# Skip "change due" dialog box in POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to skip the **Change due** dialog box in the point of sale (POS) when a transaction is paid in full and there's no change due.

For payments at the POS, there is now a greater prevalence of credit usage, as most transactions don't require change to be provided to the customer. In Dynamics 365 Commerce, you can configure POS so that the **Change due** dialog is skipped unless there's actually change due back to the customer. The **Change due** dialog box will also be shown if the receipt format for gift receipts is configured to print **As required**. When gift receipts are configured to print **As required**, the option to print a gift receipt is included in the **Change due** dialog box, overriding the **Skip change due** configuration.

## Configure property to skip Change due dialog box

The property you need to configure to skip the **Change due** dialog box is found in the **Functionality profile** level, which is a store-level setting.

To configure the property, follow these steps.

1. Search for the **Functionality profile** for the store where the dialog box should be skipped.
2. Open the functionality profile for the target store and select **Edit**.
3. Expand the **Functions** FastTab. Under the **Terminal** subheading, in the **Change due** field, select **Skip when zero**.
4. Select **Save**, and then run the **1070** channel configuration distribution schedule.
5. After the changes are synchronized, sign out of the POS and then sign back in. Make a transaction that has no change due to the customer to verify that the **Change due** dialog box isn't displayed.

# Dynamics 365 Payment Connector for Adyen

2/18/2021 • 29 minutes to read • [Edit Online](#)

This topic provides an overview of the Microsoft Dynamics 365 Payment Connector for Adyen. It includes a comprehensive list of supported features and functionality, a guide to setting up and configuring the connector, troubleshooting information, and descriptions of some common issues.

## Key terms

TERM	DESCRIPTION
Payment connector	An extension that facilitates communication between Microsoft Dynamics 365 Commerce (and associated components) and a payment service. The connector that is described in this topic was implemented by using the standard payments software development kit (SDK).
Card present	Refers to payment transactions where a physical card is presented and used on a payment terminal connector to the Dynamics 365 Point of Sale.
Card not present	Refers to payment transactions where a physical card is not present, such as e-Commerce or Call Center scenarios. In these scenarios, the payment-related information is entered manually either on an e-Commerce website, a Call Center flow, or on the point-of-sale or payment terminal.

## Overview

This topic includes the following main sections to help you evaluate and set up the Dynamics 365 Payment Connector for Adyen.

- Supported features, functionality, versions, and terminals – This section describes the set of features and functionalities that the Dynamics 365 Payment Connector for Adyen supports.
- Sign up with Adyen – This section explains how to sign up for a merchant account with Adyen.
- Setup and configuration – This section explains, in detail, how to set up and configure the Dynamics 365 Payment Connector for Adyen across the point of sale (POS), call center, and e-Commerce channels.

## Supported features, functionality, versions, and terminals

The out-of-box Dynamics 365 Payment Connector for Adyen uses the standard payments SDK. Therefore, it doesn't have special capabilities that aren't also available to other payment connectors.

### Supported versions

#### Microsoft Dynamics 365 supported versions

The first-party out-of-box Dynamics 365 Payment Connector for Adyen is supported in Microsoft Dynamics 365 for Finance and Operations version 8.1.3 (January 2019) or later, and in Microsoft Dynamics 365 Retail version 8.1.3 or later. However, third parties can still develop other payment connectors for Adyen for earlier versions of Microsoft Dynamics 365.

#### Supported Adyen Firmware versions

The list below describes the minimum and maximum Adyen firmware versions that are supported for each version of the Microsoft Dynamics 365 Retail POS.

- [8.1.3](#)
- [10.0.7](#)
- [10.0.8](#)
- [10.0.9](#)
- [10.0.10](#)
- [10.0.11](#)
- [10.0.12](#)
- [10.0.13](#)
- [10.0.14](#)
- [10.0.15](#)
- [10.0.16](#)

### Dynamics 365 Retail POS version 8.1.3

MINIMUM ADYEN FIRMWARE VERSION	MAXIMUM ADYEN FIRMWARE VERSION
adyen_v1_35p15	adyen_v1_35p15

#### NOTE

Adyen may release minor version updates after Microsoft has tested the major version. As long as a major version is supported, it's okay to have minor version updates within the same major version. These updates are normally very targeted fixes and don't meet the bar for full retesting, as long as the same major firmware version was previously tested. Updates shouldn't exceed the maximum Adyen firmware version listed in documentation.

Migrating from a Adyen firmware version earlier than version 53 to version 53 requires POS KB [4577957](#) for monthly updates of Commerce, versions 10.0.11 through 10.0.14. If one of those versions is in use and doesn't include the hotfix, post-upgrade of the payment terminal will only allow payments via NFC. Applying the hotfix to the POS resolves this issue. If the POS version is older than version 10.0.11, file a support request noting that a fix for KB [4577957](#) is required for an out of service MPOS.

### Supported payment terminals

The Dynamics 365 Payment Connector for Adyen takes advantage of the device-agnostic [Adyen Payment Terminal API](#). It supports all payment terminals that this application programming interface (API) supports. For a complete list of supported payment terminals, visit the [Adyen POS terminals](#) page.

### Supported payment instruments

#### Supported debit and credit cards

### Supported Dynamics 365 payment features

The following table shows the set of features that the Dynamics 365 Payment Connector for Adyen supports. These features use enhancements that were introduced in the payments SDK and some components in December 2018. They aren't exclusive to the Dynamics 365 Payment Connector for Adyen. For more information about how to uptake these enhancements for a different payment connector, see [Create an end-to-end payment integration for a payment terminal](#).

<a href="#">SDK-level tipping support through the Adyen connector</a>	✓ (Starting with 10.0.14)	

## Sign up with Adyen

To use the Dynamics 365 Payment Connector for Adyen, you must have a separate agreement with Adyen. To learn more about Adyen's services, or to create a test merchant account, visit the [Adyen website](#).

## Setup and configuration

### NOTE

These instructions assume that you've already signed up for a merchant account with Adyen, and that you have access to the Adyen merchant dashboard.

### Prerequisites

The following prerequisites must be completed before payments can be configured in any channel.

#### Set up a processor for new credit cards

To process payments across point of sale (POS) terminals, a call center, or e-Commerce, you must configure a new default payment processor for new credit cards. Follow these steps to configure a default payment processor.

1. Sign in to Headquarters, and go to **Accounts receivable > Payments setup > Payment services**.
2. On the Action Pane, select **New**, and then, on the **Setup** tab, enter the following information.

FIELD	DESCRIPTION	SAMPLE VALUE
Payment service	Enter the name of the payment service to configure.	Adyen Payment Service
Payment connector	Select the payment connector to use for new credit card payments.	Dynamics 365 Payment Connector for Adyen
Test mode	For the Adyen connector, in production and test environments you should set this field to <b>false</b> .	false
Default processor for credit cards	Specify whether this payment processor should be the default processor that's used for new credit cards.	Yes
Bypass payment processor for zero transactions	Specify whether this payment processor should be skipped for transactions that have a 0 (zero) amount.	Yes

3. On the **Payment service account** tab, enter the following information.

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Assembly Name	Auto populated name of the assembly for the Dynamics 365 Payment Connector for Adyen.	Yes	Yes	<i>Binary name</i>
Service account ID	Auto populated unique identifier for the setup of the merchant properties. This identifier is stamped on payment transactions and identifies the merchant properties that downstream processes (such as invoicing) should use.	Yes	Yes	<i>Guid</i>

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Version	Enter the version of the Dynamics 365 Payment Connector for Adyen to use. "V002" should be used for all new implementations, as it leverages a newer Adyen API for card not present payments and is required for <a href="#">SCA support</a> .	Yes	Yes	"V001"/"V002"
Gateway environment	Enter the Adyen gateway environment to map to. The possible values are <b>Test</b> and <b>Live</b> . You should set this field to <b>Live</b> only for production devices and transactions.	Yes	Yes	Live
Optional Domain	The optional domain is required for Live environments and should be obtained by contacting Adyen. This is the unique identifier for your Live environment in the form <b>[random]-[company name]</b> . This is present as the prefix inside the API URLs under <b>Account &gt; API URLs</b> in your company's Live account on the Adyen Customer Area portal. For additional details, see <a href="#">Live endpoints</a> .	Live only	No	Contact Adyen
Merchant account ID	Enter the unique Adyen merchant identifier. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	MerchantIdentifier

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Terminal architecture	This field must be set to <b>Cloud</b> for the <span style="border: 1px solid gray; padding: 2px;">Payment service account</span> .	Yes	Yes	Cloud
Local Password phrase	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Key Identifier	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Key Version	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Cryptor Version	Enter the Adyen cryptor version to use when you interact with the Adyen gateway. You should set this field to 1.	Yes	Yes	1
Cloud API Key	Enter the Adyen cloud API key. You can obtain this key by following the instructions on the <a href="#">How to get the API key</a> page on the Adyen website.	Yes	No	abcdefg

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Supported Currencies	Enter the currencies that the connector should process. In card-present scenarios, Adyen can support additional currencies through <a href="#">Dynamic Currency Conversion</a> after the transaction request is sent to the payment terminal. Contact Adyen support to get a list of supported currencies.	Yes	Yes	USD;EUR
Supported Tender Types	Enter the tender types that the connector should process.	Yes	Yes	Visa;MasterCard;Amex;Discover;Debit
Gift card provider	Enter the gift card provider that the connector should use to process gift cards. This field is case-sensitive.	No	No	"svs" or "givex"
Terminal gift card entry	<i>POS Only</i> Allows the customer to select between <b>Manual</b> or <b>Swipe</b> .	Yes	Yes	True/False
Allow saving payment information in e-commerce	<i>e-Commerce only</i> Gives signed-in users the option to save payment details for future online purchases.	Yes	Yes	True/False
Authorization stale period (days)	<i>POS Only</i> Number of days before an authorization is considered stale and should decline before going to the processor for capture.	Yes	Yes	"7"

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Origin Key	Required when "V002" is designated for the version. You can obtain this key by following the instructions on the <a href="#">How to get an origin key</a> page on the Adyen website.			

- On the **Card verification value** tab, leave **Prompt for card verification value** and **Allow blank card verification value** set to **No**.

## POS payment terminal

### Onboard and configure an Adyen payment terminal

#### NOTE

These instructions assume that you have access to an Adyen payment terminal.

Go to the [Point of sale](#) page on the Adyen website, and follow the instructions to onboard your Adyen payment terminal. Skip any steps that instruct you to download Adyen-specific apps. During the onboarding process, make a note of the following information for each payment terminal. You will need this information in the [Configure the payment terminal IP address and EFT POS register number](#) section later in this topic.

- IP address of the payment terminal
- POIID (POIID is comprised of the serial number and model number of the device. It is used to uniquely identify the device.)

After the payment terminal is onboarded, sign in to the [Adyen Customer Area](#), go to the terminal that you want to configure, and make a note of the following information for each payment terminal. You will need this information in the [EFT service for local network communication](#) section later in this topic.

- Key identifier
- Key passphrase
- Key version

### Set up a Dynamics 365 POS hardware profile

- Sign in to Headquarters, and go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**.
- Select the hardware profile to add the Dynamics 365 Payment Connector for Adyen for.
- Follow the steps in the [EFT service](#) and [PIN pad](#) sections that follow.

### EFT service

The Adyen payment connector can be configured to communicate with devices via the local network or through Adyen's cloud backend. For environments with unreliable internet service, or where offline mode is required, the **Local** setup should be used. For environments with strong internet connections, or if a static IP address can't be assigned to the payment terminal, the **Cloud** architecture may work best.

#### EFT service for local network communication

- On the **EFT service** FastTab, in the **EFT Service** field, select **Payment Connector**.
- On the **Connectors** tab, select **New**, and then, in the **Connector** field, select **Dynamics 365 Payment**

**Connector for Adyen.** Make sure that the value in the **Sequence number** field is lower than the value for all other connectors.

3. In the **Connector properties** section, enter the following information.

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Assembly Name	Auto populated name of the assembly for the Dynamics 365 Payment Connector for Adyen.	Yes	Yes	<i>Binary name</i>
Service account ID	Auto populated unique identifier for the setup of the merchant properties. This identifier is stamped on payment transactions and identifies the merchant properties that downstream processes (such as invoicing) should use.	Yes	Yes	<i>Guid</i>
Version	Set to <b>V001</b> for EFT settings in the hardware profile. <b>V002</b> is required for call center and storefront only.	Yes	Yes	"V001"
Gateway environment	Enter the Adyen gateway environment to map to. The possible values are <b>Test</b> and <b>Live</b> . You should set this field to <b>Live</b> only for production devices and transactions.	Yes	Yes	Live

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Optional Domain	The optional domain is required for Live environments and should be obtained by contacting Adyen. This is the unique identifier for your Live environment in the form <b>[random]-[company name]</b> . This is present as the prefix inside the API URLs under <b>Account &gt; API URLs</b> in your company's Live account on the Adyen Customer Area portal. For additional details, see <a href="#">Live endpoints</a> .	Live only	No	Contact Adyen
Merchant account ID	Enter the unique Adyen merchant identifier. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	MerchantIdentifier
Terminal architecture	This must be set to <b>Local</b> for local communications. For more information about the different Terminal API architectures, see the <a href="#">Introducing the Terminal API</a> page on the Adyen website.	Yes	Yes	Local
Local Password phrase	Enter the Adyen key passphrase for the payment terminal. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	keypassphrase123

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Local Key Identifier	Enter the Adyen key identifier for the payment terminal. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	mykey
Local Key Version	Enter the Adyen key version for the payment terminal. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	0
Local Cryptor Version	Enter the Adyen cryptor version to use when you interact with the Adyen gateway. You should set this field to 1.	Yes	Yes	1
Cloud API Key	Enter the Adyen cloud API key. You can obtain this key by following the instructions on the <a href="#">How to get the API key</a> page on the Adyen website.	Yes	No	abcdefg
Supported Currencies	Enter the currencies that the connector should process. In card-present scenarios, Adyen can support additional currencies through <a href="#">Dynamic Currency Conversion</a> after the transaction request is sent to the payment terminal. Contact Adyen support to get a list of supported currencies.	Yes	Yes	USD;EUR

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Supported Tender Types	Enter the tender types that the connector should process. These values are case-sensitive.	Yes	Yes	Visa;MasterCard;Amex;Discover;Debit
Gift card provider	Enter the gift card provider that the connector should use to process gift cards. This field is case-sensitive.	No	No	"svs" or "givex"
Terminal gift card entry	<i>POS Only</i> Allows the customer to select between <b>Manual</b> or <b>Swipe</b> .	Yes	Yes	True/False
Allow saving payment information in e-commerce	<i>e-Commerce only</i> Gives signed-in users the option to save payment details for future online purchases.	Yes	Yes	True/False
Authorization stale period (days)	<i>POS Only</i> Number of days before an authorization is considered stale and should decline before going to the processor for capture.	Yes	Yes	"7"
Origin Key	<i>Card not present only</i>			

4. On the Action Pane, select **Save**.

**EFT service for cloud communication**

1. On the **EFT service** FastTab, in the **EFT Service** field, select **Payment Connector**.
2. On the **Connectors** tab, select **New**, and then in the **Connector** field, select **Dynamics 365 Payment Connector for Adyen**. Make sure that the value in the **Sequence number** field is lower than the value for all other connectors.
3. In the **Connector properties** section, enter the following information.

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
-------	-------------	----------	-------------------	--------------

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Assembly Name	Autopopulated name of the assembly for the Dynamics 365 Payment Connector for Adyen.	Yes	Yes	<i>Binary name</i>
Service account ID	Autopopulated unique identifier for the setup of the merchant properties. This identifier is stamped on payment transactions and identifies the merchant properties that downstream processes (such as invoicing) should use.	Yes	Yes	<i>Guid</i>
Version	Set to <b>V001</b> for EFT settings in the hardware profile. <b>V002</b> is required for call center and storefront only.	Yes	Yes	"V001"
Gateway environment	Enter the Adyen gateway environment to map to. The possible values are <b>Test</b> and <b>Live</b> . You should set this field to <b>Live</b> only for production devices and transactions.	Yes	Yes	Live

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Optional Domain	The optional domain is required for live environments and should be obtained by contacting Adyen. This is the unique identifier for your live environment in the form <b>[random]-[company name]</b> . This is present as the prefix inside the API URLs under <b>Account &gt; API URLs</b> in your company's live account on the Adyen Customer Area portal. For additional details, see <a href="#">Live endpoints</a> .	Live only	No	Contact Adyen
Merchant account ID	Enter the unique Adyen merchant identifier. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	MerchantIdentifier
Terminal architecture	This must be set to <b>Cloud</b> for cloud communication with the payment terminal. For more information about the different terminal API architectures, see the <a href="#">Introducing the Terminal API</a> page on the Adyen website.	Yes	Yes	Cloud
Local Password phrase	This setting is used for local payment terminal communication only.	No	No	<i>leave blank</i>
Local Key Identifier	This setting is used for local payment terminal communication only.	No	No	<i>leave blank</i>

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Local Key Version	This setting is used for local payment terminal communication only.	No	No	<i>leave blank</i>
Local Cryptor Version	This setting is used for local payment terminal communication only. You can leave the default as-is, set to 1.	Yes	Yes	1
Cloud API Key	Enter the Adyen cloud API key. You can obtain this key by following the instructions on the <a href="#">How to get the API key</a> page on the Adyen website.	Yes	No	abcdefg
Supported Currencies	Enter the currencies that the connector should process. In card-present scenarios, Adyen can support additional currencies through <a href="#">Dynamic Currency Conversion</a> after the transaction request is sent to the payment terminal. Contact Adyen support to get a list of supported currencies.	Yes	Yes	USD;EUR
Supported Tender Types	Enter the tender types that the connector should process. These values are case-sensitive.	Yes	Yes	Visa;MasterCard;Amex;Discover;Debit
Gift card provider	Enter the gift card provider that the connector should use to process gift cards. This field is case-sensitive.	No	No	"svs" or "givex"

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Terminal gift card entry	<i>POS Only</i> Allows the customer to select between <b>Manual</b> or <b>Swipe</b> .	Yes	Yes	True/False
Allow saving payment information in e-commerce	<i>e-Commerce only</i> Gives signed-in users the option to save payment details for future online purchases.	Yes	Yes	True/False
Authorization stale period (days)	<i>POS Only</i> Number of days before an authorization is considered stale and should decline before going to the processor for capture.	Yes	Yes	"7"
Origin Key	<i>Card not present only</i>			

4. On the Action Pane, select **Save**.

#### **PIN pad**

1. On the **PIN pad** FastTab, in the **PIN pad** field, select **Network**.
2. In the **Device name** field, enter **MicrosoftAdyenDeviceV001**.

#### **Set up a Dynamics 365 register**

##### **NOTE**

These instructions assume that there is a dedicated mapping between a POS register and an Adyen payment terminal. For a hardware station that is based on Microsoft Internet Information Services (IIS), go to **Retail and Commerce > Channels > Stores > All stores**, and select the store that you're setting up. Then, on the page for that store, on the **Hardware Stations** FastTab, follow the same instructions.

Payment terminals may not be used by multiple hardware stations. If a payment terminal must be shared by multiple POS devices, an IIS hardware station must be deployed to manage communications with the payment terminal.

#### **Configure the payment terminal IP address and EFT POS register number**

1. Sign in to Headquarters, and go to **Retail and Commerce > Channel setup > POS setup > Registers**.
2. Select the register to link to the Adyen payment terminal.
3. On the **POS Registers** page, on the **General** FastTab, in the **EFT** section, in the **EFT POS register number** field, enter a unique number.
4. In the **Profiles** section, in the **Hardware profile** field, select the hardware profile that you configured earlier.
5. Save your changes.
6. On the Action Pane, on the **Register** tab, in the **Hardware** group, select **Configure IP addresses**. 7a. **If using the "Local" architecture:** On the **IP address configuration** page, on the **PIN pad** FastTab, in the **IP address** field, enter the IP address of the terminal in the following format:

`https://<IP address>:8443/nexo/<POIID>`. Here, **<IP address>** and **<POIID>** are the values that you made a

note of when you onboarded the Adyen payment terminal. Here is an example:

`https://192.168.1.3:8443/nexo/MX925-123456789`

The values in this URL are case-sensitive. 7b. If using the "Cloud" architecture: On the IP address configuration page, on the PIN pad FastTab, in the IP address field, enter the POIID value that you made a note of when you onboarded the Adyen payment terminal. Here is an example: `MX925-123456789`. The values in this field are case-sensitive.

7. If the payment terminal includes an onboard printer and you want to print receipts from the processor using that printer, enter 123 in the Port field that is separate from the IP address field in the PIN pad FastTab.

#### Update the Modern POS or IIS Hardware Station configuration

If you're packaging your own version of Modern POS by using the Retail SDK, you must follow these steps only one time in the SDK code before the installer is packaged. Otherwise, you must follow these steps after the standard Modern POS or IIS Hardware Station is installed.

1. Open the `dllhost.exe.config` file (for Modern POS) or the `web.config` file (for IIS Hardware Station).
2. Update the `PreloadedComposition` section as shown here, to switch from the legacy payment device adapter to the standard payment device adapter.

```
<PreloadedComposition>
  <composition>
    <add source="assembly"
value="Microsoft.Dynamics.Commerce.HardwareStation.Peripherals.PaymentDeviceAdapter" />
    <!-- Switch from legacy to standard Payment Device Adapter.
    <add source="assembly"
value="Microsoft.Dynamics.Commerce.HardwareStation.Peripherals.Legacy.PaymentDeviceAdapter" />
    -->
  </composition>
</PreloadedComposition>
```

3. Update the `appSettings` variable "PrintReceiptsOnCardDeclineOrVoid" value to `True` to print decline or void responses from the processor.

#### Call center

To configure the Dynamics 365 Payment Connector for Adyen for call center payments, follow the instructions in the [Set up a processor for new credit cards](#) section earlier in this topic.

#### e-Commerce

1. Sign in to Headquarters, and go to **Retail and Commerce > Channels > Online stores**.
2. Select the online store to add the Dynamics 365 Payment Connector for Adyen.
3. On the **Online store** page, on the **Payment accounts** FastTab, select **Add**.
4. In the **Connectors** field, select **Dynamics 365 Payment Connector for Adyen**.
5. Enter the following additional information.

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Assembly Name	Auto populated name of the assembly for the Dynamics 365 Payment Connector for Adyen.	Yes	Yes	<i>Binary name</i>

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Service account ID	Auto populated unique identifier for the setup of the merchant properties. This identifier is stamped on payment transactions and identifies the merchant properties that downstream processes (such as invoicing) should use.	Yes	Yes	<i>Guid</i>
Version	Enter the version of the Dynamics 365 Payment Connector for Adyen to use. "V002" should be used for all new implementations, as it leverages a newer Adyen API for card not present payments and is required for <a href="#">SCA support</a> .	Yes	Yes	"V001"/"V002"
Gateway environment	Enter the Adyen gateway environment to map to. The possible values are <b>Test</b> and <b>Live</b> .	Yes	Yes	Live
Optional Domain	Enter the domain to use when payment requests are made to Adyen. This is the unique identifier for your Live environment in the form <b>[random]-[company name]</b> . This is present as the prefix inside the API URLs under <b>Account &gt; API URLs</b> in your company's Live account on the Adyen Customer Area portal. For additional details, see, <a href="#">Live endpoints</a> .	Live only	No	Contact Adyen

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Merchant account ID	Enter the unique Adyen merchant identifier. This value is provided when you sign up with Adyen as described in the <a href="#">Sign up with Adyen</a> section.	Yes	No	MerchantIdentifier
Terminal architecture	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Password phrase	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Key Identifier	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Key Version	This field is used only for the POS payment terminal integration and should be left blank.	No	Yes	<i>Leave this field blank.</i>
Local Cryptor Version	Enter the Adyen cryptor version to use when you interact with the Adyen gateway. You should set this field to 1.	Yes	No	1
Cloud API Key	Enter the Adyen cloud API key. You can obtain this key by following the instructions on the <a href="#">How to get the API key</a> page on the Adyen website.	Yes	No	<i>The full cloud API key</i>
Supported Currencies	Enter the currencies that the connector should process.	Yes	Yes	USD;EUR

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Supported Tender Types	Enter the tender types that the connector should process.	Yes	Yes	Visa;MasterCard;Amex;Discover;Debit
Gift card provider	Enter the gift card provider that the connector should use to process gift cards. The possible values are <b>SVS</b> and <b>GIVEX</b> .	No	No	SVS
Terminal gift card entry	<i>POS Only</i> Allows the customer to select between <b>Manual</b> or <b>Swipe</b> .	Yes	Yes	True/False
Allow saving payment information in e-commerce	<i>e-Commerce only</i> Gives signed-in users the option to save payment details for future online purchases.	Yes	Yes	True/False
Authorization stale period (days)	<i>POS Only</i> Number of days before an authorization is considered stale and should decline before going to the processor for capture.	Yes	Yes	"7"
Origin Key	<i>e-Commerce Only</i> Only required when "V002" is designated for the version. You can obtain this key by following the instructions on the <a href="#">How to get an origin key</a> page on the Adyen website.			

6. On the Action Pane, select **Save**.

## Frequently asked questions

### Can I share a payment terminal with multiple hardware stations?

No. Payment terminals can only be used by a single hardware station or POS terminal. Attempting to connect multiple hardware stations to a single payment terminal will result in locking issues. If a payment terminal must be shared by multiple POS devices, an IIS hardware station must be deployed to manage the payment terminal.

### Can I reuse my existing payment terminal with the Adyen connector?

No. Adyen payment terminals are injected with the Adyen software. Therefore, existing payment terminals that aren't preconfigured with Adyen can't be reused with the Dynamics 365 Payment Connector for Adyen.

### Do I need a static IP address for the Adyen payment terminal?

Yes. Modern POS requires a known IP address to communicate with the Adyen payment terminal. Although the IP address of the Adyen payment terminal can be changed in the client, attempts to keep up with changing IP addresses involve significant overhead and could cause business disruption.

### Can I use my merchant bank?

Yes. Adyen can work with any merchant bank.

## Troubleshooting

### POS payment terminals

#### General issues

For all general issues, you should always consult the Modern POS or IIS Hardware Station event logs first. You can find these logs found under the following nodes in the Microsoft Windows event log:

- Application and Services Logs > Microsoft > Dynamics > Commerce-ModernPOS
- Application and Services Logs > Microsoft > Dynamics > Commerce-Hardware Station

#### Failing payment transactions

When payment transactions aren't successfully processed through the Adyen payment terminal, the corresponding error messages in the Dynamics 365 POS will contain a PSP reference number (PSP is the reference ID provided by Adyen used to uniquely identify each transaction). Provide this reference number when you contact Adyen support for help with specific transactions.

## Common issues

### POS payment terminals

#### The EFT terminal ID isn't set

<b>Title</b>	EFT Terminal ID is not set
<b>Symptom</b>	Payment authorization calls fail, and a hardware error occurs. An error message in the event log indicates that the <b>EFT Terminal ID</b> value isn't set.
<b>Root cause</b>	This issue can occur when the <b>EFT POS Register Number</b> field isn't set on the register or the IIS Hardware Station. It can also occur if the value is set but isn't correctly synced to the POS terminal. Finally, it can also occur when the value is cached.
<b>Fix</b>	Follow the instructions in the <a href="#">Set up a Dynamics 365 register</a> section earlier in this topic. Then run the <b>1070</b> and <b>1090</b> distribution schedules. If the issue isn't resolved, consider reactivating Modern POS, because the value of the <b>EFT POS Register Number</b> field might be cached and might need to be reset.

#### The Modern POS or IIS Hardware Station configuration isn't updated

<b>Title</b>	Config is not updated
--------------	-----------------------

<b>Symptom</b>	Modern POS error: "Sign in Error. The initialization data couldn't be loaded."
<b>Root cause</b>	This issue can occur when the POS is redeployed but the dllhost.config file hasn't been updated.
<b>Fix</b>	Follow the instructions in the <a href="#">Update the Modern POS or IIS Hardware Station configuration</a> section earlier in this topic. Then end the dllhost.exe task on the <b>Details</b> tab in Task Manager, and reopen Modern POS. If you're using an IIS Hardware Station, reset IIS.

#### Invoicing sales orders failed due to stale authorization

TITLE	CAPTURE FAILED DUE TO STALE AUTHORIZATION
<b>Symptom</b>	Invoicing sales orders fails with "Exception has been thrown by the target of an invocation. System.ArgumentNullException: Value cannot be null." The underlying error in the logs is "The following error occurred during the capture call - Dynamics 365 Payment Connector for Adyen: Error code Decline message Capture failed due to stale authorization."
<b>Root cause</b>	This error happens when an authorization older than the <b>Authorization stale period (days)</b> is sent to the payment connector for capture.
<b>Fix</b>	Ensure the value of <b>Number of days before expired in Accounts receivable parameters, Credit Card</b> is set to <b>1 less day</b> than the value set in merchant properties for all channels and then retry invoicing. The recommended value for <b>Authorization stale period (days)</b> is 14 in Adyen merchant properties and 13 in Accounts receivables parameters.

# Saving online payment instruments with the Adyen connector

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the setup and functionality that are related to saving payment instruments when you use the Adyen "card not present" payment connector for the Dynamics e-Commerce platform.

## Key terms

TERM	DESCRIPTION
Token	A string of data that a payment processor provides as a reference. Tokens can represent payment card numbers, payment authorizations, and previous payment captures. Tokens are important because they help keep sensitive data out of the point of sale (POS) system.
Card token	A token that a payment processor provides for storage in the POS system. The card token, or card reference, can be used only by the merchant who receives it
Authorization (Auth) token	After a POS system makes an authorization request to a payment processor, the payment processor provides a unique ID to the POS system as part of the response to that request. This authorization token, or authorization reference, can be used later, when the processor is called to perform actions such as reversing or voiding the authorization. However, an authorization token is most often used to capture funds when an order is fulfilled or when a transaction is being finalized.
List PI	A frequently used generic name for the capability that is described in this topic. List PI refers to the ability to save payment instruments and to list previously used payment instruments during future checkouts that are done through the same e-commerce website.
Named user	An e-commerce customer who is signed in to the online storefront at the time of checkout. Named users have a unique customer ID, and their online purchases are always mapped to the same customer ID whenever they are signed in to the online storefront.

## Overview

When e-commerce orders are created, retailers often offer to save the customer's payment card information so that it can be used for future transactions. This topic explains how that capability ("List PI") is delivered through the Microsoft Dynamics 365 Payment Connector for Adyen. Although the Adyen payment connector supports this capability out of the box, third-party payment connectors require customization. Additionally, not all payment processors might support the same method of saving payment card information.

The out-of-box implementation of the List PI capability relies on the payment processor to keep a mapping of an

online customer's unique ID to the payment instruments that have previously been processed through that payment connector. Only customers who are signed in to the website as named users have the option to save their payment card information for their next online visit. Customers who use a "guest checkout" option when they create an online order won't be able to save payment card information for future transactions.

## Prerequisites

The List PI capability requires the following elements:

- An e-commerce integration with Microsoft Dynamics 365 Commerce
- A payment connector that is compatible with the List PI capability
- A payment processor that maps unique customer IDs to the payment instruments that the customers want that payment processor to save

For more information about how to implement payment connectors and the software development kit (SDK) in general, visit the [Commerce for IT pros and developers home page](#).

## Setup

The List PI capability requires the following components and setup steps:

- **E-commerce integration** – An online storefront integration with Commerce is required. For more information about the e-Commerce SDK, see [e-Commerce platform software development kit \(SDK\)](#).
- **Online payments configuration** – The Dynamics 365 Payment Connector for Adyen supports List PI out of the box. For information about how to configure payments for online stores, see [Dynamics 365 Payment Connector for Adyen](#).

In addition to completing the ecommerce setup steps that are described in that topic, you must set the **Allow saving payment information in e-commerce** option in the Payment accounts fasttab of the **Online store** form to **Yes**.

- **Omni-channel payments configuration** – In the back office, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**. Then, on the **Omni-channel payments** tab, set the **Use omni-channel payments** option to **Yes**.

## Functional experience

### Guest checkout

When e-commerce visitors choose to check out as guests, customer records aren't created during checkout, and the customers can't save payment instruments for their next visit.

### Named user checkout

When named users (signed-in customers) go to the payment step of the checkout process, they will experience the List PI capability. The first time that a named user checks out, a **Save for my next payment** check box appears in the section where credit card information is entered.

A screenshot of a credit card payment form. At the top left, there is a radio button and a credit card icon, followed by the text "Credit Card". Below this, there are four input fields: "Cardholder name:" with the value "J. Smith", "Card Number:" with the value "1234 5678 9012 3456", "Expiry Date:" with the placeholder "MM/YY", and "CVC / CVV:" with the value "123". At the bottom, there is a checkbox labeled "Save for my next payment".

If this check box is selected, when a new credit card is submitted for payment, the named user's unique customer ID is sent to the payment processor, and the credit card is securely saved and mapped to the that unique customer ID.

If the same customer signs in during future visits to the storefront, they will be able to select the same credit card for payment at checkout.

A screenshot of a saved credit card payment method. At the top left, there is a radio button, the VISA logo, and the text "VISA (\*\*\*\* 1111)". Below this, there are two input fields: "Expiry Date:" with the value "10/2020" and "CVV:" with the value "123". At the bottom, there is a plus sign and the text "More payment methods".

### Order fulfillment and processing

E-Commerce orders where the customer applied a tender line by using the List PI capability work in the same way as orders that were created without using a saved card payment. From the standpoint of order processing and fulfillment, the two types of payment are indistinguishable.

## Details of eCommerce payment card tokenization

### Standard flow

In e-Commerce integrations, the payment card is typically entered as part of the checkout process and is saved together with the order before finalization. The card details are entered directly on a payment acceptance page that a payment processor provides. After card details are entered and the customer moves on to the next step of the checkout process, the processor creates a token that is used later in the order creation process.

When the customer finalizes the online order, the payment card token is sent to the payment processor as part of an authorization request. If the payment authorization request is successful, the payment processor replies by sending an authorization token. This authorization token is saved together with the customer's order and is referenced when that order is fulfilled from the back office.

### List PI flow

The main difference between the standard flow and the List PI flow is that the customer doesn't have to enter the full credit card number. Instead, the customer just has to select a previously saved credit card and provide the Card Verification Value (CVV number). If the customer provides the correct CVV number and moves on to

the next step of the checkout process, the payment processor provides a payment card token that will be included in the authorization request.

# Strong Customer Authentication (SCA) using the Adyen connector

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes Strong Customer Authentication (SCA) support built into the Adyen connector.

## Key terms

TERM	DESCRIPTION
Redirect	The action of moving an online shopper's browsing session out of the context of the merchant's storefront.
SCA	Strong Customer Authentication. Part of the EU Payment Services Directive 2.0 (PSD2.0) that requires online shoppers to be authenticated outside of their online shopping experience when paying with an electronic payment method.
Issuing bank	The financial institution that issues a payment instrument to a customer.

## Overview

PSD2.0 requires that SCA be supported during online shopping checkout so a customer can be authenticated by the bank that issued their payment method. The authentication commonly occurs when a shopper is going through the checkout for an online order and after they have provided their payment details. Those details are evaluated, and based on criteria provided by PSD2.0, the customer may be redirected to their bank. After being redirected to their bank, the customer is required to provide some form of authentication to confirm that they are an authorized user for the payment instrument. If the user is confirmed to be the cardholder, they are then redirected back to the storefront where the payment was previously submitted, after which checkout is allowed to proceed. If SCA fails, the process will not allowed to continue for the transaction.

## Prerequisites for SCA support

Support for SCA is provided by the out-of-box [Dynamics 365 Payment Connector for Adyen](#). This can be implemented by any third-party connector using the payments SDK.

## Setup

Setup details will vary by payment connector. For setup details related to the out-of-box Adyen connector, see the [e-Commerce section](#) of the Adyen connector topic.

## Functional experience

When a customer is redirected for SCA, they will be presented with a challenge by their bank, typically within a new browser window or iFrame. After they have been authenticated, they will be redirected back to the checkout session. If the validation fails, they will not be allowed to continue with checkout.

# Dedicated payment terminals and prompts for a printer and cash drawer

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about the capability to have a dedicated payment terminal and prompt the user to select a cash drawer and a receipt printer.

## Overview

Modern retailers are searching for ways to streamline the in-store checkout experience. Recent trends toward paperless checkout through electronic payments not only help to make the purchasing experience smoother but also reduce the need to have a full complement of peripheral devices available for every store associate.

Microsoft Dynamics 365 Commerce supports these trends by enabling a scenario where a point of sale (POS) device has a dedicated payment terminal assigned to it all the time, but it doesn't have its own receipt printer or cash drawer. When associates must print a receipt or take a cash payment, they are prompted to select a hardware station where those devices are configured.

## Key terms

TERM	DESCRIPTION
Register	The entity that is used to configure an instance of a POS register.
Device	A representation of the physical instance of a POS register and the Modern POS application that is assigned to it.
Dedicated hardware station	The hardware station business logic that is built into the Modern POS for Windows and Modern POS for Android applications.
Drawer kick (d/k) port	A traditional method for connecting a cash drawer to a receipt printer.
Network peripherals	Built-in support for network-enabled payment terminals, receipt printers, and cash drawers.

## Supported POS clients and devices

The functionality that is described in this topic is supported by the Modern POS for Windows and Modern POS for Android POS clients.

This functionality supports network-enabled payment terminals and receipt printers. You can provide cash drawer support by connecting the cash drawer to the network-enabled receipt printer via the d/k port.

Out-of-box support for this functionality is provided by the [Dynamics 365 Payment Connector for Adyen](#). However, other payment connectors might be supported via the Commerce software development kit (SDK) for payments. Supported receipt printers include network-enabled receipt printers from Star Micronics and Epson.

To set up Star Micronics receipt printers, use the Star Micronics Printer Utility to configure the device so that it

can be used over the network. This utility will also provide the IP address of the device.

To set up Epson receipt printers, use the Epson ePOS-Print utility to set up the device to use network protocols.

For more information about how to set up network peripherals, see [Network peripheral support overview](#).

## Set up a dedicated payment terminal and a prompt for a printer and cash drawer

### Set up hardware profiles

You must have two types of hardware profile. The first is assigned to the register. The second is assigned to a hardware station at the store level, and is used to logically group network receipt printers and cash drawers.

#### Set up a hardware profile for the register

To set up the hardware profile that is assigned to the register, follow these steps.

1. In Dynamics 365 Commerce, search for **Hardware profile**.
2. Select **New**.
3. Assign a hardware profile number, and then enter a description. This hardware profile will be assigned to the register itself. Therefore, a description such as **Dedicated with fallback** will suffice.
4. On the FastTabs for different device types, set up the following device types.

DEVICE	TYPE	DEVICE NAME	ADDITIONAL DETAILS
Printer	Fallback	<i>Any</i>	The device name is case-sensitive. The <b>Receipt profile ID</b> should be the same as the <b>Receipt profile ID</b> that is mapped to the network printer that is set up in the hardware profile that is assigned to the hardware station at the channel level.
Cash drawer	Fallback	<i>Any</i>	The device name is case-sensitive. Set the <b>Use shared shift</b> option to <b>Yes</b> .
EFT service	Adyen	Not applicable	For information about how to set up the out-of-box Adyen connector, see <a href="#">Dynamics 365 Payment Connector for Adyen</a> . Other payment connectors can be supported via the <a href="#">Commerce software development kit (SDK) for payments</a> .
PIN pad	Network	<b>MicrosoftAdyenDevice V001</b>	None.

5. In Dynamics 365 Commerce, search for **Registers**.

6. Select a register by selecting the register number, and then select **Edit**.
7. Assign the hardware profile that you just created to the register that should use a dedicated payment terminal. The device that is mapped to this register must use either the Modern POS for Windows application or the Modern POS for Android application.
8. Select **Save**.
9. On the Action Pane, on the **Registers** tab, select **Configure IP addresses**.
10. On the **PIN pad** FastTab, enter the IP address of the payment terminal. For information about how to get the IP address of the payment terminal by using the Adyen connector, see [Dynamics 365 Payment Connector for Adyen](#).
11. Select **Save**.

#### Set up a hardware profile for the receipt printer and cash drawer

To set up the hardware profile that is used to group the network receipt printer and cash drawer, follow these steps.

1. In Dynamics 365 Commerce, search for **Hardware profile**.
2. Select **New**.
3. Assign a hardware profile number, and then enter a description. This hardware profile will be used to group the receipt printer and cash drawer. Therefore, a description such as **Network printer and cash drawer** will suffice.
4. On the FastTabs for different device types, set up the following device types.

DEVICE	TYPE	DESCRIPTION	ADDITIONAL DETAILS
Printer	Network	<b>Epson or Star</b>	The device name is case-sensitive. The <b>Receipt profile ID</b> should be the same as the <b>Receipt profile ID</b> that is mapped to the printer that is set up in the hardware profile that is assigned to the register.
Cash drawer	Network	<b>Epson or Star</b>	The device name is case-sensitive. set the <b>Use shared shift</b> option to <b>Yes</b> .

5. Select **Save**.

#### Set up hardware stations

You must have two hardware stations. The first will be mapped to the register. The second will be selected as it's required, whenever a receipt must be printed or a cash drawer must be opened.

#### Register a hardware station

1. In Dynamics 365 Commerce, search for **All stores**.
2. Select a store by selecting its **Retail Channel Id** values, and then select **Edit**.
3. On the **Hardware stations** FastTab, select **Add**.
4. Set the **Hardware station type** field to **Dedicated**.
5. Enter a description, but don't set any other values for this hardware station. This hardware station will be

used for the register at all times.

#### **Set up a hardware station for the receipt printer and cash drawer**

1. In Dynamics 365 Commerce, search for **All stores**.
2. Select a store by selecting its **Retail Channel Id** values, and then select **Edit**.
3. On the **Hardware stations** FastTab, select **Add**.
4. Set the **Hardware station type** field to **Dedicated**.
5. Enter a description. This hardware station will be used for the receipt printer and cash drawer.
6. In the **Hardware profile** field, select the hardware profile that you previously created for the receipt printer and cash drawer.
7. Select **Save**.
8. While the hardware station for the receipt printer and cash drawer is still selected, select **Configure IP addresses**.
9. Obtain the IP address for the printer, and enter it as the IP address for both the receipt printer and the cash drawer.
10. Select **Save**.
11. Search for **Distribution schedules**.
12. Select distribution schedule **1090**, and then select **Run now**.
13. Select distribution schedule **1070**, and then select **Run now**.

#### **Set up the system to prompt for receipt printer and cash drawer selection as it's required**

1. In a supported POS client, close the current shift, if a shift is open.
2. Sign in, and then select **Non-drawer drawer operations**.
3. Use the **Manage hardware stations** operation to turn on a hardware station.
4. Select the hardware station that you created for the register to make it active.
5. Sign out of the POS, sign back in, and open a shift.

The payment terminal that is assigned to the hardware profile will now always be active, and you will be prompted if a receipt printer or cash drawer is required.

Many merchants who requested this feature are interested in reducing waste by providing email receipts and encouraging electronic payments. Depending on the configuration of the POS, store associates are prompted to select a receipt printer or cash drawer only when a customer wants a physical receipt or wants to pay with cash.

Store associates are prompted to select a hardware station only one time per transaction, unless a receipt must be printed and cash is used for payment, but the hardware profile that was originally selected doesn't include both devices. In that case, the store associate will be prompted again to select a hardware station that can be used to complete the transaction.

# Seamless offline switch for gift card and credit memo operations

2/18/2021 • 2 minutes to read • [Edit Online](#)

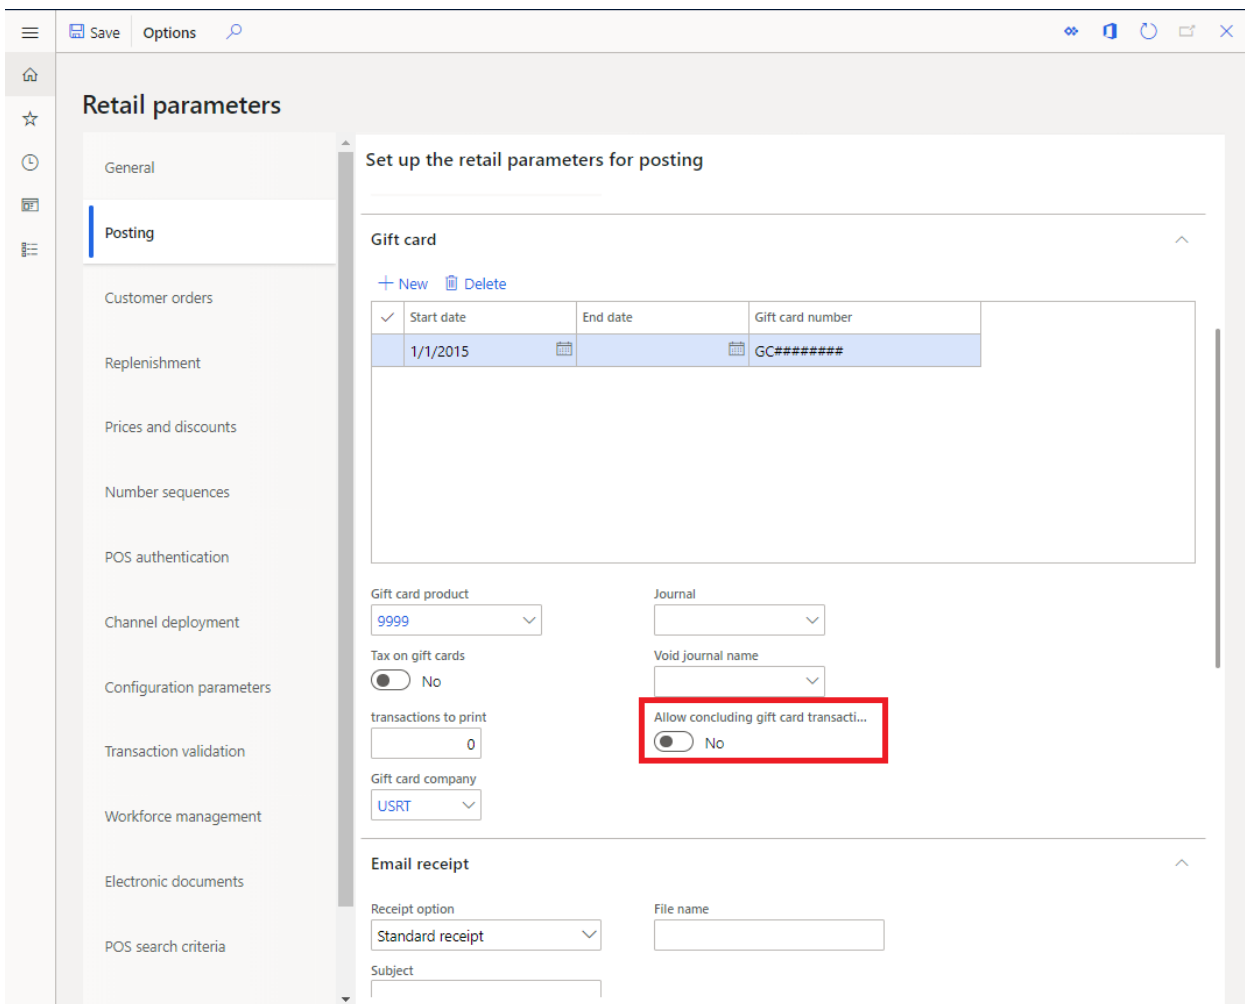

If a point of sale (POS) device loses its connection to the channel database, most POS operations and transactions that were in progress can proceed after the cashier receives a warning message about the loss of connectivity. However, in some cases, transactions have elements that rely on the real-time service, and those elements aren't supported when the POS is offline. This topic describes some functionality that helps reduce the impact of lost connectivity in these scenarios.

## Completing gift card transactions in offline mode

Internal gift cards depend on the real-time service, because the balance for the gift cards must be centrally maintained in Microsoft Dynamics 365 Commerce Headquarters. To help prevent fraud or other synchronization issues, gift cards are locked as soon as they are added to a transaction. The locking function ensures that a gift card can't be used on multiple terminals at the same time. When a transaction is completed, the gift card is updated and unlocked.

However, if the POS loses connectivity after a gift card has been added to a transaction, the gift card can become unusable. To help prevent this situation, Dynamics 365 Commerce has a parameter that enables transactions that include a gift card line to be completed while the POS is offline. When this parameter is turned on, gift card transactions that are forced offline will be saved together with offline transactions, and they will be synced to Commerce Headquarters when the offline transactions are synced. The synchronization will also unlock the gift card so that it can be used at another terminal.

To enable the functionality to conclude gift card transactions after switching to offline mode, go to the **Posting** tab on the **Commerce parameters** page. On that tab, locate the **Gift card** fasttab and set **Allow concluding gift card transactions in offline mode** to **Yes**.

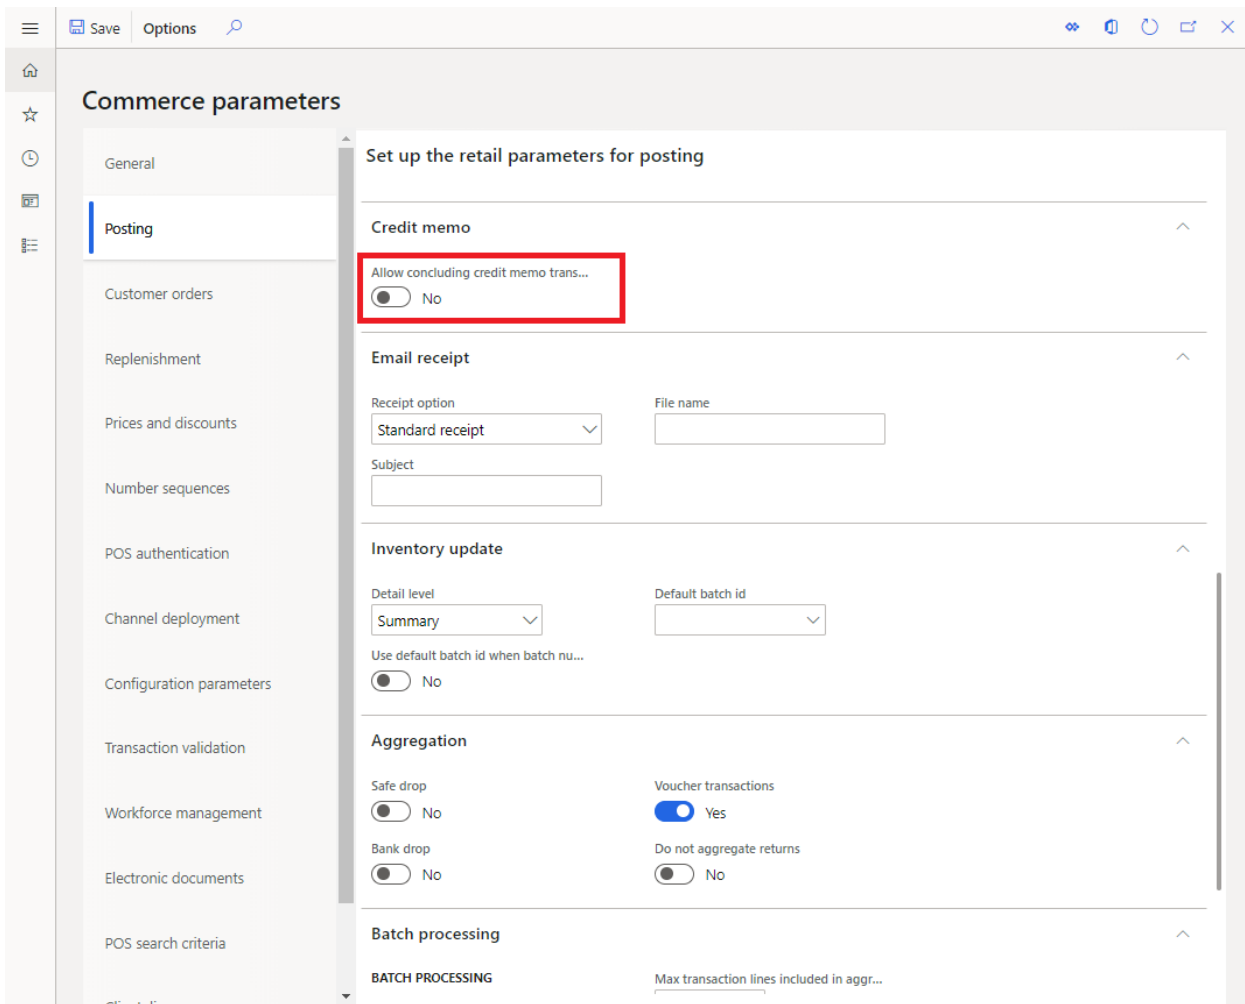

Commerce parameters are typically cached. Therefore, after the setting of this parameter is updated, and the distribution schedule is initiated to sync the change to the channel, the change can take up to 24 hours to take effect. To make the change effective immediately, reset Microsoft Internet Information Services (IIS).

## Completing credit memo transactions in offline mode

Like internal gift cards, credit memos are centrally maintained in Commerce Headquarters. Commerce has a parameter that enables credit memo transactions to be completed while the POS is offline. This parameter works like the gift card parameter that was mentioned in the previous section. When the parameter is turned on, credit memo transactions that are forced offline will be synced back to the channel database, together with other transactions that were performed while the POS was offline.

To enable the functionality to conclude credit memo transactions after switching to offline mode, go to the **Posting** tab on the **Commerce parameters** page. On that tab, locate the **Credit memo** fasttab and set **Allow concluding credit memo transactions in offline mode** to **Yes**.

Commerce parameters are typically cached. Therefore, after the setting of this parameter is updated, and the distribution schedule is initiated to sync the change to the channel, the change can take up to 24 hours to take effect. To make the change effective immediately, reset IIS.

# Set up pay invoice scenarios

2/18/2021 • 2 minutes to read • [Edit Online](#)

The Pay invoice functionality in Dynamics 365 Commerce has been expanded to support:

- Payoff of multiple sales order invoices in a single POS transaction.
- Payment of various customer invoice types including free text invoices, project-based invoices, and credit notes.

To enable these scenarios, the functionality profile for stores must be configured as outlined in below.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles** and select a profile that's linked to the stores that you want to make the changes for.
2. On the **Functions** tab, configure the following parameters as needed.
  - **Sales order invoice** – Select **Yes** to allow users to pay one or more sales order-based invoices in a single POS transaction.
  - **Free text invoice** – Select **Yes** to allow users to pay one or more free text-based invoices in a single POS transaction.
  - **Project invoice** – Select **Yes** to allow users to pay one or more project-based invoices in a single POS transaction.
  - **Sales order credit note** – Select **Yes** to allow users to settle multiple sales order-based credit notes against open invoices or process a refund to the customer for an open credit note.

## NOTE

Payment or settlement of partial amounts is not yet supported.

## NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Duplicate payments prevention

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic provides an overview of the duplicate payments protection feature for Dynamics 365 Commerce Modern POS.

## Overview

This topic describes the user experience when the point of sale (POS) recovers from a loss of communication with the payment terminal, which causes the POS and the payment terminal to be out of sync.

The duplicate payment protection feature ensures that Modern POS can seamlessly recover from a loss of communication without requiring the shopper to process another payment through the payment terminal, which can lead to duplicate payments.

### NOTE

The duplicate payments protection feature is only supported for payments made using payment terminals.

This topic covers the following aspects of the duplicate payment protection feature:

- [Prerequisites](#) – Set of prerequisites to leverage this feature in Modern POS.
- [Scenario details](#) – Detailed description of the scenarios covered by the duplicate payment protection feature.
- [Troubleshooting](#) – Steps to take when encountering issues with the duplicate payment protection feature.
- [Additional resources](#) – List of related articles you might find useful when using the duplicate payment protection feature.

## Prerequisites

- The payment connector and corresponding payment gateway or processor must support this feature. The *payment connector* is an extension which facilitates communication between Commerce (and associated components) and a payment service. The connector described in this topic was implemented using the standard payments SDK.
- If a connector implements the corresponding duplicate payment protection interfaces, the feature is automatically enabled in Modern POS. Otherwise, it is automatically turned off.

## Scenario details

The duplicate payment protection feature is applicable to any scenario in which a payment is initiated and completed on a payment terminal, but Modern POS is unable to receive the corresponding response. As a result, the customer's card (such as a credit card) is charged but the payment line is not added to the POS. In most cases, the cashier will trigger a subsequent payment on the payment terminal, which results in a duplicate payment for the customer.

### How duplicate payments scenarios are triggered

#### 1. Cashier initiates payment

The cashier initiates a card payment by clicking **Pay card**, navigates to the **Payment** page, and clicks **Tender**.

## 2. Customer interacts with payment terminal

After the payment is initiated, the payment terminal prompts the customer for payment. The customer initiates the payment process on the payment terminal.

## 3. Modern POS loses connectivity to the payment terminal

- While the customer is running a payment on the payment terminal, Modern POS loses connectivity to the payment terminal because it either crashes, loses network connectivity, is closed, or the terminal is rebooted.
- The cashier will re-launch Modern POS and address any connectivity issues.

## 4. Customer completes payment on the payment terminal

As Modern POS is being reset, the customer completes the payment on the payment terminal and is charged.

## 5. Modern POS is launched

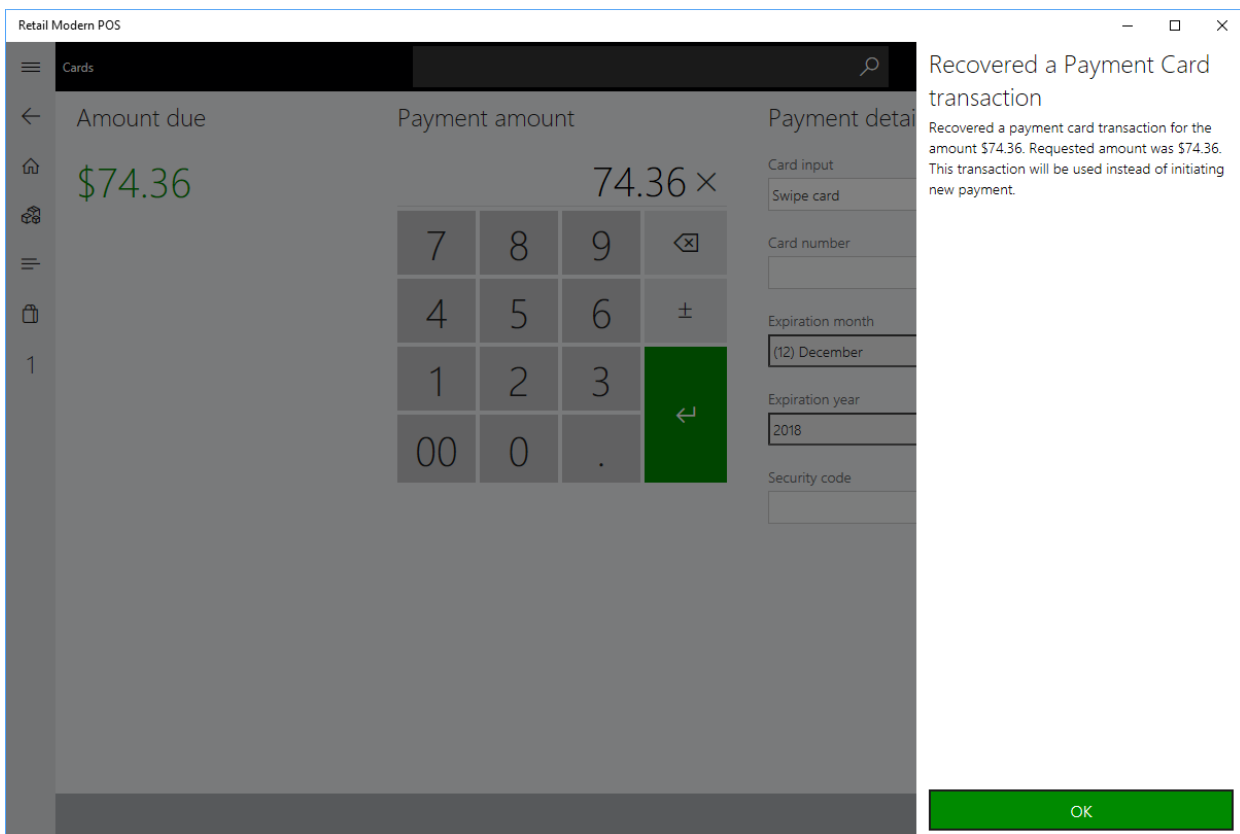

The cashier completes the reset/launch of Modern POS but the payment is not added to the cart.

### Payment recovery scenarios

Once the POS or network communications have been recovered, there are several scenarios that will result in the cashier being prompted to use the previous payment. Here are a few scenarios that can trigger payment recovery:

If there is an unrecovered payment and the cashier takes one of the following actions, the cashier is shown a dialog box indicating that a payment has already been made.

- Invokes another payment for any amount using a card payment.
- Invokes another payment for any amount using a cash payment.
- Attempts to void a line on the cart.
- Attempts to void the transaction.
- Attempts to suspend the transaction.

When the cashier clicks **OK**, the payment is recovered and added as a payment line to the cart.

The primary function of the duplicate payment protection feature is to put Modern POS back into the same state it would be if the original payment would have been successfully processed and the corresponding payment line was added to the cart.

### How to skip payment recovery

In some cases, the cashier might explicitly choose to skip the duplicate payment protection and opt not to recover a previous payment. In those cases, the cashier can use the following steps described to void the transaction without recovering the payment.

#### 1. Re-launch Modern POS

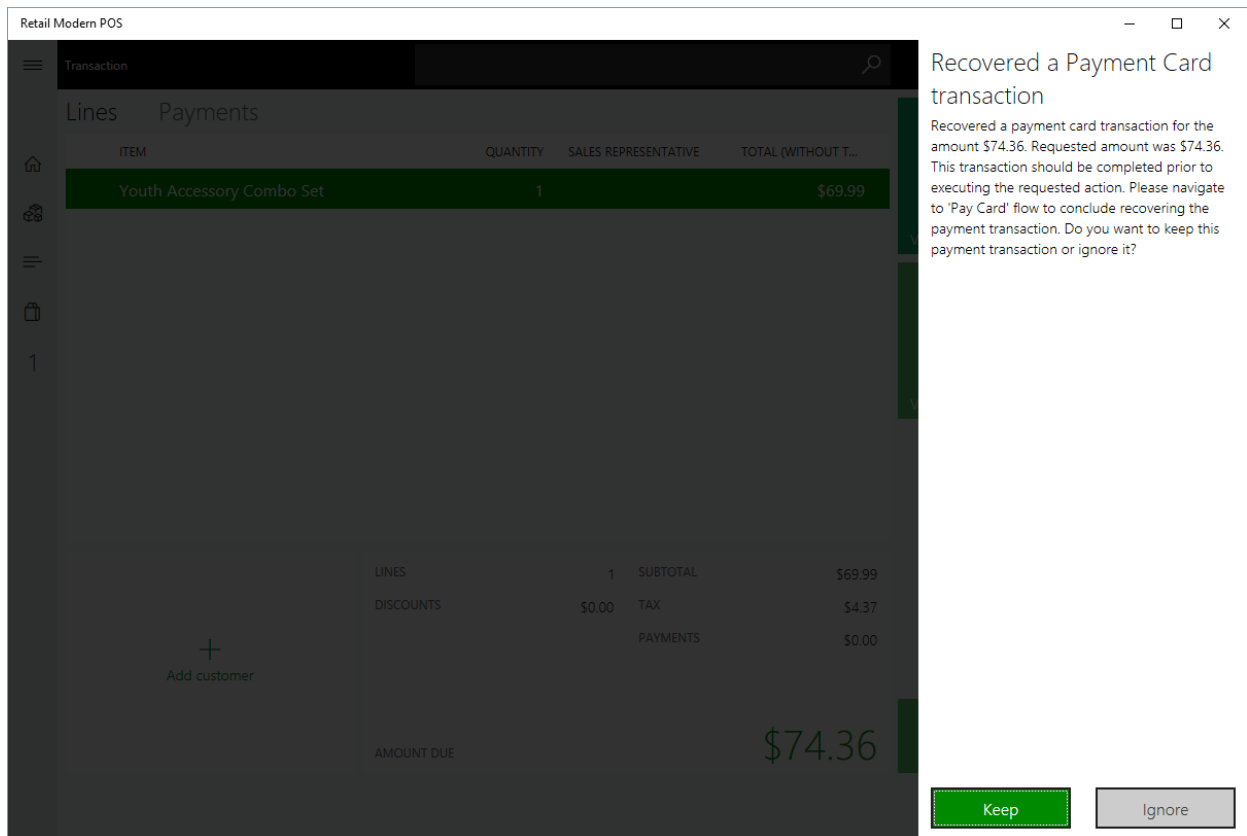

After Modern POS has lost connectivity to the payment terminal, re-launch the POS.

#### 2. Void the transaction

Navigate to the cart page and click **Void Transaction**.

#### 3. Ignore the recovered payment

A new dialog box will appear indicating that a recovered payment is available. Click **Ignore** to skip the payment recovery.

### What to do if the customer leaves the store

In some cases, the customer might leave the store before the cashier can finalize the transaction. In those cases, follow the steps described in the [How to skip payment recovery](#) section to void the transaction and manually void the payment on the portal of the payment gateway/processor.

## Troubleshooting

### General issues

For all general issues, you should always consult the Modern POS or IIS Hardware Station event logs first. The logs can be found under these nodes in the Windows event log:

- [Application and Services Logs > Microsoft > Dynamics > Commerce-ModernPOS](#)
- [Application and Services Logs > Microsoft > Dynamics > Commerce-Hardware Station](#)

### **Validate that the customer is not double charged**

Even if the duplicate payment protection feature is enabled, it is generally recommended that the merchant verifies that no double charge has occurred. To do this, check all transactions on the corresponding payment gateway/processor portal.

### **Payment recovery fails**

An error may occur while a previous payment is being recovered on Modern POS. This can happen if there is an issue in the payment connector or payment gateway/processor that does not allow the previous payment to be recovered. To resolve this issue, because the previous payment cannot be recovered, the cashier must skip the recovery as described in the [How to skip Payment Recovery](#) section.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Omni-channel payments overview

2/18/2021 • 16 minutes to read • [Edit Online](#)

This topic provides an overview of omni-channel payments in Dynamics 365 Commerce. It includes a comprehensive list of supported scenarios, information about functionality, setup, and troubleshooting, and descriptions of some typical issues.

## Key terms

TERM	DESCRIPTION
Token	A string of data that a payment processor provides as a reference. Tokens can represent payment card numbers, payment authorizations, and previous payment captures. Tokens are important because they help keep sensitive data out of the point of sale (POS) system. They are sometimes also referred to as <i>references</i> .
Card token	A token that a payment processor provides for storage in the POS system. A card token can be used only by the merchant who receives it. Card tokens are sometimes also referred to as <i>card references</i> .
Authorization (auth) token	A unique ID that a payment process provides as part of the response that it sends to a POS system after the POS system makes an authorization request. An authorization token can be used later if the processor is called to perform actions such as reversing or voiding the authorization. However, it's most often used to capture funds when an order is fulfilled or a transaction is finalized. Authorization tokens are sometimes also referred to as <i>authorization references</i> .
Capture token	A reference that a payment processor provides to a POS system when a payment is finalized or captured. The capture token can then be used to reference the payment capture in subsequent operations, such as refund requests.
Card not present	A term that refers to payment transactions where a physical card isn't presented. For example, these transactions can occur in e-commerce or call center scenarios. For these transactions, the payment-related information is manually entered on an e-commerce website, in a call center flow, or on the POS or payment terminal.
Card present	A term that refers to payment transactions where a physical card is presented and used on a payment terminal that is connected to the Microsoft Dynamics 365 POS system.

## Overview

In general, the term *omni-channel payments* describes the ability to create an order in one channel and fulfill it in another channel. The key to omni-channel payment support is preserving payment details together with the

rest of the order details, and then using those payment details when the order is recalled or processed in another channel. A classic example is the "Buy online, pick up in store" scenario. In this scenario, the payment details are added when the order is created online. They are then recalled at the POS to charge the customer's payment card at the time of pickup.

All the scenarios that are described in this topic can be implemented by using the standard Payments software development kit (SDK) that is provided with Commerce. The [Dynamics 365 Payment Connector for Adyen](#) provides an out-of-box implementation of every scenario that is described here.

## Prerequisites

Every scenario that is described in this topic requires a payment connector that supports omni-channel payments. The out-of-box Adyen connector can also be used, because it supports the scenarios that are made available through the Payments SDK. For more information about how to implement payment connectors, and about the Retail SDK in general, visit the [Retail for IT pros and developers home page](#).

## Supported versions

The omni-channel payment capabilities that are described in this topic were released as part of Microsoft Dynamics 365 for Retail version 8.1.3.

### "Card present" and "card not present" connectors

The Payments SDK relies on two sets of application programming interfaces (APIs) for payments. The first set of APIs is named `iPaymentProcessor`. It's used to implement "card not present" payment connectors that can be used in call centers and with the Microsoft Dynamics e-Commerce platform. For more information about the `iPaymentProcessor` interface, see the [Implement a payment connector and a payment device](#) white paper, which covers payments.

The second set of APIs is named `iNamedRequestHandler`. It supports the implementation of "card present" payment integrations that use a payment terminal. For more information about the `iNamedRequestHandler` interface, see [Create a payment integration for a payment terminal](#).

## Setup and configuration

The following components and setup steps are required:

- **eCommerce integration:** An integration with Commerce is required to support scenarios where an order originates in an online storefront. For more information about the Retail e-Commerce SDK, see [e-Commerce platform software development kit \(SDK\)](#). In a demo environment, the reference storefront supports omni-channel payment scenarios.
- **Online payments configuration:** The setup of the online channel must include a payment connector that has been updated to support omni-channel payments. Alternatively, the out-of-box payment connector can be used. For information about how to configure the Adyen payment connector for online stores, see [Adyen payment connector](#). In addition to the eCommerce setup steps that are described in that topic, the **Allow saving payment information in e-commerce** parameter must be set to **True** in the settings for the Adyen connector.
- **Omni-channel payments configuration:** In the back office, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**. Then, on the **Omni-channel payments** tab, set the **Use omni-channel payments** option to **Yes**. In Commerce versions 10.0.12 and later, this setting is in the **Feature Management** workspace. Select the **Omni-channel payments** feature and click **Enable now**.
- **Payment services:** The call center uses the default payment connector on the **Payment services** page to process payments. To support scenarios such as "Buy in call center, pick up in store," this default payment connector must be the Adyen payment connector or a payment connector that meets the implementation requirements for omni-channel payments.
- **EFT service:** Payments through a payment terminal must be set up on the **EFT service** FastTab of the hardware profile. The Adyen connector supports omni-channel payments scenarios out of the box. Other

payment connectors that support the `iNamedRequestHandler` interface can also be used if they support omni-channel payments.

- **Payment connector availability:** When an order is recalled, the payment tender lines that are recalled together with the order include the name of the payment connector that was used to create the authorizations that are associated with that order. When the order is fulfilled, the Payments SDK tries to use the same connector that was used to create the original authorization. Therefore, a payment connector that has the same merchant properties must be available for capture.
- **Card types:** For omni-channel scenarios to work properly, each channel must have the same setup for tender types that can be used for omni-channel. This setup includes payment method IDs and card type IDs. For example, if the `Cards` tender type has an ID of 2 in the online store setup, it should have the same ID in the retail store setup. The same requirement applies to card type IDs. If card number 12 is set to `VISA` in the online store, the same ID should be set up for the retail store.
- The Retail Modern POS for Windows or Android with built-in hardware station -or-
- Modern POS for iOS or Cloud POS with connected shared hardware station.

### Basic principle supporting omni-channel payments

Payment connectors and payment processors use tokens, or references, to reference interactions that are related to card payments. For example, when a payment authorization is requested, a reference to that authorization is provided. Therefore, the authorization can be referenced later, when funds are captured at the time of fulfillment. This authorization is unique to the merchant, payment connector, and processor.

If an order that was created online is being picked up in the store, the same payment details for that order must be recalled and used. When the original details are provided as part of the request to capture a payment against the original authorization, the payment processor will be able to handle the request and capture the payment.

To correctly reference the online order, a "card not present" payment connector that supports the same processor must also be available. In this way, the POS system can have one processor for "card present" payments, but it can also have access to other payment connectors so that it can fulfill orders that are created in other channels by using different payment processors.

## Supported scenarios

The following omni-channel payment scenarios are supported:

- Buy online, pick up in store
- Buy in call center, pick up in store
- Buy in store A, pick up in store B
- Buy in store A, ship to customer

#### NOTE

Payments made in the call center that map to the "Normal" payment function must be marked as **Prepay = Yes** to be reflected in the amount due when recalling the order in the POS. Non-prepay payments of type "Normal" are not recognized when the order is recalled in POS.

Variations of these scenarios are also supported. For example, an online order might include both lines that will be shipped to the customer and lines that will be picked up in a store. All order fulfillment options are supported via omni-channel payments.

The following sections describe the steps for each scenario and show how to run the scenario by using demo data.

## Buy online, pick up in store

Before you start, make sure that the following prerequisites are in place:

- You have a reference storefront where the Adyen connector is configured.
- The **Omni-channel payments** option on the **Commerce shared parameters** page is set to **True**. In later versions this setting is moved to the **Feature Management** workspace where you can select the **Omni-channel payments** feature and click **Enable now**.
- The Adyen payment connector is configured for the Houston POS register.
- The Retail Modern POS for Windows or Android with built-in hardware station -or-
- Modern POS for iOS or Cloud POS with connected shared hardware station.

Follow these steps to run the scenario.

1. In the reference storefront, create an order for in-store pickup. Be sure to select the **Houston** store.
2. Go through the checkout steps, and pay by using a test credit card number. You can find test credit card numbers on the [Adyen test card numbers page](#).
3. In Commerce, use the **Synchronize orders** batch job and the **P-001** distribution schedule to create the orders in the back office.
4. In the POS, on the welcome page, select the **Orders to pickup** operation to see the orders for in-store pickup.
5. Select one or more lines from the order that was created in the reference storefront, and then select **Pick up**.

The order is retrieved from the back office.

6. When the order line details are retrieved from the back office, and a card payment that can be used for omni-channel is detected, you're informed that a payment method is available.
7. Select **Use available payment method** to complete the transaction by using the card details that were entered in the reference storefront.

The order lines are loaded on the transaction page, and the balance due is 0 (zero).

8. Select the **Payments** tab to view the tender line that was pulled from the online order.
9. Select any payment method to complete the transaction.

## Buy in call center, pick up in store

1. In Commerce, on the **Customer service** page, enter **Karen Berg** in the search bar, and then select **Search**.
2. Select **Karen Berg** in the search results.
3. After Karen is loaded onto the **Customer service** page, select **New sales order**.
4. On the new sales order page, select **Header** to view the order header.
5. On the **Order header** page, set the site to **Central** and the warehouse to **Houston**.
6. On the **Deliver** tab, set the **Mode of delivery** field to **60** for customer pickup.
7. Select **Lines**, and then add one or more lines to the order.
8. Select **Complete** to enter the order completion flow.
9. Scroll down to the payments section, select **Add**, and then select a line where the payment method type is set to **Cards**.

10. Select the plus sign (+) to add a card payment.
11. Enter the details for a test credit card number that you found on the [Adyen test card numbers page](#), and then select **OK**.

**NOTE**

If the card brand for the card number that you entered differs from the brand that was selected when the payment was initiated, the payment will still go through. However, it will be posted to the accounts that are mapped to the card brand that you selected in step 10.

12. Select **OK** again to close the **Order completion payments** dialog box.
13. On the **Sales order summary** page, select **Submit**.
14. In the POS, on the welcome page, select the **Orders to pickup** operation to see the orders for in-store pickup.
15. Select one or more lines from the order that was created in the reference storefront, and then select **Pick up**.  
  
The order is retrieved from the back office.
16. When the order line details are retrieved from the back office, and a card payment that can be used for omni-channel is detected, you're informed that a payment method is available.
17. Select **Use available payment method** to complete the transaction by using the card details that were entered in the reference storefront.  
  
The order lines are loaded on the transaction page, and the balance due is 0 (zero).
18. Select the **Payments** tab to view the tender line that was pulled from the online order.
19. Select any payment method to complete the transaction.

**Buy in store A, pick up in store B**

1. Start the POS for the Houston store.
2. On the **Transaction** page, add Karen Berg to the transaction by using the number pad to enter **2001**.
3. Add one or more lines to the transaction.
4. Select **Orders** to see the order options.
5. Select **Pick up all**, and then, when you're prompted, select **Customer order**.
6. In the search bar, enter **Seattle**, and then select the **Seattle** store for pickup.
7. Select **OK** to accept the current date as the date of pickup.
8. Select **Pay card** to initiate the payment.
9. Tender the card payment for the amount that is due for the deposit.
10. Complete the deposit payment on the payment terminal.
11. After the deposit is paid, select the option to use the same card for fulfillment, and wait for the order to be completed.
12. Start the POS for the Seattle store.
13. In the POS, on the welcome page, select the **Orders to pickup** operation to see the orders for in-store

pickup.

14. Select one or more lines from the order that was created in the reference storefront, and then select **Pick up**.

The order is retrieved from the back office.

15. When the order line details are retrieved from the back office, and a card payment that can be used for omni-channel is detected, you're informed that a payment method is available.
16. Select **Use available payment method** to complete the transaction by using the card details that were entered in the reference storefront.

The order lines are loaded on the transaction page, and the balance due is 0 (zero).

17. Select the **Payments** tab to view the tender line that was pulled from the online order.
18. Select any payment method to complete the transaction.

### **Buy in store A, ship to customer**

1. Start the POS for the Houston store.
2. On the **Transaction** page, add Karen Berg to the transaction by using the number pad to enter **2001**.
3. Add one or more lines to the transaction.
4. Select **Orders** to see the order options.
5. Select **Ship all**, and then, when you're prompted, select **Customer order**.
6. In the shipping method page, select **Standard overnight**, and then select **OK** to accept today's date as the shipping date.
7. Select **OK** to accept the current date as the date of pickup.
8. Select **Pay card** to initiate the payment.
9. Tender the card payment for the amount that is due for the deposit.
10. Complete the deposit payment on the payment terminal.
11. After the deposit is paid, select the option to use the same card for fulfillment, and wait for the order to be completed.

When the order is picked, packed, and invoiced in the back office, the payment details that are provided at the POS will be used to capture the funds for the goods that are being shipped to the customer.

## Scenario details

In addition to the basic scenarios that were just described, several enhancements have been made to the Payments SDK to support omni-channel payments.

### **POS**

#### **Single swipe/dip for customer orders**

Before the omni-channel payments feature was implemented, when customer orders that included deposits were created at the POS, customers were required to swipe (or dip) their card two times: one time to pay the deposit and one time to tokenize the card for subsequent order fulfillment. When the omni-channel tokenization feature is turned on, customers must swipe their card only one time to both pay the deposit and authorize the amount that is due for goods that will be fulfilled later. At the time of fulfillment, the authorized funds are captured. Before the omni-channel tokenization feature was implemented, only a recurring card token was created for subsequent order fulfillment. Therefore, the funds for the pending fulfillment weren't authorized, and because those funds weren't being held for that specific purchase, it was less likely that they could be captured later.

#### NOTE

Single swipe isn't supported in Retail version 8.1.3. Customer orders in version 8.1.3 use the same flow that was used before the omni-channel tokenization feature was implemented.

### Cards that can't issue recurring card tokens

Some cards can't be used for omni-channel payments, because they don't support issuing recurring card tokens. When an order is created at the POS, if the deposit is paid by using a card that doesn't support recurring card tokens, the previous card tokenization flow is used. Therefore, a customer who wants to provide a payment that will be used for subsequent order fulfillment must present a second card. If the second card doesn't support recurring card tokens, the tokenization action will be declined, and the cashier will be prompted to ask the customer to provide a different card.

### Using a different card

A customer who comes to the store for order pickup has the option to use a different card. When the cashier receives the **Use available payment method** prompt at the time of order pickup, he or she can ask whether the customer wants to use the same card. If the customer has lost the card that was used to create the order and wants to pay for the order by using a different card, the cashier can select **Use a different payment method**. If the customer comes back later to pick up more items for the same order, if the original card authorization is still valid, the cashier can again ask whether the customer wants to use that card.

### Invalid authorizations

If the card that was used to create an order is no longer valid, when products are selected for pickup, the payment capture request will fail. The POS payment connector will then try to create a new authorization and capture by using the same card details. If the new authorization or capture fails, the cashier will be informed that the payment could not be processed. The cashier must then get a new payment from the customer.

### Multiple available payments

When an order that has multiple tenders and multiple lines is picked up, the cashier first receives the **Use available payment method** prompt. If there are multiple cards, when the cashier selects **Use available payment method**, existing card tender lines will be captured until the balance is met for the goods that are currently being picked up. The cashier won't have the option to select the card that should be used for the goods that are being picked up.

# Omni-channel Commerce order payments

2/18/2021 • 12 minutes to read • [Edit Online](#)

This topic describes the omni-channel Commerce order payments feature in Microsoft Dynamics 365 Commerce. This feature lets you edit e-commerce and point of sale (POS) order payments from Commerce headquarters.

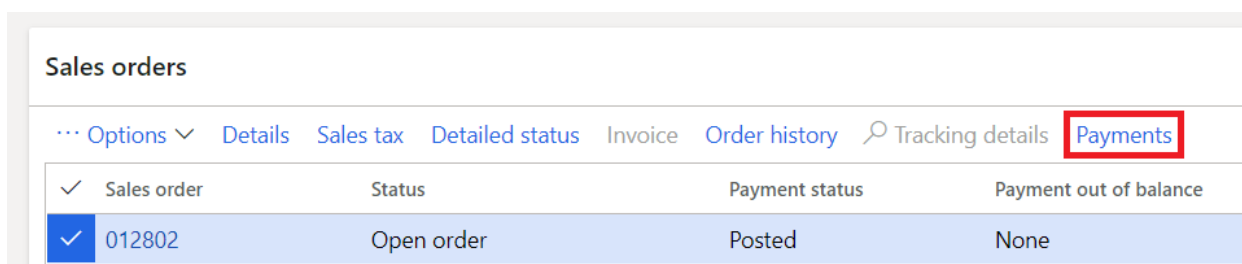

## Key terms

TERM	DESCRIPTION
Commerce payment	A payment that is associated with a customer order that was generated at the POS or in the e-commerce storefront.
Order completion	The business logic in the call center that ensures that payments have been collected before an order is submitted. The <b>Enable order completion</b> setting in the call center parameters is used to turn on this business logic. For more information, see <a href="#">Enable order completion</a> .
Call center order	An order that a call center user creates in Commerce headquarters.
Accounts receivable (AR) sales order	An order that a user who isn't a call center user creates through Accounts receivable in Commerce headquarters. Payments for AR sales orders can't be edited through call center order completion.

## Overview

Dynamics 365 Commerce consists of three main channels: POS, e-commerce, and call center. In Commerce version 10.0.12 and earlier, the management of payment lines for orders that are created in each channel isn't uniform. For example, when orders are created and edited in the call center, an order completion flow ensures that payments are specified for those orders before fulfillment. However, POS and e-commerce orders don't support call center order completion. To see the lack of uniformity, go to the **Customer service** page in Commerce headquarters, and notice which orders you can access the **Payments** page for by using the **Payments** button.

The following illustration shows an order that was created in the call center. Notice that the **Payments** button is available when the row for this order is selected.

The screenshot shows the 'Sales orders' interface. At the top, there are navigation options: 'Options', 'Details', 'Sales tax', 'Detailed status', 'Invoice', 'Order history', 'Tracking details', and 'Payments'. The 'Payments' button is highlighted with a red box. Below the navigation bar is a table with the following data:

✓ Sales order	Status	Payment status	Payment out of balance
✓ 012802	Open order	Posted	None

The following illustration shows an order that was created at the POS. Notice that the **Payments** button is unavailable when the row for this order is selected.

## Sales orders

Options ▾ Details Sales tax Detailed status Invoice Order history Tracking details **Payments**

✓ Sales order	Status	Payment status	Payment out of balance
012802	Open order	Posted	None
012801	Invoiced	Paid	None
✓ 012783	Invoiced	Not submitted	None

In Commerce version 10.0.13 and later, you can access the **Payments** page for orders that were created in e-commerce and the POS. Additionally, when the omni-channel Commerce order payments feature is turned on, the orders can be edited by using the order completion function that was previously available only for call center orders.

With this feature enabled, the **Sales order summary** dialog can be used to edit payments for orders originating in POS and e-commerce.

# Prerequisites

To turn on the omni-channel Commerce order payments feature, you must first turn on several other features and complete other configurations. Aside from being requirements for enabling **Omni-channel Commerce order payments**, these features should be turned on as a best practice because they address functional gaps that are related to orders.

If any of the prerequisites are missing when you try to turn on the omni-channel Commerce order payments feature, you receive a message that states that you can't continue until the prerequisite features and configurations are in place.

### Omni-channel Commerce order paym... ✕

Feature added 6/14/2020  
Retail and commerce  
[Learn more](#)

You cannot enable this feature. This feature requires that the following features are enabled:

- Unified payment posting journal defaults for Commerce
- Omni-channel payments
- Duplicate payment protection on invoicing
- Enable refunds over multiple captures
- Enable manual void of expired credit card payment lines when authorizations are expired.

This feature also requires that channel payment methods have operation mappings. For more information, click [learn more](#).

**Description**

This feature adds support for managing MPOS and Storefront order payment lines in a way similar to Call Center payment lines. Specifically, when this feature is enabled, credit card payments for orders created in POS and e-commerce will be editable from the Call Center. In addition to editing capabilities, orders created when this feature is enabled will support linked refunds when the order is returned in the back office. For this feature to be fully supported, at least one Call Center channel must be set up and users editing orders in the back office must be set up as users in that call center channel.

**Comments**

[Schedule](#) [Enable now](#)

## Prerequisite features

The following features are required for omni-channel Commerce order payments to work correctly.

FEATURE NAME	DESCRIPTION
Unified payment posting journal defaults for Commerce	This feature changes the way that business logic creates customer payment and customer refund payment journals for orders that are created through the call center, POS, or e-commerce channel.
Omni-channel payments	This feature enables omni-channel payment scenarios, such as buy online, pick up in store. For more information, see <a href="#">Omni-channel payments overview</a> .

FEATURE NAME	DESCRIPTION
Duplicate payment protection on invoicing	This feature enables duplicate payment protection for invoicing scenarios. Commerce payments functionality might affect customizations in invoicing scenarios. If your organization has invoicing customizations, make sure that they are refactored before you turn on Commerce payments functionality in production environments.
Enable refunds over multiple captures	This functionality improves that capability to do multiple linked refunds against an order.
Enable manual void of expired credit card payment lines when authorizations are expired	This feature adds support for manual deletion of payment lines if they expire and the authorization cannot be refreshed.

### Configure prerequisites

#### Map payment methods to operations

You must map payment methods in all channels to corresponding operations, so that the management of order payments is supported in Commerce headquarters. Map payment methods before you turn on the omni-channel Commerce order payments feature, to avoid receiving warnings for each payment method that doesn't have an equivalent operation mapping.

The following illustration shows the mapping of a payment method to an operation in call center.

#### Configure a call center

To manage POS and e-commerce order payments through Commerce headquarters, you must configure at least one call center channel. For more information about how to create a call center channel, see [Set up a call center channel](#).

#### Set up users as call center users

Users who will edit Commerce payments in Commerce headquarters must be set up as users of the call center channel. For more information about how to set up call center users, see [Set up a call center channel user](#).

#### Turn on order completion for call centers

The order completion function must be turned on for call centers. Order completion enforces business logic that makes sure that orders can be paid during fulfillment. For more information about order completion, see [Enable order completion](#).

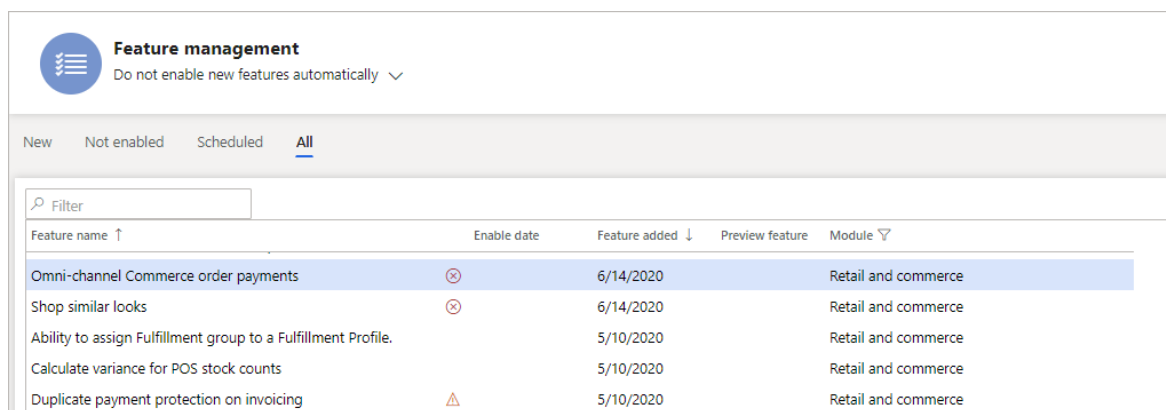

### Remove the Pay later option from the POS

When customer orders are created at the POS, the store associate can either collect a card payment for fulfillment or select **Pay later** to skip collection of card details. When the omni-channel Commerce order payments feature is turned on, the **Pay later** option should be removed from the POS. To remove it, search for **Functionality profiles** to open the **Functionality profiles** page. Select the relevant functionality provide and click **Edit**. On the **General** FastTab for the functionality profile, change the value of the **Require payment for fulfillment** field to **Card required**. This change must be synced to the channel database before it takes effect at the POS.

## Turn on the omni-channel Commerce order payments feature

After the prerequisites that are described in the previous section are in place, you can turn on the omni-channel Commerce order payments feature.

1. In the **Feature management** workspace, select the **All** tab to view the list of all features, and then search for **Omni-channel Commerce order payments**.

**Feature management**  
Do not enable new features automatically

New Not enabled Scheduled **All**

Filter

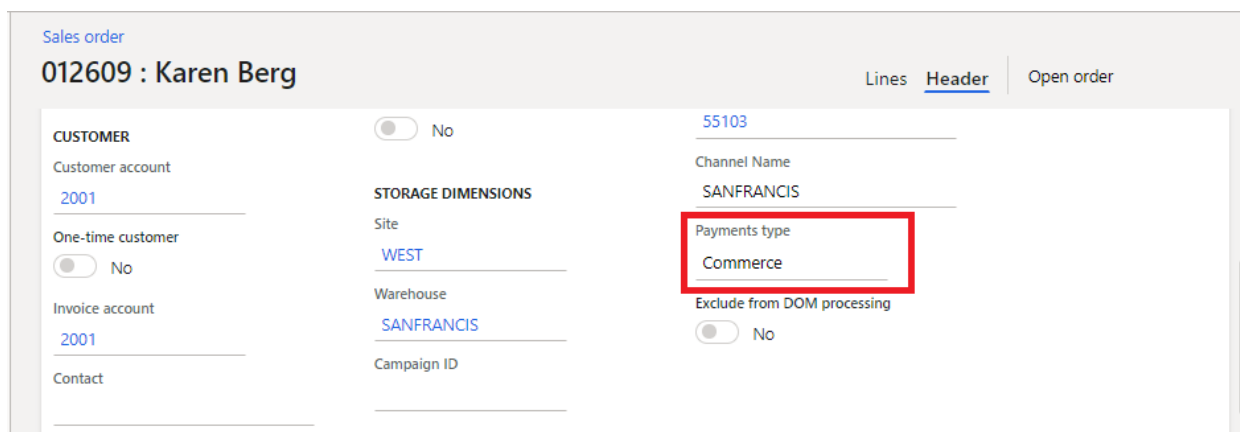

Feature name ↑	Enable date	Feature added ↓	Preview feature	Module ▾
Omni-channel Commerce order payments	⊗	6/14/2020		Retail and commerce
Shop similar looks	⊗	6/14/2020		Retail and commerce
Ability to assign Fulfillment group to a Fulfillment Profile.		5/10/2020		Retail and commerce
Calculate variance for POS stock counts		5/10/2020		Retail and commerce
Duplicate payment protection on invoicing	⚠	5/10/2020		Retail and commerce

2. Select the feature, and then select **Enable now**.

### IMPORTANT

The omni-channel Commerce order payments feature includes many changes to payments and order management workflows. You should do exhaustive testing before you turn on this feature in a production environment.

To distinguish channel orders that are created while the omni-channel Commerce order payments feature is turned on from other orders, the system shows a **Payments type** field on the order header when the feature is turned on. For POS and e-commerce orders, this field is set to **Commerce**.

Sales order  
**012609 : Karen Berg** Lines **Header** Open order

<b>CUSTOMER</b>	<input type="checkbox"/> No	55103
Customer account		Channel Name
2001		SANFRANCIS
<b>STORAGE DIMENSIONS</b>		<b>Payments type</b>
Site		Commerce
WEST		Exclude from DOM processing
Warehouse		<input type="checkbox"/> No
SANFRANCIS		
Campaign ID		

For call center orders, the **Payments type** field is set to **Call Center**. For sales orders that are created in Accounts receivable, the field isn't shown.

## Fulfill orders after the omni-channel Commerce order payments feature is turned off

POS and e-commerce orders that are created while the omni-channel Commerce order payments feature is turned on must be fulfilled while the feature is turned on. If the feature is later turned off, further processing of the orders will be prevented until the feature is turned back on.

## Manage orders that were created before the omni-channel Commerce order payments feature is turned on

Orders that were created before the omni-channel Commerce order payments feature is turned on can be processed after the feature is turned on. The editing experience for those orders won't change after the feature is turned on, and the orders won't be changed to accommodate omni-channel Commerce order payment workflows. Additionally, sales orders that non-call center users create in Accounts receivable will continue behave as they did before the feature was turned on.

### Key scenarios

When the omni-channel Commerce order payments feature is turned on, credit card payments for e-commerce and POS orders can be managed through order completion. For example, a customer places an online order and then calls into the call center to request a change to the order. In this case, the order completion function enables the payments on that order to be adjusted to support the new balance due.

The following properties on an order line can be edited before payment capture:

- Card type
- Card number
- Payment amount
- Percent amount

#### **Edit order payments**

The following scenarios in call center order completion apply to order payments that were created at the POS or in the e-commerce storefront.

#### **Uncaptured card payments**

For any card payment line on an order that hasn't yet been partially invoiced, the following properties can be edited before payment capture:

- Card type
- Card number
- Payment amount
- Percent amount

After the payments are edited, the order submission process corrects any changes that are required for edited payment lines.

SCENARIO	DESCRIPTION	SUPPORTED
----------	-------------	-----------

SCENARIO	DESCRIPTION	SUPPORTED
Edit to specify a higher amount.	For card payments that have been authorized but haven't yet been captured, the payment amount can be increased. When the amount on a payment line is increased, a new authorization is created for the new amount, and the old authorization is voided.	Yes
Edit to specify a lower amount.	For card payments that have been authorized but haven't yet been captured, the payment amount can be reduced. When the amount on a payment line is reduced, a new authorization is created for the new amount, and the old authorization is voided.	Yes
Remove an old card, and add a new card.	Uncaptured card payment authorizations can be removed from orders and replaced by a payment on a different card. The authorization for the first card is canceled, and an authorization for the new card will be obtained when the order is submitted.	Yes

#### Partially and fully captured card payments

SCENARIO	DESCRIPTION	SUPPORTED
Edit a payment that was used to invoice part of the order.	When an order that has omni-channel Commerce payments has been partially invoiced, the card payment amount for the existing card can be edited through call center order completion, down to the amount that has already been captured. A new card can then be applied to cover the balance due for the order.	Yes
Edit fully captured card payment lines to specify a higher amount.	If a card payment was fully captured, but the amount for that card payment is increased through call center order completion, a new authorization for the card is created for the increased amount when the order is submitted.	Yes

#### Remove order payments

SCENARIO	DESCRIPTION	SUPPORTED
Authorized payments	Omni-channel Commerce order card payments can be removed from an order through order completion, but only if they weren't partially captured.	Yes

SCENARIO	DESCRIPTION	SUPPORTED
Prepayments	Prepayments can't be removed through order completion. Prepayments can't be removed from an order after they are applied. Payment vouchers are already associated with them.	No
Partially captured payments	If the payment is in a <b>Paid</b> state but hasn't been fully captured, it can't be removed. However, the payment amount can be reduced to the amount that was already posted. When this happens, the a request is sent to the payment provider to reduce the authorization amount to equal the new payment amount.	No
Fully captured credit card payments and prepayments	Fully captured credit card payments and prepayments can't be removed from the order.	No

### Cancel order and sales lines

SCENARIO	DESCRIPTION	SUPPORTED
Order cancellation for credit card payments that aren't captured	If an order is canceled, card payment authorizations that haven't yet been captured are canceled.	Yes
Order cancellation for credit card payments that are captured but aren't invoiced	If an order is created at the POS, and a card payment is used to capture a deposit, the order is canceled before invoicing. The card payment is automatically refunded as part of order cancellation.	Yes
Order cancellation for orders that are partially shipped and invoiced	For orders that have been partially shipped and invoiced, cancellation will cancel the fulfillment of lines that haven't been invoiced. Open credit card authorizations for the remaining balance on the order aren't automatically canceled.	Manual refund is required.
Order cancellation for orders that are invoiced but aren't shipped	If an order is fully invoiced, but some of the items haven't been shipped, the order can be canceled. However, payments that are captured for that order won't automatically be refunded. Open authorizations for items that haven't been invoiced won't be canceled but will expire according to the authorization expiration policies of the bank that issued the card.	Manual refund is required.

SCENARIO	DESCRIPTION	SUPPORTED
Line cancellation for items that aren't fulfilled or invoiced	If an order line that hasn't been fulfilled or invoiced is canceled, the order completion process will require that payments are reduced to equal the new order total.	

## Refunds

SCENARIO	DESCRIPTION	SUPPORTED
Linked refunds for POS and e-commerce orders	Return orders that are generated from orders that originate from the POS and e-commerce channels can issue linked refunds against the cards that were charged during invoicing.	Yes
Linked refunds for AR sales orders	Although the payments can't be edited through order completion, returns that are issued for AR sales orders can be subject to a linked refund to the original card that was charged during invoicing.	
Unlinked refunds	If the merchant's return policies and the payment processor allow this approach, unlinked refunds can be specified for return orders in cases where the order was originally paid in cash, for example, or in cases where the original card that was used for payment is no longer active.	Yes
Refunds to non-card prepayments	Return orders that were originally paid through non-card prepayments, such as cash or credit memo payments, won't be subject to linked refund. An appropriate payment method, such as <b>Check</b> , must be specified for the refund payment. Organizations that allow unlinked refunds can refund non-card prepayments to credit cards that weren't previously used for the order, if the payment processor allows this approach.	Yes

## Edit and remove orders that have prepayments

SCENARIO	DESCRIPTION	SUPPORTED
Edit prepayment tender lines.	Payment vouchers are associated with prepayment tender lines. Therefore, prepayment tender lines can't be edited or removed.	No

## Related changes

To support omni-channel Commerce order payments, changes to existing functionality were introduced in

Commerce version 10.0.13.

## Consistent selection of payment journals when sales orders and refund payments are posted

In Commerce version 10.0.12 and earlier, payment journal assignment is inconsistent across channels. In Commerce version 10.0.13 and later, if the omni-channel Commerce order payments feature is turned on, all channels use the payment vouchers that are specified on the **Posting** tab of the **Commerce parameters** page.

The screenshot shows the 'Commerce parameters' configuration page, specifically the 'Posting' tab. The left sidebar lists various configuration categories, with 'Posting' selected. The main content area is titled 'Set up the retail parameters for posting' and includes several sections: 'Safe drop' (No), 'Bank drop' (No), 'Voucher transactions' (Yes), and 'Do not aggregate returns' (No). Below these are 'Batch processing' settings for parallel statements, threads, and transaction lines. The 'Invoice' section contains three sub-sections: 'PAYMENTS' with a 'Journal name' dropdown set to 'CustPay', 'TAXES' with a 'Tax calculation behavior' dropdown set to 'Recalculate', and 'REFUNDS' with a 'Journal name' dropdown set to 'ARREF'. The 'PAYMENTS' and 'REFUNDS' dropdowns are highlighted with red boxes. The 'Statement' section is partially visible at the bottom.

### Check payment method

Orders that are created at the POS don't include a check number when they're created in Commerce headquarters. When the omni-channel Commerce order payments feature is turned on, 9999 will be entered as the check number for orders that are created at the POS and paid for by check.

Additionally, the check number won't be required when **Check** is specified as the refund method of payment.

# Process credit cards without a hardware station

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to configure the point of sale (POS) to process "card not present" transactions in POS clients that don't include a hardware station. This feature specifically targets emerging scenarios such as curbside pickup.

When this feature is turned on, clients such as Cloud POS and Modern POS for iOS can make credit card processing calls through Commerce Scale Unit. They don't have to depend on a standalone hardware station that is deployed on the local network. Therefore, any POS client can support curbside pickup, and fewer setup steps are required.

## NOTE

This feature should not be turned on for registers that support offline mode. The feature routes all "card not present" payment requests through the Commerce Scale Unit, but the Commerce Scale Unit isn't available when the register goes offline.

## Key terms

TERM	DESCRIPTION
BOPIS	This abbreviation is short for "buy online, pick up in store."
Curbside pickup	This scenario resembles BOPIS. However, instead of picking up items in the store, customers don't usually enter the store and often don't even leave their vehicle.
Card not present	This term is sometimes abbreviated CNP. It describes scenarios where the credit card or other form of electronic payment isn't physically present. In BOPIS and curbside pickup scenarios, customers make a payment online or over the phone, and the payment is then captured from the POS at the time of pickup.
Hardware station	This term describes the business logic that drives interactions between the POS and payment terminals or retail peripherals such as receipt printers. The hardware station is built into the Modern POS for Windows and Modern POS for Android clients. The Cloud POS and Modern POS for iOS clients require a standalone deployed hardware station to interact with physical devices.

## Overview

When this feature is turned off, Cloud POS and Modern POS for iOS can't process "card not present" credit card requests by themselves, because they don't have a built-in hardware station. When the feature is turned on, the Commerce Scale Unit can be used to facilitate the requests for those clients.

Although this feature can also be used for Modern POS for Windows and Modern POS for Android, in addition to Cloud POS and Modern POS for iOS, it isn't supported for offline mode. Therefore, the feature should not be

used in scenarios where a Windows client uses offline mode.

## Supported scenarios

The following scenarios are supported for POS clients that don't have a built-in hardware station.

SCENARIO	DESCRIPTION
Payment capture	An order can be recalled for pickup, and the credit card payment that is associated with the order can be captured.
Linked refund	A refund can be linked to the original payment instrument for return orders and cash-and-carry transactions.
Order editing	Orders can be recalled and edited in the POS, and the same payment card can be authorized to support the new order total.
Order cancellation	For orders that are canceled, the balance that is due back to the customer can be refunded to the original payment card.

## Unsupported scenarios

Creation of credit card authorizations isn't supported. Only existing card payments can be captured, refunded, or edited.

SCENARIO	DESCRIPTION
Creating a payment	This feature doesn't support the creation of new customer orders and authorization of payments for fulfillment. Creation of new payments will continue to require a hardware station.
Changing the payment card	If an order is recalled in the POS, the same payment method must be used for pickup. Store associates can substitute a different card for the card that is associated with an order only if a hardware station is available.
Offline mode	When this feature is turned on, "card not present" requests are always sent to the Commerce Scale Unit. If a register goes offline, "card not present" requests will fail, because the Commerce Scale Unit is no longer available. The feature should not be turned on for registers that are configured to support offline mode.

## Set up the POS to process "card not present" transactions without a hardware station

The configuration to turn on this feature is completed at the register level.

1. In the back office, go to **Retail and Commerce > Channel setup > POS setup > Registers**.
2. Select the relevant register, and then select **Edit**.
3. On the **General** FastTab, in the **Card not present processing** field, select **Use retail server**. (By default, this field is set to **Use hardware station**.)

POS registers

### SANFRAN-1: San Francisco - Register 1

**General**

Register number SANFRAN-1	<b>DESCRIPTION</b> Name San Francisco - Register 1 Placement	<b>STORE</b> Store number SANFRANCIS	<b>HARDWARESTATION</b> Select upon tendering No	EFT POS register number
Device SANFRANCIS-1		<b>PROFILES</b> Hardware profile HW002 Visual profile F4MP	<b>EFT</b> Store number SANFRANCIS	Default payment method
Support offline No				<b>Card not present processing</b> Use hardware station Use hardware station Use retail server

Fiscal information

Display

4. Select **Save**.

5. After the change is saved, run the 1090 distribution schedule to sync the changes to the POS.

# Dynamics 365 Payment Connector for PayPal

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic provides an overview of the Microsoft Dynamics 365 Payment Connector for PayPal (PayPal connector). It includes a list of supported features and functionality, a guide to setting up and configuring the connector, troubleshooting information, and descriptions of some common issues.

## Key terms

TERM	DESCRIPTION
PayPal Wallet	Also known as the PayPal "button", PayPal Wallet describes the customer experience and integration supported by the PayPal Connector.
Wallet	A payment type that does not include traditional payment characteristics, such as the BIN range and expiration date, which are used to differentiate among credit and debit card types.

## Overview

Microsoft Dynamics 365 Commerce offers an out-of-box integration for PayPal Wallet. When the PayPal Connector is configured, the PayPal button is a selectable payment method as part of online order checkout. When users select **PayPal** they are directed to complete their payment directly with PayPal and then are returned to the online storefront for order completion.

The PayPal Connector is implemented using the same payments SDK that is leveraged for credit card payments. To better support PayPal payments, support for non-credit card payments has also been enhanced with the addition of support for "wallet" payment types. Specifically, PayPal payments do not return a BIN range. To support PayPal and other wallet payments, a new mapping for payments has been introduced that does not include BIN range. This new mapping can also be used to augment existing BIN range mapping for credit card payment methods. For more details, see [Wallet payment support](#).

The Microsoft Dynamics 365 Payment Connector for PayPal is not available in China. For other locales where Dynamics 365 Commerce is available, there are currently no restrictions.

## Functional overview

### PayPal Wallet in storefront

The connector supports the use of the PayPal Wallet, or PayPal button, for e-commerce payments. When the connector is configured for the online storefront, customers will be presented with the option to pay using the PayPal button at the time of payment. When the customer selects the PayPal button, they will be redirected to a PayPal Wallet mini-browser window where they will be authenticated by PayPal and can select their method of payment. Upon successful authentication and selection of a payment method, the customer will be redirected back to the storefront with the PayPal payment loaded into the checkout form. When the order is placed, the PayPal payment will be included as a payment line on the order and it will be synchronized to Commerce headquarters.

For more information on PayPal Wallet, visit the [PayPal Checkout page](#) hosted by PayPal.

## Fulfillment

Orders with PayPal payment lines are fulfilled in the same manner as orders that are paid using a credit card. When an order is created, the PayPal payment is added in an "authorized" state. Upon fulfillment, whether the order is shipped to the customer from a distribution center or picked up in a store, the payment authorization associated with the order is then "captured" using the same payments SDK requests used to capture credit card payments.

Fulfillment for PayPal orders supports incremental capture. This means that if an order is partially fulfilled and invoiced, a portion of the original authorization will be captured and, rather than getting a new authorization for the remainder, the same original authorization will be referenced when the remainder of the order is fulfilled.

## Authorization expiration

Orders made using the PayPal Payment Connector should be fulfilled within 30 days. If an order cannot be fulfilled or invoiced within 30 days, the original authorization will expire. The PayPal Connector does not currently support billing agreements. Recurring billing agreements, similar to recurring card references/tokens are required to automatically generate new authorizations after original authorization expiration. This means that if an authorization expires, the order will fall into a "do not process" state and the customer must be contacted to arrange for an alternate form of payment.

Billing agreement support, which allows for creation of new authorizations upon expiration of the original authorization, will be added in a future release.

# Testing the PayPal Payment Connector

## Creating a PayPal developer account

To test the PayPal Payment Connector, you must first create PayPal developer credentials and a PayPal sandbox environment.

1. Go to the [Test and go live](#) page provided as part of PayPal's development resources.
2. Select [Get Started](#) on the **Test and go live** page.
3. On that page, select **Log in to the Developer Dashboard**.
4. If prompted to sign in, select **Sign up**.
5. Select **Business Account**, then select **Next**.
6. Provide the email address you want to associate with your PayPal account and create a password for your PayPal account.
7. On the next page, enter contact information details, then read the PayPal user agreement and Privacy statement. If you agree to the terms, select **Agree and Create Account**.

### NOTE

The terms agreed to for the creation of a PayPal developer account are between the organization or individual creating the account and PayPal. Microsoft is in no way liable and makes no warranty as to the terms specified the agreement. These instructions are for informational purposes only.

8. After you agree to the terms, specify your business type and select **Continue**.
9. Next, go to the [PayPal Developer page](#) and select **Log in to Dashboard**.
10. Sign in using the credentials used when creating your PayPal account.
11. In the developer dashboard, select the **Default Application** in the list of RestAPI apps.

- Note the **Client ID** and **Secret** for your Sandbox account. These will be used to set up the connector in Dynamics 365 Commerce.

**NOTE**

To collect **Client ID** and **Secret** for a live environment, select the **Live** tab for the selected RestAPI app.

## Set up the connector in Dynamics 365 Commerce

### Map the PayPal wallet payment method to a processor payment method

**NOTE**

Some of these steps leverage a new capability for supporting wallet payment methods. For more information on this feature, see [Wallet payment support](#).

- Go to **Retail and Commerce > Channel Setup > Payment methods > Payment methods**.
- Select **New**.
- Specify a **Payment method ID** and **Payment method name**, such as **Wallet**. Set the **Default function** to **Wallet**, and then select **Save**.
- Go to **Retail and Commerce > Channel Setup > Payment methods > Card types**.
- Select **New**.
- Specify an **ID**, such as **PayPal**. Set an **Electronic payment name**, such as **PayPal**. Set **Type** to **Wallet**, and then specify a name for the **Issuer**, such as **PayPal**. Select **Save**.
- Select the entry previously created and select **Processor mapping**.
- On the **Processor payment method mapping** page, select the previously created **PayPal** card type. In the middle column, select the **Dynamics 365 Payment Connector for PayPal** and select **Add**.

### Set up the PayPal Payment Connector in payment services

Follow these steps to configure the PayPal payment connector in **Payment Services**.

- In Commerce headquarters, go to **Accounts receivable > Payments setup > Payment services**.
- On the Action Pane, select **New**, and then on the **Setup** tab, enter the following information.

FIELD	DESCRIPTION	SAMPLE VALUE
Payment service	Enter the name of the payment service to configure.	PayPal
Payment connector	Select the PayPal Payment Connector.	Dynamics 365 Payment Connector for PayPal
Test mode	For the PayPal Connector, in production and test environments you should set this field to <b>False</b> .	False
Default processor for credit cards	This should be set to <b>No</b> because the call center uses the default processor.	No

FIELD	DESCRIPTION	SAMPLE VALUE
Bypass payment processor for zero transactions	Specify whether this payment processor should be skipped for transactions that have a 0 (zero) amount.	Yes

3. On the **Payment service account** tab, enter the following information.

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Assembly Name	Auto-populated name of the assembly for the Dynamics 365 Payment Connector for PayPal.	Yes	Yes	<i>Binary name</i>
Service account ID	Auto-populated unique identifier for the setup of the merchant properties. This identifier is stamped on payment transactions and identifies the merchant properties that downstream processes should use (such as invoicing).	Yes	Yes	<i>Guid</i>
Merchant client ID	Enter the Sandbox <b>Client ID</b> collected from the PayPal developer dashboard under <b>Default application</b> .	Yes	Yes	<i>String</i>
Merchant API key	Enter the Sandbox <b>Secret</b> collected from the PayPal developer dashboard under <b>Default application</b> .	Yes	Yes	<i>String</i>
Supported currencies	Enter the supported currencies, semicolon separated, to be supported for the PayPal connector. The default is <b>USD</b> .	Yes	Yes, but can be edited.	USD; CAD

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Supported tender types	Other payment connectors may support multiple tender types. For PayPal, the only payment method will be <b>PayPal</b> .	Yes	Yes	PayPal
Supported payment method variants	Other payment connectors may return multiple payment method variants. For PayPal, the only variant will be <b>PayPal</b> .	Yes	Yes	PayPal
Environment	This field is used to specify whether transactions should be sent to Sandbox or Live environments.	Yes	Yes	<i>Sandbox or Live</i>

#### NOTE

When testing payments in a Sandbox environment, the **Environment** field should never be set to live and live environment. **Merchant client ID** and **Merchant API keys** must never be used. Sandbox environments are for Sandbox testing only.

### Set up the PayPal Payment Connector for the online store

1. In Commerce headquarters, go to **Retail and Commerce > Channels > Online stores**.
2. Select the online store to add the Dynamics 365 Payment Connector for PayPal.
3. On the **Online store** page, on the **Payment accounts** FastTab, select **Add**.
4. In **Connectors**, select **Dynamics 365 Payment Connector for PayPal**.
5. Enter the following additional information.

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Assembly Name	Auto-populated name of the assembly for the Dynamics 365 Payment Connector for PayPal.	Yes	Yes	<i>Binary name</i>

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Service account ID	Auto-populated unique identifier for the setup of the merchant properties. This identifier is stamped on payment transactions and identifies the merchant properties that downstream processes should use (such as invoicing).	Yes	Yes	<i>Guid</i>
Merchant client ID	Enter the Sandbox <b>Client ID</b> collected from the PayPal developer dashboard under <b>Default application</b> .	Yes	Yes	<i>String</i>
Merchant API key	Enter the Sandbox <b>Secret</b> collected from the PayPal developer dashboard under <b>Default application</b> .	Yes	Yes	<i>String</i>
Supported currencies	Enter the supported currencies, semicolon separated, to be supported for the PayPal connector. The default is <b>USD</b> .	Yes	Yes, but can be edited.	USD; CAD
Supported tender types	Other payment connectors may support multiple tender types. For PayPal, the only payment method will be <b>PayPal</b> .	Yes	Yes	PayPal
Supported payment method variants	Other payment connectors may return multiple payment method variants. For PayPal, the only variant will be <b>PayPal</b> .	Yes	Yes	PayPal

FIELD	DESCRIPTION	REQUIRED	AUTOMATICALLY SET	SAMPLE VALUE
Environment	This field is used to specify whether transactions should be sent to Sandbox or Live environments.	Yes	Yes	<i>Sandbox or Live</i>

#### NOTE

When testing payments in a Sandbox environment, the **Environment** field should never be set to live and live environment. **Merchant client ID** and **Merchant API keys** must never be used. Sandbox environments are for Sandbox testing only.

After the above changes have been made in Commerce headquarters, synchronize the changes using the **1070** distribution schedule.

#### Configure PayPal for the Storefront checkout module

For details related to configuring storefront to use PayPal in the checkout module, see [Payment module](#).

## Entering a merchant relationship with PayPal

To create a **Live** merchant account with PayPal, visit the [PayPal Checkout page](#) for self-service or [connect with a sales representative](#) to discuss custom rates.

## Additional resources

- [Payments FAQ](#)
- [Checkout module](#)
- [Payment module](#)

#### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Wallet payment support

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic provides an overview of wallet payment support for Microsoft Dynamics 365 Commerce.

## Key terms

TERM	DESCRIPTION
Wallet	A payment type that does not include traditional payment characteristics, such as the BIN range and expiration date, which are used to differentiate among credit and debit card types.
Processor payment method	A property payment card property in the payments SDK. When this property is added to supported payment methods within a connector, those payment methods can be mapped to cards or wallets configured in Commerce headquarters to avoid the traditional BIN range mapping.

## Overview

Unlike traditional credit and debit cards, wallet payment authorization responses do not include BIN ranges. Traditionally, BIN ranges have been used to match payment authorization responses to predefined card types with BIN ranges. This feature adds support for **Processor payment methods** and mapping of those variants to card types set up in Commerce headquarters.

**Processor payment method** is a property for the payments SDK that can be applied to payment methods supported for a particular payment connector. When an authorization response is received that includes the processor payment method, a lookup is performed to determine if that processor payment method has been mapped to a card or wallet type. If a mapping is found, that payment is mapped to the matching card or wallet type. If a match can't be found, a BIN lookup is performed following the traditional BIN range settings for Commerce.

Because wallet payments don't include BIN range, if a payment connector such as PayPal supports wallet payments, the payment connector should be updated to the latest payments SDK and the processor payment method property should be populated at least for all supported wallet payments.

Processor payment method mappings are also useful for traditional debit and credit card payments. Mapping processor payment methods to cards is more straightforward than BIN range mapping and less prone to errors because it is easy to ensure all possible payment methods supported by a connector are mapped to a card or wallet type.

## Wallet payment method support and processor payment methods

This feature supports a new payment method and card type called **Wallet**. The primary characteristic of a wallet payment is that it does not have a BIN range. However, wallet payment methods may not return expiration dates and some properties that have traditionally been considered mandatory. Wallet payment methods must be mapped to processor payment methods as an alternative to the traditional BIN range mapping.

### Adding support of processor payment methods

To support processor payment methods, payment connectors need to populate the **PaymentMethodVariant** property in **PaymentCardProperties**. If the payments SDK in use does not include this property, it should be updated.

### Processor payment method mapping

The **Processor payment method mapping** page can be used to map processor payment methods to configured card or wallet types. To access this page, select the **Processor mapping** link on the **Card types** page.

ID ↑	Electronic payment name	Type	Issuer
AMEXPRESS	American Express	International credit card	Credit provider
DISCOVER	Discover card	International credit card	Credit provider
EUROCARD	EuroCard	International credit card	Credit provider
GIFTCARD	Gift Card	Gift card	Gift card provider
LOYALTY	Loyalty Card	Loyalty card	US Loyalty
MAESTRO	Maestro	International debit card	Debit provider
MASTER	Mastercard	International credit card	Credit provider
PAYPAL	PayPal	Wallet	PayPal
VISA	Visa Card	International credit card	Credit provider
VISAELEC	Visa Electron	International debit card	Debit provider

When this page opens, it queries available payment connectors to collect a set of payment methods with the **PaymentMethodVariant** field populated. It then checks to determine if those payment methods have an existing mapping to a card or wallet. Payment methods that do not have a mapping are listed in the center column of the page.

### When not to use processor payment method mapping

In certain cases, processor payment method mapping may not be granular enough for reporting needs. For example, some retailers differentiate external gift cards from the same provider by their BIN range. In this scenario, the gift cards should not be mapped using the above scenario. Instead, they should continue to use traditional BIN range mapping.

### Support for unidentified card types

In some scenarios, a payment connector may return a card that does not have a BIN range or processor payment method mapping. If this occurs, the payment is authorized by the payment terminal, but is then reversed when the point of sale (POS) can't map the authorization response to a specific card type. To address this, a capability is provided to map unknown authorization responses to a default card type.

Stores  
HOUSTON: Houston

General 052 | HOUSTON | TX | 100001

IDENTIFICATION	POS REGISTER	SALES TAX	ADDRESS BOOK
Retail Channel Id 000017	Functionality profile FN001	Tax identification number (TIN)	Customer address book RetailCust
Name Houston	Inventory lookup <input type="radio"/> No	Sales tax group TX	Employee address book Houston;USRTCenfr;U...
Store number HOUSTON	PROFILES	Prices include sales tax <input type="radio"/> No	CUSTOMER
Operating unit number 052	Channel profile scu5nphoam097518925	Use destination-based tax <input type="radio"/> No	Default customer 100001
Legal entity usrt	Live channel database scu5nphoam097518925	Use customer-based taxes <input type="radio"/> No	EMAIL NOTIFICATION
Warehouse HOUSTON	Offline profile AX7	Calculate customer tax exempt <input type="radio"/> No	Email notification profile
Shipping warehouse HOUSTON	REGIONAL SETTINGS	Sales tax override group Default	ORDER FULFILLMENT
Store time zone (GMT-06:00) Central Time (US ...	Language en-us		Manual accept <input type="radio"/> No
	Currency USD		ELECTRONIC PAYMENTS
			Default for unmapped processor pay...

This capability ensures that the payment is never authorized by the terminal and then reversed by the POS. This helps avoid confusion for customers and store associates. When this setting is used, the default card for unknown authorizations should be checked periodically to ensure that wanted card types are not accidentally being mapped to the default for unknown card types. If a card type is truly unwanted for processing, it should be turned off at the processor level.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Payments FAQ

2/18/2021 • 2 minutes to read • [Edit Online](#)

## What payment scenarios are supported?

- Set up a merchant account.
- Process a call center order.
- Process an online order.
- Process a POS cash-and-carry transaction by using an accepting page.
- Process a POS cash-and-carry return by using an accepting page.
- Process a POS cash-and-carry return by using an accepting page.
- Process a POS customer order by using an accepting page.
- Process a POS cash-and-carry transaction by using Microsoft Dynamics Commerce Retail Hardware Station.
- Process a POS cash-and-carry return by using Hardware Station.
- Process a POS customer order by using Hardware Station.
- Buy online, pick up in store.
- Buy in call center, pick up in store.

## Which payment providers are supported and in what regions?

- Adyen is supported for card present and card not present transactions. For a list of supported regions, visit the [Dynamics 365 Payment Connector for Adyen overview page](#).
- PayPal is supported for online purchases. For a list of supported regions, visit the [Dynamics 365 Payment Connector for PayPal overview page](#).
- The **TestConnector** isn't supported for user acceptance testing (UAT) or for production (prod). The **TestConnector** is for sandbox and development use only, and is for sample use only.
- Mastercard Simplify is no longer supported for new customers.

## What is a payment connector and in what cases do I need to deploy and implement a payment connector?

Payment connectors are software components that can be set up which enable an application to process payments for transactions where the card is not present and transactions where the card is present.

Microsoft-provided connectors such as Adyen can be used, or custom connectors can be built by ISV partners. A connector is typically built to meet the business needs of a customer. Custom connectors are often created when there is a scenario that requires a new type of payment type (for example, linked refunds). Customers doing business in certain geographies may need new connectors if the out-of-box connectors do not support those regions.

## Are other payment connector providers supported?

Yes, but you must connect them using customization.

## What is the Service level agreement (SLA) for out-of-box payment connectors like Adyen?

For the Adyen connector, refer to the Adyen connector [overview page](#) if the issue is related to set up. For other setup or functional issues with the connector itself, create a support request with Microsoft. If the issue is originating from the device itself or Adyen's processing service, contact Adyen support at support-dynamics365@adyen.com.

## If a supported payment provider issues an update, will Microsoft automatically update the payment connector or do I need to work with the payment provider to get the updated payment connector?

If a payment connector update is issued by the payment connector provider, the updated version of the payment connector will be included in the next planned release of Dynamics 365 Commerce. However, the customer can also work directly with the payment connector provider to uptake it earlier.

# Manage Bing Maps for your organization

2/18/2021 • 2 minutes to read • [Edit Online](#)

Learn how you can manage Bing Maps for your application. When Bing Maps is turned on, people can view a map of a store, warehouse, or other location when creating orders.

## Enable Bing Maps

1. Go to **Commerce shared Parameters > Bing Maps**.
2. Select **Enable Bing Maps** to turn on Bing Maps functionality.

## Enter a Bing Maps key

Go to the [Bing Maps licensing page](#) for details about how to obtain a key.

1. Go to **Commerce shared Parameters > Bing Maps**.
2. Enter the license key in the **Bing Maps Key** field.

## Privacy notice

If you enable the Bing Maps feature, address information is automatically sent over the internet to the Bing Maps service to display an online map of the address within this application. If you click on Bing Maps within this application, you will be redirected to [www.bing.com/maps](http://www.bing.com/maps). Your use of Bing Maps is also governed by the [Bing Maps End User Terms of Use](#).

Administrators can turn the Bing Maps feature on or off under **Commerce shared Parameters > Bing Maps**. Turning the Bing Maps app off makes the feature unavailable in this application.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create and update time slots for customer pickup

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes how to create, configure, and update customer pickup time slots in Commerce headquarters.

The time slot feature gives retailers a way to define a time slot for items that the customer pickup delivery mode is turned on for. Time slots let retailers define the days and times when orders can be picked up from a store. Retailers can also define the number of orders that can be picked up during a given period. In this way, retailers can limit the number of orders that can be picked up on a given day and at a given time. The result is a better-quality experience for their customers.

## NOTE

The time slot feature is available in Microsoft Dynamics 365 Commerce version 10.0.15 and later.

The following illustration shows an example of time slot selection during e-commerce checkout.

The screenshot shows a checkout page with the following sections:

- Checkout**
- 1. PICKUP INFORMATION**
  - Pick up, San Francisco** (1 items)
  - Pickup date: 9/24/2020
  - Pickup time slot: 8:00 AM - 9:00 AM
  - Save & continue** button
- 2. PAYMENT METHOD**
- 3. CONTACT INFORMATION**
- 4. TERMS AND CONDITIONS**
- Back to shopping** button
- Place order** button

## Time slot properties

A time slot is a specific interval when a customer can choose to pick up an order from a specific store or location. The time slot management feature is available only when the customer pickup delivery mode is configured in Dynamics 365 Commerce.

A time slot is defined by using the following properties:

- **Mode of delivery** – Specify the pickup mode of delivery that the time slot applies to.
- **Minimum Days** and **Maximum Days** – Specify the earliest and latest dates that can be selected for

pickup relative to the date when the order is placed.

The **Minimum Days** property ensures that there is enough time for the retailer to process the order before it's ready for pickup. The **Maximum Days** property ensures that the user can't select a date that is too far in the future. For example, if the minimum value is set to **1**, and an order is placed on September 20, the earliest day that the order will be available for pickup is the next eligible day (September 21). In a similar way, by setting a maximum value, you can define the maximum number of days that an order can be picked up. When minimum and maximum values are defined, site users can see and select only a specific set of days during their checkout experience.

You can set the minimum value to a decimal value that is less than 1. For example, if pickup is available four hours after an order is placed, set the minimum value to **0.17** ( $= 4 \div 24$ , rounded up to two decimal places). However, if you set the minimum value to a decimal value that is more than 1, it's always rounded up to the nearest whole number. For example, a value of **1.2** will be rounded up to **2**. Similarly, if you set the maximum value to a decimal value, it's always rounded up to the nearest whole number.

- **Start Date and End Date** – Specify the start and end dates of the time slot. Each time slot entry has a start date and an end date. Therefore, you have the flexibility to add different time slots throughout the year (for example, pickups during holiday hours). If a time slot's start and end dates are changed after an order is placed, the changes won't apply to that order. When you define start and end dates, you must consider store closure dates (for example, Christmas day) and ensure that time slots aren't defined for those days.
- **Active Hours of Pickup** – Specify the period when pickup is allowed. For example, the pickup times might be between 2 PM and 5 PM every day. This property enables the pickup times to be independent of store hours. Therefore, the retailer can configure pickup times that meet its specific business requirements. When you define the active hours of pickup, you must consider store hours and ensure that pickup times aren't defined for times when the store is closed.

#### NOTE

The hours for store pickup must be defined in the time zone of the appropriate store.

- **Time Slot Interval** – Specify the duration that can be allotted to each time slot. For example, the duration of each time slot might be in increments of 15 minutes, 30 minutes, or one hour. If time slot value is 0, the time slot is available for the entire duration between the start and end time.
- **Slots Per Interval** – Specify the number of customer or orders that can be served for pickup during each time slot interval. For example, enter **1**, **2**, **3**, or any other whole number.
- **Active Days** – Specify the days of the week when the pickup time slots are active. This property lets the retailer define the days when it wants to support pickup orders.
- **Retail Channels** – Specify the retail channels. Each time slot can be associated with one or more retail stores. Depending on each store's hours of operation, one or more time slot entries can be created and associated with a channel.

Only one time slot template can be configured per channel. These channels include brick-and-mortar stores, call centers, mobile devices, and e-Commerce sites.

## Configure the time slot feature in Commerce headquarters

Time slots must be defined for each pickup mode of delivery in Commerce headquarters, so that point of sale (POS) and e-commerce channels can reference them.

- Only one time slot template can be associated with each store or channel.

- Each time slot that is created should be unique to each delivery mode in each template.
- After the time slot feature is configured, the time slot calendar will be available to the selected stores or store groups. It will also be visible at the POS, for reference.

To configure the time slot feature in Commerce headquarters, follow these steps.

1. Go to **Commerce > Channel setup > Store pickup time slot**.
2. Select **New** to create a new time slot template. To use an existing template, select the template in the left pane.
3. Enter values in the **Time Slot ID** and **Description** fields.
4. On the **Order Pickup - Time Settings** FastTab, select **Add**.
5. In the **Order Pickup - Time Settings** dialog box, define the date range, mode of delivery, active hours of delivery, active days, time slot interval, slots per interval, and other settings.

If time slots will be static for the foreseeable future, set the **End Date** field to **Never**.

#### NOTE

You can create multiple templates, but only one template can be associated with a single channel or store.

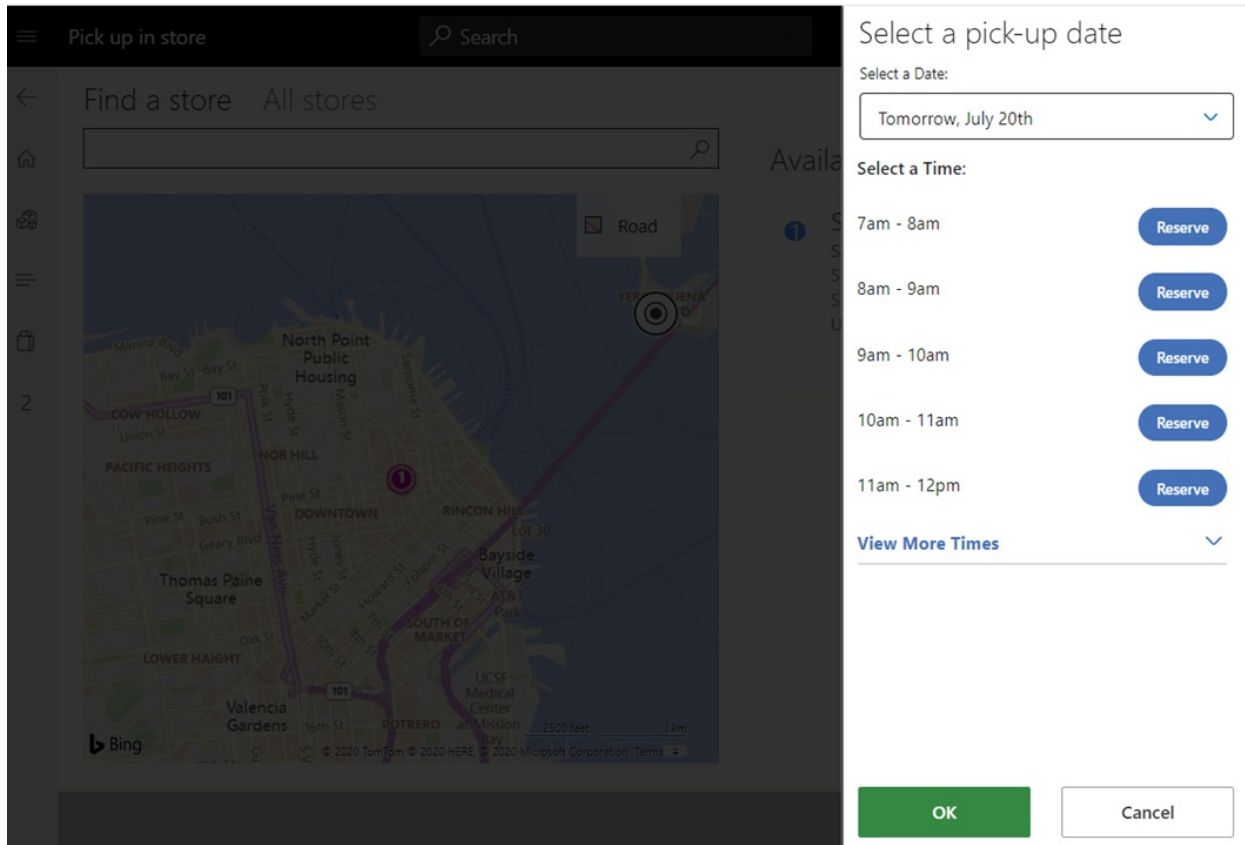

The screenshot shows the 'Order Pickup - Time Settings' dialog box. The left pane displays a table of existing time slot settings and a 'Retail Channels' list. The right pane contains configuration options for 'General', 'Setting', 'ACTIVE HOURS OF DELIVERY', 'ACTIVE DAYS', 'TIME SLOT INTERVAL', and 'SLOTS PER INTERVAL'. The 'General' section has 'Start Date' (9/22/2020), 'End Date' (9/22/2030), and 'Mode of delivery' (60). The 'Setting' section has 'Start Time' (08:00) and 'End Time' (15:00). The 'ACTIVE DAYS' section has 'Yes' selected for Monday through Sunday. The 'TIME SLOT INTERVAL' section has 'Hours' (1) and 'Minutes' (0). The 'SLOTS PER INTERVAL' section has 'Slots Per Interval' (10). 'OK' and 'Cancel' buttons are at the bottom right.

6. When you've finished, select **OK**.
7. If the time slots in a day will vary, create additional entries on the **Order Pickup - Time Settings** FastTab to ensure that the dates and times don't overlap.
8. On the **Retail Channels** FastTab, select **Add** to associate the time slot template with the stores or channels where it will be used.
9. In the **Choose organization nodes** dialog box, use the arrow buttons to select (or clear the selection of) the stores, regions, and organizations that the template should be associated with.
10. When you've finished, select **OK**.
11. On the **Distribution schedule** page, run the **1070** and **1135** jobs to sync the data to the channels.

## Time slot selection for POS orders

At the POS, when an order or order line is identified for pickup, the cashier can select the pickup store or location, and a date and time slot. If a customer has a pickup order for a different store, the cashier can select dates when the pickup will be available in that store. The store lookup will provide a reference to the dates and store times.

The following illustration shows an example of time slot selection for a POS order.

## Time slot selection for e-commerce orders

For information about how to make time slot selection available for e-commerce orders, see [Pickup information module](#).

### NOTE

Users can view or edit pickup time slots on a Commerce site's checkout page only if the pickup information module has been added to that page. If the checkout page doesn't include the pickup information module, orders will be placed without letting users specify or view time slot information.

The following illustration shows an example of an e-commerce order where a pickup time slot has been selected.

# Product information overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

## NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

This topic provides information about product information management. Product information management works with a shared product definition, categorization, and identifiers across all legal entities, and also specific configurations of a product, to fit into the business processes.

Product information is the backbone of supply chain and commerce applications across all industries. It refers to processes and technologies that focus on centrally managing information about products (for example, across supply chains). It's crucial that shared product definitions, documentation, attributes, and identifiers be used. In the various modules of a business solution, product-specific information and configuration are required in order to manage the business processes that are related to specific products, product families, or product categories.

## Product definition

A product is primarily defined by a product number, name, and description. However, other data is also required in order to describe a product or service:

- Product type: Item or service
- Product subtype: Distinct products or product masters
- Definition of the product variant model:
  - Product dimensions and dimension groups
  - Product nomenclature
  - Product configuration models
- Association of the product with one or more categories
- Definition of the product and category attributes
- Product images
- Attachments
- Units of measure and related conversions
- Translations for all names and descriptions

## Distribution, export, and import of product data

The product definition can be created in Supply Chain Management. It can also be imported from product lifecycle management (PLM), product data management (PDM), or product information management (PIM)

systems. When more than one instance of Supply Chain Management is used, one instance is typically used as the master of the product data for all other instances. This approach is supported by a large set of data entities that enable the export and import of product definition data from one instance to another.

To support the distribution of product data to many instances, Supply Chain Management lets you use Microsoft Dataverse. The product definitions can be exported from an instance of Supply Chain Management to Microsoft Dataverse. The product definitions can then be used to provision other business applications, such as Dynamics 365 Sales, with product data.

Note that, in dynamic and agile organizations, product information data changes every day. Therefore, maintenance of accurate and actual product data is a critical business process on its own.

## Product masters and product variants

In an agile world, where products must be quickly adapted to customer requirements, product definitions specify a set of products instead of distinct products. In Supply Chain Management, those generic products are known as *product masters*. Product masters hold the definition and rules that specify how distinct products are described and behave in business processes. Based on these definitions, distinct products can be generated. These distinct products are known as *product variants*.

A product master is associated with a product dimension group and a configuration technology to specify the business rules. The product dimensions (Color, Size, Style, and Configuration) are a specific set of attributes that can be used throughout the application to define and track specific behaviors of the related products. These dimensions also help users search for and identify the products.

## Configuration technologies

You can choose among three configuration technologies:

- The predefined variants are defined by predefined product dimensions. The variant definition includes the definition of a specific valid combination of dimensions, such as Color, Style, and Size. Each combination produces a distinct product variant.
- The dimension-based configuration is typically used in manufacturing scenarios and lets you use the Configuration dimension in the definition of the bills of materials (BOMs). After a specific configuration is selected, the system uses the subset of BOM lines that are valid for that configuration for planning and production. This concept is also known as *global BOM*, because one shared BOM is used for all configurations of a product.
- The constraint-based configuration uses a product configuration model to describe all possible attributes and components that are required in order to describe all possible variants of a product in a single model. The constraints of combinations of attributes can be described through regular expressions or table-based constraints. Configuration models and configurators become more important in product information management and are used across all industries.

When you plan the implementation of Supply Chain Management, it's very important that you choose the correct configuration technology for a business process. A product can't be converted from one model to another after implementation.

## Product variant model definition workspace

The **Product variant model definition** workspace gives an overview of the product masters. It also shows the status of the release of masters and related variants to specific legal entities.

## Released products

The products that are released to a specific legal entity are known as *released products*. Products can be

released in bulk to one legal entity or many legal entities at a time. Because various properties and attributes of the products might have to be added per legal entity, the **Released product maintenance** workspace lets you monitor and complete the recently released products in each legal entity, or in the suborganizations of a legal entity.

### **Released product maintenance workspace**

You can configure the **Released product maintenance** workspace from the **Configure my workspace** menu item. Select a category hierarchy and category to filter the workspace by. To adjust the relevant product data in the workspace, you can also define, in days, the time fences for **Recently released products** and **Stopped released products**.

The workspace consists of a summary of tiles and two lists. The **Open cases** list shows product change cases that have products in the selected product category hierarchy that aren't completed and closed. The **Recently released** list shows products that have been released within the time fence that is set in the workspace configuration. For each item in the list, validation is run, and the validation status is shown. This status might indicate that the required configurations for the legal entity hasn't been completed. From the list, you can directly access the **Released product details**, **Product attribute maintenance**, **Product category maintenance**, **Default order settings**, and **Text translations** pages to complete the required configuration of the product.

### **Manually creating a new released product**

You can manually create a released product in a single run, depending on the organization's business processes and any rules about whether this function should be used. This function creates a new product and automatically releases it to the current legal entity. To create a new product, click **Released products** in the **Released product maintenance** workspace or on the **Released product** list page.

#### **NOTE**

# Set up retail products

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes how to set up products in Dynamics 365 Commerce.

Before you can offer products for resale in your commerce channels, you must create and configure the products. Commerce creates organization-wide products in the product master. You can create the products, define the product properties and attributes, and assign the products to commerce category hierarchies. To make the products available to your channels and add them to an active assortment, you must release the products to the legal entities where they are available. To set up the products that you sell by using channels, complete the following tasks.

1. **Define a product hierarchy.** By using the category hierarchy features in Commerce, you can define category hierarchies to group and categorize the products that you distribute to your channels. User-defined and system attributes can be defined at the category level. Then, all products that are assigned to the category inherit those attributes. Multiple category hierarchies can be defined, and each product can be assigned to multiple hierarchies. However, in a single hierarchy, each product can be assigned to only one category.
2. **Add products and product variants to the product master.** Products that are added to the product master represent a global list of products. You can add products manually, one at a time, or you can import product data from your vendors.
3. **Release the products to legal entities.** Only products that have been released to legal entities can be made available to your channels. When you first define a product, you define it on an organization-wide level. You can then select one or more legal entities to release the product to. The product then becomes available to multiple channels across your organization. You can use this functionality to create a product one time, add and update product attributes and properties in one place, and then distribute the product across your organization, to the channels where it's available.
4. **Add products to assortments.** An assortment represents a collection of products that you offer in your channels. You can define one or more assortments, and each product can be assigned to one or more assortments. To assign products to channels, you assign the assortments to those channels. When you create an assortment, you can add products that haven't yet been released to a legal entity. However, you must release the products to a legal entity before those products can be made available to the channels.
5. **Add products to navigation hierarchies.** Before products can be browsed online or in point of sale (POS), they must be categorized in a Commerce navigation hierarchy.
6. **Add products to catalogs.** Although this step is optional for POS, online stores require that products be included in at least one catalog.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce hierarchies

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes hierarchies in Dynamics 365 Commerce.

You can create a category hierarchy to organize the products that you sell through your channels. You can use product hierarchies to categorize or group products. You can then use these products to create product assortments and customer loyalty programs. You can also assign product attributes and properties, assign a pricing structure, include the products in product promotions, and use the products for reporting. You can create one category hierarchy to represent all the products and categories in your organization, and then use that category hierarchy for multiple purposes. Alternatively, you can create multiple category hierarchies for special purposes, such as product promotions. When you create a product hierarchy, you must assign a category hierarchy type to identify the purpose of the category hierarchy. For example, only product hierarchies that are assigned the **Commerce navigation hierarchy** type are referenced when you browse products by category online or in point of sale (POS).

## Hierarchy types

The following table lists the types of category hierarchies that are available and the general purpose of each type.

CATEGORY HIERARCHY TYPE	PURPOSE
Product hierarchy	Use this hierarchy type to define the overall product hierarchy for your organization. You can use this hierarchy type for merchandising, pricing and promotions, reporting, and assortment planning. Only one product hierarchy can be assigned this hierarchy type.
Supplemental hierarchy	Use this hierarchy type for any additional category hierarchies that you want to create. For example, in the spring, you have a promotion for swimwear. Therefore, you include your swimwear products in a separate category hierarchy and apply the promotional pricing to the various product categories.
Navigation hierarchy	Use this hierarchy type to group and organize products into categories so that the products can be browsed online or in POS.

By using a category hierarchy to structure your products, you can set up and maintain product attributes and properties at the category level. These attributes and properties include settings for product dimensions and POS settings. Any products that you assign to the categories automatically inherit the attributes and properties that you define. You can also copy the property settings for any product to multiple products in a selected category at the same time.

### NOTE

# Create a new product hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a new product hierarchy in Microsoft Dynamics 365 Commerce.

## Overview

Dynamics 365 Commerce supports multiple retail channels. These retail channels include online stores, call centers, and retail stores (also known as brick-and-mortar stores). Each retail store channel can have its own payment methods, price groups, point of sale (POS) registers, income accounts and expense accounts, and staff. You must set up all of these elements before you can create a retail store channel.

A Commerce product hierarchy is used to define the overall product hierarchy for your organization. You can use a Commerce product hierarchy for merchandising, pricing and promotions, reporting, and assortment planning. Only one Commerce product hierarchy can be assigned per organization.

## Create and configure a product hierarchy

To create and configure a Commerce product hierarchy, follow these steps.

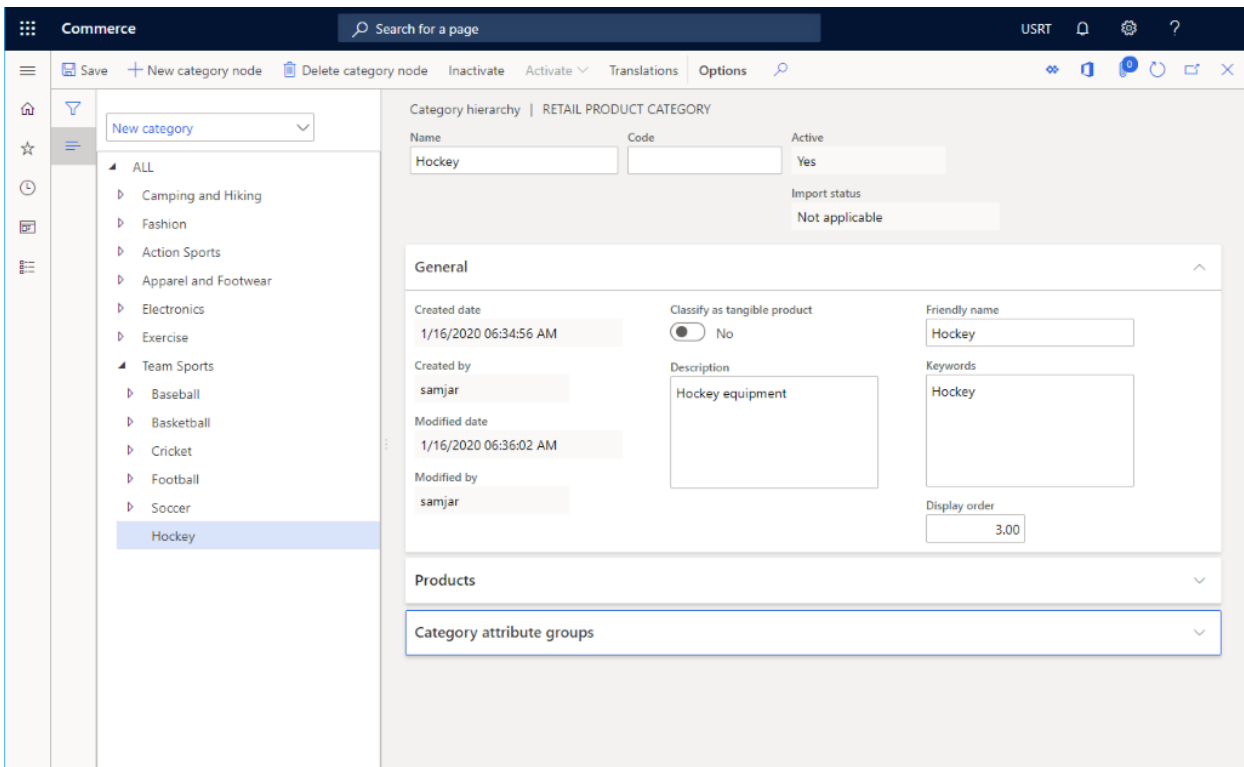

1. In the navigation pane, go to **Modules > Retail and commerce > Products and categories > Commerce product hierarchy**.
2. If no hierarchy exists yet, on the **Action** pane, select **New** to create the root of the hierarchy.
3. Under **General**:
  - a. In the **Name** box, enter a name.
  - b. In the **Description** box, enter a description.
  - c. In the **Friendly name** box, enter a friendly name.
  - d. Set **Active** to **Yes**.

## Add hierarchy nodes

To add hierarchy nodes, follow these steps.

1. On the action pane, select **Edit category hierarchy**.
2. Select the parent node you want to add a new node to, and then select **New category node**.
3. In the **General** section provide a **Name**, **Description**, **Friendly name** and **Keywords**.
4. Under **General**:
  - a. In the **Name** box, enter a name.
  - b. In the **Description** box, enter a description.
  - c. In the **Friendly name** box, enter a friendly name.
  - d. In the **Keywords** box, enter relevant keywords.
  - e. In the **Display order** box, enter a number for the display order (optional).
5. On the action pane, select **Save**.
6. Repeat the steps above to add additional nodes.

The following image shows the creation of a new product hierarchy node.

## Other settings

Category attribute groups can also be assigned to each group as required.

# Manage product categories and products

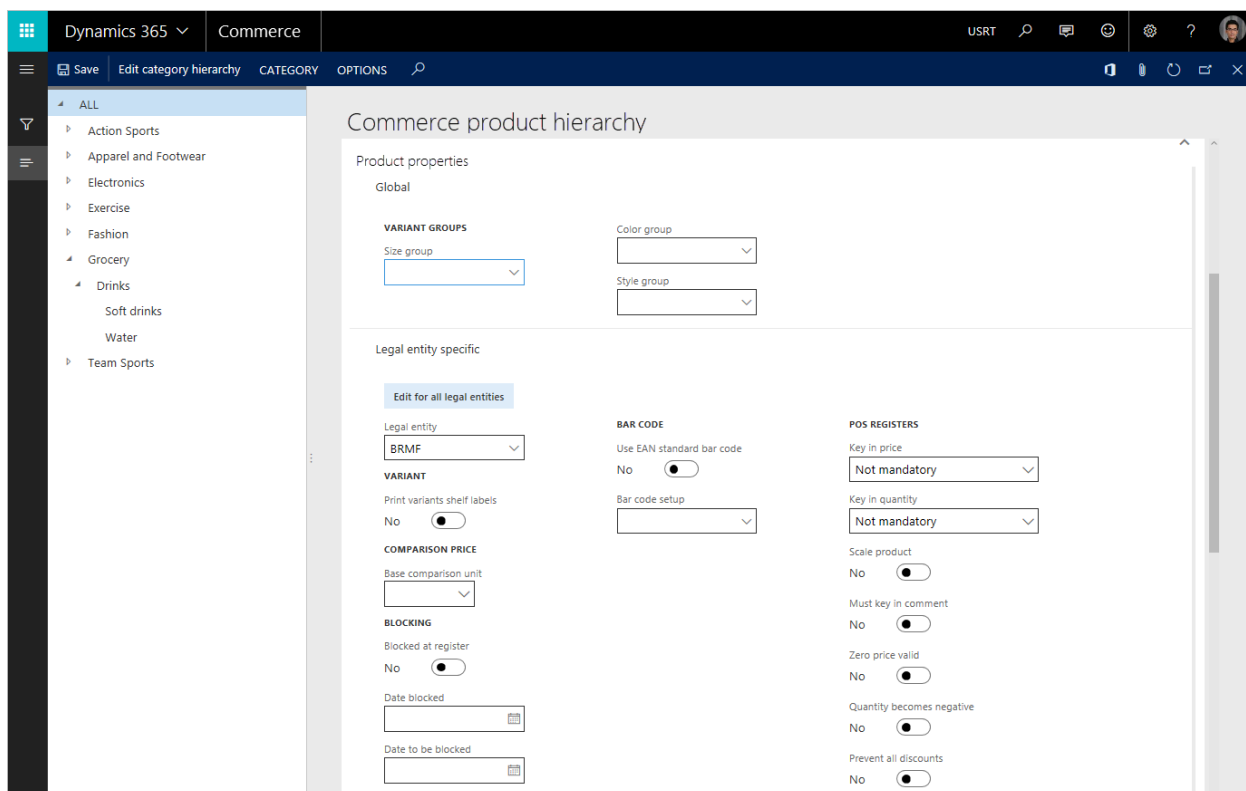

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes an enhanced way to manage product categories and products in Dynamics 365 Commerce. The enhancements let merchandising managers view a structure of product properties that is shared between the product hierarchy and released product details.

To learn more about how to manage product categories, in the **Category and product management** workspace, select the **Commerce product hierarchy** tile.

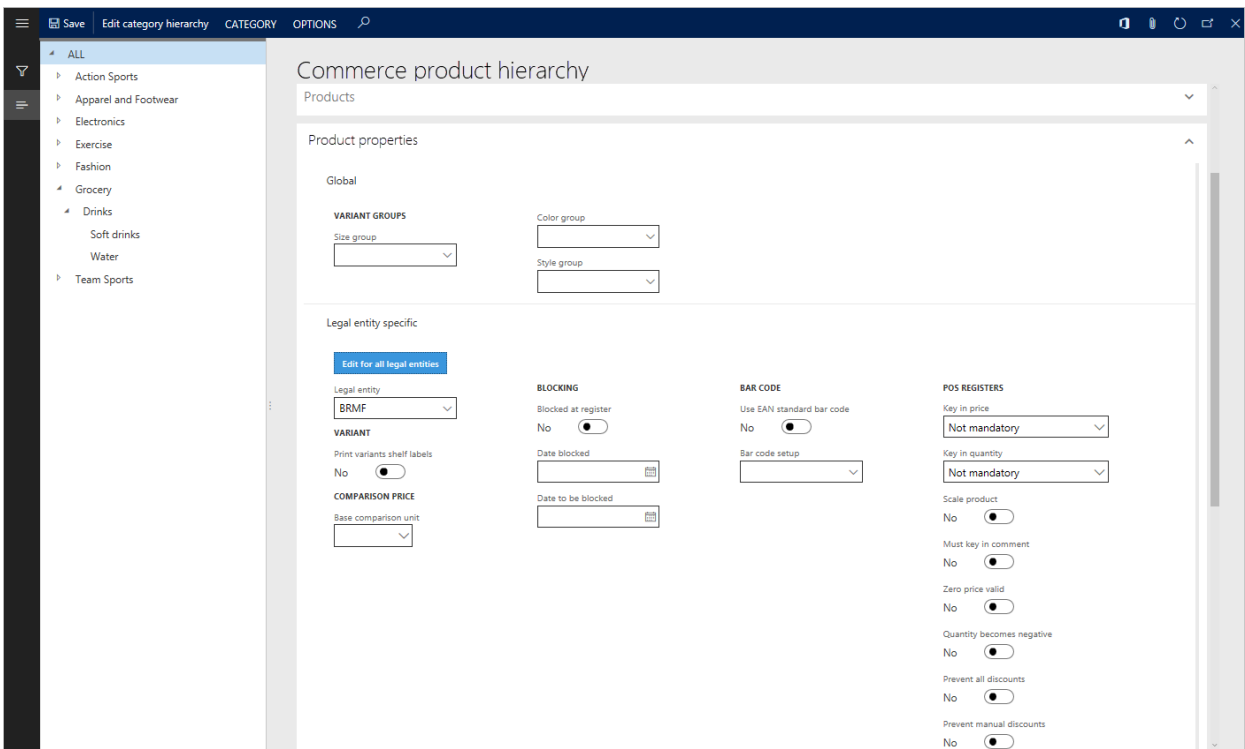

Notice the enhanced structure of the **Commerce product hierarchy** page that appears. In previous versions of the app, product properties were divided into *basic product properties* and *Retail product properties*, based on the scope of their applicability. Retail product properties are *global* in their scope of applicability. In other words, for a given product property, the same value is shared across all legal entities. By contrast, basic product properties are *legal entity–specific*. In other words, for a given basic product property, the value can differ across legal entities, depending on the individual business requirements of each legal entity.

In the enhanced product category structure, product properties are logically separated based on their applicability in a group, to reflect the structure of the released product details form structure.

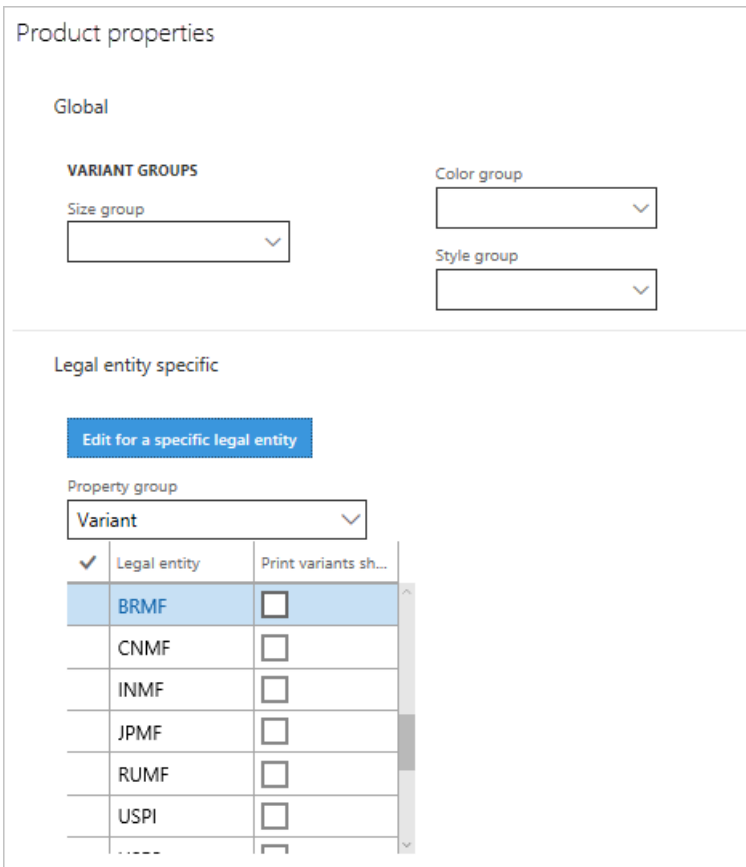

You can switch between managing legal entity–specific properties across all legal entities and managing them for a specific legal entity.

To manage properties across all legal entities, select **View for all legal entities** (or **Edit for all legal entities**).

To manage properties for a specific legal entity, select **View** for a specific legal entity (or **Edit** for a specific legal entity).

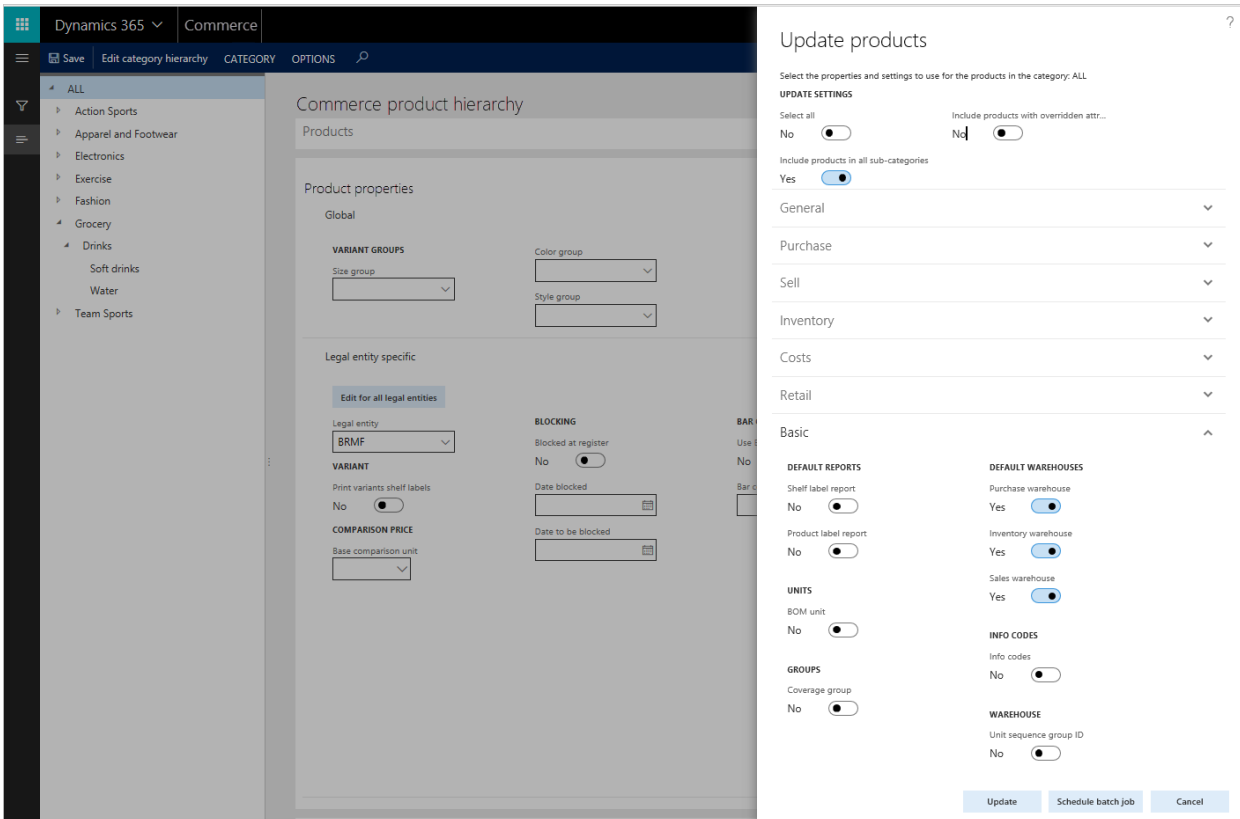

Additionally, in the enhanced product category structure, a merchandising manager can now define default values for an additional set of product properties at the level of the individual category. Then, when products are created, they inherit default values for their product properties, based on the association of those properties with an individual category in the product hierarchy. These inherited product properties can also be modified for each product to meet individual business requirements.

Selecting properties to update products on the Commerce product

# hierarchy page

You can use the new enhanced structure for product properties to select updated product properties that must be pushed to the associated products. On the **Commerce product hierarchy** page, on the Action Pane, select **Category**, and then select **Update products** to open the **Update products** dialog box.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Change the sort order for merchandising entities

2/18/2021 • 2 minutes to read • [Edit Online](#)

Retailers consider product discovery a primary tool for customer interaction across all channels. Various functionality can help customers easily discover products. For example, they can browse categories, search, and filter.

This topic explains the concepts that are related to controlling the display order for various merchandising-related entities. It also explains how to change the sort order.

## Overview

The support for sorting various merchandising-related entities has been enhanced. This support is now better aligned with existing customer scenarios that previously required extensions from implementation partners.

In versions of Retail that are earlier than version 10.0.5, the sort order for categories in the navigation hierarchy was alphabetical. The new custom sort order functionality lets merchandising managers configure the sort order for various merchandising-related entities across all end-user clients. These clients include headquarters (HQ) and call centers.

## Configure the display order for categories in the product hierarchy

Before you can complete this procedure, demo data must be installed in your environment.

1. Go to **Retail and Commerce > Products and categories > Commerce product hierarchy**.
2. Click **Edit category hierarchy**.
3. Click **Edit**.
4. In the tree, expand **ALL > Action Sports**.
5. In the tree, expand **ALL > Team Sports**.
6. In the **Display order** field, enter a number. (The number can be negative.)
7. Repeat steps 4 through 6 for any additional categories that you want to change the order of.

The display order for the channel navigation hierarchy will be reflected in HQ for the commerce product hierarchy and released products by category.

# Configure the display order for categories in the channel navigation hierarchy

Before you can complete this procedure, demo data must be installed in your environment.

1. Go to **Retail and Commerce > Products and categories > Channel navigation categories**.
2. In the list, select the **Fashion navigation** hierarchy.
3. Click **Edit category hierarchy**.
4. Click **Edit**.
5. In the tree, select **Fashion > Womenswear > Womens Shoes**.
6. In the **Display order** field, enter a number.
7. In the tree, select **Fashion > Womenswear > Tops**.

Likewise, you can define the sort order for the sub-categories.

8. In the tree, select **Fashion > Menswear > Casual Shirts**.
9. In the **Display order** field, enter a number.
10. In the tree, select **Fashion > Menswear > Coats & Jackets**.
11. In the **Display order** field, enter a number.
12. Repeat for any additional categories that you want to change the order of.

The display order for the channel navigation hierarchy is reflected in HQ, catalog, and channels.

The screenshot displays the SAP Finance and Operations interface. The top navigation bar includes 'Finance and Operations', a search bar with 'channel naviga', and user information 'USRT'. The main content area is titled 'Retail product hierarchy | FASHION NAVIGATION HIERARCHY'. On the left, a category tree is shown with 'Fashion' expanded to 'Womenswear', which is further expanded to 'Womens Shoes', and 'Sweaters' is selected. The right pane shows the configuration for the 'Sweaters' category. The 'General' tab is active, displaying fields for Name (Sweaters), Modified date (7/26/2019 10:12:59 AM), Commodity code, Description (Sweaters), Active status (Yes), Friendly name (Sweaters), Activated date (3/6/2017 12:12:52 AM), Search text (Sweaters), and Display order (-9.00). The 'Display order' field is highlighted with a red box. Below the 'General' tab, there are sections for 'Products' (81216), 'Product attribute groups', and 'Category attribute values'.

# Product dimensions

2/18/2021 • 7 minutes to read • [Edit Online](#)

There are five product dimensions: color, configuration, size, style, and version. You combine product dimensions in dimension groups and assign dimension groups to product masters. The combinations of product dimensions determine how product variants are defined.

Product dimensions are characteristics that serve to identify a product variant. You can use combinations of product dimensions to define product variants. You must define at least one product dimension for a product master in order to create a product variant.

## Product variants

Product variants are also referred to as items. An item is a tangible product, which isn't the same as a service. It's also possible to define a product master with the service type. By using the service type, you can specify product variants that include services. For example, you can specify a product master for consultancy work and product variants for work that is performed by senior consultants and junior consultants.

## Product dimensions

A product variant can be generated based on the product dimension values.

Product dimension values for the size, color, and style dimensions can be created in the following locations:

- **Size page** (**Product information management > Setup > Dimension and variant groups > Sizes**)
- **Color page** (**Product information management > Setup > Dimension and variant groups > Colors**)
- **Style page** (**Product information management > Setup > Dimension and variant groups > Styles**)

Product dimension values for the configuration dimension are typically created by using either the Product configurator or the Dimension-based configurator.

Product versions are usually created for specific versions as the product evolves during its lifecycle. Product versions are covered in detail later in this topic.

Product dimensions can also be created and maintained on the **Product dimensions** page, which can be accessed from the following locations:

- Go to **Product information management > Products > Product masters**. On the Action Pane, select **Product dimensions**.
- Go to **Product information management > Products > All products and product masters**. Select a product master. On the Action Pane, select **Product dimensions**.
- Go to **Product information management > Released products**. Select a product master. On the Action Pane, on the **Product** tab, in the **Product master** group, select **Product dimensions**.

The number of variants that you can create for an item is limited by the number of possible product dimension combinations.

**TIP**

When you use a product on an order line, for example, you select the product dimensions to identify the product variant that you want to work with.

## Example

A company sells denim jeans. The item, *Jeans*, uses the color and size product dimensions. The jeans are sold in three different colors and six different sizes. The colors are blue, black, and brown. The sizes are XS, S, M, L, XL, and XXL. Not all sizes are available in all three colors. If all combinations were available, there would be 18 different types of jeans. However, in this example, only the following nine product variant combinations are produced.

COLOR	SIZE
Blue	XS
Blue	S
Blue	M
Black	M
Black	L
Black	XL
Brown	L
Brown	XL
Brown	XXL

## The version product dimension

Version is a product dimension that is intended to help you maintain and track multiple versions of a product throughout the supply chain. Version tracking is essential to the success of manufacturers that operate in a world of constantly shrinking product lifecycles, increased quality and reliability requirements, and increased focus on product safety.

As a standard product dimension, version will behave similarly to the existing product dimensions (size, style, color, and configuration). Therefore, you can use it for other purposes besides tracking product versions.

### Turn on the version dimension

#### Before you turn on the version dimension

When you turn on the version dimension, some functionality could become broken or stop working as expected if you've installed other solutions that add customizations to the inventory dimensions. For the version dimension to be fully functional, you might have to update those solutions so that they include the version dimension in their references to the inventory dimensions.

When you're testing your solutions for compatibility with the version dimension, look for the following elements:

1. **Functionality:** Most importantly, any customizations that involve the inventory dimensions must be assessed to ensure that they can work in conjunction with the version dimension.
2. **References to the inventory dimensions:** Look out for references to the inventory dimensions (that is, places where the dimensions are explicitly referenced). References to `InventDimId` should work out of the box, but look out for references to style or color. For example, be sure to check the following elements:
  - API calls in extended classes
  - All references to specific inventory dimensions in extension code (This code must float the version dimension together with the style, color, and size dimensions.)
3. **References to obsolete API calls:** In its introduction of the version dimension, Microsoft has tried to make as few APIs as possible obsolete. The few APIs that have been made obsolete will issue a warning when you turn on the **Product dimension - version** configuration key. Calls to those API must be fixed in your extended solutions before you turn on the version dimension in a production system. Here are the version-specific obsolete APIs:
  - `RetailTransactionServiceInventory::getProductRecordId`
  - `EcoResProductNumberIdentifiedProductVariantEntity::find`
  - `EGAISAlcoholProduction_RU::findByItemDim`
  - `PCVariantConfiguration::findByProductMasterAndDimensions`
4. **Maps:** If any maps use the inventory dimensions, the corresponding relation mapping to these maps must be updated so that they include the version dimension. In the extended model or table extensions, look out for tables where the fields include inventory dimensions.
5. **Microsoft Dynamics 365 Commerce functionality:** After it's turned on, the version dimension will appear throughout the Commerce-specific code in Dynamics 365 Supply Chain Management. However, the version dimension isn't yet supported by the Commerce channel database or in the Point of Sale (POS) or e-Commerce applications. These Commerce-specific applications won't support users selling/shipping or returning/receiving inventory by version dimension. Inventory availability lookup functions won't discern inventory by version dimension in Commerce apps. This behavior resembles the current behavior of the config dimension throughout Commerce.

#### Turn on the version dimension

Before you can use the version dimension, it must be turned on in your system. This task requires admin permissions.

1. Go to **System administration > Workspaces > Feature management**.
2. Turn on the feature that is named *Product dimension version*. (For more information, see [Feature management](#).)
3. Put your system into [Maintenance mode](#).
4. Go to **System administration > Setup > License configuration**.
5. On the **Configuration keys** tab, expand **Trade**, and select the check box for **Product dimension - version**.
6. Turn off [Maintenance mode](#).

#### Areas where the version dimension isn't supported

The following areas don't support the version dimension (you can still use these areas but you won't be able to add versioned products (products where the version dimension is used) to them). For example, you can't add a versioned item to a vendor catalog. This is because adding products with the version dimension to these areas would cause breaking changes.

- Cost object monthly statement
- Cost object statement cache
- MCR sales statistics per item

- Vendor catalogs
- EcoResProductDimensionGroupEntity

In addition, the order creation and order processing features in Commerce (for example, for POS, call center, and e-commerce orders) don't support the version dimension. There is no confirmed timeline as to when Commerce orders will be enhanced to support it.

### Functional characteristics of the version dimension

The version dimension works like the other product dimensions. However, because of its specific nature, and because it's intended to maintain and track multiple versions of a product, it behaves slightly differently. Here are some of the differences and similarities:

- **There is no version group.**

Although the concept of groups exists for size, color, and style (color group, size group, and style group), no version group concept exists. Groups let you predefine the applicable values so that when, for example, you assign a color group to a product, the product can use all the colors in that color group. This concept doesn't apply to the version dimension, because the versions that a product takes aren't predefined when the product is created. Instead, versions are created during the lifecycle of the product, as they are required. Typically, if the form, fit, and function of the product remain the same, you create a new version instead of a new product.

- **Product variant suggestions work as they currently do.**

Product variant suggestions will create suggestions for all version dimension values, just as they do for other dimensions. The process of creating and releasing versioned products is the same as it is for products that use other dimensions. When you create a versioned product, the first version (V1) will be created as a product dimension, and the variants will be released. As the product changes and a new version is needed, the new version value (V2) will be added, and the required variants will be released. There is no expectation that all the versions (V1, V2, and V3) will be created in advance for the product.

#### IMPORTANT

If you turn on and use the version dimension, some solutions that reference the inventory dimensions might stop working as expected. To confirm and fix these issues, contact the independent software vendor (ISV) for your affected solutions. For more information, see [Enable the version dimension](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create a variant group

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a size, style, or color variant group for a product in Microsoft Dynamics 365 Commerce.

## Overview

Dynamics 365 Commerce supports multiple variants for products. It is ideal to set up variant groups for different product categories. For example, a size group can be created for t-shirts with sizes extra small, small, medium, large, and extra large, or a color group could be created to include all available colors of a product. Variant groups should be added before products are added.

In this topic, a size group will be created and configured. Similar procedures can be used for adding and configuring style groups and color groups.

## Create a size group

To create a size group, follow these steps.

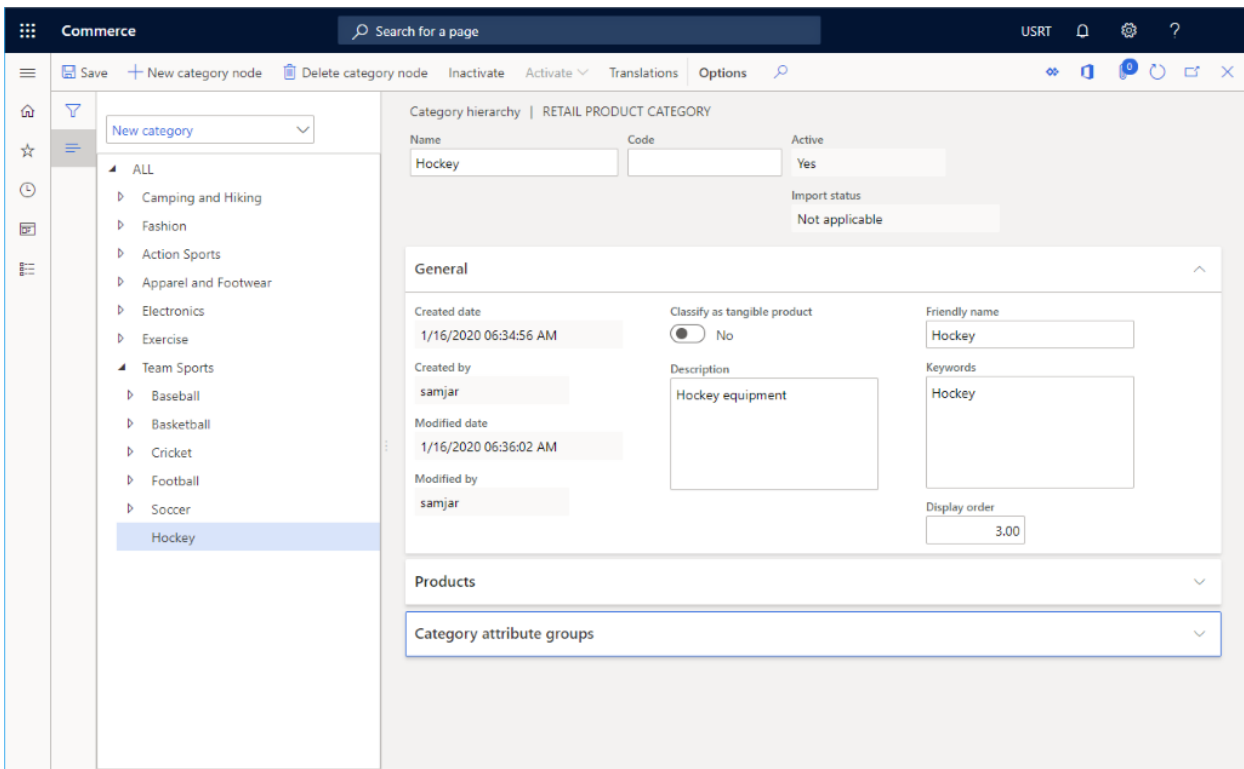

1. In the navigation pane, go to **Modules > Retail and commerce > Products and categories > Variant groups > Size groups**.
2. On the action pane, select **New**.
3. In the **Size group** box, enter a name for the size group.
4. In the **Description** box, enter an appropriate description.
5. On the action pane, select **Save**.

## Add attributes to the size group

To add attributes to a size group, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Products and categories > Variant groups > Size groups**
2. In the navigation pane, select a size group.
3. Under **Size group lines**, select **Add**.
4. In the **Size** box, enter a string representing the size (for example, "XL").
5. In the **Size name** box, enter a name for the size (for example, "Extra Large").
6. In the **Replenishment weight** box, enter a number representing the replenishment weight.
7. In the **Number in bar code** box, enter a number representing the bar code.
8. In the **Display order** box, enter a number representing the display order.
9. When finished adding sizes, select **Save** on the action pane.

The following image shows an example of a size group for "casual shirt sizes".

# Create a new product in Commerce

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a new product in Microsoft Dynamics 365 Commerce.

## Overview

A product is primarily defined by a product number, name, and description. However, other data is also required in order to describe a product or service:

## Create a new product

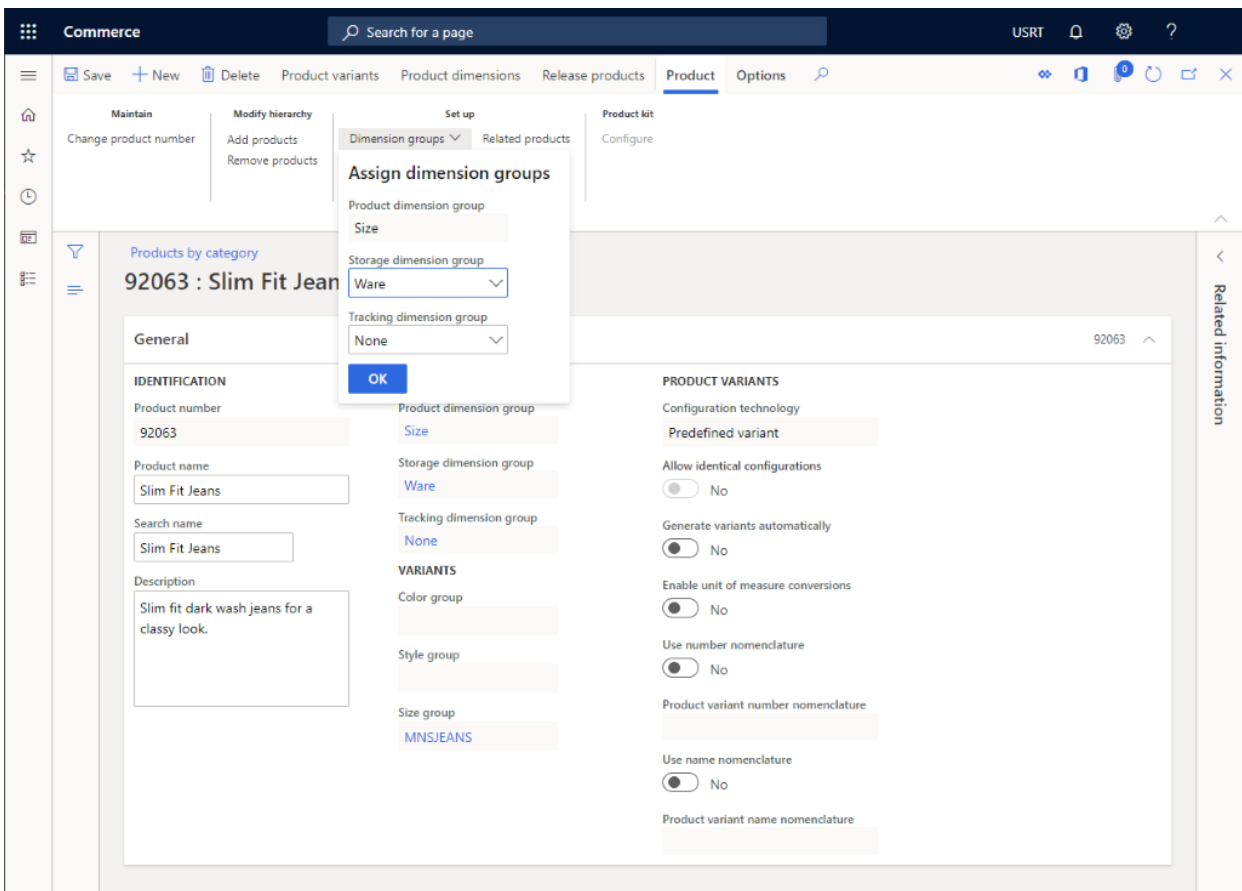

1. In the navigation pane, go to **Modules > Retail and commerce > Products and categories > Products by category**.
2. On the action pane, select **New**.
3. In the **Product type** drop-down list, select either **Item** or **Service**.
4. In the **Product subtype** drop-down list, select either **Product** (if the product will have no variants) or **Product master** (if the product will have variants).
5. In the **Product number** box, enter a product number if one is not already prepopulated.
6. In the **Product name** box, enter a product name.
7. In the **Search name** box, enter a search name.
8. In the **Retail category** drop-down list, select an appropriate category.
9. If the product is a kit, select **Yes** for **Product kit**.
10. If the product subtype is product master, set the **Product dimension group** to include the supported variants. Options include **Color**, **Size**, **Style**, and **Configuration**. You may need to create additional product dimension groups if needed.
11. In the **Configuration technology** drop-down list, select an appropriate option.
12. Select **OK**.

The following image shows an example product being added.

Product name	Product number	Search name
Dark wash straight Leg Jeans	92000	Straight Leg Jeans
Boot-Leg Vintage Wash Jeans	92064	Boot-Leg Jeans
Slim Fit Jeans	92063	Slim Fit Jeans
Relaxed Fit Straight-leg Jeans	92062	Straight-leg Jeans
Wrinkle-free Button-Down Shirt	92061	Button-Down Shirt
Easy-Fit Button-Down Shirt	92060	Button-Down Shirt
Casual Fit Button-Down Shirt	92059	Button-Down Shirt
Relaxed Fit Button-Down Shirt	92058	Button-Down Shirt
Slim Fit Button-Down Shirt	92057	Button-Down Shirt
Denim Button-Down Shirt	92056	Button-Down Shirt
Casual Drape Cardigan	92055	Casual Cardigan
Charcoal Trim Cardigan	92054	Charcoal Cardigan
Varsity Cardigan	92053	Varsity Cardigan
Blue Denim Jacket	92052	Blue Denim Jacket
All Season Windbreaker	92051	Windbreaker
Quick-Dry Performance Jacket	92050	Quick-Dry Jacket
Black Down Vest	92049	Black Down Vest

Once a product is added, additional data can be set for it, such as **Product description**, **Variant groups**, **Dimension groups**, **Product attributes**, and **Related products**.

The following image shows a product's additional details.

## Create product variants

If the product subtype is **Product master**, specific variants will need to be created.

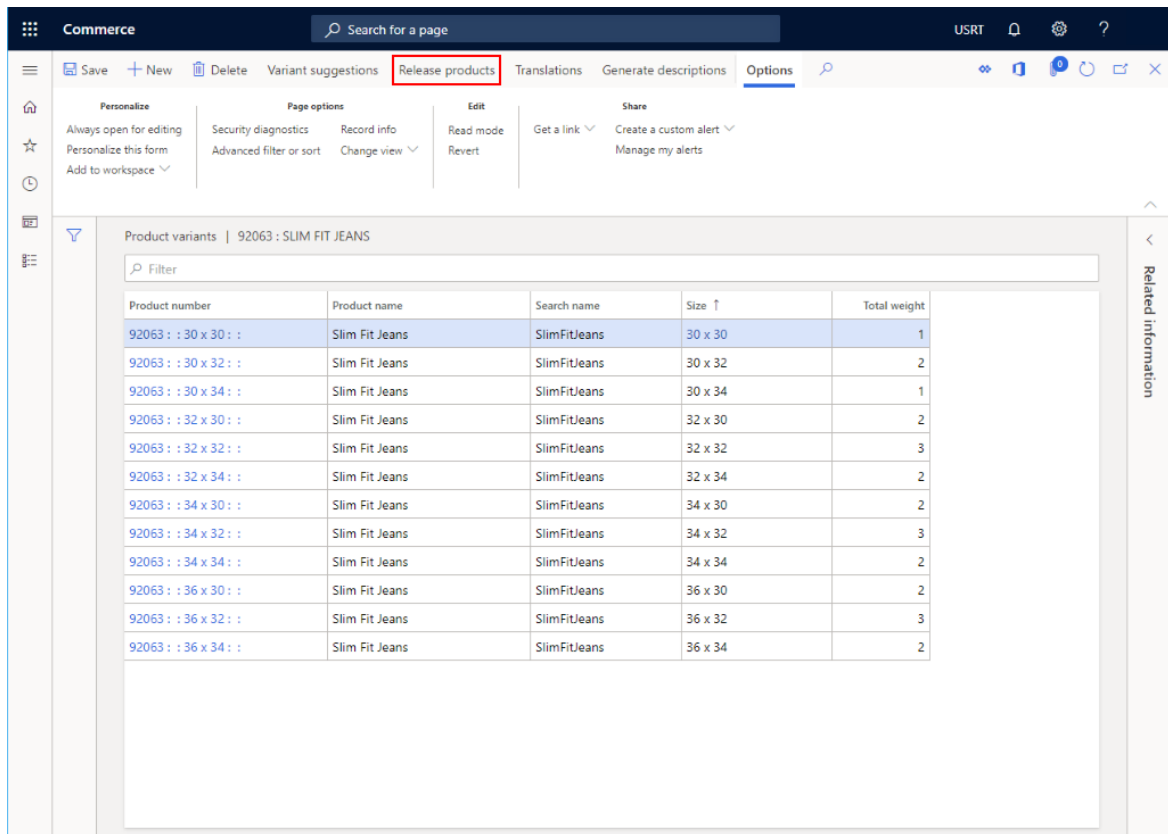

To create product variants, follow these steps.

1. On the action pane, select **Product variants**.
2. If variant groups have been selected on the action pane, select *\* Variant suggestions*.
3. Select the variants you would like to support for the product.
4. Select **Create**.

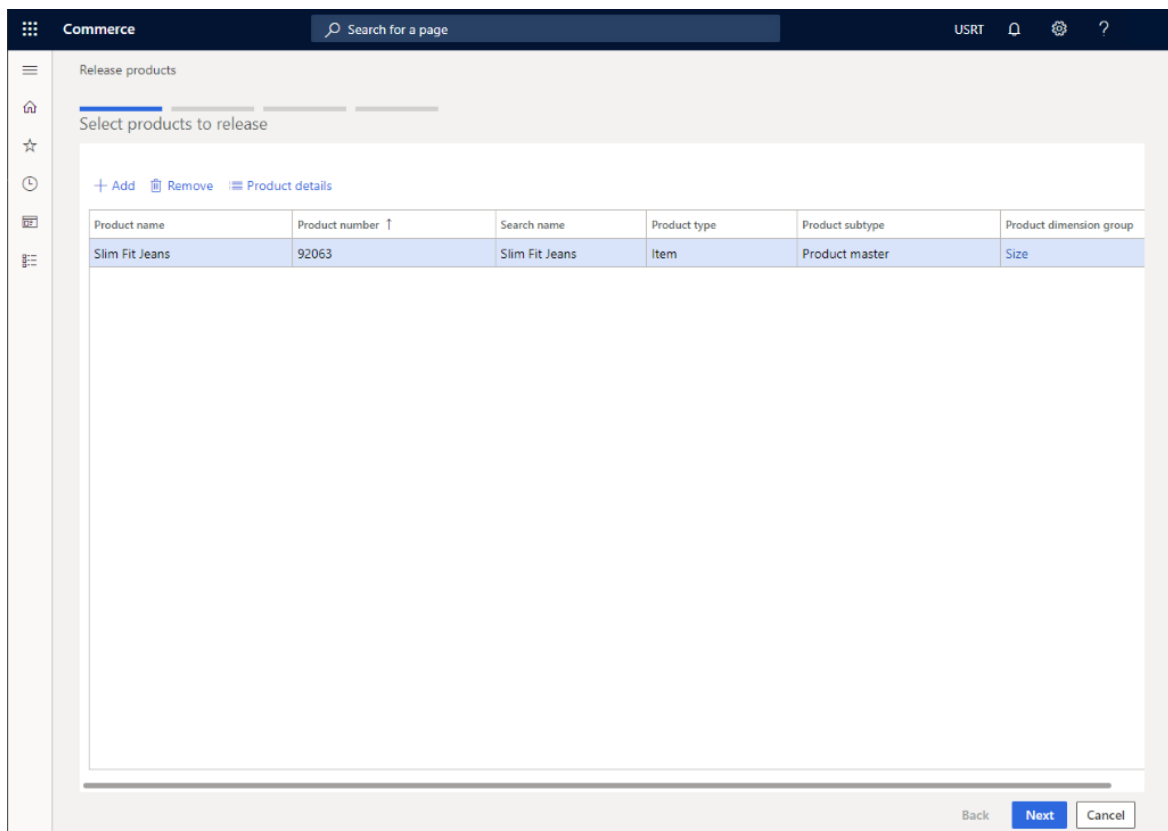

## Release a product

To sell a product it must first be released to a legal entity.

1. From the product page, select **Release products**.

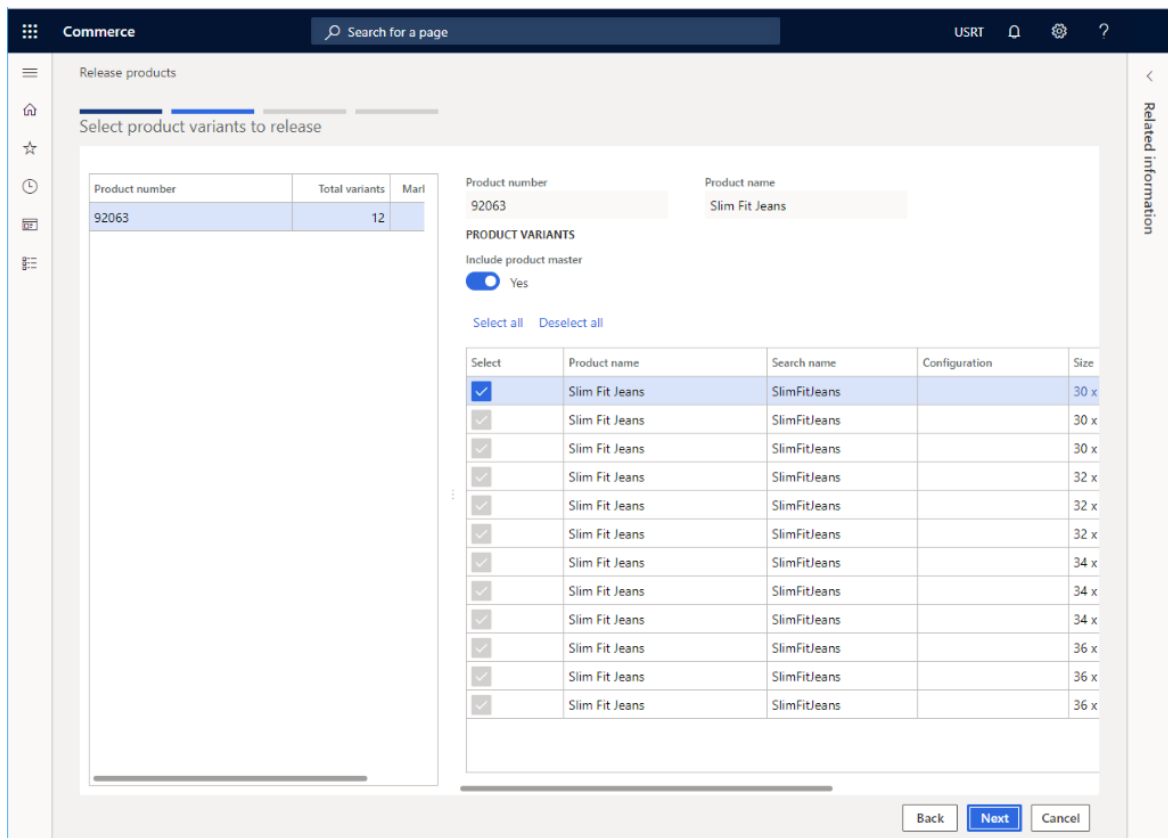

2. Select the product to release, and then select **Next**.

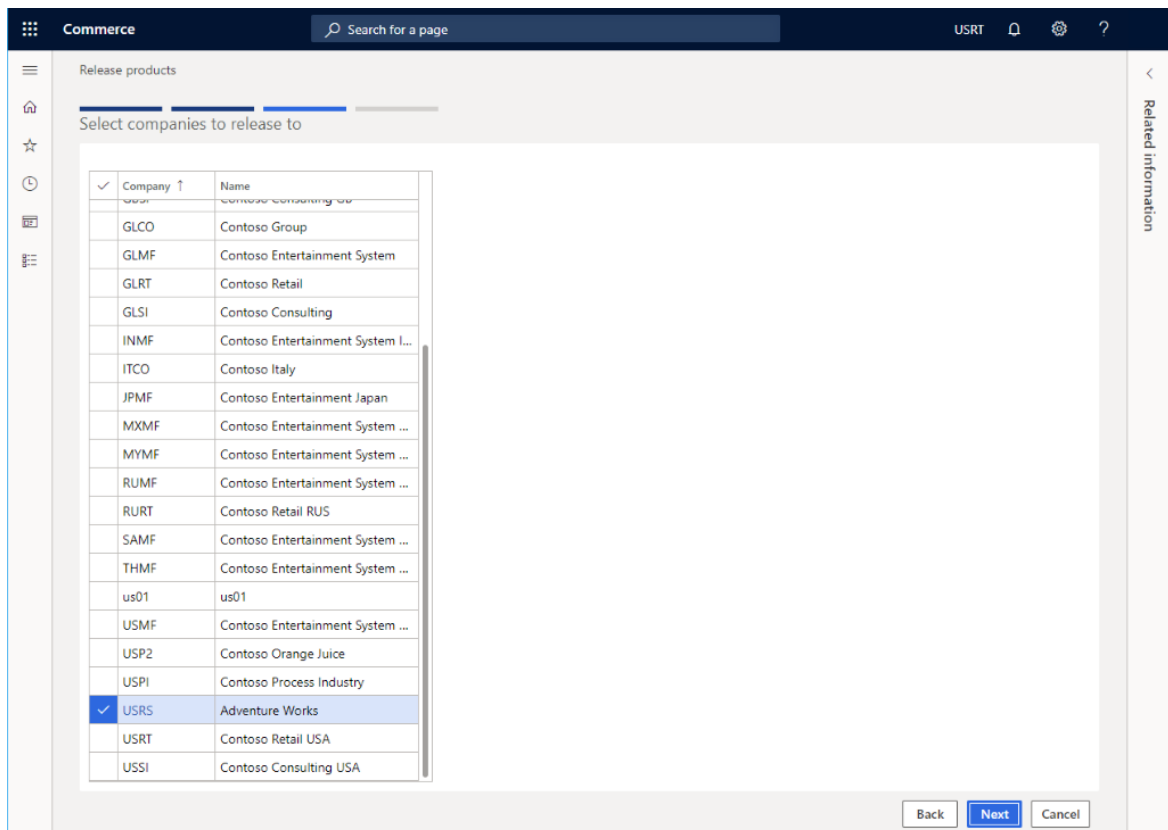

3. Select the set of product variants to release, and then select **Next**.

4. Select the legal entity, and then select **Next**.

5. Select **Finish**.

## Configure a released product

Once a product is released, it will then require further configuration that includes adding a price to the product.

1. In the navigation pane, go to **Modules > Retail and commerce > Products and categories > Released products by category**.
2. Select the product category node for the product that was released, and then select the product from the product list.
3. On the action pane, select **Edit**.
4. In the **Purchase** section, configure any required properties including **Unit**, **Price**, and **Quantity**.
5. On the action pane, select **Validate** to ensure that no errors are reported for missing fields.
6. On the action pane, select **Save**.

The following image shows an example configuration for a released product.

# Manage product categories and products

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes an enhanced way to manage product categories and products in Dynamics 365 Commerce. The enhancements let merchandising managers view a structure of product properties that is shared between the product hierarchy and released product details.

To learn more about how to manage product categories, in the **Category and product management** workspace, select the **Commerce product hierarchy** tile.

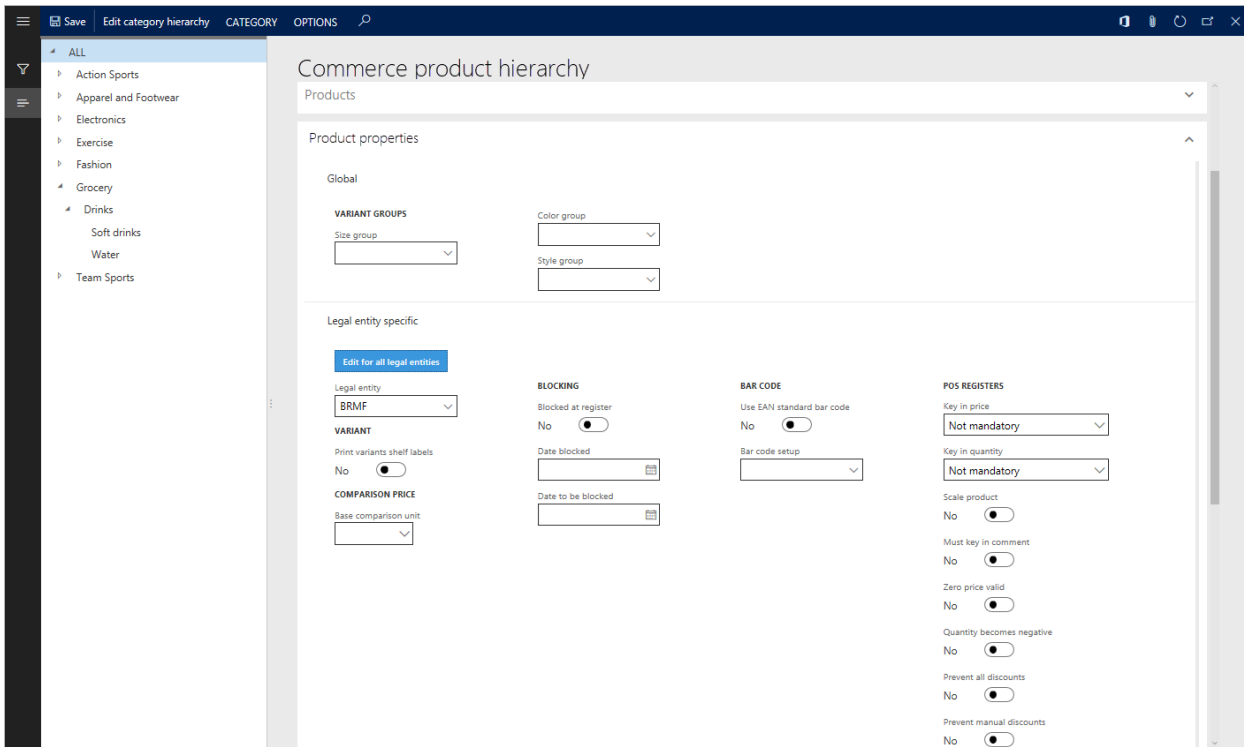

Notice the enhanced structure of the **Commerce product hierarchy** page that appears. In previous versions of the app, product properties were divided into *basic product properties* and *Retail product properties*, based on the scope of their applicability. Retail product properties are *global* in their scope of applicability. In other words, for a given product property, the same value is shared across all legal entities. By contrast, basic product properties are *legal entity–specific*. In other words, for a given basic product property, the value can differ across legal entities, depending on the individual business requirements of each legal entity.

In the enhanced product category structure, product properties are logically separated based on their applicability in a group, to reflect the structure of the released product details form structure.

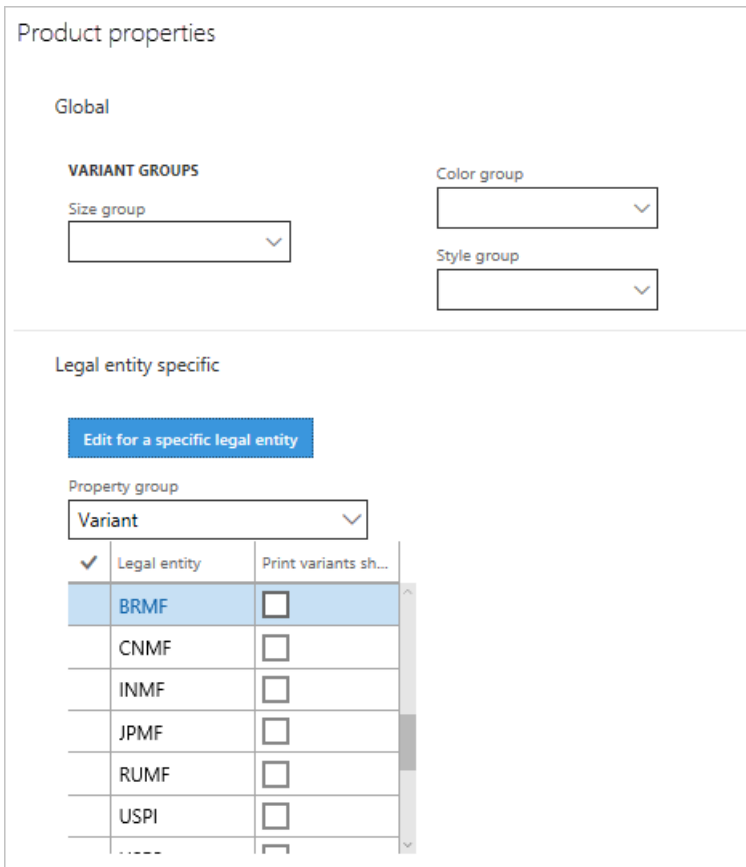

The screenshot displays the Dynamics 365 Commerce interface for managing product categories. The top navigation bar shows 'Dynamics 365' and 'Commerce'. The main content area is titled 'Commerce product hierarchy' and is divided into two main sections: 'Product properties' and 'Legal entity specific'. The 'Product properties' section includes 'Global' properties such as 'VARIANT GROUPS' (Size group, Color group, Style group) and 'Legal entity specific' properties (Legal entity, BAR CODE, POS REGISTERS, VARIANT, COMPARISON PRICE, BLOCKING). The 'Legal entity specific' section has a toggle for 'Edit for all legal entities' and a dropdown for 'Legal entity' set to 'BRMF'.

You can switch between managing legal entity–specific properties across all legal entities and managing them for a specific legal entity.

To manage properties across all legal entities, select **View for all legal entities** (or **Edit for all legal entities**).

To manage properties for a specific legal entity, select **View** for a specific legal entity (or **Edit** for a specific legal entity).

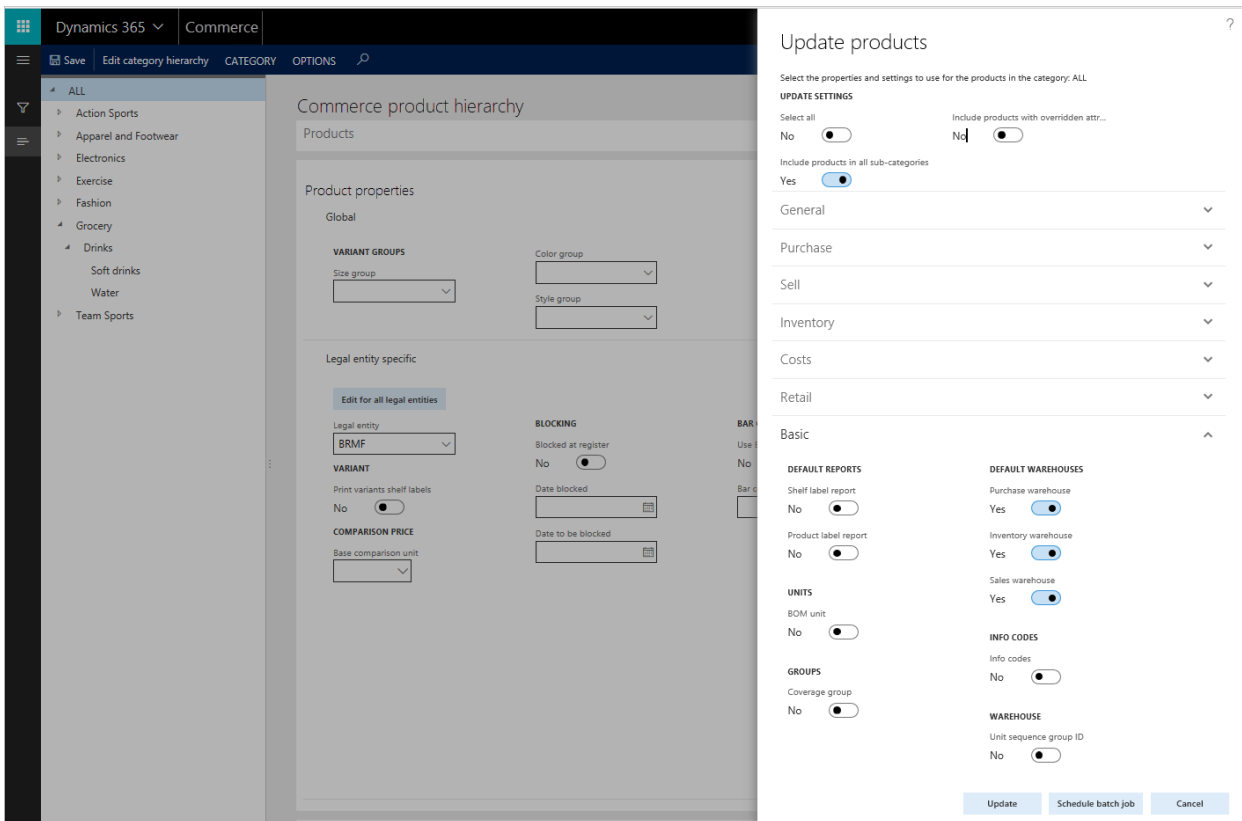

Additionally, in the enhanced product category structure, a merchandising manager can now define default values for an additional set of product properties at the level of the individual category. Then, when products are created, they inherit default values for their product properties, based on the association of those properties with an individual category in the product hierarchy. These inherited product properties can also be modified for each product to meet individual business requirements.

Selecting properties to update products on the Commerce product

# hierarchy page

You can use the new enhanced structure for product properties to select updated product properties that must be pushed to the associated products. On the **Commerce product hierarchy** page, on the Action Pane, select **Category**, and then select **Update products** to open the **Update products** dialog box.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Manage attributes and attribute groups

2/18/2021 • 10 minutes to read • [Edit Online](#)

*Attributes* provide a way to further describe a product and its characteristics through user-defined fields (such as **Memory size**, **Hard disk capacity**, **Is Energy star compliant**, and so on). Attributes can be associated with various Commerce entities, such as product categories and channels, and default values can be set for them. Products then inherit the attributes and the default values when they are associated with the product categories or channels. The default values can be overridden at the individual product level, at the channel level, or in a catalog.

For example, a typical television product might have the following attributes.

CATEGORY	ATTRIBUTE	PERMISSIBLE VALUES	DEFAULT VALUE
TV & Video	Brand	Any valid brand value	None
TV	Screen Size	20–80 inches	None
	Vertical Resolution	480i, 720p, 1080i, or 1080p	1080p
	Screen Refresh Rate	60hz, 120hz, or 240hz	60hz
	HDMI Inputs	0–10	3
	DVI Inputs	0–10	1
	Composite Inputs	0–10	2
	Component Inputs	0–10	1
LCD	3D Ready	Yes or No	Yes
	3D Enabled	Yes or No	No
Plasma	Operating Temp From	32–110 degrees	32
	Operating Temp To	32–110 degrees	100
Projection	Projection Tube Warranty	6, 12, or 18 months	12
	# of Projection Tubes	1–5	3

## Attributes and attribute types

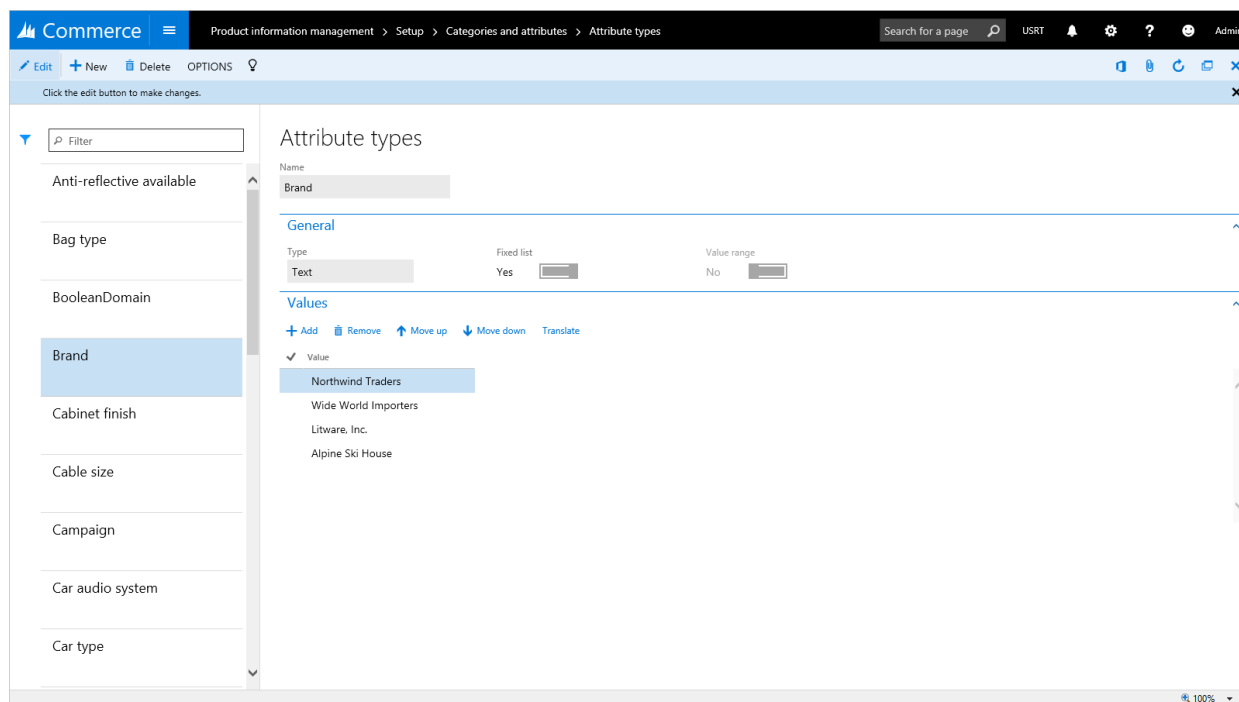

Attributes are based on *attribute types*. The attribute type identifies the type of data that can be entered for a specific attribute. The following attribute types are supported:

- **Currency** – This type supports a currency value. It can be bounded (that is, it can support a range of values), or it can be left open.
- **DateTime** – This type supports a date and time value. It can be bounded or left open.

- **Decimal** – This type supports a numerical value that includes decimal places. It also supports a unit of measure. It can be bounded or left open.
- **Integer** – This type supports a numerical value. It also supports a unit of measure. It can be bounded or left open.
- **Text** – This type supports a text value. It also supports a predefined set of possible values (that is, an *enumeration*).
- **Boolean** – This type supports a binary value (**true** or **false**).
- **Reference** – This type references other attributes.

## Set up attribute types

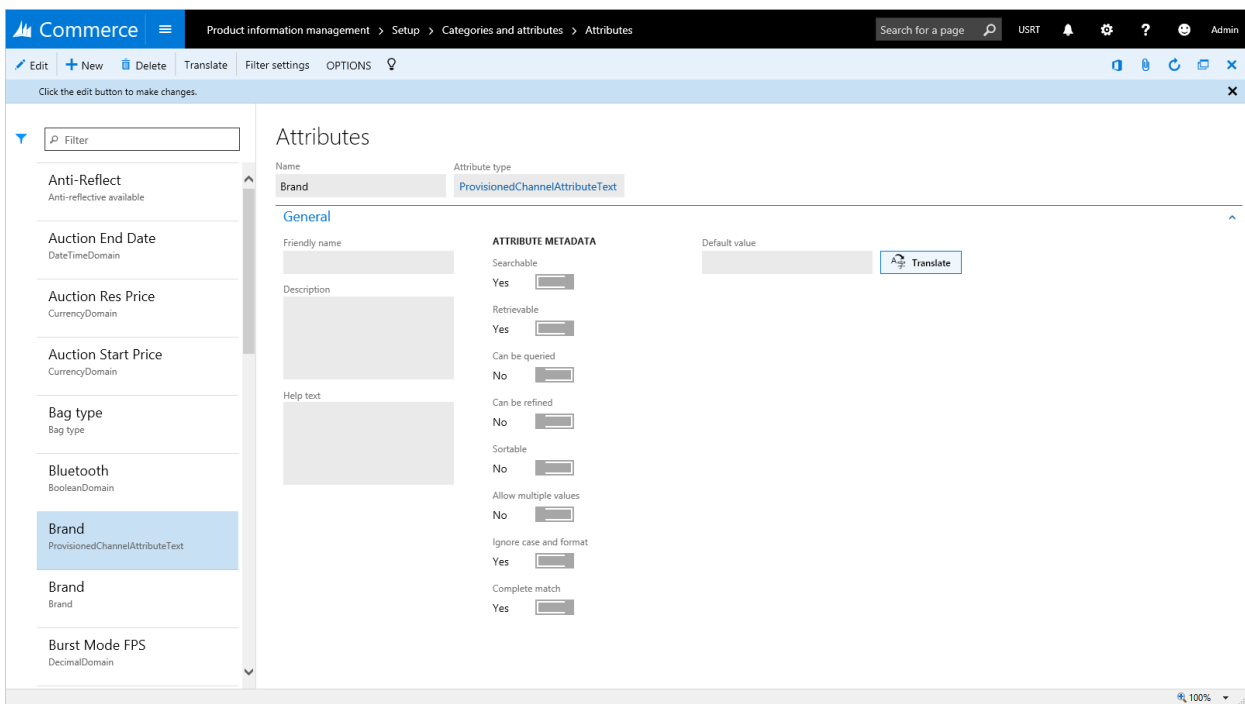

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Product information management > Setup > Categories and attributes > Attribute types**.
3. Create two attribute types of the **Text** type, set the **Fixed list** option to **Yes**, and then add a list of values:
  - Name one attribute type **Lens shape**, and add the following values: **Oval**, **Square**, and **Rectangle**.
  - Name the other attribute type **Sunglass brand**, and add the following values: **Ray ban**, **Aviator**, and **Oakley**.

## Set up an attribute

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Product information management > Setup > Categories and attributes > Attributes**.
3. Create an attribute that is named **Lens**.
4. Set the **Attribute type** field to **Lens shape**.

## Attribute metadata

*Attribute metadata* lets you select options to specify how the attributes for each product should behave. For example, you can specify whether attributes are required, whether they can be used for searches, and whether they can be used as a filter.

For products, the attribute metadata settings can be overridden at the channel level. This capability will be discussed later in this topic.

As you might notice, the **Attributes** page includes options that are related to attribute metadata. Under **Attribute metadata** for POS, one option that is named **Can be refined** affects the behavior of the attribute values in the point of sale (POS) or the way that the system handles those attribute values. Only attributes for which you may set the **Can be refined** option to **Yes**, will show up for refinement or filtering of products in the POS.

Here are the remaining attribute metadata options on the **Attributes** page:

- Searchable
- Retrievable
- Can be queried
- Sortable
- Allow multiple values
- Ignore case and format
- Complete match

These options were originally intended to improve the search functionality for the online storefront. Although Commerce doesn't include the online storefront out of the box, it does include the eCommerce Publishing Software Development Kit (SDK). Customers can use this SDK to put products into a search index of their choice. Although the product data is imported, customers should still be able to distinguish searchable data, data that can be queried, and so on. In that way, they can build an optimal index to make sure that they index only attributes that, *in their opinion*, should be indexed.

For information about the purpose of these remaining options, see [Overview of the search schema in SharePoint Server 2013](#).

# Filter settings for attributes

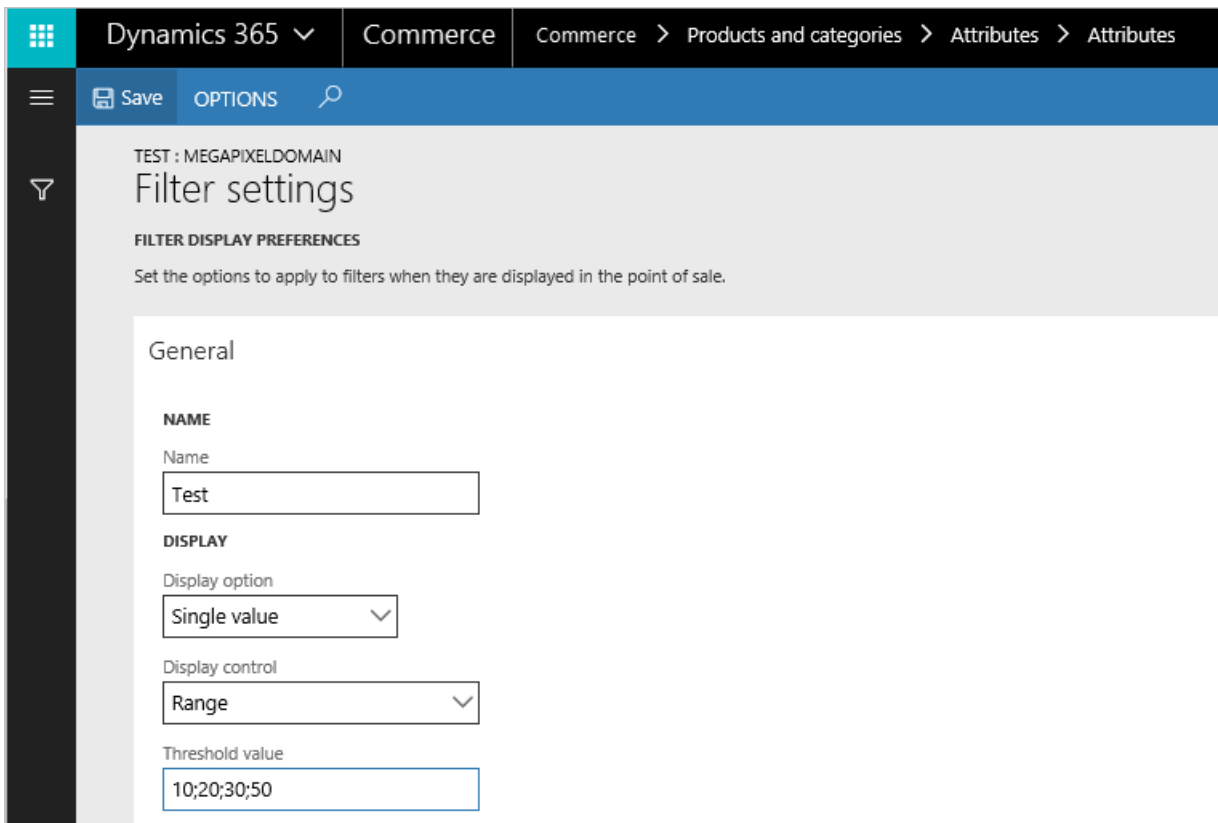

Filter settings for attributes let you define how the filters for attributes are shown in the POS. To access the filter settings for an attribute, on the **Attributes** page, select the attribute, and then, on the Action Pane, select **Filter settings**.

