This topic provides information about delayed dates in master planning. A delayed date is a realistic due date that a transaction receives if the earliest fulfillment date that master planning calculates is later than the requested date.

Master planning can calculate the earliest fulfillment date for a transaction, based on lead times, material availability, capacity availability, and various planning parameters.

If master planning calculates an order date that precedes the current date, the order can't be fulfilled on time. Therefore, the order is delayed. In this case, master planning forward-plans the order from the current date and includes lead times. These lead times start with any lower-level component items. The order then receives a delayed date. A delayed date is a realistic due date, based on the current data. Master planning also calculates the number of delay days.

In some situations, you might choose not to calculate delays, such as when users know that they can expedite lead times by selecting alternative modes of delivery.

You can configure how delays are calculated for a coverage group. You can then attach the coverage group to an item later.

On the **Master planning parameters** page, you can set the start time for the calculation of delays. If an order is fulfilled after this time, a delay of one day is added to the delay date of the order.

NOTE

In earlier versions, calculated delays were known as *futures messages*, the delayed date was known as the *futures date*, and a delayed transaction was referred to as *a transaction that was future set*.

Limited delays in production setup with multiple BOM levels

When you work with delays in a production setup that has multiple BOM levels, it is important to note that only the items directly above the item (in the BOM structure) causing the delay, will be updated with a delay as part of the master planning run. Other items in the BOM structure will not get the delay applied until the first master planning run, when the planned order for the top level is approved or firmed.

To work around this known limitation, the production orders on the top of the BOM structure with delays can be approved (or firmed) prior to the next master planning run. This way the delay from the delayed approved planned production order will be kept and all underlying components will be updated accordingly. Action messages can also be used to identify planned orders that can be moved to a later date, due to other delays in the BOM structure.

Desired date

On the **Planned order** page, under the **Delays** tab is the **Desired date** for the planned order. The desired date of a planned order is the base date for delays, which is a computed date that equals the **Requested date** calculated from the **Net Requirement**. If the planned order is a BOM line, production line or kanban line, the desired date is based on the **Requirement date** and the desired date will not be shown on the **Planned order** page.

Cancel a master planning job

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Microsoft Dynamics 365 Supply Chain Management, there are multiple options for canceling a master planning job. For example, you may want to cancel a master planning job if it was started by mistake or is running longer than expected and you want to end it. The best way to cancel a planning job is from the **Unfinished planning processes** page. Alternative options from the **Batch jobs** and **Batch jobs enhanced** pages should only be used if canceling the master planning job from the **Unfinished planning processes** page did not complete within a few minutes.

Preferred cancel option

Cancel master planning job from Unfinished planning processes page

1. Go to **Master planning > Inquiries and reports > Master planning > Unfinished planning processes**.
2. Select the line with the planning process that you want to cancel.
3. Click **Cancel**.

Additional cancel options

These should only be used if canceling the master planning job from the **Unfinished planning processes** page did not complete within a few minutes.

Delete master planning job from the Batch jobs page

1. Go to **System administration > Inquiries > Batch jobs**.
2. Select the line with the planning job that you want to delete.
3. Click **Delete**.

Abort master planning job task from the Batch jobs enhanced page

1. Go to **System administration > Inquiries > Batch jobs**.
2. If the job ID is not shown in the list, click **Switch to enhanced form**, otherwise proceed with the next step.
3. Open the batch job. Click the **Job ID** for the batch job with tasks that you want to end.
4. In **Batch tasks**, select the tasks to end.
5. Click **Change status**, choose **Canceling** and click **OK**.
6. On the **Batch tasks** FastTab, click **Abort**.

Use tracing for explosion

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains how you can use tracing to explore the causes behind the outcome of an order explosion.

By enabling tracing, you can view information about the factors that contributed to the outcome of the explosion of a particular order. The following examples show how you can use the tracing information:

- View relations between the actions on planned orders to optimize the supply chain and inventory reservations.
- View relations to orders that are already approved. You can focus on automatically firming derived requirements and then prioritize orders more accurately.
- Simulate planning results to determine whether the planning parameters are optimal.
- Identify how information such as production dates, quantities, and priorities for an order were determined.

You can view details about futures and actions for a selected order. On the **Explosion** page, tracing information is available on the **Explanation** tab in the upper pane. Tracing occurs when you explode an order. To start tracing for the order, click **Update**, and then select the **Enable trace** check box. You can use the **Find text** field to search the log for specific information. Search results are highlighted in the tree.

Action messages

2/18/2021 • 2 minutes to read • [Edit Online](#)

An action message is a system-generated suggestion to change an existing planned or firmed order.

Introduction

Action messages are generated by the master planning calculation in response to changed requirements. For example, the ship date or quantity may have changed on a sales order for which you have already created a purchase order to fulfill the demand. In this case, one or multiple action messages are generated by the master planning calculation to update the purchase order. You decide whether to make the changes that are suggested.

You can set up how action messages are calculated for a coverage group that you attach to an item.

Select action messages

On the **Coverage groups** page, you can select the action messages that you want the system to generate, and the coverage groups or items that the messages apply to. You can select the following action messages.

MESSAGE	DESCRIPTION
Advance	If you select this message, the system will generate action messages, when needed, to move orders to an earlier date. In the Advance margin field, you can also specify the maximum number of days between receipt and issue without advance action.
Postpone	If you select this message, the system will generate action messages, when needed, to move orders to a later date. In the Postpone margin field, you can specify the maximum number of days between receipt and issue without postpone action.
Decrease	If you select this message, production orders, purchase orders, and other receipt transactions should be decreased to prevent excess inventory levels.
Increase	If you select this message, production orders, purchase orders, and other receipt transactions should be increased to prevent shortages in inventory.
Derived actions	If you select this message, action messages are created for derived requirements, for example, actions for component orders fulfilling the production.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Monitor a master planning run

2/18/2021 • 4 minutes to read • [Edit Online](#)

Use a Gantt chart to visualize master planning progress

From the **View master planning progress** page, you can view details of historical master planning runs as a Gantt chart. This functionality can help you understand the time that is spent on the various phases of master planning. For a current active planning job, the **View master planning progress** page can be used to track progress and view the estimated remaining time.

Turn on and use the Master plan progress visualization feature

To use this functionality, follow these steps.

1. In the **Feature management** workspace, on the **New** tab, select **Master planning progress visualization** in the list. If the feature doesn't appear on the **New** tab, look on the **Not enabled** and **All** tabs.
2. Select **Enable now**. Alternatively, select **Schedule**, and then select the time when you want the feature to be turned on.

The **View master planning progress** page can display both historical planning jobs and active planning jobs.

To view historical planning jobs, there are two options.

1. Go to **Master planning > Setup > Plans > Master plans**, and then, on the Action Pane, select **History**. With the desired job selected, select **Inquiries**, and then select **View progress**
2. Go to **Master planning > Workspaces > Master planning**, on the Master planning tile click **History**. With the desired job selected, select **Inquiries**, and then select **View progress**

To view active planning jobs, there are two options.

1. Go to **Master planning > Workspaces > Master planning**, on the Action Pane, select **Unfinished planning process**. With the desired job selected, select **Inquiries**, and then select **View progress**.
2. Go to **Master planning > Workspaces > Master planning**, on the Master planning tile click **View progress**. With the desired job selected, select **Inquiries**, and then select **View progress**

Note you can view active jobs only when a planning job is processing.

Analyze a master planning job

In the Gantt chart, you can expand each of the following planning processes to view additional details about the time that is spent:

- Initializing
- Deleting and inserting data
- Coverage planning
- Delays
- Action messages
- Finalization
- Auto-firming

The Gantt chart is a useful tool if you want to view the impact of using action messages.

Navigation in the Gantt chart

- To expand the selected group and show the details, select the plus sign (+) in the tree view.
- To collapse the selected group, select the minus sign (–) in the tree view.
- You can use your keyboard for navigation. Use the **Up arrow** and **Down arrow** keys to move between rows. Use the **Right arrow** and **Left arrow** keys to expand and collapse groups.
- To open or close all levels in the Gantt chart, select **Expand all** or **Collapse all**.
- To view the related processing time, hover over a task. (Tasks are the lowest level in the Gantt chart.)

View an additional master planning run to compare jobs

By selecting a master planning job on field **Show additional master planning run**, you can view an additional master planning run in the Gantt chart and compare the two jobs.

BOM-level display

Bill of materials (BOM) levels are shown differently for coverage planning, delays, actions, and firming.

- **Coverage planning** – BOM levels are shown as expected. They are calculated from the top down.
Example: BOM level 0, 1, 2
- **Delays** – BOM levels are shown as the coverage planning BOM levels multiplied by –1. (In other words, they have a negative sign.)
Example: BOM level –2, –1, 0
- **Action message** – BOM levels are shown as expected. They are calculated from the top down.
Example: BOM level 0, 1, 2
- **Auto-firming** – BOM levels are shown as 999 minus the coverage planning BOM level.
Example: BOM level 999, 998, 997

The following table summarizes the behavior.

BOM LEVEL THAT IS SHOWN	END ITEM	SUBCOMPONENT	RAW MATERIAL
Coverage planning	0	1	2
Delays	0	–1	–2
Action message	0	1	2
Auto-firming	999	998	997

Visualize progress

If you view a master planning job that is currently running, progress is shown through colors in the Gantt chart. The following colors apply to the blue theme. For other color themes, the colors will differ.

- **Dark blue** – Completed planning tasks.
- **Orange** – The task that is currently in progress.
- **Light blue** – The estimate for remaining tasks.

The color is shown only on the lowest level in the Gantt chart. Select **Expand all** to view all tasks in the master planning job. The estimate of remaining tasks is based on historical master planning jobs.

Run master planning and track processing time

1. On the default dashboard, select **Master planning**.

2. In the **Plan** field, enter or select a value.
3. Select **Run**.
4. Set the **Track processing time** option to **Yes**.
5. In the **Number of threads** field, enter a number.
6. On the **Records to include** FastTab, select **Filter**.
7. In the grid, select the row where the **Field** field is set to **Item number**.
8. In the **Criteria** field, enter a value.
9. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a schedule for a site

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to schedule production orders that are not yet started for a site. The demo data company USMF is used to complete this procedure.

Identify production orders that are not started

1. Go to Production control > Production orders > All production orders.
2. Use the Quick Filter to find records. For example, filter on the Site field with a value of '1'.
 - 1 represents a site in USMF. If you are not using USMF, select a site from your own company.
3. Open the Status column filter.
4. Apply a filter on the "Status" field, with a value of "Scheduled", using the "is exactly" filter operator.

Create a schedule

1. In the list, mark or unmark all rows.
2. On the Action Pane, click Schedule.
3. Click Schedule jobs.
4. In the Scheduling direction field, select 'Backward from delivery date'.
5. Select No in the Finite capacity field.
6. Select No in the Finite material field.
7. Click OK.
 - This may take a while.

View the result of scheduled production orders

1. In the list, mark the selected row.
 - You can mark any row.
2. On the Action Pane, click Production order.
3. Click All jobs.
 - On this page, you can see the list of jobs. On the Scheduling tab, you can see the Start date and End date for a job.
4. Click Materials.
 - On this page, you can see the estimated material consumption for the operations on the production order and the current available inventory.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a plan for a site

2/18/2021 • 2 minutes to read • [Edit Online](#)

The production planner calculates the material and capacity requirements for the production of a specific item. After the sourcing suggestions are created, he finds the orders at the site for which he is planning and firms the orders, starting from the urgent ones. The most urgent orders are the ones that need to be firming on the current date. Use the demo data company USMF to perform these tasks.

Create a materials and capacity plan for an item

1. Click Master planning.
 - You need to navigate to the default Dashboard.
2. Click Run.
3. Expand the Records to include section.
4. Click Filter.
5. In the list, mark the selected row.
6. In the Criteria field, type a value.
 - Example: D0001
7. Click OK.
8. Click OK.
 - This may take a few minutes.
9. Refresh the page.

Identify the urgent planned orders for the item

1. Open Item number column filter.
2. Apply a filter on the "Item number" field, with a value of "D0001", using the "begins with" filter operator.
3. Open Order date column filter.
4. Apply a filter on the "Order date" field, with a value of current date, using the "is exactly" filter operator.

Firm all the urgent orders for the item

1. In the list, mark or unmark all rows.
2. Click Firm.
3. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Calendars and master planning

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic provides an overview of supply chain calendars and how they affect master planning. The different calendars used in master planning engine are explained, including how they affect the shipping and receiving dates in the planned orders. Finally, recommendations regarding the assignment, use and update of the calendars are given.

Definition of a calendar

You can define a calendar to use in your organization in the page in **Organization administration > Setup > Calendars > Calendars**.

Each date entry in a calendar can be **open** or **closed** or **base calendar**. This is specified in the **Control** column in the **Working times** page. For each date:

- **Open** - Indicates that work is performed on the selected day. The calendar will be updated according to the working time template.
- **Closed** - Indicates work that is not performed during the day.
- **Base calendar** - Indicates that the specific date will inherit the working times and open/closed from the base calendar. Therefore, when the base calendar is updated, the selected calendar will inherit operation times from it.

For any closed dates, the **Closed for pickup** check box will automatically be assigned. For open dates, you can manually select the **Closed for pickup** option. This indicates that work is performed on the date, but shipping is not performed.

Calendars that affect master planning

Calendar for a coverage group

A coverage group indicates a common set of parameters used for replenishment of the items that belong to the given coverage group.

To add a calendar for a coverage group, go to **Master Planning > Setup > Coverage > Coverage groups**. Find the coverage group to which you want to assign the calendar to and then select it on the **Calendar** field.

The coverage group can be assigned in different pages: - On the **Released product details** page of an item. To see the coverage group for an item, go to **Product information management > Products > Released products** and select the item to go to the **Released Products Details** page. You can see the item coverage group under the **Plan** FastTab. - On the **Item coverage** page. In the released products details page, click **Item coverage** to go to the item coverage page. In the overview tab you can see different parameters for replenishment depending on the site, warehouse, and product dimensions. The coverage group for each item will be inherited from the coverage group on the **Released product details** page. This can be overridden by using **Use specific settings** or **Override group setting** on the **General** tab. - On the **Master planning parameters** page. If an item does not have a coverage group set in the previous pages, master planning will take the general coverage group set on master planning parameters. This is set up in **Master planning > Setup > Master planning parameters** in the **General coverage group** field .

Calendar for a vendor

To indicate the working days of a vendor, you can assign a purchase calendar to the vendor on the **Purchase order defaults** page for a vendor.

To set a calendar for a vendor, you need to create the calendar in **Organization Administration > Calendars > Calendars**. When the calendar is created, you have to assign it to the vendor. Go to **Accounts Payable > Vendors > All vendors** and select the vendor that you want to assign the calendar to. Then, on the vendor's page on the **Purchase order defaults** FastTab assign the new purchase calendar using the drop-down menu.

The calendar for a vendor indicates the days on which they accept the placement of the purchase order and the dates when they can deliver the orders to your company. Consequently, the order dates for purchase orders for the vendor with a purchase calendar will be dates defined as open in the calendar. The delivery dates for those orders will also be in open days, and thus, will impact the lead time of the purchased item.

Define the lead time for a purchased item

To specify the purchase lead time (and if only working days should be considered) for an item, you need to go to the default order settings page for the product, found under **Product information management > Products > Released products** and select **Default order settings**.

NOTE

The **Working days** under purchase lead time indicates the working days of the vendor. For example, a calendar for delivery only on Tuesdays with a lead time of 10 days and working days check box selected indicates that it would take 10 weeks (10 Tuesdays) for the item to be delivered. Thus, in most cases it is not recommended to select working days for purchase order lead times.

Define lead times from the trade agreements page

Master planning can be set up to include all trade agreements for vendors. Trade agreements are fixed prices or discount agreements that are set up for one or more customers or vendors for the sale or purchase of individual or multiple products. Go to **Master planning > Setup > Master planning parameters** and on the **Planned orders** tab and select **Find trade agreements** to include the trade agreements when planning. Master planning can select the vendor with the **Minimum lead time** or with the **Lowest unit price**.

Calendar for a warehouse

You can assign a calendar to a warehouse to indicate the open dates for receiving and shipping. If no calendar has been assigned to a warehouse, it is assumed that it is open all days.

NOTE

Assigning a calendar to a transit warehouse does not have any impact. Transit warehouses are used for supporting transfer orders. The applicable shipping or receipt dates for the orders are defined by the open days within the "From" warehouse and the "To" warehouse, and the mode of delivery calendar.

Closed for pickup policy

To indicate that a warehouse is open for receiving but pickup is not possible, you can use the **Closed for pickup policy** within the warehouse calendar. This also applies to customer pickups.

Transport calendar

To indicate the dates that are available for shipping transfer orders from a **From warehouse**, you can assign a **Transport calendar**. You can set up a transport calendar per mode of delivery, or per mode of delivery and from warehouse. The transport calendar is set up in **Sales and marketing > Setup > Distribution > Modes of delivery**. Select a mode of delivery and click the **Transport calendar** button.

A line can be created for each warehouse and mode of delivery, where the calendar is added in the **Transport calendar** column. It will specify the transport calendar that will be applied when goods are shipped from the warehouse using the given mode of delivery. To apply a transport calendar to all shipments using a given mode of delivery, a line can be created without specifying the warehouse. It will affect all shipments using the given mode of delivery, regardless of the warehouse.

If no transport calendar is assigned, it is assumed that all days are open for transport.

Calendar for a customer

To indicate the dates when a customer can accept deliveries, you can assign a receipt calendar to the customer. If no calendar is assigned to a customer, it is assumed that the customer can receive orders on all days. This will affect the receipt date on the sales order lines. If you select a date in the sales order lines that is not "open" in the customer calendar, the system will indicate that the receipt date is not valid.

Note that it is only possible to include one calendar per customer. If you need to include a calendar for each different address for a customer, you can create one customer per address and then assign its respective calendar.

The requested receipt date on the sales order lines is affected by the customer calendar and by the delivery date control method. You can read more about how the earliest delivery date is calculated in [Order Promising](#).

Shipping calendar for a legal entity

To indicate the dates in which a legal entity can ship goods, you can set up a shipping calendar under **Organization administration > Organizations > Legal entities**. Select the legal entity and add the calendar in the **Foreign trade and logistics** tab in the **Shipping calendar** field. The shipping calendar will act as a source of defaults for all warehouse calendars in the legal entity.

How calendars affect dates in planning

Order date of a planned purchase order

The order date in a planned purchase order indicates the date when the order is placed. It will be an open date both in the vendor calendar and in the coverage group calendar. Sometimes, vendors need a few days of margin between when they receive the purchase order and when they are able to ship the goods. These dates are indicated in the vendor's margin days. However, if the item purchased is assigned to a coverage group with margin days, these margin days will override the vendor's margin days.

Delivery date of a planned purchase order

The receipt date of a purchase indicates the date when you will receive the goods. It will be an open date in the calendar. The calendar that will be taken into account to indicate which days the purchase orders can be received are the following, in order from highest to lowest priority:

1. Vendor's calendar
2. Coverage group calendar
3. Warehouse calendar for the receiving warehouse

Note that the coverage group calendar can be set in different pages and will take priority in the following order:

1. Item coverage group on the **Item coverage** page
2. Item coverage group on the **Released products details** page
3. Default item coverage group in **Master planning parameters**

Shipping date of a planned transfer order

When creating a transfer order between two warehouses, the shipping date and the receipt date are included in the transfer order header, along with the "From" warehouse and "To" warehouse. The difference between these two dates is the expected transportation time (in days) between the warehouses.

The shipping date of a planned transfer order indicates the date that the goods are shipped from the "From" warehouse. The calendars used for specifying the available shipping date are listed by priority:

1. Warehouse calendar of the "From" warehouse
2. Coverage group calendar (see fallback order for this calendar above) If there is a warehouse calendar set, the

shipping date will be an open date in the calendar. If there is not a warehouse calendar set, it will take the coverage group calendar.

Receipt date of a planned transfer order

The receipt date for a transfer order indicates the date that the goods are received in the "To" warehouse.

The calendars used for specifying the receipt date are the ones listed by priority:

1. Coverage group calendar
2. Warehouse calendar of the "To" warehouse If there is a coverage calendar set, the receipt date will be an open date in the calendar. If there is not a coverage group calendar set, it will take the warehouse calendar.

When finding the shipment and receiving dates for the planned transfer, the margins established by the user for shipping and receiving will also be considered.

Using calendars in master planning

Assignment of SCM calendars

It is important to set the calendars to identify the working days of the company. The best implementation is to set a calendar for each element with different working days. In other words, all external calendars (customer, vendor) and all internal (warehouse, coverage group, and mode of delivery) related to the company.

Recommendation on warehouse calendars

It is recommended to use one calendar per warehouse to include the specific changes only affecting the warehouse. For example, two or more warehouses could have the same working days but a different pickup policy. In that case, a calendar for each of the warehouses with its respective pickup policy is the best implementation for the system to include the best dates for planned purchase, transfer, and production orders. If no warehouse calendars are set, the legal entity calendar can be used as a source of defaults for the warehouse calendar.

Recommendation of coverage group calendars

Regarding the coverage group calendar, it is important to consider that that has an overriding behavior regarding receiving dates in master planning. Thus, it is recommended to use it with caution. Particularly, it is useful in the case when replenishment needs to be done specific days in the week.

Updating SCM related calendars

While it is important that all relevant calendars are assigned in their respective place (vendor, customer, warehouse, mode of delivery, or coverage group), updating them is as important so they reflect the changes. The system will define the production, transfer, purchase, and sales order dates depending on the combination of the assigned calendars. It is a best practice to clarify who holds the responsibility for assigning and updating the calendars in its corresponding areas. In case of a breakdown or any other unusual change in the working days, it is essential to update the calendars according to it. All tasks which depend on calendars, such as master planning and production scheduling, must be rerun when calendars are updated.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Improve master planning performance

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic explains the various options that can help you improve the performance of master planning or troubleshoot issues. It includes information about parameters and settings, as well as recommended configurations and actions. Also included is a summary of all the important parameters that you should consider when you have long-running master planning jobs.

This topic is intended for system admins or IT users who have the capability to troubleshoot. It's also intended for production or supply planners because it includes information about parameters that are related to business planning requirements.

Parameters related to master planning performance

Various parameters influence the running time of master planning and should be considered.

Number of threads

The **Number of threads** parameter lets you adjust the master scheduling process to help improve performance on the specific data set. This parameter specifies the total number of threads that will be used to run master planning. It causes parallelization of the master planning run, which helps decrease the running time.

You can set the **Number of threads** parameter in the **Master planning run** dialog box. To open this dialog box, go to **Master planning > Master planning > Run > Master planning**, or select **Run** in the **Master planning** workspace. To determine the best value for this parameter, you will have to rely on a trial-and-error process. However, you can use the following formulas to calculate an initial value:

- **If your industry is manufacturing:** (Number of threads) = (Number of planned orders ÷ 1,000)
- **Otherwise:** (Number of threads) = (Number of items ÷ 1,000)

The number of helpers used during master planning must be less than or equal to the maximum number of threads that are allowed on the batch server. If the number of helpers exceeds the number of threads on the batch server, the extra threads won't do any work.

NOTE

Setting the **Number of threads** parameter to 0 (zero) increases the master planning running time. Therefore, we recommend that you always set a value that is more than 0.

Number of tasks in helper task bundle

By changing the **Number of tasks in task bundle** setting (that is, the bundle size), you might be able to decrease the running time. This setting controls the number of items that are planned together by a single helper.

You can set the **Number of tasks in task bundle** parameter in the **Performance** section on the **General** tab of the **Master planning parameters** page (**Master planning > Setup > Master planning parameters**). The best value for this parameter depends on your data. Therefore, we recommend that you start with a value of **1**, and then use a trial-and-error process to determine the best value for your setup.

In general, we recommend that you increase the number of tasks when the number of items is very large (in the hundreds of thousands). Otherwise, you should decrease the number of tasks. For the following specific industries, consider these recommendations:

- In the retail and distribution industries where there are many independent items, use many helpers because there is no dependency between items.
- In the manufacturing industry where there are many bills of materials (BOMs) and shared subcomponents, use fewer helpers because dependencies between items might cause waiting times.

TIP

If you have performance issues, we recommend that you reduce the **Number of helpers in task bundle** setting to 1. You can then start the trial-and-error process to find the best value for your setup. In general, performance issues occur when one item takes longer to process than the remaining items. In this case, you will see that two subsequent tasks that have a status of **Coverage** in the master planning run take significantly different amounts of time to run. In extreme cases, this difference might be as much as 30 minutes. You can infer the amount of time that tasks take to run by looking at the duration of each task.

Use of cache

The **Use of cache** parameter lets you adjust the master scheduling process to help it perform better on the specific data set. For example, you can adjust it to achieve the following results:

- If more caching is done, more data is collected in data memory. The expectation is that the data will be used again later. If the data is in memory, you might save some database requests. However, if more caching is done, memory requirements increase.
- If less caching is done, the same data might have to be fetched from the database more often. Additionally, Application Object Server (AOS) stores little data in memory throughout the process.

It's difficult to predict which option will be better because each case depends not only on the data but also on the hardware. For example, because less caching causes additional load on the database server, it probably isn't a good idea to use that option if your database server is already overloaded.

You can set the **Use of cache** parameter in the **Performance** section on the **General** tab of the **Master planning parameters** page (**Master planning > Setup > Master planning parameters**). The effectiveness of caching depends heavily on the customer data. For example, if cached data is never needed, you just waste memory if you store data until the end of the scheduling process. In this case, if you configure less caching, performance might increase because AOS requires less memory and server resources are freed up for other tasks.

TIP

In general, we recommend that you set the **Use of cache** parameter to **Maximum**, because the parameter is intended as a performance enhancing feature. We recommend that you set the parameter to **Minimum** if you run on premises and have limited memory (approximately 2 gigabytes [GB]).

Number of orders in firming bundle

The **Number of orders in firming bundle** parameter specifies the total number of orders that will be processed at a time by each thread/batch. It causes parallelization of the autofirming process.

You can set the **Number of orders in firming bundle** parameter in the **Performance** section on the **General** tab of the **Master planning parameters** page (**Master planning > Setup > Master planning parameters**). Parallelization of the autofirming process is based on the orders that must be processed together. For example, if this parameter is set to 50, each thread or batch task will pick up 50 orders at a time and process them together. We recommend that you use a trial-and-error process to find the best value. However, you can use the following formula to calculate an initial value:

(Number of orders per bundle) = (Number of demand items ÷ Number of threads)

NOTE

If you set the **Number of orders in firming bundle** parameter to 0 (zero), no parallelization of the autofirming process will occur. The whole process will run on a single batch task and have a cumulative running time. Therefore, the running time of your master planning will increase. For this reason, we recommend that you set this parameter to a value that is more than 0 (zero).

Time fences

Time fences specify how far in the future the calculations and other requirements must be calculated by master planning. The larger the time fence is, the longer it will take master planning to run. Therefore, set the time fences according to your business requirements. For more information about time fences, see [Set up master planning](#).

Actions

Among the time fences, you can also find the **Action message** parameter. The calculation of action messages causes a longer running time for master planning. If action messages aren't regularly analyzed and applied (daily, weekly, and so on), consider turning off the calculation during the master planning run. To turn off the calculation, on the **Master plans** page (**Master planning > Setup > Plans > Master plans**), set the **Action message** time fence to 0 (zero). Also make sure that the **Action message** setting is turned off for all the coverage groups.

Futures

The calculation of futures causes a longer running time for master planning. If you aren't planning BOMs, or if delays don't have to be propagated from supply to demand during planning, consider turning off futures calculations during master planning. To turn off the calculations, set the **Futures** time fence to 0 (zero) for the master plan that you're running. Also make sure that the **Futures** setting is turned off for all the coverage groups.

One heavy routine at a time

When you schedule master planning, don't schedule any other batch job at the same time. Be especially careful that you don't schedule any other heavy routines, such as inventory close, at the same time.

Review the session log

The system can collect additional information about the tasks that run during master planning. To have the system collect this information, turn on the **Track processing time** setting in the **Master planning run** dialog box. The information that is collected can help you find bottlenecks in the run. For example, when the **Number of tasks in helper task bundle** parameter is set to 1, you can identify the item that has the longest running time. You can also compare the running times for the various threads that have a status of **Coverage** and compare the duration for each task.

To review the master planning runs of your system, follow one of these steps.

- In the **Master planning** workspace, select a master plan in the drop-down field, and then on the **Master planning** tile, select **History**. Select a job, select **Inquiries** on the FastTab, and then select **Process task duration**.
- On the **Master plans** page, select a plan in the left pane, and then select **History** on the FastTab. Select a job, select **Inquiries** on the FastTab, and then select **Process task duration**.

When you review the session log, consider the following:

- **Update** should not take a long time (in general, it should take up to 30 minutes), however, it's single-threaded.

- **Copy plan** should not take a long time (it should take about one minute).
- **Auto firming** usually takes about 30 minutes. However, it can take up to multiple hours, depending on the number of orders and the complexity of the items.
- **Auto firming** should take less time than **Coverage**.
- **Coverage** should take the longest time relative to the rest.
- **Action** and **Future message** can take a long time, depending on the data and the number of BOMs.

Filtering of items

Filters that are applied in the **Master planning run** dialog box affect the duration of the master planning run. Go to **Master planning > Master planning > Run > Master planning**, or select **Run** in the **Master planning** workspace. To exclude items from the run, we recommend that you filter by the lifecycle state of the item (not by item numbers). When you filter by lifecycle state, the update process will take less time than when you filter by item numbers.

Automatically filter by items with direct demand

To improve the master planning run time, you can choose to only include items with direct demand. This filter can only be used for a complete master planning run with no other filters applied in the **Records to include** field. A master planning run with filters will ignore the **Automatically filter by items with direct demand** setting.

The **Automatically filter by items with direct demand** field is found on the **Master planning parameters** page and can be used with both pre-processing and post-processing settings.

Pre-processing

The **Pre-processing: Automatically filter by items with direct demand** parameter ensures that the pre-processing phase of master planning only includes items that fulfill at least one of the following conditions:

- The item has an expected receipt or issue, such as a purchase order, sales order, quote, transfer order, or production order.
- The item has item coverage with safety stock (minimum on-hand inventory).
- Forecast demand after today exists for the item.
- Forecast supply after today exists for the item.
- The item includes any continuity lines from the call center module yet to be created.

NOTE

An item that has physically available on-hand inventory will not show a requirement transaction because there is no demand for the item.

Post-processing

The **Post-processing: Automatically filter by items with direct demand** option is only relevant if you set **BOM version requirement** in your coverage groups. Otherwise, you do not need to enable the parameter.

Before the coverage step starts, there is a pre-coverage step during which items with the coverage setting **BOM version requirement** enabled will be reprocessed. This is done to ensure that items from the required BOM version are planned. Items that are considered to have demand during pre-processing no longer have any demand and therefore should be excluded from the planning run.

Performance checklist summary

- **Number of threads** – Set to a value that is more than 0 (zero).

- **Number of tasks in helper task bundle** – Set to a value that is more than **0** (zero). (Use the formulas that are given earlier in this topic.)
- **Use of cache** – Set to **Maximum** unless your system is low on memory.
- **Number of orders in firming bundle** – Set to a value that is more than **0** (zero). (Use the formula that is given earlier in this topic.)
- **Time fences** – Adjust to your business needs.
- **Actions and futures** – Disable actions and future if you don't use them.
- **One heavy routine at a time** – Don't run master planning together with any other heavy routine.
- **Review the session log.**
- **Filtering of items** – Use the lifecycle state to exclude items from the master planning run. (Don't use the item numbers.)

Improve scheduling engine performance

2/18/2021 • 29 minutes to read • [Edit Online](#)

The resource scheduling engine is used when scheduling routes for planned and released production orders. The engine was originally released as part of Dynamics AX 2012 and has gone through several improvements since its release.

The [job shop scheduling problem](#) is an extremely complex combinatorial problem where solution time grows exponentially with the number of decision variables. Oftentimes, customers set up production routes and related data in a way that results in a scheduling problem that can't be solved in reasonable time even on the most modern hardware. This topic will help you understand the scheduling engine and how a specific setup can have influence on the performance.

When it comes to improving the performance of the scheduling, general guidelines recommend reducing the complexity of the problem the engine needs to solve. Some of the main factors that can affect performance include:

- Routes with many operations
- Routes with parallel operations
- Operations with quantity of resources higher than one
- Operations with many applicable resources
- Use of hard links
- Use of finite capacity
- The number of different calendars used
- The number of working time slots per day in the calendar
- Total duration of the route
- Running multiple scheduling engines in parallel

Overview of basic scheduling flow

To understand how a given setup can affect performance, it is important to understand something about how the process flows, both inside the engine and in the X++ code that surrounds it.

The basic process of scheduling an order consists of three main steps:

- **Loading data** – Here, the X++ data models are transformed into the engine's internal data model in the form of jobs and constraints.
- **Scheduling** – This is the main source for scheduling that processes the given model and constraints, and generates a result. During this process, the engine will request working time information and existing capacity reservations from X++ as needed.
- **Save data** – The engine result in the form of job capacity reservation slots is processed by X++ code to save capacity reservations and update the start and end times of the jobs/operation/order.

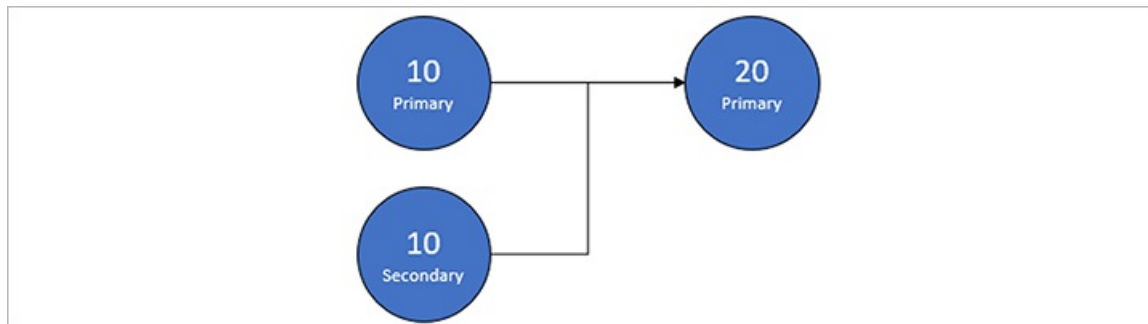

Load data into the engine

The scheduling engine has a more abstract data model than the Supply Chain Management database because it has been built as a generic engine that can handle different sources of data. The concepts of route, secondary operations, and run time need to be "translated" into the generic job and constraint model that the engine exposes. The logic for building the model has a significant amount of business logic to it and is different depending on the source data. The responsible X++ class is `WrkCtrScheduler` and it has derived classes for

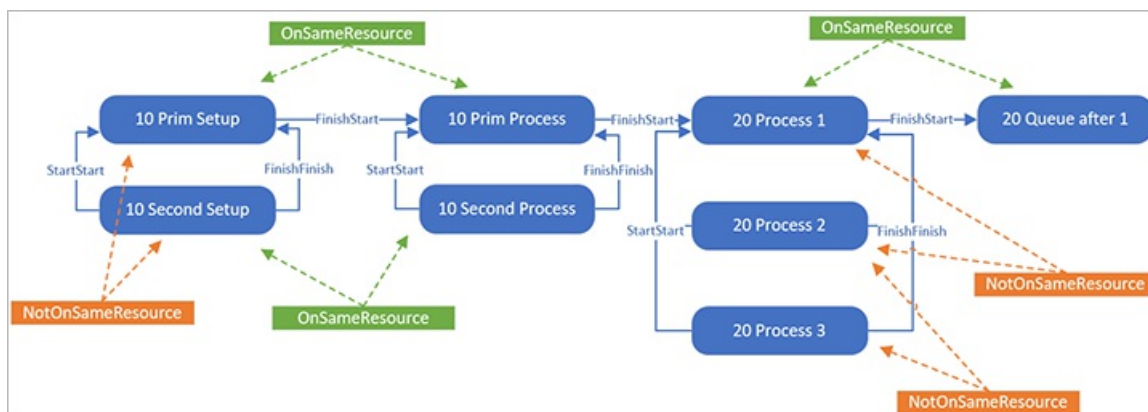

planned production orders, released production orders, and project forecasts.

As an example, consider a route shown in the following table and image, which seems relatively simple.

OPER. NO.	PRIORITY	SETUP TIME	RUN TIME	QUEUE TIME AFTER	QUANTITY OF RESOURCES	NEXT
10	Primary	1.00	2.00		1	20
10	Secondary 1				1	20
20	Primary		3.00	1.00	3	0

When sending this to the engine, it is split out into eight jobs, as shown in the following illustration (select the image to enlarge it).

The standard link between two jobs is `FinishStart`, meaning that the end time of one job must be before the start time of another job. Because the setup must be performed by the same resource that will later do the process, there are `OnSameResource` constraints between them. Between the jobs for primary and secondary operation for 10, there are `StartStart` and `FinishFinish` links, which means that the jobs must both start and end at the same time, and there are `NotOnSameResource` constraints, which will prevent the same resource for primary and secondary.

For operation 20, where the quantity of resources has been set to 3, the process job has been split into three distinct jobs where all the jobs must run at the exact same time. In this case, the route group has been set up to not reserve capacity for queue after times, which is why there is only a single job for the queue after.

The scheduling engine only understands the concepts of jobs and has no notion of operations. This means that when doing operation scheduling, the operations are also split into jobs, although these will not be persisted in the database.

For each job, we will also define what the job capacity requirement is (the number of seconds required). Depending on how the resource requirements have been defined, we may also, for each job, send a list of all the potential applicable resources that the job could run on and what the capacity requirement is for that specific resource. Even though the list of applicable resources is sent when building the model, the engine will still need

to ensure that the resource assignment is actually valid for the entire job duration.

Scheduling engine internals

Scheduling engine interface

To get an idea of how the engine works internally, it is best to look at the functionality it exposes externally. In X++, the main interface is `WrkCtrSchedulerEngineInterface`. It has the methods described in the following subsections.

General engine

METHOD	PURPOSE
<code>run</code>	Schedules all loaded jobs and returns the error code.
<code>getJobSchedulingSequenceResult</code>	Gets the scheduling result and the first error job for the sequence identified by a specific job.
<code>validateJobCapacityReservations</code>	Validates the capacity reservations for all the jobs stored by the engine.
<code>setReservationsTimeStamp</code>	Sends a timestamp to the engine set on all new capacity reservations for the scheduled jobs in the cache of the engine.
<code>addPropertyToGroupAggregation</code>	Adds a property prefix to the set of properties used when capacity is aggregated.
<code>addResource</code>	Adds a resource to the scheduling engine resource pool.
<code>addResourceGroup</code>	Adds a resource group to the scheduling engine resource group pool.
<code>addResourceGroupMembership</code>	Adds a resource as a member to a resource group.
<code>addOptimizationGoal</code>	Adds a scheduling optimization goal (duration or priority).

Individual jobs

METHOD	PURPOSE
<code>addJobInfo</code>	Adds a job information record that informs the engine about a job that should be scheduled.
<code>addConstraintJobEndsAt</code>	Adds a constraint that a job should end at a specified date and time.
<code>addConstraintJobStartsAt</code>	Adds a constraint that a job should start at a specified date and time.
<code>addConstraintMaxJobDays</code>	Defines the constraint that a job can span over a specified maximal number of days.
<code>addConstraintResourceRequirement</code>	Adds the constraint that the job must be scheduled on a specific resource.

METHOD	PURPOSE
<code>addJobBindPriority</code>	Adds a job bind priority for a (job, constraint level) pair. A higher priority value means the job variables will be bound earlier. The job will be processed before jobs with lower priority value in the same sequence.
<code>addJobCapacity</code>	Adds capacity load information for a job (like the required job runtime) independent on which resource the job runs on.
<code>addJobResourceCapacity</code>	Adds a resource to the set of resources that may be used to perform a job, and states the capacity required when running on that resource.
<code>addJobGoal</code>	Adds job goal information for a specific constraint level (earliest end time or latest start time).
<code>addJobResourcePriority</code>	Adds the priority to use when a job is scheduled on a resource.
<code>addJobResourceRuntime</code>	Specifies a job time that is dependent of the resource the job will be scheduled on.
<code>addJobRuntime</code>	Specifies a job time that is independent of the resource on which the job will be scheduled.
<code>scheduleJobOnResourceGroup</code>	Marks a job for scheduling on the resource group level.
<code>setJobResourcePreemptionAllowed</code>	Sets whether preemption is allowed for a job on a resource (if engine is allowed to schedule the job in noncontiguous capacity slots).
<code>setRequiredNumberOfResources</code>	Sets the number of resources required to schedule a job (only for operations scheduling).

Constraints between jobs

METHOD	PURPOSE
<code>addJobLink</code>	Adds a link (such as finish>start) between two jobs.
<code>addConstraintEndsDelayed</code>	Defines the constraint that a job cannot end before another jobs end plus some delay time.
<code>addConstraintJobListWorkingTimeIntersect</code>	Adds a constraint that the capacity slots reserved for the jobs must be on the intersecting working times for the two resources used by the jobs.
<code>addConstraintJobOverlap</code>	Add a constraint that defines how jobs are sequenced when a given quantity of an item can be moved between two resources while the first resource is still not finished processing, so that the second resource can start processing.
<code>addConstraintNotOnSameResource</code>	Adds a constraint that two jobs should not be scheduled on the same resource.

METHOD	PURPOSE
<code>addConstraintOnSameResource</code>	Adds a constraint that two jobs must be using the same resource.
<code>addJobSameReservations</code>	Adds a constraint that a job must end up having capacity reservations for the same time slots as the primary job.
<code>setPrimaryParallelJob</code>	Adds information about what job is the primary job in a set of parallel jobs.

Solver

The engine itself is essentially a specialized constraint solver with custom heuristics added. The solver is based on two main elements: variables and constraints.

Variable

A variable represents a domain of possible values. Scheduling engine has two types of variables:

- **DateTime variable** - Has a domain of all dates and times, and the domain can be restricted by moving the lower and upper bound for the time of the variable closer to each other.
- **Resource variable** - Has a domain of applicable resources, and the domain can be restricted by eliminating resources from the list.

Constraint

A constraint acts on variables by restricting their domains, but it also depends on variables so it gets activated when variables change. The process of "constraint propagation" is when a constraint performs its main function and reports back to the main logic if successful.

A variable is considered bound when it can't be restricted further, which for DateTime variable means that upper and lower bound is the same, and for the Resource variable that it has only a single applicable resource. When all variables are bound, a solution is found.

Constraint levels

When scheduling is executed as part of the material requirements planning (MRP) coverage phase, the orders will be scheduled backward from requirement date. However, if it is not possible to find a schedule that starts today or later and ends before the requirement date, then the scheduling direction will change to forward from today.

This main business rule is handled by organizing the constraints in levels. If no solution is found when using the constraints on the highest level, then the constraints on that level are all dropped, and the lower level is tried. In praxis, this means that for backward scheduling the model will contain a level 1 with job goals of latest start time given a maximum end time constraint (the requirement date), and a level 0 with job goals of earliest end time and given a minimum start time constraint of today.

Algorithm

The main steps of the engine algorithm are:

1. Find sequences (job chains) which can be solved separately.
2. Try to find an initial solution for the sequence for the highest constraint level.
 - a. Sort the jobs in the sequence based on job goal and priorities, such that a start job can be found.
 - b. Loop the jobs in the following sequence:
 - a. Find all constraints that need to be propagated and run propagation.
 - b. If all variables for the job have been bound, then a solution for that job has been found.
 - c. If one of the variables could not be bound without violating the constraints, then roll back the variable binding, try a different value in the domain (for resource variable), and rerun the

constraint propagation.

3. If no solution was found, then all constraints on the current constraint level is removed, the constraint level lowered (if any lower levels are available) and solution search retried with the new set of constraint.
4. If a feasible solution was found, then the optimization phase is started, which will try to find a better solution until the optimization timeout is reached or all resource combinations have been exhausted.

The constraint solver is not aware of the specifics of the scheduling algorithm. It is in the definition and combination of the various constraints that the "magic" happens.

Determining working times

A large part of the (internal) constraints in the engine controls the working time and capacity of a resource. Essentially, the task is to traverse the working time slots for a resource from a given point in a given direction, and find a long enough interval in which the jobs required capacity (time) can fit.

To do this, the engine needs to know the working times of a resource. Opposite to the main model data, the working times are *lazy loaded*, meaning that they are loaded into the engine as needed. The reason for this approach is that there are often working times in Supply Chain Management for a calendar for a very long period and typically many calendars exist so the data would be quite large to pre-load.

Calendar information is requested by the engine in chunks, by invoking the X++ class method `WrkCtrSchedulingInteropDataProvider.getWorkingTimes`. The request is for a specific calendar ID in a specific time interval. Depending on the state of the server cache in Supply Chain Management, each of these requests could end up in several database calls, which takes a long time (relative to the pure computational time). Also, if the calendar contains very elaborate working time definitions with many working time intervals per day, this adds to the time the loading takes.

When the working time data is loaded in the scheduling engine, this is retained in its internal cache for the specific calendar, meaning that if any other jobs or resources are using the same calendar then the next lookups can be performed quickly from memory. One common cause of bad performance is if a separate calendar ID is used for each resource, because data will then need to be requested for each calendar, even though the content of the calendars might be the same.

Finite capacity

When using finite capacity, the working time slots from the calendar are split and reduced based on the existing capacity reservations. These reservations are also fetched through the same

`WrkCtrSchedulingInteropDataProvider` class as the calendars, but instead use the method `getCapacityReservations`. When scheduling during master planning, the reservations for the specific master plan are considered and if enabled on the **Master planning parameters** page, the reservations from firmed production orders are also included. Similarly, when scheduling a production order, it is also an option to include reservations from existing planned orders, although this is not as common as the other way around.

Using finite capacity will cause scheduling to take longer due to several reasons:

- Fetching the capacity information from database is a slow operation and the server-side caching of capacity information is typically not as good as for working times because they are not shared among resources like calendars typically are.
- The number of working time slots to traverse increases due to the splits, and slots for a longer time period must typically be investigated before a solution can be found.
- After the scheduling is complete, a check for conflicting reservations must be performed (see the "Running scheduling engines in parallel" section for details).

Examining the resource combinations

If the job sequence only contains the standard `FinishStart` links, meaning it forms a simple chain without any branches, an optimal result (seen from the single order, not across orders) can be achieved by finding the best solution for the first job and then moving on to find the best solution for the next job. The best solution for a job

means finding the resource that can get the from and to date of the job closest to the job goal (in forward scheduling this means getting the end date of the job as early as possible) while still respecting the constraints.

When there are parallel jobs, finding a solution may involve examining different combinations of resources. The number of possible resource combinations is the product of the number of applicable resources for the connected parallel jobs. Especially when scheduling an order backwards from a requirement date, it can take quite a while for the logic to realize that there is no solution to the problem that will make the parallel jobs fit before today's date, as it will need to check all the combinations because there could be some resources that had a higher efficiency or a different calendar that might give a result. This means that if no timeout limit has been set it will run for a long time before changing the direction to forward.

This combinatorial logic also means that adding more applicable resources may make the engine run slower. If performance problems occur when having parallel operations and scheduling with infinite capacity, it can partly be fixed by having the route designer take a decision on which resource should be used and then assign the resource directly on the operation (because the engine in most cases will always end up picking the same resource, so the end result will be the same).

Hard links

Setting the link type between two jobs to hard, ensures that there is no time gap between the finish of one job and the start of the next one. This can be very useful in scenarios like when metal is heated in one job and then processed in the next job, where it is not desirable to have the metal cool down in between.

With standard soft links and forward scheduling, if the route forms a simple chain without any branches, a result can be achieved by finding a solution for the first job that satisfies its own constraints and then moving on through the chain propagating the end time from the previous job to the next job. If the current job can't find any capacity, the start time for it will be moved out further, without any consequence for the previous jobs potentially creating gaps between the jobs. However with hard links (especially in connection with finite capacity) for the same scenario, the fact that one job later in the chain cannot find capacity, will mean that all previous scheduled jobs will have to be "dragged" along one by one and thereby rescheduled a number of times. Especially in scenarios with high load for multiple resources, the hard links can cause a chain reaction where the jobs will affect each other and a number of iterations will have to be performed before the result stabilizes into a feasible schedule.

Running scheduling engines in parallel

When performing scheduling as part of a master planning run where helpers are used, each of the master planning helper threads can also pick up production order scheduling tasks. This means that multiple scheduling engines can be running at the same time. While multithreading in general is a highly significant performance benefit, there are also some functional downsides when it comes to scheduling.

In MRP, all production orders for a given bill of materials (BOM) level are scheduled in requirement date sequence, meaning that those orders with the earliest requirement date should be scheduled first and thereby have the highest chance of getting the available resource capacity. However, with multiple engines picking from the list of unscheduled orders the sequence is no longer ensured, as one might complete faster than the other.

Also, when scheduling using finite capacity and when multiple engine instances are trying to schedule orders that are potentially using the same resources at the same time interval, a race condition can occur. The number of such race conditions is recorded in the **Scheduling conflicts** field on the master plans history page. The conflict resolution logic is as follows:

- Schedule an order (lock-free) and get capacity reservations.
- Take the lock.
- Check if newer capacity reservations exist for the scheduled resources in the timespan.
 - If no, write the capacity and release the lock.

- If yes, release the lock and reschedule the order from the beginning.

So, when scheduling with multiple engine instances, the result is not fully deterministic because it will depend on the exact timing of each of the threads.

Operation scheduling performance

Even though operation scheduling is also known as rough-cut capacity planning, seen from an engine standpoint, it can be a harder problem to solve if finite capacity is used, as more data is needed to determine feasibility.

The capacity of a resource group depends on which and how many resources are members of the resource group. A resource group in itself does not have any capacity—only when resources are a member of the group will it have capacity. Because the resource group membership can vary over time, capacity must be evaluated per day.

In operations scheduling, the resource group's calendar is used to determine the start and end times for each operation. This means that the resource group's calendar places a limit on how much time can be operations scheduled for one operation on one day in one resource group. Opposite the calendar for the specific resources, the efficiency data of the calendar is ignored for the resource group as it simply denotes opening hours and not actual capacity.

For example, if the working time for a resource group on one specific date is from 8:00 to 16:00, one operation can't put more load on the resource group than what can be fit into 8 hours, no matter how much capacity that the resource group has available in total on that day. The available capacity can however limit the load further.

The load from job scheduling on all the resources included in the resource group on a given day is considered when the available capacity for the resource group on the same day is calculated. For each date, the calculation is:

Available resource group capacity = Capacity for resources in the group based on their calendar – Job scheduled load on the resources in the group – Operations scheduled load on the resources in the group – Operations scheduled load on the resource group

On the **Resource requirements** tab on the route operation, the resource requirements can be specified using either a specific resource (in which case the operation will be scheduled using that resource), for a resource group, for a resource type, or for one or more capabilities, skill, course, or certificate. While using all of these options gives a great flexibility on the route design, it also complicates the scheduling for the engine as the capacity must be accounted for per "property" (the abstract name used in the engine for capability, skills, and so on).

The resource group's capacity for a capability is the sum of the capacity for all resources in the resource group that has the capability in question. If a resource in the group has a capability, it will be considered no matter what level of the capacity is required.

In operations scheduling, the available capacity for a certain capability for a resource group will be reduced when it is loaded with an operation that requires the capability in question. If the operation requires more than one capability, the capacity will be reduced for all required capabilities.

For each date, the required calculation is:

Available capacity for a capability = Capacity for the capability – Job scheduled load on the resources with the specific capability, included in the resource group – Operations scheduled load on the resources with the specific capability, included in the resource group – Operations scheduled load on the resource group itself that require the specific capability

This means that if there is load on a specific resource, the load is considered in the calculation of the resource

group's available capacity per capability, because the load on a specific resource reduces its contribution to the resource group's capacity for a capability no matter if the load on the specific resource is for that specific capability. If there is load on the resource group level, it is considered in the calculation of the resource group's available capacity per capability only if the load is from an operation that requires the specific capability.

The above logic is complicated, as this is the same for each type of "property" so using operations scheduling with finite capacity requires a significant amount of data to be loaded.

Viewing scheduling engine input and output

To get specific details of the input and output of the scheduling process, enable logging by going to **Organization administration > Setup > Scheduling > Scheduling tracing cockpit**.

On this page, first select **Enable logging** on the Action Pane. Then run the scheduling for the production order. When complete, return to the **Scheduling tracing cockpit** page and select **Disable logging** on the Action Pane. Refresh the page and a new line will appear in the grid. Select the new line and select **Download** on the Action Pane. This will give you a .zip compressed folder containing the following files:

- **Log.txt** - This is the log file that describes the steps that the engine goes through. It is very elaborate and can be a bit overwhelming, but when used as part of experimenting with the route setup to resolve performance problems the first thing to look for is the difference in time between the first and the last line, as this will give you the exact time the scheduler has spent.
- **XmlModel.xml** - This contains the model that is built in X++ and that the engine operates on. The `JobId` used in the file correlates to the `RecId` from the source table containing the jobs (`ReqRouteJob` or `ProdRouteJob`). The typical thing to look for in this file is that the dates given in `ConstraintJobStartsAt` and `ConstraintJobEndsAt` are as expected, that the `JobGoal` property is set correctly, and that the jobs are related to each other through the `JobLink` constraints.
- **XmlSlots.xml** - This contains all the working times and capacity reservations that the engine has requested. The calendar working times and reservations will only be requested by the engine for the time periods where it tries to place the jobs (and an extra buffer), so if the file contains times very far in the future, it might be an indication of a problem with the setup. The `ResourceProperty` nodes will show for each resource which resource group and capabilities it is associated with for which periods.
- **Result.xml** - This contains the result of the scheduling run.

Note that the tracing functionality can add significant performance overhead, so only use it for investigating scheduling of specific orders in a controlled manner. If it is turned on during a master planning run it will quickly reach its size limit and stop.

Troubleshooting performance

As can be understood from all of the previous sections, there are some pitfalls when it comes to the setup and usage of the scheduling engine, which can lead to performance problems. The following check list can be used for troubleshooting such issues. It is important to look at all the points as it is most often a combination of multiple factors that leads to problems.

Performing scheduling as part of MRP when it is not needed

Even though routes are used for the production control purposes such as costing and reporting, it might not be necessary to consider them during MRP. In some cases, having a standard production lead time specified for the item will be sufficient for planning. To turn off route scheduling, set the capacity time fence to zero. If scheduling should be done, then the capacity time fence must be carefully set because it might not be necessary to consider routes for the full extent of the MRP's coverage time fence.

Note that if the order is not scheduled during MRP, then it will instead need to be scheduled when the planned order is firmed. This means that the firming process will take longer, so depending on how many of the

suggested planned orders get firmed the performance gain during MRP might be lost at firming.

Route with unnecessary operations

When designing the route, it is tempting to try to model the real world exactly with all the steps the production goes through. While this can be useful in some cases, it is not good for the performance as the model the engine needs to work on gets larger (both in terms of jobs and constraints) and more SQL statements will be executed for insertion and update of the jobs and capacity reservations. Also, there is the downstream effect of having to eventually report progress on the jobs, which can be mitigated with automatic postings. If the data is not used for anything, it creates unnecessary load.

We recommend that you only create operations that are strictly needed for scheduling (which will typically be the bottleneck resources) and/or costing purposes. Alternatively you should group many smaller distinct operations into one larger operation that represents a greater part of the process.

Many applicable resources for an operation

The number of applicable resources for an operation is determined by the resource requirements set on the operation relation. The requirement can either be for a specific (individual) resource or it can be based on the resource's membership of a resource group or capability.

If scheduling is not done using finite capacity and all the applicable resources have the same calendar and efficiency, then the scheduling engine will always end up picking the same resource for an operation, but only after trying all the applicable resources to check if there is one that is "better" than the others. In this case, the load of the scheduling can be greatly reduced simply by always assigning a specific resource to the operation at the route design time.

Route with parallel operations

While parallel operations (primary/secondary) are a powerful tool to model scenarios like when a machine and an operator are both needed to perform a specific task, it is also the source of many performance issues. If a requirement for a specific individual resource is assigned to both the primary and secondary operation, it is typically not a problem. But if there are many possible resources for each of the operations, then it adds significant computational complexity to the scheduling.

An alternative to using parallel operations is either to model the pairs as "virtual" resources (which will then represent the team that always goes together for the operation) or to simply not model one of the operations if it doesn't represent a bottleneck.

Route with quantity of resources higher than 1

If setting the quantity of resources needed for an operation higher than one, then it results effectively the same as using primary/secondary operations because multiple parallel jobs are sent to the engine. However, for this case there is not an option of using specific resource assignments, because a quantity higher than one requires that more than one resource is applicable for the operation.

Excessive use of finite capacity

Use of finite capacity requires the engine to load the capacity information from a database and can have a computational overhead because it will be harder to find a solution especially in environments where the resources are booked close to their maximum capacity. As a result, it is important to carefully evaluate if a resource really needs to use finite capacity or they can be overbooked. Because there might be a difference among finite capacity resources in how important they are not to overbook, we recommend using the bottleneck option on a resource in combination with a separate value on the plan in "Capacity time fence for bottleneck resources". Using the bottleneck concept can enable that the general finite capacity time fence can be lowered.

Setting hard links

The standard link type of the route is *soft*, which means that a time gap is allowed between the finishing time of one operation and the start of the next. Allowing this can have the unfortunate effect that, if materials or

capacity are not available for one of the operations for a very long time, the production could be idle for quite a while, meaning a possible increase of work in progress. This will not happen with hard links because the finish and start must align perfectly. But setting hard links makes the scheduling problem more difficult because working time and capacity intersections must be calculated for the two resources of the operations. If there are also parallel operations involved, this adds significant computational time. If the resources of the two operations have different calendars that don't overlap at all, the problem is unsolvable.

We recommend using hard links only when strictly necessary, and carefully consider if it is necessary for each operation of the route.

To reduce the work in progress without applying hard links, a trick is to schedule the order twice with changing to the opposite direction for the second pass. If the first schedule was done backwards from delivery date, then the second should be done forward from the scheduled start date. This will result in the jobs being compressed as much as possible so that the work in progress is minimized.

Separate calendar for each resource

One of the main sources of data for the scheduling engine is calendar information, which can be expensive to load from the database. Because calendars are generated based on templates, it would be tempting to generate a calendar for each resource and then adjust the information in this calendar when the resource has downtime and other issues. However, doing this will severely limit the engine's ability to cache the calendar data as it would need to request new data for each resource and can be a large source of performance problems. Instead, we recommend that you reuse the calendars as much as possible between the resources, and then control downtime changes by assigning a different calendar ID for a period.

High number of working time slots per calendar day

Because the engine works by examining time slots one-by-one for capacity, it is beneficial to minimize the number of time slots per calendar day. This could be done, for example, by considering whether it's important for the resulting schedule to reflect that workers have a 5-minute break every hour.

Large (or none) scheduling timeouts

Scheduling engine performance can be optimized using parameters found on the **Scheduling parameters** page. The **Scheduling timeout enabled** and **Scheduling optimization timeout enabled** settings should always be set to **Yes**. If set to **No**, the scheduling can potentially run infinitely if an unfeasible route with many options has been created.

The value for **Maximum scheduling time per sequence** controls how many seconds can, at most, be spent trying to find a solution for a single sequence (in most cases a sequence corresponds to a single order). The value to use here highly depends on the complexity of the route and settings like finite capacity, but a maximum of about 30 seconds is a good starting point.

The value for **Optimization attempts timeout** controls how many seconds can at most be used to find a better solution than the one originally found. This will only influence routes that are using parallel operations as these make it necessary to test different combinations.

NOTE

The values set for the timeouts will be applied both for scheduling of released production orders and of planned orders as part of MRP. As a result, setting very high values could significantly add to the run time of MRP when running for a plan with many planned production orders.

Master planning and multisite functionality overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Master planning takes the settings of the site and warehouse inventory dimensions into account.

The site dimension is mandatory, and you can set the warehouse dimension to be mandatory.

When a dimension is mandatory, a dimension value must be entered on all inventory transactions. Therefore, during master planning, the site and the warehouse for the initial demand are known. The site dimension is also consistent so that during the explosion of lower-level demand, the site value does not change.

When the warehouse is not set to mandatory, it may not be known from the initial demand. The planning engine must determine which warehouse to use based on the settings that are defined for the item, individual warehouses, and the details of the order line.

The following topics describe how the planning engine works, when different settings are defined, to determine the warehouse to use.

Master planning for site coverage, mandatory warehouse

2/18/2021 • 2 minutes to read • [Edit Online](#)

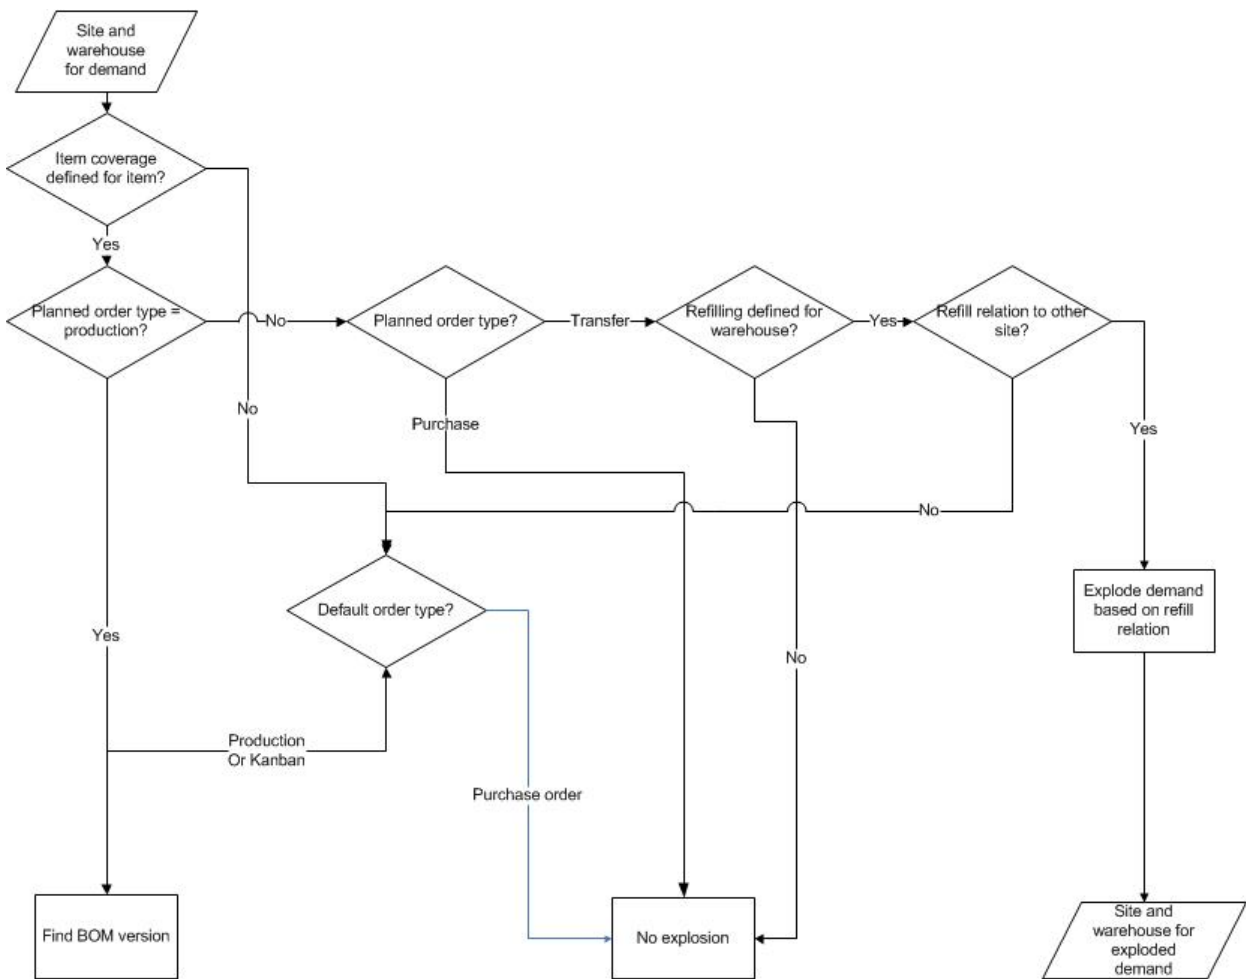

This topic describes how an item that has the site as coverage dimension is planned. Warehouse is a mandatory dimension.

This master planning scenario involves the following conditions:

- The site dimension is set to mandatory and must be entered on the demand transaction. This setting can't be modified.
- The warehouse dimension is set to mandatory and must be entered on the demand transaction.
- The site dimension is set for coverage planning. Other dimensions may be set for coverage planning also. However, they are not affected by the multisite functionality.
- The warehouse dimension is not set for coverage planning. Therefore, supply and demand are aggregated by site and, perhaps, other coverage-planned dimensions also.

The following graphic illustrates how master planning proceeds. The parameters that are referred to in the graphic, and their locations, are as follows:

- Item coverage is defined for the item. Click **Product information management > Products > Released products**. Select the item, and then click **Plan > Item coverage**.
- Refill relations are defined for the warehouse. Click **Inventory management > Setup > Inventory breakdown > Warehouses**. On the **Master planning** tab, see the **Main warehouse** field group.
- The default order type is set to Production, Purchase order, or Kanban. Click **Product information management > Products > Released products**. Select the item, and then click **Plan > Default order settings**. In the **Default order settings** form, see the **Default order type**.

Determine the BOM version

2/18/2021 • 2 minutes to read • [Edit Online](#)

During a demand explosion, if an item has a default order type of Production, the planning engine finds a valid BOM version based on the site.

The site dimension is always known and is stated on the demand transaction. The following process is used to determine the BOM version to use:

- If there is a BOM version defined for the item at the demand site, the site-specific BOM is used.
- If there is no site-specific BOM version defined for an item at the demand site, a general BOM is used. A general BOM does not state a site, and it is valid for multiple sites. If there is a general BOM, it is used.
- If there is no general BOM version to use, the demand explosion stops at this point.

A valid BOM version, whether site-specific or general, must meet the required criteria for date and quantity.

NOTE

Explosion of a BOM version

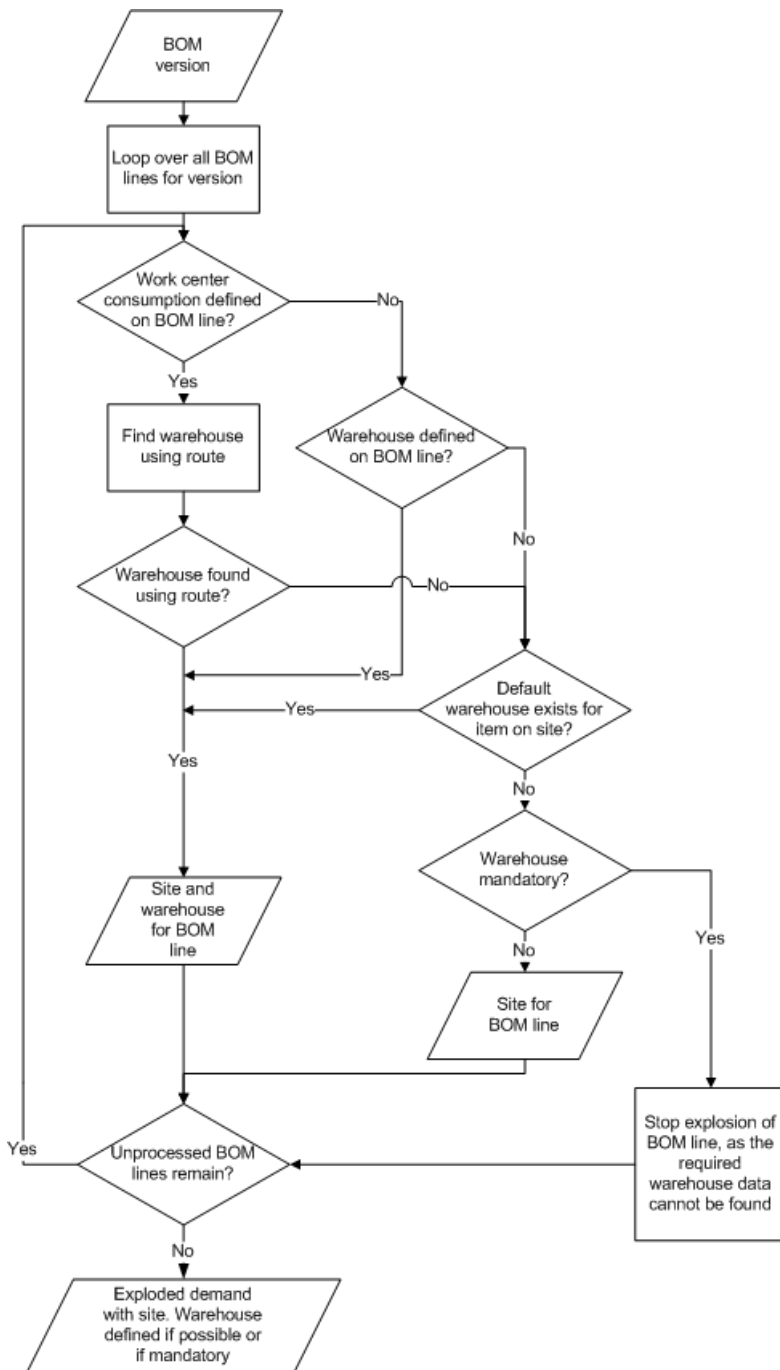

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains a master planning scenario that involves explosion of a bill of materials (BOM) version.

A demand explosion of a bill of materials (BOM) version creates a demand for each BOM line item at a specific site and, possibly, at a specific warehouse. In a site-specific BOM, a specific warehouse can be defined for each BOM line. Additionally, for each BOM line, the item's dimension settings determine whether the warehouse is required. The resulting demand for each BOM line item then becomes the starting point for additional demand explosion. This master planning scenario involves the following conditions:

- The site dimension is mandatory and must be entered on the demand transaction.
- The site dimension is consistent. Therefore, the site for lower-level demand is the same as the site on the initial demand transaction.

The following illustration shows how the process for master planning demand explosion.

Negative days and dynamic negative days

2/18/2021 • 13 minutes to read • [Edit Online](#)

This topic provides information about negative days and dynamic negative days, and how you can use them to help your business. The *negative days time fence* represents the number of days that you're willing to wait before you order new replenishment when you have negative inventory.

In this topic, you will learn the following information:

- How planned orders are created
- The correlation between the negative days time fence and the item's lead time
- How the dynamic negative days time fence is calculated, and how the item's lead time is factored into the calculation
- How to interpret the [suggestions for improving the running time for material requirements planning \(MRP\) \(master planning\)](#) that are related to negative days

This topic uses three hypothetical scenarios to help you understand this information. The difference between the scenarios is the point at which you get demand: before, during, or after the item's lead time period.

Scenario 1: You get demand before the item's lead time period

You might get demand either relatively early in your item's lead time or just before the lead time period begins. Here is an example of this scenario:

- The DemoProduct item has a six-day purchase lead time.
- On day zero (January 1), the inventory level for the DemoProduct item is 0 (zero).
- On day zero (January 1), you get a sales order for a quantity of 10 of the DemoProduct item.
- On day seven (January 7), there is an existing purchase order for a quantity of 10 of the DemoProduct item.

The following illustration shows a graphical view of this scenario.

Case A: Negative days are less than the item's lead time

If you set the negative days to a number that is less than the item's lead time, MRP looks for receipts for the DemoProduct item inside the negative days time fence. Because it doesn't find any receipts, MRP creates a new planned purchase order. This planned order is immediately delayed by six days (the lead time). Therefore, it will arrive on January 7. The existing purchase order gets a **Cancel** action message, because the creation of the new planned purchase order has made it redundant.

The following illustration shows a screenshot of this case.

Overview													
General Action Futures Period													
Update Inquiries Sorting													
Referenc...	Reference	Item num...	Requirement ...	Expiration ...	CW req. ...	Req. qua...	Accumula...	CW accumul...	Action d...	Action quan...	Futures ...	Customer acc...	Customer gr...
	Sales order	_DemoProd...	01-01-2015			-10,00	-10,00				→	US-001	30
	Planned purchase orders	_DemoProd...	07-01-2015			10,00			☒		→		
	Purchase order	_DemoProd...	08-01-2015			10,00	10,00		☒	☒	☒		

The following illustration shows a graphical view of what occurs in this case.

If you consider MRP performance and plan nervousness, this case doesn't perform well. MRP must create a new planned order, and must calculate delays and actions. These tasks are time-consuming. This case also adds two more transactions to your plan. On the other hand, the sales order is delayed by only six days, not seven days.

Case B: Negative days are more than the item's lead time

To help improve MRP performance, you can set the negative days to a number that is more than the item's lead time. Because you can't get the supply inside the lead time in this scenario, you can search for receipts for as long as this search makes sense. Although the running time for MRP will be shorter, you should watch out for additional delays to the orders.

Case C: Automatically correlate the item's lead time to the negative days time fence

To automatically correlate the item's lead time to the negative days time fence, use dynamic negative days. To use dynamic negative days, go to **Master planning > Setup > Master planning parameters**, and then, on the **General** tab, in the **Coverage** section, set the **Use dynamic negative days** option to **Yes**. MRP then looks for receipts inside the dynamic negative days time fence. This time fence is calculated by using the following formula:

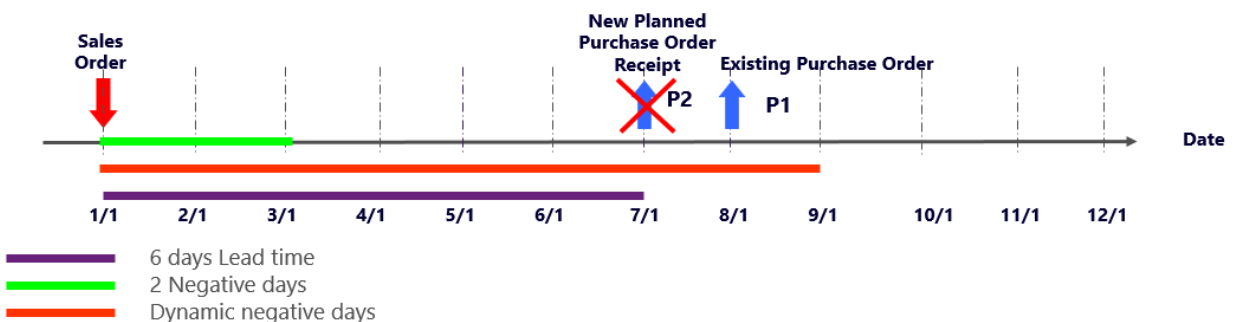

$$\text{Dynamic negative days time fence} = \text{Purchase lead time} + \text{Negative days time fence} + (\text{Current date} - \text{Requirement date})$$

(If the default order type of the DemoProduct item is **Production** or **Transfer**, the lead time is the **inventory** lead time.)

When dynamic negative days are used, the time fence that MRP looks at for receipts is now $6 + 2 + 0 = 8$ days. MRP finds the existing purchase order and pegs the sales order against it. No new planned orders are created. Therefore, the running time for MRP is shorter. The following illustration shows the net requirements for the DemoProduct item.

Reference	Reference	Number	Item number	Requireme...	Expiration date	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures date
	Sales order	000787	_DemoProd...	01-Jan-15			-10.00	-10.00				
	Purchase order	000044	_DemoProd...	08-Jan-15			10.00					

The following illustration shows a graphical view of what occurs in this case.

Case D: Use only dynamic negative days

If you set the negative days to 0 (zero) and use only the dynamic negative days time fence, the dynamic negative days time fence is $6 + 0 + 0 = 6$ days. In this case, the result is the same as the result in case A for this scenario.

MRP must create a new planned order, and must calculate delays and actions. These tasks are time-consuming and can also be frustrating. You also have two more transactions to process. Because the demand can't be fulfilled on time for the item to arrive, this case adds unnecessary complications to your plan.

The following illustration shows a screenshot for this case.

Overview													
General Action Futures Period													
Update Inquiries Sorting													
Referenc...	Reference	Item num...	Requirement ...	Expiration ...	CW req. ...	Req. qua...	Accumula...	CW accumul...	Action d...	Action quan...	Futures ...	Customer acc...	Customer gr...
	Sales order	_DemoProd...	01-01-2015			-10,00	-10,00				⇒	US-001	30
	Planned purchase orders	_DemoProd...	07-01-2015			10,00			⇐	⇒			
	Purchase order	_DemoProd...	08-01-2015			10,00	10,00		✗	✗	✗		

The following illustration shows a graphical view of what occurs in this case.

Case E: Use both negative days that are more than the item's lead time and the dynamic negative days time fence

If you set the negative days to a number that is more than the item's lead time, and if you also use the dynamic negative days time fence, the dynamic negative days time fence is $6 + 6 + 0 = 12$ days. This approach might produce a very long time fence that MRP must search for results in. For information about how case E is related to a situation where you set the negative days to a long time fence, see the [Conclusion](#) section of this topic.

Scenario 2: You get demand during the item's lead time period

You might get demand sometime during your item's lead time. Here is an example of this scenario:

- The DemoProduct item has a six-day purchase lead time.
- On day zero (January 1), the inventory level for the DemoProduct item is 0 (zero).
- On day four (January 5), which is inside the item's lead time, you get a sales order for a quantity of 10 of the DemoProduct item.
- On day seven (January 8), there is a purchase order for a quantity of 10 of the DemoProduct item.

The following illustration shows a graphical view of this scenario.

Case A: Negative days are less than the item's lead time

If you set the negative days to a number that is less than the item's lead time, MRP looks for receipts for the DemoProduct item inside the negative days time fence. Because it doesn't find any receipts, MRP creates a new planned purchase order that uses the current date as the order date. This planned order is immediately delayed by six days (the lead time). Therefore, it will arrive on January 7. The existing purchase order gets a **Cancel** action message, because the creation of the new planned purchase order has made it redundant.

The following illustration shows a screenshot for this case.

Reference	Reference	Number	Item number	Requirement ...	Expiration ...	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures ...
	Sales order	000787	_DemoProd...	05-Jan-15			-10.00	-10.00				→
	Planned purchase orders	013283	_DemoProd...	07-Jan-15			10.00					→
	Purchase order	000044	_DemoProd...	08-Jan-15			10.00	10.00		✗	✗	✗

The following illustration shows a graphical view of what occurs in this case.

Case B: Negative days are more than the item's lead time

This case resembles case B for scenario 1. If you set the negative days to a number that is more than the item's lead time, you don't get a new planned order. The sales order is attached to the existing purchase order.

Case C: Automatically correlate the item's lead time to the negative days time fence

This case resembles case C for scenario 1, because dynamic negative days work just as well as they do in that case. The dynamic negative days time fence is now $6 + 2 - 4 = 4$ days. If you use this approach, MRP finds the existing purchase order and attaches the sales order to it. Because no new planned orders are created, the running time for MRP is shorter.

The following illustration shows a screenshot of this case.

Reference	Reference	Number	Item number	Requirement ...	Expiration date	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures date
	Sales order	000787	_DemoProd...	05-Jan-15			-10.00	-10.00				
	Purchase order	000044	_DemoProd...	08-Jan-15			10.00					

The following illustration shows a graphical view of what occurs in this case.

Case D: Use only dynamic negative days

If you set the negative days to 0 (zero) and use only the dynamic negative days time fence, the dynamic negative days time fence is now $6 + 0 - 4 = 2$ days. In this case, the result is the same as the result in case A for this scenario. For a graphical view of what occurs, see case A for this scenario.

Case E: Use both negative days that are more than the item's lead time and the dynamic negative days time fence

If you set the negative days to a number that is more than the item's lead time, and if you also use the dynamic negative days time fence, the dynamic negative days time fence is $6 + 6 - 4 = 8$ days. This approach might produce a very long time fence that MRP must search for results in. For information about how case E is related to a situation where you set the negative days to a long time fence, see the [Conclusion](#) section of this topic.

Scenario 3: You get demand after the item's lead time period

You might get demand after the item's lead time. Here is an example of this scenario:

- The DemoProduct item has a six-day purchase lead time.
- On day zero (January 1), the inventory for the DemoProduct item is 0 (zero).
- On day seven (January 8), which is outside the item's lead time, you get a sales order for a quantity of 10 of the DemoProduct item.
- On day 10 (January 11), there is a purchase order for a quantity of 10 of the DemoProduct item.

The following illustration shows a graphical view of this scenario.

Case A: Negative days are less than the item's lead time

If you set the negative days to a number that is less than the item's lead time, MRP looks two days ahead of the sales order's requirement date. Because it doesn't find anything, MRP creates a planned purchase order on January 2. This planned purchase order will be shipped just in time to fulfill the sales order demand. The existing purchase order gets a Cancel action message, because it isn't required.

The following illustration shows a screenshot of this case.

Reference	Reference	Number	Item number	Requirement ...	Expiration date	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures date
	Planned purchase orders	013695	_DemoProd...	08-Jan-15			10.00	10.00				
	Sales order	000787	_DemoProd...	08-Jan-15			-10.00					
	Purchase order	000044	_DemoProd...	12-Jan-15			10.00	10.00		×	×	×

The following illustration shows a graphical view of what occurs in this case.

NOTE

In the preceding screenshot, the purchase order requirement date is January 12. Because that screenshot was taken in 2015, when January 11 was a Sunday, MRP moved the requirement date to the next working day, which was Monday, January 12. Nevertheless, the purchase order has a delivery date of January 11.

Case B: Negative days are more than the item's lead time

If you set the negative days to a number that is more than the item's lead time, you don't get a new planned order. The sales order is pegged against the existing purchase order. Therefore, the sales order is delayed. If you create a planned order, you can ship the sales order on time.

The following illustration shows a screenshot of this case.

Reference	Reference	Number	Item number	Requirement ...	Expiration date	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures date
	Sales order	000787	_DemoProd...	08-Jan-15			-10.00	-10.00				
	Purchase order	000044	_DemoProd...	12-Jan-15			10.00					

The following illustration shows a graphical view of what occurs in this case.

Case C: Automatically correlate the item's lead time to the negative days time fence

This case resembles case C for scenario 1, because dynamic negative days work just as well as, if not better than, they work in case B for this scenario.

The dynamic negative days time fence is $6 + 2 - 7 = 1$ day. However, in this case, the system still considers the negative days lead time (2), because MRP considers the maximum value between the negative days lead time and the dynamic negative days lead time. Therefore, the result in this case is the same as the result in case A for this scenario.

The following illustration shows a graphical view of what occurs in this case.

Case D: Use only dynamic negative days

If you set the negative days to 0 (zero) and use only the dynamic negative days time fence, the dynamic negative days time fence is now $6 + 0 - 7 = -1$ day. In this case, the system still considers the negative days lead time (2). Therefore, the result in this case is the same as the result in case A for this scenario and has all the same drawbacks. For a graphical view of what occurs, see case A for scenario 2.

Case E: Use both negative days that are more than the item's lead time and the dynamic negative days time fence

This case is the same as case E for scenarios 1 and 2. It has basically the same benefits and drawbacks.

Conclusion

As the three scenarios in this topic show, it's a good idea to set the negative days to a number that is more than the lead time of the items in the coverage group. It's also a good idea to use only dynamic negative days, and to set the negative days to the number of days that you're willing to wait before you order new replenishment when you have negative inventory (in other words, the number of days that you're willing to further delay demand). Additionally, items in the same coverage group should have similar lead times.

If you set the negative days to 0 (zero) and don't use dynamic negative days, MRP always creates a new planned order to fulfill demand. In this situation, it's important that you work with the action messages to make sure that you don't pile up inventory.

You might want to set the negative days to a long time fence and then work with the action messages. This approach produces good planning results, but it's also a bit slower. It might also be more difficult to analyze,

because you must analyze and apply the action messages. Here is an example:

- The DemoProduct item has a six-day purchase lead time.
- On day zero (January 1), the inventory for the DemoProduct item is 0 (zero).
- On day zero (January 1), you get a sales order for a quantity of 10 of the DemoProduct item.
- On day 10 (January 10), you get a sales order for a quantity of 10 of the DemoProduct item.
- On day 12 (January 12), there is a purchase order for a quantity of 10 of the DemoProduct item.
- Negative days are set to 20, which is much more than the item's lead time.

The following illustration shows a graphical view of what occurs.

MRP produces the following results.

Reference	Reference	Number	Item number	Requirement ...	Expiration date	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures date
	Sales order	000787	_DemoProd...	01-Jan-15			-10.00	-10.00				
	Planned purchase orders	012459	_DemoProd...	09-Jan-15			10.00			✗	✗	✗
	Sales order	000788	_DemoProd...	09-Jan-15			-10.00	-10.00				
	Purchase order	000044	_DemoProd...	12-Jan-15			10.00				⚡	

In the preceding screenshot, the sales order requirement date is January 9 instead of January 10. Because that screenshot was taken in 2015, when January 10 was a Saturday, the requirement date of the order should be the previous working day, which was Friday, January 9.

MRP creates a planned purchase order to fulfill the demand that is requested by the first sales order, but then it also recommends that you cancel the planned order, because you can advance the existing purchase order and increase the quantity on it.

The results aren't wrong, but the running time for MRP might be longer, because MRP must create all the delays and suggestions. Additionally, the planner might require more time to understand the MRP results. Most importantly, in this case, it's essential that the planner understand and use the action messages.

If you reduce the negative days to a number that's closer to the item's lead time, and you use dynamic negative days, MRP produces the following results.

Reference	Reference	Number	Item number	Requirement ...	Expiration date	CW req. qty	Req. quantity	Accumulated	CW accumulated	Action date	Action quantity	Futures date
	Sales order	000787	_DemoProd...	01-Jan-15			-10.00	-10.00				
	Planned purchase orders	013066	_DemoProd...	07-Jan-15			10.00			⚡		⇒
	Sales order	000788	_DemoProd...	09-Jan-15			-10.00	-10.00				⇒
	Purchase order	000044	_DemoProd...	12-Jan-15			10.00			⚡		

MRP creates a planned order that is attached to the first sales order. Then, as is expected, the second sales order is pegged against the existing purchase order, based on the negative days setting. This planning result is also correct, and the running time for MRP might be shorter. In this case, it isn't essential that you understand and know how to work with the action messages.

To help guarantee that the correct values are entered for your business, you must think in terms of both functionality and MRP running time. Therefore, it can take a little trial and error to determine the optimal values.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an intercompany plan

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create an intercompany plan. The demo data company used to create this procedure is USMF.

Set up an intercompany planning group

1. In the **Navigation pane**, go to **Modules > Master planning > Setup > Intercompany planning groups**.
2. Use the Quick Filter to find records. For example, filter on the Name field with a value of '10'.
3. In the list, mark the selected row.
4. Click **Delete**. This step is necessary in order to shorten the intercompany planning run. Intercompany planning will run master planning in all the companies in a planning group, starting from the lowest scheduling sequence.
5. Click **Yes**.
6. Close the page.

Create an intercompany plan

1. In the **Navigation pane**, go to **Modules > Master planning > Workspaces > Master planning**.
2. Click **Intercompany master planning**.
3. In the **Intercompany planning group** field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row. Select intercompany planning group 10.
5. In the **Number of intercompany planning iterations** field, enter '2'. Intercompany planning group 10 has two members. In order to propagate the delays from the source company (USMF) to the customer company (DEMF), you will need to run intercompany in both companies two times. The first iteration will propagate the demand and identify the delays in the source company (USMF). The second iteration will propagate the delays from USMF to DEMF.
6. In the **First iteration** field, select 'Regeneration'.
7. In the **Subsequent iterations** field, select 'Regeneration'.
8. In the **Number of threads** field, enter a number. This represents the number of parallel threads used for planning.
9. Click **OK**.

View the result of the plan

1. In the **Plan** field, click the drop-down button to open the lookup.
2. In the list, click the link in the selected row. Click the link for StaticPlan. You need to be in company USMF.
3. Click **Planned orders**.

NOTE

View outbound planned intercompany demand

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to view all the planned orders that will be fulfilled by an intercompany vendor. The demo data company used to create this procedure is DEMF.

1. Click Master planning.
2. In the Plan field, enter or select a value.
 - In the Plan field, select plan 10.
3. Click Run.
4. In the Number of threads field, enter a number.
 - This represents the number of parallel threads to be used for master planning.
5. Click OK.
 - This may take a while.
6. Click Planned intercompany demand.
7. Click Outbound planned intercompany demand.
 - This page provides an overview of all the planned demand that will be fulfilled by an internal supply chain vendor.
8. Expand the Upstream demand details section.
 - In this section, you can see the details about how the demand will be fulfilled. You may need to wait for master planning to be run in the supply company before you can see additional information here.

NOTE

Demand forecasting overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

Demand forecasting is used to predict independent demand from sales orders and dependent demand at any decoupling point for customer orders. The enhanced demand forecast reduction rules provide an ideal solution for mass customization.

To generate the baseline forecast, a summary of historical transactions is passed to Microsoft Azure Machine Learning hosted on Azure. Because this service isn't shared among users, it can easily be customized to meet industry-specific requirements. You can use Supply Chain Management to visualize the forecast, adjust the forecast, and view key performance indicators (KPIs) about forecast accuracy.

NOTE

Microsoft Azure Machine Learning Studio (classic) is required for forecast generation with machine learning. As of January 2021, it is available in Japan East, South Central US, Southeast Asia, West Central US, and West Europe. For updated information about current availability, see [Azure Products by Region](#).

Key features of demand forecasting

Here are some of the main features of demand forecasting:

- Generate a statistical baseline forecast that is based on historical data.
- Use a dynamic set of forecast dimensions.
- Visualize demand trends, confidence intervals, and adjustments of the forecast.
- Authorize the adjusted forecast to be used in planning processes.
- Remove outliers.
- Create measurements of forecast accuracy.

Major themes in demand forecasting

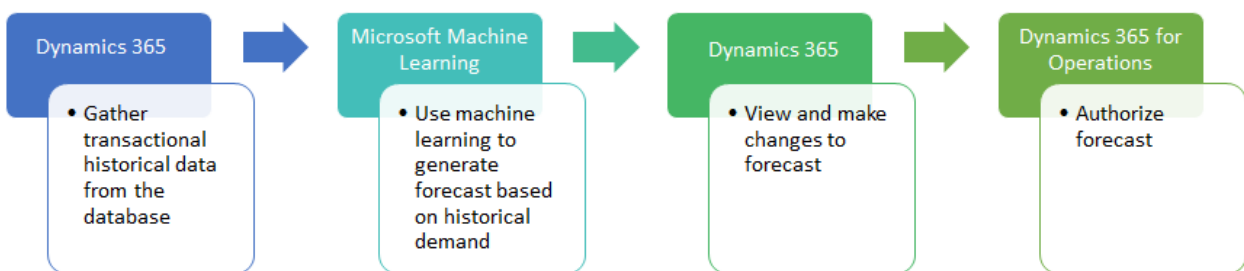

Three major themes are implemented in demand forecasting:

- **Modularity** – Demand forecasting is modular and easy to configure. You can turn the functionality on and off by changing the configuration key at **Trade > Inventory forecast > Demand forecasting**.
- **Reuse of the Microsoft stack** – Machine Learning, which is part of the Microsoft Cortana Analytics Suite, lets you quickly and easily create predictive analysis experiments, such as demand estimation experiments, by using algorithms R or Python programming languages and a simple drag-and-drop interface.
 - You can download the Demand forecasting experiments, change them to meet your business requirements, publish them as a web service on Azure, and use them to generate demand forecasts. The experiments are available for download if you've purchased a Supply Chain Management subscription for a production planner as enterprise-level user.
 - You can download any of the currently available demand prediction experiments from the [Cortana Analytics Gallery](#). Whereas the Demand forecasting experiments are automatically integrated with Supply Chain Management, customers and partners must handle the integration of experiments that they download from the [Cortana Analytics Gallery](#). Therefore, experiments from the [Cortana Analytics Gallery](#) aren't as straightforward to use as the Finance and Operations Demand forecasting experiments. You must modify the code of the experiments so that they use the Finance and Operations application programming interface (API).

- You can create your own experiments in Microsoft Azure Machine Learning Studio (classic), publish them as services on Azure, and use them to generate demand forecasts.
- If you don't require high performance, or if you don't require that a large amount of data be processed, you can use the Machine Learning free tier. We recommend that you always start from this tier, especially during implementation and testing phases. If you require higher performance and additional storage, you can use the Machine Learning standard tier. This tier requires an Azure subscription and involves additional costs. For details about Machine Learning pricing, see [Machine Learning Studio pricing](#).
- **Forecast reduction at any decoupling point** – Demand forecasting in builds on this functionality, which lets you forecast both dependent and independent demand at any decoupling point.

Basic flow in demand forecasting

The following diagram shows the basic flow in demand forecasting.

Demand forecast generation starts in Supply Chain Management. Historical transactional data from the Supply Chain Management transactional database is gathered and populates a staging table. This staging table is later fed to a Machine Learning service. By performing minimal customization, you can plug various data sources into the staging table. The data sources can include Microsoft Excel files, comma-separated value (CSV) files, and data from Microsoft Dynamics AX 2009 and Microsoft Dynamics AX 2012. Therefore, you can generate demand forecasts that consider historical data that is spread among multiple systems. However, the master data, such as item names and units of measure, must be the same across the various data sources.

If you use the Demand forecasting Machine Learning experiments, they look for a best fit among five time series forecasting methods to calculate a baseline forecast. The parameters for these forecasting methods are managed in Supply Chain Management.

The forecasts, historical data, and any changes that were made to the demand forecasts in previous iterations are then available in Supply Chain Management.

You can use Supply Chain Management to visualize and modify the baseline forecasts. Manual adjustments must be authorized before the forecasts can be used for planning.

Limitations

Demand forecasting is a tool that helps customers in the manufacturing industry create forecasting processes. It offers the core functionality of a demand forecasting solution and is designed so that it can easily be extended. Demand forecasting might not be the best fit for customers in industries such as commerce, wholesale, warehousing, transportation, or other professional services.

Demand forecast variant conversion limitation

Unit of measure (UOM) per variant conversion is not fully supported when generating demand forecast if inventory UOM is different than the demand forecast UOM.

Generating forecast (**Inventory UOM > Demand forecast UOM**) uses product UOM conversion. When loading historical data for the demand forecast generation, the product level UOM conversion will be always used when converting from inventory UOM to the demand forecast UOM, even if there are conversions defined on the variant level.

The first part of authorizing forecast (**Demand forecast UOM > Inventory UOM**) uses product UOM conversion. The second part of authorizing forecast (**Inventory UOM > Sales UOM**) uses the variant UOM conversion. When the generated demand forecast is authorized, the conversion to inventory UOM from demand forecast UOM will be done using product level UOM conversion. At the same time, conversion between the inventory unit and the sales UOM will respect the variant level defined conversions.

Note that the demand forecast UOM does not have to have any specific meaning. It can be defined as "Demand forecast unit". For each of the products, you can define the conversion to be 1:1 with the inventory UOM.

Demand forecasting setup

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes the setup tasks that you must perform to prepare for demand forecasting.

The setup tasks include setting up the following data and parameters.

Item allocation key

A demand forecast is calculated for an item and its dimensions only if the item is part of an item allocation key. This rule is enforced to group large numbers of items, so that demand forecasts can be created more quickly. The item allocation key percentage is ignored when demand forecasts are generated. Forecasts are created based on historical data only.

An item and its dimensions must be part of only one item allocation key if the item allocation key is used during forecast creation.

To add a stock keeping unit (SKU) to an item allocation key, go to **Master planning > Setup > Demand forecasting > Item allocation keys**. Use the **Assign items** page to assign an item to an allocation key.

Intercompany planning groups

Demand forecasting generates cross-company forecasts. In Dynamics 365 Supply Chain Management, companies that are planned together are grouped into one intercompany planning group. To specify, per company, which item allocation keys should be considered for demand forecasting, associate an item allocation key with the intercompany planning group member by going to **Master planning > Setup > Intercompany planning groups**.

By default, if no item allocation keys are assigned to intercompany planning group members, a demand forecast is calculated for all items that are assigned to all item allocation keys from all companies. Additional filtering options for companies and item allocation keys are available on the **Generate statistical baseline forecast** page.

Review the number of items that are forecasted. Unnecessary items might cause increased costs when you use Microsoft Azure Machine Learning.

Demand forecasting parameters

To set up demand forecasting parameters, go to **Master planning > Setup > Demand forecasting parameters**. Because demand forecasting runs cross-company, the setup is global. In other words, the setup applies to all companies.

Demand forecasting generates the forecast in quantities. Therefore, the unit of measure that the quantity should be expressed in must be specified in the **Demand forecast unit** field. The unit of measure must be unique, to help guarantee that the aggregation and percentage distribution make sense. For more information about aggregation and percentage distribution, see [Make manual adjustments to the baseline forecast](#). For every unit of measure that is used for SKUs that are included in demand forecasting, make sure that there is a conversion rule for the unit of measure and the general forecasting unit of measure. When forecast generation is run, the list of items that don't have a unit of measure conversion is logged, so that you can easily correct the setup.

Demand forecasting can be used to forecast both dependent and independent demand. For example, if only the **Sales order** check box is selected, and if all the items that are considered for demand forecasting are items that

are sold, the system calculates independent demand. However, critical subcomponents can be added to item allocation keys and included in demand forecasting. In this case, if the **Production line** check box is selected, a dependent forecast is calculated.

There are two methods for creating a baseline forecast. You can use forecasting models on top of historical data, or you can just copy over the historical data to the forecast. The **Forecast generation strategy** field lets you select between these two methods. To use forecast models, select **Azure Machine Learning**.

By clicking **Forecast dimensions** in the left pane of the **Demand forecasting parameters** page, you can also select the set of forecast dimensions to use when the demand forecast is generated. A forecast dimension indicates the level of detail that the forecast is defined for. Company, site, and item allocation key are mandatory forecast dimensions, but you can also generate forecasts at the warehouse, inventory status, customer group, customer account, country/region, state, and item plus all item dimension levels.

At any point, you can add forecast dimensions to the list of dimensions that are used for demand forecasting. You can also remove forecast dimensions from the list. However, manual adjustments are lost if you add or remove a forecast dimension.

Not all items behave in the same manner from a demand forecasting perspective. Similar items can be grouped in one item allocation key, and parameters such as transaction types and forecast method settings can be set per item allocation key. Click **Item allocation keys** in the left pane of the **Demand forecasting parameters** page.

To generate the forecast, Supply Chain Management uses a Machine Learning web service. To connect to the service, you must provide the following information if you sign in to Microsoft Azure Machine Learning Studio (classic):

- Web service application programming interface (API) key
- Web service endpoint URL
- Azure storage account name
- Azure storage account key

NOTE

The Azure storage account name and key are required only if you use a custom storage account. If you deploy the on-premises version, you must have a custom storage account on Azure, so that Machine Learning can access the historical data.

To create demand predictions, you can deploy your own service by using Machine Learning Studio or the Supply Chain Management demand forecasting experiments. Instructions for deploying the demand forecasting experiments as a web service are available in Supply Chain Management. On the **Demand forecasting parameters** page, click the **Azure Machine Learning** tab.

Settings for the demand forecasting machine learning service

To view the parameters that can be configured for the demand forecasting service, go to **Master Planning > Setup > Demand forecasting > Forecasting algorithm parameters**. The **Forecasting algorithm parameters** page shows the default values for the parameters. You can overwrite these parameters on the **Demand forecasting parameters** page. Use the **General** tab to overwrite the parameters globally, or use the **Item allocation keys** tab to overwrite the parameters per item allocation key. Parameters that are overwritten for an item allocation key affect only the forecast of items that are associated with that item allocation key.

Forecast algorithm parameters

On the **Allocation keys** tab you can set the **Forecast algorithm parameters** for each item allocation key. The following options are available.

- **Confidence level percentage:** A confidence interval consists of a range of values that act as good estimates for the demand forecast. A 95% confidence level percentage indicates there is a 5% risk that the future demand falls outside the confidence interval range.
- **Force seasonality:** Specifies whether to force the model to use a certain type of seasonality. Applies to ARIMA and ETS only. Options: AUTO(default), NONE, ADDITIVE, MULTIPLICATIVE.
- **Forecasting model:** Options: ARIMA, ETS, STL, ETS+ARIMA, ETS+STL, ALL. To select best fit model, use ALL.
- **Maximum forecasted value:** Specifies the maximum value to use for predictions. Format: +1E[n] or numeric constant.
- **Minimum forecasted value:** Specifies the minimum value to use for predictions. Format: -1E[n] or numeric constant.
- **Missing value substitution:** Specifies how gaps in historical data are filled. Options: numeric value, MEAN, PREVIOUS, INTERPOLATE LINEAR, INTERPOLATE POLYNOMIAL.
- **Missing value substitution scope:** Specifies whether the value substitution applies only to the data range of each individual granularity attribute, or to the entire dataset. Options: GRANULARITY_ATTRIBUTE(default), GLOBAL.
- **Seasonality hint:** For seasonal data, provide a hint to the forecasting model to improve forecast accuracy. Format: integer number, representing the number of buckets a demand pattern repeats itself. For example, enter "6" for data that repeats itself every 6 months.
- **Test set size percentage:** Percentage of historical data to be used as a test set for forecast accuracy calculation.

Import historical data for demand forecasts

2/18/2021 • 2 minutes to read • [Edit Online](#)

To help guarantee the accuracy of demand forecasts, you must have as much historical demand data as you can get per item or item allocation key. If the historical demand data isn't already imported, use the **Historical external demand** (ReqDemPlanHistoricalExternalDemandEntity) data entity in Dynamics 365 Supply Chain Management to import it.

In the **Data management** workspace, you can see an overview of all the fields in the entity.

1. Open the **Data management** workspace.
2. Select the **Data entities** tile.
3. Search the entity list for **Historical external demand**.
4. Select **Target fields**. The following entity fields are mandatory: site (**DeliveringSiteId**), date (**DemandDate**), quantity (**DemandQuantity**), and either item number (**ItemNumber**) or item allocation key (**ProductAllocationKeyId**).

To use the data entity, you must have a Microsoft Excel file or comma-separated values (CSV) file that contains the historical demand data. The following example shows how to import the data from a CSV file.

For more information about how to import data, including how to clean up data after an import, see [Data import and export jobs overview](#) and its related topics.

Example

You can use the following file as an example. Download the [HistoricalDemandData](#). This file contains the historical demand data for item D0001. It contains only the following mandatory fields: site, quantity, and the demand date.

1. Select the company to import the historical demand data into.
2. Open the **Data management** workspace.
3. Select the **Import** tile.
4. Enter a name for the import project, such as **Import historical demand for item D0001**.
5. In the **Source data format** field, select the file format of the file that you're importing. To import the `HistoricalDemandData` file for this example, select **CSV**.
6. In the **Entity name** field, select **Historical external demand**.
7. Save the file to your computer, and then upload it.
8. Select **Import**.
9. The **Execution summary** page is opened automatically. Verify the imported data on the page.

After you've imported the historical demand data, you can generate a demand forecast.

Generate a statistical baseline forecast

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides information about the parameters and filters that are used in the calculation of demand forecasting.

When you create a baseline forecast, you must first specify the parameters and filters that are used in the calculation. For example, you can create a baseline forecast that estimates demand based on transaction data from the past year for a specific company, for the coming month, and for a selected group of items.

To generate a demand forecast, go to **Master planning > Forecasting > Demand forecasting > Generate statistical baseline forecast**.

The forecast bucket can be selected at forecast generation time. The available values are: Day, Week, and Month.

The number of buckets to generate a forecast for is set in the **Forecast horizon** field.

When the forecast strategy is set to **Copy over historical demand**, the end of the historical horizon is ignored. The system copies the number of buckets specified in the **Forecast horizon** field to the forecast demand, starting from the date set in the **From date** field under **Historical horizon**. By copying historical demand from a certain date forward, production planners can make the plan for the next quarter in two ways:

- By copying the demand from the same quarter last year.
- By copying the demand from the previous quarter.

To prevent confusion in the production plans, a certain number of forecast buckets can be frozen. This number is set in the **Freeze time fence** field. On the **Adjusted demand forecast** page, the cells for the frozen buckets are disabled, to give a visual indication that those values should not be changed.

The start date for the baseline demand forecast doesn't have to be the current date or a date in the future. To set a different start date, use the **Baseline forecast start date - From date** field. For example, in June, users can generate a forecast for the next year. Because the forecast buckets between the end of historical demand and the start of the baseline are missing, the predictions might not be accurate. If you are using the Demand forecasting service, there are four ways in which you can fill in the missing gaps. You can choose the method that you want by setting the `MISSING_VALUE_SUBSTITUTION` parameter on the **Demand forecasting parameters** page.

NOTE

Missing value substitution only works for the gaps in data in between the start and end dates for historical data. It will not fill in data before or after the last physical data point, it only acts as extrapolation between actual existing data points.

The **Baseline forecast start date - From date** field has to be set to the beginning of a forecast bucket, for example, in the United States, a Sunday if the forecasting bucket is the week. The system automatically adjusts the **Baseline forecast start date - From date** field to match the beginning of a forecast bucket.

The **Baseline forecast start date - From date** field can be set to a date in the past. In other words, it is possible to generate a demand forecast in the past. This is useful, because it lets users adjust the forecast service parameters so that the statistical forecast generated in the past matches the actual historical demand. Users can then continue using these parameter settings to generate a statistical baseline forecast for the future.

Manual adjustments made in previous demand forecasting iterations can be automatically applied to the new baseline forecast if the **Transfer manual adjustments to the demand forecast** check box is selected. If the check box is cleared, the manual adjustments are not added to the baseline forecast – but they are not deleted.

Manual adjustments made to a forecast can be deleted only at forecast import time, by clearing the **Save the manual adjustments made to the baseline demand forecast** check box. Manual adjustments are saved at authorization time. Therefore, if a user makes manual adjustments to the forecast, but doesn't authorize the forecast back to Supply Chain Management, the changes are lost. For more information about manual adjustments and how they work, see [Authorize an adjusted forecast](#).

A demand forecast generation can have a name and comments to help users identify the forecast that has been generated. These values are visible in forecast generation history on the **Statistical baseline forecast generation history** page.

The intercompany planning group, item allocation keys, and other filters can be applied at forecast generation time. These can be used to improve performance or to split the data into manageable chunks. However, note that a demand forecast is not generated for the members of any item allocation key that is not associated with an intercompany planning group, even if the item allocation key is selected in the query.

TIP

Sometimes users might receive errors while generating a demand forecast, or forecast generation is completed with no session log. This can happen because of leftover data in the query that was previously used for forecast generation. To resolve this issue, click **Select** to open the **Query** page, select **Reset**, and then regenerate the baseline forecast.

If the forecast is not generated for a big set of items, but, for example, for one item or one item allocation key at a time, then in order to get better performance, you can select the **Use request response mode** check box on the **Master planning - Setup - Demand forecasting - Demand forecasting parameters - Azure Machine Learning** tab.

NOTE

A potentially flat looking forecast can be due to the historical data that has to be of a longer historical timeframe (a minimum 3 of time periods in order to pick out patterns, such as 3 years with monthly forecast). To get a better result, you can try changing the granularity of the time range or increase the time range.

Additional resources

- [Demand forecasting setup](#)

Make manual adjustments to the baseline forecast

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how you can make manual adjustments to a baseline forecast and view details of the forecast.

Before you make manual adjustments, it's important that you understand a few concepts on various pages.

Grid on the Adjusted demand forecast page

The **Adjusted demand forecast** page includes a grid that has the following structure:

- The first column shows the items, item allocation keys, companies, and so on, that the forecast has been generated for. The subtitle of the page provides a description of the current forecast dimensions that are shown in the grid. For example, if the subtitle of the page is **Company / Site / Item allocation key**, and one of the row headers in the grid is **USMF / 1 / D_Alloc**, that row shows the forecast for the USMF company, site 1, and the **D_Alloc** item allocation key.
- Subsequent columns represent the forecast buckets that the forecast has been generated for. Each column header is the first date of the forecast bucket that the column shows.
- The values in the cells represent the forecast for one item, item allocation key, and so on, for that specific forecast bucket.

Forecast aggregation and de-aggregation

The subtitle of the page shows the level of forecast aggregation.

For example, if the subtitle of the page is **Company / Site / Allocation key / Item number / Color / Size / Configuration / Style**, there is no forecast aggregation, and the forecast is shown at the level of the item and its dimensions. To change the aggregation, use the **Change forecast dimensions** page, which you can open from the application menu.

To modify the forecast, click in any of the cells that are available, and type the adjusted forecast value. The edited cell immediately becomes bold to indicate that the forecast that it shows isn't the forecast that the demand forecasting service created, but has been manually adjusted.

If you change the aggregation to make the page show more aggregated data, you can use the **Demand forecast lines** page to see the individual forecast lines that make up the aggregated forecast.

For example, you've generated the forecast at the item level, but you know that the demand for this item will increase across all sites because of a promotion or another similar event. In this case, you can set the aggregation to **Company / Item allocation key / Item** on the **Change forecast dimensions** page. You can adjust the global forecast for the item across all sites in the **Adjusted demand forecast** grid. To see the effect of your change across all sites, open the **Demand forecast lines** page. On this page, you will see one line for the item for each site, the adjusted forecast quantity, and the original forecast quantity.

When the adjustment of the forecasted quantity is made at an aggregated level, the system uses weighted allocation to distribute the change among the lines that create the aggregation.

You can also make manual adjustments on the **Demand forecast lines** page, by modifying either the **Total quantity** value or the **Quantity** cells in the de-aggregation grid.

Viewing details of the forecast

You can open the **Demand forecast details** page to view more information about the forecast.

The **Demand forecast details** page shows the following information in graphical and tabular formats:

- The historical demand that the forecast predictions are based on.
- The current forecast that is used by Master planning.
- The new demand forecast values and the amounts they have been manually adjusted by.
- The confidence interval for the forecasted values.
- The forecast model that was used to generate the forecast. If you're viewing aggregated data, you will see the list of all the methods that were used for all the aggregated time series.
- The internal model accuracy (MAPE). For more information about forecast accuracy, see [Monitor forecast accuracy](#).

Notes:

- If you enable **Forecast model selection on Demand forecast details** from Feature management, you will be able to select the forecast models to be include, for the historical forecast, on the **Demand forecast details** page.
- The confidence interval that appears in the **Forecast** section of the page represents the difference between the confidence interval upper limit and the confidence interval lower limit. To see the values for the upper and lower limits, hover over the chart in the **Historical demand and forecast graphically** section.
- If you use the Demand forecasting Microsoft Azure Machine Learning, you can specify the confidence level percentage that the forecast that is generated should have. A confidence interval consists of a range of values that act as good estimates for the demand forecast. A 95-percent confidence level percentage indicates that there is a 5-percent risk that the demand forecast falls outside the confidence interval range.

You can also make manual adjustments to the forecast on the **Demand forecast details** page, by modifying the values in the **Forecast** row in the **Forecast** section.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Authorize an adjusted forecast

2/18/2021 • 2 minutes to read • [Edit Online](#)

Not all forecast data must be authorized immediately. This article explains how you can specify the period that a forecast is authorized for. It also explains how you can authorize the forecast for specific companies and forecast models.

Not all forecast data must be authorized immediately. You can specify the start and end dates of the period that the forecast is authorized for. This functionality lets you freeze specific buckets.

The start and end dates that you specify must correspond to the start and end dates of the bucket that the forecast is generated in. The system enforces this restriction and automatically adjusts the dates, if adjustment is required.

On the **Details** tab of the **Authorization** page, you can view details about the forecast that was most recently generated.

You can select the companies and the forecast models to authorize the forecast for use. By default, the grid includes all the companies that forecast demand has been created for. For each company, the forecast model that corresponds to the current forecast plan that is set up in the master planning parameters is prefilled. However, you can change this forecast model to any forecast model that belongs to that company. If no forecast demand data has been generated for a selected company, you receive a warning message at import time.

It's very important that you understand how the **Save the manual adjustments made to the baseline demand forecast** check box works. If you've made manual adjustments to the statistical baseline forecast, the adjusted values are authorized for use, even if this check box is cleared. However, the changes are discarded after the authorization. Therefore, the next time that a forecast is generated, that forecast is only a statistical forecast and doesn't have any manual overrides, even if **Transfer manual adjustments to the demand forecast** is selected. Therefore, you can consider the **Save the manual adjustments made to the baseline demand forecast** check box a mechanism that lets you keep or discard all manual changes.

Monitor forecast accuracy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the types of forecast accuracy that Microsoft Dynamics 365 Supply Chain Management calculates, and explains how you can view the accuracy values.

Supply Chain Management calculates the following types of forecast accuracy:

- Historical forecast accuracy, by comparing the historical forecast that Master Planning uses with the historical demand. To view the values (both absolute values and percentage values) for historical forecast accuracy, click **Show accuracy** on the **Demand forecast details** page.
- The estimated accuracy of the forecasting model that is used to generate the predictions. You can view the accuracy percentage under **Model details - MAPE** on the **Demand forecast details** page.

NOTE

If you use the Demand forecasting Microsoft Azure Machine Learning, the calculation of internal model accuracy is based on the test data set. To specify the size of the test data set, set the **TEST_SET_SIZE_PERCENT** parameter on the **Demand forecasting parameters** page. For example, if you set the value to **20**, the last 20 percent of the historical data will be used to calculate the internal model accuracy.

Remove outliers from historical transaction data when calculating a demand forecast

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes how to exclude outliers from the historical data that is used to calculate a demand forecast. By excluding outliers, you can improve forecast accuracy.

You can exclude outliers to improve forecast accuracy. This is an optional task. Here is an overview of the process:

1. Click **Master planning** > **Setup** > **Demand forecasting** > **Outlier removal** to open the **Outlier removal** page, where you can use a query to select the transactions to exclude.
2. Select the company that the query applies to, and then enter a name and description. The **Query date** field is automatically set to the current date.
3. Select the **Active** check box to exclude the transactions that the query finds from the historical data. This setting will take effect when you create a baseline forecast.
4. On the **Outlier removal query** page, you can add, remove, and select the criteria that define which transactions will be excluded when the baseline forecast is calculated. For example, select a specific item or order transaction to exclude.
5. Click **Display transactions**. The **Outlier transactions** page lists the transactions that meet the criteria that you defined in the query, and that will be excluded from the historical data when the demand forecast is calculated.

Note: You can also create a query that is based on an existing query. Select the query to copy, and then click **Duplicate**. The **Query date** field identifies the version. You can use the query as it is, or you can click **Edit query** to modify the criteria. You can optionally modify the name and description of the new query.

Forecast reduction keys

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic provides information about the different methods that are used to reduce forecast requirements. It includes examples of the results of each method. It also explains how to create, set up, and use a forecast reduction key. Some methods use a forecast reduction key to reduce forecast requirements.

Methods that are used to reduce forecast requirements

When you include a forecast in a master plan, you can select how the forecast requirements are reduced when actual demand is included. Note that master planning excludes forecast requirements from the past, which means all forecast requirements before today's date.

To include a forecast in a master plan and select the method that is used to reduce forecast requirements, go to **Master planning > Setup > Plans > Master plans**. In the **Forecast model** field, select a forecast model. In the **Method used to reduce forecast requirements** field, select a method. The following options are available:

- None
- Percent – reduction key
- Transactions – reduction key
- Transactions – dynamic period

The following sections provide more information about each option.

None

If you select **None**, the forecast requirements aren't reduced during master scheduling. In this case, master planning creates planned orders to supply the forecasted demand (forecast requirements). These planned orders maintain the suggested quantity, regardless of other types of demand. For example, if sales orders are placed, master planning creates additional planned orders to supply the sales orders. The quantity of the forecast requirements isn't reduced.

Percent – reduction key

If you select **Percent - reduction key**, the forecast requirements are reduced according to the percentages and periods that are defined by the reduction key. In this case, master planning creates planned orders where the quantity is calculated as forecasted quantity \times reduction key in each period. If there are other types of demand, master planning also creates planned orders to supply that demand.

Example: Percent – reduction key

This example shows how a reduction key reduces demand forecast requirements according to the percentages and periods that are defined by the reduction key.

For this example, you include the following demand forecast in a master plan.

MONTH	DEMAND FORECAST
January	1,000
February	1,000
March	1,000

MONTH	DEMAND FORECAST
April	1,000

On the **Reduction keys** page, you set up the following lines.

CHANGE	UNIT	PERCENT
1	Month	100
2	Month	75
3	Month	50
4	Month	25

You assign the reduction key to the item's coverage group. Then, on the **Master plans** page, in the **Method used to reduce forecast requirements** field, you select **Percent - reduction key**.

In this case, if you run forecast scheduling on January 1, the demand forecast requirements are consumed according to the percentages that you set up on the **Reduction keys** page. The following requirement quantities are transferred to the master plan.

MONTH	PLANNED ORDER QUANTITY	CALCULATION
January	0	= 0% × 1,000
February	250	= 25% × 1,000
March	500	= 50% × 1,000
April	750	= 75% × 1,000
May through December	1,000	= 100% × 1,000

Transactions – reduction key

If you select **Transactions - reduction key**, the forecast requirements are reduced by the transactions that occur during the periods that are defined by the reduction key.

Example: Transactions – reduction key

This example shows how actual orders that occur during the periods that are defined by the reduction key reduce demand forecast requirements.

For this example, you select **Transactions - reduction key** in the **Method used to reduce forecast requirements** field on the **Master plans** page.

The following sales orders exist on January 1.

MONTH	NUMBER OF PIECES ORDERED
January	956
February	1,176

MONTH	NUMBER OF PIECES ORDERED
March	451
April	119

If you use the same demand forecast of 1,000 pieces per month that was used in the previous example, the following requirement quantities are transferred to the master plan.

MONTH	NUMBER OF PIECES REQUIRED
January	44
February	0
March	549
April	881
May through December	1,000

Transactions – dynamic period

If you select **Transactions - dynamic period**, the forecast requirements are reduced by the actual order transactions that occur during the dynamic period. The dynamic period covers the current forecast dates and ends at the start of the next forecast. In this case, master planning creates planned orders to supply the forecasted demand (forecast requirements). However, when actual order transactions are placed, the forecast requirements are reduced. The actual transactions consume part of the forecasted requirements.

When this option is used, the following behavior occurs:

- Reduction keys aren't required or used.
- If the forecast is completely reduced, the forecast requirements for the current forecast become 0 (zero).
- If there is no future forecast, forecast requirements from the last forecast that was entered are reduced.
- Time fences are included in the forecast reduction calculation.
- Positive days are included in the forecast reduction calculation.
- If actual order transactions exceed the forecasted requirements, the remaining transactions aren't forwarded to the next forecast period.

Example 1: Transactions – dynamic period

Here a simple example that shows how the **Transactions - dynamic period** method works.

For this example, you include the following demand forecast in a master plan.

DATE	DEMAND FORECAST
January 1	1,000
February 1	1,000

You also create the following sales orders.

DATE	SALES ORDER QUANTITY
January 15	200
February 15	400

In this case, the following planned orders are created.

DEMAND FORECAST DATE	QUANTITY	EXPLANATION
January 1	800	Forecast requirements (= 1,000 – 200)
January 15	200	Sales orders requirements
February 1	600	Forecast requirements (= 1,000 – 400)
February 15	400	Sales orders requirements

Example 2: Transactions – dynamic period

In most cases, systems are set up so that transactions reduce demand forecast in specific forecast periods: weeks, months, and so on. These periods are defined in the reduction key. However, the time between two demand forecast lines can also *imply* a period.

For this example, you create a demand forecast for the following dates and quantities.

DATE	DEMAND FORECAST
January 1	1,000
January 5	500
January 12	1,000

Notice that, in this forecast, there isn't a clear period between the forecast dates. Between the first and second dates there is a four-day span, and between the second and third dates there is a seven-day span. These spans are the dynamic periods.

You also create the following sales order lines.

DATE	SALES ORDER QUANTITY
December 15 in the previous year	500
January 3	100
January 10	200

In this case, the forecast is reduced in the following manner:

- Because the first sales order isn't in any period, it doesn't reduce any forecast.
- Because the second sales order is between January 1 and January 5, it reduces the forecast for January 1 by 100.
- Because the third sales order is between January 5 and January 12, it reduces the forecast for January 5 by 200.

Therefore, the following planned orders are created.

DEMAND FORECAST DATE	QUANTITY	EXPLANATION
December 15 in the previous year	500	Sales order requirements
January 1	900	Forecast requirements period January 1 to January 5 (= 1,000 – 100)
January 3	100	Sales order requirements
January 5	300	Forecast requirements period January 5 to January 10 (= 500 – 200)
January 12	1,000	Forecast requirements period January 12 to end

Create and set up a forecast reduction key

A forecast reduction key is used in the **Transactions - reduction key** and **Percent- reduction key** methods for reducing forecast requirements. Follow these steps to create and set up a reduction key.

1. Go to **Master planning > Setup > Coverage > Reduction keys**.
2. Select **New** to create a reduction key.
3. In the **Reduction key** field, enter a unique identifier for the forecast reduction key. Then, in the **Name** field, enter a name.
4. Define the periods and the reduction key percentage in each period:
 - The **Effective date** field indicates the date when creation of the periods starts. When the **Use the effective date** option is set to **Yes**, the periods start on the effective date. When it's set to **No**, the periods start on the date when master planning is run.
 - Define the periods that the forecast reduction should occur during.
 - For a specific period, specify the percentages that the forecast requirements should be reduced by. You can enter positive values to decrease requirements or negative values to increase requirements.

Use a reduction key

A forecast reduction key must be assigned to the coverage group of the item. Follow these steps to assign a reduction key to an item's coverage group.

1. Go to **Master planning > Setup > Coverage > Coverage groups**.
2. On the **Other** FastTab, in the **Reduction key** field, select the reduction key to assign to the coverage group. The reduction key then applies to all items that belong to the coverage group.
3. To use a reduction key to calculate forecast reduction during master scheduling, you must define this setting in the setup of the forecast plan or the master plan. Go to one of the following locations:
 - Master planning > Setup > Plans > Forecast plans
 - Master planning > Setup > Plans > Master plans
4. On the **Forecast plans** or **Master plans** page, on the **General** FastTab, in the **Method used to reduce forecast requirements** field, select either **Percent - reduction key** or **Transactions - reduction key**.

Reduce a forecast by transactions

When you select **Transactions - reduction key** or **Transactions - dynamic period** as the method for reducing forecast requirements, you can specify which transactions reduce the forecast. On the **Coverage groups** page, on the **Other** FastTab, in the **Reduce forecast by** field, select **All transactions** if all transactions should reduce the forecast or **Orders** if only sales orders should reduce the forecast.

[Master plans overview](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a baseline forecast

2/18/2021 • 2 minutes to read • [Edit Online](#)

A production planner can create a baseline forecast either by using time series forecast models or by copying the historical demand. This procedure shows how to copy the historical demand to create a baseline forecast for all products using one item allocation key.

Set up an item allocation key

1. Go to Master planning > Setup > Intercompany planning groups.
2. Use the Quick Filter to find records. For example, filter on the Name field with a value of '10'.
 - Demand forecasting runs across legal entities. That's why you need to set up all the companies for which you want to generate forecasts in one intercompany planning group.
3. In the list, find and select the desired record.
4. Click Item allocation keys.
 - Select all the item allocation keys for which you want to create forecasts.
5. In the list, mark the selected row.
 - Select D_Aloc item allocation key.
6. Click >.
7. Close the page.
8. Close the page.

Set up the demand forecasting parameters

1. Go to Master planning > Setup > Demand forecasting > Demand forecasting parameters.
2. Expand the Forecast algorithm parameters section.
3. In the Forecast generation strategy field, select 'Copy over historical demand'.
4. Click Save.

Create a baseline forecast

1. Go to Master planning > Forecasting > Demand forecasting > Generate statistical baseline forecast.
2. In the From date field, enter a date.
 - If you have sales orders starting from January 1, 2015, enter this date. If you don't, enter the earliest date of your sales orders.
3. In the To date field, enter a date.
 - Enter the last date of your sales orders, for example '2015-03-31'.
4. In the From date field, enter a date.
 - Enter '2015-04-01'. This date will be automatically calculated as the start date of the next forecasting bucket.
5. Expand the Records to include section.
6. Click Filter.
7. In the list, mark the selected row.
 - Mark the row where Field = Intercompany planning group.
8. In the Criteria field, type a value.
 - Type the intercompany planning group, for example, 10, that you used in the first task.

9. In the list, find and select the desired record.
 - Select the row where Field = Item allocation key.
10. In the Criteria field, type a value.
11. Click OK.
12. Expand the Advanced parameters section.
13. In the Forecast bucket field, select 'Month'.
14. In the Forecast horizon field, enter '3'.
15. In the Freeze time fence field, enter '1'.
16. Click OK.

Visualize the demand forecast

1. Go to Master planning > Forecasting > Demand forecasting > Adjusted demand forecast.
2. In the aggregated view table, select the cell in row 1, column 2. This is the second month for which you have created forecast.
3. Set QtyCell to '400'.
 - In the cell, enter a different number than the one that was forecasted, for example, 400.
4. You have made a manual adjustment to the forecast. Notice the graphical indication in the next step.
5. Click Forecast line details.
 - In this page, you can see the accuracy values, historical demand, and forecast. You can make changes to the forecast as well.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Modify a demand forecast manually

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to modify the forecast for an item. The demo data company used to create this procedure is USMF. This recording is intended for the production planner.

Modify the forecast for an item

1. In the **Navigation pane**, go to **Modules > Product information management > Products > Released products**.
2. In the list, find and select the desired record. Select the item for which you want to modify the forecast. For example, you can select item D0001.
3. On the **Action Pane**, click **Plan**.
4. Click **Demand forecast**.
5. In the list, mark the selected row. If there are no forecast lines, create a new line by clicking **New** on the app bar.
6. In the **Sales quantity** field, enter a number. This number represents the forecasted quantity for the item.
7. Click **Save**.

Modify the forecast in Excel

1. Click **Open** in Microsoft Office.
2. Click **Edit Demand forecast** in Excel. In Excel, you can add, delete and edit demand forecast lines. If you are not able to see the data in Excel, you need to sign in with the "Keep me signed in" option enabled and you need to trust the data connection app.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot master planning

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with master planning.

Bill of materials explosion behaves differently for firmed production orders and for estimated production orders for manually created work.

Issue description

When a production order is firmed, the items aren't exploded when you explode the bill of materials (BOM). However, when you manually create a work order and then estimate the production order, the items are exploded.

Issue resolution

The system is working as expected. The explosion that occurs when the production order is firmed will point to the planned order, but it doesn't appear that the planned order is currently firmed in this case. However, if the production order has been estimated, the explosion is triggered from the released production order where no planned order exists.

The Delay value isn't updated when I reschedule a planned order.

To update the delay for planned orders, open the **Rescheduling** dialog box for the planned order. On the **Explosion** FastTab, make sure that the **Perform explosion after rescheduling** option is set to *Yes*.

Production scheduling doesn't consider the safety margins that are set on the item coverage for pegged supply.

Issue description

Master planning considers the safety margins. However, the safety margins are ignored when planned production orders are scheduled.

Issue resolution

Margins are considered only during master planning, not during manual scheduling. Margins are designed to act as a buffer during the planning phase, to give some "margin" for the actual process.

To get the desired result, you can remove the margin. The route must then be updated so that it includes the desired time (for example, as queue time). Both master planning and manual scheduling should then produce the same result.

Planned orders are generated even though we have items in stock and production orders already exist for them.

You might be able to fix this issue by increasing the **Positive days** value for the relevant groups on the **Coverage group** page. This change will cause the system to determine whether on-hand inventory can be used for the demand. Then a new planned order won't be generated for the items that are in stock.

Master planning doesn't seem to respect capacity limitations and is

scheduling more than the available capacity.

Issue description

When you use operation scheduling where there is finite capacity, and where the route specifies a mix of requirements for both a resource group and individual resources, there is a small chance of overbooking because of the way that the algorithm validates for capacity conflicts. This overbooking can occur when you use helpers to run master planning. It's most likely to occur if there are many jobs that have a relatively short runtime.

Issue resolution

If it's essential that no overbooking occur for operation scheduling, you can make the scheduling part of master planning single-threaded by turning on the **Accurate finite capacity for Operation Scheduling** option on the **Master planning parameters** page. This option isn't available by default. You must manually add it to the page by using personalization features. When you use this option, scheduling will run more slowly because of the lack of parallel processing.

Planned orders take a long time to update.

Issue description

When updating the requirement quantity and/or delivery date on a planned order, it typically takes at least 30 seconds per order to save the update.

Issue resolution

This is a known issue with the built-in master planning engine. It is caused by the underlying auto explosion through the BOM structure during edits. This issue is addressed in Planning Optimization, where a planner can update and approve the relevant orders and, when desired, trigger a planning run to update planned orders for the underlying BOM structure.

One way to improve performance with the built-in master planning engine is to do the following:

1. Go to **Master planning > Setup > Plans > Master plans**.
2. Select a plan.
3. Expand the **Time fence in days** FastTab.
4. Set **Explosion** to *Yes*, and set the field below this setting to 0 (zero).

NOTE

This will limit the period for explosions performed for this master plan to a single day.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Mobile app home page

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes the **Finance and Operations (Dynamics 365)** mobile app and provides links to resources that can help you implement it in your organization.

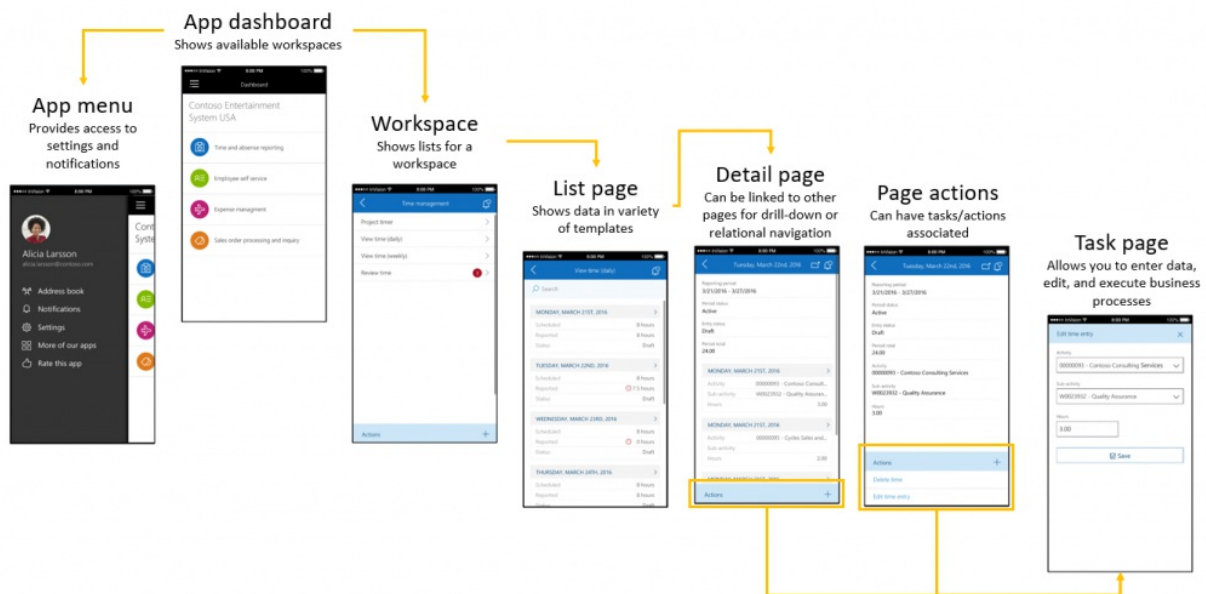

Overview

The mobile app enables your organization to make its business processes available on mobile devices. After your IT admin enables the mobile workspaces for your organization, users can sign in to the app and immediately begin to run business processes from their mobile devices. The mobile app includes the following features that can help increase productivity:

- Users can view, edit, and act on business data, even if they have intermittent network connectivity or their mobile devices are completely offline. When a device reestablishes a network connection, offline data operations are automatically synchronized.
- IT admins or developers can build and publish mobile workspaces that have been tailored to their organization. The app uses your existing code assets. Therefore, you don't have to re-implement your validation procedures, business logic, or security configuration.
- IT admins or developers can easily design mobile workspaces by using the point-and-click workspace designer that is included with the web client.
- IT admins or developers can optionally optimize the offline capabilities of workspaces by using the Business logic extensibility framework. Because data continues to be processed while a device is offline, your mobile scenarios remain rich and fluid, even if devices don't have constant network connectivity.

Elements of the mobile app

Navigation in the mobile app consists of four basic concepts: the dashboard, workspaces, pages, and actions.

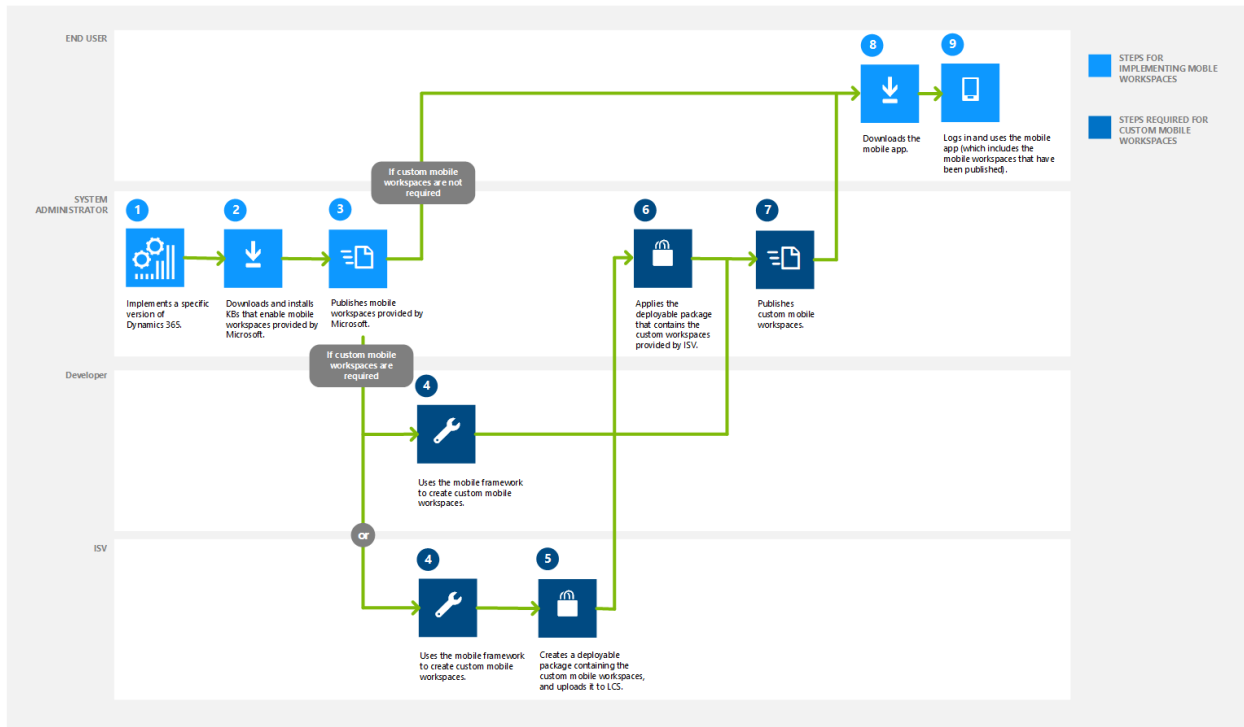

1. When you start the app, you go to the **dashboard**.
2. On the dashboard, you can see a list of **workspaces** that have been published.

3. In each workspace, you can see a list of **pages** that are available for that workspace.
4. After you're on a page, you can perform several actions. Here are some examples:
 - View detailed data.
 - Navigate to other pages for related data, such as entity details or lines.
 - See a list of actions that are available for that page. Actions let you create or edit existing data.

Implementation process

The following illustration shows the process for implementing both mobile workspaces that are provided by Microsoft and custom mobile workspaces.

The following table includes links to resources that can help you implement both mobile workspaces that are provided by Microsoft and custom mobile workspaces. The numbers in the first column correspond to the numbered steps in the previous illustration.

STEP	ROLE	ACTION	RESOURCES TO HELP YOU COMPLETE THE ACTION
1	System administrator	Implement the Finance and Operations app in your organization.	<ul style="list-style-type: none"> • If you haven't yet deployed a version of Microsoft Dynamics 365, see Deploy a demo environment. • To see a list of mobile workspaces that can be used, see Mobile workspaces recently released.

STEP	ROLE	ACTION	RESOURCES TO HELP YOU COMPLETE THE ACTION
2	System administrator	If you're using Microsoft Dynamics 365 for Operations version 1611: Download and install KBs that enable the mobile workspaces that are provided by Microsoft.	See the following topics for more information: <ul style="list-style-type: none"> • Cost controlling mobile workspace • Inventory on-hand mobile workspace • Sales orders mobile workspaces • Vendor collaboration mobile workspace • Project time entry mobile workspace • Expense management mobile workspace
3	System administrator	Publish the mobile workspaces that are provided by Microsoft.	Publish a mobile workspace
4	Developer or independent software vendor (ISV)	Use the mobile platform to create custom mobile workspaces.	Mobile platform
5	ISV	Create a deployable package that contains custom mobile workspaces, and upload the package to Microsoft Dynamics Lifecycle Services (LCS).	Create a deployable package
6	System administrator	Apply the deployable package that contains the custom workspaces that are provided by the independent software vendor (ISV).	Apply a deployable package
7	System administrator	Publish the custom mobile workspaces that are provided by the ISV.	Publish a mobile workspace
8	User	Download and install the mobile app.	Finance and Operations app for Android Finance and Operations app for iOS (Windows Phone unsupported)
9	User	Sign in, and use the mobile app. The app includes the mobile workspaces that have been published by the system administrator.	To see a list of mobile workspaces that are provided by Microsoft, see Mobile workspaces recently released .

