - **Solution 2:** Manually download and install SQL Server (Microsoft SQL Server Express or another version) by using Advanced Tools. During installation, select **Full-text search** as an additional feature.
- The installation of Modern POS fails, because the registration of performance (perf) counters failed.

**Solution:** Follow these steps to fix this issue:

1. Open a **Command Prompt** window as an administrator.
2. Enter the following command.

```
lodctr /s:"perf_backup.txt"
```

3. Enter the following command.

```
lodctr /R
```

4. If the system doesn't rebuild the performance counter settings from the system backup, rerun the **lodctr /R** command.
  5. Rerun the Modern POS installer.
- If you're using a downloaded virtual hard disk (VHD) instead of a cloud-hosted environment, the downloader might fail.
    - **Solution 1:** In a downloaded VHD, the Azure Storage Emulator must be installed and must be running correctly. Otherwise, the self-service packages can't be downloaded correctly.
    - **Solution 2:** A failure might have occurred during the process of integrating the VHD into Microsoft Hyper-V. You must manually edit permissions before the packages can be downloaded correctly. Follow these steps:
      1. In File Explorer, browse to **C:\Microsoft Dynamics 365\70\Retail Server**.
      2. Right-click the **SelfServicePackages** folder, and then select **Properties**.
      3. On the **Security** tab, select **Edit**.
      4. In the **Permissions for SelfServiceDeployment** dialog box, select **Add**.
      5. In the **Select Users, Computers, Service Accounts, or Groups** dialog box, select **Locations**.
      6. In the **Locations** dialog box, select the first entry in the list (the local computer), and then select **OK**.
      7. In the **Select Users, Computers, Service Accounts, or Groups** dialog box, enter the name **IIS\_IUSRS**, and then select **Check names**. The object name should be changed to **IIS\_IUSRS**. Select **OK**.
      8. In the **Permissions for SelfServiceDeployment** dialog box, select the new **IIS\_IUSRS** user. Under **Permissions for IIS\_IUSRS**, select **Allow** for the **Full control** permission. Select **OK**.
      9. In the **Open permission** dialog box, select **OK**.

- The latest iOS version does not support your self-signed certificate.

**Solution 1:** Utilize a domain and generate a proper domain-based certificate.

**Solution 2:** Download the open source OpenSSL library and perform the following after completing installation:

1. Using PowerShell, create a private key for the root Certificate Authority (CA) using a command such as `$ openssl genrsa -des3 -out rootCA.key 2048`. 2. You will be prompted for a password, which must be remembered for later usage. 3. Next, generate the root certificate using a command such as `$ openssl req -x509 -new -nodes -key rootCA.key -sha256 -days 1024 -out rootCA.pem`. There will be a prompt for the password entered previously and some basic certificate information.

#### NOTE

The number of days the certificate is valid for can be altered. In the above example this is 1024 days.

- d. Create a new **info.ext** file and enter the following details:
  - o `keyUsage = keyEncipherment, dataEncipherment - extendedKeyUsage = 1.3.6.1.5.5.7.3.1 - subjectAltName = @alt_names - [alt_names] - DNS.1 = <FULLY QUALIFIED DOMAIN NAME OF HOST COMPUTER>`
- e. Generate the signing request and private key using a command such as `openssl req -new -nodes -out server.csr -newkey rsa:2048 -keyout server.key`.
- f. Issue the certificate using the previously generated root certificate using a command such as `$ openssl x509 -req -in server.csr -CA rootCA.pem -CAkey rootCA.key -CAcreateserial -out server.crt -days 500 -sha256 -extfile info.ext`. There will be another prompt for the root key password and you will need to specify the number of days that the certificate is valid (500 days in this example).
- g. Generate the IIS certificate using a command such as `$ openssl pkcs12 -inkey server.key -in server.crt -export -out server.pfx`. This command will request a new password, which will be used later when the certificate is imported.
- h. Open **Certmgr.msc** and go to **Trusted Root Certificate Authorities**. Use the **Import** action to import the previously generated **rootCA.pem** root CA file.
- i. In the same window, go to **Personal** and use the **Import** action to import the previously generated **server.pfx**.
- j. Next, open the **IIS Manager**, select the **RetailHardwareStationWebSite** and select **Edit Bindings** from the right-most menu.
- k. In the new window, select the HTTPS site binding, and then select **Edit**. In the final screen, select the newly installed certificate and select **OK**.
- l. Verify the certificate is correctly being used. In a web browser, go to "`https://<hostname>/HardwareStation/ping`".
- m. Install the certificate on the iOS device:
  - o Copy the **rootCA.pem** file and rename the copy to **rootCA.crt**. - Using OneDrive or another file hosting location, upload the **rootCA.crt** and **server.crt** so that they can be downloaded onto the iOS device.
- n. On the iOS device, go to **Settings > General > Profiles** and select the downloaded profile for the **rootCA.crt**. Select **Install**.
- o. Validate that the profile status updates to **Verified**. Repeat the same process for the **server.crt** file.
- p. Go to **Settings > General > About > Certificate Trust Settings** and enable the installed

root certificate.

- q. On the iOS device, use the hardware station ping URL specified previously to verify that the certificate is trusted.
- r. Open the POS application in **Non-drawer mode** and pair to the hardware station as typically performed.

### Troubleshoot device activation for Modern POS

- The Microsoft account (Azure AD) sign-in page doesn't open.

**Solution:** The Azure AD endpoint might be unreachable. Wait a few minutes, and then try again.

- After you enter the Azure AD account, you receive an error message that states that the user isn't authorized.

**Solution:** Verify that the Azure AD user is mapped to a worker who has POS permission to activate devices. The **Manage device** permission for the worker should be set to **Yes**.

- Device activation isn't completed. It fails during one of the steps.

**Solution:** Follow this checklist to verify that all data is correct:

- Complete the Validate Devices for Activation check in Headquarters, and make sure that the device passes validation.
- On the client computer where you're activating the device, access the Commerce Scale Unit URL health check, and make sure that the health check is passed. Use the following format for the URL:  
`https://MyCompanyName.et.axcloud.dynamics.com/commerce/healthcheck?testname=ping`
- The worker must be mapped to an Azure AD account (under **External identity**).
- The Azure AD account that is mapped must belong to the same tenant.
- To map the worker to the Azure AD account, sign in to Headquarters by using the Admin account for Microsoft Dynamics Lifecycle Services (LCS).
- Make sure that the worker is set up as a Commerce user in the Manager role. (This item is checked by validation.)
- Make sure that the channel is published. (This item is checked by validation.)
- Make sure that the channel database has the synced data from Headquarters, and that download jobs are running.
- Set up the hardware profile under **Registers**. (This item is checked by validation.)
- Make sure that the register and store have a screen layout. (This item is checked by validation.)
- Make sure that a primary address is set up for the legal entity.
- Make sure that the language is set up for the Commerce Data Exchange: Real-time Service user profile (JBB in the demo data).
- Make sure that the Real-time Service profile has the correct access.
- Make sure that the electronic funds transfer (EFT) configuration value is present.

### Troubleshoot Modern POS connectivity

On a single-computer system, such as a developer topology or a demo environment, or when Commerce Scale Unit and Modern POS are installed on the same computer, Modern POS can't complete device activation.

**Solution:** This issue occurs because Modern POS can't make network calls to the same computer (that is, calls to itself). To mitigate this issue, you must enable an AppContainer loopback exception so that communications can occur to the same computer. Various applications will help enabling this loopback for Modern POS. For more information about loopback, see [How to enable loopback and troubleshoot network isolation](#).

## Additional resources

## Install the POS layout designer

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up extended logon functionality for MPOS and Cloud POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers your options for setting up extended logon for Cloud POS and Retail Modern POS (MPOS).

## Setting up extended logon

You can find the setup for bar code masks at **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. The **Functions** FastTab includes the following options that are related to extended logon.

### Staff bar code logon

When the **Staff bar code logon** option is enabled, workers who have an extended logon assigned to their point of sale (POS) credentials can log on by using a bar code.

### Staff bar code logon requires password

When the **Staff bar code logon requires password** option is enabled, the staff bar code logon selects only the worker who is assigned to the extended logon that is presented. Workers must still enter their password when this option is enabled.

### Staff card logon

When the **Staff card logon** option is enabled, workers who have an extended logon assigned to their POS credentials can log on by using a magnetic stripe.

### Staff card logon requires password

When the **Staff card logon requires password** option is enabled, the staff card logon selects only the worker who is assigned to the extended logon that is presented. Workers must still enter their password when this option is enabled.

## Assigning an extended logon

By default, only managers can assign extended logon to workers. To assign extended logon, go to **Extended log on** in POS. Then search for a worker by entering his or her operator ID in the search field. Select the worker, and then click **Assign**. On the next page, swipe or scan the extended logon to assign to the worker. If the swipe or scan is successfully read, the **OK** button becomes available. Click **OK** to save the extended logon for that worker.

## Deleting an extended logon

To delete the extended logon that is assigned to a worker, search for the worker by using the **Extended log on** operation. Select the worker, and then click **Unassign**. All extended logon credentials that are associated with that worker are removed.

## Extending extended logon

The logon service can be extended to support additional extended logon devices, such as palm scanners. For more information, see the POS extensibility documentation.

## Using extended logon

When extended logon is configured, and a worker has been assigned a bar code or magnetic stripe, the worker just has to swipe or scan his or her card while the POS logon page is displayed. If a password is also required before logon can proceed, the worker is prompted to enter his or her password.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Manage activation accounts and validate devices

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how an IT Pro can set up Commerce activation accounts for workers to activate Modern POS or Cloud POS devices.

## Setting up a device activation account for a single worker

This procedure should be completed before you activate Cloud POS.

1. In Commerce, from the **Workers** page, open the **Worker details** page for the worker to assign AAD device activation privileges to. Click **Edit**.
2. On the **Commerce** tab, click the **POS permissions** link. Make sure that the worker is in the Manager Permission group, or that **Manage Devices** is set to **Yes** for the worker.
3. On the **Commerce** tab, under **External identity**, update the values for the following fields:
  - Alias
  - UPN
  - External identifier
4. You can update the **External identity** fields by using an existing AAD account or creating a new AAD account. To update the fields, access the **External identity** options from the **Commerce** main menu (**Commerce** > **Associate existing identity** or **Commerce** > **Create new identity**).
5. To use an existing AAD account, select **Commerce** > **Associate existing identity**. In the slider, click the AAD account that has the correct name, and then click **OK**. The AAD account that is associated with that name and alias is the user's Activation account for Modern POS.
6. Complete and save the changes on the **Workers** page, and then refresh the page. The section that contains external identity information should be updated with the new information. The mapped AAD account is now your Activation account for Cloud POS and Modern POS. This account is mapped to a worker for the required POS permissions. You can use this AAD account for Modern POS or Cloud POS activation.
7. The Create external identity feature creates a new AAD account for you by using the alias that you enter. To update the fields, access the **External identity** options from the **Commerce** main menu (**Commerce** > **Create new identity**).
8. You can either manually enter the alias to generate or use the **Reset to default** button. Then manually enter a strong password, and click **OK**.
9. If the worker is created successfully, you receive a message on the **Workers** page. The mapped AAD account is now the user's Activation account for Cloud POS and Modern POS. This account is mapped to a worker for the required POS permissions. You can use this AAD account for Modern POS or Cloud POS activation.

## Setting up device activation accounts for multiple workers

You can set up activation accounts for multiple workers in bulk. However, this functionality is supported only if you're creating new external identities, not if you're associating identities.

1. In the workers form, select the list of workers to set the activation account for.

2. Click **Commerce > Create external identity** to update the fields. Any AAD accounts that are associated with the workers appear in this pane.

#### NOTE

These accounts aren't device activation accounts until you map them by using the external identity flow options.

3. If you want to use the existing AAD accounts as activation accounts, you can't map them in bulk. Cancel the selection of those workers, and then map them individually by using **Use existing external identity**.
4. To create new AAD accounts and associate them with the workers, so that they can be used as activation accounts, update the **Alias** and **Password** fields, and then click **OK**. In the main worker form, you receive a message as activation accounts are created for each worker.

## Run the Validate Devices for Activation check at headquarters

Before handing an activation account to a worker, an IT Pro must run the Validate devices check for the devices assigned to the worker. This will help identify any potential failures of device activation in advance and fix it before it is given to the worker.

1. Open the **Device** page in HQ (**Retail and commerce > Channel setup > POS setup > Devices**).
2. Select the device to validate for device activation, and then click **Validate devices for activation**. For example, select device **HOUSTON-2**.
3. In the dialog box that appears, select the worker to validate the device for (that is, the worker that you mapped to the AAD account in the previous procedure). For example, select worker **000160**.
4. Click **OK**, and make sure that you receive a message similar to the following: "Pre-Activation validation completed for Device HOUSTON-2 and Staff 000160. Validation: Passed"

## Checklist to follow before activation

1. Complete the **Validate devices for activation** check in HQ, and make sure that the device passes validation.
2. On the client machine where you're activating the device, access the Commerce Scale Unit URL health check, and make sure that the health check is passed. Use the following format:  
`https://c1xtestax404ret.cloud.test.dynamics.com/en/healthcheck?testname=ping`
3. The worker must be mapped to an AAD account (under **External identity**).
4. The AAD account to map must belong to the same tenant.
5. To map the worker to the AAD account, sign in to HQ by using the Admin account for Microsoft Dynamics Lifecycle Services (LCS).
6. Make sure that the worker is set up as a Commerce user in the Manager role (checked by validation).
7. Make sure that the channel data is present in the channel database.
8. Set up the hardware profile under **Registers > Register** (checked by validation).
9. Make sure that the register and store have a screen layout (checked by validation).
10. Make sure that a primary address is set up for the legal entity.
11. Make sure that the electronic funds transfer (EFT) configuration value is present.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create financial dimensions for POS registers and configure dimension values on registers

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through creating financial dimensions for point of sale (POS) registers, and demonstrates how to configure financial dimension values on registers. This procedure doesn't include other related steps, such as creating dimension sets and account structures. Those tasks can be found in other topics. This recording uses USRT demo company.

1. Go to General ledger > Chart of accounts > Dimensions > Financial dimensions.
2. Click New.
3. In the Use values from field, select an option.
4. In the Dimension name field, type a value.
5. Click Activate.
6. Click Close.
7. Click Activate.
8. Click Dimension values.
9. Close the page.
10. Click Save.
11. Close the page.
12. Go to Retail and Commerce > Channel setup > POS setup > Registers.
13. In the list, find and select the desired record.
14. Toggle the expansion of the Financial dimensions section.
15. Click Edit.
16. In the Terminal field, click the drop-down button to open the lookup.
17. In the list, find and select the dimension value for the register being updated.
18. Click Save.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create POS permission groups

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create a POS permission group. The demo data company used to create this task is USRT. This task is intended for the Commerce operations manager role.

1. In the navigation pane, go to **Modules > Retail and Commerce > Employees > Permission groups**.
2. Select **New**.
3. In the **POS permission group ID** field, type a value.
4. In the **Description** field, type a value.
5. Select **Yes** in the **View time clock entries** field. You can now enable or disable various permissions for your POS Permission group. For some permission you can set a value that will be used to evaluate if the POS user can perform the action. This task guide enables a few permission that might be given to a cashier.
6. Select **Yes** in the **Allow create order** field.
7. Select **Yes** in the **Allow edit order** field.
8. Select **Yes** in the **Allow retrieve order** field.
9. Select **Yes** in the **Allow password change** field.
10. Select **Yes** in the **Allow blind close** field.
11. Select **Save**. After your changes are saved you need to run the Staff distribution schedule to push the changes to commerce channels.
12. In the navigation pane, go to **Modules > Human resources > Jobs > Jobs**.
13. Next we will assign the POS permission group to a Job. In the list, find and select the desired record.
14. Select **Edit**.
15. Expand the **Job classification** section.
16. In the **POS permission group** field, enter or select a value. All Workers in Positions for this Job will use this POS permission group's settings unless the workers POS permissions have been overridden at their Position level.
17. Select **Save**. After your changes are saved you need to run the Staff distribution schedule to push the changes to channels.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create point of sale (POS) visual profiles

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through creating a new point of sale (POS) visual profile. A visual profile contains basic information that determines the appearance of POS registers. You can create several visual profiles and assign specific profiles to run on specific registers. This procedure uses the USRT demo data company.

1. Go to Retail and Commerce > Channel setup > POS setup > POS profiles > Visual profiles.
2. Click New.
3. In the Profile number field, type a value.
4. In the Description field, type a value.
5. In the Application type field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. In the Theme field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
9. In the Accent color field, click the drop-down button to open the lookup.
10. In the list, find and select the desired record.
11. In the list, click the link in the selected row.
12. Toggle the expansion of the Login background section.
13. In the Landscape image ID field, select or enter an image ID.
14. In the Portrait image ID field, select or enter an image ID.
15. Toggle the expansion of the Background section.
16. RequestPopup the Image ID.
17. In the list, click the link in the selected row.
18. Click Save.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure and install Retail hardware station

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how to configure, download, and install Retail hardware station by using self-service. It also explains how to uninstall Retail hardware station.

## IMPORTANT

It is critical to note that this component utilizes a server certificate. Server certificates must be managed for expiration. By default, a certificate expires in one calendar year (365 days).

## Download Retail hardware station by using self-service

### Configure a new Retail hardware station

#### NOTE

If you're running the February 2016, non-upgraded version of Retail (Initial release), skip step 6.

1. Use your Azure AD credentials to sign in to the Retail trial.
2. On the **Welcome** page, use the menu in the upper left to go to **Retail > Channels > Retail stores > All retail stores**.
3. On the **All retail stores** page, select the retail channel ID of the desired store. The details view for the store appears.

#### NOTE

The Houston store is the most thoroughly prepared store in the demo data.

4. On the **Retail store details** page, on the **Hardware stations** FastTab, select **Add**.

#### NOTE

The Retail Server URL that is used for the selected store is read-only. This URL will be important during the installation of Retail hardware station.

5. In the **Hardware station type** field, select **Shared** to indicate that this hardware station is an Internet Information Services (IIS), installed hardware station that will be used by external point of sale (POS) systems.

#### NOTE

The value **Shared** signifies that the installation is a truly shared hardware station installation, and that it works through HTTPS communication. By contrast, the value **Dedicated** signifies that the hardware station is a part of Modern POS, and that it works through inter-process communication.

6. Select a hardware station profile.

7. Enter the host name of the computer that you're installing Retail hardware station on. Additionally, enter the electronic funds transfer (EFT) terminal ID that is associated with that computer for merchant account information.
8. To utilize the configuration file or initial installation using mass deployment, enter the certificate thumbprint that is to be used during the installation that's detailed in the next section.

#### Download the Retail hardware station installer

1. Use your Azure AD credentials to sign in to the Retail headquarters or Retail trial.
2. On the **Welcome** page, use the menu in the upper left to go to **Retail > Channels > Retail stores > All retail stores**.
3. On the **All retail stores** page, select the retail channel ID of the desired store. The details view for the store appears.

#### NOTE

The Houston store is the most thoroughly prepared store in the demo data.

4. On the **Retail store details** page, select the **Hardware stations** FastTab.

#### NOTE

The Retail Server URL that is used for the selected store is read-only. This URL will be important during the installation of Retail hardware station.

5. Select the hardware station to download, and then select **Download**.

#### NOTE

- Browsers might block the download pop-up that is generated. You must select either **Allow once** or **Options for this site > Always allow**. Then select **Download** again.

6. On the Notification bar that appears at the bottom of the Internet Explorer window, select **Save**. (The Notification bar might appear in a different place in other browsers.)
7. If needed for mass deployment or command line deployment, repeat the above steps for the configuration file download, which is a button next to the **Download** button that you previously selected.

#### NOTE

- If the configuration file downloaded does not have the same base file name as the installer, either rename the XML configuration file to be the same base name or run the installer using the command line to specify the configuration file.
- Note that the configuration file is not required for the installation of Commerce hardware station.

8. After the files have been saved, run the installer. (This step might differ depending on your browser.)

#### Run the installer

#### NOTE

Before you run the Retail hardware station installer, make sure that all [system requirements](#) are met.

The Retail hardware station installer first extracts the associated files and then begins the installation.

1. The installer validates that all prerequisites are met. If a sideloading key is required, the installer requests it. This key is found on the **Devices** page for each device, under **General**.

**NOTE**

- If a system restart is required, the installer informs you of this requirement but can continue the installation.
- Before you can use hardware that is based on the Object Linking and Embedding for Retail Point of Sale (OPOS) standard, the OPOS Common Control Objects must be installed. If they aren't installed, the installer informs you of this requirement but can continue the installation.

2. Enter the Retail Server URL (for example, `https://MyCompanyNameret.axcloud.dynamics.com/Commerce`), and then select **Next**.

**NOTE**

You can find the Retail Server URL at the top of the **Hardware stations** FastTab on the **Retail store details** page.

3. Select a valid Secure Sockets Layer (SSL) certificate to use for HTTPS communication.

**NOTE**

The certificate must use private key storage, and server authentication must be listed in the enhanced key usage property. Additionally, the certificate must be trusted locally, and it can't be expired. It must be stored in the personal certificate store location on the local computer.

4. The next page requests the user that should be used for the IIS application pool. By default in version 1611 and later, the installer can automatically create and use a service account. If you're on a domain or require more specific controls, clear the check box, and then enter the user name and password that the application pool should run under.
5. Enter the HTTPS port to use.

**NOTE**

- You can find the HTTPS port in Retail. (See the configuration instructions earlier in this topic).
- The installer automatically enters the host name. If, for any reason, you must change the host name for the installation, you can change it here. The host name must be the fully-qualified domain name (FQDN) of the system, and it must be entered in the **Host name** field for the selected hardware station entry.

6. The installer installs Retail hardware station and then indicates whether the installation was successful.
7. When the installation is completed, the Install merchant information tool may start. This installer connects to the environment and installs the merchant account information (such as the EFT ID) for the selected hardware station.

#### NOTE

- If the hardware station that was installed won't be used for payment-related work, don't close the **Install merchant information** window without completing the remaining steps. The hardware station won't work unless this installation is successfully completed.

- For version 10.0.6 and above, the install merchant information tool is no longer used. Instead, the merchant information for the hardware station is set by the POS at the time of logon or when the hardware station is made active. If the retail server is not available when the hardware station is subsequently made active, the last known merchant properties will be used by until the connection to the retail server is re-established. If the POS client is not upgraded to version 10.0.6 at the same time the hardware station is upgraded, merchant properties will not be updated until the POS client is upgraded to an equal or later version.

8. The Install merchant information tool might request Azure AD credentials. Enter the Azure AD credentials of the user who is installing Retail hardware station.
9. The Retail Server URL is determined through the Retail hardware station installation and is entered automatically. The installer uses this URL to load the list of stores that the user is connected to via the address book.
10. Select the retail store that the hardware station was installed for.
11. Select the hardware profile that matches the hardware station that was installed on the current computer.
12. Verify that the host names and EFT terminal IDs are correct, based on the current computer and the Retail hardware station configuration that has already been completed in Retail. After you've verified this information, select **Install**.
13. When you receive a message that states that the merchant account information was installed correctly, exit the installer by selecting the **Close** button.

## Help secure Retail hardware station

Current security standards state that the following options should be set in a production environment:

#### NOTE

The hardware station installer automatically makes these registry edits as part of the installation through self-service.

- SSL should be disabled.
- Only Transport Layer Security (TLS) version 1.2 (or the current highest version) should be enabled and used.

## NOTE

By default, SSL and all version of TLS except TLS 1.2 are disabled. To edit or enable these values, follow these steps:

1. Press the Windows logo key+R to open a **Run** window.
2. In the **Open** field, type **Regedit**, and then select **OK**.
3. If a **User Account Control** window appears, select **Yes**.
4. In the new **Registry Editor** window, go to **HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\SecurityProviders\SCHANNEL\Protocols**.  
The following keys have been automatically entered to allow for TLS 1.2 only:
  - TLS 1.2\Server:Enabled=1
  - TLS 1.2\Server:DisabledByDefault=0
  - TLS 1.2\Client:Enabled=1
  - TLS 1.2\Client:DisabledByDefault=0
  - TLS 1.1\Server:Enabled=0
  - TLS 1.1\Client:Enabled=0
  - TLS 1.0\Server:Enabled=0
  - TLS 1.0\Client:Enabled=0
  - SSL 3.0\Server:Enabled=0
  - SSL 3.0\Client:Enabled=0
  - SSL 2.0\Server:Enabled=0
  - SSL 2.0\Client:Enabled=0

- No additional network ports should be open, unless they are required for known, specified reasons.
- Cross-origin resource sharing must be disabled and must specify the allowed origins that are accepted.
- Only trusted certificate authorities should be used to procure certificates that will be used on computers that run Retail hardware station.

## IMPORTANT

- Most common, lower-security software and services will stop working after all lower-security standards are disabled. To use them again, go to the preceding registry keys, and set the **Enabled** key from **0** to **1**.
- It's critical that you review security guidelines for IIS and Payment Card Industry (PCI) requirements.

## Troubleshooting

**Modern POS can detect the hardware station in its list for selection, but it can't complete the pairing**

**Solution:** Verify the following list of potential failure points:

- The computer that is running Modern POS trusts the certificate that is used on the computer that runs Retail hardware station.
  - To verify this setup, in a web browser, go to the following URL:  
`https://<Computer Name>:<Port Number>/HardwareStation/ping`
  - This URL uses a ping to verify that the computer can be accessed, and the browser indicates whether the certificate is trusted. (For example, in Internet Explorer, a lock symbol appears in the address bar. When you select this symbol, Internet Explorer verifies whether the certificate is currently trusted. You can install the certificate on the local computer by viewing the details of the certificate that is shown.)
- On the computer that runs Retail hardware station, the port that will be used by the hardware station is opened in the firewall.

- Retail hardware station has properly installed merchant account information through the Install merchant information tool that runs at the end of the Retail hardware station installer.

### **Modern POS can't detect the hardware station in its list for selection**

**Solution:** Any one of the following factors can cause this issue:

- Retail hardware station hasn't been set up correctly in Commerce headquarters. Use the steps earlier in this topic to verify that the hardware station profile and the hardware station are correctly entered.
- The jobs haven't been run to update the channel configuration. In this case, run the 1070 job for channel configuration.
- The hardware station isn't accessible from that computer. Verify that the hardware station URL ping test is accessible from a web browser. This URL can be found at the end of the hardware station installer and is in the following form: `https://<Computer Name>:<Port Number>/HardwareStation/ping`

## Uninstall Retail hardware station

You can use Control Panel in Microsoft Windows to uninstall Retail hardware station.

1. Press the Windows logo key, and then, in the search box, type **Control Panel**. In the list of search results, select **Control Panel**.
2. In Control Panel, select **Programs > Uninstall a program**. The **Programs and Features** window opens.
3. Select **Microsoft Dynamics 365 for Retail hardware station**, and then select **Uninstall** above the list of programs.
4. Wait for the uninstaller to finish removing the program.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up and design receipt formats

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article describes how to modify form layouts to control how receipts, invoices, and other documents are printed. Dynamics 365 Commerce includes a form layout designer that you can use to easily create and modify various kinds of form layouts.

## IMPORTANT

You must set up form layouts and receipt profiles to print receipts and other documents from Retail Modern POS and Cloud POS. You can include multiple form layouts in a receipt profile. You can then assign the receipt profile to a printer by modifying a hardware profile.

## Set up a receipt format

1. Click **Retail and Commerce** > **Channel setup** > **POS setup** > **POS** > **Receipt formats**.
2. On the **Receipt format** page, click **New** to create a new form layout, or select an existing form layout.
3. In the **Receipt format** field, enter an identifier for the form layout, and then select the type of receipt that this layout is used for. You can also enter a description and a short name for the receipt in the **Title** field.
4. On the **General** FastTab, select an option to define the print behavior:
  - **Always print** – The receipt is printed automatically, as appropriate.
  - **Do not print** – The receipt isn't printed.
  - **Prompt user** – The user is prompted to print the receipt.
  - **As required** – This option is used only for gift receipts. When this option is selected, the user can print a gift receipt from the **Change** page, if a gift receipt is required.