The **Filter display preferences** page includes the following fields:

- **Name** – By default, this field is set to the name of the attribute. However, you can change the value.
- **Display option** – The following options are available:
  - **Single value** – This option is available for the following attribute types: **Boolean, Currency, Decimal, Integer, and Text**. This option enables single value selection for these attributes in the client for refinement.
  - **Multi value** – This option is available for the following attribute types: **Currency, Decimal, Integer, and Text**. This option enables multi-value selection for this attribute in the client for refinement.
- **Display control** – The following options are available:
  - **List** – This option is available for the all attribute types.
  - **Range** – This option is available for the following attribute types: **Currency, Decimal, and Integer**.
  - **Slider** – This option is available for the following attribute types: **Currency, Decimal, and Integer**.
  - **Slider with bars** – This option is available for the following attribute types: **Currency, Decimal, and Integer**.
- **Threshold value** – This setting is required if you selected **Range** as the display control type. You can define values by using a semicolon (;) as a delimiter.

For example, for the filter like **Bag Volume**, a threshold value can be **10; 20; 50; 100; 200; 500; 1000; 5000**. In this case, the POS will show the following ranges. Any ranges that don't have any products in the result set will appear dimmed.

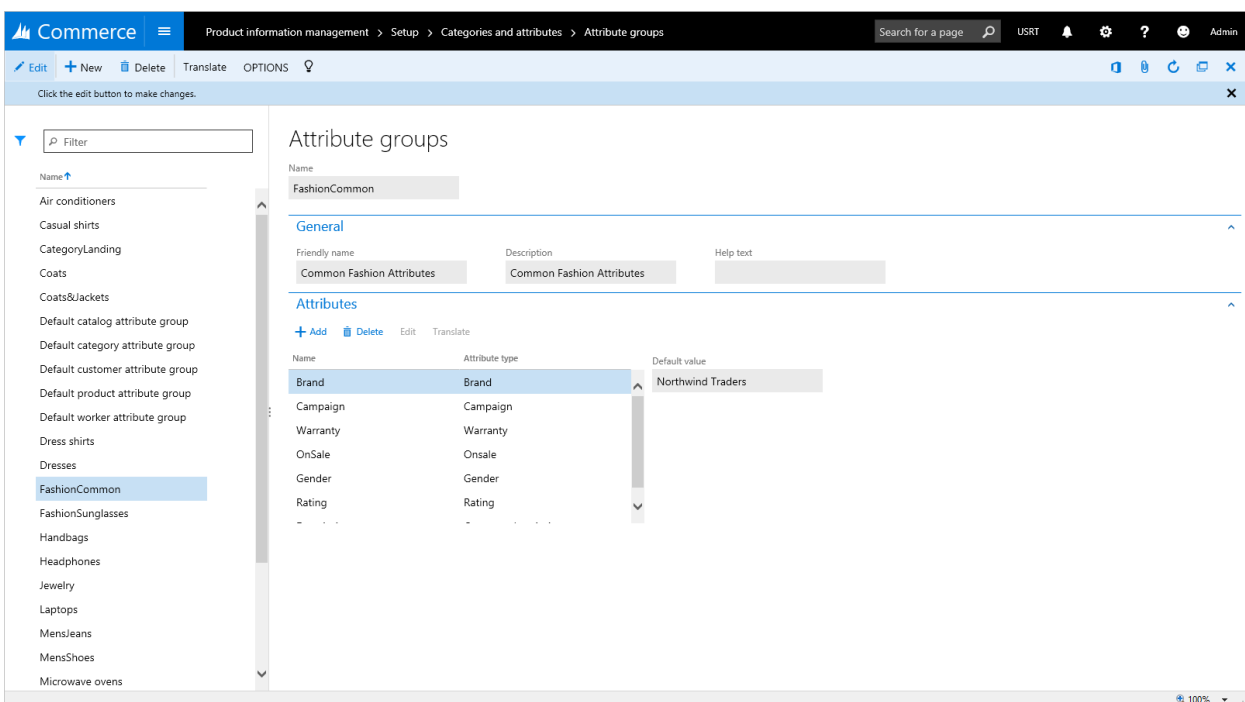

- Less than 10
- 10 – 20
- 20 – 50
- 50 – 100
- 100 – 200
- 200 – 500
- 500 or more

## Attribute groups

After attributes have been defined, they can be assigned to attribute groups. An *attribute group* is used to group the individual attributes for a component or subcomponent in a product configuration model. An attribute can be included in more than one attribute group. Attribute groups can help users configure products, because the various selections are arranged in a specific context. Attribute groups can be assigned to categories or channels.

You can also set default values for attributes that are included in an attribute group. For example, you add an attribute for color to an attribute group and select **Blue** as the default attribute value. In this case, when the attribute group is added to a product that includes color as one of its attributes, **Blue** appears as the default color for that product.

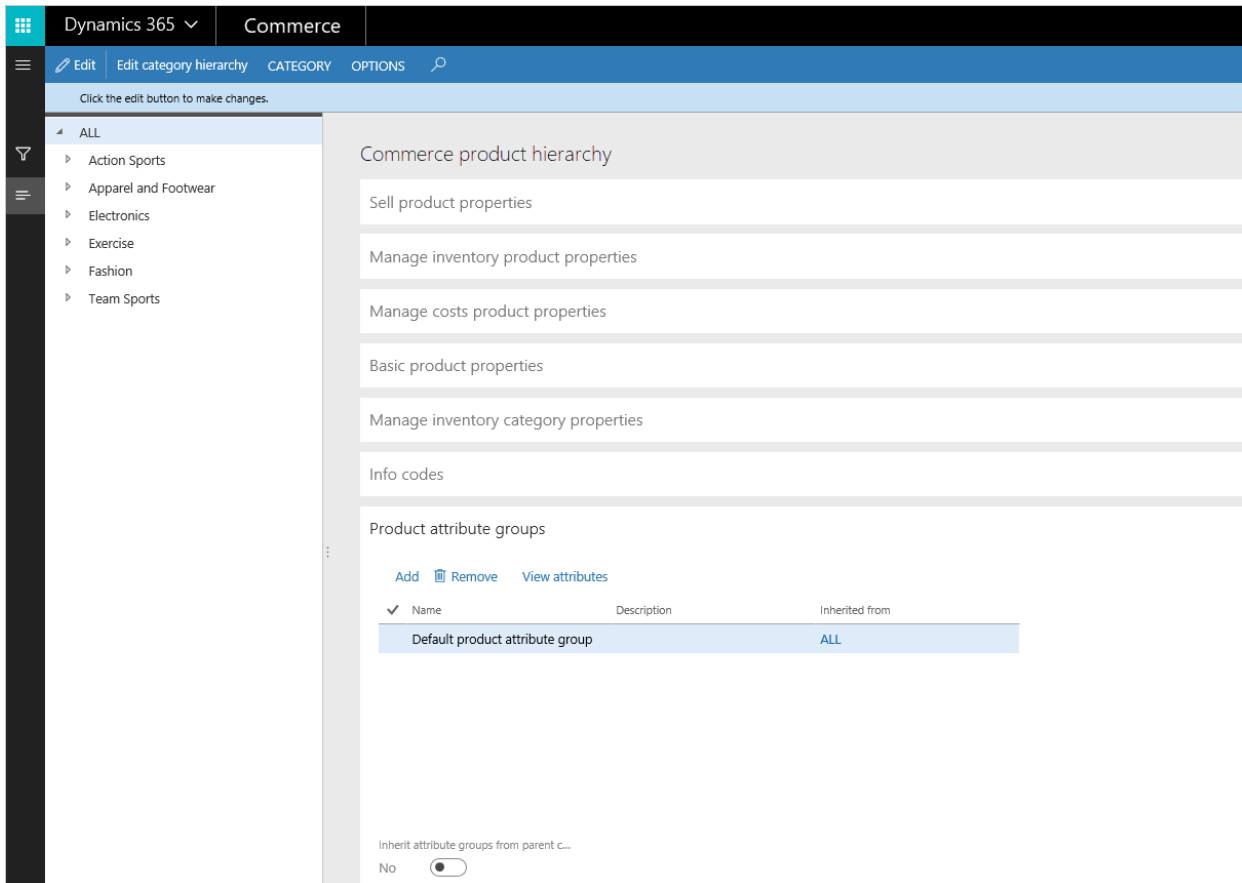

### Create an attribute group

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Product information management > Setup > Categories and attributes > Attribute groups**.
3. Create an attribute group that is named **Fashion Sunglasses**.
4. Add the following attributes: **Lens shape** and **Sunglass brand**.

### Assign attribute groups to categories

One or more attribute groups can be associated with category nodes in the following types of category hierarchies: Commerce product hierarchy, Channel navigation category hierarchy, and Supplemental product category hierarchy. Then, when products are categorized, they inherit the attributes that are included in the attribute groups.

Follow these steps to assign attribute groups to categories in the Commerce product hierarchy.

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Retail and Commerce > Category and product management > Commerce product hierarchy**.
3. Select **Fashion navigation hierarchy**.
4. Under **Menswear**, select the **Pants** category, and then, on the **Product attribute groups** FastTab, add an attribute group that is named **Men's belt**.
5. Select the **Fashion sunglasses** category, and verify the new attributes in the **Fashion Sunglasses** attribute group by selecting **View attributes**.

The attribute group should show the new **Lens shape** and **Sunglass brand** attributes.

6. Under **Menswear**, select the **Pants** category, and verify the attributes for the **Men's belt** attribute group by selecting **View attributes**.

The attribute group should show the **Men's belt brand**, **Belt fabric**, and **Belt size** attributes.

#### NOTE

This procedure can also be used to assign attribute groups to categories in the Channel navigation category hierarchy and the Supplemental product category hierarchy. In step 2, use the following navigation paths:

- Retail and Commerce > Category and product management > Channel navigation categories
- Retail and Commerce > Category and product management > Supplemental product categories

### Assign attribute groups to stores

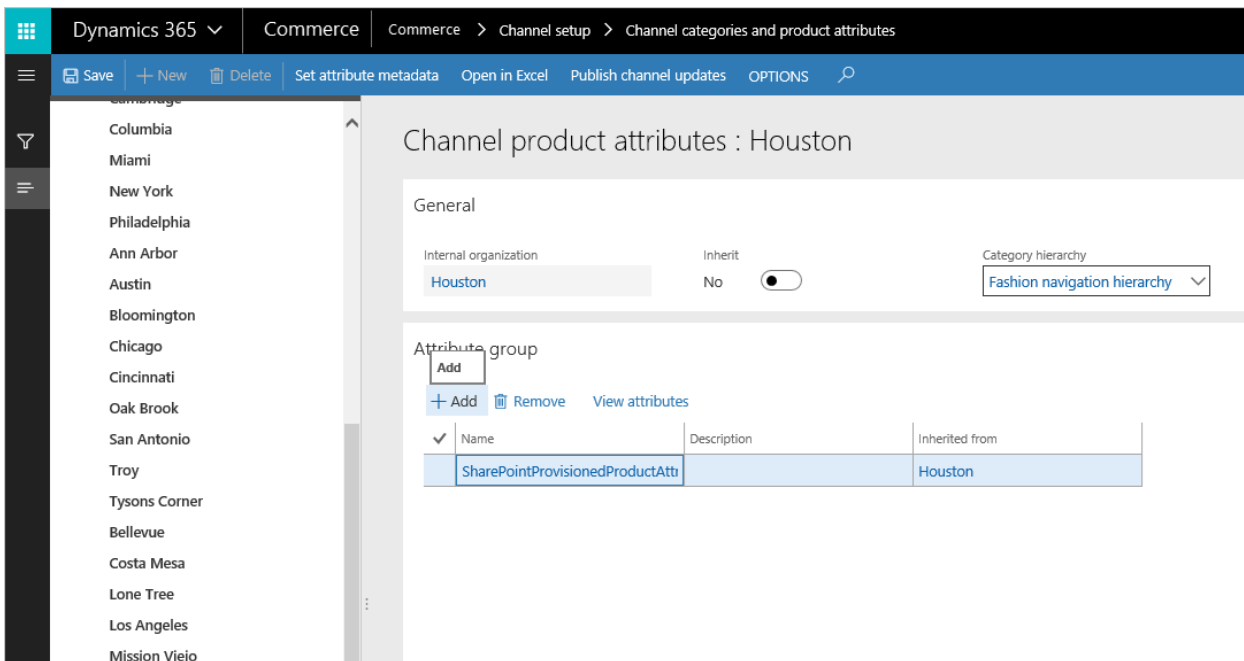

One or more attribute groups can be associated with one or more stores in the store hierarchy. Then, when products are enriched for specific stores, they inherit the attributes that are included in the attribute groups.

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Retail and Commerce > Channel setup > Channel categories and product attributes**.
3. Assign attribute groups to the Houston channel:
  - a. Select the **Houston** channel.
  - b. On the **Attribute group** FastTab, select **Add**, and then, in the **Name** field, select **SharePointProvisionedProductAttributeGroup**.
  - c. Select **Add** again, and then, in the **Name** field, select **Men's belt**.
  - d. Select **Add** again, and then, in the **Name** field, select **Fashion Sunglasses**.

#### NOTE

An option lets you specify that this channel should inherit the attribute groups from its parent channel in the hierarchy. If you set the **Inherit** option to **Yes**, the child channel node inherits all the attribute groups and all the attributes in those attribute groups.

4. Enable the attributes so that they are available in the Houston channel:
  - a. On the Action Pane, select **Set attribute metadata**.
  - b. Select the **Fashion** category node, and then, on the **Channel product attributes** FastTab, select **Include attribute** for each attribute.
  - c. Select the **Fashion Accessories** category node, select the **Fashion Sunglasses** category, and then, on the **Channel product attributes** FastTab, select **Include attribute** for each attribute.
  - d. Select the **Menswear** category node, select the **Pants** category, and then, on the **Channel product attributes** FastTab, select **Include attribute** for each attribute.

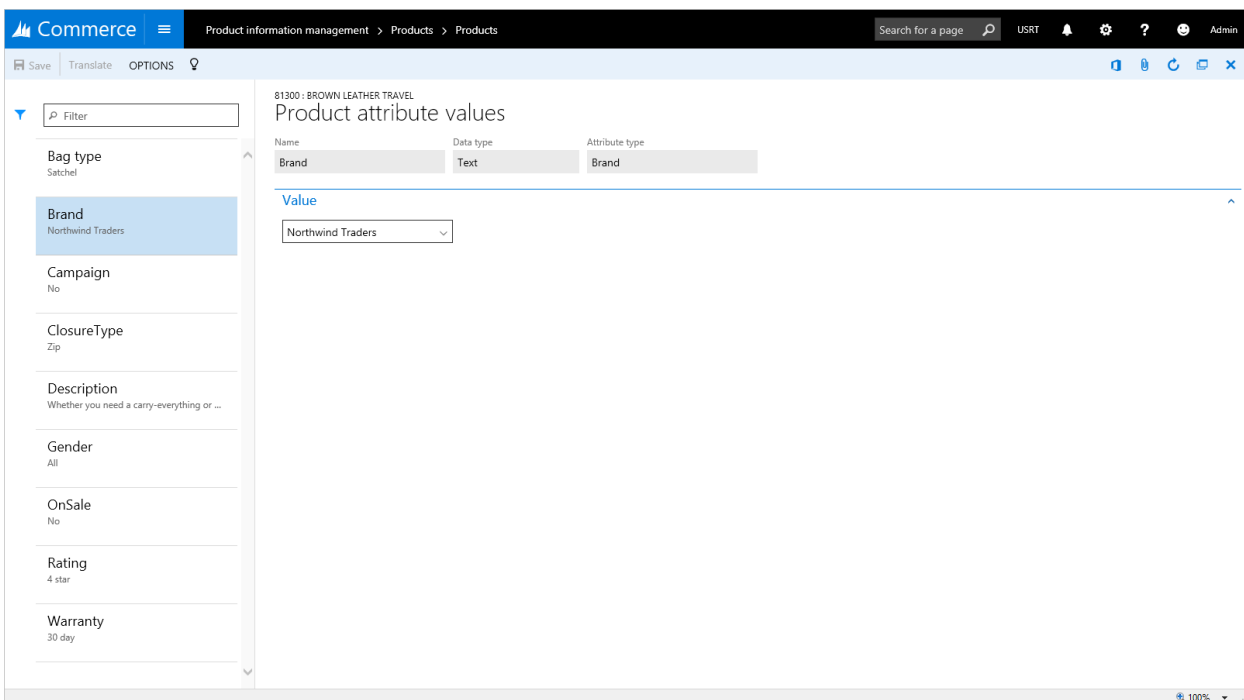

## Overriding attribute values

The default values of attributes can be overridden for individual products at the product level. Default values can also be overridden for individual products in specific catalogs that are targeted at specific channels.

### Override the attribute values of an individual product

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Retail and Commerce > Category and product management > Released products by category**.
3. Select the **Fashion > Fashion Accessories > Fashion Sunglasses** category node.
4. Select the required product in the grid. Then, on the Action Pane, on the **Product** tab, in the **Set up** group, select **Product attributes**.
5. Select an attribute in the left pane, and then update its value in the right pane.

### Override the attribute values of products in a catalog

1. Sign in to the back-office client as a merchandising manager.

2. Go to **Retail and Commerce > Catalog management > All catalogs**.
3. Select the **Fabrikam Base Catalog** catalog.
4. Select the **Fashion > Fashion Accessories > Fashion Sunglasses** category node.
5. On the **Products** FastTab, select the required product, and then select **Attributes** above the product grid.
6. On the following FastTabs, update the values of the required attributes:
  - Shared product media
  - Shared product attributes
  - Channel media
  - Channel product attributes

#### NOTE

If shared product media and shared product attributes are created, they apply to all the products.

### Override the attribute values of products in a channel

1. Sign in to the back-office client as a merchandising manager.
2. Go to **Retail and Commerce > Channel setup > Channel categories and product attributes**.
3. Select the **Houston** channel.
4. On the **Products** FastTab, select the required product, and then select **Attributes** above the product grid.

#### NOTE

If no products are available, add products by selecting **Add** on the **Products** FastTab and then selecting the required products in the **Add products** dialog box.

5. On the following FastTabs, update the values of the required attributes:
  - Shared product media
  - Shared product attributes

- Channel media
- Channel product attributes

**NOTE**

If shared product media and shared product attributes are created, they apply to all the products.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Define channel attributes

2/18/2021 • 2 minutes to read • [Edit Online](#)

Enrich the channel by adding channel and product attributes. You must add the channel to the organization default hierarchy before you can define the attributes.

## Define channel product attribute.

1. Go to Retail and Commerce > Channel setup > Channel categories and product attributes.
2. In the tree, select 'Contoso Retail\Fashion\Houston'.
3. Click Edit.
4. In the Category hierarchy field, enter or select a value.
  - The navigation hierarchy will be used for navigating the product inside your channels.
5. Expand the Attribute group section.
6. Click Add.
  - The attribute group will be shown in the product details and also will help when using the product filter.
7. In the Name field, enter or select a value.
8. Click View attributes.
9. Expand the Attributes section.
10. Click Add.
11. In the list, mark the selected row.
12. Click AddBtn.
13. Click OK.
14. Click Save.
15. Close the page.
16. Expand the Products section.
17. Click Add.
18. In the list, mark the selected row.
19. Click Add.
  - Similarly you can add multiple products.
20. Click OK.
21. Click Attributes.
22. Expand the Channel media section.
23. Click Edit.
24. In the Channel field, select an option.
25. Select the Default check box.
26. Click OK.
27. Expand the Channel product attributes section.
28. In the Brand field, type a value.
  - Similarly you can set the other attributes.
29. Click Save.
30. Close the page.
31. Click Save.

32. Click Publish channel updates.

- After publish the data will be ready for sync with the channel tables. If you didn't publish the modified data will not be synced with the channel tables.

33. Click OK.

34. Click Save.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create a channel navigation hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a channel navigation hierarchy in Microsoft Dynamics 365 Commerce.

## Overview

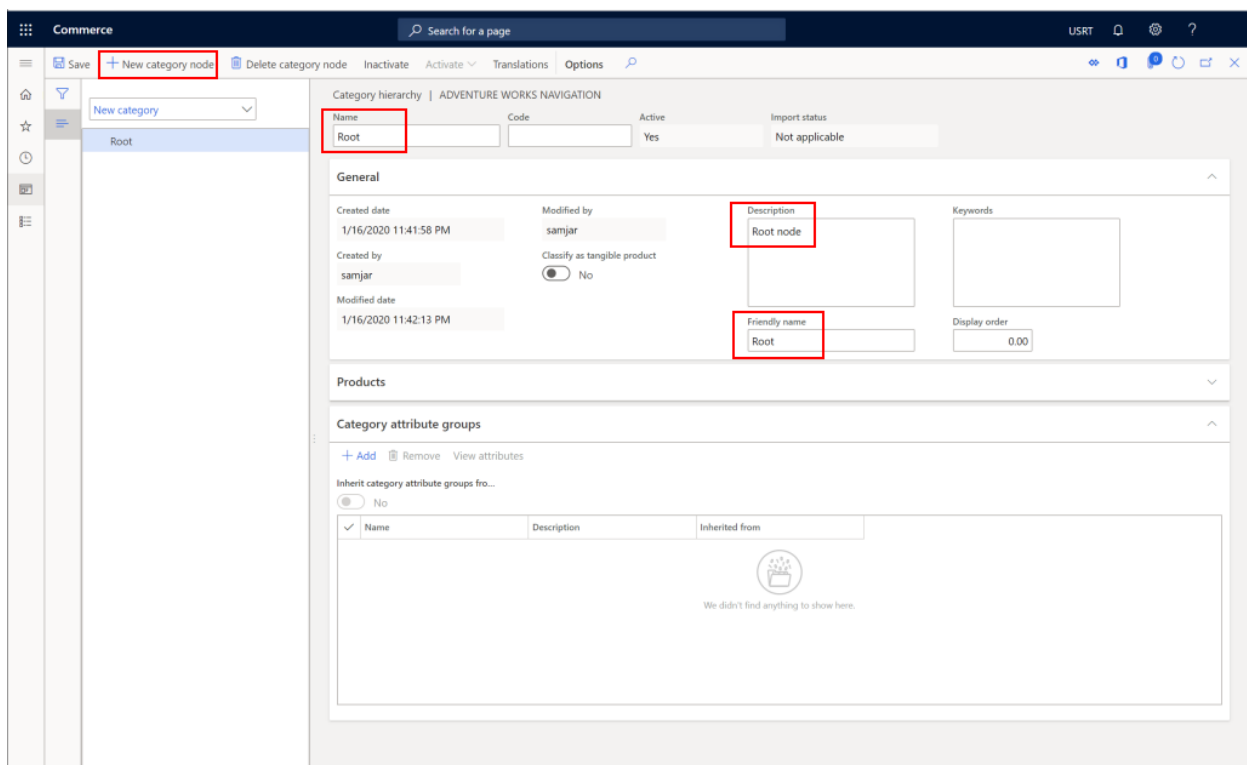

A channel navigation hierarchy is used to group and organize products into categories so that the products can be browsed online or in point of sale (POS).

## Create a channel navigation hierarchy

To create a channel navigation hierarchy, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Products and categories > Channel navigation categories**.
2. On the action pane, select **New**.
3. In the **Name** box, enter a name.
4. In the **Description** box, enter a description.
5. Select **Create**.
6. On the action pane, select **New category node** to create a root node.
7. In the **Name** box, enter a name.
8. In the **Description** box, enter a description.
9. In the **Friendly name** box, enter a friendly name.
10. On the action pane, select **Save**.

The following image shows an example root node.

The screenshot displays the Microsoft Dynamics 365 Commerce interface for creating a new category node. The main pane shows the 'New category node' form for a 'Root' node. The form is titled 'Category hierarchy | ADVENTURE WORKS NAVIGATION' and includes the following fields and sections:

- Name:** Root
- Code:** (empty)
- Active:** Yes
- Import status:** Not applicable
- General:**
  - Created date:** 1/16/2020 11:41:58 PM
  - Modified by:** samjar
  - Description:** Root node
  - Keywords:** (empty)
  - Created by:** samjar
  - Classify as tangible product:** No
  - Modified date:** 1/16/2020 11:42:13 PM
  - Friendly name:** Root
  - Display order:** 0.00
- Products:** (empty)
- Category attribute groups:**
  - Inherit category attribute groups from:** No
  - Table:**

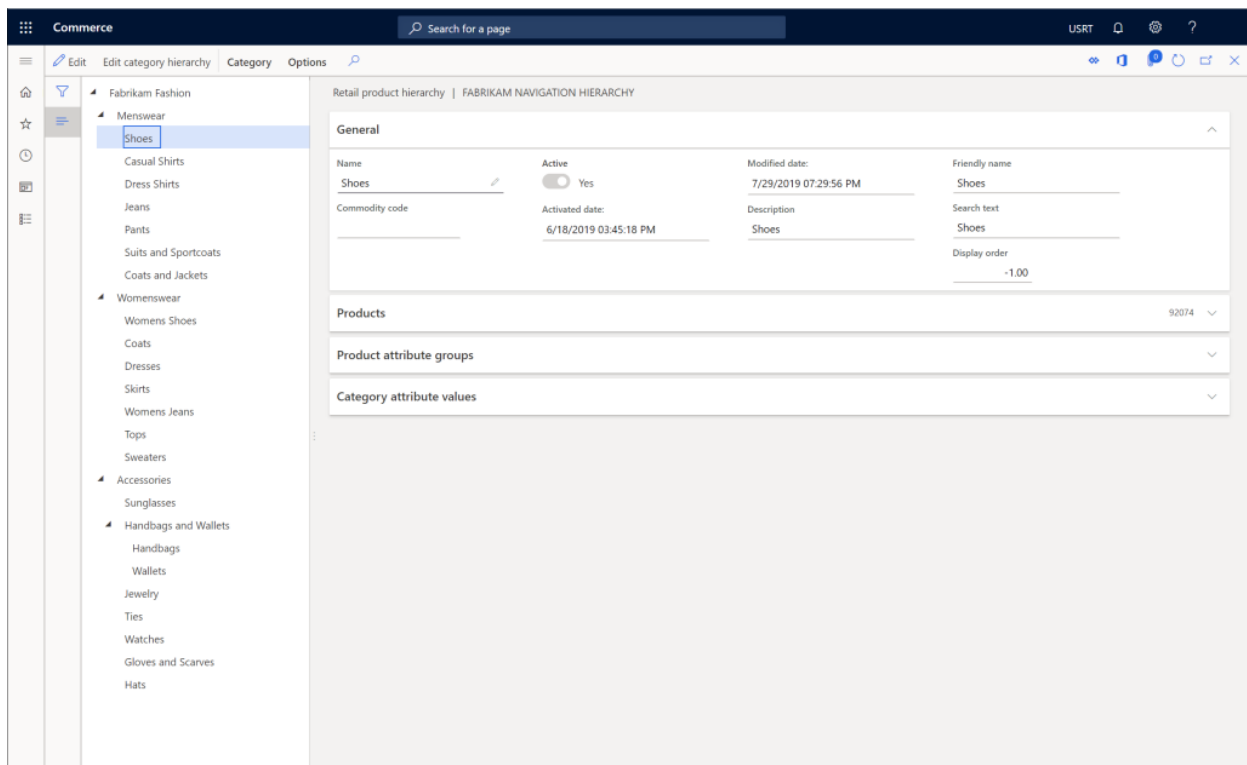

Name	Description	Inherited from
We didn't find anything to show here.		

# Create navigation category nodes

To create any additional navigation category nodes to represent the product categories on the channel, follow these steps.

1. In the navigation pane, select the parent node to add a category to.
2. On the action pane, select **New category node**.
3. In the **Name** box, enter a name.
4. In the **Description** box, enter a description.
5. In the **Friendly name** box, enter a friendly name.
6. In the **Display order** box, enter a display order (optional).
7. On the action pane, select **Save**.

The following image shows an example of a completed channel navigation hierarchy.

# Add products to category nodes

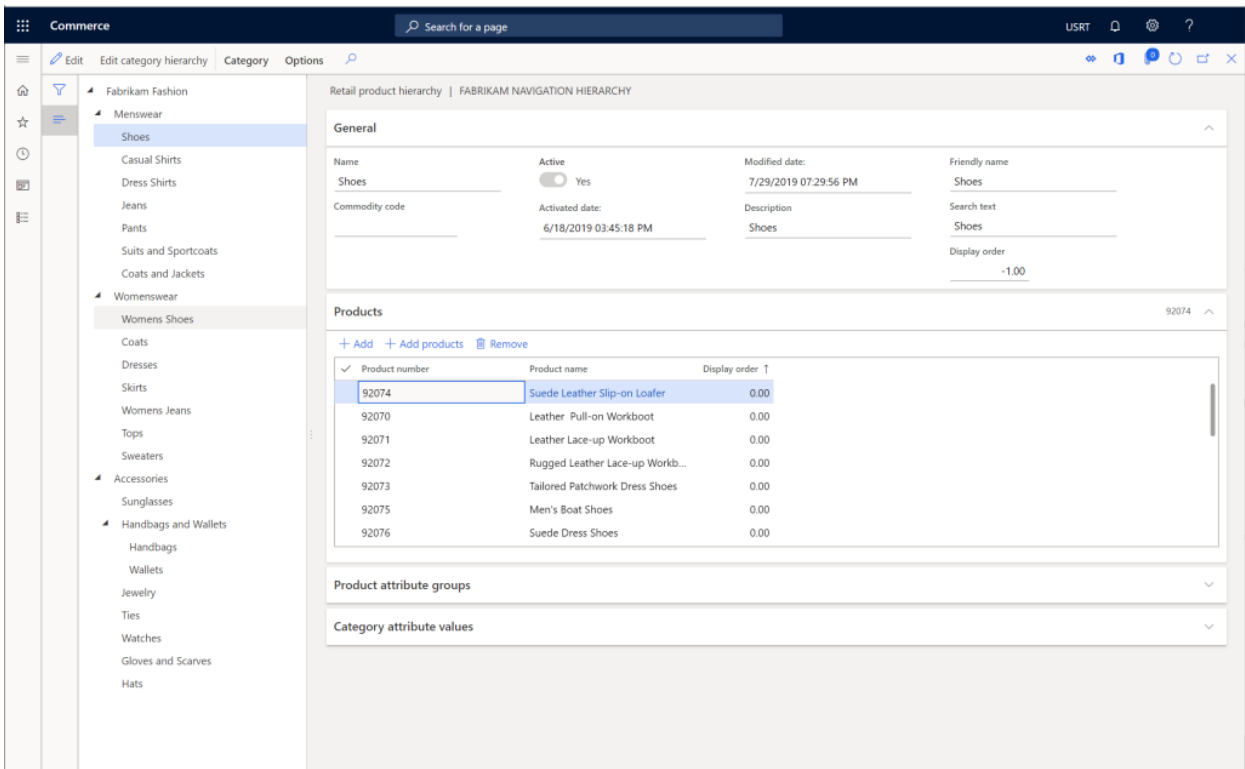

To add products to category nodes, follow these steps.

1. Select a category node.
2. Under **Products**, select **Add**.
3. Find the new product(s) you want to add using product number or product name, and then select **OK**.
4. On the action pane, select **Save**.

## NOTE

Adding products to a node inside the channel navigation hierarchy is not sufficient for the products to show up on a selected channel, the products must also be assorted to a product.

The following image shows an example node with products added.

## Add product attribute groups to category nodes

### NOTE

Attribute groups must be created before you can add them to a node inside the channel navigation hierarchy.

To add product an attribute group to a category node, follow these steps.

1. Select a category node.
2. Under **Product attribute group**, select **Add**.
3. Find the attribute group(s) you would like to add, and then select **OK**.
4. On the action pane, select **Save**.

The following image shows a sample node with product attribute groups added.

# Configure a channel to use a channel navigation hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to configure a channel to use a channel navigation hierarchy in Microsoft Dynamics 365 Commerce.

## Overview

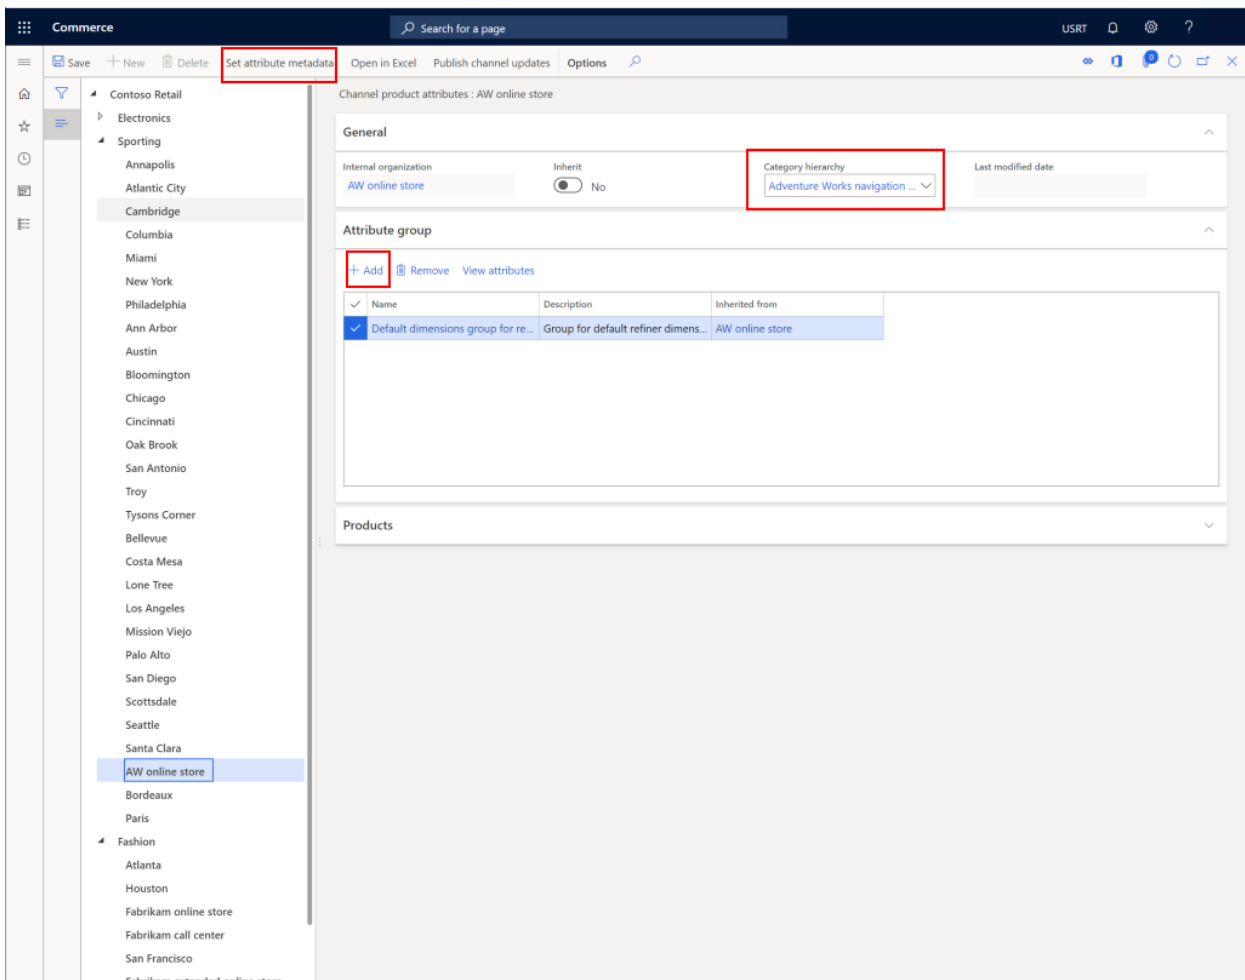

Channel navigation hierarchies organize products into categories so that the products can be browsed on an e-Commerce site or at points of sale (POS). Retail and online channels must be configured with channel navigation hierarchies.

## Configure the channel

To configure a channel to use a channel navigation hierarchy, follow these steps.

1. In the navigation pane, go to **Modules > Retail and commerce > Channel setup > Channel categories and product attributes**.
2. Select the channel to configure.
3. On the action pane, select **Set attribute metadata**.
4. In the **Category hierarchy** drop-down list, select the appropriate channel navigation hierarchy.
5. On the action pane, select **Save**.
6. Under **Attribute group**, add any attribute groups that will be global attributes for all nodes.

The following image shows how to configure a channel to use a channel navigation hierarchy.

## Set attribute metadata

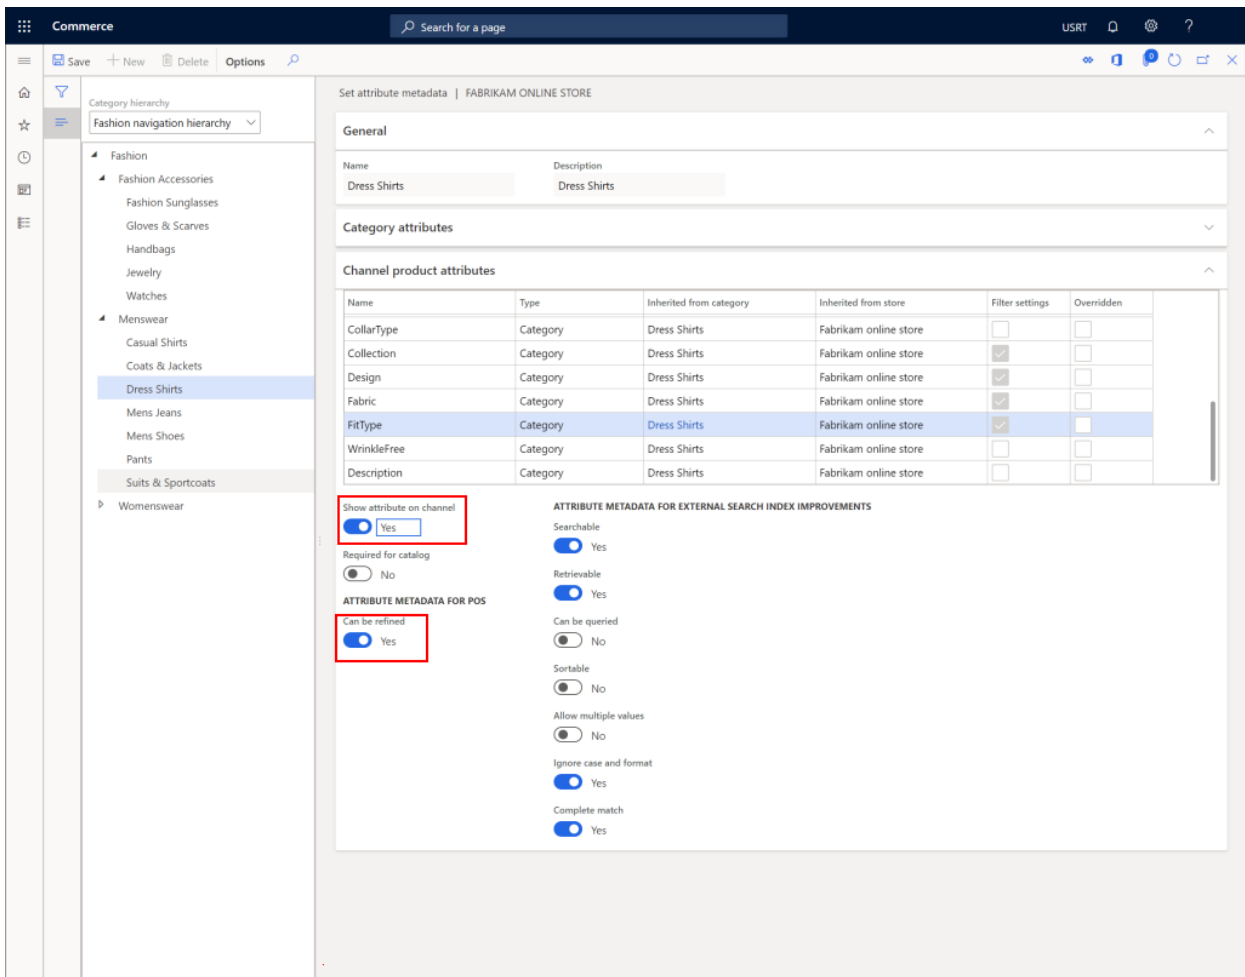

Setting the attribute metadata will allow configuration of attributes on each node.

To set attribute metadata, follow these steps.

1. On the action pane, select **Set attribute metadata**.
2. For each node select **Channel product attributes**.
3. Set **Show attribute on channel** to **Yes** and **Can be refined** to **Yes**, to enable refiners on that channel.
4. After configuring each node as desired, on the **Action pane**, select the **Save** button to save.
5. Select the **X** in the top right corner to exit this screen back to the **Channel categories and product attributes** page.

The following image shows an example set of channel product attributes configured on a channel category node.

## Publish changes

For changes to take effect, you will need to publish the changes.

To publish changes, follow these steps.

1. On the action pane, select **Publish channel updates**.
2. In the **Publish channel updates** pane, select **OK**.

The following image shows how to publish channel updates.

Commerce

# Assortment management

2/18/2021 • 5 minutes to read • [Edit Online](#)

## Overview

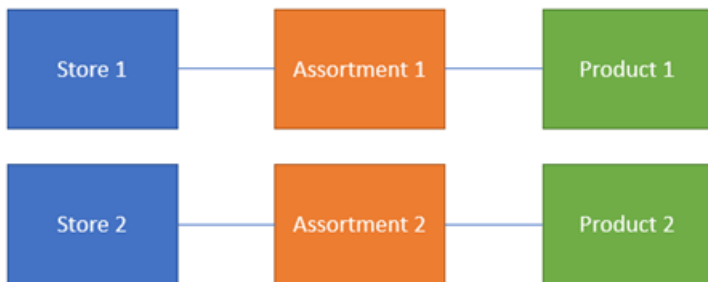

Dynamics 365 Commerce provides *assortments* that let you manage product availability across channels. Assortments determine which products are available at specific stores and during a specific period.

In Commerce, an assortment is a mapping of one or more channels (or groups of channels, when organization hierarchies are used) to one or more products (or groups of products, when category hierarchies are used).

The overall product mix of a channel is determined by the published assortments that are assigned to the channel. Therefore, you can configure multiple active assortments per channel.

### Basic assortment setup

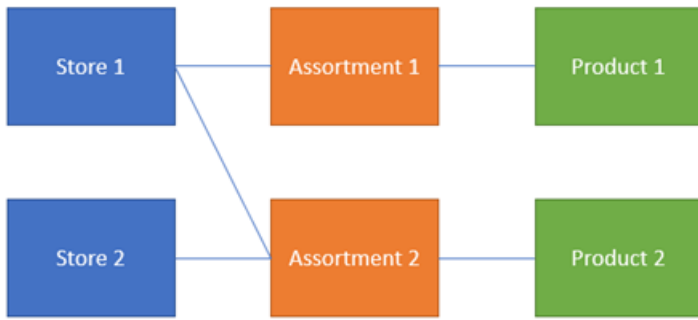

In the following example, a unique assortment is configured for each store. In this case, only product 1 is available at store 1, and only product 2 is available at store 2.

To make product 2 available at store 1, you can add the product to assortment 1.

Alternatively, you can add store 1 to assortment 2.

### Organization hierarchies

In situations where multiple channels share the same product assortments, you can configure the assortments by using the Commerce assortment organization hierarchy. When nodes from this hierarchy are added, all channels in that node and its child nodes will be included.

### Product categories

Similarly, on the product side, you can include groups of products by using product category hierarchies. You can configure assortments by including one or more category hierarchy nodes. In this case, the assortment will include all products in that category node and its child nodes.

### Excluded products or categories

In addition to including products and categories in assortments, you can use the Exclude option to define specific products or categories that should be excluded from assortments. In the following example, you want to include all the products in a specific category, except product 2. In this case, you don't have to define the assortment product by product or create additional category nodes. Instead, you can just include the category but exclude the product.

#### NOTE

If a product is both included and excluded in one or more assortments by definition, the product will always be considered excluded.

## Global and released products

Assortments are defined at a global level and can contain channels from multiple legal entities. The products and categories that are included in assortments are also shared across legal entities. However, a product must be released before it can actually be sold, ordered, counted, or received in the channel (for example, in the point of sale [POS]). Therefore, although two stores in different legal entities can share an assortment that contains the same products, the products are available only if they have been released to those legal entities.

## Dynamic and static assortments

Assortments can be defined with specific channels and products or by including organization units and categories. Assortments including references to these groups are considered dynamic assortments. If the definition or contents of those groups change while the assortment is active, the definition of the assortment will also change.

For example, an assortment is originally defined and published so that it references a category of products. If additional products are later added to the category, those products are automatically included in the definition of the existing assortment. You don't have to manually add the products to the assortment. Similarly, if an organization unit is added to a different node, the organization unit's assortment is automatically adjusted based on that definition.

## Stopped products

You can "stop" released products for the sales process by turning on a setting in the **Default order** settings. This setting is most often used when a product is at the end of its life and should not be sold at any channel. Assortments respect this setting, and stopped products won't be assorted, regardless of the assortment configuration.

## Blocked products

In addition to stopping sales of a product, you can temporarily block sales of a product. You can configure this setting on the **Commerce** tab of a released product. Blocked products are still assorted, but you will receive a message in the POS that states that the product can't be sold.

## Date effectivity

Assortments are date-effective. Therefore, retailers can configure when products should or should not be available per channel. You can define and publish assortments ahead of time, and specify the start and end dates. The products will automatically become available or unavailable on the specified dates.

## Process assortments batch job

Assortments that are defined in Commerce must be processed before they take effect. This processing is done for the following reasons:

- Assortment definitions must be de-normalized so that channels can more easily consume them. A product mix for a channel can be defined through multiple assortments that span various date ranges. When some of this information is calculated ahead of time on the server, performance at the channel is improved.
- The products and channels in the assortment can change outside the assortment itself. Dynamic assortments that contain references to categories or organization units must be processed periodically so that they include or exclude records, based on their current assignment.

## Implementation considerations

Consider the following implementation requirements as you plan and manage assortments for your Commerce implementation:

- **Data replication and database size** – Although assortments help serve the business need to manage product availability, they are also an important tool for managing the size of channel and offline databases. Well-managed assortments help reduce the amount of data that must be processed and replicated to

channel and offline databases. They also help reduce the number of records that must be persisted. Fewer records in these databases will increase performance when you add items to a transaction, search, and browse for products.

- **Date-effective/expiring assortments** – One of the most effective tools for managing the number of products in channel and offline databases is the date effectivity of assortments. If you leave open-ended (non-expiring) assortments for seasonal products or products that are at the end of their life, these databases will grow indefinitely. You can use various approaches to help manage this situation. For example, you can maintain separate assortments for seasonal products and products that are always available.
- **Sales and returns outside assortments** – This capability helps retailers effectively manage their assortments by letting them limit the number of available products to products that belong to the core product mix for the store. This capability also helps retailers handle situations where a product was mistakenly omitted from an assortment, or where a product was returned outside the effective dates for the assortment.

If product data doesn't exist in the channel database, the POS makes real-time calls to headquarters to retrieve the required information, so that the product can be sold, returned, or put on a customer order. Product information that is retrieved in this manner is available only during the scope of that transaction. The product isn't added to the assortment definition. Therefore, subsequent real-time calls will be made as required.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

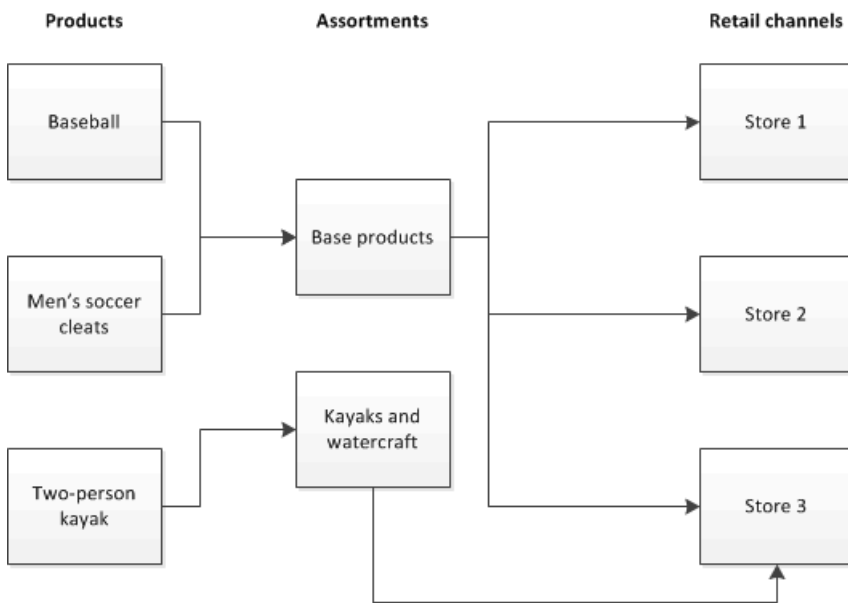

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up assortments

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article describes what an assortment is and explains how to set up assortments in Dynamics 365 Commerce.

An assortment is a collection of related products that you assign to a commerce channel, such as a brick-and-mortar store or an online store. You use assortments to identify the products that are available in each store. An assortment can include categories of products. Therefore, all products that are assigned to a specific category are included in the assortment. An assortment can also include specific products and specific variants of products. By setting up an assortment, you can assign thousands of products to your channels at that same time, in any combination that your stores require. You can set up as many product assortments as you require. Each product can be included in one or more assortments, and each assortment can be assigned to one or more channels. For example, you define one assortment that includes a base set of products. All stores receive this assortment. You then define another assortment that includes only large sporting equipment. Only your larger stores receive this assortment. The following diagram shows how products can be assigned to assortments, and how those assortments can be assigned to channels.

## Prerequisites

Before you can set up an assortment and assign it to a commerce channel, you must complete the following tasks.

TASK	DESCRIPTION
Set up a channel.	Channels represent a brick-and-mortar store, an online store, or an online marketplace. You must set up at least one channel and configure the options for the store. Assortments are assigned to stores to identify the products that a particular store carries.

TASK	DESCRIPTION
Create an organization hierarchy.	After you set up the commerce channels for your organization, you must configure an organization hierarchy that represents the organizational structure of your channels. An organization hierarchy can be used for assortments, replenishment, and reporting. By adding your channels to an organization hierarchy, you can assign assortments to groups of stores. Instead of assigning the assortment individually to each store, you assign the assortment to the high-level organization node. Then, whenever a new channel is added to the high-level organization node, that channel automatically inherits any assortments that were assigned to the higher-level organization node. You can assign assortments only to channels that are included in an organization hierarchy that is assigned the <b>Commerce assortment</b> purpose.
Define products.	Before you can add products to an assortment, you must add them in Commerce. You can add products manually, or you can import them from a vendor. After you add the products, you must release them to a legal entity. Only products that have been released to a legal entity can be made available to your channels. Products that haven't yet been released to a legal entity can be added to an assortment, and the assortment can be approved. However, until the products have been released to a legal entity, they can't be made available to the channels.
Set up a category hierarchy.	When you create your commerce products, you can group and categorize them by using the category hierarchy feature. You can create one core hierarchy to group and categorize all products that you distribute through your channels. You can also create separate, supplemental category hierarchies to group or categorize your products for special purposes, such as promotions or assortments. By using category hierarchies, you can assign all the products in a specific category to an assortment. Any products that are added to the category that is included in the assortment are automatically included in the assortment. Then, the next time that the commerce assortment scheduler is run, these products become available to the channels that the assortment is assigned to.

## Setting up an assortment

After you complete the prerequisites, you can create an assortment and assign it to your channels. To set up an assortment, you must complete the following tasks.

1. Create a new assortment, or copy an existing assortment.
2. Select the channels or the high-level groups of channels that the assortment applies to.
3. Add product categories, individual products, or product variants to the assortment. You can include all products in a specific category, or you can exclude selected products from a category that is included in the assortment.
4. Publish the assortment. When you publish an assortment, the assortment scheduler is automatically run. This process generates the list of products. When this process is completed, the products become available to the channels that the product assortment is assigned to. If changes are made to an assortment that has been published, or to the channels that the assortment is assigned to, the assortment must be updated. To update the assortment when changes are made, you can run the assortment scheduler as a batch job.

# Manage assortments (November 2016)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to create and publish a new product assortment and uses the demo data company USRT.

1. Click Category and product management.

## Create an assortment

1. Click the Assortments tab.
2. Click New.
3. Click Assortment.
  - The Assortment ID is required and must be a unique value.
4. In the Assortment name field, type a value.
5. In the Effective date field, enter a date.
6. In the Expiration date field, enter a date.
7. Expand the Commerce channels section.
8. Click Add line.
9. In the tree, select 'Contoso Retail\Electronics\Boston'.
10. Click Add.
11. Click OK.
12. Expand the Products section.
13. Click Add line.
14. In the Category field, enter or select a value.
15. Click Save.

## Publish an assortment

1. Click Publish.
2. Click Yes.

### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up bar codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes how to use bar codes in Dynamics 365 Commerce.

You can use bar codes to purchase and sell products, track product variants, and set up customers and employees. You can also use bar codes to issue and endorse coupons, gift cards, and credit memos. You can set up products so that they have standard bar codes or custom, in-house bar codes. Products can have more than one bar code. For example, a product might have multiple bar codes if it comes from various manufacturers, or if it has variants that are based on size, style, or color. Bar codes can include the weight or price of the product. Bar code masks are templates that are used to create bar codes.

## NOTE

If you assign a unique bar code to each variant combination, you can scan the bar code at the register and let the program determine which variant of the product is being sold. You can also collect and view statistics about sales by variant. Each size, color, and style group can be assigned a unique number that identifies that group in the bar code. Commerce uses the bar code mask to automatically generate bar codes for each variant combination. This functionality can be useful if there are many sizes, colors, and styles, because the number of combinations increases significantly as each variant code is added. If this functionality isn't used, bar codes must be manually assigned to each combination that represents a product variant.

You can create bar codes manually or automatically. To create bar codes, complete the following tasks in the order in which they are listed.

1. [Set up bar code mask characters.](#)
2. [Set up bar code masks.](#)
3. Configure bar code setups.
4. [Create bar codes for products.](#)

## Additional resources

[Set up bar code masks](#)

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up bar code masks

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to set up bar code mask characters, bar code masks, and how to assign bar code masks to bar codes.

## Set up bar code mask characters

Bar code masks are used to create bar codes and to quickly identify bar codes that are scanned into the point of sale (POS). Masks are comprised of characters which act as placeholders that indicate the format for the bar codes that will be created. To configure a bar code mask, you need to set up bar code mask characters. Go to **Retail and Commerce > Inventory management > Barcodes and labels > Mask characters**. Click **New** to create bar code mask characters. Mask characters can be created to indicate the following bar code data.

FIELD	DESCRIPTION
Product	Placeholder for product ID.
Any number	Used to specify a number that will be hard coded in bar codes.
Check digit	Indicates that the bar code format in a bar code mask uses a check digit to confirm the validity of a bar code.
Size digit	Indicates size in a bar code created for a product variant which includes size.
Color digit	Indicates color in a bar code created for a product variant which includes color.
Style digit	Indicates style in a bar code created for a product variant which includes a style.
EAN license code	Placeholder for EAN license issued for EAN license codes.
Price	Indicates price for price embedded bar codes.
Quantity	Indicates quantity in quantity/random weight embedded bar codes.
Employee	Indicates bar code segment for employee ID number used for bar code POS login.
Customer	Indicates customer ID segment.
Data entry	<i>Not yet implemented.</i>
Discount code	<i>Deprecated</i> as of Dynamics 365 for Retail Spring 2017 release. Previously: Indicates discount code for a bar code that's used to add a discount to a point of sale transaction.

FIELD	DESCRIPTION
Coupon code	Indicates coupon code for a bar code used to add a discount to an order. This replaced discount code.
Gift card	Indicates a gift card number when issuing or paying by gift card.
Loyalty card	Adds a loyalty customer to the transaction, and can be used when paying by loyalty.

## Define bar code masks

After bar code mask characters are specified for the necessary bar code masks, go to **Retail and Commerce > Inventory management > Barcodes and labels > Barcode mask setup**. On this page, you can define bar code masks that use the previously specified characters. These bar code masks will be used when generating bar codes and will also help to identify bar codes scanned at the POS.

1. Click **New** to create a new bar code mask.
2. Enter values in the **Mask ID** and **Description** fields, and then select a bar code mask type in the **Type** field.
3. In the **General** section, select a value in the **Bar code standard** field, and then specify the bar code prefix, if one is required.
4. In the **Bar code mask segment** section, add bar code segments that will be used in the bar code to be created.

As an example, to create a bar code mask with mask ID 'Product', you'd do the following:

1. Create a new bar code mask and select type 'Product'.
2. Select a bar code standard, for example, 'Code 39'.
3. Provide a prefix to be used to easily identify the bar code. For example, '22'.
4. Add a mask segment. The 'Product' mask segment will be selected.
5. Provide a length for the product segment, for example, '10'. The length should match the length of a product ID commonly used in the store. The mask will be displayed as a preview in the **General** section under **Mask**.

## Assign bar code masks to bar codes

Bar codes masks must be assigned to bar codes before they can be used. Continuing with the previous example, to assign the bar code mask to a bar code, do the following:

1. Go to **Organization administration > Setup > Bar codes**. Click **New** to create a new bar code.
2. Enter values in the **Barcode setup** and **Setup** fields.
3. In the **General** section, in the **Bar code type** field, select 'Code 39'. In the **Mask ID** field, select the 'Product' mask previously created.
4. Under **Size**, enter '12'.
5. Click **Save**.

The bar code mask can now be used to create bar codes for products. The above steps are examples of how to create bar code masks for products, but they also illustrate how to create bar code masks for any of the other supported bar code types. Bar code masks, types, and lengths should be adjusted for use in your specific environment.

**NOTE**

# Create and configure extended warranties

2/18/2021 • 12 minutes to read • [Edit Online](#)

This topic covers extended warranties and describes how to create and configure them in Microsoft Dynamics 365 Commerce.

## Overview

Customers are increasingly choosing extended support and services when they buy products, especially consumer products that are sold at a premium price point, such as phones and computers. By providing extended warranties for purchase, retailers can help build customer loyalty. Extended warranties let customers know where they can go for service and support. Therefore, they can have confidence that their issues will be handled effectively.

Extended warranties can be sold to customers in a retail channel during the initial product purchase. They can also be sold for a limited time after the initial purchase.

### Warranty item setup

Dynamics 365 Commerce provides functionality that lets you create a warranty item and set attributes for it. These attributes include the association between a product and a warranty item, the price of the warranty, and the duration of the warranty. After a warranty item is configured and released to the organizational unit, a retailer can sell warranties through Modern Point of Sale (MPOS), online stores, and other retail channels.

### Warranty item sales

Extended warranties are sold in a retail channel during the initial product purchase. They can also be sold for a limited time after the initial purchase.

At the point of sale (POS), sales associates are prompted to add an extended warranty when a related product is added to a customer's cart. Therefore, an upsell or cross-sell opportunity is presented to sales associates as part of the sales flow.

Customers can also return later and buy an extended warranty for a product that they previously purchased. In these cases, a sales associate can look up the original transaction and sell the customer the related extended warranty item.

### Warranty terminology

The following table defines some warranty-related terms.

TERM	DESCRIPTION
Extended warranty/Warranty	An <i>extended warranty</i> refers to a service agreement or contract that provides a prolonged warranty to customers. The extended warranty includes the additional service of replacing or repairing goods during the extended warranty's coverage period.

TERM	DESCRIPTION
Manufacturer's warranty	<p>A <i>manufacturer's warranty</i> (often referred to as a <i>limited warranty</i>) is the warranty that customers receive when they purchase a product. Here are some features of a manufacturer's warranty:</p> <ul style="list-style-type: none"> <li>• The warranty cost is included in the cost of the product. Customers don't have to pay any additional amount for a manufacturer's warranty.</li> <li>• Depending on the product category, a manufacturer's warranty typically lasts 30 days, six months, or one year. (For most consumer electronics, the warranty lasts one year).</li> <li>• The warranty covers any defects that are caused by mechanical or electrical failures. Coverage is limited, and it doesn't include any accidental damage to the purchased product. Customers who want to protect the products that they purchase from everyday damages should invest in an extended warranty. Extended warranties last two to ten years, depending on the product category. They also have wider coverage and cover everyday mishaps such as drops, spills, and stains.</li> </ul>
Warranty item	<p>A <i>warranty item</i> is an extended warranty item that is sold for a warrantable item. An example is a two-year accidental protection plan for laptops.</p>
Warrantable item	<p>A <i>warrantable item</i> is a serialized product that a warranty is sold for. For example, a laptop is a warrantable item that two-year and three-year extended warranties are sold for.</p>
Warranty group	<p>A <i>warranty group</i> is a relationship between warranty items and warrantable items. The POS uses warranty groups to determine which warranty items sales associates should be prompted to add when a warrantable item is added to a customer's cart.</p>
Warranty policy	<p>A <i>warranty policy</i> is an entity that is created in Commerce when a warranty policy is sold. A warranty policy includes information such as the start and end dates of the purchased warranty item, terms and conditions, and the serial number of the warranted product. Warranty policy numbers can be shared with customers, so that they have a reference for the extended warranty item that they purchased.</p>

## Create a warranty item

To create a warranty item in Commerce, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Products**.
2. Select **New** to create a warranty item.
3. In the **New product** dialog box, in the **Product type** field, select **Service**.
4. In the **Product subtype** field, select **Product**.
5. In the **Product service type** field, select **Service**.

6. In the **Product name** field, enter the product name.
7. In the **Retail category** field, select a value in the drop-down dialog box, and then select **OK**.
8. In the **Product number**, enter the product number.
9. Select **OK**.
10. On the **Product details** page, on the **Warranty** FastTab, set the **Unit of time** and **Length of time** fields.

FIELD NAME	VALUE	DESCRIPTION
Unit of time	<b>Day(s), Week(s), Month(s), or Year(s)</b>	This field specifies the unit of time that is used for the warranty.
Length of time	A positive integer value	This field specifies the duration of the warranty in the selected unit of time.

For example, for a two-year warranty, set the **Unit of time** field to **Year(s)** and the **Length of time** field to **2**. Alternatively, set the set the **Unit of time** field to **Month(s)** and the **Length of time** field to **24**, as shown in the following illustration.

## WAR-00001 : 2 Year Extended Protection Plan for Laptops

11. Select **Save** to save the warranty item.
12. Release the warranty product to the company so that it can be sold. For more information, see [Set up retail products](#).
13. On the **Released product details** page, on the **Warranty** FastTab, set the **Price range base**, **Lower limit**, and **Upper limit** fields.

FIELD NAME	VALUE	DESCRIPTION
------------	-------	-------------

FIELD NAME	VALUE	DESCRIPTION
Price range base	None, Base price, or Selling price	<ul style="list-style-type: none"> <li>• <b>None</b> – The <b>Lower limit</b> and <b>Upper limit</b> values of price ranges aren't applicable.</li> <li>• <b>Base price</b> – A given warranty will be applicable if the base price (that is, the price without discounts) of the warrantable item is between the <b>Lower limit</b> and <b>Upper limit</b> values that are specified here, based on the price of the warrantable item.</li> <li>• <b>Selling price</b> – This value is reserved for future use.</li> </ul>
Lower limit, Upper limit	A positive integer value	These fields define the upper and lower price limits of the warrantable item, and how the current warranty item is applicable to the warrantable item. These limits can be based on the warrantable item's base price (also known as the manufacturer's suggested retail price [MSRP]). If the <b>Price range base</b> field is set to <b>Base price</b> , only a warrantable item (product) that has a base price between the <b>Lower limit</b> and <b>Upper limit</b> values will trigger a prompt to add the warranty item at the POS.

For example, the following illustration shows the **Price range base** field set to **Base price**, the **Lower limit** field set to \$500, and the **Upper limit** field set to \$1000.

[Released product details](#)

### WAR-00001 : 2 Year Extended Protection Plan for Laptops

Warranty  Product name  FIFO

---

**Purchase**

---

**Promote**

---

**Deliver**

---

**Sell**

---

**Warranty**

WARRANTABLE PRICE RANGE	Lower limit	WARRANTY DURATION
Price range base <input type="text" value="Base price"/>	<input type="text" value="500.00"/>	Length of time <input type="text" value="24"/>
	Upper limit <input type="text" value="1,000.00"/>	Unit of time <input type="text" value="Month(s)"/>

14. Assort the warranty item to the channel where it will be sold. For more information, see [Set up assortments](#).

## Example

A laptop warrantable item (product) has a base price \$999, and there are two laptop warranty items:

- Warranty\_1 has a lower limit of \$500 and an upper limit of \$1,000, and the **Price range base** field is set to **Base price**.
- Warranty\_2 has a lower limit of \$1,001 and upper limit of \$2,000, and the **Price range base** field is set to **Base price**.

In this case, when the laptop warrantable item is added to a customer's cart, a prompt to add Warranty\_1 will be shown at the POS, because the price of the laptop is between the lower and upper limits for Warranty\_1.

### NOTE

For this example, if you want prompts to be shown for both Warranty\_1 and Warranty\_2, regardless of the price of the warrantable item, set the **Price range base** field to **None**.

## Configure channel-specific settings

Channel-specific settings let you specify whether a prompt to add a warranty item should be shown at the POS when a warrantable item is added to a customer's cart.

To configure channel-specific setting in Commerce, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Warranty > Warranty settings**.
2. On the **Channel specific** tab, in the **Prompt for warranty** column for your channel, follow one of these steps:
  - Select the check box if a prompt for the warranty item should be shown at the POS when the warrantable item is added to the cart.
  - Clear the check box if no prompt for the warranty item should be shown at the POS when the warrantable item is added to the cart.
3. Run the 1070 job to sync the data to the channel.

## Configure a number sequence for warranty policies

Each warranty policy is uniquely identified by a warranty policy number that is generated by a number sequence. For more information about number sequences, see [Number sequences overview](#).

To configure a number sequence for warranty policies in Commerce, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Warranty > Warranty settings**.
2. On the **Number sequences** tab, in the row for the **Warranty policy** reference, enter or select a value in the **Number sequence code** field.

## Set up a warranty group

A warranty group is a relationship between warranty items and warrantable items. The POS uses warranty groups to determine which warranty items sales associates should be prompted to add when a warrantable item is added to a customer's cart.

To set up a warranty group in Commerce, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Warranty > Warranty groups**.
2. Select **New** to create a warranty group.
3. In the **Name** field, enter a name for the new group.

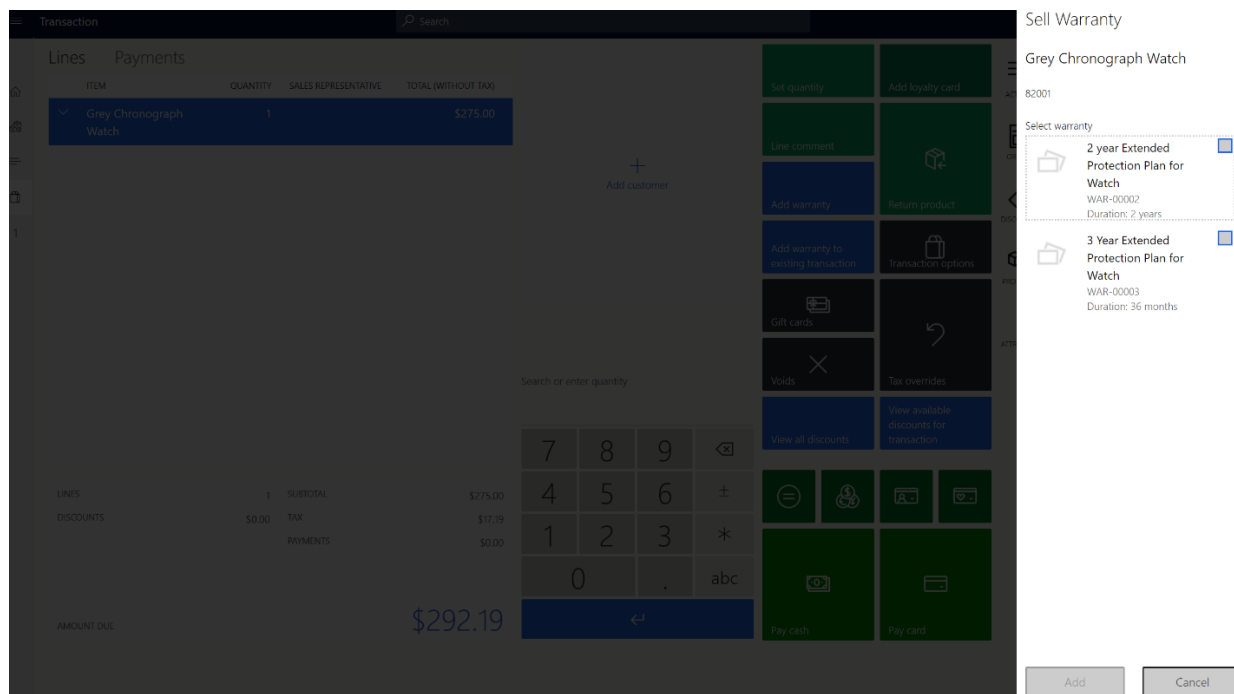

4. On the **General** FastTab, in the **Description** field, enter a description of the group.
5. On the **Warranty products** FastTab, select **Add line** to add a warranty item.
6. In the **Display order** field, enter a number to rank the warranty group at the POS. The POS will show warranty items in order of ascending rank in the warranty prompt.
7. On the **Warrantable products** FastTab, select **Add line** to add warrantable products.
8. If the warranty item is applicable to a whole category of warrantable items (products), select the category in the **Category** field. If the warranty item is applicable to a specific warrantable item (product), select the product in the **Product** field.
9. On the **Applicable channels** FastTab, select **Add line** to add the channel where you want to sell the warranty item.
10. Select **Save** to save the configuration.
11. Select **Publish** to publish the warranty group.
12. Run the **1040** job to sync the data to channel.

## Sell warranty items at the POS

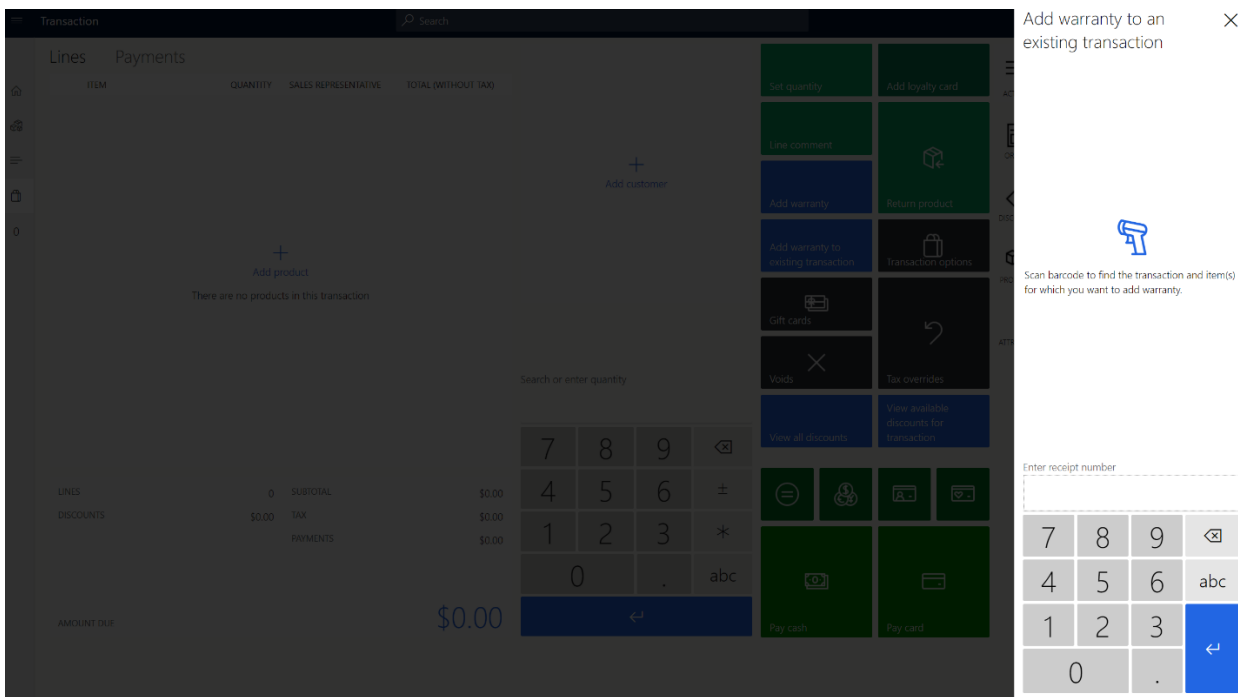

Two POS operations let sales associates sell warranty items during the workflow for customer purchases:

- **Add warranty** – This operation triggers a prompt that shows applicable warranties for a warrantable item that is selected in the cart.
- **Add warranty to existing transaction** – This operation lets sales associates sell warranties for warrantable items that were previously sold. Sales associates can find the original transaction for a warrantable item by entering the receipt number of the transaction.

The following illustration shows an example of a POS terminal page with a prompt to add a warranty item for the current purchase of a warrantable item.

The following illustration shows an example of the feature for adding a warranty item for a warrantable item that was previously sold.

## Process warranty transactions

When warranties are sold in cash-and-carry transactions, after the transactions are posted in Commerce headquarters, Commerce users can run the **Process warranty transactions** job to process the warranty transactions and create warranty policies.

To process warranty transactions in Commerce headquarters, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Warranty > Process warranty transactions**.
2. In the **Choose organization nodes** dialog box, in the **Organizational hierarchy** field, select a value.
3. In the **Available organization nodes** list, select either an individual store or, if you want to create the batch job for a group of stores, a node.
4. Select the right arrow button to add your selection to the **Selected organization nodes** list.
5. Select the **Run in the background** tab.
6. Set the **Batch processing** option to **Yes**, and then select **Recurrence**.
7. In the **Define recurrence** dialog box, in the **Start date** field, select or enter a start date for the recurrence.
8. In the **Start time** field, select or enter a start time for the recurrence.
9. Follow one of these steps:
  - Select the **No end date** option if the recurrence should never end.
  - Select the **End after** option if the recurrence should end after a specific number of runs. If you select this option, enter the number of runs.
  - Select the **End by** option if the recurrence should end by a specific date. If you select this option, select or enter the date.
10. Select **OK**.
11. Select **OK**.

# Warranty policies

When an extended warranty is sold, a warranty policy entity is automatically created. Warranty policy numbers can be shared with customers, so that they have a reference for the warranty item that they purchased. The properties of warranty policies include the effective start date and expiration date of the warranty, terms and conditions, and the serial number of the warrantable item that the warranty was sold for.

## NOTE

Warranty policy properties are automatically generated when warranty policy entities are created. Currently, they can't be manually configured or edited.

The following table describes the warranty policy properties and their values. In Commerce headquarters, the database table is named WARRANTYPOLICY.

PROPERTY NAME	VALUE	DESCRIPTION
PolicyNumber	A character string (maximum of 20 characters)	The warranty policy number
WarrantiedItemId	A character string (maximum of 20 characters)	The ID of the warrantable item
WarrantiedInventoryLotId	A character string (maximum of 20 characters)	The inventory lot ID of the warrantable item
WarrantiedSerialNumber	A character string (maximum of 20 characters)	The serial number of the warrantable item
WarrantiedFulfilledDate	A date	The fulfillment date of the warrantable item
WarrantyItemId	A character string (maximum of 20 characters)	The ID of the warranty item
WarrantyInventoryLotId	A character string (maximum of 20 characters)	The inventory lot ID of the warranty item
WarrantySalesDate	A date	The sale date of the warranty item
WarrantyEffectiveDate	A date	The effective date of the warranty policy
WarrantyExpirationDate	A date	The expiration date of the warranty policy
CustAccount	A character string (maximum of 20 characters)	The customer account number
Status	<b>Created, Voided, Effective, or Expired</b>	The status of the warranty policy
Notes	A character string (a maximum of 255 characters)	Notes about the warranty policy, such as terms and conditions

# Frequently asked questions (FAQ)

## Why don't I see a warranty prompt in the POS?

Make sure that the warranty item is assorted to the channel. Also make sure that the warranty group is configured so that it includes the relevant channel.

## When I try to add a warranty to an existing transaction and enter the customer order receipt number, why don't I see any transaction line items?

Receipts can be found only if a pull job (P-job) is run to upload the receipts to Commerce headquarters. To run the P-job, go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**, select the **P-0001** job, and then select **Run now**.

## Why is the warranty feature applicable only to serialized products?

A warranty is a service that is provided for a specific, unique product. In Dynamics 365, a product can be uniquely identified only by a serial number.

# Retail discounts

2/18/2021 • 15 minutes to read • [Edit Online](#)

## Overview

This topic provides an overview of the discounts functionality in the Dynamics 365 Commerce. It explains the properties found on the various discount forms, and best practices for discount management. However, this topic does not cover the various discounts types in detail, for example, simple, quantity, mix and match, and threshold discounts. These details will be covered in separate topics created for each of these discount types.

Because retailers require flexible discounting, and discount styles and types vary by industry, there are many ways to define discounts in Commerce. The discounting functionality was added on top of the existing discount functionality in the core product (Supply Chain Management), resulting in some duplication of functionality. As a result, the discount types can be configured for five different entities: customer, loyalty program, channel, catalog, and affiliations. Because of the number of discounting options, it's especially important that you plan and document your discounting strategy.

## Creating discounts

Each discount type has a dedicated page that you use to create and manage the discount. Commerce also has an **All discounts** page and a **Pricing and discounts management** workspace, both of which you can use to create a new discount of any type.

### Discount headers and discount lines

All discounts have a header and one or more lines. All discount types have properties defined on the header and some discount types have additional properties defined per line. For example, quantity discounts have quantity tiers. People often think about discounts in Commerce in terms of the discount header only and assume that all the lines on the discount are related to each other because they share a discount header. However, this view of discounts is too simplistic. For simple discounts and quantity discounts, it is more accurate to think of each discount line as an independent discount that shares some properties with the other discount lines. In fact, the pricing engine evaluates simple and quantity discounts in just this manner. Each discount line for simple discounts and quantity discounts is independent. For simple discounts, it is easy to understand that each discount line is independent of all other discount lines on the same discount, because there isn't a quantity or amount criterion required to qualify for the discount. For quantity discounts, you might think that the lines can be combined to reach the quantity criterion for a discount, but they don't. The quantity tiers must be reached independently for each line of a quantity discount.

When you create discounts, we recommend that you always avoid or minimize overlapping discount lines. Overlapping discount lines occur when two or more discount lines in the same discount can be applied to the same product. In this case, the pricing engine must treat the discount as two or more independent discounts that must then be evaluated against each other to find the best discount amount. In addition, it can be difficult for a user to know what the discount will be just by looking at the discount definition.

## Managing discounts

### Settings and options that are common to all discounts

This section describes the properties that are common to all types of discounts.

When you manage discounts, it's important that you understand each discount option individually, but it is equally important that you understand which options affect each other and how. The common settings for

discounts fall into two categories. In the first category are settings that filter discounts for consideration. Examples include **Status**, **Currency**, and **Unit of measure**. Settings in the second category control the order in which multiple discounts are considered and applied. Examples include **Discount concurrency mode** and **Pricing priority**. The following image shows the various properties of a discount.

The screenshot shows the configuration page for a discount. At the top, there are fields for 'Discount' (ST100000), 'Name' (Grand Opening), and 'Discount type' (Discount). Below this is a 'General' section with fields for 'Status' (Enabled), 'Currency' (USD), 'Discount concurrency mode' (Best price), 'Discount account', 'Coupon code required' (No), and 'PRICING PRIORITY' (Override priority: No, Pricing priority: 0). The 'Details' section includes 'Description', 'Disclaimer', and 'Text for fiscal receipt'. The 'Price/discount' section is collapsed. The 'Validation period' section has 'Date validation type' (Standard), 'Effective date', 'Expiration date' (Never), 'VALIDATION PERIOD' (Discount period number), 'Description', 'Start date', and 'End date'. The 'Lines' section shows a table with columns for Category, Product, Product variant, Configuration, Size, Color, Style, Name, Unit, and Line.

Category	Product	Product variant	Configuration	Size	Color	Style	Name	Unit	Line
<input checked="" type="checkbox"/>	BMX Tires & Tubes	0005					Basic Inner Tube	ea	Incl
	BMX Gloves	0008					Mesh BMX Gloves	ea	Incl
	Fielding Gloves	0015					Youth Utility Baseball Glove	ea	Incl

## Discount ID

This field is labeled **Discount** and holds a unique ID for each discount. It's set when you first create a discount and can't be changed later. In **Commerce parameters**, you can set up independent number sequences for each type of discount. In this case, make sure that the number sequences won't collide. For example, you can use a unique prefix for each discount type. For example, D for **d**iscount, Q for **q**uantity, MM for **m**ix and **m**atch, and T for **t**hreshold.

## Discount name

This field is a short free text field that is used to describe the discount. The string value in this field is shown in the MPOS and CPOS cart line and printed on Modern Point of Sale (MPOS) and Cloud POS (CPOS) customer receipts. Therefore, your cashiers and end customers will see this description. It is the primary means for MPOS/CPOS users and customers to know which discount was applied.

## Discount type

There are four types of discounts in Commerce: **Discount**, **Quantity**, **Mix and match**, and **Threshold**. The discount type is set when you first create a discount and can't be changed later. The discount type determines whether there is a quantity or amount criterion that must be met to qualify for the discount.

## Status

The status of a discount can be either **Enabled** or **Disabled**. When you first create a discount, the status is **Disabled**. Discounts can only be edited when they are disabled. When discount data is pushed to a channel, disabled discounts are not pushed. If a discount was previously enabled and pushed to the channel, then this new push will also remove the discount from the channel. When you change the status to **Enabled**, various validation checks are performed on the discount, depending on the type of discount. The list of validation checks has increased in recent updates of the product to prevent incomplete or poorly defined discounts from being pushed to commerce channels. Here is a partial list of the validations that are performed when you enable a discount:

- A discount must have at least one discount line.
- The percentage value for a percentage discount must be more than 0 (zero) and less than or equal to 100.
- The amount value for an amount discount must be more than 0 (zero). Zero and negative amounts aren't

valid.

- A discount must have at least one price group. A discount that doesn't have a price group will never be applied to a transaction.
- A Unit of measure (UoM) is required for quantity and mix-and-match discount lines.
- For quantity discounts that have two or more quantity tiers, the discount value is validated to increase as quantities increase.
- For threshold discounts that have two or more threshold tiers, the discount value for each tier must be equal to or more than the largest discount of the previous tier.
- For mix-and-match least-expensive discounts, the number of least-expensive products must be more than 1 and less than the number of products that are required to trigger the discount.

## Currency

The currency of a discount defines the currency of all amount and price fields on the discount. Different discount types have different field options. The currency also acts as a filter during discount calculation. In Commerce, all sales order and MPOS/CPOS transactions have a currency, and the pricing engine will consider only discounts that have the same currency.

## Discount concurrency mode

This determines which discounts compete on a transaction, and which discounts are compounded together. The three values for this option are **Exclusive**, **Best price**, and **Compound**.

When the value is **Exclusive** or **Best price**, only one discount can be applied to a transaction line. The only difference between **Exclusive** and **Best price** is the order that the discounts are considered and applied in. **Exclusive** discounts are always evaluated and applied before **Best price** and **Compound** discounts, if all other settings are the same. Therefore, **Exclusive** and **Best price** discount never compete for the best price. Two or more **Exclusive** discounts will compete for the best price, as will two or more **Best price** discounts.

When the value is **Compound**, the discount can be compounded with any other discount that is also set to **Compound**. Therefore, two or more **Compound** discounts will all be applied to a transaction line. When multiple **Compound** discounts are applied to a transaction line, they are applied in the following order:

1. Discount price discounts
2. Amount-off discounts
3. Percentage-off discounts

**Compound** discounts compete with **Best price** discounts when both types apply to a transaction line.

Therefore, the **Compound** setting is used to determine which discounts are combined. Depending on the discount concurrency control mode used, two or more **Compound** discounts can be combined and compete with the **Best price** discounts that apply to the same products. The discount or discounts that have the largest total discount amount are applied.

## Discount account

Commerce lets you post discount amounts for a transaction to a separate general ledger (GL) account. The discount GL account is set by the product or customer. Commerce offers a unique way to separate the discount amounts during posting. You can post each type of discount to a specific GL account. Both options can make it easier for you to determine which discounts or discount types are being used in your general ledger.

### NOTE

When the discount account posting feature is enabled, then an additional debit entry and credit entry are made to reclassify the discount posting out of the Commerce discount GL account and into the discount GL account.

## Coupon code required

Starting with version 7.2 of the app, the call center coupons are now merged with discounts. For a discount, when **Coupon code required** is set to **Yes**, the **Status** field and the standard date fields, **Effective date** and **Expiration date**, are not available. These properties are controlled by equivalent properties that are on the **Coupons** page.

When **Coupon code required** is set to **Yes** on a discount, the discount is applied to a transaction only if the coupon code or bar code is provided by MPOS/CPOS. The values of the coupon codes and bar codes are defined and configured in a separate page named **Coupons**. The **Coupons** page is where the coupon is linked to the discount. When **Coupon code required** is set to **No**, a coupon code isn't required, and the discount will always be applied through its price groups.

### **Override priority and Pricing priority**

These two fields work together. When **Override priority** is set to **Yes**, the **Pricing priority** field becomes available for editing. You can then select a pricing priority to set directly on the discount. When **Override priority** is set to **No**, the priority is inherited from the priority of the price group associated with the discount. In the case of multiple price groups association, the priority number is determined by selecting the highest pricing priority of all the price groups associated with the discount.

### **Match all associated price groups**

In Commerce version 10.0.16 and later, a configuration called **Match all associated price groups** is available on all discount forms. If the configuration is enabled, the discount will be considered only if all the price groups associated to the discount are applicable to the transaction. For example, if the two price groups named "PG-Student" (price group for student affiliation) and "RP-Houston" (price group for the Houston store) are associated to a discount, and **Match all associated price groups** is enabled, the discount will be considered only for students who are shopping in the Houston store. This configuration provides a way to restrict affiliation and loyalty-based discounts to limited stores.

#### **NOTE**

If two or more channel price groups are associated to a discount, and **Match all associated price groups** is enabled, the discount won't apply because a transaction can be associated to only one store. Therefore, all the price groups associated to the discount don't match.

### **Description**

This field is a free-form text field. It isn't used in the MPOS/CPOS system or in transactions.

### **Disclaimer**

This is a free-form text field. It isn't used in the MPOS/CPOS system or in transactions.

### **Line type**

This field is on all discount lines. The possible values are **Include** and **Exclude**. This field is used in combination with the **Category**, **Product**, and **Variant** fields to define the set of products that the discount is applied to. Exclude discount lines always override include discount lines. When **Line type** is **Exclude** many of the other fields on the discount line are grayed out, as they do not apply.

### **Unit of measure**

**Unit of measure** (UoM) is a field on all discount lines except threshold discount lines. This field is label **Unit** in Commerce. The **Unit of measure** field acts as a *filter* to determine whether a discount should be applied to a transaction line. The UoM on the transaction line must match the UoM on the discount line. Otherwise, the discount line isn't considered during discount calculation. No UoM conversion is done during discount calculation.

### **Category, product, variant, and dimensions**

**Category**, **Product**, **Variant**, and **dimensions** are the last discount settings that are common to all discounts.

These fields are set on each discount line and specify what is being discounted. They act as a filter when the pricing engine searches for discounts that can be applied to a transaction. These fields are related to each other according to these rules – categories contain products, and products can come in different variations of size, color, style, and configuration.

The pricing engine does not use the parent/child relationships of categories, products, and variants to order discounts during discount calculation. This behavior differs from the way that the pricing engine handles sales price trade agreements. For example, both a discount for 10 percent on a category and a discount for 5 percent on a product in the same category will be considered. The larger of the two discount amounts will then be used, provided that all other properties are the same and the discounts aren't set to **Compound**, in which they both will be combined. If you want to force a product discount to be used over a category discount you can use pricing priority or the discount's concurrence mode to cause one discount to be applied before another.

When you edit discounts, the **Category**, **Product**, **Variant**, and **Dimensions** settings act as filters for each other. The **Category** and **Product** fields are automatically set from the *Commerce Category Hierarchy* if a product or variant is entered directly. The following sections provide detailed descriptions of each of these fields.

### **Category**

At a minimum, you must set the **Category** field. You can select any category from the product category hierarchy or any category from a supplemental category hierarchy. However, you can't select categories from channel navigation hierarchies or other non-commerce hierarchies. If only a category is specified on a discount line, the discount will be applied to any product in that category, even products that are added to the category after the discount has been created, provided that all other discount criteria are met, such as currency and UoM.

#### **NOTE**

The category that you select on a discount line is hierarchy specific. Therefore, you can't specify a value by typing a partial value in the field, as you can in most Commerce fields. If you type in a full category name, the drop-down list will expand, and that category will be selected. In addition, you can press Alt+Down arrow to expand the selection dialog box and then press Tab to move between the hierarchy selection and hierarchy tree within the drop-down list, so that you can use the field without using a mouse.

The capability to work with categories is a key differentiator between discounts and trade agreement discounts, and the main reason that we discourage you from using trade agreement discounts. Categories are organized in a multi-level hierarchy. By contrast, the item discount groups that are used by trade agreements are only a single level of grouping, and each group is specific to one of the three trade agreement discount types, such as Line discount, Multiline discount, and Total discount. Therefore, for trade agreements, if you want to use the same set of products in all three trade agreement discount types, you must create and manage three independent discount groups. However, for discounts, you must maintain only one category. You can then use that category in all four discount types. You can also use the same category in price adjustments, assortment management, and loyalty management.

### **Product**

The product can be a released product or a released product master. All discounts are company specific. Therefore, they work only with released products. If you select a product master, the discount will be applied to all variants of the product, even variants that are released after the discount is created, provided that all other discount criteria are met, such as currency and UoM.

### **Variant**

When you select a variant on a discount line, the discount will be applied to just that variant, provided that all other discount criteria are met, such as currency and UoM.

### **Dimensions**

Starting with the Retail 8.1.1 release, we have added the capability to set up discounts at a dimension level for a product. This provides the flexibility to choose one or more dimensions of a product as discount lines. This saves

the merchandizing manager from individually adding the variants on which the discounts apply. For example, you can specify a discount on all variants with a specific style or you can specify a discount on all variants that are of a specific color and style.

#### NOTE

The capability to set up promotions based on dimensions is not supported for price adjustments. The specific interface for defining the dimensions are removed in Retail versions 10.0.4 and later.

## Best practices

- Before you create discounts, document your discounting strategy and procedure. Keep your documentation up to date as your use of the product evolves.
- Use independent number sequences for each discount type and configure the number sequences so that the discount ID by itself indicates the discount type. For example, prefix the ID of each discount type with a different alphanumeric constant: **Q** for quantity, **MM** for mix and match, and so on.
- Test your discount configuration using the price simulator before you enable discounts. The price simulator has an option that lets you treat disabled discounts as enabled. This option was designed specifically for testing discounts before they are enabled.
- Expire discounts when they are no longer valid. In this way, you prevent the total number of discounts that the pricing engine considers during a transaction from growing unbounded. Otherwise, the performance of discount calculation can be affected over time.
- Leverage the supplemental categories to group the products, for example clearance products or last season products.
- Always avoid or minimize overlapping discount lines.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Retail sales price management

2/18/2021 • 23 minutes to read • [Edit Online](#)

This topic provides information about the process of creating and managing sales prices in Dynamics 365 Commerce. It focuses on the concepts that are involved in this process, and on the effects of the various configuration options for sales prices.

## Terminology

The following terms are used in this topic.

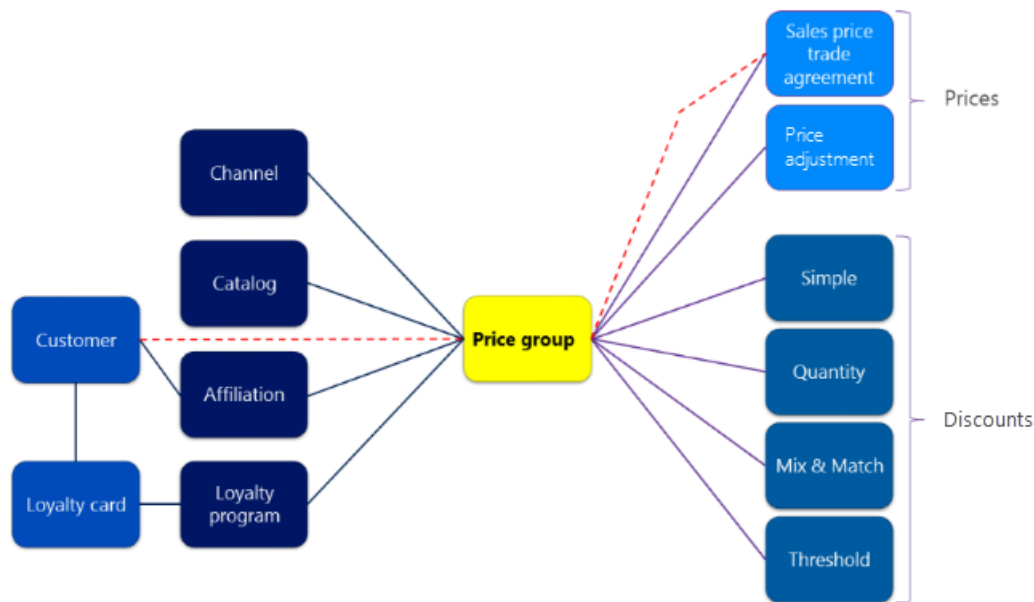

TERM	DEFINITION, USAGE, AND NOTES
Price	The single unit amount that a product sells for in a point of sale (POS) client or on a sales order. In this topic, the term <i>price</i> always refers to the sales price, not the inventory price or cost price.
Base price	The price that is set in the <b>Price</b> field on a released product.
Trade agreement price	The price that is set on a product or variant by using a trade agreement of the <b>Price (sales)</b> type.
Best price	When more than one price or discount can be applied to a product, the smallest price amount and/or the largest discount amount that produces the lowest possible net amount that the customer must pay. In this topic, the concept of best price is always referred to as "the best price." This best price differs from and should not be confused with the <b>Best price</b> enumeration value for a discount's concurrency mode.

## Price groups

Price groups are at the heart of price and discount management in Commerce. Price groups are used to assign prices and discounts to commerce entities (that is, channels, catalogs, affiliations, and loyalty programs). Because price groups are used for all pricing and discounts, it's very important that you plan how you will use them before you start.

By itself, a price group is just a name, a description, and, optionally, a pricing priority. The main point to remember about price groups is that they are used to manage the many-to-many relationships that discounts and prices have with commerce entities.

The following illustration shows how price groups are used. In this illustration, notice that "Price group" is literally at the center of pricing and discount management. The commerce entities that you can use to manage differential prices and discounts are on the left, and the actual price and discount records are on the right.

When you create price groups, you should not use a single price group for multiple types of commerce entities. Otherwise, it can be difficult to determine why a specific price or discount is being applied to a transaction.

As the red dashed line in the illustration shows, Commerce does support the core Microsoft Dynamics 365 functionality of a price group that is set directly on a customer. However, in this case, you get only sales price trade agreements. If you want to apply customer-specific prices, we recommend that you not set price groups directly on the customer. Instead, you should use affiliations.

Note that if the price group is set on the customer, then this price group gets associated to the sales order header of the orders created for this customer. If the user changes the price group on the order header, then the old price group gets replaced with the new price group only for the current order. For example, the old price group will not affect the current order, but it will still be associated to the customer for future orders.

The following sections provide more information about the commerce entities that you can use to set distinct prices when the price groups are used. The configuration of prices and discounts for all these entities is a two-step process. These steps can be done in either order. However, the logical order is to set the price groups on the entities first, because this step is likely to be a one-time setup that is done during implementation. Then, as prices and discounts are created, you can set the price groups on those prices and discounts individually.

## Channels

In the commerce industry, it's very typical to have different prices in different channels. The two primary factors that affect channel-specific prices are costs and local market conditions.

- **Costs** – The farther away a channel is from the product source, the more it costs to stock a product. For example, fresh produce has a limited shelf life and specific production requirements (for example, a growing season). During the winter, fresh lettuce likely costs more in northern climates than in southern climates. If you're setting prices for channels over a large geographical area, you will probably want to set different prices in different channels.
- **Local market conditions** – A store that has a direct competitor across the street will be much more price-sensitive than a store that doesn't have a direct competitor nearby.

## Affiliations

The general definition of an affiliation is a link to or association with a group. In Commerce, affiliations are groups of customers. Affiliations are a much more flexible tool for customer pricing and discounts than the core Microsoft Dynamics 365 concept of customer groups and discount groups. First, an affiliation can be used for both prices and discounts, whereas non-retail pricing has a different group for each type of discount and price. Next, a customer can belong to multiple affiliations but can belong to only one non-retail pricing group of each

type. Finally, although affiliations can be set up so that they are linked to a customer, they don't have to be. An ad-hoc affiliation can be used for anonymous customers at the POS. A typical example of an anonymous affiliation discount is a senior or student discount, where a customer can receive a discount just by showing a group membership card.

Although affiliations are most often associated with discounts, you can also use them to set differential pricing. For example, when a retailer sells to an employee, it might want to change the selling price instead of applying a discount on top of the regular price. As another example, a retailer that sells to both consumer customers and business customers might offer business customers better prices, based on their purchasing volume. Affiliations enable both these scenarios.

### **Loyalty programs**

In relation to prices and discounts, loyalty programs are basically just an affiliation that has a special name. Both prices and discounts can be set for a loyalty program, just as they can be set for an affiliation. However, the way that customers get loyalty pricing during a transaction or order differs from the way that they get affiliation pricing. Customers can get loyalty pricing only if a loyalty card is added to a transaction. When a loyalty card is added to a transaction, the loyalty program is also added. The loyalty program then enables special prices and discounts.

Loyalty programs can have multiple tiers, and the discounts can differ for different tiers. In this way, retailers can give frequent customers larger rewards without having to manually put those customers into a special group.

Loyalty programs have additional functionality besides prices and discounts. However, from the perspective of pricing and discounts, they are the same as affiliations.

### **Catalogs**

Some retailers use physical or virtual catalogs to market products to, and price them for, focused groups of customers. As part of their business model to target marketing via a catalog, these retailers can set differential prices on their various catalogs. Microsoft Dynamics 365 supports this capability by letting you define catalog-specific discounts and prices, just as you can define channel-specific or affiliation-specific discounts. When you edit a catalog, you can associate price groups with the catalog, just as you can associate them with a channel, affiliation, or loyalty program.

### **Best practices for price groups**

Don't use a price group for multiple entity types. Instead, use one set of price groups for channels, a different set of price groups for affiliations or loyalty programs, and so on. You can use a prefix or suffix in the name of the price group to visually group the various types of price groups that you're using.

Avoid setting price groups directly on a customer. Instead, use an affiliation. In this way, you can assign all types of prices and discounts to customers, not just sales price trade agreements.

## **Pricing priority**

By itself, a pricing priority is just a number and a description. Pricing priorities can be applied to price groups, or they can be applied directly to discounts. When pricing priorities are used, they let a retailer override the principle of the best price by controlling the order in which prices and discounts are applied to products. A larger pricing priority number is evaluated before a lower pricing priority number. Additionally, if a price or discount is found at any priority number, all prices or discounts that have lower priority numbers are ignored.

The price and a discount can come from two different pricing priorities, because pricing priorities apply to prices and discounts independently.

To use pricing priority for prices, you must assign a pricing priority to a price group and then create a sales price trade agreement for that price group.

The pricing priority feature was introduced to support the scenario where a retailer wants to apply higher prices

in a specific set of stores. For example, a retailer has defined regional prices for the east coast of the United States but wants higher prices for some products in New York City stores, because it costs more to sell some products in the city, and/or because the local market will bear a higher price.

As was described in the "Best price" section of this topic, the pricing engine typically selects the lower of two prices. Therefore, the retailer is usually prevented from using the higher of two prices in a store that has both the East coast and New York price groups. To resolve this issue before the pricing priority feature was introduced, the retailer had to define prices for every product two times and not assign both price groups. Alternatively, the retailer had to create extra price groups to isolate the products that have higher prices from products that have the usual, lower prices.

However, the pricing priority feature lets the retailer create a pricing priority for store prices that is higher than the pricing priority for regional prices. Alternatively, the retailer can create a pricing priority just for store prices and leave regional prices at the default pricing priority, which is 0 (zero). Both setups help guarantee that store prices will always be used before regional prices.

### Pricing priority example

Let's look at an example where store prices override other prices.

A national retailer sets most prices per region, and it has four regions: North east, South east, Mid-west and West. It has identified several high-cost markets that can support higher prices. These markets are in New York City, Chicago, and the San Francisco Bay area.

For this example, we will drill into the North east region. Store 1 is in Boston, and store 2 is in Manhattan. For the Boston store, two price groups are linked to the channel: North East and Store 1. For the Manhattan store, three price groups are linked to the channel: North East, NYC, and Store 2.

The retailer sets up two pricing priorities: High cost has a priority number of 5, and Store prices has a priority number of 10. (Remember that, by default, the pricing priority is 0 [zero], and a price or discount that has a higher priority number is used before a price or discount that has a lower priority number.) For the North East price group, the pricing priority is left at the default value of 0 (zero). For the NYC price group, the pricing priority is set to 5, because New York City is a high-cost market. For the Store 1 and Store 2 price groups, the pricing priority is set to 10.

Two products that the retailer sells are product 1, a commodity T-shirt, and product 2, brand-specific fashion jeans.

PRODUCT	NORTH EAST PRICE	NYC PRICE	STORE PRICE
T-shirt	\$15	Not set	Not set
Fashion jeans	\$50	\$70	Not set

The T-shirt sells for the same price (that is, \$15) at both the Boston and Manhattan stores, because only one price is set in the North East price group that is linked to both channels. The fashion jeans sell for \$50 in the Boston store, because that price is the only price that is available in that store. However, in the Manhattan store, two prices are available: \$50 and \$70. Because the pricing priority of 5 for the NYC price group is higher than the pricing priority of 0 (zero) for the North East price group, the price will be rung up as \$70 in the POS system.

#### NOTE

For each pricing priority, a full pass through the logic for the retail pricing engine is required. Therefore, to help maintain the performance of the price and discount calculation, you should use pricing priorities sparingly.

# Types of prices

In Microsoft Dynamics 365, you can set the price of a product in three places:

- Directly on the product (base price)
- In a sales price trade agreement
- In a price adjustment

The base price and trade agreement price are part of core Dynamics 365, and are available even if you don't use Commerce. The price adjustment functionality is available only in Commerce. The next section provides more information about each of these options for setting prices and explains how the options work together.

## Setting prices

### Base price

The easiest place to set the price for a product is directly on the product. The value that you set directly on a product is often referred to as the base price for the product. You set the base price in the **Price** field on the **Sell** tab of the **Released product details** page. The value that you enter is in the company currency. By default, the price is for a quantity of 1 of the unit of measure (UoM) that is set in the **Unit** field on the **Sell** tab. The actual price per unit of a product is based on the UoM, the price quantity, and the currency.

If a product has one price for everyone, the base price offers the most efficient way to manage the price of that product. Even if you use trade agreements to set prices, you might also set the base price on a product. Then, if you don't use an **All** trade agreement, you have a fallback price that is used when no trade agreement applies.

If a channel's currency differs from the company currency, the base price in that channel is determined by using currency conversion on the price that is set on the product.

Although the price unit isn't a common scenario, the pricing engine supports it. If the price unit is set to a value other than 0 (zero), the price per unit equals  $\text{Price} \div \text{Price unit}$ . For example, if a product's price is \$10.00, and the price unit is 50, the price for a quantity of 1 is \$0.20 ( $= \$10.00 \div 50$ ).

### Sales price trade agreement

By using the trade agreement journal, you can create sales price trade agreements for each product. In Microsoft Dynamics 365, there are three customer scopes for sales price trade agreements: **Table**, **Group**, and **All**. The customer scope determines the customers that a given sales price trade agreement applies to.

A **Table** sales price trade agreement is for a single customer that is set directly on the trade agreement. This scenario isn't a typical business-to-consumer (B2C) scenario. However, if it occurs, the pricing engine uses **Table** trade agreements when it determines price.

A **Group** sales price trade agreement is the type that is most often used with. Outside Commerce, **Group** sales price trade agreements are for a simple customer group. However, in Commerce, the concept of a customer group has been extended so that it's a more generic price group. A price group can be linked to a channel, affiliation, loyalty program, or catalog. For detailed information about price groups, see the "Price groups" section earlier in this topic.

#### NOTE

A trade agreement price is always used before the base price.

### Price adjustment

As the name implies, a price adjustment is used to modify the price that was either set directly on the product or set by using a trade agreement. A price adjustment can be used only to lower the price, not raise it. A price adjustment is the recommended way for retailers to create, track, and manage price markdowns for their

products over time.

There are three types of price adjustments: percentage off, amount off, and price. A price adjustment of the percentage off or amount off type is always applied to a sale transaction. However, a price adjustment of the price type is applied only if the adjusted price is less than the price that was set by using the base price or trade agreement price. Therefore, if the price that is set in a price adjustment is more than the unadjusted price, the price adjustment isn't used.

## Determining price for a product in a transaction

The calculation of the price and discount on a transaction uses the principle of finding the best price for the customer. According to this principle, if more than one price is found, the lowest price is used. Additionally, the combination of discounts that produces the largest discount amount for the whole transaction is used. In some cases, a smaller discount must be used on a single product, so that additional discounts can be applied to other products in the transaction.

The only exception to the principle of finding the best price for the customer is an option for mix-and-match least-expensive discounts. This option enables least-expensive discounts that favor the retailer when products are selected and grouped. Therefore, when a transaction includes more products than are required to qualify for the least-expensive discount, the pricing engine selects the products that produce the smallest possible discount amount for the customer.

The pricing engine returns three prices for every product: the base price, the trade agreement price, and the active price.

The base price is just the property on the product and is the same for everyone everywhere.

On the sales price trade agreement, if the **Find next** option is set to **Yes**, the lowest price that is found for applicable sales price trade agreements is used as the trade agreement price. Trade agreements can be found by using price groups or the **ALL** account code. Alternatively, trade agreements can be assigned directly to a customer. If the **Find next** option is set to **No**, the first trade agreement price that is found is used. If no sales price trade agreements are found, then the trade agreement price is set equal to the base price.

The active price is calculated by taking the trade agreement price and applying the largest price adjustment that applies to the product. If no price adjustments are found, or if the calculated active price is more than the trade agreement price, the active price is set equal to the trade agreement price. Remember that you can't raise the price of a product by using a price adjustment. The applicable price adjustments can be found only by using price groups that are assigned to a channel, catalog, affiliation, or loyalty program.

## Category price rules

The category price rules feature in Commerce gives you an easy way to create new trade agreements for all the products in a category. This feature also lets you automatically find existing trade agreements for the products in the category and expire them.

When you select the option to expire existing trade agreements, the system creates a new trade agreement journal for the products in the category that have an active trade agreement. However, the journal must be manually posted. Additionally, the category price rules can find existing trade agreements only if you're using the same price rule (that is, if you create a new price rule that uses the same category that was before). If you aren't using the same price rule, the existing trade agreements won't be expired.

The prices can be increased or decreased by using the **Price rule** and **Price basis** fields of the category price rules.

- In the **Price rule** field, select the type of price change to use:
  - **Markup** – A percentage of the price basis is used to calculate the sales price. For example, a product

that costs 10.00 and sells for 15.00 has a markup of 50 percent.

- **Margin** – A percentage of the sales price is used to calculate the amount of profit. For example, a product that costs 10.00 and sells for 15.00 has a margin of 33.3 percent.
- **Fixed amount** – An amount that is added to the price basis is used to calculate the sales price. For example, a product that costs 10.00 and sells for 15.00 has a fixed amount of 5.00.
- In the **Price basis** field, select the type of price to modify:
  - **Base cost** – The amount that the retailer paid to the supplier.
  - **Base price** – The sales price before trade agreements and price adjustments are applied.
  - **Current price** – The sales price after trade agreements and price adjustments are applied.

To easily update the prices of various products from different product categories, you can use the supplemental product categories together with the category price rules.

## Best practices

Microsoft SQL Server Express is often used for channel databases because of the cost (free). Keep in mind that SQL Server Express has hardware limitations and limits on data size. If you don't plan correctly, you can quickly reach the data size limits of SQL Server Express. This consideration applies not only to pricing but also to other areas of the product. Here are a few best practices that can help you reduce the size of your data:

- If you're using trade agreements, and your prices change, you should expire the old trade agreements by setting an end date. Over time, this approach helps reduce the number of trade agreements that are kept in channel databases. It also helps reduce the amount of data that the price calculation algorithm must work with.
- If your prices vary by product variant, consider using the product base price as the price of the most common variant. Then use trade agreements only for the variant prices that are exceptions. This approach helps reduce the number of trade agreement records. Because it's so easy to import data into Microsoft Dynamics 365, you might be tempted to import a trade agreement for every variant of every product. However, that approach can produce many trade agreements that have the same value. Therefore, it can needlessly increase the size of your data.
- Commerce processes variant-specific prices in order from most specific to least specific. If a product dimension doesn't affect the price, you don't have to define trade agreements for it. For example, a product is available in three colors and four sizes, but the price varies only by size. If you define a trade agreement for every variant, you create 12 records. Instead, you can define a trade agreement just for each size and leave the Color dimension blank. In this case, you produce only four records.

Alternatively, if not every value of a dimension produces a different price, you can define one trade agreement for the product master and leave all product dimensions blank. Then define a separate trade agreement just for each dimension value that produces a different price. For example, if the XXL size has a higher price, but all other sizes have the same price, you require only two trade agreements: one for the product master and one for the XXL size.

## Prices that include tax vs. prices that exclude tax

When you set sales prices in Dynamics 365, you don't specify whether the price value that you're setting includes or excludes tax. The value is just the price. However, the **Price includes sales tax** setting on channels lets you configure channels so that they either include or exclude tax from prices. This setting is set on the channel and can change even in a single company.

If you work with both inclusive and exclusive types of tax, it's very important that you set prices correctly, because the total amount that the customer pays will change if the **Price includes sales tax** setting on the channel is changed.

# Differences between retail pricing and non-retail pricing

A single pricing engine is used to calculate prices across all channels: Call center, Retail store, and Online stores. This helps in enabling the unified commerce scenarios.

Pricing is designed to work with retail entities instead of non-retail entities. Specifically, it's designed to set prices by store, not by warehouse.

The pricing engine **does not support** the following pricing features:

- Setting prices by Site or Site and Warehouse storage dimensions is not supported. If you only specify Site dimension on the trade agreements, then the pricing engine will ignore the Site and apply the trade agreement to all sites. If you specify both Site and Warehouse, then the behavior is undefined/untested because it's expected that retailers use the store price groups to control the prices for each store/warehouse.
- Attribute-based pricing is not supported.
- Vendor discount pass-through is not supported.
- The standard Supply Chain Management pricing engine supports the pricing calculation based on the "Requested ship date" and "Requested receipt date" along with the current date. However, retail pricing currently does not support these values. The reason is that for B2C scenarios customers do not expect the requested delivery date to affect the item price. In some cases, retailers have both B2B and B2C operations. For B2B operations it is common to change prices based on the delivery dates. These retailers can use Supply Chain Management pricing for their B2B business and retail pricing for their B2C business. Retail pricing kicks in only if the application user is added as a call center user, so the retailers can assign certain users who will work with the Supply Chain Management pricing and assign a few that will work with the Retail pricing, that is, these users should be added as a call center users. Additionally, the **Use today's date for calculating prices** property in the **Commerce parameters > pricing and discounts > Miscellaneous** section must be turned on. This way they can keep the using accounts receivable parameter value for Requested ship date or Requested receipt date for Supply Chain Management pricing, but the retail pricing will keep using the today's date for pricing calculation.

In addition, **only** the pricing engine supports the following pricing features:

- The price is based on product dimensions, in order from the most-specific variant price to the least-specific variant price to the product master price. A price that is set by using two product dimensions (for example, Color and Size) is used before a price that is set by using only one product dimension (for example, Size).
- The same price group can be used to control pricing and discounts.

## Pricing API enhancements

Price is one of the most important factors that controls the buying decisions of many customers, and many customers compare prices on various sites before they make a purchase. To help ensure that they provide competitive prices, retailers carefully watch their competitors and often run promotions. To help these retailers attract customers, it's very important that product search, the browse feature, lists, and the product details page show the most accurate prices.

In an upcoming release of Commerce, the **GetActivePrices** application programming interface (API) will return prices that include simple discounts (for example, single-line discounts that don't depend on other items in the cart). In this way, the prices that are shown are close to the actual amount that customers will pay for items. This API will include all the types of simple discounts: affiliation-based, loyalty-based, catalog-based, and channel-based discounts. Additionally, the API will return the names and validity information for the applied discounts, so that retailers can provide a more detailed description of the price and create a sense of urgency if the discount's validity will expire soon.

# Price adjustments and discounts

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about price adjustments and discounts in Dynamics 365 Commerce.

In Commerce, you can make price adjustments to products, and can also set up discounts that are applied to a line item or a transaction at the point of sale (POS), in a call center sales order, or in an online order. Both price adjustments and discounts can be linked to price groups. For both price adjustments and discounts, you can specify a single start date and end date or a reoccurring period, a discount code, and a few additional attributes.

Price adjustments and discounts can be applied to products, variants, or categories. If more than one discount applies to a product, a customer might receive either one of the discounts or a combined discount, depending on the configuration of the discount. Commerce automatically applies the discount or combination of discounts that gives the best price to the customer. When you set up a price adjustment or a discount, be sure to confirm that price groups are assigned to the correct channels, catalogs, affiliations, or loyalty programs that you want the discount to apply to. Additionally, if you want to automatically generate the discount ID, set up number sequences on the **Commerce parameters** page before you define a new price adjustment or discount.

## NOTE

You can delete a price adjustment or a discount. However, statistical information will be lost.

## Types of discounts

There are many types of discounts:

- **Simple discount** – A single percentage or amount.
- **Quantity discount** – A discount that is applied when two or more products are purchased.
- **Mix and match discount** – A discount that is applied when a specific combination of products is purchased.
- **Threshold discount** – A discount that is applied when the transaction total is more than a specified amount.
- **Tender-based discount** – A discount that is applied when the transaction total is more than a specified amount and a specific payment type (for example, cash, credit, or debit card) is used for payment.
- **Shipping discount** – A discount that is applied when the transaction total is more than a specified amount and a specific mode of delivery (for example, two day shipping or overnight shipping) is used on the order.

Both price adjustments and discounts can be associated with price groups. Price groups can then be associated with channels, catalogs, affiliations, and loyalty programs.

# Apply multiple Retail discounts to a product

2/18/2021 • 18 minutes to read • [Edit Online](#)

## Overview

This topic reviews all the factors considered when multiple discounts can be applied to a product. In this scenario, the commerce pricing engine applies as many discounts as it can, to maximize the total discount amount on a product. Multiple options affect the order in which the discounts are applied. Throughout this topic it's noted when a setting affects the order of discount application and exclusivity of a discount. The following settings affect how multiple discounts, applicable on a product, are processed.

- **Discount concurrency control model**
- **Pricing Priority**
- **Discount type (Simple, Mix and Match, Quantity, and Threshold)**
- **Discount concurrency mode (Exclusive, Best price, and Compound)**
- **Multiple occurrences mode**, when it's set to **Favor retailer** (for mix-and-match least-expensive discounts only)

The **Discount concurrency control model** is described below in detail; however, the rest of the properties are covered in [Retail discounts](#).

## Discount concurrency control model

The discount concurrency control model changes when and how multiple discounts are applied to products in a transaction. The **Best price and compound concurrency control model** option on the **Discounts** tab on the **Commerce parameters** page is different from the **Discount concurrency mode** property on each discount.

In earlier versions of the app, there was only one way to apply multiple discounts based on the **discount type**, **discount concurrency mode**, and **pricing priority** (if used) properties of discounts. Now, the discount concurrency control model setting affects how all discounts compete and compound together.

### Background on why this change was made

In previous versions of the app, you could directly customize the price engine by overlaying their custom business logic in the price engine. With the transition to an online service and to improve overall application lifecycle management, the Dynamics 365 application has been sealed and overlaying customizations are no longer allowed. New extensibility points have been added to enable the same types of customizations that were the most common. Most discount customizations are in one of the following categories.

- **Minor changes to existing discounts:** For example, moving the start date and end date from the discount header to the discount lines.
- **New discount types:** In some cases, companies need to introduce a new type of discount. For example, capping the total discount amount for a simple discount.
- **Changing the when and how (the flow) of multiple discounts being applied:** For example, having all mix and match discounts applied on top of quantity or simple discounts while still having quantity and simple discounts compete for best price or having store-specific and customer-specific discounts compete for best price and then compound the winning discount with loyalty program discounts.

The first two types of customizations are handled by providing a new extensibility model within the price engine that enables these scenarios. However, to address the third type of customization we expanded the functional

capabilities of the system by introducing this setting. A discount's concurrency mode and pricing priority already gave the user significant flexibility over the order of discount application. By introducing a new configuration setting that affects how a discount's concurrency mode and pricing priority interact, all discount ordering customization is covered, which results in the concurrency model option.

### **Best price and compound within priority, never compound across priorities**

This is the default and is the legacy way in which multiple discounts are processed. When this option is selected, all compound discounts within the same pricing priority are combined, and the combined result competes with any best price discounts in the same pricing priority. After a discount is applied to a product, all discounts at lower pricing priorities are ignored.

### **Best price only within priority, always compound across priority**

This is the new way multiple discounts can be processed. When this option is selected, discounts with **Discount concurrency mode** set to **Best price** and **Compound** are all treated as "best price" within a single pricing priority. When applied, the best price discount within a priority, is compounded with the best price and compound discounts at lower pricing priorities. In this concurrency control model, only a single discount can be applied to a product per pricing priority, and if that single discount is a best price or compound discount, then it will compound with all additional best price or compound discounts at lower pricing priorities.

### **Examples**

The following examples show how the pricing engine processes a pool of discounts for different concurrency control models.

#### **Example 1**

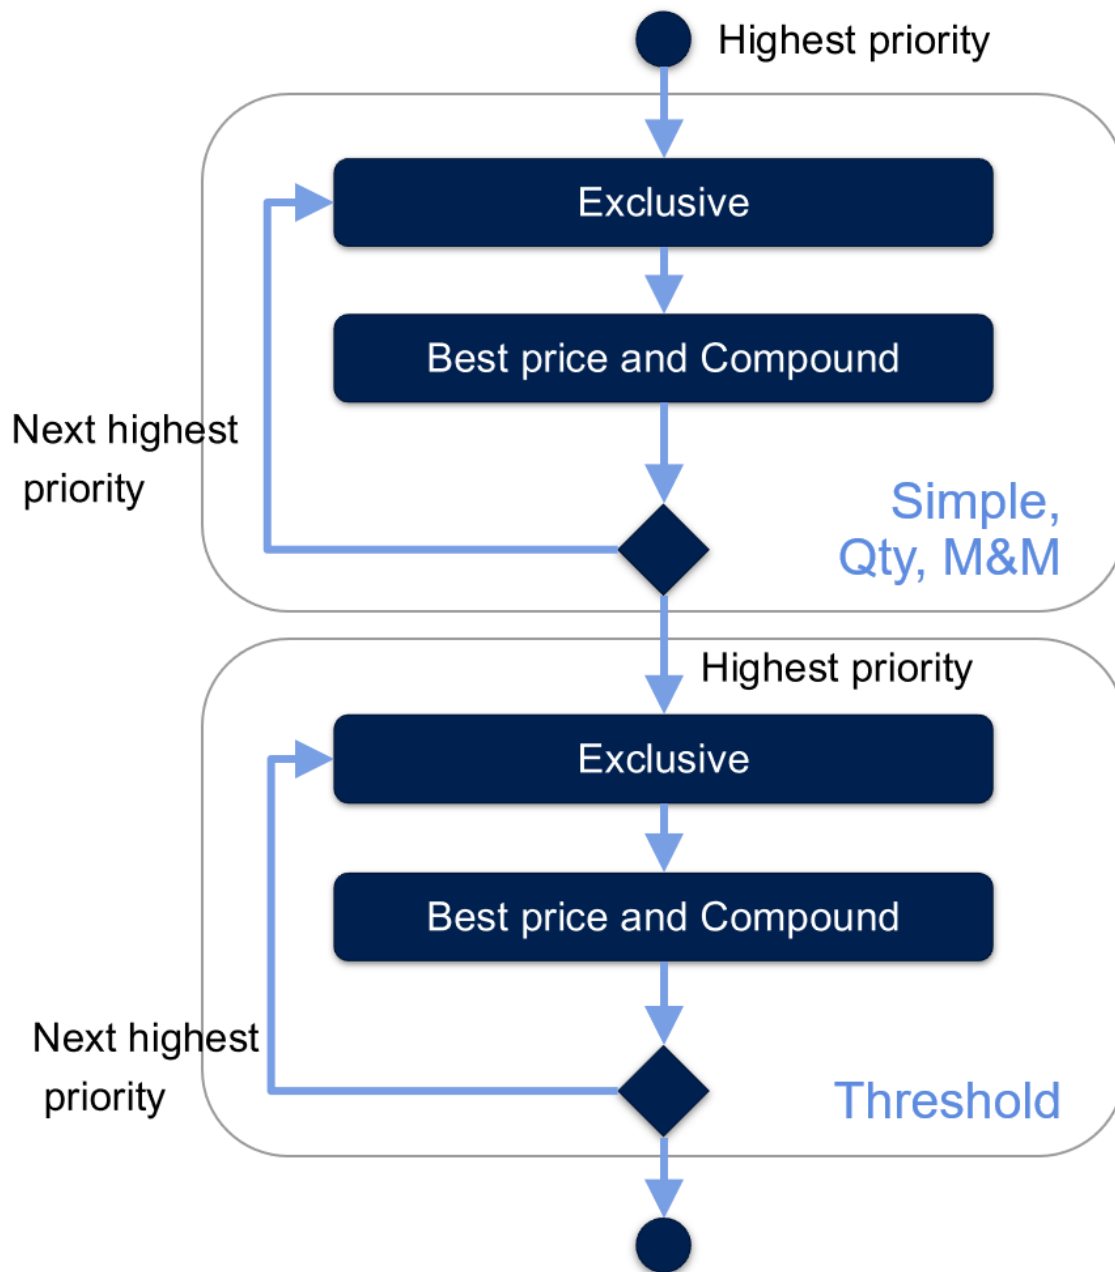

In the first scenario, **Best price and compound within priority, never compound across priorities** is selected as the discount concurrency control model. There are two pricing priorities, and for each pricing priority, there is one discount of each discount type, for example **Simple**, **Mix and Match**, **Quantity**, and **Threshold**. Let's assume there are discounts at two priorities 5 and 10 and all products have multiple discounts at both these priorities. The pool of possible pricing priorities is determined by the price groups and discounts that can be applied to the product.

1. Given that a discount concurrency control model is selected, for each product, the pricing engine next considers the highest pricing priority of the discounts that are applicable on the product. Thus, the pricing engine evaluates and applies the simple, quantity, and mix-and-match discounts with priority 10.

#### **NOTE**

Threshold discounts are not evaluated yet because, as indicated by their name, they will be evaluated against the transaction amount, after all the other discounts have been applied.

The following image shows a concise view of how the pricing algorithm loops through the discounts across various priorities. Note that this diagram applies for both the discount concurrency control models, but the difference is in the way in which the pricing algorithm treats discounts at different priorities. This difference is elaborated using the following example.

2. Within priority 10, the pricing engine first considers the discounts that have the concurrency mode set to **Exclusive**. If there is more than one exclusive discount applicable to the product, then the best exclusive discount is applied. When a product gets an exclusive discount, no other discounts can be applied to this product at any priority.

**NOTE**

Mix-and-match, least-expensive discounts that have the **Multiple occurrences mode** property set to **Favor retailer** are skipped in this step. After all the **Exclusive** discounts (**Simple, Quantity, Mix and Match**) at pricing priority 10 have been applied, then the exclusive mix-and-match **Favor retailer** discounts, at pricing priority 10, are applied to any undiscounted products.

3. Within priority 10, the pricing engine then considers the discounts that have the discount concurrency mode set to **Best price and Compound**. If multiple **Compound** discounts apply to a product, then they are compounded, and the resulting total discount amount competes against the other **Best price** discounts. Either one of the **Best price** discounts or the combination of **Compound** discounts gets applied to the product, depending on which discount gives the most benefit to the customer. Like the previous step, mix-and-match least-expensive discounts that have the **Multiple occurrences mode**

property set to **Favor retailer** are skipped in this step. Once all the **Best price** and **Compound** discounts at pricing priority 10 have been applied, then **Best price** and **Compound** mix-and-match **Favor retailer** discounts are evaluated against each other and gets applied. A **Best price** discount applies only to undiscounted products, but a **Compound** discount applies to undiscounted products and products that are discounted with another **Compound** discounts at the same pricing priority.

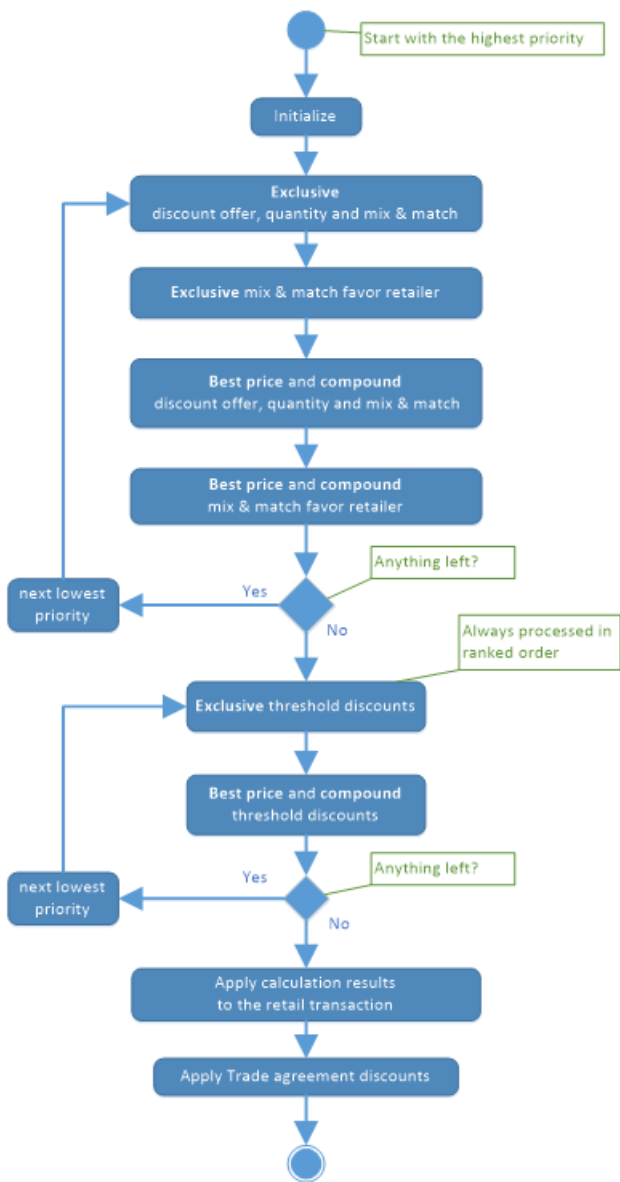

4. Because the discount concurrency control mode is set to **Best price and compound within priority, never compound across priorities** so the simple, quantity, and mix-and-match discounts applicable to the product, at pricing priority 5 do not compete with the applied discounts. At this point, for a product, all the simple, quantity, and mix-and-match discounts at the highest priority have been evaluated.
5. Next, within priority 10, the pricing engine evaluates threshold discounts that have the concurrency mode set to **Exclusive**. An **Exclusive** threshold discount can't be applied to a product that already has a discount applied, so a threshold amount is applied and evaluated only on the undiscounted products. If more than one of these discounts apply to the transaction, the discounts compete, and the largest discount is applied.
6. Next, within priority 10, the pricing engine evaluates threshold discounts that have the concurrency mode set to **Best price** and **Compound**. The pricing engine evaluates and applies threshold discounts at pricing priority 10. **Compound** threshold discounts are compounded with other **Compound** threshold discounts and compete against the other **Best price** discounts within the same pricing priority. A **Best price** threshold discount applies only to undiscounted products, but a **Compound** threshold discount applies to undiscounted products and products that are discounted with another **Compound** (**Simple, Quantity, and Mix and Match**) discount.

#### **NOTE**

If there were threshold discounts set at a higher priority, for example if it's set to 11, and all the other discount types were at priority 10 and 5, then the threshold discounts would have evaluated at priority 11 and then compounded with the simple, quantity, and mix and match discounts at priority 10. This is important because simple, quantity, and mix and match discounts are evaluated within their highest priority and the threshold discounts are evaluated within their highest priority and then compounded. Any threshold discounts at the lower priority are ignored.

At this point, all the discounts at the highest priorities have been evaluated.

The above logic is showcased in the following image, which shows the detailed view of how the pricing algorithm loops through the discounts across various priorities. Note that this diagram applies for both the discount concurrency control models, but the difference is in the way in which the pricing algorithm treats discounts at different priorities.

In this example, let's assume the following setup.

### Product information

PRODUCT #	PRODUCT PRICE
Prod1	\$10
Prod2	\$20
Prod3	\$10

### Discount setup

DISCOUNT #	DISCOUNT CONCURRENCY	PRIORITY	DISCOUNT AMOUNT	DISCOUNT TYPE	APPLICABLE ON PRODUCTS
BP1	Best price	10	15%	Simple, Quantity, or Mix and Match	Prod1, Prod2

DISCOUNT #	DISCOUNT CONCURRENCY	PRIORITY	DISCOUNT AMOUNT	DISCOUNT TYPE	APPLICABLE ON PRODUCTS
BP2	Best price	5	20%	Simple, Quantity, or Mix and Match	All products
C1	Compound	10	\$1	Simple, Quantity, or Mix and Match	Prod1, Prod2
C2	Compound	10	10%	Simple, Quantity, or Mix and Match	Prod1, Prod2
C3	Compound	5	25%	Simple, Quantity, or Mix and Match	All products
C4	Compound	5	10%	Threshold only	All products

**Step 1:** For each product, determine the highest priority where a Simple, Quantity or Mix and Match discount exists. In this case, for prod1 it is priority 10, for prod2 it is priority 10 and for prod3 it is priority 5.

**Step 2:** For each product, find **Simple, Quantity, or Mix and Match** discounts, with discount concurrency as **Exclusive**, at the highest priority applicable to individual products. In this case, there are none for prod1 and prod2 at priority 10 and similarly, there are none for prod3 at priority 5.

**Step 3:** For each product, evaluate **Simple, Quantity, or Mix and Match** discounts, with discount concurrency as **Best price** and **Compound**, at the highest priority applicable to individual products. The following table illustrates this.

**NOTE**

Two asterisks (\*\*) indicate the discount that gets applied to a product.

TRANSACTION QUANTITY	PRODUCT	PRICE	PRIORITY 10 (C1 + C2)	PRIORITY 10 (BP1)	PRIORITY 5 (C3)	PRIORITY 5 (BP2)	TOTAL	EXPLANATION
----------------------	---------	-------	-----------------------	-------------------	-----------------	------------------	-------	-------------

TRANSACTION QUANTITY	PRODUCT	PRICE	PRIORITY 10 (C1 + C2)	PRIORITY 10 (BP1)	PRIORITY 5 (C3)	PRIORITY 5 (BP2)	TOTAL	EXPLANATION
1	Prod1	\$10	\$1.90**	\$1.50	(NA)	(NA)	\$10 – 1.90 = \$8.1	Because the combination of compound discounts is more than the best price discount, C1 and C2 are applied on the product. The discounts at lower priority, such as 5, are ignored.
1	Prod2	\$20	\$2.90	\$3**	(NA)	(NA)	\$20 – 3 = \$17.00	Because the best price discount is more than the combination of compound discounts, BP1 is applied on the product. The discounts at lower priority, such as 5, are ignored.

TRANSACTION QUANTITY	PRODUCT	PRICE	PRIORITY 10 (C1 + C2)	PRIORITY 10 (BP1)	PRIORITY 5 (C3)	PRIORITY 5 (BP2)	TOTAL	EXPLANATION
1	Prod3	\$10			\$2.50**	\$2.0	\$10 – 2.50 = \$7.5	Priority 5 is highest applicable priority for this product. The compounded discount is more than the best price discount, so C3 is applied on the product.

**Step 4:** Evaluate **Threshold** discounts applicable to the individual products at the highest priority. For this example, it is priority 5 for all the products.

TRANSACTION QUANTITY	PRODUCT	DISCOUNT APPLIED	DISCOUNTED PRICE	PRIORITY 5 (C4)	AMOUNT DUE	EXPLANATION
1	Prod1	C1, C2	\$8.1	\$0.81**	8.1 – 0.81 = \$7.29	For Threshold discounts, Priority 5 is the highest applicable priority for this product, so any applicable threshold discounts at priority 5 will be compounded with the applied discounts, if the applied discounts are of discount concurrency mode <b>Compound</b> . Because Prod1 has compound discounts only, the compound threshold discounts can be compounded.

TRANSACTION QUANTITY	PRODUCT	DISCOUNT APPLIED	DISCOUNTED PRICE	PRIORITY 5 (C4)	AMOUNT DUE	EXPLANATION
1	Prod2	BP1	\$17	(NA)	\$17	<p>For Threshold discounts, Priority 5 is the highest applicable priority for this product, so any applicable threshold discounts at priority 5 will be compounded with the applied discounts if the applied discounts are of discount concurrency mode <b>Compound</b>. Because Prod2 has a "Best price" discount, other discounts CANNOT be applied to this product.</p>

TRANSACTION QUANTITY	PRODUCT	DISCOUNT APPLIED	DISCOUNTED PRICE	PRIORITY 5 (C4)	AMOUNT DUE	EXPLANATION
1	Prod3	C3	\$7.5	\$0.75**	7.5 – 0.75 = \$6.75	For Threshold discounts, Priority 5 is highest applicable priority for this product, so any applicable threshold discounts at priority 5 will be compounded with the applied discounts, if the applied discounts are of discount concurrency mode <b>Compound</b> . Because Prod3 has compound discounts only, the compound threshold discounts can be compounded.

The final amount due for Prod1 is 7.29, Prod 2 is 17, and Prod 3 is 6.75.

**Example 2**

In the second scenario, **Best price only within priority, always compound across priorities** is selected as the discount concurrency control model while rest of the discounts remain as is.

1. Given that **Discount concurrency control model** is selected, for each product the pricing engine next considers the highest pricing priority of the discounts that are applicable on a product. If, for a product, discounts from more than one priority are applicable, then each is evaluated independently, and in descending order. Thus, the pricing engine first evaluates and applies the simple, quantity, and mix-and-match discounts with priority 10 followed by the discounts at priority 5.

**NOTE**

Like the previous discount concurrency control model, the **Threshold** discounts are not evaluated yet.

2. Within priority 10, the pricing engine first considers the discounts that have the concurrency mode set to **Exclusive**. If there is more than one exclusive discount applicable to the product, then the best exclusive discount is applied. When a product gets an exclusive discount, no other discounts can be applied to this product at any priority.

#### NOTE

Mix-and-match, least-expensive discounts that have the **Multiple occurrences mode** property set to **Favor retailer** are skipped in this step. After all the **Exclusive** discounts (**Simple, Quantity** and **Mix and Match**) at pricing priority 10 have been applied, then the **Exclusive** mix-and-match **Favor retailer** discounts, at pricing priority 10, are applied to any undiscounted products.

3. Within priority 10, the pricing engine then considers the discounts that have the discount concurrency mode set to **Best price** and **Compound**. As stated before, for this discount concurrency control model, discounts with **Discount concurrency mode** set to **Best price** and **Compound** are all treated as "best price"; within a single pricing priority. So, if multiple **Compound** and **Best price** discounts apply to a product, then all these discounts compete for best price and only the best discount wins within a priority. Like the previous step, mix-and-match least-expensive discounts that have the **Multiple occurrences mode** property set to **Favor retailer** are skipped in this step. When all the **Best price** and **Compound** discounts at pricing priority 10 have been applied, then **Best price** and **Compound** mix-and-match **Favor retailer** discounts are evaluated against each other and applied. Because both **Best price** and **Compound** are treated as best price, only one discount can be applied per product at a given priority.
4. The pricing engine repeats the steps 1 through 3 for any simple, quantity, and mix-and-match discounts at pricing priority 5.

#### NOTE

The pricing engine completes steps 1 through 3, one time, for every pricing priority that applies to the transaction. Therefore, we recommend that you keep the number of pricing priorities to a minimum, based on your business requirements.

At this point, all the simple, quantity, and mix-and-match discounts at all priorities have been evaluated and applied.

5. Next, within priority 10, the pricing engine evaluates threshold discounts that have the concurrency mode set to **Exclusive**. An **Exclusive** threshold discount can't be applied to a product that already has a discount applied, so a threshold amount is applied and evaluated only on undiscounted products. If more than one of these discounts apply to the transaction, the discounts compete, and the largest discount is applied.
6. Next, within priority 10, the pricing engine evaluates threshold discounts that have the concurrency mode set to **Best price** and **Compound**. Because **Best price** and **Compound** are all treated as "best price", these discounts compete for the best discount. The selected threshold discount gets applied to those products which do not have any other types of discounts already applied at priority 10. If there are other discounts, then the threshold discount is not applied because both **Best price** and **Compound** discounts are treated as **Best price**, and only one discount per priority is allowed with this discount concurrency control.

#### NOTE

If there were threshold discounts set at a higher priority, for example, it's set to 11 and all the other discount types were at priority 10 and 5, then the threshold discounts would have evaluated at priority 11 and the best threshold discount would have been applied at priority 11 (assuming there is no **Exclusive** discount (**Simple, Quantity, or Mix and Match**) applied at a lower priority).

7. The pricing engine repeats the steps 5 and 6 for threshold discounts at pricing priority 5.

Let's use the same example as before.

### Product information

PRODUCT #	PRODUCT PRICE
Prod1	\$10
Prod2	\$20
Prod3	\$10

### Discount setup

DISCOUNT #	DISCOUNT CONCURRENCY	PRIORITY	DISCOUNT AMOUNT	DISCOUNT TYPE	APPLICABLE ON PRODUCTS
BP1	Best price	10	15%	Simple, Quantity, or Mix and Match	Prod1, Prod2
BP2	Best price	5	20%	Simple, Quantity, or Mix and Match	All products
C1	Compound	10	\$1	Simple, Quantity, or Mix and Match	Prod1, Prod2
C2	Compound	10	10%	Simple, Quantity, or Mix and Match	Prod1, Prod2
C3	Compound	5	25%	Simple, Quantity, or Mix and Match	All products
C4	Compound	5	10%	Threshold only	All products

**Step 1:** For each product, determine the highest priority where a **Simple, Quantity, or Mix and Match** discount exists. In this case, for prod1 it is priority 10, for prod2 it is priority 10, and for prod3 it is priority 5.

**Step 2:** For each product, find **Simple, Quantity, or Mix and Match** discounts, with discount concurrency as **Exclusive**, at the highest priority applicable to individual products. In this case, there are none for prod1 and prod2 at priority 10 and there are none for prod3 at priority 5.

**Step 3:** For each product, evaluate **Simple, Quantity, or Mix and Match** discounts, with discount concurrency as **Best price** and **Compound**, at the highest priority applicable to individual products. See the table below.

#### NOTE

Two asterisks (\*\*) indicate the discount that gets applied to a product.

TRANSACTION QUANTITY	PRODUCT	PRICE	PRIORITY 10 (C1)	PRIORITY 10 (C2)	PRIORITY 10 (BP1)	TOTAL	EXPLANATION
1	Prod1	\$10	\$1	\$1	\$1.50**	\$10 – 1.50 = \$8.50	Because the compound discounts are treated as the "Best price" for discounts for this discount concurrency control model, the compound discounts will not combine. Rather they all compete for the best discount. Because BP1 gives the highest discount, BP1 gets applied at priority 10.
1	Prod2	\$20	\$1	\$2	\$3**	\$20 – 3 = \$17.00	Same as above. Because BP1 gives the highest discount, BP1 gets applied at priority 10.
1	Prod3	\$10				\$10	No discounts applicable at priority 10.

**Step 4:** For each product, determine the next highest priority where a **Simple, Quantity, or Mix and Match** discount exists. In this case, it is priority 5 for all three products.

**Step 5:** At priority 5, find **Simple, Quantity, or Mix and Match** discounts with discount concurrency mode as **Exclusive**. In this case, none.

**NOTE**

If an exclusive discount existed at priority 5, then it would have been ignored as exclusive discounts cannot co-exist with other discounts which have been applied at a higher priority

**Step 6:** At priority 5, evaluate **Simple, Quantity, or Mix and Match** discounts. The following table illustrates

this.

TRANSACTION QUANTITY	PRODUCT	DISCOUNTED PRICE	PRIORITY 5 (C3)	PRIORITY 5 (BP2)	TOTAL	EXPLANATION
1	Prod1	\$8.50	\$2.13**	\$1.7	$\$8.50 - 2.13 = \$6.37$	Because the discounts across priorities are compounded, the discounts at priority 5 are compounded on the discounts applied at priority 10. C3 gives the highest discount so C3 gets applied at priority 5.
1	Prod2	\$17	\$4.25**	\$3.40	$\$17.00 - 4.25 = \$12.75$	Same as above. Because C3 gives the highest discount, C3 gets applied at priority 5.
1	Prod3	\$10	\$2.5**	\$2.0	$\$10 - 2.5 = \$7.5$	Same as above. Because C3 gives the highest discount, C3 gets applied at priority 5.

**Step 7:** Evaluate **Threshold** discounts.

TRANSACTION QUANTITY	PRODUCT	DISCOUNT APPLIED AT PRIORITY 10	DISCOUNT APPLIED AT PRIORITY 5	DISCOUNTED PRICE	PRIORITY 5 (C4)	AMOUNT DUE	EXPLANATION
----------------------	---------	---------------------------------	--------------------------------	------------------	-----------------	------------	-------------

TRANSACTION QUANTITY	PRODUCT	DISCOUNT APPLIED AT PRIORITY 10	DISCOUNT APPLIED AT PRIORITY 5	DISCOUNTED PRICE	PRIORITY 5 (C4)	AMOUNT DUE	EXPLANATION
1	Prod1	BP1	C3	\$6.37	(NA)	\$6.37	For Threshold discounts, Priority 5 is highest applicable priority for this product. But the threshold discount at priority 5 will only get applied if there is no other discount applied at the priority 5. This is because both best price and compound discounts are treated as "Best price" and only one discount per priority is allowed with this discount concurrency control. So, the threshold discount is ignored.
1	Prod2	BP1	C3	\$12.75	(NA)	\$12.75	Same as above
1	Prod3		C3	\$7.5	(NA)	\$7.5	Same as above

The final amount due for prod1 is 6.37, Prod 2 is 12.75, and Prod 3 is 7.5.

**NOTE**

For the same discount setting, the results vastly differ depending on which discount concurrency control model is selected.

# Determine the optimal combination of overlapping discounts

2/18/2021 • 7 minutes to read • [Edit Online](#)

When discounts overlap, you must determine the combination of overlapping discounts that will produce the lowest transaction total or the highest total discount. When the discount amount varies according to the price of the products that are purchased, such as in the common "Buy 1, get 1 X percent off" (BOGO) retail discount, this process becomes an issue of combinatorial optimization.

This article applies to Microsoft Dynamics AX 2012 R3 with KB 3105973 (released November 2, 2015) or later, and to Dynamics 365 Commerce. To determine the combination overlapping discounts to apply in a timely manner, we have introduced a method for applying overlapping discounts. We call this new method **marginal value ranking**. Marginal value ranking is used when the time that is required in order to evaluate the possible combinations of overlapping discounts exceeds a threshold that is configurable on the **Commerce parameters** page. In the marginal value ranking method, a value is calculated for each overlapping discount by using the discount's value on the shared products. The overlapped discounts are then applied from the highest relative value to the lowest relative value. For details about the new method, see the "Marginal value" section, later in this article. Marginal value ranking isn't used when the discount amounts for a product aren't affected by another product in the transaction. For example, this method isn't used for two simple discounts, or for a simple discount and a single product quantity discount.

## Discount examples

You can create an unlimited number of discounts on a common set of products. However, because there is no limit, performance issues can occur when you try to calculate the discounts that should be used on the various products. The following examples illustrate this issue in more detail. In example 1, we start with two products and two overlapping discounts. Then, in example 2, we show how the issue evolves as more products are added.

### Example 1: Two products and two discounts

In this example, two products are required in order to qualify for each discount, and the discounts can't be combined. The discounts in this example are **Best price** discounts. Both products qualify for both discounts. Here are the two discounts.

Discount	Details
Discount 1 - BOGO50%OFF	Buy 1 product get a 2 <sup>nd</sup> product of equal or lesser value at 50% off.
Discount 2 - B2G20%OFF	Buy 2 products and receive 20% off both.

For any two products, the better of these two discounts depends on the prices of the two products. When the price of both products is equal or almost equal, discount 1 is better. When the price of one product is significantly less than the price of the other product, discount 2 is better. Here is the mathematical rule for evaluating these two discounts against each other.

$$\text{if } \frac{\text{Price}_{P1}}{2} > \frac{\text{Price}_{P2}}{3}$$

**NOTE**

When the price of product 1 is equal to two-thirds of the price of product 2, the two discounts are equal. In this example, the effective discount percentage for discount 1 varies from a few percent (when the prices of the two products are far apart) to a maximum of 25 percent (when the two products have the same price). The effective discount percentage for discount 2 is fixed. It's always 20 percent. Because the effective discount percentage for discount 1 has a range that can be more than or less than discount 2, the best discount depends on the prices of the two products that must be discounted. In this example, the calculation is completed quickly, because only two discounts are applied on only two products. There are only two possible combinations: one application of discount 1 or one application of discount 2. There are no permutations to calculate. The value of each discount is calculated by using both products, and the best discount is used.

**Example 2: Four products and two discounts**

Next, we will use four products and the same two discounts. All four products qualify for both discounts. There are twelve possible combinations. In the end, two discounts will be applied to the transaction in one of three combinations: two applications of discount 1, two applications of discount 2, or one application of discount 1 and one application of discount 2. To illustrate the possible combinations, we will look at two different sets of four products that have different prices:

- All four products have the same price, \$15.00. In this case, the best discount combination is two applications of discount 1. Two products will be full price, and two will be 50 percent off. The discounted total for the transaction is \$45 (15 + 15 + 7.50 + 7.50), which is \$15 (25 percent) off the undiscounted total of \$60. Discount 2 is only \$12 (20 percent).
- Two products are \$20 each, one product is \$15, and one product is \$5. In this case, the best discount combination is one application of discount 2 and one application of discount 1. The following tables illustrates the discounts.

To read the tables, use one product from a row and one product from a column. For example, in the table for discount 1, when you combine the two \$20 products, you get \$10 off. In the table for discount 2, when you combine the \$15 product and the \$5 product, you get \$4 off.

Discount 1: Buy 1 Get 1 at 50% off

	\$ 20	\$ 20	\$ 15	\$ 5
\$ 20		\$ 10.0	\$ 7.5	\$ 2.5
\$ 20			\$ 7.5	\$ 2.5
\$ 15				\$ 2.5
\$ 5				

Discount 2: Buy 2 and get 20% off

	\$ 20	\$ 20	\$ 15	\$ 5
\$ 20		\$ 8.0	\$ 7.0	\$ 5.0
\$ 20			\$ 7.0	\$ 5.0
\$ 15				\$ 4.0
\$ 5				

First, we find the largest discount that is available from any two products by using either discount. The two tables show the discount amount for all combinations of the two products. The shaded portions of the tables represent either cases where a product is paired with itself, which we can't do, or a reverse pairing of two products that produces the same discount amount and can be ignored. By looking at the tables, you can see that discount 1 for the two \$20 items is the largest discount that is available for either discount on all four products. (This discount is highlighted in green in the first table.) That leaves only the \$15 product and the \$5 product. By looking at the two tables again, you can see that, for these two products, discount 1 gives a \$2.50 discount, whereas discount 2 gives a \$4 discount. Therefore, we select discount 2. The total discount is \$14. To make this discussion easier to visualize, here are two additional tables that show the effective discount percentage for all possible two-product combinations for both discount 1 and discount 2. Only half the list of combinations is included, because, for these two discounts, the order in which the two products are put into the discount doesn't matter. The highest effective discount (25 percent) is highlighted in green, and the lowest effective discount (10 percent) is highlighted in red.

Discount 1 – BOGO50%OFF

	\$20	\$20	\$15	\$5
\$20	n/a	25.0%	21.4%	10.0%
\$20	25.0%	n/a	21.4%	10.0%
\$15	21.4%	21.4%	n/a	12.5%
\$5	10.0%	10.0%	12.5%	n/a

Discount 2 – B2G20%OFF

	\$20	\$20	\$15	\$5
\$20	n/a	20%	20%	20%
\$20	20%	n/a	20%	20%
\$15	20%	20%	n/a	20%
\$5	20%	20%	20%	n/a

**NOTE**

When prices vary, and two or more discount compete, the only way to guarantee the best combination of discounts is to evaluate both discounts and compare them.

## Total possible combinations

This section continues the example from the previous section. We will add more products and another discount, and see how many combinations must be calculated and compared. The following table shows the number of possible discount combinations as the product quantity increases. The table shows what happens both when there are two overlapping discounts, as in the previous example, and when there are three overlapping discounts. The number of possible discount combinations that must be evaluated soon exceeds what even a fast computer can calculate and compare quickly enough to be acceptable for retail transactions.

Products in the transaction	Two 2-product discounts	Three 2-product discounts
	Possible pair combinations	Possible pair combinations
2	2	3
4	12	27
5	60	135
6	90	315
7	540	1890

When even larger quantities or more overlapping discounts are applied, the total number of possible discount combinations quickly goes into the millions, and the time that is required in order to evaluate and select the best possible combination quickly becomes noticeable. Some optimizations have been done in the price engine to reduce the total number of combinations that must be evaluated. However, because the number overlapping discounts and the quantities in a transaction aren't limited, a large number of combinations will always have to be evaluated whenever there are overlapping discounts. This issue is the issue that the marginal value ranking method addresses.

## Marginal value method

To resolve the issue of an exponentially increasing number of combinations that must be evaluated, an optimization exists that calculates the value per shared product of each discount on the set of products that two or more discounts can be applied to. We refer to this value as the **marginal value** of the discount for the shared products. The marginal value is the average per product increase in the total discount amount when the shared products are included in each discount. The marginal value is calculated by taking the total discount amount (DTotal), subtracting the discount amount without the shared products (DMinus\ Shared), and dividing that difference by the number of shared products (ProductsShared).

$$\frac{(D_{Total}) - (D_{Minus Shared})}{(Items_{Shared})} = \text{Marginal value}_D$$

After the marginal value of each discount on a shared set of products is calculated, the discounts are applied to the shared products in order, exhaustively, from highest marginal value to lowest marginal value. For this method, all remaining discount possibilities aren't compared every time after a single instance of a discount is applied. Instead, the overlapping discounts are compared one time and then applied in order. No additional comparisons are done. You can configure the threshold to switch to the marginal value method on the **Discount** tab of the **Commerce parameters** page. The acceptable time to calculate the total discount varies across retail industries. However, this time generally falls in the range of tens of milliseconds to one second.

# Define channel-specific discounts

2/18/2021 • 2 minutes to read • [Edit Online](#)

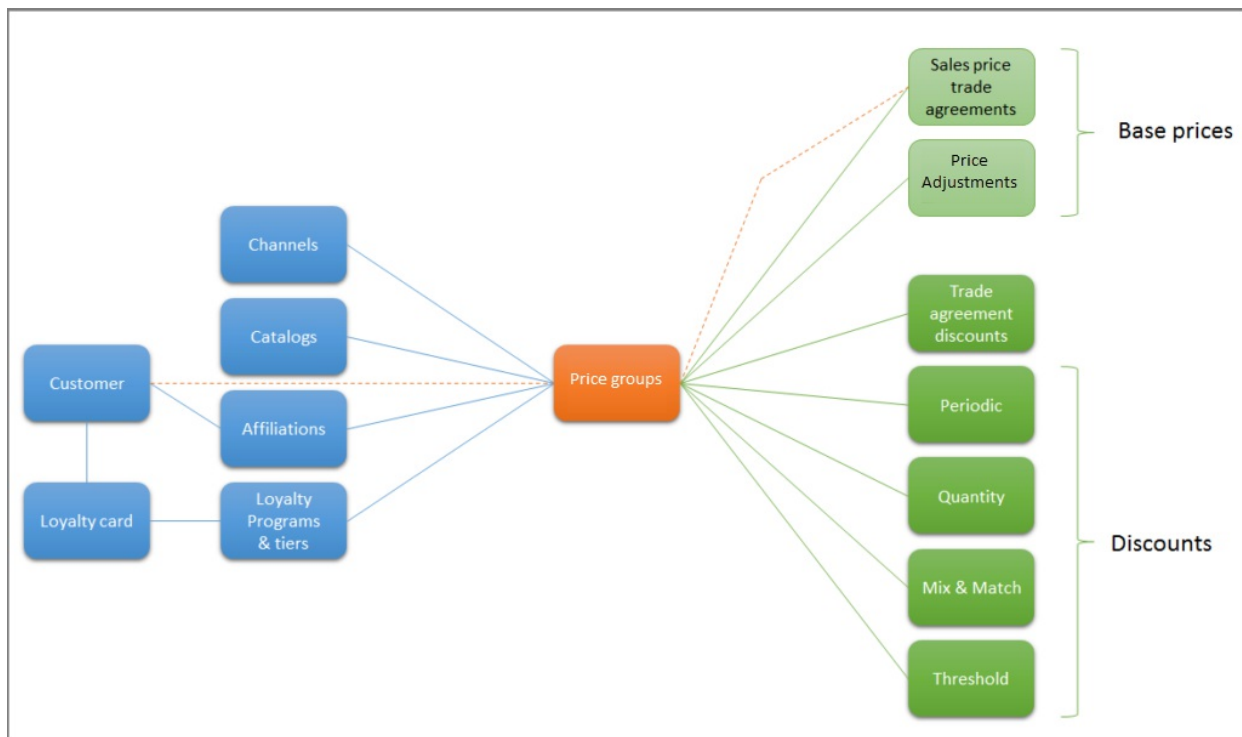

This topic reviews the concepts you need to know to create a discount for a specific channel.

## Channel-specific discounts

Retailers often offer different discounts in different channels. This may be done to address local market conditions or to deal with competing retailers.

Commerce uses price groups to define channel-specific discounts. Price groups can be assigned to one or more of the following entities: channels, catalogs, affiliations, and loyalty programs. This article discusses channels, but the same concepts apply to catalog discounts, affiliations discounts, and loyalty discounts.

## Price groups

The diagram above illustrates the relationship between entities that may be on a transaction (channel, catalog, affiliation, customer, loyalty card) and the various discount types that can be configured. All transactions occur in a channel, so the channel is guaranteed to be present on a transaction. The remaining entities are optional. On each master data page there is a link to a related price groups page where you can view and add price groups as needed. A price group is used to relate four different types of entities to discounts, price adjustments, and trade agreements. We recommend that you plan a strategy for how you will name your price groups to keep them organized. One option would be to use a letter or number prefix or suffix to distinguish between the different types. For example, 1-xxxx for channel price groups and 2-xxxx for catalog price groups. There are four inquiry pages that focus on each of the commerce entities that can have discounts associated to them.

- **Channel channel price groups** – This page shows a list of channels and discounts linked together for each price group.
- **Catalog price groups** – This page shows a list of catalogs and discounts linked together for each price group.

- **Loyalty price groups** – This page shows a list of loyalty programs and discounts linked together for each price group.
- **Affiliation price groups** – This page shows a list of affiliations and discounts linked together for each price group.

## Example channel discount set up

The following example illustrates the tasks involved in setting up a channel discount.

1. For this example, you have a channel called **Houston**, and you're going to create a new discount called **Back-to-School**.
2. Because the pricing and discount strategy includes the possibility of channel discounts, you always create a channel-specific price group when you create a channel.
3. You have the price group **Houston-PG** and it is assigned to the **Houston** channel.
4. After you create the new **Back-to-School** discount, you need to click **Price groups** on the top of the **Discount** page. The **Discount price groups** page will open. Next, click **New** and select the **Houston-PG** price group.
5. Now you can enable the discount and push it to the channel.

# Options for preventing discounts for retail products

2/18/2021 • 2 minutes to read • [Edit Online](#)

There are various reasons why retailers may want to prevent some products from being discounted, either from a promotion or during the sale at the POS.

The following options, which can be found on the **Commerce** tab of released products, will allow the product to be configured to prevent all or manual discounts. The settings can also be specified at the category level from the category hierarchy.

- **Prevent all discounts** – Select this option to prevent all types of discounts from being applied to this product. This includes promotions such as mix and match, quantity and threshold discounts, as well as manual line and transaction discounts that are applied during a sale by a POS user.
- **Prevent manual discounts** – Select this option to only prevent the manual line or transaction discounts that are applied during a sale by a POS user. Products with this option selected are still eligible for promotions, such as mix and match and quantity and threshold discounts.

## NOTE

These settings do not restrict the price override operation, because that sets the base price and is not treated as a discount.

# Tender-based discounts

2/18/2021 • 5 minutes to read • [Edit Online](#)

It's a common practice among retailers to release private, branded credit cards. The retailers benefit because they get preferred rates from the banks. Additionally, because these credit cards can encourage customers to visit the store more often, they help improve the retailer's bottom line. Therefore, retailers have an incentive to increase customer use of their branded credit cards. To achieve this goal, they often provide additional discounts to customers who use these credit cards.

Alternatively, retailers who don't provide branded credit cards might want to encourage customers to pay by using other tender types, such as cash, gift cards, or loyalty points. In this way, they can help reduce the expense of credit card processing fees. Therefore, retailers might provide discounts to customers who use these alternative tender types.

In Microsoft Dynamics 365 Commerce, retailers can configure a discount percentage that is applied to qualified lines if the customer pays by using the preferred tender type. The customer can decide whether to do a partial payment or a full payment, and Commerce determines the appropriate discount amount. Note that the discount is always given on the pre-tax amount of the qualified items.

Tender-based discounts don't compete with item-based discounts, such as periodic or manual discounts. They are always compounded over the item discounts. Therefore, even if an exclusive periodic discount is applied to an item, the tender-based discount is still applied on top of the exclusive periodic discount. Likewise, if a threshold discount is applied to the transaction, and the tender-based discount reduces the total below the threshold, the threshold discount is still applied to the transaction.

Even though tender-based discounts reduce the subtotal of the transaction, automatic charges that are applied to the transaction aren't affected. For example, if the delivery charges are calculated as \$5 because the subtotal was more than \$100, and the tender-based discount reduces the amount so that it's less than \$100, the delivery charges are still \$5 for the order.

## NOTE

Tender-based discounts are proportionally distributed to the qualified sales lines and reduce the pre-tax amount of the individual lines. If multiple tender-based discounts are configured for a tender type (for example, cash), only the best tender-based discount is applied.

Tender-based discounts can be applied only to sales lines where the prices aren't locked. If new sales lines are added to an order, the tender-based discount is applied to the new sales lines only during payment. While a customer order for pickup or shipment is being placed, the tender-based discount is applied only to the deposit amount. After the order is placed, during fulfillment, the prices of the sales lines are locked. Therefore, no tender-based discount is applied to any balance that is paid during pickup or authorized during shipment. The tender-based discount can be applied to the whole amount of a customer order only if the retailer collects the whole amount as a deposit while the order is being placed.

## IMPORTANT

In Commerce, tender-based discounts are currently limited to two payment types: credit cards and cash.

## POS user experience

If the tender-based discount is set up for cash, and the cashier at the point of sale (POS) selects a button that is mapped to the Pay cash operation, the tender-based discount is automatically applied to the transaction. The reduced amount is then shown as the balance. However, if the cashier selects the **Back** button on the payment screen, the discount is removed, and the original amount is shown on the transaction screen. The tender-based discount is removed if the payment line is voided.

For cards payments, retailers can set the tender-based discount on one or more types of credit cards. However, the system can't verify the type of credit card that is used unless the card is authorized. If the discount is applied after authorization, the payment authorization will be for a larger amount, but the payment capture will be for a smaller amount.

To help prevent this situation, if a customer pays with a credit card, the cashier sees a dialog box that lists credit cards that will bring the customer additional savings. The cashier can then ask whether the customer wants to use one of the preferred cards to get an additional discount. If the cashier uses a preferred card, the tender-based discount is applied to the transaction, and the reduced amount is shown on the payment screen. The authorization will be for the reduced amount. If the customer inserts a card that differs from the card that the cashier selected, an error message is shown, and the authorization is voided.

## Call center user experience

When the user selects **Complete** during a call center order, the **Totals** screen is shown. At first, the totals on this screen don't include tender-based discounts, because the payment method hasn't yet been selected. On the **Add payment** screen, if the user selects the payment method that the tender-based discount is configured for, the payment amount is automatically adjusted so that it reflects the discounted amount. Like the customer at the POS, the call center customer can decide whether to pay the full payment or a partial payment. Based on the amount that is paid, the tender-based discount is applied to the sales order.

### NOTE

Card validation isn't done for call center orders. For example, if the call center user selects Visa as the credit card, but the customer uses Mastercard, the system still applies the discount.

## Exclude items from discounts

Retailers often choose to exclude some products, such as new items or in-demand items, from discounts. However, they might still want to apply tender-based discounts. For example, a retailer configures Commerce so that it doesn't allow item-based discounts or manual discounts. However, if the customer pays by using the preferred tender, Commerce still applies the tender-based discount. To set up Commerce in this manner, retailers must go to **Product information management > Products > Released products**, select the item, and then, on the **Commerce FastTab**, set the **Prevent all discounts** and **Prevent tender based discounts** options to **No**, and the **Prevent discounts** and **Prevent manual discounts** options to **Yes**.

### NOTE

When the **Prevent all discounts** configuration is set to **Yes**, no discounts will be applied to the product. Not even tender-based discounts will be applied.

### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Shipping discount overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

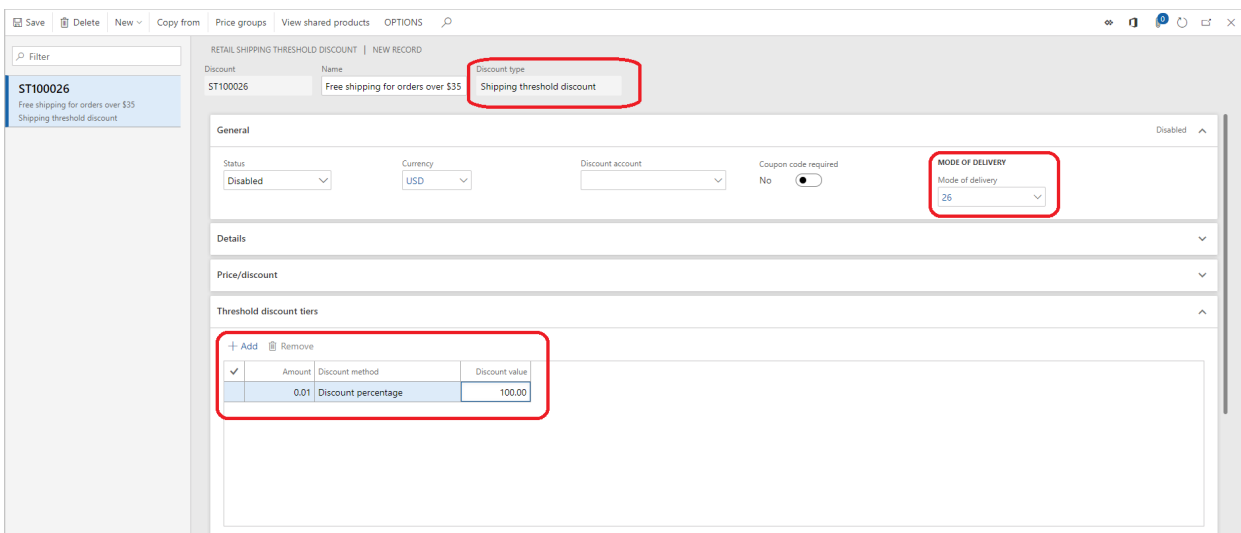

This topic provides an overview of the shipping promotion capability available within Dynamics 365 Commerce. Free or discounted shipping is one of the highly influencing factors driving the customers' online purchase decisions. Many retailers also leverage the free shipping benefit to motivate the customers to increase their basket size, thus increasing the revenue per transaction. With the 10.0 release of Retail, retailers can use "Retail shipping threshold discount" to define the thresholds, which once met, will qualify the customers for discounted or free shipping. For example, spend \$50 or more to get free 'Overnight shipping' or sign up for the loyalty program and get free 'Two-day shipping'.

This feature leverages the advanced auto charges capability that was available in the call center and e-Commerce modules but has now been made available in POS. For more information, see [Omni-channel advanced auto charges](#). These advanced auto charges need to be enabled for shipping promotion to work. These can be enabled by turning on the "Use advanced auto-charges" configuration on the **Commerce parameters > Customer orders** tab. Retailers can use the advanced auto charges feature to set various types of charges such as handling, installation, and disposal, however, the shipping discount is only applied to the shipping charges. Thus, the retailer needs to specify which of the charges are shipping charges. To specify a shipping charge, go to **Retail and Commerce > Retail and Commerce IT > Channel setup > Charges > Charge codes**. Select the **Shipping charge** check box for the desired charges. This is the only prerequisite for using the shipping threshold discount.

The screenshot shows the 'Charge codes' configuration page. The 'Shipping charge' checkbox is highlighted with a red box. The 'Refundable' checkbox is also visible. The 'Posting' and 'Foreign trade' sections are expanded, showing 'Intrastat invoice value' and 'Intrastat statistical value' options, both set to 'No'.

The next step is to configure the shipping discount itself. To do this, go to **Retail and Commerce > Pricing and discounts > shipping discounts > Shipping threshold discount**. You can define the thresholds, set the discount percent that should be applied when the thresholds are met, and choose a mode of delivery for which this discount applies, such as Standard overnight or Two-day shipping.

The screenshot shows the 'Retail shipping threshold discount' configuration page. The 'Discount type' is set to 'Shipping threshold discount'. The 'MODE OF DELIVERY' is set to '26'. The 'Threshold discount tiers' section is expanded, showing a table with one tier:

Amount	Discount method	Discount value
0.01	Discount percentage	100.00

Like product discounts, this discount honors all the existing standard discount capabilities, such as allowing the retailer to restrict these discounts with coupons so that only the customers with coupons can get these

discounts. Also, these discounts leverage the Price groups capability to determine the eligibility of the discount. For example, the retailer can choose to run these promotions only in the online channels and/or across channels for certain customer groups such as loyalty customers. Lastly, to view the charges applied on the sales lines and the applied promotion, you need to add **Manage charges** on the POS screen. Go to the **Screen layout** page to make those changes. Now run the jobs 1020, 1040, 1090, and 1110 to send the charges, shipping promotion, and screen layout information to the channels.

When the cashier creates a customer order on POS or the customer places an order on an e-Commerce website, the charges are calculated automatically. However, if the mode of delivery on the order meets the mode of delivery and the transaction amount meets the threshold set on the shipping threshold discount, then the shipping discount gets applied. Currently, the shipping discounts apply only on POS and e-Commerce orders. These discounts will also be available for call center orders in a future release of the app.

**NOTE**

Unlike product discounts such as quantity, simple, mix and match, and threshold discounts, the shipping discount does not create discount lines. Instead, the shipping discount edits the shipping charge directly and appends the name of the discount to the charge description.

# Set up coupons for retail sales

2/18/2021 • 5 minutes to read • [Edit Online](#)

## Overview of coupons

Coupons are codes and bar codes that are used to add discounts to transactions. Each coupon can have multiple codes, and each code can have its own effective dates.

Each coupon is related to one discount. The price groups that are associated with the discount define the customers that can use a coupon or the channels where a coupon is valid.

Essentially, coupons are additional validation on top of discounts. The coupon provides the coupon codes and bar codes that are required, together with date ranges for those codes. The coupon also provides optional usage limits and customer required properties. The discount provides the set of products that the coupon is valid for. The price groups for the discount provide the set of customers, channels, or catalogs that the coupon is valid for.

To create a coupon, you create the discount and the coupon separately. You then link them by selecting the discount on the coupon page in Commerce.

### NOTE

After a coupon is linked to a discount, several fields on the discount page in Commerce become read-only, because they are managed by the coupon's settings. These fields include the fields for the status and standard date ranges.

### Limited-use coupons

Coupons can be configured as limited-use coupons. The usage limit can be defined per customer or channel, or as a global limit. This limit is enforced when the code or bar code is entered or scanned in POS or during sales order entry.

The limit is enforced per coupon code on a coupon. For example, a single-use coupon that has two coupon codes can be used two times: one time for each coupon code. Each code on a coupon can be independently set to active.

The coupons can be used across any selling channel however, for call center orders, the limited use coupons can be used for only those call centers orders where the **Order completion** setting on the call center is enabled. If this is not enabled, then only non-limited use type coupons can be used in call center orders.

### NOTE

After a coupon code has reached its usage limit, the system does *not* automatically change the status of the coupon code to "Used". However that coupon code has reached its usage limit and cannot be used. If the status of a coupon code is manually set to anything other than **Active**, then this coupon code cannot be used in any channel.

## Managing coupons

You must create the discount and the coupon separately. You then link them by selecting the discount on the coupon page. After you link a coupon to a discount, several fields for the discount become read-only, because they are managed by the coupon's settings. These fields include the fields for the status and standard date ranges.

Essentially, coupons are now additional validation on top of discounts. The coupon provides the coupon codes

and bar codes, together with date ranges, the usage limits, and the customer required property. The discount provides the set of products that the coupon is valid for. The discount's price groups provide the set of customers, channels, or catalogs that the coupon is valid for.

## System setup for coupons

Before you can set up a coupon, you must set up the coupon bar code and two coupon number sequences.

1. On the **Mask characters** page, create a new mask character for the coupon code. You can select any unused character.
2. On the **Bar code mask setup** page, create a new bar code mask. Set the **Type** field to **Coupon**.
3. On the **Bar code setup** page, create a new bar code that uses the bar code mask that you just created.
4. On the **Number sequences** page, create two new number sequences. One sequence is for the coupon code ID, and the other sequence is for the coupon number. The coupon code ID is the unique identifier for each coupon code for a coupon. The coupon number is the unique identifier for a coupon. Each coupon can have multiple codes and bar codes that trigger the coupon.

### NOTE

For both number sequences, you must set the **Scope** field to **Company**. In most cases, you should automatically generate both sequence numbers.

5. On the **Commerce parameters** page, on the **Bar codes** tab, select the bar code that you created earlier.
6. On the **Commerce shared parameters** page, on the **Number sequences** tab, select the number sequences that you created for the coupon number and coupon code ID.
7. You can now open the **Coupons** page and create new coupons.

## The effect of partial updates on coupons

Coupon functionality comprises multiple distinct features. Commerce Headquarters (HQ) and the channel can be partially updated across components. Therefore, it's important that you understand how partial updates affect coupon functionality as a whole.

- **HQ is partially updated, but Commerce Scale Unit and POS aren't updated.** In an HQ update, the coupon and discount pages are updated, and the commerce price engine is also updated. If only one of those two components is updated, some pages in Commerce won't match the price calculation data. Therefore, unexpected discount calculations or errors might occur during discount calculations.
- **HQ is updated, but Commerce Scale Unit and POS aren't updated (N-1).** Because not all stores can be updated at the same time, we recommend that you update HQ before you update stores. In the N-1 scenario, new functionality that is related to coupons won't be available in stores that haven't been updated yet. For example, the coupon functionality introduces "exclude" lines. If you use exclude lines on a discount, they won't be applied in a store that is running an earlier version.
- **HQ isn't updated, but Commerce Scale Unit and POS are updated (N+1).** Because the updated price engine in Commerce Scale Unit can handle legacy discount codes during price calculations, the update should have no functional impact in this scenario.

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Show discounts in POS

2/18/2021 • 4 minutes to read • [Edit Online](#)

Promotions play an important role in motivating customers who are making purchasing decisions. For example, holidays can produce the highest number of sales for retailers, because the whole retail market is flooded with enticing promotions and discounts. If store associates know about and understand the promotions that are available, they can easily take advantage of those promotions to cross-sell and upsell items. This topic explains how Microsoft Dynamics 365 Commerce helps sales associates learn about promotions and how they can be used for cross-sell and upsell motions.

## Learn about store discounts

Commerce includes an operation that is named "View all discounts." This operation shows all the discounts that are currently running in a store. The "View all discounts" operation can be mapped to a button in the point of sale (POS), and that button can be added to the **Welcome** page or the **Transaction** page. The following illustration shows an example of the **All discounts** page that is opened.

NAME	DISCOUNT TYPE	COUPON REQUIRED	START DATE	END DATE
30% off select items	Discount	No	12/31/1899	08/06/2020
Take 20 off anything	Discount	Yes	12/31/1899	12/30/2154
Watches	Discount	No	12/31/1899	12/30/2154
Buy 2 or more and get 25% off	Multiple buy	No	12/31/1899	12/30/2154
Loyalty 20% off over \$300	Threshold discount	No	12/31/1899	12/30/2154
Loyalty 50% off sunglasses with a Sw...	Mix and match	No	12/31/1899	12/30/2154
10% Student discount on jeans	Discount	No	01/01/2020	12/30/2154

**Details**

**ADDITIONAL RESTRICTIONS**

**DESCRIPTION**  
30% off on "Suede Leather Slip-on Loafer" on Salmon color only

To show discounts, the system looks for all the discounts that match one or more of the following conditions:

- The price group of the discount matches the price group of the store.
- The price group of the discount is mapped to an affiliation or loyalty program.
- The price group of the discount is mapped to a catalog that is associated with the store.

The **All discounts** page shows only some coupon-based discounts, because retailers typically create thousands of coupons and corresponding discounts for unique customers, and this page isn't intended to show customer-specific discounts. Coupon-based discounts are shown only if the **Apply without a coupon code** option is turned on in each coupon header. In that case, cashiers can apply the coupon without having to enter or scan any coupon code or bar code.

When the **Apply without a coupon code** option is turned on, various scenarios become available. For example, cashiers can give additional discounts to customers for customer appeasement purposes or because of product defects. Printed coupon codes or bar codes don't have to be distributed to cashiers. Instead, cashiers can

select the **Apply coupon** button. The coupon is then automatically applied to the transaction. If multiple coupons exist for a coupon header, the system automatically selects the first active coupon on the transaction.

On the **All discounts** page, sales associates can also search discounts by keywords. The keyword search looks in the fields that hold the discount name and discount description. Sales associates can also filter discounts based on whether a discount requires a coupon code.

## Cross-sell and upsell by using discounts

Multiline discounts, such as quantity discounts, mix-and-match discounts, and threshold discounts, are a great way to motivate customers to buy more products to get larger discounts. Therefore, they also help increase the size of a customer's cart and retailer revenue. These discounts can be publicized on e-commerce websites, on social media, and on banners in the store.

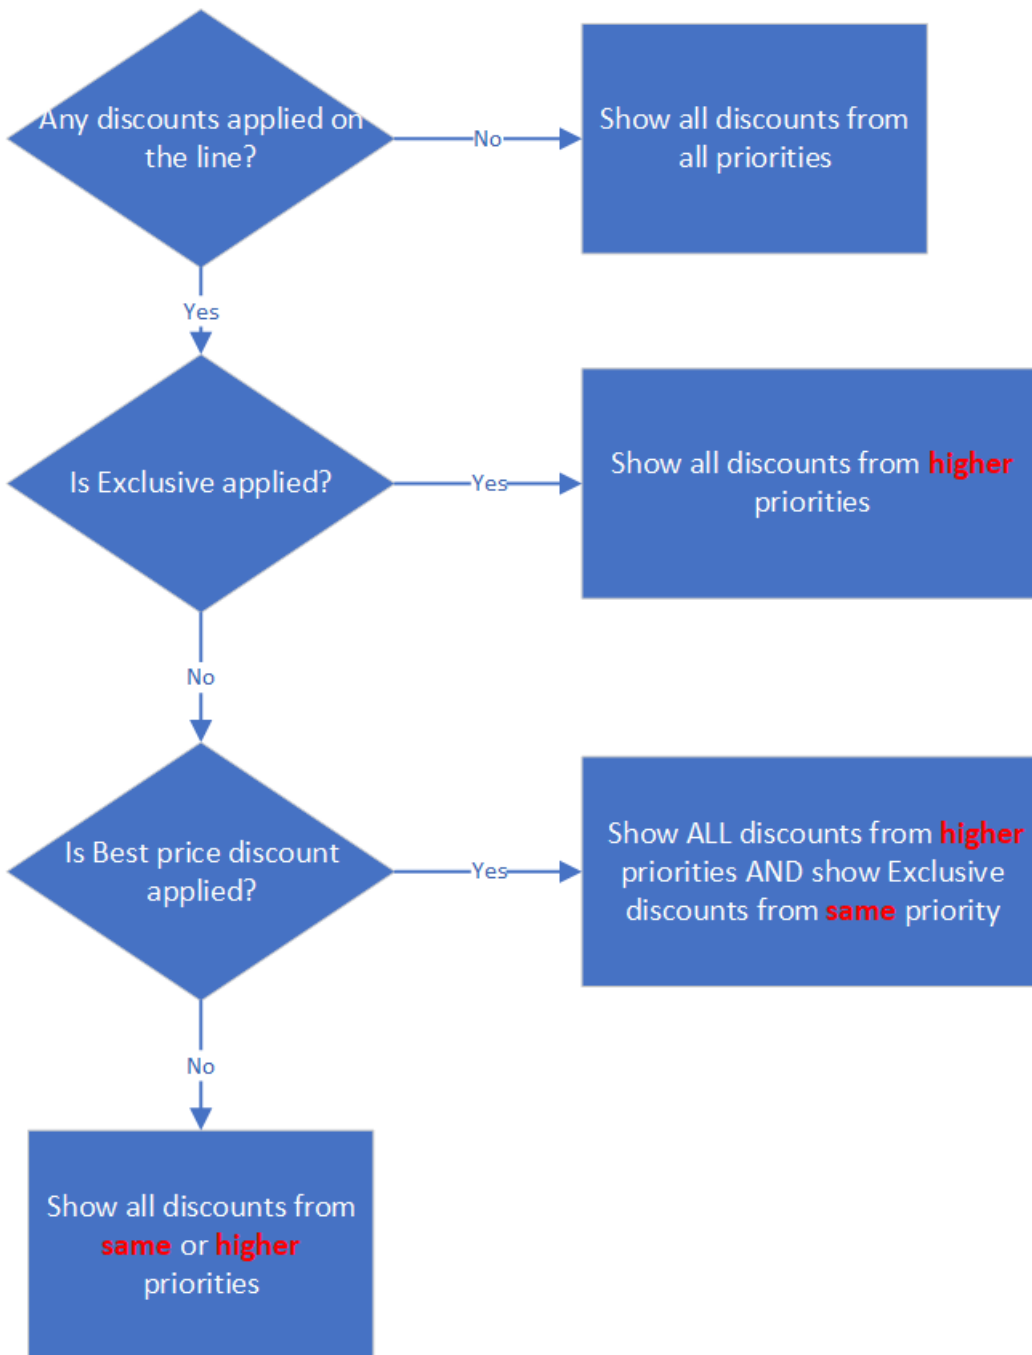

However, even when all these publicity methods are used, customers might miss the opportunity to take advantage of promotions. To make it easy for sales associates to learn what promotions are applicable to a selected line, or even to the whole cart, retailers can add the button for the "**View available discounts**" operation to the button grid on the **Transaction** page. As a result, sales associate can select a transaction line and then select the button to show all the discounts that are available for the selected line. The sales associate can also select another tab to show discounts that apply to the whole transaction. It is important to note that **View available discounts** does not show the discounts that are already applied on the sales line because the discount information is already shown on the sales line. The purpose of this scenario is to only show the discounts that are not yet applied. The exception to this is the discounts that are applied based on a coupon marked as "Apply without a coupon code". This makes it easy for the sales associate to easily remove the coupon they have applied.

The **All discounts** page shows only discounts that don't compete with any of the applied discounts. This behavior helps ensure that, if a sales associate informs a customer about a discount, and the customer takes the required action (for example, the customer buys one more item to get 10 percent off), the discount is applied to the transaction. The coupon-based discounts are shown only when the **Apply without a coupon code** option is turned on.

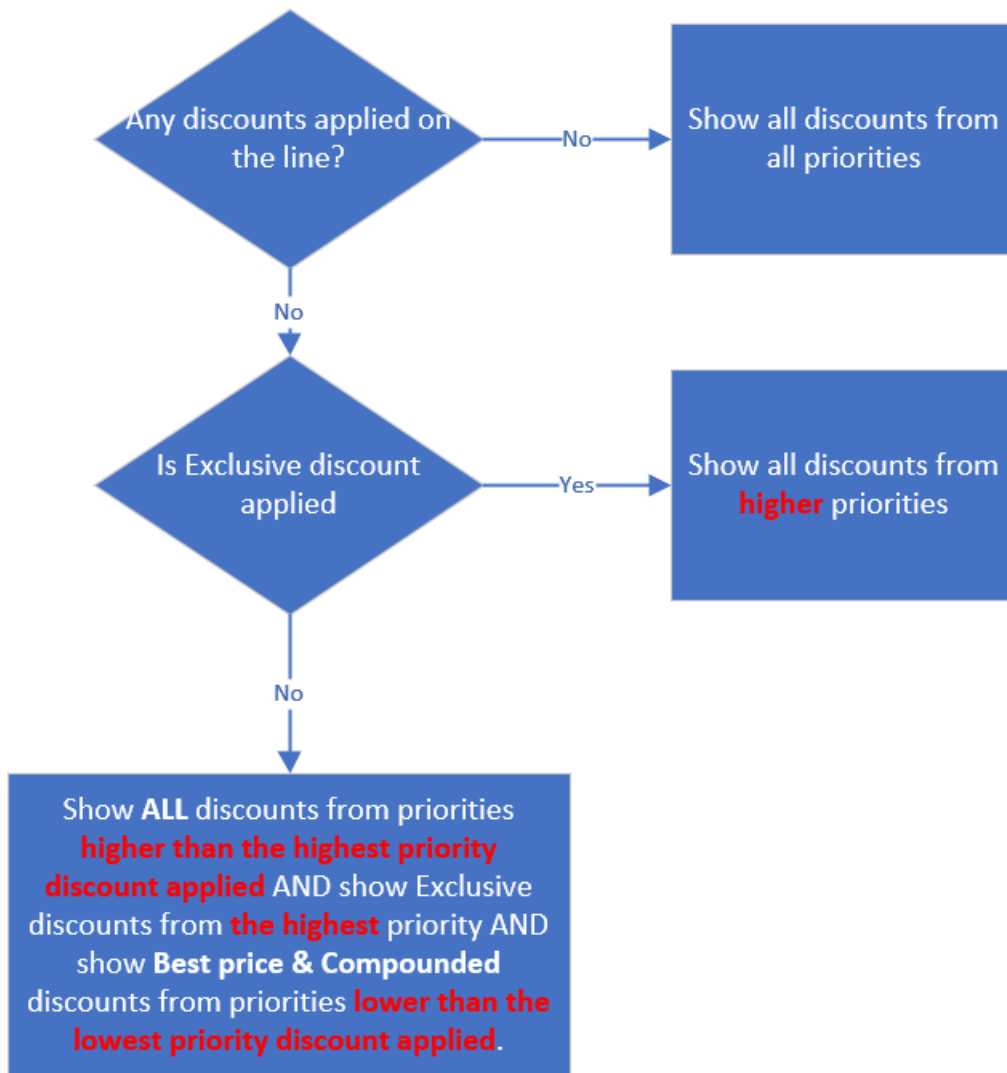

In a simple scenario where all discounts have the same priority, the discount concurrency mode is **Compounded**, and the discount concurrency control is set to **Best price and compound within priority, never compound across priorities**, the **All discounts** page shows all available discounts for a product, because all the discounts are compounded and don't compete with each other.

The following illustrations show the logic that determines which discounts are shown in advanced scenarios, such as a scenario where the discount concurrency mode is **Best price** or **Exclusive**, and two or more priorities are used. In these scenarios, the discounts that are shown are further affected based on whether the discount concurrency control is set to **Best price and compound within priority, never compound across priorities** or **Best price only within priority, always compound across priority**.

The following illustration shows the logic that is used when the discount concurrency control is set to **Best price and compound within priority, never compound across priorities**.

The following illustration shows the logic that is used when the discount concurrency control is set to **Best price only within priority**, always compound across priority.

# Retail price reports

2/18/2021 • 2 minutes to read • [Edit Online](#)

In order to provide competitive prices to their customers, retailers often change prices of products. Store managers want the ability to easily access recent or upcoming price changes so that they can plan for the required resources to update the price labels displayed on the store shelves. With release 10.0 of Retail, a store manager can open the **Price** report by navigating to **All stores > Store > Price report** and viewing the updated prices for the products associated to the store.

To enable the price report, the **Enable price report for store** parameter must be turned on. This parameter is located on the **Commerce parameters > Discounts > Miscellaneous** tab. Opening the **Price report** page displays a dialog box with various configurations. The available configurations are listed below.

CONFIGURATION	DESCRIPTION
From date / To date	The date range for which the price report should be generated. The duration is currently limited to 7 days.
Channel	The store for which the price report should be generated.
Display products with available inventory	Setting this to <b>Yes</b> will show the prices for only those products which currently have physical inventory available in the store.
Display prices for variants	Setting this to <b>Yes</b> will display the prices of the variants along with the product masters. This should only be turned <b>On</b> if you have variant-specific prices, because the number of rows grows very large. In future releases, we will enable the dimensions-based prices so that the store manager can choose the dimensions for which the prices should be displayed.
Display products with price changes	Setting this to <b>Yes</b> will display the prices for only those dates on which the price has been changed. The price for <i>one day before</i> the selected <b>From date</b> will always be displayed, so that the store manager can easily identify the products which have not changed prices for the entire selected duration, and can also view the current price.

After the report is generated, the Excel file can be downloaded for any additional filtering needs. The price report can also be used to check the historical prices of products for past dates.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Base price and trade agreements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through creating channel-specific sales price trade agreements. This procedure uses the USRT demo data company.

1. In the **Navigation pane**, go to **Modules > Retail and Commerce > Pricing and discounts management > Price groups > All price groups**. Price groups are how trade agreements are assigned to specific channels. Using price groups to assign trade agreements to a channel enables channel-specific pricing.
2. Click **New**.
3. In the **Price groups** field, type a value.
4. In the **Name** field, type a value.
5. Click **Save**.
6. Close the page.
7. In the **Navigation pane**, go to **Modules > Retail and Commerce > Channels > Stores > All stores**.
8. In the list, select 'New York'
9. On the Action Pane, click **Store**.
10. Click **Price groups**.
11. Click **New**.
12. In the **Price groups** field, click the drop-down button to open the lookup.
13. In the list, find and select the desired record.
14. Click **Save**.
15. Close the page.
16. Close the page.
17. In the **Navigation pane**, go to **Modules > Retail and Commerce > Products and categories > Released products by category**.
18. In the list, click the link in the selected row.
19. Click **Edit**.
20. Expand the **Sell** fastTab.
21. In the **Price** field, enter a number. This price is used if no applicable trade agreements are found.
22. Click **Save**.
23. On the **Action Pane**, click **Sell**.
24. Click **Create trade agreements**.
25. Click **New**.
26. In the **Name** field, click the drop-down button to open the lookup.
27. In the list, select **Commerce**. In the demo data, the **Commerce** journal name has the default relation of **Price (sales)**. That means all new lines created will default to sales price trade agreements.
28. On the **Action pane**, click **Lines**.
29. In the **Party code type** field, select 'Group'.
30. In the **Account selection** field, click the drop-down button to open the lookup.
31. In the list, find and select the desired record. This will complete the link from Channel to Price group to Trade agreement.
32. In the **Item relation** field, type a value.
33. In the **Amount in currency** field, enter a number.

34. In the **Details** fastTab, check or uncheck the **Find next** checkbox. When **Find next** is set to 'Yes', the pricing engine will continue to search for applicable trade agreements with a lower sale price. When **Find next** is set to 'No', the price engine stops searching and uses the trade agreement.
35. Click **Post**.
36. Click **OK**.
37. Close the page.
38. On the **Action Pane**, click **Sell**.
39. Click **Sales price**.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Category pricing rules to create trade agreements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to create sales price trade agreements using a category pricing rule. The demo data company used to create this task is USRT. This task is intended for the Commerce merchandising manager role.

1. Click Pricing and discount management.
2. Click New.
3. Click Category price rule.
4. In the list, mark the selected row.
5. In the Account code field, select an option.
  - A "Group" type account code is used to set up sales price trade agreements that are specific for Channels, Loyalty programs, Catalogs, and Affiliations.
6. In the Account selection field, enter or select a value.
7. In the Category field, enter or select a value.
8. In the Amount/Percent field, enter a number.
9. In the Rounding version field, enter or select a value.
10. Click Generate trade agreements.
11. Click Next.
12. In the From date field, enter a date.
13. In the To date field, enter a date.
14. Select Yes in the Find next field.
15. Click Next.
16. Click Finish.
  - This creates a Trade agreement journal and opens it for your review.
17. In the list, find and select the desired record.
  - The trade agreement journals created from the Category pricing rules aren't posted. You can review and edit the prices generated before posting them.
18. Click Edit.
19. In the Amount in currency field, enter a number.
20. Click Post.
21. Click OK.
22. Close the page.
23. Close the page.
24. Click the Category price rules tab.
  - Channel specific Category pricing rules will show in this list.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Product recommendations overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Dynamics 365 Commerce can be used to show product recommendations on the e-Commerce website and point of sale (POS) device. Product recommendations are items that a customer might be interested in. The recommendations are based on the purchase trends of other customers in online and brick-and-mortar stores.

Product recommendations allow customers to easily and quickly find products that they want while they have an experience that serves them well. Cross-selling and upselling can even be used to assist customers find additional products that they didn't originally intend to buy. When recommendations are used to enhance product discovery, they create more conversion opportunities, help increase sales revenue, and even amplify customer satisfaction and retention.

In e-Commerce, product recommendations are powered by Microsoft Recommendations machine learning technologies on a large scale.

## Recommendation service

The product recommendations service utilizes artificial intelligence and machine learning (AI-ML) technologies in the following way:

- Data in the format that the Recommendation service requires is extracted from the Commerce operational database and sent to Azure Data Lake Storage or Entity store.
- The recommendations service uses the stored data to train recommendation models for the **People also like**, **Frequently bought together**, **New**, **Best selling**, and **Trending** lists.

## Scenarios

Product recommendations are available for the following scenarios:

- **On any store page for browsing or landing page in e-Commerce:** If customers or store associates visit a store page, the recommendation engine can suggest products in the **New**, **Best Selling**, and **Trending** lists.
- **On the Product details page:** If customers or store associates visit a **Product details** page, the recommendation engine suggests additional items that are also likely to be purchased. These items appear in the **People also like** list.
- **On the Transaction page or the checkout page:** The recommendation engine suggests items, based on the whole list of items in the basket. These items appear in the **Frequently bought together** list.
- **Personalized recommendations:** Merchandizers can provide signed-in customers a personalized **picks for you** list, in addition to new functionality that allows for existing list scenarios to be personalized based on that customer. To learn more, see [Enable personalized recommendations..](#)

### Types of product recommendations

The following table describes various types of automated product recommendations available for retailers to implement in their Dynamics 365 Commerce solution via the [product collection module](#). Retailers can also show personalized results for a signed-in user if the site author chooses that option.

PRODUCT COLLECTION MODULE	TYPE	DESCRIPTION
New	Algorithmic	This module shows a list of the newest products that have been recently assorted to channels and catalogs.
Best selling	Algorithmic	This module shows a list of products that are ranked by the highest number of sales.
Trending	Algorithmic	This module shows a list of the highest-performing products for a given period, ranked by highest number of sales.
Frequently bought together	AI-ML	This module recommends a list of products that are commonly purchased together with the contents of the consumers current cart.
People also like	AI-ML	This module recommends products for a given seed product based on consumer purchase patterns.
Picks for you	AI-ML	This module recommends a personalized list of products based on purchase patterns of the signed-in user. For a guest user, this list will be collapsed.

# Enable Azure Data Lake Storage in a Dynamics 365 Commerce environment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to enable and test Azure Data Lake Storage for a Dynamics 365 Commerce environment, which is a prerequisite for enabling product recommendations.

## Overview

In the Dynamics 365 Commerce solution, all product and transaction information is tracked in the environment's Entity store. To make this data accessible to other Dynamics 365 services, such as data analytics, business intelligence, and personalized recommendations, it is necessary to connect the environment to a customer-owned Azure Data Lake Storage Gen 2 solution.

As Azure Data Lake Storage is configured in an environment, all necessary data is mirrored from the Entity store while still being protected and under customer's control.

If product recommendations or personalized recommendations are also enabled in the environment, then the product recommendations stack will be granted access to the dedicated folder in Azure Data Lake Storage to retrieve the customer's data and compute recommendations based on it.

## Prerequisites

Customers need to have Azure Data Lake Storage configured in an Azure subscription that they own. This topic does not cover the purchase of an Azure subscription or the setup of an Azure Data Lake Storage-enabled storage account.

For more information about Azure Data Lake Storage, see [Azure Data Lake Storage Gen2 official documentation](#).

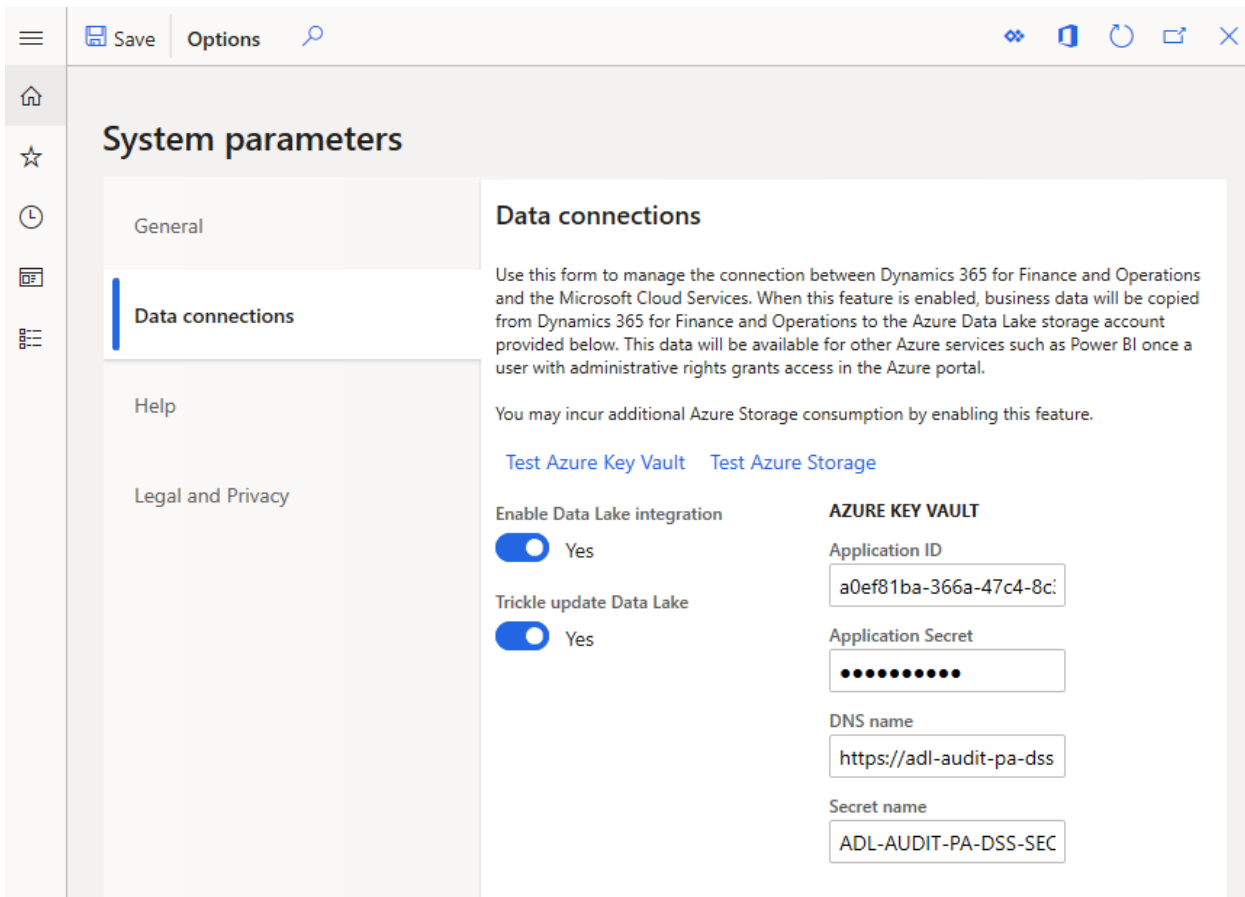

## Configuration steps

This section covers the configuration steps necessary for enabling Azure Data Lake Storage in an environment as it relates to product recommendations. For a more in-depth overview of the steps required to enable Azure Data Lake Storage, see [Make entity store available as a Data Lake](#).

### Enable Azure Data Lake Storage in the environment

1. Log in to the environment's back office portal.
2. Search for **System Parameters** and navigate to the **Data connections** tab.
3. Set **Enable Data Lake integration** to **Yes**.
4. Set **Trickle update Data Lake** to **Yes**.
5. Next, enter the following required information:
  - a. **Application ID // Application Secret // DNS Name** - Needed to connect to KeyVault where the Azure Data Lake Storage secret is stored.
  - b. **Secret name** - The secret name stored in KeyVault and used to authenticate with Azure Data Lake Storage.
6. Save your changes in the top left corner of the page.

The following image shows an example Azure Data Lake Storage configuration.

### Test the Azure Data Lake Storage connection

1. Test the connection to KeyVault using the **Test Azure Key Vault** link.
2. Test the connection to Azure Data Lake Storage using the **Test Azure Storage** link.

#### NOTE

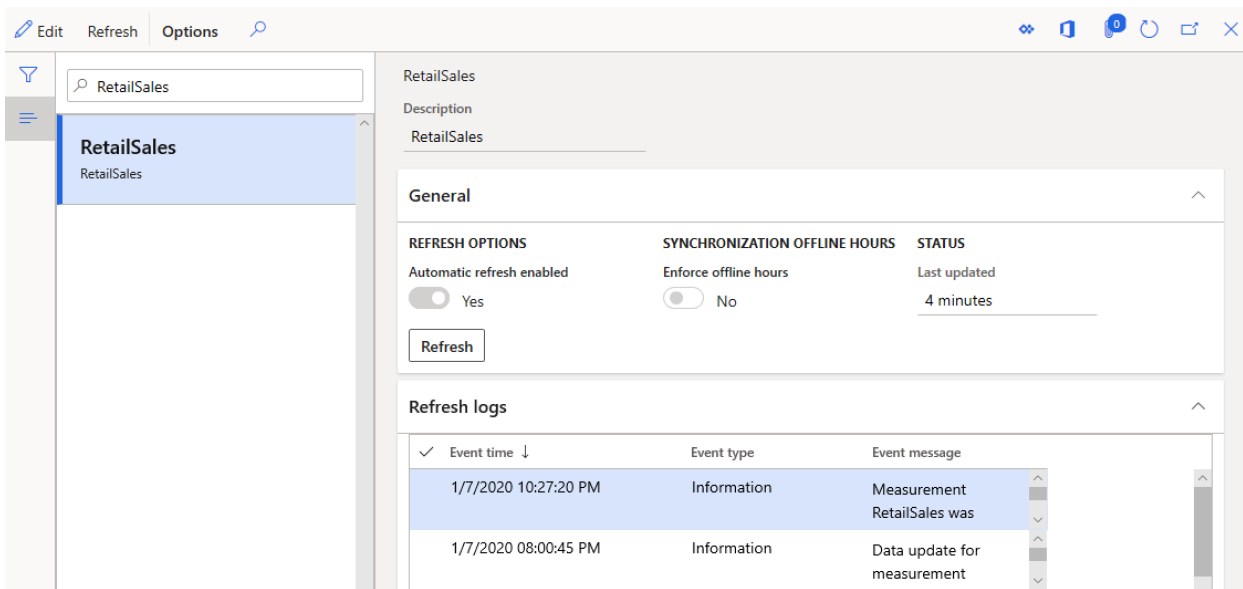

If the tests fail, double-check that all of the KeyVault information added above is correct, then try again.

Once the connection tests are successful, you must enable automatic refresh for Entity store.

To enable automatic refresh for Entity store, follow these steps.

1. Search for **Entity Store**.
2. In the list on the left, navigate to the **RetailSales** entry, and select **Edit**.
3. Ensure that **Automatic Refresh Enabled** is set to **Yes**, select **Refresh**, and then select **Save**.

The following image shows an example of Entity store with automatic refresh enabled.

Azure Data Lake Storage is now configured for the environment.

If not completed already, follow the steps for [enabling product recommendations and personalization](#) for the environment.

## Additional resources

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Enable product recommendations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to make product recommendations that are based on artificial intelligence-machine learning (AI-ML) available for Microsoft Dynamics 365 Commerce customers. For more information about product recommendation lists, see [Product recommendations overview](#).

## Recommendations pre-check

Before enabling, note that product recommendations are only supported for Commerce customers who have migrated their storage to using Azure Data Lake Storage.

The following configurations must be enabled in the back office before enabling recommendations:

1. Ensure that Azure Data Lake Storage has been purchased and successfully verified in the environment. For more information, see [Ensure that Azure Data Lake Storage has been purchased and successfully verified in the environment](#).
2. Ensure that the entity store refresh has been automated. For more information, see [Ensure that the Entity store refresh has been automated](#).
3. Confirm that Azure AD Identity configuration contains an entry for Recommendations. More information on how to do this action is below.

Additionally, ensure that RetailSale measurements have been enabled. To learn more about this set up process, see [Work with measures](#).

## Azure AD Identity configuration

This step is required for all customers running an infra-structure as a service (IaaS) configuration. For customers running on service fabric (SF), this step should be automatic and we recommend verifying the setting is configured as expected.

### Setup

1. From the back office, search for the **Azure Active Directory applications** page.
2. Verify if an entry exists for "RecommendationSystemApplication-1".

If the entry does not exist, add a new entry with the following information:

- **Client Id** - d37b07e8-dd1c-4514-835d-8b918e6f9727
- **Name** - RecommendationSystemApplication-1
- **User Id** - RetailServiceAccount

Save and close the page.

## Turn on recommendations

To turn on product recommendations, follow these steps.

1. In Commerce headquarters, search for **Feature Management**.
2. Select **All** to see a list of available features.
3. In the search box, enter **Recommendations**.
4. Select the **Product recommendations** feature.

5. In the **Product recommendations** properties pane, select **Enable now**.

The screenshot shows the 'Feature management' interface. At the top, there's a 'Feature management' header with a sub-header 'Do not enable new features automatically'. Below this, there are three columns: 'New' with a count of 4, 'Not enabled' with a count of 374, and 'Scheduled' with a count of 0. There are two buttons: 'Enable all' and 'Check for updates'. Below the header, there are tabs for 'New', 'Not enabled', 'Scheduled', and 'All'. A search bar contains '\*recommendations'. A table lists features with columns: 'Feature name', 'Enable date', 'Feature added', 'Preview feature', and 'Module'. The table has two rows: 'Personalized product recommendations' and 'Product recommendations', both with an enable date of 4/24/2020 and module 'Retail and commerce'. The 'Product recommendations' row is selected. To the right of the table is a 'Product recommendations' properties pane. It shows 'Feature added 4/24/2020', 'Retail and commerce', and a 'Learn more' link. Below this is a 'Description' section with text: 'Enabling this feature will allow the system to use purchase and product information without associating personal information to generate machine-learning recommendations based on purchase trends in your online and brick-and-mortar stores. If you disable this feature you will not receive machine-generated recommendations.' There is also a 'Comments' section with a text area. At the bottom right of the properties pane are 'Schedule' and 'Enable now' buttons.

#### NOTE

This procedure starts the process of generating product recommendation lists. It may take several hours before the lists are available and can be viewed at the point of sale (POS) or in Dynamics 365 Commerce.

## Configure recommendation list parameters

By default, the AI-ML-based product recommendation list provides suggested values. You can change the default suggested values to suit the flow of your business. To learn more about how to change the default parameters, go to [Manage AI-ML-based product recommendation results](#).

## Show recommendations on POS devices

After enabling recommendations in Commerce back office, the recommendations panel must be added to the control POS screen using the layout tool. To learn about this process, see [Add a recommendations control to the transaction screen on POS devices](#).

## Enable personalized recommendations

In Dynamics 365 Commerce, retailers can make personalized product recommendations (also known as personalization) available. In this way, personalized recommendations can be incorporated into the online customer experience and at the point of sale. When the personalization functionality is turned on, the system can associate a user's purchase and product information to generate individualized product recommendations.

To learn more about personalized recommendations, see [Enable personalized recommendations](#).

# Enable personalized recommendations

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to make personalized product recommendations available for customers in Microsoft Dynamics 365 Commerce.

## Overview

In Dynamics 365 Commerce, retailers can make personalized product recommendations (also known as personalization) available. In this way, personalized recommendations can be incorporated into the customer experience online and at the point of sale (POS). When the personalization functionality is turned on, the system can associate a user's purchase and product information to generate individualized product recommendations.

## Personalization prerequisites

Before you make personalized product recommendations available for customers, note that product recommendations are supported only for Commerce users who have migrated their storage to Azure Data Lake Store. Before customers can receive personalized product recommendations, retailers must [turn on product recommendations](#).

### NOTE

By turning on product recommendations, you also turn on personalization. However, if you turn off personalization, you don't turn off the other types of product recommendations.

For more information about product recommendations, see the [Product recommendations overview](#).

## Turn on personalization

To turn on personalization, follow these steps.

1. In Commerce headquarters, search for **Feature Management**.
2. Select **All** to see a list of available features.
3. In the search box, enter **Recommendations**.
4. Select the **Personalized product recommendations** feature.
5. In the **Personalized product recommendations** properties pane, select **Enable now**.

**Feature management**  
Do not enable new features automatically

New: 4 | Not enabled: 372 | Scheduled: 0

Buttons: Enable all | Check for updates

Navigation: New | Not enabled | Scheduled | **All**

Search: \*Recommendations

Feature name ↑	Enable date	Feature added ↓	Preview feature	Module
Personalized product recommendations	8/14/2020	4/24/2020		Retail and commerce
Product recommendations		4/24/2020		Retail and commerce

**Personalized product recommendations**  
Feature added 4/24/2020  
Retail and commerce  
[Learn more](#)

**Description**  
Personalization allows the system to associate a user's purchase and product information to generate individualized product recommendations. Disabling personalization will turn off personalized product recommendations for all users. However, disabling personalization does not disable other recommendations features and users will continue to receive non-personalized recommendations.

**Comments**

Buttons: Schedule | **Enable now**

**NOTE**

When you turn on personalization, the process of generating personalized product recommendation lists is started. Up to one day might be required before these lists are available and visible online and at the POS.

## Personalized lists

In addition to allowing for personalization of existing machine-generated lists, the recommendations service allows for personalization of the product discovery experience both online and at the POS.

After personalization is turned on, retailers can show shoppers personalized "Picks for you" lists online or "Recommended for customer" lists on POS terminals. Additionally, retailers can apply personalization to existing product recommendation lists and provide General Data Protection Regulation (GDPR) opt-out experiences for authenticated users. If you turn off personalization, you also turn off these features.

### Online "Picks for you" lists

A "Picks for you" list is an artificial intelligence-machine learning (AI-ML) list that shows an authenticated user a personalized list of suggested products. This list is based on the user's omnichannel purchase history. Personalized recommendations are dynamically updated as the user makes more purchases. This type of list also supports category filtering, so that retailers can show top picks, based on navigational hierarchies.

Before the "Picks for you" list can appear on any e-Commerce page, the following user requirements must be met:

- Users must be signed in. Anonymous users won't see personalized recommendations.
- Users must have at least one purchase on their account.
- Users must opt in to receive personalized recommendations.

The following illustration shows an example of a "Picks for you" list on an online store page.

### Select product list configuration ✕

### "Recommended for customer" lists at the POS

To enhance their clienteling experience, retailers can personalize existing customer details pages by adding a contextual "Recommended for customer" list.

The following illustration shows an example of a "Recommended for customer" list on a POS terminal.

## Apply personalization to existing recommendation lists

Retailers can apply personalization to existing recommendation lists, such as "New," "Trending," "Best selling," "People also like," and "Frequently bought together." When personalization is applied to existing lists, items that a signed-in user previously bought are removed from those lists. For both anonymous users and users who opted out of receiving personalized recommendations, default versions of the existing lists are shown. Therefore, retailers don't have to manually maintain separate page experiences.

For example, a signed-in user has already bought the black watch and the brown work boots that appear in the "Trending - default" list in the following illustration. Therefore, the user will see new products instead of those products, as shown in the "Trending - personalized" list.

Trending – default < >

				
<p>Large Face Black Leather Watch</p> <p><b>Free</b></p> <p>★★★★★ 4</p>	<p>Leather Pull-on Workboot</p> <p><b>\$170.00</b></p> <p>★★★★★ 4</p>	<p>Genuine Leather Suede Handbag Purse</p> <p><b>\$340.00</b></p> <p>★★★★★ 18</p>	<p>Retro Horn Rimmed Keyhole Nose Bridge Round Sunglasses</p> <p><b>\$140.00</b></p> <p>★★★★★ 18</p>	<p>Aqua GI</p> <p><b>\$190.0</b></p> <p>★★★</p>

Trending – personalized < >

				
<p>Genuine Leather Suede Handbag Purse</p> <p><b>\$340.00</b></p> <p>★★★★★ 18</p>	<p>Retro Horn Rimmed Keyhole Nose Bridge Round Sunglasses</p> <p><b>\$140.00</b></p> <p>★★★★★ 18</p>	<p>Aqua Glass Ball Necklace</p> <p><b>\$190.00</b></p> <p>★★★★★ 1</p>	<p>Round Pendant Hoop Earrings</p> <p><b>\$35.00</b></p> <p>★★★★★ 1</p>	<p>Silver CI</p> <p><b>\$360.00</b></p> <p>★★★</p>

To apply personalization to an existing recommendation list in the Commerce site builder, follow these steps.

1. Open an existing site builder page that contains a product collection module.
2. In the left navigation pane, select the product collection module.
3. In the right navigation pane, under **Products**, select the list.
4. In the **Select product list configuration** dialog box, under **Type**, select the list type.
5. Select the **Apply Personalization** check box, and then select **OK**.

# Opt out of personalized recommendations

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains how you can let customers opt out of receiving personalized recommendations in Microsoft Dynamics 365 Commerce.

## Overview

During account creation, new customers are automatically set up to receive personalized recommendations. However, Dynamics 365 Commerce provides various ways for retailers to let users opt out of receiving these recommendations and restrict the processing of their personal data. Authenticated users who opt out of receiving personalized recommendations will immediately stop seeing personalized lists. Additionally, all personal data that is collected for personalization will be removed from personalized recommendations models.

For more information about personalized product recommendations, see [Enable personalized recommendations](#).

## Ways for retailers to implement an opt-out experience

Retailers have three ways to implement an opt-out experience.

### Opting out on behalf of users

In Account management in Commerce back office, retailers can opt out on behalf of users.

1. From the back-office home page, search for **all customers**.
2. Search for and select a customer, and then select the **Retail** FastTab.

<b>RETAIL</b> Amount charged, not posted 0.00	<b>RECEIPT</b> Receipt option Standard receipt Receipt email	<b>LOYALTY ENROLLMENT</b> Block customer for loyalty enrollment <input type="radio"/> No	<b>PRIVACY</b> Disable personalization <input type="radio"/> No Do not track web activity <input type="radio"/> No
---	---	--	--

4. Select **Save**, and close the page.

## Module-based opt-out experience

Retailers can let authenticated users opt out of personalized recommendations by themselves. To provide this opt-out experience, add the user opt-out module to customer account profile pages.

## Custom extensions

Retailers can create their own extensions to manage the opt-out experience for users. For more information, see [Call Retail Server APIs](#) and [Online channel extensibility](#).

# Obtain a digital copy of personalized recommendations data on behalf of an authenticated user

Customers might want to obtain a digital copy of their personal data and also see an exported view of their recommendations results. If a customer requests this information, the retailer must create a customized extension that calls the Retail Server application programming interface (API) and queries for the full results from the **Picks for you** list, based on the customer's customer ID. The results can then be exported in comma-separated values (CSV) format and shared with the customer.

The following example shows how a retailer can accomplish this task.

1. The retailer creates a custom extension to pull personal recommendations data on behalf of the user. For information about how to create modules, clone existing modules, call Retail Server APIs, and call data actions, see [Online channel extensibility](#).
2. The custom extension makes a call to the **get-recommendations** core data action and passes the required information to it, based on the requirements of the list. In the case of the **Picks for you** list, the extension must pass the correct list name and customer ID to the data action.

One way to create the custom extension is to clone the existing product collection module that is used to return recommendations results. By cloning this existing module, a retailer can modify the existing code and add a new button that exports the recommendations results to a CSV file. For more information, see [Clone a module library module](#) and [Product collection modules](#).

For a full view of the Retail Server API library, see [Retail Server Customer and Consumer APIs](#).

3. After the custom extension is created, the retailer can export a CSV file of all recommendations results, based on the unique customer ID of the authenticated user.
4. The retailer can share the exported CSV file that contains the full personalized list of recommended products with the authenticated user.

# Enable "shop similar looks" recommendations

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to enable "shop similar looks" product recommendations in Microsoft Dynamics 365 Commerce.

## Overview

The "shop similar looks" recommendations feature in Dynamics 365 Commerce uses the power of artificial intelligence and machine learning (AI-ML) to deliver recommendations for visually similar products to customers. By making "shop similar looks" recommendations available for all retail channels in Commerce, retailers can increase customer satisfaction by helping customers easily find what they want.

The functionality for "shop similar looks" recommendations uses product images of seed product variants to find and recommend visually similar products in a retailer's product catalog.

"Shop similar looks" recommendations are available in both the point of sale (POS) and e-Commerce experiences.

### Example scenarios

- A customer views a black striped sweater and receives a recommendation for a similar sweater in red. The customer selects the recommended product instead of the originally viewed product and then receives recommendations for similar products in red.
- A customer uses "shop similar looks" recommendations to discover matching earrings for a ring that the customer is interested in buying.

## Enable "shop similar looks" recommendations in Commerce headquarters

Product recommendations are supported only for Commerce users who have migrated their storage to Azure Data Lake Gen2.

### Prerequisites

Before retailers can begin to show "shop similar looks" recommendations to customers, there are two prerequisite steps:

- [Enable product recommendations](#) in Commerce headquarters.
- Confirm that the media server supports HTTPS calls.

For the recommendations engine to access the product images, retailers must generate the product URLs. To generate product URLs in Commerce headquarters, follow these steps.

1. Go to **Product images**.
2. On the Action Pane, select **Define media template**.
3. In the **Define media template** properties pane, under **Media URLs**, select **Generate URLs**.