Use the Asset management mobile workspace

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic provides information about the **Asset management** mobile workspace. This workspace lets users view and create maintenance requests and work orders. Users can also view the assigned work order jobs in a calendar or list view. Assets and functional locations can also be viewed and searched for.

Overview

Asset Management is an advanced module for managing assets and work order jobs in Dynamics 365 Supply Chain Management. The **Asset management** mobile workspace lets users quickly view assigned work order jobs on the mobile device of their choice. Users can also create and manage maintenance requests, update lifecycle state, and view asset and functional location details by using their mobile device.

Specifically, the **Asset management** mobile workspace lets users perform these tasks:

- Create, view, and edit maintenance requests, take a photo or attach an existing image to the maintenance request, change the maintenance request lifecycle state.
- Create, view, and edit work orders, take a photo or attach an existing image to the work order, change the work order lifecycle state, view work order jobs.
- View assigned work order jobs in a calendar view.
- Create, view, and edit work order job, update asset counters, view maintenance checklist, view and edit work order job notes, view the tools required for the work order job.
- View or search for a specific asset or functional location.

Prerequisites

Before you can use the **Asset management** mobile workspace, your admin must set up the required user and worker accounts, and publish the workspace. For more information, see [Set up the Asset management mobile workspace](#).

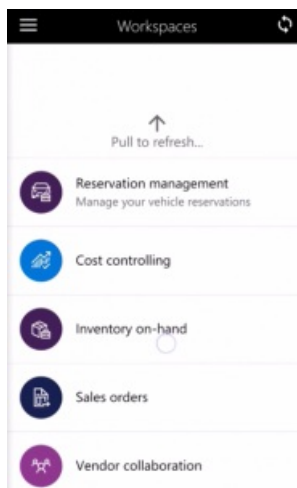

Download and install the mobile app

Download and install the Dynamics 365 for Unified Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

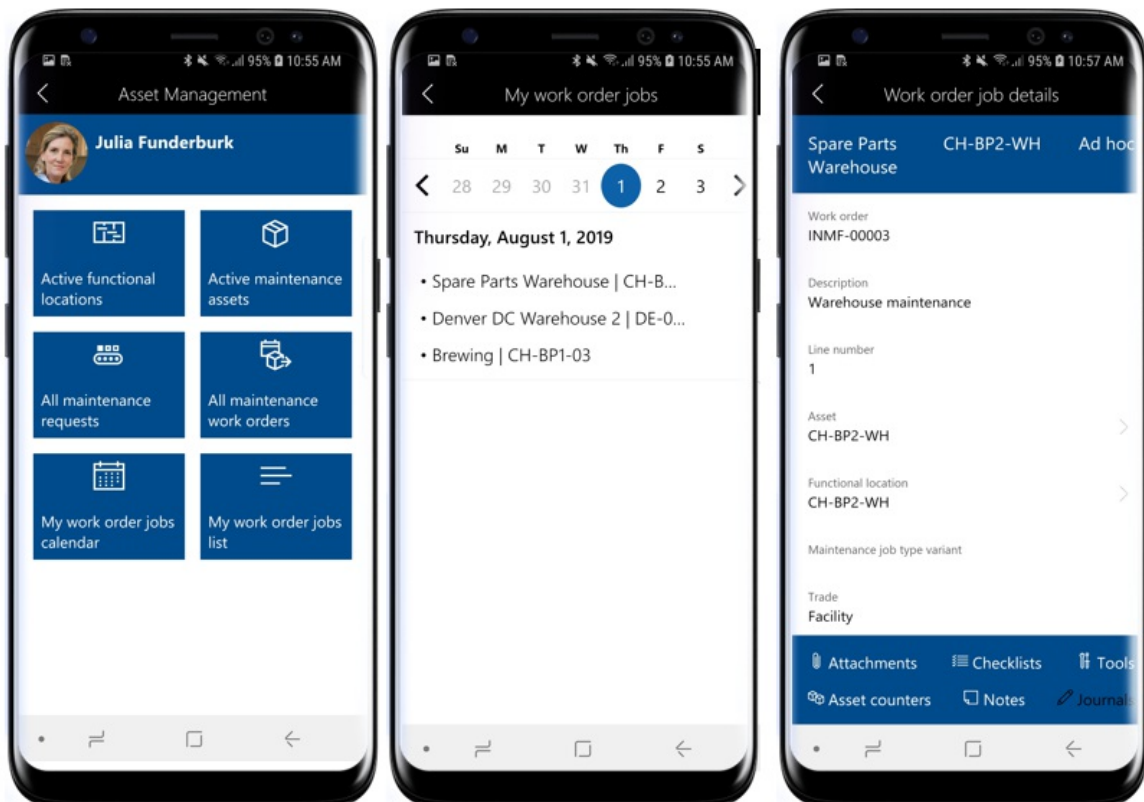

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you'll have to refresh the list of mobile workspaces.

View assigned work order jobs in calendar view

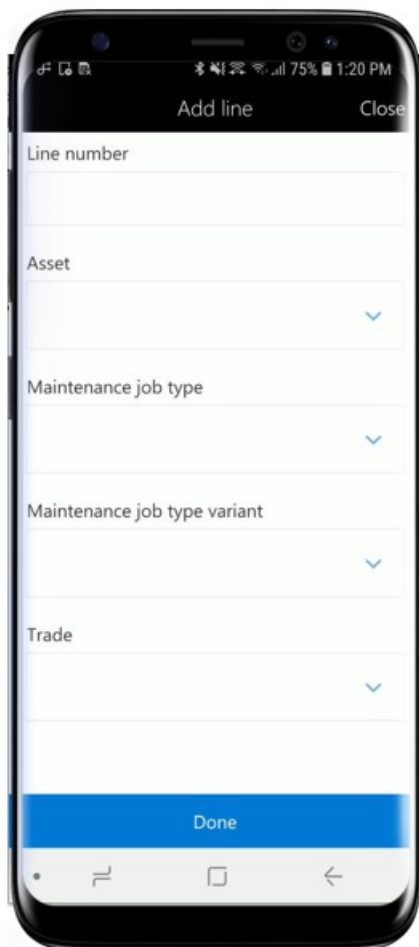

1. On your mobile device, open the **Asset management** workspace.
2. Select **My work order jobs calendar**.
3. Select the date you want to view work order jobs for. In the list, you'll see the asset ID and functional location ID for each work order job.
4. Select a work order job in the list to see job details: Asset and functional location details as well as other navigation links to view **Attachments**, **Checklists**, **Tools**, **Asset counters**, **Notes**, **Journals**.

Create a work order job

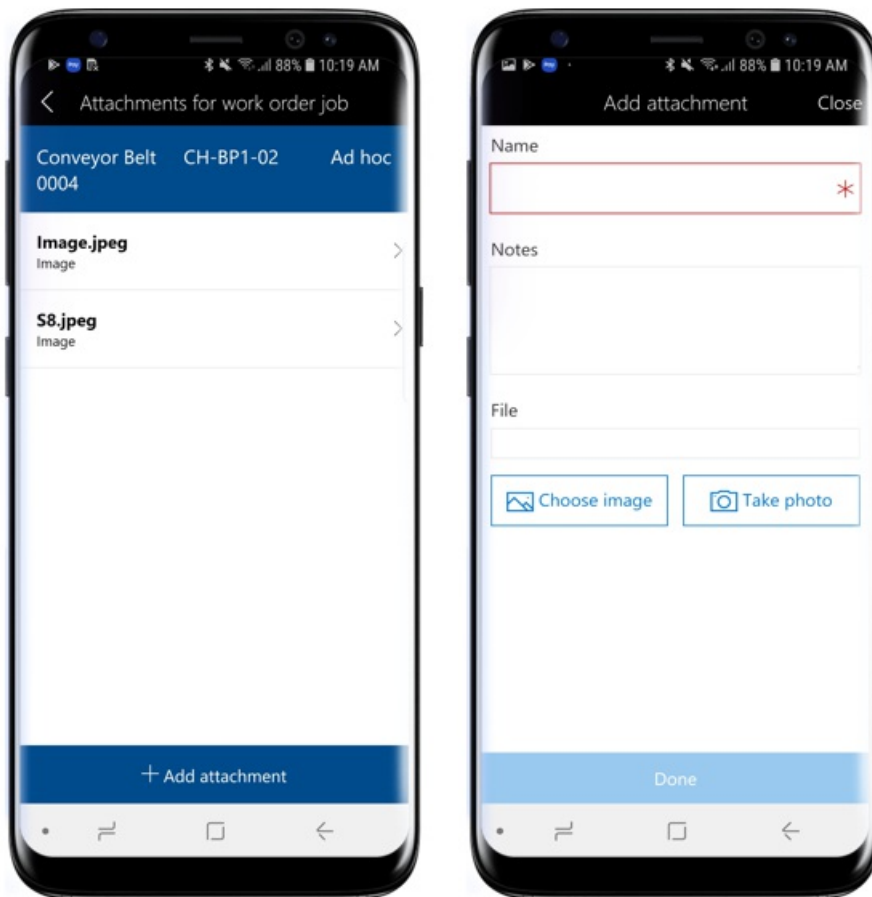

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order you want to create a new work order job for.

4. Select the **Add line** button.
5. Select the **Asset** you want to create a work order job for.
6. Select **Maintenance job type**, **Maintenance job type variant** and **Trade**.
7. Select **Done**.

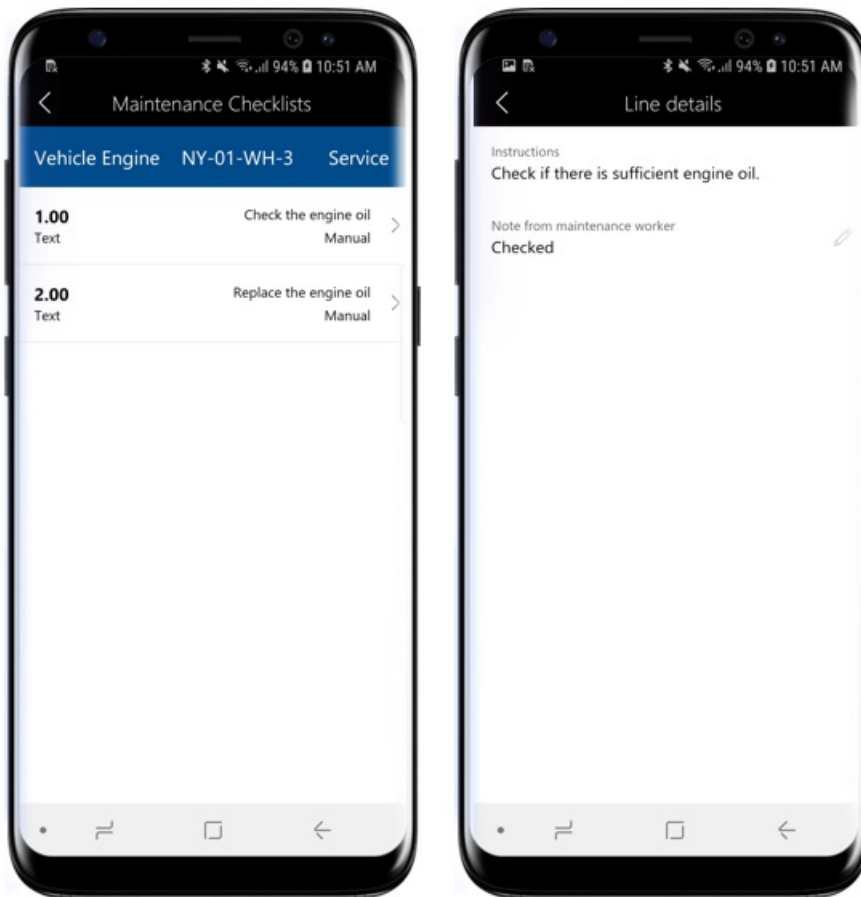

Add attachment to a work order job

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to add an attachment to.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **Work order job details** page.
4. Select **Attachments** on the **Work order job details** page.
5. You'll see existing attachments on the work order job. Select **Add attachment**.
6. Enter **Name** and **Notes** for the attachment.
7. Select **Choose image** to select a photo from the mobile gallery, or **Take photo** to take a photo.
8. Select **Done**.

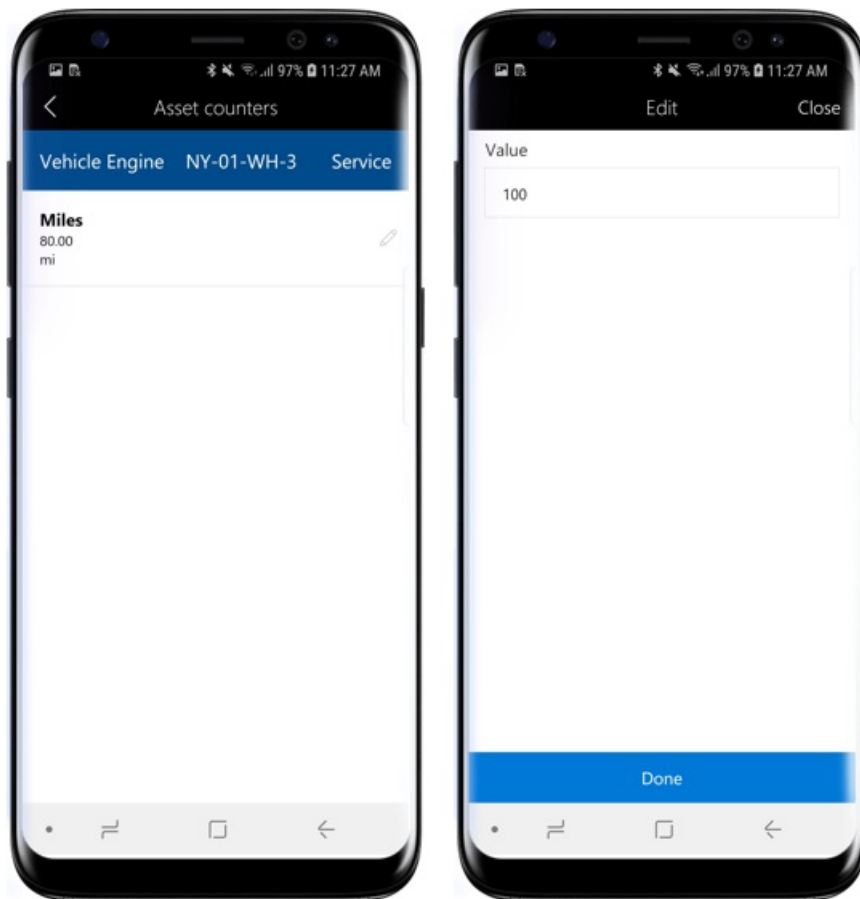

View maintenance checklist on a work order job

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to view checklists for.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.
4. Select **Checklists** on the **Work order job details** page.
5. You'll see a list of checklist lines related to the work order job. Select a checklist line to view **Instructions** and add **Notes**.
6. Select the back button (<) to return to the previous page.

View and update asset counters on a work order job

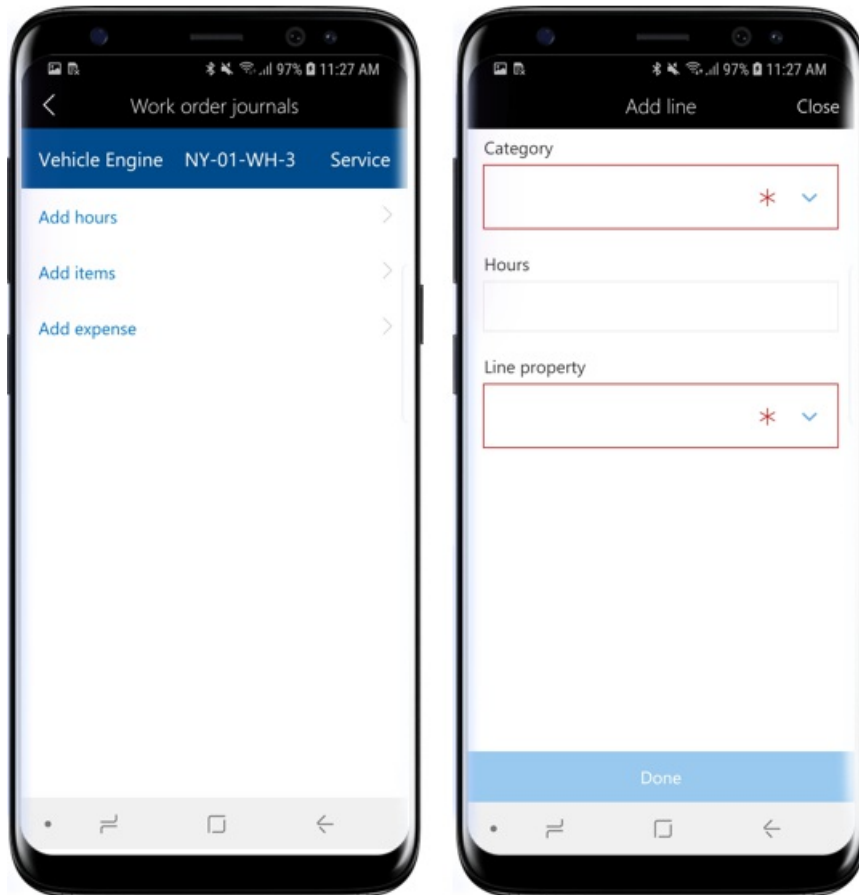

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to view asset counters for.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.
4. Select **Asset counters** on the **Work order job details** page.
5. You see a list of asset counters related to the work order job. Select the pencil icon on an asset counter line to update the counter value.
6. Enter a new counter value, and select **Done**.

Register consumption on a work order job

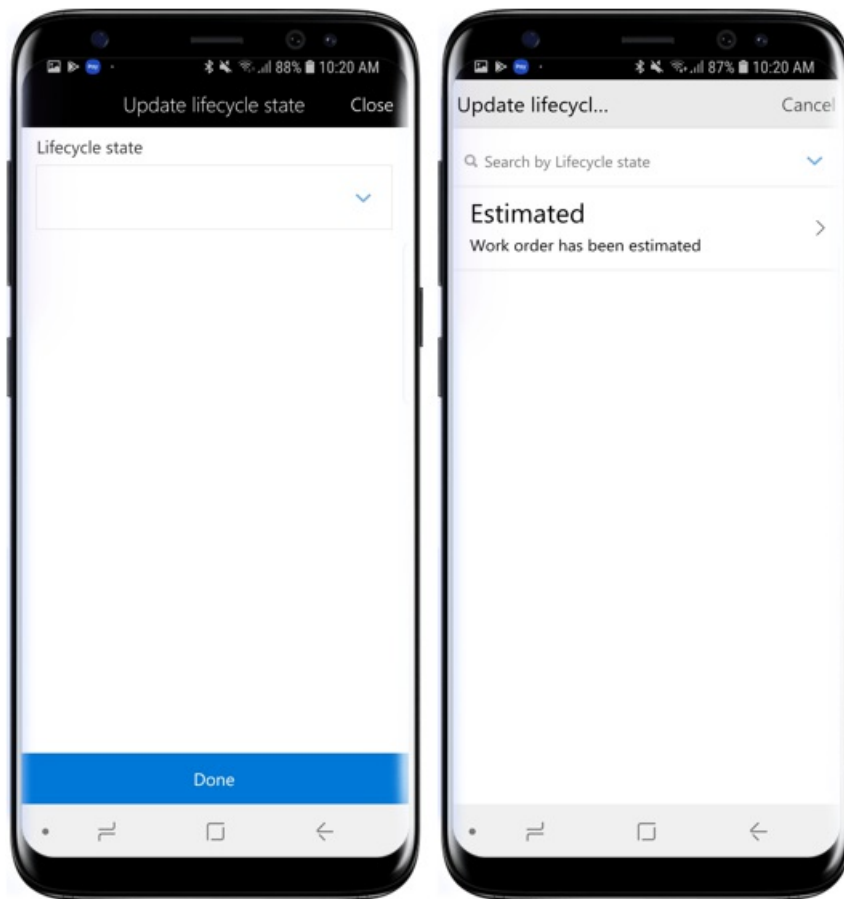

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to add consumption registrations for.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.
4. Select **Journals** on the **Work order job details** page.
5. Select **Add hours** to create work hour registrations.
 - a. Select the **Category** from the lookup.
 - b. In the **Hours** field, enter the number of work hours spent on the work order job.
 - c. Select the appropriate **Line property**.
 - d. Select **Done**.
6. Select **Add items** to create item registrations.
 - a. Select the **Item number** from the lookup.
 - b. Select the **Site** from the lookup.
 - c. Enter the **Quantity** of items consumed.
 - d. Select **Done**.
7. Select **Add expense** to create expense registrations.
 - a. Select the **Category** from the lookup.
 - b. Enter the quantity for the expense registration.
 - c. Select the **Sales currency** from the lookup.
 - d. Enter the **Cost price** for the expense registration.

e. Select Done.

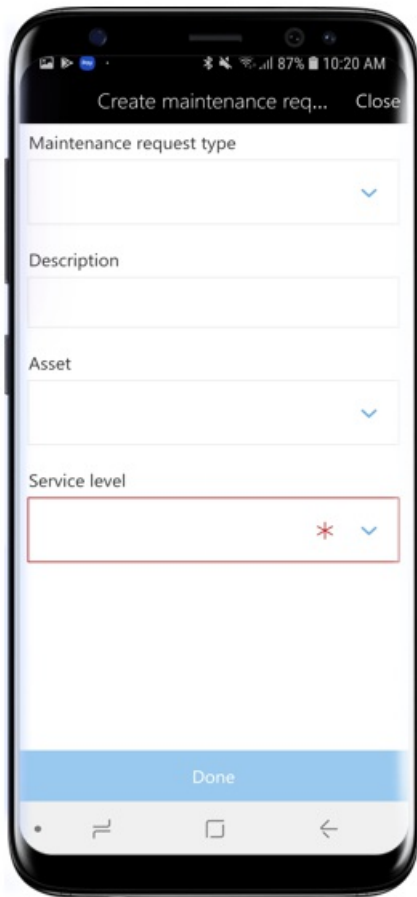

Update lifecycle state on a work order

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order you want to update lifecycle state for.
4. Select the **Update state** button at the bottom of the screen.
5. Select a new lifecycle state from the list.
6. Select **Done**.

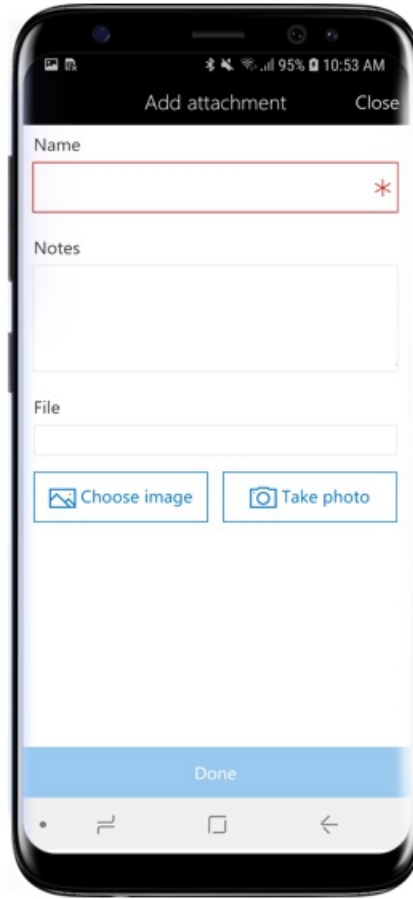

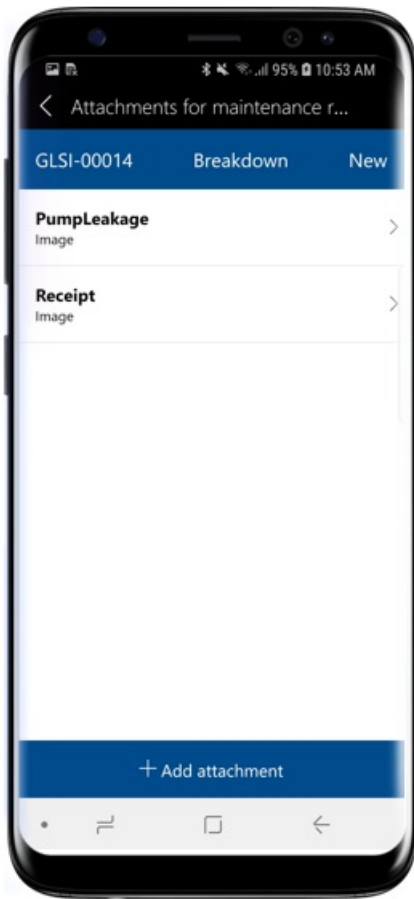

Create a maintenance request

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance requests**.
3. Select **Actions** at the bottom of the screen, and select **Create maintenance request**.
4. If number sequence is enabled for maintenance requests in **Asset management**, the **Maintenance request** field is hidden because it is automatically filled out. If the **Maintenance request** field is visible, enter a maintenance request ID.
5. Select a **Maintenance request type**.
6. Enter a **Description** for the maintenance request.
7. Select the **Asset** you want to create the request for.
8. Select the **Service level** for the maintenance request.
9. Select **Done**.

Add attachment to a maintenance request

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance requests**.
3. Select the maintenance request you want to add an attachment to.
4. Select **Attachments** at the bottom of the screen.
5. Select **Add attachments**.
6. Enter **Name** and **Notes** for the attachment.
7. Select **Choose image** to select a photo from the mobile gallery or **Take photo** to take a photo.
8. Select **Done**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Company directory mobile workspace

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides information about the **Company directory** mobile workspace. This workspace lets users view and contact other employees in their organization.

This mobile workspace can be used with the Finance and Operations mobile app.

Overview

The **Company directory** mobile workspace lets users perform these tasks:

- View a list of employees in the organization.
- Search for employees in the organization.
- View contact information for employees.
- Contact employees from the profile information.

Prerequisites

Before you can use this mobile workspace, the following prerequisites must be met.

PREREQUISITE	ROLE	DESCRIPTION
One of the following products must be deployed in your organization: <ul style="list-style-type: none">• A Finance and Operations app• Microsoft Dynamics 365 Human Resources	System administrator	If you don't already have a Finance and Operations app deployed in your organization, see Deploy a demo environment . If you don't already have Human Resources deployed in your organization, the system administrator can access a trial version from the Human Resources webpage .
The Company directory mobile workspace must be published.	System administrator	See Publish a mobile workspace .

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View the company directory by using the mobile workspace

1. In the mobile app, select the **Company directory** workspace. A list of employees is shown.
2. Select an employee. The **Employee profile** page appears. The information on this page includes the employee's first name, last name, title, and department.

Search the company directory by using the mobile workspace

1. In the mobile app, select the **Company directory** workspace.
2. In the **Search** field, enter an employee's first name, last name, title, or department to start the search.
3. Select an employee. The **Employee profile** page appears. The information on this page includes the employee's first name, last name, title, and department.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost controlling mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Cost controlling** mobile workspace. This workspace lets cost center managers view information about cost center performance anytime and anywhere.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Cost controlling** mobile workspace provides an instant view of the current performance of cost centers by comparing actual costs against the budgeted costs. You can drill down to the status of individual cost elements.

For example, an employee receives an invitation to an international conference, but the organization must cover all the travel expenses. The employee asks their manager whether they can attend the conference. The manager opens the **Cost controlling** mobile workspace on their mobile device to see whether there is budget for the employee to attend the conference.

Data security

The data in the **Cost controlling** mobile workspace is secured through user credentials. Cost center managers are allowed to see data only for their own cost center. The access-level security is managed in the **Cost accounting** module.

Cost accountants define the configuration of the **Cost controlling** mobile workspace in the **Cost accounting** module. After the workspace is published to the mobile app, it's available in the app. Therefore, all cost center managers in the organization can view data in the same format.

Actions, views, and links

The **Cost controlling** mobile workspace provides the following actions, views, and links:

- **Actions:**
 - Use **Select configuration** to select a layout.
 - Use **Select cost object** to select the cost centers to filter data on.

NOTE

The cost centers that appear in the list depend on the access that is granted in the **Cost accounting** module.

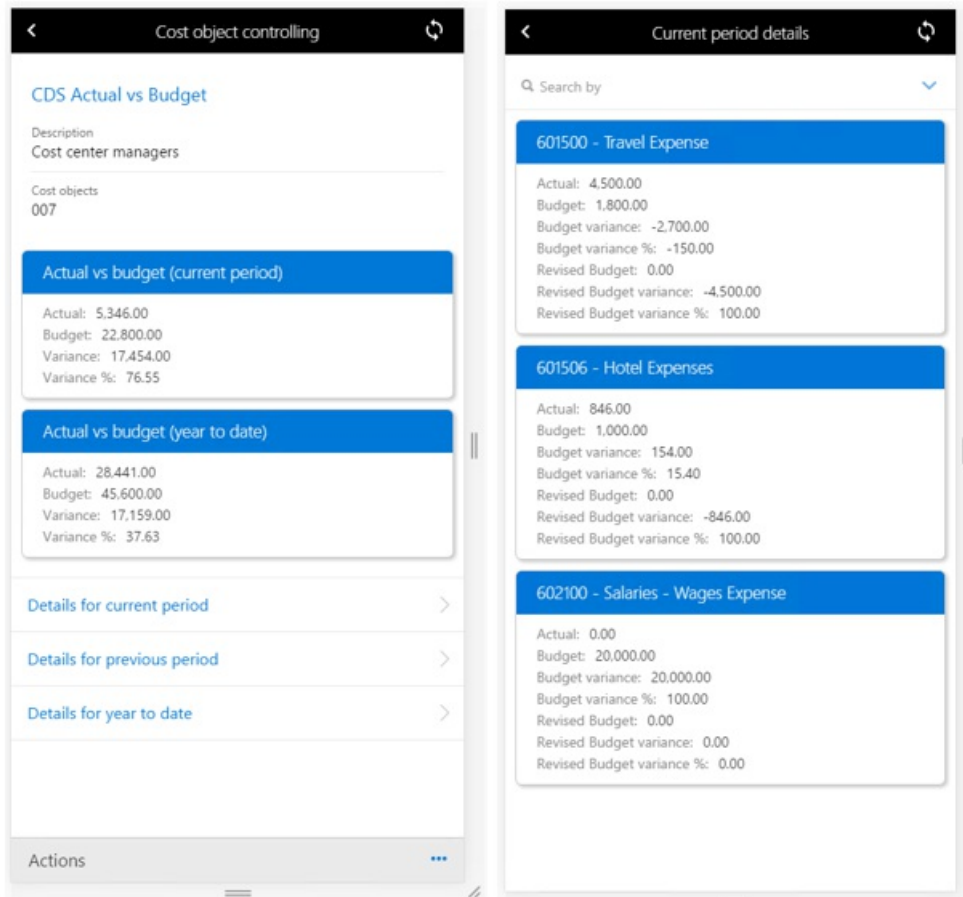

- **Views:** Based on the actions that are selected and the configuration in the **Cost accounting** module, you can view the following information on the cards:
 - Actual vs budget (current period)
 - Actual vs revised budget (current period)
 - Actual vs budget (previous period)
 - Actual vs revised budget (previous period)
 - Actual vs budget (year to date)
 - Actual vs revised budget (year to date)

The following amounts are shown on every card: Actual, Budget, Variance, and Variance %.

- **Links:**

- Details for current period
- Details for previous period
- Details for year to date

When you select a link, a card is shown for each cost element. The following amounts are shown on every card: Actual, Budget, Budget variance, Budget variance %, Revised budget, Revised budget variance, and Revised budget variance %.

Prerequisites

The prerequisites differ, based on the version of Microsoft Dynamics 365 that has been deployed for your organization.

Prerequisites if you use Microsoft Dynamics 365 Finance

If Finance has been deployed for your organization, the system administrator must publish the **Cost controlling** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use version 1611 with Platform update 3 or later

If version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
--------------	------	-------------

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Cost controlling mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none"> 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS). 2. Install the metadata hotfix. 3. Create a deployable package that contains the SCMMobile model, and then upload the deployable package to LCS. 4. Apply the deployable package.
Publish the Cost controlling mobile workspace.	System administrator	See Publish a mobile workspace .

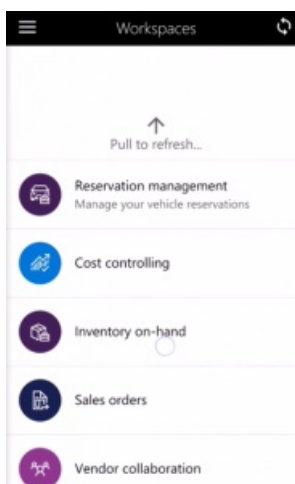

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View the performance of your cost center by using the Cost controlling mobile workspace

1. On your mobile device, select the **Cost controlling** workspace.

2. Select **Cost object controlling**.
3. Select **Actions**.
4. Select **Select configuration** to select a cost controlling layout.
5. Select **Done**.
6. Select **Actions**.
7. Select **Select cost object** to select the cost centers that you've been granted access to.
8. Select **Done**.
9. View the overall performance of your cost center.
10. Select the **Details for current period** link.
11. View the performance of individual cost elements.
12. You can also search for specific cost elements.

Inventory on-hand mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Inventory on-hand** mobile workspace. This workspace helps you gain insights into reserved and available inventory anytime and anywhere.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

Typically, companies have multiple shipments and multiple receipts of inventory every day. These movements constantly change the on-hand inventory status. The **Inventory on-hand** mobile workspace lets you see the cross-company on-hand inventory status, so that you can gain the latest insights into inventory data on the mobile device of your choice. Regardless of whether you work in the warehouse, purchasing, sales, manufacturing, or management, or have other roles, you can access on-hand inventory data anytime and anywhere.

The mobile workspace provides an instant view of the on-hand status across facilities. It lets you view on-hand inventory across facilities, current material reservations, and unreserved on-hand inventory. You can also enter item numbers to query on-hand inventory, and can do a filtered search for on-hand products or variants.

Specifically, the mobile workspace provides these features:

- You can search by product number or product name to find products to view the on-hand inventory status for.
- For the selected products, you can view the following information:
 - On-hand inventory per site
 - On-hand inventory per warehouse
 - On-hand inventory per location
 - On-hand inventory per batch (for batch-controlled products)
 - On-hand inventory per inventory status
- Product on-hand inventory is shown in the following ways:
 - By physical inventory (This view represents the total amount.)
 - By physical reserved (This view represents the reserved amount.)
 - By available physical (This view represents available amount that has no reservations.)

Prerequisites

The prerequisites differ, based on the version of Supply Chain Management that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Inventory on-hand** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Platform update 3 or later

If Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Inventory on-hand mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none"> 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS). 2. Install the metadata hotfix. 3. Create a deployable package that contains the SCMMobile model, and then upload the deployable package to LCS. 4. Apply the deployable package.
Publish the Inventory on-hand mobile workspace.	System administrator	See Publish a mobile workspace .

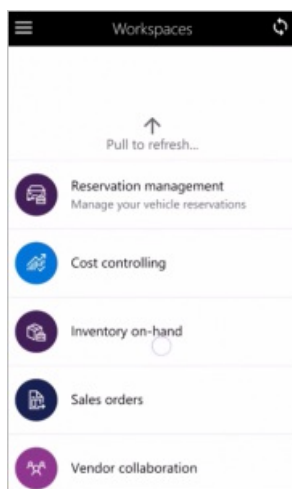

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View the on-hand inventory for a product by using the Inventory on-hand mobile workspace

1. On your mobile device, select the **Inventory on-hand** workspace.
2. Select **Check on-hand for an item**. You see a list of the products that are loaded into your app for offline use. By default, 50 items are loaded, but a developer can change this number. For more information, developers should see [Mobile platform](#).
3. If your item isn't in the list, select **Search more**. Search by product number, or switch to a search by product name.
4. Select a product. If the item has an image, the image is shown.
5. Select one of the following options to view the status of on-hand inventory:
 - View on-hand per site
 - View on-hand per warehouse
 - View on-hand per location
 - View on-hand per batch (for batch-controlled products)
 - View on-hand per inventory status

Product on-hand inventory is shown in the following ways:

- By physical inventory (This view represents the total amount.)
- By physical reserved (This view represents the reserved amount.)
- By available physical (This view represents the available amount that has no reservations.)

Invoice approvals mobile workspace

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides information about the **Invoice approvals** mobile workspace. This workspace provides a list of invoices that have been assigned to you through the vendor invoice header workflow process.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Invoice approvals** mobile workspace lets Accounts payable clerks and managers view invoices that have been assigned to them as part of the vendor invoice header workflow process. You can view the invoice information, and even the line and distribution details, to help you make informed approval decisions. From the workspace, you can take action to move the invoice through the workflow process.

Prerequisites

Before you can use this mobile workspace, the following prerequisites must be met.

PREREQUISITE	ROLE	DESCRIPTION
Microsoft Dynamics 365 Finance must be deployed in your organization.	System administrator	See Deploy a demo environment .
The Invoice approvals mobile workspace must be published.	System administrator	See Publish a mobile workspace .

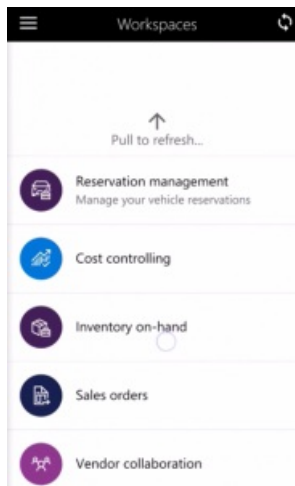

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

Approve invoices by using the Invoice approvals mobile workspace

1. On your mobile device, select the **Invoice approvals** workspace.
2. Select the invoice that has been assigned to you by the vendor invoice header workflow process.
3. On the **Invoice details** page, review the invoice header information, such as the vendor and date information.
4. Select a line on the invoice to view more detailed information about it in the **Invoice line details** view.
5. In the **Invoice line details** view, select **Distributions** to show the line distributions. Here, you can view the accounting for the invoice line. The information that is shown includes the financial dimensions and the main account.
6. On the **Invoice details** page, select **Distributions** to show all distributions. Here, you can view the accounting for the whole invoice. The information that is shown includes the financial dimensions and the main accounts.
7. Select **Attachments** to view any notes or files that are attached to the invoice.
8. On the **Invoice details** page, select the appropriate workflow action to complete your review process.
9. Select **Done**.

My team mobile workspace

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides information about the **My team** mobile workspace. This workspace lets managers view their direct reports and extended staff. They can also send praise to individuals in their reporting chain.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **My team** mobile workspace lets managers perform these tasks:

- View a list of the manager's direct reports.
- View a list of the manager's extended reporting team.
- View detailed information for each team member, such as birth date, seniority date, years of service, and compensation and performance information.
- Send praise to any individual in the manager's extended reporting team.

Prerequisites

Before you can use this mobile workspace, the following prerequisites must be met.

PREREQUISITE	ROLE	DESCRIPTION
One of the following products must be deployed in your organization: <ul style="list-style-type: none">• A Finance and Operations app• Microsoft Dynamics 365 Human Resources	System administrator	If you don't already have a Finance and Operations app deployed in your organization, see Deploy a demo environment . If you don't already have Human Resources deployed in your organization, the system administrator can access a trial version from the Human Resources webpage .
The My team mobile workspace must be published.	System administrator	See Publish a mobile workspace .

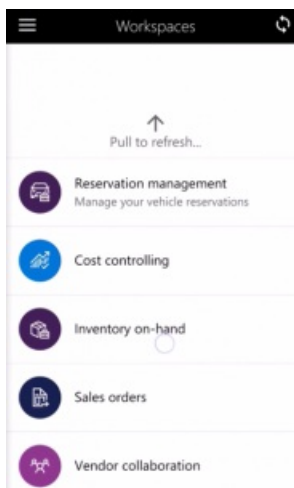

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View team members by using the My team mobile workspace

1. In the mobile app, select the **My team** workspace. A list of team members is shown. The list also shows each team member's title, and any direct reports that the member has.
2. Select a team member. The **Team member summary** page appears. The information on this page includes the team member's birth date, seniority date, years of service, years in the current position, and compensation information.

View extended team members by using the My team mobile workspace

1. In the mobile app, select the **My team** workspace. A list of team members is shown. The list also shows each team member's title, and any direct reports that the member has.
2. Select the **Direct reports** link. A list of your extended team is shown.
3. Select a team member. The **Team member summary** page appears. The information on this page includes the team member's birth date, seniority date, years of service, years in the current position, and compensation information.

Send praise about team members by using the My team mobile workspace

1. In the mobile app, select the **My team** workspace. A list of team members is shown. The list also shows each team member's title, and any direct reports that the member has.
2. Select a team member. The **Team member summary** page appears.
3. Select **Send praise**.
4. Enter the text of the praise that you want to send.
5. Select **Done**.

Purchase order approval mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Purchase order approval** mobile workspace. This workspace lets you view purchase orders and respond to them through actions. For example, you can approve or reject a purchase order.

Overview

Purchase orders that requires approval go through an approval workflow. The workflow can include various steps that require that one or more people take action. For example, a person might have to complete a task or approve the purchase order.

The **Purchase order approval** mobile workspace lets you easily view and respond to purchase orders from your mobile device. This workspace also lets you take the same workflow actions that you can take from the web client.

Prerequisites

The prerequisites vary, depending on the version of Supply Chain Management that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Purchase order approval** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4017918.	System administrator	KB 4017918 is an X++ update or metadata hotfix that contains the Purchase order approval mobile workspace. To implement KB 4017918, your system administrator must follow these steps. <ol style="list-style-type: none">1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS).2. Install the metadata hotfix.3. Create a deployable package that contains the SCM Mobile model, and then upload the deployable package to LCS.4. Apply the deployable package.
Publish the Purchase order approval mobile workspace.	System administrator	See Publish a mobile workspace .

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View orders that are assigned to you

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take action in the purchase order approval workflow.
3. Select an order. On the **Order details** page, you will see the order header information and lines. You can also find guidelines from the workflow task.
4. Select **Accounting distributions** to open the **Header accounting distributions** page.
5. Return to the **Order details** page, and select a line. From the order line details, you can also explore the line-specific accounting distributions.

Complete an action on the purchase order

After you've viewed the purchase order that is assigned to you and read the workflow instructions, you should be ready to take action.

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take

action in the purchase order approval workflow.

3. Select an order, and view the details page.
4. Select **Actions** to show the available actions. The actions that are available depend on the task that has been assigned to you.

TASK ACTION	APPROVAL ACTION
Complete	Approve
Return	Reject
Request change	Request change
Delegate	Delegate

5. Select the appropriate action.
6. On the **Complete task** page, enter a comment. Note that if you select the **Delegate** action, you must select a user to delegate the task to.
7. Select **Done**. After you refresh your workspace, the purchase order will no longer be in your list.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Sales orders mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Sales orders** mobile workspace. This workspace helps you stay up to date about your sales orders anywhere and anytime.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Sales orders** mobile workspace lets you view detailed information about each sales order. This information includes the status of the order, contact information for the customer, and contact information for the order taker. The **Sales orders** mobile workspace provides an instant view of sales orders. You can view all sales orders, view sales orders by customer, or view information about a specific sales order.

The mobile workspace provides two views to help you analyze sale orders in depth.

View all sales orders

This view lists all sales orders.

- Use one of the following filters to select the sales orders to view:
 - Search by sales order
 - Search by customer account
 - Search by customer name
 - Search by status
 - Search by release status
 - Search by created date and time
- After you select sales orders, you can view the details of specific orders. Specifically, you can view the following information:
 - Customer name and address information
 - Various dates for the sales order, such as the requested ship date and the confirmed ship date
 - Contact information for the order taker
 - Customer contact information
 - Order lines
 - Shipments that show how and when a sales order was shipped

View orders for a customer

This view lists sales orders by customer.

- Use one of the following filters to view orders for a customer:
 - Search by name
 - Search by account
- After you select a customer, you can view the following information:
 - Customer name and group
 - Customer contact information
 - Customer sales orders and details about those sales orders:

- Customer name and address information
- Various sales order dates
- Contact information for the order taker
- Customer contact information
- Order lines
- Shipments that show how and when a sales order was shipped

Prerequisites

The prerequisites differ, based on the version of Microsoft Dynamics 365 that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Sales orders** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Dynamics 365 for Operations version 1611 with platform update 3 or later

If Dynamics 365 for Operations version 1611 with platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Sales orders mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none"> 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS). 2. Install the metadata hotfix. 3. Create a deployable package that contains the SCM Mobile model, and then upload the deployable package to LCS. 4. Apply the deployable package.
Publish the Sales orders mobile workspace.	System administrator	See Publish a mobile workspace .

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company is shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View information about sales orders for a customer by using the Sales order mobile workspace

1. On your mobile device, select the **Sales orders** workspace.
2. Select **View orders for a customer**.
3. Use account or customer name information to find the customer.
4. Select the customer.
5. Select **Contact information** or **Sales orders**. If you select **Sales orders**, a list of sales orders for the customer is shown.
6. Select **Sales order**. You can now view information about sales order lines, information about shipments, customer contact information, and contact information for the order taker.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor collaboration mobile workspace

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic provides information about the **Vendor collaboration** mobile workspace. This workspace helps your vendors stay up to date about the purchase orders that have been sent to them for approval. They can also view information about new and updated purchase orders and contacts.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Vendor collaboration** mobile workspace keeps vendors informed about new purchase orders, so that they can view purchase orders and then respond to them in the web client.

NOTE

The mobile workspace should be used as a supplement to the vendor collaboration web interface, not a replacement for it.

Your vendors can use the **Vendor collaboration** mobile workspace to view new purchase orders that are sent to them for approval. It shows purchase order information, such as products, quantities, and requested delivery dates. Price information is also available, depending on the configuration of each vendor.

A user who signs in as a vendor will see which purchase orders have been responded to, and which purchase orders are still awaiting customer action. For example, a purchase order might be awaiting customer action because the vendor suggested another delivery date, but the customer hasn't yet agreed to that date. The vendor will also see a list of purchase orders that have been confirmed but haven't yet been delivered.

To respond to a purchase order, the vendor must use the vendor collaboration web interface that is available in the web client. There, the vendor can also get more information about the order, such as document attachments, the delivery address per line, and charges that are associated with the vendor.

Vendors that have a special security role can see which contact persons are registered for a vendor account. The same security role lets a vendor view the status of any user request that has been submitted.

The vendor collaboration web interface in the web client must be used to create new contacts and submit new user requests.

The **Vendor collaboration** mobile workspace lets a vendor perform these tasks:

- View new purchase orders that are sent to the vendor.
- View purchase orders that the vendor has responded to, and that are awaiting customer action.
- View purchase orders that have been confirmed but haven't yet been fully received.
- View contact person information that is registered for the vendor account. (This task requires an additional security role.)
- View information about a user request that was submitted by the vendor, and follow the status of the request. (This task requires an additional security role.)

Prerequisites

The prerequisites vary, depending on the version of Microsoft Dynamics 365 that has been deployed for your

organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Vendor collaboration** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
KB 3216943 must be implemented if you're using Platform update 3.	System administrator	KB 3216943 is a binary update that is required if you're using Platform update 3. To implement this KB, the system administrator must follow these steps. <ol style="list-style-type: none">1. Download KB 3216943 from Microsoft Dynamics Lifecycle Services (LCS).2. Install the binary update, which is delivered as a deployable package. For information about how to apply a deployable package, see Apply a deployable package.
KB 4013633 must be implemented.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Inventory on-hand mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none">1. Download the metadata hotfix from LCS.2. Install the metadata hotfix.3. Create a deployable package that contains the SCM Mobile model, and then upload the deployable package to LCS.4. Apply the deployable package.
The Vendor collaboration mobile workspace must be published.	System administrator	See Publish a mobile workspace .
The vendor user must have access to the vendor collaboration web interface in the web client and must set up a vendor collaboration user.	Purchasing professionals and the system administrator	Follow the steps in the following topics to set up and work with the vendor collaboration web interface. <ul style="list-style-type: none">• Use vendor collaboration to work with external vendors• Manage vendor collaboration users• Set up and maintain vendor collaboration• Use vendor collaboration to work with customers in Supply Chain Managements

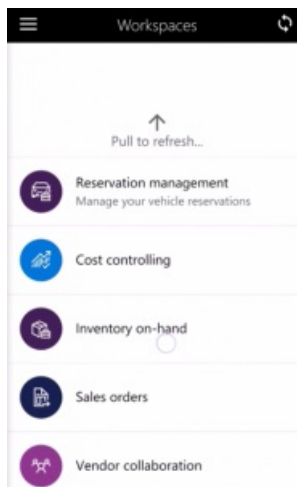

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

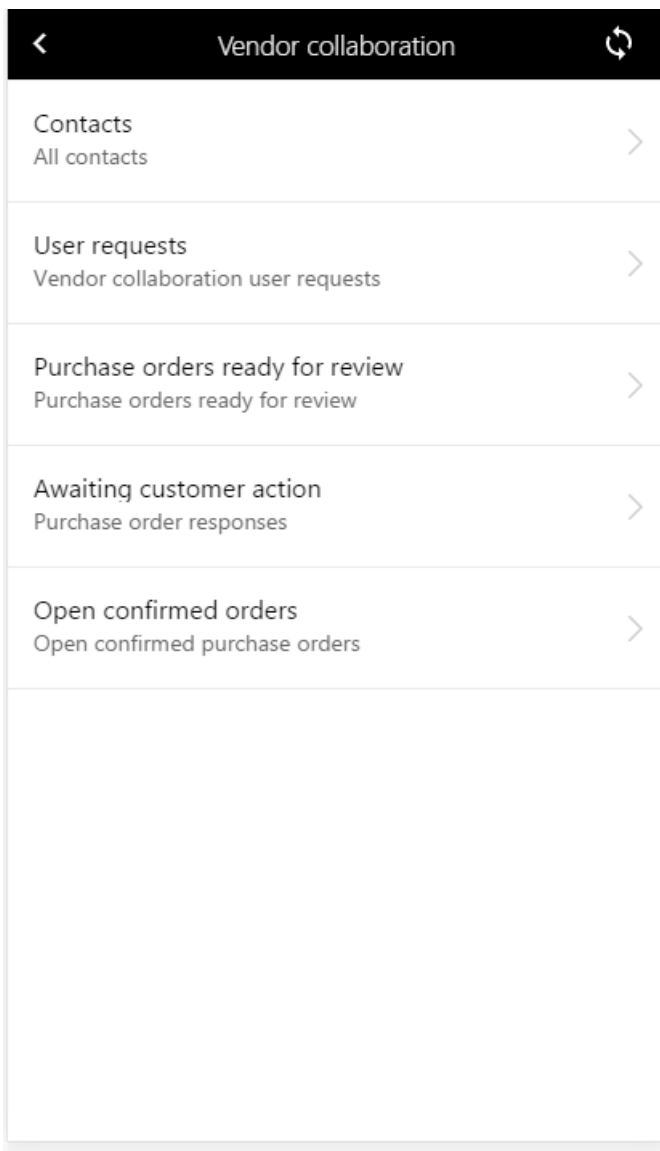

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

Use the Vendor collaboration mobile workspace

When you select the **Vendor collaboration** workspace, you'll see the following options.

The **Vendor collaboration** workspace includes the following pages.

Contacts

The **Contacts** page lets you see all the contacts that have been set up for the vendor account. It shows the contact person's name, primary email address, and user alias, if the contact person has an alias. This page also shows whether the contact person's user account is active. When you select a contact, you see contact details, such as the legal entities that the person is a contact for. You also see contact information, such as a telephone number or an alternative email address.

User requests

The **User requests** page lets you see all the user requests that you've submitted via the vendor collaboration web interface. You can also follow the status of those requests. When you select a user request, you can see what was requested, add or inactivate a user, change security, and see which security roles were requested for the user.

Purchase orders ready for review

The **Purchase orders ready for review** page lets you see all the purchase orders that the customer has sent, but that haven't yet been responded to. You can view selected information about the order, such as which products were requested and when those products should be delivered. Price information is also available, depending on the configuration of the vendor.

You can also see whether the purchase order has notes or attachments. However, to open notes and attachments, you must use vendor collaboration web interface in the web client. Select **Purchase order line** to see all the lines together with their details. For each line, an indicator will show whether there are notes or

attachments, or whether the delivery address differs from the delivery address that is shown on the header.

To respond to the purchase order, you must use the vendor collaboration web interface in the web client.

Awaiting customer action

The **Awaiting customer action** page lets you find purchase orders that you or another person in your company who has access to vendor collaboration has responded to. The purchase orders are visible in this list only if the customer must take one of the following actions on the purchase order:

- If the purchase order was rejected, the customer must either update or cancel the original order, and then send it again. When the purchase order is sent again, it no longer appears on the **Awaiting customer action** page.
- If the purchase order was accepted with changes, the customer must either update the original order and then send it again for review, or update the order per the requested changes and then confirm it immediately. In both cases, the purchase order no longer appears on the **Awaiting customer action** page.
- If the purchase order was accepted but still appears on the **Awaiting customer action** page, the purchase order wasn't automatically confirmed when it was accepted. It's now waiting for a purchasing agent to change the order status to **Confirmed**. Typically, a purchase order is considered an agreement between the customer and the vendor as soon as the vendor accepts the order. Therefore, the update to **Confirmed** status is usually just a formality.

When you select a purchase order, additional details appear about the response. You can see the line details and response for every line. The line status shows which of the following responses has been given:

- Accepted
- Rejected
- Accepted with changes
- Substituted/Substitute
- Split into schedule/Schedule line

Note that the **Delivering** field is set to either **Yes** or **No** to indicate whether the lines will be delivered. A line might not be delivered because for the following reasons:

- The line was rejected.
- A substitution was made, and the original line isn't expected to be delivered as requested in the received order.
- The line was split into multiple schedule lines, and the original line isn't expected to be delivered as requested in the received order.

Any changes that have been made to the order line response are shown. However, uploaded notes and attachments aren't shown. To view notes and attachments, you must use the vendor collaboration web interface in the web client.

Open confirmed orders

When the purchase order is confirmed by the customer (that is, the status of the purchase order is changed to **Confirmed**), it appears in the open confirmed order. It will remain in the list until it's registered as received by the customer.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Publish mobile workspaces

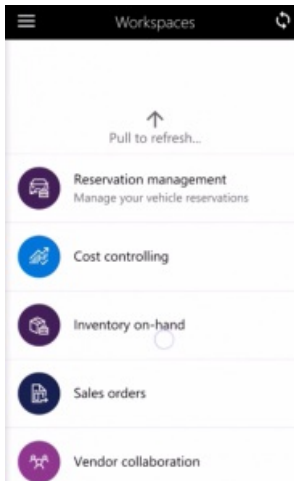

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the steps that system administrators must follow to publish a mobile workspace. A mobile workspace must be published so that users can access it in the mobile app.

Publish a mobile workspace

1. In your browser, start your web client.
2. Click **Settings** > **Mobile app**.
3. Select the mobile workspace to publish.
4. Click **Publish**.

After a new workspace is published, users must pull to refresh the list of mobile workspaces.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Office integration overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

Applies to these Dynamics 365 apps:

Commerce, Finance, Supply Chain Management

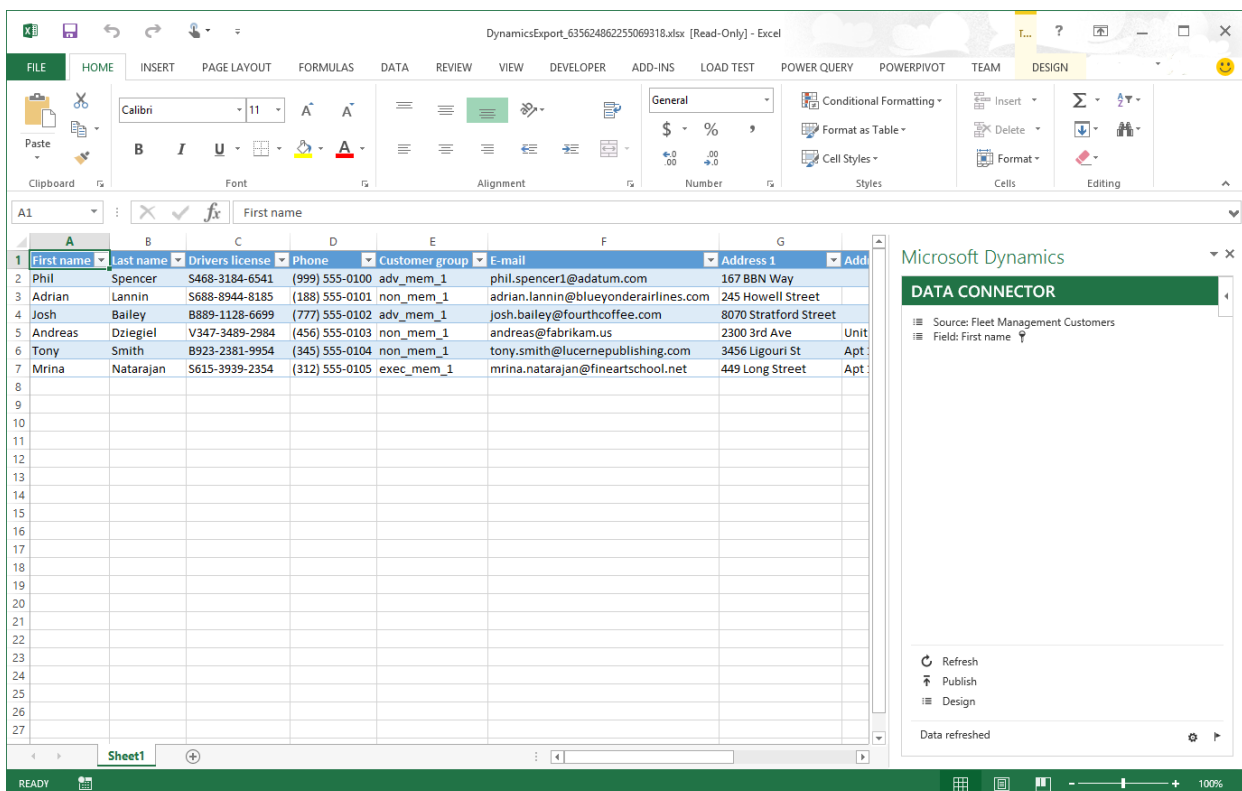

This topic reviews Microsoft Office integration concepts and features. The integration depends on several technologies:

- Working in Microsoft Azure
- Working with Azure Active Directory (Azure AD)
- Running a web client in multiple browsers

The Microsoft Office integration capabilities provide users with a productive environment that helps them get the job done by using Office products.

Excel Data Connector add-in

Microsoft Excel can change and quickly analyze data. The Excel Data Connector app interacts with Excel workbooks and OData services that are created for publicly exposed data entities. The Excel Data Connector add-in enables Excel to become a seamless part of the user experience. The Excel Data Connector add-in is built by using the Office Web add-ins framework. The add-in runs in a task pane. Office Web Add-ins are web applications that run inside an embedded Internet Explorer browser window.

1	First name	Last name	Drivers license	Phone	Customer group	E-mail	Address 1	Add.

Dynamics AX 2012 architecture vs. Finance and Operations architecture

There are several differences between versions. For both, we built lightweight add-ins that run in Excel and use services to connect to the application.

Dynamics AX 2012

Excel > VSTO (.NET) Add-in > Windows Communication foundation (WCF) > Authentication through Active

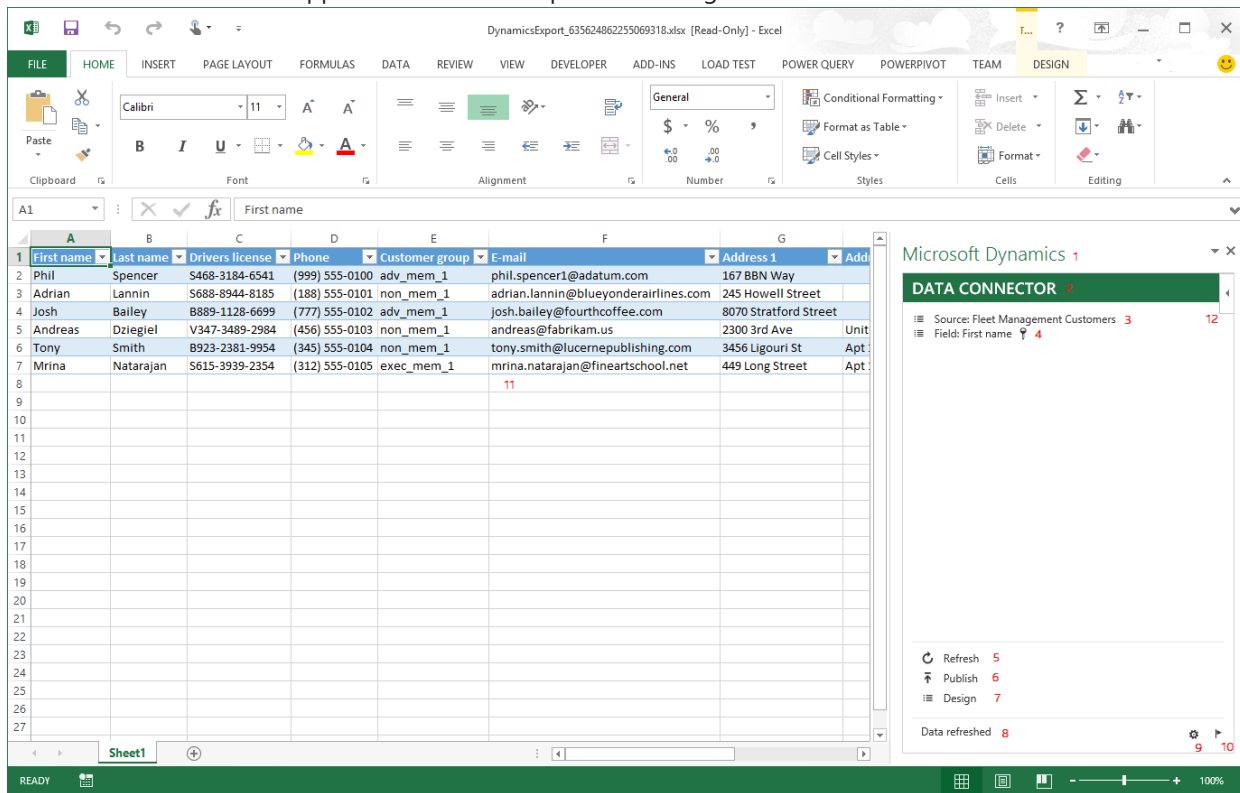

Directory (AD) > AIF SOAP services on the AOS > AX Services and Tables > AX query engine > Database

Finance and Operations

Excel > Office Web Add-in (JS + HTML) > JavaScript OData API (Olingo) > Authentication through Azure Active Directory (AAD) > AX OData services on the AOS > AX Entities > AX LINQ provider > AX Database

Office Add-in explained

The Excel Data Connector app is located in a task pane on the right side of a workbook.

The following table describes the parts of the add-in. The numbers correspond to the numbers in the preceding screen shot.

NUMBER	NAME	DESCRIPTION
1	Add-in primary title	The title of the add-in that is provided to the Office Web Add-ins framework.
2	Add-in secondary title	The title of the add-in that is provided by the add-in.
3	Source name	The label of the entity that provides data for the selected data table. You can hover over the label to see the corresponding name.
4	Field name	The label of the field that provides data for the selected data table column. You can hover over the label to see the corresponding name and type.
5	Refresh button	Refresh the data in the workbook.
6	Publish button	Publish the data changes in the workbook.
7	Design button	Open the design-time experience.

NUMBER	NAME	DESCRIPTION
8	Status bar	The status bar provides brief temporary information alerts. Information that is appears in the status bar also appears in the Messages dialog box.
9	Options button	Open the Options dialog box.
10	Messages button	Open the Messages dialog box, which displays the information messages, warnings, and errors that the program provides to the user. A number sometimes appears next to the Messages button to provide a count of the warnings or errors that the user might be interested in.
11	Excel data table containing data	The filter and sort controls in the columns headers can be used on this data. The filters must be removed before data changes are published.
12	Office Web Add-ins menu	The Office Web Add-ins menu button provides several standard links. The most important of the links is used to reload the add-in. When the add-in is reloaded, it updates all the data for the workbook that is contained in tables that are associated with the add-in.

Authentication

OData sits on the same authentication stack as the server. The add-in uses OAuth to facilitate authentication.

Lookups and drop-down lists

When you click in a table cell, any lookup, enumeration drop-down list, or date picker that is associated with that cell will be shown inside the add-in, underneath the source and field information. Any value that you select inside the add-in is put into the currently selected table cell.

Adding and deleting records

To add a record, either start typing in a row directly below a table, or use the Tab key to tab away from the last cell of the last row in the table. To delete a record, select the row by clicking the row label (1, 2, 3, and so on), and delete all the cells in that row. To publish the changes, click **Publish**. The **Messages** dialog box shows how many records were added, edited, and deleted.

Workbook Designer

You can use the **Workbook Designer** page to design an editable custom export workbook that contains an entity and a set of fields. To open the **Workbook Designer (ExportToExcelWorkbookDesigner)** page, click **Common > Common > Office Integration > Excel workbook designer**. Before you can publish data edits, all the key fields of the entity must be in the Excel table. Key fields have a key symbol next to them. To successfully create or update a record, it must have all the mandatory fields in the Excel table. Mandatory fields have an asterisk (*) next to them.

AVAILABLE FIELDS

🔑	Vehicle rental ID
*	Drivers license
*	First name
*	Last name
*	Start date

To retrieve the resulting workbook, click **Create workbook** in the app bar.

Click **View related form** to see the data that the entity exposes. This button is only enabled for entities that have a **FormRef** property value.

Document management

Document management supports saving record attachments in Azure Blob storage and SharePoint Online. Database storage is deprecated. Azure Blob storage is equivalent to storage in the database since documents can only be accessed through the application and it provides the added benefit of providing storage that doesn't negatively affect the performance of the database. Azure blob storage is the default and works immediately. SharePoint storage will work immediately if you have an O365 license since we auto-discover the SharePoint tenant e.g. a user on the TenantA.onmicrosoft.com O365/AAD tenant gets TenantA.sharepoint.com as the SharePoint site. If document management has been turned off by the user, turn it on by clicking **Options > General > Miscellaneous** and setting **Document handling active** to **Yes**.

DOCUMENT HANDLING

Document handling active

Yes

On any page that has data, an **Attach** button will be available in the upper-right corner.

The **Attachments** page provides a view of the attachments (documents) that are associated with the record that was selected on the previous page. You can add new attachments to the record by clicking the **New** button (+) in the app bar. For the **File** and **Image** document types, you will be prompted to provide the associated file.

Document preview

A preview for supported file types is provided on the **Preview** FastTab. Basic document types, such as PNG images and text files, are supported by default. Office document types, such as Microsoft Word, Excel, and PowerPoint files, must use a production Office Web Apps Server, which might not be available in a OneBox configuration.

Frequently asked questions

Office Licensing

What Microsoft 365 licenses are available?

There are lots of [Microsoft 365 license options](#). You should select the license that makes sense for your organization.

After purchasing a Microsoft 365 license, what needs to be done to set up SharePoint storage for attachments?

Open the Document Parameters form and ensure that the SharePoint server has been automatically discovered

and set. Now open or create a Document Type, set the Document Type's location to "SharePoint" and select the folder that the files should be stored in.

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Office integration tutorial

2/18/2021 • 27 minutes to read • [Edit Online](#)

Applies to these Dynamics 365 apps:

Commerce, Finance, Human Resources, Supply Chain Management

In this tutorial, you will use and build Office integration experiences that involve Excel, Word, Document Management, and email.

Overview

In this tutorial, you will use and build Microsoft Office integration experiences that involve Microsoft Excel, Microsoft Word, the Document Management subsystem, and email. You will see how Excel and Word use data entities as an entry point into the system, how Excel can become a core part of the user experience, and how Excel and Word can be used for ad-hoc lightweight reporting. You will also see how files can be stored and shared by using the Document Management and email capabilities.

Prerequisites

For this tutorial, you must access the environment by using Remote Desktop, and you must be provisioned as an administrator on the instance. For more information, see [Deploy and access development environments](#). If you're running Internet Explorer on the virtual machine (VM), you must enable font and file downloads at **Internet Options > Security > Custom Level**. Microsoft Visual Studio 2015 runs on the VM, and it must run as an administrator so that metadata and compilation files can be overwritten. To make sure that Visual Studio runs as an administrator, search for the program, and pin it to the taskbar. Then right-click the shortcut on the taskbar, right-click **Visual Studio 2015**, click **Properties > Advanced**, and select the **Run as administrator** check box. Visual Studio will now run as an administrator via a single left click of the taskbar shortcut.

Key concepts

- **Entities and OData** – You will use the Microsoft Dynamics Excel Data Connector App (Excel App) to create, read, update, and delete. The connector uses OData services that are created for any entity that is left in the default state of "public" (**DataEntity.Public=Yes**).
- **Apps for Office** – The Excel App is built by using the Apps for Office framework (which is also known as the Office Web API). The Excel App is web-based, and therefore shares technology with the client and will run inside both on-premises Excel instances and Microsoft Excel Online (Microsoft 365). The app runs inside Excel in a task pane.
- **Microsoft Office 2016** – The Excel and Word Apps use advances in the Apps for Office framework that were introduced in Office 2016. Therefore, Office 2016 is required in order to run the Excel and Word Apps.
- **Authentication** – The Excel and Word Apps run in an Internet Explorer window inside Excel and Word. Even if the user is running the client in an InPrivate Browsing session in Internet Explorer, or in a different browser, such as Chrome, Internet Explorer is still used to run the app inside Excel or Word. Authentication is facilitated by OAuth, and the user can select accounts and sign in within the app. Internet Explorer will first try to automatically sign the user in. Therefore, if you aren't signed in as the correct user, or if you have trouble signing in, you might have to force a sign-out from the app by using the sign-out link on the user menu in the lower-right corner of the app. After sign-out, right-click in the app, and try to sign in again.
- **Excel App** – In addition to facilitating refresh and publish data operations, the Excel App also provides source and field information, lookups, filtering, error messaging, and a design experience for adding or removing fields, table columns, or labels from entity data sources.

Setup

Load the Fleet data set

During this tutorial, we will mainly use forms, entities, and data in the Fleet Management model. Therefore, we must first load the Fleet data set.

1. Navigate to **Fleet Management > Setup > Fleet setup**.
2. Click **Create**.

Static Export to Excel experiences

Static Export to Excel

Static Export to Excel provides a quick mechanism for getting data into grids on a page. The standard mechanism for triggering Export to Excel is the **Open in Microsoft Office** menu. Static Export to Excel is also available via a shortcut menu on the grid.

1. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
2. Click **Open in Microsoft Office > Export to Excel > Customers**.
3. Download and open the workbook that is generated. Note that the columns in the workbook match the columns in the grid.
4. Select ("mark") the first two rows by clicking in the left edge of the row, below the "Select all" check mark.
5. Right-click the grid header to open the shortcut menu. Note that both **Export all rows** and **Export marked rows** are available as commands.
6. Click **Export marked rows**. Note that the columns in the workbook match the columns in the grid, and that the rows that are exported match the rows that you marked.

Modify the static Export to Excel experience

You can suppress the static Export to Excel mechanism for a grid or change the label that appears on the **Open in Microsoft Office** menu.

1. Start Visual Studio 2015. Make sure that it's running as an administrator.
2. Click **View > Application Explorer** (or press Ctrl+E, Ctrl+E).
3. Navigate to **AOT > User Interface > Forms > FMCustomer**.
4. Right-click **FMCustomer**, and then click **Add to new project**.
5. In Solution Explorer, double-click the **FMCustomer** form to open the designer view.
6. Select **FMCustomerDesignTab(Tab)TabPageGrid(TabPage)MainGrid(Grid)**.
7. In the **Properties** window, find the **Export Label** property.
8. Set the **Export Label** property to **Fleet Customers**.
9. Save the form. If you're asked whether you want to overwrite the existing form or save it as a new form, click **Overwrite**.
10. Build the solution (press Ctrl+Shift+B).
11. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
12. Click **Open in Microsoft Office**. Note that the **Customers** option has changed to **Fleet Customers**.

Generated Open in Excel experiences

Generated Open in Excel

Generated Open in Excel options are automatically added to forms when the system finds data entities that have the same root data source as the form. The workbook that is generated will contain a single table data source where the data from that entity is loaded. The Open in Excel experiences are listed on the **Open in Microsoft Office** menu. (When an entity has the same root data source as a form, it's added as an option in the **Open in**

Excel section of the **Open in Microsoft Office** menu. This option is referred to as a “generated” option.)

1. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
2. Click **Open in Microsoft Office > Open in Excel > Fleet Management Customers (unfiltered)**.
3. Download and open the workbook that is generated. This workbook contains the Excel Data Connector App, a binding to the **Fleet Management Customer** entity, and a pointer to the server that the workbook was generated from.
4. Click **Enable editing** to enable the Excel Data Connector App to load. Customer data is read from the OData service on the server and added to the table.
5. In Internet Explorer, on the **Customer** page, click **Edit** (or press F2), and change the email address of one of the customers.
6. In the Excel App, click **Refresh**. Note that the new email address is shown in Excel.
7. In Excel, change the email address of one of the customers.
8. In the Excel App, click **Publish**.
9. In Internet Explorer, click **Refresh** in the upper right of the page (or press Shift+F5). Note that the new email address is shown on the **Customer** page.
10. In Excel, click the **Settings** (gear) button in the lower-right corner of the Excel App. You can use the dialog box that appears to adjust the settings in the current workbook. Note that the **Server URL** value matches the start of the URL that is shown in Internet Explorer. Also note that the data refresh and data publish operations are listed.
11. Click **Cancel** to close the **Settings** dialog box.
12. Click the **Message Center** (flag) button in the lower-right corner of the Excel App. The message center dialog box that appears provides information about what is occurring in the Excel App.

Add and remove table columns from an existing table data source in the Excel App

The Excel App has a design experience that lets users add and edit bindings to entity data sources and labels. To add and remove fields from an existing binding, you use the edit experience that is outlined in the following steps.

1. Get a workbook that has an existing table data source:
 - a. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
 - b. Click **Open in Microsoft Office > Open in Excel > Fleet Management Customers (unfiltered)**.
 - c. Download and open the workbook that is generated. This workbook contains the Excel Data Connector App, a binding to the Fleet Management Customer entity, and a pointer to the server that the workbook was generated from.
 - d. Click **Enable editing** to enable the Excel Data Connector App to load. Customer data is read from the OData service on the server and added to the table.
2. Open the data source for editing:
 - a. In Excel, in the Excel App, click **Design**. A list of table and field data sources appears.
 - b. Click the **Edit** (pencil) button next to the existing table data source. The data source details are shown.
3. Remove fields. In the **Selected** list, double-click a field. Alternatively, click a field, and then click **Remove**. To select multiple fields, keep the Ctrl key held down while you click them. To select all fields, press Ctrl+A.
4. Add fields. In the **Available** list, double-click a field. Alternatively, click a field, and then click **Add**. To select multiple fields, keep the Ctrl key held down while you click them. To select all fields, press Ctrl+A.
5. Change the field order. In the **Selected** list, click a field, and then click **Up** or **Down**.
6. Change a field label. In the **Selected** list, click a field, and then click in the **Column label** field below the list. You can change the label to either a static string or a label identifier that will be translated to the active language (for example, @SYS129977).

7. Apply the changes that you made to data source fields:
 - a. Click **Update** to return to the data source list.
 - b. Click **Refresh** to make sure that any new fields are filled with data.

Change an automatically generated Open in Excel experience

The automatically generated Open in Excel experiences that are created for entities have a single table binding. The list of fields that are added to that table binding is defined by the **AutoReport** field group if the table binding contains fields. Otherwise, the key and mandatory fields for the entity are automatically added. The order of fields in the **AutoReport** group determines the order of fields in the table binding.

1. Start Visual Studio 2015. Make sure that it's running as an administrator.
2. Click **View** > **Application Explorer** (or press Ctrl+E, Ctrl+E).
3. Navigate to **AOT** > **Data Model** > **Data Entities** > **FMCustomerEntity**.
4. Right-click **FMCustomerEntity**, and then click **Add to project**.
5. Expand **FMCustomerEntity** > **Field Groups** > **AutoReport**.
6. Reverse the order of the **First name** and **Last name** fields by clicking the **Last name** field and moving it up (press Alt+Up arrow key).
7. Save the entity. If you're asked whether you want to overwrite the existing entity or save it as a new entity, click **Overwrite**.
8. Build the solution (press Ctrl+Shift+B).
9. In Internet Explorer, navigate to **Fleet Management** > **Customers** > **Customer**.
10. Click **Open in Microsoft Office** > **Open in Excel** > **Fleet Management Customers**.
11. Open the workbook that is generated.
12. Click **Enable editing** to enable the Excel Data Connector App to load. Note that the **Last name** column appears before the **First name** column.

Open in Excel Online

The Excel App is built by using a new Apps for Office framework. This framework provides a JavaScript-based web application programming interface (API) that enables apps to communicate with Office applications. The biggest advantage of this new framework is that apps can run in on-premises Excel instances (Win32), Excel Online (Microsoft 365), and Excel on the Apple iPad. They will also be able to run in other Excel apps in the future.

1. Navigate to **Fleet Management** > **Customers** > **Customer**.
2. Click **Open in Microsoft Office** > **Open in Excel** > **Fleet Management Customers**.
3. Click **SharePoint**.
4. Browse to the desired Microsoft SharePoint folder.
5. Click **Save**. The default behavior is to open the file after it's saved. Note that the workbook opens in Excel Online. In Excel Online, capabilities of the Excel App, such as refresh and publish, and the design experience, should work just as they work in on-premises Excel instances.

Template Open in Excel experiences

Template Open in Excel

Template options resemble the generated Open in Excel options. They are automatically added to forms when the system finds templates that have the same first data source as the root data source in the form. A workbook template can have multiple data sources. It can also have unbound content. The Open in Excel experiences are listed on the **Open in Microsoft Office** menu. The **Excel workbook designer** page provides an easy way to get a generated Open in Excel experience for an entity. It also provides a mechanism getting a blank workbook that contains just the Excel App and a pointer to the server.

1. In Internet Explorer, navigate to **Common > Common > Office integration > Excel workbook designer**.
2. Select the **FleetCustomer** entity.
3. Add all fields in the list of available fields to the list of selected fields.
4. Click **Create workbook**.
5. Open the workbook that is generated. This workbook contains the Excel Data Connector App, a binding to the **Fleet Management Customer** entity, and a pointer to the server that the workbook was generated from.
6. Click **Enable editing** to enable the Excel Data Connector App to load. Customer data is read from the OData service on the server and added to the table.
7. Insert a blank row above the table, and enter **Fleet Customers** as the title.
8. Rename the worksheet **FleetCustomers**.
9. Rearrange some of the fields in the table. Click **Design** to open the design experience.
10. Next to the **FleetCustomer** data source, there are buttons for editing and deleting the data source. Click **Edit** to see the field list.
11. Select fields, and move them as you require. Set the order for the first three fields to **FirstName**, **LastName**, and **DriverLicense**.
12. Click **Update**. Note that the field order is changed.
13. Click **Done**.
14. Click the **Settings** (gear) button.
15. Click **Clear binding data** so that the workbook contains no bound data.
16. Click **OK**.
17. Save the workbook as **FleetCustomersBasic.xlsx**.
18. In Internet Explorer, navigate to **Common > Common > Office integration > Document templates**.
19. Click **New**.
20. Browse to the file that you just saved.
21. Click **OK**. The template is added as a line in the templates table.
22. In the **FleetCustomersBasic** row, clear the **Apply current record filter** check box, so that an unfiltered list of customers will be loaded after the template is opened.
23. Change the **Template display name** value to **Fleet Customers Basic**.
24. Navigate to **Fleet Management > Customers > Customer**.
25. Click **Open in Microsoft Office**. Note that **Fleet Customers Basic** is now an option in the **Open in Excel** section. Click that option.
26. Open the workbook that is generated.
27. Click **Enable editing** to enable the Excel Data Connector App to load. Customer data is read from the OData service on the server and added to the table binding that you created.

Register a template as a system-defined template

Templates that are registered as system-defined templates are loaded at deployment. This behavior is useful for independent software vendors (ISVs) and partners that want to package templates together with other model artifacts.

1. Start Visual Studio 2015 by opening the previously created project where the model is set to **Fleet Management**, or create a new project.
2. Right-click the project, and then click **Add > New item**.
3. Select the **Resource** item type.
4. Set the name to **FleetCustomersBasicTemplate**.
5. Make sure that the **FleetCustomersBasic.xlsx** file is closed.

6. Click **Add**.
7. Select the **FleetCustomersBasic.xlsx** file. Note that the resource is added to the project.
8. Click **View** > **Application Explorer** (or press Ctrl+E, Ctrl+E).
9. Navigate to **AOT** > **Classes** > **Code** > **FMTemplateRegistrations**.
10. Right-click **FMTemplateRegistrations**, and then click **Add to project**.
11. Open **FMTemplateRegistrations**. The **FMTemplateRegistrations.xpp** code file should be shown.
12. Copy one of the existing lines, and change it by providing the template name, resource name, description, display name, and **Apply current record filter** and **List in Open in Office menu** values. The display name is the text that appears as an Open in Excel option. The description appears when the user holds the pointer over that item. The display name and description can be either labels or static strings. The code should resemble the following example.

```
this.addTemplate(  
    OfficeAppApplicationType::Excel,  
    resourceStr(FleetCustomersBasicTemplate),  
    resourceStr(FleetCustomersBasicTemplate),  
    "Template for fleet customers", "Fleet customers basic", NoYes::No, NoYes::Yes);
```

13. Save the code. If you're asked whether you want to overwrite the existing code or save it as a new file, click **Overwrite**.
14. Build the solution (press Ctrl+Shift+B).
15. Verify that the change was successful. In Internet Explorer, navigate to **Common** > **Common** > **Office integration** > **Document templates**.
16. Click **Reload system templates**.
17. Click **Yes** to confirm that you want to reload the system templates.
18. Verify that the new system-defined template is loaded, and that the template name is **FleetCustomersBasicTemplate**.

Journal Entry in Excel experience powered by a template

1. In Internet Explorer, navigate to **General ledger** > **Journal entries** > **General journals**.
2. Make sure that you're in company **USMF**.
3. Create a new journal by clicking **New**.
4. Set the name to **GenJrn**.
5. Click **Open lines in Excel**.
6. Open the workbook that is generated, and enable editing as required. Note that header fields are filled with data.
7. Enter a new line, and set the **MainAccount** field to **110110**. Enter a description, a currency, and a debit amount. Note that lookups are provided for the company and currency fields, because those relationships are defined for this entity.
8. Click **Publish**. Note that the line is updated with the current date and a debit amount of 0 (zero).
9. In Internet Explorer, click **Lines**. Note that line that you entered in Excel is shown.

Lookups in Excel experiences

Lookups in the Excel App

To facilitate data entry, the Excel App provides lookups and data assistance. Date fields provide a date picker,

enumeration (enum) fields provide an enum list, and relationships provide a relationship lookup.

1. In Internet Explorer, navigate to **Fleet Management > Rentals > Rental**.
2. Click **Open in Microsoft Office > Open in Excel > Fleet Management Rentals**.
3. Open the workbook that is generated.
4. Click **Enable editing** to enable the Excel Data Connector App to load and read in data.
5. Click a **Drivers license** value. Note that a relationship lookup now appears in the Excel App and shows a list of customers. Because relationship lookups are in their first generation, no filtering or sorting is currently supported.
6. Click another customer in the lookup, and note that the **Drivers license** value changes. Because this field is part of the key, click the original **Drivers license** value to reset it. Note that the **Drivers license**, **First name**, and **Last name** fields form a multi-part key, but the Excel App doesn't immediately change all parts of the multi-part key.
7. Click a **Start date** value. Note that a date picker now appears in the Excel App.
8. Click another date to change the **Start date** value.
9. Click **Design**, and edit the FleetRental data source by adding the **Status** field as a column in the table binding.
10. When you've finished adding the **Status** column, click a **Status** value. Note that an enum list now appears in the Excel App.
11. While focus is in the **Status** column, move up and down the list of rentals to see how quickly the enum list changes to reflect the current value. The whole enum list is shown, so that the user can quickly see all the available values.
12. Click a different **Status** value to see how an enum value can be changed by using a single click.

Create a relationship lookup

When relationships exist between entities, a relationship lookup is shown.

1. Start Visual Studio 2015 by opening the previously created project where the model is set to **Fleet Management**, or create a new project.
2. Click **View > Application Explorer** (or press Ctrl+E, Ctrl+E).
3. Navigate to **AOT > Data Model > Tables > FMCustGroup**.
4. Right-click, and then click **Open designer**.
5. In the designer, right-click **FMCustGroup**, and then click **Add-ins > Create data entity**. Artifacts are added to the project.
6. Open the designer view for **FMCustGroupEntity**.
7. In the property sheet for **FMCustGroupEntity**, set **Public Collection Name** to **FleetCustomerGroups** and **Public Entity Name** to **FleetCustomerGroup**.
8. Add the **CustGroup** and **Description** fields to the **AutoLookup** field group.
9. If **FMCustomerEntity** isn't already in the project, add it.
10. Open the designer view for **FMCustomerEntity**.
11. Right-click **Relations**, and then click **New > Relation**.
12. On the new relation, set **Name** to **CustomerGroup**, **Cardinality** to **ZeroMore**, **RelatedDataEntity** to **FMCustGroupEntity**, **RelatedDataEntityCardinality** to **ZeroOne**, **RelationshipType** to **Association**, **Role** to **CustomerGroupSource**, and **RelatedDataEntityRole** to **CustomerGroupTarget**.
13. Build the solution (press Ctrl+Shift+B).
14. Verify that the change was successful. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
15. Click **Open in Microsoft Office > Open in Excel > Fleet Management Customers**.
16. Open the workbook that is generated.
17. Click a **Customer group** value.

18. Change the **Customer group** value for a customer.
19. Publish the change.
20. Change the value back, and publish that change.

Create a custom lookup

You can create custom lookups to show data options when an enum or relationship isn't sufficient. The main use case is when data must be retrieved from an external service and presented in real time.

1. Start Visual Studio 2015 by opening the previously created project where the model is set to **Fleet Management**, or create a new project.
2. Open the designer view for **FMCustomerEntity**.
3. Right-click **Methods**, and then click **New Method**.
4. Add the **lookup_Country** code from the following example.

```
public class FMCustomerEntity extends common
{
    [SysODataActionAttribute("FMCustomerEntityCountryCustomLookup", false), //Name in $metadata
    SysODataCollectionAttribute("_fields", Types::String), //Types in context
    SysODataFieldLookupAttribute("Country")] //Name of field
    public static str lookup_Country(Array _fields)
    {
        OfficeAppCustomLookupListResult result = new OfficeAppCustomLookupListResult();

        result.items().value(1, "US");
        result.items().value(2, "AU");
        result.items().value(3, "FR");
        result.items().value(4, "GR");
        result.items().value(5, "NZ");

        return result.serialize();
    }
}
```

5. Save the code. If you're asked whether you want to overwrite the existing code or save it as a new file, click **Overwrite**.
6. Build the solution (press Ctrl+Shift+B).
7. Verify that the change was successful. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
8. Click **Open in Microsoft Office > Open in Excel > Fleet Management Customers**.
9. Open the workbook that is generated.
10. Click a **Country** value.
11. Change the **Country** value for a customer.
12. Publish the change.
13. Change the value back, and publish that change.

Export to Word experiences

Export to Word

Export to Word experiences can be used for lightweight reporting. They are powered by pre-built templates. The Export to Word experiences are listed on the **Open in Microsoft Office** menu. Let's look at an example

experience that has been created for Fleet Management Customers.

1. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
2. Click **Open in Microsoft Office > Export to Word > Customer information Fleet Management Customers (unfiltered)**.
3. Download and open the document that is generated. The document contains data from the record that is currently selected.

Create a Word template

The Microsoft Dynamics App for Office can be run in Word to enable the creation of templates that can then be used for document generation.

1. Add a trusted catalog that points to the file share that contains the Microsoft Dynamics App manifest:
 - a. In Word, click **File > Options**.
 - b. Click **Trust Center > Trust Center Settings**.
 - c. Click **Trusted Add-in Catalogs**.
 - d. In the **Catalog URL** field, enter the file share location of the manifest.
 - e. Click **Add catalog**.
 - f. Click **OK**.
 - g. Click **OK**.
 - h. Restart Word.
2. Add the Microsoft Dynamics App to a document:
 - a. In Word, click **Insert > My Add-ins > Shared Folder > Microsoft Dynamics**.
 - b. Click **Insert**.
 - c. In the app, click **Add server information**.
 - d. In the **Server URL** field, enter the start of the URL (protocol + hostname). For example, enter `https://topo00dfa4stbobaos.cloudax.test.dynamics.com`.
 - e. Click **OK**.
 - f. Click **Yes** to apply the settings change and reload the app.
3. Sign in to the app:
 - a. Click **Sign In**. The Azure Active Directory sign-in screen should provide a list of credentials. If you encounter an error, force a sign-out (by using the sign-out link in the lower-right corner of the app), and then sign in again.
 - b. Select the appropriate account, or click **Use another account**.
 - c. Enter the credentials for that environment, and then click **Sign in**.
4. Load the template designer applet:
 - a. After sign-in, click **Load applets**.
 - b. Select **Template Designer**.
 - c. Click **OK**.
 - d. Click **Yes** to confirm.
 - e. Click **OK** to close the settings page. The latest OData metadata is loaded.
5. Follow one of these steps:
 - Add a fields data source:
 - a. In the app, click **Design**.
 - b. Click **Add fields**.
 - c. Select **FleetCustomer**.
 - d. Click **Next** to go to the field selection page.

- e. In the document, add a title and/or some blank lines at the top of the document.
 - f. In the app, in the **Available** list, select the **FirstName** field.
 - g. Click **Add label** to add a content control that references the "First name" label.
 - h. In the document, click to put focus into the document, click again to put focus at the end of the label, and then press the Right arrow key until the cursor is outside the content control (the control box will disappear).
 - i. Add a separator, such as space+hyphen+space (" - ") or space+colon+space (" : ").
 - j. In the app, click **Add value** to add a content control that references the **FirstName** field.
 - k. Repeat the process for the **LastName** field label and value.
 - l. Continue to add fields as desired.
- Add a table data source:
 - a. In the app, click **Design**.
 - b. Click **Add table**.
 - c. Select **FleetCustomer**.
 - d. Click **Next** to go to the field selection page.
 - e. In the document, add a title and/or some blank lines at the top of the document.
 - f. In the app, in the **Available fields** list, add the **FirstName**, **LastName**, and **City** fields.
 - g. Click **Done**.
6. In Word, save the template document.

Create a Word template and use it for document generation

After you've built a Word template, you can upload it to create an Export to Word experience.

1. Upload a template:
 - a. Navigate to **Common > Common > Office integration > Document templates**. Alternatively, search for the page.
 - b. Click **New**.
 - c. Click **Browse**.
 - d. In the dialog box, select a previously created template, and then click **Open**. Note that the Root data entity is obtained from the template and appears near the bottom of the dialog box.
 - e. Click **OK**.
 - f. Scroll down the list of templates to confirm that the template was added.
 - g. Optional: If the template should not be filtered to the user's current record, clear the **Apply current record filter** check box.
 - h. Optional: If the template should not be filtered to the user's current company, clear the **Apply company filter** check box.
2. Use the uploaded template for document generation:
 - a. Navigate to a page that shares the same root data source as the template's root data entity. For **FleetCustomer (FMCustomerEntity)**, that page is **Fleet Management > Customers > Customer**.
 - b. Click **Open** in **Microsoft Office > Export to Word**, and click the template.
 - c. Download and open the document that is generated.

Document Management and SharePoint experiences

Add a SharePoint document type

The Document Management subsystem can be used to attach files to records. Most non-executable file types are supported as attachments. A document preview is provided for Office document files and PDFs. Administrators

create document types to indicate where attachments should be stored. When administrators use SharePoint as the storage location, they must provide a specific folder that the files should be put in. Security of that SharePoint folder is a separate administration responsibility.

1. In Internet Explorer, navigate to **Organization administration > Document management > Document management parameters**.
2. Click **SharePoint**.
3. Make sure that the **Default SharePoint server** field is set to a default value for the tenant, such as **contosoax7.sharepoint.com**.
4. Click **Test SharePoint connection**. Note a successful connection.
5. Click **Save**.
6. Navigate to **Organization administration > Document management > Document types**.
7. Click **New**.
8. Set **Type** to **SharePointDoc**.
9. Set **Name** to **SharePointDoc**.
10. Set **Location** to **SharePoint**.
11. Click the **Edit** (pencil) button next to the **SharePoint Address** field.
12. On the left side of the dialog box, select a site. For the contosoax7 tenant, select **ContosoAX Team Site**.
13. On the right side of the dialog box, select a folder. For the contosoax7 tenant, select **ContosoAX Team Site > Documents > OfficeIntegration > Attachments**.
14. Click **OK**.
15. Click **Save**.
16. Click the **Browse** (globe) button next to the **SharePoint Address** field. Note that a new browser tab that shows the selected folder appears.
17. Use Windows Explorer to create a Word document in the Documents folder, and enter a few words in the document.
18. In Internet Explorer, navigate to **Fleet Management > Customers > Customer**.
19. Put focus on the first customer, and then click the **Attach** (paperclip) button in the upper-right corner of the page.
20. Click **New > SharePointDoc**.
21. Click **Browse**, and select the Word document that you created.
22. Expand the **Preview** FastTab to see a preview of the Word document.
23. Expand the **Attachment** FastTab to see the file location of the Word document.
24. In Internet Explorer, use the previously opened tab that shows the SharePoint folder to double-check that the file has been placed appropriately.

Email experiences

Send mail via a local mail client

Email workflows that are enabled via the SysEmail framework can generate email messages (.eml files) that contain attachments. You can then send these messages via Microsoft Outlook or another email client.

1. In Internet Explorer, navigate to **Accounts receivable > Customers > All customers**.
2. Select **US-008 Sparrow Retail**.
3. Click **Collect > Customer balances > Collections** to open the **Collections** page.
4. Click **Communicate > Email > Statements to contact**.
5. Click **OK** to accept the default values in the dialog box.
6. If you're prompted for the mail option to use, clear the **Do not ask again** check box (you can change this option from the user options page), select **Use an email app, such as Outlook**, and then click **OK**.

7. If you're running Internet Explorer on your laptop, open the email (.eml) file that is generated. If you're running Internet Explorer on the VM, copy the file to your laptop, and open it there.
8. Note the email address in the **To** field and the generated workbook attachment.

Send mail via SMTP

Email workflows that are enabled via the SysEmail framework can also be created in a simple email dialog box and then sent via Simple Mail Transfer Protocol (SMTP).

1. In Internet Explorer, navigate to **System administration > Setup > Email > Email parameters**.
2. Click **SMTP settings**.
3. Set the **Outgoing mail server** to the desired SMTP server:
 - For [Microsoft 365 production](#) (including *.onmicrosoft.com accounts): smtp.office365.com (Find this setting via outlook.office.com, at **Settings > Mail > POP and IMAP**.)
 - For Outlook/Hotmail: smtp-mail.outlook.com
4. Set the user name and password to an appropriate email account and password.
5. Leave **SSLRequired** turned on, and leave **SMTP port number** set to **587**.
6. Click **Save**.
7. In Internet Explorer, navigate to **Accounts receivable > Customers > All customers**.
8. Select **US-008 Sparrow Retail**.
9. Click **Collect > Customer balances > Collections** to open the **Collections** page.
10. Click **Communicate > Email > Statements to contact**.
11. Click **OK** to accept the default values in the dialog box.
12. If you're prompted for the mail option to use, select **Use the Microsoft Dynamics 365 for Finance and Operations email client**, and then click **OK**.
13. To receive the test message, change the **To** address to your email address.
14. Enter a subject and body for the message.
15. Click **Send**. The message should be delivered in one to five minutes. Note that the message will appear to be sent from the email account that is set on the **Email parameters** page. If that email account is given "Send As" (or "Send email from this mailbox") permissions for the From address that is used in the **Send email** dialog box, messages will appear to come from that address.
 - You can configure "Send As" permissions in the Microsoft 365 admin center (portal.office.com/Admin), at **Users > Active users > User > Edit mailbox permissions > Send email from this mailbox**. For more information, see [Enable sending email from another user's mailbox in Microsoft 365](#).
 - Before users can send email messages, "Send As" permissions for each user email account in the client must be given to the email account that is set on the **Email parameters** page. For more information, see [How to set up a multifunction device or application to send email using Microsoft 365](#).
16. Email that is sent directly from the server, without user interaction, is sent via a batch process and requires that the **Email distributor batch** process be started. Follow these steps to start the process:
 - a. Navigate to **System administration > Periodic tasks > Email processing > Batch**.
 - b. Turn on **Batch processing**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

View and update entity data with Excel

2/18/2021 • 9 minutes to read • [Edit Online](#)

Applies to these Dynamics 365 apps:

Commerce, Finance, Supply Chain Management

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [Service update availability](#).

This topic explains how to open entity data in Microsoft Excel, and then view, update, and edit the data by using the Microsoft Dynamics Excel add-in. To open entity data, you can start from either Excel or Finance and Operations apps.

By opening entity data in Excel, you can quickly and easily view and edit the data by using the Excel add-in. This add-in requires Microsoft Excel 2016 or later.

NOTE

If your Microsoft Azure Active Directory (Azure AD) tenant is configured to use Active Directory Federation Services (AD FS), you must make sure that the May 2016 update for Office has been applied, so that the Excel add-in can correctly sign you in.

To learn more about how to use the Excel add-in, watch the short [Create an Excel template for header and line patterns](#) video.

Open entity data in Excel when you start from a Finance and Operations app

1. On a page in a Finance and Operations app, select **Open in Microsoft Office**.

If the root data source (table) for the page is the same as the root data source for any entities, default **Open in Excel** options are generated for the page. **Open in Excel** options can be found on frequently used pages, such as **All vendors** and **All customers**.

2. Select an **Open in Excel** option, and open the workbook that is generated. This workbook has binding information for the entity, a pointer to your environment, and a pointer to the Excel add-in.
3. In Excel, select **Enable editing** to enable the Excel add-in to run. The Excel add-in runs in a pane on the right side of the Excel window.
4. If you're running the Excel add-in for the first time, select **Trust this Add-in**.
5. If you're prompted to sign in, select **Sign in**, and then sign in by using the same credentials that you used to sign in to the Finance and Operations app. The Excel add-in will use a previous sign-in context from the browser and automatically sign you in, if it can. (For information about the browser that is used based on the operating system, see [Browsers used by Office add-ins](#)) To ensure that sign-in was successful, verify the user name in the upper-right corner of the Excel add-in.

The Excel add-in automatically reads the data for the entity that you selected. Note that there will be no data in

the workbook until the Excel add-in reads it in.

Open entity data in Excel when you start from Excel

1. In Excel, on the **Insert** tab, in the **Add-ins** group, select **Store** to open the Office Store.
2. In the Office Store, search on the keyword **Dynamics**, and then select **Add** next to **Microsoft Dynamics Office Add-in** (the Excel add-in).
3. If you're running the Excel add-in for the first time, select **Trust this Add-in** to enable the Excel add-in to run. The Excel add-in runs in a pane on the right side of the Excel window.
4. Select **Add server information** to open the **Options** pane.
5. In your browser, copy the URL of your target Finance and Operations app instance, paste it into the **Server URL** field, and then delete everything after the host name. The resulting URL should have only the host name.

For example, if the URL is `https://xxx.dynamics.com/?cmp=usmf&mi=CustTableListPage`, delete everything except `https://xxx.dynamics.com`.

6. Select **OK**, and then select **Yes** to confirm the change. The Excel add-in is restarted and loads metadata.

The **Design** button is now available. If the Excel add-in has a **Load applets** button, you probably aren't signed in as the correct user. For more information, see "The Load applets button is shown" in the [Troubleshooting](#) section of this topic.
7. Select **Design**. The Excel add-in retrieves entity metadata.
8. Select **Add table**. A list of entities appears. The entities are listed in "Name - Label" format.
9. Select an entity in the list, such as **Customer - Customers**, and then select **Next**.
10. To add a field from the **Available fields** list to the **Selected fields** list, select the field, and then select **Add**. Alternatively, double-click the field in the **Available fields** list.
11. After you've finished adding fields to the **Selected fields** list, make sure that the cursor is in the correct place in the worksheet (for example, cell A1), and then select **Done**. Then select **Done** to exit the designer.
12. Select **Refresh** to pull in a set of data.

View and update entity data in Excel

After the Excel add-in reads entity data into the workbook, you can update the data at any time by selecting **Refresh** in the Excel add-in.

Edit entity data in Excel

You can change entity data as you require and then publish it back to Finance and Operations apps by selecting **Publish** in the Excel add-in. To edit a record, select a cell in the worksheet, and then change the cell value. To add a new record, follow one of these steps:

- Click anywhere in the data sources table, and then select **New** in the Excel add-in.
- Click anywhere in the last row of the data sources table, and then press the Tab key until the cursor moves out of the last column of that row and a new row is created.
- Click anywhere in the row immediately below the data sources table, and start to enter data in a cell. When you move the focus out of that cell, the table expands to include the new row.
- For field bindings of header records, select one of the fields, and then select **New** in the Excel add-in.

Note that a new record can be created only if all the key and mandatory fields are bound in the worksheet, or if default values were filled in by using the filter condition.

To delete a record, follow one of these steps:

- Right-click the row number next to the worksheet row that should be deleted, and then select **Delete**.
- Right-click anywhere in the worksheet row that should be deleted, and then select **Delete > Table Rows**.

If data sources have been added as related data sources, the header is published before the lines. If there are dependencies between other data sources, you might have to change the default publishing order. To change the publishing order, in the Excel add-in, select the **Options** button (the gear symbol), and then, on the **Data Connector** FastTab, select **Configure publish order**.

Add or remove columns

You can use the designer to adjust the columns that are automatically added to the worksheet.

NOTE

If the **Design** button doesn't appear below the **Filter** button in the Excel add-in, you must enable the data source designer. Select the **Options** button (the gear symbol), and then select the **Enable design** check box.

1. In the Excel add-in, select **Design**. All the data sources are listed.
2. Next to the data source, select the **Edit** button (the pencil symbol).
3. In the **Selected fields** list, adjust the list of fields as you require:
 - To add a field from the **Available fields** list to the **Selected fields** list, select the field, and then select **Add**. Alternatively, double-click the field in the **Available fields** list.
 - To remove a field from the **Selected fields** list, select the field, and then select **Remove**. Alternatively, double-click the field.
 - To change the order of fields in the **Selected fields** list, select a field, and then select **Up** or **Down**.
4. To apply your changes to the data source, select **Update**. Then select **Done** to exit the designer.
5. If you added a field (column), select **Refresh** to pull in an updated set of data.

Change the publish batch size

When users publish changes to data records by using the Excel add-in, the updates are submitted in batches. The default publish batch size is 100 rows. In version 10.0.17 and later, the **Allow configuration of the publish batch size in the Excel add-in** feature gives you flexible control over the publish batch size.

System administrators can specify a system-wide limit on the publish batch size for "Open in Excel" workbooks by setting the **Publish batch limit** field in the **App parameters** section of the **Office app parameters** page.

The publish batch size can also be changed for an individual workbook by using the Excel add-in.

1. Open the workbook in Excel.
2. Select the **Option** (gear) button in the upper right of the Excel add-in.
3. Set the **Publish batch size** field as desired. The value that you set must be less than the system-wide publish batch limit.
4. Select **OK**.
5. Save the workbook. If you don't save the workbook after you make changes to the add-in settings, those changes won't persist when the workbook is reopened.

Excel workbook template authors can use the same procedure to set the publish batch size for templates before they upload them into the system.

Copy environment data

The data that is read into the workbook from one environment can be copied to another environment. However, you can't just change the connection URL, because the data cache in the workbook will continue to treat the data as existing data. Instead, you must use the Copy Environment Data functionality to publish the data to a new environment as new data.

1. Select the **Options** button (the gear symbol), and then, on the **Data Connector** FastTab, select **Copy Environment Data**.
2. Enter the server URL for the new environment.
3. Select **OK**, and then select **Yes** to confirm the action. The Excel add-in is restarted and connects to the new environment. Any existing data in the workbook is treated as new data.

After the Excel add-in is restarted, a message box states that the workbook is in Environment copy mode.

4. To copy the data into the new environment as new data, select **Publish**. To cancel the environment copy operation and review the existing data in the new environment, select **Refresh**.

Troubleshooting

There are a few issues that can be resolved through some easy steps.

- **The Load applets button is shown** – If the Excel add-in has a **Load applets** button after sign-in, you probably aren't signed in as the correct user. To resolve this issue, verify that the correct user name appears in the upper-right corner of the Excel add-in. If an incorrect user name appears, select it, sign out, and then sign back in.
- **You receive a "Forbidden" message** – If you receive a "Forbidden" message while the Excel add-in is loading metadata, the account that is signed in to the Excel add-in doesn't have permission to use the targeted service, instance, or database. To resolve this issue, verify that the correct user name appears in the upper-right corner of the Excel add-in. If an incorrect user name appears, select it, sign out, and then sign back in.
- **A blank webpage is shown over Excel** – If a blank webpage is opened during the sign-in process, the account requires AD FS, but the version of Excel that is running the Excel add-in isn't recent enough to load the sign-in dialog box. To resolve this issue, update the version of Excel that you're using. To update the version of Excel when you're in an enterprise that is on the deferred channel, use the [Office deployment tool to move from the deferred channel to the current channel](#).
- **You receive a time-out while you publish data changes** – If you receive time-out messages while you're trying to publish data changes to an entity, consider reducing the publish batch size for the affected workbook. Entities that trigger larger amounts of logic on record changes might require updates to be sent in smaller batches to help prevent time-outs.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create Open in Excel experiences

2/18/2021 • 18 minutes to read • [Edit Online](#)

Applies to these Dynamics 365 apps:

Commerce, Finance, Human Resources, Supply Chain Management

Learn about creating Open in Office experiences for Excel and Word.

What are Open in Excel experiences?

Open in Excel experiences are:

- Based on entities and the OData services that they create.
- Dynamically-generated or based on a pre-defined template.
- Editable and refreshable via the Excel Add-in.

The following image shows the **Excel Add-in** being used for Journal entry.

The screenshot displays an Excel spreadsheet titled "LedgerJournalLineEntryTemplate_635702638412497567(1) [Read-Only] - Excel". The spreadsheet is titled "General Ledger Journal Entry" and contains a table of journal entries. The table has columns for Date, Account type, MainAccount, BusinessUnit, Department, Description, Currency, Debit, and Credit. The data shows various entries for "Benefits" and "Payroll Tax" for the date 1/20/2011. A summary row at the bottom shows Totals with a Debit of 3,575,931.49 and a Credit of 710,016.87. On the right side of the spreadsheet, there is a "Microsoft Dynamics DATA CONNECTOR" panel with options for Refresh, Publish, Filter, and Design.

Date	Account type	MainAccount	BusinessUnit	Department	Description	Currency	Debit	Credit
1/20/2011	Ledger	602180	002	026	Benefits	USD	2,808.00	\$ -
1/20/2011	Ledger	602180	002	025	Benefits	USD	312.00	\$ -
1/20/2011	Ledger	602180	002	024	Benefits	USD	4,992.00	\$ -
1/20/2011	Ledger	602180	002	023	Benefits	USD	19,656.00	\$ -
1/20/2011	Ledger	602180	002	022	Benefits	USD	3,432.00	\$ -
1/20/2011	Ledger	602180	001	026	Benefits	USD	4,212.00	\$ -
1/20/2011	Ledger	602180	001	025	Benefits	USD	468.00	\$ -
1/20/2011	Ledger	602180	001	024	Benefits	USD	7,488.00	\$ -
1/20/2011	Ledger	602180	001	023	Benefits	USD	29,484.00	\$ -
1/20/2011	Ledger	602180	001	022	Benefits	USD	5,148.00	\$ -
1/20/2011	Ledger	602120	002	026	Payroll Tax	USD	2,246.40	\$ -
1/20/2011	Ledger	602120	002	025	Payroll Tax	USD	249.60	\$ -
1/20/2011	Ledger	602120	002	024	Payroll Tax	USD	3,993.60	\$ -
1/20/2011	Ledger	602120	002	023	Payroll Tax	USD	15,724.80	\$ -

Where are the Open in Excel experiences?

Open in Excel experiences are usually found under in the Open in Excel section of the Open in Microsoft Office menu, but an explicit button can be added for these experiences.

What's the difference between Export to Excel and Open in Excel?

The Export to Excel options and experiences are both found in the Open in Microsoft Office menu:

- The Export to Excel options are static exports of grid data. Each one corresponds to a visible grid. All the grid data for the current filter is placed into a workbook.
- The Open in Excel experiences utilize the Excel Add-in to facilitate refresh and publish.

The following image shows the **Open in Microsoft Office** menu on the **Fleet Customers** form with a template **Open in Excel** option, a generated **Open in Excel** option, and a static **Export to Excel** option.

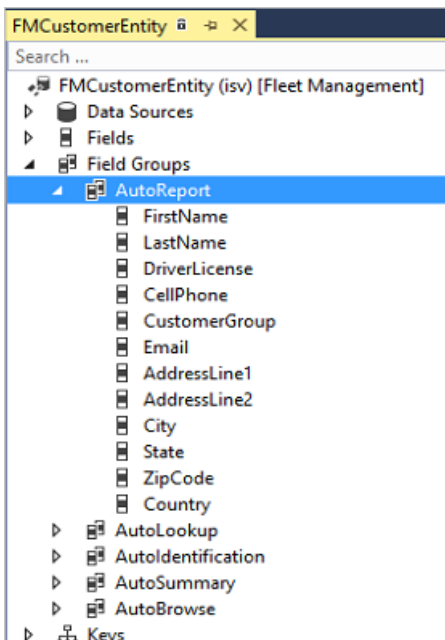

When will an entity show as an Open in Excel option?

When an entity has the same root datasource (table) as a form, it will be added as an option in the Open in Excel section of the Open in Microsoft Office menu. This is referred to as a "generated" option.

What fields will be shown in the workbook?

The default fields that will be added into the workbook are the key and mandatory fields of the entity. If a different set of fields should be provided by default, then those fields can be added into the **AutoReport field group** on the entity. The following image shows the Visual Studio view of the AutoReport field group for the FMCustomerEntity.

What fields will be shown when an entity is the target of a lookup?

When a relationship is defined between two entities, if the identifier for one entity is shown on the other entity, then the fields that will be shown in that lookup are either the key fields, or the fields in the **AutoLookup field group** if it is not empty. Relationship lookups are not currently supported, but they will eventually be displayed in the app in a similar way to the enumeration lookups. The Excel Add-in with an enumeration lookup is shown below.

What should be done to make an entity ready for use in Excel?

Define the AutoReport and AutoLookup field groups and test them using the Excel App design experience.

Why does an automatically added entity option have "(unfiltered)" after the entity name?

Currently, a filter is not added to these options, hence the term "(unfiltered)". In the future, an attempt will be made to apply the filter from the form to these options. For example, if a list of Customers was filtered to just Customers in the state of California, then, in the future, the entity will be scanned for the state field and if it is found then a filter would be added automatically.

How can an entity be added as an Open in Excel option on a form that doesn't share the same root datasource?

A generated Open in Excel option can be added on any form by implementing the `OfficeGeneratedWorkbookCustomExporter` interface. When adding a generated option programmatically, the set of fields can be explicitly specified. For more information, see [Modifying the Open in Office menu through interfaces](#).

What are the region-specific considerations for defining entities?

The Open in Excel generated experiences can be made region-specific by adding region-specific fields into the AutoLookup group. These region-specific fields will then be included in the generated workbook.

How can I create a custom lookup for an entity field in Excel?

A custom lookup can be shown for an Entity field.

- Name - The method needs to have a name that is "lookup_<fieldname>" e.g. a field "MyField" could have a lookup method "lookup_MyField".
- Attributes – Attributes need to be added to the method:

- SysODataActionAttribute(str <name>, Boolean <isInstanceMethod>)
- SysODataCollectionAttribute(str <name>, Types <type>, "Value")
- Return – The method should return a list of strings.

Example

```
public class ExportToExcel_SimpleEntity extends common
{
    [SysODataActionAttribute("Lookup_StringLookupField", true),
    SysODataCollectionAttribute("return", Types::String, "Value")]
    public List lookup_StringLookupField()
    {
        List lookupList = new List(Types::String);
        const int items = 5;

        for (int item = 0; item < items; item++)
        {
            lookupList.addEnd(strfmt('%1 - %2 (%3)', this.StringField, this.IntField, item));
        }

        return lookupList;
    }
}
```

How does the app get injected into a workbook to start building a template?

The Excel Add-in is injected into a workbook when a generated Open in Excel experience is triggered or when a workbook is created using the **Common > Common > Office integration > Excel workbook designer** form.

- The **Create workbook** button will add the selected entity and fields, a pointer to the server, and the app into a workbook.
- The **Create blank workbook** button will simply add a pointer to the server and the app into a workbook.
- The **View related** form will navigate to the form relating to the currently selected entity to more easily review the effect of data changes made in Excel.
- The **Get entity record count** button will show the record count for the currently selected entity. The Excel Add-in will handle large sets of data within the memory limits of a user's machine. By default, the Excel Add-in has a data governor that restricts the data size to one million cells but, depending on the performance abilities of the user's machine, this can usually be extended to around 2.5 million cells.

The following image shows the **Excel workbook designer** form.

After obtaining a workbook containing the Excel Add-in, additional datasources can be added using the **Design** button. Currently, datasources cannot be removed.

When will a template show as an Open in Excel option?

When a template listed in the **Common > Common > Office integration > Document templates** form (DocuTemplate) has `ShowInOpenInOfficeMenu` set to `Yes` and has the same root datasource (table) as the current form, it will be added as an option in the **Open in Excel** section of the **Open in Microsoft Office** menu. The following image shows the **Document templates** form.

TEMPLATE TYPE	TEMPLATE NAME	COMPANY	LANGUAGE	ROOT DATA ENTITY	TEMPLATE DISPLAY NAME	DESCRIPTION
Excel	FMTemplateCustomersWithLocati			FMCustomerEntity	Customer locations	Template provides a map of custo
Excel	FMTemplateRentalsByStatus			FMRentalEntity	Rentals by status	Template provides rental status cc
Excel	LedgerJournalLineEntryTemplate			LedgerJournalHeaderEntity	LedgerJournalLineEntryTemplate	General journal line entry using an
Word	DocuGenerationTestStringKeyTem			ExportToExcel_StringKeyEntity	DocuGenerationTestStringKeyTem	This is a test description

Will a filter be added to the template?

In the **Document Templates** form, the standard filter for "current record" can be turned on and off. If the filter is on, when the template is invoked as an **Open in Excel** option, then a filter for the current record will be added to the workbook. The filter will be the key fields and their values.

How can templates be defined in metadata and code and loaded automatically?

When adding a template into the **Document Templates** form, it is added for that instance and is referred to as a "user-defined" template. Templates can also be defined in metadata and code and loaded automatically, thus making them "system-defined" templates. To create a system-defined template using metadata and code, you need to do the following:

- Define the template.
- Create a new resource in a project.
- Define a new class that extends the `DocuTemplateRegistrationBase` class and add an implementation of the `registerTemplates` method.

The `LedgerJournalLineEntryTemplateRegistration` and `FMTemplateRegistrations` classes are good examples of

template registrations defined in code. The `LedgerJournalLineEntryTemplate` and `FMTemplateCustomersWithLocations` resources are the corresponding templates stored in metadata as resources. When a template has a registration class, it will be loaded when the **Reload system templates** button is clicked in the **Document Templates** form.

How do templates get loaded into a fresh deployment?

To load system defined templates, click the **Reload system templates** button in the **Common > Common > Office integration > Document templates** form, as shown below.

In the future, we will do the equivalent of clicking that button during deployment.

How do I decide if I should create a template?

A template is an artifact that needs to be maintained and versioned. If you can avoid defining a template without sacrificing much from the user experience, then you probably should use a template. Create a template if:

- You need additional content or formatting in the template.
- You want to combine multiple entities/datasources in the same workbook.

Don't create a template if:

- You can just specify a set of fields to show in a table binding.

What are the region-specific considerations for templates?

When creating a template for an entity that has region-specific fields, you should leave those region-specific fields out of the template, otherwise all users will see the region-specific fields. Templates should cater to the majority of users by default and region-specific users can add those fields using the easy-to-use design experience of the Excel Add-in. The region-specific fields and columns can be added by users as needed. That template can be either saved to local computer for reuse by a single user or uploaded via the Document Templates form for reuse by any user of that instance. A couple of other considerations:

- If a region has a region-specific entity, then a region-specific template could be created.
- If a region is important enough, then you could define a region-specific template as well as a region-generic template.

How do I add an explicit button for a template Open in Excel option?

An explicit button can be added for Open in Excel experiences. The label shown on the button should usually be "Open target in Excel" where target is the name of the target data like "lines" or "catalog". The code behind such a button will:

- Obtain the template to be used.
- Add a filter.
- Pass the template to the user.

An example of this code can be found on the `LedgerJournalTable` form (**General ledger > Journals > General journal**) in the `Clicked` method on the `OpenLinesInExcel` button.

```

[Control("Button")]
class OpenLinesInExcel
{
    /// <summary>
    /// Opens the current journal in Excel for line entry and editing
    /// </summary>
    public void clicked()
    {
        super();

        const str templateName = resourceStr(LedgerJournalLineEntryTemplate);
        DocuTemplate template = DocuTemplate::findTemplate(OfficeAppApplicationType::Excel,
templateName);

        // Ensure the template was present
        if (template && template.TemplateID == templateName)
        {
            Map filtersToApply = new Map(Types::String, Types::String);

            // Create lines filter
            ExportToExcelFilterBuilder filterBuilder = new
ExportToExcelFilterBuilder(tablestr(LedgerJournalLineEntity));
            str filterString = filterBuilder.areEqual(fieldstr(LedgerJournalLineEntity, JournalBatchNumber),
LedgerJournalTable.JournalNum);
            filtersToApply.insert(tablestr(LedgerJournalLineEntity), filterString);

            // Create header filter
            filterBuilder = new ExportToExcelFilterBuilder(tablestr(LedgerJournalHeaderEntity));
            filterString = filterBuilder.areEqual(fieldstr(LedgerJournalHeaderEntity, JournalBatchNumber),
LedgerJournalTable.JournalNum);
            filtersToApply.insert(tablestr(LedgerJournalHeaderEntity), filterString);

            // Generate the workbook using the template and filters
            DocuTemplateRender renderer = new DocuTemplateRender();
            str documentUrl = renderer.renderTemplateToStorage(template, filtersToApply);

            // Pass the workbook to the user
            if (documentUrl)
            {
                Browser b = new Browser();
                b.navigate(documentUrl, false, false);
            }
            else
            {
                error(strFmt("@ApplicationFoundation:DocuTemplateGenerationFailed", templateName));
            }
        }
        else
        {
            warning(strFmt("@ApplicationFoundation:DocuTemplateNotFound", templateName));
        }
    }
}

```

The following image shows the **General ledger > Journals > General journal** form with the **Open lines in Excel** button highlighted.

◀ Previous Next ▶

To programmatically add generated and template Open in Excel options, Open in Excel options can be added by implementing the `ExportToExcelGeneratedCustomExport` and `ExportToExcelTemplateCustomExport` interfaces. This allows the addition of options to forms where the entity or template doesn't have the same table as the root datasource. An example of when you would use this capability is on forms without a datasource, potentially containing only a collection of form parts. The following example adds generated and template Open in Excel options programmatically to the **FM Rental** form.

```

[Form]
public class FMRental extends FormRun implements ExportToExcelGeneratedCustomExport,
ExportToExcelITemplateCustomExport
{
...

    public List getExportOptions()
    {
        List exportOptions = new List(Types::Class);

        ExportToExcelExportOption exportOption =
ExportToExcelExportOption::construct(ExportToExcelExportType::CustomGenerated, int2str(1));
        exportOption.setDisplayNameWithDataEntity(tablestr(FMRentalEntity));
        exportOptions.addEnd(exportOption);

        ExportToExcelExportOption exportOption2 =
ExportToExcelExportOption::construct(ExportToExcelExportType::CustomTemplate, int2str(2));
        exportOption2.displayName("Analyze rentals");
        exportOptions.addEnd(exportOption2);

        return exportOptions;
    }

    public ExportToExcelDataEntityContext getDataEntityContext(ExportToExcelExportOption _exportOption)
    {
        ExportToExcelDataEntityContext context = null;

        if (_exportOption.id() == int2str(1))
        {
            context = ExportToExcelDataEntityContext::construct(tablestr(FMRentalEntity),
tablefieldgroupstr(FMRentalEntity, AutoReport));
        }

        return context;
    }

    public System.IO.Stream getTemplate(ExportToExcelExportOption _exportOption)
    {
        System.IO.Stream stream = null;

        if (_exportOption.id() == int2str(2))
        {
            stream =
Microsoft.Dynamics.Ax.Xpp.MetadataSupport::GetResourceContentStream(resourcestr(FMRentalEditableExportTempla
te));
        }

        return stream;
    }

    public void updateTemplateSettings(ExportToExcelExportOption _exportOption,
Microsoft.Dynamics.Platform.Integration.Office.ExportToExcelHelper.SettingsEditor _settingsEditor)
    {
    }
...

```

How do I add a filter for a programmatically-added template Open in Excel option?

A template Open in Excel option can be programmatically added by implementing the `ExportToExcelITemplateCustomExport` interface and providing a template in the `getTemplate` method. A filter for that option can be programmatically added by using the `ExportToExcelFilterBuilder` API in the `updateTemplateSettings` method.

```

public void updateTemplateSettings(ExportToExcelExportOption _exportOption,
Microsoft.Dynamics.Platform.Integration.Office.ExportToExcelHelper.SettingsEditor _settingsEditor)

{

_settingsEditor.SetFilterExpression(tableStr(RetailTmpBulkProductAttributeValueEntity),
element.getExportToExcelFilterExpression());

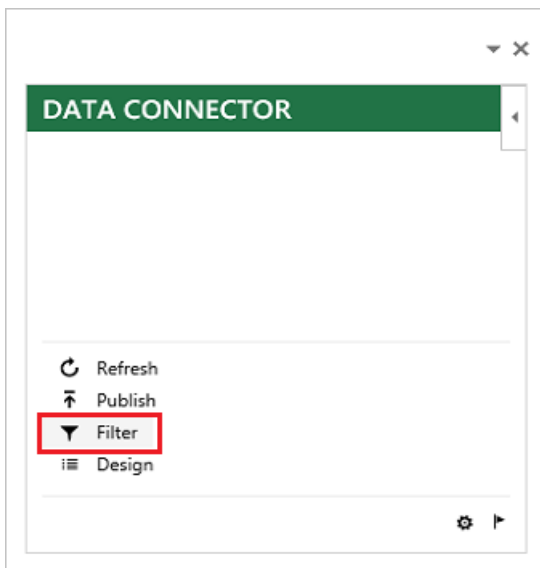

DictDataEntity dictDataEntity = new DictDataEntity(tableNum(RetailTmpBulkProductAttributeValueEntity));

_settingsEditor.SetFilterExpressionByPublicName(dictDataEntity.publicEntityName(),
element.getExportToExcelFilterExpression());

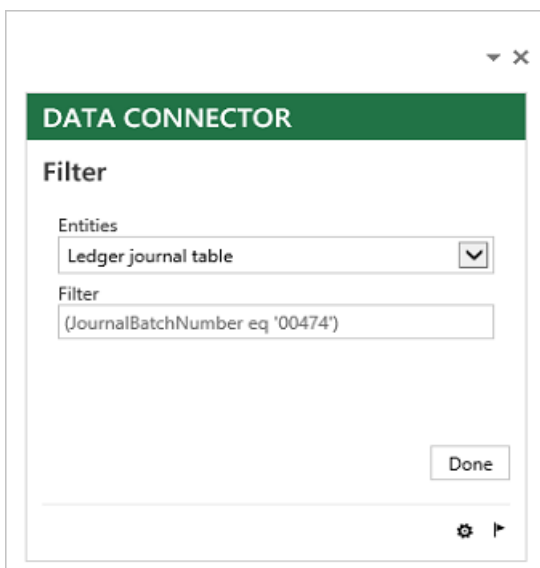

}

```

After a filter has been added programmatically, the resulting filter can be viewed in the Excel Add-in using the **Filter** button. The following image shows the Excel Add-in with the **Filter** button highlighted.

The following image shows the Excel Add-in with the **Filter** dialog box opened.

How do I enable relationship lookups in Excel?

To enable relationship lookups in the Excel Data Connector, you must ensure that the following metadata is set.

- The Role and Related Data Entity Role defined on the relationship need to be unique among all

relationships on both the source and target entity. Also, the relation role properties must be unique across all entities. This is particularly important for relationships involving entities with many relationships, such as DimensionCombinationEntity. If you're not seeing an expected lookup, try changing the role names to the following format:

- **Role:** [this entity's public name] + [target entity's public name] + [target entity field] + "Source"
- **Related Data Entity Role:** [this entity's public name] + [target entity's public name] + [target entity field] + "Target"
- The Cardinality and Related Data Entity Cardinality need to be set appropriately.
- At least one constraint must be added to the relationship. With the exception of dimension relationships, which are a special case, the properties constrained must both be public.

How can I enable users to create new header records as well as lines in a workbook?

To enable creation of header records and related lines, the header data source must be added as a set of "fields" and the lines data source must be added as a related table. This pattern can work well for document data entry scenarios such as Journal entry.

To learn more about header records and related lines, watch the short [Create an Excel template for header and line patterns in Dynamics 365 for Finance and Operations](#) video.

To design a workbook with header fields and a lines table that enables header creation:

1. In the Excel Add-in, click **Design** to open the Designer. Select **Add fields** to add a header data source.
2. Select the header fields that you want to use. Be sure to include all the key fields or the **New** button won't be enabled.
3. For all of the string header value fields, manually apply "Text" format for that cell using **Excel ribbon > Home tab > Number group > set "Number"** in the format drop-down menu. If the Text format isn't manually set on a string field and there's a string value with leading zeros like "00045", then Excel will automatically change it to "45" and an error will be shown like: *"Unable to change the value of PurchaseOrderHeader's PurchaseOrderNumber field as it is a key field"*. Currently, the API doesn't allow for automatically applying the text formatting on individual cells (versus table columns).
4. In the Designer, on the header data source, click the **Add related table** button represented by a double plus icon.
5. Select the line fields that you want to use.

Here's an example of a header data source with a related table data source.

- PurchaseOrderHeader (Fields)
 - dataAreald
 - PurchaseOrderNumber
 - PurchaseOrderName
 - OrderVendorAccountNumber
- PurchaseOrderLine (Table - related)
 - LineNumber
 - ItemNumber
 - LineDescription
 - OrderedPurchaseQuantity
 - LineAmount

To use a header and lines workbook to create a new header and lines, follow these steps:

1. In the workbook, move the focus to a cell with a header value.
2. In the Excel Add-in, click **New**.
3. Enter header values and lines as needed.
4. Select **Publish**.

How can fields be added, removed, or moved within an existing template workbook?

Fields can be added into an existing template workbook by editing the workbook stored in **Document Templates**.

1. Get the original template workbook.
 - a. Open the **Document Templates** form.
 - b. Find the existing template workbook.
 - c. Download the workbook.
 - d. Open the workbook and enable editing so that the Excel Add-in runs.
2. Make changes to the template.
 - a. In the Excel Add-in, select **Design**.
 - b. Click the **Edit** button (pencil icon) next to the datasource that you want to add a field into.
 - c. Add fields by moving them from the **Available fields** list into the **Selected fields** list. Double-clicking a field will move it. Remove fields by moving them from the **Selected fields** list into the **Available fields** list. Move fields using the **Up** and **Down** buttons.
 - d. After changes are complete, select **Update**, select **Yes** to confirm, and then select **Done** to exit the Designer (if appropriate, select **Refresh** to verify that the data is correctly populated).
 - e. Clear the data from the template before upload by clicking **Options** (gear icon), expand the **Data Connector** section, then click the **Clear binding data** button.
 - f. Use **Save As** to store the template somewhere temporarily.
3. Upload the changed template.
 - a. Return to the **Document Templates** form and upload the changed template.
 - b. Click **New** and browse to find the changed template.
 - c. Select the saved template file and click **Open**.
 - d. In the **Upload template** dialog box, remove the underscore and trailing random number from the name. For example, "CustInvoiceJournalTemplate_636564840743000567" becomes "CustInvoiceJournalTemplate".
 - e. A confirmation dialog box should show that "A template with this name already exists...", click **Yes** to confirm replacement of the previous template. Note that if this confirmation is not shown, then the template name is different and it is being uploaded as a new template.
4. Open the form that the template is used on and use the changed template.

Troubleshooting

If you are not seeing an expected lookup, validate relationship metadata by checking the metadata feed available at [YourSiteURL]/data/\$metadata. Search the \$metadat feed for the public name of your entity to find its EntityType element, then make sure there is a child NavigationProperty element with a name equal to the Role value of the relationship. If the navigation property exists, it will be used by the Excel Data Connector to show a relationship lookup. Lookups are not shown under the following conditions:

- All of the entity's key fields are included as constraints in the relationship.
- The selected field is a key and the selected record is not new.

- The authenticated user does not have permission to access the entity targeted by the lookup.

How do dimensions work?

The easiest way to set up dimension metadata on data entities is to use the data entity creation wizard, which will automatically create the private relationships and public display value fields exactly as the dimensions framework needs them. If you want to customize your dimensions setup, see [Add dimensions to Excel templates](#). Lookups, are only generated automatically for non-ledger dimensions. Custom dimensions are not supported currently. If you want to enable lookups for ledger dimensions (MainAccount, Department, CostCenter, etc.), see [Add dimensions to Excel templates](#) for guidance on creating relationships on DimensionCombationEntity and DimensionSetEntity fields. When those relationships are present, relationship lookups will be displayed in the Excel Data Connector. The Excel Data Connector supports two types of dimension data entry: editing the display value directly or editing each attribute of the display value in a separate column. If both the display value column and the individual attribute columns are bound, they can both be edited and published separately. If both the display value and an individual attribute are edited in the same row, the individual attribute change overrides the display value change.

How do I create formula table columns?

If a formula is needed in a table, then add a formula column. When in the field selection page for a table binding, click the **Formula** button above the Selected fields list to add a new formula column. The label and value for the formula are entered in the fields immediately below the Selected fields list. After adding a new formula column, leave the value empty and click **Update**. After the field has been added to the table, use standard Excel capabilities to create a formula, then copy the formula and paste it into the formula column value field. When defining a formula, make sure there is more than one row in the table, otherwise the formula that Excel provides may be for ALL rows instead of THAT row. To specify just the current row, the at sign (@) is needed. For example, sum of four columns for all rows `"=SUM(Table1[[ColumnA]:[ColumnD]])"` versus sum of four columns for the current row `"=SUM(Table1[@[ColumnA]:[ColumnD]])"`.

Known issues

Refresh doesn't automatically occur in old templates

The ability to control "refresh on open" was added as a setting. To add this to the default behavior, existing templates and workbooks need to have the **Refresh on open** check box selected in **Options > Data Connector > Refresh Options**.

Error finding entity

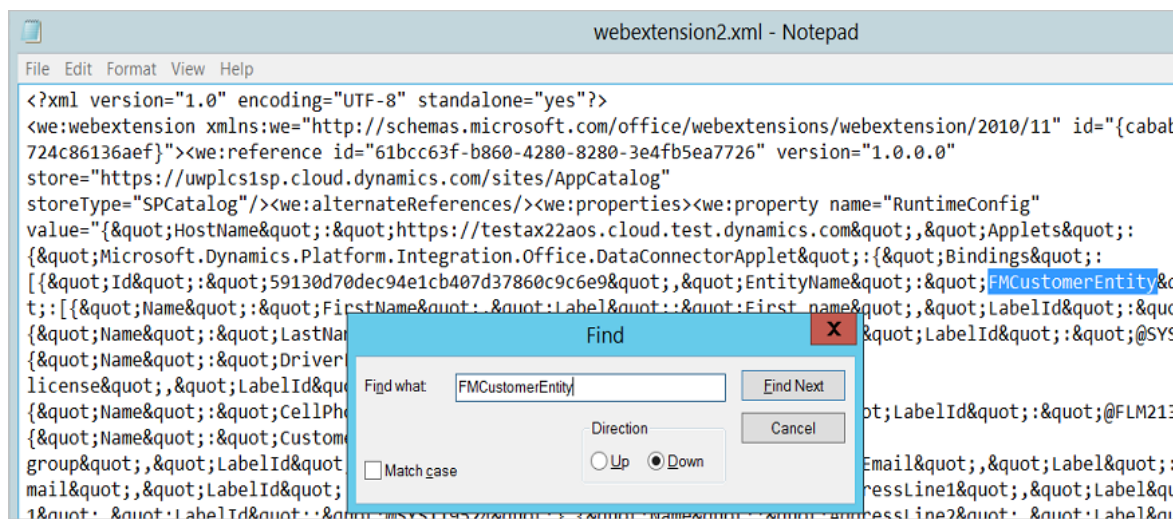

The reference to entities changed from using the Private Entity Name (DataEntity.Name) to Public Entity Name (DataEntity.PublicEntityName). If the public and private names for an entity were different and that entity was used in an Excel template or workbook, then this will cause the following error to be displayed in the Excel App: "Error Finding Entity. Details: Entity "<DataEntity.Name>" not found".

To resolve this, change the binding information in the affected template so that it points to DataEntity.PublicEntityName instead of DataEntity.Name.

1. For the DataEntity.Name that needs to be replaced, determine the DataEntity.PublicEntityName, for example replace FMCustomerEntity with FleetCustomer.
2. Find the affected template.
3. Change the file extension on the template from .xlsx to .zip.

4. The file to be changed will be one of the webextension*.xml files in the xlwebextensions directory, such as 2015-05-25-FleetCustomersWithLocations.zipxlwebextensionswebextension2.xml.
5. Open the file to ensure that you have the correct location.
6. Find the DataEntity.Name, such as FMCustomerEntity.

7. Extract the zip file.
8. Open the webextension xml file.
9. Replace the DataEntity.Name with the corresponding DataEntity.PublicEntityName.
10. Save the webextension .xml file changes.
11. Rename the old zip file, for example, add ".old" to the name.
12. Create a new zip file of all the previously extracted content. This usually involves highlighting the content inside the archive/zip folder and creating a zipped folder using that content.
13. Verify that the zip file has the "_rels", "docProps", and "xl" folders in the root of the zip file.
14. Rename the zip file as needed, for example rename the file 2015-05-25-FleetCustomersWithLocations.zip.
15. Change the zip file extension to .xlsx.
16. Re-publish the workbook .xlsx file, if needed.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

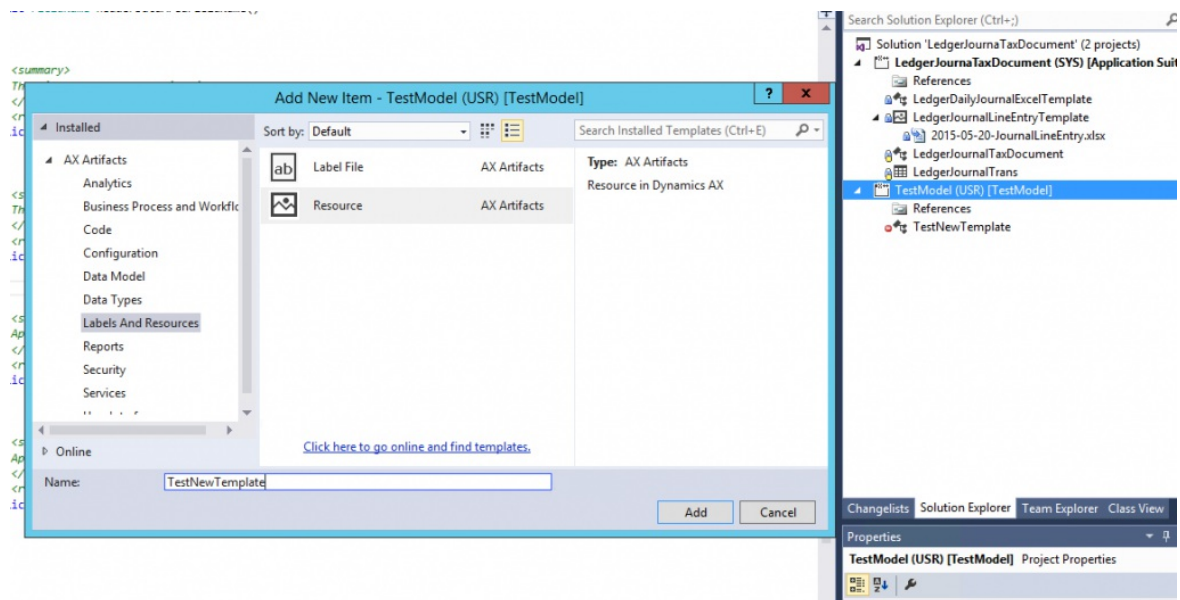

Add templates to the Open lines in Excel menu

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how you can promote a template to the Open lines in the Excel menu that is available on journal pages.