## Print images

The receipt designer includes a **Logo** variable that can be used to specify images to be printed on the receipt. Images that are included in receipts using the **Logo** variable should be monochrome bitmap (.bmp) file types. If a .bmp image is specified in the receipt designer, but is not printing when sent to the printer, the file size may be too large or the pixel dimensions on the image are not compatible with the printer. If this occurs, try reducing the image file resolution.

## Design a receipt format

Use the form layout designer to graphically create the layout of the form document. The **Receipt format designer** page has three sections: **Header**, **Lines**, and **Footer**. Some types of form layouts use elements from all three sections, whereas other types use elements from only one or two sections. To view the elements that are available for each section, click the appropriate button in the navigation pane on the left side of the page.

1. Click **Retail and Commerce** > **Channel setup** > **POS setup** > **POS** > **Receipt formats**.
2. On the **Receipt format** page, select a form layout, and then click **Designer**.
3. Click **Run** to start to install the Commerce designer host.
4. On the Notification bar that appears at the bottom of the Internet Explorer window, click **Open** to start to

install the one-click designer. (The Notification bar might appear in a different location in other browsers.) The progress indicator shows the progress of the installation process.

5. After the installation is completed, enter your Commerce user name and password, and then click **Sign in** to start the designer.
6. After your credentials are validated and the designer starts, you can start to design the receipt format or modify an existing format.
7. To create the elements of the form, select the **Header**, **Lines**, or **Footer** section, and then drag an element from that section to the workspace. Most elements contain variables that are automatically populated with data from the database. Other elements, such as **Text**, let you print custom text on the receipt.

#### NOTE

You can specify how many lines each section spans by adjusting the number in the lower-right corner of that section. To make it easier to modify a section, increase its height by dragging the sizing bar at the bottom of the section. The height of the section on the workspace doesn't affect the number of lines on the actual receipt.

8. After you drag an element to the workspace, set the properties for the part in the **Object information** pane at the bottom of the page. Enter one or more of the following settings:
  - **Align** – Set the alignment of the field to either **Left** or **Right**.
  - **Fill char** – Specify the white space character. By default, an empty space is used, but you can enter any character.
  - **Prefix** – Enter the value that appears at the beginning of the field. This setting applies only to the **Lines** section of the layout.
  - **Characters** – Specify the maximum number of characters that the field can contain if the element contains a variable. If the text in the field is longer than the number of character that you specify, the text is truncated to fit the field.
  - **Variable** – This check box is selected automatically if the element contains a variable and can't be customized.
  - **Font type** – Set the font style to either **Regular** or **Bold**. Bold letters use two times as much space as regular letters. Therefore, some characters might be truncated.
  - **Font size** – Set the font size to either **Regular** or **Large**. Large letters are two times higher than regular letters. Therefore, using large letters may lead to overlapping text in the receipt.
  - **Delete** – Click this button to remove the selected part from the form layout.

## Assign receipt profiles

Receipt profiles are assigned directly to printers through the hardware profile.

1. Open the hardware profile by clicking **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profile**.
2. Select the printer, and then, in the **Receipt profile** field, assign the receipt profile to use on the register.

#### NOTE

If two printers are used, one printer can be used to print standard 40-column thermal receipts. The second printer is typically used to print full-page receipt types that require more information. These receipt types include customer order receipts and customer invoices.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Send email receipts from Modern POS (MPOS)

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Modern Point of Sale (MPOS), you can send receipt emails when a transaction is tendered at the point of sale (POS).

## Prerequisite

To send email receipts, you must configure a Simple Mail Transfer Protocol (SMTP) server.

## Set up email receipts

### Set default options for email receipts

1. Select **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**.
2. On the **Posting** tab, on the **Email receipt** FastTab, in the **Receipt option** field, select a default option:
  - **Standard receipt** – Print receipts from the POS register.
  - **Email** – Send receipts to customers in email messages.
  - **Both** – Print receipts from the POS register, and send receipts to customers in email messages.
3. In the **Subject** field, enter the text that should appear by default on the subject line of a receipt that is sent as an email message.

### Set email receipt options for a customer

1. Go to **Retail and Commerce > Customers > All customers**.
2. On the **All customers** list page, select a customer, and then select **Edit**.
3. On the customer details page, on the **Commerce** FastTab, in the **Receipt option** field, select an option:
  - **Standard receipt** – The customer will receive only printed receipts. The printed receipt is generated from the POS register.
  - **Email** – The customer will receive only email receipts.
  - **Both** – The customer will receive both printed receipts and email receipts.
4. If you selected either **Email** or **Both** in the **Receipt option** field, enter the customer's email address in the **Receipt email** field.

### Set up an email receipt profile

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Receipt profiles**.
2. Press **Ctrl+N** to create a receipt profile.
3. Enter values in the **Receipt profile ID** and **Description** fields.
4. On the **General** FastTab, select **Add** to add a receipt type.
5. Select **Receipt** as the receipt type, and select the receipt format to use for email receipts.

### Add an email receipt profile to the functionality profile

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**.
2. Select **Edit**.
3. On the **General** FastTab, in the **Receipt profile ID** field, specify an email receipt profile.

## Set up an email template for receipts

1. Go to **Organization email templates** under either **Retail and Commerce > Headquarters setup > Setup > Organization email templates** or **Organization administration > Setup > Organization email templates**.
2. Select **New**.
3. Enter information in the following fields:
  - In the **Email ID** field, enter **EmailRecpt**.
  - In the **Email description** field, enter an optional description.
  - In the **Sender name** field, specify the name that should appear as the sender of the email. Customers will see this name as the **From** name on the email.
  - In the **Sender email** field, specify a valid email address. Customers will see this email address as the **From** email address on the email.
4. Under **General**, enter information in the following fields:
  - In the **Default language code** field, select a language. This is the language that the receipt will be sent in when templates for multiple languages are configured and the store or customer's preferred language doesn't match any of those additional languages.
5. In the **Email message content** pane, select **New** to create a new template instance. Enter information in the following fields:
  - In the **Language** field, specify the language this template will be localized in. Note that this only applies to emailed receipts that contain HTML with static content above and/or below the `%message%` placeholder.
  - In the **Subject** field, enter a title for the email receipts.
  - Select the **Has body** check box.
  - Select **Edit** to upload your template HTML. At a minimum, your template instance must contain the following code:

```
<pre>
%message%
</pre>
```

You can also add HTML to display a header, footer, logo or any other static content that you want included in the receipt email. For more information about creating HTML receipt templates, see [Create a template for emailed receipts](#).

5. Depending on the settings that you configured, you must run the appropriate distribution schedule jobs to synchronize the changes to MPOS.
  - **1010** – Customer
  - **1070** – Channel configuration
  - **1090** – Registers
  - **1110** – Global configuration

## MPOS transactions

After the changes are synchronized to the store, MPOS prompts the user for an email address for each transaction (if this feature is enabled). If an email address is already on file for the customer, that address appears in the email address prompt. If a customer hasn't been named, or if an email address hasn't been entered for a named customer, enter an email address, and then select **Send**. When the transaction is finalized,

the real-time service will send the customer an email that has the receipt in the body of the message, as you configured earlier.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Reset receipt numbers

2/18/2021 • 4 minutes to read • [Edit Online](#)

## NOTE

We require that you select the **Independent sequence** property for all receipt types in the functionality profile before using this feature. Also, the system time zone of the device, where the POS is being used, should match the corresponding store time zone. Due to these limitations, we recommend that you do not use this feature in production while we work to fix these issues in a future release.

Retailers generate receipt numbers for various actions in the store, such as cash and carry transactions, return transactions, customer orders, quotations, and payments. Although retailers define their own receipt formats, some countries or regions have regulations that put restrictions on these receipt formats. For example, these regulations might limit the number of characters on the receipt, require consecutive receipt numbers, restrict some special characters, or require a reset of receipt numbers at the beginning of the year. Microsoft Dynamics 365 Commerce makes the process of managing receipt numbers very flexible, to help retailers meet regulatory requirements. This topic explains how to use the functionality for resetting receipt numbers.

In Commerce, receipt formats can be alphanumeric. You can put both static content and dynamic content in them. Static content includes alphabetic character, numbers, and special characters. Dynamic content includes one or more characters that represent information such as the store number, terminal number, date, month, year, and number sequences that are automatically incremented. The formats are defined in the **Receipt numbering** section of the functionality profile. The following table describes the characters that represent the dynamic content.

CHARACTERS	DESCRIPTION
S	The character <b>S</b> is used for the store number. For example, if a store is numbered HOUSTON1, the format <b>SSS</b> shows "ON1" on the receipt. The format <b>SSSSS</b> shows "STON1" on the receipt.
T	The character <b>T</b> is used for the terminal number. For example, if a terminal is numbered 0001, the format <b>TTTT</b> shows "0001" on the receipt.
C	The character <b>C</b> is used for the staff ID number. For example, if a staff member has an ID of 000160, the format <b>CCCC</b> shows "0160" on the receipt.
ddd	The characters <b>ddd</b> correspond to the day of the year, from 1 through 366. For example, on January 15, the format <b>ddd</b> shows "015" on the receipt.
MM	The characters <b>MM</b> are used for the two-digit month. For example, in January, the format <b>MM</b> show "01" on the receipt.
DD	The characters <b>DD</b> are used for the two-digit day of the month. For example, on January 15, the format <b>DD</b> shows "15" on the receipt.

CHARACTERS	DESCRIPTION
YY	The characters <b>YY</b> are used for the two-digit year. For example, in any month during the year 2020, the format <b>YY</b> shows "20" on the receipt.
#	A number sign ( <b>#</b> ) is used for sequential numbering. For example, the format <b>####</b> shows "0001," "0002," "0003," and so on, on the receipt.

You can reset the sequential numbering of the receipt on a specific date. Then, for the first transaction that occurs after 12:00 AM on the selected reset date, the system resets the receipt's number sequence to 1. You can also specify whether the reset occurs only one time, or whether it recurs every year. If yearly recurrence is specified, the reset automatically occurs every year until the retailer chooses to stop it.

To turn on the reset, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**.
2. On the **Receipt numbering** FastTab, select **Reset number reset date**.
3. In the drop-down dialog box, in the **Reset date** field, select a future date when the reset should occur.
4. In the **Reset receipt type** field, select **One time only** or **Yearly**.
5. Select **OK**.

After you select a date, it appears in the **Next receipt number reset date** column. The reset date is applicable to all receipt transaction types. Therefore, the receipt number sequence will be reset for all receipt types.

When the reset date arrives, the receipt number is reset for the first transaction of each type. In addition, in the functionality profile, the reset date is moved from the **Next receipt number reset date** column to the **Current receipt number reset date** column. This change indicates that if a register isn't used on the reset date, the receipt number will be reset the next time that the register *is* used. For example, on December 3, 2019, you select **January 1, 2020**, as the reset date. On January 1, when the registers make their first transaction, the receipt number are reset. However, one register isn't used at all during December and January, but then starts to be used in February. In this case, because a reset action was defined, the receipt number for that register will be reset when the register makes its first transaction in February.

You can use the **Clear reset date** functionality to clear future reset dates. However, if the reset date occurred in the past, it can't be undone. Therefore, the reset will still occur for all registers where the reset hasn't yet occurred.

**NOTE**

Depending on the reset date that you select, and the receipt format, you might have duplicate receipt numbers. Although the point of sale (POS) system can handle these situations, they increase the amount of time that is required to process returns, because sales associates must select among the duplicate receipts. Other complications that are related to data cleanup can occur if the duplicate receipts weren't a planned consequence. Therefore, we recommend that you use dynamic date characters (for example, **ddd**, **MM**, **DD**, and **YY**) to help prevent duplicate receipt numbers after a reset.

# Embed processor credit card receipts in customer receipts

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to embed credit card receipts from payment processors into a customer's itemized transaction receipt. This capability is available in Microsoft Dynamics 365 Commerce version 10.0.8 and later.

## Key terms

TERM	DESCRIPTION
Customer's receipt	The receipt that is generated for a cash-and-carry transaction at the point of sale (POS).
Customer's credit card receipt	The credit card receipt that is printed as a record of the credit card payment or other electronic payment that is used in a transaction.

## Overview

This topic describes the steps that are required to embed the credit card receipt from a payment processor directly into a customer's receipt. In Dynamics 365 Retail version 10.0.7 and earlier, several elements from the customer's credit card receipt could be embedded into the customer's itemized transaction receipt. However, the actual receipt that comes from the payment processor could not be included. That solution wasn't acceptable for all retailers, because the configurable receipt fields in the customer's credit card receipt didn't always include all the details that are stipulated by local statutory requirements.

## Prerequisites

The following items are required to embed processor credit card receipts into customer receipts:

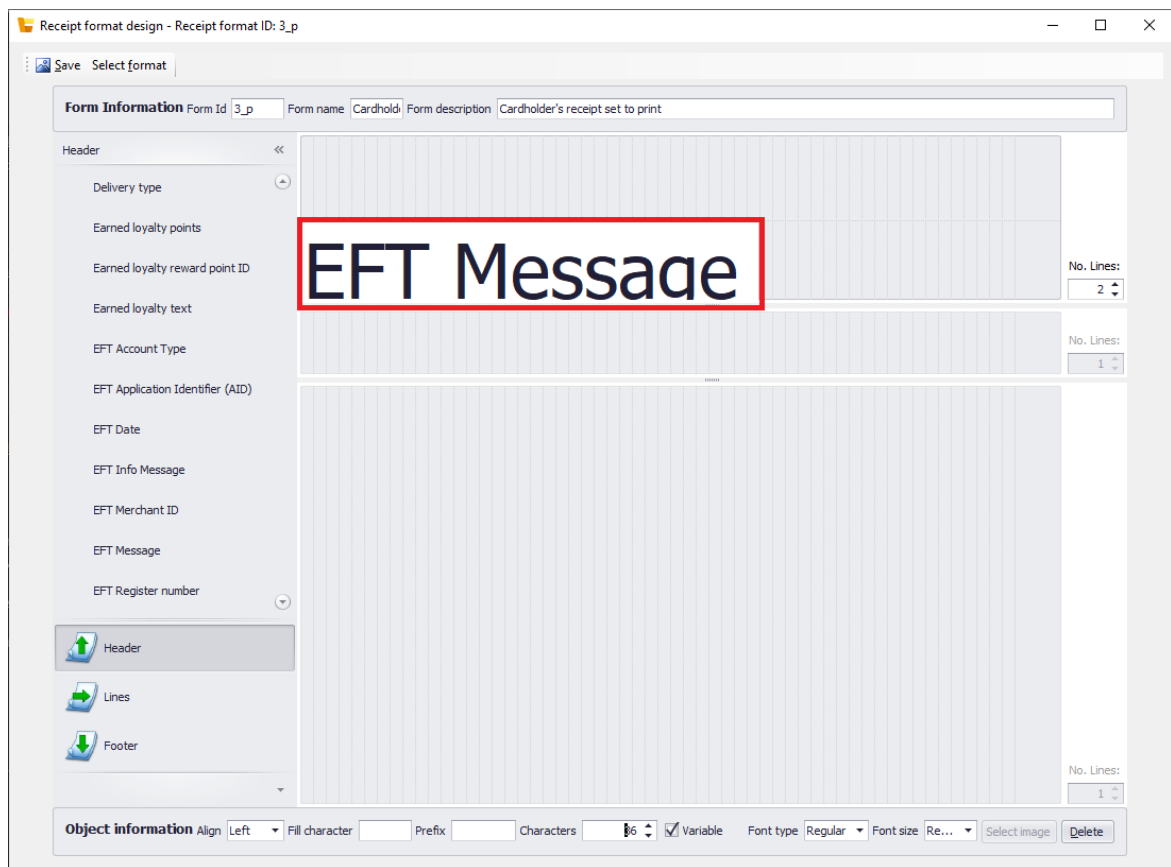

- A payment connector that is implemented in accordance with the payments software development kit (SDK)
- A POS that has a working printer

## Set up receipts

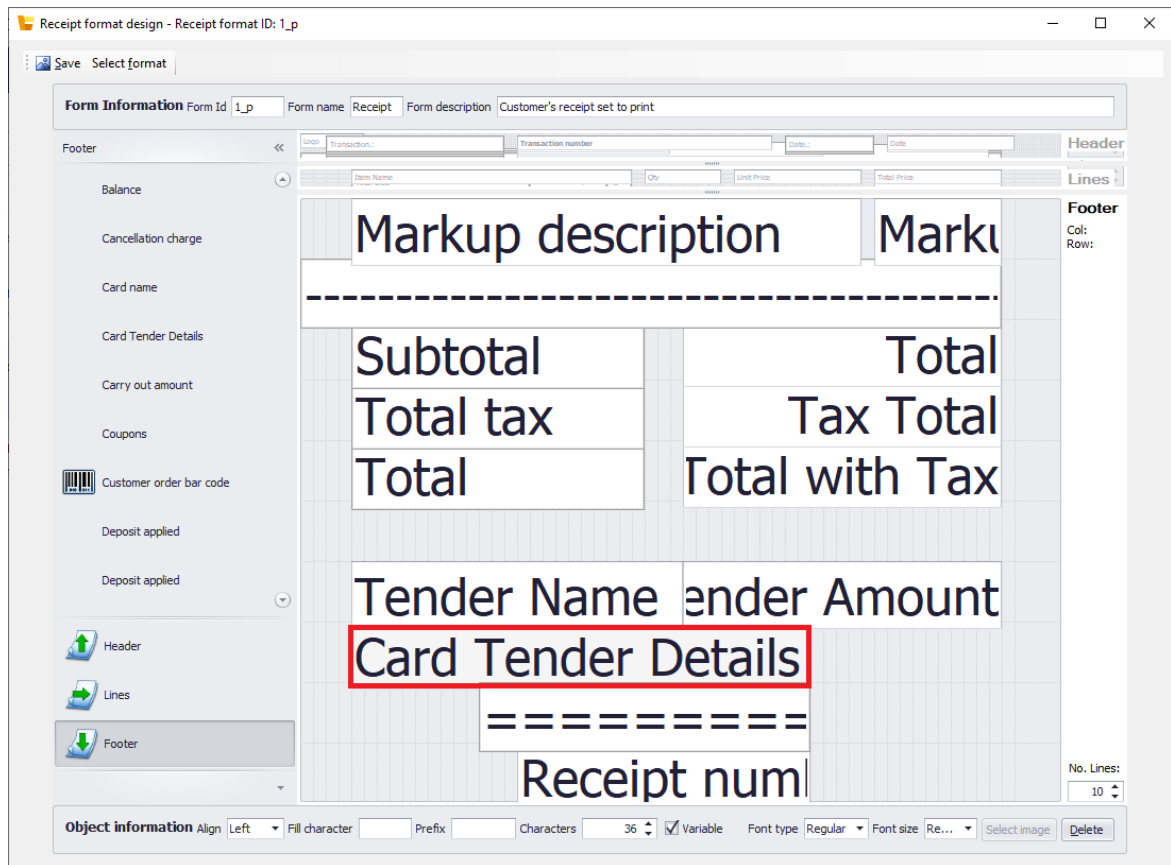

1. In the POS, search for "receipt formats" to open the **Receipt formats** page.
2. Select the receipt of the **Customer's credit card receipt** type that will be used at the POS. If you're using demo data, select receipt format 3\_P, and set the **Print Behavior** field to **Do not print**.
3. Select **Designer** to open the receipt designer.
4. Remove all the fields from the receipt format.

To edit a section of the receipt, you must first select that section at the bottom of the left pane in the receipt designer. Then select the desired receipt variable in the selected section. Finally, to delete the selected variable, you can use the **Alt+D** keyboard shortcut.

5. Select the **Header** section at the bottom of the left pane, and then drag the **EFT Message** receipt variable into the header.

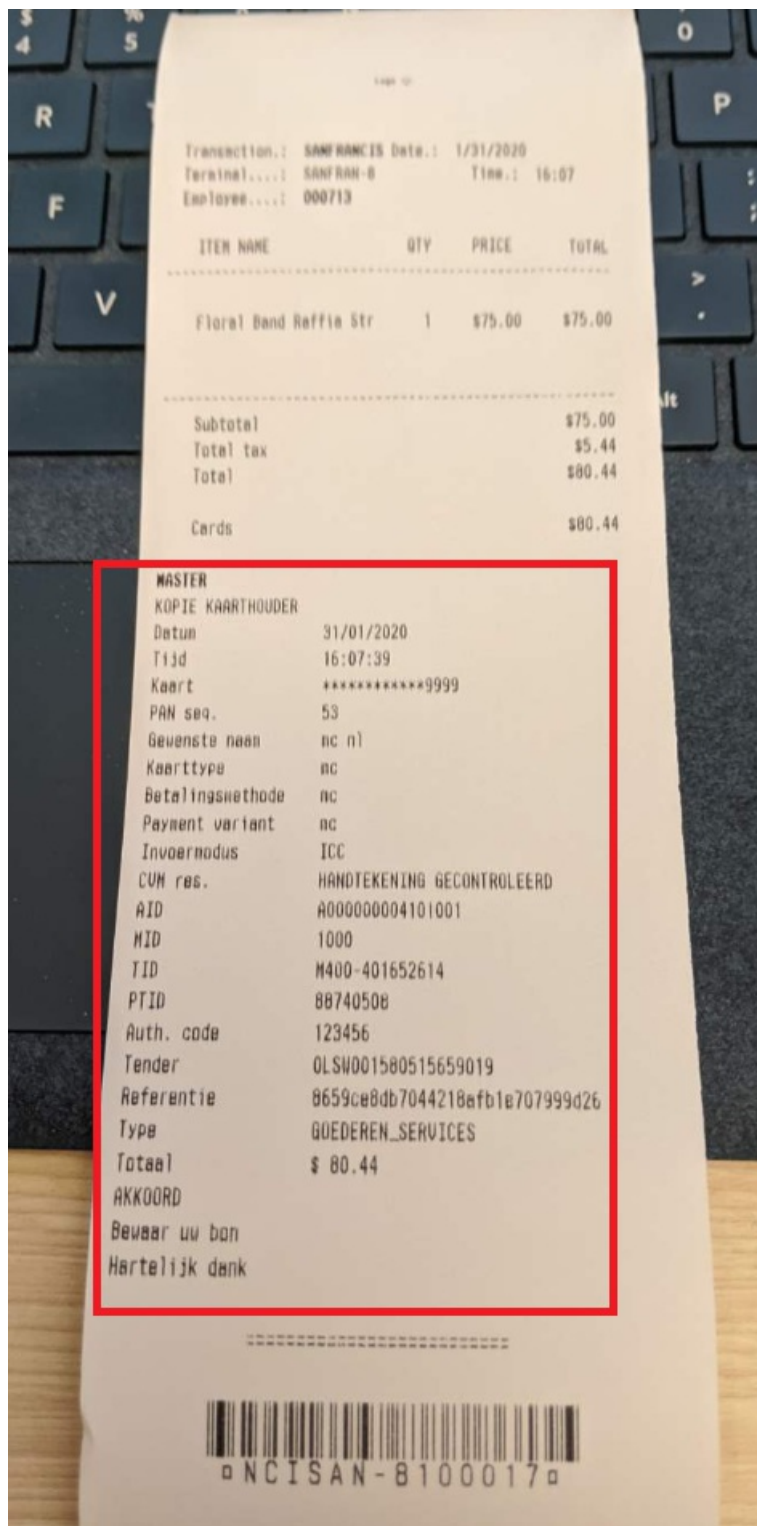

6. Select **Save**.
7. While the receipt designer is still open, select **Select format** in the upper-left corner to open the receipt selector.
8. In the receipt selector, select the receipt of the **Receipt** type that will be used at the POS. If you're using demo data, select receipt format **1\_p**.
9. In the receipt designer, select the **Footer** section at the bottom of the left pane, and then drag the **Card Tender Details** receipt variable into the footer.

10. Select **Save**.
11. Sync the changes to the POS by using the **1090** distribution schedule.
12. Close the shift in the POS, and then open a new shift.
13. Perform a credit card transaction to confirm that the processor's credit card receipt is embedded into the customer's receipt.

# Configure the functionality profile for a sales representative

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to configure a store's functionality profile settings that apply to sales representatives using the USRT demo data company.

1. Go to Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles.
2. Click Edit.
3. Expand the Functions section.
  - You can use the functionality profile settings to configure POS to automatically add the cashier's default sales group, to prompt for sales groups, and to require sales groups.
4. In the Prompt for sales representative field, select an option.
5. Select Yes in the Require sales representative field.

## NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create financial dimensions for retail channels and configure dimension values on stores

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through creating a commerce channel financial dimension with dimension values and steps to configure financial dimension values on stores. The topic does not include other related steps, such as creating dimension sets and account structures. This procedure uses the USRT company in demo data.

1. Go to General ledger > Chart of accounts > Dimensions > Financial dimensions.
2. Click New.
3. In the Use values from field, select 'Commerce channels'.
4. In the Dimension name field, type a value.
5. Click Activate.
6. Click Close.
7. Click Activate.
8. Click Dimension values.
9. Close the page.
10. Click Save.
11. Close the page.
12. Go to Retail and Commerce > Channels > Stores > All stores.
13. In the list, click the link in the selected row.
14. Toggle the expansion of the Financial dimensions section.
15. Click Edit.
16. In the Commerce channel field, click the drop-down button to open the lookup.
17. In the list, find and select the dimension value for the store being updated.
18. In the list, click the link in the selected row.
19. In the CostCenter field, click the drop-down button to open the lookup.
20. In the list, find and select the desired record.
21. In the list, click the link in the selected row.
22. In the Department field, click the drop-down button to open the lookup.
23. In the list, find and select the desired record.
24. In the list, click the link in the selected row.
25. Click Save.

## NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up an online channel

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to create a new online channel in Microsoft Dynamics 365 Commerce.

## Overview

Dynamics 365 Commerce supports multiple retail channels. These retail channels include online stores, call centers, and retail stores (also known as brick-and-mortar stores). Online stores give customers the option of purchasing products from the retailer's online store in addition to its retail stores.

To create an online store in Commerce, you must first create an online channel. Before you create a new online channel, ensure that you have completed the [Channel set up prerequisites](#).

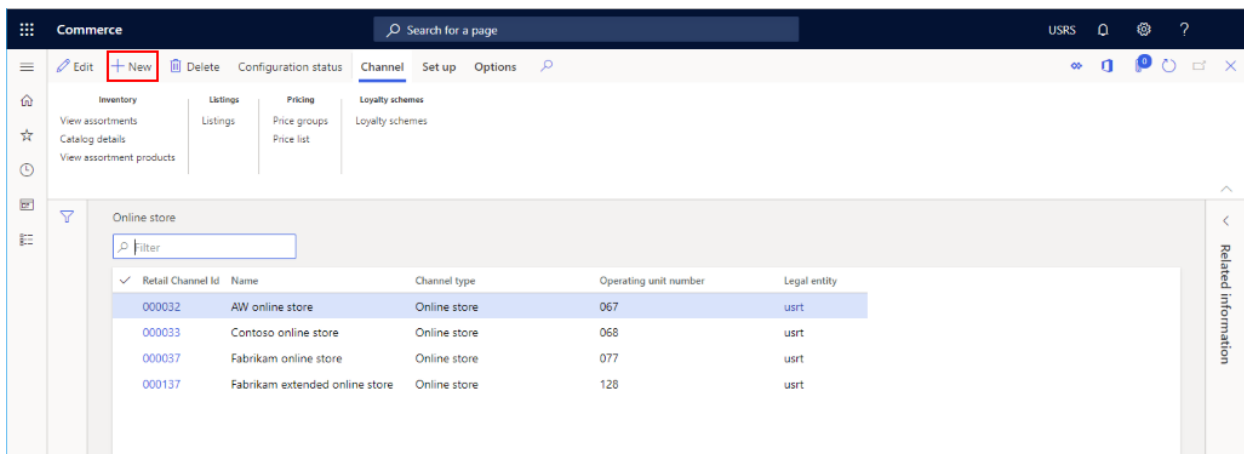

Before you can create a new site, at least one online store must be created in Commerce. For more information, see [Create an e-Commerce site](#).