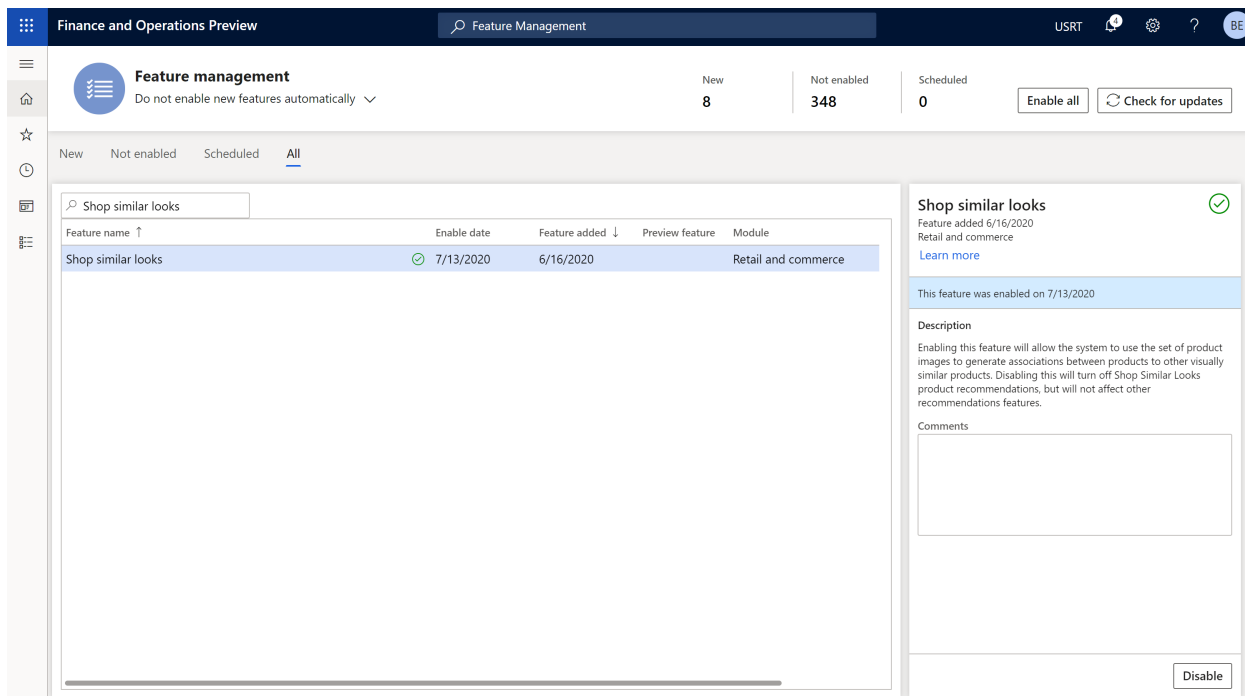

#### NOTE

When you enable the "shop similar looks" recommendations feature, the process of generating product recommendation lists begins. Up to a day might be required before those lists are available and visible online and on POS terminals.

To enable the "shop similar looks" recommendations feature in Commerce headquarters, follow these steps.

1. Go to **Feature management**.
2. In the list of available features, search for and select **Shop similar looks**.
3. In the right pane, select **Enable** to turn on the service.

The following illustration shows the **Shop similar looks** feature on the **Feature management** page in Commerce headquarters.

After the preceding tasks been completed, POS terminals are automatically enhanced with a contextual **Shop similar products** panel. By selecting **See more**, POS terminal users can be taken to a dedicated "shop similar looks" page that can be filtered further.

#### NOTE

If you turn off the "shop similar looks" recommendations feature, no other types of product recommendations are affected. For more information about product recommendations, see [Product recommendations overview](#).

## Add a Shop similar looks button to product details pages by using Commerce site builder

After you enable the "shop similar looks" recommendations feature in Commerce headquarters, an option in Commerce site builder lets retailers to add a **Shop similar looks** button to the buy box on any product details page (PDP). A customer who selects this button is taken to a dedicated "shop similar looks" page that returns visually similar products. There, the customer can use selectors to further filter the products.

To add a **Shop similar looks** button to a PDP by using Commerce site builder, follow these steps.

1. Open an existing site builder page that contains a buy box module.
2. In the left navigation pane, select the buy box module.
3. In the right navigation pane, select the **Enable Shop Similar Looks Link** check box.
4. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it. After the page is published, the PDP will include a **Shop similar looks** button.

The following illustration shows the **Enable Shop Similar Looks Link** check box and **Shop similar looks**

button on an example PDP in site builder.

The screenshot displays the Dynamics 365 Commerce site builder interface for a Product Detail Page (PDP). The main content area shows the product '3" Feather Earrings' priced at \$55.00. The product description reads: 'Black 3" feathers held by gold clips.' The quantity is set to 1, and there is a note 'Low stock available'. The 'Add to bag' button is highlighted in green. Below the product image, there are buttons for 'Find in store' and 'Shop similar looks', both of which are highlighted with red boxes. The right sidebar contains the 'Buybox' configuration panel, where the 'Enable Shop Similar Looks Link' checkbox is checked and highlighted with a red box. The left sidebar shows the page structure with various slots and containers.

# Enable "shop similar description" recommendations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to enable "shop similar description" product recommendations in Microsoft Dynamics 365 Commerce.

The "shop similar description" recommendations feature in Dynamics 365 Commerce uses artificial intelligence and machine learning (AI-ML) to deliver recommendations for products that have descriptions that are similar to what the customer is looking for. By making "shop similar description" recommendations available for all retail channels in Commerce, retailers can help customers easily find what they want.

The functionality for "shop similar description" recommendations uses the product name and description of seed products to find and recommend similar products in a retailer's product catalog.

"Shop similar description" recommendations are available in both the point of sale (POS) and e-commerce experiences.

## Example scenarios

The following example scenarios show the types of recommendations that the "shop similar description" functionality can provide:

- A customer views a pair of retro-style horn-rimmed glasses and receives a set of recommendations for other glasses that have a similar design, in the context of the retailer's industry.
- A customer uses "shop similar description" recommendations to discover coffee flavors that are similar to a flavor that they previously purchased from the retailer.

## Set up "shop similar description" recommendations

Product recommendations are supported only for Commerce users who have migrated their storage to Azure Data Lake Storage Gen2.

### Prerequisites

Before "shop similar description" recommendations can be shown to customers, you must complete the following prerequisites:

- [Enable product recommendations](#) in Commerce headquarters.
- Confirm that the media server supports HTTPS calls.

### Turn on the "shop similar description" recommendations feature

To turn on the "shop similar description" recommendations feature in Commerce headquarters, follow these steps.

1. In the **Feature management** workspace, in the list of available features, search for and select **Shop similar description**.
2. In the right pane, select **Enable**.

## NOTE

When you turn on the feature, the system starts to generate product recommendation lists. It might take up to a day for those lists to become available and visible online and on POS terminals.

If you turn off the feature, other types of product recommendations aren't affected. For more information about product recommendations, see [Product recommendations overview](#).

## Add a Shop similar description button to product details pages

After you turn on the "shop similar description" recommendations feature in Commerce headquarters, you can add a **Shop similar description** button to the buy box on any product details page (PDP). A customer who selects this button is taken to a dedicated **Shop similar description** page that shows visually similar products. The customer can then use selectors to further filter the products.

To add a **Shop similar description** button to a PDP by using Commerce site builder, follow these steps.

1. Open an existing site builder page that contains a buy box module.
2. In the left navigation pane, select the buy box module.
3. In the right pane, select the **Enable Shop Similar description Link** check box.
4. Select **Save**.
5. Select **Finish editing** to check in the page, and then select **Publish** to publish it. After the page is published, the PDP will include a **Shop similar description** button.

The following illustration shows the **Enable shop similar description Link** check box and the **Shop similar description** button on an example PDP in site builder.

The screenshot displays the Commerce site builder interface for a product details page (PDP). On the left, a navigation pane shows the page structure, with the 'Buybox (Required)' module selected. The main content area shows a product titled '3" Feather Earrings' with a price of 'Free'. Below the product image, there are buttons for 'Add to bag', 'Find in store', 'Shop similar looks', and 'Shop similar description'. On the right, the 'Buybox' configuration panel is visible, with the 'Enable Shop Similar description Link' checkbox checked and highlighted by a red box. Other options in the panel include 'Enable Shop Similar Looks Link', 'Allow custom price', 'Minimum price', 'Maximum price', and 'Event IDs to track'.

# Add product recommendations on POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

At its core, product recommendations are a transformative business application that span across all commerce spaces to create rich, engaging, and tailored product discovery experiences. To implement this feature on POS, follow the steps on [how to add recommendations to your POS devices](#).

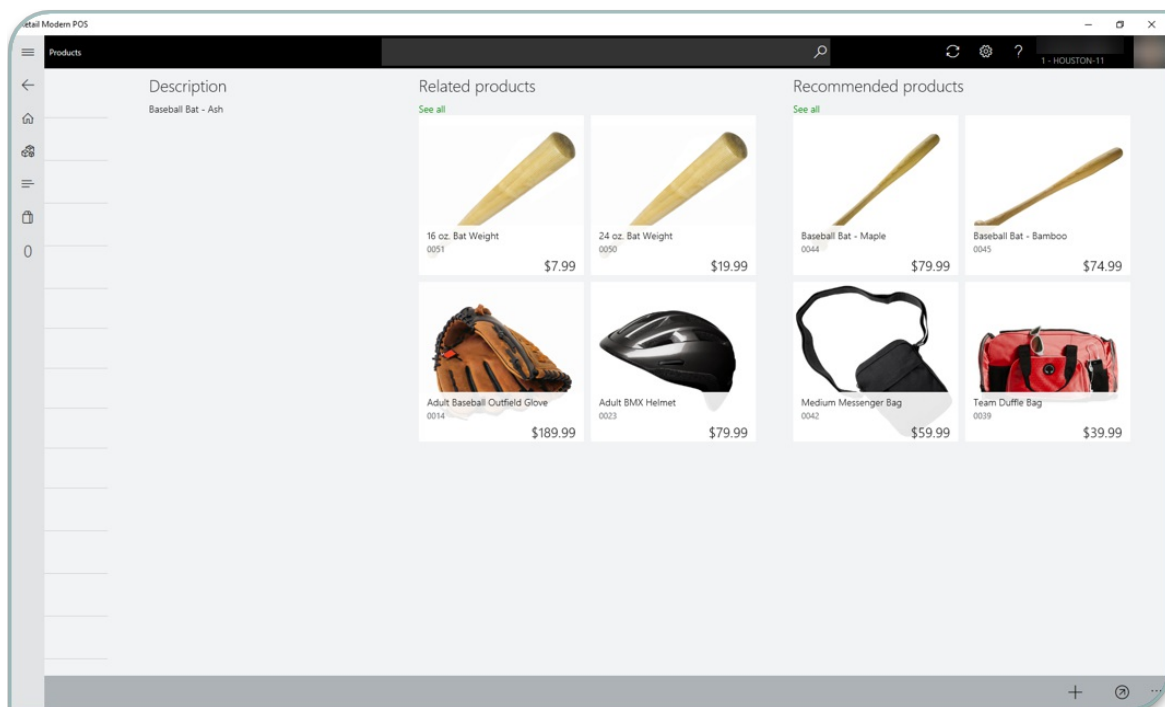

For more information about product recommendations features, read the [product recommendations overview](#).

## Scenarios

Product recommendations are enabled for the following POS scenarios. They are available in Cloud POS or Modern POS (MPOS).

### 1. On the **Product details** page:

- If a store associate visits a **Product details** page when looking at previous transactions across different channels, the recommendations service suggests additional items that are likely to be purchased together.

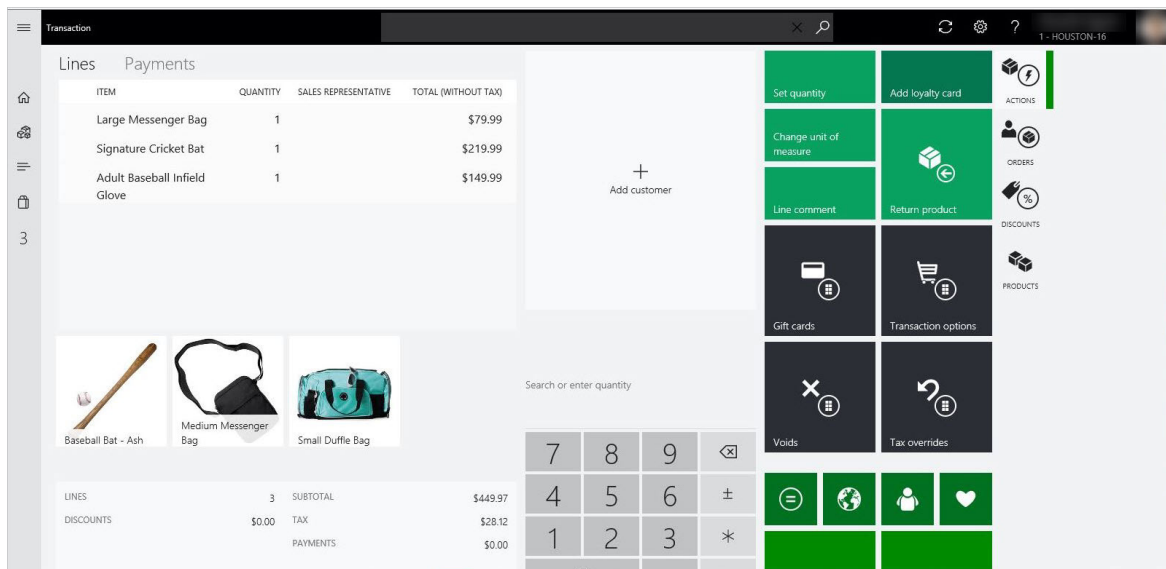

### 2. On the **Transaction** page:

- The recommendation engine suggests items based on the entire list of items in the basket that are frequently bought together.

#### **NOTE**

To display recommendations on the **Transaction** page, the retailer needs to update the screen layout in Dynamics 365 Commerce. The **Recommendations** control must be dropped onto the **Transaction** page.

## Configure Commerce to enable POS recommendations

To set up product recommendations, follow these steps:

1. Ensure your service has been updated to the **10.0.6 build**.
2. Follow the instructions on how to [enable product recommendations](#) for your business.
3. Optional: To display recommendations on the transaction screen, go to **Screen Layout**, choose your screen layout, launch the **Screen layout designer**, and then drop the **recommendations** control where needed.
4. Go to **Commerce parameters**, select **Machine-learning**, select **Yes** under **Enable POS recommendations**.
5. To see recommendations on POS, run global configuration job **1110**. To reflect changes made to POS screen layout designer, run channel configuration job **1070**.

## Troubleshoot issues where you have Product recommendations already enabled

- Navigate to **Commerce Parameters > Recommendation lists > Disable product recommendations** and run **Global configuration job [9999]**.
- If you added the **Recommendations** control to your transaction screen using the **Screen layout designer**, please remove that as well.
- If you have additional questions, check out the [Product recommendations FAQ](#) for more information.

# Add recommendations to the transaction screen

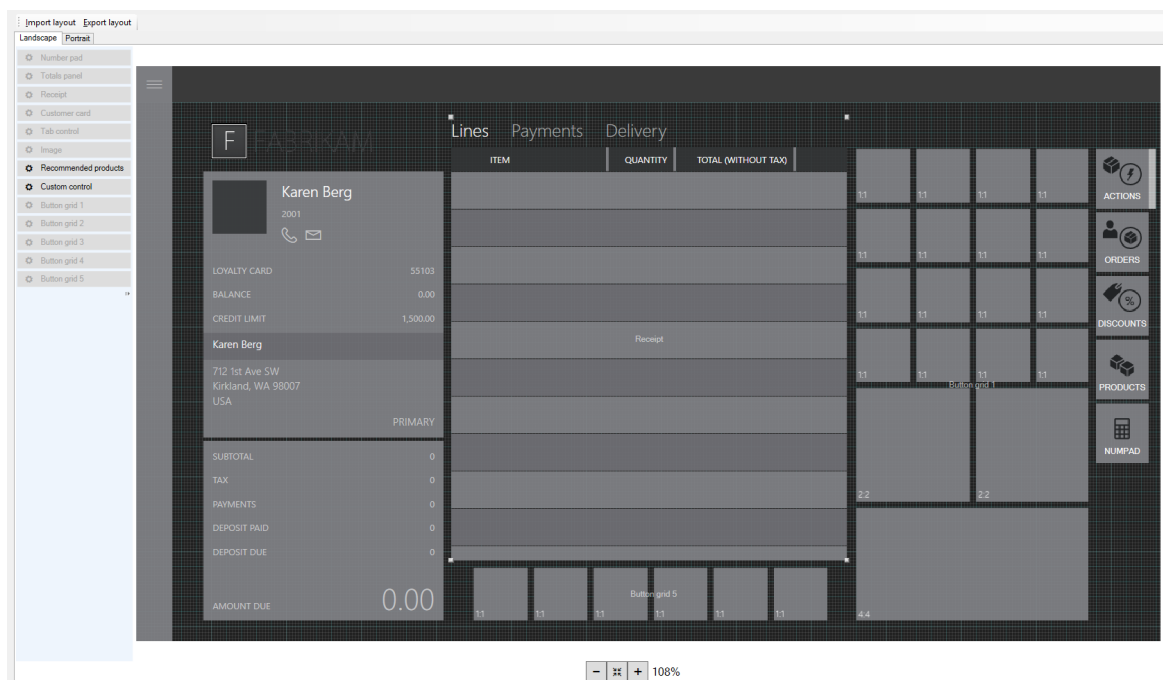

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add a recommendations control to the transaction screen on a point of sale (POS) device using the screen layout designer in Microsoft Dynamics 365 Commerce. For more information about product recommendations, read the [product recommendations on POS documentation](#).

You can display product recommendations on your POS device when you use Commerce. To display product recommendations, you need to add a control to the transaction screen using the screen layout designer.

## Open Layout designer

1. Go to **Retail and Commerce > Channel setup > POS setup > POS > Screen layouts**.
2. Use the Quick Filter to find the screen that you want to add the control to. For example, filter on the **Screen layout ID** field using a value of **F2CP16:9M**.
3. In the list, find and select the desired record. For example, select **Name: F2CP16:9M Screen Layout ID: F2CP16:9M**.
4. Click **Layout designer**.
5. Follow the prompts to launch the layout designer. When prompted for credentials, enter the same credentials that were in use when the Layout designer was launched from **Screen layouts** page.
6. When you log in, a page similar to the one below appears. The layout will be different depending on the customizations that were made for your store.

## Choose a display option

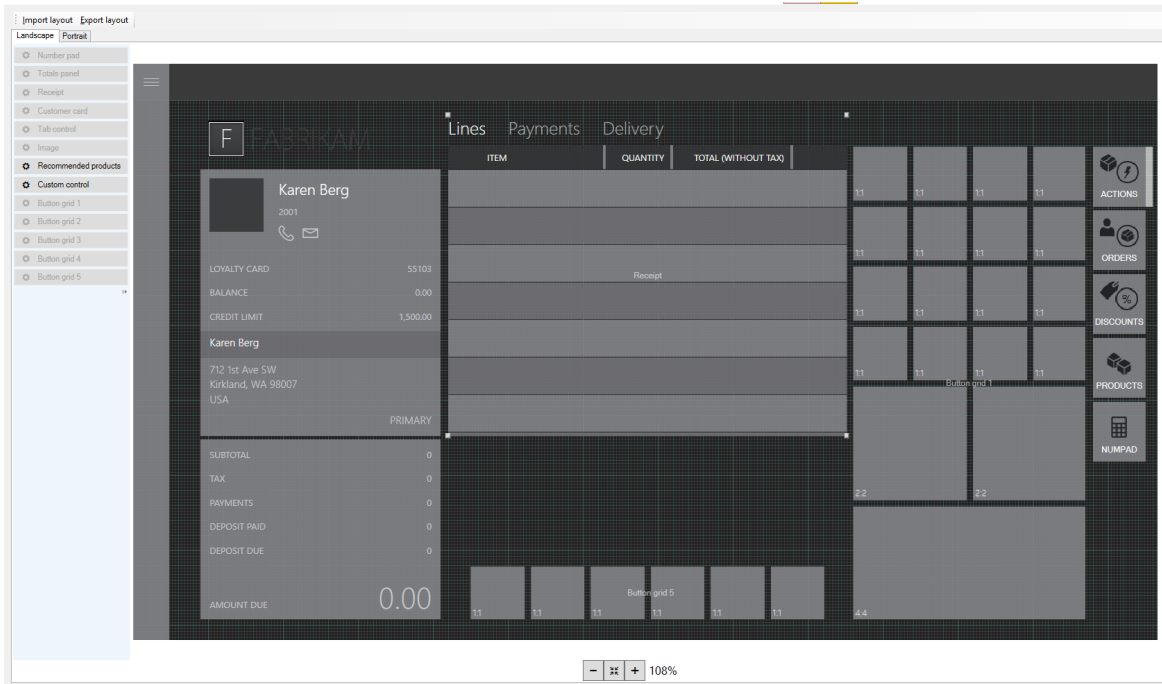

There are two configurations options available. Choose the option that works best for your store, and follow the remaining instructions to finish setting up the control. The two options are:

- Recommendations are always visible.

- A **Recommendations** tab appears in the grid on the right side of the screen.

### Make recommendations always visible

1. Reduce the height of the transaction lines details area so that it is the same height as the customer panel to its left.

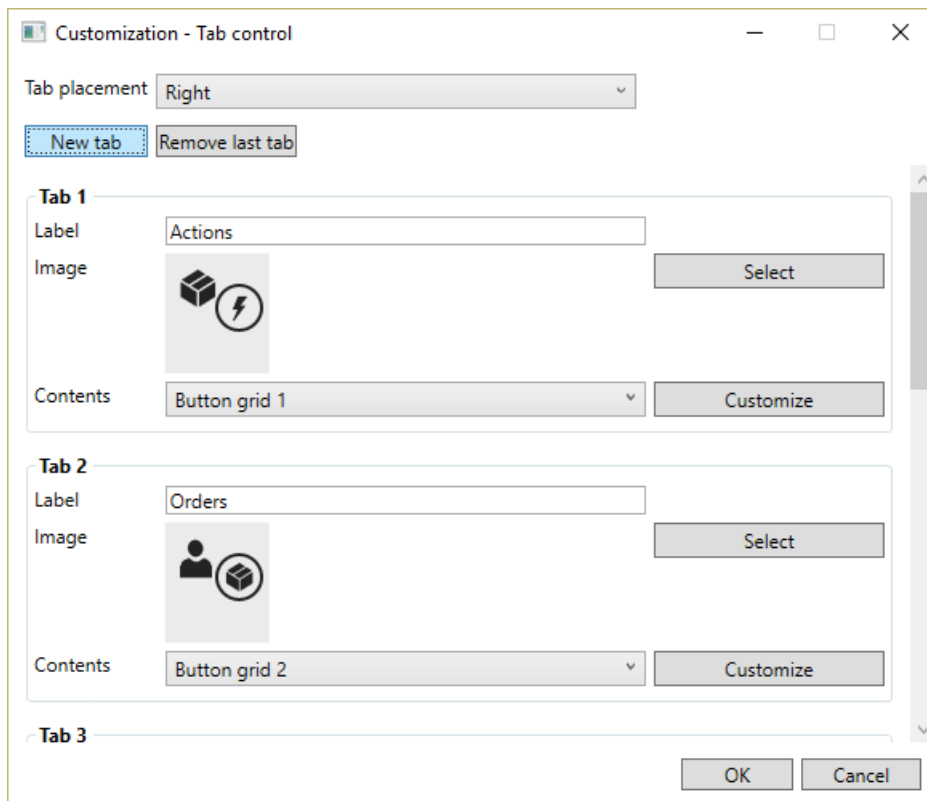

2. From the menu on the left, drag and drop the recommendations control to between the transaction line details area and the button grid in the center bottom of the transaction screen. Resize the control so it fits in that space.

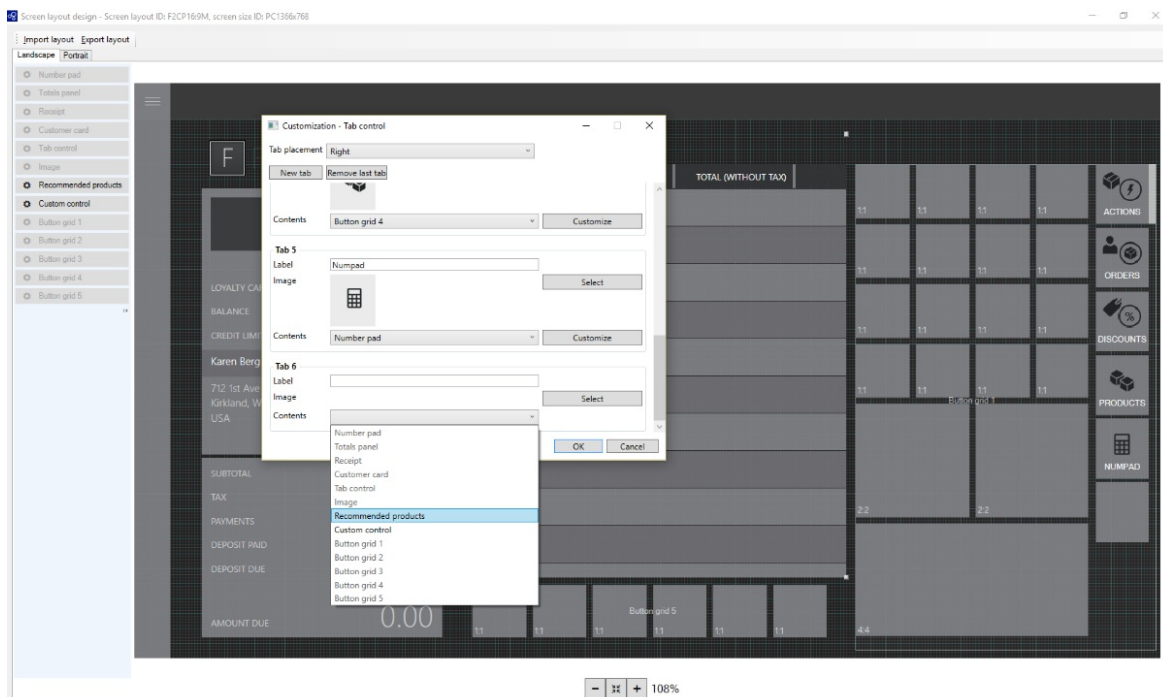

3. Click the **X** to save and exit Layout designer.
4. In Commerce, go to **Retail and Commerce > Retail and Commerce IT > Distribution schedules**.
5. In the list, select **1090 Registers**.
6. Click **Run now**.

### Add a Recommendations tab to the button grid on the right side of the screen

1. Right-click in the empty space below the last tab on the button grid located on the right side of the page.
2. Click **Customize**.

3. Click **New tab**.
4. Find the new tab that you just added. You may need to scroll down.
5. In the **Contents** drop-down, select **Recommended products**.

6. In the **Label** field, type a name for the recommendations tab. For example, type 'Recommended products'.
7. In the **Image** field, select the image to appear on the tab.
8. Click **OK**. The new tab appears in the button grid.

9. Click the **X** to save and exit Layout designer.
10. In Commerce, go to **Retail and Commerce > Retail and Commerce IT > Distribution schedules**.
11. In the list, select **1090 Registers**.
12. Click **Run now**.

# Adjust AI-ML-based product recommendation results

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains how to adjust product recommendation results based on artificial intelligence-machine learning (AI-ML) to your business.

After enabling product recommendations, the default settings will take effect; these parameters will work for many needs. It is best to plan to spend some time evaluating whether the results fit the selling motion of products. We suggest evaluating results for a few days before changing parameters as needed before testing again.

## Understanding recommendation list parameters

Before changing the parameters, learn about how they will affect the results below.

### "Trending" product list

The "Trending" product list has two parameters that can be changed:

**Trending product list configuration**

This list shows the highest performing products for a given time period.

Include new products from last X days

Include sales from last X days

1. **Include new products from last X days** - Products that have been added within the specified number of days before the current date can be used to select product candidates. The default value in the picture suggests that products as old as 180 days can be used in the trending product list.
2. **Include sales from last X days** - Sales transactions that have occurred within the specified number of days before the current date can be used to order the products. The default value above suggests that all purchases made of a product in the last 30 days would be used to determine the placement of the product in the trending product list.

### "Best selling" product list

Depending on your business, the "Best selling" list can bring different results than trending, even though they both use transaction data to order products. Because best selling has no cut off based on assortment date, Best selling can still highlight very popular, older products that might have been dropped from the trending list.

The "Best selling" product list has one parameter that can be changed:

**Bestselling list configuration**

This list shows products ranked by the highest number of sales.

Include sales from last X days

1. **Include sales from last X days** - Sales transactions that have occurred within the specified number of

days before the current date can be used to order the products. The default value above suggests that all purchases made of a product in the last 30 days would be used to determine the placement of the product in the Best selling product list.

## Manually add or remove products from recommendation lists

### For "New," "Trending," or "Best selling" lists

1. Go to **Retail and Commerce > Product recommendations > Recommendation parameters.**
2. In the list of shared parameters, select **Recommendation lists.**
3. Select the list add or remove products from.
4. To add products to the table, select **Add line.**
5. Under the Product column, search for a product by **Name** or **Product number.**

#### New product list configuration

This list shows the newest products assorted to channels and catalogs.  
Products included will appear at the beginning of the list. Products excluded will not appear in the list.

[+ Add line](#) [🗑 Remove](#)

✓	Product	Line type	Display order
	0004	Include	1.00
	0061	Exclude	0.00
✓	0001	Include	2.00

Product number ↑      Product name

- 0001 Youth Accessory Combo Set
- 0002 Adult Helmet Accessory Combo...
- 0003 Signature Mountain Bike Tire
- 0004 Premium Mountain Bike Tire
- 0005 Basic Inner Tube
- 0006 Inner Tube Patches
- 0007 Full Finger BMX Gloves

6. Under the Line type column, select one of two options:
  - **Include** – forces a product to the front of the list
  - **Exclude** – removes a product from appearing in the list

## New product list configuration

This list shows the newest products assorted to channels and catalogs.

Products included will appear at the beginning of the list. Products excluded will not appear in the list.

[+ Add line](#) [Remove](#)

✓	Product	Line type	Display order
	0061	Exclude	0.00
	0001	Include	2.00
✓	0004	Include	1.00

7. Changing the **Display order** will change the order that products marked **include** will appear in the list.

- If two products have the same **display order** value, then the final order of those two results may differ from the back office.

8. To remove products from the table: select the line to remove and select **Remove**.

### For "People also like" or "Frequently bought together" lists

In the context of "Frequently bought together" or "People also like" lists, machine learning is used to analyze consumer purchase patterns to recommend related products commonly purchased together for a unique seed product.

A *seed product* is the product you want to generate results for. In the context of manually adjusting recommendation lists, you are adding or removing results for this product.

Follow these steps to manually add or remove results for a seed product:

1. Select the **Seed product**.
2. Under the **Product** column, search for a product by **Name** or **Product number**.

### Frequently bought together configuration

This list uses machine learning to analyze consumer purchase patterns to recommend related items that are commonly purchased for a given seed item.

Products included will appear at the beginning of the list. Products excluded will not appear in the list.

[+ Add line](#) [Remove](#)

✓	Seed product	Product	Line type	Display order
✓	0006		Exclude	0.00

Product number ↑	Product name
0001	Youth Accessory Combo Set
0002	Adult Helmet Accessory Combo...
0003	Signature Mountain Bike Tire
0004	Premium Mountain Bike Tire
0005	Basic Inner Tube
0006	Inner Tube Patches
0007	Full Finger BMX Gloves

3. Under the **Line type** column, select one of two options:

- **Include** – forces a product to the front of the list
- **Exclude** – removes a product from appearing in the list

## Frequently bought together configuration

This list uses machine learning to analyze consumer purchase patterns to recommend related items that are commonly purchased for a given seed item.

Products included will appear at the beginning of the list. Products excluded will not appear in the list.

[+ Add line](#) [Remove](#)

✓	Seed product	Product	Line type	Display order
	0006	0002	Include	1.00
	0049	0094	Include	1.00
✓	0006	0124	Include	2.00
			Exclude	
			Include	

4. To remove products from the table: select the line to remove and select Remove.

# Manually create curated recommendations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how merchandizers can manually create and manage product recommendations lists for Microsoft Dynamics 365 Commerce customers.

Curated lists are collections of individual content, created and curated by people.

## Create a new list

To create a curated product recommendation list, follow these steps.

1. Go to **Retail and Commerce > Product recommendations > Recommendation lists**.
2. Select **New**.
3. In the **List Id** field, enter a value.
4. In the **List name** field, enter a value.
  - The **List name** is the title of the list that will appear in the curated lists section of the **Product collection** module.
5. To add products to the list, select **Add products**.
6. To change the order of the products in the list, enter a value in the **Display order** column.
  - If two products have the same display order value, then the final order of those two results may differ from the back office.
7. Select **Save** to save the list.

## Example List

[Recommendation lists](#)

### sb1-popular : Popular near you

# Create recommendations with demo data

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides guidance on how to leverage omni-channel product recommendations in Tier-1 single box environments using pre-populated, customizable demo data.

Omni-channel product recommendations provide a set of editorially curated or programmatically generated list of products. These lists can be used in several scenarios, depending on the business need. For more information about product recommendation lists, see [Product recommendations overview](#).

For Tier-2 and higher Dynamics 365 environments, product recommendations are automatically computed based on customer data. Using product recommendations demo data does not disable any product recommendations solution already provisioned in the environment and any costs associated with its usage.

For Tier-1 environments, product recommendations are based only off the static demo data stored in a .csv file.

## Enabling product recommendations demo data in an environment

To enable product recommendations demo data, you need to deploy the Dynamics 365 Commerce Preview Demo Extension to the respective environment. Doing so automatically enables product recommendations demo data.

## Default demo data

Each OneBox type environment comes with a preloaded set of product recommendations demo data stored in the comma separated 'reco\_demo\_data.csv' file, located on the Commerce Scale Unit.

The data is structured along the following columns.

COLUMN NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUES
RecoList	✓	The specific product recommendation list type that the demo data point is to generate.	<ul style="list-style-type: none"><li>• RecoBestSelling</li><li>• RecoNew</li><li>• RecoTrending</li><li>• RecoCart</li><li>• RecoPeopleAlsoBuy</li></ul>
OperatingUnitNumber	✓	The specific operating unit number where product recommendations are expected to be surfaced.	
Category		The category the specific list should be returned for. If no category is specified, the list is for top of navigation hierarchy only.	

COLUMN NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUES
SeedItemId		For lists that require seed (RecoPeopleAlsoBuy and RecoCart), the product those lists should show additional products for.	
CustomerId		For lists that require a customer identifier (RecoPicks). The default value '0' applies to all customers.	
ItemIds	✓	One or more products to be returned as the result, separated by ','.	

## Customize demo data

You can edit the default demo data with any product and category information configured in HQ. After you update the .csv, the product recommendations that are returned to customers will immediately reflect the changes.

The extension contains a datafile called 'RecoMockDataset.csv', which allows you to control the dataset used to power the mock recommendations results. The file name can be controlled through extension configuration using the **ext.Recommendations.DemoFilePath** setting. This enables you to have multiple datasets available that can be switched between easily through configuration.

```
<settings>
  <add name="ext.Recommendations.DemoFilePath" value="RecoMockDataset.csv" />
</settings>
```

# Product recommendations FAQ

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about processes and tools that you can use to troubleshoot issues that are related to [product recommendations](#) or their results.

## Best practices

It's very important to utilize the concept of product masters and variants. The sensible grouping of variants to a parent product master helps the list algorithms and service create better models. Additionally, the service can serve just one instance of a product instead of putting all closely related variants in a list. When all closely related variants are put in a list, erroneous or duplicate results can occur.

## Why are products missing from my recommendation lists?

Typically, if an item is missing from a product recommendation list, there might be a product configuration issue. For example, there might be an incorrect product start date or end date, a dimension might be misconfigured, or the product might not be in the correct channel assortment, etc.

If an item is missing from a recommendation list that is based on artificial intelligence-machine learning (AI-ML), the item might not fit the criteria of the recommendation list, or it might not have enough purchase transactions for the recommendation list to show it.

We recommend that you check these steps:

1. **Make sure that product recommendations have been enabled in HQ.** For more information about how to enable this service, see [Enable product recommendations](#).
2. **Make sure that key product properties are set.** For example, product assortments must be set to **Include**.
3. **For newly assorted products, it might take up to 3 hours before the product will start appearing in the new list.**
4. **If a product is still not appearing in Trending, Best selling, People also like, or Frequently bought together, then that product might not have enough transactions.** In this case, you can either wait for more transactions to occur, update the default recommendation list parameters, or use manual intervention to modify the recommendation product list results. For more information about recommendation parameters, see [Manage AI-ML-based product recommendation results](#).
5. **Make sure that the product meets the recommendation criteria for the list.** For more information about product recommendation parameters, see [Manage AI-ML-based product recommendation results](#).

## How can I prevent poor recommendation results from being returned?

Recommendation lists require a large volume of transactions to produce results. Therefore, it's important that users provide full historical transaction data.

Additionally, products that have no transactions or few transactions typically don't have **People also like** or **Frequently bought together** results, and don't appear in **Trending** or **Best selling** recommendation lists. This situation can often occur for very new products, or for old products that have a small number of purchases. Popular new items will easily overcome this issue.

We recommend that you follow these steps:

1. **Make sure that the product meets the recommendation criteria for that list.** For more information about product recommendation parameters, see [Modify AI-ML-based product recommendation results](#).
  2. **If the product is new, consider modifying a recommendation list until the product has more transactions.** For more information about how to modify recommendation list results, see [Manage AI-ML-based product recommendation results](#).
- **Make sure that the product meets the recommendation criteria for that list.** For more information about product recommendation parameters, see [Manage AI-ML-based product recommendation results](#).
  - **If the product is new, consider modifying a recommendation list until the product has more transactions.** For more information about how to modify recommendation list results, see [Manage AI-ML-based product recommendation results](#).

## Can I remove a product but still see it in the store?

You can adjust lists that are algorithmically generated if a business need arises. However, if a product is removed from a recommendation list, the product will remain discoverable in the store. For more information about how to modify product recommendation results, see [Manage AI-ML-based product recommendation results](#).

If you must block an item from being discovered in the store, you must change the **Item assortments** value to **Exclude**.

## How do I add a list to an e-Commerce page?

For information about how to add product recommendation pages to your e-Commerce website, see [Add product recommendation lists to pages](#).

## How do I enable recommendations on POS?

After enabling product recommendations, you will need to add the recommendations panel to the control POS screen. For more information, see [Add a recommendations control to the transaction screen on POS devices](#).

# Ratings and reviews overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers ratings and reviews in Microsoft Dynamics 365 Commerce.

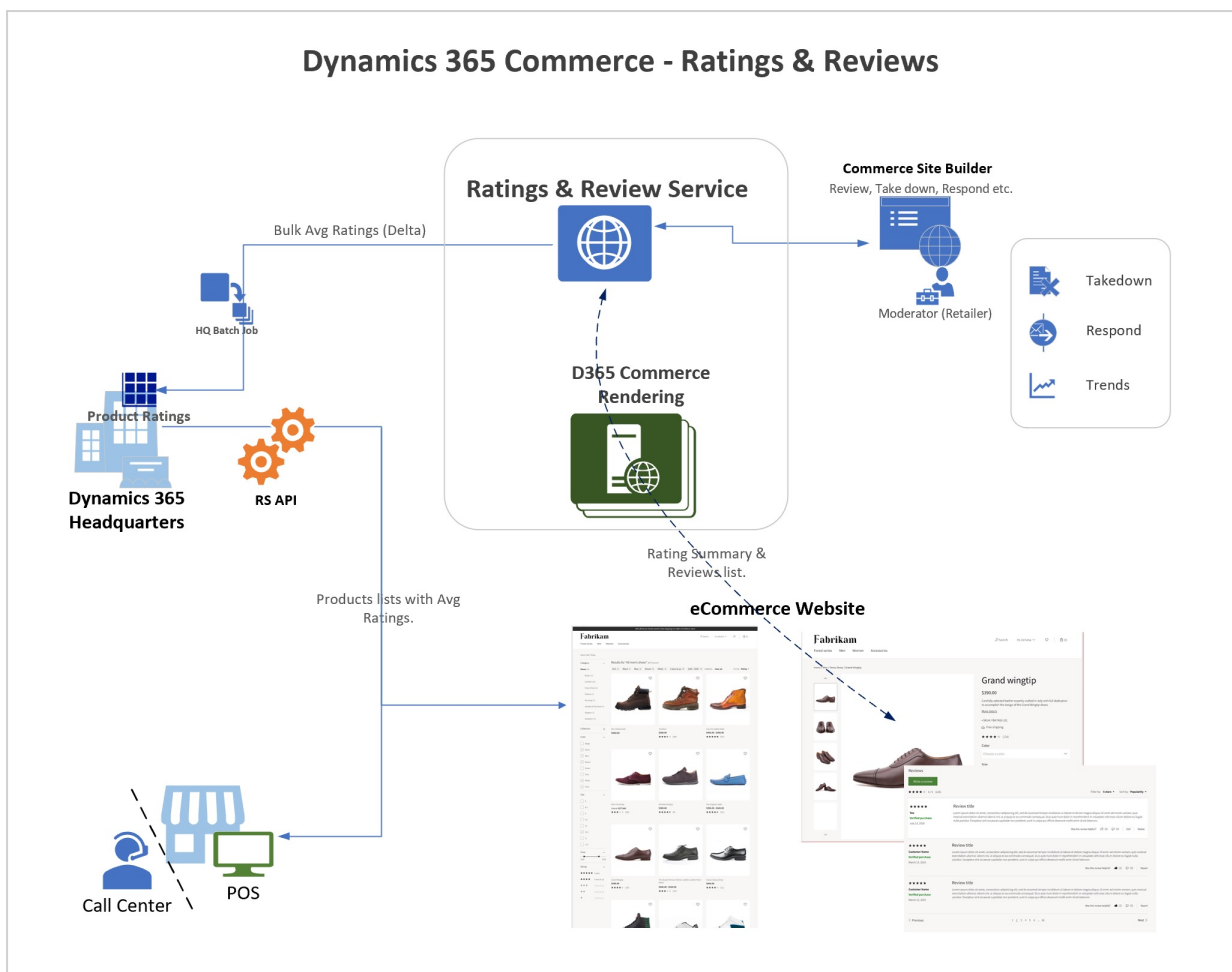

## Overview

Ratings and reviews are crucial for e-Commerce customers who want to know how other customers perceive a product. They can also help consumers make purchase decisions. In Dynamics 365 Commerce, the ratings and reviews solution lets retailers capture product reviews and ratings from customers. Retailers can then show average ratings and review information across their e-Commerce website.

Average rating information is shown in point of sale (POS) and call center channels. Therefore, sales associates can use it to help users make decisions. Ratings and reviews can also serve as a feedback mechanism that retailers can use to improve the quality of a product and therefore increase sales.

Ratings and reviews functionality in Dynamics 365 Commerce is an omnichannel solution and is natively available as part of the platform. The ratings and reviews solution is built on top of Microsoft Azure, which provides high scalability and reliability.

The following illustration shows how the ratings and reviews solution works in Dynamics 365 Commerce.

The ratings and reviews solution in Dynamics 365 Commerce uses Azure Cognitive Services to offer automatic moderation of profane words in 40 languages. Because human approval isn't required, moderation costs are reduced. The system also offers moderator tools that can be used to respond to customer concerns, feedback,

and take-down requests, and to address data requests from users.

The ratings and reviews solution provides widgets that show rating summaries in product lists, in search results, on product details page, and in other places. The widgets show complete review lists, and they also provide sorting and filtering options.

The ratings and reviews solution also provides a business intelligence (BI) template that includes a set of metrics to provide insights into ratings and reviews. Ratings and reviews data can be exported for further analysis.

# Opt in to use ratings and reviews

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to opt in to use ratings and reviews on your Microsoft Dynamics 365 Commerce site.

## Overview

The ratings and reviews solution is an omni-channel solution that you can make available in Dynamics 365 Commerce by using Microsoft Dynamics Lifecycle Services (LCS). LCS is an administration portal that retailers use to manage their environments from provisioning to decommissioning.

If you want to use the ratings and reviews solution on your Commerce website, you must opt in for ratings and reviews during deployment of your e-Commerce site on Dynamics 365 Commerce.

## Opt in to use ratings and reviews

To opt in to use ratings and reviews on your site, follow these steps.

1. Follow the steps in [Deploy a new e-Commerce site](#).
2. While you're still in LCS, go to **Retail deployment setup > Other settings**.
3. Set the **Enable ratings and reviews service** option to **Yes**.
4. In the **AAD security group for ratings and review moderator (security group object id)** field, enter the ID of the Microsoft Azure Active Directory (Azure AD) security group that includes the ratings and reviews moderators.

### Other Settings

# Manage ratings and reviews

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to manage ratings and reviews in Microsoft Dynamics 365 Commerce site builder.

## Overview

Dynamics 365 Commerce uses Microsoft Azure Cognitive Service to automatically moderate review text by redacting profane words. In addition, moderators can use Dynamics 365 Commerce site builder to implement the following manual tasks:

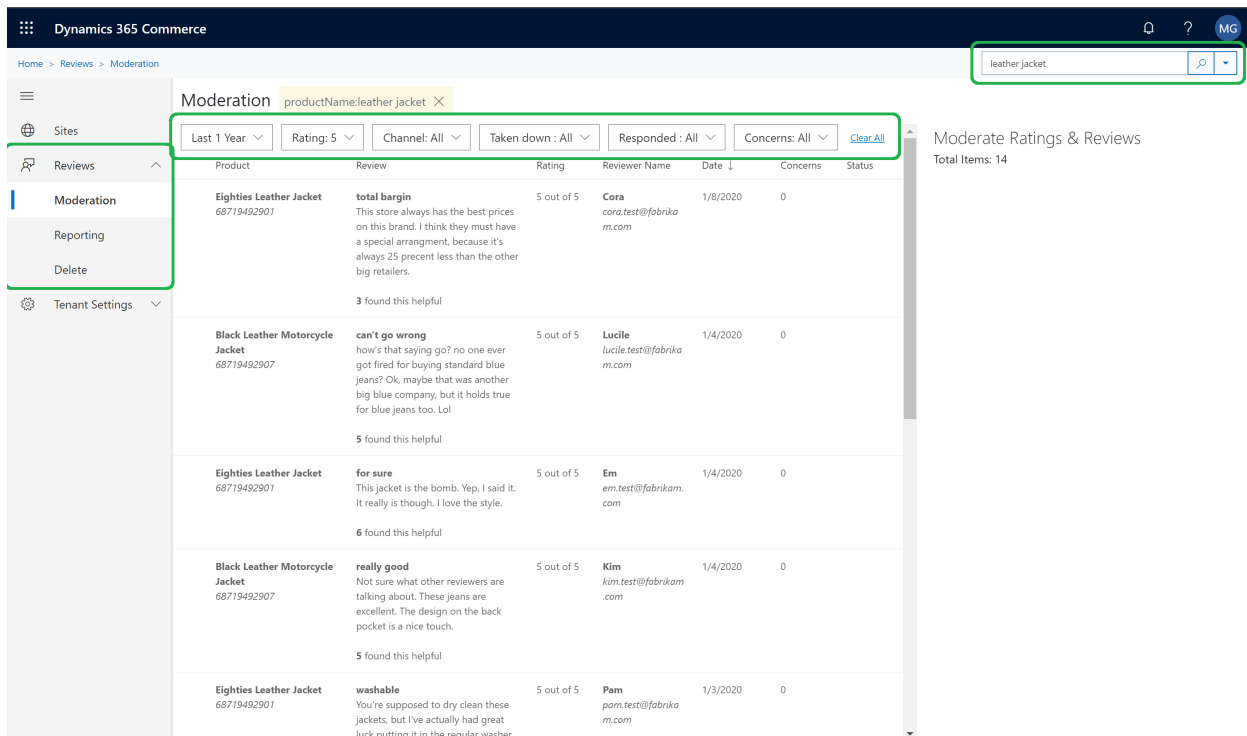

- Moderate reviews by responding to them or removing them.
- Delete a customer's reviews at the customer's request.
- Bulk-import ratings and reviews data for all products into a Microsoft Power BI template, so that trends for ratings and reviews can be analyzed.

## Read a review

To read to a review in Commerce site builder, follow these steps.

1. Go to **Home > Reviews > Moderation**.
2. Use the search field in the upper right of the page to filter the reviews that are shown by product ID, product name, or review text.

Additional filters let you limit the reviews by period, rating, channel, or concern status (taken down, responded, or reported).

The screenshot shows the Dynamics 365 Commerce Moderation interface. The search bar at the top right contains the text "leather jacket". The main content area displays a table of reviews for the product "Eighties Leather Jacket". The table has columns for Product, Review, Rating, Reviewer Name, Date, Concerns, and Status. The reviews are filtered by "Last 1 Year", "Rating: 5", "Channel: All", "Taken down: All", "Responded: All", and "Concerns: All".

Product	Review	Rating	Reviewer Name	Date	Concerns	Status
Eighties Leather Jacket 68719492901	<b>total bargain</b> This store always has the best prices on this brand. I think they must have a special arrangement, because it's always 25 percent less than the other big retailers.  3 found this helpful	5 out of 5	Cora cora.test@fabrikam.com	1/8/2020	0	
Black Leather Motorcycle Jacket 68719492907	<b>can't go wrong</b> how's that saying go? no one ever got fired for buying standard blue jeans? Ok, maybe that was another big blue company, but it holds true for blue jeans too. Lol  5 found this helpful	5 out of 5	Lucile lucile.test@fabrikam.com	1/4/2020	0	
Eighties Leather Jacket 68719492901	<b>for sure</b> This jacket is the bomb. Yep, I said it. It really is though. I love the style.  6 found this helpful	5 out of 5	Em em.test@fabrikam.com	1/4/2020	0	
Black Leather Motorcycle Jacket 68719492907	<b>really good</b> Not sure what other reviewers are talking about. These jeans are excellent. The design on the back pocket is a nice touch.  5 found this helpful	5 out of 5	Kim kim.test@fabrikam.com	1/4/2020	0	
Eighties Leather Jacket 68719492901	<b>washable</b> You're supposed to dry clean these jackets, but I've actually had great luck putting it in the regular washer	5 out of 5	Pam pam.test@fabrikam.com	1/3/2020	0	

## Respond to a review

Sometimes, customers who purchased a product express their satisfaction or dissatisfaction, or they don't understand how to use the product. As a moderator, you can post a response to a review. This response appears

together with the review on the site.

To respond to a review in Commerce site builder, follow these steps.

1. Go to **Home > Reviews > Moderation**.
2. Find and select the review that requires a response.
3. In the properties pane on the right, select **Add a response**.
4. Enter the response text and the name that should be shown for the responder. The default responder name is **Moderator**.
5. When you've finished, select **Post response**.

The screenshot shows the Dynamics 365 Commerce Moderation interface. The main area displays a table of reviews for the product 'leather jacket'. The table has columns for Product, Review, Rating, Reviewer Name, Date, Concerns, and Status. The second review, 'can't go wrong' by Lucile, is selected. On the right, the properties pane shows the review details and a 'Respond to Review' form with an 'Add a response' button highlighted in green.

Product	Review	Rating	Reviewer Name	Date	Concerns	Status
Eighties Leather Jacket 68719492901	<b>total bargain</b> This store always has the best prices on this brand. I think they must have a special arrangement, because it's always 25 percent less than the other big retailers. 3 found this helpful	5 out of 5	Cora cora.test@fabrikam.com	1/8/2020	0	
<b>Black Leather Motorcycle Jacket</b> 68719492907	<b>can't go wrong</b> how's that saying go? no one ever got fired for buying standard blue jeans? Ok, maybe that was another big blue company, but it holds true for blue jeans too. Lol 5 found this helpful	5 out of 5	Lucile lucile.test@fabrikam.com	1/4/2020	0	
Eighties Leather Jacket 68719492901	<b>for sure</b> This jacket is the bomb. Yep, I said it. It really is though. I love the style. 6 found this helpful	5 out of 5	Em em.test@fabrikam.com	1/4/2020	0	
Black Leather Motorcycle Jacket 68719492907	<b>really good</b> Not sure what other reviewers are talking about. These jeans are excellent. The design on the back pocket is a nice touch. 5 found this helpful	5 out of 5	Kim kim.test@fabrikam.com	1/4/2020	0	
Eighties Leather Jacket 68719492901	<b>washable</b> You're supposed to dry clean these jackets, but I've actually had great luck putting it in the regular washer on the gentle cycle. Be sure to only put a few drops of detergent in though. No shrinkage so far -- fingers crossed. 5 found this helpful	5 out of 5	Pam pam.test@fabrikam.com	1/3/2020	0	
Eighties Leather Jacket 68719492901	<b>get it</b> want a nuck confidene builder? Buy this jacket. How can you not	5 out of 5	Archibald archibald.test@fabrikam.com	1/3/2020	0	

## Take down a review

Sometimes, there is a business justification for moderators to take down customer reviews.

To take down a review in Commerce site builder, follow these steps.

1. Go to **Home > Reviews > Moderation**.
2. Find and select the review that must be taken down.
3. In the properties pane on the right, select a takedown reason under **Takedown Review**, and then select **Take down**.

## Delete a customer's reviews at the customer's request

Sometimes, customers want their ratings and reviews data to be permanently deleted from an e-Commerce website. A moderator who receives a removal request from a customer can remove the customer's data by using the review deletion feature. To find and delete a customer's data, the moderator requires the email address that the customer used to sign in and provide reviews.

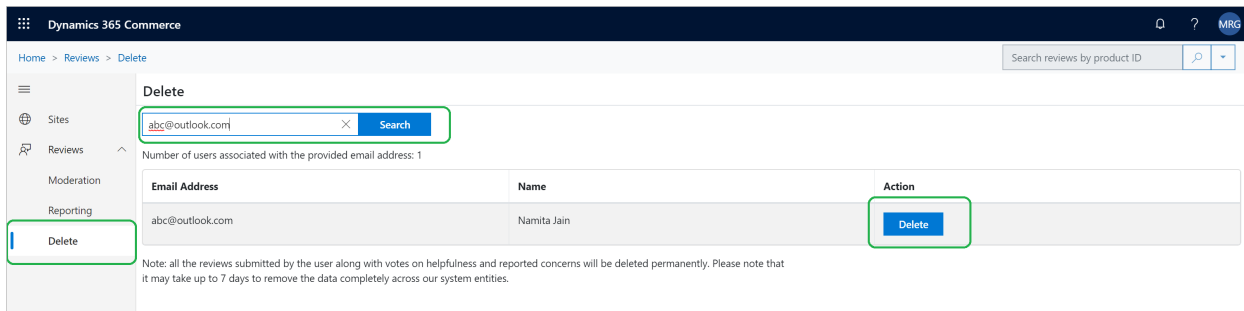

To find and delete customer data in Commerce site builder, follow these steps.

1. Go to **Home > Reviews > Delete**.
2. In the **Search for users by email address** box, enter the customer's email address, and then select **Search**.
3. If the customer has any review activity (for example, review submissions, votes about the helpfulness of

another customer's reviews, or comments about another customer's review), the results are shown. For each item, there is a **Delete** button.

4. For each item that must be deleted, select **Delete**. When you're prompted for confirmation, select **Yes**.

#### NOTE

- It can take up to seven days for data to be completely removed from the system. Moderators should notify customers about this delay.
- If customers have changed their name in their account settings, multiple items might appear in the search results. In this case, to completely delete the customer's data, the moderator must select **Delete** for each item.

## Download ratings and reviews data

Commerce site builder lets moderators import ratings and reviews data in bulk, so that they can analyze trends. A Power BI template that includes basic metrics is available. Moderators can use this template to connect bulk-imported data and view a dashboard. They don't have to create a custom dashboard. Moderators can also customize the Power BI template to meet their specific needs.

To download ratings and reviews data in Commerce site builder, follow these steps.

1. Go to **Home > Reviews > Reporting**.
2. Select **Download review data** to download ratings and reviews data in bulk in comma-separated values (CSV) format.

## View ratings and reviews trends

Moderators can download the Power BI template so that they can view trends in a dashboard.

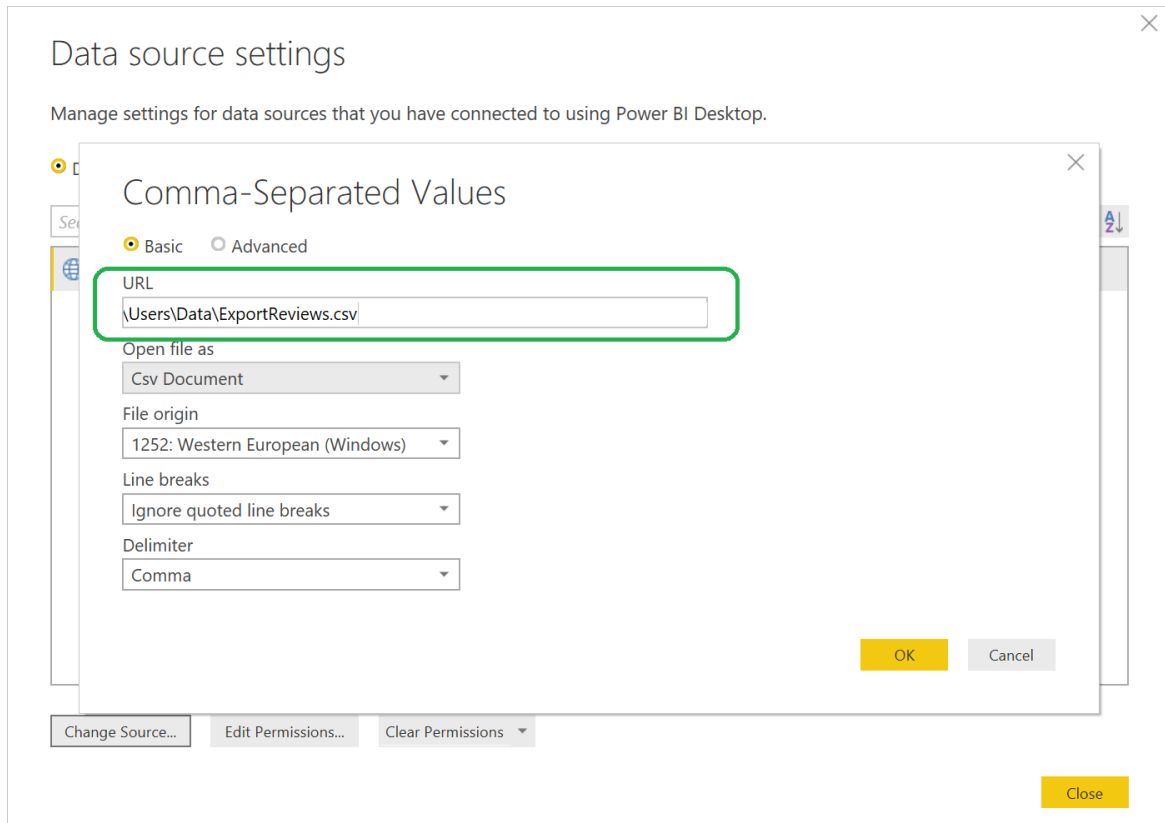

To view ratings and reviews trends in Commerce site builder, follow these steps.

1. Go to **Home > Reviews > Reporting**.
2. Select **PowerBI template** to download the template.

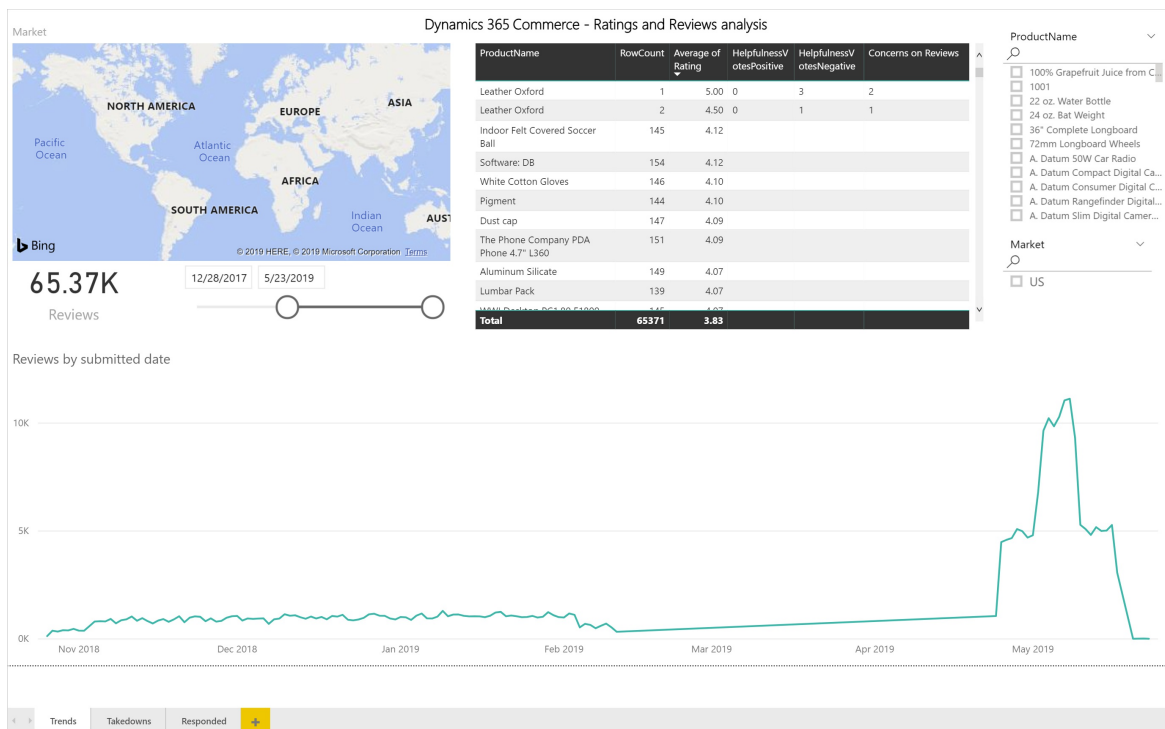

3. Open the downloaded template by using the Power BI app. Close the **Access to web content** dialog box that appears, and then close the "Refresh" error message that appears.
4. Go to **Home**, select **Edit queries**, and then select **Data source settings**.
5. In the **Data source settings** dialog box, select **Change Source**.

- In the URL field, enter the path of the reviews data that you downloaded in the previous procedure (for example, c:\reviews\ReviewsData.csv).

- Select **OK**, and then select **Apply changes**. It will take one to two minutes to apply your changes to the data source.
- Select **Trends sheet** to view ratings and reviews trends.

# Configure ratings and reviews

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to configure your e-Commerce site to show customer ratings and reviews in Microsoft Dynamics 365 Commerce.

## Overview

Ratings and reviews on e-Commerce websites help customers learn about products before they make a purchase decision by showing them what other customers think about those products. For e-Commerce websites, ratings and reviews are also a mechanism for collecting customer feedback about products.

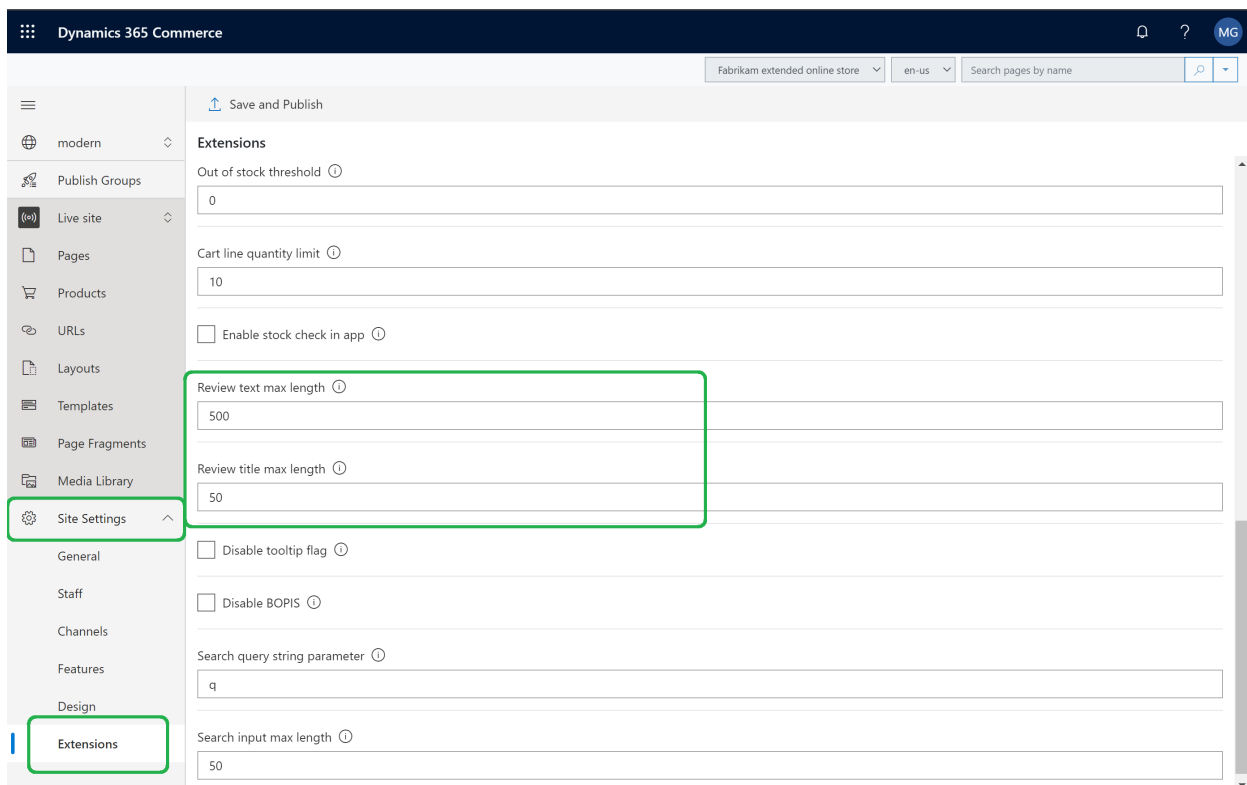

## Configure a site to show ratings and reviews

Configuration values for ratings and reviews, such as the tenant ID, review text length, and review title length, are configured at the site level.

To configure a site to show ratings and reviews, follow these steps.

1. Go to **Home > Sites**.
2. Select the name of your site.
3. Go to **Site settings > Extensions**.
4. In the **Review text max length** field, enter the maximum number of characters that review text can have (for example, 1000).
5. In the **Review title max length** field, enter the maximum number of characters that review titles can have (for example, 55).
6. Select **Save and Publish**.

The following illustration shows what this configuration looks like in Dynamics 365 Commerce.

The screenshot shows the Dynamics 365 Commerce interface. The top navigation bar includes the Dynamics 365 Commerce logo, a search bar, and user information (MG). The left sidebar shows the navigation menu with 'Site Settings' and 'Extensions' highlighted. The main content area displays the 'Extensions' configuration page for the 'Fabrikam extended online store' in the 'en-us' locale. The 'Review text max length' field is set to 500, and the 'Review title max length' field is set to 50. Other fields include 'Out of stock threshold' (0), 'Cart line quantity limit' (10), 'Enable stock check in app' (unchecked), 'Disable tooltip flag' (unchecked), 'Disable BOPIS' (unchecked), 'Search query string parameter' (q), and 'Search input max length' (50).

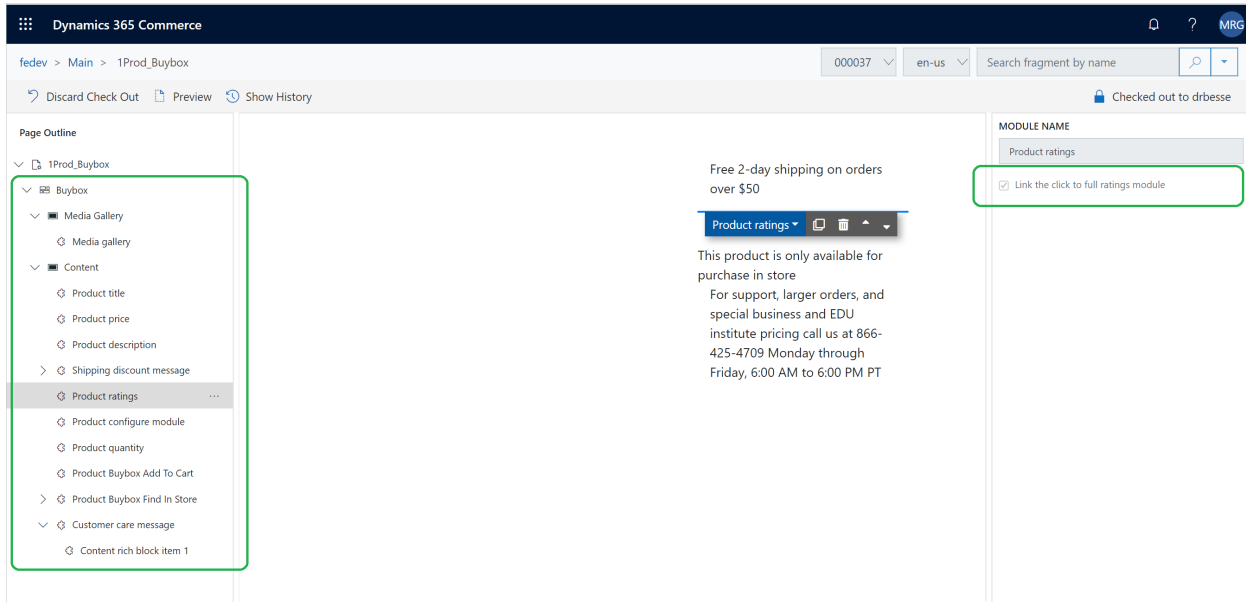

# Link a product rating to the Reviews section of a PDP

A product rating is shown below the product title at the top of PDP. The product rating can be configured so that it's linked to the **Reviews** section of the same PDP.

To link a product rating to the **Reviews** section of the PDP, follow these steps.

1. Open the PDP template.
2. Go to **Buy box container module settings**.
3. Under **Buy box**, select **Product ratings**, and then select the **Link the click to full reviews module** check box.

The following illustration shows what this configuration looks like in Dynamics 365 Commerce.

# Configure the link for the privacy and policy page

To configure the link for the privacy and policy page, follow these steps.

1. Go to **Home > Sites**.
2. Select the name of your site.
3. Go to **Site settings > Extensions**.
4. On the **Routes** tab, under **RNR Privacy and Policy**, select **Add a link**. If a link is already entered, and you want to replace it, select the link.
5. In the **Add a link** dialog box, select the link for the privacy and policy page, and then select **OK**.
6. Select **Save and Publish**.

# Sync product ratings in Dynamics 365 Commerce

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to sync product ratings in Microsoft Dynamics 365 Commerce.

## Overview

To consume product ratings in omnichannels, such as at the point of sale (POS) and in call centers, product ratings from the ratings and reviews service must be imported into the Commerce channel database. When product ratings are made available in omnichannels, they can help customers indirectly during their interactions with sales associates.

This topic describes following tasks:

1. Configure **Product ratings sync job** as a batch job to synchronize product ratings from the **Ratings and Reviews service**.
2. Verify that the batch job for product rating synchronization was successful.
3. Make product ratings available at the POS.

## Configure a batch job to synchronize product ratings

### IMPORTANT

Before you start, make sure that version 10.0.6 or later of Dynamics 365 Commerce is installed.

### Initialize the commerce scheduler

To initialize the commerce scheduler, follow these steps.

1. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Initialize commerce scheduler**. Alternatively, search for "Initialize commerce scheduler."
2. In the **Initialize commerce scheduler** dialog box, make sure that the **Delete existing configuration** option is set to **No**, and then select **OK**.

### Verify the RetailProductRating subjob

To verify that the **RetailProductRating** subjob exists, follow these steps.

1. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Scheduler subjobs**. Alternatively, search for "Scheduler subjobs."
2. In the subjob list, find or search for the **RetailProductRating** subjob.

The following illustration shows an example of the subjob details in Commerce.

The screenshot displays the Commerce scheduler interface. At the top, there are navigation options: Edit, New, Delete, Copy scheduler subjob, and OPTIONS. A search bar is present. The left sidebar shows a list of subjobs, with 'RetailProductRating' highlighted and circled in green. The main area shows the configuration for the 'RetailProductRating' subjob. The 'SCHEDULER SUBJOBS' header is also circled in green. The configuration includes a table for 'SCHEDULER SUBJOBS' with columns 'Subjob number' and 'Description', showing 'RetailProductRating' with subjob number 'RetailProductRating'. Below this is the 'Setup' section with options for 'Reference only' (No), 'Pull data' (No), 'Replicate DataAreaID' (No), and 'Channel schema'. The 'Scheduled by' section shows a table with columns 'Job name' and 'Description', listing '1040' with description 'Products'.

#### NOTE

If you don't find the **RetailProductRating** subjob, you might already have run the **Sync product ratings** job and the **1040 CDX** job before you initialized the Commerce scheduler. In this case, follow these steps to run the **Full data sync** job.

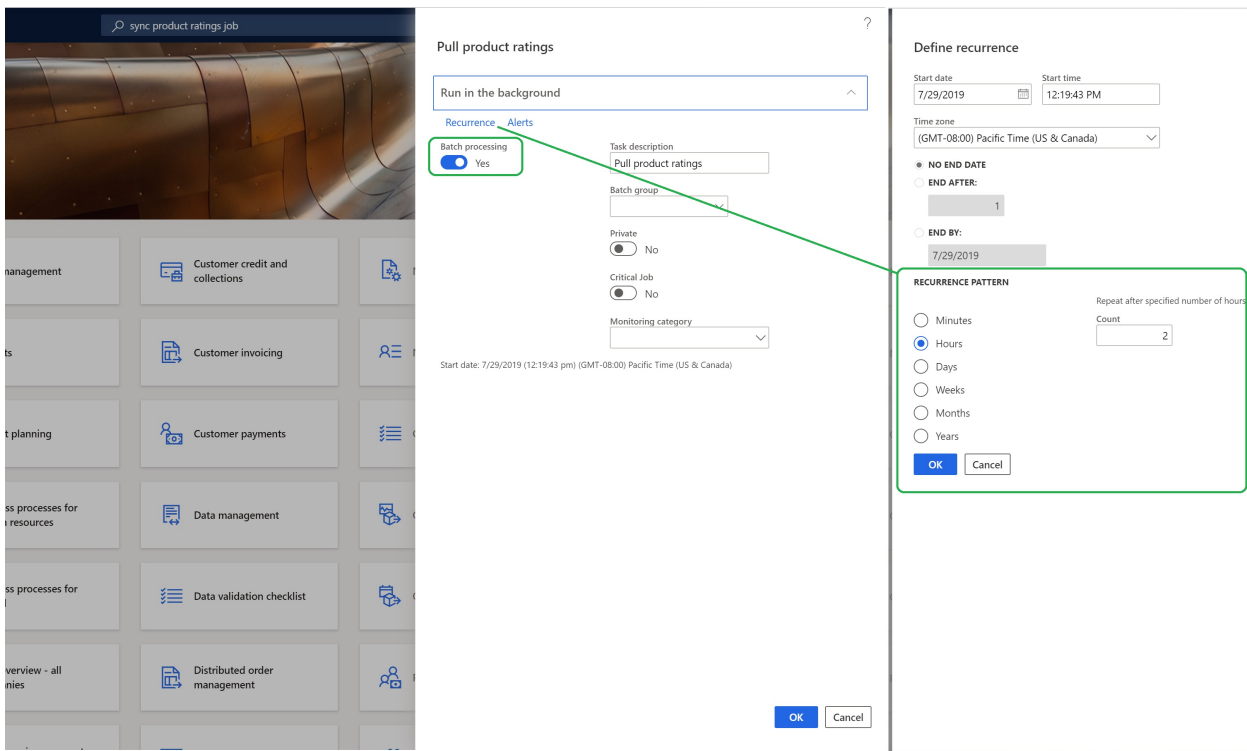

1. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Channel database**. Alternatively, search for "Channel database."
2. Select the channel database to sync.
3. On the action pane, select **Full data sync**.
4. In the **Select a distribution schedule** drop-down dialog box, select **1040 - products**, and then select **OK**.
5. Repeat the steps of the previous procedure to verify that the **RetailProductRating** subjob has been created.

#### Import product ratings

To import product ratings into Commerce from the ratings and reviews service, follow these steps.

1. Go to **Retail and Commerce > Headquarters setup > Commerce scheduler > Sync product ratings job**. Alternatively, search for "Sync product ratings job."
2. In the **Pull product ratings** dialog box, on the **Run in the background** FastTab, select **Recurrence**.
3. In the **Define recurrence** dialog box, set up a recurrence pattern. (The suggested value is two hours.) Don't schedule a recurrence that is less than one hour.
4. Select **OK**.
5. Set the **Batch process** option to **Yes**. This setting helps guarantee that you will be able to audit the logs and verify the status of batch job runs.
6. Select **OK** to schedule the batch job.

The following illustration shows an example of batch job configuration in Commerce.

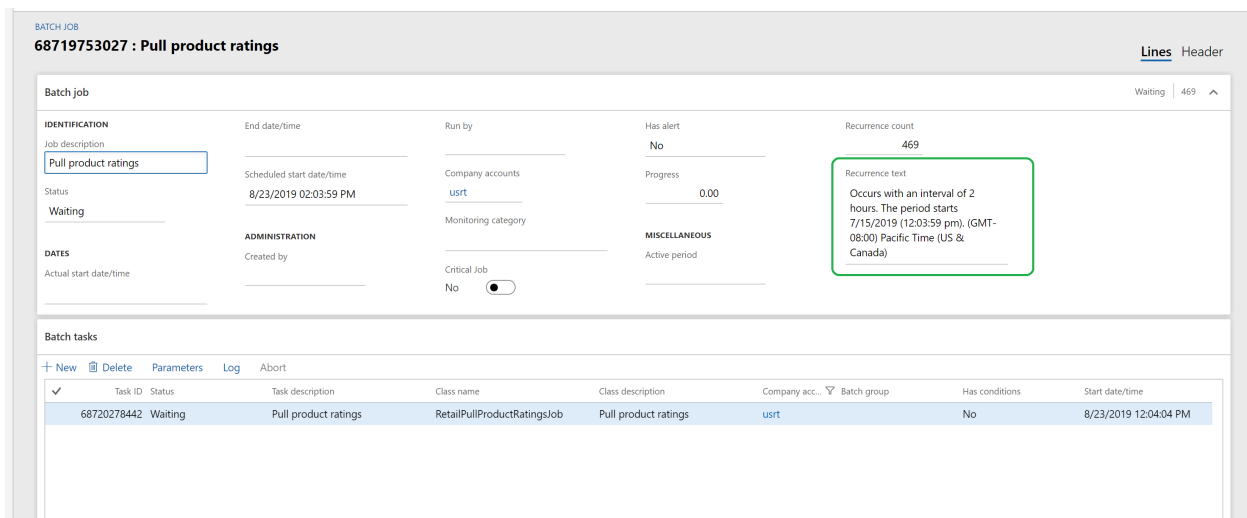

## Verify that the batch job for product rating synchronization was successful

To verify that the **Sync product ratings** batch job was successful, follow these steps.

1. Go to **Retail and Commerce > System administrator > INQUIRIES > Batch jobs** or, if you're using a Commerce-only stock keeping unit (SKU), **Retail and Commerce > INQUIRIES and reports > Batch jobs** instead. Alternatively, search for "Batch jobs."
2. To view the details of the batch job, in the batch job list, in the **Job description** column, search for a description that contains "Pull product ratings."
3. Select the job ID to view the batch job details, such as the scheduled start date/time and the recurrence text.

The following illustration shows an example of the batch job details in Commerce when the batch job is scheduled to run at two-hour intervals.

## Make product ratings available at the POS

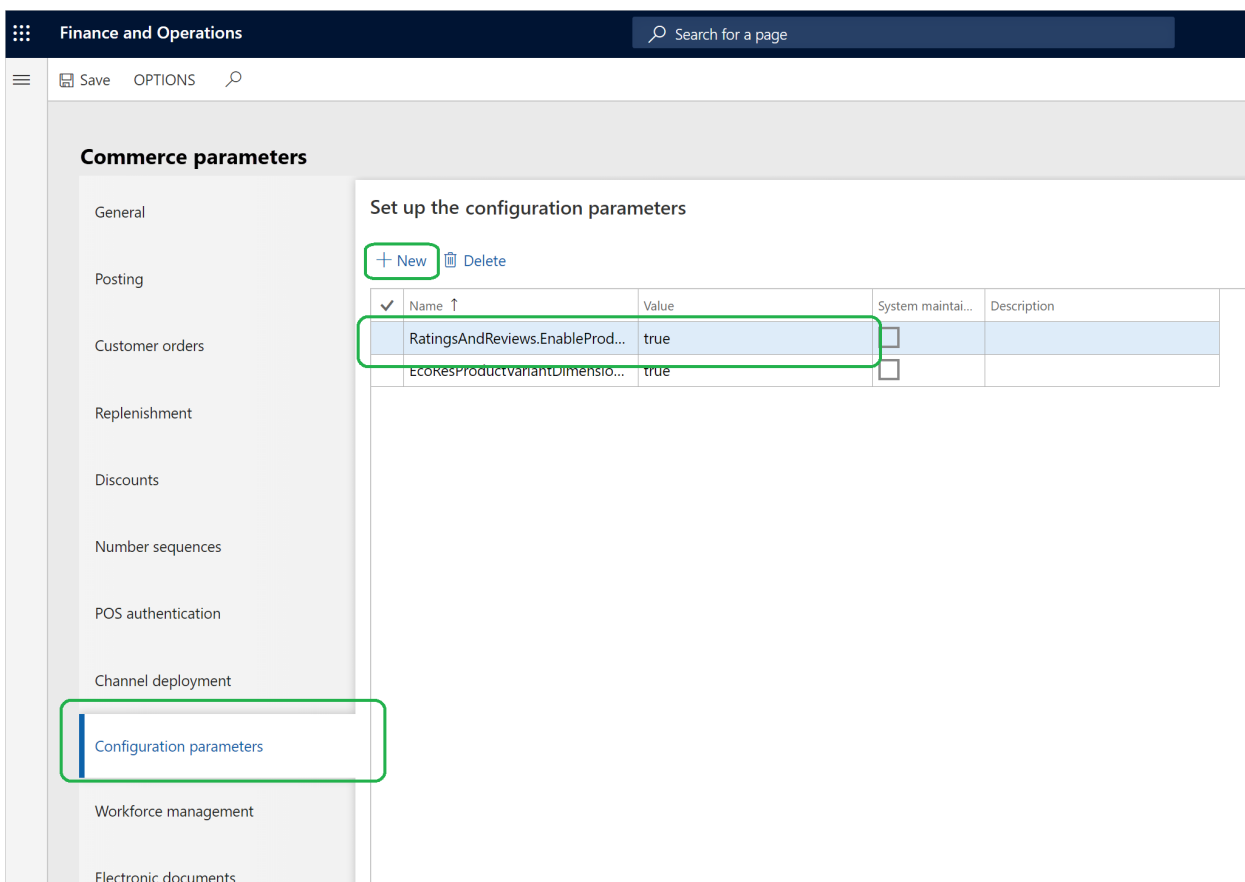

The ratings and reviews solution in Dynamics 365 Commerce is an omnichannel solution. However, products ratings aren't shown at the POS by default. To help customers in stores see ratings and reviews when they are

being helped by sales associates, you must turn on product ratings at the POS.

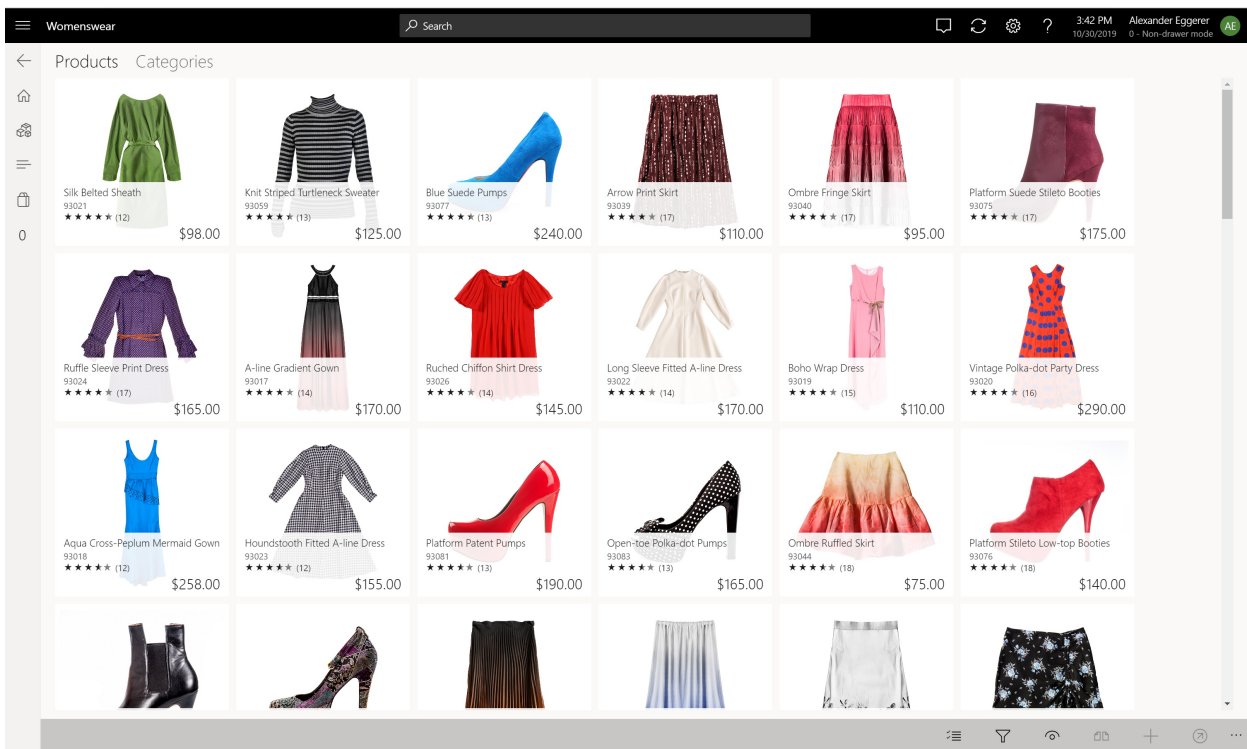

To turn on product ratings at the POS, follow these steps.

1. Go to **Retail and Commerce > Commerce setup > Parameters > Commerce parameters**.  
Alternatively, search for "Commerce parameters."
2. On the **Configuration parameters** tab, select **New**.
3. Enter a name such as **RatingsAndReviews.EnableProductRatingsForRetailStores**, and set the value to **true**.
4. Select **Save**.
5. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**. Alternatively, search for "Distribution schedule."
6. In the job list, select **1110 (Global configuration)**, and then select **Run now**.
7. After the job has successfully run, verify that products ratings are now shown at the POS.

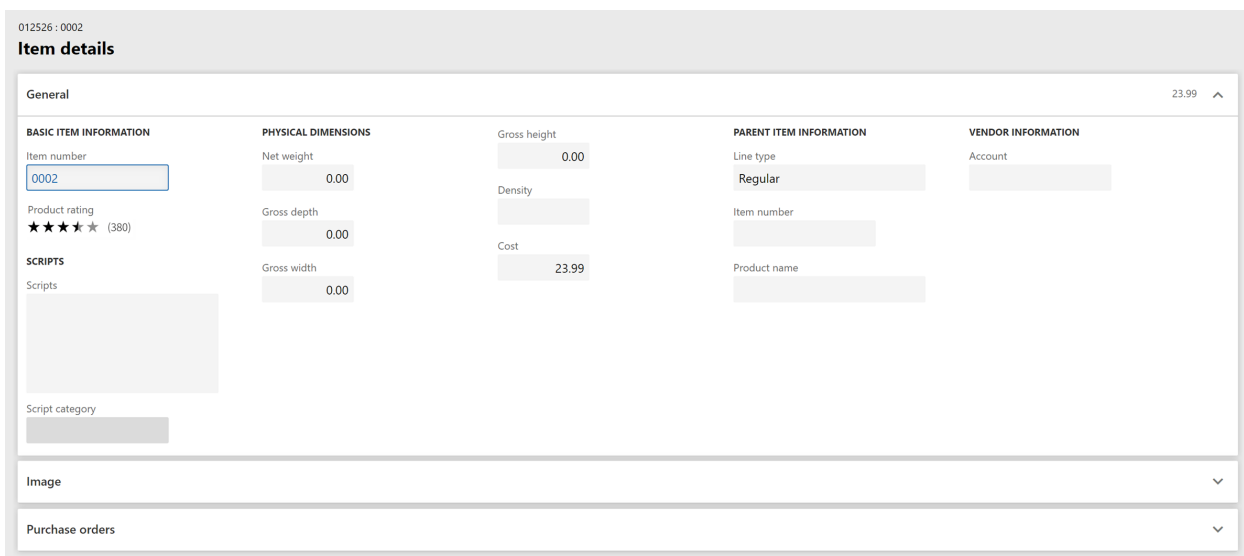

The following illustration shows an example of the configuration of the Commerce parameters to turn on product ratings at the POS.

The following illustration shows an example of product ratings at the POS.

The following illustration shows an example of product ratings in call center channels.

# Commerce inventory management

2/18/2021 • 5 minutes to read • [Edit Online](#)

When you work with inventory in Microsoft Dynamics 365 Commerce and use any of the Commerce applications that are connected to a Commerce Scale Unit (CSU), it's important to know that the order processing logic in CSU provides limited support for some inventory dimensions and some inventory item types. Commerce applications don't support the full range of item configuration capabilities that is available through the item configuration options in Dynamics 365 Supply Chain Management.

The Commerce applications running on CSU don't support the following product dimensions and item configurations:

- Configuration product dimension and bill of materials (BOM) items (except retail kit products, which use some components of the BOM framework)
- Catch weight items
- Version product dimension-controlled items

The Commerce applications running on CSU do not support the following tracking dimensions:

- Owner dimension
- The point of sale (POS) application can offer limited support for the following dimensions. POS may automatically enter some of the dimensions in inventory transactions, based on the configuration of the warehouse or store setup. POS won't fully support the dimensions in the way that they are supported if a sales transaction is manually entered in Commerce headquarters, however.
- **Warehouse Location** – When they use the new [Inbound operation](#) and [Outbound operation](#) POS operations, users can select a warehouse inventory location to receive items into or ship outbound transfer order items out of. If they use the obsolete **Picking and receiving** operation, limited location management support is available for receiving and shipping outbound transfers. That support is available only if the **Use warehouse management process** option has been turned on for the item and the store warehouse. An inventory location can't currently be used with the **Stock count** operation or the **Inventory lookup** operation.
- **License plate** – License plates are applicable only when the **Use warehouse management process** option has been turned on for the item and the store warehouse. In POS, if inventory is received into a store warehouse by using the **Inbound operation** operation or the **Picking and receiving** operation where the warehouse management process has been turned on, and if the location that has been selected to receive the item into is linked to a location profile that requires license plate control, the POS application systematically applies a license plate to the receiving line. POS users can't change or manage this license plate data. If full management of license plates is required, we recommend that the store use the [warehousing app](#) or the back-office client to manage the receipt of these items.
- **Serial number** – The POS application provides limited support for registration of a single serial number on a sales transaction line for orders that are created in POS and include serialized items. This serial number isn't validated against registered serial numbers that are already in inventory. If a sales order is created in the call center channel or fulfilled through enterprise resource planning (ERP), and multiple serial numbers are registered on a single sales line during the fulfillment process in ERP, those serial numbers can't be applied or validated if a return is processed for the order in POS. When inventory is received by using the **Inbound operation** operation, users can [register or confirm the serial numbers received](#).

- **Batch ID** - The POS application provides limited support during statement posting if a batch-controlled item is sold, but POS users aren't able to define the batch ID that was sold or picked when using the POS application.
- **Inventory status** – For items that use the warehouse management process and require an inventory status, this status field can't be set or modified through the POS application. The default inventory status that is defined in the store warehouse configuration is used when items are received into inventory.

#### NOTE

All organizations must test item configurations through Commerce apps in development or test environments before they deploy those item configurations to production environments. Test your items by using them to perform regular cash-and-carry sales transactions in POS and create customer orders (if applicable) through POS, call center or e-commerce to validate they can be fully supported. You should also test POS fulfillment and inventory processes (such as inventory receiving and order fulfillment operations) before you deploy any new item configurations, to make sure that the POS application can support them. Testing must include running a full statement/order posting process in your test environment and verifying that no posting issues occur when orders for these items are created and posted in Commerce headquarters.

If items are configured in a way that isn't supported by the Commerce applications and appropriate testing isn't done, data failures that aren't easily corrected or may not be able to be corrected at all, may occur.

## Purchase orders

Purchase orders are created in Commerce headquarters. If a store warehouse is included in the purchase order header or on purchase order lines, the lines can be received at the store by using the [Inbound operation](#) operation in POS.

## Transfer orders

Transfer orders can be created in Commerce headquarters, or through either the [Inbound operation](#) or [Outbound operation](#) operation in POS. Use the **Inbound operation** POS operation to create a transfer order request to have inventory sent to the store from another warehouse or store location. Use the **Outbound operation** POS operation to create a transfer order request to have inventory shipped from the store to another warehouse or store location. After a transfer order for a store is created, that store can manage the receipt of inventory for the transfer order through the **Inbound operation** operation in POS. If the store is shipping inventory to another location, the **Outbound operation** operation in POS is used to manage that store's outbound shipment process.

## Stock counts

Stock counts can be either scheduled or unscheduled. Scheduled stock counts are created through Commerce headquarters by creating a Counting journal document that is linked to the store's warehouse. This journal specifies the items that must be counted. The store can then access these predefined counting journals and act on them by using the **Stock count** operation in POS. Store users initiate an unscheduled stock count as it's required when they use the **Stock count** operation in POS. Unlike scheduled stock counts, unscheduled stock counts don't have a predefined list of items. When a stock count of either type is completed in POS, it's committed and sent to the head office. At the head office, the count must then be validated and posted in Commerce headquarters as a separate step.

## Inventory lookup

The product quantity that is currently on hand for multiple stores and warehouses can be viewed on the **Inventory lookup** page. In addition to the current on-hand quantity, the future available-to-promise (ATP)

quantities can be viewed for each store. Select the store to view the ATP quantities for, and then select **Show store availability**. For information about the configuration options that are available, see [Calculate inventory availability for retail channels](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure inventory buffers and inventory levels

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to configure inventory buffers and inventory levels that determine the messaging about inventory availability on Microsoft Dynamics 365 Commerce sites.

## Overview

Dynamics 365 Commerce headquarters holds inventory data and various channels such as point of sale (POS) applications, e-Commerce storefronts, and other custom integrated applications that pull and push inventory around in an asynchronous manner. Therefore, the available inventory values that are obtained through the on-hand inventory page in Commerce headquarters, through the POS user interface (UI), and through e-Commerce inventory availability APIs aren't always 100-percent accurate in real time.

Instead of showing actual inventory values in e-Commerce storefronts, many retailers prefer just to show messaging about inventory availability status (for example, "Available" or "Out of stock") to inform customers whether an item is available for purchase or potentially out of stock. For this approach, inventory buffers and inventory levels that determine the inventory availability messaging must be made available and configured.

## Prerequisite: Turn on the inventory buffers and inventory levels feature

The feature for inventory buffers and inventory levels is controlled through Feature management in Commerce headquarters. To turn on the feature, follow these steps.

1. Go to **System administration > Workspaces > Feature management**.
2. Search for the **Enable inventory buffers and inventory levels** feature, select its row, and then select **Enable now**.

After the feature is turned on, you can find inventory levels at **Retail and Commerce > Inventory management**.

## Create and configure an inventory level profile

An *inventory level profile* determines whether a given product quantity status is considered in stock, out of stock, or some other custom status. You can create and configure multiple inventory level profiles per legal entity. Each profile consists of a set of inventory levels, and each level is defined by a *range*, a *code*, and a *label*.

- **Range** – Each range is defined by a *start quantity* and an *end quantity*. A quantity value falls in a range if it's more than the start quantity of that range and not more than the end quantity.
- **Code** – A code is an internal abbreviation that represents the level. Customers who directly integrate with the inventory APIs can use codes to build additional logic for a given inventory level. For example, they can turn off the purchase capability for a product when its inventory level code is **OOS** ("out of stock").
- **Label** – A label is a meaningful customer-facing message that conveys an inventory level to customers on an e-Commerce site.

### Create an inventory level profile

To create an inventory level profile, follow these steps.

1. Go to **Retail and Commerce > Inventory management > Inventory levels**.
2. On the Action Pane, select **New**, and then enter values in the **Profile ID** and **Description** fields.

3. On the **Ranges** FastTab, select **Add** to add a new level, and then enter values in the **Start quantity**, **End quantity**, **Code**, and **Label** columns for that level. Repeat this step to add more levels. As you require, you can edit the values in the data grid, or you can select **Delete** to remove a level.
4. On the Action Pane, select **Save**.

When a new profile is created, two inventory levels are automatically initialized:

- **OOS** – The "out of stock" level, where the lower bound of the range is negative infinity. The start quantity and code can't be edited for this level.
- **AVAIL** – The "available" level, where the upper bound of the range is infinity. The end quantity and code can't be edited for this level.

#### **NOTE**

There can be no gaps or overlap between ranges in the profile definition.

You can use the **Translations** button on the Action Pane to configure localized strings for the label message. You must then run the 1110 (**Global configuration**) distribution schedule job to sync the localized strings to channels.

### **Configure an inventory level profile**

You can configure an inventory level profile at either the product category level or the individual product level. When an inventory level profile is configured for a product, the inventory level is determined based on the ranges that are defined in the linked profile. Otherwise, the "available" or "out of stock" inventory level is determined based on whether the product has a positive on-hand quantity.

To configure an inventory level profile for a category, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Commerce product hierarchy**.
2. Select the category to configure an inventory level profile for.
3. On the **Sell product properties** FastTab, select a legal entity.
4. In the **Commerce inventory** section, in the **Inventory level profile** field, select one of the predefined inventory level profiles.

You can use the **Update products** button on the Action Pane to propagate the value of the category-level profile to the category's underlying products. For more information, see [Manage product categories and products](#).

To configure an inventory level profile for a released product, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Released products by category**.
2. Select a product, and then open its product details page.
3. On the **Sell** FastTab, in the **Commerce inventory** section, in the **Inventory level profile** field, select one of the predefined inventory level profiles.

When a new product is created, the **Inventory level profile** field, like many other product-level attributes, will be set to the value that is configured for the category that the product is associated with.

#### **NOTE**

The inventory level profile is a legal entity-specific attribute. For the same category or product, the inventory level profile value can vary across legal entities.

To sync the configurations of inventory level profiles to channels, follow these steps.

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Run the **1040 (Product)** distribution schedule.

## Configure an inventory buffer

The *inventory buffer* is a user-defined value that subtracts the additional quantity of an item from the original quantity to calculate the estimated quantity. This estimated quantity gives retailers a safe buffer so that they don't oversell a product by selling more than its actual on-hand inventory. You can configure the inventory buffer at either the product category level or the individual product level. If no inventory buffer is specified, the default value of **0** (zero) is used.

To configure the inventory buffer for a category, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Commerce product hierarchy**.
2. Select the category to configure the inventory buffer for.
3. On the **Sell product properties** FastTab, select a legal entity.
4. In the **Commerce inventory** section, in the **Inventory buffer** field, enter a positive value.

You can use the **Update products** button on the Action Pane to propagate the value of the category-level buffer to the category's underlying products. For more information, see [Manage product categories and products](#).

To configure the inventory buffer for a released product, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Released products by category**.
2. Select a product, and then open its product details page.
3. On the **Sell** FastTab, in the **Commerce inventory** section, in the **Inventory buffer** field, enter a positive value.

When a new product is created, the **Inventory buffer** field will be set to the value that is configured for the category that the product is associated with.

### NOTE

If both the inventory buffer and inventory level profiles are configured for a product, the product's estimated quantity (that is, the original quantity minus the buffer value) will be used for range calculation to determine the inventory level.

To sync the configurations of inventory buffers to channels, follow these steps.

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Run the **1040 (Product)** distribution schedule.

## Use inventory buffers and inventory levels in e-Commerce scenario

Commerce site builder uses the inventory buffer and inventory level capabilities in Commerce headquarters to determine inventory availability messaging on e-Commerce sites. For more information, see [Apply inventory settings](#).

Alternatively, if you integrate with a third-party e-Commerce solution, you can use the **GetEstimatedAvailability** and **GetEstimatedProductWarehouseAvailability** APIs to show inventory availability for a product in your e-Commerce scenario. For more information about these APIs, see [Calculate inventory availability for retail channels](#).

The introduction of inventory buffers and inventory levels enables these APIs to return inventory level codes and label messages that are determined based on total available and available physical values. The APIs can be

further configured to determine whether the inventory quantity is returned together with the message, and whether the available quantity is reduced by the inventory buffer value.

To configure the response of the product availability APIs, follow these steps.

1. Go to **Retail and commerce > Headquarters setup > Parameters > Commerce parameters**.
2. In the **Store inventory** section, on the **Inventory** tab, in the **Product availability APIs for e-Commerce** field, select a value.
3. To apply the settings to channels, run the **1110 (Global configuration)** distribution schedule job.

# Work with serialized items in the POS

2/18/2021 • 11 minutes to read • [Edit Online](#)

Many retailers sell products that require serial control. These products are referred to as *serialized items*. Some retailers might want to maintain serial numbers in store or warehouse inventory for tracking purposes. Other retailers might want to capture serial numbers during the sales process, for service and warranty purposes. This topic explains how you can manage serialized items in the Microsoft Dynamics 365 Commerce point of sale (POS) application.

## Serial number configurations

An item is considered a serialized item if it's assigned a tracking dimension group that's set up to allow for serial numbers. In Commerce headquarters, on the **Tracking dimension groups** page, select the **Active** option to enable serial numbers for the inventory process, or select the **Active in sales process** option to enable serial numbers for the sales process.

On the **Tracking dimensions** FastTab, turn on the **Blank receipt allowed** parameter to allow serial number to be an optional input during the inventory receipt process of serialized item. Turning off this parameter enforces serial number to be a required input. Similarly, the **Blank issue allowed** parameter controls whether serial number is required during the inventory shipment process.

### NOTE

To use the **Inbound inventory** and **Outbound inventory** POS operations to register or validate serial numbers against a serialized item, you must configure that item to be assigned a tracking dimension group that's set up to allow for serial numbers for the **Active** option, not the **Active in sales process** option.

## Serial number management page

In the **Inbound inventory** and **Outbound inventory** POS operations, if the item that is being selected, received, or shipped is a serialized item, the **Details** pane contains a **Manage serial number** option that links to the **Serial number management** page where you can register or validate serial numbers for the item. Alternatively, you can open the **Serial number management** page either by selecting the **Serial number** action on the app bar of the order details view, or by selecting the **Manage serial number** option in the dialog box that prompts you during the receiving or shipping process.

The **Serial number management** page lists all open serial number lines that are pending registration or validation. There might be two tabs on this page: one for the current item and another for all serialized items in the order.

The **Status** field on the **Serial number management** page provides information about the current stage that each serial number is in:

- **Not registered** – The serial number hasn't been provided, or the preregistered serial number hasn't yet been validated (in the receiving process).
- **Registering** – The serial number has been registered and saved locally to the store's channel database, or the preregistered serial number has been validated. Only serial numbers that have a status of **Registering** will be submitted to Commerce headquarters when you finish receiving or fulfillment.

## Receive serialized items

The **Inbound inventory** POS operation lets users perform the following tasks for serialized items:

- Register serial numbers against serialized items when those items are received in the store via a purchase order.
- Validate preregistered serial numbers against serialized items when those items are received in the store via a purchase order or transfer order.

### **Register serial numbers against serialized items**

For a purchase order, you'll be prompted with a dialog box with the **Manage serial number** option during the receiving process of a serialized item. You can select that option to open the **Serial number management** page and start to register serial numbers. You can also skip this step during the receiving process and provide the input later, before the receipt is posted.

By default, the tab for the current item is shown. All serial number lines have an empty serial number value and a status of **Not registered**. You can scan serial number bar codes, or you can select **Serial number** on the app bar to continuously enter serial numbers. The serial numbers that you enter appear in the list, and their status is changed to **Registering**. The maximum number of serial numbers that you can register in the list is equal to the receiving quantity. If you make a mistake, you can select **Edit** or **Clear** in the **Details** pane to make changes to the serial numbers that you entered.

You can also register serial numbers on the **All serialized items** tab of the **Serial number management** page. In the list, select the item that you want to register serial numbers against.

### **Validate serial numbers on serialized items**

For a transfer order, the outbound side must preregister serial numbers on the serialized items during the shipment process. For a purchase order, the supplier might provide serial number information through an Advance Shipment Notice (ASN), and you can preregister the numbers on the items that will be shipped. In both cases, the serial numbers are known before the receipt. Therefore, on the inbound side, you just have to validate that you received what you were supposed to receive.

To validate serial numbers, you can open the **Serial number management** page either during the receiving process or at any time before the receipt is posted. For each serialized item that has preregistered serial numbers, all the serial numbers are automatically set to an initial status of **Not registered** on this page. To validate serial numbers, you can scan or enter them. As serial number are entered, the application validates whether they match preregistered serial numbers. If they match, their status is changed to **Registering**. Otherwise, you receive an error message. Alternatively, you can directly select a serial number, then select the **Validate serial number** option in the **Details** pane to quickly mark that serial number as validated. The maximum number of serial numbers that you can validate in the list is equal to the receiving quantity.

You can also validate serial numbers on the **All serialized items** tab of the **Serial number management** page. In the list, select the item that you want to validate serial numbers against.

## **Ship serialized items**

You can use the **Outbound inventory** POS operation to register serial numbers against serialized items when shipping them out of current store via a transfer order.

### **Register serial numbers against serialized items**

For a transfer order, you'll be prompted with a dialog box with the **Manage serial number** option during the shipping process of a serialized item. You can select the option to open the **Serial number management** page and start to register serial numbers. You can also skip this step during the shipping process and provide the input later, before the shipment is posted.

By default, the tab for the current item is shown. All serial number lines have an empty serial number value and a status of **Not registered**. You can scan serial number bar codes, or you can select **Serial number** on the app

bar to continuously enter serial numbers. The serial numbers that you enter appear in the list, and their status is changed to **Registering**. The maximum number of serial numbers that you can register in the list is equal to the shipping quantity. If you make a mistake, you can select **Edit** or **Clear** in the **Details** pane to make changes to the serial numbers that you entered.

You can also register serial numbers on the **All serialized items** tab on the **Serial number management** page. In the list, select the item that you want to register serial numbers against.

Optionally, you can enable serial number availability validation during the serial number registration against an outbound transfer order. With this validation, if you attempt to ship a serial number that is not available in the inventory of the shipping store, you will receive an error message and must provide a different number.

To enable such validation, as a prerequisite, you need to schedule the following jobs to run on a recurring basis:

- **Retail and Commerce > Retail and Commerce IT > Products and inventory > Product availability with tracking dimensions**
- **Retail and Commerce > Distribution schedules > 1130 (Product availability)**

## Sell serialized items in POS

While the POS application has always supported selling serialized items, in Commerce version 10.0.17 and later, organizations can enable functionality that enhances the business logic that's triggered when selling products that are configured for serial number tracking.

When the **Enhanced serial number validation in POS order capture and order fulfillment** feature is enabled, the following product configurations are evaluated when selling serialized products in POS:

- **Serial type** setup for the product (**active** or **active in sales**).
- **Blank issue allowed** settings for the product.
- **Physical negative inventory** settings for the product and/or the selling warehouse.

### Active serial configurations

When items are sold in POS that are configured with an **Active** serial number tracking dimension, POS initiates validation logic that prevents users from completing the sale of a serialized item with a serial number that can't be found in the selling warehouse's current inventory. There are two exceptions to this validation rule:

- If the item is also configured with **Blank issue allowed** enabled, users can skip the entry of the serial number and sell the item with no serial number designation.
- If the item and/or the selling warehouse is configured with **Physical negative inventory** enabled, the application accepts and sells a serial number that can't be confirmed to be in inventory at the warehouse that it's being sold against. This configuration allows the inventory transaction for that specific item/serial number to go negative, and therefore the system will allow for sales of unknown serial numbers.

#### IMPORTANT

To ensure that the POS application can properly validate whether the serial numbers being sold for **Active** serial type items are in the selling warehouse's inventory, it's required that organizations run the **Product availability with tracking dimensions** job in Commerce headquarters and the accompanying **1130** product availability distribution job through Commerce headquarters on a frequent basis. As new serialized inventory is received into selling warehouses, in order for the POS to validate inventory availability of serial numbers being sold, the inventory master must frequently update the channel database with the most up-to-date inventory availability data. The **Product availability with tracking dimensions** job takes a current snapshot of master inventory, including serial numbers, for all company warehouses. The **1130** distribution job takes that inventory snapshot and shares it with all configured channel databases.

### Active in sales process serial configurations

Items configured with the serial dimension as **Active in sales process** don't go through any inventory validation logic, as this configuration implies that the inventory serial numbers aren't pre-registered into stock and the serial numbers are only captured at the time of sale.

If **Blank issue allowed** is also configured for **Active in sales process** configured items, the serial number entry can be skipped. If **Blank issue allowed** isn't configured, the application requires the user to enter a serial number, even though it won't be validated against available inventory.

### Apply serial numbers during creation of POS transactions

The POS application immediately prompts users for serial number capture when selling a serialized item, but the application allows users to skip the entry of serial numbers up to a certain point in the selling process. When the user begins to capture payment, the application enforces and requires serial number entry for any items that aren't configured to be fulfilled through future shipments or pickups. Any serialized items configured for cash and carry or carryout fulfillment require the user to capture the serial number (or agree to leave it blank if the item configuration allows for it) before completing the sale.

For serialized items sold for future pickup or shipment, POS users can skip entering the serial number initially and still complete the customer order creation.

#### NOTE

When selling or fulfilling serialized products through the POS application, a quantity of "1" is enforced for the serialized items on the sales transaction. This is a result of how the serial number information is tracked on the sales line. When selling or fulfilling a transaction for multiple serialized items through POS, each sales line must be only configured with a quantity of "1".

### Apply serial numbers during customer order fulfillment or pickup

When fulfilling customer order lines for serialized products using the **Order Fulfillment** operation in POS, POS enforces the capture of the serial number before final fulfillment. Therefore, if a serial number wasn't provided during the initial order capture, it must be captured during the pick, pack, or ship processes in POS. A validation is done at each step and the user will only be asked for serial number data if it's missing or no longer valid. For example, if a user skips the pick or pack steps and immediately initiates a shipment, and a serial number hasn't been registered for the line, POS will require the serial number to be entered before completion of the final invoice step. When enforcing the capture of the serial number during order fulfillment operations in POS, all rules mentioned previously in this topic still apply. Only serialized items configured as **Active** go through a serial number inventory stock validation. Items configured as **Active in sales process** won't get validated. If **Physical negative inventory** is allowed for **Active** products, any serial number will be accepted, regardless of stock availability. For both **Active** and **Active in sales process** items, if **Blank issue allowed** is configured, a user can leave serial numbers blank if desired during the pick, pack, and ship steps.

Validations for serial numbers will also occur when a user performs the pick up operations on customer orders in POS. The POS application doesn't allow a pick up to be finalized on a serialized product unless it passes the validations as mentioned earlier. The validations are always based on the product's tracking dimension and selling warehouse configurations.

# Push products from distribution center to store using buyer's push

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through the steps to create and process a Buyer's push to distribute products from one location to one or many stores. The user can define multiple configurations and have the system suggest how to distribute the products, or manually enter where the products are distributed to and how much gets distributed to each store. This procedure doesn't include setup of data that can be used in the Buyer's push, such as replenishment rules, organizational hierarchies, and store weights. This procedure uses the USRT demo company.

1. Go to Buyer's push.
2. Click New.
3. In the Description field, type a value.
4. In the Site field, enter or select a value.
5. In the Warehouse field, enter or select a warehouse that has products with on-hand quantities.
6. Click Add.
7. In the list, mark the selected row.
8. In the Item number field, enter or select a product.
9. Click Add.
10. In the list, mark the selected row.
11. In the Item number field, enter or select a variant product.
  - When entering a variant product, lines will be created for each variant.
12. In the list, mark a row.
13. In the Pushed quantity field, type how many of the selected product you want to distribute.
14. In the Additional quantity to push field, enter the quantity of the products that have available quantity to distribute.
15. In the Distribution field, enter 'Location weight'.
  - You can select the other types to use other rules for the distribution.
16. In the Replenishment hierarchy field, select a value.
17. Select Yes in the Respect assortments field.
18. Click Calculate quantities and review the quantities that are added to the rows in the Warehouse section.
19. Click Create order.
20. Click Yes.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up rules and parameters for cross docking and buyer's push

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates the steps to create Replenishment rules. Replenishment rules can be used to control how products are distributed to stores when using Cross-docking and Buyer's push. Replenishment rules can be set up for stores or store groups. The weight defined for each line in a rule will control how the quantities of products will get distributed between the stores when using Replenishment rules as the distribution method in Cross-docking or Buyer's push. This procedure uses the USRT demo company.

1. Go to Replenishment rules.
2. Click New.
3. In the Replenishment rule field, type a value.
4. In the Description field, type a value.
5. Click Save.
6. Click Add.
7. In the list, mark the selected row.
  - You can choose Replenishment hierarchy or Channel for the type. The value controls whether the selection in Name will be a hierarchy of channels or a specific channel. For this example, leave it set as Replenishment hierarchy.
8. In the Name field, select a value.
  - The default weight value is populated from the weight defined on the warehouse. This weight can be used for the Replenishment rule or you can enter a new weight in the Weight field.
9. In the Weight field, enter a number.
10. Click Add.
11. In the list, mark the selected row.
12. In the Type field, select 'Channel'.
13. In the Name field, enter or select a value.
14. In the Weight field, enter a number.
15. Click Save.

# Inbound inventory operation in POS

2/18/2021 • 20 minutes to read • [Edit Online](#)

In Microsoft Dynamics 365 Commerce version 10.0.10 and later, inbound and outbound operations in the point of sale (POS) replace the picking and receiving operation.

## NOTE

In Commerce version 10.0.10 and later, any new features in the POS application that are related to receiving store inventory against purchase orders and transfer orders will be added to the **Inbound operation** POS operation. If you're currently using the picking and receiving operation in POS, we recommend that you develop a strategy for moving from that operation to the new inbound and outbound operations. Although the picking and receiving operation won't be removed from the product, there will be no further investments in it, from a functional or performance perspective, after version 10.0.9.

## Prerequisite: Configure an asynchronous document framework

The inbound operation includes performance improvements to ensure that users who have high volumes of receipt postings across many stores or companies, and large inventory documents, can process those documents to Commerce Headquarters without experiencing time-outs or failures. These improvements require use of an asynchronous document framework.

When an asynchronous document framework is used, you can commit inbound document changes from POS to Commerce Headquarters and then move on to other tasks while the processing to Commerce Headquarters occurs in the background. You can check the status of a document through the **Inbound operation** document list page in POS to make sure that posting was successful. In the POS application, you can also use the inbound operation active document list to see any documents that could not be posted to Commerce Headquarters. If a document fails, POS users can make corrections to it and then try again to process it to Commerce Headquarters.

## IMPORTANT

The asynchronous document framework must be configured before a company tries to use the inbound operation in POS.

To configure an asynchronous document framework, complete the following procedures.

### Create and configure a number sequence

1. Go to **Organization administration > Number sequences > Number sequences**.
2. On the **Number sequences** page, create a number sequence.
3. In the **Number sequence code** and **Name** fields, enter user-defined values.
4. On the **References** FastTab, select **Add**.
5. In the **Area** field, select **Commerce parameters**.
6. In the **Reference** field, select **Retail document operation identifier**.
7. On the **General** FastTab, in the **Setup** section, set the **Continuous** option to **No** to ensure that there are no performance issues.

### Create and schedule two batch jobs for the document processing and monitoring tasks

#### NOTE

In Commerce version 10.0.13 and later, you don't have to configure these batch jobs through the batch job framework. The batch processes can be configured from the **Retail and Commerce > Retail and Commerce IT** menu. Use the **Retail document operation monitor** and **Retail document operation processing** menu options to configure the batch jobs.

The batch jobs that you create will be used to process documents that fail or time out. They will also be used when the number of active inventory documents that are being processed from POS exceeds a system-configured value.

1. Go to **System administration > Inquiries > Batch jobs**.
2. On the **Batch job** page, create two batch jobs:
  - Configure one job to run the **RetailDocumentOperationMonitorBatch** class.
  - Configure the other job to run the **RetailDocumentOperationProcessingBatch** class.
3. Schedule the new batch jobs to run on a recurring basis. For example, set the schedule so that the jobs are run every five minutes.

## Prerequisite: Add Inbound operation to the POS screen layout

Before your organization can use the inbound operation functionality, it must configure the **Inbound operation** POS operation on one or more of your [POS screen layouts](#). Before you deploy the new operation in a production environment, make sure that you thoroughly test it and train your users to use it.

## Overview

The inbound operation lets POS users perform the following tasks:

- Receive inventory into store stock from either confirmed purchase order documents or shipped transfer order documents.
- View information about historical inventory receipts for a period of seven days after the document has been fully received.
- Create new inbound transfer order requests.

When the inbound operation is started from the POS application, a list page view appears. This view shows open purchase order and transfer order documents that have inventory lines that are scheduled to be received by the current store. To find and select a specific document, users can scroll the list or use the search feature.

The inbound inventory document list has three tabs:

- **Active** – This tab shows documents that are fully or partially open, and that contain lines or quantities on lines that must still be received.
- **Draft** – This tab shows new inbound transfer order requests that the store has created. However, the documents have only been saved locally. They haven't yet been submitted to Commerce Headquarters for processing.
- **Complete** – This tab shows a list of purchase order or transfer order documents that the store has fully received during the last seven days. This tab is for informational purposes only. All the information about the documents is read-only data for the store.

When you view documents on any of the tabs, the **Status** field can help you understand the stage that the document is in.

- **Draft** – The transfer order document has only been saved locally to the store's channel database. No

information about the transfer order request has yet been submitted to Commerce Headquarters.

- **Requested** – The purchase order or transfer order has been created in Commerce Headquarters, and is fully open. No receipts have yet been processed against the document. For documents of the purchase order document type, receiving can begin at any time while the status is **Requested**.
- **Partially shipped** – The transfer order document has one or more lines or partial line quantities that have been posted as shipped by the outbound warehouse. These shipped lines are available to be received through the inbound operation.
- **Fully shipped** – The transfer order has had all its lines and full line quantities posted as shipped by the outbound warehouse. The whole document is available to be received through the inbound operation.
- **Partially received** – Some of the lines or line quantities on the purchase order or transfer order document have been received by the store, but some lines remain open.
- **Fully received** – All lines and quantities on the purchase order or transfer order document have been fully received. The documents are accessible only on the **Complete** tab and are read-only by store users.
- **In progress** – This status is used to inform device users that the document is being actively worked on by another user.
- **Paused** – This status is shown after **Pause receiving** is selected to temporarily stop the receiving process.
- **Processing in HQ** – The document was submitted to Commerce Headquarters from the POS application, but it hasn't yet been successfully posted to Commerce Headquarters. The document is going through the asynchronous document posting process. After the document is successfully posted to Commerce Headquarters, its status should be updated to **Fully received** or **Partially received**.
- **Processing failed** – The document was posted to Commerce Headquarters and rejected. The **Details** pane shows the reason for the posting failure. The document must be edited to fix data issues, and then it must be resubmitted to Commerce Headquarters for processing.

When you select a document line in the list, a **Details** pane appears. This pane shows additional information about the document, such as shipment and date information. A progress bar shows how many items must still be processed. If the document wasn't successfully processed to Commerce Headquarters, the **Details** pane also shows error messages that are related to the failure.

In the document list page view, you can select **Order details** on the app bar to view the document details. You can also activate receipt processing on eligible document lines.

In the document list page view, you can also create a new inbound transfer order request for a store. The documents remain in **Draft** status, and they can be adjusted or deleted until they are submitted to Commerce Headquarters for processing. After they are submitted to Commerce Headquarters, the transfer order lines can no longer be changed from the POS application.

## Receiving process

After you select a purchase order or transfer order document on the **Active** tab, you can select **Order details** to begin the receiving process.

By default, the **Receiving now** view is shown. This view is optimized for bar code scanning. It can be used to build a list of the items that have been scanned, so that those items can be received. To begin the receiving process, you can start to scan item bar codes.

As item bar codes are scanned in the **Receiving now** view, the application validates the items against the selected purchase or transfer order document, to make sure that each scanned item matches a valid item on the document. In the **Receiving now** view, each scan of a bar code is assumed to represent the receipt of a quantity of one unit, unless a quantity is embedded in the bar code. You can repeatedly scan bar codes in this view to build a list of all the items and quantities for the receipt.

### Example scenario

A user receives a purchase order that contains 10 units of bar code 5657900266. The user can scan that bar code 10 times to update the **Receiving now** field by one unit per scan. When the user has completed the scans, the **Receiving now** field for the item's line will show that a quantity of 10 was received.

Alternatively, in a scenario where the item quantity is large, the user might prefer to manually enter the quantity instead of scanning the bar code for each item that is received. In this case, the user can scan the bar code one time to add the item to the **Receiving now** list. The user can then select the associated line in the **Receiving now** view and then, in the **Details** pane that appears on the right side of the page, update the **Receiving quantity** field for the item.

Although the **Receiving now** view is optimized for bar code scanning, users can also select **Receive product** on the app bar, and then enter the item ID or bar code data through a dialog box. After the item that was entered is validated, the user is prompted to enter the receipt quantity.

The **Receiving now** view provides a focused way for users to see which products they are receiving. Alternatively, the **Full order list** view can be used. This view shows the whole list of document lines for the selected purchase or transfer order document. Users can manually select lines manually in the list and then, in the **Details** pane, update the **Receiving quantity** field for the selected line. In the **Full order list** view, users can scan bar codes, or they can use the **Receive product** function to enter the item ID or bar code, and data about the received quantity, without first having to select the matching item line in the list.

### **Over-receiving validations**

Validations occur during the receiving process for the document lines. They include validations for over-delivery. If a user tries to receive more inventory than was ordered on a purchase order, but either over-delivery isn't configured or the amount that is received exceeds the over-delivery tolerance that is configured for the purchase order line, the user receives an error and isn't allowed to receive the excess quantity.

Over-receiving isn't permitted for transfer order documents. Users will always receive errors if they try to receive more than was shipped for the transfer order line.

### **Close purchase order lines**

You can close the remaining quantity on an inbound purchase order during the receiving process if the shipper has confirmed that they can't ship the full quantity that was requested. To do so, the company must be configured to allow underdelivery of purchase orders. Additionally, an underdelivery tolerance percentage must be defined for the purchase order line.

To configure the company to allow underdelivery of purchase orders, in Commerce headquarters, go to **Procurement and sourcing > Setup > Procurement and sourcing parameters**. On the **Delivery** tab, turn on the **Accept underdelivery** parameter. Then run the **1070 (Channel configuration)** distribution schedule job to sync the setting changes to channels.

Underdelivery tolerance percentages for a purchase order line can be predefined on products as part of the product configurations in Commerce headquarters. Alternatively, they can be set or overwritten on a specific purchase order in Commerce headquarters.

After an organization completes the purchase order underdelivery configurations, POS users will see a new **Close remaining quantity** option in the **Details** pane when an inbound purchase order line is selected in the **Inbound inventory** operation. If the user closes the remaining quantity, POS performs a validation to verify whether the quantity being closed is within the underdelivery tolerance percentage defined on the purchase order line. If the underdelivery tolerance is exceeded, an error message is displayed and the user won't be able to close the remaining quantity until the previously received quantity plus the **Receiving now** quantity meets or exceeds the minimal quantity that needs to be received based on the underdelivery tolerance percentage.

With **Close remaining quantity** option turned on for a purchase order line, when the user completes the receipt by using the **Finish receiving** action, a closure request is also sent to Commerce headquarters, and any unreceived quantity of this order line will be cancelled. At that point the line is considered fully received.

## Receiving location-controlled items

If the items that are being received are location-controlled, users can select the location where they want to receive the items during the receiving process. We recommend that you configure a default receiving location for your store warehouse, to make this process more efficient. Even if a default location is configured, users can override the receiving location on selected lines as they require.

The operation respects the **Blank receipt allowed** configuration on the **Location** storage dimension and doesn't require that a location dimension be entered if blank receipt is configured. If blank receipt locations aren't allowed for an item, the POS application shows an error and requires that a location be entered before the receipt can be posted.

## Receive all

As you require, you can select **Receive all** on the app bar to quickly update the **Receiving now** quantity for all the document lines to the maximum value that is available to be received for those lines.

## Receipt of unplanned items on purchase orders

In Commerce version 10.0.14 and later, users can receive a product that was not originally on the purchase order. To enable this functionality, turn on **Add lines to Purchase Order during Point of Sale receiving**.

This feature only works for purchase order receiving. It's not possible to receive items against transfer orders when the items weren't previously ordered and shipped from the outbound warehouse.

Users can't add new products to the purchase order during POS receiving if purchase order [change management workflow](#) is enabled in Commerce headquarters (HQ). To enable change management, all changes to a purchase order must first be approved before receiving is allowed. Because this process allows a receiver to add new lines to the purchase order, receiving will fail if the change management workflow is enabled. If change management is enabled for all purchase orders or for the vendor linked to the purchase order actively being received in POS, the user can't add new products to the purchase order during receiving in POS.

The functionality that enables adding lines can't be used as a workaround for receiving additional quantities of products already on the purchase order. Over-receiving is managed through the standard [over-receiving](#) settings for the product line on the purchase order.

If **Add lines to Purchase Order during Point of Sale receiving** is enabled and a user is receiving with the **Inbound operation** in POS, if the user scans or keys a product barcode or product number that isn't recognized as an item on the current purchase order, but is recognized as a valid item, the user receives a message about adding the item to the purchase order. If the user adds the item to the purchase order, the quantity entered in **Receiving now** is considered the ordered quantity for the purchase order line.

When the purchase order receipt is complete and submitted to HQ for processing, the added lines are created on the purchase order master document. On the purchase order line in HQ, there will be an **Added by POS** flag on the **General** tab of the purchase order line. The **Added by POS** flag indicates that the purchase order line was added by the POS receiving process and was not a line that was on the purchase order prior to receiving.

## Cancel receiving

You should use the **Cancel receiving** function on the app bar only if you want to back out of the document and don't want to save any changes. For example, you initially selected the wrong document and don't want any of the previous receiving data saved.

## Pause receiving

If you're receiving inventory, you can use the **Pause receiving** function if you want to take a break from the receiving process. For example, you might want to perform another operation from the POS, such as ringing up a customer sale, or delay posting of the receipt.

When you select **Pause receiving**, the document's status is changed to **Paused**. Therefore, users will know that data has been entered for the document, but the document hasn't yet been committed. When you're ready to

resume the receiving process, select the paused document, and then select **Order details**. Any **Receiving now** quantities that were previously saved are retained and can be viewed from the **Full order list** view.

## Review

Before the final commitment of the receipt to Commerce headquarters (HQ), you can use the review functionality to validate the inbound document. The review will alert you to any missing or incorrect data that may cause processing failure and provide you the opportunity to correct problems before submitting the receipt request. To enable the **Review** function on the app bar, enable the **Enable validation in POS inbound and outbound inventory operations** feature through the **Feature management** workspace in Commerce headquarters (HQ).

The **Review** function validates the following issues in an inbound document:

- **Over-receiving** – the receiving now quantity is greater than the ordered quantity. The severity of this issue is determined by the overdelivery configuration in Commerce headquarters (HQ).
- **Under-receiving** – the receiving now quantity is less than the ordered quantity. The severity of this issue is determined by the underdelivery configuration in Commerce headquarters (HQ).
- **Serial number** – the serial number is not provided or validated for a serialized item that requires serial number to be registered in inventory.
- **Location not set** – the location is not specified for a location-controlled item where blank location is not allowed.
- **Deleted lines** – the order has lines deleted by a Commerce headquarters (HQ) user that is not known to POS application.

Set the **Enable automatic validation** parameter to **Yes** in **Commerce parameters > Inventory > Store inventory** to have the validation executed automatically when **Finish receiving** is selected.

## Finish receiving

When you've finished entering all the **Receiving now** quantities for products, you must select **Finish receiving** on the app bar to process the receipt.

When users complete a purchase order receipt, they are prompted to enter a value in the **Receipt number** field, if this functionality is configured. Typically, this value is equivalent to the identifier of the vendor packing slip. The **Receipt number** data will be stored in the Product receipt journal in Commerce Headquarters. Receipt numbers aren't captured for transfer order receipts.

When asynchronous document processing is used, the receipt is submitted through an asynchronous document framework. The time that it takes for the document to be posted depends on the size of the document (the number of lines) and the general processing traffic that is occurring on the server. Typically, this process occurs in a matter of seconds. If document posting fails, the user is notified through the **Inbound operation** document list, where the document status will be updated to **Processing failed**. The user can then select the failed document in POS to view the error messages and the reason for the failure in the **Details** pane. A failed document remains unposted and requires that the user return to the document lines by selecting **Order details** in POS. The user must then update the document with corrections, based on the errors. After a document is corrected, the user can try again to process it by selecting **Finish fulfillment** on the app bar.

## Create an inbound transfer order

From POS, users can create new transfer order documents. To begin the process, select **New** on the app bar while you're in the main **Inbound operation** document list. You're then prompted to select a **Transfer from** warehouse or store that will provide the inventory to your store location. The values are limited to the selection that is defined in the configuration of the store's fulfillment group. In an inbound transfer request, your current store will always be the **Transfer to** warehouse for the transfer order. That value can't be changed.

You can enter values in the **Ship date**, **Receive date**, and **Mode of delivery** fields as you require. You can also

add a note that will be stored together with the transfer order header, as an attachment to the document in Commerce Headquarters.

After the header information is created, you can add products to the transfer order. To start the process of adding items and requested quantities, select **Add product**. In the **Details** pane, you can also add a line-specific note to the journal lines. These notes will be stored as a line attachment.

After lines are entered on the inbound transfer order, you must select **Save** to save the document changes locally or **Submit request** to submit the order details to Commerce Headquarters for further processing. If you select **Save**, the draft document is stored in the channel database, and the outbound warehouse can't run the document until it has been successfully processed via **Submit request**. You should select **Save** only if you aren't ready to commit the request to Commerce Headquarters for processing.

If a document is saved locally, it can be found on the **Drafts** tab of the **Inbound operation** document list. While a document is in **Draft** status, you can edit it by selecting **Edit**. You can update, add, or delete lines as you require. You can also delete the whole document while it's in **Draft** status, by selecting **Delete** on the **Drafts** tab.

After the draft document is successfully submitted to Commerce Headquarters, it appears on the **Active** tab and has a status of **Requested**. At this point, users in the inbound store or warehouse can no longer edit the requested inbound transfer order document. Only users in the outbound warehouse can edit the document, by selecting **Outbound operation** in the POS application. The editing lock ensures that no conflicts occur because an inbound requestor changes the transfer order at the same time that the outbound shipper is actively picking and shipping the order. If changes are required from the inbound store or warehouse after the transfer order has been submitted, the outbound shipper should be contacted and asked to enter the changes.

After the document is in **Requested** status, it's visible on the **Active** tab. However, it can't yet be received by the inbound store or warehouse. After the outbound warehouse has shipped some or all of the transfer order, the inbound store or warehouse can post receipts in POS. When the outbound side processes the transfer order documents, their status is updated from **Requested** to **Shipped** or **Partially Shipped**. After the documents are in **Shipped** or **Partially Shipped** status, the inbound store or warehouse can post receipts against them using the inbound operation receiving process.

# Outbound inventory operation in POS

2/18/2021 • 16 minutes to read • [Edit Online](#)

In Microsoft Dynamics 365 Commerce version 10.0.10 and later, inbound and outbound operations in the point of sale (POS) replace the picking and receiving operation.

## NOTE

In version 10.0.10 and later, any new features in the POS application that are related to receiving store inventory against purchase orders and transfer orders will be added to the inbound operations operation. If you're currently using the picking and receiving operation in POS, we recommend that you develop a strategy for moving from that operation to the new inbound and outbound operations. Although the picking and receiving operation won't be removed from the product, there will be no further investments in it, from a functional or performance perspective, after version 10.0.9.

## Prerequisite: Configure an asynchronous document framework

The outbound operation includes performance improvements to ensure that users who have high volumes of receipt postings across many stores or companies, and large inventory documents, can process those documents to Commerce headquarters (HQ) without experiencing time-outs or failures. These improvements require use of an asynchronous document framework.

When an asynchronous document framework is used, you can commit outbound document changes from POS to Commerce headquarters (HQ) and then move on to other tasks while the processing to Commerce headquarters (HQ) occurs in the background. You can check the status of the document through the **Outbound operation** document list page in POS to make sure that posting was successful. In the POS application, you can also use the outbound operation active document list to see any documents that could not be posted to Commerce headquarters (HQ). If a document fails, POS users can make corrections to it and then try again to process it to Commerce headquarters (HQ).

## IMPORTANT

The asynchronous document framework must be configured before a company tries to use the outbound operation in POS.

To configure an asynchronous document framework, complete the following procedures.

### Create and configure a number sequence

1. Go to **Organization administration > Number sequences > Number Sequences**.
2. On the **Number sequences** page, create a number sequence.
3. In the **Number sequence code** and **Name** fields, enter user-defined values.
4. On the **References** FastTab, select **Add**.
5. In the **Area** field, select **Commerce parameters**.
6. In the **Reference** field, select **Retail document operation identifier**.
7. On the **General** FastTab, in the **Setup** section, set the **Continuous** option to **No** to ensure that there are no performance issues.

### Create and schedule two batch jobs for the document processing and monitoring tasks

#### NOTE

In Commerce version 10.0.13 and later, you don't have to configure the batch jobs through the batch job framework. The batch processes can be configured from the **Retail and Commerce > Retail and Commerce IT** menu. Use the **Retail document operation monitor** and **Retail document operation processing** menu options to configure the batch jobs

The batch jobs that you create will be used to process documents that fail or time out. They will also be used when the number of active inventory documents that are being processed from POS exceeds a system-configured value.

1. Go to **System Administration > Inquiries > Batch jobs**.
2. On the **Batch job** page, create two batch jobs:
  - Configure one job to run the **RetailDocumentOperationMonitorBatch** class.
  - Configure the other job to run the **RetailDocumentOperationProcessingBatch** class.
3. Schedule the new batch jobs to run on a recurring basis. For example, set the schedule so that the jobs are run every five minutes.

## Prerequisite: Add Outbound operation to the POS screen layout

Before your organization can use the outbound operation functionality, it must configure the **Outbound operation** POS operation on one or more of your [POS screen layouts](#). Before you deploy the new operation in a production environment, make sure that you thoroughly test it and train your users to use it.

## Overview

The outbound operation lets POS users perform the following tasks:

- Post shipments for transfer order documents in cases where the user's store is the designated outbound warehouse.
- View information about historical transfer order shipments that were posted by the store.
- Create new outbound transfer order requests.

When the outbound operation is started from the POS application, a list page view appears. This view shows open transfer order documents that have inventory lines that the user's current store is intended to ship and fulfill. To find a select a document, users can scroll the list or use the search feature.

The outbound inventory document list has three tabs.

- **Active** – This tab shows transfer orders that have a status of **Requested** or **Partially Shipped**. The orders contain lines or quantities on lines that must be shipped by the user's current store. This tab also shows orders that have a status of **Processing in HQ** (that is, they are waiting for confirmation of successful posting from Commerce headquarters (HQ)) or **Processing failed** (that is, posting to Commerce headquarters (HQ) was unsuccessful, and the user must correct data and try again to submit the orders).
- **Draft** – This tab shows new outbound transfer order requests that the user's store created. However, the documents have only been saved locally. They haven't yet been submitted to Commerce headquarters (HQ) for processing.
- **Complete** – This tab shows a list of transfer order documents that the store has fully shipped during the last seven days. This tab is for informational purposes only. All the information about the documents is read-only data for the store.

When you view documents on any of the tabs, the **Status** field can help you understand the stage that the document is in.

- **Draft** – The transfer order document has only been saved locally to the store's channel database. No information about the transfer order request has yet been submitted to Commerce headquarters (HQ).
- **Requested** – The purchase order or transfer order has been created in Commerce headquarters (HQ) and is fully open. The user's current store has yet processed any shipments against the document.
- **Partially shipped** – The transfer order document has one or more lines or partial line quantities that have been posted as shipped by the outbound warehouse. These shipped lines are available to be received through the inbound operation.
- **Fully shipped** – The transfer order has had all its lines and full line quantities posted as shipped by the outbound warehouse.
- **In progress** – This status is used to inform device users that the document is being actively worked on by another user.
- **Paused** – This status is shown after **Pause receiving** is selected to temporarily stop the receiving process.
- **Processing in HQ** – The document was submitted to Commerce headquarters (HQ) from the POS application, but it hasn't yet been successfully posted to Commerce headquarters (HQ). The document is going through the asynchronous document posting process. After the document is successfully posted to Commerce headquarters (HQ), its status should be updated to **Fully received** or **Partially received**.
- **Processing failed** – The document was posted to Commerce headquarters (HQ) and rejected. The **Details** pane shows the reason for the posting failure. The document must be edited to fix data issues, and then it must be resubmitted to Commerce headquarters (HQ) for processing.

When you select a document line in the list, a **Details** pane appears. This pane shows additional information about the document, such as shipment and date information. A progress bar shows how many items must still be processed. If the document wasn't successfully processed to Commerce headquarters (HQ), the **Details** pane also shows error messages that are related to the failure.

In the document list page view, you can select **Order details** on the app bar to view the document details. You can also activate receipt processing on eligible document lines.

In the document list page view, you can also create a new outbound transfer order for a store.

## Transfer order shipping process

After you select a transfer order document on the **Active** tab, you can select **Order details** to begin the fulfillment process. The **Full order list** view appears. This page shows all the document lines that contain the item. It also shows details of the ordered quantity.

Each scan of a bar code updates the quantity in the **Shipping now** field by one unit. Alternatively, you can enter a shipping quantity by selecting **Ship product** on the app bar, entering an item ID, and then entering the quantity. If the item is location-controlled, you can confirm or set the shipping location for the document line.

In the **Full order list** view, you can manually select a line in the list and then update the **Shipping now** quantity for the selected line in the **Details** pane.

### Over-delivery shipping validations

Validations occur during the receiving process for the document lines. They include validations for over-delivery. If a user tries to receive more inventory than was ordered on a purchase order, but either over-delivery isn't configured or the quantity that is received exceeds the over-delivery tolerance that is configured for the purchase order line, the user receives an error and isn't allowed to receive the excess quantity.

### Underdelivery close lines

In Commerce version 10.0.12, functionality was added that lets POS users close or cancel remaining quantities during outbound order shipment if the outbound warehouse determines that it can't ship the full quantity that was requested. Quantities can also be closed or canceled later. To use this capability, the company must be

configured to allow underdelivery of transfer orders. Additionally, an underdelivery percentage must be defined for the transfer order line.

To configure the company to allow underdelivery of transfer orders, in Commerce headquarters (HQ), go to **Inventory management > Setup > Inventory and warehouse management parameters**. On the **Inventory and warehouse management parameters** page, on the **Transfer orders** tab, turn on the **Accept underdelivery** parameter. Then run the **1070** distribution scheduler job to sync the parameter changes to your store channel.

Underdelivery percentages for a transfer order line can be predefined on products as part of product configuration in Commerce Headquarters. Alternatively, they can be set or overwritten on a specific transfer order line through Commerce headquarters (HQ).

After an organization completes configuring transfer order underdelivery, POS users will see a new **Close remaining quantity** option in the **Details** pane when they select an outbound transfer order line through the **Outbound operation** function. When the user completes the shipment by using the **Finish fulfillment** operation, they can send a request to Commerce headquarters (HQ) to cancel the remaining unshipped quantity. If the user closes the remaining quantity, Commerce performs a validation to verify that the quantity that is being canceled is within the underdelivery percentage tolerance defined on the transfer order line. If the underdelivery tolerance is exceeded, an error message is displayed and the user won't be able to close the remaining quantity until the previously shipped and "ship now" quantity meets or exceeds the underdelivery tolerance.

After the shipment is synced to Commerce headquarters (HQ), the quantities that are defined in the **Ship now** field for the transfer order line in POS are updated to a shipped status in Commerce headquarters (HQ). Any unshipped quantities that previously would have been considered "ship remain" quantities (that is, quantities that will be shipped later) are considered canceled quantities instead. The "ship remain" quantity for the transfer order line is set to **0** (zero), and the line is considered fully shipped.

### **Shipping location-controlled items**

If the items that are being shipped are location-controlled, users can choose the location that they want to issue the inventory from during the shipping process. We recommend that you configure a default issue location for your store warehouse, to make this process more efficient. Even if a default location is configured, users can override the issue location on selected lines as they require.

The operation respects the **Blank receipt allowed** configuration on the **Location** storage dimension and doesn't require that a location dimension be entered if blank receipt is configured. If blank receipt locations aren't allowed for an item, the POS application shows an error and requires that a location be entered before the receipt can be posted.

### **Ship all**

As you require, you can select **Ship all** on the app bar to quickly update the **Shipping now** quantity for all the document lines to the maximum value that is available to be fulfilled for those lines.

### **Cancel fulfillment**

Use the **Cancel fulfillment** function on the app bar only if you want to back out of the document and don't want to save any changes. For example, you initially selected the wrong document and don't want any of the previous shipping data saved.

### **Pause fulfillment**

If you're fulfilling the transfer order, you can use the **Pause fulfillment** function if you want to take a break from the process. For example, you might want to perform another operation from the POS, such as ringing up a customer sale, or delay posting of the shipment to Commerce headquarters (HQ).

When you select **Pause fulfillment**, the document's status is changed to **Paused**. Therefore, user will know that data has been entered in the document, but the document hasn't yet been committed. When you're ready to

resume the fulfillment process, select the paused document, and then select **Order details**. Any **Shipping now** quantities that were previously saved will be retained and can be viewed from the **Full order list** view.

## Review

Before the final commitment of the fulfillment to Commerce headquarters (HQ), you can use the **Review** function to validate the outbound document. This function alerts you to potential missing or incorrect data that may cause a processing failure, and provide you the opportunity to correct issues before submitting the fulfillment request. To enable the **Review** function on the app bar, enable the **Enable validation in POS inbound and outbound inventory operations** feature through Feature management in Commerce headquarters (HQ).

The **Review** function validates the following issues in an outbound document:

- **Over-shipping** – the shipping now quantity is greater than the ordered quantity. The severity of this issue is determined by the overdelivery configuration in Commerce headquarters (HQ).
- **Under-shipping** – the shipping now quantity is less than the ordered quantity. The severity of this issue is determined by the underdelivery configuration in Commerce headquarters (HQ).
- **Serial number** – serial number is not provided or not available for a serialized item that requires a serial number to be registered in inventory.
- **Location not set** – location is not specified for a location-controlled item where location is not allowed to be blank.
- **Deleted lines** – the order has lines deleted by a Commerce headquarters (HQ) user that is not known to the POS application.

If you set the **Enable automatic validation** parameter to **Yes** in **Commerce parameters > Inventory > Store inventory operations**, validation is executed automatically when you select the **Finish fulfillment** function.

## Finish fulfillment

When you've finished entering all the **Shipping now** quantities for products, you must select **Finish fulfillment** on the app bar.

When asynchronous document processing is used, the receipt is submitted through an asynchronous document framework. The time that it takes for the document to be posted depends on the size of the document (the number of lines) and the general processing traffic that is occurring on the server. Typically, this process occurs in a matter of seconds. If document posting fails, the user is notified through the **Outbound operation** document list on the **Active** tab, where the document status will be updated to **Processing failed**. The user can then select the failed document in POS to view the error messages and the reason for the failure in the **Details** pane. A failed document remains unposted and requires that the user return to the document lines by selecting **Order details** in POS. The user must then update the document with corrections, based on the errors. After a document is corrected, the user can try again to process it by selecting **Finish fulfillment** on the app bar.

## Create an outbound transfer order

From POS, users can create new transfer order documents. To begin the process, select **New** on the app bar while you're in the main **Outbound operation** document list. You're then prompted to select a **Transfer to** warehouse or store that your current store will send inventory to. The values are limited to the selection that is defined in the configuration of the store's fulfillment group. In an outbound transfer request, your current store will always be the **Transfer from** warehouse for the transfer order. That value can't be changed.

You can enter values in the **Ship date**, **Receive date**, and **Mode of delivery** fields as you require. You can also add a note that will be stored together with the transfer order header, as an attachment to the document in Commerce headquarters (HQ).

After the header information is created, you can add products to the transfer order. To start the process of

adding items and requested quantities, scan bar codes or select **Add product**.

After lines are entered on the outbound transfer order, you must select **Save** to save the document changes locally or **Submit request** to submit the order details to Commerce headquarters (HQ) for further processing. If you select **Save**, the draft document is stored in the channel database, and the outbound warehouse can't run the document until it has been successfully processed via **Submit request**. Select **Save** only if you aren't ready to commit the request to Commerce headquarters (HQ) for processing.

If a document is saved locally, it can be found on the **Drafts** tab of the **Inbound operation** document list. While a document is in **Draft** status, you can edit it by selecting **Edit**. You can update, add, or delete lines as you require. You can also delete the whole document while it's in **Draft** status, by selecting **Delete** on the **Drafts** tab.

After the draft document is successfully submitted to Commerce headquarters (HQ), it appears on the **Active** tab and has a status of **Requested**. At this point, only users in the outbound warehouse can edit the document, by selecting **Outbound operation** in the POS application. Users in the inbound warehouse can view the transfer order on the **Active** tab of the **Inbound operation** document list, but they can't edit or delete it. The editing lock ensures that no conflicts occur because an inbound requestor changes the transfer order at the same time that the outbound shipper is actively picking and shipping the order. If changes are required from the inbound store or warehouse after the transfer order has been submitted, the outbound shipper should be contacted and asked to enter the changes.

After the document is in **Requested** status, it's ready for fulfillment processing by the outbound warehouse. As the shipment is processed by using the outbound operation, the status of the transfer order documents is updated from **Requested** to **Fully shipped** or **Partially shipped**. After the documents are in **Fully shipped** or **Partially shipped** status, the inbound store or warehouse can post receipts against them by using the inbound operation receiving process.

Fully shipped transfer orders are moved to the **Complete** tab of the **Outbound operation** document list. There, they remain visible to users in the outbound store or warehouse, in read-only mode, for seven days.

# Calculate inventory availability for retail channels

2/18/2021 • 13 minutes to read • [Edit Online](#)

This topic describes how a company can use Microsoft Dynamics 365 Commerce to view estimated on-hand availability for products in the online and store channels.

## Accuracy of calculation

Commerce uses multiple servers and databases to ensure scalability and performance. Therefore, it's important that you understand that the available inventory values that are provided through the point of sale (POS) application, the e-Commerce inventory availability application programming interfaces (APIs), and the on-hand inventory pages in Commerce Headquarters might not be 100-percent accurate in real time. If transactions that are created for products in the online or store channel haven't yet been synced to the Commerce Headquarters server and database, the on-hand inventory pages in Commerce Headquarters might not show an accurate real-time inventory value for those products. Conversely, if you configured your company so that users in Commerce Headquarters or other integrated applications can sell, receive, return, or otherwise adjust inventory out of a store or online warehouse, the POS or online channel might not have all the information that is required to show an accurate real-time on-hand value for items.

This topic explains the data synchronization processes that can be run frequently to help limit the latency of data between applications or channels. However, it's critical that you understand that all on-hand availability data that is provided during the operational day is considered an estimated value. Therefore, if you try to compare the on-hand inventory information that the application provides with actual physical inventory on the shelves, or if you try to compare the on-hand values that are shown in POS with the on-hand data that you find for the same warehouse in Commerce Headquarters, the values might differ. This difference during the operational day is expected and should not be considered an issue. If you want to audit data and make sure that the values that are provided in the inventory availability APIs and Commerce Headquarters match the actual physical units that you find on your store or warehouse shelves, the best time to do it is after channel operations have stopped for the day and all transactions have been correctly synced between Commerce Headquarters and the channel.

## Use inventory lookup APIs for e-Commerce inventory availability requests

You can use the following APIs to show inventory availability for a product when your customers are shopping on an e-Commerce site.

- **GetEstimatedAvailability** – Use this API to get inventory availability for the item in the e-Commerce channel warehouse or all warehouses that are linked to the configuration of the fulfillment group for the e-Commerce channel. This API can also be used for warehouses in a specific search area or radius, based on longitude and latitude data.
- **GetEstimatedProductWarehouseAvailability** – Use this API to request inventory for an item from a specific warehouse. For example, you can use it to show inventory availability in scenarios that involve order pickup.

### NOTE

These APIs replace the **GetProductAvailabilities** and **GetAvailableInventoryNearby** APIs in Dynamics 365 Retail version 10.0.7 and earlier.

Both APIs fetch data from the Commerce server and provide an estimate of on-hand inventory for a specific combination of a product or product variant and a warehouse. Although other APIs that are available on the Commerce server can go directly to Commerce Headquarters to fetch on-hand quantities for products, we don't recommend that they be used in an e-Commerce environment because of potential performance issues and the related impact that these frequent requests can have on your Commerce Headquarters servers. Additionally, if the on-hand inventory is calculated through the Commerce server, the calculation is more likely to include inventory that was sold in recent e-Commerce transactions that haven't yet been synced to Commerce Headquarters. Although Commerce Headquarters might not have information about these transactions, the Commerce server and channel database have the data. Therefore, the data will be factored in and can help provide a more accurate estimate of a product's available inventory.

### **Get started with e-Commerce calculated inventory availability**

Before you use the two APIs that were mentioned earlier, you must enable the **Optimized product availability calculation** feature through the **Feature management** workspace in Commerce Headquarters.

Before the APIs can calculate the best estimate of inventory availability for an item, a periodic snapshot of inventory availability from Commerce Headquarters must be processed and sent to the channel database that the e-Commerce Commerce Scale Unit uses. The snapshot represents the information that Commerce Headquarters has about inventory availability for a specific combination of a product or product variant and a warehouse. It can include inventory adjustments or movements that are caused by inventory receipts, or by shipments or other processes that are performed in Commerce Headquarters and that the e-Commerce channel has information about only because of the synchronization process.

The database snapshot that the **Product availability** job creates calculates only the inventory transactions that were processed and posted in Commerce Headquarters at the time when the snapshot was taken. If inventory was sold for a product in a store warehouse through a cash-and-carry or asynchronous customer order sale in the POS application, Commerce Headquarters won't immediately have information about the related inventory issue transaction for the sale. It will have information about the inventory that is sold for these types of store sales only after the P-job uploads the related transaction from the store's channel database into Commerce Headquarters and the related sales order is created through statement posting or the trickle feed posting processes. The process of creating the order in Commerce Headquarters creates the related inventory transactions. For e-Commerce channel orders, Commerce Headquarters has information about the inventory transactions only after the transactions are sent to Commerce Headquarters through the P-job and the order synchronization process is completed. Therefore, it's important that you understand that the inventory snapshot value that is provided in the **Product availability** job might not be 100-percent accurate in real time because of the constant sales processing that occurs across distributed servers.

To take a snapshot of inventory in Commerce Headquarters, follow these steps.

1. Go to **Retail and Commerce > Retail and Commerce IT > Products and inventory > Product availability**.
2. Select **OK** to run the **Product availability** job. You can also schedule this job so that it's run in a batch.

After the **Product availability** job has finished running, the data that was captured must be pushed to the e-Commerce channel databases, so that the latest Commerce Headquarters inventory snapshot can be considered in the calculation of estimated on-hand inventory.

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Run the **1130 (Product availability)** job to sync the snapshot data that the **Product availability** job created from Commerce Headquarters to your channel databases.

When inventory availability is requested from the **GetEstimatedAvailability** or **GetEstimatedProductWarehouseAvailability** API, a calculation is run to try to get the best possible estimate of inventory for the product. The calculation references any e-Commerce customer orders that are in the channel database but that weren't included in the snapshot data that the 1130 job provided. This logic is

performed by tracking the last processed inventory transaction from Commerce Headquarters and comparing it with the transactions in the channel database. It provides a baseline for the channel-side calculation logic, so that the additional inventory movements that occurred for customer order sales transactions in the e-Commerce channel database can be factored into the estimated inventory value that the API provides.

The channel-side calculation logic returns an estimated physically available value and a total available value for the requested product and warehouse. The values can be shown on your e-Commerce site if you want, or they can be used to trigger other business logic on your e-Commerce site. For example, you can show an "out of stock" message instead of the actual on-hand quantity that the API passed.

The calculation logic that the channel-side e-Commerce APIs use for the estimated inventory value can evaluate inventory based only on customer orders that have been created in the channel database but that haven't yet been synced and posted in Commerce Headquarters. If your channel database also contains transactional data for cash-and-carry sales for store-specific warehouses, the cash-and-carry sales aren't factored into the channel-side e-Commerce calculation for those warehouses.

## Configure the inventory lookup operation in the POS channel

In Retail version 10.0.9 and earlier, the **Inventory lookup** operation from POS used a real-time service call to Commerce Headquarters to get inventory information for the selected product, for both the user's current store and any other stores that are configured for the fulfillment group as part of the channel configuration for the store. In Commerce version 10.0.10 and later, you can turn off real-time service calls to Commerce Headquarters. Instead, you can use channel-side calculation on the Commerce server to determine the on-hand inventory that is physically available for the store and any other locations that are defined in the fulfillment group. This channel-calculated inventory configuration is also useful for locations where internet connectivity is unreliable, because you don't have to be online to get inventory lookups from Commerce Headquarters.

When channel-side calculation is correctly configured and managed, it can provide a more reliable estimate of the current store inventory, because it uses the transactional data that is in the Commerce channel database but that Commerce Headquarters might not yet have information about. For example, if you use the existing real-time service call for inventory lookups in POS, Commerce Headquarters probably won't yet have information about a cash-and-carry sale that just occurred for a product. Therefore, the on-hand inventory value that Commerce Headquarters returns for that product will probably exceed the store's actual on-hand inventory by one unit. However, if you use channel-side calculation, the cash-and-carry sale can be factored into the calculation and deducted from the on-hand value that is shown. Although the values that both the channel-side calculation and the real-time service call provide are only estimates of on-hand inventory, the value that the channel-side calculation provides is much more likely to be accurate for the current store.

### Get started with POS channel-side calculated inventory availability

To use the channel-side calculation logic and turn off real-time service calls for inventory lookups from the POS application, you must first enable the **Optimized product availability calculation** feature through the **Feature management** workspace in Commerce Headquarters. In addition to enabling the feature, you must make changes to the **Functionality profile**.

To change the **Functionality profile**, follow these steps:

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**.
2. Select a functionality profile.
3. On the **Functions** FastTab, in the **Invent availability calculation** section, change the value of the **Invent availability calculation mode** field from **Real time service** to **Channel**. By default, all functionality profiles use real-time service calls. Therefore, you must change the value of this field if you want to use channel-side calculation logic. Every retail store that is linked to the selected functionality profile will be affected by this change.

You must then sync the changes to the channel through the distribution schedule process by performing the following steps:

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Run the **1070 (Channel configuration)** job.

After the configuration is completed, the information that is provided about physically available inventory no longer uses a real-time service call when a user in the POS application uses the **Inventory lookup** operation (standard and matrix views). Instead, data about physically available inventory for the current store and all the stores in the fulfillment group is calculated based on the last-known snapshot that was delivered to the channel database from Commerce Headquarters. The snapshot value is further refined by the channel-side calculation to adjust the physically available value, based on additional sales or return transactions that exist for the selected product in the channel database that were not included in the last synchronized snapshot from the 1130 job. If the channel database doesn't contain transactional data for any of the warehouses or stores in the fulfillment group, it contains no additional transactions that can be factored into a recalculation of the value. Therefore, the best estimate of on-hand inventory that can be shown for those warehouses or stores is the data from the last-known Commerce Headquarters snapshot.

The **Order fulfillment** screens of POS also leverage the channel side calculation to show on-hand inventory for items when an order fulfillment line is selected and a user views the **Details** panel for on-hand inventory for the selected item.

## Optimize your inventory data

To ensure the best possible estimate of inventory, it's critical that you use the following Commerce batch jobs and run them frequently:

- **P-job** – The P-job is found on the **Distribution schedules** page and should be run frequently. This job brings e-Commerce orders, asynchronous customer orders that POS created, and cash-and-carry orders that POS created from the channel databases into Commerce Headquarters, so that they can be processed further. Until this data is synced from the channel to Commerce Headquarters, Commerce Headquarters has no information about inventory adjustments to products in the warehouses that result from those transactions.
- **Synchronize orders** – This job processes the raw transactional data in Commerce Headquarters that the P-job provides and converts e-Commerce and asynchronous customer order transactions into sales orders in Commerce Headquarters. Until this job is processed and the sales orders are created, no inventory transactions are created. Therefore, on-hand inventory in Commerce Headquarters won't consider the transactions.
- **Calculate transactional statements in batch** – For cash-and-carry transactions that are created in the store, the trickle feed posting process ensures that inventory that is related to the sales is updated efficiently. To get the most efficient processing of inventory transactions for cash-and-carry orders, make sure that you configure your system to use [trickle feed posting](#).
- **Post transactional statements in batch** – This job is also required for trickle feed posting. It follows the **Calculate transactional statements in batch** job. This job systematically posts the calculated statements, so that sales orders for cash-and-carry sales are created in Commerce Headquarters and Commerce Headquarters more accurately reflects your store's inventory.
- **Product availability** – This job creates the snapshot of inventory from Commerce Headquarters.
- **1130 (Product availability)** – This job is found on the **Distribution schedules** page and should be run immediately after the **Product availability** job. This job transports the inventory snapshot data from Commerce Headquarters to the channel databases.

It's recommended that you don't run those batch jobs too frequently (every few minutes). Frequent runs will overload Commerce headquarters (HQ) and can potentially impact performance. In general, it's good practice to

run product availability and 1130 jobs on an hourly basis, and schedule P-job, synchronize orders, and trickle feed posting-related jobs with the same or higher frequency.

**NOTE**

For performance reasons, when channel-side inventory availability calculations are used to make an inventory availability request using the e-Commerce APIs or the new POS channel-side inventory logic, the calculation uses a cache to determine whether enough time has passed to justify running the calculation logic again. The default cache is set to 60 seconds. For example, you turned on channel-side calculation for your store and viewed the on-hand inventory for a product on the **Inventory lookup** page. If one unit of the product is then sold, the **Inventory lookup** page won't show the reduced inventory until the cache has been cleared. After users post transactions in POS, they should wait 60 seconds before they verify that the on-hand inventory has been reduced.

If your business scenario requires a smaller cache time, contact your product support representative for help.

# Purchase order overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

This article provides general information about purchase orders (POs) and links to additional articles that are related to the various stages that a PO goes through.

A purchase order (PO) is a document that represents an agreement with a vendor to buy goods or services. The document also helps keep track of product receipts that are made toward the order and, later, the accounting of vendor invoices that the vendor bills toward the order.

The **Purchase orders** page contains an overview of the available orders and lets you modify those orders. When you open a PO, you can select the **Header** view, which contains information that is specified only one time for each PO, such as the vendor details. Alternatively, you can select the **Lines** view, where you can modify order lines. Typically, you will switch between these two views as you modify POs. Charges aren't listed directly on the **Purchase orders** page, but are accessed via menus on the order header and lines.

There are many reports where you can view information about POs, product receipts, and vendor invoices. These reports are found in the **Procurement and sourcing** and **Accounts payable** modules.

The **Purchase order preparation** and **Purchase order receipt and follow-up** workspaces let you view lists of POs in the various states that they have progressed to. They also provide a summary of the actions that must be taken. The **Purchase order preparation** workspace is focused on PO creation and review, processing of the order through approval, and confirmation with the vendor. The **Purchase order receipt and follow-up** workspace is focused on processing the receipt of goods or services against POs. It includes lists that give insight into receipts that are overdue, or that will soon be due for delivery by the supplier. These workspaces aren't used to perform the related receipt activities that are done in the warehouse. Those activities are performed by using pages in the **Inventory management** and **Warehouse management** modules. Processing of vendor invoices should be done by using the **Vendor invoice entry** workspace, and payments should be done by using the **Vendor payments** workspace.

The following articles provide an overview of the various stages that a PO goes through:

- [Create purchase orders](#)
- [Approve and confirm purchase orders](#)
- [Product receipt against purchase orders](#)
- [Overview of vendor invoices](#)

## Types of purchase orders

There are three types of POs. When you create a PO, you must specify the type. You can set up a default order type for new orders on the **Procurement and sourcing parameters** page.

PO TYPE	DESCRIPTION
Journal	Use this type to create a draft order. This type doesn't affect stock quantities or generate inventory transactions. The PO journal lines aren't included in master scheduling.
Purchase order	Use this type to create POs when orders are confirmed with a vendor, and as the orders are processed through receipt and invoicing before payment is made to the vendor. This type of PO is the most common.

PO TYPE	DESCRIPTION
Returned order	Use this type when you return goods to the vendor. This type of order requires that you specify the return material authorization (RMA) number that the vendor gives you. You specify the RMA number on the <b>General</b> tab of the PO. The order lines must have negative quantities.

## Purchase order statuses

POs include several status fields that indicate the progress of the order. All these fields are visible in the **Header** view of the order, and a few of them are also visible in the grid overview of all orders. The **Status** field shows the status for quantities on the order. The following values are available:

- **Open order** – Orders have been created, and quantities are on order.
- **Received** – Some of the quantities have been received, but they haven't been invoiced yet.
- **Invoiced** – The full quantity on the order has been invoiced. **Note:** If an order has been *partially* invoiced, neither **Received** status nor **Invoiced** status is appropriate. Therefore, the order will still have a status of **Open order**.
- **Canceled** – An order was confirmed but later canceled. Therefore, this status indicates that there are no longer any open quantities on order.

The **Document status** field helps you quickly review the order's progress in terms of documents that have been processed. It shows the status of the most recent document that has been completed for the order. The following values are available:

- **None** – No document has been processed for the order yet.
- **Purchase inquiry** – A purchase inquiry has been generated, and the order is awaiting feedback from the vendor.
- **Purchase order** – Confirmation has been processed on the order.
- **Product receipt** – Product receipt has been processed on the order.
- **Invoice** – An invoice has been accounted with the order.

The **Approval status** field is used when a PO goes through a review process or workflow. The following values are available:

- **Draft, In review, and Rejected** – These statuses are used only when an approval workflow is used for the PO.
- **Approved** – This status is assigned to orders that have completed workflow approval. Orders that are created without using an approval workflow receive a status of **Approved** immediately.
- **In external review** – This status is used in scenarios where a purchase inquiry is sent to the vendor, so that the vendor can confirm terms of the PO. This status is also used in the process that is initiated by the **Confirmation request** action. For this process, the vendor is asked to confirm terms of the PO by connecting to your system and registering whether it confirms or rejects the order.
- **Confirmed** – This status is assigned after the order has been confirmed. Typically, this status is the last approval status that is assigned to an order.

# Create purchase orders

2/18/2021 • 9 minutes to read • [Edit Online](#)

This article describes the process and options when you manually create a purchase order.

When you create a purchase order (PO), general information about the whole order is specified in the PO header, and you then add one or more PO lines. This article describes some of the most frequently used options that are available.

You can also create POs by copying lines from another PO document or a sales order. In this case, you can reverse the sign on the inventory, as you would reverse the sign on an invoice to indicate credit.

Although you can manually create POs, they are more typically generated from other processes. Orders can be automatically created based on other documents, such as requisitions. Alternatively, they can be created as part of the master planning process through planned POs. If you use purchase agreements, POs can be created by the **Release order** action. There are also more advanced methods for automatically creating a PO. For example, orders can be created when you use direct delivery or intercompany order chains.

## Creating a purchase order header

When you create a new PO, a dialog box appears, where you can enter the most common information for the PO header. When you click **OK** to close the dialog box, the order is created, and you can then specify additional information in the header.

The first detail that you must consider when you create a PO is the type of order. The **Purchase order** type is used most often. However, if a credit invoice is required, you can use the **Returned order** type.

You must specify the supplier in the **Vendor account** field. For this field, you can search on either the account or the vendor name. If a vendor delivers from multiple locations but uses a single invoice account, you can select that invoice account in the **Invoice account** field and then use it with different vendor accounts. If you must create a PO for products that won't be ordered repeatedly, you can use the **One-time supplier** option. This option automatically creates a new vendor account that is marked as a one-time account, to support a later clean-up process for one-time accounts in the **Accounts payable** module. When you select a vendor account, many fields in the PO header inherit default values from the information that is associated with the vendor account. For example, the default delivery site and warehouse are copied from the vendor information. However, you can override these default values if the purchase is intended for another location.

If the supplier has provided a reference number for the order, you can record this information in the **Vendor reference** field. For returned orders, you must specify a value in the **RMA** field to reference the supplier's authorization for processing the return.

If a purchase agreement is associated with the order, you must specify this information in the **Purchase agreement** field.

The PO header also contains information about charges that apply to the whole order instead of individual lines. Charges can be automatically added to the order if automatic charges have been set up for the vendor or the vendor's charge group. You can also manually add charges to the order header by clicking **Maintain charges** on the Action Pane.

## Adding purchase order lines

POs can be for physical products or for services. A setting on the inventory model group determines whether a

particular item number applies to a product or a service. Usually, the item that is purchased is specified by an item number. However, if the order is for products or services that are directly consumed, you can also specify the item by using a procurement category.

PO lines contain lots of fields, but many of these fields have a default value or a value that is inherited from the order header. Additional fields are set when you select a product or service. The fields that are most often set manually include the fields for the item number, quantity, and requested delivery date. Information about unit price and discounts is also very important, but the values of those fields are often determined by trade agreements or purchase agreements.

When you select a product, you can search on all or part of the product name instead of using the item number. If the product has several variants, such as different sizes, you can see an overview of the available variants by using the **Add lines** function or by using the lookup that is available in the **Variant number** field.

Often, you will have to specify several dimensions for the item that is selected on each PO line. The dimensions that must be specified depend on the dimension groups that have been assigned to the product master definition. For example, you will often have to specify a site and warehouse to indicate the location that the product should be delivered to. You identify product variants by specifying a variant number, or by entering values for one or more product dimensions, such as color, size, configuration, or style. Tracking dimensions, such as batch and serial number, let you uniquely identify each inventory lot. After you've created an order, you can capture dimension values on the order by using the **Registration** action. For example, you have ordered a quantity of five pieces of an item. Later, you register that three of those pieces will be black, and two of them will be blue. This approach is an alternative to capturing the dimension information during arrival registration.

You can check the details of the inventory transaction status for stocked products. For example, you might want to check the on-hand inventory to help you decide how much to order. Alternatively, you might want to review the inventory status of an ordered quantity to see whether inbound arrival registration has occurred.

A PO line that is being used to return a product to the vendor will have a negative quantity. You can select a specific lot to return by using the **Reservation** action.

Sometimes, you might want to divide the quantity that you've ordered, so that different parts of it are delivered on different dates. You can set up these deliveries by using the **Delivery schedule** action, which is available on the **Purchase order line** menu in the **Lines** view.

Charges can be automatically added to PO lines, if automatic charges have been set up for the vendor or vendor charge group, and for the item or item charge group. However, more typically, charges are added manually at the order line level. To add a charge, open the **Maintain charges** page by using the **Maintain charges** action on the **Financials** menu in the **Lines** view. The advantage of adding charges directly at the order line level is that the charge can be allocated as an inventory cost. To set up charge codes to account product cost, use the **Item** debit option. These types of charges must be allocated from the PO header to the lines before the order can be confirmed. For example, you might want to allocate charges based on the quantity on each line. The charge category also affects how charges are accounted. For example, fixed charges specify a fixed amount, and percent charges are calculated as a percentage of the net amount for the order line. POs can be assigned to a load, and the load might include an estimate of the expected expense for the transportation cost. You can allocate this expense from the load back to the PO lines.

## Purchase order actions

After you've added the header and lines to the PO, you must often complete additional steps before the order is ready to be confirmed. Because so many options are available, you might find it helpful to use [Action search](#) to find the relevant menu item.

You can configure products on the order so that they have supplementary items. Supplementary items are products that must or can be bought together with other products. Supplementary products might be added free of charge as accompanying products, or you may be able to decide whether to add them to the order or

not. You can review the supplementary items after each order line that is added. However, you will probably find it more convenient to review and add relevant supplementary items for all the order lines by using the **Supplementary items** page, which you can open from the Action Pane.

Discounts are usually added to lines as they are created. However, a few discounts apply to the whole order:

- The **Total discount** action calculates a total discount percentage that is applied to the full order. Don't confuse this discount with the cash discount percentage. Cash discounts are applied when the invoice is paid, and they depend on payment settlement by a specific date.
- If a multi-line discount applies, you must use the **Multiline discount** action to calculate and assign it to the order. Multi-line discounts are discounts that can be offered if a mix of products on the order exceeds a joint threshold. Only a few companies use this type of discount.

Charges that have a charge code that uses the **Item** debit type must be assigned to the line level before the order can be confirmed. You might find it convenient to assign these charges at the order header level, so that you can specify the total amount of the charge. However, in this case, the charge must then be allocated down to each line before the order can be confirmed. You can use the **Allocate charges** action to split amounts from charges that are assigned at the header level down to the order lines. Charges can be split according to the net amount of each line, according to the quantity that has been ordered, or evenly across the order lines. After you've allocated charges to the lines, the charge is removed from the order header.

POs can be configured to require that budget funds be allocated to the order before it can be processed. In this case, you can use the **Budget checking** action to allocate the budget.

You might have to delay the completion of a PO. For example, you might require additional information about products or services, or you might have to get authorization for the spend. There are several ways to hold back an order. For example, you can wait to confirm the order. Alternatively, if a change management workflow is being used, don't submit the order for approval. If you must block all orders for a particular vendor, you can also mark the vendor as **On hold** for processing on the vendor master. There are also circumstances that might prevent the order from being processed. For example, processing might be prevented if credit limits have been exceeded, or if required budget funds aren't available.

# Product receipt against purchase orders

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the various options for registering products as received.

Product receipt is the process of recording that products that were ordered have been received, so that the purchase order (PO) lines can then be processed for invoicing. In some cases, products go through preregistration, where additional information from the supplier is recorded before the products are received. When products arrive, they are first marked as **Registered**. The products might then go through additional processes, such as quality management, before they are finally marked as **Received**.

## Preregistration (ASN)

Suppliers might share information about products that will be shipped. In this case, you can preregister the products to record this information before the products are received. By preregistering products, you reduce the amount of work that is required during item registration and receipt. Suppliers can provide product information electronically through an Advance Shipment Notice (ASN) that is then automatically recorded in the system. The information in the ASN includes the quantity of products that will be shipped and the date when they will be shipped. The ASN might also include information such as batch or serial numbers. Registration of the ASN occurs in the **Transportation management** module.

## Registration

Product receipt registration often occurs at the inbound docks in a warehouse. It's performed either by using a hand-held device or through arrival journals. Alternatively, you can manually register product receipt by using the **Registration** action on the **Purchase order** page. In both cases, the products are marked as **Registered**. Note that the products aren't yet marked as **Received**.

Products that are received in a warehouse might go through quality inspection before they are put away into inventory. Either quality orders or quarantine orders can be used to perform quality inspection. If quality orders are used, you can configure the process to temporarily block products through a reservation while they are inspected. If quarantine orders are used, products are moved to another warehouse for inspection. This warehouse is known as the quarantine warehouse. In both quality inspection processes, some of the goods might be scrapped, either because they don't conform to the quality expectations or because the quality inspection involves destructive testing of a sample of the product.

## Product receipt

Most often, the **Product receipt** action on the **Purchase orders** page is used to mark products as **Received** on the PO. The **Posting product receipt** page has various options for the quantity that is accounted as received. For example, you can set the **Quantity** field to **Ordered quantity** or **Receive now quantity**. Alternatively, if a warehouse arrival process has been used, you will often set this field to **Registered quantity**. You can modify the quantities on each order line that will be marked as **Received**, to account for any discrepancies, such as under-delivery and over-delivery. During product receipt, you must specify a product receipt identifier, which is typically a reference to the packing slip from the supplier. This identifier is required for accounting, because it enables checks or audits of supplier packing slips against what has been received, and the accounted inventory or expense.

POs can be created for products that aren't intended as inventory but are considered an expense. This category includes order lines where the products are marked as **Not stocked** by their inventory model group, and also

lines that use procurement categories. In this case, the items might not go through arrival registration and receipt in the warehouse. Instead, the **Product receipt** action is used to record the receipt directly on the PO, and the receipt is based on the ordered quantity, not a registered quantity.

You can create PO lines where the **New fixed asset** option is enabled. This option indicates that the purchase should be considered a fixed asset instead of inventory. In this case, the fixed asset determination rules that have been configured determine whether the purchase of the product or category exceeds specific thresholds, and must therefore be accounted for as an asset and go through fixed asset management. Purchases can also be made toward an existing fixed asset. In this case, the amount is adjusted as appropriate.

You can select multiple orders and process receipt on all those orders together. This approach isn't used very often, but you might want to use it if a supplier has consolidated shipments for you into a single load. During product receipt on the purchase, there is a function for doing summary updates. Summary updates let you post a single packing slip from the supplier for more than one PO.

POs might be created from a sales order where the **Direct delivery** option was selected. When direct delivery is used, the products never arrive in your warehouse but are shipped directly from the supplier to the customer. In this case, the receipt is usually recorded directly on the PO. The receipt can be done automatically, such as through electronic data interchange (EDI) integration with the supplier. Alternatively, if the PO is an intercompany PO, Supply Chain Management automates the receipt on the intercompany sales order when shipment occurs. When direct delivery is used, products are still accounted as inventory, even though they don't physically arrive at the warehouse. Therefore, when product receipt is registered on the PO, the sales order is automatically updated with a packing slip, so that the overall change to inventory is 0 (zero). In direct delivery scenarios, you should not require preregistration. If you're using warehouses that are enabled for warehouse management, you can get around the requirement for license plate registration by specifying a virtual warehouse instead. You specify this warehouse in the **Direct delivery warehouse** field on the product.

After the product receipt has been processed on the PO, the PO status is set to **Received** to indicate that the invoice can be processed for the order. You can review details about products that have already been received by using the **Product receipt journals** page.

You can access this page from the **Receipt** action group on the **Purchase order** page. The information in the journals includes details about the quantities, dates, and dimensions.

# Approve and confirm purchase orders

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes the statuses that a purchase order (PO) goes through after it has been created, and the effect of enabling change management on POs.

After a purchase order (PO) has been created, it might have to go through an approval process. After the vendor has agreed to the order, the PO is set to a status of **Confirmed**.

## Approval of purchase orders

POs that don't use change management have a status of **Approved** as soon as they are created, whereas POs that use change management have a status of **Draft** when they are first created. A PO that has been created by firming a planned order from master planning is always set to a status of **Approved**, regardless of the change management settings. A PO creates inventory transactions only when it reaches the **Approved** status. Therefore, that inventory doesn't appear as available for reservation or marking until the order is accepted.

You enable change management for POs by setting the **Activate change management** option on the **Procurement and sourcing parameters** page. When change management is enabled, POs must go through an approval workflow after they have been completed. Supply Chain Management has a workflow process editor where you can define a workflow to represent your approval process. This workflow can include rules for automatic approval, rules that determine who will be assigned to approve particular POs, and rules for escalating a workflow that has been waiting for approval for a long time. You can enable the change management process for all vendors or for specific vendors. You can also set up the process so that it can be overridden for individual POs.

When change management is enabled, POs move through six approval statuses, from **Draft** to **Finalized**. After an order has been approved, users who want to modify it must use the **Request change** action.

APPROVAL STATUS	DESCRIPTION	REQUEST CHANGE IS ENABLED
Draft	The PO is a draft and hasn't been submitted for approval in the PO workflow.	No
In review	The PO was submitted for approval in the PO workflow. Approval is pending.	No
Rejected	The PO was rejected during the approval process.	No
Approved	The PO was approved.	Yes
Confirmed	The PO was confirmed. A PO can't be confirmed until it has been approved.	Yes
Finalized	The PO was made final. It's now financially closed and can no longer be changed.	No

## Confirming purchase orders

POs that have an approval status of **Approved** can go through additional steps before they are confirmed. For example, you might have to send a purchase inquiry to the vendor to inquire about prices, discounts, or delivery dates. In this case, you can set the PO to the **In external review** status by using the **Purchase inquiry** action.

Vendors that are set up to use the Vendor portal can review orders on the portal, and approve or reject them. During this review process, the PO has a status of **In external review**. The Vendor portal can be configured so that a confirmation from the vendor automatically confirms the order in Supply Chain Management. Alternatively, you can manually confirm a PO after you receive confirmation from the vendor. If a vendor rejects a PO, the rejection is received together with the reason for the rejection and suggestions for changes. In this case, the status of the PO remains **In external review**.

There is also an option to generate a pro-forma confirmation for an order before the actual confirmation has been processed. This option just creates a report that you can share with the vendor. It doesn't create any journal information.

After the vendor has agreed to the order, the next step is to record the PO as committed. You can complete this step by using either the **Confirmation** action or the **Confirm** action. Both these actions set the approval status of the order to **Confirmed**. Confirmation of an order initiates two additional processes:

- A journal is created to store an exact copy of what was confirmed in the system. Sometimes, orders require changes, and additional journals are created after the updated order is confirmed. These journals let you view the history of the various versions of the order that were confirmed.
- Accounting distributions are created, and order checks and budget checks occur if this functionality has been enabled. If either check fails, you receive an error message that states that changes must be made to the PO before it can be confirmed again.

A vendor might request some type of assurance that payment will be provided for a purchase. There are various methods for providing this guarantee within accounts payable processes. For example, the **Prepayment** action reserves funds for the PO, and this prepayment is recorded on the PO.

## Changing purchase orders

In some situations, you might have to change a PO after it has reached an approval status of **Approved** or **Confirmed**.

If the PO was created by using a change management process, you can make changes by recalling the order or, if the order has already been approved, by using the **Request change** action. In this case, the approval status is changed back to **Draft**, and you can then modify the order. After you've finished making changes, you might have to submit the PO for re-approval. You can configure the types of changes that require re-approval by using a **Re-approval rule for purchase orders** policy rule on the **Purchasing policies** page.

If part of the ordered quantity for a PO line has been delivered, you can't change the ordered quantity when the purchase order is in **Draft**. However, you can change the **Deliver remainder** quantity on the line for the purchase order that is in **Draft** status.

After an order has been confirmed, you can no longer delete it. However, you can cancel the total quantity or any remaining quantity on an order, provided that the quantity hasn't been received or invoiced. You can then use the **Finalize** action to prevent further processing.

## Canceling purchase orders

A PO can be canceled by using the **Cancel** action on the header.

If the quantity has been partially registered, received, or invoiced, you can cancel only the remaining quantity that hasn't been registered, received, or invoiced. The order quantity is then reduced accordingly. When the quantity on the line is updated, the line status is also updated. For example, the original quantity on the line is 5,

and a quantity of 3 is received. In this case, only two can be canceled. The line is then updated to **Received** status.

If a delivery remainder is added to the order line, and it exceeds the quantity on the order line, the **Cancel** action doesn't cancel the excess quantity. Instead, the line remains in **Open order** status, because it has a remaining quantity. For example, the original quantity on the line is 5, and the delivery remainder is 7. If the order is canceled, five are canceled, and a quantity of 2 remains, as you can see in the inventory transactions.

To cancel the whole quantity on a PO line, you should cancel the delivery remainder quantity on the line. The line will then be updated to **Canceled** status.

If a PO is under change management, any change, such as cancellation of the order or the delivery remainder, must be submitted to the workflow system and approved before the process can be completed and the inventory transactions can be updated as canceled.

# Purchase order approval mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Purchase order approval** mobile workspace. This workspace lets you view purchase orders and respond to them through actions. For example, you can approve or reject a purchase order.

## Overview

Purchase orders that requires approval go through an approval workflow. The workflow can include various steps that require that one or more people take action. For example, a person might have to complete a task or approve the purchase order.

The **Purchase order approval** mobile workspace lets you easily view and respond to purchase orders from your mobile device. This workspace also lets you take the same workflow actions that you can take from the web client.

## Prerequisites

The prerequisites vary, depending on the version of Supply Chain Management that has been deployed for your organization.

### Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Purchase order approval** mobile workspace. For instructions, see [Publish a mobile workspace](#).

### Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4017918.	System administrator	KB 4017918 is an X++ update or metadata hotfix that contains the <b>Purchase order approval</b> mobile workspace. To implement KB 4017918, your system administrator must follow these steps. <ol style="list-style-type: none"><li>1. <a href="#">Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS)</a>.</li><li>2. <a href="#">Install the metadata hotfix</a>.</li><li>3. <a href="#">Create a deployable package</a> that contains the <b>SCM Mobile</b> model, and then upload the deployable package to LCS.</li><li>4. <a href="#">Apply the deployable package</a>.</li></ol>
Publish the <b>Purchase order approval</b> mobile workspace.	System administrator	See <a href="#">Publish a mobile workspace</a> .

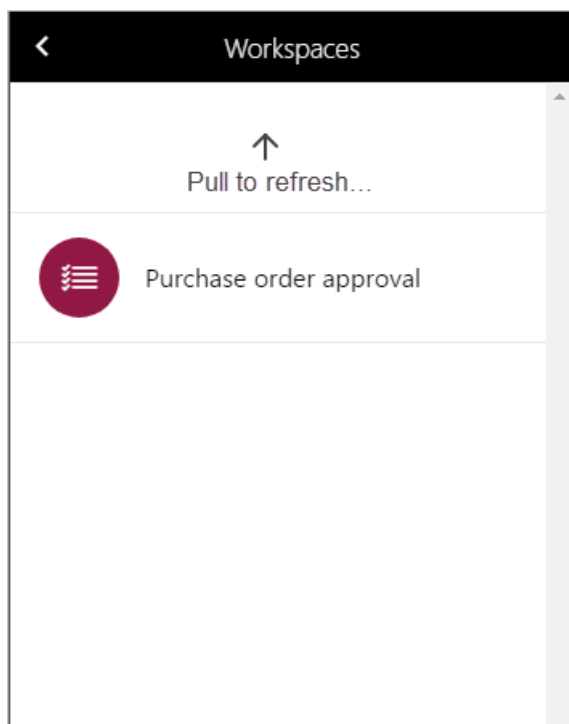

## Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

## Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

## View orders that are assigned to you

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take action in the purchase order approval workflow.
3. Select an order. On the **Order details** page, you will see the order header information and lines. You can also find guidelines from the workflow task.
4. Select **Accounting distributions** to open the **Header accounting distributions** page.
5. Return to the **Order details** page, and select a line. From the order line details, you can also explore the line-specific accounting distributions.

## Complete an action on the purchase order

After you've viewed the purchase order that is assigned to you and read the workflow instructions, you should be ready to take action.

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take

action in the purchase order approval workflow.

3. Select an order, and view the details page.
4. Select **Actions** to show the available actions. The actions that are available depend on the task that has been assigned to you.

TASK ACTION	APPROVAL ACTION
Complete	Approve
Return	Reject
Request change	Request change
Delegate	Delegate

5. Select the appropriate action.
6. On the **Complete task** page, enter a comment. Note that if you select the **Delegate** action, you must select a user to delegate the task to.
7. Select **Done**. After you refresh your workspace, the purchase order will no longer be in your list.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create product packages for purchase orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through creating a product package and using it on a purchase order. The purchase order will be used to create an order for a pre-defined set of products. This procedure uses the USRT demo data company.

## Create a product package

1. Go to Retail and Commerce > Inventory management > Replenishment > Product packages.
2. Click New.
3. In the Package number field, type a value.
4. In the Description field, type a value.
5. In the Vendor account field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. Click Add.
8. In the Item number field, type '0160'.
9. In the Size field, click the drop-down button to open the lookup.
10. In the list, click the link in the selected row.
11. In the Quantity field, enter a number.
12. Click Add.
13. In the Item number field, type '0160'.
14. In the Variant number field, click the drop-down button to open the lookup.
15. In the list, click the link in the selected row.
16. In the Quantity field, enter a number.
17. Click Add.
18. In the Item number field, type '0175'.
19. In the Quantity field, enter a number.
20. Click Save.
21. Close the page.

## Add package to purchase order

1. Go to Accounts payable > Purchase orders > All purchase orders.
2. Click New.
3. In the Vendor account field, click the drop-down button to open the lookup.
4. In the list, select the same vendor that the product package was previously created for, if a vendor was selected.
5. Toggle the expansion of the General section.
6. In the Site field, click the drop-down button to open the lookup.
7. In the list, click the link in the selected row.
8. In the Warehouse field, click the drop-down button to open the lookup.
9. In the list, click the link in the selected row.
10. Click OK.
11. Toggle the expansion of the Line details section.

12. Click the Product packages tab.
13. Click Purchase order line.
14. Click Create lines from package.
15. In the list, find and select the product package created in previous step.
16. In the Quantity field, enter a number.
17. Click Create.
18. Click Save.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Customer orders in Point of Sale (POS)

2/18/2021 • 12 minutes to read • [Edit Online](#)

This topic provides information about how to create and manage customer orders in Point of Sale (POS). Customer orders can be used to capture sales where shoppers want to pick up products on a later date, pick up products from a different location, or have items shipped to them.

In an omni-channel commerce world, many retailers provide the option of customer orders, or special orders, to meet various product and fulfillment requirements. Here are some typical scenarios:

- A customer wants products to be delivered to a specific address on a specific date.
- A customer wants to pick up products from a store or location that differs from the store or location where the customer purchased those products.
- A customer inside a store location wants to order products today and pick them up from the same store location on a later date.

Retailers can use customer orders to minimize lost sales that stock outages might otherwise cause, because the merchandise can be delivered or picked up at a different time or place.

## Set up customer orders

Before you try to use customer order functionality in POS, make sure that you complete all the required configurations in Commerce headquarters.

### Configure modes of delivery

To use customer orders, you must configure modes of delivery that the store channel can use. You must define at least one mode of delivery that can be used when order lines are shipped to a customer from a store. You must also define at least one pickup mode of delivery that can be used when order lines are picked up from the store. Modes of delivery are defined on the **Modes of delivery** page in Commerce headquarters. For more information about how to set up modes of delivery for Commerce channels, see [Define delivery modes](#).

Mode of delivery	Description	Charge group	Expedit
60	Customer pickup		

Retail channels			
✓	Name	Party ID	
<input checked="" type="checkbox"/>	Fabrikam call center	000001741

<input checked="" type="checkbox"/>	USA		Include

### Set up fulfillment groups

Some stores or warehouse locations might not be able to fulfill customer orders. By configuring fulfillment groups, an organization can specify which stores and warehouse locations are shown as options to users who

create customer orders in POS. Fulfillment groups are configured on the **Fulfillment groups** page. Organizations can create as many fulfillment groups as they require. After a fulfillment group is defined, link it to a store by selecting **Fulfillment group assignment** from the **Set up** tab on the Action Pane of the **Stores** page.

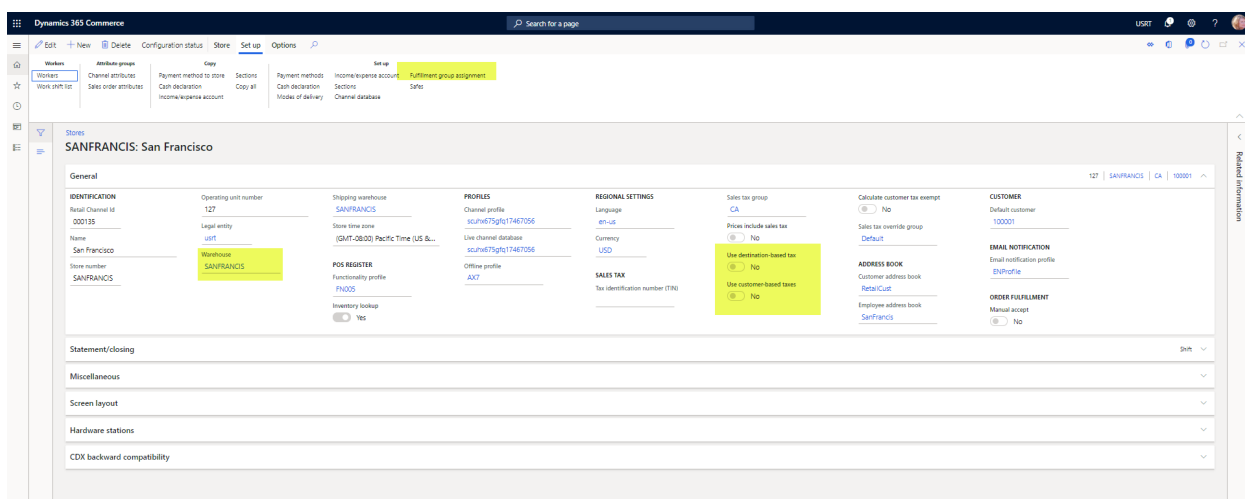

In Commerce version 10.0.12 and later, organizations can define whether the warehouse or warehouse and store combinations that are defined in fulfillment groups can be used for shipping, for pickup, or for both shipping and pickup. This allows for added flexibility for the business to determine which warehouses can be selected when creating a customer order for items to ship vs. which stores can be selected when creating a customer order for items to pick up. To use these configuration options, turn on the **Ability to specify locations as "Shipping" or "Pickup" enabled within Fulfillment group** feature. If a warehouse that's linked to a fulfillment group isn't a store, it can be configured only as a shipping location. It can't be used when orders for pickup are configured in POS.

## Configure channel settings

When you work with customer orders in POS, you must consider some of the settings of the store channel. These settings are found on the **Stores** page in Commerce headquarters.

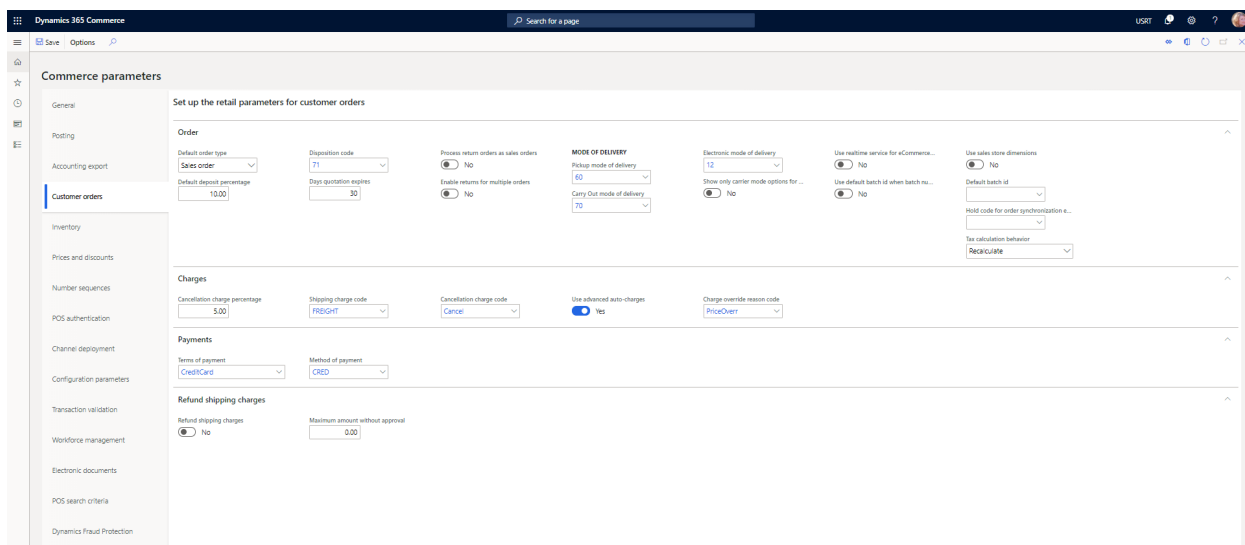

- **Warehouse** – This field indicates the warehouse that is used to fulfill orders that are configured for shipment from the store.
- **Fulfillment group assignment** – Select this button (on the **Set up** tab on the Action Pane) to link the fulfillment groups that are referenced to show options for pickup locations or shipment origins when customer orders are created in POS.
- **Use destination-based tax** – This option indicates whether the shipping address is used to determine the tax group that is applied to order lines that are shipped to the customer's address.
- **Use customer-based tax** – This option indicates whether the tax group that is defined for the customer's delivery address is used to tax customer orders that are created in POS for shipment to the customer's home.

## Set up customer order parameters

Before you try to create customer orders in POS, you must configure the appropriate parameters in Commerce headquarters. These parameters can be found on the **Customer orders** tab of the **Commerce parameters** page.

- **Default order type** – You can specify the order type that is assigned by default to customer orders that are created in POS. These customer orders can be either sales orders or quotation orders. Regardless of the default order type, users can still create both sales orders and customer orders from POS.
- **Default deposit percentage** – Specify the percentage of the order total amount that the customer must pay as a deposit before an order can be confirmed. Depending on their privileges, store associates might be able to override the amount by using the **Deposit override** operation in POS, if that operation is configured for the transaction screen layout.
- **Pickup mode of delivery** – Specify the mode of delivery that should be applied to sales order lines that are configured for pickup in POS.
- **Carryout mode of delivery** – Specify the mode of delivery that should be applied to sales order lines that are considered carryout order lines when a mixed cart is created, where some lines will be picked up or shipped, and other lines will be carried out by the customer immediately.
- **Cancellation charge percentage** – If a charge should be applied when a customer order is canceled, specify the amount of that charge.
- **Cancellation charge code** – Specify the Accounts receivable charge code that should be used when a cancellation charge is applied to canceled customer orders through POS. The charge code defines the financial posting logic for the cancellation charge.
- **Shipping charge code** – If the **Use advanced auto charges** option is set to **Yes**, this parameter setting has no effect. If that option is set to **No**, users will be prompted to manually enter a shipping charge when they create customer orders in POS. Use this parameter to map an Accounts receivable charge code that will be applied to orders when users enter a shipping charge. The charge code defines the financial posting logic for the shipping charge.
- **Use advanced auto charges** – Set this option to **Yes** to use system-calculated auto charges when customer orders are created in POS. These auto charges can be used to calculate shipping fees or other order or item-specific charges. For more information about how to set up and use advanced auto charges, see [Omni-channel advanced auto charges](#).

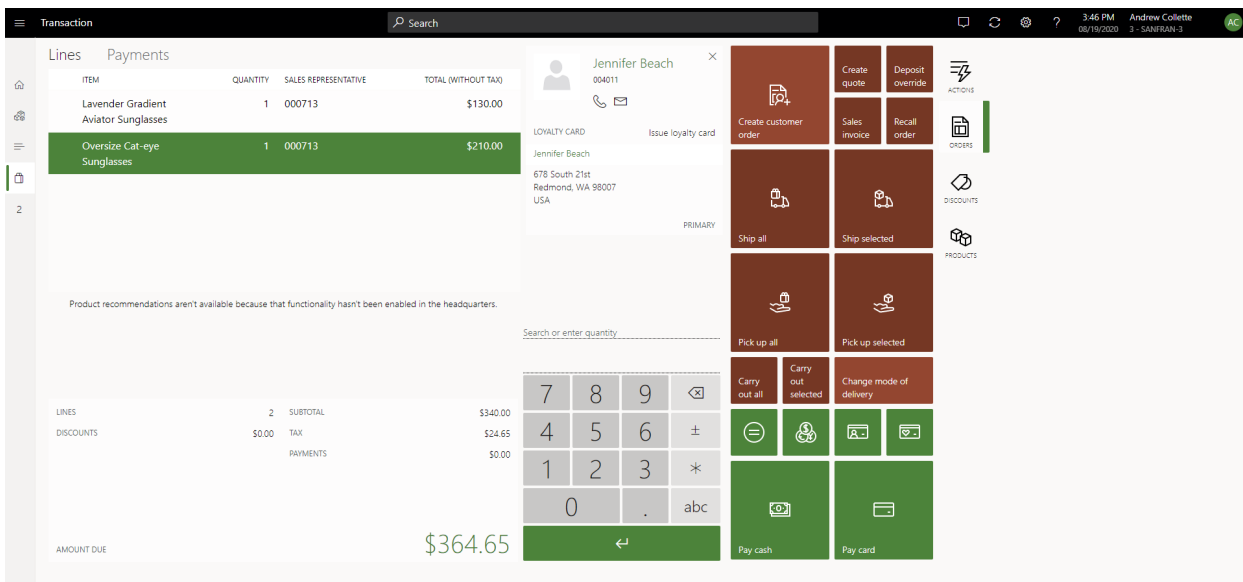

## Update transaction screen layouts in POS

Make sure that the POS [screen layout](#) is configured to support the creation and management of customer orders, and that all required POS operations are configured. Here are some of the POS operations that are recommended to correctly support customer order creation and management:

- **Ship all products** – This operation is used to specify that all lines in the transaction cart will be shipped to a destination.

- **Ship selected products** – This operation is used to specify that selected lines in the transaction cart will be shipped to a destination.
- **Pick up all products** – This operation is used to specify that all lines in the transaction cart will be picked up from a selected store location.
- **Pick up selected products** – This operation is used to specify that selected lines in the transaction cart will be picked up from a selected store location.
- **Carry out all products** – This operation is used to specify that all lines in the transaction cart will be carried out. If this operation is used in POS, the customer order will be converted to a cash-and-carry transaction.
- **Carryout out selected products** – This operation is used to specify that selected lines in the transaction cart are being carried out by the customer at the time of purchase. This operation is useful only in a [hybrid order](#) scenario.
- **Recall order** – This operation is used to search and retrieve customer orders so that POS users can edit, cancel, or perform fulfillment-related operations on them as required.
- **Change mode of delivery** – This operation can be used to quickly change the mode of delivery for lines that are already configured for shipment, without requiring that users go through the "ship all products" or "ship selected products" flow again.
- **Deposit override** – This operation can be used to change the deposit amount that the customer will pay for the selected customer order.

## Work with customer orders in POS

### NOTE

Revenue recognition functionality isn't currently supported for use in Commerce channels (e-commerce, POS, call center). Items configured with revenue recognition shouldn't be added to orders created in Commerce channels.

### Create a customer order for products that will be shipped to the customer

1. On the POS transaction screen, add a customer to the transaction.
2. Add products to the cart.
3. Select **Ship selected** or **Ship all** to ship the products to an address on the customer account.
4. Select the option to create a customer order.
5. Confirm or change the "ship from" location, confirm or change the shipping address, and select a shipping method.
6. Enter the customer's desired order shipment date.
7. Use the payment functions to pay for any calculated amounts that are due, or use the **Deposit override**

operation to change the amounts that are due, and then apply payment.

8. If the full order total wasn't paid, enter a credit card that will be captured for the balance that is due on the order when it's invoiced.

### Create a customer order for products that the customer will pick up

1. On the POS transaction screen, add a customer to the transaction.
2. Add products to the cart.
3. Select **Pick up selected** or **Pick up all** to initiate the order pick up configuration.
4. Select the store location where the customer will pick up the selected products.
5. Select a date when the item will be picked up.
6. Use the payment functions to pay for any calculated amounts that are due, or use the **Deposit override** operation to change the amounts that are due, and then apply payment.
7. If the full order total wasn't paid, select whether the customer will provide payment later (at pick up), or whether a credit card will be tokenized now, and then used and captured at the time of pickup.

### Edit an existing customer order

Retail orders that are created in either the online or store channel can be recalled and edited through POS as required.

#### IMPORTANT

Not all retail orders can be edited through the POS application. Orders that are created in a call center channel can't be edited through POS if the [Enable order completion](#) setting is turned on for the call center channel. To ensure correct payment processing, orders that originated in a call center channel and that use Enable order completion functionality must be edited through the call center application in Commerce headquarters.

In version 10.0.17 and later, users can edit eligible orders through the POS application, even if the order is partially fulfilled. However, orders that are fully invoiced still can't be edited through POS. To enable this capability, turn on the **Edit partially fulfilled orders in Point of Sale** feature in the **Feature management** workspace. If this feature is not enabled, or if you're using version 10.0.16 or earlier, users will only be able to edit customer orders in POS if the order is fully open. Further, if the feature is enabled, you can limit which stores can edit partially fulfilled orders. The option to disable this capability for specific stores can be configured through the **Functionality profile** under the **General** FastTab.

1. Select **Recall order**.
2. Use **Search** to enter filters to find the order, and then select **Apply**.
3. Select the order in the list of results, and then select **Edit**. If the **Edit** button is unavailable, the order is in a state where it can't be edited.
4. From the transaction cart, make any necessary changes to the customer order. Some changes might be prohibited during editing.
5. Complete the editing process by selecting a payment operation.
6. To exit the editing process without saving any changes, you can use the **Void transaction** operation.

### Cancel a customer order

1. Select **Recall order**.
2. Use **Search** to enter filters to find the order, and then select **Apply**.
3. Select the order in the list of results, and then select **Cancel**. If the **Cancel** button is unavailable, the order is in a state where it can no longer be canceled.
4. If cancellation charges are configured, confirm them. You can adjust the cancellation charges before you confirm them, as required.
5. From the transaction cart, complete the cancellation process by selecting a payment operation. If deposits

that were paid exceed the cancellation charge, refund payments might be due.

6. To exit the cancellation process without saving any changes, you can use the **Void transaction** operation.

## Finalizing the customer order shipment or pickup from POS

After an order is created, the items will be picked up by the customer from a store location or shipped, depending on the configuration of the order. For more information about this process, see the [store order fulfillment](#) documentation.

## Asynchronous transaction flow for customer orders

Customer orders can be created in POS in either synchronous mode or asynchronous mode. If you notice performance issues or user delays when you create customer orders in POS, consider turning on asynchronous order creation.

### Enable customer orders to be created in asynchronous mode

1. In Commerce headquarters, on the **Functionality profiles** page, select the functionality profile that corresponds to the store that you want to configure.
2. On the **General** FastTab, set the **Create customer order in async mode** option to **Yes**.

When the **Create customer order in async mode** option is set to **Yes**, customer orders are always created in asynchronous mode, even if Retail Transaction Service (RTS) is available. If you set this option to **No**, customer orders are always created in synchronous mode by using RTS. When customer orders are created in asynchronous mode, they're pulled and created as retail transactions in Commerce headquarters from the Commerce Pull (P) jobs. The corresponding sales orders for the retail transactions are created when **Synchronize orders** is run either manually or through a batch process.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Hybrid customer orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

A hybrid customer order is a single order, which contains products that can be carried out of the store by the customer, as well as products that will be picked up or shipped later.

In Commerce, you can select either carry out all products or carry out selected products for a customer order. The product lines that are marked as carry out are automatically invoiced after the order is created, similarly this is the same for an order that is to be picked-up after the order is created. The amount due on hybrid orders is determined by adding the deposit percentage on pick and ship product lines with the full amount of the carry out lines. For hybrid orders, the system switches between customer order mode and cash and carry mode as follows:

- If all products in the cart are set to **Carry out delivery**, the order will be handled as a Cash and Carry transaction.
- If any or all lines in the cart are set to either **Pick** or **ship delivery**, the order will be handled as a Customer order transaction.

If a cart line is selected and **Pick selected**, **Ship selected**, or **Carry out selected** is selected, only the specific cart line is set with that delivery method. In that case, the downstream flow of the operation continues as usual. However, if **Pick selected**, **Ship selected**, or **Carry out selected** is selected without a cart line being selected, a new page opens that lists all the cart lines. On that screen, you can select multiple lines at once for setting the delivery method. When you use that method for selecting lines, any previous delivery method that has been assigned to the line will be overridden.

# Recall order operation in POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

The **Recall order** operation in the Commerce point of sale (POS) provides updated order search and filtering features and order-specific information. This feature is available in Commerce versions 10.0.15 and later.

To enable this functionality, turn the **Improved Recall order operation in POS** feature on in **Feature management** workspace in Commerce headquarters. After you enable the feature, consider updating your [screen layouts](#) in POS to take advantage of some of the changed capabilities.

The configuration of the **Recall order** operation button allows organizations to deploy the operation with a pre-defined display.

The screenshot shows the 'Configure button' dialog box. The 'Action' dropdown is set to 'Recall order'. The 'Default display' dropdown is open, showing options: 'Orders to pick up' (highlighted), 'None', 'Orders to fulfill', 'Orders to pick up', and 'Orders to ship'. The 'Appearance' section includes fields for 'Button text' (Recall order), 'Image alignment' (Center), 'Size in columns' (2), 'Size in rows' (2), 'Font size' (12), 'Font style' (Regular), and 'Use custom theme' (checked). Color pickers are visible for 'Back color', 'Back color 2', 'Border color', and 'Font color'. A 'Button preview' window shows a red button with a white icon. 'OK' and 'Cancel' buttons are at the bottom.

The display options are as follows.

- **None** – This option deploys the operation with no specific display. When a user opens the operation with this configuration, they will be prompted to search and find orders or choose from a pre-defined order filter.
- **Orders to fulfill** – When a user launches the operation, a query will run automatically to search and display a list of orders that are to be fulfilled by the store. These orders are configured for in-store pickup or store shipment and the lines of these orders have not yet been picked or packed.
- **Orders to pick up** – When a user launches the operation, a query will run automatically to search and display a list of orders that are configured for in-store pickup at the user's current store.
- **Orders to ship** - When a user launches the operation, a query will run automatically to search and display a list of orders that are configured for shipment from the user's current store.

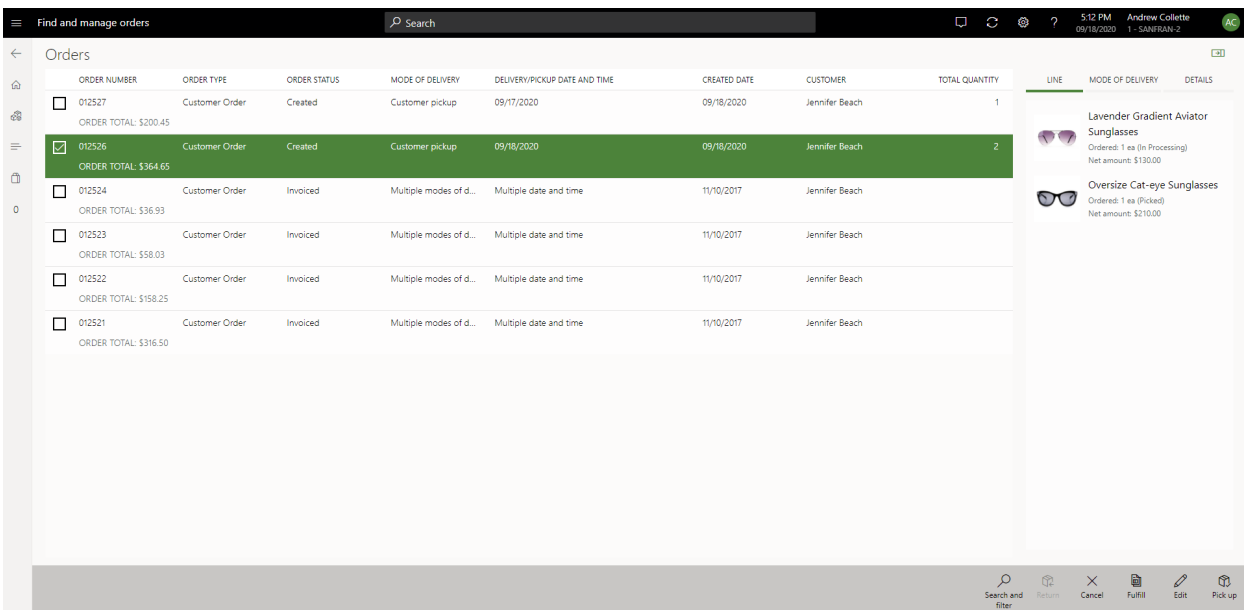

When launching the **Recall order** operation from POS, if the display is configured to **None**, a user will be able to search and retrieve orders in one of the following ways.

- Scan order barcodes. This will search order number, channel reference, and receipt ID fields for matches.
- Select **Search orders** or **Search and filter** icon on the AppBar to use the filtering mechanism to locate orders that meet the filter criteria.

- Choose from a pre-defined filter from the **Show Orders** drop-down menu (orders to fulfill, orders to pick up, or orders to ship).

After search criteria are applied, the application will display a list of matching sales orders.

A user can select an order on the list to view additional details. The information panel on the right side of the screen displays specifics on the selected order, including order line details, delivery details, and fulfillment details.

From the AppBar, a user can select an operation. Depending on the status of the order, certain operations may not be enabled.

- **Return** – Executes a return for one or more invoices related to the selected customer order.
- **Cancel** – Issue a full cancellation of the selected sales order.
- **Fulfill** – Transfers the user to the order fulfillment page, which will be pre-filtered for the selected order. Only order lines that are open for fulfillment by the user's store for the selected order will be displayed.
- **Edit** – Allows users to make changes to the selected customer order.
- **Pick up** – Launches the pickup flow, which allows the user to choose the products to be picked up and creates the pickup sales transaction.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Enable multiple pickup delivery modes for customer orders

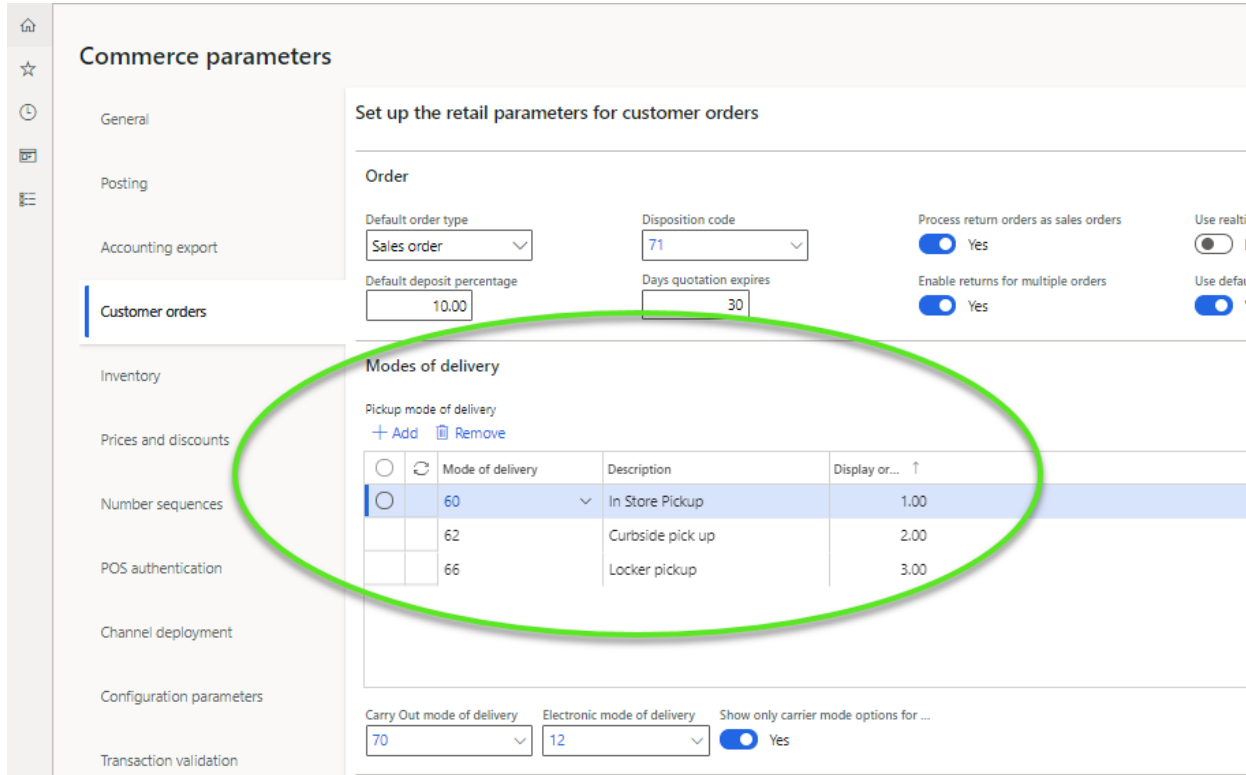

2/18/2021 • 5 minutes to read • [Edit Online](#)

In Microsoft Dynamics 365 Commerce version 10.0.16 and later, organizations can define multiple modes of delivery that shoppers or sales associates can choose among when they create an order that will be picked up at a store. In this way, organizations can provide multiple pickup options to their shoppers. For example, many retailers now offer shoppers the choice of in-store pickup or curbside pickup for their orders. Commerce supports the configuration of these different pickup delivery modes. Users can then take advantage of them when they create customer orders in any supported Commerce channel (e-commerce, call center, or store).

## Enable and configure pickup delivery modes

To use this functionality, turn on the **Support for multiple pickup delivery modes** feature in the **Feature management** workspace in Commerce headquarters. After you turn on the feature, additional configuration is required.

In Commerce version 10.0.15 and earlier, organizations can define only one mode of delivery as the designated pickup delivery mode. This definition is done on the **Commerce parameters** page. In version 10.0.16 and later, when you turn on the **Support for multiple pickup delivery modes** feature, the mode of delivery that was previously defined as the pickup delivery mode on the **Commerce parameters** page is automatically copied into the new configuration for pickup delivery modes.

The screenshot displays the 'Commerce parameters' page in Microsoft Dynamics 365 Commerce. The left-hand navigation pane includes sections for General, Posting, Accounting export, Customer orders (highlighted), Inventory, Prices and discounts, Number sequences, POS authentication, Channel deployment, Configuration parameters, and Transaction validation. The main content area is titled 'Set up the retail parameters for customer orders' and is divided into several sections:

- Order:** Contains fields for Default order type (Sales order), Disposition code (71), Default deposit percentage (10.00), and Days quotation expires (30). It also features four toggle switches: 'Process return orders as sales orders' (Yes), 'Use realti' (off), 'Enable returns for multiple orders' (Yes), and 'Use defat' (Yes).
- Modes of delivery:** This section is circled in green. It includes a 'Pickup mode of delivery' section with '+ Add' and '- Remove' buttons. Below is a table with columns for 'Mode of delivery', 'Description', and 'Display or...'. The table contains three rows:

Mode of delivery	Description	Display or...
60	In Store Pickup	1.00
62	Curbside pick up	2.00
66	Locker pickup	3.00
- Bottom section:** Contains 'Carry Out mode of delivery' (70), 'Electronic mode of delivery' (12), and a 'Show only carrier mode options for ...' toggle switch (Yes).

After you turn on the **Support for multiple pickup delivery modes** feature, you can define multiple pickup delivery modes in the **Pickup mode of delivery** grid on the **Modes of delivery** FastTab on the **Customer orders** tab of the **Commerce parameters** page.

The **Carry Out mode of delivery** and **Electronic mode of delivery** fields, and the **Show only carrier mode options for ship orders** option, have been relocated to this FastTab.

Before you configure additional pickup delivery modes, you must define the modes of delivery. On the **Modes of delivery** page in Commerce headquarters, add the modes of delivery that should be considered pickup delivery modes. Make sure that all configuration is completed. For example, make sure that the mode of delivery is linked to appropriate channels and items. When you've finished, run the **Process delivery modes** job to create the relationships among the mode of delivery, channels, and items. When the job has finished running, open the **Distribution schedule** page in Commerce headquarters, and run the **1120** distribution job to ensure that the relevant Commerce channel databases are updated with your new delivery mode configuration.

Modes of delivery

Mode of delivery	Description	Charges group	Expedite
62	Curbside pick up		

---

**Retail channels**

[Add line](#) [Remove](#)

<input type="radio"/> Name	Party ID
<input checked="" type="radio"/> Houston	000001099
<input type="radio"/> Fabrikam online store	000001568
<input type="radio"/> Fabrikam call center	000001741
<input type="radio"/> San Francisco	000002230
<input type="radio"/> Fabrikam extended online store	000002231
<input type="radio"/> Fashion call center	000002255

---

**Products**

[+ Add line](#) [+ Add products](#) [Remove](#)

<input type="radio"/> Category	Product	Product variant	Name	Line type
<input checked="" type="radio"/> ALL				Include
<input type="radio"/> ALL	Digital Gift Card		Digital Gift Card	Exclude
<input type="radio"/> Gift Cards	Digital Gift Card		Digital Gift Card	Exclude
<input type="radio"/> Gift Cards	E-mail Gift Card		E-mail Gift Card	Exclude

---

**Addresses**

[+ Add line](#) [Remove](#)

<input type="radio"/> Country/region	State	Line type
<input checked="" type="radio"/> USA		Include

After you define the additional pickup delivery modes, add them to the **Pickup mode of delivery** grid on the **Commerce parameters** page. Then run the appropriate distribution jobs to update the relevant Commerce channel databases with the configuration change.