Some of the most frequently used templates are the journal templates. Some of these journal templates have been promoted so that they appear on the **Open lines in Excel** menu by default. However, when you add a new template to the system, it's available on the **Open in Office** menu by default. To promote the template so that it's available on the **Open lines in Excel** menu, follow these steps.

1. Create a Microsoft Excel template, and save it locally. For more information, see the "Create Open in Excel experiences" article.
2. In Microsoft Visual Studio, create a new project for a model that has a reference to the ApplicationSuite model.

3. Create a new class, implement the **LedgerJournalExcelTemplate** interface, and extend **DocuTemplateRegistrationBase**. Your implementation (supported journal type, and so on) defines the context that your template will be available as an option for in the Open in Excel experience. This example uses **LedgerJournalHeaderEntity** and **LedgerJournalLineEntity**, but you aren't limited to these entities. You can define your own entities, provided that they entities follow the journal header/line entity pattern. Here is an example from the **LedgerDailyJournalExcelTemplate** class.

```
using Microsoft.Dynamics.Platform.Integration.Office;
public class TestNewTemplate extends DocuTemplateRegistrationBase implements
LedgerJournalExcelTemplate
{
    private const DocuTemplateName ExcelTemplateName = resourceStr(TestNewTemplate);
    private const EntityName LineEntityName = tableStr(LedgerJournalLineEntity);
    private const FieldName LineEntityJournalNum = fieldStr(LedgerJournalLineEntity,
JournalBatchNumber);
    private const FieldName LineEntityDataAreaId = fieldStr(LedgerJournalLineEntity, dataAreaId);
    private const FieldName HeaderEntityName = tableStr(LedgerJournalHeaderEntity);
    private const FieldName HeaderEntityJournalNum = fieldStr(LedgerJournalHeaderEntity,
JournalBatchNumber);
    private const FieldName HeaderEntityDataAreaId = fieldStr(LedgerJournalHeaderEntity, dataAreaId);
    /// <summary>
```

```

/// A boolean value which indicates whether the journal type is supported for the Excel template.
/// </summary>
/// <param name = "_ledgerJournalType">The ledger journal type.</param>
/// <returns>True if the journal type is supported; otherwise, false.</returns>
public boolean isJournalTypeSupported(LedgerJournalType _ledgerJournalType)
{
    return _ledgerJournalType == LedgerJournalType::Daily;
}
/// <summary>
/// Gets the document template name.
/// </summary>
/// <returns>The document template name</returns>
public DocuTemplateName documentTemplateName()
{
    return ExcelTemplateName;
}
/// <summary>
/// Gets a collection of the supported account types for the entity.
/// </summary>
/// <returns>A collection of <c>LedgerJournalACType</c> values.</returns>
public Set supportedAccountTypes()
{
    Set accountTypeSet = new Set(Types::Integer);
    accountTypeSet.add(LedgerJournalACType::Ledger);
    return accountTypeSet;
}
/// <summary>
/// Gets a collection of the supported offset account types for the entity.
/// </summary>
/// <returns>A collection of <c>LedgerJournalACType</c> values.</returns>
public Set supportedOffsetAccountTypes()
{
    Set offsetAccountTypeSet = new Set(Types::Integer);
    offsetAccountTypeSet.add(LedgerJournalACType::Ledger);
    return offsetAccountTypeSet;
}
/// <summary>
/// Validates the journal is valid for the template.
/// </summary>
/// <param name = "_ledgerJournalTable">The <c>LedgerJournalTable</c> record.</param>
/// <returns>True if the journal is valid for the template; otherwise, false.</returns>
public boolean validateJournalForTemplate(LedgerJournalTable _ledgerJournalTable)
{
    return LedgerJournalExcelTemplate::validateJournalForTemplate(_ledgerJournalTable, this);
}
public void registerTemplates()
{
    this.addTemplate(
        OfficeAppApplicationType::Excel,
        ExcelTemplateName,
        ExcelTemplateName,
        'Test new template',
        'Test new template',
        NoYes::No,
        NoYes::No,
        NoYes::No);
}
/// <summary>
/// The resource name of the header entity.
/// </summary>
/// <returns>The resource name of the header entity.</returns>
public EntityName headerEntityName()
{
    return HeaderEntityName;
}
/// <summary>
/// The resource name of the line entity.
/// </summary>
/// <returns>The resource name of the line entity.</returns>

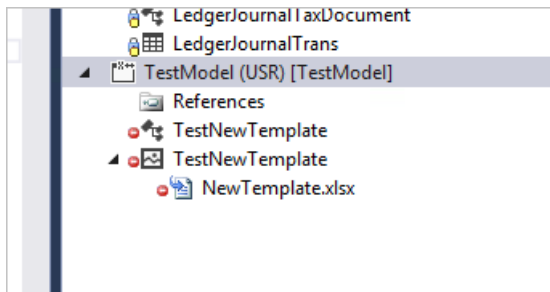

```

```

public EntityName lineEntityName()
{
    return LineEntityName;
}
/// <summary>
/// The field name for the header journal batch number.
/// </summary>
/// <returns>The field name for the header journal batch number.</returns>
public FieldName headerJournalBatchNumberFieldName()
{
    return HeaderEntityJournalNum;
}
/// <summary>
/// The field name for the header data area.
/// </summary>
/// <returns>The field name for the header data area.</returns>
public FieldName headerDataAreaFieldName()
{
    return HeaderEntityDataAreaId;
}
/// <summary>
/// The field name for the line journal batch number.
/// </summary>
/// <returns>The field name for the line journal batch number.</returns>
public FieldName lineJournalBatchNumberFieldName()
{
    return LineEntityJournalNum;
}
/// <summary>
/// The field name for the line data area.
/// </summary>
/// <returns>The field name for the line data area.</returns>
public FieldName lineDataAreaFieldName()
{
    return LineEntityDataAreaId;
}
/// <summary>
/// Append additional filter to the default filtering behavior.
/// </summary>
/// <returns>The original filter with new filter(s) appended; Otherwise, the original
filter</returns>
public FilterCollectionNode appendHeaderEntityFilters(FilterCollectionNode _headerFilter,
ExportToExcelFilterTreeBuilder _headerFilterBuilder)
{
    return _headerFilter;
}
/// <summary>
/// Append additional filter to the default filtering behavior.
/// </summary>
/// <returns>The original filter with new filter(s) appended; Otherwise, the original
filter</returns>
public FilterCollectionNode appendLineEntityFilters(FilterCollectionNode _lineFilter,
ExportToExcelFilterTreeBuilder _lineFilterBuilder)
{
    FilterCollectionNode lineFilter = _lineFilterBuilder.and(
        _lineFilterBuilder.areEqual(fieldStr(LedgerJournalLineEntity, AccountType),
LedgerJournalACType::Ledger),
        _lineFilterBuilder.areEqual(fieldStr(LedgerJournalLineEntity, OffsetAccountType),
LedgerJournalACType::Ledger));
    return _lineFilterBuilder.and(_lineFilter, lineFilter);
}
}

```

4. Build the project/model that has the new resources. You should have one new resource and one new class.

5. In the client, go to **Common > Common > Office integration > Document templates > Reload system templates**. You will see the new template in the list, and if you open the journal page that you added the template to, you will also see that template on the **Open lines in Excel** menu.

Customize the Open in Microsoft Office menu

2/18/2021 • 10 minutes to read • [Edit Online](#)

Applies to these Dynamics 365 apps:

Commerce, Finance, Supply Chain Management

Most pages include an Open in Microsoft Office menu. This topic provides information about the Open in Office menu, and explains how to customize it by adding, removing, and changing options.

Overview

The **Open in Microsoft Office** menu button (**Open in Office** menu) is a system-defined button that appears on pages. The **Open in Office** menu contains menu items that let you export data to various Office products, such as Microsoft Excel and Microsoft Word. The following table describes the menu items on the **Open in Office** menu.

MENU ITEM	DESCRIPTION
Export to Excel	The data is exported to an Excel workbook. The workbook contains no references back to Finance and Operations, and the data can't be refreshed.
Export to Word	The data is exported to a Word document. The document contains no references back to Finance and Operations, and the data can't be refreshed.
Open in Excel	A workbook is created that contains the Microsoft Dynamics Office add-in. The workbook contains a reference back to Finance and Operations, and the data can be refreshed, updated, and published from the Data Connector that is hosted in the add-in.

How menu items are added to the Open in Office menu

The export options are added to the **Open in Office** menu in the following manner:

1. In the **Export to Excel** group, a menu item is added for each visible grid.
2. For each root data source on the page, the set of data entities that have the same root data source is determined. For each of these data entities, the following menu items are added:
 - In the **Open in Excel** group, a menu item is added for a default export of the data entity.
 - In the **Open in Excel** group, a menu item is added for each Document Template record of the **Excel** type that has the same root data entity and is marked for inclusion on the **Open in Office** menu.
 - In the **Export to Word** group, a menu item is added for each Document Template record of the **Word** type that has the same root data entity and is marked for inclusion on the **Open in Office** menu.

Default exports

The **Open in Office** menu provides a default export for each data entity. This export includes all the fields in the **AutoReport** group on the data entity. If **SaveDataPerCompany** is set to **Yes** for the data entity, a filter is applied to limit the data to the current company.

Document templates

Document templates can be added from the **Document templates** page. Several fields that are associated with each Document Template record control the behavior of that template on the **Open in Office** menu.

FIELD	DESCRIPTION
Root data entity	The root data entity of the template. The root data entity is used to determine which pages the template can be included on.
List in Office menu	If this field is selected, the template will be included on the Open in Office menu on applicable pages. (The applicable pages depend on the root data entity).
Apply record filter	If this field is selected, the data will be filtered, based on the record that is currently selected on the page.
Apply company filter	If this field is selected, the data will be filtered, based on the current company.

Trimmed template columns and fields

For Excel templates that are included on the **Open in Office** menu, columns and fields will be trimmed from the workbook, based on the configuration keys that are applied to the system and the applicable country/region context. If a configuration key is associated with a column or field in the workbook, the column or field will be removed if the configuration key is disabled. If a set of country/region codes is associated with the column or field in the workbook, the column or field will be removed if the country/region code isn't in scope.

Open in Office menu customization

There are several methods for customizing the content that appears on the **Open in Office** menu on a given page. For example, you can customize the content statically through metadata properties on model element and code attributes. However, customization via code gives you the finest level of control. In code, you can either implement one or more interfaces on a page, or use extensions and event subscriptions. The following sections describe the customization scenarios that are most often used.

Modifying the Open in Office menu through interfaces

If you must modify a page that you own, interfaces are the most appropriate customization method, because they give access to all private members of the page and allow for deeper customization. You can apply the following interfaces to the code for a page.

INTERFACE	DESCRIPTION
OfficeMenuCustomizer	Use this interface to modify the set of data entities that is considered for a page and add custom menu items.
OfficeGeneratedWorkbookCustomExporter	Use this interface to do a custom export of a workbook that is generated at run time.
OfficeTemplateCustomExporter	Use this interface to do a custom export that is based on a Document Template record.

Modifying the Open in Office menu through extensions and event subscriptions

If you must modify a page that you don't own, you should avoid using interfaces, because that approach will

require over-layering. Instead, you should do the customization through extensions and event subscriptions. To use this approach, implement an extension class that subscribes to the **OnInitializing** event of the page that you're customizing. From this event handler, get the **OfficeFormRunHelper** for the page, and subscribe to its **OfficeMenuInitializing** event. The following example shows sample code for this approach.

```
public static class MyForm_Extension
{
    [FormEventHandler(formStr(MyForm), FormEventType::Initializing)]
    public static void ExportToExcel_DataEntityCustom_OnInitializing(xFormRun sender, FormEventArgs e)
    {
        FormRun formRun = sender as FormRun;
        if (formRun)
        {
            OfficeFormRunHelper officeHelper = formRun.officeHelper();
            if (officeHelper)
            {
                officeHelper.OfficeMenuInitializing +=
                eventhandler(MyForm_Extension::officeMenuInitializingHandler);
            }
        }
    }
    private static void officeMenuInitializingHandler(FormRun _formRun, OfficeMenuEventArgs _eventArgs)
    {
        // Modify the OfficeMenuOptions available on the OfficeMenuEventArgs.menuOptions() as necessary.
    }
}
```

Typical customization scenarios

The following examples assume that the `_menuOptions` variable contains the **OfficeMenuOptions** instance that you're customizing.

Modifying the set of data entities that is considered for a page

Many of the menu items on the **Open in Office** menu are added automatically, based on the data entities that are considered for the page. However, in some cases, the algorithm that is used to determine the set of data entities might not determine the correct set. To modify the set of data entities that is considered for the page, you can use the **OfficeMenuOptions** that is available from either the **OfficeMenuCustomizer.customizeMenuOptions** method or the **OfficeFormRunHelper.OfficeMenuInitializing** delegate.

```
// Add an entity to the list
OfficeMenuDataEntityOptions entityOptions = OfficeMenuDataEntityOptions::construct(tableStr(MyEntity));
_menuOptions.dataEntityOptions().addEnd(entityOptions);
// Remove an entity from the list
ListIterator dataEntityOptionsIterator = new ListIterator(_menuOptions.dataEntityOptions());
while (dataEntityOptionsIterator.more())
{
    OfficeMenuDataEntityOptions dataEntityOptions = dataEntityOptionsIterator.value();
    if (dataEntityOptions.dataEntityName() == tableStr(MyOtherEntity))
    {
        dataEntityOptionsIterator.delete();
    }
    else
    {
        dataEntityOptionsIterator.next();
    }
}
```

Specifying the default data entity–related options that are included

The **OfficeMenuDataEntityOptions** class lets you specify whether to include a menu item for a default export or a menu item that is related to a document template.

```
// Find the entity options if they were included by default.
OfficeMenuDataEntityOptions entityOptions = _menuOptions.getOptionsForEntity(tableStr(MyEntity));
if (!entityOptions)
{
    // The entity options were not included. Add them.
    entityOptions = OfficeMenuDataEntityOptions::construct(tableStr(MyEntity);
    _menuOptions.dataEntityOptions().addEnd(entityOptions);
}
entityOptions.includeDefault(false); // Don't include the default export menu item.
entityOptions.includeTemplates(false); // Don't include Document Template related menu items.
```

Adding a custom export menu item – Generating a workbook

To explicitly add a menu item, you must add it to the **OfficeMenuOptions.customMenuItems()** list. To add a menu item that corresponds to a workbook that is generated at run time, use an

OfficeGeneratedExportMenuItem.

```
OfficeGeneratedExportMenuItem menuItem = OfficeGeneratedExportMenuItem::construct(tableStr(MyEntity),
"MyCustomGeneratedExportId");
menuItem.setDisplayNameWithDataEntity();
_menuOptions.customMenuItems().addEnd(menuItem);
```

To define what is actually exported, use an **ExportToExcelDataEntityContext**. The method for specifying the **ExportToExcelDataEntityContext** depends on whether you're using interfaces or extensions and event subscriptions to customize the **Open in Office** menu.

Using interfaces

If you're using interfaces, you must implement the

OfficeGeneratedWorkbookCustomExporter.getDataEntityContext() method.

```
public ExportToExcelDataEntityContext getDataEntityContext(OfficeGeneratedExportMenuItem _menuItem)
{
    ExportToExcelDataEntityContext context = null;
    if (_menuItem.id() == "MyCustomGeneratedExportId")
    {
        context = ExportToExcelDataEntityContext::construct(tableStr(MyEntity), tableFieldGroupStr(MyEntity,
MyFieldGroup));
    }
    return context;
}
```

Using extensions and event subscriptions

If you're using extensions and event subscriptions, the

OfficeGeneratedExportMenuItem.getDataEntityContext delegate should be subscribed to before you add the menu item to the **OfficeMenuOptions.customMenuItems()** list. The code for the event handler should resemble the preceding code for the interface. The following example shows how to do the event subscription.

```
menuItem.getDataEntityContext += eventhandler(MyForm_Extension::getDataEntityContextHandler);
```

Adding a custom export menu item – Specifying a document template

To explicitly add a menu item, you must add it to the **OfficeMenuOptions.customMenuItems()** list. To add a menu item that corresponds to a Document Template record, use an **OfficeTemplateExportMenuItem**.

```
OfficeTemplateExportMenuItem menuItem =
OfficeTemplateExportMenuItem::construct(OfficeAppApplicationType::Excel, "MyTemplateId",
"MyCustomTemplateExportId");
_menuOptions.customMenuItems().addEnd(menuItem);
```

To modify the template at run time, you can supply a set of initial filters. These filters will replace any filters in the template for the specified data entities. Additionally, you can modify filters and specify many settings by using **WorkbookSettingsManager**. The following sections show examples.

Using interfaces

If you're using interfaces, you must implement the

OfficeTemplateCustomExporter.getInitialTemplateFilters() and **OfficeTemplateCustomExporter.updateTemplateSettings()** methods.

```
public Map getInitialTemplateFilters(OfficeTemplateExportMenuItem _menuItem)
{
    Map initialFilters = new Map(Types::String, Types::Class);
    if (_menuItem.id() == "MyCustomTemplateExportId")
    {
        // Add an initial filter.
        ExportToExcelFilterTreeBuilder bldr = new ExportToExcelFilterTreeBuilder(_menuItem.dataEntityName());
        FilterNode filter = // create the filter..
        initialFilters.insert(_menuItem.dataEntityName(), filter);
    }
    return initialFilters;
}
public void updateTemplateSettings(OfficeTemplateExportMenuItem _menuItem,
Microsoft.Dynamics.Platform.Integration.Office.SettingsManager _settingsManager)
{
    if (_menuItem.id() == "MyCustomTemplateExportId")
    {
        // Set a new filter.
        ExportToExcelFilterTreeBuilder bldr = new ExportToExcelFilterTreeBuilder(_menuItem.dataEntityName());
        FilterNode filter = // create the filter..
        Excel.WorkbookSettingsManager workbookSettingsManager = _settingsManager as Excel.WorkbookSettingsManager;
        workbookSettingsManager.SetEntityFilter(entityMetadata.PublicEntityName, filter);
        // Adjust settings.
        DataConnectorAppletSettings settings = settingsManager.DataConnectorSettings;
        DataConnectorAppletUserOptions options = settings.DataOptions;
        options.RefreshOnOpen = true;
        options.EnableDesign = false;
        workbookSettingsManager.DataConnectorSettings = settings;
    }
}
```

Using extensions and event subscriptions

If you're using extensions and event subscriptions, the

OfficeTemplateExportMenuItem.getInitialTemplateFilters and **OfficeTemplateExportMenuItem.updateTemplateSettings** delegates should be subscribed to before you add the menu item to the **OfficeMenuOptions.customMenuItems()** list. The code for the event handlers should resemble the preceding code for the interface. The following example shows how to do the event subscription.

```
menuItem.getInitialTemplateFilters += eventhandler(MyForm_Extension::getInitialTemplateFiltersHandler);
menuItem.updateTemplateSettings += eventhandler(MyForm_Extension::updateTemplateSettingsHandler);
```

Additional customizations

The following customizations let you modify the contents of the **Open in Office** menu for a page without using

interfaces or extensions and event handlers.

Removing an Export to Excel menu item for a grid

On the **Open in Office** menu, the **Export to Excel** group will contain a menu item for each visible grid. To remove a grid from the **Open in Office** menu, set the **ExportAllowed** metadata property on the grid to **No**. After you make this change, users won't be able to export the grid by using the shortcut menu for the grid.

Renaming an Export to Excel menu item for a grid

To rename the **Export to Excel** menu item that is related to a grid, set the **ExportLabel** metadata property on the grid to the appropriate label.

Removing all menu items for a data entity from all pages

Integration scenarios require that some data entities be publicly available via the OData Service. However, it isn't always appropriate that these data entities appear on the **Open in Office** menu by default. In this scenario, you can add the **OfficeMenuOmit** code attribute to the entity declaration.

```
[OfficeMenuOmit]
public class MyEntity extends common
{
    // Entity code...
}
```

After you make this change, by default, the entity won't appear on the **Open in Office** menu on pages that have a matching root data source. However, if the entity should be added to a specific page, you can use other customization mechanisms to add it.

Adding a menu item button to a page that corresponds to an Open in Office menu entry

Sometimes, it's appropriate that the Action Pane of a page have a menu item button that corresponds to a custom menu item on the **Open in Office** menu. In this case, you can model a menu item button that has the following properties:

- **Menu Item Type:** Action
- **Menu Item Name:** ExportToExcelExportForm
- **Parameters:** The ID of the menu item

Then, a mouse click of this menu item button is equivalent to a mouse click of the corresponding menu item on the **Open in Office** menu.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure and send email

2/18/2021 • 13 minutes to read • [Edit Online](#)

The behavior of the email subsystem is influenced by a combination of administrator configuration, user configuration, and user choices. This topic is divided into sections for administrators and users to make it easy to find relevant information.

Both administrators and users set the behavior of the email subsystem.

[Administrator] Email parameters page

Configuration tab

On the **Email parameters** page, note the following settings on the **Configuration** tab.

FIELD	DESCRIPTION
Batch email provider	Specifies which email provider will be used to send emails that are sent by processes in a batch or non-interactive manner. The Exchange provider will use the account associated with the batch process.
Attachment size limit	Specifies the maximum size of a single email that can be sent via the email subsystem.

In Platform update 32, an **Email history** page was added to allow administrators to review all sent emails, including any errors that might have prevented an email from being sent. By default, the last 30 days of email history is retained. This can be configured by changing the **Number of days to retain email history** to a non-zero amount. Zero provides the default amount and behavior.

In version 10.0.16/Platform 40, an **Email throttling** section is visible, if your environment has enabled the **Email throttling** feature in Feature management. This feature allows non-interactive email providers (such as the batch email provider) to adhere to a per-minute sending limit. This can prevent errors from the system attempting to send more emails than the provider allows. The sending limits for Microsoft 365 email providers are set automatically according to [Exchange Online sending limits](#). Manual configuration is required for all other email providers. The per-minute sending limit can be removed from a provider by resetting the **per-minute email sending limit** field to 0.

SMTP settings tab

On the **Email parameters** page, note the following settings on the **SMTP settings** tab.

FIELD	DESCRIPTION
Outgoing mail server	The host name of the desired SMTP server. <ul style="list-style-type: none">For Microsoft 365 production (including *.onmicrosoft.com accounts) use smtp.office365.com. (You can find this setting at outlook.office.com at Settings > Mail > POP and IMAP.)For Outlook/Hotmail use smtp-mail.outlook.com.
SMTP port number	Typically, the port number should be set to 587 for secure transport.

FIELD	DESCRIPTION
User name and Password	Specify, as needed, to send the email via the appropriate mail account. All users need to provide the SMTP account Send As and Send On Behalf Of permissions to enable the ability to send Simple Mail Transfer Protocol (SMTP) mail. You can configure Send As permissions in the Microsoft 365 admin center (portal.office.com/Admin), at Users > Active users > User > Edit mailbox permissions > Send email from this mailbox . For more information, see Enable sending email from another user's mailbox in Microsoft 365 .
Specify if SSL is required	Determines whether secure transport is used. Typically, this is Yes , except for internal or troubleshooting scenarios.

[Administrator] Email distributor batch process

Email that is sent directly from the server, without user interaction, via SMTP is sent by the **Email distributor batch** process. That batch process must be started to process the email queue. To start the process, open the **Email distributor batch** pane (**System administration > Periodic tasks > Email processing > Batch**) and turn on **Batch processing**.

If the Exchange provider is used, then the user account associated with the batch process (usually admin) will be sender.

[Administrator] User email

The default **send from** address for each user is pulled from the **Email** field on the **Users** page (**System administration > Users > Users**). Administrators can override this **send from** default if needed using the **Sender email** field on the **Options** page.

[User] Email provider selection section on the Options page

The **Options** page can be opened via **Settings > User options**. The **Email provider selection** section is on the **Account** tab.

FIELD	DESCRIPTION
Email provider ID	Allows the user to select the email provider that should be used when sending an email. Selecting an option here is the equivalent of selecting Do not ask again in the How would you like to send email dialog box. Selecting the blank option Prompt for which email provider to use will cause the How would you like to send email dialog box to display when an email is going to be sent.

FIELD	DESCRIPTION
Sender email	<p>Allows the administrator to provide an email address override for the user in the From field of the email. By default, the email alias that is associated with the user account is used as the From field in new emails, but this user option email address will override that. When sending email via SMTP, the user needs to have appropriate Send As and Send On Behalf Of permissions configured in Exchange or on the SMTP server.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>[!NOTE] You can configure Send As and Send On Behalf Of permissions in the Microsoft 365 admin center (portal.office.com/Admin) at Users > Active users > User > Edit mailbox permissions > Send email from this mailbox. For more information, see Enable sending email from another user's mailbox in Microsoft 365.</p> </div>

[User] How would you like to send email dialog box (optional)

When an email is going to be sent, the user will see the **How would you like to send email** dialog box that will list the available options for sending email.

FIELD	DESCRIPTION
Use an email app, such as Outlook	Provides the user with a generated email (.eml) file.
Use Exchange email server	Uses the Exchange Online server associated with the tenant. On-premises Exchange servers are currently not supported for the Exchange mail provider.
Use the system email client	Opens the Send email composition dialog box and then sends the resulting email via SMTP.
Do not ask again	If this field is not selected, the next time an email is sent the most recently selected option will be used and the dialog box will not open.

[User] Send email dialog box (optional)

The **Send email** dialog box is opened to allow the user to edit the contents of the email that will be sent. Some of the following fields will be pre-populated in this window.

FIELD	DESCRIPTION
From	Populated from the Email field on the Options page.
To, Cc, Bcc, Subject, and Body	Populated with values specified by the process that initiated the sending of the email. These fields can be edited as needed by the user.
Attachments list	May be populated with attachments specified by the process that initiated the sending of the email. This list can be edited as needed by the user.

When the email is ready to be sent, the **Send** button will cause the email to be sent via SMTP.

Usage scenarios to verify if email is configured correctly

Send mail via a local mail client

Email workflows that are enabled via the SysEmail framework can generate email messages (.eml files) that contain attachments. You can then send these messages via Microsoft Outlook or another email client.

1. In Internet Explorer, navigate to **Accounts receivable > Customers > All customers**.
2. Select **US-008 Sparrow Retail**.
3. Click **Collect > Customer balances > Collections** to open the **Collections** page.
4. Click **Communicate > Email > Statements to contact**.
5. Click **OK** to accept the default values in the dialog box.
6. If you're prompted for the mail option to use, clear the **Do not ask again** check box (you can change this option from the **User options** page), select **Use an email app, such as Outlook**, and then click **OK**.
7. If you're using Internet Explorer on your computer, open the email (.eml) file that is generated. If you're using Internet Explorer on the VM, copy the file to your computer, and open it there.
8. Note the email address in the **To** field and the generated workbook attachment.

Send mail via SMTP

Email workflows that are enabled via the SysEmail framework can also be created in a simple email dialog box and then sent via Simple Mail Transfer Protocol (SMTP).

1. Go to the **Email parameters** page.
2. Click **SMTP settings**.
3. Set the **Outgoing mail server** to the desired SMTP server:
 - For **Microsoft 365 production** (including *.onmicrosoft.com accounts) use smtp.office365.com. (Find this setting via outlook.office.com, at **Settings > Mail > POP and IMAP**.)
 - For Outlook/Hotmail use smtp-mail.outlook.com.
4. Set the user name and password to an appropriate email account and password.
5. Leave **SSLRequired** turned on, and leave **SMTP port number** set to **587**.
6. Click **Save**.
7. In Internet Explorer, navigate to **Accounts receivable > Customers > All customers**.
8. Select **US-008 Sparrow Retail**.
9. Click **Collect > Customer balances > Collections** to open the **Collections** page.
10. Click **Communicate > Email > Statements to contact**.
11. Click **OK** to accept the default values in the dialog box.
12. If you're prompted for the mail option to use, select **Use the Microsoft Dynamics 365 for Finance and Operations email client**, and then click **OK**.
13. To receive the test message, change the **To address** to your email address.

Ensure that the account specified in the SMTP settings is able to **Send As** and **Send On Behalf Of** your email account. The easiest way to ensure this is to use your email account in the SMTP settings.

14. Enter a subject and body for the message.

15. Click **Send**. The message should be delivered in one to five minutes.

[Administrator] Workflow email notifications

Workflow email configuration is a collection of related settings that work in conjunction.

Workflow email notification setup

1. Verify email settings:
 - a. Go to **System administration > Setup > Email > Email parameters**.
 - b. Verify that SMTP is enabled.
 - c. Set the SMTP mail server settings.
2. Verify that the email batch process is running:
 - a. Go to **System administration > Periodic tasks > Email processing > Email distributor batch**.
 - b. Enable the **Batch processing** option.
 - c. Optionally, adjust the recurrence of the email process:
 - a. Select **No end date** to adjust all recurrences of the email batch process.
 - b. Adjust the count.
 - c. Adjust to run every minute if needed.
3. Verify workflow notification system email templates:
 - a. Go to **System administration > Setup > Email > System email templates** (for system-wide templates).
 - b. Verify that the **Sender email** field is set and valid.
4. Verify workflow notification organization email templates:
 - a. Go to **Organization administration > Setup > Organization email templates** (for organization-specific templates).
 - b. Verify that the **Sender email** field is set and valid.
5. Verify that the user can receive email notifications:
 - a. Go to **Settings > User options**.
 - b. Go to the **Account** tab.
 - a. Set the **Email provider ID** (for example, SMTP).
 - b. Optionally, set a **Sender email** override if the default **send from** address should not be used for the current user.
 - c. Navigate to the **Workflow** tab. Set the option to send notifications in email to **Yes**.
6. Verify that the workflow system will send email notifications:

For each workflow that should have a notification, open the workflow properties in the workflow editor.

 - a. Click **Basic settings**. Adjust the email template for the workflow notifications.
 - b. Click **Notifications**.
 - a. Enable the events for which a user should be notified.
 - b. Set the recipient of the workflow notification for each event notification that is enabled.
 - c. On a workflow approval element for which a user should be notified:

- a. Go to **Properties**.
- b. Enable the events for which a user should be notified.
- c. Set the recipient of the workflow notification for each event notification that is enabled.

Workflow email notification testing

The testing for email notifications is to simply trigger the notification and then check for it.

1. Submit a workflow that has been set up for email notifications.
2. Check the workflow history to make sure that a workflow work item was assigned to the expected user.
3. Check the status of the pending email notification in **System administration > Periodic tasks > Email processing > Batch email sending status**.

If the email fails to send, make sure that the SMTP mail account can be opened.

4. Check for the email notification in the appropriate inbox.

Troubleshoot email

There are a few standard steps that can help you troubleshoot the configuration of email settings.

1. Verify email settings:
 - a. Go to **System administration > Setup > Email > Email parameters**.
 - b. Verify that SMTP is enabled.
 - c. Verify the settings of the SMTP mail server.
 - d. Sign in to the SMTP account in a separate window to make sure that the account and password are correct.
 - e. Send a test email using **System administration > Setup > Email > Email parameters > Test email**.
2. Verify that the email batch process is running:
 - a. Go to **System administration > Periodic tasks > Email processing > Batch**.
 - b. Make sure that the **Batch processing** option is set to **Yes**.
 - c. Review the recurrence of the email process:
 - a. Select **No end date** to adjust all recurrences of the email batch process.
 - b. Adjust the count as you require.
3. To review the contents and status of batch emails, go to **System administration > Periodic tasks > Email processing > Batch email sending status**.
 - a. If you're using a release that is earlier than Platform update 28, personalize the form to add the email sender for easy review. To do this, right-click the grid header, select **Add columns**, select **Email**, and then click **Insert**. If the **Email** field isn't added into the grid, you can view the sender by selecting **Show message**, and then selecting the **Email** field.
 - b. Verify that emails are being sent from the correct account. If the account is incorrect, you need to adjust settings such as user options, system templates, or organization templates, as needed.
 - c. Verify that all email user accounts have been granted permission to **Send As** for the configured SMTP account (see step 4 for details).
4. In Platform update 32, an **Email history** page was added to allow administrators to review all sent emails, including any errors that might have prevented an email from being sent. The **Email history** page will show interactive as well as non-interactive/batch emails. For any emails that have an **Email status** of **Failed**, review the error message on the **Failure details** tab and determine if corrective

actions should be taken.

5. In the Microsoft 365 admin center, verify that all user mail accounts that will be used to send emails have **Send As** and **Send On Behalf Of** permissions for the configured SMTP account. For more information, see [Enable sending email from another user's mailbox in Microsoft 365](#).
6. Sign in to all user mailboxes to verify that they are valid and can be accessed using sign in.
7. Send a test email using **System administration > Setup > Email > Email parameters > Test email**.
8. If the SMTP settings were migrated from another environment, clear the password field and re-enter the password to ensure that the field encryption hasn't negatively affected the stored value.
9. If you continue to experience issues when email is sent via SMTP, enter the SMTP account information in a tool such as [SMTPer.net](#) to verify that the SMTP server and account are valid and working correctly.

Troubleshoot the Exchange mail provider

The **Email parameters** page allows an administrator to select Exchange as an interactive email provider and as the Batch email provider. The Exchange mail provider will use the current user's Exchange Online account to send emails. When used as the Batch email provider, the batch account will be used. No additional configuration is needed. If troubleshooting is needed, ensure that the current user's account can be signed into and that emails can be sent from that account to the intended recipients.

Exchange mail provider not supported for external users

Users that are external to the primary tenant will not have exchange accounts on that tenant, so the Exchange mail provider is not supported for external users.

Other notes

The system communicates with Exchange or an SMTP server like a typical email client, so standard behavior and limits apply. For example, standard [Exchange Online receiving and sending limits](#) apply.

Troubleshooting

Where do workflow email templates come from?

The email templates will be sourced from either system email templates or organization email templates depending on whether the workflow is a system-level (not company specific) or organization-level (company specific) workflow.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Develop email experiences by using the SysMailer framework

2/18/2021 • 6 minutes to read • [Edit Online](#)

Sending emails

The SysMailer framework is a new, extensible way to send email. It replaces all previous application programming interfaces (APIs) for mail, such as CDO.Messaging (SysMailer), MAPI (SysINetMail), and Outlook COM (SmmOutlookEmail). Those older mail APIs won't work correctly in Finance and Operations applications. By taking advantage of the SysPlugin framework and several .NET technologies, SysMailer provides a configurable experience for users and enables the application consumers to remain agnostic to the email option that users use to send email.

The SysMailer framework consists of a factory class that is used to retrieve an email provider, a set of email providers that send messages, a message builder that builds the messages, and the forms that are related to configuring and interacting with the email providers. To consume the SysMailer framework, an application developer primarily uses the **SysMailerFactory** and **SysMailerMessageBuilder** classes. The email provider factory is used to retrieve interactive or non-interactive email providers, so that multiple messages can be sent at the same time, or so that a message can be sent directly. The email providers expect the messages that they send to be encapsulated in .NET **System.Net.Mail.MailMessage** objects. The message builder class is used to build the .NET object that is passed to the email provider.

Scenarios

This topic describes three scenarios:

- Sending an interactive message
- Sending a non-interactive (batch) message
- Sending multiple non-interactive (batch) messages

Sending an interactive message

The following example is taken from the **CustCollectionsEmail** class. It demonstrates multiple features of the framework, such as the ability to chain message builder calls, conditionally set the sender address ("from" address), and add attachments.

```

using (System.IO.Stream attachmentStream = this.generateAttachment())
{
    var messageBuilder = new SysMailerMessageBuilder();
    messageBuilder.addTo(context.parmEmailAddress())
        .setSubject(emailSubject)
        .setBody(SysEmailMessage::stringExpand(emailBody,
            SysEmailTable::htmlEncodeParameters(templateTokens)));
    if (emailSenderAddr)
    {
        messageBuilder.setFrom(emailSenderAddr, emailSenderName);
    }
    else if (custParameters.CollectionsOMTeam)
    {
        var collectionsEmail = OMTeam::find(custParameters.CollectionsOMTeam).primaryEmail();
        if (strLen(collectionsEmail) > 0)
        {
            messageBuilder.setFrom(collectionsEmail);
        }
    }
    if (attachmentStream != null)
    {
        messageBuilder.addAttachment(
            attachmentStream,
            strFmt('%1%2', strReplace(DateTimeUtil::toStr(DateTimeUtil::utcNow()), ':', ''), '.xlsx'));
    }
    SysMailerFactory::sendInteractive(messageBuilder.getMessage());
}

```

Sending a non-interactive (batch) message

The following example is taken from the **VendRequestCompanyWorkflowManager** class. It shows how you can send a single message non-interactively.

```

// The vendor <vendor name> has been approved and has been added to the vendor master.
messageText = strFmt("@SYS134393", DirPartyTable::findRec(vendRequestCompany.VendParty).Name);
// Request
var messageBuilder = new SysMailerMessageBuilder();
messageBuilder.setFrom(senderEmail)
    .addTo(recipientEmail)
    .setSubject("@SYS130372")
    .setBody(messageText);
SysMailerFactory::sendNonInteractive(messageBuilder.getMessage());

```

Sending multiple non-interactive (batch) messages

The following example is taken from the **UserAdAddManager** class. It shows how you can get an instance of a batch email provider before you iterate over a list of emails to send.

```

var mail = SysMailerFactory::getNonInteractiveMailer();
var messageBuilder = new SysMailerMessageBuilder();
for (i = 1; i <= conLen(_notifyCon); i++)
{
    notifyEmailsStr = conPeek(_notifyCon, i);
    select firstonly RecId, Email from sysUser where sysUser.Id == notifyEmailsStr;
    if (sysUser.RecId && sysUser.Email != '')
    {
        messageBuilder.reset()
            .setFrom(_emailFrom)
            .addTo(sysUser.Email)
            .setSubject("@SYS129183")
            .setBody(errorStr);
        mail.sendNonInteractive(messageBuilder.getMessage());
        delete_from tmpUserErrorNotification;
    }
}
}

```

Important considerations

- A sender address ("from" address) is required when messages are sent to an email provider. A receiver address ("to" address) is required when messages are sent non-interactively. If these conditions aren't met, the framework throws an exception. If **getMessage** is called on the message builder before any call to **setFrom** is made, the builder tries to set the sender address to the current user's email address or network alias.
- When messages are sent, the way that the sender address ("from" address) is used depends on the provider:
 - **EML provider**: The sender address is removed from the message before the message is opened in the user's email client. Therefore, the email client can set the sender address to the default account that is configured for sending mail.
 - **SMTP provider**: The Simple Mail Transfer Protocol (SMTP) server must be configured to allow messages to be sent by using the sender address. In other words, the SMTP server must allow the impersonation of emails that are sent from it. Otherwise, the SMTP server might prevent the messages from being sent, flag them as spam, and so on.
- When messages are sent, the framework returns a Boolean value that indicates whether the operation to send the message was successful. However, it doesn't report any messages to the Action Center when the operation is successful. You decide whether messages are shown in the Action Center.
- By default, the body of all messages that are sent is in rich-text (HTML) format. If an application scenario requires that plain text be used to maintain newline spacing, you can pass **false** to the optional **_isHtml** parameter of the **setBody** method on the message builder.

Adding a new email provider

You can add email providers by using the pluggable framework. When you use the factory class and interfaces, new email providers immediately become available for use across all relevant application scenarios. Examples of email providers can be found in the existing provider implementations, `SysMailerEML` and `SysMailerSMTP`, and also in an existing tutorial implementation, `Tutorial_SysMailerMailTo`. The examples that follow are excerpts from the implementation of the `SysMailerEML` email provider.

To implement an email provider, you must create an implementation class that has the following properties:

- The class must have the appropriate **Export** attributes.
- The class must implement the base **SysIMailer** methods, **getId** and **getDescription**.
- The class must implement the **SysIMailerInteractive** interface, the **SysIMailerNonInteractive** interface, or both interfaces.

Specify attributes for the implementation class

The first step is to specify attributes for the implementation class. The class must have two attributes:

- **ExportAttribute** – The framework uses this attribute to discover the plug-in. The attribute specifies that the plug-in is an implementation of **SysIMailer** and therefore part of the SysMailer framework.
- **ExportMetadataAttribute** – The framework uses this attribute to find specific instances of a plug-in that have specific metadata. The attribute specifies the ID of the email provider, so that a single provider can be discovered quickly. **No two email providers should ever have the same ID.**

```
using System.IO;
using System.Net.Mail;
using System.Text.RegularExpressions;
#define SysMailerEML_ID('EML')
/// <summary>
/// The <c>SysMailerEML</c> class is an interactive email provider implementation that sends messages by
generating
/// an EML file, uploading it to Azure temporary blob storage, and then redirecting the user's browser to
/// the file to save or open for sending using their default email client.
/// </summary>
// This is a framework class. Customizing this class may cause problems with future upgrades to the
software.
[System.ComponentModel.Composition.ExportAttribute(IdentifierStr(Dynamics.AX.Application.SysIMailer)),
System.ComponentModel.Composition.ExportMetadataAttribute(extendedTypeStr(SysMailerId), #SysMailerEML_ID)]
public class SysMailerEML implements SysIMailerInteractive
{
```

Implement the SysIMailer interface

The **SysIMailer** interface includes identifiable information about an email provider, regardless of the capabilities of the email provider itself. To implement this interface, you must create two methods:

- **getId** – This method returns the same ID that is specified in the **ExportMetadataAttribute** attribute.
- **getDescription** – This method returns a non-technical description that indicates how the email will be sent.

```
public SysMailerId getId()
{
    return #SysMailerEML_ID;
}
public SysMailerDescription getDescription()
{
    // Use an email app, such as Outlook
    return "@ApplicationFoundation:EmailProviderEMLDescription";
}
```

Implement a combination of the SysIMailerInteractive and SysIMailerNonInteractive interfaces

The **SysIMailerInteractive** and **SysIMailerNonInteractive** interfaces are very simple. They implement the **sendInteractive** and **sendNonInteractive** methods, respectively. An email provider might implement one or both methods, depending on its capabilities. Each method that is implemented takes a **.NET System.Net.Mail.MailMessage** object that you use to construct and send the email.

```
public boolean sendInteractive(System.Net.Mail.MailMessage _message)
{
    using (var emlStream = this.generateEmIFile(_message))
    {
        Dynamics.AX.Application.File::SendFileToUser(emlStream, 'message.eml');
    }
    return true;
}
```

The **System.Net.Mail.MailMessage** object contains a large amount of advanced functionality that is related to MIME messages. You can build a relatively complex message object and pass it to an email provider. If there is specific functionality that an email provider doesn't support, the email provider is expected to handle the functionality actively (by modifying the message), passively (by making an internal call to another email provider), or not at all (by throwing an error).

Migration from Microsoft Dynamics AX 2012 to Finance and Operations applications

Migration involves using the **SysMailerMessageBuilder** object to build a message and then using the **SysMailerFactory** to send it, as outlined in the examples in this topic.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot the Office integration

2/18/2021 • 16 minutes to read • [Edit Online](#)

Applies to these Dynamics 365 apps:

Commerce, Finance, Human Resources, Supply Chain Management

This topic provides answers to questions, tips, and troubleshooting information about the capabilities of the Microsoft Office integration. The questions and issues that are discussed range across user, administration, and development scenarios.

Frequently asked questions

What platforms do the Office Add-ins support?

The Microsoft Excel Add-in and Microsoft Word Add-in are built by using the Office Web/JavaScript Add-in framework. This framework was originally released for Microsoft Office 2013 but received significant updates in Microsoft Office 2016. For more information, see [Office Add-in host and platform availability](#). The Excel Add-in requires ExcelAPI 1.2. Therefore, use the [Office Add-in host and platform availability](#) matrix to determine which platforms support the Excel Add-in. For many users, the phrase "Excel 2016 with the latest updates" is sufficient.

Are the Office Add-ins safe?

In an age of malware, full connectivity, and compliance risks, nothing is completely secure. However, the web add-ins, like other websites, are basically a web application that interacts with the Office client products via a limited application programming interface (API). For more details, see [Office Add-ins platform overview](#)

Does the Excel Add-in support Office for Mac?

No. Support for Apple Mac and iOS is currently under development. The Office JavaScript (JS) APIs work differently in Apple Safari and Internet Explorer, especially in respect to authentication. For details about platform support for the Office JS APIs, see [Office Add-in host and platform availability](#).

What version of Office is required for the Excel Add-in to support AD FS?

For more information, see the "Troubleshooting issue" section later in this topic.

How can I force an update of Office?

If your Office build isn't updated, you might be on the deferred track ([Overview of update channels for Microsoft 365 Apps](#)). In this case, you can [use the Office Deployment Tool to move to the Current channel](#) or sign up for the [Office Insider program](#) to help guarantee that you have the latest updates. The easiest method is to use the Office Deployment Tool to switch to the Current channel. In this case, the latest updates will be installed immediately.

Why can't you tell me what version of Office or Excel a particular issue is fixed in?

Office has many releases. These releases receive updates at different times and have different version numbers that don't correspond. Some frequently used Office versions and update methods are Click to Run (C2R) Current channel, C2R Deferred, C2R First Update Deferred, Office Insider Fast, Office Insider Slow, and MSI/MSO (install from DVD). For more information about Office versions, see the [Release information for updates to Microsoft 365 Apps](#) page.

Why am I having trouble signing into the Excel Add-in?

The Excel Add-in runs inside an Internet Explorer window. By default, the Excel Add-in picks up stored credentials from Internet Explorer, and Internet Explorer provides the current Microsoft Windows credentials if there are no stored credentials. Make sure that you're using the correct credentials to sign in. In the Excel Add-in, explicitly

sign out, and then sign in to help guarantee that the correct credentials are used.

The Excel Add-in seems to be slow when it publishes records. How can I learn more about what is occurring?

Most of the work that the Excel Add-in does should occur on the server. To learn where the time is being spent, you can use [Fiddler \(a free download\)](#) to make sure that the Excel Add-in works as you expect.

The Excel Add-in sends the published records as a request. When those records are processed, the response is sent back from the server. The Excel Add-in then creates another message that contains the next set of records to publish, and sends that request. Five to ten seconds of processing time in the Excel Add-in should be required between the previous response from the server and the next request to the server.

To check processing time in the Excel Add-in versus the server/service, follow these steps.

1. Start [Fiddler](#).
2. Publish a few records to test the process.
3. Make sure that you can view that request and response in Fiddler ([make sure that HTTPS traffic is being decrypted](#)).
4. Publish a larger number of records.
5. In Fiddler, watch the time that is required from a request to its response, and from a response to the next request.
 - If the time from a request to its response is large, the bottleneck is the server/service.
 - If the time from a response to the next request is large, the bottleneck is the Excel Add-in (that is, the client).

Why is the Export to Excel functionality limited to 10,000 records (prior to Platform update 22)?

Prior to Platform update 22, the Export to Excel functionality is limited to 10,000 records. This limitation is in place because the export process uses the form from which data is being exported to provide the following records with fields and data that can't be obtained otherwise: formatted values, calculated values, and temporary table data. Because the form is used during the export, it occurs inside the client process that is shared by all the users on a given computer. During the export, those other users are blocked from interacting with the client.

With Platform update 22 and later, Export to Excel has a progress dialog box and is no longer a blocking process for other users, so larger datasets can be exported. Exporting data via Export to Excel will be slower than using the Excel Add-in or the Data Management framework, but it will return exactly the data shown in the grid. This is useful for filtered datasets. The user is presented with a dialog box that allows them to stop at any point. Because the export can take some time, it is recommended that the export is done with the Chrome or Edge browsers, with the automatic download option enabled. The automatic download option will ensure that the browser downloads the file as soon as the export is complete to ensure that the download link is used within the 15-minute time limit.

The ideal alternative to Export to Excel is to use Open in Excel and the Excel Add-in. The Excel Add-in retrieves data by using the OData service, and takes advantage of the security that the entities provide. The import and export capabilities in the Data management framework (DMF) and Data import/export framework (DIXF) can also be used. However, DMF/DIXF is often limited to administrators.

If you have concerns about giving users access to the data via the Excel Add-in, because they should not be able to update records, consider the following points:

- The entities should have all the validation and logic that the forms have. If they don't, it's a bug.
- The way that entities are secured resembles the way that forms are secured. Therefore, if a user should not have permission to update or write data by using a form that exposes that data, the user should not have permission to update or write data by using an entity that exposes that data.

Why is the Publish button in the Excel Add-in unavailable?

All key and mandatory fields must be present to publish data back to the entity. Try to edit the design to add more fields to the binding.

Why are the Excel Add-in, the Word Add-in, and the Open in Excel options only available when the Internet is available?

For all environments, including on-premises, the Excel and Word Add-ins, and the libraries they use, are loaded from multiple Internet locations and therefore will only run when the Internet is available. For on-premises environments, when the Internet is not available, the Open in Excel options are hidden because the Excel Add-in will not run without access to the Content Delivery Network (CDN) that houses the Excel Add-in.

Can the Excel Add-in and Word Add-in be made available to users using Centralized Deployment?

Yes, Centralized Deployment is supported. For more information, see [Centralized Deployment](#).

To use Centralized Deployment, on the **App parameters** tab on the **Office App Parameters** page change the **App ID**, **Store**, and **Store Type**:

- **App ID:** 61bcc63f-b860-4280-8280-3e4fb5ea7726
- **Store:** EXCatalog
- **Store Type:** Centralized Deployment

In case a change back to Office Store is needed, the standard values are:

- **App ID:** WA104379629
- **Store:** en-US
- **Store Type:** Office Store

NOTE

- **Name**, **Version**, and **Notes** are values that provide information but they are not needed to run the Excel Add-in.
- These same values are also used for the Word Add-in when it is run from the Document Templates form.

If you encounter issues with Centralized Deployment for some users, it could be one of these problems:

- One or more users are members in a group that is more restrictive than others
- The user referenced is on a different Microsoft 365 account (such as a personal account)

What is the cell limit for the Excel Add-in?

The default Excel Add-in cell limit is about half the limit of what the Excel Add-in can handle on a reasonably fast machine. The speed of the machine is the limitation. If problems are encountered, then the cell limit should be reduced and/or the filter should be adjusted to reduce the data set. A common workaround is to use a filter to manage the data in smaller pieces instead of all at once.

How do I make an entity available in the Excel Add-in and/or as an Open in Excel option?

If the entity is marked as "IsPublic=Yes" and has unique PublicEntityName and PublicCollectionName values, then it will be available via the OData service. Check that there aren't any existing entities with the same PublicEntityName and PublicCollectionName values by looking at the \$metadata feed for the environment (preferably in Google Chrome): [https://SomeFullEnvironmentURL.dynamics.com/data/\\$metadata](https://SomeFullEnvironmentURL.dynamics.com/data/$metadata)

Why are date and time values in UTC in the Excel Add-in?

The Excel Add-In, Data Management Framework, and Power BI reporting are all designed to interact with data directly on the database level. Because there is no client to adjust Date and Time data to the time zone of the user, all Date and Time values are in UTC.

Troubleshooting issues

[Fixed] Issue: During sign-in to the Excel Add-in, I receive the following error message: "AADSTS65001: The user or administrator has not consented to use the application with ID XYZ"

Issue: During sign in to the Excel Add-in, you receive the following error message: "AADSTS65001: The user or administrator has not consented to use the application with ID XYZ."

Explanation: Typically, this issue occurs because Microsoft Azure Active Directory (Azure AD) can't find the Azure AD application that represents the Excel Add-in. That issue occurs because, during the [configuration of Microsoft Power BI](#), an Azure AD application was added that has the App ID URI set to the environment URL.

Fix: Make sure that no Azure AD apps have the App ID URI set to the environment URL. App ID URIs should be fabricated, unique URIs, such as `https://contosoAXPowerBI`.

[Fixed] Issue: During sign-in to the Excel Add-in, I receive the following error message: "AADSTS50001: The application named ABC was not found in the tenant named XYZ"

Issue: During sign-in to the Excel Add-in, you receive the following error message: "AADSTS50001: The application named ABC was not found in the tenant named XYZ."

Explanation: This issue probably occurs because an error in the deployment system caused the environment to get a URL that wasn't added to the configured list of service principals for the tenant.

Fix: File a support issue for your environment, so that the problem can be investigated and the configuration can be adjusted.

[Fixed] Issue: After the Excel Add-in starts and updates data, I receive the following error message: "An error occurred while writing to the data cache"

Issue: After the Excel Add-in starts and updates data, you receive the following error message: "An error occurred while writing to the data cache." The details of the error state, "The argument is invalid or missing or has an incorrect format."

Explanation: You receive this error message if the client is open in Internet Explorer, and the user clicks **Open** immediately after selecting the **Open in Excel** option. The way that Internet Explorer handles temporary Internet files causes an issue in Excel. This issue, in turn, causes API calls to fail.

Workaround: In Internet Explorer, when you open a workbook, click **Save** first, and then click **Open**. The file will then be opened from your Downloads folder. Alternately, use the Edge or Google Chrome browser. By default, both these browsers save files to a Downloads folder. Therefore, the issue doesn't occur.

Long-term fix: We are working with the Office team to understand this issue so that it can be fixed in Excel.

Issue: When I send email by using SMTP, the server response is "5.7.60 SMTP; Client does not have permissions to send as this sender"

Issue: When you send email by using Simple Mail Transfer Protocol (SMTP), you might receive an error message that states that the server response was "5.7.60 SMTP; Client does not have permissions to send as this sender." Alternatively, the error message might state, "Something went wrong while generating the report."

Explanation: This issue is usually caused by incorrect setup of the Send As permissions for the email account.

Fix: You can configure Send As permissions in the Microsoft 365 admin center (portal.office.com/Admin). Click **Users > Active users > User > Edit mailbox permissions > Send email from this mailbox**. For more information, see [Give mailbox permissions to another user in Microsoft 365 - Admin Help](#).

The following illustration shows the setup of SMTP on the **Email parameters** page. Here, you must provide the outgoing mail server, port, user name, password, and Secure Sockets Layer (SSL) requirements.

Email parameters

Email providers

SMTP settings

SMTP settings

Outgoing mail server: smtp.office365.com
SMTP port number: 587
User name: serviceacct@d365forops.onmicro
Password: [REDACTED]
Specify if SSL is required: Yes

IMPORTANT

All users must give the SMTP account Send As permissions on their email setup in Microsoft 365. This configuration is done in the mailbox permissions in Microsoft Exchange or in the Microsoft 365 Admin portal. The following illustration shows the setup for the Test User account, where the SMTP service account is added in the **Send As** section.

[Fixed] Issue: The Office Add-ins don't yet support AD FS

Affected versions: CTP8 and the February 2016 releases

Issue: When users from an Azure AD tenant that uses Active Directory Federation Services (AD FS) try to sign in to the Office Add-ins (in other words, when the users enter their account, and then press Tab or click in the field to enter their password), a separate browser window opens. This browser window usually has a URL that starts with `https://az689774.vo.msecnd.net/dynamicsofficeapp/v1.2.1.0/App/DynamicsApp.html?id_token=`. The user can't sign in.

Explanation: During sign-in to the Office add-ins (both the Excel Add-in and the Word Add-in), a redirect to the AD FS site for the tenant occurs. However, that site is an unknown and therefore disallowed application domain (AppDomain).

Long-term fix: The long-term fix for this issue was put in place on May 10, 2016. The Office Add-ins now use a new Dialog API that the Office team added.

Taking advantage of the add-in updates that support AD FS: All Office installations should be updated via **File > Account > Updates** (for click-to-run installations) or via Windows Update (for MSI installations). The AD FS Dialog API was included in the May update (16.0.6868.2060). For information about updates, see the [Microsoft 365 client update channel releases](#) page.

If your Office build isn't updated, you might be on the deferred track ([Overview of update channels for Microsoft 365 Apps](#)). In this case, you can [use the Office Deployment Tool to move to the Current channel](#) or sign up for the [Office Insider program](#) to help guarantee that you have the latest updates. Additionally, see [Install the latest version of Office](#) and [Office 2016 Deployment Guides for Admins](#).

If Office updates can't be installed, the following workaround can unblock users.

Workaround: Use Internet Explorer to sign in to the client before you use the Office Add-ins

This workaround requires user knowledge and extra steps. After users have been educated about this workaround, it should be straightforward for them.

User steps: Before users open Excel (or Word), they should sign in to the client by using Internet Explorer.

Explanation: The Excel or Word Add-in will use the sign-in context, and no redirect will be required. The earlier sign-in must occur in Internet Explorer, because the Office Add-ins run inside an Internet Explorer window in Excel and Word. The sign-in context lasts 6 to 24 hours, depending on policies. Therefore, a new sign-in through Internet Explorer is required only occasionally.

1. Exit Internet Explorer and Excel.
2. Start Internet Explorer, and sign in to the client.
3. Test the Excel Add-in by using an Open in Excel experience. (For example, click **Fleet Management > Customers > Customer > Open in Microsoft Office > Open in Excel > Fleet Management Customers**.)

[Fixed] Issue: The Excel Add-in doesn't correctly run or enable sign-in

Issue: When users try to sign into the Excel Add-in, a blank authentication dialog box appears, or an error message is shown instead of the authentication page. The user can't sign in.

Explanation: The Excel Add-in relies on the Office Web JS Add-in platform and uses Azure AD for authentication. If a proxy is used, several URLs must be accessible for users to run and sign in to the Excel Add-in. Additionally, if AD FS is used, the AD FS URL must use HTTPS.

Solution: Because this issue is a customer-specific network issue, it requires a customer-specific resolution. If AD FS is used, make sure that the AD FS URL uses HTTPS. Additionally, make sure that all the following URLs are accessible from the user's computer.

The following URLs are accessed for loading.

- `https://az689774.vo.msecnd.net:443`
- `https://az689774.vo.msecnd.net`
- `https://appsforoffice.microsoft.com:443`
- `https://appsforoffice.microsoft.com`
- `https://secure.aadcdn.microsoftonline-p.com:443`
- `https://secure.aadcdn.microsoftonline-p.com`
- `https://az416426.vo.msecnd.net:443`
- `https://az416426.vo.msecnd.net`
- `https://telemetryservice.firstpartyapps.oaspapps.com:443`

- <https://telemetryservice.firstpartyapps.oaspapps.com>
- <https://nexus.officeapps.live.com:443>
- <https://nexus.officeapps.live.com>
- <https://browser.pipe.aria.microsoft.com:443>
- <https://browser.pipe.aria.microsoft.com>
- <http://schemas.microsoft.com>

The following URLs are accessed for authentication.

- <https://login.windows.net:443>
- <https://login.windows.net>
- <https://login.microsoftonline.com:443>
- <https://login.microsoftonline.com>

Issue: The Excel Add-in needs an explicit sign out after encountering an AADSTS50058 "silent sign in failed" error

Issue: When users try to sign in to the Excel Add-in after some period of inactivity, the user encounters the AADSTS50058 "silent sign in failed" error and is forced to sign out before signing back in.

Explanation: The Excel Add-in uses Azure AD for authentication. When authentication occurs, a token is created for the user. That token has an expiration period. After the token has expired, an AADSTS50058 error will occur indicating that "silent sign in failed".

Solution: The user needs to sign out and sign back in. We will improve this behavior in the future by automatically signing the user out to enable faster sign in.

Issue: When trying to use a document template with Open in Excel a "Record for id GUID not found" error displays

Issue: The "Record for id GUID not found" error can display when copying a database from one environment to another.

Explanation: Copying the database is problematic for document templates, record attachments, and other files that are stored in Azure blob storage. When the database is copied from one environment to another, the files are not copied along with the records, so the files that the application tries to access are not found.

Solution: For document templates, the solution is to identify the templates that are needed and load a copy of those template files into the target environment.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Organization administration home page

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic points to content that will help power users and administrators configure the system to work smoothly and effectively for your organization and business.

Much of the content listed here applies to features in the **Organizational administration** module. However, there are a couple of tasks, such as creating and using a record template, that can be performed in any module to help your organization run more efficiently.

Number sequences

Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require identifiers. A master data record or transaction record that requires an identifier is referred to as a *reference*. Before you can create new records for a reference, you must set up a number sequence and associate it with the reference.

- [Number sequences overview](#)
- [Set up number sequences using a wizard](#) (Task guide)
- [Set up number sequences on an individual basis](#) (Task guide)

Organizations

An organization is a group of people who are working together to carry out a business process or achieve a goal. Organizational hierarchies represent the relationships between the organizations that make up your business.

Before you set up organizations and organization hierarchies, make sure that you plan how your business will be modeled. The organization model has a significant effect on implementation and business processes.

- [Organizations and organizational hierarchies overview](#)
- [Plan your organizational hierarchy](#)
- [Create an organization hierarchy](#) (Task guide)
- [Create a legal entity](#) (Task guide)
- [Create an operating unit](#) (Task guide)

Address books

The global address book is a centralized repository for master data that must be stored for all internal and external persons and organizations that the company interacts with. The data that is associated with party records includes the party's name, address, and contact information.

After you create the global address book, you can create additional address books as you require, such as a separate address book for each company in your organization or for each line of business.

- [Global address book overview](#)
- [Plan for the global address book and other address books](#)
- [Configure the global address book](#)
- [Address books FAQ](#)

Workflow

Workflow is a system that you can use to create individual workflows, or business processes. When you create a workflow, you specify how a document flows, or moves, through the system by showing who must complete a task, make a decision, or approve a document.

- [Workflow system overview](#)
- [Workflow elements](#)
- [Actions in workflow approval processes](#)
- [Create workflows overview](#)

Electronic signatures

An electronic signature confirms the identity of a person who is about to start or approve a computing process. In some industries, an electronic signature is as legally binding as a handwritten signature. Electronic signatures are a regulations compliance requirement for several regulated industries, such as pharmaceuticals, food and beverage, and aerospace and defense.

You can use electronic signatures for critical business processes. Some processes have built-in electronic signature capabilities. You can also create custom signature requirements for any database table and field.

- [Electronic signatures overview](#)
- [Set up electronic signatures](#) (Task guide)

Case management

By planning, tracking, and analyzing cases, you can develop efficient resolutions that can be used for similar issues. For example, when customer service representatives or Human Resources generalists create cases, they can find information in knowledge articles to help them work with or resolve a case more efficiently.

- [Case management overview](#)
- [Plan case category security, case processes, and case categories](#)

Record templates

Record templates can help you to create records more quickly. You can create a record template so that field values that are used often do not have to be entered explicitly for each new record.

- [Record templates overview](#)
- [Create a record template to facilitate data entry](#) (Task guide)
- [Use record template to create a new record](#) (Task guide)

General organization administration

- [Change the banner or logo](#) (Task guide)
- [Configure document management](#)
- [Configure and send email](#)
- [Date/time data and time zones](#)

NOTE

Number sequences overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require identifiers. A master data record or transaction record that requires an identifier is referred to as a *reference*.

Before you can create new records for a reference, you must set up a number sequence and associate it with the reference. We recommend that you use the pages in **Organization administration** to set up number sequences. If module-specific settings are required, you can use the parameters page in a module to specify number sequences for the references in that module. For example, in **Accounts receivable** and **Accounts payable**, you can set up number sequence groups to allocate specific number sequences to specific customers or vendors.

When you set up a number sequence, you must specify a scope, which defines which organization uses the number sequence. The scope can be **Shared**, **Company**, **Legal entity**, or **Operating unit**. **Legal entity** and **Company** scopes can be combined with **Fiscal calendar period** to create even more specific number sequences.

Number sequence formats consist of segments. Number sequences with a scope other than **Shared** can contain segments that correspond to the scope. For example, a number sequence with a scope of **Legal entity** can contain a legal entity segment. By including a scope segment in the number sequence format, you can identify the scope of a particular record by looking at its number.

In addition to segments that correspond to scopes, number sequence formats can contain **Constant** and **Alphanumeric segments**. A **Constant** segment contains a set of letters, numbers, or symbols that does not change. An **Alphanumeric** segment contains a set of letters or numbers that increment every time that a number is used. Use a number sign (#) to represent incrementing numbers and an ampersand (&) to represent incrementing letters. For example, the format #####_2017 creates the sequence 00001_2017, 00002_2017, and so on.

Number sequence examples

The following examples show how to use segments to create number sequence formats. In particular, the examples demonstrate the effects of using scope segments.

Expense report numbers

In the following example, expense report numbers are set up for the legal entity that is titled **CS**.

- **Area:** Travel and expense
- **Reference:** Expense report number
- **Scope:** Legal entity
- **Legal entity:** CS

SEGMENTS	SEGMENT TYPE	VALUE
Segment 1	Legal entity	CS
Segment 2	Constant	-EXPENSE-

SEGMENTS	SEGMENT TYPE	VALUE
Segment 3	Alphanumeric	####

Example of formatted number: CS-EXPENSE-0039

You can set up a similar number sequence format for other legal entities. For example, for a legal entity that is named **RW**, if you change only the value of the legal entity segment, the formatted number is RW-EXPENSE-0039. You can also change the whole number sequence format for other legal entities. For example, you can omit the legal entity scope segment to create a formatted number such as Exp-0001.

Sales order numbers

In the following example, sales order numbers are set up for the company ID **CEU**.

- **Area:** Sales
- **Reference:** Sales order
- **Scope:** Company
- **Company:** CEU

SEGMENTS	SEGMENT TYPE	VALUE
Segment 1	Constant	SO-
Segment 2	Alphanumeric	####

Example of formatted number: SO-0029

Even though a scope segment is not included in the format, numbering restarts for each company ID. If you use the same format for all company IDs, the same numbers are used in each company. For example, sales order number SO-0029 is used in each company. You can also change the whole number sequence format for other company IDs.

Purchase requisition numbers

In the following example, purchase requisition numbers are organization-wide.

- **Area:** Purchase
- **Reference:** Purchase requisition
- **Scope:** Shared

SEGMENTS	SEGMENT TYPE	VALUE
Segment 1	Constant	Req
Segment 2	Alphanumeric	####

Example of formatted number: Req0052

Because the scope is **Shared**, the number sequence format is used across the organization. You cannot set up different number sequence formats for different parts of the organization.

Performance considerations for number sequences

Consider the following information about how the configuration of number sequences can affect system performance before you set up number sequences.

Continuous and non-continuous number sequences

Number sequences can be continuous or non-continuous. A continuous number sequence does not skip any numbers, but numbers may not be used sequentially. Numbers from a non-continuous number sequence are used sequentially, but the number sequence may skip numbers. For example, if a user cancels a transaction, a number is generated, but not used. In a continuous number sequence, that number is recycled later. In a non-continuous number sequence, the number is not used.

Continuous number sequences are typically required for external documents, such as purchase orders, sales orders, and invoices. However, continuous number sequences can adversely affect system response times because the system must request a number from the database every time that a new document or record is created.

If you use a non-continuous number sequence, you can enable **Preallocation** on the **Performance** FastTab of the **Number sequences** page. When you specify a quantity of numbers to preallocate, the system selects those numbers and stores them in memory. New numbers are requested from the database only after the preallocated quantity has been used.

Unless there is a regulatory requirement that you use continuous number sequences, we recommend that you use non-continuous number sequences for better performance.

Automatic cleanup of number sequences

In case of a power failure, an application error, or other unexpected failure, the system cannot recycle numbers automatically for continuous number sequences. You can run the cleanup process manually or automatically to recover the lost numbers.

Carefully consider server usage when you plan the cleanup process. We recommend that you perform the cleanup as a batch job during non-peak hours.

Set up number sequences on an individual basis

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up number sequences on an individual basis. Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require them. A master data or transaction record that requires an identifier is referred to as a reference. Before you can create new records for a reference, you must set up a number sequence and associate it with the reference. You can set up all required number sequences at the same time by using the **Set up number sequences** wizard, or you can create or modify individual number sequences by using the **Number sequences** page.

1. Go to **Navigation pane > Modules > Organization administration > Number sequences > Number sequences**.
2. Select **Number sequence**.
3. In the **Number sequence code** field, type a value.
4. In the **Name** field, type a value.
5. On the **Scope parameters** FastTab, select a scope for the number sequence and select scope values from the drop-down list. The scope defines which organizations use the number sequence. In addition, number sequences that have a scope other than **Shared** can have segments that correspond to their scope. For example, a number sequence with a scope of **Legal entity** can have a legal entity segment. For more information about scopes, see [Number sequence overview](#).
6. Expand the **Segments** section.
 - Define the format for the number sequence by adding, removing, and rearranging segments.
 - Number sequences of all scopes can contain *Constant segments* and *Alphanumeric segments*. Constant segments contain a set of alphanumeric characters that do not change. Use this segment type to add a hyphen or other separators between number sequence segments. Alphanumeric segments contain a combination of number signs (#) and ampersands (&). These characters represent letters and numbers that increment every time that a number from the sequence is used. Use a number sign (#) to indicate incrementing numbers and an ampersand (&) to indicate incrementing letters. For example, the format `#####_2014` creates the sequence `00001_2014`, `00002_2014`, and so on. At least one alphanumeric segment must be present. Scope segments, such as company or legal entity, are not required. However, if you do not include scope segments in the format, numbers for the selected reference are still generated per scope.
7. Expand the **References** section. Select the document type or record to assign this number sequence to. This step is optional for sequences that are defined for special application usage patterns. In these scenarios, a new number is generated by using the value of a number sequence code or ID, without using a reference. An example of a special application usage pattern is a voucher series that is used for specific journal names. However, we do not recommend that you use such patterns.
8. Expand the **General** section. On the General FastTab, specify whether the number sequence is manual, and continuous or non-continuous. In addition, enter the lowest and highest numbers that can be used in the number sequence. We do not recommend changing a non-continuous number sequence to a continuous number sequence. The number sequence will not be truly continuous. This change may also cause duplicate key violations in the database. In addition, continuous number sequences have a larger effect on performance.
9. Click **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up number sequences using a wizard

2/18/2021 • 2 minutes to read • [Edit Online](#)

Number sequences are used to generate readable, unique identifiers for master data records and transaction records that require them. A master data or transaction record that requires an identifier is referred to as a reference. Before you can create new records for a reference, you must set up a number sequence and associate it with the reference. This topic explains how to set up all required number sequences at the same time by using a wizard. The demo data company used to create this procedure is USMF.

1. Go to **Navigation > Modules > Organization administration > Number sequences > Number sequences**.
2. Select **Generate**.
3. Select **Next**.
 - On this page, you can modify the identification code, the lowest value, and the highest value. In addition, you can indicate whether the number sequence must be continuous.
 - Do not select the **Continuous** option if you must preallocate numbers for the number sequence. To add a scope segment to the format of a number sequence, select the format in the list, and then select **Include scope in format**. To remove a scope segment from the format of a number sequence, select the format in the list, and then select **Remove scope from format**. To exclude a number sequence from automatic generation, select the number sequence in the list, and then select **Delete**.
4. Select **Next**.
5. Select **Finish**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure number sequences for warehouse flows

2/18/2021 • 5 minutes to read • [Edit Online](#)

The *Number sequence extensions* feature adds a new configuration page for setting up number sequences. It enables flexible configuration of GS1-regulated IDs, including GS1 prefixes and check digits (modulo 10), and enforces a length limit on existing number sequences.

Standard number sequence segments aren't suitable for GS1 implementation, because no check digit is calculated, and the company's GS1 prefix must be updated manually.

This feature adds the following functionality:

- Bill of lading (BOL) IDs can be generated in advance.
- A unique number sequence can be generated for serial shipping container code (SSCC) numbers.
- GS1-compliant number sequences can be created for BOL and SSCC numbers. The feature adds out-of-box support for license plate IDs, container IDs, wave label IDs, and BOL IDs.
- Configuration of license plate ID numbers is flexible. For example, you can include or exclude application identifiers (AI), such as leading zeros (00).

This functionality makes it more efficient to support labeling of cartons and to adjust new numbers that are generated by the system.

Turn on the Number sequence extensions feature

Before you can use the feature, it must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Number sequence extensions*

Set up the feature

To set up number sequence extensions in your system, follow these steps.

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **General** tab, in the **GS1 company prefix** field, and enter your company's GS1 prefix. This value will affect all number sequences where the GS1 prefix is included as a segment.
3. If you want to generate BOL numbers for wave labels, on the **Reports** tab, select the **Generate BOL number when printing wave labels** check box.

NOTE

This check box is available only if the functionality for [wave label printing](#) is turned on.

4. Go to **Warehouse management > Setup > Number sequence extensions**
5. On the Action Pane, select **Create default setup**. A GS1-compliant BOL number sequence and three types of SSCC number sequences are created. All these number sequences take the length of your company's GS1 prefix into account.

For more information about how to customize these default number sequences and/or add new sequences, see the next section. You can also remove any of these sequences if you don't need them.

6. Go back to **Warehouse management > Setup > Warehouse management parameters**.
7. On the **Number sequences** tab, select a relevant number sequence extension to use to generate numbers for your license plate IDs, wave label IDs, container IDs (in this case, select the appropriate **SSCC-18 number** sequence), and/or BOL IDs (in this case, select the **BOL** sequence). By default, number sequence extensions are supported only for these four types of IDs.

The next time that a new number is generated for one of these number sequences, the new logic will be used.

NOTE

If you don't select a number sequence extension for license plate IDs, the current rules for generating license plate IDs will be used. Otherwise, your selected number sequence will be used. The other IDs will use a plain number sequence until you apply a number sequence extension for them.

Create and edit number sequences

In the previous section, you generated a default set of number sequences. This section explains how each number sequence is defined. It also explains how to create custom sequences, and how to edit the default or custom sequences.

To create and edit number sequences, follow these steps.

1. Go to **Warehouse management > Setup > Number sequence extensions**.
2. On the Action Pane, select **New**.
3. In the **Number sequence extension** field, enter a name for the new sequence. In the **Description** field, enter a description.
4. On the **Segments** FastTab, use the buttons on the toolbar to assemble your numbering format by adding, deleting, and arranging segments. In the **Segment** field for each row, assign a segment type to define the purpose and content of that segment. The following table describes the types of segments that are available.

SEGMENT TYPE	DESCRIPTION
Constant	This segment type adds the same constant text for each generated number in the sequence. In the Value field, enter the required text. The Length field is automatically updated to the length of the text that you entered in the Value field.
Number sequence	In the Value field, enter a number sign (#) for each character that should be shown in the generated sequence. The number sequence itself might generate longer numbers, but only the right-most characters will be shown. The Length field is automatically updated to the number of number signs that you entered in the Value field. To comply with GS1 requirements for SSCC-18 numbers, make sure that the length of this segment is 16 minus the length of your GS1 prefix.

SEGMENT TYPE	DESCRIPTION
GS1 prefix	This segment type adds the value that is set in the GS1 company prefix field on the Warehouse management parameters page. The Value field shows the value that is set on the Warehouse management parameters page, and the Length field shows the number of characters in the value. Both the Value field and the Length field are read-only.
Application identifier	In the Value field, enter an application identifier, as specified by the relevant GS1 policy for this type of number sequence. For example, enter <i>00</i> for SSCC or <i>420</i> for BOL. The Length field is automatically updated to the length of the identifier that you entered in the Value field.
Packing type	For items that can be clearly identified, this segment type adds a field value from the relevant unit sequence group (from the Unit sequence groups page). (This behavior matches the existing logic for license plate IDs.) For license plates that include multiple stock keeping units (SKUs), this segment type adds <i>0</i> (zero) by default. For this segment type, the Value field is always set to <i>P</i> , and the Length field is always set to <i>1</i> .
Check digit	This segment type adds a check digit, which is a modulo 10 calculation. (This behavior matches the existing logic for license plate IDs.) For this segment type, the Value field is always set to a caret (^), and the Length field is always set to <i>1</i> .

- To view an example of your final number format, inspect the **Format** field at the bottom of the **Segments** FastTab.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Organizations and organizational hierarchies overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

An organization is a group of people who are working together to carry out a business process or achieve a goal. Organizational hierarchies represent the relationships between the organizations that make up your business.

Organizations

You can define the following types of internal organizations: legal entities, operating units, and teams.

All internal organizations are types of the **Party** entity. Therefore, these organizations use the address book to store address and contact information. A party, which can be either a person or an organization, can belong to one or more address books.

Legal entities

A legal entity is an organization that has a registered or legislated legal structure. Legal entities can enter into legal contracts and are required to prepare statements that report on their performance.

A company is a type of legal entity. Currently, companies are the only kind of legal entity that you can create, and every legal entity is associated with a company ID. This association exists because some functional areas in the program use a company ID, or DataAreald, in their data models. In these functional areas, companies are used as a boundary for data security. Users can access data only for the company that they are currently logged on to.

Operating units

An operating unit is an organization that is used to divide the control of economic resources and operational processes in a business. People in an operating unit have a duty to maximize the use of scarce resources, improve processes, and account for their performance.

The types of operating units include cost centers, business units, value streams, departments, and commerce channels. The following table provides more information about each type of operating unit.

OPERATING UNIT TYPE	DESCRIPTION	PURPOSE
Cost center	An operating unit in which managers are accountable for budgeted and actual expenditures.	Used for the management and operational control of business processes that span legal entities.
Business unit	A semi-autonomous operating unit that is created to meet strategic business objectives.	Used for financial reporting that is based on industries or product lines that the organization serves independently of legal entities.
Value stream	An operating unit that controls one or more production flows.	Commonly used in lean manufacturing to control the activities and flows that are required to supply a product or service to consumers.

OPERATING UNIT TYPE	DESCRIPTION	PURPOSE
Department	An operating unit that represents a category or functional part of an organization that performs a specific task, such as sales or accounting.	Used to report on functional areas. A department may have profit and loss responsibility, and may consist of a group of cost centers.
Commerce channel	An operating unit that represents a brick and mortar store, an online store or an online marketplace.	Used for the management and operational control of one or more stores within or across legal entities.

Teams

A team is an organization in which the members share a common responsibility, interest, or objective. Teams cannot be used in organizational hierarchies.

Organizational hierarchies

Set up organizational hierarchies to view and report on your business from different perspectives. For example, you can set up a hierarchy of legal entities for tax, legal, or statutory reporting. Set up a hierarchy that is based on operating units to report financial information that is not legally required, but that is used for internal control. For example, you can create a purchasing hierarchy to control purchasing policies, rules, and business processes.

Each hierarchy is assigned a purpose. The purpose of a hierarchy determines the types of organizations that can be included in the hierarchy. The purpose also determines which application scenarios a hierarchy can be used in.

Organizations in a hierarchy can share parameters, policies, and transactions. An organization can inherit or override the parameters of its parent organization. However, shared master data, such as products and address books, applies to the whole organization and cannot be overridden for individual organizations. Creating organizations and hierarchies requires careful planning. For more information, see [Plan your organizational hierarchy](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Plan your organizational hierarchy

2/18/2021 • 13 minutes to read • [Edit Online](#)

Before you set up organizations and organization hierarchies, make sure that you plan how your business will be modeled. The organization model has a significant effect on the implementation and business processes.

Organizational hierarchies represent the relationships between the organizations that make up a business. Therefore, the most important consideration when you model organizations is the structure of your business. We recommend that you define organization structures based on feedback from executives and senior managers from functional areas, such as finance and accounting, human resources, operations, purchasing, and sales and marketing.

When you are planning hierarchies, it is also important to consider the relationship between the organizational hierarchy and financial dimensions. You can set up multiple organizational hierarchies to represent different views of your business. By using financial dimensions, you can create reports based on these views. Work with your partner to create hierarchies that address both organizational and statutory reporting needs.

NOTE

Although you can use financial dimensions to represent legal entities without creating the legal entities, financial dimensions aren't designed to address the operational or business needs of legal entities. The interunit accounting functionality is designed to address only the accounting entries that are created by each transaction.

IMPORTANT

You shouldn't decide how to model organizations based only on the information in this article. This documentation is a guide. You can work with your Partner for additional guidance. Your Partner has gained experience in various industries and across the customer base.

Decide whether to model internal organizations as legal entities or operating units

You must have at least one legal entity to represent your business. A legal entity can enter legal contracts and is required to prepare financial statements that report on its performance.

Legal entities can be used for transactional business or for consolidation. This means that a legal entity in Finance and Operations does not necessarily represent a real entity in your business. For example, a company that participates in transactions can own subsidiary legal entities. In this scenario, a legal entity is required for transactions, and a virtual legal entity is required to consolidate the results and balances of the subsidiary legal entities.

Internal organizations in your business, such as regional offices, can be represented as additional legal entities, or as operating units of the main legal entity. An operating unit is not required to be a legally defined organization. Operating units are used to control economic resources and operational processes in the business. For example, departments and cost centers are operating units.

Some functionality works differently depending on whether the organization is a legal entity or an operating unit. Carefully consider the functionality described below as you make your decision.

Master data

If the organization is modeled as a legal entity

Some master data, such as customers, payment terms, tax authorities, and site-specific stock ordering, must be set up for each legal entity. Some master data, such as users, products, and most human resources data, is shared among all legal entities.

If the organization is modeled as an operating unit

Master data is shared among operating units.

Module parameters**If the organization is modeled as a legal entity**

Parameters for modules, such as Accounts receivable parameters, Accounts payable parameters, and Cash and bank management parameters, must be set per legal entity. Because the module setup for legal entities is separate, each subsidiary can comply with local statutory requirements and business practices. For example, a professional services legal entity and a manufacturing legal entity can have different module parameters even though they report to the same parent company.

If the organization is modeled as an operating unit

Module parameters are shared among operating units.

Data security**If the organization is modeled as a legal entity**

Most data is automatically secured by company ID. A company ID is a unique identifier for the data that is associated with a legal entity. A company can be associated with only one legal entity, and a legal entity can be associated with only one company. Users can access data only for the companies that they have access to. You do not need to customize to secure data by company ID.

If the organization is modeled as an operating unit

Data can be secured per operating unit by creating customized data security policies. Data security policies are used to limit access to data. For example, assume that a user is allowed to create purchase orders only in a particular operating unit. Data security policies can be created to prevent the user from accessing purchase order data from any other operating unit. The volume of transactions and the number of security policies can affect performance. When you design security policies, keep performance in mind.

Ledgers**If the organization is modeled as a legal entity**

Each legal entity requires a ledger that provides a chart of accounts, accounting currency, reporting currency, and fiscal calendar. A balance sheet can be created only for a legal entity. Main accounts, dimensions, account structures, charts of accounts, and account rules can be used by more than one legal entity.

If the organization is modeled as an operating unit

An operating unit can't have its own ledger information. If your internal organizations do not require unique ledgers, you can model them as operating units. Ledger information will be set up for the parent legal entity in the hierarchy. Income statements can be created for operating units within a legal entity or for the parent legal entity.

Fiscal calendars**If the organization is modeled as a legal entity**

Each legal entity has its own fiscal calendar. If your internal organizations use different fiscal years and fiscal calendars, you must model the organizations as legal entities.

If the organization is modeled as an operating unit

Operating units must share a fiscal calendar. If your internal organizations can use the same fiscal years and fiscal calendars, you can model the organizations as operating units.

Consolidation**If the organization is modeled as a legal entity**

You must consolidate the financial results for regional offices into a single, consolidated company in order to

prepare financial statements.

If the organization is modeled as an operating unit

Consolidation is not required, because data is already shared among operating units.

Centralized payments

If the organization is modeled as a legal entity

Centralized payments must be set up so that invoices for all child legal entities can be paid to or from a single parent legal entity.

If the organization is modeled as an operating unit

Centralized payments are not required because all invoices are recorded in a single legal entity.

Intercompany transactions

If the organization is modeled as a legal entity

Intercompany sales orders, purchase orders, payments, or receipts can be applied to one another. You are not required to use journal vouchers. You can view intercompany transactions at the sub-ledger level (Accounts receivable, Accounts payable). The following examples illustrate how intercompany transactions are handled.

Example 1: Headquarters provides services to regional offices and must charge the costs of those services to the regional offices

If you model the regional office as a legal entity, you have the following options:

- Headquarters creates a journal entry to cross-charge the regional office for the expense. The transactions cannot be aged.
- Headquarters sends a purchase order for the services to the regional office. A sales order is automatically created in the legal entity for the regional office, with intercompany sub-ledger transactions.

Example 2: Headquarters procures and pays for service that is delivered to a regional office

If you model the regional office as a legal entity, you have the following options:

- The invoice and payment follow the regulatory requirements of headquarters. Headquarters can create a journal entry to cross-charge the regional office for the expense. The transactions cannot be aged.
- The invoice and payment follow the regulatory requirements of headquarters. Headquarters can create an intercompany sub-ledger transaction.

If the organization is modeled as an operating unit

Intercompany transactions among operating units are supported only through journal vouchers. An operating unit cannot issue or receive a purchase order, sales order, or invoice from another operating unit in the same legal entity. You cannot view intercompany transactions at the sub-ledger level (Accounts receivable, Accounts payable). The following examples illustrate how intercompany transactions are handled.

Example 1: Headquarters provides services to regional offices and must charge the costs of those services to the regional offices

If you model the regional office as an operating unit, headquarters enters an expense transaction and codes it to the regional office.

Example 2: Headquarters procures and pays for service that is delivered to a regional office

If you model the regional office as an operating unit, the invoice and payment follow the regulatory requirements of headquarters. The invoice can be coded to the regional office. On the income statement, use a balancing financial dimension to report costs for the regional office.

Local tax requirements

If the organization is modeled as a legal entity

A legal entity is subject to the tax laws of the tax authority in the country/region where the legal entity is registered. For example, a legal entity that is registered in Denmark is subject to Danish tax laws and regulations. A legal entity can belong to only one country/region. The country/region that you select for the primary address of the legal entity controls the country/region-specific features that are available to that legal entity. For example, if the primary address of the legal entity is in Denmark, features that are related to Danish tax laws and regulations become available. Therefore, if your organizations are in different countries/regions and require

different local tax options, you must set up the organizations as separate legal entities.

If the organization is modeled as an operating unit

Operating units use the country context of the parent legal entity. Operating units in the same legal entity cannot have different country/region-specific requirements. If your organizations are in the same country/region and use the same tax options, you can set them up as operating units.

Statutory reporting for a country/region

If the organization is modeled as a legal entity

For countries/regions that are supported, most statutory reports can be created. For information about which reports are available for each country/region, see the [Microsoft Dynamics Localization Portal](#). (A CustomerSource logon is required.)

NOTE

A posting layer in the general ledger allows you to make adjusting entries to a parent company that uses a different accounting standard than the child company. For example, for a company that uses generally accepted accounting practices in the United Kingdom (UK GAAP), you can make adjusting entries in the posting layer. These entries can be consolidated into a parent company that uses generally accepted accounting principles (GAAP) in the United States. The adjusting entries do not affect UK GAAP reporting.

If the organization is modeled as an operating unit

Statutory reports must be created by using another application. You must ensure that data is captured in Finance and Operations apps to support the requirements of each operating unit, where they differ from the requirements of headquarters.

Currency

If the organization is modeled as a legal entity

If your organizations must use different functional currencies, you must model the organizations as legal entities. Functional currencies are set up per legal entity. However, you can enter transactions in multiple currencies.

If the organization is modeled as an operating unit

If your organizations can use a single functional currency, you can model the organizations as operating units. Operating units must share a functional currency. However, you can enter transactions and create reports in multiple currencies.

Year-end closing

If the organization is modeled as a legal entity

If laws and accounting practices differ among the countries/regions where your organizations are located, you may require different year-end procedures per organization. This means that you must model the organizations as legal entities. Each legal entity has its own year-end procedures.

If the organization is modeled as an operating unit

If laws and accounting practices are the same among the countries/regions where your organizations are located, you may use a single set of year-end procedures. This means that you can model the organizations as operating units. All operating units must use the same year-end closing procedure.

Number sequences

If the organization is modeled as a legal entity

Number sequences for some references can be set up per legal entity. Some number sequences can be shared.

If the organization is modeled as an operating unit

Number sequences for some references can be set up per operating unit. Some number sequences can be shared.

Products

If the organization is modeled as a legal entity

Product definitions are shared, and they must be released to individual legal entities before they can be included in transactions. Each legal entity has its own set of released products that can be included in transaction documents. If your internal organizations must use different sets of products, you must model the organizations as legal entities.

NOTE

Even though product definitions are shared, in each legal entity where a product has been released, you can specify different sales, purchase, and stocking parameters for the item at each inventory site.

If the organization is modeled as an operating unit

All operating units share the same set of products. If your internal organizations can share the same set of products, you can model the organizations as operating units.

Inquiry and reporting

If the organization is modeled as a legal entity

You must manually change companies to enter transactions and perform inquiries in multiple legal entities. Because of data security boundaries, consolidated inquiry and reporting can be resource intensive and time-consuming.

If the organization is modeled as an operating unit

You do not need to change companies to access data from multiple operating units. Consolidated inquiry and reporting and individual regional inquiry is easier and faster.

Best practices for modeling organizations and hierarchies

Consider the following best practices when you implement an organization hierarchy:

- Create a department to model the intersection between a legal entity and a business unit. You can then roll up data from a department to a legal entity for statutory reporting, and from a department to a business unit for internal reporting. Departments can serve as profit centers. If you use departments, you do not have to use legal entities and business units as dimensions in the account structure. You can use just departments as a dimension. However, you must use both cost centers and departments as dimensions in the account structure if cost centers are used only as cost accumulators, and departments are used for revenue recognition.
- Model multiple hierarchies for operating units if you have complex requirements for reporting profit and loss.
- In a single legal entity, do not model multiple hierarchies for the same hierarchy purpose.
- Do not create a hierarchy for every purpose. Usually, you can use one hierarchy for multiple purposes. For example, one hierarchy of operating units can be assigned to all policy-related purposes.
- Create balanced hierarchies. In a hierarchy, all nodes that are the same distance from the root node are defined as a level. In a balanced hierarchy, only one type of operating unit can occur at each level, and the distance from the root node to each level is consistent. If there are intermediate levels between a department and a legal entity or a business unit, placeholder organizations may be required to create a balanced hierarchy.
- Do not model a separate hierarchy of operating units if the structure for legal entities is also your operating structure. A mixed hierarchy of legal entities and operating units may serve both purposes.
- Before you model major restructuring scenarios, use the hierarchy's effective dates to perform an impact analysis and a validation test.
- Use draft mode to change a hierarchy before you publish a new version in a production environment.
- Limit the number of people who have permissions to add or remove organizations from a hierarchy in a

production environment. A smaller number reduces the chance that costly mistakes can occur and corrections must be made.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an organization hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use the following procedure to create an organizational hierarchy. You can use organizational hierarchies to view and report on your business from various perspectives. For example, you can set up one hierarchy for tax, legal, or statutory reporting. You can then set up another hierarchy to report financial information that is not legally required, but that is used for internal reporting.

Before you create an organizational hierarchy, you must create organizations. For more information, see the "Create a legal entity" or "Create an operating unit" tasks. You can also create departments and teams.

The demo data company used to create this procedure is USMF.

Create a hierarchy

1. Go to **Navigation pane > Modules > Organization administration > Organizations > Organization hierarchies**.
2. On the **Action pane**, click **New**.
3. In the **Name** field, type a value.
4. In the **Purpose** section, click **Assign purpose**.
5. In the list, find and select the desired record. Select a purpose to assign to your organization hierarchy.
6. In the **Assigned hierarchies** section, click **Add**.
7. In the list, mark the selected row. Find the hierarchy you just created.
8. Click **OK**.

Add organizations to the hierarchy

1. In the list, find and select the desired record. Select your hierarchy.
2. In the **Assigned hierarchies** section, click **View hierarchy**.
 - Add organizations, as necessary.
 - To add an organization, click **Edit** and then **Insert** to add the organization. When you are done making changes you can **Save** a draft and/or **Publish** the changes.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a legal entity

2/18/2021 • 2 minutes to read • [Edit Online](#)

A legal entity is an organization that is identified through registration with a legal authority. Legal entities can enter into contracts and are required to prepare statements that report on their performance. The following procedure explains how to create a legal entity. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Organization administration > Organizations > Legal entities**.
2. Click **New**.
3. In the **Name** field, type a value.
4. In the **Company** field, type a value.
5. In the **Country/region** field, enter or select a value.
6. Click **OK**. In the **General** section, provide the following general information about the legal entity: Enter a search name, if a search name is required. A search name is an alternate name that can be used to search for this legal entity. Select whether this legal entity is being used as a consolidation company. Select whether this legal entity is being used as an elimination company.
7. Expand the **Addresses** section. In the **Addresses** section, click **Edit** to enter address information, such as the street name and number, postal code, and city.
8. Expand the **Contact information** section. In the **Contact information** section, enter information about methods of communication, such as email addresses, URLs, and telephone numbers.
9. Expand the **Statutory reporting** section. In the **Statutory reporting** section, enter the registration numbers that are used for statutory reporting.
10. Expand the **Registration numbers** section. In the **Registration numbers** section, enter any information required by the legal entity.
11. Expand the **Bank account information** section. In the **Bank account information** section, enter bank accounts and routing numbers for the legal entity.
12. Expand the **Foreign trade and logistics** section. In the **Foreign trade and logistics** section, enter shipping information for the legal entity.
13. Expand the **Number sequences** section. In the **Number sequences** section, you can view the number sequences that are associated with the legal entity.
14. Expand the **Images** section. In the **Images** section, view or change the logo and/or dashboard image that are associated with the legal entity.
15. Expand the **Tax registration** section. In the **Tax registration** section, enter the registration numbers that are used to report to tax authorities.
16. Expand the **Tax 1099** section. In the **Tax 1099** section, enter 1099 information for the legal entity.
17. Click **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an operating unit

2/18/2021 • 2 minutes to read • [Edit Online](#)

An operating unit is an organization that is used to divide the control of economic resources and operational processes in a business. People in an operating unit have a duty to maximize the use of scarce resources, improve processes, and account for their performance. The types of operating units include cost centers, business units, departments, and value streams. Use the following procedure to create an operating unit. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Organization administration > Organizations > Operating units**.
2. Click **New** to open the drop dialog.
3. In the list, find and select the desired record. Select the type of operating unit you want to create.
4. In the list, click the link in the selected row.
5. In the **Name** field, type a value.
 - Expand the **General** section, if necessary.
 - Provide general information about the operating unit, such as an identification number, DUNS number, and manager.
 - Expand the **Addresses** section, if necessary.
 - Enter address information, such as the street name and number, postal code, and city. Click **Add** to enter a new address record, or click **Edit** to modify an existing address record.
 - Expand the **Contact information** section, if necessary.
 - Enter information about methods of communication, such as email addresses, URLs, and telephone numbers. To enter a new communication record, click **New**. To modify an existing communication record, click **More options > Advanced**.
6. Optionally, change the **Operating unit number** as needed. Note that this number is a unique identifier for the corresponding **Party** record and cannot be the same as any other operating unit.
7. Select **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Global address book overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

The global address book is a centralized repository for master data that must be stored for all internal and external persons and organizations that the company interacts with. The data that is associated with party records includes the party's name, address, and contact information. Other details vary, depending on whether the party is a person or an organization. Each party record is assigned to a party, and each party can be associated with one or more party roles in a company. Party roles include customer, prospect, worker, user, vendor, competitor, applicant, and contact. For example, the organization party First Up Consultants, can be associated with customer, business relation, and vendor roles in the CEE company, and can also be associated with the vendor role in the CEU company. Here are some of the benefits of this shared data:

- The data shows the relationships that people and organizations have with other areas of the company. The relationship between two organizations changes when one organization has multiple roles, such as vendor and customer. Communication between the two organization also changes. There might be special agreements that can be negotiated to encourage a closer partnership with the other organization.
- Setup and maintenance are easier. For example, when an address changes, the update must be made in only one place. All the other associated records are updated automatically.

How the global address book works

The following illustration shows how party records, party roles, locations, and transactions interact and relate to an address book. As the illustration shows, a party record can belong to one or more address books. Each party record can store one or more locations, or addresses, and is assigned a party role. The role that is assigned to the party record can have specific transactions types associated with it. The following sections provide more information about party roles, locations, and transaction types. The following image is a graphical representation of the ways that parties, party roles, locations, and transactions interact in relation to the global address book.

Party roles

Roles that are associated with party records are referred to as party roles. There are several party roles, and they can be assigned to both party types, person and organization. Here are the definitions for each party role:

- **Customer** – Individuals, companies, or other entities who purchase goods and services that are produced by other individuals, companies, or entities.
- **Prospect** – A party that might provide a service or benefit to a legal entity.
- **Worker** – A person who assumes the role of an employee or a contractor, and who is paid in exchange for services.
- **User** – A person who is a user of the system.
- **Vendor** – A party that supplies products to one or more legal entities in exchange for payment.
- **Competitor** – A person or organization that provides goods or services that are similar to the goods or services that your business provides.

- **Applicant** – A person who makes a formal written or electronic request to work for or fill an open position in an organization.
- **Contact** – A person, either inside or outside your organization, that you have created an entry for. In this entry, you can save information such as the person's street and email addresses, telephone and fax numbers, and webpage URLs.

Creating new party records

There are two ways to enter party records in the global address book:

- **Creating a party record when you don't know the role** – When you create a party record and don't know the role type (for example, you don't know whether the party is a customer or an opportunity), you create the record in the global address book. You can select the role type later.
- **Creating a party record when you know the role** – If you know the role type for the party, you can create a record on the appropriate page for that type. For example, if the party is a customer, you create a record on the **Customer** page. When you create and save a record by using the page for the party's role type, the record is automatically created in the global address book.

Party roles and transactions

For transactions that are a part of the business processes, multiple parties might be associated with each transaction. An example is a customer that needs to be referenced on project quotations.

Parties locations, addresses, and contact information

Each party record's addresses, locations, and contact information are shared across all the party roles that are associated with that party. Therefore, when any of this information is changed, all other associated records are updated accordingly.

Locations and transactions

When a party role is included in a transaction, the location, address, or contact information of the party can be accessed when transaction details are entered.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Plan for the global address book and other address books

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the considerations and decisions that you must make during the planning process, before you set up and configure the global address book and any additional address books. Some of the decisions will require that you confirm the decisions that have been made for other areas of the product, such as the organization hierarchy.

Global address book

Before you begin to work with the global address book, you must determine the default values for it. These default values are then used for any additional address books that you create.

Decisions

- What sequence should names be displayed in for party records of the **Person** type? For example, one sequence is last name, middle name, first name.
- Should party records be deleted from the address book when the role record is deleted? For example, if a customer record is deleted, should the party record also be deleted?
- When a new record is created, should users be notified if a duplicate record is found in the global address book?
- Should the Data Universal Numbering System (DUNS) number be included in a party record's information?
- If the DUNS number is included in a party record, should the uniqueness of the number be checked?
- When a party record is created in the global address book, do you want a default party type, person, or organization?
- Which user roles should have access to the private addresses and contact information of party records?

Additional address books

After you create the global address book, you can create additional address books as you require, such as a separate address book for each company in your organization or for each line of business. For example, Fabrikam is an international organization that has multiple companies and multiple lines of business. Fabrikam plans to create an address book for each line of business. For lines of business that occur in more than one location, such as the pneumatic tools business, Fabrikam plans to create an address book for each location. Chris, the IT manager at Fabrikam, has created the following list of address books that are required. This list also describes the party records that each address book must include.

- **Public Sector Contracts (PubSC)** – Party records for all parties that are involved in the public sector contracts that Fabrikam holds.
- **Private Sector Contracts (PriSC)** – Party records for all parties that are involved in the private sector contracts that Fabrikam holds.
- **Electronic Tools (ET)** – Party records for all parties that are involved in the purchase or sale of electronic tools, or that otherwise interact with the electronic tools that are provided by or purchased for Fabrikam in the Fabrikam-Japan company.
- **Pneumatic Tools (PTJPN)** – Party records for all parties that are involved in the purchase or sale of pneumatic tools, or that otherwise interact with the pneumatic tools that are provided by or purchased for Fabrikam in the Fabrikam-Japan company.

- **Pneumatic Tools (PTUSA)** – Party records for all parties that are involved in the purchase or sale of pneumatic tools, or that otherwise interact with the pneumatic tools that are provided by or purchased for Fabrikam in the Fabrikam-US company.

Decision:

- How many additional address books will you create?

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure the global address book

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to set the default values and security policies for the global address book.

The demo data company used to create this task is USMF. This task is intended for the Planning and configuration team.

1. In the Navigation pane, go to **Modules > Organization administration > Global address book > Global address book parameters**.
2. In the **Name sequence** field, select how names should be shown.
3. In **Delete parties with no roles**, select whether to delete parties with that have not been assigned a role.
4. In **Use duplicate check**, select whether to check for duplicate records.
5. In **Display DUNS number on addresses**, select whether to display the DUNS number on addresses.
6. In **Check for unique DUNS number**, select whether to check for unique DUNS numbers.
7. In the **Party** field, select an option.
8. In the **Customer** field, select an option.
9. In the **Vendor** field, select an option.
10. In the **Prospect** field, select an option.
11. In the **Competitor** field, select an option.
12. Click the **Private location security** tab.
13. In the list, find and select the desired record. Press the Shift key to select multiple roles to add to the **Selected roles** pane and then click the arrow to add the selected roles.
14. Click **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Address books FAQ

2/18/2021 • 5 minutes to read • [Edit Online](#)

How do I check for duplicate records?

You can check for duplicate records directly from the **Global address book** list page. On the Action Pane, on the **Party** tab, in the **Maintain** group, click **Check for duplicates**. Then select the values to include in the check for duplicates.

Can I bulk add or delete party records from an address book?

Yes, you can add multiple party records to an address book and also remove multiple party records.

- To add multiple party records to an address book, on the **Global address book** list page, select the parties in the list. Then, on the Action Pane, on the **Party** tab, in the **Maintain** group, click **Assign parties**. Select the address books to add the selected party records to, and then click **OK**. All the selected party records are added to the address books that you selected.
- To remove multiple party records from an address book, on the **Global address book** list page, select the parties in the list. Then, on the Action Pane, on the **Party** tab, in the **Maintain** group, click **Remove parties**. Select the address books to remove the parties from, and then click **OK**. All the selected party records are removed from the address books that you selected.

Can I change the party type of a record, or do I have to delete the old record and create a new one?

Occasionally, you might have to change the party type of a record from person to organization or from organization to person. For example, Nancy is a member of the sales team for Fabrikam U.K. At a trade show in London, she meets six new prospects. Nancy creates a prospect party record for each prospect. When Nancy saves the records, each record is also created in the global address book. Fabrikam has set the default party type to organization, but two of the new prospects should have a record type of person. Therefore, when Nancy returns from the trade show, she must change the party type of the two prospect records. To change a party record from one party type to another, you must first create a new party record of the correct type in the global address book. You then associate the old party record with this new record. After you have made the new party association, delete the original party record that has the incorrect record type.

How do I change the name or address of a party record?

You can update the name of a party record, and the addresses that are associated with that record, at any time.

- To update the name of a party record, open the party record, and then, on the Action Pane, click **Edit**. On the **General** FastTab, enter the new name for the party, and then save the record.
- To update an address for a party record, open the party record, and then, on the **Addresses** FastTab, select the address to update. Click **Edit**, and then, on the **Edit address** page, make the required changes to the address or address parameters.

Can I merge two or more party records into one record?

Occasionally, you might want to merge two or more party records into a single record. This can occur if you create one or more duplicate party records, either on purpose or unintentionally. When you merge party records, you select one record to keep. The information from the other records is then merged into this record.

For example, you discover that information about Fabrikam is stored in three party records: A, B, and C. You decide to keep party record A. Therefore, the information that is stored in party records B and C will be merged into party record A. There are some situations where you can't merge party records:

- You can't merge party records that are associated with the same party role, such as customer or vendor, in the same legal entity. For example, party A is associated with a customer in legal entity 123, and party B is associated with a different customer in legal entity 123. These party records can't be merged, because if they were merged, the merged party record would be associated with multiple customers in the same legal entity, and this isn't allowed. However, the records can be merged if party B is associated with a vendor in legal entity 123 or with a customer in a different legal entity.
- You can't merge internal party organization records in the same legal entity, team, or operating unit.

Should I create a party record in the global address book or in another place, such as the Customer or Vendor page?

You can enter party records either in the global address book or on the appropriate entity page. When you add a record in one location, the same record is always added in the other location. For example, if you add a party record for a customer in the global address book, the record is also added on the **Customer** page. Likewise, if you add a party record for a customer on the **Customer** page, the record is also added in the global address book. Use the following guidelines to decide where you should enter new party records:

- **Creating a party record when you don't know the entity type** – If you must create a party record but don't know the entity type (for example, you don't know whether the entity is a customer or an opportunity), create the record in the global address book. You can select the entity type later.
- **Creating a party record when you know the entity type** – If you know the entity type for the party, you can create a record on the applicable page for that type. For example, create a record for a customer on the **Customer** page. When you create and save a record by using the appropriate entity page, the record is automatically created in the global address book.

Can I translate address information for party records?

You can set up translations of address information, so that the information appears in your user language (system language) in your program, but in another language on documents such as sales orders. You can enter translations for country/region names, address purposes, and name sequences. For example, your system language is Danish, and you create a sales order for a customer in France. In this case, you can view the customer record in Danish in the program but display the address information in French on the printed sales order. When you set up translations, you should enter a translation for every item in the list. Any item that you don't enter a translation for will appear in the system language. For example, your system language is Danish, and you send a document to a customer in Spain. If you haven't entered Spanish (ESP) translations for the address information, that information will appear in Danish both in the program and on the printed document.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure address books

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure, and the decisions that you made in the Planning the configuration of the global address book and additional address books topic, to set up additional address books for your organization.

The demo data company used to create this task is USMF. This recording is intended for the Planning and configuration team members.

Configure address books

1. In the **Navigation** pane, go to **Modules > Organization administration > Global address book > Address books**.
2. Click **New**.
3. In the **Name** field, type a value.
4. In the **Description** field, type a value.
5. Click **Save**.
6. In the list, find and select the desired record.
7. Click the arrow to add the selected available teams to the address book.
8. Click **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Workflow system overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the workflow system.

What is workflow?

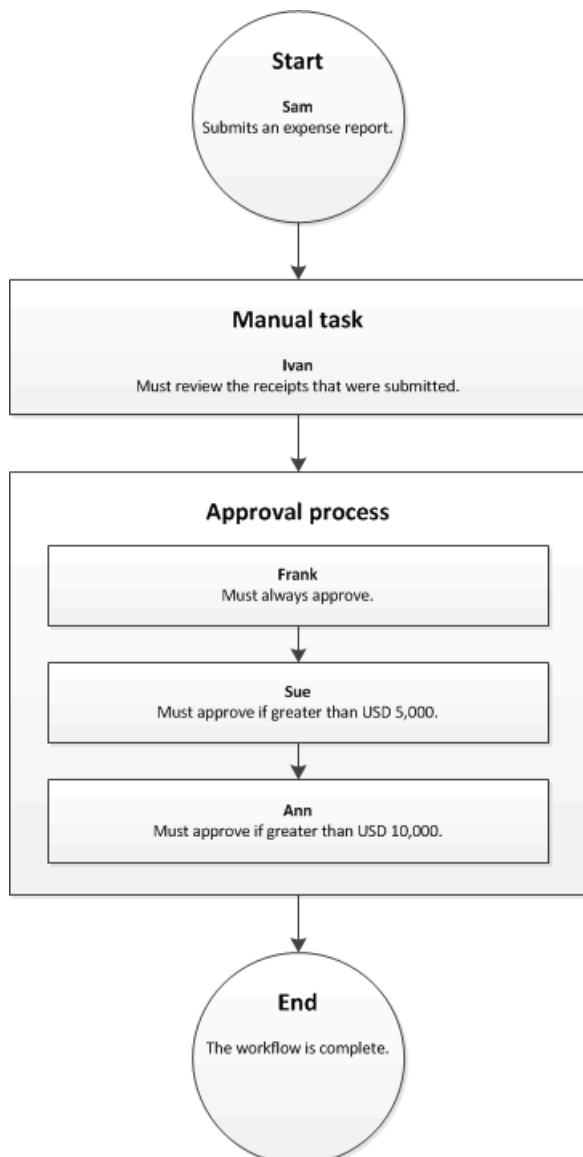

The term *workflow* can be defined in two ways: as a system and as a business process.

Workflow is a system

Workflow is a system that runs on the Application Object Server (AOS). The workflow system provides functionality that you can use to create individual workflows, or business processes.

Workflow is a business process

A workflow represents a business process. It defines how a document flows, or moves, through the system by showing who must complete a task, make a decision, or approve a document. For example, the following illustration shows a workflow for expense reports.

To better understand this workflow, suppose that Sam submits an expense report for USD 7,000. In this scenario, Ivan must review the receipts that Sam routes to him. Then Frank and Sue must approve the expense report.

Now suppose that Sam submits an expense report for USD 11,000. In this scenario, Ivan must review the receipts, and Frank, Sue, and Ann must approve the expense report.

Benefits of using the workflow system

There are several benefits of using the workflow system in your organization:

- **Consistent processes** – You can define how specific documents, such as purchase requisitions and expense reports, are processed. By using the workflow system, you ensure that documents are processed and approved in a consistent and efficient manner.
- **Process visibility** – You can track the status, history, and performance metrics of workflow instances. This helps you determine whether changes should be made to the workflow to improve efficiency.
- **Centralized work list** – Users can view a centralized work list that displays the workflow tasks and approvals that are assigned to them.

Workflow system architecture

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes the architecture of the workflow system.

The workflow infrastructure consists of two components that are hosted on Application Object Server (AOS): the X++ workflow runtime and the managed workflow runtime.

The X++ workflow runtime consists of the following components:

- Workflow runtime application programming interface (API)
- A messaging batch job
- A message queue

Either the messaging batch job or the workflow runtime API can invoke the application code, if it's required. The X++ workflow runtime is compiled into the Common Intermediate Language (CIL) of the Microsoft .NET Framework.

The managed workflow runtime consists of the Windows Workflow Foundation and Finance and Operations apps extensions.

Logically, the workflow infrastructure is an extension and is transparent to users. Physically, both the X++ workflow and the managed workflow runtimes are hosted on AOS. The workflow infrastructure uses batch processing on AOS and .NET Interop to integrate both subsystems, and to pass messages from one subsystem to the other. The X++ code that is run in the batch processor is compiled to .NET CIL. The batch processing runs in the .NET common language runtime (CLR).

The following figure shows the high-level architecture of the workflow infrastructure.

Users can use workflow pages and controls to participate in business processes.

Developers can create workflows for the objects that they have added. The following table describes the workflow steps that occur when a user submits an expense report to the workflow system for approval.

STEP	RUNTIME	ACTIVITY
1	X++ workflow runtime	<p>A user submits an expense report by clicking the Submit button on one of the workflow controls. This action causes X++ code to activate a workflow instance by calling the workflow runtime API. The workflow runtime API posts a message to the message queue. The messaging batch job reads the message and sends a workflow activation request to the managed workflow runtime.</p> <p>[!NOTE] The messaging batch job processes the message queue at one-minute intervals.</p>

STEP	RUNTIME	ACTIVITY
2	Managed workflow runtime	<p>.NET Interop from X++ receives the message and starts a new workflow instance via Windows Workflow Foundation. This workflow instance performs a callback to the X++ workflow runtime API via .NET Interop to X++ CIL and posts a message that the workflow has started.</p> <p>After the message is posted, the managed workflow runtime saves the idle workflow instance to the database. The runtime then removes the workflow instance from memory. When the managed workflow runtime receives another message from the X++ workflow runtime for this workflow instance, it restores the workflow instance to memory and resumes it.</p> <p>Each workflow instance is unique. If two users submit their expense reports for approval, two workflow instances are started.</p>
3	X++ workflow runtime	<p>The messaging batch job reads the workflow started message from the message queue and invokes the application event handler to process a workflow started event. The batch job then posts an acknowledgment message that the event was processed.</p>
4	Both	<p>This same messaging pattern is repeated, as required, throughout the lifecycle of the workflow instance.</p>

The workflow architecture helps provide a reliable and durable messaging system, and also helps guarantee that the state of the workflow is always synchronized with the state of the application. If an unexpected hardware or software failure occurs, the workflow instance state is returned to its last known saved point, and the message stays in the queue. Therefore, from an architecture perspective, the recovery model is to fix the problem and resume the workflow.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Workflow elements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the various elements that make up a workflow.

A workflow consists of elements. The sections that follow describe each type of element.

Tasks

A *task* is a unit of work that must be performed. Two types of tasks can be added to a workflow: manual tasks and automated tasks.

Manual task

A *manual task* is a unit of work that must be performed by a user. For example, an expense report workflow can have manual tasks that require the assigned users to complete the following actions:

- Review the receipts that are submitted together with an expense report.
- Call an employee's manager.

Automated task

An *automated task* is a unit of work that must be performed by the system. No human interaction is required. For example, a sales order workflow can have automated tasks that require the system to complete the following actions:

- Perform a credit check.
- Create a customer record for the customer, if a record doesn't already exist.

Approval processes

An *approval process* is a process that consists of separate steps. At each approval step, the user can perform the following actions:

- Approve the document.
- Reject the document.
- Request a change to the document.
- Assign the document to another user for approval.

Line-item workflow elements

A workflow can be created to process either documents or the line items on a document. For example, you've created an approval workflow for timesheets. (We will refer to this workflow as the *document workflow*.) You can add a *line-item workflow* element to that document workflow. When the line-item element is run, each line item on the document is submitted for processing. You might want all the line items to be processed by the same line-item workflow, or you might want each line item to be processed by a different line-item workflow. Imagine that an employee has submitted a timesheet that resembles the following figure.

Timesheet: 1234
Employee: 5678
Submitted by: Mike

Your Organization's Name

Date	Project ID	Project Manager	Description of Work	Start Time	Stop Time
DD/MM/YY	1111	Mary	Work at site A	9:00	17:00
DD/MM/YY	1111	Mary	Work at site A	9:00	17:00
DD/MM/YY	2222	Hans	Work at site B	9:00	17:00
DD/MM/YY	3333	Jen	Work at site C	9:00	17:00
DD/MM/YY	3333	Jen	Work at site C	9:00	17:00

Document workflow
You can configure a workflow to process the whole document.

Line-item workflow
You can configure a workflow to process each line item on the document.

In this scenario, you might want to create the following line-item workflows:

- **Line-item workflow 1** – This workflow is used to process line items where the project ID is 1111.
- **Line-item workflow 2** – This workflow is used to process line items where the project ID is 2222.
- **Line-item workflow 3** – This workflow is used to process line items where the project ID is 3333.

Flow-control elements

The following elements let you design workflows that have alternate branches or branches that run at the same time.

Manual decision

A *manual decision* is a point where a workflow divides into two branches. A user must make a decision, and this decision determines which branch is used to process the document that was submitted.

Conditional decision

A *conditional decision* is also a point where a workflow divides into two branches. However, the system decides which branch is used to process the document that was submitted. To make this decision, the system evaluates the document to determine whether it meets specified conditions.

Parallel activity

A *parallel activity* is a workflow element that includes two or more workflow branches that run at the same time.

Subworkflow

A *subworkflow* is a workflow that runs in the context of another workflow.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

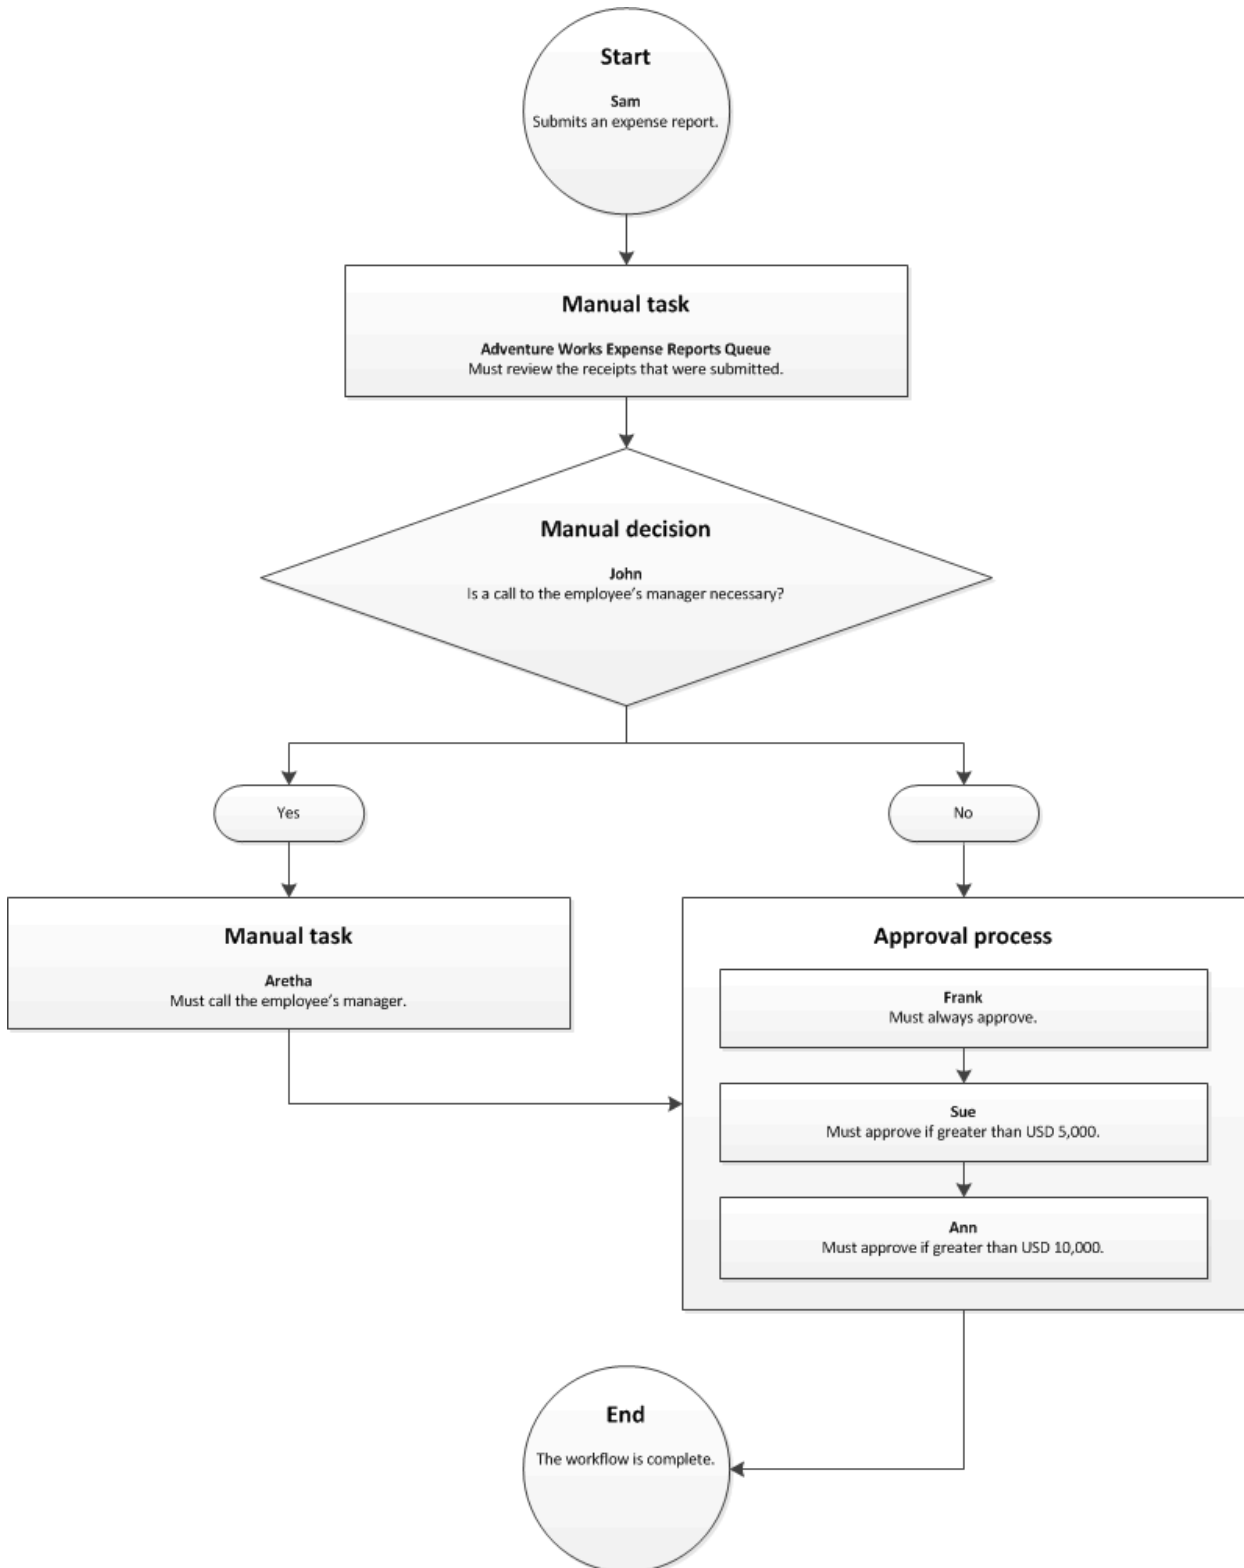

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Actions in workflow approval processes

2/18/2021 • 6 minutes to read • [Edit Online](#)

This article explains the actions that each participant in a workflow approval process can take.

A workflow can involve several groups of people: the originator, task assignees, decision makers, and approvers. For example, in the following expense report workflow, Sam is the originator, the members of the queue are task assignees, John is a decision maker, and Frank, Sue, and Ann are approvers.

The following sections explain the workflow actions that each group can perform.

Actions that an originator can perform

The originator starts a workflow instance by submitting a document for processing. For example, Sam must click the **Submit** button on the **Expense report** page to submit his expense report.

Actions that a task assignee can perform

A task can be assigned to multiple people or to a work item queue that is monitored by several people. However, only one person can complete a task. For example, Sam has submitted an expense report and has routed his receipts to his organization's Expense Reports department for review.

The members of the Adventure Works Expense Reports department monitor the queue. Julie, a member of that department, has accepted the task of reviewing Sam's expense report and receipts. She can now perform one of the following actions: complete, reject, delegate, request change, reassign, or release.

NOTE

The actions that are available vary, depending on how the software developer designed the task.

Complete

When a user completes a task, the document that was submitted for processing is assigned to the next user in the workflow, if there is a next user. If no additional processing is required, the workflow process ends.

For example, Julie, a member of the Adventure Works Expense Reports department, has accepted the task of reviewing Sam's expense report and receipts. After Julie completes her review, the document is assigned to John.

Reject

When a user rejects a document, the workflow process ends.

For example, Julie, a member of the Adventure Works Expense Reports department, has accepted the task of reviewing Sam's expense report and receipts. If Julie rejects the expense report, the workflow process ends.

Sam can then resubmit the expense report. He can make changes first, or he can resubmit the original version. If Sam resubmits the expense report, the workflow process starts at the manual review task.

Delegate

When a user delegates a task, the task is assigned to another user.

For example, Julie, a member of the Adventure Works Expense Reports department, has accepted the task of reviewing Sam's expense report and receipts. Julie delegates this task to Tim, who is her assistant.

Tim then acts on behalf of Julie. Therefore, when Tim completes his review, the expense report is assigned to John, just as if Julie had completed the task.

Request change

When a user requests a change to a document that was submitted, the document is sent back to the originator.

For example, Julie, a member of the Adventure Works Expense Reports department, has accepted the task of reviewing Sam's expense report and receipts. Julie notices some errors on the expense report and requests changes. The expense report is sent back to Sam.

Sam can resubmit the expense report. He can make the requested changes first, or he can resubmit the original version. If Sam resubmits the expense report, a member of the work item queue must review the expense report

and the receipts again.

Reassign

The members of a work item queue can reassign documents that are in that queue to another queue.

For example, Julie, a member of the Adventure Works Expense Reports department, is monitoring the queue. To help balance the workload, she can reassign the expense report, and the receipts that are included with it, to another queue.

Release

Occasionally, a member of a work item queue might accept a task, but then decide that he or she can't complete the task. In this case, the person who accepted the task can release the document back to the work item queue.

For example, Julie, a member of the Adventure Works Expense Reports department, has accepted the task of reviewing Sam's expense report and receipts. If Julie decides that she can't complete the task, she can release the document. The expense report is returned to the queue, so that other members of the Adventure Works Expense Reports department can complete the task.

Actions that a decision maker can perform

Typically, a document is assigned to a decision maker, because there is a question that the decision maker must answer. The answer to the question is typically **Yes** or **No**, or **True** or **False**. If the decision maker doesn't select one of those choices, he or she can delegate the decision.

[Choice 1] or [Choice 2]

A decision maker must answer a question that is related to the document. The answer to the question is typically **Yes** or **No**, or **True** or **False**. The answer that the decision maker selects determines the workflow branch that is used to process the document.

For example, Sam's expense report is assigned to John. John must decide whether the information in the document requires a call to Sam's manager. If John decides that a call is required, the expense report is assigned to Aretha, who must then call Sam's manager. If John decides that a call isn't required, the expense report is assigned to Frank for approval.

Delegate

When a decision maker delegates a decision, the document is assigned to another user who must make the decision.

For example, Sam's expense report is assigned to John. John delegates the decision to Maria, who is his assistant.

Maria then acts on behalf of John. If Maria decides that a call to Sam's manager is required, the expense report is assigned to Aretha, who must then call Sam's manager. If Maria decides that a call isn't required, the expense report is assigned to Frank for approval.

Actions that an approver can perform

When a document is assigned to an approver, the approver can perform one of the following actions: approve, reject, delegate, or request change.

Approve

When an approver approves a document, the document is assigned to the next user in the workflow, if there is a next user. If no additional processing is required, the workflow process ends.

For example, Sam has submitted an expense report for USD 6,000, and this document is assigned to Frank. When Frank approves the document, it's assigned to Sue for approval. When Sue approves the expense report,

the workflow process ends.

Reject

When an approver rejects a document, the workflow process ends.

For example, Sam has submitted an expense report for USD 12,000, and this document is assigned to Sue. If Sue rejects the expense report, the workflow process ends.

Sam can resubmit the expense report. He can make changes first, or he can resubmit the original version of the expense report. If Sam resubmits the expense report, the workflow process starts at the approval process.

Delegate

When an approver delegates a document, the document is assigned to another user for approval.

For example, Sam has submitted an expense report for USD 12,000, and this document is assigned to Frank. Frank delegates the expense report to Ann.

Ann then acts on behalf of Frank. Therefore, when Ann approves the document, it's assigned to Sue for approval, just as if Frank had approved it. After Sue approves the document, it's sent to Ann for approval.

Request change

When an approver requests a change to a document, the document is sent back to the originator.

For example, Sam has submitted an expense report for USD 12,000, and this document is assigned to Sue. If Sue requests a change, the expense report is sent back to Sam.

Sam can resubmit the expense report. He can make the requested changes first, or he can resubmit the original version of the expense report. If Sam resubmits the expense report, it's sent to Frank for approval, because Frank is the first approver in the approval process.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create workflows overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create a workflow.

Open the workflow editor

The module that you're working in determines the types of workflow that you can create. Follow these steps to select the type of workflow to create and open the workflow editor.

1. Open the module that you want to create a new workflow for. For example, to create a workflow for purchase requisitions, click **Procurement and sourcing**.
2. Click **Setup > [Module name] workflows**.
3. On the list page that appears, on the Action Pane, click **New**.
4. On the **Create workflow** page, select the type of workflow to create, and then click **Create workflow**. The workflow editor appears. You can now use the following procedures to design the workflow.

Drag workflow elements onto the canvas

The **Workflow elements** area of the workflow editor contains the elements that you can add to your workflow. To add elements to the workflow, drag them onto the canvas.

Connect the elements

To connect one workflow element to another, hold the pointer over an element until connection points appear. Click a connection point, and drag it to another element. Be sure to connect all the elements.

Configure the properties of the workflow

Follow these steps to configure the properties of the workflow.

1. Click the canvas to make sure that no workflow element is selected.
2. Click **Properties** to open the **Properties** page for the workflow.
3. Follow the procedures in the [Configure workflow properties](#) topic.

Configure the elements of the workflow

Configure each element that you dragged onto the canvas. For information about how to configure each workflow element, see the following topics:

- [Configure manual tasks in a workflow](#)
- [Configure automated tasks in a workflow](#)
- [Configure approval processes in a workflow](#)
- [Configure approval steps in a workflow](#)
- [Configure manual decisions in a workflow](#)
- [Configure conditional decisions in a workflow](#)

Resolve any errors or warnings

The **Errors and warnings** pane at the bottom of the workflow editor shows messages that have been generated for the workflow. To find the element where an error or warning occurred, double-click the error or warning message. You must resolve all errors and warnings before you can make the workflow active.

Save and activate the workflow

When you're ready to save and activate the workflow, follow these steps.

1. Click **Save and close** to close the workflow editor and open the **Save workflow** page.
2. Enter comments about the changes that you've made to the workflow, and then click **OK**.
3. If all errors and warnings have been resolved, the **Activate workflow** page appears. Select one of the following options:
 - To activate this version of the workflow, click **Activate the new version**. When a workflow is active, users can submit documents to it for processing.
 - If you don't want to activate this version, click **Do not activate the new version**. You can activate the workflow later.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure workflow properties

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to configure the various properties of a workflow.

To configure the properties of a workflow, open the workflow in the workflow editor. Click the canvas of the workflow editor, and then click **Properties** to open the **Properties** page. You can then use the following procedures to configure the various properties of the workflow.

Name the workflow

Follow these steps to enter a name for the workflow.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the workflow. For example, if you create a purchase requisition workflow for each country/region that you operate in, you can name the purchase requisition workflow **Purchase Requisitions Denmark** or **Purchase Requisitions Spain**.

Specify the workflow owner

The workflow owner is the person who manages and maintains the workflow. Follow these steps to specify the workflow owner.

1. In the left pane, click **Basic Settings**.
2. In the **Owner** list, select the name of the person who will manage the workflow.

Select an email template

Follow these steps to select the email template that is used to generate notification messages about the workflow.

1. In the left pane, click **Basic Settings**.
2. In the **Email template for workflow notifications** list, select the template.

Enter instructions for users

You can provide instructions to users who submit documents for processing and approval. These users are also referred to as *originators*. For example, you're creating a purchase requisition workflow, and you enter instructions. Those instructions can then be viewed by users who enter purchase requisitions on the **Purchase requisitions** page. To view instructions, the originator clicks the icon in the workflow message bar. Follow these steps to enter instructions for users.

1. In the left pane, click **Basic Settings**.
2. In the **Submission instructions** field, enter the instructions.
3. To personalize the instructions, you can insert placeholders. Placeholders are replaced with the appropriate data when the instructions are shown to users. To insert a placeholder, follow these steps:
 - a. Click in the **Submission instructions** field to specify where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.

- d. Click **Insert**.
4. To add translations of the instructions, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you will enter the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders. For instructions about how to enter a placeholder, see step 3.
 - f. Click **Close**.

NOTE

Placeholders cannot be added using copy and paste because the target information is not pasted in correctly. Use the interface to add placeholders.

Specify when this workflow is used through activation conditions

You can create multiple workflows that are based on the same workflow type. When you have multiple workflows that are based on the same type, you must specify when each workflow is used using activation conditions. If activation conditions are not met, then the default workflow is used. Similarly, if there is only one workflow configuration defined for a workflow type, then that workflow configuration will be used regardless of the activation conditions.

For example, you can create a purchase requisition workflow for each country/region that you operate in, such as Purchase Requisitions Denmark and Purchase Requisitions Spain, with the following conditions:

- Purchase Requisitions Denmark is used when: country/region = DK
- Purchase Requisitions Spain is used when: country/region = ES

Follow these steps to specify when the workflow that you're configuring is used.

1. In the left pane, click **Activation**.
2. Select the **Set the conditions for running this workflow** check box.
3. Click **Add condition**.
4. Enter a condition.
5. Enter any additional conditions that are required.
6. Run through the workflow with some target records to verify that the condition correctly includes and excludes records.

Specify when notifications are sent

When a document is submitted for processing, a workflow instance is created. You can send notifications to users when workflow instances that are based on the workflow are started, completed, terminated, or stopped because of an error. Follow these steps to specify when notifications are sent.

1. In the left pane, click **Notifications**.
2. Select the check box for each event that should trigger notifications:
 - **Started** – Send notifications when a workflow instance is started.
 - **Stopped** – Send notifications when a workflow instance is stopped because of an error.
 - **Completed** – Send notifications when a workflow instance is completed.

- **Unrecoverable** – Send notifications when a workflow instance is stopped because of an unrecoverable error.
 - **Terminated** – Send notifications when a workflow instance is terminated.
3. Select the row for an event that you selected in step 2.
 4. On the **Notification text** tab, enter the text of the notification.
 5. To personalize the text, you can insert placeholders. Placeholders are replaced with the appropriate data when the text is shown to users. To insert a placeholder, follow these steps:
 - a. Click in the field to specify where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
 - e. A common **Notification text** placeholder to include is "Last Notes: %Workflow.Last note%", which displays any comments from the previous step.
 6. To add translations of the text, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, Click **Add**.
 - c. In the list that appears, select the language that you will enter the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders. For instructions about how to enter a placeholder, see step 5.
 - f. Click **Close**.
 7. On the **Recipient** tab, use the following options to specify who should receive the notifications.

OPTION	NOTIFICATIONS ARE SENT TO THESE USERS	TO SEND NOTIFICATIONS, FOLLOW THESE STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"> 1. On the Recipient tab, click Participant. 2. On the Role based tab, in the Type of participant list, select the type of group or role to send notifications to. 3. In the Participant list, select the group or role to send notifications to.
Workflow user	Users who are participants in this workflow	<ol style="list-style-type: none"> 1. On the Recipient tab, click Workflow user. 2. On the Workflow user tab, in the Workflow user list, select a participant in this workflow.
User	Specific users	<ol style="list-style-type: none"> 1. On the Recipient tab, click User. 2. On the User tab, the Available users list includes all users. Select the users to send notifications to, and move those users into the Selected users list.

8. Repeat steps 3 through 7 for each event that you selected in step 2.

Enter comments about the changes that you made to the workflow

To enter comments about the changes that you made to the workflow, follow these steps.

1. In the left pane, click **Notes**.
2. In the **Enter comments about the workflow** field, enter your comments.
3. Review your comments. After you add comments, you can't modify them.
4. Click **Add** to add your comments to the **Comment history** area.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure manual tasks in a workflow

2/18/2021 • 14 minutes to read • [Edit Online](#)

This topic explains how to configure the properties for a manual task.

To configure a manual task in the workflow editor, right-click the task, and then click **Properties** to open the **Properties** page. Then use the following procedures to configure the properties for the manual task.

Name the task

Follow these steps to enter a name for the manual task.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the task.

Enter a subject line and instructions

You must provide a subject line and instructions to users who are assigned to the task. For example, if you're configuring a task for purchase requisitions, the user who is assigned to the task sees the subject line and instructions on the **Purchase requisitions** page. The subject line appears in a message bar on the page. The user can then click the icon in the message bar to view the instructions. Follow these steps to enter a subject line and instructions.

1. In the left pane, click **Basic Settings**.
2. In the **Work item subject** field, enter the subject line.
3. To personalize the subject line, you can insert placeholders. Placeholders are replaced with appropriate data when the subject line is shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
4. To add translations of the subject line, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 3.
 - f. Click **Close**.
5. In the **Work item instructions** field, enter the instructions.
6. To personalize the instructions, you can insert placeholders. Placeholders are replaced with appropriate data when the instructions are shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.

7. To add translations of the instructions, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 6.
 - f. Click **Close**.

Assign the task

Follow these steps to specify who the manual task should be assigned to.

1. In the left pane, click **Assignment**.
2. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to step 3.

OPTION	USERS THAT THE TASK IS ASSIGNED TO	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"> 1. After you select Participant, on the Role based tab, in the Type of participant list, select the type of group or role to assign the task to. 2. In the Participant list, select the group or role to assign the task to.

OPTION	USERS THAT THE TASK IS ASSIGNED TO	ADDITIONAL STEPS
Hierarchy	Users in a specific organizational hierarchy	<ol style="list-style-type: none"> 1. After you select Hierarchy, on the Hierarchy selection tab, in the Hierarchy type list, select the type of hierarchy to assign the task to. 2. The system must retrieve a range of user names from the hierarchy. These names represent users that the task can be assigned to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: <ol style="list-style-type: none"> a. To specify the starting point, select a person in the Start from list. b. To specify the ending point, click Add condition. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 3. On the Hierarchy options tab, specify which users in the range the task should be assigned to: <ul style="list-style-type: none"> • Assign to all users retrieved – The task is assigned to all users in the range. • Assign only to last user retrieved – The task is assigned to only the last user in the range. • Exclude users with the following condition – The task isn't assigned to users in the range who meet a specific condition. Click Add condition to specify the condition.
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.

OPTION	USERS THAT THE TASK IS ASSIGNED TO	ADDITIONAL STEPS
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. The Available users list includes all users. Select the users to assign the task to, and then move those users to the Selected users list.
Queue	A work item queue	<ol style="list-style-type: none"> 1. After you select Queue, click the Queue based tab. 2. To assign the task to a specific queue, follow these steps: <ol style="list-style-type: none"> a. In the Queue type list, select Work item queues. b. In the Queue name list, select the queue. 3. If a specific condition should determine which queue the task is assigned to, follow these steps: <ol style="list-style-type: none"> a. In the Queue type list, select Conditional work item queues. b. In the Queue name list, select Conditional queue. <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] This option is used for only a few workflows, such as Case management.</p> </div>

3. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to complete the task. Select one of the following options:

- **Hours** – Enter the number of hours that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Days** – Enter the number of days that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Weeks** – Enter the number of weeks that the user has to complete the task.
- **Months** – Select the day and week that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of the month.
- **Years** – Select the day, week, and month that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of December.