## Create and configure a new online channel

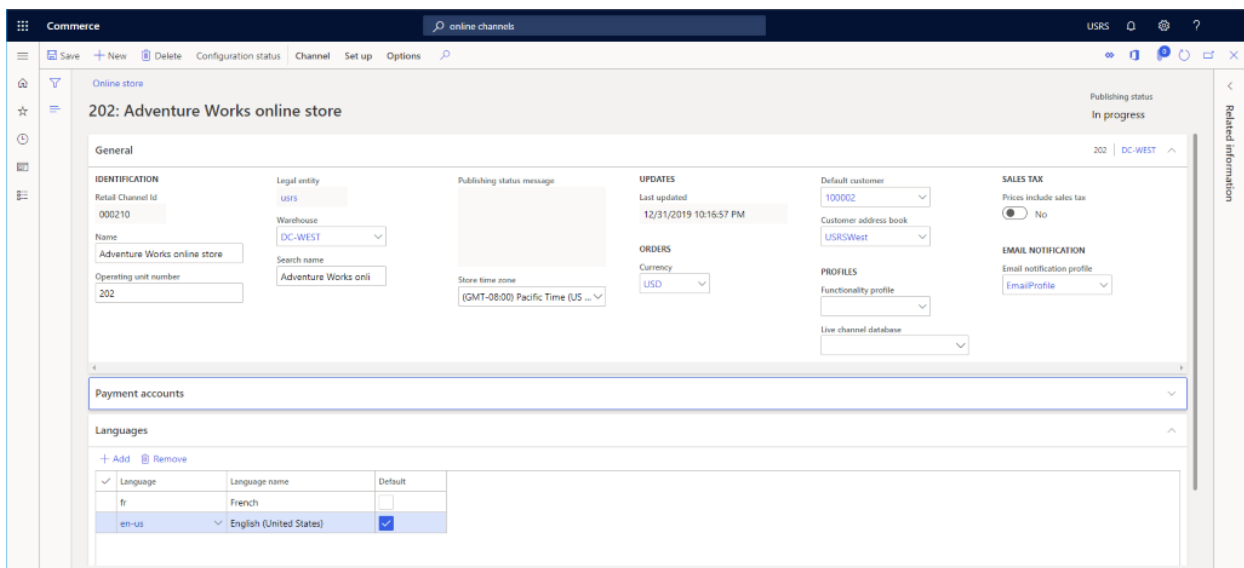

To create and configure a new online channel, follow these steps.

1. In the navigation pane, go to **Modules > Channels > Online Stores**.
2. On the action pane, select **New**.
3. In the **Name** field, provide a name for the new channel.
4. In the **Legal entity** drop-down, enter the appropriate legal entity.
5. In the **Warehouse** drop-down, enter the appropriate warehouse.
6. In the **Store time zone** field, select the appropriate time zone.
7. In the **Currency** field, select the appropriate currency.
8. In the **Default customer** field, provide a valid default customer.
9. In the **Customer address book** field, provide a valid address book.
10. In the **Functionality profile** field, select a functionality profile if applicable.
11. In the **Email notification profile** field, provide a valid email notification profile.
12. On the action pane, select **Save**.

The following image shows the creation of a new online channel.

The following image shows an example online channel.

## Set up languages

If your e-Commerce site will support multiple languages, expand the **Languages** section and add additional languages as needed.

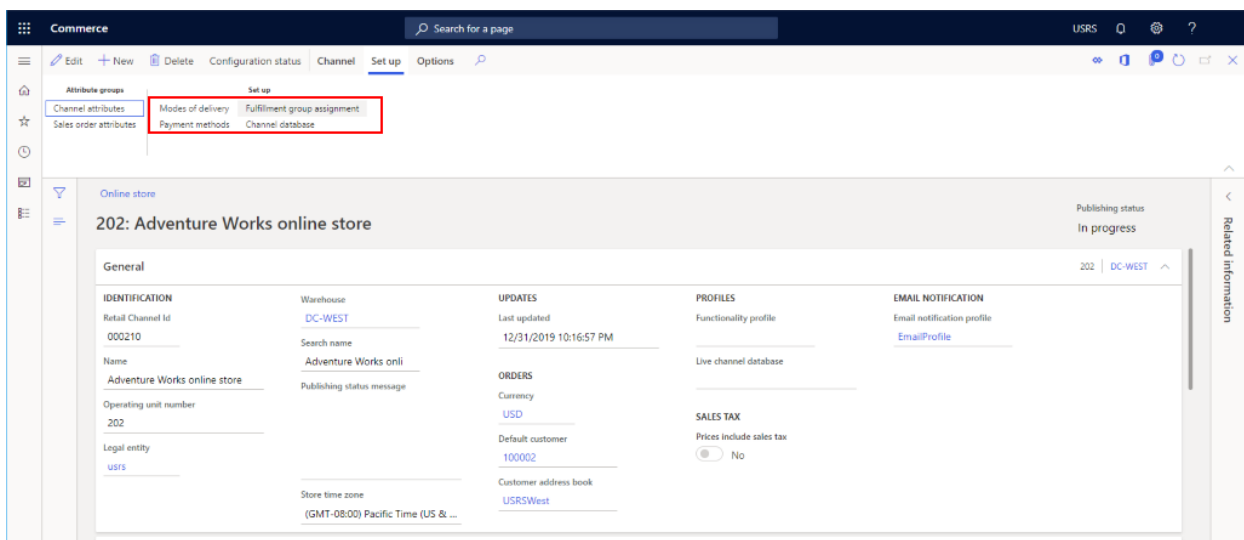

## Set up payment account

From within the **Payment account** section, you can add a third-party payment provider. For information on setting up an Adyen payment connector, see [Dynamics 365 Payment Connector for Adyen](#).

## Additional channel setup

Additional tasks that are required for online channel setup include setting up payment methods, modes of delivery, and the fulfillment group assignment.

The following image shows **Modes of delivery**, **Payment methods**, and **Fulfillment group assignment** setup options on the **Set up** tab.

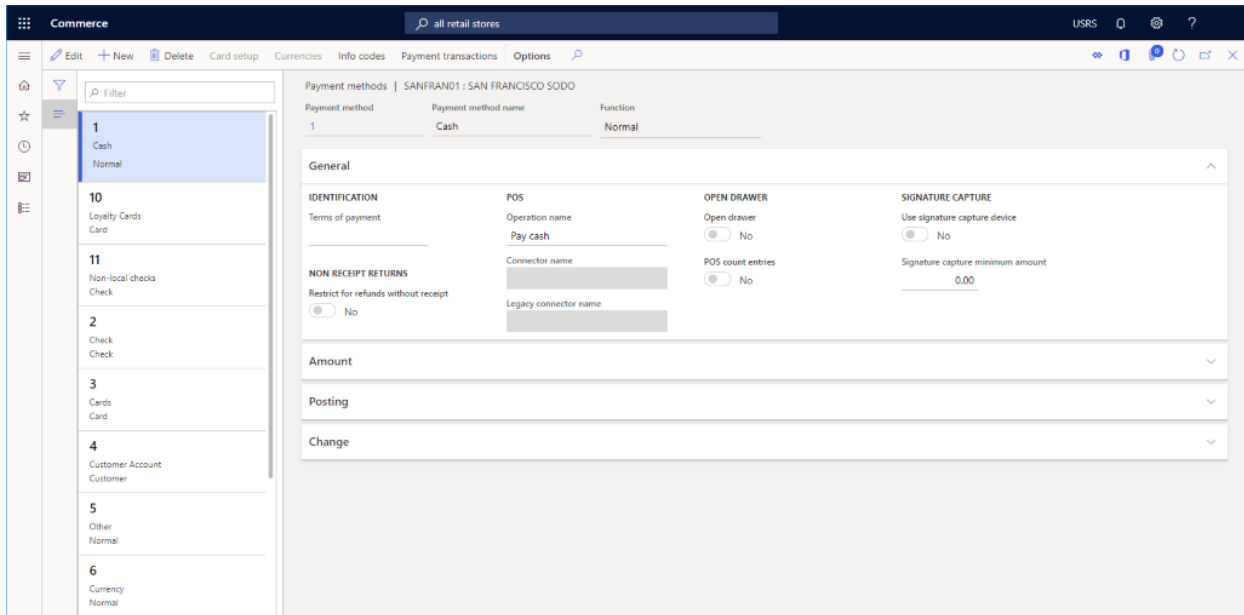

## Set up payment methods

To set up payment methods, for each payment type supported on this channel follow these steps.

1. On the action pane, select the **Set Up** tab, then select **Payment methods**.
2. On the action pane, select **New**.
3. In the navigation pane, select a desired payment method.

4. In the **General** section, provide an **Operation name** and configure any other desired settings.
5. Configure any additional settings as required for the payment type.
6. On the action pane, select **Save**.

The following image shows an example of a cash payment method.

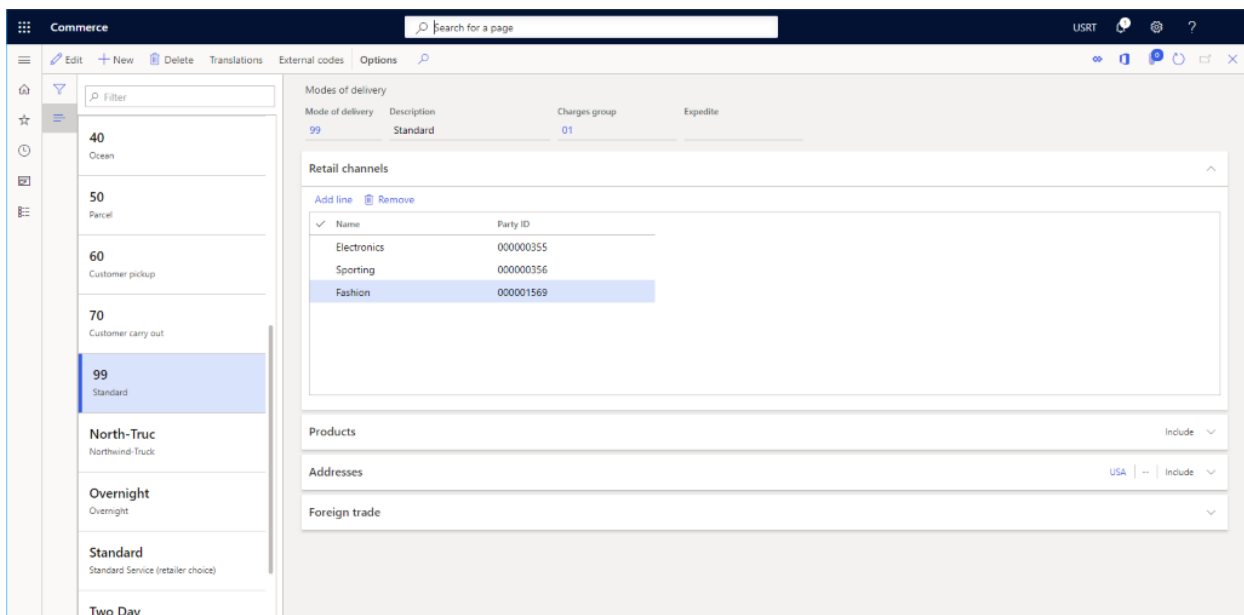

### Set up modes of delivery

You can see the configured modes of delivery by selecting **Modes of delivery** from the **Set up** tab on the **Action pane**.

To change or add a mode of delivery, follow these steps.

1. In the navigation pane, go to **Modules > Inventory management > Modes of delivery**.
2. On the action pane, select **New** to create a new mode of delivery, or select an existing mode.
3. In the **Retail channels** section, select **Add line** to add the channel. Adding channels using organization nodes instead of adding each channel individually can streamline adding channels.

The following image shows an example of a mode of delivery.

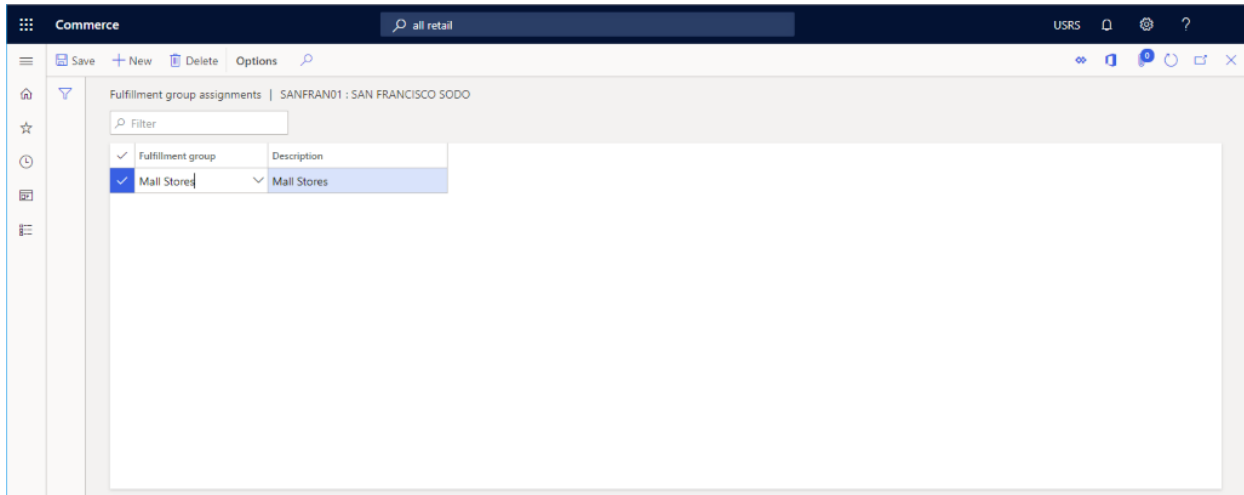

### Set up a fulfillment group assignment

To set up a fulfillment group assignment, follow these steps.

1. On the action pane, select the **Set up** tab, then select **Fulfillment group assignment**.
2. On the action pane, select **New**.
3. In the **Fulfillment group** drop-down list, select a fulfillment group.
4. In the **Description** drop-down list, enter a description.
5. On the action pane, select **Save**.

The following image shows an example of a fulfillment group assignment setup.

# Call center sales functionality

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Dynamics 365 Commerce, a call center is a type of channel that can be defined in the application. Defining a specific channel for your call center entities allows the system to tie specific data defaults and order processing defaults to sales orders created by a user of the call center channel.

Call center features include advanced price and promotions, catalogs, gift cards, loyalty programs, and coupons. Call center orders are also leveraged by the point of sale (POS) application to support cross-channel order fulfillment scenarios.

It's important to note that while the call center module can be utilized by other industries outside of Commerce, the current release of the call center application hasn't been optimized for use in business-to-business (B2B) order processing scenarios, or scenarios where orders have a large number of sales lines. It's recommended that users who want to utilize the call center features for order processing outside of typical direct-to-consumer transaction processing, take adequate time to test and validate that enabling call center functionality will meet functional and performance needs.

In addition to supporting order creation, the call center module also provides a user-friendly customer service application that makes it easier for users to locate customer accounts and review all of the related customer order data and attributes. The customer service screen is designed to enable a user to quickly access order-related data that will allow them to answer the most common order-related questions received from customers.

This page provides links to relevant documentation related to the setup, configuration, and functional use of the call center features.

# Set up a call center channel

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to create a new call center channel in Microsoft Dynamics 365 Commerce.

## Overview

In Dynamics 365 Commerce, a call center is a type of Commerce channel that can be defined in the application. Defining a channel for your call center entities allows the system to tie specific data and order processing defaults to sales orders. While a company can define multiple call center channels in Commerce, it is important to note that an individual user may only be linked to one call center channel.

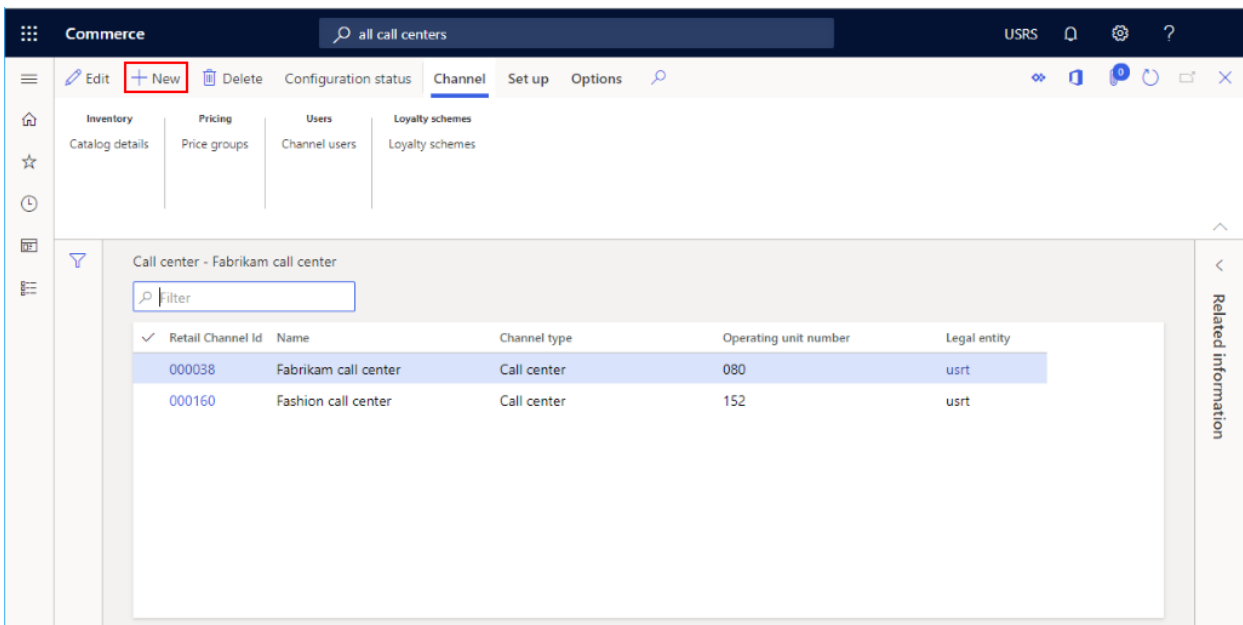

Before you create a new call center channel, ensure that you have completed the [Channel setup prerequisites](#).

## Create and configure a new call center channel

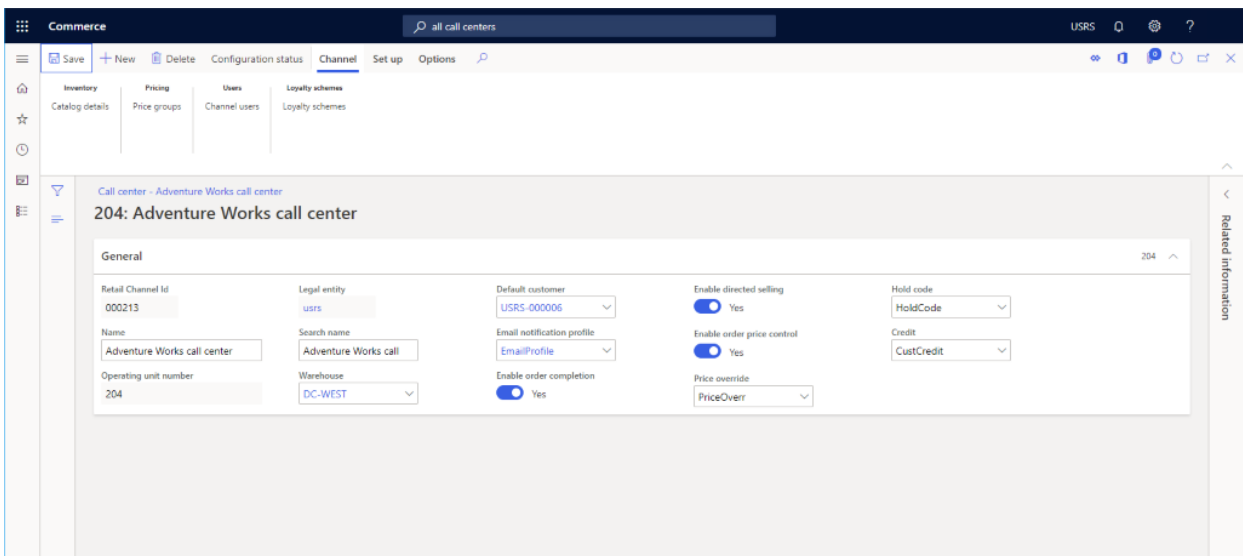

To create and configure a new call center channel, follow these steps.

1. In the navigation pane, go to **Retail and Commerce > Channels > Call centers > All call centers**.
2. On the action pane, select **New**.
3. In the **Name** field, provide a name for the new channel.
4. Select the appropriate **Legal entity** from the drop-down.
5. Select the appropriate **Warehouse** location from the drop-down. This location will be used as the default on sales orders created for this call center channel, unless other defaults have been defined at the customer or item level.
6. In the **Default customer** field, provide a valid default customer. This data is used to assist in autopopulating defaults when new customer records are created. When creating call center orders, it is not advisable to create orders for the default customer.
7. In the **Email notification profile** field, provide a valid email notification profile. As call center orders are created and processed, the email notification profile is used to trigger automated email alerts to customers with information about their order status.
8. Provide a **Price override** info code. You may need to create an info code for this first. This info code provides the set of reason codes that the user will be prompted to choose from when using the price override functionality on a call center order.
9. Provide a **Hold code** info code. You may need to create an info code for this first. This info code provides the set of optional reason codes that the user will be prompted to choose from when placing an order on hold.
10. Provide a **Credit** info code. You may need to create an info code for this first. This info code provides the set of reason codes that the user can choose from when using the order credit functionality of call center to give misc refunds to the customer for customer service reasons.
11. Optional: set up financial dimensions on the **Financial dimensions** FastTab. The dimensions entered here will default on any sales order created in this call center channel.
12. Click **Save**.

The following image shows the creation of a new call center channel.

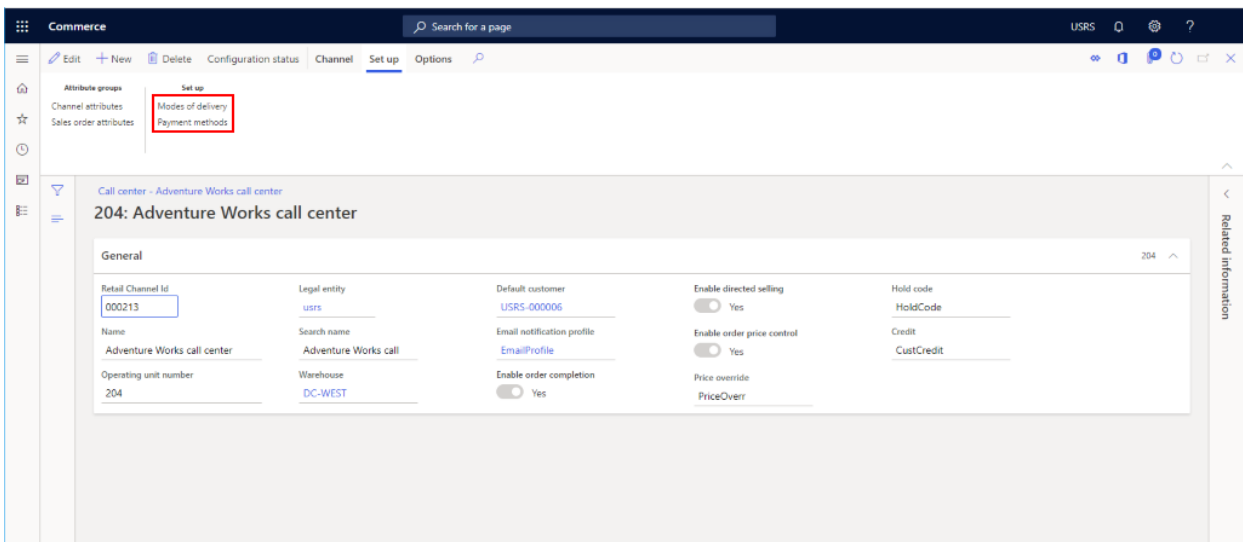

The following image shows an example call center channel.

## Additional channel setup

Additional tasks required for call center channel setup include setting up payment methods and modes of delivery.

The following image shows **Modes of delivery** and **Payment methods** setup options on the **Set up** tab.

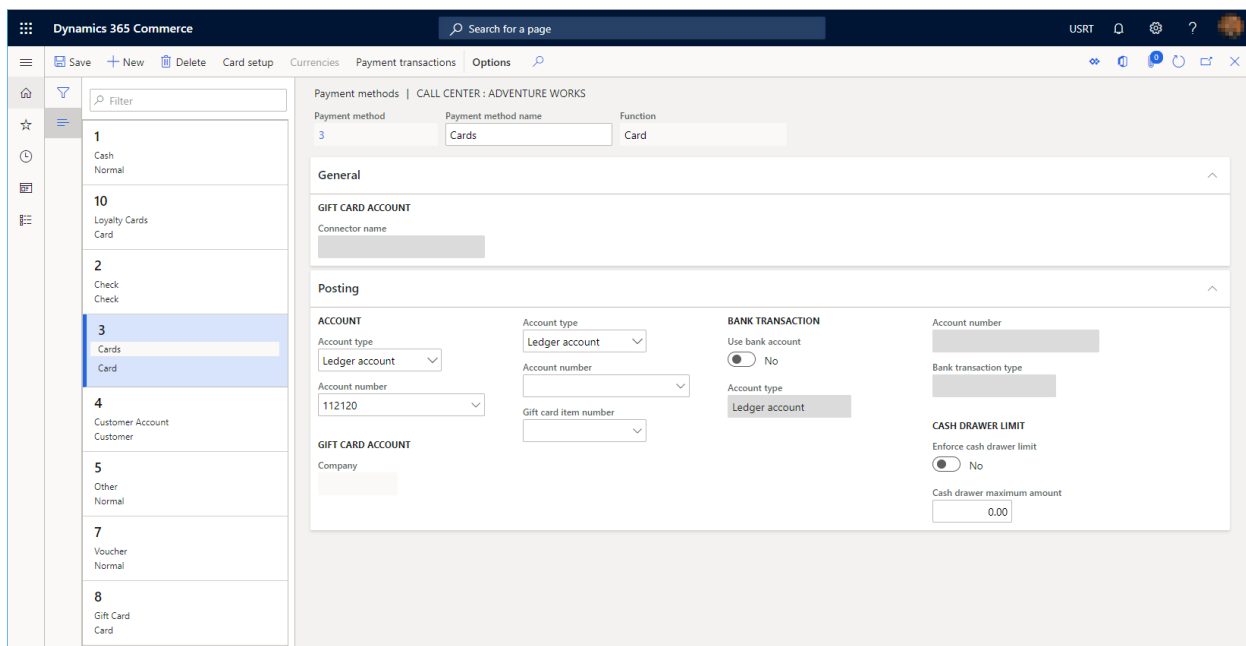

## Set up payment methods

To set up payment methods, follow these steps for each payment type supported on this channel. Users will be required to select from pre-defined payment methods to link them to the call center channel. Before setting up your call center payment methods, first set up your master methods of payment in **Retail and Commerce > Channel setup > Payment methods > Payment methods**.

1. On the action pane, select the **Set up** tab, and then select **Payment methods**.
2. On the action pane, select **New**.
3. In the navigation pane, select a payment method from the pre-defined payments available.
4. Configure any additional settings as required for the payment type. For credit cards, gift cards, or loyalty cards, additional setup is required by selecting the **Card setup** function.
5. Configure proper posting accounts for the payment type in the **Posting** section.
6. On the action pane, click **Save**.

The following image shows an example of a cash payment method.