**NOTE**

Apart from the existing pickup delivery mode that is copied to the **Pickup mode of delivery** grid when you turn on the **Support for multiple pickup delivery modes** feature, for every additional pickup delivery mode configuration that you create, you should configure new modes of delivery. When you add modes of delivery to the **Pickup mode of delivery** grid, Commerce validates whether any active open sales lines already use them. If any open sales lines are found, you receive an error message. Modes of delivery aren't considered pickup delivery modes until all open sales lines that use them have been closed (either invoiced or canceled).

### IMPORTANT

After you define more than one pickup delivery mode on the **Commerce parameters** page, the **Support for multiple pickup delivery modes** feature becomes mandatory and can no longer be turned off. If you must turn off the feature, remove all but one pickup delivery mode from the **Pickup mode of delivery** grid. When only one pickup delivery mode is defined, the feature is longer considered mandatory and can be turned off.

### E-commerce site configurations

When the **Support for multiple pickup delivery modes** feature is turned on, the following modules on e-commerce pages show the new pickup delivery modes as configured:

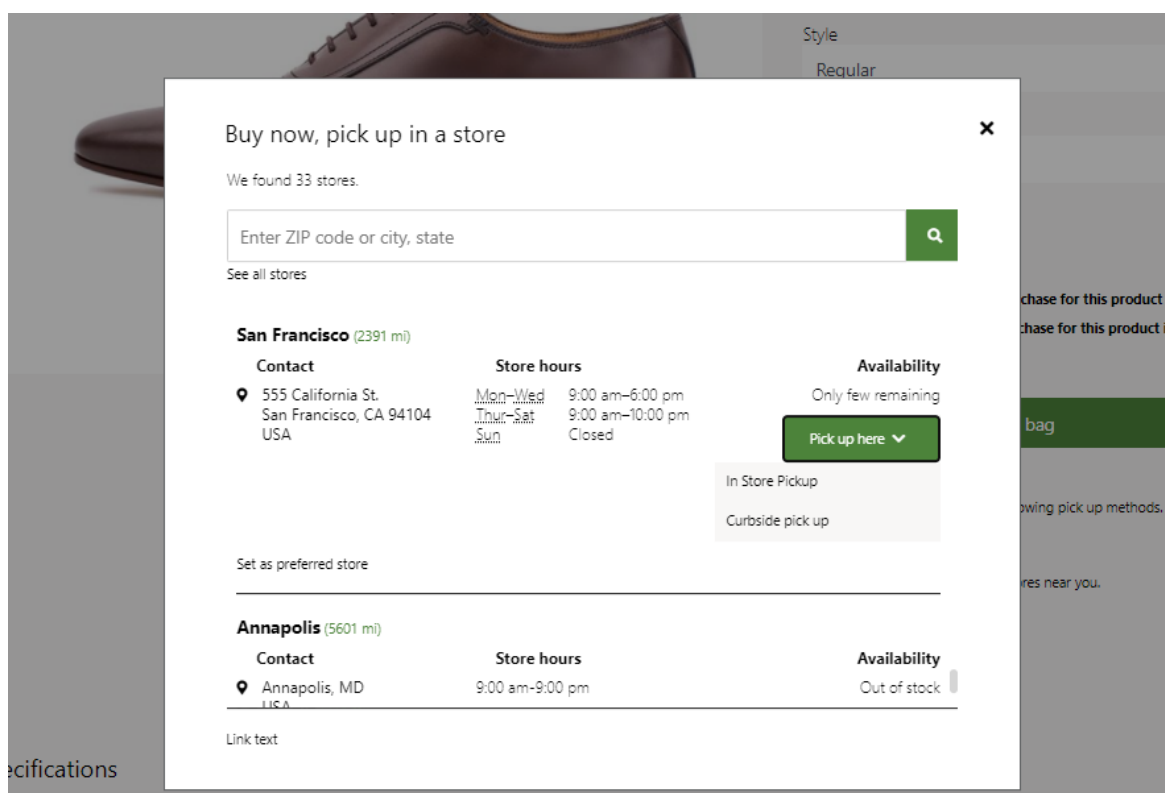

- Buy box
- Store selector
- Cart
- Pickup information
- Order confirmation
- Order details

No additional steps are required on e-commerce pages to make the pickup delivery modes available.

## Work with multiple pickup delivery modes

When multiple pickup delivery modes are available for a channel, an enhanced experience is provided to customers when they shop for products that will be picked up.

- In e-commerce channels, shoppers can select any valid pickup delivery mode that is available. For example, a retailer defines two pickup delivery modes (in-store pickup and curbside pickup), both are configured in the **Pickup mode of delivery** grid, and both are valid for the order fulfillment channel and the product that a shopper is currently purchasing. In this case, the shopper can select their preferred pickup delivery mode. The selected pickup delivery mode then becomes the mode of delivery that is linked to the sales order line when the order is created in Commerce headquarters.

- In store channels, if a customer order for pickup is created through the point of sale (POS) application, the sales associate is prompted to choose among the available pickup delivery modes, if any have been configured. If only one valid pickup delivery mode is available for the channel and item, the sales associate isn't prompted to select it. Instead, the available pickup delivery mode is automatically applied to the order lines.

- In call center channels, when users create pickup orders, they can manually select any defined pickup delivery mode that is linked to the call center channel. The system then validates that the selected pickup delivery mode can be used when the item that is being linked to it is ordered. When a pickup delivery mode is selected in call center channels, the sales order lines must be linked to a valid store warehouse. If a non-store warehouse is defined on a call center sales line, a pickup delivery mode can't be set on that sales line.
- Sales associates can use the **Order recall** or **Order fulfillment** operation in the POS application to retrieve a list of orders or order lines for pickup. If a sales associate uses a predefined search filter to show all orders that will be picked up at the current store, the queries are modified to ensure that the search results include all eligible orders that use any pickup delivery mode. POS users can also use existing filters to narrow down the list of orders to a specific pickup delivery mode. For example, they can show only orders for curbside pickup.

ORDER NUMBER	ORDER TYPE	ORDER STATUS	MODE OF DELIVERY	DELIVERY/OUT DATE AND TIME	CREATED DATE	CUSTOMER	TOTAL QTY.	PAYMENT STATUS	ORDER TOTAL

## Considerations for distributed order management

The [distributed order management \(DOM\)](#) features in Commerce ignore any sales lines that are marked for store pickup. These features have been updated to ensure that sales lines that are linked to configured pickup delivery modes bypass the DOM logic and won't be reallocated to a new fulfillment warehouse.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Process customer order pickups in POS

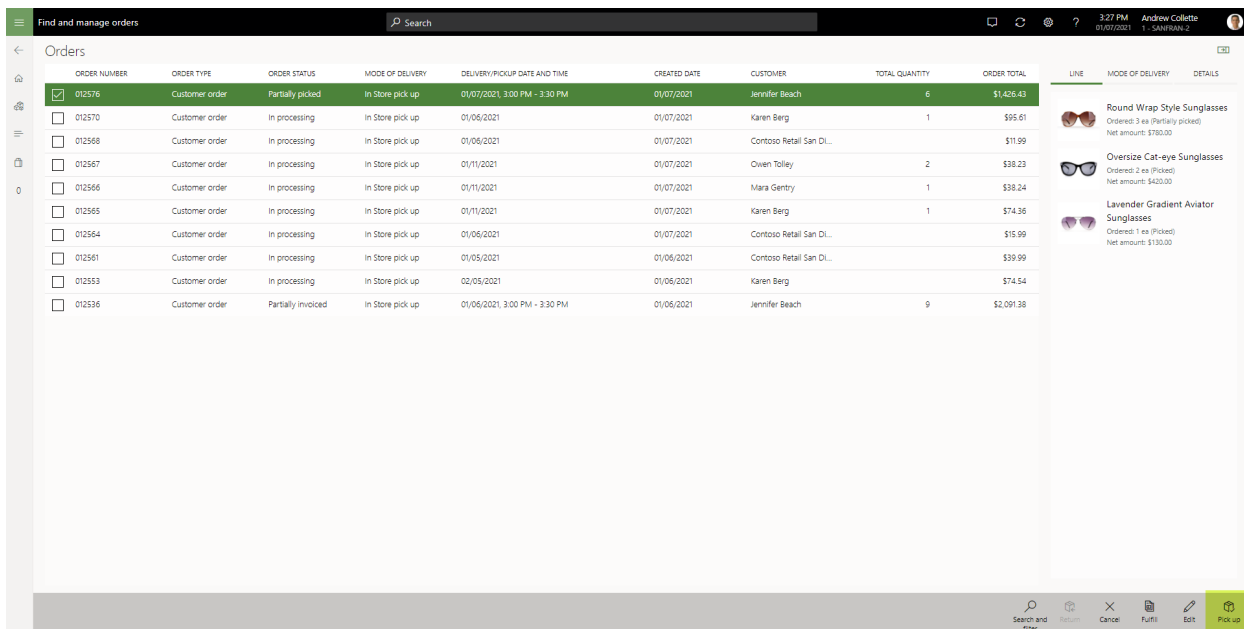

2/18/2021 • 3 minutes to read • [Edit Online](#)

When a [customer order](#) is created for store pickup, a store user can use the point of sale (POS) application to start the pickup of inventory. POS will run the final payment capture as required. It will also complete the inventory and financial posting for the quantities that are picked up.

If you're a store user, you can perform the pickup by using either the **Recall order** operation or the **Order fulfillment** operation in POS. To make the **Pick up** operation available, you must first follow one of these steps:

- To use the **Recall order** operation, search for and select the order that will be picked up.
- To use the **Order fulfillment** operation, search for and select one or more order lines.

If the selected order or order lines aren't configured for pickup at that specific store, or if the order has already been fully picked up, the **Pick up** operation will be unavailable.

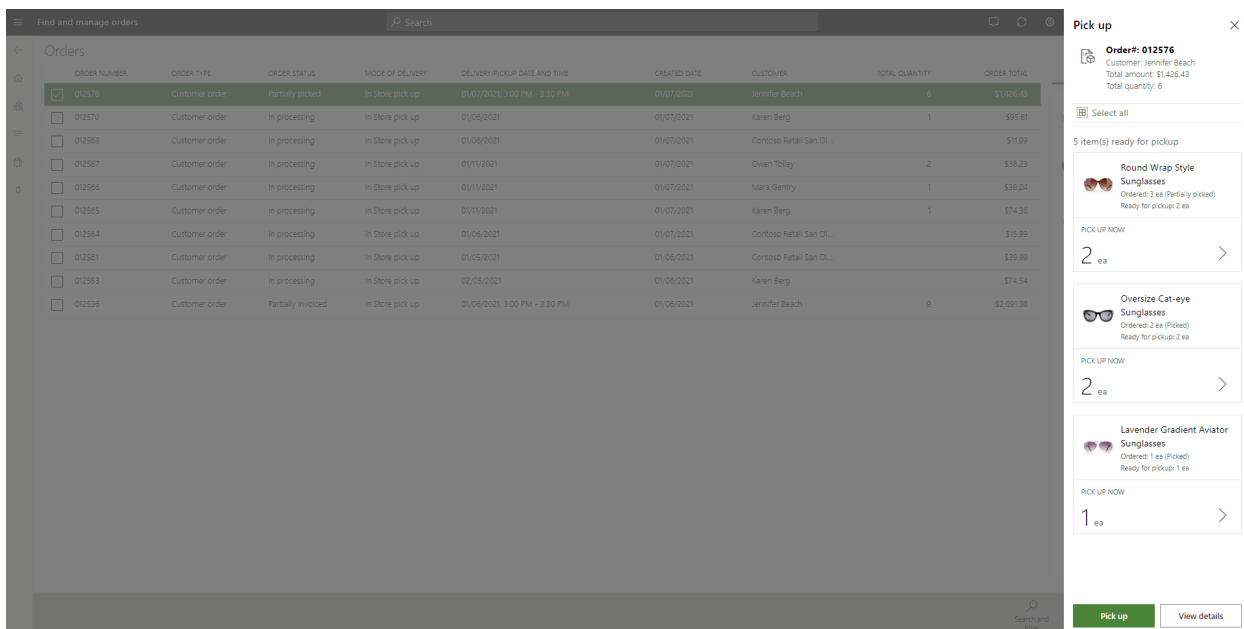

The screenshot displays the 'Find and manage orders' screen in the POS application. It features a table of orders with columns for Order Number, Order Type, Order Status, Mode of Delivery, Delivery/Pickup Date and Time, Created Date, Customer, Total Quantity, and Order Total. The first order, 012576, is highlighted in green and marked as 'Partially picked'. To the right, a detailed view of this order line is shown, listing 'Round Wrap Style Sunglasses' with a quantity of 3 (1 partially picked) and a net amount of \$780.00. Below this, 'Oversize Cat-eye Sunglasses' (2 ea, \$420.00) and 'Lavender Gradient Aviator Sunglasses' (1 ea, \$130.00) are also listed. The bottom navigation bar includes icons for Search and Filter, Return, Cancel, Fulfill, Edit, and Pick up.

ORDER NUMBER	ORDER TYPE	ORDER STATUS	MODE OF DELIVERY	DELIVERY/PICKUP DATE AND TIME	CREATED DATE	CUSTOMER	TOTAL QUANTITY	ORDER TOTAL
<input checked="" type="checkbox"/> 012576	Customer order	Partially picked	In Store pick up	01/07/2021 3:00 PM - 3:30 PM	01/07/2021	Jennifer Beach	6	\$1,426.43
<input type="checkbox"/> 012570	Customer order	In processing	In Store pick up	01/06/2021	01/07/2021	Karen Berg	1	\$95.61
<input type="checkbox"/> 012568	Customer order	In processing	In Store pick up	01/06/2021	01/07/2021	Cortoso Retail San Di...		\$11.99
<input type="checkbox"/> 012567	Customer order	In processing	In Store pick up	01/11/2021	01/07/2021	Owen Tolley	2	\$38.23
<input type="checkbox"/> 012566	Customer order	In processing	In Store pick up	01/11/2021	01/07/2021	Mara Gentry	1	\$38.24
<input type="checkbox"/> 012565	Customer order	In processing	In Store pick up	01/11/2021	01/07/2021	Karen Berg	1	\$74.36
<input type="checkbox"/> 012564	Customer order	In processing	In Store pick up	01/06/2021	01/07/2021	Cortoso Retail San Di...		\$15.99
<input type="checkbox"/> 012561	Customer order	In processing	In Store pick up	01/05/2021	01/06/2021	Cortoso Retail San Di...		\$39.99
<input type="checkbox"/> 012553	Customer order	In processing	In Store pick up	02/05/2021	01/06/2021	Karen Berg		\$74.54
<input type="checkbox"/> 012535	Customer order	Partially invoiced	In Store pick up	01/06/2021 3:00 PM - 3:30 PM	01/06/2021	Jennifer Beach	9	\$2,091.38

In Microsoft Dynamics 365 Commerce version 10.0.17 and later, the **Improved user experience for pick up order processing in Point of Sale** feature can be turned on through Feature management in Commerce headquarters. If this feature is turned off, users can't select pickup quantities. By default, the full quantity that was ordered for the line is the quantity that will be picked up. This experience can be problematic, because users might forget to select some items for pickup when they perform the pickup through order fulfillment.

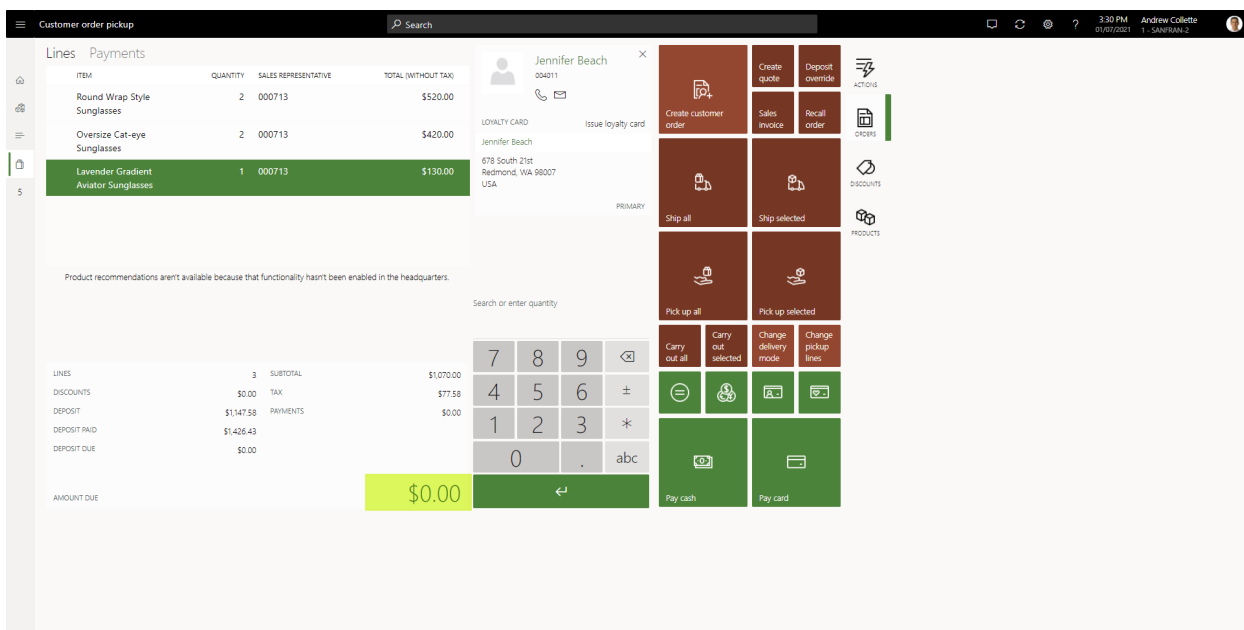

The **Improved user experience for pick up order processing in Point of Sale** feature gives users more control over the selection of products that will be picked up and the quantity of those products that will be picked up. Users don't have to select every line of the sales order on the order fulfillment page before they select **Pick up**. All the items that can be picked up will be shown. Users can specify multiple lines for pickup even if only one product line is selected.

When the **Improve user experience for pick up order processing in Point of Sale** feature is turned on, and you select the **Pick up** operation, the **Pick up** dialog box appears. There, you can select the items and quantities that will be picked up. By default, any ordered quantity that has inventory in a picked or packed state is considered eligible for pickup. By default, that quantity is set as the pickup quantity. You can change the quantity that was entered, provided that the quantity isn't 0 (zero) and doesn't exceed the total open (that is, non-invoiced) quantity for the selected line.

After you select the quantities that will be picked up and then select **Pick up**, the transaction page appears. If the [omni-channel payments](#) feature is turned on, and there are pre-authorized credit card payments on file, you must apply the payment.

On the transaction page, the system calculates the amounts that are due by calculating the total that is due for the selected pickup items and then subtracting any previously applied deposits or authorized credit card payments. You must process payment to complete the pickup transaction. If the [screen layout](#) of the transaction page is configured so that it includes the **Conclude transaction** operation, and no amount is due, you can complete the transaction without selecting a payment method. If the **Conclude transaction** operation isn't available, you can select the **\$0.00 amount due** link in the **Totals** pane to conclude the transaction without having to select a payment method.

## Changing pickup lines or quantities

If you must change the pickup quantity after you've selected the items that will be picked up, you can select **Set quantity**. You can't set the pickup quantity to 0 (zero) or increase it to a value that exceeds the non-invoiced quantity that remains for the ordered line. To remove a pickup line from the transaction cart, select **Void transaction**. The current transaction will be stopped, and the flow for the **Pick up** operation will be restarted.

If the **Improve user experience for pick up order processing in Point of Sale** feature is turned on,

organizations can add a button for the **Change pickup lines** operation to the screen layout of the transaction page. After you create the pickup transaction cart in POS and select items, you can select **Change pickup lines** if you must change the pickup items but don't want to void the whole transaction. In the **Change pickup lines** dialog box that appears, you can change the pickup items and quantities. The transaction cart is then updated to reflect your changes.

The screenshot displays a POS interface for a 'Customer order pickup'. The main screen shows a list of items with columns for ITEM, QUANTITY, SALES REPRESENTATIVE, and TOTAL (WITHOUT TAX). The items listed are:

ITEM	QUANTITY	SALES REPRESENTATIVE	TOTAL (WITHOUT TAX)
Round Wrap Style Sunglasses	2	000713	\$520.00
Oversize Cat-eye Sunglasses	2	000713	\$420.00
Lavender Gradient Aviator Sunglasses	1	000713	\$130.00

The interface also includes a customer profile for Jennifer Beach, a numeric keypad, and a 'Change pickup items' dialog box on the right. The dialog box shows 5 items ready for pickup:

- Round Wrap Style Sunglasses (Ordered: 3 ea (partially picked), Ready for pickup: 2 ea)
- Oversize Cat-eye Sunglasses (Ordered: 2 ea (picked), Ready for pickup: 2 ea)
- Lavender Gradient Aviator Sunglasses (Ordered: 1 ea (picked), Ready for pickup: 1 ea)

# Create call center orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through looking up a customer, creating a new order, searching for a product, and collecting payment from the customer. This procedure uses demo data company USRT and is intended for the Sales Order Clerk. Pre-requisites: The user who completes the procedure is set up as a Call center user and the Fabrikam Semi-Annual Catalog is published with at least one Source code on it.

1. Go to **Retail and Commerce > Customers > Customer service**.
2. For **SearchText**, enter the search criteria to look up the customer.
  - For this example procedure, enter "Karen" and select **Tab**.
3. Select **Search**.
  - Since there is only one customer named "Karen" in demo data, the result will be automatically selected.
4. Select **New sales order**.
5. Expand or collapse the **Sales order** header section.
6. Select the source code for the catalog.
  - If there are no active source codes you can skip this step.
7. Select **Add line**.
8. For **Item number**, enter the item search term.
  - For this sample procedure, enter a partial item number of '8111' and press tab. This action will bring up the item search window.
9. Select the product to add to the sales order.
10. Enter the sales quantity.
11. Select **Create**.
12. Select **Complete** to capture the customer payment.
13. Select **Add**.
  - The Add link is in the Payments tab. Expand the Payments tab if it is collapsed.
14. Select the payment method.
  - For this procedure, select the cash payment method.
15. Close the page.
16. Enter the amount.
  - For this procedure, enter an amount equal to the order balance that can be seen in the Sales order summary page to the left of the amount field. This action will allow you to complete the order as fully paid.
17. Select **OK**.
18. Select **Submit**.

# Customize transactional emails by mode of delivery

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set up custom email templates for specific notification types and modes of delivery in Microsoft Dynamics 365 Commerce.

Transactional emails can now be customized for a combination of a notification type (for example, **Order created**, **Order packed**, or **Order invoiced**) and a mode of delivery (for example, overnight, in-store pickup, or curbside pickup). Custom transactional emails let retailers provide their customers order with fulfillment experiences that are tailored to the order's mode of delivery. For example, the "order packed" event can be customized so that it provides curbside pickup instructions for customers who choose curbside pickup. Alternatively, it can provide shipping carrier and delivery information for customers who choose to have their order shipped.

## NOTE

To use the functionality for customized transactional emails, you first must turn on the **Customize transactional email templates by mode of delivery** feature by going to **Workspaces > Feature management** in Commerce headquarters.

Emails can be customized by mode of delivery for the following notification types:

- **Order cancellation** – This email notification type is new.
- **Order created**
- **Order confirmed**
- **Order invoiced** – This email notification type is new. It can be used instead of the **Order shipped** notification type that will send a notification for any invoice event that has a shipped mode of delivery (not a pickup, carry out, or electronic mode of delivery).
- **Order picked**
- **Order packed**
- **Order ready for pickup** – This notification type can be customized by mode of delivery only if the **Support for multiple pickup delivery modes** feature is turned on. In that case, this notification type is functionally equivalent to the **Order packed** notification type.
- **Payment failed**
- **Replacement order created**

## Configure email templates for specific modes of delivery

For this procedure, the assumption is that you've already created your new, custom email templates and added them to the **Organization email templates** page. For information about how to create and upload email templates, see [Create email templates for transactional events](#).

To configure email templates for specific modes of delivery in Commerce headquarters, follow these steps.

1. Go to **Commerce email notification profile**.
2. Under **Retail event notification settings**, select an existing notification type.
3. While the notification type is still selected, select **Configure modes of delivery**.
4. In the **Modes of delivery** dialog box, select **New**.
5. In the new row, in the **Mode of delivery** field, select a mode of delivery.

6. In the **Email ID** field, select the email template to map to the mode of delivery.
7. Select the **Active** check box.
8. Repeat steps 4 through 7 to add more modes of delivery.
9. When you've finished, select **OK**.

#### **NOTE**

- When more than one mode of delivery is present across lines in a sales order, the default template will be used. The default template is the template that is mapped to the notification type on the **Commerce email notification profile** page.
- If a sales order has a mode of delivery that hasn't been configured for a custom email template, the default email template will be used.

# Change mode of delivery in POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set up and use the "change mode of delivery" functionality in your point of sale (POS) environment.

In Dynamics 365 Commerce versions 10.0.10 and later, the **Change mode of delivery** operation (647) is available to add to your POS screen layouts.

The change mode of delivery feature provides you with the option to change the mode of delivery for one or more shipment-configured sales lines on the POS transaction. In previous versions of Commerce, you had to go through the full **Ship all** or **Ship selected** configuration flows if you wanted to change the mode of delivery on an existing line that was configured for shipment. This process was time consuming and could result in accidental changes to the delivery origin or delivery dates for the line. The new functionality provides an alternative method for efficiently updating the mode of delivery on these sales lines.

For more information about how to add an operation to a button on your POS button grid, see [Screen layouts for the point of sale](#).

After this feature is configured in POS, when you select **Change mode of delivery**, you will be presented with a list page that allows you to choose the lines of the transaction that you want to change the mode of delivery for. You can choose some or all of the lines, or exit without making any changes. The sales lines that were previously configured for shipment are the only lines in the list that you can change. If you want to change a line designated for pickup or carryout to ship, you must use the **Ship all** or **Ship selected** operations. Conversely, if you want to change a line designated as a shipment to a pickup or carryout, you must use the **Pickup all**, **Pickup selected**, **Carryout all**, or **Carryout selected** operations.

After you select the lines that you want to change, click **Change mode of delivery** to be prompted to select the delivery mode options. If you selected multiple lines to change, POS will only display modes of delivery that have been configured as allowable for all of the selected products. Modes of delivery can be configured to support specific products and delivery addresses. If there is a mode of delivery that is acceptable for one product and address combination but is not acceptable for another selected product and address combination, the mode of delivery is not available. You may need to select lines one by one and change the mode of delivery for each line separately if you want to select a mode of delivery for one product that is not supported by another product.

After you select the new mode of delivery, the transaction page is displayed. To review your new delivery mode selections, select the **Delivery** tab on the transaction list.

# Distributed order management (DOM)

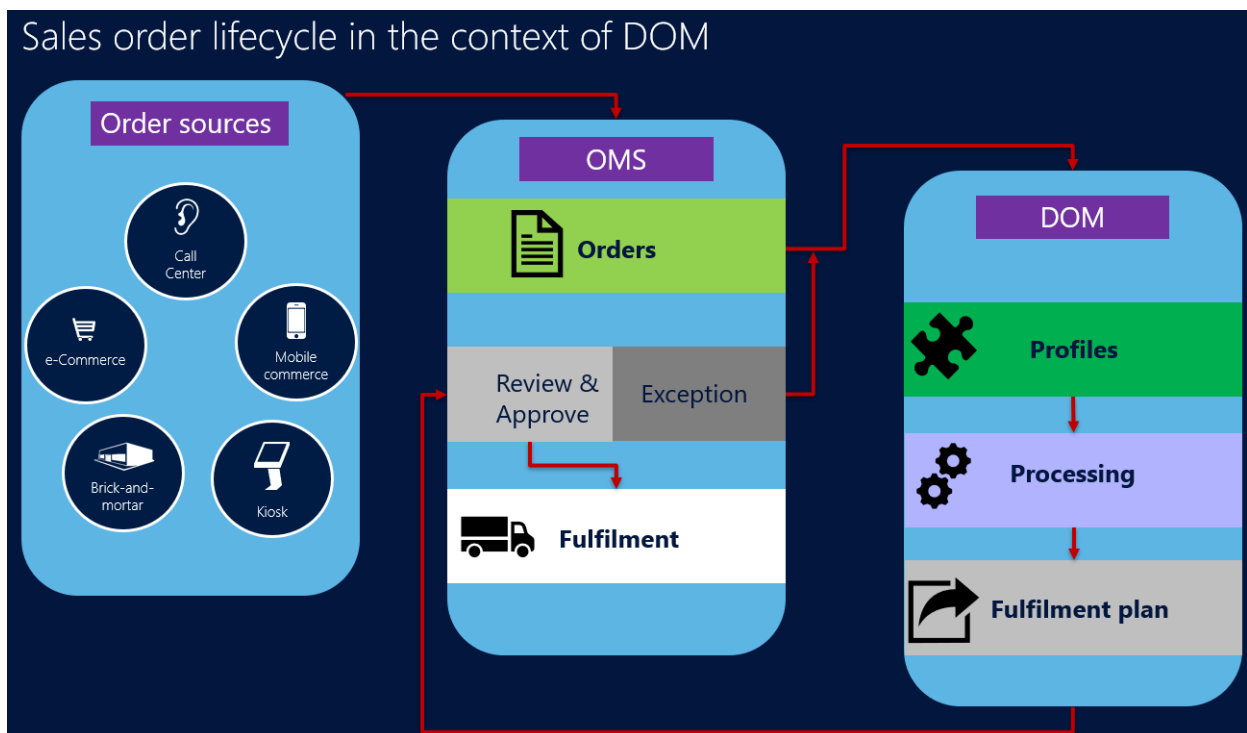

2/18/2021 • 20 minutes to read • [Edit Online](#)

In the new paradigm for commerce operations, retailers strive to provide personalized customer engagement, omni-channel experiences, and frictionless interactions. Because so many choices are available, consumers will shop wherever they can have the most favorable experience. In many cases, prices and products are no longer the top deciding factors for consumers.

To help improve the customer experience, retailers must have visibility into their inventory in real time, across all their channels. A single, holistic view of all the inventory can help optimize order fulfillment, allocation, and distribution. Therefore, adoption and implementation of a distributed order management (DOM) system are becoming more imperative for retailers.

DOM optimizes order fulfillment across a complex network of systems and processes. It relies on a single, global view of inventory across the whole organization to intelligently manage orders, so that they are fulfilled accurately and in a more cost-effective manner. By improving the efficiency of a retailer's supply chain, DOM helps the retailer better meet customer expectations.

The following illustration shows the lifecycle of a sales order in a DOM system.

## Set up DOM

1. Go to **System administration > Setup > License configuration**.
2. On the **Configuration keys** tab, expand the **Commerce** node, and then select the **Distributed Order Management** check box.
3. Go to **Retail and Commerce > Distributed order management > Setup > DOM parameters**.
4. On the **General** tab, set the following values:
  - **Enable distributed order management** – Set this option to **Yes**.

- **Confirm Bing Maps usage for DOM** – Set this option to **Yes**.

**NOTE**

You can set this option to **Yes** only if the **Enable Bing Maps** option on the **Bing Maps** tab of the **Commerce shared parameters** page (**Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**) is also set to **Yes**, and if a valid key is entered in the **Bing Maps key** field.

The [Bing Maps Dev Center](#) portal allows you to restrict access on your Bing Maps API keys to a set of domains that you specify. With this feature, customers can define a strict set of referrer values or IP address ranges that the key will be validated against. Requests originating from your allow list will process normally, while requests from outside of your list will return an access denied response. Adding domain security to your API key is optional and keys left as-is will continue to function. The allow list for a key is independent from all of your other keys, enabling you to have distinct rules for each of your keys. Distributed Order Management does not support the setting up of domain-referred properties.

- **Retention period in days** – Specify how long the fulfillment plans that DOM runs generate are kept in the system. The **DOM fulfillment data deletion job setup** batch job will delete any fulfillment plan that is older than the number of days that you specify here.
- **Rejection period (in days)** – Specify how much time must pass before a rejected order line can be assigned to the same location.

5. On the **Solver** tab, set the following values:

- **Max auto-fulfillment attempts** – Specify how many times the DOM engine will try to broker an order line to a location. If the DOM engine can't broker an order line to a location in the specified number of attempts, it will flag the order line as an exception. It will then skip that line in future runs until the status is manually reset.
- **Local store region radius** – Enter a value. This field helps determine how locations are grouped and considered equal in terms of distance. For example, if you enter **100**, every store or distribution center within a 100-mile radius of the fulfillment address is considered equal in terms of distance.
- **Solver type** – Select a value. Two solver types are released with Commerce: **Production Solver** and **Simplified Solver**. For all machines that will run DOM (that is, all servers that are part of the DOMBatch group), **Production Solver** must be selected. The Production Solver requires the special license key that, by default, is licensed and deployed in production environments. For non-production environments, this license key must be manually deployed. To manually deploy the license key, follow these steps:
  - a. In Microsoft Dynamics Lifecycle Services, open the Shared asset library, select **Model** as the asset type, and download the **DOM license** file.
  - b. Start Microsoft Internet Information Services (IIS) Manager, right-click **AOSService website**, and then select **Explore**. A Windows Explorer window is opened at **<AOS service root>\webroot**. Make a note of the **<AOS Service root>** path, because you will use it in the next step.
  - c. Copy the configuration file in the **<AOS Service root>\PackagesLocalDirectory\DOM\bin** directory.
  - d. Go to the Headquarters client, and open the **DOM parameters** page. On the **Solver** tab, in the **Solver type** field, select **Production solver**, and confirm that no error messages appear.

#### NOTE

The Simplified Solver is provided so that retailers can try out the DOM feature without having to deploy the special license. Organizations should not use the Simplified Solver in production environments.

The Production Solver improves performance (such as the number of orders and order lines that can be handled in a run) and convergence of results (since a batch of orders might not yield the best result in some scenarios). Some rules like the **Partial orders** rule and the **Maximum number of locations** rule require Production Solver.

6. Go back to **Retail and Commerce > Distributed order management > Setup > DOM parameters**.

7. On the **Number sequences** tab, assign the required number sequences to the various DOM entities.

#### NOTE

Before the number sequences can be assigned to the entities, they must be defined on the **Number sequences** page (**Organization administration > Number sequences > Number sequences**).

8. The DOM feature supports the definition of various types of DOM rules, and organizations can configure multiple rules, depending on their business needs. DOM rules can be defined for a group of locations or individual locations, and for a specific product category, product, or variant. To create the grouping of locations that must be used for the DOM rules, follow these steps:

- a. Go to **Retail and Commerce > Channel setup > Fulfillment groups**.
- b. Select **New**, and enter a name and description for the new group.
- c. Select **Save**.
- d. Select **Add line** to add a single location to the group. Alternatively, select **Add lines** to add multiple locations.

#### NOTE

In Commerce version 10.0.12 and higher, **Ability to specify locations as 'Shipping' or 'Pickup' enabled within Fulfillment group** must be enabled in the **Feature Management** workspace.

This feature add new configurations on the **Fulfillment group** page so you can define if the warehouse can be used for shipping or if the warehouse/store combination can be used for shipping, pickup, or both.

If you enable the feature, the options available for location selection when you create pickup or shipment orders in POS will be updated.

Enabling the feature also results in updated pages in POS when the "ship all" or "ship selected" operations are selected.

9. To define rules, go to **Retail and Commerce > Distributed order management > Setup > Manage rules**. The following DOM rules are currently supported:

- **Minimum inventory rule** – This rule type lets organizations "ring fence" a specific quantity of a product for purposes other than order fulfillment. For example, organizations might not want DOM to consider all the inventory that is available in a store for order fulfillment. Instead, they might want to reserve some inventory for walk-in customers. When this rule type is used, you can define the minimum inventory to keep for a category of products, an individual product, or a product variant per location or group of locations.
- **Fulfillment location priority rule** – This rule type lets organizations define a hierarchy of

locations to establish the priority that the DOM engine considers when it tries to identify fulfillment locations for specific products. The valid range of priorities is 1 through 10, where 1 is the highest priority and 10 is the lowest priority. Locations that have higher priority are considered before locations that have lower priority. If the rule is defined as a hard constraint rule, orders are brokered only to locations that priorities are defined for.

- **Partial orders rule** – This rule lets organizations define whether an order or order lines can be partially fulfilled. The following parameters are available:
  - **Fulfill partial orders?** – If this option is set to **Yes**, DOM can fulfill only part of the quantity on an order line. This partial fulfillment is achieved by splitting the order line.
  - **Fulfill partial lines?** – If this option is set to **Yes**, DOM can fulfill a partial quantity of order lines. This partial fulfillment is achieved by splitting the order line.
  - **Fulfill order from one location only** – If this option is set to **Yes**, DOM makes sure that all lines on an order are fulfilled from a single location.

The following table explains the behavior when a combination of these parameters is defined.

COMBINATION NUMBER	FULFILL PARTIAL ORDERS	FULFILL PARTIAL LINES	FULFILL ORDER FROM ONE LOCATION ONLY	DESCRIPTION
1	Yes	Yes	Yes	A few lines of the order can be fulfilled, and individual lines can be partially fulfilled, but all the lines must be from the same location in an instance of the DOM run. (This combination isn't currently supported.)
2	Yes	No	Yes	A few lines of the order can be fulfilled, but individual lines can't be partially fulfilled, and all the fulfilled lines must be from the same location in an instance of the DOM run. (This combination isn't currently supported.)

COMBINATION NUMBER	FULFILL PARTIAL ORDERS	FULFILL PARTIAL LINES	FULFILL ORDER FROM ONE LOCATION ONLY	DESCRIPTION
3	Yes	Yes	No	A few lines of the order can be fulfilled, individual lines can be partially fulfilled, and each line can be fulfilled from more than one location in an instance of the DOM run.
4*	No	Not applicable	No	All order lines must be fulfilled, individual lines can't be partially fulfilled, and each order line can be fulfilled from a different location.
5*	No	Not applicable	Yes	All order lines must be fulfilled, individual lines can't be partially fulfilled, and all the order lines can be delivered from one location only.
6*	No	Not applicable	No	This combination works like combination 4, because <b>Fulfill partial lines</b> can't be set to <b>Yes</b> when <b>Fulfill partial orders</b> is set to <b>No</b> .
7*	No	Not applicable	Yes	This combination works like combination 5, because <b>Fulfill partial lines</b> can't be <b>Yes</b> when <b>Fulfill partial orders</b> is <b>No</b> .

COMBINATION NUMBER	FULFILL PARTIAL ORDERS	FULFILL PARTIAL LINES	FULFILL ORDER FROM ONE LOCATION ONLY	DESCRIPTION
8	Yes	No	No	A few lines of the order can be fulfilled, but individual lines can't be partially fulfilled, and the various order lines can be fulfilled from more than one location in an instance of the DOM run.
9*	No	Not applicable	Yes	All order lines must be fulfilled, and all the order lines must be fulfilled from one location only.

\* If **Fulfill partial orders** is set to **No**, **Fulfill partial lines** is always considered to be set to **No**, regardless of how it's actually set.

**NOTE**

In Retail version 10.0.5, the parameter **Fulfill order from one location only** was changed to **Maximum fulfilling locations**. Instead of allowing a user to configure whether orders can be fulfilled from one location only or fulfilled from as many locations as it can be, users can now specify whether the fulfillment can be from a definite set of locations (up to 5) or from as many locations as it can be. This provides more flexibility in terms of how many locations the order can be fulfilled from. This rule only works with Production Solver.

- **Offline fulfillment location rule** – This rule lets organizations specify a location or group of locations as offline or unavailable to DOM, so that orders can't be assigned to those locations for fulfillment.
- **Maximum rejects rule** – This rule lets organizations define a threshold for rejections. When the threshold is reached, the DOM processor will mark an order or order line as an exception, and exclude it from further processing.

After order lines are assigned to a location, the location can reject an assigned order line, because it might not be able to fulfill that line for some reasons. Rejected lines are marked as an exception and put back into the pool for processing in the next run. During the next run, DOM will try to assign the rejected line to a different location. The new location can also reject the assigned order line. This cycle of assignment and rejection can occur multiple times. When the rejection count hits the threshold that is defined, DOM will mark the order line as a permanent exception and won't pick the line for assignment again. DOM will consider the order line again for reassignment only if a user manually resets the status of the order line.

- **Maximum distance rule** – This rule lets organizations define the maximum distance that a location or group of locations can be to fulfill the order. If overlapping maximum distance rules are defined for a location, DOM will apply the lowest maximum distance that is defined for that location.

- **Maximum orders rule** – This rule lets organizations define the maximum number of orders that a location or group of locations can process during a calendar day. If the maximum number of orders is assigned to a location in a single day, DOM won't assign any more orders to that location for the rest of that calendar day.

Here are some of the common attributes that can be defined for all the preceding rule types:

- **Start date and End date** – Every rule can be made date-effective by using the these fields.
- **Disabled** – Only rules that have a value of **No** for this field are considered in a DOM run.
- **Hard constraint** – A rule can be defined as either a hard constraint or not a hard constraint. Every DOM run goes through two iterations. In the first iteration, every rule is treated as a hard constraint rule, regardless of the setting of this field. In other words, every rule is applied. The only exception is the **Location priority** rule. In the second iteration, the rules that weren't defined as hard constraint rules are removed, and the order or order lines that weren't assigned to locations when all the rules were applied are assigned to locations.

10. Fulfillment profiles are used to group a collection of rules, legal entities, sales order origins, and modes of delivery. Every DOM run is for a specific fulfillment profile. In this way, organizations can define and run a set of rules for a set of legal entities, on orders that have specific sales order origins and modes of delivery. Therefore, if different set of rules must be run for different sets of sales order origins or modes of delivery, the fulfillment profiles can be defined accordingly. To set up fulfillment profiles, follow these steps:

- Go to **Retail and Commerce > Distributed order management > Setup > Fulfillment profiles**.
- Select **New**.
- Enter values in the **Profile** and **Description** fields.
- Set the **Auto apply result** option. If you set this option to **Yes**, the results of the DOM run for the profile will be automatically applied to the sales order lines. If you set it to **No**, the results can only be viewed in the fulfillment plan. They won't be applied to the sales order lines.
- If you want the DOM profile to be run for orders that have every sales order origin, including orders where the sales order origin is undefined, set the **Process orders with empty sales origin** option to **Yes**. To run the profile for only a few sales order origins, you can define them on the **Sales origins** page, as explained later.

#### NOTE

In Commerce version 10.0.12 and higher, **Ability to assign Fulfillment group to a Fulfillment Profile** must be enabled in the **Feature Management** workspace.

This feature adds a new configuration on the **Fulfillment profile** page that can be associated to a single fulfillment group.

If you select the fulfillment group, the DOM rules for that fulfillment profile will efficiently run against the "shipping" warehouses included in the fulfillment group.

To effectively use this feature, ensure that there is one fulfillment group that contains all the shipping warehouses, and then associate that fulfillment group to the fulfillment profile.

- On the **Legal entities** FastTab, select **Add**, and then select a legal entity.
- On the **Rules** FastTab, select **Add**, and then select the rule to link to the profile.
- Repeat the previous two steps until all the required rules are associated with the profile.
- Select **Save**.
- On the Action Pane, on the **Setup** tab, select **Modes of delivery**.
- On the **Modes of delivery** page, select **New**.

- l. In the **Company** field, select the legal entity. The list of companies is limited to the legal entities that you added earlier.
- m. In the **Mode of delivery** field, select the mode of delivery to associate with this profile. A mode of delivery can't be associated with multiple active profiles.
- n. Repeat the previous two steps until all the required modes of delivery are associated with the profile.
- o. Close the **Modes of delivery** page.
- p. On the Action Pane, on the **Setup** tab, select **Sales order origins**.
- q. On the **Sales origins** page, select **New**.
- r. In the **Company** field, select the legal entity. The list of companies is limited to the legal entities that you added earlier.
- s. In the **Sales origin** field, select the sales origin to associate with this profile. A sales origin can't be associated with multiple active profiles.
- t. Repeat the previous two steps until all the required sales origins are associated with the profile.
- u. Close the **Sales origins** page.
- v. Set the **Enable profile** option to **Yes**. If there are any errors in the setup, you receive a warning message.

## DOM processing

DOM will run only in a batch job. To configure the batch job for DOM runs, follow these steps.

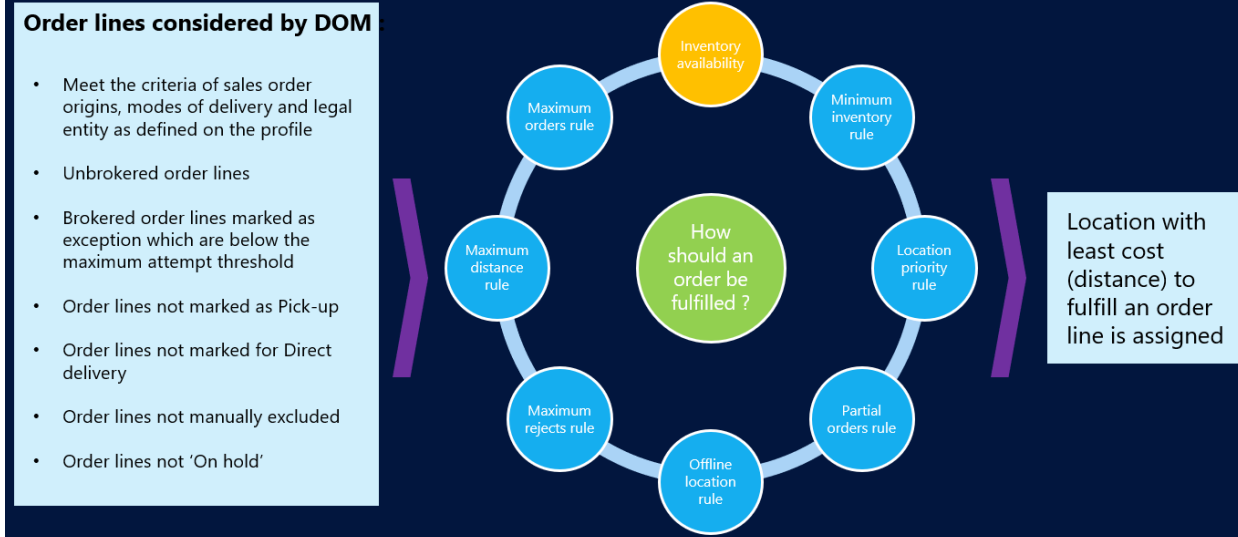

1. Go to **Retail and Commerce > Distributed order management > Batch processing > DOM processor job setup**.
2. On the **Parameters** FastTab, in the **Fulfillment profile** field, select a profile that DOM must be run for.
3. On the **Run in the background** FastTab, in the **Batch group** field, select a configured batch group.
4. In the **Task description** field, enter a name for the batch job.
5. Select **Recurrence**, and define the recurrence of the batch job.
6. Select **OK**.

At the time of processing, DOM will consider the order and order lines as described here:

- Order lines that meet the criteria for sales order origins, modes of delivery, and legal entity as defined in the DOM profile, and that also meet any of these criteria:
  - They are created from commerce channels.
  - They have never been brokered by DOM.
  - They have been brokered by DOM before, but they are marked as exceptions and are below the maximum threshold for attempts.
  - The mode of delivery isn't pick-up or electronic delivery.
  - They aren't marked for delivery.
  - They aren't manually excluded.
- Orders that aren't on hold

After it applies the rules, inventory constraints, and optimization, DOM picks the location that is closest to the customer's delivery address.

## Distributed order management – Order brokering

## Results of DOM runs

If the fulfillment profile is set to **Auto apply**, the results of the run will be automatically applied to the sales order lines, and the fulfillment plan can be viewed separately. However, if the fulfillment profile isn't set to **Auto apply**, the results of the run can be seen only from the fulfillment plan view.

To view all the fulfillment plans that are generated, follow these steps.

1. Go to **Retail and Commerce > Distributed order management > Distributed order management**.
2. In the **Distributed order management** workspace, select the **Fulfillment Plans** tile.
3. Select the ID of the relevant order fulfillment plan to view the fulfillment plan.

The order details section of the fulfillment plan shows the original sales order lines that were part of the run. Besides the standard sales order line fields, the order details section also includes the following three DOM-related fields:

- **Fulfillment type** – This field indicates whether the sales order line is fully brokered, partially brokered, or not brokered at all to a location.
- **Split** – This field indicates whether one sales order line has been split and brokered to different locations.
- **Number of fulfillment locations** – This field indicates how many fulfillment lines were created for one sales order line (based on the number of locations that the original sales order line was brokered to).

The order fulfillment details section shows the assignment of the original sales order lines to different locations, together with their quantities.

## Order line actions and statuses

The following describes settings on the order line. To open the order line, go to **Retail and Commerce > Customers > All sales orders**.

- If you set the **Exclude from DOM processing** option on the **General** tab of the sales order line to **Yes**, the order or order line will be excluded from DOM processing.
- The **DOM status** field on the **General** tab of the sales order line can be set to one of the following

values:

- **None** – The order line has never been brokered.
- **Complete** – The order line has been successfully brokered and assigned to a location.
- **Exception** – The order line has been brokered but can't be assigned to a location. Exceptions have multiple subtypes that can be viewed from the DOM workspace:
  - **No quantity available** – There is no available inventory to assign the order to in the locations.
  - **Maximum rejections** – The order line has reached the maximum threshold for rejections.
  - **Data modification conflict** – The sales order line has been changed since the order was brokered. Therefore, the fulfillment plan can't be applied to the order.
  - **Order line specific exception** – There are multiple exceptions on the order line.
- During the sales order entry, DOM can be run in an interactive mode. While you're entering an order line, after you specify the product and quantity, you can select **Update line** and then, under **DOM**, select **Suggest fulfillment location**. You then see a list of locations that is based on DOM rules that can fulfill the quantity on the order line. This list is sorted by distance. Select a location to set the relevant site and warehouse on the sales order line. For this functionality to work, there must be an existing, active fulfillment profile that matches the sales origin and delivery mode on the sales line.
- To view the DOM run logs for a sales order line, select **Sales order line**, and then, under **DOM**, select **View DOM Logs**. The DOM logs show all the events and logs that were generated by the DOM run. The logs can help you understand why a specific location was assigned to the order line, and what rules and constraints were considered as a part of the assignment. On the **Manage** tab, the DOM logs are also available at the level of the sales order header.

## Run a clean-up job for DOM fulfillment plans

As DOM processing is run, fulfillment plans are created. Over time, the system will keep numerous fulfillment plans. To manage the number of fulfillment plans that the system keeps, you can configure a batch job that deletes older fulfillment plans, based on the **Retention period in days** value.

1. Go to **Retail and Commerce > Distributed order management > Batch processing > DOM fulfillment data deletion job setup**.
2. In the **Batch group** field, select a configured batch group.
3. Select **Recurrence**, and define the recurrence of the batch job.
4. Select **OK**.

## More information

Here are some things to consider when you use the DOM feature:

- Currently, DOM looks only at orders that are created from commerce channels. Sales orders are identified as sales orders when the **Commerce sale** option is set to **Yes**.
- Microsoft hasn't tested DOM with advanced warehouse management features. Customers and partners must be careful to determine whether DOM is compatible with the advanced warehouse management capabilities and processes that are relevant to them.
- DOM is available only on the cloud version of Commerce. It isn't supported in on-premises deployments.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cost configuration for distributed order management (DOM)

2/18/2021 • 7 minutes to read • [Edit Online](#)

Organizations consider multiple cost components to determine the optimal location to fulfill an order from. Some of these cost components are shipping cost, handling cost, and packaging cost. A combination of these costs is calculated to determine the fulfillment location.

When the first iteration of distributed order management (DOM) in Dynamics 365 Commerce optimized the assignment of orders to fulfillment locations, it factored in distance only. Although distance can be correlated with cost, it isn't the same as cost. For example, an overnight shipping method costs more than three-day shipping or seven-day shipping over the same distance.

The cost configuration feature lets retailers define and configure additional cost components that will be calculated and factored in to determine the optimal location to fulfill order lines from.

When cost components are configured, the DOM solver uses only those cost definitions to determine the optimal location for order fulfillment. It doesn't consider the distance component as a cost. However, if no cost components are configured, the DOM solver does use the distance component as a cost to determine the optimal location for order fulfillment.

## Set up cost components

Two major cost component types can be defined in the system: **Shipping** and **Other**.

Both cost component types support multiple calculation bases, as shown in the following table.

COST COMPONENT TYPE	CALCULATION BASIS
Shipping	<ul style="list-style-type: none"><li>• Simple</li><li>• Tiered</li></ul>
Other	<ul style="list-style-type: none"><li>• Sales order</li><li>• Sales line</li><li>• Location</li></ul>

### Shipping cost component type

This section explains how to set up each combination of the **Shipping** cost component type and a calculation basis for shipping costs. It also explains how the DOM solver uses each combination.

#### Cost component type = Shipping and Calculation basis = Simple

If a combination of the **Shipping** cost component type and the **Simple** calculation basis is used, the shipping cost for a mode of delivery is based on either a flat cost or distance.

You must set up the following fields for this combination:

- **Cost factor** – Enter a unique identifier for the cost factor.
- **Description** – Enter the name and description of the cost factor.
- **Start date** and **End date** – You can use these fields to limit the cost factor for a specific date range. If you

leave these fields blank, the cost factor is valid for an indefinite period.

- **Active** – Indicate whether the cost factor is active. The DOM considers only active cost factors that are associated with the fulfillment profile.
- **Company** – Specify the legal entity that the cost factor is configured for. All lines of the calculation criteria must be for the same legal entity.
- **Modes of delivery** – Specify the modes of delivery that the cost is configured for.
- **Calculation type** – Specify how the cost should be calculated for a specific mode of delivery. Two calculation types are supported:
  - **Fixed** – A flat cost is used for the mode of delivery. If you select this calculation type, the **Cost** field defines the flat cost.
  - **Per-distance unit** – The cost for the mode of delivery is calculated as the cost value that is specified in the **Cost** field times the distance between the delivery address and the locations.
- **Cost** – Specify the cost value that is used in conjunction with the **Calculation type** field to compute the cost for a mode of delivery.

**Cost component type = Shipping and Calculation basis = Tiered**

If a combination of the **Shipping** cost component type and the **Tiered** calculation basis is used, the shipping cost for a mode of delivery is based on either a flat cost or distance. However, in this combination, the distance is based on a tiered range of distances.

You must set up the following fields for this combination:

- **Cost factor** – Enter a unique identifier for the cost factor.
- **Description** – Enter the name and description of the cost factor.
- **Default cost** – Specify the cost that should be used for a mode of delivery if the distance between the delivery address and the location doesn't fall into any of the tiered distances for the mode of delivery.
- **Start date** and **End date** – You can use these fields to limit the cost factor for a specific date range. If you leave these fields blank, the cost factor is valid for an indefinite period.
- **Active** – Indicate whether the cost factor is active. The DOM considers only active cost factors that are associated with the fulfillment profile.
- **Company** – Specify the legal entity that the cost factor is configured for. All lines of the calculation criteria must be for the same legal entity.
- **Modes of delivery** – Specify the modes of delivery that the cost is configured for.
- **Distance type** – Specify whether the tiered distance definition is an aerial distance or a road distance.
- **Distance units** – Specify the unit that the tiered distance is measured in.
- **Distance from** – Specify the start range for the tiered distance.
- **Distance to** – Specify the end range for the tiered distance.
- **Calculation type** – Specify how the cost should be calculated for a specific mode of delivery and tiered distance. Two calculation types are supported:
  - **Fixed** – A flat cost is used for the mode of delivery. If you select this calculation type, the **Cost** field defines the flat cost.
  - **Per distance unit** – The cost for the mode of delivery and tiered distance is calculated as the cost value that is specified in the **Cost** field times the distance between the delivery address and the

locations.

- **Cost** – Specify the cost value that is used in conjunction with the **Calculation type** field to compute the cost for a mode of delivery.

#### NOTE

- When you define tiered distances, the system validates that there are no missing or overlapping distances.
- The distance type that is used for a mode of delivery must be the same across all the tiered distances.

### Other cost component type

This section explains how to set up each combination of the **Other** cost component type and an other cost type for non-shipping costs. It also explains how the DOM solver uses each combination.

#### Cost component type = Other and Other cost type = Sales order

A combination of the **Other** cost component type and the **Sales order** other cost type is used to define non-shipping costs at the sales order level.

You must set up the following fields for this combination:

- **Cost factor** – Enter a unique identifier for the cost factor.
- **Description** – Enter the name and description of the cost factor.
- **Start date** and **End date** – You can use these fields to limit the cost factor for a specific date range. If you leave these fields blank, the cost factor is valid for an indefinite period.
- **Active** – Indicate whether the cost factor is active. The DOM considers only active cost factors that are associated with the fulfillment profile.
- **Cost** – Specify the cost value for a non-shipping cost at the sales order level.

#### Cost component type = Other and Other cost type = Sales line

A combination of the **Other** cost component type and the **Sales line** other cost type is used to define non-shipping costs at the sales order line level.

You must set up the following fields for this combination:

- **Cost factor** – Enter a unique identifier for the cost factor.
- **Description** – Enter the name and description of the cost factor.
- **Start date** and **End date** – You can use these fields to limit the cost factor for a specific date range. If you leave these fields blank, the cost factor is valid for an indefinite period.
- **Active** – Indicate whether the cost factor is active. The DOM considers only active cost factors that are associated with the fulfillment profile.
- **Cost** – Specify the cost value for a non-shipping cost at the sales order line level.

#### Cost component type = Other and Other cost type = Location

A combination of the **Other** cost component type and the **Location** other cost type is used to define non-shipping costs for a group of locations or an individual location.

You must set up the following fields for this combination:

- **Cost factor** – Enter a unique identifier for the cost factor.
- **Description** – Enter the name and description of the cost factor.
- **Start date** and **End date** – You can use these fields to limit the cost factor for a specific date range. If you leave these fields blank, the cost factor is valid for an indefinite period.
- **Active** – Indicate whether the cost factor is active. The DOM considers only active cost factors that are associated with the fulfillment profile.

- **Fulfillment group** – Specify the group of locations that the non-shipping cost is defined for.
- **Fulfillment location** – Specify the location that the non-shipping cost is defined for.

**NOTE**

You can't specify a fulfillment group and a fulfillment location on the same line for location-based calculation criteria.

- **Cost** – Specify the cost value for a non-shipping cost at the fulfillment group level or fulfillment location level.

**IMPORTANT**

For DOM to consider these costs when it's run, you must add the cost factor to the relevant fulfillment profile.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Store order fulfillment

2/18/2021 • 14 minutes to read • [Edit Online](#)

Many retailers would like to optimize order fulfillment by enabling stores to fill orders. Order fulfillment at the store level can help to ease overstock scenarios for a specific store, or may be needed from a logistical standpoint in cases where a store has extra capacity or is located within closer shipping distance to the customer. To address this need, a unified order fulfillment operation is available at the point of sale.

Orders for fulfillment at a specific store have the store's warehouse designated on the header or lines of the order.

The order fulfillment operation in the point of sale provides a single work area in the point of sale that can be used to process orders. This includes everything from accepting the order, to marking it as shipped, or initiating store pickup.

## Access unified order fulfillment in the point of sale

Order fulfillment, [Operation ID 928](#), can be used to access the store order fulfillment work area in the point of sale.

The order fulfillment operation does not have its own permission out-of-the-box, but in the future, users will be able to use the **Allow retrieve order** permission to invoke the operation from the point of sale.

At the store level, a configuration setting is available to determine whether an order line must be accepted manually from within the point of sale. If that configuration option is not set, order lines will be accepted by default. If that configuration option is turned on, users at the point of sale will need to select **Allow accept order** permission to accept orders from within the point of sale.

Order lines can also be rejected from the point of sale. Rejecting an order line signifies that it will not be fulfilled at that store and sends the order line back for reassignment to another store or warehouse. Order line rejection permission is granted through the **Allow order reject** permission.

## Order fulfillment operation parameters

Order fulfillment provides out-of-the-box parameters that can be applied to the operation when it is called in the point of sale. When the **All orders** parameter is configured, all orders are shown when the operation is used. The **Orders to ship** parameter shows only orders that must be shipped from the store and **Orders for pick up** shows orders that will be picked up in-store.

## Orders for fulfillment

The order fulfillment operation shows only orders that will either be picked up in or shipped from the current store. Orders for other stores to fulfill are not listed when using the order fulfillment operation.

## Line selection

Lines can be selected using the **Select** function in the Action Pane. When **Select** is enabled, multiple lines can be selected for processing. You can clear selected lines by clicking the same line again.

## Line details

Line details can be shown using the line details flyout menu. When this menu is used, three tabs are provided to

show additional information for the selected line. The first tab, **Line details** shows details for the line itself such as quantity ordered and remaining. Additional details are provided including quantity picked, packed, and invoiced as well as mode of delivery and delivery address. The **Order details** tab provides order header information including customer, customer ID, order number, order total, and balance. The **Inventory** tab shows information for the selected line in terms of physical available inventory, reserved inventory and ordered inventory.

If multiple lines are selected, the order line details flyout menu will only indicate that multiple lines are selected. To show details for a single line, clear the lines until only one line remains.

## Pending order lines

Unified order fulfillment includes the ability to manually accept orders. By default, orders for fulfillment at the store are already accepted. However, if business processes dictate that a worker at the store level must accept orders, manual acceptance can be turned on at the retail store level. To enable order acceptance, go to **Retail and Commerce > Channels > Stores > All stores**. Open the desired store and on the **General** tab, locate the **Order fulfillment** sub header. This sub header has a **Manual accept** option that is set to **No** by default. By setting this option to **Yes** and synchronizing the changes to the channel database, order lines can go through the acceptance process.

Workers with the **Allow accept order** permission can open order fulfillment and select lines for acceptance. Once lines have been accepted, their state changes from **Pending** to **Accepted** and the rest of the order fulfillment process can proceed. When **Manual accept** is turned on, orders will not be processed until they have been accepted.

Orders for store pickup never have the **Pending** state. This is done to avoid a scenario in which a customer arrives at the store and the order line cannot be processed because a worker with the proper privilege is not available.

## Accepted order lines

Orders with the line state **Accepted** can proceed through the rest of the order fulfillment process at the point of sale. After an order has been accepted, any remaining action can be taken against the order line.

For example, an accepted order line can be selected and then picked up directly without going through picking and packing.

## Line actions

### Pick

The **Pick** category of actions is provided to aid in the process of picking order lines from shelves. The picking action can only be performed on order lines that have been previously accepted.

#### Action: Picking

- **Resulting POS status:** Picking
- **Resulting back office status:** No change

After an order has been accepted, lines can be selected and marked as **Picking**. Marking a line as **Picking** is a way to indicate that the picking work is already being performed on a line. This prevents two workers from attempting to pick the same order lines at the same time.

#### Action: Print picking list

- **Resulting status:** Picking
- **Resulting back office status:** No change

Picking lists can be printed at the point of sale to assist workers performing the picking process. A printed picking list can be carried with the worker performing picking and as products are picked, the worker would manually mark them as picked on the picking list.

The picking list format is configured in Commerce and added to the receipt profile. For more information about setting up receipt profiles, see [Receipt templates and printing](#).

If lines are selected and a picking list is printed for those lines, they are automatically updated with the **Picking** status.

#### **Action: Mark as picked**

- **Resulting status:** Picked or partially picked
- **Resulting back office status:** Picked or partially picked

After the physical picking process has been performed, lines can be marked as **Picked**. Selecting a line and marking it as **Picked** performs a real-time call to update the order line. After the line has been marked as **Picked** at the point of sale, the status in the back office is also updated to **Picked** and inventory transactions reflect that the specified quantity has been decremented.

When orders are processed over time, partial quantities can be processed for a specific line. If a line is selected and the action **Mark as picked** is taken, and the quantity is greater than one, the user is prompted for the quantity. The remaining quantity to be picked is auto-filled. If less than the remaining quantity is specified, the status of the line becomes **Partially picked**. When the order line is updated in the back office, it will also reflect the partially picked status and the quantity entered by the user is used for the inventory update.

If an order line is picked in error, the unpick process must be performed on the order line in the back office. There is currently no unpick action supported at the point of sale.

Orders lines from different orders can be selected and marked as **Picking**, printed on the same pick list, or marked as **Picked**.

#### **Pack**

Order lines can be packed at any point after the order line has been accepted.

#### **Action: Print packing slip**

- **Resulting status:** Packed or partially packed
- **Resulting back office status:** Delivered or partially delivered

This action marks lines as packed or partially packed and prints a packing slip. A packing slip can be printed to validate the products that have been packed together. The packing slip format is configured in Commerce and added to the receipt profile. For more information about setting up receipt profiles, see [Receipt templates and printing](#).

#### **Action: Mark as packed**

- **Resulting status:** Packed or partially packed
- **Resulting back office status:** Delivered or partially delivered

The **Mark as packed** action can be used to indicate that lines are packed without printing a packing slip. Both **Print packing slip** and **Mark as packed** result in inventory transactions in the back office. Packing lines in the point of sale will result in packing slip journals being generated in the back office.

If an order line is packed in error, the packing slip journal must be corrected at the back office.

Only lines on the same order and with the same mode of delivery can be packed at the same time.

Currently, the option to mark store pickup lines as **Packed** is disabled. This capability will be added in a future

release. The packing slip creation process will be enhanced to support injection of third-party shipping information into the packing slip process.

### **Pick up**

Orders for store pickup can be directly picked up once they are retrieved in the point of sale. Store pick up orders are not subject to acceptance.

#### **Action: Pick up**

- **Resulting status:** Invoiced or partially invoiced
- **Resulting back office status:** Invoiced or partially invoiced

If a line is selected for pick up from unified order fulfillment, the entire order is loaded into the point of sale and the full quantity for the selected line is marked. Other lines on the order are also loaded into the transaction view of the point of sale, but with quantity marked as zero.

After lines for pickup have been loaded into the transaction view, the transaction can be tendered as usual.

Lines that have been fully invoiced through pick up will no longer show up in unified order processing. Lines that have been partially picked up will continue to appear in unified order fulfillment until they have been picked up in full.

If a line is picked up in error, a return must be performed to correct the error.

Only lines on the same order and with the same mode of delivery can be picked up at the same time.

### **Shipping**

Order lines to be shipped from the store can be processed through unified order fulfillment using the **Ship** action. If manual order line acceptance is configured at the channel level, orders must be accepted prior to shipping. After an order line has been accepted and has a **Pending** or other status, lines can be shipped.

#### **Action: Ship**

- **Resulting status:** Invoiced or partially invoiced
- **Resulting back office status:** Invoiced or partially invoiced

Lines shipped from unified order fulfillment are invoiced from the back office similar to if the order is invoiced directly from the back office. Lines being shipped from unified order fulfillment are not loaded into the transaction view and there is no tendering performed at the time the lines are shipped.

Order lines that have been fully shipped no longer appear in unified order fulfillment. Partially shipped lines will continue to appear in unified order fulfillment until they have been shipped in full.

Only lines from the same order can be shipped at the same time. If the lines from the same order have different modes of deliver, they can still be selected for shipping at the same time.

### **Reject**

Lines or partial lines can be rejected. This allows them to be reassigned from the back office to another store or warehouse. Lines can only be rejected if they have not yet been picked or packed. To reject a line that has already been picked or packed, that line must be unpicked or unpacked from the back office.

#### **Action: Reject**

- **Resulting status:** Rejected
- **Resulting back office status:** No change

The rejected order lines can be viewed from the **Sales order processing and inquiry** workspace. Clear the person filter on the workspace to view all the rejected order lines across the stores. The **Rejected order lines** tab under the **Orders and favorites** section display the order line details. Additionally, the users can click the

**Rejected order lines** button under the **Summary** section to navigate to a sales order view. This shows all the orders that have one or more rejected order lines. If Distributed Order Management (DOM) is enabled, then these rejected orders will be automatically reassigned to the appropriate stores for fulfillment, however, these order lines can be manually reassigned as well. To do so, select the line that shows the **Fulfillment status as Rejected** and change the site/warehouse as needed. Click the **Update line** drop-down menu and click **Reset fulfillment status** to change the fulfillment status from **Rejected** to **Accepted** or **Pending** depending on the order fulfillment set up. After the fulfillment status is reset, then the store workers will be able to view the order lines in POS.

## Line quantity tracking

A single order line of quantity greater than one can be processed over time, resulting in multiple sub states for order lines. For example, if a builder has a project that required 500 boards, but the builder will only pick up or have a few boards delivered at a time over the course of the project, there could be quantities that are being picked, packed, and shipped at the same time.

Any time a line is selected, the remaining amount for the line will be auto-filled to assume that the remaining quantity is being processed. Using the above example, if 200 boards have already been picked and the line for boards is selected for picking, the remaining quantity of 300 will be automatically filled in the quantity. The same is true if 200 boards have already been invoiced. In that case, only the remaining quantity will be auto filled.

Continuing with the above example, if 200 boards are marked as packed and shipping is selected, the full amount of 500 will be autofilled. If only 200 boards are shipped, the system will assume that the previously packed boards are being shipped and the packed quantity will be decremented. If 201 boards are shipped, the packed boards are first decremented with the remaining single board being decremented from the quantity remaining.

## Line statuses

Order lines in the point of sale have several statuses to reflect the state of the order line. Statuses in the point of sale and back office do not match in all cases. Order line status can be viewed through the point of sale using the order fulfillment operations. In the back office, order lines can be viewed from the order details. Order details can be accessed through **Retail and Commerce > Customers > All customer orders**. Select the **Order ID** to view order details. From order details select the **Sales order** tab, then select **Detailed status** under the **View** subheader.

- **Pending** – Order lines that have been assigned to a store, but not yet accepted have the **Pending** status when viewed at the point of sale. Lines pending acceptance in the point of sale will have the **Order processing** status in the back office.
- **Accepted** – Order lines that have been manually accepted or automatically accepted will have the status of **Accepted** when viewed at the point of sale. Lines with the **Accepted** status will show as **Order processing** in the back office.
- **Picking** – Lines that are currently being picked at the store level have the status of **Picking**. Those same lines, when viewed at the back office, will show as **Order processing**.
- **Picked and Partially picked** – Lines that have been picked or partially picked at the point of sale will have the status **Picked** or **Partially picked**. The same lines in the back office will also show as **Picked** or **Partially picked**.
- **Packed and Partially packed** – Lines that have been packed or partially packed at the point of sale will have the status **Packed** or **Partially packed**. The same lines in the back office will also show as **Delivered** or **Partially delivered**.
- **Partially invoiced** – Lines that have been partially picked up or partially shipped will have the status **Partially invoiced** at the point of sale and in the back office.
- **Invoiced** – Lines that have been fully invoiced at the point of sale will no longer show up for fulfillment. In

the back office the status for those lines is **Invoiced**.

## Order fulfillment filtering

Order fulfillment at the point of sale includes filtering to help the user easily find what they need. Filters can be changed through the Action Pane at the bottom of the **Point of sale** screen. By default, a **Delivery type** filter is applied, based on how the operation is set up. If the operation is set up with the **All orders** parameter, then that filter is applied when accessing order fulfillment. The same applies for the **Store pickup** and **Ship from store** parameters. Other filters that can be applied to the order fulfillment view include:

- Customer number
- Customer name
- Customer email
- Order number
- Mode of delivery
- Receipt number
- Channel reference ID
- Originating store number
- Line status
- Created date
- Delivery date
- Receipt date

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up order fulfillment for stores

2/18/2021 • 8 minutes to read • [Edit Online](#)

## Overview

Many retailers would like to optimize order fulfillment by enabling stores to fill orders. Order fulfillment at the store level can help to ease overstock scenarios for a specific store, or may be needed from a logistical standpoint in cases where a store has extra capacity or is located within closer shipping distance to the customer. To address this need, a unified order fulfillment operation is available at the point of sale.

Orders for fulfillment at a specific store has the store's warehouse designated on the header or lines of the order.

The order fulfillment operation in the point of sale provides a single work area in the point of sale that can be used to process orders. This includes everything from accepting the order, to marking it as shipped, or initiating store pickup.

## Set up the order fulfillment operation

Order fulfillment, [Operation ID 928](#), can be used to access the store order fulfillment work area in the point of sale.

Follow the steps in [Add the operation to a button grid](#) to specify which parameter to use when invoking order fulfillment at the point of sale. By default, after specifying the order fulfillment operations, the **All orders** is selected. When configured with this parameter, the operation will list all order lines for fulfillment at the current store. Also available is **Orders to ship**, which can be assigned to a button and utilized when the user only wants to see orders that will ship out of the store. Finally, there is **Orders for pick up**. When invoked at the point of sale, this only lists orders to be picked up at the store. The different parameters can be assigned to different buttons to give the user a variety of ways to view order fulfillment.

### Enable users to access order fulfillment at the point of sale

The order fulfillment operation does not have its own permission out-of-the-box, but in the future, users may require the **Allow retrieve order** permission to invoke the operation from the point of sale.

At the store level, a configuration setting is available to determine whether an order line must be accepted manually from within the point of sale. If that configuration option is not set, order lines will be accepted by default. If that configuration option is turned on, users at the point of sale will need to have the **Allow accept order** permission to accept orders from within the point of sale.

### Enable manual order acceptance

By default, order lines assigned to a store are marked as **Accepted**. This means that it is assumed they will be fulfilled from the assigned store and will not be subject to further assignment. In certain cases, retailers may want to manually accept orders before they can be fulfilled. For example, if a store is short staffed and is unable to fulfill orders, a store manager will only accept as many orders for processing as they feel can adequately be processed in a given day. Until an order is accepted, it may be reassigned by the back office to a different store. In this way, order acceptance also provides a way to indicate that an order has been acknowledged by a store and will be fulfilled.

Order lines for store pickup are marked as **Pending** and are not subject to acceptance.

To turn on manual acceptance for order lines, navigate to **Retail and Commerce > Channels > Stores > All stores**. Select the store and click in the store ID to view the store's details. Click **Edit**. On the **General** FastTab, locate the **Order fulfillment** subheader and change **Manual accept** from **No** to **Yes**.

## Enable reject order line capability

Order lines can also be rejected from the point of sale. Rejecting an order line signifies that it will not be fulfilled at that store and sends the order line back for reassignment to another store or warehouse. Order line rejection permission is granted through the **Allow reject order** permission in the POS permission group associated with the worker. While rejecting a line, the retailers can mandate their workers to provide a reason for rejection. This can be achieved by using info codes of **Info code activity** type **Order fulfillment** and assigning the info code to **Reject order line** in the functionality profile associated with the channel.

### NOTE

Only the info codes of **Info code activity** type **Order fulfillment** can be assigned to the **Reject order line** action.

## Synchronize changes to the channel database

After the operation has been assigned to a button grid, the proper permissions have been assigned, and the channel is configured, the changes must be synchronized to the channel database. To do so, navigate to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**. Select schedule "1090-Registers" to sync button grid changes and then click **Run now**. Next, sync permissions changes by selecting "1060-Staff" and then click **Run now**. Next, sync channel changes by selecting "1070-Channel configuration" and click **Run now**. Finally, sync the newly created info code for reject reason by selecting the "1110-Global configuration" and click **Run now**.

## Use order fulfillment at the point of sale

Open the point of sale and select the order fulfillment operation. Depending on how it is configured, either all lines, order lines for pickup, or order lines to ship will be listed.

### Order fulfillment view

The order fulfillment view lists order lines for fulfillment at the store and includes the following columns:

- Order number
- Product number
- Description
- Quantity ordered
- Requested delivery date
- Customer name
- Fulfillment status

Additional information for a specific order line can be viewed by selecting the order line and then opening the flyout menu located just below the logged in user/shift information shown in the point of sale header. This menu includes 2 tabs: one for line details and another for order details. The line details tab includes the following information:

- Quantity ordered
- Quantity remaining to be shipped/picked up
- Quantity picked
- Quantity packed
- Quantity invoiced (already picked up or shipped)
- Mode of delivery
- Delivery address

The details flyout menu also has a tab that provides more order level details including:

- Customer name

- Customer ID
- Order number
- Order total
- Order balance

At the bottom of the order fulfillment view is an Action Pane. This contains all of the actions that can be taken against an order line. If an action is not available based on a line's status, that action will be unavailable.

By default, orders will have a status of **Accepted**. Order status can be viewed as a column in the list of order lines. If **Manual accept** is configured at the channel level, all lines to be shipped will show as **Pending** and must be accepted before they can be fulfilled. Orders for store pickup are **Pending** by default and do not need to be accepted.

### Order fulfillment line actions

- **Edit** – If an order status is pending, it can be edited at the point of sale. Orders that have already been partially picked, packed, or invoiced cannot be edited from the order fulfillment view.
- **Accept** – If **Manual accept** is configured at the channel level, lines must be first accepted before they can move through the order fulfillment process.
- **Pick** – The pick option supports several actions. First, **Picking** updates the status of the order line so others in the store do not attempt to pick the same line. Next, **Print picking list** prints a picking list for the selected line or lines and also updates their status to **Picking**. Picking list formats are controlled as part of receipt formats. For more information about how to set up receipt formats, see [Receipt templates and printing](#). Finally, **Mark as picked** indicates the line has been picked. **Mark as picked** initiates corresponding inventory transactions in the back office. Picking actions can be performed at the same time for multiple order lines across orders and for all modes of delivery.
- **Reject** – Lines or partial lines can be rejected. This allows them to be reassigned from the back office to another store or warehouse. Lines can only be rejected if they have not yet been picked or packed. To reject a line that has already been picked or packed, that line must be unpicked or unpacked from the back office.
- **Pack** – The pack option supports two actions: **Print packing slip** will print a packing slip for the selected lines and **Mark as packed** will mark the lines as packed and mark the lines as delivered in the back office. Only order lines that belong to the same order and have the same mode of delivery can be packed at the same time. Packing slip formats are controlled as part of receipt formats. For more information about how to set up receipt formats, see [Receipt templates and printing](#).
- **Ship** – The ship action will mark selected lines as **Delivered** in the back office. After a line has been fully shipped, it will no longer appear in the order fulfillment view.
- **Pickup** – The pickup action adds the lines to the transaction view for pickup. If there are other lines on the order that aren't currently being picked up, they will be added to the transaction view with quantity zero. After a line has been fully picked up, it will no longer appear in the order fulfillment view.

### Order fulfillment filtering

Order fulfillment at the point of sale includes filtering to help the user easily find what they need. Filters can be changed on the Action Pane at the bottom of the **Point of sale** screen. By default, a **Delivery type** filter is applied, based on how the operation is set up. If the operation is set up with the parameter **All orders**, then that filter is applied when accessing order fulfillment. The same applies for the **Store pickup** and **Ship from store** parameters. Other filters that can be applied to the order fulfillment view include:

- Customer number
- Customer name
- Customer email
- Order number
- Mode of delivery
- Receipt number

- Channel Reference ID
- Originating store number
- Line status
- Created date
- Delivery date
- Receipt date

# Show order notifications in the point of sale (POS)

2/18/2021 • 5 minutes to read • [Edit Online](#)

In the modern retail environment, store associates are assigned various tasks, such as helping customers, entering transactions, doing stock counts, and receiving orders in the store. The point of sale (POS) client provides a single application where associates can perform all these tasks and many others. Because various tasks must be performed during the day, associates might have to be notified when something requires their attention. The notification framework in the POS helps by letting retailers configure role-based notifications. As of Dynamics 365 for Retail with application update 5, these notifications can be configured only for POS operations.

Currently, the system can show notifications only for order fulfillment operations. However, because the framework is designed to be extensible, developers will eventually be able to write a notification handler for any operation and show the notifications for that operation in the POS.

## Enable notifications for order fulfillment operations

To enable notifications for order fulfillment operations, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS > Operations**.
2. Search for the **Order fulfillment** operation, and select the **Enable notifications** check box for it to specify that the notification framework should listen to the handler for this operation. If the handler is implemented, notifications for this operation will then be shown in the POS.
3. Go to **Retail and Commerce > Employees > Workers >**, under Commerce tab, open the POS permissions associated with the worker. Expand the **Notifications** FastTab, add the **Order fulfillment** operation, and set the **Display order** field to **1**. If more than one notification is configured, this field is used to arrange the notifications. Notifications that have a lower **Display order** value appear above notifications that have a higher value. Notifications that have a **Display order** value of **1** are at the top.

Notifications are shown only for operations that are added on the **Notifications** FastTab, and you can add operations there only if the **Enable notifications** check box for those operations has been selected on the **POS operations** page. Additionally, notifications for an operation are shown to workers only if the operation is added to the POS permissions for those workers.

### NOTE

Notifications can be overridden at the user level. Open the worker's record, select **POS permissions**, and then edit the user's notification subscription.

4. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. In the **Notification interval** field, specify how often notifications should be pulled. For some notifications, the POS must make real-time calls to the back-office application. These calls consume the compute capacity of your back-office application. Therefore, when you set the notification interval, you should consider both your business requirements and the impact of real-time calls to the back-office application. A value of **0** (zero) turns off notifications.
5. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**. Select the **1060 (Staff)** schedule to synchronize notification subscription settings, and then select **Run now**. Next, select the **1070 (Channel configuration)** schedule to synchronize the permission interval, and then select

Run now.

## View notifications in the POS

After you complete the preceding steps, the workers will be able to view the notifications in the POS. To view notifications, press the notification icon in the top right corner of the POS. A notification center appears and shows notifications for the order fulfillment operation. The notification center should show the following groups in the order fulfillment operation:

- **Store pickup** – This group shows the count of orders that have a delivery mode of **Pickup**, and that are scheduled for pickup from the current store. You can press the number on the group to open the **Order fulfillment** page. In this case, the page will be filtered so that it shows only the active orders that are set up for pickup from the current store.
- **Ship from store** – This group shows the count of orders that have the delivery mode of **Shipping**, and that are scheduled for shipment from the current store. You can press the number on the group to open the **Order fulfillment** page. In this case, the page will be filtered so that it shows only the active orders that are set up for shipment from the current store.

When new orders are assigned to the store for fulfillment, the notification icon changes to indicate that there are new notifications, and the count for the appropriate groups is updated. Even though the groups are refreshed at regular intervals however, POS users can manually refresh the groups at any time by selecting the **Refresh** button next to the group. Lastly, if a group has a new item, that the current worker hasn't viewed, then the group shows a burst symbol to indicate new content.

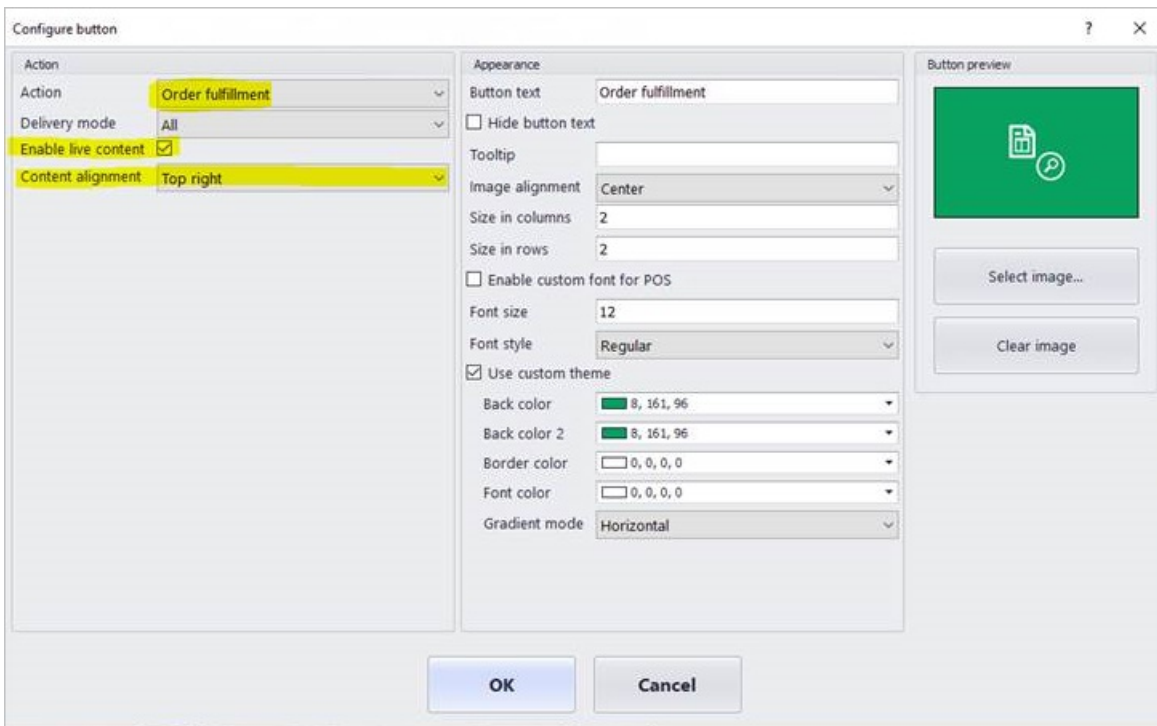

## Enable live content on POS buttons

POS buttons can now show a count to help workers easily determine which tasks require their immediate attention. To show this number on a POS button, you must complete the notification setup that is described earlier in this topic (that is, you must enable notifications for an operation, set up a notification interval, and update the POS permission group for the worker). Additionally, you must open the button grid designer, view the button's properties, and select the **Enable live content** check box. In the **Content alignment** field, you can select whether the count appears in the upper-right corner of the button (**Top right**) or in the center (**Center**).

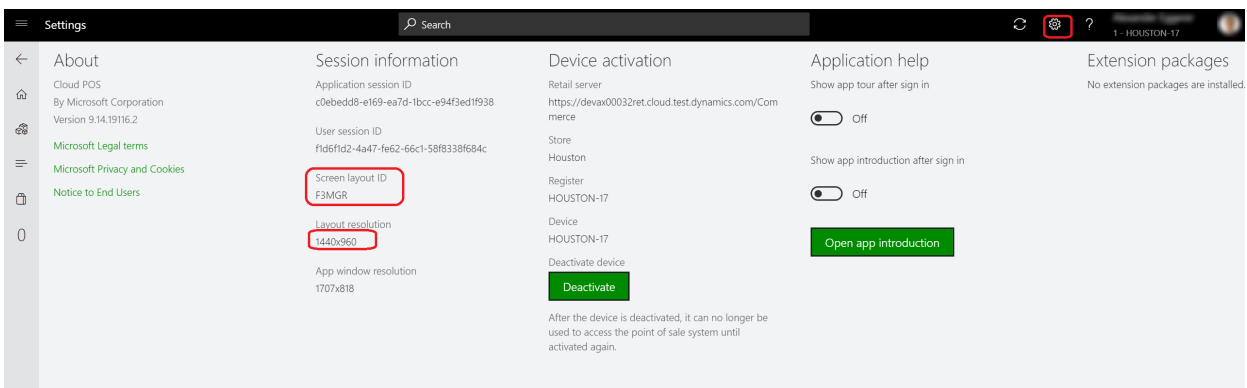

### NOTE

The live content can be enabled for operations only if the **Enable notifications** check box has been selected for them on the **POS operations** page, as described earlier in this topic.

The following illustration shows the live content settings in the button grid designer.

To show the notification count on a button, you need to ensure that the correct screen layout is being updated. To determine the screen layout that is being used by the POS, select the **Settings** icon in upper-right corner and note the **Screen layout ID** and **Layout resolution**. Now using Edge browser, go to the **Screen layout** page, find the **Screen layout ID** and **Layout resolution** identified above and select the **Enable live content** check box. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule** and run the 1090 (Registers) job to synchronize layout changes.

The following illustration shows the effect of selecting **Top right** versus **Center** in the **Content alignment** field for buttons of various sizes.

The image shows a Windows Start menu on the left and a Notifications window on the right. The Start menu features several tiles: 'Current transaction' (shopping cart icon), 'Return transaction' (shopping cart with arrow icon), 'Order fulfillment - ALL' (two tiles, each with a document icon and a count of 1), 'Order fulfillment - Pick Up' (calendar icon, count 1), 'Order fulfillment - Ship' (calendar with checkmark icon, count 0), and 'Select hardware station' (two small tiles, each with a count of 1). The Notifications window is titled 'Order fulfillment' and shows 'Last updated: 01/17/2018 5:43 PM'. It contains two sections: 'Store pickup' with a count of 1, and 'Ship from store' with a count of 0.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Using continuity program

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through selling a continuity program and processing related sales orders. To complete this procedure, the user has to be set up as a call center user. This procedure uses the USRT demo data company.

1. Go to Retail and Commerce > Customers > Customer service.
2. In the SearchText field, type 'Karen' and then press the Tab key.
  - The advanced search dialog should pop up. If it doesn't, click Search to the right of this field.
3. In the list, mark the selected row.
  - There should be only one row with Karen Berg showing. Select the row by clicking on the checkmark column on the far left of the grid.
4. Click Select.
5. Click New sales order.
  - It's a good idea to note the sales order number. You'll need it later in this procedure.
6. In the Item number field, type '88000' and then press the Tab key.
  - This is a continuity item in the USRT demo data.
7. Click Complete.
8. In the Payment method field, enter 'Visa'.
9. Click Add credit card.
  - Enter the required credit card information on this page.
10. Click OK.
11. Expand the Payment section.
  - To submit a call center order, payments have to be entered for the order.
12. Click OK.
13. Click Submit.
  - You're done creating a new continuity order. Next, you'll run two batch processes that are used to process the continuity orders.
14. Close the page.
15. Go to Retail and Commerce > Continuity > Process continuity payments.
16. In the Continuity item field, type '88000' and then press the Tab key.
17. Click OK.
18. Go to Retail and Commerce > Continuity > Create continuity child orders.
  - This process will create new sales orders based on the settings of your continuity programs.
19. In the Continuity item field, type '88000' and then press the Tab key.
  - Item '88000' is a continuity item in the USRT demo data.
20. In the Sales order field, enter or select a value.
  - Enter the sales order number that you noted earlier in the procedure. This will keep the processing time to a minimal for this procedure. The Sales order field field is optional--you could process all orders for any one program.
21. Click OK.

# Linked refunds of previously approved and confirmed transactions

2/18/2021 • 4 minutes to read • [Edit Online](#)

Returns are an important operation for retailers. The ability to accept returns for sales and refund payments to customers gives retailers a way to service the needs of customers and to help resolve their issues.

This topic provides information about how to configure and use linked refunds. A linked refund is a refund of a transaction that was previously approved and confirmed. The refund can be either a full refund or a partial refund of the transaction, and it can't exceed the full amount of the original authorization. The functionality for linked refunds is available in Microsoft Dynamics 365 Retail version 10.0.1.

In Microsoft Dynamics 365 Retail version 10.0 and earlier, retailers can process refunds to cards, but cashiers must manually specify these refunds. Cashiers can process refunds to the original mode of payment only if the customer provides that mode of payment. Therefore, by providing new card details, customers can use the return process to move balances from one card to another and therefore do unauthorized card balance transfers.

By using linked refunds, retailers can greatly reduce risk by making sure that refunds are processed only to the card that was authorized during the original transaction. To help prevent unauthorized card balance transfers, the system can prompt cashiers to use the confirmed and approved card token to process refunds. By using the original mode of payment for refunds, retailers can help reduce their card authorization costs.

## Prerequisites

[Payment method setup](#)

[Omni channel payments setup](#)

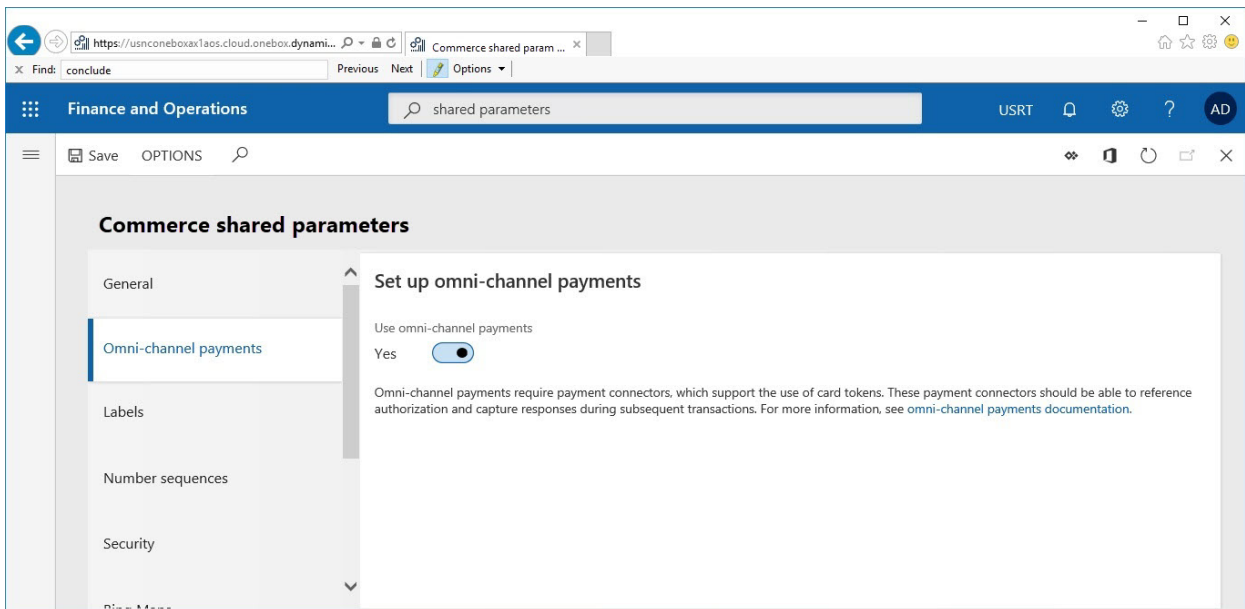

### **Additional setup**

Customers who aren't using the out-of-box implementation of the Adyen Connector must set up the connector that supports tokenization of credit cards. All the scenarios that are described in this topic can be implemented by using the standard Payments software development kit (SDK) that is provided with Commerce. The [Dynamics 365 Payment Connector for Adyen](#) provides an out-of-box implementation of every scenario that is described here.

## Turn on the linked refunds functionality

The linked refunds functionality works with the omni-channel payments functionality that is available in Microsoft Dynamics 365 Retail 8.1.3 and later.

To turn on the linked refunds functionality, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**. On the **Omni-channel payments** tab, set the **Use omni-channel payments** option to **Yes**.

When you turn on the omni-channel payments functionality, you change the business process flow for calculating shipping charges and other charges, and for adding those charges to point of sale (POS) sales. Therefore, make sure that you test and train your employees before you turn on this functionality.

When the omni-channel payments functionality is turned on, the card payment tokens that are used in one channel (for example, a call center or Modern POS (MPOS)) will be available in all channels that are set up for the retailer. For POS applications, the linked refunds functionality will also be turned on. For call center, MPOS, and e-Commerce applications, customers can still manually enter card numbers for payment.

### Supported flows

Cashiers can process a refund to the card that was used during the original transaction, even if the card isn't presented for the return.

- Linked refunds for cash-and-carry transactions that use credit or debit cards
- Linked refunds for customer orders that use credit or debit cards

### Unsupported flows

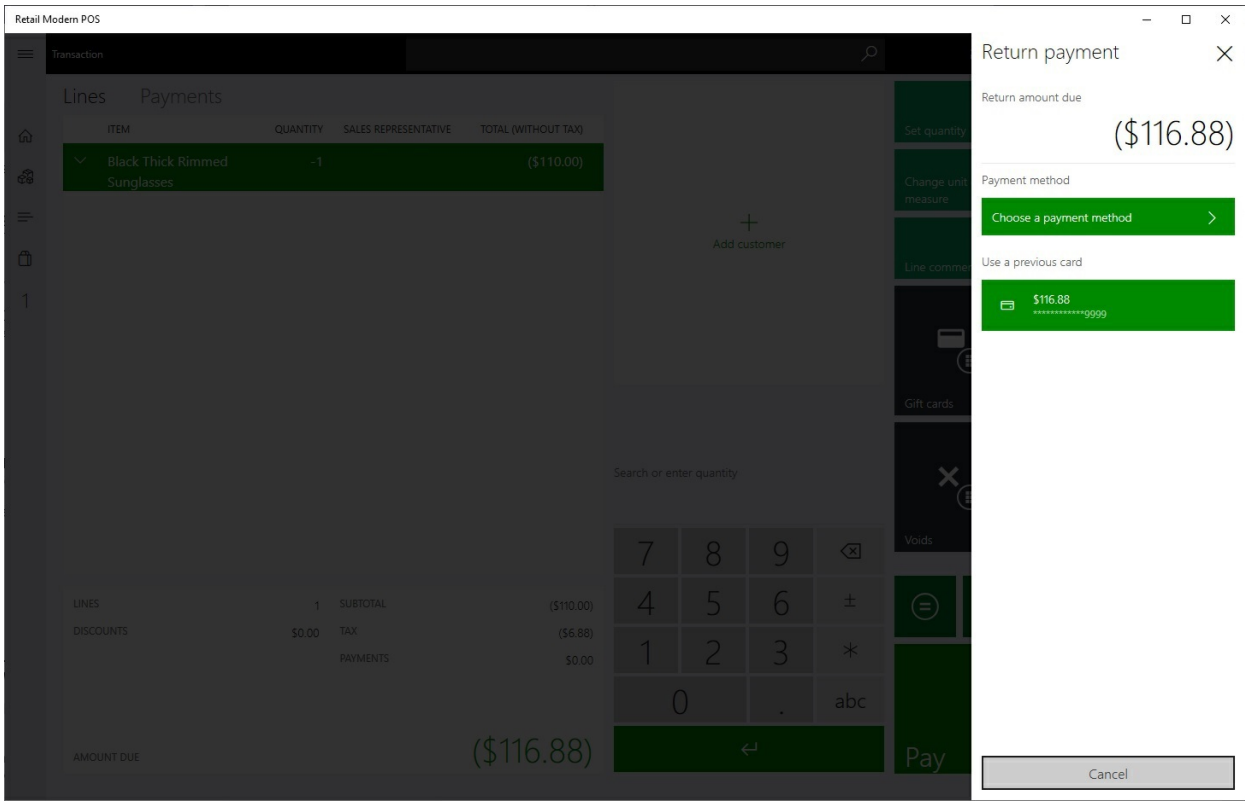

- Linked refunds for transactions that use gift cards
- Linked refunds for transactions that use loyalty cards
- Linked refunds for exchange orders
- Multiple return orders in the same transaction
- Returns without a receipt or customer account details

## Use case examples

This section presents examples of use cases to help you understand the configuration and use of linked refunds and payment authorizations in the context of a customer order or a return where a receipt is presented. These examples show the behavior of the application when the **Omni-channel payments** parameter has been turned on.

### Customer account-based or receipt-based return that has a single card authorization

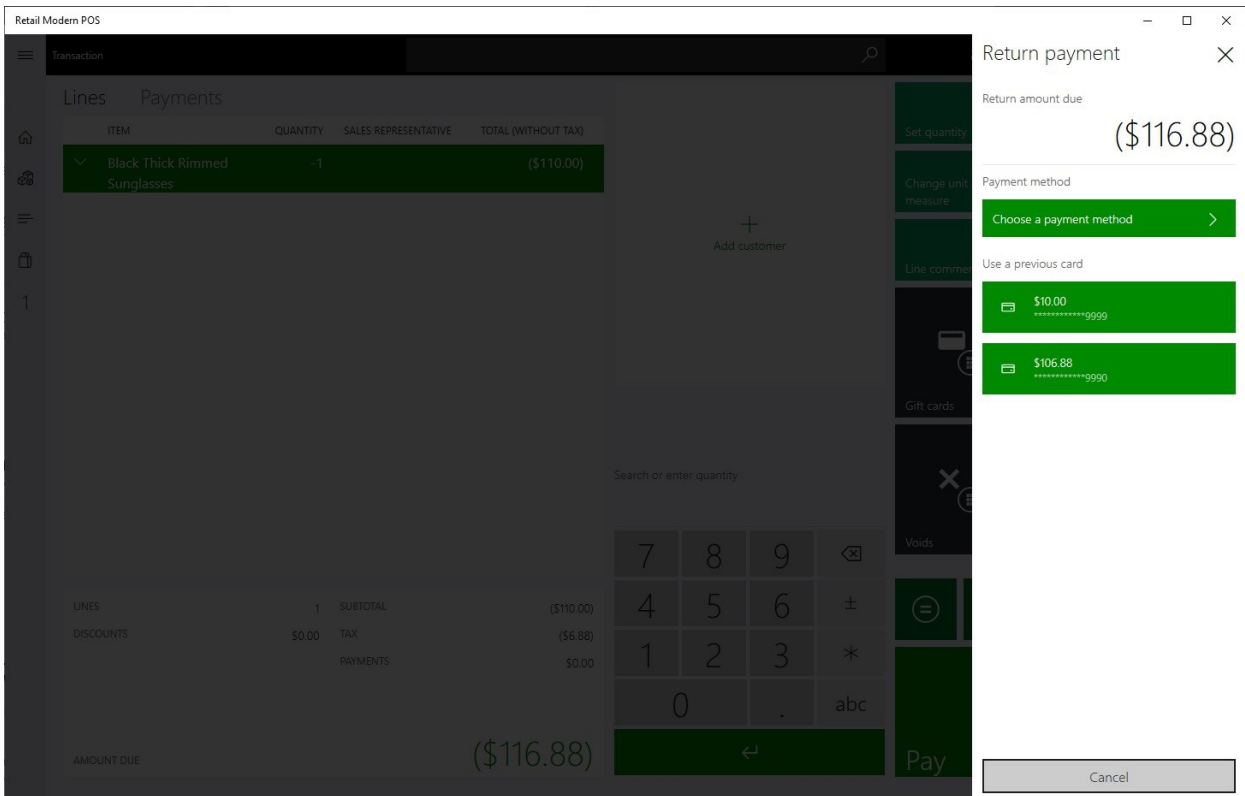

A customer comes to return an item that was purchased by using a single credit card. The customer provides a receipt, and the return is being made within the allowed period for returns. When the cashier scans the receipt, the item for return is processed. When the cashier processes the payment refund by selecting the button for any payment method, the existing credit card authorization is shown.

When the cashier selects the credit card authorization, the payment refund is processed, and the **Transaction end** screen appears. If a receipt printing is configured, the cashier is prompted to print a receipt.

**Customer account-based or receipt-based return that has multiple card authorizations**

A customer comes to return an item that was purchased by using multiple credit cards. When the cashier scans the receipt, the item for return is processed. When the cashier processes the payment refund by selecting the button for any payment method, all the existing credit card authorizations are shown.

When the cashier selects a credit card authorization, the payment refund is processed. If more must be refunded, the current transaction screen shows the remaining amount. When the cashier processes the payment refund for this amount, the remaining credit card authorizations are shown. This process continues until there is no

remaining amount that must be refunded.

After the full amount is successfully refunded, the cashier can complete the transaction, and a receipt can be printed as configured.

# Sell and return products that aren't part of a store's assortment

2/18/2021 • 2 minutes to read • [Edit Online](#)

A common scenario for any retailer is to sell products to their customers or accept returns from their customers even if they don't carry the specific products in their store (in other words, the products are not assorted to the store).

Here are some typical scenarios:

- A retailer doesn't carry all its products in a specific store. The remaining products are stored in the warehouse. The store associate can assist the customer by searching or browsing for the products in the warehouse, add them to the cart, and complete the checkout by selecting a delivery method, such as shipping to an address from the warehouse or letting the customer pick up the product from the current store or from another store.
- A retailer doesn't carry specific products in the store or doesn't have them in stock at the store the customer visited, but the products are available in other stores. The store associate can assist the customer by searching or browsing the products in the other store, add them to the cart, and complete the checkout by selecting a delivery method.
- A retailer has many stores in and around a specific city or zip code and doesn't want to force the customers to return products to the same store they were purchased in. Instead, customers can return products to any store.

Those common scenarios are available for retailers using Commerce. With Commerce, you can:

- Search or browse products at other stores.
- Search or browse all released products.
- Create cash-and-carry transactions or customer orders.
- Select delivery options for customer orders.
- Pick up products at the current store or another store.
- Cancel an order at the current store or another store.
- Return an order with or without the receipt at the current store or another store.

## NOTE

# Configure and process an exchange on a return order

2/18/2021 • 2 minutes to read • [Edit Online](#)

In previous versions of Dynamics 365 Commerce, returns against customer orders were processed by using the return order document in Headquarters. However, the return order document can be used to process only products that are being returned. The returned products are indicated by a negative quantity on the return order lines. By contrast, sales are indicated by a positive quantity. However, the return order document doesn't support positive quantities. Because of this limitation, previous versions of the app didn't support scenarios where product exchanges are done by using the return order document.

However, functionality has been added to support scenarios where exchanges are done on return orders. Commerce now uses the sales order document instead of the return order document to process these types of transactions.

## Configure Commerce to support exchanges on return orders

Follow these steps to configure the system to support exchanges on return orders.

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**. On the **Customer orders** FastTab, set the **Process return orders as sales orders** option to **Yes**.
2. Run the **Global configuration distribution schedule** job (1110).

## Make an exchange

After the system is configured as described in the previous section, the point of sale (POS) user will still select a sales order or sales invoice to process a return, as in previous versions of the app. However, after the return items are added to the cart, the user will be able to add new sales lines to the cart.

For these new sales lines, the user must define all the attributes that are required in order to process a customer order line. These attributes include the delivery method and fulfillment location. The payment that is due for the transaction will be a net of the return order lines and sales order lines. When payment is tendered for the transaction, the return order will be posted as a sales order document in Headquarters, and the system will immediately invoice the return lines.

To provide better visibility into the various amounts for the cart, three new amount fields have been added to the cart. You can use the screen designer to make these new fields available in the POS user interface (UI).

- **Deposit applied** – The deposit amount that is applied on a transaction when the user does a customer order pickup. If there is no deposit override, and a 10-percent deposit is configured, the amount in this field is 90 percent of the total amount of the customer order.
- **Carry out amount** – The total amount for lines where the delivery mode was set to **Carry out** when the customer order was created or edited, or during a customer order exchange. The amount in this field includes taxes and charges.
- **Return amount** – The total amount for lines that have negative quantities during the customer order exchange. The amount in this field includes taxes and charges.

**NOTE**

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Restrict payment methods for returns without a receipt

2/18/2021 • 2 minutes to read • [Edit Online](#)

Each payment type that a retailer accepts must be configured when the system is set up. This topic describes how certain payment types can be restricted for refund if the returns are made without a receipt.

## Set up payment methods

To set up payment methods, the following tasks must be completed.

1. Create the payment methods that are accepted by the entire organization.
2. Create organization-wide card types and card numbers. If credit cards or debit cards are accepted, you must create one payment method for cards, and then create the organization-wide card types and card numbers.
3. Set up store payment methods. Associate payment methods with each store, and then enter the store-specific settings for each payment method.
4. Set up card payment methods for stores. For any card payment methods that the store accepts, complete the card setup.

The screenshot shows the Dynamics 365 Finance and Operations interface. The breadcrumb navigation is 'Commerce > Channels > Stores > All stores'. The main navigation bar includes 'Edit', '+ New', 'Delete', 'Configuration status', 'STORE', 'SET UP', and 'OPTIONS'. The 'SET UP' section is expanded, showing 'Payment methods' highlighted in yellow. Other options include 'Income/expense account', 'Channel database', 'Cash declaration', 'Sections', and 'Fulfillment group assignment'. Below the navigation, there is a message: 'Click the edit button to make changes.' The 'STORES' section contains a search filter and a table with the following data:

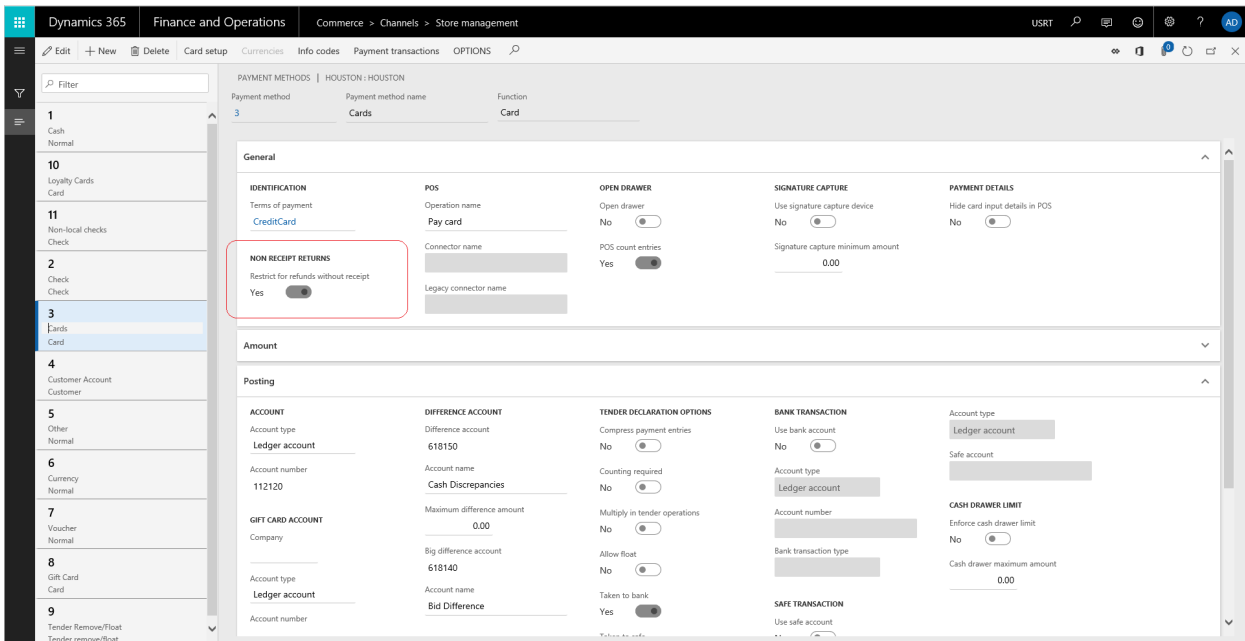

Channel Id	Name	Channel type	Operating unit ...	Store number	Warehouse	Sales tax
000001	Annapolis	Retail store	036	ANNAPOL	ANNAPOL	MD

## Restrict payment methods for returns without a receipt

For each store payment method, on the **Store management** page, under **Non receipt returns**, set **Restrict for refunds without receipt** to **Yes**.

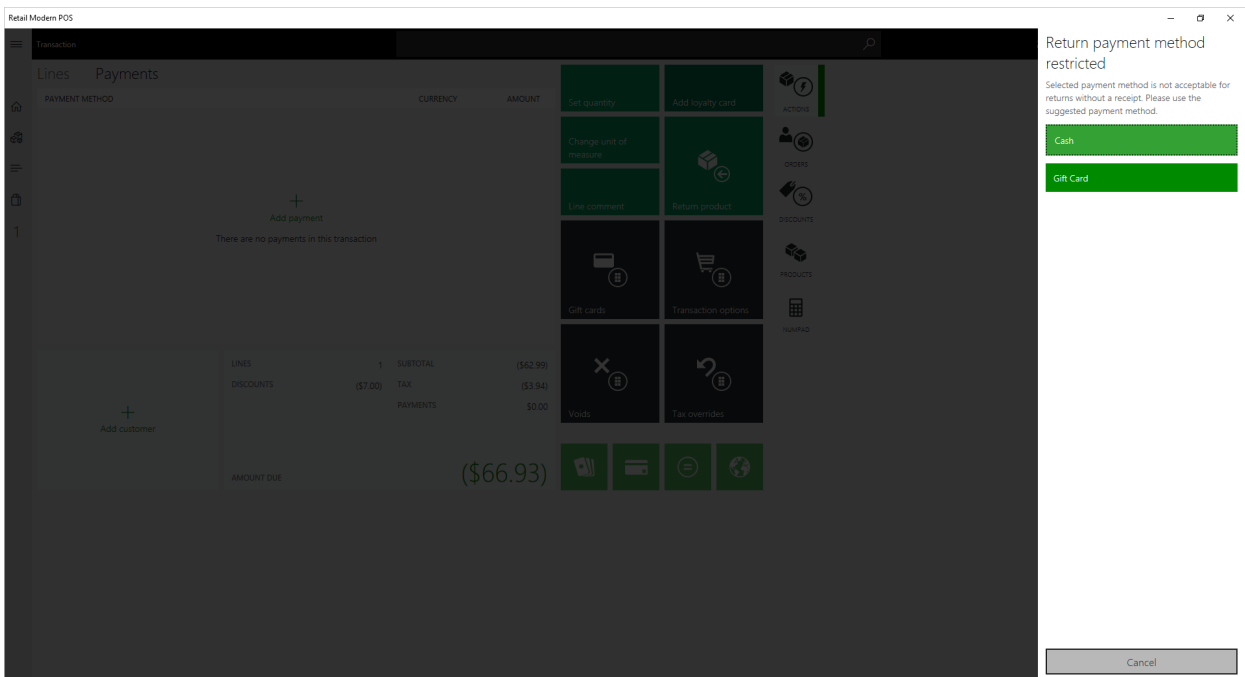

The default value of the toggle is **No**, which ensures that the payment method is allowed for refunds.

When **Restrict for refunds without receipt** is set to **Yes**, the selected payment method will not be allowed for refunds.

**NOTE**

When a cashier selects a payment method that is restricted for refund without a receipt, a message displays to verify the acceptable payment methods.

If a transaction has both a receipted return and a return without a receipt, the restriction conditions will not be enforced because the transaction will be a return workflow with a receipt.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Return items across multiple customer orders and invoices

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes two features that optimize customer order returns over multiple invoices.

## Enable refunds over multiple captures

This feature enables multiple linked refunds against the same customer order.

1. Go to the **Feature management** workspace and search for **Enable refunds over multiple captures**.
2. Select **Enable refunds over multiple orders** and then click **Enable**.

## Enable proper tax calculation for returns with partial quantity

This feature ensures that when an order is returned using multiple invoices, the taxes will ultimately be equal to the tax amount originally charged.

1. Go to the **Feature management** workspace and search for **Enable proper tax calculation for returns with partial quantity**.
2. Select **Enable proper tax calculation for returns with partial quantity** and then click **Enable**.

## Process returns

After these features are turned on and the changes are synchronized to the stores, the cashier in the store can select multiple sales orders for a customer for their return.

When the orders are selected, a list of all the returnable products across all the invoices for the orders will display. The cashier can then select the products to return. A single return order will be created for all the selected products.

If the order is fully returned, the amount of taxes returned to the customer will be equal to the amount of tax originally charged.

# Create and update a returns and refunds policy for a channel

2/18/2021 • 3 minutes to read • [Edit Online](#)

## Overview

The channel return policy in Dynamics 365 Commerce enables retailers to set enforcements on which payment tenders can be allowed for processing a return on a point of sale (POS) device.

This topic describes the steps to set up a returns and refunds policy for a channel.

The scope of the policy is currently limited to setting the payment tenders that can be allowed for a channel. The "allowed" list is based on the payment methods used to make the purchase. For example:

- If a purchase was made using a gift card, the store policy is to process refunds only to a new gift card or to give store credit.
- If a sale is made using cash, the options allowed for refund are cash, gift card, and customer account, but not credit card.

## Enable return policy

To enable the channel return policy functionality, do the following:

1. Go to the **Feature Management** workspace in Dynamics 365 Commerce.
2. Search for the **Enable channel return policies** feature in the list of feature names.
3. Select **Enable now**.

## Configure return policy

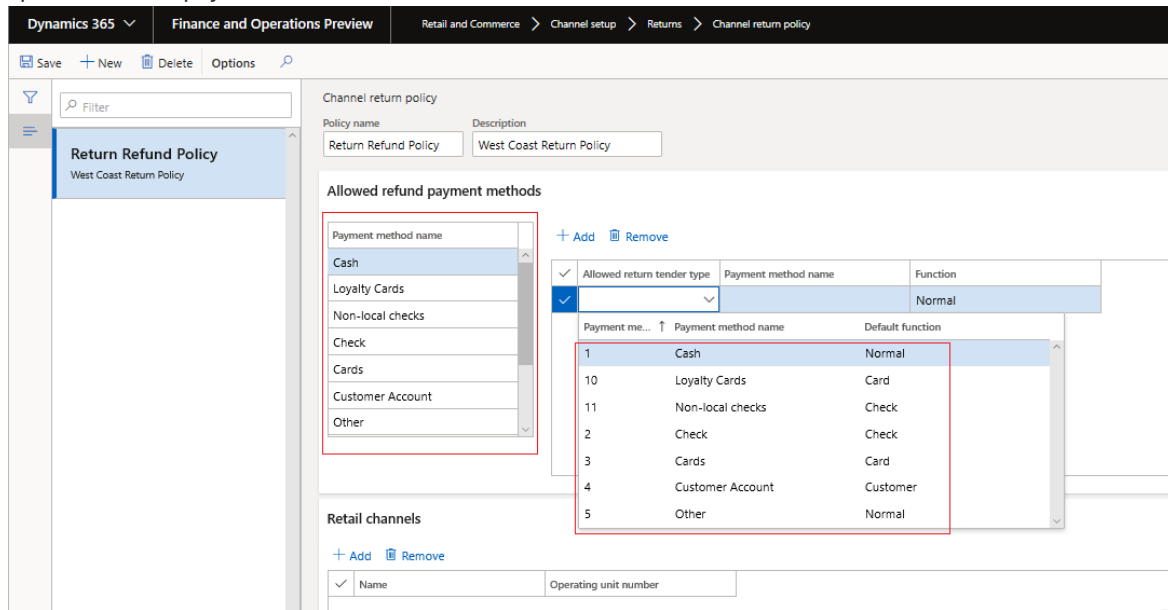

Follow these steps to configure a return policy for a retail store or online retail channel.

1. Go to **Retail and Commerce > Channel Setup > Returns > Channel return policy**.
2. Select **New** to create a new return policy template. To use an existing template, select the template in the left pane. For new templates, add a name and description that will help you identify the policy when it is being applied to the channel.

The screenshot displays the Dynamics 365 Commerce interface for configuring a channel return policy. The breadcrumb navigation at the top reads: Retail and Commerce > Channel setup > Returns > Channel return policy. The left-hand navigation pane shows the 'Return Refund Policy' section selected, with a sub-item 'West Coast Return Policy'. The main content area is titled 'Channel return policy' and contains the following elements:

- Channel return policy header:** A table with two columns: 'Policy name' (containing 'Return Refund Policy') and 'Description' (containing 'West Coast Return Policy').
- Allowed refund payment methods:** A section with a list of payment methods on the left: Cash, Loyalty Cards, Non-local checks, Check, Cards, Customer Account, and Other. To the right is a table with columns 'Allowed return tender type', 'Payment method name', and 'Function'. The table is currently empty, displaying a 'We didn't find anything to show here.' message.
- Retail channels:** A section with a table with columns 'Name' and 'Operating unit number'. This table is also empty, displaying a 'We didn't find anything to show here.' message.

3. In the **Allowed refund payment methods** section, define **Allowed** return payment tenders that are specific to each payment method.

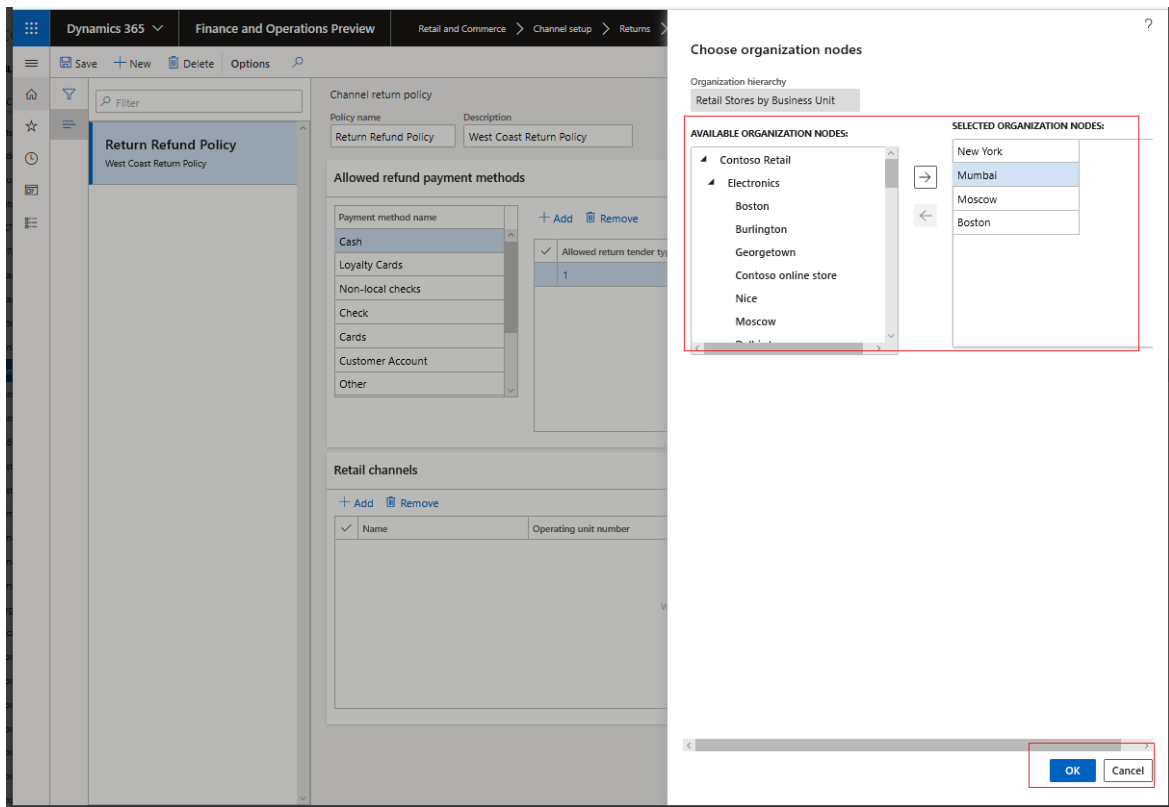

#### IMPORTANT

- The payment methods are derived from the payment methods set for the organization.
- Adding an allowed return tender type for each listed payment method will ensure that returns can be made to the allowed return tender type.

4. Associate the return policy template with the stores where it will be used. Select **Add** in the **Retail Channels** tab and associate the available channels.

- In the **Choose organization nodes** dialog box, select the stores, regions, and organizations that the template should be associated with.
- Only one return policy template can be associated with each store.
- Use the arrow buttons to select stores, regions, or organizations.
- The effective date on the policy will be the date on which the policies are applied to the channels and the channel jobs are run.

5. On the **Distribution schedule** page, run the **1070** job to make the channel return policy available to the POS.

## Preview the channel return policy in the POS

Follow the steps in either of the following examples to view the allowed return tender types in POS.

1. Sign in to the POS as a cashier or manager.
2. Under **Shift and Drawer**, select **Show journal**.
3. Select the transaction that is part of the return.
4. Select the items to refund, and choose the payment method.
  - If the payment tender selected is in the allowed list of return tender types, the cashier can complete the transaction.
  - If the payment tender selected is not allowed, an error message is displayed.
  - Select **Amount Due** to display a list of all the allowed return tender types.

-or-

1. Sign in to the POS as a cashier or manager.
2. Select **Return Transaction** and enter the receipt ID using a barcode scan or by manual entry.
3. Select the transaction that is part of the return.
4. Select the items to refund, and choose the payment method.
  - If the payment tender selected is in the allowed list of return tender types, the cashier can complete the transaction.
  - If the payment tender selected is not allowed, an error message is displayed.
  - Select **Amount Due** to display a list of all the allowed return tender types.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Clienteling overview

2/18/2021 • 11 minutes to read • [Edit Online](#)

Many retailers, especially high-end specialty retailers, want their sales associates to form long-term relationships with their key customers. The associates are expected to know about these customers' likes and dislikes, purchase history, product preferences, and important dates, such as anniversaries and birthdays. Associates need a place where they can capture this information and easily find it when it's required. If this information is available in a single view, the associates can easily target customers who meet specific criteria. For example, they can find all customers who prefer to shop for handbags, or customers who have an important event approaching, such as a birthday or anniversary.

## Client book

In Microsoft Dynamics 365 Commerce, retailers can use the client book functionality to help store associates form long-term relationships with key customers.

The client book includes customer cards that show contact information for each customer, together with three more properties that are defined by the retailer and configured in Headquarters. Retailers can decide the three most important things that sales associates should know about customers. For example, a jewelry retailer might want to include important dates such as anniversaries or birthdays, because these dates are occasions when people might buy more jewelry. Similarly, a fashion retailer might want to include the customer's preferred shopping interests and brands.

The client book also lets sales associates filter the list so that it shows only customers who meet specific criteria. For example, a new collection of shoes has arrived in the store, and an associate wants to inform customers who like to buy shoes. In this case, the associate can filter the client book to find the relevant customers and then take further action.

If any customers are no longer considered key customers for some reason, and therefore should not be closely managed, sales associates can remove them from their client book.

Some retailers don't want to manage customers at the sales associate level. Instead, they want to manage a list of key customers at the store level. These retailers can view customers from store client books. By using this option, retailers can view the customers from the client books of all the sales associates whose address book matches the address book of the current store. In this way, if an associate works in multiple stores of the legal entity, the client book shows the customers from all those stores. This functionality supports additional capabilities. For example, customers can be reassigned from one associate to another associate. This capability is useful when associates are transferred or leave the company.

Each sales associate can have one client book per legal entity, and associates can add one or more customers to their client book. In Commerce, each customer can currently be added to only one client book. However, Microsoft plans to add functionality that lets a single customer be added to multiple client books.

### NOTE

Unlike customer search, the client book doesn't filter customer records based on the store's address books.

## Activities and notes

Online channels give retailers ways to learn about customer preferences without requiring that customers explicitly provide this information. By contrast, when customers interact with sales associates in the store, they

explicitly share information about their preferences. Unfortunately, this information can be lost after the sale is over. However, if this information is recorded, it can help retailers better understand customers, and therefore help them provide better recommendations and a better overall shopping experience.

To capture the critical information that customers share, sales associates can use not only the client book attributes, but also use the activities and notes functionality. Retailers can configure the activity types, such as information about the store visit, email address, phone number, and appointments. Activities that associates create can be viewed in a timeline format at the point of sale (POS). They can also be viewed on the **Activities** tab on the **All customers > General** page in Headquarters.

Sales associates can also use notes to capture generic customer information that can be referenced before every interaction. These notes are saved in Headquarters, and can be viewed in the customer profile or on the customer details page in the call center.

#### NOTE

Currently, all notes and activities can be viewed by any sales associate who works for the legal entity and can view customer details pages. Notes and activities aren't limited to the associate who added a customer to the client book.

## Integration with Dynamics 365 Customer Insights

By using the Dynamics 365 Customer Insights application, retailers can aggregate data from the various systems that customers use to interact with the retailer's brand. They can then use this data to generate a single view of the customer and derive insights. The integration of Customer Insights with Commerce lets retailers select one or more measures that should be shown on the customer card in the client book. For example, retailers can use the data in Customer Insights to calculate the "churn probability" for a customer and define the "next best action." If these values are defined as measures, they can be shown on the customer card and can provide crucial information to sales associates. For more information about Customer Insights, see the [Dynamics 365 Customer Insights](#) documentation. For more information about measures, see [Measures](#).

## Set up clienteling

To turn on the clienteling functionality in your environment, follow these steps.

1. In the **Feature management** workspace, filter the features by the **Retail and commerce** module.

The screenshot shows the 'Feature management' interface. At the top, there are statistics: 'New' (28), 'Not enabled' (104), and 'Scheduled' (0). There are buttons for 'Enable all' and 'Check for updates'. Below the statistics, there are tabs for 'New', 'Not enabled', 'Scheduled', and 'All'. A search bar contains 'Retail and commerce'. A table lists features with columns for 'Enable date', 'Feature added', and 'Module'. The 'Clienteling' feature is highlighted in blue, and its 'Module' is 'Retail and commerce'. To the right of the table, there is a detailed view for the 'Clienteling' feature, including its description and a 'Comments' section. At the bottom right of the feature details, there are 'Schedule' and 'Enable now' buttons.

Enable date	Feature added	Module
10/7/2019	Feature added: "Retail and commerce"	Retail and commerce
10/7/2019	Module: "Retail and commerce"	Retail and commerce
8/31/2019	(India) Search customers in Reta...	Retail and commerce
8/1/2019	Clienteling	Retail and commerce
8/1/2019	Fiscal integration local storage b...	Retail and commerce
7/24/2019	Enable display order for mercha...	Retail and commerce
6/3/2019	(Retail GST for India) Update cre...	Retail and commerce

2. Turn on the **Clienteling** feature by selecting **Enable now**.
3. On the **Commerce Parameters** page, on the **Number sequence** tab, select the **Client book identifier** row. Then, in the **Number sequence code** field, select a number sequence. The system will

use this number sequence to assign an ID to client books.

4. Select **Save**.
5. Create a new attribute group that contains the attributes that you want to capture for customers who are managed in client books. For instructions, see [Attributes and attribute groups](#).
  - Define the required attributes as **Can be refined**. Sales associates can then use these attributes to filter their client book.
  - Set the display order for these attributes. This display order determines which attributes should be shown on the customer card in the client book. A display order of 1 is considered higher than a display order of 2. Therefore, the attribute that has a display order of 1 will be shown before to the attribute that has a display order of 2.

#### NOTE

You can make Customer Insights available from the same page. However, an Azure application ID and secret must be created, for authentication purposes. (For information about the requirements, see the [Turn on the integration of Customer Insights with Commerce](#) section later in this topic.) If Customer Insights is turned on, and you select one or more measures that should be shown on the customer card, those measures will be shown first. Next, client book attribute groups will be shown, based on the display order. For example, if you select two measures from Customer Insights, those two measures and one client book attribute will be shown on the customer card. (The client book attribute that is shown will be the attribute that has the highest display order.)

6. On the **Commerce parameters** page, on the **Clienteling** tab, in the **Client book attribute group** field, select the attribute group that you just created.

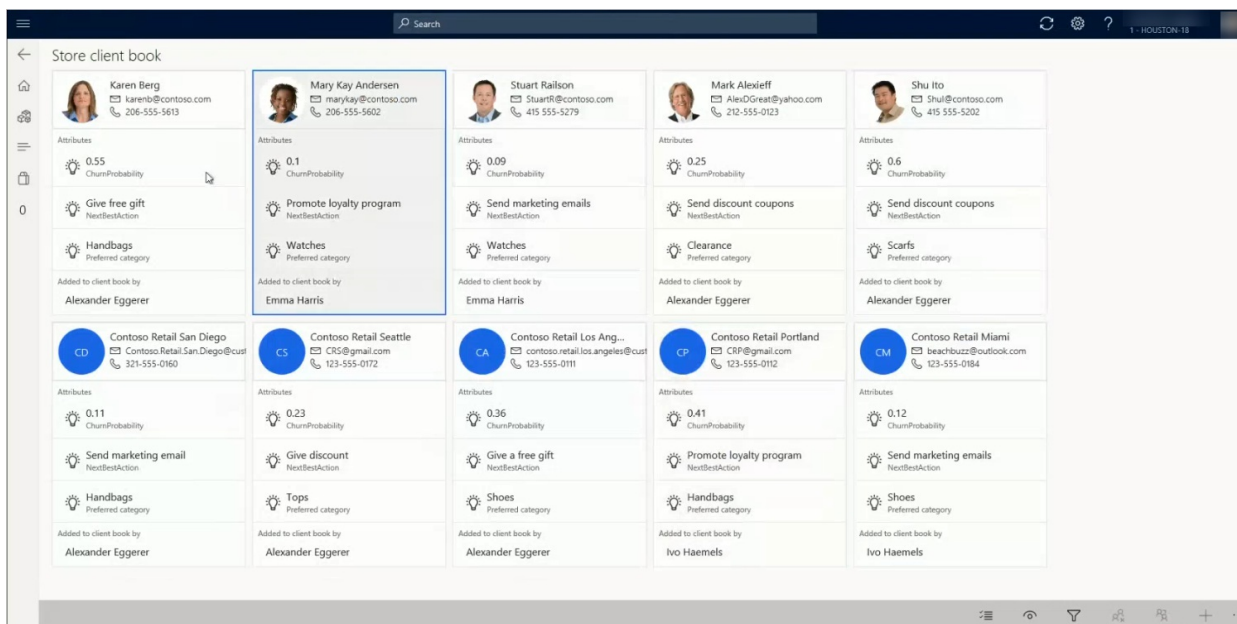

7. To capture activities that occur at the POS, define the activity types on the **Activity types** page (**Retail and Commerce > Customers > Activity types**).

#### NOTE

Activity types are pulled by the Commerce Scale Unit when it makes a real-time call for the first time. After the activities are pulled, they are cached for a few hours. If you change the activity types, wait until the cache is no longer valid. Alternatively, for non-production environments, restart the Commerce Scale Unit service.

8. Add two buttons to the appropriate POS screen layout, so that sales associates can view their own client book and the store client book. (Store client books include clients from all client books of all associates who share an address book with the store.) The corresponding operations are named **View customers in client book** and **View customers from store client books**, respectively. Three additional operations that are related to client books are available. These operations determine which associates can add, remove, and reassign customers from the client book. They are named **Add customer to client book**, **Remove customers from client book**, and **Reassign customers to a client book**, respectively.
9. Run the following distribution schedule jobs: 1040, 1150, 1110, and 1090.

After you've completed this procedure, sales associates can open the customer details page at the POS, and add customers to their client book, view and capture activities and notes for customers, and target customers by using customer and client book attributes to filter the client book. The following illustration shows an example of a client book.

## Turn on the integration of Customer Insights with Commerce

To turn on the integration of Customer Insights with Commerce, you must make sure that you have an active instance of Customer Insights in the tenant where Commerce is provisioned. You must also have an Azure Active Directory (Azure AD) user account that has an Azure subscription.

Follow these steps to set up the integration.

1. In the Azure portal, register a new application and make a note of the application name, application ID, and secret. This information will be used for service-to-service authentication between Commerce and Customer Insights. Note the secret safely, as it will be required to save it in the key vault. For the following example, use `CI_Access_name`, `CI_Access_AppID`, `CI_Access_Secret` for the application name, application ID, and secret respectively. For more information, see [Quickstart: Register an application with the Microsoft identity platform](#).

### IMPORTANT

Take steps so that you will remember to change the secret before it expires. Otherwise, the integration will unexpectedly stop.

2. Go to your Customer Insights instance and search for the name of the application created above (in this example, "CI\_Access\_name").
3. Create an Azure key vault, and take a note of the name and URL (in this example, "KeyVaultName", "KeyVaultURL"). For instructions, see [Quickstart: Set and retrieve a secret from Azure Key Vault using the Azure portal](#).
4. Save the secret (in this example, "CI\_Access\_Secret") in the vault. When this secret is stored in the vault, the secret gets a name. Note the secret name (in this example, 'SecretName').
5. To access the secret from Azure Key Vault, you need to create another application with an application ID and secret (in this example, "KeyVault\_Access\_AppID" and "KeyVault\_Access\_Secret"). Note the secret safely, as it will not be displayed again.
6. Next, you need to give permissions to the application to access the Key Vault from Commerce using APIs. Go to the application page in Azure portal. Under the **Manage** section, select **API permissions**. Add the permission to access **Azure key vault**. For this permission, select **Access policy**. Select the template as **Secret management**, and select the **Get**, **List**, **Decrypt**, and **Encrypt** options.

7. In Commerce headquarters, go to **System administration > Setup > Key Vault parameters**, and enter the required information for the key vault. Then, in the **Key Vault client** field, enter the application ID that you used in step 4, so that Commerce can access the secrets in the key vault.
8. To add the application that you created in step 1 to the list of safe applications (sometimes referred to as a safe list), go to Customer Insights, and select **View** access to the application. For instructions, see [Permissions](#).
9. On the **System administration > Setup > Key Vault parameters** page in Commerce HQ, update the fields as described below:
  - **Key Vault url:** "KeyVaultURL" (from step 3 above).
  - **Key Vault client:** "KeyVault\_Access\_AppID" (from step 5 above).
  - **Key Vault secret key:** "KeyVault\_Access\_Secret" (from step 5 above).
  - Under **Secrets** section:
    - **Name:** Any name, for example "CISecret".
    - **Description:** Any value.
    - **Secret:** `vault:///>` In this example it will be "vault://KeyVaultName/SecretName".

After you update the fields, select **Validate** to ensure the secret can be accessed by the Commerce application.

8. In Commerce, on the **Commerce parameters** page, on the **Clienteling** tab, on the **Dynamics 365 Customer Insights** FastTab, set the **Application ID** to "CI\_Access\_AppID" (from step 1 above). For **Secret name**, select the name of the secret entered in step 7 above ("CISecret"). Set the **Enable Customer Insights** option to **Yes**. If the setup is unsuccessful for any reason, an error message will be displayed, and this option will be set to **No**.

You can have multiple environments in Customer Insights, such as test and production environments. In the **Environment instance ID** field, enter the appropriate environment. In the **Alternate customer ID** field, enter the property in Customer Insights that is mapped to the customer account number. (In Commerce, the customer account number is the customer ID.) The remaining three properties are the measures that will be shown on the customer card in the client book. You can select up to three measures to show on the customer card. However, you are not required to select any measures. As mentioned previously, the system shows these values first, and then it shows the values for the client book attribute group.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Loyalty overview

2/18/2021 • 18 minutes to read • [Edit Online](#)

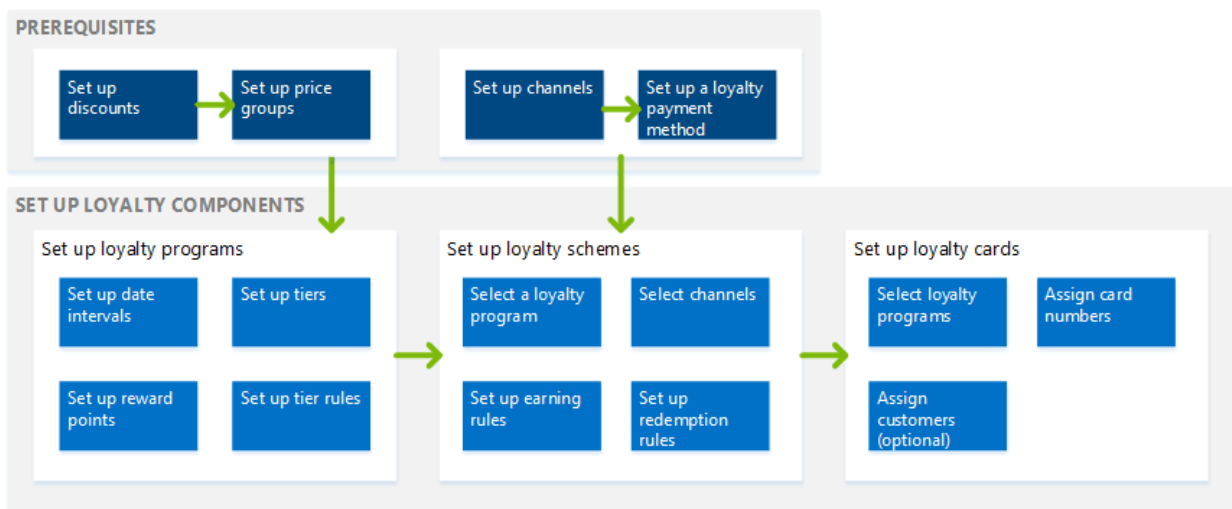

Loyalty programs can help increase customer loyalty by rewarding customers for their interactions with the retailer's brand. In Dynamics 365 Commerce, you can set up simple or complex loyalty programs that apply across your legal entities in any commerce channel. This topic describes the loyalty capabilities within Commerce and the corresponding setup steps to help the retailer easily get started with their loyalty programs.

You can set up your loyalty program so that they include the following options.

- Set up multiple types of rewards that you offer in your loyalty programs, and track participation in your loyalty programs.
- Set up loyalty programs that represent the different reward incentives that you offer. You can include loyalty program tiers to offer greater incentives and rewards to customers who shop more frequently or spend more money in your stores.
- Define earning rules to identify the activities that a customer must complete to earn rewards. You can also define redemption rules to identify when and how a customer can redeem rewards.
- Issue loyalty cards from any channel that participates in your loyalty programs, and link loyalty cards to one or more loyalty programs that the customer can participate in. You can also link a customer record to a loyalty card, so that the customer can pool loyalty points from multiple cards and redeem them.
- Manually adjust loyalty cards, or transfer the loyalty rewards balance from one card to another to accommodate or reward a customer.

## Setting up loyalty programs

You must set up several components to enable the loyalty feature in Commerce. The following diagram illustrates the loyalty components and how they relate to each other.

## Loyalty components

The following table describes each component and where it's used in the loyalty setup.

COMPONENT	DESCRIPTION	WHERE IT'S USED
-----------	-------------	-----------------

COMPONENT	DESCRIPTION	WHERE IT'S USED
Set up discounts (prerequisite)	Set up the discounts that you offer to your loyalty customers. For example, you can offer 5 percent off all apparel products.	Discounts must be added to price groups before they can be included in a loyalty program. Price groups are assigned to loyalty programs and loyalty tiers.
Set up price groups (prerequisite)	Price groups are used to create and manage prices and discounts for products. Set up the price groups that include the discounts that apply to your loyalty programs.	Price groups are assigned to loyalty programs and loyalty program tiers.
Set up channels (prerequisite)	Commerce channels are the stores that participate in your loyalty programs, such as a brick-and-mortar store, an online store, or a call center. You must set up your channels before you can assign loyalty programs to them.	You assign channels to a loyalty program if the channel is participating in the loyalty program.
Set up the loyalty payment method (prerequisite)	To ensure the loyalty points can be redeemed in any channel, such as brick and mortar stores, online stores, or call centers, you must set up the bin range for the loyalty cards on the <b>Card numbers</b> page.	Set up a loyalty type payment method, and then assign the loyalty payment method to the channels that are participating in the loyalty program.
Set up date intervals	Date intervals provide a flexible way to set the time span that applies to loyalty tiers. Use date intervals to specify how long a customer can stay in a tier or how much time a customer has to complete an activity to qualify for a tier.	Date intervals apply only if you use tiers in your loyalty programs. You select the date interval that applies to program tiers, and also the date intervals that apply to program tier rules.
Set up reward points	Reward points are the types of reward that you offer to your customers. Rewards points can be redeemable or non-redeemable. Redeemable reward points can be exchanged for products. Non-redeemable reward points are used for tracking purposes or to advance a customer to the next tier in a loyalty program.	Reward points are referenced in tier rules and are used to qualify a customer for a specific tier. Reward points are also referenced in loyalty schemes in earning and redemption rules. In earning rules, you specify the rewards that a customer can earn for a specific activity. In redemption rules, you specify the reward that the customer can redeem.
Set up loyalty programs	Loyalty programs are the core loyalty entity that you offer. Each loyalty program can also have loyalty tiers assigned to it. Discounts and price groups are assigned to the loyalty programs at either the program level or the tier level.	You create loyalty schemes for your loyalty programs. You assign loyalty cards to your loyalty programs, and loyalty cards can be assigned to a customer. Channels participate in the loyalty programs that are assigned to the loyalty schemes. Any customer who holds a loyalty card can participate in the loyalty programs that are assigned to the card.

COMPONENT	DESCRIPTION	WHERE IT'S USED
Set up loyalty tiers and tier rules	Loyalty tiers are optional levels that you can define for your loyalty programs. You can set up base discounts and rewards for all customers who participate in the loyalty program, and you can set up additional discounts and rewards for customers who achieve the various levels in the program. For each loyalty tier that you define, you can set up the rules that qualify a customer for that tier. You can also define how long customers can remain in that tier after they have reached it.	Loyalty tiers and loyalty tier rules are defined in the loyalty programs. If you don't define any loyalty tiers, all customers who participate in the loyalty program qualify for the discounts that you assign in the loyalty program price group. If you define loyalty tiers, you can set up earning rules and redemption rules for the loyalty tiers in the loyalty scheme.
Set up loyalty schemes	Loyalty schemes specify the earning rules and redemption rules that apply to a selected loyalty program. You assign channels to a loyalty scheme to identify which loyalty program, earning rules, and redemption rules apply to a store.	A loyalty scheme is assigned to a loyalty program and channels. You can assign many loyalty schemes to the same loyalty program, and you can assign many loyalty schemes to many channels.
Set up loyalty cards	A loyalty card entitles the card holder to participate in the loyalty programs that are assigned to the card. Loyalty cards can be issued anonymously, or they can be assigned to a specific customer. You can view the loyalty transactions for a specific card, and you can view a summary of loyalty points that have been accumulated on the card. You can issue loyalty cards from any channel. You can also manually adjust a loyalty card to upgrade the customer to a different tier, add loyalty points, or transfer the loyalty point balance from one card to another.	You assign loyalty programs to a loyalty card.

## Loyalty processes

The following table describes the processes that must be run to send the loyalty configurations and data to your stores, and to retrieve the loyalty transactions from your stores.

PROCESS NAME	DESCRIPTION	PAGE NAME
1050 (loyalty information)	Run this process to send the loyalty data from Commerce to the stores. It's a good idea to schedule this process to run frequently, so that loyalty data is transmitted to all stores.	Distribution schedule

PROCESS NAME	DESCRIPTION	PAGE NAME
Process loyalty schemes	Run this process to associate loyalty schemes with the channels that the loyalty scheme is assigned to. This process can be scheduled to run as a batch process. You must run this process if you change loyalty configuration data, such as loyalty schemes, loyalty programs, or loyalty reward points.	Process loyalty schemes
Post earned loyalty points in batches	Run this process to update loyalty cards so that they include transactions that were processed offline. This process applies only if the <b>Post earned points in batches</b> check box is selected on the <b>Commerce shared parameters</b> page, so rewards can be earned offline.	Post earned loyalty points in batches
Update loyalty card tiers	Run this process to evaluate the customer's earning activity against the tier rules for a loyalty program, and to update the customer's tier status. This process is required only if you change the tier rules in loyalty programs and want the updated rules to be retroactively applied to loyalty cards that have already been issued. This process can be run as a batch process or for individual cards.	Update loyalty card tiers

## Loyalty capabilities

- Using the price groups associated with the loyalty program and loyalty tiers, retailers can easily create special prices and discounts for loyalty members.
- As a part of a loyalty scheme retailers can create different earning and redemption rules by tiers to differentiate the rewards for customers in different tiers. Retailers can also include "affiliations" as a part of the earning and redemption rules so that certain group of customers can be a part of existing tiers, but still be rewarded differently. This prevents the need to create additional tiers.

### NOTE

The earning rules within a loyalty scheme are additional. For example, if you create a rule to reward a gold tier member 10 points for each US dollar, and you also create a rule for a customer with "veteran" affiliation to reward 5 points for each US dollar, then a veteran who is also a gold tier member would earn 15 points for 1 US dollar, as the customer qualifies for both lines. However, if the veteran customer was not a gold tier member, then he would earn 5 points for each dollar. To reflect the changes in the channels, run the **Process loyalty schemes** and **1050** (loyalty information) jobs.

		Purchase products by amount	Fashion			0.0100	USD	Total spent	Amount	0.0100
		Purchase products by quantity	Mens Shoes			1.0000		Fabrikam rewards	Amount	25.0000
		Sales transaction count				1.0000		Total transactions	Quantity	1.0000
Gold		Purchase products by amount	Fashion			1.0000	USD	Fabrikam rewards	Amount	10.0000

- Retailers often have special prices for a certain group of customers that they don't want loyalty programs applied to. For example, wholesalers or employees who get special pricing and no loyalty points. Commonly, "affiliations" are used to provide the special pricing to such customer groups. To restrict certain customer groups of customers from earning loyalty points, the retailer can specify one or more affiliations under the **Excluded affiliations** section of the loyalty scheme. That way, when customers belonging to excluded affiliations are existing loyalty members, they won't be able to earn loyalty points for their purchases. To reflect the changes in the channels, run the **Process loyalty schemes and 1050** (loyalty information) jobs.

- The Point of Sale allows the flexibility for retailers to either use the physical loyalty cards or generate a

unique loyalty card number automatically. To enable the automatic generation of loyalty cards in the stores, turn on **Generate loyalty card number** in the functionality profile associated to the store. For online channels, retailers can use the IssueLoyaltyCard API to issue loyalty cards to customers. Retailers can either provide a loyalty card number to this API, which will be used to generate the loyalty card, or the system will use the loyalty card number sequence set in Commerce. However, if the number sequence is not present, and the retailer does not provide a loyalty card number while calling the API, then an error is displayed.

Card number will be generated automatically by the system when issued

Account details

Contoso Seattle  
3002

↔ Change customer account

- Earned and redeemed loyalty points can now be saved for each transaction and sales orders against the sales line, so that the same amount can be refunded or taken back in the case of full or partial returns. Moreover, having the visibility for points at the sales line level provides the capability for call center users to answer customer questions on how many points were earned or redeemed for each line. Prior to this change, reward points were always recalculated during returns, which resulted in a different amount than the original, if the earning or redemption rules were changed and also the call center users did not have the visibility on the points breakdown. The points can be viewed under the **Card transactions** form for each loyalty card. To enable this feature turn on the configuration **Post loyalty points per sales line** under **Commerce shared parameters > General** tab.

#### NOTE

We strongly recommend turning this feature on to ensure, in case of returns, the correct amount of points can be refunded or taken from the customer.

- Retailers can now define the vesting period for each reward point. A vesting period configuration will define the duration from the earn date, after which the reward points would become available to the customers. Unvested points can be viewed in the **Unvested points** column on the **Loyalty cards** page. When the customers return some items for which the loyalty points were earned, then by default, the system will deduct the unvested points first and then deduct any balance from the available points. However, you can configure to deduct the available points only instead of deducting from unvested points.

Additionally, retailers can define the maximum loyalty reward point limit per loyalty card. This field can be used to reduce the impact of loyalty fraud. When the maximum award points have been reached, the user cannot earn more points. The retailer can decide to block such cards until they have investigated for potential fraud. If the retailer determines fraud, the retailer can block the loyalty card for the customer and mark the customer as blocked. To do this, set the **Block customer for loyalty enrollment** property to **Yes** under **All customers** on the **Commerce** FastTab. The blocked customers will not be able to be issued a loyalty card in any of the channels.

- Affiliations are used to provide special pricing and discounts, but there be some affiliations that retailers do not want their customers to see. For example, an affiliation titled "High spend customer" might not be well received by some customers. Moreover, there are some affiliations that should not be managed in the store, for example, employees, because you do not want the cashiers to decide who is an employee and thus provide employee-based discounts. Retailers can now select the affiliations which should be hidden in the channels. Affiliations marked as **Hide in channels** cannot be viewed, added, or removed in the POS. However, the pricing and discounts associated with the affiliation will still be applied to the products.

- If a loyalty card is compromised, a replacement card needs to be generated and the existing points transferred to the new card. The replacement card flow has been simplified in this release. Additionally, customers can gift some or all of their loyalty points to friends and family. When points are transferred, points adjustment entries are created for each loyalty card. The replacement card and transfer balance functionality can be accessed from the Loyalty cards page.

- Retailers may want to capture the effectiveness of a particular channel to enroll customers into a loyalty program. The enrollment source for the loyalty cards is now saved so that retailers can run reports on this data. The enrollments source is automatically captured for all the issued loyalty cards from MPOS/CPOS or e-Commerce channels. For the loyalty cards issued from the back office application, the call center user can select an appropriate channel.
- In earlier releases, retailers could use MPOS/CPOS to redeem loyalty points for customers in a store. However, in those releases, because the loyalty balance is displayed in loyalty points, the cashier could not view the currency value amount that could be applied toward the current transaction. The cashier had to do the points to currency conversion before paying by loyalty points. In the current release, after lines are added to the transaction the cashier can see the amount that the loyalty points can cover for the current transaction, making it easy to apply some or all of the loyalty points to the transaction. Additionally, the cashier can see the points that will be expiring in next 30 days, so they can upsell or cross-sell to motivate the customer to spend the expiring points at that transaction.

- With the 8.1.3 release, we have enabled the "pay by loyalty" option in the call center channel. To enable this option, create a loyalty tender type and associate it with the call center.

**NOTE**

Because the loyalty payments are set up as card payments, you will have to select a card from the **Card setup** page.

After this is set up, customers can redeem their loyalty points in the call center. Additionally, we are enhancing the user experience further to show the "Amount covered by loyalty points", so that the call center users do not have to navigate to a different screen to view the loyalty balance.

- Many retailers award loyalty points only based on the sales transactions, but the more customer-centric retailers want to reward their customers for any of their engagement activity with their brand. For example, they want to provide rewards for completing an online survey, visiting a store, liking the retailers on Facebook, or tweeting about the retailer. To do this, the retailer can define any number of "Other activity type" and define the corresponding earning rules for these activities. There is also an exposed Commerce Scale Unit API "PostNonTransactionalActivityLoyaltyPoints" that can be called when an activity is identified that should reward the customer with loyalty points. This API expects the Loyalty card ID, Channel ID, and the Other Activity Type ID, so that the customer who should be rewarded can be located and the earning rule for the activity can be identified.

Awarding points for non-transaction activities generally has two major steps:

- Realizing an activity has occurred that should be rewarded.
- Rewarding the appropriate points.

The first step is external to Commerce, such as tweeting about the brand or liking the brand on Facebook. After this activity has been recognized, the retailers can call the above-mentioned Commerce Scale Unit API and award loyalty points in real time. In such scenarios, there is no need for a review step because an activity has occurred and corresponding points should be awarded. However, there are scenarios where the retailer would want to review the records prior to awarding the points. For example, the retailer has set up a workshop in the store for which the customers sign up on the ecommerce website or any other event registering application. However, only the attending customers should earn loyalty points. For such scenarios, in the 10.0 release, we introduced a data entity named **Retail loyalty other activity type lines**. This data entity enables the retailers to use either Data Import/Export Framework (DIXF) or OData API to record the activities that should award customers with loyalty points. The data entity stores the activities in a journal named **Loyalty lines for other activities**, which can be used for review and modification purposes. After the data has been reviewed, the IT user can either manually post the activity lines or run a job named **Process other activity type for loyalty lines**, which will post all the unposted activity lines and award the points to the customers based on the earning rules. In the above scenario, the event registration application would call OData API to send the customer information to Commerce. However, the IT user can post the activity lines for only those customers who attended the workshop and delete the activity lines for the other customers.

#### NOTE

Currently, the system forces users to set up a number sequence for "other activity types", but this will not be a required step in future releases. To set up a number sequence, go to **Commerce shared parameters > Number sequences** and select a number sequence for **Loyalty other activity type ID**.

- To provide good customer service and effectively resolve customer queries, it is important for the cashiers to have access to complete customer's profile. With the 10.0 release, cashiers will be able to see loyalty history details along with the associated loyalty program and tier information on POS.
- Free or discounted shipping is one of the highly motivating factors for customers to buy online. To enable the retailers to set up shipping promotions, with the 10.0 release, we have introduced a new type of promotion named "Shipping threshold discount," where the retailer can define the thresholds, which once met, will qualify the customers for discounted or free shipping. For example, spend \$35 for free 'Two day ship' or Free 'Two day ship' for all loyalty customers. This feature leverages the new Advanced auto charges capability. Refer the [documentation on Advanced auto charges](#). These advanced auto charges need to be enabled for shipping promotion to work. These can be enabled from the **Customer orders** tab on the **Commerce parameters** page and turn on the "Use advanced auto-charges" configuration. Additionally, because a retailer can set up multiple types of charges, such as handling or installation, the retailer needs to specify which charge is considered shipping charge. The shipping discounts are only applied to the shipping charges. To specify charge as Shipping charge, navigate to the

**Charge codes** form present under **Retail and Commerce > Retail and Commerce IT > Channel setup > Charges** and turn on the "Shipping charge" checkbox for the desired charges. Now you can navigate to the **Shipping threshold discount** form and set up the discount.

Like product discounts, this discount honors all the existing standard discount capabilities, such as allowing the retailer to restrict these discounts with the coupons so that only the customers with coupons can get these discounts. Also, these discounts leverage the Price groups capability to determine the eligibility of such discounts. For example, the retailer can choose to run these promotions only in the online channels and/or across channels for certain customer groups such as loyalty customers. After the order lines with the specified delivery mode meets the defined threshold, then the shipping discount gets applied and reduces the shipping charge based on the discount set up.

**NOTE**

Unlike other periodic discounts such as quantity, simple, mix and match, and threshold discounts, the shipping discount does not create discount lines, rather edits the shipping charge directly and appends the name of the discount to the charge description.

# Define loyalty programs

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows how to set up a loyalty program with two loyalty tiers. This procedure uses the USRT demo data company.

1. Go to Retail and Commerce > .. > Loyalty programs.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. Click Add line.
6. In the Level field, enter a number.
7. In the Tier field, enter a name for the loyalty tier.
8. In the Description field, type a value.
9. In the Date interval field, click the drop-down button to open the lookup.
  - This date interval should extend into the future. For example, if the date interval that is selected for gold tier is a one-year period, any customer who qualifies for the gold tier can receive the rewards that are assigned to the gold tier for one year. If the customer re-qualifies for the gold tier while they are in the tier, the date that the tier expires is extended by another year from the date when they re-qualify.
10. In the list, click the link in the selected row.
11. Click Add line.
12. In the Level field, enter a number.
13. In the Tier field, enter a name for the loyalty tier.
14. In the Description field, type a value.
15. In the Date interval field, click the drop-down button to open the lookup.
16. In the list, click the link in the selected row.
17. Click Save.
18. In the list, find and select the desired record.
  - Tier rules define the minimum number of a reward point needed to be earned during a time period to qualify for the tier.
19. Toggle the expansion of the Tier rules section.
20. Click New.
  - You can have more than one tier rule per tier. For example, you could have three different criteria to earn a tier; by spending \$500 in one month, by spending \$1000 over one year, and by having 20 transactions in one year. To do this, you would need to create three tier rules.
21. In the Reward point field, click the drop-down button to open the lookup.
  - This should be a non-redeemable loyalty reward point.
22. In the list, click the link in the selected row.
23. In the Minimum issued points field, enter a number.
  - For the lowest level tier, if all customers qualify simply by participating in the program, enter '0'.
24. In the Evaluation date interval field, click the drop-down button to open the lookup.
  - This date interval should extend into the past. Only points earned during this date interval will be counted towards reaching the minimum issued points value.
25. In the list, click the link in the selected row.

26. Click Save.
27. In the list, find and select the desired record.
28. Click New.
29. In the Reward point field, click the drop-down button to open the lookup.
30. In the list, click the link in the selected row.
31. In the Minimum issued points field, enter a number.
32. In the Evaluation date interval field, click the drop-down button to open the lookup.
  - This date interval should extend into the past.
33. In the list, click the link in the selected row.
34. Click Save.
35. Click Price groups.
  - If you want to give loyalty customers discounts, you'll need to assign one or more price groups to the loyalty program and assign the price groups to discounts. It is a best practice to not mix price groups across different types of discounting entities. For example, don't use the same price group for a loyalty discount and a channel discount.
36. In the Price group field, click the drop-down button to open the lookup.
  - The Price groups link at the top of the page is for the loyalty program. The Price groups link in the Program tiers FastTab is for a specific loyalty tier only.
37. In the list, click the link in the selected row.
38. Click Save.
39. Close the page.
40. Click Save.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Define loyalty reward points

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through defining loyalty reward points. You should set up loyalty reward points before you set up a loyalty program. This procedure uses the USRT demo data company.

1. Go to Retail and Commerce > Customers > Loyalty > Loyalty reward points.
2. Click New.
3. In the Reward point ID field, type a value.
4. In the Description field, type a value.
5. In the Reward point type field, select an option.
  - Select Quantity if you want the reward points to be rounded to the nearest integer. Select Amount if you want the reward points to be rounded according to currency rounding rules. If you select Quantity, skip the next step of this procedure..
6. In the Currency field, type a value.
  - For Amount type reward points, all points issued will have the selected currency. For Quantity type reward points, this field doesn't apply—skip this step.
7. Check or uncheck the Redeemable checkbox.
8. In the Redeem ranking field, enter a number.
  - Redeem ranking is used when two or more redeemable reward points can be used to pay for products. If the two reward points have the same redeem ranking, then the one that needs to lower number of points will be used.
9. In the Expiration time value field, enter a number.
  - The reward points will expire the specified number of days, months, or years after when the points are issued. A value of '0' means the loyalty reward points will never expire.
10. In the Expiration time unit field, select an option.
11. Click Save.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Define loyalty schemes

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure walks through how to define a loyalty scheme. Loyalty schemes are reward earning and redeeming rules for a loyalty program. This procedure uses the USRT demo data company.

1. Go to Retail and Commerce > Customers > Loyalty > Loyalty schemes.
2. Click New.
3. In the Scheme ID field, type a value.
4. In the Description field, type a value.
5. In the Name field, click the drop-down button to open the lookup.
  - You can have multiple loyalty schemes for a loyalty program. Loyalty schemes can be for all channels or only a sub-set of channels.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.
8. Click Save.
9. Click Add line.
10. In the Activity type field, select an option.
  - Select Purchase products by amount if you want customers to earn rewards based on how much they spend. Select Purchase products by quantity if you want customers to earn rewards based on how many products they buy. Select Sales transaction count if you want customers to earn rewards for each sales transaction, regardless of what or how much is purchased.
  - Select a category. The category will limit which products this earning rule applies to.
  - If you want the earning rule to apply to all products, leave this field blank.
11. In the Activity amount/quantity field, enter a number.
  - For activity type Sales transaction count, you should always use a value of '1.0'. For activity types of Purchase by amount or Purchase by quantity, any transaction that is less than the value entered will not trigger the earning rule. For example, if the activity type is Purchase by amount, and you enter '10.00', then a sales transaction for '9.00' will not earn rewards for this earning rule.
12. In the Activity currency field, type a value.
13. In the Reward point ID field, click the drop-down button to open the lookup.
14. In the list, click the link in the selected row.
15. In the Reward points field, enter a number.
  - Amount type reward points will record earned amounts with decimals. For example, if the earning rule states 1 reward point earned for every 1 Canadian Dollar spent, and the customer spends 1.25 Canadian Dollars, then the customer will earn 1.25 reward points. Quantity type reward points will record earned amounts in integers. Using the example where the earning rule states 1 reward point earned for every 1 Canadian Dollar spent, and the customer spends 1.25 Canadian Dollars, then the customer will earn 1.0 reward points.
16. Click Save.
17. Click Add line.
  - Redemption rules are used when the loyalty payment method is used.
18. In the Reward point ID field, click the drop-down button to open the lookup.
  - Only redeemable reward points are shown.
19. In the list, click the link in the selected row.
20. In the Reward points field, enter a number.

21. In the Redemption type field, select an option.

- Selecting Payment by amount causes the Amount or quantity field to be treated as a currency value. In this case, the amount of reward points used per currency unit of payment is a fixed ratio. Selecting Payment by quantity causes the Amount or quantity field to be treated as a quantity value. In this case, the amount of reward points used per item quantity is a fixed ratio, however, the amount in currency can vary if the price of items paid for with loyalty reward points varies for the same quantity. Redemption type of Loyalty points discount is only valid when the 'Russia' Country/Regional specific features configuration key is enabled, and the POS functionality profiles has an ISO code of 'RU'.
- Select a category. The category will limit which products this redemption rule applies to.
- If you want the redemption rule to apply to all products, leave this field blank.

22. In the Amount or quantity field, enter a number.

23. In the Currency field, type a value.

24. Click Save.

25. Click Add line.

- Select one or more nodes from the Available organization nodes list and move them to the Selected organization nodes list by clicking the arrow between the two lists.

26. Click OK.

27. Click Save.

- Anytime you change the channels for a loyalty scheme, you must run Process loyalty schemes. That way, the channels will get updated loyalty schemes.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Process loyalty reward point adjustments

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to look up loyalty card information and adjust loyalty reward points. The demo data company used to create this task is USRT. This task is intended for the Commerce operations manager role or a Customer service manager role.

1. Go to Loyalty cards.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click Card transactions.
  - On this page you can view all loyalty transactions for the selected loyalty card.
5. Close the page.
6. Click Card adjustments.
7. Click New.
8. In the Reward point field, enter or select a value.
9. In the Amount or quantity field, enter a number.
  - You can add or remove points from the loyalty card by using positive or negative amounts.
10. In the Loyalty program field, enter or select a value.
11. In the Comment field, type a value.
12. Click Post adjustment.
13. Click Yes.
14. Close the page.
  - Normally at this point you'd refresh the page to see the result of the reward points adjustment in the Reward point summary tab. But if you are running this as a task guide, don't refresh now because if you do, the task guide will stop.
15. Click Card transactions.
16. Close the page.

## NOTE

# Retail statements

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Dynamics 365 Commerce, the statement posting process is used to account for the transactions that occur in Cloud point of sale (POS) or Modern POS (MPOS). The statement posting process uses the distribution schedule to pull a set of POS transactions into the headquarters (HQ) client. The parameters that are defined on the **Commerce parameters** and **Stores** pages are used to select the transactions that are pulled into individual statements.

The following illustration shows the statement posting process. In this process, transactions that are recorded in the POS are transmitted to the client by using the Commerce scheduler. After the client receives the transactions, you can create, calculate, and post the transaction statement for the store.

## Creating and posting statements

You can create a statement manually or by using batch processes that you set up to run periodically throughout the day. In both cases, the following steps are used to create and post statements.

### Create the statement

This step identifies the store that the statement is manually created for. If you configure a batch process, you can automatically create statements for all stores, based on a schedule that you define.

### Calculate the statement

In this step, the transaction lines are selected based on criteria that are defined for each store on the **Commerce parameters** and **Stores** pages. On these pages, you define the criteria and specify how the transactions are calculated. To view a list of the transactions that are included in the statement before you calculate the statement, use the **Transactions** page.

Statement calculation uses tender declarations from the registers as the counted amount. Alternatively, you can

enter the counted amount manually. The statement shows the difference between the sales amount for the transactions and the actual counted amount in all payment methods. The statement is posted only if this difference is less than the maximum posting difference that is defined for the store.

#### NOTE

The statement calculation process uses the global number sequence.

When you calculate a statement, the calculation includes the following tasks:

- For the selected date range, mark transactions that weren't included in a previous statement calculation.
- Calculate the total amounts that were tendered in the selected transactions. The results are shown on the statement lines, depending on the statement method:
  - If the statement method is **Total**, a line is created for each payment method in the selected transactions.
  - If the statement method is **Staff**, a line is created for each payment method in transactions that were performed by the selected staff member.
  - If the statement method is **POS terminal**, a line is created for each payment method in transactions that were performed on the selected register.
  - If the statement method is **Shift**, a line is created for each payment method in transactions that were performed during a shift.

If the **Split by Statement method** check box is selected on the **Stores** page, a separate statement is created based on the value that is selected in the **Statement method** field.

If your store's operating hours extend past midnight, you can configure statement posting so that it's based on the end of the business day instead of the end of the calendar day.

On the **Stores** page, on the **Statement/closing** FastTab, in the **End of business day** field, enter the time that the last transaction must be recorded to be included in the business day's statement. Select the **Post as business day** check box to post the transactions within the same business day. When the statement is posted, transactions that are recorded within the same business day can be included on the same sales order, even if some transactions occur before midnight and other transactions occur after midnight.

#### **Example: Post a statement for a business day that extends over two calendar days**

A store is open between 8:00 AM and 3:00 AM, and the **Post as business day** check box is selected in the store's configuration. On May 31, the store records transactions between 8:00 AM and midnight. The store also records transactions between 12:01 AM and 3:00 AM on June 1.

When the store posts its statement for the close of the business day, the sales order that is generated includes all transactions that were recorded between the business hours of 8:00 AM and 3:00 AM, even though the transactions occurred on two days, May 31 and June 1.

If the **Post as business day** check box is cleared for the same store, separate sales orders are generated when the store posts its statement for the close of the business day. One sales order includes the transactions that were recorded between the business hours of 8:00 AM and midnight on May 31, and the second sales order includes the transactions that were recorded between the business hours of 12:01 AM and 3:00 AM on June 1.

#### NOTE

Before you can create statements, you should close the shifts in the statement period.

## Post the statement

When you post a statement, sales orders and invoices are created for the sales in the statement.

- Cash and carry sales are aggregated onto one sales order, and are invoiced for the default customer who is assigned to the store.
- Sales for which a customer was added to the transaction in POS generate separate sales orders and invoices, one for each unique customer.

Payment journals are automatically created for the payments in the statement, and the inventory is updated for the POS store.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Retail transaction consistency checker

2/18/2021 • 5 minutes to read • [Edit Online](#)

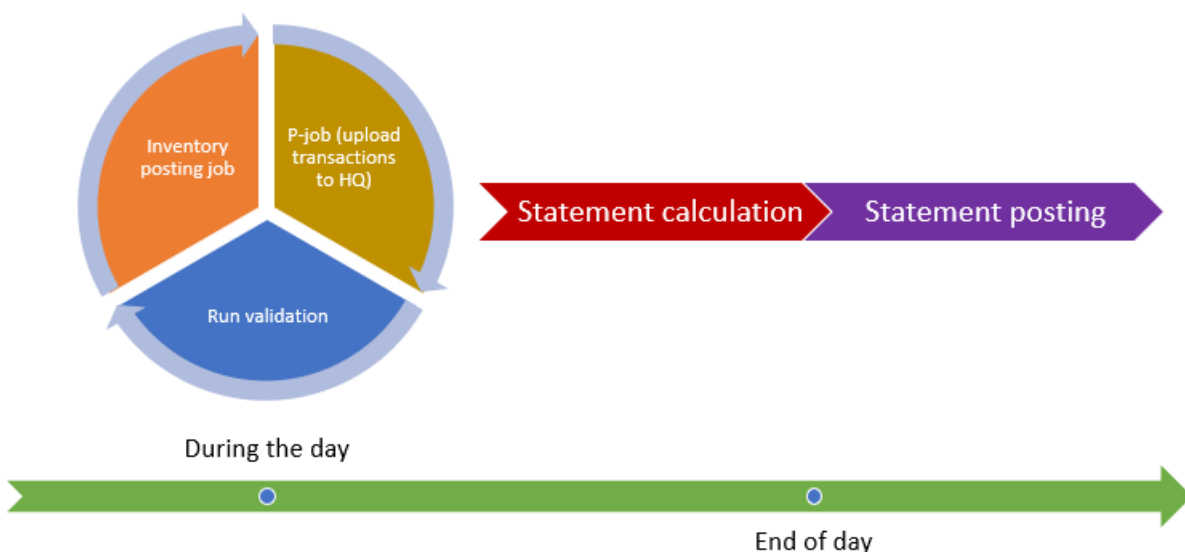

This topic describes the transaction consistency checker functionality in Microsoft Dynamics 365 Commerce. The consistency checker identifies and isolates inconsistent transactions before they are picked up by the statement posting process.

When a statement is posted, posting can fail due to inconsistent data in the commerce transaction tables. The data issue may be caused by unforeseen issues in the point of sale (POS) application, or if transactions were incorrectly imported from third-party POS systems. Examples of how these inconsistencies may appear include:

- The transaction total on the header table does not match the transaction total on the lines.
- The line count on the header table does not match with the number of lines in the transaction table.
- Taxes on the header table do not match the tax amount on the lines.

When inconsistent transactions are picked up by the statement posting process, inconsistent sales invoices and payment journals are created, and the entire statement posting process fails as a result. Recovering the statements from such a state involves complex data fixes across multiple transaction tables. The transaction consistency checker prevents such issues.

The following chart illustrates the posting process with the transaction consistency checker.

The **Validate store transactions** batch process checks the consistency of the commerce transaction tables for the following scenarios.

- **Customer account** – Validates that the customer account in the transaction tables exists in the HQ customer master.
- **Line count** – Validates that the number of lines, as captured on the transaction header table, matches the number of lines in the sales transaction tables.
- **Price includes tax** – Validates that the **Price includes tax** parameter is consistent across transaction lines and the price on the sales line is in accordance with price includes tax and tax exempt configuration.
- **Payment amount** - Validates that the payment records match the payment amount on the header, while also factoring in the configuration for penny rounding in General Ledger.
- **Gross amount** – Validates that the gross amount on the header is the sum of the net amounts on the lines plus the tax amount, while also factoring in the configuration for penny rounding in General Ledger.

- **Net amount** – Validates that the net amount on the header is the sum of the net amounts on the lines, while also factoring in the configuration for penny rounding in General Ledger.
- **Under / Over payment** – Validates that the difference between the gross amount on the header and the payment amount doesn't exceed the maximum underpayment/overpayment configuration, while also factoring in the configuration for penny rounding in General Ledger.
- **Discount amount** – Validates that the discount amount on the discount tables and the discount amount on the transaction line tables are consistent, and that the discount amount on the header is the sum of the discount amounts on the lines, while also factoring in the configuration for penny rounding in General Ledger.
- **Line discount** – Validates that the line discount on the transaction line is the sum of all the lines in the discount table that corresponds to the transaction line.
- **Gift card item** – Commerce doesn't support the return of gift card items. However, the balance on a gift card can be cashed out. Any gift card item that is processed as a return line instead of a cash-out line fails the statement posting process. The validation process for gift card items helps guarantee that the only return gift card line items on the transaction tables are gift card cash-out lines.
- **Negative price** – Validates that there are no negative price transaction lines.
- **Item & Variant** – Validates that items and variants on the transaction lines exist in the item and variant master file.
- **Tax amount** - Validates that tax records match the tax amounts on the lines.
- **Serial number** - Validates that the serial number is present in the transaction lines for items that are controlled by serial number.
- **Sign** - Validates that the sign on the quantity and the net amount are the same in all the transaction lines.
- **Business date** - Validates that the financial periods for all the business dates for the transactions are open.
- **Charges** - Validates that the header and line charge amount is in accordance with price, including tax and tax exempt configuration.

## Set up the consistency checker

Configure the "Validate store transactions" batch process, at **Retail and Commerce > Retail and Commerce IT > POS posting**, for periodic runs. The batch job can be scheduled based on store organization hierarchy, similar to how the "Calculate statement in batch" and "Post statement in batch" processes are set up. We recommend that you configure this batch process to run multiple times in a day and schedule it so that it runs at the end of every P-job execution.

## Results of validation process

The results of the validation check by the batch process are tagged on the appropriate transaction. The **Validation status** field on the transaction record is either set to **Successful** or **Error**, and the date of the last validation run appears on the **Last validation time** field.

To view more descriptive error text relating to a validation failure, select the relevant store transaction record and click the **Validation errors** button.

Transactions that fail the validation check and transactions that have not yet been validated will not be pulled into statements. During the "Calculate statement" process, users will be notified if there are transactions that could have been included in the statement but weren't.

If a validation error is found, the only way to fix the error is to contact Microsoft Support. In a future release, capability will be added so that users can fix the records that failed through the user interface. Logging and auditing capabilities will also be made available to trace the history of the modifications.

**NOTE**

Additional validation rules to support more scenarios will be added in a future release.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Disable rules in the retail transaction consistency checker

2/18/2021 • 2 minutes to read • [Edit Online](#)

Retailers can have business scenarios and processes that are unique to them. Therefore, not all the rules that are included by default in the commerce transaction consistency checker are applicable to all retailers. To accommodate differences, Microsoft Dynamics 365 Commerce provides functionality that can be used to disable the rules that aren't applicable.

To view the list of rules that are available in the transaction consistency checker in your environment, and to see the status of each rule, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**, and select the **Transaction validation** tab.

By default, the status of every rule is set to **Enabled**. Therefore, all the rules are used to validate transactions before they are pulled into the commerce statements. To disable a rule, change its status to **Disabled**. Disabled rules aren't considered when transactions are validated during the statement calculation process.

To bypass the whole validation process, regardless of the rules that are enabled, go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**, and then, on the **Transaction validation** tab, set the **Disable consistency checker for Commerce transactions** option to **Yes**. After this option is set to **No**, it can't be set back to **Yes** from the user interface (UI).

# Edit and audit cash and carry and cash management transactions

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to edit and audit cash and carry and cash management transactions in Microsoft Dynamics 365 Commerce.

## Overview

Dynamics 365 Commerce customers use both a first-party point of sale (POS) application and third-party POS applications. In the case of the first-party application, store transactions are pulled into Commerce headquarters from the channels through a batch process. In the case of third-party applications, transactions are pulled into Commerce headquarters through integration. In both cases, after transactions are pulled into Commerce headquarters, a consistency check process must be performed. This process runs multiple validations on the transactions, and only transactions that are successfully validated are pulled into the statement so that they can be posted in Commerce headquarters.

Commerce transactions might fail validation for various reasons. A bug in the integration code or in the POS application might cause inconsistent data. Alternatively, a user error might cause inconsistent data. For example, a user deletes a product after it was synced to the channel, or a user closes a fiscal period without posting transactions for that period. Although these transactions are flagged and are excluded from the statements, they can disrupt a customer's daily process of posting daily sales to the financials. In Commerce, you can edit the transactions that fail validation while you also maintain an audit of all the changes.

## Edit transactions

In Commerce version 10.0.5, the only transactions that can be edited are cash and carry transactions, such as sales and returns. Customer orders and online orders can't be edited. In Commerce version 10.0.6 and later, cash management transactions can also be edited.

To edit transactions in Commerce headquarters, follow these steps.

1. Install the [Microsoft Dynamics Office Add-in](#).
2. In Commerce headquarters, open the **Store financials** workspace. The **Transaction validation failures** tile provides a prefiltered view of the transaction page that failed one or more validation rules.
3. Open the transaction page, select the record that failed validation, select **Office Add in**, and then select **Edit selected transaction**. An Excel file that shows the details of the selected transaction is opened. This file contains the following worksheets:
  - **Lines** – This worksheet has the header and product lines for the transaction, and related data for the transaction.
  - **Payments** – This worksheet has the details of the payment lines for the transaction.
  - **Discounts** – This worksheet has the discount-related details for the transaction.
  - **Taxes** – This worksheet has the tax-related details for the transaction.
  - **Charges** – This worksheet has the charges-related data for the transaction.
4. In the Excel file, modify the appropriate fields, and then upload the data back into Commerce headquarters by using the publishing functionality of the Dynamics Excel Add-in. After the data is published, the changes will be reflected in the system. During publication, no validation is done for

changes that users make.

5. You can view a complete audit trail of the changes by selecting **View audit trail** in the **Retail transaction** header for the header-level changes, and in the relevant section and record on the appropriate transaction page. For example, all changes that are related to sales lines will be shown on the **Sales transactions** page, and all changes that are related to payments will be shown on the **Payment transactions** page. The following audit details are maintained for the changes:

- Modified date and time
- Field
- Old value
- New value
- Modified by

6. After you've made and published your changes, run **Validate store transactions** to validate that those changes are consistent and valid.

#### NOTE

You can edit only transactions that failed validation. If you want to edit a transaction that passed validation, change the validation status of the transaction to **Error** or **None**, and then publish the change. You can then edit the data on the header or in any other child records of the transaction, and publish the header or records.

## Bulk-edit transactions that are linked to a statement

Commerce version 10.0.6 and later support the option to bulk-edit transactions at the statement level.

To bulk-edit transactions that are linked to a statement in Commerce headquarters, follow these steps.

1. Open the **Statements** page, and select the statement that contains the transactions that must be edited.
2. Select the **Open in Microsoft Office** button.
3. Depending on what must be edited, select one of the following options:
  - **Edit cash and carry transactions** – This option lets you edit all the cash and carry transactions that are included in the statement. The following Excel worksheets are available:
    - **Transaction** – This worksheet has all the header-level information for the sales transactions.
    - **Sales transaction** – This worksheet has all the line-level information for the sales transactions.
    - **Payment transactions** – This worksheet has all the payment line information for the sales transactions.
    - **Discount transactions** – This worksheet has all the discount line information for the sales transactions.
    - **Tax transactions** – This worksheet has all the tax line information for the sales transactions.
    - **Charge transactions** – This worksheet has all the charge line information for the sales transactions.
  - **Edit cash management transactions** – This option lets you edit all the cash management transactions that are included in the statement. The following Excel worksheets are available:
    - **Transaction** – This worksheet has all the header-level information for the cash management transactions.
    - **Bank tender transactions** – This worksheet has all the bank drop transaction details.
    - **Safe tender transactions** – This worksheet has all the safe drop transaction details.

- **Tender declaration** – This worksheet has all the tender declaration transaction details.
- **Income-expense transaction** – This worksheet has all the income-expense transaction line details.
- **Payment transactions** – This worksheet has all the payment-related information for the **Pay invoice** operation and the income-expense transaction.

4. Edit the required transactions.

#### NOTE

Validations aren't done when you publish bulk-edited transactions. You must make sure that all your edits are accurate, and that the fidelity of data across the worksheets is maintained. For example, if you want to change the transaction date, so that you can manage scenarios where the fiscal or inventory period for the open transactions is closed, you must change the date on all the Excel worksheets that have the **Business date** column. To validate transactions after they have been edited, you can select **Revalidate transactions** on the **Statements** page. Wait for the validation job to finish running before you post the statement.

5. If the aggregation has already been generated, open the **Aggregated transactions** page, and select **Regenerate sales order xml**.

## Bulk-edit transactions that aren't linked to a statement

Commerce version 10.0.10 and later support the option to bulk-edit transactions that fail validation but aren't linked to a statement.

To bulk-edit transactions that aren't linked to a statement in Commerce headquarters, follow these steps.

1. Open the **All stores** page, and select the store that transactions must be edited for.
2. Select the **Open in Microsoft Office** button, and then select **Edit cash and carry transactions**.
3. Edit the required transactions, and then publish them.

# Edit and audit online order and asynchronous customer order transactions

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to edit and audit online order and asynchronous customer order transactions in Microsoft Dynamics 365 Commerce.

## Overview

Between Commerce versions 10.0.5 and 10.0.6, support was added for editing cash and carry transactions (such as sales and returns) and cash management transactions (such as float entry and tender removal). In Commerce version 10.0.7, support was added for editing online order transactions and asynchronous customer order transactions.

## Edit and audit order transactions

To edit and audit order transactions in Commerce headquarters, follow these steps.

1. Install the [Microsoft Dynamics Office Add-in](#).
2. On the **Retail parameters** page, on the **Customer orders** tab, on the **Order** FastTab, specify a hold code for **Hold code for order synchronization errors**.
3. Open the **Store financials** workspace. The **Online order synchronization errors** and **Customer order synchronization errors** tiles provide a prefiltered view of the retail transaction page. Each shows the transaction records that have failed synchronization for the corresponding order type.
4. Open either the **Online order synchronization errors** page or the **Customer order synchronization errors** page. Select a record to view the synchronization error details. The **Synchronization status** FastTab provides the following error details:
  - Pending order status
  - Order error details
  - Modified date and time
  - Retry count
5. If the error details indicate that the record must be fixed, select **Office Add in**, and then select **Edit selected transaction**. An Excel file that shows the details of the selected transaction is opened.
  - If the transaction that is being edited is an online order transaction, the Excel file contains the following worksheets:
    - **Transaction** – This worksheet has the header details for the transaction.
    - **Sales transaction** – This worksheet has the line details for the transaction.
    - **Payment transactions** – This worksheet has the details of the payment lines for the transaction.
    - **Discount transactions** – This worksheet has the discount-related details for the transaction.
    - **Tax transactions** – This worksheet has the tax-related details for the transaction.
    - **Charges transactions** – This worksheet has the charges-related data for the transaction.
  - If the transaction that is being edited is an asynchronous customer order transaction, the Excel file contains the following worksheets:

- **Lines** – This worksheet has the header and line details for the transaction.
  - **Payments** – This worksheet has the details of the payment lines for the transaction.
  - **Discounts** – This worksheet has the discount-related details for the transaction.
  - **Taxes** – This worksheet has the tax-related details for the transaction.
  - **Charges** – This worksheet has the charges-related data for the transaction.
6. In the Excel file, in the **Pending order status** field, enter **Editing**, and then publish the change. In this way, you prevent the **Synchronize order** job that is running in batch mode from skipping this record during processing.
  7. In the Excel file, modify the appropriate fields, and then upload the data back into Commerce headquarters by using the publishing functionality of the Dynamics Excel Add-in. After the data is published, the changes will be reflected in the system. During publication, no validation is done for changes that users make.
  8. You can view a complete audit trail of the changes by selecting **View audit trail** in the **Retail transaction** header for the header-level changes, and in the relevant section and record on the appropriate transaction page. For example, all changes that are related to sales lines will be shown on the **Sales transactions** page, and all changes that are related to payments will be shown on the **Payment transactions** page. The following audit details are maintained for the changes:
    - Modified date and time
    - Field
    - Old value
    - New value
    - Modified by
  9. After you've made and published your changes, select **Synchronize order** to immediately start the synchronization process. Alternatively, you can wait for the synchronization process that is running in batch mode to process the transaction.

By default, after the orders are successfully synced, they are put in a hold status, based on the hold code that is defined in the Commerce parameters. The hold on the orders must be removed before the orders can be processed further for fulfillment or other operations.

# Edit financial dimensions for retail transactions

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to edit financial dimensions for retail transactions in Microsoft Dynamics 365 Commerce.

## Edit financial dimensions

To edit financial dimensions for retail transactions in Commerce headquarters, follow these steps.

1. Open the **Financial dimensions configuration for integrating applications** page.
2. Select the active **Default dimensions integration** record.
3. On the **Financial dimensions** FastTab, make sure that all the dimensions that you want to edit in the Excel worksheet are present in the **Selected** list. For more information, see [Data entities](#).
4. Download and open the Excel file from the **Statements** page, the **Retail transactions** page, or the **Transaction validation failures** tile in the **Store financials** workspace.
5. To change the transaction financial dimension, select **Design**, and then select the pencil symbol next to the **Transaction (auditable)** row.
6. Find and select the **FinancialDimensionDisplayValue** field, select a cell in the header part of the Excel worksheet, and then select **Add label**.
7. Select a cell below the cell that you selected in the previous step, select **Add Value**, and then select **Refresh**. The financial dimensions are added to the Excel worksheet, and they can then be edited and published.
8. To change the dimensions on the transaction lines, select the **Sales transactions (auditable)** row, select the pencil symbol, and then repeat steps 6 and 7.
9. To change the dimensions on the payment lines, select the **Payment transactions (auditable)** row, select the pencil symbol, and then repeat steps 6 and 7.

# Create an Excel workbook to edit retail transactions

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create an Excel workbook so that you can edit retail transactions in Microsoft Dynamics 365 Commerce.

## Overview

There is a predefined Excel template that customers can access from different parts of the system and use to edit and audit retail transactions. However, customers can also create a custom Excel workbook for this purpose.

## Create and configure an Excel workbook

To create and configure an Excel workbook so that you can edit retail transactions, follow these steps.

1. Open Excel, and create a blank workbook.
2. On the **Insert** tab, select **My add-ins**.
3. In the right pane, select the **Add server information** link.
4. Enter the server URL, and then select **OK**.
5. If you receive a "No applet registrations found" error message, follow these steps to resolve the issue:
  - a. In Commerce, go to **System administration > Setup > Office app parameters**.
  - b. On the **App parameters** FastTab, select **Initialize app parameters**.
  - c. In the confirmation message box, select **OK**.
  - d. On the **Registered applets** FastTab, select **Initialize applet registration**.
  - e. Repeat the previous three steps as required.
6. Select **Design**, and then select **Add table**.
7. Based on the data that has to be modified, select the entities that must be added to the Excel workbook for editing. Use the following table as a reference.

TRANSACTION TYPE	DATA ENTITIES TO USE
Cash and carry transactions, Online orders, Async customer orders, Async customer quotes	Transaction (auditable), Sales transaction (auditable), Payment transactions (auditable), Tax transactions (auditable), Discount transactions (auditable), Charge transactions (auditable)
Bank drop	Transaction (auditable), Banked tender transactions (auditable)
Safe drop	Transaction (auditable), Safe tender transactions (auditable)
Tender declaration	Transaction (auditable), Tender declaration transactions (auditable)

TRANSACTION TYPE	DATA ENTITIES TO USE
Income, Expense	Transaction (auditable), Income/Expense transactions (auditable), Payment transactions (auditable)
Declare starting amount, Tender removal, Float entry, Change tender, Invoice payment, Customer deposit	Transaction (auditable), Payment transactions (auditable)

**NOTE**

It's important that you add only one data entity to each Excel workbook. Additionally, all fields that are marked by a key symbol must be added to the relevant workbook.

8. After the workbook is configured, apply the required filters. Be sure to apply the same filters to all the worksheets in the file. Avoid loading very large amounts of data into the Excel file. Otherwise, performance might be affected, and Excel and your system might slow down. We recommend that you always use "Company" and either "Statement Number" or "Transaction Number" as filters for your file.
9. After the filters are configured, select **Refresh** to load the data.
10. Edit the required data, and then publish it. If the **Publish** button is unavailable, some key fields probably weren't added to the Excel workbook.

# Add fields to an Excel workbook to edit retail transactions

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add fields to a Microsoft Excel workbook so that you can edit retail transactions in Microsoft Dynamics 365 Commerce.

## Overview

When you generate an Excel file so that you can edit retail transactions, the file is filled with some default fields. If a field that must be updated isn't visible by default in the generated Excel file, you can add it.

## Add fields to a worksheet in an Excel workbook

To add fields to an Excel workbook so that you can edit retail transactions, follow these steps.

1. Download and open the Excel file from the **Statements** page, the **Retail transactions** page, or the **Transaction validation failures** tile in the **Store financials** workspace.
2. Select **Design**.
3. Select the pencil symbol for the desired table, and then, in the list of available fields, find and select the field that you want to add.
4. Select **Add**, and then select **Update**. You can reorder fields.
5. After the update is completed, select **Refresh** to fetch the data for the new column.

The new field and data for it should now be available for editing in Excel.

# Trickle feed-based order creation for retail store transactions

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Dynamics 365 Retail versions 10.0.4 and earlier, statement posting is an end-of-day operation and all transactions are posted in the books at the end of the day. Large transactions must then be processed in a limited time window, sometimes resulting in load and locks and statement posting failures. Retailers also can't recognize revenue and payments in their books throughout the day.

With trickle feed-based order creation introduced in Retail version 10.0.5, transactions are processed throughout the day, and only the financial reconciliation of tenders and other cash management transactions are processed at the end of the day. This functionality splits the load of creating sales orders, invoices, and payments throughout the day, providing better perceived performance and the ability to recognize revenue and payments in the books in near real-time.

## How to use trickle feed-based posting

1. To enable trickle feed-based posting of retail transactions, enable the feature named **Retail statements - Trickle feed** using Feature management.

### IMPORTANT

Before you enable the feature, make sure that no pending statements are waiting to be posted.

2. The current statement document will be split into two types: transactional statement and financial statement.
  - The transactional statement will pick up all unposted and validated transactions and create sales orders, sales invoices, payment and discount journals, and income-expense transactions at the cadence that you configure. You should configure this process to run at a high frequency so that documents are created when the transactions are uploaded into Headquarters through the P-job. With the transactional statement that already creates sales orders and sales invoices, there is no real need to configure the **Post inventory** batch job. However, you can still use it to meet specific business requirements that you may have.
  - The financial statement is designed to be created at the end of the day and only supports the closing method of **Shift**. This statement will be limited to financial reconciliation and will only create the journals for the difference amounts between counted amount and transaction amount for the different tenders, along with journals for other cash management transactions.
3. To calculate the transactional statement, go to **Retail and Commerce > Retail and Commerce IT > POS Posting > Calculate transactional statements in batch**. To post the transactional statements in batch, go to **Retail and Commerce > Retail and Commerce IT > POS Posting > Post transactional statements in batch**.
4. To calculate the financial statement, go to **Retail and Commerce > Retail and Commerce IT > POS Posting > Calculate financial statements in batch**. To post the financial statements in batch, go to **Retail and Commerce > Retail and Commerce IT > POS Posting > Post financial statements in batch**.

**NOTE**

The menu items **Retail and Commerce > Retail and Commerce IT > POS Posting > Calculate statements in batch** and **Retail and Commerce > Retail and Commerce IT > POS Posting > Post statements in batch** are removed with this new feature.

Alternately, transactional and financial statement types can be created manually. Go to **Retail and Commerce > Channels > Stores** and click **Statements**. Click **New** and then choose the type of statement that you want to create. Fields on the **Statements** page and actions under the **Statement group** of the page will show relevant data and actions based on the selected statement type.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create, calculate, and post statements for a retail store

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the manual steps for creating, calculating, and posting a statement for a store. There are also batch jobs that can be configured for the same tasks. The steps for configuring and running the batch jobs can be found in other topics. To complete this procedure, you must have transactions that were completed in POS and then pulled into Dynamics 365 Commerce. This recording uses the USRT company in demo data.

1. Select **Store financials** from the home page.
2. Select **New statement**.
3. In the **Store number** field, select a option from the drop-down.
4. Select **OK**.
5. The **Setup** group has the settings that control what transactions are included in the statement and how they are grouped into statement lines. You can open the **Setup** group and change these settings, or you can use the defaults.
  - The **Statement method** field defines how the statement lines will be grouped.
  - Select a staff member or a register in the **staff/register** field if you want to calculate a statement only for the specific staff member or register.
6. In the **Closing method** field, select an option.
7. Select **Calculate statement** from the Action Pane.
8. Select **Yes**.
  - After calculating the statement, there should be lines created with total amounts for each payment method and statement method that was used.
  - Enter a counted amount in each line if it needs to be entered or updated. The counted field is populated with amounts from tender declarations done in POS.
9. Select **Post statement** from the Action Pane.
10. Select **Close**.
11. Close the pane.
12. At the home page, select **Store financials**.
13. Select the **Posted statements** tab.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Financial reconciliation in retail stores

2/18/2021 • 3 minutes to read • [Edit Online](#)

In Microsoft Dynamics 365 Commerce version 10.0.10 and earlier, the functionality that the point of sale (POS) client provides for end-of-day processes in retail stores lets store clerks and store managers perform end-of-day operations. For example, they can do tender declarations, blind-close shifts, reconcile shift transactions, and close shifts. However, there is no capability in POS to finalize the financial information for shifts, so that it can be used to post the financials in Commerce headquarters. Typically, store managers are responsible for completing this task. Before they can sign off on a shift, they must review the information, make any corrections that are required, and finalize the totals for that shift. The finalized totals should then be posted in financial modules in Commerce headquarters.

Additionally, in Commerce version 10.0.10 and earlier, store managers can review and make some adjustments to statement lines in Commerce headquarters. However, the capability is limited, and store managers rarely have access to the Commerce headquarters client. Moreover, financial retail statement review and adjustment can be done only when the statements are created in Commerce headquarters. However, that process is typically a nightly process. Therefore, store managers must wait for the shift sign-off when financial retail statements are created in Commerce headquarters.

In Commerce version 10.0.11 and later, store managers can review, adjust, and finalize their shifts in the POS client itself. That data is then used to create and post financial retail statements in Commerce headquarters.

## NOTE

The functionality that is related to financial reconciliation in retail stores works only if trickle feed-based order creation is turned on. For more information, see [Trickle feed-based order creation for retail store transactions](#).

## Set up financial reconciliation

Follow these steps to use the financial reconciliation functionality.

1. In the **Feature management** workspace, turn on the **Retail statements - Trickle feed** feature.
2. In the POS functionality profile for the appropriate store, set the **Enable financial reconciliation in store** option to **Yes**.

## More information about financial reconciliation

When the financial reconciliation functionality is turned on, some of the parameters that are defined on the **Statement/closing** FastTab of the **Retail stores** page in Commerce headquarters are synced to the channel database. The same set of calculation criteria and amount thresholds that is used for retail statements is enforced.

When the **Close shift** operation is invoked, the system validates that the system-computed amounts and the declared amounts match. If they differ, and the difference exceeds defined thresholds, the user is prompted and can make the required adjustments.

Adjustments can be made for each tender. When a tender is selected, the user can view the totals for different transaction types and edit the totals for a specific transaction type. During editing, the system shows the original computed amount and the overridden amount for that transaction type. The user can also capture notes as a part of the editing process. Notes can be used for auditing purposes.

Users can ignore the validation prompts and messages, and can proceed to close the shift. However, if a user ignores the validation prompts, the same issues will arise and will have to be fixed when the shift posts financial statements in Commerce headquarters.

The **Close shift** operation in POS also validates that all transactions in the offline database are synced to the channel database. If any transactions aren't synced, the user receives a warning message, because this situation can cause the system amounts to be incorrectly computed. In this situation, the user can end the **Close shift** operation and try to sync the offline transactions to the channel database. Alternatively, the user can manually adjust the system-computed amounts to account for the transactions that aren't synced, so that the correct set of financial numbers is finalized and posted.

When trickle feed statement posting is used, so that the posting of transactions is separated from the posting of financials, you can choose to adjust the system-computed amounts for missing offline transactions. In this way, you ensure that financials are always accounted and posted correctly, regardless of missing transactions. Offline transactions can be synced to the channel database and Commerce headquarters, and then posted later, separately from the financial postings.

Details of the financial reconciliation for a shift are synced to Commerce headquarters by using the P-job.

Financial retail statements in Commerce headquarters don't compute totals to show the details on the statement lines. Instead, the finalized amounts in the POS client are used to create and post financial retail statements.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Improvements to statement posting functionality

2/18/2021 • 14 minutes to read • [Edit Online](#)

This topic describes the first set of improvements that have been made to the statement posting feature. These improvements are available in Microsoft Dynamics 365 for Finance and Operations 7.3.2.

## Activation

By default, during deployment of Finance and Operations 7.3.2, the program is set up to use the legacy feature for statement postings. To enable the improved statement posting feature, you must turn on the configuration key for it.

- Go to **System administration > Setup > License configuration**, and then, under the **Retail and Commerce** node, clear the **Statements (legacy)** check box, and select the **Statements** check box.

When the new **Statements** configuration key is turned on, a new menu item that is named **Statements** is available. This menu item lets you manually create, calculate, and post statements. Any statement that causes an error when the batch posting process is used will also be available through this menu item. (When the **Statements (legacy)** configuration key is turned on, the menu item is named **Open statements**.)

Commerce includes the following validations that are related to these configuration keys:

- Both configuration keys can't be turned on at the same time.
- The same configuration keys must be used for all the operations that are performed on a given statement during its lifecycle (Create, Calculate, Clear, Post, and so on). For example, you can't create and calculate a statement while the **Statement (legacy)** configuration key is turned on, and then try to post the same statement while the **Statement** configuration key is turned on.

### NOTE

We recommend that you use the **Statements** configuration key for the improved statement posting feature, unless you have compelling reasons to use the **Statements (legacy)** configuration key instead. Microsoft will continue to invest in the new and improved statement posting feature, and it's important that you switch to it at the earliest opportunity to benefit from it. The legacy statement posting feature is deprecated starting in 8.0 release.

## Setup

As part of the improvements to the statement posting feature, three new parameters have been introduced on the **Statement** FastTab on the **Posting** tab of the **Commerce parameters** page:

- **Disable clear statement** – This option is applicable only for the legacy statement posting feature. We recommend that you set this option to **No** to prevent users from clearing statements that are in a semi-posted state. If statements that are in a semi-posted state are cleared, data becomes corrupted. You should set this option to **Yes** only in exceptional circumstances.
- **Reserve inventory during calculation** – We recommend that you use the **Post inventory** batch job for inventory reservation, and that you set this option to **No**. When this option is set to **No**, the improved statement posting feature doesn't try to create inventory reservation entries at the time of calculation (if entries weren't already created through the **Post inventory** batch job). Instead, the feature creates inventory reservation entries only at the time of posting. This implementation was a design choice and was based on the fact that the time window between the calculation process and the posting process is

typically small. However, if you want to reserve inventory at the time of calculation, you can set this option to **Yes**.

The legacy statement posting feature always reserves inventory during the statement calculation process (if reservation wasn't already done through the **Post inventory** batch job), regardless of the setting of this option.

- **Disable counting required** – When this option is set to **Yes**, the posting process for a statement continues, even if the difference between the counted amount and the transaction amount on the statement is outside the threshold that is defined on the **Statement** FastTab for stores.

Additionally, the following parameters have been introduced on the **Batch processing** FastTab on the **Posting** tab of the **Commerce parameters** page:

- **Maximum number of parallel statement posting** – This field defines the number of batch tasks that will be used to post multiple statements.
- **Max thread for order processing per statement** – This field represents the maximum number of threads used by the statement posting batch job to create and invoice sales orders for a single statement. The total number of threads that will be used by the statement posting process will be computed based on the value in this parameter multiplied by the value in the **Maximum number of parallel statement posting** parameter. Setting the value of this parameter too high can negatively impact the performance of the statement posting process.
- **Max transaction lines included in aggregation** – This field defines the number of transaction lines that will be included in a single aggregated transaction before a new one is created. Aggregated transactions are created based on different aggregation criteria such as customer, business date, or financial dimensions. It is important to note that the lines from a single transaction will not be split across different aggregated transactions. This means that there is a possibility that the number of lines in a aggregated transaction is slightly higher or lower based on factors such as number of distinct products.
- **Maximum number of threads to validate store transactions** – This field defines the number of threads that will be used to validate transactions. Validating transactions is a required step that needs to occur before the transactions can be pulled into the statements. You also need to define a **Gift card product** on the **Gift card** FastTab on the **Posting** tab of the **Commerce parameters** page. This needs to be defined even if gift cards are not used by the organization.

#### **NOTE**

All settings and parameters that are related to statement postings, and that are defined on stores and on the **Commerce parameters** page, are applicable to the improved statement posting feature.

## Processing

Statements can be calculated and posted in batch using the menu items **Calculate statements in batch** and **Post statements in batch**. Alternatively, statements can be manually calculated and posted by using the **Statements** menu item that the improved statement posting feature provides.

The process and steps for calculating and posting statements in a batch are the same as they were in the legacy statement posting feature. However, significant improvements have been made in the core back-end processing of the statements. These improvements make the process more resilient, and provide for better visibility into the states and error information. Therefore, users can address the root cause of errors and then continue the posting process without causing data corruption and without causing data fixes to be required.

The following sections describe some of the major improvements for the statement posting feature that appear in the user interface for statements and posted statements.

## Status details

A new state model has been introduced in the statement posting routine across the calculation and posting processes.

The following table describes the various states and their order during the calculation process.

STATE ORDER	STATE	DESCRIPTION
1	Started	The statement was created and is ready to be calculated.
2	Marked	The transactions that are in scope for the statement are identified based on the statement parameters, and they are marked with the statement ID.
3	Calculated	The statement lines are computed and shown.

The following table describes the various states and their order during the posting process.

STATE ORDER	STATE	DESCRIPTION
1	Checked	Multiple validations are done that are related to parameters (for example, the disposition charge), and to the statement and statement lines (for example, the difference between the counted amount and the transaction amount).
2	Aggregated	Sales transactions for named and unnamed customers are aggregated based on the configuration. Every aggregated transaction is eventually converted to a sales order.
3	Customer order created	Based on the aggregated transaction, sales orders are created in the system.
4	Customer order invoiced	Sales orders are invoiced.
5	Discounts posted	Periodic discount journals are posted based on the configuration.
6	Income/expense posted	Income/expense transactions are posted as vouchers.
7	Vouchers linked	Payment journals are created and linked to the corresponding invoice.
8	Payments posted	Payment journals are posted.
9	Gift cards posted	Gift card transactions are posted as vouchers.
10	Posted	The statement is marked as posted.

Every state in the preceding tables is independent in nature, and a hierarchical dependency is built between the states. This dependency flows from top to bottom. If the system encounters any errors while it's processing a state, the status of the statement is reverted to the previous state. Any subsequent reattempt of the process resumes from the state that failed and continues to move forward. This approach has the following benefits:

- The user has complete visibility into the state where the error occurred.
- Data corruption is avoided. For example, in the legacy statement posting feature, there were instances where some sales orders were invoiced but others were left open. There were also instances where some payment journals didn't have a corresponding invoice to settle, because the invoice posting had an error.
- Users can see the current state of a statement by using the **Status details** button in the **Execution details** group of the statement. The status details page has three sections:
  - The first section shows the current status of the statement, together with the error code and a detailed error message, if an error occurred.
  - The second section shows the various states of the calculation process. Visual cues indicate states that have been successfully run, states that could not be run because of errors, and states that haven't yet been run.
  - The third section shows the various states of the posting process. Visual cues indicate states that have been successfully run, states that could not be run because of errors, and states that haven't yet been run.

Additionally, the header of the second and third sections shows the overall status of the relevant process.

### Event logs

A statement goes through various operations (for example, Create, Calculate, Clear, and Post), and multiple instances of the same operation might be called during the statement's lifecycle. For example, after a statement is created and calculated, a user can clear the statement and calculate it again. The **Event logs** button in the **Execution details** group of the statement provides a complete audit trail of the various operations that were called on a statement, together with information about when those operations were called.

### Aggregated transactions

During the posting process, the sales transactions are aggregated based on the configuration. These aggregated transactions are stored in the system and used to create sales orders. Every aggregated transaction creates one corresponding sales order in the system. You can view the aggregated transactions by using the **Aggregated transactions** button in the **Execution details** group of the statement.

The **Sales order detail** tab of an aggregated transaction shows the following information:

- **Record ID** – The ID of the aggregated transaction.
- **Statement number** – The statement that the aggregated transaction belongs to.
- **Date** – The date when the aggregated transaction was created.
- **Sales ID** – When a sales order is created from the aggregated transaction, the sales order ID. If this field is blank, the corresponding sales order hasn't been created.
- **Number of aggregated lines** – The total number of lines for the aggregated transaction and sales order.
- **Status** – The last status of the aggregated transaction.
- **Invoice ID** – When the sales order for the aggregated transaction is invoiced, the sales invoice ID. If this field is blank, the invoice for the sales order hasn't been posted.

The **Transaction details** tab of an aggregated transaction shows all the transactions that have been pulled into the aggregated transaction. The aggregated lines on the aggregated transaction show all the aggregated records from the transactions. The aggregated lines also show details such as the item, variant, quantity, price, net amount, unit, and warehouse. Basically, each aggregated line corresponds to one sales order line.

From the **Aggregated transactions** page, you can download the XML for a specific aggregated transaction by using the **Export sales order XML** button. You can use the XML to debug issues that involve sales order creation and posting. Just download the XML, upload it to a test environment, and debug the issue in the test environment. The functionality for downloading the XML for aggregated transactions isn't available for statements that have been posted.

The aggregated transaction view provides the following benefits:

- The user has visibility into the aggregated transactions that failed during sales order creation and the sales orders that failed during invoicing.
- The user has visibility into how transactions are aggregated.
- The user has a complete audit trail, from transactions, to sales orders, to sales invoices. This audit trail wasn't available in the legacy statement posting feature.
- Aggregated XML file make it easier to identify issues during sales order creation and invoicing.

### **Journal vouchers**

The **Journal vouchers** button in the **Execution details** group of the statement shows all the various voucher transactions that are created for a statement, and that are related to discounts, income/expense accounts, gift cards, and so on.

Currently, the program shows this data only for posted statements.

### **Payment journals**

The **Payment journals** button in the **Execution details** group of the statement shows all the various payment journals that are created for a statement.

Currently, the program shows this data only for posted statements.

## Other improvements

Other, back-end improvements that users can see have been made to the statement posting feature. Here are some examples:

- The aggregation doesn't consider the staff, terminal, and shift entities. Because there are fewer aggregation parameters, fewer sales order lines must be processed.
- The occurrence of deadlock on transaction tables is reduced by introducing additional extension tables and by doing insert operations instead of update operations on the transaction tables.
- The number of running batch tasks has been parameterized and limited. Therefore, this number can be fine-tuned specifically to a customer's environment. In the legacy statement posting feature, an unlimited number of batch tasks was created at the same time. The results were unmanageable loads, overhead, and bottlenecks on the batch server.
- Statements are efficiently queued for processing by prioritizing the statements that have the maximum number of transactions.
- Batch processes such as **Calculate statements in batch** and **Post statements in batch** are run only in batch mode. In the legacy statement posting feature, users could choose to run these batch processes in an interactive mode which is a single threaded operation unlike batch processes which are multi-threaded.
- In the legacy statement posting feature, any failure of a batch task put the whole batch job in an error state. In the improved feature, batch task failures don't put the batch job in an error state if other batch tasks are successfully completed. You should assess the posting status for a batch execution run by using the **Statements** page, where you can see any statements that weren't posted because of errors.
- In the legacy statement posting feature, the first occurrence of a statement failure causes the whole batch to fail. The remaining statements aren't processed. In the improved feature, the batch process continues to process all statements, even if some of the statements fail. One benefit is that users gain visibility into the exact number of statements that have errors. Therefore, users don't have to be stuck in a continuous loop of

fixing the errors and running the post statement process till all statements are posted.

## General guidance about the statement posting process

- We recommend that you run the statement posting process in a batch, because batch runs take advantage of the power of the batch framework in terms of multithreading. Multithreading is required in order to handle the huge volumes of transactions that are normally seen in statement postings.
- We recommend that you turn on negative physical inventory on the item model group, so that you have a seamless posting experience. In some scenarios, negative statements might not be able to be posted unless there is negative physical inventory. For example, in theory, if there is only one unit of an item in inventory, and there have been a sales transaction and a return transaction for the item, the transaction should be able to be posted even if negative inventory isn't turned on. However, because the statement posting process pulls both the sales transaction and the return transaction in a single customer order, there is no guarantee that the sales line will be posted first, followed by the return line. Therefore, errors can occur. If negative inventory is turned on in this scenario, the transaction posting isn't negatively affected, and the system will correctly reflect the inventory.
- We recommend that you use aggregation while you calculate and post statements. Therefore, the following settings are recommended for some of the aggregation parameters:
  - Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**. Then, on the **Posting** tab, on the **Inventory update** FastTab, in the **Detail level** field, select **Summary**.
  - Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**. Then, on the **Posting** tab, on the **Aggregation** FastTab, set the **Voucher transactions** option to **Yes**.

# Improved handling of batch-tracked items

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Point of Sale (POS), batch numbers can't be captured for batch-tracked items at the time of sale. However, for specific configurations, when sales are posted in the headquarters through customer orders or statement posting, the Microsoft Dynamics system expects that valid batch numbers for batch-tracked items exist, and that they will be used during the invoicing process.

If valid batch numbers are available for products, the customer order invoicing process and the sales order invoicing process from statement posting use them. Otherwise, the customer order invoicing process can't post, and the POS user receives an error message. Statement posting then goes into an error state. This error state occurs even when negative inventory has been turned on for the products.

Improvements that have been made in Retail version 10.0.4 and later help guarantee that, when negative inventory is turned on for batch-tracked items, customer order invoicing and sales order invoicing through statement posting aren't blocked for those items if the inventory is 0 (zero) or a batch number isn't available. The new functionality uses a default batch ID for the sales lines when batch numbers aren't available.

To define the default batch ID that is used for customer orders, on the **Commerce parameters** page, on the **Customer orders** tab, on the **Order** FastTab, set the **Default batch id** field.

To define the default batch ID that is used for sales order invoicing through statement posting, on the **Commerce parameters** page, on the **Posting** tab, on the **Inventory update** FastTab, set the **Default batch id** field.

## NOTE

This functionality is available only when advanced warehousing is turned on for the specific store warehouse and items. In a later release, the functionality will also be supported for scenarios where advanced warehouse management isn't used.

## NOTE

Support for improved handling of batch-tracked items during statement posting for non-advanced warehouse management scenarios was introduced in Retail version 10.0.5.

# Payment configurations for Retail statements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates configurations for Commerce store payment methods, which affect how statements get created and posted.

This recording uses the USRT demo company.

1. Go to Retail and Commerce > Channels > Stores > All stores.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. On the Action Pane, click Set up.
5. Click Payment methods.
6. Expand or collapse the Posting section.
7. Click Edit.
  - Select whether the amounts received for this payment method should be posted to a ledger account or bank account.
  - Select the account that amounts received for this payment method should be posted to.
  - Select an account to post possible differences between the total transaction amount received and the amount counted for this payment method.
  - In this field you can enter an amount to control when the difference amount should be posted to another difference account. You can use this to track big differences.
  - Select an account to post possible differences between the total transaction amount received and the amount counted, when it exceeds the value that is defined in the "Maximum difference amount" field.
  - Select "Yes" to post bank drop amounts to a separate account.
  - In this field you can select whether bank drop amounts should be posted to a ledger account or a bank account.
  - Select the account to post bank drop amounts into.
  - Select the bank transaction type to use when posting bank drop amounts to the bank account.
  - Select "Yes" to post safe drop amounts to a separate account.
  - Select whether safe drop amounts should be posted to the ledger account or the bank account.
  - Select the account to post safe drop amounts into.
8. Click Save.

# Configure and run job to calculate statements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through configuring and running recurrent batch jobs to create and calculate statements for a selected store or group of stores. This procedure uses the USRT company in demo data.

1. Go to All workspaces > Store financials.
2. Click Calculate statements.
  - Select either a specific store, or a node if you want to create the batch job for a group of stores.
  - Click the arrow to add your selection.
3. Click the Run in the background tab.
4. Under Batch processing, select 'Yes'.
5. Click Recurrence.
6. In the Start date field, enter a date.
7. In the Start time field, enter a time.
8. Select the No end date option.
9. In the PatternUnit field, enter 'Days'.
10. In the Per field, enter a number.
11. Click OK.
12. Click OK.

## NOTE

# Configure and run job to post statements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through configuring and running a recurrent batch job to post statements for a selected store or group of stores. This procedure uses the USRT company in demo data.

1. Go to All workspaces > .. > Store financials.
2. Click Post statements in batch.
  - Select an organizational hierarchy and then in the organization nodes tree, select either an individual store or a node. Select a node if you want to create the batch job for a group of stores.
  - Click the arrow to add your selection.
3. Click the Run in the background tab.

**Choose organization nodes**

**General** **Run in the background**

Organization hierarchy  
Retail Stores by Region

**AVAILABLE ORGANIZATION NODES:**

# Store configurations for Retail statements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through configurations for the store that affect how Commerce statements get created and posted. Financial dimensions on stores are covered in another procedure. This procedure uses the USRT demo company.

1. In the **Navigation pane**, go to **Modules > Retail and Commerce > Channels > Stores > All stores**.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click **Edit**.
5. The settings in the **Statement/closing** FastTab affect the statement creation, validation, and posting for the store. Expand the **Statement/closing** FastTab.
6. In the **Statement method** field, select the method you want to use to group the statement lines by.
7. Select "Yes" in **One statement per day** if there should only be one statement created per day when creating statements from the statement creation batch job.
8. The **Tender declaration calculation** field defines whether tender declarations should be added together or if the last one should be used.
9. In the **Rounding** field, select the ledger account to post rounding differences into.
10. In the **Maximum rounding difference** field, enter the maximum rounding difference allowed.
11. In the **Posting** field, enter the maximum total posting difference allowed for a statement.
12. In the **Shift** field, enter the maximum total difference within a shift in a statement.
13. In the **Transaction** field, enter the maximum total difference in a statement line.
14. In the **Closing method** field, define whether transactions that will be included in a statement should be part of a closed shift or if they can be any transactions within the defined date/time range.
15. In the **End of business day** field, enter a time if transactions that happen after midnight should be posted with the previous day.
16. Select "Yes" in **Post as business day** if transactions that happen after midnight should be posted as part of the previous day.
17. Select "Yes" in **Split by Statement method** to get statements created for each statement method defined. This action can be useful if the performance of the posting needs to be improved for stores with high transaction volumes since it will create many smaller statements that can be processed in parallel.
18. In the **General** FastTab, in the **Default customer** field, you can select the customer account to use for sales to walk-in customers.

## NOTE

# Posting of online sales and payments

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through configuring and running a recurrent batch job to create sales orders and payments for online store transactions.

Posting online sales and payments is a two-stage process.

- Pulling the online commerce transaction data in HQ.
- Synchronizing orders to create sales orders in HQ.

Pulling the online transaction data can be done either by manually running the P-job or by creating a recurrent batch job.

## **Manually running the P-job**

1. Go to All workspaces > Retail and Commerce IT.
2. Click Distribution schedule.
3. Select P-0001.
4. Adjust channel database groups, if required.
5. Click Run now.
6. Click Yes.

## **Scheduling a recurring P-job**

1. Go to All workspaces > Retail and Commerce IT.
2. Click Distribution schedule.
3. Select P-0001.
4. Click Create batch job.
5. Click Run in the background.
6. Enable Batch processing.
7. Click Recurrence..
8. Select the No end date option.
9. In the Count field, enter interval between the runs in minutes. Typically this would be 5-10.
10. Click OK.
11. Click OK.

Orders can be synchronized either by manually running the "Synchronize orders"-job or by creating a recurring batch job.