If the user doesn't complete the task in the allotted time, the task is overdue. A task that is overdue can be escalated, based on the options that you select in the **Escalation** area of the page.

Specify what happens when the task is overdue

If a user doesn't complete the manual task in the allotted time, the task is overdue. A task that is overdue can be escalated, or automatically assigned to another user. Follow these steps to escalate the task if it's overdue.

1. In the left pane, click **Escalation**.
2. Select the **Use escalation path** check box to create an escalation path. The system automatically assigns the task to the users who are listed in the escalation path. For example, the following table represents an escalation path.

SEQUENCE	ESCALATION PATH
1	Assign to: Donna
2	Assign to: Erin
3	Final action: Reject

In this example, the system assigns the overdue task to Donna. If Donna doesn't complete the task in the allotted time, the system assigns the task to Erin. If Erin doesn't complete the task in the allotted time, the system rejects the document that was submitted for processing.

3. To add a user to the escalation path, click **Add escalation**. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to step 4.

OPTION	USERS THAT THE TASK IS ESCALATED TO	ADDITIONAL STEPS
--------	-------------------------------------	------------------

OPTION	USERS THAT THE TASK IS ESCALATED TO	ADDITIONAL STEPS
Hierarchy	Users in a specific organizational hierarchy	<ol style="list-style-type: none"> 1. After you select Hierarchy, on the Hierarchy selection tab, in the Hierarchy type list, select the type of hierarchy to escalate the task to. 2. The system must retrieve a range of user names from the hierarchy. These names represent users that the task can be escalated to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: <ol style="list-style-type: none"> a. To specify the starting point, select a person in the Start from list. b. To specify the ending point, click Add condition. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 3. On the Hierarchy options tab, specify which users in the range the task should be escalated to: <ul style="list-style-type: none"> • Assign to all users retrieved – The task is escalated to all users in the range. • Assign only to last user retrieved – The task is escalated to only the last user in the range. • Exclude users with the following condition – This task isn't escalated to users in the range who meet a specific condition. Click Add condition to specify the condition.
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.

OPTION	USERS THAT THE TASK IS ESCALATED TO	ADDITIONAL STEPS
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. The Available users list includes all users. Select the users to escalate the task to, and then move those users to the Selected users list.

4. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to complete the task. Select one of the following options:

- **Hours** – Enter the number of hours that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Days** – Enter the number of days that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Weeks** – Enter the number of weeks that the user has to complete the task.
- **Months** – Select the day and week that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of the month.
- **Years** – Select the day, week, and month that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of December.

5. Repeat steps 3 through 4 for each user that should be added to the escalation path. You can change the order of the users.

6. If the users in the escalation path don't complete the task in the allotted time, the system takes action on the task. To specify the action that the system takes, select the **Action** row, and then, on the **End action** tab, select an action.

Specify when the system automatically acts on the task

You can configure the system to take action on the manual task if specific conditions are met. For example, a task requires that a member of the Expense reports department review the receipts that are submitted together with an expense report. According to company policy, this task must be performed if the total amount of the expense report is more than USD 100. In this scenario, you can configure the system to automatically mark the task as **Complete** when the total amount is less than 100. Follow these steps to specify when the system takes action on the manual task.

1. In the left pane, click **Automatic actions**.
2. Select the **Enable automatic actions** check box.
3. Click **Add condition**.
4. Enter a condition.
5. Enter any additional conditions that are required.
6. To verify that the conditions that you entered are configured correctly, follow these steps:
 - a. Click **Test**.
 - b. On the **Test workflow condition** page, in the **Validate condition** area, select a record.
 - c. Click **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
 - d. Click **OK** or **Cancel** to return to the **Properties** page.

7. In the **Auto complete action** list, select the action that the system should take on the task.

Specify when notifications are sent

You can send notifications to people when a manual task has been delegated, escalated, completed, or rejected, or when a change has been requested. Follow these steps to specify when notifications are sent, and who the notifications are sent to.

1. In the left pane, click **Notifications**.
2. Select the check box next to the events that notifications should be sent for:
 - **Delegate** – The task has been assigned to another user.
 - **Escalate** – The assigned user hasn't completed the task in the allotted time.
 - **Complete** – The assigned user has completed the task.
 - **Reject** – The assigned user has rejected the document that was submitted.
 - **Request change** – The assigned user has requested a change to the document that was submitted.
3. Select the row for an event that you selected in step 2.
4. On the **Notification text** tab, in the text box, enter the text of the notification.
5. To personalize the notification, you can insert placeholders. Placeholders are replaced with appropriate information when the notification is shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
6. To add translations of the notification, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 5.
 - f. Click **Close**.
7. On the **Recipient** tab, specify who the notifications are sent to. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 8.

OPTION	NOTIFICATION RECIPIENTS	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none">1. After you select Participant, on the Role based tab, in the Type of participant list, select the type of group or role to send notifications to.2. In the Participant list, select the group or role to send notifications to.

OPTION	NOTIFICATION RECIPIENTS	ADDITIONAL STEPS
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.
User	Specific users	<ol style="list-style-type: none"> After you select User, click the User tab. The Available users list includes all users. Select the users to send notifications to, and then move those users to the Selected users list.

8. Repeat steps 3 through 7 for each event that you selected in step 2.

Set a time limit

Follow these steps if the manual task must be completed in a specific time.

NOTE

The options that you select in this procedure override the options that you selected in the **Assignment** and **Escalation** areas of the page.

- In the left pane, click **Advanced settings**.
- Select the **Set a time limit for the workflow element** check box.
- In the **Duration** field, specify when the task must be completed. Select one of the following options:
 - Hours** – Enter the number of hours that the task must be completed in. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - Days** – Enter the number of days that the task must be completed in. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - Weeks** – Enter the number of weeks that the task must be completed in.
 - Months** – Select the day and week that the task must be completed by. For example, you might want the task to be completed by Friday of the third week of the month.
 - Years** – Select the day, week, and month that the task must be completed by. For example, you might want the task to be completed by Friday of the third week of December.
- If the time limit is exceeded, the system takes action on the task. In the **Action** list, select the action that the system should take.

Specify which actions are available to the user

When the manual task is assigned to a user, the user must take action on the task. Follow these steps to specify which actions the user can take on the task.

NOTE

The actions that are available vary, depending on the design of the task.

1. In the left pane, click **Advanced settings**.
2. Select the **Complete** check box if the user should be able to mark the task as **Complete**.
3. Select the **Reject** check box if the user should be able to reject the document that was submitted.
4. Select the **Request change** check box if the user should be able to request changes to the document that was submitted.
5. Select the **Delegate** check box if the user should be able to assign the task to another user.
6. Select the **Reassign** check box if the user should be able to reassign the task to another user in the work item queue.
7. Select the **Release** check box if the user should be able to reassign the task to the work item queue. Another user can then complete the task.

Configure automated tasks in a workflow

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to configure the properties for an automated task.

To configure an automated task in the workflow editor, right-click the task, and then click **Properties** to open the **Properties** page. Then use the following procedures to configure the properties for the automated task.

Name the task

Follow these steps to enter a name for the automated task.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the task.

Specify when notifications are sent

You can send notifications to people when an automated task has been run or canceled. Follow these steps to specify when notifications are sent, and who they are sent to.

1. In the left pane, click **Notifications**.
2. Select the check box next to the events to send notifications for:
 - **Execution** – Notifications are sent when the task has been run.
 - **Canceled** – Notifications are sent when the task has been canceled.
3. Select the row for an event that you selected in step 2.
4. On the **Notification text** tab, in the text box, enter the text of the notification.
5. To personalize the notification, you can insert placeholders. Placeholders are replaced with appropriate data when the notification is shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
6. To add translations of the notification, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 5.
 - f. Click **Close**.
7. On the **Recipient** tab, specify who the notifications are sent to. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 8.

OPTION	NOTIFICATION RECIPIENTS	ADDITIONAL STEPS
--------	-------------------------	------------------

OPTION	NOTIFICATION RECIPIENTS	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"> 1. After you select Participant, on the Role based tab, in the Type of participant list, select the type of group or role to send notifications to. 2. In the Participant list, select the group or role to send notifications to.
Workflow user	Users who participate in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. The Available users list includes all users. Select the users to send notifications to, and then move those users to the Selected users list.

8. Repeat steps 3 through 7 for each event that you selected in step 2.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure approval processes in a workflow

2/18/2021 • 6 minutes to read • [Edit Online](#)

Use the following procedure to configure the properties of the approval process.

To configure an approval process, in the workflow editor, right-click the approval element, and then click **Properties** to open the **Properties** form.

Name the approval process

Follow these steps to enter a name for the approval process.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the approval process.

Specify when the system automatically acts on the document

You can configure the system to automatically act on the document if specific conditions are met. For example, the system can approve expense reports that have total amounts that are less than USD 100. Follow these steps to specify when the system acts on the document.

1. In the left pane, click **Automatic actions**.
2. Select the **Enable automatic actions** check box.
3. Click **Add condition**.
4. Enter a condition.
5. Enter additional conditions, if necessary.
6. To verify that the conditions that you entered are configured correctly, complete the following steps:
 - a. Click **Test** to open the **Test workflow condition** form.
 - b. Select a record in the **Validate condition** area of the form.
 - c. Click **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
 - d. Click **OK** or **Cancel** to return to the **Properties** form.
7. In the **Auto complete action** list, select the action that the system should take on the document.

Specify when notifications are sent

You can send notifications to people when a document has been approved, rejected, delegated, or escalated, or when a change has been requested. Follow these steps to specify when notifications are sent, and who the notifications are sent to.

1. In the left pane, click **Notifications**.
2. Select the check box next to the events to send notifications for:
 - **Delegate** – When a document has been assigned to another user for approval.
 - **Escalate** – When the assigned user has not acted on a document in the allotted time.
 - **Approve** – When a document has been approved.

- **Reject** – When a document has been rejected.
 - **Request change** – When the assigned user has requested a change to a document that was submitted.
3. Select the row for an event that you selected in step 2.
 4. Click the **Notification text** tab.
 5. In the text box, enter the text for the notification.
 6. To personalize the text, you can insert placeholders, which are replaced with the appropriate data when they are displayed to users. To insert a placeholder, follow these steps:
 - a. Click in the text box at the location where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that is displayed, select the placeholder to insert.
 - d. Click **Insert**.
 7. To add translations of the notification, click **Translations**. In the form that is displayed, follow these steps:
 - a. Click **Add**.
 - b. In the list that is displayed, select the language in which you will enter the text.
 - c. In the **Translated text** text box, enter the text.
 - d. To personalize the text, insert placeholders.
 - e. Click **Close**.
 8. Click the **Recipient** tab.
 9. Specify who the notifications are sent to. Select one of the options in the following table, and then follow the additional steps for the option before you go to step 10.

OPTION	NOTIFICATION RECIPIENTS	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"> 1. After you select Participant, click the Role based tab. 2. In the Type of participant list, select the type of group or role to send notifications to. 3. In the Participant list, select the group or role to send notifications to.
Workflow user	Users who participate in the current workflow	<ol style="list-style-type: none"> 1. After you select Workflow user, click the Workflow user tab. 2. In the Workflow user list, select a user who participates in the workflow.
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. Select the users to send notifications to, and then move these users to the Selected users list.

10. Repeat steps 3 through 9 for each event that you selected in step 2.

Specify a final approver

You can designate a final approver for scenarios where the approver is the person who submitted the document for approval and the "disallow approval by submitter" is being used. Follow these steps to specify a final approver.

1. In the workflow editor, right-click the approval element, and then select **Properties** to open the **Properties** form.
2. In the left pane, click **Advanced settings**.
3. Select the **Use final approver** check box.
4. In the list, select a user to be the final approver.

Set a time limit

Follow these steps if the approval process must be completed in a specific time.

NOTE

The options that you select in these steps override the options that you selected in the **Assignment** and **Escalation** areas of each approval step.

1. In the left pane, click **Advanced settings**.
2. Select the **Set a time limit for the workflow element** check box.
3. In the **Duration** field, specify when the approval process must be completed. Select one of the following options:
 - **Hours** – Enter the number of hours in which the approval process must be completed. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - **Days** – Enter the number of days in which the approval process must be completed. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - **Weeks** – Enter the number of weeks in which the approval process must be completed.
 - **Months** – Select the day and week by which the approval process must be completed. For example, you may want the approval process to be completed by Friday of the third week of the month.
 - **Years** – Select the day, week, and month by which the approval process must be completed. For example, you may want the approval process to be completed by Friday of the third week of December.
4. If the time limit is exceeded, the system acts on the document. In the **Action** list, select the action that the system should take.

Specify which actions are available to the user

When a document is assigned to a user for approval, the user must act on the document. Follows these steps to specify which actions the user can take on the document that was submitted.

1. In the left pane, click **Advanced settings**.
2. Select the **Approve** check box if the user can approve the document.
3. Select the **Reject** check box the user can reject the document.
4. Select the **Request change** check box the user can request changes to the document.
5. Select the **Delegate** check box if the user can assign the document to another user for approval.

NOTE

The **Enable actions from the work list in Enterprise Portal** check box has been deprecated.

Configure the approval steps

An approval process consists of approval steps. Complete the following procedure to add steps the approval process and configure the steps.

1. In the workflow editor, double-click the approval process. The workflow editor displays the steps of the approval process.
2. To add an approval step, drag the step from the **Workflow elements** area to the canvas.
3. To configure an approval step, see [Configure approval steps in a workflow](#).

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure approval steps in a workflow

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic explains how to configure the properties of an approval step.

To configure an approval step in the workflow editor, right-click the approval step, and then click **Properties** to open the **Properties** page. Then use the following procedures to configure the properties of the approval step.

Name the step

Follow these steps to enter a name for the approval step.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the approval step.

Enter a subject line and instructions

You must provide a subject line and instructions to users who are assigned to the approval step. For example, if you're configuring an approval step for purchase requisitions, the user who is assigned to the step sees the subject line and instructions on the **Purchase requisitions** page. The subject line appears in a message bar on the page. The user can then click the icon in the message bar to see the instructions. Follow these steps to enter a subject line and instructions.

1. In the left pane, click **Basic Settings**.
2. In the **Work item subject** field, enter the subject line.
3. To personalize the subject line, you can insert placeholders. Placeholders are replaced with appropriate data when the subject line is shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
4. To add translations of the subject line, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 3.
 - f. Click **Close**.
5. In the **Work item instructions** field, enter the instructions.
6. To personalize the instructions, you can insert placeholders. Placeholders are replaced with appropriate data when the instructions are shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.

7. To add translations of the instructions, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 6.
 - f. Click **Close**.

Assign the approval step

Follow these steps to specify who the approval step should be assigned to.

1. In the left pane, click **Assignment**.
2. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to step 3.

OPTION	USERS THAT THE APPROVAL STEP IS ASSIGNED TO	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"> 1. After you select Participant, on the Role based tab, in the Type of participant list, select the type of group or role to assign the step to. 2. In the Participant list, select the group or role to assign the step to.

OPTION	USERS THAT THE APPROVAL STEP IS ASSIGNED TO	ADDITIONAL STEPS
Hierarchy	Users in a specific organizational hierarchy	<ol style="list-style-type: none"> 1. After you select Hierarchy, on the Hierarchy selection tab, in the Hierarchy type list, select the type of hierarchy to assign the step to. 2. The system must retrieve a range of user names from the hierarchy. These names represent users that the step can be assigned to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: <ol style="list-style-type: none"> a. To specify the starting point, select a person in the Start from list. b. To specify the ending point, click Add condition. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 3. On the Hierarchy options tab, specify which users in the range the step should be assigned to: <ul style="list-style-type: none"> • Assign to all users retrieved – The step is assigned to all users in the range. • Assign only to last user retrieved – The step is assigned to only the last user in the range. • Exclude users with the following condition – The step isn't assigned to any users in the range who meet a specific condition. Click Add condition to specify the condition.
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.

OPTION	USERS THAT THE APPROVAL STEP IS ASSIGNED TO	ADDITIONAL STEPS
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. The Available users list includes all system users. Select the users to assign the step to, and then move those users to the Selected users list.

3. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to take action on, or respond to, documents that reach the approval step. Select one of the following options:

- **Hours** – Enter the number of hours that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Days** – Enter the number of days that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Weeks** – Enter the number of weeks that the user has to respond.
- **Months** – Select the day and week that the user must respond by. For example, you might want the user to respond by Friday of the third week of the month.
- **Years** – Select the day, week, and month that the user must respond by. For example, you might want the user to respond by Friday of the third week of December.

If the user doesn't take action on the document in the allotted time, the document is overdue. A document that is overdue is escalated, based on the options that you select in the **Escalation** area of the page.

4. If you assigned the approval step to multiple users or a group of users, on the **Completion policy** tab, select one of the following options:

- **Single approver** – The action that is applied to the document is determined by the first person who responds. For example, Sam has submitted an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill. If Sue is the first person who responds to the document, the action that she takes is applied to the document. If Sue rejects the document, it's rejected and sent back to Sam. If Sue approves the document, it's sent to Ann for approval.

- **Majority of approvers** – The action that is applied to the document is determined when most of the approvers respond. For example, Sam has submitted an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill. If Sue and Jo are the first two approvers who respond, the action that they take is applied to the document.
 - If Sue approves the document, but Jo rejects it, the document is rejected and sent back to Sam.
 - If both Sue and Jo approve the document, it's sent to Ann for approval.
- **Percentage of approvers** – The action that is applied to the document is determined when a specific percentage of the approvers respond. For example, Sam has submitted an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill, and you entered 50 as the percentage. If Sue and Jo are the first two approvers who respond, the action that they take is applied to the document, because they meet the requirement for 50 percent of approvers.
 - If Sue approves the document, but Jo rejects it, the document is rejected and sent back to Sam.
 - If both Sue and Jo approve the document, it's sent to Ann for approval.
- **All approvers** – All the approvers must approve the document. Otherwise, the workflow can't continue. For example, Sam has submitted an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill. If Sue and Joe approve the document, but Bill rejects it, the document is rejected and sent back to Sam. If Sue, Jo, and Bill all approve the document, it's sent to Ann for approval.

Specify when the approval step is required

You can specify when the approval step is required. The approval step can always be required, or it can be required only if specific conditions are met.

The approval step is always required

Follow these steps if the approval step is always required.

1. In the left pane, click **Condition**.
2. Select the **Always run this step** option.

The approval step is required in specific conditions

The approval step that you're configuring might be required only if specific conditions are met. For example, if you're configuring an approval step for a purchase requisition workflow, you might want the approval step to occur only if the amount of the purchase requisition is more than USD 10,000. Follow these steps to specify when the approval step is required.

1. In the left pane, click **Condition**.
2. Select the **Run this step only when the following condition is met** option.
3. Enter a condition.
4. Enter any additional conditions that are required.
5. To verify that the conditions that you entered are configured correctly, follow these steps:
 - a. Click **Test**.
 - b. On the **Test workflow condition** page, in the **Validate condition** area, select a record.
 - c. Click **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
 - d. Click **OK** or **Cancel** to return to the **Properties** page.

Specify what happens when the document is overdue

If a user doesn't take action on a document in the allotted time, the document is overdue. A document that is overdue can be escalated, or automatically assigned to another user for approval. Follow these steps to escalate the document if it's overdue.

1. In the left pane, click **Escalation**.
2. Select the **Use escalation path** check box to create an escalation path. The system automatically assigns the document to the users who are listed in the escalation path. For example, the following table represents an escalation path.

SEQUENCE	ESCALATION PATH
1	Assign to: Donna
2	Assign to: Erin
3	Final action: Reject

In this example, the system assigns the overdue document to Donna. If Donna doesn't respond in the allotted time, the system assigns the document to Erin. If Erin doesn't respond in the allotted time, the system rejects the document.

3. To add a user to the escalation path, click **Add escalation**. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to

step 4.

OPTION	USERS THAT THE DOCUMENT IS ESCALATED TO	ADDITIONAL STEPS
Hierarchy	Users in a specific organizational hierarchy	<ol style="list-style-type: none">1. After you select Hierarchy, on the Hierarchy selection tab, in the Hierarchy type list, select the type of hierarchy to escalate the document to.2. The system must retrieve a range of user names from the hierarchy. These names represent users that the document can be escalated to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves:<ol style="list-style-type: none">a. To specify the starting point, select a person in the Start from list.b. To specify the ending point, click Add condition. Then enter a condition that determines where in the hierarchy the system stops retrieving names.3. On the Hierarchy options tab, specify which users in the range the document should be escalated to:<ul style="list-style-type: none">• Assign to all users retrieved – The document is escalated to all users in the range.• Assign only to last user retrieved – The document is escalated to only the last user in the range.• Exclude users with the following condition – The document isn't escalated to any users in the range who meet a specific condition. Click Add condition to specify the condition.

OPTION	USERS THAT THE DOCUMENT IS ESCALATED TO	ADDITIONAL STEPS
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.
User	Specific users	<ol style="list-style-type: none"> After you select User, click the User tab. The Available users list includes all users. Select the users to escalate the document to, and then move those users to the Selected users list.

- On the **Time limit** tab, in the **Duration** field, specify how much time the user has to take action on, or respond to, documents. Select one of the following options:
 - Hours** – Enter the number of hours that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - Days** – Enter the number of days that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - Weeks** – Enter the number of weeks that the user has to respond.
 - Months** – Select the day and week that the user must respond by. For example, you might want the user to respond by Friday of the third week of the month.
 - Years** – Select the day, week, and month that the user must respond by. For example, you might want the user to respond by Friday of the third week of December.
- Repeat steps 3 through 4 for each user that should be added to the escalation path. You can change the order of the users.
- If the users in the escalation path don't respond in the allotted time, the system automatically take action on the document. To specify the action that the system takes, select the **Action** row, and then, on the **End action** tab, select an action.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure manual decisions in a workflow

2/18/2021 • 12 minutes to read • [Edit Online](#)

This topic explains how to configure the properties of a manual decision.

To configure a manual decision in the workflow editor, right-click the manual decision, and then click **Properties** to open the **Properties** page. Then use the following procedures to configure the properties of the manual decision.

Name the decision

Follow these steps to enter a name for the manual decision.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the manual decision.

Enter a subject line and instructions

You must provide a subject line and instructions to users who are assigned to the manual decision. For example, if you're configuring a decision for purchase requisitions, the user who is assigned to the decision sees the subject line and instructions on the **Purchase requisitions** page. The subject line appears in a message bar on the page. The user can then click the icon in the message bar to view the instructions. Follow these steps to enter a subject line and instructions.

1. In the left pane, click **Basic Settings**.
2. On the **Instructions** tab, in the **Work item subject** field, enter the subject line.
3. To personalize the subject line, you can insert placeholders. Placeholders are replaced with appropriate data when the subject line is shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
4. To add translations of the subject line, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 3.
 - f. Click **Close**.
5. In the **Work item instructions** field, enter the instructions.
6. To personalize the instructions, you can insert placeholders. Placeholders are replaced with appropriate data when the instructions are shown to users. Follow these steps to insert a placeholder:
 - a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.

- d. Click **Insert**.
7. To add translations of the instructions, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 6.
 - f. Click **Close**.

Specify the possible outcomes of a decision

Typically, when a document is assigned to a decision maker, the decision maker is asked a question. The answer to this question is usually **Yes** or **No**, or **True** or **False**. Follow these steps to specify the possible outcomes of the manual decision.

1. In the left pane, click **Basic Settings**.
2. On the **Outcomes** tab, in the **Outcome 1** field, enter the name of the outcome, or the option.
3. To add translations of the outcome, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. Click **Close**.
4. In the **Outcome 2** field, enter the name of the outcome, or the option.
5. To add translations of the outcome, follow these steps:
 - a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. Click **Close**.

Specify when notifications are sent

You can send notifications to people when a decision has been made, delegated, or escalated. Follow these steps to specify when notifications are sent, and who the notifications are sent to.

1. In the left pane, click **Notifications**.
2. Select the check box next to the events that notifications should be sent for:
 - **[Choice 1]** – The assigned user has selected **[Choice 1]**.
 - **[Choice 2]** – The assigned user has selected **[Choice 2]**.
 - **Delegate** – The assigned user has assigned the decision to another user.
 - **Escalate** – The assigned user hasn't made the decision in the allotted time.
3. Select the row for an event that you selected in step 2.
4. On the **Notification text** tab, in the text box, enter the text of the notification.
5. To personalize the notification, you can insert placeholders. Placeholders are replaced with appropriate

data when the notification is show to users. Follow these steps to insert a placeholder:

- a. In the text box, click where the placeholder should appear.
 - b. Click **Insert placeholder**.
 - c. In the list that appears, select the placeholder to insert.
 - d. Click **Insert**.
6. To add translations of the notification, follow these steps:
- a. Click **Translations**.
 - b. On the page that appears, click **Add**.
 - c. In the list that appears, select the language that you're entering the text in.
 - d. In the **Translated text** field, enter the text.
 - e. To personalize the text, you can insert placeholders as described in step 5.
 - f. Click **Close**.
7. On the **Recipient** tab, specify who the notifications are sent to. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 8.

OPTION	NOTIFICATION RECIPIENTS	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"> 1. After you select Participant, on the Role based tab, in the Type of participant list, select the type of group or role to send notifications to. 2. In the Participant list, select the group or to send notifications to.
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. The Available users list includes all users. Select the users to send notifications to, and then move those users to the Selected users list.

8. Repeat steps 3 through 7 for each event that you selected in step 2.

Assign a decision

Follow these steps to specify who a manual decision should be assigned to.

1. In the left pane, click **Assignment**.
2. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to step 3.

OPTION	USERS THAT THE DECISION IS ASSIGNED TO	ADDITIONAL STEPS
Participant	Users who are assigned to a specific group or role	<ol style="list-style-type: none"><li data-bbox="1023 203 1342 387">1. After you select Participant, on the Role based tab, in the Type of participant list, select the type of group or role to assign the decision to.<li data-bbox="1023 398 1342 488">2. In the Participant list, select the group or role to assign the decision to.

OPTION	USERS THAT THE DECISION IS ASSIGNED TO	ADDITIONAL STEPS
Hierarchy	Users in a specific organizational hierarchy	<ol style="list-style-type: none"> 1. After you select Hierarchy, on the Hierarchy selection tab, in the Hierarchy type list, select the type of hierarchy to assign the decision to. 2. The system must retrieve a range of user names from the hierarchy. These names represent users that the decision can be assigned to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: <ol style="list-style-type: none"> a. To specify the starting point, select a person in the Start from list. b. To specify the ending point, click Add condition. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 3. On the Hierarchy options tab, specify which users in the range the decision should be assigned to: <ul style="list-style-type: none"> • Assign to all users retrieved – The decision is assigned to all users in the range. • Assign only to last user retrieved – The decision is assigned to only the last user in the range. • Exclude users with the following condition – The decision isn't assigned to any users in the range who meet a specific condition. Click Add condition to specify the condition.
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.

OPTION	USERS THAT THE DECISION IS ASSIGNED TO	ADDITIONAL STEPS
User	Specific users	1. After you select User , click the User tab. 2. The Available users list includes all users. Select the users to assign the decision to, and then move those users to the Selected users list.

3. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to make the decision. Select one of the following options:

- **Hours** – Enter the number of hours that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Days** – Enter the number of days that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Weeks** – Enter the number of weeks that the user has to make the decision.
- **Months** – Select the day and week that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of the month.
- **Years** – Select the day, week, and month that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of December.

If the user doesn't make the decision in the allotted time, the decision is overdue. A decision that is overdue is escalated, based on the options that you select in the **Escalation** area of the page.

Specify what happens when a decision is overdue

If a user doesn't make the decision in the allotted time, the decision is overdue. A decision that is overdue can be escalated, or automatically assigned to another user. Follow these steps to escalate the decision if it's overdue.

1. In the left pane, click **Escalation**.
2. Select the **Use escalation path** check box to create an escalation path. The system automatically assigns the decision to the users who are listed in the escalation path. For example, the following table represents an escalation path.

SEQUENCE	ESCALATION PATH
1	Assign to: Donna
2	Assign to: Erin
3	Final action: [Choice 1]

In this example, the system assigns the overdue decision to Donna. If Donna doesn't make the decision in the allotted time, the system assigns the decision to Erin. If Erin doesn't make the decision in the allotted time, the system selects **[Choice 1]** as the decision.

3. To add a user to the escalation path, click **Add escalation**. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 4.

OPTION	USERS THAT THE DECISION IS ESCALATED TO	ADDITIONAL STEPS
Hierarchy	Users in a specific organizational hierarchy	<ol style="list-style-type: none"> 1. After you select Hierarchy, on the Hierarchy selection tab, in the Hierarchy type list, select the type of hierarchy to escalate the decision to. 2. The system must retrieve a range of user names from the hierarchy. These names represent users that the decision can be escalated to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: <ol style="list-style-type: none"> a. To specify the starting point, select a person in the Start from list. b. To specify the ending point, click Add condition. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 3. On the Hierarchy options tab, specify which users in the range the decision should be escalated to: <ul style="list-style-type: none"> • Assign to all users retrieved – The decision is escalated to all users in the range. • Assign only to last user retrieved – The decision is escalated to only the last user in the range. • Exclude users with the following condition: – The decision isn't escalated to any users in the range who meet a specific condition. Click Add condition to specify the condition.
Workflow user	Users in the current workflow	<ul style="list-style-type: none"> • After you select Workflow user, on the Workflow user tab, in the Workflow user list, select a user who participates in the workflow.

OPTION	USERS THAT THE DECISION IS ESCALATED TO	ADDITIONAL STEPS
User	Specific users	<ol style="list-style-type: none"> 1. After you select User, click the User tab. 2. The Available users list includes all users. Select the users to escalate the decision to, and then move those users to the Selected users list.

4. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to make the decision. Select one of the following options:
 - **Hours** – Enter the number of hours that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - **Days** – Enter the number of days that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - **Weeks** – Enter the number of weeks that the user has to make the decision.
 - **Months** – Select the day and week that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of the month.
 - **Years** – Select the day, week, and month that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of December.
5. Repeat steps 3 through 4 for each user that should be added to the escalation path. You can change the order of the users.
6. If the users in the escalation path don't make the decision in the allotted time, the system makes the decision. To specify the option that the system selects, select the **Action** row, and then, on the **End action** tab, select an option.

Set a time limit

Follow these steps if the decision must be made in a specific time.

NOTE

The options that you select in this procedure override the options that you selected in the **Assignment** and **Escalation** areas of the page.

1. In the left pane, click **Advanced settings**.
2. Select the **Set a time limit for the workflow element** check box.
3. In the **Duration** field, specify when the decision must be made. Select one of the following options:
 - **Hours** – Enter the number of hours. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - **Days** – Enter the number of days. Then select the calendar that your organization uses, and enter information about your organization's work week.
 - **Weeks** – Enter the number of weeks.
 - **Months** – Select the day and week that the decision must be made by. For example, you might want the decision to be made by Friday of the third week of the month.
 - **Years** – Select the day, week, and month that the decision must be made by. For example, you might

want the decision to be made by Friday of the third week of December.

4. If the time limit is exceeded, the system makes the decision. In the **Action** list, select the option that the system should select.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure conditional decisions in a workflow

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use the following procedure to configure the properties of a conditional decision.

A conditional decision is a point at which a workflow divides into two branches. To configure a conditional decision, in the workflow editor, right-click the conditional decision, and then click **Properties** to open the **Properties** form.

Name a decision

Follow these steps to enter a name for a conditional decision.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the conditional decision.

Set conditions

The system determines which branch is used by evaluating the submitted document to determine whether it meets specific conditions.

1. In the left pane, click **Basic Settings**.
2. Click **Add condition**.
3. Enter a condition.
4. Enter additional conditions, if they are required.
5. To verify that the conditions that you entered are configured correctly, complete the following steps:
 - a. Click **Test** to open the **Test workflow condition** form.
 - b. Select a record in the **Validate condition** area of the form.
 - c. Click **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
 - d. Click **OK** or **Cancel** to return to the **Properties** form.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure parallel activities in a workflow

2/18/2021 • 2 minutes to read • [Edit Online](#)

To configure a parallel activity, complete the following procedures in the workflow editor.

A parallel activity consists of workflow branches that run at the same time.

Name a parallel activity

Follow these steps to enter a name for a parallel activity.

1. Right-click the parallel activity, and then click **Properties** to open the **Properties** form.
2. In the left pane, click **Basic Settings**.
3. In the **Name** field, enter a unique name for the parallel activity.
4. Click **Close**.

Configure the branches of a parallel activity

Follow these steps to add and configure the branches of this parallel activity.

1. Double-click the parallel activity to display the branches of the parallel activity.
2. To add a branch, drag the **Branch** element from the **Workflow elements** area to an insertion point on the canvas. The following figure shows an insertion point.

NOTE

The order of the branches is not important because all the branches of a parallel activity run at the same time.

3. To configure each branch, see [Configure parallel branches in a workflow](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure parallel branches in a workflow

2/18/2021 • 2 minutes to read • [Edit Online](#)

To configure a parallel branch, complete the following procedures in the workflow editor.

A parallel branch is essentially a workflow that runs in the context of a parent workflow.

Name a branch

Follow these steps to enter a name for a parallel branch.

1. Right-click the parallel branch, and then click **Properties**. The **Properties** form is displayed.
2. In the left pane, click **Basic Settings**.
3. In the **Name** field, enter a unique name for the parallel branch.
4. Click **Close**.

Design and configure the elements of a branch

Follow these steps to design and configure the elements of a parallel branch.

1. Double-click the parallel branch.
2. Drag workflow elements onto the canvas, and then configure the elements, just as you would to create any other workflow. For more information, see [Create workflows overview](#).

Additional resources

[Create workflows overview](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure line-item workflows

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to configure a line-item workflow element.

To configure a line-item workflow element, in the workflow editor, right-click the element, and then click **Properties** to open the **Properties** page. Then use the following procedures to configure the properties of the line-item workflow element.

Name the line-item workflow element

Follow these steps to enter a name for the line-item workflow element.

1. In the left pane, click **Basic Settings**.
2. In the **Name** field, enter a unique name for the line-item workflow element.

Specify whether the same workflow is used to process all line items

Follow these steps to specify whether the same workflow is used to process all the line items on a document.

1. In the left pane, click **Basic Settings**.
2. If the same workflow should process all the line items on a document, click **Invoke a single workflow for all line-items**. Then select the workflow to use to process the line items.
3. If a specific workflow should process line items that meet a specific set of conditions, click **Invoke a workflow for each line-item**. Then follow these steps to define the set of conditions:
 - a. Click **Add**.
 - b. Select the condition in the table.
 - c. On the **Condition name** tab, enter a name for the set of conditions that you're defining.
 - d. Click **Add condition** to enter a condition.
 - e. Enter any additional conditions that are required.
 - f. To verify that the set of conditions that you entered is configured correctly, click **Test**. On the **Test workflow condition** page, in the **Validate condition** area, select a record, and then click **Test**. The system evaluates the record to determine whether it meets the conditions that you defined. Click **OK** or **Cancel** to return to the **Properties** page.

On the **Workflow** tab, select the workflow select the workflow to use to process line items that meet the set of conditions that you defined.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure the Workflow message processing batch job as critical

2/18/2021 • 2 minutes to read • [Edit Online](#)

The workflow system uses various batch jobs. **Workflow message processing** is an important batch job used to process workflow messages. If workflow is a key component of your organization, you should consider configuring the **Workflow message processing** batch job as critical.

Configuring the **Workflow message processing** batch job as critical ensures that the system actively tracks its status. When a critical batch job fails, the support team can better monitor failures and take action to resolve any issues that may have caused the failure.

Follow these steps to configure the **Workflow message processing** batch job as critical.

1. Navigate to the **Batch jobs** page.
2. Search for **Workflow message processing** using the quick filter.
3. Select the **Workflow message processing** batch job.
4. Click **Edit** in the action pane.
5. Select the **Critical Job** check box.
6. Click **Save** in the action pane.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Delegate work items in a workflow

2/18/2021 • 2 minutes to read • [Edit Online](#)

Manually delegate a work item

To delegate an individual work item, select the **Delegate** option in the **Workflow** menu and then enter the user to be delegated to along with a comment. This will reassign the work item to that user so they can complete it.

Manually delegate multiple work items

Multiple work items can be delegated together from the **Work items assigned to me** page. The following workflow types are eligible for mass delegation: Purchase agreement approval workflow, Purchase order workflow, Purchase requisition review, and Vendor invoice workflow. The **Delegate multiple work items** feature is disabled by default and can be enabled in **Workspaces > Feature management**. Contact your system administrator for help with enabling this feature.

1. Go to **Common > Common > Work items > Work items assigned to me**.
2. Select the work items that will be delegated.
3. Click the **Delegate work items** menu.
4. In the **User** field, select the user to delegate the work items to.
5. In the **Comment** field, enter a comment that explains why you're delegating the work items.
6. Click the **Delegate work items** button to complete the work item delegation.

Automatically delegate work items

If you plan to be out of the office or otherwise unavailable to act on work items for a period of time, you can automatically delegate new work items to other users using the **User options** page.

Set up automatic delegation

1. Go to **Common > Setup > User options**.
2. Click the **Workflow** tab. Make sure the Delegation section is expanded. To configure the system to automatically delegate your work items to other users, you must create delegation rules, which specify when certain types of work items are delegated. Follow these steps to create a delegation rule.
3. Click **Add**.
4. In the **Scope** field, select an option:
 - All – Delegate all work items that are assigned to you.
 - Module – Delegate only the work items that are related to a specific type of workflow. If you select this option, you must select the type of workflow in the **Name** field.
 - Workflow – Delegate only the work items that are related to a specific workflow. If you select this option, you must select the workflow in the **Name** field.
5. In the **Name** field:
 - For **Module** scope, select the target module.
 - For **Workflow** scope, select the target workflow.
6. In the **Delegate** field, select the user to delegate the work items to. Use the **Start date/time** and **End date/time** fields to specify when you want the work items to be automatically delegated.
7. In the **Start date/time** field, enter a date and time.
8. In the **End date/time** field, enter a date and time.

9. Select the **Enabled** check box to activate the delegation rule.
10. In the **Comment** field, enter a comment that explains why you're delegating the work items.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

View workflow history

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the steps to view the status of a document that was submitted to the workflow system for processing and approval. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Common > Inquiries > Workflow > Workflow history**.

- Use this form to view the status of a document that was submitted to the workflow system for processing and approval.
- The **Instance ID** is the identification code of the workflow instance that is processing, or has processed the document.
- The **Status** is the workflow status of the document.
- The **Workflow ID** is the identification code of the workflow that is processing, or has processed the document.
- The **Document** is the identification code of the document.
- The **Document type** is the type of document that was submitted for processing.
- The **Workflow** is the name of the workflow that is processing, or has processed the document.
- The **Version** is the version number of the workflow that is processing, or has processed the document.
- The **Created date and time** is the date and time that the document was submitted.
- The **Elapsed time** is the time that has passed since the document was submitted.
- The **Resume** button allows you to resume the workflow process for the selected document.
- The **Recall** button allows you to recall the selected document so that it is not processed.

2. In the list, select the link in the desired row.

- Make sure the **Work items** section is expanded. In this section you can view the work items that are associated with the selected document. For example, a task may have to be completed, or the document may have to be approved.
- The **Reassign** button will open a dialog box where you can reassign a work item to another user.
- Make sure the **Tracking details** section is expanded. In this section you can view the workflow history of the selected document.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Enable users to receive workflow-related email messages

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can configure the system to send email messages to users when workflow-related events occur. For example, email messages can be sent to users when documents are assigned to them for approval. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > System administration > Users > Users**.
2. In the list, find and select the desired record.
3. On the **Action pane**, click **User options**.
4. Click the **Workflow** tab. Make sure that the **Notifications** section is expanded. In the **Notifications** section, you can specify how you want the user to be notified about workflow-related events.
5. In the **Line-item workflow notification type** field, select an option.
 - Grouped – Notifications for line items are grouped into a single email message.
 - Individual – An email message is sent for each line item.
 - If you want the user to receive notifications in the client, select the **Send notifications in email** check box.
6. Click **Save**.
7. Close the page.

NOTE

The workflow email templates will be sourced from either system email templates or organization email templates depending on whether the workflow is a system-level (not company specific) or organization-level (company specific) workflow.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a workflow type

2/18/2021 • 2 minutes to read • [Edit Online](#)

To add workflow support for a document, you must create a workflow type. After you create a workflow type, it can be used to create workflow configurations for the document. This topic provides links to the procedures for creating a workflow type.

You create workflow types to define the following elements:

- The workflow document to assign the workflow to
- A category that defines the module that the workflow type is available in
- Tasks, automated tasks, and approvals that are supported for the workflow
- The workflow started, completed, configuration data change, and canceled event handlers
- A `SubmitToWorkflowMenuItem` menu item

In this section

- [Workflow type checklist](#)
- [Create a workflow category](#)
- [Create a query for a workflow type](#)
- [Create a new workflow type](#)
- [Create a workflow document class](#)
- [Create a `SubmitToWorkflow` class](#)
- [Associate a workflow document class with a workflow type](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Workflow type checklist

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the steps that are required to create a new workflow type. Workflow types are used to create configurations for a workflow.

Workflow type checklist

1. If an existing category isn't appropriate, create a new workflow category to use for the workflow type. For more information, see [Create a workflow category](#).
2. Create a query that accesses the document that the new workflow type is being created for. For more information, see [Create a query for a workflow type](#).
3. Create a workflow type in Application Explorer. Typically, you complete this step by using the **Workflow** wizard. For more information, see [Create a new workflow type](#).

We recommend that you use the **Workflow** wizard to create a workflow type. The wizard performs the following tasks. In some cases, you must add more code for your workflow type. Links are provided so that you can see the details of the actions that the wizard performs and the additional steps that you must perform to complete your workflow type.

1. Create a workflow document class, and then bind the query that is used for the workflow to the class. For more information, see [Create a workflow document class](#).
2. Bind the workflow document class to the workflow type. For more information, see [Associate a workflow document class with a workflow type](#).
3. Create workflow event handlers for started, completed, configuration change, and canceled events, and then bind event handlers to the workflow type. For more information, see [Create a workflow event handler](#).
4. Create a class for **SubmitToWorkflowMenuItem**. Optionally create a class for **CancelMenuItem**. Bind the classes to the action menu items that you will create in the next step. For more information, see [Classes and methods](#).
5. Create an action menu item for the **SubmitToWorkflowMenuItem** workflow property. Optionally create an action menu item for the **CancelMenuItem** property. Bind the actions to the workflow type. For more information, see [Create a new workflow type](#).

Next steps

After you create a workflow type, you can add tasks, automated tasks, and approvals.

[Configure workflow properties](#)

[Configure manual tasks in a workflow](#)

[Configure automated tasks in a workflow](#)

[Configure approval processes in a workflow](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a workflow category

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you create a workflow type, you must assign it to a workflow category. The workflow category determines whether the workflow type is available in a specific module. If an appropriate workflow category doesn't already exist, you must create it.

For example, a workflow type for a customer invoice should not be available in the **Master planning** module. To make the workflow type available only in the **Customer** module, select the **Customer** module when you create a workflow category.

This topic describes how to create a workflow category.

Create a workflow category

1. In Application Explorer, expand the **Business Process and Workflow** node.
2. Follow one of these steps to create the workflow category:
 - Right-click the **Workflow Categories** node, and then select **New Workflow Category**. A new workflow category group appears under the **Workflow Categories** node. Right-click the new workflow category, and then select **Properties**.
 - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Workflow category**. Enter a name for the category, and then select **Create**.
3. On the **Properties** sheet, set the following properties, as required.

PROPERTY	VALUE
Name	Specify the name that is used to reference the workflow category.
Label	Specify the label that is used for the workflow category in the user interface (UI).
Help Text	Specify the description that is shown for the workflow category in the workflow configuration UI.
Module	Specify the module that the workflow will be available in. The default module is Ledger .

After you create a workflow category, a workflow type can be bound to it. Typically, the **Workflow** wizard completes this step. However, the following procedure explains how to manually bind a workflow type to a workflow category.

Bind a workflow type to a workflow category

1. In Application Explorer, expand the **Business Process and Workflow** node, and then expand the **Workflow Types** node.
2. Right-click the workflow type that you want to bind to a workflow category, and then select **Properties**.
3. On the **Properties** sheet, set the **Category** property to the workflow category that you created in the previous procedure.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a query for a workflow type

2/18/2021 • 2 minutes to read • [Edit Online](#)

Before you create a workflow type, you must create a query that will access the table fields for the workflow document. This topic describes how to create a query for a workflow type.

Create a query for a workflow type

1. Follow one of these steps to create a new query:
 - In Application Explorer, right-click the **Queries** node, and then select **New Query**. A query group appears under the **Queries** node. Right-click the new query, and then select **Rename**. Enter a name for the query.
 - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Query**. Enter a name for the query, and then select **Create**.
2. Expand the new query, right-click the **Data Sources** node, and then select **New Data Source**. A data source group appears under the **Data Sources** node.
3. Right-click the new data source group, and then select **Properties**.
4. On the **Properties** sheet, set the **Table** property to the main table for the document type that you're defining a workflow for.
5. In the Application Object Tree (AOT), right-click the new query, and then select **Save**.

For more information about how to create queries, see [Create queries by using the AOT](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a new workflow type

2/18/2021 • 2 minutes to read • [Edit Online](#)

To make the workflow process available for a workflow document, you must create the workflow types that are used in the workflow configuration user interface (UI). This topic describes how to create a workflow type in Application Explorer.

A workflow type defines the following information:

- The document that the workflow is used for
- Workflow categories, which are used to assign a workflow type to a specific module
- Tasks, automated tasks, approvals, and line item workflows that the user can configure
- Menu items and event handlers

Create a new workflow type

1. Follow one of these steps to open the **Workflow** wizard. The wizard will help you create a new workflow type.
 - In Application Explorer, right-click the **Business Process and Workflow** node, and then select **Add-Ins > Workflow type wizard**.
 - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Workflow type**. Enter a name for the query, and then select **Create**.
2. Set the following values for the wizard.

VALUE	DESCRIPTION
Name	Specify the name that will be used for the workflow type.
Category	Select the workflow category that will be used for the workflow type. The category determines the module that the workflow type is available in. You can use an existing category or a new category that you create. For more information, see Create a workflow category .
Query	Select the query that will access the table fields for the workflow document. For more information, see Create a query for a workflow type .
Document menu item	Select the menu item that points to the main page that shows the document that you're creating the workflow type for.
Document web menu item	Select the web menu item that points to the Enterprise Portal page that shows the document that you're creating the workflow type for.

3. Specify the types of menu items that you want to create. You can create menu items, web menu items, or both.
4. Select **Next**. A list of all the resources that will be created for the workflow type is shown.
5. Select **Finish** to create the resources. The wizard creates classes, menu items, web menu items, the

workflow type, and a project that contains all the items.

6. When dialog box appears that indicates the status, select **OK**. The project that contains the workflow type resources is shown.

After you create a workflow type, the next step is to create a workflow document class to expose document data for conditions. For more information, see [Create a workflow document class](#).

See also

[Create a workflow type](#)

[Create a workflow category](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a workflow document class

2/18/2021 • 3 minutes to read • [Edit Online](#)

You define table fields in a query to create workflow conditions. In a typical scenario, calculated fields are used to determine the behavior of a workflow. For example, a dynamic sales total of all records in a table can be used as a workflow condition to determine whether the step should be used. However, a limitation of queries is that you can't define calculated fields in the queries themselves. To overcome this query limitation, you must use a workflow document class. This topic describes how to create a workflow document class.

The workflow document class that you create defines table fields for conditions in two ways: the Application Explorer query and parameter methods. You must override the `getQueryName` method of the [WorkflowDocument class](#) to return the name of the query. You can optionally add calculated fields by adding parameter methods that have a specific signature on the class. For more information about workflow conditions, see [Configure workflow properties](#) and [Configure conditional decisions in a workflow](#).

The following procedures explain how to create a workflow document class that includes a parameter method for a calculated field. Before you begin, you must create a query that specifies the data that will be accessed. For more information about workflow queries, see [Create a query for a workflow type](#).

NOTE

If you used the **Workflow** wizard to create the workflow type, the wizard has already created the workflow document class.

Create a workflow document class

1. Follow one of these steps to create a new query:
 - In Application Explorer, expand the **Classes** node. Right-click the **Classes** node, and then select **New Class**. A class group appears under the **Classes** node. Right-click the new class, select **Rename**, and then enter a name for the workflow document class.
 - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Class**. Enter a name for the class, and then select **Create**.
2. Expand the new class, select **classDeclaration**, right-click the class declaration, and then select **Edit**.
3. Enter the following code in the class declaration.

```
class <MyWorkflowDocumentClassName> extends WorkflowDocument
{
}
```

4. Close the **Editor** window, and select **Yes** to save your changes.
5. Right-click the new class, point to **Override Method**, and then select **getQueryName**. A method node that is named `getQueryName` appears under the workflow document class node, and the **Editor** window appears.

NOTE

Be sure to select `getQueryName` as the method to override. The `WorkflowDocument.getQuery` method is used only internally to retrieve the actual query, based on the string that is returned by the `WorkflowDocument.getQueryName` method.

6. In the **Editor** window, enter the following code for the query method.

```
QueryName getQueryName()
{
    return querystr(<MyWorkflowDocumentQueryName>);
}
```

After you create the workflow document class, you can bind it to the workflow type. For more information, see [Associate a workflow document class with a workflow type](#).

You can add a calculated field to the workflow document class only if it meets these conditions:

- It must be named `parm <name>`.
- It must define the `CompanyId`, `TableId`, and `RecId` parameters.
- It must return an extended data type (EDT) that will be included in the list of fields that define conditions or notification messages. The label for the EDT must uniquely identify the value.

Add a calculated field to the workflow document class

1. In the workflow document class that you want to add a calculated field to, right-click the class, and then select **New Method**. A new method node appears under the **Classes** node.
2. Right-click the new method node, and then select **Edit**.
3. Enter code in the format that is shown in the following example. This example shows how to add a calculated field to determine the total credit amount for a journal.

```
public TotalJournalCreditAmount parmTotalJournalCreditAmount(CompanyId _companyId, TableId _tableId,
RecId _recId)
{
    // The calculateAmounts method contains business and validation logic
    this.calculateAmounts(_companyId, _tableId, _recId);
    return totalJournalCreditAmount;
}
```

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a SubmitToWorkflow class

2/18/2021 • 2 minutes to read • [Edit Online](#)

A workflow is started when the user selects the **Submit** button on the workflow toolbar. The **Submit** button is bound to an action menu item that calls the **main** method of a class that you create to activate a workflow. This topic describes how to create a **SubmitToWorkflow** class and use the name of the workflow type to activate the workflow.

You can also activate a workflow by using the workflow configuration ID or the workflow sequence number. The basic procedure is the same. For more information, see [Activating a workflow](#).

NOTE

If you used the **Workflow** wizard to create the workflow type, the wizard has already created a workflow submission manager class. You just have to add code to it.

Create a SubmitToWorkflow class

1. In Application Explorer, expand the **Classes** node.
2. Right-click the **Classes** node, and then select **New Class**. A class group appears under the **Classes** node.
3. Right-click the new class, and then select **New Method**. A new method node appears under the **Classes** node.
4. Right-click the new method, and then select **Edit**.
5. Enter the following code for the **main** method to use the name of the workflow type to activate the workflow.

NOTE

This example applies to workflow submissions. For an example that also works with Enterprise Portal, see [Adding enterprise portal support for workflow submission](#).

```

public static void main(Args args)
{
    // Variable declaration.
    recId _recId = args.record().RecId;
    WorkflowCorrelationId _workflowCorrelationId;
    // Hardcoded workflow type name.
    WorkflowTypeName _workflowTypeName = workflowtypestr("MyWorkflowType");
    // Initial note is the information that users enter when they
    // submit the document for workflow.
    WorkflowComment _initialNote = "";
    WorkflowSubmitDialog workflowSubmitDialog;
    // Opens the submit to workflow dialog box for user comments.
    workflowSubmitDialog =
WorkflowSubmitDialog::construct(args.caller().getActiveWorkflowConfiguration());
    workflowSubmitDialog.run();
    if (workflowSubmitDialog.parmIsClosedOK())
    {
        _recId = args.record().RecId;
        // Get user comments from the submit to workflow dialog box.
        _initialNote = workflowSubmitDialog.parmWorkflowComment();
        try
        {
            ttsbegin;
            // Activate the workflow from a template.
            _workflowCorrelationId = Workflow::activateFromWorkflowType(_workflowTypeName, _recId,
_initialNote, NoYes::No);
            ttscommit;
            // Updates the workflow button to display Actions instead of Submit.
            args.caller().updateWorkflowControls();
        }
        catch(exception::Error)
        {
            // ToDo Insert your error code here.
        }
    }
}
}

```

6. Close the Editor window, and select **Yes** to save your changes.

NOTE

When you save this code, you will receive an "Empty compound statement" warning message in the **Compiler Output** window unless you add valid code in the `catch(exception::Error)` block.

Associate a workflow document class with a workflow type

2/18/2021 • 2 minutes to read • [Edit Online](#)

To create a workflow, you must bind a workflow document class to the workflow type. The workflow document class contains references to the table data fields that the workflow uses. This topic describes how to bind a workflow document class to a workflow type.

NOTE

If you used the **Workflow** wizard to create the workflow type, the wizard has already bound the workflow document class to the workflow type.

Before you begin the following procedure, you must create a workflow document class to expose the table fields that are used for conditions in the configuration user interface (UI). For more information, see [Create a workflow document class](#).

Bind a workflow document class to a workflow type

1. In Application Explorer, expand the **Workflow** node.
2. In the **Workflow Types** node, right-click the workflow type that you want to bind a workflow document class to, and then select **Properties**.
3. On the **Properties** sheet, set the **Document** property to the workflow document class that defines the workflow document.

Workflow types report

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic points you to a report that lists the available workflow types.

To create a workflow, you must first select the *type* of workflow that you want to create. For example, you may want to create a **Purchase requisition line review** workflow to define who must approve line items on purchase requisitions. For more information about creating a workflow, see [Create workflows overview](#).

View the report

The **Workflow types report**, included with the [Technical reference reports](#), lists each type of workflow that is available. The report also describes what each type of workflow is used for and indicates whether the workflows of each type are associated with a specific company in the organization or with the whole organization.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Workflow FAQ

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic answers frequently asked questions about the workflow system.

Why are multiple notifications received when a work item is rejected?

When a work item is rejected, that work item is completed as rejected. Another work item is created and assigned to the originator. This means that there is a notification to the originator for the rejected work item, and a separate notification to the user assigned to the new "change requested" work item.

Each notification is for a different work item, but the similarity can cause confusion. We are looking at ways to improve this in a future release.

Why are my workflow exports failing?

There is currently a limitation in the workflow export feature that prevents workflow names from exceeding 48 characters. Using a name that is longer than 48 characters can result in a "Server failed to authenticate the request" error and/or prevent a file to be exported without a file type. The following blog post provides more details, [Workflow export troubleshooting](#).

Can the submitter of a workflow also approve the workflow?

Yes, a submitter of a workflow can also approve the workflow if it is configured that way. To prevent this behavior, set **System administration > Workflow > Workflow parameters > General > Approver > Disallow approval by submitter** to Yes.

Can I add alerts to workflows to provide notifications to users?

Here are a few key areas to note about adding alerts to workflows to provide notifications:

- Alerts versus workflow notification mechanisms
 - Alerts can be set up for record changes. Workflows change records, so it's possible to set up an alert related to a record change caused by a workflow. However, because workflows have different built-in notification options, using alerts isn't ideal.
- Standard notifications from workflows
 - Workflows have built in email notifications. A customer can configure the notifications so that the users are sent emails. Those notifications don't result in Action Center messages for users.
 - In a future update we will be adding an Action Center message so a user is assigned a workflow work item.
- Adding notifications to workflows
 - Action Center messages can be created for specific users, such as a message created from a workflow in X++.
 - [Workflows have business events](#) that the customer could use to trigger Flows have the notifications that they are looking for.

In summary, if a user does not get the proper notification from the Action Center when they are assigned a workflow work item, then leverage [Workflow business events](#) with Microsoft Power Automate to provide additional or different notifications.

Why is workflow editor not able to start under AD FS?

When running under Active Directory Federation Services (AD FS) in an upgraded environment, the workflow editor may have trouble starting. If it does, make sure that the URL "https://dynamicsaxworkflweditor/" is added to the property **Microsoft Dynamics 365 for Operations On-premises - Workflow - Native application** in the ADFS settings.

Why am I getting SQL deadlocks on workflow processing?

The default field value for the **Number of workflow items per batch** on the **Workflow parameters** page is 0. A value of 0 causes the default to change to 20 items per batch. Be careful when adjusting this value because a high number of items per batch (> 40) can cause SQL deadlocks.

What is the Workflow Enhanced Error feature?

The Workflow Enhanced Error feature in version 10.0.13 adds error codes to differentiate different classes of workflow errors. The error messages reported will be mostly similar with minor differences to make them clearer.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Alerts overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

About alerts

Alerts form a notification system for critical events in the system. You can use alerts to stay informed about events that you want to track during the workday. You can easily create your own set of alert rules so that you're alerted about deliveries that are overdue, orders that are deleted, prices that change, or other events that you must respond to.

In enterprise resource planning (ERP), there are several typical scenarios where the alerts feature can be used. Here are some examples.

Scenario 1: Create an alert rule for new sales orders

1. Open the **All sales orders** page.
2. On the Action Pane, on the **Options** tab, in the **Share** group, select **Create a custom alert**.
3. In the **Create alert rule** dialog box, on the **Alert me when** FastTab, in the **Event** field, select **Record has been created**.

Scenario 2: Create an alert rule for postponement of a delivery date

1. Open the **All purchase orders** page.
2. Select a purchase order ID to access the purchase order details.
3. Expand the **Purchase order header** FastTab.
4. On the Action Pane, on the **Options** tab, in the **Share** group, select **Create a custom alert**.
5. In the **Create alert rule** dialog box, on the **Alert me when** FastTab, in the **Field** field, select **Delivery date**.
6. In the **Event** field, select **has been postponed**.

After you close the **Create alert rule** dialog box, your rule appears on the **Manage alert rules** page. You can use the **Manage alert rules** page to update your existing alert rules. For example, you can modify event triggers, update event notifications, and update expiration dates. To open the **Manage alert rules** page, use the **Alert me** button on the **Options** tab of the Action Pane.

What occurs when an alert rule is created?

When you create alert rules, you can associate a predefined event with a specific field. For example, the date that is specified in the field arrives, or the contents of the field change. Alternatively, you can associate an event with the records on a specific page. For example, a record is created, or a record is deleted.

When the selected event occurs for the field or for a record on the page, an alert is sent to you. For example, you create a rule where you associate the **Delivery date** field on a specific purchase order line with the **was due this amount of time ago** event. You set the time frame to five days. In this case, an alert is sent five days after the delivery date of that purchase order line.

Additionally, you can refine alert rules by setting conditions. For example, you can be alerted about new purchase orders that are created for specific vendor accounts.

Preparing for an alert

Before you set up an alert rule, decide when or in what situations you want to receive alerts. When you know which event you want to be notified about, find the page where the data that causes that event appears. The

event can be a date that arrives or a specific change that occurs. Therefore, you must find the page where the date is specified, or where the field that changes or the new record that is created appears. After you have this information, you can create the alert rule.

Components of an alert rule

An alert rule has five components:

- **Event** – The event that triggers an alert rule can be a date that arrives or a specific change that occurs. You define events on the **Send email alerts for job status changes** FastTab of the **Create alert rule** dialog box.
- **Condition** – On the **Alert me for** FastTab of the **Create alert rule** dialog box, you can select the scope of the condition, to control when you're alerted about events. You can apply the rule either to the current record only or to all visible records on the page. If the rule applies across legal entities, you can set the **Organization-wide** option to **Yes**.
- **Expiry of rule** – On the **Alert me until** FastTab of the **Create alert rule** dialog box, you can specify how long the alert rule should be active.
- **Contents** – On the **Alert me with** FastTab of the **Create alert rule** dialog box, you can specify the subject text and message text that the alert messages should use.
- **User** – On the **Alert who** FastTab of the **Create alert rule** dialog box, you can specify which user should receive the alert messages. By default, your user ID is selected.

NOTE

This option is restricted to organization administrators.

Create alert rules

2/18/2021 • 5 minutes to read • [Edit Online](#)

Getting started

Before you set up an alert rule, decide when or in what situations you want to receive alerts. When you know which event you want to be notified about, find the page where the data that causes that event appears. The event can be a date that arrives or a specific change that occurs. Therefore, you must find the page where the date is specified, or where the field that changes or the new record that is created appears. After you have this information, you can create the alert rule.

When you create an alert rule, you define the criteria that must be met before an alert is triggered. Criteria is basically the match between the occurrence of an event and the fulfillment of specific conditions. When an event occurs, the system starts to perform a check according to the conditions that are set up.

Ensure the alert batch jobs are running

The batch jobs for data change and due date alerts need to be running for the alert conditions to be processed and the notifications to be sent. To run batch jobs, go to **System administration > Periodic tasks > Alerts** and add a new batch job for **Change based alerts** and/or **Due date alerts**. If a long and frequently running batch job is needed, select **Recurrence** and set **No end date** with a **Recurrence pattern** of **Minutes** and a **Count** of 1.

Events

The event that triggers an alert rule can be a date that arrives or a specific change that occurs. Triggers for events are defined on the **Alert me when** FastTab of the **Create alert rule** dialog box. The events that are available for a particular field depend on the trigger that is selected.

For example, if you're setting up an alert rule for the **Start date** field, due date events are appropriate. Therefore, the **is due in** event type is available for that field. However, for a field such as **Cost center**, a due date event isn't appropriate. Therefore, the **is due in** event type isn't available. Instead, the **has changed** event type is available.

Event types

Three types of events can occur:

- **Create-type and delete-type events** – These events trigger an alert when a record is created or deleted.
- **Update-type events** – These events trigger an alert when the data in a specific field changes.
- **Due date-type events** – These events trigger an alert when a date arrives.

Changes that occur can be initiated by a user. For example, a user changes the delivery date of a purchase order. Alternatively, changes can occur as part of a process. For example, the **Status** field on a page changes to reflect the life cycle of various processes in the system.

Conditions

On the **Alert me for** FastTab in the **Create alert rule** dialog box, you can use conditions to control when you're alerted about events.

For example, you can specify that the system should alert you when the status of purchase orders changes, but only if the status matches a specific set of conditions. Specifically, you want to be alerted when the status of a purchase order is set to **Received**. This change in status is the event that triggers the alert.

Next, you must decide which purchase orders you want to be alerted about. For example, you can select one of the following options. These options define the conditions for the alert rule.

- **Current selected record** – You receive an alert when the status of a specific purchase order changes to **Received**.
- **All records** – You receive an alert when the status of a purchase order is changed for an item in the active page view. You can use the advanced filtering that is available on the page to create rules for a specific set of records. For example, you can create an alert that is triggered for all purchase orders for the customers in a specific customer group.

Expiry of rule

On the **Alert me until** FastTab of the **Create alert rule** dialog box, you can specify how long the alert rule should be active.

Alert contents

On the **Alert me with** FastTab of the **Create alert rule** dialog box, you can specify the subject text and message text that the alert messages should use.

User ID

On the **Alert me with** FastTab of the **Create alert rule** dialog box, you can specify which user should receive the alert messages. By default, your user ID is selected. The ability to change the user receiving the alert is restricted to organization administrators.

Alerts as business events

You can send alerts externally using the business events framework. When creating an alert, set **Organization-wide** to **No** and set **Send externally** to **Yes**. After you have the alert triggering the business event, you can trigger a flow built in Power Automate using the **When a business event occurs** trigger on the Finance and Operations connector, or explicitly send the event to a business events endpoint via the **Business events catalog**.

Create an alert rule

0. Ensure the alert batch jobs are running (see above).
1. Open the page that contains the data to monitor.
2. On the Action Pane, on the **Options** tab, in the **Share** group, select **Create alert rule**.
3. In the **Create alert rule** dialog box, in the **Field** field, select the field to monitor.
4. In the **Event** field, select the type of event.
5. On the **Alert me for** FastTab, select the desired option. If you want to send the alert as a business event, set the **Organization-wide** value to **No**.
6. If the alert rule should become inactive on a specific date, on the **Alert me until** FastTab, select an end date.
7. On the **Alert me with** FastTab, in the **Subject** field, accept the default subject heading for the email message, or enter a new subject. The text becomes the subject heading for the email message that you receive when an alert is triggered. If you want to send the alert as a business event, set **Send externally** to **Yes**.
8. In the **Message** field, enter an optional message. The text becomes the message that you receive when an

alert is triggered.

9. Select **OK** to save the settings and create the alert rule.

Limitations and workarounds

Workaround for creating alerts for the secondary data sources of a form

You can't create alerts for some secondary data sources on forms. For example, when creating alerts on the customer or vendor posting profiles form, only the fields on the header (CustLedger or VendLedger) are available and not the dimension accounts. The workaround for this limitation is to use **SysTableBrowser** to open that table as primary data source.

1. Open the table in the **SysTableBrowser** form.

```
https://<EnvironmentURL>/?cmp=USMF&mi=SysTableBrowser&TableName=<TableName>
```

2. Create an alert from the **SysTableBrowser** form.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Batch processing of alerts

2/18/2021 • 4 minutes to read • [Edit Online](#)

Alerts are processed by the batch processing functionality. You must set up batch processing before the process and deliver alerts.

Batch processing functionality supports two types of events:

- Events triggered by change-based events. These events are also referred to as create/delete and update events.
- Events triggered by due dates.

You can set up batch processes for each type of event.

Batch processing for change-based events

The system reads all change-based events that have occurred since batch processing was last run. Change-based events include updates to fields, the deletion of records, and the creation of records. These events are compared with the conditions that you set up in alert rules. When an event matches the conditions in a rule, the batch process generates an alert.

Frequency for change-based events

For change-based events, you can set up a batch job that triggers the processing of an event soon after the system logs the event. If you set up the batch job to recur more often, users receive their alerts sooner after changes occur. However, a high frequency for batch processing might adversely affect system performance.

On the other hand, a batch job that recurs less often, and that you schedule for times when the system load is low, might help improve system performance. However, a low frequency for batch processing might not meet the users' demands for timely alerts.

Therefore, when you set up the frequency of batch processing for change-based events, consider the balance between the timeliness of alerts and the performance of the whole system. These considerations become more relevant as the number of users who create alert rules increases. The frequency doesn't affect the number of events that the system processes. However, if more users create rules, the process runs more checks. This type of data exchange might affect system performance.

The risks of low batch frequency

If you set up a low frequency for batch processing for change-based events, data that is relevant to the conditions in alert rules might change before processing. Therefore, you might lose alerts.

For example, you create an alert to trigger when the event is **customer contact changes** and the condition is **customer = BB**. In other words, when the customer contact for customer BB changes, the process logs the event. However, the batch processing system is set up so that batch processing occurs less often than data entry. If the customer name changes from **BB** to **AA** before the event is processed, the data in the database no longer matches the condition in the rule, **customer = BB**. Therefore, when the event is finally processed, no alert is generated.

Set up processing for change-based alerts

1. Go to **System administration > Periodic tasks > Alerts > Change based alerts**.
2. In the **Change based alerts** dialog box, enter the appropriate information.

Batch processing for due-date events

The system detects all events that are caused by due dates, and these events are compared with the conditions that are set up in alert rules. The batch process generates an alert when an event matches the conditions in a rule.

Frequency for due-date events

For due-date events, you might want to set up batch jobs that are run during the night or at specific times of the day, to balance the system load. We recommend that you set up the batch job so that it's run at least one time per day. If alerts should be sent as early as possible, set up the batch processing to occur immediately after the system date changes. If you want to generate alerts for due-date events that occur after a batch job has already processed alerts, you can run the batch job again on the same day.

For example, a batch job has been run on a particular day. You then create a purchase order that has a due date that should trigger an alert on that same day. To receive the alert on that day, you must run the batch job again after the purchase order is created. However, if you don't run the batch job again on that day, the next day's batch job detects any due-date events that weren't processed on previous days.

NOTE

Even when the batch process is run more than one time per day, alerts aren't duplicated for the same due-date event and conditions. Alerts are generated only for dates that have become due because of changes that occurred in the system after the last batch job was run.

Batch processing window

The processing of alert rules in a company can be stopped for several reasons. These reasons include vacations, system errors, or other issues that prevent the batch jobs from being run for some time.

To prevent due-date alerts from becoming obsolete because the batch job hasn't been run for several days, you can set up a batch processing window. A batch processing window can be used to prevent a batch job from being run for a specified number of days.

If you set up a batch processing window, an alert is sent when the alert rule is processed, even if the alert exceeds the time limit that is defined in the due-date criteria. An alert continues to be sent for as long as the period that is defined by this time limit plus the batch processing window isn't exceeded. However, when the period exceeds the value defined by the time limit plus the batch processing window, an alert is no longer sent.

Set up processing for due-date alerts

1. Go to **System administration > Periodic tasks > Alerts > Due date alerts**.
2. In the **Due date alerts** dialog box, enter the appropriate information.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Client alert notifications by email

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can define custom alert rules that monitor filtered views of data and automatically send email notifications when predefined events occur. The option to send email notifications is available for all supported alert types and you can also turn them on for existing alert rules.

You can use built-in controls to create alert rules that monitor the filtered views of system batch jobs. By monitoring the value of the **Status** field, you can also configure alert rules that send email when a batch job fails. After you create these alert rules, you no longer have to check reports for changes to business data. Instead, you can let the intelligent change detection service do the monitoring for you.

Client alerts depend on the email subsystem that is provided through integration with Microsoft Office. We recommend that you use the Simple Mail Transfer Protocol (SMTP) provider, so that email distribution doesn't have to rely on a local mail client.

To send notifications by email, customers must configure integrated email services. Email notifications are sent to recipients on behalf of alert owners.

For more information about how to configure email, see [Configure and send email](#).

The following image shows the **Create alert rule** dialog box, which now includes a **Send email** option.

The screenshot displays the 'Create alert rule' dialog box in Dynamics 365. The dialog is titled 'Create alert rule' and is for a 'Customers' table. It shows the following fields and options:

- Rule ID:** 000311
- Table name:** Customers
- Alert me for:** Customers
- Alert me until:** (empty)
- Alert me with:** (empty)
- Subject:** Record has been created in Custo
- User ID:** Admin
- Message:** (empty text area)
- Send email:** Yes (checked)
- Email recipients:** karif@contoso.com

The background shows a table of customers with columns for Account, Name, and Invoice. The table is filtered to show all customers.

NOTE

When the **Send email** option is set to **Yes**, alert notifications will continue to be delivered from the Action Center.

Alert notification email templates

The service sends email notifications by using predefined email templates that deliver the basic details of the alert notification.

The following image shows the structure of the alert notifications when they are received by email.

<p>From: owner@domain.com Sent: Thursday, November 29, 2018 To: target@domain.com Subject: Alert Notification – Record has been created in Customers</p> <p> Microsoft Dynamics 365</p> <p>Message: Custom alert messages entered by the Alert owner goes here</p> <p>Details: View customer account: Test Cust 02, Test Account 02</p>	<p>From: owner@domain.com Sent: Thursday, November 29, 2018 To: target@domain.com Subject: Alert Notification – Field Customer group in table Customers has changed</p> <p> Microsoft Dynamics 365</p> <p>Message: Custom alert messages entered by the Alert owner goes here</p> <p>Details: View Customer account: DE-001, Contoso Europe</p>	<p>From: owner@domain.com Sent: Thursday, November 29, 2018 To: target@domain.com Subject: Alert Notification – Record has been deleted in Customers</p> <p> Microsoft Dynamics 365</p> <p>Message: Custom alert messages entered by the Alert owner goes here</p> <p>Details: Go to Customers</p>
RECORD CREATED	FIELD CHANGED	RECORD DELETED

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Electronic signatures overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides an overview of electronic signatures and describes how they can be used.

What is an electronic signature?

An electronic signature confirms the identity of a person who is about to start or approve a computing process. In some industries, an electronic signature is as legally binding as a handwritten signature.

Electronic signatures are a regulations compliance requirement for several regulated industries, such as pharmaceuticals, food and beverage, and aerospace and defense. They are also required for compliance with regulations in 21 CFR Part 11 that was issued by the Food and Drug Administration (FDA) in the United States.

NOTE

An electronic signature by itself isn't the same as a digital signature. An electronic signature is just a substitute for a handwritten signature, whereas a digital signature provides additional security measures. A digital signature can help identify whether another user or process has tampered with the data. A digital signature can also be verified, and this verification can't be refuted by the owner of the certificate that was used to sign the data. As described below, electronic signatures have built-in digital signature functionality.

Electronic signatures

You can use electronic signatures for critical business processes. Some processes have built-in electronic signature capabilities. You can also create custom signature requirements for any database table and field.

Electronic signatures have built-in digital signature functionality. Every user who signs documents must obtain a valid cryptographic certificate. When a document is signed, the private key that is associated with that certificate is validated. Electronic signature information is recorded in a log to provide an audit trail. To set up electronic signatures, see [Set up electronic signatures](#).

Users who require access to electronic signatures

Three kinds of users typically require security access to electronic signatures: electronic signature administrators, signers, and electronic signature auditors.

Electronic signature administrator

The electronic signature administrator sets up signature requirements, general parameters, and approvers, and receives alerts when signatures can't be verified. By default, a user who belongs to the **Information technology manager** security role has permission to administer electronic signatures.

Signer

A signer provides electronic signatures for documents and processes that require signatures. By default, a user who belongs to the **System user** security role has permission to sign documents electronically.

NOTE

The signer might require additional permissions before access is granted to data that is related to the document or process that is being signed. A user who changes data and must then sign for those changes must have permission to change the data. A user who signs on behalf of another user might not require access to the data. An example of this kind of user is a supervisor who signs for an employee's changes.

Electronic signature auditor

The electronic signature auditor reviews the database log and the signature review log that is available from the database log. By default, a user who belongs to the **Information technology manager** security role has permission to audit electronic signatures.

If you use a role other than **Information technology manager**, make sure that the role is assigned the following privileges:

- View electronic signature failures
- View database log

Signing documents electronically

Get a certificate

Before you sign documents electronically, you must request a certificate.

NOTE

Microsoft SQL Server features are used to create certificates and enable electronic signing. No additional certificate or public key infrastructure (PKI) is required.

When you request a certificate, a public key and a private key are created for you. The private key is encrypted by using a password that is known only to you. When you sign a document electronically, your identity is verified when you enter the password.

To request a certificate, on the **Options** page, on the **Accounts** tab, click **Get certificate**.

You must enter and confirm the password that you will use for signing. The password is used to protect your private key and authorize the use of your certificate. This password isn't stored in the database, and it isn't available to anyone else, not even to the administrator.

If you forget the password that is connected with your certificate, that certificate must be reset. If you reset the certificate, you don't affect documents that you signed by using the previous certificate. To reset the certificate, on the **Options** page, click **Reset certificate**.

Sign a document electronically

The **Sign document** page is displayed when you make a change that requires an electronic signature.

1. On the **Sign document** page, click the **Document** tab to review the changes to the document.
2. On the **Signature** tab, select a reason code.
3. Enter a comment, if a comment is required.
4. If your user ID doesn't appear in the **Signer** field, select it in the list.
5. Enter your location, if this information is required.
6. Click **OK**.

Sign for another user's changes

Occasionally, you might want a user to sign for another user's changes. For example, a supervisor might be

required to sign for changes that an employee makes to a bill of materials (BOM). Use this procedure to designate a user as a signer for another user.

NOTE

When one user signs for another user's change, the signature must be provided at the workstation of the user who made the change. The user can't save the change until the signature has been provided.

To designate approvers, follow these steps.

1. On the **Options** page, on the **Accounts** tab, click **Designate approver**.
2. In the **Approver user ID** field, select the ID of the user who must sign for another user's changes.
3. In the **Sign for user ID** field, select the ID of the user whose changes must be signed for.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up electronic signatures

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to set up electronic signatures. An electronic signature confirms the identity of a person who is about to start or approve a computing process. The demo data company used to create this procedure is DAT.

Enable the Electronic signature configuration key

1. Go to System administration > Setup > License configuration.
2. In the tree, expand 'Administration'.
 - Verify that the Electronic signature check box is selected.
 - If the Electronic signature check box is not selected, you must enable maintenance mode. Maintenance mode can be enabled in this environment by running a maintenance job from Lifecycle Services, or by using the Deployment.Setup tool locally.
3. Close the page.

Set up electronic signature parameters

1. Go to Organization administration > Setup > Electronic signature > Electronic signature parameters.
2. Click Edit.
3. In the Notice field, type a value.
 - Enter the notice that signers will receive when a signature is requested. You can enter any text. Typically, this text tells the user what it means to sign a document electronically.
 - If you want to enter the Notice text in additional languages, click the Translations button.
4. Click Save.
5. Close the page.

Set up reason codes for electronic signatures

1. Go to Organization administration > Setup > Electronic signature > Electronic signature reason codes.
2. Click New.
 - You must set up reason codes before using electronic signatures. A valid reason code is required when signing a document. A signer selects a reason code to indicate the purpose of an electronic signature. For example, a reason code could be used to indicate legal approval.
3. In the Reason code field, type a value.
4. In the Description field, type a value.
 - Enter additional reason codes, if needed.
5. Click Save.
6. Close the page.

Require electronic signatures for existing processes

1. Go to Organization administration > Setup > Electronic signature > Electronic signature requirements.
2. In the list, find and select the desired record.
 - Select a process that requires electronic signatures.
3. Select or clear the Signature required check box.
 - Repeat these steps for each process that requires electronic signatures.

4. Click Save.

Create a custom requirement for electronic signatures

1. Click New.

2. Select or clear the Signature required check box.

3. In the Name field, enter a name for the process that requires electronic signatures.

4. In the Table name field, click the drop-down button to open the lookup.

5. In the list, find and select the table where the data that must be signed is stored.

6. In the list, click the link in the selected row.

7. In the Field name field, click the drop-down button to open the lookup.

8. In the list, find and select the field in the table that you want to monitor.

9. In the list, click the link in the selected row.

- Specify when a signature is required. Select Always if a signature is required when the data in the field changes. Select Only if a signature is required only under certain conditions. If you select Only, you must also select one of the following options: When a record is inserted, When a record is updated, or When a record is deleted.

10. Click Save.

11. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Case management overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

By planning, tracking, and analyzing cases, you can develop efficient resolutions that can be used for similar issues. For example, when customer service representatives or Human Resources generalists create cases, they can find information in knowledge articles to help them work more efficiently. The following examples show how cases can be used for different situations in an organization.

Example: How Fabrikam uses cases for customers in the private sector

Lisa, a customer service representative at Fabrikam, receives a telephone call from Lionel, a Fabrikam customer. Lionel is having trouble setting the correct volume level on the new sound system that Fabrikam installed in his music store. Lisa creates a case for Lionel and assigns the **Volume** category to the case. Lisa then elevates the priority and assigns a one-day service level agreement (SLA) to the case.

Lisa also enters the case details in the case log. Lisa notices that several knowledge articles are associated with the **Volume** category, and that three of them are marked as helpful for resolving cases. Lisa opens each article and discusses the resolution steps with Lionel, but none of the solutions solve the issue that Lionel is having with the new sound system. Lisa tells Lionel that an audio technician will call him within 24 hours and work to solve the issue.

Lisa activates the case, and a set of activities is created. She assigns the activities to Terrence, a member of the audio engineering team. Terrence sees that new activities are assigned to him. He opens the case and reads the case log to learn more about the case. Terrence encountered the same issue the day before, and he developed a solution. Terrence contacts Lionel and offers this solution for the issue. Terrence also enters it in the case details.

Because his solution is successful, Terrence decides to document it, so that other people can use it if they encounter the same issue. Terrence adds the document to the **Knowledge article** page, assigns the document to the **Volume** category, and manually elevates the ranking, so that other Fabrikam employees will know that it's a successful solution. Terrence then elevates the case to the next level. By elevating the case, he creates a new activity for Marie, who is a quality assurance representative in the customer service department.

Marie sees that a new activity is assigned to her, and opens the case that is associated with the activity. Marie reviews the case and the case details to make sure that the correct process was followed for the case. Marie verifies that the actual case time did not exceed the time frame that was estimated in the SLA. Marie notes that Terrence contacted the customer, and that the issue was resolved. Marie is satisfied with the treatment that the customer received and the results of the case. She resolves the case as closed. When Marie closes the case, the open activity that is assigned to her is also closed.

Example: How City Power & Light uses cases for customers in the public sector

Annie, a customer service representative with City Power & Light, receives a telephone call from a resident of the city that City Power & Light serves. Annie records the call as an activity and takes notes of the conversation. The resident tells Annie that his house has no power. Annie informs the resident that City Power & Light will investigate, find, and resolve the issue as quickly as possible.

Annie then creates a case, associates the telephone call with the case, and creates a service order. Annie knows that other residents are likely to call to report a power outage. Therefore, to avoid overwhelming the customer service center, and to save time, Annie sends a group instant message (IM) to inform the other representatives about the issue, and to tell them that a case and service order have been created. Annie includes the case

number and service order number in her IM. Then, if City Power & Light receives more telephone calls about the power outage, the customer service representatives can create an activity for each telephone call and assign it to the existing case.

Example: How Fabrikam uses cases for employees

The following scenarios show how Fabrikam Human Resources generalists in different locations can use case management when they address issues for employees.

In Great Britain

Christine, the Human Resources generalist for the Great Britain division of Fabrikam, receives a telephone call from Peter, a Fabrikam employee. Peter informs Christine that nine weeks ago, immediately after the birth of his son, he changed the number of dependents on his tax withholdings. Peter wants to know why the changes haven't become effective. Christine creates a case for Peter. She reviews Peter's tax information and learns that, although Peter entered new dependent information, he didn't select a start date for the new tax withholdings. Christine sends an email message to inform Peter that he must select a start date and resubmit his changes. Peter replies to Christine's message to tell her that he has now selected a start date and resubmitted his changes. Christine attaches the email message from Peter to the case record, verifies that the correct changes were made and submitted, and closes the case.

In the United States

Luke, the Human Resources generalist for the United States division of Fabrikam, receives an email message from Shannon, a Fabrikam employee. Shannon is a machine operator who was injured on the job six months ago. Since then, she has been working with Humongous Insurance to have her medical expenses paid. Because Shannon contacted Luke about this issue four weeks ago, a case has already been created. Shannon's new email message explains that Humongous Insurance is still not returning her telephone calls. Luke opens the existing case, adds Shannon's email message as a document, and reviews the case log. When Luke created this case, he assigned the **Insurance** category to it. He now sees that there is a new knowledge article that is associated with the **Insurance** category. Luke reads the knowledge article and learns that all phones at Humongous Insurance are down while the company's telephone system is being updated. The article states that the insurance company sent an email message to all its customers, but that several customers did not receive the message because of a problem with the company's email system. All customers who have active insurance claims are asked to send their inquiries to Humongous Insurance by email or paper mail. Luke sends Shannon an email message that explains what she must do to have her insurance claim settled. He also ranks the knowledge article that he read as a helpful source of information. Luke creates another activity for himself, so that he can follow up with both Shannon and Humongous Insurance in four weeks to make sure that the claim has been resolved. After four weeks, Luke contacts Shannon. He learns that Humongous Insurance has paid her claims, and that she is happy with the resolution. Luke changes the status of the case to **Closed**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Plan case category security, case processes, and case categories

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes the considerations and decisions that you must make during the planning process, before you begin to configure cases.

You can use the case functionality to resolve both issues that are external to your organization and internal issues.

Case category security by role

Only appropriate employees in an organization should have access to cases and related information. To control which employees have access to view, create, and update different types of cases, you can assign security roles to case category types. You must determine which security roles should have access to the various case category types.

Decision: Determine which security roles should have access to the following case category types. Your organization might not use all these category types, so make decisions only for those categories that are appropriate.

- General
- Sales
- Purchase
- Service
- Project
- Production
- Collections
- Audit
- Web
- Human Resources
- Product change
- FMLA

Case processes

You should set up processes that employees must follow for the cases that are opened in your organization. Processes help guarantee consistency for the people who are involved in cases, and also help employees resolve cases faster and more efficiently. You can set up a process for each case category that cases are assigned to. Although planning a separate process for each case type takes time, case resolution will go much more smoothly if the processes are planned out.

Decisions: For each case process, you must make the following decisions:

- What are the name and description of the process?
- Is the process active, and should employees use it when they handle a case that the process is assigned to?
- Who in the organization will be responsible for applying the process to a case? For example, Cost accounting or Human resources might be responsible for some case processes. Note that multiple areas can be responsible for completing one process.

Case categories

The Case category hierarchy provides a list of categories that you can assign cases to (see the "Case category security by role" section). Each top-level category includes subcategories, so that you can create more specific categories for the cases that your organization works with. Review the list of existing categories and subcategories to determine whether you must create more. If you must create more categories and subcategories, you must make the following decisions for each addition.

Decisions:

- Are you creating a new top-level category?
 - What is the name of the category
- Are you creating a new subcategory?
 - What is the parent category of the subcategory?
 - What is the name of the subcategory?
 - Which worker will own the subcategory?
 - What department is the subcategory assigned to?
 - What case process will be assigned to this subcategory?
 - What is the default service level agreement (SLA) that is assigned to this subcategory?
 - Should an activity be created when a case that this subcategory is assigned to is opened?
 - If so, what are the activity category, type, purpose, and phase?
 - Should a follow-up activity for the case be created?
 - If so, what are the follow-up activity category, type, purpose, and phase?

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Record templates overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article introduces the concept of record templates and explains how they can be used to create records that share information.

Record templates can help you to create records more quickly, however you can only create record templates for some record types.

For example, imagine you are entering rental information for a car rental business that is located in San Francisco. Since most of the customers are likely to be from the San Francisco area, it would be nice if you could automatically fill in the values for the **State**, **Country**, and **City** fields on the rental form.

NOTE

You can apply templates only in areas that you have access to. However all template titles are visible to you when you create a new record, and to other users as well, if you are creating templates that will be available for all users. Be sure to consider this when naming templates. For example, avoid using names that include words, such as "commission," if is confidential that some employees in the company have commission-based salaries.

When one or more templates that you have access to exist for a specific form and you attempt to create a new record in the form, the **Select a template for** page is displayed. When you select a template from the list, the new record is created and contains default information that is based on the template that you selected. If you do not want to use templates when you create new records, select the **Do not ask again** check box in the **Select a template for** page. To display the template selection dialog box again, right-click any record, click **Record info**, and then click **Show template selection**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a record template to facilitate data entry

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic demonstrates how to create a record template so that field values that are used often do not have to be entered explicitly for each new record. In this procedure, you'll create a new record for new laptops that should be added to your fixed assets. This procedure uses the USMF sample company.

1. In the navigation pane, go to **Modules > Fixed assets > Fixed assets > Fixed assets**.
2. Select **New**.
3. In the **Fixed asset group** field, enter or select a value.
4. In the **Name** field, type a value. For example, enter **Corporate lead laptop**.
5. In the **Search name** field, type a value. For example, enter **laptop**.
6. Expand the **Technical information** section.
7. In the **Make**, **Model**, and **Model year** fields, type values.
8. On the Action Pane, select **Options**.
9. Select **Record info**.
10. Select **User template**.
11. In the **Name** field, type a value.
12. In the **Description** field, type a value.
13. Select **OK**.
14. Select **Close**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Use record template to create a new record

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to use a previously defined record template to create a new record. To complete this procedure, you must first complete the "Create a record template to facilitate data entry" procedure.

This procedure uses the USMF company.

1. In the **Navigation pane**, go to **Fixed assets > Fixed assets > Fixed assets**.
2. Click **New**. You will be prompted to select a template. Select the one that corresponds to your business need.
3. In the list, find and select the desired record.
4. Click **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure document management

2/18/2021 • 15 minutes to read • [Edit Online](#)

This topic explains how to configure document management (document handling) so that it stores file attachments and notes for records. It includes information about the concepts and features that are involved in this functionality.

To learn more about document management, watch the short [Document Management](#) video.

Configure document types

Document types are used to categorize the documents that you attach to records or the templates that you create. Each document type can be stored in a unique location.

A default set of document types is provided. You can use these document types to categorize an attachment as a file, image, note, or URL. The **File** and **Image** default document types are configured to use **Azure storage** as the location.

To create a new document type, follow these steps.

1. Go to the **Document types** page.
2. Click **New**.
3. In the **Type** field, enter a short name for the new document type, such as **SharePoint** or **HR Docs**.
4. In the **Name** field, enter a longer name, such as **SharePoint files** or **HR Docs**.
5. In the **Class** field, specify a class to define the behavior for the document type:
 - **Attach file** – The user is prompted for a file.
 - **Attach URL** – The user can enter a URL in the **Notes** field, such as `https://www.microsoft.com`. The **Open** button on the **Attachments** page will open the URL on a browser tab.
 - **Simple note** – The user can add a simple note in the **Notes** field.
6. If you specified **Attach file** in the **Class** field, in the **Location** field, specify the storage mechanism to use.
7. If you specified **SharePoint** in the **Location** field, specify the Microsoft SharePoint address in the **SharePoint Address** field. To do this, click the **Edit** button (pencil symbol) and use the **Folder selection** dialog box.

Configure SharePoint storage

Microsoft SharePoint Online is one of the storage locations that are supported natively. Currently, only SharePoint Online is supported. Support for on-premises SharePoint (a local SharePoint server) may be added in the future.

To use SharePoint storage, set the **Location** field for a document type to **SharePoint**. Then, in the **SharePoint Address** field, enter a valid SharePoint address.

To configure SharePoint storage, follow these steps.

1. Go to the **Document management parameters** page.
2. On the **SharePoint** tab, in the **Default SharePoint server** field, review the host name that was

automatically detected for the SharePoint site, such as contosoax7.sharepoint.com. Typically, the SharePoint host name is in the form tenantname.sharepoint.com, and accounts on that tenant are in the form `user1@tenantname.onmicrosoft.com`.

Typically, if no default SharePoint server is specified, either there is no SharePoint site for the tenant, or a valid Microsoft 365 license isn't associated with the current user (the admin).

3. Optional: Click **Test SharePoint connection** to test the specified SharePoint host name. This verifies that the security and license are working correctly.
4. Optional: Click **Open SharePoint** to open the specified SharePoint host name in a browser. Note that this does not verify security, it just opens the SharePoint path in a browser tab for easy exploration.

Troubleshooting SharePoint communication

SharePoint communication works for the current user only if the following conditions are met:

- A Microsoft 365 license is associated with the user's account.
- The user is a typical user on the tenant, not an external user (for example, a user from another tenant).
- There is a SharePoint site for the tenant (for example, Contoso.SharePoint.com).
- The user has access to the folder that the document is stored in.

If documents stored in SharePoint don't open or don't display in preview, follow these steps to troubleshoot the issue:

1. Verify the Admin account has an associated email account (verify or change this in the **User** page). If this isn't set up, you need to add the email and provider via the OData Excel add-in. By default, the email address isn't present in the Excel design. The user needs to edit the Excel design, add all fields, apply, and refresh. Once complete, you can update the Admin account.
2. After the Admin account has an associated email account, sign in to Dynamics as the admin.
3. Open an attachment that is stored in SharePoint.
4. Sign in with another user account that has read access to the attachments page and the configured SharePoint folder. Verify that they can also open and preview the attachment.

Configure file types

By modifying the list of file extensions that are allowed, you can control the types of files that users can attach to records.

To specify file types, follow these steps.

1. Go to the **Document management parameters** page.
2. On the **File types** tab, review the default file types.
3. Remove any file types that users should not be able to attach to records, and add any file types that users should be able to attach to records.

Configure document preview

The attachments preview uses the Web app Open Platform Interface (WOPI) that is provided by Microsoft Office Online Server. On the **Document management parameters** page, on the **General** tab, in the **Office Web Apps Server** field, specify the Office Online Server instance to use for attachment previews. The default value is `https://onenote.officeapps.live.com`. This value points to the cloud-based WOPI server.

For a Microsoft Dynamics 365 Finance + Operations (on-premises) environment

The default cloud-based WOPI server in Finance + Operations can't read the attachment file to provide a

preview. If previews are required, you must [install an on-premises Office Online Server instance](#) and configure it inside the environment. Set the **Office Web Apps Server** field to the host name of the installed Office Online Server instance, and then click **Save**.

If previews aren't required, set the **Office Web Apps Server** field to `https://localhost`. The preview will then show the message "No preview available" instead of an error message.

Document preview (WOPI) will not work in environments with an IP safe list enabled

Document preview (WOPI) will not work in environments with an IP safe list enabled, because the WOPI service that provides the preview will not be able to connect back to the file service to retrieve the file for rendering.

Other configuration

Here are some other configuration options to consider, although these options are rarely used:

- On the **Document management parameters** page, on the **General** tab, you can use the **Use Document Tables** option to enable the **Active document tables** allow list. If you set this option to **Yes**, you disable attachments on all other tables. Therefore, turn on this option only when it's required.
- On the **Document management parameters** page, on the **General** tab, you can use the **Maximum file size in megabytes** field to set the maximum file size for attachments. Note that the ability of users to provide files is also constrained by the file size limit that is set for the environment in configuration files. These configuration files can't be changed via a client page.
- On the **Options** page (**Settings** > **User options**), on the **Preferences** tab, you can use the **Enable document handling** option to disable document handling (document management).

Accessing document management attachments

Document management appears to users as the **Attach** button at the top of most pages that contain data. When you select the **Attach** button (or when you use the corresponding keyboard shortcut, **Ctrl+Shift+A**), the **Attachments** page is opened in the context of the data source of the control that is currently selected on the page. This page shows all the attachments that are related to the corresponding data source.

The **Attach** button also shows a count of the attachments for the currently selected record. Therefore, you can determine whether there are attachments for the current record without having to open the **Attachments** page. The button shows exact counts for zero through nine attachments. If there are more than nine attachments, the button shows **9+** as the count. In this way, the performance impact and visual noise that exact larger counts might cause are reduced.

In version 10.0.12, the **Show related document attachments** feature changes the document attachment experience in two ways. First, when the feature is enabled, the **Attachments** page doesn't show only attachments that are related to a single data source. Instead, it shows attachments from all data sources on the page that are related to the active record. The count of attachments on the **Attach** button also reflects this change. Second, users can move and copy attachments between the related data sources on the **Attachments** page.

Document attachment history

Starting in version 10.0.16/Platform update 40, a history mechanism has been made available for record attachments. This allows your organization to maintain an audit of actions related to individual attachments. In particular, you can see when an attachment was created, marked for pending deletion, restored, deleted, or moved and who performed that action. Note that attachment history is not maintained until 10.0.16/Platform update 40, so any actions on attachments prior to that version will not be available.

Configuration of document attachment history

Document attachment history can be enabled (or disabled) by going to **Document management parameters**

> **General** > **History** > **Enable document history**. The default history retention period is 180 days, but this value can be modified as needed using the **Number of days to retain history** field.

Viewing an attachment's history

There are two entry points for viewing the history of a record attachment:

- When you are looking at the attachments for a specific record (see the [Accessing document management attachments](#) section for more details), you can view the history for the current set of attachments on the **Attachments** page by selecting the **Document history** button in the Action pane.
- Administrators can select the **Document history** button in the **History** section of the **Document management parameters** page. This action opens the **Document history** page, which shows a list of all attachments in the system. You can then drill into any record to see the detailed history for the selected attachment.

Attachment recovery

In Platform update 29, an attachment recovery feature has been added that provides a recycle bin for record attachments to be recovered within a configured period of time.

Configuration of attachment recovery

Attachment recovery can be enabled by going to **Document management parameters** > **General** > **Deferred deletion** > **Deferred deletion enabled**. The default for **Number of days to defer deletion** is 30 days but can be changed as needed. If the **Number of days to defer deletion** value is zero, this means that the deleted attachments will be recoverable for an indefinite period.

After attachment recovery is enabled, a batch job with this name will be created, "Scans for deleted references which have reached the end of their retention period". This batch job will use the **Number of days to defer deletion** to determine how long to retain a deleted attachment based on the **Deleted data and time**.

Deleting attachments when attachment recovery is active

When a user deletes an attachment, a notification will be added to the Message Center to provide confirmation of the deletion and an option to undo to the action if the deletion was unintended.

Table extension support has been built-in, so that any extension or custom field values on the **DocuRef** or **DocuValue** tables will be retained to enable their recovery.

Recovering attachments

When attachment recovery is enabled, attachments can be recovered in one of three ways:

1. Immediately after deletion, the user can use the undo link in the **Attachment deleted** notification.
2. On the **Attachments** page, a **Deleted attachments** button provides access to the list of deleted attachments that can be recovered for a particular record. The deleted attachments can be opened for review, permanently deleted, or restored.
3. In **System administration** > **Inquiries**, the **Deleted attachments** page provides access to the list of deleted attachments that can be recovered for any record. The deleted attachments can be opened for review, permanently deleted, or restored.

Scanning attachments for viruses and malicious code

When you work with attachments, you might want to scan the files for viruses and malicious code. Therefore, in version 10.0.12 and later, extension points are available so that customers can integrate with the file scanning software of their choice when they work with attachments. A similar extension point is also available for file upload. For more information, see [File upload control](#).

IMPORTANT

Out of the box, Finance and Operations apps don't scan files for viruses and malicious code, and we don't recommend specific software for file scanning. Instead, customers are responsible for choosing their own file scanning software, and for adding the appropriate code to the delegate handlers so that they can use the software or service of their choice to scan files.

The **Docu** class exposes the following two delegates. Handlers can be implemented for these delegates for document scanning purposes:

- **Docu.delegateScanDocument()** – This delegate applies the file scanning logic when a new document attachment is uploaded, or when a user tries to preview or download an existing attachment. The corresponding action will fail if the scanning service determines that the file is malicious.
- **Docu.delegateScanDeletedDocument()** – This delegate applies the file scanning logic to documents in the attachments recycle bin when a user tries to preview or download a file. The corresponding action will fail if the scanning service determines that the file is malicious.

Implementation details

The following example of the **ScanDocuments** class shows boilerplate code for the two handlers. For general information about how to implement handlers for delegates, see [EventHandlerResult classes in request or response scenarios](#).

```

public final class ScanDocuments
{
    [SubscribesTo(classStr(Docu), staticDelegateStr(Docu, delegateScanDocument))]
    public static void Docu_delegateScanDocument(DocuRef _docuRef, EventHandlerRejectResult
_validationResult)
    {
        if (!ScanDocuments::scanDocument(_docuRef))
        {
            _validationResult.reject();
        }
    }

    [SubscribesTo(classStr(Docu), staticDelegateStr(Docu, delegateScanDeletedDocument))]
    public static void Docu_delegateScanDeletedDocument(DocuDeletedRef _docuDeletedRef,
EventHandlerRejectResult _validationResult)
    {
        if (!ScanDocuments::scanDeletedDocument(_docuDeletedRef))
        {
            _validationResult.reject();
        }
    }

    private static boolean scanDocument(DocuRef _docuRef)
    {
        /*
        Custom implementation required for connecting to a scanning service
        If document scanning process found an issue, return false; otherwise, return true;
        */
        return true;
    }

    private static boolean scanDeletedDocument(DocuDeletedRef _docuDeletedRef)
    {
        /*
        Custom implementation required for connecting to a scanning service
        If document scanning process found an issue, return false; otherwise, return true;
        */
        return true;
    }
}

```

Frequently asked questions

What is the difference between document handling and document management?

There is no difference between document handling and document management. Both terms refer to the same functionality. Different terms are used in different versions of the product.

What is the difference between document management and print management?

Document management lets you add notes, documents, and other files to records.

Print management lets you control print settings for selected reports. Print settings include the number of copies, the printer destination, and the multilanguage text that can be included on the report. For more information, see [Document Reporting Services](#).

What is the difference between document types and file types?

Document types are used to categorize the documents that you attach to records or the templates that you create. Each document type can be stored in a unique location. The table for document types is named DocuType.

File types include Microsoft Word documents and images. A file type is denoted by the extension of the file, such

as .txt, .png, .doc, .xlsx, or .pdf.

Does document management integrate with Microsoft 365?

Yes. SharePoint storage is supported natively and can be selected as the storage location for a document type. In addition, any URL addressable file can be made an attachment via the URL document type.

How does the default storage location for Document Management change in Finance + Operations environments?

For Finance + Operations, the Azure Blob storage provider for attachments is replaced by a file folder storage provider so that attachments are kept on-premises instead of being stored in the cloud. Therefore, the default storage location for attachments is a file folder.

If I accidentally delete an attachment stored in Azure Blob storage, can it be restored?

If an attachment stored in Azure Blob storage is accidentally deleted, it cannot be restored or recovered because it has been permanently deleted and the reference to it has also been deleted.

Is the database information about attachments stored separately from the attachments themselves?

Record attachment information is stored in the DocuRef and DocuView tables. The DocuRef table is the record that represents the attachment. The DocuRef record points to the record being attached to and to a DocuView record. The DocuView record points to the file that is the attachment. Files are stored outside the database, therefore any database operations, like restoring from backup, will only affect the database information about the attachment, not the attachment file itself.

Can attachments be stored in the database?

No. By default, attachments are stored in Azure Blob storage.

What are the main differences between Azure Blob storage and database storage?

Database storage is Azure SQL Database. File storage is Azure Blob storage. Azure Blob storage is simpler and much less expensive.

How much storage do we get for Azure Blob storage?

That information is in the [licensing guide](#). Currently, you get 40 gigabytes (GB) of storage.

What is the cost for additional storage?

The cost for additional storage varies, but it's similar to the [standard Azure costs for storage](#). In other words, the cost is about \$0.05 per GB.

How can we learn how much storage we've already used?

There will be proactive communications when you're approaching your database and file storage limits. However, Microsoft Dynamics Lifecycle Services (LCS) provides some information, and you can log support requests for additional information.

Is there an option to export all document attachments from the system?

Although attachments can be exported, that capability isn't a standard capability, because there isn't a standard attachment entity. Entities that provide attachments for a specific business document or record must be built.

How can attachments be extracted from the system?

To extract attachments, an Attachments entity must be built for a specific business document or record. There isn't a standard attachment entity because the identity for each record type is different. To learn how to build an Attachments entity, you can find examples in the Application explorer by searching for "Attachment" under the AOT > Data Model > Data Entities node.

How does the document preview work for attachments stored in SharePoint?

The files are retrieved from SharePoint using the current user permissions by the WOPI service. Those files are then rendered in HTML to provide a document preview. This means that the current user needs access to the

files to be able to preview them or open them.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure and send email

2/18/2021 • 13 minutes to read • [Edit Online](#)

The behavior of the email subsystem is influenced by a combination of administrator configuration, user configuration, and user choices. This topic is divided into sections for administrators and users to make it easy to find relevant information.

Both administrators and users set the behavior of the email subsystem.

[Administrator] Email parameters page

Configuration tab

On the **Email parameters** page, note the following settings on the **Configuration** tab.

FIELD	DESCRIPTION
Batch email provider	Specifies which email provider will be used to send emails that are sent by processes in a batch or non-interactive manner. The Exchange provider will use the account associated with the batch process.
Attachment size limit	Specifies the maximum size of a single email that can be sent via the email subsystem.

In Platform update 32, an **Email history** page was added to allow administrators to review all sent emails, including any errors that might have prevented an email from being sent. By default, the last 30 days of email history is retained. This can be configured by changing the **Number of days to retain email history** to a non-zero amount. Zero provides the default amount and behavior.

In version 10.0.16/Platform 40, an **Email throttling** section is visible, if your environment has enabled the **Email throttling** feature in Feature management. This feature allows non-interactive email providers (such as the batch email provider) to adhere to a per-minute sending limit. This can prevent errors from the system attempting to send more emails than the provider allows. The sending limits for Microsoft 365 email providers are set automatically according to [Exchange Online sending limits](#). Manual configuration is required for all other email providers. The per-minute sending limit can be removed from a provider by resetting the **per-minute email sending limit** field to 0.

SMTP settings tab

On the **Email parameters** page, note the following settings on the **SMTP settings** tab.

FIELD	DESCRIPTION
Outgoing mail server	The host name of the desired SMTP server. <ul style="list-style-type: none">For Microsoft 365 production (including *.onmicrosoft.com accounts) use smtp.office365.com. (You can find this setting at outlook.office.com at Settings > Mail > POP and IMAP.)For Outlook/Hotmail use smtp-mail.outlook.com.
SMTP port number	Typically, the port number should be set to 587 for secure transport.

FIELD	DESCRIPTION
User name and Password	Specify, as needed, to send the email via the appropriate mail account. All users need to provide the SMTP account Send As and Send On Behalf Of permissions to enable the ability to send Simple Mail Transfer Protocol (SMTP) mail. You can configure Send As permissions in the Microsoft 365 admin center (portal.office.com/Admin), at Users > Active users > User > Edit mailbox permissions > Send email from this mailbox . For more information, see Enable sending email from another user's mailbox in Microsoft 365 .
Specify if SSL is required	Determines whether secure transport is used. Typically, this is Yes , except for internal or troubleshooting scenarios.

[Administrator] Email distributor batch process

Email that is sent directly from the server, without user interaction, via SMTP is sent by the **Email distributor batch** process. That batch process must be started to process the email queue. To start the process, open the **Email distributor batch** pane (**System administration > Periodic tasks > Email processing > Batch**) and turn on **Batch processing**.

If the Exchange provider is used, then the user account associated with the batch process (usually admin) will be sender.

[Administrator] User email

The default **send from** address for each user is pulled from the **Email** field on the **Users** page (**System administration > Users > Users**). Administrators can override this **send from** default if needed using the **Sender email** field on the **Options** page.

[User] Email provider selection section on the Options page

The **Options** page can be opened via **Settings > User options**. The **Email provider selection** section is on the **Account** tab.

FIELD	DESCRIPTION
Email provider ID	Allows the user to select the email provider that should be used when sending an email. Selecting an option here is the equivalent of selecting Do not ask again in the How would you like to send email dialog box. Selecting the blank option Prompt for which email provider to use will cause the How would you like to send email dialog box to display when an email is going to be sent.

FIELD	DESCRIPTION
Sender email	<p>Allows the administrator to provide an email address override for the user in the From field of the email. By default, the email alias that is associated with the user account is used as the From field in new emails, but this user option email address will override that. When sending email via SMTP, the user needs to have appropriate Send As and Send On Behalf Of permissions configured in Exchange or on the SMTP server.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>[!NOTE] You can configure Send As and Send On Behalf Of permissions in the Microsoft 365 admin center (portal.office.com/Admin) at Users > Active users > User > Edit mailbox permissions > Send email from this mailbox. For more information, see Enable sending email from another user's mailbox in Microsoft 365.</p> </div>

[User] How would you like to send email dialog box (optional)

When an email is going to be sent, the user will see the **How would you like to send email** dialog box that will list the available options for sending email.

FIELD	DESCRIPTION
Use an email app, such as Outlook	Provides the user with a generated email (.eml) file.
Use Exchange email server	Uses the Exchange Online server associated with the tenant. On-premises Exchange servers are currently not supported for the Exchange mail provider.
Use the system email client	Opens the Send email composition dialog box and then sends the resulting email via SMTP.
Do not ask again	If this field is not selected, the next time an email is sent the most recently selected option will be used and the dialog box will not open.

[User] Send email dialog box (optional)

The **Send email** dialog box is opened to allow the user to edit the contents of the email that will be sent. Some of the following fields will be pre-populated in this window.

FIELD	DESCRIPTION
From	Populated from the Email field on the Options page.
To, Cc, Bcc, Subject, and Body	Populated with values specified by the process that initiated the sending of the email. These fields can be edited as needed by the user.
Attachments list	May be populated with attachments specified by the process that initiated the sending of the email. This list can be edited as needed by the user.

When the email is ready to be sent, the **Send** button will cause the email to be sent via SMTP.

Usage scenarios to verify if email is configured correctly

Send mail via a local mail client

Email workflows that are enabled via the SysEmail framework can generate email messages (.eml files) that contain attachments. You can then send these messages via Microsoft Outlook or another email client.

1. In Internet Explorer, navigate to **Accounts receivable > Customers > All customers**.
2. Select **US-008 Sparrow Retail**.
3. Click **Collect > Customer balances > Collections** to open the **Collections** page.
4. Click **Communicate > Email > Statements to contact**.
5. Click **OK** to accept the default values in the dialog box.
6. If you're prompted for the mail option to use, clear the **Do not ask again** check box (you can change this option from the **User options** page), select **Use an email app, such as Outlook**, and then click **OK**.
7. If you're using Internet Explorer on your computer, open the email (.eml) file that is generated. If you're using Internet Explorer on the VM, copy the file to your computer, and open it there.
8. Note the email address in the **To** field and the generated workbook attachment.

Send mail via SMTP

Email workflows that are enabled via the SysEmail framework can also be created in a simple email dialog box and then sent via Simple Mail Transfer Protocol (SMTP).

1. Go to the **Email parameters** page.
2. Click **SMTP settings**.
3. Set the **Outgoing mail server** to the desired SMTP server:
 - For **Microsoft 365 production** (including *.onmicrosoft.com accounts) use smtp.office365.com. (Find this setting via outlook.office.com, at **Settings > Mail > POP and IMAP**.)
 - For Outlook/Hotmail use smtp-mail.outlook.com.
4. Set the user name and password to an appropriate email account and password.
5. Leave **SSLRequired** turned on, and leave **SMTP port number** set to **587**.
6. Click **Save**.
7. In Internet Explorer, navigate to **Accounts receivable > Customers > All customers**.
8. Select **US-008 Sparrow Retail**.
9. Click **Collect > Customer balances > Collections** to open the **Collections** page.
10. Click **Communicate > Email > Statements to contact**.
11. Click **OK** to accept the default values in the dialog box.
12. If you're prompted for the mail option to use, select **Use the Microsoft Dynamics 365 for Finance and Operations email client**, and then click **OK**.
13. To receive the test message, change the **To address** to your email address.

Ensure that the account specified in the SMTP settings is able to **Send As** and **Send On Behalf Of** your email account. The easiest way to ensure this is to use your email account in the SMTP settings.
14. Enter a subject and body for the message.

15. Click **Send**. The message should be delivered in one to five minutes.

[Administrator] Workflow email notifications

Workflow email configuration is a collection of related settings that work in conjunction.

Workflow email notification setup

1. Verify email settings:
 - a. Go to **System administration > Setup > Email > Email parameters**.
 - b. Verify that SMTP is enabled.
 - c. Set the SMTP mail server settings.
2. Verify that the email batch process is running:
 - a. Go to **System administration > Periodic tasks > Email processing > Email distributor batch**.
 - b. Enable the **Batch processing** option.
 - c. Optionally, adjust the recurrence of the email process:
 - a. Select **No end date** to adjust all recurrences of the email batch process.
 - b. Adjust the count.
 - c. Adjust to run every minute if needed.
3. Verify workflow notification system email templates:
 - a. Go to **System administration > Setup > Email > System email templates** (for system-wide templates).
 - b. Verify that the **Sender email** field is set and valid.
4. Verify workflow notification organization email templates:
 - a. Go to **Organization administration > Setup > Organization email templates** (for organization-specific templates).
 - b. Verify that the **Sender email** field is set and valid.
5. Verify that the user can receive email notifications:
 - a. Go to **Settings > User options**.
 - b. Go to the **Account** tab.
 - a. Set the **Email provider ID** (for example, SMTP).
 - b. Optionally, set a **Sender email** override if the default **send from** address should not be used for the current user.
 - c. Navigate to the **Workflow** tab. Set the option to send notifications in email to **Yes**.
6. Verify that the workflow system will send email notifications:

For each workflow that should have a notification, open the workflow properties in the workflow editor.

 - a. Click **Basic settings**. Adjust the email template for the workflow notifications.
 - b. Click **Notifications**.
 - a. Enable the events for which a user should be notified.
 - b. Set the recipient of the workflow notification for each event notification that is enabled.
 - c. On a workflow approval element for which a user should be notified:

- a. Go to **Properties**.
- b. Enable the events for which a user should be notified.
- c. Set the recipient of the workflow notification for each event notification that is enabled.

Workflow email notification testing

The testing for email notifications is to simply trigger the notification and then check for it.

1. Submit a workflow that has been set up for email notifications.
2. Check the workflow history to make sure that a workflow work item was assigned to the expected user.
3. Check the status of the pending email notification in **System administration > Periodic tasks > Email processing > Batch email sending status**.

If the email fails to send, make sure that the SMTP mail account can be opened.

4. Check for the email notification in the appropriate inbox.

Troubleshoot email

There are a few standard steps that can help you troubleshoot the configuration of email settings.

1. Verify email settings:
 - a. Go to **System administration > Setup > Email > Email parameters**.
 - b. Verify that SMTP is enabled.
 - c. Verify the settings of the SMTP mail server.
 - d. Sign in to the SMTP account in a separate window to make sure that the account and password are correct.
 - e. Send a test email using **System administration > Setup > Email > Email parameters > Test email**.
2. Verify that the email batch process is running:
 - a. Go to **System administration > Periodic tasks > Email processing > Batch**.
 - b. Make sure that the **Batch processing** option is set to **Yes**.
 - c. Review the recurrence of the email process:
 - a. Select **No end date** to adjust all recurrences of the email batch process.
 - b. Adjust the count as you require.
3. To review the contents and status of batch emails, go to **System administration > Periodic tasks > Email processing > Batch email sending status**.
 - a. If you're using a release that is earlier than Platform update 28, personalize the form to add the email sender for easy review. To do this, right-click the grid header, select **Add columns**, select **Email**, and then click **Insert**. If the **Email** field isn't added into the grid, you can view the sender by selecting **Show message**, and then selecting the **Email** field.
 - b. Verify that emails are being sent from the correct account. If the account is incorrect, you need to adjust settings such as user options, system templates, or organization templates, as needed.
 - c. Verify that all email user accounts have been granted permission to **Send As** for the configured SMTP account (see step 4 for details).
4. In Platform update 32, an **Email history** page was added to allow administrators to review all sent emails, including any errors that might have prevented an email from being sent. The **Email history** page will show interactive as well as non-interactive/batch emails. For any emails that have an **Email status** of **Failed**, review the error message on the **Failure details** tab and determine if corrective

actions should be taken.

5. In the Microsoft 365 admin center, verify that all user mail accounts that will be used to send emails have **Send As** and **Send On Behalf Of** permissions for the configured SMTP account. For more information, see [Enable sending email from another user's mailbox in Microsoft 365](#).
6. Sign in to all user mailboxes to verify that they are valid and can be accessed using sign in.
7. Send a test email using **System administration > Setup > Email > Email parameters > Test email**.
8. If the SMTP settings were migrated from another environment, clear the password field and re-enter the password to ensure that the field encryption hasn't negatively affected the stored value.
9. If you continue to experience issues when email is sent via SMTP, enter the SMTP account information in a tool such as [SMTPer.net](#) to verify that the SMTP server and account are valid and working correctly.

Troubleshoot the Exchange mail provider

The **Email parameters** page allows an administrator to select Exchange as an interactive email provider and as the Batch email provider. The Exchange mail provider will use the current user's Exchange Online account to send emails. When used as the Batch email provider, the batch account will be used. No additional configuration is needed. If troubleshooting is needed, ensure that the current user's account can be signed into and that emails can be sent from that account to the intended recipients.

Exchange mail provider not supported for external users

Users that are external to the primary tenant will not have exchange accounts on that tenant, so the Exchange mail provider is not supported for external users.

Other notes

The system communicates with Exchange or an SMTP server like a typical email client, so standard behavior and limits apply. For example, standard [Exchange Online receiving and sending limits](#) apply.

Troubleshooting

Where do workflow email templates come from?

The email templates will be sourced from either system email templates or organization email templates depending on whether the workflow is a system-level (not company specific) or organization-level (company specific) workflow.

Additional resources

[Troubleshoot the Office integration](#)

[Office integration tutorial](#)

[Configure email functionality in Microsoft Dynamics AX \[AX 2012\]](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Date/time data and time zones

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about date and time fields, and time zones.

Date and time fields

There are three types of date and time fields that correspond to different data types in the database:

- **Combined date/time fields** – These fields are the preferred method of entering date and time data. The **utcdatetime** data type stores time and date data in a single field in Coordinated Universal Time (UTC). UTC is the primary time standard by which the world regulates clocks and time. It is, within about 1 second, mean solar time at 0° longitude; it does not observe daylight saving time. Time zones around the world are expressed using positive or negative offsets from UTC. For most purposes, UTC is considered interchangeable with Greenwich Mean Time (GMT). The current version of UTC is defined by International Telecommunications Union Recommendation (ITU-R TF.460-6).
- **Date fields** – These fields are used to enter dates only. The **date** data type stores a day, month, and year. However, these values are not stored in UTC and cannot be associated with a time zone.
- **Time fields** – These fields are used to display the number of seconds that have elapsed since midnight on the current date. The **timeofday** data type stores an integer value. Time values are not stored in UTC.

Time zones

To express UTC times in the local time, you must provide a time zone. The time zone controls the offset from UTC that is the equivalent of the local time. For example, the offset for Moscow is UTC+3. Your preferred time zone is first set according to the Windows locale of your computer, although it might have been changed by an administrator. Your preferred time zone is used only when displaying combined dates and times. To set the preferred time zone for a user, go to **Users** page. The page will show the list of users of the system. Select the user that you want to set the preferred time zone for, and click **User options**. On the **Language and region** tab, select the preferred time zone.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Procurement and sourcing overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

This article gives an overview of the functionality that's available in the Procurement and sourcing module.

Procurement and sourcing covers all the steps from identifying a need for product and services through procuring the product, receipt, invoicing, and processing of payment with vendors. Procurement processes can be configured toward specific business needs by defining purchasing policies and workflows.

Identifying a need for product and services

The need for products or services may arise from *requisitions*, for example, when an employee requires a product. *Product catalogs* can be set up to guide the selection of available products to select from, or requests can be made for products that are not yet made available in a catalog, allowing the purchasing department to consider how the product can be supplied.

Spending limits can be used to constrain requisition spending, and the *purchasing workflow* adds the option of requiring approval before ordering happens. It's also possible to specify budget fund allocation, if required.

The procurement department identifies suppliers for required products and services, and this can involve a *request for quotation* being sent out to multiple potential suppliers. It's possible to share the specifications of the product that's being requested and potential vendors can view these to see if they can deliver a product that conforms with them. Vendors return their bids which are then reviewed by the procurement department before they select the supplier that they want to procure from.

Purchase orders include an option to send out a *purchase inquiry* to the vendor as an alternative to a more comprehensive request for quotation process. The purchase inquiry can be used to help establish terms like prices, discounts, and delivery date for the order. If vendors are set up to use the **Vendor** portal, purchase inquiry functionality is disabled. Instead the order is shared on the **Vendor** portal, and when a *confirmation request* is sent the vendor can directly confirm the order.

Vendor catalogs can be used to collect information on the product assortment that vendors can supply. Vendors can publish their own catalog, so it's easier to keep the catalog up to date. It's possible to attach an *approved vendor list* to a product, and this can help guide vendor selection when new purchase orders are opened, and prevent the use of unintended vendors.

Procurement

Purchase orders can be created in a number of different ways including:

- As an outcome of master planning which has identified a demand that requires a purchase. This process generates planned purchase orders, and when these are released, purchase orders are generated.
- Through the processing of purchase requisitions that result in procurement.
- Through the processing of purchase agreements, where purchase orders are created as released orders from the agreements. This is commonly used when purchase agreements are used to represent blanket orders.
- Manually, when the purchase order that's created is not based on another document.

Purchase orders that are configured with *purchase approval workflows* require approval before they are recorded as approved, and this is required before the order can be processed further.

Purchase orders are *confirmed* to represent that an agreement has been established with the vendor. The purchase order will then gradually progress through different states until ultimately being invoiced or canceled.

When you create a purchase order, many of the fields are pre-populated with values that default from the information stored about the vendor in the **Vendors** page. This means that there are a limited number of fields that you need to fill in on the purchase order, although you can choose to override the default values.

Prices and discounts

Prices and discounts includes information about the prices, discounts, and rebate terms that they offer. Prices and discounts can be represented as *trade agreements*. Trade agreements represent vendor price lists with prices or discounts, and have a specific set of dates for which the agreement is valid. Prices and discounts can be negotiated and represented through *purchase agreements* with conditions like commitments to buy certain volumes or monetary amounts as a precondition for the negotiated terms. *Rebate agreements* can be created with vendors where the procurement of specific products or groups of products may trigger a rebate from the vendor depending on the purchase amount or volume.

Delivery options

There are different options for the delivery process associated with a purchase order. Ordered products can be split into *delivery* schedules, where parts of the ordered quantity can be planned for delivery on different dates. Delivery can also include *direct delivery* initiated from a sales order, which automates the generation of the packing slip on the sales order at the same time as the product receipt is recorded on the purchase order. Purchase orders can also be part an *intercompany order* chain, also referred to as intercompany purchase orders, where products are ordered from a matching intercompany sales order. In this situation, some steps are automated across the two related intercompany orders.

Supplementary items

Products can be set up to include *supplementary items*. This is to propose products that are related to the product that's being ordered. The additional products may be required, or may be optional. In some cases, supplementary items may be added as free products that accompany the purchase of other products.

Purchase order charges

Charges can be assigned to the purchase order. This can happen automatically through setup of automatic charges or by adding the charges manually. Charges can be assigned to the order at the header level, or at the order line level. Accounting of charges can be set up in different ways. For example, you can set up a charge to be accounted as a product cost. If you do this, the charges must be assigned at the order line level before the order can be confirmed. There is an option that can help allocate charges from the order header to the lines.

Product receipt and invoicing

Purchase orders that include physical products commonly require *arrival registration* to happen within a warehouse, and after this a *product receipt* is registered for the order. Purchase orders with products that fulfill requisitions may be configured so that the employee who has requested the products also needs to provide a *confirmation of receipt*.

Some purchase orders include products that are services or other non-physical products where receipt in a warehouse is not needed. Products can be created as services or *procurement categories* can be used directly on the purchase order for such orders. With these orders, accounting of product receipt is sometimes skipped and the order is invoiced directly, or alternatively product receipt registration is done on the purchase order without any prior arrival registration.

Receipt of products may result in automatic consumption for a specific purpose. This includes implied consumption with direct delivery, consumption towards a project, or accounting the product as a fixed asset.

When *vendor invoices* arrive from the vendor they may first be recorded in the *invoice register* independent of the purchase order, and then later approved as a record against the purchase order. Recording the vendor invoice with the purchase order includes matching of the product receipt toward the invoice.

Accounting distributions can be specified on the purchase order to describe how accounting should be done

within the ledger, and can also define how budget fund allocation is obtained when this is included in your configuration.

Invoiced purchase orders will record the liability into the vendor account within accounts payable, from where the *vendor payment* can be processed.

Vendor performance

Performance and review of purchasing is supported through *procurement and account payable reports*, which include spend analysis and vendor performance analysis.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Procurement and sourcing workflows

2/18/2021 • 2 minutes to read • [Edit Online](#)

Some organizations require that purchase requisitions and purchase orders are approved by a user other than the person who entered the transaction. To set up an approval process, you can create a workflow.

A workflow represents a business process. It defines how a document flows through the system and indicates who must complete a task or approve a document. There are several benefits of using the workflow system in your organization:

- **Consistent processes** — You can define the approval process for specific documents, such as purchase requisitions and expense reports. Using the workflow system helps to ensure that documents are processed and approved in a consistent and efficient manner.
- **Process visibility** — You can track the status, history, and performance metrics of a specific workflow instance. This helps you determine whether changes should be made to the workflow to improve efficiency.
- **Centralized work list** — Users can view a centralized work list to view the workflow tasks and approvals assigned to them across all workflows they participate in. This is available in the Work items page.

The types of workflows that you can create

The following workflow types are available for Procurement and sourcing.

TYPE	USE THIS TYPE TO
Purchase requisition review	Create review and approval workflows for purchase requisitions.
Purchase requisition line review	Create review and approval workflows for purchase requisition lines.
Purchase order workflow	Create review and approval workflows for purchase orders.
Purchase order line workflow	Create review and approve workflows for purchase order lines.
Vendor add application workflow	Create review and approval workflows for adding new vendors via vendor requests.

IMPORTANT

When you are adding a new workflow, you might also see the following obsolete workflows listed in the **Create workflow** dialog box. These are related to the *confirmation of receipt* functionality that was available in [Dynamics AX 2012](#), but which has now been deprecated. These workflows are currently unsupported.

- Delivery due date notification workflow
- Invoice received notification workflow
- Product receipt failed notification workflow
- Unconfirmed product receipt rejection notification workflow

Creating a workflow

To create a workflow, go to Procurement and sourcing > Setup > Procurement and sourcing workflows and create a new workflow by selecting the type of workflow you want to create.

In the workflow canvas you can drag workflow elements into the designer and link the elements into a flow. The workflow elements should be configured. For approval and task workflow elements you can configure which participant should take action.

Types of participants

You can assign an approval step to the following groups of participants.

USER GROUP	DESCRIPTION
Participant	Assign the approval step to members of a group or role.
Hierarchy	Assign the approval step to users in a specific organizational hierarchy.
Workflow user	Assign the approval step to users of this workflow.
Queue	Assign the approval step to a work item queue.
User	Assign the approval step to specific users.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot procurement and sourcing workflows

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with procurement and sourcing workflows.

Error when re-submitting a purchase order to the workflow after a change: "Changes to purchase order X are allowed only in a Draft state when change management is activated"

This issue occurs only if the purchase order was in a *Confirmed* state before you requested changes. If you request changes while the purchase order is in an *Approved* state, the workflow can be processed successfully.

Error description

The following error occurs in the workflow when a purchase order is resubmitted after a change:

```
Stopped (error): X++ Exception: Changes to purchase order PO0000569 are only allowed in state Draft when change management is activated at  
SysWorkflowParticipantProvider-resolve  
SysWorkflowParticipantProvider-resolveParticipants  
SysWorkflowServiceProvider-resolveParticipant  
SysWorkflowQueue-resume
```

Issue resolution

This issue can occur because of inconsistency in purchase order distributions.

To unblock this issue and reset the purchase order to a *Draft* state, go to **Procurement and sourcing > Periodic tasks > Clean up > Purchase order distribution reset**. For more information, see the following blog post: [Resolve PO distribution errors in Dynamics 365 Supply Chain Management](#).

The issue will be fixed through [this Microsoft Knowledge Base \(KB\) article](#).

One or more accounting distributions are either over-distributed or under-distributed.

This issue can occur because of inconsistency in purchase order distributions.

To unblock this issue and reset the purchase order to a *Draft* state, go to **Procurement and sourcing > Periodic tasks > Clean up > Purchase order distribution reset**. For more information, see the following blog post: [Resolve PO distribution errors in Dynamics 365 Supply Chain Management](#).

If a delivery remainder is canceled on a purchase order where change management is turned on, the purchase order goes to a *Confirmed* state.

Issue description

For a purchase order that is subject to change management, if the only change that is requested is the cancellation of a delivery remainder on one or more of the lines, the purchase order will go directly to a *Confirmed* state when it's approved, and no journal will be created.

Issue resolution

Cancellation of a delivery remainder doesn't affect the contents of the confirmation journal. This functionality should be used when the line has been partially received, and the remainder quality should be canceled in the process step after the purchase order has been confirmed with the vendor.

If this should be reflected on the purchase order confirmation, the quantity should be adjusted on the purchase order line so that the confirmation will be required. Alternatively, if nothing has been received on the line, the quantity can be removed. In this case, reconfirmation will be required.

Canceled purchase orders appear in the draft list in the Purchase order preparation workspace.

Issue description

After you cancel purchase orders that were in a *Confirmed* state, the canceled purchase orders still appear in the list of draft purchase orders in the **Purchase order preparation** workspace.

Issue resolution

This issue occurs only for purchase orders that are subject to change management. It occurs because the cancellation is considered a change that must be approved. The approval can be done automatically by the system. Therefore, the process is to submit the canceled purchase order to the approval workflow so that it can go to an *Approved* state. At that point, the purchase order will no longer appear in the list of draft purchase orders in the **Purchase order preparation** workspace.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Procurement catalogs overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article describes, at a high level, how purchasing professionals can set up and maintain procurement catalogs. Procurement catalogs define the items and services that company employees can order for internal use.

Purchasing professionals can create and maintain catalogs of the items and services that can be purchased for internal use in an organization. After catalogs are set up, company employees can create purchase requisitions to order from them. The catalogs can be used to enforce purchasing policies, so that employees can order only the items and services that are allowed for their buying legal entity. When you create a procurement catalog, you should consider the following tasks:

- Configure your procurement category hierarchy before you create the catalog.
- Determine which products you want your employees to be able to order. You can show or hide specific products in a catalog node, or you can show or hide all the products in a node.
- Determine how many procurement catalogs you require. Access to a procurement catalog is determined by the catalog policy rule that you configure for the legal entity and operating unit that an employee is assigned to.

Several factors determine the products that employees can order and the procurement categories that they can use when they create purchase requisitions:

- The category access policy rule in the purchasing policy determines which procurement categories are available in the purchase requisition. If no rule is defined, all procurement categories are available.
- Employees can order a product only if it's in the active procurement catalog for your organization, and if it's in an enabled node and not hidden. The product must also be in a category that a particular employee has access to according to the category access policy rule.
- The catalog policy rule specifies the catalog that is used. If no catalog policy rule is defined, the category access rule alone determines the products that an employee can order on the requisition.

Prerequisites

The following table describes the tasks that must be completed before a purchasing professional can create a procurement catalog.

TASK	ROLE	DESCRIPTION
------	------	-------------

TASK	ROLE	DESCRIPTION
Set up a procurement category hierarchy.	Purchasing manager	Procurement category hierarchies classify items or transactions for reporting and analysis. By using a procurement category hierarchy, companies can strategically manage categories, products, vendors, and other procurement factors from a central location. One procurement category hierarchy is defined for a whole organization. The catalog is based on the procurement category hierarchy: the categories in the hierarchy become nodes in the catalog. The vendors and products are included in your catalog.
Add vendors and products to procurement categories.	Purchasing manager	When the procurement category hierarchy is created for your organization, each procurement category can be associated with specific vendors, products, and so on. These associations are copied automatically to the catalog.

Setting up a catalog

After the prerequisites have been met, you can set up catalogs. You can create either one catalog that your whole organization uses or multiple catalogs that the various divisions in your organization use. If you create one catalog for the whole organization, access to the catalog is controlled by your purchasing policy rules.

The catalog defines which products are available when purchase requisitions are created, but you can use category access policies rules to apply additional restrictions. Because the nodes in a catalog are procurement categories, they can be suppressed by a category access policy rule. In this case, the products in that category are not available for employees to use on requisitions. You define category access policy rules on the **Purchasing policies** page. The following table describes the tasks that must be completed to set up a catalog.

TASK	ROLE	DESCRIPTION
Create a new catalog.	Purchasing agent	When you create a catalog, you specify a name and description for the catalog. You also define whether the catalog is updated manually or automatically, and specify the catalog owner.
Control whether products are available in the catalog.	Purchasing agent	Because the products are inherited from the procurement categories, they all appear in the appropriate catalog nodes. You can control whether all products in a node are hidden or shown when the catalog is used in a purchase requisition. You can also control whether individual products in a node are hidden or shown.

TASK	ROLE	DESCRIPTION
Publish the catalog.	Purchasing agent	Before a catalog is available for employees to use in a requisition, you must define a catalog policy rule for the catalog, set the catalog's status to Active , and publish the catalog. You can inactivate catalogs that you no longer want to be available to your users.

Updates are published either automatically or manually, depending on the option that you select for the catalog in the **Default update type** field on the **Catalogs** page. The following default update types are available for catalogs:

- **Dynamic** – The catalog is automatically updated whenever it's changed.
- **Static** – The catalogs must be manually updated.
- **Both** – If the catalog includes product categories that have a default update type of **Static**, it must be manually updated when these categories are updated. If the catalog includes product categories that have a default update type of **Dynamic**, it is automatically updated whenever it's changed.

Create a procurement catalog

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create a procurement catalog. This task would typically be carried out by a procurement professional. You will also learn how employees can use the catalog when they create a requisition. Before you can create a catalog, there must be a procurement category hierarchy in your system. The hierarchy is inherited by the new catalog, along with all the products that are in the hierarchy. You can use this guide in demo data company USMF where the procurement category hierarchy is available, as well as the examples used in the procedure steps.

Ensure that a procurement category hierarchy exists

1. Go to **navigation pane > Modules > Procurement and sourcing > Procurement categories**. A procurement category hierarchy is available in the USMF demo data company and products have been added to the **Office machines/Computers** category. If you're running this procedure as a task guide, you'll need to unlock the guide if you want to browse through the category. If a hierarchy was not available, you'd create it by clicking **New**. This can only be done once.
2. Close the page.

Create a catalog

1. Go to **navigation pane > Modules > Procurement and sourcing > Catalogs > Procurement catalogs**.
2. Select **New procurement catalog** to open the drop dialog.
3. In the **Name** field, type a value.
4. Select **OK**.
5. In the tree, expand **CORP PROCUREMENT CATEGORIES**.
6. In the tree, expand **OFFICE MACHINES**.
7. In the tree, select **Computers**.
 - The products from the procurement category are displayed in the list. If you want to add a product to the category you need to do this on the **Procurement category hierarchy** page or on the **Item details** page.
 - The **Default** update type determines whether new products that have been added to the procurement category hierarchy are immediately visible in the catalog. If the update type is set to **Dynamic**, changes are visible immediately. If the update type is **Static**, new products are only visible to people using the catalog after the catalog has been re-published. The **Publish** action is available on the Action Pane at the top of the page. If products are removed from the procurement category hierarchy, the change is immediately visible, regardless of the value in the **Default** update type field.
8. On the Action Pane, select **Category navigation** and ensure that **Enable** is selected.
9. Select **Activate catalog**.
10. Close the page.

Make the catalog visible

1. Go to **navigation pane > Modules > Procurement and sourcing > Setup > Policies > Purchasing policies**.
2. Select **Procurement Policy USMF**. You need to select the purchasing policy for the legal entity that the

worker connected to your user profile is allowed to order products in. In the USMF demo data, the Admin user is connected to the worker called **Julia Funderburk**, and she orders products in USMF by default.

3. Select the catalog that you've just created.
4. Select **OK**.

Use the catalog

1. Go to navigation pane > **Modules > Procurement and sourcing > Purchase requisitions > All purchase requisitions**.
2. Select **New**.
3. In the **Name** field, type a value.
4. Select **OK**.
5. Select **Add products**.
6. In the list, find and select the desired record. You can use the category hierarchy on the left or the filter at the top of the list to filter the products.
7. Select **Add to lines**.
8. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a procurement category hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create new nodes in a procurement category hierarchy and how to configure a procurement category to be used in a procurement process. These tasks would typically be carried out by a Purchasing manager. Before you can start this procedure, there must be a category hierarchy of type Procurement. If you're using a demo data company, you can run this procedure in the USMF company.

Add a new procurement category

1. Go to **Navigation pane > Modules > Procurement and sourcing > Consignment > Procurement categories**.
2. On the Action Pane, select **Edit category hierarchy**. The current procurement category hierarchy is displayed in the left side of the page. You are about to modify the hierarchy.
3. On the Action Pane, select **New category node**. The system selects the top node by default. If you are running this procedure as a task guide, you can click the Unlock button and select another parent node to insert your new node into. Once that is done, lock the task guide again and then click New category node.
4. In the **Name** field, type a value.
5. In the **Description** field, type a value.
6. In the **Friendly name** field, type a value. The friendly name is optional. It will be displayed in category lookups together with the category name.
7. Select **Save**.

Add products to your new procurement category

1. Go to **Procurement and sourcing > Consignment > Procurement categories**. Select the node you just added. If you're running this procedure as a task guide you might need to unlock the task guide to select the node.
2. Toggle the expansion of the **Products** section.
3. Select **Add** to associate products with the procurement category.
4. Select the products you want to add to the procurement category.
5. Select the arrow to add the products to the **Selected** table.
6. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Purchase requisition overview

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic describes the purchase requisition workflow and the different statuses that a purchase requisition can have.

Depending on the setup of your organization, you can create purchase requisitions for products that your organization uses. A purchase requisition is an internal document that authorizes the Purchasing department to buy items or services.

After a purchase requisition is approved, it can be used to generate a purchase order. Purchase orders are the external documents that the Purchasing department submits to vendors.

Creating purchase requisitions

You can create a purchase requisition on the **My purchase requisitions** page, and select the items and services that you require. You can select items from a procurement catalog that your organization has created, or you can request items that aren't found in a catalog by selecting a procurement category and entering the product details.

Before you can submit a purchase requisition for review, workflows must be configured. You use a workflow to move a purchase requisition through the review process, from an initial status of **Draft** to a final status of **Approved**.