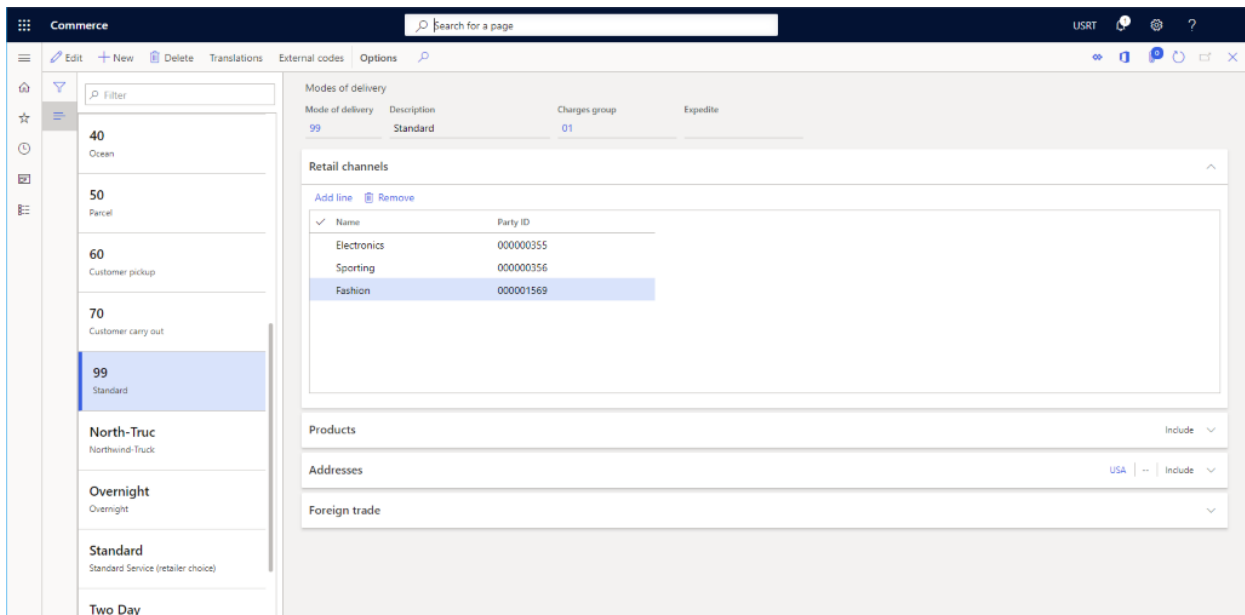

## Set up modes of delivery

You can see the configured modes of delivery by selecting **Modes of delivery** from the **Set up** tab on the **Action** pane.

To change or add a mode of delivery to be associated to the call center channel, follow these steps.

1. From the Call center modes of delivery form, select **Manage modes of delivery**
2. On the action pane, select **New** to create a new mode of delivery, or select an existing mode.
3. In the **Retail channels** section, click **Add line** to add the call center channel. Adding channels using organization nodes instead of adding each channel individually can streamline adding channels.
4. Ensure the mode of delivery has been configured with data on the **Products** FastTab and the **Addresses** FastTab. If no products or delivery addresses are valid for the mode of delivery, choosing it during order entry will result in errors.
5. After any changes have been made to the call center mode of delivery configurations, the **Process delivery modes** job must be run to explode the change matrix. This job can be found by navigating to **Retail and Commerce > Retail and Commerce IT > Process delivery modes**.

The following image shows an example of a mode of delivery.

### Set up channel users

To create a sales order that is linked to the call center channel from Commerce Headquarters, the user creating the sales order must be linked to the call center channel. The user cannot manually link a sales order created in Commerce Headquarters to the call center channel. The link is systematic, and is based on the user and the user's relationship to the call center channel. A user may only be linked to one call center channel.

1. On the action pane, select the **Channel** tab, and then select **Channel users**.
2. On the action pane, select **New**.
3. Choose an existing **User ID** from the dropdown selection list to link this user to the call center channel

After the channel user setup is done and the user creates a new sales order in Commerce Headquarters, the sales order will be linked to their associated call center channel. Any configurations for this channel will be applied systematically to the sales order. A user can confirm which call center channel the sales order is linked to by viewing the channel name reference on the sales order header.

### Set up price groups

Price groups are optional, but if used, can control which sales prices will be offered to customers placing orders in the call center channel. If a price group has not been configured for the customer, or if catalog price groups are not being applied to the sales order (using the **Source code ID** field on the call center order header), then the channel price group is used to locate item prices. If a price group is not found on the call center channel, the default item master prices are used.

To set up a price group, do the following.

1. On the action pane, click the **Channel** tab, and then select **Price groups**.

2. On the action pane, click **New**.
3. Select a **Retail price group** from the dropdown selection list.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Call center catalogs

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic describes the call center–specific functionality linked to the catalog capabilities in Dynamics 365 Commerce.

The catalog features found in Commerce can be used for multiple purposes. Initially the catalog features were created to support third-party e-Commerce integrations. Catalog setup allowed companies to create a grouping of products and attributes that could be published externally for consumption by a third-party e-Commerce solution.

When call center channel support was added, the catalog concept was expanded to add additional capabilities for supporting and managing features related to traditional direct-to-consumer marketing catalogs. A direct-to-consumer company will often produce printed catalogs, which are then mailed to one or more segments of customers. These catalogs will typically have specific promotions or offers that will only be honored if the customer provides a catalog identification code at the time of order creation.

Direct-to-consumer marketing companies are very focused on tracking the response to these catalogs to ensure that the costs to produce and mail them are justified. To track the response, a code is traditionally printed on the back of the catalog and this code is then requested and applied when the catalog recipient calls to place an order by phone (or now more traditionally the code may be entered when the customer places an order online). While there are different industry terms that have been used to identify this catalog tracking code (including key code, promo code, catalog code, source code), we refer to the code in Commerce as the **Source code ID**.

## Basic catalog setup

Go to **Retail and Commerce > Catalogs and assortments > All catalogs** to configure your catalog.

When you create a new catalog, you must first link the catalog to one or more channels. This is done in the **Commerce channels** FastTab on the **Catalog setup** form. Click **Add** and select one or more channels. Only items linked to your selected channel **assortments** can be used when creating the catalog.

To add products to a catalog, a navigation hierarchy must be chosen. The navigation hierarchy will support the category structure for the catalog. You must pick from one of the navigation hierarchies linked to the channels selected on the **Commerce channels** FastTab of the **Catalog** page. If a navigation channel was not linked to a channel previously, go to **Retail and Commerce > Channel setup > Channel categories and product attributes** to link a navigation hierarchy default to each of your channels.

On the **Catalogs** menu tab, on the **Catalog setup** page, click **Add products** to configure the products to add to the catalog, or select a node in the navigation hierarchy (selecting a node will change the screen presentation and allow you to add products directly to a category within the catalog).

Click the top node of the catalog hierarchy to return to the main catalog header view. Configure effective and expiration dates as necessary on the **General** FastTab.

Before the catalog is available to use, it must be published. Click **Validate catalog** on the **Catalogs** menu to process a validation. This is required action and will validate that the required setup is accurate. Click **View results** to see the details of the validation. If errors are found, you must correct the data and run validation again until the validation has passed.

After validation is confirmed, click **Workflow** on the menu to start the approval workflow. Click **Submit** on the **Workflow** menu to execute the process. Configure the steps and authorized users for the workflow from **Retail and Commerce > Headquarters setup > Commerce workflows**. The workflow will define the steps

needed to get the catalog into an **Approved** status. When the catalog is in an **Approved** status, you can click the **Publish** option on the **Catalogs** menu to complete the process. After the catalog is in a **Published** status, it can be used in call center order entry and send catalog processes.

## Use catalogs to drive sales order pricing and promotions

A core reason for defining a catalog to use with a call center is to be able to configure specific prices and promotions for that catalog. Customers ordering from this catalog will receive these prices and promotions in call center order entry if the catalog's **Source code ID** is applied to the order header or lines.

To configure catalog-specific prices, select the **Price groups** option from the **Catalogs** tab to link one or more price groups to the catalog. All trade agreements, price adjustment journals, and advanced discounts (threshold, quantity, mix and match) that have been linked to the same price group will be applied when customers order from this catalog.

On the **Source codes** FastTab, click **Add** to add one or more **Source code ID** identifiers to this catalog. This is the code that will be applied during call center order entry to the sales order header (and lines). This code is used to link the sales order to the catalog and ultimately to the price groups and any special prices and promotions that have been configured.

## Use the source ID to track costs and response rates

When defining the **Source code ID**, you can optionally link this ID to a **Target market ID**. The **Target market ID** can be defined in **Retail and Commerce > Customers > Target market**. The target market is a list of customers and/or prospects that belong to a user-defined segment. Linking the customer or prospect data to the source code ID allows for better visibility into the recipients of the catalog. If a customer is linked to a target market and that target market is linked to an active source code ID/catalog, call center users will be able to see what catalogs a customer has received by selecting the **Source codes** menu option on the **Customers** menu tab on the **Customer service** page. During order entry, call center users can also see the specific catalogs a customer was sent in the **Source** drop-down list on the sales order header. Changing the filter from **All** to **Targeted** will allow the user to see the specific active catalogs the customer was sent. This is helpful in situations where the customer may have forgotten their catalog or can't locate or read the catalog code when they are calling in to create a sales order.

It's possible to link multiple source code IDs to a catalog. This is often needed when a company wants to track the response rate by different segments. The company will give a unique catalog code to different customer segments, which allows for tracking the response rate, down to the segment level, within a particular catalog event.

Selecting a particular **Source code ID** record and clicking the **Details** option on the **Source codes** FastTab will provide additional fields where sales projections, mailing costs, and mailing dates can be captured. This data is helpful for doing detailed analysis on the effectiveness of the catalog. Users can return to this page over time and use the **Source code analysis** and **Compare promotions** buttons to trigger analytical reports based on current sales data and compare costs and budget to actuals.

## Configure catalog-specific order and item scripts

When a call center user is creating a sales order, they can use on-screen scripts. These text-based scripts may provide additional information that the user should say to the customer, or it may be internal notes/reminders that the call center user should review and react to as they are creating the sales order.

It is often helpful to have different sets of scripts for different catalogs. On the **Scripts** FastTab, pre-defined scripts can be linked to a catalog. Use the **Timing** field to determine if the script will appear at the beginning of the order (as soon as the source code ID is entered on the order header), or at the end of the order (in the sales order summary form).

When selecting a node in the catalog's hierarchy and working with the data on the **Products** FastTab, users can also link scripts that are specific to catalogs or items using the **Scripts** action.

## Configure catalog-specific up-sell and cross-sell items

Linking up-sell/cross-sell suggestions to an item can be done from the products setup, but in some cases, a company may want to promote special up-sell/cross-sell items to customers ordering a specific product from a specific catalog. On the **Products** FastTab, select an item and click **Up-sell/cross-sell items** to configure products to be up or cross-sold to customers who purchase the selected item from the catalog. During call center order entry, catalog-specific up-sell/cross-sell items will appear on the screen instead of standard up-sell/cross-sell products that may have been configured for that item through the usual product configuration.

Up-sell/cross-sell items can also take advantage of the script features to show specific messages that a user will see when the up-sell/cross-sell item is displayed during order entry. Scripts tied to up-sell/cross-sell products configured specifically for a catalog product will only appear when that catalog's source code is applied in call center order entry.

## Catalog page analysis

On the **Catalogs** tab, options are available to configure **Catalog pages**. This feature allows you to define specific pages and page types for the printed catalog and their associated costs.

When configuring the products in the catalog, use the **Product page layout** action to define the specific pages, percentage of page, and position of page details for the item. Configuring this data will allow users to take advantage of the **Catalog area analysis report**. This report is found by navigating to **Retail and Commerce > Call center reports > Catalog area analysis** report. This report analyzes sales placed against the catalog (sales orders where the source ID for the catalog was tied to the order header or line) and their associated percent of page and costs to give a traditional direct marketing **Square inch analysis** report.

## Catalog requests

As catalogs are configured and published in Commerce, the **Send catalog** feature can be utilized. This feature is available on the **Customer search** and **Customer service** pages. After selecting a customer record through **Customer search** or while viewing a selected customer's account from **Customer service**, users may select the **Send catalog** option which will open a dialog box allowing the user to choose from a list of any published and active catalogs. A user can select a catalog and a quantity, and a particular source code ID to send. When they click the **Send** button, a request is stored which can then be managed by printing the **Catalog requests** report. This report is found by navigating to **Retail and Commerce > Call center reports > Catalog requests** report. It lists all the catalog requests, including the customer name and address details of the customer who requested the catalog. This report can be used internally or the data can be transmitted to a third-party supporting external processes for physically sending the catalog to the customer.

## Additional features

On the **Catalogs** tab, options for configuring a **Payment schedule** and **Free products** are also available. If the source code ID linked to the catalog is applied during call center order entry, the customer will be eligible for the free products or use of the specific catalog payment schedules as defined. If it's necessary to limit the customer to only being able to select from payment schedules linked to their catalog and not all active payment schedules in the system, the **Only allow catalog plans** check box can be selected for one or more of the source code IDs defined to enforce that limitation.

## Additional notes

Currently, when a source code ID is applied to a sales order in call center, it is used to drive prices, promotions,

scripts and up-sell/cross-sell's that are catalog specific. The system will not prohibit or prevent a product that is not in the catalog from being ordered on the sales order. If an item is ordered that is not part of the catalog, the system will first use the **Price group** that is defined on the call center channel (**Retail and Commerce > Channels > Call centers > All call centers**) for item price or promotions. If no specific channel price is found, the base selling price of the item will be used.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up call center channels

2/18/2021 • 7 minutes to read • [Edit Online](#)

A company can define multiple call center channels in Dynamics 365 Commerce. Call center channels are configured at **Retail and Commerce > Channels > Call centers > All call centers**, and they are specific to a legal entity.

When a new call center channel is created, it's systematically assigned an operating unit number. Because call centers are created as operating units, users can link the call center channel to various Commerce features, such as assortments, catalogs, and specific modes of delivery.

A default warehouse can be configured on the call center channel. Then, when sales orders are created in that channel, the default warehouse is automatically entered on the sales order header, unless another warehouse has been defined on the customer that is selected for the sales order. In that case, the customer's warehouse is entered by default.

Users must be linked to a call center channel to use the features of call center. Any sales order that a user creates is automatically linked to that user's call center channel. Currently, a single user may not be linked to multiple call center channels at the same time.

An email notification profile can also be configured on the call center channel. The profile defines the set of email templates that is used when email is sent to customers who place orders through the call center channel. The email triggers can be configured against system events, such as order submission or order shipment.

Before sales can be correctly process through a call center channel, correct [payment methods](#) and delivery modes must be defined for the channel.

At the level of the call center channel, you can define other default values that are related to the financial dimensions that will be linked to orders that are created by that channel.

## Options for order processing behavior

Three settings in the configuration of a call center have a major effect on the features and functions that are available for sales orders that are created against that call center: **Enable order completion**, **Enable direct selling**, and **Enable order price control**.

### Enable order completion

The **Enable order completion** setting on the call center channel has a major effect on the order processing flow of sales orders that are entered for that channel. When this setting is turned on, all sales orders must go through a set of validation rules before they can be confirmed. You run these rules by selecting the **Complete** button that is added on the Action Pane of the sales order page. All sales orders that are created when the **Enable order completion** setting is turned on must go through the order completion process. This process enforces the capture of payment and payment validation logic. In addition to payment enforcement, the order submission process can trigger [fraud checks](#) that you configure in the system. Orders that fail payment or fraud validations are put on hold and can't be released to further processing (such as picking or shipping) until the issue that caused the hold is resolved.

When the **Enable order completion** setting is turned on for the call center channel, if line items are entered on a sales order and the channel user tries to close or navigate away from the sales order form without first selecting **Complete**, the system enforces the order completion process by opening the sales order recap page and requiring that the user correctly submit the order. If the order can't be correctly submitted together with payment, the user can use the [order holds](#) functionality to put the order on hold. If the user is trying to cancel

the order, he or she must correctly cancel it by using either the Cancel function or the Delete function, depending on the function that the user's security allows.

If the **Enable order completion** setting is turned on for the call center channel, the **Payment status** field will be tracked on the order. The system calculates the **Payment status** when the sales order is submitted. Only orders that have an approved payment status are allowed to move through the system for additional order processing steps, such as picking and shipping. If payments are declined, the **do not process** flag will be enabled on the detailed order status, this puts the order on hold until the payment issue is resolved.

Additionally, if the **Enable order completion** setting is turned on, when users create sales orders and are in line item entry mode, the **Source** field will be available on the main sales order header. The **Source** field is used to capture a [catalog source code](#) in a direct marketing selling scenario. This code can then drive special prices and promotions.

Even if the **Enable order completion** setting is turned off, users can still apply a source code to a sales order. However, they must first open the sales order header details to access the **Source** field. In other words, some additional clicks are required. The same behavior applies to features such as ship complete and expedited orders. These features are available for all orders that are created in the call center. However, when the **Enable order completion** setting is turned on, users can see the configuration of these features on the sales header while they are in the line entry view. They don't have to drill into the sales order header details to find the appropriate settings and fields.

### **Enable direct selling**

If the **Enable direct selling** setting is turned for the call center channel, users can take advantage of the upsell and cross-sell features of Commerce. In this case, pop-up windows appear during order entry and suggest other products that the call center user can offer to the customer. The products that are suggested are based on the product that was just ordered on the sales order line. Currently, the upsell and cross-sell suggestions are configured at the item level on products or catalogs. If the **Enable direct selling** setting is turned off for the call center channel, pop-up windows don't appear during order entry, even if a valid upsell or cross-sell was defined for an item that is being ordered.

When the **Enable direct selling** setting is turned on, the scripts and images features of the sales order entry page are also turned on. In this case, an information panel is available on right side of the page during order entry. This panel can show scripts that are related to the generic order entry process, the catalog source code that was applied, or scripts that are related to the items that are being ordered. Additionally, the images panel can show a product image for the items that are being ordered, if an image has been defined for the item in the product setup.

### **Enable order price control**

When the **Enable order price control** setting is turned, only authorized users can change the sales price of an item during order entry. The changes must be within defined tolerances. Users who don't have the proper authorization must submit a request for a price change instead. The request will then be processed through system workflows for review and approval.

## **Channel users**

When you define the call center channel, you must link channel users to the call center. Otherwise, the call center can't be used in the system. When users sign in to Commerce and enter sales orders or return orders on a page that is related to order entry, their user ID is validated against the configuration of the call center channel. If a user is linked to a specific call center channel, orders that the user creates inherit the traits and default values of that channel.

By default, the **Sale** flag on the sales order header is turned on for all orders that call center users create. The orders can then take advantage of the system's commerce-specific price and promotions features.

Users who aren't linked to a call center channel use the standard order entry features of Microsoft Dynamics 365 Finance. Orders that these users enter through the sales order entry form will not be systematically identified as Commerce orders. Additionally, these orders entered by these users will not be subject to any of the order completion processing rules, pricing logic, or other order validations that can be defined in the call center channel configuration or call center system parameters.

After you've finished configuring the call center channel and defining channel users, to help ensure the desired system behavior, make sure that all required Call center parameters are defined at **Retail and Commerce > Channel setup > Call center setup > Call center parameters**. Make sure that related number sequences are also defined.

**NOTE**

To use call center functionality, the configuration key for **Multiple ship-to** must be enabled. This configuration key can be found in the **Trade configuration** keys under **System Administration > Setup > License Configuration**. This is required due to call center functionality that performs various validations based on the delivery address configured at the sales order line level.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure call center delivery modes and charges

2/18/2021 • 9 minutes to read • [Edit Online](#)

When a sales order is placed in Dynamics 365 Commerce, if the person who entered the sales order is linked to a call center channel, logic and rules are used to validate the mode of delivery (delivery mode) and calculate charges for the order.

When you create a sales order, you can select a delivery mode on the sales order header and the sales order lines. By default, the delivery mode that you select on the header is used for all sales order lines. However, you can override the default delivery mode on individual sales lines as you require. You can also define a delivery mode on a customer record. Then, when orders are created for the customer, that delivery mode is used by default on the sales order header.

Commerce has capabilities that let users limit the delivery modes that can be used by a channel, the delivery modes that can be used for a product, and the delivery modes that are valid for specific shipping destinations. Charges can also be defined so that additional fees are added to a customer's order, based on the delivery modes that are selected for the sales order and the total order value.

## Define delivery modes

Before you specify which delivery modes can be used for call center orders, and define the associated rules and charges, you must define the delivery modes. Go to **Sales and marketing > Setup > Distribution > Modes of delivery**. Select **New** to create a new delivery mode. Alternatively, select an existing delivery mode in the list, and then select **Edit** to make changes.

In the **Mode of delivery** field, you can enter any combination alphanumeric characters, based on your business requirement. You can then use the **Description** field to provide additional context. The **Charges group** and **Expedite** fields are optional and will be explained in more detail later in this topic.

On the **Commerce channels** FastTab, add any channel that should be allowed to use the delivery mode when sales transactions are created in that channel.

On the **Products** FastTab, you can specify which products and/or product categories the delivery mode can and can't be used for. For example, if a product can't be shipped by air because of hazardous material (hazmat) restrictions, make sure that the product or product category is excluded from all delivery modes that involve air transportation.

On the **Addresses** FastTab, you can specify which countries or regions, or states, the delivery mode can and can't be used for. For example, orders that are shipped to Hawaii or Alaska aren't eligible for ground delivery. Therefore, these states should be excluded from any delivery mode that is associated with a ground delivery service but included in any delivery mode that is associated with an air delivery service.

## Validate delivery modes for a call center order

After the delivery modes are defined, you must run the **Process delivery modes** batch job. This job makes the delivery modes available so that they can be used in sales order processes for channels. To run the **Process delivery modes** job, go to **Retail and Commerce > Retail and Commerce IT > Process delivery modes**. This job should be run any time that new delivery modes are added to a channel or changes are made to existing delivery mode/channel relationships.

After you run the **Process delivery modes** batch job, you can go to **Retail and Commerce > Channels > Call centers > All call centers**. On the **All call centers** page, on the Action Pane, on the **Set up** tab, select

**Modes of delivery.** The **Modes of delivery** page lists all the valid delivery modes for the selected call center channel. To edit existing delivery modes or add new delivery modes, select **Manage modes of delivery**. Note that the **Process delivery modes** job must be run whenever changes are made.

## Define charges for delivery services

When sales orders are created for customers, a company might want to add charges that are automatically calculated based on the delivery modes that are selected for the order. These charges can be configured so that they are the same for all customers and delivery modes. Alternatively, the charges can vary, depending on the customer and/or the delivery modes that are selected for the sales order.

To define the charges, go to **Retail and Commerce > Channel setup > Charges > Auto charges**. Select **New** to add new charges. Alternatively, select an existing entry, and then select **Edit**.

Charges can be defined so that they are calculated at the level of either the order header or the order lines. Use the **Level** field to select the level desired.

Charges can be defined for a specific customer, a group of customers, or all customers. In the **Account code** field, select **Table** to define charges that are applied only to a specific customer. Select **Group** to define charges for a specific customer group. Select **All** to apply the charges to every customer who places a sales order that uses the related delivery mode. If you selected **Table** or **Group** in the **Account code** field, select the customer or customer group in the **Account relation** field.

Charges can be configured so that they are applied for a specific delivery mode, a delivery mode group, or all delivery modes. If you select **Table** in the **Mode of delivery code** field, you must select a specific delivery mode in the **Mode of delivery relation** field. If you select **Group**, you must select a delivery mode group in the **Mode of delivery relation** field. Delivery mode groups are defined at **Retail and Commerce > Channel setup > Charges > Delivery charges group**. They can then be linked to one or more delivery modes on the **Modes of delivery** page. If you select a group when you define charges, any delivery mode that is linked to the selected delivery group uses those charges. Finally, if you select **All** in the **Mode of delivery code** field, all delivery modes use the charges. Therefore, you don't select a value in the **Mode of delivery relation** field.

In the **Lines** section, you can define one or more charges by currency, as you require. Charges must be linked to a charges code that defines the financial posting rules for the charge. The **Category** field is used to define how charges are calculated. For example, if customers should be charged a flat rate of \$9.95 to have an order shipped by a specific delivery mode, use the **Fixed** category. If the business decides to charge customers a percentage of the order total to cover the delivery charges, use the **Percent** category. The actual charge to the customers is defined in the **Charges value** field.

Companies often configure tiered charges. In this case, the amount that customers pay for delivery is based on the order value. To configure tiered charges, enter values in the **From amount** and **To amount** fields in addition to defining the charge itself in the **Charges value** field. For example, for orders that have a value that is less than \$50, a retailer charges \$5.95 for ground shipping. For orders that have a value that is equal to or more than \$50, but less than \$100, the retailer charges \$7.95. Finally, for orders that have a value that is equal to or more than \$100, the retailer provides free shipping. The following illustration shows the configuration of these charges.

Auto charges

Account code: All | Account relation: | Mode of delivery code: Table | Mode of delivery relation: 20

Lines

+ Add | Remove

✓	Currency	Charges code	Category	Charges value	Charges currenc...	From amount	To amount	Sales tax group	Keep
	USD	FREIGHT	Fixed	5.95	USD	0.01	49.99		<input type="checkbox"/>
	USD	FREIGHT	Fixed	7.95	USD	50.00	99.99		<input type="checkbox"/>
	USD	FREIGHT	Fixed	0.00	USD	100.00	9,999,999.00		<input type="checkbox"/>

You can use a mixture of categories for charges, depending on your business requirements. For example, for all orders that have a value that is less than \$100, there is a fixed charge of \$9.95 for shipping. Then, for orders that have a value that is equal to or more than \$100, delivery charges are calculated at a rate of 5 percent of the order value. The following illustration shows the configuration of these charges.

Auto charges

Account code: All | Account relation: | Mode of delivery code: Table | Mode of delivery relation: 20

Lines

+ Add | Remove

✓	Currency	Charges code	Category	Charges value	Charges currenc...	From amount	To amount	Sales tax group	Keep
	USD	FREIGHT	Fixed	9.95	USD	0.01	99.99		<input type="checkbox"/>
	USD	FREIGHT	Percent	5.00	USD	100.00	999,999.00		<input type="checkbox"/>

## Apply delivery modes during order entry in a call center

When a new sales order is created, a value must be specified in the **Mode of delivery** field on the **Delivery** FastTab of the sales order header. This field might be filled in automatically, based on default values from the customer record.

The delivery mode that is defined on the order header is automatically copied to the sales order lines as they are created. However, you can change the delivery mode setup for a specific line item on the **Delivery** tab in the **Line details** section of the sales order entry page.

If the selected delivery mode isn't valid for the product or the delivery address that is defined for the order or order line, you receive an error message. You must then select a delivery mode that has been defined to support that product or address configuration.

## Calculation of delivery charges during entry of order

If the **Enable order completion** setting is turned on for your call center channel, shipping charges are automatically calculated for sales orders when users select **Complete**. The following message appears at the top of the **Sales order summary** page: "Tiered charges calculated." The charges that are calculated are added to the value of the **Sales total** field. On the **Amount** FastTab, the **Charges** field shows the total amount of all charges that have been calculated for the order and lines. To see a more detailed breakdown of the charges, select **Order** on the **Sales order summary** page, and then select the **Charges** option to view, add, or edit the charges. Note that the calculation of delivery charges on the order header is based on the delivery mode that is linked to the header. Line-level delivery charges are calculated based on the delivery mode that is configured for the sales line. If multiple delivery modes are used on different lines, multiple charges might be applied and added together. The total amount is then shown in the **Charges** field on the **Sales order summary** page.

If the **Enable order completion** setting is turned off, users must manually trigger the calculation of charges. On the **Sales order** page, on the Action Pane, on the **Sell** tab, in the **Calculate** group, select **Tiered charges**.