## **Manually running order synchronization**

Follow these steps to manually run "Synchronize orders" job once.

1. Go to All workspaces > Store financials.
2. Click Synchronize orders.
3. In the Organization hierarchy field, select 'Stores by Region'.
  - Select either a specific online store, or select a node if you want to create the batch job for a group of stores.
  - Click the arrow to add your selection.
4. Click the Run in the background tab.
5. Disable Batch processing

6. Click Recurrence.
7. Select End After option
8. In the End After field, enter 1.
9. Click OK.
10. Click OK.

### **Scheduling recurring order synchronization**

This procedure walks through configuring and running a recurrent batch job to create sales orders and payments for online store transactions. This procedure uses the USRT company in demo data.

1. Go to All workspaces > Store financials.
2. Click Synchronize orders.
3. In the Organization hierarchy field, select 'Stores by Region'.
  - Select either a specific online store, or select a node if you want to create the batch job for a group of stores.
  - Click the arrow to add your selection.
4. Click the Run in the background tab.
5. Enable Batch processing
6. Click Recurrence.
7. Select the No end date option.
8. In the Count field, enter interval between the runs in minutes. Typically this would be 2-20
9. Click OK.
10. Click OK.

## Data entities involved in the process

# Task management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of task management for managers and workers in Microsoft Dynamics 365 Commerce.

## Overview

In a retail environment, it's always difficult to make sure that tasks are performed by the right person at the right time. Retailers must be able to notify workers about upcoming tasks and provide related business context, so that the tasks can be completed correctly and on time.

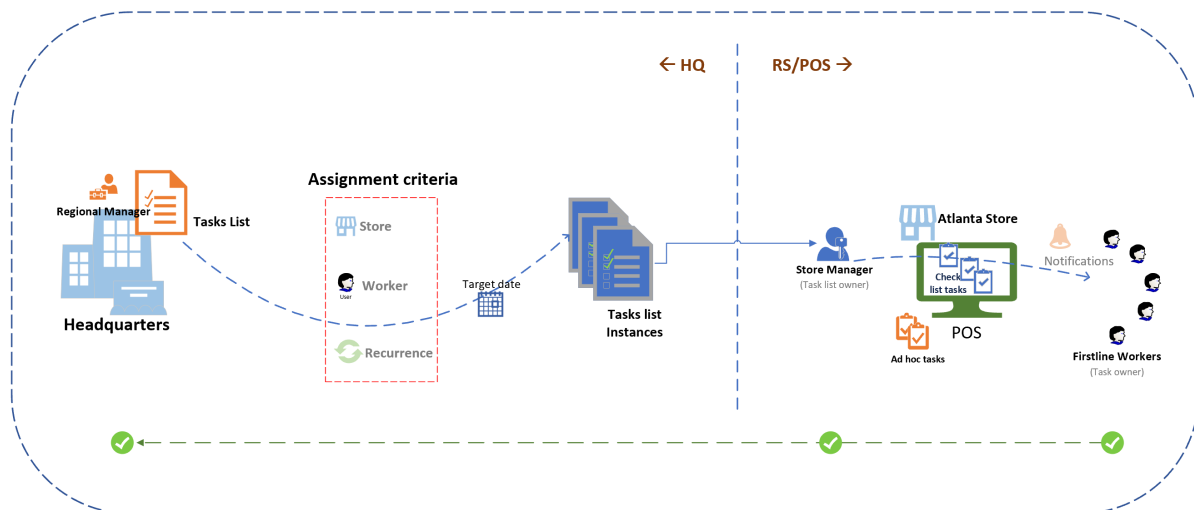

Task management is a productivity feature in Dynamics 365 Commerce that lets managers and workers create task lists, manage assignment criteria, track task status, and integrate these operations between Commerce back office and point of sale (POS) applications.

Headquarters personas can use task management to create task lists for retail stores, and to track status by store or worker. They can also create recurrent tasks (for example, "Thursday night closing checklist").

Store managers can use task management to assign tasks to individual workers, send notifications about upcoming tasks or tasks that are past due, update task status, and create single-purpose tasks in the POS application. Workers can then see notifications, view task details, and update task status at the POS.

The following illustration shows the conceptual architecture of task management in Commerce.

### Dynamics 365 Commerce - Task Management Conceptual Architecture

# Configure task management

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to configure task management features in Microsoft Dynamics 365 Commerce.

## Overview

Before Dynamics 365 Commerce managers and employees can use the task management features in Commerce, task management must be configured. Configuration steps include granting permissions to managers and employees, distributing permissions to point of sale (POS) clients, setting up POS notifications, and configuring the **Tasks** tile on the home page of a POS application.

## Configure permissions for store managers

Every worker in a given store can view all tasks that are assigned to that store. They can also update the status of the tasks that are assigned to them. However, personas such as store managers must have task management permissions to manage tasks that are assigned to the store and to create single-purpose tasks.

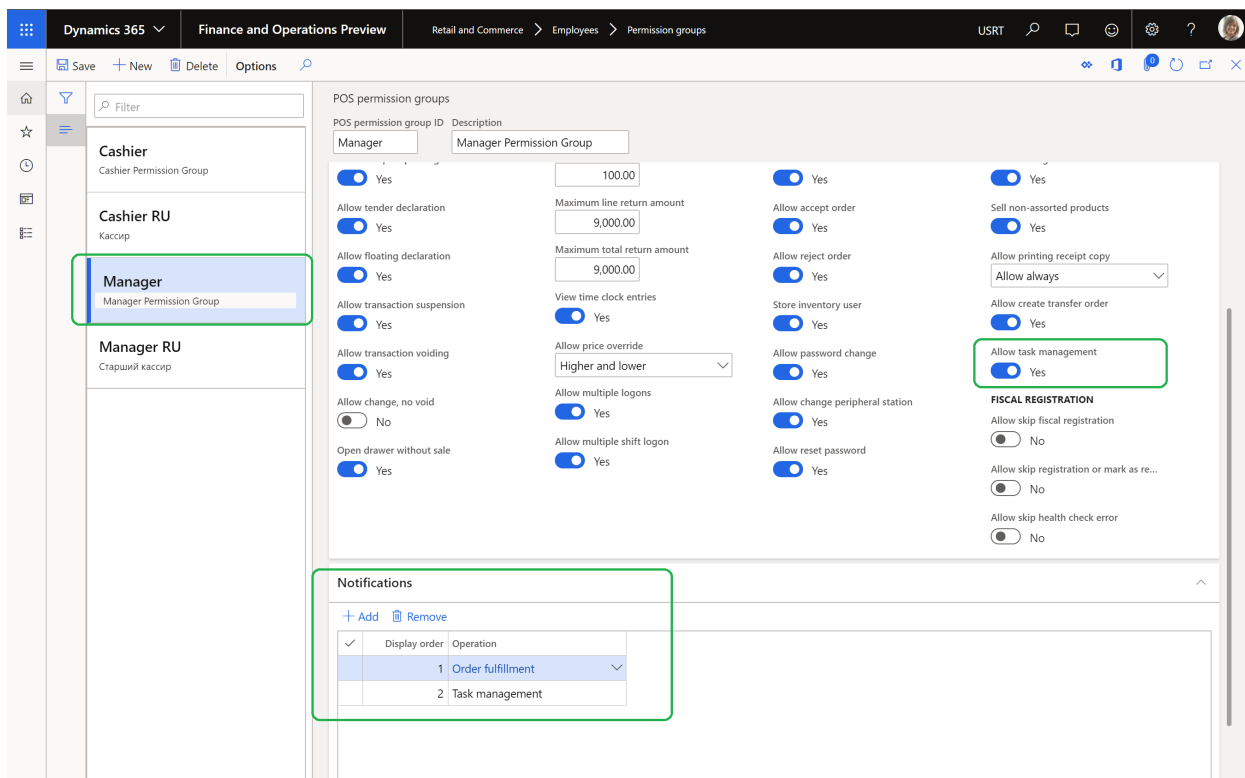

To configure task management permissions for store managers, follow these steps.

1. Go to **Retail and Commerce > Employees > Permission groups**.
2. Select a specific permission group (for example, **Manager**), and then select **Edit**.
3. On the **Permissions** FastTab, set the **Allow task management** option to **Yes**.
4. On the **Notifications** FastTab, add the **Task management** operation, and enter a value in the **Display order** field. For example, enter 2 if the **Order fulfillment** operation already has a **Display order** value of 1.

### NOTE

If a non-manager persona must have task management permissions in the POS, you can grant permission to the individual. Alternatively, you can create a new permission group for non-managers and set the **Allow task management** option to **Yes**.

The following illustration shows how to configure task management permissions for store managers.

## Configure permissions for employees

Employees must have permissions to create task lists, manage assignment criteria, and configure the recurrence of any task list. To configure these permissions, you assign employees to the **Retail task manager** role.

To configure permissions for an employee, follow these steps.

1. Go to **Retail and Commerce > Employees > Users**.
2. Select an employee.
3. On the **User's roles** FastTab, select **Assign roles**.
4. In the **Assign roles to user** dialog box, select the **Retail task manager** role, and then select **OK**.

## Distribute permissions to POS clients

Before employees can use POS clients, permissions must be distributed and synced to those clients.

To distribute permissions to POS clients, follow these steps.

1. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
2. Select the **1060 (Staff)** distribution schedule, and then select **Run now**.
3. Select the **1070 (Channel configuration)** distribution schedule, and then select **Run now**.

## Configure POS notifications for tasks

Task management must be configured so that notifications are available in the POS application.

To configure POS notifications for tasks, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS > POS operations**.
2. Find operation **1400 (Task management)**, and select the **Enable notifications** check box for it.

The following illustration shows the **Task management** operation on the **POS operations** page.

Operation ID	Operation name	Permission ID	Permission ID2	Check user acc...	User operati...	Enable notificat...	Allow task link
1218	Force unlock peripheral	1002	0	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
1219	Open URL	0	0	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
1220	Manage safes	1023	0	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

For more information about how to configure POS notifications, see [Show order notifications in the point of sale \(POS\)](#).

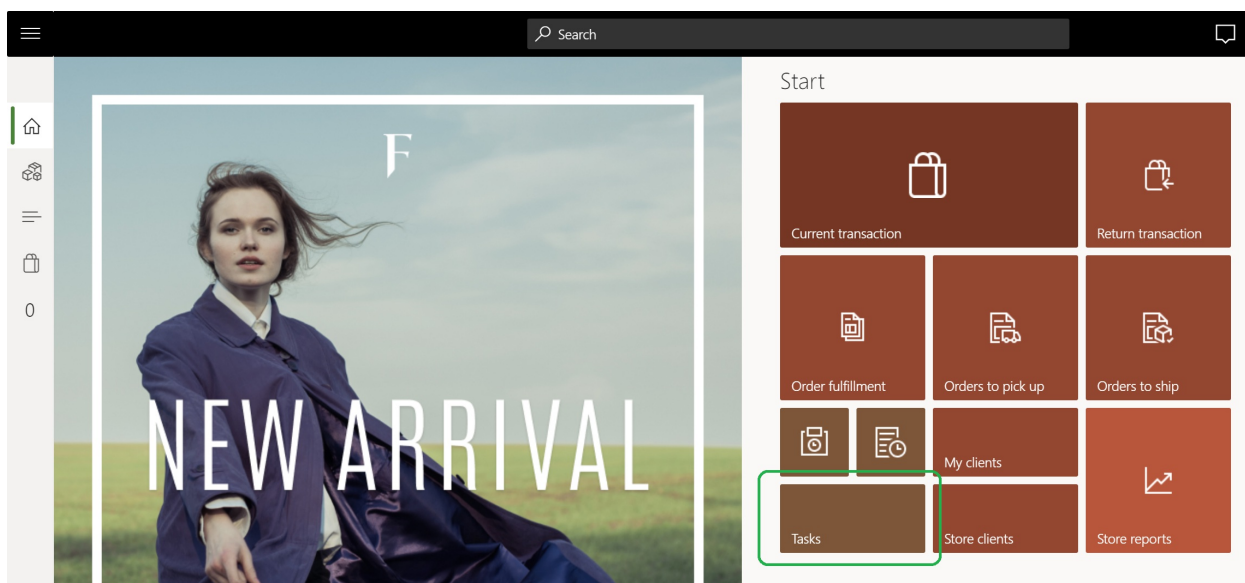

## Configure the Tasks tile on a POS application home page

Before you configure the **Tasks** tile on the home page of a POS application, see [Screen layouts for the point of sale \(POS\)](#) for information about how to configure and add new buttons to a POS screen layout.

To configure the **Tasks** tile on a POS application home page, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS > Screen layouts**.
2. Select a screen layout, select a layout size, and select a button grid.
3. On the **Button grids** FastTab, select **Designer** to edit the selected button grid.
4. Add a **Tasks** tile to the appropriate section of the home page.

The following illustration shows an example of a **Tasks** tile on a POS home page.

# Create task lists and add tasks

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to create task lists and add tasks to them in Microsoft Dynamics 365 Commerce.

## Overview

A *task* defines a specific piece of work or an action that someone must complete on or before a specified due date. In Dynamics 365 Commerce, a task can include detailed instructions and information about a contact person. It can also include links to back-office operations, point of sale (POS) operations, or site pages, to help improve productivity and provide the context that the task owner requires to complete the task efficiently.

A *task list* is a collection of tasks that must be completed as part of a business process. For example, there might be a task list that a new worker must complete during onboarding, a task list for cashiers who work evening shifts, or a task list that must be completed to prepare the store for an upcoming holiday season. In Commerce, every task list that has a target date can be assigned to any number of stores or employees, and it can be configured to recur.

Both managers and workers can create task lists in Commerce back office, and then assign them to a set of stores.

## Create a task list

To create a task list, follow these steps.

1. Go to **Retail and Commerce > Task management > Task management administration**.
2. Select **New**, and then enter values in the **Name**, **Description**, and **Owner** fields.
3. Select **Save**.

## Add tasks to a task list

To add tasks to a task list, follow these steps.

1. On the **Tasks** FastTab of an existing task list, select **New** to add a task.
2. In the **Create a new task** dialog box, in the **Name** field, enter a name for the task.
3. In the **Due data offset from target date** field, enter a positive or negative integer value. For example, enter -2 if the task should be completed two days before the task list's due date.
4. In the **Notes** field, enter detailed instructions.
5. In the **Contact person** field, enter the name of a subject matter expert that the task owner can contact if he or she needs help.
6. In the **Task link** field, enter a link, based on the nature of the task.

### TIP

Although you can use the **Assigned to** field to assign tasks to someone while you're creating a task list, we recommend that you avoid assigning tasks during task list creation. Instead, assign the tasks after the list is instantiated for individual stores.

## Use task links to help improve worker productivity

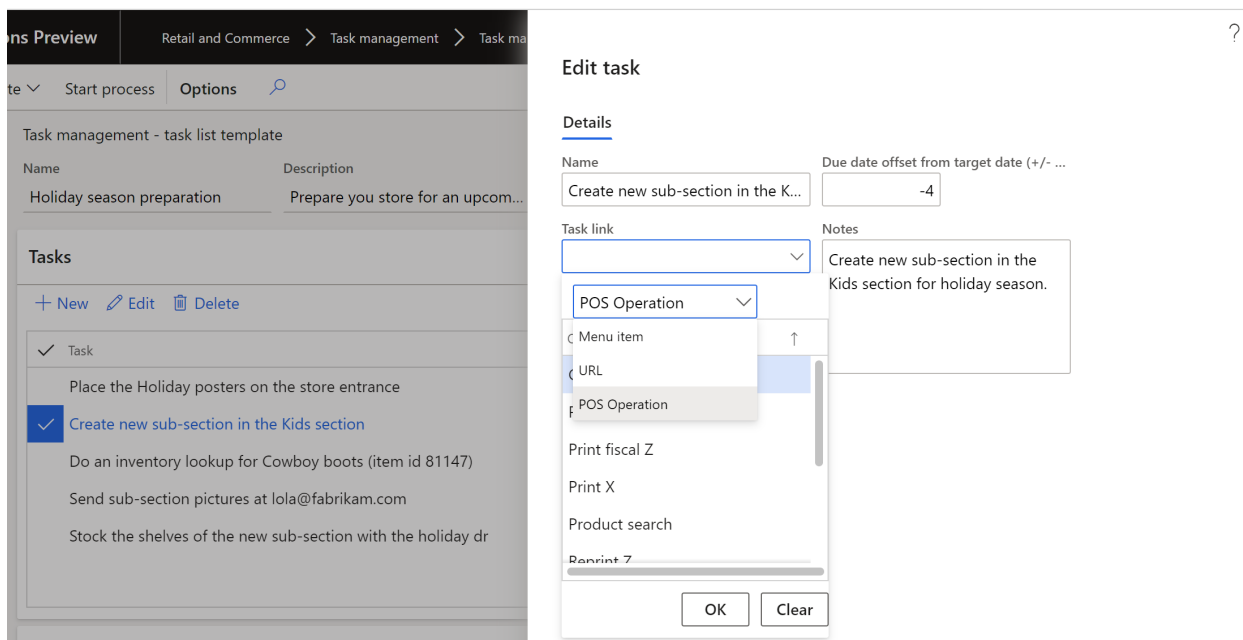

Commerce lets you link tasks to specific POS operations, such as running a sales report, viewing an online training video for new employee orientation, or performing a back-office operation. This feature helps task owners get the information that they need to complete a task efficiently.

To add task links while you create a task, follow these steps.

1. On the **Tasks** FastTab of an existing task list, select **Edit**.
2. In the **Edit task** dialog box, in the **Task link** field, select one or more of the following options:
  - Select **Menu item** to configure a back-office operation, such as "Product kits."
  - Select **POS Operation** to configure a POS operation, such as "Sales reports."
  - Select **URL** to configure an absolute URL.

The following illustration shows the selection of task links in the **Edit task** dialog box.

### Configure a POS operation so that it can be linked to a task

To configure a POS operation so that it can be linked to a task, follow these steps.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS > POS operations**.
2. Select **Edit**, find the POS operation, and then select the **Enable Task Management** check box for it.

# Assign task lists to stores or employees

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to assign task lists to stores or employees in Microsoft Dynamics 365 Commerce.

## Overview

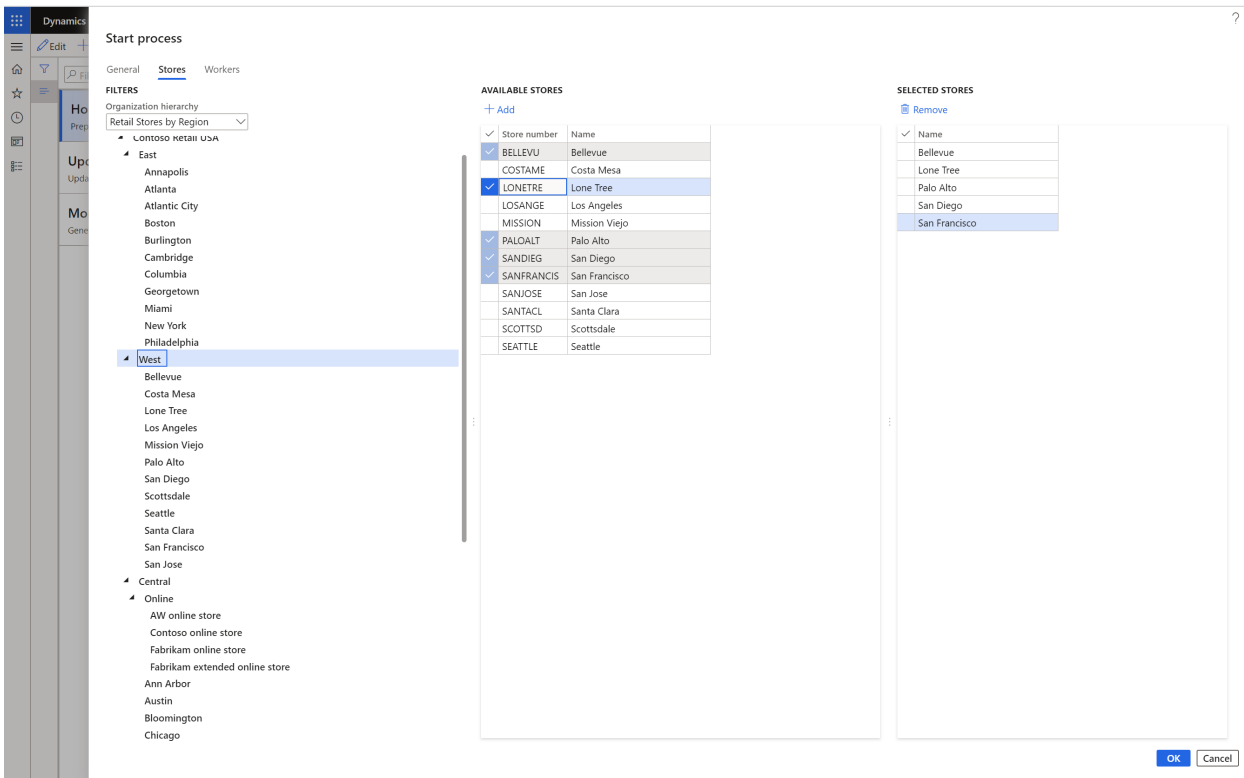

Task management in Dynamics 365 Commerce lets you assign a task list to multiple stores or employees, or to a combination of stores and employees. For example, a regional manager for 20 stores might want to assign the **Holiday season preparation** task list to all 20 stores.

## Start the task list assignment process

To start the process of assigning a task list, follow these steps.

1. Go to **Retail and Commerce > Task management > Task management administration**.
2. Select the task list to assign.
3. Select **Start process**.
4. In the **Start process** dialog box, on the **General** tab, in the **Process name** field, enter a name (for example, **East region stores**).
5. In the **Target date** field, specify a date.
6. To assign the task list to stores, on the **Stores** tab, use the **Organization hierarchy** filter to find and select the stores.  
  
To assign the task list to employees, on the **Workers** tab, find and select the employees.
7. Select **OK** to start the process. The task list is assigned to the selected stores or employees.

The following illustration shows an example of how to find and select stores in the **Start process** dialog box.

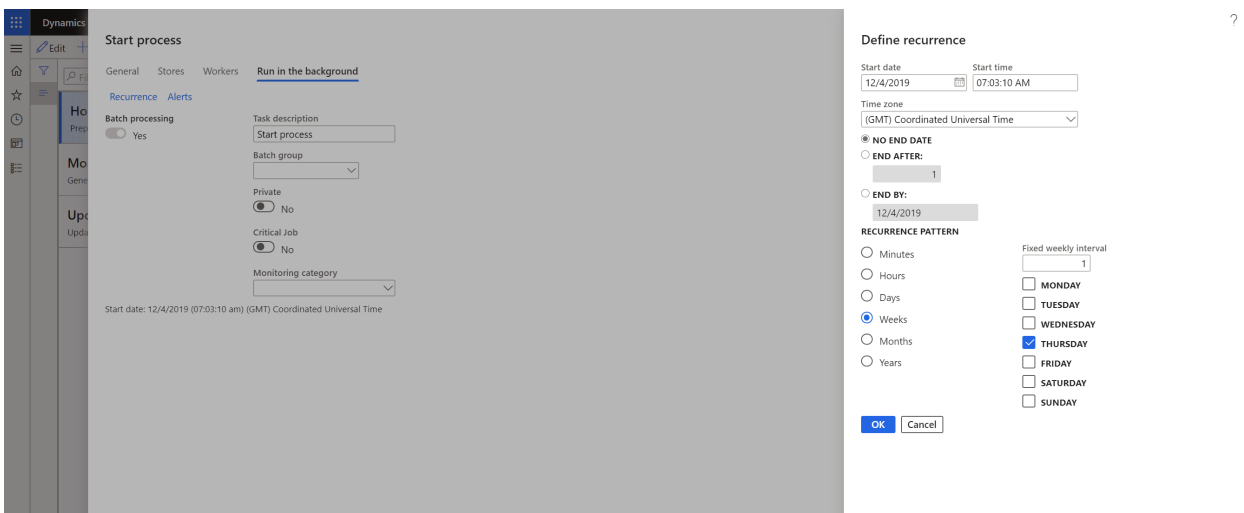

## Assign task lists on a recurring basis

Retailer sometimes have recurrent tasks, such as "Thursday closure checklist" or "First day of the month checklist." Therefore, they might want to assign the task list on a recurring basis.

1. Go to **Retail and Commerce > Task management > Task management administration.**
2. Select the task list to assign.
3. Select **Start process.**
4. In the **Start process** dialog box, on the **General** tab, in the **Process name** field, enter a name.
5. Set the **Recurrence** option to **Yes.**
6. In the **Recurrence target date offset in days** field, enter a number of days. For example, if you enter **4**, the target date is the recurrence date plus four days.
7. On the **Run in the background** tab, select **Recurrence.**
8. In the **Define recurrence** dialog box, enter the frequency criteria, and then select **OK.**

The following illustration shows an example of how to enter frequency criteria in the **Define recurrence** dialog box.

## Track task list status

If you're a regional manager or store manager, you might want to track the status of task lists that have been assigned to multiple stores or employees. You can then follow up with stores or workers that didn't complete their assigned tasks on time. Commerce back office lets you view the status of task lists, reassign tasks, or change the status of a task.

To track the task list status for all tasks, follow these steps.

1. Go to **Retail and Commerce > Task management > Task management processes**.
2. Select the **All task lists** tab to view the status of all task lists that are assigned to various stores.

To track the task list status for all tasks that are assigned to you, follow these steps.

1. Go to **Retail and Commerce > Task management > Task management processes**.
2. Select the **My tasks** or **All tasks** tab to view or update the status of tasks that are assigned to you.

# Task management in POS

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes task management in the Microsoft Dynamics 365 Commerce point of sale (POS) application.

## Overview

The Dynamics 365 Commerce POS application has task management features that let store managers and workers manage tasks and update task status. Store workers can access tasks either by selecting the **Tasks** tile on the POS home page or by selecting task notifications. By default, store workers are taken to the **My tasks** tab, where they can view the tasks that are assigned to them. However, they can easily switch to the **Overdue tasks**, **Open tasks**, and **Task lists** tabs.

## Task operations for store managers

Store managers can perform the following task operations in the POS application by using the buttons on the command bar:

- **Assign** – Assign selected tasks to a store worker.
- **Task status** – Change the status of selected tasks.
- **Filter** – By default, only active tasks are shown. However, by applying filters, managers can view all tasks, even tasks that have been completed or canceled.
- **New task** – Create a task under an existing task list, or create an single-purpose task.

Store workers can perform the following task operations in the POS application by using the buttons on the command bar:

- **Task status** – Change the status of selected tasks.
- **Filter** – By default, only active tasks are shown. However, by applying filters, workers can view all tasks, even tasks that have been completed or canceled.

The following illustration shows the **My tasks** tab in the Commerce POS application.

PRIORITY	TASK NAME	DUE DATE	STATUS	TASK LIST
1	Task name	10/04/2019 5:00 PM	In progress	Task list 1
1	Stock the shelves of the new sub section...	10/04/2019 5:00 PM	Completed	Task list 2
1	Task name	10/04/2019 5:00 PM	In progress	Ad hoc
2	Task name	10/04/2019 5:00 PM	In progress	Task list 1
2	Task name	10/04/2019 5:00 PM	Completed	Task list 2
3	Task name	10/04/2019 5:00 PM	Completed	Task list 1
4	Task name	10/04/2019 5:00 PM	Not started	Task list 1
4	Task name	10/04/2019 5:00 PM	In progress	Task list 1
5	Task name	10/04/2019 5:00 PM	Overdue	Task list 1
5	Task name	10/04/2019 5:00 PM	Not started	Task list 1

# E-commerce site overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides an overview of the support for e-commerce sites in Microsoft Dynamics 365 Commerce. It includes information about how e-commerce online stores are initialized and managed in Dynamics 365 Commerce. It also provides links to more information about online stores, and about how to set up and configure an e-commerce site. Although this topic covers many of the basics, it doesn't cover everything that is required to set up a production e-commerce site. More advanced topics can be found in the Dynamics 365 Commerce documentation.

## Online store channel

Before you can build your site in Dynamics 365 Commerce, at least one online store channel must be set up. For more information, see [Set up an online channel](#).

In Dynamics 365 Commerce, you use an online store channel to establish the products, pricing, languages, payment methods, delivery modes, fulfillment centers, and other aspects of the online experience that should be available to your customers.

Only one online store channel has to be set up before you can get started with Dynamics 365 Commerce. However, a single e-commerce site can provide the online experience for multiple online stores. For example, if multiple online stores are set up to support different geographical regions, a single set of e-commerce pages can be used to provide the unique experiences that are defined by each store. For more information about how to configure a site to support multiple online stores, see [Associate an online site with a channel](#).

After an online store is set up, it can be associated with the Dynamics 365 Commerce site that will serve as your online storefront. For more information about online stores and how to set them up, see [Set up online stores](#).

## Deploy a new e-commerce tenant

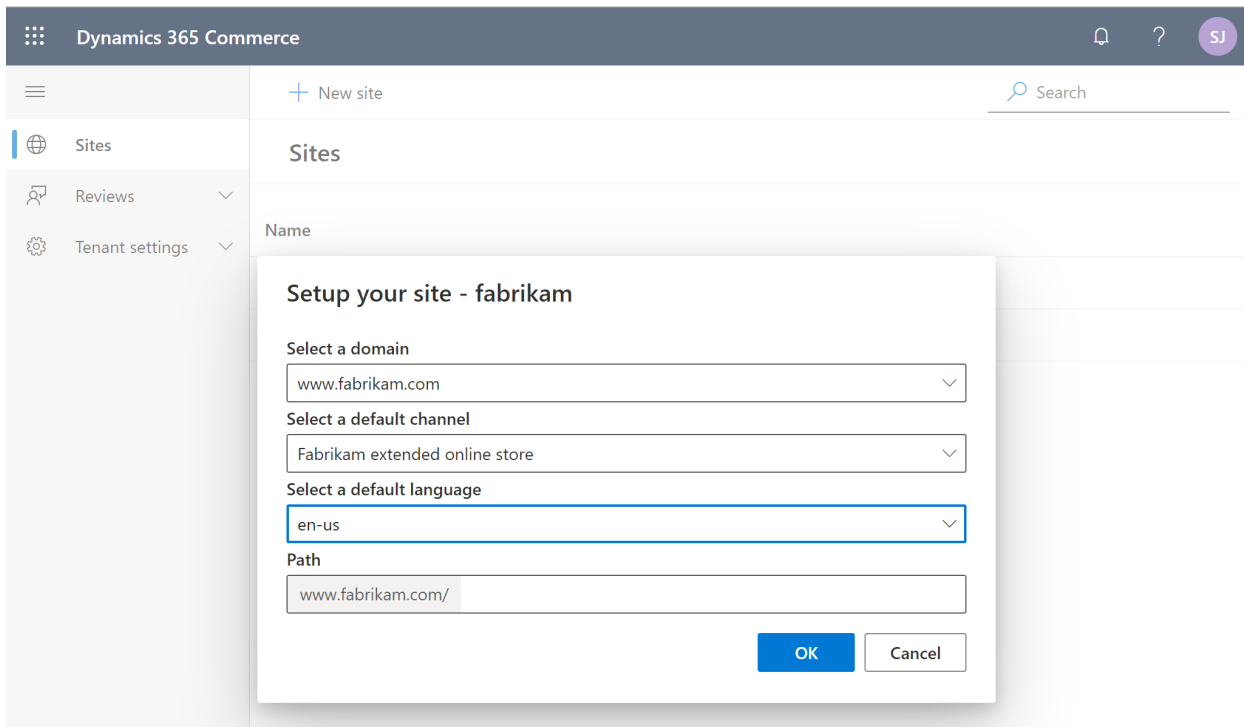

During initialization of an e-commerce site, you're prompted for a domain name. For more information about domains in Commerce, see [Configure your domain name](#) and [Domains in Dynamics 365 Commerce](#). To deploy a new e-commerce tenant by using [Microsoft Dynamics Lifecycle Services \(LCS\)](#), follow the steps in [Deploy a new e-commerce tenant](#). After your e-commerce tenant is set up in LCS, a link to Commerce site builder will be provided. You can then use Commerce site builder to initialize and configure your e-commerce sites.

## Initialize your e-commerce site

When you start Commerce site builder from LCS, the **Sites** page appears. This page includes two preconfigured sites, **default** and **fabrikam**, as shown in the example in the following illustration.

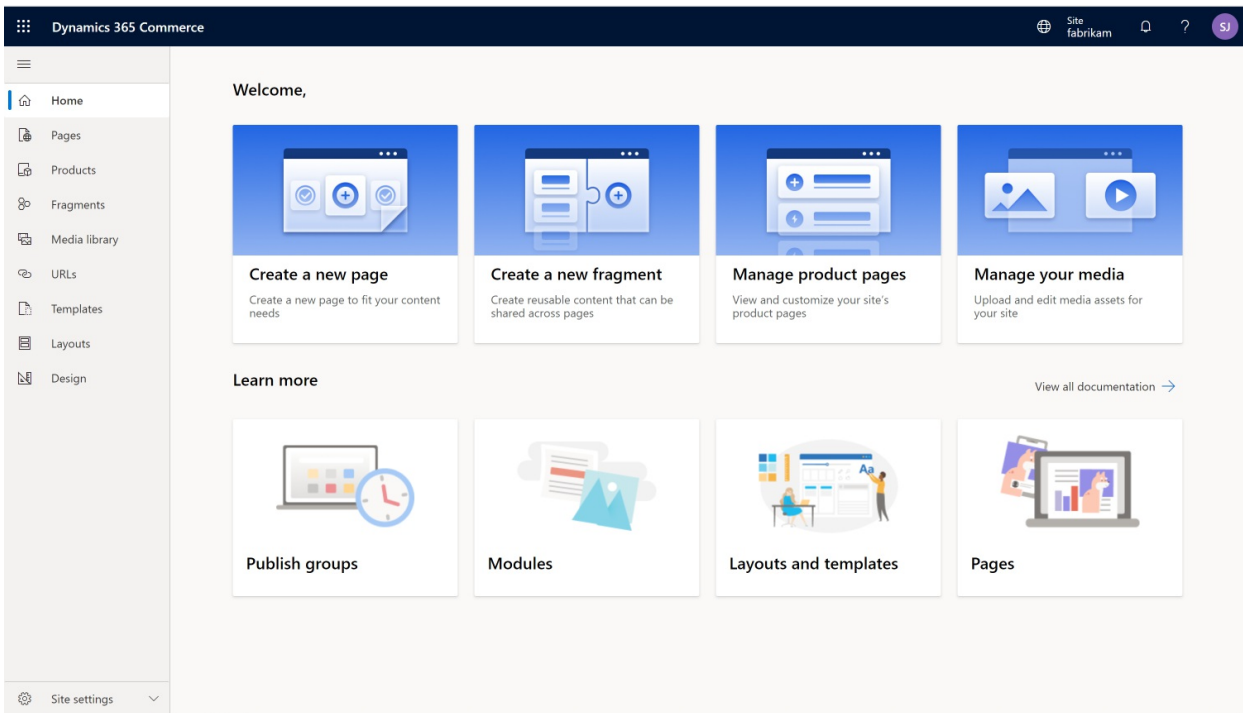

When you select one of these sites, you're prompted to select a domain name, a default online store channel, a supported language for the selected channel, and a path. If only one channel is used, you can leave the path blank. More online store channels or languages can be configured later in Commerce site builder. Each additional channel or language will require a unique path. For example, you have two online channels that are associated with a single site, and the domain name for the site is `www.fabrikam.com`. In this case, the path for one channel can be the default value that has no path (`https://www.fabrikam.com`), and the second channel can be set to a new path, such as `site2`, that will have the URL `https://www.fabrikam.com/site2`. The following illustration shows an example of a site initialization dialog box in Commerce site builder.

The **Sites** page also includes a **New site** button. The dialog box that appears when you select this button resembles the site initialization dialog box, but it's used to create a new site. New sites are blank. They don't include the same default templates, fragments, pages, and images that are provided with the **default** and **fabrikam** sites. However, as you require, you can open a support ticket to request that a copy of the default content be added to a new blank site. For more information, see [Create an e-commerce site](#).

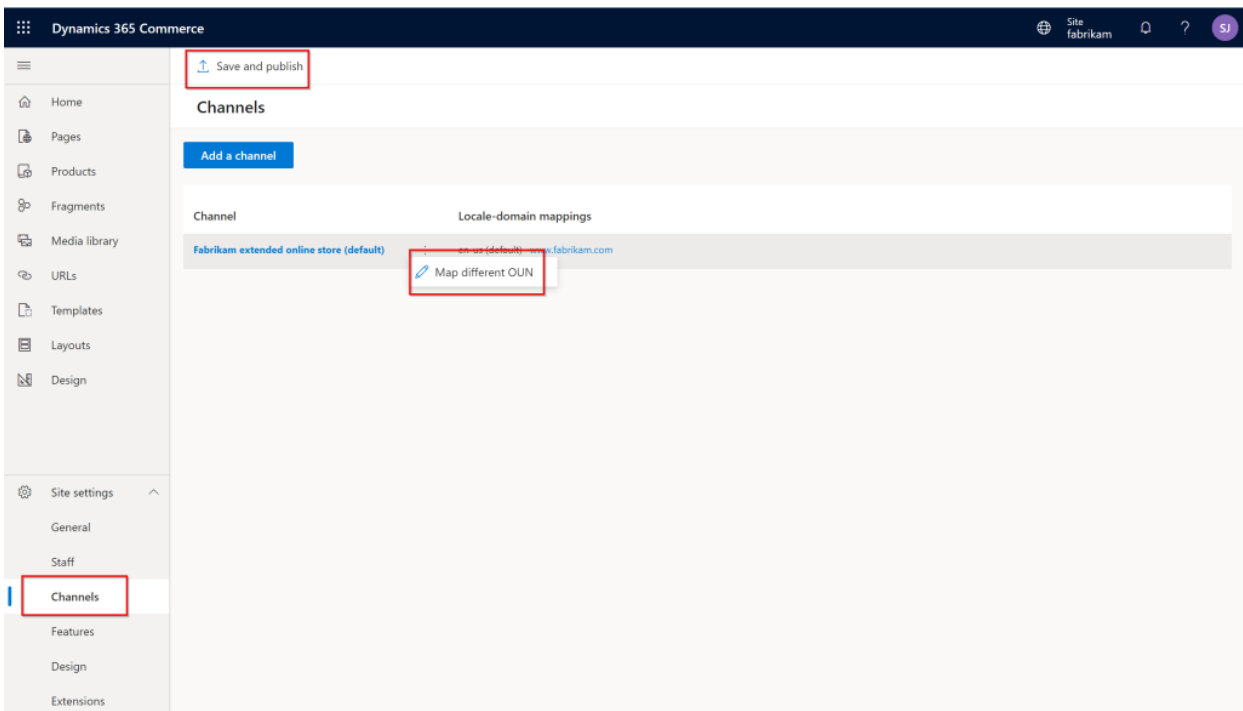

After a new site is initialized, the Commerce site builder **Home** page appears. This page includes links to common actions and guidance content, as shown in the example in the following illustration.

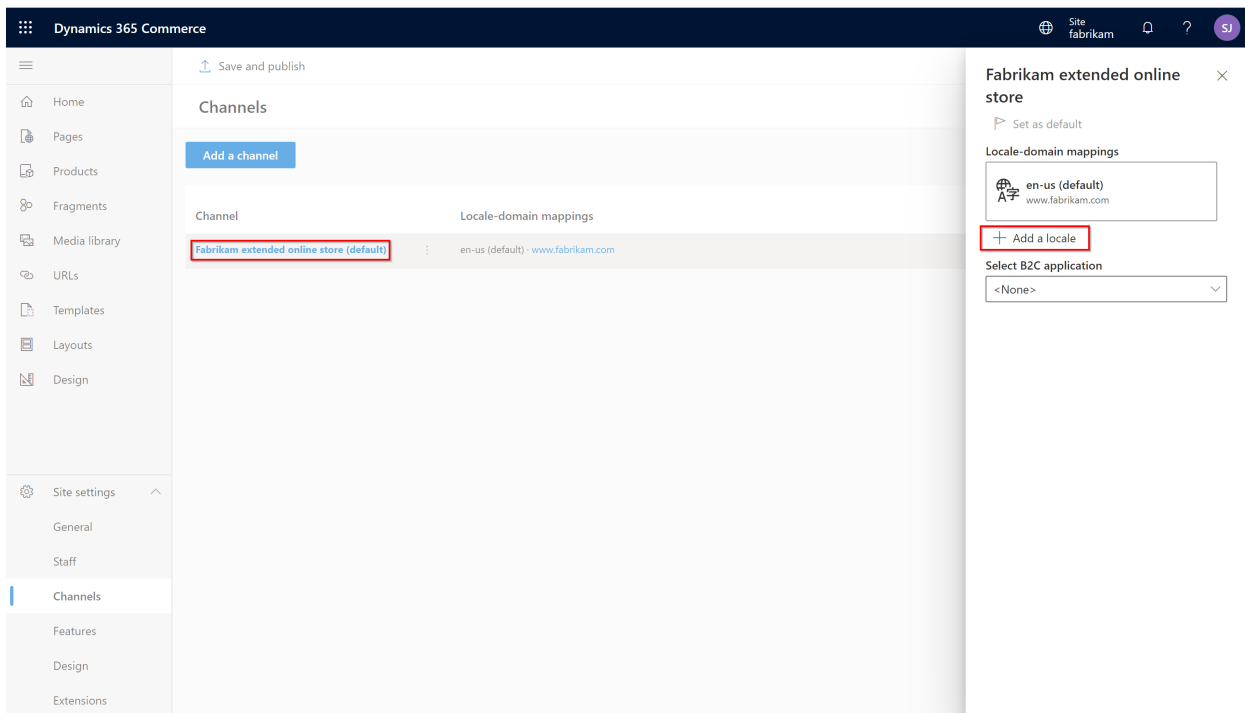

## Modify online store channels or add online store channels to an e-commerce site

After an e-commerce site is created, you can change the channel that it's associated with by following the steps in [Associate an e-commerce site with an online channel](#). The example in the following illustration shows how a channel operating unit number (OUN) can be changed on the **Channels** page (**Site settings** > **Channels**). After you've finished making a change, be sure to select **Save and publish**. In this way, you ensure that the change is published.

You can add new channels by selecting **Add a channel**. To add new languages to a channel, select the channel, and then select **Add a locale** in the channel dialog box that appears. Before locales can appear in the dialog box, they must be preconfigured for the online store channel in Commerce headquarters.

## Set up an Azure B2C tenant

Dynamics 365 Commerce uses Azure Active Directory (Azure AD) business-to-consumer (B2C) to support user credential and authentication flows. For information about how to set up your Azure B2C tenant, see [Set up a B2C tenant in Commerce](#), [Set up custom pages for user sign-ins](#), and [Configure multiple B2C tenants in a Commerce environment](#).

## Overview of the default site pages

The default and fabrikam sites include preconfigured templates, fragments, and pages to help you get started. For more information, see the following topics:

- [Home page overview](#)
- [Product details page overview](#)
- [Cart and checkout pages overview](#)
- [Account management pages overview](#)

## Manage site settings

For information about how to manage your site settings, see the following topics:

- [Manage e-commerce users and roles](#)
- [Search engine optimization \(SEO\) considerations for your site](#)
- [Manage Content Security Policy \(CSP\)](#)
- [Select a site theme](#)

## Manage site content

For information about how to manage site content, see the following topics:

- [Page model glossary](#)
- [Document states and lifecycle](#)
- [Templates and layout](#)
- [Work with fragments](#)

- [Work with modules](#)
- [Digital asset management overview](#)
- [Module library overview](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Configure your domain name

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to configure a domain name for a Microsoft Dynamics 365 e-commerce site.

## Add domains during e-commerce initialization

To associate domains with your Dynamics 365 Commerce e-commerce environment, initialize e-commerce as described in [Deploy a new e-commerce tenant](#). During initialization, you're asked to provide information that will be used to provision your e-commerce environment. In the **Supported host names** field, add all the domains that you plan to use with this environment. Multiple domains should be separated with semi-colon. In this way, the domains are configured in all the required Commerce components, and they are ready to be used when you switch traffic from your content delivery network (CDN) or web server and point it to the e-commerce front ends.

## Add domains after e-commerce initialization

To associate new domains with your e-commerce environment after e-commerce initialization, you must submit a service request.

## Additional resources

[Deploy a new e-commerce tenant](#)

# Deploy a new e-commerce tenant

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to deploy a new Dynamics 365 Commerce e-commerce site by using Microsoft Dynamics Lifecycle Services (LCS).

## Overview

Microsoft Dynamics Lifecycle Services (LCS) is a cloud-based collaborative workspace that partners and customers can use to manage their projects and environments, view the latest information about Microsoft Dynamics products and features, and create, track, and browse support incidents. E-commerce management features are integrated into LCS.

To learn more about LCS, see the [Lifecycle Services User Guide](#).

## Get started

Before you can initialize e-commerce, you must initialize a project, an environment, and a Retail Cloud Scale Unit (RCSU). To do the initialization in LCS, you must have permissions for either the Project Owner or Environment manager role. The production and sandbox environment topologies are supported.

For more information about environments, see [Environment planning](#). For more information about RCSU, see [Initialize Retail Cloud Scale Unit](#).

## Initialize e-commerce

Use this procedure to initialize the e-commerce feature in an existing environment.

Before you begin, make sure that you have the following required information:

- The RCSU that will be used.
- The Microsoft Azure Active Directory security group that will be used for e-commerce system admins.
- The Microsoft Azure Active Directory security group that will be used for ratings and reviews moderators.
- The domains that will be associated with the environment.

In addition, you can collect the following optional information:

- Azure AD business-to-consumer (B2C) information:
  - Tenant Name.
  - Client ID.
  - Login Custom Domain.
  - Reply URL.
  - SignUp SignIn Policy ID.
  - Reset password Policy ID.
  - Edit Profile Policy ID.

### NOTE

This information can be added later, through a service request.

After you've collected the required information, follow these steps to initialize e-commerce.

1. Sign in to [LCS](#).
2. Open the project that contains the environment where you want to initialize e-commerce.
3. In the **Environments** section, select the environment.
4. Under **Environment features**, select the **Retail manage** link.
5. On the **e-Commerce** tab, select **Setup**. A dialog box appears, where you must enter the information that is required for provisioning.
6. Fill in the required information, and then go to the next page.
7. On the next page, fill in the required information, and then submit the form. You're returned to the **e-Commerce** tab, where you should see that initialization has been started.
8. To view the initialization status, either **Refresh** or return to the **e-Commerce** tab later.

When e-commerce is initialized from LCS, the system provisions several components that are required for e-commerce and associates them with the environment. After provisioning is complete, the **e-Commerce** tab on the **Retail management** page is updated to reflect the provisioning. The page shows the latest customization deployments and the status of any other ongoing deployments. It also includes links to the e-commerce site and the Commerce site builder where sites are authored.

## Access Commerce site builder

To access Commerce site builder, go to the **e-Commerce** tab on the **Retail management** page in LCS and select the **e-Commerce site management tool** link. The site builder landing page displays a tenant-level view. From this page, you can:

- Modify tenant-level settings.
- Navigate to any site you have created, and have permission to view.
- Access Reviews features such as moderation and reporting.
- Create a new site. For more information about how to create a new site, see [Create an e-commerce site](#) .

## Additional resources

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Create an e-commerce site

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the steps and information required to create a new e-commerce site in Dynamics 365 Commerce site builder.

When you license the Dynamics 365 Commerce capabilities, site builder will be provisioned with a starter site that you can use as a basis for your own site. However, if you want to start from scratch or if you want to establish a second site, you will need to establish a new site in the site authoring environment.

## Set up your site

To set up your site, do the following.

1. Open the site builder environment. You can find a link to site builder in Microsoft Lifecycle Services (LCS) in the environment features page for Commerce.
2. On the home page for the site authoring environment, select **New site**.
3. In the **New site** dialog box, provide the following information.

FIELD	DESCRIPTION
Site name	Enter the display name that should be used for your site in the site authoring environment. This name is visible only in the authoring environment and will not be shown to customers.
Site administrator's security group	Specify the Microsoft Azure Active Directory (Azure AD) security group that manages users who have the site administrator role in this site.
Default channel (operating unit number)	Select the online store that this site will serve as the web storefront for. If you want your e-commerce site to support multiple online stores, you must associate the stores with your site in <b>Site settings</b> after the site is set up.
Default language	Specify the default language for this online store and market. An online store can support multiple languages. If you want to support multiple languages for this online store or another online store, you can configure that support in <b>Site settings</b> after the site is set up.
Domain	Select a domain name that will serve as the domain for this online store. If you haven't configured any domains in LCS, you can leave this field blank. After your domain is configured in LCS, you must add it to your online store in <b>Site settings</b> .

FIELD	DESCRIPTION
Path	When your site supports more than one language for a given domain name, use the path field to create a unique site URL for that domain and language combination. If the language you specified in the <b>Default language</b> field is the only language you will support for this domain, or will continue to be the default language after you have localized your site into additional languages, we recommend that you leave this field empty.

After your site is created, you can verify that it is associated with your online store by selecting the **Products** tab. You should see the assortment of products that has been allocated to the online store. You can also use the drop-down menu in the upper left of the page to access the allocated products by category.

# Associate a Dynamics 365 Commerce site with an online channel

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to bind your Microsoft Dynamics 365 Commerce site to one or more online stores.

After you've provisioned your Dynamics 365 Commerce e-commerce environment by using the Microsoft Dynamics Lifecycle Services (LCS) portal, you're ready to establish your first e-commerce website. As part of the initial site creation, you associate the site with an online store that was previously created. This step binds the site to an online channel and lets the site show the navigation hierarchy, products, categories, prices, shipping options, and everything else that you defined in the online store.

To establish a new site and associate an online store with it, in LCS, select the link for the site authoring environment. Then, on the page for the site authoring environment, select **New site**. In the **New site** dialog box, you must provide some basic information about your site. For a complete explanation of the information that you must provide, see [Create a new e-commerce site](#).

After your site is created, you can verify that it's associated with your online store by selecting the **Products** tab. You should see the assortment of products that has been allocated to the online store. You can also use the drop-down field in the upper left of the page to access the products by category.

# Manage robots.txt files

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to manage robots.txt files in Microsoft Dynamics 365 Commerce.

## Overview

The robots exclusion standard, or robots.txt, is a standard that websites use to communicate with web robots. It instructs web robots about any areas of a website that should not be visited. Robots are often used by search engines to index websites.

To exclude robots from a server, you create a file on the server. In this file, you specify an access policy for robots. The file must be accessible via HTTP at the local URL `/robots.txt`. The robots.txt file helps search engines index the content on your site.

Dynamics 365 Commerce lets you upload a robots.txt file for your domain. For each domain in your Commerce environment, you can upload one robots.txt file and associate it with that domain.

For more information about the robots.txt file, visit [The Web Robots Pages](#).

## Upload a robots.txt file

After you've created and edited your robots.txt file according to the [robots exclusion standard](#), make sure that the file is accessible on the computer where you will use the Commerce authoring tools. The file must be named **robots.txt**. For best results, it must be in the format that is noted in the standard. Each Commerce customer is responsible for validating and maintaining the contents of its robots.txt file. To upload a robots.txt file, you must be signed in to Commerce as a system admin.

To upload a robots.txt file in Commerce, follow these steps.

1. Sign in to Commerce as a system admin.
2. In the left navigation pane, select **Tenant Settings** (next to the gear symbol) to expand it.
3. Under **Tenant Settings**, select **Robots.txt**. A list of all the domains that are associated with your environment appears in the main part of the window.
4. Select **Manage** to upload a robots.txt file for a domain in your environment.
5. On the menu on the right, select the **Upload** button (the upward-pointing arrow) next to the domain that is associated with the robots.txt file. A file browser dialog box appears.
6. In the dialog box, browse to and select the robots.txt file that you want to upload for the associated domain, and then select **Open** to complete the upload.

### NOTE

During upload, Commerce verifies that the file is a text file, but it doesn't validate the file's contents.

## Download a robots.txt file

To download a robots.txt file in Commerce, follow these steps.

1. Sign in to Commerce as a system admin.
2. In the left navigation pane, select **Tenant Settings** (next to the gear symbol) to expand it.

3. Under **Tenant Settings**, select **Robots.txt**. A list of all the domains that are associated with your environment appears in the main part of the window.
4. Select **Manage** to download a robots.txt file for a domain in your environment.
5. On the menu on the right, select the **Download** button (the downward-pointing arrow) next to the domain that is associated with the robots.txt file. A file browser dialog box appears.
6. In the dialog box, go to the desired location on your local drive, confirm or enter a file name, and then select **Save** to complete the download.

#### NOTE

This procedure can be used to download only robots.txt files that were previously uploaded via the Commerce authoring tools.

## Delete a robots.txt file

To delete a robots.txt file in Commerce, follow these steps.

1. Sign in to Commerce as a system admin.
2. In the left navigation pane, select **Tenant Settings** (next to the gear symbol) to expand it.
3. Under **Tenant Settings**, select **Robots.txt**. A list of all the domains that are associated with your environment appears in the main part of the window.
4. Select **Manage** to delete a robots.txt file for a domain in your environment.
5. On the menu on the right, select the **Delete** button (the trash can symbol) next to the domain that is associated with the robots.txt file. A file browser window appears.
6. In the file browser window, browse to and select the robots.txt file that you want to delete for the domain, and then select **Open**. A warning message box appears.
7. In the message box, select **Delete** to confirm deletion of the robots.txt file.

#### NOTE

This procedure can be used to delete only robots.txt files that were previously uploaded via the Commerce authoring tools.

# Upload URL redirects in bulk

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to implement URL redirects in bulk by uploading a redirect comma-separated values (CSV) file in Microsoft Dynamics 365 Commerce.

## Overview

After you've finished creating a new e-commerce site in Dynamics 365 Commerce, and it's ready to go live, you must make the Domain Name System (DNS) switch from your old site to your new site. After you make this switch, the URLs for the new site will likely differ from the URLs for the old site. For specific URLs, traffic that uses the old URL can be redirected to the new URL. In this way, you ensure that site visitors reach the desired location. Redirects help prevent broken links for your customers and help you maintain your established search engine optimization (SEO) results.

Although redirects for individual links can be manually configured in DNS, manual configuration becomes tedious if multiple links must be redirected. To streamline the redirect process, Commerce provides the capability to upload a data file that contains bulk redirect mappings for your site. In the site settings in Commerce site builder, your system admin can upload and publish a CSV file that handles bulk URL redirects.

## Redirect CSV file

To handle URL redirects, Commerce supports a simple but specific CSV file. This file uses the following schema:

```
source URL, target URL, redirect type, case sensitivity
```

Here is an explanation of the elements of this schema:

- **Source URL:** The original URL that must be redirected.
- **Target URL:** The URL that users will be redirected to when they try to go to the source URL.
- **Redirect type:** Set this value to **301** or **302**, depending on the type of redirect that you want to use.
  - The **301** redirect type represents permanent redirects and is the most frequently used redirect type. It's the best option when you must maintain search engine optimization (SEO) rankings.
  - The **302** redirect type represents temporary redirects and is less frequently used. It's the best option when you must maintain link targeting during temporary maintenance or other non-permanent scenarios.
- **Case sensitivity:** Set this value to **true** if your source URL paths are case-sensitive. Case sensitivity will then be honored for the source URL paths. Set this value to **false** if case sensitivity isn't required. If you leave this value blank, the default value of **false** is used.

The following example shows a set of redirect rows in a redirect CSV file.

```
https://www.contoso.com/shop, https://www.fabrikam.com/allstores, 301, true
https://www.contoso.com/news, https://www.fabrikam.com/updates, 301, false
https://www.contoso.com/news, https://www.fabrikam.com/updates, 301
```

### IMPORTANT

The following rules must be followed. Otherwise, the bulk URL redirects won't work correctly.

- **No header is allowed in the CSV file:** The first or topmost row must start with the first redirect row.
- **There must be no circular entries:** The source URL in a row must not be used as the target URL in the same row. You must also avoid implementations where a target URL is linked back as a source URL, either in a different row of the CSV file or in a DNS redirect.
- **Source and target URLs must be in valid URL format:** No spaces or invalid characters can be used in URLs.
- **No query string URLs are supported:** Commerce won't run query strings that are provided as source or target URLs.
- **The CSV file must be in valid CSV format:** The CSV file must have comma-separated values, a separate line for each redirect, and valid file formatting, and it must have no header.

## Upload a redirect CSV file

Redirect CSV files can be uploaded by using Commerce site builder. The person who uploads a redirect CSV file to a site must be an admin for that site.

To upload a redirect CSV file, follow these steps.

1. In Commerce site builder, go to the site that will receive the bulk URL redirects.
2. Go to **Site settings > General**.
3. Under **URL Redirect Mapping**, select **Upload**.
4. In File Explorer, browse to your CSV file, select it, and then select **Open**.
5. Under **URL Redirect Mapping**, set the option to **On** to activate the redirects.
6. On the command bar, select **Save and Publish** to commit the changes. Allow up to 15 minutes for the redirects to take effect.

### IMPORTANT

Only one bulk redirect CSV file can be loaded and active per site at any time.

## Update an uploaded redirect CSV file

A previously uploaded redirect CSV file can be downloaded for reference. Alternatively, after the file is downloaded, it can be edited and then uploaded again.

To update an uploaded redirect CSV file, follow these steps.

1. In Commerce site builder, go to the site that will receive the bulk URL redirects.
2. Go to **Site settings > General**.
3. Under **URL Redirect Mapping**, select **Download**.
4. Save the file to your local computer.
5. Edit the CSV file as appropriate, and then save it.
6. Under **URL Redirect Mapping**, select **Replace**.
7. In File Explorer, browse to the replacement CSV file, select it, and then select **Open**.
8. Under **URL Redirect Mapping**, set the option to **On** to activate the redirects.
9. On the command bar, select **Save and Publish** to commit the changes. Allow up to 15 minutes for the redirects to take effect.

# Turn off bulk redirects

To turn off the bulk redirects in an uploaded redirect CSV file, follow these steps.

1. Create and save a new CSV file that has valid but nonexistent source and target URLs (for example, `https://www.com,https://www.com,301`).
2. In Commerce site builder, go to the site that will receive the bulk URL redirects.
3. Go to **Site settings > General**.
4. Under **URL Redirect Mapping**, select **Replace**.
5. In File Explorer, browse to your new CSV file, select it, and then select **Open**.
6. Under **URL Redirect Mapping**, set the option to **On** to activate the redirects.
7. On the command bar, select **Save and Publish** to commit the changes. Allow up to 15 minutes for the redirects to stop working.

# Set up a B2C tenant in Commerce

2/18/2021 • 14 minutes to read • [Edit Online](#)

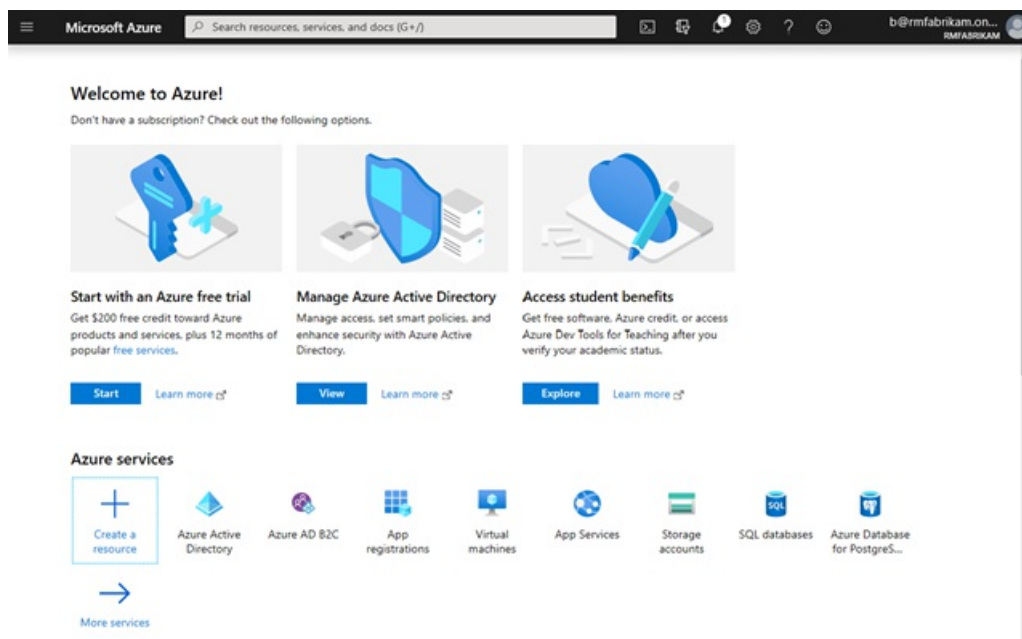

This topic describes how to set up your Azure Active Directory (Azure AD) business-to-consumer (B2C) tenants for user site authentication in Dynamics 365 Commerce.

## Overview

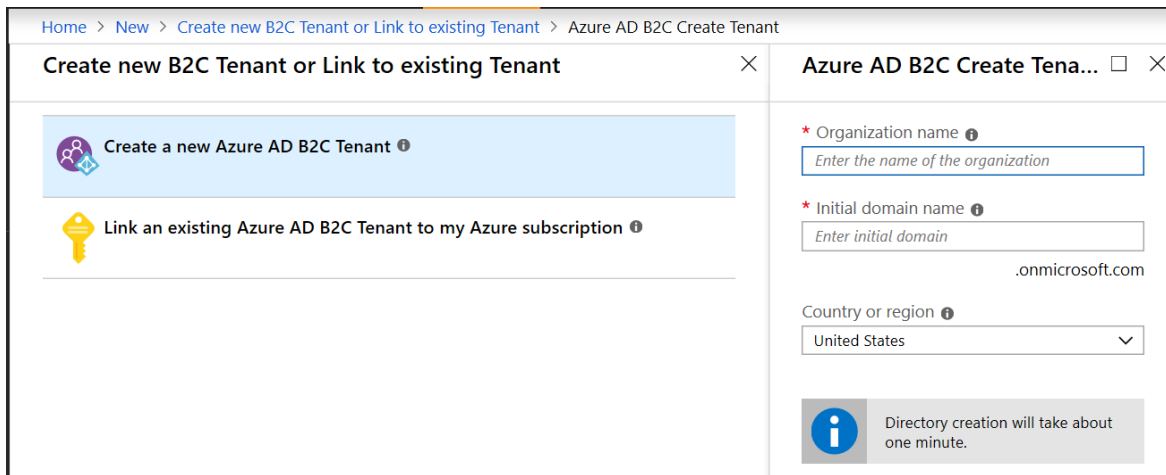

Dynamics 365 Commerce uses Azure AD B2C to support user credential and authentication flows. A user can sign up, sign in, and reset their password through these flows. Azure AD B2C stores sensitive user authentication information, such as username and password. The user record in the B2C tenant will store either a B2C local account record or a B2C social identity provider record. These B2C records will link back to the customer record in the Commerce environment.

## Create or link to an existing AAD B2C tenant in the Azure portal

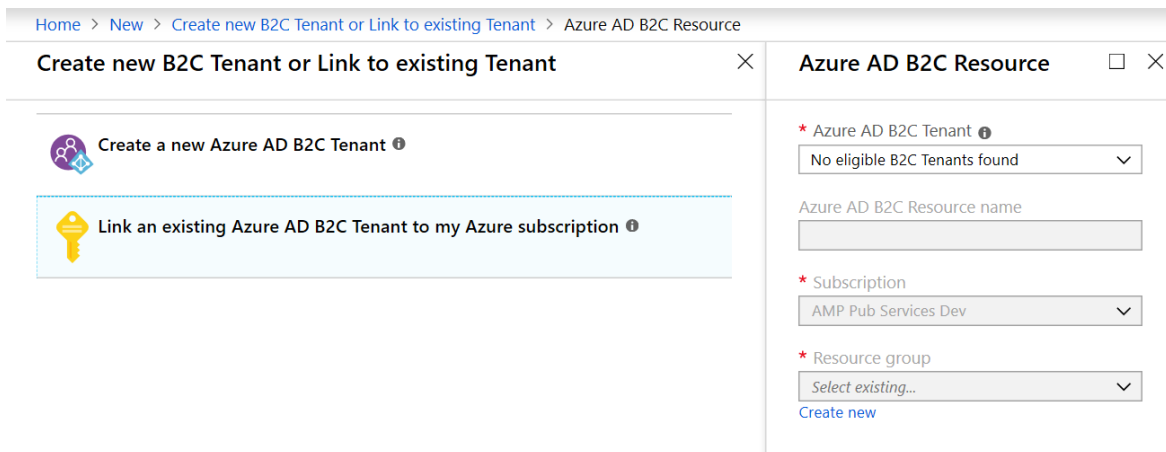

1. Sign in to the [Azure portal](#).
2. From the Azure portal menu, select **Create a resource**. Be sure to use the subscription and directory that will be connected with your Commerce environment.

3. Go to **Identity > Azure Active Directory B2C**.
4. Once on the **Create New B2C Tenant** or **Link to existing Tenant** page, use one of the options below that best suits your company's needs:
  - **Create a new Azure AD B2C Tenant**: Use this option to create a new AAD B2C tenant.
    - a. Select **Create a new Azure AD B2C Tenant**.
    - b. Under **Organization name**, enter the organization name.
    - c. Under **Initial domain name**, enter the initial domain name.
    - d. For **Country or region**, select the country or region.
    - e. Select **Create** to create the tenant.

- **Link an existing Azure AD B2C Tenant to my Azure subscription:** Use this option if you already have an Azure AD B2C tenant you want to link to.
  - a. Select **Link an existing Azure AD B2C Tenant to my Azure subscription**.
  - b. For **Azure AD B2C Tenant**, select the appropriate B2C tenant. If the message "No eligible B2C Tenants found" appears in the selection box, you do not have an existing eligible B2C tenant and will need to create a new one.
  - c. For **Resource group**, select **Create new**. Enter a **Name** for the resource group that will contain the tenant, select the **Resource group location**, and then select **Create**.

5. Once the new Azure AD B2C directory is created (this may take a few moments), a link to the new directory will appear on the dashboard. This link will direct you to the "Welcome to Azure Active Directory B2C" page.

Country or region ⓘ

United States ▼

 Click [here](#) to manage your new directory 

## NOTE

If you have multiple subscriptions within your Azure account or have set up the B2C tenant without linking to an active subscription, a **Troubleshoot** banner will direct you to link the tenant to a subscription. Select the troubleshooting message and follow the instructions to resolve the subscription issue.

The following image shows an example of an Azure AD B2C **Troubleshoot** banner.

## Create the B2C application

Once the B2C tenant has been created, you will create a B2C application within the tenant to interact with the Commerce actions.

To create the B2C application, follow these steps.

1. In the Azure portal, select **Applications(Legacy)** and then select **Add**.
2. Under **Name**, enter the name of the desired AAD B2C application.
3. Under **Web App/Web API**, for **Include web app / web API**, select **Yes**.
4. For **Allow implicit flow**, select **Yes** (the default value).
5. Under **Reply URL**, enter your dedicated reply URLs. See [Reply URLs](#) below for information on reply URLs and how to format them here.
6. For **Include native client**, select **No** (the default value).
7. Select **Create**.

### Reply URLs

Reply URLs are important as they provide an allow list of the return domains when your site calls Azure AD B2C to authenticate a user. This permits the return of the authenticated user back to the domain from which they are signing into (your site domain).

In the **Reply URL** box on the **Azure AD B2c - Applications > New application** screen, you need to add separate lines for both your site domain and (once your environment is provisioned) the Commerce-generated URL. These URLs must always use a valid URL format and must be base URLs only (no trailing forward slashes or paths). The string `/_msdyn365/authresp` then needs to be appended to the base URLs, as in the following examples.

- `https://www.fabrikam.com/_msdyn365/authresp` (The domain should match the e-commerce domain completely. If you have multiple domains, you need to add this URL for each domain.)
- `https://fabrikam-prod.commerce.dynamics.com/_msdyn365/authresp`

## Create user flow policies

User flows are the policies Azure AD B2C uses to provide secure sign in, sign up, edit profile, and forget password user experiences. Dynamics 365 Commerce uses these flows to perform the policy actions to interact with the Azure AD B2C tenant. When a user interacts with these policies, they are redirected to the Azure AD B2C tenant to perform the actions.

Azure AD B2C provides three basic user flow types:

- Sign up and sign in

- Profile editing
- Password reset

You can choose to use the default user flows provided by Azure AD, which will display a page hosted by AAD B2C. Alternately, you can create an HTML page to control the look and feel of these user flow experiences.

To customize the user policy pages for Dynamics 365 Commerce, see [Set up custom pages for user logins](#). For additional information, see [Customize the interface of user experiences in Azure Active Directory B2C](#).

### Create a sign up and sign in user flow policy

To create a sign up and sign in user flow policy, follow these steps.

1. In the Azure portal, select **User flows (policies)** in the left navigation pane.
2. On the **Azure AD B2C – User flows (policies)** page, select **New User Flow**.
3. On the **Recommended** tab, select **Sign up and sign in**.
4. Under **Name**, enter a policy name. This name will display afterwards with a prefix the portal assigns (for example, "B2C\_1\_").
5. Under **Identity providers**, select the appropriate check box.
6. Under **Multifactor Authentication**, select the appropriate choice for your company.
7. Under **User attributes and claims**, select options to collect attributes or return claims as appropriate. Commerce requires the following default options:

COLLECT ATTRIBUTE	RETURN CLAIM
Email Address	Email Addresses
Given Name	Given Name
	Identity Provider
Surname	Surname
	User's Object ID

8. Select **Create**.

The following image is an example of the Azure AD B2C sign up and sign in user flow.

Home > Azure AD B2C - User flows (policies) > Create a user flow > Create

### Create

Sign up and sign in

← Select a different type of user flow

Get started with your user flow with a few basic selections. Don't worry about getting everything right here, you can modify your user flow after you've created it.

**1. Name \***

The unique string used to identify this user flow in requests to Azure AD B2C. This cannot be changed after a user flow has been created.

\* B2C\_1\_ signinsignupe2e

**2. Identity providers \***

Identity providers are the different types of accounts your users can use to log into your application. You need to select at least one for a valid user flow and you can select multiple.

Please select at least one identity provider

Email sign up

**3. Multifactor authentication**

Enabling multifactor authentication (MFA) requires your users to verify their identity with a second factor before allowing them into your application. [Learn more about MFA](#)

Multifactor authentication

**4. User attributes and claims**

User attributes are values collected on sign up. Claims are values about the user returned to the application in the token. You can create custom attributes for use in your directory.

	Collect attribute	Return claim

## Add social identity providers (Optional)

Social identity providers allow users to use their social accounts for authentication. Adding social identity provider authentication is optional in Dynamics 365 Commerce.

If social identity provider authentication is not added, the default Azure AD B2C profiles will be the main profiles for your user base. Users will select their own username (their preferred email address) and set a password. Azure AD B2C will authenticate users directly.

If social identity provider authentication is added and a user chooses one of the social identity providers offered, an entity is still created in the Azure AD B2C tenant. Azure AD B2C will then authenticate the user's credentials with the social identity provider.

### NOTE

The identity provider sign in creates a record in the B2C tenant, but in a different format than local accounts since it will call the external social identity provider reference for authentication. The user can use the same email address across social identity providers, meaning that the email username used for authentication may not be unique to the tenant. Azure AD B2C will only enforce that users have a unique email address on local B2C accounts.

Before you can add a social identity provider for authentication, you must go to the identity provider's portal and set up an identity provider application as instructed in the Azure AD B2C documentation. A list of links to the documentation is provided below.

- [Amazon](#)
- [Azure AD \(Single Tenant\)](#)
- [Microsoft Account](#)
- [Facebook](#)
- [GitHub](#)
- [Google](#)
- [LinkedIn](#)
- [OpenID Connect](#)
- [Twitter](#)

## Add and set up a social identity provider

To add and set up a social identity provider, follow these steps.

1. In the Azure portal, navigate to **Identity Providers**.
2. Select **Add**. The **Add identity provider** screen appears.
3. Under **Name**, enter the name to be displayed to users on your sign in screen.
4. Under **Identity provider type**, select an identity provider from the list.
5. Select **OK**.
6. Select **Set up this identity provider** to access the **Set up the social identity provider** screen.
7. Under **Client ID**, enter the client ID as obtained from the identity provider application setup.
8. Under **Client secret**, enter the client secret as obtained from the identity provider application setup.
9. Attach user flow for sign in sign up policies:
10. Go to **Azure AD B2C – User flows (policies) > {your sign-in sign-up policy} > Identity providers**.
11. To attach the sign in/sign up user flow policy, select each identity provider you have set up for your account. To test these, select **Run user flow** for each identity provider. A new tab will display the sign-in page displaying the new identity provider selection box.

The following image shows examples of the **Add identity provider** and **Set up the social identity provider** screens in Azure AD B2C.

The image shows two side-by-side screenshots from the Azure AD B2C portal. The left screenshot is titled 'Add identity provider' and shows the following fields: 'Name' with the value 'Facebook', 'Identity provider type' with the value 'Facebook', and 'Set up this identity provider' with the value 'Required'. The right screenshot is titled 'Set up the social identity provider' and shows the following fields: 'Client ID' with the value '00' and 'Client secret' with the value '00'. Both screenshots have a breadcrumb trail: 'Home > Azure AD B2C - Identity providers > Add identity provider > Set up the social identity provider'.

The following image shows an example of how to select identity providers on the Azure AD B2C **Identity Providers** page.

The image shows the 'Identity providers' page in the Azure AD B2C portal. The breadcrumb trail is 'Home > Azure AD B2C - User flows (policies) > B2C\_1\_signinsigne2e - Identity providers'. The page title is 'B2C\_1\_signinsigne2e - Identity providers'. Below the title, there is a search bar and a navigation menu with options: 'Run user flow', 'Save', 'Discard', and 'Manage identity providers'. The main content area contains a table of identity providers. The table has two columns: 'IDENTITY PROVIDER' and 'NAME'. The table contains two rows: 'Facebook' and 'Local Account'. Both rows have a checkmark in the 'IDENTITY PROVIDER' column. The 'NAME' column contains 'Facebook' and 'Email signup' respectively.

IDENTITY PROVIDER	NAME
<input checked="" type="checkbox"/> Facebook	Facebook
<input checked="" type="checkbox"/> Local Account	Email signup

The following image shows an example of a default sign-in screen with a social identity provider sign-in button displayed.

## Update Commerce headquarters with the new Azure AD B2C information

Once the Azure AD B2C provisioning steps above are completed, the Azure AD B2C application must be registered in your Dynamics 365 Commerce environment.

To update headquarters with the new Azure AD B2C information, follow these steps.

1. In Commerce, go to **Commerce Shared Parameters** and select **Identity Providers** in the left menu.
2. Under **Identity Providers**, do the following:
  - a. In the **Issuer** box, enter the identity provider issuer URL. To find your issuer URL, see [Obtain issuer URL](#) below.
  - b. In the **Name** box, enter a name for your issuer record.
  - c. In the **Type** box, enter **Azure AD B2C (id\_token)**.
3. Under **Relying Parties**, with the above B2C identity provider item selected, do the following:
  - a. In the **ClientID** box, enter your B2C application ID. You can find this in the **Application ID** box of your B2C application's properties page.
  - b. In the **Type** box, enter **Public**.
  - c. In the **User Type** box, enter **Customer**.
4. On the action pane, select **Save**.
5. In the Commerce search box, search for **Distribution schedule**
6. In the left navigation menu of the **Distribution schedules** page, select job **1110 Global configuration**.
7. On the action pane, select **Run Now**.

### Obtain issuer URL

To obtain your identity provider issuer URL, follow these steps.

1. Create a metadata address URL in the following format using your B2C tenant and policy:

```
https://<B2CTENANTNAME>.b2clogin.com/<B2CTENANTNAME>.onmicrosoft.com/v2.0/.well-known/openid-configuration?p=<B2CSIGN-INPOLICY>
```

- Example:

```
https://d365plc.b2clogin.com/d365plc.onmicrosoft.com/v2.0/.well-known/openid-configuration?p=B2C_1_signinup
```

2. Enter the metadata address URL into a browser address bar.
3. In the metadata, copy the identity provider issuer URL (the value for "issuer").

- Example: `https://login.fabrikam.com/073405c3-0113-4f43-b5e2-df01266e24ae/v2.0/`.

## Configure your B2C tenant in Commerce site builder

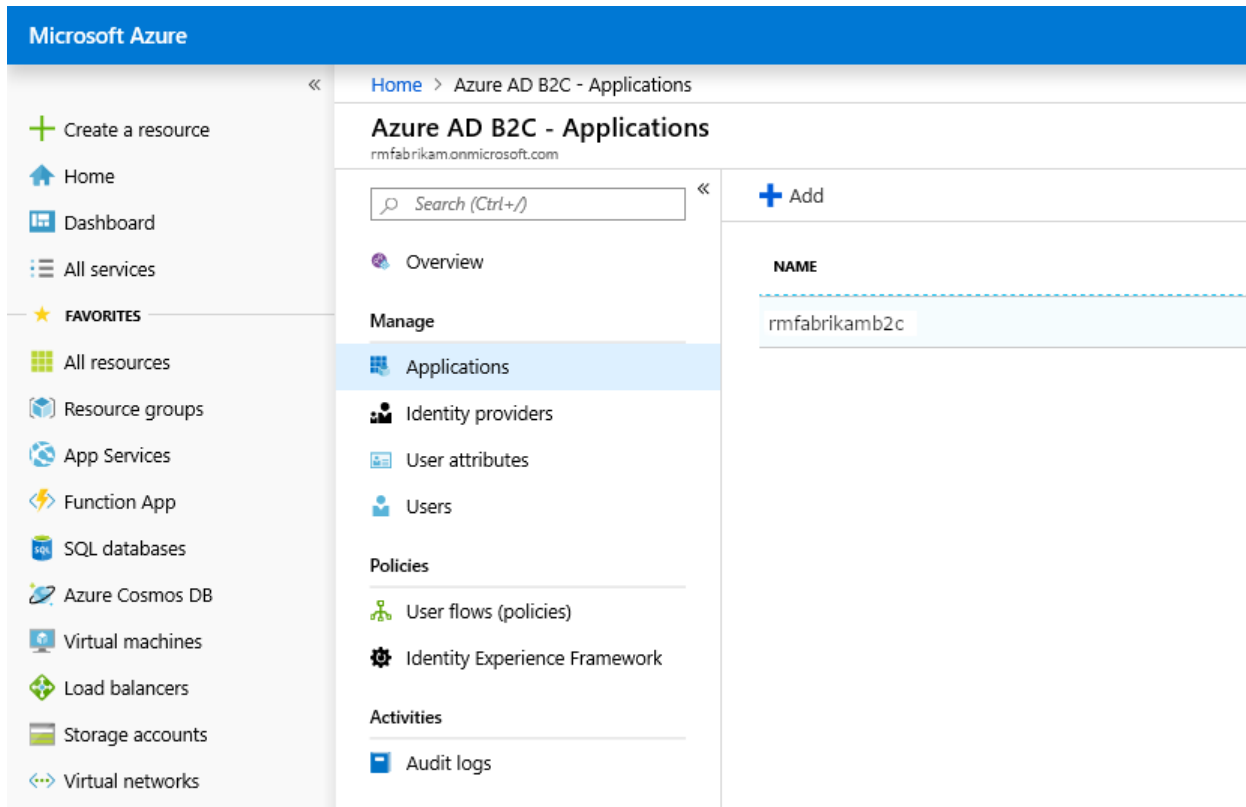

Once setup of your Azure AD B2C tenant is completed, you must configure the B2C tenant in Commerce site builder. Configuration steps include collecting B2C application information from the Azure portal, entering that B2C application information into site builder, and then associating the B2C application with your site and channel.

### Collect the required application information

To collect the required application information, follow these steps.

1. In the Azure portal, go to **Home > Azure AD B2C - Applications**.
2. Select your application, and then in the left navigation pane select **Properties** to obtain the application details.
3. From the **Application ID** box, collect the application ID of the B2C application created in your B2C tenant. This will later be entered as the **Client GUID** in site builder.
4. Under **Reply URL**, collect the reply URL.
5. Go to **Home > Azure AD B2C – User flows (policies)**, and then collect the names of each user flow policy.

The following image shows an example of the Azure AD B2C - Applications page.

The following image shows an example of an application **Properties** page in Azure AD B2C.

**B2C\_1\_signinsignupe2e**

### Enter your AAD B2C tenant application information into Commerce

You must enter details of the Azure AD B2C tenant into Commerce site builder before associating the B2C tenant with your site(s).

To add your AAD B2C tenant application information to Commerce, follow these steps.

1. Sign in as an administrator to Commerce site builder for your environment.
2. In the left navigation pane, select **Tenant Settings** to expand it.
3. Under **Tenant Settings**, select **B2C Settings**.
4. In the main window next **B2C Applications**, select **Manage**. (If your tenant appears in the B2C Applications list, then it was already added by an administrator. Verify that the items in step 6 below match your B2C Application.)
5. Select **Add B2C Application**.
6. Enter the following required items in the form displayed, using values from your B2C tenant and application. Fields that are not required (those without an asterisk) may be left blank.
  - **Application Name:** The name for your B2C Application, for example "Fabrikam B2C".
  - **Tenant Name:** The name of your B2C tenant (for example, use "fabrikam" if the domain appears as

"fabrikam.onmicrosoft.com" for the B2C tenant).

- **Forget Password Policy ID:** The forget password user flow policy ID, for example "B2C\_1\_PasswordReset".
- **Signup Signin Policy ID:** The sign up and sign in user flow policy ID, for example "B2C\_1\_signup\_signin".
- **Client GUID:** The B2C application ID, for example "22290eb2-c52e-42e9-8b35-a2b0a3bcb9e6".
- **Edit Profile Policy ID:** The profile editing user flow policy ID, for example "B2C\_1A\_ProfileEdit".

7. Select **OK**. You should now see the name of your B2C application appear in the list.

8. Select **Save** to save your changes.

### Associate the B2C application to your site and channel

#### WARNING

If your site is already associated with a B2C application, changing to a different B2C application will remove the current references established for users already signed up in this environment. If changed, any credentials associated with the currently-assigned B2C application will not be available to users.

Only update the B2C application if you are setting up the channel's B2C application for the first time or if you intend to have users re-sign up with new credentials to this channel with the new B2C application. Take caution when associating channels to B2C applications, and name applications clearly. If a channel is not associated to a B2C application in the steps below, users signing into that channel for your site will be entered into the B2C application showing as **default** in the **Tenant Settings > B2C Settings** list of B2C applications.

To associate the B2C application to your site and channel, follow these steps.

1. Navigate to your site in Commerce site builder.
2. In the left navigation pane, select **Site Settings** to expand it.
3. Below **Site Settings**, select **Channels**.
4. In the main window under **Channels**, select your channel.
5. In the channel properties pane on the right, select your B2C application name from the **Select B2C Application** drop down menu.
6. Select **Close**, and then select **Save and Publish**.

## Additional B2C information

### Customer migration

If you are considering migrating customer records from a previous identity provider platform, please work with the Dynamics 365 Commerce team to review your customer migration needs.

For additional Azure AD B2C documentation on customer migration, see [Migrate users to Azure Active Directory B2C](#).

### Custom policies

For additional information regarding customizing Azure AD B2C interactions and policy flows beyond what is offered by B2C standard policies, see [Custom policies in Azure Active Directory B2C](#).

### Secondary admin

An optional, secondary administrator account can be added in the **Users** section of your B2C tenant. This can be a direct account or a general account. If you need to share an account across team resources, a common account can also be created. Due to the sensitivity of the data stored in Azure AD B2C, a common account should be monitored closely per your company's security practices.

# Set up custom pages for user sign-ins

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes how to build custom pages in Microsoft Dynamics 365 Commerce that handle customized sign-ins for users of Azure Active Directory (Azure AD) business-to-consumer (B2C) tenants.

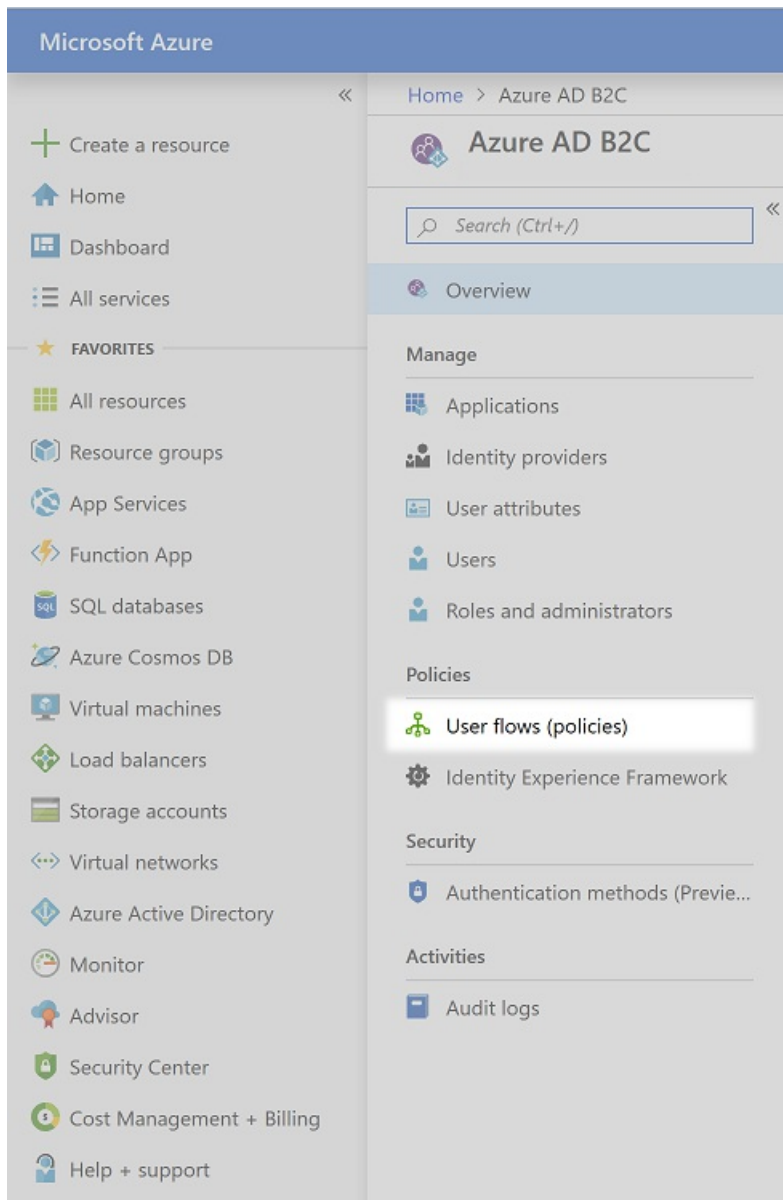

## Overview

To use custom pages that are authored in Dynamics 365 Commerce to handle user sign-in flows, you must set up the Azure AD policies that will be referenced in the Commerce environment. You can configure the "Sign up and sign in," "Profile editing," and "Password reset" Azure AD B2C policies by using the Azure AD B2C application. The Azure AD B2C tenant and policy names can then be referenced during the provisioning process that is done for the Commerce environment by using Microsoft Dynamics Lifecycle Services (LCS).

The custom Commerce pages can be built by using the sign in, sign up, account profile edit, or password reset module. The page URLs that are published for these custom pages should then be referenced in Azure AD B2C policy configurations in the Azure portal.

## Set up B2C policies

After you set up your Azure AD B2C tenant and associate it with your Commerce environment, go to the **Azure AD B2C** page in the Azure portal, and then, on the menu, under **Policies**, select **User flows (policies)**.

You can now configure the "Sign up and sign in," "Profile editing," and "Password reset" user sign-in flows.

### Configure the "Sign up and sign in" policy

To configure the "Sign up and sign in" policy, follow these steps.

1. Select **New user flow**, and then, on the **Recommended** tab, select the **Sign up and sign in** policy.
2. Enter a name for the policy (for example, **B2C\_1\_SignInSignUp**).
3. In the **Identity Providers** section, select the identity providers to use for the policy. At a minimum, **Email signup** must be selected.
4. In the **Collect attribute** column, select the check boxes for **Email Address**, **Given Name**, and **Surname**.
5. In the **Return claim** column, select the check boxes for **Email Addresses**, **Given Name**, **Identity Provider**, **Surname**, and **User's Object ID**.

## Create

### 4. User attributes and claims

User attributes are values collected on sign up. Claims are values about the user returned to the application in the token. You can create custom attributes for use in your directory.

	Collect attribute	Return claim
City ⓘ	<input type="checkbox"/>	<input type="checkbox"/>
Country/Region ⓘ	<input type="checkbox"/>	<input type="checkbox"/>

## NOTE

The policy name will be fully referenced in the Commerce environment. (The **B2C\_1\_** prefix will be included in the reference.) Policies can't be renamed after they are created. If you're replacing an existing policy for your Commerce environment, you can delete the original policy and build a new policy that has the same name. Alternatively, if the environment has already been provisioned, you can submit the new policy name through a service request.

You will return to this policy to finish the setup after you've built the custom pages. For now, close the policy to return to the **User flows (policies)** page in the Azure portal.

### Configure the "Profile editing" policy

To configure the "Profile editing" policy, follow these steps.

1. Select **New user flow**, and then, on the **Recommended** tab, select the **Profile editing** policy.
2. Enter a name for the policy (for example, **B2C\_1\_EditProfile**).
3. In the **Identity Providers** section, select the identity providers to use for the policy. At a minimum, **Local Account SignIn** must be selected.
4. In the **Collect attribute** column, select the check boxes for **Email Addresses** and **Surname**.
5. In the **Return claim** column, select the check boxes for **Email Addresses**, **Given Name**, **Identity Provider**, **Surname**, and **User's Object ID**.
6. Select **OK** to create the policy.
7. Double-click the new policy name, and then, in the navigation pane, select **Properties**.
8. Set the **Enable JavaScript enforcing page layout (preview)** option to **On**.

You will return to this policy to finish the setup after you've built the custom pages. For now, close the policy to return to the **User flows (policies)** page in the Azure portal.

### Configure the "Password reset" policy

To configure the "Password reset" policy, follow these steps.

1. Select **New user flow**, and then, on the **Preview** tab, select the **Password reset v1.1** policy.

Create a user flow

Select a user flow type

A user flow is a series of pages for your users to interact with to sign up or sign into their account. Choose one to start with and you can create multiple user flows to define your entire authentication experience for your app. [Learn more about user flow types.](#)

Recommended Preview All

V2 user flows allow you to use new features that are not available for older versions. [For more information click here.](#)

<b>Sign up and sign in v2</b> Lets a user register for or log into their account	<b>Profile editing v2</b> Lets the user configure their user attributes	<b>Password reset v1.1</b> Allows a user to choose a new password after verifying their email (new page layouts available)
<b>Password reset v2</b> Allows a user to choose a new password after verifying their email	<b>Sign up v2</b> Lets the user register for an account	<b>Sign in v2</b> Lets the user log into their account
<b>Sign in using ROPC</b> Lets users with local accounts sign in directly in native apps (no browser required)		

2. Enter a name for the policy (for example, **B2C\_1\_ForgetPassword**).
3. In the **Identity Providers** section, select **Reset password using email address**.
4. In the **Return claim** column, select the check boxes for **Email Addresses**, **Given Name**, **Surname**, and **User's Object ID**.

## Create

---

### 4. Application claims

User attributes are values collected on sign up. Claims are values about the user returned to the application in the token. You can create custom attributes for use in your directory.

	Return claim
City ⓘ	<input type="checkbox"/>
Country/Region ⓘ	<input type="checkbox"/>
Display Name ⓘ	<input type="checkbox"/>
Email Addresses ⓘ	<input checked="" type="checkbox"/>
Given Name ⓘ	<input checked="" type="checkbox"/>
Job Title ⓘ	<input type="checkbox"/>
Postal Code ⓘ	<input type="checkbox"/>
State/Province ⓘ	<input type="checkbox"/>
Street Address ⓘ	<input type="checkbox"/>
Surname ⓘ	<input checked="" type="checkbox"/>
User's Object ID ⓘ	<input checked="" type="checkbox"/>

Ok

5. Select **OK** to create the policy.
6. Double-click the new policy name, and then, in the navigation pane, select **Properties**.
7. Set the **Enable JavaScript enforcing page layout (preview)** option to **On**.

You will return to this policy to finish the setup after you've built the custom pages. For now, close the policy to return to the **User flows (policies)** page in the Azure portal.

## Build the custom pages

To build the custom pages to handle user sign-ins, follow these steps.

1. In the Commerce authoring tools, go to your site.
2. Build the following five templates and five pages:
  - A **Sign In** template and page that use the sign in module.
  - A **Sign Up** template and page that use the sign up module.
  - A **Password Reset** template and page that use the password reset module.
  - A **Password Reset verification** template and page that use the password reset verification module.

- A **Profile Edit** template and page that use the account profile edit module

When you build the pages, follow these guidelines:

- For each page or module, use the layout and style that best suit your business requirements.
- Publish all pages and URLs that must be used in the Azure AD B2C setup.
- After the pages and URLs are published, collect the URLs that must be used for the Azure AD B2C policy configurations. A `?preloadscripts=true` suffix will be added to every URL when it's used.

#### **IMPORTANT**

Don't reuse universal headers and footers that have relative links. Because these pages will be hosted in the Azure AD B2C domain when they are used, only absolute URLs should be used for all links.

## Configure Azure AD B2C policies with custom page information

In the Azure portal, return to the **Azure AD B2C** page, and then, on the menu, under **Policies**, select **User flows (policies)**.

### **Update the "Sign up and sign in" policy with custom page information**

To update the "Sign up and sign in" policy with custom page information, follow these steps.

1. In the **Sign in and sign up** policy that you configured earlier, in the navigation pane, select **Page layouts**.
2. Select the **Unified sign up or sign in page** layout.
3. Set the **Use custom page content** option to **Yes**.
4. In the **Custom page URI** field, enter the full sign-in URL. Include the `?preloadscripts=true` suffix. For example, enter `www.<my domain>.com/sign-in?preloadscripts=true`.
5. In the **Page Layout Version (Preview)** field, select **1.2.0**.
6. Select the **Local account sign up page** layout.
7. Set the **Use custom page content** option to **Yes**.
8. In the **Custom page URI** field, enter the full sign-up URL. Include the `?preloadscripts=true` suffix. For example, enter `www.<my domain>.com/sign-up?preloadscripts=true`.
9. In the **Page Layout Version (Preview)** field, select **1.2.0**.
10. In the **User attributes** section, follow these steps:
  - a. For the **Email Address**, **Given Name**, and **Surname** attributes, select **No** in the **Requires Verification** field.
  - b. For the **Given Name** and **Surname** attributes, select **No** in the **Optional** field.

Select a page to customize its appearance. You can provide your own html and css to add your own branding and layout. [Learn more about customizing your page.](#)

Surname	No	No	TextBox	Surname

## Update the "Profile editing" policy with custom page information

To update the "Profile editing" policy with custom page information, follow these steps.

1. In the **Profile Editing** policy that you configured earlier, in the navigation pane, select **Page layouts**.
2. Select the **Profile edit page layout**.
3. Set the **Use custom page content** option to **Yes**.
4. In the **Custom page URI** field, enter the full profile edit URL. Include the **?preloadscripts=true** suffix. For example, enter  .
5. In the **Page Layout Version (Preview)** field, select **1.2.0**.
6. In the **User attributes** section, follow these steps:
  - a. For the **Email Address**, **Given Name** attributes, select **No** in the **Requires Verification** field.
  - b. For the **Given Name** and **Surname** attributes, select **No** in the **Optional** field.

## Update the "Password reset" policy with custom page information

To update the "Password reset" policy with custom page information, follow these steps.

1. In the **Password Reset** policy that you configured earlier, in the navigation pane, select **Page layouts**.
2. Select the **New password page layout**.
3. Set the **Use custom page content** option to **Yes**.
4. In the **Custom page URI** field, enter the full password reset URL. Include the **?preloadscripts=true** suffix. For example, enter  .
5. In the **Page Layout Version (Preview)** field, select **1.2.0**.
6. Select the **Account verification page layout**.
7. Set the **Use custom page content** option to **Yes**.
8. In the **Custom page URI** field, enter the full password reset verification URL. Include the **?preloadscripts=true** suffix. For example, enter  .

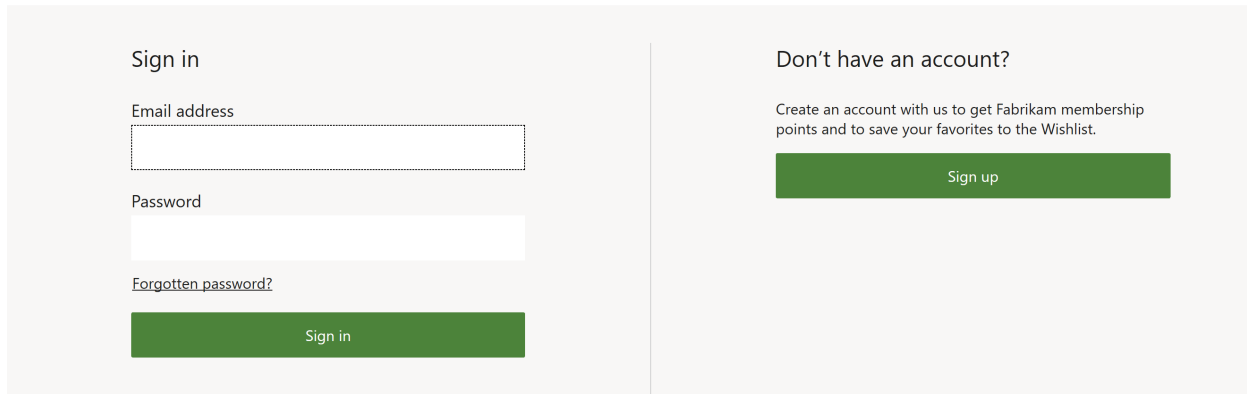

9. In the **Page Layout Version (Preview)** field, select **1.2.0**.

## Customize default text strings for labels and descriptions

In the module library, sign-in modules are prefilled with default text strings for the labels and descriptions. You can customize these strings in the software development kit (SDK) by updating the values in the `global.json` file for the sign in module.

For example, the default text for the forgotten password link is **Forgotten password?**. The following shows this default text on the sign-in page.

### Fabrikam

However, in the `global.json` file for the module library sign-in module, you can edit the text to **Forgot Password?**, as shown in the following illustration.

```
src > resources > modules > {} global.json > {} @msdyn365-commerce-modules.forgotPasswordButtonAriaLabel
1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
"@msdyn365-commerce-modules.passwordDescription": {
  "value": "Must have at least 8 characters and contain at least three of the following: uppercase letters, lowercase letters, numbers, and symbols.",
  "_value.comment": "Must have more than 8 characters with at least 1 number."
},
"@msdyn365-commerce-modules.signUpButtonAriaLabel": {
  "value": "Create an account",
  "_value.comment": "Sign-up button aria label"
},
"@msdyn365-commerce-modules.signUpButtonText": {
  "value": "Create an account",
  "_value.comment": "Sign-up button text"
},
"@msdyn365-commerce-modules.forgotPasswordButtonAriaLabel": {
  "value": "Forgot password?",
  "_value.comment": "Forgot password button aria label."
},
```

After you update the `global.json` file and publish your changes, the new link text appears in the sign-in module in both Commerce and on the live sign-in page.

# Configure multiple B2C tenants in a Commerce environment

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes when and how to set up multiple Microsoft Azure Active Directory (Azure AD) business-to-consumer (B2C) tenants per channel for user authentication in a dedicated Dynamics 365 Commerce environment.

## Overview

Dynamics 365 Commerce uses the Azure AD B2C cloud identity service to support user credentials and authentication flows. Users can use the authentication flows to sign up, sign in, and reset their password. Azure AD B2C stores a user's sensitive authentication information, such as his or her user name and password. The user record is unique to each B2C tenant, and it uses either user name (email address) credentials or social identity provider credentials.

In most cases, a single Azure AD B2C tenant is used in a Commerce environment. Commerce customers can then create and publish multiple sites in the same Commerce environment, and the same customer credentials will be used across these sites. However, if the sites in the environment should be treated as different brands and appear to users as separate businesses, a B2C tenant can be configured for the channel that is used for the site/brand separation.

## Considerations when multiple B2C tenants are set up per channel

Often, when each channel or site is being treated as a separate business, the best option with respect to user authentication flows in Commerce is to use separate legal entities. However, if you want to keep each channel/site in the same environment and legal entity, but want to have separate user authentication for each site, it's important that you consider the following points before you proceed:

- Users will have their own distinct credentials for each channel/site.

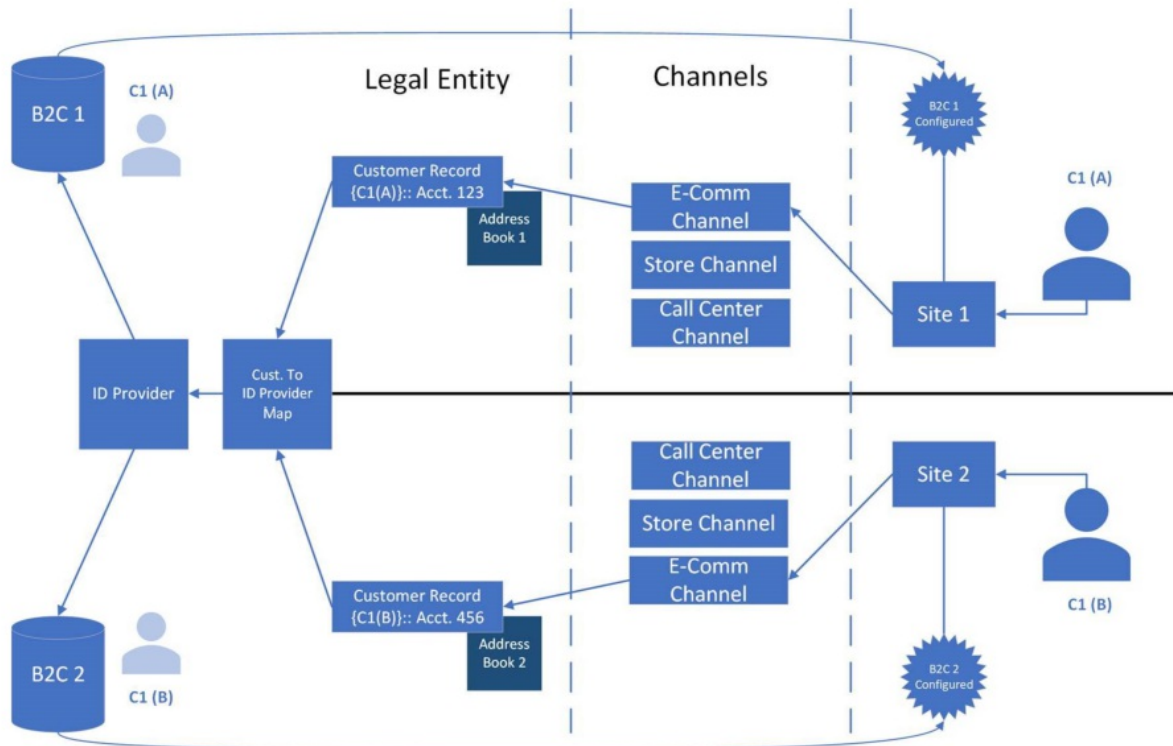

The same person can have two separate accounts per channel/site, because each account will be a unique entry into a separate B2C tenant.

- In the Microsoft Dynamics environment, separate customer records will be returned for global record searches.

If a user uses the same email address across channels/sites, global customer searches will return results for each channel/site. (A channel indicator will be shown.)

- The address book can be used to help group users, so that they can be tracked per channel.
- The number of customer records per channel might increase, and this increase might affect the performance of global customer searches.
- B2C tenants must be carefully mapped to a channel, to help prevent situations where customers sign up for an incorrect tenant. Otherwise, confusion or tracking issues can occur.

The following illustration shows multiple B2C tenants in a Commerce environment.

If you decide that your business requires distinct B2C tenants per channel in the same Commerce environment, complete the procedures in the following sections to request this feature.

## Request that B2C per channel be enabled in your environment

Currently, if you want distinct B2C tenants per channel to be available in the same Commerce environment, you must submit a request to Dynamics 365 Commerce. For more information, see [Get support for Lifecycle Services \(LCS\)](#), or discuss this issue with your Commerce solutions contact.

## Configure B2C tenants in your environment

To configure B2C tenants in your environment, complete the relevant procedures in this section.

### Add an Azure AD B2C tenant

To add an Azure AD B2C tenant to your environment, follow these steps.

1. Sign in to Commerce site builder for your environment as a system admin. To configure Azure AD B2C tenants, you must be a system admin for the Commerce environment.
2. In the left navigation pane, select **Tenant Settings** to expand it.
3. Select **B2C Settings**, and then select **Manage**.
4. Select **Add B2C Application**, and then enter the following information:
  - **Application Name:** Enter the name that should be used for the application in the context of managing it in Commerce. We recommend that you use the application name that you chose when you set up the Azure AD B2C application in the Azure portal. In this way, you can help reduce confusion when you manage B2C tenants in Commerce.
  - **Tenant Name:** Enter the B2C tenant name as it appears in the Azure portal.
  - **Forget Password Policy ID:** Enter the policy ID (the name of the policy in the Azure portal).
  - **Signup Signin Policy ID:** Enter the policy ID (the name of the policy in the Azure portal).
  - **Client GUID:** Enter the Azure AD B2C tenant ID as it appears in the Azure portal (not the application

ID for the B2C tenant).

- **Edit Profile Policy ID:** Enter the policy ID (the name of the policy in the Azure portal).

5. When you've finished entering this information, select **OK** to save your changes.

#### NOTE

You should leave fields such as **Scope**, **Non Interactive Policy ID**, **Non Interactive Client ID**, **Login Custom Domain**, and **Sign Up Policy ID** blank unless the Dynamics 365 Commerce team instructs you to set them. Your new Azure AD B2C tenant should now appear in the list under **Manage B2C Applications**.

### Manage or delete an Azure AD B2C tenant

1. Sign in to Commerce site builder for your environment as a system admin. To configure Azure AD B2C tenants, you must be a system admin for the Commerce environment.
2. In the left navigation pane, select **Tenant Settings** to expand it.
3. Select **B2C Settings**, and then select **Manage**.
4. To edit a B2C tenant, select the pencil symbol next to it. To delete a B2C tenant, select the trash can symbol next to it.
5. Select **Save**, and then select **Publish** to activate your changes.

#### WARNING

When a B2C tenant is configured for a live/published site, users might have signed up by using accounts that are present on the tenant. If you delete a configured tenant on the **Tenant Settings > B2C Tenant** menu, you remove the association of that B2C tenant from sites that are associated with any channels of the tenant. In this case, your users might no longer be able to sign in to their accounts. Therefore, use extreme caution when you delete a configured tenant.

When a configured tenant is deleted, the B2C tenant and records will continue to be maintained, but the Commerce system configuration of that tenant will be changed or removed. Users who try to sign up or sign in to the site will create a new account record in the default or newly associated B2C tenant that is configured for the channel of the site.

## Configure your channel with a B2C tenant

1. Sign in to Commerce site builder for your environment as a system admin. To configure Azure AD B2C tenants, you must be a system admin for the Commerce environment.
2. In the left navigation pane, select **Site Settings** to expand it.
3. Select **Channels**, and then select the channel to configure.
4. In the properties pane on the right, in the **Select B2C Application** field, select the configured Azure AD B2C tenant to use for this channel.
5. On the command bar, select **Save and Publish** to commit the new or updated configuration.

#### WARNING

If you change the B2C application that is assigned to the channel, you remove the current references that have been established for any users who have already signed up in the environment. In this case, any credentials that are associated with the currently assigned B2C application won't be available to users. Therefore, change a channel Azure AD B2C configuration only if you're setting up the channel for the first time, and no users have been able to sign up. Otherwise, users might have to sign up again to establish a record in the new Azure AD B2C tenant.

# Domains in Dynamics 365 Commerce

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes how domains are handled in Microsoft Dynamics 365 Commerce.

Domains are web addresses used to navigate to Dynamics 365 Commerce sites in a web browser. You control management of your domain with a chosen Domain Name Server (DNS) provider. Domains are referenced throughout Dynamics 365 Commerce site builder to coordinate how a site will be accessed when published. This topic reviews how domains are handled and referenced throughout the lifecycle of the Commerce site development and launch.

## Provisioning and supported host names

When provisioning an e-commerce environment in [Microsoft Dynamics Lifecycle Services \(LCS\)](#), the **Supported host names** box on the e-commerce provisioning screen is used to enter domains that will be associated with the deployed Commerce environment. These domains will be the customer-facing Domain Name Server (DNS) names where e-commerce websites will be hosted. Entering a domain at this stage does not start diverting traffic for the domain to Dynamics 365 Commerce. Traffic for a domain will only be routed to the Commerce endpoint when the DNS CNAME record is updated to use the Commerce endpoint with the domain.

### NOTE

Multiple domains can be entered into the **Supported host names** box by separating them with semi-colons.

The following illustration shows the LCS e-commerce provisioning screen with the **Supported host names** box highlighted.

## Other Settings

Azure active directory  
Microsoft

Supported host names (separated by ';')

Ex - www.contoso.com;www.contosousa.com \*

AAD security group for system admin

(Search for the group using first few letters of its name then press enter/icon to search.)

Filter

Enable ratings and review service

Yes

AAD security group for ratings and review moderator

(Search for the group using first few letters of its name then press enter/icon to search.)

Filter

Initialize

Cancel

You can create a service request to add additional domains to an environment if provisioning has already occurred. To create a service request in LCS, within your environment go to **Support > Support issues** and select **Submit an incident**.

## Commerce-generated URLs

When provisioning a Dynamics 365 Commerce e-commerce environment, Commerce will generate a URL that will be the working address for the environment. This URL is referenced in the e-commerce site link shown in LCS after the environment is provisioned. A Commerce-generated URL is in the format

`https://<e-commerce tenant name>.commerce.dynamics.com`, where the e-commerce tenant name is the name entered in LCS for the Commerce environment.

You can use production site host names in a sandbox environment as well. This option is ideal when you will be copying a site from a sandbox environment to production.

# Site setup

After your e-commerce environment is provisioned, you must set up your site in Commerce site builder to associate your site to the working URL.

When you first set up a site in site builder, the **Setup your Site** dialog box will appear.

The following illustration shows the **Setup your Site** dialog box for a site named "default" when you access the site for the first time in site builder.

**Setup your Site - default** ✕

Select a domain

Select a default channel

Select a default language

**Path**

/

OK Cancel

The **Select a domain** box allows you to associate one of the supported host names provided for your site in LCS to your site in site builder.

The **Path** box can be left blank, or an additional path string can be added that will be reflected in your working URL. Leaving the **Path** box blank associates the base Commerce-generated URL with the site being set up in site builder. Paths must be unique for each site/domain pair. Within the site and domain selected, only one site in the environment can use the blank path or be associated with a unique path string. Any string added to the **Path** field during site setup will become a subpath of the base Commerce-generated URL used to access the site in a web browser.

**NOTE**

The path is also known as the **Match path** when adding a channel in the **Site Settings > Channels** configuration section of site builder.

For example, if you have a site in site builder called "fabrikam" in an e-commerce tenant named "xyz," and if you set up the site with a blank path, then you would access the published site content in a web browser by going

directly to the base Commerce-generated URL:

```
https://xyz.commerce.dynamics.com
```

Alternately, if you had added a path of "fabrikam" during this same site's setup, you would access the published site content in a web browser using the following URL:

```
https://xyz.commerce.dynamics.com/fabrikam
```

## Pages and URLs

After your site is set up with a path, all URLs associated with pages in site builder will build on the working URL (the Commerce-generated URL, or the Commerce-generated URL plus the path) for the site. Creating a new URL in site builder (**URLS /> +New**) by selecting a page from the list in the **New URL** dialog box and entering the URL path for that page will associate that URL with the selected page. The URL path value then appends to the site's working URL to access the page, and is labeled as `./<URL path>` in the URL list of the **URLs** page in site builder.

The following illustration shows the **New URL** dialog box in site builder with an example URL path highlighted.

### New URL

Select a page

<input checked="" type="checkbox"/> Name ↓	Description
<input checked="" type="checkbox"/> example	

URL path

The following illustration shows the **URLs** page in site builder with an example URL highlighted in the list.

# URLs

 35 results

Name	Type
<code>./example</code>	URL
<code>./password-reset</code>	URL
<code>./orderconfirmation</code>	URL

## Domains in site builder

The supported host names values are available to be associated as a domain when setting up a site. When selecting a supported host name value as the domain, you will see the chosen domain referenced throughout site builder. This domain is only a reference within the Commerce environment, live traffic for that domain will not yet be forwarded to Dynamics 365 Commerce.

When working with sites in site builder, if you have two sites set up with two different domains, you can append the `?domain=` attribute to your working URL to access the published site content in a browser.

For example, environment "xyz" has been provisioned, and two sites have been created and associated in site builder: one with the domain `www.fabrikam.com` and the other with the domain `www.constoso.com`. Each site was set up using a blank path. These two sites could then be accessed in a web browser as follows using the `?domain=` attribute:

- `https://xyz.commerce.dynamics.com?domain=www.fabrikam.com`
- `https://xyz.commerce.dynamics.com?domain=www.constoso.com`

When a domain query string is not given in an environment with multiple domains provided, Commerce uses the first domain you provided. For example, if the path "fabrikam" was provided first during site setup, the URL `https://xyz.commerce.dynamics.com` could be used to access the published site content site for `www.fabrikam.com`.

## Traffic forwarding in production

You can simulate multiple domains using domain query string parameters on the `commerce.dynamics.com` endpoint itself. But when you need to go live in production, you must forward the traffic for your custom domain to the `<e-commerce tenant name>.commerce.dynamics.com` endpoint.

The `<e-commerce tenant name>.commerce.dynamics.com` endpoint does not support custom domain Secure Sockets Layers (SSLs), so you must set up custom domains using a front door service or content delivery network (CDN).

To set up custom domains using a front door service or CDN, you have two options:

- Set up a front door service like Azure Front Door to handle front-end traffic and connect to your Commerce environment. This provides greater control over domain and certificate management and more granular security policies.
- Use the Commerce-supplied Azure Front Door instance. This requires coordinating action with the Dynamics

365 Commerce team for domain verification and obtaining SSL certificates for your production domain.

For information about how to set up a CDN service directly, see [Add support for a content delivery network \(CDN\)](#).

To use the Commerce-supplied Azure Front Door instance, you must create a service request for CDN setup assistance from the Commerce onboarding team.

- You will need to provide your company name, the production domain, environment ID, and production e-commerce tenant name.
- You will need to confirm if this is an existing domain (used for a currently active site) or a new domain.
- For a new domain, the domain verification and SSL certificate can be achieved in a single step.
- For a domain serving an existing website, there is a multistep process required to establish the domain verification and SSL certificate. This process has a 7-working-day service level agreement (SLA) for a domain to go live, because it includes multiple sequential steps.

To create a service request in LCS, within your environment go to **Support > Support issues** and select **Submit an incident**.

#### NOTE

Custom domains with SSL are only supported on production environments. For non-production environments such as sandbox and user acceptance testing (UAT), use the Commerce-generated URL to access published content in a web browser.

## SSL certificate process

When a service request is filed, the Commerce team will coordinate the following steps with you.

For new domains:

- The Commerce team will set up the Azure Front Door instance (Commerce-hosted).
- The Commerce team will then provide the CNAME record to point your custom domain.
- After the CNAME record is updated, the Commerce-hosted Azure Front Door instance will be able to verify the domain ownership and get the SSL certificate.

For existing/active domains:

- The Commerce team will instruct you to add an `afdverify.<custom-domain>` CNAME record to provide to your domain DNS provider.
- When complete, the Commerce team will add the domain to the Azure Front Door instance and provide additional DNS TXT records to be added to the DNS for the domain.
- After the TXT records are completed, the Commerce team will complete the Azure Front Door updates for the domain that will set up the SSL certificate.

## Apex domains

The Commerce-supplied Azure Front Door instance does not support apex domains (root domains that do not contain subdomains). Apex domains require an IP address to resolve, and the Commerce Azure Front Door instance exists with virtual endpoints only. To use an apex domain, you have two options:

- **Option 1** - Use your DNS provider to redirect the apex domain to a "www" domain. For example, `fabrikam.com` redirects to `www.fabrikam.com` where `www.fabrikam.com` is the CNAME record that points to the Commerce-hosted Azure Front Door instance.

- **Option 2** - Set up a CDN/front door instance on your own to host the apex domain.

**NOTE**

If you are using Azure Front Door, you must also set up an Azure DNS in the same subscription. The apex domain hosted on Azure DNS can point to your Azure Front Door as an alias record. This is the only work around, as apex domains must always point to an IP address.

# Add support for a content delivery network (CDN)

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to add a content delivery network (CDN) to your Microsoft Dynamics 365 Commerce environment.

## Overview

When you set up an e-commerce environment in Dynamics 365 Commerce, you can configure it to work with your CDN service.

Your custom domain can be enabled during the provisioning process for your e-commerce environment. Alternatively, you can use a service request to set it up after the provisioning process is completed. The provisioning process for the e-commerce environment generates a host name that is associated with the environment. This host name has the following format, where *<e-commerce-tenant-name>* is the name of your environment:

*<e-commerce-tenant-name>.commerce.dynamics.com*

The host name or endpoint that is generated during the provisioning process supports a Secure Sockets Layer (SSL) certificate only for \*.commerce.dynamics.com. It doesn't support SSL for custom domains. Therefore, you must terminate SSL for custom domains in your CDN and forward traffic from the CDN to the host name or endpoint that Commerce generated.

Additionally, the *statics* (JavaScript or Cascading Style Sheets [CSS] files) from Commerce are served from the endpoint that Commerce generated (\*.commerce.dynamics.com). The statics can be cached only if the host name or endpoint that Commerce generated is put behind the CDN.

## Set up SSL

To help guarantee that SSL is set up, and that statics are cached, you must configure your CDN so that it is associated with the host name that Commerce generated for your environment. You must also cache the following pattern for statics only:

```
/_msdyn365/_scnr/*
```

After you provision your Commerce environment with the custom domain that is provided, or after you provide the custom domain for your environment by using a service request, point your custom domain to the host name or endpoint that Commerce generated.

As was previously mentioned, the generated host name or endpoint supports an SSL certificate only for \*.commerce.dynamics.com. It doesn't support SSL for custom domains.

## CDN services

Any CDN service can be used with a Commerce environment. Here are two examples:

- **Microsoft Azure Front Door Service** – The Azure CDN solution. For more information about Azure Front Door Service, see [Azure Front Door Service Documentation](#).
- **Akamai Dynamic Site Accelerator** – For more information, see [Dynamic Site Accelerator](#).

## CDN setup

The CDN setup process consists of these general steps:

1. Add a front-end host.
2. Configure a backend pool.
3. Set up rules for routing and caching.

### **Add a front-end host**

Any CDN service can be used, but for the example in this topic, Azure Front Door Service is used.

For information about how to set up Azure Front Door Service, see [Quickstart: Create a Front Door for a highly available global web application](#).

### **Configure a backend pool in Azure Front Door Service**

To configure a backend pool in Azure Front Door Service, follow these steps.

1. Add `<ecom-tenant-name>.commerce.dynamics.com` to a backend pool as a custom host that has an empty backend host header.
2. Under **Load balancing**, leave the default values.

The following illustration shows the **Add a backend** dialog box in Azure Front Door Service with the backend host name entered.

# Add a backend

[← Go back to backend pool](#)

Backends are your application servers where Front Door will route your client requests to. You can assign weights to your backends to define proportion of traffic to be sent and set priority for the backends to define active/stand-by kind of architectures. [Learn more](#)

Backend host type \*

Backend host name \* ⓘ

Backend host header ⓘ

HTTP port \* ⓘ

HTTPS port \* ⓘ

Priority \* ⓘ

Weight \* ⓘ

Status

 Disabled  Enabled

The following illustration shows the **Add a backend pool** dialog box in Azure Front Door Service with the default load balancing values.

# Add a backend pool

A backend pool is a set of equivalent backends to which Front Door load balances your client requests. [Learn more](#)

Name \*

## BACKENDS

Backend host name	Status	Priority	Weight
ecomtenant.commerce.dynamics.com	Enabled	1	50

+ [Add a backend](#)

## HEALTH PROBES

Front Door sends periodic HTTP/HTTPS probe requests to each of your configured backends to determine the proximity and health of each backend to load balance your end user requests. [Learn more](#)

Status

Disabled  Enabled

## LOAD BALANCING

Configure the load balancing settings to define what sample set we need to use to call the backend as healthy or unhealthy. The latency sensitivity with value zero (0) means always send it to the fastest available backend, else Front Door will round robin traffic between the fastest and the next fastest backends within the configured latency sensitivity. [Learn more](#)

Sample size \* ⓘ

Successful samples required \* ⓘ

Latency sensitivity (in milliseconds) \* ⓘ

## Set up rules in Azure Front Door Service

To set up a routing rule in Azure Front Door Service, follow these steps.

1. Add a routing rule.
2. In the **Name** field, enter **default**.
3. In the **Accepted protocol** field, select **HTTP and HTTPS**.

4. In the **Frontend hosts** field, enter **dynamics-ecom-tenant-name.azurefd.net**.
5. Under **Patterns to match**, in the upper field, enter **/\***.
6. Under **Route Details**, set the **Route type** option to **Forward**.
7. In the **Backend pool** field, select **ecom-backend**.
8. In the **Forwarding protocol** field group, select the **Match request** option.
9. Set the **URL rewrite** option to **Disabled**.
10. Set the **Caching** option to **Disabled**.

To set up a caching rule in Azure Front Door Service, follow these steps.

1. Add a caching rule.
2. In the **Name** field, enter **statics**.
3. In the **Accepted protocol** field, select **HTTP and HTTPS**.
4. In the **Frontend hosts** field, enter **dynamics-ecom-tenant-name.azurefd.net**.
5. Under **Patterns to match**, in the upper field, **/\_msdyn365/\_scnr/\***.
6. Under **Route Details**, set the **Route type** option to **Forward**.
7. In the **Backend pool** field, select **ecom-backend**.
8. In the **Forwarding protocol** field group, select the **Match request** option.
9. Set the **URL rewrite** option to **Disabled**.
10. Set the **Caching** option to **Disabled**.
11. In the **Query string caching behavior** field, select **Cache every unique URL**.
12. In the **Dynamic compression** field group, select the **Enabled** option.

The following illustration shows the **Add a rule** dialog box in Azure Front Door Service.

## Add a rule

A routing rule maps your frontend host and a matching URL path pattern to a specific backend pool. [Learn more](#)

\* Name  ✓

Accepted protocol  ▼

Frontend hosts  ▼

### PATTERNS TO MATCH

Set this to all the URL path patterns that this route will accept. For example, you can set this to `/users/*` to accept all requests on the URL `www.contoso.com/users/*`. [Learn more](#)

✓

### ROUTE DETAILS

Once a route for a Front Door is matched, the configuration below defines the behavior of the route - forward and serve from the cache, or redirect. [Learn more](#)

Route type  Forward  Redirect

\* Backend pool  ▼

Forwarding protocol  HTTPS only  
 HTTP only  
 Match request

URL rewrite

Caching

\* Query string caching behavior  ▼

\* Dynamic compression  Enabled  Disabled

### WARNING

If the domain that you will use is already active and live, create a support ticket from the **Support** tile in [Microsoft Dynamics Lifecycle Services](#) to get assistance for your next steps. For more information, see [Get support for Finance and Operations apps or Lifecycle Services \(LCS\)](#).

If your domain is new and is not a pre-existing live domain, you can add your custom domain to the configuration for Azure Front Door Service. This will enable web traffic to direct to your site via the Azure Front Door instance. To add the custom domain (for example, `www.fabrikam.com`), you must configure a Canonical Name (CNAME) for the domain.

The following illustration shows the **CNAME configuration** dialog box in Azure Front Door Service.

## CNAME configuration

A CNAME record is used to specify that a domain name is an alias for another domain. In your scenario, that would be mapping 'www.fabrikam.com' to 'dynamics-ecom-tenant-name.azurefd.net'. Create a CNAME record with your DNS provider using the configuration below.

Source	www.fabrikam.com
Type	CNAME
Destination	dynamics-ecom-tenant-name.azurefd.net

You can use Azure Front Door Service to manage the certificate, or you can use your own certificate for the custom domain.

The following illustration shows the **Custom Domain HTTPS** dialog box in Azure Front Door Service.

### CUSTOM DOMAIN HTTPS

Enable HTTPS protocol for a custom domain that's associated with Front Door to ensure sensitive data is delivered securely via TLS/SSL encryption when sent across internet. [Learn more](#)

Status

Enabled  Disabled

Certificate management type

Front Door managed  Use my own certificate

For detailed instructions on adding a custom domain to your Azure Front Door, see [Add a custom domain to your Front Door](#).

Your CDN should now be correctly configured so that it can be used with your Commerce site.

# Enable location-based store detection

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to turn on location-based store detection for your Dynamics 365 Commerce site.

## Overview

Location-based store detection in Commerce lets you provide relevant site content to customers, based on their location. When location-based store detection is turned on, the Commerce rendering service uses the country/region information from the IP address of the customer's web browser to direct the customer to the best geographical site configuration that is available.

## Privacy notice

If you turn on the location-based store detection feature, information from the customer's browser is sent to a Microsoft location service. This information is then used to provide the customer content that is relevant to his or her location. Both the information that is sent from the customer's browser and the location-based information that is returned to the customer are subject to privacy and cookie compliance policies.

## Turn on location-based store detection

To turn on location-based store detection in Commerce, follow these steps.

1. In the authoring tool, go to your site.
2. In the navigation pane on the left, select **Site Management**.
3. Select **Site Settings**.
4. Set the **Enable location based store detection** option to **On**.

# E-commerce digital gift cards

2/18/2021 • 4 minutes to read • [Edit Online](#)

## IMPORTANT

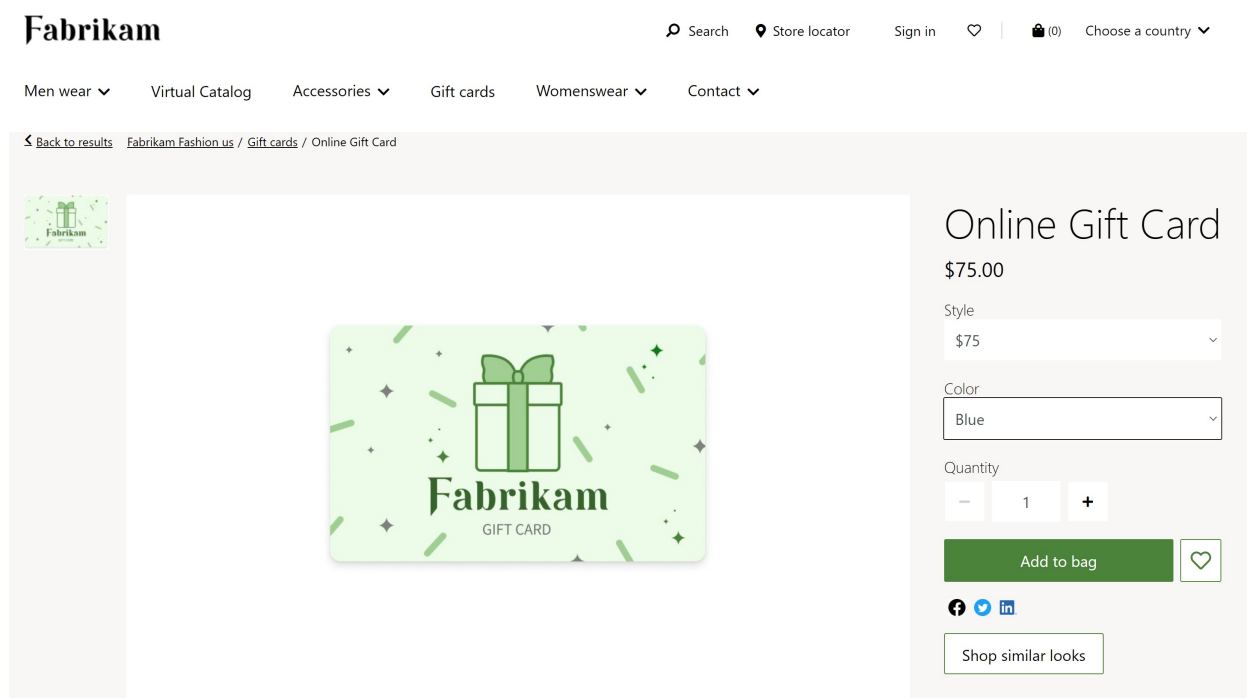

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic describes how digital gift cards work in the e-commerce implementation of Microsoft Dynamics 365 Commerce. It also provides an overview of important configuration steps.

In Dynamics 365 Commerce, the purchase of digital gift cards follows the same flow as the purchase of other products in the system. No additional modules have to be configured. If multiple gift cards are added to the cart, the gift card items aren't aggregated on a single sales line. This behavior is required because each sales line is invoiced by using a separate gift card number.

The purchase of digital gift cards is supported in the Dynamics 365 Commerce 10.0.16 release and later.

The following illustration shows an example of the product details page (PDP) for a digital gift card on the Fabrikam e-commerce site.

## Turn on the digital gift card feature in Commerce headquarters

For the purchase flow for digital gift cards to work in Dynamics 365 Commerce, the **Purchasing gift card on e-Commerce feature** must be turned on in Commerce headquarters. You can find the feature in the **Feature management** workspace in Commerce headquarters, as shown in the following illustration.

**Feature management**  
Do not enable new features automatically

New: 1 | Not enabled: 444 | Scheduled: 0

Buttons: Enable all | Check for updates

Feature name	Enable date	Feature added	Preview feature	Module
Purchasing gift card on e-Commerce feature	10/8/2020	9/15/2020		Retail and commerce
Purchasing cXML enhancements		11/11/2019		Procurement and sourcing
Purchasing card processing		10/11/2019		Accounts payable

**Purchasing gift card on e-Commerce f...** ✓

Feature added 9/15/2020  
Retail and commerce  
[Learn more](#)

This feature was enabled on 10/8/2020

**Description**  
When this feature is enabled it allows gift cards to be purchased on e-commerce. It ensures a gift card product can be uniquely identified and the necessary workflows for gift card purchase can be triggered on e-commerce.

**Comments**

## Configure a digital gift card in Commerce headquarters

Digital gift card products should be configured in Commerce headquarters. The process resembles the process for other products. However, the following important steps are specific to the configuration of gift cards for purchase. For more information about how to create and configure products, see [Create a new product in Commerce](#).

- When you configure digital gift card products in the **New product** dialog box, set the **Product type** field to **Service**. (To open the dialog box, go to **Retail and commerce > Products and categories > Products by category**, and select **New**.) Products of the **Service** type aren't checked for available inventory before an order is placed. For more information, see [Create a new product](#).
- On the **Commerce parameters** page, on the **Posting** tab, the **Gift card product** field must be set to **Digital Gift Card**, as shown in the following illustration. If the product is an external gift card, see [Support for external gift cards](#) for more information.

Finance and Operations Preview | commerce parameter | USRT

Save | Options

### Commerce parameters

- General
- Posting**
- Accounting export

- If a gift card must support multiple predefined amounts (for example, \$25, \$50, and \$100), the **Size** dimension should be used to set up those predefined amounts. Each predefined amount will be a variant. For more information, see [Product dimensions](#).
- If customers must be able to specify a custom amount for a gift card, first set up a variant that allows for a custom amount. Next, open the product from the **Released products in category** page, and then, on

the Commerce FastTab, set the **Key in price** field to **Must key in new price**, as shown in the following illustration. This setting ensures that customers can enter a price when they browse the product on a PDP.

- The mode of delivery for a digital gift card must be set to **Electronic**. On the **Modes of delivery** page (**Retail and commerce > Channel setup > Modes of delivery**), select the **Electronic** mode of delivery in the list pane, and then add the digital gift card product to the grid on the **Products** FastTab, as shown in the following illustration. For more information, see [Set up modes of delivery](#).

- Make sure that an online functionality profile has been created and associated with your online store in Commerce headquarters. In the functionality profile, set the **Aggregate products** option to **Yes**. This setting ensures that all items except gift cards are aggregated. For more information, see [Create an online functionality profile](#).

- To ensure that customers receive an email after a gift card is invoiced, create a new email notification type on the [Email notification profiles](#) page, and set the **Email notification type** field to **Issue gift card**. For more information, see [Set up an email notification profile](#).

## Add product images to the Commerce site builder Media library

You must add product images for digital gift card products to the Commerce site builder Media library. Make sure that the file names of the gift card image files follow your site's naming conventions for product images. For more information, see [Upload images](#).

## Configure a custom amount for a digital gift card in Commerce site builder

If a digital gift card is configured to allow for a custom amount, this behavior must also be enabled in the [buy box module](#) that is used on your site's PDPs. The buy box module supports module configuration to allow for custom amounts. You can also define the minimum and maximum amounts that are allowed for custom amounts.

To configure a custom amount for a digital gift card in Commerce site builder, follow these steps.

1. Go to the buy box module that is used on your site's PDPs. This buy box module might be implemented in a fragment, in a template, or on a page.
2. Select **Edit**.
3. In the properties pane on the right, select the **Allow custom price** check box.
4. Optional: To define minimum and maximum amounts for custom amounts, enter amounts under **Minimum price** and **Maximum price**.
5. Select **Finish editing**, and then select **Publish**.

# Home page overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of the home page in Microsoft Dynamics 365 Commerce.

## Overview

The home page is the default page that shoppers go to when they visit an e-Commerce site. Typically, this page showcases products and promotions by using a combination of marketing modules. The home page should be rich with images and text to keep shoppers engaged.

The following illustration shows an example of a home page that was built by using the module library and the "Fabrikam" theme.

[Shop Women](#)

[Shop Men](#)

[Shop Accessories](#)

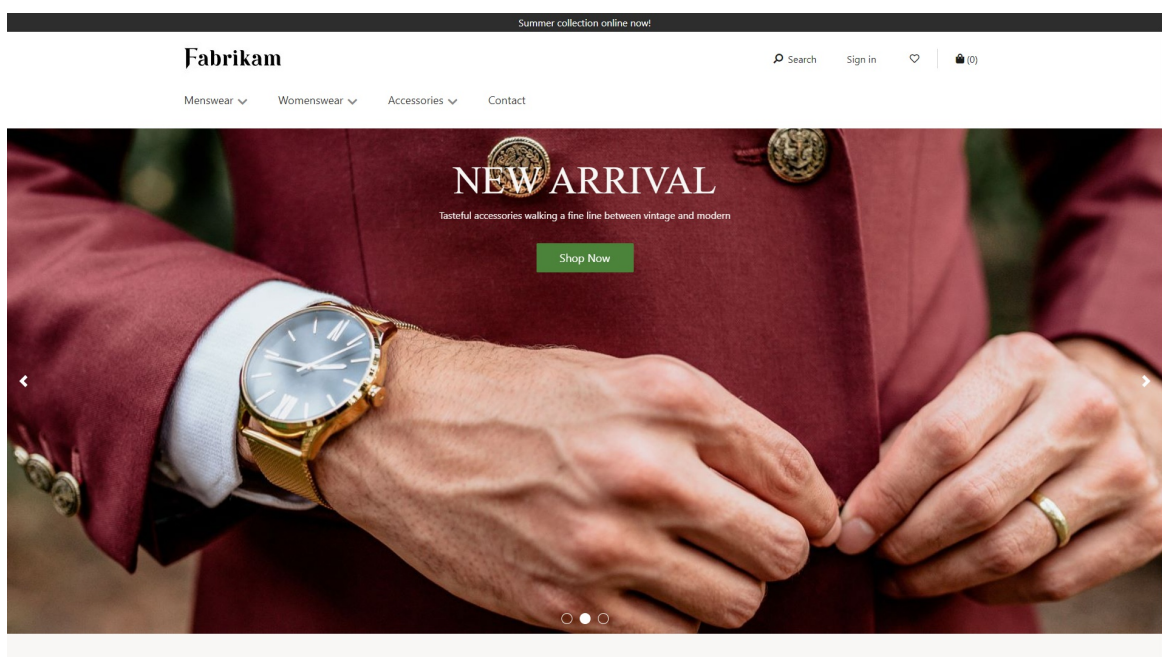

The top of the home page has a header that shows all the product categories and other pages that the retailer wants customers to browse. The bottom of the home page has a footer that contains quick links to various topics that might interest customers.

The main section of the home page can highlight products, categories, or promotions by using various Dynamics 365 Commerce modules:

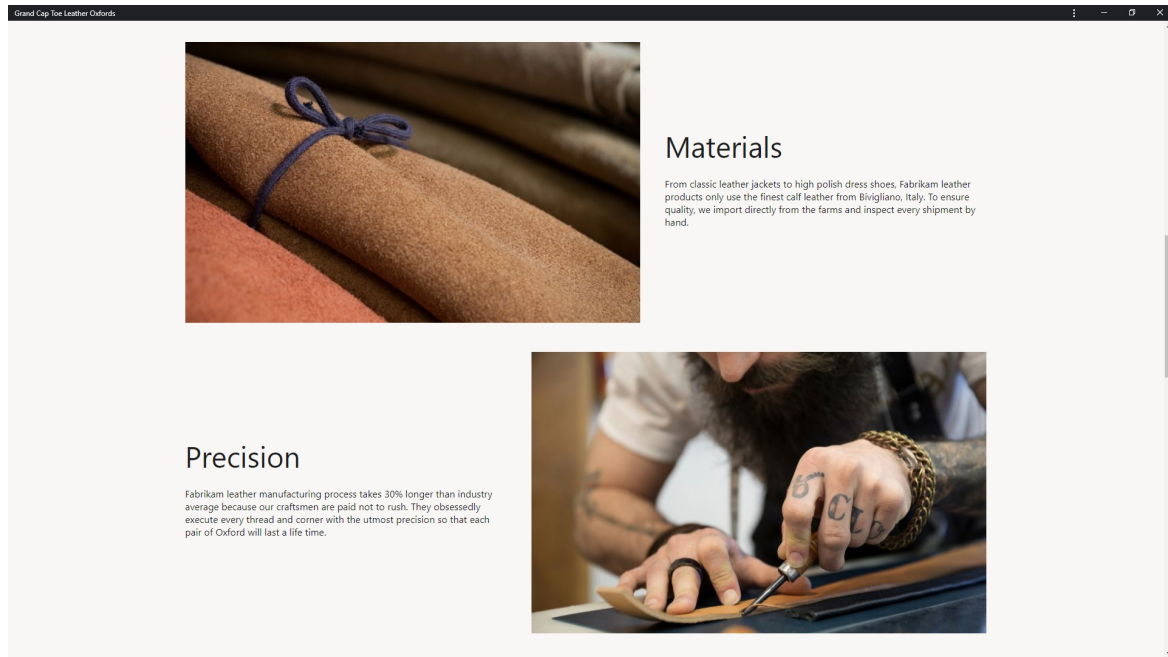

- **Hero** – Typically, the first item at the top of the main section shows one or more "hero" images that highlight new products and promotions in the store. If there are multiple hero images, they are hosted in a carousel module so that users can browse them.

The following illustration shows an example of a home page where the first item in the main section is a hero layout of a content block module that is named "New Arrival."

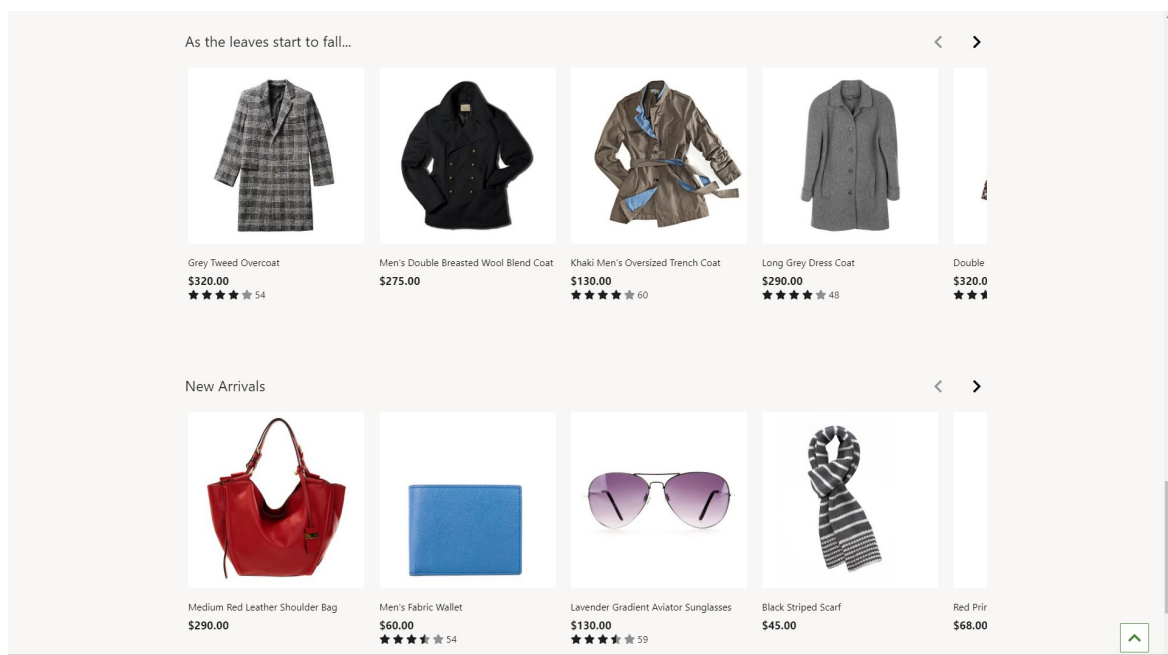

- **Feature** – A feature layout of a content block module is used to market products or promotions by using a combination of images and text. Features layouts can be used independently, or they can be hosted in a carousel module.

The following illustration shows an example of feature layout of a content block module on a home page.

- **Tile** – A tile layout of a content block module is used to showcase multiple products or category of products by using a combination of images and text in a multicolumn layout. In the illustration of a home page that appears earlier in this topic, a tile layout is used for the three-column rendering of the **Shop Women**, **Shop Men**, and **Shop Accessories** items.
- **Video player** – A video player module can be used to showcase video content on the home page. The illustration of a home page that appears earlier in this topic includes a video player module.
- **Text block** – A content rich block module can be used to present text content on the home page in a single-column or multicolumn layout.
- **Product recommendations** – Product recommendations modules are used to show lists, such as **New**, **Trending**, and **Best Selling** on the home page. These lists showcase products based on shopping trends, and they can be algorithmically generated or manually curated. They help customers quickly discover top products and then continue to shop.

The following illustration shows an example of product recommendations modules on a home page.

**NOTE**

All the modules that are listed here can be used on any site page. However, their placement on the home page is important because that page is where customers first interact with your site.

## Header and footer modules

The top of a PDP has a header that shows all the product categories and other pages that the retailer wants customers to browse. The bottom of the page has a footer that contains quick links to various topics that might interest customers.

## Buy box module

The most important module on a PDP is the buy box module, which appears as the first item in the main section of the page. A buy box module shows important product information, such as the product name, the product description, the product price, product images, and product ratings.

The buy box module lets the customer select product options (for example, a size, style, and color) and add the product to the cart. It also lets the customer buy the product online and pick it up in a store. The buy online and pick up in store module uses integration with Bing Maps application programming interfaces (APIs) to find nearby stores or stores in another location that the customer specifies.

A buy box module requires a product ID. This ID is derived from the page context. If a buy box module is added to a page where the page context doesn't include a product ID, it won't render the information correctly.

## Product specifications module

The product specifications module can be used to showcase additional details about the product. These details are taken from product attributes in Commerce. The product specifications module shows every attribute where the **visible** property is set to **true**. It requires a product ID to retrieve the product attributes.

## Recommendations module

The recommendations module is an important module on a PDP. While customers browse for products, more product options should be presented to them, so that they can find the correct product and make a purchase. Recommendations help customers easily discover related content and continue to shop.

Different types of recommendation lists are available:

- The **People also like** list is based on machine learning. It uses the transaction history of other customers to

provide recommendations. This list is generated by the recommendations service and resembles "Customers who bought this also bought..." lists. A product ID is required to generate this list.

- A **Related** list can be configured for a product in Commerce. For example, for a brown leather travel handbag, more handbags that are leather-based or designed for travel purposes can be configured for the related list. Other types of related lists, such as **Accessories** and **More like this**, can also be configured in Commerce. A product ID is required to generate this list. Therefore, if it's added to a home page, where the page context doesn't include a product ID, the list will be empty.
- Algorithmically generated recommendation lists, such as **Trending**, **Best Selling**, and **New**, can be used on PDPs. Although these lists might not be directly related to the product on the PDP, they are another way to help customers find products that might interest them. These types of lists don't require a product ID. They are generic lists that are generated based on shopping patterns across the site.
- Editorial lists are manually curated lists. For example, a retailer might decide to manually curate lists of products that it wants to showcase.

## Ratings and reviews modules

Three modules can be used to show and add reviews:

- **Reviews** – This module lists ratings and reviews that have been provided by other customers. Customers can sort and filter the reviews. This module also lets customers like or dislike reviews, and report issues.
- **Write review** – This module lets customers write their own reviews of a product.
- **Ratings histogram** – This module includes a histogram that shows the ratings trend for a product.

For more details, see [Ratings and reviews overview](#).

## Marketing modules

If marketing content is unique to a specific product, any marketing module can be added to the PDP. You can add marketing modules to a PDP by "enriching" the page. For more details, see [Enrich a product page](#).

# Cart and checkout pages overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides an overview of the cart and checkout pages in Microsoft Dynamics 365 Commerce.

## Overview

The cart page of an e-Commerce website shows all items that a customer has added to the cart. The cart page is built by using the cart module. The cart module is a container that hosts all the modules that are required to showcase items in the cart. The cart module can also use other modules to show the order summary and any promotional codes that have been applied to the customer order.

The checkout page of an e-Commerce website presents a step-by-step flow that customers follow to enter all the information that is required to place an order. A checkout module can include modules that handle the shipping address, shipping methods, billing information, order summary, and other information that is related to customer orders.

## Cart page

The cart page serves as the shopping bag and includes all the items that have been added to the cart.

The following illustration shows an example of a cart page that was built by using the module library and the "Fabrikam" theme.

The screenshot displays the Fabrikam e-commerce website's shopping bag and order summary. At the top, a dark banner reads "Summer collection online now!". The Fabrikam logo is on the left, and navigation links for "Menswear", "Womenswear", "Accessories", and "Contact" are below it. On the right, there are search, user profile ("Karen"), heart, and cart (1) icons.

The main content area is titled "Shopping bag" and features a product card for "Grand Cap Toe Leather Oxfords". The product image shows a brown leather shoe. Details include "Size: 7.5", "Color: Brown", and "Style: Regular". The quantity is set to 1, and the price is \$390.00. Below the product card, there is a "Ship to an address" section with a "Pick this up" button, and links for "Move to Wishlist" and "Remove".

To the right of the product card is the "Order summary" section. It includes a "Promo Code" field with an "Apply" button. The summary shows: Subtotal \$390.00, Estimated shipping "To be calculated", Estimated tax "To be calculated", and Order total \$390.00. Below this, it states "Amount due \$390.00" with a note "\*Before applicable taxes". At the bottom of the summary are two buttons: "Checkout now" (green) and "Back to shopping" (white).

At the bottom of the page, there is a "Frequently bought together" section with navigation arrows.

The main body of the cart page shows all the items that the customer has added to the cart. All applicable discounts are showcased. These discounts include complex discounts. Examples include "Buy 3 items and get 10% off" or "Buy a bottle and a backpack to get 10% off." The order summary module shows the amount that is due after discounts, shipping, taxes, and so on, have been applied. There is also a promo code module that lets the customer apply or remove promotional codes.

A customer can shop anonymously or as a signed-in user. If a customer is signed in, items in the cart are preserved between sessions. In this way, the customer can continue to shop from multiple devices.

From the cart, the customer can proceed to checkout. A customer can initiate checkout as a guest user or as a signed-in user.

For information about how to author a cart page, see [Add a cart module to a page](#).

## Checkout page

The checkout page is where customers enter the information that is required to place an order.

The following illustration show an example of a checkout page that was built by using the module library.

The main body of the checkout page is where all the order information is collected. This information includes the

shipping address, delivery options, and payment information. Checkout has a step-by-step flow, because the information must be entered in a specific order to be processed. For example, the shipping address must be entered before the shipping costs can be calculated and the payment can be authorized.

### **Shipping address**

A shipping address is required if items must be shipped. The format of shipping addresses for each locale can be configured in Dynamics 365 Commerce. For example, if the items will be shipped to the United States, the shipping address must include a street address, state, and ZIP Code. Some basic input validation is done for shipping address fields, such as validation for alphanumeric characters, maximum length, and numbers. Although the validity of the address itself isn't verified, this verification can be done by using customized third-party services.

The shipping address is applied to all items in the cart that the "ship" option is selected for. If you use the checkout flow that is provided in the module library, individual cart items can't be shipped to different addresses. If you require this capability, it can be implemented through customization of the checkout modules.

After the shipping address is provided, the shipping methods that are available from the Dynamics 365 Commerce online store are shown. The shipping methods and the addresses that they support can be configured in Commerce.

### **Payment**

The next step in the checkout flow is payment. In e-Commerce, multiple methods of payment can be used to place orders, such as credit cards, gift cards, and loyalty points. A combination of these payment methods can also be used. Depending on the payment methods that are used, additional information might be required. For example, a credit card payment requires a billing address. Credit card payments are processed by using the Adyen Payment Connector.

#### **Loyalty points**

During the checkout flow, a customer who is a member of a loyalty program and who has accrued loyalty points can redeem those loyalty points for an order. The loyalty points module is shown only if the customer has an existing loyalty membership. For non-members and guest users, this module is hidden.

#### **Gift cards**

The module library lets internal gift cards be redeemed for an order. To apply an internal gift card, the customer must be signed in. For additional security, we recommend that you customize the flow by using a personal identification number (PIN) for internal gift cards.

### **Signed-in and guest users**

The customer can complete the checkout process as a guest user or a signed-in user. If the customer signs in, account information such as saved shipping addresses and saved credit card details is automatically retrieved.

### **Order summary**

Checkout shows a summary of the line items in the cart, so that the customer can verify the order before he or she places it. The line items can't be edited during the checkout flow. However, a link to the cart is provided in case the user wants to go back and edit line items.

After the customer provides shipping and billing information, the order summary reflects the amount that is due after loyalty points, gift cards, and other payments have been applied.

### **Order confirmation and email**

When the customer places an order, a confirmation number is provided. At this point, the payment has been authorized but not charged. The payment will be charged only when the order is fulfilled (that is, when it's either shipped or picked up).

After an order is created, an order confirmation email is sent to the customer.

For more information about how to author a checkout page, see [Add a checkout module to a page](#).

# Account management pages overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of account management pages in Microsoft Dynamics 365 Commerce.

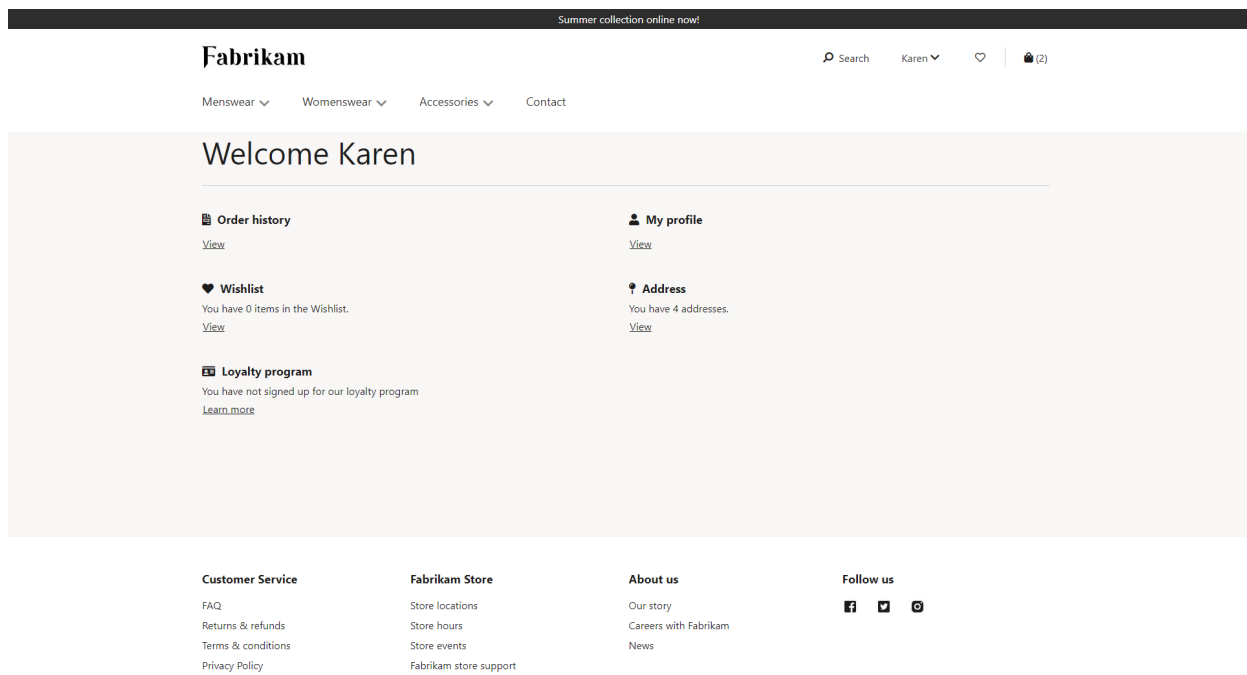

## Overview

Account management pages let customers view information that is related to their account and orders. Account management pages include the account management landing page, and pages for the user's profile, addresses, order history, order details, loyalty points, and wish list.

### Account management landing page

When a customer signs in and selects **My Account**, the account management landing page is opened. This page provides a quick summary of all account-related information, such as the user's profile, orders, wish list, addresses, loyalty points. From this page, the customer can access more details for each area.

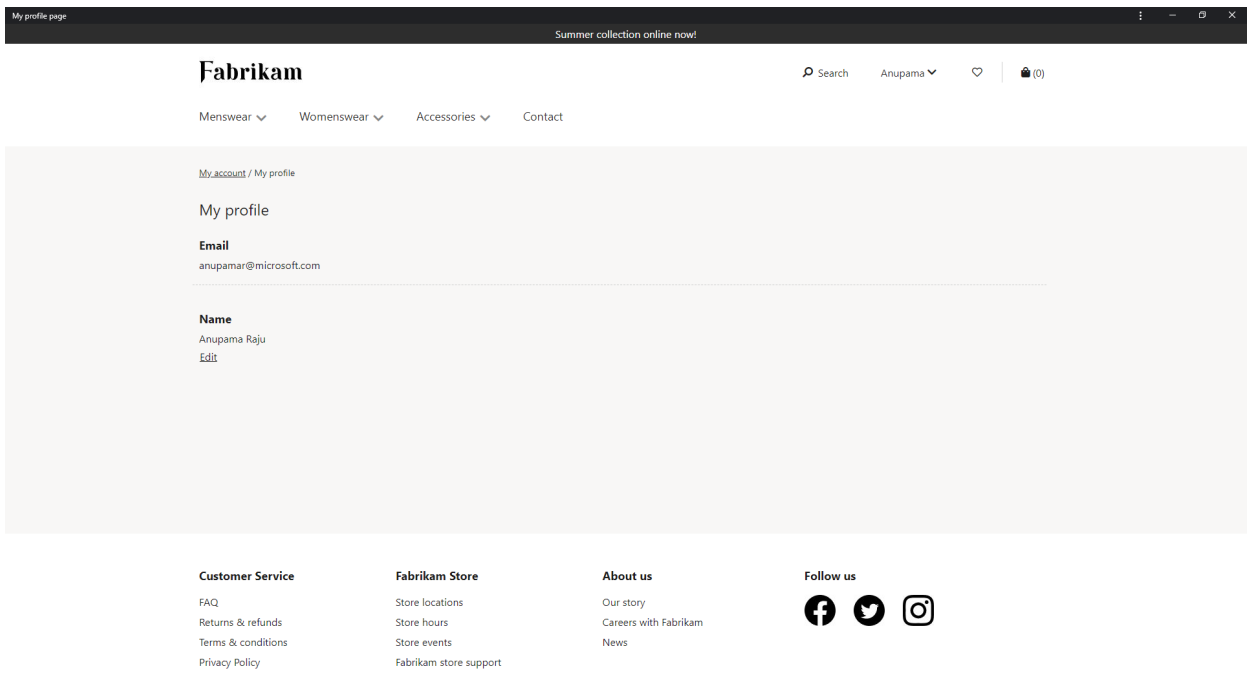

The following illustration shows an example of the account management landing page.

### My profile page

The **My profile** page shows customer's account information, such as his or her name and phone number. The customer can update his or her profile information on this page. This page can be customized so that it includes additional customer account preferences, such as an option for opting in to marketing email.

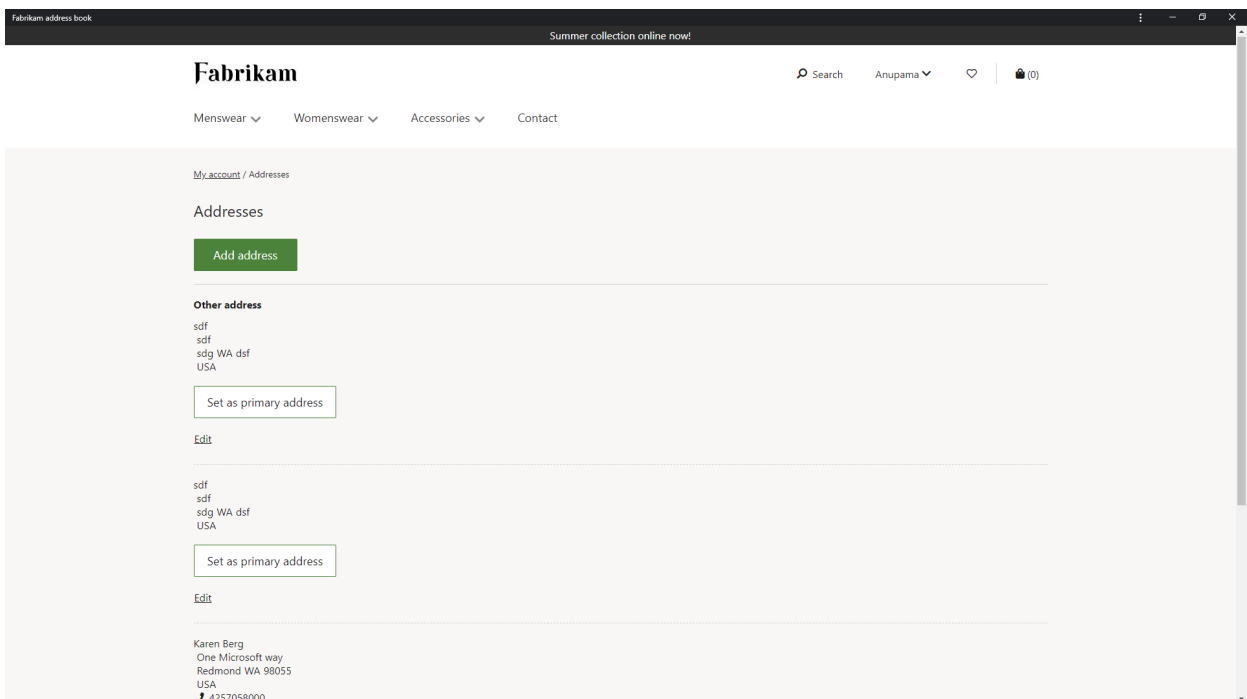

The following illustration shows an example of a **My profile** page that was built by using the module library.

## Addresses page

The **Addresses** page lets the customer add addresses to his or her account. It also shows the list of addresses that the customer has previously added or saved to the account. These addresses are addresses that the customer entered either on this page or while placing an order.

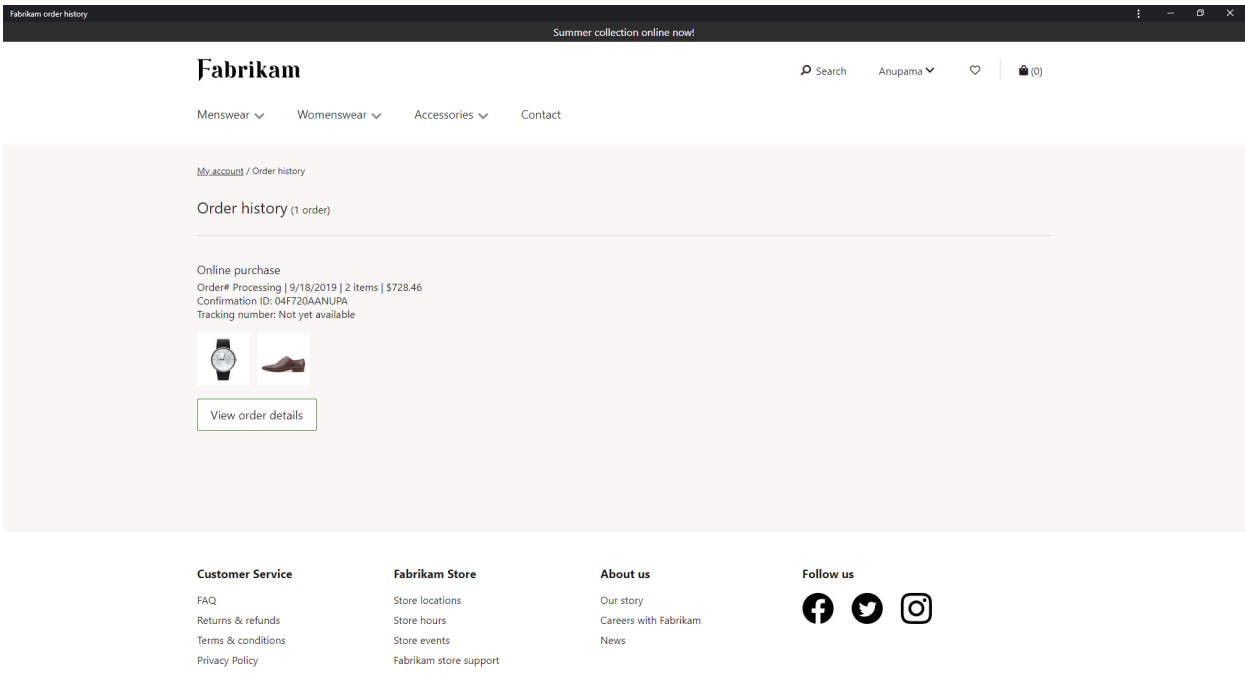

The following illustration shows an example of the **Addresses** page.

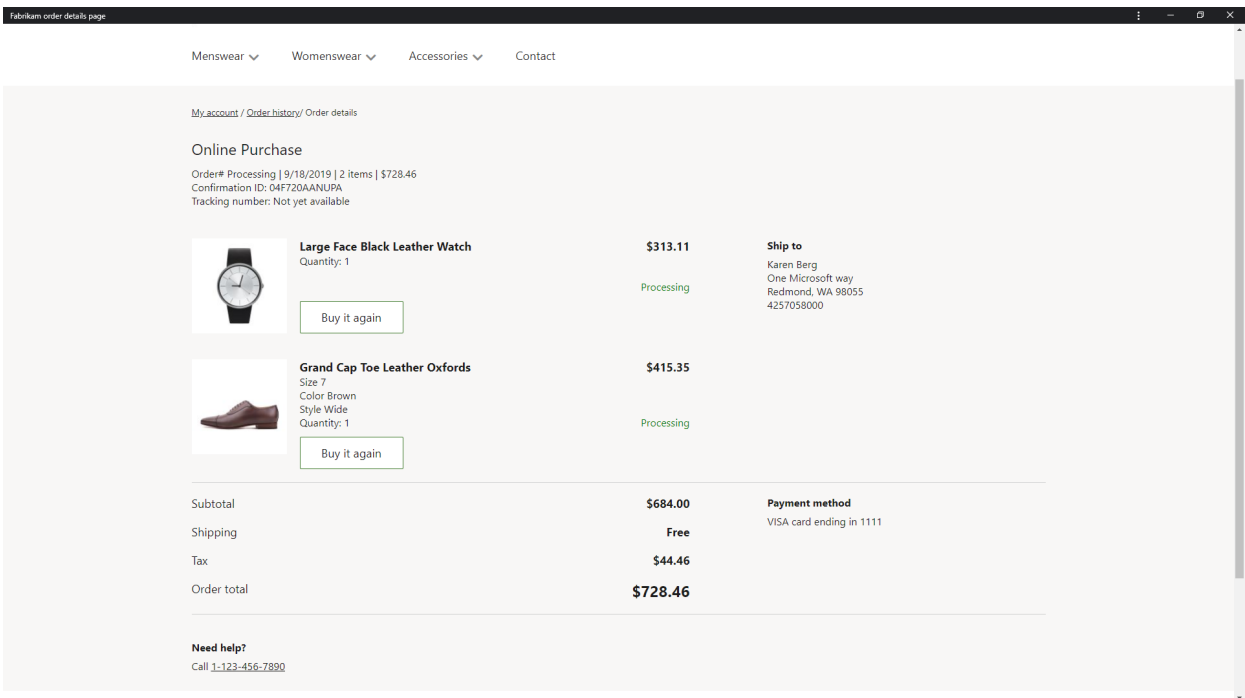

## Order history and Order details pages

The **Order history** page shows a summary of all orders that the customer has submitted by using his or her account. It gives a quick summary of the items that were ordered, the confirmation number, sales ID, tracking information, and other information. If the customer wants to view a more detailed breakdown of each order, there is an **Order details** page. This page includes information such as the shipping address, payment information, discounts, taxes, and shipping costs for the order.

The following illustration shows an example of the **Order history** page.

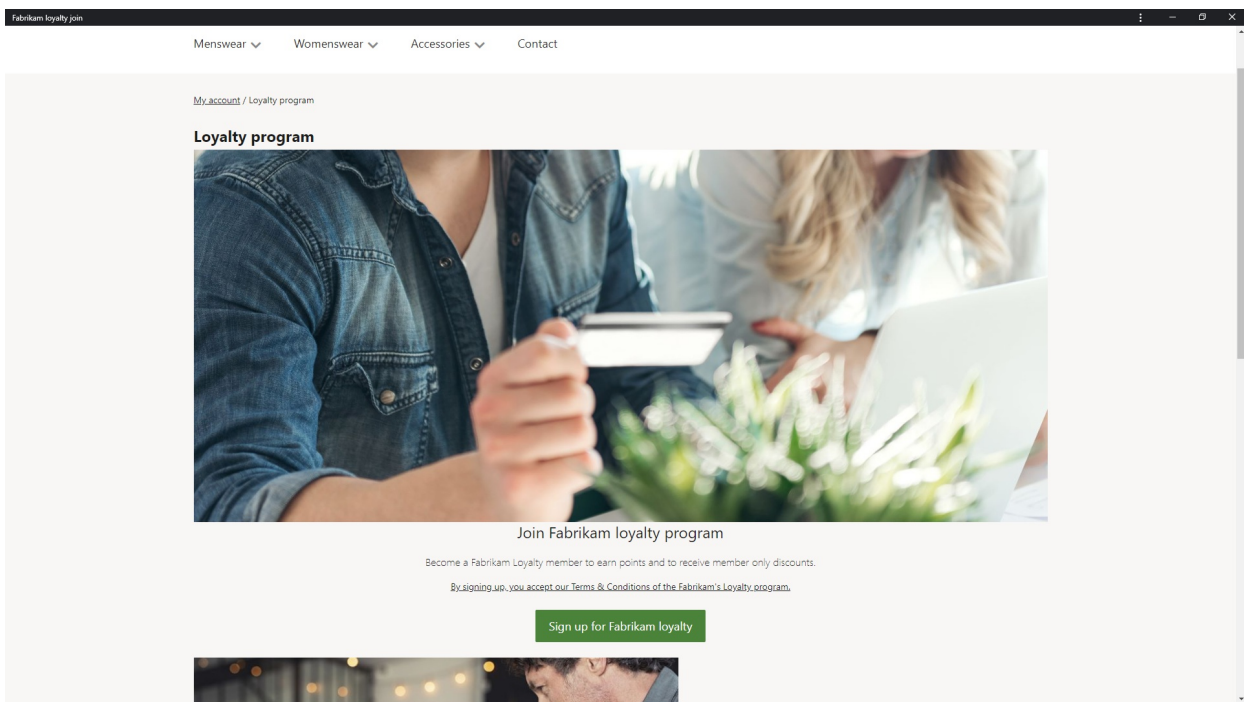

The following illustration shows an example of the **Order details** page.

## Loyalty program page

The **Loyalty program** page lets the customer become a member of a loyalty program. After a customer has signed up for a loyalty program, the **Loyalty program** page include details such as the number of points that have been earned and the number of points that have been redeemed.

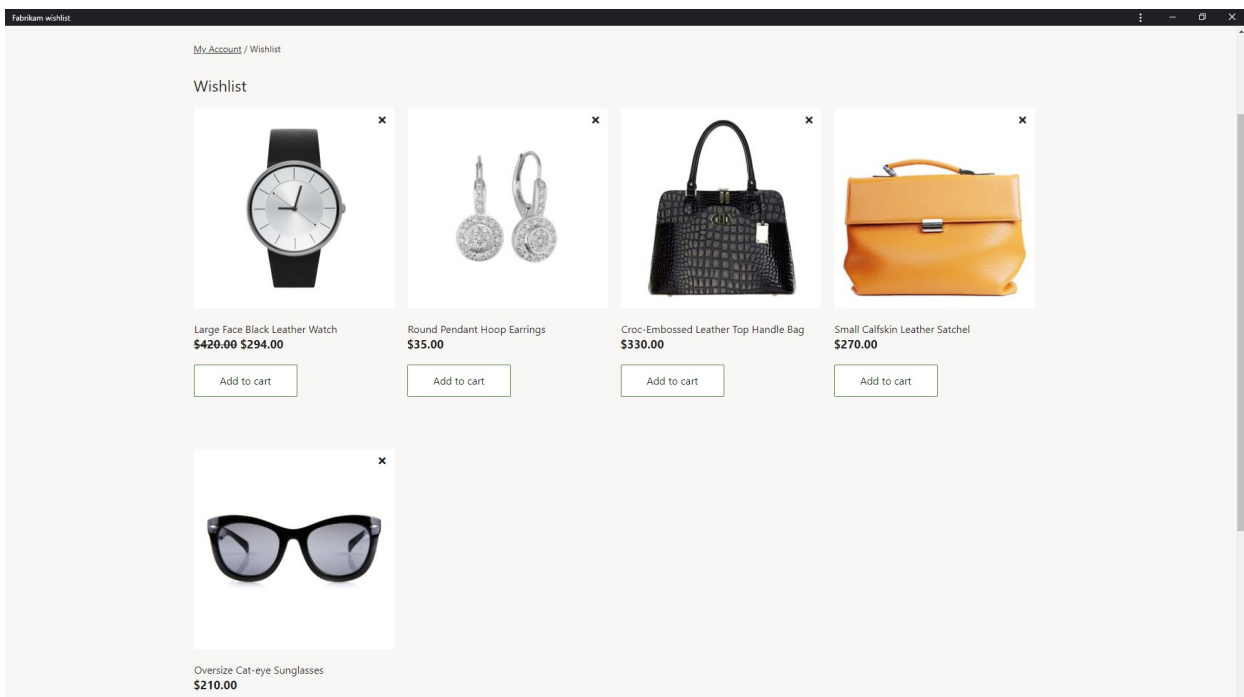

The following illustration shows an example of a **Loyalty program** page.

## Wishlist page

The **Wishlist** page shows a list of the items that the customer has added to his or her wish list. Both products and product variants can be added to the wish list. From this page, the customer can remove an item from the wish list or add an item directly to the cart.

The following illustration shows an example of a **Wishlist** page.

For more information about account management modules and how to author them, see [Account Management](#).

# Authoring page overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides an overview of the authoring page in Microsoft Dynamics 365 Commerce.

## Overview

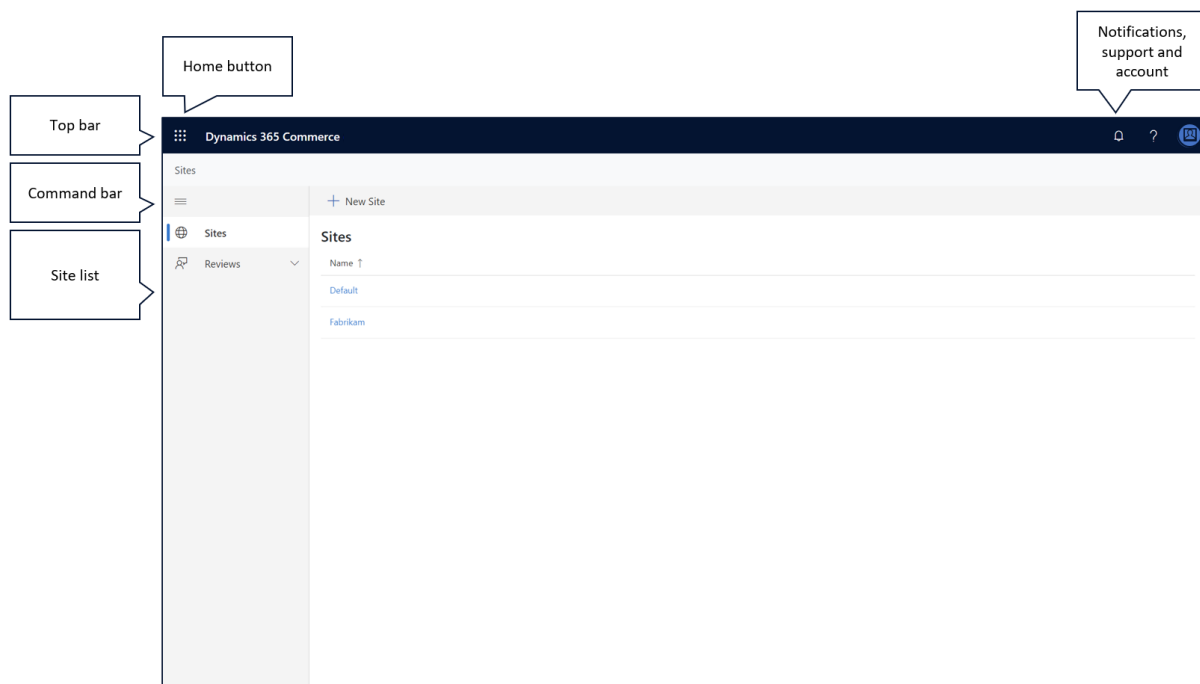

Websites can be created to support various business needs. They can represent a whole business, offer a single channel of the business, or target a specific audience or segment of an audience. For example, a clothing manufacturer might have a website that showcases all the brands that it owns. The same clothing manufacturer might then have a separate website for each of those brands, and also a set of websites that feature luxury fashion, outdoor fashion, and children's fashion.

Dynamics 365 Commerce supports the creation and management of multiple websites, and each website can have its own appearance and content. The authoring page serves as a common access point for these websites. You can use it to sign in to and out of the system, and to create new websites.

Currently, the authoring page consists of the following sections.

- **Top bar** – The top bar appears at the top of the authoring page. It provides easy access to e-Commerce tools, notifications, support links, and user sign-in.
- **Command bar** – The command bar appears below the top bar. It can be used to create new websites.
- **Site list** – The site list fills all the space below the command bar. It provides a comprehensive list of websites and the domains that are associated with them.

The following illustration shows the authoring page.

## Use the Home button to select a tool

The **Home** button is in the upper-left corner of the authoring page. It provides easy access to other e-Commerce tools. When you select this button, a menu of the tools that you can use is opened. When you select a tool, the menu is closed, and the selected tool is loaded in the browser.

## View and clear notifications

The **Notifications** button is one of the buttons in the upper-right corner of the authoring page. It looks like a bell. By selecting this button, you can view all the notifications that have been sent to you.

Notifications are used throughout the authoring tool to inform you when actions have been completed. For example, a notification might state, "Your page has been published" to inform you that a publish action was successful.

Notifications can also inform you about errors that were encountered while an action was being performed. Select the error notification to open its message. The information in this message can help you resolve the error.

You can clear notifications from the notification menu by selecting **Remove** at the bottom of the notification message. To clear notifications in bulk, select **Remove all** at the bottom of the notification menu.

## Get help with the authoring tool

The **Help** button is another button in the upper-right corner of the authoring page. It looks like a question mark. When you select this button, a menu of the following predefined options is opened:

- **Site development help** – If you select this option, the documentation for creating a new website is opened on a new browser tab.
- **Feedback and support** – Select this option to open a Microsoft Yammer channel where you can leave feedback about the authoring tool or request support.
- **Privacy and cookies** – If you select this option, the Microsoft privacy statement is opened on a new browser tab.
- **About** – Select this option to open a message box that contains information about the authoring tool and the version that you're currently using.

## Sign in to and out of the authoring tool

The **My account** button is another button in the upper-right corner of the authoring page. It looks like a colored circle. By selecting this button, you can see which account you used to sign in, and you can also sign out of that account as you require.

To sign in to or out of the authoring tool, follow one of these steps.

- If you aren't already signed in to the authoring tool, select **My account > Sign in** to sign in.
- If you're already signed in and want to sign out, select **My account > Sign out**.

## Change the display language of the authoring tool

You can also use the **My account** button to change the language of the text strings that appear in the authoring tool.

To change the display language, follow these steps.

1. Select **My account > Change language**. A dialog box appears.
2. Select one of the user languages, and then select **Save**.

## Create a new website

Dynamics 365 Commerce supports the creation and management of multiple websites, and each website can have its own appearance and content.

To create a new website, follow these steps.

1. On the command bar, select **New Website**. A dialog box appears.
2. Enter the following required information for the new website:
  - **Site name** – Enter the name of the website. This name isn't shown to website customers. Instead, it's used in the site list and other places in the authoring tool.
  - **Site administers security group** – Enter the full name of the Microsoft Azure Active Directory (Azure AD) security group that contains the users who should have administrative access to the website. The admin group name, together with the other permissions for the website, can be changed after the website is created.
  - **Default channel** – Enter the default merchandizing channel that should be associated with the website. The default channel determines the products that can be sold through the website.
  - **Default language** – After you specify the default channel, select the default language for the channel. The default channel defines the language that products are shown in if the customer doesn't specify a preferred language.
  - **Default market** – Enter the default market for the website. The default market defines the market that is shown if the customer doesn't specify a preferred market.
  - **Domain** – Select the web domain that should be associated with the website. This domain is the domain that the website's customers will go to in their browser.
3. Select **OK**. The new website is created.

#### NOTE

Creation of a new website can take up to 60 seconds. After the process is completed, a notification appears in the notification area. Additionally, the website appears in the site list and has the site name that you entered.

## Select a website to author

The site list provides a comprehensive list of the websites that are associated with the e-Commerce system. Websites appear in alphabetical order. The domain that is associated with each website is also shown. To view the contents of a website and start to author pages, select the name of the website. The authoring tool and the content for the website are loaded.

After the authoring tool is loaded, you can select **Home** to return to the authoring page.

# Manage e-Commerce users and roles

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to grant users access to the authoring environment for your Microsoft Dynamics 365 Commerce site.

To help control user access and grant users permission to perform specific tasks, the site authoring environment uses security groups that you create in Microsoft Azure Active Directory (Azure AD). You first assign a new or existing security group from Azure AD to each role in the authoring environment. You then grant or revoke permissions for individual users by either adding those users to an appropriate security group or removing them from a security group.

## Overview of roles in the authoring environment

The Dynamics 365 for Commerce authoring environment supports the following roles.

ROLE	DESCRIPTION
System Administrator	Users who have this role have all privileges for all tools, and for all ratings and reviews. They can also create sites.
Administrator	Users who have this role have all privileges for all tools and RnR in a given site structure.
Web Producer	Users who have this role can create pages, fragments and templates, upload and manage assets, and enrich products and categories.
Reader	Users who have this role can view pages, templates, assets, fragments, layouts and settings, but may not make changes.
RnR Moderator	Users who have this role can moderate product reviews.

## System Administrator role

When you provision Dynamics 365 Commerce in the Microsoft Dynamics Lifecycle Services (LCS) environment, you're asked to provide a security group for the **System Administrator** role. This role is then automatically applied to all sites that you create in the environment that you're configuring. The security group for this role can be updated only in LCS. On the **Site Administration** page for all sites, it appears as read-only and is for informational purposes only.

## Administrator role

When you create a new site in Commerce, you're asked to provide a security group for the **Administrator** role. See the table earlier in this topic for an overview of the permissions that this role grants.

## Add or update security groups

After your site is created, only users who are in the security groups that are associated with the **System Administrator** and **Administrator** roles can access the authoring environment for that site. To assign users to the **Web Producer**, **RnR Moderator**, and **Reader** roles, you must assign security groups to those roles. To add

a security group to a role, or to update a security group that is currently assigned to a role, follow these steps.

1. Go to the site that you want to update.
2. In **Site management**, open the **Security** page.
3. Select the role to modify.
4. Add security groups to roles, or remove security groups from roles.

# Apply inventory settings

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic covers inventory settings and describes how to apply them in Microsoft Dynamics 365 Commerce.

## Overview

Inventory settings specify whether inventory should be checked before products are added to the cart. They also define inventory-related merchandising messages, such as "In stock" and "Only a few left." These settings ensure that a product can't be purchased if it's out of stock.

Dynamics 365 Commerce provides estimates of on-hand availability for products. For information about how estimated on-hand availability is calculated, see [Calculate inventory availability for retail channels](#).

In Commerce site builder, inventory thresholds and ranges can be defined for a product or a category. They determine whether inventory can be classified as in stock, low stock, or out of stock. For details, see [Configure inventory buffers and inventory levels](#).

### NOTE

Support for inventory thresholds and ranges is available in the Dynamics 365 Commerce 10.0.12 release.

## Inventory settings

In Commerce, inventory settings are defined at **Site Settings > Extensions > Inventory Management** in site builder. There are four inventory settings, one of which is obsolete (deprecated):

- **Enable stock check in app** – This setting turns on a product inventory check. Buy box, cart, and pick up in store modules will then check product inventory, and will allow a product to be added to the cart only if inventory is available.
- **Inventory level based on** – This setting defines how inventory levels are calculated. The available values are **Total Available**, **Physical Available**, and **Out of stock threshold**. In Commerce, inventory threshold and ranges can be defined for each product and category. The inventory APIs return product inventory information for both the **Total Available** property and the **Physical Available** property. The retailer decides whether the **Total Available** or **Physical Available** value should be used to determine the inventory count and the corresponding ranges for in-stock and out-of-stock statuses.

The **Out of stock threshold** value of the **Inventory level based on** setting is an old (legacy), obsolete value. When it's selected, the inventory count is determined from the results of the **Total Available** value, but the threshold is defined by the **Out of stock threshold** numeric setting that is described later. This threshold setting applies to all products across an e-commerce site. If inventory is below the threshold number, a product is considered out of stock. Otherwise, it's considered in stock. The capabilities of the **Out of stock threshold** value are limited, and we don't recommend that you use it in version 10.0.12 and later.

- **Inventory ranges** – This setting defines the inventory ranges that message are shown for on site modules. It's applicable only if either the **Total Available** value or the **Physical Available** value is selected for the **Inventory level based on** setting. The available values are **All**, **Low and out of stock**, and **Out of stock**.

- When **All** is selected, messages for all inventory ranges, from in stock ("Available" message) to out of stock ("Out of stock" message), will be shown.
- When **Low and out of stock** is selected, messages for all inventory ranges except in stock ("Available" message) will be shown.
- When **Out of stock** is selected, only the "Out of stock" message will be shown.
- **Out of stock threshold** – This old numeric setting will take effect only if the **Out of stock threshold** value is selected for the **Inventory level based on** setting.

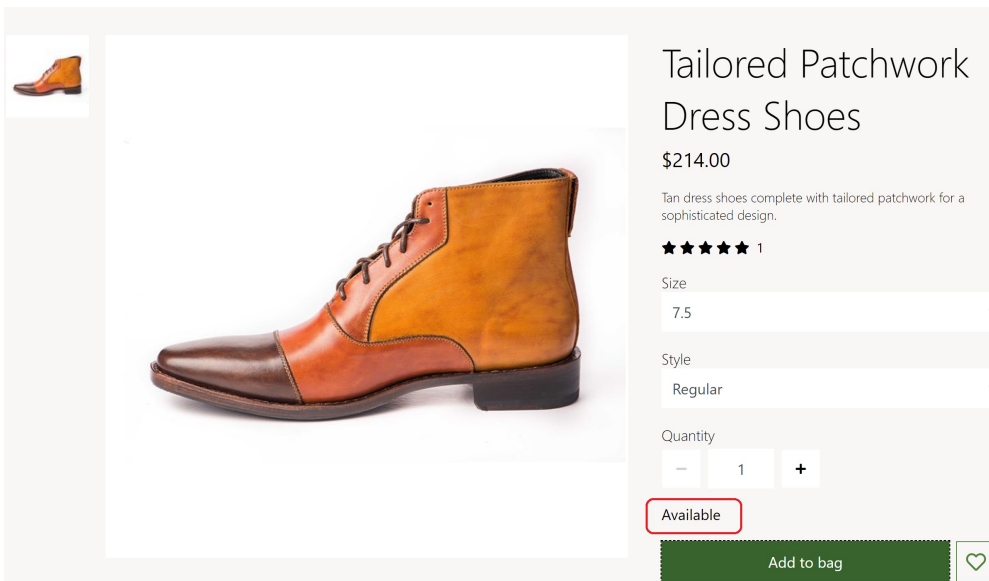

#### IMPORTANT

These settings are available in the Dynamics 365 Commerce 10.0.12 release. If you are updating from an older version of Dynamics 365 Commerce, you must manually update the appsettings.json file. For instructions on updating the appsettings.json file, see [SDK and module library updates](#).

## Modules that use inventory settings

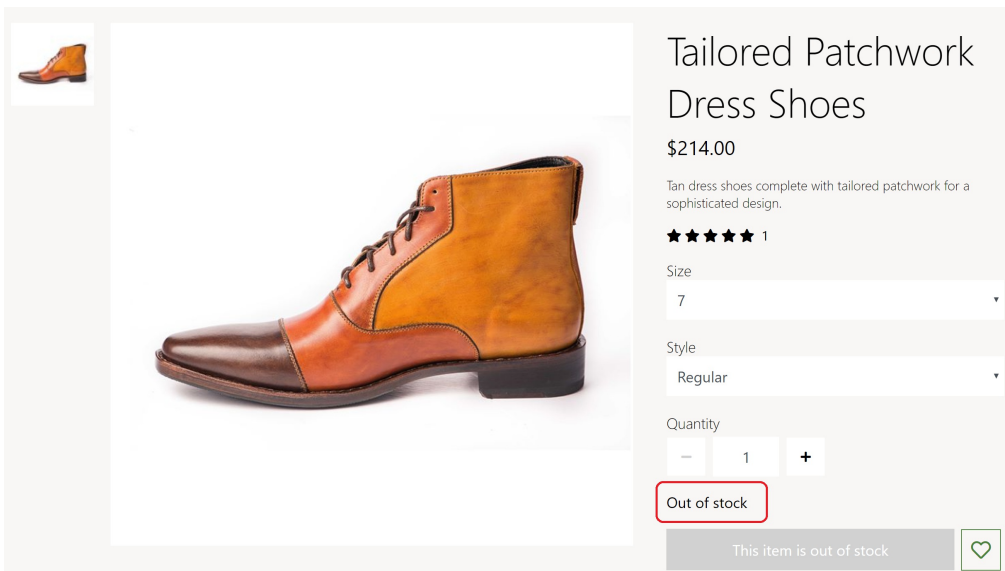

Buy box, wishlist, store selector, cart, and cart icon modules use inventory settings to show the inventory ranges and messages.

The following image shows an example of a product details page (PDP) that is showing an in-stock ("Available") message.

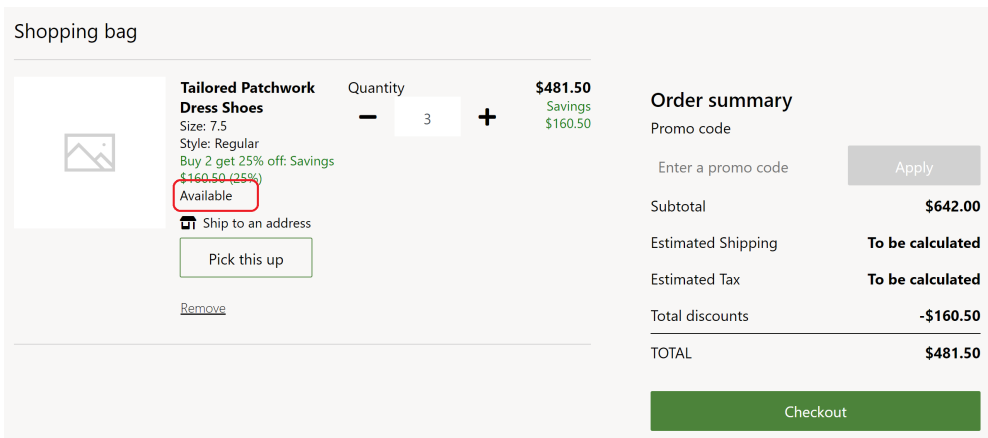

The following image shows an example of a PDP that is showing an "Out of stock" message.

The following image shows an example of a cart that is showing an in-stock ("Available") message.

# Search engine optimization (SEO) considerations for your site

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers search engine optimization (SEO) considerations for your site from development to production.

## A site that is under development

While a site is under development, all site pages should have the **NOINDEX** and **NOFOLLOW** meta tags, so that search engines don't index the pages and store development versions of your site in their cache. To do this configuration, you must add the default meta tags module to the site page template. The default meta tags properties will then be available in the SEO properties section in the page editor. You can use these properties to manage the meta tags.

## Soft launch of a site

During a "soft launch," a website is made available to a limited audience or market before the full launch occurs. If you do a soft launch of your website, you should consider leaving the **NOINDEX** meta tags in place. In this way, you help guarantee that the soft launch remains restricted to the limited audience that you want to reach.

## A site that is in production

When a site is in production, you should make sure that all site pages are correctly tagged. Microsoft Dynamics 365 Commerce uses the information that is entered for a page to render all the SEO information on that page. The following modules provide this functionality: category page summary, list page summary, and product page summary.

To optimize search engine indexing, the rendering framework uses both information from the SEO properties that are configured in Dynamics 365 Commerce and module-specific information. For a site that is in production, you should make sure that the robots.txt file allows for indexing of your whole site, and that it contains links to your published site map document. You should turn on the site map generation functionality at **Site Settings > Site maps enabled**.

### **Page SEO settings for internal preview, limited audiences, and all audiences**

Because Dynamics 365 Commerce supports "what you see is what you get" (WYSIWYG) authenticated previews in visual page builder, authors can prepare their page content without having to worry that the information will become visible to site visitors. If a page must be published, but its exposure must be limited, it should have the **NOINDEX** meta tag, so that it won't be indexed by search engines. Then, when the page is ready for all audiences, all the basic SEO metadata should be present, to maximize the efficiency of search engine indexing. Additionally, the **NOLIMIT** meta tag should be removed.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Manage Content Security Policy (CSP)

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to manage Content Security Policy (CSP) in Microsoft Dynamics 365 Commerce.

## Overview

CSP is an additional layer of security that helps detect and mitigate some types of web attacks. The purpose of these attacks can range from data theft, to site defacement, to the distribution of malware. CSP provides an extensive set of policy directives that help you control the resources that a site page is allowed to load. Each directive defines the restrictions for a specific type of resource.

When CSP is turned on for an e-Commerce site, it helps enhance security by blocking connections, scripts, fonts, and other types of resources that originate from unknown or malicious sources. In Dynamics 365 Commerce, CSP is turned on by default. However, it will likely require additional configuration for most sites. The Dynamics 365 Commerce online software development kit (SDK) provides a default list of allowed source URLs that style, script, and application programming interface (API) calls can be made from. You can edit this list on the **Extensions** tab in the site builder tool.

For more information about CSP, see [Content Security Policy Reference](#).

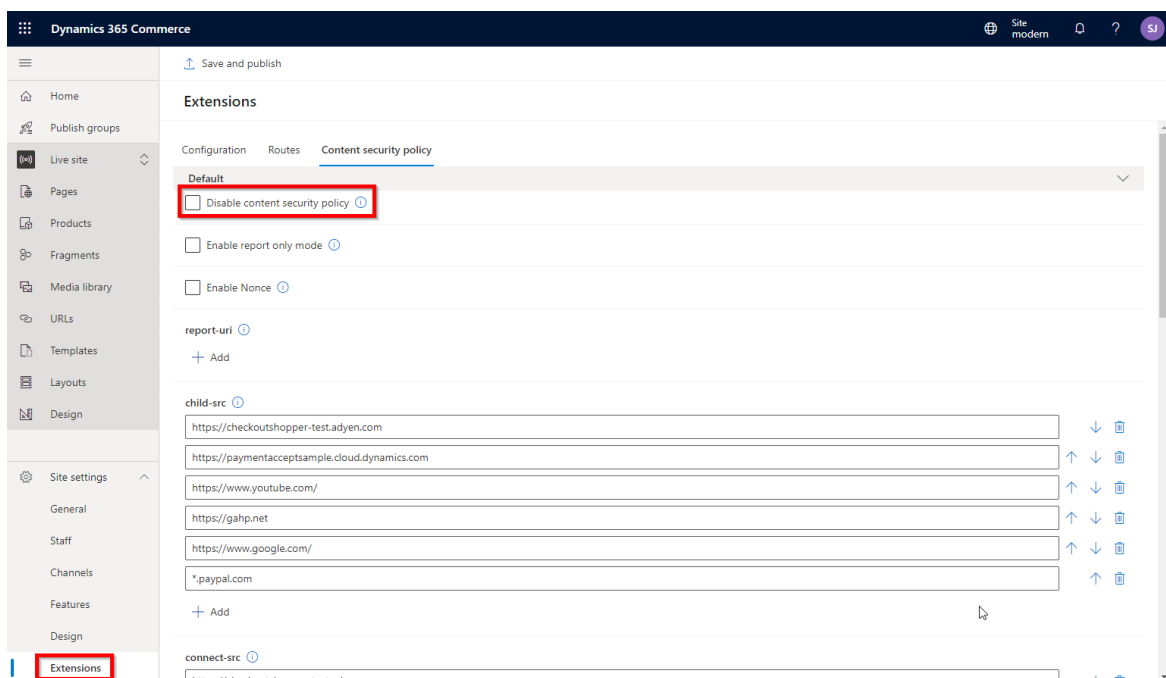

## CSP settings

### Turn off CSP for a site

To prevent CSP from applying policies to your site, you can turn it off for that site in site builder.

To turn off CSP for a site, follow these steps.

1. In site builder, select the site you are working on.
2. Select **Site settings**, and then select the **Extensions** tab.
3. On the **Content security policy** tab, select the **Disable content security policy** check box.

4. Select **Save and publish**.

### Enable report only mode

If CSP is enabled, content security policy will not be enforced, but any violations will be reported to URIs specified by the `report-uri` directive.

To enable report only mode, follow these steps.

1. In site builder, select the site you are working on.
2. Select **Site settings**, and then select the **Extensions** tab.
3. On the **Content security policy** tab, select the **Enable report only mode** check box.

### Enable nonce

Enabling nonce (number used once) will block the execution of all inline scripts except those specified within the [inline script](#) module. A unique cryptographic nonce is generated and added to each script specified in the CSP header.

To enable nonce, follow these steps.

1. In site builder, select the site you are working on.
2. Select **Site settings**, and then select the **Extensions** tab.
3. On the **Content security policy** tab, select the **Enable Nonce** check box.

## CSP directives in Commerce

The following CSP directives can be used on Commerce sites.

DIRECTIVE	DESCRIPTION
child-src	This directive defines valid sources of web workers and nested browsing contexts that are loaded by using elements such as <code>&lt;frame&gt;</code> and <code>&lt;iframe&gt;</code> .
connect-src	This directive defines the URLs that AJAX requests can be made from.
font-src	This directive defines valid sources of fonts.
frame-ancestors	This directive specifies valid parents that may embed a page using <code>&lt;frame&gt;</code> , <code>&lt;iframe&gt;</code> , <code>&lt;object&gt;</code> , <code>&lt;embed&gt;</code> , or <code>&lt;applet&gt;</code> elements. Setting this directive to "none" is similar to specifying the "X-Frame-Options: DENY" directive (which is also supported in older browsers).
frame-src	This directive defines valid sources for nested browsing context loading using elements such as <code>&lt;frame&gt;</code> and <code>&lt;iframe&gt;</code> .
img-src	This directive defines valid sources of images.
media-src	This directive defines valid sources of audio and video, such as HTML5 <code>&lt;audio&gt;</code> and <code>&lt;video&gt;</code> elements.
object-src	This directive defines valid sources of plug-ins, such as <code>&lt;object&gt;</code> , <code>&lt;embed&gt;</code> , and <code>&lt;applet&gt;</code> elements.

DIRECTIVE	DESCRIPTION
report-uri	This directive defines URI(s) that the browser will post CSP violation reports to. These violation reports consist of JSON documents sent via an HTTP POST request to the specified URI.
script-src	This directive defines valid sources of JavaScript.
style-src	This directive defines valid sources of stylesheets.

### Example: Configure a CSP directive

The following example procedure shows how to configure a CSP directive so that an external script can be called from your site.

1. In site builder, select the site you are working on.
2. Select **Site settings**, and then select the **Extensions** tab.
3. On the **Content security policy** tab, under **script-src**, select **Add**, and then enter the full URL of the external script that should be called.

The screenshot shows the Dynamics 365 Commerce Site Management interface. The breadcrumb navigation is 'Sites > Fabrikam > Site Management'. The page title is 'Dynamics 365 Commerce'. The left sidebar shows 'Extensibility' selected. The main content area is titled 'Content Security Policy' and includes a 'Save and Publish' button. Under the 'Default' section, there is a checkbox for 'Disable content security policy'. Below this, a 'Required property' section lists several CSP directives: 'child-src', 'connect-src', 'font-src', 'img-src', 'media-src', 'object-src', 'script-src', and 'style-src'. Each directive has an '+ Add' button. The 'script-src' directive is highlighted with a red box, and its input field contains the URL 'https://www.example.com/scripts/example.js'. A trash icon is visible to the right of the input field. The bottom right corner of the page shows the time '11:27 AM' and the date '10/4/2019'.

#### 4. Select Save and publish.

## Interpret and fix CSP errors

When you first configure CSP for a site, some pages probably won't be loaded at all or won't work as intended, because CSP is blocking external connections, scripts, fonts, and other types of resources from being loaded. Fortunately, CSP logs some helpful errors that you can use to fix, tune, and clean up unwanted or unneeded requests.

The following illustration shows an example of CSP errors in a web browser's developer tools.

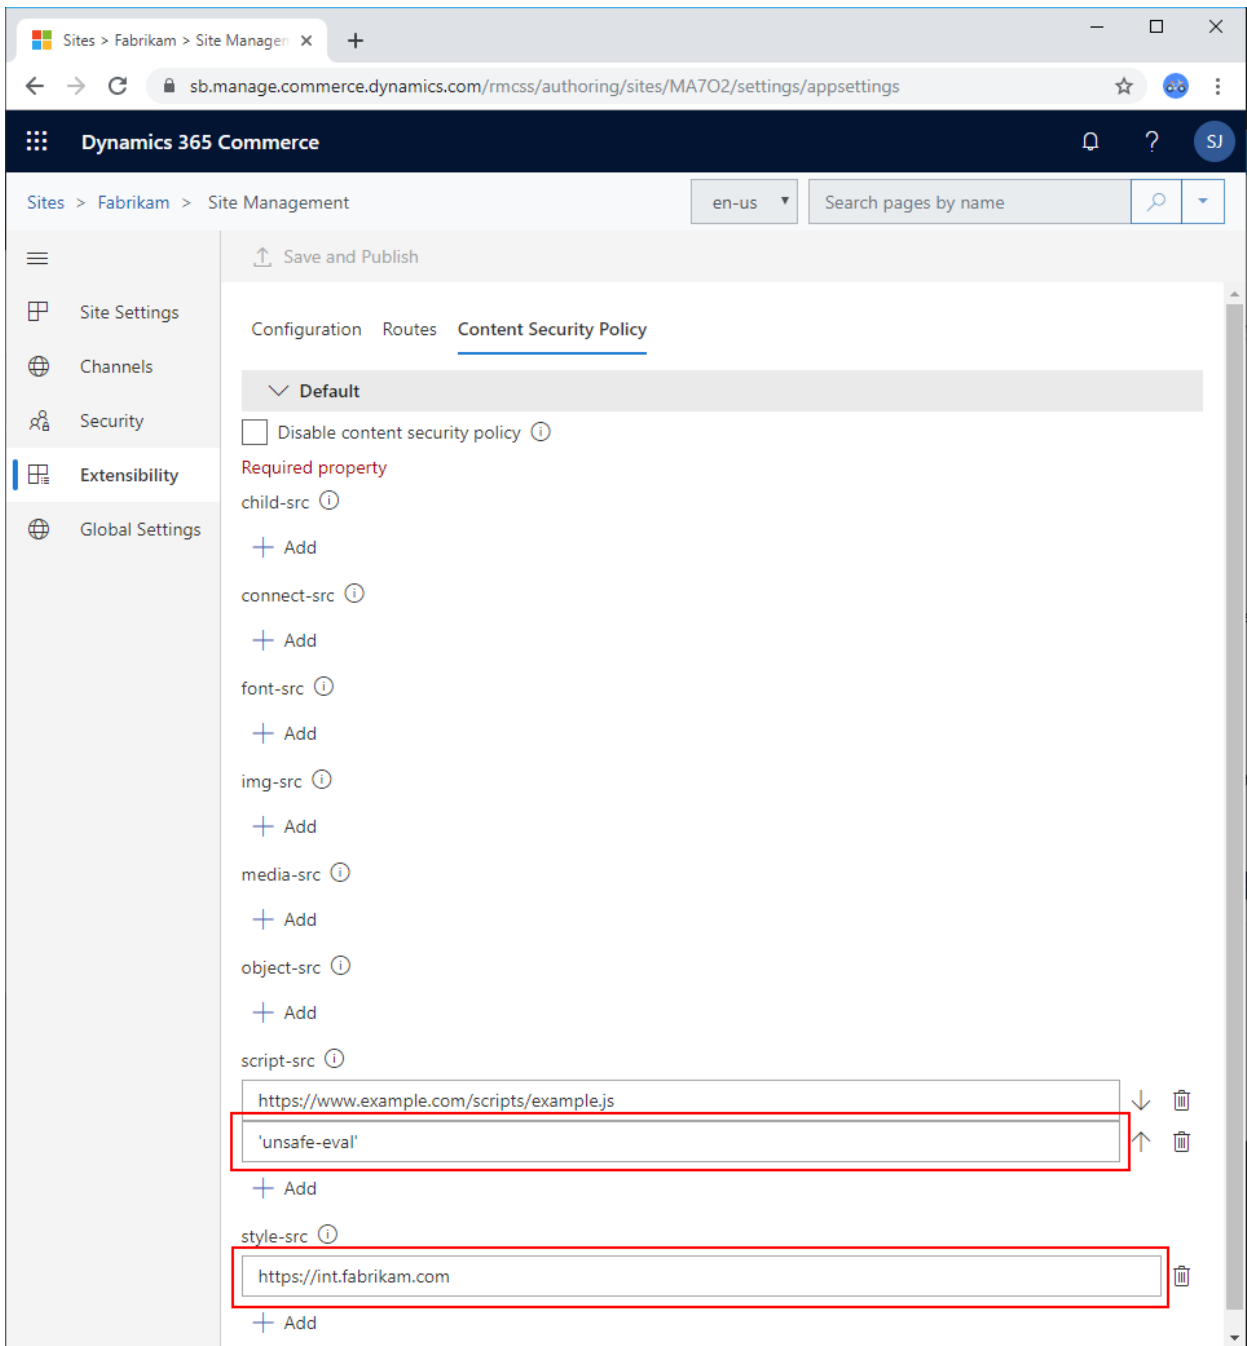

```
Uncaught EvalError: Refused to evaluate a string as JavaScript because 'unsafe-eval' is not an allowed source of script in the following Content Security Policy directive: "script-src 'self' 'unsafe-  
https://*.vo.msecnd.net/scripts/ https://dc.services.visualstudio.com/ https://checkoutshopper-test.adyen.com".  
at eval (anonymous)  
at jquery-bundle-1.10.2-ce=001-0008dc=RV1:3  
at Function.globalEval (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
at init.domManip (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
at init.prepend (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
at Array.<anonymous> (authorize?o=b2c-1-silent-ver=5.3.0.0:16)  
at Array.<anonymous> (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
at a (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
at Object.fireWith [as resolveWith] (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
at Object.<anonymous> (jquery-bundle-1.10.2-ce=001-0008dc=RV1:3)  
Refused to load the stylesheet 'https://int.fabrikem.com/_msdyn365/scrn/53e9550d-6ed3-4e6c-9603-7fefa76731fd/static/css/fabrikem/fabrikem.min.css' because it violates the following Content Security  
'unsafe-inline' https://*.commerce.dynamics.com https://checkoutshopper-test.adyen.com'. Note that 'style-src-elem' was not explicitly set, so 'style-src' is used as a fallback.
```

There are two CSP errors in this example:

- The **Eval** function is blocked by default, because it can cause arbitrary JavaScript execution. To allow this function, add **'unsafe-eval'** to your site's **script-src** directive. The single quotation marks are required.
- The external stylesheet is blocked. To allow a stylesheet to be loaded from an external domain, add the URL to your site's **style-src** directive.

The following screenshot shows what the fixed settings look like on the **Content Security Policy** tab in Commerce.

## Update page mocks that use CSP

If you're testing modules by using the online SDK in a development environment, you can also add CSP by using page mocks. In a page mock, you must either add a top-level **"appContext"** property or go to the existing top-level **"appContext"** property, and create a property under it that is named **"contentSecurityPolicy"**. There, you can add key/value pairs of directives to policies, as shown in the following example.

```
"appContext": {
  "contentSecurityPolicy": {
    "script-src": ["https://www.w3schools.com/js/myScript.js"],
    "font-src": ["https://*.commerce.dynamics.com"]
  }
}
```

**NOTE**

If you add CSP policies in a page mock, the page mock won't include any of the default CSP policies that are provided by the platform.

You can turn off CSP in a page mock by using the following code.

```
"appContext": {  
  "contentSecurityPolicy": {  
    "disableContentSecurityPolicy": true  
  }  
}
```

# Opt out of web activity event collection

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how you can let customers opt out of web activity event collection in Microsoft Dynamics 365 Commerce.

## Overview

Dynamics 365 Commerce lets site administrators analyze the web activity of users of their e-commerce sites. In that way, they can better understand how their sites are used, and they can optimize the sites to provide an improved user experience and meet business objectives.

## Ways for administrators to implement an opt-out experience

Administrators have three ways to implement an opt-out experience.

### Opt out on behalf of users

In Account management in Commerce headquarters (HQ), administrators can opt out on behalf of users.

1. In the HQ client, on the **All customers** page, search for and select a customer.
2. On the customer details page, on the **Retail** FastTab, in the **Privacy** section, set the **Do not track web activity** option to **Yes**.

Retail			
RETAIL	RECEIPT	LOYALTY ENROLLMENT	PRIVACY
Amount charged, not posted 0.00	Receipt option Standard receipt	Block customer for loyalty enrollment <input type="radio"/> No	Disable personalization <input type="radio"/> No
Post as shipment <input type="radio"/> No	Receipt email _____		Do not track web activity <input type="radio"/> No

3. Select **Save**, and then close the page.

### Module-based opt-out experience

Administrators can let authenticated users opt out of web activity event collection by themselves. To provide this opt-out experience, add the user opt-out module to customer account profile pages.

### Custom extensions

Administrators can create their own extensions to manage the opt-out experience for users. For more information, see [Call Retail Server APIs](#) and [Online channel extensibility](#).

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Ways to add content

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview and links to documentation about how to manage content using the Microsoft Dynamics 365 Commerce site builder web authoring toolset.

## Overview

There are many ways to change the look, feel, and content of your site. Depending on the required level of customization, many of these changes can be implemented by non-developers within site builder, the web authoring toolset included with Dynamics 365 Commerce. Site builder enables you to build templates, select themes, and select and configure modules without writing any code. By contrast, development skills are required to create a new theme or module, because the e-Commerce software development kit (SDK) and the Microsoft Dynamics Lifecycle Services (LCS) deployment workflow must be used.

The following topics are good jumping off points to start understanding how to add and manage site content. Most of the topics listed focus on areas of your site that don't require a developer. Some address basic content editing, while others focus on site administrator tasks. Each of these topics will denote specific tasks might require SDK work. Each topic assumes that you have already provisioned a site and been granted access to the site builder toolset for your site.

Select one of the following topics to get started.

- To familiarize yourself with the content management terminology used in site builder and within this documentation, see [Page model glossary](#).
- To understand how modules work within content management workflows, see [Work with modules](#).
- To change the text, images, or video on an existing site page, see [Work with modules](#).
- To see how fragments can make content management more efficient and flexible, see [Work with fragments](#).
- To help ensure a successful on-brand authoring experience for web content authors, see [Templates and layouts overview](#) and [Work with templates](#).
- To rearrange sections on a site page, see [Work with layouts](#).
- To change the fonts, colors, and general look of site pages, see [Select a site theme](#) or [Work with CSS override files](#).
- To rearrange or add new navigation options, see [Customize site navigation](#).
- To learn how to stage, preview, and publish a broad set of concurrent web content changes, see [Work with publish groups](#).

# Page model glossary

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes the various elements that are used on the pages of a Microsoft Dynamics 365 Commerce site.

## Page element definitions

The following table provides a summary of terms that you should be familiar with when you change the look, feel, and content of your site. For more thorough explanations and procedures, follow the links.

TERM	DESCRIPTION AND NOTES
<a href="#">Module</a>	<p><b>Definition:</b> Modules are building block that can be authored and make up the skeleton of a webpage. Examples include header, hero, and carousel modules.</p> <p><b>Where it's selected:</b> Deployed modules can be selected and configured in various stages of the site authoring workflow, such as the template, layout, page, and fragment authoring stages.</p> <p><b>Where it's edited:</b> Custom modules are created in code by using the software development kit (SDK). They are then uploaded to your site, where they become available for selection.</p>
Module property	<p><b>Definition:</b> Module properties are specific settings that are defined by the module. They can be edited in the e-Commerce authoring tools. For example, module properties are used to set the heading and background image of a banner module.</p> <p><b>Where it's configured:</b> Module properties are selected and configured in the property pane that appears in the authoring environments (editors) for templates, layouts, pages, fragments, and app settings.</p>
<a href="#">Template</a>	<p><b>Definition:</b> Templates define the module combinations and options that should be used for a category of pages (for example, marketing pages, category pages, and product pages).</p> <p><b>Where it's selected:</b> Templates can be selected during page or layout creation workflows.</p> <p><b>Where it's edited:</b> Templates are authored in the template editor. No code is required to create or modify them.</p>

TERM	DESCRIPTION AND NOTES
<p>Layout</p>	<p><b>Definition:</b> Layouts define the final selection and arrangement of modules from the parent template's set of options. A layout can be configured for a single page (<i>custom layout</i>), or it can be shared by multiple pages (<i>preset layout</i>).</p> <p><b>Where it's selected:</b> Layouts can be selected during new page creation or when a different layout is required for an existing page.</p> <p><b>Where it's edited:</b> Layouts are authored in the layout editor. No code is required to create or modify them.</p>
<p>Page instance</p>	<p><b>Definition:</b> Page instances define the final, page-specific localized content for a single page. This content is derived from the values of module properties.</p> <p><b>Where it's selected:</b> Pages are selected when URLs are assigned.</p> <p><b>Where it's edited:</b> Pages are edited in the page editor. No code is required to create or modify them.</p>
<p>Theme</p>	<p><b>Definition:</b> Themes define the Cascading Style Sheet (CSS), and determine the look and feel of the modules that are rendered on a page.</p> <p><b>Where it's selected:</b> After a theme is uploaded to your site by using Microsoft Dynamics Lifecycle Services (LCS), it can be selected as a property of the page container module.</p> <p><b>Where it's edited:</b> Themes are currently created and edited by using the SDK. They are then uploaded to your site by using LCS.</p>
<p>Fragment</p>	<p><b>Definition:</b> Fragments are fully configured modules that have localized content that can be reused and centrally updated across multiple pages. For example, a fragment that is created from a header module can be used in all templates and on all pages across your site, and centrally updated in one place.</p> <p><b>Where it's selected:</b> Fragments can be selected wherever modules can be selected. They can be substituted for a module to help increase efficiency through reusable and centralized authoring.</p> <p><b>Where it's edited:</b> Fragments are edited in the fragment editor. No code is required to create or modify them.</p>

TERM	DESCRIPTION AND NOTES
URL	<p><b>Definition:</b> Uniform resource locators (URLs) are addresses that point to webpages or other URLs.</p> <p><b>Where it's selected:</b> URLs are selected if links between pages are required.</p> <p><b>Where it's edited:</b> URLs are edited in the URL editor. No code is required to create or modify them.</p>
Asset	<p><b>Definition:</b> Assets are file binaries that have an extension such as .jpg, .docx, .pdf, or .mpg.</p> <p><b>Where it's selected:</b> Assets are selected as module properties for modules that require them.</p> <p><b>Where it's edited:</b> Assets are uploaded, and associated metadata is edited in the asset manager.</p>

# Document states and lifecycle

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers the various document states of page elements in Microsoft Dynamics 365 Commerce.

## Document state descriptions

The [Page elements](#) topic lists various documents types in the content management system (CMS). These document types can have several states in the authoring tool. The document states help prevent data conflicts and enforce version control. They determine who can change the documents, when the documents can be changed, and when changes can be viewed by other people.

The following table shows the possible document states of page elements in Commerce.

DOCUMENT STATE	SITE BUILDER ACTION	DESCRIPTION
Checked out	Select <b>Edit</b> .	The applicable document is checked out to you. While a document is in this state, it can't be changed by other authenticated system users, and any changes that you make to the document are visible only to you.
Saved	Select <b>Save</b> .	Changes that have been made to a checked-out document are saved to the database, but the document isn't yet checked in or published. The saved changes aren't visible to other authenticated system users until the author selects <b>Finish editing</b> . They aren't visible to external users until the item is published.
Discarded check out	Select <b>Discard edits</b> .	All changes to the checked-out document are discarded, and the item reverts to the last version that was checked in.
Checked in	Select <b>Finish editing</b> .	The edited document is checked in. All changes are visible to other authenticated system users, and those users can then edit the document. Each check-in creates a document version record in the item's history.
Published	Select <b>Publish</b> .	The document is published, and the changes are pushed to your live site and become discoverable by external users. Items can be published only if they have first been checked in by selecting <b>Finish editing</b> .

# Work with publish groups

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes the publish groups feature in Microsoft Dynamics 365 Commerce.

## Overview

E-commerce websites are constantly updated with new content throughout the year. Updates are often published in batches around busy e-commerce events such as holidays, seasonal marketing campaigns, or promotional launches. These updates often require that groups of website content (for examples, pages, images, fragments, and templates) be staged, validated, and published concurrently in a single action.

The ability to group items into logical sets that publish items together, where each set has its own lifecycle, provides many advantages to site authors. In Commerce, these logical sets are known as publish groups. They let site authors track sets of updates as their own configurable, testable, and publishable entities.

Authors can preview updates in a staged publish group without affecting the live site or other self-contained publish groups. Authors can then schedule the publish action to simultaneously publish all the items in the publish group to the live site. The ability to group, preview, and schedule updates for publishing is important for many enterprise-level companies that generate considerable annual revenue around event-based site update milestones.

Companies can incur costs from slow or invalidated content rollouts that don't go smoothly. Publish groups help guarantee that launches are organized, validated, and published on time. Whether they are large or small, publish groups provide a valuable toolset that helps authors organize and simplify ongoing site update tasks.

## When to use publish groups

You can use publish groups whenever you must stage and publish multiple documents together. For example, if your website updates content every season, you can create publish groups for these seasonal marketing motions. Your "Autumn Seasonal Update" publish group might contain new seasonal images, fragments that have seasonal marketing messages, pages that include seasonal product collections, or other seasonal website updates.