Purchase requisition statuses

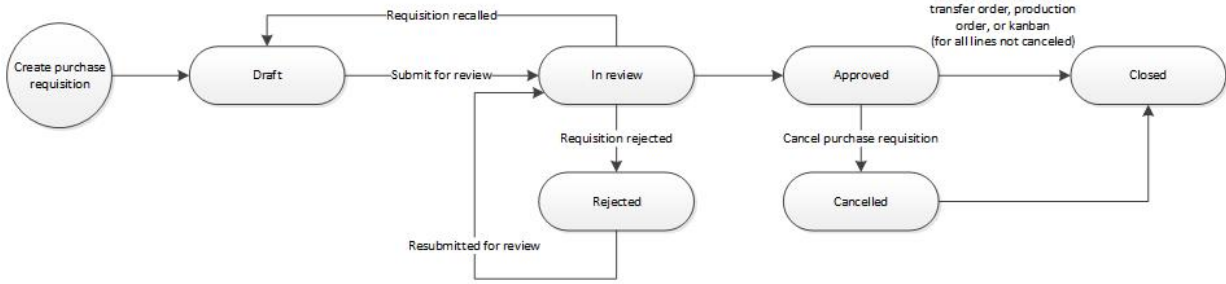

When you create a purchase requisition, a status is assigned to it. A status is also assigned to every line that you add to a purchase requisition. When you submit a purchase requisition to a workflow for review, the status of the purchase requisition and the status of each line are updated as the lines move through the workflow process.

You can configure the purchase requisition workflow process to route a purchase requisition through the review process as a single document. Alternatively, the lines on a purchase requisition can be routed individually to the appropriate reviewers. If the purchase requisition lines are reviewed individually, the status of each purchase requisition line can be updated as the line moves through the review process. When all lines have completed the review process and no review steps remain for the purchase requisition, the status of the whole purchase requisition is updated.

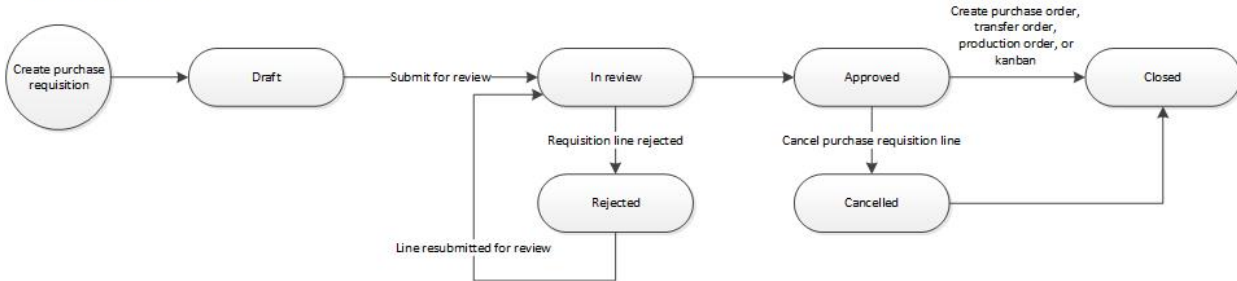

Purchase requisition workflow

The following diagram shows the statuses that are assigned to a purchase requisition and a purchase requisition line as they move through the workflow process.

Purchase requisition header statuses

Purchase requisition line statuses

Purchase requisition header and line status relationships

The overall status of a purchase requisition is determined by the status of the purchase requisition lines. Therefore, the review process must be completed for all purchase requisition lines before the review process for the whole purchase requisition can be completed. The following table describes the statuses that are assigned to a purchase requisition header and lines as the purchase requisition moves through the workflow process.

PURCHASE REQUISITION STATUS	PURCHASE REQUISITION LINE STATUS	DESCRIPTION
Draft	Draft	The purchase requisition and purchase requisition line have been created, but they haven't been submitted for review. Purchase requisitions and purchase requisition lines that have a status of Draft can be modified. A purchase requisition or purchase requisition line also has a status of Draft if it has been recalled but hasn't been resubmitted for review. Note: You can submit or recall a purchase requisition at the document level. However, you can't submit or recall a single purchase requisition line.

PURCHASE REQUISITION STATUS	PURCHASE REQUISITION LINE STATUS	DESCRIPTION
In review	<ul style="list-style-type: none"> • In review • Rejected 	<p>If the workflow has been configured to route purchase requisition lines to individual reviewers, each line can have a status of In review or Rejected. The purchase requisition status is updated when the review process is completed for all purchase requisition lines and no review steps remain for the purchase requisition.</p> <ul style="list-style-type: none"> • In review – The purchase requisition lines have been submitted for review. When the workflow process is completed for a purchase requisition line, the status of that line remains In review until all remaining purchase requisition lines have been reviewed. • Rejected – A purchase requisition line has been rejected. Purchase requisition lines that are rejected can be modified and resubmitted. <p>If you resubmit a purchase requisition line that has been rejected, the review process starts over for all lines in the purchase requisition that are still in review.</p> <p>Note: You can recall a purchase requisition that has already been submitted. When you recall a purchase requisition, all other purchase requisition lines are also recalled. Purchase requisition lines that have been recalled can be deleted.</p>
Rejected	Rejected	The purchase requisition and all purchase requisition lines have been rejected. Purchase requisitions and purchase requisition lines that have been rejected can be resubmitted.

PURCHASE REQUISITION STATUS	PURCHASE REQUISITION LINE STATUS	DESCRIPTION
Approved	<ul style="list-style-type: none"> • Approved • Cancelled • Closed 	<p>All purchase requisition lines have completed the review process, and there are no more review steps for the purchase requisition.</p> <ul style="list-style-type: none"> • Approved – The review process for a purchase requisition line has been completed, and the line is approved. • Cancelled – The purchase requisition line was approved, but it has been canceled because it's no longer required. Only purchase requisition lines that have been approved can be canceled. • Closed – The purchase requisition line was approved, and documents have been generated, depending on the requisition purpose. <ul style="list-style-type: none"> ◦ If the requisition purpose is consumption, a purchase order has been generated for the purchase requisition line. ◦ If the requisition purpose is replenishment, one or more fulfillment documents have been generated.
Cancelled	Cancelled	<p>The purchase requisition and all purchase requisition lines have been canceled.</p> <p>Note: If you no longer require an item that is on a purchase requisition line, you must cancel the purchase requisition line if it has already been approved. Only purchase requisition lines that have been approved can be canceled. If any purchase requisition lines are in review, the purchase requisition will have a status of In review. In this case, you can recall the purchase requisition and delete the appropriate purchase requisition line.</p>

PURCHASE REQUISITION STATUS	PURCHASE REQUISITION LINE STATUS	DESCRIPTION
Closed	<ul style="list-style-type: none"> • Closed • Cancelled 	<p>The purchase requisition is closed, and one or more fulfillment documents have been generated.</p> <ul style="list-style-type: none"> • Closed – The purchase requisition line was approved, and documents have been generated, depending on the requisition purpose. <ul style="list-style-type: none"> ◦ If the requisition purpose is consumption, a purchase order has been generated for the purchase requisition line. ◦ If the requisition purpose is replenishment, one or more fulfillment documents have been generated. • Cancelled – The purchase requisition line was approved, but it has been canceled because it's no longer required. Only purchase requisition lines that have been approved can be canceled. <p>Note: If you no longer require an item on a purchase requisition line that has been closed, you must cancel the line on the fulfillment document that was generated for the purchase requisition line.</p>

Distributing costs to multiple financial accounts

You can distribute the cost of a product that is included in a purchase requisition to multiple financial accounts. If your organization uses dimensions, such as cost centers and departments, you can distribute the cost of a product to dimensions for financial accounts.

Requisition purposes

Requisition purposes make the process of fulfilling requisition demand more flexible. When you create a requisition, you can assign one of two purposes to it: consumption or replenishment. Depending on the requisition purpose and the setup of your organization, requisition demand can be fulfilled by a purchase order, transfer order, production order, or kanban.

In the procurement policies, you can control the requisition purposes that are available when a requisition is created for your organization.

Requisitions that have a purpose of consumption

A requisition that has a purpose of consumption represents demand for items or services that will be used internally by your organization. The demand that is created by this kind of requisition is always fulfilled by a purchase order. If Supply Chain Management is set up to automatically generate purchase orders, purchase orders are created after the purchase requisition is approved.

Requisitions that have a purpose of replenishment

A requisition that has a purpose of replenishment represents demand to replenish inventory. For example, you create a requisition to replenish items so that they can be sold at a specific retail location at a specific time. The demand that is created by this kind of requisition can be fulfilled by a purchase order, transfer order, production order, or kanban.

When the requisition purpose is replenishment, demand is expressed as a quantity instead of a monetary amount. Therefore, encumbrance accounting, budgetary control, business rules for fixed asset determination (BRAD), project accounting, and any related rules don't apply. Only products that are stocked and released to the specified legal entity can fulfill replenishment requisition demand. To define the products that are available when the requisition purpose is replenishment, use the **Replenishment category access policy rule** page.

To use purchase requisitions that have a purpose of replenishment, you must set up master scheduling to include requisition demand. The fulfillment method for the demand that is created by this kind of requisition is then determined automatically, based on the supply policies that have been set up for the items in your organization and planned by using master scheduling.

Purchase requisitions and requests for quotation

In some cases, you must start a request for quotation (RFQ) process to identify the vendor and price for products that are requested in a purchase requisition. An RFQ can be generated when the purchase requisition is in review. When you accept a bid, information about the vendor, price, and so on, is transferred to the requisition.

You can put a purchase requisition on hold by selecting the **On hold** check box on the **Purchase requisition details** page. Processing of the purchase requisition can continue only after you remove the hold by clearing the check box.

NOTE

In e-procurement, the RFQ for your purchase requisition might allow vendors to add alternate lines. In this case, your purchase requisition will reflect approved alternates.

Demand consolidation

By consolidating purchase requisition lines from multiple purchase requisitions, you can increase your negotiating power with your vendors to achieve better pricing, lower shipping and handling costs, and reduced overhead costs.

Purchase requisition lines are eligible for demand consolidation only if the following statements are true:

- The purchase requisition has been approved.
- The purchase requisition meets the purchasing policy rule criteria for manual processing and demand consolidation.

Approved purchase requisition lines that meet the criteria for manual processing are listed on the **Release approved purchase requisitions** page. If a purchase requisition line also meets the criteria for demand consolidation, the line can be added to a consolidation opportunity.

A consolidation opportunity is a set of purchase requisition lines that are grouped together, so that the purchasing professional can negotiate the best deal with vendors. Purchase requisition lines that you select for a consolidation opportunity appear on the **Purchase requisition consolidation** page. You can modify the lines on this page, if changes are required. You can also add new lines to the consolidation opportunity or remove existing lines.

After you add requisition lines to a consolidation opportunity and make any changes that you require, you can create a purchase order for the consolidated purchase requisition lines.

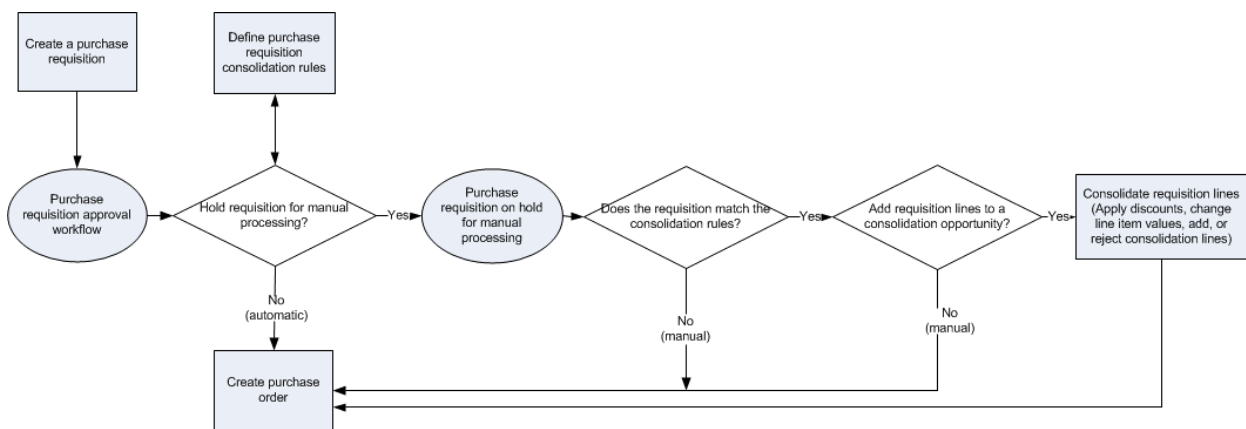

NOTE

Changes that you make to a purchase requisition line on the **Purchase requisition consolidation** page are reflected on the purchase order that you create. However, the line remains unchanged in the purchase requisition, so that its history is preserved.

To create a purchase order for purchase requisition lines that aren't eligible for demand consolidation or aren't selected for a consolidation opportunity, you must process the lines manually.

Consolidating purchase requisition lines

The process for demand consolidation starts when a purchase requisition is approved in a workflow and, if budget control is configured for your organization, when the budget reservations and pre-encumbrances have been recorded. The following diagram shows the process flow for demand consolidation.

To consolidate approved purchase requisition lines, follow these steps:

1. Review approved requisition lines that have been held for manual processing, and that are eligible for demand consolidation.
2. Select lines to add to a consolidation opportunity.
3. Create a new consolidation opportunity, or add requisition lines to an existing consolidation opportunity.
4. Make any required changes to the requisition lines, and remove requisition line items that you no longer want to include in the consolidation opportunity.
5. Create purchase orders for consolidated requisition lines or for purchase requisition lines in a consolidation opportunity.

Purchase requisition workflow

2/18/2021 • 8 minutes to read • [Edit Online](#)

The workflow process moves purchase requisitions through the review process, from an initial status of Draft to a final status of Approved. When a purchase requisition is submitted for review, the workflow process is started. After a purchase requisition is approved, a purchase order can be generated for the purchase requisition lines and submitted to the vendor for order fulfillment.

Before a purchase requisition can be submitted for review, you must configure a workflow. The workflow process can include one or more review steps, in any order. The workflow process can also be configured to skip the review tasks and automatically approve the purchase requisition. You can configure the workflow to route the purchase requisition as a single document, or you can route individual purchase requisition lines to the appropriate reviewers. You can also create a scenario where the purchase requisition is routed as a single document to some reviewers and selected purchase requisition lines are routed to other reviewers.

If purchase requisition lines are reviewed individually, the review process must be completed for all purchase requisition lines before the workflow process can move to the next step, and before the review process for the purchase requisition as a whole can be completed. When the review process has been completed for the purchase requisition and all its lines, the overall status of the purchase requisition is updated to **Approved**.

You can configure your workflow to represent the business process for purchase requisitions in your organization. When you configure your purchase requisition workflow process, consider the following questions:

- What expenditures must be reviewed?
- What expenditures can be automatically approved?
- Who is required to review and approve expenditure requests? What role are these users assigned to?
- What process must be followed if a reviewer is not available?

The following examples illustrate two ways that you can configure a workflow for purchase requisitions.

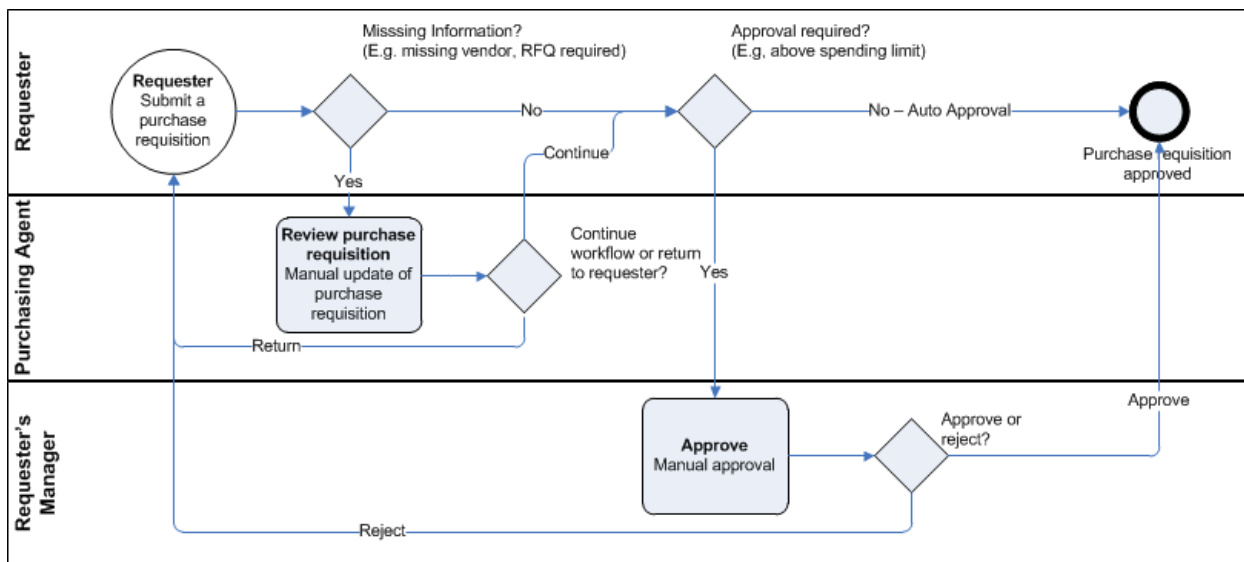

Example 1: Route a purchase requisition as a single document for review

The following illustration shows how a purchase requisition can flow through the workflow review process as a single document. The lines on the purchase requisition aren't routed individually. The following roles are included in the workflow process for this example:

- **Requester** – The user who requests the items or services. The requester can prepare the purchase requisition, or another worker can prepare the purchase requisition on the requester's behalf. This worker is the preparer. The preparer is responsible for managing the purchase requisition throughout the review process. Only the preparer of the purchase requisition can modify it.

Note: A worker must be granted the appropriate permissions to create a purchase requisition on behalf of someone else. Use the **Purchase requisition permission** page to set up these permissions.

- **Purchasing agent** – The user who performs a procurement review and can approve the document.
- **The requester's manager** – The user who performs a managerial review and can approve the document.

In this example, the workflow process for the purchase requisition includes the following steps:

1. The preparer submits a purchase requisition for review.
2. The purchasing agent receives a notification. The notification requests that the purchasing agent verify the information in the purchase requisition. If required information is missing, the purchasing agent can either add it or return the purchase requisition to the preparer to add it. When all the required information has been filled in, the purchase requisition can move to the next step in the review process.
3. The requester's manager reviews the purchase requisition. The purchase requisition might be routed to the requester's manager if, for example, the amount of the purchase requisition exceeds the requester's spending limit for purchase requisitions. The requester's manager can approve or reject the purchase requisition, or return it to the preparer for changes.

Example 2: Route the individual purchase requisition lines for review

The following illustration shows how the individual purchase requisition lines can be routed through a workflow. In general, the process for each line is the same as the process for a purchase requisition that is reviewed as a single document. However, each line must complete the workflow process individually before the workflow can be completed for the whole purchase requisition.

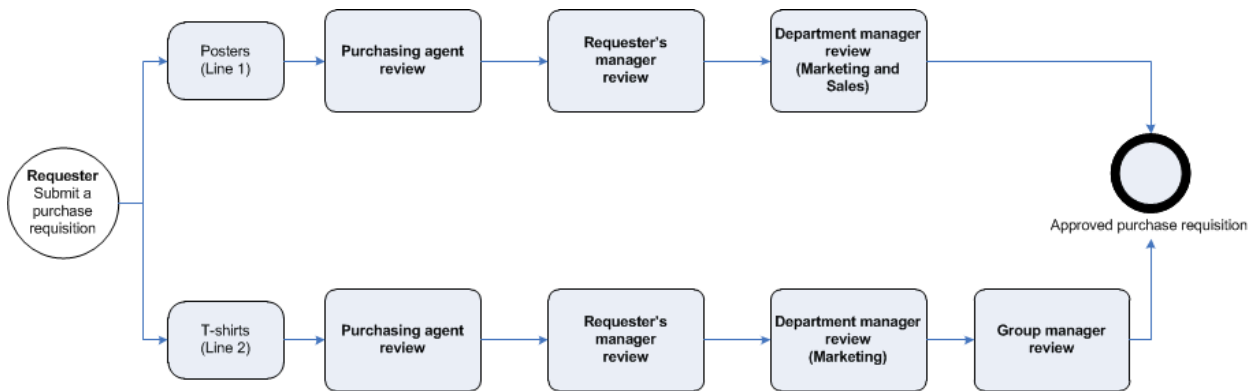

In this example, a worker enters a request for posters and T-shirts for a marketing campaign. The cost of the posters is split between the Marketing department and the Sales department. If the cost of the posters or T-shirts exceeds the signing limit authority for department managers, the purchase requisition must also be reviewed by the group manager.

The following roles are included in the workflow process for this example:

- **Requester** – The user who requests the items or services. The requester can prepare the purchase requisition, or another worker can prepare the purchase requisition on the requester's behalf. This worker is the preparer. The preparer is responsible for managing the purchase requisition throughout the review process. Only the preparer of the purchase requisition can modify it.

Note: A worker must be granted the appropriate permissions to create a purchase requisition on behalf of someone else. Use the **Purchase requisition permission** page to set up these permissions.

- **Purchasing agent** – The user who performs a procurement review and can approve the document.
- **The requester's manager** – The user who performs a managerial review and can approve the document.
- **Department manager** – The user who performs an expenditure review and can approve the document.
- **Group manager** – The user who performs a signature authority review and can approve the document.

In this example, the workflow process for the purchase requisition lines includes the following steps:

1. The preparer submits a purchase requisition for review. Each line is routed to the reviewer who is configured to receive it in the workflow process.
2. The purchasing agent receives a notification. The notification requests that the purchasing agent verify the information in the purchase requisition and on the purchase requisition lines. When the purchase requisition is opened by the purchasing agent all the lines are visible, but a visual indicator shows which lines have been sent to the purchasing agent for review. If required information is missing, the purchasing agent can either add it or return a purchase requisition line to the preparer to add it. When all the required information has been filled in, the purchase requisition line can move to the next step in the review process. Purchase requisition lines can continue through the review process independently of each other.
3. The requester's line manager reviews and approves the purchase requisition lines. The approval might be routed to the requester's manager if, for example, the amount on a purchase requisition line exceeds the requester's spending limit for purchase requisition lines. The manager can approve or reject one or both of the purchase requisition lines.
4. The department manager for the Marketing department reviews the purchase requisition lines for both the posters and the T-shirts. The Sales department manager reviews the purchase requisition line only for the posters, because that is the only cost that is being charged to the Sales department.
5. The group manager reviews and approves the purchase requisition line for the T-shirts only if group manager approval is required because, for example, the amount on the purchase requisition line exceeds the department manager's approval limit. The group manager does not have to approve the purchase requisition line for the posters.

NOTE

The system currency must be set if the header workflow for a purchase requisition requires approvals related to signing limits.

Configuring a workflow for purchase requisitions

To route a purchase requisition for review, you must configure the purchase requisition workflow processes. The workflow process that you define controls the interaction between the user who requested the items (the requester) and the reviewer and approver in the workflow. The routing of the purchase requisition depends on the conditions that are specified in the workflow configuration. For example, these conditions determine when the purchase requisition should be routed, the user or role that it should be routed to, and the actions that users can take.

The examples in this topic show how a purchase requisition can be routed through a workflow as a single document or as individual purchase requisition lines. You can also configure a workflow for purchase requisitions that reflects the internal control review of purchase requisitions that is defined for your organization.

The participants or the reviewers that a task is assigned to in a workflow can be members of a particular user

group, users who have a particular security role, users who are associated with the submitter in a managerial hierarchy, or named users or users who have specific expenditure responsibilities.

Purchase requisition expenditure reviewers

Expenditure reviewer configurations let you dynamically route expenditures for review, based on the user who is assigned to a project role or a financial dimension where the expenditure is being charged. The workflow process uses the specified project role or financial dimension owner to determine who the expenditure should be routed to.

You can define one or more expenditure reviewer configurations and then select a configuration when you create a workflow. You can configure the expenditure reviewer values for every legal entity in your organization. After you define the expenditure reviewer configurations, you assign a configuration to your workflow task.

You don't have to define expenditure reviewer configurations. Instead, you can assign specific users or user groups as reviewers when you define your workflow. However, if you have a complex organization, expenditure reviewers can increase the efficiency of your approval process. In addition, if you set up expenditure reviewers, you don't have to update workflow reviewer assignments every time that a reviewer changes job roles.

You can set up the expenditure reviewers on the **Purchase requisition expenditure reviewers** page. Create an expenditure reviewer configuration, and enter values for each legal entity in your organization. For requisitions that are assigned to a project, you can specify the role that is responsible for reviewing the requisitions: Project manager, Project controller, or Project sales manager. Expenditures will be routed to the user who is assigned to the specified role. You can also route the expenditure to the financial dimension owner by selecting the appropriate financial dimension option on the **Organization distributions** tab.

To use one of the expenditure reviewers that you set up in a workflow, you must set the **Type of participant** option to **Expenditure participants** in the **Assignment** properties for the relevant workflow element.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Requests for quotation (RFQs) overview

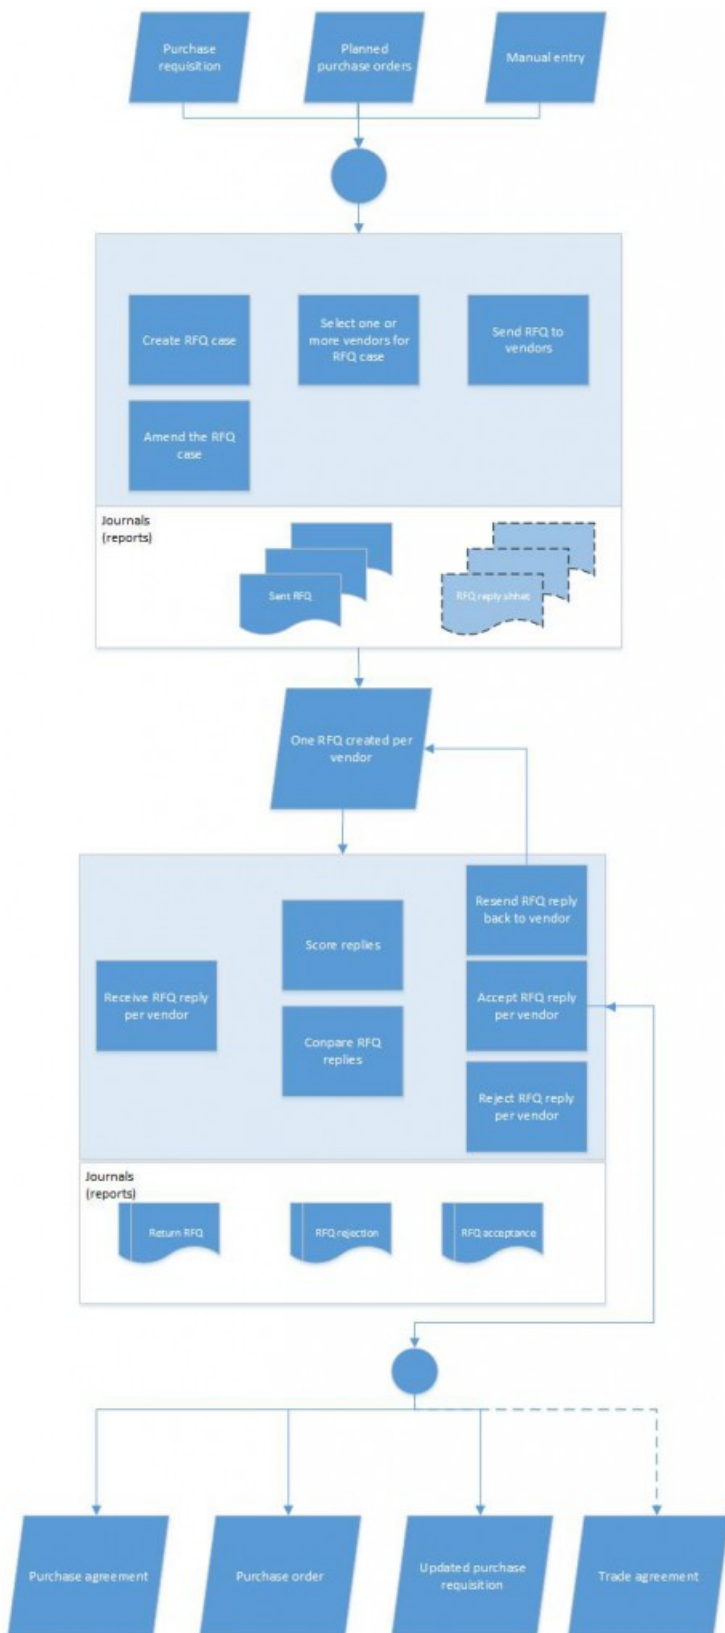

2/18/2021 • 18 minutes to read • [Edit Online](#)

This topic provides an overview of requests for quotation (RFQs). Organizations issue RFQs when they want to receive competitive offers from several vendors for the items or services that they must purchase. In an RFQ, you ask vendors to provide the prices and delivery times for the item quantities that you specify. You can also ask vendors to specify whether there are any incidental charges, such as shipping costs, or any discounts for large orders or early payment of the vendor invoice.

The RFQ process consists of the following tasks:

1. Create and send an RFQ to one or more vendors.
2. Receive and register bids (RFQ replies).
3. Transfer bids that you accept to a purchase order, purchase agreement, or purchase requisition.

The following illustration shows an overview of the RFQ process.

You can create an RFQ case from planned orders, from a purchase requisition, or by manual entry. The RFQ case is the base document that you use to issue an RFQ to each vendor.

After you prepare the RFQ case and add vendors, select **Send** (**Send and publish** for public sector) on the RFQ case. An RFQ journal is generated for each vendor that you sent the RFQ to. You can configure the Printing options for the Send action so that it either prints a report for each vendor to an archive or sends a report to each vendor's email address. In addition, you can use the RFQ journal for each vendor to generate a report that you can send or resend to the vendor later. You can also configure the Send action so that it generates a reply sheet that the vendor can fill in.

This topic covers the process for handling RFQs when vendor collaboration isn't used. If your system is set up

for vendor collaboration, vendors can enter bids directly in Supply Chain Management. For more information, see [Vendor collaboration with customers](#) and [Vendor collaboration with external vendors](#).

If you must amend an RFQ after you send it, you can resend the RFQ to vendors when you've finished by using the two amendment actions: Create and Finalize.

When you receive bids by email, you can handle these bids from the **Request for quotations** page.

If a second iteration of a reply from a vendor is required, select **Return** on the **Request for quotation** page. The Return action generates a new journal and a report that will be printed, archived, and sent according to your Printing settings.

If you added scoring criteria to your RFQ case, the RFQ will have a scoring panel where you can enter the scores. The total scores will appear on the RFQ and when you compare the replies on the **Compare replies** page. On the **Compare replies** page, you can also compare other reply data, such as the line price, delivery date, and total price.

After you choose a bid or a number of lines in a bid, you can accept all or some lines and reject the rest. Acceptance journals, rejection journals, and corresponding reports are generated, and will be printed, archived, and sent according to your Printing settings. When you accept a bid or specific lines in a bid, either a purchase agreement or a purchase order is generated, or a purchase requisition is updated, depending on the purchase type of the RFQ. You can create a trade agreement that you can use later for any of the replies, regardless of whether you accepted or rejected them.

An RFQ case has two statuses: lowest and highest, you can view the status on the list page for **All request for quotations**. The lowest status is the least advanced stage of any line in the RFQ case, and the highest status is the most advanced stage of any line in the RFQ case. For example, say that an RFQ case with three lines is sent to two vendors, so there are two RFQs each with three lines. All lines are **Sent**. Now a bid is entered from one of the vendors and the RFQ lines get the status **Received**. This means that out of the three lines on the RFQ case, all of them are **Sent** for one RFQ and **Received** for another RFQ. The lowest status will then be **Sent**, and the highest status is **Received**.

These statuses will be described in more detail later in this topic.

Setting up RFQ functionality

Before you can create an RFQ case, you must set up RFQ information on the **Procurement and sourcing parameters** page. When you create an RFQ case, you can specify default values that are copied to the RFQ. You can specify the following default values:

- The purchase type of new RFQs: **Purchase order** or **Purchase agreement**
- The expiration date and time offset from the day the RFQ case is created.
- Solicitation type, which may default a specific scoring method to the RFQ case.
- Delivery information and payment terms.

You can override these values for a specific RFQ case.

You should also configure the amendment process. As part of this configuration, you can turn on field locking. When field locking is turned on, a procurement professional who wants to amend an RFQ must first select **Create** in the **Amendment** section of the **Quotation** tab on the RFQ case. Then, after the RFQ case has been updated with the amendment, the procurement professional must complete the process by selecting **Finalize**. The Finalize action generates an email that notifies the vendors about the amended RFQ.

On the **Procurement and sourcing parameters** page, you select the template to use for the email notification that is sent to vendors. When a template is created in **Email templates**, it can contain the following replacement tokens:

- %RFQ case%
- %Reason for bid return%
- %Reason for amendment%
- %Amendment prepared by%
- %Company%
- %RFQ case name%
- %Expiry Date Time%
- %Date%

The %Reason for bid return% and %Reason for amendment% tokens are replaced by text that the procurement professional can enter when he or she completes the amendment in the **Amendment** wizard. The values for the %Amendment prepared by% and %Company% tokens are automatically taken from the RFQ. The %Date% token is replaced by the current date.

If you want to cancel an RFQ after it's been sent, you can do that from the RFQ case. For the cancellation, an email template is required to send the cancellation notification to the vendor's contact persons. The template must be selected on the **Procurement and sourcing parameters** page. When the template is created, it can contain the following replacements tokens:

- %Reason for cancellation%
- %RFQ case%
- %RFQ cancelled by%
- %Company%
- %RFQ case name%
- %Date%

The %Reason for cancellation% token is replaced by text that the procurement professional can enter in the **Cancellation** wizard. The %Date% token is replaced by the current date.

If you want to use reason codes on a bid to indicate why it was rejected or accepted, you must set up reason codes on the **Vendor reasons** page.

On the **Form setup** page in Procurement and sourcing, you can configure the appearance of your printed or stored RFQ documents.

NOTE

For a public-sector configuration, you must use the amendment process to change an RFQ that has already been sent. When an RFQ is sent, fields are locked. Therefore, to make changes to the RFQ, you must select **Create** to start the amendment process, as described earlier. The locking behavior is controlled by the **Lock RFQ when they are sent** option on the **Procurement and sourcing parameters** page. By default, this parameter is set to **Yes**, and for a public-sector configuration, the default setting can't be changed. Therefore, although the amendment process can be handled manually in a non-public-sector configuration, it must be used for a public-sector configuration.

When you create an RFQ case of the type Purchase order and add an inventory item to the RFQ, an inventory transaction is generated that has a receipt status of **Quotation receipt**. Only RFQ case lines that have this status are considered when you use a master plan to calculate supplies. If you want the master plan to include RFQ case lines as an expected receipt, you must configure this behavior in the setup of master planning.

A purchasing manager or agent can create and maintain solicitation types to suit the organization's procurement requirements. Each solicitation type can be associated with a scoring method. Scoring methods consist of a set of criteria that can be used when you score bids. You must set up solicitation types, scoring methods, and scoring criteria on the **Solicitation type** and **Scoring method** pages.

Choose default fields to include in vendor RFQ reply forms

You can specify specific types of information that you want to receive from vendors when they reply to (bid on) a request for quotation (RFQ). Fields that you mark as default are included on the online form provided for vendor collaboration. To make these settings:

1. If you haven't already done so, use the [Feature management](#) page to enable the *Select RFQ fields to include in vendor RFQ reply forms* feature.
2. Go to **Procurement and sourcing > Setup > Procurement and sourcing parameters**.
3. Open the **Request for quotation** tab.
4. Select the **Default requests for quotation** reply fields link under the **Set up default values for requests for quotations** heading.
5. The **Default request for quotation reply fields** dialog box opens.
6. The **RFQ fields included in vendor RFQ reply forms** section includes a slider for each field that is available for use in RFQ reply forms. Fields set to *Yes* in this section will be included (together with their values) in RFQ reply forms. Set the slider to *No* for each field where you want to prevent vendors from seeing data when reviewing bids. This allows you to enter estimated or expected values during RFQ entry for internal purposes without the vendor seeing what has been entered.

You can override these settings for individual RFQ cases as needed.

Creating and sending an RFQ

You create an RFQ case, select the vendors that you want to bid on the RFQ case, and then send RFQs to the vendors. You can use Printing settings to route the RFQ report and reply sheet reports to your preferred destination.

You can manually create an RFQ case of either the **Purchase order** purchase type or the **Purchase agreement** purchase type.

If the RFQ case is of the **Purchase order** type, the following behavior occurs that deviates from other types of RFQ cases:

- When RFQ case lines are created, inventory transactions are generated that have a receipt status of **Quotation receipt**.
- When you accept a bid, a purchase order is generated.

If the RFQ is of the **Purchase agreement** type, the following behavior occurs that deviates from other RFQ cases:

- The RFQ case is used for an agreement to purchase a specific quantity or value of product over time. You must select the date range that applies to the purchase agreement and the name of the person who manages the purchase agreement.
- When you accept a bid, a purchase agreement is generated.

If the RFQ case is generated from a purchase requisition, the **Purchase requisition** type is automatically assigned. You can't manually create an RFQ case of the **Purchase requisition** type.

You can create an RFQ case from a purchase requisition only if the status of the purchase requisition is **In review** and you're assigned to do the next workflow task. The lines in the purchase requisition are automatically updated as you accept lines from bids (RFQ replies) that you received from vendors. You can't complete, reject, approve, or perform any other actions on the purchase requisition until the requisition line is updated with an accepted RFQ line or the RFQ case is cancelled.

When you create an RFQ case, you can select a solicitation type. The solicitation type determines the set of scoring criteria that is used to score RFQ replies to the RFQ case.

You can add a questionnaire to an RFQ case. This questionnaire then appears on all RFQ replies after you send the RFQ. The completion of the questionnaire is a mandatory task before the bid can be submitted.

Although defaults are provided, you can change the **RFQ fields included in vendor RFQ reply forms** settings for each individual RFQ case as needed. To do so, create or open an RFQ case. Then, on the Action Pane, open the **Quotation** tab and, from the **Replies** section, select **Set RFQ reply defaults**. The **Default request for quotation reply fields** dialog box opens, which works the same as it does when setting the defaults for vendor RFQ reply forms, except your changes here will only affect the current RFQ case. For details about how to enable this functionality and how it works, see [Choose default fields to include in vendor RFQ reply forms](#).

There are three ways to select the vendors to add to an RFQ case:

- Add the vendors one by one.
- Search for all vendors that meet specific criteria.
- Automatically add all vendors that are approved for the procurement categories that are used on the RFQ case lines.

When the RFQ case is ready, select **Send**. The Send action generates journals and reports that will be printed, archived, and sent according to your printing settings.

If you set **Use vendor for recalculating prices** and **Use vendor specific item information** to **Yes** on the **Sending request for quotation** page when you sent the RFQ to a vendor, some vendor-specific information is automatically entered in the RFQ for that vendor.

Amending an RFQ case

Occasionally, you must change an RFQ case after you send it. You might have to change an RFQ case if, for example, the delivery dates have changed, or you want additional products or different quantities of products. You can configure the amendment process so that it's either more restrictive or less restrictive.

If you configure the amendment process so that it's more restrictive, before you can modify the fields on an RFQ case that has already been sent, you must select **Create** on the RFQ case to start an amendment. After you've completed your changes, you must select **Finalize**. You're then guided through the process of adding information for the email that is sent to notify vendors about the amendment. The updated RFQ report, which includes an amendment note, is automatically attached to the email.

If you configure the amendment process so that it's less restrictive, you don't have to select **Create** before you can modify the fields on an RFQ case that has already been sent. However, you must manually add an amendment note on the RFQ and send the case again. Be aware that this approach can be used only if none of the replies (bids) have been edited. If you've entered a reply and it's in a **Received** state, the **Send** button is unavailable. In this case, you must select **Create** and then **Finalize**, as you must do in the more restrictive process. The reply is then reset to reflect the changes to the RFQ case.

If vendors use the vendor collaboration interface to enter bids, you must always use the amendment process to notify vendors about changes to the RFQ case. This process helps prevent the situation where vendors bid on an outdated RFQ case while their bid is in progress. For more information about vendor collaboration, see [Vendor collaboration with external vendors](#).

If you want to invite additional vendors to bid, and no changes have been made to the RFQ case, you can use the **Send** button. The vendors that you added will appear on the **Send** page and will receive the email invitation.

Receiving and registering RFQ replies

When you send an RFQ, a reply sheet is automatically generated. As you receive bids on an RFQ, you must enter them via the **Request for quotation** page by clicking the action **Edit RFQ reply**. This will allow you to enter the bid information in a dedicated bid form. Initially, the **Reply progress** will be **Not started**. When you click

Edit RFQ reply, the progress status is **Purchaser is updating** until the bid is submitted. Click **Submit** when you have entered the bid information. The Reply progress status will change to **Submitted by purchaser**. Similarly, with vendor collaboration enabled, the **Reply progress** will update as the vendor interacts with the bid. The status then changes from **Vendor is updating** to **Submitted by vendor**. When the bid is submitted, a journal is created as **Received**. The reply (bid) has to be submitted in order to be registered as received, and only then it can be further processed as accepted or rejected.

If you need to update the bid, you should go through the same process as above and submit again.

Note that editing the **Request for quotation** form is only allowed for information that relates to processing the bid, not for entering the bid. To enter or modify the bid, click **Edit RFQ reply**.

When you enter the bid information, and if the RFQ case allows for alternate lines, you can add alternate lines for lines that only have a procurement category and no catalog item specified,. Click **Add alternate** to add alternate lines.

If you've entered a reply but require a new offer from the vendor, you can return the RFQ. A new journal and a report are generated, that can be sent to the vendor.

You can see an overview of all RFQs and their statuses: **Sent, Received, Accepted, Rejected, Cancelled, Declined** on the **Request for quotation follow-up** page.

Accepting and rejecting bids, and transferring accepted bids to downstream documents

After you've identified the best bid, such as the bid that offers the best total price, you accept the bid. You can accept some lines in a bid and reject others. You can also accept lines from different vendors. Be aware that if you accept some lines, you're prompted to reject all the other lines. Therefore, if you want to accept other lines, you must select **Cancel** when you're prompted. The status of the RFQ reply for each vendor that you accept bids or lines from is updated to **Accepted**.

If you, while you prepare the purchase order or purchase agreement, need to add an additional line to the RFQ, you can do so by clicking **Add line** on the **Request for quotation** page line grid. You can only view and edit this line in **Request for quotation** page. It will be visible on the bid page when it is accepted.

When you accept a bid or one or more lines in a bid, a purchase order or a purchase agreement is automatically generated. You can then reject the bids from all the other vendors.

On the reply, you can add a reason code to explain why you accepted or rejected a bid.

When you accept a bid of the **Purchase requisition** type, the purchase requisition lines will be updated with the following information that reflects the information of the accepted bid:

- Unit price
- Discount percentage
- Discount amount
- Purchase charges
- Line charges
- Vendor
- External number
- External description

The following table shows how the RFQ status changes as you accept and reject bids from vendors.

Statuses – highest and lowest

On the Vendor tab of the RFQ case, you can see the lines with the highest and the lowest status for a particular vendor. When the vendor is added, and no lines have yet been sent, both the lowest and the highest status is

Created. When the RFQ is sent to the vendor with all lines, the status of the two lines will be **Sent**. If some lines in a bid from a vendor are accepted and others are rejected, the rejected lines will get the lowest status which is **Rejected**, and the accepted lines will get the highest status which is **Accepted**.

On the RFQ case lines, you can see the highest and the lowest status per line across all vendors. If you have sent a line to all the vendors in the RFQ case and no one have responded yet both the lowest and the highest status is **Sent**. When at least one vendor responds, the highest state will change to **Received**. If you add a new vendor to the case, the lowest status will change to **Created**

The highest and the lowest status on the RFQ case is an aggregation of the status on the <Vendor tab and the Lines tab.

The statuses are ranked in the following way from lowest to highest: Created, Sent, Received, Rejected, Accepted, Declined, Canceled.

The following table shows how the RFQ case status changes when you create an RFQ case with lines and then send it to vendors.

ACTION	LOWEST RFQ CASE STATUS	HIGHEST RFQ CASE STATUS	LOWEST RFQ CASE LINE STATUS	HIGHEST RFQ CASE LINE STATUS
Create the RFQ case header and line.	Created	Created	Created	Created
Send RFQs to all vendors in the RFQ case.	Sent	Sent	Sent	Sent
Add another vendor.	Created	Sent	Created	Sent
Send the RFQ to the second vendor.	Sent	Sent	Sent	Sent

All the lines on the RFQ's that are related to the RFQ case will be in **Sent** state.

The following table shows how the RFQ status changes as you receive bids and register the information on the RFQ reply sheet.

ACTION	LOWEST STATUS ACROSS ALL LINES OF ALL RFQS	HIGHEST STATUS ACROSS ALL LINES OF ALL RFQS	LOWEST RFQ CASE HEADER STATUS	HIGHEST RFQ CASE HEADER STATUS	LOWEST RFQ CASE LINE STATUS	HIGHEST RFQ CASE LINE STATUS
Register one vendor's bid to an RFQ, and save it.	Sent	Received	Sent	Received	Sent	Received
Register the second vendor's bid to an RFQ, and save it.	Received	Received	Received	Received	Received	Received

In the example below you can see the highest and lowest status on the RFQ case where one bid has been received and the other bid has been accepted. When a received bid is rejected, the lowest status will change from received to rejected on the RFQ case header and line.

ACTION	LOWEST STATUS ACROSS ALL LINES OF ALL RFQS	HIGHEST STATUS ACROSS ALL LINES OF ALL RFQS	LOWEST RFQ CASE HEADER STATUS	HIGHEST RFQ CASE HEADER STATUS	LOWEST RFQ CASE LINE STATUS	HIGHEST RFQ CASE LINE STATUS
Accept one of the bids. (or at least one line)	Received	Accepted	Received	Accepted	Received	Accepted
Reject all the other bids.	Rejected	Accepted	Rejected	Accepted	Rejected	Accepted

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a request for quotation

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows you how to create a request for quotation. This would typically be done by a purchasing agent. You can use this procedure in demo data company USMF or on your own data. You need to have set up solicitation types before you start. Once you've completed this task and you've created and sent an RFQ you can then enter the replies per vendor, compare them, and award the contract.

Prepare a new RFQ

1. Go to **Navigation pane > Modules > Procurement and sourcing > Requests for quotations > All requests for quotations**.
2. Click **New**. The following purchase types are available: Purchase order (this is the default): a document that confirms the offer to buy products, or the acceptance of an offer to sell products in exchange for payment. Purchase requisition: this type is automatically selected if you create an RFQ directly from a purchase requisition. If you manually select this option, you'll get an error. Purchase agreement: an agreement to purchase a specific quantity or value of product over time. If you select this option, you must select the date range that applies to the purchase agreement.
3. In the **Document title** field, type a value.
4. In the **Solicitation type** field, enter or select a value.
 - If a scoring method is associated with the solicitation type, this will be the default scoring method for the RFQ that you're creating. It is possible to change the scoring method later.
 - In the **Delivery date** field, enter a date.
 - Select the date by which you want to receive the items.
 - In the **Expiration date and time** field, enter a date and time.
 - Specify the date and time by which vendors must respond to the RFQ.
5. In the **Warehouse field**, enter or select a value. The delivery address will default to the warehouse address.
6. Click **OK**.

Add lines

After you've specified the basic information about your RFQ, you specify the goods or services that you want vendors to bid on. Item is the default line type.

1. In the **Item number** field, enter or select a value. If you're using USMF, you can select T0020.
2. In the **Quantity** field, enter a number.
3. Click **Add line**.
4. In the **Line type** field, select 'Category'. You can use the Category line type to create RFQs for non-inventory goods or services. You then need to select the type of goods or services from a hierarchy of procurement categories.
5. In the **Procurement category** field, enter or select a value.
6. In the **Product name** field, type a value.
7. In the **Quantity** field, enter a number.
8. In the **Unit** field, enter or select a value.

Add vendors

1. Click **Header** to change from the Lines view to the Header view.
2. Expand the **Vendor** section.
3. Click **Auto-add vendors**. You can add vendors to the RFQ automatically, based on the procurement category of the items requested. If there are no vendors approved for the categories included in the lines you can add vendors manually.
4. Click **Add**.
5. In the **Vendor account** field, enter or select a value.
6. Click **Add**.
7. In the **Vendor account** field, enter or select a value. Once you've selected a vendor, the status is Created. This means that the vendor information has been saved in the RFQ, but you have not sent the RFQ to the vendor. You can add a vendor to an RFQ regardless of the vendor status.

Send the RFQ to vendors

1. On the **Action Pane**, click **Send**. In the Sending request for quotation page, check that the vendors in the list are the ones that you want to receive the RFQ.
2. Click **Print**. This dialog allows you to print the RFQ. If you choose to print a reply sheet, the contents of this are defined in Procurement and Sourcing parameters. To choose how to print reply sheets, once you've opened the Print dialog, click Advanced printing options. One RFQ will be printed for each vendor containing the lines that have the status of Created or Sent. Canceled lines and lines with registered replies will not be printed.
3. Click **Cancel**.
4. Click **OK**.
5. Close the page.
6. Close the page.

View the RFQ journal

1. Go to **Procurement and sourcing > Requests for quotations > Request for quotations follow-up > Request for quotation journals**.
2. Click **Preview/Print**.
3. Click **Original preview**.
4. Close the page.
5. Close the page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a requisition that uses an RFQ

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to add price and vendor information to a purchase requisition from an RFQ process. The example shown in this guide can be used in the USMF demo data company, and you must be logged in as an Admin to complete all the steps. The tasks in this guide would typically be done by procurement professionals.

Create a requisition

1. In the navigation pane, go to **Modules > Procurement and sourcing > Purchase requisitions > Purchase requisitions prepared by me**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Requested date** field, enter a date.
5. In the **Accounting date** field, enter a date.
6. Select **OK**.
7. In the **Reason** field, enter or select a value.
8. Select **Add line**.
9. In the **Procurement category** field, select a category in the tree, and then select **OK**.
10. In the **Product name** field, type a value.
11. In the **Quantity** field, enter a number.
12. In the **Unit** field, enter or select a value.
13. Select **Save**.
14. Select **Workflow** to open the drop dialog.
15. Select **Submit**.
16. Close the page.
17. Select **Submit**.

Reassign a workflow task

The next task is to create an RFQ to get bids from vendors for the product. In USMF demo data, the requisition workflow is set up with a rule so that if a vendor is not selected, or the unit price is 0 for a line, a task is assigned to a specific worker to create an RFQ. To continue with this guide, you need to re-assign that task to another user (yourself). You can only do this if you are logged in as an Admin.

1. Select **Workflow** to open the drop dialog.
2. Select **View history**.
3. Refresh the page.
4. Expand the **Tracking details** section.
5. In the tree, select the line that starts with "Line workflow activated on".
6. Select **View workflow details**.
7. Expand the **Work items** section.
8. Select **Reassign**.
9. In the **User** field, select **Admin**.
10. Select **Reassign**.
11. Close the two pages.

Create an RFQ

1. Refresh the page.
2. Select **Request for quotation**.
3. In the **Buying legal entity** field, select **USMF**. You must select the same legal entity that's on the requisition line.
4. In the list, mark the selected row. If you had multiple lines on your purchase requisition, select all the lines that you want to add to the RFQ.
5. Select **OK**.
6. Refresh the page.
7. Ensure that the FactBox is open, then expand the **Related documents** section.
8. Select the link in the **Request for quotation** field to open the RFQ that was just created.
9. Select **Header**.
10. Select **Add**.
11. In the **Vendor account** field, enter or select a value.
12. Select **Add**.
13. In the **Vendor account** field, enter or select a value.
14. Select **Send**.
15. Select **OK**.
16. Select **Enter reply**.
17. On the Action Pane, select **Reply**.
18. Select **Copy data to reply**. This copies data, such as the quantity and dates, from the RFQ to the reply.
19. In the **Unit price** field, enter a number. This is the price that you've received from the vendor. You might also want to enter additional information from the vendor.
20. Select **Accept**.
21. Select **OK**.

Verify that vendor and price have been transferred to the requisition

1. Close the page.
2. Select **Lines**.
3. Select **Related information**.
4. Select **Purchase requisition**.
5. Select the line that was transferred to the RFQ. Verify that the price and vendor have been copied to the requisition.
6. Select **Workflow** to open the drop dialog.
7. Select **Complete**.
8. Select the page.
9. Select **Complete**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a scoring method for RFQs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create a scoring method. A scoring method is a set of criteria that can be used to compare bids that are sent in reply to a request for quotation (RFQ). For example, you might want to rate a vendor on past performance, or rate whether the company is environmentally friendly or a good collaborator, or you might want to compare bids based on price. The scoring method can be associated with a solicitation type as the default scoring method for RFQs of that type. These tasks would typically be carried out by a purchasing manager. You can use this procedure in demo data company USMF or on your own data.

1. Go to Procurement and sourcing > Setup > Request for quotation > Scoring method.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. Click Save.
6. Click New.
7. In the Name field, type a value.
8. In the Description field, type a value.
 - This description is shown along with the scoring method name when a scoring method is selected for an RFQ.
9. In the Range from field, enter a number.
 - The range limits what the procurement professional can enter as a score. When there are multiple scoring criteria on an RFQ, the scores that have been entered are added to each other and the sum is made available to allow the bids to be compared.
10. In the Range to field, enter a number.
11. Click New.
12. In the Name field, type a value.
13. In the Description field, type a value.
14. In the Range from field, enter a number.
15. In the Range to field, enter a number.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create solicitation types and scoring criteria for RFQs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This guide shows you how to create a solicitation type and associate this with a scoring method. It also shows how to use the solicitation type on a request for quotation (RFQ) which then sets the default scoring method. These tasks would typically be carried out by a purchasing manager. You can use this procedure in demo data company USMF or on your own data. You need to have a scoring method available before you start.

Create a solicitation type

1. Go to Procurement and sourcing > Setup > Request for quotation > Solicitation type.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. In the Scoring method field, select the scoring method that you want to use for this solicitation type.
6. Click Save.
7. Close the page.

Use the solicitation type

1. Go to Procurement and sourcing > Requests for quotations > All requests for quotations.
2. Click New.
3. In the Solicitation type field, select the solicitation type that you have just created. *
4. Click OK.
5. Click Scoring criteria.
 - The scoring criteria that are shown are the ones from the scoring method that you associated with the solicitation type. You can choose to add or delete criteria on this page. It's also possible to add new criteria by copying them from other scoring methods.
6. Click Copy criteria.
7. In the Scoring method field, enter or select a value.
8. Click OK.
9. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Responding to vendor questions on Request for quotations

2/18/2021 • 4 minutes to read • [Edit Online](#)

When your agency has sent a request for quotation (RFQ), vendors sometimes have questions that pertain to the request. Vendors that have questions related to an RFP can submit their questions and read the answers on **Vendor collaboration** page, when you make that page available to them. When vendor questions are accepted, **Questions and answers** is available on the **Request for quotation bid** page on **Vendor collaboration**, and for your agency through the **Request for quotation** page, **Questions and answers**.

Users can publish answers to vendor questions more than once. Vendors can't no longer post questions after a vendor is selected and the RFQ is awarded, or after the cutoff date for questions is reached.

Turn on the feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Procurement and sourcing*
- **Feature name:** *RFQ questions and answers*

Allow questions and answers to be used in RFQs

1. Go to **Procurement and sourcing > Setup > Procurement and sourcing parameters**.
2. Open the **Request for quotation** tab.
3. Set the following options as needed:
 - **Allow vendor questions:** Enables or disables vendor questions for RFQ cases. You must set this to *Yes* to use the features described in this topic.
 - **Default direct response:** When you reply to a question, you can choose to reply to all vendors who received the RFQ or to reply only to the specific vendor who submitted the question. You can make choose this option each time you reply, but this setting controls the default. If you usually reply to all vendors, set this to *No*. If you usually reply to individual vendors, set this to *Yes*.

Setting up for vendor questions

When creating a request for quotation, you determine whether vendors can ask questions about the RFQ.

1. Navigate to **Procurement and sourcing > Requests for quotations** then click **New > Request for quotation**
2. In the **New request for quotation** page, **Header** to set the **Vendor question options** fields to allow questions before a certain date.
3. Set the **Allow vendor question** option to **Yes** so the vendors can enter questions. Users can enter and answer questions and designate commonly asked questions to publish for vendors when the RFQ is sent to vendors.
4. Optional: In the **Cutoff date** field, define the final date by which questions must be submitted. If no cutoff date is entered, questions are accepted as long as the RFQ is open and accepting bids.
5. Click **Save** to save the RFQ.

6. Click **Send** to send the RFQ to the vendors for bidding.

Entering and replying to vendor questions

Vendors enter questions in the **Vendor Collaboration > Request for quotations bid page, Vendor questions** FastTab. The question is visible only to the vendor and users.

Entering a vendor question

1. In Vendor collaboration, in the **Request for quotation bid** page, click **Questions and answers**, and then click **+ Ask a question**.

NOTE

Alternately, a user can enter questions for a vendor on the **Request for quotation** page, by clicking **Manage replies**, **Edit RFQ reply** then clicking **Questions and answers**.

2. On the **Question** field, enter the question text.
3. Click the **Submit**. Repeat steps 1-3 to add a question.
4. When done, click **Save** to save your questions.

Replying to a single vendor

The question and answer are visible only to the vendor and users.

1. On the **Request for quotations** page, click the **Questions and answers** to display the **Questions and answers** page.
2. Click **Edit**.
3. Enter text in the **Answer** field to respond to the vendor's question.
4. Check the **Direct response** box.
5. Click **Save** to save your replies.
6. Click **Send answers** to send the answers to the vendor.

Replying to all vendors

If you receive the same question from multiple vendors, you can group the questions and respond with one answer. All vendors receive notification when the commonly asked questions and answers are published. The vendors and anyone with access to the request for quotation can view the summary of questions and answers.

1. On the **Request for quotations** page, click the **Questions and answers** to display the **Questions and answers** page.
2. Click **Edit**.
3. Choose a code for the common question, such as the letter 'a.'
4. For each line that asks a similar question, enter the code in the **Group code** field. For example, for each line asking about item color, enter 'a.'
5. Choose one of the lines with the code value, and enter the question and answer the way you want them to read in the summary that will be available when the questions and answers are published (**Group question**, **Group answer** fields).
6. Optional: You can mark the **Direct response** check box to send the answers only to the selected vendors.
7. Click **Save** to save your answers.
8. Optional: You can revert the questions and answers to the previously published values if you want to undo

your changes.

9. Click **Send answers** to send your answers to the vendors.

Changing RFQ to allow or disallow questions

You can make changes to allow or disallow questions to RFQs until the RFQ is awarded. You can also extend or shorten the time frame in which vendors can submit questions. For published RFQs, you must modify a request for quotation to allow or disallow vendor questions or adjust the time frame for questions.

IMPORTANT

If you amend an existing RFQ for the purpose of allowing vendor questions, the system will clear all existing responses when you resend the RFQ.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Enter and compare RFQ bids and award contracts

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic explains how to enter replies to a request for quotation (RFQ), score and compare bids, and then award the contract to one of the vendors. You can use this procedure in the **USMF** demo data company.

Before you start this procedure, you must have an RFQ that has two lines, and that has been sent to at least two vendors. To create this RFQ, complete the [Create a request for quotation](#) procedure. Scoring criteria must also be set up before you can complete this procedure.

You can enter the bid as either a vendor or a procurement professional. For more information, see [Set up and maintain vendor collaboration](#).

Enter a reply as a vendor

1. On the dashboard, select **Vendor bidding**.
2. In the **New bid invitations** list, find an RFQ that was just sent. Select the RFQ to review what was requested.
3. Select **RFQ attachments** to review any attachments that have been added.
4. Select **Bid** to make the fields editable. Notice that the **Bid progress** field is set to **Vendor is updating**.
5. On the header and lines, enter the values from the bid reply.
6. If any attachments should be added to the bid, select **Bid attachments**.
7. Select the **Bidding guiding items** FastTab to view whether any documents are required.
8. Select the **Amendments** FastTab to view whether the RFQ has been amended.
9. Select the **Questionnaire** FastTab. Any questionnaires that appear here must be answered.
10. Select the **Line details** FastTab to view extended information about the line.
11. Select **Reset from RFQ** only if you must reset the values that have been entered to the original RFQ values.
12. You can save the bid at any time and do additional processing later, provided that the expiration date and time haven't passed. In this case, you can find the bid in the **Bids in progress** list in the **Vendor bidding** workspace.
13. When the bid is ready to be sent, select **Submit**. If you don't want to bid, select **Decline**. Submitted bids are available in the **Submitted bids** list in the **Vendor bidding** workspace.
14. After the bid is submitted, you can recall it at any time before the expiration date and time. Note that when a bid is recalled, it isn't treated as submitted. When the bid is accepted or rejected by the procurement department, it appears in either the **Awarded bids** or **Lost bids** list in the **Vendor bidding** workspace.

Enter a reply from a vendor as a procurement professional

1. Make sure that the permission to edit vendor bids is set up. Go to **Procurement and sourcing > Setup > Procurement and sourcing parameters**. On the **Request for quotations** tab, set the **Purchaser can edit vendors bid** option to **Yes**.
2. Go to **Procurement and sourcing > Requests for quotations > All requests for quotations**.
3. Select an RFQ that has a status of **Sent**, and then select the link in the **Request for quotation case** field.
4. Select **Manage replies**. The page that appears shows an RFQ for each vendor that was invited to bid.
5. Select an RFQ that hasn't been replied to. (The **Reply progress** field should be set to **Not started**.)
6. Select **Edit > Edit RFQ reply**. The **RFQ reply** page appears. As a procurement professional, you can now enter the reply on behalf of the vendor. Notice that the **Bid progress** field is set to **Purchaser is updating**.

7. Enter the bid data. When you've finished, select **Submit**.

Score the bids

1. On the **All requests for quotations** page, select the RFQ case that you want to score replies for.
2. Select **Manage replies**.
3. Select the reply to score.
4. Select **Header** so that you can view the scoring for the bid.
5. On the **Bid scoring** FastTab, enter a number in the **Score** field for one of the scoring criteria. If you hover over a scoring criterion, a tooltip shows the range that the score must be within. In this demo, you can enter a number between 1 and 5 for any of the scoring criteria.
6. Repeat step 5 for another scoring criterion.
7. If the RFQ case has a questionnaire that was sent to the vendors, you can enter the vendor responses on the **Questionnaires** FastTab.
8. Close the page.
9. Repeat steps 1 through 8 for all the other bids.

Compare the replies

1. On the Action Pane, on the **General** tab, select **Compare replies**.
2. In the **Rank** field, enter a number.
 - This page shows the bids, together with the header and line information, and also the total score at the header level. You can compare the lines by sorting the grid so that comparable lines are next to each other. The following information is also included:
 - **Quantity** – The quantity that the vendor quoted. This quantity might not equal the quantity that is specified in the RFQ.
 - **Net amount** – The price that the vendor quoted for the items on the line, minus any discounts.
 - **Deviation** – The number of days by which the delivery date on the bid header or line differs from the requested delivery date on the RFQ header or line. You can enter a rank for each bid.
3. Select the header line for the other bid that you want to rank.
4. In the **Rank** field, enter a number.
5. Select **Save**.

Reject a bid

1. Select the header line for the bid that you want to reject. You can accept, reject, or return only one bid or the lines on only one bid at a time.
2. Select the **Mark** check box.
 - If you select the **Mark** check box on the header of the bid, all the lines are also marked. To reject or accept only some of the lines on the bid, you can mark just those lines. Additionally, you can accept one vendor's bid for some lines of an RFQ and then award other RFQ lines to a different vendor. However, you must do one bid at a time.
 - If alternate lines are present, you can accept either the original bid line or its alternate, but not both.
3. Select **Reject**.
4. Select **Parameters**, and then, in the **Reason reject** field, enter or select your reason for rejecting the bid. The reason is stored in the reply.
5. Select **OK**.
6. Select **OK**.

Accept a bid

1. Select the bid to accept, and then select the link in the **Request for quotation** field. If you're on the **Compare request for quotation replies** page, the highlighted bid that has focus is the bid that the system will consider during the Accept action. You can accept lines from only one bid at a time.
2. On the Action Pane, select **Reply**.
3. Select **Accept**. If you marked only specific lines, the Accept action will include only those lines. If you want to accept all the lines on the bid, you don't have to mark the lines.
4. Select **Parameters**, and then, in the **Reason accept** field, enter or select your reason for accepting the bid. The reason is stored in the bid.
5. Select **OK**.
6. Select **OK**. When you select **OK**, a purchase order is generated based on the lines that are included in the RFQ acceptance. If there are other bids that haven't been processed (accepted, rejected, or returned), the system prompts you to reject them.

View the purchase order that is generated

On the Action Pane, on the **General** tab, select **Purchase order**. The page that appears shows the purchase order that was generated when you accepted the bid.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Purchase order overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

This article provides general information about purchase orders (POs) and links to additional articles that are related to the various stages that a PO goes through.

A purchase order (PO) is a document that represents an agreement with a vendor to buy goods or services. The document also helps keep track of product receipts that are made toward the order and, later, the accounting of vendor invoices that the vendor bills toward the order.

The **Purchase orders** page contains an overview of the available orders and lets you modify those orders. When you open a PO, you can select the **Header** view, which contains information that is specified only one time for each PO, such as the vendor details. Alternatively, you can select the **Lines** view, where you can modify order lines. Typically, you will switch between these two views as you modify POs. Charges aren't listed directly on the **Purchase orders** page, but are accessed via menus on the order header and lines.

There are many reports where you can view information about POs, product receipts, and vendor invoices. These reports are found in the **Procurement and sourcing** and **Accounts payable** modules.

The **Purchase order preparation** and **Purchase order receipt and follow-up** workspaces let you view lists of POs in the various states that they have progressed to. They also provide a summary of the actions that must be taken. The **Purchase order preparation** workspace is focused on PO creation and review, processing of the order through approval, and confirmation with the vendor. The **Purchase order receipt and follow-up** workspace is focused on processing the receipt of goods or services against POs. It includes lists that give insight into receipts that are overdue, or that will soon be due for delivery by the supplier. These workspaces aren't used to perform the related receipt activities that are done in the warehouse. Those activities are performed by using pages in the **Inventory management** and **Warehouse management** modules. Processing of vendor invoices should be done by using the **Vendor invoice entry** workspace, and payments should be done by using the **Vendor payments** workspace.

The following articles provide an overview of the various stages that a PO goes through:

- [Create purchase orders](#)
- [Approve and confirm purchase orders](#)
- [Product receipt against purchase orders](#)
- [Overview of vendor invoices](#)

Types of purchase orders

There are three types of POs. When you create a PO, you must specify the type. You can set up a default order type for new orders on the **Procurement and sourcing parameters** page.

PO TYPE	DESCRIPTION
Journal	Use this type to create a draft order. This type doesn't affect stock quantities or generate inventory transactions. The PO journal lines aren't included in master scheduling.
Purchase order	Use this type to create POs when orders are confirmed with a vendor, and as the orders are processed through receipt and invoicing before payment is made to the vendor. This type of PO is the most common.

PO TYPE	DESCRIPTION
Returned order	Use this type when you return goods to the vendor. This type of order requires that you specify the return material authorization (RMA) number that the vendor gives you. You specify the RMA number on the General tab of the PO. The order lines must have negative quantities.

Purchase order statuses

POs include several status fields that indicate the progress of the order. All these fields are visible in the **Header** view of the order, and a few of them are also visible in the grid overview of all orders. The **Status** field shows the status for quantities on the order. The following values are available:

- **Open order** – Orders have been created, and quantities are on order.
- **Received** – Some of the quantities have been received, but they haven't been invoiced yet.
- **Invoiced** – The full quantity on the order has been invoiced. **Note:** If an order has been *partially* invoiced, neither **Received** status nor **Invoiced** status is appropriate. Therefore, the order will still have a status of **Open order**.
- **Canceled** – An order was confirmed but later canceled. Therefore, this status indicates that there are no longer any open quantities on order.

The **Document status** field helps you quickly review the order's progress in terms of documents that have been processed. It shows the status of the most recent document that has been completed for the order. The following values are available:

- **None** – No document has been processed for the order yet.
- **Purchase inquiry** – A purchase inquiry has been generated, and the order is awaiting feedback from the vendor.
- **Purchase order** – Confirmation has been processed on the order.
- **Product receipt** – Product receipt has been processed on the order.
- **Invoice** – An invoice has been accounted with the order.

The **Approval status** field is used when a PO goes through a review process or workflow. The following values are available:

- **Draft, In review, and Rejected** – These statuses are used only when an approval workflow is used for the PO.
- **Approved** – This status is assigned to orders that have completed workflow approval. Orders that are created without using an approval workflow receive a status of **Approved** immediately.
- **In external review** – This status is used in scenarios where a purchase inquiry is sent to the vendor, so that the vendor can confirm terms of the PO. This status is also used in the process that is initiated by the **Confirmation request** action. For this process, the vendor is asked to confirm terms of the PO by connecting to your system and registering whether it confirms or rejects the order.
- **Confirmed** – This status is assigned after the order has been confirmed. Typically, this status is the last approval status that is assigned to an order.

Approve and confirm purchase orders

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes the statuses that a purchase order (PO) goes through after it has been created, and the effect of enabling change management on POs.

After a purchase order (PO) has been created, it might have to go through an approval process. After the vendor has agreed to the order, the PO is set to a status of **Confirmed**.

Approval of purchase orders

POs that don't use change management have a status of **Approved** as soon as they are created, whereas POs that use change management have a status of **Draft** when they are first created. A PO that has been created by firming a planned order from master planning is always set to a status of **Approved**, regardless of the change management settings. A PO creates inventory transactions only when it reaches the **Approved** status. Therefore, that inventory doesn't appear as available for reservation or marking until the order is accepted.

You enable change management for POs by setting the **Activate change management** option on the **Procurement and sourcing parameters** page. When change management is enabled, POs must go through an approval workflow after they have been completed. Supply Chain Management has a workflow process editor where you can define a workflow to represent your approval process. This workflow can include rules for automatic approval, rules that determine who will be assigned to approve particular POs, and rules for escalating a workflow that has been waiting for approval for a long time. You can enable the change management process for all vendors or for specific vendors. You can also set up the process so that it can be overridden for individual POs.

When change management is enabled, POs move through six approval statuses, from **Draft** to **Finalized**. After an order has been approved, users who want to modify it must use the **Request change** action.

APPROVAL STATUS	DESCRIPTION	REQUEST CHANGE IS ENABLED
Draft	The PO is a draft and hasn't been submitted for approval in the PO workflow.	No
In review	The PO was submitted for approval in the PO workflow. Approval is pending.	No
Rejected	The PO was rejected during the approval process.	No
Approved	The PO was approved.	Yes
Confirmed	The PO was confirmed. A PO can't be confirmed until it has been approved.	Yes
Finalized	The PO was made final. It's now financially closed and can no longer be changed.	No

Confirming purchase orders

POs that have an approval status of **Approved** can go through additional steps before they are confirmed. For example, you might have to send a purchase inquiry to the vendor to inquire about prices, discounts, or delivery dates. In this case, you can set the PO to the **In external review** status by using the **Purchase inquiry** action.

Vendors that are set up to use the Vendor portal can review orders on the portal, and approve or reject them. During this review process, the PO has a status of **In external review**. The Vendor portal can be configured so that a confirmation from the vendor automatically confirms the order in Supply Chain Management. Alternatively, you can manually confirm a PO after you receive confirmation from the vendor. If a vendor rejects a PO, the rejection is received together with the reason for the rejection and suggestions for changes. In this case, the status of the PO remains **In external review**.

There is also an option to generate a pro-forma confirmation for an order before the actual confirmation has been processed. This option just creates a report that you can share with the vendor. It doesn't create any journal information.

After the vendor has agreed to the order, the next step is to record the PO as committed. You can complete this step by using either the **Confirmation** action or the **Confirm** action. Both these actions set the approval status of the order to **Confirmed**. Confirmation of an order initiates two additional processes:

- A journal is created to store an exact copy of what was confirmed in the system. Sometimes, orders require changes, and additional journals are created after the updated order is confirmed. These journals let you view the history of the various versions of the order that were confirmed.
- Accounting distributions are created, and order checks and budget checks occur if this functionality has been enabled. If either check fails, you receive an error message that states that changes must be made to the PO before it can be confirmed again.

A vendor might request some type of assurance that payment will be provided for a purchase. There are various methods for providing this guarantee within accounts payable processes. For example, the **Prepayment** action reserves funds for the PO, and this prepayment is recorded on the PO.

Changing purchase orders

In some situations, you might have to change a PO after it has reached an approval status of **Approved** or **Confirmed**.

If the PO was created by using a change management process, you can make changes by recalling the order or, if the order has already been approved, by using the **Request change** action. In this case, the approval status is changed back to **Draft**, and you can then modify the order. After you've finished making changes, you might have to submit the PO for re-approval. You can configure the types of changes that require re-approval by using a **Re-approval rule for purchase orders** policy rule on the **Purchasing policies** page.

If part of the ordered quantity for a PO line has been delivered, you can't change the ordered quantity when the purchase order is in **Draft**. However, you can change the **Deliver remainder** quantity on the line for the purchase order that is in **Draft** status.

After an order has been confirmed, you can no longer delete it. However, you can cancel the total quantity or any remaining quantity on an order, provided that the quantity hasn't been received or invoiced. You can then use the **Finalize** action to prevent further processing.

Canceling purchase orders

A PO can be canceled by using the **Cancel** action on the header.

If the quantity has been partially registered, received, or invoiced, you can cancel only the remaining quantity that hasn't been registered, received, or invoiced. The order quantity is then reduced accordingly. When the quantity on the line is updated, the line status is also updated. For example, the original quantity on the line is 5,

and a quantity of 3 is received. In this case, only two can be canceled. The line is then updated to **Received** status.

If a delivery remainder is added to the order line, and it exceeds the quantity on the order line, the **Cancel** action doesn't cancel the excess quantity. Instead, the line remains in **Open order** status, because it has a remaining quantity. For example, the original quantity on the line is 5, and the delivery remainder is 7. If the order is canceled, five are canceled, and a quantity of 2 remains, as you can see in the inventory transactions.

To cancel the whole quantity on a PO line, you should cancel the delivery remainder quantity on the line. The line will then be updated to **Canceled** status.

If a PO is under change management, any change, such as cancellation of the order or the delivery remainder, must be submitted to the workflow system and approved before the process can be completed and the inventory transactions can be updated as canceled.

Purchase order approval mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Purchase order approval** mobile workspace. This workspace lets you view purchase orders and respond to them through actions. For example, you can approve or reject a purchase order.

Overview

Purchase orders that requires approval go through an approval workflow. The workflow can include various steps that require that one or more people take action. For example, a person might have to complete a task or approve the purchase order.

The **Purchase order approval** mobile workspace lets you easily view and respond to purchase orders from your mobile device. This workspace also lets you take the same workflow actions that you can take from the web client.

Prerequisites

The prerequisites vary, depending on the version of Supply Chain Management that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Purchase order approval** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4017918.	System administrator	KB 4017918 is an X++ update or metadata hotfix that contains the Purchase order approval mobile workspace. To implement KB 4017918, your system administrator must follow these steps. <ol style="list-style-type: none">1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS).2. Install the metadata hotfix.3. Create a deployable package that contains the SCMMobile model, and then upload the deployable package to LCS.4. Apply the deployable package.
Publish the Purchase order approval mobile workspace.	System administrator	See Publish a mobile workspace .

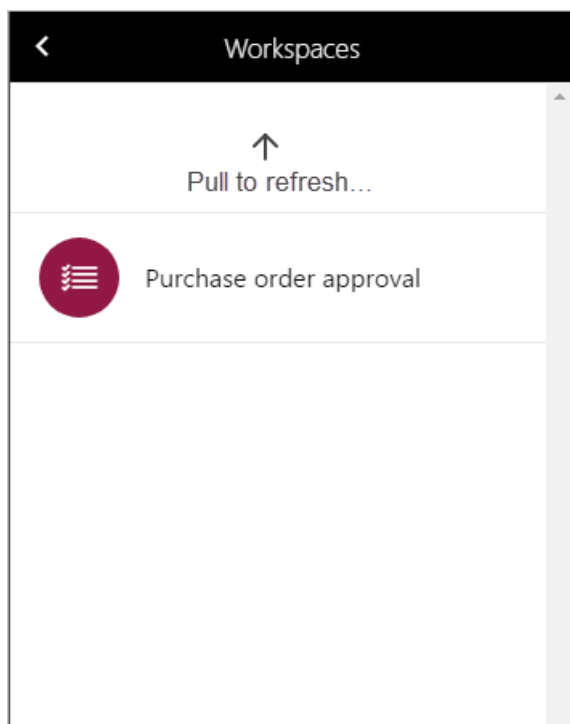

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View orders that are assigned to you

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take action in the purchase order approval workflow.
3. Select an order. On the **Order details** page, you will see the order header information and lines. You can also find guidelines from the workflow task.
4. Select **Accounting distributions** to open the **Header accounting distributions** page.
5. Return to the **Order details** page, and select a line. From the order line details, you can also explore the line-specific accounting distributions.

Complete an action on the purchase order

After you've viewed the purchase order that is assigned to you and read the workflow instructions, you should be ready to take action.

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take

action in the purchase order approval workflow.

3. Select an order, and view the details page.
4. Select **Actions** to show the available actions. The actions that are available depend on the task that has been assigned to you.

TASK ACTION	APPROVAL ACTION
Complete	Approve
Return	Reject
Request change	Request change
Delegate	Delegate

5. Select the appropriate action.
6. On the **Complete task** page, enter a comment. Note that if you select the **Delegate** action, you must select a user to delegate the task to.
7. Select **Done**. After you refresh your workspace, the purchase order will no longer be in your list.

Record the receipt of goods on the purchase order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to record receipt of goods directly on a purchase order. It's also possible to register product receipt in the warehouse, and then later record it on the purchase order. This task is typically done by a purchasing agent or an accounts payable coordinator. The example shown in this guide can be used in the USMF demo data company. The example includes steps to create a simple purchase order so that you can play the procedure as a task guide. If you were using the procedure on your own data, you would start at the **Record receipt of goods** subtask.

Prepare a new purchase order for receipt of goods

1. Go to **Navigation pane > Modules > Procurement and sourcing > Purchase orders > All purchase orders**.
2. Select **New**.
3. In the **Vendor account** field, enter .
4. Select **OK**.
5. In the **Item number** field, enter .
6. In the **Quantity** field, enter .
7. On the Action Pane, select **Purchase**.
8. Select **Confirm**.

Record receipt of goods

1. On the Action Pane, select **Receive**.
2. Select **Product receipt**. The **Quantity** field allows you to select different options for the quantity that you want to receive. For example, if a quantity has previously been registered in the warehouse, you can select **Registered quantity**. For this example, use the value **Ordered quantity**.
3. Expand the **Overview** section.
4. In the **Product receipt** field, type any value. This field is used to enter a reference that will be used as voucher for the product receipt journal.
5. Expand the **Lines** section.
6. Set **Quantity** to '4'. Here you are able to manually specify the quantity that is being received for each line on the order.
7. Select **OK**. The goods have now been recorded as received on the purchase order, and a product receipt journal has been created as document to reflect this. You can use the Product receipt action to review the journals created with the purchase order, and see what was received, and when.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot purchase orders

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with purchase orders.

An action can be completed only after the line number is fully distributed.

This issue can occur because of inconsistency in purchase order distributions.

To unblock this issue and reset the purchase order to a *Draft* state, go to **Procurement and sourcing > Periodic tasks > Clean up > Purchase order distribution reset**. For more information, see the following blog post: [Resolve PO distribution errors in Dynamics 365 Supply Chain Management](#).

When purchase orders are imported through data management, purchase order line numbers don't follow the increment that defined in system parameters.

Issue description

By default, automatically generated line numbers for purchase order lines that are imported through the *Purchase order lines V2* data entity don't use the system line number increment that is specified in system parameters. If you manually create a purchase order and add lines through the user interface (UI), the line numbers are incremented correctly. However, if you use the Data management framework (DMF), they aren't incremented correctly.

This issue occurs because, when you import lines via DMF, if line numbers aren't already assigned in the imported entity, the system uses DMF's method for assigning them. That method always increments line numbers by one.

Issue workaround

Make sure that the desired line numbers are already given in the data entity line number fields when you import the purchase order lines. In this case, DMF won't overwrite the line numbers.

A default tax group and a default cash discount aren't filled in from the invoice account.

If you're using an invoice account that differs from the customer account, a default tax group and a default cash discount aren't filled in from the invoice account when a purchase order is created.

This behavior is by design. The default values for the tax group, cash discounts, and other price information are based on the customer account, not the invoice account.

I receive an "Object reference not set" error during purchase order confirmation, or an "Exception has been thrown by the target of an invocation" exception occurs during vendor invoice posting.

This issue can occur because of inconsistency in purchase order distributions.

To unblock this issue and reset the purchase order to a *Draft* state, go to **Procurement and sourcing >**

Periodic tasks > Clean up > Purchase order distribution reset. For more information, see the following blog post: [Resolve PO distribution errors in Dynamics 365 Supply Chain Management](#).

One or more accounting distributions are either over-distributed or under-distributed.

Issue description

You receive the following error: "One or more accounting distributions is either over-distributed or under-distributed."

Issue resolution

This issue can occur because of inconsistency in purchase order distributions.

To unblock this issue and reset the purchase order to a *Draft* state, go to **Procurement and sourcing > Periodic tasks > Clean up > Purchase order distribution reset**. For more information, see the following blog post: [Resolve PO distribution errors in Dynamics 365 Supply Chain Management](#).

Can I show only purchase orders that I created?

This functionality isn't currently available.

Can I reserve inventory and create transactions against registered inventory on a purchase order?

Issue description

Even when items are in a *Registered* state on a purchase order, you can still reserve the inventory. In other words, you can create transactions against the registered inventory.

Reproduce the issue

The following procedure shows one way to reproduce the issue.

1. Create a purchase order.
2. Register the purchase order line.
3. Notice that you can generate reservations or transactions against the registered inventory.

Issue resolution

This behavior is by design. The expectation is that the registered items have physically arrived in the warehouse or inventory, and that they are therefore available for reservation.

Purchase orders don't reflect the language settings of the legal entity.

Issue description

The product name on a purchase order is shown in the system language instead of the language that is set for the legal entity where the purchase order was created.

Reproduce the issue

The following procedure shows one way to reproduce the issue.

1. Set the system language to *EN-US* (US English).
2. Make sure that there is a product where the *EN-US* and *DE* (German) languages are maintained for translations of the product name.
3. Change the language of a legal entity to *DE*.
4. In the legal entity where *DE* is set as the language, create a purchase order that includes the product.

5. Notice that the product name is still shown in US English (the system language).

Issue resolution

This behavior is by design. On purchase orders, the product is always shown in the system language. The purchase order language is used when a confirmation journal is created.

The Approved vendor list by product entity doesn't allow the effective date to be changed.

Issue description

A product has an approved vendor that has, for example, an effective date of January 11, 2018 (*01/11/2018*), and an expiration date of *Never*. If you try to change the effective date to January 10, 2018 (*01/10/2018*), or January 12, 2018 (*01/12/2018*), you receive the following error:

Cannot create a record in Approved supplier list (PdsApproveVendorList). The 'Expiration' value needs to be greater than or equal to the 'Effective' value.

Issue resolution

You can only extend the period that the vendor is approved for. The following rules apply:

- To change the effective date so that it's earlier than any of the existing records (periods) for the item vendor, the expiration date of the new period must be before all the expiration dates in the existing records.
- To change the expiration date so that it's later than any of the existing periods, the effective date must be after the latest expiration date in any existing record.
- To reduce the overall period that the vendor is approved for, you must delete or modify existing records. Alternatively, you can use the **truncate** switch during import. This switch deletes all existing records in the table for approved vendors by item.

For the example scenario that is described in the issue description, where a record has an effective date of *01/11/2018* and an expiration date of *Never*, you can import a new record that has an effective date of *01/10/2018* and an expiration date of *Never*. However, you can't reduce the period so that the effective date is updated to *01/12/2018* via data management. You must make this change through the UI.

After I change the delivery address on a purchase order header, the delivery name isn't synced.

Issue description

The address on the header of a purchase order is updated to an address that isn't a delivery address. Although the address is updated on the purchase order, the delivery name isn't updated based on the updated address.

Issue resolution

This behavior is by design. The selected address must be classified as a delivery address. Otherwise, the delivery name isn't updated based on the selected address.

Can I find the user who canceled a purchase order?

This information is tracked only if the purchase order is subject to change management. If you use change management, you can see who submitted the change (the cancellation), and who approved it.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create purchase orders

2/18/2021 • 9 minutes to read • [Edit Online](#)

This article describes the process and options when you manually create a purchase order.

When you create a purchase order (PO), general information about the whole order is specified in the PO header, and you then add one or more PO lines. This article describes some of the most frequently used options that are available.

You can also create POs by copying lines from another PO document or a sales order. In this case, you can reverse the sign on the inventory, as you would reverse the sign on an invoice to indicate credit.

Although you can manually create POs, they are more typically generated from other processes. Orders can be automatically created based on other documents, such as requisitions. Alternatively, they can be created as part of the master planning process through planned POs. If you use purchase agreements, POs can be created by the **Release order** action. There are also more advanced methods for automatically creating a PO. For example, orders can be created when you use direct delivery or intercompany order chains.

Creating a purchase order header

When you create a new PO, a dialog box appears, where you can enter the most common information for the PO header. When you click **OK** to close the dialog box, the order is created, and you can then specify additional information in the header.

The first detail that you must consider when you create a PO is the type of order. The **Purchase order** type is used most often. However, if a credit invoice is required, you can use the **Returned order** type.

You must specify the supplier in the **Vendor account** field. For this field, you can search on either the account or the vendor name. If a vendor delivers from multiple locations but uses a single invoice account, you can select that invoice account in the **Invoice account** field and then use it with different vendor accounts. If you must create a PO for products that won't be ordered repeatedly, you can use the **One-time supplier** option. This option automatically creates a new vendor account that is marked as a one-time account, to support a later clean-up process for one-time accounts in the **Accounts payable** module. When you select a vendor account, many fields in the PO header inherit default values from the information that is associated with the vendor account. For example, the default delivery site and warehouse are copied from the vendor information. However, you can override these default values if the purchase is intended for another location.

If the supplier has provided a reference number for the order, you can record this information in the **Vendor reference** field. For returned orders, you must specify a value in the **RMA** field to reference the supplier's authorization for processing the return.

If a purchase agreement is associated with the order, you must specify this information in the **Purchase agreement** field.

The PO header also contains information about charges that apply to the whole order instead of individual lines. Charges can be automatically added to the order if automatic charges have been set up for the vendor or the vendor's charge group. You can also manually add charges to the order header by clicking **Maintain charges** on the Action Pane.

Adding purchase order lines

POs can be for physical products or for services. A setting on the inventory model group determines whether a

particular item number applies to a product or a service. Usually, the item that is purchased is specified by an item number. However, if the order is for products or services that are directly consumed, you can also specify the item by using a procurement category.

PO lines contain lots of fields, but many of these fields have a default value or a value that is inherited from the order header. Additional fields are set when you select a product or service. The fields that are most often set manually include the fields for the item number, quantity, and requested delivery date. Information about unit price and discounts is also very important, but the values of those fields are often determined by trade agreements or purchase agreements.

When you select a product, you can search on all or part of the product name instead of using the item number. If the product has several variants, such as different sizes, you can see an overview of the available variants by using the **Add lines** function or by using the lookup that is available in the **Variant number** field.

Often, you will have to specify several dimensions for the item that is selected on each PO line. The dimensions that must be specified depend on the dimension groups that have been assigned to the product master definition. For example, you will often have to specify a site and warehouse to indicate the location that the product should be delivered to. You identify product variants by specifying a variant number, or by entering values for one or more product dimensions, such as color, size, configuration, or style. Tracking dimensions, such as batch and serial number, let you uniquely identify each inventory lot. After you've created an order, you can capture dimension values on the order by using the **Registration** action. For example, you have ordered a quantity of five pieces of an item. Later, you register that three of those pieces will be black, and two of them will be blue. This approach is an alternative to capturing the dimension information during arrival registration.

You can check the details of the inventory transaction status for stocked products. For example, you might want to check the on-hand inventory to help you decide how much to order. Alternatively, you might want to review the inventory status of an ordered quantity to see whether inbound arrival registration has occurred.

A PO line that is being used to return a product to the vendor will have a negative quantity. You can select a specific lot to return by using the **Reservation** action.

Sometimes, you might want to divide the quantity that you've ordered, so that different parts of it are delivered on different dates. You can set up these deliveries by using the **Delivery schedule** action, which is available on the **Purchase order line** menu in the **Lines** view.

Charges can be automatically added to PO lines, if automatic charges have been set up for the vendor or vendor charge group, and for the item or item charge group. However, more typically, charges are added manually at the order line level. To add a charge, open the **Maintain charges** page by using the **Maintain charges** action on the **Financials** menu in the **Lines** view. The advantage of adding charges directly at the order line level is that the charge can be allocated as an inventory cost. To set up charge codes to account product cost, use the **Item** debit option. These types of charges must be allocated from the PO header to the lines before the order can be confirmed. For example, you might want to allocate charges based on the quantity on each line. The charge category also affects how charges are accounted. For example, fixed charges specify a fixed amount, and percent charges are calculated as a percentage of the net amount for the order line. POs can be assigned to a load, and the load might include an estimate of the expected expense for the transportation cost. You can allocate this expense from the load back to the PO lines.

Purchase order actions

After you've added the header and lines to the PO, you must often complete additional steps before the order is ready to be confirmed. Because so many options are available, you might find it helpful to use [Action search](#) to find the relevant menu item.

You can configure products on the order so that they have supplementary items. Supplementary items are products that must or can be bought together with other products. Supplementary products might be added free of charge as accompanying products, or you may be able to decide whether to add them to the order or

not. You can review the supplementary items after each order line that is added. However, you will probably find it more convenient to review and add relevant supplementary items for all the order lines by using the **Supplementary items** page, which you can open from the Action Pane.

Discounts are usually added to lines as they are created. However, a few discounts apply to the whole order:

- The **Total discount** action calculates a total discount percentage that is applied to the full order. Don't confuse this discount with the cash discount percentage. Cash discounts are applied when the invoice is paid, and they depend on payment settlement by a specific date.
- If a multi-line discount applies, you must use the **Multiline discount** action to calculate and assign it to the order. Multi-line discounts are discounts that can be offered if a mix of products on the order exceeds a joint threshold. Only a few companies use this type of discount.

Charges that have a charge code that uses the **Item** debit type must be assigned to the line level before the order can be confirmed. You might find it convenient to assign these charges at the order header level, so that you can specify the total amount of the charge. However, in this case, the charge must then be allocated down to each line before the order can be confirmed. You can use the **Allocate charges** action to split amounts from charges that are assigned at the header level down to the order lines. Charges can be split according to the net amount of each line, according to the quantity that has been ordered, or evenly across the order lines. After you've allocated charges to the lines, the charge is removed from the order header.

POs can be configured to require that budget funds be allocated to the order before it can be processed. In this case, you can use the **Budget checking** action to allocate the budget.

You might have to delay the completion of a PO. For example, you might require additional information about products or services, or you might have to get authorization for the spend. There are several ways to hold back an order. For example, you can wait to confirm the order. Alternatively, if a change management workflow is being used, don't submit the order for approval. If you must block all orders for a particular vendor, you can also mark the vendor as **On hold** for processing on the vendor master. There are also circumstances that might prevent the order from being processed. For example, processing might be prevented if credit limits have been exceeded, or if required budget funds aren't available.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase order

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic shows you how to create a purchase order manually. It's more typical for purchase orders to be created automatically as result of master planning, direct delivery, and other processes. Purchase orders are typically created by a purchasing agent. The example shown here can be used in the USMF demo data company using the values that are suggested in the notes for various steps.

Create the purchase order header

1. Go to **Navigation pane > Modules > Procurement and sourcing > Purchase orders > All purchase orders**.
2. Select **New**.
3. Select vendor account **US-101**. When you select a vendor, details from the vendor record such as address, invoice account, delivery terms, and delivery mode will be copied as default values into the order header. You can change these values at any time.
4. Expand the **General** section.
 - The **Site** field together with the **Warehouse** field specifies where the procured goods or services must be delivered to. The default delivery address is the site. Both fields can be populated with values set up for the selected vendor, or you can specify them manually.
 - The **Delivery date** field is used to specify when procured goods and services need to be delivered. You can specify a single delivery date for the order, or the individual order lines can be given unique delivery dates. If the delivery date specified here cannot be met for specific products or services because they have longer lead times, then those lines will be created with a later delivery date to accommodate for this.
5. Expand the **Administration** section. The **Orderer** field can be used to specify who is placing the order. This may be convenient to share with the vendor in case they need to contact that person. The field may be assigned a value automatically if the current user account is associated with a name on the **Users** page.
6. Select **OK**. The order header has now been created. When you work with purchase order lines, only a summary of the header information is shown. If you need to view the rest of the information, select **Header**.

Add a purchase order line

1. Select **Purchase order line**.
2. Select **Dimensions**. Products can be in variants that are differentiated by dimensions, such as color, size, or style. Products can also be set up to use storage dimensions, such as site and warehouse. There are also optional tracking dimensions, such as batch and serial numbers. To improve the efficiency of order entry, you can add the dimension fields that you commonly use directly to the order grid.
3. Select the **Color** check box. Optional: If you select the **Save setup** field, the dimensions you have chosen will also be shown on the order line grid the next time you open the purchase order page.
4. Select **OK**.

5. In the **Item number** field, select **T0004**.

- Order lines are created for products and services by specifying an item number, or as expenses by specifying a procurement category.
- The **Procurement** category field is used for adding lines where procured items are expensed directly, rather than going into inventory. This means that if you need to expense a purchase you can do this by creating a purchase order line that specifies a procurement category, rather than creating a line with an item number. Items can also be associated with a procurement category and in this case, the procurement category is shown as informational only.

6. In the **Color** field, enter or select a value. The **Site** and **Warehouse** fields are typically populated with values from the order header, but it is possible to override the fields if some lines need to be delivered to different locations.

7. In the **Quantity** field, enter a number.

- Select the quantity that you want to purchase. The **Quantity** field is automatically populated with the minimum order quantity for the product if this is set up, or with the value of 1.
- The **Unit** field indicates the unit of measure for the ordered quantity. Typically, the unit is automatically provided from the purchasing unit on the product master data, but you can change this.
- The **Unit price** field typically contains a value from either a purchase agreement or a trade agreement. It's possible to change the unit price on individual order lines, for example if a unique price is negotiated with the vendor.
- The **Discount** field represents a discount amount per unit. This discount therefore reduces the unit price by the discount. This discount is commonly supplied automatically from purchase agreements or trade agreements, but it is possible to override on individual lines if unique discounts have been negotiated with the vendor.
- A discount percentage can be entered that reduces the net amount for the line accordingly. The discount percent is often supplied automatically from purchase agreements or trade agreements, but it is possible to override on individual lines if a unique discount percentage has been negotiated with the vendor.
- The value in the **Net Amount** field is calculated from other fields on the line including quantity, unit price, discount, and discount percent. It's possible to change the Net amount, but then the **Unit Price**, **Discount**, and **Discount percent** fields will be blank and when you post toward the line, the amount posted will be proportional to the net amount. Typically the **Net Amount** field is only used for displaying the net amount of the line.

8. Expand the **Line details** section.

9. Select the **Delivery** tab. A unique delivery date can be assigned to each order line. The date is inherited from the field on the purchase order header, but you can change this.

Review order totals

1. Select **Totals**.

- If you don't see the **Totals** action, select the **Purchase Order** tab on the Action Pane.
- This dialog box shows totals for the whole order.
- The **Selection** field allows you to change the basis of how totals are calculated. For example, you could choose **Product receipt quantity** to show totals that relate to the amount of the product(s) that have been received, or **Ordered quantity** to show the amount of product that was ordered.

2. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase order with a delivery schedule

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic demonstrates how to create a delivery schedule for a purchase order. A delivery schedule is used when a quantity on an order or a journal is requested to be delivered in multiple shipments. The example shown in this guide can be used in the USMF demo data company. This procedure would typically be done by a purchasing agent.

Create a delivery schedule

1. In the navigation pane, go to **Modules > Procurement and sourcing > Purchase orders > All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Vendor account** field, enter .
4. Select **OK**.
5. In the **Item number** field, enter .
6. In the **Quantity** field, enter .
7. Select **Purchase order line**.
8. Select **Delivery schedule**.
 - The **Delivery schedule** page allows you to specify the number of shipments in which the total quantity of the order line will be delivered from the vendor.
 - By default, the system copies the total quantity and other delivery details of the original purchase line into the first delivery schedule line. In this example, we'll create a schedule for two shipments, with the second shipment's date offset by a week from the first shipment.
9. In the **Quantity** field, change the quantity to .
10. Select **New**.
11. In the **Quantity** field, enter as the remaining quantity.
 - In the delivery date field, select a date that's one week after the date on the first delivery line.
 - You can keep track of the total quantity that's allocated to the delivery schedule lines by looking at the **Total** and **Remaining** fields. When the remaining quantity is zero, the full quantity from the original line has been allocated to the schedule.
12. Expand the **Charges conversion** section.
 - The options here allow you to control how you want charges to be distributed across the delivery schedule lines. If you select **Copy gross amounts**, the charge amount on the original order line is copied to each delivery line. The **Allocate to delivery lines** option divides the original line charge according to the quantity on each delivery line.
13. Collapse the **Charges conversion** section.
14. Select **OK**.
 - The delivery schedule has now been applied to the order.
 - The original order line, now referred to as a Commercial line, has been converted to an Order line with multiple deliveries. It is marked with a distinct icon and acts as a header for the delivery lines.
15. Select the second order line, which is the first of the two delivery lines.

- The two new lines, referred to as Delivery lines, make up one delivery schedule. The order will be processed against these lines and not the original line. If documents such as confirmations, product receipt journals, or invoices are printed, only the delivery lines are shown.

Change the delivery schedule

You can change the quantity on delivery lines. If you do this, the commercial line is automatically updated to the total quantity in the delivery lines.

1. In the **Quantity** field of the first delivery line, change the quantity from to .
2. Select the first order line (the commercial line).

- The quantity on the commercial line has been changed to 11.

Process product receipt using delivery schedules

The purchase order must be confirmed before the product receipt can be processed. In this example, receipt is recorded directly on the purchase order. The receipt could also have been recorded when the goods arrived in the warehouse.

1. On the Action Pane, select **Purchase**.
2. Select **Confirm**.
3. On the Action Pane, select **Receive**.
4. Select **Product receipt**. In the **Product receipt** field, type any value.
 - This field is used to enter a reference that will be used as voucher for the product receipt journal.
 - In the **Quantity** field, select **Ordered quantity**. This option means that the receipt will process for the quantity that the order lines were created with.
 - Make sure that the **Print product receipt** field is set to **No**. Printing isn't needed in this example.
5. Expand the **Lines** section.
 - Notice how the product receipt is created for the two delivery lines and not the original order line. If the receipt had been recorded in the warehouse, it would also have been recorded on the delivery schedule lines.
6. Collapse the **Lines** section.
7. Select **OK** to post the receipt.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase order for a one-time supplier

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create a purchase order for a one-time supplier. The supplier is created automatically with the purchase order, rather than having to create the vendor account manually. Purchase orders are typically created by a purchasing agent. The example shown in this guide can be used in the USMF demo data company. It is a prerequisite that a one-time vendor account has been set up in the Account payable parameters page.

Create a purchase order for a one-time supplier

1. Go to Procurement and sourcing > Purchase orders > All purchase orders.
2. Click New.
3. Select Yes in the One-time supplier field.
 - A vendor account is automatically created and assigned to the purchase order. The vendor account is created based on the template that is specified on the General tab in the Accounts payable parameters page.
4. In the Name field, type a name for the supplier.
5. Click OK.
 - The purchase order can now be completed and processed like any other order. There are no special characteristics related to how this is done. The invoice will account a due transaction on the vendor account that was created with the order, and payment will then be processed.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase release order when creating the purchase order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to use a purchase agreement when you create a purchase order. The purchase agreement has to be applied when you create the purchase order because there are general terms that should be copied to the purchase order header. Typically this task would be carried out by a purchasing agent. As a prerequisite for this guide, you must have an effective purchase agreement with a product quantity commitment for a vendor and items. The same procedure can be used if you have a purchase agreement with other types of commitments. You can run this guide in demo data company USMF. If you're using USMF, you can run the "Create a purchase agreement" guide first to set up the necessary preconditions for this guide.

Create a purchase order

1. Open the purchase order preparation workspace.
2. Click New purchase order.
3. In the Vendor account field, click the drop-down button to open the lookup.
4. In the list, find and select the desired record.
5. In the list, click the link in the selected row.
6. Toggle the expansion of the General section.
7. In the Purchase agreement field, click the drop-down button to open the lookup.
 - All available agreements for the vendor are listed here. Find the effective agreement that you want to use.
8. In the list, click the link in the selected row.
9. Click Yes.
10. Click OK.

Add a line

1. In the Item number field, type a value.
 - If there are specific inventory or location dimensions on the commitment you must enter the same values on the purchase order line to make use of the agreement.
2. In the Site field, click the drop-down button to open the lookup.
 - The site may already be populated with the default value from the order, or from the vendor. If this is the case, skip this step.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. In the Quantity field, enter a number.
 - Validate that the price is copied from the commitment.

Look up the commitment

1. Click Update line.
2. Click Attached.
 - Here you can get details for the purchase agreement. For example, you can see the price and whether the price and discount are fixed, which means that if you change price or discount on the purchase

order to a different value than on the commitment, the system will remove the link so the purchase order line does not fulfill the commitment. You can also see if the Max is enforced option is selected, which means that the quantity on the commitment cannot be exceeded by summing all of the purchases that fulfill the commitment.

3. Close the page.

Look up the purchase agreement

1. On the Action Pane, click General.

2. Click Purchase agreement.

3. Close the page.

4. Close the page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase release order from a purchase agreement

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to use a purchase agreement when you create a purchase order. The purchase agreement has to be applied when you create the purchase order because there are general terms that should be copied to the purchase order header. Typically this task would be carried out by a purchasing agent. As a prerequisite for this guide, you must have an effective purchase agreement with a product quantity commitment for a vendor and items. The same procedure can be used if you have a purchase agreement with other types of commitments. You can run this guide in demo data company USMF. If you're using USMF, you can run the "Create a purchase agreement" guide first to set up the necessary preconditions for this guide.

Create a purchase order

1. In the **Navigation pane**, go to **Workspaces > Purchase order preparation**.
2. Click **New purchase order**.
3. In the **Vendor account** field, click the drop-down button to open the lookup.
4. In the list, find and select the desired record.
5. In the list, click the link in the selected row.
6. Expand the **General** fastTab.
7. In the **Purchase agreement** field, click the drop-down button to open the lookup. All available agreements for the vendor are listed here. Find the effective agreement that you want to use.
8. In the list, click the link in the selected row.
9. Click **Yes**.
10. Click **OK**.

Add a line

1. In the **Item number** field, type a value. If there are specific inventory or location dimensions on the commitment you must enter the same values on the purchase order line to make use of the agreement.
2. In the **Site** field, click the drop-down button to open the lookup. The site may already be populated with the default value from the order, or from the vendor. If this is the case, skip this step.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. In the **Quantity** field, enter a number. Validate that the price is copied from the commitment.

Look up the commitment

1. Click **Update line**.
2. Click **Attached**. Here you can get details for the purchase agreement. For example, you can see the price and whether the price and discount are fixed, which means that if you change price or discount on the purchase order to a different value than on the commitment, the system will remove the link so the purchase order line does not fulfill the commitment. You can also see if the Max is enforced option is selected, which means that the quantity on the commitment cannot be exceeded by summing all of the purchases that fulfill the commitment.
3. Close the page.

Look up the purchase agreement

1. On the **Action Pane**, click **General**.
2. Click **Purchase agreement**.
3. Close the page.
4. Close the page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase return order

2/18/2021 • 4 minutes to read • [Edit Online](#)

This procedure shows you how to create a purchase return order by using the Credit note action to copy lines from a vendor invoice document to a new PO. It also shows you how to confirm the order and process shipment of the goods back to the vendor. The example shown in this procedure can be used in the USMF demo data company. This task would typically be carried out by a purchasing agent.

Create a new purchase return order

1. Go to **Navigation pane > Modules > Procurement and sourcing > Purchase orders > All purchase orders**. The first step is to create a new purchase order to be used as the purchase return order.
2. Click **New**.
3. In the **Vendor account** field, enter "US-102".
4. Click **OK**.
5. On the **Action Pane**, click **Purchase**.
6. Click **Credit note**. This is the page from which you can copy from an existing vendor invoice to your return order. This is the same page that's used for other copy actions. But because we've opened it from the Credit note action, the page is configured to support the creation of a return order that offsets vendor invoices.
7. Expand the **Parameters** section.
 - The **Invert sign** option is automatically selected, and cannot be changed. This ensures that the sign is changed for the quantities, and that order lines that are added will offset the vendor invoice.
 - The **Copy charges** option is automatically selected, and cannot be changed. This means that charges from the vendor invoice are added to the purchase return order to offset the original charge. It's possible to modify the changes on the order header and lines later.
 - The **Copy precisely** option is automatically selected, and cannot be changed. This ensures that an exact copy is made of the values in all the fields on the vendor invoice header and lines. This means that a purchase return order is created with values that match all terms used with the vendor invoice document.
 - The **Delete purchase lines** option deletes any purchase order lines that already exist on the purchase order before adding the new lines. In this example we have not yet added any lines to the purchase return order, so there wouldn't be any effect. Use this option with caution, as it deletes all existing lines without further warning.
 - The **Copy order header** option is automatically selected, and cannot be changed. This ensures that information is copied from the vendor invoice and applied to the purchase return order header. This is useful because it helps to ensure that the purchase return order offsets the invoice by using similar terms.
8. Collapse the **Parameters** section.
9. Expand the **Invoices** section. The page has been opened from the Credit note action, so the only option available is to copy information from vendor invoices. This tab shows all the available invoices for the vendor account that's specified on the purchase return order that you created earlier. The invoices are

identified by the invoice voucher or the purchase order IDs.

10. Locate the vendor invoice identified by invoice number AP-0006, and highlight that line by clicking on any field in that line.
11. Select the line by clicking in the check box for the line. Notice that the lines available on the vendor invoice are automatically selected together with the order. This particular vendor invoice has 2 order lines. For this example, we'll return part of the quantity from the second line.
12. Highlight the second line (the one with item M0006) by clicking on any field in that line.
13. In the **Quantity** field, change the quantity to 10. This is the quantity that we'll return to the vendor.
14. Highlight the first line (the one with item M0005) by clicking on any field in that line.
15. Clear the check box for the line. Only the lines that you've selected will be copied to your order.
16. Collapse the **Invoices** section.
17. Expand the **Selected lines or header to be copied** section. This view shows a summary of all the documents and lines that you've selected to be copied to your order.
18. Collapse the **Selected lines or header to be copied** section.
19. Click **OK**. The line that you selected has now been copied to your purchase return order. The **Quantity** field shows -10.
20. In the **Purchase order line** section, click **Inventory**.
21. Click **Marking**. The order line that was created is marked against the inventory transaction from the vendor invoice. This ensures that the inventory that's returned to the vendor is the same as the inventory that was received from them earlier. There are some situations where marking does not occur, for example, if the inventory has already been marked as Consumed, or if the product is one that doesn't use marking.
22. Click **OK**.

Confirm and record the shipment of goods

1. Click **Actions > Confirm**.
2. On the **Action Pane**, click **Receive**.
3. Click **Product receipt**.
 - This page is used to record product receipt for purchase orders and also to process the return of goods back to the vendor. Order lines with a negative quantity mean that goods are to be returned to the vendor, and the document that can be generated from this page can be used as packing slip for this use.
 - In the **Quantity** field, select **Ordered quantity** for this example. This ensures that the shipment will be processed for the full ordered quantity that the order lines were created with.
4. In the **Product receipt** field, type a value. This field is used to enter a reference that will be used as a voucher for the product receipt journal.
5. Click **OK**. The goods have now been recorded as shipped on the purchase return order, and a product receipt journal has been created. You can use the **Product receipt** action to review the journals created with the purchase order, and see what was received or returned, and when.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create project purchase order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create a project purchase order. This task uses the USSI data set.

1. Go to Project management and accounting > Projects > All projects.
2. In the list, click the link in the selected row.
3. On the Action Pane, click Manage.
4. Click Item task.
5. Click Purchase order.
6. In the Vendor account field, enter or select a value.
7. In the Site field, enter or select a value.
 - These steps aren't required, but they do simplify the purchase order by setting up a default site and warehouse for the purchase order lines.
8. In the Warehouse field, enter or select a value.
9. Click OK.
10. In the list, mark the selected row.
11. In the Item number field, enter or select a value.
 - This can be the item number or a procurement category.
12. Expand the Line details section.
13. Click the Project tab.
 - Verify that the sales and cost prices are available. If they are not available but needed, enter the information.
14. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a repeat purchase order

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic shows you how to create a repeat purchase order (PO) by copying lines from an earlier purchase order document to a new PO or to an existing PO. There are two methods for creating repeat orders. You can use the actions available at the document level from the Action Pane, or you can use the line detail actions. The document level actions are mainly intended for creating a new purchase order by adding lines and header information from another order, while the line details action is mainly for adding lines to an existing order. The example shown in this guide can be used in the USMF demo data company. This task would typically be carried out by a purchasing agent.

Create a new repeat purchase order

1. In the navigation pane, go to **Modules > Procurement and sourcing > Purchase orders > All purchase orders**. First we'll try the option for copying information to a new order.
2. Select **New**.
3. In the **Vendor account** field, enter .
4. Select **OK**.
5. On the Action Pane, select **Purchase order**.
6. Select **From all**. This is the page from which you can copy from existing orders to your order. There are different options for how the lines are copied, and different kinds of documents that you can copy from. We'll look at the options for how lines are copied first.
7. Expand the **Parameters** section.
 - The **Quantity factor** field is useful if you need to use a quantity that is different than the one that's on the order that you're copying from. For instance, if you want to order twice the quantity that's in the lines that you're copying from, you'd type '2' in this field and then the system will add lines where the original quantity has been doubled.
 - The **Invert sign** field also supports changing the ordered quantity by changing the sign of the quantity for order lines that are added. This may be useful if you need to reverse a transaction, by creating order lines that negate the transaction. This option is automatically selected when the page is opened from the **Create credit note** action.
 - The **Copy charges** option allows you to copy charges to your new order from the document that you're copying the order lines from.
 - The **Recalculate prices** option uses the current prices and discounts rather than copying these from the document that you're copying other information from.
 - The **Copy precisely** option creates an exact copy of the values in all the fields on the order document header and lines. If this option is not selected, default values are used for many of the fields relating to the vendor and products just as if you were creating the new order manually. For example, if the order that you're copying from had overridden the default Invoice account for the vendor, that same Invoice account would be copied to your order. If you didn't select the **Copy precisely** option, the default Invoice account for the vendor would be used on your order instead.
 - The **Delete purchase lines** option deletes all purchase order lines that already exist on the purchase order that you're copying to, before applying the new lines. Use this option with caution, as it deletes all existing lines without further warning.

- If you use the **Copy order header** option, you don't need to manually create the header information on your new order. Note that this option will result in default values being used for the fields associated with the vendor. If the document that you're copying from has non-default values that you want to copy, use the **Copy precisely** option as well.
 - There are different document sources that you can copy from, and each has a separate section on this page. For example, the **Purchase orders** section allows you to copy from existing purchase orders.
8. In the **Purchase orders** section, select the lines you'd like to be copied to your clipboard. It's possible to select additional purchase orders lines from other purchase orders and copy them to your order as well. It's also possible to add lines from other kinds of purchase documents. The next few steps review the different options.
 9. Expand the **Confirmation** section. Here you can select purchase order confirmations to copy from. The purchase order confirmations are identified by the associated purchase journal ID or the purchase order ID.
 10. Expand the **Product receipts** section. Here you can select product receipt journals to copy from. The product receipt journals are identified by the product receipt voucher or the purchase order ID.
 11. Expand the **Invoices** section. Here you can select vendor invoices to copy from. The invoices are identified by the invoice voucher or the purchase order ID.
 12. Expand the **Selected lines or header to be copied** section. This view shows a summary of all documents and lines that have been selected to be copied to your order.
 13. Select **OK**. The lines that you selected have been copied to your new purchase order.

Copy lines to an existing purchase order

Instead of copying an entire order, it's more common to create a new PO and complete information on the PO header, and then copy individual lines from existing orders.

1. Select **Purchase order line**.
2. Select **From all**. The page that opens is identical to the one shown before, but different options are selected when it's opened from the order lines view. Let's review the parameters.
3. Expand the **Parameters** section.
 - The **Delete purchase lines** option is not selected. This means that you can copy new lines to your order without removing existing lines.
 - The **Copy order header** option is also not selected, as we're only adding additional lines to the order.
 - For this example, we'll copy lines from an existing purchase order.
4. Select the line for the desired purchase order. Notice that the single order line that's on this PO is also selected.
5. Select **OK**. The additional order line has been added to your purchase order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a requisition for consumption

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the process of creating a requisition. It shows you different ways to search for products in your procurement catalog and how to add a product that isn't in your catalog. Before you start this procedure, you must have a purchasing policy set up with Consumption as the default type of requisition. You can walk through this procedure in demo data company USMF, or using your own data. The procedure can only be carried out by a user profile that is set up as worker. This task would normally be carried out by an employee. The **Employee** employ security role will allow you to carry out the tasks, or if you're using USMF, you can log in as **Alicia**.

Create a new requisition

1. Go to **Navigation pane > Modules > Procurement and sourcing > Purchase requisitions > Purchase requisitions prepared by me**.
2. Select **New**.
3. In the **Name** field, give the requisition a name.
4. In the **Requested date** field, enter a date. By default, the requested date and accounting date are copied to the purchase requisition lines. They can be changed at the line level. The requested date is the requested delivery date.
5. In the **Accounting date** field, enter a date. The accounting date is used to record the accounting entry in the general ledger, and to validate whether budget funds are available.
6. Select **OK**.
7. In the **Reason** field, select an option from the drop-down menu. By default, the business justification reason that you select appears for the purchase requisition lines, but you can change it at the line level.
8. Select the reason.
9. In the **details** field enter a more descriptive justification for the requisition.

Add a line to the requisition

1. Select **Add line**. There are two ways of adding lines to the purchase requisition. If you already know the product number or you already know that you are requesting a product that is not in the product catalog, then you can add the line directly with **Add line**. The other way is to use **Add products** where you can use searching and filtering to find items in the product catalog.
2. Select the row you just created.
 - The requester is the worker that has requested the requisition.
 - By default the person preparing the requisition is the worker who has requested it. You have to be given permission to prepare a requisition line on behalf of another worker. If you have such permissions then the other workers will show up in this lookup.
3. In the **Item number** field, type a value. The items that are available for you to choose are limited by the category access policy and the procurement catalog for the buying legal entity.
4. In the **Quantity** field, enter a number.

Add more products to the requisition

1. Select **Add products**. This is the option where you can search for products in the product catalog.
2. In the **Find procurement category node** field, enter the first part of the name of the category that you are

looking for, and then select **Enter**. For example, enter .

3. Use the **InvokeDefaultButton** shortcut.
4. Use the **Filter** to filter the list of products in the selected category.
5. Select the product card that you want to add to the requisition.
6. Select **Add to lines**.
7. In the **Quantity** field, enter a number.
8. In the **Find procurement category node** field, type the first part of the name of the category that you are looking for, and then select **Enter**. For example, enter (highlighters).
9. Use the **InvokeDefaultButton** shortcut.
10. Select **Add unlisted product to lines** to add a product that's not listed in the procurement catalog.
11. In the **Product name** field, type a value.
12. In the **Unit** field, type a value.
13. Select **OK**.
14. In the **Item description** field, add a description of the product.
15. In the **Quantity** field, enter a number.
16. In the **Unit price** field, enter a number. If you know the price for a particular vendor (that you select in the vendor account field) then that price can be entered.
17. In the **Vendor account** field, open the drop-down list to select an option. The vendors that are available in this field depend on the purchasing policies and the status that the vendor has for the current procurement category. As an alternative to selecting a vendor here, you can select **Suggest vendor**.
18. In the list, select the vendor you want to use.
19. In the **External item number** field, type a value. This is a reference number for the product that is known by the vendor. For example, this could be the item number of the product in the vendor's own catalog.
20. Select **OK**.

Distribute amounts

1. Select **Financials**.
2. Select **Distribute amounts**. This process shows you how to distribute the cost for the first line between 2 accounts. This can also be done later when the requisition is in review.
3. Select **Split** to create a new distribution line.
4. In the **Ledger account** field select the first cost center that should take part of the cost.
5. Select the other distribution line.
6. In the **Ledger account** field specify the other cost center.
7. Select **Distribute equally**.
8. Close the page.

View line details

1. Toggle the expansion of the **Line details** section.

Submit the requisition

1. Select **Workflow** to open the drop dialog.
2. Select **Submit**.
3. Close the page.
4. In the **Comment** field, type a note for the approver of the requisition.
5. Select **Submit**.
6. Close the page.

7. Refresh the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Purchase agreements

2/18/2021 • 7 minutes to read • [Edit Online](#)

This article provides information about purchase agreements. A purchase agreement is a contract that commits an organization to buy a specified quantity or amount by using multiple purchase orders over time. In exchange for this commitment, the buyer receives special prices and discounts.

Purchase agreements can apply to a specific quantity of a product, a specific currency amount of a product, or a specific currency amount of the products in a procurement category. The prices and discounts of the purchase agreement override the prices and discounts that are specified in any trade agreements that exist.

On the **Purchase agreements** page, you can create, apply, and follow up on purchase agreements that exist between your organization and your vendors. For example, after you create a purchase agreement, you can order directly from it. Each purchase agreement has a validity period that is defined by the person who creates the purchase agreement. The delivery date of a purchase must be within the effective dates of this validity period.

After you create a purchase agreement, you must activate it before it becomes effective. To activate a purchase agreement, set the **Mark agreement as effective** option to **Yes**.

To prevent your purchase agreement from being used and confirmed, mark the agreement status as **Closed**. You can still update the status to **Effective** any time after making this change.

Responsible workers on purchase agreements

You can identify a primary responsible worker and secondary responsible worker on the purchase agreement classification. These values will be inherited by the resulting purchase agreement. You're not required to add responsible workers to the purchase agreement, and they can be modified directly on a per case basis on the purchase agreement itself. You can't specify a secondary responsible worker without a primary responsible worker, although you don't have to have a secondary responsible worker. You can't specify the same worker as both the primary and secondary responsible worker.

IMPORTANT

Before you can use the responsible party feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Procurement and sourcing*
- **Feature name:** *Purchase agreement responsible party*

Commitment types

Each line in a purchase agreement is a commitment to buy something. You can use lines from multiple purchase orders (POs) to fulfill the commitment. There are four types of commitments:

- **Product quantity commitment** – You purchase a specific quantity of a product.
- **Product value commitment** – You purchase a specific currency amount of a product.
- **Product category value commitment** – You purchase a specific currency amount in a procurement category. The amount can be for a catalog item or a non-catalog item.
- **Value commitment** – You purchase a specific currency amount of any product or products in any

procurement category.

Pricing terms for purchase agreements

Pricing terms can vary, depending on the type of commitment. The pricing terms from purchase agreements override any other pricing terms that are set up for trade agreements. The following table describes the price-related fields that are affected by each commitment type. Fields that contain **Yes** can be updated on an order line.

COMMITMENT TYPE	UNIT PRICE	PRICE UNIT	DISCOUNT PERCENT	CASH DISCOUNT AMOUNT
Product quantity commitment	Yes	Yes	Yes	Yes
Product value commitment			Yes	
Product category value commitment			Yes	
Value commitment			Yes	

Policies for purchase agreements

The following policies affect the way that the link between a purchase agreement commitment and the corresponding PO lines works:

- **Max is enforced** – The total quantity or amount for all order lines can't exceed the quantity or amount that is specified on the related commitment.
- **Price and discount is fixed** – The price on an order line and the price on the related commitment must be the same. If the price is changed on the order line, the link to the commitment is broken. If the link is broken, the order line doesn't contribute to the fulfillment of the commitment.
- **Minimum release amount and Maximum release amount** – If an amount is specified, you receive a message if you make any change to an order line that causes the order line to differ from the related commitment.

Fulfillment calculations for purchase agreements

Fulfillment quantities and amounts are shown on the **Fulfillment** tab on the **Line details** FastTab of the **Purchase agreements** page.

The **Fulfillment** area shows the remaining amount or quantity that is required to fulfill the commitment.

The **Agreement** area shows the total quantity or the total amount that the sales agreement line is valid for.

You can access the PO lines and the invoice lines that contribute to the fulfillment calculation by selecting the **Related information** action on the lines or on the header of a purchase agreement.

Confirmations and version history for purchase agreements

When you confirm a purchase agreement, the current version of the purchase agreement is stored in a history table. If you change the purchase agreement, you can confirm it again to store another version of the purchase agreement in the history. If you don't confirm a purchase agreement, you can still use it to create POs. However, the history information for the purchase agreement isn't stored. You can preview or print all versions of the

agreement. You can then share the revisions with your vendor to obtain approval.

Applying purchase agreements in the ordering process

When you create a PO, you can apply a purchase agreement to it. Information from the terms for the agreement, such as the payment terms, delivery terms, and delivery address, is then copied to the header of the PO. If the PO contains one or more lines for products or categories that are covered by the agreement, the prices and discounts from the purchase agreement are used for those lines. The amount or quantity on the order line contributes to the fulfillment of the commitment in the purchase agreement. The same PO can include both lines that aren't related to a purchase agreement and lines that have a commitment for a purchase agreement.

You can select a purchase agreement only when you're creating a PO. You can't select a purchase agreement after the PO has been created.

In some situations where POs are created indirectly, you can control whether Supply Chain Management automatically searches for applicable purchase agreements. For example, you might do this when you're automatically firming planned POs or creating POs that are based on sales orders.

Matching policy on purchase agreements

You can define a line matching policy on the header of the purchase agreement. This line matching policy will respect the accounts payable parameters line matching policy when the **Allow matching policy override** field on the **Accounts payable parameters** page (on the **Price and quantity matching** FastTab) is set to **Higher than company policy**. Documents that reference the purchase agreement will use the line matching policy that's defined on the purchase agreement header unless otherwise defined on the corresponding item, item and vendor, or category purchasing policy.

Purchase agreements and intercompany trade

Intercompany trading relationships can be created between vendor accounts and customer accounts that are in different legal entities. When a sales order or PO is created for one of the parties, an intercompany order chain is created. In the order chain, the sales order and PO are created in the appropriate legal entities.

You can create a purchase agreement or sales agreement for one of the intercompany trading parties. You can then generate the corresponding sales agreement or purchase agreement for the other intercompany trading party in the other legal entity.

If you create an intercompany PO that uses the intercompany purchase agreement in one legal entity, the corresponding intercompany sales order uses the corresponding intercompany sales agreement in the other legal entity. The fulfillment of the sales agreement commitments and the fulfillment of the purchase agreements are synchronized, just as the intercompany sales order and the intercompany PO are synchronized.

Financial dimensions on purchase agreements

You can copy financial dimensions to document headers or to individual lines of a purchase agreement. If you change the dimensions in the agreement header or on the agreement line, the change doesn't affect any released orders, but it will be reflected on any new orders.

Create a purchase agreement

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic guides you through the creation of a purchase agreement. This would typically be done by a purchasing manager. You can use this procedure in demo data company USMF or on your own data. You need to have set up purchase agreement classifications before you start. Once you've created an agreement you can use it when you create a PO, and this will copy the purchase agreement conditions to the header and to any lines in the order that are affected by the agreement.

Create a new purchase agreement

1. Go to **Navigation pane > Modules > Procurement and sourcing > Purchase agreements > Purchase agreements**.
2. Click **New**.
3. In the **Vendor account** field, select the drop-down menu and select the row of the desired record.
4. In the **Purchase agreement classification** field, select the drop-down menu and select the row of the desired record.
5. Expand the **General** FastTab.
6. In the **Expiration date** field, enter a date.
 - This expiration date will be the default for all commitment lines and will determine how long each specific commitment is valid.
7. In the **Document title** field, type a name for your purchase agreement.
 - Leave the **Default commitment** field set to **Product quantity commitment** (or change it if it's not set to this).
 - The default commitment value determines your options on the agreement lines. If you need a new commitment type when you're creating the agreement lines, you need to change the default commitment on the header. There are 4 types of commitments: **Product quantity commitment** - for a specific quantity of a product; **Product value commitment** - for a specific currency amount of a product; **Product category value commitment** - for a specific currency amount in a procurement category where the amount can be for a catalog item or a non-catalog item; **Value commitment** - for a specific currency amount which can be fulfilled by any product or by any procurement category.
8. Select **OK**.

Add a commitment

1. Select **Add line**.
2. In the **Item number** field, select the desired record from the drop-down menu.
3. In the **Quantity** field, enter a number. This is the total quantity that you have agreed to buy from your vendor.
4. In the **Unit price** field, enter a number.
5. Expand the **Line details** section.
6. Set the **Max is enforced** option to **Yes**. The **Max is enforced** option limits the use of the commitment. You can only purchase up to the quantity that's specified in the **Quantity** field for the line.

Add header conditions

1. On the Action Pane, select **Options**.
2. Select **Change view**.
3. Select **Header view**.
4. Expand the **Terms** section.
5. In the **Method of payment** field, select the desired record in the drop-down menu. The payment terms from the vendor account are shown here by default.
6. In the **Mode of delivery** field, select the desired record in the drop-down menu.
7. In the **Delivery terms** field, select the drop-down button to open the lookup.

Confirm and activate the agreement

1. On the Action Pane, select **Purchase agreement**.
2. Select **Confirmation**. Set the **Mark agreement as effective** option to **Yes**.
3. Select **OK**.
4. On the Action Pane, select **Purchase agreement**.
5. Select **Purchase agreement confirmations**. The **Preview/Print** option allows you to generate a document for the purchase agreement which you can then print or send to the vendor. If you update the agreement later on and re-confirm it, both versions will be shown here.
6. Close the page.

Automatic allocation of charges

2/18/2021 • 9 minutes to read • [Edit Online](#)

Based on the customer that you're working with or the item that you're selling, you might want to apply specific additional charges. The *charges* feature in Microsoft Dynamics 365 Supply Chain Management helps you automatically allocate charges to purchase orders or sales orders.

Automatic charges, or auto charges, are automatically applied when you create a sales order or a purchase order. You can define auto charges for specific vendors, customers, groups of vendors, or items. You can also define auto charges that apply to all vendors, customers, or items.

Set up charges codes

To allocate charges, you must first define charges codes.

1. Follow one of these steps:
 - For purchase orders: Go to **Accounts payable** > **Charges setup** > **Charges code**.
 - For sales orders: Go to **Accounts receivable** > **Charges setup** > **Charges code**.
2. On the Action Pane, select **New** to create a charges code.
3. In the header of the new record, set the following fields:
 - **Charges code** – Enter a code for the charges.
 - **Description** – Enter a description of the charges.
 - **Item sales tax group** – Select an item sales tax group, if applicable.
 - **Prorate** – Set this option to *Yes* if you want to prorate your charges. This option is available only for sales orders.
 - **Maximum amount** – Enter the maximum amount that is allowed for the charges code. This field is used to validate charges for vendor invoices. It's available only for purchase orders.

NOTE

To turn on the functionality for validating charges for purchase orders, go to **Accounts payable** > **Setup** > **Accounts payable parameters**. On the **Invoice validation** FastTab, in the **Invoice validation** section, set the **Enable invoice matching validation** option to *Yes*.

4. The **Posting** FastTab includes **Debit** and **Credit** sections. Set the following fields, depending on the ledger that you want to post the charges to:
 - **Type** – Select the type of account that you're posting to (*Ledger, Customer, or Item*).
 - **Posting** – Select the type of postings to create (such as *Broker fee* or *Customer settlement*).
 - **Account** – Select the account to post the charge for.
5. On the Action Pane, select **Save**.

Create charge groups

Charge groups automatically allocate specific charges to a group of customers or vendors. The following subsections describe how to create and assign these charge groups.

Charge groups for purchase orders

To create charge groups for purchase orders, follow these steps.

1. Go to **Accounts payable > Charges setup > Vendor charges group**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
 - **Charges group** – Enter the name of the charge group.
 - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.
4. Go to **Accounts payable > Vendors > All vendors**, and either open an existing vendor or create a new vendor.
5. On the **Purchase order defaults** FastTab, in the **Purchase order** section, set the **Charges group** field to the charge group that you just created.

Charge groups for sales orders

To create charge groups for sales orders, follow these steps.

1. Go to **Accounts receivable > Charges setup > Customer charge groups**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
 - **Charges group** – Enter the name of the charge group.
 - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.
4. Go to **Accounts receivable > Customers > All customers**, and either open an existing customer or create a new customer.
5. On the **Purchase order defaults** FastTab, in the **Sales order** section, set the **Charges group** field to the charge group that you just created.

Define auto charges

After your charges codes are set up, follow these steps to define the auto charges.

1. Follow one of these steps:
 - For purchase orders: Go to **Procurement and sourcing > Setup > Charges > Automatic charges**.
 - For sales orders: Go to **Accounts receivable > Setup > Charges setup > Auto charges**.
2. In the list pane, in the **Level** field, select the level where your auto charge applies:
 - *Main* – Apply charges to the order header.
 - *Line* – Apply charges to the order lines.
3. Select an existing auto charge to edit it, or select **New** to define a new auto charge.
4. In the **Account code** list, select one of the following values to specify the scope of accounts that will be affected:
 - *Table* – Assign charges to a specific customer or vendor.
 - *Group* – Assign charges to a miscellaneous charges group.
 - *All* – Assign charges to all customers or vendors.
5. In the **Customer relation** or **Vendor relation** field, select a specific customer or vendor if you set the **Account code** field to *Table*. If you set the **Account code** field to *Group*, select a customer or vendor

charges group.

6. In the **Item code** field, select one of the following values to specify the scope of items that will be affected. You can select an item code only when you define auto charges at the line level.
 - *Table* – Assign charges to a specific item.
 - *Group* – Assign charges to an item charges group.
 - *All* – Assign charges to all items.
7. In the **Item relation** field, select a specific item if you set the **Item code** field to *Table*. If you set the **Item code** field to *Group*, select an item charges group.
8. **For sales orders only:** In the **Mode of delivery code** field, select one of the following values to specify the scope of delivery modes that will be affected:
 - *Table* – Assign charges to a specific mode of delivery.
 - *Group* – Assign charges to a mode of delivery group.
 - *All* – Assign charges to all modes of delivery.
9. **For sales orders only:** In the **Mode of delivery relation** field, select a specific mode of delivery if you set the **Mode of delivery code** field to *Table*. If you set the **Mode of delivery code** field to *Group*, select a mode of delivery group.
10. On the **Lines** FastTab, define the charges and the charges rates that will be used when the current auto charge is applied. You can use the toolbar on this FastTab to add as many lines as you require. For each line, set the following fields:
 - **Currency** – Select the currency that should be used to calculate the charge.
 - **Charges code** – Select the code for the charge.
 - **Category** – Select one of the following values:
 - *Fixed* – The charge is entered as a fixed amount on the line. Fixed charges can be used on charges both in the order header and on the order lines.
 - *Pcs* – The charge is based on the unit. These charges can be used only on order lines. They will appear when you calculate the order total.
 - *Percent* – The charge is entered as a percentage on the line. Percentage charges can be used on charges both in the order header and on the order lines.
 - *Intercompany percent* – The charge is entered as a percentage on the line for intercompany orders. Intercompany percentage charges can be used only on order lines.
 - *External* – The charge is calculated by a third-party service that is associated with one or more shipping carriers.
 - **Charges value** – Enter the charge value, based on the category that you selected.
 - **Charges currency code** – Specify a currency for the charge if you want to use a currency other than the currency that you specified in the **Currency** field. You can use a different currency only if the **Debit type** or **Credit type** field is set to either *Ledger account* or *Item* for the selected charges code.
 - **From amount** – Specify a starting amount to apply the auto charge to. In this context, the amount refers to the order total.
 - **To amount** – Specify the ending amount to apply the auto charge to. In this context, the amount refers to the order total.
 - **Sales tax group** – Specify a sales tax group.
 - **Site and Warehouse** – Specify a site and warehouse if charges should be applied only for a

specific site and warehouse.

- **Keep** – Select this check box to keep the charges transactions after invoicing is completed, so that the charge will be applied every time that you create a new invoice for the selected customer account.

11. **For sales orders only:** If you want to calculate tiered charges, see [Tiered charges on sales orders](#) for information.

Allocate charges from the header to a line

The following procedure shows how to allocate header-level charges to a line. Before you start this procedure, you should already have a header-level charge of the *fixed amount* type and an order where that charge is applied. Additionally, the order should already include at least one line item.

1. Open the purchase order or charge order.
2. On the Action Pane, follow one of these steps:
 - For purchase orders: On the **Purchase** tab, in the **Charges** group, select **Allocate charges**.
 - For sales orders: On the **Sell** tab, in the **Charges** group, select **Allocate charges**.
3. In the **Allocate charges to order lines** dialog box, set the following fields:
 - **Charges allocation** – Select one of the following values to specify how the charges should be allocated:
 - *Net amount* – Allocate charges according to each line amount relative to the total net amount.
 - *Quantity* – Allocate charges according to the number of units for each line relative to the total number of units.
 - *Per line* – Allocate charges equally among the total number of lines.
 - **Allocate charges to lines** – Select a value to specify whether charges should be allocated to all lines, to positive lines only, or to negative lines only.
 - **Allocate all** – Select this check box to allocate charges to order lines even if the charges code has a debit type other than *Item*.
 - **Received** – Select this check box to allocate charges only to received order lines.
 - **Stocked** – Select this check box to allocate charges to only inventoried order lines.
 - **Show selections and clear specific lines** – Select this check box to exclude specific lines from this allocation. When you select this check box, the **Choose lines to exclude from allocation** grid is opened. This grid includes only lines that match the criteria that are defined by the **Allocate charges to lines** and **Stocked** settings. For example, if you set the **Allocate charges to lines** field to *Positive lines* and select the **Stocked** check box, the grid shows only lines that are both positive and inventoried. In addition, the grid automatically filters out any lines that the full quantity has already been received for. While the grid is open, clear the **Include** check box for each line that should be excluded from allocation.

IMPORTANT

When you work with the **Choose lines to exclude from allocation** grid, be sure to leave the grid open until you select **Allocate**. If you close the grid before you select **Allocate**, your settings in the grid will be lost. Therefore, charges will be allocated based on the criteria that you previously defined.

4. Select **Allocate** to apply your settings and close the dialog box.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor rebates

2/18/2021 • 9 minutes to read • [Edit Online](#)

Vendor rebates help companies better manage their supplier rebate programs by automating tasks that are required in order to administer, track, and claim rebates that are earned.

This topic provides an overview of the most common tasks that you might want to perform when you work with vendor rebates. The overview covers the following tasks:

- Review details of a rebate agreement.
- Identify orders that qualify for rebates, and generate rebate claims.
- Review and approve claims.

Audience and purpose

The information in this topic is intended for business decision makers in enterprise companies, in positions such as purchase manager, chief financial officer (CFO), and accounting manager, who have the following responsibilities:

- Negotiate vendor price, discount, and rebate agreements.
- Manage staff that processes rebate claims and collects payments.
- Order inventory at the best possible prices.

People in these positions are looking for ways to achieve various goals. Here are some examples:

- Flexibly accommodate different types of vendor promotion programs and rebate conditions.
- Reduce the administrative burden and errors that are associated with monitoring promotion performance and processing claims.
- Improve cash flow forecasts by accruing for future receivables.
- Have a quantified basis for ongoing and future negotiations with vendors about rebates.

Review details of a vendor rebate agreement

A vendor rebate agreement is a record of a contract with a vendor that specifies the negotiated terms and conditions under which the company qualifies for a monetary reward in return for achieving preset purchase targets. Vendor rebate agreements are recorded on the **Rebate agreements** page.

To open the **Vendor rebate agreements** page, select **Procurement and sourcing > Vendor rebates > Rebate agreements**.

Vendor rebate agreements

OVERVIEW GENERAL NOTE DIMENSIONS

Workflow approval status	Rebate program ID	Vendor code	Vendor selection	Item code	Item selection	Unit	Unit type	Minimum qua...	Minimum amo...	Start date	Expiry date
Approved	Promo	Table	US-101	Table	T0020	ea	Inventory unit	10	0,00	2/1/2014	Never

CUMULATE: Cumulate purchases by: Month
 PRICE: Taken from: Gross
 ACCOUNTS: Rebate program accrual account: 130701
 CURRENCY: Currency: USD
 APPROVAL: Approval required: Yes
 LINE BREAKS: Rebate line break type: Quantity
 VALIDATION: Validated: Yes
 Period type:
 Rebate program expense account: 520202
 Validated by: 000020

LINES

Vendor code	Vendor selection	Item code	Item selection	Currency	Unit	Rebate line br...	From value	To value	Value	Amount type
Table	US-101	Table	T0020	USD	ea	Quantity	10,00	20,00	15,0000	Amount per unit
Table	US-101	Table	T0020	USD	ea	Quantity	20,00	0,00	30,0000	Amount per unit

On the **Vendor rebate agreements** page, you can view details about the negotiated conditions of a vendor agreement.