The "Tiered charges calculated" message appears. You can then select the **Charges** option on the **Sell** tab to view, edit, or delete the calculated charges.

## Use expedited delivery modes on call center orders

You can optionally link an expedite code to any delivery mode that you configure. This code is used as a prioritization sorting and reporting tool. It doesn't currently cause additional fees to be applied to the order. To set up expedite codes, go to **Sales and marketing > Setup > Distribution > Expedite codes**.

For example, for orders that will be shipped by next-day air, picking must be done in the warehouse by 1 PM every day. In this case, an expedite code can be created, and that code can be linked to any next-day delivery mode that is configured in the system. When the warehouse creates its pick wave, the appropriate expedite code in the **Expedite** field can be used as a filter, so that picking is run only for orders that have delivery modes that are linked to that code.

Additionally, when a call center order is entered, an expedite code can be manually applied either to the sales order header or to an individual sales order line. Again, the code can be used for sorting or reporting purposes. Sometimes, an order must be handled carefully because of a customer service issue. In this case, a specific expedite code can be applied to the order header or lines to help identify and prioritize the order during the fulfillment process.

# Set up and work with call center fraud alerts

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to set up criteria and rules to put potentially fraudulent sales orders on hold for further review. The fraud check feature is used to determine the validity of the information in a sales order. If the information in the sales order appears to be questionable, based on an organization's fraud criteria and rules, the order can be put on hold for further review. In this case, the order can't be released to the warehouse for further processing until the hold has been cleared.

## NOTE

This feature can be used only with sales order processing for the Commerce call center channel.

## Turning on the fraud check feature

To use the fraud check feature, you must set the **Enable order completion** option on the channel to **Yes** when the call center channel is [defined](#). When order completion is turned on, call center users must select **Complete** on the sales order page for all sales orders that are created. The Complete action causes the **Sales order summary** page to open. After users enter the required payment data on the **Sales order summary** page, they select **Submit** to finalize the order. When the order is submitted, the fraud check feature is triggered, and any rules that are active in the system are automatically validated.

Call center users can also manually put sales orders on hold for fraud review before they select **Submit**. To manually put a sales order on hold, on the **Sales order summary** page, select **Hold > Manual fraud hold**. You're then prompted to enter a comment to explain your reason for putting the order on hold. This comment will appear in the [order holds](#) workbench to provide context to the user who reviews orders that are on hold to determine whether the order should be released.

In addition to configuring the **Enable order completion** option on the channel, you must configure the fraud check feature in the Call center parameters. Go to **Retail and Commerce > Channel setup > Call center setup > Call center parameters**. On the **Call center parameters** page, on the **Holds** tab, set the **Fraud check** option to **Yes**.

On the **Holds** tab, you should also define the [hold codes](#) that will be applied to an order that is either manually or automatically put on hold for fraud review. Set the hold codes in the **Manual fraud hold code** and **Fraud hold code** fields. You might find it helpful to create two unique hold codes, so that users who work in the holds workbench can easily filter and distinguish automatic holds from manual holds.

For the fraud check feature to work effectively, you must also set the **Minimum score** field. Every fraud criterion and rule that is defined in the system has a score. When a sales order is checked for fraud matches, if one or more matches are found, the scores are added together to give the order a total fraud score. If the total fraud score for an order exceeds the value of the **Minimum score** field, the order is automatically put on hold. You can optionally use the other score-related fields on the **Holds** tab to define the email score, phone score, ZIP/postal code score, and extended ZIP/postal code score. If you don't specify a score for any of these static fraud criteria when you define them on the **Static fraud data** page, the system will score them by using the default scores that you specify on the **Holds** tab of the **Call center parameters** page.

Finally, use the **Fraud comment type** field to specify the document type that should be used when users enter comments when they manually put an order on hold for fraud review. Most often, this field is set to **Note**.

# Defining fraud criteria and rules

The system references two types of fraud criteria to determine whether an order should be put on hold for fraud review:

- **Static fraud data** uses a specific value, such as a phone number that has been put on a list of blocked numbers or an email address that has been flagged because it's known to have been used for previous fraudulent transactions. To set up static fraud data, go to **Retail and Commerce > Channel setup > Call center setup > Fraud > Static fraud data**. On the **Static fraud data** page, you can add fraud criteria manually or through data import. Scores are attached to the fraudulent information. If the fraud check feature is turned on, every sales order that is entered is compared to the static data. If the data is found in either the customer's billing address or the delivery address that is linked to the order header, or if the data is found in the delivery addresses that are linked to any of the lines on that sales order, the scores of all unique matches are added together and compared to the **Minimum score** value to determine whether the order should be put on hold.
- **Fraud rules** consist of user-defined variables and the conditions that are defined for those variables. To create rules, go to **Retail and Commerce > Channel setup > Call center setup > Fraud > Rules**. Fraud rules let a company configure a more complex rule set that can include **AND** or **OR** statements to evaluate multiple conditions. For example, a user wants all orders for customers who belong to a specific customer group and who ordered a specific product to be put on hold for fraud review. In this case, conditions to validate the customer and products are defined on the **Rules** page, and an **AND** condition is used. An order is then put on hold only if both conditions are true, and if the score value that is assigned to this rule, plus the score value of any other rules that the order matches, causes the order's total fraud score to exceed the **Minimum score** value that is defined on the **Call center parameters** page.

## NOTE

Multiple rules or overly complex rules will affect system performance when sales orders are submitted. The fraud check feature hasn't been optimized to handle a large volume of static fraud data entries and many active rules. Remember that every rule is evaluated when call center users select **Submit** during sales order entry. The rules are evaluated against the sales order header and all order lines. The more rules there are and the more complex the rule statements are, the more time will be required for processing. If there are many line items on an order, and many active rules and static data entries, the automatic process of reviewing and validating all the data and calculating a fraud score can have a severe impact on performance. Organizations that use this feature should always test and confirm that the processing time for order submission is acceptable before they apply any changes to rules or static fraud criteria to the production environment.

# Identifying orders that are on hold for fraud review

When call center users submit a sales order, if the order matches the fraud criteria or rules, and if the score exceeds the minimum, the users receive a warning message that states that the order has been put on hold. Users can close this message, because it's for informational purposes only. Users can optionally communicate this information to the customer. The business should determine the protocol that users follow in this situation.

The order is saved, but the **Do not process** flag is set on it. This flag helps guarantee that the order can't be released to the warehouse. At any time, users can view the setting of the **Do not process** flag for any sales order on the **Detailed status** page. This page can be opened from the **All sales order** and **Customer service** pages. The system also updates the value of the **Detailed status** field for the order to **Fraud hold**.

To view and manage the orders that are on hold for fraud review, go to **Retail and Commerce > Customers > Order holds**. On the **Order holds** page, select an entry in the list, and then click **Order hold** to see a more detailed view that includes information about the reason for the hold. On the **Fraud details** FastTab, you can view the systematic fraud criteria that were found to be a match for the order and the scores that were applied. If the order was put on manual hold, you can review any comments that were entered by the user who put the

order on hold by looking at the **Fraud notes** section on the **Notes** FastTab.

For more information about how to work with hold orders, see [Order holds](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Add a channel to an organizational hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add a channel to an organizational hierarchy in Microsoft Dynamics 365 Commerce.

## Overview

Channels need to be associated with one or more organizational hierarchies. Before creating channels, you need to confirm that your organizational hierarchies have been set up.

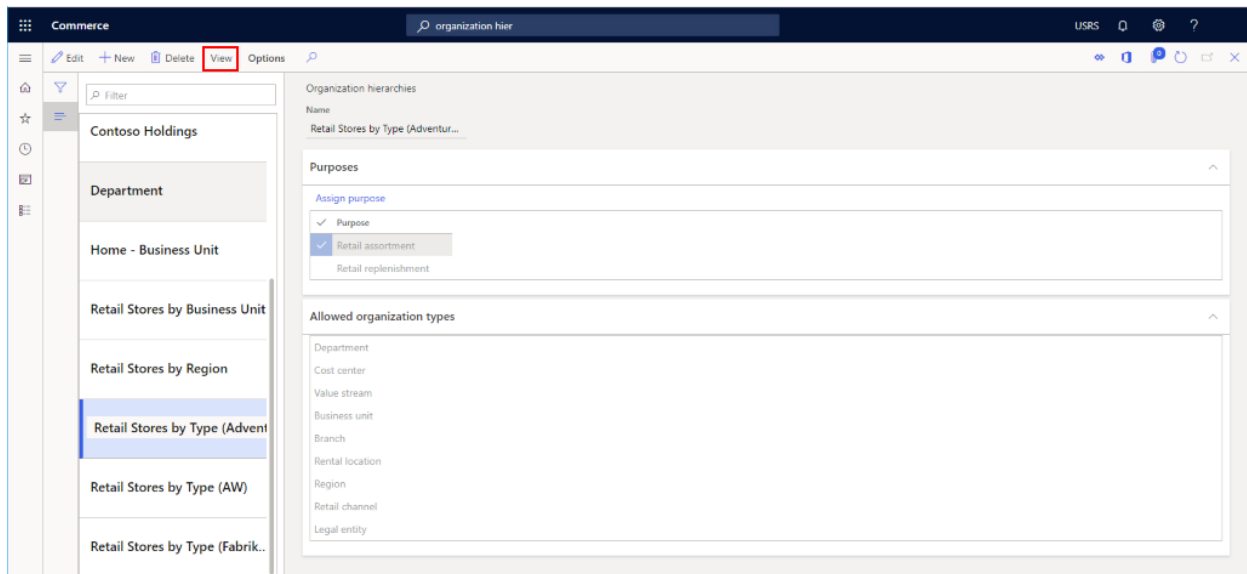

See [Organizational hierarchies](#) for more details on how to create organizational hierarchies.

## Select a hierarchy

To select a hierarchy, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel Setup > Organization hierarchies**.
2. From the list, select the organization hierarchy that you'll be adding the channel to.
3. On the action pane, select **View** to view hierarchy details.

The following image shows organizational hierarchy details for the selected hierarchy.

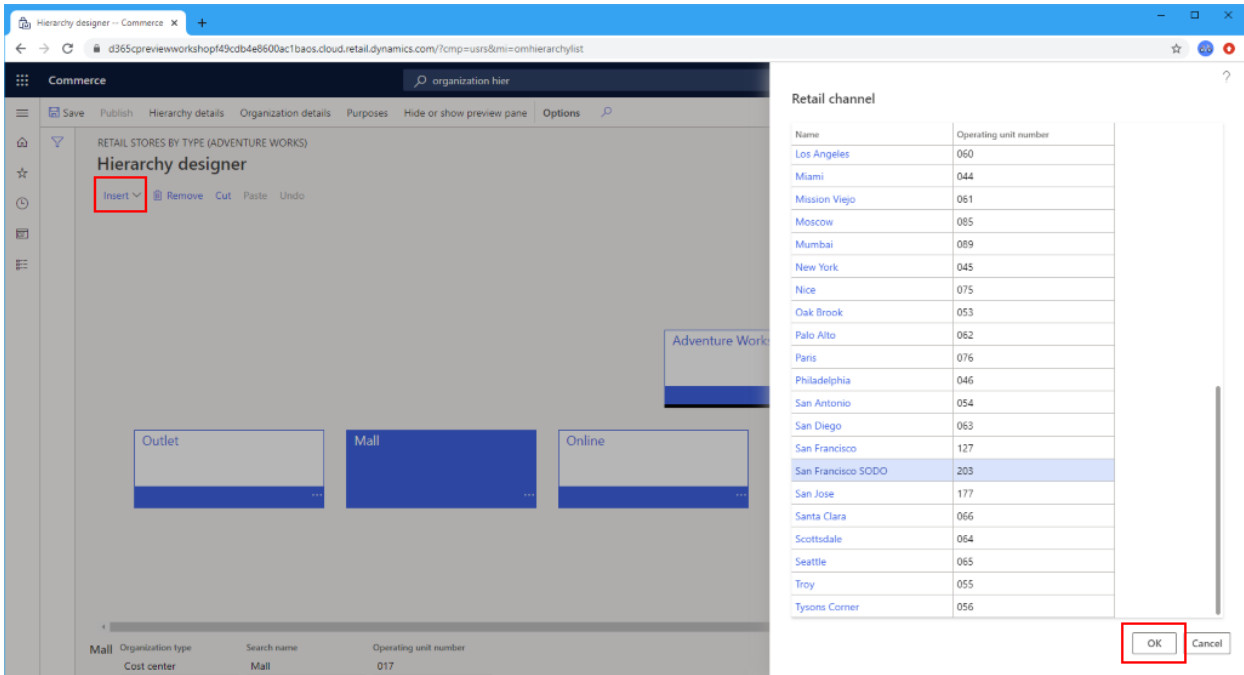

## Add a channel to a hierarchy node

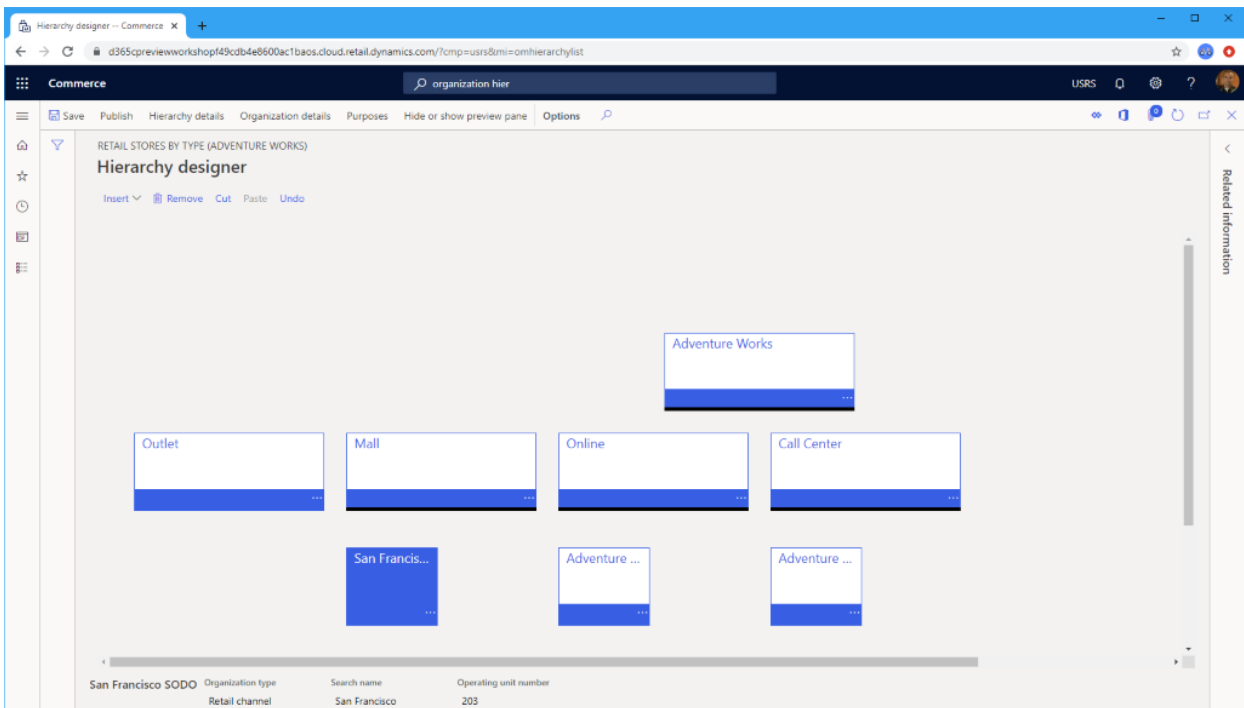

To add a channel to a hierarchy node, follow these steps.

1. On the action pane, select **Edit**.
2. Select the hierarchy node you want the channel added to, then from the **Insert** drop-down list, select **Retail Channel**.
3. Select the channel to add, then select the **OK** button.
4. On the action pane, select **Save**.
5. On the action pane, select **Publish** and provide an **Effective date** in the past to have this action go into effect immediately.

The following image shows how to select a channel to add to a hierarchy node.

The following image shows a hierarchy with various channels added.

## Additional resources

# Omni-channel advanced auto charges

2/18/2021 • 17 minutes to read • [Edit Online](#)

This topic provides information on configuration and deployment of the advanced auto charges features that are available in Dynamics 365 for Retail version 10.0.

When the advanced auto charges features are enabled, orders created in any supported Commerce channel (point of sale (POS), call center, and online), can take advantage of the [auto charges](#) configurations defined in the ERP application for both header and line-level related charges.

In releases prior to Retail version 10.0, [auto charge](#) configurations are only accessible by orders created in e-Commerce and call center channels. In versions 10.0 and later, POS-created orders can leverage the auto charges configurations. That way, additional miscellaneous charges can systematically be added to sales transactions.

When using releases prior to version 10.0, a POS user is prompted to manually enter a shipping fee during the creation of a "ship all" or "ship selected" POS transaction. While the miscellaneous charges capabilities of the application are utilized in respect to how the charges are written to the order, no systematic calculation is provided – the calculation relies on the user's input to determine the value of the charges. The charges can only be added as a single "shipping" related charges code and cannot easily be edited or changed in the POS after they are created.

The use of manual prompts to add shipping charges is still available in versions 10.0 and later. If an organization does not enable the **Advanced Auto-charges** parameter, the POS prompts for manual entry of charges will remain the same.

With the advanced auto charges feature, POS users can have systematic calculations for any defined miscellaneous charges based on auto charges setup tables. In addition, users will have the ability to add or edit an unlimited number of additional charges and fees to any POS sales transaction at the header or line-level (for a cash and carry or customer order).

## Enabling advanced auto charges

On the **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters** page, go to the **Customer orders** tab. On the **Charges** FastTab, set **Use advanced auto-charges** to **Yes**.

The screenshot shows the Dynamics 365 Commerce parameters page. The breadcrumb navigation is: Dynamics 365 > Finance and Operations > Commerce > Headquarters setup > Parameters > Commerce parameters. The page title is "Commerce parameters". The left sidebar contains a navigation menu with categories: General, Posting, Customer orders (selected), Replenishment, Discounts, Number sequences, POS authentication, Channel deployment, Configuration parameters, Workforce management, Electronic documents, and POS search criteria. The main content area is titled "Set up the parameters for customer orders". It is divided into several sections: "Order" (Default order type: Sales order, Default deposit percentage: 100.00, Disposition code: 71, Days quotation expires: 30, Process return orders as sales o...: No, Enable returns for multiple orders: No, MODE OF DELIVERY: Pickup mode of delivery: 40, Carry Out mode of delivery: 30, Electronic mode of delivery: 12), "Charges" (Cancellation charge percentage: 5.00, Shipping charge code: FREIGHT, Cancellation charge code: Cancel, Use advanced auto-charges: Yes), "Payments" (Terms of payment: CreditCard, Method of payment: CRED), and "Refund shipping charges" (Refund shipping charges: Yes, Maximum amount without approval: 0.00).

When advanced auto charges are enabled, users are no longer prompted to manually enter a shipping charge at the POS terminal when creating a ship-all or ship-selected customer order. POS order charges are systematically calculated and added to the POS transaction (if a corresponding auto charges table that matches the criterion of

the order being created are found). Users can also add or maintain header or line-level charges manually through newly added POS operations that can be added to the POS screen layouts.

When advanced auto charges are enabled, the existing **Commerce parameters** for **Shipping charges code** and **Refund shipping charges** are no longer utilized. These parameters are only applicable if the **Use advanced auto charges** parameter is set to **No**.

Before you enable this feature, ensure that you have tested and trained your employees, as the enabled feature will change the business process flow of how shipping or other charges are calculated and added to POS sales orders. Make sure that you understand the impact of the process flow to the creation of transactions from POS. For call center and e-Commerce orders, the impact of enabling advanced auto charges is minimal. Call center and e-Commerce applications will continue to have the same behavior they have had historically related to the auto charges tables to calculate additional order fees. Call center channel users will continue to have the ability to manually edit any system calculated auto charges at the header or line level, or manually add additional miscellaneous charges at the header or line level.

## Additional POS operations

For advanced auto charges to work properly in your POS application environment, new POS operations have been added. These operations must be added to your [POS screen layouts](#) and deployed to the POS devices as you deploy advanced auto charges. If these operations are not added, users will not be able to manage or maintain miscellaneous charges on the POS transactions and will have no way of adjusting or changing the charges values that are systematically calculated based on auto charges configurations. At minimum, it is suggested that you deploy the **Manage charges** operation to your POS layout.

The new operations are as follows.

- **142 - Manage charges** – Use this operation to allow POS users to view and edit miscellaneous charges for the POS transaction that were either added manually or systematically through auto charges calculations.
- **141 - Add header charges** – Use this operation to give the user the ability to manually add a header-level miscellaneous charge to any POS sales transaction (and select the charges code to be used).
- **140 - Add line charges** – Use this operation to give the user the ability to manually add a line level miscellaneous charge to any POS sales transaction line (and select the charges code to be used).
- **143 - Recalculate charges** – Use this operation to perform a full recalculation of the charges for the sales transaction. Any previously user-overwritten auto charges will be recalculated based on the current cart configuration.

As with all POS operations, security configurations can be made to require manager approval in order to execute the operation.

It is important to note that the above listed POS operations can also be added to the POS layout even if the **Use advanced auto-charges** parameter is disabled. In this scenario, organizations will still get added benefits of being able to view manually added charges and edit them using the **Manage charges** operation. Users may also use the **Add header charges** and **Add line charges** operations for POS transactions even when **Use advanced auto-charges** parameter is disabled. The **Recalculate charges** operation has less functionality if used when **Use advanced auto-charges** is disabled. In this scenario, nothing would be recalculated and any charges manually added to the transaction would just reset to \$0.00.

## Use case examples

In this section, sample use cases are presented to help you understand the configuration and usage of auto charges and miscellaneous charges within the context of channel orders. These examples illustrate the behavior of the application when the **Use advanced auto-charges** parameter has been enabled.

### **Auto charges header charges example**

## Use case scenario

A retailer wants to automatically add charges for freight when transactions are created in any Commerce channel that require a shipment of products to the customer. The retailer offers two methods of delivery: Ground and Air. If a customer chooses Ground delivery and the order value is less than \$100, the retailer wants to charge the customer a freight charge of \$10.00. If the order is over \$100 in value and the customer chooses ground shipping, the customer will not be charged any additional freight fees. If the customer chooses the Air method of delivery for all orders, regardless of their total value, will be charged a freight fee of \$20.00.

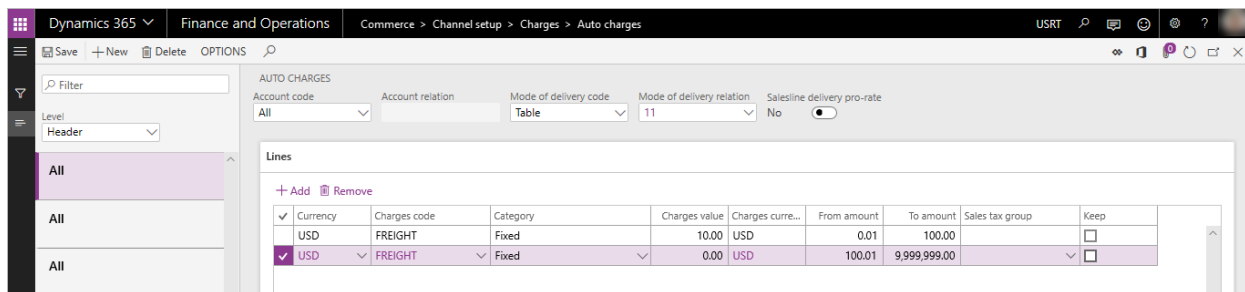

## Setup and configuration

This scenario requires the configuration of two auto charges tables.

Go to **Accounts receivable > Charges setup > Auto charges**.

Configure two different header-level auto charges. Configure one for the "Ground mode" of delivery and one for the "Air mode" of delivery. For this scenario, configure them to be used for "All customers".

For the ground delivery charges, in the lines section of the **Auto-charges** page, define a charge that will be applied for orders between \$.01 and \$100 as \$10.00. Create another charges line to indicate orders over \$100.01 will have no charges.

For the air delivery charges, in the lines section of the auto charges form, define a charge of \$20.00 that will be applied to all orders (between a value of \$.01 to \$9,999,999).

Send the changes to the Commerce Scale Unit/Channel DB so that the POS can utilize them by running the **1040 distribution schedule job**.

## Sales processing for this scenario

After the configuration steps above are complete and the changes have been applied to the channel database, any customer order or sales transaction created in the POS, call center, or e-Commerce channels that have the ground or air delivery methods set at the header level will utilize these charges and automatically apply them to the sale.

At this time, the charges will apply to all sales transactions created within the legal entity that utilize these delivery modes, as there is no functionality to designate that an auto charge configuration will only apply to a specific selling channel.

For POS and e-Commerce scenarios, because there is no clearly defined "header" on these orders, header-level charges will only apply if all sales lines on the transaction are set to ship with the exact same mode of delivery. If there are "mixed-modes" of fulfillment on the transactions created by POS or e-Commerce, only line-level auto charges will be considered and applied.

In call center scenarios, the user has control over the setting of the delivery mode at the order header, therefore header-level charges will apply for these orders even if some of the sales lines have been configured to use a different mode of delivery. Header-level charges for call center orders will always be based on the mode of delivery that is defined at the order header level of the sales order.

## Auto charges line charges example

### Use case scenario

A retailer wants to add an additional charge to the customer for setup fees when the customer purchases a

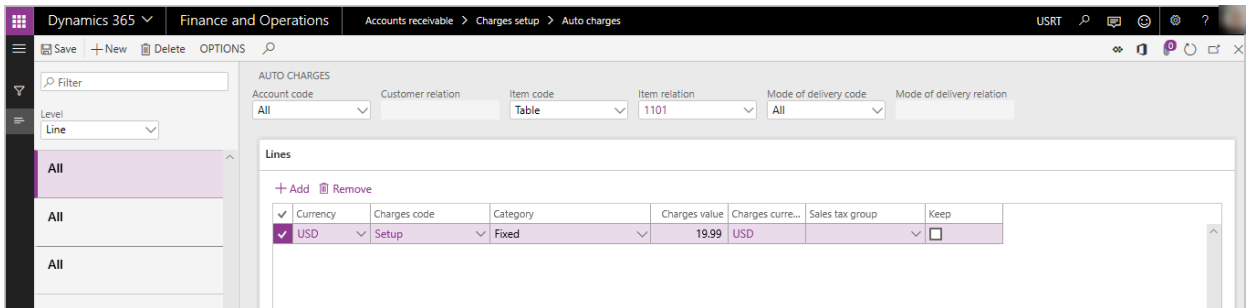

particular model of computer. This computer requires additional non-optional setup actions that the retailer will perform for the customer. The retailer has informed customers that there will be an additional fee for this setup. The retailer prefers to manage the charges related to this fee separately from the product sales price for financial reporting purposes. A setup fee of \$19.99 will be charged to the customer when this specific computer is purchased in any channel.

### Setup and configuration

This scenario requires the configuration of one line-level auto charges table.

Go to **Accounts Receivable > Charges setup > Auto charges**.

Set the **Level** drop-down menu to **Line**, and create a new auto charges record for all customers and for the specific product or product group where the setup fees will be charged.

Send the charges to the Commerce Scale Unit/Channel DB so that the POS can utilize them by running the **1040 distribution schedule job**.

### Sales processing for this scenario

After the configurations steps above are complete and the changes have been applied to the channel database, any customer order or sales transaction created in the POS, call center, or e-Commerce channels that have this item on the order will trigger a line-level charge to be systematically added to the order total.

At this time the charges will apply to any sales line that matches the configuration of the line-level auto charges within the legal entity, as there is no functionality to configure a line-level auto charge to apply only to a specific selling channel.