An advantage of publish groups is that you can stage multiple updates in parallel. For example, soon after the update for the "Autumn Seasonal Update" publish group, there might be a content update for a specific holiday weekend. In this case, you can stage content for the "Autumn Seasonal Update" publish group at the same time that you stage content for a subsequent "Autumn Holiday Update" publish group. Each publish group contains its own unique set of pages, images, fragments, templates, and so on. You can stage, preview, and validate these two publish groups independently but on a concurrent timeline. Each publish group can then be scheduled to go live on your site at specific dates and times.

## Turn on the publish groups feature

The publish groups feature is optional and must be turned for your site.

To turn on the publish groups feature for your site in the Commerce authoring tools, follow these steps.

1. In the left navigation pane, select **Site Settings** to expand it.
2. Under **Site Settings**, select **Features**.
3. Set the **Publish groups** option to **On**.

# Create a publish group

To create a publish group for your site in the Commerce authoring tools, follow these steps.

1. In the left navigation pane, select **Publish Groups**.
2. In the top command bar, select **New**.
3. In the **Create Publish Group** dialog box, under **Publish Group Name**, enter a descriptive name. Then select **OK**.

## Set the publish group authoring context

In Commerce, the default authoring context is the live site context. The live site authoring context is the default view where you can view and make changes directly to your website without using a publish group. It represents the latest direct updates to the published version of your site. If the context control under **Publish Groups** in the left navigation pane shows the name **Live site**, you're working in the live site authoring context. **Live site** is the default name of the context control. Otherwise, the context control shows the name of a publish group.

To work in a publish group, you must switch to the publish group authoring context for it. To set the publish group context, follow one of these steps.

- In the left navigation pane, select the context control directly under **Publish Groups**, and then select the name of the publish group in the list of options that appears. The context control is renamed and shows the name of the publish group.
- In the left navigation pane, select **Publish Groups**, and then, under **Publish Groups**, select the name of the publish group. The context control is renamed and shows the name of the publish group.

After you set your publish group authoring context, you're working in that publish group context when you preview and edit site content.

To return to the default live site authoring context, select the context control, and then select **Live site**.

## Add pages or other items to a publish group

After you've selected a publish group authoring context, and the context control in the left navigation pane shows its name, you can create content just as you do in the default live site context. You can also add existing pages or other items from other publish groups, or from the live site context.

To copy existing pages to a publish group, follow these steps.

1. Select the authoring context to copy from, and then, in the left navigation pane, select **Pages**.
2. Select the page to add to a publish group.
3. In the command bar, select **Copy to Publish group**.
4. In the **Select a Publish Group** dialog box, select the publish group to add the page to, and then select **OK**.

You can use the same basic steps to create customized product pages, URLs, templates, layouts, fragments, and media library assets, or to add existing items of these types to a publish group.

## Validate a publish group

To make sure that all dependencies in publish group content are satisfied, and that all validations are passed, you can run validation to identify any issues that must be addressed before you schedule a publish action.

To validate your publish group before you schedule it, follow these steps.

1. In the left navigation pane, select **Publish Groups**.

2. Select the publish group to validate.
3. In the command bar, select **Validate**.

Validation is run on all content in the publish group. Any issues that will prevent a successful publish action are shown in a notification box that appears in the upper right.

#### **NOTE**

Validation is always run automatically when a publish group is scheduled. However, the **Validate** button in the command bar is useful because it helps identify issues that you must fix before you try to schedule a publish group to go live.

## Schedule a publish group to go live

To schedule a publish group to go live on your site, follow these steps.

1. In the left navigation pane, select **Publish Groups**.
2. Under **Publish Groups**, select the publish group to schedule.
3. In the command bar, select **Edit Schedule**. The **Edit Schedule** dialog box appears.
4. Select the date and time when your publish group should go live, and then select **OK**.

To unschedule a publish group, follow the same steps, but select **Unschedule publish group** in the **Edit Schedule** dialog box.

#### **NOTE**

Very large publish groups might take up to a minute or two to be published when their scheduled time arrives. Be aware that a publish action isn't instantaneous, and that smaller publish groups will be published faster.

## Publish groups FAQ

### How many items can be in a publish group?

Currently, there is a limit of 2,000 items per publish group. Be aware that very large publish groups might take several minutes to be published when their scheduled time arrives.

### Are publish groups like code "branches" in software development terminology?

Yes and no. Publish groups can be thought of as forked versions of your site. In that way, they do act like branches. However, there is no concept of a merge at the level of individual items. The item that is published last just overwrites what previously existed, and the most recent publish action always supersedes previous publish actions.

### Can I schedule two publish groups to go live at the same time?

No. For performance and conflict reasons, the system will force you to stagger scheduled publish groups at least five minutes apart.

### Can I use publish groups to schedule omnichannel back-office items, such as discounts and product updates?

Currently, the publish groups feature supports only website content. However, Microsoft is aware that integration with back-office merchandising scenarios could be valuable for the coordination and automation of omnichannel campaign launches.

# Enable and use cross-channel sharing

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to enable and use the cross-channel sharing feature of Microsoft Dynamics 365 Commerce site builder.

## Overview

Cross-channel sharing lets retailers reuse and share content among multiple channels of a site. This capability is useful when the site channels have a compatible base language, or when they have numerous content items in common.

Cross-channel sharing works by enabling a default channel that will be searched for available content when a channel-specific version of the requested content isn't found. Content that is intended to be shared among channels is created in the default channel. That content can be localized for any locale that is used on any site channel.

## When to use cross-channel sharing

Cross-channel sharing is useful when multiple channels on a single site can share content. For example, a retailer that has multiple brands and storefronts that are grouped under a single site can share some content among some or all of the storefronts. This shared content can include pages for terms and conditions, payment terms, shipment methods, and frequently asked questions (FAQ).

Cross-channel sharing also supports fragments. Therefore, a content page that contains channel-specific fragments can be created as cross-channel content. In this case, although most of the content will be shared among channels, channel-specific fragments on a cross-channel page will be rendered only when they are requested from the corresponding storefront channel.

Sites that have only one channel, or sites that have multiple channels that can't share content, won't benefit from cross-channel sharing.

## Enable cross-channel sharing

Cross-channel sharing is enabled at the site level. This operation is one-way. In other words, after cross-channel sharing is enabled, it can't be disabled.

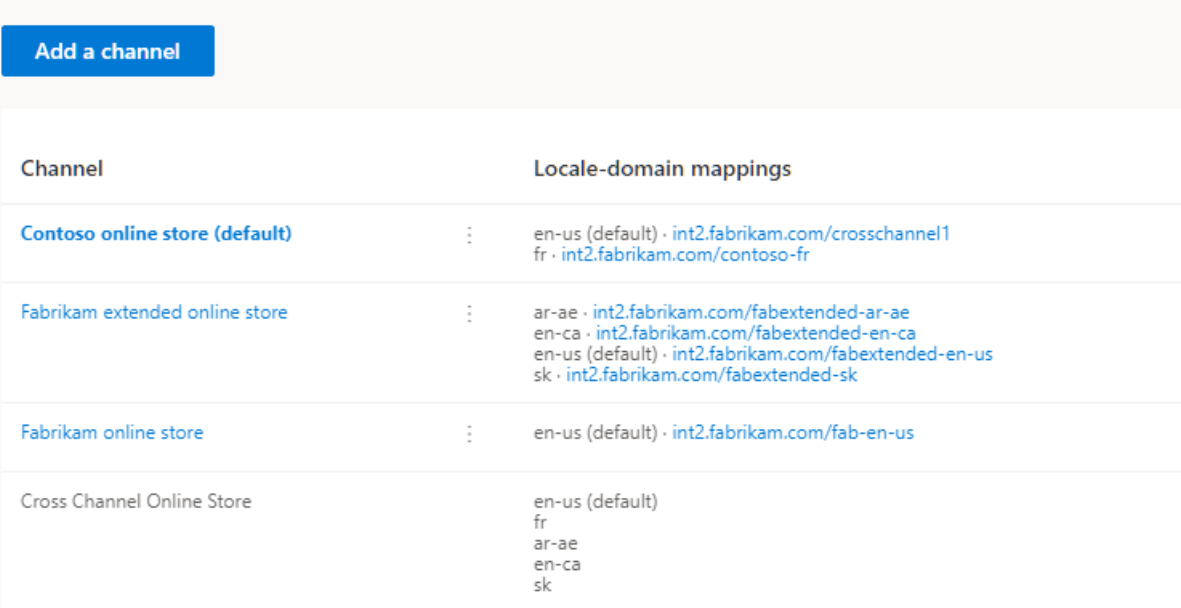

To enable cross-channel sharing in Commerce site builder, follow these steps.

1. Go to **Site settings > Features**.
2. Set the option for the **Cross Channel** feature to **On**.

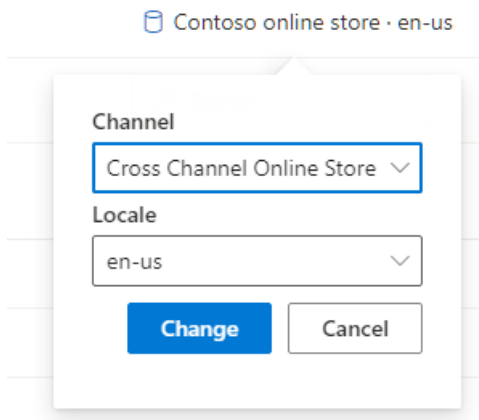

After you enable cross-channel sharing, cross-channel information will appear in the **Channels** section at **Site settings > Features**, as the example in the following illustration shows.

## Channels

Channel	Locale-domain mappings
Contoso online store (default)	en-us (default) · <a href="https://int2.fabrikam.com/crosschannel1">int2.fabrikam.com/crosschannel1</a> fr · <a href="https://int2.fabrikam.com/contoso-fr">int2.fabrikam.com/contoso-fr</a>
Fabrikam extended online store	ar-ae · <a href="https://int2.fabrikam.com/fabextended-ar-ae">int2.fabrikam.com/fabextended-ar-ae</a> en-ca · <a href="https://int2.fabrikam.com/fabextended-en-ca">int2.fabrikam.com/fabextended-en-ca</a> en-us (default) · <a href="https://int2.fabrikam.com/fabextended-en-us">int2.fabrikam.com/fabextended-en-us</a> sk · <a href="https://int2.fabrikam.com/fabextended-sk">int2.fabrikam.com/fabextended-sk</a>
Fabrikam online store	en-us (default) · <a href="https://int2.fabrikam.com/fab-en-us">int2.fabrikam.com/fab-en-us</a>
Cross Channel Online Store	en-us (default) fr ar-ae en-ca sk

Additionally, after you enable cross-channel sharing, the **Channel** field in the upper right of Commerce site builder will include a **Cross Channel Online Store** option that you can use to manage cross-channel content, as shown in the following illustration.

## Create and use cross-channel content

You can create and use cross-channel content in multiple ways. For example, you can create cross-channel fragments, create cross-channel pages that use cross-channel and channel-specific content, and override cross-channel fragments with channel-specific versions of fragments.

### Create a cross-channel fragment

To create a cross-channel fragment in Commerce site builder, follow these steps.

1. Go to **Fragments**, and select **New** to create a new fragment.
2. In the **New fragment** dialog box, select the **Promo banner** module, and then, under **Fragment name**, enter a name (for example, **Cross-channel banner**). Then select **OK**.
3. In the property pane for the **Promo banner** module, select **Add Message**, and then select **Message**.
4. In the **Message** dialog box, under **Text**, enter **Cross-channel**, and then select **OK**.

5. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

This cross-channel fragment can be used on cross-channel or channel-specific pages that are created on any site channel.

### Create a cross-channel page that uses cross-channel content

Cross-channel pages can be used on any channel of your site. Therefore, you can create a shared content page one time and make any subsequent updates in a single place. For example, a cross-channel **Terms and conditions** page that has the URL `/toc` can be shared among all the channels of a site. If the base URLs for the site channels are `www.fabrikam.com/brand1` and `www.fabrikam.com/brand2`, the same cross-channel, shared **Terms and conditions** page will be available from both site channel URLs, at `www.fabrikam.com/brand1/toc` and `www.fabrikam.com/brand2/toc`, respectively. If the **Terms and conditions** page must be updated later, you have to update only the single, shared page.

To create a cross-channel page in Commerce site builder that uses cross-channel content, follow these steps.

1. Go to **Pages**, and select **New** to create a new page.
2. In the **Choose a template** dialog box, select a template, such as **Marketing**.
3. Under **Page name**, enter a name for the page (for example, **Cross-channel page**).
4. Under **Page URL**, enter a page URL (for example, **examplepage**), and then select **OK**.
5. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add fragment**.
6. In the **Add fragment** dialog box, select the cross-channel fragment that you created earlier that has a promo banner, and then select **OK**.
7. Select **Save**, and then select **Preview** to preview the page. You should see the promo banner that says, "Cross-channel."
8. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

### Create a channel-specific page that uses cross-channel content

By using cross-channel content on channel-specific pages, you can create a shared content fragment one time and then use it on channel-specific pages. This "single sourcing" is useful for shared content such as terms and conditions, payment terms, or contact information.

To create a channel-specific page in Commerce site builder that uses cross-channel content, follow these steps.

1. From within a specific channel, such as **Fabrikam extended online store**, go to **Pages**, and then select **New** to create a new page.
2. In the **Choose a template** dialog box, select a template, such as **Marketing**.
3. Under **Page name**, enter a name for the page (for example, **Channel-specific page**).
4. Under **Page URL**, enter a page URL (for example, **channelspecificpage**), and then select **OK**.
5. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add fragment**.
6. In the **Add fragment** dialog box, under **Channel**, select **Cross Channel Online Store**. The cross-channel fragment that you created earlier should appear in the list. Select it, and then select **OK**.
7. Select **Save**, and then select **Preview** to preview the page. You should see the promo banner that says, "Cross-channel."
8. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

### Create a channel-specific version of a cross-channel page

Cross-channel sharing supports overrides of cross-channel content. For example, all but one of your site channels share the same piece of content. That one site channel requires different content. To implement the different content for it, you override the cross-channel content with channel-specific content by creating a channel-specific version of the cross-channel page.

To create a channel-specific version of a cross-channel page in Commerce site builder, follow these steps.

1. In the **Channel** field in the upper right, select **Cross Channel Online Store**.
2. Open the cross-channel page that you created earlier.
3. In the **Channel** field in the upper right, select the channel that should have specific content. The page editor shows a message that prompts you to create a new page variant.
4. Select **Create page variant**.
5. In the **Main** slot of the page variant, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Promo banner** module, and then select **OK**.
7. In the property pane for the **Promo banner** module, select **Add Message**, and then select **Message**.
8. In the **Message** dialog box, under **Text**, enter **Channel-specific**, and then select **OK**.
9. Select **Save**, and then select **Preview** to preview the page. You should see the promo banner that says, "Channel-specific."
10. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

Now, if you use the base URL of the channel and go to the URL of the cross-channel page on that site, you will see the channel-specific content instead of the cross-channel content.

# Add a logo

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add a logo to your site in Microsoft Dynamics 365 Commerce.

## Overview

When you build your site, one of the first things that you will probably do is add your company or brand logo to the site's header. The Dynamics 365 Commerce online module library provides a module that makes this task easy.

You can add a logo directly to a template, layout, or page. In this way, you can easily change the logo that appears on specific pages or groups of pages. However, this topic covers the most frequent scenario, where you add your logo to a header fragment that can be reused across all the pages of your site.

## Prerequisites

Before you can add a logo to all the pages of your site, you must complete these tasks.

1. Upload your logo to the Media Library.
2. Create a header fragment. For more information about how to create and use fragments, see [Work with fragments](#).
3. Include the header fragment in the template that the pages of your site use for their layout and module options. For more information about templates, see [Work with templates](#).

## Add a logo to a header fragment

To add a logo to the header fragment for your site, follow these steps.

1. In the navigation pane on the left, select **Fragments**.
2. Select the header fragment that you created, and then select **Edit**.
3. Expand the header module.
4. In the property pane for the header module, provide an image and link for the logo.
5. Save the header fragment, finish editing it, and publish it.

After you publish the updated header fragment, all site pages that use the template that contains the header fragment will show your logo.

# Select a site theme

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set or change your site's theme in Microsoft Dynamics 365 Commerce.

## Overview

A site's layout and style (for example, fonts, sizes, and colors) are defined by the theme that you select and apply to the site. A theme is created and deployed by a developer at your company. For an overview of themes, see [Theming overview](#). For more information about how to create and deploy themes, see [Create a new theme](#).

By default, when you first create a site, it uses a theme that is named **Fabrikam**. This default theme is provided as part of the Commerce module library. After you've deployed additional themes for your site, you can configure the site so that it uses one of them instead.

## Select the site theme

To select the theme that is applied to your site, follow these steps.

1. In the site authoring environment, go to your site.
2. Go to **Site Management > Extensibility**.
3. Under **Theme**, select a theme on the drop-down menu.
4. To apply the selected theme to your site, select **Save and publish**.

### NOTE

The theme that you select is published to your site as soon as you select **Save and publish** on the **Extensibility** page. To preview a theme on your site before you apply it, you can use your development or sandbox environment.

# Work with CSS override files

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes why, when, and how to use Cascading Style Sheets (CSS) override files in Microsoft Dynamics 365 Commerce.

## Overview

Permanent site styles should usually be handled through a site's theme. Themes provide the foundational CSS and style settings for the modules on any page of your site. Themes are created by using the Dynamics 365 Commerce online software development kit (SDK), and they are deployed to your websites through Microsoft Dynamics Lifecycle Services (LCS). Theme debugging capabilities and module interface configurations in the SDK help site developers create customizable and cohesive site design packages. When these design packages are deployed to a site, site authors can focus on creating, editing, and publishing content instead of site development.

Given the usual lifecycle of a theme, the dependency on developers to make style changes through the SDK and LCS deployment pipeline can be prohibitive in some scenarios. Site prototypes or hotfixes can seem cumbersome if the SDK isn't configured, or if you don't have time to wait for an LCS deployment.

In these scenarios, CSS override files can help. In the Commerce authoring tools, authenticated users can upload a CSS file, preview it, and then activate it to override a site's theme. The overhead of SDK or LCS deployment isn't required. The overrides that are specified in a CSS override file can be as small as a change to a single text style or as wide-ranging as a complete brand overhaul.

Before you use CSS override files, be aware of the following limitations:

- Only one CSS override file can be active on a site at a time. Therefore, all active overrides must be present in a single override file.
- Although you can preview the overrides in the Commerce authoring tools, there are no dedicated debugging features to help identify any bugs that the overrides introduce. In other words, when you use CSS override files, you don't have the same toolset that the SDK provides for module and authoring validation.

Nevertheless, CSS override files provide a quick way to prototype a design or implement a hotfix before a full theme update is developed and deployed.

## Create a CSS override file

To create a CSS override file, you can use any integrated development environment (IDE), text editor, or source code editor. A typical approach is to use standard web debuggers in your browser to identify style selectors, properties, and values on your existing site. Most browsers let you change values and preview them in the debugger. After you've identified the changes that you want to make, you can save them to your own CSS file.

## Upload a CSS override file

To upload a CSS file to your site in Commerce, follow these steps.

1. In the authoring tools, go to your site.
2. In the navigation pane on the left, select **Design**.

#### NOTE

Depending on the version of the Commerce authoring tools that you're using, you might have to expand **Settings** in the navigation pane before you can select **Design**.

3. At the top of the main design pane, select the **CSS override** tab, if it isn't already selected.
4. Under **Available CSS overrides**, select **Upload CSS file**. A File Explorer window appears.
5. In File Explorer, browse to and select a CSS file, and then select **Open**. The uploaded CSS file now appears under **Available CSS overrides**.

## Preview a CSS override file

To preview a CSS override file before you make it active on your live site, follow these steps.

1. In the navigation pane on the left, select **Design**, and then, on the **CSS override** tab, under **Available CSS overrides**, find the CSS file that you want to preview.
2. Next to the CSS file name, select **Preview site**.
3. In the **Select a URL** dialog box, select the URL of the site that you want to see the override applied to, and then select **OK**.
4. If there are multiple variants for the selected URL, select the desired variant in the **Preview variations** dialog box that appears.

A new browser tab or window is opened, where you can validate your style overrides against your site. You can then share the URL with other authenticated Commerce users for review and feedback.

## Activate a CSS override file on your live site

After you've previewed and approved the CSS override file, you can activate it on your live site.

#### NOTE

Only one CSS override file can be active on your site at a time. If you activate a new override file, the previous override file is inactivated. Therefore, make sure that all required overrides are present in a single CSS override file.

To activate a CSS override file, follow these steps.

1. In the navigation pane on the left, select **Design**, and then, on the **CSS override** tab, under **Available CSS overrides**, find the CSS file that you want to activate.
2. Under the CSS file name, select **Activate**. The override file immediately becomes active on your live site.

## Deactivate a CSS override file on your live site

To deactivate a CSS override file on your site, follow these steps.

1. In the navigation pane on the left, select **Design**, and then, on the **CSS override** tab, under **Available CSS overrides**, find the CSS file that you want to deactivate.
2. Under the CSS file name, select **Deactivate**. The override file immediately becomes inactive on your live site.

**TIP**

To access additional options for CSS override files, select the ellipsis (...) next to the CSS file name. The **Download**, **Rename**, and **Replace** options are useful for quick changes to an existing CSS override file.

# Work with style presets

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to work with site style presets in Microsoft Dynamics 365 Commerce site builder.

## Overview

A style preset is a stored set of all authorable style values across a site's theme. It can be used to immediately change the look of a site from site builder. Style presets let Commerce site builder authors quickly change, preview, and activate a set of style values across their site, without having to use Cascading Style Sheets (CSS) or deploy themes. Font styles, button styles, and site colors are typical examples of style variables that can be managed through style presets.

The set of style variables that is available in a site is determined by the theme and module library that is deployed to a site's tenant. The Dynamics 365 Commerce online software development kit (SDK) lets developers implement as many (or as few) authorable style variables as they require for a given theme. By enabling more style variables, a theme developer can put final choices about site styles into the hands of site builder authors. Therefore, non-developers can update and preview site styles by using the toolset. The capability is also useful for any scenario where direct changes to themes or CSS will cause unnecessary overhead.

Themes where authorable style variables are enabled require a default style preset. They can optionally include additional preset options as part of a deployed theme package. For example, a theme can be deployed that has a single default "modern light" style preset. Alternatively, it might include additional style preset options besides the default preset, such as "modern dark," "vintage light," or "vintage dark." These built-in theme presets are created by developers and can be used as starting points for new site designs.

In site builder, authors can select among a theme's built-in presets, or they can create their own style presets and customizations by using the enabled style variables. A style preset can be previewed in site builder before it's activated on the live site. After an author's style changes are reviewed, the style preset can then be set to "active" for the live site.

## Preview a style preset

To preview a style preset on your site in site builder, follow these steps.

1. In the left navigation pane for your site, go to **Site Settings > Design**.
2. On the **Style presets** tab at the top of the design editor, in the **Available presets** list, select a preset, and then select **View** to go to the preset editor.

If there are currently no presets in the **Available presets** list, see [Create a custom style preset](#) for information about how to create a custom style preset.

### NOTE

Presets that were included with the theme are indicated by a **Built-in** badge. These built-in presets are read-only. To copy a built-in preset as a new customizable preset, select the ellipsis button (...) for the preset, and then select **Save as**.

3. On the command bar, select **Preview**.
4. Select a URL from your site to use to preview the style preset, and then select **OK**.

5. Select the channel-specific and locale-specific URL variant to preview by selecting the variant's name. A new preview browser window is opened, where the selected style preset is applied to the specified page.

#### NOTE

The preview URL is persistent and authenticated. Therefore, you can copy, paste, and send it to other authenticated co-workers for review before you set it to "active" on your live site. The preview URL is also useful for checking styles on different devices, in different browsers, and on different screens.

#### TIP

While you edit a style preset, you might find it helpful to leave the preview browser window for it open in a separate browser window, so that you can quickly validate your changes. After you save your changes to a preset, refresh the open preview browser window to validate the user experience.

## Create a custom style preset

To create a custom style preset in site builder, follow these steps.

1. In the left navigation pane for your site, go to **Site Settings > Design**.
2. On the **Style presets** tab at the top of the design editor, on the command bar, select **New preset**.
3. Enter a name and description for the new preset, and then select **Save**. A new customizable preset is created that uses the theme's default values as a starting point.

#### NOTE

You can also create a new custom style preset from any existing preset by selecting the ellipsis button (...) for that preset and then selecting **Save as**. Alternatively, select **Save as** on the command bar in the preset editor.

## Modify global and module type style values

Some of a theme's style variables are shared among multiple module types. These style variables are referred to as *global* style variables. Examples include primary site colors, default font styles, and button styles. By setting global variables, you might change the look across many different module types.

Some style values can be unique to a module type, or they might have to optionally override a default global value. If a site's theme has implemented module type style variables, site builder authors can customize the style of a module type independently of the global settings. Module type variables can either augment or override the global style variables in a theme.

#### NOTE

The hierarchy of style values in a site behaves in the following manner. Style values that appear farther to the right override the style values to the left of them.

Theme default values < Global style values < Module type style values < CSS override

To change a style preset's global or module type values in site builder, follow these steps.

1. In the left navigation pane for your site, go to **Site Settings > Design**.
2. On the **Style presets** tab at the top of the design editor, select **View** for any style preset to go to the preset editor.

3. Select **Preview**, and then follow the URL selection steps to open a full-browser-window preview for your preset. Leave this preview browser window open.
4. In the preset editor, select **Edit** in the upper right.
5. Use the style variable controls in the editor to change some global style values.
6. At the top of the editor, on the **Modules** tab to the right of the **Global** tab, select a module type that must be styled.
7. Use the style controls to change some values for the module type.
8. When you're ready to preview your changes, select **Save** on the command bar.
9. Return to the open preview browser window, and refresh it. The full-browser-window preview is useful for checking style changes at different view breakpoints, in different browsers, and on different device platforms.
10. When all changes have been completed and validated, select **Finish editing** in the upper right of the editor.

#### NOTE

If you're editing the style preset that is currently active on your site, you will see a blue **Active** badge in the editor. This badge indicates that the preset is currently live on your website. If you change the active preset, select **Publish** to push those changes to your live site.

## Make a new style preset active on your live site

To set a style preset as the new active preset on your site, follow these steps.

- Select the **Set as active button** in one of these places:
  - The command bar in the style preset editor
  - The ellipsis menu (...) for any available preset in the main view on the **Style presets** tab at **Site Settings > Design**

The preset's style values are made active across your public-facing website.

# Add a favicon

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to add a favicon to your site.

## Overview

A favicon is a small graphics file that is shown on a web browser tab, in the Address bar, in the browsing history, and in bookmarks or favorites, among other places. We recommend that you add a favicon to your site, because it represents and reinforces your brand, and helps distinguish your site from other sites that your customers visit.

Although you can add multiple favicons of various sizes and file types to your site, this topic shows how to add a single favicon. However, the same process and location are used to add more favicons.

## Upload a favicon to your site's asset collection

To upload a favicon to your site's asset collection, follow these steps.

1. In the left navigation pane, select **Media Library**.
2. On the command bar, select **Upload > Upload Media Items**.
3. In the File Explorer window, browse to the favicon image file that you want to upload, select it, and then select **Open**.
4. In the **Upload Media Item** dialog box, enter the required title and alt text.
5. If you want to publish the image immediately after upload, select the **Publish media items after upload** check box.

### NOTE

If you don't select the **Publish media items after upload** check box, you must return to **Media items** page and manually publish the favicon later.

6. Select **OK**.
7. In the property pane on the right, copy the public URL of the favicon. You will use this URL later.

## Create the HTML for your favicon

To create the HTML for the favicon, use the following HTML string. For the **href** attribute, replace **Public\_URL\_for\_your\_favicon** with the public URL that you copied earlier.

```
<link rel="shortcut icon" href="Public_URL_for_your_favicon">
```

## Create a fragment that contains a metatag for your favicon

To create a fragment that contains a metatag for your favicon, follow these steps.

1. Go to **Fragments**, and select **New**.
2. In the **New fragment** dialog box, select **Metatags** as the module that the fragment is based on.

3. Enter a name for the fragment, and then select **OK**.
4. In the fragment hierarchy tree, select the **Default metatags** child.
5. In the right pane, under **Meta Tags**, select **Add**, and then enter the HTML string that you created earlier for the favicon.
6. Select **Finish editing**, and then select **Publish** to publish the fragment.

## Add the metatag fragment to the HTML head section of your pages

To add the metatag fragment to the HTML **head** section of your pages, follow these steps.

1. Go to **Templates**, open the template for the pages that you want to add your favicon to, and then select **Edit**.
2. In the template hierarchy tree, select the ellipsis (...) button to the right of the **HTML head** container, and then select **Add fragment**.
3. In the **Select fragment** dialog box, select the metatag fragment that you created earlier, and then select **OK**.
4. Select **Finish editing**, and then select **Publish** to publish the template.

### NOTE

If your site uses more than one template, you must add the metatags fragment to all of them.

When you preview pages that are based on the template that you added the metatags fragment to, you should now see the favicon on the browser tab.

# Add a welcome message

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add a welcome message to your Microsoft Dynamics 365 Commerce website.

## Overview

A welcome message on your e-Commerce website can inform visitors about ongoing sales, site updates, or availability of seasonal collections. The welcome message is set by using the alert module.

The alert module should be added to the **Error/Information messages** slot of the header fragment. The alert module lets you specify the text that is shown, the text color, and the alignment. It also lets you specify whether visitors to the site can dismiss the message.

When a welcome message is added to a shared header fragment, it will be shown on every page that uses the template where that shared header fragment is used.

To add a welcome message to your site, follow these steps.

1. In Commerce site builder, go to your site.
2. Select **Fragments**.
3. Select the header fragment to add the message to.
4. In the outline tree, expand **Error/Information messages**.
5. Select the alert module, and then select **OK**. If an alert module doesn't yet exist, first select the ellipsis button (...) next to **Error/Information messages**, and then select **Add module**.
6. In the property pane on the right, on the **Data** tab, select **Add Data Source**, and then select **Content**.
7. In the **Input Text** field, enter the text of the welcome message.
8. Select **Save**, select **Finish editing** to check in the header fragment, and then select **Publish** to publish it.

The welcome message will now appear at the top of every site page that uses the selected header fragment.

# Add a copyright notice

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add a copyright notice to your e-Commerce website.

## Prerequisites

Before you can add a copyright notice to your site, you must have the following items:

- A template that includes a shared footer fragment.
- A page that uses that template.

## Add a copyright notice

To add a copyright notice to the bottom of every page that uses a specific template, follow these steps.

1. Go to **Fragments**, and then select **New**.
2. In the **New fragment** dialog box, select the **Footer** module, and name the fragment. For example, enter **Footer-Copyright**.
3. Select **OK**.
4. In the navigation pane, select the ellipsis button (...) next to **Footer**, and then select **Add Module**.
5. In the dialog box, select **Footer category**, and then select **OK**.
6. In the navigation pane, select the ellipsis button next to **Footer category**, and then select **Add Module**.
7. In the dialog box, select **Text block**, and then select **OK**.
8. In the navigation pane, select **Text block**.
9. In the properties pane on the right, in the **Paragraph** field, add your copyright message. For example, enter **(C) Fabrikam 2019**.
10. Select **Save**, select **Finish editing**, and then select **Publish**.
11. Go to **Templates**, select the template, and then select **Edit**.
12. Under **Page Outline**, expand **Body**, and then expand **Default Page**.
13. Select the ellipsis button next to **Footer Slot**, and then select **Add Fragment**.
14. Select the fragment that you created earlier, and then select **Select**.
15. Select **Finish editing** to check in the template, and then select **Publish** to publish it.

The footer that contains the copyright notice automatically appears at the bottom of all pages that use the selected template.

# Add languages to your site

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to add support for additional languages to a Microsoft Dynamics 365 Commerce site.

## Overview

You can localize your website into any language that Commerce supports. (The list of supported languages appears later in this topic.) To add a language on your website, you must first add it to an online store that is bound to your site.

## Add a language to an online store

To add a language to an online store, follow these steps.

1. Open the Dynamics 365 Commerce environment for your site.
2. Go to **Retail and Commerce > Channels > Online stores** to access the list of online stores that are configured for your environment. Alternatively, enter **online stores** as a search term.
3. Select the online store to add a language for.
4. On the **Languages** FastTab, select **Add**.
5. In the **Language** field, select the language to add.

The language that you added will now be available so that you can configure your site to use it in the site authoring environment.

# Add script code to site pages to support telemetry

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to add client-side script code to your site pages to support the collection of client-side telemetry.

## Overview

Web analytics are an essential tool when you want to understand how your customers interact with your site and make decisions that will help optimize the experience for maximum conversion. Many web analytics packages are available to help you achieve these goals, such as Google Analytics, Clicky, Moz Analytics, and KISSMetrics. Most web analytics packages require that you add client-side script code in the `<head>` element of the HTML for all pages of your site.

### NOTE

The instructions in this topic also apply to other custom client-side functionality that Microsoft Dynamics 365 Commerce doesn't natively offer.

## Create a reusable fragment for your script code

A fragment allows you to reuse inline or external script code across all pages on your site, regardless of the template they use.

### Create a reusable fragment for your inline script code

To create a reusable fragment for your inline script code in site builder, follow these steps.

1. Go to **Fragments**, and then select **New**.
2. In the **New fragment** dialog box, select **Inline script**.
3. Under **Fragment name**, enter a name for the fragment, and then select **OK**.
4. Under the fragment that you created, select the **Default inline script** module.
5. In the property pane on the right, under **Inline script**, enter your client-side script. Then configure other options as you require.
6. Select **Save**, and then select **Finish editing**.
7. Select **Publish**.

### Create a reusable fragment for your external script code

To create a reusable fragment for your external script code in site builder, follow these steps.

1. Go to **Fragments**, and then select **New**.
2. In the **New fragment** dialog box, select **External script**.
3. Under **Fragment name**, enter a name for the fragment, and then select **OK**.
4. Under the fragment that you created, select the **Default external script** module.
5. In the property pane on the right, under **Script source**, add an external or relative URL for the external script source. Then configure other options as you require.
6. Select **Save**, and then select **Finish editing**.
7. Select **Publish**.

#### NOTE

If content security policy (CSP) is enabled for your site, ensure that all external URLs are added to the `script-src` CSP directive in Commerce site builder. For more information, see [Manage Content Security Policy \(CSP\)](#).

## Add a fragment that includes script code to a template

To add a fragment that includes script code to a template in site builder, follow these steps.

1. Go to **Templates**, and open the template for the pages that you want to add your script code to.
2. In the left pane, expand the template hierarchy to show the **HTML Head** slot.
3. In the **HTML Head** slot, select the ellipsis button (...), and then select **Add fragment**.
4. Select the fragment that you created for your script code.
5. Select **Save**, and then select **Finish editing**.
6. Select **Publish**.

## Add an external script or inline script directly to a template

If you want to insert an inline or external script directly into a set of pages that are controlled by a single template, you don't have to create a fragment first.

### Add an inline script directly to a template

To add an inline script directly to a template in site builder, follow these steps.

1. Go to **Templates**, and open the template for the pages that you want to add your script code to.
2. In the left pane, expand the template hierarchy to show the **HTML Head** slot.
3. In the **HTML Head** slot, select the ellipsis button (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select **Inline script**.
5. In the property pane on the right, under **Inline script**, enter your client-side script. Then configure other options as you require.
6. Select **Save**, and then select **Finish editing**.
7. Select **Publish**.

### Add an external script directly to a template

To add an external script directly to a template in site builder, follow these steps.

1. Go to **Templates**, and open the template for the pages that you want to add your script code to.
2. In the left pane, expand the template hierarchy to show the **HTML Head** slot.
3. In the **HTML Head** slot, select the ellipsis button (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select **External script**.
5. In the property pane on the right, under **Script source**, add an external or relative URL for the external script source. Then configure other options as you require.
6. Select **Save**, and then select **Finish editing**.
7. Select **Publish**.

# Work with modules

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes how and when to use modules in Microsoft Dynamics 365 Commerce.

## Overview

Modules are logical building blocks that make up your page structure, and they have various purposes and scopes. Some modules are high-level containers, and their only purpose is to hold and organize other modules (child modules). Other modules, such as a simple image placement module, have a very specific purpose. Other modules, such as a carousel module, fall somewhere between those two categories.

By default, your Dynamics 365 Commerce site includes a module library that lets you achieve most basic e-Commerce scenarios. You should be able to construct an end-to-end e-Commerce site just by using these modules. However, you might also want to customize these modules or build new, custom modules for specific needs. If you want to build custom modules, a module design software development kit (SDK) is available to help you create a custom module library.

## Container modules and slots

As was mentioned earlier, some modules are designed to hold child modules. These modules are known as *containers*, and they allow for hierarchies of nested modules. Container modules include *slots*. Slots are used to handle the layout and purpose of child modules in the container. An example is a basic page container module (a top-level module for any page) that defines several important slots:

- A header slot
- A sub-header slot
- A main slot
- A footer slot
- A sub-footer slot

The module's developer defines these slots, and determines which child modules and how many child modules can be put directly inside it. For example, the header slot might support only one module of the **Header Module** type, whereas the body slot might support an unlimited number of modules of any type (except other page container modules).

In the authoring tools, page authors don't have to know in advance which modules can and can't be put in each slot. When page authors select a slot and then try to select a module to add to it, they see a filtered view of module types that are supported for that slot.

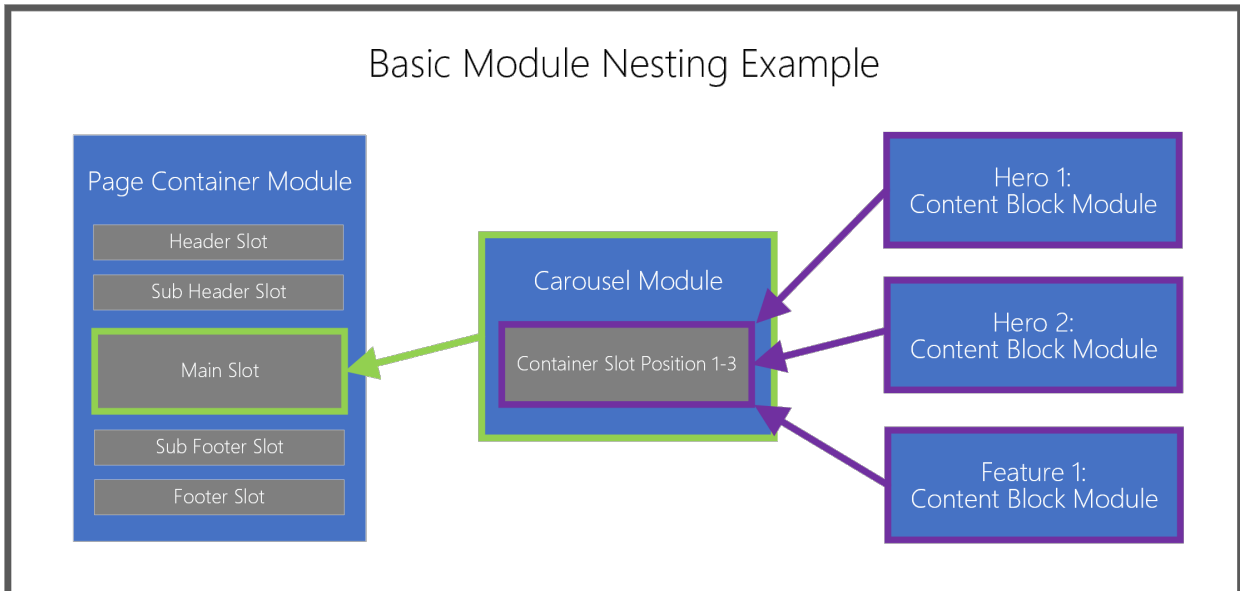

## Content modules

Content modules contain content and media elements, such as text (for example, headlines, paragraphs, and links) or asset references (for example, images, video, and PDFs). Typical content module types include content block, text block, and promo banner modules. Modules of these three types can contain text or media, and they don't require any child modules to make something visible on a page.

The majority of typical, day-to-day page and content authoring activities involve content modules, primarily because these modules define the actual content that is rendered in their parent container modules. Many content modules are available, and these modules are typically the last pieces that you will add to a page's hierarchy of nested modules.

The following illustration shows how modules are nested inside parent container module slots.

## Add or remove modules

The following procedures describe how to add and remove modules.

### Add a module

To add a module to a slot or container on a page, follow these steps.

1. In the outline pane on the left or directly in the main canvas, select a container or slot to which a child module can be added.

#### NOTE

The module designer defines the list of modules types that can be added to a specific module slot. Template authors can then refine the allowed module options to help guarantee consistent search engine optimization (SEO) and authoring efficiency for all the pages that are built from a specific template. When adding a module to a slot, the **Add Module** dialog box is automatically filtered so that it shows only modules that are supported in the selected container or slot. This list of allowed modules is determined by the page's template or the container's module definition.

2. If using the outline pane, select the ellipsis (...) next to the module name, and then select **Add Module**. If using the controls directly within the canvas, select the plus symbol (+) in an empty slot or adjacent to the currently selected module, and then select **Add Module**.

#### NOTE

If a container or slot doesn't support new child modules, the **Add Module** option is unavailable.

3. In the **Add Module** dialog box, select a module to add to your page.

#### TIP

**Content block** is a good module type for beginners to work with.

4. Select **OK** to add the selected module to the selected container or slot on your page.

### Remove a module

To remove a module from a slot or container on a page, follow these steps.

1. In the outline pane on the left, select the ellipsis (...) next to the name of the module to be removed, and then select the trash can symbol. Alternately, in the main canvas you can select the trash can symbol on a selected module's toolbar.
2. When prompted to confirm that you want to remove the module, select **OK**.

## Move a module to a new position

To move a module to a new position within your page, use any of the following methods.

### Move a module using the outline pane

To move a module using the outline pane, follow these steps.

1. Select and hold the module you want to move in the outline pane, then drag the module to a new position in the outline. The blue line in the outline and on the canvas indicates where the module can be placed.
2. Release the module to drop it into the new position.

### Move a module directly within the canvas

To move a module directly within the canvas, follow these steps.

1. Select the module you want to move in the canvas.
2. Select either an upward or downward pointing arrow symbol in the module's toolbar, and then drag the arrow to a new position on the page. The blue line in the canvas and outline indicates where the module can be placed. If a module cannot be moved up or down, that arrow symbol will be grayed out.
3. Release the module to drop it into the new position.

### Move a module using the ellipsis menu

To move a module using the ellipsis menu, follow these steps.

1. Select a module in either the outline or the canvas.
2. Select the ellipsis (...) next to the module's name in the outline pane, or in the module's toolbar in the canvas.
3. If the module can be moved up or down within the container or slot, you will see options for **Move up** or **Move down**. Select the desired move option to move the module up or down relative to its siblings.

## Configure modules

The following procedures describe how to configure content and container modules.

### Configure a content module

To configure a content module on a page, follow these steps.

1. In the outline pane on the left, expand the tree and select any content module (for example, **Content block**). Alternately, you can select the module in the main canvas.
2. In the module properties pane on the right, enter properties for any desired module controls.
3. On the command bar, select **Save**. This will also refresh the preview canvas.

### Edit module text properties

Module text properties that are not read-only can be edited directly in the canvas.

To edit module text properties, follow these steps.

1. Select the text control in the canvas, then place your cursor where you wish to edit text.
2. Enter your text content.
3. Select anywhere outside the text content to continue editing other content.

## Inline image selection

Module images that are not read-only can be changed directly from the canvas.

To choose a new image for a content module, follow these steps.

1. In the canvas, double-click the image. This will bring up the media picker window.
2. Find and select a new image you want to use, and then select **OK**. The new image is now rendered in the canvas.

## Configure a container module

To configure a container module on a page, follow these steps.

1. Select a container module on your page (for example, a carousel or fluid container module).
2. In the properties pane on the right, expand the nested controls by selecting the headers, and set any required control values.
3. In the outline pane on the left, select the ellipsis button next to the name of either the container or any slots inside the container, and then select **Add Module**. Then, add child modules to the selected container. For more information, see the [Work with modules](#) section earlier in this topic.
4. If multiple child modules exist as siblings in a parent container, you can change their display order in the parent container. Select the ellipsis button for a module, and then use the up arrow and down arrow buttons.

# Work with fragments

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes why, when, and how to use fragments in Microsoft Dynamics 365 Commerce.

## Overview

Fragments allow for a centralized authoring experience for module configurations that must be reused throughout your site. For example, headers, footers, and banners are often configured as fragments, because they are shared across many pages. You can think of fragments as miniature webpages that can be inserted into other pages on your site. Fragments have their own lifecycle. In other words, they are created, referenced, updated, and deleted as independent entities in the authoring tools.

After fragments are configured, they can be used wherever modules can be used in your site structure. Fragments can be referenced on pages, in layouts, in templates, and in other fragments.

### NOTE

Fragments can be nested up to seven levels deep inside other fragments.

For example, if you want to promote a seasonal event cross many pages on our site, you can use a fragment. The first step in the process of creating a new fragment is to select the type of module that you want to start from. For this example, you can build the fragment from a hero module.

### NOTE

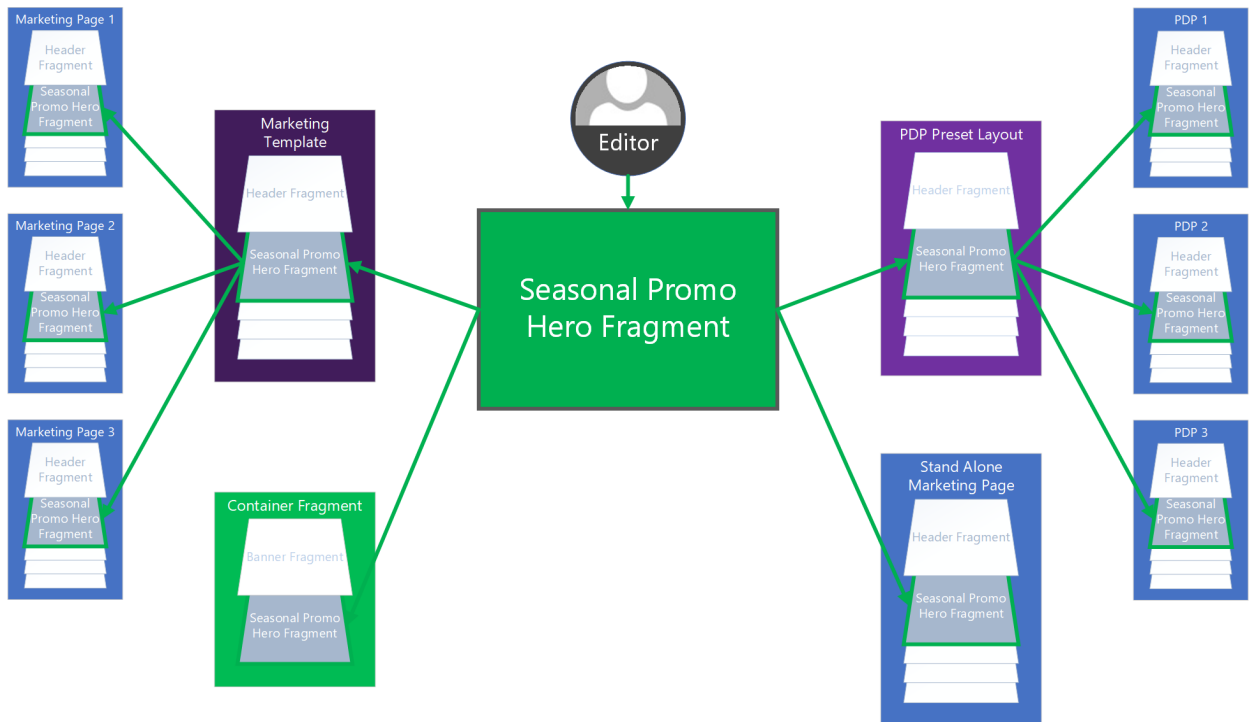

Fragments can be built from any module type.

You can then configure the hero fragment with your specific promotional content. You can also localize it as you require. The new stand-alone hero fragment can then be consumed as a preconfigured module throughout your site. You can easily add it to templates, to specific pages, or to other fragments that can contain hero modules.

All the places where the fragment is added are references to the central hero fragment that you created. If you publish changes to the fragment, those changes are immediately reflected in all the places where the fragment is referenced across the site. Therefore, fragments provide a powerful and efficient way to reuse and centrally manage module configurations on a site. By effectively using them, you can significantly increase agility and help reduce the cost that is associated with managing site content.

The following illustration shows how fragments can be used to centralize authoring of shared module configurations across an e-Commerce site.

Fragments enable centralized authoring for module configurations that are re-used across your site

## Create a fragment

You can either create a new fragment or save an existing module configuration as a fragment.

### Save an existing module configuration as a fragment

To convert a previously configured module to a reusable fragment in Commerce site builder, follow these steps.

1. Open a page or template that contains the module that you want to convert to a fragment.
2. In the outline pane on the left or directly in visual page builder, select the previously configured module.
3. Select the ellipsis (...) next to the name of the module in either the outline pane or the selected module's toolbar in visual page builder.
4. Select **Share as fragment**.
5. In the **Save as fragment** dialog box, enter a name for the fragment.
6. Select **OK** to save the module configuration as a fragment that can be added to other pages.

### Create a new fragment

To create a new fragment in Commerce site builder, follow these steps.

1. In the navigation pane on the left, select **Fragments**.
2. Select **New**. A **New fragment** dialog box appears that shows all the available module types. As was mentioned earlier, fragments can be created from any module type.
3. Select a module type for your fragment.

#### TIP

By selecting a generic container module type, you get the most flexibility when you need to update and configure your fragment later.

## Add, remove, or edit fragments on a page

The following procedures describe how to add, remove, and edit fragments.

### Add a fragment

To add a fragment to a page in Commerce site builder, follow these steps.

1. In the outline pane on the left or directly in visual page builder, select a container or slot to which child modules can be added.
2. Select the ellipsis (...) next to the name of the container or slot. Alternately, if using visual page builder, select the plus symbol (+).
3. Select **Add fragment**.

#### NOTE

If the container or slot doesn't support new child modules, the **Add fragment** option is unavailable.

4. In the **Select fragment** dialog box, search for and select a fragment to add. If no available fragments are listed, you might first have to create a fragment from a module type that the selected container or slot supports.
5. Select your desired fragment to add it to the container or slot on your page.

#### NOTE

The modules that are allowed in a container or slot are defined by the page's template or the modules' own definitions.

### Remove a fragment

To remove a fragment from a slot or container on a page in Commerce site builder, follow these steps.

1. In the outline pane on the left, select the ellipsis (...) next to the name of the fragment to be removed, and then select the trash can symbol. Alternately, you can select the fragment in visual page builder and select the trash can symbol in the fragment's toolbar.
2. When you're prompted to confirm that you want to remove the fragment, select **OK**.

#### NOTE

When you remove a fragment from a page, you just remove the reference to it from that page. You do **not** delete the fragment from your site. To delete fragments from your site, you must use the fragment inspector user interface (UI). You can delete fragments from a site only if they aren't currently referenced by any pages, templates, or other fragments.

### Edit a fragment

To edit fragments, you must use the fragment editor UI. This restriction is by design. It helps guarantee that authors don't confuse the process of editing the modules for a specific page with the process of editing fragments that might be shared across many pages.

To edit a fragment in Commerce site builder, follow these steps.

1. In the navigation pane on the left, select **Fragments**.
2. Under **Fragments**, select the fragment to edit.
3. Edit the fragment's module properties and structure as you require. The process resembles the process for editing modules are edited in the page editor view.

You can also edit a fragment by selecting it on a page, in a template, or in a parent fragment, and then selecting **Edit Fragment** in the properties pane on the right.

# Templates and layouts overview

2/18/2021 • 7 minutes to read • [Edit Online](#)

Templates are a foundational element of the Microsoft Dynamics 365 Commerce page model. If your goal is to maximize efficiency and consistency for site authoring workflows, it's important that you learn how to take advantages of templates for your website. Early decisions about template structure are important, and can significantly affect cost and agility for daily, seasonal, and site-wide brand updates. Well-structured templates have other benefits too. For example, they help improve site-wide search engine optimization (SEO) scores and minimize bug counts.

A good way to start to work with templates is to understand the functional benefits of templates and layouts, the differences between them, and the hierarchy.

The following illustration shows the page model hierarchy behind a rendered webpage.

ENTITY	BASIC FUNCTION
Template	Templates define the module options and basic scaffolding for a set of layouts and page instances.
Layout	Layouts define the final selection and arrangement of modules for a page or a set of pages.
Page instance	Page instances define the data and content for specific pages.

# Templates

Templates are at the top of the Dynamics 365 Commerce page model hierarchy and represent an important early step for site configuration. Conceptually, templates help control consistency across a family of child layouts and pages by defining the base structure and authoring options for downstream layout creation and page creation workflows. Templates can help simplify the content authoring process through predefined, centrally managed elements (such as headers and footers) and guided authoring flows that help guarantee that module configuration choices are on-brand.

## Controlling consistency

When you design a template, the biggest business decision that you must make is how much control the template should have over the page creation process. A template that leaves everything open for a downstream author is the easiest type of template to create, but it might have long-term consequences for the maintenance of pages that are created from it. A well-written template provides guidance and a streamlined authoring experience, but it also gives authors enough flexibility so that they can complete their task. All these aspects depend on the level of control that the template enforces.

Templates can help content authors be more efficient and stay on-brand in the following ways:

- Limit the modules that can be used on a page.
- Suggest default module and configuration choices.
- Explicitly make some module and configuration choices that are controlled at the template level. This process is also known as *locking a setting*.

The following example shows how a basic template (template X) can be configured:

- All child layouts of template X must have a header container, a body container, and a footer container.
- In template X, the configuration of the header container is locked and can be changed only in template X itself. All child layouts and pages always have this header.
- The body container requires at least one module and up to a maximum of ten modules. These modules are defined by downstream layouts and pages.
- For the body container, the hero, feature, carousel, and banner modules are available.
- A footer container is configured in template X, but it can be overridden by downstream layouts and pages.

The template in this example defines a simple structure and set of options for downstream content authors. Notice that some parts of a page (in this case, the header) are fully defined and locked in the template, and they can't be changed by downstream authors. Other parts (in this case, the body) can be defined by downstream authors within specific guidelines (in this case, a minimum number and maximum number of modules of specific types). And other parts (in this case, the footer) are defined in the template but can be overridden by downstream authors.

An important initial step for site and brand admins is to determine the correct balance between constraint and flexibility for child layout and page authors. When templates are used, this balance is completely configurable. It affects whether page elements are centrally updated (locked in the template) or left to individual child levels that are lower in the page hierarchy.

To start to use templates, [Work with templates](#).

## Layouts

Layouts are the next level in the page model hierarchy, below templates. Whereas a template defines all the modules that are allowed for a page, a layout is an explicit selection and arrangement of modules. Pages are the next level in the page model hierarchy, below layouts. They define the localized content for the modules that are selected in the layout.

The following example builds on the template example from the previous section, and shows how a basic layout can be configured:

- The parent template of the layout requires that the body container have between one and ten modules. These modules can be only hero, feature, carousel, and banner modules. Therefore, the layout can define the following selection and arrangement of modules:
  - The first module in the body container is a banner module, and it's followed by a hero module and two feature modules.
  - The first feature module is left-aligned, and the second feature module is right-aligned.
- Even though a default footer is inherited from the parent template, the template author left the footer unlocked. Therefore, the layout can override it by defining a different footer fragment.

The layout in this example defines the final arrangement of modules for child pages. Like a template, a layout can define default or locked module properties that will always be inherited by child pages (for example, the alignment of the feature modules). The actual content or data for every module in the layout is then defined farther down the hierarchy, in each child page instance. An important distinction here is that layouts don't directly contain localizable content, whereas their child pages do. The layout's primary function is to define the final arrangement and default configuration of modules for its child pages.

This hierarchy is powerful for two reasons. First, layouts that share the same parent template are treated as compatible for layout switching scenarios. Therefore, the layout for any page can be changed to another layout from the same template hierarchy without requiring that page-level content be reauthored. You can take advantage of this capability to do seasonal design updates, experiment, or do a permanent site redesign. Second, layouts provide another way to centrally modify shared elements for a group of pages without requiring updates to individual pages. For example, if a product category has 1,000 pages that share the same layout, the modules can be reordered in the layout, and this change will immediately be reflected in all 1,000 child pages.

By understanding this hierarchy, you can deliver an agile and efficient site structure that helps save cost, is scalable, and produces better results as the site evolves over time.

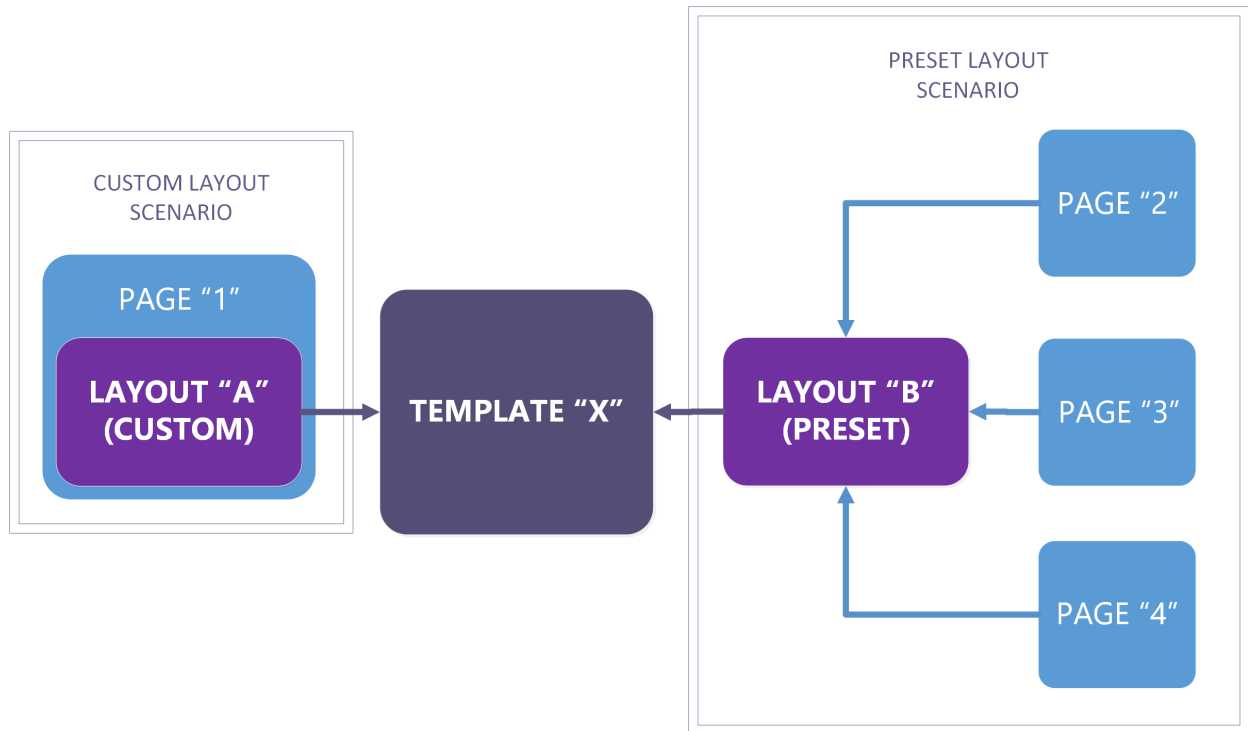

### **Preset and custom layouts**

Layouts on your site can be either *preset* or *custom*:

- **Preset layouts** allow for a page creation workflow where all modules are already selected and arranged, and only data entry is required. This approach can help save time when many pages must be authored that have the same layout requirements. Preset layouts have a one-to-many relationship with their child pages. Therefore, a single preset layout can be used to centrally control the module arrangement for hundreds or thousands of child pages.
- **Custom layouts** are essentially single-use layouts that are embedded in one page. They aren't exposed as an option when other new pages are created or in layout switching scenarios. The benefit of this approach is that an author can experiment by authoring a page that uses a custom layout. Then, if the author wants to reuse the layout for other pages, it can easily be converted to a preset layout. The new preset layout is then exposed as an option in page creation workflows and in layout switching scenarios for pages from the same template hierarchy. Conversely, preset layouts can be branched into custom layouts. In this way, an author can break a page away from the preset layout and create a new single-use custom layout. (This new custom layout is still bound by any constraints in the parent template.)

Preset layout and custom layouts are edited in different parts of the authoring toolset. Because custom layouts have no dependencies on other pages, they are edited directly in the page editor. In this case, the existence of a layout is mostly transparent to the user and is exposed only in page-level properties and through the actions for layout options. However, because changes to preset layouts can affect many child pages, they must be edited in the layout editor, where publish actions consider the full downstream impact on child pages.

The following illustrations shows scenarios for preset and custom layouts.

To start to use preset layouts, see [Work with preset layouts](#).

# Work with templates

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes how to work with templates in Microsoft Dynamics 365 Commerce.

## Overview

As was discussed in [Templates and layouts overview](#), templates define the set of options that is available to downstream authors. Templates are useful to an enterprise's web authoring team for several reasons, and well-structured templates can help with all the following goals:

- Simplify the authoring experience for day-to-day content editor roles.
  - Filter module options so that only relevant modules are shown for a specific page section. (For example, a marketing section of a template can be configured to filter out irrelevant modules that should never be used in that context, and that will just complicate content authoring tasks if they are shown.)
  - Configure default module setting to help improve authoring efficiency.
  - Define default page fragments to help improve authoring efficiency. (For example, header and footer fragments in a template will automatically appear on every downstream page.)
- Keep enterprise sites on-brand by defining an approved set of module arrangement and configuration options.

### TIP

Successful e-Commerce sites provide customers with familiar, repeatable, and on-brand user experience (UX) design patterns. By using templates, you help control consistency across your site.

- Improve search engine optimization (SEO) scores by ensuring repeatable and programmatically defined page definitions and metadata.

### NOTE

Although templates are designed to control consistency across a site, they can theoretically be configured so that they don't enforce any consistency. Brand and site administrators can define any level of variability for the pages on their site. For example, a template can be left entirely open, so that content authors can create any page design that they choose. In this case, none of the benefits in the preceding list are applicable.

## Modify a template

Templates are modified by using the template editor.

To open the template editor, follow one of these steps:

- In the navigation pane of your site, select **Templates**, and then select the template to modify.
- In the page editor for an existing page, select the top node in the outline tree on the left. Then, in the property pane on the right, select **Edit Template**.

The outline tree view on the left shows the module options and structures that are available to child layouts and pages. When you select a module in the outline tree, you can view the template properties for the selected

module in the property pane on the right. Some of these properties are unique to template editing. The following table describes these properties.

PROPERTY NAME	DESCRIPTION
Min Occurs	This property defines the minimum number of occurrences for the selected module. For example, if the value is set to <b>1</b> , the module is required for downstream authors, whereas if the value is set to <b>0</b> (zero), the module is optional.
Max Occurs	This property defines the maximum number of occurrences for the selected module. For example, if the value is set to <b>1</b> , the module can be added only one time.
Min Modules (Containers)	For modules that contain other modules (that is, for <i>containers modules</i> ), this property defines the minimum number of total modules that should be added as children. For example, for a carousel module, the value might be set to a number that is more than 1.
Max Modules (Containers)	For container modules, this property defines the maximum number of total modules that should be added as children. For example, for a carousel module, the value might be set to a number that is less than 10.
Locked	A <b>Locked</b> Boolean control appears next to all core module properties. It lets the template author lock a module setting in the template. A module setting that is locked can't be overridden by any child layouts or pages. It becomes a centrally editable property value for all layouts and pages that use the template.

## Create a new template

To create a new template, follow these steps.

1. In the navigation pane of your site, select **Templates** to open the template inspector view.
2. Select **New Template**.
3. In the template creation dialog box, enter a name and description for the template. The values that you enter will be shown to authors when they create new pages. Therefore, enter metadata that will be useful to page authors. For example, enter **Use this template to create general marketing pages** as the description. This metadata can be edited later.
4. Select **OK** to create the new template and open the template editor. The template editor shows an outline tree on the left and a property pane on the right.
5. In the outline tree, expand the nodes, and select the **HTML Head** slot.
6. If there aren't yet any modules in this slot, select the ellipsis button (...), and then select **Add Module**.
7. In the **Add Module** dialog box, select **Default page summary**, and then select **OK**.
8. In the outline tree, select the new module, and then, in the property pane, enter any default settings that should be automatically configured for all child pages of the template. If you don't want any default settings, leave the values blank.
9. In the outline tree, select the **Body** slot, select the ellipsis button, and then select **Add Module**.
10. Select a page container module (there might be only one option), and then select **OK**.

Under the new page container module, you will see a new set of slots (**Header**, **Main**, and so on). Here, you can add and configure the module options that will be available to authors when they create pages from this

template. By default, if you don't add any modules to a slot, all available modules types are supported for that slot.

The template is now technically valid, and it can be saved, checked in, and used to create new pages. However, the next three sections describe some other default settings that you might want to configure first.

## Add a header and a footer

If your site already has a header fragment, follow these steps to add a header and a footer to a template.

1. In the outline tree, expand the **Body** slot and its child page module.
2. Select the **Header** slot.
3. Select the ellipsis button for the **Header** slot, and then select **Add Fragment**.
4. Search for and select your site's header fragment, and then select **OK**.

All pages that use the template will now automatically inherit this header fragment.

If your site doesn't yet have a header fragment, see [Create a fragment](#) for information about how to create it, and then complete the previous procedure.

## Change the template theme

To set the default theme for all pages that use a template, follow these steps.

1. In the outline tree on the left, expand the **Body** slot.
2. In the **Body** slot, select the page container module (for example, **Default Page**).
3. In the property pane on the right, in the **Theme** field, select a theme.

By default, all new pages will now use the selected theme. To prevent pages from overriding this setting at the layout or page level, set the **Locked** Boolean control to **True**.

## Add a script to a template

You can add HTML `<script>` elements that contain JavaScript to your template. In this way, you can provide default script behaviors to the HTML head, body begin, and body end sections of your pages.

To add a script to a template, follow these steps.

1. In the outline tree on the left, select the slot where you want to add the `<script>` element (for example, the HTML head, body begin, or body end).
2. Select the ellipsis button for the slot, and then select **Add Module**.
3. In the **Add Module** dialog box, select a script module (for example, **External Script** or **Inline Script**).
4. In the property pane on the right, in the appropriate script property control (for example, **Inline Script** or **Script tags**), enter your script.
5. In the property pane, enter any other optional settings that you want to configure.

### TIP

If you want to reuse any of your script modules for other templates, you can convert them to fragments. In this way, you help make the authoring process more efficient, and you centralize the update process. For information about how to convert a script module to a fragment, see [Save an existing module configuration as a fragment](#).

## Save, check in, preview, and publish a template

To save and check in a template, follow these steps.

1. Select **Save** at the top of the template editor. Saved changes don't affect downstream pages until they are checked in.
2. Select **Finish editing**. Your changes are now discoverable for downstream workflows.

To preview your changes, either open an existing page that uses the template or create a new page from the template.

After you've previewed the changes to your template, follow one of these steps to publish the template to your live site:

- Go to **Templates**, select the template, and then select **Publish**.
- Select the layout name to open the layout editor, and then select **Publish**.
- Publish a page that references the unpublished template. The template is automatically published.

#### **WARNING**

When a template, or any other content management system (CMS) item, is published, it's discoverable on the internet. Don't publish documents or assets until you're ready to make them public. Document versions that have been saved and checked in, but that haven't been published, are discoverable only to authenticated system users.

# Work with preset layouts

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to work with preset layouts in Microsoft Dynamics 365 Commerce.

## Overview

Before you complete the procedures in this topic, be sure to read [Preset and custom layouts](#). For a general overview, see [Templates and layouts overview](#).

## Create a new preset layout

There are two methods for creating a preset layout. You can save an existing custom layout as a new preset layout, or you can create a preset layout from scratch.

### Create a preset layout from an existing custom layout

To create a preset layout from an existing custom layout, follow these steps.

1. Open an existing page that doesn't currently use a preset layout, and that has a module structure that you want to reuse for other pages on your site.
2. Select **Edit** to check out the page.
3. Select **Save as new layout**. The **Save as new layout** dialog box appears.
4. Enter a name and description for your preset layout. The values that you enter will be shown to other authors when they create new pages from your layout or switch to it. Therefore, enter values that will be useful to page authors.
5. Select **OK**.

The preset layout will now be available when you create new pages or select a different layout for a page in the same template hierarchy.

#### TIP

To quickly see whether a specific page is currently bound to a preset layout, select the page in the pages list view, and inspect the layout metadata in the property pane on the right.

### Create a new preset layout

To create a preset layout from scratch, follow these steps.

1. In the navigation pane on the left, select **Layouts**.
2. Select **New Layout**. The **New layout** dialog box appears.
3. Select the template to use for your preset layout.
4. Enter a name and description for your preset layout. The values that you enter will be shown to other authors when they create new pages from your layout or switch to it. Therefore, enter values that will be useful to page authors.
5. Select **OK** to create the new preset layout and open the layout editor.
6. In the layout editor, add and configure modules by using the outline tree on the left and the property pane on the right. (The process resembles the process for adding and configuring modules for a template in the template editor.) The arrangement of modules and any locked default settings become the centralized module configuration for any pages that use this preset layout.

# Modify a preset layout

To modify a preset layout, follow these steps.

1. In the navigation pane on the left, select **Layouts**.
2. In the layout editor, in the outline tree on the left, select the module to modify. Then follow any of these steps:
  - To move a module up or down inside its parent, select the ellipsis button (...) for the module, and then select **Move up** or **Move down**.
  - To change a module's default settings, use the property pane to enter default values and optionally lock them for all downstream pages.
  - To add new modules or fragments to container modules, select the ellipsis button, and then select **Add module** or **Add fragment**.
  - To remove a module from the layout, select the ellipsis button, and then select **Delete**.

## Change a preset layout theme

A typical practice is to set a default theme for all pages that use a preset layout.

To set or change the theme for all child pages that use your preset layout, follow these steps.

1. In the layout editor, in the outline tree on the left, select the page container module. (Typically, this module is the second node and is named **Default page**.)
2. In the property pane on the right, in the **Theme** field, select a theme.

## Save, check in, preview, and publish a preset layout

To save and check in your preset layout, follow these steps.

1. Select **Save** at the top of the layout editor. Saved changes don't affect downstream pages until they are checked in.
2. Select **Finish editing**. Your changes are now discoverable for downstream workflows.

To preview your changes, either open an existing page that uses the preset layout or create a new page from the layout.

After you've previewed the changes to your preset layout, follow one of these steps to publish the layout to your live site:

- Go to **Layouts**, select the layout, and then select **Publish**.
- Select the layout name to open the layout editor, and then select **Publish**.
- Publish a page that references the unpublished layout. The layout will automatically be published.

### WARNING

Preset layouts can be referenced by multiple pages. When you publish a preset layout, be aware that you might affect the layout of multiple pages.

## Additional resources

[Templates and layouts overview](#)

[Work with templates](#)

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Modify an existing site page

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to modify an existing site page in Microsoft Dynamics 365 Commerce.

## Overview

When you must modify a page, the first step is to open it in the page editor. Go to the site that contains your page, and then, in the list of pages, find the page that you want. If you can't find the page, you can use the authoring tool's rich search functionality. Either type the exact page name, or type the first few letters of it and then an asterisk (\*). A filtered list of pages appears. You can use this list to find the page that you want. After you find the correct page, select the page name to open the page in the page editor.

### TIP

If your page is visible in the page inspector, you can select **Edit** and check the page out before you open it in the page editor. In this way, you can check out multiple pages at the same time.

After the page is open in the page editor, you must make sure that it's checked out to you. The command bar in the authoring tool is dynamic, context-sensitive, and state-sensitive. Therefore, it shows only the actions that you can currently perform on the page. For example, if the page isn't checked out to you, the **Save** and **Finish editing** buttons don't appear on the command bar. The state of the page is also shown on the right side of the window.

If the page isn't already checked out to you, select **Edit** on the command bar. The command bar changes to reflect the new state of the page. You also receive a notification that states that the page was checked out to you.

The next step is to make your actual changes. Often, you will use the page outline tree on the left to find and select the module that you want to change, and then make changes in the properties pane on the right.

However, your change might sometimes involve adding or removing models or fragments. To add a fragment or module, use the page outline tree to find the slot that you want to add the module or fragment to, and then select the ellipsis button (...) for that slot. A menu appears that includes commands for adding a module or fragment. To remove a module or fragment, find and select it in the page outline tree, select the ellipsis button, and then select the command to delete the module or fragment.

### TIP

You can also view and edit the properties for any module that is visible in the visual page builder preview by selecting it directly.

After you've finished making your changes and previewing their effect, you should check in the page by selecting **Finish editing** on the command bar.

To publish your changes immediately, select **Publish** on the command bar. The latest checked-in version of the page that you modified is published and becomes available to external users who view your site.

## Example: Change the video on the home page

The following example shows how to modify the home page by changing the video that appears in the video

player module.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. In the navigation pane on the left, select **Pages**.
3. Find and select the home page to open it in the page editor.
4. On the command bar, select **Edit**.
5. In the page outline, select the **Main** slot.
6. Under the **Main** slot, expand all the fluid container modules.
7. Find and select the video player module.
8. In the properties pane on the right, select the **video** property. The asset picker appears.
9. In the asset picker, select an available video asset, or select **Upload new asset** to upload a new video asset.
10. Select **OK**.
11. Select **Save**, and then select **Finish editing**.
12. In the **Comments** field, enter **Changed the video**, and then select **OK**.
13. Select **Preview** to preview the updated page. When you've finished, close the preview tab to return to the authoring tool.
14. Select **Publish**.

# Add a new site page

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to add a new site page in Microsoft Dynamics 365 Commerce.

## Overview

After you've created templates and fragments for your site, the next step is to start to create pages that use them. To get started, you must select a template or layout, a page name, and a page URL.

## Template or layout

You can use either a template or a layout for your new page. For more information, see [Templates and layouts overview](#).

## Page name

The page name must be unique to your page. It should be descriptive, so that you can easily find it and other people know what the page is intended for. Choose the page name carefully, because it can't be changed later.

## Page URL

You can have the option to enter a URL for your new page. When you create a page, you can enter a string that will be used to form a complete URL. This string is known as a relative URL or a URL slug. A complete URL is then generated based on the URL slug, and the new page is assigned to it. You can change the URL slug later, before you publish the page. For more information, see [Create a page URL](#).

### NOTE

Dynamics 365 Commerce decouples URLs and content. In other words, a page can be created that isn't associated with an URL, and a URL can be created that isn't associated with a page. Therefore, content swapping can be done for a URL and doesn't require downtime, and redirects are easier to manage.

## Add a new page

To add a new site page to your site, follow these steps.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. Select **New Page**.
3. In the **New Page** dialog box, select a template, and then select **OK**.
4. In the **Page Name** field, enter a page name (for example, **My New Page**).
5. In the **URL** field, enter a string (URL slug) to complete the URL (for example, **mynewpage**).
6. Select **OK**. The page editor appears. Notice that a header and a footer are automatically added to the page, based on the template that you selected.
7. In the page outline, select the **Main** slot, select the ellipsis button (...), and then select **Add Module**.
8. Select **Container**, and then select **OK**.
9. Select **Fluid Container**, select the ellipsis button, and then select **Add Module**.
10. Select **Content Rich block**, and then select **OK**.

11. Select **Content Rich Block**, select the ellipsis button, and then select **Add Module**.
12. Select **Content rich block item**, and then select **OK**.
13. In the properties pane on the right, select **Paragraph**, and then, in the field, enter **My test text**.
14. Select **Save**, and then select **Finish editing**.
15. In the **Comments** field, enter **Added new page**, and then select **OK**.
16. Select **Preview** to preview your page. When you've finished, close the preview tab to return to the authoring tool.
17. Select **Publish**.
18. In the navigation path (breadcrumbs), select **Fabrikam** (or the name of your site).
19. In the navigation pane on the left, select **URLs**.
20. Find and select your URL (**mynewpage**) in the list.
21. Select **Publish**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Select page layouts

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create and select page layouts in Microsoft Dynamics 365 Commerce.

## Create layouts for an existing page

### NOTE

You can create layouts for an existing page only if that page has at least two modules under the main slot.

To create layouts for an existing page, follow these steps.

1. Go to **Pages**, and find the existing page in the list. Use the search feature as you require.
2. Select the page, select **Edit** to check it out, and then select the page name to open it. Make a note of the module order.
3. Select **Save as New Layout**.
4. Enter a name for the layout, and then select **OK**.
5. Select **Convert to Embedded Layout**.
6. Change the order of the modules as you require, and make a note of the new order.
7. Select **Save as New Layout**.
8. Enter a name for the layout, and then select **OK**.
9. Select **Change Layout**, select the first layout that you created, and then select **OK**. Make a note of the module order. Change it so that it matches the module order that was saved with the layout.
10. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

## Select a different layout for an existing page

### NOTE

You can select a different layout for an existing page only if the template that was used to create that page has more than one layout.

To select a different layout for an existing page, follow these steps.

1. Go to **Pages**, and find the existing page in the list. Use the search feature as you require.
2. Select the page, select **Edit** to check it out, and then select the page name to open it.
3. Select **Change layout**.
4. Select the new layout for the page, and then select **OK**. The page editor is refreshed to show the new layout.
5. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Manage SEO metadata

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to manage search engine optimization (SEO) metadata in Microsoft Dynamics 365 Commerce.

## Overview

SEO metadata for a site can be managed by using site maps and page metadata.

## Site maps

A site map is a machine-readable list, in XML format, of the pages on your website. It's intended to be consumed by search engines, so that they can provide better search results from your site. Site maps can be manually ingested by search engines or published in a robots.txt file.

Dynamics 365 Commerce supports automatic generation of site maps. Site maps are automatically updated when pages are published and unpublished.

### Turn on site map generation

1. Sign in to the authoring tool.
2. Under **Sites**, select **Fabrikam** (or the name of your site).
3. In the navigation pane on the left, select **Site Management**.
4. Make sure that the **Site maps enabled** option is turned on.

## Page metadata

Dynamics 365 Commerce lets you manage SEO metadata for individual pages. You can view and modify this information in the **SEO Properties** section of a page container. The following SEO metadata properties are supported:

- Title
- Description
- SEO keywords
- Aria labels
- noindex
- nofollow
- noarchive
- nocache
- noOpenDirectoryProject
- nosnippet
- noImageIndex
- unavailableAfter

### Modify page metadata

To modify page metadata, follow these steps.

1. Under **Sites**, select the **Fabrikam** (or the name of your site).
2. In the navigation pane on the left, select **Pages**.

3. Select the home page to open it in the page editor.
4. On the command bar, select **Edit**.
5. In the properties pane on the right, expand **Default metatags**.
6. To add a new metatag, select **Add**, and then enter the tag in the field. To remove an existing metatag, select the trash can symbol to the right of it.
7. Select **Save**, and then select **Finish editing**.
8. In the **Comments** field, enter **Updated metatags**, and then select **OK**.
9. Select **Preview** to preview your page. When you've finished, close the preview tab to return to the authoring tool.
10. Select **Publish**.

# Save, preview, and publish a page

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to save, preview, and publish a page in Microsoft Dynamics 365 Commerce.

## Save a page

To save a page, you must have it checked out to yourself and open in the page editor. To check out a page, select **Edit** on the command bar. After you've finished editing a page, you should immediately save it to ensure that your changes are stored.

When you save a page, the changes are visible only to you. The save operation is intended primarily to store changes while the page isn't yet ready to be checked in. When you've finished modifying the page, we recommend that you check it in, so that the changes become visible to others. At that point, the page can also be checked out by other users who must modify it.

## Preview a page

The authoring tool offers two kinds of preview features: visual page builder, which is a "what you see is what you get" (WYSIWYG) preview pane in the page editor, and a separate preview window.

While you're using the page editor, a "what you see is what you get" (WYSIWYG) preview appears in the center pane. This preview is automatically updated whenever you save the page. You can also manually update it by selecting **Refresh** on the command bar. The preview renders the page just as the site's users will see it, but authoring helpers are rendered on top of it.

When you've finished modifying the page, you might want to preview it to see what customers will see. To preview a page, select **Preview** on the command bar. The preview will appear in a separate browser window. The page in the preview window is rendered just as the site's user will see it. You can resize the window to make sure that responsive modules are correctly rendered in all view ports.

### NOTE

Authentication and correct permissions are required to preview unpublished content. Therefore, if you share the URL of the preview with someone, that person must have the correct permissions to access the content.

## Publish a page

When your page is ready, the next step is to publish it, so that external users can view the content. Before you can publish a page, you must check it in by selecting **Finish editing** on the command bar.

You can publish and unpublish pages from either the page inspector or the page editor. The page inspector shows a list of pages and allows for bulk operations. The page editor can be used to publish or unpublish only the single page that is open in it.

To publish one or more pages from the page inspector, select the pages, make sure that they are checked in, and then select **Publish** on the command bar. The pages are published, and you receive a notification about the operation in the authoring tool.

To publish a single page from the page editor, the procedure is similar. While the page is open in the page editor, make sure that it has been checked in, and then select **Publish** on the command bar. The page is published, and

you receive a notification about the operation.

When you publish a page, just the page content is published. You and other users can go to the page and view it only after a URL is associated with it. The URL must be published separately.

#### **IMPORTANT**

Before you can publish a page, any images or fragments that the page references must already be published.

## Save, preview, and publish a home page

To save, preview, and publish a home page, follow these steps.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. In the navigation pane on the left, select **Pages**.
3. Find and select the home page to open it in the page editor.
4. Select **Edit**.
5. Modify the page as you require.
6. Select **Save**, and then select **Finish editing**.
7. In the **Comments** field, enter a note about the changes that you made, and then select **OK**.
8. Select **Preview** to preview your page. When you've finished, close the preview tab to return to the authoring tool.
9. Select **Publish**.

## Publish a URL

To publish a URL, follow these steps.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. In the navigation pane on the left, select **URLs**.
3. Find and select the URL to publish.
4. On the command bar, select **Publish**.

# Enrich a product page

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to enrich a product page in Microsoft Dynamics 365 Commerce.

## Overview

By default, your site uses a generic page to show product data. This page includes the basic information about the product and the controls that are required to sell it. However, you can supplement the information that comes from the Commerce Scale Unit with additional images or text for a specific product. This process is known as enriching the product page.

In many cases, you will want to use specific additional content for your products. When you go to **Retail and Commerce** in the authoring tool, you will see a list of products from the channel that is assigned to the site. In this list, the **Enriched** column indicates whether the product page for a product has been enriched. If a check mark appears in the column, an enriched product page exists for the product. If no check mark appears, the default product page and content are used for the product. You can preview both enriched and non-enriched product pages by selecting a product name in the list.

## Enrich a product page

To enrich a product page, follow these steps.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. In the navigation pane on the left, select **Products**.
3. Select any product that doesn't have an enriched product page.
4. On the Action Pane, select **Enrich product page**.
5. Select **PDP-template**, and then select **OK**.
6. In the page outline tree on the left, expand the **Main** slot.
7. Select the ellipsis button (...) for the **Main** slot, and then select **Add Module**.
8. Select **Container 2**, and then select **OK**.
9. Select the ellipsis button for **Container 2**, and then select **Add Module**.
10. Select **Feature**, and then select **OK**.
11. In the properties pane on the right, in the **Rich Text** field, enter the updated description of the product.
12. In the **Heading** field, enter heading text, and then select **OK**.
13. Select **Save**, and then select **Finish editing**.
14. In the **Comments** field, enter **Enriched a product**, and then select **OK**.
15. Select **Preview** to preview the enriched product page. When you've finished, close the preview tab to return to the authoring tool.
16. Select **Publish**.

# Enrich a category landing page

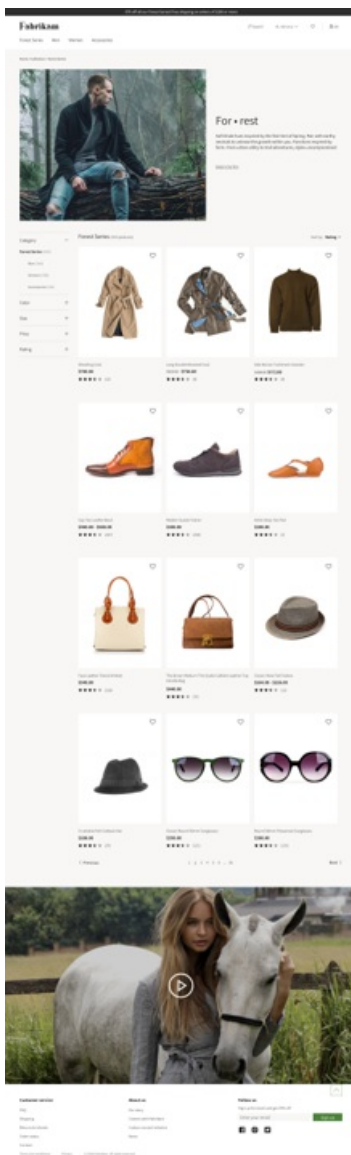

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers the enrichment of category pages in Dynamics 365 Commerce.

## Overview

Commerce provides a default category landing page that is used when category data is shown. A default category page contains required elements, such as refiners, categorized product placement, sorting options, a choice summary, and pagination controls.

However, instead of using the default category page, you might want to use an "enriched" category landing page that has more content and more specific elements. A typical enrichment might involve adding category-specific marketing content to the category page. This content might include cross-category product placement for cross-sell purposes, editorial lists, images, videos, and other text. You can either modify the default category page or define a different category page for a specific category.

In Commerce site builder, the **Products** page includes a list of categories from the channel that are assigned to the site. If the **Enriched** status is selected for a category page, that category page has been enriched. Otherwise, the default category page and content are used for the category. You can preview both the enriched and non-

enriched category pages for a category by selecting the category name.

To enrich a category page, do the following.

1. On the **Products** page, select the name of the category for which you want to enrich the category page. The default category page for the selected category is opened in the page editor.
2. Select **Enrich category page**.
3. Select a template for the enriched category page. If you're making only minor changes, you can select the default category page. Alternatively, you can select a specific category page template. When you select the template, the page editor is opened, and the selected template is used to create a new category page for the selected category. The page is checked out to you, and you can now make your changes.

#### **NOTE**

Modules that use category specification data use the data from your selected category. The settings of the template that you select determine the changes that you can make.

# Verify page content accessibility

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to verify the accessibility of page content in Microsoft Dynamics 365 Commerce.

## Overview

When you've finished changing a page, you should make sure that the content is accessible to everyone on the web. In the Commerce authoring tools, you can easily verify the accessibility of page content by using the integrated [Microsoft Accessibility Insights](#) service. This service verifies your page content against the latest [World Wide Web Consortium \(W3C\) accessibility](#) guidelines.

The [Microsoft Accessibility Insights](#) integration must be turned on at the tenant or site level before you can use it.

## Turn on Microsoft Accessibility Insights for all the sites in your tenant

To turn on the [Microsoft Accessibility Insights](#) integration for all the Commerce sites in your tenant, follow these steps.

### NOTE

To access tenant settings, you must be signed in to Commerce as a system admin.

1. Sign in to Commerce as a system admin.
2. In the left navigation pane, select **Tenant Settings** (next to the gear symbol) to expand it.
3. Under **Tenant Settings**, select **Features**.
4. Set the **Accessibility Check** option to **On**.

## Turn on Microsoft Accessibility Insights for a single site

To turn on the [Microsoft Accessibility Insights](#) integration for a single Commerce site, follow these steps.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. In the left navigation pane, select **Site Settings** to expand it.
3. Under **Site Settings**, select **Features**.
4. Set the **Accessibility Check** option to **On**.

## Verify the accessibility of the content on the home page

To use the integrated [Microsoft Accessibility Insights](#) service to scan and verify the content of your home page in Commerce, follow these steps.

1. Under **Sites**, select **Fabrikam** (or the name of your site).
2. In the left navigation pane, select **Pages**.
3. Find and select the home page to open it in the page editor.
4. On the command bar, select **Check accessibility**. The **Check Accessibility** page appears.
5. After the scan is completed, review the contents of the report.
6. If any checks failed, select each failed check item to expand it so that you can view more details.

7. To close the report after you've finished reviewing it, scroll to the bottom of the **Check Accessibility** page, and select **OK**.

# Create dynamic e-commerce pages based on URL parameters

2/18/2021 • 3 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic describes how to set up a Microsoft Dynamics 365 Commerce e-commerce page that can serve dynamic content, based on URL parameters.

An e-commerce page can be configured to serve different content, based on a segment in the URL path. Therefore, the page is known as a dynamic page. The segment is used as a parameter to retrieve the page content. For example, a page that is named **blog\_viewer** is created and associated with the URL `https://fabrikam.com/blog`. This page can then be used to show different content, based on the last segment in the URL path. For example, the last segment in the URL `https://fabrikam.com/blog/article-1` is **article-1**.

Separate custom pages that override the dynamic page can also be associated with segments in the URL path. For example, a page that is named **blog\_summary** is created and associated with the URL `https://fabrikam.com/blog/about-this-blog`. When this URL is requested, the **blog\_summary** page that is associated with the `/about-this-blog` parameter is returned instead of the **blog\_viewer** page.

## NOTE

The functionality for hosting, retrieving, and showing dynamic page content is implemented by using a custom module. For more information, see [Online channel extensibility](#).

## Set up a dynamic e-commerce page

To set up a dynamic e-commerce page, you must create the dynamic page, create the base URL, and configure the route to the dynamic page.

### Create the page that will serve dynamic content

To create a page that will serve dynamic content, follow the steps in [Add a new site page](#). The page that you create will require implementation of a module that uses the last segment in the URL path to retrieve content from an external data source. For more information about custom module development, see [Online channel extensibility](#).

### Create the base URL for the dynamic page

To create the base URL for the dynamic page in Commerce site builder, follow these steps.

1. Go to **URLs**, and select **New > New URL**.
2. In the **Create new URL** dialog box, select **Internal page**. Under **URL path**, enter the path that will serve as the root for the dynamic page (in this example, `/blog`). Then select **Next**.
3. In the **Select a page** dialog box, select the page that you created to serve as the dynamic page, and then select **Save**.
4. Select **Publish**.

## Configure the route to the dynamic page

To configure the route to the dynamic page in Commerce site builder, follow these steps.

1. Go to **Site Settings > Extensions**.
2. Under **Parameterized URL paths**, select **Add**, and then enter the URL path that you entered when you created the URL (in this example, **/blog**).
3. Select **Save and publish**.

After the route is configured, all requests to the parameterized URL path will return the page that is associated with that URL. If any requests contain an additional segment, the associated page will be returned, and the page content will be retrieved by using the segment as a parameter. For example,

`https://fabrikam.com/blog/article-1` will return the **blog\_summary** page, and the page content will be retrieved by using the **/article-1** parameter.

## Override a parameterized URL with a custom page

To override a parameterized URL with a custom page in Commerce site builder, follow these steps.

1. Go to **URLs**, and select **New > New URL**.
2. In the **Create new URL** dialog box, select **Internal page**. Under **URL path**, enter the path that includes the segment to override (in this example, **/blog/about-this-blog**). Then select **Next**.
3. In the **Select a page** dialog box, select the custom page, and then select **Save**.
4. Select **Publish**.
5. If the custom page hasn't yet been published, go to **Pages**, select the custom page, and then select **Publish**.

After the custom page is published, it will be served instead of the dynamic page that has parameterized content.

# Customize site navigation

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to create a customized online navigation hierarchy to organize your products for browsing on your Microsoft Dynamics 365 Commerce site.

## Overview

Online storefronts typically let customers discover and browse products by navigating through product categories. This capability is usually provided by tabs at the top of the page or by a navigation bar on the left. In Dynamics 365 Commerce, you can create and manage the hierarchal structure of your category navigation and the products that are included in the various categories.

## Create a channel navigation hierarchy

To create a channel navigation hierarchy, follow these steps.

1. Go to **Retail and Commerce > Products and categories > Category and product management**.
2. Select **Category hierarchies**, and then select **New**.
3. Name the hierarchy.

### NOTE

The topmost category that you create is the root category node. It won't be shown on your site. To create a category hierarchy where a single top-level node is shown on your site, create and name the category as a child of the root category.

4. Select **New category node**, and name the category.
5. Continue to create sibling and child categories as you require.

You can now assign products to each category that you created under the top-level category.

## Customize the order of categories

By default, the categories that you define will appear in alphabetical order on your site. However, you can also customize the display order of categories.

## Assign a category hierarchy type

1. Go to **Retail and Commerce > Products and categories > Category and product management**.
2. Select **Category hierarchies**.
3. On the Action Pane, on the **Category hierarchy** tab, in the **Set up** group, select **Associate hierarchy type**.
4. Select **New**.
5. In the **Category hierarchy type** field, select **Channel navigation hierarchy**.
6. In the **Category hierarchy** field, select the channel navigation hierarchy that you created earlier.

# Publish new or updated navigation hierarchies

To make your navigation hierarchy available to your online storefront, follow these steps.

1. Go to **Retail and Commerce > Channel setup > Channel categories and product attributes**.
2. In the tree on the left, select your online store.
3. Select **Publish channel updates**.
4. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
5. In the list, find and select **Job 1040**.
6. Select **Run now**.
7. Repeat steps 5 and 6 for jobs 1070 and 1150.

## Show categories on your site

To show your category hierarchy on your online storefront, you must add the navigation menu module in the appropriate location in a template or fragment. The navigation menu module will then show your navigation hierarchy, provided that you've published your navigation hierarchy to the channel that your site is bound to.

### NOTE

The navigation menu module that is included in the module library lets users navigate only to categories that don't have subcategories. If your customers should be able to navigate to categories that have subcategories, you must customize the navigation menu module.

## Add custom navigation options

On your navigation menu, you can add navigation options that aren't part of your product category hierarchy. For example, at the end of the list of product categories, you can add a **Contact Us** item that points to a contact page that you've built for your site.

To add custom navigation options to your navigation menu, follow these steps.

1. In the template or fragment that you want to customize, select the navigation menu module.
2. In the property pane, on the **Data** tab, select **Add item** to create a new content management system (CMS) navigation item.
3. Enter link text and a URL.
4. Repeat steps 2 and 3 to add more custom navigation options.
5. When you've finished, select **Save** to save the template or fragment, and then select **Finish editing** to check it in.

# Create a page URL

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic covers the basic concepts and procedures for creating a page URL on your site.

## Overview

The full, or absolute, URL that points to a page on your site consists of distinct parts. For example, the URL

`https://www.contoso.com/en-us/contactus` has the following parts:

- `https://www.contoso.com` – The HTTP protocol and the site's domain.
- `/en-us` – The site's language path.
- `/contactus` – The relative URL for the **Contact Us** page. A relative URL is also known as a URL *slug*.

You establish your site's domain and optional language path when you set up the site. You can add more domains and language paths to your site through the online stores page in the site's settings.

The URL slug for a page exists as a standalone entity in the site authoring environment. A page URL consists of two parts: a name that represents the URL slug, and a pointer to a page on either your site or an external site. A page URL can also be configured to act as a redirect to another page on either your site or an external site.

## Create a page URL

There are two ways to create page URLs:

- Automatically, when you create a page
- Manually, from the **URLs** page

### Create a page URL when you create a page

If you provide a name in the **URL** field when you create a new page, a page URL that points to that page is automatically created on the **URLs** page. After you publish the URL and the page that it points to, site users (your customers) can access the page that is associated with the URL.

#### NOTE

If you publish a URL without publishing the page that it points to, site users receive a 404 error when they try to access the page. If you publish a page without publishing the URL that points to it, the page can't be accessed by using a URL.

### Manually create a page URL

When you create new pages, you aren't required to specify a page URL. If you leave the URL field blank, the page is created in an unlinked state. In this case, customers won't be able to access the page, even if it's published. To make the page accessible, you must manually create the URL and link it to the page.

To manually create the page URL for a page, follow these steps.

1. On the **URLs** page, select **New**.
2. Select the site page to associate with the URL.
3. Enter the URL slug, and then select **OK**.

At this point, the URL is in a draft state. It must be published before site users can access the associated page.

# Update a page URL

To update the target page of a page URL, follow these steps.

1. On the **URLs** page, select the URL to update.
2. In the property pane on the right, select the ellipsis button (...) next to the target page field.
3. In the dialog box, select a different page, and then select **OK**.
4. Save and publish the URL.

# Redirect a page URL

Sometimes, you might want your customers to view a different page when they request a specific URL. In these cases, the best and easiest approach is often to change the page that the page URL points to. However, you might have legitimate reasons for using HTTP 301 or 3023 redirects to redirect requests for a URL to a different URL.

To redirect a URL to a different URL, follow these steps.

1. On the **URLs** page, select the URL to update.
2. In the property pane on the right, select **Redirect**.
3. Select a destination for the redirect:
  - To point to another page on your site, select **Internal URL**, select the ellipsis button (...), and then select the URL to redirect to.
  - To point to a page on an external site, select **External URL**, and then enter the full URL for that page. Be sure to include the protocol. For example, enter `https://domain.com/new/page`. If the URL already redirects to an internal URL, you must select **Clear selection** before you can enter an external URL.
4. Select a redirect type:
  - **Permanent redirect (301)** – Select this option when you know that your content is moving permanently and won't revert to its previous URL. Search engines will assign the search engine optimization (SEO) value of the redirecting URL to the URL that is being redirected to and update their record to show the new URL.
  - **Temporary redirect (302)** – Select this option to redirect traffic without updating search engines. This approach is typically used if the content will soon revert to its previous URL.
5. When you're ready to implement the redirect, save and publish the URL.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Digital asset management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of digital asset management in Microsoft Dynamics 365 Commerce site builder.

## Overview

Dynamics 365 Commerce site builder's Media Library features rich digital asset management functionality, including support for the following:

- Image assets
- Video assets
- Other types of binary assets, such as Office documents and PDF files
- Localized images
- Folder uploads
- Cropping of images
- Customizing of image focal points
- Omni-channel image assets (product, product variants, catalog, category, worker, and customer images)

Digital assets are channel-specific, with the exception of omni-channel assets, which are environment-wide by default.

Digital assets and management features are located within site builder under **Media Library** on the left navigation pane within a site.

## Additional resources

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Upload images

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to upload images in Microsoft Dynamics 365 Commerce site builder.

## Overview

The Commerce site builder Media Library allows you to upload images, either singly or in bulk using folders. You should always upload the version of the image with highest resolution and quality, because the image resizer component will automatically optimize the image for different viewports and their breakpoints.

### Image information specified during upload

When uploading an image, the following information can be specified.

- **Title, Alt Text, Description, Keywords:** Metadata of the image or images. Title and alt text are required values.
- **Select category:**
  - **None:** Used for an e-Commerce storytelling image or images.
  - **Product, Category, Customer, Employee, Catalog:** Used for Dynamics 365 Commerce omni-channel image or images.
- **Publish assets after upload:** When this check box is selected, the image or images are published immediately after upload.

#### NOTE

Image assets with a category assigned are also automatically tagged with the category as a keyword to aid searching for assets of a specific category.

### Naming conventions for omni-channel images

If you have configured the Media Library as the omni-channel image backend, you can use image categories to indicate which category the uploaded image belongs to. There is also a naming convention that should be followed to ensure that images are retrieved correctly by other channels, such as point of sale (POS).

The default naming convention varies based on the category:

- Catalog images should be named `"/Catalogs/{LanguageId}/{CatalogName}.jpg"`
- Category images should be named `"/Categories/{CategoryName}.png"`
- Customer images should be named `"/Customers/{CustomerNumber}.jpg"`
- Employee images should be named `"/Workers/{WorkerNumber}.jpg"`
- Product images should be named `"/Products/{ProductNumber}_000_001.png"`
  - 001 is the sequence of the image and it can be 001, 002, 003, 004 or 005
- Product variant images should be named `"/Products/{ProductNumber}_{Size}_{Color}_{Style}_000_001.png"`

## Upload an image

To upload an image in site builder, follow these steps.

1. In the left navigation pane, select **Media Library**.

2. On the command bar, select **Upload > Upload Media Items**.
3. In the File Explorer window, navigate to and select one or more image files to upload, and then select **Open**.
4. In the **Upload Media Item** dialog box, enter the required title and alt text.
5. Enter optional description and keywords and select a category if desired.
6. If you want to publish the image(s) immediately after upload, select the **Publish media items after upload** check box.
7. Select **OK**.

## Upload a folder of images

To bulk upload a folder of images in site builder, follow these steps.

1. In the left navigation pane, select **Media Library**.
2. On the command bar, select **Upload > Upload Folder**.
3. In the File Explorer window, navigate to and select a folder to upload, and then select **Open**.
4. In the **Upload Media Items** dialog box, enter optional keywords and select a category if desired.
5. If you want to publish the images in the folder immediately after upload, select the **Publish media items after upload** check box.
6. Select **OK**.

## Additional resources

[Upload and serve static files](#)

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Upload videos

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to upload videos in Microsoft Dynamics 365 Commerce site builder.

## Overview

The Commerce site builder Media Library allows you to upload videos. You should always upload the version of a video with the highest bitrate and resolution, because the video will be automatically converted to be suitable for different viewports and their breakpoints.

### Video information specified during upload

When uploading a video, the following information can be specified.

- **Title, Description, Keywords:** Metadata of the video.
- **Automatically generate closed captions:** Specifies whether closed captions should be automatically generated for the video.
- **Closed Caption:** Specifies the closed captions to be used.
- **Regular Audio:** Specifies the regular audio track to be used.
- **Thumbnail:** Specifies the thumbnail for the video. If not specified, it will be generated automatically.
- **Descriptive Audio:** Specifies the descriptive audio track to be used.

## Upload a video

To upload a video in site builder, follow these steps.

1. In the left navigation pane, select **Media Library**.
2. On the command bar, select **Upload > Upload Media Items**.
3. In the File Explorer window, navigate to and select one or more video files to upload, and then select **Open**.
4. In the **Upload Media Item** dialog box, enter the required title and alt text.
5. Enter optional description and keywords and select a category if desired.
6. If you want to publish the image(s) after immediately upload, select the **Publish media items after upload** check box
7. Select **OK**.

If you are uploading multiple types of assets simultaneously (for example, images and videos), in the **Upload Media Item** dialog box you will only be able to specify keywords, whether the files should be published immediately after upload, and whether closed captions should be automatically generated for video files. All the assets will share the same keywords.

# Upload files other than images and videos

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to upload files other than images and videos in Microsoft Dynamics 365 Commerce site builder.

## Overview

The Commerce site builder Media Library supports the uploading of binary assets other than images or videos. For example, you might want to upload Microsoft Excel, Microsoft Word, Microsoft PowerPoint, or PDF files.

The following document types are supported:

- 7Z
- AVI
- CS
- CSS
- DOC
- DOCX
- EPUB
- GIF
- INDD
- JAR
- JPG
- JPEG
- JS
- MP3
- MP4
- MPEG
- MPG
- ODP
- ODS
- ODT
- PDF
- PNG
- PPT
- PPTX
- PS
- QXP
- RAR
- RTF
- SVG
- TAR
- TGZ
- TXT
- WMV

- XLS
- XLSX
- XML
- ZIP

## Upload a file

To upload a file to Commerce site builder, follow these steps.

1. In the left navigation pane, select **Media Library**.
2. On the command bar, select **Upload > Upload Media Items**.
3. In File Explorer, select one or more files and then select **Open**.
4. In the **Upload Media Item** dialog box, enter title, description, and keyword metadata as needed.
5. To publish the file(s) immediately after upload, select the **Publish media items after upload** check box.
6. Select **OK**.

# Crop images

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to crop images in Microsoft Dynamics 365 Commerce site builder.

## Overview

The Commerce site builder Media Library allows you to crop images to optimize them for different module types and viewports.

## Crop an image

To crop an image in site builder, follow these steps.

1. In the left navigation pane of Commerce site builder, select **Media Library**.
2. In the main window, select the image you want to modify.
3. On the command bar, select **Edit**.
4. Select the image to enter **Edit Mode**.
5. Under **Edit Mode**, select **Edit View by Module**.
6. From the **Module** drop-down menu, select the module type.
7. From the **View type** drop-down menu, select the view type.
8. From the **Placement** drop-down menu, select the image placement.
9. From the **Viewport** drop-down menu, select the viewport size.
10. The image is overlaid with the area representing the crop region. Move and resize the crop region as needed. The aspect ratio will be maintained automatically.
11. When you're done, on the command bar, select **Save**, and then select **Finish editing**.

After custom cropping is completed, image modifications will take effect almost immediately.

# Customize image focal points

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to customize image focal points in Microsoft Dynamics 365 Commerce site builder.

## Overview

When an image is uploaded to the Commerce site builder Media Library, the system attempts to determine the focal point of the image. For example, if the image has a person on it, the system will set the focal point to the face of the person by default. In most cases the automatically set focal point works well for all viewports, but sometimes you may want to adjust the focal point to ensure that a specific part of the image is always visible.

### Define a custom focal point for an image

To define a custom focal point for an image, follow these steps.

1. In the left navigation pane of Commerce site builder, select **Media Library**.
2. In the main window, select the image you want to modify.
3. On the command bar, select **Edit**.
4. Select the image to enter **Edit Mode**.
5. Under **Edit Mode**, select **Change Focal Point**. A circular focal point control appears over the image.
6. Select the focal point control to move it over the desired focal point.
7. When you're done, on the command bar select **Save**, and then select **Finish editing**.

# Upload and serve static files

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to upload a static file into Microsoft Dynamics 365 Commerce site builder, and how to create a custom URL and file name that can be used to request that file.

Some third-party connectors require that a file be hosted and served from the e-commerce site. These connectors expect that the file will be returned by requests to a specific callback URL path and file name. Therefore, this topic explains how to upload and serve a static file that has a user-definable URL and file name on a Dynamics 365 Commerce e-commerce site.

## Create a site URL that returns a static file

To create a site URL that returns a static file in Commerce site builder, follow these steps.

1. Go to your site's Media library, and upload the file that should be served by requests to the URL that you will define. If you've already uploaded the file, you can skip this step.
2. Go to **URLs** for your site.
3. Select **New > New URL**.
4. In the **New URL** dialog box, select **Media library asset**.
5. In the **URL path** field, enter the URL path. Include the file name in the path.
6. Select **Next**. The Media library is opened and shows all media assets of the **document** type that have been uploaded.
7. Select the file that should be served for requests to the URL that you defined in step 5.
8. Select **Save**.

At this point, the URL that you created is in a draft state. The file that the URL points to won't be returned until you publish the URL. Before you publish the URL, you can validate that it returns the correct data.

## Validate and publish a URL

To validate an URL before you publish it, follow these steps.

1. Go to **URLs** for your site, and select the URL to preview.
2. In the properties pane on the right, below the **Edit** button, select the correct URL link. A new browser window is opened, and you should receive a 404 error.
3. Append the **?preview=inprogress** query string to the URL (for example, `https://yoursite.com/callback.html?preview=inprogress`), and reload the page. The file that you uploaded to the Media library should be returned in the response.

After you've validated the URL, you can publish it.

1. Go to **URLs** for your site, and select the URL.
2. Select **Publish** on the command bar.

## Update the file that a URL points to

After a URL is published, you can update it so that it points to a different file. Alternatively, you can update the URL so that it points to a different the type of resource, as described in the next section. For example, you can point the URL to an internal page or a redirect.

To update the file that a URL points to, follow these steps.

1. Go to **URLs** for your site, and select the URL to update.
2. In the properties pane on the right, select **Edit**.
3. Under **URL assignment**, select the **Step 2** box, and then select a new document from the Media library.
4. Select **Apply**.

## Update the asset type that a URL points to

You can also update a URL so that it points to a different type of asset (resource), such as an internal page or a redirect.

To update the asset type that a URL points to, follow these steps.

1. Go to **URLs** for your site, and select the URL to update.
2. In the properties pane on the right, select **Edit**.
3. Under **URL assignment**, under **Step 1**, select a different asset type.
4. Select the **Step 2** box, and then select the new asset.
5. Select **Apply**.

## Change the URL path

After a URL is created, its path can't be changed. If you must change the URL path that serves a file or any other type of resource, you have to create a new URL, map it to the existing file or other resource, and then unpublish and delete the old URL.

To change the URL path, follow these steps.

1. To create a new URL and map it to the existing file or another resource, follow the instructions in the [Create a site URL that returns a static file](#) section earlier in this topic.
2. Select the new URL, and select **Publish** on the command bar. The new URL is published.
3. To unpublish the old URL, select it, and then select **Unpublish** on the command bar. You can now delete the old URL if you want.

# Compliance overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic is an overview of the compliance guidance that is provided with Microsoft Dynamics 365 Commerce to help you make your company's sites compliant. Compliance is an important factor for all businesses, because it helps their user base connect with their site content. By staying compliant, you can also help protect your company from expensive legal action or hefty fines.

The compliance documentation includes a review of areas that you should consider when you use Dynamics 365 Commerce, to help you meet your company's compliance requirements.

You're responsible for reviewing your company's compliance requirements, and for authoring and building sites that meet the standards of those requirements. The following topics provide examples that show how you can take compliance into account as you use the Commerce authoring tools.

To learn more about the basic principles that Microsoft uses, visit the [Microsoft Trust Center](#). On that site, you can also get more information about areas of compliance.

## Additional resources

# Accessibility features and capabilities

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the accessibility features and capabilities in Microsoft Dynamics 365 Commerce.

## Overview

Accessibility features and capabilities provide the functional means for all users to access and perform actions so that they can accomplish their goals. This broad range of users might require assistive tools for hearing, vision, mobility, or neurodiversity.

Various features in Dynamics 365 Commerce let you build your site so that it includes assistive functionality. When you design your site, you should consider the areas of accessibility functionality that are mentioned in the [Microsoft Accessibility Center](#).

This topic describes some additional areas of accessibility functionality that you should consider when you use Dynamics 365 Commerce.

## Image alt text

Dynamics 365 Commerce has a built-in digital asset management system to track image and video assets that are used on your site. Image captions, descriptions, and alt text can be added in the properties pane for an image when it's selected or uploaded.

## Video accessibility

The Dynamics 365 Commerce digital asset management system supports several accessibility features for video content. The following table lists some examples.

VIDEO FEATURE	DESCRIPTION
Closed captioning (CC)	Text that can be shown for the audio and audio descriptive elements of a video, to help users who are deaf or hard of hearing
Subtitles	Caption files that show the text of context clues or dialog on-screen
Audio transcripts	A textual transcript of spoken words that is generated from the audio of a video asset
Descriptive audio	A non-primary audio channel that describes the content or context that is occurring on-screen
Minimum age gate	An attribute that can store the minimum age that a viewer must be to view a video (metadata only)

### Configure video accessibility elements

In the Commerce **Media Library** section for your site, you can upload video assets that have separate files for closed captions, regular audio, and descriptive audio. Closed captions can also be generated automatically when

a video asset is uploaded.

#### **Generate or upload closed caption files during video asset upload**

To have a closed caption file automatically generated when you upload a video, follow this step.

- In the **Asset Upload** dialog box, select **Automatically generate closed captions**. If you're generating a closed caption file, the file selector for closed caption files will be unavailable in the dialog box.

To manually upload a closed caption file when you upload a video, follow this step.

- In the **Asset Upload** dialog box, clear **Automatically generate closed captions**.

To upload regular audio or descriptive audio files for the video, use the file selector in the **Asset Upload** dialog box.

#### **NOTE**

Closed caption, regular audio, and descriptive audio assets can also be added after a video asset is uploaded. Go to **Media Library**, select the video asset, and select **Edit** to check it out. Then, in the properties pane for the video asset, upload the additional assets.

#### **Edit CC and audio transcript files**

CC and audio transcript files can be edited directly in the authoring tool. Video playback is available during editing.

To edit CC and audio transcript files, follow these steps.

1. Go to **Media Library**, and select the file name of the video asset. The closed caption and transcript content editor appears.
2. Select **Edit**.
3. Edit the closed caption or transcript text.
4. When you've finished, select **Save**, and then select **Finish editing**.
5. When you're ready to publish, select **Publish**.

#### **Set the Minimum Age attribute**

A **Minimum Age** metadata attribute can be associated with video assets.

To set the **Minimum Age** attribute for a video asset, follow these steps.

1. Go to **Media Library**, and select the video asset.
2. Select **Edit**.
3. In the properties pane for the video asset, set the **Minimum Age** attribute.

#### **NOTE**

The properties pane is used only to set and store the metadata attribute value. Customized modules must be created to use this attribute for playback gating.

# Cookie compliance

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes considerations for cookie compliance and the default policies that are included in Microsoft Dynamics 365 Commerce.

## Overview

Privacy is an important factor when tracking technologies that affect e-Commerce customers. Because of privacy compliance standards such as the General Data Protection Regulation (GDPR) in the European Union (EU), electronic privacy guidelines must be considered for any site that is active today. Because many e-Commerce sites are globally accessible by default, it's important that you review the compliance standards for your e-Commerce site.

To learn more about the basic principles that Microsoft uses for cookie compliance, visit the [Microsoft Trust Center](#). On that site, you can also get more information about areas of compliance and privacy.

The following table shows the current reference list of cookies placed by Dynamics 365 Commerce sites.

COOKIE NAME	USAGE
.AspNet.Cookies	Store Microsoft Azure Active Directory (Azure AD) authentication cookies for single sign-on (SSO). Stores encrypted user principal information (name, surname, email).
_msdyn365__cart_	Store cart ID used to obtain list of products added to cart instance.
_msdyn365__ucc_	Cookie compliance consent tracking.
ai_session	Detects how many sessions of user activity have included certain pages and features of the app.
ai_user	Detects how many people used the app and its features. Users are counted using anonymous IDs.
b2cru	Stores redirect URL dynamically.
JSESSIONID	Used by payment connector Adyen to store user session.
OpenIdConnect.nonce.*	Authentication
x-ms-cpim-cache:.*	Used for maintaining the request state.
x-ms-cpim-csrf	Cross-site request forgery (CSRF) token used for protection from CSRF.
x-ms-cpim-dc	Used to route requests to the appropriate production authentication server instance.

COOKIE NAME	USAGE
x-ms-cpim-rc.*	Used to route requests to the appropriate production authentication server instance.
x-ms-cpim-slice	Used to route requests to the appropriate production authentication server instance.
x-ms-cpim-ssorushmoreb2c.onmicrosoft.com_0	Used for maintaining the SSO session.
x-ms-cpim-trans	Used for tracking transactions (the number of open tabs authenticating against a business-to-consumer (B2C) site), including the current transaction.

## Site user cookie consent on an e-Commerce site

If an e-Commerce site feature or module uses a non-essential cookie, a site user's consent must be obtained before the cookie is tracked. To allow site users to provide cookie consent on the e-Commerce site, a site author must add and configure a cookie consent module in the page's header module to ensure that the consent is prompted for and received. Site user consent must be given before a feature or module using a non-essential cookie can be rendered on a site page.

# Add a privacy policy page

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to add a privacy policy page to your site in Microsoft Dynamics 365 Commerce.

## Overview

Privacy compliance includes organizational measures that inform site users about how their data is collected and handled. Users can then decide how they want their personal data to be handled and can take appropriate action.

## Review the Microsoft privacy statement in Dynamics 365 Commerce

To review the Microsoft privacy statement while you're signed in to the Dynamics 365 Commerce authoring tools, select the **Help** button (?) in the upper-right corner, and then select **Privacy and cookies**. A new tab is opened that has a link to the [Microsoft privacy statement](#).

## Build a privacy policy page for your site

In Dynamics 365 Commerce, there are several ways to give users of your site access to your privacy policy. This section shows how to build a privacy policy page and then reference the page by using a footer fragment.

The guidance that follows is an example that shows how to build a generic privacy policy page for a Commerce site. You're responsible for designing and implementing a privacy policy page solution that best meets your company's legal requirements.

To start, in the authoring tools, go to the site that you want to build a privacy policy page for.

### Create a template

#### NOTE

If a template that can be used for the privacy policy page has already been created, skip ahead to the [Build a privacy policy page](#) section.

To create a template, follow these steps.

1. Go to **Templates**, and then select **New** to create a page template.
2. In the **New Template** dialog box, under **Template Name**, enter **Promo banner template**, and then select **OK**.
3. In the template, add any required modules to the required page slots. For guidance, hover over the red exclamation marks. (For example, the **HTML Head** slot might require a **Default External Script** module.)
4. In the **Body** slot, add a **Default Page** module.
5. In the **Default Page** module, in the **Main** slot, add a **Content Rich Block** module.
6. In the **Content Rich Block** module, add a **Content rich block item** module.
7. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.

### Build a privacy policy page

To build a privacy policy page, follow these steps.

1. Go to **Pages**, and then select **New** to create a page.

2. In the **Choose a template** dialog box, select the template for the privacy policy page.
3. Enter a page name and page URL, and then select **OK**.
4. In the **Main** slot of the page, add a **Content Rich Block** module.
5. In the **Content Rich Block** module, add a **Content rich block item** module.
6. In the properties pane for the **Content Rich Block** module, select **Add Data Source**, and then select **Rich Text Content**.
7. In the rich text editor, enter the content for the privacy policy page. Expand the rich text editor to full-screen mode as you require.
8. When you've finished entering content, select **Preview** to preview the page in the web browser.
9. Complete any remaining additions to the page and module properties.
10. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

To publish the URL for the privacy policy page, follow these steps.

1. Go to **URLs**, and select the URL for the privacy policy page.
2. Select **Publish** to publish the selected URL.

### Create a link to the privacy policy page in a footer

You can add a link to the privacy policy page to a fragment. In this way, you can share the link and update it across multiple site pages by referencing the fragment. This example shows how to add a link to the privacy policy page to a footer fragment.

To add a link to a footer fragment, follow these steps.

1. Go to **Fragments**, and then select **New** to create a page fragment.
2. In the **New fragment** dialog box, select the **Footer** module.
3. Under **Fragment name**, enter a name for the fragment, and then select **OK**.
4. In the **Footer category** slot, add a **Footer item** module.
5. In the properties pane on the right, select **Link text**.
6. In the **Link text** dialog box, enter the link text and link target of the privacy policy page, and then click **OK**.
7. To get the URL of the privacy policy page, go to **Pages**, go to the privacy policy page, and copy the URL from the properties pane.
8. Select **Save**, select **Finish editing** to check in the fragment, and then select **Publish** to publish it.
9. Preview the fragment, and test the link to the privacy policy page.

The fragment can now be referenced in the template for other site pages. When this fragment is referenced in the **Footer** module of a template, the link reference will appear on any pages that are built by using that template.

# Replace user IDs associated with tracked content changes

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to replace user IDs that are associated with tracked content changes in Microsoft Dynamics 365 Commerce site builder.

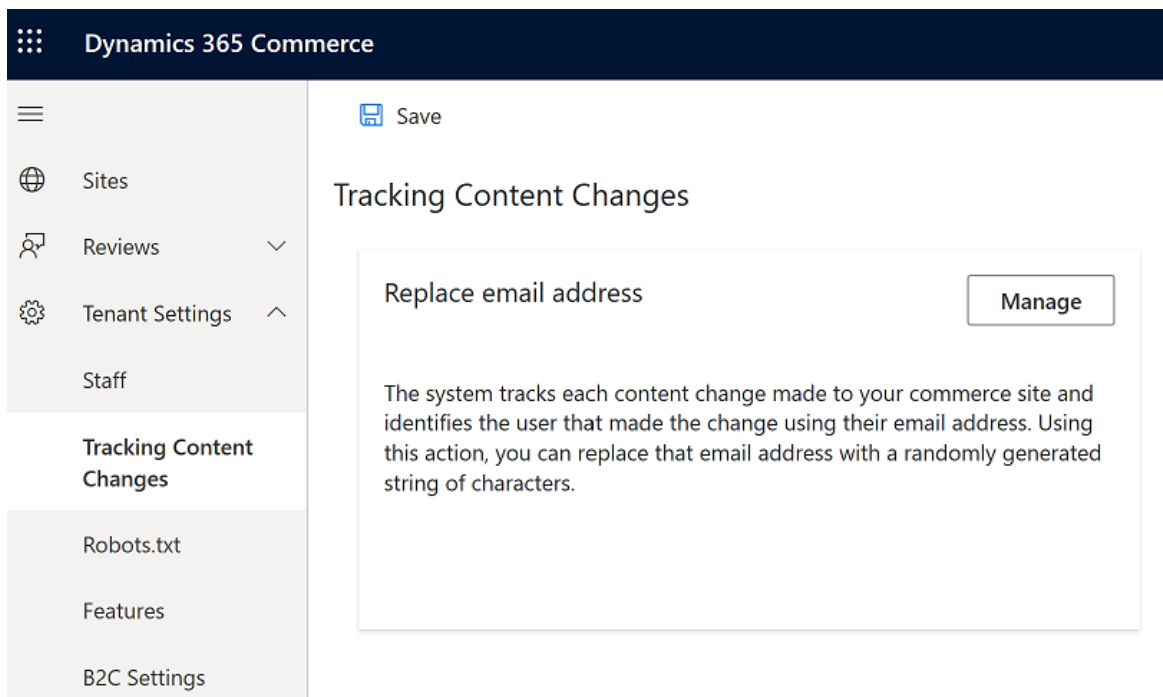

## Overview

In Dynamics 365 Commerce, the site builder authoring tool tracks changes that are made to items in the content management system (CMS). Therefore, a document change history can be shown to help teams track their efforts when they collaborate on content. To assign user identities to tracked changes, the system uses user IDs from the Azure Active Directory (Azure AD) identity management system. These user IDs are also the email addresses that are issued by Azure AD. Commerce system admins can replace user ID references in the change tracking history logs in site builder as they require.

## Replace a user ID in site builder

To replace a user ID in site builder, follow these steps.

1. Go to the **Home** page for your site.
2. In the left navigation pane, expand **Tenant Settings**, and then select **Tracking Content Changes**.

3. On the **Tracking Content Changes** page, select **Manage**.
4. In the **Replace email address** field, enter the user ID email address that should be removed from the change tracking logs, and then select **Replace**. (You can enter multiple email addresses before you select **Replace**.)

## Manage email address

### Replace email address

 user1@fabrikam.onmicrosoft.com

5. Select **OK**, and then select **Save**. A message box notifies you that the records for the user IDs that you entered have been updated.

#### **NOTE**

Site builder replaces every user ID email address with an anonymized, randomly generated string to remove all CMS references to the email address. This action affects only the history logs that are referenced in the specific e-Commerce environment (tenant) that is associated with the site builder instance.

# Module library overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic presents an overview of the Microsoft Dynamics 365 Commerce module library.

The Dynamics 365 Commerce module library is a collection of modules that can be used to build an e-Commerce website. Modules have both user interface (UI) aspects and functional behavior aspects.

Themes can be applied to the modules in the module library to change their look and feel. The themes use Cascading Style Sheets (CSS). A theme for a fictitious e-Commerce site that is named "Fabrikam" is provided as part of the module library and can be used as a reference.

## Module library modules

The following types of modules are provided in the module library:

- **Container module** – A container module is a simple module that acts as a host for other modules. It controls the layout of the modules that are inside it.
- **Marketing modules** – Marketing modules include content block, text block, video player, and carousel modules. All these modules can be used to showcase content. They can be put on any page and are driven by data from the content management system (CMS).
- **Header and footer modules** – Header and footer modules appear in the header and footer of all site pages. These modules can be configured as required through properties.
- **Search modules** – Products can be discovered by using the search module in the header. Search results appear on the search results page. Products can also be discovered on category pages, which are dedicated pages for each category that is supported in the channel navigation hierarchy. In addition, refiner modules can be used to further filter results on search results and category pages.
- **Product details page modules** – Product details pages use several modules to show product information. The buy box module lets customers view products and add them to the cart. Other modules, such as the tech specs module, show the product details. The ratings and reviews module can be used to view and provide reviews.
- **Buy online pick up in store module** – The buy online pick up in store module is integrated with Bing Maps. It can be used to find nearby stores where customers can pick up products that they have purchased.
- **Purchase modules** – Purchase modules include the cart module, which can be used to add items to the cart. The checkout module captures the shipping address, delivery options, and gift card, loyalty program, and credit card information, so that an order can be processed. After an order is placed, the order confirmation module can be used to show the confirmation details.
- **Account management modules** – The sign-in module lets customers sign in to an existing account, and the sign-up module lets them create a new account. After an account is created, the order history module can be used to view recent orders, and the order details module can be used to view order details.
- **Recommendations module** – Recommendations are shown by using the product placement module. This module supports algorithmic and editorial lists that can be showcased on any page.

# Container module

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic covers container modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

A container module is a module that hosts other modules inside it. The primary purpose of a container module is to define, through the properties that are set for it, the layout of the modules that it contains. For example, those modules can appear side by side in a two-column, three-column, four-column, or six-column layout. They can also be limited to the width of the container, or they can fill the screen. A heading can also be added to every container module.

Three container modules are supported: container, container with 2-slots, and container with 3-slots. Modules of any type can be put inside these containers.

## NOTE

We recommend that you always put modules inside a container module, so that they can be limited to the width of the container.

## Examples of container modules in e-Commerce

- A site author wants a three-column layout, where three modules appear side by side. Therefore, the site author uses a container module of the container with 3-slots type.
- A site author wants a six-column layout, where six modules appear side by side. Therefore, the site author uses a container of the contain type that has six columns inside it.
- A site author wants to put a module on a page but doesn't want it to fill the screen. Therefore, the site author adds the module to a container module and sets the container's **Width** property to **Fit container**.

The following image shows an example of a container module that contains a carousel module in Commerce site builder. In this example, the **Width** property of the container module is set to **Fill Screen**.

The screenshot displays the Dynamics 365 Commerce site builder interface. The main workspace shows a 'Homepage' page with a 'Carousel container' module selected. The carousel displays a woman in a purple coat with the text 'NEW ARRIVALS' and 'Into the summer breeze with all new designer dresses'. The right-hand pane shows the properties for the 'Carousel container' module, with the 'Width' property set to 'Fill Screen' and the 'Container Layout' set to 'Stacked'. The left-hand pane shows the site structure, including 'Live site', 'Pages', 'Products', 'URLs', 'Layouts', 'Templates', 'Page Fragments', and 'Media Library'.

# Container module properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Heading text and heading tag ( <b>H1</b> , <b>H2</b> , <b>H3</b> , <b>H4</b> , <b>H5</b> , or <b>H6</b> )	An optional heading can be provided for the container. By default, the <b>H2</b> heading tag is used for the heading. However, the tag can be changed to meet accessibility requirements.
Width	<b>Fit container</b> or <b>Fill screen</b>	If the value is set to <b>Fit container</b> (the default value), the modules inside the container are limited to the width of the container. If the value is set to <b>Fill screen</b> , the modules aren't limited to the container width but can fill the screen.
Number of columns	<b>1</b> , <b>2</b> , <b>3</b> , <b>4</b> , <b>6</b> , or <b>12</b>	This property defines the number of columns in the container. A container can have up to 12 columns.

## Container with 2-slots

The container with 2-slots type is optimized for a two-column layout. This type of container has two slots to allow for a side-by-side view of the modules that are inside.

Additional properties can be used to optimize the layout for different view ports (mobile devices, tablets, computers, and so on). For every view port, the width of each column can be defined. The following column width settings are available:

- **75%/25%** – The first module has a column width of 75 percent, and the second module has a column width of 25 percent. A **25%/75%** option is also available.
- **50%/50%** – Both modules have equal column width.
- **67%/33%** – The first module has a column width of 67 percent, and the second module has a column width of 33 percent. A **33%/67%** option is also available.
- **100%** – Both modules have a full-column width. Therefore, the modules are vertically stacked in a single column. Although this single-column layout goes against intent of the container with 2-slots type, it might be preferable for some view ports (for example, extra-small view ports such as mobile devices).

### Container with 2-slots properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Heading text and heading tag	An optional can be provided for the container.
X-Small view port configuration	<b>25%/75%</b> , <b>75%/25%</b> , <b>50%/50%</b> , <b>67%/33%</b> , <b>33%/67%</b> , or <b>100%</b>	This property defines the layout for extra-small view ports.
Small view port configuration	<b>25%/75%</b> , <b>75%/25%</b> , <b>50%/50%</b> , <b>67%/33%</b> , <b>33%/67%</b> , or <b>100%</b>	This property defines the layout for small view ports, such as mobile devices.
Medium view port configuration	<b>25%/75%</b> , <b>75%/25%</b> , <b>50%/50%</b> , <b>67%/33%</b> , <b>33%/67%</b> , or <b>100%</b>	This property defines the layout for medium view ports, such as tablets.

PROPERTY NAME	VALUES	DESCRIPTION
Large view port configuration	25%/75%, 75%/25%, 50%/50%, 67%/33%, 33%/67%, or 100%	This property defines the layout for large view ports, such as computers.

## Container with 3-slots

The container with 3-slots modules type is optimized for a three-column layout.

Additional properties can be used to optimize the layout for different view ports. For every view port, the width of each column can be defined. The following column width settings are available:

- 33%/33%/33% – All three modules have equal column width.
- 50%/25%/25% – The first module has a column width of 50 percent, and each of the remaining two modules has a column width of 25 percent. 25%/50%/25% and 25%/25%/50% options are also available.
- 16%/16%/67% – Each of the first two modules has a column width of 16 percent, and the third module has a column width of 67 percent. 16%/67%/16% and 67%/16%/16% options are also available.

### Container with 3-slots properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Heading text and heading tag	An optional heading can be added to the container.
X-Small view port configuration	33%/33%/33%, 50%/25%/25%, 25%/50%/25%, 25%/25%/50%, 16%/16%/67%, 16%/67%/16%, or 67%/16%/16%	This property defines the layout for extra-small view ports.
Small view port configuration	33%/33%/33%, 50%/25%/25%, 25%/50%/25%, 25%/25%/50%, 16%/16%/67%, 16%/67%/16%, or 67%/16%/16%	This property defines the layout for small view ports, such as mobile devices.
Medium view port configuration	33%/33%/33%, 50%/25%/25%, 25%/50%/25%, 25%/25%/50%, 16%/16%/67%, 16%/67%/16%, or 67%/16%/16%	This property defines the layout for medium view ports, such as tablets.
Large view port configuration	33%/33%/33%, 50%/25%/25%, 25%/50%/25%, 25%/25%/50%, 16%/16%/67%, 16%/67%/16%, or 67%/16%/16%	This property defines the layout for large view ports, such as computers.

## Add a container module to a page

To add a container player module to a new page and set the required properties, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter **Container template**, and then select **OK**.
3. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Default Page** module, and then select **OK**.
5. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
6. Go to **Pages**, and select **New** to create a new page.

7. In the **Choose a template** dialog box, select the video player template that you created. Under **Page name**, enter **Container page**, and then select **OK**.
8. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add Module**.
9. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
10. In the property pane for the container module, set the **Number of columns** property to **1** and the **Width** property to **Fill container**.
11. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
12. In the **Add Module** dialog box, select the **Content block** module, and then select **OK**.
13. In the property pane for the content block module, configure the heading, image, and layout.
14. Select **Save**, and then select **Preview** to preview the page. You should see one feature module that fits within the width of the container module.
15. In the property pane for the container module, change the value of the **Number of columns** property to **3**.
16. Add two more content block modules to the container module, and configure them.
17. Select **Save**, and then select **Preview** to preview the page. You should now see three content block modules that appear side by side.
18. After you've achieved the layout that you want, select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Accordion module

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic covers accordion modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Accordion modules are container-like modules that are used to organize the information or modules on a page by providing a collapsible drawer-like capability. An accordion module can be used on any page.

Inside every accordion module, one or more accordion item modules can be added. Each accordion item module represents a collapsible drawer. Inside every accordion item module, one or more modules can be added. There are no restrictions on the types of modules that can be added to an accordion item module.

The following image shows an example of an accordion module that is used to organize information on a store's frequently asked questions (FAQ) page.

The screenshot shows a 'Frequently asked questions' section with a heading and 'Open all | Close all' links. The accordion is expanded to show the first question: 'How do I make payments?'. The answer includes a list of accepted payment methods (Credit Cards: Visa, MasterCard; Gift Cards) and a note that cash, CODs, checks, money orders, and gift certificates are not accepted. Other questions listed include 'How can I track my order?', 'How do I know if my order online is secure?', 'What happens when my item is backordered?', 'What are the benefits of registering?', and 'Can I buy online and pick up in store?'.

## Accordion module properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Text	This property specifies an optional text heading for the accordion module.
Expand All	True or False	If the value is set to <b>True</b> , expand/collapse functionality is turned on, so that all items in the accordion module can be expanded and collapsed.

PROPERTY NAME	VALUES	DESCRIPTION
Interaction Style	<b>Independent</b> or <b>Expand one item only</b>	This property defines the style of interaction for accordion items. If the value is set to <b>Independent</b> , each accordion item can be expanded or collapsed independently. If the value is set to <b>Expand one item only</b> , only one item can be expanded at a time. As items are expanded, previously expanded items are collapsed.

## Accordion item module properties

PROPERTY NAME	VALUES	DESCRIPTION
Title	Text	This property specifies the title text for the accordion item module. By selecting the title region, users can expand or collapse the section.
Expand by default	<b>True</b> or <b>False</b>	If the value is set to <b>True</b> , the accordion item is expanded by default when the page is loaded.

## Add an accordion module to a FAQ page

To add an accordion module to a FAQ page and set its properties in site builder, follow these steps.

1. Go to **Pages**, and use the Fabrikam marketing template (or any template that has no restrictions) to create a new page that is named **Store FAQ**.
2. In the **Main** slot of the **Default page**, select the ellipsis (...), and then select **Add Module**.
3. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
4. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
5. In the **Add Module** dialog box, select the **Accordion** module, and then select **OK**.
6. In the property pane of the accordion module, select **Heading** next to the pencil symbol.
7. In the **Heading** dialog box, under **Heading Text**, enter **Frequently asked questions**. Then select **OK**.
8. In the property pane of the accordion module, select the **Show expand all** check box, and then, in the **Interaction style** field, select **Independent**.
9. In the **Accordion** slot, select the ellipsis (...), and then select **Add Module**.
10. In the **Add Module** dialog box, select the **Accordion item** module, and then select **OK**.
11. In the property pane of the accordion item module, under **Title**, enter title text (for example, **How do returns work?**).
12. In the **Accordion item** slot, select the ellipsis (...), and then select **Add Module**.
13. In the **Add Module** dialog box, select the **Text block** module, and then select **OK**.
14. In the property pane of the text block module, enter a paragraph of text (for example, **Returns must be processed via the call center. Contact 1-800-FABRIKAM for returns. Products have a 30-day return policy. Returns must be initiated within this time frame.**).
15. In the **Accordion** slot, add a few more accordion item modules. In each accordion item module, add a text block module that has content.
16. Select **Save**, and then select **Preview** to preview the page. The page will show an accordion module that has the content that you added.

17. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

[Module library overview](#)

[Container module](#)

[Tab module](#)

[Text block module](#)

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Tab module

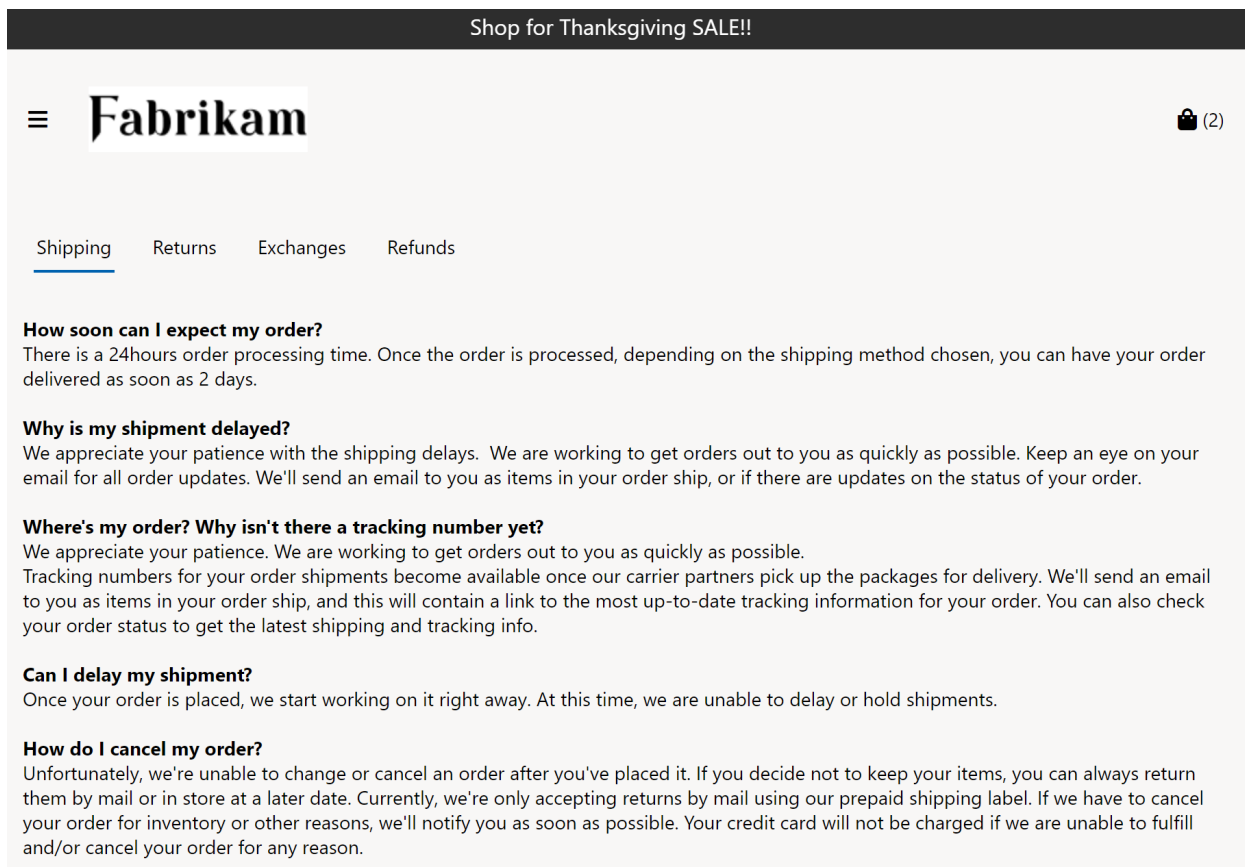

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers tab modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Tab modules are container-like modules that are used to organize the information on a site page on tabs. They can be used on any page where information must be presented on tabs.

In every tab module, one or more tab item modules can be added. Each tab item module represents a single tab. In each tab item module, one or more modules can be added. There are no restrictions on the types of modules that can be added to a tab item module.

The following image shows an example of a tab module on a site page. In this example, the **Shipping** tab is selected.

The screenshot shows a website header with a dark bar containing the text "Shop for Thanksgiving SALE!!". Below the header is the Fabrikam logo and a shopping cart icon with "(2)" items. A navigation bar contains four tabs: "Shipping" (which is underlined and selected), "Returns", "Exchanges", and "Refunds". The main content area displays several sections of text related to shipping, each with a bold heading:

- How soon can I expect my order?**  
There is a 24hours order processing time. Once the order is processed, depending on the shipping method chosen, you can have your order delivered as soon as 2 days.
- Why is my shipment delayed?**  
We appreciate your patience with the shipping delays. We are working to get orders out to you as quickly as possible. Keep an eye on your email for all order updates. We'll send an email to you as items in your order ship, or if there are updates on the status of your order.
- Where's my order? Why isn't there a tracking number yet?**  
We appreciate your patience. We are working to get orders out to you as quickly as possible. Tracking numbers for your order shipments become available once our carrier partners pick up the packages for delivery. We'll send an email to you as items in your order ship, and this will contain a link to the most up-to-date tracking information for your order. You can also check your order status to get the latest shipping and tracking info.
- Can I delay my shipment?**  
Once your order is placed, we start working on it right away. At this time, we are unable to delay or hold shipments.
- How do I cancel my order?**  
Unfortunately, we're unable to change or cancel an order after you've placed it. If you decide not to keep your items, you can always return them by mail or in store at a later date. Currently, we're only accepting returns by mail using our prepaid shipping label. If we have to cancel your order for inventory or other reasons, we'll notify you as soon as possible. Your credit card will not be charged if we are unable to fulfill and/or cancel your order for any reason.

## Tab module properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Text	This property specifies an optional text heading for the tab module.
Active Tab Index	Number	This property specifies the tab that should be active by default when a page is loaded. If no value is provided, the first tab item is active by default.

# Tab item module properties

PROPERTY NAME	VALUES	DESCRIPTION
Title	Text	This property specifies the title text for the tab item module.

## Add a tab module to a page

To add a tab module to a page and set the properties, follow these steps.

1. Use the Fabrikam marketing template (or any template that has no restrictions) to create a new page that is named **Store policies page**.
2. In the **Main** slot of the **Default page**, select the ellipsis (...), and then select **Add Module**.
3. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
4. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
5. In the **Add Module** dialog box, select the **Tab** module, and then select **OK**.
6. In the property pane of the tab module, select **Heading** next to the pencil symbol.
7. In the **Heading** dialog box, under **Heading Text**, enter heading text (for example, **Policies**). Then select **OK**.
8. In the **Tab** slot, select the ellipsis (...), and then select **Add Module**.
9. In the **Add Module** dialog box, select the **Tab item** module, and then select **OK**.
10. In the property pane of the tab item module, under **Title**, enter title text (for example, **Delivery**).
11. In the **Tab item** slot, select the ellipsis (...), and then select **Add Module**.
12. In the **Add Module** dialog box, select the **Text block** module, and then select **OK**.
13. In the property pane of the text block module, under **Rich text**, enter a paragraph of text.
14. In the **Tab** slot, add a few more tab item modules that have titles. In each tab item module, add a text block module that has content.
15. Select **Save**, and then select **Preview** to preview the page. The page will show a tab module that contains tab item modules have the content that you added.
16. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Iframe module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers the iframe module and describes how to add it to site pages in Microsoft Dynamics 365 Commerce.

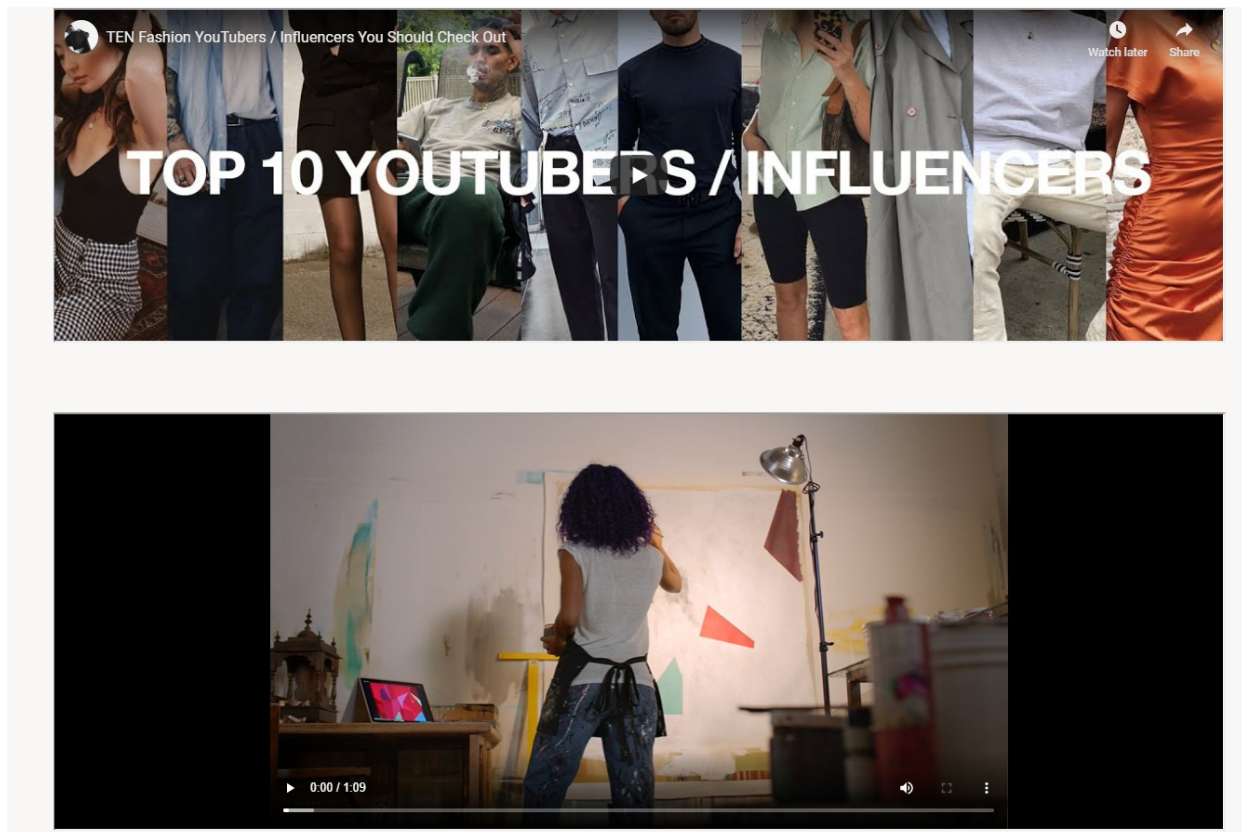

An iframe module provides an iframe (inline frame) that hosts external content on a site. For example, it can be used to host a YouTube video or a PDF file viewer on any site page.

An iframe module requires a target URL. It then hosts the content of the target page inside an HTML **iframe** element. External URLs must be on the allow list per the site's content security policy (CSP) directives. For iframe content, URLs should be allowed by using the **frame-ancestor** directive. For more information, see [Manage Content Security Policy \(CSP\)](#).

## NOTE

The iframe module is available in the Dynamics 365 Commerce 10.0.13 release.

The following image shows examples of iframe modules that showcase external videos on site pages.

## Iframe module properties

PROPERTY NAME	VALUE	DESCRIPTION
Heading	Text	The heading for the module.
Target URL	URL	The URL that is hosted in the module.

PROPERTY NAME	VALUE	DESCRIPTION
Height	Number or percentage	The height of the module, in pixels or as a percentage. For example, the value <b>100</b> will be treated as a number of pixels, and the value <b>100%</b> will be treated as a percentage.
Aria label	Text	An Accessible Rich Internet Applications (ARIA) label can be defined for accessibility purposes.

## Add an iframe module to a page

To add an iframe module to a page to show an external video, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter **Marketing template**, and then select **OK**.
3. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
4. Go to **Pages**, and select **New** to create a new page.
5. In the **Choose a template** dialog box, select the **Marketing template** template. Under **Page name**, enter **Marketing page**, and then select **OK**.
6. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add Module**.
7. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
8. In the module's properties pane, set the **Width** value to **Fill Container**.
9. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
10. In the **Add Module** dialog box, select the **iframe** module, and then select **OK**.
11. In the module's properties pane, set the **Target URL** value to an external URL for a video.
12. Set other properties, such as **Heading** and **Height**, as you require.
13. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
14. Go to the marketing page on your site. You should see that the video is rendered in the iframe module.

# Promo banner module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers promo banner modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Promo banner modules are used to show inline informational messages on a page. They can be used to show site-wide promotions that appear on all pages of an e-Commerce site.

Promo banner modules support a text message and a link. If multiple messages are added to a promo banner module, it becomes a rotating carousel banner that lets customers cycle through all the messages.

Promo banner modules are driven by data from the content management system (CMS) and can be put on any page.

## Usage examples of promo banners in e-Commerce

Promo banners can be used in the site header to show site-wide promotions or messages, as in the following examples.

"Annual sale ends in 10 days"

"Save big with back to school sale. Shop Now."

"Shop for Thanksgiving SALE!"

The following image shows an example of a promo banner.

## Promo banner module properties

PROPERTY NAME	VALUE	DESCRIPTION
Banner messages	Text and links	An array of text and links.
Autoplay	<b>True</b> or <b>False</b>	A value that indicates whether messages are automatically cycled through, if multiple messages are configured.
Slide transition interval	A number of milliseconds (ms)	The interval that is used to cycle through messages.
Allow dismiss	<b>True</b> or <b>False</b>	If the value is set to <b>True</b> , customers can dismiss the alert.

PROPERTY NAME	VALUE	DESCRIPTION
Show carousel flipper	<b>True or False</b>	A value that indicates whether the carousel flippers should be shown, so that customers can manually cycle through multiple banner items.
Text alignment	<b>Right, Left, or Center</b>	The text alignment in the promo banner module.
Link	A URL	The URL for an optional link.

## Add a promo banner module to a page

To add a promo banner module to a page and set the required properties, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template Name**, enter **Promo banner template**, and then select **OK**.
3. Under **Page Outline**, add a **Default page** module to the **Body** slot.
4. Select **Finish editing** to check in the template, and then select **Publish** to publish it.
5. Use the template that you just created to create a page that is named **Promo banner page**.
6. In the **Main** slot of the new page, add a container module.
7. In the pane on the right, set the **Width** value to **Fill Container**.
8. Under **Page Outline**, add a promo banner module to the container module.
9. In the settings for the banner module, add one or more banner messages. Each message can have text together with a link. You can edit the other properties to customize the module further.
10. Select **Save**, and then select **Preview** to preview the page. At the top of the page, you should see an alert that shows the text that you added.
11. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

### NOTE

A promo banner is typically used in the page header slot or a subheader slot.

# Carousel module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers carousel modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

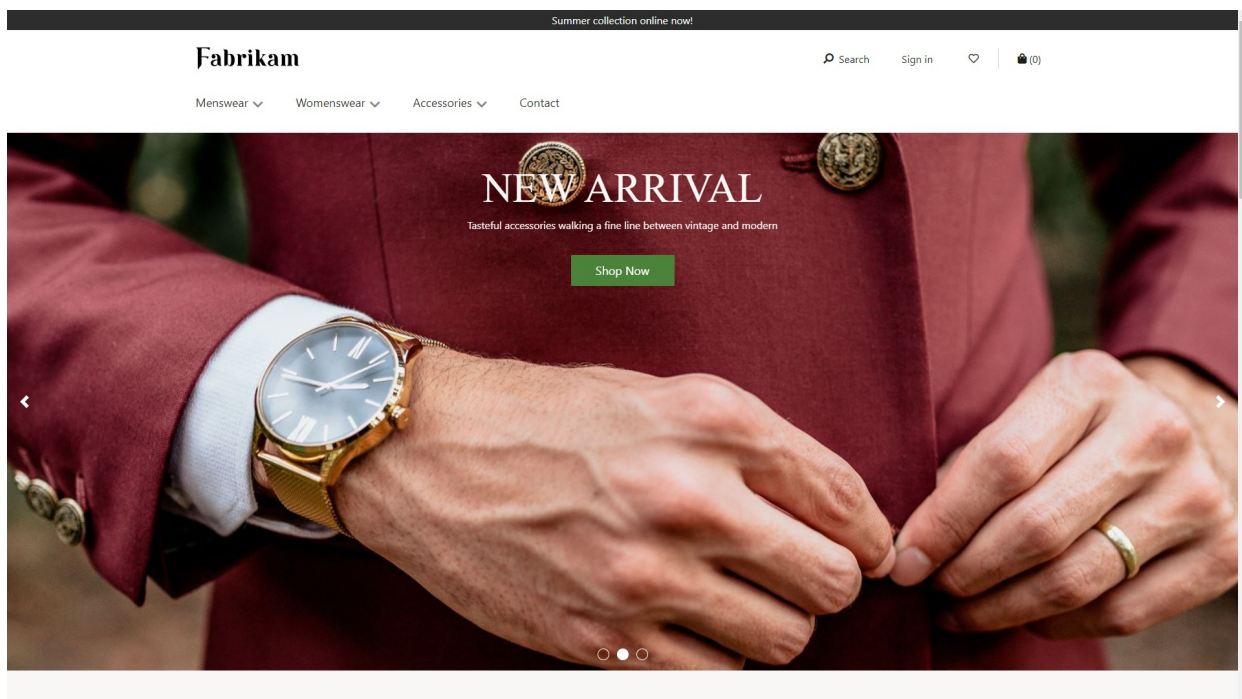

A carousel module is used to put multiple promotional items (including rich images) in a rotating carousel banner that customers can browse. For example, a retailer can use a carousel module on a home page to showcase multiple new products or promotions.

You can add content block modules inside a carousel module. The properties of the carousel module then define how those modules are rendered.

## Examples of carousel modules in e-Commerce

- A carousel that has multiple promotional modules inside it can be used on a home page.
- A carousel that has multiple promotional modules inside it can be used on a product details page.
- A carousel can be used on any marketing page to promote multiple promotions or products.

The following image shows an example of a carousel module that is used on a home page. This carousel module contains multiple content block items.

## Carousel module properties

PROPERTY NAME	VALUE	DESCRIPTION
---------------	-------	-------------

PROPERTY NAME	VALUE	DESCRIPTION
Autoplay	<b>True or False</b>	If the value is set to <b>True</b> , the transition between items inside the carousel occurs automatically. If the value is set to <b>False</b> , no transition occurs unless the customer uses the keyboard or mouse to move from one item to the next item.
Slide transition interval	A value in seconds	The interval for transitions between items.
Transition type	<b>Slide or Fade</b>	The transition effect between items.
Hide carousel flipper	<b>True or False</b>	If the value is set to <b>True</b> , the carousel flipper and sequence indicator are hidden.
Allow carousel dismiss	<b>True or False</b>	If the value is set to <b>True</b> , users can dismiss the carousel.

## Add a carousel module to a page

To add a carousel module to a new page and set the required properties, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template Name**, enter **Carousel template**, and then select **OK**.
3. In the **Body** slot, add a **Default page** module.
4. Select **Finish editing** to check in the template, and then select **Publish** to publish it.
5. Use the carousel template that you just created to create a page that is named **Carousel page**.
6. In the **Main** slot of the new page, add a container module.
7. In the pane on the right, set the **Width** value to **Fill Screen**.
8. Under **Page Outline**, add a carousel module to the container module.
9. Add a content block module to the carousel module. Set the properties of the content block module by providing **Heading**, **Link**, **Layout**, and other properties.
10. Add and configure another content block module.
11. Set additional properties for the carousel module as you require.
12. Select **Save**, and then select **Preview** to preview the page. The page should show a carousel that has two modules inside it (a hero module and a feature module). You can change additional properties for the carousel, hero, and feature modules to achieve the desired effect.
13. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Text block module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers text block modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

A text block module is a module that is used to add textual content. This content can be informational or promotional.

Text block modules are driven by data from the content management system (CMS) and can be put on any page. They are stand-alone modules that don't depend on page context or any other modules.

## Examples of text block modules in e-Commerce

Text block modules can be used in the following ways:

- To showcase product features on a product details page.
- For informational purposes on any page. For example, they can explain the benefits of loyalty programs, describe shipping and return policies, answer frequently asked questions, or provide "about us" content.
- To add custom messages on a product details page. (for example, "Free shipping for orders over \$50").
- For disclaimers and contact details on product details pages, cart pages, checkout pages, and other pages (for example, "Shipping and returns are subject to store policies").

The following image shows an example of a text block module that is used on a home page.

## Text block module properties

PROPERTY NAME	VALUE	DESCRIPTION
Rich text	Rich text	Paragraph text. Some basic rich text capabilities are supported, such as bold, underlined, and italic text.
Custom class name	A Cascading Style Sheets (CSS) class name	The name of a custom CSS class that a developer provides to format this module. The class name should be defined in the theme pack.
Font size	<b>Small, Medium, Large, or X-Large</b>	The font size of the content.

## Add a text block module to a page

To add a text block module to a new page and set the required properties, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter **Content template**.
3. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.

4. In the **Add Module** dialog box, select the **Default page** module, and then select **OK**.
5. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
6. Go to **Pages**, and select **New** to create a new page.
7. In the **Choose a template** dialog box, select **Content template**. Under **Page name**, enter **Content page**, and then select **OK**.
8. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add Module**.
9. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
10. In the property pane for the container module, set the **Width** property to **Fill container**.
11. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
12. In the **Add Module** dialog box, select the **Text block** module, and then select **OK**.
13. In the property pane of the text block module, add text to the **Rich text** field.
14. Select **Save**, and then select **Preview** to preview the page.
15. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Content block module

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic covers content block modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

A content block module is used to market products or promotions through a combination of images and text. For example, a retailer can add a content block module to the home page of an e-Commerce site to promote a new product and attract the attention of customers.

A content block module is driven by data from the content management system (CMS). It's a stand-alone module that doesn't depend on any other modules on the page. A content block module can be put on any site page where a retailer wants to market or promote something (for example, products, sales, or features).

## Examples of content block module in e-Commerce

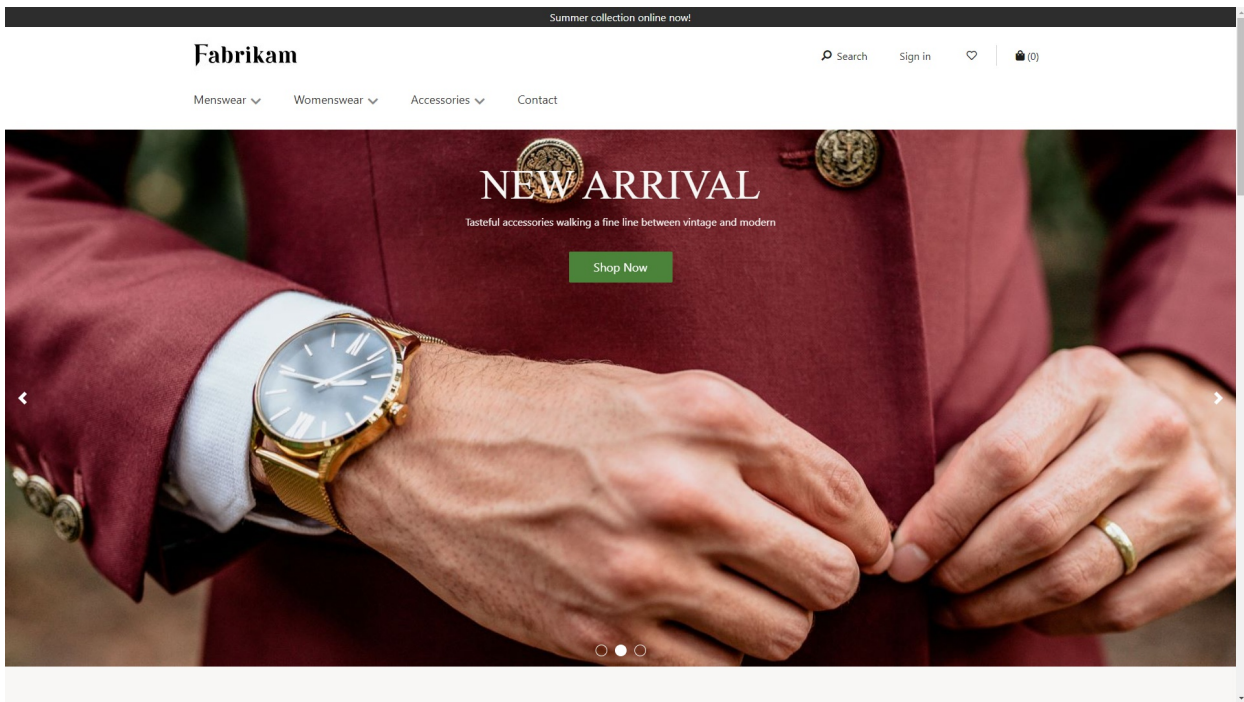

- A content block module can be used on the home page of an e-Commerce site to highlight promotions and new products.
- A content block module can be used on a product details page to showcase product information.
- Multiple content block modules can be put inside a carousel module to highlight multiple products or promotions.

## Content block modules and themes

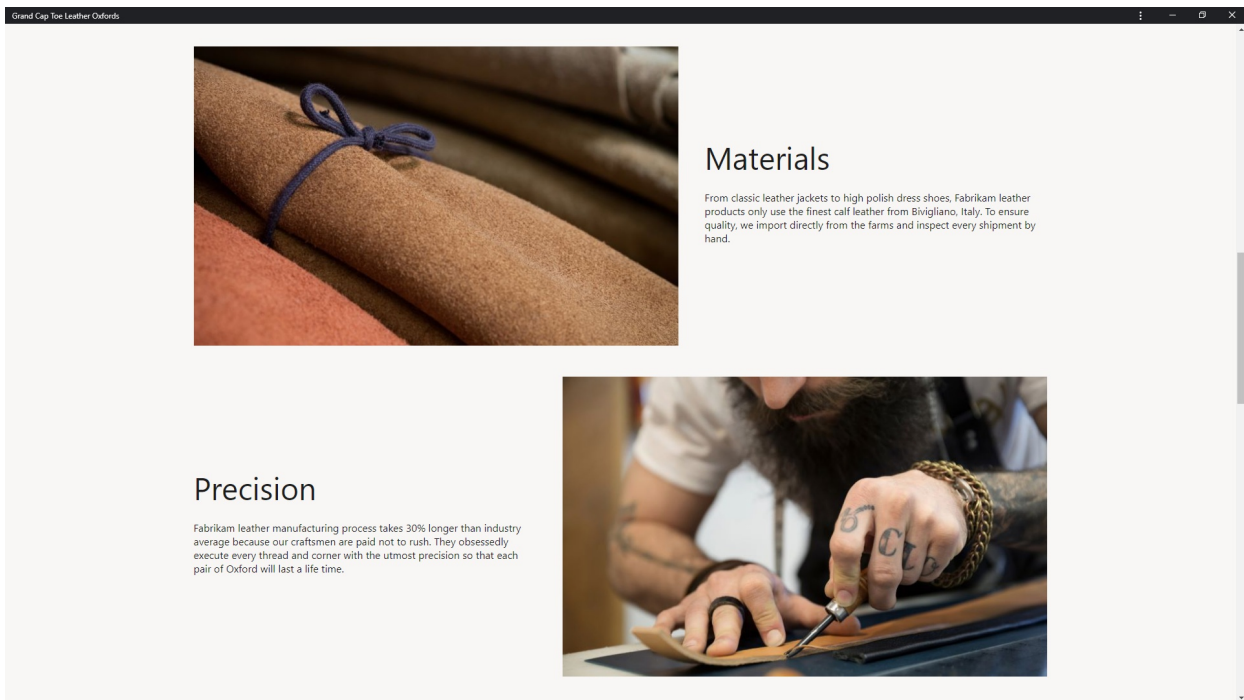

Content block modules can support various layouts and styles based on a theme. For example, the Fabrikam theme supports three layout variations of a content block module: hero, feature, and tile. The hero layout shows an image on the background with text overlay. The feature layout shows an image and text side by side. The tile layout allows multiple content blocks in a tile format.

In addition, the theme can expose different properties for each layout. A theme developer can build more layouts with more styles using the content block module.

The following image shows an example of a content block module with a hero layout.

The following image shows an example of a content block module with a feature layout.

## Content block module properties

PROPERTY NAME	VALUES	DESCRIPTION
Image	Image file	An image can be used to showcase a product or a promotion. An image can be uploaded to the image gallery, or an existing image can be used.
Heading	Heading text and heading tag (H1, H2, H3, H4, H5, or H6)	Every hero module can have a heading. By default, the H2 heading tag is used for the heading. However, the tag can be changed to meet accessibility requirements.

PROPERTY NAME	VALUES	DESCRIPTION
Paragraph	Paragraph text	Hero modules support paragraph text in rich text format. Some basic rich text capabilities are supported, such as bold, underlined, and italic text, and hyperlinks. Some of these capabilities can be overridden by the page theme that is applied to the module.
Link	Link text, link URL, Accessible Rich Internet Applications (ARIA) label, and <b>Open link in new tab</b>	Hero modules support one or more "call to action" links. If a link is added, link text, a URL, and an ARIA label are required. ARIA labels should be descriptive to meet accessibility requirements. Links can be configured so that they are opened on a new tab.

## Content block module properties exposed by the Fabrikam theme

PROPERTY NAME	VALUES	DESCRIPTION
Text placement	<b>Left, Right, Center</b>	This property defines the position of the text on the image. It only applies to the hero layout.
Text theme	<b>Light</b> or <b>Dark</b>	A color scheme can be defined for the text, based on the background image. For example, if the image has a dark background, a light theme can be applied to make the text more visible and to meet color contrast ratios for accessibility purposes. It only applies to the hero layout.
Image placement	<b>Left, Right</b>	This property specifies if the image should be to the left or right of the text. It only applies to the feature layout.

## Add a content block module to a new page

To add a hero module to a new page and set the required properties, follow these steps.

1. Go to **Templates**, and create a page template that is named **Content block template**.
2. In the **Main** slot of the default page, add a hero module.
3. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
4. Use the hero template that you just created to create a page that is named **Content block page**.
5. In the **Main** slot of the default page, select the ellipsis button (...), and then select **Add Module**.
6. In the **Add Module** dialog box, under **Select Modules**, select the hero module, and then select **OK**.
7. In the outline tree on the left, select the content block module.
8. In the properties pane on the right, select **Add an image**. Then either select an existing image or upload a new image.
9. Select **Heading**.
10. In the **Heading** dialog box, add the heading text, select the heading level, and then select **OK**.

11. Under **Rich Text**, add text as you require.
12. Select **Add Link**.
13. In the **Link** dialog box, add link text, a link URL, and an ARIA label for the link, and then select **OK**.
14. Select the **Hero** layout.
15. Select **Save**, and then select **Preview** to preview the page.
16. Select **Finish editing** to check in the template, and then select **Publish** to publish it.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Video player module

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic covers video player modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

The video player module is used to support video playback. It can be added to any page, provided that video content is uploaded to and available in the content management system (CMS). The video player module supports the .mp4 media type.

## Video player module

The video player module can be used to showcase videos on an e-Commerce site. It supports all playback capabilities, such as play, pause, full-size mode, audio descriptions, and closed captions. The video player module also supports customization of closed captions to meet Microsoft accessibility standards. For example, you can customize the font size and background color.

The video player module also supports secondary audio tracks. When a video is uploaded to the CMS, a secondary audio track can also be uploaded. The video player module can then play the secondary audio track if a user selects it.

### Examples of video player modules in e-Commerce

- Instructional videos on product details pages or marketing pages
- Promotional videos or videos about policies on any marketing page
- Marketing videos that highlight product features on product details pages or marketing pages

The following image shows an example of a video player module on a home page.

### Video player module properties

PROPERTY NAME	VALUE	DESCRIPTION
Auto play	<b>True or False</b>	When the value is set to <b>True</b> , the video is automatically played.
Mute	<b>True or False</b>	When the value is set to <b>True</b> , the audio is muted. For this player, the default value is <b>False</b> . In the Chrome browser, autoplay videos are muted by default, and the audio is played only if the user manually plays the video.
Loop	<b>True or False</b>	When the value is set to <b>True</b> , the video is repeated in a loop.
Media	Video file path and name	The video file that is played in the video player.
Play fullscreen	<b>True or False</b>	When the value is set to <b>True</b> , the video is played in full-screen mode.
Play pause trigger	<b>True or False</b>	When the value is set to <b>True</b> , a play/pause button is shown on the video.
Video player controls	<b>True or False</b>	When the value is set to <b>True</b> , all video player controls are shown. These controls include play and pause buttons, a progress indicator, and closed caption options.
Hide poster image	<b>True or False</b>	A video can have a poster frame. When the value of this property is set to <b>True</b> , the poster frame is hidden.
Mask level	A number from <b>0</b> through <b>100</b>	The mask that is applied to the video for styling.

## Add a video player module to a page

### NOTE

Before you create a video player module, you must first upload a video to the Media Library.

To add a video player module to a new page and set the required properties, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter **Video player template**, and then select **OK**.
3. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Default Page** module, and then select **OK**.
5. In the **Main** slot of the **Default Page** module, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
7. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.

8. In the **Add Module** dialog box, select the **Video player** module, and then select **OK**.
9. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
10. Go to **Pages**, and select **New** to create a new page.
11. In the **Choose a template** dialog box, select the video player template that you created. Under **Page name**, enter **Video player page**, and then select **OK**.
12. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add Module**.
13. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
14. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
15. In the **Add Module** dialog box, select the **Video player** module, and then select **OK**.
16. In the property pane of the video player module, select **Add a video**.
17. In the **Media Picker** dialog box, select a video, and then select **Upload new media item**.
18. In File Explorer, select a video file, and then select **Open**.
19. In the **Upload Media Item** dialog box, enter a title and other information as needed, and then select **OK**.
20. In the **Media Picker** dialog box, select **Close**.
21. Select **Save**, and then select **Preview** to preview the page. You should see the video module on the page. You can change additional settings to customize the behavior of the module.
22. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Header module

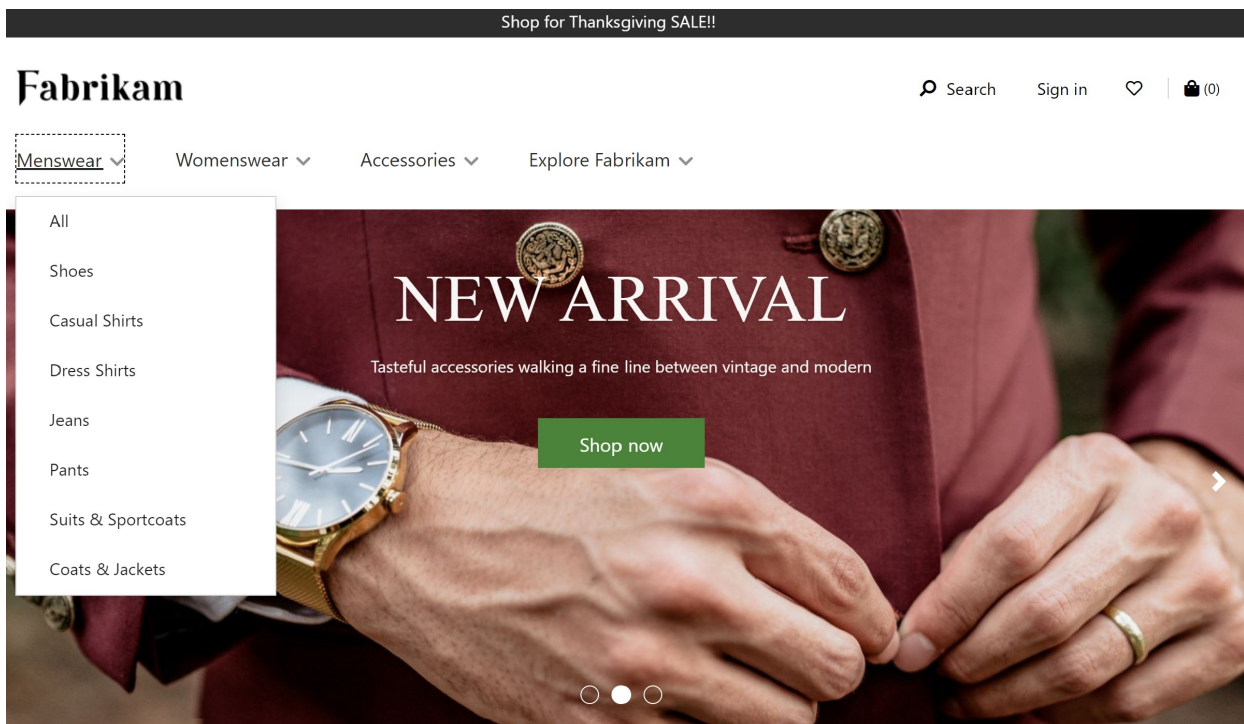

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic covers header modules and describes how to create page headers in Microsoft Dynamics 365 Commerce.

In Dynamics 365 Commerce, a page header is configured as a page fragment that includes the header, promo banner, and cookie consent modules.

The header module includes a site logo, links to the navigation hierarchy, links to other pages on the site, a cart icon module, a wishlist symbol, sign-in options, and the search bar. A header module is automatically optimized for the device that the site is being viewed on (in other words, for a desktop device or a mobile device). For example, on a mobile device, the navigation bar is collapsed into a **Menu** button (which is sometimes referred to as a *hamburger menu*).

The following image shows an example of a header module on a home page.

## Properties of a header module

A header module supports **Logo image**, **Logo link**, and **My account links** properties.

The **Logo image** and **Logo link** properties are used to define a logo on the page. For more information, see [Add a logo](#).

The **My account links** property can be used to define account pages that the site owner wants to show quick links for in the header.

## Modules that are available within a header module

The following modules can be used in a header module:

- **Navigation menu** – The navigation menu represents the channel navigation hierarchy and other static navigation links. For more information, see [Navigation menu module](#).

- **Search** – The search module lets users enter search terms to search for products. The URL of the default search page and the search query parameters must be provided at **Site Settings > Extensions**. The search module has properties that let you suppress the search button or label as you require. The search module also supports auto-suggest options, such as product, keyword, and category search results.
- **Cart icon** - The cart icon module represents the cart icon, which shows the number of items in the cart at any given time. For more information, see [Cart icon module](#).
- **Site selector** - The site selector module lets users browse across different predefined sites, based on market, regions, and locales. For more information, see [Site selector module](#).
- **Store selector** - The store selector module can be included in a header module's store selector slot. It lets users browse and find nearby stores. Users can also specify a preferred store. That store will then be shown in the header. When the store selector module is included in the header module, its **Mode** property must be set to **Find stores**. For more information, see [Store selector module](#).

#### NOTE

- Support for using the cart icon module in header modules is available in the Dynamics 365 Commerce 10.0.11 release.
- Support for using the site selector module in header modules is available in the Dynamics 365 Commerce 10.0.14 release.
- Support for using the store selector module in header modules is available in the Dynamics 365 Commerce 10.0.15 release.

## Create a header fragment for a page

To create a header fragment, follow these steps.

1. Go to **Fragments**, and select **New** to create a new fragment.
2. In the **New fragment** dialog box, select the **Container** module, enter a name for the fragment, and then select **OK**.
3. Select the **Default container** slot, and then, in the properties pane on the right, set the **Width** property to **Fill Screen**.
4. In the **Default container** slot, select the ellipsis (...), and then select **Add Module**.
5. In the **Add Module** dialog box, select the **Cookie consent**, **Header**, and **Promo banner** modules, and then select **OK**.
6. In the properties pane of the **Promo banner** module, select **Add Message**, and then select **Message**.
7. In the **Message** dialog box, add text and links for the promotional content, and then select **OK**.
8. In the properties pane of the **Cookie consent** module, add and configure text and a link to the site privacy page.
9. In the **Navigation menu** slot of the header module, select the ellipsis (...), and then select **Add Module**.
10. In the **Add Module** dialog box, select the **Navigation menu** module, and then select **OK**.
11. In the property pane for the navigation menu module, under **Source for navigation menu**, select **Retail Server**.
12. In the property pane for the navigation menu module, under **Static menu items**, select **Add Menu item**, and then select **Menu item**.
13. In the **Menu item** dialog box, under **Menu Item Text** enter "Contact."
14. In the **Menu item** dialog box, under **Menu Item Link target** select **Add a link**.
15. In the **Add a link** dialog box, select the URL for the site's "Contact" page, and then select **OK**.
16. In the **Menu item** dialog box, select **OK**.
17. In the **Search** slot of the header module, select the ellipsis (...), and then select **Add Module**.

18. In the **Add Module** dialog box, select the **Search** module, and then select **OK**.
19. In the property pane for the search module, configure the properties as needed.
20. In the **Cart icon** slot of the header module, select the ellipsis (...), and then select **Add Module**.
21. In the **Add Module** dialog box, select the **Cart icon** module, and then select **OK**.
22. In the property pane for the cart icon module, configure the properties as needed. If you want the cart icon to display a cart summary (also known as a mini cart) when users hover over it, select **Show mini cart**.
23. Select **Save**, select **Finish editing** to check in the fragment, and then select **Publish** to publish it.

To help ensure that a header appears on every page, follow these steps on every page template that is created for the site.

1. In the **Header** slot of the **Default page** module, add the footer fragment that you created.
2. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.

# Footer module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers footer modules and describes how to create them in Microsoft Dynamics 365 Commerce.

The footer module is a special container that is used to host the modules that appear in the page footer. For example, it can include links to various pages across the site, such as **Contact Us** and **Store Policies** pages.

The following image shows an example of a footer module on a site page.

## Customer Service

## About us

Our story  
Careers with Fabrikam  
News

## Follow us

## Footer module properties

Like most containers, a footer module supports properties for the heading and the width. It also supports the addition of multiple footer category modules. Each footer category module that is added is rendered as a column in the footer module.

## Modules available in a footer module

**Footer items** – A footer items module can contain a heading, an image, and a link. The heading can be used either alone or in combination with an image and a link. Every link in the footer can be configured so that it has just text (for example, "Contact Us" and "Privacy" links), or so that it has both text and an image (for example, social media links).

**Back to top** – A back to top module provides a link for quick navigation to the top of the page. A destination is required. The default destination value is #, which takes the user to the top of the page.

## Create a footer module

1. Go to **Fragments**, and select **New** to create a new fragment.
2. In the **New fragment** dialog box, select the **Container** module, enter a name for the fragment, and then select **OK**.
3. In the **Default container** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Footer category** module, and then select **OK**.
5. In the **Footer category** slot, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Footer item** module, and then select **OK**.
7. Select the **Footer item** slot, and then, in the properties pane on the right, configure the heading, link and link text, and image as needed.
8. To add more footer items, repeat steps 5 through 7 for each.
9. To add a "back to top" link to your footer, select the ellipsis (...) in the **Footer category** slot, and then select **Add Module**.

10. In the **Add Module** dialog box, select the **Back to top** module, and then select **OK**.
11. Select the **Back to top** slot, and then, in the properties pane on the right, configure the text and other module properties as needed.
12. Select **Finish editing** to check in the fragment, and then select **Publish** to publish it.

To help guarantee that a header appears on every page, follow these steps on every page template that is created for the site.

1. In the **Footer** slot of the **Default page** module, add the footer fragment that you created.
2. Select **Finish editing** to check in the template, and then select **Publish** to publish it.

By adding the fragment to page templates, you help guarantee that the footer is rendered on every page.

# Buy box module

2/18/2021 • 6 minutes to read • [Edit Online](#)

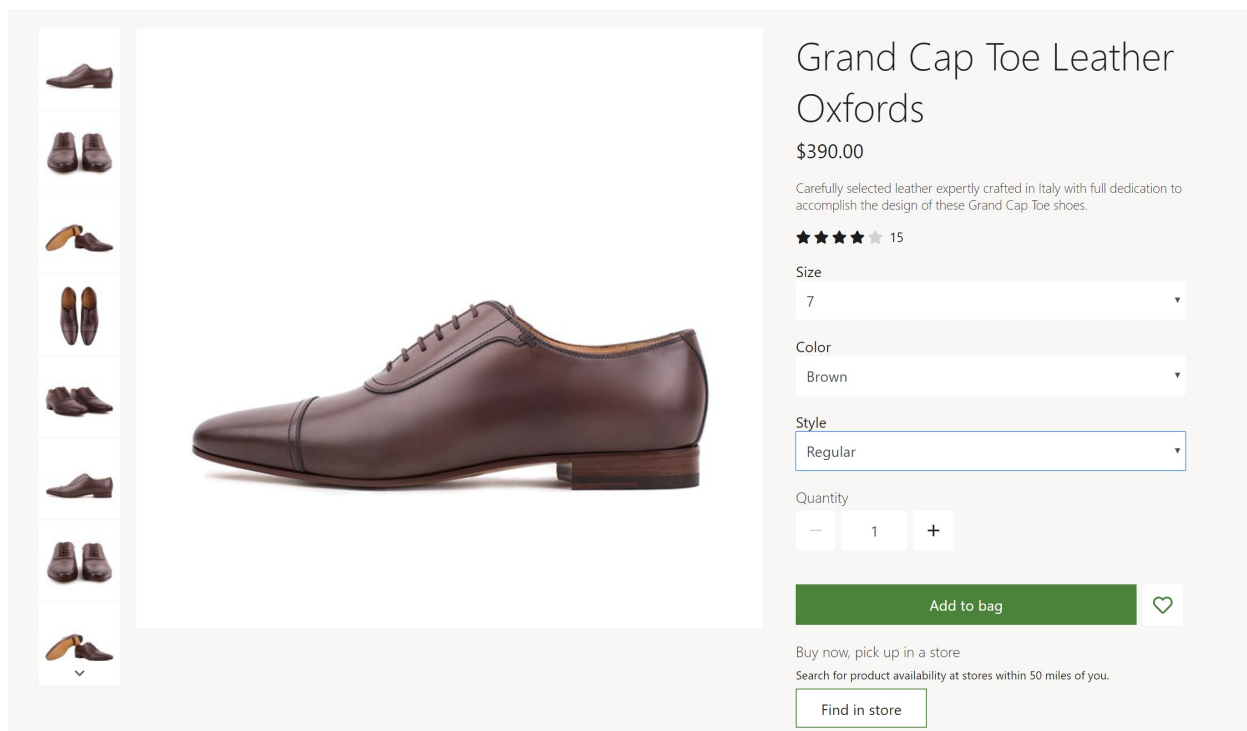

This topic covers buy box modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

The term *buy box* typically refers to the area of a product details page that is "above the fold," and that hosts all the most important information that is required to make a product purchase. (An area that is "above the fold" is visible when the page is first loaded, so that users don't have to scroll down to see it.)

A buy box module is special container that is used to host all the modules that are shown in the buy box area of a product details page.

The URL of a product details page includes the product ID. All the information that is required to render a buy box module is derived from this product ID. If a product ID isn't provided, the buy box module won't be rendered correctly on a page. Therefore, a buy box module can be used only on pages that have product context. To use it on a page that doesn't have product context (for example, a home page or a marketing page), you must do additional customizations.

The following image shows an example of a buy box module on a product details page.

## Buy box module properties and slots

On a product details page, a buy box is divided into two regions: a media region on the left and a content region on the right. By default, the ratio of the width of the media region column to the width of the content region column is 2:1. On mobile devices, the two regions are stacked so that one region appears below the other region. Themes can be used to customize the column widths and stacking rank.

A buy box module renders the title, description, price, and ratings of a product. It also lets customers select product variants that have different product attributes, such as size, style, and color. When a product variant is selected, other properties in the buy box (for example, the product description and images) are updated to reflect the variant information.

A quantity selector is provided, so that customers can specify the quantity of items to purchase. The maximum quantity that can be purchased can be defined in the site settings.

From the buy box, customers can also perform actions such as adding a product to the cart, adding a product to their wishlist, and selecting a pickup location. These actions can be performed on a product or a product variant. To add a product to a wishlist, the customer must be signed in.

Themes can be used to remove or change the order of buy box product properties and action controls.

## Module properties

- **Heading tag** – This property defines the heading tag for the product title. If the buy box is at the top of the page, this property should be set to **h1** to meet accessibility standards.
- **Enable "shop similar looks" recommendations** - This property allows the buy box to show links to products that look similar to the currently viewed item. This feature is available in Commerce release 10.0.13 and later.

## Modules that can be used in a buy box module

- **Media gallery** – This module is used to showcase images of a product on a product details page. For more information about this module, see [Media gallery module](#).
- **Store selector** – This module shows a list of nearby stores where an item is available for pickup. It lets users enter a location to find stores that are nearby. For more information about this module, see [Store selector module](#).
- **Social share** - This module can be added to the buy box to allow users to share product information on social media. For more information, see [Social share module](#).

## Buy box module settings

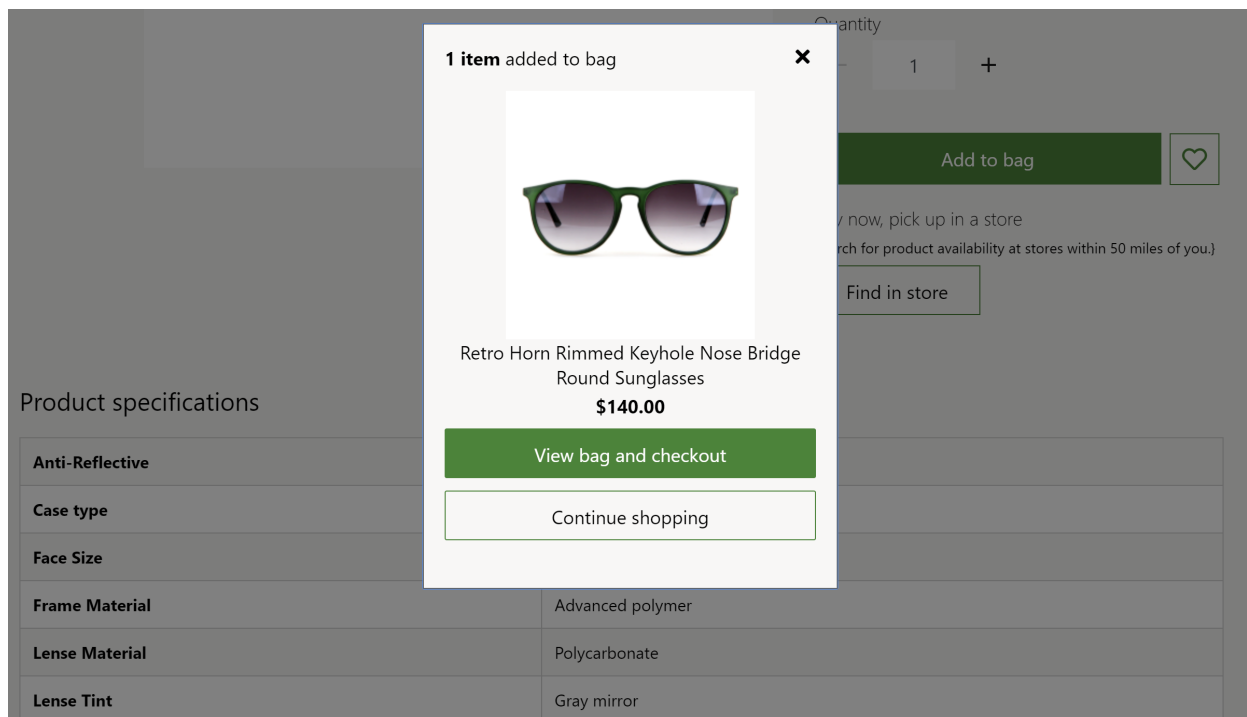

The following buy box module settings can be configured at **Site Settings > Extensions**:

- **Cart line quantity limit** – This property is used to specify the maximum number of each item that can be added to the cart. For example, a retailer might decide that only 10 of each product can be sold in a single transaction.
- **Inventory** – For information about how to apply inventory settings, see [Apply inventory settings](#).
- **Add product to cart** - This property is used to specify the behavior after an item is added to the cart. The possible values are **Navigate to cart page**, **Do not navigate to cart page**, and **Show notification**. When the value is set to **Navigate to cart page**, users are sent to the cart page after they add an item. When the value is set to **Do not navigate to cart page**, users aren't sent to the cart page after they add an item. When the value is set to **Show notification**, users are shown a confirmation notification and can continue to browse on the product details page.

### IMPORTANT

The **Add product to cart** site settings are available in the Dynamics 365 Commerce 10.0.11 release. If you are updating from an older version of Dynamics 365 Commerce, you must manually update the appsettings.json file. For instructions on updating the appsettings.json file, see [SDK and module library updates](#).

The following image shows an example of an "added to cart" confirmation notification on the Fabrikam site.

## Commerce Scale Unit interaction

The buy box module retrieves product information by using Commerce Scale Unit application programming interfaces (APIs). The product ID from the product details page is used to retrieve all information.

## Add a buy box module to a page

To add a buy box module to a new page and set the required properties, follow these steps.

1. Go to **Fragments**, and select **New** to create a new fragment.
2. In the **New fragment** dialog box, select the **Buy box** module.
3. Under **Fragment name**, enter the name **Buy box fragment**, and then select **OK**.
4. In the **Media Gallery** slot of the buy box module, select the ellipsis (...), and then select **Add Module**.
5. In the **Add Module** dialog box, select the **Media gallery** module, and then select **OK**.
6. In the **Store selector** slot of the buy box module, select the ellipsis (...), and then select **Add Module**.
7. In the **Add Module** dialog box, select the **Store selector** module, and then select **OK**.
8. Select **Save**, select **Finish editing** to check in the fragment, and then select **Publish** to publish it.
9. Go to **Templates**, and select **New** to create a new template.
10. In the **New Template** dialog box, under **Template name**, enter **PDP template**, and then select **OK**.
11. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.
12. In the **Add Module** dialog box, select the **Default Page** module, and then select **OK**.
13. In the **Main** slot of the default page, select the ellipsis (...), and then select **Add fragment**.
14. In the **Select fragment** dialog box, select the **Buy box fragment** fragment that you created earlier, and then select **OK**.
15. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
16. Go to **Pages**, and select **New** to create a new page.
17. In the **Choose a template** dialog box, select the **PDP template** template. Under **Page name**, enter **PDP page**, and then select **OK**.
18. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add fragment**.
19. In the **Select fragment** dialog box, select the **Buy box fragment** fragment that you created earlier, and then select **OK**.

20. Save and preview the page. Add the **?productid= <product id>** query string parameter to the URL of the preview page. In that way, the product context is used to load and render the preview page.
21. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it. A buy box should appear on the product details page.

# Media gallery module

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic covers media gallery modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Media gallery modules show one or more images in a gallery view. Media gallery modules support thumbnail images, which can be arranged either horizontally (as a row below the image) or vertically (as a column next to the image). Media gallery modules also provide capabilities that enable images to be zoomed (magnified) or viewed in full-screen mode. To be rendered in a media gallery module, an image must be available in the Commerce site builder Media Library. Currently, media gallery modules support only images.

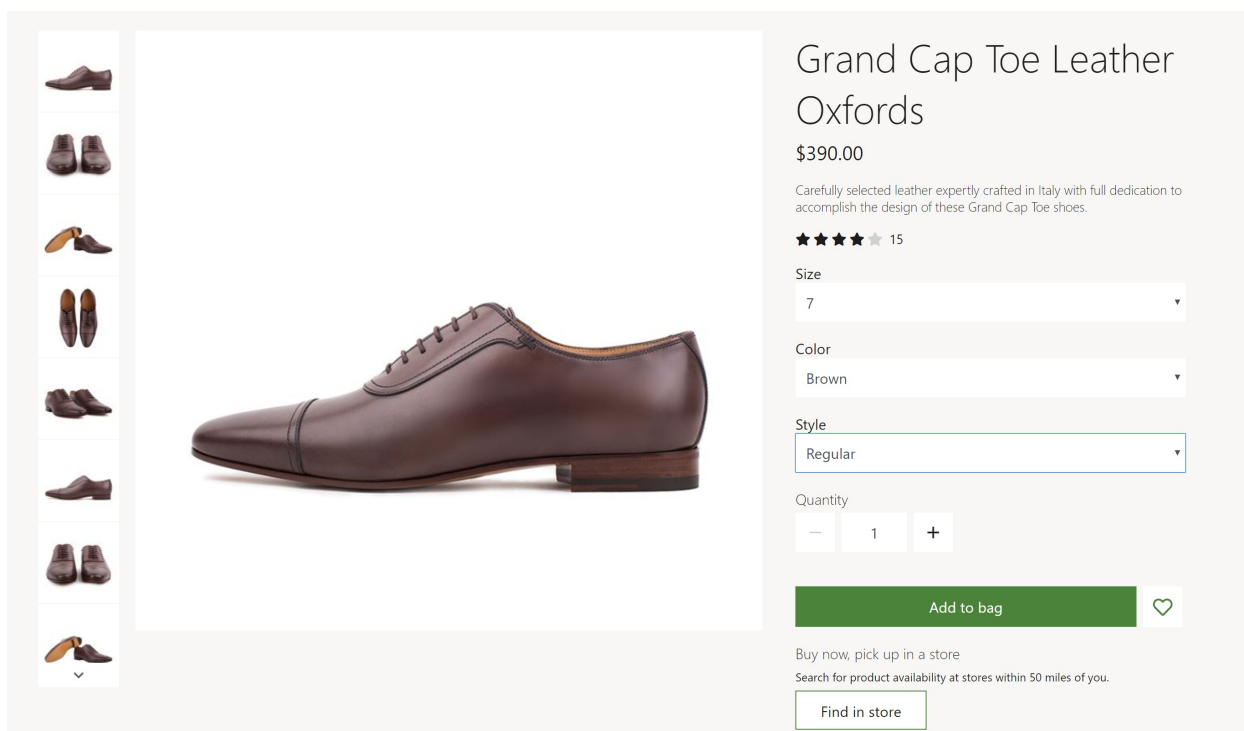

In the default mode, a media gallery module uses the product ID that is available from the page context of a product details page (PDP) to render the corresponding product images. In Commerce headquarters, a media file path must be defined for all products. Images should then be uploaded to the site builder Media Library according to the file path that was defined for the products in Commerce headquarters. These images include images for products and any product variants. For more information about how to upload images to site builder Media Library, see [Upload images](#).

Alternatively, a media gallery module can host a fully curated set of images on an image gallery page, where there are no dependencies on the product ID or page context. In this case, images must be uploaded to site builder Media Library and specified in site builder.

Here are some usage examples for media gallery modules:

- Rendering product images on a PDP
- Rendering product images on a product marketing page
- Showcasing a curated set of images on a marketing page, such as a gallery page

In the example in the following illustration, a buy box on a PDP hosts product images by using a media gallery module.

**Grand Cap Toe Leather Oxfords**

## Media gallery properties

PROPERTY NAME	VALUES	DESCRIPTION
Image source	<b>Page context</b> or <b>Product ID</b>	The default value is <b>Page context</b> . If <b>Page context</b> is selected, the module expects the page to provide the product ID information. If <b>Product ID</b> is selected, the product ID for an image must be provided as the value of the <b>Product ID</b> property. This capability is available in Commerce version 10.0.12.
Product ID	A product ID	This property is applicable only if the value of the <b>Image source</b> property is <b>Product ID</b> .
Image zoom	<b>Inline</b> or <b>Container</b>	This property lets the user zoom images in the media gallery module. An image can be zoomed either inline or in a separate container next to the image. This capability is available in 10.0.12
Zoom scale	A decimal number	This property specifies the scale factor for zooming images. For example, if the value is set to 2.5, images are magnified 2.5 times.
Full screen	<b>True</b> or <b>False</b>	This property specifies whether images can be viewed in full-screen mode. In full-screen mode, images can be also be further magnified if the zoom capability is turned on. This capability is available in Commerce version 10.0.13.
Images	Images that are selected from site builder Media Library	In addition to being rendered from a product, images can be curated for a media gallery module. These images will be appended to any product images that are available. This capability is available in Commerce version 10.0.12.
Thumbnail orientation	<b>Vertical</b> or <b>Horizontal</b>	This property specifies whether thumbnail images should be shown in a vertical strip or a horizontal strip.

The following illustration shows an example of a media gallery module where the full-screen and zoom options are available.

The following illustration shows an example of a media gallery module that has curated images (that is, the specified images aren't dependent on the product ID or page context).

## Commerce Scale Unit interaction

When the image source is derived from the page context, the product ID from the PDP is used to retrieve the images. The media gallery module retrieves the image file path for products by using Commerce Scale Unit application programming interfaces (APIs). The images are then pulled from the Media Library so that they can be rendered in the module.

## Add a media gallery module to a page

To add a media gallery module to a marketing page, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter **Marketing template**, and then select **OK**.
3. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Default Page** module, and then select **OK**.
5. In the **Main** slot of the default page, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
7. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
8. Go to **Pages**, and select **New** to create a new page.
9. In the **Choose a template** dialog box, select the **Marketing template** template. Under **Page name**, enter **Media gallery page**, and then select **OK**.
10. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add Module**.
11. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
12. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
13. In the **Add Module** dialog box, select the **Media gallery** module, and then select **OK**.
14. In the property pane for the media gallery module, under **Image source**, select **Productid**. Then, in the **Product id** field, enter a product ID.
15. Select **Save**, and then select **Preview** to preview the page. You should be able to see the images for the product in a gallery view.
16. To use only curated images, in the property pane, under **Image source**, select **Productid**. Then, under **Images**, select **Add an image** as many times as required to add images from the Media Library.
17. Set any additional properties that you want to set, such as **Image zoom**, **Zoom factor**, and **Thumbnails orientation**.
18. When you've finished, select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Ratings and reviews modules

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers ratings and reviews modules used on product details pages (PDPs) in Microsoft Dynamics 365 Commerce.

Ratings and reviews on e-Commerce websites help customers learn about products before they make a purchase decision, and are also a mechanism for collecting customer feedback about products.

Ratings are shown on product list pages, category list pages, search results pages, and other site pages.

Ratings histograms and product reviews are shown on PDPs. A **Write a review** button lets customers submit ratings and reviews for a product. These PDP features are controlled by ratings and review modules.

## Ratings and reviews modules on PDPs

Three modules show the ratings and reviews summary on PDPs:

- Write review module
- Product reviews list module
- Ratings histogram module

The following illustration shows what the ratings and reviews modules look like on a PDP.

**TIP**  
 For information about how to optimize PDP templates and layouts so that you can share the configurations for ratings and reviews modules among multiple PDPs on your e-Commerce site, see [Templates and layouts overview](#).

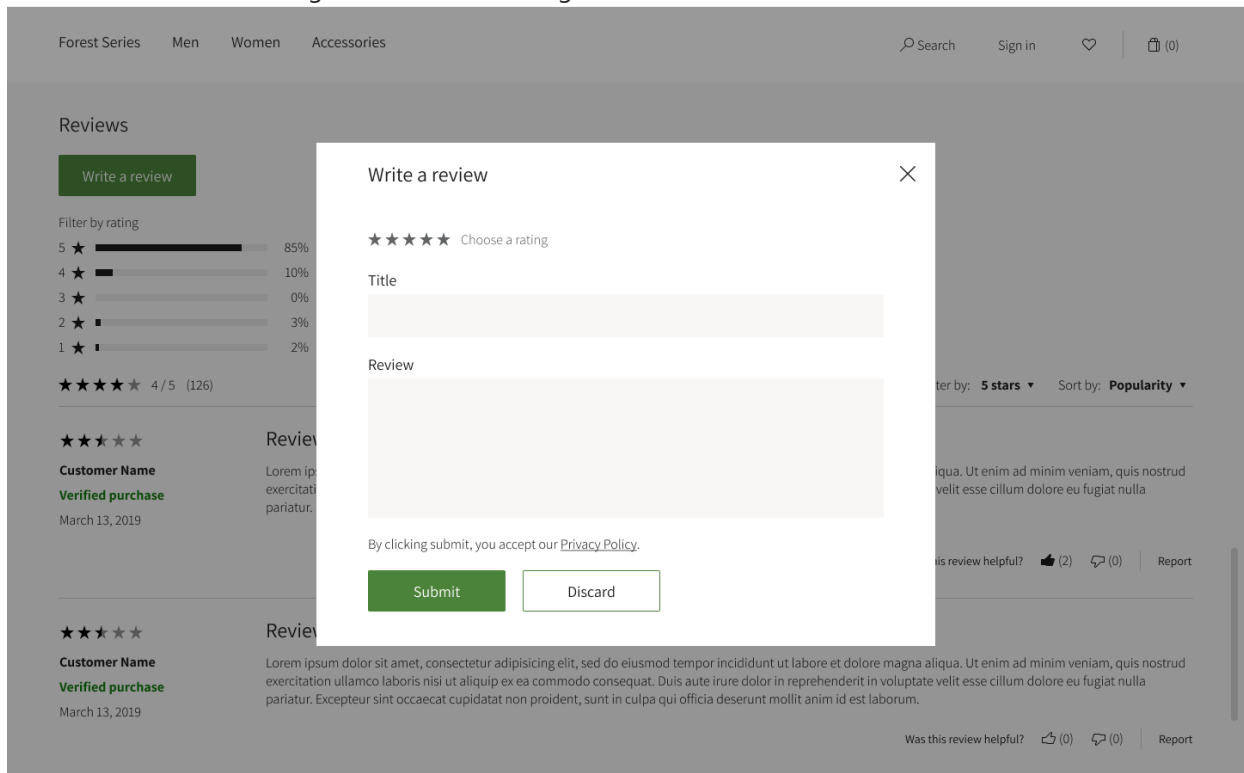

The following illustration shows how the **Add module** dialog box presents ratings and reviews modules in Dynamics 365 Commerce.

**Write review module**

The write review module includes a **Write a review** button that lets users sign in, assign a rating, and write a

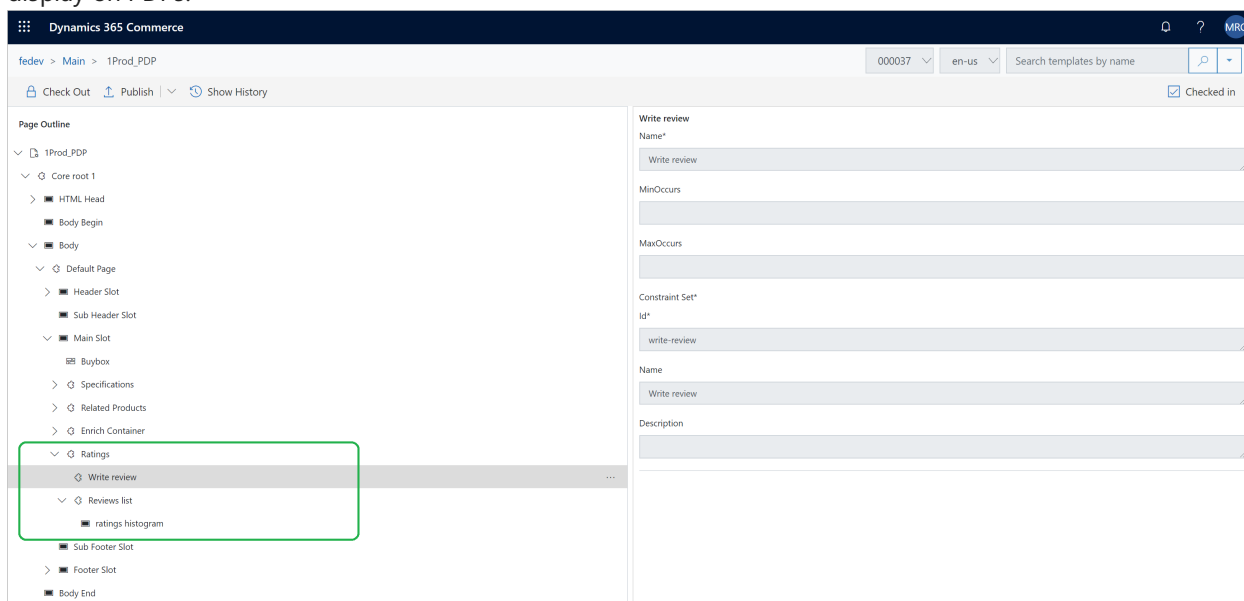

review of a product. This module also lets users edit a rating or review that they previously submitted. This module typically appears above the ratings histogram and product reviews list modules on a PDP. The following illustration shows the **Write a review** dialog box that appears when a customer selects **Write a review**. The customer can use this dialog box to submit a rating and a review.

The following table shows the write review module property that needs to be configured in the authoring tool. | Property name | Value | Property description | |-----|-----|-----| | Name | Write review | The name of the write review module. |

### Ratings histogram module

The ratings histogram module shows a ratings histogram. This module typically appears between the write review module and the product reviews list module on a PDP. The ratings histogram module requires no configuration. You just have to add the module in the PDP template. The following illustrations shows what a PDP template looks like in Dynamics 365 Commerce when ratings and reviews modules are configured for display on PDPs.

### Product reviews list module

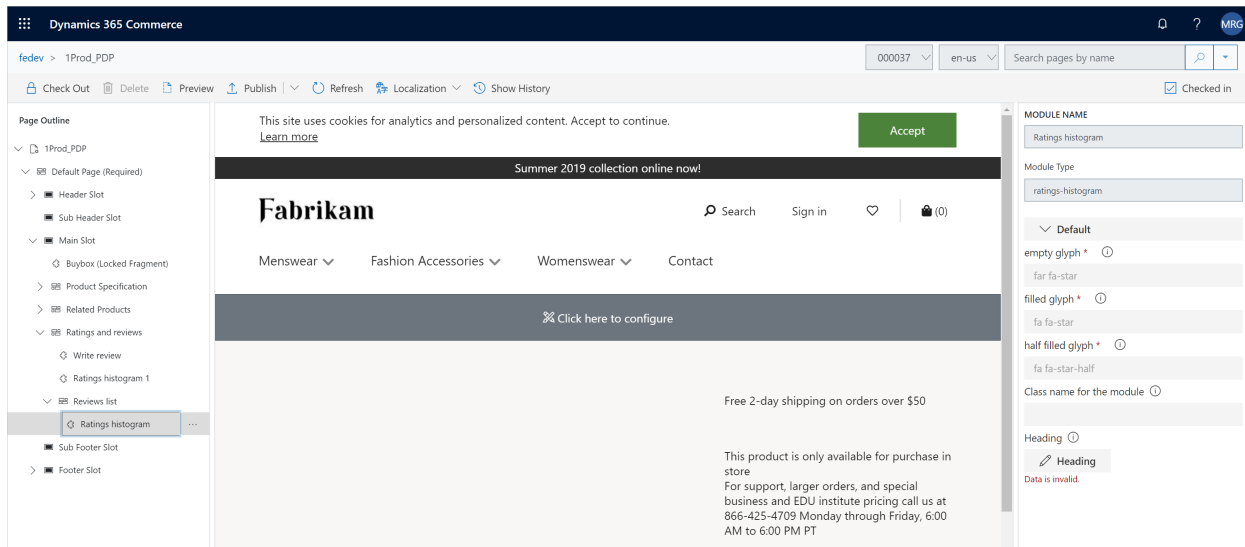

The product reviews list module shows a list of product reviews together with sort, filter, and pagination options. This module typically appears after the ratings histogram module on a PDP. The following table shows the

product reviews list module properties that need to be configured in the authoring tool.

PROPERTY NAME	VALUE	PROPERTY DESCRIPTION
Reviews shown on each page	10	The number of reviews that should be shown at a time on a PDP. <b>Next</b> and <b>Previous</b> buttons are included, so that users can move through the pages of reviews.

### Ratings histogram – Summary view

The product reviews list module includes a slot where you can add a ratings histogram module. The following illustration shows how you can add a ratings histogram module in the product reviews list module in Dynamics 365 Commerce.

# Social share module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers social share modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Social share modules allow users to share e-Commerce site page URLs on social media such as Facebook, Twitter, Pinterest, and LinkedIn. Site page URLs can also be shared via email. Social share modules are commonly used on product details pages (PDPs) to help users share product information.

Each social share module is a container for social share item modules. Each social share item module can be configured to point to a specific social media site. Integration with Facebook, Twitter, Pinterest, LinkedIn, and email is supported out of the box. When a site user selects a social media symbol, an HTML iframe is launched for the respective social media site. Within the iframe, the user can sign in and post the page content that they were viewing.

Each social media platform may track cookies, so this module requires site users to accept the cookie consent notification message. When cookie consent is not accepted, the module will be hidden on the page. For more information, see [Cookie compliance](#).

The following illustration highlights an example of a social share module used on a product details page.

# Social share item module properties

PROPERTY NAME	VALUE	DESCRIPTION
Social media	Facebook, Twitter, Pinterest, LinkedIn, Mail	A drop-down menu with a list of social media platforms.
Icon	Image	This will be the image that will be shown for the respective social media. As a best practice, refer to the social media platform's SDK for the recommended image to use for each platform.

## Add a social share module to a buy box module

To add a social share module to a buy box module, follow these steps.

1. In the Fabrikam site, select **Pages**, and then select the **DefaultPDP** page to open the product details page.
2. In the **Buybox (required)** slot, select the ellipsis (...), and then select **Add Module**.
3. In the **Add Module** dialog box, select the **Social Share** module, and then select **OK**.
4. In the **Social Share** slot, select the ellipsis (...), and then select **Add Module**.
5. In the **Add Module** dialog box, select the **SocialShare** module, and then select **OK**.
6. In the properties pane of the **SocialShare** module, under **Orientation**, select **Horizontal**. Add a caption as needed.
7. In the **SocialShare** slot, select the ellipsis (...), and then select **Add Module**.
8. In the **Add Module** dialog box, select the **SocialShareItem** module, and then select **OK**.
9. In the properties pane of the **SocialShareItem** module, under **Social Media**, select **Facebook**.
10. In the properties pane of the **SocialShareItem** module, under **Icon**, select **+ Add an image**.
11. In the **Media Picker** dialog box, select the Facebook logo image, and then select **OK**. If no Facebook logo image is present, select **Upload new media item** to upload one.
12. Add and configure additional **SocialShareItem** modules as needed.
13. Select **Save**, and then select **Preview** to preview the page. The page will show the social share module.
14. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Cart module

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic covers cart modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

A cart module shows the items that have been added to the cart before the customer proceeds to checkout. The module also shows an order summary and lets the customer apply or remove promotional codes.

The cart module supports signed-in checkout and guest checkout. It also supports a **Back to shopping** link. You can configure the route for this link at **Site Settings > Extensions > Routes**.

The cart module renders data based on the cart ID, which is a browser cookie available throughout the site.

The following image shows an example of a cart page on the Fabrikam site.

## Cart module properties and slots

PROPERTY	VALUES	DESCRIPTION
Heading	Heading text and a heading tag (H1, H2, H3, H4, H5, or H6)	A heading for the cart, such as "Shopping bag" or "Items in your cart."
Show out of stock errors	<b>True</b> or <b>False</b>	If this property is set to <b>True</b> , the cart page will show stock-related errors. We recommend that you set this property to <b>True</b> if inventory checks are applied on the site.

PROPERTY	VALUES	DESCRIPTION
Show shipping charges for line items	<b>True or False</b>	If this property is set to <b>True</b> , cart line items will show the shipping charges, if this information is available. This feature isn't supported in the Fabrikam theme, because users select shipping only in the checkout flow. However, this feature can be turned on in other workflows if it's applicable.
Show available promotions	<b>True or False</b>	If this property is set to <b>True</b> , the cart shows available promotions, based on items in the cart. This capability is available in the Dynamics 365 Commerce 10.0.16 release.

## Modules that can be used in a cart module

- **Text block** – This module supports custom messaging in the cart module. The messages are driven by the content management system (CMS). Any message can be added, such as "For issues with your order, contact 1-800-Fabrikam."
- **Store selector** – This module shows a list of nearby stores where an item is available for pickup. It lets users enter a location to find stores that are nearby. For more information on this module, see [Store selector module](#).

## Module properties

The following cart module settings can be configured at **Site Settings > Extensions**:

- **Maximum quantity** – This property is used to specify the maximum number of each item that can be added to the cart. For example, a retailer might decide that only 10 of each product can be sold in a single transaction.
- **Inventory** – For information about how to apply inventory settings, see [Apply inventory settings](#).
- **Back to shopping** – This property is used to specify the route for the **Back to shopping** link. The route can be configured at the site level, allowing retailers to take the customer back to the home page or any other page on the site.

### IMPORTANT

In the Dynamics 365 Commerce 10.0.14 release and later, items in the cart are aggregated based on the settings that are defined in the online functionality profile for the online store in Commerce headquarters. For more information about how to create an online functionality profile and set the properties that are required for aggregation, see [Create an online functionality profile](#).

## Commerce Scale Unit interaction

The cart module retrieves product information by using Commerce Scale Unit APIs. The cart ID from the browser cookie is used to retrieve all the product information from Commerce Scale Unit.

## Add a cart module to a page

To add a cart module to a new page and set the required properties, follow these steps.

1. Go to **Fragments**, and select **New** to create a new fragment.
2. In the **New fragment** dialog box, select the **Cart** module.
3. Under **Fragment name**, enter the name **Cart fragment**, and then select **OK**.
4. Select the **Cart** slot.
5. In the properties pane on the right, select the pencil symbol, enter heading text in the field, and then select the check mark symbol.
6. In the **Cart** slot, select the ellipsis (...), and then select **Add Module**.
7. In the **Add Module** dialog box, select the **Store selector** module, and then select **OK**.
8. Select **Save**, select **Finish editing** to check in the fragment, and then select **Publish** to publish it.
9. Go to **Templates**, and select **New** to create a new template.
10. In the **New Template** dialog box, under **Template name**, enter a name for the template.
11. In the outline tree, select the **Body** slot, select the ellipsis (...), and then select **Add fragment**.
12. In the **Select fragment** dialog box, select the **Cart fragment** fragment, and then select **OK**.
13. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
14. Go to **Pages**, and select **New** to create a new page.
15. In the **Choose a template** dialog box, select the template that you created, enter a page name, and then select **OK**.
16. Select **Save**, and then select **Preview** to preview the page.
17. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Cart icon module

2/18/2021 • 2 minutes to read • [Edit Online](#)

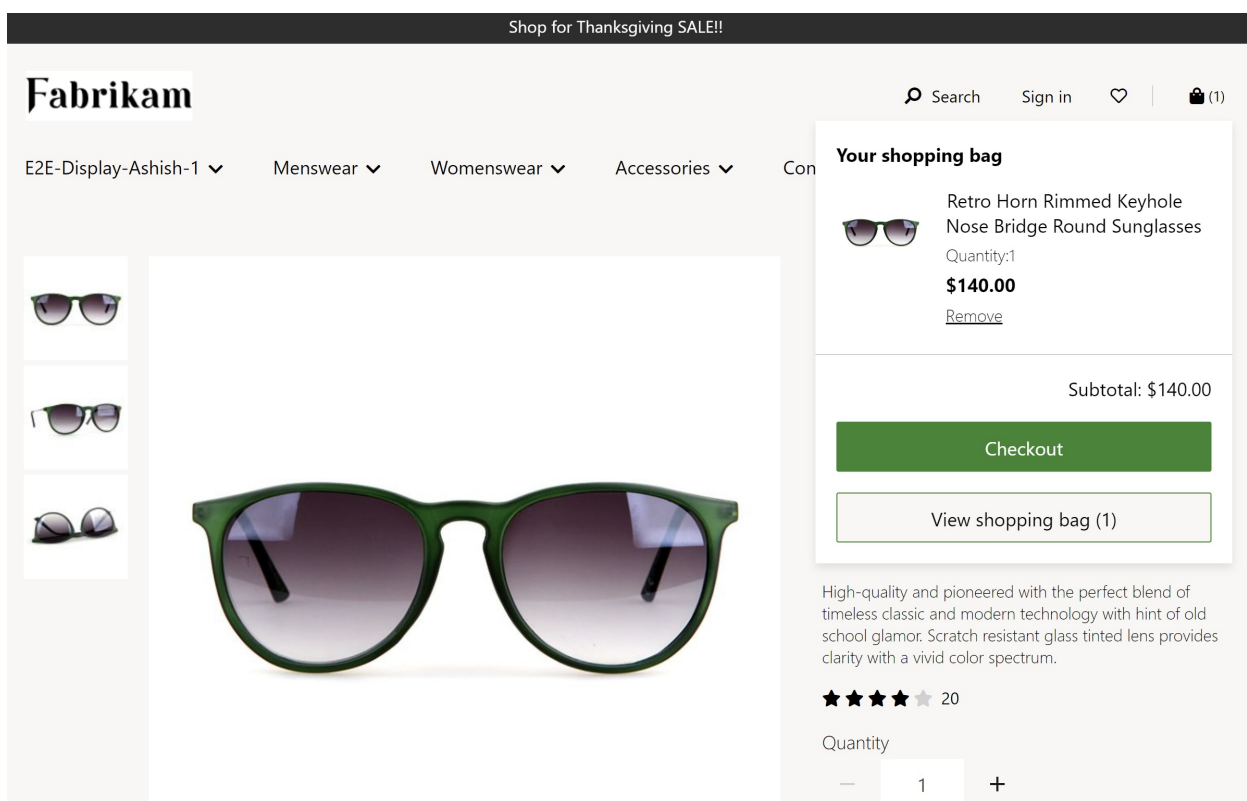

This topic covers the cart icon module and describes how to add it to site pages in Microsoft Dynamics 365 Commerce.

The cart icon module represents the cart in the header module of the page, and shows the number of items in the cart. The cart icon module also displays a cart summary (also known as a mini cart) when the cart icon is hovered over. The mini cart provides the user with a summary of the items in the cart without having to navigate to the cart page. In addition, it also allows the user to directly go to checkout page if they are happy with the summary. This reduces the number of page navigations and makes checkout faster.

## NOTE

Support for the cart icon module is available in the Dynamics 365 Commerce 10.0.11 release.

The following image shows an example of a cart icon module that displays a mini cart in the Fabrikam header.

## Module properties

- **Show mini cart** – When true, this property enables a cart summary (mini cart) to be displayed when the cart icon is hovered over. This functionality is only supported for desktop view ports.

## Add a cart icon module to a page

To add a cart icon module, see [Header module](#).

# Checkout module

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to add a checkout module to a page and set the required properties.

A checkout module is a special container that hosts all modules that are required to create an order. It presents a step-by-step flow that a customer uses to enter all the relevant information to make a purchase. It captures the shipping address, shipping method, and billing information. It also provides an order summary and other information that is related to a customer order.