The agreement's header specifies the general conditions that qualify a company for rebates. In effect, the header information specifies that a vendor grants a rebate when a specific product is bought in a specific quantity. On the header, you also specify the unit of measure rebate option and the calculation date type.

- On the **Overview** tab, if you have lines with **Item code** set to *table* to specify the item, then the agreement is for that specific item. If you have lines with **Item code** set to *Group* or *All* to specify the items, then the vendor rebate agreement will be individually processed per item qualifying for the item code, not across all items qualifying for the item code.
- On the **General** tab, in the **Unit of measure rebate option** field, you can define whether a unit of measure should be a condition for the purchase order line to qualify for a rebate claim.
 - **Convert** – A purchase order line qualifies for a vendor rebate per the rebate agreement. You will receive a rebate regardless of the unit of measure that is applied on the line.
 - **Exact match** – To qualify for a rebate, a purchase line must have the same unit of measure that is specified on the agreement.
- On the **General** tab, in the **Calculation date type** field, select the date that is used to determine whether the purchase occurs in the validity period of the rebate agreement.
 - **Created** – Use the creation date of the purchase order.
 - **Requested delivery** – Use the requested delivery date.

On the agreement lines, you can specify the vendor rebate agreement in more detail.

- In the **Cumulate purchase by** field, you can set the calculation of the rebate claim. The amount can be set to depend on a period (of week, month, year, lifetime or a customized period). The **Invoice** value indicates that a rebate claim will be determined every time that a purchase order line is invoiced.
- In the **Taken from** field, you can specify the basis for the rebate calculation.
 - **Gross** – The rebate is calculated based on the gross price of the item.
 - **Net** – The rebate is calculated based on the net price of the item (that is, the price after other discounts have been applied).
- The **Rebate program accrual account** and **Rebate program expense account** fields specify account numbers that will receive accrued rebate amounts during the intermediate stage between approval and processing.
- When the **Approval required** option is set to **Yes**, the rebate claim must be approved before it can be

accrued or paid out.

- The **Rebate line break type** field specifies the basis for the rebates.
 - **Quantity** – The rebates are volume-based.
 - **Amount** – The rebates are amount-based.
- On the **Lines** FastTab, you can see how different quantity tiers can be set up to grant different rebates. For example, in the previous illustration, the **From value** and **To value** fields indicate that a product quantity between 10 and 19 units will qualify for a rebate of USD 15 per unit.

NOTE

The **From value** value is inclusive, whereas the **To value** value is exclusive. For example, the **Rebate line break type** field is set to **Quantity**, and you enter 1 in the **From value** field and 3 in the **To value** field. In this case, the rebate amount applies when you purchase one or two items, but not when you purchase three items.

- In the **Workflow approval status** field, the **Approved** value indicates that the agreement can be applied to purchase orders that meet the agreement's conditions.

Identify orders that qualify for rebates, and generate rebate claims

When purchase orders are placed with a vendor that the company has a rebate agreement with, the program identifies any future vendor credit payments. If the purchase orders qualify for a rebate, a rebate claim is generated for every order line as soon as a purchase invoice has been posted. This process is automatic. Later, you can review the expected rebates and see the impact of those rebates on the product's cost and profit margin.

View details of rebates that are applied to a purchase order line per the vendor rebate agreement

1. On the **Purchase order** page, select an order line, and then select **Purchase order line > View > Price details**.
2. On the **Price details** page, select the **Rebates** FastTab.

The rebate information is also shown in the **Vendor rebate** field in the **Margin estimation** section of the **Price details** page.

NOTE

On the **Procurement and sourcing parameters** page, on the **Prices** tab, verify that the **Enable price details** option is set to **Yes**. If the option is set to **No**, you won't be able to view the rebates.

Review and approve claims

Rebate claims that are generated represent the future payments that can be expected from the vendor. Before a credit note is issued to the vendor, the agreement owner typically wants to review the claims and approve them. However, note that the status of a claim determines whether the claim is ready to go through the approval process.

The status of claims and the effect on the approval process

When a claim is generated, its status is set to **To be calculated** if the rebate is granted on a cumulative basis or **Calculated** if the rebate is granted per invoice. If the status of a claim is **To be calculated**, the claim must go through a calculation process that is handled by the **Cumulate** function. Only claims that have a status of **Calculated** can be included in the approval process.

NOTE

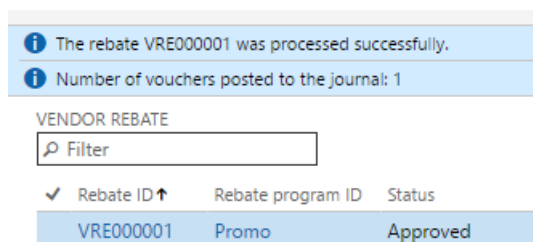

If the **Approval required** option on a vendor rebate agreement is set to **No**, any claims that are generated will have a status of **Approved**. The approval is mandatory for claims that are granted on a cumulative basis.

Approve claims, and view postings and invoice details

When claims have been approved, they can be processed by Accounts payable (A/P). A credit memo (vendor invoice) for the rebate claim amount is automatically generated. The credit can then be added to the vendor balance, and the A/P team can include it in the regular settlement process.

1. Select **Procurement and sourcing > Vendor Rebates > Rebate claims** to open a rebate claim.
2. Close the rebate claim.
3. Mark the claim, and then, on the Action Pane, select **Approve**.
4. On the request page, in the **Vendor** field, select the vendor that you're authorized to receive a rebate from, and then select **OK**.

A Rebate accrual journal is posted for the claim amount. This posting debits the Accrued Vendor Rebates Receivable account for the expected vendor credit and credits the interim Accrued Vendor Rebates Received account for the expected gain.

5. In the rebate list, select the line, and then, on the Action Pane, select **Rebate transactions** to see and navigate to the journal batch number for this rebate accrual posting.

To move the claims to the regular A/P process, the A/P clerk must now complete the rebate claim handling by running the Process function.

6. On the Action Pane, select **Process**, and then select **Filter**. In the **Criteria** field for the **Vendor account** field, select the vendor to process rebate claims for, select other relevant filters, and then select **OK**.

The message bars and the fact that the status is changed to **Completed** indicate that the following events have occurred:

- A Rebate accrual journal posting has reversed the previous interim amounts on the accrual receivable and expense accounts.
- A vendor invoice (credit note) for the rebate amount has been created.

NOTE

The setting of the **Manual invoice posting** option on the **Rebate program** tab of the **Procurement and sourcing parameters** page determines whether a vendor invoice is posted manually or automatically as part of claim processing.

- When the vendor invoice is posted, either automatically or manually, the vendor's Payable account has been debited, and the Discounts and Allowances Received account has been credited.

NOTE

The Discounts and Allowances Received account number is specified for the procurement category that is used on the purchase invoice line for the rebate. The procurement category, in turn, is set on the **Rebate program** tab of the **Procurement and sourcing parameters** page.

7. In the rebate list, select the line, and then, on the Action Pane, select **Rebate transactions** to see and navigate to the journal batch number for this rebate accrual posting and also the vendor invoice number.
8. Select the line for the vendor invoice transaction, and then, on the Action Pane, select **Vendor invoice**. If the vendor invoice has been posted, you will see the Invoice journal. Otherwise, you will see the vendor invoice as a pending vendor invoice that requires manual posting.

The invoice line specifies the details of the vendor invoice for the **Commissions and Rebates** procurement category.

9. On the **All vendors** page, select the vendor that you receive a rebate from, and then, on the Action Pane, select **Transactions**. Find the line for the invoice. The rebate amount has now been added to the vendor balance.

Summary

The process for handling vendor rebates involves multiple manual tracking tasks that are often tedious. By automating these tasks, the vendor rebate management feature can help you move through the following processes:

- Generating accurate rebate claims
- Accruing the expected receivable and interim gain in the general ledger
- Updating the vendor balance and the income statement with the allowance that is due

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot prices, discounts, agreements, and rebates

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with prices, discounts, agreements, and rebates.

I can't link a purchase agreement to a purchase order line after the purchase order is created.

A purchase agreement must be associated with a purchase order when the purchase order is created. Otherwise, purchase order lines can't be associated with purchase agreement lines.

What check triggers the "Update prices and discounts entered manually or external document" message?

When you change the shipping date, you might receive a message that states, "Update prices and discounts entered manually or external document." You receive this message because, if the shipping date is changed, a different trade or sales agreement might be triggered and cause a price change. A change to the shipping date can also affect warehouse schedules and other related information.

The message is triggered whenever any of the dates or some other parameters are changed. The purpose of the message is to make sure that you're aware of price changes that can occur because of those changes.

The message is the trade agreement evaluation (TAE) prompt. For a full description, see [Trade agreement evaluation policies](#).

A purchase order receipt doesn't include all charges.

Reproduce the issue

The following procedure shows one way to reproduce the issue.

1. On the **Procurement and sourcing parameters** page, on the **Delivery** tab, make sure that the **Generate charges on product receipt** option is set to *Yes*.
2. Create a purchase order that includes charges.
3. Confirm the purchase order.
4. Receive the purchase order.
5. Look at the receipt total, and compare it to the expected total.
6. Notice that not all the charges are included on the purchase order receipt.

Issue resolution

The resolution depends on the way that the miscellaneous charges have been set up. For information about how to set up miscellaneous charges to meet your requirements, see the following blog post: [Post misc. charges at time of product receipt](#).

Trade agreement prices and discounts aren't applied on sales or purchase order lines that are imported through data management.

Issue description

Trade agreements that are applicable to sales or purchase order lines aren't applied on lines that are imported through data management. However, the same trade agreements are applied on sales or purchase order lines that are manually created.

Reason for the issue

If purchase order lines that are imported via data management already include price information, the trade agreement won't be reevaluated for those lines. For example, if **Line discount percentage** or any of the price and discount values is set for a line, then trade agreements will not be looked up for that line.

Issue workaround

This behavior is expected, and is similar for both sales orders and purchase orders.

As a workaround, import the purchase order lines without setting any price information. The trade agreements will then be applied, and the purchase order lines will be updated based on the defined trade agreements.

A vendor rebate isn't cumulated based on invoices.

Issue description

If invoices that are posted have different due dates, those invoices aren't reflected in vendor rebates that are generated from them.

Issue resolution

By design, the due date isn't considered when the vendor rebate is calculated. Consider customizing the system so that the due date and the relation to the invoice are more apparent with respect to the actual vendor rebate.

Unit prices on purchase orders aren't calculated based on the unit conversion.

Issue description

When a unit is changed on a purchase order, trade agreement prices aren't recalculated according to unit conversion definitions.

Issue resolution

Prices are always obtained from trade agreements (or other price settings in the system, such as sales agreements or item prices), and they are set for a unit.

If the unit is changed on an order line, the system looks for a price for the new unit and applies that price. If no price is found for the unit, the system doesn't apply a price. The unit conversion can't be used to recalculate the price into another unit. Theoretically, the price for one box of ten might not equal ten times the price of one box.

Issue workaround

One way to work around this issue is to make sure that there are trade agreements for the units that you expect will be used on order lines for the item.

Currency conversion issues occur with trade agreements.

Trade agreement prices aren't recalculated according to the currency when the currency differs on a purchase order.

The *Generic currency* feature lets you define prices and discounts in only one currency. You can then convert to other currencies as you require. Furthermore, after the conversion is done, the feature can automatically apply smart rounding.

When I open the Purchase agreement page in a line view mode, I can't personalize the page by adding the Price unit field in the overview of the line.

Some shared fields in the agreement framework can't be included in personalizations. This limitation occurs because of the data model that is implemented. Therefore, you can't personalize the Price unit field.

The maximum limit from a purchase agreement isn't effective on a purchase requisition.

Issue description

When a purchase requisition is linked to a purchase agreement, the maximum limit from the purchase agreement isn't effective on the purchase requisition. The default price information is correctly entered, but more than the maximum limit from the purchase agreement can be ordered in the purchase requisition.

Issue resolution

This behavior is expected. Because requisitions aren't always approved, a quantity or amount should not be reserved on the purchase agreement. Therefore, you won't meet the maximum limit from the purchase agreement.

Trade agreements can be created from rejected RFQs. Therefore, the system doesn't prevent trade agreement journals from being created if the RFQ line hasn't been accepted.

You can create trade agreements for any replies for a request for quotation (RFQ), regardless of whether they were accepted or rejected. For more information, see [Requests for quotation \(RFQs\) overview](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Purchasing policies overview

2/18/2021 • 12 minutes to read • [Edit Online](#)

This article provides information about purchasing policies. A purchasing policy is a collection of rules that control the requisition process. Purchasing policies help procurement administrators implement their procurement strategy by creating a policy structure that is aligned with the organization's strategic purchasing requirements.

A purchasing policy consists of a set of policy rules. When you define a policy rule, you first select a rule type. You then create a rule for the rule type by defining the settings, the start date, and the end date for the rule.

For example, an administrator creates a policy, selects the **Catalog policy** rule type, and then adds a catalog policy rule to the policy. This catalog policy rule specifies that the Adventure catalog must be used for internal procurement. After the purchasing policy is associated with a particular organization, employees of that organization see the Adventure catalog when they create requisitions.

Assigning policies to organizations

Before a policy can take effect, it must be associated with an organization. Purchasing policies are associated with the **Procurement internal control** hierarchy purpose. Therefore, purchasing policies apply only to organizations in hierarchies that have a hierarchy purpose of **Procurement internal control**. You can also select organizations from the flat list of legal entities in the CompanyInfo table. These legal entities are designated in the policy framework as "Companies."

Determining which rule to apply

Depending on how you configure your purchasing policies, multiple rules can affect the users in an organization. The following examples illustrate different ways that you can configure purchasing policies and specify how policies are applied when a transaction occurs.

Example 1: Simple purchasing policy configuration

Organizations that are small and less complex can set up purchasing policies by legal entity, and can use only the Companies organization hierarchy.

For Fabrikam, a small business, purchasing requirements vary little across the organization. Purchasing rules vary only among the organization's legal entities. For example, employees of Fabrikam Canada and employees of Fabrikam U.S. purchase goods and services from different catalogs and different vendors. Therefore, Fabrikam sets up its purchasing policies at the legal-entity level.

Fabrikam creates two purchasing policies. Policy A applies to its U.S. legal entity, 1111. Policy B applies to its Canadian legal entity, 2222. When an employee in legal entity 1111 creates a purchase requisition, the policy rules are derived from policy A. For example, the product catalog that the employee sees is specified in the catalog policy rule for policy A.

When an employee in legal entity 2222 creates a purchase requisition, the policy rules are derived from policy B.

Note: If an employee of legal entity 1111 purchases an item on behalf of an employee of legal entity 2222, the policy rules that are specified for legal entity 2222 (that is, the policy rules from policy B) are applied.

Example 2: Complex purchasing policy configuration

In the previous example, all purchasing rules were defined in a single organization hierarchy, the Companies organization hierarchy. However, a complex organization might define policies for multiple organization

hierarchies.

Contoso is a large company that requires complex purchasing rules to control the requisition process. Contoso has defined rules for two different organization hierarchies: Department and Global purchasing control.

Policy 123 is defined for the Department organization hierarchy for the Sales UK – Sales department. In policy 123, the purchase requisition control rule specifies that restrictions must be enforced for minimum order quantities. In this rule, the **Enforce minimum order quantity restrictions** option is selected.

Policy 456 is defined for the Global purchasing control organization hierarchy for the Sales and Marketing department. In policy 456, the purchase requisition control rule doesn't specify that restrictions must be enforced for minimum order quantities. In this rule, the **Enforce minimum order quantity restrictions** option is de-selected.

Sam works in the Sales UK – Sales department in Contoso's United Kingdom office. The policies for both the Department and Global purchasing control organization hierarchies apply to his department. When Sam creates a purchase requisition, the system must determine which policy to apply. The system administrator set up the purchasing policy parameters to specify that purchasing policies must be applied in the following order of precedence:

1. Global purchasing control
2. Department
3. Companies

Therefore, policy 456 is applied to the purchase requisition that Sam creates, and no minimum order quantity is required for the purchase requisition.

Policy rules

Catalog policy rule

The catalog policy rule determines which procurement catalog users see when they create purchase requisitions. If a user has been granted permission to order products on behalf of another user, the requisition uses the catalog policy rule that is defined for the requester's legal entity and operating unit to determine which catalog to display. Before you can define a catalog policy rule, you must create and publish a procurement catalog.

Category access policy rule

The category access policy rule determines which categories users have access to when they create purchase requisitions. If no rule is specified, all the procurement categories can be added to the purchase requisition.

1. Select the **Include parent rule** option to apply the category access policy rule of the parent organization to the category.
2. In the **Available categories** pane, select the categories that the rule applies to. When you select a category, all categories that are higher in the hierarchy are also added to the **Selected categories** list.
3. Select the **Include subcategories** option to apply the rule to all subcategories of the selected category.

Category policy rule

The category policy rule defines how users can select vendors for each category. It also defines requirements for the receiving and invoicing processes.

Re-approval rule for purchase orders

The re-approval rule is an optional rule that defines the criteria for requiring re-approval when a purchase order is changed. The selected fields are evaluated in the purchase order workflow when the "Requires purchase order re-approval" condition is set up in the workflow.

NOTE

Accounting distribution will always be reset when an approved purchase order with change management enabled is changed. So you should be aware that if you want to avoid a re-approval of a purchase order when certain fields are changed, the field Accounting distribution.changed should NOT be included as a selected field for re-approval.

Purchase requisition RFQ rule

The purchase requisition RFQ rule defines criteria for requiring a request for quotation (RFQ) for a purchase requisition line. If a line meets the conditions, the "informal RFQ" or "formal RFQ" stamp appears on the requisition line.

Purchase requisition control rule

The purchase requisition control rule for requisitions of type **consumption** is an optional rule. When you create rules of this type, you can set options on various tabs:

- On the **Workflow submission** tab, you can configure the fields that must be entered on the requisition line for the requisition to be submitted for approval.
- On the **Order quantities** tab, you can configure the fields that are required on the purchase requisition under certain conditions. You can also enforce order quantities.
- On the **Dates** tab, you can configure whether the accounting date is the same as the requested date
- On the **Address** tab, you can define whether the user is allowed to create new addresses in the system to apply to the purchase requisition.

Requisition purpose rule

The requisition purpose rule is an optional rule that determines the type of requisition purpose that is allowed for a specific legal entity. Unless another purpose is indicated in this rule, requisitions automatically have a purpose of **Consumption** when they are created.

Replenishment category access policy rule

The replenishment category access policy rule is an optional rule that determines the products that are available to fulfill requisition demand for a specific legal entity when the requisition purpose is **Replenishment**.

Replenishment control rule

The replenishment control rule is an optional rule that defines the fields that must be entered on the requisition line for the requisition to be submitted for approval when the requisition purpose is **Replenishment**.

Purchase order creation and demand consolidation rule

The purchase order creation and demand consolidation rule defines the policy rules to use when a purchase order is generated from an approved purchase requisition. When you create rules of this type, you can set options on various tabs:

- On the **Purchase order split** tab, you can define criteria for splitting purchase requisition lines onto separate purchase orders.
- On the **Price/discount transfer** tab, you can define when to recalculate the price agreement when a purchase order is created:
 - **Only if no trade agreement** – Prices and discounts are transferred from the purchase requisition only if there is no applicable trade agreement or base price. If a trade agreement or base price exists for the item or vendor, the prices and discounts are recalculated based on the trade agreement or the base price, and are applied to the purchase order. Unless otherwise specified, this is the default behavior.
 - **Always** – Prices and discounts are always transferred from the purchase requisition.

You can also allow the requester to change the method of price and discount transfer for individual

purchase requisition lines, regardless of the price/discount transfer rule that is defined. Select the **Allow manual override per purchase requisition line** option to enable this capability.

- On the **Item description transfer** tab, you can transfer the item description from the requisition when it originates from an RFQ.
- On the **Price Tolerance** tab, you can define rules to route approved purchase requisitions back through the review process when the price of a procurement catalog item increases. Set the maximum amount that the net amount on a line item on a purchase requisition can increase between the time when the purchase requisition is approved and the time when the purchase order is created. The net amount is calculated by using the following formula: $[(\text{Quantity} \times (\text{Unit price} - \text{Discount}) \div \text{Price unit}) + \text{Purchase miscellaneous charges}] \times (100 - \text{Discount percent}) \div 100$ Purchase requisition lines that exceed the price tolerance that you set are held for manual processing. The rules that you configure on the **Error processing** tab determine how the purchase requisition lines are processed.
- On the **Error processing** tab, you can configure the processing rule that is applied to a purchase requisition if it fails validation during purchase order creation because of a vendor error or a price tolerance error. Select one of the following options:
 - **No action** – The purchase requisition lines remain on the **Release approved purchase requisitions** page. The status of the purchase requisition lines remains **Approved**. However, the errors must be resolved before a purchase order can be generated for the purchase requisition lines.
 - **Cancel the purchase requisition line** – The purchase requisition lines are canceled. The requester can create a new purchase requisition for the canceled lines if he or she still wants to request the line items.
 - **Create a new purchase requisition line** – The purchase requisition lines are canceled. New purchase requisitions are then generated that contain only the purchase requisition lines that failed validation. The new purchase requisitions that are generated have a status of **Draft**. These purchase requisitions can be resubmitted for review after the validation errors have been resolved. The preparer of the purchase requisition lines is notified that the lines were canceled, and that new purchase requisitions were generated for the purchase requisition lines that failed.
- On the **Manual purchase order creation** tab, you can define the parameters that determine whether a purchase requisition must be manually processed, or whether it can be automatically converted to a purchase order. The parameters can apply to internal catalog items, external catalog items, or non-catalog items. Select one of the following options:
 - **Manually create purchase orders** – Manually create purchase orders for all purchase requisitions.
 - **Automatically create purchase orders** – Automatically create purchase orders for all approved purchase requisitions. No purchase requisitions are held for manual purchase order creation.
 - **Automatically create purchase orders except under these conditions** – Manually create purchase orders for purchase requisitions that match the criteria that you define. All other purchase requisitions that are approved are automatically converted to purchase orders. If you select **Automatically create purchase orders except under these conditions**, you can add procurement categories and vendors to specify which approved purchase requisition lines are held for manual processing. This option can apply to internal catalog items, external catalog items, and non-catalog items. When you select a procurement category, any subcategories for that procurement category are also selected. Select the **All** option for a specific type of purchase requisition line to hold all lines of that line type for manual processing.

If you want purchase orders to be generated automatically from approved purchase requisitions when the batch job for purchase order generation runs, select the **Run automatic purchase order creation as a batch job** option. This option applies only to purchase requisitions that don't require manual processing. By running automatic purchase order generation as a batch job, you can schedule this activity at a time when resources are less constrained. If the **Prepayment required** option is selected on the

purchase requisition lines, select the **When the requisition is set up for prepayment** option to hold approved purchase requisitions for manual processing. Purchase requisitions that are held for manual processing can be filtered so that you can view only those purchase requisition lines that require prepayment.

- On the **Demand consolidation** tab, you can define the parameters that determine whether purchase requisitions that are manually processed can be considered for purchase requisition consolidation. The parameters can apply to internal catalog items, external catalog items, or non-catalog items. Select one of the following options:
 - **Do not allow demand consolidation** – No approved purchase requisition lines are eligible for demand consolidation. This option is selected by default and applies only to purchase requisition lines that require manual processing for purchase order creation.
 - **Always allow demand consolidation** – All approved purchase requisition lines are eligible for demand consolidation. **Note:** If you select the **Always allow demand consolidation** option on the **Demand consolidation** tab, but you select the **Automatically create purchase orders** option on the **Manual purchase order creation** tab, all purchase requisitions are held for manual processing.
 - **Allow demand consolidation under these conditions** – Define the criteria that determine whether approved purchase requisition lines are eligible for demand consolidation. For each type of purchase requisition line, you can set the criteria by procurement category and vendor. If you select **Allow demand consolidation under these conditions**, you can set the criteria by procurement category and vendor for each type of purchase requisition line. When you select a procurement category, any subcategories for that procurement category are also selected. If you select the **All** option for a specific line type, all purchase requisition lines of that line type are eligible for demand consolidation.

Create purchasing policies

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows you how to create purchasing policies to align with your business processes for purchasing. Before you can create purchasing policies, you must set up the purchasing policy parameters. It's possible to create, modify, and retire a purchasing policy, but you can't delete a purchasing policy. This procedure would typically be carried out by a purchasing manager. You can use this procedure in demo data company USMF or on your own data.

Set up policy parameters

1. In the navigation pane, go to **Modules > Procurement and sourcing > Setup > Policies > Purchasing policies**.
2. On the Action Pane, select **Parameters**.
 - Policy precedence rules apply to different levels in your organization. The organizational units that are shown depend on your organizational hierarchy, and on which levels in the hierarchy have been assigned the purpose of Procurement internal control. For example, your organization might have legal entities, cost centers, regions, and departments, but it may be that only some of these have a hierarchy purpose of Procurement internal control. As a default, the organization of type Company is available.
3. Select the **Policy rule type parameters** tab.
4. In the tree, go to **Purchasing policy > Purchase requisition control rule**.
 - You define the order of precedence for policy resolution at the policy level. However, for some policy types, you can override the order of precedence for individual policy rule types. For example, you might define the order of precedence for purchasing policies to be: cost center, department, company. For the catalog policy rule, you might want the order of precedence to be: department, cost center, company. You can change the order of precedence for the Catalog policy rule. When a worker creates a requisition, the catalog that is displayed is determined by the policies that are associated with the worker's department, then their cost center, and then their company.
 - If there's more than one organizational level listed, you can use the Up/Down arrows to set the order of precedence for the Purchase requisition control rule.
5. Close the page.

Create a new policy

1. Select **New**.
2. In the **Name** field, type a value.
3. In the **Description** field, type a value.
 - A single purchasing policy can only apply to one organization hierarchy. For example, you could have one hierarchy called "Geographic" and one called "Department", and have a different purchasing policy for each.
 - Select an organization that the policy should apply to.
4. Select the arrow to add the selected organization.
 - You can repeat this process to add more organizations.

Add a policy rule

1. In the **Policy rule type** list, select **Requisition purpose rule**.
 - You'll create a rule that sets the default requisition purpose to type Consumption but allows the Replenishment type to be selected instead.
2. Select **Create policy rule**.
3. Select **Yes** in the **Allow manual override** field.
4. Select **Close**.
 - Now you can set up other policy rules for the purchasing policy. Note that a Policy rule type cannot have overlapping rules that are active at the same time within a single procurement policy.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up policies for procurement category hierarchies

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to set up rules for ordering products in a category. The rules are defined for a specific purchasing policy. The category access rule controls which procurement categories employees have access to when they create a requisition. When a requisition is being created, the purchasing policy and category access rule that should be applied are determined by the legal entity and the operational unit that the employee belongs to. You can use this procedure in demo data company USMF. This task would typically be carried out by a purchasing manager.

Find the procurement policy

1. In the Navigation pane, go to **Modules > Procurement and sourcing > Setup > Policies > Purchasing policies**.
2. Click the link on the 'Procurement Policy USMF' policy. This is the policy that you'll add a rule to. It must be an Active policy.

Create a category access rule

1. Expand the **Policy rules** fastTab.
2. In the **Policy rule type** list, select the **Category access policy rule**. If the **Create policy rule** button is dimmed, it's because there's already an active policy rule for Category access. Check the **Effective** and **Expiration** fields to determine which it is, then select it, and click **Retire policy rule**. If the **Create policy rule** button is available, you don't need to do anything.
3. Click **Create policy rule**.
4. In the **Effective date** field, enter a date and time. The time must not overlap with another rule that's already active.
5. Select a category that the rule will apply to. Make a note of which category this is – you'll need it later. When you select a category, its parent category or categories will also be added to the Selected categories list. If you want the rule to apply to all subcategories of the selected category, select the **Include subcategories** check box.
6. Click the right arrow to add to the **Selected categories** list.
7. Click **OK**. If you set the **Include parent rule** option to Yes, the policy rule that you define for a parent category is also assigned to its child categories, if no policy rule has been defined for the child categories.

Create a category policy rule

1. In the **Policy rule type** list, select the **Category policy rule**. If the **Create policy rule** button is dimmed, select the active policy rule, and then click **Retire policy rule**.
2. Click **Create policy rule**.
3. In the **Effective date** field, enter a date and time.
4. Click **Add**.
5. In the **Category** field, select the same category that you used for the **Category access rule**.
6. In the **Vendor selection** field, select an option. Select a rule to control which kind of vendors can be selected for the category when requisitions are created.
7. Click **Close**. The policy rules that you have defined have been for requisitions of type Consumption. If you wanted to define policies for requisitions of type Replenishment, you would create a rule for the Policy rule

type called "Replenishment category access policy rule".

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product receipt against purchase orders

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the various options for registering products as received.

Product receipt is the process of recording that products that were ordered have been received, so that the purchase order (PO) lines can then be processed for invoicing. In some cases, products go through preregistration, where additional information from the supplier is recorded before the products are received. When products arrive, they are first marked as **Registered**. The products might then go through additional processes, such as quality management, before they are finally marked as **Received**.

Preregistration (ASN)

Suppliers might share information about products that will be shipped. In this case, you can preregister the products to record this information before the products are received. By preregistering products, you reduce the amount of work that is required during item registration and receipt. Suppliers can provide product information electronically through an Advance Shipment Notice (ASN) that is then automatically recorded in the system. The information in the ASN includes the quantity of products that will be shipped and the date when they will be shipped. The ASN might also include information such as batch or serial numbers. Registration of the ASN occurs in the **Transportation management** module.

Registration

Product receipt registration often occurs at the inbound docks in a warehouse. It's performed either by using a hand-held device or through arrival journals. Alternatively, you can manually register product receipt by using the **Registration** action on the **Purchase order** page. In both cases, the products are marked as **Registered**. Note that the products aren't yet marked as **Received**.

Products that are received in a warehouse might go through quality inspection before they are put away into inventory. Either quality orders or quarantine orders can be used to perform quality inspection. If quality orders are used, you can configure the process to temporarily block products through a reservation while they are inspected. If quarantine orders are used, products are moved to another warehouse for inspection. This warehouse is known as the quarantine warehouse. In both quality inspection processes, some of the goods might be scrapped, either because they don't conform to the quality expectations or because the quality inspection involves destructive testing of a sample of the product.

Product receipt

Most often, the **Product receipt** action on the **Purchase orders** page is used to mark products as **Received** on the PO. The **Posting product receipt** page has various options for the quantity that is accounted as received. For example, you can set the **Quantity** field to **Ordered quantity** or **Receive now quantity**. Alternatively, if a warehouse arrival process has been used, you will often set this field to **Registered quantity**. You can modify the quantities on each order line that will be marked as **Received**, to account for any discrepancies, such as under-delivery and over-delivery. During product receipt, you must specify a product receipt identifier, which is typically a reference to the packing slip from the supplier. This identifier is required for accounting, because it enables checks or audits of supplier packing slips against what has been received, and the accounted inventory or expense.

POs can be created for products that aren't intended as inventory but are considered an expense. This category includes order lines where the products are marked as **Not stocked** by their inventory model group, and also

lines that use procurement categories. In this case, the items might not go through arrival registration and receipt in the warehouse. Instead, the **Product receipt** action is used to record the receipt directly on the PO, and the receipt is based on the ordered quantity, not a registered quantity.

You can create PO lines where the **New fixed asset** option is enabled. This option indicates that the purchase should be considered a fixed asset instead of inventory. In this case, the fixed asset determination rules that have been configured determine whether the purchase of the product or category exceeds specific thresholds, and must therefore be accounted for as an asset and go through fixed asset management. Purchases can also be made toward an existing fixed asset. In this case, the amount is adjusted as appropriate.

You can select multiple orders and process receipt on all those orders together. This approach isn't used very often, but you might want to use it if a supplier has consolidated shipments for you into a single load. During product receipt on the purchase, there is a function for doing summary updates. Summary updates let you post a single packing slip from the supplier for more than one PO.

POs might be created from a sales order where the **Direct delivery** option was selected. When direct delivery is used, the products never arrive in your warehouse but are shipped directly from the supplier to the customer. In this case, the receipt is usually recorded directly on the PO. The receipt can be done automatically, such as through electronic data interchange (EDI) integration with the supplier. Alternatively, if the PO is an intercompany PO, Supply Chain Management automates the receipt on the intercompany sales order when shipment occurs. When direct delivery is used, products are still accounted as inventory, even though they don't physically arrive at the warehouse. Therefore, when product receipt is registered on the PO, the sales order is automatically updated with a packing slip, so that the overall change to inventory is 0 (zero). In direct delivery scenarios, you should not require preregistration. If you're using warehouses that are enabled for warehouse management, you can get around the requirement for license plate registration by specifying a virtual warehouse instead. You specify this warehouse in the **Direct delivery warehouse** field on the product.

After the product receipt has been processed on the PO, the PO status is set to **Received** to indicate that the invoice can be processed for the order. You can review details about products that have already been received by using the **Product receipt journals** page.

You can access this page from the **Receipt** action group on the **Purchase order** page. The information in the journals includes details about the quantities, dates, and dimensions.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor invoices overview

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic provides general information about vendor invoices. Vendor invoices are requests for received payment for products and services. Vendor invoices might represent a bill for ongoing services, or they can be based on purchase orders for specific items and services.

Vendor invoices

A vendor invoice from a purchase order is produced when products or services are received according to a purchase order placed with a vendor. The vendor invoice contains a header, and one or more lines for items or services. A vendor invoice completes the cycle from purchase order to product receipt to vendor invoice.

Although some vendor invoices connect to a purchase order, vendor invoices can also contain lines that don't correspond to purchase order lines. You can also create vendor invoices that aren't associated with any purchase order. These vendor invoices might represent ongoing services, such as a utility bill. You don't have to reference a purchase order when you add an ongoing service.

There are several ways to enter a vendor invoice:

- The vendor invoice register lets you quickly enter invoices that don't reference a purchase order, so that you can accrue the expense. By using the vendor invoice approval journal, you can select those invoices and post them to the vendor balance to reverse the accrual.
- The vendor invoice journal lets you quickly enter invoices that don't reference a purchase order, in a single step.
- Together with the vendor invoice pool, the vendor invoice register lets you quickly enter invoices to accrue the expense. You can open the associated purchase orders later to post the invoice against the expense account.
- The **Open vendor invoices** and **Pending vendor invoices** pages let you create vendor invoices from confirmed purchase orders.

The following discussion provides more information about how to use the **Open vendor invoices** or **Pending vendor invoices** page to create a vendor invoice from a purchase order.

Understanding invoice line quantities

When you open a vendor invoice from a related purchase order, the system creates invoice lines from the purchase order. By default, the system takes the quantities from the product receipt. However, you can use any of the following default behaviors:

- **Receive now quantity** – Use this option for partial shipments. The system sets the default value in the **Quantity** from the quantity specified in the **Receive now** field on the purchase order.
- **Ordered quantity** – Use this option for complete shipments. The system sets the default value in the **Quantity** from the quantity specified in the **Ordered** field on the purchase order.
- **Registered quantity** – Use this option if the item requires registration, as specified on the **Item model groups** page. The default value in the **Quantity** field is the physical update quantity that has been registered.
- **Product receipt quantity** – Use this option if a product receipt has already been received for the order. The system takes the default value in the **Quantity** field from the total quantity of available product receipts.
- **Registered quantity and services** – Use this option if quantities have been registered in arrival journals

for stocked items or items that aren't stocked. This option also includes services, regardless of whether they are registered.

If your legal entity uses invoice matching, you can view the results of the quantity matching in the **Product receipt quantity match** column. You can also use the **Matching details** button on the **Review** tab of the Action Pane to view the results of the quantity matching.

Adding a line that wasn't on the purchase order

You can add a line that wasn't on the purchase order to the vendor invoice. You must select an item number or procurement category. You can then add quantities, prices, and amounts to the line. The line will be included only in matching policies for invoice totals.

Submitting a vendor invoice for review

Your organization might use workflows to manage the review process for vendor invoices. Workflow review can be required for the invoice header, the invoice line, or both. The workflow controls apply to the header or the line, depending on where the focus is when you select the control. Instead of the **Post** button, a **Submit** button displays send the vendor invoice through the review process.

Preventing invoice from being submitted to workflow

Following are several ways you can prevent an invoice from being submitted to a workflow.

- **Invoice total and the registered total are not equal.** The person who submitted the invoice will receive an alert that the totals aren't equal. The alert provides an opportunity to correct the balances before resubmitting the invoice to workflow. This feature is available if the **Prohibit submission to workflow when the invoice total and registered invoice total are not equal** parameter on the **Feature management** page is turned on.
- **Invoice contains unallocated charges.** The person who submitted the invoice will receive an alert that the invoice has unallocated charges so they can correct the invoice before resubmitting it to workflow. This feature is available if the **Prohibit submission to workflow when there are unallocated charges on a vendor invoice** parameter on the **Feature management** page is turned on.
- **Invoice contains the same invoice number as another posted invoice.** The person who submitted the invoice will receive an alert that an invoice with a duplicate number was found, and they can correct it before resubmitting to workflow. This alert will be displayed when the **Check the invoice number used** parameter in Accounts payable is set to **Reject duplicate**. This feature is available if the **Prohibit submission to workflow when the invoice number already exists on a posted invoice, and your system is not set up to accept duplicate invoice numbers** parameter on the **Feature management** page is turned on.

Matching vendor invoices to product receipts

You can enter and save information for vendor invoices, and you can match invoice lines to product receipt lines. You can also match partial quantities for a line.

You can create a vendor invoice that is based on the product receipt line items that have been received through the current date, even if all the items for a particular purchase order haven't yet been received. For example, you might use this option if a vendor sends one invoice per month to cover all the deliveries that it shipped during that month. Each product receipt represents a partial or complete delivery of the items on the purchase order.

When an invoice is in workflow, the approver can update invoice quantities so that they match the value in the **Product-receipt-quantity-to-match** field. To do so, select the **Update the invoice quantities to match**

product receipt quantities in workflow feature in the **Feature management** workspace and select **Enable**. If an approver in the workflow process has removed all the matches from all the product receipts from the invoice line, the invoice line will be deleted. When this feature isn't enabled, invoice quantities are not updated for invoices in workflow.

When you post the invoice, the **Invoice remainder** quantity for each item is updated with the total of the received quantities from the selected product receipts. If both the **Invoice remainder** quantity and the **Deliver remainder** quantity for all items on the purchase order are 0 (zero), the status of the purchase order is changed to **Invoiced**. If the **Invoice remainder** quantity isn't 0, the status of the purchase order remains unchanged, and additional invoices can be entered for it.

This option assumes that at least one product receipt has been posted for the purchase order. The vendor invoice is based on these product receipts and reflects the quantities from them. The financial information for the invoice is based on the information that is entered when you post the invoice.

For more information, see [Record vendor invoice and match against received quantity](#).

Configure an automated task for vendor invoice workflow to post the vendor invoice using a batch job

You can add an automated posting task to the Vendor invoice workflow so that invoices are processed in a batch. Posting invoices in a batch lets the workflow process continue without having to wait for the posting to finish, which improves the overall performance of all the tasks submitted to the workflow.

To post a vendor invoice in a batch, on the **Feature management** page, turn on the **Vendor invoice batch posting** parameter. Vendor invoice workflows are configured by going to **Accounts payable > Setup > Accounts payable workflows**.

You can see the **Post the vendor invoice using a batch** task in the workflow editor, regardless of whether the feature parameter, **Vendor invoice batch posting**, is enabled. When the feature parameter is not enabled, an invoice that contains the **Post the vendor invoice using a batch** task won't process in workflow until the parameter is enabled. The **Post the vendor invoice using a batch** task must not be used in the same workflow as the **Post vendor invoices** automated task. Also, the **Post the vendor invoice using a batch** task should be the last element in the workflow configuration.

You can specify the number of invoices to include in the batch, and the number of hours to wait before rescheduling a batch, by going to **Accounts payable > Setup > Accounts payable parameters > Invoice > Invoice workflow**.

Working with multiple invoices

You can work with multiple invoices at the same time and post all of them at the same time. If you need to create multiple invoices, use the **Pending vendor invoices** page. If you must post and print multiple vendor invoices, use the invoice approval journal. If you're using the invoice approval journal, at least one product receipt must be posted for the purchase order, and an invoice for the purchase order must be posted in an invoice register. The financial information for the invoice comes from the invoice that was posted in the register.

Recovering vendor invoices that are being used

While a vendor invoice is being used, it can't be edited by another user. However, the state of an invoice might sometimes indicate that the invoice is being used, even though it isn't being actively edited. For example, the application might have stopped responding while the invoice was being edited, or a user might have inadvertently left the invoice open in the application.

You can use the **Recover vendor invoices** page to recover or release vendor invoices that have been in use for

more than four hours, so that they can be edited. You can open this page from the **Periodic task** navigation or a tile on the **Vendor invoice entry** workspace. After an invoice is recovered, it will be available for editing on the **Vendor invoice** page.

You can access the **Recover vendor invoices** page only if the **Recover vendor invoices in use** security duty and privilege are assigned to you. Additionally, the **Allow vendor invoice recovery** parameter on the **Accounts payable parameters** page must be turned on.

Resetting the workflow status for vendor invoices from Unrecoverable to Draft

A workflow instance that has stopped because of an unrecoverable error will have a workflow status of **Unrecoverable**. When the status of a vendor invoice workflow is **Unrecoverable**, you can reset it to **Draft** by selecting **Recall**. You can then edit the vendor invoice. This feature is available if the **Resetting the workflow status for vendor invoices from Unrecoverable to Draft** parameter on the **Feature management** page is turned on.

You can use the **Workflow history** page to reset the workflow status to **Draft**. You can open this page from **Vendor invoice** or from the **Common > Inquires > Workflow** navigation. To reset the workflow status to **Draft**, select **Recall**. You can also reset the workflow status to **Draft** by selecting the **Recall** action on the **Vendor invoice** or **Pending vendor invoices** page. After the workflow status is reset to **Draft**, it becomes available for editing on the **Vendor invoice** page.

Viewing the invoice total on the Pending vendor invoices page

You can view the invoice total on the **Pending vendor invoices** page by enabling the **Display invoice total on pending vendor invoices list** parameter on the **Accounts payable parameters** page.

Troubleshoot product receipts and invoicing

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with product receipts and invoicing.

I can't post more than one invoice for a purchase order line that has category-based items.

A quantity is mandatory if you want to post invoices. Therefore, if the full quantity of a line has been invoiced for only a partial amount, you won't be able to invoice the remaining amount on another invoice.

I receive an "Object reference not set" error during purchase order confirmation, or an "Exception has been thrown by the target of an invocation" exception occurs during vendor invoice posting.

This issue can occur because of inconsistency in purchase order distributions.

To unblock this issue and reset the purchase order to a *Draft* state, go to **Procurement and sourcing** > **Periodic tasks** > **Clean up** > **Purchase order distribution reset**. For more information, see the following blog post: [Resolve PO distribution errors in Dynamics 365 Supply Chain Management](#).

I can't consolidate multiple product receipts into a single purchase order.

You can't consolidate multiple product receipts into a single purchase order if the different product receipt lines have different accounting dates.

In earlier versions of Microsoft Dynamics 365 Supply Chain Management, consolidation was allowed in this situation. However, the practice is prone to error. The accounting date on the purchase order lines that are created should not differ from the accounting date on the product receipt lines that those purchase order lines were created from. (The accounting date on the purchase order lines matches the accounting date on the purchase order header.) Therefore, the consolidation of multiple product receipts into a single purchase orders is no longer allowed.

The accounting date is used, for example, for budget reservations and encumbrance. Therefore, it should be kept during the transition from product receipt to purchase order.

When product receipts are canceled, transactions can be posted to a suspended ledger account.

Issue description

If a product receipt is canceled, the system allows transactions to be posted to suspended ledger accounts, even though the main accounts are suspended.

Reproduce the issue

The following procedure shows one way to reproduce the issue.

1. On the **Accounts payable parameters** page, on the **General** tab, make sure that the **Post product**

receipt in ledger option is set to *Yes*.

2. Create a purchase order, and add an order line that has a quantity of *1,000* for a product.
3. Confirm the purchase order.
4. Post the product receipt, and check the vouchers.
5. Suspend the relevant main accounts, *200140* and *140200*.
6. Cancel the posted product receipt.
7. Notice that transactions can be posted to the suspended ledger accounts.

Issue resolution

Transactions can be posted to the suspended ledger accounts when product receipts are canceled, because this behavior allows for correct postings.

A product receipt voucher number is consumed even if no financial voucher is generated during product receipt.

If the **Accrue liability on product receipt** option is set to *No* for the item model group, no postings to the general ledger will occur. However, a physical event will be recorded for the purpose of accounting in a subledger, and that event requires a voucher number. This voucher number is the voucher number that is referenced in the inventory transactions.

We recommend that you set the **Accrue liability on product receipt** option to *Yes*, as described in the following blog post: [Post Misc. charges at time of product receipt](#).

The Post to charge account in ledger setting isn't turned on.

Issue description

This issue occurs when a purchase order is invoiced, if the **Post to charge account in ledger** option is set to *Yes* on the **Invoice** tab of the **Accounts payable parameters** page.

Reproduce the issue

The following procedure shows one way to reproduce the issue.

1. Go to **Accounts payable > Setup > Accounts payable parameters**.
2. On the **Invoice** tab, set the **Post to charge account in ledger** option to *Yes*.
3. Go to **Inventory management > Setup > Posting > Posting**.
4. On the **Purchase order** tab, make sure that you've deleted all the lines in the purchase expenditure for the product.
5. Go to **Accounts payable > Purchase orders > All purchase orders**.
6. Create a purchase order. In the **Vendor account** field, select *1001 Acme Office Supplies*.
7. Add a purchase order line that has the following settings:
 - **Item number:** *D0011 Laser Projector*
 - **Site:** *1*
 - **Warehouse:** *11*
 - **Quantity:** *4*
8. On the Action Pane, on the **Purchase** tab, in the **Action** group, select **Confirm**.
9. On the Action Pane, on the **Receive** tab, in the **Generate** group, select **Product receipt**.
10. In the **Posting product receipt** dialog box, in the **Product receipt** field, enter an arbitrary number, and

then select **OK**.

11. On the Action Pane, on the **Invoice** tab, in the **Generate** group, select **Invoice**.
12. In the **Number** field, enter an arbitrary number as the invoice number.
13. Update the match status, and post.
14. Notice that you now receive the following error when you generate an invoice from a purchase order:
"Account number for transaction type Purchase expenditure for product does not exist."

Issue resolution

This depends on the parameter settings for invoices and invoice groups. For more information, see the following blog post: [Accounting for Purchase charge and Stock variation](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up and maintain vendor collaboration

2/18/2021 • 8 minutes to read • [Edit Online](#)

The vendor collaboration interface exposes a limited set of information about purchase orders, invoices, and consignment stock to external vendor users. From this interface, a vendor can also reply to requests for quotation (RFQs), and view and edit basic company information.

This topic explains how to set up vendor collaboration in Dynamics 365 Supply Chain Management. It also explains how to set up a workflow to provision new vendor collaboration users, and how to manage the security roles for those users.

NOTE

The information about the setup of security roles for vendor collaboration applies only to the current version of Finance and Operations. In Microsoft Dynamics AX 7.0 (February 2016) and Microsoft Dynamics AX application version 7.0.1 (May 2016), you collaborate with vendors by using the **Vendor portal** module. For information about user permissions for the Vendor portal in Microsoft Dynamics AX, see [Vendor portal user security](#).

Set up vendor collaboration security roles

A procurement professional or a vendor that has enough permissions can request that a contact person be provisioned as a user by enabling **Provision vendor user** on the contact person record. During the provisioning process, user permissions are selected for the new external user, and the new vendor user request is submitted. It's important that you correctly set up the user permissions that are available for selection in the vendor user request. Otherwise, vendors might be granted access to information that they should not have access to in Supply Chain Management.

Set up the security roles that are available for selection when a new user request is used for a contact person

1. Select **System administration > Security > External roles**.
2. Select **New**, and then select a security role and the **Vendor** party role.

You might want to add the **Vendor admin (external)** and **Vendor (external)** roles that are provided in Supply Chain Management. Alternatively, you can use security roles that your company has created.

You should make the **Vendor admin (external)** role available only if vendors should be able to create new contacts, submit vendor collaboration user requests for new users and changes to user information, and handle those requests via a workflow.

If you plan to manually set up vendor contacts and users, you can make just the **Vendor (external) role** available. This role will then be the only role that can be requested through a vendor user request.

NOTE

The **SystemUser** role is automatically granted when you manually create a new user account. Therefore, you must remove that role and assign the **SystemExternalUser** role. If new user accounts are created via the workflow that is initiated by a vendor user request to provision a new user, one or more of the roles that you've set up for vendor collaboration and the **SystemExternalUser** role will be assigned.

Vendor admin (external) security role

The **Vendor admin (external)** role can be used for external vendors that maintain vendor contact information

and make requests to provision new vendor collaboration users. External users who have this security role can perform the following tasks:

- View and modify contact person information, such as the person's title, email address, and telephone number.
- Add a new or existing contact person to the vendor accounts that they are a contact for.
- Delete any contact person that they have created.
- Activate or inactivate the association between a contact person and a vendor account. After the association between a contact person and a vendor account is inactivated, the contact person can't be referred to on new purchase orders or other documents.
- Deny or allow a contact person's access to documents on the vendor collaboration interface that are specific to the vendor account. After the association between a contact person and a vendor account is inactivated, access to documents that are specific to the vendor account is always denied.
- Request a new user account for a contact person by using the **Provision user** action.
- Request that a contact person's user account be inactivated.
- Request that a contact person's user account be modified to add or remove security roles.
- View RFQs.

Vendor (external) security role

The **Vendor (external) role** can be used for external vendors that will work with purchase orders. External users who have this security role can perform the following tasks:

- Respond to and view information about purchase orders.
- Maintain vendor collaboration invoices.
- View consignment inventory.
- View and respond to RFQs.
- View vendor information.

Set up security roles that are used when prospective vendors are onboarded

To onboard vendors that are initiated via a prospective vendor registration request, you must set up an external security role. This role will be assigned to new users during the provisioning process that is controlled by the workflow of the **User request workflow (platform)** type. For more information, see the [Set up workflows to process vendor collaboration user requests](#) section later in this topic.

For information about how to onboard prospective vendors, see [Onboard vendors](#).

Set up a security role that is used when a new prospective vendor user request is submitted

1. Select **System administration > Security > External roles**.
2. Select **New**, and then select a security role and the **Prospective vendor** party role.

You should add the **Vendor prospect (external)** role that is provided in Supply Chain Management.

The security role will grant access only to the new vendor registration wizard.

Set up workflows to process vendor collaboration user requests

To help guarantee that all the relevant tasks are completed, and that the appropriate approvals are given, you must set up workflows to handle vendor collaboration user requests.

Vendor collaboration user requests are submitted either by external vendors that have the **Vendor admin (external)** security role or similar permissions, or by procurement professionals in your company. They can also be generated from prospective vendor registration requests during the vendor onboarding process.

There are three types of requests:

- Requests to provision a new user
- Requests to inactivate an existing user
- Requests to modify the security roles of an existing user

For more information about vendor collaboration user requests, see [Manage vendor collaboration users](#).

You must create two or more workflows to process all three types of vendor collaboration user requests. New workflows are created on the **User workflows** page.

Example of a workflow for provisioning new users and modifying security roles

To handle vendor user requests to create new users and modify security roles, you can put a branching condition at the beginning of the workflow. In this way, a different branch of the workflow is used, depending on whether the request is to create a new user or modify an existing user.

To set up this branching, create a new workflow of the **User Request Workflow (Platform)** type. The branches of this workflow might contain the following elements.

Branch to provision new users

1. Assign an approval task to the person who is responsible for approving that new users should be granted access to vendor collaboration information.
2. Assign a task to the person who is responsible for requesting new Microsoft Azure Active Directory (Azure AD) user accounts in Azure portal. Use the predefined **Send Azure B2B user invitation** task for this step. B2B users can be automatically exported to Azure AD. Use the predefined **Provision Azure AD B2B user**. For more information, see [Export B2B users to Azure AD](#).
3. Assign an approval task to the person who uploads to Azure. If an account isn't successfully created, this person rejects the task and ends the workflow. This approval task can be skipped if you've included the step that automatically exports new user accounts to Azure via the B2B application programming interface (API).
4. Add an automated task that provisions a new user. Use the predefined **Automated provision user** task for this step.
5. Add a task that notifies the new user. You might want to send the new user a welcome email that includes a URL for Supply Chain Management. This email can use a template that you create on the **Email messages** page and then select on the **User workflow parameters** page. The template can include the **%portal URL%** tag. When the welcome email is generated, this tag which will be replaced by the URL of the Supply Chain Management tenant.

NOTE

This workflow can be used in multiple scenarios that involve user onboarding. For example, it can be used when prospective vendors or contact persons require a vendor collaboration account. Therefore, you should phrase the email as a general statement that can be used for multiple purposes.

Branch to modify security roles

1. Assign an approval task to the person who is responsible for approving changes to security roles.
2. Add an automated task that adds or removes the relevant security roles. Use the **Automated provision user** task for this step.

Example of a workflow for inactivating a user

Create a workflow of the **Inactivate user request workflow platform** type, and then add the following tasks.

1. Assign an approval task to the person who is responsible for accepting requests to inactivate users. You can

add conditions to automate this approval step.

2. Add an automated task that inactivates the user. Use the **Automated user inactivation** task for this step.
3. Add any clean-up tasks that are required. For example, you can add a task that removes the account from your directory in Azure portal.

Enable vendor collaboration for a specific vendor

Before you create a user account for someone who will use vendor collaboration, you must set up the vendor so that it can use vendor collaboration. On the **Vendors** page, on the **General** tab, set the **Collaboration activation** field. The following options are available:

- **Active (PO is auto-confirmed)** – Purchase orders are automatically confirmed if the vendor accepts them without requesting changes.
- **Active (PO is not auto-confirmed)** – Your organization must manually confirm purchase orders after the vendor has accepted them.

NOTE

Procurement professionals in your company can also complete this task.

Troubleshoot the provisioning of new vendor collaboration users

New vendor collaboration users are provisioned via the workflow that you set up to process vendor collaboration user requests of the **Provision vendor user** type.

If the email address of a new vendor collaboration user belongs to a domain that is registered with Azure as a tenant (that is, if it's a managed domain account), the email address must be an existing Azure AD account. Otherwise, the provisioning process can't be completed.

For more information about the process that is used in the **Send Azure B2B user invitation** task in the workflow for Azure AD account management, see [Azure Active Directory B2B collaboration](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage vendor collaboration users

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how you can request the provisioning of new vendor collaboration users, and how to add new vendor collaboration contacts.

The vendor collaboration interface in Dynamics 365 Supply Chain Management exposes information about purchase orders, invoices, and consignment stock to external vendors. You can create new vendor collaboration contacts and request that new users are provisioned if you're working as an external vendor with the **Vendor admin (external)** security role, or similar permissions. You can also perform these tasks if you're working as a procurement professional. In this topic, this role refers to a procurement professional who is working within the company that owns the instance of Supply Chain Management. For more information about how to use vendor collaboration if you're an external vendor, see [Vendor collaboration with customers](#).

For more information about how to use vendor collaboration if you're a procurement professional, see [Vendor collaboration with external vendors](#).

Add new vendor collaboration contacts

If you want someone to have access to vendor collaboration they first have to be added as a vendor collaboration contact. You may also want to add contacts for employees in your company who won't use vendor collaboration. For example, they could be the point of contact for other kinds of procurement information. New contacts are added on the **All contacts** page, which is accessed from the **Vendor collaboration > Contacts** menu. To add a new contact:

1. Click **New**.
2. Enter the contact person details.
3. Choose which legal entity they're representing in your company, and which legal entity they'll work with in the company that they'll collaborate with. You do this by selecting a **Legal entity in my company/Legal entity in customer company** pair.
4. Click **Create**.

If you want to delete a contact, it's only possible to delete the ones that you've created.

Vendor collaboration user requests

Vendor collaboration user requests can be raised by a procurement professional, or by an external vendor administrator.

- If you're an external vendor, you submit requests from the **All contacts** page within the **Vendor collaboration** module.
- If you're a procurement professional, you submit requests from the **View contacts** page. To do this, on the vendor record, in the **Setup** section on the Action Pane, select **Contacts > View contacts**.

You can make a request to provision a user, to inactivate a user, or to modify security roles. If you're an external vendor administrator, you must be registered as a contact person for the vendor accounts that you want to make user requests for, and you must have access to the vendor collaboration interface for those vendor accounts.

When a request is submitted it is added to the **Vendor collaboration user requests** list in the **Vendor collaboration** module, and to the **Vendor collaboration user request** list in the **Procurement and**

sourcing module (the Procurement and sourcing module is not accessible to external users).

Provision a user

Before you can request that a new user is provisioned, that person must be set up as a contact for one or more vendor accounts. To create a request for a new vendor collaboration user:

1. On the **All contacts** page, click **Provision vendor user**.
2. Enter an email address for the user. This address will be used by the user to sign in to Supply Chain Management. If the email address belongs to a domain registered as a tenant with Microsoft Azure, then the email address has to be an existing Azure Active Directory (AAD) account in order for the provisioning process to complete successfully. If the email address does not belong to a domain registered with Microsoft Azure, an AAD account will be created as part of the provisioning process and the new user will receive an invitation mail. Consumer email addresses with domains such as @hotmail.com, @gmail.com, or @comcast.net cannot be used to register a user.
3. Set the **Vendor collaboration access allowed** option to **Yes** for all the legal entities that the user needs access to.
4. In the **Assign user roles** section, select the **Assign** check box for the security roles that the new user should have.
5. Click **Submit**.

When the vendor user request is submitted, the **Vendor collaboration access allowed** field is set to **Yes** for the selected vendor account and a user request workflow is started. As part of the workflow, a new user is created, and security roles are assigned. In addition, an Azure B2B service is activated which initiates interaction with Azure portal and associates a new or existing AAD account with the Supply Chain Management user account. For more information, see [What is Azure AD B2B collaboration?](#)

Inactivate a user

There are two ways to remove access to vendor collaboration for a user:

- On the **Contacts** page for the vendor, set the **Vendor collaboration access allowed** option to **No** for the contact. This can be done individually per legal entity that the person is a contact for. This option can only be used by procurement professionals.
- Inactivate the entire user account, by submitting an **Inactivate vendor user** request.

To request that a user is inactivated:

1. On the **All contacts** page, click **Inactivate vendor user**.
2. Write a comment in the **Business justification** field.
3. Click **Submit**.

Modify security roles

The **Maintain vendor user roles** page is the same as the **Provision vendor user** page except that the list of security roles can be edited.

To request that the security roles are modified for a user:

1. On the **All contacts** page, click **Maintain vendor user roles**.
2. Write a comment in the **Business justification** field.
3. In the **Maintain user roles** section, select the security roles that you want to assign, or clear the ones that you want to remove.
4. Click **Submit**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up vendor accounts

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes the types of information that you must specify when you create a new vendor account.

When you create a vendor account, you enter information about the vendor. This information is used to automatically enter data in documents and to track activity that involves the vendor. For example, you can configure the following information for a vendor:

- Assign a vendor group. Every vendor must be assigned to a vendor group. The vendors in a vendor group have parameters that they share. For example, they might have the same terms of payment.
- Configure the vendor for catalog import. Vendors can provide a file that contains the catalog of their items and services. This file can be uploaded so that your workers can order from the vendor.
- Assign the vendor to procurement categories.
- Allow an existing vendor to do business with another legal entity in your organization.
- Put a vendor on hold for specific types of transactions.
- Set up banking information for the vendor, so that you can send payments electronically.
- Set up tax, delivery, invoice, and payment information for the vendor. By default, these settings are copied to new documents that you create for the vendor.
- Set up default financial dimensions that are used to automatically post transactions with the vendor to financial accounts.

To speed up the process of creating vendor accounts, you can create templates. To create a template, on the **Vendor** page, on the Action Pane, click **Options > Record info**. Then click **Company accounts template**. Company account templates are shared with other users.

You can also create a user template for your own use. You can't delete a vendor that is associated with other records, such as contacts or products.

Vendor account numbers

The account number is a unique identifier for a vendor. You can set up account numbers so that they're generated automatically when you create a vendor. You can also configure the number sequence so that account numbers are entered manually. For example, you might want to use the vendor's telephone number as the identifier.

Vendor organizations and individual vendors

When you create a new vendor account, you must select whether the vendor is an organization or a person. Your selection affects the information that you must fill in for the vendor. For a person, this information includes the first name, last name, and title. For an organization, this information includes the organization number and the number of employees.

Addresses

For each vendor, you can define multiple addresses, each of which is used for a different purpose. For example, you can create an address that has a purpose of **Invoice**. Or, if you will pay the vendor by using checks, you can set up an address that has a purpose of **Remit-to**. If you must specify an address to use for money transfers to foreign banks, the purpose will be **SWIFT**.

Vendor contacts

You can store contacts for a vendor. These contacts can then be used on documents such as purchase orders or requests for quotation (RFQs).

To add contacts for a vendor, on the **All vendors** page, on the **Vendor** tab, in the **Set up** group, click **Contacts > Add contacts**.

You can create vendor contacts from scratch. Alternatively, you can copy details from another person who is already registered in Supply Chain Management, and edit the information as you require.

Note: Adding a contact for a vendor isn't the same as adding contact information for that vendor. Although you might add general contact information for a vendor, you might also have several specific people who are contacts at that company, and who all have their own contact information.

You can't delete a contact person record if the contact is referenced on a document. Instead, you can inactivate the contact.

You can add vendor contacts to your personal contacts in Microsoft 365. However, you must first set up synchronization between Supply Chain Management and Microsoft 365 in both Microsoft Exchange Server synchronization and the Microsoft Outlook setup wizard.

Vendors in different legal entities

If a vendor is registered for only one legal entity in your organization, and other legal entities must register the same vendor, you can use the **Add vendor to another legal entity** page to configure the vendor to do business with another legal entity. You must select a vendor group, currency, and hold status for the vendor in the selected legal entity.

If multiple legal entities in your organization do business with the same vendor, and each legal entity maintains a separate vendor account for that vendor, you can merge the party IDs for the vendor accounts. In this way, information such as the address and the number of employees can be shared, so that you must update it in only one place.

To merge party IDs, follow these steps.

1. On the **Global address book** page, select the address book records that represent the vendor in each legal entity that should be included in the mapping.
2. On the Action Pane, click **Merge records**.

Agreements

When you set up a vendor account, you might also want to register the agreements that you have with the vendor. You can set up price and discount agreements by using the actions on the vendor record. You can also set up a purchase agreement on the **Purchase agreements** page.

Putting a vendor on hold

You can put a vendor on hold for various transaction types. The following options are available:

- **No** – No holds have been put on the vendor.
- **Invoice** – No invoices can be posted for the vendor.
- **All** – The vendor is on hold for all transaction types. These transaction types include purchase requisitions, invoices, and payments.
- **Payment** – No payments can be generated for the vendor.
- **Requisition** – Purchase requisitions can't be created for the vendor, and requisition lines already created

before the vendor was set on hold can't be converted to a purchase order. Requisition lines for the vendor will be canceled if your policy is set to create purchase orders automatically.

- **Never** – The vendor is never put on hold for inactivity.

When you put a vendor on hold, you can also specify a reason and a date when the on-hold status will end. If you don't enter an end date, the vendor's on-hold status lasts indefinitely.

You can bulk update the on-hold status to **All** for vendors based on the selected criteria on the **Vendor inactivation** page, and assign a reason for why the vendor is on-hold.

The following criteria are used to include vendors that have been inactive in a period, include or exclude vendors that are employees, and exclude vendors that are under a grace time before the next hold.

- Based on the number of days that you enter in the **In activity period** field on the **Vendor inactivation** page, the application calculates the latest date where the vendor can have any activity to be considered inactive. That is, the current date minus the number of days that you enter. If one or more invoices exist for the vendor where the date is later than the calculated latest date, the vendor will be excluded from the inactivation. This is also validated if the vendor has payments after that date, open purchase requisitions, open purchase orders, requests for quotations, or replies.
- The number of days in the **Grace time before next hold** field is used to calculate the latest grace date. That is, the current date minus the days that you enter. This only applies to vendors who have previously been inactivated. In the case of a previous inactivation, the application verifies the history of other occurrences of inactivation for the vendor and checks if the latest inactivation occurred before the latest grace date. If this is the case, the vendor will be included in the inactivation process.
- The parameter **Include employees** refers to vendors that are linked to an employee. You can set if you want to include those employees.

This process will always exclude vendors where the value in the **Vendor hold** field is **Never**.

Vendors that pass the validations are put on-hold, which sets the **Vendor hold** field value to **All** and the **Reason** to what has been selected. A record in the on-hold history is created for the vendor.

Vendor invoice account

If more than one vendor has the same billing address, or if a vendor is invoiced through a third party, you can specify an invoice account on the vendor record. The invoice account is the account that the invoice amount is credited to when you create a vendor invoice from a purchase order. If you don't enter an invoice account on the vendor record, the vendor account is used as the invoice account.

Vendor bank accounts

If you must make payments to a vendor bank account, you can enter information about the vendor's bank and bank accounts on the **Vendor bank accounts** page. You can also enter information about validation and payments for the bank account. For example, you can add prenotes to vendor bank accounts. These prenotes can be used to verify the accuracy of account data, such as routing numbers and account numbers. You must specify a default account for payments to the vendor. However, when you make an actual payment, you can change this account to one of the vendor's other accounts.

Ledger accounts

You can specify the default accounts that automatically appear in vendor invoice journals for the specified vendor. This functionality can be useful if you typically pay for the same types of items or services from the same vendors over time. When you specify a default account, you can quickly and efficiently enter journal entries in the invoice journal. The default accounts that you specify aren't used for purchase orders, or for vendor invoices that are entered on the **Vendor invoice** page.

You select default accounts on the **Default account setup** page, which you can open from the **Invoice** tab on the vendor record. The accounts that you select here appear in the filtered list of accounts for the vendor account when you enter a journal entry. You can set one of the accounts as a default account.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a vendor account

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a vendor account, and add an address and contact information. The procedure does not show how to populate all fields for purchasing and financial purposes. To learn more about those fields, please read the field descriptions. You can use this procedure in demo data company USMF or on your own data. Vendor accounts are typically created by a procurement professional or accounts receivable personnel.

Create a vendor account

1. Go to **Navigation pane > Modules > Procurement and sourcing > Vendors > All vendors**.
2. Click **New**.
3. In the **Vendor account** field, type a value.
 - The value may be populated automatically. If so, you can skip this step.
 - You can create vendor accounts for a person or organization. This will affect which fields are available. In this example, we'll create a vendor account for an organization.
4. In the **Name** field, enter or select a value. If your vendor is an already a registered party in your system you can use drop down and select them in this field and the new vendor account will inherit the address and contact information that's already registered.
5. In the **Group** field, enter or select a value. The vendor group is used to group vendors that have any of the following parameters in common: Terms of payment, settle period, inventory posting ledger accounts – including the sales tax group, default ledger accounts, product filter codes, or supply forecast configuration.
6. In the **Number of employees** field, enter a number.
7. In the **Organization number** field, type a value.

Add an address

1. Expand the **Addresses** section.
2. Click **Add**.
3. In the **Purpose** field, enter or select a value. You can select one or more purposes. These are used to select the correct address for a given purpose. For example, if the purpose is "Invoice" that address will be used when you send invoices.
4. In the **Name or description** field, type a value.
5. In the **Country/region** field, enter or select a value. Enter the address details. The country/region that you selected will determine the fields you are presented with, corresponding to the address format for the country/region.
6. Click **OK**.

Add contact information

1. Expand the **Contact information** section.
2. Click **Add**.
3. In the **Description** field, type a value.
4. In the **Type** field, select an option.
5. In the **Contact number/address** field, type a value. You can select the Primary check box if this is the primary contact.

6. Click **Save**.
7. Close the page.
8. Close the page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a vendor bank account

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create a bank account for a vendor. You can use this procedure in demo data company USMF.

1. Go to **Navigation pane > Modules > Procurement and sourcing > Vendors > All vendors**.
2. Select the vendor that you want to create a bank account for, and then click the link on the **Vendor account ID** field.
3. On the **Action Pane**, click **Vendor**.
4. Click **Bank accounts**.
5. On the **Action Pane**, click **New**.
6. In the **Bank account** field, type a value. This ID will be used to identify the bank account on the vendor record.
7. In the **Name** field, type a value.
8. In the **Bank groups** field, enter or select a value.
9. In the **Routing number type** field, select an option. This is the type of routing number that's used for international payments.
10. In the **Bank account number** field, type a value.
11. In the **SWIFT code** field, type a value.
12. In the **IBAN** field, type a value.
 - The IBAN number must be in the correct format. For example, you could use DE89370400440532013000.
 - The status of the bank account is Active if the Active date has been reached, and the Expiration date has not been exceeded. It's also active if both the Active date and Expiration date fields are blank. If the dates in both the Active date and Expiration date fields are in the future electronic payments are not available. Other payment types are available and the bank account is active.
13. Expand the **Setup** section.
14. In the **Text code** field, type a value. This field specifies a code that will appear on the bank statement of the recipient.
15. In the **Message to bank** field, type a value.
16. In the **Exchange reference** field, type a value. This is the reference number for any forward-term or fixed-term rate of exchange.
17. In the **Currency** field, enter or select a value. When prenotes are issued, this section provides an overview of their status (pending or approved).
18. Expand the **Address** section.
19. Expand the **Prenotes** section.
20. Expand the **Contact information** section.
21. In the **Telephone** field, type a value.
22. Close the page.
23. Click **Edit**.
24. Expand the **Payment** section.
25. In the **Bank account** field, select the account that you've just created.
26. Click **Save**. The address may be inherited from the bank group, if one is specified, or you can add it here.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor posting profiles

2/18/2021 • 4 minutes to read • [Edit Online](#)

Vendor posting profiles control the posting of vendor transactions to the general ledger.

Vendor posting profiles

Vendor posting profiles enable you to assign general ledger accounts and document settings to all vendors, a group of vendors, or a single vendor. These settings will be used when you create purchase orders, vendor invoices, and cash payments. For some transactions, you can select a posting profile that differs from and takes precedence over the posting profiles that are set up for transactions on this page. The default posting profile is defined on the **Ledger and Sales Tax** FastTab on the **Accounts payable parameters** page. The default posting profile is then included automatically on the header of new documents where you can change it to a different posting profile, if needed.

You can also associate posting definitions with transaction posting types on the **Transaction posting definitions** page. Posting definitions control the posting of vendor transactions to the general ledger instead of posting profiles.

Creating a posting profile

Setup

Specify the ledger accounts that are used in the posting of transactions that use the selected posting profile. Select an account code and, whenever possible, an account or group number for the selected posting profile. In the posting process, the most appropriate posting profile for each transaction is located by searching for the most specific account code, account number, or group and number combination in the following priority.

ACCOUNT CODE FIELD VALUE	ACCOUNT/GROUP NUMBER FIELD VALUE	SEARCH PRIORITY
Table	Specific vendor account	1
Group	Vendor group that is assigned to the vendor	2
All	Blank	3

If you want all vendor transactions to have the same posting profile, set up only one posting profile with **All** in the **Account code** field. Specify the following values to set up your posting profile.

FIELD	DESCRIPTION
Posting profile	Enter a code for the posting profile. For example, you could create two posting profiles to obtain one account for vendor balances in the national currency and another for vendor balances in a foreign currency. You could call one account National and the other Foreign.
Description	Enter a description of the posting profile.

FIELD	DESCRIPTION
Account code	<p>Specify whether the posting profile applies to a specific vendor, a group of vendors, or all vendors:</p> <ul style="list-style-type: none"> • Table – The posting profile applies to a single vendor. Select the vendor account in the Account/Group number field. • Group – The posting profile applies to a vendor group. Select the vendor group in the Account/Group number field. • All – The posting profile applies to all vendors. Leave the Account/Group number field blank.
Account/Group number	<p>If Table is selected in the Account code field, select the account number of the vendor that is associated with the posting profile. If Group is selected, select a vendor group. If All is selected, leave this field blank.</p>
Summary account	<p>Select the ledger account that will be used as the summary account for the vendors that the posting profile relates to. The Do not allow manual entry parameter for this main account will be marked. If you subsequently remove this account from the posting profile, validate the Do not allow manual entry setting on the Main accounts page.</p> <p>Note: If the Use posting definitions option is selected on the General ledger parameters page, the transaction posting definition for vendor invoices is used instead of the summary account.</p>
Settle account	<p>Select the liquidity ledger account that is used for cash flow forecasts. This field is only available when cash flow forecasting is enabled.</p>
Sales tax prepayments	<p>Select the account for sales tax payments that are received in advance.</p> <p>Note: The posting profile that is used when the payment is marked as a prepayment is selected in the Posting profile with Prepayment journal voucher field in the Ledger and sales tax area on the Accounts payable parameters page.</p>
Arrival	<p>Select the ledger account that information about unapproved vendor invoices is posted to. The information is entered in the Invoice register journal. For example, a user enters very basic information about vendor invoices when they are received in the invoice register. When the invoice register is posted, the transactions are posted to the account that is entered here and in the Offset account field. When the invoices are approved, the debt is transferred from the arrival account to the vendor summary account.</p>
Offset account	<p>Select the ledger account that is used for offsetting unapproved vendor invoices that are updated by using the invoice register. The offset account acts as the offset account for transactions that are posted to arrival accounts. Therefore, the account contains vendor purchases that have not yet been approved.</p>

Table restrictions

For transactions that have the selected posting profile, specify whether transactions will be settled automatically, interest will be calculated, and collection letters will be issued. You can also select the account that is used when transactions that have the selected posting profile are closed.

Specify the following values to set up your posting profile

FIELD	DESCRIPTION
Settlement	Select this option to enable automatic settlement of transactions that have this posting profile. If this option is cleared, you must manually settle transactions by using the Settle open transactions page.
Cancel	Select this option if you want to be able to cancel transactions that have this posting profile.
Close	Select a posting profile to change to when transactions that have this posting profile are closed. A transaction is regarded as closed when it has been settled in full.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor request configurations

2/18/2021 • 2 minutes to read • [Edit Online](#)

To complete a vendor request, a vendor contact person must complete the prospective vendor registration wizard.

In the **Vendor request configurations** form, you can create profiles that specify required fields and visible fields in the prospective vendor registration wizard.

The vendor registration wizard will start out by asking the prospective vendor user which country/region the vendor is doing business in. This information determines the applicable configuration. If no specific configuration is defined for a country/region, a default configuration will be used.

Set up a vendor request configuration

By default, there is a vendor configuration available in the Vendor request configurations form.

It is not possible to select country/regions for the default configuration, so the **Countries/regions** section cannot be changed.

1. Click **Procurement and sourcing > Setup > Vendors**, and then click **Vendor request configurations**.
2. Click the **Fields** tab to set the status of the listed fields.
3. Hidden (Not visible)
4. Displayed (Visible but not mandatory)
5. Required (Visible and mandatory)
6. Click the **Content** tab to specify if text is going to be shown on the wizard and if there should be an acknowledgement that the prospective vendor user must accept this before moving to the next step in the wizard. The acknowledgement will be requested for any terms and conditions that the user must accept to continue.

You can also enter a confirmation message that will be displayed when the wizard is finalized, and you can add one or more questionnaires.

Create a vendor configuration for a specific country/region

1. Click **Procurement and sourcing > Setup > Vendors**, and then click **Vendor request configurations**.
2. Click **New** to create a new configuration, and provide a name for the configuration.
3. Click **Save**.
4. Open the **Country/regions** tab to select the country/region that the configuration should be used for.
5. Complete the configuration by following the guidelines for the default configuration.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Onboard vendors

2/18/2021 • 11 minutes to read • [Edit Online](#)

New vendors can be onboarded and registered as vendors in Microsoft Dynamics 365 Supply Chain Management, based on information that is collected from a person who represents the vendor.

The process consists of the following steps, where various roles perform actions in the system.

1. **Data management OData – Entity import** - The initial request is the prospective vendor registration request. Typically, this request comes from a source such as a customer-hosted website that allows anonymous access. Vendors can sign up by providing basic information, such as the vendor name, justification, organization number, and name and email address of the contact person. The requests are imported via the Data management interface.
2. **Prospective vendor registration request list page** - Based on the information that is provided in the prospective vendor registration request, a procurement professional decides whether the vendor should be onboarded. The procurement professional views the incoming request on the **Prospective vendor registration requests** list page.
3. **User provisioning workflow** - When a procurement professional has verified the information in the incoming request and has decided to continue with the onboarding process, the user request workflow provisions the new user and sends an invitation email to accept the contact person as an authenticated user of Microsoft Dynamics 365.
4. **Vendor registration wizard** - The vendor's contact person signs in by using the new user account. He or she completes a vendor registration wizard to provide information such as addresses, business information, procurement categories, and questionnaire responses.
5. **Approval workflow** - A vendor request that includes the registration information is created. This vendor request is submitted to a workflow, and is routed for review and approval.
6. **Creation of a vendor master and user role modification** - When the vendor request is approved, a vendor record is created. The user account of the vendor's contact person is either granted permission to vendor collaboration or inactivated.

The following table shows the steps and roles that are involved in the process.

ROLE AND "PROCESS"	DATA MANAGEMENT ODATA – ENTITY IMPORT	PROSPECTIVE VENDOR REGISTRATION REQUEST LIST PAGE	USER PROVISIONING WORKFLOW	VENDOR REGISTRATION WIZARD	APPROVAL WORKFLOW	CREATION OF A VENDOR MASTER AND USER ROLE MODIFICATION
System	The request for a new vendor is imported.					After the vendor request is accepted, the vendor record is created.
Procurement professional		Start the onboarding process.			Review and either accept or reject the vendor request.	

ROLE AND "PROCESS"	DATA MANAGEMENT ODATA – ENTITY IMPORT	PROSPECTIVE VENDOR REGISTRATION REQUEST LIST PAGE	USER PROVISIONING WORKFLOW	VENDOR REGISTRATION WIZARD	APPROVAL WORKFLOW	CREATION OF A VENDOR MASTER AND USER ROLE MODIFICATION
Administrator			Create a user in Supply Chain Management and Microsoft Azure.			
Vendor contact person			Send email to the contact person.	Register vendor information.		

For a quick demonstration of the vendor onboarding process, watch this short YouTube video about [How to onboard a new vendor in Finance and Operations](#).

Importing the prospective vendor registration request

The prospective vendor registration request is an entity in Supply Chain Management. You can set up the system to import data via this entity.

The following table shows the information that this entity contains, and that can be imported.

FIELD	DESCRIPTION
Vendor name	The name of the vendor.
Business justification	The reason or reasons for the vendor request.
Organization number	An officially known registration number.
Line of business	The line of business that the vendor is in.
Contact person's first name	The first name of the person who will be invited to register vendor information.
Contact person's middle name	The middle name of the person who will be invited to register vendor information.
Contact person's last name	The last name of the person who will be invited to register vendor information.
Contact person's email	The email address that will be used to create a new user in Supply Chain Management, and that will be registered in the tenant's Azure Active Directory (Azure AD) account.
Submitted date	The date when the request was created in an external system.

FIELD	DESCRIPTION
Legal entity	The legal entity where the vendor is requesting to become a vendor. This value must be a legal entity code that has been registered in Supply Chain Management. If no value is received through the import process, a value from the Procurement and sourcing parameters is applied.
Vendor type	The vendor can be either an organization or a person. The vendor type determines how the vendor is finally created.

After the prospective vendor registration request is imported, it appears on the **Prospective vendor registration request** list page. From this list page, a procurement professional can invite the user. A user request for provisioning the user is sent to a workflow.

Submitting a prospective vendor user request

The purpose of a prospective vendor user request is to provision the person who submitted the initial request, so that he or she can sign in to Supply Chain Management by using the email account that is provided in the prospective vendor registration request.

The prospective vendor user request is processed by the user request workflow. This workflow communicates through Azure AD B2B collaboration. It creates a user in Supply Chain Management that has the appropriate security settings.

New users that are set up have the following security roles:

- System external user
- Vendor prospective (external)

The new user will receive an email that is generated by the user request workflow. This email invites the user to sign in to the system.

For information about the configuration of the email and the workflow in general, see the description of a user request workflow in [Set up and maintain vendor collaboration](#).

Vendor registration

A prospective vendor user who signs in to Supply Chain Management will see the first page of a vendor registration wizard, where he or she can enter vendor information.

The wizard reflects the configuration of the vendor request. The country or region where the vendor does business determines what information is requested in the wizard and what information is mandatory.

For more information about the vendor request configuration, see [Set up and maintain vendor collaboration](#). The following table gives an overview of the pages in the wizard and the purpose of each page.

PAGE	DESCRIPTION
Country/region	The country or region determines the vendor request configuration that is applied on the remaining wizard pages. It also determines values in the Tax state lookup.
Terms and conditions	This page might be available, depending on the vendor request configuration. If it's available, the user must acknowledge the terms and conditions to continue.

PAGE	DESCRIPTION
Vendor information	This page contains the vendor name, which is automatically entered from the original prospective vendor registration request. It also contains the organization number, the vendor's telephone number, fax number, and email address, and the vendor's addresses for various purposes.
Contact person information	This page contains the contact person's name, which is automatically entered from the original prospect vendor registration request. It also contains the contact person's telephone number and email address, and the contact person's addresses for various purposes.
Business information	This page contains tax registration numbers (for various countries or regions) and the numbers of employees. It also indicates whether the business is minority owned.
Procurement categories	This page contains the procurement categories that the vendor is requesting approval for. The user can select categories in the procurement category hierarchy. You can configure the number of levels that are shown in the hierarchy at Procurement and sourcing parameters > Vendor collaboration , under Procurement and sourcing > Setup .
Questionnaires	The wizard might include a set of questionnaires for the vendor. Questionnaires that appear in the wizard are configured either on the vendor request or per procurement category. If questionnaires are configured per procurement category, the procurement categories that the vendor requests approval for determine the questionnaires that appear in the wizard. On the Procurement categories page, you can add a questionnaire under the relevant category and set the activity type to Vendor onboarding .

When the prospective vendor user completes the vendor registration wizard, a vendor request is created.

Manually or automatically submit a vendor request

A vendor request can be created as a draft and manually submitted to a workflow. Alternatively, the vendor request can be automatically submitted to a workflow when the vendor registration wizard is completed. A request can be submitted manually if, for example, a procurement professional wants to assess whether the request should be routed through an approval process before it's submitted to the workflow.

- Select **Procurement and sourcing parameters > Vendor collaboration**, and then select **Auto submit prospective vendor registration to workflow** to configure the vendor request so that it's submitted automatically to a workflow when the vendor registration wizard is completed.

Vendor requests

Vendor requests are available on the **Vendor collaboration user requests** page.

A vendor request contains the information that the prospective vendor user entered in the vendor registration wizard.

The request lets you review the vendor information and decide whether the vendor should become a registered vendor.

The vendor request should be submitted to a workflow, and it should be routed to the relevant reviewers and approvers. For basic information about how to set up workflows, see [Procurement and sourcing workflows](#).

The following table shows the statuses that vendor requests can have.

STATUS	DESCRIPTION
Draft	The vendor request hasn't yet been submitted.
Request submitted	The vendor request has been submitted, and the first step in the workflow is being processed.
Pending review	If there are multiple reviewers in a workflow task, a reviewer can accept the task of reviewing the vendor request and then complete the review. If there is only one reviewer, that participant can complete the review by selecting Completed in the workflow action. He or she doesn't have to accept the work item first.
Request pending approval	The vendor request has been routed to the participants for approval, and there is an option to request additional information. A request for additional information cause the work item to be routed back to the submitter. The vendor request can also be approved or rejected while it's in this status.
Application change request	Additional information has been requested by the approver, and the vendor request has been routed to the person who submitted the vendor request. The submitter can add required information and then resubmit the vendor request. If a vendor request is resubmitted, the status is changed back to Request pending approval status.
Request approved	This status is a final state.
Request rejected	This status is a final state.

Approving a vendor request

When a vendor request is approved, a vendor account is created, and the status **Approved** appears on both the initial prospective vendor registration request and the vendor request.

Before you approve a vendor request, on the **New vendor** page, on the **General** FastTab, select **Vendor group** to select a vendor group.

If the prospective vendor user should have access to Supply Chain Management as a vendor collaboration user who represents the vendor, set the vendor collaboration access permission to **Yes**. To inactivate the user account that the prospective vendor used to register, set this permission to **No**.

If the vendor collaboration access permission is set to **Yes**, when the vendor request is approved, a request is submitted to modify the user's roles so that the user has the roles that are defined for the **Vendor** type in **External roles**. If this permission is set to **No**, when the vendor request is approved, a request is submitted to inactivate the user. In this case, the workflow to inactivate a user request must be set up.

For a vendor account to be created when the vendor request is approved, the number sequence for creating vendors from vendor requests must be set to **Auto**.

For an overview of the access permissions of a vendor collaboration user, see [Set up and maintain vendor](#)

collaboration.

Rejecting a vendor request

If a vendor request is rejected, a reason for rejection must be selected in the vendor request.

When a vendor request is rejected, a request is submitted to inactivate the user. In this case, the workflow to inactivate a user request must be set up. For more information, see [Set up and maintain vendor collaboration](#).

When a vendor request is rejected, the status **Rejected** appears on both the initial prospective vendor registration request and the vendor request.

Deleting a prospective vendor registration request in various statuses

The various statuses of a prospective vendor registration request give an overview of the request's progress.

By using the **Delete** action on the prospective vendor registration request, you can clean up and remove the chain of records that has been created, and you can inactivate the user account. The result of the **Delete** action varies, depending on the status of the prospective vendor registration request, as shown in the following table.

STATUS	STATUS DESCRIPTION	RESULT OF THE DELETE ACTION
New	No actions have been taken on the request.	The prospective vendor registration request is deleted.
User requested	When you select Invite user , the status is changed to User requested , and a prospective user request is created and submitted to a user request workflow.	You can't delete a prospective vendor registration request that has this status, because the user request workflow hasn't ended.
User invited	The user request workflow is approved, and the user is created.	A request to inactivate the user is created, and the prospective vendor registration request is deleted.
Registration in progress	The new user has signed in and has started the vendor registration wizard.	A request to inactivate the user is created, and the prospective vendor registration request and the data that was entered in the vendor registration wizard are deleted.
Vendor request created	The vendor registration wizard has been completed.	A request to inactivate the user is created, and the prospective vendor registration request, the data that was entered in the vendor registration wizard, and the vendor request are deleted. <div data-bbox="1034 1760 1422 1890" style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">[!NOTE] You can't use the Delete action when the vendor request is in a review process in the workflow.</div>
Approved	The vendor request is approved.	The prospective vendor registration request, the data that was entered in the vendor registration wizard, and the vendor request are deleted.

STATUS	STATUS DESCRIPTION	RESULT OF THE DELETE ACTION
Rejected	The vendor request is rejected.	The prospective vendor registration request, the data that was entered in the vendor registration wizard, and the vendor request are deleted.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor collaboration with external vendors

2/18/2021 • 16 minutes to read • [Edit Online](#)

The **Vendor collaboration** module is targeted at vendors who don't have electronic data interchange (EDI) integration with Microsoft Dynamics 365 Supply Chain Management. It lets vendors work with purchase orders (POs), invoices, consignment inventory information, and requests for quotation (RFQs), and also lets them access parts of their vendor master data. This topic explains how you can collaborate with external vendors who use the vendor collaboration interface to work with POs, RFQs, and consignment inventory. It also explains how to enable a specific vendor to use vendor collaboration, and how to define the information that all vendors see when they respond to a PO.

For more information about what external vendors can do in the vendor collaboration interface, see [Vendor collaboration with customers](#).

NOTE

The information about vendor collaboration in this topic applies only to the current version of Supply Chain Management. In Microsoft Dynamics AX 7.0 (February 2016) and Microsoft Dynamics AX application version 7.0.1 (May 2016), you collaborate with vendors by using the **Vendor portal** module. For information about the **Vendor portal** module, see [Collaborate with vendors by using the Vendor portal](#).

For more information about how vendors can use vendor collaboration in invoicing processes, see [Vendor collaboration invoicing workspace](#). For information about how to provision new vendor collaboration users, see [Manage vendor collaboration users](#).

Defining the information that is shown to vendors when they respond to POs

When vendors respond to a PO that you send them, they see one of three message boxes, where they must confirm that they want to accept the PO, reject it, or accept it with changes. Because the information that must be shown to the vendor at that point might be specific to your business, you can specify the text that appears in each confirmation message. For example, the text can inform the vendor about the next steps in the process, or about terms and conditions.

To define the text that's shown in the PO response, follow these steps

1. On the **Information for vendors responding to POs** page, select the response type, and then select **Edit**.
2. In the **Information message** box, enter the information that should be shown to vendors in the message box.

If you must add messages in more than one language, create separate messages, and specify the appropriate language code for each. The message that is shown to each vendor will be in the language that the vendor uses.

Setting the vendor collaboration options for a specific vendor

An administrator configures the general settings for vendor collaboration, such as the security roles that are available for all vendors that you collaborate with. However, there are also settings that can differ for each vendor account. You should configure these settings.

- Enable vendor collaboration.

- Specify whether the vendor should see price information.

Enabling vendor collaboration

Before user accounts can be created for an external vendor, you must configure the vendor account so that vendor can use vendor collaboration. On the **Vendors** page, on the **General** tab, set the **Collaboration activation** field. The following options are available:

- **Active (PO is auto-confirmed)** – POs are automatically confirmed if the vendor accepts them without changes.
- **Active (PO is not auto-confirmed)** – Your organization must manually confirm POs after the vendor has accepted them.

Specifying whether the vendor should see price information

To share price information for POs via the vendor collaboration interface, you must set the **Purchase order prices/amount** option on the **Purchase order defaults** tab for the vendor account to **Yes**. This price information includes the unit price, discounts, and charges.

Working with POs when vendor collaboration is used

Sending a PO to a vendor

POs are prepared in Supply Chain Management. When a PO has a status of **Approved**, you send it to the vendor by selecting **Send for confirmation** on the **Purchase order** page. The PO status is then changed to **In External Review**. After the PO has been sent, the vendor can see it on the **Purchase orders for review** page in the vendor collaboration interface. The vendor can then accept the PO, reject it, or suggest changes to it. The vendor can also add comments to communicate information such as changes to the PO. If you want to draw the vendor's attention to a new PO, you can also use the Print management system to send the PO by email.

Confirmation and acceptance of a PO by a vendor

After a vendor accepts a PO, the PO can be automatically confirmed, or it might have to be manually confirmed. The behavior depends on whether the **Collaboration activation** field is set to **Active (PO is auto-confirmed)** or **Active (PO is not auto-confirmed)** for the vendor.

The following table shows the typical exchange of information, depending on the vendor's response when you send a PO for confirmation.

VENDOR RESPONSE	RESULT
<p>The vendor accepts the order, and Supply Chain Management is configured to automatically confirm POs that the vendor accepts.</p>	<p>The status of the order is updated to Confirmed. If the order can't be updated for some reason, the vendor response is still recorded as Accepted, but the status of the PO remains In External Review.</p> <p>The PO that was sent to the vendor and that has a status of In External Review is updated with confirmed delivery dates on the lines. This update initiates a new version that is automatically set to Confirmed status. When the PO is confirmed, it appears in the vendor collaboration interface.</p>
<p>The vendor accepts the order, but Supply Chain Management isn't configured to automatically confirm POs that the vendor accepts.</p>	<p>The vendor response is recorded as Accepted, but the status of the PO remains In External Review.</p> <p>The PO that was sent to the vendor and that has a status of In External Review is updated with confirmed delivery dates on the lines. This update initiates a new version that is automatically set to In External Review status. You can then manually confirm the PO.</p>

VENDOR RESPONSE	RESULT
The vendor rejects the order.	The vendor response is recorded as Rejected , and the status of the PO remains In External Review . The rejection is received together with the vendor's note.
<p>The vendor accepts the order with changes. Changes are suggested at the line level. The vendor can accept or reject individual lines. Here are some other changes that the vendor can suggest:</p> <ul style="list-style-type: none"> • Change dates or quantities. • Split lines for different delivery dates or quantities. • Substitute an item. <p>The vendor can't change price information and charges. However, the vendor can suggest these changes by using notes.</p>	The vendor response is recorded as Accepted with changes , and the status of the PO remains In External Review . The statuses show the types of changes that the vendor has suggested. For information about the automatic consumption of changes, see the "Update the PO when a vendor suggests changes" section later in this topic.

You can use the **Purchase order preparation** workspace to monitor which POs the vendor has responded to. This workspace contains two lists that contain POs that have a status of **In External Review**:

- In external review requires action
- In external review awaiting vendor response

Changing a PO

To change a PO that a vendor has already responded to, you must send the vendor a new version of the PO. The new PO will have a version suffix to indicate that it's a modified version of a PO that was previously sent. The **Purchase order vendor confirmation history** page lets you and your vendors track the history of each order. The previously confirmed version of a PO remains in the list of confirmed POs until the new PO has been confirmed.

Canceling a PO

When you cancel a PO, the status is changed to **Approved**. You must send the PO back to the vendor, so that the vendor can confirm or reject the cancellation. After the cancellation is confirmed, the PO appears in the vendor's list of confirmed POs as **Cancelled**.

Adding attachments to a PO

You can add attachments such as files, images, and notes to the PO by using the document management system. Attachments of the **External** type will be visible to the vendor when you send the PO.

Updating a PO when a vendor suggests changes

If a vendor has responded to a PO and suggested changes, the next step is to process the response.

In the **Purchase order preparation** workspace, in the **In external review requires action** list, you can identify POs that a vendor has accepted with changes. From this list, you can also navigate to the vendor's response.

On a response, a vendor can change the following information on the header:

- Vendor document reference
- Mode of delivery
- Delivery terms
- Confirmed delivery date

The vendor can also add a note or attachment.

On the lines, the vendor can change the quantity and the delivery dates, add notes and attachments, reject a line, substitute a line with another product that is entered as text, and split a line into multiple deliveries. The status of a line varies, depending on the changes that the vendor has suggested:

- **Accepted with changes**
- **Rejected**
- **Substituted** – In this case, an extra line is added that has a status of **Substitute**.
- **Confirmed**
- **Split into schedule** – In this case, extra lines are added that have a status of **Schedule lines**.

If a line has no changes, the line status is **Accepted**.

On the response, the line statuses tell you the types of changes that the vendor made. Additionally, all fields that were changed appear bold to help you identify the changes.

You can update a PO by selecting **Process PO update** on the response or on one line at a time. An **Is PO update processed?** field on the header and the lines indicates whether the system has processed the header or lines to update the PO with changes that originate from the response. You can run the **Process PO update** action only one time per header or line.

Not all suggested changes can be updated on a PO. Only updates on the header, and updates of dates and quantities on lines, can be automatically updated on the PO. For other changes, you must manually update the PO. In this case, the value of the **Is PO update processed?** field is **Manual update**. For example, if a vendor suggests that a line be split into a schedule, this change must be made manually.

Every line that has a status of **Accepted** will have a confirmed delivery date. When you run the **Process PO update** action, this date is updated on the PO. Notes and attachments aren't automatically transferred to the current PO. Additionally, trade agreements aren't reassessed on the PO lines when you update the current PO via the **Process PO update** action.

PO statuses and versions

This section describes the various statuses that a PO can have up to the time when it's confirmed. It also describes when new versions of a PO are made available to the vendor. The behavior varies, depending on whether you use change management for POs.

Versions and statuses if you don't use change management

The following table shows an example of the changes in status and version that a PO might go through.

ACTION	STATUS AND VERSION
The initial version of the PO is created in Supply Chain Management.	The status is Approved .
The PO is sent to the vendor.	A version is registered in the vendor collaboration interface, and the status is changed to In External Review .
The vendor sends an Accepted with changes response.	The status is still In External review .
You make some changes that the vendor requested.	The state is changed to Approved .
You send the new version of the PO to the vendor.	A new version is registered in the vendor collaboration interface, and the status is changed to In External Review .

ACTION	STATUS AND VERSION
The vendor accepts the new version of the PO.	The status is still In External Review , unless the vendor account is configured to automatically set POs to Confirmed status when the vendor accepts them.

Vendors don't have to confirm a PO by using the vendor collaboration interface. They can also send an email or communicate their acceptance of a PO via other channels. You can then manually confirm the order. In this case, you receive a warning that states that the order is being confirmed even though there is no response from the vendor. The PO then appears in the confirmation history as an open confirmed order that doesn't have any responses. At this point, the vendor no longer has the option to confirm or reject the PO.

NOTE

The version of the PO that is available to other processes in Supply Chain Management is always the latest version, even if that version hasn't yet been registered in the vendor collaboration interface.

Versions and statuses if you use change management

If change management is enabled for POs, POs go through an approval workflow to reach the **Approved** status. This process isn't visible to the vendor.

The following table shows an example of the changes in status and version that a PO might go through when change management is turned on. A version is registered when the PO is approved, not when the PO is sent to the vendor or confirmed.

ACTION	STATUS AND VERSION
The initial version of the PO is created in Supply Chain Management.	The status is Draft .
The PO is submitted to the approval process. (The approval process is an internal process that the vendor isn't involved in.)	The status is changed from Draft to In Review to Approval if the PO isn't rejected during the approval process. The approved PO is registered as a version.
The PO is sent to the vendor.	The version is registered in the vendor collaboration interface, and the status is changed to In External Review .
You make some changes that the vendor requested, either manually or by using the Process PO update action on the response to update the PO.	The status is changed back to Draft .
The PO is submitted to the approval process again.	The status is changed from Draft to In Review to Approval if the PO isn't rejected during the approval process. Alternatively, the system can be configured so that specific field changes don't require re-approval. In this case, the status is first changed to Draft and is then automatically updated to Approved . The approved PO is registered as a new version.
You send the new version of the PO to the vendor.	The new version is registered in the vendor collaboration interface, and the status is changed to In External Review .
The vendor approves the new version of the PO.	The status is changed to Confirmed , either automatically, or when you receive the response from the vendor and then confirm the PO.

Sharing information about consignment inventory

If you're using consignment inventory, vendors can use the vendor collaboration interface to view information on the following pages:

- **Purchase orders consuming consignment inventory** – POs for consignment inventory are generated when the ownership of the inventory is changed from the vendor to your company. A product receipt is posted at the same time. These consignment POs are shown only on the **Purchase orders consuming consignment inventory** page. They aren't included on the **All confirmed purchase orders** page in the **Vendor collaboration** module.
- **Products received from consignment inventory** – This page lists all the transactions where the ownership of products has been transferred from the vendor to your company. Vendors can use this information to invoice the customer.
- **On-hand consignment inventory** – This page shows the vendor-owned on-hand consignment inventory that has been received at your warehouse.

Working with RFQs when you use vendor collaboration

This section describes the interactions between customers and vendors during the RFQ process. It also explains how information is communicated to the vendors. For a basic overview of support for the RFQ process, see [Requests for quotation \(RFQs\) overview](#).

Alternates, attachments, amendments, and returns

- **Alternates** – On the header of an RFQ case, you can specify that alternates are allowed for non-catalog item lines. When alternates are enabled, vendors can add an alternate line for each requested line.
- **Attachments** – Attachments can be added at both the header level and the line level of an RFQ case. Attachments can be classified as either internal or external. Internal attachments can be viewed only on the customer side, whereas vendors can view external attachments after they are sent.

Vendors can also add attachments on their bid reply. These attachments can be viewed on the customer side after a vendor submits the bid reply. Attachments that vendors add are always classified as external. To access an attachment that a vendor has submitted together with a bid, select **Bid attachments** or **Bid line attachments**.

To open attachments that were sent together with the RFQ case, use the document handling paper clip symbol on the reply.

- **Amendments** – When an amendment is finalized, the existing bid replies are removed so that they can be replaced by updated values. Information such as the line price and quantity from previous bid replies can be viewed via the journals on the RFQ case.

To enforce amendment processing, on the **Procurement and sourcing parameters** page, on the **Request for quotations** FastTab, set the **Lock RFQs when they are sent** option to **Yes**. (This option is set and required for Public sector.)

- **Returns** – If a vendor has submitted a bid, but more or modified information is required for the RFQ case, the customer can return the bid to the vendor. The data from the bid that was previously submitted is retained, and the vendor can make the requested modifications without having to restart the bid process.

Public sector extensions

For Public sector, the extended functionality enables an RFQ case to be sent to vendors and published. When you publish an RFQ, anyone who requests the information can view the work that complies with most public-sector regulations. All available work is reflected on the **Open published requests for quotations** list page, and the

canceled, pending, or awarded RFQs can be viewed on the **Closed published requests for quotations** list page. These documents can also be viewed on a site outside Supply Chain Management through integrations with the following data entities:

- Published requests for quotations
- Published requests for quotations line
- Published requests for quotations header attachments

These entities let people who aren't provisioned users in Supply Chain Management, but who have anonymous access to the external site, view the available and closed work. Additionally, extended functionality in **Send and publish** lets the user who sets up parameters for the RFQ process define an email template. Then, when the procurement professional creates the RFQ case, he or she must select the email template to send the required information to the vendors on the RFQ case.

The user who sets up parameters for the RFQ process can create multiple email templates. These email templates can contain both static text and the following replacement tokens. The tokens will be replaced with contextual values when an email is created.

- %RFQCase%
- %RFQCaseName%
- %bidType%
- %inviteOnly%
- %expiryDateTime%
- %requester%
- %requestingDepartment%
- %accountnum%
- %todaysdate%
- %createddate%

If an amendment is required and is sent after the RFQ is sent, the RFQ will be resent to all invited vendors. The published document will also be updated on the **Open published requests for quotations** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Vendor collaboration with customers

2/18/2021 • 9 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic describes how you can use vendor collaboration to work with customers in Microsoft Dynamics 365 Supply Chain Management. Vendors can complete a series of business processes from the following workspaces:

- **Purchase order confirmation** – Monitor and respond to purchase orders (POs).
- **Vendor bidding** – View requests for quotation (RFQs), and respond to them by entering bids.
- **Vendor information** – View and update vendor master data.
- **Invoicing** – Work with invoices. This topic doesn't cover the **Invoicing** workspace. For more information about this workspace, see [Vendor collaboration invoicing workspace](#).

Vendors can also monitor information about consignment inventory.

Working with POs in the Purchase order confirmation workspace

The **Purchase order confirmation** workspace lets you respond to the purchase orders (POs) that have been sent to you for review. It also lets you view information about POs that are awaiting action from the customer, and POs that have been confirmed but are still open.

There are three lists in the **Purchase order confirmation** workspace:

- **Purchase orders for review** – This list shows POs that have been sent to you and are awaiting a response from you. After you respond, the PO disappears from the list. If the customer sends you a new version of the PO before you've responded to the previous version, only the latest version is shown.
- **Awaiting customer action** – This list shows all the POs that you've responded to but that the customer hasn't yet confirmed. If you accept a PO, you can monitor it in this list until the status is changed to **Confirmed**. If you reject a PO or accept it with changes, you can monitor it here until the customer sends a new version.
- **Open confirmed purchase orders** – This list shows all the POs for your account that have a status of **Confirmed**. When products or services are fully received against the PO, the PO disappears from the list.

You can use the following pages to work with POs:

- **Purchase orders for review** – This page contains the same information as the **Purchase orders for review** list in the workspace. See the description earlier in this topic.
- **Purchase order vendor confirmation history** – This page contains all POs and all versions of POs that have been sent to the vendor. It also contains all the responses that have been returned from the vendor.
- **Open confirmed purchase orders** This page contains the same information as the **Open confirmed purchase order** list in the workspace. See the description earlier in this topic.
- **All confirmed purchase orders** – This page contains all the POs that have been confirmed. The POs that are shown on this page include POs where products or services have been received. You can use this list to monitor POs that you can send invoices for.

Responding to POs

The POs that the customer sends you to review appear in the **Purchase order confirmation** workspace and on the **Purchase orders for review** page. After you open a PO, you can accept it, reject it, or accept it with changes. There might be attachments on the PO header or on individual lines. Additionally, you can attach information to your response on the PO header or individual lines. For example, you might suggest a substitute item for one of the lines.

You can preview and print the PO as a PDF file by using the **Preview/Print** option. You can also use the **Display dimensions** action to hide or show the following dimension columns: **Site, Warehouse, Color, Size, Style,** and **Configuration**.

If you use the **Accept with changes** option, you can accept or reject individual lines. You can also make the following changes to lines:

- Change dates or quantities. To update the confirmed delivery date on all lines, use the **Update delivery date** option on the PO header.
- Split lines for different delivery dates or quantities.
- Substitute an item. In the **Line details** section, enter an item description and the item number in the **External** field.

You can't change pricing information or charges, but you can use notes to make suggestions for these changes.

If the customer sends you a new version of a PO, it will have a version suffix to indicate that it's a modified version of a PO that was previously sent. The **Purchase order vendor confirmation history** page lets you track the history of each order.

Monitoring consignment inventory

If you're using consignment inventory, you can use the vendor collaboration interface to view information on the following pages:

- **Purchase orders consuming consignment inventory** – POs for consignment inventory are generated when the customer takes ownership of the inventory. These consignment POs are shown only on this page. They aren't included on the **All confirmed purchase orders** page.
- **Products received from consignment inventory** – This page lists all the transactions where the ownership of products has been transferred to the company that is consuming the inventory. You can use this information to invoice the customer.
- **On-hand consignment inventory** – This page shows the on-hand consignment inventory that is owned by your company, but that is on hand at the customer's warehouse.

Working with RFQs in the Vendor bidding workspace

The **Vendor bidding** workspace lets you view the requests for quotation (RFQs) that your company has been invited to respond to. You can also respond to the RFQs.

The workspace also shows all the RFQs that you've lost or won. Additionally, if the system is configured for the public sector, the workspace shows the RFQs that are publicly available.

Viewing RFQs

Open the **Vendor bidding** workspace to access the following information:

- Select **New bid invitations** to see the RFQs that your company has been invited to respond to. From here, you can view an RFQ and start the bidding process. You can also see amended RFQs that a new bid must be submitted for.
- Select **Returned bids** to see the RFQs that the customer has returned to you so that you can provide more

information or update the bid.

- Select **Bids in progress** to see the RFQs that you or a contact person who represents your company has been working on but hasn't yet submitted.
- Select **Awarded bids** to see when the customer has awarded at least one line item in your bid.
- Select **Lost bids** to see bids where all lines have been rejected.
- Select the **Request for quotations** link to see a list of all the vendor's RFQ invitations and any bids that have been submitted. The **Request for quotations** page lists all the RFQs that a vendor has been involved in. You can search by status.
- Select the **Declined bids** link to see a list of all the RFQs where a vendor's contact person has declined to bid.

Working with RFQs that are publicly available

People who work in the Public sector can see open and expired RFQs that have been made available to the public.

- Select the **Open published requests for quotations** link to see a list of open RFQs that are available to the public. An open RFQ is an RFQ that hasn't yet expired. You can find the expiration date and time on the header of the RFQ.

If you've been invited to bid, you can find the same RFQ on the **New bid invitations** page. Sometimes, you might want to bid on an open RFQ, but you haven't been invited to bid. In this case, you might be able to invite yourself, provided that the customer has enabled self-invitation for the RFQ case.

Enhance the accessibility of the **Open published requests for quotations** link by turning on the **Display the "Open published requests for quotation" link as a tile** feature. This feature converts the link to a tile and moves it to a prominent location, so that it's easy to find.

- Select the **Closed published requests for quotations** link to see a list of closed RFQs that are available to the public. A closed RFQ is an RFQ that has expired. You can find the expiration date and time on the header of the RFQ.

A closed RFQ shows all vendor bids down to the line level. As bids are awarded or rejected, this information is reflected in the closed RFQ. Any attachments that are included in the bid are also available.

NOTE

This functionality is available only if the Public sector configuration is turned on.

Bidding

- Select **Bid** to start to bid on an RFQ.

When the editing is enabled for bid fields on the headers and lines of an RFQ you can enter your bid directly in the line grid. You must also consider any additional bid information that should be added in the line details.

When you start to work on a bid, it appears in the **Bids in progress** section.

At any time before the expiration date, you can save a bid. You can then return later to finish and submit the bid. After you submit a bid, you can recall and update it up until the expiration date.

- Select **Reset from RFQ** to reset the data that you entered for a bid and revert to the original RFQ. You can reset the header or the line.
- Select **Add alternate** or **Remove alternate** in the line grid to work with alternates.

Some RFQs allow for alternate bids. You can specify alternate bids only for lines of the **Category** type,

because specific items can't be added as alternates.

- Select **RFQ attachment** or **RFQ lines attachment** to open any attachment that the customer has added to an RFQ. Select **Bid attachments** or **Bid line attachments** to upload attachments together with the bid.

There might be questionnaires that you must answer before you're allowed to submit a bid.

- Select **Decline** if you don't want to bid. After you select **Decline**, you can't recall the action and enter a bid.

If an RFQ is amended, you must enter a new bid. You can find information about the amendment on the **Amendments** tab of the RFQ page. Amended RFQs appear on the **New bid invitations** page.

Accessing vendor master data in the Vendor information workspace

As a vendor, you can access part of the information that the customer maintains in the vendor master record. Therefore, you can keep the information up to date. To update the information, you must have a vendor admin (external) role.

The accessible information is the vendor name, addresses, contact information, contact persons and their contact information, identification numbers, tax registration numbers, procurement categories that the vendor is approved to sell to the customer in, and information about certifications.

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Import vendor catalogs

2/18/2021 • 2 minutes to read • [Edit Online](#)

Vendor catalogs import

In Dynamics 365 Supply Chain Management, purchasing professionals can create and maintain catalogs for company employees to use when they order items and services for internal use. To create a procurement catalog, you can add the items and services that you want to make available to employees, either by importing the product catalog data or by manually adding the product catalog data to the product master.

You can upload catalog data submitted by a vendor from the Microsoft Dynamics 365 client.

The product data that a vendor submits to you, in the form of a catalog maintenance request (CMR) file, must be in XML file format. The CMR file should contain the details for the products that the vendor supplies to your company.

Import vendor catalog data

To import vendor catalog data, you must complete the following tasks:

1. Set up a project in the Data management workspace where you have defined your data mapping rules. Select **Data management** and then select **Set up roles for data projects**.
2. Set up a procurement category hierarchy, and assign your vendors to procurement categories. If you use commodity codes, add the commodity codes to the procurement categories. For information about setting up a procurement category hierarchy, see [Set up a procurement category hierarchy](#).
3. Configure the vendor for catalog import. Select a vendor, and then select **Procurement > Set up > Configure vendor for catalog import**.
4. Configure workflow for catalog import. Create a CMR file template and share this with your vendor.
5. Select **Procurement and sourcing > Common > Catalogs > Vendor catalogs** to create a vendor catalog. The catalog maintenance request (CMR) files that you receive from your vendor are grouped in this catalog.
6. Upload the CMR file.
7. Review, approve, or reject the products in the vendor catalog. The products are automatically mapped to the procurement categories.

Approved products are added to the product master and are released to the selected legal entities. Only approved products can be added to the procurement catalog.

Generate a catalog import file template

The catalog import file template is an XSD file that you use to create a CMR file for a vendor's products. You can use the CMR file to create a new catalog, replace an existing catalog, or modify an existing catalog.

1. Select **Procurement and sourcing > Catalogs > Vendor catalogs** and double-click the catalog that you want to work with.
2. Download a current catalog import template (XSD file). On the **Update catalog** page, on the **Action Pane**, on the **Catalogs** tab, in the **Related information** group, click **Generate catalog template** and

select **Procurement category**.

- With the **Procurement category** option you can generate a catalog template that includes the procurement categories in which the vendor is authorized to provide products.
3. In the **Save as** dialog box, select the location where you want to store the catalog file template and save the file.

For more information and for examples, refer to this blog post: [Vendor catalogs in Dynamics AX](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up an external catalog for PunchOut e-procurement

2/18/2021 • 7 minutes to read • [Edit Online](#)

By using the external catalog, you can ensure that the product and price information that you subsequently process in Supply Chain Management is accurate and up to date. The requisition can then be approved and converted to a purchase order and an order can be placed at the vendor.

When the external catalog is set up and an employee is preparing a requisition, there will be an option to redirect to an external site, the external catalog, and return the shopping basket that was created at the external site. This communication is based on the cXML protocol and it has to be set up between the systems of the buying and the selling organization.

To set up the communication, your vendor has to provide pieces of information for you to use in the configuration of the external catalog such as Identity, domain of the buyers company, for example, "DUNS" and "DUNS number", credentials, and the URL to reach the vendors catalog.

Setting up an external catalog

The external catalog should enable an employee who enters a purchase requisition to be redirected to an external site to select products. The products that the employee selects from the external catalog are returned with up-to-date price information and from here, they can be added to the purchase requisition. The intention is not to enable employees to place an order on the external site. When setting up the external catalog, you need to make sure that the purpose of the site that can be accessed by the external catalog is to collect quote information and not to place a real order.

To set up an external vendor catalog, complete the following tasks:

1. Set up a procurement category hierarchy. For more information, see [Set up policies for procurement category hierarchies](#).
2. Register the vendor in Supply Chain Management. Before you can set up configurations to access an external vendor's catalog, you must set up the vendor and the vendor contact in Microsoft Dynamics 365. The external catalog's vendor must also be added to the selected procurement category. For more information about registering vendors, see [Manage vendor collaboration users](#). For information about how to assign vendors to a procurement category, see [Approve vendors for specific procurement categories](#).
3. Make sure that the units of measure and the currency that the vendor uses are set up. For information about how to create a unit of measure, see [Manage unit of measure](#).
4. Configure the external vendor catalog by using the requirements for your vendor's external catalog site. For more details about this task, see [Configure the external vendor catalog](#).
5. Test the vendor's external catalog configurations to verify that the settings are valid and that you can access the vendor's external catalog. Use the **Validate settings** action to validate the request setup message that you've defined. This message should cause the vendors external catalog site to be opened in a browser window. During validation, you can't order items and services from the vendor. To order items and services, you must access the vendor's catalog from a purchase requisition.
6. Activate the external catalog by using the **Activate catalog** button on the **External catalogs** page. The external catalog must be activated before employees can use it. You can inactivate the external catalog at any time.

Configure the external vendor catalog

This section gives more details about task 4 in the preceding section.

1. Enter a name and description for the vendor's external catalog. The name that you enter will appear on the cart that represents the external catalog that is shown to employees who creates a requisition. Employees can click on the cart to open the catalog on the vendor's external catalog site.
2. Add an image by using the **External catalog image** action. The image will appear on the cart that represents the external catalog that is shown to employees who create a requisition. Note that the image's width and height must be equal. Otherwise the image won't be displayed correctly.
3. Select whether the vendor's external catalog website should appear in the same browser window as the one where the employee has created the requisition, or if it should open in a new window.
4. Select the vendor for the catalog. In the **Legal entities** list, there is a row for each legal entity where the vendor is set up. To allow users to request products directly from the vendor's catalog in some legal entities but not others, you can use the **Prevent access** or **Allow access** button for each legal entity where you want the catalog to be or not to be available.
5. In the **Default expiration (Days)** field, enter the number of days that a quotation received from the external catalog is valid and can be used to purchase from the external vendor. When a quotation is created and retrieved from the vendor's external catalog site, the quotation is valid as of the current system date and remains valid for the number of days that you enter in this field.
6. Click the **Add** button to start mapping the procurement categories to the external catalog. Then, in the Category name list, select a category. The list of categories is a superset of procurement categories that the vendor has been mapped to in all the legal entities that are set up for the vendor.

NOTE

Procurement policies are used to allow or restrict access to categories for the buying legal entity or receiving operating unit. Punchout to an external catalog requires that access be allowed to at least one of the procurement categories that is mapped to the catalog.

7. Set up the cXML setup request message that will be sent to the vendor. The automatically generated message format is the minimal template that is required in order to start a session. Fill in values for the tags.

At any time, you can reload the system-generated message template by clicking **Restore message format**. Note that if you restore the message format, the current message will be replaced by the automatically generated message format, which has empty tags.

cXML setup message

Below you can find a description of the tags that are included in the template:

FIELD	DESCRIPTION
< Header > < From > < Credential domain="" >	The domain of the buyer's company.
< Header > < From > < Credential> < Identity > < /Identity >	The identity of the buyer's company.
< Header > < To > < Credential domain="" >	The domain of the vendor's company.
< Header > < To > < Credential> < Identity > < /Identity >	The identity of the vendor's company.

FIELD	DESCRIPTION
< Header > < Sender > < Credential domain="" >	The domain of the buyer's company.
< Header > < Sender > < Credential > < Identity > < /Identity>	The identity of the buyer's company.
< Header > < Sender > < Credential > < SharedSecret > < /SharedSecret >	The shared secret for the buyer's company.
< Request deploymentMode="" >	The test or production deployment.
< Request > < PunchOutSetupRequest > < SupplierSetup > < URL > < /URL>	The URL of the vendor's PunchOut endpoint.

Extrinsic elements

An extrinsic element is additional information, such as a user name that is based on a user that punches out. The extrinsic element is set when the PunchOut occurs and it can be sent in the request setup message. Your vendor could have a requirement for receiving an extrinsic element in the setup request. In that case, you should add the extrinsic element to the list of extrinsic elements in the **Message format** section of the **External catalog** page. Specify a name for the extrinsic element that the vendor can recognize and map it to a value. The options for values are: User name, User email, or Random value. For more information about the cXML protocol, see the [cXML.org website](http://cXML.org).

Post back message

The post back message is the message that is received from the vendor when the user checks out from the external site and returns to Supply Chain Management. Post back messages can't be configured. The messages are based on the cXML protocol definition. Here is the information that can be part of the post back message that is received on a requisition line.

MESSAGE RECEIVED FROM VENDOR	COPIED TO REQUISITION LINE
< ItemIn quantity="" >	Quantity
< ItemIn> < ItemID > < SupplierPartID > < /SupplierPartID >	External item ID
< ItemDetail> < UnitPrice > < Money currency="" >	Currency
< ItemDetail > < UnitPrice > < Money > < /Money >	Unit price
< ItemDetail > < Description ShortName="" >	Product name
< ItemDetail > < Description > < /Description >	Included in item description; Product name if ShortName is not specified.
< ItemDetail > < UnitOfMeasure > < /UnitOfMeasure >	Unit
< ItemDetail > < Classification > < /Classification >	Included in item description
< ItemDetail > < Classification domain="" >	Included in item description

Delete an external catalog

Delete an external catalog with the Delete action on the page.

If a product from the external vendor catalog has been requested, the external vendor catalog cannot be deleted. Instead, the status of the external vendor catalog is set to inactive. If you want to remove access to the external vendor's catalog site, but not delete it, change the external catalog status to Inactive.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Purchasing cXML Enhancements

2/18/2021 • 27 minutes to read • [Edit Online](#)

The *Purchasing cXML Enhancements* feature builds on the [existing external catalog functionality](#) that is used for purchase requisitions. This existing functionality is known as *PunchOut*. Although a purchase order doesn't have to originate from a purchase requisition, there must be a connection between the vendor on a purchase order and the parameters that are used to send the purchase order document.

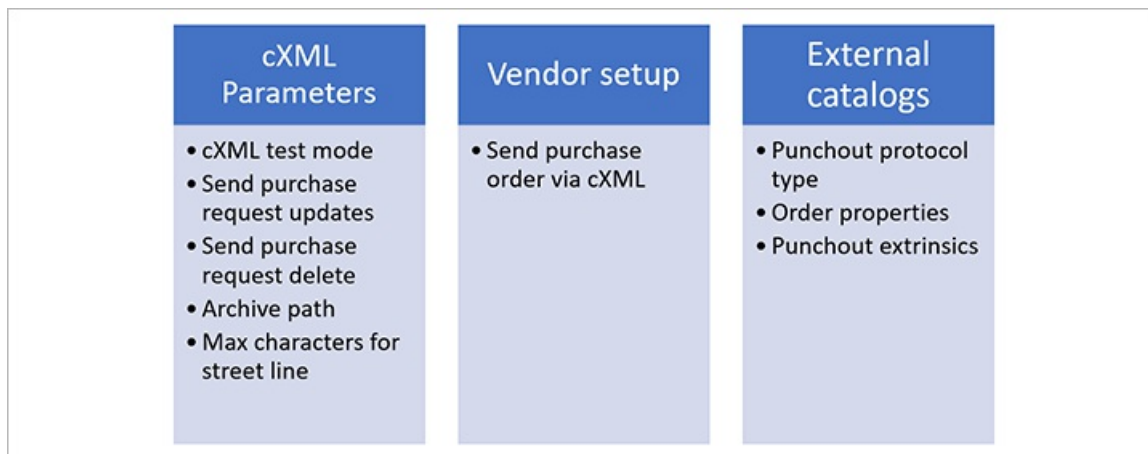

Turn on the Purchasing cXML Enhancements feature

To turn on the feature, open the [Feature management](#) page, and search for the feature that is named *Purchasing cXML Enhancements*. Select the feature, and then select **Enable now** to turn it on.

After you turn on the feature, you should configure settings in the following three areas:

- **cXML parameters** – Use these settings to set up some global parameters for the functionality for sending purchase orders.
- **Vendor setup** – If commerce eXtensible Markup Language (cXML) should be used by default for all new purchase orders that are created for any vendor, set the **Send purchase order via cXML** option to *Yes* for that vendor.
- **External catalogs** – Use the new **Order properties** settings to define the format of the purchase order document and how it's sent.

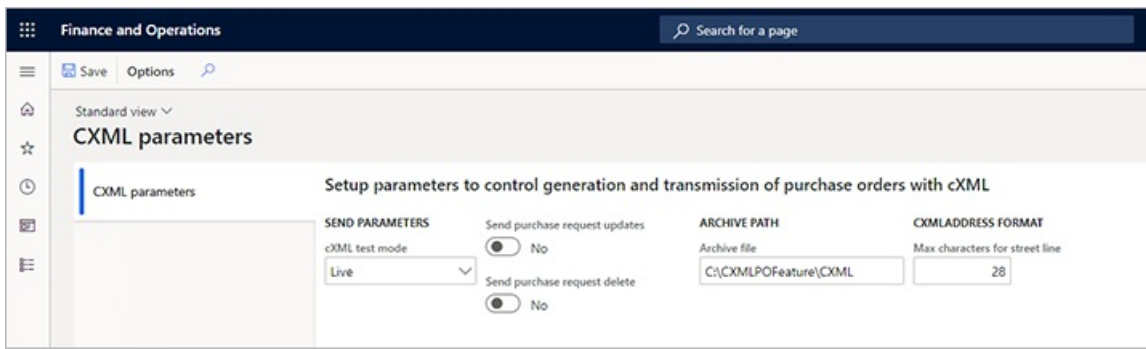

The following illustration summarizes this configuration.

In addition, you must set up the [Purchase order request batch job](#). This batch job is used to send the confirmed purchase orders.

Set up global cXML parameters

Use the [cXML parameters](#) page to make a few global settings that apply to the functionality for sending purchase orders.

Go to **Procurement and sourcing > Setup > cXML management > cXML parameters**, and set the following parameters:

- **cXML test mode** – This global parameter affects the way that purchase orders are physically sent from the batch job. Select one of the following values:
 - **Test** – In this mode, the batch job can be running, and the XML document for the message is generated, but it isn't sent. Instead, it's saved on the purchase order request for review purposes. This mode is helpful when you're in an initial implementation, and you want to see how data is entered in the cXML message. You might also want to generate sample messages that you can send to vendors for initial validation.
 - **Live** – In this mode, the feature uses the [external catalog settings](#) to physically transmit each document to the vendor.
- **Send purchase request updates** – Set this option to *Yes* to send an update message for purchase orders. Set it to *No* to prevent the message from being sent. Most vendors prefer not to receive update messages. Instead, they require that customers contact them by phone or email if a purchase order should be changed. This parameter is a global parameter, and no override can be specified on the external catalog for each vendor. A purchase order will be marked as updated if you post a second confirmation on a purchase order, but the first confirmation has already been sent and acknowledged by the vendor. If there is a second confirmation, but the first confirmation hasn't been sent, the second confirmation will be treated as a new document. You can confirm a purchase order as many times as you want until one confirmation is sent. The next confirmation will then be treated as an update message.
- **Send purchase request delete** – Set this option to *Yes* to send a delete message for purchase orders. Set it to *No* to prevent the message from being sent. Most vendors prefer not to receive delete messages. Instead, they require that customers contact them by phone or email if a purchase order was sent by mistake. This parameter is a global parameter, and no override can be specified on the external catalog for each vendor. A purchase order will be marked as deleted if you cancel the purchase order in Supply Chain Management.
- **Archive file** – Specify the file path where you want to export and save archived cXML documents. The path is used when you run the purge function from the **Purchase order request** page.
- **Max characters for street line** – Enter the maximum number of characters that can be used in the street field for addresses in the cXML document. This global parameter affects all vendors unless an override is specified on the external catalog properties.

Set up vendor purchase orders to use cXML

Every time that you confirm a purchase order where the **Send purchase order via cXML** option is set to *Yes*, the system automatically generates the cXML message and delivers it to the vendor that is associated with that purchase order. There are two ways to control this option for your purchase orders:

- To set up a vendor so that it automatically uses cXML for all new purchase orders that are created from a requisition, go to **Procurement and sourcing > Vendors > All vendors**, and select or create a vendor to

open its details page. Then, on the **Purchase order defaults** FastTab, set the **Send purchase order via cXML** option to *Yes*. If cXML should also automatically be used for new purchase orders that are **not** created from a requisition, you must also set the **ENABLEMANUALPO** order property to *True* for the related external catalog, as described in the [Set the order properties](#) section later in this topic.

- For individual purchase orders, go to **Procurement and sourcing > Purchase orders > All purchase orders**, and select or create a purchase order to open its details page. Switch to the **Header** view, and then, on the **Setup** FastTab, set the **Send purchase order via cXML** option as required.

Set up an external catalog to use cXML

On the **External catalogs** page, for each of your catalogs, you can set up the PunchOut functionality and the functionality for sending purchase orders. To find the relevant settings, go to **Procurement and sourcing > Catalogs > External catalogs**. Start by [setting up each catalog as usual](#). This process includes assigning a vendor, selecting the categories that the vendor is allowed to supply, and activating the catalog. Then configure the additional settings that are described in this section.

NOTE

When you confirm a purchase order that can be sent via cXML, the system looks up the vendor that is associated with the purchase order and then finds the first active external catalog that is associated with that vendor. The system then uses the settings from that external catalog to send the purchase order. If multiple external catalogs are set up, the system uses only the first external catalog that it finds, based on the vendor on the purchase order. Therefore, we recommend that you create just one external catalog for each vendor.

Set the PunchOut protocol type

On the **General** FastTab of the **External catalogs** page, set the **Punchout protocol type** field to *cXML*. This option will be the only available option, unless a partner has extended the functionality and provides an additional option in the extension.

If you're also using the catalog for PunchOut, you must also [set up the message format](#). The message format is used to establish the connection to the vendor in the PunchOut transaction from the requisition. When a purchase order is sent, the order properties will be used to establish the connection with a vendor.

Set the order properties

The *Purchasing cXML Enhancements* feature adds a new **Order properties** FastTab for external catalogs. This FastTab provides a grid where you can define the order properties. It also provides a toolbar. This toolbar contains the following three buttons that you can use to manage the order properties:

- **Default properties** – When you're setting up a new catalog, select this button to add a predefined collection of commonly used properties to the grid.
- **New** – Add a new property to the grid.
- **Delete** – Delete the currently selected property from the grid. If you accidentally delete a default property, select **Default properties** to restore all the missing properties.

Every time that you add one or more properties to the grid, use the right column to specify a value for each.

Use the default properties in the following way:

- **BUYER_COOKIE** – This tracking field can be used to indicate specific information for your company. Unless you have an agreement with the vendor about how this property is used, it doesn't have very much meaning when sending a purchase order. Therefore, you should set it to a simple value.
- **DELIVERTO** – When the shipping address is entered in the document from the purchase order, the **Attention information** field is used to set the **DeliverTo** field in the XML message. If you require that this value be a requester name, and you will set the requester field on the purchase order header, enter the value *REQUESTER* for this property, so that the requester name will be entered in the **DeliverTo** field in the XML. In this case, the primary email address and phone number that are used will be from the requester instead of the orderer.
- **DEPLOYMENTMODE** – Set this property as required by the vendor. The values are usually *PRODUCTION* or *TEST*. Set the value based on your communication with the vendor. Usually, it must match the intended system behind the **ORDERCHECKURL** value that the vendor indicates as a test or production system.
- **FIXEDBILLADDRESSID** – When the **addressID** field in the XML message is set, it picks up the location that is specified on the address. If the ID value that you've communicated to the vendor differs from the value on the address location for some reason, you can force an override by specifying the value here. The assumption is that you will use only one address with the vendor, and that the address is set up in the vendor's system. The billing address is the primary invoice address that is specified for the legal entity in Supply Chain Management.
- **FIXEDSHIPADDRESSID** – When the **addressID** field in the XML message is set, it picks up the location that is specified on the address. If the ID value that you've communicated to the vendor differs from the value on the address location for some reason, you can force an override by specifying the value here. The assumption is that you will use only one address with the vendor, and that the address is set up in the vendor's system. The shipping address is the address that is specified on the header of the purchase order. Most vendors accept only header addresses, not line addresses. Although there are fields for line addresses in the XML, they will be set to the header address.
- **FROM_DOMAIN** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **FROM_IDENTITY** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **ORDERCHECKURL** – Enter the URL to transmit the purchase order documents to. This URL starts with

`https://` and is supplied by your vendor.

- **PAYLOAD_ID** – Enter a prefix value for the payload ID, as required for the business processes that are in place for the current vendor.
- **SENDER_DOMAIN** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **SENDER_IDENTITY** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **SHARED_SECRET** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **STREETLENGTH** – Enter a number that represents the maximum number of characters that the vendor will accept as a street name. If a value is entered here, it overrides the value that is specified on the **cXML parameters** page. The system will remove line breaks and spaces to try to fit the standard address in Supply Chain Management into the number of characters that is specified here. Any additional characters will be truncated.
- **TO_DOMAIN** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **TO_IDENTITY** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **USERAGENT** – Enter a value to identify the system that you're using. For example, enter *Dynamics 365 Supply Chain Management*.
- **VERSION** – Enter a cXML version number, if the vendor requests this information. The default version is *1.2.008*. This version is stable and is accepted by most vendors.
- **RESPONSETEXT** – Enter any custom text that you expect the vendor to return in the cXML response message after the order has been sent. In this way, the system can mark the message as *Acknowledged*. If the response doesn't match standard text or the customer text that you enter here, the request will be marked as *Error*.
- **RESPONSETEXTSUB** – Set this property to *TRUE* if you want to search the vendor response text for the values that are specified in the **RESPONSETEXT** field. For example, the vendor might return a long string that includes "OK" in the response. In this case, you can enter *OK* in the **RESPONSETEXT** field and set **RESPONSETEXTSUB** to *TRUE* to search for "OK" anywhere in the response. The order can then be set to *Acknowledged*.
- **CONTENTTYPE** – In a typical catalog setup, you don't have to set this property. If you receive a server 500 error from a vendor's system when you send a purchase order, you can do testing by setting this property to *FALSE*. That value will change a setting in the web request and might enable the message to be sent for some platforms.
- **ENABLEHEADERS** – Set this property to *TRUE* to send headers together with the purchase order. You must set this property only if the vendor requires it. If you set this property to *TRUE*, add extra custom properties that are based on the names that the vendor provides, and prefix them with *H_*. Typical examples include **H_USERID**, **H_PASSWORD**, **H_RECEIVERID**, and **H_ACTIONREQUEST**. The following custom properties are included in the default properties:
 - **H_USERID** – If the trading partner requires that you send a user ID as part of the URL to submit a purchase order, enter the value here.
 - **H_PASSWORD** – If the trading partner requires that you send a password as part of the URL to submit a purchase order, enter the value here.

- **ENABLEMANUALPO** – If this property is set to *TRUE*, when users manually create purchase orders (that is, when they don't start from a requisition), those purchase orders will inherit the setting of the **Send purchase order via cXML** option from the vendor. If this property isn't set, or if it's set to *FALSE*, the **Send purchase order via cXML** option won't be set on the purchase order header for manually created purchase orders. For purchase orders that are created from a requisition, the setting of the **Send purchase order via cXML** option is always inherited from the vendor, regardless of the setting of this property. For more information, see the [Set up vendor purchase orders to use cXML](#) section earlier in this topic.
- **PUNCHOUTPOONLY** – If this property is set to *TRUE*, only purchase requisition lines that are created from the PunchOut process will set the **Send purchase order via cXML** option on the purchase order header. In addition, the purchase requisition line type of all lines on the purchase order must be *External catalog item*. Otherwise, the cXML purchase order can't be created.
- **PUNCHOUTSHIPTO** – If this property is set to *TRUE*, the default address of the legal entity will be added to the PunchOut setup request message when the user opens an external catalog. This address is added as the **ShipTo** address. Vendors will use the **ShipTo** address to show pricing based on the company location.
- **TRACEPUNCHOUT** – Set this property to *TRUE* if you receive an error message when you try to browse to an external catalog from the requisition. Trace information will then be filled in for the **PunchOutSetupRequest** and **PunchOutResponse** messages that are sent between Supply Chain Management and the vendor site. You can view this information on the **cXML cart message log** page, which you can open from the **External catalog setup** page for the vendor catalog that you're having issues with. You should set this property to *TRUE* only if you're troubleshooting, because it creates a large performance overhead on the database for each PunchOut. For more information, see the [View the cXML cart message log for external catalog PunchOut](#) section later in this topic.
- **REPLACENEWLINE** – Set this property to *TRUE* if you're having an issue because a vendor's system is sending a **PunchOutResponse** message that includes newline characters (\n). This issue might occur if the vendor's messages are parsed through middleware or a procurement hub. If you're having an issue with a new vendor setup, set the **TRACEPUNCHOUT** property to *TRUE* to view the **PunchOutResponse** message and determine whether the XML tags are broken up by newline characters.
- **POCOMMENTS** – Set this property to *TRUE* if you want the cXML document to include notes that are attached to the purchase order in Supply Chain Management. The attachment text is included in the header comments in the purchase order message. For more information about how the system selects and processes these attachments, see the [Attach notes to a purchase order](#) section later in this topic.
- **VENDCOMMENTS** – Set this property to *TRUE* if you want the cXML document to include notes that are attached to the purchase order in Supply Chain Management. The attachment text is included in the header comments in the purchase order message. For more information about how the system selects and processes these attachments, see the [Attach notes to a purchase order](#) section.
- **CLEANAMP** – Set this property to *TRUE* if you receive an error message when you try to do a PunchOut to a vendor, and the vendor's return URL includes incorrectly encoded ampersands (&).
- **PUNCHOUTTZ** – Set this property to *TRUE* if the vendor that you're working with uses the International Organization for Standardization (ISO) 8601 standard to do a specific validation of the date/time of PunchOut request message. Supply Chain Management uses the Coordinated Universal Time (UTC) date in the **PunchOutSetupRequest** message. Therefore, when you set this property to *TRUE*, *+00:00* is added to the date/time format.
- **WMSADDRESSID** – Set this property to *TRUE* to use the warehouse number on the purchase order header as the **addressID** value in the **ShipTo** address for the purchase order request that is sent to the

vendor. If you set a value for the **FIXEDSHIPADDRESSID** property, that value takes precedence over this value. Therefore, you should use one property or the other to set the **addressID** value in the **ShipTo** address for the document.

- **PUNCHOUTSHIPTOUSER** – This property works together with the **PUNCHOUTSHIPTO** property. If **PUNCHOUTSHIPTO** is set to *TRUE*, the address for the legal entity is picked up. If **PUNCHOUTSHIPTOUSER** is set to *TRUE*, the primary address from the PunchOut user is used instead of the legal entity address.

Activate the external catalog

When you've finished setting up all the properties and configuring other settings for your external catalog, go back to the **General** FastTab of the **External catalogs** page, and set the **Active** option to *Yes*.

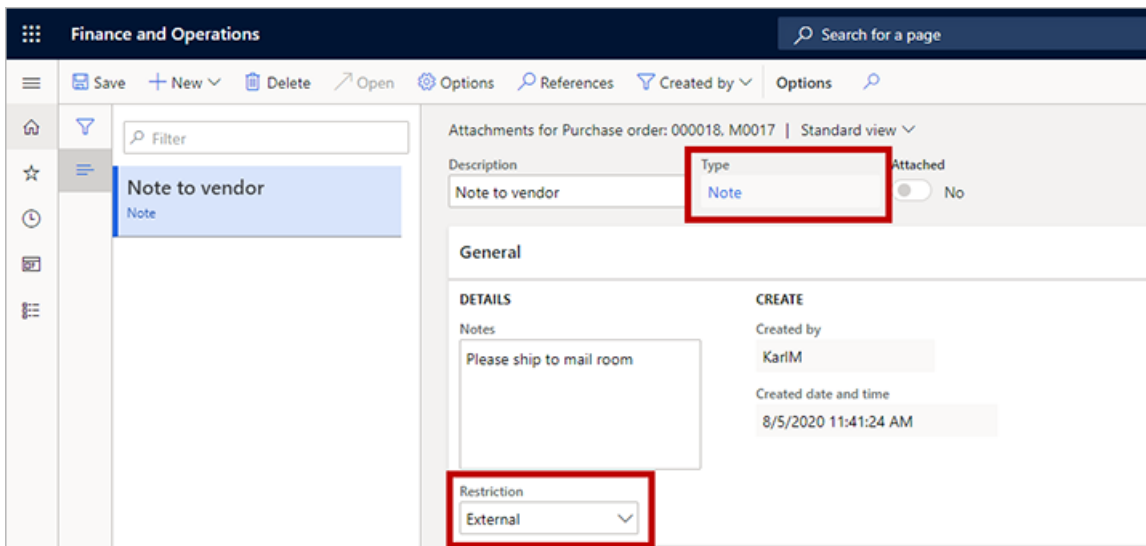

Attach notes to a purchase order

As was mentioned in the [Set the order properties](#) section, if you want your delivered cXML to include text from notes that are attached to the relevant purchase order and/or vendor records, you can set the **POCOMMENTS** and/or **VENDCOMMENTS** property to *TRUE* in the external catalog setup. This section provides more detail about how the system selects and processes these attachments, if you use them.