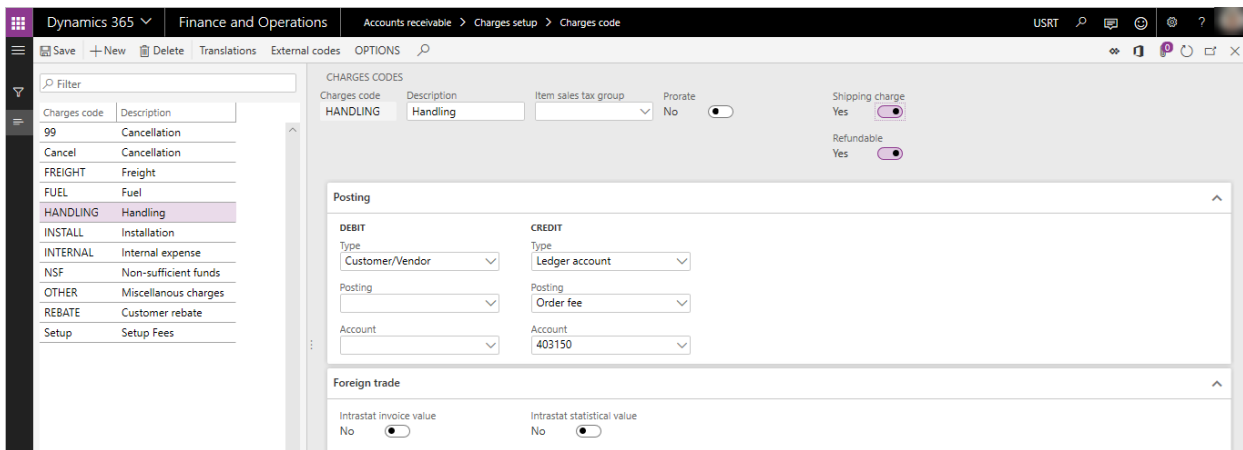

### Manual header charges example

#### Use case scenario description

A retailer is making an exception to typical processes by offering to provide a special home delivery of products to customers who order products in the store. The retailer and the customer have agreed that the customer will pay an additional \$25 handling fee for this service. The order-taker needs to add this additional fee to the transaction. Because the fee is a blanket fee and not related to any single product on the order, a header charge will be utilized.

### Setup and configuration

Ensure the charges code that will be used in this scenario has been properly configured by going to **Accounts Receivable > Charges setup > Charges** to define an appropriate charges code for the scenario.

If the charge should be considered a "shipping" related charge for the purpose of shipping related discounts or promotions, set **Shipping charge** on the charges code to **Yes**. If this charge is also allowed to be systematically refunded during the processing of a return transaction in the POS application, set **Refundable** to **Yes**. The **Refundable** flag is only applicable when the **Use advanced auto-charges** parameter is set to **Yes**.

Send the charges to the Commerce Scale Unit/Channel DB so that the POS can utilize them by running the **1040 distribution schedule job**.

The **Add header charge** operation must be configured in your [POS screen layout](#) so that a button that is accessible to the user from POS can call this operation (operation 141). The screen layout changes must be distributed to the channel as well through the distribution schedule function.

#### Sales processing of manual header charges

To execute the scenario in the POS application, the POS user will create the sales transaction as usual, adding the products and any other configurations to the sale. Prior to collecting payment, the user should execute the **Add header charge** operation, which will prompt the user to select a charges code and enter the charges value. Once the user completes the process, the charge will be added to the sales order as a header-level charge.

This process can be applied in the call center by using the existing **Charges** feature found on the **Sell** tab on the toolbar. On the **Maintain charges** page, the user can add a new charges line to the order header.

#### Manual line charges example

##### Use case scenario

A customer has requested that two of the five items on their sales order be gift-wrapped. The retailer offers this optional service for a fee of \$2.00 per item. The order-taker will need to add these fees to the specific items that need to be gift-wrapped.

##### Setup and configuration

Ensure the charges code that will be used in this scenario has been properly configured by going to **Accounts Receivable > Charges setup > Charges** to define an appropriate charges code for the scenario.

If the charge should be considered a "shipping" related charge for the purpose of shipping related discounts or promotions, set the **Shipping charge** on the charges code to **Yes**. If the charge is also allowed to be systematically refunded during the processing of a return transaction in the POS application, set **Refundable** to **Yes**. The **Refundable** flag is only applicable when the **Use advanced auto-charges** parameter is set to **Yes**.

Send the charges to the Commerce Scale Unit/Channel DB so that the POS can utilize them by running the **1040 distribution schedule job**.

The **Add line charge** operation must be configured in your [POS screen layout](#) so that a button that is accessible to the user from POS can call this operation (operation 140). The screen layout changes must be distributed to the channel as well through the distribution schedule function.

##### Sales processing of the manual line charge

To execute the scenario in the POS application, the POS user will create the sales transaction as usual, adding the

products and any other configurations to the sale. Prior to collecting payment, the user should select the specific line where the charge will apply from the POS item list display and execute the **Add line charge** operation. The user will be prompted to select a charges code and enter the charges value. Once the user completes the process, the charge will be linked to the line and added to the order total as a line level charge. The user can repeat the process to add additional line charges to other items lines on the transaction if needed.

The same process can be applied in the call center by using the "maintain charges" feature found under the **Financials** drop-down menu in the **Sales order lines** section on the **Sales order** page. Selecting this option will open the **Maintain charges** page where the user can add a new line-specific charge to the transaction.

## Additional features

### Editing charges on a POS sales transaction

The **Manage charges** operation (142) should be added to the **POS screen layout** so that a user can view and edit or override any system-calculated or manually created header or line-level charges. If the operation is not added, users will not be able to adjust the value of the charges on the POS transaction, nor will they be able to view the details of the charges such as the type of charges code tied to the charge.

On the **Manage charges** page in POS, the user can view both header and line-level charges details. The user can use the **Edit** function available on this page to make changes to the amount charged to a specific charges line. Once a charges line is overwritten manually, it will not be systematically recalculated unless the user initiates the **Recalculate charges** operation.

If the **Charge override reason code** has been configured on the **Commerce parameters** setup page, the user will be prompted to provide a reason code when charges have been modified in the POS application.

If reason codes have been captured for overwritten charges, a new report is also available to review and audit these overrides. The report can be found in **Retail and Commerce > Inquiries and reports > Charge override history**.

### Refunding charges on a POS return transaction

If the **Use advanced auto-charges** parameter is set to **Yes**, the existing Commerce parameter for **Refund shipping charges** is no longer applicable. To indicate which charges should be systematically refunded to a customer when using advanced auto charges, ensure the related charges code has been configured as **Refundable** on the **Charges code** setup page. Make sure that the settings have been synchronized to your Commerce channel databases through distribution schedule processing.

### Refunding charges on a return order transaction

Charges are not systematically refunded to **Return orders** created in Commerce. Users are required to select the **Copy charges** option when creating the **Return order**. If **Copy charges** is not selected, charges from the original sales transaction will not be automatically refunded. If **Copy charges** is selected, all charges will be copied to the return order and the user can manually edit or remove any charges they do not want to have refunded. The call center return order process currently does not acknowledge the **Refundable** flag on the **Charges code** setup.

### Configuring POS receipts to show charges

The following receipt elements have been added to the receipt line and footer to support the advanced auto charges functionality.

- **Line Shipping Charges** – This line-level element can be used to recap specific charges codes that have been applied to the sales line. Only charges codes that have been flagged as **Shipping** charges on the **Charges code** page will be displayed here.
- **Line Other Charges** – This line-level element can be used to recap any non-shipping specific charge codes that have been applied to the sales line. These are charges codes where the **Shipping** flag on the **Charges code** page has not been enabled.

- **Order Shipping Charges Details** – This footer-level element displays the descriptions of the charge codes applied to the order that have been flagged as **Shipping** charges on the **Charges code** setup page.
- **Order Shipping Charges** – This footer-level element shows the dollar value of the shipping-related charges.
- **Order Other Charges Details** – This footer-level element displays the description of the charges codes applied to the order that have not been flagged as shipping-related charges.
- **Order Other Charges** – This footer-level element displays the dollar value of the other charges that are not shipping-related.

It is recommended that the organization also add free text fields to the receipt footer, in order to define the areas where charges will be recapped.

### **Preventing charges from being calculated until the POS order is completed**

Some organizations may prefer to wait until the user has finished adding all of the sales lines to the POS transaction before calculating charges. To prevent calculation of charges as items are added to the POS transaction, turn on the **Manual charge calculation** parameter in the **Functionality profile** used by the store. Enabling this parameter will require the POS user to use the **Calculate totals** operation when they have completed adding the products to the POS transaction. The **Calculate totals** operation will then trigger the calculation of any auto charges for the order header or lines as applicable.

### **Charges override reports**

If users manually override the calculated charges or add a manual charge to the transaction, this data will be available for auditing in the **Charge Override History** report. The report can be accessed from **Retail and Commerce > Inquiries and reports > Charge Override History**. It is important to note that the data needed for this report is imported from the channel database into HQ through the "P" distribution schedule jobs. Therefore, information about overrides just performed in the POS may not be immediately available on this report until this job has uploaded the store transaction data into HQ.

# Enable and configure auto charges by channel

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to enable and configure automatic charges (auto charges) by channel in Microsoft Dynamics 365 Commerce.

## Overview

You might have scenarios where recycling fees or other fees must be applied to a group of products that are sold in all or some stores in a specific state (for example, California). The **Enable filter auto charges by channel** feature in Commerce lets you specify auto charges by channel (for example, a specific brick-and-mortar channel). This feature is available in Dynamics 365 Commerce version 10.0.10 and later.

To enable and configure auto charges by channel, you must complete the following tasks:

- Turn on the **Enable filter auto charges by channel** feature.
- Configure the organization hierarchy purpose.
- Define auto charges by channel.

### NOTE

The **Enable filter auto charges by channel** feature works only if the advanced auto charges feature is also turned on. For information about how to turn on the advanced auto charges feature, see [Omni-channel advanced auto charges](#).

## Turn on the Enable filter auto charges by channel feature

To enable auto charges by channel in Commerce, follow these steps.

1. Go to **System administrator > Workspaces > Feature management**.
2. On the **Not enabled** tab, in the **Feature name** list, find and select **Enable filter auto charges by channel**.
3. In the lower-right corner, select **Enable now**. After the feature has been turned on, it will appear in the list on the **All** tab.
4. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
5. In the left pane, find and select the **1110 (Global configuration)** job.
6. On the Action Pane, select **Run now** to propagate the configuration changes.

### WARNING

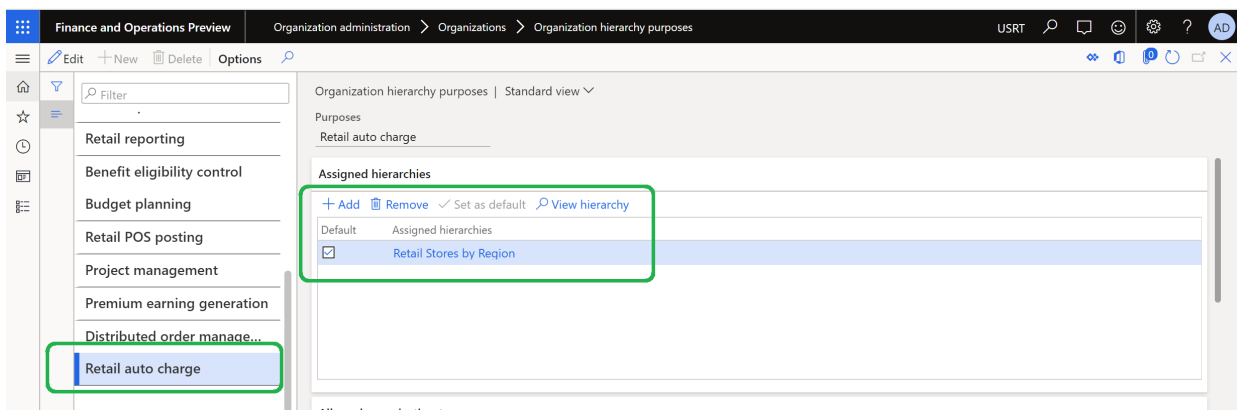

If you turn off the **Enable filter auto charges by channel** feature after you've already used it, the **Retail channel relation** field under **Auto charges** will no longer appear, and you will lose all existing configurations. If removal of the **Retail channel relation** configurations will cause auto charges rules to be duplicated, an attempt to turn off the feature will fail. Before you turn off the feature, be sure to review all auto charges rules and make any required changes.

## Configure the organization hierarchy purpose

A new organization hierarchy purpose that is named **Retail auto charge** has been created to manage the hierarchy for auto charges by channel.

To assign a default hierarchy to an organization hierarchy purpose in Commerce, follow these steps.

1. Go to **Organization administration > Organizations > Organization hierarchy purposes**.
2. In the left pane, select **Retail auto charge**.
3. Under **Assigned hierarchies**, select **Add**.
4. In the **Organization hierarchies** dialog box, select an organization hierarchy (for example, **Retail Stores by Region**), and then select **OK**.
5. Under **Assigned hierarchies**, select **Set as default**.
6. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
7. In the left pane, find and select the **1040 (Products)** job.
8. On the Action Pane, select **Run now**.
9. Repeat the previous two steps to run the **1070 (Channel configuration)** and **1110 (Global configuration)** jobs.

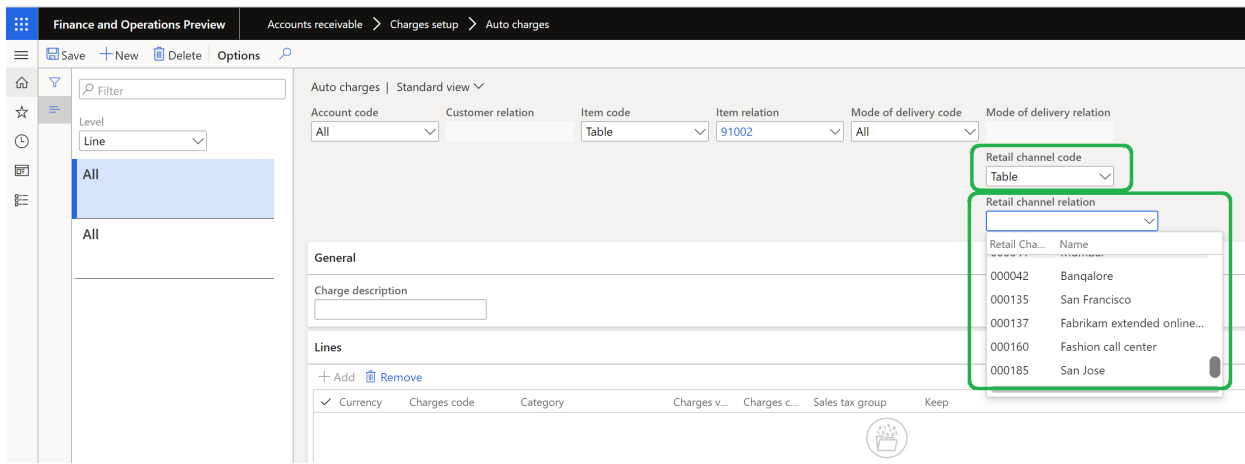

## Define auto charges by channel

After you've turned on the **Enable filter auto charges by channel** feature and configured the **Retail auto charge** organization hierarchy purpose, auto charges by channel can be defined at either the order header level or the order line level.

To define auto charges by channel in Commerce, follow these steps.

1. Go to **Accounts receivable > Charges setup > Auto charges**.
2. In the left pane, in the **Level** field, select either **Header** or **Line**, depending on your business requirements.
3. In the **Retail channel code** field, select the appropriate channel code (for example, **Table** or **Group**). If the default setting, **All**, is used, charge rules are applied to all channels.
  - If you select **Group**, make sure that a retail channel charges group is created at **Retail and Commerce > Channel setup > Charges > Retail channel charge groups**.
  - If you select **Table**, you can select a specific channel (for example, **San Francisco**) in the **Retail channel relation** field.
4. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
5. In the left pane, find and select the **1040 (Products)** job.
6. On the Action Pane, select **Run now**.
7. Repeat the previous two steps to run the **1070 (Channel configuration)** and **1110 (Global configuration)** jobs.

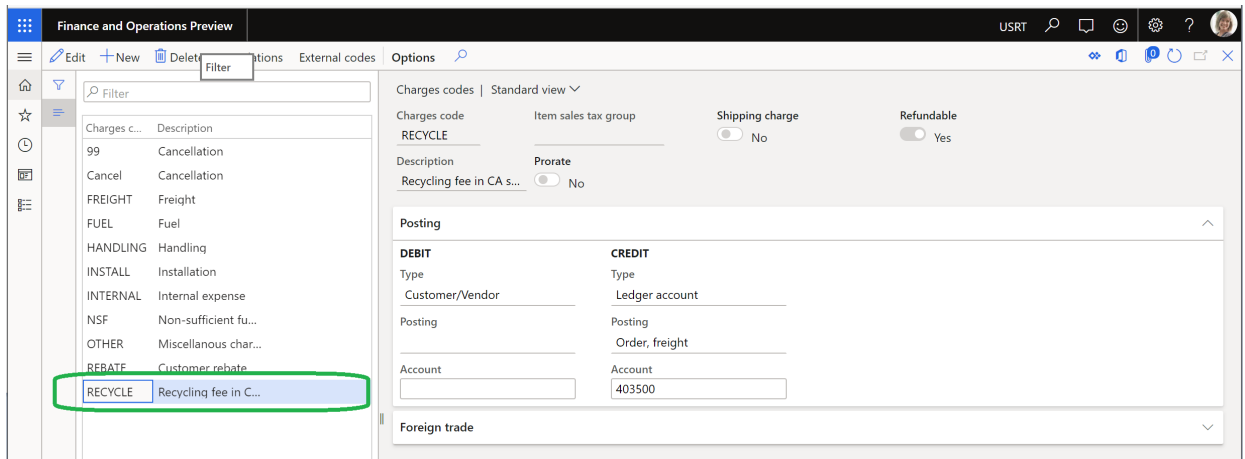

## Example scenario

The following example outlines the steps that are required to configure a product so that recycling fees are charged when the product is sold through a San Francisco brick-and-mortar channel. The example also shows how the auto charges appear in the Commerce point of sale (POS) application.

The organization defines a charges code that is named **RECYCLE**, as shown in the following illustration.

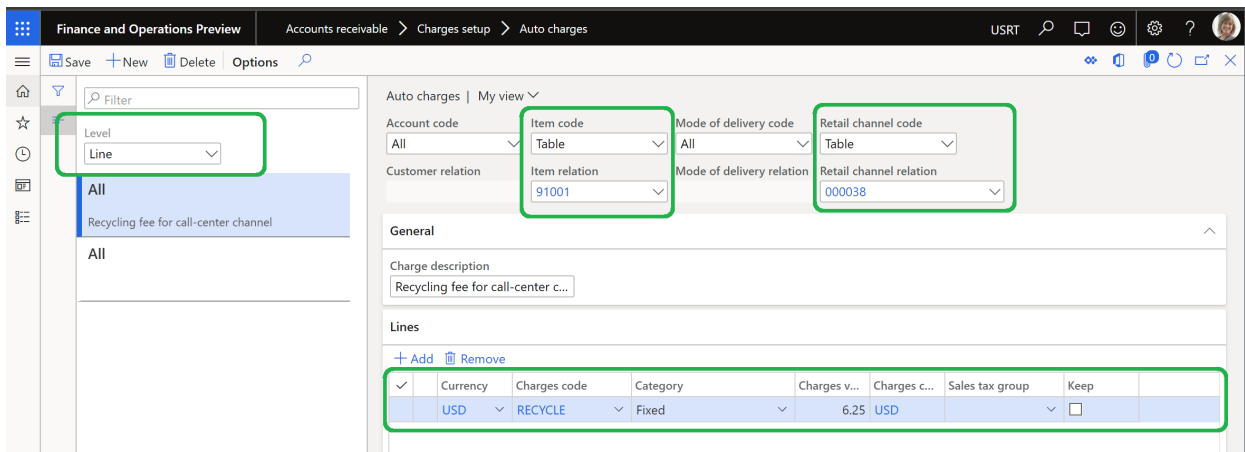

An auto charge is created at the line level. It has the following configuration:

- The **Account code** field is set to **All**.
- The **Item code** field is set to **Table**.
- The **Item relation** field is set to product ID **91001**.
- The **Mode of delivery code** field is set to **All**.
- The **Retail channel code** field is set to **Table**.
- The **Retail channel relation** field is set to the **San Francisco** store.

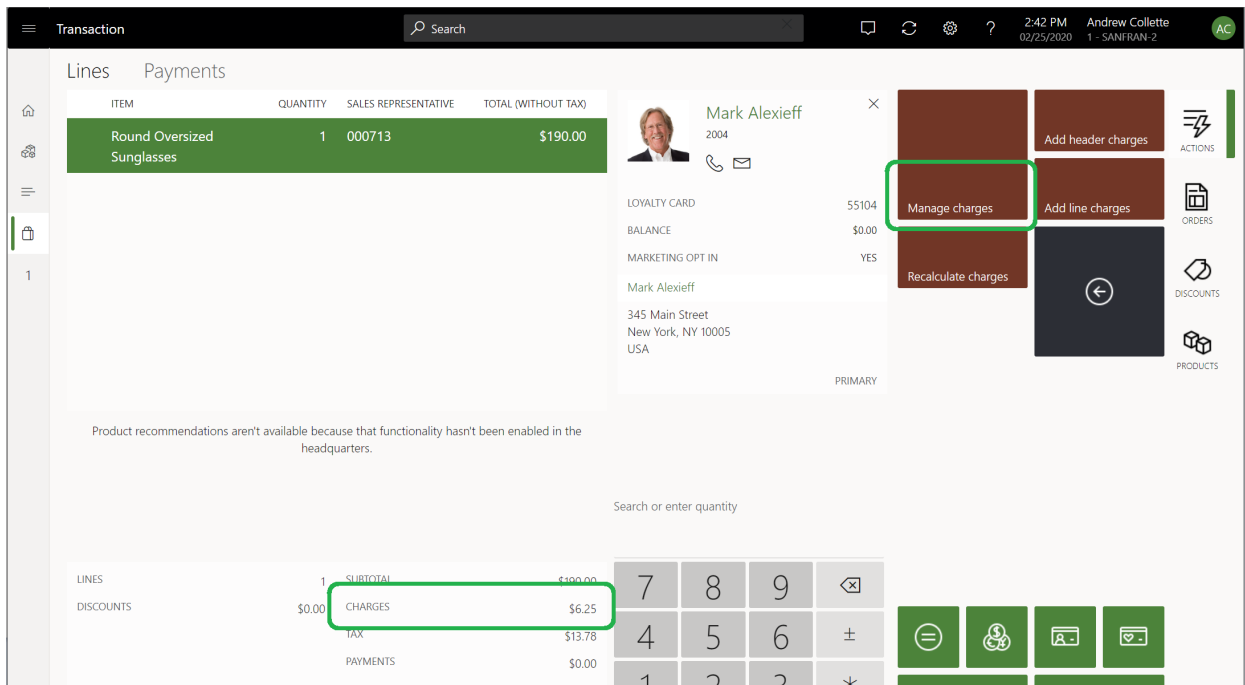

An auto charges line is created. It has the following configuration:

- The **Currency** field is set to **USD**.
- The **Charges code** field is set to **RECYCLE**.
- The **Category** field is set to **Fixed**.
- The **Charges** field is set to **\$6.25**.

In the POS application, a sales order is created in the **San Francisco** store channel. The **Charges** line shows the recycling fee of **\$6.25**.

By selecting **Transaction options > Charges > Manage charges** in the POS application, you can view the charges code and description for the recycling fee.

# Prorate header charges to matching sales lines

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes the functionality for grouping header-level auto-charges and prorating them to commerce sales lines. This functionality is available for transactions that are created at the point of sale (POS) in Retail version 10.0.1 and sales that are created in a call center in Retail version 10.0.2.

This functionality is available only if the [advanced auto-charges](#) feature is turned on by using the option on the **Commerce parameters** page. Additionally, the enhanced calculation method for auto-charges can be applied only to sales orders that are created through commerce channels (the POS, a call center, and the Dynamics e-Commerce platform).

This new functionality gives organizations more flexibility in the way that header-level auto-charges are calculated and applied to sales transactions.

In versions of the app earlier than version 10.0.1, header-level auto-charges that have a specific mode of delivery relation are calculated only when there is a match with the mode of delivery that is defined on the sales order header.

For example, header-level auto-charges are defined for mode of delivery **99** and mode of delivery **11**. A sales order is created, and mode of delivery **99** is defined on the order header. However, some of the sale lines are set up so that they're shipped by using mode of delivery **11**. In this case, only the header-level charges that are linked to mode of delivery **99** are considered and applied to the sales order.

In Commerce, the header-level charges have an additional feature that lets you define a [tiered charge configuration](#) that is based on the order value. For example, if the order value is between \$50.00 and \$200.00, an organization might want to charge a freight charge of \$5.00. However, if the order value is between \$200.01 and \$500.00, the freight charge might be \$4.00.

Some organizations want the benefits of the tiered charge calculation that is provided with header-level charges. However, in scenarios that involve mixed modes of delivery, they also want to make sure that the charges that are calculated are based on a match with the mode of delivery that is defined on each sales line.

You can now configure header-level auto-charges so that all modes of delivery on the order are considered when charges are calculated. This functionality requires a more complex calculation logic to calculate the header-level charges. The logic groups together all the items that are shipped using the same mode of delivery, and it treats that group as the calculation group for the items when it calculates the header-level auto-charges. For items that have the same mode of delivery, auto-charges are calculated based on the combined sales value of the items. In this way, the appropriate auto-charge tier is determined.

After the appropriate header-level charges are obtained for the sales lines that are shipped using the same mode of delivery, the calculated charges are prorated down to the sales line level. Because these charges are at the line level and not kept at the header level, a more specific link is made between the item and the charge value that calculated for it. This behavior can be useful in partial return scenarios, where an organization wants to refund only part of the charge instead of the whole charge when only some items are returned.

## Scenarios

The following two sample scenarios outline how these charges are calculated both when the new functionality is used and when it isn't used.

### Scenario 1

This scenario outlines the behavior when the **Pro-rate to matching sales lines** option is set to **No** in the auto-charge setup. (The behavior is equivalent to the behavior of header-level charges in app versions that are earlier than version 10.0.1.)

In this scenario, the organization has defined header-level charges for mode of delivery relation 99 and mode of delivery relation 11. No auto-charges are configured for mode of delivery 21.

AUTO CHARGES

Account code: All | Customer relation: | Item code: All | Item relation: | Mode of delivery code: Table | Mode of delivery relation: 99 | Pro-rate to matching sales lines: No

Lines

+ Add Remove

✓	Currency	Charges code	Category	Charges value	Charges currenc...	From amount ↑	To amount	Sales tax group	Keep
	USD	FREIGHT	Fixed	10.00	USD	0.01	50.00		<input type="checkbox"/>
	USD	FREIGHT	Fixed	15.00	USD	50.01	250.00		<input type="checkbox"/>
✓	USD	FREIGHT	Fixed	20.00	USD	250.01	99,999.99		<input type="checkbox"/>

AUTO CHARGES

Account code: All | Customer relation: | Item code: All | Item relation: | Mode of delivery code: Table | Mode of delivery relation: 11 | Pro-rate to matching sales lines: No

Lines

+ Add Remove

✓	Currency	Charges code	Category	Charges value	Charges currenc...	From amount	To amount	Sales tax group	Keep
	USD	FREIGHT	Fixed	5.00	USD	0.01	50.00		<input type="checkbox"/>
	USD	FREIGHT	Fixed	7.00	USD	50.01	100.00		<input type="checkbox"/>
	USD	FREIGHT	Fixed	8.00	USD	100.01	250.00		<input type="checkbox"/>
✓	USD	FREIGHT	Fixed	0.00	USD	250.01	9,999,999.00		<input type="checkbox"/>

A sales order is created in the call center, and the mode of delivery is set to 99. This order contains five items. Two order lines have been configured to use mode of delivery 99, two lines have been configured to use mode of delivery 11, and one line has been configured to use mode of delivery 21, as shown in the following table.