A checkout module renders data based on the cart ID. This cart ID is saved as a browser cookie. A cart ID is required to render information in the checkout module, such as the items in the order, the total amount, and discounts.

The following image shows an example of a Fabrikam checkout module on a checkout page.

## Checkout module properties

A checkout module shows an order summary and provides the functionality for placing an order. To gather all the customer information that is required before an order can be placed, additional modules must be added to the checkout module. Therefore, retailers have the flexibility to add custom modules to the checkout flow, or to exclude modules, based on their requirements.

PROPERTY NAME	VALUES	DESCRIPTION
Checkout heading	Heading text and a heading tag ( <b>H1</b> , <b>H2</b> , <b>H3</b> , <b>H4</b> , <b>H5</b> , or <b>H6</b> )	A heading for the checkout module.
Order summary heading	Heading text	A heading for the order summary section of the module.
Cart line items heading	Heading text	A heading for cart line items that are shown in the checkout module.
Show shipping charges on line item	<b>True</b> or <b>False</b>	If this property is set to <b>True</b> , the shipping charges that are applicable for line items will be shown on cart lines. If the <b>Header charge with no proration</b> feature is turned on in Commerce headquarters, the shipping charge will be applied at the header level, not the line level. This feature was added in Commerce version 10.0.13.

## Modules that can be used in the checkout module

- **Shipping address** – This module lets a customer add or select the shipping address for an order. For more information about this module, see [Shipping address module](#).

The following image shows an example of a shipping address module on a checkout page.

The screenshot shows a checkout page with a shipping address form on the left and an order summary on the right. The shipping address form includes fields for Name, Street, City, State (a dropdown menu), Zip code, Country (a dropdown menu), and Phone. There are 'Save' and 'Cancel' buttons at the bottom of the form. The order summary on the right shows a subtotal of \$610.00, shipping and tax marked as 'To be calculated', and an amount due of \$610.00. Below the summary are 'Place order' and 'Back to shopping' buttons. A shopping bag section on the right lists two items: 'Belted Dress Boots' (Size: 6, Style: Regular, \$220.00, Quantity: 1) and 'Grand Cap Toe Leather Oxfords' (Size: 7).

- **Delivery options** – This module lets a customer select a mode of delivery for an order. For more information about this module, see [Delivery options module](#).

The following image shows an example of a delivery options module on a checkout page.

The screenshot shows a checkout page with a delivery options module on the left and an order summary on the right. The shipping address is pre-filled with 'Karen Berg, One Microsoft way, Redmond WA 98055, USA, 4257058000'. A 'Change' button is next to the address. The delivery options section has three radio buttons: 'Standard' (selected), 'Standard overnight', and 'Overnight', all with a 'Free' price. There is a 'Save & continue' button. Below the delivery options are sections for '3. PAYMENT METHOD' and '4. CONTACT INFORMATION'. At the bottom are 'Back to shopping' and 'Place order' buttons. The order summary on the right is identical to the previous screenshot, showing a subtotal of \$610.00, shipping and tax marked as 'To be calculated', and an amount due of \$610.00. A shopping bag section on the right lists two items: 'Belted Dress Boots' (Size: 6, Style: Regular, \$220.00, Quantity: 1) and 'Grand Cap Toe Leather Oxfords' (Size: 7).

- **Checkout section container** – This module is a container that you can put multiple modules inside to create a section within the checkout flow. For example, you can put all payment-related modules inside this container to make them appear as one section. This module affects only the layout of the flow.
- **Gift card** – This module lets a customer pay for an order by using a gift card. For more information about this module, see [Gift card module](#).
- **Loyalty points** – This module lets a customer pay for an order by using loyalty points. It provides a summary of available points and expiring points, and lets the customer select the number of points to

redeem. If the customer isn't signed in or isn't a loyalty member, or if the total amount in the cart is 0 (zero), this module is automatically hidden.

- **Payment** – This module lets a customer pay for an order by using a credit or debit card. Customers can also provide a billing address for the payment option that they select. For more information about this module, see [Payment module](#).

The following image shows an example of gift card, loyalty points, and payment modules on a checkout page.

The screenshot displays a checkout page with a '3. PAYMENT METHOD' section on the left and a 'Shopping bag' section on the right. The payment section includes a notice, a loyalty card field (55131), an amount covered by loyalty (\$0.00), and an amount to use field (0). It also features gift card fields for PIN and expiration date, and a credit card section with fields for cardholder name, card number, expiry date, and CVC. A billing address section is also present. The shopping bag section shows a list of items with their prices and discounts.

- **Contact information** – This module lets a customer add or change the contact information (email address) for an order.
- **Text block** – This module contains any messaging that is driven by the content management system (CMS). For example, it might contain a message that states, "For issues with your order, contact 1-800-Fabrikam."
- **Checkout terms and conditions** – This module shows rich text that contains the terms and conditions and a check box for the customer input. The check box is optional and configurable. The input is captured by the module and can be used as a check before order placement is triggered, but it isn't included in the order summary information. This module can be added to the checkout container, checkout section container, or terms and conditions slot, according to business needs. If it's added to the checkout container or checkout section container slot, it will appear as a step in the checkout process. If it's added to the terms and conditions slot, it will appear near the order placement button.

The following image shows an example of terms and conditions on a checkout page.

## Commerce Scale Unit interaction

Most of the checkout information, such as the shipping address and shipping method, is stored in the cart and processed as part of the order. The only exception is the credit card information. This information is processed directly by using the Adyen payment connector. The payment is authorized, but it isn't charged until the order is fulfilled.

## Add a checkout module to a page and set the required properties

To add a checkout module to a new page and set the required properties, follow these steps.

1. Go to **Fragments**, and select **New** to create a new fragment.
2. In the **New fragment** dialog box, select the **Checkout** module.
3. Under **Fragment name**, enter the name **Checkout fragment**, and then select **OK**.
4. Select the **Checkout module** slot.
5. In the properties pane on the right, select the pencil symbol, enter heading text in the field, and then select the check mark symbol.
6. In the **Checkout Information** slot, select the ellipsis (...), and then select **Add Module**.
7. In the **Add Module** dialog box, select the **Shipping address**, **Delivery options**, **Checkout section container**, and **Contact information** modules, and then select **OK**.
8. In the **Checkout section container** module, select the ellipsis (...), and then select **Add Module**.
9. In the **Add Module** dialog box, select the **Gift card**, **Loyalty**, and **Payment** modules, and then select **OK**. In this way, you make sure that all the payment methods appear together in a section.
10. In the **Terms and conditions** slot, add a **Checkout terms and conditions** module if it's required. In the module's properties pane, configure the terms and condition text as appropriate.
11. Select **Save**, and then select **Preview** to preview the fragment. Some modules that don't have a cart context might not be rendered in the preview.
12. Select **Finish editing** to check in the fragment, and then select **Publish** to publish it.
13. Create a template that uses the new checkout fragment.
14. Create a checkout page that uses the new template.

# Payment module

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic covers the payment module and explains how to configure it in Microsoft Dynamics 365 Commerce.

The payment module lets customers pay for orders by using credit or debit cards. Payment integration for this module is provided by the Dynamics 365 Payment Connector for Adyen. For more information about how to set up and configure the payment connector, see [Dynamics 365 Payment Connector for Adyen](#).

As of Commerce release 10.0.14, the payment module has also been integrated with the Dynamics 365 Payment Connector for PayPal to allow customers to pay for orders using PayPal. For more information on how to set up and configure the Dynamics 365 Payment Connector for PayPal, see [Dynamics 365 Payment Connector for PayPal](#).

## Dynamics 365 Payment Connector for Adyen

The payment module hosts the payment information that is served via Adyen in an HTML inline frame (iframe). The payment module interacts with the Commerce Scale Unit to retrieve the Adyen payment information. As part of the Commerce Scale Unit interaction, the payment module can allow billing address information to be served either in the iframe via Adyen or as a separate module. In the Fabrikam theme, the billing address is enabled as a separate module. This approach allows for more formatting flexibility, because the address lines can be rendered so that they resemble the lines of the shipping address.

The payment module also lets signed-in customers save their payment information. The payment information and billing address are saved and managed via the Adyen payment connector.

The payment module covers any order charges that aren't already covered by loyalty points or a gift card. If the total for an order is fully covered by loyalty points or gift card credits, the payment module will be hidden, and the customer will be able to place the order without it.

The Adyen payment connector also supports strong customer authentication (SCA). Part of the European Union (EU) Revised Payment Services Directive (PSD2) requires that online shoppers be authenticated outside of their online shopping experience when they use an electronic payment method. During the checkout flow, customers are redirected to their banking site, and then after authentication they are redirected back to the Commerce checkout flow. During this redirection, the information that a customer has entered during the checkout flow (for example, shipping address, delivery options, gift card information, and loyalty information) will persist. Before you can turn on the Adyen payment connector feature, the payment connector must be configured for SCA in Commerce headquarters. For more information, see [Strong Customer Authentication using Adyen](#). This feature was enabled in Commerce release 10.0.12.

### NOTE

For the Adyen payment connector, the iframe module in the payment module can be rendered only if you add the Adyen URL to your site's allow list. To complete this step, add `*.adyen.com` to the `child-src`, `connect-src`, `img-src`, `script-src`, and `style-src` directives of your site's content security policy. For more information, see [Manage Content Security Policy](#).

The following illustration shows an example of gift card, loyalty, and Adyen payment modules on a checkout page.

## Dynamics 365 Payment Connector for PayPal

As of Commerce release 10.0.14, the payment module is also integrated with the Dynamics 365 Payment Connector for PayPal. For more information about how to set up and configure this payment connector, see [Dynamics 365 Payment Connector for PayPal](#).

On the checkout page, you can have both Adyen and the PayPal connectors configured. The payment module has been enhanced with additional properties to help identify which connector it should work with. For details, see the **Supported tender types** and **Is primary payment** module properties in the following table.

When the payment module is configured to use the PayPal payment connector, a PayPal button appears on the checkout page. When invoked by the customer, the payment module renders an iframe containing PayPal information. The customer can sign in and provide their PayPal information within this iframe to complete their transaction. When a customer chooses to pay with PayPal, the remaining balance on the order will be charged via PayPal.

The PayPal payment connector does not require a billing address module because all billing-related information is handled by PayPal within its iframe. However, the shipping address and delivery options modules are required.

The following illustration shows an example of two payment modules on a checkout page, one configured with the Adyen payment connector and the other with the PayPal payment connector.

### 3. PAYMENT METHOD

**Important Notice.** Payment services are provided by designated third-party payment providers. Payment information is for demonstration purposes only and does not process actual transactions; however, any payment information that you input will be sent to the designated third-party payment provider, and will be handled in accordance with the terms and conditions and privacy statement of the payment provider.

The following illustration shows an example of the PayPal iframe invoked using the PayPal button.

## Payment module properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Heading text	An optional heading for the payment module.
Height of the iframe	Pixels	The iframe height, in pixels. The height can be adjusted as required.
Show billing address	True or False	If this property is set to <b>True</b> , the billing address will be served by Adyen inside the payment module iframe. If set to <b>False</b> , the billing address won't be served by Adyen, and a Commerce user will have to configure a module to show the billing address on the checkout page. For the PayPal payment connector, this field has no impact, as the billing address is fully handled within PayPal.
Payment style override	Cascading Style Sheets (CSS) code	Because the payment module is hosted in an iframe, there is limited styling capability. You can achieve some styling by using this property. To override site styles, you must paste the CSS code as the value of this property. Site builder CSS overrides and styles don't apply to this module.

PROPERTY NAME	VALUES	DESCRIPTION
Supported tender types	String	If multiple payment connectors are configured, you should provide the supported tender type string as defined in the Commerce headquarters payment connector configuration (see the following image). If blank, it defaults to the Adyen payment connector. Added in Commerce release 10.0.14.
Is primary payment	True or False	If <b>True</b> , any error messages will be generated from the primary payment connector on the checkout page. If both Adyen and PayPal payment connectors are configured, set Adyen to <b>True</b> , which was added in Commerce release 10.0.14.

The following illustration shows an example of the **Supported Tender Types** value set to "PayPal" in the payment connector configuration in Commerce headquarters.

[Online store](#)

## 128: Fabrikam extended online store

The screenshot shows the configuration page for a payment connector. The 'Supported Tender Types' field is highlighted with a red box and contains the value 'PayPal'. Other fields include 'Connector' (Dynamics 365 Payment Connector), 'Assembly Name' (Microsoft.Dynamics.C...), 'Service Account Id' (ee919080-281c-43a3-...), 'Merchant Client Id' (ARnZk4Lyd1d6OUni8...), 'Merchant API key' (masked with dots), 'Supported Currencies' (USD), and 'Supported Payment Method Variants' (PayPal).

## Billing address

A billing address module can be used on the checkout page if the Adyen payment connector billing address lines do not sufficiently match the appearance of the rest of the site.

To use a billing address module on the checkout page when the payment module is integrated with the Adyen payment connector, set the **Show billing address** property to **False** so that a dedicated billing address module can be used instead of the default Adyen billing address. In this case, the site author should include a billing address module on the checkout page. The Adyen payment connector also allows the ability to use the shipping address as the billing address to minimize the number of steps for the site user.

Similar to payment modules, a **Supported tender types** property has been added to the billing address

module in Commerce release 10.0.14. The value of this property should be identical to the value provided in the payment module to ensure that they work together. For the Adyen payment connector, both the payment module and the billing address module should leave this value blank (the default state). For the PayPal connector, a dedicated billing address module is not required. For other types of payment connectors, the string should be provided as configured in Commerce headquarters.

## Add a payment module to a checkout page and set the required properties

A payment module can be added only to a checkout module. For more information about how to configure a payment module for a checkout page, see [Checkout module](#).

If both Adyen and PayPal payment connectors are needed, add both modules to the payment section. Ensure that the **Supported tender types** property value is configured for PayPal, and leave it blank for Adyen. Also, set the **Is primary payment** property to **True** for Adyen.

# Shipping address module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes covers the shipping address module and explains how to configure it in Microsoft Dynamics 365 Commerce.

The shipping address module lets customers add or select the shipping address for an order during the checkout flow. If a customer is signed in, any addresses that were previously saved for that customer are shown, and the customer can select among them. The customer can also add a new address. The shipping address module is used for all items on an order that require shipping.

Shipping address formats can be defined in Commerce headquarters for each country or region, and the shipping address module then enforces country/region-specific rules.

When customers enter a shipping address during the checkout flow, they have the option to save the address as a primary address. This option is shown only if a customer is signed in.

Although the shipping address module doesn't provide address validation, this functionality can be implemented through customization.

The following illustration shows an example of a new shipping address module on a checkout page.

The screenshot displays a checkout page with a shipping address form on the left and an order summary on the right. The form is titled "1. SHIPPING ADDRESS" and includes fields for Name, Street, City, State (a dropdown menu), Zip code, Country (a dropdown menu), and Phone. At the bottom of the form are "Save" and "Cancel" buttons. The order summary on the right shows a subtotal of \$610.00, shipping and tax marked as "To be calculated", and a total amount due of \$610.00. Below the summary is a "Place order" button and a "Back to shopping" link. A shopping bag section on the right shows two items: "Belted Dress Boots" (Size: 6, Style: Regular, \$220.00, Quantity: 1) and "Grand Cap Toe Leather Oxfords" (Size: 7).

## Module properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Heading text and a heading tag (H1, H2, H3, H4, H5, or H6)	An optional heading for the shipping address module.

PROPERTY NAME	VALUES	DESCRIPTION
Show address type	True or False	If this optional property is set to <b>True</b> , an address type, such as <b>Home</b> or <b>Business</b> , will be shown. If no address type is specified, the address will automatically be saved as <b>Type=Other</b> .
Enable auto suggestion	True or False	If this optional property is set to <b>True</b> , automatic address suggestions will be provided. These suggestions are powered by Bing Maps. For information about how to set up Bing Maps integration for your site, see <a href="#">Store selector module</a> . This feature is available as of the Commerce version 10.0.15 release.
Auto suggest options	A number	If automatic address suggestions are enabled, you can specify additional options, such as the maximum number of suggestions that should be provided.

## Add a shipping address module to a checkout page and set the required properties

A shipping address module can be added only to a checkout module. For more information about how to configure the shipping address module and add it to a checkout page, see [Checkout module](#).

# Delivery options module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers delivery options modules and explains how to configure them in Microsoft Dynamics 365 Commerce.

Delivery options modules let customers select a mode of delivery such as shipping or pickup for their online order. A shipping address is required to determine the mode of delivery. If the shipping address changes, the delivery options must be retrieved again. If an order includes only items that will be picked up in a store, this module is automatically hidden.

For information about how to configure modes of delivery, see [Online channel setup](#) and [Set up modes of delivery](#).

Each delivery mode can have an associated charge. For more information about how to configure charges for an online store, see [Omni-channel Advanced auto-charges](#).

In Commerce version 10.0.13, the delivery options module has been updated to support the **Header charges without proration** and **Shipping as a line charge** features. If proration is turned off, the expectation is that the e-Commerce workflow won't allow a mixed mode of delivery for the items in the cart (that is, some items are selected for shipment, but others are selected for pickup). The **Header charges without proration** feature requires that the **Enable consistent delivery mode handling in channel** flag be turned on in Commerce headquarters. When that flag is turned on, shipping charges will be applied at either the header level or the line level, depending on the configuration in Commerce headquarters.

The Fabrikam theme supports a mixed mode of delivery, where some items are selected for shipment but others are selected for pickup. In this mode, shipping charges will be prorated for all items that are selected for the shipping mode of delivery. For a mixed mode of delivery to work, you must first configure the **Header charges with proration** feature in Commerce headquarters. For more information about this configuration, see [Prorate header charges to match sales lines](#).

If shipping charges apply to line items, they can be shown on the cart line for each item. This functionality requires that the **Show shipping charges on line item** property be turned on for both the cart module and the checkout module. For more information, see [Cart module](#) and [Checkout module](#).

The following illustration shows an example of a delivery options module on a checkout page.

## Delivery options module properties

PROPERTY	VALUES	DESCRIPTION
Heading	Heading text and a heading tag (H1, H2, H3, H4, H5, or H6)	An optional heading for the delivery options module.
Custom CSS class name	Text	A custom Cascading Style Sheets (CSS) class name that will be used to render this module, if applicable.
Filter Delivery Mode Option	<b>Do not filter</b> or <b>Non-shipping modes</b>	A value that specifies whether the delivery options module should filter out all non-shipping delivery modes.

## Add a delivery options module to a checkout page and set the required properties

A delivery options module can be added only to a checkout module. For more information about how to configure the delivery options module and add it to a checkout page, see [Checkout module](#).

# Pickup information module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers the pickup information module and describes how to add it to checkout pages in Microsoft Dynamics 365 Commerce.

The pickup information module can be used in a checkout module to show order pickup information. Customers can view available pickup dates and time slots, and then select a suitable time to pick up their order. For example, a customer can choose to pick up an order at 3 PM on March 21 from the San Francisco store.

Pickup time slots for the appropriate stores must be configured in Commerce headquarters. For more information, see [Create and update time slots for customer pickup](#).

If a pickup information module is created on a checkout page, but no time slots are defined for the store that is selected for pickup, the module will show information, but the user won't be able to select any time slots. Time slots are optional and aren't required to place an order.

If multiple items are selected for pickup across multiple stores, the pickup information module will let the user select a time slot for each store, provided that time slots are available for it.

## NOTE

Support for time slots and the checkout pickup information module is available in Dynamics 365 Commerce version 10.0.15 and later.

The following illustration shows an example of time slot selection through the pickup information module on a checkout page.

The screenshot displays a checkout page with the following sections:

- Checkout**
- 1. PICKUP INFORMATION**
  - Pick up, San Francisco** (1 items)
  - Pickup date:
  - Pickup time slot:
  -
- 2. PAYMENT METHOD**
- 3. CONTACT INFORMATION**
- 4. TERMS AND CONDITIONS**

At the bottom of the page, there are two buttons:  and .

## Module properties

- **Heading** – Enter a heading for the module.

## Show time slot information after an order is placed

After an order is placed, information about the selected time slot can be viewed in the [order confirmation module](#) and the [order details module](#). Both these modules have a **Show timeslot information** property. Before they can show the selected time slot during the order process, this property must be set to **True**.

## Add a checkout pickup information module to a page

For instructions about how to add a pickup information module to a checkout page and set the required properties, see [Checkout module](#).

The following illustration shows an example of an e-Commerce checkout page that includes time slots for pickup line items.

## Checkout

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Order confirmation module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers order confirmation modules and describes how to use them in Microsoft Dynamics 365 Commerce.

The order confirmation module is used to show order confirmation details after an order has been placed. It shows the order confirmation ID, order contact information, and other order details, such as the items that were purchased, payment information, pickup options, and the shipping method.

## Order confirmation module properties

PROPERTY NAME	VALUES	DESCRIPTION
Heading	Heading text and heading tag (H1, H2, H3, H4, H5, or H6)	The order confirmation module can have a heading. By default, the H2 heading tag is used for the heading. However, the tag can be changed to meet accessibility requirements.
Contact number	Text	A contact number can be provided for order-related questions.
Show pickup timeslot information	True or False	This property is available in Dynamics 365 Commerce 10.0.15 and higher. When true, it displays the pickup timeslot information if provided for a pickup item.

## Modules that can be used on an order confirmation page

When you create an order confirmation page, you can add other relevant modules in addition to the order confirmation module. Here are some examples:

- **Recommendations module** – The recommendations module can be added to the order confirmation page to suggest other products to the customer.
- **Marketing modules** – Any marketing module can be added to the order confirmation page to show marketing content.

## Add an order confirmation module to a page

To add an order confirmation module to a new page and set the required properties, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter the name **Order confirmation template**, and then select **OK**.
3. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Default page** module, and then select **OK**.
5. In the **Main** slot of the **Default Page** module, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Order confirmation** module, and then select **OK**.
7. Select **Save**, and then select **Preview** to preview the template. The order confirmation module won't be

rendered, because it requires the context of the order confirmation number.

8. Select **Finish editing** to check in the template, and then select **Publish** to publish it.
9. Go to **Pages**, and select **New** to create a new page.
10. In the **Choose a template** dialog box, select **Order confirmation template**. Under **Page name**, enter **Order confirmation page**, and then select **OK**.
11. In the **Main** slot of the **Default Page** module, select the ellipsis (...), and then select **Add Module**.
12. In the **Add Module** dialog box, select the **Order confirmation** module, and then select **OK**.
13. In the properties pane for the order confirmation module, select **Heading** next to the pencil symbol.
14. In the **Heading Text** field of the **Heading** dialog box, enter the heading text **Order confirmation**, and then select **OK**.
15. Select **Save**, and then select **Preview** to preview the page.
16. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Gift card module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers gift card modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Gift card modules can be used in checkout modules to accept gift cards, a common form of payment used for e-Commerce transactions. The gift card module supports Dynamics 365, SVS, and Givex gift cards. SVS and Givex gift cards are redeemed via the Adyen payment provider. For more information about support for external gift cards such as SVS and Givex, see [Support for external gift cards](#).

## NOTE

Support for redeeming SVS and Givex gift cards during checkout flow is available in the Dynamics 365 Commerce 10.0.11 release.

There are two gift card modules available:

- **Gift card** - This module can be used on a checkout page to redeem a gift card as tender.
- **Gift card balance check** - This module can be used on any page to check the balance on a gift card. This module is available in Commerce release 10.0.14 and later.

## NOTE

Support for the gift card balance check module is available in the Dynamics 365 Commerce 10.0.14 release.

The following image shows an example of a gift card module on a checkout page.

Gift card	PIN	Expiration date
<input type="text"/>	<input type="text" value="PIN"/>	<input type="text" value="MM/YYYY"/>
Your gift card may or may not include these fields		
<input type="button" value="Apply"/>		
Gift card ending in 5000 (Available balance \$3,415.13) <a href="#">Remove</a>		

## Module properties

- **Show additional fields** - This property defines what fields should be displayed for gift cards in addition to the gift card number, which is always displayed by default. For example, some gift cards support displaying a personal identification number (PIN), and others support displaying a PIN and expiration date. Alternatively, this property could be set to "None", which would only display the gift card number and no additional fields.

Supported values:

- PIN
- Expiration date
- PIN and expiration date

- None

## Site settings for gift card modules

In Commerce site builder under **Site Settings > Extensions**, there is a gift card module setting called **Supported gift card type**. This setting supports three values:

- **Dynamics 365 gift card** - When this setting is applied, the gift card module only allows the redemption of Dynamics 365 gift cards. This setting is only supported for signed-in users on the e-Commerce site.
- **SVS and Givex gift cards** - When this setting is applied, the gift card module only allows the redemption of Givex and SVS gift cards. This setting is supported for signed-in and anonymous users on the e-Commerce site.
- **Dynamics 365, SVS, and Givex gift cards** - When this setting is applied, the gift card module allows the redemption of Dynamics 365, Givex, and SVS gift cards. This setting is only supported for signed-in users on the e-Commerce site.

### IMPORTANT

These settings are available in the Dynamics 365 Commerce 10.0.11 release and are required only if you need support for SVS or Givex gift cards. If you are updating from an older version of Dynamics 365 Commerce, you must manually update the appsettings.json file. For instructions on updating the appsettings.json file, see [SDK and module library updates](#).

## Add a gift card module to a page

For instructions on how to add a gift card module to a checkout page and set the required properties, see [Checkout module](#).

# Map module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers map modules and describes how to configure them in Microsoft Dynamics 365 Commerce.

A map module shows the locations of stores on an interactive map that is rendered by using the [Bing Maps V8 Web Control](#). A Bing Maps API key is required and must be added to the shared parameters page in Commerce headquarters. Map modules provide different views, such as Road, Aerial, and Streetside, that users can select to view map locations. They also allow for interactions such as zooming and using the user's location.

A map module works in conjunction with the store selector module to determine the geographic locations of stores that must be rendered on a map. Store selector and map modules interact when a user selects a store in one of those modules on a site page. Map modules can be extended for other scenarios, beyond interaction with store selector modules. However, module customization is required.

## NOTE

The map module is available in the Dynamics 365 Commerce 10.0.13 release.

The following image shows an example of a map module that is used on a store locations page.

**Fabrikam store locator and directory**  
We found 2 stores within 100 miles of you.

Enter ZIP code or city, state

See all stores

**1. Bellevue** (8 mi)

Microsoft Bing Maps Terms

## Module properties

PROPERTY NAME	VALUE	DESCRIPTION
Heading	Text	The heading for the module.
Pushpin options: Default icon	Image	The pushpin symbol image to use for stores that are shown on a map.
Pushpin options: Active icon	Image	The pushpin symbol image to use for a store that is selected on a map.

PROPERTY NAME	VALUE	DESCRIPTION
Pushpin options: Default icon color	Character string	The text or hexadecimal value for the color of pushpin symbols on a map.
Pushpin options: Active icon color	Character string	The text or hexadecimal value for the color of selected pushpin symbols on a map.
Show index	<b>True or False</b>	If this property is set to <b>True</b> , every pushpin symbol that indicates a store will show an index. This index will match the index in the list view that the store selector module shows.

## Add allowed mapping URLs to a site's content security policy directives

For the maps module to interact with Bing Maps, you must ensure that the following mapping URLs are allowed per your site's content security policy (CSP). This setup is done in Commerce site builder, by adding allowed URLs to various site CSP directives (for example, `img-src`). For more information, see [Content security policy](#).

- To the `connect-src` directive, add `*.bing.com`.
- To the `img-src` directive, add `*.virtualearth.net`.
- To the `script-src` directive, add `*.bing.com`, `*.virtualearth.net`.
- To the `script style-src` directive, add `*.bing.com`.

## Add a map module to a page

For detailed information about how to configure a map module on a page, see [Store selector module](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Store selector module

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic covers the store selector module and describes how to add it to site pages in Microsoft Dynamics 365 Commerce.

Customers can use the store selector module to pick up a product in a selected store after an online purchase. In Commerce version 10.0.13, the store selector module also includes additional capabilities that can showcase a **Find a Store** page that shows nearby stores.

The store selector module lets users enter a location (city, state, address, and so on) to search for stores within a search radius. When the module is first opened, it uses the customer's browser location to find stores (if consent is provided).

## Store selector module usage in e-Commerce

- A store selector module can be used on a product details page (PDP) to select a store for pickup.
- A store selector module can be used on a cart page to select a store for pickup.
- A store selector module can be used on a standalone page that shows all available stores.

## Bing Maps integration

The store selector module is integrated with the [Bing Maps REST application programming interfaces \(APIs\)](#) to use Bing's Geocoding and Autosuggest features. A Bing Maps API key is required and must be added to the shared parameters page in Commerce headquarters. The Geocoding API is used to convert a location to latitude and longitude values. The integration with the Autosuggest API is used to show search suggestions when users enter locations in the search field.

For the Autosuggest REST API, you must ensure that the following URLs are allowed per your site's content security policy (CSP). This setup is done in Commerce site builder, by adding allowed URLs to various CSP directives for the site (for example, `img-src`). For more information, see [Content security policy](#).

- To the `connect-src` directive, add `*.bing.com`.
- To the `img-src` directive, add `*.virtualearth.net`.
- To the `script-src` directive, add `*.bing.com`, `*.virtualearth.net`.
- To the `script style-src` directive, add `*.bing.com`.

## Pickup in store mode

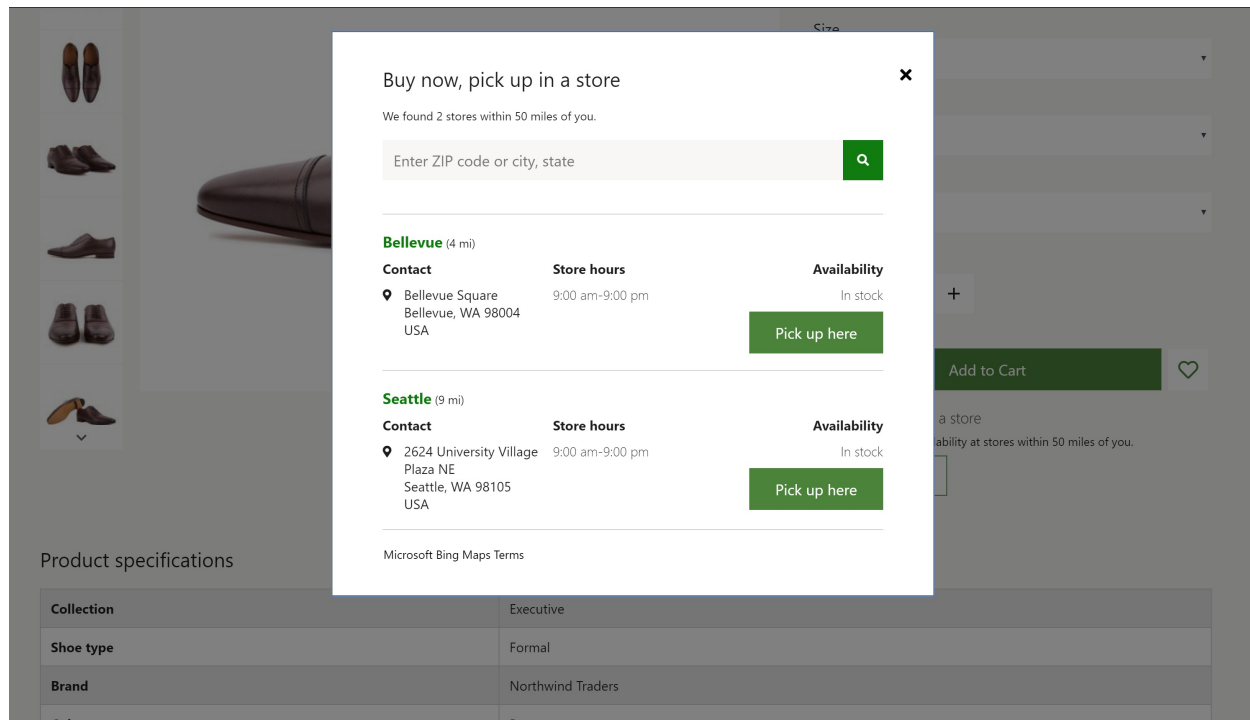

The store selector module supports a **Pick up in store** mode that shows a list of stores where a product is available for pickup. It also shows store hours and product inventory for each store in the list. The store selector module requires the context of a product to render product availability and to let the user add the product to the cart, if the product's delivery mode is set to **pickup** at the selected store. For more information, see [Inventory settings](#).

The store selector module can be added to a buy box module on a PDP to show stores where a product is available for pickup. It can also be added to a cart module. In this case, the store selector module shows pickup options for each line item in the cart. The store selector module can also be added to other pages or modules via extensions and customizations.

For this scenario to work, products should be configured so that the **pickup** delivery mode is used. Otherwise,

the module won't be shown on the product pages. For more information about how to configure the delivery mode, see [Set up modes of delivery](#).

The following image shows an example of a store selector module used on a PDP.

#### NOTE

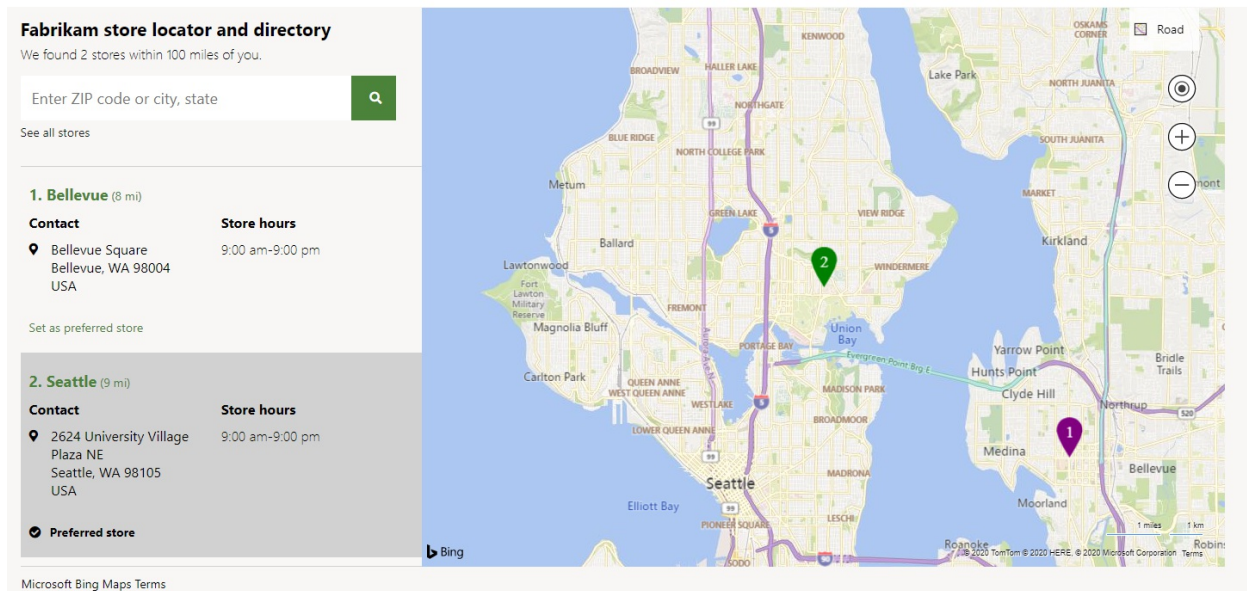

In version 10.0.16 and later, a new feature can be enabled which allows an organization to define multiple pick up modes of delivery options for customers. If this feature is enabled, the store selector and other modules of e-Commerce will be enhanced to allow the shopper to choose from potentially multiple pick up delivery options if configured. To learn more about this feature, refer to [this documentation](#).

## Find stores mode

The store selector module also supports a **Find stores** mode. This mode can be used to create a store locations page that shows available stores and their information. In this mode, the store selector module works without product context and can be used as a standalone module on any site page. In addition, if the relevant settings are turned on for the module, users can select a store as their preferred store. When a store is selected as a user's preferred store, the store ID is maintained in the browser cookie. Therefore, the user must accept a cookie consent message.

The following illustration shows an example of a store selector module that is used together with a map module on a store locations page.

## Render a map

The store selector module can be used together with the map module to show the store locations on a map. For more information about the map module, see [Map module](#)

## Store selector module properties

PROPERTY NAME	VALUE	DESCRIPTION
Heading	Text	The heading for the module.
Mode	<b>Find stores</b> or <b>Pick up in store</b>	<b>Find stores</b> mode shows available stores. <b>Pick up in store</b> mode lets users select a store for pickup.
Style	<b>Dialog</b> or <b>Inline</b>	The module can be rendered either inline or in a dialog box.
Set as preferred store	<b>True</b> or <b>False</b>	When this property is set to <b>True</b> , users can set a preferred store. This feature requires that users accept a cookie consent message.
Show all stores	<b>True</b> or <b>False</b>	When this property is set to <b>True</b> , users can bypass the <b>Search radius</b> property and view all stores.
Autosuggest options: Max results	Number	This property defines the maximum number of autosuggest results that can be shown via the Bing Autosuggest API.
Search radius	Number	This property defines the search radius for stores, in miles. If no value is specified, the default search radius of 50 miles is used.

PROPERTY NAME	VALUE	DESCRIPTION
Terms of service	URL	This property specifies the terms of service URL that is required to use the Bing Maps service.

## Add a store selector module to a page

For **Pickup in store** mode, the module can be used only on PDPs and cart pages. You must set the mode to **Pickup in store** in the module's property pane.

- For information on how to add a store selector module to a buy box module, see [Buy box module](#).
- For information on how to add a store selector module to a cart module, see [Cart module](#)

To configure the store selector module to show available stores for a store locations page, as in the illustration that appears earlier in this topic, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New Template** dialog box, under **Template name**, enter **Marketing template**, and then select **OK**.
3. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
4. Go to **Pages**, and select **New** to create a new page.
5. In the **Choose a template** dialog box, select the **Marketing template** template. Under **Page name**, enter **Store locations**, and then select **OK**.
6. In the **Main** slot of the new page, select the ellipsis (...), and then select **Add Module**.
7. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
8. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
9. In the **Add Module** dialog box, select the **Container with 2 columns** module, and then select **OK**.
10. In the module's properties pane, set the **Width** value to **Fill Container**.
11. Set the **X-Small view port column configuration** value to **100%**.
12. Set the **Small view port column configuration** value to **100%**.
13. Set the **Medium view port column configuration** value to **33% 67%**.
14. Set the **Large view port column configuration** value to **33% 67%**.
15. In the **Container with 2 columns** slot, select the ellipsis (...), and then select **Add Module**.
16. In the **Add Module** dialog box, select the **Store selector** module, and then select **OK**.
17. In the module's properties pane, set the **Mode** value to **Find stores**.
18. Set the **Search radius** value in miles.
19. Set other properties, such as **Set as preferred store**, **Show all stores**, and **Enable auto suggestion**, as you require.
20. In the **Container with 2 columns** slot, select the ellipsis (...), and then select **Add Module**.
21. In the **Add Module** dialog box, select the **Map** module, and then select **OK**.
22. In the module's properties pane, set any additional properties as you require.
23. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Account management pages and modules

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic covers account management pages and modules in Microsoft Dynamics 365 Commerce.

Account management refers to a group of pages that is used to manage user account-related information in Dynamics 365 Commerce. Account management pages include the account management landing page, user profile page, user address page, order history page, order details page, loyalty page, and wish list page.

## Account management landing page

The account management landing page uses the following modules:

- **Container** - All account management landing page modules should be placed within a container.
- **Account welcome tile** – This module is used to provide a welcome message on the account management page. It includes properties for the heading.
- **Account generic tile** - This module can be used to provide headings and links to account management pages, such as the "Order history" or "My profile" pages. The generic tile module can be used to configure a tile for any page. In Fabrikam, this module is used for "Order history" and "My profile" page links on the account management landing page.
- **Account wishlist tile** – This module is used to provide a summary of the items on the customer's wish list. For example, it might state, "You have 10 items in your wish list." It includes properties for the heading and the "View details" link. The "View details" link should be configured to redirect to the wish list page.
- **Account address tile** – This module is used to provide a summary of the user's addresses. For example, it might state, "You have 2 addresses added to your account." It includes properties for the heading and the "View details" link. The "View details" link should be configured to redirect to the user address page.
- **Account loyalty tile** – This module is used to display and link to loyalty program information. This tile has two states: one state shows links to join a loyalty program if the user is not a member already. The other state shows links to view the loyalty details page when the user is already a member. Properties include the heading, the "Sign-up" link, and the "View loyalty" link. The "View loyalty" link should be configured to redirect to the loyalty page. The "Sign-up" link should be configured to redirect to a page where users can join the loyalty program.

## Order history page

The order history page uses the order history module to show all the recent orders that the user has placed.

## Order details page

The order details page provides detailed information for each order and is accessed from the order history page. It uses the order details module, which requires the sales ID or transaction ID to retrieve the order details.

## User profile page

The user profile page shows user account details, such as a user's name and email address. It uses the user profile details and user profile edit modules. Although the email address can't be removed, it can be edited. The user profile page also shows user preferences that enable a user to opt in or opt out from certain features, such as personalization of recommendation lists.

## User address page

The user address page shows the list of addresses that are associated with the user account. The user either provided these addresses during checkout or added them directly on this page. The user address module is used to add and edit addresses, set the primary address, and render existing addresses on the page.

### **Wish list page**

The wish list page shows the items that have been added to the customer's wish list. It uses the wish list module to render wish list items.

### **Loyalty page**

The loyalty page lets customers view their loyalty details if they are already loyalty program members. They can also view the points that they have earned and redeemed in recent transactions. The page uses the loyalty details module to showcase the loyalty details.

To join loyalty program, a marketing page can be created with loyalty sign up and loyalty terms modules. If the user is not a member of a loyalty program, these modules will enable the user to sign up.

# Product collection modules

2/18/2021 • 6 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic provides an overview of product collection modules in Microsoft Dynamics 365 Commerce.

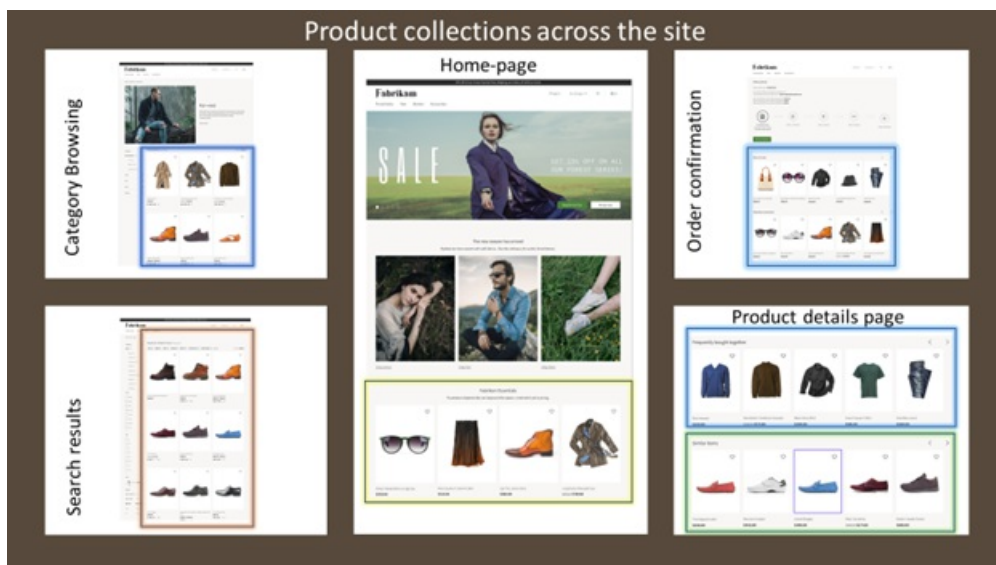

Product discovery is a primary tool that retailers use to engage with their customers on an e-Commerce website. Product collection modules help retailers build compelling shopping experiences by providing an intuitive visual interface that can be used to quickly author product collections.

Product collection modules represent physical products and services on the website. A product collection module is typically linked to a details page where customers can purchase a product or service, or learn more about it.

The sources for product collections can be lists of the following four types:

- Editorial lists of products that are manually defined in Dynamics 365 Commerce as related products for a product, or product lists
- Algorithmic lists, such as lists of new, best-selling, or trending products
- Recommendation lists that are based on machine learning
- Personalization lists that support personalized results for a customer. Customers must be signed in to the e-Commerce site to see personalized results. Guest users don't see personalized results. Customers can opt out of personalization from the [account management page](#).

The following illustration shows the different types of product collections being used on an e-Commerce site.

## NOTE

Always use product collection modules to show a group of products of a similar type.

# Product collection modules and types

The following table describes various types of product collection modules in Dynamics 365 Commerce.

PRODUCT COLLECTION MODULE	TYPE	DESCRIPTION
Category	Category	This module shows a list of products in a category, as defined by the navigation category hierarchy that the retailer created for a channel.
Related products	Editorial	This module shows a list of products that a merchandising manager has configured as related products in Commerce, for the relation type that the author has selected.
Search results	Search query	This type of product collection module shows a list of products that best match the search query that the customer entered.
Curated product lists	Editorial	This module shows custom lists that merchandisers and editors have created in Commerce.
New	Algorithmic	This module shows a list of the newest products that have been assorted to channels and catalogs. This list can show personalized results for a signed-in user if the site author chooses that option.
Best selling	Algorithmic	This module shows a list of products that are ranked by the highest number of sales. This list can show personalized results for a signed-in user if the site author chooses that option.
Trending	Algorithmic	This module shows a list of the highest-performing products for a given period. This list can show personalized results for a signed-in user if the site author chooses that option.
Frequently bought together	Artificial intelligence/Machine learning	This module uses machine learning to analyze consumer purchase patterns and recommend related items that are frequently bought together with a given product. This list can show personalized results for a signed-in user if the site author chooses that option.

PRODUCT COLLECTION MODULE	TYPE	DESCRIPTION
People also like	Artificial intelligence/Machine learning	This module uses machine learning to analyze consumer purchase patterns and recommend items that are related to a given product. This list can show personalized results for a signed-in user if the site author chooses that option.
Picks for you	Artificial intelligence/Machine learning	This module uses machine learning to analyze the purchase patterns of the signed-in user and provide personalized recommendations that are based on those purchase patterns. For a guest user, this list will be collapsed.

## Supported modules

The product collection module supports the [quick view module](#), which lets users view product information and add items to the cart from a product collection page.

## Add a product collection module to a category page

To add a product collection module to a category page, follow these steps.

1. Go to **Pages**, and select **New** to create a new page.
2. In the **Choose a template** dialog box, select the same template as that used by your default category page. Under **Page name**, enter an appropriate name, and then select **OK**.
3. In the **Sub footer** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
5. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Product collection** module, and then select **OK**.
7. In the properties pane for the product collection module, select **Add a product list**.
8. In the **Select product list configuration** dialog box, select the type of list, the list source, and enter the number of items. Configure any other options that are available for the list type. For more information about list types, see the table that follows.
9. Select **OK**.
10. Select **Save**, and then select **Preview** to preview the page.
11. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

The following table shows the list types that are available for selection in the **Select product list configuration** dialog box.

TYPE	DESCRIPTION	USAGE	PAGE CONTEXT	SPECIFIC CONTEXT	PERSONALIZATION
------	-------------	-------	--------------	------------------	-----------------

TYPE	DESCRIPTION	USAGE	PAGE CONTEXT	SPECIFIC CONTEXT	PERSONALIZATION
Products by category	A list of products that belong to a given category. This category is determined from either the page context or the context that the author provides.	This type of list can be used on any page (for example, a home page, category page, marketing page, or product details page [PDP]) to promote a specific category of products.	Category from the page context, where available (for example, a category page)	The author can provide a specific category as context for the list.	Not applicable
Related products	A list of products that a merchandising manager has configured as related products for the relation type in Commerce.	This type of list is used primarily on PDPs, but it can be used on any page if a parent product is provided.	Product from the page, relation type (mandatory)	The product can be selected in the picker, and the relation type is used.	Not applicable
Curated	A custom list that merchandisers and editors have created in Commerce.	Enrich category page, home page, checkout and cart pages, and product pages	Not applicable	Not applicable	Not applicable

TYPE	DESCRIPTION	USAGE	PAGE CONTEXT	SPECIFIC CONTEXT	PERSONALIZATION
Algorithmic	<ul style="list-style-type: none"> <li>• <b>New</b> – A list of the newest products that have been assorted to channels and catalogs.</li> <li>• <b>Best-selling</b> – A list of products that are ranked by the highest number of sales.</li> <li>• <b>Trending</b> – A list of the highest-performing products for a given period.</li> </ul>	Home page, enrich category page, and checkout and cart pages	Category from the page context (for example, a category page)	The category that is determined by the site author	Supported
Frequently bought together	A list that uses machine learning to analyze consumer purchase patterns and recommend related items that are frequently bought together with a given product.	This type of list is applicable only to the cart page.	Cart	Not applicable	Supported
People also like	A list that uses machine learning to analyze consumer purchase patterns and recommend items that are related to a given product.	This type of list is used on PDPs to show products that other customers have bought.	Product context from the page	The product that is provided by the site author	Supported

TYPE	DESCRIPTION	USAGE	PAGE CONTEXT	SPECIFIC CONTEXT	PERSONALIZATION
Picks for you	A list that uses machine learning to determine customer preferences.	This type of list can be used on any page.	Not applicable	Not applicable	Supported

# Quick view module

2/18/2021 • 2 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic covers quick view modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

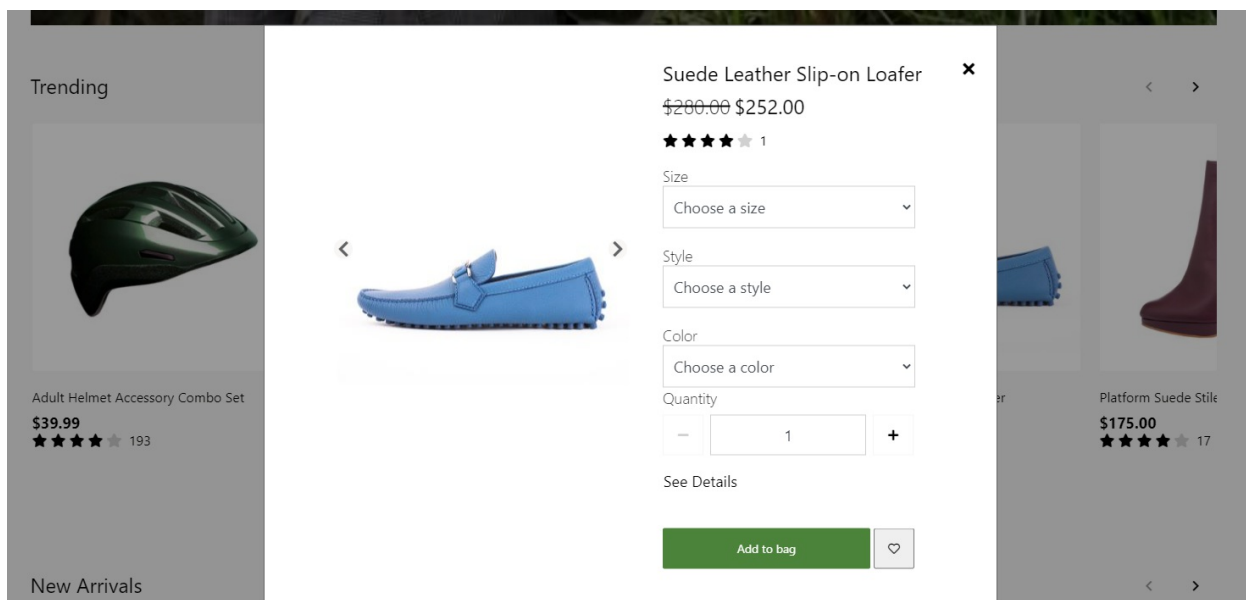

The quick view module lets users quickly view product information when they browse products on a list page, and add one or more products to the cart from the list page, without having to go to the product details page (PDP). The quick view module provides an overview of the product information that users require to make an "add to cart" decision. It also provides a link to the PDP, so that users can view additional product details and purchase options.

The quick view module is supported by the [product collection](#) and [search results](#) modules.

## IMPORTANT

The quick view module is available as of the Commerce version 10.0.17 release.

The following illustration shows an example of a quick view module on a product list page.

## Module properties

The quick view module supports some of the same functions as the buy box module. Therefore, the properties of a quick view module resemble the properties of a buy box module.

PROPERTY	VALUES	DESCRIPTION
----------	--------	-------------

PROPERTY	VALUES	DESCRIPTION
Heading tag	H1, H2, H3, H4, H5, or H6	This property defines the heading tag for the product title. If the quick view module is at the top of the page, this property should be set to H1 to meet accessibility standards.
Allow custom price	True or False	If this property is set to True, the user can enter a custom price.
Minimum price	Integer	This property is applicable only if the <b>Allow custom price</b> property is set to True. It defines the minimum price that the user can enter (for example, \$1).
Maximum price	Integer	This property is applicable only if the <b>Allow custom price</b> property is set to True. It defines the maximum price that the user can enter (for example, \$1,000).

## Commerce site builder settings

Like the buy box module, the quick view module respects the settings at **Site Settings > Extensions > Add product to cart**. However, the **Navigate to cart page** setting is ignored, because it's inconsistent with the purpose of the quick view module, which is to enable users to browse multiple products on a list page and add them to the cart without moving away from the list page.

## Add a quick view module to a product collection module

A quick view module can be added to the product collection and search results modules.

To add a quick view module to a product collection module in Commerce site builder, follow these steps.

1. Go to **Pages**, and then select the home page for the Fabrikam site.
2. Go to any **Product Collection** module on the homepage, select the ellipsis (...), and then select **Add Module**.
3. In the **Add Module** dialog box, select the **Quick View** module, and then select **OK**.
4. In the properties pane of the **Quick View** module, select **Heading**. In the **Heading** dialog box, set the **Heading Level** field to H2, and then select **OK**.
5. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Breadcrumb module

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic covers breadcrumb modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

Breadcrumb modules are used to provide secondary navigation on site pages. They are typically shown at the top of a page, below the header. Although breadcrumb modules can be added to any page, they are most often used on product details pages (PDPs), to show the product category hierarchy and provide a quick way to move around a site. A breadcrumb module can also be used to show a "Back to results" link when users open a PDP from a search or list page. In this way, users can quickly return to their filtered list page to continue shopping.

On pages that have product category context, such as PDPs and category pages, breadcrumb modules show the category hierarchy. On pages that don't have category context, breadcrumb modules show **<Site root> / <Current page>** by default. Breadcrumb modules can also be manually configured on other types of site pages to show links to specific pages on the site.

## NOTE

The breadcrumb module is available in the Dynamics 365 Commerce 10.0.12 release.

The following image shows an example of a breadcrumb module that shows the category hierarchy on a PDP.

The screenshot shows a product page for a brown leather pull-on workboot. At the top left is the Fabrikam logo with a hamburger menu icon. At the top right is a shopping bag icon with a '(2)' next to it. Below the logo is a breadcrumb trail: [Fabrikam Fashion](#) / [Menswear](#) / [Shoes](#) / [Leather Pull-on Workboot](#). The main image shows a side view of the brown leather boot with a pull-on tab at the back. To the right of the image, the product title 'Leather Pull-on Workboot' is displayed in a large font, followed by the price '\$170.00'. Below the price is a short description: 'Functional pull-on workboot made of authentic leather.' There is a 'Size' dropdown menu with 'Choose a size' selected. Below that is a 'Quantity' section with minus, plus, and '1' buttons. At the bottom of the product information is a green 'Add to bag' button and a heart icon for wishlists. At the very bottom of the page, there is a navigation bar with a back arrow, four circular indicators (the first is filled), and a forward arrow. Below the navigation bar, there is a promotional message: 'Buy now, pick up in a store Search for product availability at stores within 100 miles of you.'

# Breadcrumb module settings

The breadcrumb module relies on the **Breadcrumb display type on PDP** setting, which is defined at **Site Settings > Extensions** in site builder. This setting has three possible values:

- **Show category hierarchy** – When this value is selected, the breadcrumb module will show the full category hierarchy of the product that is viewed on the PDP.
- **Show back to results** – When this value is selected, the breadcrumb module will show a "Back to results" link on a PDP if the user opened the PDP from a module that allows for a "Back to results" link. This functionality is available when users navigate from category, search, list, and recommendation lists pages. To support this functionality, product collection and search results modules have a property that is named **Allow back to results on PDP**. This property gives you the flexibility to define which modules should support the "Back to results" link functionality on the PDP. For example, when **Show back to results** is selected for the **Breadcrumb display type on PDP** setting of the breadcrumb module, and **Allow back to results on PDP** is selected for the search page search results module, a "Back to results" link will be shown when users navigate from the search page to a PDP.
- **Show category hierarchy and back to results** – This value is a combination of the previous two. When this value is selected, the breadcrumb module will show both the full category hierarchy and a "Back to results" link (if it's configured) on a PDP.

## IMPORTANT

These settings are available in the Dynamics 365 Commerce 10.0.12 release. If you are updating from an older version of Dynamics 365 Commerce, you must manually update the appsettings.json file. For instructions on updating the appsettings.json file, see [SDK and module library updates](#).

# Breadcrumb module properties

PROPERTY NAME	VALUES	DESCRIPTION
Root	Text or link	This optional property specifies link text and a link target for the breadcrumb site root. If this property isn't configured, no root will be defined.
Breadcrumb link	Link	This optional property specifies links for a manually configured breadcrumb, if these links are required. Links appear in the order that they are listed in.

# Add a breadcrumb module to a new page

To add a breadcrumb module to a PDP and set the required properties, follow these steps.

1. Go to **Site Settings > Extensions**, and then, for the **Breadcrumb display type on PDP** setting, select **Show category hierarchy**.
2. Go to **Templates**, and select the PDP template.
3. In the **Container** slot that contains the buy box module, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Breadcrumb** module, and then select **OK**.
5. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.
6. Go to **Pages**, and open a PDP that uses the PDP template. If a PDP doesn't yet exist, create one.
7. In the **Container** slot that contains the buy box module, select the ellipsis (...), and then select **Add Module**.

8. In the **Add Module** dialog box, select the **Breadcrumb** module, and then select **OK**.
9. In the properties pane of the **Breadcrumb** slot, under **Root**, select **Link text**.
10. In the **Link text** dialog box, enter **Home**, and then, under **Link target**, select **Add a link**.
11. In the **Add a link** dialog box, select a link for the breadcrumb root, and then select **OK**.
12. Select **Save**, and then select **Preview** to preview the page.
13. Select **Finish editing** to check in the template, and then select **Publish** to publish it.

# Navigation menu module

2/18/2021 • 3 minutes to read • [Edit Online](#)

## IMPORTANT

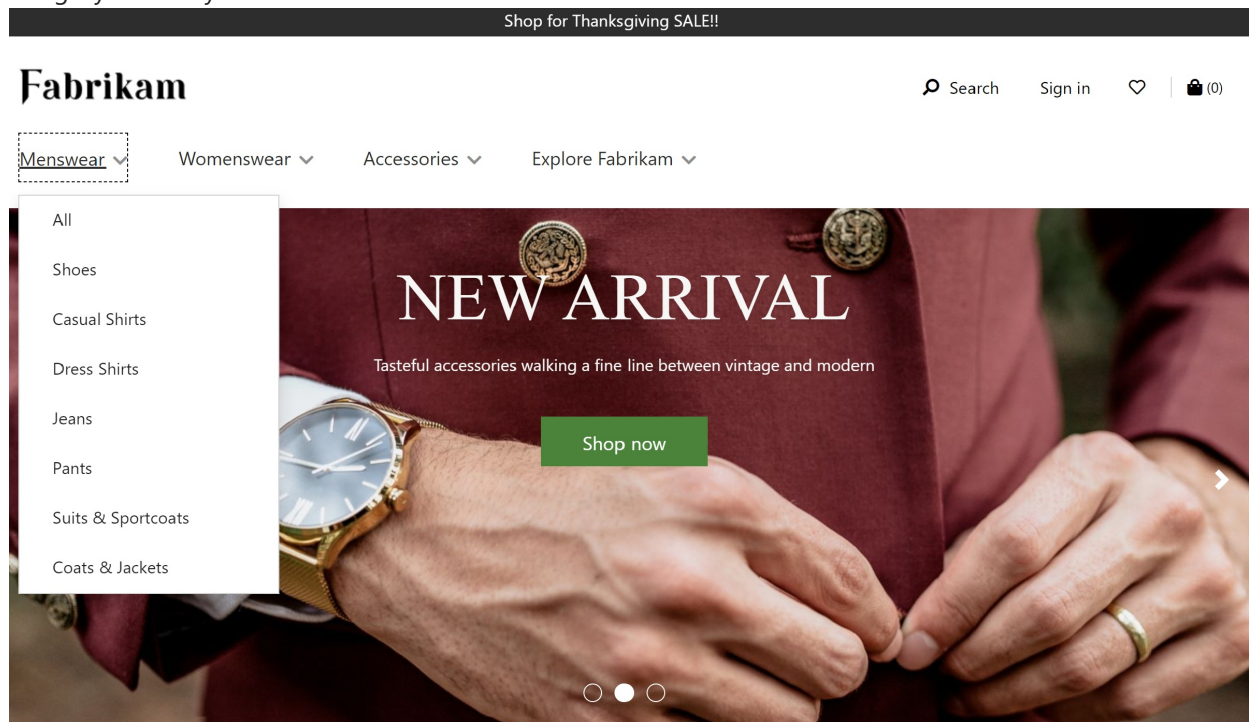

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic covers navigation menu modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

The primary purpose of navigation menu modules is to allow site users to browse products and site pages according to the channel navigation hierarchy defined in Dynamics 365 Commerce headquarters. Items configured in a navigation menu module appear as site header navigation. Navigation menu modules also support static menu items that link to other pages on an e-Commerce site.

The navigation menu module can be added to the header module of a page. In the Fabrikam theme, the navigation menu shows two levels by default. In the Starter theme, the navigation menu shows three levels by default. To change to the number of levels, a view extension is required on the theme.

The following illustration shows an example of a navigation menu for the Fabrikam site with two levels of category hierarchy and some static menu items.

## Navigation menu module properties

PROPERTY NAME	VALUE	DESCRIPTION
---------------	-------	-------------

PROPERTY NAME	VALUE	DESCRIPTION
Source	<b>Retail, Manual authoring, Retail and manual authoring</b>	The <b>Retail</b> value allows the channel navigation hierarchy from Commerce headquarters to be displayed on the navigation menu. The <b>Manual authoring</b> value allows static menu items to be curated. The <b>Retail and manual authoring</b> value allows a mix of both.
Show category images	<b>True or False</b>	When enabled, this property displays category images on the navigation menu as defined in Commerce headquarters for each category. Added in Commerce release 10.0.14.
Show promotions	<b>True or False</b>	When this property is enabled, promotions can be configured by using images, links, and text. This property was added in the Commerce version 10.0.17 release.
Add promotions	Text, image, or link	When the <b>Show promotions</b> property is enabled, you can add text, an image, or a link as promotional content on the navigation menu.
Enable multi-level navigation menu	<b>True or False</b>	When this property is enabled, the navigation menu can show multiple levels of the navigation hierarchy. This feature is available in the Commerce version 10.0.15 release.
Number of levels	integer	This property defines the numbers of levels that should be shown if the <b>Enable multilevel navigation menu</b> property is set to <b>True</b> .
Static menu item	Array of values	Static menu items that associate a menu item name with a link to a static site page. You can create menu items below other menu items. By default, static menus appear at the root level and will be appended to the channel navigation hierarchy if it exists.
Show root menu	<b>True or False</b>	When this property is enabled, the navigation menu can be defined under a custom root (for example, <b>Shop now</b> ). This feature is available in the Dynamics 365 Commerce 10.0.15 release.
Root menu	string	This property can be used to define text for a custom root if the <b>Show root menu</b> property is set to <b>True</b> .

The following illustration shows an example of a category image displayed on the navigation menu for the Fabrikam site.

# Site selector module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers the site selector module and describes how to add it to site pages in Microsoft Dynamics 365 Commerce.

When a business has different sites across markets, regions, and locales, site users need an easy way to switch between sites and select their preferred shopping site. To accommodate this scenario, the site selector module lets users browse across multiple sites.

The site selector module must be configured with the list of sites (markets, regions, or locales) that site users can browse.

## NOTE

The site selector module is available in the Dynamics 365 Commerce 10.0.14 release.

The following illustration shows an example of a site selector module that is featured in the header of a site page.

## Site selector module properties

PROPERTY NAME	VALUE	DESCRIPTION
Heading	Text	The heading for the module.
Site options	Name, Image, URL	This property specifies a name, a link to the site's home page, and an optional image to show for each site that is included in the module. The image can be a flag, or some representation of a market, region, or locale.

## Add a site selector module to a page

The site selector module can be added to the [Header module](#) under the site selector slot. After it's added, you can define the module heading and site options.

2/18/2021 • 3 minutes to read • [Edit Online](#)

## IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic covers search results modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

The search results module returns product search results and a list of applicable refiners for the products. Search results modules on Dynamics 365 Commerce sites can be used to render pages for the following scenarios:

- Search results that are initiated by a user search
- Search results that show a specific set of products, such as "Shop similar looks"
- Lists of products that belong to a category

For more information about category and search results pages, see [Default category landing page and search results page overview](#).

The following illustration shows an example of a search results page for a category on the Fabrikam site.

## Search results module properties

The following table lists the properties of search result modules, together with their values and descriptions.

PROPERTY	VALUES	DESCRIPTION
Items per page	Integer	The number of items that should be shown on each page.

PROPERTY	VALUES	DESCRIPTION
Allow back on PDP	<b>True</b> or <b>False</b>	If this property is set to <b>True</b> , when a user selects a product on the search results page, the breadcrumb navigation on the product details page (PDP) that is opened will show a "Back to results" link.
Expand Refiners	<b>All</b> , <b>1</b> , <b>2</b> , <b>3</b> , or <b>4</b>	The number of top refiners that should be expanded when a page is loaded. For example, if this property is set to <b>3</b> , the first three refiners on the page will be expanded.
Hide category hierarchy display	<b>True</b> or <b>False</b>	If this property is set to <b>True</b> , the category hierarchy display on the page will be hidden. This property should be set to <b>True</b> if you're using the <a href="#">breadcrumb module</a> to show the category hierarchy.
Include product attributes in search results	<b>True</b> or <b>False</b>	If this property is set to <b>True</b> , attributes will be returned for the products in the search results. Although these attributes can be shown on a Commerce site, an extension is required.
Show affiliation prices	<b>True</b> or <b>False</b>	If this property is set to <b>True</b> , affiliation prices for products will be shown in the search results when a signed-in user browses the page.

#### IMPORTANT

In the Dynamics 365 Commerce 10.0.16 release and later, the **Show affiliation prices** configuration can be used to show affiliation prices on the page.

## Supported modules

The search results module supports the [quick view module](#), which lets users view product information and add items to the cart from the search results page.

## Add a search results module to a category page

To add a search results module to a category page, follow these steps.

1. Go to **Templates**, and select **New** to create a new template.
2. In the **New template** dialog box, enter the name **Search results**, and then select **OK**.
3. In the **Body** slot, select the ellipsis (...), and then select **Add Module**.
4. In the **Add Module** dialog box, select the **Default Page** module, and then select **OK**.
5. In the **Main** slot of the **Default Page** module, select the ellipsis (...), and then select **Add Module**.
6. In the **Add Module** dialog box, select the **Container** module, and then select **OK**.
7. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.

8. In the **Add Module** dialog box, select the **Breadcrumb** module, and then select **OK**.
9. In the **Breadcrumb** properties pane, enter the value **1** for **Min Occurs**.
10. In the **Container** slot, select the ellipsis (...), and then select **Add Module**.
11. In the **Add Module** dialog box, select the **Search results** module, and then select **OK**.
12. In the **Search results** properties pane, enter the value **1** for **Min Occurs**, and then set any other required properties for the search results module. By setting these properties in the template, you ensure that any customizations to a specific category page will automatically include these settings.
13. Select **Finish editing**, and then select **Publish** to publish the template.
14. Go to **Pages**, and select **New** to create a new page.
15. In the **Choose a template** dialog box, select the **Search results** template that you created, enter **Category page** for **Page name**, and then select **OK**. Because all the values are set in the template, the page is ready to be published.
16. Select **Finish editing** to check in the page, and then select **Publish** to publish it.

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cookie consent module

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic covers cookie consent modules and describes how to add them to site pages in Microsoft Dynamics 365 Commerce.

The cookie consent module prompts site users to explicitly provide consent to allow cookies for any feature or module that tracks browser cookies. The consent is required the first time a site user browses a site in a new browser session. When consent is received, it is tracked and the site user will not be prompted for consent again. For more information, see [Cookie compliance](#).

If site user cookie consent is not received, any features or modules that require cookie consent will not be rendered on the page. For example, the checkout module, social share module, and preferred store feature all require cookie consent and will not be rendered if site user consent is not received.

A cookie consent module can be configured on a page's header fragment so that it can be enforced when the page loads. The cookie consent module should have a clear message informing the site user about cookie usage on the site and should provide a link to the site's privacy page.

The following illustration highlights an example of a cookie consent message with a link to the site's privacy policy page displayed on the header of a site page.

**Fabrikam**

## Cookie consent module properties

PROPERTY NAME	VALUE	DESCRIPTION
Rich Text	Rich Text	Specifies a Rich Text notification to site users that the site uses browser cookies and that users should accept the use of cookies for the site to be fully functional.

PROPERTY NAME	VALUE	DESCRIPTION
Links	URL	One or more links can be added to a site's privacy page that describes the types of cookies that are tracked on the site.

## Add a cookie consent module to site pages

To efficiently add a cookie consent module to multiple site pages, it can be added to a shared page header fragment. After the header fragment is added to all site pages, a cookie consent notification will automatically be rendered the first time a site user navigates to any site page.

For more information about header fragments and modules, see [Header module](#).

# Default category landing page and search results page overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of the default category landing page and search results page in Microsoft Dynamics 365 Commerce e-Commerce.

## Default category landing page

The default category landing page is the page that website users typically are taken to when they select a category in the navigation hierarchy. The category page lets you browse, and you can also sort and refine the categorized products.

At the top of the page is a header that shows all the product categories and other pages that the merchandising manager has categorized. Configuration is done as part of the configuration of the channel navigation hierarchy. At the bottom of the page is a footer that includes quick links to various topics that a shopper might be interested in.

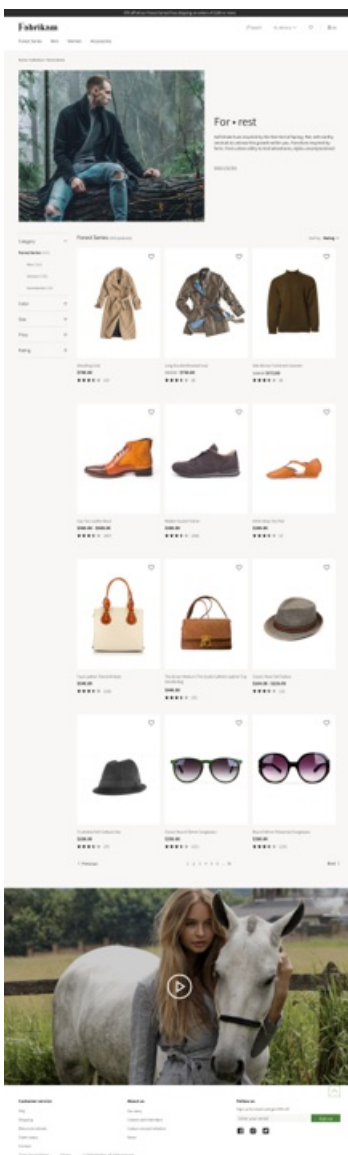

The following components are essential for a category:

- **Product placement tiles** show the products that the merchandising manager has defined in a category as part of the configuration of the navigation hierarchy.
- **Refiners and choice summary** are filters that provide counts and that can be used to refine items. The merchandising manager configures them as part of the configuration of the metadata related to channel categories and product attributes.

- **Sorting options** are used by website visitors to sort the products. By default, the following sorting options are available:
  - Price – low to high
  - Price – high to low
  - Product name – [A-Z]
  - Product name – [Z-A]
  - Ratings – low to high
  - Ratings – high to low
- **Pagination** lets website visitors move from one page of categorized product results to another page.
- **Total count** provides the total number of products that are defined in a category.

## Enrich a category landing page

If you want a category landing page to have a more tailored experience for a specific category, you can "enrich" the category landing page for that category. For example, you can add a marketing video and some category storytelling to get the shopper's attention. For more information, see [Enrich a category landing page](#).

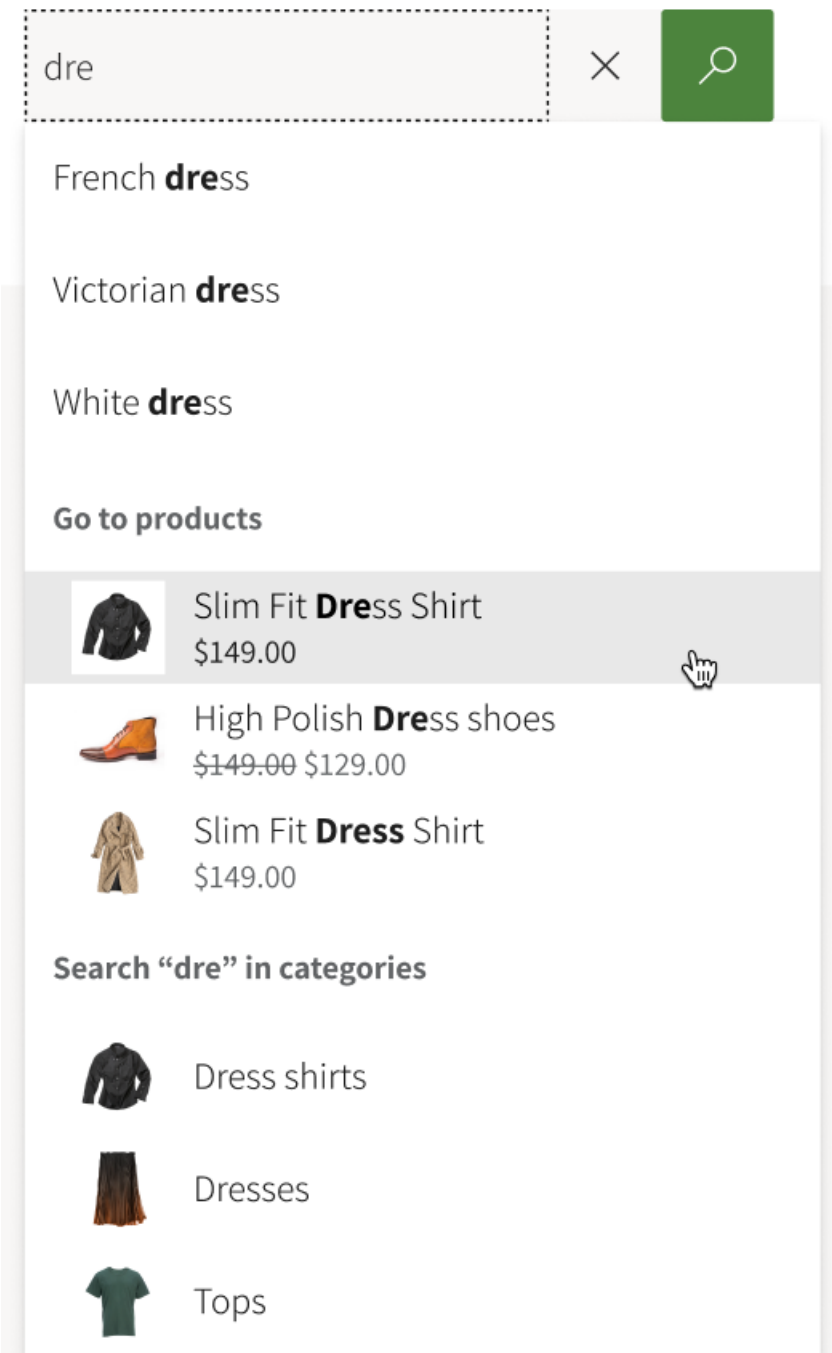

## Auto-suggest and search results pages

Website users can explore a site either by going to a category from the navigation hierarchy or by entering a search term in the search field.

As soon as users start to type in the search field, they experience the immersive auto-suggest functionality that suggests search terms.

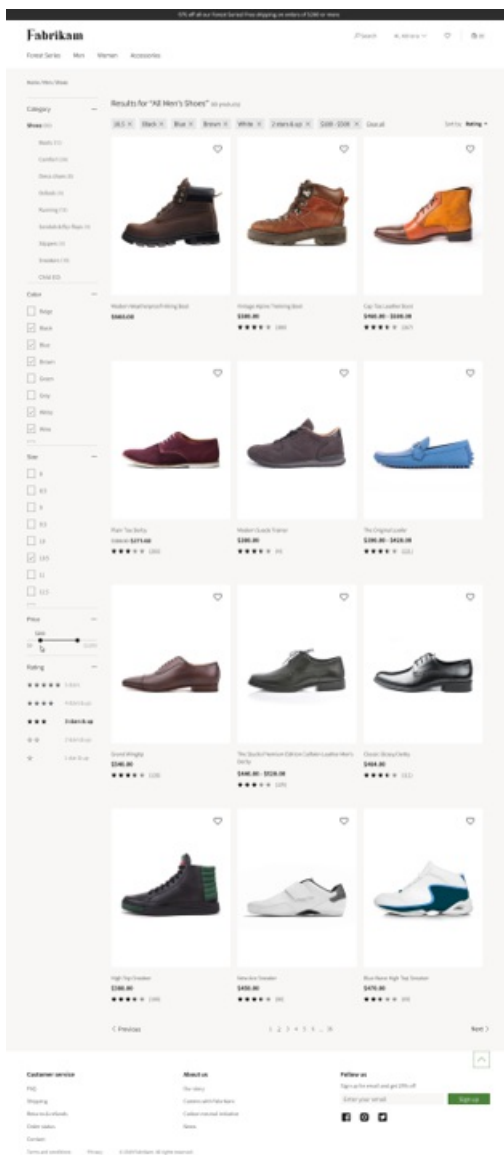

Here are some of the types of suggestions that might be shown:

- **Keywords** are used to find items across all products that are assorted to the channel.
- **Products** provide direct links to the product details page.
- **Scoped category search suggestions** list various categories and let users search for the keyword in a specific category.

When users select one of the keyword or scoped category search suggestions, or when there are no suggestions for the search term that they enter, they are redirected to a search results page. The users can then browse, sort, and refine the list of search results to find the desired item.

The following components are essential for a search results page:

- **Product placement tiles** show the products for the user's search. By default, these tiles are sorted by the cloud-powered search relevancy score for the user search.
- **Refiners and choice summary** are filters that provide counts and that can be used to refine items. The merchandising manager configures them as part of the configuration of the "channel categories and product attributes" metadata.
- **Sorting options** are used by website visitors to sort the products. By default, the following sorting options are available:
  - Price – low to high
  - Price – high to low
  - Product name – [A-Z]
  - Product name – [Z-A]
  - Ratings – low to high
  - Ratings – high to low
  - Default
- **Pagination** lets website visitors move from one page of categorized product results to another page.
- **Total count** provides the total number of products that are defined in a category and that match the search criteria.

## NOTE

These cloud-powered search capabilities are available starting in version 10.0.8. Ensure that under **Commerce Parameters > Configuration Parameters** there is an entry for "ProductSearch.UseAzureSearch set to 'true'".

### Commerce parameters

# Cloud-powered search overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic gives an overview of cloud-powered search in Microsoft Dynamics 365 Commerce.

## Overview

Product discoverability helps guarantee that customers can quickly and easily find products by browsing categories, searching, and filtering. Retailers consider product discovery a primary tool for customer interaction across all channels.

Customers are accustomed to the nearly instantaneous response times of web search engines, sophisticated e-Commerce websites, social apps, automatic suggestions that appear as they type search terms, faceted navigation, and highlighting. If customers can't find the product that they are looking for quickly enough in one e-Commerce store, they won't hesitate to go to a different e-Commerce store.

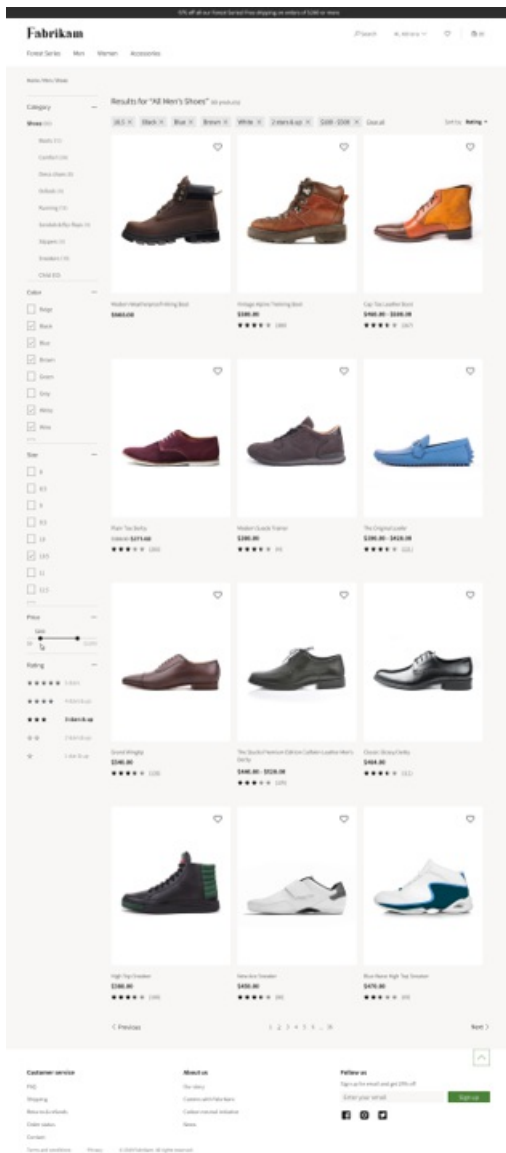

The cloud-powered product discoverability in Dynamics 365 Commerce helps retailers continue to increase consumer retention and conversion rates across all channels, both e-Commerce channels and point of sale (POS) channels.

The Dynamics 365 Commerce search experience has improved capabilities to help retailers achieve better product discoverability. At the same time, these capabilities deliver the scalability and performance that are required for e-Commerce traffic.

## Browse and search

Search relevance and performance are key factors in the omnichannel experience, because product discovery relies primarily on search functionality for information retrieval and content navigation. An effective and efficient browse and search experience helps increase conversion.

The following illustration shows an example of typical browse and search functionality.

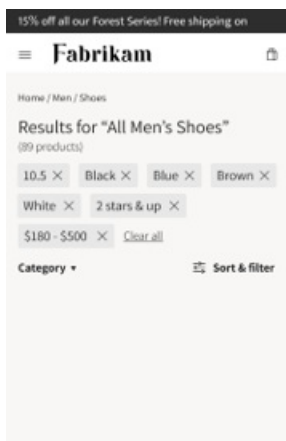

## Faceted navigation and choice summary

Faceted navigation helps customers more easily browse for content by letting them filter on refiners that are linked to terms in a term set. After a customer has selected and applied refiners, a summary of the choices is shown.

By using faceted navigation, you can configure different refiners for different terms in a term set, without having to create additional pages.

The following illustration shows an example where faceted navigation is used in a search.

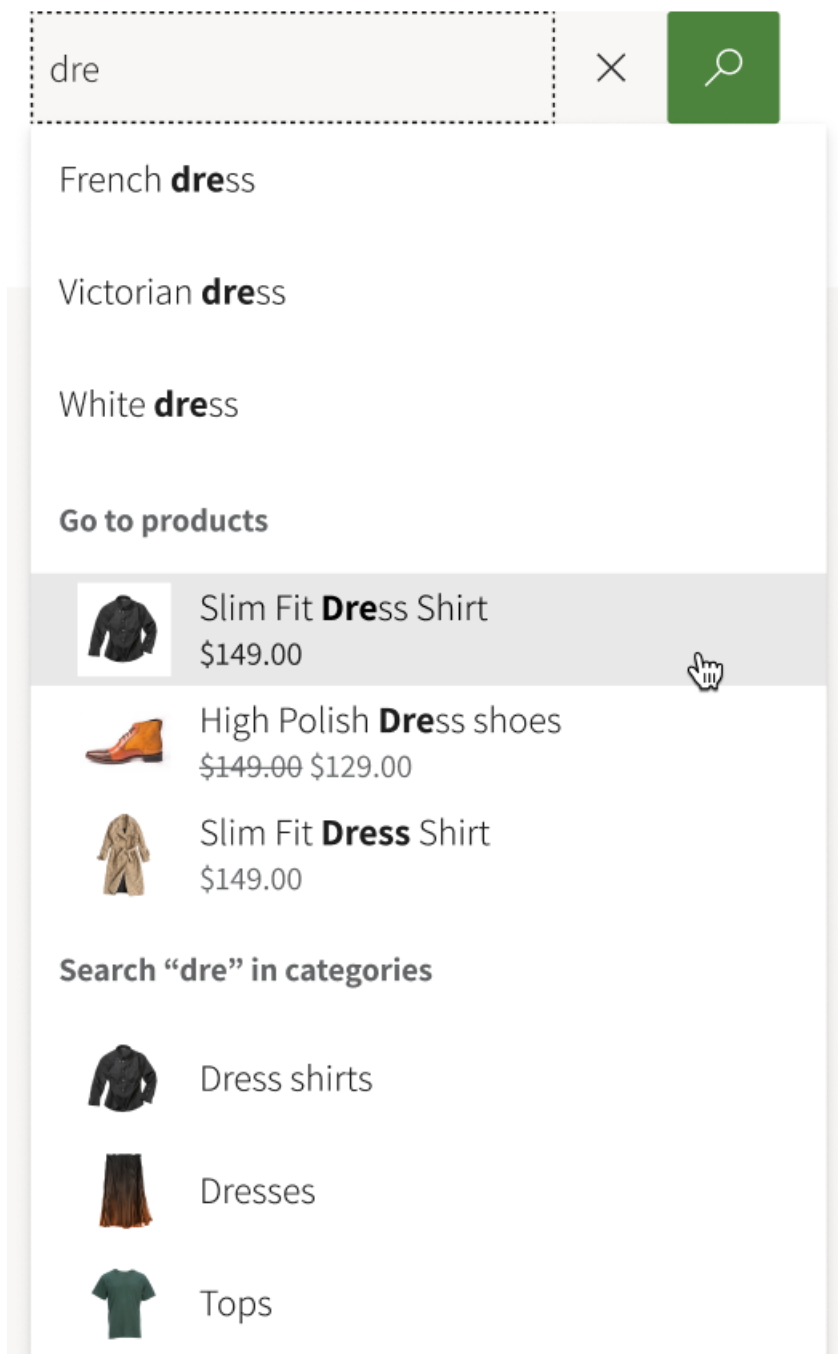

# Immersive autosuggest

Current autosuggest functionality just shows keywords that trigger a search for the matching keyword. Because of new enhancements in Dynamics 365 Commerce, customers can often discover links to products before they have finished typing.

Dynamics 365 Commerce also supports functionality for keyword matches in various categories. This functionality lets customers see the number of matching keywords across categories and trigger a search for a keyword in other categories.

The following illustration shows an example where immersive autosuggest is being used.

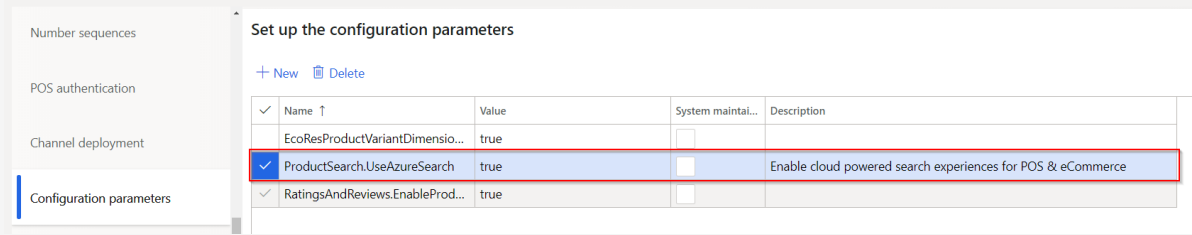

## Sort

Enhanced sorting in Dynamics 365 Commerce lets customers sort, search, and browse search results, and refine them by criteria such as price, product name, and product number. Customers can also sort results based on whether a product is new, top-selling, or recently added.

## NOTE

These cloud-powered search capabilities are available starting in version 10.0.8. Ensure that under **Commerce Parameters > Configuration Parameters** there is an entry for "ProductSearch.UseAzureSearch set to 'true'".

### Commerce parameters

The screenshot shows a configuration interface for Commerce parameters. On the left, there is a sidebar with categories: Number sequences, POS authentication, Channel deployment, and Configuration parameters (selected). The main area is titled 'Set up the configuration parameters' and contains a table with columns: Name, Value, System maintai..., and Description. The table has three rows, with the second row highlighted in blue and a red border around it.

✓ Name ↑	Value	System maintai...	Description
EcoResProductVariantDimensio...	true	<input type="checkbox"/>	
✓ ProductSearch.UseAzureSearch	true	<input type="checkbox"/>	Enable cloud powered search experiences for POS & eCommerce
✓ RatingsAndReviews.EnableProd...	true	<input type="checkbox"/>

# Generate online channel reports

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to generate reports for your online channel in Microsoft Dynamics 365 Commerce.

## Overview

You can generate and view several reports in Commerce to see how your online channel is performing.

## Channel summary report

The **Channel summary** report shows a summary of the following transactions for the selected channel:

- Sales transactions
- Payment transactions
- Tax transactions
- Discounted transactions

To generate a **Channel summary** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Channel summary report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.
4. In the **Channel** field, select the online channel.
5. Select **OK**.

## Channel sales by year report

The **Channel sales by year** report shows a comparison of year-over-year sales for a specific store. You select the year to compare the sales against, and the report compares sales for the selected year with sales for the previous year.

To generate a **Channel sales by year** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Channel sales by year report**.
2. In the **From calendar year** field, enter a year.
3. In the **To calendar year** field, enter a year.
4. In the **Channel** field, select the online channel.
5. Select **OK**.

## Channel sales by hour report

The **Channel sales by hour** report shows sales metrics per hour for a selected channel or operating unit.

To generate a **Channel sales by hour** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Channel sales by hour report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.

4. In the **Channel** field, select the online channel.
5. Select **OK**.

## Top customers report

The **Top customers** report shows sales metrics for the top  $N$  customers for a selected channel or operating unit. The value  $N$  is a number from 10 to 100 and is based on a user-selected aggregate measure.

To generate a **Top customers** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Top customers report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.
4. In the **Channel** field, select the online channel.
5. Select **OK**.

## Top discounts report

The **Top discounts** report shows sales metrics for the top  $N$  discounts for a selected channel or operating unit. The value  $N$  is a number from 10 to 100 and is based on a user-selected aggregate measure.

To generate a **Top discounts** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Top discounts report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.
4. In the **Channel** field, select the online channel.
5. Select **OK**.

## Top products report

The **Top products** report shows sales metrics for the top  $N$  products for a selected channel or operating unit. The value  $N$  is a number from 10 to 100 and is based on a user-selected aggregate measure.

To generate a **Top products** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Top products report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.
4. In the **Channel** field, select the online channel.
5. Select **OK**.

## Category sales report

The **Category sales** report shows sales metrics over a selected period for each node of a category hierarchy for a selected channel or operating unit.

To generate a **Category sales** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Category sales report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.
4. In the **Channel** field, select the online channel.
5. Select **OK**.

# Organization sales report

The **Organization sales** report shows the performance of your stores by organization unit. This report includes the sales quantity and amount by store, and the profit margin for each store. The organization unit is based on the default reporting hierarchy.

To generate an **Organization sales** report, follow these steps.

1. Go to **Retail and Commerce > Inquiries and reports > Sales reports > Organization sales report**.
2. In the **From date** field, enter a date.
3. In the **To date** field, enter a date.
4. Select **OK**.

# Experimentation in Dynamics 365 Commerce

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use experimentation in Dynamics 365 Commerce to validate hypotheses about the effectiveness of your e-Commerce pages and make decisions with data-driven confidence. Commerce supports A/B testing on pages, modules, and fragments and enables you to measure the impact of proposed changes to your website.

You can create, edit, and manage page and content treatments known as **variations** in Commerce site builder. Commerce integrates with third-party services that you can use to create experiments and treatment assignments. Real-time event streams captured in Commerce enable the analytics that define the experiment results in the third-party service. You can then leverage these analytics to help support or refute your hypothesis.

## Set up prerequisites

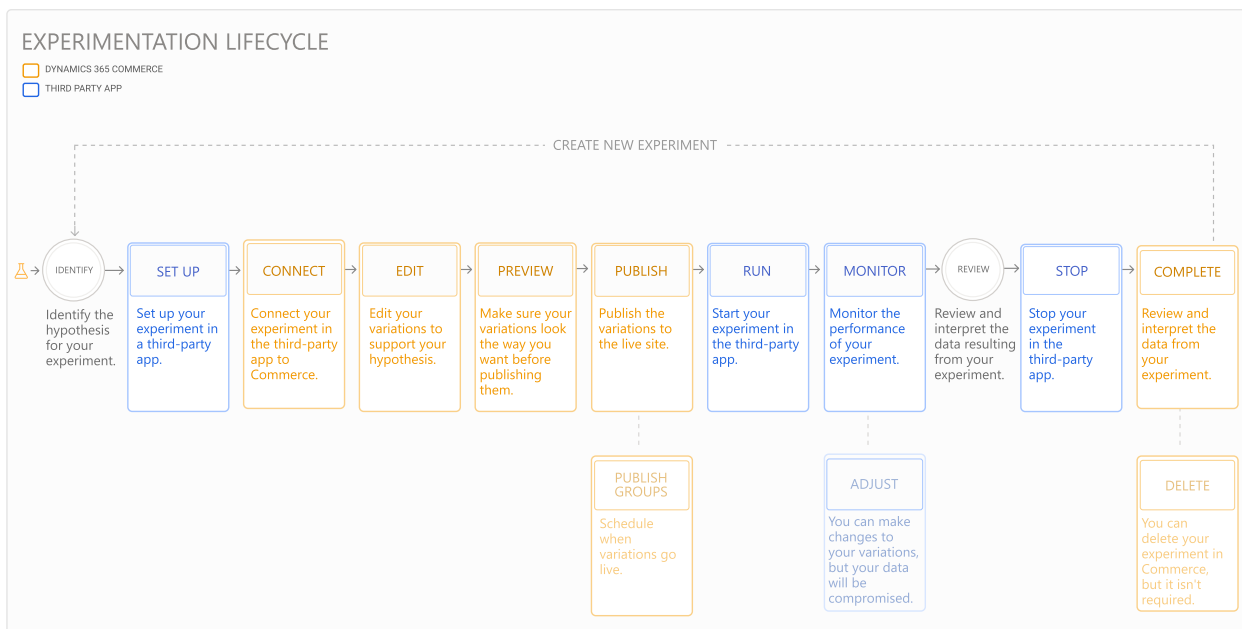

1. **Get the correct version of Commerce** - Upgrade your module library, online channel extensibility software development kit (SDK), and Commerce Scale Unit to Commerce version 10.0.13 or later.
2. **Set up an experimentation connector** - An experimentation connector allows Commerce to connect with third-party services to retrieve the list of experiments and determine when to show an experiment to a user. You can purchase a third-party connector from [AppSource](#). Follow the setup instructions provided by the publisher. You can alternatively use the sample test connector from Commerce to test the experimentation workflow without needing to configure an external service. For more information, see [Configure and enable connectors](#).
3. **Turn on the experimentation feature flags in Commerce** - You can enable experimentation at the tenant level by going to **Tenant Settings > Features** or at the site level at **Site Settings > Features**.
  - Enable the **Experimentation** flag to create experiment variations of modules within a page without affecting or copying other content that isn't part of the experiment. This ensures that ongoing content updates outside the experiment stay in sync during the experiment lifecycle. Disabling this flag stops all experiments from being shown to users and removes all editing functions within site builder.
  - Enable the **Experiment on pages or fragments** flag to run experiments on a page or fragment. This creates a full instance copy of the entire page or fragment for all modules within the page or fragment. Use this mode when you want to test comprehensive content changes, or where synchronizing ongoing content changes across instances isn't a concern. Disabling this flag prevents creation and editing of new experiments on pages and fragments.

### NOTE

The **Experimentation** flag must also be enabled for the **Experiment on pages or fragments** functionality to work.

## Experimentation lifecycle

Setting up an experiment, creating variations, and running an experiment is an iterative process. The diagram below illustrates the experimentation lifecycle in Commerce and the third-party service.

To learn more about each step in the experimentation process, refer to the following topics.

- [Identify a hypothesis and determine metrics for an experiment](#)
- [Set up an experiment](#)
- [Connect and edit an experiment](#)
- [Preview and publish an experiment](#)
- [Run and monitor an experiment](#)
- [Promote a variation and complete an experiment](#)

#### NOTE

To learn where an experiment is in the lifecycle, select **Experiments** in the left navigation pane of site builder. A list of experiments is displayed with the status of each experiment in both Commerce and the third-party service. For more information, see [Review the status of an experiment](#).

## Next step

[Identify a hypothesis and determine success metrics for an experiment](#)

#### NOTE

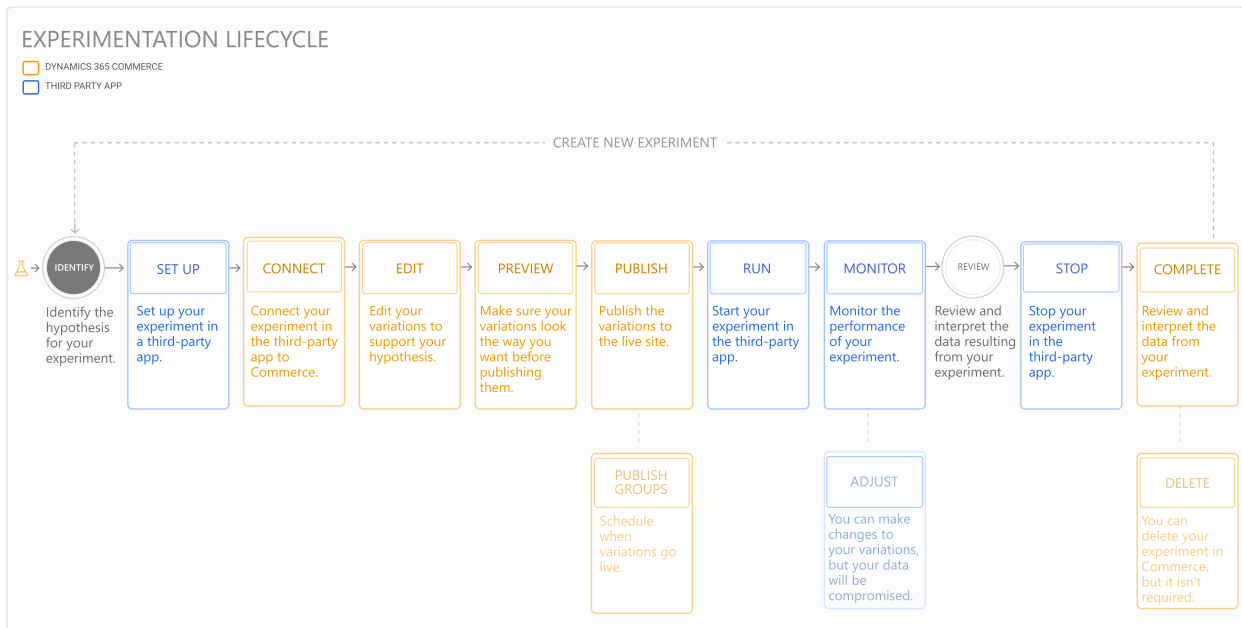

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Identify a hypothesis and determine success metrics for an experiment

2/18/2021 • 2 minutes to read • [Edit Online](#)

The first phase in the experimentation lifecycle includes identifying the hypothesis for the experiment and determining the metrics you'll track to evaluate success. The following diagram shows all of the steps involved in [setting up and running an experiment](#) on an e-Commerce website in Dynamics 365 Commerce. Additional steps are covered in separate topics.

A hypothesis is a statement where you predict the outcome of the experiment. Many factors go into defining a hypothesis, for example, research about user behavior and website data you've collected. With the hypothesis, you'll define the assumption or theory you want to validate with your experiment. An example of a hypothesis for your experiment may be *"a picture of a white t-shirt on my home page will drive a higher clickthrough rate than a navy sweater during summer months because people want to wear something lightweight and light colored in the summer."* In that case, you'll create variations that include a white t-shirt and a navy sweater, and publish both at the same time.

To validate a hypothesis, the success or failure of an experiment should be directly tied to user actions; for example, if the website user clicks on a link or button. These actions must correspond with events that will be reported to the third-party service tracking the experiment. Over time, the percentage of users that take the action will be tallied as a metric you can use to generate reports and conduct analyses. To review all of the available events and attributes, see [Commerce component events for diagnostics and troubleshooting](#).

## Previous step

[Experimentation in Dynamics 365 Commerce](#)

## Next step

[Set up an experiment](#)

**NOTE**

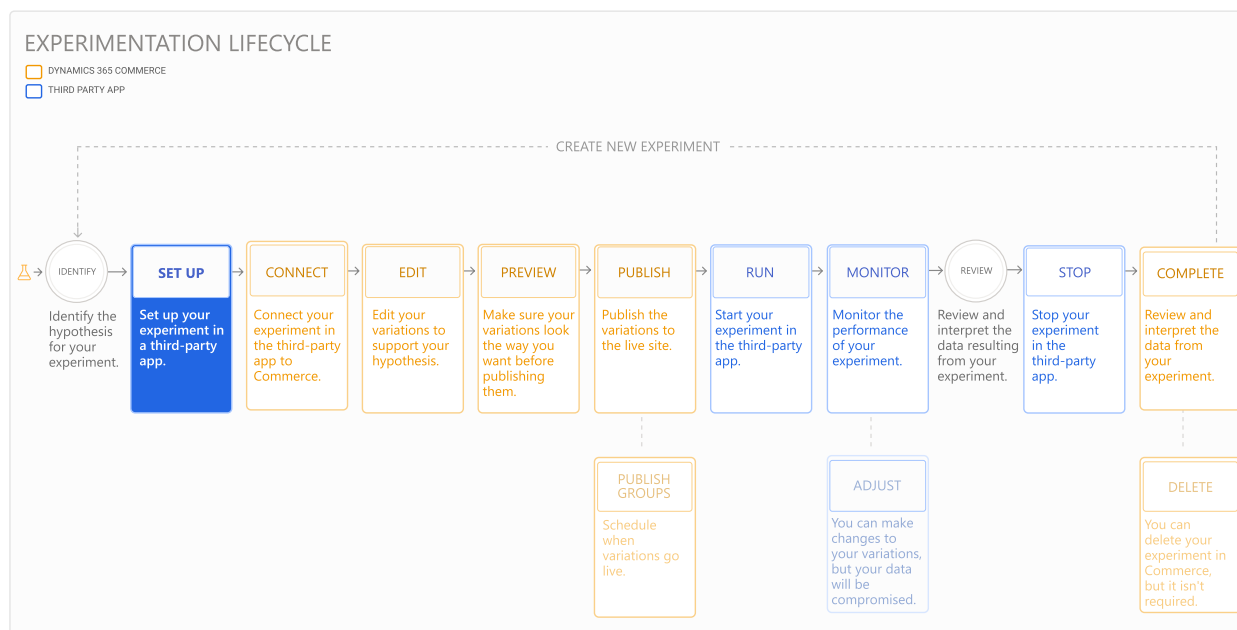

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up an experiment

2/18/2021 • 2 minutes to read • [Edit Online](#)

After you [define a hypothesis](#) and [determine what success metrics you want to use](#), you'll need to set up your experiment in the third-party service. The following diagram shows all of the steps involved in setting up and running an experiment on an e-Commerce website in Dynamics 365 Commerce. Additional steps are covered in separate topics.

## Set up your experiment in the third-party service

By now you should have chosen your third-party service to run and monitor your experiment, and set up the experimentation connector. These prerequisites are listed in [Experimentation in Dynamics 365 Commerce](#).

Follow the steps required to create your experiment in the third-party service. If the connector is configured properly, the complete list of experiments you set up in the third-party service will appear in Commerce site builder within about 5 minutes.

## Set up your success metrics

Every experiment needs metrics to measure the impact of the variations and to validate the hypothesis. Follow the steps below to enable the computation of metrics in the third-party service using live telemetry events from Dynamics 365 Commerce.

To set up your success metrics, follow these steps.

1. In Commerce site builder, select **Pages** in the left navigation pane, and then select the page that you want to collect metrics for.
2. Go to the **Event IDs to track** section in the right property pane of the page or module you want to track.
3. Select **View**. A list of all event IDs is displayed. Copy the event you want to track, and paste the event key into the designated location in the third-party service. If you need more than one event, copy the keys one at a time.
  - To learn how to view all of the available events and attributes, including page views and revenue tracking, see [Commerce component events for diagnostics and troubleshooting](#).

4. Take any other steps for tracking metrics as required in the third-party service.

## Previous step

[Identify a hypothesis and determine metrics for an experiment](#)

## Next step

[Connect and edit an experiment](#)

### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

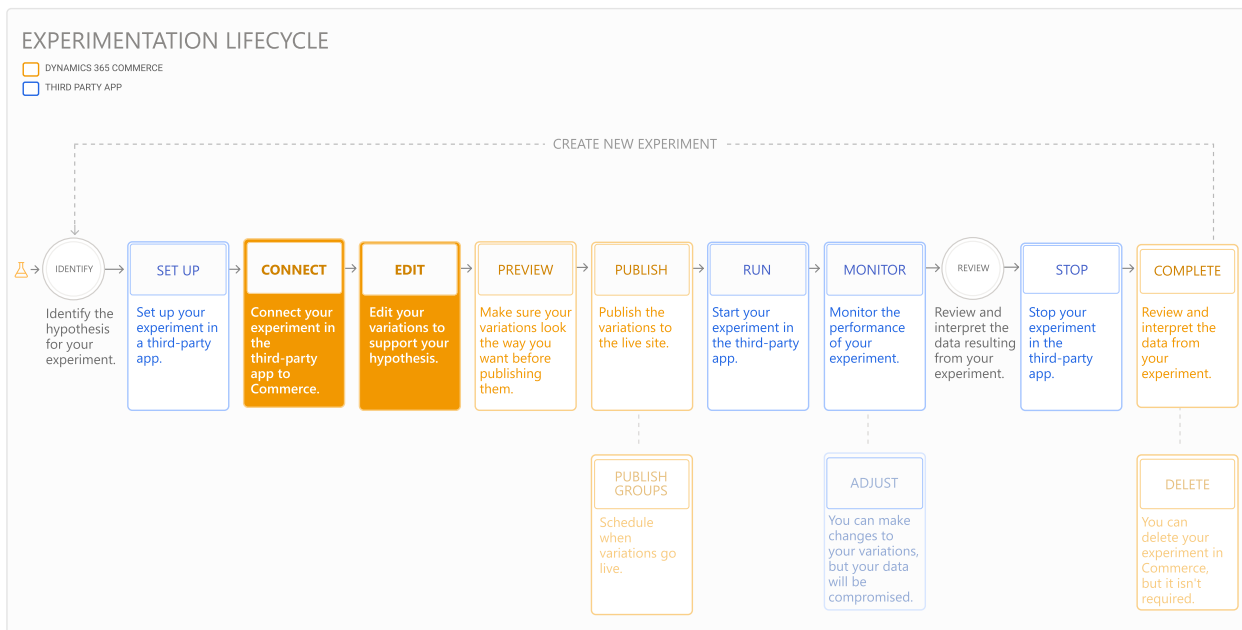

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Connect an experiment and edit variations

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to connect your experiment in Commerce and make changes to your variations so that they align with your hypothesis.

The following diagram shows all of the steps involved in setting up and running an experiment on an e-Commerce website in Dynamics 365 Commerce. Additional steps are covered in separate topics.

After you've [set up your experiment](#) in a third-party service, you'll connect the experiment in Dynamics 365 Commerce and edit the experiment variations.

## Planning considerations

Before you connect your experiment in Commerce, you'll need to make some decisions that impact the way Commerce manages your content.

### Determine the scope of your experiment

When you connect an experiment, you are prompted to define the scope of the experiment. Experiments are defined as **partial** scope or **entire** scope.

- Choose **partial** if you want to conduct an experiment on a specific portion of a page. If you select this option, you must identify which modules are included in the experiment. Changes that are made to parts of the default page or fragment that aren't related to the experiment are automatically synchronized across variations.
- Choose **entire** if you want to conduct an experiment on an entire page or fragment. Separate copies of the default page or fragment are created. You won't have to select which modules are included in the experiment because the whole editing surface is available to change. You can add, delete, or re-order modules as needed. However, if any changes are made to the default page or fragment that the experiment is associated with, those changes have to be manually synchronized across all variations.

#### NOTE

If you associate your experiment with a page that uses a layout, you can only scope the experiment as **entire**.

### Decide if you want to schedule when your experiment is published

If you want to schedule when your experiment is published to your live site, make sure the content you want to associate with the experiment is available in a publish group *before* you connect the experiment.

For more information about publish groups, refer to [Work with publish groups](#).

## Connect your experiment

To connect your experiment, you'll launch the **Connect experiment** wizard. The wizard walks you through the steps required to connect your experiment. When you complete the wizard, your experiment is connected and variations are created and ready to be edited.

To get started connecting your experiment in Commerce site builder, follow these steps.

1. To launch the **Connect experiment** wizard, select **Experiments** in the left navigation pane, and then select **Connect**. Alternatively, you can access the wizard from a page or fragment editor by editing it and selecting **Connect experiment** on the command bar.

#### NOTE

A page can only be connected to one experiment at a time. To connect a page to a different experiment, first delete the experiment that the page is currently connected to.

2. Choose the page or fragment you want to run your experiment on.
3. Set the experimentation scope to **partial** or **entire**, based on the choice you made in the [Determine the scope of your experiment](#) section above.

#### NOTE

The **Experiment on pages or fragments** feature flag must be enabled if you want to experiment on a full page or fragment. Refer to the [Experimentation in Dynamics 365 Commerce](#) topic for more information.

4. In the final step of the wizard, select **Generate variations and exit wizard**. Variations are created for the experiment.

## Edit your variations

When you exit the wizard, variations are created for you.

Next, you'll edit the variations so they reflect the choices that you need to verify in the experiment hypothesis. Choose one of following procedures that corresponds to the scope you chose for your experiment in the [Determine the scope of your experiment](#) section above.

### Edit variations for experiments with partial scope

Follow these steps if you defined the scope of your experiment as **partial** in the **Connect experiment** wizard.

1. In editor view, use the variations drop-down menu below the command bar to edit each variation based on your original hypothesis. You may also want to establish a control or base variation by leaving one of the variations unchanged.

2. Select the module to be experimented on, select the ellipsis (...), and then select **Add to experiment**.

### **Edit variations for experiments with entire scope**

If you defined the scope of your experiment as **entire** in the **Connect experiment** wizard, while in editor view, use the variations drop-down menu below the command bar to edit each variation based on your original hypothesis.

#### **NOTE**

In either case, you may also want to establish a control or base variation by leaving one of the variations unchanged.

## Previous step

[Set up an experiment](#)

## Next step

[Preview and publish an experiment](#)

#### **NOTE**

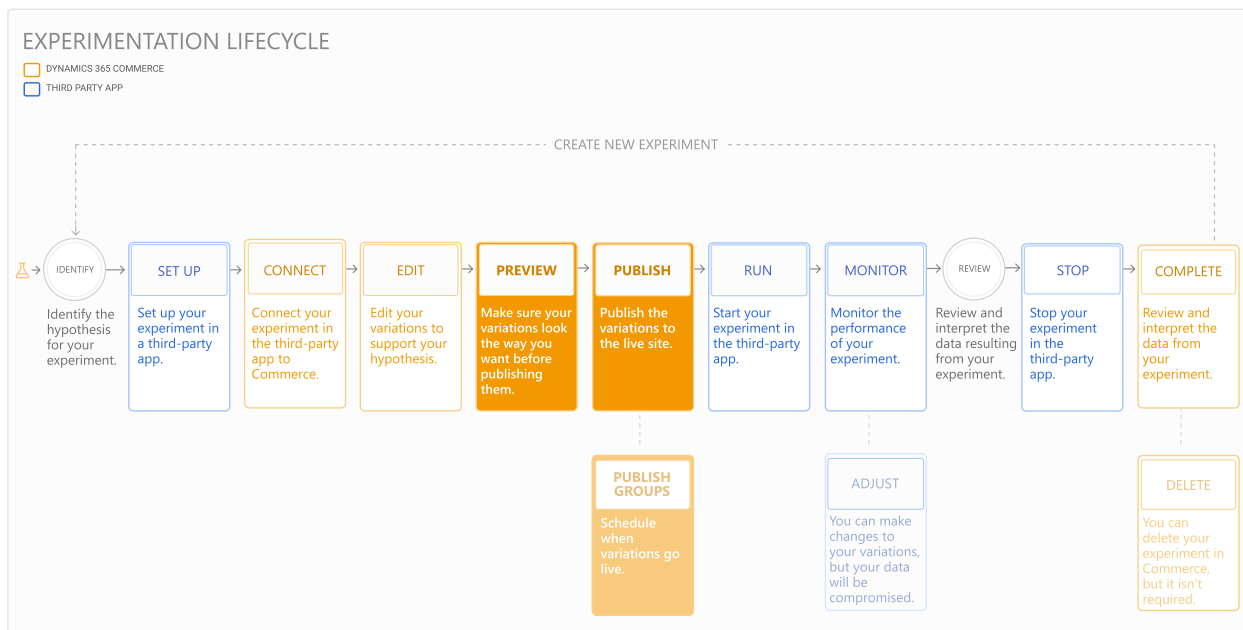

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Preview and publish an experiment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to preview and publish your experiment in Dynamics 365 Commerce after you've [connected your experiment and edited your variations](#). The following diagram shows all of the steps involved in setting up and running an experiment on an e-Commerce website in Dynamics 365 Commerce. Additional steps are covered in separate topics.

## Preview your experiment variations

You can preview your variations and continue editing them until they look the way you want them to.

To preview your experiment variations in Commerce site builder, follow these steps.

1. From the variations drop-down menu below the command bar, select the content you want to preview.
2. On the command bar, select **Preview**. A preview of what the content will look like when it's published is displayed.
3. To preview a different variation, select it from the variation drop-down menu and select **Preview** again.

## Publish your experiment

If you aren't using a publish group to schedule when your experiment goes live and you want to publish immediately, select **Publish** in the command bar. All variations that belong to the experiment will be published.

### IMPORTANT

If the page has an unpublished URL, you must first publish the URL or it won't be visible to your website users. For details, see [Save, preview, and publish a page](#).

### Use publish groups to schedule when your experiment goes live

Variations created in site builder can be scheduled for publishing by using a publish group. Within a publish group, you can connect a page or fragment to your experiment by selecting **Experiments** in the left navigation pane. You can also do this by selecting **Pages** or **Fragments** and following the instructions in [Connect an](#)

[experiment and edit variations](#). For information about publish groups, see [Work with publish groups](#).

When using publish groups with experiments, there are some important considerations to be aware of.

- When you add a page or fragment that has an experiment running on it to a publish group, the experiment will be removed from the page or fragment in the publish group.
- Experiments that are connected to pages in a live site aren't available to pages within publish groups and vice-versa. Similarly, pages that have experiments running on them in a live site aren't available to other experiments in publish groups and vice versa.
- When you publish or schedule a publish group, all content in the publish group is published, regardless of whether there's an experiment associated with the publish group.
- Because a publish group continues to persist after it's been published to a live site, experiments in the publish group will also persist. Therefore, you won't be able to associate other experiments with the same page or fragment. To avoid this limitation, delete any publish groups with persisting experiments. Similarly, if you want to delete an experiment in a live site that also exists in a publish group, delete it from the publish group first.

## Previous step

[Connect and edit an experiment](#)

## Next step

[Run and monitor an experiment](#)

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

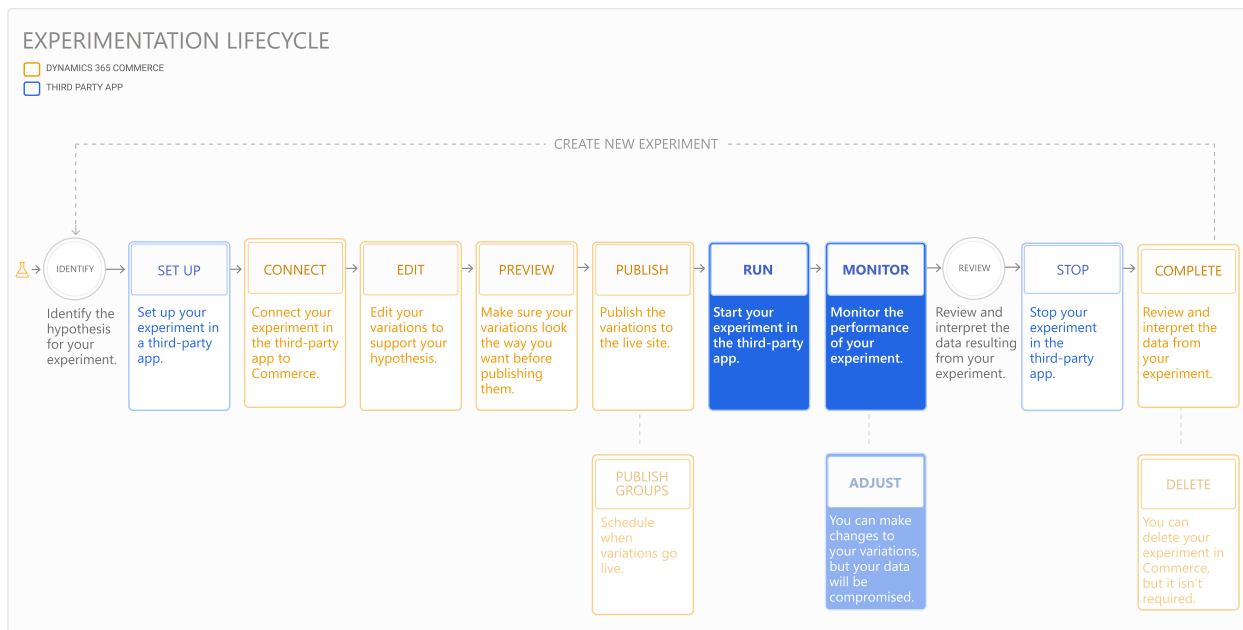

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Run and monitor an experiment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to run and monitor your experiment in a third-party app, and change variations if needed. Before you complete the steps in this topic, you'll first need to [publish](#) your experiment in Commerce.

The following diagram shows all of the steps involved in setting up and running an experiment on an e-Commerce website in Dynamics 365 Commerce. Additional steps are covered in separate topics.

After you publish your variations, all of the steps you need to do in Commerce to run your experiment are complete. The next step is determining which variation to show to each user when they request a page. The third-party service makes that determination, but first you have to activate the experiment within the service. Since the steps for activating an experiment vary from service to service, you'll need to follow the instructions included with your service or provider. If the experiment is not activated, users will only see the default version of the page (no variations will be displayed).

You'll need to keep the experiment running long enough to gather data for statistically valid results. Use the third-party service to monitor the experiment-related data and analytics while the experiment is running.

## Adjust your variations

If for any reason you need to modify your variations, follow the steps below.

### IMPORTANT

If you make changes to a live experiment in Commerce or the third-party service, your results may be significantly impacted. Consider letting the experiment run its course and then creating a new experiment for major changes.

1. In Commerce site builder, select **Experiments** in the left navigation pane, and then select the experiment.
2. Select the variation you want to update from the drop-down menu.
3. Make any needed changes, and then preview and publish the variations. For more information, see [Preview and publish an experiment](#).
4. Go to the third-party service to make any experiment setup-related changes.

## Previous step

[Preview and publish an experiment](#)

## Next step

[Promote a variation and complete an experiment](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Promote a variation and complete an experiment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to promote the variation that produced the best results in your experiment, and how to complete the experiment. The following diagram shows all of the steps involved in setting up and running an experiment on an e-Commerce website in Dynamics 365 Commerce. Additional steps are covered in separate topics.

After you've [run your experiment](#) and collected sufficient data to determine which variation you want to use on your live site, you'll promote the variation and end the experiment.

## Promote a variation

Use the data and analytics related to the experiment in the third-party service to decide which variation produced the best results. You can then promote it by replacing the current content on the live site with the winning variation so that it's available to all users of your website.

To promote the winning variation, follow these steps.

1. In Commerce site builder, select **Experiments** in the left navigation pane, and then select the experiment.
2. On the command bar, select **Complete experiment**.
3. In the **Complete the experiment** dialog box, select **Review the experiment data**. The third-party service opens where you can validate the metrics and determine which variation performed the best.
4. In the **Complete the experiment** dialog box, select the winning variation, and then select **Next**.
5. Open the third-party service and stop the experiment.
6. In site builder, select **Complete** to overwrite the original live page and publish the winning variation so that it's available to all users of your website.

### NOTE

If you choose to keep the current live page and not publish a variation, select **Republish the original page**.

# Delete your experiment

While it's not required that you delete a completed experiment in Commerce, you may choose to delete it to save space or clean up your workspace.

To delete an experiment in Commerce site builder, follow these steps.

1. Select **Experiments** in the left navigation pane, and then select the experiment.

## NOTE

If the experiment is still active, stop the experiment in the third-party service before proceeding.

2. On the command bar, select **Unpublish** to remove the variation content from the live site.
3. Select **Delete** to delete the experiment.

## Previous step

[Run and monitor an experiment](#)

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Review the status of an experiment

2/18/2021 • 2 minutes to read • [Edit Online](#)

There are many steps involved in setting up and running an experiment in Dynamics 365 Commerce. For information about the experimentation lifecycle, see [Experimentation in Dynamics 365 Commerce](#).

To learn where an experiment is in the lifecycle, in Commerce site builder select **Experiments** in the left navigation pane. A list of experiments is displayed with the status of each experiment in both Commerce and the third-party service that is being used to enable the creation of experiments, assign variations, and analyze data.

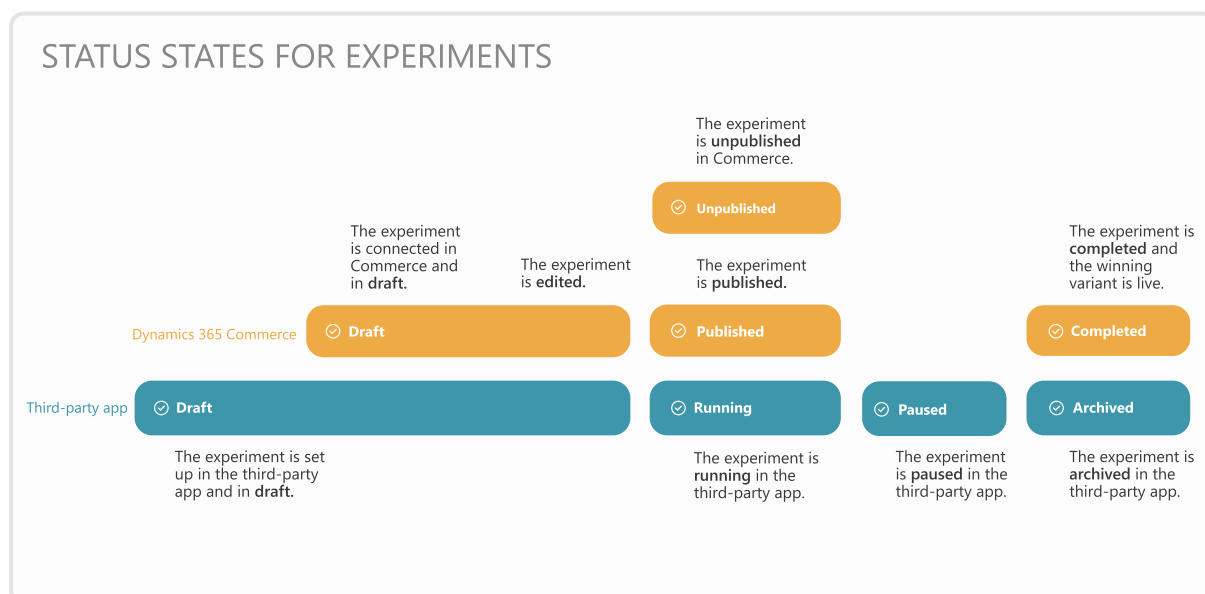

In the **Commerce status** column, the following values may be displayed.

- **Draft** - The experiment is connected to a page or fragment in Commerce and is being edited.
- **Published** - The experiment variations are ready to be displayed on your website. If the experiment is running in the third-party service, website users will see a variation of the page or fragment as selected by the third-party service.
- **Unpublished** - The experiment is no longer available on your website. Website users will only see the default version of the page or fragment even if the experiment is running in the third-party service.
- **Completed** - The experiment has run its course and a variation was promoted to live for all website users.

Similarly, in the **third-party status** column, the following values may be displayed to indicate what status the experiments are in the third-party service.

- **Draft** - The experiment is set up in the third-party service but hasn't been started.
- **Running** - The experiment was started in the third-party service and is collecting data.
- **Paused** - The experiment is paused and not collecting data. You must resume the experiment for it to collect data again.
- **Archived** - The experiment has run its course and has been cataloged in the third-party service for future reference.

The diagram below shows both sets of statuses and how they relate to each other.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Build custom response pages for 4xx/5xx status code errors

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to build custom response pages for 4xx and 5xx status code errors by using the authoring tools in Microsoft Dynamics 365 Commerce.

## Overview

If a request isn't successful, the server issues HTTP status code error responses. The 404 status code is captured and returned if a page isn't found, and the 500 status code is captured and returned if a server error occurs. In Dynamics 365 Commerce, application users can build custom status code error response pages that are shown to users for these status code error responses.

## Build a status code error response page

To start to build a status code error response page, follow these steps.

1. In your preferred web browser, sign in to Dynamics 365 Commerce.
2. Select the site that you want to build a 4xx/5xx status code error response page for.

### Build the template

To build the template for the status code error response page, follow these steps.

1. Go to **Templates**.
2. Select **New** to create a page template.
3. In the **New Template** dialog box, under **Template Name**, enter a name for the new template, and then select **OK**.
4. Build the template, based on the structure that you want the status code error response page to have.
5. Select **Save**, select **Finish editing** to check in the template, and then select **Publish** to publish it.

### Build the status code error response page

To build the status code error response page, follow these steps.

1. Go to **Pages**.
2. Select **New** to create a page.
3. In the **Choose a template** dialog box, select a template, and then, under **Page name**, enter a name for the status code error response page. Leave the **Page URL** field blank.
4. Build the page.
5. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

#### NOTE

You can create separate status code error response pages for 4xx and 5xx status code errors. Alternatively, you can use the same general status code error response page for both error categories.

### Set up a redirect for the status code error response page

To set up a redirect for the status code error response page, follow these steps.

1. Go to **URLs > New > New Alias**, and select the status code error response page that you built earlier.
2. In the **Alias** field, enter either **default-4xx** or **default-5xx**, depending on the status code error response page that you're setting up a redirect for. These aliases must be published. Otherwise, the redirect won't work.
3. Select **OK** to commit the linking.

#### **NOTE**

If you're using a single status code error response page for both error categories, repeat this procedure to link an alias for the other error category to the same page.

# Dynamics 365 Fraud Protection integration with Dynamics 365 Commerce

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes out-of-box integrations that are available between Microsoft Dynamics 365 Commerce and Dynamics 365 Fraud Protection.

## Key terms

TERM	DESCRIPTION
Purchase protection	The Fraud Protection module that analyzes purchases for fraud, based on risk levels that are determined by the merchant.
Storefront	The out-of-box e-commerce storefront that is provided with Commerce.
Azure Data Lake Storage Gen2	Data Lake Storage Gen2 is used to make Commerce data available for processing by the <b>Loss prevention</b> module.

## Overview

Fraud Protection is a service that offers fraud protection solutions to help retailers prevent fraudulent activity and identify places where fraud might be unnoticed. This topic describes out-of-box integrations between Fraud Protection and Commerce. It will be updated as new integrations between the two services are released in future releases. For more information about Fraud Protection, including information about modules that aren't yet supported by an out-of-box integration with Commerce, visit the [Fraud Protection landing page](#). You can also [request a callback](#) from a Dynamics 365 sales representative to discuss how Fraud Protection can help boost profitability, reduce operational expenses, and improve customer experiences.

Starting October 2020, a limited capacity of Fraud Protection is included in the Microsoft Dynamics 365 Commerce license. Commerce customers can now use Fraud Protection for no extra charge, up to the limits specified below:

- **Purchase protection**- Up to 2,000 assessments per month.
- **Account protection**- Up to 20,000 assessments per month.
- **Loss prevention**- Up to 8,000 transactions per month.

You have the option of purchasing additional Fraud Protection add-ons if your usage requires higher limits.

To start using Fraud Protection if you are an existing Commerce customer, visit the [Fraud Protection portal](#), sign in with tenant global administrator credentials, and complete a one-time setup for your environment.

## Purchase protection in Commerce

### Purchase protection overview

The first generally available offering from Fraud Protection is a purchase protection module that lets merchants sign in to the Fraud Protection dashboard for their organization and define fraud rules for online purchases. Based on the settings that a merchant configures in Fraud Protection, e-commerce transactions can be validated

with Fraud Protection before they are sent for payment authorization.

When an order is sent to the Fraud Protection purchase protection module, Fraud Protection analyzes the purchase and provides a risk assessment, based on merchant-defined fraud rules, insights that are driven by artificial intelligence (AI), and consortium-based fraud analytics. If the fraud score that is returned for the order exceeds the merchant's risk tolerance, Fraud Protection instructs the storefront to reject the order. If an order isn't rejected, Fraud Protection returns a fraud score that the storefront can use to determine the next steps in the order fulfillment process. Those steps might include putting the order on hold for manual review or follow-up with the customer who placed the order.

## Supported capabilities in the purchase protection integration

### Purchase events

Currently, Commerce is in public preview. However, when it becomes generally available, the purchase protection integration will support the receipt of Fraud Protection risk assessments and termination of orders in the online storefront.

Here is the flow for purchase events.

1. A storefront customer adds items to the basket and proceeds to checkout.
2. The customer enters shipping and payment details.
3. After the prerequisites are completed, the customer selects **Place order**.
4. Order details are sent to Fraud Protection for purchase protection assessment.
5. If the merchant rules that are defined in Fraud Protection determine that the order should be rejected, a response is sent to the storefront, and the order is terminated.

If Fraud Protection purchase protection causes an order to be terminated, the user receives the following error message: "The order cannot be processed at this time. Please try again later."

[Sign in](#) | [Account](#)

[Phones](#) [Audio](#) [Cameras](#) [Home appliances](#) [TV and video](#) [Computers](#)

The order cannot be processed at this time. Please try again later.

One Microsoft Way  
Redmond WA 98052 USA

PAYMENT METHOD [Edit](#)

CREDIT CARD  
\$254.54

BILLING ADDRESS

One Microsoft Way  
Redmond WA 98052 US

### ORDER SUMMARY

Subtotal: \$239.00

Shipping and handling: \$0.00

Tax: \$15.54

**Order total: \$254.54**

Total savings: \$0.00

Alternatively, if the merchant rules determine that the order should be approved, the response that is sent to the storefront includes the fraud score and the reason code that were determined by Fraud Protection. For the initial

integration, the Fraud Protection assessment isn't used in any way, and the response for both approval and rejection scenarios isn't saved.

Rejected orders aren't sent to payment processors for authorization, and they don't go through the order creation process in the back office.

#### **Bank events**

If an online order is approved based on the Fraud Protection assessment, the next step is to authorize payments for that order, if payment authorizations are applicable. Once the order is authorized with the payment processor, Fraud Protection is notified of the authorization result. By sending these results to Fraud Protection, the advanced AI can be trained to better predict future authorization results, thereby boosting the quality of future Fraud Protection assessments.

#### **Purchase status events**

Purchase status events resemble bank events. After an order is created in the Commerce back office, a signal is sent to Fraud Protection to indicate that the order was successfully created. Both bank events and purchase status events are informational events. Therefore, no response is expected from Fraud Protection.

#### **Setup**

The out-of-box purchase protection integration requires a Fraud Protection environment. To set up Fraud Protection, [request a callback](#) from a Dynamics 365 sales representative.

After the merchant's Fraud Protection environment is available, and purchase protection settings have been configured, the setup can continue in the Commerce back office.

#### **Key Vault setup**

The integration setup requires that a secret be used when Commerce communicates with Fraud Protection to get a purchase protection result. That secret must be stored by using an Azure Key Vault client. For information about how to set up a Key Vault client, see [Setting up Azure Key Vault Client](#).

The Fraud Protection certificate that is stored in Key Vault can be referenced only if it's referenced by Key Vault parameters in the Commerce back office. To set up Key Vault parameters, go to **Retail and Commerce > Headquarters setup > Parameters > Key Vault parameters** in Commerce.

Next, select the Key Vault URL that is used to store the Fraud Protection secret, and select **Add**. Then specify the name, description, and path of the Key Vault secret that is used to authenticate Commerce when it sends orders for purchase protection assessment.

#### **Commerce parameters setup**

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**.
2. On the **Dynamics Fraud Protection** tab, set the **Enable Dynamics Fraud Protection integration** option to **Yes**.
3. On the **Configuration** FastTab, add the Azure Active Directory (Azure AD) client ID, and then select the name of the Key Vault secret that you configured earlier.

By default, the **Assessment type** field is set to **Evaluate**. In this case, Fraud Protection will passively check orders for fraud but won't actively reject orders. Therefore, merchants can compare Fraud Protection risk assessments with their current fraud tools to understand the impact of Fraud Protection on acceptance rates.

Alternatively, the **Assessment type** field can be set to **Protect**. In this case, Fraud Protection will return "Reject" assessments, and fraudulent orders will be terminated before they are sent for authorization or created in the back office.

4. The **Dynamics Fraud Protection endpoint URL** field must be set. This URL is provided by Fraud Protection and will vary across user acceptance testing (UAT) and production environments.

**Commerce parameters**

- Channel deployment
- Configuration parameters
- Transaction validation
- Workforce management
- Electronic documents
- POS search criteria
- Clienteling
- Dynamics Fraud Protection**

**Set up Dynamics 365 Fraud Protection integration for Commerce**

**Enable Dynamics 365 Fraud Protection integration** ^

Yes

By enabling this feature, you consent to allow authorized users of the Dynamics 365 online service to activate, configure, and enable certain functionality which transmits certain of your data to an external system. Please consult the feature technical documentation for [more information](#) and review our [Privacy Statement](#).

**Configuration** ^

Azure Active Directory Client ID

KeyVault app secret name

Assessment type

Dynamics Fraud Protection endpoint ...

**NOTE**

The Key Vault and Fraud Protection settings are company-specific. To enable Fraud Protection for production environments, you don't enter the Azure AD client ID through the user interface (UI). Instead, you must create and submit a [service request](#). In the title of your request, clearly indicate that the request is to configure Fraud Protection purchase protection for a production Commerce or Retail environment.

## Loss prevention in Commerce

The **Loss prevention** capability in Fraud Protection will be made generally available in the third quarter (Q3) of 2020. The out-of-box integration for Loss prevention will be available in Commerce version 10.0.12.

### Loss prevention overview

Fraud that arises from abuse of return and discount policies is a top source of shrinkage for retailers. Existing physical deterrents are easy to work around. Therefore, to catch the most sophisticated forms of abuse, it's critical that retailers use artificial intelligence (AI) to identify loss.

The **Loss prevention** module in Fraud Prevention analyzes in-store returns and discounts to identify anomalies that might be caused by abuse of return and discount policies. By using AI, the **Loss prevention** module can identify patterns and anomalies that indicate potential fraud, and can uncover hard-to-detect sources of shrinkage.

The **Loss prevention** module analyzes Commerce data that is available through Data Lake Storage Gen2. This integration is an opt-in integration and isn't turned on by default.

After **Loss prevention** has finished analyzing the data, the results are surfaced in a [Fraud Protection](#) dashboard. From there, users can evaluate the results and observe trends that might indicate potential fraud.

### Turning on the Loss prevention integration with Commerce

#### Set up Fraud Protection

To set up Fraud Protection, [request a callback](#) from a Dynamics 365 sales representative. When the merchant's Fraud Protection environment is available, and Loss prevention settings have been configured, you can continue the setup by turning on Data Lake Storage Gen2 for the Commerce environment.

#### Turn on Data Lake Storage Gen2 for your Commerce environment

Before the data can be available in Data Lake Storage Gen2, the service must be turned on for the Commerce environment. For information about how to turn on Data Lake Storage Gen2 for your Commerce environment, see [Enable Azure Data Lake Storage in a Dynamics 365 Commerce environment](#).

#### Turn on Loss prevention

You can turn on the Loss prevention integration through the **Feature management** workspace in Commerce. The feature is named "Dynamics 365 Fraud Protection (DFP) Loss prevention." No other setup in Commerce is required to turn on the integration.

#### **Configure Loss prevention to connect to Data Lake Storage Gen2**

The final step is to return to the Fraud Protection environment and connect Loss prevention to the Data Lake Storage Gen2 pool that is associated with the Commerce account.

## Privacy notice

When you turn on the feature, some of your data is shared with other Microsoft online services. This data includes information about payments, credit, returns, and transaction status, or personal data. Fraud Protection purchase protection assessments aren't stored by the Retail or Commerce online services.

Your privacy is important to Microsoft. To learn more, read the [Microsoft Privacy Statement](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up a B2B e-commerce site

2/18/2021 • 17 minutes to read • [Edit Online](#)

Business-to-business (B2B) e-commerce sites provide some key capabilities that optimize the workflow for a B2B user. This topic describes how to set up a B2B e-commerce site in Microsoft Dynamics 365 Commerce. It goes through the modules and site settings that must be configured to enable B2B-specific scenarios.

## Prerequisites

- To setup a B2B e-commerce site, you must enable and configure specific features in Commerce headquarters, as described in this topic.
- Core experiences, such as product discovery, product details pages, the cart, and checkout are powered by the same modules that are used for business-to-consumer (B2C) e-commerce sites. Site authors should be familiar with all the modules that Dynamics 365 Commerce supports. For more information, see [Module library overview](#).
- This topic assumes that site authors understand the basics of Commerce site builder, templates, fragments, and pages, so that they can enable the B2B features for e-commerce sites.

## Site-level settings

You can access site-level settings in site builder, at **Site Settings > Extensions**. The following two site-level settings apply to B2B scenarios:

- **Enable customer account payments** – This property enables users to pay for orders by using customer accounts. The available values are **Enabled for B2B customers**, **Enabled for B2C customers**, **Enabled for all customers**, and **Disabled for all customers**. If your B2B site supports customer accounts, you should select **Enabled for B2C customers**.
- **Enable order quantity limits** – This property lets you set limits on the number of items that can be ordered for each product or category. The available values are **Enabled for B2B customers**, **Enabled for B2C customers**, **Enabled for all customers**, and **Disabled for all customers**.

### NOTE

When you upgrade to the latest version of the module library, you must follow additional steps to ensure that the previously described site settings are available in your environment. For more information, see [Update the app.settings.json file](#).

## Create business partner sign-up pages

To become a business partner, users must first submit a business partner request. A link to the business partner request page will be available on the B2B home page, so that users can initiate the process. After users submit a business partner request, they will receive confirmation that the request has been submitted.

### Create a business partner request page

The **Partner sign up** module on a business partner request page is used to initiate user requests to become business partners. This module lets you collect the user information that is required for the sign-up process. Additionally, the **Business account address** module is used to capture the user's address.

To set up and configure the business partner request page in site builder, follow these steps.

1. Create a template that is named **Sign-up**. This template should include the following modules:
  - Partner sign up
  - Breadcrumb
  - Header
  - Footer
  - Content block
  - Text block
  - Product collection
2. Use the **Sign-up** template to create a page that is named **Business Partner Request**.
3. In the **Header** slot, add the header fragment that is preconfigured with the site header.
4. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
5. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
6. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the home page, and enter **Home** as the link text.
7. In the **Container** slot, add a **Partner sign up** module below the **Breadcrumb** module. In the module properties pane, under **Heading**, enter **Become a business partner**.
8. In the **Partner sign up** slot, add a **Business account address** module.
9. In the **Container** slot, add a **Text block** module below the **Partner sign up** module. Here, you can define some terms and conditions for the sign-up process.
10. Select **Save**, and then select **Preview** to preview the page.
11. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
12. Publish the URL for the page.

### **Create a business partner request confirmation page**

After a business partner request is submitted, a confirmation page should be shown to the user to acknowledge the submission.

To set up and configure the request confirmation page in site builder, follow these steps.

1. Use the **Sign-up** template that you created earlier to create a page that is named **Partner Request Confirmation**.
2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
5. In the **Container** slot, add a **Content block** module. In the module properties pane, under **Heading**, enter **Request submitted**. In the **Rich Text** field, enter **Your request has been submitted**. Under **Links**, configure a link to the home page, and enter **Back to shopping** as the link text.
6. Add another **Container** module, and add a **Product Collection** module to it.
7. Configure the **Product Collection** module with the recommendation or category list that you want to showcase on the page.
8. Select **Save**, and then select **Preview** to preview the page.
9. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
10. Publish the URL for the page.

To add a link to the request confirmation page in site builder, follow these steps.

1. Go to the **Business Partner Request** page that you created earlier, and select **Edit**.
2. Select the **Partner sign up** module slot. In the properties pane, under **Link to the Sign-Up Confirmation page**, configure the link to the business partner request page that you created earlier.
3. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

### **Add a business partner request link to the home page**

After the business partner request sign-up and confirmation pages are created, you must make the sign-up page accessible through a link on the home page. You can complete this task by adding the link to any **Content block** module on the home page.

To add a business partner request link to the home page in site builder, follow these steps.

1. Go to the home page for your site, and select **Edit**.
2. Select a **Content block** module slot. In the module properties pane, under **Links**, configure a link to the business partner request page that you created earlier, and enter **Sign up to be a business partner** or similar text as the link text. Add an image as appropriate.
3. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

## Account management landing page

The account management landing page includes all the account management information that is required for both B2B and B2C e-commerce sites. Only signed-in users can view this page.

To create and configure a B2B account management landing page in site builder, follow these steps.

1. Create a template that is named **Account management**. This template should include the following modules:
  - Header
  - Footer
  - Breadcrumb
  - Account welcome tile
  - Account generic tile
  - Account Address tile
  - Account wishlist tile
  - Account address tile
  - Account loyalty tile
  - Account customer balance tile
  - Account order templates tile
  - Organization users
  - Business organization list
  - Customer account balance
  - Order template lines
  - Order template list
  - Account invoice tile
  - Invoices list
  - Invoice details
2. Use the **Account management** template to create a page that is named **My Account**.
3. In the **Header** slot, add the header fragment that is preconfigured with the site header.

4. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
5. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
6. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the home page, and enter **Home** as the link text.
7. In the **Container** slot, add a **Welcome tile** module. In the module properties pane, under **Heading**, enter **Welcome**.
8. In the **Main** slot, add another **Container** module (**Container 2**). In the module properties pane, set the **Width** value to **Fill Container**. Set the **Children Shown** value to **Two**.
9. In the **Container 2** slot, add an **Account generic tile** module. In the module properties pane, under **Heading**, enter **My Profile**. Under **Links**, configure a link to the **My profile** page.
10. In the **Container 2** slot, add another **Account generic tile** module. In the module properties pane, under **Heading**, enter **Order history**. Under **Links**, configure a link to the order history page.
11. In the **Main** slot, add another **Container** module (**Container 3**). In the module properties pane, set the **Width** value to **Fill Container**. Set the **Children Shown** value to **Two**.
12. In the **Container 3** slot, add an **Account address tile** module. In the module properties pane, under **Heading**, enter **My Address**. Under **Links**, configure a link to the **My address** page.
13. In the **Container 3** slot, add an **Account wishlist tile** module. In the module properties pane, under **Heading**, enter **My Wishlist**. Under **Links**, configure a link to the **My wishlist** page.
14. In the **Main** slot, add another **Container** module (**Container 4**). In the module properties pane, set the **Width** value to **Fill Container**. Set the **Children Shown** value to **Two**.
15. In the **Container 4** slot, add an **Organization users** module. In the module properties pane, under **Heading**, enter **Organization Users**.
16. In the **Container 4** slot, add an **Account customer balance tile** module. In the module properties pane, under **Heading**, enter **Account credit**.
17. In the **Main** slot, add another **Container** module (**Container 5**). In the module properties pane, set the **Width** value to **Fill Container**. Set the **Children Shown** value to **Two**.
18. In the **Container 5** module, add an **Account order templates tile** module. In the module properties pane, under **Heading**, enter **Order Templates**.
19. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

#### **NOTE**

Some of the sections that you added in step 13 through 18 won't appear on the "what you see is what you get" (WYSIWIG) canvas in site builder, because they require a signed-in B2B account.

## Create and configure customer balance pages and modules

Customer accounts can be used to pay for orders. The available balance in a customer account can be viewed from a user's account management page.

### **Create a customer balance page**

Before signed-in B2B users can view their customer balance, you must create a customer balance page.

To create a customer balance page in site builder, follow these steps.

1. Use the **Account management** template that you created earlier to create a page that is named **Customer Balance**.
2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add another **Container** module (**Container 3**). In the module properties pane, set the **Width** value to **Fill Container**. Set the **Children Shown** value to **Two**.
5. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the account management landing page, and enter **My Account** as the link text.
6. In the **Container** slot, add a **Customer Account Balance** module. In the module properties pane, under **Heading**, enter **Account Balance**.
7. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
8. Publish the URL for the page.
9. Go to the account management landing page (**My Account**) that you created earlier.
10. In the properties pane for the **Account customer balance tile** module, add a link to the customer balance page.
11. Save and publish the page.

The customer balance page has now been created, and users can access it from the account management landing page.

### **Configure a checkout page so that the customer balance can be used as a form of payment**

The **Customer Account Payment** module is required to enable the customer balance to be used as a form of payment. This module should be added to the checkout page as a form of payment. For information about how to configure a checkout page and the modules that are required for checkout, including all payment details, see [Checkout module](#).

After you've configured a checkout page, you must add the **Customer Account Payment** module to the payment section, and then save and publish the page. B2B users will then be able sign in to the e-commerce site and apply their available customer balance to orders during checkout.

In addition, at **Site Builder > Extensions**, you must make sure that the **Enable customer account payments** property is set to **Enabled for B2B customers**.

## **Create order template pages**

Two order template pages can be set up for a B2B e-commerce site: an order templates list page and an order template lines page.

An order templates list page shows a list of all order templates that are available. It's set up by using the **Order templates list** module. The order templates list page lets you create or delete a template, and add the items in a template to the cart.

An order template lines page shows the details of the order template that is selected on an order templates list page. It's set up by using the **Order templates lines** module. When a user selects the name of a template on an order templates list page, the order template lines page appears and shows the details of the template. The user can then view and edit the items in the template.

### **Create an order templates list page**

To create an order templates list page in site builder, follow these steps.

1. Use the **Account management** template that you created earlier to create a page that is named **Order templates**.

2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
5. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the account management landing page, and enter **My Account** as the link text.
6. In the **Container** slot, add an **Order templates list** module.
7. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
8. Publish the URL for the page.
9. Go to the account management landing page (**My Account**) that you created earlier.
10. In the properties pane for the **Account order templates tile** module, under **Links**, configure a link to the order templates list page that you just created.
11. Save and publish the page.

The order templates list page has now been created, and users can access it from the account management landing page.

### Create an order template lines page

To create an order template lines page in site builder, follow these steps.

1. Use the **Account management** template that you created earlier to create a page that is named **Order template lines**.
2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
5. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the account management landing page, and enter **My Account** as the link text.
6. In the **Container** slot, add an **Order template lines** module.
7. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
8. Publish the URL for the page.

## Onboard business partner users

The organization users page lets the administrator of a business partner organization onboard additional users from that organization to the B2B e-commerce site. It's set up by using the **Business organization list** module. From the organization users page, an administrator can add or remove users, define account balances, and request statements for a user.

To create an organization users page in site builder, follow these steps.

1. Use the **Account management** template that you created earlier to create a page that is named **Organization Users**.
2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
5. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the account management landing page, and enter **My Account** as the link text.
6. In the **Container** slot, add a **Business organization list** module. In the module properties pane, under **Heading**, enter **Organization Users**.

7. In the **Business organization list** module properties pane, enable the **Table Sort** and **Table pagination** properties. Set the pagination count to **5**.
8. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
9. Publish the URL for the page.
10. Go to the account management landing page (**My Account**) that you created earlier.
11. In the properties pane for the **Organization users tile** module, under **Links**, configure a link to the organization users page that you just created.
12. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

## Create invoice pages

An invoices list page shows a list of all available invoices. It's set up by using the **InvoicesList** module. From the invoice list page, users can pay off or request invoices.

An invoice details page shows the details of the invoice that is selected on an invoices list page. It's set up by using the **Invoice details** module. When a user selects an invoice ID on an invoice list page, the invoice details page appears and shows the details of the invoice.

### Create an invoices list page

To create an invoices list page in site builder, follow these steps.

1. Use the **Account management** template that you created earlier to create a page that is named **Invoices List**.
2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
5. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the account management landing page, and enter **My Account** as the link text.
6. In the **Container** slot, add an **InvoicesList** module. In the module properties pane, under **Heading**, enter **Invoices**.
7. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
8. Publish the URL for the page.
9. Go to the account management landing page (**My Account**) that you created earlier.
10. In the properties pane for the **Account invoices tile** module, under **Links**, configure a link to the invoices list page that you just created.
11. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

### Create an invoice details page

To create an invoice details page in site builder, follow these steps.

1. Use the **Account management** template that you created earlier to create a page that is named **Invoice Details**.
2. In the **Header** slot, add the header fragment that is preconfigured with the site header.
3. In the **Footer** slot, add the footer fragment that is preconfigured with the site footer.
4. In the **Main** slot, add a **Container** module. In the module properties pane, set the **Width** value to **Fill Container**.
5. In the **Container** slot, add a **Breadcrumb** module. In the module properties pane, under **Links**, configure a link to the account management landing page, and enter **My Account** as the link text. Then configure a link to the invoices list page, and enter **Invoice Lists** as the link text.
6. In the **Container** slot, add an **Invoice details** module.

7. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.
8. Publish the URL for the page.

# Create org modeling hierarchies for B2B organizations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create organizational modeling hierarchies for business-to-business (B2B) organizations in Microsoft Dynamics 365 Commerce.

In Commerce headquarters, business partner organizations are represented by customer and customer hierarchy entities. The business partner organization and its users are represented as customers, and customer hierarchies are used to associate those customers with each other.

When a business partner request to join a B2B e-commerce site is approved, the following actions are performed:

- Two new customer records are created in the system: a **Type Organization** customer record for the business partner organization and a **Type Person** customer record for the requestor (that is, the business partner user who submitted the request).
- A new customer hierarchy record is created under **Customer > Customer hierarchy**. This record has the following header properties:
  - **Customer hierarchy ID** – A unique ID for the customer hierarchy. This ID uses the number sequence that is defined in Commerce shared parameters in Commerce headquarters.
  - **Name** – The organization name of the business partner, as specified in the onboarding request.
  - **Purpose** – This property is set to the predefined value **B2B organization**.
  - **Organization** – The customer ID of the business partner.

Here are the details of the customer hierarchy record:

- The customer record of the requestor is associated with the customer hierarchy.
- The administrator role is associated with the requestor.

When the administrator adds more users to the business partner organization on a B2B site, a new customer record for each user is created in Commerce headquarters. This customer record is also added to the relevant customer hierarchy record for the business partner and has the role of a "user."

## NOTE

In most cases, the corresponding property values of all customer records in a hierarchy should match. For example, because all business partner users should get similar prices for products, their price group and associated configurations should match. However, the system doesn't enforce this consistency. Therefore, the relevant Commerce headquarters users are responsible for ensuring that the property values and configurations match for all customers in a given hierarchy.

Commerce headquarters users can look at the property values for all customer records in the hierarchy in a side-by-side view. Select the relevant customer record properties by selecting the tab names on the drop-down menu. Users can directly view and edit the property values from this view. Alternatively, if you want to apply all the values from the administrator customer record to all the user customer records, select **Override** in the customer hierarchy details.

# Manage business partner users on B2B e-commerce websites

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes how administrators can add, edit, and delete business partner users on business-to-business (B2B) e-commerce websites.

B2B e-commerce websites require that organizations register to become business partners. After an organization submits registration details to a B2B e-commerce website, it goes through a qualification process. If the organization is successfully qualified, it's onboarded as a business partner.

After an organization is onboarded as a business partner, the organization user who initiated the request to become a business partner is identified as the administrator user and is granted privileges to onboard additional authorized users of the B2B e-commerce website. These authorized users can then place orders on behalf of the business partner.

## Turn on the B2B e-commerce capabilities feature in Commerce headquarters

The B2B e-commerce capabilities feature in Commerce headquarters enables organizations to onboard business partners and define administrator users. This feature also enables administrators to create and manage business partner users and teams, and to assign specific roles to them. Finally, it enables business partner users to create order templates and use existing orders to reorder products.

To turn on the B2B e-commerce capabilities feature in Commerce headquarters, follow these steps.

1. Go to **Workspaces > Feature Management**.
2. On the **All** tab, filter on the **Module** field by using the term **Retail and commerce**.
3. Find and select the feature that is named **Enable the use of B2B eCommerce capabilities**, and then select **Enable now**.

## Create a number sequence and add it to Commerce shared parameters

Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require identifiers. For more information about number sequences, see [Number sequences overview](#).

To create a number sequence and add it to Commerce shared parameters in Commerce headquarters, follow these steps.

1. Go to **Retail and Commerce > Headquarters setup > Number sequences > Number sequences**, and create a number sequence.
2. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**, and add the new number sequence to the **Customer hierarchy ID** reference.

## Set up the administrator user for a new business partner

Potential business partners can initiate the onboarding process to a B2B e-commerce website by submitting an onboarding request via a link on the site. After a potential business partner user selects the link, they can

provide the details that are required for onboarding and sign-up. After the request is submitted, a submission confirmation page appears. If the submission is approved, the requestor (that is, the user who initiated the onboarding request) becomes the business partner administrator user.

To approve and set up a business partner administrator user in Commerce headquarters, follow these steps.

1. Go to **Retail and Commerce IT > Distribution schedule**.
2. Run the **P-0001** job to pull all business partner onboarding requests into Commerce headquarters.
3. After the **P-0001** job has successfully run, go to **Retail and Commerce IT > Customer**, and run the **Synchronize customers and business partners from async mode** job. After this job has successfully run, the onboarding requests are created as prospects records in Commerce headquarters. The **Type ID** field of these records is set to **B2B prospect**.
4. Go to **Customers > All prospects**, and open the prospects page.
5. Select the prospect record for the new business partner to open the prospect details page.
6. On the **General** tab, select **Convert > Approve/Reject** to approve or reject the onboarding request. When a confirmation message appears, confirm that you want to continue with the process, and approve the request. An email is then sent to the requestor's email address to confirm that their organization has been approved as a business partner.

After you approve the request, the **Status** field of the prospect record is set to **Approved**. Additionally, two new customer records are created in the system: a **Type Organization** customer record for the business partner organization and a **Type Person** customer record for the requestor. A customer hierarchy record for the business partner is also created.

7. Go to **Retail and Commerce IT > Distribution schedule**, and run the **1010 (Customers)** job to push the newly created customer and customer hierarchy records to the channel database.

After the request is approved, and the customer and customer hierarchy records are synced to the channel database, the requestor can sign in to the B2B e-commerce website by using the email address that they provided when they submitted the request. Users can use the sign-up flow to define the password for their account.

## Onboard additional business partner users

The business partner administrator user can onboard additional business partner users to the B2B e-commerce website as required.

To onboard additional business partner users to a B2B e-commerce website, follow these steps.

1. Sign in to the B2B e-commerce website as an administrator.
2. Go to **My Account > Organization users > View details**, and select **Add a user**.
3. Enter the required information, and then select **Save**. The status of the new user is set to **Pending**.

After the **P-0001** and **Synchronize customers and business partners from async mode** jobs are run, a **Type Person** customer record for the new user is created in Commerce headquarters. This customer record is also associated with the relevant business partner's customer hierarchy record. Additionally, an email is sent to the new user's email address to notify them that they have been added as a user of the business partner organization and can now sign in to the B2B e-commerce website.

4. Run the **1010 (Customers)** job to sync the new business partner user to the channel database.

After the customer record is synced, the status of the user on the B2B e-commerce website is set to **Active**, and the new user can sign in to the B2B e-commerce website by using their email address. Users can use the sign-up

flow to define the password for their account.

## Edit business partner user details

To edit the details of business partner users, follow these steps.

1. Sign in to the B2B e-commerce website as an administrator.
2. Go to **My Account > Organization users > View details**, select the **Edit** button (pencil symbol), make the required changes, and then select **Save**. The changes take effect only after the **P-0001, Synchronize customers and business partners from async mode**, and **1010 (Customers)** jobs have been run.

## Remove a business partner user

As required, an administrator can remove existing users of a business partner organization from the list of users who can access the B2B e-commerce website.

To remove a business partner user, follow these steps.

1. Sign in to the B2B e-commerce website as an administrator.
2. Go to **My Account > Organization users > View details**, and select the **Remove** button ("X" symbol). When a confirmation message appears, confirm that you want to remove the user. The change takes effect only after the **P-0001, Synchronize customers and business partners from async mode**, and **1010 (Customers)** jobs have been run.

### NOTE

When you remove a user from the list of users who can access the B2B e-commerce website, the corresponding customer record is removed from the business partner's customer hierarchy record. However, the customer record itself isn't deleted from Commerce headquarters.

## Onboard business partner and users in Commerce headquarters

Administrators can onboard business partners and users directly in Commerce headquarters.

To onboard business partners and users in Commerce headquarters, follow these steps.

1. Create a **Type Organization** customer record for the business partner organization.
2. Create **Type Person** customer records for business partner users. Make sure that a primary email address is specified for every customer.
3. For each **Type Person** customer record that must be designated as an administrator user of the business partner organization, on the **Retail** FastTab, set the **B2B administrator** option to **Yes**.
4. Create a customer hierarchy ID. In the **Name** field, enter a name.
5. In the **Organization** field, enter the business partner organization customer.
6. Select **Add**, and then select a customer in the **Name** field.
7. Repeat this process to add additional customers to the hierarchy.

## Additional information

- All the jobs that are mentioned in this topic can be configured to run on a schedule in a batch format. The expectation is that business partners will configure batch jobs as required.
- Currently, only one user/customer record can be designated as an administrator user, and that role can be changed only in Commerce headquarters. There is no support for self-service capabilities that let business partners to designate multiple administrators or change administrators from B2B e-commerce websites.

- Although spending limits can be defined for users, enforcement of spending limits during the order entry process hasn't yet been implemented.
- All business logic and validation for a user's experience on a B2B e-commerce website are based on the configuration of the customer record that is mapped to the user in Commerce headquarters.

# Configure the customer account payment method for B2B e-commerce sites

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to configure the customer account payment method for business-to-business (B2B) e-commerce sites.

Retailers can accept various types of payment in exchange for the products and services that they sell in an e-commerce channel. Each payment type that a retailer accepts must be configured in Microsoft Dynamics 365 Commerce when the system is set up. The customer account (or "on account") payment method must be supported on B2B e-commerce sites.

## Prerequisites

1. Add the customer account payment method in Commerce headquarters.
2. Associate the customer account payment method with the e-commerce channel.
3. Make sure that **Allow on account** is enabled for the customer at **Retail and Commerce > Customers > All customers > Payment defaults** in Commerce headquarters. Also make sure that **Credit limit** parameters are set appropriately for the customer at **Retail and Commerce > Customers > All customers > Credit and Collections** in Commerce headquarters.

## Enable the customer account payment method in Commerce site builder

To enable the customer account payment method in Commerce site builder, follow these steps.

1. Go to **Site Settings > Extensions**.
2. Set the **Enable customer account payments** property to **Enabled for B2B customers**.
3. Select **Save and Publish**.

### NOTE

The new site settings take effect only after the app.settings.json file is updated. For more information, see [SDK and Module library updates](#).

## Enable the customer account payment method on the checkout page for the B2B e-commerce site

To enable the customer account payment method on the checkout page for the B2B e-commerce site, follow these steps.

1. In Commerce site builder, find and edit the checkout page or fragment that contains the checkout module for the B2B e-commerce site.
2. In the **Checkout section container** slot, select **Add Module**, and then add a **Customer account payment** module.
3. Position the **Customer account payment** module by selecting the ellipsis (...), and then selecting **Move Up** or **Move Down** as required.
4. Select **Save**, select **Finish editing** to check in the page, and then select **Publish** to publish it.

# Confirm that the customer account payment method has been enabled and published

To confirm that the customer account payment method has been enabled, follow these steps.

1. Sign in to the e-commerce site.
2. Add a product to the cart.
3. Go to the checkout page. You should see the new **Customer Account** payment method.

# Set product quantity limits for B2B e-commerce sites

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set product quantity limits for business-to-business (B2B) e-commerce sites.

Most products have a unit of measure that defines their grouping. The grouping affects how the products can be sold. Some products might have an additional grouping for quantities. This grouping determines whether the products can be sold as individual units or multiples, and whether there is a minimum or maximum order quantity limit that must be followed.

The quantity limiting feature ensures that the minimum, maximum, multiple, and standard quantities that are configured in Microsoft Dynamics 365 Commerce (in the default order settings or the Commerce site builder site settings) are applied to customer orders that are placed on an e-commerce site. Product quantity limits aren't currently supported for the point of sale (POS) and call centers.

Many retailers provide the option of customer orders (also known as special orders) to meet various product and fulfillment requirements. Here are some typical scenarios:

- A customer wants products of specific variants to be sold in multiples of a few.
- A customer wants to pick up products from a store or location that differs from the store or location where the customer purchased those products. However, the packing standards for the stores differ from the packing standards for online sales distribution.
- A customer wants to buy a limited-edition product that has a maximum quantity limit for items that can be purchased.

## Turn on the default order settings feature in Commerce headquarters

Before you can set product quantity limits, the default order settings feature must be turned on in Commerce headquarters.

To turn on the default order settings feature, follow these steps.

1. Go to **System administration > Workspaces > Feature management**.
2. Find and select the **Support the Site and Default order settings in the customer order** feature.
3. At the bottom of the right pane, select **Enable now**.

## Define quantity settings

You can define the quantity settings on the **Default order settings** page.

To define the quantity settings, follow these steps.

1. Go to **Product Retail and Commerce > Products and categories > Released products by category**.
2. Select a released product.
3. On the Action Pane, on the **Manage inventory** tab, in the **Order settings** group, select **Default order settings**.
4. On the **Default order settings** page, on the **Sales order** FastTab, in the **Sales quantity** section, set the

product sales quantities:

- **Multiple** – The quantity that the product can be bought in multiples of.
- **Minimum Order Quantity** – The minimum number of products that must be purchased.
- **Maximum Order Quantity** – The maximum number of products that can be purchased.
- **Standard Order Quantity** – The default quantity that is automatically entered when the product is selected.

## Turn on the B2B order quantity limits feature in Commerce site builder

To turn on the B2B order quantity limits feature in Commerce site builder, follow these steps.

1. Go to **Site settings > Extensions**
2. Under **Enable Order Quantity Limits**, select **Enabled for B2B customers** in the drop-down menu.

### NOTE

Updated site builder settings take effect only after the app.settings.json file has been updated. For more information, see [SDK and Module library updates](#).

# Monitor sales and margin performance

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can monitor sales and margin performance in real time using Dynamics 365 Commerce.

As part of Commerce, users can monitor sales and margin performance in real time across different levels of the organization hierarchy for the following dimensions:

- Products
- Categories
- Discounts
- Years as time period
- Registers/terminals
- Staff/employees
- Customers
- Operating units

Additionally, two unique reports that take advantage of hierarchical grid structuring let users monitor sales and margin performance by drilling down from the top category node to individual leaf nodes of the category in the default product category hierarchy. Users can also drill-down from the top operating unit to an individual channel in the organization hierarchy that is defined as the default organization hierarchy for reporting. You can open the reports from any of the following locations:

- **Store management** workspace > **Retail and Commerce** > **Channels** > **Store management** > **Reports**
- **Category and product management** workspace > **Retail and Commerce** > **Product and categories** > **Store management** > **Reports**
- **Pricing and discount management** workspace > **Retail and Commerce** > **Pricing and discounts** > **Store management** > **Reports**
- **Inquiries and reports** section > **Retail and Commerce** > **Inquiries and reports** > **Sales reports**

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Analyze sales trends and patterns

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can study sales trends and patterns in real time in Dynamics 365 Commerce.

As part of Commerce, users can study sales trends and patterns in real time across different levels of the organization hierarchy over a period of years by using the out-of-box **Channel sales by year** report. You can open this report from any of the following locations:

- **Store management** workspace > **Retail and Commerce** > **Channels** > **Store management** > **Reports** > **Channel sales by year report**
- **Store financials** workspace > **Retail and Commerce** > **Channels** > **Store financials** > **Reports** > **Channel sales by year report**
- **Inquiries and reports** section > **Retail and Commerce** > **Inquiries and reports** > **Sales reports** > **Channel sales by year report**

Users can also study sales trends and patterns by hour across different levels of the organization hierarchy over a selected period by using the out-of-box **Channel sales by hour** report. You can open this report from any of the following locations:

- **Store management** workspace > **Retail and Commerce** > **Channels** > **Store management** > **Reports** > **Channel sales by hour report**
- **Store financials** workspace > **Retail and Commerce** > **Channels** > **Store financials** > **Reports** > **Channel sales by hour report**
- **Inquiries and reports** section > **Retail and Commerce** > **Inquiries and reports** > **Sales reports** > **Channel sales by hour report**

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Assess sales performance by product

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can study profitability for the top 10 products using Dynamics 365 Commerce.

As part of Commerce, users can also study profitability for the top products (10 to 100) across different levels of the organization hierarchy, based on one of the following criteria:

- Sales amount
- Quantity
- Gross profit margin
- Margin percentage

For this assessment, you can use the out-of-box **Top products** report, which you can open from any of the following locations:

- **Store management workspace > Retail and Commerce > Channels > Store management > Reports > Top products report**
- **Category and product management workspace > Retail and Commerce > Channels > Store management > Reports > Top products report**
- **Inquiries and reports section > Retail and Commerce > Inquiries and reports > Sales reports > Top products report**

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Assess customer and product profitability

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains how you can use the in-memory and real-time analytics to access, explore, and gain insight about customers and product profitability from your Dynamics 365 Commerce data.

As part of Commerce, users can study profitability for the top customers (10 to 100) across different levels of the organization hierarchy, based on one of the following criteria:

- Sales amount
- Quantity
- Gross profit margin
- Margin percentage

For this assessment, you can use the out-of-box **Top customers** report, which you can open from any of the following locations:

- **Store management** workspace > **Retail and Commerce** > **Channels** > **Store management** > **Reports** > **Top customers report**
- **Inquiries and reports** section > **Retail and Commerce** > **Inquiries and reports** > **Sales reports** > **Top customers report**

Likewise, users can study profitability for the top products (10 to 100) across different levels of the organization hierarchy, based on one of the following criteria:

- Sales amount
- Quantity
- Gross profit margin
- Margin percentage

For this assessment, you can use the out-of-box **Top products** report, which you can open from any of the following locations:

- **Store management** workspace > **Retail and Commerce** > **Channels** > **Store management** > **Reports** > **Top products report**
- **Category and product management** workspace > **Retail and Commerce** > **Products and categories** > **Store management** > **Reports** > **Top products report**
- **Inquiries and reports** section > **Retail and Commerce** > **Inquiries and reports** > **Sales reports** > **Top products report**

## NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Analyze store performance

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains how you can use the in-memory and real-time analytics to access, explore, and gain insight about store performance, based on your Dynamics 365 Commerce data.

As part of Retail, users can study store performance in real time across different levels of the organization hierarchy over a selected period by opening the out-of-box **Channel summary** report from any of the following locations:

- **Retail store management workspace > Retail > Channels > Retail store management > Reports > Channel summary report**
- **Retail store financials workspace > Retail > Channels > Retail store financials > Reports > Channel summary report**
- **Inquiries and reports section > Retail > Inquiries and reports > Sales reports > Channel summary report**

This report provides a snapshot of following summaries as part of store performance:

- Gross sales summary
- Tender type summary
- Tax summary
- Price overrides summary
- Discounts summary

## NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up Recency, Frequency, and Monetary (RFM) analysis

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to set up a Recency, Frequency, and Monetary (RFM) analysis of your customers.

Recency, frequency, and monetary (RFM) analysis is a marketing tool that your organization can use to evaluate the data that is generated by customer purchases. After you set up RFM analysis, customers are assigned a calculated RFM score as they make purchases. The RFM score can be a three-digit rating or an aggregate number, depending on how your organization has configured RFM analysis. Here's how the rating works if your organization uses a three-digit rating for the score:

- The first digit is the customer's recency rating, which is how recently the customer made a purchase from your organization.
- The second digit is the customer's frequency rating, which is how often the customer makes purchases from your organization.
- The third digit is the customer's monetary rating, which is how much the customer spends when he makes purchases from your organization.

For example, your organization has set the ratings on a scale of 1 through 5, where 5 is the highest rating. In this case, a customer rating of 535 tells you the following information about the customer:

- **Recency rating of 5** – The customer recently made a purchase.
- **Frequency rating of 3** – The customer purchases products from your organization moderately often.
- **Monetary rating of 5** – When the customer makes a purchase, he spends a significant amount of money.

If your organization uses an aggregate number for the score, the individual ratings are added together. For the same example, the customer has a rating of 13 (5 + 3 + 5).

## Set up RFM analysis for the customers in your organization

1. Go to **Call center > Periodic > RFM analysis**.
2. On **RFM analysis** page, select **New**. In the **RFM definition** field, enter a name for the RFM definition. For example, you could call the definition RFM-A.
3. Enter a start date and end date for this RFM definition.
4. On the **General** FastTab, do the following:
  - If each section of the RFM score must contain an equal count of customers, select the **Even distribution** check box.
  - Select the **Add scores** check box to aggregate the three scores. For example, this would give a customer an RFM score of 13 instead of 535.
  - Select the **Save history** check box to require the system to save the statistical data for customers so that the data can be used to calculate the RFM score.
5. On the **Recency** FastTab, do the following:
  - In the **Divisions** field, enter the number of divisions, or groups, which will be used to calculate the recency score for customers. For example, if you have 100 customers, a division of 5 means that there are 20 customers for each score. The 20 customers who have made purchases most recently have a

recency score of 5. The next 20 customers have a recency score of 4, and so on. If you have 50 customers, 10 customers have a recency score of 5, 10 have a recency score of 4, and so on.

- In the **Priority** field, select how much weight to give the recency parameter in relation to the other parameters when the RFM score is calculated for a customer. For example, you might place more value on the recency score than the monetary score.
- In the **Multiplier** field, enter the value by which to multiply the recency score. If you do not enter a value, the score will not be multiplied.
- In the **Period** field, select the time period by which the recency score is calculated. For example, by week or by month.

6. On the **Frequency** FastTab, do the following:

- In the **Divisions** field, enter the number of divisions, or groups, which will be used to calculate the frequency score for customers.
- In the **Priority** field, select how much weight to give the frequency parameter in relation to the others when the RFM score is calculated for a customer.
- In the **Multiplier** field, enter the value by which to multiply the frequency score. If you do not enter a value, the score will not be multiplied.

7. On the **Monetary** FastTab, do the following:

- In the **Divisions** field, enter the number of divisions, or groups, which will be used to calculate the monetary score for customers.
- In the **Priority** field, select how much weight to give the monetary parameter in relation to the others when the RFM score is calculated for a customer.
- In the **Multiplier** field, enter the value by which to multiply the monetary score. If you do not enter a value, the score will not be multiplied.
- In the **Gross/net** field, select whether the customer's monetary score should be calculated by using the gross or net invoice amount.
- If a customer's return amounts should be subtracted from the customer's total invoice calculation, select the **Subtract returns** check box.

## View a customer's RFM score

Use this procedure to view a customer's RFM score.

1. Go to **Call center > Journals > Customer service**.
2. On the **Customer service** page, in the **Customer service** pane, in the search fields, select the keyword type to search on and enter the search text.
3. Select **Search**.
4. On the **Customer search** page, select the customer record that you want, and then click **Select customer**.

The RFM score is displayed in the **Order history** group on the right side of the **Customer service** page.

## View or clear the history of an RFM analysis record

Use this procedure to view or clear the history of an RFM analysis record.

1. Go to **Call center > Periodic > RFM analysis**.
2. On the **RFM analysis** page, select the record that you want to view.
3. To view the record history, select the **History** FastTab.
4. To clear the history of the record, select **Clear history**.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Overview of fiscal integration for Commerce channels

2/18/2021 • 10 minutes to read • [Edit Online](#)

## Introduction

This topic is an overview of the fiscal integration capabilities that are available in Dynamics 365 Commerce. Fiscal integration includes integration with various fiscal devices and services that enable fiscal registration of sales in accordance with local fiscal laws that are aimed at preventing tax fraud in the retail industry. Here are some typical scenarios that can be covered by using fiscal integration:

- Register a sale on a fiscal device that is connected to point of sale (POS), such as a fiscal printer, and print a fiscal receipt for the customer.
- Securely submit information that is related to sales and returns that are completed in Retail POS to an external web-service that is operated by the tax authority.
- Help guarantee inalterability of sales transaction data through digital signatures.

The fiscal integration functionality is a framework that provides a common solution for further development and customization of the integration between Retail POS and fiscal devices and services. The functionality also includes fiscal integration samples that support basic scenarios for specific countries or regions, and that work with specific fiscal devices or services. A fiscal integration sample consists of several extensions of Commerce components and is included in the software development kit (SDK). For more information about the fiscal integration samples, see [Fiscal integration samples in the Retail SDK](#). For information about how to install and use the Retail SDK, see [Retail software development kit \(SDK\) architecture](#).

To support other scenarios that aren't supported by a fiscal integration sample, to integrate Retail POS with other fiscal devices or services, or to cover requirements of other countries or regions, you must either extend an existing fiscal integration sample or create a new sample by using an existing sample as an example.

## Fiscal registration process and fiscal integration samples for fiscal devices

A fiscal registration process in Retail POS can consist of one or more steps. Each step involves fiscal registration of specific transactions or events in one fiscal device or service. The following solution components participate in the fiscal registration in a fiscal device that is connected to a Hardware station:

- **Commerce runtime (CRT) extension** – This component serializes transaction/event data in the format that is also used for interaction with the fiscal device, parses responses from the fiscal device, and stores the responses in the channel database. The extension also defines the specific transactions and events that must be registered. This component is often referred to as a *fiscal document provider*.
- **Hardware station extension** – This component initializes the communication with the fiscal device, sends requests and direct commands to the fiscal device based on the transaction/event data that is extracted from the fiscal document, and receives responses from the fiscal device. This component is often referred to as a *fiscal connector*.

A fiscal integration sample for a fiscal device contains the CRT and Hardware station extensions for a fiscal document provider and a fiscal connector, respectively. It also contains the following component configurations:

- **Fiscal document provider configuration** – This configuration defines an output method and a format for fiscal documents. It also contains a data mapping for taxes and payment methods, to make data from Retail

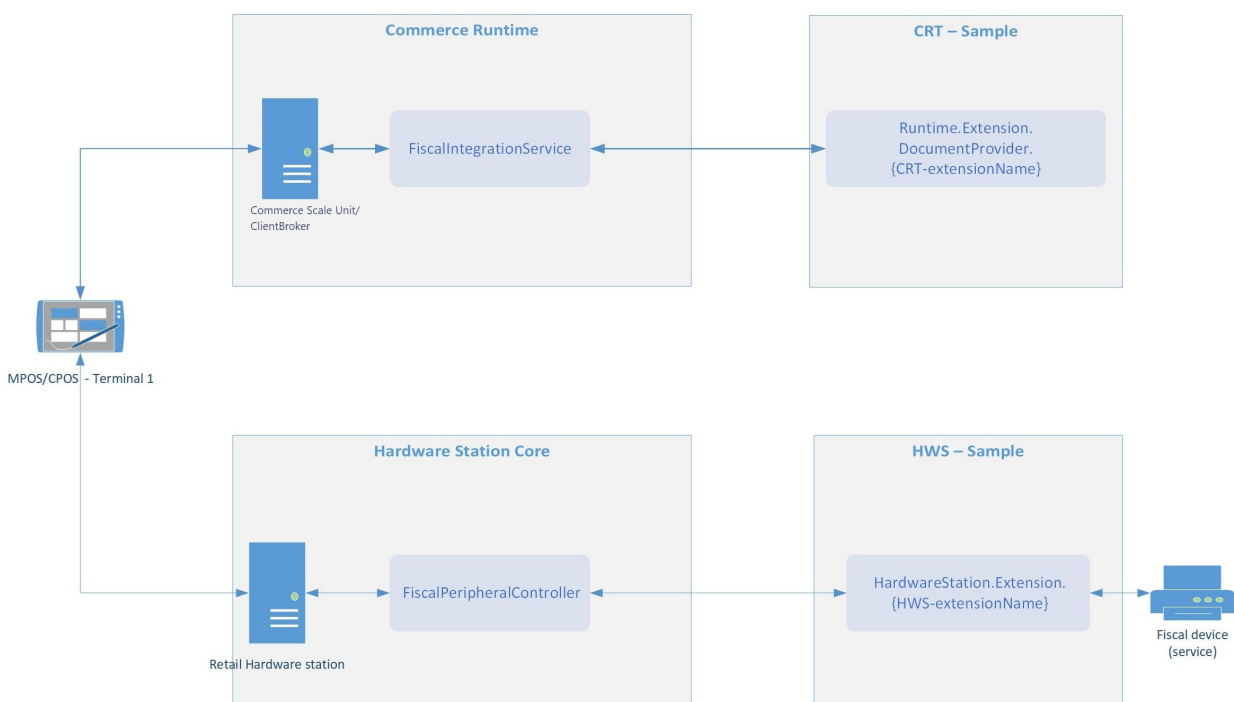

POS compatible with the values that are predefined in the fiscal device firmware.

- **Fiscal connector configuration** – This configuration defines the physical communication with the specific fiscal device.

A fiscal registration process for a specific POS register is defined by a corresponding setting in the POS functionality profile. For more details about how to configure a fiscal registration process, upload fiscal document provider and fiscal connector configurations, and change their parameters, see [Set up a fiscal registration process](#).

The following example shows a typical fiscal registration execution flow for a fiscal device. The flow starts with an event in the POS (for example, finalization of a sales transaction) and implements the following sequence of steps:

1. The POS requests a fiscal document from CRT.
2. CRT determines whether the current event requires fiscal registration.
3. Based on the fiscal registration process settings, CRT identifies a fiscal connector and corresponding fiscal document provider to use for the fiscal registration.
4. CRT runs the fiscal document provider that generates a fiscal document (for example, an XML document) that represents the transaction or event.
5. The POS sends the fiscal document that CRT prepares to a Hardware station.
6. The Hardware station runs the fiscal connector that processes the fiscal document and communicates it to the fiscal device or service.
7. The POS analyzes the response from the fiscal device or service to determine whether the fiscal registration was successful.
8. CRT saves the response to the channel database.

## Error handling

The fiscal integration framework provides the following options to handle failures during fiscal registration:

- **Retry** – Operators can use this option when the failure can be resolved quickly, and the fiscal registration can be rerun. For example, this option can be used when the fiscal device isn't connected, the fiscal printer is out of paper, or there is a paper jam in the fiscal printer.
- **Cancel** – This option lets operators postpone the fiscal registration of the current transaction or event if it fails. After the registration is postponed, the operator can continue to work on the POS and can complete any

operation that the fiscal registration isn't required for. When any event that requires the fiscal registration occurs in the POS (for example, a new transaction is opened), the error handling dialog box automatically appears to notify the operator that the previous transaction wasn't correctly registered and to provide the error handling options.

- **Skip** – Operators can use this option when the fiscal registration can be omitted under specific conditions and regular operations can be continued on the POS. For example, this option can be used when a sales transaction that the fiscal registration failed for can be registered in a special paper journal.
- **Mark as registered** – Operators can use this option when the transaction was actually registered in the fiscal device (for example, a fiscal receipt was printed), but a failure occurred when the fiscal response was being saved to the channel database.

#### **NOTE**

The **Skip** and **Mark as registered** options must be activated in the fiscal registration process before they are used. In addition, corresponding permissions must be granted to operators.

The **Skip** and **Mark as registered** options enable info codes to capture some specific information about the failure, such as the reason for the failure or a justification for skipping the fiscal registration or marking the transaction as registered. For more details about how to set up error handling parameters, see [Set error handling settings](#).

#### **Optional fiscal registration**

Fiscal registration might be mandatory for some operations but optional for others. For example, the fiscal registration of regular sales and returns might be mandatory, but the fiscal registration of operations that are related to customer deposits might be optional. In this case, failure to complete the fiscal registration of a sale should block further sales, but failure to complete the fiscal registration of a customer deposit should not block further sales. To distinguish mandatory and optional operations, we recommend that you handle them through different document providers, and that you set up separate steps in the fiscal registration process for those providers. The **Continue on error** parameter should be enabled for any step that is related to optional fiscal registration. For more details about how to set up error handling parameters, see [Set error handling settings](#).

#### **Manually running fiscal registration**

If the fiscal registration of a transaction or event has been postponed after a failure (for example, if the operator selected **Cancel** in the error handling dialog box), you can manually rerun the fiscal registration by invoking a corresponding operation. For more details, see [Enable manual execution of postponed fiscal registration](#).

#### **Fiscal registration health check**

The health check procedure for fiscal registrations verifies the availability of the fiscal device or service when specific events occur. If the fiscal registration can't currently be completed, the operator is notified in advance.

The POS runs the health check when the following events occur:

- A new transaction is opened.
- A suspended transaction is recalled.
- A sales or return transaction is finalized.

If the health check fails, the POS shows the health check dialog box. This dialog box provides the following buttons:

- **OK** – This button lets the operator ignore a health check error and continue to process the operation. Operators can select this button only if the **Allow skip health check error** permission is enabled for them.
- **Cancel** – If the operator selects this button, the POS cancels the last action (for example, an item isn't added to a new transaction).

#### NOTE

The health check is run only if the current operation requires fiscal registration, and if the **Continue on error** parameter is disabled for the current step of the fiscal registration process. For more details, see [Set error handling settings](#).

## Storing fiscal response in fiscal transaction

When fiscal registration of a transaction or event is successful, a fiscal transaction is created in the channel database and linked to the original transaction or event. Similarly, if the **Skip** or **Mark as registered** option is selected for a failed fiscal registration, this information is stored in a fiscal transaction. A fiscal transaction holds the fiscal response of the fiscal device or service. If the fiscal registration process consists of several steps, a fiscal transaction is created for each step of the process that resulted in a successful or failed registration.

Fiscal transactions are transferred to Headquarters by the *P-job*, together with transactions. On the **Fiscal transactions** FastTab of the **Store transactions** page, you can view the fiscal transactions that are linked to transactions.

A fiscal transaction stores the following details:

- Fiscal registration process details (process, connector group, connector, and so on). It also stores the serial number of the fiscal device in the **Register number** field, if this information is included in the fiscal response.
- The status of the fiscal registration: **Completed** for successful registration, **Skipped** if the operator selected the **Skip** option for a failed registration, or **Marked as registered** if the operator selected the **Mark as registered** option.
- Info code transactions that are related to a selected fiscal transaction. To view the info code transactions, on the **Fiscal transactions** FastTab, select a fiscal transaction that has a status of **Skipped** or **Marked as registered**, and then select **Info code transactions**.

## Fiscal texts for discounts

Some countries or regions have special requirements about additional texts that must be printed on fiscal receipts when different kinds of discounts are applied. The fiscal integration functionality lets you set up a special text for a discount that is printed after a discount line on a fiscal receipt. For manual discounts, you can configure a fiscal text for the info code that is specified as the **Product discount** info code in the POS functionality profile. For more details about how to set up fiscal texts for discounts, see [Set up fiscal texts for discounts](#).

## Printing fiscal X and fiscal Z reports

Fiscal integration functionality supports generation of end-of-day statements that are specific to the integrated fiscal device or service:

- New buttons that run corresponding operations should be added to the POS screen layout. For more details, see [Set up fiscal X/Z reports from the POS](#).
- In the fiscal integration sample, these operations should be matched to the corresponding operations of the fiscal device.

## Fiscal integration samples in the Retail SDK

The following fiscal integration samples are currently available in the Retail SDK:

- [Fiscal printer integration sample for Italy](#)
- [Fiscal printer integration sample for Poland](#)

- [Fiscal registration service integration sample for Austria](#)
- [Fiscal registration service integration sample for Czech Republic](#)
- [Control unit integration sample for Sweden](#)
- [Fiscal registration service integration sample for Germany](#)

The following fiscal integration functionality is also available in the Retail SDK but doesn't currently take advantage of the fiscal integration framework. Migration of this functionality to the fiscal integration framework is planned for later updates.

- [Digital signature for France](#)
- [Digital signature for Norway](#)

The following legacy fiscal integration functionality that is available in Retail SDK does not use the fiscal integration framework and will be deprecated in later updates:

- [Control unit integration sample for Sweden \(legacy\)](#)

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Set up the fiscal integration for Commerce channels

2/18/2021 • 12 minutes to read • [Edit Online](#)

## Introduction

This topic provides guidelines for setting up the fiscal integration functionality for Commerce channels. For more information about the fiscal integration, see [Overview of fiscal integration for Commerce channels](#).

The process of setting up the fiscal integration includes the following tasks:

1. Configure fiscal connectors that represent fiscal devices or services that are used for fiscal registration purposes, such as fiscal printers.
2. Configure document providers that generate fiscal documents that will be registered in fiscal devices or services by fiscal connectors.
3. Configure the fiscal registration process that defines a sequence of fiscal registration steps and the fiscal connectors and fiscal document providers that are used for each step.
4. Assign the fiscal registration process to point of sale (POS) functionality profiles.
5. Assign connector technical profiles to hardware profiles.

## Set up a fiscal registration process

Before you use the fiscal integration functionality, you should configure the following settings.

1. Update Commerce parameters.
  - a. On the **Commerce shared parameters** page, on the **General** tab, set the **Enable fiscal integration** option to **Yes**. On the **Number sequences** tab, define the number sequences for the following references:
    - Fiscal technical profile number
    - Fiscal connector group number
    - Registration process number
  - b. On the **Commerce parameters** page, define the number sequence for the fiscal functional profile number.

### NOTE

Number sequences are optional. Numbers for all fiscal integration entities can be generated either from number sequences or manually.

2. Upload configurations of fiscal connectors and fiscal document providers.

A fiscal document provider is responsible for generating fiscal documents that represent transactions and events that are registered on the POS in a format that is also used for the interaction with a fiscal device or service. For example, a fiscal document provider might generate a representation of a fiscal receipt in an XML format.

A fiscal connector is responsible for the communication with a fiscal device or service. For example, a fiscal connector might send a fiscal receipt that a fiscal document provider created in an XML format to a fiscal printer. For more details about fiscal integration components, see [Fiscal registration process and fiscal integration samples for fiscal devices](#).

- a. On the **Fiscal connectors** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal connectors**), upload an XML configuration for each device or service that you plan to use for fiscal integration purposes.

**TIP**

By selecting **View**, you can view all functional and technical profiles that are related to the current fiscal connector.

- b. On the **Fiscal document providers** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal document providers**), upload an XML configuration for each device or service that you plan to use.

**TIP**

By selecting **View**, you can view all functional profiles that are related to the current fiscal document provider.

For examples of configurations of fiscal connectors and fiscal document providers, see [Fiscal integration samples in the Retail SDK](#).

**NOTE**

Data mapping is considered part of a fiscal document provider. To set up different data mappings for the same connector (for example, state-specific regulations), you should create different fiscal document providers.

3. Create connector functional profiles and connector technical profiles.

- a. On the **Connector functional profiles** page (**Retail and Commerce > Channel setup > Fiscal integration > Connector functional profiles**), create a connector functional profile for each combination of a fiscal connector and a fiscal document provider that is related to this fiscal connector.

- a. Select a connector name.
- b. Select a document provider.

You can change the data mapping parameters in a connector functional profile. To restore the default parameters that are defined in the fiscal document provider configuration, select **Update**.

**Examples**

	FORMAT	EXAMPLE
VAT rates settings	value : VATrate	1 : 2000, 2 : 1800
VAT codes mapping	VATcode : value	vat20 : 1, vat18 : 2
Tender types mapping	TenderType : value	Cash : 1, Card : 2

**NOTE**

Connector functional profiles are company-specific. If you plan to use the same combination of a fiscal connector and a fiscal document provider in different companies, you should create a connector functional profile for each company.

- b. On the **Connector technical profiles** page (**Retail and Commerce > Channel setup > Fiscal integration > Connector technical profiles**), create a connector technical profile for each fiscal connector.
  - a. Select a connector name.
  - b. Select a connector type. For devices that are connected to a Hardware station, select **Local**.

**NOTE**

Only local connectors are currently supported.

Parameters on the **Device** and **Settings** tabs in a connector technical profile can be changed. To restore the default parameters that are defined in the fiscal connector configuration, select **Update**. While a new version of an XML configuration is loaded, you receive a message that states that the current fiscal connector or fiscal document provider is already being used. This procedure doesn't override manual changes that were previously made in connector functional profiles and connector technical profiles. To apply the default set of parameters from a new configuration, on the **Connector functional profiles** page or the **Connector technical profiles** page, select **Update**.

4. Create fiscal connector groups.

A fiscal connector group combines functional profiles of fiscal connectors that perform identical functions and are used at the same step of a fiscal registration process. For example, if several fiscal printer models can be used in a store, fiscal connectors for those fiscal printers can be combined in a fiscal connector group.

- a. On the **Fiscal connector group** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal connector groups**), create a new fiscal connector group.
  - b. Add functional profiles to the connector group. On the **Functional profiles** tab, select **Add**, and select a profile number. Each fiscal connector in a connector group can only have one functional profile.
  - c. To suspend use of the functional profile, set the **Disable** option to **Yes**. This change affects only the current connector group. You can continue to use the same functional profile in other connector groups.
5. Create a fiscal registration process.

A fiscal registration process is defined by the sequence of registration steps and the connector group that is used for each step.

- a. On the **Fiscal registration process** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal registration processes**), create a new record for each unique process of fiscal registration.
- b. Add registration steps to the process:
  - a. Select **Add**.
  - b. Select a fiscal connector type.

- c. In the **Group number** field, select an appropriate fiscal connector group.
6. Assign entities of the fiscal registration process to POS profiles.
    - a. On the **POS functionality profiles** page (**Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**), assign the fiscal registration process to a POS functionality profile. Select **Edit**, and then, on the **Fiscal registration process** tab, in the **Process number** field, select a process.
    - b. On the **POS hardware profile** page (**Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**), assign connector technical profiles to a hardware profile. Select **Edit**, add a line on the **Fiscal peripherals** tab, and then, in the **Profile number** field, select a connector technical profile.

#### NOTE

You can add several technical profiles to the same hardware profile. However, a hardware profile or POS functionality profile should have only one intersection with any fiscal connector group.

The fiscal registration flow is defined by the fiscal registration process and also by some parameters of fiscal integration components: the Commerce runtime extension for the fiscal document provider and the Hardware station extension for the fiscal connector.

- The subscription of events and transactions to fiscal registration is predefined in the fiscal document provider.
  - The fiscal document provider is also responsible for identifying the fiscal connector that is used for fiscal registration. It matches the connector functional profiles that are included in the fiscal connector group that is specified for the current step of the fiscal registration process with the connector technical profile that is assigned to the hardware profile of the Hardware station that the POS is paired to.
  - The fiscal document provider uses the data mapping settings from the fiscal document provider configuration to transform transaction/event data such as taxes and payments while a fiscal document is generated.
  - When the fiscal document provider generates a fiscal document, the fiscal connector can either send it to the fiscal device as is, or parse it and transform it into a sequence of commands of the device application programming interface (API), depending on how the communication is handled.
7. On the **Fiscal registration process** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal registration processes**), select **Validate** to validate the fiscal registration process.

We recommend that you run this type of validation in the following cases:

- After you've completed all the settings for a new registration process, including when you assign registration processes to POS functionality profiles and hardware profiles.
  - After you make changes to an existing fiscal registration process, and those changes might cause a different fiscal connector to be selected at runtime (for example, if you change the connector group for a fiscal registration process step, enable a connector functional profile in a connector group, or add a new connector functional profile to a connector group).
  - After you make changes in the assignment of connector technical profiles to hardware profiles.
8. On the **Distribution schedule** page, run the **1070** and **1090** jobs to transfer data to the channel database.

## Set up fiscal texts for discounts

In some cases, a special text must be printed on a fiscal receipt if a discount is applied. You can set up fiscal texts

for discounts on the **Fiscal connector group** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal connector groups**).

- For manual discounts that are applied at the POS, you should set a fiscal text for the info code or info code group that is specified as the **Product discount** info code in the POS functionality profile.
  1. On the **Fiscal connector group** page, select **Text for fiscal receipt**.
  2. On the **Info codes** tab, select **Add**, and select an info code or info code group.
  3. In the **Info code number**, select a value.
  4. In the **Subcode number** field, select a value if a subcode is required for the selected info code.
  5. In the **Text for fiscal receipt** field, specify a fiscal text that should be printed on a fiscal receipt.
  6. Set the **Print user input on fiscal receipt** option to **Yes** to override the text on a fiscal receipt with information that a user manually enters at the POS. This option applies only to info codes that have an input type of **Text**.

#### NOTE

You can specify a fiscal text for several info codes to support scenarios where info code groups, linked info codes, and triggered info codes are used. In these scenarios, the fiscal receipt will contain the fiscal texts from all info codes that are linked to the transaction line where the discount was applied.

- For channel-specific discounts, you should define a fiscal text for the discount ID.
  1. On the **Fiscal connector group** page, select **Text for fiscal receipt**.
  2. On the **Discounts** tab, select **Add**, and select a discount ID.
  3. In the **Text for fiscal receipt** field, specify a fiscal text that should be printed on a fiscal receipt.

#### NOTE

If several discounts are applied to the same transaction line, the fiscal receipt will contain fiscal texts from all discounts that are linked to those transaction line.

## Set error handling settings

The error handling options that are available in the fiscal integration are set in the fiscal registration process. For more information about error handling in the fiscal integration, see [Error handling](#).

1. On the **Fiscal registration process** page (**Retail and Commerce > Channel setup > Fiscal integration > Fiscal registration processes**), you can set the following parameters for each step of the fiscal registration process:
  - **Allow skip** – This parameter enables the **Skip** option in the error handling dialog box.
  - **Allow mark as registered** – This parameter enables the **Mark as registered** option in the error handling dialog box.
  - **Continue on error** – If this parameter is enabled, the fiscal registration process can continue on the POS register if the fiscal registration of a transaction or event fails. Otherwise, to run the fiscal registration of the next transaction or event, the operator must retry the failed fiscal registration, skip it, or mark the transaction or event as registered. For more information, see [Optional fiscal registration](#).

#### NOTE

If the **Continue on error** parameter is enabled, the **Allow skip** and **Allow mark as registered** parameters are automatically disabled.

2. The **Skip** and **Mark as registered** options in the error handling dialog box require the **Allow skip registration or mark as registered** permission. Therefore, on the **Permission groups** page (**Retail and Commerce > Employees > Permission groups**), enable the **Allow skip registration or mark as registered** permission.
3. The **Skip** and **Mark as registered** options let operators enter additional information when fiscal registration fails. To make this functionality available, you should specify the **Skip** and **Mark as registered** info codes on a fiscal connector group. The information that operators enter is then saved as an info code transaction that is linked to the fiscal transaction. For more details about info codes, see [Info codes and info code groups](#).

#### NOTE

The **Product** trigger function isn't supported for the info codes that are used for **Skip** and **Mark as registered** in fiscal connector groups.

- On the **Fiscal connector group** page, on the **Info codes** tab, select info codes or info code groups in the **Skip** and **Mark as registered** fields.

#### NOTE

One fiscal document and one non-fiscal document can be generated on any step of a fiscal registration process. A fiscal document provider extension identifies every type of transaction or event as related to fiscal or non-fiscal documents. The error handling feature applies only to fiscal documents.

- **Fiscal document** – A mandatory document that should be registered successfully (for example, a fiscal receipt).
- **Non-fiscal document** – A supplementary document for the transaction or event (for example, a gift card slip).

4. If the operator must be able to continue to process the current operation (for example, creation or finalization of a transaction) after a health check error occurs, you should enable the **Allow skip health check error** permission on the **Permission groups** page (**Retail and Commerce > Employees > Permission groups**). For more information about the health check procedure, see [Fiscal registration health check](#).

## Set up fiscal X/Z reports from the POS

To enable fiscal X/Z reports to be run from the POS, you should add new buttons to a POS layout.

- On the **Button grids** page, follow the instructions in [Add POS operations to POS layouts by using Button grid designer](#) to install the designer and update a POS layout.
  1. Select the layout to update.
  2. Add a new button, and set the **Print fiscal X** button property.
  3. Add a new button, and set the **Print fiscal Z** button property.
  4. On the **Distribution schedule** page, run the **1090** job to transfer changes to the channel database.

# Enable manual execution of postponed fiscal registration

To enable manual execution of a postponed fiscal registration, you should add a new button to a POS layout.

- On the **Button grids** page, follow the instructions in [Add POS operations to POS layouts by using Button grid designer](#) to install the designer and update a POS layout.
  1. Select the layout to update.
  2. Add a new button, and set the **Complete fiscal registration process** button property.
  3. On the **Distribution schedule** page, run the **1090** job to transfer your changes to the channel database.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# User-defined certificate profiles for retail stores

2/18/2021 • 6 minutes to read • [Edit Online](#)

## Overview

This topic provides an overview of the certificate profiles that are available in Microsoft Dynamics 365 Commerce. This functionality extends the [Manage secrets for retail channels](#) feature by adding support for local certificates.

While the point of sale (POS) is running in offline mode, it can't access the certificates that are stored in the key vault. The local certificate should be used instead. The following capabilities are supported:

- Using local certificates in key vault fallback scenarios
- Using local certificates without a key vault (for example in an on-premises installation)
- Gradual update of certificates, where some stores and terminals use a new version of the certificate, but other stores and terminals continue to use the previous version

The certificate profiles functionality lets you specify a default certificate and set the order that certificates in the same certificate profile are searched in. This functionality also provides a similar setup approach for local certificates and Key Vault certificates. You can add company-specific settings for certificates, but the unique cross-company identifier for each certificate can be used in the Commerce channels.

## Scenarios

The certificate profiles functionality supports the following scenarios in the Commerce channels:

- Use a local certificate in key vault fallback scenarios. Here are some examples of these fallback scenarios:
  - The key vault storage isn't accessible.
  - A certificate isn't found in the key vault storage.
  - The POS is running in offline mode.
- Use local certificates, but without storing them in the key vault (for example, in an on-premises installation).
- Do a gradual update of certificates, where a new version of the certificate is used only in stores or on terminals where the new version is already available.
- Use the same certificate in several companies.

## Set up certificate profiles

The following procedure explains how to set up certificate profiles. Before you use certificate profiles in the Commerce channels, follow these steps to configure the settings.

1. In the **Feature management** workspace, turn on the **User-defined certificate profiles for retail stores** feature.
2. Go to **System administration > Setup > Certificate profiles**.
3. Create a record, and set the **Certificate profile**, **Name**, and **Description** fields for it.

#### NOTE

The certificate profile is a unique identifier of a certificate across all companies and Commerce components.

4. On the **Legal entities** tab, add a line, and select the legal entity (company) that the current certificate profile should be used for. If the certificate profile should be used for multiple legal entities, repeat this step to add a line for each additional legal entity.
5. Select **Settings** to open the **Certificate profile settings** page, where you can enter company-specific settings for the certificate profile.

### Certificate profile settings

When you select **Settings** for certificate profile lines, the **Certificate profile settings** page appears. This page lets you specify which certificates can be used when the current certificate profile is called in the Commerce channels. You can also specify the order that certificates should be searched in.

#### NOTE

The **Priority** field is automatically set. A value of **1** represents the highest priority. When a new line is added on the **Certificate profile settings** page, its priority is set to a number that is one more than the priority of the previous line. To change the priority of a specific line, select the line, and then select either **Move up** to increase the priority or **Move down** to decrease the priority.

When you add a new line to the **Certificate profile settings** page, set the following fields:

- **Location type** – Select the location where the certificate is stored. This field has two possible values: **Local certificate** and **Key Vault**.
- **Key Vault certificate** – This field is required if you set the **Location type** field to **Key Vault**. Use it to specify a Key Vault certificate secret.

#### NOTE

Before you use a Key Vault certificate in certificate profiles, be sure to upload a certificate to the key vault storage, and follow the instructions in [Set up the Azure Key Vault client](#).

- **Store name** – This field is optional and is available only if you set the **Location type** field to **Local certificate**. Use it to specify a default store name that should be used to search local certificates.
- **Store location** – This field is optional and is available only if you set the **Location type** field to **Local certificate**. Use it to specify a default store location that should be used to search local certificates.

#### NOTE

The default store name and store location are added to simplify the process of searching local certificates in the Commerce runtime. X509StoreProvider has a list of folders where certificates are stored. If the default store name and the default store location aren't specified, X509StoreProvider tries to find a certificate in the other folders on its list.

- **Thumbprint** – This field is required and available only if you set the **Location type** field to **Local certificate**. Use it to specify the certificate thumbprint.
- **Comments** – This field is optional and lets users enter notes.

## Workflow: Searching certificates in the Commerce runtime

Here is the basic workflow that is used to search for a certificate when a certificate profile is called in the Commerce runtime.

1. The system identifies whether the certificate profile has company-specific settings for the current legal entity.
2. The system tries to find the certificate by using the values on the **Certificate profile settings** page for the line where the **Priority** field is set to **1**.
  - If the **Location type** field is set to **Key Vault**, the value of the **Key Vault certificate secret** field is used to search for the certificate on the **Key vault parameters** page. The certificate is then searched for in the key vault storage.
  - If the **Location type** field is set to **Local certificate**, X509StoreProvider first searches for the certificate by using the default store name and store location, if these parameters are specified. It then searches in all other folders on its list of folders.
3. If the certificate isn't found, the process is repeated for the line where the **Priority** field is set to **2**, and so on.

### NOTE

If the certificate profile has no settings for the current legal entity, or if the certificate search is unsuccessful for all lines on the **Certificate profile settings** page, the certificate isn't found.

## Caching the results of certificate searches

The results of certificate searches are cached. The default expiration time for a cache is one hour. However, this time can be customized and can be set to a maximum value of 24 hours.

## Gradual update

If a new version of the certificate is introduced, but it can't be updated in all stores at the same time, the certificate profiles functionality enables the certificate to be updated gradually.

1. Find a certificate profile and the line that should be updated, and then select **Settings**.
2. Add a line, and specify settings that are related to the latest version of the certificate.
3. Increase the **Priority** value of the new line. Use the **Move up** button to move the line so that it's above the line for the previous version of the same certificate.

### NOTE

In the Commerce runtime, the new version of the certificate will be called first. If the certificate hasn't yet been updated in a specific store or on a specific terminal, the previous version will be called.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Fiscal registration service integration sample for Austria

2/18/2021 • 19 minutes to read • [Edit Online](#)

## Introduction

To meet local fiscal requirements for cash registers in Austria, the Dynamics 365 Retail functionality for Austria includes a sample integration of the point of sale (POS) with an external fiscal registration service. The sample extends the [fiscal integration functionality](#). It's based on the [EFR \(Electronic Fiscal Register\)](#) solution from [EFSTA](#) and enables communication with the EFR service via the HTTPS protocol. The EFR service should be hosted on either the Retail Hardware station or a separate machine that can be connected to from the Hardware station. The sample is provided in the form of source code and is part of the Retail software development kit (SDK).

Microsoft doesn't release any hardware, software, or documentation from EFSTA. For information about how to get the EFR solution and operate it, contact [EFSTA](#).

## Scenarios

The following scenarios are covered by the fiscal registration service integration sample for Austria:

- Registration of cash transactions in the fiscal registration service:
  - Send detailed transaction data to the fiscal registration service. This data includes sales line information, and information about discounts, payments, and taxes.
  - Capture a response from the fiscal registration service. This response includes a digital signature and a link to the registered transaction.
  - Register taxes, and map them to the fiscal registration service's tax codes.
  - Print the QR code for a registered transaction on the receipt.
- Registration of gift card operations and customer deposits as non-cash transactions in the fiscal registration service:
  - Issue or add money to a gift card.
  - Register a customer account deposit.
  - Register a customer order deposit.
- Registration of non-sales transactions and events as non-cash transactions in the fiscal registration service:
  - Open shift and Close shift
  - Start amount, Float entry, and Tender removal
  - Price override
  - Tax override
  - Print copy of receipt
  - Open drawer
  - Print X report
  - Print Z report
- Printing end-of-day statements (X/Z reports) that have Austria-specific fields:
  - Total number of products or services that were delivered to customers
  - Breakdown of sales by tax rate

- Breakdown of payments by cashier/cash register operator
- Price discounts and returns that reduce daily sales
- Zero sales (giveaways)
- Error handling, such as the following options:
  - Retry fiscal registration if a retry is possible, such as if the fiscal registration service isn't available, isn't ready, or isn't responding.
  - Postpone fiscal registration.
  - Skip fiscal registration, or mark the transaction as registered, and include info codes to capture the reason for the failure and additional information.
  - Check the availability of the fiscal registration service before a new sales transaction is opened or a sales transaction is finalized.

### Default data mapping

The following default data mapping is included in the fiscal document provider configuration that is provided as part of the fiscal integration sample:

- Value-added tax (VAT) rates mapping:  
*A: 20.00; B: 10.00; C: 13.00; D: 0.00; E: 19.00; F: 7.00*

### Gift cards

The fiscal registration service integration sample implements the following rules that are related to gift cards:

- Exclude sales lines that are related to the *Issue gift card* and *Add to gift card* operations from a cash transaction. Instead of registering those lines as a part of a cash transaction, register them as a separate non-cash transaction in the fiscal registration service.
- Don't print a tax group breakdown and a QR code on a receipt if the receipt consists only of gift card lines.
- Print the total amount of gift cards that are issued or re-charged in a transaction separately from the cash transaction amount on the receipt.
- Save calculated adjustments of payment lines in the channel database with a reference to a corresponding fiscal transaction.
- Payment by gift card is considered a regular payment.

### Customer deposits and customer order deposits

The fiscal registration service integration sample implements the following rules that are related to customer deposits and customer order deposits:

- Register a non-cash transaction if a transaction is a customer deposit.
- Register a non-cash transaction if a transaction contains only a customer order deposit or a customer order deposit refund.
- Deduct the customer order deposit amount from payment lines when a hybrid customer order is created.
- Save calculated adjustments of payment lines in the channel database with a reference to a fiscal transaction for a hybrid customer order.

### Limitations of the sample

The fiscal registration service supports only scenarios where sales tax is included in the price. Therefore, the **Price include sales tax** option must be set to **Yes** for both stores and customers.

## Set up Commerce for Austria

This section describes the Commerce settings that are specific to and recommended for Austria. For more information set up information, see [Commerce home page](#).

To use the Austria-specific functionality, you must specify the following settings:

- In the primary address of the legal entity, set the **Country/region** field to **AUT** (Austria).
- In the POS functionality profile of every store that is located in Austria, set the **ISO code** field to **AT** (Austria).

You must also specify the following settings for Austria. Note that you must run appropriate distribution jobs after you complete the setup.

### Set up VAT per Austrian requirements

You must create sales tax codes, sales tax groups, and item sales tax groups. You must also set up sales tax information for products and services. For more information about how to set up and use sales tax features, see [Sales tax overview](#).

On sales receipts, you can print an abbreviated code for a sales tax code (for example, "A" or "B"). To make this functionality available, set the **Print code** field on the **Sales tax codes** page.

### Set up stores

On the **All stores** page, update the store details. Specifically, set the following parameters:

- In the **Sales tax group** field, specify the sales tax group that should be used for sales to the default customer.
- Set the **Prices include sales tax** option to **Yes**.
- Set the **Name** field to the company name. This change helps guarantee that the company name appears on a sales receipt. Alternatively, you can add the company name to the sales receipt layout as free-form text.
- Set the **Tax identification number (TIN)** field to the company identification number. This change helps guarantee that the company identification number appears on a sales receipt. Alternatively, you can add the company identification number to the sales receipt layout as free-form text.

### Set up functionality profiles

Set up POS functionality profiles:

- On the **Receipt numbering** FastTab, set up receipt numbering by creating or updating records for the **Sale**, **Sales order**, and **Return** receipt transaction types.

### Configure custom fields so that they can be used in receipt formats for sales receipts

You can configure the language text and custom fields that are used in the POS receipt formats. The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, add the following records for the labels of the custom fields for receipt layouts. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the table are just examples. You can change them to meet to your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or more than 900001.

Add the following POS labels to the **POS** section of **Language text** from the table:

LANGUAGE ID	TEXT ID	TEXT
en-US	900001	QR Code
en-US	900002	Continuous Number
en-US	900003	Tax Retail Print Code

LANGUAGE ID	TEXT ID	TEXT
en-US	900004	Total (sales)
en-US	900005	Total Tax (sales)
en-US	900006	Total Include Tax (sales)
en-US	900007	Tax Amount (sales)
en-US	900008	Tax Basis (sales)

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. Note that **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page:

NAME	TYPE	CAPTION TEXT ID
QRCODE	Receipt	900001
CONTINUOUSNUMBER	Receipt	900002
RETAILPRINTCODE	Receipt	900003
SALESTOTAL	Receipt	900004
SALESTOTALTAX	Receipt	900005
SALESTOTALINCLUDETAX	Receipt	900006
SALESTAXAMOUNT	Receipt	900007
SALESTAXBASIS	Receipt	900008

### Configure receipt formats

For every required receipt format, change the value of the **Print behavior** field to **Always print**.

In the Receipt format designer, add the following custom fields to the appropriate receipt sections. Note that field names correspond to the language texts that you defined in the previous section.

- **Header:** Add the following fields:
  - **Store name** and **Tax Identification Number** fields, which are used to print the company name and identity number on receipts. Alternatively, you can add the company name and identity number to the layout as free-form text.
  - **Store address**, **Date**, **Time 24H**, **Receipt Number**, and **Register number** fields.
  - **Continuous Number** fields, to identify the number of the cash transaction in the fiscal registration service.
- **Lines:** Add the following fields:
  - **Item name**.
  - **Qty**.
  - **Total price with tax**.
  - **Tax Retail Print Code**, which is used to print the abbreviated code that corresponds to the sales tax

code that applies to the item.

- **Footer:** Add the following fields:
  - Payment fields, so that the payment amounts for each payment method are printed. For example, add the **Tender name** and **Tender amount** fields to one line of the layout.
  - **Sales total** field group:
    - **Total (sales)** field, which is used to print the receipt's total cash sale amount. The amount excludes tax. Prepayments and gift card operations are excluded.
    - **Total Include Tax (sales)** field, which is used to print the receipt's total cash sale amount. The amount includes tax. Prepayments and gift card operations are excluded.
    - **Total Tax (sales)** field, which is used to print the receipt's total tax amount for cash sales. Prepayments and gift card operations are excluded.
  - **Tax break down** field group. The fields in this field group must be printed on a separate line.
    - **Tax Id** field, which is a standard field that enables a sales tax summary to be printed for each sales tax code. The field must be added to a new line.
    - **Tax Percentage** field, which is a standard field that is used to print the effective tax rate for the sales tax code.
    - **Tax Basis (sales)** field, which is used to print the receipt's total cash sale amount for the sales tax code. Prepayments and gift card operations are excluded.
    - **Tax Amount (sales)** field, which is used to print the receipt's tax amount for cash sales for the sales tax code.
    - **Tax Retail Print Code** field, which is used to print the abbreviated code that corresponds to the sales tax code.
  - **QR Code** field, which is used to print the reference to the registered cash transaction in the form of QR code.

For more information about how to work with receipt formats, see [Set up and design receipt formats](#).

### Configure fiscal integration

Complete the fiscal integration setup steps as described in [Set up the fiscal integration for Commerce channels](#):

- [Set up a fiscal registration process](#). Note also the settings for the fiscal registration process that are [specific to this fiscal registration service integration sample](#).
- [Set error handling settings](#).
- [Enable manual execution of postponed fiscal registration](#).

## Deployment guidelines for cash registers for Austria

The fiscal registration service integration sample for Austria is part of the Retail SDK. For information about how to install and use the SDK, see the [Retail software development kit \(SDK\) architecture](#).

This sample consists of extensions for the CRT, Hardware station, and POS. To run this sample, you must modify and build the CRT, Hardware station, and POS projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Azure DevOps, where no files have been changed yet.

Follow these steps to set up a development environment so that you can test and extend the sample.

### Enable Commerce runtime extensions

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under `RetailSdk\SampleExtensions\CommerceRuntime`.

#### DocumentProvider.EFRSample component

1. Find the `Runtime.Extensions.DocumentProvider.EFRSample` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.EFRSample\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.EFRSample.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit:** Copy the assembly to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EFRSample" />
```

#### DocumentProvider.DataModelEFR component

1. Find the `Runtime.Extensions.DocumentProvider.DataModelEFR` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.DataModelEFR\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit:** Copy the assembly to the `\bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
```

#### Update extension configuration file

1. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
2. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsAustria" />
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.RegisterAuditEventAustria" />
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.XZReportsAustria" />
```

### Enable Hardware station extensions

The Hardware station extension components are included in the Hardware station samples. To complete the following procedures, open the solution, **HardwareStationSamples.sln.sln**, under **RetailSdk\SampleExtensions\HardwareStation**.

#### EFRSample component

1. Find the **HardwareStation.Extension.EFRSample** project, and build it.
2. In the **Extension.EFRSample\bin\Debug** folder, find following files:
  - The **Contoso.Commerce.HardwareStation.EFRSample.dll** assembly
  - The **Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll** assembly
3. Copy the assembly files to the Hardware station extensions folder:
  - **Shared hardware station:** Copy the files to the bin folder under the IIS Hardware station site location.
  - **Dedicated hardware station on Modern POS:** Copy the files to the Modern POS client broker location.
4. Find the extension configuration file for the Hardware station's extensions. The file is named **HardwareStation.Extension.config**.
  - **Shared hardware station:** The file is located under the IIS Hardware station site location.
  - **Dedicated hardware station on Modern POS:** The file is located under the Modern POS client broker location.
5. Add the following line to the **composition** section of the configuration file.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.EFRSample.dll" />
```

### Enable Modern POS extension components

1. Open the solution at **RetailSdk\POS\ModernPOS.sln**, and make sure that it can be compiled without errors. Additionally, make sure that you can run Modern POS from Microsoft Visual Studio by using the **Run** command.

#### NOTE

Modern POS must not be customized. You must enable User Account Control (UAC), and you must uninstall previously installed instances of Modern POS as required.

2. Enable the extensions to be loaded by adding the following lines in **extensions.json**.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/AuditEvent.AT"
    }
  ]
}
```

#### NOTE

For more information, and for samples that show how to include source code folders and enable extensions to be loaded, see the instructions in the readme.md file in the **Pos.Extensions** project.

3. Rebuild the solution.
4. Run Modern POS in the debugger, and test the functionality.

#### Enable Cloud POS extension components

1. Open the solution at **RetailSdk\POS\CloudPOS.sln**, and make sure that it can be compiled without errors.
2. Enable the extensions to be loaded by adding the following lines in **extensions.json**.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/AuditEvent.AT"
    }
  ]
}
```

#### NOTE

For more information, and for samples that show how to include source code folders and enable extensions to be loaded, see the instructions in the readme.md file in the **Pos.Extensions** project.

3. Rebuild the solution.
4. Run the solution by using the **Run** command and following the steps in the Retail SDK handbook.

#### Set up the registration process

To enable the registration process, follow these steps to set up Headquarters. For more details, see [Set up the fiscal integration for Commerce channels](#).