To set the types of notes that the system will look for, go to **Procurement and sourcing > Setup > Forms > From setup**. Then, on the **Purchase order** tab, set the **Include documents of type** field to the type of note that you want to be able to include. Only text notes will be included, not document attachments.

The screenshot shows the 'Form setup' page in Dynamics 365 Finance and Operations. The page is titled 'Set up formats for purchase orders' and is divided into three main sections: LAYOUT, SHOW IN SHEET, and UPDATES. The LAYOUT section includes a 'Paper format' dropdown menu set to 'Blank paper' and an 'Include document on sheets' dropdown menu set to 'All'. The SHOW IN SHEET section has a list of checkboxes for 'Configuration', 'Size', 'Color', 'Style', 'Site', 'Warehouse', 'Inventory status', 'Location', 'License plate', 'Batch number', 'Serial number', and 'Owner'. The 'Site' and 'Warehouse' checkboxes are checked. The UPDATES section has a 'Mark order updates' toggle switch set to 'Yes'.

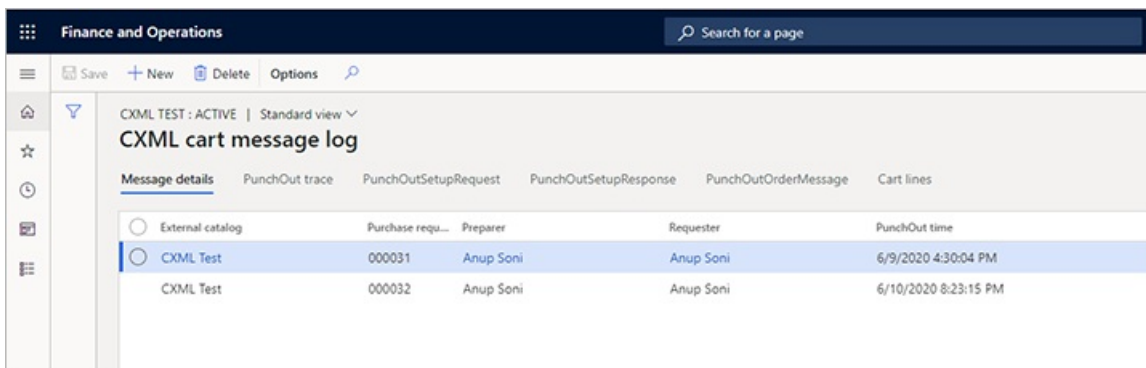

Attachments will be included with a purchase order only if their **Type** field is set to the value that you select in the **Include documents of type** field, and if their **Restriction** field is set to *External*. To create, view, or edit the attachments for a purchase order, go to **Procurement and sourcing > All purchase orders**, select or create a purchase order, and then select the **Attachments** button (paperclip symbol) in the upper-right corner.

View the cXML cart message log for external catalog PunchOut

When you set the **Punchout protocol type** field to *cXML* for an external catalog, the system will capture a message log of the carts that come back from vendors. This log can be used for troubleshooting and other data purposes.

To open the log for an external catalog, select the relevant catalog, and then, on the Action Pane, select **cXML cart message log**. The **cXML cart message log** page shows a list of the carts that have been returned, the XML that is related to those carts, and the lines that were created on the related purchase requisition.

Set the extrinsic elements for external catalog PunchOut

When you set the **Punchout protocol type** field to *cXML* for an external catalog, you can add custom extrinsic elements that will be inserted at the correct place in the request XML message.

To add extrinsic elements to an external catalog, follow these steps.

1. Go to **Procurement and sourcing > Catalogs > External catalogs**.
2. Select the relevant catalog.
3. On the **Message format** FastTab, in the **Extrinsics** section, select **Add** to add a row to the grid for each extrinsic element that you want to include. On each row, set the following fields:
 - **Name** – Enter a name for the element. This value will become the value of the **name** attribute for the **Extrinsic XML** element that is created by each row. Usually, you will work with your vendor to agree on the name for each extrinsic element.
 - **Value** – Select a value for the element. This value will become the value of the XML element that is created by each row. The following values are available:

- **User name** – Use the name of the user who is doing the PunchOut. This name is the sign-in name for Supply Chain Management.
- **User email** – Use the email address of the user who is doing the PunchOut. This address is the address that the user has set up on the **Account** tab of the **User options** page.
- **Random value** – Use a unique random value.
- **User full name** – Use the full name of the contact person who is associated with the user who is accessing the external catalog.
- **Firstname** – Use the first name of the contact person who is associated with the user who is accessing the external catalog.
- **Lastname** – Use the last name of the contact person who is associated with the user who is accessing the external catalog.
- **Phone number** – Use the primary phone number of the contact person who is associated with the user who is accessing the external catalog.

Order properties

The user or admin won't see the extrinsic elements, because they aren't added until the user does a PunchOut. They will automatically be inserted between the **BuyerCookie** and **BrowserFromPost** elements in the cXML setup request message. Therefore, you don't have to set them manually in the XML when you set up the external catalog.

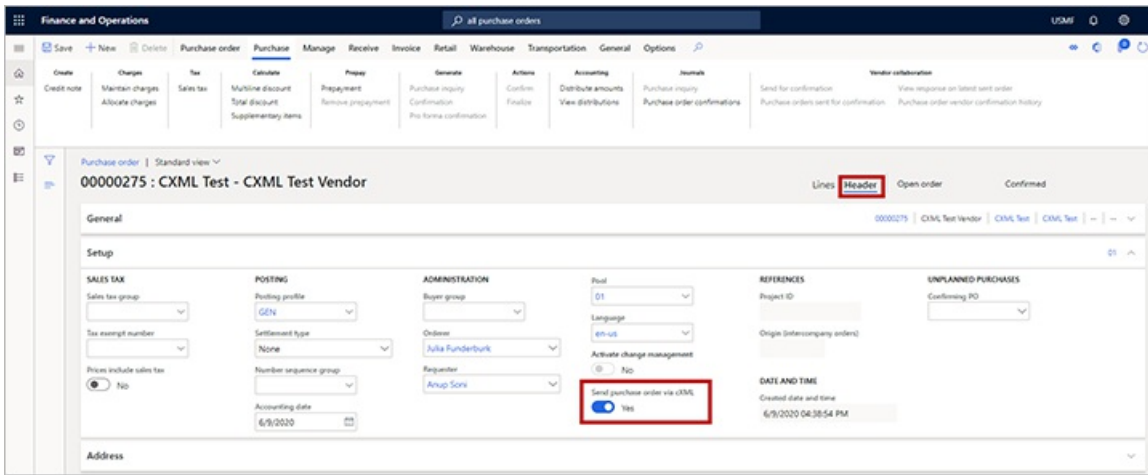

```
<Request deploymentMode="production">
  <PunchOutSetupRequest operation="create">

    <BrowserFormPost>
      <URL></URL>
    </BrowserFormPost>
  </PunchOutSetupRequest>
</Request>
```

Create and process a purchase order

When you create a purchase order for a vendor, it will inherit the setting of the **Send purchase order via cXML** option from that vendor. However, the setting remains available on the **Setup** FastTab in the **Header** view of the purchase order, so that you can change it later as required.

When you create a purchase order from a purchase requisition that came from a PunchOut flow, all the required line details will be filled in. You can then manually add purchase order lines or copy them from other purchase orders. Be sure to set all required fields. These required fields include the external reference number, which is the vendor number that will be used in the cXML message.

When you've finished filling in all the details for the purchase order, be sure to confirm it. No message is sent unless the purchase order is confirmed. To confirm a purchase order, on the Action Pane, on the **Purchase** tab, in the **Actions** group, select **Confirm**.

After the purchase order is confirmed, you can view the status of the confirmation through the **Purchase order confirmations** journals. On the Action Pane, on the **Purchase** tab, in the **Journals** group, select **Purchase order confirmations**.

Each purchase order can have many confirmations. Each confirmation is marked with an incremental number. In the following illustration, the purchase order is *00000275*, and the confirmation is *00000275-1*. This numbering reflects standard Supply Chain Management functionality, where changes in a purchase order, and therefore the type of cXML message that should be sent to the vendor, are identified based on the confirmation. As the illustration shows, the **Purchase order confirmations** page also includes **Order send status** and **Order request vendor status** fields. For more information about the various status values that you might see on this page, see the [Monitor purchase order requests](#) section later in this topic.

Schedule the Purchase order request batch job

To activate the batch job for sending purchase order requests, go to **Procurement and sourcing > Setup > cXML Management > Purchase order request**, and then, on the Action Pane, on the **Purchase order request** tab, in the **Batch** group, select **Submit job** to open the **Purchase request prepare and send** dialog box. You can use this dialog box to set up the recurrence, just as you usually do for batch jobs in Supply Chain Management. Select an interval, based on your order volume. Although you can run the batch job every minute, it's probably best to send batches throughout the business day, based on order receipt windows that match your vendors' schedules.

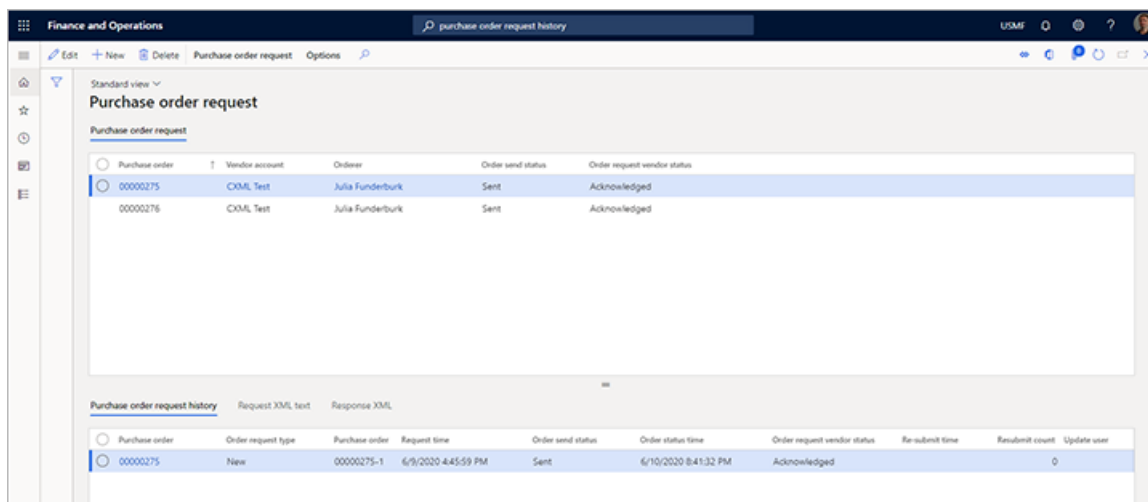

For example, your vendor has a policy that states that all orders that are received by 1 PM will be shipped on the same day. In this case, you might have to run the batch only a few times during the morning to communicate any orders that you have. The remaining orders will then be sent the next day. This decision is purely a business decision. You can review it and set the parameters for it accordingly.

The process will look for purchase order request documents that have a status of *Waiting*. If you have an order that you must send to a vendor immediately, you can select **Submit job** and set the **Batch processing** option to *No*.

Monitor purchase order requests

View the status of a purchase order

When orders that can be sent via cXML are confirmed, they go into *Waiting* status. As was described in the [Create and process a purchase order](#) section, you can view the purchase order status on the **Purchase order request** page. Each purchase order request can have one of several statuses, depending on its parameters and data. This section describes the various status types and the values that they can have. This information can help you manage issues and understand the status of your purchase orders.

Purchase order	Vendor account	Orderer	Order send status	Order request vendor status
00000275	CXML Test	Julia Funderburk	Sent	Acknowledged
00000276	CXML Test	Julia Funderburk	Sent	Acknowledged

Purchase order	Order request type	Purchase order	Request time	Order send status	Order status time	Order request vendor status	Re-submit time	Resubmit count	Update user
00000275	New	00000275-1	6/9/2020 4:45:59 PM	Sent	6/10/2020 8:41:32 PM	Acknowledged		0	

The grid in the upper part of the **Purchase order request** page might show the following status values:

- **Order send status** – This field can have one of the following values:
 - **Waiting** – The document is waiting to be sent.
 - **Sent** – The document has been sent.
 - **Stopped** – The document was marked as *Stopped* before it was sent. (To mark a document as *Stopped*, select **Stop** on the Action Pane of the **Purchase request** page.)
 - **Archive** – The document has been purged. (To purge a document, select **Purge** on the Action Pane of the **Purchase request** page.)
- **Order request vendor status** – This field can have one of the following values:
 - **Waiting** – The document is waiting to be sent.

- **Acknowledged** – The document has been acknowledged as received by the vendor. You can review the detailed XML message that is returned from the vendor by selecting the **Response XML** tab in the lower part of the page.
- **Error** – The document was sent to the vendor, but an error occurred. You can review the error message by selecting the **Response XML** tab in the lower part of the page.

The grid on the **Purchase order request history** tab in the lower part of the **Purchase order request** page might show the following values:

- **Order request type** – This field can have one of the following values:
 - **New** – The line is marked as new immediately after the purchase order is confirmed.
 - **Update** – If a confirmation has already been sent and acknowledged by the vendor, the next confirmation will be marked as *Update*. Updates will be sent only if the **Send purchase request updates** option is set to *Yes* in the [global cXML parameters](#).
 - **Delete** – If a confirmation has already been sent and acknowledged by the vendor, but the purchase order is canceled, the confirmation that is waiting will be marked as *Delete*. Deletions will be sent only if the **Send purchase request delete** option is set to *Yes* in the [global cXML parameters](#).
- **Request time** – The time when the order confirmation was created. You can compare the request time with the order status time to determine the time between confirmation and vendor acknowledgment.
- **Order send status** – This field is the same as the **Order send status** field in the upper part of the page. It's repeated here to make it easier to view the status at the confirmation level. If the **Order request type** field is set to *New*, and the purchase order is reconfirmed before a confirmation is sent, the **Order send status** field is set to *Archive*.
- **Order status time** – The time when the purchase order request history record was last updated. (The updates include status changes.)
- **Order request vendor status** – This field is the same as the **Order request vendor status** field in the upper part of the page. It's repeated here to make it easier to view the status at the confirmation level.
- **Re-submit time** – The time when the record was resubmitted.
- **Re-submit count** – The number of times that the record has been resubmitted. A high number indicates multiple failures, and therefore might indicate an issue with either your data setup or your vendor's data setup.

View the XML for a purchase order request message

To view the XML for the purchase order request message, select the **Request XML text** tab at the bottom of the **Purchase order request** page. The information on this tab can be helpful during testing or error validation. To make the information easier to read, you can view it as a formatted message. Copy the contents of the tab to a text file, and then view it in an XML editor.

View the details of the vendor response

To view the content of a vendor acknowledgment or error response, select the **Response XML** tab at the bottom of the **Purchase order request** page.

```
Purchase order request history Request XML text Response XML
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE cXML SYSTEM "http://xml.cxml.org/schemas/cXML/1.2.007/cXML.dtd"> <cXML version="1.2.005" xmlns="en-US" payloadID="6/10/2020 3:41:32 PM
<Response>
  <Status code="200" text="Order Received"> </Status>
</Response>
</cXML>
-----
Start to load the response into to the StringReader
About to try to load the string into the XML reader.

Use external catalogs for PunchOut e-procurement

2/18/2021 • 2 minutes to read • [Edit Online](#)

By using external catalogs for PunchOut e-procurement, you don't have to maintain information about your vendors' products in your own master data. Instead, the shopping cart on a vendor's website is converted to requisition lines that have the correct product information.

You should avoid maintaining the descriptions and prices of your vendors' products in your own product master data. Instead, use external catalogs for PunchOut e-procurement. Then, when employees create requisitions, they can "punch out" to a vendor's external catalog site (in other words, they leave your system and go to the vendor's site). The products that are added to the shopping cart on the vendor's website can then be converted to requisition lines. Therefore, you get the correct product information: product ID, name, price, and so on.

To use external catalogs, an employee must create a requisition on the **My purchase requisitions** page.

The employee who creates a requisition is referred to as the preparer of the requisition. As a preparer, you can complete the following tasks.

Use the **External catalogs** line action to open a page that includes all external catalogs that are available for the specified requester, buying legal entity, and receiving operating unit.

Depending on your permissions, change the requester, buying legal entity, and receiving operating unit. A change in those values might change the list of external catalogs that are available to a requester. The external catalogs that are available depend on the current active purchasing policies for the buying legal entity or the receiving operating unit. These policies can allow or prevent access to specific procurement categories. Therefore, the list of external catalogs that are mapped to these procurement categories can be affected.

For more information about policies, see [Purchasing policies overview](#).

- To find external catalogs for specific procurement categories, enter text in the catalog search field.
- To add products from a vendor's external catalog on the vendor's website, click the external catalog. Then add products to the shopping cart, and check out. The shopping cart lines will be transferred to Microsoft Dynamics 365.

If there are multiple options for procurement categories, select the correct procurement category before you add the lines to the requisition. After lines have been added to a requisition, you can add more lines without using external catalogs. Alternatively, you can continue to use external catalogs to add lines.

When the requisition is ready, use the **Workflow > Submit** action to submit it for approval.

Vendor collaboration mobile workspace

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic provides information about the **Vendor collaboration** mobile workspace. This workspace helps your vendors stay up to date about the purchase orders that have been sent to them for approval. They can also view information about new and updated purchase orders and contacts.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Vendor collaboration** mobile workspace keeps vendors informed about new purchase orders, so that they can view purchase orders and then respond to them in the web client.

NOTE

The mobile workspace should be used as a supplement to the vendor collaboration web interface, not a replacement for it.

Your vendors can use the **Vendor collaboration** mobile workspace to view new purchase orders that are sent to them for approval. It shows purchase order information, such as products, quantities, and requested delivery dates. Price information is also available, depending on the configuration of each vendor.

A user who signs in as a vendor will see which purchase orders have been responded to, and which purchase orders are still awaiting customer action. For example, a purchase order might be awaiting customer action because the vendor suggested another delivery date, but the customer hasn't yet agreed to that date. The vendor will also see a list of purchase orders that have been confirmed but haven't yet been delivered.

To respond to a purchase order, the vendor must use the vendor collaboration web interface that is available in the web client. There, the vendor can also get more information about the order, such as document attachments, the delivery address per line, and charges that are associated with the vendor.

Vendors that have a special security role can see which contact persons are registered for a vendor account. The same security role lets a vendor view the status of any user request that has been submitted.

The vendor collaboration web interface in the web client must be used to create new contacts and submit new user requests.

The **Vendor collaboration** mobile workspace lets a vendor perform these tasks:

- View new purchase orders that are sent to the vendor.
- View purchase orders that the vendor has responded to, and that are awaiting customer action.
- View purchase orders that have been confirmed but haven't yet been fully received.
- View contact person information that is registered for the vendor account. (This task requires an additional security role.)
- View information about a user request that was submitted by the vendor, and follow the status of the request. (This task requires an additional security role.)

Prerequisites

The prerequisites vary, depending on the version of Microsoft Dynamics 365 that has been deployed for your

organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Vendor collaboration** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
KB 3216943 must be implemented if you're using Platform update 3.	System administrator	KB 3216943 is a binary update that is required if you're using Platform update 3. To implement this KB, the system administrator must follow these steps. <ol style="list-style-type: none">1. Download KB 3216943 from Microsoft Dynamics Lifecycle Services (LCS).2. Install the binary update, which is delivered as a deployable package. For information about how to apply a deployable package, see Apply a deployable package.
KB 4013633 must be implemented.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Inventory on-hand mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none">1. Download the metadata hotfix from LCS.2. Install the metadata hotfix.3. Create a deployable package that contains the SCMMobile model, and then upload the deployable package to LCS.4. Apply the deployable package.
The Vendor collaboration mobile workspace must be published.	System administrator	See Publish a mobile workspace .
The vendor user must have access to the vendor collaboration web interface in the web client and must set up a vendor collaboration user.	Purchasing professionals and the system administrator	Follow the steps in the following topics to set up and work with the vendor collaboration web interface. <ul style="list-style-type: none">• Use vendor collaboration to work with external vendors• Manage vendor collaboration users• Set up and maintain vendor collaboration• Use vendor collaboration to work with customers in Supply Chain Managements

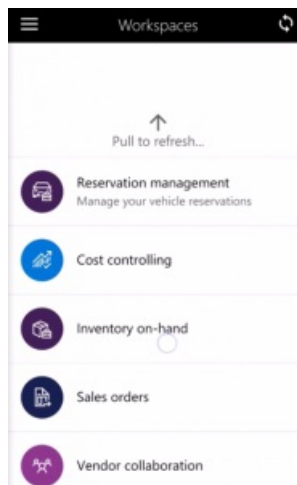

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

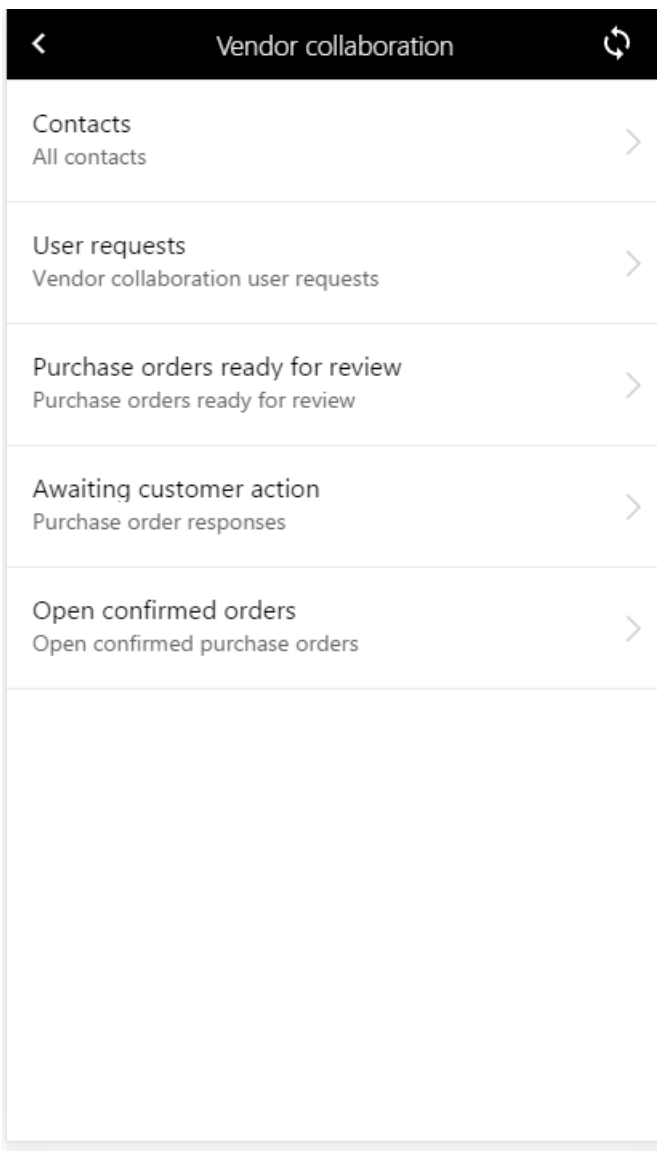

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

Use the Vendor collaboration mobile workspace

When you select the **Vendor collaboration** workspace, you'll see the following options.

The **Vendor collaboration** workspace includes the following pages.

Contacts

The **Contacts** page lets you see all the contacts that have been set up for the vendor account. It shows the contact person's name, primary email address, and user alias, if the contact person has an alias. This page also shows whether the contact person's user account is active. When you select a contact, you see contact details, such as the legal entities that the person is a contact for. You also see contact information, such as a telephone number or an alternative email address.

User requests

The **User requests** page lets you see all the user requests that you've submitted via the vendor collaboration web interface. You can also follow the status of those requests. When you select a user request, you can see what was requested, add or inactivate a user, change security, and see which security roles were requested for the user.

Purchase orders ready for review

The **Purchase orders ready for review** page lets you see all the purchase orders that the customer has sent, but that haven't yet been responded to. You can view selected information about the order, such as which products were requested and when those products should be delivered. Price information is also available, depending on the configuration of the vendor.

You can also see whether the purchase order has notes or attachments. However, to open notes and attachments, you must use vendor collaboration web interface in the web client. Select **Purchase order line** to see all the lines together with their details. For each line, an indicator will show whether there are notes or

attachments, or whether the delivery address differs from the delivery address that is shown on the header.

To respond to the purchase order, you must use the vendor collaboration web interface in the web client.

Awaiting customer action

The **Awaiting customer action** page lets you find purchase orders that you or another person in your company who has access to vendor collaboration has responded to. The purchase orders are visible in this list only if the customer must take one of the following actions on the purchase order:

- If the purchase order was rejected, the customer must either update or cancel the original order, and then send it again. When the purchase order is sent again, it no longer appears on the **Awaiting customer action** page.
- If the purchase order was accepted with changes, the customer must either update the original order and then send it again for review, or update the order per the requested changes and then confirm it immediately. In both cases, the purchase order no longer appears on the **Awaiting customer action** page.
- If the purchase order was accepted but still appears on the **Awaiting customer action** page, the purchase order wasn't automatically confirmed when it was accepted. It's now waiting for a purchasing agent to change the order status to **Confirmed**. Typically, a purchase order is considered an agreement between the customer and the vendor as soon as the vendor accepts the order. Therefore, the update to **Confirmed** status is usually just a formality.

When you select a purchase order, additional details appear about the response. You can see the line details and response for every line. The line status shows which of the following responses has been given:

- Accepted
- Rejected
- Accepted with changes
- Substituted/Substitute
- Split into schedule/Schedule line

Note that the **Delivering** field is set to either **Yes** or **No** to indicate whether the lines will be delivered. A line might not be delivered because for the following reasons:

- The line was rejected.
- A substitution was made, and the original line isn't expected to be delivered as requested in the received order.
- The line was split into multiple schedule lines, and the original line isn't expected to be delivered as requested in the received order.

Any changes that have been made to the order line response are shown. However, uploaded notes and attachments aren't shown. To view notes and attachments, you must use the vendor collaboration web interface in the web client.

Open confirmed orders

When the purchase order is confirmed by the customer (that is, the status of the purchase order is changed to **Confirmed**), it appears in the open confirmed order. It will remain in the list until it's registered as received by the customer.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Approve vendors for specific procurement categories

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to approve vendors for specific procurement categories in Dynamics 365 Supply Chain Management. When a purchase requisition is created, there may be a requirement to select an approved or preferred vendor, depending on how the purchasing policies are set up. This procedure shows you how to specify that a vendor is approved or preferred for a specific procurement category. This task would usually be carried out by a procurement professional. You can use this procedure in demo data company USMF.

1. In the navigation pane, go to **Modules > Procurement and sourcing > Vendors > All vendors**.
2. Select the vendor that you want to set as an approved or preferred vendor for a category.
3. On the Action Pane, select **General**.
4. Select **Categories**.
5. Select **Add category**.
6. In the **Category** field, select **OFFICE AND DESK ACCESSORIES (OFFICE AND DESK ACCESSORIES)**.
7. In the **Vendor category status** field, select **Preferred**. It's possible to specify more than one preferred vendor for a category.
8. Select **Save**.
9. In the navigation pane, go to **Modules > Procurement and sourcing > Procurement categories**.
10. In the tree, select **CORP PROCUREMENT CATEGORIES\OFFICE AND DESK ACCESSORIES**.
11. Expand the **Vendors** section. Check if the vendor that you selected appears as a preferred vendor for the Office and desk accessories category. If you're running this procedure as a task guide, you may have to select the **Unlock** button to be able to scroll down to the list of vendors. It's also possible to add preferred and approved vendors on this page.
12. In the tree, expand **OFFICE AND DESK ACCESSORIES** and select **Scissors**.
13. Select **No** in the **Inherit vendors from parent category:** field.
14. Select **Yes** in the **Inherit vendors from parent category:** field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Approve vendors for specific products

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to approve vendors for specific products. This allows you to control which vendors can be used when the product is added to a purchase order. You can use this procedure in demo data company USMF, or on your own data. This task would typically be carried out by a Purchasing manager.

1. In Navigation Pane, go to **Modules > Product information management > Products > Released products**.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Expand the **Purchase** fastTab. If there is a primary vendor shown in the **Vendor** field, then you need to add this vendor as an approved vendor in the following steps. Make a note of the vendor number, if one is shown.
5. On the Action Pane, click **Purchase**.
6. Click **Setup**.
7. Click **Add**.
8. In the **Vendor** field, enter or select a value. Select the approved vendor. At least one of the lines has to be the primary vendor if there was one in the product record. If you made a note of the vendor number earlier, select it here.
9. In the **Expiration** field, enter a date. Choose a date that is a few months ahead.
10. Click **Add**.
11. In the **Vendor** field, enter or select a value.
12. In the **Expiration** field, enter a date. Choose a date that is different than the previous expiration date.
13. Close the page.
14. On the Action Pane, click **Approved vendors**.
15. In the **Expiration** field, enter a date. This date acts as a filter so you can see who the approved vendors are, up to a certain date.
16. Close the page.
17. On the Action Pane, click **Effective period**.
18. In the **Show vendors expired by** field, enter a date. You can use this page to identify vendors where the approval status will expire after a certain date.
19. Close the page.
20. Click **Edit**.
21. In the **Approved vendor check method** field, select an option. This field allows you to select the policy for what should happen if the product is added to a purchase order line where the vendor is not an approved vendor.
22. Click **Save**.
23. Close the page.
24. Close the page.
25. In Navigation Pane, go to **Modules > Procurement and sourcing > Vendors > Vendor/item relations > Approved vendor list by item**. This page gives you an overview of all products and the approved vendors.
26. Close the page.
27. In Navigation Pane, go to **Modules > Procurement and sourcing > Vendors > All vendors**. You can also start from a vendor and then go to the list of approved products for that vendor account.
28. In the list, find and select the desired record.

29. On the Action Pane, click **Procurement**.
30. Click **Approved vendor list by vendor**.
31. Close the page.
32. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Search for vendors

2/18/2021 • 2 minutes to read • [Edit Online](#)

Learn how to search for vendors based on specific criteria. This example shows you how to search for vendors that are approved for a particular procurement category and have their primary address in a specific country. You can run this procedure in demo data company USMF, or on your own data. This task would usually be carried out by a procurement professional.

1. Go to Procurement and sourcing > Vendors > Vendor search.
2. Click on the Plus icon to open the Procurement category selection page.
3. In the tree, select 'CORP PROCUREMENT CATEGORIES\OFFICE MACHINES'.
 - If you're running this procedure as a task guide, you may have to click the Unlock button before you can select the correct node. If you're not using USMF, select one of the categories that you have.
4. Click Add.
 - It's possible to select more than one category here. If you do so, the search will find all the vendors that are approved for at least one of the categories.
5. Click OK.
6. In the Country/region field, type a value.
7. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up permissions for ordering products on behalf of someone else

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to grant workers permission to prepare purchase requisitions on behalf of other workers. In other words, a purchase requisition "preparer" can create a requisition for another "requester." The procedure also shows how to grant a worker permission to order items and services in different legal entities or operating units. Typically, these tasks are performed by a purchasing manager. You can use this procedure either on data for the USMF demo company or on your own data.

Grant permission to enter purchase requisitions on behalf of another worker

1. In the navigation pane, go to **Modules > Procurement and sourcing > Setup > Policies > Purchase requisition permissions**. Make sure that the **Current view** field is set to **By preparer**. The list in the left pane shows the people who can be granted permission to prepare requisitions on behalf of other people.
2. Select the person to grant permission to (the preparer).
3. Select **Add**.
4. Find and select the person to add as a requester.
 - The requester is the person that the preparer can create requisitions on behalf of.
 - In the **Authorization** field, select **Specific** if the preparer should be able to create purchase requisitions on behalf of the selected worker. Select **Reporting** if the preparer should also be able to create purchase requisitions on behalf of all workers who report to that worker.
5. In the **Effective** field, enter a date.
6. In the **Expiration** field, enter a date.

View preparers who have permission to create purchase requisitions for a selected worker

1. In the **Current view** field, select **By requester**. This view shows a list of preparers who have been granted permission to create purchase requisitions on behalf of a selected worker.
2. Use the Quick Filter to find the worker that you just added as the requester.
3. Select the requester. The Preparer list shows the people who have permission to order items on behalf of the requester who is selected in the left pane. You can add additional preparers here. This view also lets you grant the requester permission to create requisitions in legal entities and operating units that aren't that person's primary legal entity or operating unit.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up project resource information

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to set up a project resource. This task uses the USMF data set.

1. Go to Project management and accounting > Project resources > Resources list.
2. Click New resource.
3. In the Worker field, enter or select a value.
4. In the Calendar field, enter or select a value.
5. In the Period code field, enter or select a value.
6. Click Create.
7. Click Cost prices.
8. Click Cost price - hour.
9. Click New.
10. In the Effective date field, enter a date.
11. In the Cost price field, enter a number.
12. Click Save.
13. Close the page.
14. Click Sales prices.
15. Click Sales price - hour.
16. Click New.
17. In the Effective date field, enter a date.
18. In the Pricing field, enter a number.
19. In the Valid for field, select an option.
20. Click Save.
21. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Submit and approve project budget

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create and submit the budget for a project.

When you create a project budget, you can enter estimated revenues and costs for a project, and then use those to control actual project transactions. In project budgeting, all original budgets and revisions must be sent to project workflow for approval. Workflow gives you increased control over the process and creates a change history record.

This task was created using the USSI data set.

1. In the **Navigation pane**, go to **Modules > Project management and accounting > Projects > All projects**.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. On the **Action Pane**, click **Plan**.
5. Click **Project budget**.
6. In the **Description** field, type a value.
7. Expand the **Cost** fastTab.
8. Click **New**.
9. In the **Transaction type** field, select an option.
10. In the **Category** field, enter or select a value.
11. In the **Original budget** field, enter a number.
12. Expand the **Revenues** fastTab.
13. Click **New**.
14. In the list, mark the selected row.
15. In the **Transaction type** field, select an option.
16. In the **Category** field, enter or select a value.
17. In the **Original budget** field, enter a number.
18. Click **Save**.
19. Click **Workflow**.
20. Click **Submit**.
21. In the **Comment** field, type a value.
22. Click **Submit**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Submit and approve project budget revision

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure provides information about revising a project budget. You can revise a project budget as many times as necessary, however you can't see the amount of an individual revision if the budget has been revised more than one time.

This task uses the SSI data set.

1. Go to Project management and accounting > Projects > All projects.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. On the Action Pane, click Plan.
5. Click Project budget.
6. Click New revision.
7. Expand the Costs section.
8. In the Revision amount field, enter a number.
9. Click Save.
10. Click Workflow.
11. Click Submit.
12. In the Comment field, type a value.
13. Click Submit.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product information overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

This topic provides information about product information management. Product information management works with a shared product definition, categorization, and identifiers across all legal entities, and also specific configurations of a product, to fit into the business processes.

Product information is the backbone of supply chain and commerce applications across all industries. It refers to processes and technologies that focus on centrally managing information about products (for example, across supply chains). It's crucial that shared product definitions, documentation, attributes, and identifiers be used. In the various modules of a business solution, product-specific information and configuration are required in order to manage the business processes that are related to specific products, product families, or product categories.

Product definition

A product is primarily defined by a product number, name, and description. However, other data is also required in order to describe a product or service:

- Product type: Item or service
- Product subtype: Distinct products or product masters
- Definition of the product variant model:
 - Product dimensions and dimension groups
 - Product nomenclature
 - Product configuration models
- Association of the product with one or more categories
- Definition of the product and category attributes
- Product images
- Attachments
- Units of measure and related conversions
- Translations for all names and descriptions

Distribution, export, and import of product data

The product definition can be created in Supply Chain Management. It can also be imported from product lifecycle management (PLM), product data management (PDM), or product information management (PIM)

systems. When more than one instance of Supply Chain Management is used, one instance is typically used as the master of the product data for all other instances. This approach is supported by a large set of data entities that enable the export and import of product definition data from one instance to another.

To support the distribution of product data to many instances, Supply Chain Management lets you use Microsoft Dataverse. The product definitions can be exported from an instance of Supply Chain Management to Microsoft Dataverse. The product definitions can then be used to provision other business applications, such as Dynamics 365 Sales, with product data.

Note that, in dynamic and agile organizations, product information data changes every day. Therefore, maintenance of accurate and actual product data is a critical business process on its own.

Product masters and product variants

In an agile world, where products must be quickly adapted to customer requirements, product definitions specify a set of products instead of distinct products. In Supply Chain Management, those generic products are known as *product masters*. Product masters hold the definition and rules that specify how distinct products are described and behave in business processes. Based on these definitions, distinct products can be generated. These distinct products are known as *product variants*.

A product master is associated with a product dimension group and a configuration technology to specify the business rules. The product dimensions (Color, Size, Style, and Configuration) are a specific set of attributes that can be used throughout the application to define and track specific behaviors of the related products. These dimensions also help users search for and identify the products.

Configuration technologies

You can choose among three configuration technologies:

- The predefined variants are defined by predefined product dimensions. The variant definition includes the definition of a specific valid combination of dimensions, such as Color, Style, and Size. Each combination produces a distinct product variant.
- The dimension-based configuration is typically used in manufacturing scenarios and lets you use the Configuration dimension in the definition of the bills of materials (BOMs). After a specific configuration is selected, the system uses the subset of BOM lines that are valid for that configuration for planning and production. This concept is also known as *global BOM*, because one shared BOM is used for all configurations of a product.
- The constraint-based configuration uses a product configuration model to describe all possible attributes and components that are required in order to describe all possible variants of a product in a single model. The constraints of combinations of attributes can be described through regular expressions or table-based constraints. Configuration models and configurators become more important in product information management and are used across all industries.

When you plan the implementation of Supply Chain Management, it's very important that you choose the correct configuration technology for a business process. A product can't be converted from one model to another after implementation.

Product variant model definition workspace

The **Product variant model definition** workspace gives an overview of the product masters. It also shows the status of the release of masters and related variants to specific legal entities.

Released products

The products that are released to a specific legal entity are known as *released products*. Products can be

released in bulk to one legal entity or many legal entities at a time. Because various properties and attributes of the products might have to be added per legal entity, the **Released product maintenance** workspace lets you monitor and complete the recently released products in each legal entity, or in the suborganizations of a legal entity.

Released product maintenance workspace

You can configure the **Released product maintenance** workspace from the **Configure my workspace** menu item. Select a category hierarchy and category to filter the workspace by. To adjust the relevant product data in the workspace, you can also define, in days, the time fences for **Recently released products** and **Stopped released products**.

The workspace consists of a summary of tiles and two lists. The **Open cases** list shows product change cases that have products in the selected product category hierarchy that aren't completed and closed. The **Recently released** list shows products that have been released within the time fence that is set in the workspace configuration. For each item in the list, validation is run, and the validation status is shown. This status might indicate that the required configurations for the legal entity hasn't been completed. From the list, you can directly access the **Released product details**, **Product attribute maintenance**, **Product category maintenance**, **Default order settings**, and **Text translations** pages to complete the required configuration of the product.

Manually creating a new released product

You can manually create a released product in a single run, depending on the organization's business processes and any rules about whether this function should be used. This function creates a new product and automatically releases it to the current legal entity. To create a new product, click **Released products** in the **Released product maintenance** workspace or on the **Released product** list page.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product identifiers

2/18/2021 • 18 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

This topic provides information about the various types of product identifiers and explains how you can add product identifiers in your product data.

When you work with products on the shop floor or in a warehouse in Microsoft Dynamics ERP or Microsoft Dynamics CRM, you must have a good strategy for identifying those products and product variants.

Unique product number/product ID

In Dynamics 365 Supply Chain Management, the primary identifier for a product is the product number (that is, the unique product ID). This number can be automatically generated by a number sequence or manually associated with a product. For product variants, the numbers can be defined through the product nomenclature template.

In many cases, the product number isn't originally created in Dynamics 365 Supply Chain Management. Instead, it's associated with a product in a product lifecycle management (PLM) system or a product data management (PDM) system. In this case, you use data entities to import the products and product variants. Supply Chain Management then uses the numbers in all operations.

When you implement Supply Chain Management, you should give special consideration to your strategy for product numbers. A good numbering system improves logistics flows and helps prevent errors. A good product identifier has a maximum of 15 characters. Ideally, it has fewer than 10 characters and includes no more than five classifying characters. You can also use search names to enable quick searches. A search name is an additional name that represents the classifications of a product.

When you use Microsoft Dataverse, the product number in Supply Chain Management is also the product number in Microsoft Dataverse. Product variants are synchronized to Dataverse as distinct products.

Item number and product dimensions

The item number is the product identifier that is used by a specific legal entity. Ideally, the item number should be identical to the product number. If the nomenclature differs per legal entity, it becomes difficult to follow a product throughout the supply chain, and burdensome relabeling and referencing processes are introduced. For compatibility with older versions (that is, with Microsoft Dynamics AX 2009 and earlier), we have preserved this model. However, we recommend that you eliminate identifiers that are specific to legal entities whenever you can, and that you use the unique product number as the primary identifier instead.

Additionally, a product variant can't be uniquely identified by an item number. It always requires the combination of an item number and all the product dimensions that are defined on the product master. This requirement can become cumbersome and can slow down the identification processes. For this reason too, we

recommend that you use the unique product number instead the item number whenever you can.

Many pages still have the item number and product dimensions as the primary identifiers. However, the product numbers can be used for searches. At **Sales and marketing > Setup > Search > Search parameters**, you can change the search lookup so that it uses product numbers instead of item numbers as the primary search strategy. If you set the **Enable lookup for product search** option to **Yes**, the lookup will show not only product masters but product variants. For more information, see [Search for products and product variants during order entry](#).

Additionally, you will be able to search and filter on the product number, the product name and description, and the product dimension IDs of the product variant. When you select a variant, the related item number and all product dimension IDs will be selected. Therefore, you can more easily find and select the correct variant. This setting is highly recommended if you use product variants and the unique product number as the primary identifiers for products. The only exception might be the fashion industry, where the business processes often require that you select the master before you select a variant. You should carefully evaluate this option before you implement the numbering system.

NOTE

The item number for a product can't be changed once one or more transactions exist for that product.

Product name and description

The product name and description are the human-readable identifiers of a product and can be maintained in many languages. By default, the Supply Chain Management client shows all product information in the default company language, not in the user's language. However, translated product names and descriptions are used in all communication with customers and vendors. The translations are based on the language code of the customer and vendor accounts.

For product variants, the product name can be generated through a product nomenclature template. Because there is no requirement that product names be unique, you might find multiple products that have the same name.

Product and item search names

Supply Chain Management offers a secondary search name for products and also for items (released products). This search name doesn't have to be unique, and it can be changed after a product or product variant is created. We recommend that you use the search name to search for products by categories. The search names enable quick searches, especially in sales and purchase processes.

The search name can also contain a customer or vendor product ID, or some other external product ID, if this external ID is the primary search criterion for a product.

External product identifiers (Customer and vendor identifiers)

For released products, you can maintain the item numbers, item names, and item descriptions that the customer or vendor uses. The references are shown on external documents, such as sales orders, purchase orders, packing slips, and invoices. In the current version of Supply Chain Management, the external references aren't shown on core operations pages. The only exception is the vendor item number. This number is shown in the **Product information** dialog box if a default vendor is defined for the released product.

You can maintain the external product identifiers by released product, released product variant, customer or customer group, or vendor or vendor group.

On the **Released products** page, follow one of these steps.

- For customers, on the **Sell** tab, in the **Related information** group, select **External item description**.
- For vendors, on the **Purchase** tab, in the **Related information** group, select **External item description**.

On the **External item descriptions** page, you can associate the customer's or vendor's item number with a released product. This association must be done for each legal entity. The following information can be captured. Unfortunately, the labels are slightly misleading in the current version of Supply Chain Management. However, these labels might be changed in a future version.

FIELD	CORRESPONDING CUSTOMER INFORMATION	CORRESPONDING VENDOR INFORMATION
External item number	The customer's item number	The vendor's item number
Description	The name that the customer associates with the item	The name that the vendor associates with the item
External item text	The customer's item description	The vendor's item description

If many customers or vendors use the same item numbers (as in the case of a purchase association or a commerce group, for example), you can create groups of customer or vendors to simplify the maintenance of external product information.

- For customer groups, go to **Sales > Setup > Items > External item description** to create and maintain the groups and the related item numbers. To associate customers with a group, go to **Accounts receivable > Customers > All customers**, and then, on the **Sales order defaults** FastTab, specify a value in the **Item - customer group** field.
- For vendor groups, go to **Procurement and sourcing > Setup > External item description group** to create and maintain the groups the related item numbers. To associate vendors with a group, go to **Accounts payable > Vendors > All vendors**, and then, on the **Purchase order defaults** FastTab, specify a value in the **Item - vendor group** field.

Bar codes

If you want to use a bar code scanner to identify products, the product identifier must meet the requirements of the bar code standard that is used. Therefore, bar codes don't typically contain the raw product number but a number that is generated specifically for the selected bar code technology. You can maintain multiple bar codes by bar code type. You can even associate the same bar code with multiple products and then select the actual active association when you scan a bar code.

Before you define bar codes, you can define one or more bar code setups. The bar code setups can help validate that bar codes follow the required guidelines, and that they can therefore be effectively printed and scanned. You can also maintain special bar codes for specific product quantities.

We recommend that you use the bar code setup to maintain Global Trade Item Number (GTIN) or International Article Number (EAN) codes.

To maintain bar codes, on the **Released products** page, on the **Manage inventory** tab, in the **Warehouse** group, select **Bar codes**.

GTIN codes

In e-commerce, it's crucial that all parties speak a common language and refer to products by using a common set of identifiers. Therefore, some industries rely on the [GTIN](#), which is a global item number system that is facilitated by GS1.

We recommend that you maintain the GTIN as a bar code. However, you can also maintain it on the **Item -**

GTIN page. To open this page, on the **Released products** page, on the **Manage inventory** tab, in the **Warehouse** group, select **GTIN codes**. Note that the GTIN isn't maintained as a global number. Instead, it's maintained by legal entity.

In Supply Chain Management, you define packaging variants in the warehouse operations by defining specific units of measure. For example, an item might be stored in pieces, in bundles of six, in trays of 18, or in full pallets. A specific unit of measure will be defined for each of these packaging variants. Because the GTIN is typically related to the packaging unit of a product, the **Item - GTIN** page lets you maintain multiple GTIN codes per product and unit of measure. However, you can't use the same GTIN code more than one time for different items or product variants of a legal entity.

To maintain **GTIN codes**, on the **Released products** page, on the **Manage inventory** tab, in the **Warehouse** group, select **GTIN**.

External codes

External codes can be defined for many entities. For example, you can define external codes to identify products and released products. These external codes can be used to associate statistical codes or tax codes with released products and released product variants. External codes are defined by legal entity and code type. They must be unique by legal entity, code type, and table reference.

Unfortunately, there is no standard functionality that lets you search for products by external codes.

Data entities that are used to import and export product identifiers

ENTITY NAME	IMPORT IDENTIFIERS	EXPORT IDENTIFIERS	COMMENTS
Products V2	Product number, product search name, product name, product description	Product number, product search name, product name, product description	Depending on the settings of the entity and the number sequence for the product number, the product number can be automatically created at the time of import.
Product variants	Product number, product search name, product name, product description	Product number, product search name, product name, product description	Depending on the product nomenclature template, the product number can be automatically created at the time of import. However, you can import any unique product number, and that product number doesn't have to follow the structure of the product nomenclature templates.
Product translations	Product name, product description	Product name, product description	This entity overwrites any language. Note that when the name or description of a legal entity's primary language is overwritten, the name and description of the product itself is changed.

ENTITY NAME	IMPORT IDENTIFIERS	EXPORT IDENTIFIERS	COMMENTS
Released product creation V2	Item number, product number, item search name	Item number, product number, item search name, product search name, product name	This entity can be a challenge when number sequences are used during the creation of new released products. Both the Item number number sequence and the Product number number sequence have an influence. However, the Item number number sequence is per legal entity, whereas the Product number number sequence is global. Therefore, we don't recommend that you use the Item number number sequence when you deploy new released products. Obviously, when the entity is used to release an existing product, the product number must be given in the entity. For more information, see the "Product and item number sequences" section in this topic.
Released product variants	Item number, product dimensions, product number	Product number, product search name, product name, product description, product dimensions	Like the Product variants entity, this entity can be used to create new products that either follow the product nomenclature template or use their own product numbers for the variant.
External item description for customers	Customer item number, customer item name, customer description, customer account	Customer item number, customer item name, customer description, customer account	A group of customers (for example, a buyer association) can be aggregated into one group by using the External item description customer groups entity.
External item description for vendors	Vendor item number, vendor item name, vendor description, vendor account	Vendor item number, vendor item name, vendor description, vendor account	A group of vendors (for example, a sales association or industry organization) can be aggregated into one group by using the External item description vendor groups entity.

ENTITY NAME	IMPORT IDENTIFIERS	EXPORT IDENTIFIERS	COMMENTS
Item Barcode	Bar code	Bar code	Note that, at the time of import, you must refer to a bar code setup that is defined in the target system. The imported bar code references are validated against that bar code setup and are rejected if the bar codes don't match the requirements that are defined in that bar code setup.
External codes for released products	External code	External code, external code classes, item number	External codes are by legal entity. For import, you must refer to a defined code class. Import the code classes by using the External code classes for released products entity.
External codes for released product variants	External code	External code, external code classes, item number, product dimensions	External codes are by legal entity. For import, you must refer to a defined code class. Import the code classes by using the External code classes for released products entity. This entity refers to product variants by the item number and product dimensions.
External codes for released product variants by product number identifier	External code	External code, external code classes, product number	External codes are by legal entity. For import, you must refer to a defined code class. Import the code classes by using the External code classes for released products entity. This entity refers to product variants by the product number of the variant. (From the next major release)
GTIN	Not applicable	Not applicable	Currently, there is no specific entity that is used to import and export GTIN codes. We recommend that you use the Item Barcode entity instead.

ENTITY NAME	IMPORT IDENTIFIERS	EXPORT IDENTIFIERS	COMMENTS
Product entity common data service identifier entity	Not applicable	Item number, item search name, product search name, vendor item number, customer item number, external codes, GTIN codes, bar codes	This entity consolidates all identifiers into one data model, so that one interface can be used to easily export all identifiers and their related types. Use the Product entity identifier code entity to export the identifier codes and descriptions. Use the Product entity identifier scope entity to export additional scope information to an identifier, such as the party, legal entity, quantity, or unit.

Product and item number sequences

You can define two different number sequences:

- The **Product number** number sequence for the global product number
- The **Item number** number sequence for the item number per legal entity

NOTE

You should use the item number as a separate identifier only when you migrate different legal entities from different sources that had different numbering systems. You should always try to use a product identifier that is unique across all legal entities. Therefore, you should set the **Manual** option to **Yes** for the **Item number** number sequence. In this way, the item number will follow the product number on creation. If Supply Chain Management isn't the leading system for new product numbers, you should set the **Manual** option to **Yes** for both the **Item number** and **Product number** number sequences.

When you use the **Released product creation V2** entity to create products, multiple settings can affect how the number sequences are used to create the product number and item number:

- Settings of the **Product number** number sequence
- Settings of the **Item number** number sequence
- The mapping of the item number
- The mapping of the product number

The following table provides an overview of the results of import and manual creation when specific combinations of the number sequence and field mapping settings.

PRODUCT NUMBER NUMBER SEQUENCE	ITEM NUMBER NUMBER SEQUENCE	MAPPING OF THE ITEM NUMBER	MAPPING OF THE PRODUCT NUMBER	RESULT OF ENTITY IMPORT	RESULT OF MANUAL CREATION	CONCLUSION
--------------------------------	-----------------------------	----------------------------	-------------------------------	-------------------------	---------------------------	------------

PRODUCT NUMBER NUMBER SEQUENCE	ITEM NUMBER NUMBER SEQUENCE	MAPPING OF THE ITEM NUMBER	MAPPING OF THE PRODUCT NUMBER	RESULT OF ENTITY IMPORT	RESULT OF MANUAL CREATION	CONCLUSION
Manual = No	Manual = No	No mapping	No mapping	Product numbers use the Product number sequence. Item numbers use the Item number sequence.	Product numbers use the Product number sequence. Item numbers use the Item number sequence.	With this configuration, product numbers will follow the product number sequence and item numbers will follow the item number sequence. However, this configuration won't work if there is more than one item (row) to be imported.
Manual = No	Manual = Yes	Auto generate	No mapping	Both product numbers and item numbers use the Item number sequence.	Both product numbers and item numbers use the Product number sequence.	Both product numbers and item numbers will follow the product number sequence. This is the recommended approach to import bulk products with the Released product creation V2 data entity.
Manual = No	Manual = Yes	No mapping	No mapping	Both product numbers and item numbers use the Product number sequence.	Both product numbers and item numbers use the Product number sequence.	Both product numbers and item numbers will use the product number sequence. However, this configuration won't work if there is more than one item (row) to be imported.

PRODUCT NUMBER NUMBER SEQUENCE	ITEM NUMBER NUMBER SEQUENCE	MAPPING OF THE ITEM NUMBER	MAPPING OF THE PRODUCT NUMBER	RESULT OF ENTITY IMPORT	RESULT OF MANUAL CREATION	CONCLUSION
Manual = Yes	Not applicable	Not applicable	Auto generate	You receive the following error message: "Number sequence can't be detected."	According to the Item number number sequence	This setting isn't supported for import.

Product entity identifier (Export all product identifiers)

The product entity identifier model was created to enable version 1.0 of Dataverse to be provisioned with all identifiers that are used to refer to a product. To simplify this task, all identifiers are aggregated into one global identifier table, so that they can be exported as one model. Note that this version of Dataverse doesn't use the product identifiers model. Therefore, the **Product entity common data service identifier entity** entity and this process have limited practical use and will likely be subject to change in the future.

The product identifier table is a global table that is populated from all reference tables of the Main legal entity through a recurring batch job. You must select a legal entity and a product category hierarchy as the definition of the global product master scope. Generation of the global product identifier table is limited to products that are released to the selected legal entity and products that are members of the product hierarchy that is selected for the **Common data service** role in the product category hierarchy.

This process assumes that product master data is primarily maintained in one central legal entity. (However, this legal entity can be a virtual legal entity that is used only to maintain global master data.)

Follow these steps to configure the environment.

1. Select the category hierarchy for Dataverse. On the **Category hierarchy role associations** page, if no hierarchy is associated with the **Common data service** role, you must create a new association. Select the **Common data service** role, and then associate the category hierarchy that represents the product portfolio that should be synchronized to Dataverse.
2. Select the legal entity for global product master data. On the **Product information management parameters** page, on the **Product attributes** tab, select the master company where the product and item identifiers are primarily maintained.
3. Define the identifier code types and codes that should be exported. Go to **Product information management > Setup > Product identifier codes**. To generate the identifier code types, select **Generate codes**. A code type entry is generated for each type for identifier that is found in the selected legal entity.

Note that, for bar codes, a code type is generated for each bar code setup. For external codes, a code type is generated for each external code class.

You can now maintain the list of code types. You can change the code, name, and description. You can also delete code types. Code types that you delete won't be used to populate the global product entity identifier tables.

4. When you've finished defining the product identifier code types, you can create the identifiers in the global table by starting the **Create product entity identifiers** job on the **Product entity identifier codes** page. You should run this job in a batch. This job should be set up as a periodic batch job so that the table is populated according to new entries.

You can now use the **Product entity common data service identifier entity**, **Product entity identifier code**, and **Product entity identifier scope** data entities to export the identifiers for any target system.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a hierarchy of product classification

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a new category hierarchy and assign a commodity code hierarchy type. The demo data company used to create this procedure is USMF. This procedure is intended for the category manager.

Create the new category hierarchy

1. Go to **Navigation pane > Modules > Product information management > Setup > Categories and attributes > Category hierarchies**.
2. Click **New**.
3. In the **Name** field, type a value.
4. In the **Description** field, type a value.
5. Click **Create**.

Build the hierarchy

1. Click **New** category node.
2. In the **Name** field, type a value.
3. In the **Code** field, type a value.
4. In the **Friendly name** field, type a value.
5. Click **New** category node.
6. In the **Name** field, type a value.
7. In the **Code** field, type a value.
8. In the **Friendly name** field, type a value.
9. Click **New** category node.
10. In the **Name** field, type a value.
11. In the **Code** field, type a value.
12. In the **Friendly name** field, type a value.
13. Click **New** category node.
14. In the **Name** field, type a value.
15. In the **Code** field, type a value.
16. In the **Friendly name** field, type a value.
17. Close the page.

Classify the hierarchy

1. In the list, find and select the desired record.
2. On the **Action Pane**, click **Category hierarchy**.
3. Click **Associate hierarchy type**.
4. Click **New**.
5. In the **Category hierarchy type** field, select an option. Select the **Commodity code category hierarchy type for product classification**.
6. In the **Category hierarchy** field, click the drop-down button to open the lookup.
7. In the list, find and select the desired record.

8. In the list, click the link in the selected row.

9. Close the page.

NOTE

Classify a product using category hierarchies

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to classify a product using category hierarchies. Use category hierarchies to classify products for export, procurement, sales, or other purposes. This task is typically performed by a product manager. The example uses product number M0009 in demo data company USMF.

1. Select **Released product maintenance**.
2. Select **All released products**.
3. In the list, find and select the desired record.
4. On the Action Pane, select **Product**.
5. Select **Product categories**.
6. Select **New**.
7. In the **Category hierarchy** field, enter or select a value.
8. In the **Category** field, enter or select a value.
9. Select **New**.
10. In the **Category hierarchy** field, enter or select a value.
11. In the **Category** field, enter or select a value.
12. Close the page.

NOTE

Nomenclature of product variant numbers and names

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how you can set up a product number nomenclature to replace the fixed [Product master number - Configuration - Size - Color - Style] format. The new nomenclature has a targeted format that includes the product master number, active product dimensions, and text delimiters of your choice. You can also create a nomenclature for product names. Finally, you can build a nomenclature to identify configurations that are created by the constraint-based product configurator. These nomenclatures can contain attributes of your choice.

The new nomenclatures for product variant numbers and product variant names let you include segments in the identifiers for product variants. These segments can include the product master number and name, product dimension IDs and names, number sequences, text constants, and attributes. This functionality lets you quickly find a specific product variant when you create a sales order or a purchase order. You create nomenclatures for both product variant numbers and product variant names by using the **Product nomenclature** page. To open this page, click **Product information management > Setup**.

Nomenclature of predefined product variants

Product variants are generated for product masters according to one of three configuration technologies:

- Predefined variants
- Constraint-based
- Dimension-based

Each product variant has a number and a name, and the product variant identification nomenclatures let you select the segments that will be included in each product variant number or name. You can select the following segments on the **Product nomenclature** page:

- Product master number
- Product master name
- Number sequence value
- Text constant
- Product dimensions
 - Configuration ID or name
 - Color ID or name
 - Size ID or name
 - Style ID or name

After you define a product variant identification number nomenclature, you can associate it with a product dimension group. All product masters that reference this product dimension group will then be assigned product variant numbers according to the nomenclature. However, product variant name nomenclatures can't be associated with product dimension groups. You can also assign a product variant identification nomenclature directly to a product master. In this case, the product variants that belong to the product master will be assigned product variant numbers and names according to the nomenclatures.

Example

A T-shirt (TS1234) is produced in three sizes (S, M, L), four colors (Red, Green, Blue, Yellow), and two styles (Polo, V). Therefore, 24 product variants are possible ($= 3 \times 4 \times 2$). You create a product variant number nomenclature

that has the following segments:

1. Product master number
2. Text constant: "-"
3. Color
4. Text constant: "-"
5. Size
6. Text constant: "-"
7. Style

In this case, the product variant number for a red, small, polo T-shirt will be TS1234-Red-Small-Polo.

Nomenclature of constraint-based configurations

For constraint-based configurations, you can create a dedicated nomenclature for the configuration product dimension. You can select the following segments on the **Product nomenclature** page:

- Number sequence value
- Text constant
- Attribute value

Each component in a product configuration model can have its own configuration nomenclature. Only attributes that belong to the component can be used. Attributes from subcomponents or user requirements can't be used.

Example

A product configuration model has a root component that has two attributes:

- Material (Plastic, Wood, Steel)
- Length (10...100)

You create a configuration nomenclature that has the following segments:

1. Attribute value: Material
2. Text constant: "AAA"
3. Attribute value: Length

In this case, the configuration ID for wood material that has a length of 78 will be WoodAAA78.

Nomenclature of dimension-based configurations

For dimension-based configurations, you can create a dedicated nomenclature for the configuration product dimension. You can select the following segments on the **Product nomenclature** page:

- Number sequence value
- Text constant
- Configuration group item

You can define a configuration nomenclature for a bill of materials (BOM).

Example

A BOM has four BOM lines that are divided into two configuration groups:

- BOM line: M0007, Standard cabinet
 - Configuration group: Cabinet
- BOM line: M0008, High end cabinet
 - Configuration group: Cabinet

- BOM line: M0021, Front grill cloth
 - Configuration group: Front grill
- BOM line: M0022, Front grill metal
 - Configuration group: Front grill

You create a configuration nomenclature that has the following segments:

1. Configuration group: Cabinet
2. Text constant: "&"
3. Configuration group: Front grill

In this case, the configuration ID for a standard cabinet that has a cloth front grill will be M0007&M0021.

Nomenclature for a combination of product variants and configurations

When you use either the constraint-based configuration technology or the dimension-based configuration technology to configure product variants for a product master, the product variant numbers of the product variants can include the nomenclature from the configuration dimension. Follow these steps to configure variants.

1. On the **Product nomenclature** page, define a product variant number nomenclature that includes the configuration dimension.
2. Assign the nomenclature to a product dimension group that has the configuration dimension.
3. Define a configuration nomenclature for the components or BOMs that will be used to configure the product variants.

You can also create nomenclatures for the product variant names. The product variant names can be configured to include the configuration ID or name.

Example for constraint-based configurations

For this example, you use a product variant number nomenclature that consists of the following segments:

1. Product master number
2. Text constant "_"
3. Configuration

The configuration nomenclature consists of the following segments:

1. Attribute value: Material
2. Text constant: "AAA"
3. Attribute value: Length

You enter the following values for segments:

- Product master number = **M0099**
- Material = **Plastic**
- Length = **12**

In this case, the product variant number will be M0099_PlasticAAA12.

Example for dimension-based configurations

For this example, you use a product variant number nomenclature that consists of the following segments:

1. Product master number

2. Text constant "/"
3. Configuration

The configuration nomenclature consists of the following segments:

1. Configuration group: Cabinet
2. Text constant: "&"
3. Configuration group: Front grill

You enter the following values for segments:

- Product master number = **D0123**
- Cabinet = **M0008**
- Front grill = **M0022**

In this case, the product variant number will be D0123//M0008&M0022.

Numbering conflicts

In some cases, a product variant number nomenclature that you set up might not produce unique product variant numbers. For example, the product variant numbers won't be unique if one active product dimension isn't included in the nomenclature for a product master that uses the predefined variant configuration technology. The way that you handle conflicts varies, depending on the configuration technology.

Predefined variants

An error occurs if you try to manually create or automatically generate product variants, and more than one product variant ends up with the same product variant number. To avoid this scenario, you should use all active product dimensions in the product dimension group. Alternatively, include a number sequence to help guarantee that the product variant numbers are unique.

Constraint-based configurations

Depending on the nomenclature, the system might try to assign a non-unique product variant number to a configuration. In this case, the system uses the number sequence for the configuration dimension as the product variant number instead, and you receive a warning. To avoid this scenario, you should include enough attributes in the nomenclature to help guarantee unique product variant numbers. You should also make sure that the **Reuse** option is turned on for the component.

Dimension-based configurations

During one step of the configuration process, the system suggests a configuration value according to the nomenclature. In this step, you can manually change the configuration value. When you save the configuration, the system verifies that the configuration value is unique. If the value that you entered isn't unique, you receive an error message. To save the configuration, you must enter a unique configuration value.

Create a product number nomenclature for predefined product variants

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up a product number nomenclature for predefined product variants, and how you assign it to the appropriate product dimension group. The demo data company used to create this procedure is USMF. The new product number nomenclature is assigned to the Color and Size product dimension group. This task would typically be done by a product designer.

Create a product number nomenclature

1. Select **Product variant model definition**.
2. Select **Product nomenclature**.
3. Select **New**.
4. In the **Name** field, enter a nomenclature name that helps to identify the target product dimension group, for example, .
5. In the **Description** field, type a value.
6. Select **Add**.
7. Select **Product master number**.
8. Select **Add**.
9. Select **Text constant**.
10. In the **Text** field, type a value.
11. Select **Add**.
12. Select **Color**.
13. Select **Add**.
14. Select **Text constant**.
15. In the **Text** field, type a value.
16. Select **Add**.
17. Select **Size**.
18. Close the page.

Assign the nomenclature to a product master

1. Select **Product dimension groups**.
2. Select the **SizeCol product dimension group**.
3. Select **Edit**.
4. Select **Yes** in the **Use nomenclature** field.
5. In the **Product variant number nomenclature** field, enter or select a value.
6. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a product number nomenclature for configured product variants

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to set up a product number nomenclature for configured product variants, and how it can be attached to a configurable product master. This procedure also demonstrates how you can build a configuration nomenclature for a product configuration model component. The demo data company used to create this procedure is USMF. The new product number nomenclature is assigned to the D0004 product master. This task would typically be done by a product designer.

Create a product number nomenclature

1. Click Product variant model definition.
2. Click Product nomenclature.
3. Click New.
4. In the Name field, type a value.
5. In the Description field, type a value.
6. Click Add.
7. Click Product master number.
8. Click Add.
9. Click Text constant.
10. In the list, mark the selected row.
11. In the Text field, type a value.
12. Click Add.
13. Click Configuration.
14. Close the page.

Assign the product number nomenclature to a product master

1. Click Product masters.
2. Use the Quick Filter to find records. For example, filter on the Product number field with a value of 'D'.
3. In the list, click the link in the selected row.
4. Click Edit.
5. Select Yes in the Use nomenclature field.
6. In the Product variant number nomenclature field, enter or select a value.
7. Close the page.
8. Close the page.

Create nomenclature for a product configuration model component

1. Click Product configuration models.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click Edit.
5. Select Yes in the Use configuration nomenclature field.

6. Click Add.
7. Click Attribute value.
8. In the list, mark the selected row.
9. In the Attribute field, enter or select a value.
10. Click Add.
11. Click Text constant.
12. In the list, mark the selected row.
13. In the Text field, type a value.
14. Click Add.
15. Click Attribute value.
16. In the list, mark the selected row.
17. In the Attribute field, enter or select a value.
18. Click Add.
19. Click Text constant.
20. In the list, mark the selected row.
21. In the Text field, type a value.
22. Click Add.
23. Click Attribute value.
24. In the list, mark the selected row.
25. In the Attribute field, enter or select a value.
26. Click Add.
27. Click Text constant.
28. In the list, mark the selected row.
29. In the Text field, type a value.
30. Click Add.
31. Click Attribute value.
32. In the list, mark the selected row.
33. In the Attribute field, enter or select a value.
34. Click Add.
35. Click Text constant.
36. In the list, mark the selected row.
37. In the Text field, type a value.
38. Click Add.
39. Click Number sequence value.
40. In the list, mark the selected row.
41. In the Number sequence field, enter or select a value.
42. Close the page.
43. Close the page.
44. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a new product

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a new shared product. It is usually carried out by a product designer. The demo data company used to create this task is USMF.

Create a product

1. In the Navigation pane, go to **Modules > Product information management > Products > Products**.
2. Select **New**.
3. In the **Product number** field, type a value. If a number sequence has not been set up for the product number, it must be entered manually.
4. In the **Product name** field, type a value. The product name defaults to the search name. You can change this if needed.
5. Select **OK**.

Set up dimension groups

1. Select **Dimension groups** to open the drop dialog.
2. In the **Storage dimension group** field, enter or select a value. The storage dimension group determines which storage dimensions you must enter on each transaction for the product and how it will be tracked in inventory.
3. In the **Tracking dimension group** field, enter or select a value. The tracking dimension group determines which tracking dimensions you must enter for each transaction for the product, and how it will be handled in inventory.
4. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a product master

2/18/2021 • 2 minutes to read • [Edit Online](#)

Create a product master for the predefined variants. The demo data company used to create this procedure is USMF. This procedure is intended for the product designer.

Create a new product master

1. Go to **Navigation pane > Modules > Product information management > Products > Product masters**.
2. Click **New**.
3. In the **Product number** field, type a value. The number must be unique. A number sequence can be set for the **Product number** field. In this case, the user doesn't have to enter a value.
4. In the **Product name** field, type a value. Enter a descriptive product name. The value defaults to the search name, but this can be changed by the user.
5. In the **Product dimension group** field, click the drop-down button to open the lookup. The product dimension group determines which of the 4 product dimensions that can be used to create product variants. This example uses a group with color and size.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row. The default **Configuration technology** is 'Predefined variant'. This will be used for this example.
8. Click **OK**.

Select product dimension groups

1. In the **Color group** field, click the drop-down button to open the lookup.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the **Size group** field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.
6. In the list, click the link in the selected row.

Add dimension groups

1. On the **Action Pane**, click **Product**.
2. Click **Dimension groups** to open the drop dialog.
3. In the **Storage dimension group** field, click the drop-down button to open the lookup. The storage dimensions help you control how items are stored and taken from inventory. For example, a storage dimension can include Site and Warehouse.
4. In the list, find and select the desired record.
5. In the list, click the link in the selected row.
6. In the **Tracking dimension group** field, click the drop-down button to open the lookup. The tracking dimension group determines which tracking dimensions you can add to a product. For example, the batch number and serial number are used to track inventory items.
7. In the list, find and select the desired record.
8. In the list, click the link in the selected row.
9. Click **OK**.

10. Click **Save**.

11. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create predefined product variants

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through creating product variants for a product master using the combinations of product dimensions. The demo company used to create this procedure is USMF.

Create a product master

1. Go to Product information management > Products > Product masters.
2. Click New.
3. In the Product number field, type a value.
 - Entering a product number manually is only required if no number sequence has been set for the product number field. In other words, skip the step if number sequence has been set for the field.
4. In the Product name field, type a value.
5. In the Product dimension group field, enter or select a value.
 - Select the product dimension group SizeCol (Size and Color).
6. Click OK.

Add product dimensions

1. Click Product dimensions.
 - This example shows how to manually enter product dimensions. You can also choose to select a size, color or style group that includes the product dimension values you want to use.
2. Click New.
3. In the list, mark the selected row.
4. In the Size field, enter or select a value.
5. In the Name field, type a value.
6. Click New.
7. In the list, mark the selected row.
8. In the Size field, enter or select a value.
9. In the Name field, type a value.
10. Click the Colors tab.
11. Click New.
12. In the list, mark the selected row.
13. In the Color field, enter or select a value.
14. In the Name field, type a value.
15. Click New.
16. In the list, mark the selected row.
17. In the Color field, enter or select a value.
18. In the Name field, type a value.
19. Click Save.
20. Close the page.

Generate product variants

1. Click Product variants.

2. Click Variant suggestions.
3. Click Select all.
 - In this example, all possible variants are selected. If only a subset of the possible product dimension combinations will be used to create variants, you can select the individual entries.
4. Click Create.
 - You can generate descriptions for all your variants based on the combination of product dimension values. The descriptions are optional.
5. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Unit of measure conversion per product variant

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains how to set up unit of measure conversions for various product variants.

Instead of creating multiple individual products that must be maintained, you can use product variants to create variations of a single product. For example, a product variant might be a T-shirt of a given size and color.

Previously, unit conversions could be set up only on the product master. Therefore, all product variants had the same unit conversion rules. However, when the *Unit of measure conversions for product variants* feature is turned on, if your T-shirts are sold in boxes, and the number of T-shirts that can be packed in a box depends on the size of the T-shirts, you can now set up unit conversions between the different shirt sizes and the boxes that are used for packaging.

Turn on the feature in your system

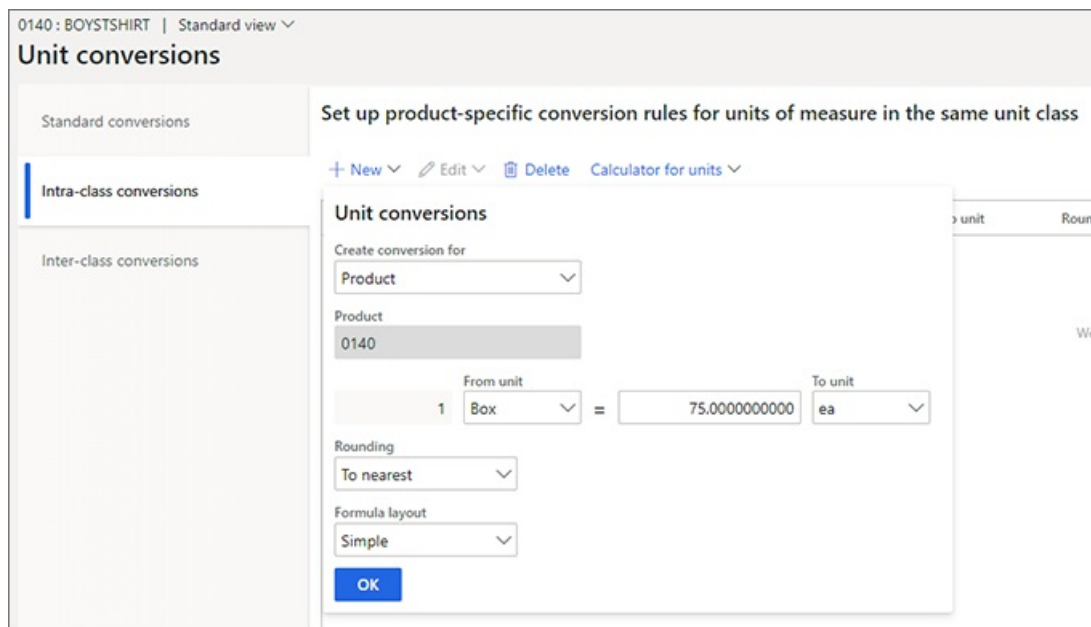

If you don't already see this feature in your system, go to [Feature management](#), and turn on the *Unit of measure conversions for product variants* feature.

Set up a product for unit conversion per variant

Product variants can be created only for products that are product masters. For more information, see [Create a product master](#). The *Unit of measure conversions for product variants* feature isn't available for products that are set up for catch-weight processes.

To configure a product master to support unit conversion per variant, follow these steps.

1. Go to **Product information management > Products > Product masters**.
2. Create or open a product master to go to its **Product details** page.
3. Set the **Enable unit of measure conversions** option to *Yes*.
4. On the Action Pane, on the **Product** tab, in the **Set up** group, select **Unit conversions**.
5. The **Unit conversions** page opens. Select one of the following tabs:
 - **Intra-class conversions** – Select this tab to convert between units that belong to the same unit class.
 - **Inter-class conversions** – Select this tab to convert between units that belong to different unit classes.
6. Select **New** to add a new unit conversion.
7. Set the **Create conversion for** field to one of the following values:
 - **Product** – If you select this value, you can set up a unit conversion for the product master. That unit conversion will be used as a fallback for all product variants that no unit conversion is defined for.
 - **Product variant** – If you select this value, you can set up a unit conversion for a specific product variant. Use the **Product variant** field to select the variant.

8. Use the other fields that are provided to set up your unit conversion.

9. Select **OK** to save the new unit conversion.

TIP

You can open the **Unit conversions** page for a product or a product variant from any of the following pages:

- Product details
- Released products details
- Released product variants

Example scenario

In this scenario, a company sells T-shirts in sizes small, medium, large, and extra-large. The T-shirt is defined as a product, and the different sizes are defined as variants of that product. The shirts are packed in boxes. For sizes small, medium, and large, there can be five shirts in each box. However, for size extra-large, there is space for only four shirts in each box.

The company wants to track the different variants in the *Pieces* unit, but it's selling them in the *Boxes* unit. For sizes small, medium, and large, the conversion between the inventory unit and the sales unit is 1 Box = 5 Pieces. For size extra-large, the conversion is 1 Box = 4 Pieces.

1. From the **Released product details** page for the T-Shirt product, open the **Unit conversions** page.
2. On the **Unit conversions** page, set up the following unit conversion for the **X-Large** released product variant.

FIELD	SETTING
Create conversion for	Product variant
Product variant	T-Shirt : : X-Large : :
From unit	Boxes
Factor	4

FIELD	SETTING
To Unit	Pieces

3. Because the **Small**, **Medium**, and **Large** product variants all have the same unit conversion between the *Box* and *Pieces* units, you can define the following unit conversion for them on the product master.

FIELD	SETTING
Create conversion for	Product
Product	T-Shirt
From unit	Boxes
Factor	5
To Unit	Pieces

Using Excel to update the unit conversions

If a product has many product variants that have different unit conversions, it's a good idea to export the unit conversions to a Microsoft Excel workbook, update them, and then publish them back to Dynamics 365 Supply Chain Management.

To export unit conversions to Excel, on the **Unit conversions** page, on the Action Pane, select **Open in Microsoft Office**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a released product for a single company

2/18/2021 • 4 minutes to read • [Edit Online](#)

This procedure walks through how to create a single released product in the context of a single legal unit. After the released product is created, it's immediately available in this unit only. You can walk through this procedure in demo data company USMF. This task is usually performed by a product designer.

Create a released product

1. Go to Released products.
2. Click New.
3. In the Product number field, type a value.
 - If a product number is not automatically entered in the Product number field, type a unique product number. This step is only required if no number sequence has been set up for product numbers.
4. In the Product name field, type a value.
 - The Product name is defaulted to the search name. If needed, you can select to change the search name.
5. In the Item model group field, click the drop-down button to open the lookup.
 - The item model groups contain settings that determine how items are controlled and handled on item receipts and issues. The settings also determine how the consumption of items are calculated.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.
8. In the Item group field, click the drop-down button to open the lookup.
 - Item groups are used to manage inventory by dividing inventory items into groups based on item characteristics. For example, to manage how information is posted to main accounts, you can create a series of different item groups that are associated with specific main accounts. This lets you track the inventory value of items at different stages.
9. In the list, find and select the desired record.
10. In the list, click the link in the selected row.
11. In the Storage dimension group field, click the drop-down button to open the lookup.
 - The storage dimensions help you control how items are stored and taken from inventory. For example, a storage dimension can be Site and Warehouse.
12. In the list, find and select the desired record.
13. In the list, click the link in the selected row.
14. In the Tracking dimension group field, click the drop-down button to open the lookup.
 - The tracking dimension group determines which tracking dimensions you can add to a product. For example, the batch number and serial number are used to track inventory items.
15. In the list, find and select the desired record.
16. In the list, click the link in the selected row.
17. In the Inventory unit field, click the drop-down button to open the lookup.
 - The inventory unit determines how the product is quantified when it's stored in inventory.
18. In the list, find and select the desired record.
19. In the list, click the link in the selected row.
20. In the Purchase unit field, click the drop-down button to open the lookup.
 - The purchase unit determines how the product is quantified when it's purchased from a vendor.

21. In the list, find and select the desired record.
22. In the list, click the link in the selected row.
23. In the Sales unit field, click the drop-down button to open the lookup.
 - The sales unit determines how the product is quantified when it's sold to a customer.
24. In the list, find and select the desired record.
25. In the list, click the link in the selected row.
26. In the BOM unit field, click the drop-down button to open the lookup.
 - The BOM unit determines how the product is quantified when including it in a bill of materials (BOM).
27. In the list, find and select the desired record.
28. In the list, click the link in the selected row.
29. In the Item sales tax group field, click the drop-down button to open the lookup.
 - The item sales tax group in the Sales taxation group determines how sales tax is calculated for each item.
30. In the list, find and select the desired record.
31. In the list, click the link in the selected row.
32. In the Item sales tax group field, click the drop-down button to open the lookup.
 - The item sales tax group in the Purchase taxation group determines how purchase tax is calculated for each item.
33. In the list, find and select the desired record.
34. In the list, click the link in the selected row.
35. Click OK.

Add product characteristics

1. Expand or collapse the Manage inventory section.
2. In the Net weight field, enter a number.
3. In the Tare weight field, enter a number.
4. In the Gross depth field, enter a number.
5. In the Gross width field, enter a number.
6. In the Gross height field, enter a number.
7. In the Volume field, enter a number.

Add financial dimensions

1. Expand or collapse the Financial dimensions section.
2. In the BusinessUnit field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. In the CostCenter field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.
8. In the Department field, click the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. In the list, click the link in the selected row.
11. In the ItemGroup field, click the drop-down button to open the lookup.
12. In the list, find and select the desired record.
13. In the list, click the link in the selected row.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product data entities

2/18/2021 • 4 minutes to read • [Edit Online](#)

To import and export product data, you must use data entities. The following table provides details about the product-related data entities and describes the purpose of each.

ENTITY	APPLICATION OBJECT TREE (AOT) NAME (TYPE)	NOTES
Products V2	<code>EcoResProductV2Entity</code>	This entity is used to import and export shared products-distinct products and product masters. It allows for updates. It doesn't support set-based SQL operations. It's enabled for Open Data Protocol (OData).
Released products V2	<code>EcoResReleasedProductV2Entity</code>	This entity is used to import and export released products-distinct products and product masters. It allows for updates. It requires that the shared product already be created. When a new released product is imported, a release of the shared product occurs. There are also separate entities that can be used to import and export released product masters and released distinct variants. This entity doesn't support set-based SQL operations or delete operations. It's enabled for OData.
Released product creation V2	<code>EcoResReleasedProductCreationV2Entity</code>	This entity is used to import shared products and released products in one step. Although it supports exports, that use isn't recommended, because the purpose of the entity is product creation. It doesn't support updates. It supports a limited set of fields (fields that are available in the product creation dialog box). It doesn't support set-based SQL operations. It isn't exposed through OData.
Product variants	<code>EcoResProductVariantEntity</code>	This entity is used to import and export shared product variants. It allows for updates. It requires that dimension values already be created. The integration key is the product master plus product dimensions. This entity doesn't support set-based SQL operations. It's enabled for OData. It supports delete operations. It can't be extended through the addition of new product dimensions.

ENTITY	APPLICATION OBJECT TREE (AOT) NAME (TYPE)	NOTES
Product variants by product number identification	EcoResProductNumberIdentifiedProductVariantEntity	This entity is used to import and export shared product variants. It allows for updates. It requires that dimension values already be created. The integration key is the product number (whereas the integration key for the Product variants entity is the product master plus product dimensions).
Released product variants	EcoResReleasedProductVariantEntity	This entity is used to import and export released product variants. It allows for updates. It requires that shared product variants already be created. When a new released product variant is imported, a release of the shared product variant occurs. This entity doesn't support set-based SQL operations. It's enabled for OData. Although it supports delete operations, that use currently causes data corruption because of a bug in the current platform. This entity can't be extended through the addition of new product dimensions.
Released product variants by product number identification	EcoResProductNumberIdentifiedReleasedProductVariantEntity	This entity resembles the Released product variants entity, but the integration key is the product number instead of the product master plus product dimensions. It can be extended through the addition of new product dimensions.
Sellable released products	EcoResSellableReleasedProductEntity	This entity is used to export only sellable products. Sellable products are products that have the information that they require in order to be used in a sales order. The same rules apply when a product is validated by using the Validate function on the Released products page.
Released Distinct products V2	EcoResDistinctProductV2Entity	This entity is used to export distinct products. Those distinct products can be products, subtype products, and product variants.
Released products masters V2	EcoResProductMasterV2Entity	This entity is used to import and export product masters. It isn't enabled for data management.
Item - barcode	EcoResProductBarcodeEntityV3	This entity is used to export products and bar codes. This entity doesn't allow change tracking, updates, or deletes. To use change tracking, updates, or deletes on barcodes, use the Item - barcode association entity.

ENTITY	APPLICATION OBJECT TREE (AOT) NAME (TYPE)	NOTES
Item - barcode association	EcoResProductBarcodeAssociationEntity	<p>This entity is used to export products and bar codes. It allows change tracking, updates, and deletes. To use the entity, the feature <i>Item - barcode improvements</i> must be enabled in feature management. Its entity key is <code>AssociationID</code>, which creates the association between the barcode and the product. To add support for this key, the table <code>InventitemBarcodeAssociation</code> will be populated for existing item barcode data when you turn on the feature. The table is populated using a batch job and if your barcode table has a large number of records, it could take significant time to run the batch job. Therefore, we recommend that you plan to enable the feature (and therefore run the batch job) at a time that fits your business schedule.</p>
Product lifecycle states	EcoResProductLifecycleStateEntity	<p>This entity is used to import and export the different product lifecycle states that can be assigned to a product.</p>

NOTE

You can use the **Released Products V2** data entity to import products into the system only if the shared product has already been created. Otherwise, to import products into the system, you must use the **Product creation** data entity.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product lifecycle state overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

A product lifecycle state documents the lifecycle state of a released product or product variant. Product lifecycle states are defined by the user, typically a product manager or a product master data manager. Specific business processes, such as master planning, can be affected by a specific lifecycle state.

A released product or product variant can be associated with a product lifecycle state that documents in which lifecycle state a specific product or variant is currently in. You can define any number of product lifecycle states by assigning a state name and description. You can select one lifecycle state as the default state for new released products. Released product variants inherit their product lifecycle state from their released product master on creation. When changing the lifecycle state on a released product master, you can choose to update all existing variants that have the same original state.

Create a new product lifecycle state

- To create a new product lifecycle state, see [Create a new product lifecycle state](#).
- To create a default product lifecycle state, see [Create a default product lifecycle state](#).

Associate product lifecycle states to released products

There are multiple ways to associate a product lifecycle state to released products or product variants.

- On creation of a new released product, the default **Product lifecycle state** is automatically assigned.
- On release of a product to a legal entity, the default **Product lifecycle state** is automatically assigned.
- On release of a product variant to a legal entity, the **Product lifecycle state** associated to the released product master in this legal entity is automatically assigned to the new variant.

You can manually update the product lifecycle state by using:

- The **Released products** list page or **Details view**.
- The **Released product variants** list page or **Details view**.
- Find the obsolete products or product variants based on demand and associate a lifecycle state.

For more information:

- To associate a product lifecycle state to a released product master, see [Assign a product lifecycle state to a released product master](#).
- To associate a product lifecycle state to a release product, see [Assign a product lifecycle state to a released product](#).

Impact on master planning

The product lifecycle state has only one control flag: **Is active for planning**. By default, this is set to **Yes** for all created product lifecycle states, but it can be changed to **No**. When set to **No**, the associated released products or released product variants are:

- Excluded from master planning.
- Excluded from BOM-level calculation.

For detailed information about how to use product lifecycle state to exclude products from master planning and

BOM-level calculation, see [Create a product lifecycle state to exclude products from Master planning](#)

NOTE

For performance reasons, it is highly recommended to associate all obsolete released products or product variants, especially when working with non-reusable product configuration variants, with a product lifecycle state that is deactivated for master planning.

Default migration, import, and export

The product lifecycle states are supported by data entities, and the lifecycle state can be set to a variable state through either the released product data entity or the released variant data entity.

Find obsolete products and products variants

You can run a simulation analysis to find the obsolete released products or product variants and then update their product lifecycle status. To find obsolete products, see [Find obsolete product variants and assign a product lifecycle state](#). This topic shows how to find obsolete released products or product variants and how to associate a product lifecycle state to the obsolete products. It also shows how to view the simulation results and assess how many products and product variants will be associated with a new product lifecycle state when running the update without simulation.

By running the analysis in a simulation mode, the products and product variants identified as obsolete are displayed in a specific form, where they can easily be reviewed. The analysis searches for transactions and specific master data to identify products that have no demand within a variable period and no master data that can result in demand. New released products within a variable period can be excluded from the analysis. When the analysis simulation returns the expected result, the user can run the analysis and set a new product lifecycle state to all products identified as obsolete by the analysis.

NOTE

Note that all analysis and updates must be done within the same legal entity.

Criteria to select and update released products or product variants

Use the following criteria to select and update the released products and product variants:

- The product lifecycle state of the product or product variant must be different from the new desired state.
- The product or product variant was created some days ago based on the number of days that you enter in the selection dialog box.
- There are no open production orders (= status < ended) for the product or product variant.
- There are no open inventory transactions (= status issue ReservPhysical to QuotationIssue or status receipt Registered to QuotationReceipt) for the product or product variant.
- There are no inventory transactions within the last number of days for the product or product variant.
- There is no future demand or supply forecast for the product or product variant.
- No minimum stock level has been set in item coverage for the product or product variant.
- No active fixed quantity kanban rule for the product or product variant.
- No service order line for the product or product variant.
- No active or future sales or purchase agreement lines for the product or product variant.
- The product or product variant is not used in a BOM that is associated with a non-expired approved BOM version for a product or variant that is active for planning.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a new product lifecycle state

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a new product lifecycle state. A product lifecycle state documents the lifecycle state of a released product or product variant. Product lifecycle states are defined by the user, typically a product manager, or a product master data manager. Specific business processes, for example, Master planning, can be affected by a specific lifecycle state.

Create a product lifecycle state

1. Go to Product information management > Setup > Product lifecycle state.
2. Click New.
3. In the State field, type a value.
4. In the Description field, type a value.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a default product lifecycle state

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a default product lifecycle state as well as how to associate the default state with released products.

Create a default lifecycle state

1. Go to Product information management > Setup > Product lifecycle state.
2. Click New.
3. In the State field, type a value.
4. Select Yes in the Default when released to legal entity field.
5. In the Description field, type a value.
6. Select No in the Is active for planning field.

NOTE

If a new released product should not be included in Master planning, select No. If it should be included in Master planning, leave the control at its default value Yes.

Create a new released product

1. Close the page.
2. Go to Product information management > Products > Released products.
3. Click New.
4. In the Product number field, type a value.
5. In the Product name field, type a value.
6. In the Search name field, type a value.
7. In the Item model group field, enter or select a value.
8. In the Item group field, enter or select a value.
9. In the Storage dimension group field, enter or select a value.
10. In the Tracking dimension group field, enter or select a value.
11. Click OK.

NOTE

The default product lifecycle state is a global definition.

Change the product to an active state

1. In the Product lifecycle state field, enter or select a value.

NOTE

Assume that you have set up an active state, you can now select the active state to allow the product to be used in Master planning and BOM-level calculation. Obviously, this only makes sense if all the product details that are required for consistent planning are specified.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Assign a product lifecycle state to a released product master

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to assign a product lifecycle state to a released product master and its variants.
Prerequisite: You need to play the task guide "Create a new product lifecycle state" first to make sure that you have at least one product lifecycle state created before you can play this task guide.

Find a released product master

1. Go to Product information management > Products > Released products.
2. In the list, find and select the desired record.

NOTE

A product master has the Product subtype Product master.

Update the lifecycle state

1. Click Edit.
2. In the Product lifecycle state field, enter or select a value.
3. Click Save.
4. Click Yes.

NOTE

If Yes is selected, all the related released product variants that have the same original status as the released product master are also updated to the new product lifecycle state. If No is selected, all variants keep their actual state. Variants that have a different product lifecycle state from the released product master are not updated.

Verify the lifecycle state of the variants

1. Click Released product variants.

NOTE

Note that all variants have inherited the selected lifecycle state from the released product master.

2. In the list, mark the selected row.
3. In the Product lifecycle state field, enter or select a value.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Assign a product lifecycle state to a released product

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to assign a product lifecycle state to a released product. Prerequisite: You need to play the task guide "Create a new product lifecycle state" first to make sure that at least one product lifecycle state is created before you can play this guide.

Find a released product that you want to assign a product lifecycle state

1. Go to Product information management > Products > Released products.
2. Use the Quick Filter to find records. For example, filter on the Item number field with a value of 'd'.
3. In the list, click the link in the selected row.
4. Click Edit.
5. In the Product lifecycle state field, enter or select a value.
6. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Find obsolete product variants

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to find obsolete released products or product variants and how to associate a product lifecycle state to the obsolete products. Prerequisite: You need to define at least one product lifecycle state that is inactive for planning before you can play this task guide.

Run a simulation

1. Go to Product information management > Periodic tasks > Change lifecycle state for obsolete products.
2. In the New product lifecycle state field, enter or select a value.
3. Select Yes in the Run simulation without updating product data field.
4. In the Exclude products created within this number of days field, enter a number.
5. In the Exclude products used in transactions (in number of days) field, enter a number.
6. Expand the Records to include section.
7. Click Filter.
8. In the list, mark the selected row.
9. In the Criteria field, type a value.
10. Click OK.
11. Click OK.

NOTE

It is recommended to run the simulation in batch if you expect to search a large number of products. Also, make sure that the simulation is not run during the most active working time of the company.

Review the simulation results

1. Go to Product information management > Inquiries and reports > Product lifecycle state maintenance history.

NOTE

On this page, you can review the simulation results and make an assessment of how many products and product variants will be associated with a new product lifecycle state when running the update without simulation.

Run the update of the Product lifecycle state for obsolete products

1. Close the page.
2. Go to Product information management > Periodic tasks > Change lifecycle state for obsolete products.
3. Expand the Records to include section.

NOTE

Note that the last selection has been saved.

4. Select No in the Run simulation without updating product data field.
5. Expand the Run in the background section.

NOTE

Depending on how many products and product variants are affected, consider running this job in batch. Make sure that you are not running a large update job during the most active working hours in the company.

6. Click OK.
7. Go to Product information management > Inquiries and reports > Product lifecycle state maintenance history.

NOTE

Review the changed released products and product variants.

8. In the list, find and select the desired record.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a product lifecycle state to exclude products from Master planning

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a new product lifecycle state that excludes the products from Master planning and BOM-level calculation.

Create an obsolete state

1. Go to Product information management > Setup > Product lifecycle state.
2. Click New.
3. In the State field, type a value.
4. Select No in the Is active for planning field.
5. In the Description field, type a value.

Associate the obsolete state to a released product

1. Close the page.
2. Go to Product information management > Products > Released products.
3. Use the Quick Filter to find records. For example, filter on the Search name field with a value of 'M00'.
4. Click Edit.
5. In the list, mark the selected row.
6. In the Product lifecycle state field, enter or select a value.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a bar code for a product

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows how to manually create a bar code using the item number M0001 as an example. The demo data company used to create this procedure is USMF.

1. Select **Released product maintenance** on the homepage.
2. Go to **Products > Released products** under the **Links** section.
3. In the list, find and select the desired record. For this example, select item number **M0001**.
4. On the Action Pane, select **Manage inventory**.
5. Select **Bar codes**.
6. Select **New**.
7. Mark the selected row that is created in the list below.
8. In the **Barcode setup** field, enter or select a value.
9. In the **Bar code** field, enter or select a value.
10. In the **Bar code** field, type a value.
11. In the **Quantity** field, enter a number.
12. Select **Save**.
13. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Enter the GTIN code for a product

2/18/2021 • 2 minutes to read • [Edit Online](#)

GTIN codes are assigned by the GS1 organization. In this example, you will enter a code for product number M0001 in demo data company USMF.

1. Click Released product maintenance.
2. Click Released products.
3. Expand the Product image FactBox.
4. In the list, find and select the desired record.
5. On the Action Pane, click Manage inventory.
6. Click GTIN codes.
7. Click New.
8. In the list, mark the selected row.
9. In the Unit field, enter or select a value.
10. In the GTIN code field, select an option.
11. In the GTIN field, type a value.
12. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create batch attributes for a product

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a batch attribute, assign default value ranges, and include the attribute in a group. The demo data company used to create this procedure is the USP2 Company.

1. Go to Inventory management > Setup > Batch > Batch attributes.
2. Click New.
3. In the Attribute field, type a value.
4. In the Description field, type a value.
5. In the Attribute type field, select 'Fraction'.
 - This procedure uses the Fraction type to enable decimal values. You can select other attribute types. If you select the Enumeration type, you must enter values in the enumeration list before you can enter a value in the Target field.
6. In the Minimum field, enter a number.
7. In the Maximum field, enter a number.
8. In the Increment field, enter a number.
9. In the Target field, type a value.
10. Click Save.
11. Close the page.
12. Go to Inventory management > Setup > Batch > Batch attribute groups.
13. Click New.
14. In the Attribute group field, type a value.
15. In the Description field, type a value.
16. Click Save.
17. Click Group attributes.
18. Click New.
19. In the Attribute field, click the drop-down button to open the lookup.
20. In the list, find and select the desired record.
21. In the list, click the link in the selected row.
 - An attribute can be included in any of the groups.
22. Click Save.
23. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add an image to a product

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to add an image to a product. The demo data company used to create this task is USMF.

1. Go to Product information management > Products > Released products.
2. Expand the Product image FactBox.
3. In the list, find and select the desired record.
 - For example, select the item number C0002.
4. Click Change image.
5. Click New.
 - Click Browse. Find the image that you want to use, select it, and then close the dialog box.

NOTE

Country of origin

2/18/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

Many organizations issue certificates to their vendors to ensure that products meet specific certification standards. These certificates often depend on the country of origin. The country of origin feature lets you link a product to its country of origin and keep track of its product certifications.

Turn on the country of origin feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Product information management*
- **Feature name:** *Country of origin management feature*

Configure source and destination countries

Before you issue a certificate for a product, you must link the product to its destination country and its country of origin.

1. Go to **Product information management > Setup > Product compliance > Country of origin > Country of origin rules**.
2. Select an existing country setup to edit, or select **New** on the Action Pane to create a new country setup.
3. Set the following values for the selected or new country.

FIELD	DESCRIPTION
Item number	Select the item number of the product.
Destination country	Select the country that you're sending the product to.
Origin country	Select the country that you're shipping the product from.

The purpose of this setup is to help you generate a bill of materials (BOM) report where you can include the country of origin for each part that source and destination countries are specified for. This report will help you get a holistic picture of where your parts come from and where they are going.

Keep track of vendor certificates

You can use the **Country of origin vendor certificates** page to keep track of certificates that you issue to vendors.

You must decide which certificate documents you're issuing and how you will report them to customers. This

feature helps you keep track of your certificates. It also lets you choose whether the relevant certificate numbers appear on invoices, packing slips, and/or order confirmations.

To set up your certificate information, follow these steps.

1. Go to **Product information management > Setup > Product compliance > Country of origin > Country of origin vendor certificates**.
2. Select an existing certificate setup to edit, or select **New** on the Action Pane to create a new certificate setup.
3. Set the following settings for the selected or new certificate.

FIELD	DESCRIPTION
Vendor account	Select the vendor that you issued the certificate to.
Item number	Select the item that you issued the certificate for.
Country/region	The destination country or region where you must use this certificate.
Certificate number	Enter the identification number of the certificate that you issued.
Effective	Select the first date when the current certificate is valid.
Expiration	Select the last date when the current certificate is valid.
Print on invoice	Select this check box to print the certificate number on invoices that are addressed to the specified country during the specified date range.
Print on packing slip	Select this check box to print the certificate number on packing slips that are addressed to the specified country during the specified date range.
Print on sales order	Select this check box to print the certificate number on sales orders that are addressed to the specified country during the specified date range.

Include the country of origin on BOM reports

When you generate a BOM report, you can include the country of origin for each part that you specified source and destination countries for on the **Country of origin rules** page.

1. Go to **Product information management > Products > Released products**.
2. Select or create a product to open its **Released product details** page.
3. On the Action Pane, on the **Engineer** tab, in the **BOM** group, select **Designer**.
4. On the page that appears, on the Action Pane, select **BOM > Print**.
5. In **Bill of materials lines** dialog box, set the **Destination country** field to the destination country that you want to view on your report.
6. Select **OK**.

A report that shows information about the country of origin of each part is generated and shown. Here is an example of the report.

Finance and Operations Search for a page

Options

Go to | Find | Zoom | Export

Lines - Destination Country: FRA
Contoso Entertainment System USA

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Dual-use goods

2/18/2021 • 5 minutes to read • [Edit Online](#)

Dual-use goods are typically items that have both civilian and military applications. For example, a chemical might be used as either a fertilizer or an explosive. Many countries have special regulations that apply to the export, import, and transportation of dual-use goods. Therefore, it's important that companies that are involved in the international trade of dual-use goods keep track of the various policies and certificates.

The dual-use feature helps companies keep track of products that are identified as dual-use goods, stores certificate numbers for each relevant product and destination country, and print valid certificate numbers on relevant invoices, packing slips, and/or sales orders. It helps ensure that, when your products are shipped, they always include up-to-date certifications.

Consider the following scenario:

1. The **Dual use country setup** page in your system indicates that shipments to France require a certification.
2. The **Released product details** page for product X-100 indicates that it's a dual-use good. Together, the code, category, group, and regime indicate the export control classification that the product belongs to.
3. The **Dual use certificates** page includes a certificate for product X-100 when it's shipped to France. This certificate expires January 1, 2020.
4. On June 17, 2020, you create a sales order for a customer company that is based in France, and the order includes product X-100.
5. When you save the sales order, the system determines the following information:
 - a. Does the order include any products that are dual-use goods?
 - b. If the order includes dual-use goods, does the destination country require dual-use certificates?
 - c. If the country requires dual-use certificates, does a valid certificate exist for each dual-use good for the destination country?
6. The order includes product X-100, the product is being shipped to France, and a French certificate exists for the product. However, the certificate has expired. Therefore, you receive the following warning message: "Dual use certificates for one or more dual-use items in this sales order aren't valid. Do you want to proceed with the confirmation?"

This topic explains how to configure all the settings that are required to set up dual-use goods and support this scenario.

Define dual-use requirements for each relevant country

Different countries have different requirements for dual-use goods. You use the **Dual use country setup** page to keep track of the countries that do and don't require a certificate. The information that you specify here is checked when you create sales orders, and you will be reminded to provide the required certifications.

To set up the information about dual-use requirements for different countries, follow these steps.

1. Go to **Product information management > Setup > Product compliance > Dual use products > Dual use country setup**.
2. Select an existing country setup to edit it, or select **New** on the Action Pane to create a new country

setup.

3. Set the following values for the selected or new country setup.

FIELD	DESCRIPTION
Country/region	Select the country that you're tracking requirements for.
Certificate Required	Select this check box for countries that require a certification for dual-use goods. Clear it for countries that don't require this certification.

Create dual-use categories

Dual-use goods must often be categorized according to their export control classification number (ECCN). The ECCN is an alphanumeric code that categorizes items based on factors such as the commodity and technology. The **Dual use categories** page helps you make a list of the categories that you use, for reporting purposes.

To set up dual-use categories, follow these steps.

1. Go to **Product information management > Setup > Product compliance > Dual use products > Dual use categories**.
2. Select an existing category to edit it, or select **New** on the Action Pane to create a new category.
3. Set the following values for the selected or new category.

FIELDS	DESCRIPTION
Dual use code	Enter the full ECCN code (for example, <i>3A001</i>).
Dual use category	Enter the commerce control list (CCL) category part of the ECCN code. For example, for the ECCN code <i>3A001</i> , this value is <i>3</i> .
Dual use group	Enter the product group part of the ECCN code. For example, for the ECCN code <i>3A001</i> , this value is <i>A</i> .
Dual use regime	Enter the regime code for the item. This code identifies the reason why the item is classified as a dual-use good. For example, for the ECCN code <i>3A001</i> , this value is <i>001</i> .

Apply dual-use categories to products

To identify a product as a dual-use good and apply a dual-use category to it, follow these steps.

1. Go to **Product information management > Products > Released products**.
2. Select or create a product to open its **Released product details** page.
3. On the **Foreign trade** FastTab, set the **Dual use products** option to **Yes** to identify the current product as a dual-use good.
4. Set the **Dual use code** field to the code that applies to the current product. (You defined this code on the **Dual use categories** page.)

This setup is checked when you create a sales order.

Set up dual-use certificates

You use the **Dual use certificates** page to set up and manage the required dual-use certificates for each product and country. You can track each certificate's details, such as the country and the dates of validity. You can also set options to specify where this information should be printed. For example, the information can be printed on the invoice, packing slip, and/or sales order. This setup is checked when you create a sales order.

1. Go to **Product information management > Setup > Product compliance > Dual use products > Dual use certificates**.
2. Select an existing certificate to edit it, or select **New** on the Action Pane to create a new certificate.
3. Set the following values for the selected or new certificate.

FIELD	DESCRIPTION
Item number	Select the item number of the dual-use good that this certificate applies to.
Country/region	The destination country or region where you must use this certificate.
Certificate number	The number that appears on the certificate that is issued to the vendor or customer.
Effective	Select the first date when the current certificate is valid.
Expiration	Select the last date when the current certificate is valid.
Print on invoice	Select this check box to print the certificate number on invoices that are addressed to the specified country during the specified date range.
Print on packing slip	Select this check box to print the certificate number on packing slips that are addressed to the specified country during the specified date range.
Print on sales order	Select this check box to print the certificate number on sales orders that are addressed to the specified country during the specified date range.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Hazardous materials overview

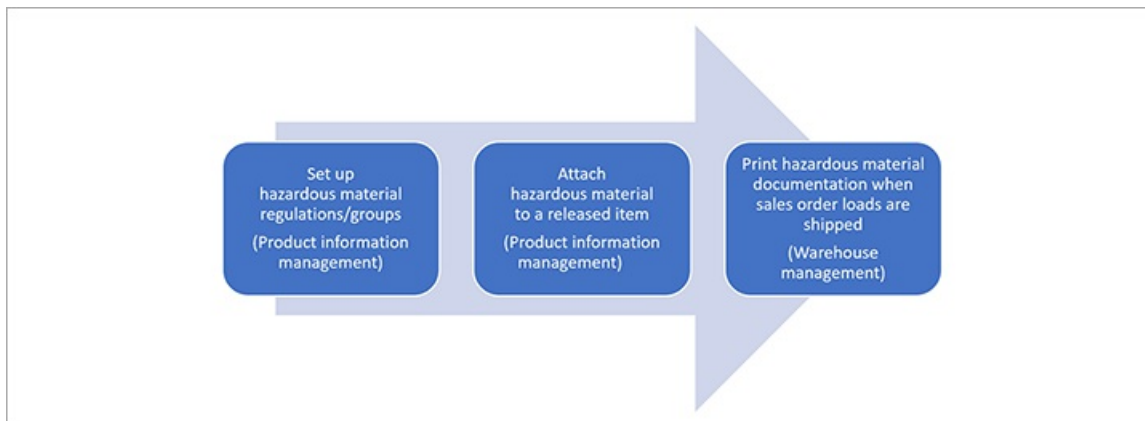

2/18/2021 • 2 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

To remain compliant with shipping and transport regulations, organizations that ship materials that are classified as dangerous goods must include additional paperwork with their shipments. The hazardous materials feature lets customers store information that is related to released items. This information can then be used to help prepare shipping documentation. An organization that ships dangerous goods must have its own processes and procedures for managing the shipping process. Microsoft Dynamics 365 Supply Chain Management is just a tool that can help generate the required documents.

The following diagram illustrates the steps needed to set up and use the hazardous materials feature.

The hazardous materials feature is set up in Product information management and provides documents that can be printed through Warehouse management. Therefore, broadly speaking, those areas are the two main areas where you will review, set up, and use this feature's functionality:

- **Product information management** – Set up the codes that will be applied to a released product.
- **Warehouse management** – Work with additional shipping documents that will be printed for shipments.

IMPORTANT

The hazardous materials features in Supply Chain Management provide a collection of useful product information fields and related functionality that can help you record and reference information that is related to your hazardous products. These features can also help you design and print shipment documents that include some of the same information about any hazardous materials that you're shipping. However, the system won't automatically make you compliant with all applicable regulations in your country or region. Although these tools are intended to help you comply with common regulations, they are neither sufficient in themselves nor guaranteed to be so. Your organization is responsible for being aware of all applicable regulations and for taking all necessary steps to comply with them.

Product information management

Product information management provides a range of setup tables where you can enter reference information for the various dangerous goods lists for road, air, and sea freight.

The following common regulations were referenced when this functionality was developed:

- **ADR** – Regulations that are related to the international carriage of dangerous goods by road
- **CFR 49** – Regulations in the United States for the carriage of dangerous goods
- **IMDG** – The International Marine Dangerous Goods (IMDG) code
- **IATA** – The International Air Transport Association (IATA) dangerous goods regulations

Each set of regulations provides standardized lists of dangerous goods and reference codes. Therefore, Supply Chain Management provides a reference table for the common codes on those lists. Each list also has some unique codes that you can define.

For more information about how to set up regulations and values for hazardous materials, and how to assign the values to relevant products, see the following topics:

- [Set up hazardous materials](#)
- [Hazardous materials in products, orders, shipments, and loads](#)

Warehouse management

When you prepare a shipment in Warehouse management, you will be able to print several new reports that use the information that you set up in Product information management. For more information about the available reports and how to use them, see [Hazardous materials inquiries and reports](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up hazardous materials

2/18/2021 • 20 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

To use hazardous materials functionality, you must first set up the data that is required to classify items as hazardous materials. Then, when you create a sales order that includes an item that is classified as a hazardous material, the system generates hazardous material documentation for that sales order when it's shipped.

Turn on the hazardous materials feature for your system

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Product information management*
- **Feature name:** *Hazardous materials product information and shipping documentation*

Hazardous material regulations

To use the hazardous materials processes, you must first create a regulation. Regulations define how the printed shipping text is created for an item. They also define the associated modes of delivery.

Here are some common regulations:

- **ADR** – Regulations that are related to the international carriage of dangerous goods by road
- **CFR 49** – Regulations in the United States for the carriage of dangerous goods
- **IMDG** – The International Marine Dangerous Goods (IMDG) code
- **IATA** – The International Air Transport Association (IATA) dangerous goods regulations

These regulations help determine what information should be shown when you print the shipping text for an item. You can define as many regulations as you must comply with.

IMPORTANT

The functionality for setting up information codes that are related to hazardous materials doesn't make your company compliant with regulations. It's only a tool that helps you build processes for your company.

Typically, a regulation is available for a specific mode of transport, such sea freight, road freight, or air freight. Therefore, you can associate each regulation with a mode of delivery. The mode of delivery will be used when specific documents are printed in Warehouse management. In Warehouse management, each shipment is linked to a shipping carrier and carrier service that are set up in the **Transportation** module. The mode of delivery is associated with the shipping carrier and carrier service. When you run a report, the mode of delivery is used to find the shipping print text that is associated with a released item.

This setup data isn't specific to each legal entity (company). Therefore, you can have a common set of hazardous material information that is shared among all your legal entities.

For each regulation, you can define a materials list and use it as a template list that is associated with released items. For each regulation, you can also define a print setup. A print setup lets you define how the shipping text for an item is constructed. The print setup is used to construct the shipping print text for a released item.

To set up hazardous material regulations, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material regulation**. On the **Hazardous material regulation** page, you can create any number of regulations and configure each by using the fields that are described in the following subsections.

Hazardous material regulation header

Each regulation has a code and a description. The following table describes the fields that are available on the header.

FIELD	DESCRIPTION
Regulation code	Enter a code to identify the hazardous material regulation record.
Description	Enter a description of the hazardous material regulation.

Print setup FastTab

Each regulation can have any number of print setups. You define the print setups on the **Print setup** FastTab. The following table describes the fields that are available for each print setup.

FIELD	DESCRIPTION
Sequence	Define the order in which fields will be referenced in the shipping text.

FIELD	DESCRIPTION
Print field	<p>Select the field to include in the shipping text. Not all fields for the hazardous material will be available to print. Only the common fields that are used to define shipping text in the various regulations will be available. You should define the first print field as a field separator that has a Sequence value of 0 (zero), so that it can be used as the separator between other fields. Only one reference to the field separator is required.</p> <p>The following values are available:</p> <ul style="list-style-type: none"> • Field separator – This print field is used as the field separator for the text. Only one field separator is required in the sequence. Usually you should set the Sequence value for this print field to 0 (zero). The system will look for a field separator and use the first one that it finds in the list. The text value that is used in the string will come from the Print after field. • Identification – This print field puts the identifying code and/or description in the print text. • Class – This print field puts the class code and/or description in the print text. • Division – This print field puts the division code and/or description in the print text. • Packing group – This print field puts the packing group code and/or description in the print text. • Tunnel code and/or description – This print field puts the tunnel code and/or description in the print text. • Proper shipping name – This print field puts the proper shipping name in the print text. • Technical name – This print field puts the technical name and/or description in the print text. • Transport category – This print field puts the transport category code and/or description in the print text. • Stowage – This print field puts the stowage code and/or description in the print text. • Fixed text – This print field enters the text that is defined in the Fixed text field for this row. • Label code and/or description – This print field puts the label code and/or description in the print text. • Aircraft packing – This print field puts the aircraft packing instructions code and/or description in the print text. • Limited quantity – This print field checks whether the item is marked as a limited-quantity item and, if it is, enters the text that is defined in the Fixed text field for this row. • Packing description – This print field puts the packing description in the print text.
Print before	Enter the text that should be printed before the content that is defined by the Print field setting.
Print after	Enter text that should be printed after the content that is defined by the Print field setting.

FIELD	DESCRIPTION
Print with previous	Select this check box to prevent the field separator from being printed between the previous field and this field. Use this check box for print fields that are either optional or included with another print field.
Fixed text	If you set the Print field field to Fixed text or Limited quantity , enter the text that should be printed.
Include in print	Select which value or values from the selected print field should be printed for this row. You can print the code, the description, or both the code and the description.

Mode of delivery FastTab

The regulation is a shared table and isn't specific to each legal entity. However, modes of delivery are legal entity-specific. Therefore, when you set up a mode of delivery, you must select the relationship between the regulation, legal entity, and mode of delivery.

The following table describes the fields that are available on the **Mode of delivery** FastTab.

FIELD	DESCRIPTION
Company	Select a legal entity to associate with this regulation.
Mode of delivery	Based on the legal entity that you selected, select the mode of delivery that should be associated with the regulation.

Country FastTab

For reference purposes, you can list the countries or regions that the regulation is relevant for. However, when shipment reports are run, only the mode of delivery is used to determine the regulation. When you review a warehouse shipment, there isn't a direct link to the mode of delivery. The shipment can be associated with a shipping carrier and carrier service. When you define a carrier service, you must associate it with a mode of delivery. This relationship will be used on shipment reports such as the bill of lading to find the shipping print text for an item.

The following table describes the field that is available on the **Country** FastTab.

FIELD	DESCRIPTION
Country/region	Select a country/region to associate with the regulation.

Material codes

Material codes establish settings that are related to a specific hazardous component that might be included in a released product. Each material code belongs to a specific hazardous material regulation, and its definition must conform to that regulation. When you apply a material code to a released product by using the **Material code** field, all the material code's hazardous materials settings are automatically applied to that product. Therefore, the process of setting up released products is faster and less prone to error.

To manage your hazardous material definitions, follow these steps.

1. Go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material regulation**.

2. Select the regulation to set up a hazardous material definition for.
3. On the Action Pane, on the **Setup** tab, select **Hazardous materials**.
4. In the **Material code** field, enter a material code for the hazardous material definition. You will select this value when you apply the material code to a released product.

The **Regulation code** field is read-only and shows the regulation that you selected in step 2.

5. Use the remaining fields on this page to create and set up each hazardous material that applies to your selected regulation. The fields that are available are a subset of the hazardous material fields that are available for individual released products. For more information, see [Hazardous materials in products, orders, shipments, and loads](#).

Hazardous material classification groups

Each hazardous material classification group defines a group of field values that establish a template. You can use this template later, when you set up hazardous material information for a released item.

When you assign the code for a hazardous material classification group to a released item, the information that is associated with that classification group will be copied into the appropriate fields of the item. Therefore, you can simplify the setup processes by establishing a set of related field values that you often use together.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information that is shared among all your legal entities.

To set up hazardous material classification groups, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material classification group**. On the **Hazardous material classification group** page, you can create any number of groups and configure each by using the fields that are described in the following table.

FIELD	DESCRIPTION
Group code	Enter a code to identify the group.
Description	Enter a description of the group.
Class code	Associate a hazardous material class code with the group.
Division code	Associate a hazardous material division code with the group.
Packing group code	Associate a packing group code with the group.
Transport category code	Associate a transport category code with the group.
Multiplier	Enter the hazardous material multiplier that applies to the selected class and division of hazardous materials, according to the applicable regulation. This multiplier is used as part of the formula that calculates the total <i>hazardous material points</i> that are included in a load or shipment. For more information about hazardous material points and this multiplier, see Material management FastTab .

Hazardous material classes

A hazardous material class is typically mapped to the list of classes that is provided in the regulation that you're conforming to. For example, US regulation CFR 49 lists "class 3" as flammable and combustible liquids. You can

set up the classes that are relevant to the materials that you must classify.

Each class will be assigned to a material setup in the materials list that is related to the regulation. You will assign a class to each released item as required, to describe the hazardous nature of a product.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information that is shared among all your legal entities.

Hazardous material classes work together with divisions, groups, and compatibility groups in the following way:

- When you assign a hazardous material class to a released item, you must also assign a [hazardous material division](#).
- You can use hazardous material classes together with [hazardous material classification groups](#) to establish a template of codes for setting up items.
- You can use [hazardous material compatibility groups](#) to establish which hazardous material classes and divisions can be shipped together.

To set up hazardous material classes, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material class**. On the **Hazardous material class** page, you can create any number of classes and configure each by using the fields that are described in the following table.

FIELD	DESCRIPTION
Class code	Enter a code to identify this class. You define this code for the item. It will then be used in lookup lists when you assign a hazardous material class to a released item.
Description	Enter a description of the class.

Hazardous material divisions

A hazardous material division is a subset of a hazardous material class. You must assign both a division and a class to every product that includes hazardous materials.

For classes that don't have any divisions, create a division where the code is 0. For example, in the IATA regulation, class-7 radioactive materials have no subdivisions. In this case, you will create a 0 division that you can associate with a released product when you assign the class.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information that is shared among all your legal entities.

Hazardous material divisions work together with classes, groups, and compatibility groups in the following ways:

- When you assign a hazardous material division to a released item, you must also assign a [hazardous material class](#).
- You can use hazardous material divisions together with [hazardous material classification groups](#) to establish a template of codes for setting up items.
- You can use [hazardous material compatibility groups](#) to establish which hazardous material classes and divisions can be shipped together.

To set up hazardous material divisions, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material division**. On the **Hazardous material division** page, you can create any number of divisions and configure each by using the fields that are described in the following table.

FIELD	DESCRIPTION
Division	Enter a code to use as a reference number for the division.
Description	Enter a description of the division.
Class	Look up and assign the class that the division belongs to.

Hazardous material compatibility groups

Hazardous material compatibility groups establish which hazardous material classes and divisions can be shipped together. When operators create warehouse loads or shipments, they can run a compatibility check that will issue a warning if the load or shipment includes items that don't all belong to the same compatibility group.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information that is shared among all your legal entities.

To set up hazardous material compatibility groups, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material compatibility group**. On the **Hazardous material compatibility group** page, you can create any number of compatibility groups and configure each by using the fields that are described in the following subsections.

Hazardous material compatibility group header

Each compatibility group has a code and a description. The following table describes the fields that are available on the header.

FIELD	DESCRIPTION
Compatibility group	Enter a code to identify the compatibility group
Description	Enter a description of the compatibility group.

Compatibility group details

Each compatibility group establishes a list of classes and divisions of hazardous materials that can be shipped together.

FIELD	DESCRIPTION
Class	Select a hazardous material class that is compatible with all other classes in the group.
Division	Select a hazardous material division that belongs to the selected class.

Hazardous material specification values

Microsoft Dynamics 365 Supply Chain Management provides several types of hazardous material specifications. For each type, you must establish a centralized set of values for each relevant field. Users can then select among those values when they configure hazardous material definitions or released products. Supply Chain Management provides a collection of pages where you can establish the values. Each page is dedicated to one type of specification. For a description of each available specification and information about how to establish the values that are available for it, see the following subsections.

One example of a hazardous material specification is the *stowage code*, which specifies how a given material can be stored during transport. By using the information in this section, you will establish a central collection of stowage codes. This collection will then be presented to users in a drop-down list when they set the stowage code for a released product.

These hazardous material specification values aren't specific to each legal entity, Therefore, you can have a set of common values that are shared among all your legal entities.

You will use [material codes](#) to establish common collections of settings for each specification as it applies to a given regulation. You can then apply the appropriate code to each released product as required. For information about how to apply a hazardous material code to a specific released product, and how to configure individual settings of that product for any specification that is described here, see [Hazardous materials in products, orders, shipments, and loads](#).

Hazardous material emergency response

The *Hazardous material emergency response* specification indicates what should be done if something goes wrong while a product that contains a given hazardous material is being transported.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material emergency response**. On the **Hazardous material emergency response** page, you can create any number of values and configure each with a classification code and a short description.

Hazardous material identification

The *Hazardous material identification* specification identifies the class or nature of a hazardous material. The value is typically a code that is based on a United Nations (UN) standard. Each class is identified by a code and a description, and it can set limits on transport methods. For example, to identify a flammable item or material, you create a hazardous material class that uses the code *FL* and the description *Flammable*. You also specify that the class must not be transported by air.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material identification**. On the **Hazardous material identification** page, you can create any number of values and configure each by using the fields that are described in the following table.

FIELD	DESCRIPTION
Identification	Enter a code to use as a reference number that identifies this class of hazardous material.
Description	Enter a description of this class.
Restrict from air transport	Select this check box to indicate that this class of hazardous material should not be transported by air.
Restrict from sea transport	Select this check box to indicate that this class of hazardous material should not be transported by sea.

Hazardous material label

The *Hazardous material label* specification identifies the dangerous goods label that must be applied to relevant released products. The labels themselves will describe how the product should be handled. For example, you have a product that contains a poisonous gas. In this case, you set up a label code that represents the poisonous gas label. You also build your business process so that it looks up this value when you ship products.

To set up values for this specification, go to **Product information management > Setup > Hazardous**

material shipping documentation > Hazardous material label. On the **Hazardous material label** page, you can create any number of labels and configure each with an identifying code and a short description.

Hazardous material packing descriptions

The *Hazardous material packing descriptions* specification indicates how a hazardous item must be packed. For example, it might have to be packed in a specific type of steel drum or some other type of special packaging.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material packing descriptions**. On the **Hazardous material packing descriptions** page, you can create any number of packing descriptions and configure each with an identifying code and a short description.

Hazardous material packing group

The *Hazardous material packing group* specification identifies the packing group for a hazardous item. The packing group lets you define a code and a description to indicate how hazardous material items must be packed during transportation or shipment. The packing group is assigned to the item through the **Item hazardous materials** page.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material packing group**. On the **Hazardous material packing group** page, you can create any number of packing groups and configure each with an identifying code and a short description.

Hazardous material packing instruction

The *Hazardous material packing instruction* specification identifies packing instructions that must be followed when a given hazardous item is prepared for transportation by air.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material packing instruction**. On the **Hazardous material packing instruction** page, you can create any number of packing instruction identifiers and configure each with an identifying code and a short description.

Hazardous material stowage

The *Hazardous material stowage* specification indicates how a product must be stored on a ship when it's transported by sea freight.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material stowage**. On the **Hazardous material stowage** page, you can create any number of stowage identifiers and configure each with an identifying code and a short description.

Hazardous material transport category

The *Hazardous material transport category* specification is typically used to group similar hazardous products on reports. For example, transport categories are used on the **Shipment summary** report, which you can print from the warehouse shipment record.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material transport category**. On the **Hazardous material transport category** page, you can create any number of transport categories and configure each with a display name and a short description.

Hazardous material technical name

The *Hazardous material technical name* specification can be used to provide a commonly used or internal company name that describes each material.

To set up values for this specification, go to **Product information management > Setup > Hazardous**

material shipping documentation > Hazardous material technical name. On the **Hazardous material technical name** page, you can create any number of technical names and configure each with a display name and a short description.

Hazardous material tunnel

The *Hazardous material tunnel* specification limits the types of tunnels that a hazardous material can be transported through by identifying the types of tunnels that must be used. Tunnel categories are established by applicable regulations for hazardous material transport. This specification usually applies only to road transport.

To set up values for this specification, go to **Product information management > Setup > Hazardous material shipping documentation > Hazardous material tunnel**. On the **Hazardous material tunnel** page, you can create any number of tunnel identifiers and configure each with an identifying code and a short description.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Hazardous materials in products, orders, shipments, and loads

2/18/2021 • 14 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic explains how to set hazardous material properties for released products, how to put stock limits on hazardous items, and how to include hazardous materials in a sales order, shipment, or load.

Set hazardous material specifications for products

After you've defined a hazardous material regulation and set up the related reference codes as described in [Set up hazardous materials](#), you can associate this information with released items. The shipping text for shipping documents will be drawn from the hazardous materials information for the released items.

As part of the process of associating a released item with a hazardous material, you must specify the regulation code and the material. Different regulation codes might be associated with an item, depending on the modes of transport, and you can associate multiple regulations and material codes with each item.

To set up a released product as a hazardous material, follow these steps.

1. Go to **Product information management > Products > Released products**.
2. Select or create a product to open its **Released product details** page.
3. On the **Manage inventory** FastTab, set the **Hazardous material** option to **Yes**. This setting identifies the item as a dangerous good and is used when shipping documentation is printed.
4. On the Action Pane, on the **Manage inventory** tab, in the **Compliance** group, select **Item hazardous material**.
5. Fill in the **Item hazardous materials** page for the selected item by using the fields that are described in the following subsections.

Item hazardous materials header

The following table describes the fields that are available at the top of the **Item hazardous materials** page.

FIELD	DESCRIPTION
Item number	The released product that you're working with.
Regulation code	Select the hazardous material regulation that applies to the product. The regulation defines how the printed shipping text is created for an item and the associated modes of delivery. After it's assigned, the code can't be edited on this page. However, you can assign a new regulation code by selecting New .

FIELD	DESCRIPTION
Material code	(Optional) Select the hazardous material code that applies to the product. The material code provides a template that includes default values for many other fields on this page. When you select a code, all its hazardous materials specifications will be copied to the current product. However, the system first prompts you to confirm that item material data should be filled in from the material code.
Group code	(Optional) Select the hazardous material classification group code that applies to the product. As for the Material code field, when you select a code, all its hazardous materials specifications will be copied to the current product. However, the system first prompts you to confirm that item class group data should be filled in from the group code.

Descriptions FastTab

The following table describes the fields that are available on the **Descriptions FastTab**.

FIELD	DESCRIPTION
Proper shipping name	Enter the standard description for the material, as specified by the applicable regulation. You can provide translations for this value on the Item ship text translation FastTab , as described in the next section.
Technical name	Select the common or generic name for the material. This name might be a name that your company uses internally for the material.
N.O.S.	Select this check box to indicate that the Proper shipping name value is a not-otherwise-specific (N.O.S.) shipping name for the item. N.O.S. shipping names are used for groups of similar chemicals and materials that have specific end uses, but that might not be listed by name in the hazmat table in a specific regulation.

Item ship text translation FastTab

The **Item ship text translation FastTab** contains a grid that shows translations of the **Proper shipping name** values that are defined for the primary language on the **Descriptions FastTab**. These translations can be used in shipping print text for one or more additional languages.

The following table describes the fields that are available on the **Item ship text translation FastTab**.

FIELD	DESCRIPTION
Language	The language code that the row uses. For example, pt-br indicates Brazilian Portuguese.
Shipping print text	The translated Proper shipping name value in the language that the row uses.

To add or edit a translation, select **Translations** above the grid to open **Text translations** page. Then follow one of these steps:

- To add a new translation, on the Action Pane, select **Add**. Select the language to add, and then, in the

Translated text field, enter the translated text.

- To edit an existing translation, select a target language in the **Language** field, and edit the translated text in the **Translated text** field, as required.

Material management FastTab

The following table describes the fields that are available on the **Material management** FastTab.

FIELD	DESCRIPTION
Class	Select the hazardous material class that the product belongs to, as defined by the regulation that you're conforming to. You must assign both a division and a class to every product that includes hazardous materials.
Description	The description that is defined for the class that is selected in the Class field. This field is read-only.
Division	Select the hazardous material division that the product belongs to, as defined by the regulation that you're conforming to. The division is a subset of the class. You must assign both a division and a class to every product that includes hazardous materials.
Identification	Select the hazardous material identification code. Typically, this code is based on a United Nations (UN) standard.
Packing group	Select the packing group that applies to the current item.
Description	The description that is defined for the group that selected in the Packing group field. This field is read-only.
Packing Descriptions	Select the applicable packing description code. This code references a description that indicates how the product must be packed.
Hazardous material labels	Select a code that references the applicable dangerous goods label that should be applied to the product.
Limited quantity	Set this option to Yes to report the total product weight that is included in each load and on each load line.
Quantity	Enter the quantity of hazardous material in the product, in the specified unit. This value will be used to calculate the total hazardous material score for loads and shipments that include the product.
Multiplier	Enter the multiplier that is applied when the hazardous material score is calculated for each load line that includes the product. This value is specified by the applicable regulation, according to the type of hazardous material that is contained in the product.
Unit	Select the unit of measure that applies to the quantity of hazardous material in the product, as specified in the Quantity field. This value will be used to calculate the total hazardous material score for loads and shipments that include the product.

How the hazardous material score is calculated

Several of the values that are specified on the **Material management** FastTab for a product are used to calculate a *hazardous material score* for each load line that includes that product. The score is calculated by using the following formula:

$$\text{Hazardous material score} = \langle \text{LineQty} \rangle \times \langle \text{HazmatQty} \rangle \times \langle \text{UnitConversion} \rangle \times \langle \text{Multiplier} \rangle$$

Here is a key to the formula:

- $\langle \text{LineQty} \rangle$ is the quantity of product that is specified for a load line.
- $\langle \text{HazmatQty} \rangle$ is the quantity of hazardous material that is specified for a product in the **Quantity** field on the **Material management** FastTab.
- $\langle \text{UnitConversion} \rangle$ is a conversion factor for converting between the unit that is used for the load line quantity and the unit that is specified for a product in the **Unit** field on the **Material management** FastTab.
- $\langle \text{Multiplier} \rangle$ is the multiplier that is specified for a product in the **Multiplier** field on the **Material management** FastTab.

This score is reported for each load line that contains a product where these values are specified. For more information, see the [Shipments that include hazardous materials](#) and [Loads that include hazardous materials](#) sections later in this topic.

How the hazardous material weight is calculated

Loads and load lines that contain products where the **Limited quantity** option on the **Material management** FastTab is set to **Yes** will show the total hazardous material weight, as described in the [Shipments that include hazardous materials](#) and [Loads that include hazardous materials](#) sections later in this topic. The hazardous material weight is calculated by using the following formula:

$$\text{Hazardous material weight} = \langle \text{LineQty} \rangle \times \langle \text{ProductWeight} \rangle \times \langle \text{UnitConversion} \rangle$$

Here is a key to the formula:

- $\langle \text{LineQty} \rangle$ is the quantity of product that is specified for a load line.
- $\langle \text{ProductWeight} \rangle$ is the net weight that is specified for the product, in the inventory unit that is specified for the product.
- $\langle \text{UnitConversion} \rangle$ is a conversion factor for converting between the unit that is used for the load line quantity and the inventory unit that is used for $\langle \text{ProductWeight} \rangle$.

Transport information FastTab

The following table describes the fields that are available on the **Transport information** FastTab.

FIELD	DESCRIPTION
Transport category	Select the related transport category.
Tunnel Code	Select the related tunnel restriction code for the item.
Hazardous material stowage	Select the reference code that is used for sea freight stowage handling when the item is shipped by sea freight.
Aircraft type	Select the aircraft restriction that applies for the material when it's shipped by air freight.
Packing - cargo aircraft only	Based on the value that you selected in the Aircraft type field, select the packing instructions code that applies when the product can be shipped only by cargo aircraft.

FIELD	DESCRIPTION
Packing - passenger and cargo aircraft	Based on the value that you selected in the Aircraft type field, select the packing instructions code that applies when the product can be shipped by either cargo aircraft or passenger aircraft.
IATA Star	Set this option to Yes to indicate that the air transport specifications that are entered on this FastTab are related to the International Air Transport Association (IATA) dangerous goods standard. This field is for informational purposes only.
Emergence response	Select the code that references instructions for handling the material in an emergency.

Environmental information FastTab

The following table describes the fields that are available on the **Environmental information** FastTab.

FIELD	DESCRIPTION
Environmentally dangerous	Set this option to Yes to indicate that the product is environmentally dangerous. Use this field for your own reporting purposes.
Marine pollutant	Set this option to Yes to indicate that the product is a marine pollutant. Use this field for your own reporting purposes.

Set stock limits for hazardous products

For safety reasons, you might have to limit the total amount of a given product that can be stocked at a single location. To set stock limits for a released product, follow these steps.

1. Go to **Product information management > Products > Released products**.
2. Select a product to open its **Released product details** page.
3. On the Action Pane, on the **Manage inventory** tab, in the **Compliance** group, select **Reporting details**.
4. In the **Hazardous stock limit** and **Hazardous warning limit** fields, set appropriate values for the selected product.

The **Hazardous material stock limit** report lets you monitor the stock levels of the hazardous materials in your warehouse locations, to make sure that they remain under the safe limits that are established here. For more information, see [Hazardous material stock limit report](#).

Sales order transactions that include hazardous materials

To include a product that is classified as a hazardous material on a sales order, you must associate the relevant shipping carrier with the sales order. Open the sales order, and then, on the **Delivery** FastTab, set the **Shipping carrier** and **Carrier service** fields as required.

The shipping carrier is also associated with the mode of delivery. Therefore, you must make sure that this information is aligned with the hazardous material regulation. In other words, the mode of delivery that is specified in the hazardous material regulation must match the specifications on the sales order header. In this way, the regulation, shipping carrier, and service are connected to the shipment lines that are used on a sales order.

After a sales order is finalized and ready to be shipped, it can be released to the warehouse to indicate the transfer between sales and warehouse operations.

Shipments that include hazardous materials

View hazardous material scores for each shipment line

The **Shipment details** page for a shipment shows the total hazardous material weight and point values that have been calculated for each load line that is included in that shipment. To view the scores and weights, follow these steps.

1. Go to **Warehouse management > Shipments > All shipments**.
2. Select a shipment to open its **Shipment details** page.
3. On the **Load lines** FastTab, inspect the lines. For each line, you will see the hazardous material calculations in the following fields:
 - **Hazardous material points** – This field shows the hazardous material score for the load line. The value is calculated according to the rules and values that have been established for the applicable regulation and in the released product setup. The calculation takes the quantity on the load line and references the multiplier in the [material management setup](#) for the released product.
 - **Limited quantity net weight** – For products that are marked as limited-quantity products because of their hazardous material content, this field shows the total net weight of hazardous content that is included on the load line. The calculation is based on the products that are marked as hazardous materials in the released product setup. If an item is marked as a limited-quantity item, the calculation takes the quantity on each load line and references the weight in the [material management setup](#) for the released product.

Check for compatibility among hazardous materials that are included in a shipment

The system can evaluate whether all the hazardous materials that are included in a shipment are suitable to be shipped together. To evaluate compatibility, the system checks the compatibility group that is assigned to each product that is included in the shipment. For more information, see [Hazardous material compatibility groups](#).

To run the compatibility check, follow these steps.

1. Go to **Warehouse management > Shipments > All shipments**.
2. Select a shipment to open its **Shipment details** page.
3. On the Action Pane, on the **Shipments** tab, in the **Actions** group, select **Compatibility check**.

You receive a message that informs you of the results of the check.

Loads that include hazardous materials

View hazardous material scores for each load line

The **Load details** page for a load shows the total hazardous material weight and point values that have been calculated for that load and for each load line. To view the scores and weights, follow these steps.

1. Go to **Warehouse management > Shipments > All loads**.
2. Select a load to open its **Load details** page. (You can also open load details by selecting a link from a related shipment.)
3. On the **Load** FastTab, you can review the total hazardous material scores and weights for the whole load by inspecting the following fields:
 - **Hazardous material points** – This field shows the hazardous material score for the load. The value

is calculated according to the rules and values that have been established for the applicable regulation and in the released product setup. The calculation takes the quantity that is included in the load and references the multiplier in the [material management setup](#) for the released product.

- **Limited quantity net weight** – For products that are marked as limited-quantity products because of their hazardous material content, this field shows the total net weight of hazardous content that is included in the load. The calculation is based on the products that are marked as hazardous materials in the released product setup. If an item is marked as a limited-quantity item, the calculation takes the quantity in each load and references the weight in the [material management setup](#) for the released product.
4. To review the scores and weights for individual lines, select the **Load lines** FastTab. The values that are provided for each line resemble the values that are provided for the whole load, as described in the previous step.

Check for compatibility among hazardous materials that are included in a load

The system can evaluate whether all the hazardous materials that are included in a load are suitable to be shipped together. To evaluate compatibility, the system checks the compatibility group that is assigned to each product that is included in the load. For more information, see [Hazardous material compatibility groups](#).

To run the compatibility check, follow these steps.

1. Go to **Warehouse management > Shipments > All loads**.
2. Select a shipment to open its **Load details** page. (You can also open load details by selecting a link from a related shipment.)
3. On the Action Pane, on the **Loads** tab, in the **Actions** group, select **Compatibility check**.

You receive a message that informs you of the results of the check.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Hazardous materials inquiries and reports

2/18/2021 • 6 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

Microsoft Dynamics 365 Supply Chain Management provides various reports that are related to hazardous materials. Many of these reports are required so that you remain compliant with various hazardous material regulations during shipping and storage.

All these reports, except the **Multimodal dangerous goods** report, use the mode of delivery that is defined for the shipment to find the regulation that should be used to print the shipping text for items. The mode of delivery is associated with the shipping carrier and the carrier service. Therefore, you must set up a shipping carrier and carrier service, and link them to a mode of delivery. The mode of delivery is related to the hazardous materials regulation.

The following illustration shows the sequence of activities that occur when the system generates hazardous materials reports.

Set up hazardous materials reporting

Usually, if you ship items that contain hazardous materials, you must generate specific reports to help preserve safety and comply with hazardous materials regulations. To set up your reports, follow these steps.

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. Open the **Reports** tab. On the **Hazardous materials report parameter** FastTab, set the following fields.

SECTION	FIELD	DESCRIPTION
Multimodal Dangerous Goods	Regulation code	Select the regulation that should be used when a Multimodal dangerous goods report is generated.
Hazardous Material stock limits	Regulation code	Select the regulation that should be used when stock limits are evaluated.

SECTION	FIELD	DESCRIPTION
Carriage of merchandise by road	CMR group product	CMR stands for "carcinogenic, mutagenic, and reprotoxic substances." Set this option to Yes to configure the system to print specific warnings and messages that are related to the handling of these substances.
Carriage of merchandise by road	Hazardous material group description	Enter the text of specific warnings that are related to CMR and carriage of merchandise by road. This text will be included on the report.
Shippers declaration	Warning	Enter the text of a warning message that should be printed on the shipper's declaration form (for example, "Warning: Dangerous Goods, Flammable").
Shippers declaration	Footer declaration	Enter the text of a message that should be printed at the bottom of the shipment declaration document.
Hazardous goods report language	Hazardous goods domestic report language	Select the default language for hazardous materials reports that are associated with domestic shipments.
Hazardous goods report language	Hazardous goods export report language	Select the default language for hazardous materials reports that are associated with international shipments.

Hazardous materials report

The **Hazardous materials** report shows a list of all items that have been set up and defined so that they have dangerous goods information. You can use this report to monitor and review the information that you must maintain. The page for the report shows a limited selection of fields from the hazardous material setup. However, you can personalize it to add additional fields as you require.

To view this report, go to **Product information management > Inquiries and reports > Hazardous material shipping documentation > Hazardous materials**.

Hazardous material stock limit report

The **Hazardous material stock limit** report lets you monitor the stock levels of the hazardous materials in your warehouse locations, to make sure that they remain under established, safe limits. These limits come from the limits that are defined for each released product.

To view this report, go to **Product information management > Inquiries and reports > Hazardous shipping documentation > Hazardous material stock limits**.

For more information about how to set stock limits on a released product, see [Set stock limits for hazardous products](#).

The regulation that is used for stock limits is defined on the **Warehouse management parameters** page. Go

to **Warehouse management > Setup > Warehouse management parameters**, and then, on the **Reports** tab, in the **Hazardous materials stock limit**, specify a regulation code. For more information, see the [Set up hazardous materials reporting](#) section earlier in this topic.

Verified gross mass report

The **Verified gross mass** report lets you print information about the weight of a shipment.

To generate and print this report, go to **Warehouse management > Shipments > All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Verified gross mass**.

Multimodal dangerous goods report

The **Multimodal dangerous goods** report is provided for shipments that must be moved by using a combination of transport methods. It's typically used when a shipment is moved first by road and later by sea.

To generate and print this report, go to **Warehouse management > Shipments > All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Multi model dangerous goods**.

When you generate this report, the information is saved so that you can edit it and/or reprint the report if you must. To edit a generated report, go to **Warehouse management > Inquiries and reports > Hazardous materials shipping documentation > Multimodal dangerous goods**, and find the relevant report in the list. After you've finished editing the content as you require, select **Print** on the Action Pane to print the report.

Shippers declaration report

The **Shippers declaration** report lets you print information that is related to a declaration of the materials that are included in the shipment.

To generate and print this report, go to **Warehouse management > Shipments > All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Shippers declaration**.

Carriage of merchandise by road report

The **Carriage of merchandise by road** report resembles a bill of lading but is typically used for road transportation in Europe under the Agreement concerning the International Carriage of Dangerous Goods by Road (ADR) regulations. This report uses the shipping print text for an item unless you set the **Hazardous material group description** field on the **Warehouse management parameters** page.

To generate and print this report, go to **Warehouse management > Shipments > All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Carriage of merchandise by road**.

When you generate this report, the information is saved so that you can edit it and/or reprint the report if you must. To edit a generated report, go to **Warehouse management > Inquiries and reports > Hazardous materials shipping documentation > Carriage of merchandise by road**, and find the relevant report in the list. After you've finished editing the content as you require, select **Print** on the Action Pane to print the report.

Shipment summary report

The **Shipment summary** report provides information that is summarized by the transport category that is related to the released items.

To generate and print this report, go to **Warehouse management > Shipments > All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Shipment summary**.

bill of lading report

When the hazardous materials feature is turned on in your system, the **bill of lading** report includes a **Hazardous materials** column that indicates whether a load includes hazardous materials. This report is available from the **All loads** page, as usual.

Packing list report

When the hazardous materials feature is turned on in your system, packing lists include additional information that is related to the shipping print text for an item. This report is available from the **All loads** page, as usual.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product-related translations FAQ

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to manage translations for products, product dimension values, and product attributes.

What product-related data can be translated?

You can create translations for the following product-related information:

- Names and descriptions of products.
- Descriptions, friendly names, and help text of product attribute values.
- Names and descriptions of product dimension values.

You can translate the product-related information into any language that is available from the **Text translation** page. For more information, see the following section **How do I create translations for product-related information**.

Where can I view the translated information?

You can view translations of product-related information in any external source document, such as an invoice, that uses a language where translations are available.

How do I create translations for product-related information?

To create translations for a product, follow these steps:

1. Click **Product information management > Common > Released products**.
2. Select a product, and on the Action Pane, in the **Languages** group, click **Translations**.
3. In the **Text translation** page, in the **Language** field, select a language. To add more languages, expand the **Language** field, and then click **OK**.
4. In the **Translated text** group, enter translations in the **Description** and **Product name** fields.

To create translations for product attributes, follow these steps:

1. Click **Product information management > Common > Released products**.
2. Under **Setup**, click **Attributes**, and then click **Attributes**.
3. In the **Attributes** page, click **Translate**.
4. In the **Text translation** page, in the **Language** field, select a language. To add more languages, expand the **Language** field, and then click **OK**.
5. In the **Translated text** group, enter translations in the **Description**, **Friendly name**, and **Help text** fields.

To create translations for product dimension values, follow these steps:

1. Click **Product information management > Common > Released products**.
2. Select a product, and then click **Product dimensions**.
3. Select one of the links for the product dimensions: **Configurations**, **Sizes**, **Colors**, or **Style**.
4. Select a dimension value and then click **Translate**.
5. In the **Text translation** page, in the **Language** field, select a language. To add more languages, expand the **Language** field, and then click **OK**.
6. In the **Translated text** group, enter translations in the **Name** and **Description** fields.

Can the names of product variants be translated?

Product variants are based on the dimensions of a released product. Product variant names are based on a combination of dimension values. When the dimension values that are associated with a product variant are translated, the name of the product variant appears in the translated version.

Example

Your product is a T-shirt that comes in different sizes and colors and the variant names are based on the following details:

- Product number: #3
- Dimensions: Size and color
- Size dimension values: Small, Medium, Large
- Color dimension values: Red, Green, Black

The name of a product variant that is based on the dimension values Small and Red is **#3:Small:Red**.

A customer wants to buy some small, red T-shirts and the name of the T-shirt must appear in French on the invoice. You translate the dimension values, Small and Red, into French, and the name of the product variant is **#3:Petit:Rouge**.

TIP

To set the preferred language of a customer, follow these steps:

1. Click **Sales and marketing > Common > Customers > All customers**.
2. Double-click a customer to open the **Customers** page. On the **General** tab, in the **Language** field, select the **language**.

What happens if a customer has a preferred language for which no translations are available?

If translations are not available in the customer's preferred language, the names and descriptions are displayed in the global language of your own company.

Can I manage translations for a series of dimension values at the same time?

Dimension values are product specific and you can manage the translations for the dimension values for each product. However, if you create a dimension value group and create translations for the values in the value group, it is easier to manage the translations.

Example

Your company produces T-shirts in different styles, and each style is available in the sizes Small, Medium, and Large. The sizes are collected in one dimension value group. When a new T-shirt style is added, you can associate it with the dimension value group that is used for sizes, so that all the sizes are available for the product. You can also add or change translations for the sizes in the dimension value group at any time.

A dimension value that is associated with a product through a dimension variant group must be maintained from the product variant group.

To create a dimension value group, follow these steps:

1. Click **Product information management > Setup > Variant groups**.

2. Select **Size groups**, **Color groups**, or **Style groups**.
3. Click **New**, and then enter a name for the group in the **Size group**, **Color group**, or **Style group** field. Click **Sizes**, **Colors**, or **Styles** to create lines for the groups.
4. In the **Size group lines**, **Color group lines**, or **Style group lines** page, click **New**, and then create the sizes, colors, and styles for the groups.

To manage translations for values in a dimension value group, follow these steps:

1. Follow the steps in the previous procedure for creating a dimension value group to open the **Size group lines**, **Color group lines**, or **Style group lines** page.
2. Click **Text translation**. In the **Text translation** page, in the **Translated text** group, enter translations in the **Name** and **Description** fields.

When can translations of product-related information be managed?

Translations of product-related information can be managed at any time. When translations are updated for a dimension value that is associated with a product, the product information is updated, regardless of whether the product has transactions.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Search for products and product variants during order entry

2/18/2021 • 5 minutes to read • [Edit Online](#)

Use the **Item number** field to search for products and product variants when you manually create a sales order line or a purchase order line. This lets you quickly find product variants when you only have the configuration string or one of the product dimensions available.

Sometimes, having too much of something is not the best situation to be in, and this is especially true if you sell a number of products that are similar, and you are trying to remember item numbers or product search names in order to find the right product to put on a sales order. You can use the **Item number** field on a sales order line or a purchase order line as a search field. You can enter any part of a product name, number, or dimension and get a lookup that displays all the items that match the search word.

How search works

When you search for products or product variants, it is important to understand how the search feature finds the products that match the text that you enter. The key search rules in delivering search results are:

- Search results will return any matching record, disregarding the field that the search text is entered in.
- The search text needs to be present in the matching record in its full length.
- A match will occur even if the search text is found in the middle of a text string in the matching record. It does not have to appear in the beginning of a text string.
- The search text is treated as a single text string even if it contains white space.

Examples

The following examples use products and product variants to illustrate how search is handled in various scenarios. **Prerequisite:** Under **Sales and marketing > Setup > Search > Search parameters > Search type**, select the **Full match** option.

PRODUCT TYPE	PRODUCT NAME	DISPLAY PRODUCT NUMBER	ITEM NUMBER	CONFIGURATION
Distinct product	SpeakerMidRange	D0001	D0001	NA
Product variant	Active speaker	D0010:::Black:	D0010	000005
Product variant	Active speaker	D0010:::White:	D0010	White

If you type 'speak' in the **Item number** field, you will get all the products above as a result in the lookup. If you type 'black' in the **Item number** field, you will get the second product as a result, because it has the text 'black' in the display product number. These two examples illustrate that the search is not only at the beginning of the field, a match will occur even if the search text is found in the middle of a text string in the matching record.

If you type '05' you will only get the second product variant as a result, because it has '05' in the configuration. This illustrates that the search is across all the enabled fields on the **Search criteria** page.

If you type 'speak 05' you will not get any results. This is because the search looks for the full text that is entered. The search will not try to find 'speak' and then narrow the results to those containing '05'.

You can limit the number of search results by using the **Number of results** field on the **Sales and marketing**

> **Setup** > **Search** > **Search parameters** page. If you set this field to 0, all search results will be returned. If you set it to 10, for example, it will return a maximum 10 search results.

Configure the product search

Before you can use the product and product variant search feature, follow these steps to configure the product search.

Step 1: Include all the relevant product and product variant identifiers and dimensions in the search criteria

Examples of product and product variant identifiers and dimensions that you can search by are **Product name**, **Item number**, **Display product number**, **Configuration**, **Color**, **Size**, **Style**, **Search name**, etc.

Go to **Sales and marketing** > **Setup** > **Search** > **Search criteria** page. The **Search criteria** page allows you to define criteria for customer, prospect, and product search. Make sure you filter the page by using product search criteria. You can do this by switching to **Product** in the page's menu.

To add the display product number to the search criteria, click **New** in the page's menu. This will add a new record in the **Search criteria** grid. Open the **Field name** column lookup and chose **DisplayProductNumber**. To add the product's configuration to the search criteria, create a new record in the **Search criteria** grid and chose **configId** in the **Field name** column. In the same manner, create a record with **Field name** **InventColorId** for the color dimension, **InventSizeId** for the size dimension, and **InventStyleId** for the style dimension.

Step 2: Populate the database table that is used for product search

In the **Search criteria** page, click the **Update search data** button. In the **Update search data** dialog box, make sure that **Source** is set to **Product**, and then click **OK**. The system will aggregate in one table all the selected search criteria specified in step 1. If you have a lot of products and product variants, this operation can be quite lengthy and you may receive a warning. We recommend that you schedule the search table population on the batch server at a time when the server is not too busy.

Until the table is populated, product search will not provide the correct results. If you do not get any search results, make sure that this table is populated.

The table only has to be populated when the search criteria is modified. Newly released products and variants are automatically added to the table. Deleted products and variants are automatically removed from the table.

Step 3: Enable the lookup for product search on sales and purchase order lines

You can enable this functionality by going to **Sales and marketing** > **Setup** > **Search** > **Search parameters** and setting **Enable lookup for search** to **Yes** on the **General** tab.

For sales order line entry, the default behavior is to open the **Product search** page when you start typing in the **Item number** field, and then press the **Tab** key. The **Product search** page changes the context during order line creation and may be considered unnecessarily intrusive. If you prefer to get the search results in a lookup and not lose context during order line entry, you can use the search lookup instead. If you search for a product or product variant, but you don't select anything in the lookup and press the **Tab** key, the **Product search** page will display.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Default order settings for dimensions and product variants

2/18/2021 • 11 minutes to read • [Edit Online](#)

Default order settings in Dynamics 365 Supply Chain Management define the site and warehouse where items will be sourced from or stored, the minimum, maximum, multiple and standard quantities that will be used for trading or inventory management, the lead times, the stop flag, and the order promising method. Default order settings are used when creating purchase orders, sales orders, transfer orders, inventory journals, and by master planning for generating planned orders. Default order settings can be item specific, site specific, product variant specific, or product dimension specific.

To define the default order settings for a product, follow these steps.

1. Go to **Product information management > Products > Released products**.
2. Select the relevant product in the grid.
3. On the Action Pane, follow one of these steps to open the **Default order settings** page for the selected product:
 - On the **Plan** tab, in the **Order settings** group, select **Default order settings**.
 - On the **Manage inventory** tab, in the **Order settings** group, select **Default order settings**.
4. Configure the settings as described in the rest of this topic.

Default order settings

There are three types of default order settings for purchases, sales, and inventory. The default order settings for purchases are used when creating:

- Purchase order lines
- Purchase agreement lines
- Request for quotation lines
- Purchase requisition lines
- Consignment replenishment lines (partially supported, see note)
- Planned purchase orders

NOTE

For consignment replenishment order lines, the only settings from the **Purchase order** FastTab of the **Default order settings** page that apply are the **Default site** field, **Default warehouse** field, and **Stopped** check box.

The default order settings for sales are used when creating:

- Sales order lines
- Sales agreement lines
- Sales quotation lines
- Return order lines and item replacement lines
- Demand forecast lines

The default sales order settings also apply when creating:

- Project item requirements
- Service order item requirements

The default order settings for inventory are used when creating:

- Inventory journals
- Transfer orders
- Planned transfer orders

The default inventory order settings also apply when creating:

- Quarantine orders
- Quality orders
- Production orders
- BOM lines
- Planned production orders

Full definition of a released product

When you create a transaction, you must specify the full definition of a released product on the line, so that Supply Chain Management can try to identify the default order settings. In the full definition of a released product, the item number and all the active product dimensions, such as configuration, size, style, version, and color, are specified on the transaction. For example, if you manually create a purchase order line for a released product variant, you must specify all the required product dimensions before the site, warehouse, quantities, and lead time will appear by default on the order line.

Not all of the default order settings parameters are applied when creating order or journal lines. Quantities and lead times will only display by default when appropriate. For example, when counting a journal line, only the site and warehouse will display by default when the line is created. For this reason, no default quantity or checks on multiple and minimums are performed when creating the line or posting the journal.

The system always attempts to find a default site and warehouse when an order or journal line is created. The site is not always displayed by default from the order settings. For example, when creating a sales order or a purchase order, the site from the order header is automatically used on the order lines. When creating a BOM line, the site from the BOM header is used. After the site is determined, it will be used to find any site-specific order settings that can then be used as the default for the warehouse.

The default order type, the purchase, and the inventory lead times can be overridden by the item's coverage rules on the **Item coverage** page. Although the default order settings don't allow for the distinction between the production and transfer lead time, the item coverage rules allow for it. However, the item coverage setup will only be used by Master planning (MRP) when creating planned production and planned transfer orders and will not apply when manually creating production and transfer orders.

Default order settings rules

You can define general default order settings and any number of default order setting rules that apply only in certain conditions, such as site or a specific product dimension or product dimensions combination. You can't define warehouse-specific order settings.

Rank in default order settings

The default order settings rules have ranks. The higher the rank, the more important the rule is, meaning that it will have a higher priority and be used before the rules with lower ranks. The general default order settings have rank zero, which can't be modified. There can only be one rule with rank zero. Rules can have the same rank, provided that the dimensions they apply to differ. This is useful for modeling site-specific order settings. When a new default order settings rule is created, the values for order values, stop flag, etc. are inherited from the rule

with rank zero, but can be overridden.

Default order settings for released products

For distinct released products, you can define general order settings or site-specific order settings. The general order settings will always have rank zero. If you set up new sales, purchase, and inventory order settings at the same time, we recommend that you use the **Details view** on the **Default order settings** page. To switch to the details view, go to **Options > Page options > Change view > Details view**.

Site-specific order settings

To create site-specific order settings, select **New**. In **Details view**, enter the site in the **Site** field in the **Settings applicable for** section. In **Grid view**, enter the site in the **Site** column. The new rule is automatically assigned a new rank value that is more than 0 (zero). You can create as many site-specific rules as you require. To indicate that they are equally important, you can assign the same rank value to all the site-specific rules.

If you are in **Details view**, you can't get the overview of the rules created for the item. Use the **Show/Hide list** button to see overview information. When an order line of any type is created and it has no site provided, Supply Chain Management searches for a rule with no site specified. This helps to determine a default site on the order line. This site is then used to search for a site-specific rule, where a default warehouse may have been set. This warehouse is applied to the order line.

Specific order settings for product dimension

You can define order settings rules for any active product dimension or combination of active product dimensions. If a product dimension field is empty, then that the rule applies to all values of the product dimension.

Consider the following example product.

Product name	Photoelectric sensor
Item number	XW56
Configuration (used to model the type of light)	C1-Visible red light, C2-Infrared light
Version	V1, V2, V3

For this example, assume that the product is procured and not produced. Also assume that configuration C1 is more commonly used, so it has shorter lead times.

Create the following default order settings to model this scenario.

RANK	SITE	CONFIGURATION	VERSION	PURCHASE - OVERRIDE DEFAULT SETTINGS	PURCHASE LEAD TIME	PURCHASE - STOPPED	SALES - OVERRIDE DEFAULT SETTINGS	SALES - STOPPED
10		C1		Yes	2			
0					5			

When a purchase order line or a planned purchase order is created for item XW56, configuration C1, regardless of the version or site where the line is put, the lead time will be considered 2. Assume that all versions besides V3 are stopped.

You can create the following default order settings rules.

RANK	SITE	CONFIGURATION	VERSION	PURCHASE - OVERRIDE DEFAULT SETTINGS	PURCHASE LEAD TIME	PURCHASE - STOPPED	SALES - OVERRIDE DEFAULT SETTINGS	SALES - STOPPED
20			V2	Yes		Yes	Yes	Yes
20			V1	Yes		Yes	Yes	Yes
10		C1		Yes	2			
0					5			

The two rules for stopping the old versions have the same rank. Therefore, they are equally important. Because both these rules have a higher rank than the rule for configuration C1, they take precedence over the rule for configuration C1.

This example explains the need for the rank. If the rank isn't used, when a purchase order is created for configuration C1 and version V2, the two rules that are defined for V2 and C1 will be ambiguous. To solve the ambiguity, Supply Chain Management will search through the rules in descending order of rank and apply the first applicable rule. In the current example, when a purchase order line is created for configuration C1 and version V2, the user will receive a warning message that states that the item is on hold, and that this hold is caused by the version value. If the rule for the configuration had a higher rank than the rule for the version, a purchase order line would be successfully created for configuration C1 and version V2, and the user would receive no "item on hold" message.

Consider the following default order setting rules.

RANK	SITE	CONFIGURATION	VERSION	DEFAULT SITE	DEFAULT WAREHOUSE	PURCHASE - OVERRIDE DEFAULT STORAGE DIMENSIONS	PURCHASE WAREHOUSE
20	2					Yes	22
10		C1	V2	2	21		
0				1	11		

The system traverses the set of rules two times to determine the site and warehouse. When a purchase order line is created for configuration C1, version V2, the site is determined based on the rule that has a rank of 10. The system then searches for a rule for site 2 to determine a warehouse. Rule 20 is found, and because it has a higher rank, the warehouse on the purchase order line will be 22, not 21.

As general guidance, specific rules and rules for dimensions that are more important than other dimensions get higher ranks, while more generic rules get lower ranks.

The rule with rank zero serves as a safety net. If no other rules are hit, then the default order settings from rule zero will be used.

Because the rank number is important, on the **Default order settings** Action Pane, there are functions to move a rule up or down and to renumber the rules, so that they are always in increments of 10.

The number of rules created for a released product may be many. In order to get a better understanding of what each rule is overriding and why it's needed, we recommend using the **Grid view** on the **Default order**

settings page. You can enable the grid view by going to **Options > Page options > Change view > Grid view**. The number of columns displayed in the grid could be quite significant, especially for the sales and inventory tabs. To limit the number of columns shown in the grid, groups of columns can be hidden or displayed by using the buttons on the **Default order settings > Column display** menu.

Specific order settings for released product variant

If the rule system for default order settings is too cumbersome, then there is the option to define default order settings for each product variant. The following example shows how this will look for the product and the cases described above.

RANK	SITE	CONFIGURATION	VERSION	PURCHASE - OVERRIDE DEFAULT SETTINGS	PURCHASE LEAD TIME	PURCHASE - STOPPED	SALES - OVERRIDE DEFAULT SETTINGS	SALES - STOPPED
10		C2	V3	Yes	5			
10		C2	V2	Yes	5	Yes	Yes	Yes
10		C2	V1	Yes	5	Yes	Yes	Yes
10		C1	V3	Yes	2			
10		C1	V2	Yes	2	Yes	Yes	Yes
10		C1	V1	Yes	2	Yes	Yes	Yes
0					5			

The rank in this case doesn't really matter, so you can choose to hide it. This solution potentially introduces a maintenance issue. However, you may want to consider using this setup if you are considering integrating with Product Lifecycle Management (PLM) systems.

Use strict or standard validation of default order quantities

You can choose how strict the system should be when validating quantities entered in the **Default order settings** for a product. When you use the new strict option, the **Standard order quantity** must always be a multiple of the specified **Multiple** value for purchase orders, inventory, and sales orders. If you are using strict validation, you won't be able to save default order settings that don't meet this requirement (and an error is shown in the message bar).

Strict validation applies to **Standard order quantity** values specified on the **Purchase order**, **Inventory**, and **Sales order** FastTabs of the **Default order settings** page. Each FastTab has its own **Multiple** setting, which is used to validate the **Standard order quantity** value specified for that FastTab.

Enable the strict validation option

Before you can use the strict validation option, it must be enabled on your system. Administrators can use the [Feature management](#) page to check the feature status and enable it if needed. Here, the feature is listed as:

- **Module** - *Product information management*
- **Feature name** - *Strict validation on default order quantities*

Set the validation option

To set the validation option:

1. Go to **Product information management > Setup > Product information management parameters**.
2. On the **General** tab, set **Validation on default order quantities** to one of the following values:
 - **Strict** - Select this option to ensure that all **Standard order quantity** values will be a multiple of the **Multiple** value for each FastTab (**Purchase order, Inventory, and Sales order**).
 - **Standard** - Select this option to use standard validation (which works the same as when this feature isn't enabled).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Bills of materials and formulas

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about bills of materials (BOMs) and formulas, which are a central part of the definition of products and product variants. BOMs and formulas specify the required materials or ingredients for a specific product. Formulas also specify the co-products and by-products that are received in a specific production context.

Bills of materials

A bill of materials (BOM) defines the components that are required in order to produce a product. The components can be raw materials, semi-finished products, or ingredients. In some cases, services can be referenced in a BOM. However, BOMs typically describe the *material resources* that are required.

When it's combined with a route or production flow that describes the operations and resources that are required in order to build a product, the BOM forms the foundation for calculating the estimated cost of the product.

A BOM is an individual entity that is described by the following information:

- BOM ID
- BOM name
- The BOM lines that describe the components and ingredients
- The BOM versions, which define the product and period that the BOM can be used for

A single BOM describes a single level that is identified by a unique ID. Components might have their own BOMs that are referenced by BOM versions. You can display and edit the complete hierarchy of BOMs for a specific product in the BOM designer.

Formulas, co-products, and by-products

A formula is a subtype of BOM that is typically used for process manufacturing. In addition to components and ingredients, a formula describes co-products and by-products. In the actual version, the definition of co-products and by-products for the formula requires the formula version. A formula is typically defined for one specific finished product (a formula or planning item) that is defined in the formula version.

BOMs in the product lifecycle

In the product lifecycle, many types of BOM might be created for various reasons:

- **Sketching/Draft BOM** – This BOM gives a draft estimation of required materials in an early design phase and helps you do a rough estimate of cost and estimated product attributes. This BOM isn't usually used in enterprise resource planning (ERP).
- **Engineering BOM** – This BOM is typically used when you design products that are based on existing product portfolios. Engineering BOMs are structured to simplify the design process and group complex products into engineering modules. For simple products, it might be possible to use engineering BOMs for the actual production process. However, for other products, the engineering BOM must be converted to an actual production BOM. Engineering BOMs are typically represented by phantoms in the BOM hierarchy. Although engineering BOMs can be used for the planning and execution of manufacturing operations, this approach can lead to inefficiencies, especially in repetitive operations where many orders are created.
- **Planning BOM** – This BOM is used to do planning for material requirements. The demand of components and ingredients is calculated based on the demand of the finished products. Like costing BOMs, planning BOMs might represent a specific mix of material that is used in a period.

- **Production BOM** – This is the actual BOM that is used for a specific production. A production BOM must take into account the actual resources that are used to produce the product. When a production order, batch order, or kanban is created, the multiple levels of BOMs that are represented by phantoms are collapsed into one level and distributed over the operations for the order.
- **Costing BOM** – This BOM is used to calculate the estimated cost of a product. For example, you can use a costing BOM when standard cost is used or the estimated planned cost of a given product is calculated. Costing BOMs can refer to a specific mix of materials and resources that is expected to be used. Therefore, you can use the costing BOM to create a representative estimated cost for a period and help avoid variances over time.

The types of BOM that are actually used in an implementation depend on the implementation, and also on the business scenarios and requirements. In simple implementations, a planning BOM, production BOM, and costing BOM can be modeled as one BOM. In environments that have frequent engineering changes and multiple alternative routes, a larger set of BOM types will probably be required.

Approval of BOMs and formulas

Each BOM and formula can be separately approved or unapproved. Typically, approval of a BOM or formula occurs when the first relevant BOM version is approved. However, in some business scenarios, these approvals might be different steps in the process and might involve different process owners.

Note that, if a BOM is unapproved, all related BOM versions are also unapproved.

BOM and formula versions

To relate a specific BOM or formula to a product variant that can be produced, you must create a BOM version or formula version. The validity of BOM versions and formula versions can be constrained by period, quantity, site, specific product dimensions, and other criteria. Formula versions have additional important attributes, such as yield, co-product and by-product definitions, and the cost distribution instructions for the formula.

Approval of BOM and formula versions

Before a BOM version can be used in the planning or manufacturing process, it must be approved. When a BOM version is approved, the related BOM can also be approved, depending on the user's selection and authentication rights. Note that a BOM version can be approved only if the related BOM itself is approved.

Activation of the default BOM or formula version

To set a specific BOM or formula as the default BOM version or formula version that will be used by master planning or used to create production orders, you must activate the version. When a version is activated, the uniqueness of the version for the given constraints (for example, period, site, or quantity) is verified. You receive an error message if the version that you're trying to activate conflicts with a version that is already active. You must then either inactivate the conflicting version or modify the version constraints (usually the period) to prevent an ambiguous activation.

Product change with case management

The product change case for approval and activation of new or changed BOMs and BOM versions provides an easy way to see an overview of the BOM version constraints. You can also approve and activate all BOMs and formulas that are related to a specific change for one activation date.

Alternative BOM versions

Sometimes, the active BOM version or formula version should not be used in forecasts, sales, or a parent product. In this case, you can select a specific approved BOM as part of the requirement (forecast line, sales line, or BOM line) if an approved BOM version or formula version exists for the alternative BOM or formula.

When planned orders, production orders, or kanbans are created, the planner or shop floor supervisor can use any approved BOM version that is valid on the requested planned production date to plan for or produce a

specific product. The BOM version that is used doesn't have to be activated as the default BOM version.

BOM and formula lines

A BOM line is created for each material, service, or ingredient. The line defines the planned consumption of the specified product variant and also defines the various attributes that are related to the planned consumption.

BOM lines can have the following line types: **Item**, **Phantom**, **Pegged supply**, **Vendor**.

Item

Select the **Item** line type for materials or services that are directly consumed, and that don't require further explosion or pegged supply.

Phantom

Select the **Phantom** line type when you want to explode any lower-level BOM items that are contained on the BOM line. In Master scheduling, in planned cost calculation, or on estimation of a production order that uses BOM lines of the **Phantom** type, the parent BOM line that refers to a product variant that has a phantom BOM is replaced by the component items that are listed as BOM lines in that BOM, as determined by the applicable active BOM version of that product variant. If the product variant has an applicable active route, the operations of that route are merged into the parent route.

Note that phantoms are typically used to simplify the engineering process. Extensive use of phantom BOMs in many levels has an effect on performance, especially in highly repetitive manufacturing scenarios. To improve performance, you should avoid deep hierarchies of phantoms. Instead, use pre-exploded production BOMs and routes.

Pegged supply

Select the **Pegged supply** line type when you want to create a subproduction, a BOM line event kanban, or a direct purchase order for any product variant that the BOM line references. The subproduction, event kanban, or purchase order is created when you estimate the production order. The required item quantities are automatically reserved for the consuming production order.

Vendor

Select the **Vendor** line type if the production process uses a subcontractor, and you want a subproduction or purchase order to be created automatically for the subcontractor.

Note about subcontracted operations in a BOM: The service or work that is performed by the subcontractor must be created as service item that is tracked in inventory. You must attach the service item to the parent item as a BOM line. The route must contain an operation that is assigned to the subcontractor's operations resource.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

BOM designer functionality

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how you can use the BOM designer page to design and work with tree structures for bills of materials (BOMs). You can click Setup to select different configurations and specify what information appears on the lines of the tree.

When you open the **BOM designer** page from the **Released products** page, it displays the hierarchy of bills of materials (BOMs) that are active and approved for the selected item, the default order site of the item, and the actual date.

Click **Filter** to change the initial selection in the view. By setting the display principle to **Selected/Active or Selected**, you can select individual BOM or route versions to use in the view. You can select non-approved and non-active BOM versions to show or maintain in the BOM designer.

Note: If you open the BOM designer from the **Bills of materials** list page, it doesn't display route information. Currently, the selection of a BOM or route version is a property of the BOM and route version, and applies to all instances of the BOM designer.

The following sections describe the functionality that is available on the various tabs of the BOM designer.

Analyzing a BOM structure by using the BOM designer

The BOM designer has two sections:

- The tree view of the BOM structure.
- The details section, which shows details of the selected data. When you select a node in the tree view, the FastTabs in the details section are updated based on that node:
 - **BOM line details** – Shows the details of the BOM line that is selected in the tree view.
 - **Item data** – Shows the details of the main item or the item that is used in the selected node. You can click **Edit released product** to maintain the selected item.
 - **BOM** – Shows the header of the BOM that is related to the selected node.
 - **Route** – Shows the header of the route that is related to the selected node.
 - **Route operations** – Shows a preview of the operations for the route. When a BOM line that is assigned to a specific operation is selected, the operation is marked as **Component needed at operations**.

Selecting a BOM and route

The filter that is applied for the BOM and route is displayed in the header of the BOM designer. You can change the filter by using the **Filter** dialog box. The following table describes the fields in this dialog box.

FIELD	DESCRIPTION
Product dimensions	If the selected finished product is a product master, you can define the active product dimensions for the main selection. Note: If you open the BOM designer for a product that isn't a product master, no product dimensions can be selected in the Filter dialog box.

FIELD	DESCRIPTION
Site	Change the site that the BOM tree is displayed for. The default site is the default inventory site of the finished item.
Display principle	Select the version display principle that applies to the current BOM structure and the current route: <ul style="list-style-type: none"> • When the principle is set to Active or Selected/Active, the valid BOM or route version for this date is found. • When the principle is set to Selected/Active or Selected, you can select a BOM version or route version by clicking BOM > BOM versions or Route > Route versions.
Version date	Enter the version date for the BOM and route. The version identifies which BOM version is used on a specific date, as determined by the version dates in the BOM version setup.
From quantity	Filter the versions by selecting a specific from quantity. If you set a value, different BOM and route versions might be selected.
Show valid only	When you select the check box, the tree structure shows only BOM lines that have valid dates. Right-click or double-click a BOM line to open the Edit BOM line page, where you can see the validity dates for that BOM line.

When you use the BOM designer to review or edit BOMs that consist of one or more levels of phantoms, the route that is associated with the top item typically spans the complete BOM hierarchy. To simplify the overview, you can lock the top-level route in the display by clicking **View > Lock route**. To unlock the route, click **View > Unlock route**.

Adding and editing BOMs and BOM lines

Use the **BOM lines** or **BOM** functions to modify the BOM lines or BOM. When you select a node in the tree, the type of the node determines that functions that are available.

FUNCTION	DESCRIPTION	NODE TYPE AND CONDITIONS
BOM lines > Edit	Open a dialog box where you can edit the BOM line attributes.	This function is available when a BOM line node is selected.
BOM lines > Delete	Delete a BOM line from the selected BOM.	This function is available when a BOM line node is selected, and the BOM isn't locked for editing.
BOM lines > Add before line	Open a dialog box where you can select a product variant to include before the selected BOM line.	This function is available when a BOM line node is selected.

FUNCTION	DESCRIPTION	NODE TYPE AND CONDITIONS
BOM lines > Add to component BOM	Open a dialog box where you can select a product variant to include at the end of the selected BOM.	This function is available when the node that is selected has a selected BOM. If this function isn't available, a BOM version might be missing for the selected item variant. In this case, you can click BOM > Create version to create the missing version for the selected node.
BOM lines > Add after line	Open a dialog box where you can select a product variant to include after the selected BOM line.	This function is available when a BOM line node is selected.
BOM > Create version	Create a new BOM version or BOM for the product variant of the selected node.	This function is available when the BOM line node that is selected is linked to an item that has a production type of BOM or Formula .
BOM > Calculation	Open a dialog box where you can run the cost or sales price calculation for the selected product variant.	This function is available when the node that is selected is related to a BOM version.
BOM > Check	Validate and check the selected BOM.	This function is available when the node that is selected is related to a BOM version.

Configuring the tree view

Click **Setup** to customize the information that is shown in the tree view of the BOM designer.

FIELD GROUP	DESCRIPTION
BOM	Use the check boxes to select the criteria that are shown in the tree structure. The BOM designer displays the selected criteria at the bottom of both tabs.
Route	Use the check boxes to select the criteria that are shown for the routes.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Formula designer

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to use the formula designer to analyze and maintain formulas in a tree view.

When you open the **Formula designer** page from the **Released products** page, the tree in the left pane shows the list of co-products and the hierarchy of ingredients for the released product. The structure is derived from the hierarchy of formulas that are active and approved for the selected item and its ingredients, the default order site of the item, and the actual date.

Click **Setup** to select different configurations and specify what information appears on the lines of the tree.

Click **Filter** to change the initial selection in the view. If you set the display principle to **Selected/Active** or **Selected**, you can select individual formula or route versions to use in the view. You can select non-approved and non-active formula versions to show or maintain in the formula designer.

NOTE

If you open the **Formula designer** page from the **Bills of materials** list page, it doesn't show route information. Currently, the selection of a formula or route version applies to all instances of the formula designer.

The following sections describe the functionality that is available in the BOM designer.

Analyze a formula structure by using the formula designer

The formula designer has two sections:

- The tree view of the formula structure.
- The details section, which shows details of the selected data. When you select a node in the tree view, the FastTabs in the details section are updated based on that node:
 - **Formula line details** – View the details of the formula line that is selected in the tree view.
 - **Item data** – View the details of the main item or the item that is used in the selected node. You can click **Edit released product** to maintain the selected item.
 - **Formula** – View the header of the formula that is related to the selected node.
 - **Route** – View the header of the route that is related to the selected node.
 - **Route operations** – View a preview of the operations for the route. When a bill of materials (BOM) line that is assigned to a specific operation is selected, the operation is marked as **Component needed at operations**.

Select a formula and route

The filter that is applied for the formula and route is shown in the header of the formula designer. You can change the filter by using the **Filter** dialog box. The following table describes the fields in this dialog box.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
Product dimensions	If the selected finished product is a product master, you can define the active product dimensions for the main selection. Note that if you open the formula designer for a product that isn't a product master, no product dimensions can be selected in the Filter dialog box.
Site	Change the site that the ingredient tree is shown for. The default site is the default inventory site of the finished item.
Display principle	Select the version display principle that applies to the current formula structure and the current route: <ul style="list-style-type: none"> • When the principle is set to Active or Selected/Active, the valid formula or route version for this date is found. • When the principle is set to Selected/Active or Selected, you can select a formula version or route version by clicking Formula > Formula versions or Route > Route versions.
Version date	Enter the version date for the formula and route. The version identifies which formula version is used on a specific date, based on the version dates in the formula version setup.
From quantity	Filter the versions by selecting a specific "from" quantity. If you set a value, different formula and route versions might be selected.
Show valid only	When you select the check box, the tree structure shows only formula lines that have valid dates. Right-click or double-click a formula line to open the Edit formula line page, where you can see the validity dates for that formula line.

When you use the formula designer to review or edit formulas that consist of one or more levels of phantoms, the route that is associated with the top item typically spans the complete formula hierarchy. To simplify the overview, you can lock the top-level route in the display by clicking **View > Lock route**. To unlock the route, click **View > Unlock route**.

Add and edit formulas and formula lines

Use the **BOM lines** or **Formula** functions to modify the formula lines or formula. When you select a node in the tree, the type of the node determines the functions that are available.

FUNCTION	DESCRIPTION	NODE TYPE AND CONDITIONS
BOM lines > Edit	Open a dialog box where you can edit the formula line attributes.	This function is available when a formula line node is selected.
BOM lines > Delete	Delete a formula line from the selected formula.	This function is available when a formula line node is selected, and the formula isn't locked for editing.

FUNCTION	DESCRIPTION	NODE TYPE AND CONDITIONS
BOM lines > Add before line	Open a dialog box where you can select a product variant to include before the selected formula line.	This function is available when a formula line node is selected.
BOM lines > Add to component BOM	Open a dialog box where you can select a product variant to include at the end of the selected formula.	This function is available when the node that is selected has a selected formula. If this function isn't available, a formula version might be missing for the selected item variant. In this case, you can click Formula > Create version to create the missing version for the selected node.
BOM lines > Add after line	Open a dialog box where you can select a product variant to include after the selected formula line.	This function is available when a formula line node is selected.
Formula > Create version	Create a new formula version or formula for the product variant of the selected node.	This function is available when the formula line node that is selected is linked to an item that has a production type of BOM or Formula .
Formula > Calculation	Open a dialog box where you can run the cost or sales price calculation for the selected product variant.	This function is available when the node that is selected is related to a formula version.
Formula > Check	Validate and check the selected formula.	This function is available when the node that is selected is related to a formula version.

Configuring the tree view

Click **Setup** to customize the information that is shown in the tree view of the formula designer.

FIELD GROUP	DESCRIPTION
BOM	Use the check boxes to select the criteria that are shown in the tree structure. The formula designer shows the selected criteria at the bottom of both tabs.
Route	Use the check boxes to select the criteria that are shown for the routes.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Override the default reservation principle for materials in production

2/18/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

The *Override default production reservation* feature lets you set a default reservation principle for each item model group. Therefore, different reservation principles can automatically be applied for each item that is part of a production bill of materials (BOM) or batch order formula. You can select whether each item model group should override the default reservation principle that is set for an order, and what reservation principle should be used instead (*manual, estimation, scheduling, release, or start*).

When you create a new production order or batch order, you're prompted to select the reservation principle that should be applied to that order and all its BOM lines or formula lines. When the *Override default production reservation* feature is used, some or all of the BOM or formula lines can override that reservation principle and instead use the reservation principle that is set for the relevant item model group.

For example, if you have raw materials or ingredients that require pick work, BOM or formula lines that are created for those products require a physical reservation, because physical reservation is a prerequisite for the generation of warehouse work. Typically, if you want the reservation to occur automatically, you select one of the following reservation principles: *estimation, scheduling, release, or start*. On the other hand, if you have materials or ingredients that don't require pick work, because they are consumed directly from a location, you typically select the *manual* reservation principle, which doesn't make any physical reservations or generate any pick work.

Turn on the feature

Before you can use the feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Production control*
- **Feature name:** *Override default production reservation*

Assign a production reservation policy to an item model group

1. Go to **Cost management > Inventory accounting policies setup > Item model groups**.
2. Create or select an item model group.
3. On the **Inventory policies** FastTab, select the **Override item production reservation** check box.
4. In the **Reservation** field, select the reservation principle for items that belong to the selected model group. (Those items include items that are on a BOM or formula line.)
 - **Manual** – Items in the model group won't automatically be physically reserved for production. However, they can still be manually reserved as required.

- **Estimation** – Items in the model group will be physically reserved during estimation of the production order.
- **Scheduling** – Items in the model group will be physically reserved during scheduling of the production order.
- **Release** – Items in the model group will be physically reserved when the production order is released.
- **Start** – Items in the model group will be physically reserved at the start of the production order.

Example: Using reservation principles in a bulk/pack scenario

A bulk lubricant material is produced in a 1,000-liter mixer. After the bulk material is ready, it's pumped out to several filling stations, where bottles of different sizes are filled. After filling is completed, the bottles are packed into boxes. Those boxes are then packed onto pallets.

In this scenario, a batch order to make 1,000 liters of bulk material is created. (This order is the bulk order.) When this batch order is completed, it's reported as finished to the material input location of the filling stations. A batch order to fill and pack each bottle size is then created. (These orders are the pack orders.) The pack orders have a formula that consists of the bulk material, an empty bottle, a label, and other packing materials. Because the bulk material flows directly from the mixer tank to the filling stations, no warehouse work is required to pick this ingredient, and the bulk material is consumed directly from the input location. Therefore, the reservation principle is set to *manual*. The other materials are staged to the filling station by pick work. Therefore, the reservation principle for these lines is set to *release*, for example, so that the reservation automatically occurs when the pack order is released.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add variant products to purchase orders using variant weights

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through the steps for using variant weights to auto populate purchase order lines for each variant of a product. When you select the quantity of the product you want to purchase, purchase order lines are created for all the variants of the product with suggested quantities based on the weights configured on the product variants. This procedure doesn't include steps to configure weight values on product dimensions and product variants. This procedure uses the USRT company in demo data.

1. Go to Accounts payable > Purchase orders > All purchase orders.
2. Click New.
3. In the Vendor account field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. Toggle the expansion of the General section.
6. In the Site field, click the drop-down button to open the lookup.
7. In the list, click the link in the selected row.
8. In the Warehouse field, click the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. In the list, click the link in the selected row.
11. Click OK.
12. Toggle the expansion of the Line details section.
13. Click the Variants tab.
14. Click Add line.
15. In the list, mark the selected row.
16. In the Item number field, type '0140'.
17. Set Quantity to '1000'.
18. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a sales order for a configurable product

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to apply a configuration template to a product on a sales order. This example uses the D0006 speaker model in the USMF demo data company. Typically, a sales order processor uses this procedure.

Create a sales order

1. Click Sales order processing and inquiry.
2. Click New.
3. Click Sales order.
4. In the Customer account field, select US-001.
5. Click OK.
6. In the Item number field, select D0006.
 - For this task, you must select a configurable product.
7. Click Product and supply.
8. Click Configure line.
 - Note that the price has changed, based on the configuration that was selected, and that the Include cable field is now set to True.
 - Note the default price and the settings that are selected for the cable.
9. Click Load template.
 - This example shows how you can apply a template to select a predefined configuration. If you're using this procedure as a task guide and want to see the other attribute values that are available, you must click the Unlock button.
10. Click OK.
11. Click OK.
12. Expand the Line details section.
13. Click the Product tab.
 - The configuration of the item is now listed under the product dimensions.
14. Close the page.

Select the product configuration

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create sales price selection criteria

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a sales price selection criterion for attribute-based sales price models. This procedure requires that at least one sales price model be available. This example uses the price model for the Speaker solution sales price model in the USMF demo data company. Typically, a product manager uses this procedure.

Add a new criterion for an existing sales price model

1. Click Product variant model definition.
2. Click Product configuration models.
3. In the list, select the row for the Speaker solution product model, but don't click the link for the model name.
4. On the Action Pane, click Model.
5. Click Price model criteria.
6. Click New.
7. In the Name field, type 'Customer group 10'.
 - The name of the price model criterion is used to help identify the underlying selection criteria.
8. In the Price model field, enter or select a value.
9. In the Order type field, select Sales order.
 - The order type determines the database fields that will be available for the selection query.
10. In the Valid from field, enter a date.
11. In the Expire by field, enter a date.
12. Click Save.

Create the query for the selection criteria

1. Click Edit.
2. In the Table field, select Customers.
3. In the Field field, select Customer group.
 - In this example, we will use a specific customer group for the selection criteria.
4. In the Criteria field, select Customer group 10.
5. Click OK.

Set up attribute-based pricing for configurable products

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up attribute-based pricing. As a prerequisite, you must have a product configuration model that has one or more components and attributes. This example uses the High End Speaker product model in the USMF demo data company. Typically, a product manager uses this procedure.

Create a new price model

1. Select **Product variant model definition** on the home page.
2. Select **Product configuration models** in the **links** section.
3. In the list, select the **High End Speaker** line, but don't select the link for the name.
4. On the Action Pane, select **Model**.
5. Select **Price models**.
6. Select **New**.
7. In the **Price model name** field, type a value. Use a name that makes the model easy to identify.
8. In the **Description** field, type a value.
9. Select **Save**.

Add price elements

1. Select **Edit**. Each component in a product model can have a base price element and any number of price expression rules. You can also add prices in different currencies.
2. In the **Base price expression** field, type a value. For example, type 100. A base price expression can be a numerical value, or it can consist of an arithmetic calculation that involves one or more attributes.
3. Select **Add**.
4. In the **Name** field, type . The price expression name helps identify what the price element represents. In this example, we are creating a price element for the Rosewood speaker cabinet finish option.
5. Select **Edit condition**. A price condition helps guarantee that a price expression element is included in the sales price only if a specific combination of attributes is present.
6. In the **ConstraintBody** field, enter .
7. Select **OK**.
8. In the **Expression** field, type a value. For example, type .
9. Close the page.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

BOM calculations

2/18/2021 • 9 minutes to read • [Edit Online](#)

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the **Calculations** page. This topic provides information about BOM calculations.

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the **Calculations** page. You use the **Calculations** page to perform the following tasks:

- Calculate the cost of a manufactured item, and generate an associated item cost record within a costing version.
- Calculate the sales price of a manufactured item, and generate an associated item sales price record within a costing version.

The way that you use the **Calculations** page varies slightly, depending on how you initiate the BOM calculations. The way that you use the **Calculations** page also depends on whether the BOM calculations involve a costing version for standard costs or planned costs, and on several policies that are defined in the costing version that is used in the BOM calculations. **Note:** A variation of the **Calculations** page is used in the context of a sales order, sales quotation, or service order line item. These calculations are known as order-specific BOM calculations. An order-specific BOM calculation doesn't generate an item cost record within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation details** page. The calculation record includes a calculated cost and a calculated sales price. The **Calculations** page can be opened for a single manufactured item or for a costing version:

- To calculate costs for a single manufactured item, you initiate BOM calculations from the **Item price** page. The **Calculations** page inherits the item identifier. The costing version, BOM version, route version, calculation quantity, calculation date, and site must be specified.
 - By default, the BOM version and route version are set to the active versions for the item, site, date, and calculation quantity. However, you can override the default values with approved versions.
 - By default, the calculation quantity is set to the item's standard order quantity. However, you can override the default value.
 - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version. A future calculation date determines how pending cost records are used. BOM calculations use a pending cost record that has the nearest from-date that is on or before the calculation date.
- To calculate costs for all manufactured items or selected items, or to update items on a where-used basis, you initiate BOM calculations from the **Costing version setup** page or the **Costing version maintenance** page. The **Calculations** page inherits the costing version.
 - For the calculations, it's assumed that the active BOM version and route version are used for a manufactured item (and for the related site, date, and quantity), unless a manufactured component has a specified sub-BOM or subroute.
 - For the calculations, it's assumed that the standard order quantity is used for manufactured items. The standard order quantity provides the basis for calculating component quantities, determining the relevant BOM versions and route versions (when you use quantity-sensitive BOMs and routes), and amortizing constant costs. However, when a manufactured component has a BOM line type of **Production** or **Vendor**, or when you use a make-to-order explosion mode for the BOM calculations, this assumption doesn't apply, because quantities reflect the specified calculation quantity.
 - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version.

Other variations in BOM calculations reflect the costing type and restrictions of the costing version:

- BOM calculations that use standard costs must be restricted by costing version policies, because the restrictions help guarantee that standard costing principles are used. Standard costing principles require the enforcement of restrictions about the use of standard costs for purchased items, a single-level explosion mode, and the inclusion of miscellaneous charges in unit costs.
- BOM calculations that use planned costs don't have to follow standard costing principles. These BOM calculations can use different explosion modes, alternative sources of cost data for purchased items, and optional enforcement of restrictions within the costing version.

BOM calculations that use standard costs

Policies within the costing version (for standard costs) can mandate enforcement of five BOM calculation policies. The **Recording restriction** option in the costing version mandates one of these policies, where miscellaneous charges must be included in the unit price. Miscellaneous charges for purchased items can be entered manually, whereas miscellaneous charges for manufactured items reflect the calculated amortization of constant costs. The **Calculation restriction** option in the costing version mandates the other four BOM calculation policies:

- The source of cost contributions for purchased items must be based on standard costs. In other words, BOM calculations must use the item cost records within the specified costing version, or within the fallback that contains standard costs.
- To help guarantee accurate and consistent calculation of standard costs, the explosion mode must be single-level.
- To help guarantee consistent results when the sales price of the items is calculated, the profit setting must be mandated. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle must be mandated, and can be set to **None**, **Active** (for active cost records), or **Costing version** (for a specified costing version).

BOM calculations that use planned costs

Policies within the costing version (for planned costs) can optionally mandate enforcement of five BOM calculation policies. Alternatively, the policies can just provide default values. The **Recording restriction** option in the costing version determines whether the BOM calculation policy about miscellaneous charges will be mandated or act as a default value. Miscellaneous charges can optionally be included in the unit price. The **Calculation restriction** option in the costing version determines whether the other four BOM calculation policies will be mandated or act as default values:

- The source of cost contributions for a purchased item can be the item cost records within a costing version. Alternatively, the source can be defined by the BOM calculation group that is assigned to the item. For example, the BOM calculation group can define purchase price trade agreements as the source of cost contribution data.
- The explosion mode can be single-level, multilevel, or make-to-order, or it can be based on the BOM line item. The explosion mode for the BOM line type replicates the cost calculation logic for production order estimates.
- The profit setting can be mandated, or it can be a default value. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle can be mandated, or it can be a default value. The fallback principle can be set to **None**, **Active** (for active cost records), or **Costing version** (for a specified costing version).

BOM calculations generate warning messages and other types of messages. Several BOM calculation policies determine the types of messages. The warning conditions are defined in the BOM calculation group that is assigned to items. However, you can override these warning conditions when you initiate a BOM calculation. When the fallback principle is used, it's often helpful if the fallback is shown as an information message. When

you're trying to update calculated costs for items that have missing cost records, it's also helpful if the information message identifies items that weren't updated.

BOM calculations that use the fallback principle

The following situations illustrate two uses of the fallback principle:

- **Two-version approach to standard cost updates** - A costing version can contain the incremental changes to standard costs, such as pending cost records that represent new items or cost changes. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.
- **Simulation of the effect of cost changes by using planned costs** - A costing version for planned costs can contain incremental changes for simulation purposes. This costing version will include pending cost records that represent the simulated cost changes to items, cost categories, and calculation formulas for indirect cost. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.

BOM calculation of a suggested sales price

When you use a cost-plus-markup approach, the calculated sales price for an item reflects the set of profit-setting percentages that is specified for the BOM calculation, and the costs that are associated with the item's component items, routing operations, and applicable manufacturing overheads. The markup reflects profit-setting percentages that are assigned to cost groups, and the cost groups that are assigned to items, cost categories for routing operations, and the indirect cost calculation formulas for manufacturing overheads. The sets of profit-setting percentages are labeled **Standard**, **Profit 1**, **Profit 2**, and **Profit 3**. Within the Profit 1 set, for example, a profit-setting percentage of 50 percent can be defined for a cost group that is assigned to purchased material, and a profit-setting percentage of 80 percent can be defined for a cost group that is assigned to cost categories for routing operations. The context of the BOM calculation determines how the results of a calculated sales price are handled:

- **BOM calculation for an item and specified costing version** - The BOM calculation generates a pending sales price record within the costing version. This sales price record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). The sales price record acts mainly as reference information and isn't used as the basis for a sales price on sales orders.
- **Order-specific BOM calculation** - A variation of the **BOM calculation** page is used in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation doesn't generate a record in the within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation results** page. This calculation record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). Information about a selected calculation record can be transferred to the originating line item. For example, the calculated sales price can be transferred to a sales order line item.

Order-specific BOM calculations

An order-specific BOM calculation represents a variation of a BOM calculation for a manufactured item. The order-specific BOM calculation is performed in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation generates a calculation record that appears on the **BOM calculation results** page. The calculation record includes a calculated weight, a calculated cost that is based on active cost records, and a calculated sales price. The calculation record that each order-specific BOM calculation for an item generates on the **BOM calculation results** page is uniquely identified by a calculation number. The results of a calculation record can be optionally transferred to the originating line item. An order-specific BOM calculation differs from a BOM calculation for a manufactured item in two ways:

- An order-specific BOM calculation doesn't generate an item cost record within a costing version. Therefore,

the BOM calculation policies aren't applied when an item cost record is created, or when a cost record is overwritten.

- An order-specific BOM calculation always uses the active cost records for components, cost categories, and indirect cost calculation formulas.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot product information

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with product information.

I can't delete a released product.

Issue description

You can delete a released product and all its variants only if the released product doesn't have any related transactions.

Issue resolution

Follow these steps to delete a released product or product master.

1. Close all open transactions for the items.
2. Reduce the inventory to 0 (zero).
3. Perform inventory closing.
4. Delete all product variants for the product master that you want to delete.

Can I change the item number of a released product?

In most cases, you can't edit item numbers for released products, because that change will cause data to become corrupted. You can edit the item number only if you must repair data corruption that was caused by a previous rename of the primary key of that released product, as mentioned in the list of [removed or deprecated features for Finance and Operations 10.0.0 with Platform update 24](#).

If you want to be able to edit item numbers for released products, [vote for this idea in Ideas portal](#).

The default flushing principle from the product isn't being entered on the bill of materials line.

Issue description

When you add an item to a bill of materials (BOM) line, the system doesn't use the default flushing principle information that is set up for the item. In other words, the flushing principle from the item doesn't appear on the BOM line page.

Issue resolution

If you specify a flushing principle on a BOM line, it will apply to that BOM line. However, if the flushing principle is blank, or if it isn't set on a BOM line, the flushing principle that is set on the item will still apply to that BOM line, even though it isn't shown on the BOM line.

The defaulting logic for other features in Microsoft Dynamics 365 Supply Chain Management doesn't usually work in this way. However, the current behavior can't be changed. Otherwise, some existing customizations that rely on it might be broken.

The system lets me save duplicate bar codes for different items or for the same item that has different dimensions.

The system doesn't currently enforce unique bar codes, and the addition of this restriction would be a breaking

change. In fact, Microsoft has evidence that some existing customer installations would be broken by this change. However, we will consider a broader design change to enable this feature in the future.

I receive the following error message when I edit item record templates: "The warehouse location cannot be created because the item is not stocked. To stock items, the Stocked product option on the associated item model group must be selected."

Issue description

This issue occurs if you follow these steps to try to create a template for an item that isn't stocked.

1. Open a released product that isn't stocked.
2. On the Action Pane, on the **Options** tab, select **Record info**.
3. In the **Record information** dialog box, select **Company accounts template**.

In this case, you receive the following error message:

The warehouse location cannot be created because the item is not stocked. To stock items, the Stocked product option on the associated item model group must be selected.

Issue resolution

The process of creating product templates requires extra product-specific logic. Therefore, you can't use the generic **Company accounts template** button for this purpose. Instead, follow these steps.

1. Open a released product.
2. On the Action Pane, on the **Product** tab, in the **New** group, select **Template > Create shared template**.

Default Help text that is added in product attributes isn't entered in a released product.

A description and Help text that are added in the product attributes aren't visible or entered by default in the released products. This behavior is by design.

The default quantity that is entered differs when it's registered from a BOM and when it's registered from a BOM version.

Issue description

By default, when you add an item to a BOM, the quantity is set to 1 instead of the quantity that is defined in the **Min. order quantity** field on the **Default order settings** page for a selected product. However, when you add an item from a BOM version, and the item and variant are selected, the quantity that is entered by default takes into account the minimum quantity that is set in the default order settings for the specific dimensions.

Issue resolution

This behavior is expected. However, the fact that the logic differs in the BOM and the BOM version is a known issue. Nevertheless, this behavior won't be changed, because a change could affect many different customer scenarios.

In the released product details, I can't change the attached images that were uploaded from the Product document attachments data entity.

Issue description

This issue can occur when you attach an image to an item by using the *Product document attachments* data entity. In this case, the item image is shown for the item. However, if you select **Change image**, nothing is shown in the list of uploaded images. Additionally, no attachments are shown for the item.

Issue resolution

The *EcoResProductDocumentAttachmentEntity* entity (*Product document attachments*) imports document attachments for *products* but not for *released products*. (Released products are also known as *items*.) To view the attachments for an item on the **Released product details** page, you must use the *EcoResReleasedProductDocumentAttachmentEntity* entity (*Released product document attachments*) instead.

The Microsoft Flow connector shows the following error message: "Update not allowed for field 'ProductNumber'."

Issue description

This issue occurs if you try to update the **Product number** field by using the *Released products* entity V2 and Microsoft Flow.

Issue resolution

This behavior is expected. The ability to edit the product number for a released product was removed in Dynamics 365 Finance and Operations 10.0.0 with platform update 24 to help prevent data corruption. In exceptional cases, where you must repair data corruption that was caused by a previous rename of the primary key of a released product, you can ask Microsoft Support to temporarily remove this restriction.

I can't create a released product variant in another legal entity.

Issue description

If you try to release a product master without variants, and then create the variants in each legal entity (company) as they are required, you won't be able to release the variants by using variant suggestions. You also won't be able to manually create the variants.

Issue resolution

This behavior is by design. The relations of a product master and the dimensions that the master can take are kept at a shared level. Therefore, you can't create the available dimensions for a shared product master in the specific legal entity where those dimensions are released and then replicate the process in each legal entity where the dimensions are required. Instead, you must change your release process to adapt to the designed process.

Here is the process for releasing products.

1. Create the shared product master and the dimensions that can be released to the legal entities.
2. Release the products to the legal entities either by using variant suggestions or by manually adding the combinations that should be released.

Alternatively, you can directly create the released product.

When I release a variant in another company, I receive the following error message: "Product variant with specified dimensions has already been created."

Issue description

If a product variant has already been released in a company A, and you try to release it in company B by using

the **New** button on the **Released product variants** page, you will receive the following error message:

Product variant with specified dimensions has already been created.

Issue resolution

The **New** button on the **Released product variants** page creates the variant and releases it in the company context. If the variant has already been created, you can't use the **New** button to release it in another company.

To fix the issue, open the **Product master** page, and select **Release product** to release the existing variant in the desired company.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product configuration overview

2/18/2021 • 9 minutes to read • [Edit Online](#)

The need to configure products to meet special requirements is becoming the rule rather than the exception, in both business-to-business and business-to-consumer relationships.

A manufacturer that supports configure-to-order scenarios has an opportunity to tend more carefully to customer needs. Additionally, by stocking semi-finished goods in the form of generic components instead of finished products, the manufacturer can reduce the capital that is tied to inventory.

A successful move from a manufacture-to-stock setup to a configure-to-order setup requires careful analysis of the product structures, identification of product families, and componentization. To reduce the number of parts and minimize the number of goods that are in process, it's very important that you understand the product interfaces, and that you design for reusability.

There are several product configuration modeling principles, such as rule-based, dimension-based, and constraint-based modeling. Studies show that the constraint-based methodology can reduce the number of code lines in models by about 50 percent compared to other modeling principles. Therefore, this methodology can reduce the total cost of ownership (TCO). By moving from a rule-based model that is based on X++ code to a constraint-based model, you no longer require a developer license in order to maintain product models.

Product configuration

The industrialization period has led to great achievements in producing high-quality and feature-rich products at affordable prices. The economies of scale have made it possible for most people in the industrialized world to buy cars, TVs, household appliances, and other goods that most of us consider a necessary part of our everyday life.

As many products have become commodities, a need to differentiate them has arisen. The immediate response of manufacturers to this challenge has been to create variants of each product, so that customers have more alternatives. This strategy has led to increased forecast challenges, and also to an increase in inventory cost and unsold products that become obsolete.

By adopting a configure-to-order philosophy, manufactures have an opportunity to meet customer demand for unique products while reducing or eliminating obsolete inventory items. When a manufacture-to-stock philosophy is shifted to a configure-to-order philosophy, one immediate challenge that arises is that the need for short lead times must be balanced against low inventory levels.

The key to success here is to carefully analyze the product portfolio, and to look for patterns in both product features and processes. The goal is to identify generic components that can be manufactured by the same equipment and used in all variants.

The new Product configuration feature set includes a user interface (UI) that provides a visual overview of the product configuration model structure, and also a declarative constraint syntax that doesn't have to be compiled. Therefore, companies that want to support a configuration practice can get started more easily. As the following sections explain, a product designer no longer requires the support of a developer to build a product configuration model, test it, and release it to the sales organization.

Building a product configuration model

There are several approaches that a user can take to build a product configuration model. One option is to follow a sequential flow by first creating all the reference data, such as product masters, distinct products, and

operational resources, and then including them as components, bill of materials (BOM) lines, route operations, and other elements of the product configuration model. Alternatively, you can select a more iterative approach by first creating the model and then adding reference data as the need arises.

Components

A product configuration model consists of one or more components that are tied together through subcomponent relationships. Components are defined one time, and can then be used many times in one or more product configuration models. The components are the main building blocks of a product configuration model, and nearly all information about the model is related to them.

Attributes

Each component has one or more attributes that identify its properties. The attributes are what users will choose during the configuration process. Attributes control both inter-component and intra-component relationships through inclusion in constraints or calculations. Through conditions that are applied to BOM lines, the attributes can be used to determine which physical parts the configured product will consist of. Additionally, an attribute can control the property of a BOM line through a mapping mechanism. Similar functionality exists for route operations regarding both inclusion and property settings.

NOTE

When you create attribute types, avoid creating a high number of values for the attribute type domain. Doing so could cause slowdowns in the product configurator.

Expression constraints

Use of a constraint-based product configuration model implies that some limitations exist when the user selects values for the various attributes. Such limitations can be implemented as expression constraints by using the Optimization Modeling Language (OML). Alternatively, a constraint can be implemented in the form of a table constraint.

Table constraints

Table constraints can be user-defined or system-defined.

A user-defined table constraint is built by the user. The user selects a combination of attribute types to represent the columns of the table and then enters values from the domains of the selected attribute types to form the rows in the table constraint.

A system-defined table constraint is defined by selecting which table to use as a reference and then selecting fields from this table to form the columns in the constraint. The rows of the table constraint are the rows of the Supply Chain Management table that are present at configuration time.

A table constraint is included in a product configuration model by referencing the table constraint definition and mapping the relevant attributes in the model to the columns in the table constraint.

Calculations

Calculations represent a mechanism for performing arithmetic operations in a configuration model. For example, a calculation can determine the length of a specific piece of raw material or the processing time for a polishing operation. Calculations are imperative and set the value for a target attribute after all the attribute values that are included in the calculation expression become available.

Subcomponents

Subcomponents represent the nodes in the product configuration model structure. For each subcomponent relationship, a reference must be specified to a product master that has the variant configuration technology set to constraint-based configuration.

User requirements

A user requirement has all the constituents of a subcomponent. The only difference is that a user requirement isn't bound to a product master. The practical effect of this difference is that any BOM lines or route operation that are defined in the context of a user requirement are collapsed into the parent component BOM structure or route. This behavior resembles the behavior of a phantom BOM.

BOM lines

BOM lines are included to identify the manufacturing BOM for each component. A BOM line must reference an item, and all item properties can be set to a fixed value or mapped to an attribute.

Route operations

Route operations are included to identify the manufacturing route. A route operation must reference a defined operation, and all operation properties can be set to a fixed value. All properties except resource requirements can be mapped to an attribute instead of a value.

Validating and testing a product configuration model

Validation of a product configuration model can occur on several levels in the model and can therefore cover various scopes. The lowest level is for a single expression constraint. In this case, validation is typically performed by the product designer to verify that the syntax of an expression is correct.

Similarly, a condition for a BOM line or a route operation can be validated in isolation.

Validation can also be done for a user-defined table constraint definition. In this case, the user can verify that the values that are entered for each field are inside the domain of the corresponding attribute types.

Finally, validation can be done for a complete product configuration model to verify that the complete syntax is correct, and that all naming and modeling conventions have been respected.

Testing

Testing a model is similar to running an actual configuration session. The user can walk through the configuration pages and verify that the model structure supports the configuration process. The user can verify that the attribute values are correct, and that the attribute descriptions guide the user to select the correct values. Finally, after a test session is completed, the system tries to create the BOM and the route that corresponds to the selected attribute values, and presents an error message if anything goes wrong.

The configuration page

To navigate between components, click **Next**, or click a component in the product configuration model tree to set focus on it.

Finalizing a model for configuration

When a product configuration model is ready to be used in configure-to-order scenarios, a version must be created. However, there are several options that can enhance the modeling experience.

User interface

The configuration UI can be modified by introducing attribute groups in one or more subcomponents. Such a grouping can highlight the relationships between specific attributes and help the configuration user identify the area of the product that is currently in focus.

Templates

One or more configuration templates can be created to speed up the configuration process. Alternatively, templates can be created to promote specific attribute combinations, such as when a sales campaign focuses on a specific set of product features.

Translations

If the product will be sold in different countries/regions, translations can be created for all text that appears in the configuration UI. This text includes not only name and description fields, but also attribute text values.

Versions

The last and most important step in the finalization process is to create a version for the product configuration model. The version represents the relationship between the product master, which can be selected for configuration on an order or quotation line, and the product configuration model. A version must be approved and activated before it can be used in a configuration session.

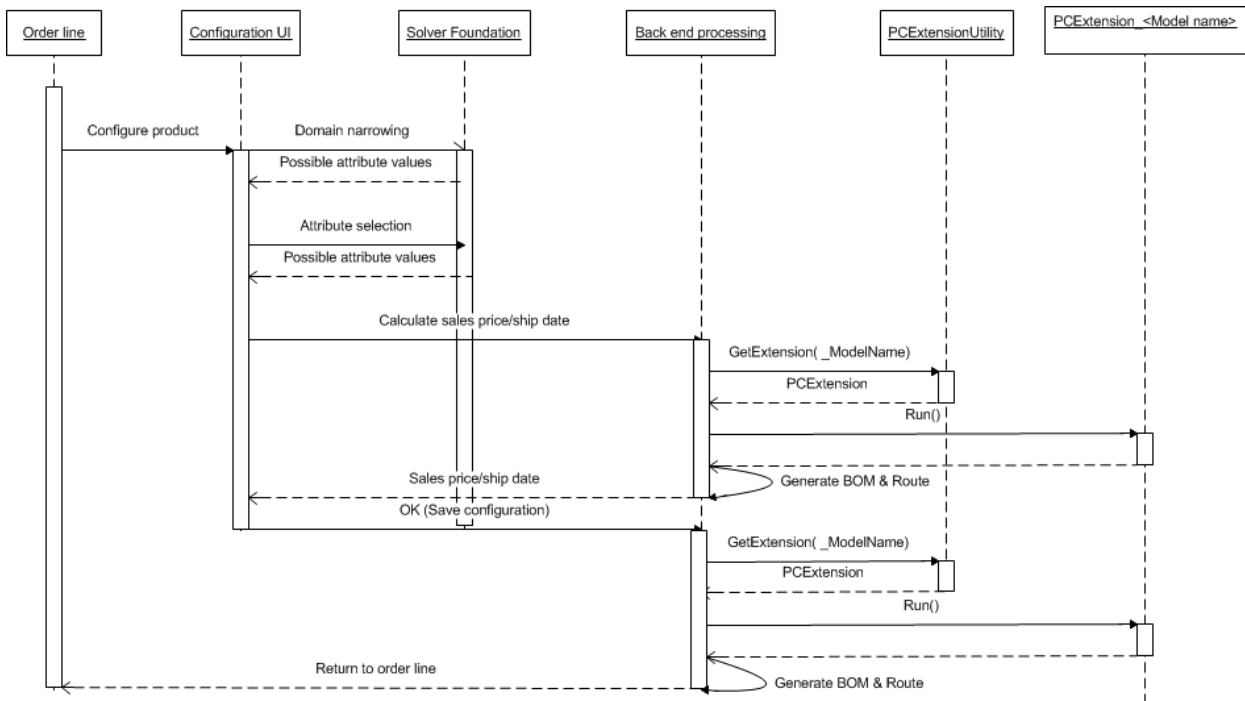

Extending a product configuration model through the API

A dedicated application programming interface (API) has been implemented, so that partners and others who have a developer license can extend the capabilities of a product configuration model. The main goal has been to establish a mechanism that lets partners and customers who use the existing Product Builder migrate the code that is embedded in Product Builder models to the API. In this way, they can migrate their models from Product Builder to a product configuration. However, new partners and customers can also benefit from using the API to extend new product configuration models.

PCAdaptor class

The API is implemented by using a set of **PCAdaptor** classes that expose the data structure of the product configuration models. An instance of the **PCAdaptor** class must be created for each model that will be extended. After a configuration session is completed, the system checks for an instance of this class and runs it if it's found.

The following flow diagram outlines the process.

Product configuration API flow diagram

Product configuration

Product configuration can be performed from the following places:

- Sales order line
- Sales quotation line
- Purchase order line
- Production order line

- Item requirement line (project)

The purpose of the configuration is to create a distinct variant of the product that meets the customer's requirement. A unique configuration ID is created for each new configuration. This ID enables tracking through inventory.

Multiple sites and intercompany

If configuration will be done at a site, or even a company, that differs from the site or company where production will occur, the BOM and the route will be created for and put at the supplier site in the supplying company. The product variant will be released in all companies that participate in the supply chain.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Dimension-based product configuration overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

Dimension-based product configuration represents a simple solution for creating many product variants from a single product master and its bill of materials.

Dimension-based product configuration is one of the three built-in product configuration technologies. The two other technologies are predefined variants and constraint-based configuration. All three technologies use a product master as the starting point and allow the user to create many product variants for one product master.

Key concepts

Dimension-based product configuration is based on the following key concepts:

- Product masters
- Configuration product dimension
- Configuration groups
- Bill of materials (BOM)
- Configuration route
- Configuration rules

Product masters

A product master is the starting point for any product configuration process. For the dimension-based product configuration, you need a product master with this particular configuration technology and a product dimension group that includes the configuration product dimension.

Configuration product dimension

The configuration product dimension is used to identify the product variants for a product master with the dimension-based configuration technology. The configuration dimension value is entered by the user and should help to identify the individual product variants.

Configuration groups

Configuration groups are defined in a central repository and can be used for all dimension-based product configuration models. Configuration groups are associated to the individual BOM lines and hold together a group of lines that are mutually exclusive. This means that only one line in a group can be selected for a single product variant.

Bill of materials (BOM)

The BOM represent the building blocks for a dimension-based product configuration. It must include all the different products that can be used in any product variant. Each line in the BOM can reference a configuration group. If a line doesn't reference a configuration group, it will be included in all product variants.

Configuration route

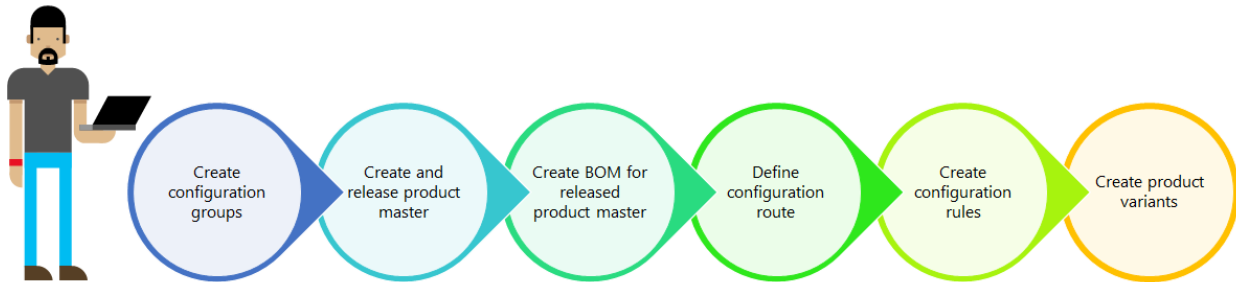

The configuration route determines the sequence of the configuration groups, as they will be displayed to the user during the product configuration process.

Configuration rules

The configuration rules represent a mechanism for ensuring that a product included in one configuration group in a BOM enforces either an inclusion or an exclusion of a product in a different configuration group in the same BOM.

Product modeling process

The natural sequence for building a product model for a dimension-based product starts with defining the relevant configuration groups. It is important to ensure that all products which will be used in the BOM have been released to the company that the product model is built for. With these building blocks in place, the user can create the BOM and assign configuration groups to all relevant BOM lines. When the BOM is complete, a configuration route can be defined for ordering the configuration groups in the proper sequence.

If there are certain products from different configuration groups that either must or must not be used together, you can create configuration rules that will enforce these product relationships. After the BOM has been tied together with a dimension-based product master through a BOM version and both have been approved and activated, you can create product configurations and enter a name for each configuration. The configurations can be defined before any transactions are generated or it can be done when the need for a certain configuration occurs.

Suggested use

The dimension-based configuration technology is best used for products with limited variability and the combination of the standard product dimensions size, color, style, and configuration is unsuitable for identifying a specific product variant. An example could be bicycle with frame height, wheel size, brake types, and different gears.

Next step

The following eight task guides are listed in the order in which you should complete them.

1. [Create a dimension-based product master](#)
2. [Release a dimension-based product master](#)
3. [Complete basic setup of a released product master](#)
4. [Define configuration groups](#)
5. [Create a bill of materials for a dimension-based product master](#)
6. [Define configuration routes](#)
7. [Create configuration rules](#)
8. [Create dimension-based configurations](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product dimensions

2/18/2021 • 7 minutes to read • [Edit Online](#)

There are five product dimensions: color, configuration, size, style, and version. You combine product dimensions in dimension groups and assign dimension groups to product masters. The combinations of product dimensions determine how product variants are defined.

Product dimensions are characteristics that serve to identify a product variant. You can use combinations of product dimensions to define product variants. You must define at least one product dimension for a product master in order to create a product variant.

Product variants

Product variants are also referred to as items. An item is a tangible product, which isn't the same as a service. It's also possible to define a product master with the service type. By using the service type, you can specify product variants that include services. For example, you can specify a product master for consultancy work and product variants for work that is performed by senior consultants and junior consultants.

Product dimensions

A product variant can be generated based on the product dimension values.

Product dimension values for the size, color, and style dimensions can be created in the following locations:

- **Size page** (**Product information management > Setup > Dimension and variant groups > Sizes**)
- **Color page** (**Product information management > Setup > Dimension and variant groups > Colors**)
- **Style page** (**Product information management > Setup > Dimension and variant groups > Styles**)

Product dimension values for the configuration dimension are typically created by using either the Product configurator or the Dimension-based configurator.

Product versions are usually created for specific versions as the product evolves during its lifecycle. Product versions are covered in detail later in this topic.

Product dimensions can also be created and maintained on the **Product dimensions** page, which can be accessed from the following locations:

- Go to **Product information management > Products > Product masters**. On the Action Pane, select **Product dimensions**.
- Go to **Product information management > Products > All products and product masters**. Select a product master. On the Action Pane, select **Product dimensions**.
- Go to **Product information management > Released products**. Select a product master. On the Action Pane, on the **Product** tab, in the **Product master** group, select **Product dimensions**.

The number of variants that you can create for an item is limited by the number of possible product dimension combinations.

TIP

When you use a product on an order line, for example, you select the product dimensions to identify the product variant that you want to work with.

Example

A company sells denim jeans. The item, *Jeans*, uses the color and size product dimensions. The jeans are sold in three different colors and six different sizes. The colors are blue, black, and brown. The sizes are XS, S, M, L, XL, and XXL. Not all sizes are available in all three colors. If all combinations were available, there would be 18 different types of jeans. However, in this example, only the following nine product variant combinations are produced.

COLOR	SIZE
Blue	XS
Blue	S
Blue	M
Black	M
Black	L
Black	XL
Brown	L
Brown	XL
Brown	XXL

The version product dimension

Version is a product dimension that is intended to help you maintain and track multiple versions of a product throughout the supply chain. Version tracking is essential to the success of manufacturers that operate in a world of constantly shrinking product lifecycles, increased quality and reliability requirements, and increased focus on product safety.

As a standard product dimension, version will behave similarly to the existing product dimensions (size, style, color, and configuration). Therefore, you can use it for other purposes besides tracking product versions.

Turn on the version dimension

Before you turn on the version dimension

When you turn on the version dimension, some functionality could become broken or stop working as expected if you've installed other solutions that add customizations to the inventory dimensions. For the version dimension to be fully functional, you might have to update those solutions so that they include the version dimension in their references to the inventory dimensions.

When you're testing your solutions for compatibility with the version dimension, look for the following elements:

1. **Functionality:** Most importantly, any customizations that involve the inventory dimensions must be assessed to ensure that they can work in conjunction with the version dimension.
2. **References to the inventory dimensions:** Look out for references to the inventory dimensions (that is, places where the dimensions are explicitly referenced). References to `InventDimId` should work out of the box, but look out for references to style or color. For example, be sure to check the following elements:
 - API calls in extended classes
 - All references to specific inventory dimensions in extension code (This code must float the version dimension together with the style, color, and size dimensions.)
3. **References to obsolete API calls:** In its introduction of the version dimension, Microsoft has tried to make as few APIs as possible obsolete. The few APIs that have been made obsolete will issue a warning when you turn on the **Product dimension - version** configuration key. Calls to those API must be fixed in your extended solutions before you turn on the version dimension in a production system. Here are the version-specific obsolete APIs:
 - RetailTransactionServiceInventory::getProductRecordId
 - EcoResProductNumberIdentifiedProductVariantEntity::find
 - EGAISAlcoholProduction_RU::findByItemDim
 - PCVariantConfiguration::findByProductMasterAndDimensions
4. **Maps:** If any maps use the inventory dimensions, the corresponding relation mapping to these maps must be updated so that they include the version dimension. In the extended model or table extensions, look out for tables where the fields include inventory dimensions.
5. **Microsoft Dynamics 365 Commerce functionality:** After it's turned on, the version dimension will appear throughout the Commerce-specific code in Dynamics 365 Supply Chain Management. However, the version dimension isn't yet supported by the Commerce channel database or in the Point of Sale (POS) or e-Commerce applications. These Commerce-specific applications won't support users selling/shipping or returning/receiving inventory by version dimension. Inventory availability lookup functions won't discern inventory by version dimension in Commerce apps. This behavior resembles the current behavior of the config dimension throughout Commerce.

Turn on the version dimension

Before you can use the version dimension, it must be turned on in your system. This task requires admin permissions.

1. Go to **System administration > Workspaces > Feature management**.
2. Turn on the feature that is named *Product dimension version*. (For more information, see [Feature management](#).)
3. Put your system into [Maintenance mode](#).
4. Go to **System administration > Setup > License configuration**.
5. On the **Configuration keys** tab, expand **Trade**, and select the check box for **Product dimension - version**.
6. Turn off [Maintenance mode](#).

Areas where the version dimension isn't supported

The following areas don't support the version dimension (you can still use these areas but you won't be able to add versioned products (products where the version dimension is used) to them). For example, you can't add a versioned item to a vendor catalog. This is because adding products with the version dimension to these areas would cause breaking changes.

- Cost object monthly statement
- Cost object statement cache
- MCR sales statistics per item

- Vendor catalogs
- EcoResProductDimensionGroupEntity

In addition, the order creation and order processing features in Commerce (for example, for POS, call center, and e-commerce orders) don't support the version dimension. There is no confirmed timeline as to when Commerce orders will be enhanced to support it.

Functional characteristics of the version dimension

The version dimension works like the other product dimensions. However, because of its specific nature, and because it's intended to maintain and track multiple versions of a product, it behaves slightly differently. Here are some of the differences and similarities:

- **There is no version group.**

Although the concept of groups exists for size, color, and style (color group, size group, and style group), no version group concept exists. Groups let you predefine the applicable values so that when, for example, you assign a color group to a product, the product can use all the colors in that color group. This concept doesn't apply to the version dimension, because the versions that a product takes aren't predefined when the product is created. Instead, versions are created during the lifecycle of the product, as they are required. Typically, if the form, fit, and function of the product remain the same, you create a new version instead of a new product.

- **Product variant suggestions work as they currently do.**

Product variant suggestions will create suggestions for all version dimension values, just as they do for other dimensions. The process of creating and releasing versioned products is the same as it is for products that use other dimensions. When you create a versioned product, the first version (V1) will be created as a product dimension, and the variants will be released. As the product changes and a new version is needed, the new version value (V2) will be added, and the required variants will be released. There is no expectation that all the versions (V1, V2, and V3) will be created in advance for the product.

IMPORTANT

If you turn on and use the version dimension, some solutions that reference the inventory dimensions might stop working as expected. To confirm and fix these issues, contact the independent software vendor (ISV) for your affected solutions. For more information, see [Enable the version dimension](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a dimension-based product master

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a new product master with dimension-based configuration technology. The demo data company used to create this procedure is USMF. This is the first procedure out of eight that explains how to build combinations for dimension-based configuration.

1. Go to Product information management > Products > Product masters.
2. Click New.
3. In the Product number field, type a value.
 - Entering a product number is mandatory if no number sequence has been set up for the product number field.
4. In the Product name field, type a value.
5. In the Product dimension group field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
 - Select the configuration dimension for this procedure.
7. In the list, click the link in the selected row.
8. In the Configuration technology field, select an option.
 - Select the Dimension-based configuration technology.
9. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Release a dimension-based product master

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to release a product master, which will be used for the dimension-based configurations. The demo data company used to create this procedure is USMF. It is a prerequisite that you have created a product master with the dimension-based configuration technology. This is the second procedure out of eight which explains how to build combinations for dimension-based configuration.

1. Go to Product information management > Products > Product masters.
 - Filter the Configuration technology column so that only the dimension-based configuration is displayed. For example, you can filter the column by typing Dimension.
2. In the list, mark the selected row.
3. Click Release products.
4. Click Next.
 - For products that are created with the dimension-based configuration technology, the product variants must be created in the company where the bill of materials will be created.
5. Click Next.
6. In the list, find and select the desired record.
 - Select the company USMF for this procedure.
7. Click Next.
8. Click Finish.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Complete basic setup of a released product master

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows how to complete the minimum setup that is required before the product master can be used in BOM versions.

This is the third procedure out of eight which explains how to build combinations for dimension-based configuration. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Product information management > Products > Released products**.
2. In the list, find and select the desired record. Select the product master that you have released in the second procedure. This product master is created with the dimension-based configuration technology.
3. On the Action Pane, select **Product**.
4. Select **Dimension groups** to open the drop dialog.
5. In the **Storage dimension group** field, select the drop-down button to open the lookup.
6. In the list, find and select the desired record. The storage dimension group determines which storage dimensions are used for product transaction. Select **Site** for this procedure.
7. In the **Tracking dimension group** field, select the drop-down button to open the lookup.
8. In the list, find and select the desired record. The tracking dimension group determines which tracking dimensions are used for product transaction. Select **None** for this procedure.
9. Click **OK**.
10. Click **Edit**.
11. In the **Item model group** field, select the drop-down button to open the lookup.
12. In the list, find and select the desired record. Item model groups contain settings that determine how items are controlled and handled on item receipts and issues. They also determine how item consumption is calculated. Select **FIFO** for this procedure.
13. Expand the **Manage costs** section.
14. In the **Item group** field, select the drop-down button to open the lookup.
15. In the list, find and select the desired record. Item groups are used to manage inventory by dividing inventory items into groups. Select **CarAudio** for this procedure.
16. On the Action Pane, select **Plan**.
17. Select **Default order settings**.
18. In the **Default order type** field, select an option. Select **Production** to specify that the default supply option for this product master is to produce it.
19. Select **Save**.
20. Close the page.
21. Close the **Released product details** form.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define configuration groups

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to define product configuration groups by creating two groups in the demo data company USMF Company. This is the fourth procedure out of eight which explains how to build combinations for dimension-based configuration.

1. Go to Product information management > Setup > Bills of materials and formulas > Configuration groups.
2. Click New.
3. In the Configuration group field, type a value.
 - Type a name for the configuration group that will be used for the bill of material lines.
4. In the Name field, type a value.
5. Click New.
6. In the Configuration group field, type a value.
 - Type a name for the configuration group that will be used for the bill of material lines.
7. In the Name field, type a value.
8. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a bill of materials for a dimension-based product master

2/18/2021 • 2 minutes to read • [Edit Online](#)

For this procedure you should have completed the previous 4 guides in this sequence of eight recordings. The first 4 recordings set up data that is required to complete this procedure. The demo data company used to create this procedure is USMF. This task is typically handled by the product designer.

Select the product

1. Click Released product maintenance.
2. Click Released products.
3. In the list, mark the selected row.
 - Find the released product master with dimension-based configuration technology that you created in the first task guide in this sequence.
4. On the Action Pane, click Engineer.
5. Click BOM versions.

Create new BOM and BOM version

1. Click New.
2. Click BOM and BOM version.
3. In the Name field, type a value.
 - Setting a site
 - In this procedure we don't set a specific site for the BOM.
4. Click OK.
5. Click New.
 - In this procedure we will add four lines to the BOM. Two lines represent cable options and two lines represent cabinet options.
6. In the list, mark the selected row.
7. In the Item number field, enter or select a value.
 - Select item number A0001, HDMI 6' Cables.
8. In the Configuration group field, enter or select a value.
 - Select the Cable configuration group created in guide 4 in this sequence.
9. Click New.
 - Select item number A0002, HDMI 12' Cables.
10. In the list, mark the selected row.
11. In the Item number field, enter or select a value.
12. In the Configuration group field, enter or select a value.
 - Select the Cable configuration group again.
13. Click New.
14. In the list, mark the selected row.
15. In the Item number field, enter or select a value.
 - Select item number D0002 Cabinet.
16. In the Configuration group field, enter or select a value.

- Select the Cabinet configuration group for this BOM line.

17. Click New.

18. In the list, mark the selected row.

19. In the Item number field, enter or select a value.

- Select Item number M0007 StandardCabinet as the last BOM line.

20. In the Configuration group field, enter or select a value.

- Select the Cabinet configuration group for the last BOM line.

Approve and activate

1. Close the page.

2. Click Approve.

3. In the Approved by field, enter or select a value.

4. Select Yes in the Do you also want to approve the bill of materials? field.

5. Click OK.

6. Click Activate.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define configuration route

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on defining a configuration route that determines the sequence in which the configuration groups will be presented. The demo data company used to create this procedure is USMF. This is the sixth procedure out of eight that explains how to build combinations for dimension-based configuration.

1. Go to Product information management > Bills of materials and formulas > Bills of materials.
2. In the list, find and select the desired record.
3. On the Action Pane, click Options.
4. Click Change view.
5. Click Header view.
6. Expand or collapse the Configuration route section.
7. Click Add.
8. In the list, mark the selected row.
9. In the Configuration group field, click the drop-down button to open the lookup.
10. In the list, click the link in the selected row.
11. Click Add.
12. In the list, mark the selected row.
13. In the Configuration group field, click the drop-down button to open the lookup.
14. In the list, find and select the desired record.
15. In the list, click the link in the selected row.
16. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create configuration rules

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure creates configuration rules that can be used for dimension-based configuration to enforce or prevent certain combinations of BOM lines. The demo data company used to create this procedure is USMF. This is the seventh procedure out of eight that explains how to build combinations for dimension-based configuration.

1. Go to Product information management > Bills of materials and formulas > Bills of materials.
2. In the list, find and select the desired record.
 - Find and select the BOM for the dimension-based configuration.
3. On the Action Pane, click Options.
4. Click Change view.
5. Click Header view.
 - Open the header view to access the Configuration route FastTab.
6. Expand or collapse the Configuration route section.
 - The Configuration route FastTab must be in the expanded mode.
7. Click Configuration rules.
8. Click New.
9. In the list, mark the selected row.
10. In the Item number field, click the drop-down button to open the lookup.
 - The items in the current configuration group are displayed. Select the one that represents the condition in the rule.
11. In the list, click the link in the selected row.
12. In the Method field, select an option.
 - It is possible to enforce either a selection or a deselection of an item from another configuration group.
13. In the Derived group field, click the drop-down button to open the lookup.
14. In the list, find and select the desired record.
15. In the list, click the link in the selected row.
 - Select the desired configuration group.
16. In the Derived item number field, click the drop-down button to open the lookup.
17. In the list, click the link in the selected row.
 - Select the item number that will be either selected or deselected depending on the chosen method.
18. Close the page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create dimension-based configurations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to define a configuration for a dimension-based product. This is the last procedure in the series that explains how to build combinations for dimension-based configuration. The execution of this procedure is dependent on the data created in the previous seven recordings. The demo data company used to create this procedure is USMF.

Find the dimension-based product master

1. Click Released product maintenance.
2. Click Released products.
3. In the list, mark the selected row.
 - Select the dimension-based product master that you created in the first recording in this sequence of 8 recordings.

Create configurations

1. On the Engineering Action Pane, click Maintain configurations.
2. Click Configure.
3. In the list, mark the selected row.
4. In the Item number field, enter or select a value.
 - Select any of the items in the first configuration group.
5. In the list, find and select the desired record.
6. In the Item number field, enter or select a value.
 - Select any item from the second configuration group.
7. Click OK.
8. In the list, mark the selected row.
9. In the Configuration field, type a value.
 - Enter a configuration name that will make it easy to identify the configuration.
10. In the Description field, type a value.
 - Enter a description of the configuration to explain what it contains.
11. Click OK.

NOTE

Set up a product configuration model

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes the steps for setting up and creating a product configuration model.

TASK	DESCRIPTION
Create a product master.	Create a product master from the Product master list. Release the product master to all relevant companies. For a product master that is used as a version for a product configuration model or as a subcomponent, Constraint-based configuration must be selected as the configuration technology, and the configuration dimension must be selected only for the product dimension group.
Create components.	Create components on the Components page. Components are the building blocks of a product configuration model and can be reused in multiple product configuration models.
Create attribute types.	Create attribute types on the Attribute types page. Attribute types specify the set of data types for all attributes that are used in product configuration models. Attributes of the Boolean , Text with a fixed list, and Integer with a range types list the set of values that are available when you configure a product variant based on a product configuration model.
Create a product configuration model.	Create a product configuration model on the New product configuration model page.
Add attributes to a product configuration model.	Create an attribute on the Attributes FastTab on the Constraint-based product configuration model details page. Attributes describe the features of the product configuration model.
Add constraints to a product configuration model.	Create constraints on the Constraints FastTab on the Constraint-based product configuration model details page. Constraints are limitations that a product configuration must satisfy. Constraints are either expression constraints or table constraints.
Add subcomponents to a product configuration model.	Create subcomponents on the Subcomponents FastTab on the Constraint-based product configuration model details page. Subcomponents are related to components and are linked to items that represent the subcomponent.
Add user requirements to a product configuration model.	User requirements are similar to subcomponents, but they don't reference an item. You can think about user requirements as a phantom BOM. Any BOM lines or route operations that are placed directly under the user requirement will be collapsed into the parent component.

TASK	DESCRIPTION
Add BOM lines to a product configuration model.	Create BOM lines on the BOM lines FastTab on the Constraint-based product configuration model details page. BOM lines represent a part that is required to build a variant of the product.
Add route operations to a product configuration model.	Create route operations on the Route operations FastTab on the Constraint-based product configuration model details page. Route operations represent a step in a sequence of steps that are performed to make a variant of the product.
Create an active version for a product configuration model.	Create an active version of the product configuration model on the Versions page. A version is the relationship between a product configuration model and a product master. A product configuration model that has an active version can be configured from a sales order, sales quotation, purchase order, or production order.
Test a product configuration model.	Test the product configuration model from either the Constraint-based product configuration model details page or the Product configuration models list page. Testing the product configuration models simulates the product model configuration process that occurs during order handling.
Create product configuration model template.	Create a product configuration model template on the Configuration templates page. A configuration template includes values for attributes in the product configuration model. Select the attribute values on the Configure line page. You can select to load a product model configuration template during product model configuration.
Configure an item.	Product configuration models can be configured from a sales order, sales quotation, purchase order, or production order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Calculations for product configuration models FAQ

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes calculations for product configuration models and explains how to use calculations together with constraints.

Calculations can be used for arithmetic or logical operations. They complement expression constraints in product configuration models. You can define calculations on the **Constraint-based product configuration model details** page and then build expressions for the calculations in the expression editor. For more information, see [Create calculations](#).

What is a calculation?

A calculation is an element that you can use in a product configuration model. Calculations complement constraints by letting you use decimal numbers to calculate values when you configure a product. Additionally, calculations have a larger set of available operators than constraints have.

Like a constraint, a calculation is associated with a specific component in a product configuration model, and can't be reused by or shared with another component. One important difference between calculations and constraints is that calculations are imperative (unidirectional), whereas constraints are declarative (bi-directional). For more information about constraints, see [Expression constraints and table constraints in product configuration models](#).

A calculation consists of a target attribute and a calculation expression.

What is a target attribute?

A target attribute is an attribute that receives the result of the calculation expression.

In the following expression, the target attribute is a tablecloth measurement:

Expression: `If[decimalAttribute1 <= decimalAttribute2, True, False]`

DecimalAttribute1 is the table length, and **decimalAttribute2** is the tablecloth length. The expression returns the value **True** to the target attribute if **decimalAttribute2** is greater than or equal to **decimalAttribute1**. Otherwise, the expression returns **False**. Therefore, the tablecloth measurement is acceptable if the tablecloth length is the same as or exceeds the length of the table.

What attribute types can be set to target attributes?

All attribute types that the product configurator supports can be set to target attributes, except text without a fixed list.

Can the value of a target attribute restrict the values of the input attributes in a calculation?

No, the value of a target attribute can't restrict the values of the input attributes, because calculations are unidirectional. Therefore, the value of the target attribute is set based on changes in the value of the input attributes, but a change in the value of the target doesn't affect the value of the input attributes. This behavior differs from the behavior for constraints. Constraints occur in both directions.

Example

In the following expression, the target for the calculation is the length of a power cord, and the input value is a color:

Expression: [If Color == "Green", 1.5, 1.0]

When you configure the item, the length of the power cord is set to 1.5 if you specify **Green** as the value of color attribute. If you specify any other color, the length is set to 1.0. However, because calculations are unidirectional, the calculation doesn't set the value of the color attribute to **Green** if you specify a length of 1.5.

What happens if a calculation has a target attribute of the integer type but a calculation generates a decimal number?

If a target attribute is of the integer type, but a calculation generates a decimal number, only the integer part of the calculated result is returned. The decimal part is removed, and the result isn't rounded. For example, a result of 12.70 is shown as 12.

When do calculations occur?

Calculations occur when a value has been provided for all input attributes.

Can I overwrite the value that is calculated for the target attribute?

You can overwrite the value that is calculated for the target attribute, unless the target attribute is set as hidden or read-only.

How do I set a target attribute as hidden or read-only?

To set an attribute as hidden or read-only, follow these steps.

1. Click **Product information management > Common > Product configuration models**.
2. Select a product configuration model, and then, on the Action Pane, click **Edit**.
3. On the **Constraint-based product configuration model details** page, select the attribute to use as a target attribute.
4. On the **Attributes** FastTab, select **Hidden** or **Read-only**.

Can a calculation overwrite the values that I set?

No. The values that you set when you configure a product are the values that are used. The calculation that occurs when the input values in a calculation are changed can't overwrite the values that you provide for a specific attribute.

What happens if I remove an input value in a calculation?

If you remove an input value in a calculation, the value of the target attribute is also removed.

Why do I receive an error message that says that my model is in contradiction?

This message is shown when a calculation includes an error, or when a contradiction exists in one or more constraints. For more information about contradictions in constraints, see [Expression constraints and table constraints in product configuration models](#). Here are some situations where errors can occur in calculations:

- A value is divided by 0 (zero).
- A conflict exists between the following two elements:

- The values that are available for an attribute and are limited by a constraint
- A value that is generated by a calculation
- The values that are returned by the calculation are outside the domain of the attribute. An example is an integer from [1..10] that is calculated to 0.

Why do I receive an error message even though I successfully validated my product model?

Calculations aren't included in the validation. You must test the product configuration model to find errors in calculations. To test a product configuration model, follow these steps.

1. Click **Product information management > Common > Product configuration models**.
2. Select a product configuration model, and then, on the Action Pane, in the **Run** group, click **Test**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configuration rules

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides general information about configuration rules. Configuration rules define relationships between items in a bill of materials (BOM) for products that use the dimension-based configuration technology.

Configuration rules are available when you define dimension-based configuration models. Configuration rules are used to either enforce or prohibit specific item combinations in a bill of materials (BOM). After a BOM has been created and the relevant items have been assigned to their respective configuration groups, one or more configuration rules can be defined. If two items belong together, the **Select** operator is used to ensure inclusion. If two items are mutually exclusive, the **Deselect** operator is used to ensure exclusion.

Note: This information applies only to product masters that use the dimension-based configuration technology.

Existing configurations aren't affected by subsequent changes to the configuration rules. However, it's important that you set the rules before you define a new configuration, and that you check the rules if you think they have been changed.

Note: For the **Select** method, the derived configuration group, item number, and configuration are automatically selected. For the **Deselect** method, the derived configuration group, item number, and configuration can't be selected.

Expression constraints and table constraints in product configuration models

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes the use of expression constraints and table constraints. Constraints control the attribute values that you can select when you configure products for a sales order, sales quotation, purchase order, or production order. You can use expression constraints or table constraints, depending on how you prefer to build the constraints.

Constraints are used to control the attribute values that you can select when you configure products for a sales order, sales quotation, purchase order, or production order. You can use expression constraints or table constraints, depending on how you prefer to build the constraints.

What are expression constraints?

Expression constraints are characterized by an expression that uses arithmetic and Boolean operators and functions. An expression constraint is written for a specific component in a product configuration model. It can't be reused by or shared with another component. However, the expression constraints for a component can reference attributes of the component's subcomponents.

What are table constraints?

Table constraints list the combinations of values that are allowed for attributes when you configure a product. Table constraint definitions can be used generically. When you create a table constraint for a component in a product configuration model, you select a table constraint definition. To create the combinations that are allowed, you add attributes of specific types to the components. Each attribute type has a specific value.

Example of a table constraint

This example shows how you can limit the configuration of a speaker to specific cabinet finishes and fronts. The first table shows the cabinet finishes and fronts that are generally available for configuration. The values are defined for the **Cabinet finish** and **Front grill** attribute types.

ATTRIBUTE TYPE	VALUES
Cabinet finish	Black, Oak, Rosewood, White
Front grill	Black, Metal, White

The next table shows the combinations that are defined by the **Color and finish** table constraint. By using this table constraint, you can configure a speaker that has an oak finish and a black grill, a Rosewood finish and a white grill, and so on.

FINISH	GRILL
Oak	Black
Rosewood	White
White	Black

FINISH	GRILL
White	White
Black	Black
Black	Metal

You can create system-defined and user-defined table constraints. For more information, see [System-defined and user-defined table constraints](#).

What syntax should be used to write constraints?

You must use Optimization Modeling Language (OML) syntax when you write constraints. The system uses Microsoft Solver Foundation constraint solver to solve the constraints.

Should I use table constraints or expression constraints?

You can use either expression constraints or table constraints, depending on how you prefer to build the constraints. You build a table constraint as a matrix, whereas an expression constraint is an individual statement. When you configure a product, it doesn't matter what kind of constraint is used. The following example shows how the two methods differ.

When you configure a product by using the following constraint setups, these combinations are allowed:

- A product in the color Black, and in size 30 or 50
- A product in the color Red and in size 20

Table constraint setup

COLOR	SIZE
Black	30
Black	50
Red	20

Expression constraint setup