ITEM	LINE QUANTITY	DELIVERY MODE	PRICE PER UNIT
81331	1	11	\$10
81332	1	99	\$50
81333	2	11	\$30
81334	3	99	\$10
81334	3	21	\$5

In this scenario, the whole order is evaluated against the auto-charge table for mode of delivery 99. The full total of all sales lines is used to determine a matching tier in the auto-charge configuration, and this charge is applied at the order header level. In this example, the order total is \$165.00, and the \$15.00 freight charge is applied to the order header. Auto-charges that are configured for mode of delivery 11 are never referenced or applied.

In this scenario, if a customer returns some of the items on the order, and if the [charge code has been configured so that it will be refunded](#), the total header-level charge is systematically applied to the refund, even if only some of the items are returned.

## Scenario 2

In this scenario, header-level charges are defined for mode of delivery relation 99 and mode of delivery relation 11. However, the **Pro-rate to matching sales lines** option is set to **Yes** for these auto-charge tables.

AUTO CHARGES									
Account code	Customer relation	Item code	Item relation	Mode of delivery code	Mode of delivery relation	Pro-rate to matching sales lines			
All		All		Table	99	Yes <input checked="" type="checkbox"/>			

Lines									
✓	Currency	Charges code	Category	Charges value	Charges currenc...	From amount ↑	To amount	Sales tax group	Keep
	USD	FREIGHT	Fixed	10.00	USD	0.01	50.00		<input type="checkbox"/>
	USD	FREIGHT	Fixed	15.00	USD	50.01	250.00		<input type="checkbox"/>
✓	USD	FREIGHT	Fixed	20.00	USD	250.01	99,999.99		<input type="checkbox"/>

AUTO CHARGES									
Account code	Customer relation	Item code	Item relation	Mode of delivery code	Mode of delivery relation	Pro-rate to matching sales lines			
All		All		Table	11	Yes <input checked="" type="checkbox"/>			

Lines									
✓	Currency	Charges code	Category	Charges value	Charges currenc...	From amount	To amount	Sales tax group	Keep
	USD	FREIGHT	Fixed	5.00	USD	0.01	50.00		<input type="checkbox"/>
	USD	FREIGHT	Fixed	7.00	USD	50.01	100.00		<input type="checkbox"/>
	USD	FREIGHT	Fixed	8.00	USD	100.01	250.00		<input type="checkbox"/>
✓	USD	FREIGHT	Fixed	0.00	USD	250.01	9,999,999.00		<input type="checkbox"/>

This scenario uses the same sales order that contains five lines. The mode of delivery on the order header is set to 99, but the mode of delivery for each item on the sales order is configured as shown in the following table.

ITEM	LINE QUANTITY	DELIVERY MODE	PRICE PER UNIT
81331	1	11	\$10
81332	1	99	\$50
81333	2	11	\$30
81334	3	99	\$10
81334	3	21	\$5

Because the auto-charge configuration is set to prorate to matching sales lines, the system performs the following calculation steps.

1. All items that have the same mode of delivery are grouped together, and the system calculates the total product value of the items in the group.

#### Delivery mode 11

- Item 81331, quantity 1 = \$10
- Item 81333, quantity 2 = \$60 net (\$30 per unit)
- **Total product value for delivery mode 11 = \$70**

#### Delivery mode 99

- Item 81332, quantity 1 = \$50
- Item 81334, quantity 3 = \$30 net
- **Total product value for delivery mode 99 = \$80**

## Delivery mode 21

- Item 81334, quantity 3 = \$15 net
  - **Total product value for delivery mode 21 = \$15**
2. The system looks for the configuration for header-level auto-charges that matches the customer and mode of delivery settings for each group of items. If the configuration is found, the system looks in the tiered configuration to find the charge that should be applied, based on the total product value of items in the mode of delivery group.

## Delivery mode 11

- Total product value = \$70
- **Charge value = \$7**

## Delivery mode 99

- Total product value = \$80
- **Charge value = \$15**

## Delivery mode 21

- Total product value = \$15
- **Charge value = \$0** (No auto-charges have been configured for this combination of a customer and a mode of delivery.)

AUTO CHARGES									
Account code	Customer relation	Item code	Item relation	Mode of delivery code	Mode of delivery relation	Pro-rate to matching sales lines			
All		All		Table	11	Yes			
Lines									
+ Add - Remove									
✓ Currency	Charges code	Category	Charges value	Charges curre...	From amount	To amount	Sales tax group	Keep	
USD	FREIGHT	Fixed	5.00	USD	0.01	50.00			
USD	FREIGHT	Fixed	7.00	USD	50.01	100.00			
USD	FREIGHT	Fixed	8.00	USD	100.01	250.00			
USD	FREIGHT	Fixed	0.00	USD	250.01	9,999,999.00			

AUTO CHARGES									
Account code	Customer relation	Item code	Item relation	Mode of delivery code	Mode of delivery relation	Pro-rate to matching sales lines			
All		All		Table	99	Yes			
Lines									
+ Add - Remove									
✓ Currency	Charges code	Category	Charges value	Charges curre...	From amou... 1	To amount	Sales tax group	Keep	
USD	FREIGHT	Fixed	10.00	USD	0.01	50.00			
USD	FREIGHT	Fixed	15.00	USD	50.01	250.00			
USD	FREIGHT	Fixed	20.00	USD	250.01	99,999.99			

3. The system calculates the charge value that should be applied to each line, based on proration logic that considers the proportional value of the line in relation to the group's total product value.

## Delivery mode 11

- Charge value = \$7
- Group product value = \$70
- Line 1 value = \$10 (= 14.2857 percent of the group value)
- Line 3 value = \$60 (= 85.7143 percent of the group value)
- **Line charge for line 1 = \$1**
- **Line charge for line 3 = \$6**

## Delivery mode 99

- Charge value = \$15
- Group product value = \$80
- Line 2 value = \$50 (= 62.5 percent of the group value)
- Line 4 value = \$30 (= 37.5 percent of the group value)
- **Line charge for line 2 = \$9.38**

- Line charge for line 4 = \$5.62

#### Delivery mode 21

- Charge value = \$0
- Group product value = \$15
- Line 5 value = \$15 (= 100 percent of the group value)
- Line charge for line 5 = \$0

Therefore, for this example, item 81334 will be assigned a freight charge of \$5.62. You can view these charges on the **Maintain charges** page for the sales line. The following illustration shows what this page looks like for item 81334.

Charges code	Description	Category	Keep	Charges value	Currency	Broker contract...	Sales tax group	Item sales tax group
FREIGHT	Freight	Fixed	<input type="checkbox"/>	5.62	USD	<input type="checkbox"/>	OH	

**LEDGER**

Voucher:

Date:

Amount in transaction currency:

Calculated value:

**INTERCOMPANY**

Company:

Intercompany invoice number:

When this method of calculation is used in a partial return scenario, if the charge code is refundable, only the part of the charge that is allocated to that line will be refunded when the item is returned.

# Set up continuity programs for call centers

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes how to set up a continuity program for a call center.

In a continuity program, which is also known as a recurring order program, customers receive regular product shipments according to a predefined schedule. Each shipment can contain a different product, as in the case of a book-of-the-month club, or the same product can be sent repeatedly. To set up a continuity program, you must complete the following tasks.

1. Set the continuity parameters on the **Call center parameters** page.
2. Create a continuity program that specifies details such as the payment schedule, the timing of the shipments, and whether billing is up front. You must also add a list of products that are included in the continuity program. Each product receives an event ID number that is assigned sequentially, beginning with 1. The event IDs determine the order that products are sent in.
  - If customers receive a different product in each shipment, the products are sent in sequential order, based on their event IDs and beginning with the current event.
  - If customers receive the same product in each shipment, the list contains only one product that has one event ID. The same event occurs repeatedly. You can specify how many times each event is repeated.
3. Create a parent product that represents the continuity program that you created in task 2. If you add this product to a sales order, the **Continuity** page opens. You can then use that page to create the actual continuity order. The parent product doesn't specify the individual products that the customer receives in each shipment.

After you've set up a continuity program as described above, you can create a continuity order for a customer. You might also have to perform the following additional maintenance tasks.

- **Update the current continuity event period** – Set up a batch job that tells the system what the current event period is.
- **Create continuity child orders** – Create child orders from the parent continuity order.
- **Process continuity payments** – Process billing and notifications for payments that are associated with continuity sales orders.
- **Extend continuity lines** (if required) – Extend the number of times that a continuity event can be repeated. The repetition of shipments can then extend beyond the limit that was set in the **Continuity repeat threshold** field in the call center parameters.
- **Perform a continuity update** (if required) – Synchronize changes between the continuity program and the continuity parent sales orders.
- **Close continuity parent lines and orders** – Close continuity orders.

# Define continuity schedules

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic walks through setting up a continuity program (otherwise known as reoccurring orders). This topic uses company USRT in the demo data.

## Create continuity program

1. Go to Retail and Commerce > Continuity > Continuity programs.
2. Click New.
3. In the Schedule ID field, type the continuity schedule ID.
4. In the Order start field, select 'First event'.
  - If a customer places a new order for the continuity program, there are two options for which product will be shipped: 1. First event: the first product in the continuity program will be shipped. 2. Current event: the current product will be shipped. For example. three months into the program, the customer will receive the third in the program.
5. Select 'Yes' to prompt for the order start date.
6. Click Add line.
7. In the Item number field, type the item number for the first product ('0013').
8. Type 'CP'.
9. Enter the date when the first product will be available for order.
10. Click Add line.
11. In the Item number field, type '0014'.
12. In the Date interval code field, clear the value so the field is empty.
  - For this procedure, clear the date interval. You'll set the date as incremental from the start date of the first item.
13. Here you'll enter the interval at which the products are shipped. Type '30'.
  - For a monthly program, you'll enter 30 days for the interval.
14. Click Add line.
15. In the Item number field, type '0015'.
16. Type 'End'.
17. Click Save.

## Assign to continuity item

1. Go to Product information management > Products > Released products.
2. Select item '0016'.
  - For this procedure, you'll select item number 0016. Normally, you'll have created a released product that has additional continuity business logic applied when it's placed on a sales order in call center.
3. In the list, click the link in the selected row.
4. Click Edit.
5. Expand or collapse the Sell section.
6. Here you'll enter the continuity program that this item represents. Type the Schedule ID you created earlier.
  - When this item is sold in a call center, additional business logic is applied from the selected continuity program.
7. Click Save.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create and update store hours

2/18/2021 • 2 minutes to read • [Edit Online](#)

## Overview

From a single place, retailers can create, maintain, and manage the store hours for different stores across geographic regions. The store hours can then be shown on point of sale (POS) terminals. In this way, cashiers can share store hours with customers and better help shoppers who are interested in inventory in other stores. The store hours can also be printed on receipts, in case customers want to return to the store later.

Multiple store hours can be configured across different channels. These channels include brick-and-mortar stores, call centers, mobile devices, and e-Commerce sites.

If a customer has a pickup order for a different store, the cashier can select dates when the pickup will be available in that store. The store lookup will provide a reference to the dates and store times. The cashier can select a date and location, and can also print a pickup receipt that includes the store hours.

This functionality is available in Microsoft Dynamics 365 Retail versions 8.1.2 and later.

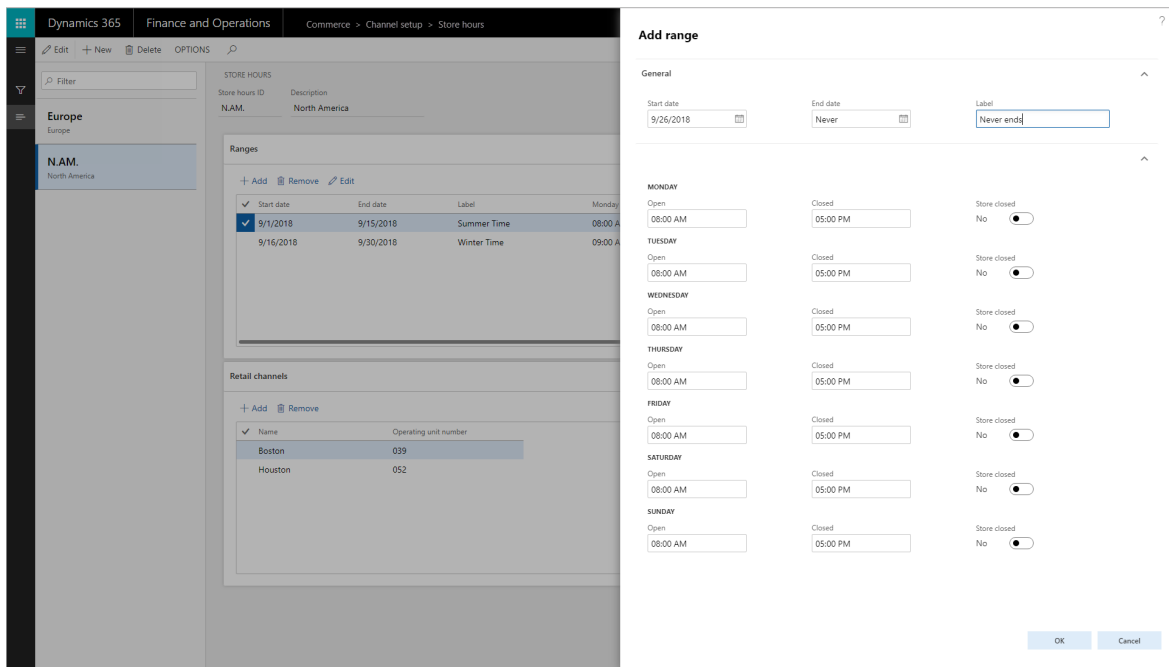

## Configure store hours

Follow these steps to configure store hours.

1. Go to **Retail and Commerce > Channel Setup > Store hours**.
2. Select **New** to create a new store hours template. To use an existing template, select the template in the left pane.
3. In the **Add range** dialog box, define the date range, the store hours, and any holidays that are required.
  - If store hours don't change, select **Never ends** in the **End date** field.
  - If the store hours are for a specific month, week, or day, set the appropriate dates in the **Start Date** and **End date** fields.

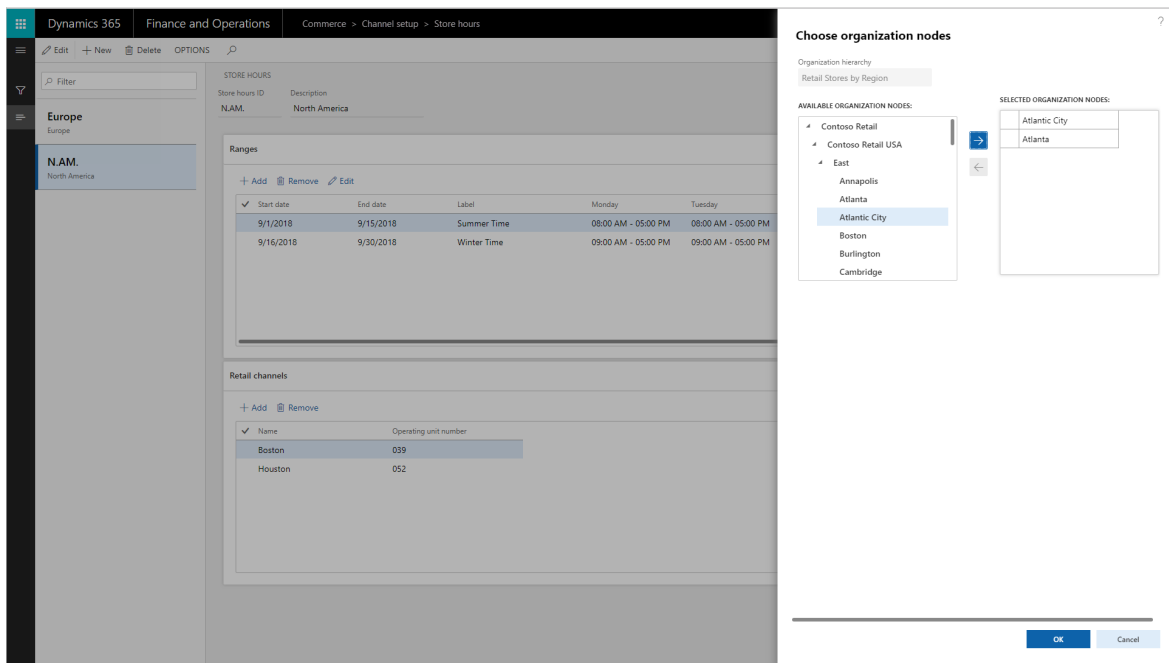

### NOTE

You can create multiple templates that have overlapping start and end dates. Therefore, you can, for example, define store hours for stores in different time zones.

4. Associate the store hours template with the stores where it will be used. In the **Choose organization nodes** dialog box, select the stores, regions, and organizations that the template should be associated with.

- Only one store hours template can be associated with each store.
- Use the arrow buttons to select stores, regions, or organizations. The calendar will be available to the stores or store groups, and it will be visible at the POS for reference.

5. On the **Distribution schedule** page, run the 1070 and 1090 jobs to make the store hours available to the POS.

## Add store hours to printed receipts

Follow these steps to add store hours to the printed POS receipts.

1. Open the receipt designer.
2. Select **Footer** in the lower-left corner.
3. Drag the **Store hours** element from the left pane to the footer at the bottom of the receipt template.
4. You can edit the default label on the **Store hours** element as you require.

5. Save the receipt, and close the receipt designer.
6. On the **Distribution schedule** page, run the **1070** and **1090** jobs.
7. Sign in to the POS.
8. Complete a sale, and select to print a receipt.

POS receipts now include the store hours. If any holidays were included in the template, they are shown on the receipt.

<b>Random Receipt</b>		
Selling Item 1	X 2 Qty	\$3.67
(Random Product Description)		
Selling Item 2	X 2 Qty	\$3.67
(Random Product Description)		
Selling Item 3	X 2 Qty	\$3.67
(Random Product Description)		
Selling Item 4	X 2 Qty	\$3.67
(Random Product Description)		
<b>Total</b>		<b>\$14.68</b>
<b>Discount</b>		<b>\$00.00</b>
<b>Taxes</b>		<b>\$00.00</b>
<b>Store Hours</b>		
Monday - Friday: 8:00 am - 7:00 pm		
Saturday: 10:00 am - 4:00 pm		
Sunday: Closed

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce Scale Unit (self-hosted)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes Commerce Scale Unit (self-hosted) and when to use it.

## Overview

Commerce Scale Unit (self-hosted) is a set of features that supports selling products in a store that has inconsistent internet connectivity to a back office or headquarters (HQ). The Store Scale Unit is designed specifically for in-store operation, and enables cross-terminal transactions and shift operations despite poor internet service. By automatically connecting to the back office, when you do have internet connectivity, your store can seamlessly process credit card transactions, issue gift cards, and sync data with HQ. The Store Scale Unit is available for download in the standard HQ deployment.

## Is Commerce Scale Unit (self-hosted) right for you?

Before you begin setting up Commerce Scale Unit (self-hosted), take a moment determine whether this option is the right fit for your store. Commerce Scale Unit (self-hosted) is a deployment choice intended for retailers with store locations that have slow or intermittent internet connectivity, and who need the flexibility of the Commerce Scale Unit deployed on premises in each store. In scenarios where a stable internet connection is available and there is low latency to the cloud environment, then it is recommended to consider operating the store as Cloud only, without setting up a Commerce Scale Unit. Consider the following before you begin:

- Carefully choose the store topology configuration for each store to either operate with a self-hosted or cloud-hosted Commerce Scale Unit topology. Reconfiguring a live store from a self-hosted to cloud-hosted Commerce Scale Unit or vice versa may cause a service disruption.
- Commerce Scale Unit will support both MPOS and Cloud POS within the store.
- Commerce Scale Unit (self-hosted) can be set up in a one-box deployment topology on a single computer (recommended) or in a multi-box topology on different computers.
- If you choose the one-box option, most of the settings are pre-configured. For a multi-box topology, you will have to manually configure connections between components.
- With Commerce Scale Unit (self-hosted), users can perform cross-terminal scenarios across multiple POS devices, like suspend/recall transactions and shift operations, even with temporary network disruption to HQ.
- With Commerce Scale Unit (self-hosted), users cannot perform any real-time operations such as issuing gift cards, looking up products, or performing credit card transactions, unless there is internet connectivity to HQ or a payment provider. If most of your transactions involve real-time transactions, then you will always need internet connectivity to enable the connection to HQ or payment provider.
- Direct database connectivity from POS to the channel database is not supported in the Commerce Scale Unit. The POS devices always use the Commerce Scale Unit for performing operations.

### NOTE

It is critical to note that Commerce Scale Unit (self-hosted) does not replace offline. Currently, Retail Modern POS with an offline database is the only way to have offline capabilities.

## Get started with Commerce Scale Unit (self-hosted)

To get started, review the following topic on configuring the Commerce Scale Unit (self-hosted), [Configure and](#)

[install Commerce Scale Unit \(self-hosted\)](#).

## Additional resources

[Configure and install Commerce Scale Unit \(self-hosted\)](#)

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure and work with call center order holds

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes the order hold features that Dynamics 365 Commerce has for call center orders.

## Configuring call center order holds

To use the call center order hold features, you must first define hold codes. To create a set of user-defined hold codes, based on your business requirements, go to **Sales and marketing > Setup > Sales orders > Order hold codes**. You can optionally flag one of the hold codes as the default hold code by setting the **Default for sales order** option to **Yes** for it. This hold code will be used any time that a sales order is put on hold. If a sales order has reserved inventory, and the reservations must be automatically removed if the order is put on hold for a particular reason, set the **Remove inventory reservations** option to **Yes** for the reason codes.

To specify the type of note that will be captured when users who put a sales order on hold enter optional notes, go to **Accounts receivable > Setup > Accounts receivable parameters**, and then, on the **Sales setup** FastTab, on the **General** tab, set the **Note type** field. Use the **On Hold sales order status** field to define the color that will be used to highlight sales orders that are on hold when they are viewed on the **Customer service** page.

To create an optional set of hold reason codes, go to **Retail and Commerce > Channel setup > Info codes**. These info codes can be used as a secondary reason code to further define the main hold code. Select **New** to create a reason code set, and then select **Subcodes** to define the list of additional reasons. To link any info codes that you define to the call center channel, go to **Retail and Commerce > Channels > Call centers > All call centers**. On the **General** FastTab, set the **Hold code** field.

## Putting orders on hold

Orders that call center users create in the back-office Commerce program can be manually put on hold manually or automatically in specific situations.

During order entry, but before order submission and confirmation, call center users might want to manually put an order on hold to prevent it from being released to the warehouse for further processing. For example, the customer who is placing the order might not be ready to commit to it, or critical data that is required in order to process the order might be missing.

On the order entry page, the call center user can put an order on hold by using the **Order holds** option on the **Sales order** tab of the order entry menu. Alternatively, the user can select the **Hold** menu item on the **Sales order summary** page that appears when he or she selects **Complete** on a call center sales order.

In both cases, the **Order holds** page appears. The user can then select **New** to create a hold for the order. In the **Hold code** field, the user should select the code that best describes the reason for the hold. In the **Reason code** field, the user can optionally select an additional code to provide a second level of description of the hold.

On the **Notes** FastTab, in the **Hold Notes** field, the user can enter additional, free-form notes to provide additional context or information about the hold. These notes can help other users who review or work with the hold order later.

After the hold information is entered and saved, the user can close the **Order holds** page. The user is then returned to the sales order entry page. If no further actions are required on the sales order, the user can close the sales order entry page.

If the **Enable order completion** flag is turned on in the call center channel, payment doesn't have to be applied to an order that is put on hold. By contrast, for a sales order that isn't put on hold, users can't leave the sales order entry page until payment is applied. Of course, payment will be required before the order hold is released.

Additionally, call center users can put a manual fraud hold on orders that are suspicious for some reason. Orders can also be put on hold automatically when they match active fraud criteria and rules. For more information on about this type of order hold, see [Set up fraud alerts](#).

## Viewing and managing orders that are on hold

### Viewing hold information for a single sales order

On the **Customer service** page, users can visually identify orders that are on hold, because the order lines are highlighted in a specific color. This color is defined by the **On Hold sales order status** field on the **Accounts receivable parameters** page.

#### NOTE

If the line is selected on the page, the highlight color isn't visible.

Users can also view detailed status information for a sales order to learn whether the order is on hold. The detailed status information can be accessed from the **All sales orders** or **Customer service** page. If an order is on hold, the **Do not process** flag is set for it, and the **Detailed status** field shows a status of either **On Hold** or **Fraud Hold**, depending on the scenario.

To view the details of an individual order hold, users can open a detailed view of the **Order hold** page from the **Customer service** page, by using the **Options** menu for the selected order. Users can also access this view from the **All sales order** page, by selecting the **Order holds** menu item on the **Sales order** tab.

### Viewing all orders that are on hold

To view all orders that have been put on manual or automatic hold, go to **Retail and Commerce > Customers > Order holds**.

The **Order holds** workbench provides a list view of all orders that are on hold because of manual or fraud-related hold actions. By taking advantage of the standard filtering and sorting options on the page, users can create views that let them work with or manage specific hold codes that they are responsible for reviewing. The **Order holds** workbench also indicates the number of days that an order has been on hold. This information can help users prioritize the queue.

To get a more detailed view of the orders that are on hold, users can click the **Order hold** option on the menu. This view provides information about the customer, any notes that have been applied to the order, customer, or hold action. The view also provides details about the reason for an automatic hold, if the order was put on hold because it matched a fraud rule.

From both the list view and the detailed view of the **Order holds** page, users can view or edit additional order-related information, such as payments, totals, and notes.

The options on the **Hold checkout** tab might be useful if multiple users in your company work on the hold queue at the same time. By selecting the **Check out** option, users can indicate that they are working to review and investigate the order hold. In this way, other users don't waste time by trying to do the same work. From the detailed view of the **Order holds** page, users can view information about the checkout date and time, and the user who checked out the hold record.

After a hold record is checked out, only the user who checked it out can clear the checkout. This restriction is intended to prevent users from taking records that other users are already working on. To release an order back to the queue so that other users can work on it, the user who checked out the record selects the **Clear**

checkout option.

#### NOTE

The hold isn't released when the checkout is cleared.

In some situations, such as when a user is out sick or has left the company, records that are checked out to that user might have to be reassigned to another user. A manager can reassign records by using the **Override checkout** option.

## Releasing orders that are on hold

In both the list view and the detailed view of the **Order holds** page, the **Clear hold** tab contains the options that are used to release an order hold. Use the **Clear holds** option to release an order from the selected hold code.

Call center orders require payment. Therefore, a hold can't be fully cleared if payment hasn't been applied to the order. On the **Call center parameters** page, on the **Holds** tab, make sure that the **Submit when cleared** parameter is turned on. This setting helps guarantee that a cleared hold order goes through the correct order submission logic to validate and authorize payments. If payments are missing, the user receives an error, and the hold code isn't cleared.

If the **Submit when cleared** parameter hasn't been set, users should select the **Clear and submit** option on the **Clear hold** menu to help guarantee that the order goes through all the required payment validations. If order submission fails when the **Enable order completion** flag is turned on in the call center channel, the order is released from its hold status, but the **Do not process** flag remains set. Therefore, the order isn't released to the warehouse until correct payments have been applied and validated.

If users want to clear a hold but make additional changes to the order before it's released for further processing, they can select the **Clear and modify** option. This option removes the hold code and opens the sales order details so that users can make additional changes to the order. Users can also apply payment and submit the sales order through payment validation logic when the **Enable order completion** flag is turned on in the call center channel.

## Reporting options

Go to **Retail and Commerce > Inquiries and reports > Call center reports > Order holds report** to run a report about order holds by date range, hold code, or other related criteria.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Payment methods

2/18/2021 • 3 minutes to read • [Edit Online](#)

Each payment type that a retailer accepts must be configured when the system is set up. This article describes the payment types that you can set up and describes the process for setting them up.