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**. On the **General** tab, set the **Enable fiscal integration** option to **Yes**.
2. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal connectors**, and load the connector configuration. The file location is **RetailSdk\SampleExtensions\HardwareStation\Extension.EFRSample\Configuration\ConnectorEFRSample.xml**.
3. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal document providers**, and load the document provider configurations. The configuration files are located under **RetailSdk\SampleExtensions\CommerceRuntime\Extensions.DocumentProvider.EFRSample\C**onfiguration:
  - DocumentProviderEFRSampleAustria.xml
  - DocumentProviderNonFiscalEFRSampleAustria.xml
4. Go to **Retail and Commerce > Channel setup > Fiscal integration > Connector functional profiles**. Create two new connector functional profiles, one for each document provider that you loaded earlier, and select the connector that you loaded earlier. Update the data mapping settings as required.
5. Go to **Retail and Commerce > Channel setup > Fiscal integration > Connector technical**

**profiles.** Create a new connector technical profile, and select the connector that you loaded earlier. Update the connection settings as required.

6. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal connector groups.** Create two new fiscal connector groups, one for each connector functional profile that you created earlier.
7. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal registration processes.** Create a new fiscal registration process, two fiscal registration process steps, and select the fiscal connector groups that you created earlier.
8. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles.** Select a functionality profile that is linked to the store where the registration process should be activated. On the **Fiscal registration process** FastTab, select the fiscal registration process that you created earlier. To enable registration of non-fiscal events on the POS, on the **Functions** FastTab, under **POS**, set the **Audit** option to **Yes**.
9. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles.** Select a hardware profile that is linked to the Hardware station that the fiscal printer will be connected to. On the **Fiscal peripherals** FastTab, select the connector technical profile that you created earlier.
10. Open the distribution schedule (**Retail and Commerce > Retail and Commerce IT > Distribution schedule**), and select jobs **1070** and **1090** to transfer data to the channel database.

### Production environment

The previous procedure enables the extensions that are components of the fiscal registration service integration sample. In addition, you must follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Make the following changes in the package configuration files under the **RetailSdk\Assets** folder:
  - In the **commerceruntime.ext.config** and **CommerceRuntime.MPOSOOffline.Ext.config** configuration files, add the following lines to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EFRSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsAustria" />
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.RegisterAuditEventAustria" />
/>
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.XZReportsAustria" />
```

- In the **HardwareStation.Extension.config** configuration file, add the following line to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.EFRSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
```

2. Make the following changes in the **BuildTools\Customization.settings** package customization configuration file:

- Add the following lines to include the CRT extensions in the deployable packages.

```
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.EFRSample.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll" />
```

- Add the following line to include the Hardware station extension in the deployable packages.

```
<ISV_HardwareStation_CustomizableFile  
Include="$(SdkReferencesPath)\Contoso.Commerce.HardwareStation.EFRSample.dll" />  
<ISV_HardwareStation_CustomizableFile  
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll" />
```

3. Start the MSBuild Command Prompt for Visual Studio utility, and run **msbuild** under the Retail SDK folder to create deployable packages.
4. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).
5. Complete all the required setup tasks that are described in the [Set up Commerce for Austria](#) section.

## Design of extensions

### Commerce runtime extension design

The purpose of the extension that is a fiscal document provider is to generate service-specific documents and handle responses from the fiscal registration service.

The CRT extension is **Runtime.Extensions.DocumentProvider.EFRSample**.

For more details about the design of the fiscal integration solution, see [Overview of fiscal integration for Commerce channels](#).

#### Request handler

There are two request handlers for document providers:

- **DocumentProviderEFRFiscalAUT** – This handler is used to generate fiscal documents for the fiscal registration service.
- **DocumentProviderEFRNonFiscalAUT** – This handler is used to generate non-fiscal documents for the fiscal registration service.

These handlers are inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the connector document provider name that is specified in Headquarters.

The connector supports the following requests:

- **GetFiscalDocumentDocumentProviderRequest** – This request contains information about what document should be generated. It returns a service-specific document that should be registered in the fiscal registration service.
- **GetNonFiscalDocumentDocumentProviderRequest** – This request contains information about what non-fiscal document should be generated. It returns a service-specific document that should be registered in the fiscal registration service.
- **GetSupportedRegistrableEventsDocumentProviderRequest** – This request returns the list of events to subscribe to. Currently, the following events are supported: sales, printing X report, printing Z report, customer account deposits, customer order deposits, audit events, and non-sales transactions.
- **GetFiscalRegisterResponseToSaveDocumentProviderRequest** – This request returns the response from the fiscal registration service. This response is serialized to form a string so that it's ready to be saved.

#### Configuration

The configuration files are located in the **Configuration** folder of the extension project:

- **DocumentProviderFiscalEFRSampleAustria** – For fiscal documents.
- **DocumentProviderNonFiscalEFRSampleAustria** – For non-fiscal documents.

The purpose of these files is to enable settings for the document provider to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following setting is added:

- VAT rates mapping

### Hardware station extension design

The purpose of the extension that is a fiscal connector is to communicate with the fiscal registration service.

The Hardware station extension is **HardwareStation.Extension.EFRSample**. The Hardware station extension uses the HTTP protocol to submit documents that the CRT extension generates to the fiscal registration service. It also handles the responses that are received from the fiscal registration service.

### Request handler

The **EFRHandler** request handler is the entry point for handling requests to the fiscal registration service.

The handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the fiscal connector name that is specified in Headquarters.

The connector supports the following requests:

- **SubmitDocumentFiscalDeviceRequest** – This request sends documents to the fiscal registration service and returns a response from it.
- **IsReadyFiscalDeviceRequest** – This request is used for a health check of the fiscal registration service.
- **InitializeFiscalDeviceRequest** – This request is used to initialize the fiscal registration service.

### Configuration

The configuration file is located in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the fiscal connector to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added:

- **Endpoint address** – The URL of the fiscal registration service.
- **Timeout** – The amount of time, in milliseconds, that the driver will wait for a response from the fiscal registration service.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Commerce localization for Brazil

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the scope of the Microsoft Dynamics 365 Commerce functionality that is specific to Brazil. It includes information about features and functionality that are designed to address specific federal tax, retail, accounting, financial, or statutory reporting laws or regulations that typically affect retail businesses in Brazil (within the scope of the [Brazilian localization](#)).

However, Commerce doesn't address all laws, regulations, or commercial requirements in Brazil, because laws and regulations vary in the way that they affect organizations. For more information, see the [Product localization and translation availability guide](#).

## Capabilities of the Commerce localization for Brazil

### Scope that is available in Brazil

The following features in Commerce headquarters and the point of sale (POS) are available to Commerce customers in Brazil:

- Retail product management and calculation of Brazil-specific taxes that are applicable to sales to final consumers. This feature includes an estimated tax breakdown in printed fiscal receipts.
- Generation of NFC-e (Nota Fiscal do Consumidor eletrônica) electronic fiscal documents for retail sales (model 65), submission of the electronic fiscal documents via the government's web services, and printing of DANFE (Documento Auxiliar da Nota Fiscal Eletrônica) NFC-e receipts.
- Cancellation of retail sales via the government's web services within the allowed timeframe.
- Generation of NF-e (Nota Fiscal eletrônica) electronic fiscal documents for retail returns (model 55), submission of the electronic fiscal documents via the government's web services, and printing of DANFE receipts.
- Generation of CF-e (Cupom Fiscal eletrônico) electronic fiscal documents for retail sales in São Paulo (model 59) and registration of the electronic fiscal documents in the SAT (Sistema Autenticador e Transmissor de Cupons Fiscais Eletrônicos) fiscal device.
- Electronic funds transfer (EFT) integration for the POS. This feature includes integration with popular local and global payment providers, and support for debit and credit card payments.
- Management of Brazil-specific customer registration numbers. This feature includes capabilities for entering, viewing, and modifying CNPJ (Cadastro Nacional da Pessoa Jurídica)/CPF (Cadastro de Pessoas Físicas) tax registration numbers or Foreigner IDs, and for registering these numbers in NFC-e, NF-e, and CF-e, and printed receipts.
- Postponed registration of electronic fiscal documents in the event of network failures (offline contingency mode), and subsequent transmission of electronic fiscal documents in contingency from Commerce headquarters.
- Control of electronic fiscal documents in Commerce headquarters. This feature includes capabilities for discarding the documents and registering a cancellation by substitution.
- Generation and submission of electronic fiscal documents for customer orders.
- The ability to issue linked NF-e over all types of registered fiscal documents.
- N-1 support, so that customers who run Microsoft Dynamics AX 2012 R3 in their stores can work with Microsoft Dynamics 365 Commerce headquarters after an upgrade.
- Support for Brazil-specific fields, such as CNPJ/CPF tax registration numbers, when customer master records are merged in a call center.

## Supported scenarios

The following scenarios are supported by Commerce localization for Brazil:

- Cash-and-carry sales of goods
- Cancellations and returns of cash-and-carry sales of goods
- Cash-and-carry sales of goods in offline contingency mode
- Cancellation by substitution
- Issuing gift cards and payments by gift cards
- Registering and processing customer orders in the POS
- Posting fiscal documents in retail statements in Commerce headquarters
- Sales via e-Commerce storefronts
- Call center sales

## Fiscal registration for Brazil

Fiscal registration is the immediate registration of retail sales per local fiscal laws that are aimed at preventing tax fraud in the retail industry. The following main fiscal registration methods are available in Brazil:

- Generation of an NFC-e electronic fiscal document for a retail sale, and submission of the document to tax authorities (SEFAZ [Secretaria de Fazenda]) via a dedicated web service that is maintained by SEFAZ.
- Registration of a retail sale, in a SAT fiscal device that is connected to the POS, by using a CF-e electronic fiscal document.
- Registration of a retail sale in a fiscal printer that is connected to the POS.

Commerce supports fiscal registration via the [Fiscal integration framework](#) and its extensions for specific countries or regions. Formats of electronic fiscal documents that meet the legal requirements in Brazil are configured by using the [Electronic reporting](#) functionality. Electronic fiscal documents are submitted via the [Electronic invoicing service](#). For more information about the submission process for electronic fiscal document and configuration for Brazil, see [Electronic invoicing add-on for Brazil](#).

### NOTE

Integration with fiscal printers isn't available in Commerce. You can take advantage of the [N-1 capabilities](#) to integrate Microsoft Dynamics AX 2012 R3 Retail Enterprise Point of Sale (EPOS), which supports the integration with fiscal printers for Brazil in Commerce headquarters.

## Availability of Commerce localization features for Brazil

FEATURE	PUBLIC PREVIEW	GENERAL AVAILABILITY (GA)	POST-GA	NOT PLANNED
Retail product management, and tax setup and calculation	X			
NFC-e (model 65) and DANFE for retail sales	X			
Communication with SEFAZ via <a href="#">Electronic invoicing service</a>	X			

FEATURE	PUBLIC PREVIEW	GENERAL AVAILABILITY (GA)	POST-GA	NOT PLANNED
Retail statements in Commerce headquarters	X			
Handling of fiscal customer information (for example, CPF/CNPJ)		X		
NF-e (model 55) and DANFE for sales returns		X		
CF-e (model 59) for sales in São Paulo and integration with a SAT device		X		
NFC-e/NF-e contingency in the POS (offline mode)		X		
Transmission of NFC-e/NF-e in contingency from Commerce headquarters		X		
NFC-e cancellation, discard, cancellation by substitution		X		
EFT integration (Adyen and basic capabilities)		X		
Searching for customers by registration numbers in the POS			X	
EFT integration (advanced capabilities and additional providers)			X	
Fiscal documents for customer orders from the POS			X	
NF-e linked to NFC-e/CF-e and DANFE			X	

FEATURE	PUBLIC PREVIEW	GENERAL AVAILABILITY (GA)	POST-GA	NOT PLANNED
N-1 support for upgrade from AX 2012 R3			X	
E-Commerce capabilities for Brazil			X	
Merging CNPJ/CPF in customer master records in the call center			X	
Retail fiscal documents in fiscal book statements*				X
Integration of the POS with fiscal printers				X

\* *Fiscal book statements* are SPED (Sistema Público de Escrituração Digital) Fiscal, SPED Contributions, and ICMS-ST (Imposto sobre Circulação de Mercadorias e Serviços - Substituição Tributária) compensation and restitution statements for the supported states.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Advance invoices for Commerce for Eastern Europe

2/18/2021 • 3 minutes to read • [Edit Online](#)

The information in this topic applies to the Eastern European localization and is specific to the commerce industry.

For Poland, Hungary, and Czech Republic, when a prepayment is received from a customer via Point of Sale (POS), the prepayment must be registered for tax purposes, and it's required to generate and print an advance invoice document that includes the prepayment amount. Additionally, for Poland, advance invoice transactions must be posted in the general ledger.

When the invoice for the sales order is finally posted, the final document should include the advance invoice, and any prepayments should be indicated.

If you generate sales orders from Accounts receivable, you must manually generate advance invoices by using the procedure in [Advance invoices for Eastern Europe](#). If you generate sales orders via POS, the system generates and posts the advance invoices for you.

## Supported scenarios

The following scenarios are supported:

- Create and post an advance invoice.
- Modify a deposit amount. If a customer decides to increase the amount of a deposit, an additional advance invoice is issued. For all other changes to the deposit amount (for example, if a customer order is edited), a credit note is created for the advance invoice that was previously generated, and a new advance invoice is generated and posted for the corrected amount.
- Cancel a sales order that has linked advance invoices. In this case, a credit note is created for the advance invoice.
- Post a sales order invoice that has linked advance invoices. The advance invoice that is linked to a sales order is reversed for the amount of the sales invoice. The advance invoice transactions are settled with advance invoice reversal transactions.

## Set up advance invoices

### Turn on the functionality for creating advance invoices

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**.
2. On the **Customer orders** tab, on the **Order** FastTab, set the **Create advance invoice for deposit** option to **Yes**.

### Define the parameters for posting advance invoices

1. Go to **Accounts receivable > Setup > Accounts receivable parameters**.
2. On the **Updates** tab, on the **Advance invoice** FastTab, set the **Posting profile**, **Sales tax group**, and **Item sales tax group** fields. If these fields are set correctly, the advance invoice will be posted. If these fields aren't set, advance invoices won't be posted.

### Turn off posting of the Sales tax on prepayment journal voucher

The Sales tax on prepayment journal voucher must not be posted if advance invoice posting is turned on. To verify that this requirement is met, follow these steps.

1. Go to **Accounts receivable > Setup > Accounts receivable parameters**.

2. On the **Ledger and sales tax** tab, on the **Payment** FastTab, make sure that the following fields are blank or set to **No**:

- Sales tax on prepayment journal voucher
- Posting profile with prepayment journal voucher
- Tax group for prepayment
- Item Sales tax group

## Print advance invoices

You can print advance invoices from POS on a Microsoft Windows printer that is connected to the hardware station. There are two options for printing an advance invoice from POS:

- **Print an advance invoice after a transaction is concluded in POS.** This option occurs automatically if an advance invoice was generated and a Windows printer was correctly set up. In this case, only the last advance invoice that is linked to the customer order is printed.
- **Reprint an advance invoice from the transaction journal.** Select **Show journal** to open the transactions journal, find the customer order, and then select **Print Advance invoice**. In this case, all advance invoices that are linked to the customer order are printed.

### Set up a Windows printer

Follow these steps to enable documents to be printed from POS on a Windows printer that is connected to the hardware station.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**.
2. Select a hardware profile that is related to the store where the printer is used.
3. In either the **Printer** section or the **Printer 2** section, update the settings:
  - In the **Printer** field, select **Windows driver**.
  - In the **Device name** field, enter the name of the printer.
4. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**.
5. Select job **1090**, and then select **Run now**.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Petty cash management for Commerce for Eastern Europe

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article contains information about Eastern European localization specific for the commerce industry.

In accordance with the Eastern Europe accounting requirements, you can set up operations for cash accounts to automate the processes for receipts, cash documents and cash reports. For more information, go to [\(EEUR\) Set up parameters for cash management](#).

Retailers can accept various types of payment in exchange for the products and services that they sell. Although cash is the most common form of payment, retailers can also receive payment in the form of checks, cards, or vouchers. In Retail point of sale (POS), cash, credit card receipts, and other payments are processed through a cash office.

You can do the following by using Cash management in Commerce:

- Create a cash account for the selected payment method for each store.
- Use cash journals to post cash transactions and customer payments that are received at a retail POS.
- Aggregate transactions in a statement line when you post a statement. You can aggregate safe drops, bank drops, voucher transactions, remove tender transactions, float entry transactions, income transactions, expense transactions, customer payments, sales transactions, and return transactions.

All transactions that take place in POS are posted using a ledger journal. You can use cash payment journals, customer payment journals, and general journals to create and post the statements. For more information, go to [Create, calculate, and post statements for a retail store](#).

On the **Posted statements** page, on the Action Pane, you can do the following:

- Go to **Inquiries > Cash payment journal** to access the cash payment journals that are related to the statement.
- Go to **Inquiries > General journal** to access the ledger journals that are related to the statement, other than customer payments and cash payments.

## Set up for cash management for POS

You must complete the following setup procedure before you use cash management:

- Set up a payment method for each payment type that the retailer accepts on the **Payment methods** page. You can use different payment methods for posting transactions in POS. For more information about payment methods, see [Payment methods](#).
- Set up parameters for cash operations.
- Set up a payment method for cash payments in a store.

### Set up parameters for cash operations

You can set up parameters to create and post cash transactions in Commerce. You can use cash payment journals, customer payment journals, or general journals to post sales transactions and payment transactions in the POS. You can aggregate transactions that have the same properties when you post a statement.

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**. In the left pane, click **Posting**.

2. In the **Posting** area, on the **Aggregation** FastTab, set **Tender remove/float** to **Yes** to aggregate the remove tender transactions or float entry transactions that are associated with a statement line when you post the statement. A remove tender transaction is created when you withdraw cash from the POS cash drawer. A float entry transaction is created when you deposit cash in the POS cash drawer.
3. Activate the individual parameters listed below to aggregate the transactions that are associated with a statement line when you post the statement:
  - **Bank drop** – Aggregate bank transactions.
  - **Safe drop** – Aggregate safe transactions.
  - **Income/Expense transactions** – Aggregate income transactions or expense transactions.
  - **Voucher transactions** – Aggregate voucher transactions.
  - **Customer payments** – Aggregate customer payments.
  - **Sales and returns** – Aggregate sales and returns transactions.
4. On the **Payments** FastTab, select a default journal name for the following options:
  - **Customer payment journal** – This journal is used to post customer payments.
  - **Cash payment journal** – This journal is used to post cash payments.
  - **General journal** – This journal is used to post transactions other than cash payments and customer payments.

### Set up a payment method for cash payments in a store

Use the following procedure to set up a payment method for cash payments in a store.

1. Go to **Retail and Commerce > Channels > Stores > All stores**.
2. On the **All stores** list page, select the store to set up a payment method for.
3. On the Action Pane, on the **Set up** tab, in the **Set up** group, click **Payment methods**.
4. On the **Payment method** page, create or select a payment method.
5. On the **Posting** FastTab, in the **Account** field group, in the **Account type** field, select **Cash account**.

#### NOTE

You can select **Cash account** in the **Account type** field only if you select **Normal** or **Tender remove/float** in the **Function** field.

6. In the **Account number** field, select a cash account number for the payment method.
7. In the **Tender remove/float** field group, in the **Offset account** field, select the offset account to post remove tender or float entry transactions for the payment method.

#### NOTE

You must set up offset accounts for both the cash tender payment method and the remove tender or float entry payment method for a store. This creates balanced general ledger entries for remove tender or float entry transactions.

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Customer invoices and return sales orders in Eastern European countries

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set up information for customer invoices and return sales orders in Eastern European countries.

You can set up the following information for customer invoices and return sales orders that are generated in Retail point of sale (POS).

- You can use sales tax groups to process returns by using return sales orders. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**. Open the **Posting > Invoice** tab, and then set **Use sales tax group for returns** to **Yes**.
  - To specify the sales tax group for returns that are made by a customer, on the **Customers** page, on the **Commerce** FastTab, in the **Sales tax group for returns** field, select a sales tax group. When you post a return sales order for a customer, the return sales order line is updated with the sales tax group for returns that is specified in the **Customers** form.
  - To specify a sales tax group for returns that are made at a retail POS by a customer, on the **Stores** page, on the **General** FastTab, in the **Sales tax group for returns** field, select a sales tax group. When you post a return sales order for a customer of a store, the return sales order line is updated with the sales tax group for returns that are specified on the **Stores** page.
- You can use the posting date of a customer invoice or a return sales order as the sales date of the invoice or return if the invoice or return does not have a default sales date. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce parameters**. Open the **Posting > Invoice** tab, and then set **Use posting date as sales date** to **Yes**.
- You can use the number range that is provided by the tax authorities to number Latvian and Lithuanian customer invoices and return sales orders.
  - Go to **Organization administration > Number sequences > Counters management**. There should be a record where **Module = Sales** and **Type = Invoice**.
  - Go to **Organization administration > Number sequences > Invoice numbering setup**. Select the **Commerce** check box for the number sequence line that is used to number the customer invoices.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Deployment guidelines for Advance Invoice report printing for Czech Republic, Hungary, and Poland

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows how to enable the Dynamics 365 Commerce localization for Czech Republic, Hungary, and Poland. The localization consists of several extensions of Commerce components. These extensions let you print the **Advance Invoice** report from Point of Sale (POS). For more information about localization for Czech Republic, Hungary, and Poland, see [Advance invoices for Commerce for Eastern Europe](#).

The localization is part of the Retail software development kit (SDK). For information, see the [Retail software development kit \(SDK\) architecture](#).

The localization consists of extensions for the Commerce runtime (CRT) and POS. To enable this localization, you must modify the CRT configuration file and modify and build POS projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Microsoft Visual Studio Team Services, where no files have been changed yet.

## Development environment

Complete these procedures to set up a development environment, so that you can test the functionality.

### CRT extension components

1. Find the extensions configuration file for CRT.

The file is named `commerceruntime.ext.config`, and is located in the `bin\ext` folder under the IIS Commerce Scale Unit site location.

2. Register the CRT change in the extensions configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.UseAdvanceInvoice" />
```

#### WARNING

Do **not** edit the `commerceruntime.config` file. This file isn't intended for any customizations.

### Modern POS extension components

1. Open the solution at `RetailSdk\POS\ModernPOS.sln`, and make sure that it can be compiled without errors. Additionally, make sure that you can run Modern POS from Microsoft Visual Studio by using the **Run** command.

#### NOTE

Modern POS must not be customized. You must enable User Account Control (UAC), and you must uninstall previously installed instances of Modern POS as required.

2. Enable the extensions to be loaded in `extensions.json` by adding the following lines in the appropriate location.

```
{
  "extensionPackages": [
    {
      "baseUri": "Microsoft/AdvanceInvoice"
    }
  ]
}
```

3. Rebuild the solution.
4. Run Modern POS in the debugger and test the functionality.

### Cloud POS extension components

1. Open the solution at `RetailSdk\POS\CloudPOS.sln`, and make sure that it can be compiled without errors.
2. Enable the extensions to be loaded in `extensions.json` by adding the following lines in the appropriate location.

```
{
  "extensionPackages": [
    {
      "baseUri": "Microsoft/AdvanceInvoice"
    }
  ]
}
```

3. Rebuild the solution.
4. Run Cloud POS in the debugger and test the functionality.

### Set up required parameters in Headquarters

For more information, see [Advance invoices for Commerce for Eastern Europe](#).

## Production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Complete the steps in the **Cloud POS extension components** or **Modern POS extension components** sections earlier in this topic.
2. Make the following change in the package configuration files under the `RetailSdk\Assets` folder.

In the `commercerruntime.ext.config` configuration files, add the following lines to the `composition` section.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.UseAdvanceInvoice" />
```

3. Run `msbuild` for the Retail SDK to create deployable packages.
4. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Fiscal registration service integration sample for Czech Republic

2/18/2021 • 18 minutes to read • [Edit Online](#)

## Introduction

To meet local fiscal requirements for cash registers in the Czech Republic, the Dynamics 365 Commerce functionality for the Czech Republic includes a sample integration of the point of sale (POS) with an external fiscal registration service. The sample extends the [fiscal integration functionality](#). It's based on the [EFR \(Electronic Fiscal Register\)](#) solution from [EFSTA](#) and enables communication with the EFR service via the HTTPS protocol. The EFR service ensures Electronic Registration of Sales (EET - Elektronická evidence tržeb), that is, the online transmission of the sales data to a fiscal web service of tax authorities.

The EFR service should be hosted on either the Commerce Hardware station or a separate machine that can be connected to from the Hardware station. The sample is provided in the form of source code and is part of the Retail software development kit (SDK).

Microsoft doesn't release any hardware, software, or documentation from EFSTA. For information about how to get the EFR solution and operate it, contact [EFSTA](#).

## Scenarios

The following scenarios are covered by the fiscal registration service integration sample for the Czech Republic.

- Registration of cash transactions in the fiscal registration service.
  - Send detailed transaction data to the fiscal registration service. This data includes sales line information, and information about discounts, payments, and taxes. The fiscal registration service further sends the data to the web-service of tax authorities and receives a confirmation from it that includes the fiscal identification code of the transaction.
  - Capture a response from the fiscal registration service. This response includes fiscal data such as the fiscal identification code and the security code of the transaction, etc.
  - Print the fiscal data for a registered transaction on the receipt.
- Registration of gift card operations and customer deposits in the fiscal registration service.
  - Issue or add money to a gift card.
  - Register a customer account deposit.
  - Create a customer order and register a deposit for the order.
  - Edit a customer order and override the deposit for the order.
  - Cancel a customer order and refund the deposit for the order.
- Error handling, such as the following options.
  - Retry fiscal registration if a retry is possible, such as if the fiscal registration service isn't available, isn't ready, or isn't responding.
  - Postpone fiscal registration.
  - Skip fiscal registration, or mark the transaction as registered, and include info codes to capture the reason for the failure and additional information.
  - Check the availability of the fiscal registration service before a new sales transaction is opened or a sales transaction is finalized.

### Default data mapping

The following default data mapping is included in the fiscal document provider configuration that is provided as part of the fiscal integration sample.

- Value-added tax (VAT) rates mapping:

*A: 21.00; B: 15.00; C: 10.00; Z: 0.00*

- Default VAT group mapping. Any VAT amounts that cannot be mapped to one of the predetermined VAT groups will be attributed to the default (basic) VAT group:

*A*

- Deposit VAT group mapping. Customer deposit amounts and customer order deposit amounts will be attributed to the deposit VAT group:

*Z*

### Gift cards

The fiscal registration service integration sample implements the following rules that are related to gift cards.

- Sales lines that are related to the *Issue gift card* or *Add to gift card* operations in a sales transaction are marked with a special attribute when the transaction is registered in the fiscal registration service.
- A payment by gift card is considered a regular payment and marked with a special attribute when the

transaction is registered in the fiscal registration service.

#### Customer account deposits and customer order deposits

The fiscal registration service integration sample implements the following rules that are related to customer account deposits and customer order deposits.

- A transaction that is related to a customer account deposit or a customer order deposit is registered in the fiscal registration service as a single line transaction and is marked with a special attribute. The deposit VAT group is specified in this line.
- When a hybrid customer order is created, that is, a customer order that contains products that can be carried out of the store by the customer, as well as products that will be picked up or shipped later, the transaction registered in the fiscal registration service contains lines for the products that are carried out, as well as a line for the order deposit.
- A payment from a customer account is considered a regular payment and marked with a special attribute when the transaction is registered in the fiscal registration service.
- The customer order deposit amount that is applied to a customer order *Pick up* operation is considered a regular payment and marked with a special attribute when the transaction is registered in the fiscal registration service.

#### Offline registration

If the fiscal registration service fails to transmit transaction data to the fiscal web service of tax authorities (e.g. due to the response timeout) and to receive a confirmation from the web-service (that is, the fiscal identification code of the transaction), it generates a local signature for the transaction and includes it and a special error code in the response. The fiscal registration service resends transactions in original order in background as soon as the network connection is restored.

#### Limitations of the sample

The fiscal registration service supports only scenarios where sales tax is included in the price. Therefore, the **Price include sales tax** option must be set to **Yes** for both stores and customers.

## Set up Commerce for Czech Republic

This section describes the Commerce settings that are specific to and recommended for the Czech Republic. For more information, see [Commerce home page](#).

To use the Czech-specific functionality, you must specify the following settings.

- In the primary address of the legal entity, set the **Country/region** field to **CZE** (Czech Republic).
- In the POS functionality profile of every store that is located in the Czech Republic, set the **ISO code** field to **CZ** (Czech Republic).

You must also specify the following settings for the Czech Republic. Note that you must run appropriate distribution jobs after you complete the setup.

#### Set up VAT per Czech Republic

You must create sales tax codes, sales tax groups, and item sales tax groups. You must also set up sales tax information for products and services. For more information about how to set up and use sales tax features, see [Sales tax overview](#).

#### Set up stores

On the **All stores** page, update the store details. Specifically, set the following parameters.

- In the **Sales tax group** field, specify the sales tax group that should be used for sales to the default customer.
- Set the **Prices include sales tax** option to **Yes**.
- Set the **Name** field to the company name. This change helps guarantee that the company name appears on a sales receipt. Alternatively, you can add the company name to the sales receipt layout as free-form text.
- Set the **Tax identification number (TIN)** field to the company identification number. This change helps guarantee that the company identification number appears on a sales receipt. Alternatively, you can add the company identification number to the sales receipt layout as free-form text.

#### Set up functionality profiles

Set up POS functionality profiles.

- On the **Receipt numbering** FastTab, set up receipt numbering by creating or updating records for the **Sale**, **Sales order**, and **Return** receipt transaction types.

#### Set up registration numbers

1. Go to **Organization administration > Global address book > Registration types > Registration types**. Create a new registration type. Specify the **Country/region** field to **CZE** (Czech Republic) and make it restricted to Organization.
2. Go to **Organization administration > Global address book > Registration types > Registration categories**. Create a new registration category. Select the registration type from the previous step and set the **Registration category** to **Business Premise ID**.
3. Go to **Organization administration > Organizations > Operating units**. For each store located in the Czech Republic, select the unit related to the store. On the **Address** FastTab expand the **More**

options drop-down list and select **Advanced**.

4. On the opened **Manage addresses** page you must specify following setting.

- On the **Address** FastTab set the **Country/region** field to **CZE**.
- On the **Registration ID** FastTab create a new record. Select the registration type created earlier and set the registration number.

#### Configure custom fields so that they can be used in receipt formats for sales receipts

You can configure the language text and custom fields that are used in the POS receipt formats. The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, add the following records for the labels of the custom fields for receipt layouts. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the table are just examples. You can change them to meet your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or more than 900001.

Add the following POS labels to the **POS** section of **Language text** from the table:

LANGUAGE ID	TEXT ID	TEXT
en-US	900001	ID provozovny/pokladny
en-US	900002	BKP
en-US	900003	FIK
en-US	900004	PKP
en-US	900005	Info
en-US	900006	Sequence number

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. Note that **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page:

NAME	TYPE	CAPTION TEXT ID
TLT	Receipt	900001
SEC	Receipt	900002
SIGN	Receipt	900003
FISCAL	Receipt	900004
INFO	Receipt	900005
CONTINUOUSNUMBER	Receipt	900006

#### Configure receipt formats

For every required receipt format, change the value of the **Print behavior** field to **Always print**.

In the Receipt format designer, add the following custom fields to the appropriate receipt sections. Note that field names correspond to the language texts that you defined in the previous section.

- **Header:** Add the following fields.
  - **Store name** and **Tax Identification Number:** these fields are used to print the company name and identity number on receipts. Alternatively, you can add the company name and identity number to the layout as free-form text.
  - **Store address**, **Date**, **Time 24H**, **Receipt Number**, and **Register number**.
  - **Sequence number:** this field identifies the number of the cash transaction in the fiscal registration service.
- **Lines:** Add the following fields.
  - **Item name**
  - **Qty**
  - **Total price with tax**
- **Footer:** Add the following fields.
  - Payment fields, so that the payment amounts for each payment method are printed. For example, add the **Tender name** and **Tender amount** fields to one line of the layout.
  - **ID provozovny/pokladny:** this field prints the identifiers of the business premises and the cash register.

- **BKP**: this field prints the taxpayer's security code that is assigned by the fiscal registration service.
- **FIK**: this field prints the fiscal identification code of the transaction that is assigned by the web-service of tax authorities in case of successful online registration.
- **PKP**: this field prints the taxpayer's signature code that is generated by the fiscal registration service in case of offline registration.
- **Info**: this field prints the additional information from the fiscal registration service.

For more information about how to work with receipt formats, see [Set up and design receipt formats](#).

### Configure fiscal integration

Complete the fiscal integration setup steps as described in [Set up the fiscal integration for Commerce channels](#).

- [Set up a fiscal registration process](#). Note also the settings for the fiscal registration process that are [specific to this fiscal registration service integration sample](#).
- [Set error handling settings](#).
- [Enable manual execution of postponed fiscal registration](#).

## Deployment guidelines for cash registers for Czech Republic

The fiscal registration service integration sample for the Czech Republic is part of the Retail SDK. For information about how to install and use the Retail SDK, see the [Retail software development kit \(SDK\) architecture](#).

This sample consists of extensions for the CRT and Hardware station. To run this sample, you must modify and build the CRT and Hardware station projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Azure DevOps, where no files have been changed yet.

Follow these steps to set up a development environment so that you can test and extend the sample.

### Enable Commerce runtime extensions

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under `RetailSdk\SampleExtensions\CommerceRuntime`.

#### DocumentProvider.EFRSample component

1. Find the `Runtime.Extensions.DocumentProvider.EFRSample` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.EFRSample\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.EFRSample.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit**: Copy the assembly to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS**: Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit**: The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS**: The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EFRSample" />
```

#### DocumentProvider.DataModelEFR component

1. Find the `Runtime.Extensions.DocumentProvider.DataModelEFR` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.DataModelEFR\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit**: Copy the assembly to the `\bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS**: Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit**: The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS**: The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
```

#### Update extension configuration file

1. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
2. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsCzechia" />
```

#### Enable Hardware station extensions

The Hardware station extension components are included in the Hardware station samples. To complete the following procedures, open the solution, `HardwareStationSamples.sln.sln`, under `RetailSdk\SampleExtensions\HardwareStation`.

##### EFRSample component

1. Find the `HardwareStation.Extension.EFRSample` project, and build it.
2. In the `Extension.EFRSample\bin\Debug` folder, find following files:
  - The `Contoso.Commerce.HardwareStation.EFRSample.dll` assembly
  - The `Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll` assembly
3. Copy the assembly files to the Hardware station extensions folder:
  - **Shared hardware station:** Copy the files to the `bin` folder under the IIS Hardware station site location.
  - **Dedicated hardware station on Modern POS:** Copy the files to the Modern POS client broker location.
4. Find the extension configuration file for the Hardware station's extensions. The file is named `HardwareStation.Extension.config`.
  - **Shared hardware station:** The file is located under the IIS Hardware station site location.
  - **Dedicated hardware station on Modern POS:** The file is located under the Modern POS client broker location.
5. Add the following line to the `composition` section of the configuration file.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.EFRSample.dll" />
```

#### Set up the registration process

To enable the registration process, follow these steps to set up Headquarters. For more details, see [Set up a fiscal registration process](#).

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**. On the **General** tab, set the **Enable fiscal integration** option to **Yes**.
2. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal connectors**, and load the connector configuration. The file location is `RetailSdk\SampleExtensions\HardwareStation\Extension.EFRSample\Configuration\ConnectorEFRSample.xml`.
3. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal document providers**, and load the document provider configuration. The configuration file is `RetailSdk\SampleExtensions\CommerceRuntime\Extensions.DocumentProvider.EFRSample\Configuration\DocumentProviderFisc`.
4. Go to **Retail and Commerce > Channel setup > Fiscal integration > Connector functional profiles**. Create a new connector functional profile. Select the document provider and the connector that you loaded earlier. Update the data mapping settings as required.
5. Go to **Retail and Commerce > Channel setup > Fiscal integration > Connector technical profiles**. Create a new connector technical profile, and select the connector that you loaded earlier. Update the connection settings as required.
6. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal connector groups**. Create a new fiscal connector group, for the connector functional profile that you created earlier.
7. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal registration processes**. Create a new fiscal registration process, a fiscal registration process step, and select the fiscal connector group that you created earlier.
8. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. Select a functionality profile that is linked to the store where the registration process should be activated. On the **Fiscal registration process** FastTab, select the fiscal registration process that you created earlier.
9. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**. Select a hardware profile that is linked to the Hardware station that the fiscal printer will be connected to. On the **Fiscal peripherals** FastTab, select the connector technical profile that you created earlier.
10. Open the distribution schedule (**Retail and Commerce > Retail and Commerce IT > Distribution schedule**), and select jobs **1070** and **1090** to transfer data to the channel database.

#### Production environment

The previous procedure enables the extensions that are components of the fiscal registration service integration sample. In addition, you must follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Make the following changes in the package configuration files under the **RetailSdk\Assets** folder.

- In the **commercerruntime.ext.config** and **CommerceRuntime.MPOSOOffline.Ext.config** configuration files, add the following lines to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EFRSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsCzechia" />
```

- In the **HardwareStation.Extension.config** configuration file, add the following line to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.EFRSample" />
```

2. Make the following changes in the **BuildTools\Customization.settings** package customization configuration file.

- Add the following lines to include the CRT extensions in the deployable packages.

```
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.EFRSample.d11" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.d11" />
<ISV_HardwareStation_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.d11" />
```

- Add the following line to include the Hardware station extension in the deployable packages.

```
<ISV_HardwareStation_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.HardwareStation.EFRSample" />
```

3. Start the MSBuild Command Prompt for Visual Studio utility, and run **msbuild** under the Retail SDK folder to create deployable packages.

4. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).

5. Complete all the required setup tasks that are described in the [Set up Commerce for Czech Republic](#) section.

## Design of extensions

### Commerce runtime extension design

The purpose of the extension that is a fiscal document provider is to generate service-specific documents and handle responses from the fiscal registration service.

The CRT extension is **Runtime.Extensions.DocumentProvider.EFRSample**.

For more details about the design of the fiscal integration solution, see [Fiscal registration process and fiscal integration samples for fiscal devices](#).

#### Request handler

There is a single **DocumentProviderEFRFiscalCZE** request handler for document provider, which is used to generate fiscal documents for the fiscal registration service.

This handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the connector document provider name that is specified in Headquarters.

The connector supports the following requests.

- **GetFiscalDocumentDocumentProviderRequest** – This request contains information about what document should be generated. It returns a service-specific document that should be registered in the fiscal registration service.
- **GetSupportedRegistrableEventsDocumentProviderRequest** – This request returns the list of events to subscribe to. Currently, the following events are supported: sales, customer account deposits and customer order deposits.
- **GetFiscalRegisterResponseToSaveDocumentProviderRequest** – This request returns the response from the fiscal registration service. This response is serialized to form a string so that it's ready to be saved.

#### Configuration

The **DocumentProviderFiscalEFRSampleCzech** configuration file is located in the **Configuration** folder of the extension project. The purpose of this file is to enable settings for the document provider to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added.

- VAT rates mapping
- Default VAT group
- Deposit VAT group

### Hardware station extension design

The purpose of the extension that is a fiscal connector is to communicate with the fiscal registration service.

The Hardware station extension is **HardwareStation.Extension.EFRSample**. The Hardware station extension uses the HTTP protocol to submit documents that the CRT extension generates to the fiscal registration service. It also handles the responses that are received from the fiscal registration service.

#### Request handler

The **EFRHandler** request handler is the entry point for handling requests to the fiscal registration service.

The handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the fiscal connector name that is specified in Headquarters.

The connector supports the following requests.

- **SubmitDocumentFiscalDeviceRequest** – This request sends documents to the fiscal registration service and returns a response from it.
- **IsReadyFiscalDeviceRequest** – This request is used for a health check of the fiscal registration service.
- **InitializeFiscalDeviceRequest** – This request is used to initialize the fiscal registration service.

#### Configuration

The configuration file is located in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the fiscal connector to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added.

- **Endpoint address** – The URL of the fiscal registration service.
- **Timeout** – The amount of time, in milliseconds, that the driver will wait for a response from the fiscal registration service.

#### NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Fiscal printer integration sample for Poland

2/18/2021 • 11 minutes to read • [Edit Online](#)

## Introduction

The Dynamics 365 Commerce functionality for Poland includes a sample integration of the point of sale (POS) with a fiscal printer. The sample extends the [fiscal integration functionality](#) and supports the POSNET THERMAL HD 2.02 protocol for fiscal printers from [Posnet Polska S.A.](#) The sample enables communication with a fiscal printer that is connected via a COM port by using a native software driver. It was implemented and tested by using a software emulator that Posnet provided for the Posnet Thermal HD FV EJ fiscal printer. The sample is provided in the form of source code and is part of the Retail software development kit (SDK).

Microsoft doesn't release any hardware, software, or documentation from Posnet. For information about how to get the fiscal printer and operate it, contact [Posnet Polska S.A.](#)

## Scenarios

The following scenarios are covered by the fiscal printer integration sample for Poland:

- Sales scenarios:
  - Print a fiscal receipt for cash-and-carry sales and returns.
  - Capture a response from the fiscal printer, and store it in the channel database.
  - Taxes:
    - Map to the fiscal printer's tax codes (departments).
    - Transfer mapped tax data to the fiscal printer.
  - Payments:
    - Map to the fiscal printer's methods of payment.
    - Print payments on a fiscal receipt.
    - Print change information.
  - Print line discounts.
  - Gift cards:
    - Exclude an issued/re-charged gift card line from a fiscal receipt for a sale.
    - Print a payment that uses a gift card as a regular method of payment.
  - Print fiscal receipts for customer order operations:
    - A fiscal receipt isn't printed for a customer order deposit.
    - Print a fiscal receipt for carry-out lines of a hybrid customer order.
    - Print a fiscal receipt for the pickup operation for a customer order.
    - Print a fiscal receipt for a return order.
  - Print the [customer information](#) that is specified for a sales transaction on a fiscal receipt. An example of this information is the customer's VAT number.
- End of day statements (fiscal X and fiscal Z reports).
- Error handling, such as the following options:
  - Retry fiscal registration if a retry is possible, such as if the fiscal printer isn't connected, isn't ready, or isn't responding, the printer is out of paper, or there is a paper jam.
  - Postpone fiscal registration.
  - Skip fiscal registration, or mark the transaction as registered, and include info codes to capture the reason for the failure and additional information.
  - Check the availability of the fiscal printer before a new sales transaction is opened or a sales transaction is finalized.

### Default data mapping

The following default data mapping is included in the fiscal document provider configuration that is provided as part of the fiscal integration sample:

- Value-added tax (VAT) rates mapping:

*0 : 23.00 ; 1 : 8.00 ; 2 : 5.00 ; 3 : 0.00*

- Tender type mapping:

*0 : 0 ; 1 : 0 ; 2 : 2 ; 3 : 2 ; 4 : 0 ; 5 : 0 ; 6 : 0 ; 7 : 2 ; 8 : 0*

### Gift cards

The fiscal printer integration sample implements the following rules that are related to gift cards:

- Exclude sales lines that are related to the *Issue gift card* and *Add to gift card* operations from the fiscal receipt.
- Don't print a fiscal receipt if it consists only of gift card lines.
- Deduct the total amount of gift cards that are issued or re-charged in a transaction from payment lines of the fiscal receipt.
- Save calculated adjustments of payment lines in the channel database with a reference to a corresponding fiscal transaction.
- Payment by gift card is considered a regular payment.

#### Customer deposits and customer order deposits

The fiscal printer integration sample implements the following rules that are related to customer deposits and customer order deposits:

- Don't print a fiscal receipt if a transaction is a customer deposit.
- Don't print a fiscal receipt if a transaction contains only a customer order deposit or a customer order deposit refund.
- Print the amount of the previously paid deposit on a fiscal receipt for a customer order pickup operation.
- Deduct the customer order deposit amount from payment lines when a hybrid customer order is created.
- Save calculated adjustments of payment lines in the channel database with a reference to a fiscal transaction for a hybrid customer order.

#### Limitations of the sample

- The fiscal printer supports only scenarios where sales tax is included in the price. Therefore, the **Price include sales tax** option must be set to **Yes** for both stores and customers.
- Daily reports (fiscal X and fiscal Z) are printed by using the embedded *Shift report* format.
- Printing a bar code on fiscal receipts is considered a potential customization, because this feature isn't supported in the embedded formats and can be implemented only by using the customizable **Super-format** report.
- The fiscal printer doesn't support mixed transactions. The **Prohibit mixing sales and returns in one receipt** option should be set to **Yes** in POS functionality profiles.

## Set up Commerce for Poland

### Configure fiscal integration

Complete the fiscal integration setup steps as described in [Set up the fiscal integration for Commerce channels](#):

- [Set up a fiscal registration process](#). Note also the settings for the fiscal registration process that are [specific to this fiscal printer integration sample](#).
- [Set error handling settings](#).
- [Set up fiscal X/Z reports from the POS](#).
- [Enable manual execution of postponed fiscal registration](#).

### Enable extensions

#### Commerce runtime extension components

The Commerce runtime (CRT) extension components are included in the Retail SDK. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under

`RetailSdk\SampleExtensions\CommerceRuntime`.

1. Find the `Runtime.Extensions.DocumentProvider.PosnetSample` project, and build it.
2. In the `Extensions.DocumentProvider.PosnetSample\bin\Debug` folder, find the `Contoso.Commerce.Runtime.Extensions.DocumentProvider.PosnetSample.dll` assembly file.
3. Copy the assembly file to the CRT extension folder:
  - **Commerce Scale Unit:** Copy the assembly to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extensions configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension's configuration file. Add `source="assembly"` and `value="Contoso.Commerce.Runtime.Extensions.DocumentProvider.PosnetSample"`.
6. Restart the Commerce service.
  - **Commerce Scale Unit:** Restart the Commerce service site from IIS Manager.
  - **Client broker:** End the `dllhost.exe` process in Task Manager, and then restart Modern POS.

### Hardware station extension components

The Hardware station extension components are included in the Retail SDK. To complete the following procedures, open the Hardware Station solution, `HardwareStationSamples.sln`, under `RetailSdk\SampleExtensions\HardwareStation`.

1. Find the `Extension.PosnetThermalFVFiscalPrinterSample` project, and build it.
2. In the `Extension.PosnetThermalFVFiscalPrinterSample\bin\Debug` folder, find the `Contoso.Commerce.HardwareStation.PosnetThermalFVFiscalPrinterSample.dll` assembly file.
3. Copy the files to a deployed Hardware station machine:
  - **Remote Hardware station:** Copy the files to the `bin` folder under the IIS Hardware station site location. Copy the printer driver libraries (`libposcmbth.dll`, `libcmbth_serial.dll`, and `cmbth_pl.Ing`).
4. Find the configuration file for the Hardware station's extensions. The file is named `HardwareStation.Extension.config`:
  - **Remote Hardware station:** The file is located under the IIS Hardware station site location.
5. Add the following section to the `composition` section of the config file.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.PosnetThermalFVFiscalPrinterSample" />
```

6. Restart the Hardware station service:
  - **Remote Hardware station:** Restart the Hardware station site from IIS Manager.

### Set up the registration process

To enable the registration process, follow these steps to set up Headquarters. For more details, see [Set up a fiscal registration process](#).

1. Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Fiscal Connectors**. Import the configuration from `RetailSdk\SampleExtensions\HardwareStation\Extension.Posnet.ThermalDeviceSample\Configuration\ConnectorConnectorPos`
2. Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Fiscal Document providers**. Import the configuration from `RetailSdk\SampleExtensions\CommerceRuntime\Extension.DocumentProvider.PosnetSample\Configuration\DocumentProvide`
3. Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Connector Technical profiles**. Create a new profile, and select the loaded connector from the earlier step. Update connection settings if an update is required.
4. Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Connector Functional profiles**. Create a new profile, and select the loaded connector and document provider from the earlier steps. Update data mapping settings, if an update is required.
5. Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Connector Functional group**. Create a new group, and select the connector functional profile from the earlier step.
6. Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Registration process**. Create a new process, and select the connector functional group from the earlier step.
7. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. Open the functionality profile that is linked to the store where the registration process should be activated. On the **Fiscal registration process** FastTab, select the registration process that was created earlier.
8. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**. Open the hardware profile that is linked to the Hardware station that the fiscal printer will be connected to. On the **Fiscal peripherals** FastTab, select the connector technical profile.
9. Open the distribution schedule (**Retail and Commerce > Retail and Commerce IT > Distribution schedule**), and select jobs `1070` and `1090` to transfer data to the channel database.

### Production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Complete the steps that are described in the [Enable extensions](#) section earlier in this topic.
2. Make the following changes in the package configuration files under the `RetailSdk\Assets` folder:
  - In the `commerceruntime.ext.config` and `CommerceRuntime.MPOSOOffline.Ext.config` configuration files, add the following line to the `composition` section.

```
<add source="assembly" value="Contoso.Commerce.Runtime.Extensions.DocumentProvider.PosnetSample" />
```

- In the `HardwareStation.Extension.config` configuration file, add the following line to the `composition` section.

```
<add source="assembly"
value="Contoso.Commerce.HardwareStation.PosnetThermalFVFiscalPrinterSample" />
```

3. Make the following changes in the **BuildTools\Customization.settings** package customization configuration file:

- Add the following line to include the CRT extension in the deployable packages.

```
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.Extensions.DocumentProvider.PosnetSample.dll"/>
```

- Add the following line to include the Hardware station extension in the deployable packages.

```
<ISV_HardwareStation_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.HardwareStation.PosnetThermalFVFiscalPrinterSample.dll"/>
```

4. Start the MSBuild Command Prompt for Visual Studio utility, and run **msbuild** under the Retail SDK folder to create deployable packages.
5. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).

## Design of extensions

### Commerce runtime extension design

The purpose of the extension that is a fiscal document provider is to generate printer-specific documents and handle responses from the fiscal printer.

The Commerce runtime extension is **Runtime.Extensions.DocumentProvider.PosnetSample**. This extension generates a set of printer-specific commands in JavaScript Object Notation (JSON) format that are defined by POSNET specification 19-3678.

For more details about the design of the fiscal integration solution, see [Fiscal registration process and fiscal integration samples for fiscal devices](#).

#### Request handler

The **DocumentProviderPosnetProtocol** request handler is the entry point for the request to generate documents from the fiscal printer.

The handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the connector document provider name that is specified in Headquarters.

The connector supports the following requests:

- **GetFiscalDocumentDocumentProviderRequest** – This request contains information about what document should be generated. It returns a printer-specific document that should be registered in the fiscal printer.
- **GetSupportedRegistrableEventsDocumentProviderRequest** – This request returns the list of events to subscribe to. Currently, the following events are supported: sales, printing X report, and printing Z report.

#### Configuration

The configuration file is found in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the document provider to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added:

- VAT rates mapping
- Tender type mapping
- Deposit payment type

### Hardware station extension design

The purpose of the extension that is a fiscal connector is to communicate with the fiscal printer.

The Hardware station extension is **HardwareStation.Extension.PosnetThermalFVFiscalPrinterSample**. This extension calls the functions of the POSNET driver to submit commands that the Commerce runtime extension generates to the fiscal printer. It also handles device errors.

#### Request handler

The **FiscalPrinterHandler** request handler is the entry point for handling the request to the fiscal peripheral device.

The handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the fiscal connector name that is specified in Headquarters.

The connector supports the following requests:

- **SubmitDocumentFiscalDeviceRequest** – This request sends documents to printers and returns the response from the fiscal printer.
- **IsReadyFiscalDeviceRequest** – This request is used for a health check of the device.
- **InitializeFiscalDeviceRequest** – This request is used for printer initialization.

#### **Configuration**

The configuration file is located in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the connector to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added:

- **Connection string** – This string describes the details of the connection to the device in a format that is supported by the driver. For details, see the POSNET driver documentation.
- **Date and time synchronization** – This setting specifies whether the date and time of the printer must be synced with the connected Hardware station.
- **Device timeout** – The amount of time, in milliseconds, that the driver will wait for a response from the device. For details, see the POSNET driver documentation.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Customer information management for Poland

2/18/2021 • 7 minutes to read • [Edit Online](#)

## Introduction

This topic describes how you can handle customer information, such as the customer's value-added tax (VAT) number, in Retail point of sale (POS) for Poland.

You can specify the customer's VAT number when you create or edit a customer master record in POS. You can also specify a VAT number for a sales transaction by copying it from the transaction customer or entering it manually. The customer information can then be printed on both regular and fiscal receipts, and it can be used for invoicing purposes.

### NOTE

This functionality is available in version 10.0.7 and later.

## Setup

You must complete the following configuration to use this functionality:

- Set up a registration type for the VAT number.
- Add the **Add customer information** operation to screen layouts.
- Activate the inquiry for customer information.
- Set up receipt formats.
- Configure channel components.

### Set up a registration type for the VAT number

Before VAT numbers can be specified in POS, you must create an appropriate registration type for the VAT number and link it to the **VAT ID** registration category. For more information about how to work with registration types and registration IDs, see [Registration IDs](#).

### WARNING

If a registration type isn't created or isn't linked to the **VAT ID** registration category, an error will be generated in POS when VAT number is filled in for a customer address.

### Add the Add customer information operation to screen layouts

The **Add customer information** operation can be used to add customer information, such as the VAT number, to a sales transaction. This information can be copied from the customer that is specified for the transaction, or it can be manually entered.

On the **Button grids** page, select the button grid where the operation should appear, and open the Button grid designer. Add a new button, and then, in the **Action** field, select **Add customer information**. For more information about how to work with screen layouts and button grids, see [Screen layouts for the point of sale \(POS\)](#).

### Activate the inquiry for customer information

If the customer information isn't specified for a sales transaction, an inquiry for that information can be

triggered automatically after the transaction is finalized. This approach is an alternative to the **Add customer information** operation.

To activate the inquiry for customer information, set the **Enable inquiry of customer information in sales transactions** option to **Yes** in the **Tax parameters** section on the **Functions** FastTab of the **POS functionality profiles** page.

### Set up receipt formats

You can configure receipt formats so that the customer's VAT number is printed on receipts.

#### NOTE

The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, on the **POS** tab, add the following record for the label of the custom field for receipt formats. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the following table are just examples. You can change them to meet your requirements. However, the **Text ID** value that you use must be unique, and it must be equal to or more than 900001.

LANGUAGE ID	TEXT ID	TEXT
en-US	900001	VAT number

On the **Custom fields** page, add the following record for the custom field for receipt formats. Note that the **Caption text ID** value must correspond to the **Text ID** value that you specified on the **Language text** page.

NAME	TYPE	CAPTION TEXT ID
FISCALCUSTOMER_VATID_PL	Receipt	900001

In the Receipt format designer, add the custom field to the appropriate receipt section for every receipt format that is required. For more information about how to work with receipt formats, see [Receipt templates and printing](#).

### Configure channel components

To make the functionality that is specific to Poland available, you must configure extensions for channel components. For more information, see the [Deployment guidelines](#) section later in this topic.

## Example scenarios

The following example scenarios show how to work with customer information in POS for Poland.

#### Scenario 1: Make a sale to an anonymous customer

1. Sign in to POS.
2. Add items to the cart.
3. Select **Add customer information**, and then select **Enter manually**.
4. Enter the customer's VAT number, and then select **OK**.
5. Register payments for the transaction, and then finalize the transaction.
6. Verify that the printed receipt contains the customer's VAT number.

#### Scenario 2: Make a sale to a new named customer

1. Sign in to POS.
2. Add items to the cart.
3. Select **Add customer**, and then select **New**.
4. Specify the new customer's attributes.
5. Select **Create a new address**. Then specify the new customer's contact information and an address.
6. In the **VAT number** field, enter the customer's VAT number.
7. Save the customer record and the customer address record, and add the customer to the transaction.
8. Register payments for the transaction, and then finalize the transaction.
9. Because the inquiry for customer information has been activated, but customer information hasn't been added to the transaction, the **Enter customer information** dialog box is opened. Select **Yes**, and then select **Copy from transaction customer**.
10. Verify the customer's VAT number, and then select **OK**.
11. Verify that the printed receipt contains the customer's VAT number.

#### NOTE

If you must specify a different customer for the transaction, you must clear the customer information and then copy it again after the new customer is added.

### Scenario 3: Change the customer information for a sale to a named customer

1. Sign in to POS.
2. Add items to the cart.
3. Select **Add customer**, and then select a customer account to add it to the transaction.
4. Select **Add customer information**, and then select **Copy from transaction customer**.
5. Verify the customer's VAT number, and then select **OK**.
6. Select **Add customer information**, and then select **Clear** to clear the customer information from the transaction.
7. Select **Add customer information**, and then select **Enter manually**.
8. Specify the customer's VAT number, and then select **OK**.
9. Register payments for the transaction, and then finalize the transaction.
10. Verify that the printed receipt contains the customer's VAT number.

## Deployment guidelines

This section provides deployment guidance for enabling customer information management in the localization of Dynamics 365 Commerce for Poland.

#### NOTE

Some steps in these procedures vary, depending on the product version you're using. For more information, see [What's new or changed in Dynamics 365 for Retail](#).

If you want to enable the integration of POS with fiscal printers for Poland, and specifically if you want to print customer VAT numbers on fiscal receipts, you must deploy the [fiscal printer integration sample for Poland](#).

### Update customizations

Follow these steps to update customizations.

- [Retail 10.0.7 and later](#)
- [Retail 10.0.12 and later](#)

If any of your customizations include request handlers for the `SaveCartRequest` or `CreateSalesOrderServiceRequest` requests:

1. Find the request handler for `SaveCartRequest`.
2. Find the line of code that runs the original request handler.
3. Add the following lines before calling the original request handler:

```
using Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdPoland.Services;  
  
...  
  
new TaxRegistrationIdFiscalCustomerService().Execute(request);
```

4. Find the request handler for `CreateSalesOrderServiceRequest`.
5. Find the line of code that runs the original request handler.
6. Replace it with the following code:

```
using Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdPoland.Services;  
  
...  
  
return new TaxRegistrationIdFiscalCustomerService().Execute(request);
```

## Update a development environment

Follow these steps to update a development environment.

### CRT extension components

1. Find the extension configuration file for the Commerce runtime (CRT):
  - **Commerce Scale Unit:** Find the `CommerceRuntime.Ext.config` file in the `bin\ext` folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Find the `CommerceRuntime.MPOSOffline.Ext.config` file under the local CRT client broker location.
2. Register the CRT extension in the extension configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdPoland" />
```

### WARNING

Do not edit the `CommerceRuntime.config` and `CommerceRuntime.MPOSOffline.config` files. These files aren't intended for any customizations.

### Modern POS extension components

Follow these steps to make the `TaxRegistrationId.PL` extension available.

1. Open the solution at `RetailSdk\POS\ModernPOS.sln`.
2. In `POS.Extensions\extensions.json`, turn on the extension.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/TaxRegistrationId.PL"
    }
  ]
}
```

3. Build the solution.
4. Open Modern POS, and test the functionality.

#### Cloud POS extension components

Follow these steps to make the TaxRegistrationId.PL extension available.

1. Open the solution at RetailSdk\POS\CloudPOS.sln.
2. In POS.Extensions\extensions.json, turn on the extension.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/TaxRegistrationId.PL"
    }
  ]
}
```

3. Build the solution.
4. Open Cloud POS, and test the functionality.

#### Update a production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply the packages in a production environment.

1. In the CommerceRuntime.Ext.config and CommerceRuntime.MPOSOffline.Ext.config configuration files under the RetailSdk\Assets folder, add the following lines to the composition section.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdPoland" />
```

2. Turn on the TaxRegistrationId.PL POS extension.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/TaxRegistrationId.PL"
    }
  ]
}
```

3. Run **msbuild** for the whole Retail software development kit (SDK) to create deployable packages.
4. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Retail SDK packaging](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cash register functionality for France

2/18/2021 • 16 minutes to read • [Edit Online](#)

This topic provides an overview of the cash register functionality that is available for France in Dynamics 365 Commerce. It also provides guidelines for setting up the functionality.

The functionality consists of the following parts:

- Common point-of-sale (POS) features that are available to customers in all countries or regions. Examples include an option to register various events in the POS audit log.
- France-specific features, such as digital signatures for sales transactions.

## Overview

### Common POS features

To learn about POS features that are available to customers in all countries or regions, see [Commerce home page](#).

The following POS localization features that are available to customers in all countries or regions can now be used specifically for France:

- **Register additional events in the POS audit event log.** If the **Audit** option in the POS functionality profile is set to **Yes**, the following events are registered in the POS audit event log:
  - Sign-in
  - Sign-out
  - Printing a copy of a receipt
  - Starting offline mode
  - Ending offline mode
  - Cleanup of transactions from the channel database

### France-specific POS features

The following France-specific POS features are enabled when the **ISO code** field in the POS functionality profile is set to **FR**.

#### Digital signing overview

The following types of data (transactions and events) are digitally signed in POS:

- Sales transactions
- Copies of receipts
- Closed shift/Z reports
- Audit events

The signature is created and recorded in the channel database at the same time that the transaction is finalized or the event is registered. The data that is signed is a text string that consists of several data fields. These fields vary, depending on the type of data. The general signing process consists of the following steps:

1. Based on the type of data, select the next sequential number for signing purposes.
2. Extract the data fields that must be signed from the record that is being signed.
3. Build a string that consists of a comma-separated list of the data fields.
4. Add the previous signature for the same type of data.

5. Calculate a hash code of the string by using the SHA-x algorithm.
6. Encrypt the resulting string by using a digital certificate.
7. Do the base64url transformation for the resulting string.
8. Store the string that is used for signing, the sequential number, the signature, and the thumbprint of the certificate in a fiscal response record that is linked to the transaction or event.
9. Transfer the fiscal response to the enterprise resource planning (ERP) system in Headquarters, together with the transaction or event.

#### **Digital signing of sales transactions**

Only transactions for cash sales are signed. Here are some examples of transactions that are excluded from the signing process:

- Prepayments (customer account deposits)
- Quotations
- Prepayments for sales orders (customer order deposits)
- Issuing a gift card and adding funds to a gift card
- Non-sales transactions (float entry, tender removal, and so on)

The data that is signed for a sales transaction is a text string that consists of the following data fields:

1. The total amount of sales lines. The amount includes tax per tax rate.
2. The total amount of sales. The amount includes tax.
3. The date and time of the transaction, in the format YYYYMMDDHHMMSS.
4. The register number.
5. The sequential number of the signed sales transaction.
6. The type of sales transaction.
7. A value (Y/N) that indicates whether the transaction is the first signed sales transaction for the register.
8. The previous signature for the same register. A blank value is used for the first signed sales transaction.

You can view the transaction signature, together with the transaction data that was used to generate it, on the **Fiscal transactions** FastTab of the **Store transactions** page in Headquarters.

#### **Digital signing of receipt copies**

When a copy of a receipt is printed, the event is registered in the POS audit event log. Only copies of receipts for signed sales transactions are signed. The data that is signed for a receipt copy event is a text string that consists of the following data fields:

1. The receipt number of the original sales transaction.
2. The type of transaction for the original sales transaction.
3. The number of the receipt copy for this sales transaction.
4. The staff ID of the operator who is printing the receipt copy.
5. The date and time of the receipt copy event, in the format YYYYMMDDHHMMSS.
6. The sequential number of the signed receipt copy event.
7. A value (Y/N) that indicates whether the transaction is the first signed receipt copy event for the register.
8. The previous signature for the same register. A blank value is used for the first signed receipt copy event.

You can view the signature of the receipt copy, together with the event data that was used to generate it, on the **Signature** tab of the **Audit events** page in Headquarters.

#### **Digital signing of closed shifts**

When a shift is closed, the event is registered in the POS audit event log. The data that is signed for a shift closing event is a text string that consists of the following data fields:

1. The total amount of sales. The amount includes tax per tax rate.

2. The total amount of sales. The amount includes tax.
3. The date and time of the shift closing event, in the format YYYYMMDDHHMMSS.
4. The sequential number of the shift closing event.
5. A value (Y/N) that indicates whether the transaction is the first signed shift closing event for the register.
6. The previous signature for the same register. A blank value is used for the first signed shift closing event.

You can view the signature of a closed shift, together with the shift data that was used to generate it, on the **Signature** tab of the **Shifts** page in Headquarters.

#### **Digital signing of events**

The data that is signed for an event other than a receipt copy or shift closing event is a text string that consists of the following data fields:

1. The sequential number of the signed event.
2. A predefined event code.
3. A description of the event.
4. The date and time of the event.
5. The staff ID of the operator who raised the event.
6. The register number.
7. A value (Y/N) that indicates whether the transaction is the first signed event for the register.
8. The previous signature for the same register. A blank value is used for the first signed event.

You can view the event signature, together with the event data that was used to generate it, on the **Signature** tab of the **Audit events** page in Headquarters.

#### **Receipts**

Receipts for France can include additional information that was implemented by using custom fields:

- **Transaction type** – You can add a field to a receipt format layout to identify the type of transaction. For example, a sales receipt will include the text "Sales."
- **Sequential number of signed sales transaction** – A receipt can include the sequential number of a signed sales transaction. This number is used to associate the printed receipt with a digital signature in the database.
- **Extract from digital signature** – A receipt can include an extract from the digital signature. This extract is used to confirm that the transaction is signed. It consists of a concatenation of the third, seventh, thirteenth, and nineteenth symbols of the signature.
- **Reprint number** – An original receipt or a receipt copy can include the number of the receipt copy. For an original receipt, the value is **0** (zero).
- **Line count** – A receipt can include the number of printed item lines on the receipt.
- **Sales totals** – Custom fields for receipt totals exclude non-sales amounts from the total transaction amounts. Non-sales amounts include amounts for the following operations:
  - Prepayments (customer account deposits)
  - Prepayments for sales orders (customer order deposits)
  - Issuing a gift card
  - Adding funds to a gift card
- **Certification data** – A receipt can include the category and number of the certificate of compliance that an authorized body issued per the NF 525 certification requirements.
- **Build number** – A receipt can include the POS build number.

### Restricting the duration of shifts

There is an option to enforce daily shift closing in POS. A shift can't last longer than the time that is specified in the **Shift closing time** field. Several minutes before that time, the operator will start to receive warnings that the shift must be closed. The number of minutes is determined by the value of the **Shift closing interval (minutes)** field.

### X and Z reports

The information that is included on X and Z reports is based on French requirements:

- **Total sales** for the shift. This information includes amounts only for cash sales transactions. Prepayments and operations for issuing a gift card are excluded.
- **Total returns** for the shift.
- **Cumulative grand total**. This amount is calculated as the cumulative grand total amount of the previous shift plus the total sales amount of this shift minus the absolute value of the total returns amount of this shift.
- **Cumulative perpetual grand total**. This amount is calculated as the cumulative perpetual grand total amount of the previous shift plus the total sales amount of this shift plus the absolute value of the total returns amount of this shift.
- Value-added tax (VAT) amounts per tax rate.

The totals are also stored in the closed shift record and transferred to Headquarters.

### Period grand total journal

Period grand total journals summarize sales totals per store and fiscal period.

Period grand total journals are maintained on the **Period grand total journal** page. To create a new journal, you must specify a store. If previous journals exist for the store, the next fiscal period after the last closed journal for the store is automatically used as the new journal period. If previous journals do not exist, you can specify the end date of the journal. In this case, the fiscal period that includes the specified date is used as the journal period.

The journal can then be calculated. Shifts that were closed during the journal period are selected, and totals are calculated for those shifts. You can view the journal's tax totals per sales tax code. You can also view the shifts that are included in the journal.

After the journal is calculated, it can be closed. A closed journal can't be modified, and another journal can't be created for a previous period, the same period, or an intersecting period. However, the last closed journal for a store can be canceled. In that case, another journal can be created for the same store and period.

A closed journal is digitally signed. You can view the journal signature, together with the journal data that was used to generate it, on the **Signature details** tab of the **Period grand total journal** page in Headquarters.

### Archive

An archive is an XML file that can be exported from a Period grand total journal that has been closed. It includes the totals for the closed period, and also includes detailed data about sales transactions and events. The exported file is digitally signed, and the signature is contained in a separate file.

The archive format is implemented by using [Electronic reporting \(ER\)](#).

## Setting up Commerce for France

This section describes the Commerce settings that are specific to and recommended for France. For more information, see [Commerce home page](#).

To use the France-specific functionality, you must complete these tasks:

- Set the **Country/region** field to **FRA** (France) in the primary address of the legal entity.
- Set the **ISO code** field to **FR** (France) in the POS functionality profile of every store that is located in France.

You must also specify the following settings for France. Note that you must run appropriate distribution jobs after you complete the setup.

### Set up the legal entity

You must make the following changes on the **Legal entities** page. These settings are used in the archive format.

- On the **Bank account information** FastTab, in the **Routing number** field, specify the VAT identifier of the organization.
- On the **Statutory reporting** FastTab, in the **NAF code** field, specify the Nomenclature des Activités Françaises (NAF) code of the organization.
- On the **Tax registration** FastTab, in the **Tax registration number** field, specify the Système d'identification du répertoire des établissements (SIRET) number of the organization.

### Set up VAT per French requirements

You must create sales tax codes, sales tax groups, and item sales tax groups. You must also set up sales tax information for products and services. For more information about how to set up and use sales tax, see [Sales tax overview](#).

You must also specify sales tax groups and enable the **Prices include sales tax** option for stores that are located in France.

### Set up functionality profiles

You must enable auditing by setting the **Audit** option to **Yes**.

To enforce daily shift closing, you must make the following changes:

- Set the **Enforce daily shift closing** option to **Yes**.
- Set the **Shift closing time** and **Shift closing interval (minutes)** fields.

### Configure custom fields so that they can be used in receipt formats for sales receipts

You can configure the language text and custom fields that are used in the POS receipt formats. The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, add the following records for the labels of the custom fields for receipt layouts. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the table are just examples. You can change them to meet to your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or higher than 900001.

LANGUAGE ID	TEXT ID	TEXT ID
en-US	900001	Transaction type
en-US	900002	Sequential number
en-US	900003	Digital signature
en-US	900004	Reprint number
en-US	900005	Sales tax amount
en-US	900006	Sales total

LANGUAGE ID	TEXT ID	TEXT ID
en-US	900007	Sales total tax
en-US	900008	Sales total including tax
en-US	900009	Build number
en-US	900010	Certification category
en-US	900011	Certificate number
en-US	900012	Line count

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. Note that **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page.

NAME	TYPE	CAPTION TEXT ID
TRANSACTIONTYPE	Receipt	900001
SEQUENTIALNUMBER	Receipt	900002
DIGITALSIGNATURE	Receipt	900003
REPRINTNUMBER	Receipt	900004
SALESTAXAMOUNT	Receipt	900005
SALESTOTAL	Receipt	900006
SALESTOTALTAX	Receipt	900007
SALESTOTALINCLUDETAX	Receipt	900008
BUILDNUMBER	Receipt	900009
CERTIFICATIONCATEGORY	Receipt	900010
CERTIFICATENUMBER	Receipt	900011
LINECOUNT	Receipt	900012

### Configure receipt formats

For every required receipt format, change the value of the **Print behavior** field to **Always print**.

In the Receipt format designer, add the following custom fields to the appropriate receipt sections. Note that field names correspond to the language texts that you defined in the previous section.

- **Header:** Add the following field:
  - **Transaction type** – This field identifies the type of receipt.
- **Lines:** We recommend that you add the following standard fields:

- **Unit price with tax**
- **Total price with tax**
- **Tax ID**
- **Footer:** Add the following fields:
  - **Sales total** – This field prints the receipt's total cash sale amount. The amount excludes tax. Prepayments and gift card operations are excluded.
  - **Sales total tax** – This field prints the receipt's total tax amount for cash sales. Prepayments and gift card operations are excluded.
  - **Sales total including tax** – This field prints the receipt's total cash sale amount. The amount includes tax. Prepayments and gift card operations are excluded.
  - **Tax ID** – This standard field enables a sales tax summary to be printed per sales tax code. The field must be added to a new line.
  - **Sales tax amount** – This field prints the receipt's tax amount for cash sales per sales tax code. Prepayments and gift card operations are excluded. The field must be added to the same line as the **Tax ID** field.
  - **Sequential number** – This field prints the sequential number of a signed sales transaction.
  - **Digital signature** – This field prints the extract from the digital signature.
  - **Reprint number** – This field prints the number of a receipt copy.
  - **Build number** – This field prints the POS build number.
  - **Certification category** – This field prints the category of the certificate of compliance that an authorized body issued per the NF 525 certification requirements.
  - **Certificate number** – This field prints the number of the certificate of compliance that an authorized body issued per the NF 525 certification requirements.
  - **Line count** – This field prints the number of printed item lines on a receipt.
  - **Text** – Add a text field, and specify the VAT identifier of the organization.
  - **Text** – Add a text field, and specify the NAF code of the organization.
  - **Text** – Add a text field, and specify the SIRET number of the organization.
  - **Store name** – This standard field prints the name of the store.
  - **Store address** – This standard field prints the address of the store.

For more information about how to work with receipt formats, see [Set up and design receipt formats](#).

### **Configure the digital signature parameters for Headquarters**

To digitally sign Period grand total journals and archives, you must set up digital signature parameters. The signing is done by using a digital certificate that is stored in Microsoft Azure Key Vault storage. The following steps must be completed before you can use a certificate that is stored in Key Vault storage:

- The Key Vault storage must be created. We recommend that you deploy the storage in the same geographical region as the Commerce Scale Unit.
- The certificate must be uploaded to the Key Vault storage.
- The Application Object Server (AOS) application must be authorized to read secrets from the Key Vault storage.

For more information about how to work with Key Vault, see [Get started with Azure Key Vault](#).

Then, on the **Key Vault parameters** page, you must specify the parameters for accessing the Key Vault storage:

- **Name and Description** – The name and description of the Key Vault storage.
- **Key Vault URL** – The URL of the Key Vault storage.
- **Key Vault client** – An interactive client ID of the Azure Active Directory (Azure AD) application that is associated with the Key Vault storage for authentication purposes. This client should have access to read

secrets from the storage.

- **Key Vault secret key** – A secret key that is associated with the Azure AD application that is used for authentication in the Key Vault storage.
- **Name, Description, and Secret reference** – The name, description, and secret reference of the certificate.

Finally, on the **Commerce parameters** page, you must specify the parameters for digital signatures:

- **Certificate** – Select the certificate that you configured in the previous step.
- **Hash function** – Specify one of the cryptographic hash algorithms that are supported by Microsoft .NET, such as **SHA1**.
- **Encoding** – Specify the encoding of the signed data, such as **UTF-8**.

### Configure the archive export format

You can download the ER configuration for the archive from Microsoft Dynamics Lifecycle Services (LCS). For more information, see [Import electronic reporting configurations](#). You must download the following versions, or later versions, of the configurations:

- **Retail channel data.version.2** data model
- **Archiving DMM.version.2.3** data model mapping
- **Retail data archive FR .version.2.5** format

After you import the configurations, on the **Commerce parameters** page, on the **Electronic documents** tab, in the **Retail data archive export format** field, select the **Retail data archive FR .version.2.5** format.

### Renitalize Commerce components

#### NOTE

You only need to complete the steps of this section if you are updating an existing environment.

To enable audit events, you must reinitialize the Commerce Extensible enumerations. To enable transmitting France-specific data from POS to HQ, you must reinitialize the Commerce Scheduler.

On the **General** FastTab of the **Commerce parameters** page, click **Initialize**. For more information, see [Initialize seed data in new Retail environments](#)

There is an option to separately configure the scheduler. Click **Commerce scheduler** > **Initialize commerce scheduler**. On the **Initialize Commerce scheduler** page, click **OK**.

### Configure channel components

To enable France-specific functionality, you must configure extensions for channel components. For more information, see the [deployment guidelines](#).

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Deployment guidelines for cash registers for France

2/18/2021 • 20 minutes to read • [Edit Online](#)

This topic is a deployment guide that shows how to enable the Dynamics 365 Commerce localization for France. The localization consists of several extensions of components. For example, the extensions let you print custom fields on receipts, register additional audit events, sales transactions, and payment transactions in Point of Sale (POS), digitally sign sales transactions, and print X and Z reports in local formats. For more information about the localization for France, see [Cash register functionality for France](#).

This localization is part of the Retail software development kit (SDK). For information about how to install and use the SDK, see the [Retail software development kit \(SDK\) architecture](#).

This localization consists of extensions for the Commerce runtime (CRT), Retail Server, and POS. To run this sample, you must modify and build the CRT, Retail Server, and POS projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Microsoft Visual Studio Online (VSO), where no files have been changed yet.

## NOTE

In Commerce 10.0.8 and above, Retail Server is known as Commerce Scale Unit. Because this topic applies to multiple previous versions of the app, *Retail Server* is used throughout the topic.

## Storing a certificate for digital signing in Azure Key Vault

The digital signature extension uses a certificate that is installed in the local certificate storage of the machine where Retail Server is deployed. The thumbprint of the certificate must be specified in the configuration file (see the [SequentialSignatureRegister component](#) section later in this topic). Depending on the implementation topology, the certificate might have to be stored in [Microsoft Azure Key Vault storage](#). The localization for France contains a code sample that shows how to override the signing flow and sign sales transactions by using a certificate that is stored in Azure Key Vault storage.

### Prerequisites

The following steps must be completed before you can use a certificate that is stored in Azure Key Vault storage:

- The Azure Key Vault storage must be created. We recommend that you deploy the storage in the same geographical region as the Retail Server.
- The certificate must be uploaded to the storage.
- The Retail Server application must be authorized to read secrets from the storage.

For more information about how to work with Azure Key Vault, see [Get started with Azure Key Vault](#).

### Using the sample

The `DigitalSignatureKeyVaultSample` project contains sample code that uses a certificate that is stored in Azure Key Vault storage. To use the sample in a production environment, you must implement logic so that the following parameters can be specified in the `HashAndSignData` method of the `CertificateSignatureServiceRequestHandler` class:

- **Azure Key Vault URL** – The URL of the Azure Key Vault storage.

```
settings.Add(WellKnownKeyVaultSettings.KeyVaultUrl, "Set your Azure Key Vault URL here");
```

- **Client ID** – An interactive client ID of the Azure Active Directory (Azure AD) application that is associated with the Azure Key Vault storage for authentication purposes. This client should have access to read secrets from the Azure Key Vault storage.

```
settings.Add(WellKnownKeyVaultSettings.KeyVaultInteractiveClientId, "Set the client ID here");
```

- **Client secret** – A secret key that is associated with the Azure AD application that is used for authentication in the Azure Key Vault storage.

```
// Secret key value should be encrypted and stored in a safe place.
settings.Add(WellKnownKeyVaultSettings.KeyVaultClientSecretKey, "Set the secret key here");
```

- **Secret reference** – A secret reference to the certificate.

```
SecretCertificate secretCertificate = settingsHelper.SecretProvider.GetSecret("vault:///{{Specify the secret reference}}") as SecretCertificate;
```

To override the signing flow, follow these steps.

1. Build the **DigitalSignatureKeyVaultSample** project, and copy the **Contoso.Commerce.Runtime.DigitalSignatureKeyVaultSample.dll** assembly to the **bin\ext Retail Server** folder.
2. Update the **commerceRuntime.ext.config** file by adding the following line to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DataSignatureKeyVaultSample" />
```

#### NOTE

The thumbprint of the certificate that is used for digital signing should be specified in the configuration file of the **SequentialSignatureRegister** assembly, even if the certificate is stored in Azure Key Vault storage. For more information, see the [SequentialSignatureRegister component](#) section later in this topic.

### Using certificate profiles in Commerce channels

In Commerce version 10.0.15 and later, you can use the [User-defined certificate profiles for retail stores](#) feature that supports failover to offline when Key Vault or Headquarters are not available. The feature extends the [Manage secrets for retail channels](#) feature.

To apply the new feature in the CRT extension, follow these steps.

1. Create a new CRT extension project (C# class library project type). Use the sample templates from the Retail software development kit (SDK) (RetailSDK\SampleExtensions\CommerceRuntime).
2. Add custom handler for **CertificateSignatureServiceRequest** in the **SequentialSignatureRegister** project.
3. To read a secret call, **GetUserDefinedSecretCertificateServiceRequest** using a constructor with **profileId** parameter. That will start the functionality working with settings from Certificate profiles. Based on the settings, the certificate will be retrieved either from Azure Key Vault or local machine storage.

```
GetUserDefinedSecretCertificateServiceRequest getUserDefinedSecretCertificateServiceRequest = new
GetUserDefinedSecretCertificateServiceRequest(profileId: "ProfileId", secretName: null, thumbprint: null,
expirationInterval: null); GetUserDefinedSecretCertificateServiceResponse
```

```
getUserDefinedSecretCertificateServiceResponse =  
request.RequestContext.Execute(getUserDefinedSecretCertificateServiceRequest);  
  
X509Certificate2 Certificate = getUserDefinedSecretCertificateServiceResponse.Certificate;
```

4. When the certificate is retrieved, proceed with data signing.
5. Build the CRT extension project.
6. Copy the output class library and paste it into ...RetailServer\webroot\bin\Ext for manual testing.
7. In the CommerceRuntime.Ext.config file, update the extension composition section with the custom library information.

## Specifying application attributes that will be printed on receipts

You can use custom fields to print the following application attributes on receipts:

- **Build number** – The software version of the POS application. By default, the value should equal the POS build number that Microsoft assigned to the POS application.
- **Certificate category** and **Certificate number** – The category and number of the certificate of compliance that an accredited body issues for the application. By default, the values equal the category and the number of the certificate that is granted to Microsoft:
  - Microsoft Dynamics 365 for Commerce:
    - **Certificate category:** C
    - **Certificate number:** 18/0202
  - Microsoft Dynamics 365 for Commerce:
    - **Certificate category:** B
    - **Certificate number:** 18/0203

### NOTE

By default, the certificate category and number that are assigned are printed. If you're implementing Commerce, you must override the certificate category and number.

If you customize the POS application, and your customizations affect the compliance of the application, you might have to request a new certificate of compliance from an accredited body. In this case, you must override the build number, and the certificate category and number. Otherwise, the default values for the certificate category and number will be printed, but you must still specify the POS build number that Microsoft assigned to the POS application.

### Overriding the build number

The software version/build number and publisher are specified in `RetailSDK\BuildTools\Customization.settings`.

```
<CustomVersion Condition="'$(CustomVersion)' == ''>1.0.0.1</CustomVersion>  
<CustomName Condition="'$(CustomName)' == ''>Contoso Retail Customization</CustomName>  
<CustomDescription Condition="'$(CustomDescription)' == ''>Contoso Retail Customization</CustomDescription>  
<CustomPublisher Condition="'$(CustomPublisher)' == ''>CN=Contoso Ltd.</CustomPublisher>  
<CustomPublisherDisplayName Condition="'$(CustomPublisherDisplayName)' == ''>Contoso Ltd.  
</CustomPublisherDisplayName>  
<CustomCopyright Condition="'$(CustomCopyright)' == ''>Copyright © 2016</CustomCopyright>
```

### Overriding the certificate category and number

The certificate category and number are specified in

`RetailSDK\SampleExtensions\CommerceRuntime\Extensions.ReceiptsFrance\GetSalesTransactionCustomReceiptFieldService`.

```
/// <summary>
/// Certification category.
/// </summary>
private const string CertificationCategory = "C";

/// <summary>
/// Certificate number.
/// </summary>
private const string CertificateNumber = "18/0202";
```

#### NOTE

You must also override the certificate category and number if you're implementing Commerce. In this case, use the certificate category and number that are provided in the [Specifying application attributes that will be printed on receipts](#) section earlier in this topic.

## Development environment

Follow these steps to set up a development environment so that you can test and extend the localization functionality.

### CRT extension components

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under `RetailSdk\SampleExtensions\CommerceRuntime`.

#### CommonFrance component

1. Find the `Runtime.Extensions.CommonFrance` project, and build it.
2. In the `Extensions.CommonFrance\bin\Debug` folder, find the `Contoso.Commerce.Runtime.CommonFrance.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Retail Server:** Copy the assembly to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Retail Server site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.CommonFrance" />
```

#### ReceiptsFrance component

1. Find the `Runtime.Extensions.ReceiptsFrance` project, and build it.
2. In the `Extensions.ReceiptsFrance\bin\Debug` folder, find the

**Contoso.Commerce.Runtime.ReceiptsFrance.dll** assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.ReceiptsFrance" />
```

#### **SalesPaymentTransExt component**

1. Find the `Runtime.Extensions.SalesPaymentTransExt` project, and build it.

2. In the `Extensions.SalesPaymentTransExt\bin\Debug` folder, find the `Contoso.Commerce.Runtime.SalesPaymentTransExt.dll` assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SalesPaymentTransExt" />
```

#### **SalesPaymentTransExtFrance component**

1. Find the `Runtime.Extensions.SalesPaymentTransExtFrance` project, and build it.

2. In the `Extensions.SalesPaymentTransExtFrance\bin\Debug` folder, find the `Contoso.Commerce.Runtime.SalesPaymentTransExtFrance.dll` assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and

it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SalesPaymentTransExtFrance" />
```

#### SequentialSignatureFrance component

1. Find the `Runtime.Extensions.SequentialSignatureFrance` project, and build it.
2. In the `Extensions.SequentialSignatureFrance\bin\Debug` folder, find the `Contoso.Commerce.Runtime.SequentialSignatureFrance.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Retail Server:** The file is named `commercerruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SequentialSignatureFrance" />
```

#### SequentialSignatureRegister component

1. Find the `Runtime.Extensions.SequentialSignatureRegister` project.
2. Modify the `App.config` file by specifying the thumbprint, store location, and store name for the certificate that should be used to sign sales transactions. The `certificateThumbprint` property is the only mandatory property. The value must be a string that is 40 characters long in upper case and that doesn't include any delimiters. For more information, see [How to retrieve the thumbprint of a certificate](#).

```
<?xml version="1.0" encoding="utf-8"?>
<configuration>
  <configSections>
    <section name="SequentialSignatureRegister"
type="Contoso.Commerce.Runtime.SequentialSignatureRegister.Configuration.SequentialSignatureRegisterC
onfigSection, Contoso.Commerce.Runtime.SequentialSignatureRegister"/>
  </configSections>
  <SequentialSignatureRegister certificateThumbprint="insert key certificateThumbprint here"
certificateStoreLocation="LocalMachine" certificateStoreName="My"/>
  <startup>
    <supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.5.1"/>
  </startup>
</configuration>
```

3. Build the project.
4. In the `Extensions.SequentialSignatureRegister\bin\Debug` folder, find the following files:
  - The `Contoso.Commerce.Runtime.SequentialSignatureRegister.dll` assembly file
  - The `Contoso.Commerce.Runtime.SequentialSignatureRegister.dll.config` configuration file
5. Copy the files to the CRT extension folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

6. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOffline.Ext.config`, and it's under the local CRT client broker location.

7. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SequentialSignatureRegister" />
```

#### **SequentialSignatureRegister.Contracts component**

1. Find the `Runtime.Extensions.SequentialSignatureRegister.Contracts` project, and build it.

2. In the `Extensions.SequentialSignatureRegister.Contracts\bin\Debug` folder, find the `Contoso.Commerce.Runtime.SequentialSignatureRegister.Contracts.dll` assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

#### **XZReportsFrance component**

1. Find the `Runtime.Extensions.XZReportsFrance` project, and build it.

2. In the `Extensions.XZReportsFrance\bin\Debug` folder, find the `Contoso.Commerce.Runtime.XZReportsFrance.dll` assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.XZReportsFrance" />
```

#### **RestrictingShiftDuration component**

- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

1. Find the `Runtime.Extensions.RestrictingShiftDuration` project, and build it.

2. In the `Extensions.RestrictingShiftDuration\bin\Debug` folder, find the

Contoso.Commerce.Runtime.RestrictingShiftDuration.dll assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commercerruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.RestrictingShiftDuration" />
```

### Retail Server extension components

#### SalesTransactionSignature Retail Server sample component

1. In the

`RetailSDK\SampleExtensions\RetailServer\RetailServer.Extensions.SalesTransactionSignatureSample` folder, find the `RetailServer.Extensions.SalesTransactionSignatureSample` project, and build it.

2. In the `RetailServer\Extensions.SalesTransactionSignatureSample\bin\Debug` folder, find the `Contoso.RetailServer.SalesTransactionSignatureSample.dll` assembly file.

3. Copy the assembly file to the `\bin\ext` folder under the IIS Retail Server site location.

4. Find the configuration file for Retail Server. The file is named `web.config`, and it's in the root folder under the IIS Retail Server site location.

5. Register the Retail Server extensions in the `extensionComposition` section of the configuration file.

```
<add source="assembly" value="Contoso.RetailServer.SalesTransactionSignatureSample" />
```

### Proxy extension component

You must complete the following procedure to enable the extensions in offline mode for Modern POS.

#### SalesTransactionSignature Retail proxy sample component

1. In the

`RetailSDK\SampleExtensions\RetailProxy\RetailProxy.Extensions.SalesTransactionSignatureSample` folder, find the `RetailServer.Extensions.SalesTransactionSignatureSample` project, and build it.

2. In the `RetailProxy\RetailProxy.Extensions.SalesTransactionSignatureSample\bin\Debug` folder, find the `Contoso.Commerce.RetailProxy.SalesTransactionSignatureSample` assembly file.

3. Copy the assembly files to the `\ext` folder under the local CRT client broker location.

4. Register the proxy change in the extensions configuration file. The file is named `RetailProxy.MPOSOOffline.ext.config`, and it's under the local CRT client broker location.

```
<add source="assembly" value="Contoso.Commerce.RetailProxy.SalesTransactionSignatureSample" />
```

## Modern POS extension components

1. Open the solution at `RetailSdk\POS\ModernPOS.sln`, and make sure that it can be compiled without errors. Additionally, make sure that you can run Modern POS from Microsoft Visual Studio by using the **Run** command.

### NOTE

Modern POS must not be customized. You must enable User Account Control (UAC), and you must uninstall previously installed instances of Modern POS as required.

2. Include the following existing source code folders in the `Pos.Extensions` project.

- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)
- SalesTransactionSignatureSample
- SequentialSignature
- AuditEventSignatureSample
- RestrictingShiftDuration
- SalesTransBuildNumberSample

### NOTE

To view all files in the project folder, not just the files that are included in the project, select the **Show All Files** button in Solution Explorer. If this button isn't available, make sure that you selected the project. The icons of files and folders that aren't currently part of the project have a dotted outline. Right-click the folder to include in the project, and then select **Include in Project**.

3. Enable the extensions to be compiled by removing the following folders from the exclude list in `tsconfig.json`:

- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)
- SalesTransactionSignatureSample
- SequentialSignature
- AuditEventSignatureSample
- RestrictingShiftDuration
- SalesTransBuildNumberSample

4. Enable the extensions to be loaded by adding the following lines in `extensions.json`:

- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
{
  "baseUrl": "SalesTransactionSignatureSample"
},
{
  "baseUrl": "SequentialSignature"
},
{
  "baseUrl": "AuditEventSignatureSample"
},
{
  "baseUrl": "RestrictingShiftDuration"
},
{
  "baseUrl": "SalesTransBuildNumberSample"
}
```

#### NOTE

For more information, and for samples that show how to include source code folders and enable extensions to be loaded, see the instructions in the readme.md file in the **Pos.Extensions** project.

5. Rebuild the solution.
6. Run Modern POS in the debugger, and test the functionality.

#### Cloud POS extension components

1. Open the solution at **RetailSdk\POS\CloudPOS.sln**, and make sure that it can be compiled without errors.
2. Include the following existing source code folders in the **Pos.Extensions** project:
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)
  - SalesTransactionSignatureSample
  - SequentialSignature
  - AuditEventSignatureSample
  - RestrictingShiftDuration
  - SalesTransBuildNumberSample

#### NOTE

To view all files in the project folder, not just the files that are included in the project, select the **Show All Files** button in Solution Explorer. If this button isn't available, make sure that you selected the project. The icons of files and folders that aren't currently part of the project have a dotted outline. Right-click the folder to include in the project, and then select **Include in Project**.

3. Enable the extensions to be compiled by removing the following folders from the exclude list in **tsconfig.json**:
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)
  - SalesTransactionSignatureSample

- SequentialSignature
- AuditEventSignatureSample
- RestrictingShiftDuration
- SalesTransBuildNumberSample

4. Enable the extensions to be loaded by adding the following lines in `extensions.json`:

- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
{
  "baseUrl": "SalesTransactionSignatureSample"
},
{
  "baseUrl": "SequentialSignature"
},
{
  "baseUrl": "AuditEventSignatureSample"
},
{
  "baseUrl": "RestrictingShiftDuration"
},
{
  "baseUrl": "SalesTransBuildNumberSample"
}
```

#### NOTE

For more information, and for samples that show how to include source code folders and enable extensions to be loaded, see the instructions in the `readme.md` file in the `Pos.Extensions` project.

5. Rebuild the solution.

6. Run the solution by using the `Run` command and following the steps in the Retail SDK handbook.

7. Test the functionality.

#### Set up required parameters in Headquarters

For more information, see [Cash register functionality for France](#).

## Production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Complete the steps in the [Cloud POS extension components](#) or [Modern POS extension components](#) section earlier in this topic.
2. Make the following changes in the package configuration files under the `RetailSdk\Assets` folder:
  - a. In the `commerceruntime.ext.config` and `CommerceRuntime.MPOSOOffline.Ext.config` configuration files, add the following lines to the `composition` section:
    - [Retail 7.3.2 and later](#)
    - [Retail 7.3.5 and later](#)
    - [Retail 8.1.1 and later](#)

```
<add source="assembly" value="Contoso.Commerce.Runtime.CommonFrance" />
<add source="assembly" value="Contoso.Commerce.Runtime.ReceiptsFrance" />
<add source="assembly" value="Contoso.Commerce.Runtime.RestrictingShiftDuration" />
<add source="assembly" value="Contoso.Commerce.Runtime.SalesPaymentTransExt" />
<add source="assembly" value="Contoso.Commerce.Runtime.SalesPaymentTransExtFrance" />
<add source="assembly" value="Contoso.Commerce.Runtime.SequentialSignatureFrance" />
<add source="assembly" value="Contoso.Commerce.Runtime.SequentialSignatureRegister" />
<add source="assembly" value="Contoso.Commerce.Runtime.XZReportsFrance" />
```

To use a certificate that is stored in Azure Key Vault storage for digital signing, add the following line.

#### NOTE

Before you add this line, complete the steps in the [Storing a certificate for digital signing in Azure Key Vault](#) section earlier in this topic.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DataSignatureKeyVaultSample" />
```

- b. In the `RetailProxy.MPOSOOffline.ext.config` configuration file, add the following lines to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.RetailProxy.SalesTransactionSignatureSample" />
```

3. Make the following changes in the **Customization.settings** package customization configuration file:

- a. Add the following lines to the **ItemGroup** section to include the Commerce proxy extension in the deployable packages.

```
<ISV_RetailProxy_CustomizableFile
  Include="$(SdkReferencesPath)\Contoso.Commerce.RetailProxy.SalesTransactionSignatureSample.dll
" />
```

- b. Add the following lines to the **ItemGroup** section to include the CRT extensions in the deployable packages:

- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```

<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.CommonFrance.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.ReceiptsFrance.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.RestrictingShiftDuration.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesPaymentTransExt.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesPaymentTransExtFrance.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SequentialSignatureFrance.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SequentialSignatureRegister.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SequentialSignatureRegister.dll.config"
/>
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SequentialSignatureRegister.Contracts.d
ll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.XZReportsFrance.dll" />

```

To use a certificate that is stored in Azure Key Vault storage for digital signing, add the following line.

#### NOTE

Before you add this line, complete the steps in the [Storing a certificate for digital signing in Azure Key Vault](#) section, earlier in this topic.

```

<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DataSignatureKeyVaultSample.dll" />

```

- c. Add the following lines to the **ItemGroup** section to include the Retail Server extension in the deployable packages.

```

<ISV_RetailServer_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.RetailServer.SalesTransactionSignatureSample.dll" />

```

4. Update the Retail Server configuration file. In **RetailSDK\Packages\RetailServer\Code\web.config**, add the following lines to the **extensionComposition** section.

```

<add source="assembly" value="Contoso.RetailServer.SalesTransactionSignatureSample" />

```

5. Modify the certificate's configuration file by specifying the thumbprint, store location, and store name for the certificate that should be used to sign sales transactions. Then copy the configuration file to the **References** folder. The file is named **Contoso.Commerce.Runtime.SequentialSignatureRegister.dll.config**, and it's under **Extensions.SequentialSignatureRegister\bin\Debug**.
6. Override the build number and the category and number of the certificate of compliance, as required. For more information, see the instructions in the [Specifying application attributes that will be printed on receipts](#) section earlier in this topic.
7. Start the MSBuild Command Prompt for Visual Studio utility, and run **msbuild** under the Retail SDK

folder to create deployable packages.

8. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).

### **Enable the digital signature in offline mode for Modern POS**

To enable the digital signature in offline mode for Modern POS, you must follow these steps after you activate Modern POS on a new device.

1. Sign in to POS.
2. On the **Database connection status** page, make sure that the offline database is fully synchronized. When the value of the **Pending downloads** field is **0** (zero), the database is fully synchronized.
3. Sign out of POS.
4. Wait a while for the offline database to be fully synchronized.
5. Sign in to POS.
6. On the **Database connection status** page, make sure that the offline database is fully synchronized. When the value of the **Pending transactions in offline database** field is **0** (zero), the database is fully synchronized.
7. Restart Modern POS.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Fiscal registration service integration sample for Germany

2/18/2021 • 21 minutes to read • [Edit Online](#)

## Introduction

To meet local fiscal requirements for cash registers in Germany, the Microsoft Dynamics 365 Commerce functionality for Germany includes a sample integration of the point of sale (POS) with an external fiscal registration service. The sample extends the [fiscal integration functionality](#). It's based on the [EFR \(Electronic Fiscal Register\)](#) solution from [EFSTA](#) and enables communication with the EFR service via the HTTPS protocol. The EFR service should be hosted on either the Retail Hardware station or a separate computer that can be connected to from the Hardware station. The sample is provided in the form of source code and is part of the Retail software development kit (SDK).

Microsoft doesn't release any hardware, software, or documentation from EFSTA. For information about how to get the EFR solution and operate it, contact [EFSTA](#).

## Scenarios

The following scenarios are covered by the fiscal registration service integration sample for Germany.

### Sales operations

- **Registration of cash-and-carry sales and returns in the fiscal registration service:**

Registration of sales operations includes the following steps:

1. Registration of the transaction start

The start of each transaction is registered in a technical security element (TSE) that is connected to the EFR service. As a result of registration a TSE assigns a transaction ID (TID).

2. Registration of the transaction end

When a transaction is concluded at the POS, it's registered by using the same TID that was assigned during registration of the transaction start. At that moment, detailed transaction data is sent to the fiscal registration service. This data includes sales line information, and information about discounts, payments, and taxes.

3. Capturing a response from the fiscal registration service

Security data is received from a TSE as a part of a response and is saved in the transaction in the channel database. The security data consist of the following information: - TID - Date and time of the transaction start - Date and time of the transaction end - Signature counter - Check value - Serial number of the TSE

- **Registration of customer orders in the fiscal registration service:** The registration process is the same as the process for cash-and-carry sales and returns.
- **Registration of operations that involve gift cards and deposits:** The registration process is the same as the process for cash-and-carry sales and returns.

### Notifying users about fiscal registration failures

There are two ways that the fiscal registration service can notify users about failures that occurred during the fiscal registration:

- Print additional information from the response in the **Info message** field on receipts.

- Show notifications from the fiscal service as user messages at the POS.

#### NOTE

This notification mechanism requires that the **Show fiscal registration notifications** parameter on the **Connector technical profiles** page be turned on.

#### Printing receipts

Receipt printing is mandatory in Germany. All receipts must contain at least the following information:

- Name and address of the company
- Information about goods, including their prices and quantities
- Information about payments that were received
- Information about taxes, including total amounts per tax rate
- Security data:
  - TID
  - Date and time of the transaction start
  - Date and time of the transaction end
  - Signature counter
  - Check value
  - Serial number of the TSE
- Informational message

#### NOTE

A QR code can also be printed on receipts. Although the QR code is optional, it's highly recommended. For more information about how to get QR code as a part of a response from the fiscal registration service, see the "EFR Guide [DE]" document that is published on the [EFSTA documentation](#) website.

The **Info message** field on receipts shows a notification from the fiscal registration service. For example, if a signature device is broken, special text can be printed on a receipt.

#### Voided, suspended, and recalled transactions

- A voided transaction is registered as a request to terminate a transaction in the fiscal registration service.
- A suspended transaction is registered as a request to terminate a transaction in the fiscal registration service.
- Recall of a suspended transaction is registered as the start of a new transaction in the fiscal registration service.

#### Non-sales transactions and shift closing

The following non-sales transactions are registered as non-fiscal operations in the fiscal registration service by using the **NFS** tag:

- Declare start amount
- Float entry
- Tender removal
- Safe drop
- Bank drop
- Income accounts
- Expense accounts

The **Close shift** operation is also registered as a non-fiscal operation in the fiscal registration service by using the **NFS** tag.

### Data export and audit

All transactions must be signed by a TSE to ensure their integrity, authenticity, and completeness, and to help prevent manipulation of recorded data.

#### WARNING

Only a certified TSE can be used. For information about the types and models of TSEs that are supported in the EFR solution, see the "EFR Guide [DE]" document that is published on the [EFSTA documentation](#) website. For information about how to choose and obtain a TSE, contact [EFSTA](#).

Regulations in Germany require support for the DSFinV-K export. The DSFinV-K export can be triggered in the EFR solution. For more information about the DSFinV-K export, see the "EFR Guide [DE]" document that is published on the [EFSTA documentation](#) web-site.

### Default data mapping

The following default data mapping is included in the fiscal document provider configuration that is provided as part of the fiscal integration sample.

- **Tender type mapping:** 1: 0; 2: 1; 3: 3; 4: 8; 5: 2; 6: 0; 7: 7; 8: 6; 9: 0; 10: 8; 11: 1

#### NOTE

In each pair of values that is separated by a semicolon (;), the first number refers to a payment method that is set up for the store. The second number refers to a corresponding payment group in the EFR service, as represented by the **PayG** attribute.

- **Value-added tax (VAT) rates mapping:** A: 19.00; B: 7.00; C: 10.70; D: 5.50; E: 0.00

#### NOTE

In each pair of values that is separated by a semicolon (;), the letter refers to a tax group in the EFR service, as represented by the **TaxG** attribute. The number refers to the tax percentage.

- **Tax group for gift cards and deposits:** G
- **Tax group for VAT exempt:** F

#### WARNING

Tax settings in the default data mapping are responsible for matching tax settings in the system and tax groups in the EFR service. Tax groups can be printed on receipts only if the **Code for printing** field is set on the **Sales tax codes** page.

### Limitations of the sample

The fiscal registration service supports only scenarios where sales tax is included in prices. Therefore, the **Prices include sales tax** option must be set to **Yes** for both stores and customers.

The fiscal service doesn't support situations where more than one sales tax code is applied to the same transaction line.

The fiscal integration framework doesn't support sales quotations. Therefore, those operations aren't registered in the fiscal service.

# Set up Commerce for Germany

This section describes the Commerce settings that are specific to and recommended for Germany. For more setup information, see [Commerce home page](#).

To use the functionality that is specific to Germany, you must specify the following settings.

- In the primary address of the legal entity, set the **Country/region** field to **DEU** (Germany).
- In the POS functionality profile of every store that is located in Austria, set the **ISO code** field to **DE** (Germany).

You must also specify the following settings for Germany. Be sure to run appropriate distribution jobs after you complete the setup.

## Set up VAT per German requirements

You must create sales tax codes, sales tax groups, and item sales tax groups. You must also set up sales tax information for products and services. For more information about how to set up and use sales tax features, see [Sales tax overview](#).

On sales receipts, you can print an abbreviated code for a sales tax code (for example, "A" or "B"). To make this functionality available, set the **Code for printing** field on the **Sales tax codes** page.

## Set up stores

On the **All stores** page, update the store details. Specifically, set the following parameters:

- In the **Sales tax group** field, specify the sales tax group that should be used for sales to the default customer.
- Set the **Prices include sales tax** option to **Yes**.
- Set the **Name** field to the company name. This change helps ensure that the company name appears on a sales receipt. Alternatively, you can add the company name to the sales receipt layout as free-form text.
- Set the **Tax identification number (TIN)** field to the company identification number. This change helps ensure that the company identification number appears on a sales receipt. Alternatively, you can add the company identification number to the sales receipt layout as free-form text.

## Set up functionality profiles

Set up POS functionality profiles. On the **Receipt numbering** FastTab, set up receipt numbering by creating or updating records for the **Sale**, **Sales order**, and **Return** receipt transaction types.

## Configure custom fields so that they can be used in receipt formats for sales receipts

You can configure the language text and custom fields that are used in the POS receipt formats. The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, add the following records for the labels of the custom fields for receipt layouts. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the table are just examples. You can change them to meet to your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or more than 900001.

Add the following POS labels to the **POS** section of the **Language text** page.

LANGUAGE ID	TEXT ID	TEXT
en-US	900001	QR code

LANGUAGE ID	TEXT ID	TEXT
en-US	900002	Transaction ID
en-US	900003	Tax Retail Print Code
en-US	900004	Tax Amount (sales)
en-US	900005	Tax Basis (sales)
en-US	900006	Transaction start date time
en-US	900007	Transaction end date time
en-US	900008	Serial number of the security element
en-US	900009	Signature counter
en-US	900010	Check value
en-US	900011	Info message

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. Note that the **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page.

NAME	TYPE	CAPTION TEXT ID
QRCODE_DE	Receipt	900001
TRANSACTIONID_DE	Receipt	900002
RETAILPRINTCODE_DE	Receipt	900003
SALESTAXAMOUNT_DE	Receipt	900004
SALESTAXBASIS_DE	Receipt	900005
TRANSACTIONSTARTDATETIME_DE	Receipt	900006
TRANSACTIONENDDATETIME_DE	Receipt	900007
SECURITYELEMENTSERIALNUMBER_DE	Receipt	900008
SIGNCOUNTER_DE	Receipt	900009
SIGN_DE	Receipt	900010
INFOMESSAGE_DE	Receipt	900011

### Configure receipt formats

For every receipt format that is required, change the value of the **Print behavior** field to **Always print**.

In the Receipt format designer, add the following custom fields to the appropriate receipt sections. Note that field names correspond to the language texts that you defined in the previous section.

- **Header:** Add the following fields:
  - **Store name** and **Tax Identification Number** fields, which are used to print the company name and identification number on receipts. Alternatively, you can add the company name and identification number to the layout as free-form text.
  - **Store address**, **Date**, **Time 24H**, **Receipt Number**, and **Register number** fields.
- **Lines:** Add the following fields:
  - **Item name** field
  - **Qty** field
  - **Total price with tax** field
  - **Tax Retail Print Code** field, which is used to print the abbreviated code that corresponds to the sales tax code that applies to the item
- **Footer:** Add the following fields:
  - Payment fields, so that the payment amounts for each payment method are printed. For example, add the **Tender name** and **Tender amount** fields to one line of the layout.
  - Fields in the **Tax break down** field group. The fields in this field group must be printed on a separate line.
    - **Tax Id** field, which is a standard field that enables a sales tax summary to be printed for each sales tax code. The field must be added to a new line.
    - **Tax Percentage** field, which is a standard field that is used to print the effective tax rate for the sales tax code.
    - **Tax Basis (sales)** field, which is used to print the receipt's total cash sale amount for the sales tax code. Prepayments and gift card operations are excluded.
    - **Tax Amount (sales)** field, which is used to print the receipt's tax amount for cash sales for the sales tax code.
    - **Tax Retail Print Code** field, which is used to print the abbreviated code that corresponds to the sales tax code.
  - Fields that contain secured transaction data that is returned by the fiscal registration service:
    - **Transaction ID** field, which identifies the number of the cash transaction in the fiscal registration service
    - **Transaction start date time** field
    - **Transaction end date time** field
    - **Serial number of the security element** field
    - **Signature counter** field
    - **Check value** field
    - **QR Code** field, which is used to print the reference to the registered cash transaction in the form of a QR code
  - **Info message** field, so that notification messages from the fiscal registration service can be shown on receipts. For example, if a signature device is broken, special text can be printed on a receipt.

For more information about how to work with receipt formats, see [Set up and design receipt formats](#).

### **Configure fiscal integration**

Set up the fiscal integration by completing the following steps that are described in [Set up the fiscal integration](#)

for Commerce channels:

1. [Set up a fiscal registration process](#). Also note the settings for the fiscal registration process that are [specific to this fiscal registration service integration sample](#).
2. [Set error handling settings](#).

#### WARNING

The error handling capabilities of the fiscal integration framework might be not fully aligned with the local fiscal regulations.

- We recommend that you leave the **Continue on error** option on the **Fiscal registration process** page turned off, because all transactions must be correctly registered, even if the first attempt at fiscal registration wasn't successful.
- Before you turn on the **Skip or Mark as registered** option on the **Fiscal registration process** page, you should discuss these changes to the fiscal registration process with your tax consultant or the local tax office.

3. [Enable manual execution of postponed fiscal registration](#).

## Deployment guidelines for cash registers for Germany

The fiscal registration service integration sample for Germany is part of the Retail SDK. For more information about how to install and use the Retail SDK, see the [Retail software development kit \(SDK\) architecture](#).

This sample consists of extensions for the Commerce runtime (CRT) and Hardware station. To run this sample, you must modify and build the CRT and Hardware station projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Azure DevOps, where no files have been changed yet.

Follow these steps to set up a development environment so that you can test and extend the sample.

### Enable CRT extensions

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under `RetailSdk\SampleExtensions\CommerceRuntime`.

#### DocumentProvider.EFRSample component

1. Find the `Runtime.Extensions.DocumentProvider.EFRSample` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.EFRSample\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.EFRSample.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit:** Copy the assembly to the `\bin\ext` folder under the Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file:

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EFRSample" />
```

#### DocumentProvider.DataModelEFR component

1. Find the `Runtime.Extensions.DocumentProvider.DataModelEFR` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.DataModelEFR\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit:** Copy the assembly to the `\bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
```

#### Update the extension configuration file

1. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
2. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsGermany" />
```

#### Enable Hardware station extensions

The Hardware station extension components are included in the Hardware station samples. To complete the following procedures, open the solution `HardwareStationSamples.sln.sln` under `RetailSdk\SampleExtensions\HardwareStation`.

#### EFRSample component

1. Find the `HardwareStation.Extension.EFRSample` project, and build it.
2. In the `Extension.EFRSample\bin\Debug` folder, find following assembly files:
  - `Contoso.Commerce.HardwareStation.EFRSample.dll`
  - `Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll`
3. Copy the assembly files to the Hardware station extensions folder:
  - **Shared hardware station:** Copy the files to the `bin` folder under the IIS Hardware station site location.
  - **Dedicated hardware station on Modern POS:** Copy the files to the Modern POS client broker location.
4. Find the extension configuration file for the Hardware station's extensions. The file is named `HardwareStation.Extension.config`.

- **Shared hardware station:** The file is located under the IIS Hardware station site location.
- **Dedicated hardware station on Modern POS:** The file is located under the Modern POS client broker location.

5. Add the following line to the **composition** section of the configuration file.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.EFRSample.dll" />
```

### Set up the registration process

To enable the registration process, follow these steps to set up Commerce Headquarters. For more details, see [Set up the fiscal integration for Commerce channels](#).

1. Go to **Retail and Commerce > Headquarters setup > Parameters > Commerce shared parameters**. On the **General** tab, set the **Enable fiscal integration** option to **Yes**.
2. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal connectors**, and load the connector configuration. The file location is **RetailSdk\SampleExtensions\HardwareStation\Extension.EFRSample\Configuration\ConnectorEFRSample.xml**.
3. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal document providers**, and load the document provider configurations. The configuration file is **RetailSdk\SampleExtensions\CommerceRuntime\Extensions.DocumentProvider.EFRSample\Configuration\DocumentProviderFiscalEFRSampleGermany.xml**.
4. Go to **Retail and Commerce > Channel setup > Fiscal integration > Connector functional profiles**. Create a new connector functional profile, and select the document provider and the connector that you loaded earlier. Update the data mapping settings as required.

#### NOTE

By default, the **Include customer data** option is set to **Yes**. If you don't want customer information such as names and addresses to be sent to the fiscal registration service, you can change the setting to **No**.

5. Go to **Retail and Commerce > Channel setup > Fiscal integration > Connector technical profiles**. Create a new connector technical profile, and select the connector that you loaded earlier. Update the connection settings as required.

#### WARNING

By default, the **Show fiscal registration notifications** parameter is turned on. We recommend that you leave it turned on, because the fiscal registration service sends notifications about some specific errors that might occur during fiscal registration (for example, a transaction wasn't signed at the moment of registration).

6. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal connector groups**. Create a new fiscal connector group for the connector functional profile that you created earlier.
7. Go to **Retail and Commerce > Channel setup > Fiscal integration > Fiscal registration processes**. Create a new fiscal registration process, create a fiscal registration process step, and select the fiscal connector group that you created earlier.
8. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. Select a functionality profile that is linked to the store where the registration process should be activated. On the **Fiscal registration process** FastTab, select the fiscal registration process that you created earlier.

9. Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**. Select a hardware profile that is linked to the Hardware station that the fiscal printer will be connected to. On the **Fiscal peripherals** FastTab, select the connector technical profile that you created earlier.
10. Go to **Retail and Commerce > Retail and Commerce IT > Distribution schedule**, and run jobs 1070 and 1090 to transfer data to the channel database.

### Production environment

In the previous procedure, you enabled the extensions that are components of the fiscal registration service integration sample. In addition, you must follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Make the following changes in the package configuration files under the **RetailSdk\Assets** folder:

- In the **commerceruntime.ext.config** and **CommerceRuntime.MPOSOOffline.Ext.config** configuration files, add the following lines to the **composition** section.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsGermany" />
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EFRSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
```

- In the **HardwareStation.Extension.config** configuration file, add the following lines to the **composition** section.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.EFRSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR" />
```

2. Make the following changes in the **BuildTools\Customization.settings** package customization configuration file:

- Add the following lines to include the CRT extensions in the deployable packages.

```
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.EFRSample.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll" />
```

- Add the following lines to include the Hardware station extensions in the deployable packages.

```
<ISV_HardwareStation_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.HardwareStation.EFRSample.dll" />
<ISV_HardwareStation_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.DataModelEFR.dll" />
```

3. Start the MSBuild Command Prompt for Visual Studio utility, and run **msbuild** under the Retail SDK folder to create deployable packages.
4. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).
5. Complete all the required setup tasks that are described in the [Set up Commerce for Germany](#) section earlier in this topic.

# Design of extensions

## CRT extension design

The purpose of the extension that is a fiscal document provider is to generate service-specific documents and handle responses from the fiscal registration service.

The CRT extension is `Runtime.Extensions.DocumentProvider.EFRSample`. For more details about the design of the fiscal integration solution, see [Overview of fiscal integration for Commerce channels](#).

### Request handler

There is one request handler for the document provider, `DocumentProviderEFRFiscalDEU`. This handler is used to generate fiscal documents for the fiscal registration service. It's inherited from the `INamedRequestHandler` interface. The `HandlerName` method is responsible for returning the name of the handler. The handler name should match the connector document provider name that is specified in Commerce Headquarters.

The connector supports the following requests:

- **GetFiscalDocumentDocumentProviderRequest** – This request contains information about what document should be generated. It returns a service-specific document that should be registered in the fiscal registration service.
- **GetFiscalTransactionExtendedDataDocumentProviderRequest** – This request returns the response together with extended data.

### Configuration

The `DocumentProviderFiscalEFRSampleGermany` configuration file is located in the **Configuration** folder of the extension project. The purpose of this file is to enable settings for the document provider to be configured from Commerce Headquarters. The file format is aligned with the requirements for fiscal integration configuration.

The following settings are added:

- **VAT rates mapping** – The mapping of tax percentage values that are set up for the sales tax codes to values of the `TaxG` (tax group) attribute in requests that are sent to the fiscal service.
- **Tax group for gift cards and deposits** – The value of the `TaxG` attribute in requests that are sent to the fiscal service, based on operations that involve gift cards or deposits.
- **Tender type mapping** – The mapping of payment methods to values of the `PayG` (payment group) attribute in requests that are sent to the fiscal service.
- **Tax group for VAT exempt** – The value of the `TaxG` attribute in requests that are sent to the fiscal service, based on operations that are exempt from tax obligations.
- **Include customer data** – If this parameter is turned on, requests to the fiscal service will contain customer information such as names and addresses in cases where a customer is added to a transaction.

## Hardware station extension design

The purpose of the extension that is a fiscal connector is to communicate with the fiscal registration service.

The Hardware station extension is `HardwareStation.Extension.EFRSample`. It uses the HTTP protocol to submit documents that the CRT extension generates to the fiscal registration service. It also handles the responses that are received from the fiscal registration service.

### Request handler

The `EFRHandler` request handler is the entry point for handling requests to the fiscal registration service. This handler is inherited from the `INamedRequestHandler` interface. The `HandlerName` method is responsible for returning the name of the handler. The handler name should match the fiscal connector name that is specified in Commerce Headquarters.

The connector supports the following requests:

- **SubmitDocumentFiscalDeviceRequest** – This request sends documents to the fiscal registration service and returns a response from it.
- **IsReadyFiscalDeviceRequest** – This request is used for a health check of the fiscal registration service.
- **InitializeFiscalDeviceRequest** – This request is used to initialize the fiscal registration service.

#### **Configuration**

The configuration file is located in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the fiscal connector to be configured from Commerce Headquarters. The file format is aligned with the requirements for fiscal integration configuration.

The following settings are added:

- **Endpoint address** – The URL of the fiscal registration service.
- **Timeout** – The amount of time, in milliseconds (ms), that the driver will wait for a response from the fiscal registration service.
- **Show fiscal registration notifications** – If this parameter is turned on, notifications from the fiscal service will be shown as user messages at the POS.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Goods and Services Tax (GST) integration for cash registers for India

2/18/2021 • 12 minutes to read • [Edit Online](#)

This topic provides a walkthrough of the features that are related to Goods and Services Tax (GST). It also highlights the effect of GST on various types of commerce business transactions, and shows the accounting and posting of transactions where the receipt is printed at the point of sale (POS).

## Prerequisites

- Set up GST for India. For more information, see [India Goods and Services Tax \(GST\)](#).
- Configure Commerce channel components. To enable India-specific functionality, you must configure extensions for channel components. For more information, see the [deployment guidelines](#).

## India tax entities for Commerce

The following table shows the navigation paths for the India tax entities in Commerce.

INDIA TAX ENTITIES	NAVIGATION PATH IN COMMERCE
Business verticals	Retail and Commerce > Channel setup > Sales taxes > Business verticals
Enterprise tax registration numbers	Retail and Commerce > Channel setup > Sales taxes > Enterprise tax registration numbers
GST reference number sequence group	Retail and Commerce > Channel setup > Sales taxes > GST reference number sequence group
HSN codes	Retail and Commerce > Channel setup > Sales taxes > HSN codes
Service accounting codes	Retail and Commerce > Channel setup > Sales taxes > Service accounting codes
Maintain setoff hierarchy profiles	Retail and Commerce > Channel setup > Sales taxes > Maintain setoff hierarchy profiles
VAT schedules	Retail and Commerce > Channel setup > Sales taxes > VAT schedules
Tax setup	Retail and Commerce > Channel setup > Sales taxes > Tax configuration > Tax setup

### NOTE

The navigation paths for the India tax entities in Commerce differ from the navigations paths in Finance. For information about the navigation paths in Finance, see [India Goods and Services Tax \(GST\)](#).

# Validate tax information for the store

The tax information for the store comes from the selected warehouse. This warehouse is defined in the warehouse master. The configured tax information from the store is printed on the POS receipt. It's also updated on the sales order at the headquarters for the financial postings.

Follow these steps to view the tax information for a store.

1. Go to **Retail and Commerce > Channels > Stores > All stores**.
2. Select a store.
3. Select the **Tax information** FastTab.

## Configure language texts and custom fields

You can configure the language text and custom fields that are used in the POS receipt formats. The default company of the user who creates the receipt setup should be the same as the legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

### Set up the POS language text

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profile > Language text**.
2. On the **POS** tab, on the **POS language text** FastTab, select the language ID for the text. The language should match the user's preferred language.
3. In the **Text ID** field, enter a unique ID that is equal to or more than **900001**.
4. In the **Text** field, enter the language text.

Language text

POS

Commerce Scale Unit

Setup POS language text for user interface fields and POS messages.

POS language text

+ Add Remove

Filter

Language ID	Text ID ↑	Text
en-US	900001	GST TIN No
en-US	900002	Company PAN No
en-US	900003	VAT TIN No
en-US	900004	SAC
en-US	900005	HSN
en-US	900006	Tax Component

### Create custom fields

When you create custom fields, the value of the **Caption text ID** field must match the value that you entered for the **Text ID** field on the **Language text** page.

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profile > Custom fields**.
2. Enter a name for the field.
3. Select the field type.
4. In the **Caption text ID** field, enter the **Text ID** value for one of the language texts on the **Language text**

page.

### Custom fields

Filter

Name	Type	Caption text ID ↑
GSTINNO_IN	Receipt	900001
COMPANYPANNO_IN	Receipt	900002
VATTINNO_IN	Receipt	900003
SACCODE_IN	Receipt	900004
HSNCODE_IN	Receipt	900005
TAXCOMPONENT_IN	Receipt	900006

## Create the receipt format

You can use Receipt format designer to add custom fields to the appropriate receipt sections. For more information, see [Set up and design receipt formats](#).

1. Go to **Retail and Commerce > Channel setup > POS setup > POS profile > Receipt formats**.
2. Select a receipt format for the **Receipt** receipt type, and make the required changes.

## Update receipt profiles

After you create a receipt format, you can assign that format to a receipt profile.

Follow these steps to update a receipt profile.

1. Go to **Retail and Commerce > Setup > POS > Receipt profile**.
2. Select the receipt profile to update.
3. Select **Edit**.

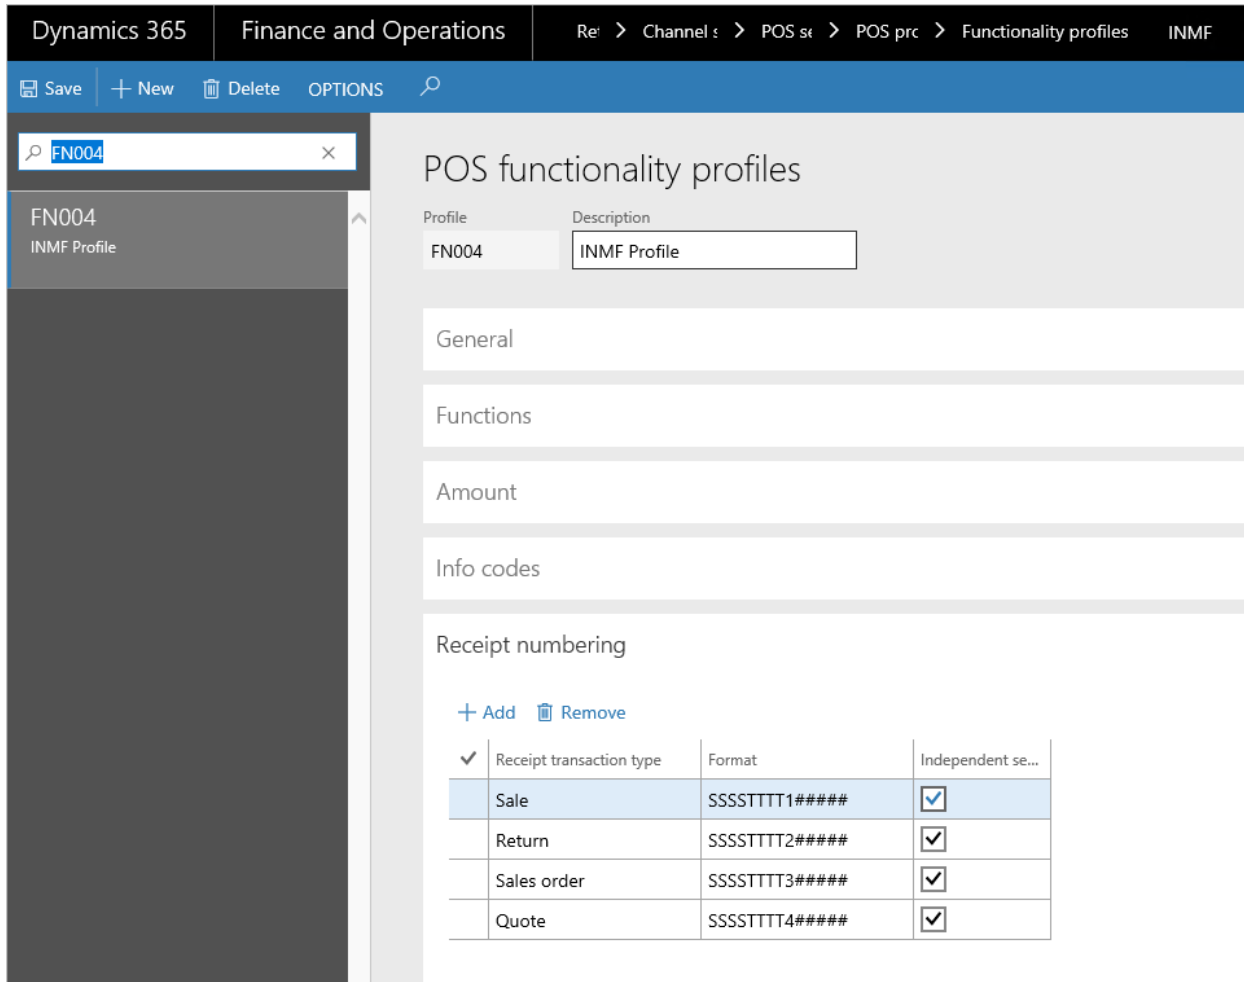

4. For each receipt type in the list, select a receipt format.

## Update the POS invoice number

You can reconcile the POS receipt number with the invoice number for customer transactions. If you set the **Update POS invoice number** option to **Yes** on the **Posting** tab of the **Commerce parameters** page, the POS receipt number is entered in the **Transaction ID** field for corresponding sales orders.

You can set the **Update POS invoice number** option to **Yes** only if the existing receipt number format includes both the store number and the terminal number. The following illustration shows a POS functionality profile where the receipt numbering includes the store number and the terminal number.

The screenshot shows the Dynamics 365 interface for 'POS functionality profiles'. The breadcrumb navigation is 'Retail > Channel > POS st > POS prc > Functionality profiles > INMF'. The page title is 'POS functionality profiles'. The profile name is 'FN004' and the description is 'INMF Profile'. The 'Receipt numbering' section contains a table with the following data:

Receipt transaction type	Format	Independent se...
Sale	SSSSTTTT1#####	<input checked="" type="checkbox"/>
Return	SSSSTTTT2#####	<input checked="" type="checkbox"/>
Sales order	SSSSTTTT3#####	<input checked="" type="checkbox"/>
Quote	SSSSTTTT4#####	<input checked="" type="checkbox"/>

## Run a distribution schedule

To synchronize Tax Engine (GTE) data from headquarter to the POS database, you must add a job to the **Distribution schedule** page.

Follow these steps to verify that the job exists and to run the job.

1. Go to **Retail and Commerce > Periodic > Data distribution > Distribution schedule**.
2. Verify that a new job, **1180**, has been added for **Generic tax engine**.
3. Run all the jobs (**9999**).

## Example scenarios

The following example scenarios walk you through sample transactions for India:

- Scenario 1: Sell to a registered customer
- Scenario 2: Sell taxable goods to a consumer

- Scenario 3: Sell taxable goods to an anonymous customer where GST is price-inclusive
- Scenario 4: Sell an exempted good
- Scenario 5: Return the transaction that has GST

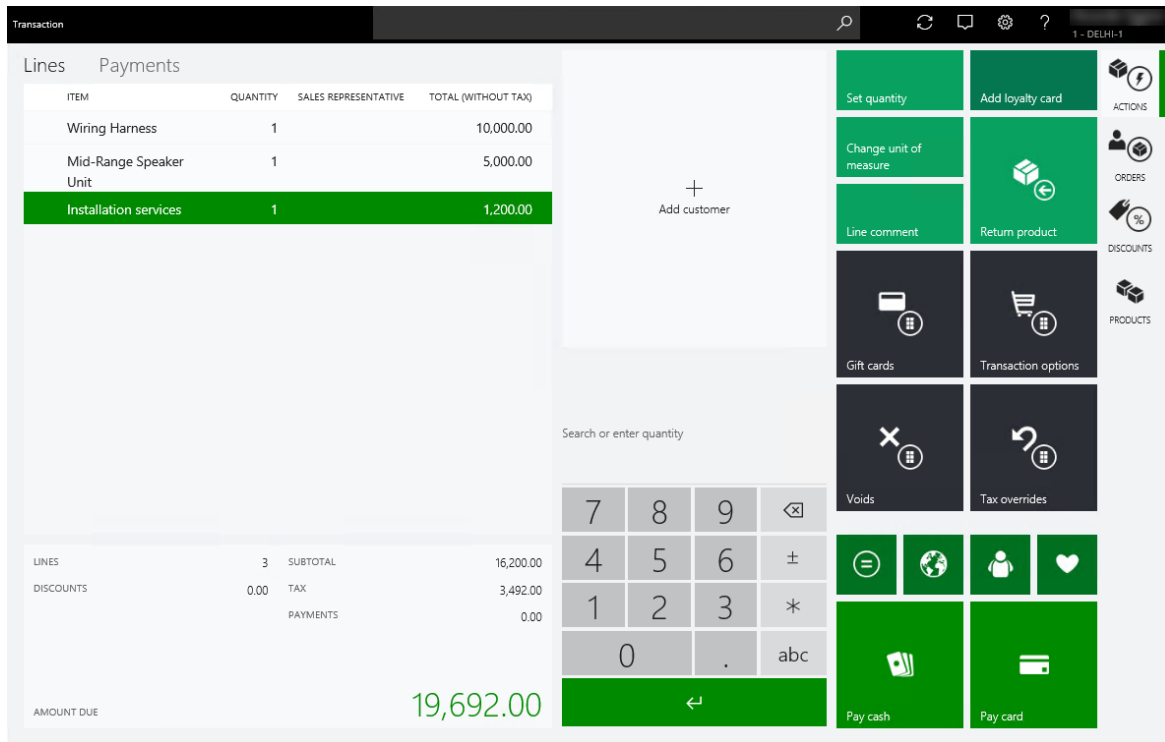

**Scenario 1: Sell to a registered customer**

Sales to a registered customer are known as *business-to-business* (B2B) sales. If the store location and the place of supply (that is, the customer address) are in the same state, the transaction is an *intrastate sale*, and Central GST (CGST) and State GST (SGST) must be paid. If the store location and the place of supply are in different states, the transaction is an *interstate sale*, and Integrated GST (IGST) must be paid.

**NOTE**

For these transactions, the fields for the customer address and the registration number are required.

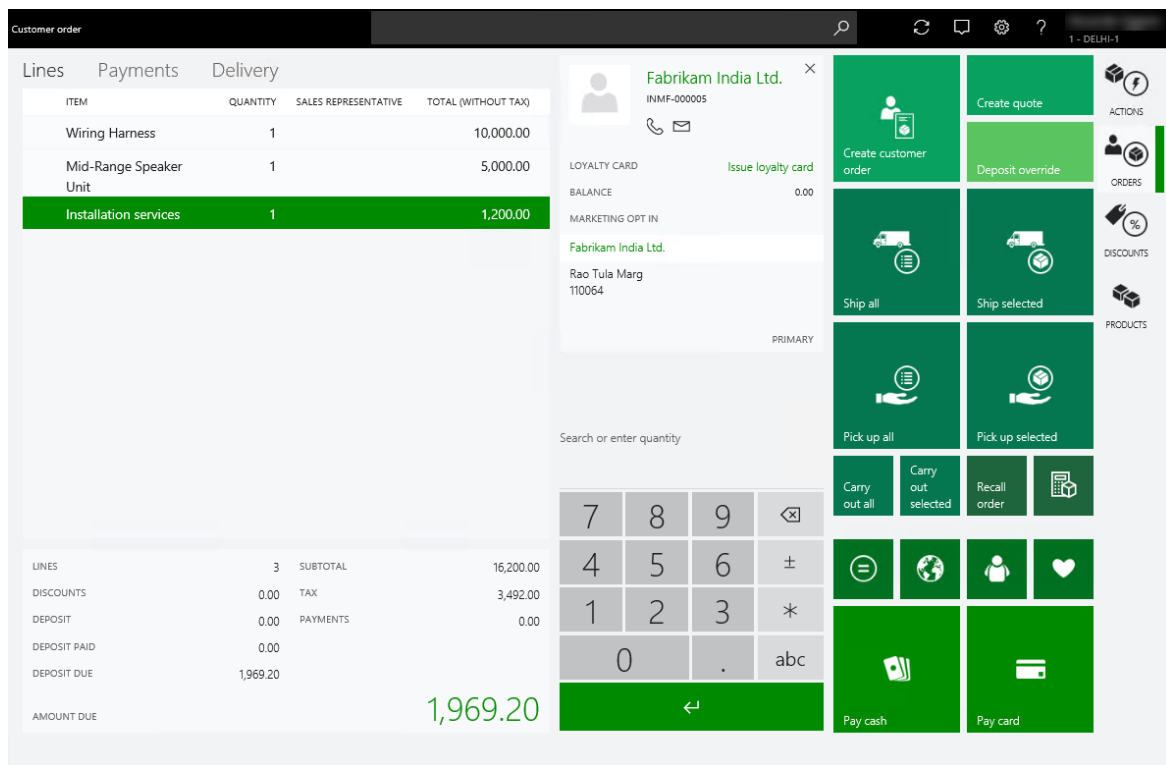

1. Sign in to the POS.
2. Enter the items, and then select **Enter**.

3. Validate the GST calculations. Consider the rate that is defined in the tax setup.

ITEM/SERVICE	UNIT PRICE	TAX RATES	CGST	SGST
M0001	10,000.00	CGST 12%, SGST 11%	1,200.00	1,100.00
M0002	5,000.00	CGST 10%, SGST 10%	500.00	500.00
S0001	1,200.00	CGST 11%, SGST 5%	132.00	60.00
	16,200.00		1,832.00	1,660.00
Total amount				19,692.00

4. Select **Orders** > **Create customer order**.
5. Select **Add customer**, and select the customer account.
6. Select **Pick up all**.
7. Select the store and the pick-up date.
8. Select **OK**.

**NOTE**

In this example, the state of the store location is Delhi, and the state of the customer address is also Delhi. Because the state is the same, intrastate GST is calculated.

9. Select **Exact** to process the deposit payment.
10. Validate the receipt:
  - a. Select **Show journal**.
  - b. Select the transactions.
  - c. Select **Receipt**.

### Scenario 2: Sell taxable goods to a consumer

When you sell to unregistered customers, the sales are referred to as *business-to-consumer* (B2C) sales. Tax is calculated in the same manner for B2B and B2C sales.

1. Sign in to the POS.
2. Enter an item, and then select **Enter**.
3. Select **Add customer**, and select the customer account.

- a. Go to **Retail and Commerce > Channels > Stores > Open statements.**
- b. Create a statement.
- c. Select **Calculate statement** and then **Post statement.**

10. Validate the voucher transactions:

- a. Go to **Retail and Commerce > Customers > All sales orders.**
- b. Select the sales invoice.
- c. On the Action Pane, on the **Invoice** tab, select **Invoice journals.**
- d. Select **Voucher.**

LEDGER ACCOUNT NAME	DEBIT AMOUNT (RS.)	CREDIT AMOUNT (RS.)
Customer account		12,500.00
IGST payable account	2,500.00	
Sales account	10,000.00	

e. Select **Tax document.**

f. Verify that the return receipt number is updated as the transaction ID.

# Update credit notes with references to original invoices

## NOTE

This functionality is available with Application update 10.0.3 and later.

In order to be correctly reflected in the GSTR reporting, sales credit notes should contain references to original sales invoices. When store transactions are posted through statements, it is not always possible to establish this reference for return transactions. You can use the **Update credit notes with references to original invoices** procedure to update the **Original GST transaction ID** link in credit notes so that the link correctly references the related original sales invoice. The procedure is located on the **Retail and Commerce > Retail and Commerce IT > POS posting** menu.

It is also recommended that you enable the **Do not aggregate returns** parameter on the **Commerce parameters** page. In this case, each return transaction will be posted as a separate sale order when posting a statement. This option is only available if the transaction aggregation is enabled.

# Manage customer registration numbers from POS

## NOTE

This functionality is available in Application update 10.0.6 and later.

You can specify customer registration numbers, such as GSTIN, VAT number (TIN), and PAN number, when creating or editing a customer master record and a customer address record in POS. The customer registration numbers may be printed in receipts or used for searching customers in POS.

## Configure printing customer registration numbers in receipts

To enable printing customer registration numbers in receipts, follow the procedure outlined in the [Configure language texts and custom fields](#) section. Add language texts and custom fields with the following names:

- TAXREGISTRATIONGST\_IN for the GST registration number;
- TAXREGISTRATIONTIN\_IN for the VAT registration number;
- TAXREGISTRATIONPAN\_IN for the PAN number.

Add the custom fields to receipt profiles.

## Enable searching customers by tax registration numbers in POS

To enable searching customers by tax registration numbers in POS, on the **POS search criteria** tab of the **Commerce parameters** page, add a record on the **Customer search criteria** fast-tab and select **Tax registration number** in the **Customer search criteria** drop-down list. Select the **Display as shortcut** checkbox while keeping the **Can be refined** checkbox clear. Run the 1110 job on the **Distribution schedules** page.

## NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Deployment guidelines for cash registers for India

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic is a deployment guide that shows how to enable the requirements for Goods and Services Tax (GST) in the Dynamics 365 Commerce app's localization for India. For more information about the localization for India, see [Goods and Services Tax \(GST\) integration for cash registers for India](#).

This sample is part of the Retail software development kit (SDK). For information about how to install and use the SDK, see the [Retail software development kit \(SDK\) architecture](#).

This sample consists of extensions for the Commerce runtime (CRT). To run this sample, you must modify and build the CRT projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Microsoft Visual Studio Online (VSO), where no files have been changed yet.

## NOTE

Some steps in the procedures in this topic differ, depending on the version of the app that you're using. For more information, see [What's new or changed in Dynamics 365 Retail](#).

## Prerequisites

Make sure that the Visual C++ Redistributable Packages are present on the machine that you're running Goods and Services Tax (GST) calculations on. For Cloud POS, and for Modern POS in online mode, this machine is Retail Server (Retail Server is known as Commerce Scale Unit in Commerce 10.0.8 and above). For Modern POS in offline mode, it's the Modern POS machine itself. To get the packages, see [Download the Visual C++ Redistributable Packages](#).

## Development environment

Follow these steps to set up a development environment so that you can test and extend the sample.

### The CRT extension components

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`. You can find this solution under `RetailSdk\SampleExtensions\CommerceRuntime`.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

1. Find the `Runtime.Extensions.GenericTaxEngine` project, and build it.

2. Find the following files:

- In the `Extensions.GenericTaxEngine\bin\Debug` folder:
  - `Contoso.Commerce.Runtime.Extensions.GenericTaxEngine.dll`
- In the `Reference\Newtonsoft.Json\9.0.0.0` folder:

- Newtonsoft.Json.dll
- In the **Reference\TaxEngine** folder:
  - Microsoft.Dynamics365.Tax.Core.dll
  - Microsoft.Dynamics365.Tax.DataAccessor.dll
  - Microsoft.Dynamics365.Tax.DataAccessFramework.dll
  - Microsoft.Dynamics365.Tax.DataModel.dll
  - Microsoft.Dynamics365.Tax.Metadata.dll
  - Microsoft.Dynamics365.LocalizationFramework.dll
  - Microsoft.Dynamics365.LocalizationFrameworkCore.dll
  - Microsoft.Dynamics365.ElectronicReportingMapping.dll
  - Microsoft.Dynamics365.XppSupportLayer.dll
- Find the following folders in the **Reference\Z3** folder:
  - x86
  - x64

3. Copy the 11 assembly files, and both x64 and x86 folders to the CRT extensions folder:

- **Retail Server:** Copy the assemblies to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Retail server site location.
- **Local CRT on Modern POS:** Copy the assemblies to the `\ext` folder under the local CRT client broker location.

4. Find the extensions configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extensions configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.Extensions.GenericTaxEngine" />
```

#### **WARNING**

Do not edit the `commerceruntime.config` and `CommerceRuntime.MPOSOffline.config` files. These files aren't intended for any customizations.

### **The extension components**

1. Open `web.config` in the root folder under the IIS Retail Server site location. Note that Retail Server is known as Commerce Scale Unit in Commerce 10.0.8 and above.
2. Register the extensions in the `extensionComposition` section of the configuration file.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

**The ClientBroker extension components**

1. Open `RetailProxy.MPOSOffline.ext.config` under the local CRT client broker location.
2. Register the Proxy extensions in the `extensionComposition` section of the configuration file.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

**The Modern POS extension components**

Enable the Tax Registration Id extension.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

**The Cloud POS extension components**

Enable the Tax Registration Id extension.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

**Set up required parameters in Headquarters**

For more information, see [Goods and Services Tax \(GST\) integration for cash registers for India](#).

## Production environment

Follow these steps to create deployable packages that contain components, and to apply the packages in a

production environment.

1. In the `commerceruntime.ext.config` and `CommerceRuntime.MPOSOffline.Ext.config` configuration files under the `RetailSdk\Assets` folder, add the following lines to the `composition` section.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

```
<add source="assembly" value="Contoso.Commerce.Runtime.Extensions.GenericTaxEngine" />
```

2. In the `RetailProxy.MPOSOffline.ext.config` configuration file under the `RetailSdk\Assets` folder, add the following lines to the `composition` section.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

3. Update the web configuration file. In the `RetailSDK\Packages\RetailServer\Code\web.config` file, add the following lines to the `extensionComposition` section.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

4. In the `Customization.settings` package customization configuration file under the `RetailSdk\BuildTools` folder, add the following lines to the `ItemGroup` section to include the CRT extensions in deployable packages.

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

```

<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.Extensions.GenericTaxEngine.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.Tax.Core.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.Tax.Metadata.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.Tax.DataAccessor.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.Tax.DataAccessFramework.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.Tax.DataModel.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.LocalizationFramework.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.LocalizationFrameworkCore.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.ElectronicReportingMapping.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\TaxEngine\Microsoft.Dynamics365.XppSupportLayer.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Newtonsoft.Json\9.0.0\Newtonsoft.Json.dll" />

```

5. Modify the following files to include the Z3 libraries in deployable packages:

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)
  
- Packages\ModernPOS.Sdk\Sdk.ModernPOSSetup.csproj
- Packages\ModernPOSOffline.Sdk\Sdk.ModernPOSSetupOffline.csproj
- Packages\RetailServer\Sdk.RetailServerSetup.proj

Add the following lines to the **ItemGroup** section.

```

<_bin_ext_Z3_x86_File Include="..\..\References\Z3\x86\*.*)" />
<_bin_ext_Z3_x64_File Include="..\..\References\Z3\x64\*.*)" />

```

For **Sdk.ModernPOSSetup.csproj** and **Sdk.ModernPOSSetupOffline.csproj** also add the following lines to the **<Target Name="CopyPackageFiles">** section.

```

<Copy SourceFiles="@(_bin_ext_Z3_x86_File)"
DestinationFolder="$(OutputPath)content.folder\CustomizedFiles\ClientBroker\ext\x86"
SkipUnchangedFiles="true" />
<Copy SourceFiles="@(_bin_ext_Z3_x64_File)"
DestinationFolder="$(OutputPath)content.folder\CustomizedFiles\ClientBroker\ext\x64"
SkipUnchangedFiles="true" />

```

For **Sdk.RetailServerSetup.proj** also add the following lines to the **<Target Name="CopyPackageFiles">** section.

```
<Copy SourceFiles="@(_bin_ext_Z3_x86_File)"
DestinationFolder="$(OutputPath)content.folder\RetailServer\Code\bin\ext\x86"
SkipUnchangedFiles="true" />
<Copy SourceFiles="@(_bin_ext_Z3_x64_File)"
DestinationFolder="$(OutputPath)content.folder\RetailServer\Code\bin\ext\x64"
SkipUnchangedFiles="true" />
```

6. Enable the Tax Registration Id POS extension:

- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 8.1.3 and later](#)
- [Retail 10.0 and later](#)
- [Retail 10.0.6 and later](#)

**NOTE**

This step doesn't apply to this version.

7. Run **msbuild** for the whole Retail SDK to create deployable packages.

8. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create retail deployable packages](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Support for upgrade and N-1 for India

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the steps needed to set up and use Phased Rollout (N-1) commerce components for India. The upgrade procedure and the workflow for N-1 are basically the same as for a general Dynamics 365 Commerce environment. For general information about N-1 installation and usage, see [Upgrade and N-1 support for Retail](#).

In addition, the following steps are important for upgrade:

- Both Commerce Headquarters and AX 2012 Retail components must support Goods and Services Tax (GST) calculation. See the [Prerequisites](#) section for details.
- Downgrade of the GST configuration is required to use the configuration prepared for Commerce at the AX 2012 channel side.
- Distribution schedule includes additional upload and download jobs required to synchronize GST configuration and tax calculation results between Headquarters and AX 2012 channels.

## Prerequisites

- Update AX 2013 R3 retail components to GST Update 2, [KB4058327](#), or higher. For details, see [India GST Update 2 - Release Notes](#).
- Set up basic N-1 environment. For more information, refer to [Phased Rollout \(N-1\) installation, configuration, and cutover guide](#).
- Set up Commerce GST for India in Headquarters according to the [Goods and Services Tax \(GST\) integration for cash registers for India](#) guide.

## Periodic procedure to downgrade tax configuration

GST configuration data differs between AX 2012 and Commerce versions. A special periodic procedure should be run to transform data. To run this procedure, do the following:

1. Sign in to Headquarters, and go to **Retail and Commerce > Retail and Commerce IT > Process tax configuration from N-1**.
2. Click **OK**.

Each time tax configuration changes are made and finalized the above operation should be run before sending the data to the AX 2012 channel.

### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Fiscal printer integration sample for Italy

2/18/2021 • 11 minutes to read • [Edit Online](#)

## Introduction

The Commerce functionality for Italy includes a sample integration of the point of sale (POS) with a fiscal printer. The sample extends the [fiscal integration functionality](#) so that it works with [Epson FP-90III Series](#) printers from Epson, and it enables communication with a fiscal printer in the web server mode via the EpsonFPMate web-service using Fiscal ePOS-Print API. The sample supports the Registratore Telematico (RT) mode only. The sample is provided in the form of source code and is part of the Retail software development kit (SDK).

Microsoft doesn't release any hardware, software, or documentation from Epson. For information about how to get the fiscal printer and operate it, contact [Epson Italia S.p.A.](#)

## Scenarios

The following scenarios are covered by the fiscal printer integration sample for Italy:

- Sales scenarios:
  - Print a fiscal receipt for cash-and-carry sales and returns.
  - Capture a response from the fiscal printer, and store it in the channel database.
  - Taxes:
    - Map to the fiscal printer's tax codes (departments).
    - Transfer mapped tax data to the fiscal printer.
    - Print taxes on a fiscal receipt.
  - Payments:
    - Map to the fiscal printer's methods of payment.
    - Print payments on a fiscal receipt.
    - Print change information.
  - Print line discounts.
  - Gift cards:
    - Exclude an issued/re-charged gift card line from a fiscal receipt for a sale.
    - Print a payment that uses a gift card as a regular method of payment.
  - Print fiscal receipts for customer order operations:
    - A fiscal receipt isn't printed for a customer order deposit.
    - Print a fiscal receipt for carry-out lines of a hybrid customer order.
    - Print a fiscal receipt for the pickup operation for a customer order.
    - Print a fiscal receipt for a return order.
  - Print a bar code for the receipt number on a fiscal receipt.
  - Print the [customer information](#) that is specified for a sales transaction on a fiscal receipt. An example of this information is the customer's lottery code.
- End of day statements (fiscal X and fiscal Z reports).
- Error handling, such as the following options:
  - Retry fiscal registration if a retry is possible, such as if the fiscal printer isn't connected, isn't ready or isn't responding, the printer is out of paper, or there is a paper jam.
  - Postpone fiscal registration.
  - Skip fiscal registration, or mark the transaction as registered, and include info codes to capture the reason for the failure and additional information.
  - Check the availability of the fiscal printer before a new sales transaction is opened or a sales transaction is finalized.

### Default data mapping

The following default data mapping is included in the fiscal document provider configuration that is provided as part of the fiscal integration sample:

- Value-added tax (VAT) rates mapping:  
*1 : 22.00 ; 2 : 10.00 ; 3 : 4.00 ; 4 : 0.00*
- Tender type mapping:  
*1 : 0 ; 2 : 1 ; 3 : 2 ; 4 : 2 ; 5 : 0 ; 6 : 0 ; 7 : 0 ; 8 : 2 ; 9 : 0 ; 10 : 2 ; 11 : 1*

### Gift cards

The fiscal printer integration sample implements the following rules that are related to gift cards:

- Exclude sales lines that are related to the *Issue gift card* and *Add to gift card* operations from the fiscal receipt.

- Don't print a fiscal receipt if it consists only of gift card lines.
- Deduct the total amount of gift cards that are issued or re-charged in a transaction from payment lines of the fiscal receipt.
- Save calculated adjustments of payment lines in the channel database with a reference to a corresponding fiscal transaction.
- Payment by gift card is considered a regular payment.

#### Customer deposits and customer order deposits

The fiscal printer integration sample implements the following rules that are related to customer deposits and customer order deposits:

- Don't print a fiscal receipt if a transaction is a customer deposit.
- Don't print a fiscal receipt if a transaction contains only a customer order deposit or a customer order deposit refund.
- Print the amount of the previously paid deposit on a fiscal receipt for a customer order pickup operation.
- Deduct the customer order deposit amount from payment lines when a hybrid customer order is created.
- Save calculated adjustments of payment lines in the channel database with a reference to a fiscal transaction for a hybrid customer order.

#### Limitations of the sample

- The fiscal printer supports only scenarios where sales tax is included in the price. Therefore, the **Price include sales tax** option must be set to **Yes** for both stores and customers.
- Daily reports (fiscal X and fiscal Z) are printed by using the format that is embedded in the fiscal printer's firmware.
- The fiscal printer doesn't support mixed transactions. The **Prohibit mixing sales and returns in one receipt** option should be set to **Yes** in POS functionality profiles.
- The sample supports integration only with a fiscal printer that is working in the RT (Registratore Telematico) mode.

## Set up Commerce for Italy

### Configure fiscal integration

Complete the fiscal integration setup steps as described in [Set up the fiscal integration for Commerce channels](#):

- [Set up a fiscal registration process](#). Note also the settings for the fiscal registration process that are [specific to this fiscal printer integration sample](#).
- [Set up fiscal texts for discounts](#).
- [Set error handling settings](#).
- [Set up fiscal X/Z reports from the POS](#).
- [Enable manual execution of postponed fiscal registration](#).
- [Set up the functionality for management of customer information in POS](#)

### Enable extensions

#### Commerce runtime extension components

The Commerce runtime extension components are included in the Retail SDK. To complete the following procedures, open the CRT solution, **CommerceRuntimeSamples.sln**, under **RetailSdk\SampleExtensions\CommerceRuntime**.

1. Find the **Runtime.Extensions.DocumentProvider.EpsonFP90IIISample** project, and build it.
2. In the **Extensions.DocumentProvider.EpsonFP90IIISample\bin\Debug** folder, find the **Contoso.Commerce.Runtime.DocumentProvider.EpsonFP90IIISample.dll** assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit**: Copy the assembly to the **\bin\ext** folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS**: Copy the assembly to the **\ext** folder under the local CRT client broker location.
4. Find the extensions configuration file for CRT:
  - **Commerce Scale Uni**: The file is named **commercerruntime.ext.config**, and it's in the **bin\ext** folder under the IIS Commerce Scale Uni site location.
  - **Local CRT on Modern POS**: The file is named **CommerceRuntime.MPOSOOffline.Ext.config**, and it's under the local CRT client broker location.
5. Register the CRT change in the extensions configuration file. Add **source="assembly"** and **value="Contoso.Commerce.Runtime.DocumentProvider.EpsonFP90IIISample"**.
6. Restart the Commerce Scale Unit:
  - **Commerce Scale Uni**: Restart the Commerce Scale Uni site from IIS Manager.
  - **Client broker**: End the **dllhost.exe** process in Task Manager, and then restart Modern POS.

#### Hardware station extension components

The Hardware station extension components are included in the Retail SDK. To complete the following procedures, open the Hardware Station solution, **HardwareStationSamples.sln**, under **RetailSdk\SampleExtensions\HardwareStation**.

1. Find the **HardwareStation.Extensions.EpsonFP90IIIFiscalDeviceSample** project, and build it.

- In the `Extensions.EpsonFP90IIIFiscalDeviceSample\bin\Debug` folder, find the `Contoso.Commerce.HardwareStation.EpsonFP90IIIFiscalDeviceSample.dll` assembly file.
- Copy the files to a deployed Hardware station machine:
  - Remote Hardware station:** Copy the files to the `bin` folder under the IIS Hardware station site location.
  - Local Hardware station:** Copy the files to the Modern POS client broker location.
- Find the configuration file for the Hardware station's extensions. The file is named `HardwareStation.Extension.config`:
  - Remote Hardware station:** The file is located under the IIS Hardware station site location.
  - Local Hardware station:** The file is located under the Modern POS client broker location.
- Add the following section to the `composition` section of the config file.

```
<add source="assembly"
value="Contoso.Commerce.HardwareStation.Extension.EpsonFP90IIIFiscalDeviceSample" />
```

- Restart the Hardware station service:
  - Remote Hardware station:** Restart the Hardware station site from IIS Manager.
  - Local Hardware station:** End the `dllhost.exe` process in Task Manager, and then restart Modern POS.

### Set up the registration process

To enable the registration process, follow these steps to set up Headquarters. For more details, see [Set up a fiscal registration process](#).

- Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Fiscal Connectors**. Import the configuration from `RetailSdk\SampleExtensions\HardwareStation\Extension.EpsonFP90IIIFiscalDeviceSample\Configuration\ConnectorEpsonFP90IIISar`
- Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Fiscal Document providers**. Import the configuration from `RetailSdk\SampleExtensions\CommerceRuntime\Extension.DocumentProvider.EpsonFP90IIISample\Configuration\DocumentProvide`
- Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Connector Technical profiles**. Create a new profile, and select the loaded connector from the earlier step. Update the connection settings if an update is required.
- Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Connector Functional profiles**. Create a new profile, and select the loaded connector and document provider from the earlier steps. Update data mapping settings if an update is required.
- Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Connector Functional group**. Create a new group, and select the connector functional profile from the earlier step.
- Go to **Retail and Commerce > Channel Setup > Fiscal Integration > Registration process**. Create a new process, and select the connector functional group from the earlier step.
- Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Functionality profiles**. Open the functionality profile that is linked to the store where the registration process should be activated. On the **Fiscal registration process** FastTab, select the registration process that was created earlier.
- Go to **Retail and Commerce > Channel setup > POS setup > POS profiles > Hardware profiles**. Open the hardware profile that is linked to the Hardware station that the fiscal printer will be connected to. On the **Fiscal peripherals** FastTab, select the connector technical profile.
- Open the distribution schedule (**Retail and Commerce > Retail and Commerce IT > Distribution schedule**), and select jobs **1070** and **1090** to transfer data to the channel database.

### Production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

- Complete the steps that are described in the [Enable extensions](#) section earlier in this topic.
- Make the following changes in the package configuration files under the `RetailSdk\Assets` folder:

- In the `commercerruntime.ext.config` and `CommerceRuntime.MPOSOOffline.Ext.config` configuration files, add the following line to the `composition` section.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.EpsonFP90IIISample" />
```

- In the `HardwareStation.Extension.config` configuration file, add the following line to the `composition` section.

```
<add source="assembly"
value="Contoso.Commerce.HardwareStation.Extension.EpsonFP90IIIFiscalDeviceSample" />
```

- Make the following changes in the `BuildTools\Customization.settings` package customization configuration file:
  - Add the following line to include the CRT extension in the deployable packages.

```
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.DocumentProvider.EpsonFP90IIISample.dll
"/>
```

- Add the following line to include the Hardware station extension in the deployable packages.

```
<ISV_HardwareStation_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.HardwareStation.EpsonFP90IIIFiscalDeviceSample.
dll"/>
```

4. Start the MSBuild Command Prompt for Visual Studio utility, and run **msbuild** under the Retail SDK folder to create deployable packages.
5. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).

## Design of extensions

### Commerce runtime extension design

The purpose of the extension that is a fiscal document provider is to generate printer-specific documents and handle responses from the fiscal printer.

The Commerce runtime extension is **Runtime.Extensions.DocumentProvider.EpsonFP90IIISample**.

For more details about the design of the fiscal integration solution, see [Fiscal registration process and fiscal integration samples for fiscal devices](#).

#### Request handler

The **DocumentProviderEpsonFP90III** request handler is the entry point for the request to generate documents from the fiscal printer.

The handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the connector document provider name that is specified in Headquarters.

The connector supports the following requests:

- **GetFiscalDocumentDocumentProviderRequest** – This request contains information about what document should be generated. It returns a printer-specific document that should be registered in the fiscal printer.
- **GetSupportedRegistrableEventsDocumentProviderRequest** – This request returns the list of events to subscribe to. Currently, the following events are supported: sales, printing X report, and printing Z report.

#### Configuration

The configuration file is located in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the document provider to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added:

- VAT codes mapping
- VAT rates mapping
- Tender type mapping
- Barcode type for receipt number
- Deposit payment type

### Hardware station extension design

The purpose of the extension that is a fiscal connector is to communicate with the fiscal printer.

The Hardware station extension is **HardwareStation.Extension.EpsonFP90IIIFiscalDeviceSample**. This extension uses the HTTP protocol to submit documents that the Commerce runtime extension generates to the fiscal printer. It also handles the responses that are received from the fiscal printer.

#### Request handler

The **EpsonFP90IIISample** request handler is the entry point for handling request to the fiscal peripheral device.

The handler is inherited from the **INamedRequestHandler** interface. The **HandlerName** method is responsible for returning the name of the handler. The handler name should match the fiscal connector name that is specified in Headquarters.

The connector supports the following requests:

- **SubmitDocumentFiscalDeviceRequest** – This request sends documents to printers and returns the response from the fiscal printer.
- **IsReadyFiscalDeviceRequest** – This request is used for a health check of the device.
- **InitializeFiscalDeviceRequest** – This request is used for printer initialization.

#### Configuration

The configuration file is located in the **Configuration** folder of the extension project. The purpose of the file is to enable settings for the connector to be configured from Headquarters. The file format is aligned with the requirements for fiscal integration configuration. The following settings are added:

- **Endpoint address** – The URL of the printer.

- **Date and time synchronization** – This setting specifies whether the date and time of the printer must be synced with the connected Hardware station.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Customer information management for Italy

2/18/2021 • 8 minutes to read • [Edit Online](#)

## Introduction

This topic describes how you can handle customer information, such as the customer's lottery code, in the Commerce point of sale (POS) for Italy.

You can specify the customer information, such as the fiscal code or lottery code, when you create or edit a customer master record in POS. You can also specify the lottery code for a sales transaction by copying it from the transaction customer or entering it manually. The lottery code can then be printed on both regular and fiscal receipts, and it can be used for the national lottery. Personal fiscal codes can also be used to search for a customer in POS.

### NOTE

This functionality is available in version 10.0.7 and later.

## Setup

You must complete the following configuration to use this functionality:

- Set up a registration type for the lottery code.
- Add the **Add customer information** operation to screen layouts.
- Activate the inquiry for customer information.
- Set up receipt formats.
- Add a customer search criterion.
- Configure channel components.

### Set up a registration type for the lottery code

Before lottery codes can be specified in POS, you must create an appropriate registration type for the lottery code and link it to the **Lottery code** registration category. For more information about how to work with registration types and registration IDs, see [Registration IDs](#).

### WARNING

If a registration type isn't created or isn't linked to the **Lottery code** registration category, an error will be generated in POS when the lottery code is filled in for a customer address.

### Add the Add customer information operation to screen layouts

The **Add customer information** operation can be used to add customer information, such as the lottery code, to a sales transaction. This information can be copied from the customer that is specified for the transaction, or it can be manually entered.

On the **Button grids** page, select the button grid where the operation should appear, and open the Button grid designer. Add a new button, and then, in the **Action** field, select **Add customer information**. For more information about how to work with screen layouts and button grids, see [Screen layouts for the point of sale \(POS\)](#).

## Activate the inquiry for customer information

If the customer information isn't specified for a sales transaction, an inquiry for that information can be triggered automatically after the transaction is finalized. This approach is an alternative to the **Add customer information** operation.

To activate the inquiry for customer information, set the **Enable inquiry of customer information in sales transactions** option to **Yes** in the **Tax parameters** section on the **Functions** FastTab of the **POS functionality profiles** page.

## Set up receipt formats

You can configure receipt formats so that the customer's fiscal code and lottery code are printed on receipts.

### NOTE

The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, on the **POS** tab, add the following records for the labels of the custom fields for receipt formats. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the following table are just examples. You can change them to meet your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or more than 900001.

LANGUAGE ID	TEXT ID	TEXT
en-US	900001	Lottery code
en-US	900002	Fiscal code

On the **Custom fields** page, add the following records for the custom fields for receipt formats. Note that the **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page.

NAME	TYPE	CAPTION TEXT ID
FISCALCUSTOMER_LOTTERYCODE_IT	Receipt	900001
CUSTOMER_FISCALCODE_IT	Receipt	900002

In the Receipt format designer, add the custom fields to the appropriate receipt section for every receipt format that is required. For more information about how to work with receipt formats, see [Receipt templates and printing](#).

## Add a customer search criterion

You can add a customer search criterion so that customers can be searched for in POS by their fiscal codes.

On the **Commerce parameters** page, on the **POS search criteria** tab, add a new customer search criterion. In the **Customer search criteria** field, select **Tax registration number**. Select the **Display as shortcut** check box, but leave the **Can be refined** check box cleared. Then, on the **Distribution schedules** page, run the **1110** job.

## Configure channel components

To make the functionality that is specific to Italy available, you must configure extensions for commerce channel components. For more information, see the [Deployment guidelines](#) section later in this topic.

# Example scenarios

The following example scenarios show how to work with customer information in POS for Italy.

## Scenario 1: Make a sale to an anonymous customer

1. Sign in to POS.
2. Add items to the cart.
3. Select **Add customer information**, and then select **Enter manually**.
4. Enter the customer's lottery code, and then select **OK**.
5. Register payments for the transaction, and then finalize the transaction.
6. Verify that the printed receipt contains the customer's lottery code.

## Scenario 2: Make a sale to a new named customer

1. Sign in to POS.
2. Add items to the cart.
3. Select **Add customer**, and then select **New**.
4. Specify the new customer's attributes. In the **Fiscal code** field, enter the customer's fiscal code.
5. Select **Create a new address**. Then specify the new customer's contact information and an address.
6. In the **Lottery code** field, enter the customer's lottery code.
7. Save the customer record and the customer address record, and add the customer to the transaction.
8. Register payments for the transaction, and then finalize the transaction.
9. Because the inquiry for customer information has been activated, but customer information hasn't been added to the transaction, the **Enter customer information** dialog box is opened. Select **Yes**, and then select **Copy from transaction customer**.
10. Verify the customer's lottery code, and then select **OK**.
11. Verify that the printed receipt contains the customer's lottery code.

### NOTE

If you must specify a different customer for the transaction, you must clear the customer information and then copy it again after the new customer is added.

## Scenario 3: Change the customer information for a sale to a named customer

1. Sign in to POS.
2. Add items to the cart.
3. Select **Add customer**, and then select a customer account to add it to the transaction.
4. Select **Add customer information**, and then select **Copy from transaction customer**.
5. Verify the customer's lottery code, and then select **OK**.
6. Select **Add customer information**, and then select **Clear** to clear the customer information from the transaction.
7. Select **Add customer information**, and then select **Enter manually**.
8. Specify the customer's lottery code, and then select **OK**.
9. Register payments for the transaction, and then finalize the transaction.
10. Verify that the printed receipt contains the customer's lottery code.

# Deployment guidelines

This section provides deployment guidance for enabling customer information management in the localization of Commerce for Italy.

## NOTE

Some steps in these procedures vary, depending on the version of Commerce that you're using. For more information, see [What's new or changed in Dynamics 365 for Retail](#).

If you want to enable the integration of POS with fiscal printers for Italy, and specifically if you want to print customer lottery codes on fiscal receipts, you must deploy the [fiscal printer integration sample for Italy](#).

## Update customizations

Follow these steps to update customizations.

- [Retail 10.0.7 and later](#)
- [Retail 10.0.12 and later](#)

If any of your customizations include request handlers for the `SaveCartRequest` or `CreateSalesOrderServiceRequest` requests:

1. Find the request handler for `SaveCartRequest`.
2. Find the line of code that runs the original request handler.
3. Add the following lines before calling the original request handler:

```
using Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdItaly.Services;  
...  
new TaxRegistrationIdFiscalCustomerService().Execute(request);
```

4. Find the request handler for `CreateSalesOrderServiceRequest`.
5. Find the line of code that runs the original request handler.
6. Replace it with the following code:

```
using Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdItaly.Services;  
...  
return new TaxRegistrationIdFiscalCustomerService().Execute(request);
```

## Update a development environment

Follow these steps to update a development environment.

### CRT extension components

1. Find the extension configuration file for the Commerce runtime (CRT):
  - **Commerce Scale Unit:** Find the `CommerceRuntime.Ext.config` file in the `bin\ext` folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Find the `CommerceRuntime.MPOSOOffline.Ext.config` file under the local CRT client broker location.
2. Register the CRT extension in the extension configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdItaly" />
```

## WARNING

Do **not** edit the `CommerceRuntime.config` and `CommerceRuntime.MPOSOffline.config` files. These files aren't intended for any customizations.

### Modern POS extension components

Follow these steps to make the `TaxRegistrationId.IT` extension available.

1. Open the solution at `RetailSdk\POS\ModernPOS.sln`.
2. In `POS.Extensions\extensions.json`, turn on the extension.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/TaxRegistrationId.IT"
    }
  ]
}
```

3. Build the solution.
4. Open Modern POS, and test the functionality.

### Cloud POS extension components

Follow these steps to make the `TaxRegistrationId.IT` extension available.

1. Open the solution at `RetailSdk\POS\CloudPOS.sln`.
2. In `POS.Extensions\extensions.json`, turn on the extension.

```
{
  "extensionPackages": [
    {
      "baseUrl": "Microsoft/TaxRegistrationId.IT"
    }
  ]
}
```

3. Build the solution.
4. Open Cloud POS, and test the functionality.

### Update a production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply the packages in a production environment.

1. In the `CommerceRuntime.Ext.config` and `CommerceRuntime.MPOSOffline.Ext.config` configuration files under the `RetailSdk\Assets` folder, add the following lines to the `composition` section.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.TaxRegistrationIdItaly" />
```

2. Turn on the `TaxRegistrationId.IT` POS extension.

```
{
  "extensionPackages": [
    {
      "baseUri": "Microsoft/TaxRegistrationId.IT"
    }
  ]
}
```

3. Run **msbuild** for the whole Retail software development kit (SDK) to create deployable packages.
4. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Retail SDK packaging](#).

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Global CFDI electronic invoices for Mexico

2/18/2021 • 5 minutes to read • [Edit Online](#)

The Commerce functionality for Mexico supports the Comprobantes fiscales digitales por internet (CFDI) format for Mexican companies. For more information about CFDI electronic invoices, see [Electronic invoices \(CFDI\)](#).

When a company closes the daily process, it must issue a Global CFDI document to consolidate all receipts that were issued to the final consumers. This document includes the following information for each transaction that is registered during the period:

- A receipt number
- A corresponding amount

## Processing Global CFDI documents

The Global CFDI functionality lets you perform the following tasks:

- Create an electronic invoice, in Global CFDI format (layout 3.3), that is based on the posted commerce statement. For more information about the layout, see [CFDI layout version 3.3](#).
- For each electronic invoice generate a file in the .pdf or .xml format, and send it to the customer as an email attachment. After the Global CFDI electronic invoices are generated, they are verified and certified by a digital signature service provider (PAC) in the same way as other CFDI documents. For more information, see [Electronic invoices \(CFDI\)](#) and [Inquire and print an electronic invoice](#).

To generate and submit a Global CFDI electronic invoice, follow these steps.

1. As a preparatory step, on the **Retail** tab of the **Electronic invoice parameters** page (**Organization administration > Setup > EInvoice > Electronic invoice parameters**), you must specify the default parameters of the Global CFDI format.
2. Close the shift at the point of sale (POS).
3. Run the P-job in the distribution schedule to transfer transactions from the channel database to Headquarters.
4. Calculate and post a statement by following the steps in [Create, calculate, and post a statement for a retail store](#).
5. Run the **Post CFDI – Electronic invoices** periodic operation to create Global CFDI electronic invoices that are based on a posted statement. You can select a statement number for this periodic operation. If you don't select a statement number, the system creates Global CFDI electronic invoices for all posted statements that haven't yet been processed.

As a result of the **Post CFDI – Electronic invoices** periodic operation, two Global CFDI electronic invoices are created. One electronic invoice collects all receipts that are related to sales operations, and the other collects all receipts that are related to returns. For the electronic invoice that is related to returns, the **Return** attribute is set to **Yes**. You can view these electronic invoices on the **CFDI (electronic invoices)** page (**Retail and Commerce > Inquiries and reports > CFDI (electronic invoices)**).

All further workflows, such as communication with a service provider, generation of the .pdf and .xml files, and manual functions are the same as the workflows for CFDI Normal electronic invoices.

6. Run the **Export/import electronic invoice process** periodic operation to submit electronic invoices to

the PAC.

## Updates for the Global CFDI functionality

In Microsoft Dynamics 365 for Finance and Operations version 10.0.2 (May 2019), the Global CFDI functionality was extended to support new requirements that were introduced in the second revision of the *Global CFDI filling guide*. Starting in Microsoft Dynamics 365 for Finance and Operations version 10.0.2 (May 2019), you can perform the following tasks:

- At the customer's request, generate a separate CFDI Normal electronic invoice that is based on a sale or return operation that is registered at the POS.

In this case, the sale or return operation should be registered as a customer order. For more information about the functionality for customer orders, see [Customer orders in Modern POS \(MPOS\)](#).

- In a CFDI electronic invoice that is generated based on returns, specify universally unique identifiers (UUIDs) for CFDI electronic invoices that are related to the original sales operations.

Starting in Dynamics 365 for Finance and Operations version 10.0.2 (May 2019), the Global CFDI functionality also supports the following additional scenarios:

- [Item returns across multiple customer orders and invoices](#)
- Customer order returns that involve an exchange, when a customer invoice includes both lines that have positive amounts and lines that have negative amounts

### Showing related CFDI documents in a CFDI electronic invoice

To show the UUIDs of the original sales in CFDI electronic invoices for returns, turn on the **Specify related CFDI in returns** parameter on the **Retail** tab of the **Electronic invoice parameters** page (**Organization administration > Setup > EInvoice > Electronic invoice parameters**). After you turn on this parameter, both Global CFDI and CFDI Normal documents are generated that include the following information:

- A list of related electronic invoices.
- A status of **Draft**. (This status is a new status that was introduced in version 10.0.2). An electronic invoice is automatically set to this status if a UUID isn't specified for all the related electronic invoices. The **Export/import electronic invoice process** periodic procedure skips all electronic invoices that have a status of **Draft**.
- An XML file that is generated, where the **CFDI relacionados** section contains the list of related electronic invoices. You can view the list of related electronic invoices by selecting **Inquiries > Related e-invoices**. You can also manually add a new related electronic invoice on the same page.

The status of electronic invoices is automatically updated later, when all related electronic invoices get their UUIDs. To manually update the status of an electronic invoice, you can use the **Mark as ready** function. The status of the electronic invoice will be changed, and it will become available for export.

### Excluding customer orders from Global CFDI electronic invoices

To process customer orders as CFDI Normal electronic invoices in the same way that sales orders are processed in the **Accounts receivable** module, and to exclude those operations from the Global CFDI electronic invoices, turn on the **Exclude customer orders from CFDI Global** parameter on the **Retail** tab of the **Electronic invoice parameters** page (**Organization administration > Setup > EInvoice > Electronic invoice parameters**). After you turn on this parameter, a separate electronic invoice is created based on each sale or return operation that is posted via a customer order at the POS.

The following customer order operations can cause a CFDI Normal electronic invoice to be posted:

- Customer order pickup
- Customer order return

- Hybrid customer order (For more information about this scenario, see [Hybrid customer orders](#).)

When the **Exclude customer orders from CFDI Global** parameter is turned off, and no previous customer invoice was posted from the same customer order and processed as a separate electronic invoice (CFDI Normal), customer orders are included in Global CFDI electronic invoices. Otherwise, customer orders are processed as separate electronic invoices (CFDI Normal). Therefore, they are excluded from Global CFDI electronic invoices.

Customer order returns are processed in the same way (either CFDI Global or CFDI Normal) as the original sales operations.

### **Limitations**

Note the following limitations:

- All invoices from an original sales order are included in a return electronic invoice as the related CFDI documents.
- The scenario of a customer order return that involves an exchange is supported only for Global CFDI electronic invoices.

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cash register functionality for Norway

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic provides an overview of the cash register functionality that is available for Norway in Dynamics 365 Commerce. It also provides guidelines for setting up the functionality. The functionality consists of the following parts:

- Common point-of-sale (POS) features that are available to customers in all countries or regions. Examples include an option that lets you prevent a copy of a receipt from being printed more than one time.
- Norway-specific features, such as digital signatures for sales transactions.

## Overview of cash register functionality for Norway

### Common POS features

To learn about POS features that are available to customers in all countries or regions, see [Help resources for Dynamics 365 Retail](#).

The following POS localization features that were previously implemented and made available to customers in all countries or regions can now be used specifically for Norway:

- **Print text fields on a receipt in a large font size.** You can use the **Font size** parameter in the Receipt format designer to specify that the large font size should be used for a field in the receipt format. (The large font size is approximately double the usual font size.) For example, you can use this parameter to print the "Copy" indicator on a copy of a receipt in large characters.
- **Register the printing of receipt copies in the POS audit event log.** You can use the **Audit** parameter in the POS functionality profile to enable copies of receipts to be printed and other POS audit events to be registered. The audit events are registered in the channel database and in Headquarters. You can view the audit events on the **Audit events** page.
- **Prevent a copy of a receipt from being printed more than one time.** When the **Audit** parameter in the POS functionality profile is enabled, the **Allow printing receipt copies** POS permission controls whether copies of receipts can be printed. There is also an option that lets you prevent a copy of a receipt from being printed more than one time.

Additionally, the following POS feature was implemented for Norway but made available to customers in all countries or regions:

- **Register additional events in the POS audit event log.** If the **Audit** parameter in the POS functionality profile is enabled, the following events are registered in the POS audit event log:
  - Price checks
  - Tax overrides
  - Corrections to line quantities
  - Clearing transactions from the channel database

### Norway-specific POS features

The following Norway-specific POS features are enabled when the **ISO code** parameter in the POS functionality profile is set to **No**.

#### Digital signing of sales transactions

Every sales transaction is digitally signed. The signature is created and recorded in the POS transaction journal at the same time that the transaction is finalized. The signature is also available in the journal that is exported for

audit purposes.

Only transactions for cash sales are signed. Here are some examples of transactions that are excluded from the signing process:

- Prepayments (customer account deposit)
- Prepayments for sales orders (customer order deposit)
- Issuing a gift card
- Non-sales transactions (float entry, tender removal, and so on)

The data that is signed is a text string that consists of the following data fields. The data fields are separated by semicolons.

1. Previous signature for the same POS (A zero [0] is used for the first transaction.)
2. Transaction date
3. Transaction time
4. Sequential signed transaction number
5. Transaction amount including tax
6. Transaction amount excluding tax

The digital signing process uses an RSA 1024-bit key that has a SHA-1 hash function (RSA-SHA1-1024). A certificate that is installed on Commerce Scale Unit is used for signing. The unique identifier of the certificate (footprint) is recorded together with the signature.

The signature is stored in the store database and the headquarters (HQ) database together with the transaction data. You can view the transaction signature, together with the transaction data that was used to generate it, on the **Fiscal transactions** FastTab of the **Store transactions** page.

#### **Receipts**

Receipts for Norway can include additional information that was implemented by using custom fields:

- **Receipt title** – You can add a field to a receipt format layout to identify the type of receipt. For example, a sales receipt will include the text "Sales receipt".
- **Signed transaction sequential number** – The sequential number of a signed transaction can appear on the receipt to associate a printed receipt with a digital signature in the database.
- **Receipt totals** – Custom fields for receipt totals exclude non-sales amounts from total transaction amounts. Non-sales amounts include amounts for the following operations:
  - Prepayments (customer account deposit)
  - Prepayments for sales orders (customer order deposit)
  - Issuing a gift card
  - Adding funds to a gift card

#### **X and Z reports**

The information that is included on X and Z reports is based on Norwegian requirements. For example, **Total cash sales** amounts include only amounts for cash sales transactions and exclude issue gift card operations and prepayments. Total cash sales are also listed per item group and payment method. In addition, cumulative **Grand total sales** and **Grand total returns** amounts are maintained and printed.

#### **SAF-T Cash Register audit file**

You can export the POS transaction journal in the predefined Standard Audit File - Tax (SAF-T) Cash Register format. The audit file includes information about the organization, relevant master data (such as item groups, items, and tax codes), cash sales transaction data together with signatures for those transactions, non-sales event data, and end-of-date report data.

The audit file can be exported for the following scenarios:

- Per store
- All stores
- Per terminal
- All terminals

You can also send a report from one legal entity on behalf of another legal entity. In this case, you must run the export from the operating legal entity and specify the reporting legal entity as the sender of the report.

The SAF-T Cash Register format is implemented at Headquarters by using [Electronic reporting](#).

## Setting up Commerce for Norway

This section describes the settings that are specific to and recommended for Norway. For more information, see [Help resources for Dynamics 365 Retail](#).

To use the Norway-specific functionality, you must complete these tasks:

- Set the **Country/region** field to **NOR** (Norway) in the primary address of the legal entity.
- Set the **ISO code** field to **NO** (Norway) in the POS functionality profile of every store that is located in Norway.

You must also specify the following settings for Norway.

### Set up the legal entity

Make sure that the name of the legal entity is specified. This name will be printed on X and Z reports.

Additionally, on the **Bank account information** FastTab, in the **Routing number** field, specify the organization number.

### Set up value-added tax (VAT) per Norwegian requirements

You must create sales tax codes, sales tax groups, and item sales tax groups. You must also set up sales tax information for products and services. For more information about how to set up and use sales tax, see [Sales tax overview](#).

You must also specify sales tax groups and enable the **Prices include sales tax** option for stores that are located in Norway.

### Set up functionality profiles

You must enable auditing and set up receipt numbering.

### Update POS permissions groups and individual permission settings for store workers

Set the **Allow printing receipt copy** permission to an appropriate value:

- **Allow always** – The operator can print a copy of a receipt multiple times.
- **Allow only once** – The operator can print a copy of a receipt only one time.
- **Allow only once, and only if HQ DB is available** – The operator can print a copy of a receipt only one time, and only if the HQ database is available through Commerce Data Exchange: Real-time Service, so that the system can verify that no copies of the receipt have previously been printed in any store.
- **Never** – The operator can't print a copy of a receipt.

### Configure custom fields so that they can be used in receipt formats for sales receipts

On the **Language text** page, add the following records for the labels of the custom fields for receipt layouts. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the table are just examples. You can change them to meet to your requirements.

LANGUAGE ID	TEXT	TEXT ID
en-US	Receipt title	900011
en-US	Is gift card	900012
en-US	Total (sales)	900013
en-US	Tax total (sales)	900014
en-US	Total with tax (sales)	900015
en-US	Tax amount (sales)	900016
en-US	Cash transaction ID	900017

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. Note that **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page.

NAME	TYPE	CAPTION TEXT ID
ReceiptTitle	Receipt	900011
IsGiftCard	Receipt	900012
SalesTotalExt	Receipt	900013
TaxTotalExt	Receipt	900014
TotalWithTaxExt	Receipt	900015
AmountPerTaxExt	Receipt	900016
CashTransactionSequentialNumber	Receipt	900017

### Configure receipt formats

For all required receipt formats, change the value of the **Print behavior** field to **Always print** for the receipt format.

In the Receipt format designer, add the following custom fields to the appropriate receipt sections. Note that field names correspond to the language texts that you defined in the previous section.

#### 1. Header:

- **Receipt title** – This field identifies the type of receipt.
- **Cash transaction ID** – This field prints the sequential number of the signed cash transaction.

#### 2. Lines:

- **Is gift card** – This field marks the receipt line as related to the Issue gift card or Add to gift card operation.

#### 3. Footer:

- **Total (sales)** – This field prints the receipt's total cash sale amount. The amount excludes tax. Prepayments and gift card operations are excluded.

- **Tax total (sales)** – This field prints the receipt's total tax amount for cash sales. Prepayments and gift card operations are excluded.
- **Total with tax (sales)** – This field prints the receipt's total cash sale amount. The amount includes tax. Prepayments and gift card operations are excluded.
- **Tax amount (sales)** – This field prints the receipt's tax amount for cash sales per tax code. Prepayments and gift card operations are excluded.

For more information about how to work with receipt formats, see [Set up and design receipt formats](#).

### **Configure the SAF-T Cash Register export format**

The SAF-T Cash Register configuration is available for download from Microsoft Dynamics Lifecycle Services (LCS). For more information, see [Import electronic reporting configurations](#). You must download the following configurations:

- **Retail channel data.version.1** – The data model configuration.
- **DMM Retail channel data.version.1.12** – The data model mapping configuration.
- **NO SAF T Cash Register.version.1.15** – The format configuration.

After you import the configurations, on the **Commerce parameters** page, on the **Electronic documents** tab, in the **SAF-T Cash register export format** field, select the name of the format configuration that was imported.

You must also map required master data to predefined SAF-T standard codes. For more information, see the SAF-T Cash register documentation that is provided by the Norwegian Tax Administration. To create the mapping, you must set the new **SAF-T Cash register code** field on the following pages:

- Item groups
- Payment methods
- Sales tax codes

### **Configure channel components**

To enable Norway-specific functionality, you must configure extensions for channel components. For more information, see the [deployment guidelines](#).

#### **NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Deployment guidelines for cash registers for Norway

2/18/2021 • 32 minutes to read • [Edit Online](#)

This topic is a deployment guide that shows how to enable the Dynamics 365 Commerce localization for Norway. The localization consists of several extensions of Commerce components. For example, the extensions let you print custom fields on receipts, register additional audit events, sales transactions, and payment transactions in Point of Sale (POS), digitally sign sales transactions, and print X and Z reports in local formats. For more information about the localization for Norway, see [Cash register functionality for Norway](#).

This sample is part of the Retail software development kit (SDK). For information about the SDK, see the [Retail software development kit \(SDK\) architecture](#).

This sample consists of extensions for the Commerce runtime (CRT), Retail Server, and POS. To run this sample, you must modify and build the CRT, Retail Server, and POS projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Microsoft Visual Studio Online (VSO), where no files have been changed yet.

## NOTE

In Commerce 10.0.8 and above, Retail Server is known as Commerce Scale Unit. Because this topic applies to multiple previous versions of the app, *Retail Server* is used throughout the topic.

## NOTE

Some steps in the procedures in this topic differ, depending on the version of Commerce that you're using. For more information, see [What's new or changed in Dynamics 365 Retail](#).

## Using certificate profiles in Commerce channels

In Commerce versions 10.0.15 and later, you can use the [User-defined certificate profiles for retail stores](#) feature that supports failover to offline when Key Vault or Commerce headquarters aren't available. The feature extends the [Manage secrets for retail channels](#) feature.

To apply this functionality in the CRT extension, follow these steps.

1. Create a new CRT extension project (C# class library project type). Use the sample templates from the Retail software development kit (SDK) (RetailSDK\SampleExtensions\CommerceRuntime).
2. Add custom handler for CertificateSignatureServiceRequest in the SequentialSignatureRegister project.
3. To read a secret call, GetUserDefinedSecretCertificateServiceRequest using a constructor with profileId parameter. That will start the functionality working with settings from Certificate profiles. Based on the settings, the certificate will be retrieved either from Azure Key Vault or local machine storage.

```
GetUserDefinedSecretCertificateServiceRequest getUserDefinedSecretCertificateServiceRequest = new
GetUserDefinedSecretCertificateServiceRequest(profileId: "ProfileId", secretName: null, thumbprint: null,
expirationInterval: null); GetUserDefinedSecretCertificateServiceResponse
getUserDefinedSecretCertificateServiceResponse =
request.RequestContext.Execute(getUserDefinedSecretCertificateServiceRequest);
```

```
X509Certificate2 Certificate = getUserDefinedSecretCertificateServiceResponse.Certificate;
```

4. When the certificate is retrieved, proceed with data signing.
5. Build the CRT extension project.
6. Copy the output class library and paste it into ...RetailServer\webroot\bin\Ext for manual testing.
7. In the CommerceRuntime.Ext.config file, update the extension composition section with the custom library information.

## Development environment

Complete these procedures to set up a development environment so that you can test and extend the sample.

### The CRT extension components

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under `RetailSdk\SampleExtensions\CommerceRuntime`.

#### ReceiptsNorway component

1. Find the `Runtime.Extensions.ReceiptsNorway` project, and build it.
2. In the `Extensions.ReceiptsNorway\bin\Debug` folder, find the `Contoso.Commerce.Runtime.ReceiptsNorway.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Retail Server:** Copy the assembly to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Retail Server site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.ReceiptsNorway" />
```

#### WARNING

Do **not** edit the `commerceruntime.config` and `CommerceRuntime.MPOSOOffline.config` files. These files aren't intended for any customizations.

#### SalesPaymentTransExt component

1. Find the `Runtime.Extensions.SalesPaymentTransExt` project, and build it.
2. In the `Extensions.SalesPaymentTransExt\bin\Debug` folder, find the `Contoso.Commerce.Runtime.SalesPaymentTransExt.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker

location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SalesPaymentTransExt" />
```

#### WARNING

Do not edit the `commerceruntime.config` and `CommerceRuntime.MPOSOOffline.config` files. These files aren't intended for any customizations.

#### XZReportsNorway component

1. Find the `Runtime.Extensions.XZReportsNorway` project, and build it.

2. In the `Extensions.XZReportsNorway\bin\Debug` folder, find the `Contoso.Commerce.Runtime.XZReportsNorway.dll` assembly file.

3. Copy the assembly file to the CRT extensions folder:

- **Retail Server:** Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.

4. Find the extension configuration file for CRT:

- **Retail Server:** The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
- **Local CRT on Modern POS:** The file is named `CommerceRuntime.MPOSOOffline.Ext.config`, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.XZReportsNorway" />
```

#### WARNING

Do not edit the `commerceruntime.config` and `CommerceRuntime.MPOSOOffline.config` files. These files aren't intended for any customizations.

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

#### RegisterAuditEvent sample component

1. Find the `Runtime.Extensions.RegisterAuditEventSample` project, and build it.

2. In the `Extensions.RegisterAuditEventSample\bin\Debug` folder, find the `Contoso.Commerce.Runtime.RegisterAuditEventSample.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Retail Server**: Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS**: Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Retail Server**: The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS**: The file is named `CommerceRuntime.MPOSOffline.Ext.config`, and it's under the local CRT client broker location.
5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.RegisterAuditEventSample" />
```

#### WARNING

Do not edit the `commerceruntime.config` and `CommerceRuntime.MPOSOffline.config` files. These files aren't intended for any customizations.

#### SalesTransactionSignature sample component

1. Find the `Runtime.Extensions.SalesTransactionSignatureSample` project.
2. Modify the `App.config` file by specifying the thumbprint, store location, and store name for the certificate that should be used to sign sales transactions.
3. Build the project.
4. In the `Extensions.SalesTransactionSignatureSample\bin\Debug` folder, find the following files:
  - The `Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll` assembly file
  - The `Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll.config` configuration file
5. Copy the files to the CRT extensions folder:
  - **Retail Server**: Copy the assembly to the `\bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS**: Copy the assembly to the `\ext` folder under the local CRT client broker location.
6. Find the extension configuration file for CRT:
  - **Retail Server**: The file is named `commerceruntime.ext.config`, and it's in the `bin\ext` folder under the IIS Retail Server site location.
  - **Local CRT on Modern POS**: The file is named `CommerceRuntime.MPOSOffline.Ext.config`, and it's under the local CRT client broker location.
7. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SalesTransactionSignatureSample" />
```

## WARNING

Do not edit the `commerceruntime.config` and `CommerceRuntime.MPOSOffline.config` files. These files aren't intended for any customizations.

### The Retail Server extension components

#### SalesTransactionSignature Retail Server sample component

1. In the `RetailSDK\SampleExtensions\RetailServer\RetailServer.Extensions.SalesTransactionSignatureSample` folder, find the `RetailServer.Extensions.SalesTransactionSignatureSample` project, and build it.
2. In the `RetailServer\Extensions.SalesTransactionSignatureSample\bin\Debug` folder, find the `Contoso.RetailServer.SalesTransactionSignatureSample.dll` assembly file.
3. Copy the assembly file to the Retail Server extensions folder.
  - [Application update 4](#)
  - [Application update 5 and later](#)
  - [Retail 7.3.1](#)
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)

The folder is the `\bin` folder under the IIS Retail Server site location.

4. Find the configuration file for Retail Server. The file is named `web.config`, and it's in the root folder under the IIS Retail Server site location.
5. Register the Retail Server extensions in the `extensionComposition` section of the configuration file.

```
<add source="assembly" value="Contoso.RetailServer.SalesTransactionSignatureSample" />
```

6. Register the dependencies of the Retail Server extensions.
  - [Application update 4](#)
  - [Application update 5 and later](#)
  - [Retail 7.3.1](#)
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)
1. In the `CommerceRuntime\Extensions.SalesTransactionSignatureSample\bin\Debug` folder, find the following files:
  - The `Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll` assembly file
  - The `Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll.config` configuration file
2. Copy the files to the `\bin` folder under the IIS Retail Server site location.
3. Register the CRT change in the extension configuration file for CRT. This file is named `commerceruntime.ext.config`, and it's in the `bin` folder under the IIS Retail Server site location.

```
<add source="assembly" value="Contoso.Commerce.Runtime.SalesTransactionSignatureSample" />
```

## The Modern POS extension components

### Implement the proxy code for offline mode

This part is equivalent to the Retail Server controller, but it extends the local CRT that is used when the client isn't connected.

1. In the **customization.settings** file, change the **@(RetailServerLibraryPathForProxyGeneration)** section so that it uses the new Retail Server assembly for proxy generation.
2. Implement the following interface methods in the **StoreOperationsManager** class. For the first iteration, add the following code:

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
public Task<bool> SalesTransactionSignatureServiceIsReady()
{
    throw new NotImplementedException();
}
public Task<FiscalTransaction> GetLastFiscalTransaction(string storeNumber, string terminalId)
{
    throw new NotImplementedException();
}
```

3. To regenerate the proxy code, build the **Proxies** folder from the command line by using the **msbuild /t:Rebuild** command.
4. Resolve the **Proxies.RetailProxy** project dependencies:
  - [Application update 4](#)
  - [Application update 5 and later](#)
  - [Retail 7.3.1](#)
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)

Open **RetailSDK\Proxies\RetailProxy\Proxies.RetailProxy.csproj**, add the **RetailSDK\SampleExtensions\CommerceRuntime\Extensions.SalesTransactionSignatureSample\CommerceRuntime.Extensions.SalesTransactionSignatureSample** project to the solution, and add a project reference to the **RetailProxy** project to reference **SalesTransactionSignatureSample**.

5. Adjust the interface methods in the **StoreOperationsManager** class:
  - [Application update 4](#)
  - [Application update 5 and later](#)
  - [Retail 7.3.1](#)
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)

```

public Task<bool> SalesTransactionSignatureServiceIsReady()
{
    return Task.Run(() =>
CommerceRuntimeManager.Runtime.Execute<SalesTransactionSignatureServiceIsReadyResponse>(new
SalesTransactionSignatureServiceIsReadyRequest(), null).IsReady);
}
public Task<FiscalTransaction> GetLastFiscalTransaction(string storeNumber, string terminalId)
{
    return Task.Run(() => CommerceRuntimeManager.Runtime.Execute<GetLastFiscalTransactionResponse>
(new GetLastFiscalTransactionRequest(), null).FiscalTransaction);
}

```

6. Update the `dllhost.exe.config` file so that the client broker loads the new RetailProxy assembly.

```

<add key="RetailProxyAssemblyName" value="Contoso.Commerce.RetailProxy" />
<add key="AdaptorCallerFullTypeName" value="Contoso.Commerce.RetailProxy.Adapters.AdaptorCaller" />

```

#### Retail proxy extension component (Retail 7.3.1 and later)

Complete the following procedure only if you're using Retail 7.3.1 and later.

1. In the `RetailSDK\SampleExtensions\RetailProxy\RetailProxy.Extensions.SalesTransactionSignatureSample` folder, find the `RetailServer.Extensions.SalesTransactionSignatureSample` project, and build it.
2. In the `RetailProxy\RetailProxy.Extensions.SalesTransactionSignatureSample\bin\Debug` folder, find the `Contoso.Commerce.RetailProxy.SalesTransactionSignatureSample` assembly file.
3. Copy the assembly files to the `\ext` folder under the local CRT client broker location.
4. Register the Retail proxy change in the extension configuration file. The file is named `RetailProxy.MPOSOffline.ext.config`, and it's under the local CRT client broker location.

```

<add source="assembly" value="Contoso.Commerce.RetailProxy.SalesTransactionSignatureSample" />

```

#### Modern POS extension components

1. Open the solution at `RetailSdk\POS\ModernPOS.sln`, and make sure that it can be compiled without errors. Additionally, make sure that you can run Modern POS from Microsoft Visual Studio by using the **Run** command.

#### NOTE

Modern POS must not be customized. You must enable User Account Control (UAC), and you must uninstall previously installed instances of Modern POS as required.

2. Include the following existing source code folders in the `Pos.Extensions` project.

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)
- `AuditEventExtensionSample`

- [SalesTransactionSignatureSample](#)
3. Enable the extensions to be compiled in `tsconfig.json` by removing the following folders from the exclude list.
    - [Application update 4](#)
    - [Application update 5 and later](#)
    - [Retail 7.3.1](#)
    - [Retail 7.3.2 and later](#)
    - [Retail 7.3.5 and later](#)
    - [Retail 8.1.1 and later](#)
  4. Enable the extensions to be loaded in `extensions.json` by adding the following lines in the appropriate place.
    - [Application update 4](#)
    - [Application update 5 and later](#)
    - [Retail 7.3.1](#)
    - [Retail 7.3.2 and later](#)
    - [Retail 7.3.5 and later](#)
    - [Retail 8.1.1 and later](#)

```
{
  "baseUrl": "AuditEventExtensionSample"
},
{
  "baseUrl": "SalesTransactionSignatureSample"
}
```

#### **NOTE**

For more information, and for samples that show how to include source code folders and enable extensions to be loaded, see the instructions in the `readme.md` file in the `Pos.Extensions` project.

5. Rebuild the solution.
6. Run Modern POS in the debugger, and test the functionality.

### **Cloud POS extension components**

1. Open the solution at `RetailSdk\POS\CloudPOS.sln`, and make sure that it can be compiled without errors.
2. Include following existing source code folders in the `Pos.Extensions` project.
  - [Application update 4](#)
  - [Application update 5 and later](#)
  - [Retail 7.3.1](#)
  - [Retail 7.3.2 and later](#)
  - [Retail 7.3.5 and later](#)
  - [Retail 8.1.1 and later](#)

- AuditEventExtensionSample
- SalesTransactionSignatureSample

3. Enable the extensions to be compiled in **tsconfig.json** by removing following folders from the exclude list.

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

- AuditEventExtensionSample
- SalesTransactionSignatureSample

4. Enable the extensions to be loaded in **extensions.json** by adding the following lines in the appropriate place.

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
{
  "baseUrl": "AuditEventExtensionSample"
},
{
  "baseUrl": "SalesTransactionSignatureSample"
}
```

#### **NOTE**

For more information, and for samples that show how to include source code folders and enable extensions to be loaded, see the instructions in the readme.md file in the **Pos.Extensions** project.

5. Rebuild the solution.

6. Run the solution by using the **Run** command and following the steps in the Retail SDK handbook.

7. Test the functionality.

#### **Set up required parameters in Headquarters**

For more information, see [Cash register functionality for Norway](#).

## Production environment

Follow these steps to create deployable packages that contain Commerce components, and to apply those packages in a production environment.

1. Complete the steps in the [Cloud POS extension components](#) or [Modern POS extension components](#) section earlier in this topic.

2. Make the following changes in the package configuration files under the **RetailSdk\Assets** folder:

a. In the **commerceruntime.ext.config** and **CommerceRuntime.MPOSOOffline.Ext.config** configuration files, add the following lines to the **composition** section:

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
<add source="assembly" value="Contoso.Commerce.Runtime.ReceiptsNorway" />
<add source="assembly" value="Contoso.Commerce.Runtime.RegisterAuditEventSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.SalesPaymentTransExt" />
<add source="assembly" value="Contoso.Commerce.Runtime.SalesTransactionSignatureSample" />
<add source="assembly" value="Contoso.Commerce.Runtime.XZReportsNorway" />
```

b. Enable Commerce Proxy customization:

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

In the **dllhost.exe.config** configuration file, add the following lines to the **appSettings** subsection of the **configuration** section.

```
<add key="RetailProxyAssemblyName" value="Contoso.Commerce.RetailProxy"/>
<add key="AdaptorCallerFullTypeName" value
="Contoso.Commerce.RetailProxy.Adapters.AdaptorCaller"/>
```

3. Make the following changes in the **Customization.settings** package customization configuration file:

a. Enable Retail Proxy customization.

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

Add the following lines to the **<ItemGroup**

**Condition="'@(RetailServerLibraryPathForProxyGeneration)' == ''>** section.

```
<RetailServerLibraryPathForProxyGeneration
Include="$(SdkReferencesPath)\Contoso.RetailServer.SalesTransactionSignatureSample.dll"/>
```

b. Add the following lines to the **ItemGroup** section to include the CRT extensions in the deployable packages:

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.ReceiptsNorway.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.RegisterAuditEventSample.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesPaymentTransExt.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll.con
fig" />
<ISV_CommerceRuntime_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.XZReportsNorway.dll" />
```

c. Add following lines to the **ItemGroup** section to include the Retail Server extension in the deployable packages:

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

```
<ISV_RetailServer_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.RetailServer.SalesTransactionSignatureSample.dll" />
<ISV_RetailServer_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll" />
<ISV_RetailServer_CustomizableFile
Include="$(SdkReferencesPath)\Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll.con
fig" />
```

4. Modify the following files to include the resource files for Norway in deployable packages:

- Packages\_SharedPackagingProjectComponents\Sdk.ModernPos.Shared.csproj
- Packages\RetailServer\Sdk.RetailServerSetup.proj
- For the **Sdk.ModernPos.Shared.csproj** file
  - Add line to the **ItemGroup** section

```
<<File_name> Include="$(SdkReferencesPath)\nb-NO\*" />
```

#### NOTE

Instead of the <File\_name> specify a name of the resource file. The same is relevant for the other examples given below.

- Add line to the **Target Name="CopyPackageFiles"** section

```
<Copy SourceFiles="@(<File_name>)"
DestinationFolder="$(OutputPath)content.folder\CustomizedFiles\ClientBroker\ext\nb-NO"
SkipUnchangedFiles="true" />
```

- For the **Sdk.RetailServerSetup.proj** file

- Add line to the **ItemGroup** section

```
<<File_name> Include="$(SdkReferencesPath)\nb-NO\*" />
```

- Add line to the **Target Name="CopyPackageFiles"** section

```
<Copy SourceFiles="@(<File_name>)"
DestinationFolder="$(OutputPath)content.folder\RetailServer\Code\bin\ext\nb-NO"
SkipUnchangedFiles="true" />
```

5. Modify the certificate's configuration file by specifying the thumbprint, store location, and store name for the certificate that should be used to sign sales transactions. Then copy the configuration file to the **References** folder.

- [Application update 4](#)
- [Application update 5 and later](#)
- [Retail 7.3.1](#)
- [Retail 7.3.2 and later](#)
- [Retail 7.3.5 and later](#)
- [Retail 8.1.1 and later](#)

The file is named **Contoso.Commerce.Runtime.SalesTransactionSignatureSample.dll.config**, and it's under **CommerceRuntime\Extensions.SalesTransactionSignatureSample\bin\Debug**.

6. Update Retail Server configuration file. In the **RetailSDK\Packages\RetailServer\Code\web.config** file, add the following lines to the **extensionComposition** section.

```
<add source="assembly" value="Contoso.RetailServer.SalesTransactionSignatureSample" />
```

7. Run **msbuild** for the whole Retail SDK to create deployable packages.
8. Apply the packages via Microsoft Dynamics Lifecycle Services (LCS) or manually. For more information, see [Create deployable packages](#).

### **Enable the digital signature in offline mode for Modern POS**

To enable the digital signature in offline mode for Modern POS, you must follow these steps after you activate Modern POS on a new device.

1. Sign in to POS.
2. On the **Database connection status** page, make sure that the offline database is fully synchronized. When the value of the **Pending downloads** field is **0** (zero), the database is fully synchronized.
3. Sign out of POS.
4. Wait a while for the offline database to be fully synchronized.
5. Sign in to POS.
6. On the **Database connection status** page, make sure that the offline database is fully synchronized. When

the value of the **Pending transactions in offline database** field is **0** (zero), the database is fully synchronized.

7. Restart Modern POS.

**NOTE**

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Cash register functionality for Sweden

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic provides an overview of the cash register functionality that is available for Sweden in Dynamics 365 Commerce. It also provides guidelines for setting up the functionality. The functionality consists of the following parts:

- Common point-of sale (POS) features that are made available to customers in all countries or regions, such as an option to prevent sales and returns from being combined on one receipt
- Sweden-specific features, such as additional counters in daily POS reports
- A sample for integration of POS with Sweden-specific fiscal devices that are known as control units.

## Overview of cash register functionality for Sweden

### Common POS features

To learn about common POS features that are available to customers in all countries or regions, see [Commerce home page](#).

Additionally, the following POS features that were implemented for Sweden have been made available to customers in all countries or regions:

- **Prohibit sales and returns from being combined on one receipt.** When you set the **Prohibit mixing sales and returns in one receipt** parameter in the POS functionality profile to **Yes**, Cloud POS and Modern POS won't let users create a transaction that contains both positive and negative lines.
- **Print text fields on the receipt in a large font size.** You can use the **Font size** parameter in the Receipt format designer to specify that the large font size should be used for a field in a receipt format. (The large font size is approximately double the usual font size.) For example, you can use this parameter to print the "Copy" indicator on a receipt copy in large characters.
- **Register the printing of receipt copies in the POS audit event log.** You can use the **Audit** parameter in the POS functionality profile to enable the printing of receipt copies and other POS audit events to be registered. The audit events are registered in the channel database and in Headquarters. You can view the audit events on the **Audit events** page.
- **Prevent a copy of a receipt from being printed more than one time.** When the parameter **Audit** in the POS functionality profile is enabled, the **Allow printing receipt copies** POS permission controls whether receipt copies can be printed. There is also an option to prevent a copy of a receipt from being printed more than one time.

### Sweden-specific POS features

The following Sweden-specific POS features are enabled when the **ISO code** parameter in the POS functionality profile is set to **SE**:

- Additional counters on daily POS reports, such as X-reports and Z-reports:
  - Receipt copy count and total amount
  - Value added tax amounts per tax rate
  - Total quantities of items and services sold
  - Total sales excluding and including VAT
  - Grand total sales, returns, and net
- An **Electronic journal (Sweden)** channel report that lists continuous use events in the POS, such as sales, returns, receipt copies, drawer openings, and price overrides.

#### NOTE

Currently, the **Electronic journal (Sweden)** report can't be exported or printed. However, functionality for exporting and printing the report will be added later.

### Integration of Retail POS with control units

- [Retail 10.0.6 and earlier](#)
- [Retail 10.0.7 and later](#)

For more information about the integration with control units that is available in Retail versions up to and including Retail 10.0.6, see [Sample for POS integration with control units for Sweden \(legacy\)](#).

## Setting up Commerce for Sweden

This section describes the settings that are specific to and recommended for Sweden. For more information, see [Commerce home page](#).

To use the Sweden-specific functionality, you must complete these tasks:

- Set the **Country/region** field to **SWE** (Sweden) in the primary address of the legal entity.
- Set the **ISO code** field to **SE** (Sweden) in the POS functionality profile of every store that is located in Sweden.

Sweden-specific settings can be divided into two groups:

- General settings
- Control unit-specific settings

### General settings

You must specify the following general settings for Sweden.

1. Set up the following parameters for value-added tax (VAT) per Swedish requirements:

- Sales tax codes
- Sales tax groups
- Item sales tax groups
- Sales tax settings in items (item sales tax groups for sales)

For more information about how to set up and use sales tax, see [Sales tax overview](#).

2. On the **All stores** page, update store details. Specifically, set the following parameters:

- In the **Sales tax group** field, set the sales tax group that should be used for sales to the default customer.
- Select the **Prices include sales tax** check box.
- Set the **Store name** field so that it includes the company name. This change helps guarantee that the company name appears on a sales receipt. Alternatively, you can add the company name to the sales receipt layout as free-format text.
- Set the **Tax identification number (TIN)** field so that it includes the company identification number. This change helps guarantee that the company identification number appears on a sales receipt. Alternatively, you can add the company identification number to the sales receipt layout as free-format text.

3. Set up POS functionality profiles:

- On the **Functions** FastTab, select the **Audit** and **Prohibit mixing sales and returns in one**

receipt check boxes.

- On the **Receipt numbering** FastTab, set up receipt numbering. Create or update records for the **Sale** and **Return** receipt transaction types. Set the formats so that they include only numeric characters. Clear the **Independent sequence** check box in both records.
4. Update POS permissions groups and individual permission settings for store workers. Set the **Allow printing receipt copy** permission to an appropriate value:
    - **Allow always** – The operator can print a copy of a receipt multiple times.
    - **Allow only once** – The operator can print a copy of a receipt only one time.
    - **Allow only once, and only if HQ DB is available** – The operator can print a copy of a receipt only one time, and only if the headquarters database is available through Real-Time service, so that the system can verify that no copies of the receipt have previously been printed in any store.
    - **Never** – The operator can't print a copy of a receipt.
  5. Make the required changes to receipt formats for sales receipts:
    - Change the value of the **Print behavior** field to **Always print** for the receipt format.
    - In the Receipt format designer, make these changes:
      - Add at least the following fields to the **Header** section of the receipt layout:
        - **Store name** and **Tax Identification Number** fields, so that the company name and identity number are printed receipts. Alternatively, you can add the company name and identity number to the layout as free-format text.
        - **Store address**, **Date**, **Time 24H**, **Receipt Number**, and **Register number** fields.
        - **Reprint Message** field, so that the "Copy" indicator is printed on receipt copies. Set the **Font size** field for the **Reprint Message** field to **Large**.
      - Add at least the following field to the **Lines** section of the receipt layout: **Item name**, **Qty**, and **Total price with tax**.
      - Add at least the following fields to the **Footer** section of the receipt layout:
        - Tax fields, so that the receipt tax amounts for each tax rate are printed. For example, add the **Tax Id**, **Tax percentage**, and **Tax amounts** fields to one line of the layout.
        - Payment fields, so that the payment amounts for each payment method are printed. For example, add the **Tender name** and **Tender amount** fields to one line of the layout.
  6. On the **Channel reports configuration** page, set up the **Electronic journal (Sweden)** report. In the **Permission groups** field, select the POS permission groups that should be allowed to run the report.

### Control unit-specific settings

- [Retail 10.0.6 and earlier](#)
- [Retail 10.0.7 and later](#)

For more information about setting up and configuring the integration with control units that is available in Retail versions up to and including Retail 10.0.6, see [Sample for POS integration with control units for Sweden \(legacy\)](#).

#### NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

# Control unit integration sample for Sweden

2/18/2021 • 20 minutes to read • [Edit Online](#)

## NOTE

This sample fiscal integration functionality replaces the earlier [Sample for POS integration with control units for Sweden](#). The earlier sample doesn't take advantage of the [fiscal integration framework](#) and will become obsolete in later updates. For information about how to migrate from the earlier sample to the current sample, see the [Migrating from the earlier integration sample](#) section.

## Introduction

The Commerce functionality for Sweden includes a sample integration of the point of sale (POS) with Sweden-specific fiscal devices that are known as *control units*. This sample extends the [fiscal integration functionality](#). It's assumed that a control unit is physically connected to a Hardware station that the POS is paired with. As an example, this sample uses the application programming interface (API) of the [CleanCash Type A](#) control unit by Retail Innovation HTT AB. Version 1.1.4 of the CleanCash API is used.

The sample is provided in the form of source code and is part of the Retail software development kit (SDK).

Microsoft doesn't release any hardware, software, or documentation from Retail Innovation HTT AB. For information about how to get the control unit and operate it, contact [Retail Innovation HTT AB](#).

## Scenarios

The control unit integration sample for Sweden includes the following capabilities:

- Sales, returns, and receipt copies are automatically registered in a control unit that is connected to the Hardware station that is paired with the POS.
- The control code and the manufacturing number of the control unit for a registered transaction are captured from the control unit and saved in the transaction. This data is also referred to as a *fiscal response*. The fiscal response can be viewed on the [Store transactions](#) page.
- Custom fields for the control code and the manufacturing number of the control unit can be added to a receipt layout. In that way, you can print the fiscal response for a transaction on a receipt.
- The fiscal response for a transaction is shown on the [Electronic journal \(Sweden\)](#) channel report.
- Several error handling options are available. Here are some examples:
  - Retry fiscal registration, if a retry is possible. You can retry fiscal registration if, for example, the control unit isn't connected, isn't ready, or isn't responding.
  - Postpone fiscal registration.
  - Skip fiscal registration, or mark the transaction as registered, and include info codes to capture the reason for the failure and additional information.
  - Verify the availability of the control unit before a new sales transaction is opened or a sales transaction is finalized.

### Default data mapping

The following default data mapping is included in the fiscal document provider configuration that is distributed as a part of the fiscal integration sample.

**Value-added tax (VAT) code mapping** sets device-specific value-added tax (VAT) codes to corresponding sales tax codes. VAT code mapping should have the following format:

```
1 : code1 ; 2 : code2
```

Here is an explanation of this format:

- *1* and *2* are device-specific VAT codes.
- A semicolon (;) is used as a separator.
- *code1* and *code2* are sales tax codes that are configured in Headquarters.

Control units support up to four different VAT codes. Therefore, the VAT code mapping might be set up as shown here:

```
1 : code1 ; 2 : code2 ; 3 : code3 ; 4 : code4
```

## NOTE

Multiple sales tax codes can be mapped to the same device-specific VAT code.

### Limitations of the sample

The control unit integration sample for Sweden doesn't currently support customer order scenarios.

## Setting up the integration with control units

For more information about the setup that is required for Sweden, see [Setting up Commerce for Sweden](#).

## Configuring Sweden-specific receipts

### Configure custom fields so that they can be used in receipt formats for sales receipts

You can configure the language text and custom fields that are used in POS receipt formats. The default company of the user who creates the receipt setup should be the same legal entity where the language text setup is created. Alternatively, the same language texts should be created in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, add the following records for the labels of the custom fields for receipt layouts. Note that the **Language ID**, **Text ID**, and **Text** values that are shown in the table are just examples. You can change them to meet your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or greater than 900001.

Add the following POS labels in the **POS** section of the **Language text** page.

LANGUAGE ID	TEXT ID	TEXT
en-US	900001	Register control code
en-US	900002	Register device

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. Note that **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page.

NAME	TYPE	CAPTION TEXT ID
SE_FISCALREGISTERCONTROLCODE	Receipt	900001
SE_FISCALREGISTERID	Receipt	900002

### Configure receipt formats

For every receipt format that is required, change the value of the **Print behavior** field to **Always print**.

In the Receipt format designer, add the following custom fields to the **Footer** section. Note that field names correspond to the language texts that you defined in the previous section of this topic.

- **Register control code** – This field prints the control code.
- **Register device** – This field prints the manufacturing number of the control unit.

For more information about how to work with receipt formats, see [Receipt templates and printing](#).

### Configure fiscal integration

Complete the fiscal integration setup steps that are described in [Set up the fiscal integration for Commerce channels](#):

- [Set up a fiscal registration process](#). Be sure to note the settings for the fiscal registration process that are [specific to this control unit integration sample](#).
- [Set error handling settings](#).
- [Enable manual execution of postponed fiscal registration](#).

## Deployment guidelines for cash registers for Sweden

This topic serves as a deployment guide that shows how to enable the localization of Microsoft Dynamics 365 Commerce for Sweden. The localization is part of the Retail SDK. For information about how to install and use the Retail SDK, see the [Retail SDK documentation](#).

This sample consists of extensions for the Commerce runtime (CRT), POS, and Hardware station. To run this sample, you must modify and build the CRT and Hardware station projects. We recommend that you use an unmodified Retail SDK to make the changes that are described in this topic. We also recommend that you use a source control system, such as Microsoft Azure DevOps, where no files have been changed yet.

Follow these steps to configure a development environment so that you can test and extend the sample. You must also complete all the required setup tasks that are described in the [Setting up the integration with control units](#) section.

### Enable CRT extensions

The CRT extension components are included in the CRT samples. To complete the following procedures, open the CRT solution, `CommerceRuntimeSamples.sln`, under `RetailSdk\SampleExtensions\CommerceRuntime`.

#### DocumentProvider.CleanCashSample component

1. Find the `Runtime.Extensions.DocumentProvider.CleanCashSample` project, and build it.
2. In the `Runtime.Extensions.DocumentProvider.CleanCashSample\bin\Debug` folder, find the `Contoso.Commerce.Runtime.DocumentProvider.CleanCashSample.dll` assembly file.
3. Copy the assembly file to the CRT extensions folder:
  - **Commerce Scale Unit:** Copy the assembly to the `\bin\ext` folder under the Microsoft Internet Information Services (IIS) Commerce Scale Unit site location.
  - **Local CRT on Modern POS:** Copy the assembly to the `\ext` folder under the local CRT client broker location.
4. Find the extension configuration file for CRT:
  - **Commerce Scale Unit:** The file is named `commercerruntime.ext.config`, and it's in the `bin\ext`

folder under the IIS Commerce Scale Unit site location.

- **Local CRT on Modern POS:** The file is named **CommerceRuntime.MPOSOOffline.Ext.config**, and it's under the local CRT client broker location.

5. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Contoso.Commerce.Runtime.DocumentProvider.CleanCashSample" />
```

#### Update the extension configuration file

1. Find the extension configuration file for CRT:

- **Commerce Scale Unit:** The file is named **commerceruntime.ext.config**, and it's in the **bin\ext** folder under the IIS Commerce Scale Unit site location.
- **Local CRT on Modern POS:** The file is named **CommerceRuntime.MPOSOOffline.Ext.config**, and it's under the local CRT client broker location.

2. Register the CRT change in the extension configuration file.

```
<add source="assembly" value="Microsoft.Dynamics.Commerce.Runtime.ReceiptsSweden" />
```

#### Enable Hardware station extensions

The Hardware station extension components are included in the Hardware station samples. To complete the following procedures, open the solution, **HardwareStationSamples.sln.sln**, under **RetailSdk\SampleExtensions\HardwareStation**.

##### CleanCash component

1. Find the **HardwareStation.Extension.CleanCashSample** project, and build it.

2. In the **Extension.CleanCashSample\bin\Debug** folder, find the **Contoso.Commerce.HardwareStation.CleanCashSample.dll** assembly file.

3. Copy the assembly file to the Hardware station extensions folder:

- **Shared hardware station:** Copy the file to the **bin** folder under the IIS Hardware station site location.
- **Dedicated hardware station on Modern POS:** Copy the file to the Modern POS client broker location.

4. Find the extension configuration file for the Hardware station's extensions. The file is named **HardwareStation.Extension.config**.

- **Shared hardware station:** The file is under the IIS Hardware station site location.
- **Dedicated hardware station on Modern POS:** The file is under the Modern POS client broker location.

5. Add the following line to the **composition** section of the configuration file.

```
<add source="assembly" value="Contoso.Commerce.HardwareStation.CleanCashSample.dll" />
```

#### Enable Modern POS extension components