Retailers can accept various types of payment in exchange for the products and services that they sell. Although cash is the most common form of payment, retailers can also receive payment in the form of checks, cards, vouchers, and so on. Each payment type that the retailer accepts must be configured in Dynamics 365 Commerce when the system is set up. The following list describes each payment type that can be set up:

- **Cash** – Money in the physical form of currency, such as banknotes and coins. This currency can be either the company currency or the store's local currency.
- **Check** – A negotiable instrument that instructs payment of a specific amount of a specific currency, and that is drawn on a specific bank. A check is typically valid either indefinitely or for six months after the date of issue, unless another period of validity is specified. This period varies, depending on the bank that the check is drawn on. There are various kinds of checks, such as order checks, counter checks, bearer checks, and account payee checks. You can set up checks as a payment method for each store. Checks can be accepted in the currency that is defined at either the company level or the store level. You must set up checks as a payment method before you can accept a check as payment in a store.
- **Currency** – The primary form of payment other than the company's default currency. Coins and paper money are both forms of currency. The currency payment method represents all currency that is used. Before you can use this payment method, you must set up currencies and specify exchange information for the currencies.
- **Card** – All the kinds of cards that are used, such as debit cards and credit cards. It's a good idea to set up one card payment method at the organization level, to represent every kind of card. Then, at the store level, set up a payment method for each card or set of cards that is processed by using the same settings. You must set up the manufacturer cards that are available in the market, such as debit cards and credit cards, before you can accept the cards as payment in a store.
- **Credit memo** – Credit memos that are issued or redeemed at the point of sale. The credit memo can be a credit or a return credit memo that is issued against a return sale. If credit memos are only partially redeemed, the program issues a new credit memo for the new balance. The new credit memo has a new number. A credit memo can be used only one time, and the system keeps a record of all the numbers that are used. The record can be viewed on the **Credit memo table** page. A customer can't redeem more than the value of the credit memo.
- **Gift Card** – Gift cards that are issued and redeemed at the point of sale. Overpayment isn't allowed on gift cards. All gift cards should have card number mappings.
- **Customer account** – Payments that can be charged to a customer account at the register at the time of the sale. You can also use this payment method to collect sales information or customer-specific discounts when the customer makes a payment by using another payment method. In this case, you must set up customer-specific information.
- **Loyalty points** – The points that customers accumulate through loyalty programs. If you create loyalty programs, customers can earn points and then redeem them in various ways. For example, in some loyalty programs, customers can redeem loyalty points in the form of a discount or even use them as a form of payment.

To set up payment methods, you must complete the following tasks.

1. Set up payment methods for an organization. Create the payment methods that are accepted by the whole

organization.

2. Create organization-wide card types and card numbers. If credit cards or debit cards are accepted, you must create one payment method for cards, and then create the organization-wide card types and card numbers.
3. Set up store payment method. Associate payment methods with each store, and then enter the store-specific settings for each payment method.
4. Set up card payment methods for stores. For any card payment methods that the store accepts, complete the card setup.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Payment methods in call centers

2/18/2021 • 5 minutes to read • [Edit Online](#)

In Dynamics 365 Commerce, the configuration of the call center channel includes a setting that is named **Enable order completion**. This setting helps guarantee that all orders that users of the channel create are released to order processing only if they have a prepaid or pre-authorized payment that is within approved tolerances. If the **Enable order completion** setting is turned on, call center users can enter payments against sales orders for customers by using the payment processing features of Call center. If the setting is turned off, call center users can't use the Call center payment processing features, but they can still apply prepayments to sales orders by using standard Accounts receivable functionality.

As part of the channel configuration, a company can define the methods of payment that are allowed for a call center channel. The call center channel uses the same payment methods that are defined for the store channels.

To configure the payment methods for a call center channel, go to **Retail and Commerce > Channels > Call centers > All call centers**, and then, on the **Set up** menu, select the **Payment methods** option.

When you create a payment method, there are five payment method functions that you can assign.

FUNCTION	DESCRIPTION
Normal	Use the <b>Normal</b> function on your payment method when you define payment methods such as cash or vouchers. When these types of payments are applied to a sales order in the call center, the <b>Prepay</b> flag will default to <b>Yes</b> . This will immediately post a prepayment voucher to the customer account when this order is submitted. Users may change the <b>Prepay</b> flag to <b>No</b> if desired so that the payment voucher is not created until invoice posting. The prepayment voucher is posted in the customer transaction history, where it will be systematically settled against the invoice for the sales order.
Check	Use the <b>Check</b> function when you define a bank check instrument as a form of payment. When this type of payment is applied to a sales order, the user must enter the customer's check number as part of the payment application processing. Check payments are always treated as prepayments when they are applied and payment vouchers are created immediately upon order submission. These prepayment vouchers will be systematically settled against the invoices that are created for the order.

FUNCTION	DESCRIPTION
Cards	Card payment types represent any type of payment that requires entry of a card number that has been defined on the customer's payment card. Examples include credit cards and gift cards. When you configure these types of payments, you must use the <b>Card setup</b> menu to define the card IDs that are associated with this payment method. At the time of order entry, users can indicate whether the card payment will be prepaid, by using the <b>Prepay</b> option that appears on the payment entry page. Unless the business requires prepayments, the typical flow of a true credit card payment is a two-step process, where authorization is obtained at the time of order entry, and then payment is settled and collected from the customer's card at the time of invoicing. For gift card payments, prepayment is recommended, because the gift card balance should be reduced immediately so that the customer can't apply that same value somewhere else.
Customer	The <b>Customer</b> function on a payment method implies that the payment will be applied to the customer's credit limit or put "on account." In Commerce, a customer can be assigned a credit limit that can be validated at the time of order entry. Payments that are made by using a payment method that is linked to the <b>Customer</b> function create a liability against the customer's account. Then, when the sales order is invoiced, a balance due is shown. In these situations, customers typically send a payment, according to terms that have been given. Alternatively, a previous open credit voucher on the customer's account can be applied to settle the balance that is due. Note that even if you define this payment method, it doesn't appear among the payment selection options in call center order entry unless the <b>Allow on account</b> flag is set on the customer record for the customer that you're working with. This flag is found on the <b>Payment Defaults</b> tab of the customer record.
Tender Remove/Float	The <b>Tender Remove/Float</b> function isn't used by the call center. It's applicable only when you define the methods of payment that the point of sale (POS) application uses in a store channel.

As methods of payment are defined, they should be linked to a ledger or bank account. If you omit this step, users will receive errors when they try to save the payment type.

## Refund payment methods

For refund processing scenarios, Call center also uses some of the payment methods that are defined in Accounts receivable. To configure these payment methods, go to **Retail and Commerce > Channel setup > Call center setup > Call center refund methods**. You must complete this configuration to process refund checks to customers. For example, if a customer originally paid for an order by using cash or a check, the user might want to send the customer a refund check through Accounts receivable. In this case, the cash and check payment types in the call center must be mapped to the correct payment method in Accounts receivable to help guarantee that the refund is correctly processed.

Additionally, if a user is processing a return order as a call center user in Commerce, but he or she can't link the return to an original sale, the **Return** payment method must be defined in the Call center parameters. Go to **Retail and Commerce > Channel setup > Call center setup > Call center parameters**, and then, on the

**RMA/Return** tab, in the **Payment method** field, make sure that a payment method is defined. The payment method will be the payment method that is used for refunds. Typically, it will be defined as either a check method or a customer account method.

# Refund payment processing in call centers

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic explains how payment refunds are generated through call centers when returns are created, or when orders or order lines are canceled.

A user who creates a return order for a customer as a call center user in Microsoft Dynamics 365 Commerce headquarters uses the **Return order** page to create the initial return materials authorization (RMA). The RMA defines the products that the customer wants to return or exchange, and it creates a linked return sales order that has an order type of **Returned order**. This linked returned order is used to track the posting of the returned inventory and any credit notes or payment refunds that are posted.

If the **Enable order completion** option is set to **Yes** for the call center channel, the call center user who creates the RMA must run the order completion processing flow by selecting **Complete** on the **Return order** page. The **Complete** function provides a calculated return summary that outlines the refund amount that is due. Additionally, when it's correctly configured, it systematically creates a refund payment line against the returned order.

Call center logic determines the payment method for the refund payment line, based on the payment method that was used for the original order. If the return order that is created isn't linked to an original order, a default payment method that is taken from a system parameter is applied.

## How a call center determines which payment method to apply to a return order

The call center uses the payment method of the original order to determine the payment method that should be applied to a return order. Here is how this process works for the following original payment methods:

- **Normal** (cash) or **Check** – When a return order that is created references an original order that was paid for by using the normal (cash) or check payment type, the call center application references configurations on the **Call center refund methods** page. This page enables organizations to define, by order currency, how refunds are issued to customers for orders that were originally paid for by using the normal or check payment type. The **Call center refund methods** page also enables organizations to select whether a system-generated refund check is sent to the customer, or whether a customer account credit is created against the internal customer account balance. In these scenarios, call center logic references the currency of the return order and then uses the **Retail payment method** value for that currency to create a refund payment line on the return sales order. Later, an accounts receivable (AR) customer payment journal that uses the mapped AR payment method is linked to the currency.

The following illustration shows the configuration for a scenario where a customer returns products from a sales order that is linked to the USD currency, and that was originally paid for by using the normal or check payment type. In this scenario, a refund will be issued to the customer through a system-generated refund check. The REF-CHK AR payment method has been configured as a refund check payment type.

Currency ↑	Retail payment method	AR payment method
EUR	4	REFUND
USD	2	REF-CHK

- **Credit card** – When a return order that is created references an original order that was paid for by using a credit card, call center logic for refund payments applies the same original credit card to the return order.
- **Loyalty card** – When a return order that is created references an original order that was paid for by using a customer loyalty card, call center logic for refund payments applies the refund to the same loyalty card.
- **Gift card (internal)** – When a return order that is created references an original order that was paid for by using a gift card that was issued from Dynamics 365 Commerce (internal gift card functionality), call center logic for refund payments applies the refund to the same original gift card number.
- **Gift card (External)** – When a return order that is created references an original order that was paid for by using an external third-party gift card, call center logic for refund payments applies the default return payment method that is defined on the **RMA/Return** tab of the **Call center parameters** page.

If the original order payment type is unknown for any reason, or if multiple payment methods were used to pay for the original order, call center logic applies the default return payment method that is defined on the **RMA/Return** tab of the **Call center parameters** page.

The following illustration shows the **Payment method** field on the **RMA/Return** tab of the **Call center parameters** page.

#### NOTE

The refund processing rules that are described earlier also apply to orders or order lines that a call center user cancels in Commerce headquarters. If the cancellation of an order or specific order lines causes any overpayments, the same rules will be used to generate refund payment lines.

Typically, a return order goes through a standard process, where inventory is received (or scrapped), a packing slip is posted against the return order, and then an invoice posting process is run for the return sales order. The return sales order is linked and systematically generated as part of the process of creating the return order. In

typical scenarios, payment refunds aren't issued to customers until the invoice for the return sales order is posted.

### What happens when an invoice is posted on a return sales order

The following scenarios explain what happens when an invoice is posted on a return sales order:

- If the refund payment on the return order is for a credit card, additional logic is invoked when the invoice is posted. This logic calls the payment processor to refund payment to the customer's credit card. A refund customer payment voucher is also created and systematically posted against the customer's account. This payment journal will be settled against the return order credit note voucher.
- If the refund payment that must be issued is for the check payment type, a customer payment voucher that uses the AR payment method is created, and must be manually posted or printed before the payment voucher can be posted against the customer account. To process the refund check, users can use either the **Customer payment journal** page in Accounts receivable or the specialized **Refund check processing** page in Retail and Commerce.
- If the refund payment that must be issued is for the internal gift card or loyalty card payment type, when the return order is invoiced, the refund payment voucher is created and posted against the customer account. This invoicing step also adds the refund amount back to the customer's internally tracked gift card balance or loyalty points balance.
- If a payment method that uses the **Customer** function (for example, a customer account) is linked to the return sales order, credit limit validations are ignored when the payment is processed. No payment voucher is created or posted in this context. When a customer payment type is used on a return order, the credit note voucher that the invoice posting process creates serves as the customer credit voucher and indicates a refund to the customer's AR balance.

## Advance credit

When a user processes return orders as a call center user in a call center where the **Enable order completion** option is set to **Yes**, an exception to the previously described process for refund payment posting can occur if the call center user who is creating the return order sets the **Advance credit** option to **Yes** on the **RMA/Return** tab of the **Call center parameters** page. In this case, the payment refund occurs immediately after the return order is successfully submitted by using the **Submit** function on the **Return summary** page. The system immediately creates a prepayment customer payment voucher for the return value, even though the return sales order itself hasn't yet been invoiced. This approach can be used in situations where an organization must issue refunds to customers in advance because of customer service issues, and it doesn't want to require that returned inventory be received before the refunds are issued.

## Replacement orders

When a return order is issued, the **Replacement order** function can be used to generate a new sales order for the customer. This approach can be used in exchange scenarios. The **Replacement order** function creates another sales order for the new items that must be sent, but a cross-reference link on the **RMA/Return** tab of the **Call center parameters** page links the replacement order, the RMA, and the returned sales order.

When payments on a replacement order are processed, organizations have two options:

- Refund the customer for the return order, based on the original payment method, and then collect a separate payment for the replacement order. No additional configuration is required to use this option.
- Set the **Apply credit** option to **Yes** on the **RMA/Return** tab of the **Call center parameters** page. In this case, a customer payment method is systematically applied to both the return order and the replacement order. This option can help prevent any external refund payment from being issued. It also helps prevent any payment processing on the transaction. It can be useful in situations where an even exchange is being processed, and the organization prefers to use the credit voucher that is generated when the return order is

invoiced to pay for the invoice that is generated by the replacement order. When the **Apply credit** option is set to **Yes**, the organization must manually settle the credit note against the replacement order's invoice after both those financial documents have been generated.

A setting of **Yes** for the **Apply credit** option is applicable only when the return order will be linked to a replacement order. In this case, the customer payment method that will be used to systematically pay for the return and the exchange order is defined by the **Apply credits payment method** field on the **RMA/Return** tab of the **Call center parameters** page. Only a payment of the **Customer** function payment type can be selected in this field.

#### NOTE

For a return order that has no linked replacement order, a setting of **Yes** for the **Apply credit** option will have no effect on the return order payment logic, because this setting applies only to replacement orders.

**Call center parameters**

Set up parameters for order returns and exchanges

**RETURN PAYMENT METHODS**

Payment method: 4

Apply credits payment method: 4

Allow payment override: No

**EXCHANGES**

Source code for exchange: Original

Default exchange source code: Mail

Allow expired source code: Yes

**RETURN ORDER DEFAULT VALUES**

Pending return hold: Pending re

Exchange balance hold: Pending ex

Apply credit: No

Advance exchange: Release exchange

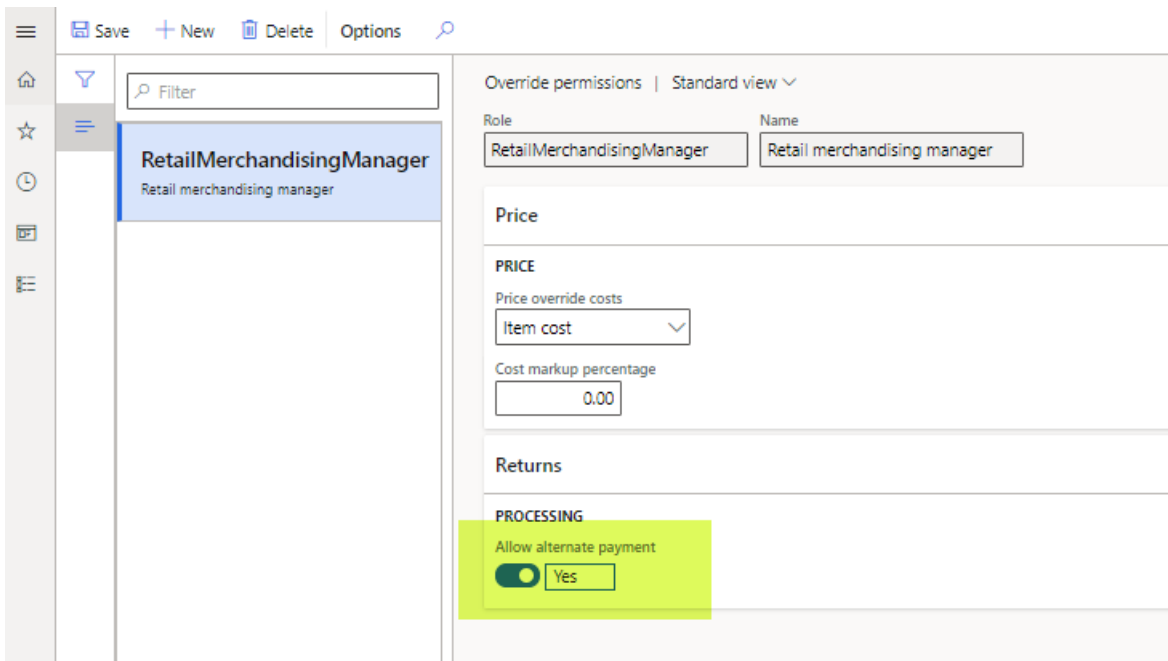

Advance credit: No

#### IMPORTANT

If users who create replacement orders plan to use the **Apply credit** option, they should not run the **Complete** function on the return order before they set the **Apply credit** option to **Yes**. After the **Complete** function is run, the refund payment is calculated and applied to the return sales order. Any attempt to set the **Apply credit** option to **Yes** after a refund payment has already been calculated and applied won't trigger a recalculation of the refund payment, and the payment method that is selected in the **Apply credits payment method** field won't be applied. If the **Apply credit** option must be used in this context, the user must delete the replacement order and the RMA, and then start over and create a new RMA. This time, the user must ensure that the **Apply credit** option is set to **Yes** before the **Complete** function is run.

## Payment overrides for call center returns

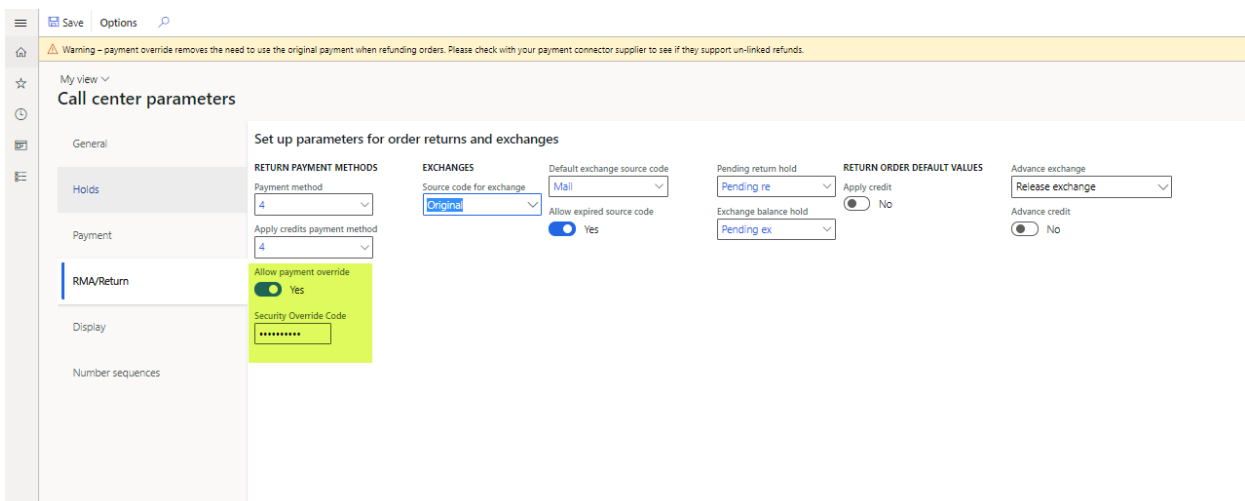

Although call center logic systematically determines the refund payment method in the manner that is described earlier in this topic, users might sometimes want to override those payments. For example, a user might edit or remove existing refund payment lines, and apply new payment lines. System-calculated refund payments can be changed only by users who have the correct override permissions. These permissions can be configured on the **Override permissions** page in Retail and Commerce. To do a refund payment override, the user must be linked to a security role where the **Allow alternate payment** option is set to **Yes** on the **Override permissions** page.

Alternatively, an organization can set the **Allow payment override** option to **Yes** on the **RMA/Return** tab of the **Call center parameters** page. In this case, a security override code must be selected in the **Security Override Code** field. The security override code is an alphanumeric code that must be externally managed, because users can't view it in Commerce headquarters after it's set. The security override code should be known by only a few key, trusted people in an organization. When the **Allow payment override** option is set to **Yes**, if any users who don't have the correct role permissions try to change the method of payment on a return order, they will have the option to enter the security override code. If they don't know it, or if a manager or supervisor can't enter it on the page for them, they won't be able to override the return payment method.

#### NOTE

If the security override code is lost or forgotten, the organization will have to reset it by defining a new security override code in the **Security Override Code** field on the **RMA/Return** tab of the **Call center parameters** page.

#### IMPORTANT

Before organizations try to override refund payments that use credit card payment types, they should verify that their credit card processor allows for unlinked returns. Many processors require that refunds be posted back to the original card. Any attempt to issue a refund to a card that has no previous captures might cause posting failures with the processor.

# Credit card setup, authorization, and capture

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides an overview of credit card authorization in Microsoft Dynamics 365 Finance. It includes information about how to set up a payment service, add a credit card to a sales order, and void an authorization.

## Setting up the credit card payment service

To use credit cards, you must set up and activate a payment service on the Payment services page. A payment service acts as a bridge between your legal entity and the bank that processes a customer's credit card charges. You must work with a credit card provider that is listed in the Payment connector field and set up an account with that provider. You must then set up the other options on the Payment services page, set up credit card types for American Express, Discover, MasterCard, and Discover on the Credit card types page, and activate the provider as the default provider. You must also follow these steps to complete your setup:

- On the Accounts receivable parameters page, specify parameters for using credit card authorizations.
- On the Terms of payment page, set up payment terms for credit cards. In the Payment type field, select Credit card.
- On the Customer credit cards page, enter credit card information for customers.

## Adding a new credit card

You can create new credit card records on the Customers page by using Customer, Set up, Credit card. You can also create credit card records when you enter sales orders on the Sales order page, by using Manage, Customer, Credit card, Register.

## Adding a credit card to a sales order

You can add a credit card to a sales order by selecting a credit card in the credit card lookup on the Price and discounts FastTab on the Sales order page. To start the authorization process, on the Action Pane, on the Manage tab, select Credit card and Authorize.

## Authorizing a credit card

When a credit card is authorized, the card number and cardholder's name are verified, and the available credit balance is confirmed. Optionally, the card verification value and the cardholder's address are verified. The customer's available credit balance is then reduced by the amount of the invoice. The payment service sends information that the credit card has been approved or declined. When the sales order is invoiced, the credit card is charged (captured) for the invoice amount.

### Card verification value

You can require the card verification value, which is sometimes referred to as the card's security code. For American Express, this is a four-digit value. For Discover, MasterCard, and Visa, it is a three-digit value.

### Address verification

Address verification information is always sent to the payment provider. You can decide how much information is required for a transaction to be accepted. Be sure to check with your provider to determine whether it accepts this information. Here are the options for address verification:

- **Always accept transaction** – Accept the transaction, regardless of address verification results.

- **Account holder** – Compare the cardholder's name from the transaction with the credit card company's information.
- **Billing address** – Compare the cardholder's name and billing address from the transaction with the credit card company's information.
- **Billing postal code** – Compare the cardholder's name, billing address, and postal code from the transaction with the credit card company's information.

## Data support

For each credit card type that is supported, you can specify the level of data support. The level controls how much information about a transaction is transferred to the payment service. Be sure to check with your provider to determine whether it can provide this information. Here are the options for the level of data support:

- **Level 1** – Transfer the transaction date, transaction amount, and description.
- **Level 2** – Transfer all Level 1 information, plus the shipping and merchant addresses, and tax information.
- **Level 3** – Transfer all Level 2 information, plus order line information.

## Partial payments

If you ship part of an order, the amount of the partial order is captured, and the authorization, which was for the amount of the whole order, is closed. A new authorization is then submitted for the remaining amount of the order that hasn't been shipped.

## Voiding an authorization

To void a credit card authorization, you can change the method of payment to another method that doesn't have a type of Credit card.

# Configure cash denominations for the point of sale (POS)

2/18/2021 • 2 minutes to read • [Edit Online](#)

Cash denominations for notes and coins can be defined in the back office to be used by cashiers, sales associates, and managers at the store from within the POS. These denominations can be used to aid in counting cash for end of day tender declarations or for quickly tendering a sale.

## Define denominations

The denominations are set up per store on the **Set up > Cash declaration** option from the store property page.

The screenshot shows the Dynamics 365 Commerce interface. The breadcrumb navigation is 'Commerce > Channels > Stores > All stores'. The 'SET UP' menu is open, and 'Cash declaration' is highlighted with a red box. Below the menu, there is a 'Click the edit button to make changes.' message and a table of stores.

✓	Retail Channel Id	Name	Channel type	Operating unit ...	Store number	Warehouse	Sales tax group	Default cu
	000015	Chicago	Retail store	050	CHICAGO	CHICAGO	IL	100001
	000016	Cincinnati	Retail store	051	CINCINN	CINCINN	OH	100001
✓	000017	Houston	Retail store	052	HOUSTON	HOUSTON	TX	100001
	000018	Oak Brook	Retail store	053	OAKBROO	OAKBROO	IL	100001
	000019	San Antonio	Retail store	054	SANANTO	SANANTO	TX	100001
	000020	Troy	Retail store	055	TROY	TROY	MI	100001

To define a denomination:

1. Click **New**.
2. Specify the type (coin or note).
3. Specify the amount (value).

Type	Amount in trans...	Currency
Coin	0.01	USD
Coin	0.05	USD
Coin	0.10	USD
Coin	0.25	USD
Coin	0.50	USD
Note	1.00	USD
Note	2.00	USD
Note	5.00	USD
Note	10.00	USD
Note	20.00	USD
Note	50.00	USD
Note	100.00	USD

## Configure the functionality profile

When paying by cash in POS, the user can use the note denominations to quickly enter the amount paid by the customer. In the functionality profile, you can configure the two options for showing the denomination in POS.

- **Greater or equal to amount due** – By default, POS will only show the note denominations that are greater than the amount due, which allows for one-touch tendering. For example, if the amount due is \$7.50, POS would show the following denominations: \$10, \$20, \$50, and \$100. Touching any of these amounts will automatically tender the sale for that amount. The \$1 and \$5 notes are not shown since these amounts are less than the amount due.
- **All denominations** – Select this option to always show all note denominations in POS, regardless of the amount due. This means that the user can use a combination of notes to reach the amount due. For example, if the amount due is \$25.00, the user can choose \$20 and \$5 to complete the sale.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure credit card processing

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through how to view the list of payment providers and how to configure a payment account for accounts receivable. This procedure uses the USRT company in demo data and is intended for Administrators and IT Professionals.

## View a list of payment providers

1. Go to Accounts receivable > Payments setup > Payment services.
2. Click View available providers.

## Configure payment account

1. Click New.
2. In the Payment service field, type a value.
3. In the Payment connector field, select an option.
4. Toggle the expansion of the Payment service account section.
5. In the Environment: field, type 'PROD'.
6. Click Credit card types.
7. In the Payment journal field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
9. Click Add.
10. In the Currency field, type a value.
11. In the list, find and select the desired record.
12. In the Payment journal field, click the drop-down button to open the lookup.
13. In the list, click the link in the selected row.
14. Click Add.
15. In the Currency field, type a value.
16. In the list, find and select the desired record.
  - You can repeat these steps for as many card types as you need.