```
(Color == "Black" & (size == "30" | size == "50")) | (color == "Red" & size = "20")
```

Should I use operators or infix notation when I write expression constraints?

You can write an expression constraint by using either the available prefix operators or infix notation. For the **Min**, **Max**, and **Abs** operators, you can't use infix notation. These operators are included as standard operators in most programming languages.

What operators and infix notation can I use when I write expression constraints?

The following tables list the operators and infix notation that you can use when you write an expression constraint for a component in a product configuration model. The examples in the first table show how to write

an expression by using either infix notation or operators.

OPERATOR	DESCRIPTION	SYNTAX	EXAMPLES
Implies	This is true if the first condition is false, the second condition is true, or both.	Implies[a, b], infix: a -: b	<ul style="list-style-type: none"> • Operator: Implies[x != 0, y >= 0] • Infix notation: x != 0 -: y >= 0
And	This is true only if all conditions are true. If the number of conditions is 0 (zero), it produces True .	And[args], infix: a & b & ... & z	<ul style="list-style-type: none"> • Operator: And[x == 2, y <= 2] • Infix notation: x == 2 & y <= 2
Or	This is true if any condition is true. If the number of conditions is 0 (zero), it produces False .	Or[args], infix: a b ... z	<ul style="list-style-type: none"> • Operator: Or[x == 2, y <= 2] • Infix notation: x == 2 y <= 2
Plus	This sums its conditions. If the number of conditions is 0 (zero), it produces 0 .	Plus[args], infix: a + b + ... + z	<ul style="list-style-type: none"> • Operator: Plus[x, y, 2] == z • Infix notation: x + y + 2 == z
Minus	This negates its argument. It must have exactly one condition.	Minus[expr], infix: -expr	<ul style="list-style-type: none"> • Operator: Minus[x] == y • Infix notation: -x == y
Abs	This takes the absolute value of its condition. It must have exactly one condition.	Abs[expr]	Operator: Abs[x]
Times	This takes the product of its conditions. If the number of conditions is 0 (zero), it produces 1.	Times[args], infix: a * b * ... * z	<ul style="list-style-type: none"> • Operator: Times[x, y, 2] == z • Infix notation: x * y * 2 == z
Power	This takes an exponential. It applies exponentiation from right to left. (In other words, it's right-associative.) Therefore, Power[a, b, c] is equivalent to Power[a, Power[b, c]] . Power can be used only if the exponent is a positive constant.	Power[args], infix: a ^ b ^ ... ^ z	<ul style="list-style-type: none"> • Operator: Power[x, 2] == y • Infix notation: x ^ 2 == y
Max	This produces the largest condition. If the number of conditions is 0 (zero), it produces Infinity .	Max[args]	Operator: Max[x, y, 2] == z

OPERATOR	DESCRIPTION	SYNTAX	EXAMPLES
Min	This produces the smallest condition. If the number of conditions is 0 (zero), it produces Infinity .	Min[args]	Operator: Min[x, y, 2] == z
Not	This produces the logical inverse of its condition. It must have exactly one condition.	Not[expr], infix: !expr	<ul style="list-style-type: none"> • Operator: Not[x] & Not[y == 3] • Infix notation: !x! (y == 3)

The examples in the next table show how to write infix notation.

INFIX NOTATION	DESCRIPTION
$x + y + z$	Addition
$x * y * z$	Multiplication
$x - y$	Binary subtraction is translated the same as binary addition where there is a negated second.
$x ^ y ^ z$	Exponentiation that has right associativity
!x	Boolean not
$x \text{ :- } y$	Boolean implication
x	y
$x \& y \& z$	Boolean and
$x == y == z$	Equality
$x != y != z$	Distinct
$x < y < z$	Less than
$x > y > z$	Greater than
$x <= y <= z$	Less than or equal to
$x >= y >= z$	Greater than or equal to
(x)	Parentheses override default precedence.

Why aren't my expression constraints validated correctly?

You can't use reserved keywords as solver names for attributes, components, or subcomponents in a product configuration model. Here is a list of the reserved keywords that you can't use:

- Ceiling

- Element
- Equal
- Floor
- If
- Less
- Greater
- Implies
- Log
- Max
- Min
- Minus
- Plus
- Power
- Times
- Slot
- Model
- Decision
- Goal

Solver strategy for product configuration

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how you can use the solver strategy to improve the performance of product configuration.

The concept of solver strategies was first introduced in Cumulative update 7 (CU7) for Microsoft Dynamics AX 2012 R2. It was extended in Cumulative update 8 (CU8) for Microsoft Dynamics AX 2012 R3 and Microsoft Dynamics 365 for Finance and Operations, Enterprise edition 7.3.

The solver strategy concept now consists of the following strategies:

- Default
- Minimal domains first
- Top-down
- Z3

Solver strategy

A product configuration model can be formulated as a [constraint satisfaction problem \(CSP\)](#). Microsoft Solver Foundation (MSF) provides two types of solver strategies to solve the CSPs that can be used from product configuration models. These solver strategies rely on [heuristics](#), which are used to determine the order that the variables of the CSPs are considered in when the problem is being solved. Heuristics can significantly affect performance when a problem or class of problems is being solved.

The solver strategy for product configuration models determines which solver is used with heuristics. The **Default**, **Minimal domains first**, and **Top-down** strategies use the two solvers from MSF, whereas the **Z3** strategy uses the Z3 solver.

Real customer implementation studies have shown that a change in the solver strategy for a product configuration model can reduce the response time from minutes to milliseconds. Therefore, it's worth the effort to try different solver strategies to find the most efficient strategy for your product configuration model.

Change the settings for the solver strategy

To change the solver strategy, on the **Product configuration models** page, on the Action Pane, select **Model properties**. Then, in the **Edit the model details** dialog box, select a solver strategy.

The screenshot shows the Dynamics 365 interface for product configuration models. The main window displays a list of models under the heading 'PRODUCT CONFIGURATION MODELS'. The list includes:

Name	Description
Car Audio System	Car audio system - kit
High End Speaker (D0004)	Configurable high end speaker
Licensed High End Speaker	Configurable high end speaker
Speaker solution	High end speaker with cable an...

The 'Edit the model details' dialog box is open, showing the following fields and options:

- Name: Car Audio System
- Description: Car audio system - kit
- Solver strategy: Default (selected)
- Minimal domains first
- Top-down
- Z3
- Select existing component (checked)
- Name: (empty)
- OK and Cancel buttons

Currently, there is no logic that automatically detects which solver strategy will be the most efficient strategy for constraint-based product configuration. Therefore, you must try the solver strategies one by one.

The following table provides recommendations about the solver strategy to use in various scenarios.

SOLVER STRATEGY	USE THE STRATEGY IN THIS SCENARIO
Default	The Default strategy has been optimized to solve models that rely on table constraints. Customer implementation studies have shown that this strategy is the most efficient strategy in scenarios where table constraints are used extensively.
Minimal domains first	The Minimal domains first and Top-down strategies are closely related. Customer implementation studies have shown that the Top-down strategy, outperforms the Minimal domains first strategy. However, the Minimal domains first strategy is kept in the product for backward compatibility. Both these solver strategies have been shown to be more efficient at solving models that contain several arithmetic expressions where no table constraints are used. However, in some cases, the Default strategy outperforms these two strategies. Therefore, remember to try each strategy.
Top-down	The Minimal domains first and Top-down strategies are closely related. Customer implementation studies have shown that the Top-down strategy, outperforms the Minimal domains first strategy. However, the Minimal domains first strategy is kept in the product for backward compatibility. Both these solver strategies have been shown to be more efficient at solving models that contain several arithmetic expressions where no table constraints are used. However, in some cases, the Default strategy outperforms these two strategies. Therefore, remember to try each strategy.
Z3	We recommend that you use the Z3 strategy as the default solver strategy. If you're concerned about performance and scalability, you can evaluate the other strategies.

Reuse product configurations

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can specify that you want to automatically reuse an existing configuration for a product. Then, when a user has completed a configuration session, the system verifies whether a configuration that matches the user's selections already exists. If a matching configuration is found, the configuration ID, corresponding bill of materials (BOM), and route are reused.

Requirements for reusing configurations

To enable configurations to be reused, you must specify the following information for the components and attributes on the **Product configuration model details** page:

- **Components and subcomponents** – On the **General** FastTab, in the **Reuse configurations** field, select **Yes**.
- **Attributes** – On the **Attributes** FastTab, select the **Include in reuse** option. This option appears only when the related component is enabled for reuse. If you don't select any attributes for reuse, the configuration is always reused, regardless of the user's selections during a configuration session. The attribute values in the existing configuration must match the user's selections. For example, if the user selects **Blue** as the color during a configuration session, the system verifies whether an existing configuration of the component has the color blue.

Resetting configuration reuse

When you reset configuration reuse, previously created configurations are no longer considered. You might want to reset configuration reuse if the BOM or route was changed, but no related attributes were changed. You reset configuration reuse on the **General** FastTab for the component.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

System-defined and user-defined table constraints

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains the two types of table constraints for components in a product configuration model - user-defined and system-defined. Table constraints represent matrices of the allowed attribute combinations, where each row defines one set of possible attribute values.

Table constraints represent matrices of the combinations of attributes that are allowed for components in a product configuration model. Each row in the table defines one set of possible attribute values. You can declare two types of constraints in a product configuration model:

- **Expression constraint** – Create an expression that defines relations between attributes to guarantee that only compatible values can be selected during product configuration.
- **Table constraint** – Create a table that defines all the combinations that are allowed for a specified set of attributes. Two types of table constraints are available: user-defined table constraints and system-defined table constraints.

This article describes user-defined and system-defined table constraints for components in a product configuration model.

User-defined table constraints

A user-defined table constraint is a type of matrix that is used to describe the combinations of attribute values that are defined by attribute types. For example, if you produce speakers, you can include columns for the cabinet finish and the front grill in the user-defined table constraint. The attribute type for the cabinet finish has four values, and the attribute type for the front grill has three values. Therefore, if constraints aren't used, there are $4 \times 3 = 12$ possible combinations. However, in this example, only six combinations are allowed, as shown in the following table. This information is displayed on the **Allowed combinations** tab on the **Edit table constraint** page.

CABINET FINISH	FRONT GRILL
Black	Black
Black	Metal
Oak	Black
Rosewood	White
White	Black
White	White

User-defined table constraints are defined by static table input that works the same way as an expression constraint. When you use a user-defined table constraint, the advantage is that tables are often easier to create, understand, and maintain than long expression constraints.

System-defined table constraints

A system-defined table constraint creates a dynamic mapping between an attribute type and a field in a table. When a system-defined table constraint is included in a product configuration model, the mapping guarantees that the data in the table is shown instead of the values of the attribute type. The result is a dynamic constraint, because the table contents can be modified (for example, by other modules).

When you create a system-defined table constraint, you select a table, optionally define the query to use, and then associate attribute types to the fields in the selected table. The types of fields must match the types of attribute types.

Before a table constraint can take effect on a product configuration model, the table constraint must be included in a constraint on one of the model's components. The procedure is to create a new constraint, select the table constraint type, and then select the table constraint definition to use. Finally, all fields in the table constraint must be mapped to attributes in the product configuration model.

[Product configuration models overview](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create product model components

2/18/2021 • 2 minutes to read • [Edit Online](#)

Constraint-based product configuration models use components as building blocks to establish the product model structure. The components must be created before a product model can be built. The demo data company used to create this procedure is USMF.

1. Click Product variant model definition.
2. Click Product configuration models.
3. On the Action Pane, click Model.
4. Click Components.
5. Click New.
6. In the Name field, type a value.
7. In the Description field, type a value.
8. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a product configuration model

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a product configuration model and enter basic information such as attributes and subcomponents. The demo data company used to create this procedure is USMF.

Create a product model

1. Click Product variant model definition.
2. Click Product configuration models.
3. Click New.
4. In the Name field, type a value.
5. In the Description field, type a value.
6. In the Solver strategy field, select an option.
 - The solver strategy determines how the constraints in a constraint-based product configuration model are processed. This selection can have an impact on the performance of the product configuration model.
7. In the Name field, type a value.
 - The root component represents the product configuration model, but it can also be used in other product models.
8. Click OK.
9. In the Reuse configurations field, select an option.
 - If the reuse configurations parameter is set to Yes, the system will check for identical configurations after each configuration session and reuse if an exact match is found.

Add attributes

1. Expand the Attributes section.
2. Click Add.
3. In the list, mark the selected row.
4. In the Name field, type a value.
5. In the Solver name field, type a value.
 - The Solver name is used by the constraint solver of the product configurator. It must not include spaces or special characters except _ (underscore).
6. In the Description field, type a value.
 - The description text is displayed to the configuration user and can therefore serve as help in selecting the right attribute value.
7. In the Attribute type field, enter or select a value.
 - The attribute type determines which values are available for the attribute.
8. Select the Include in reuse check box.
 - This option is only available when the Reuse configurations option is selected. Including the attribute in the reuse check box means that this attribute will be considered when the system is looking for an exact match.

Add subcomponents

1. Expand the Subcomponents section.
2. Click Add.
3. In the list, mark the selected row.
4. In the Name field, type a value.
5. In the Solver name field, type a value.
6. In the Description field, type a value.
7. In the Component field, enter or select a value.
 - Each subcomponent must reference a component definition. This design supports reusable components and ensures that once a component has been defined it can be used in many product models.
8. Click Save.
9. Click BOM line details.
 - The BOM line details form enables the user to select the required properties for the subcomponent. Each property can be given a fixed value or mapped to an attribute. Mapping to an attribute will result in the BOM line property getting different values depending on the configuration selection.
10. In the Item number field, enter or select a value.
 - Each subcomponent represents a configurable product master with constraint-based configuration technology. The reference is made through the item number.
11. Select the Set check box.
12. Select Yes in the Calculation field.
 - Setting the calculation option ensures that the product will be included when running a cost calculation for the product.
13. Click the Setup tab.
14. Select the Set check box.
15. In the Quantity field, enter a number.
 - The quantity field determines how much of this product will be consumed in the configured product.
16. Select the Set check box.
17. In the Per series field, enter a number.
18. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add an expression constraint to a product configuration model

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how you can add a new constraint expression to a product configuration model. It shows how you can mandate that corner protection must be applied to a speaker if the user has selected a front grill in metal. The procedure uses the High end speaker component in the demo company USMF.

Create an expression constraint

1. Click Product variant model definition.
2. Click Product configuration models.
3. In the list, find and select the desired record.
 - This example uses the high end speaker model.
4. In the list, click the link in the selected row.
5. Expand the Constraints section.
6. Click Add.
7. Click Create.
8. In the Name field, type a value.

Enter expression

1. Click Edit expression.
 - If you unlock the user interface in the task recording at this stage, you can use IntelliSense and the list of symbols to build the constraint expression .
2. In the ConstraintBody field, enter 'Implies[FrontGrill=="Metal", CornerProtection] ' .
 - This expression logic states: If the Front grill is metal, then the corner protection option must be selected.
3. Click Validate.
 - The validate function runs through the constraint expression and checks for syntax errors.
4. Click Close.
5. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add a calculation to a product configuration model

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to add a new calculation to a product configuration model. It shows how you can create a logical expression using the "If" operator to set a speaker height to 10 for white speakers and 15 for all other cabinet finishes. The procedure uses the High end speaker component in the demo company USMF.

Add a calculation

Create calculation expression

1. Click Edit expression.
2. In the ConstraintBody field, enter 'If[CabinetFinish=="White", 10, 15]'.
3. Click Validate.
4. Click Close.
5. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintain BOM for a product configuration model

2/18/2021 • 2 minutes to read • [Edit Online](#)

Running this procedure requires an existing product configuration model. The High end speaker model in the demo company USMF is used to create this procedure.

Add a BOM line

1. Click Product variant model definition.
2. Click Product configuration models.
3. In the list, find and select the desired record.
 - Select the High end speaker for this procedure.
4. In the list, click the link in the selected row.
5. Expand the BOM lines section.
6. Click Add.
7. In the Name field, type a value.
8. In the Description field, type a value.
9. Click Save.

Add BOM line details

1. Click BOM line details.
2. In the Item number field, enter or select a value.
 - For example, you can select the item M0055.
 - For each BOM line property, you can select if it takes a fixed value or is mapped to an attribute.
3. Select the Set check box.
4. Select Yes in the Calculation field.
 - Setting the Calculation property to Yes ensures that the BOM line is included in cost calculations.
5. Click the Setup tab.
6. Select the Set check box.
7. In the Quantity field, enter a number.
 - The quantity field determines how much of the item that will be included in the BOM. This could be an obvious candidate for an attribute mapping.
8. Click the Dimension tab.
 - Verify if any of the product dimensions are active, and therefore must have a value or attribute assigned.
9. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintain route for a product model

2/18/2021 • 2 minutes to read • [Edit Online](#)

Running this procedure requires that a product configuration model exists. This procedure uses the High end speaker model in the demo company USMF to walk you through the process.

Add a route operation

1. Click Product variant model definition.
2. Click Product configuration models.
3. In the list, find and select the desired record.
 - Select the High end speaker model for this exercise.
4. In the list, click the link in the selected row.
5. Expand the Route operations section.
6. Click Add.
7. In the Name field, type a value.
8. In the Description field, type a value.
9. Click Save.

Enter route operation details

1. Click Route operation details.
2. In the Operation field, enter or select a value.
3. In the Oper. No. field, enter a number.
 - Operation numbers determine the route sequence.
 - Each property on a route operation can get a static value or be mapped to an attribute. Mapping to an attribute will result in the value being set as part of the configuration.
4. In the Route group field, enter or select a value.
 - The route group determines essential behavior for costing, consumption, and setup.
5. Click the Setup tab.
6. Click the Times tab.
7. In the Process qty. field, enter a number.
 - Determine how many will be processed during one operation.
8. In the Hours/time field, enter a number.
 - Enter the time ratio.
9. Select the Set check box.
10. In the Run time field, enter a number.
 - Determine the processing time for the quantity that you have specified.
11. Click the Resource requirements tab.
12. Click Add.
13. In the list, mark the selected row.
14. In the Requirement type field, select an option.
 - Decide if you want to specify specific resources or capabilities that they must possess.
15. In the Requirement field, enter or select a value.
16. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Attribute-based sales prices for constraint-based product configuration

2/18/2021 • 7 minutes to read • [Edit Online](#)

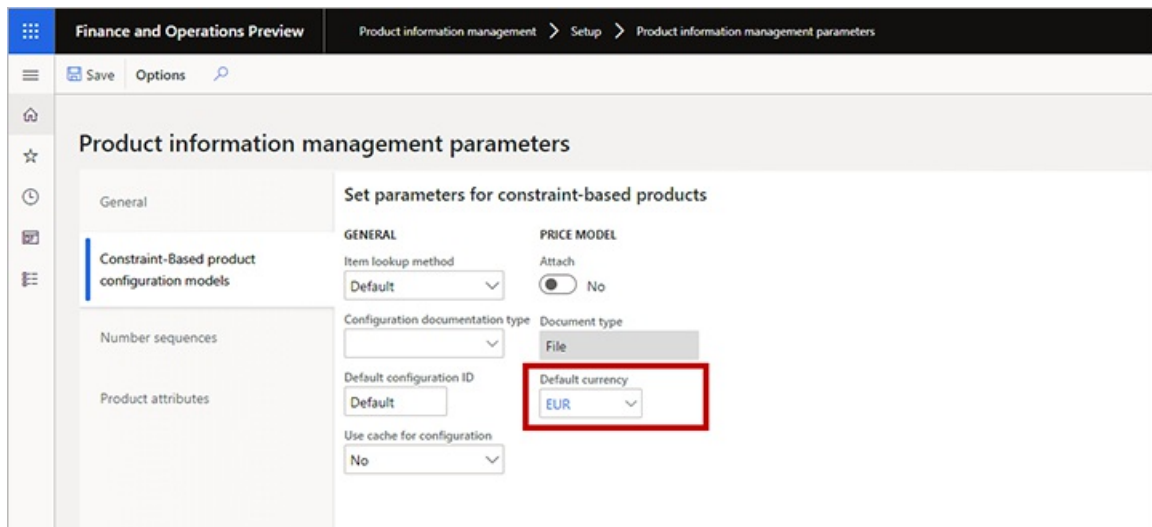

This topic describes how to build sales price models with sales prices based on components and attributes rather than on the physical bill of material and the route. You can build several sales price models for each product configuration model.

Set relevant product information management parameters

Before you start building your price models, you must define a default currency, which is used when you build your sales price models. You can also choose whether to attach a Microsoft Excel file with a price breakdown for all order or quotation lines. The price breakdown will enable you to share details with customers about how you arrived at a specific sales price for a configured product.

To set your default currency:

1. Go to **Product information management > Setup > Product information management parameters**.
2. Open the **Constraint-Based product configuration models** tab.
3. Open the **Default currency** drop-down list and select your currency.

4. If you'd like to attach an Excel file with a price breakdown for all order or quotation lines, then in the **Price model** section, set **Attach** to **Yes**.

Build your sales price models

To build a sales price model:

1. Go to **Product information management > Products > Product configuration models**.
2. Select the target product configuration model.
3. On the Action pane, open the **Model** tab and, from the **Set up** group, select **Price models**.
4. The **Price models** page opens.
5. Select a price model or add a new one to the grid.

- Select **Edit** to open the edit page for your selected model, which provides the following features:
 - The header of the form shows the default currency and lets you add new currencies for your price setup.
 - The left pane shows all the components and user requirements of the product model. Each node in the product model tree can have one base-price expression and an optional number of expression rules. An expression rule consists of a condition and an expression and each expression rule covers a product option that helps control the price of the product.
 - When you build your conditions and expressions, you have the same operators available as for calculations in a product model. The expression editor also supports both conditions and expressions.
- Select a node in the left column and then use the features described in the previous step to establish pricing rules for it (see also the example provided after this procedure). Repeat this step for each node as needed.

The following example shows a base price of a static number of 899.95 EUR, which can be modified by one or more of the following five expression rules, depending on the configuration selected by the customer:

- For white cabinet finish, subtract 59.95 EUR.
- For corner protection, add 35.95 EUR.
- For a metal front grill, add 89.95 EUR.
- For rosewood cabinet finish, add 119.95 EUR.
- Add 12.95 EUR for each unit of speaker height.

Name	Condition	Expression
All white	CabinetFinish == "White"	-59.95
Corner protection	CornerProtection	35.95
Metal front grill	FrontGrill == "Metal"	89.95
Rosewood	CabinetFinish == "Rosewood"	119.95
Speaker height		SpeakerHeight * 12.95

Add support for multiple currencies

When a configurable product is sold, the system checks whether the prices have been set explicitly in the currency of the customer. If so, the explicit values are used. If not, the system uses the currency exchange rates established for the sales company to convert the default currency value to the customer's currency.

To add explicit prices in an additional currency:

- Open the edit page for your price model, as described in [Build your sales price models](#).
- Select the **Add** button in the header of the price model to open the **Currencies** drop-down dialog box, which lists the available currencies.
- Select the currency you want to add in the **Currencies** drop-down dialog box and then select **OK**.
- The **Current currency** drop-down list now includes the currency that you just added, plus any other currencies that may have been added previously. Select your new currency and notice that the grid in the **Expression rules** section now includes two expression fields:

- **Expression** - Shows the expression (or constant value) for finding the price using the currency currently selected for **Current currency**.
- **Default expressions** - Shows the expression (or constant value) for finding the price using the default currently (shown in the **Default currency** field).

NOTE

The **Condition** field for the expression rules is "owned" by the default currency, which means that you can't modify the condition for other currencies. You also can't add new expression rules while a currency other than the default currency is selected as the **Current currency**.

5. Edit values in the **Expression** column as needed for the current currency.

In the example below, *EUR* is the default currency, and *USD* has been added as an additional currency.

The screenshot shows the 'Standard prices' configuration for 'SPEAKER SOLUTION'. The 'Current currency' is set to USD. The 'Expression rules' table is as follows:

Name	Condition	Expression	Default expression
All white	CabinetFinish == "White"	-79.95	-59.95
Corner protection	CornerProtection	59.95	35.95
Metal front grill	FrontGrill == "Metal"	109.95	83.95
Rosewood	CabinetFinish == "Rosewood"	159.95	119.95
Speaker height		SpeakerHeight * 15.95	SpeakerHeight * 12.95

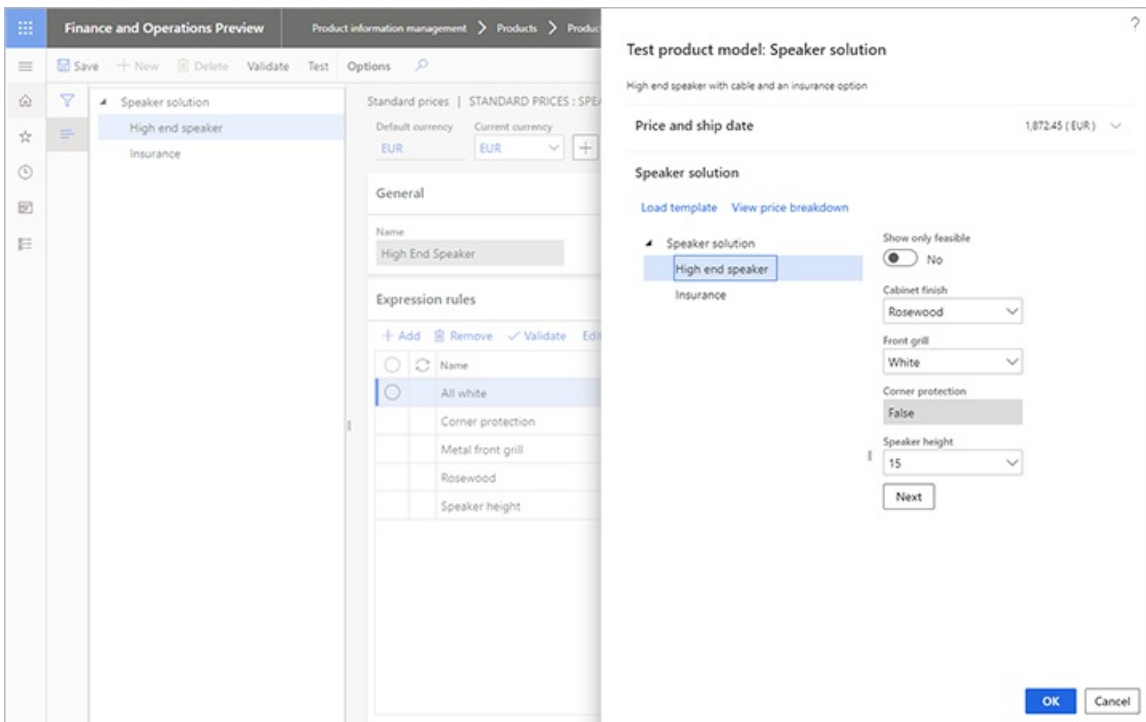

NOTE

You can't add expression rules that are unique for a non-default currency. To create expression rules that would be relevant only for a currency other than the default currency, set the price expression for the default currency to zero. Then set the appropriate expression for the non-default currency.

Test your price model

To test how the sales prices work in a configuration session, open the edit page for your price model, as described in [Build your sales price models](#) and then select **Test** on the Action Pane. The **Test product model** dialog box opens, where you can do the following:

- Use the configuration settings offered here to select product options and then see how they affect the value shown for **Price and ship date**.
- Select **View price breakdown** to download an Excel document that shows full details about how the price was calculated.

The downloaded spreadsheet shows both the absolute value and the contribution as a percentage for each active price element. If you have set the **Attach** price model option on the **Product information management parameters** page, this Excel sheet gets attached to the order or quotation line.

21																	

Set up selection criteria for price models

When your price models are in place, you must establish at least one selection criterion to pick up the price model when you configure to quote or to order. You'll do this by setting up one or more queries. In a combination with matching sales price models, the queries provide great flexibility in targeting sales prices for particular customers, regions, periods, and other criteria.

To set up selection criteria for price models:

1. Go to **Product information management > Products > Product configuration models**.
2. Select the target product configuration model.
3. On the Action pane, open the **Model** tab and, from the **Set up** group, select **Price model criteria**. The **Price model criteria** page opens.
4. If the query row you need doesn't exist yet, select **New** on the Action Pane to add a new row to the grid and make the following settings for it:

- **Name** - Enter a name for this row.
- **Description** - Briefly describe the query and what it is for.
- **Price model** - Select a **price model** (from the current configuration model) that the query will apply when triggered.
- **Order type** - Select the type of order where the query will apply.
- **Valid from** - Specify the first day when the query will apply.
- **Expire by** - Specify the last date when the query will apply.

Name	Description	Price model	Order type	Valid from	Expire by
Standard prices - orders	Query for standard prices on sal...	Standard prices	Sales order	11/1/2013	12/31/2154
Standard prices - customer quo...	Query for standard prices on ou...	Standard prices	Quotation type customer	11/1/2013	12/31/2154
Standard prices - prospects	Query for standard prices on pr...	Standard prices	Quotation type prospect	11/1/2013	12/31/2154

5. Select the row for the query you want to define and then select **Edit** on the **Action Pane**. The query designer dialog box opens. It works like most query designers in Supply Chain Management. Use it to define the conditions under which the price model for the row you selected should be applied.
6. Repeat steps 4-5 for each query you require.

TIP

You can save time by copying an existing row that is already similar to a new one that you need to add. To do this, select a target row and then select **Duplicate** on the Action Pane.

7. When you have finished setting up your criteria, arrange them into the proper order in the **Price model criteria** list. To reposition a row, select the row and then select **Up** or **Down** on the Action Pane.

IMPORTANT

At configuration time, the system starts searching from the top of the list and uses the first query that matches the data on the quote or the order line. Therefore, you must put your most specific queries on top. If you place a general query at the top of the list, this is the one that will be used even though there might be a query further down the list that targets the exact customer or prospect of the configuration.

Set attribute-based sales prices for the product model version

The final step is to specify attribute-based sales prices for the product model version. To do this:

1. Go to **Product information management > Products > Product configuration models**.
2. Select the target product configuration model.
3. On the Action Pane, open the **Model** tab and, from the **Product model details** group, select **Versions**.
4. The **Versions** page opens. Make sure the **Pricing method** is set to **Attribute based**.

Finance and Operations Preview | Product information management > Products > Product configuration models

Edit + New Delete Approve Activate Options

Versions | SPEAKER SOLUTION

Filter

Product number	From date	To date	Approved	Approver	Active	Pricing method
D0006	1/3/2009	12/31/2154	✓	000019	✓	Attribute based

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Approve a product configuration model

2/18/2021 • 2 minutes to read • [Edit Online](#)

Running this procedure requires that at least one product configuration model is available. This procedure uses the High end speaker model in the demo data company USMF. Note that this model has already been approved, but the procedure walks you through the entire process.

1. Click Product variant model definition.
2. Click Product configuration models.
3. In the list, find and select the desired record.
 - Select the High end speaker model for this procedure.
4. Click Versions.
5. Click New.
6. In the Product number field, enter or select a value.
 - The reference to a product represents a version of a product configuration model. Only product masters which have the constraint-based configuration technology will appear in this list.
7. In the From date field, enter a date.
 - Select when the product model version will be available.
8. In the To date field, enter a date.
 - Select an end date when this product model version will expire, or select Never.
9. Click Approve to open the drop dialog.
10. In the Approved by field, enter or select a value.
 - Select the person who is responsible for approving product models for use in operations.
11. Click OK.
12. In the Pricing method field, select an option.
 - Activate the product model version. It is only possible to have one product active for one product model at a time.
13. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transfer data for product models

2/18/2021 • 2 minutes to read • [Edit Online](#)

Exporting data for a product configuration model requires that you have at least one product model available. This procedure uses the High end speaker model in the demo company USMF to show you how to export data for this model.

1. Click Product variant model definition.
2. Click Product configuration models.
3. In the list, find and select the desired record.
 - Select the High end speaker model for this procedure.
4. On the Action Pane, click Model.
5. Click Export product model.
 - The download behavior varies from browser to browser depending on how the security settings are set up.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot the product configurator

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with the product configurator.

Item text is overwritten when I configure a product on a sales order line.

Issue description

This issue occurs when you create a sales order line for a configurable item and then modify the item text. When you configure the item and then select **OK**, the text is overwritten with the standard text.

Issue resolution

This behavior is expected. The text field includes the variant name, which is filled in only after you configure the line. Therefore, you must change the text after you've configured the line, not before.

Integer attributes are incorrectly rounded when product configuration models are calculated.

Issue description

This issue can occur when you perform the following series of actions:

1. Set up the following attributes on a production configuration model:
 - Input (integer)
 - Percent (decimal)
 - Result (integer)
2. Create a calculation that has the following expression:

$$\text{Result} = \text{Input} \times \text{Percent} \div 100$$

In this case, the integer result isn't always correctly rounded. For example, the input is 1,000, and the percentage is 2.40. Therefore, you expect the integer result to be 24, because 2.40 percent of 1,000 is 24 (or 24.00 in decimal form). Instead, the result is shown as 23. However, when the percentage is 2.39, the calculation is rounded to 24 instead of 23. When the percentage is 2.50, the calculation is rounded to 25, as expected.

Issue resolution

This issue occurs because of the way that Microsoft Solver Foundation internally represents numbers by using fractions. For the preceding example, the result of the calculation where the percentage is 2.40 is represented as $27021597764222975 \div 1125899906842624 = 23.999999999999991182158029987476766109466552734375$. When .NET casts this value as an integer, it will return 23.

This behavior won't be changed, because other scenarios depend on it. For the preceding example, you can fix the issue by introducing an additional decimal attribute and a calculation.

For example, you can set up the following attributes on a production configuration model:

- Input (integer)
- Percent (decimal)

- `ResultDecimal` (decimal)
- `ResultInteger` (integer)

You can then add the following calculations:

- $ResultDecimal = Input \times Percent \div 100$
- $ResultInteger = ResultDecimal$

Engineering change management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Feature summary

Today's manufacturers require strong product data management, version control, and engineering change management to succeed in a world of constantly shrinking product lifecycles, increased quality and reliability requirements, and an increased focus on product safety.

Engineering change management brings structure and discipline to the product data management process, and enables products to be defined, released, and revised in a controlled manner that is supported by workflows. Through product versions and engineering change management, you can document, assess the impact of, and apply engineering changes throughout the whole lifecycle of a product.

Engineering change management helps you plan and manage product versioning, and manage product lifecycles and engineering changes. Here is a list of its main features:

- Product versioning
- Enhanced product release functionality that lets you maintain product master data in one legal entity (the engineering company) and publish the fully configured released product to other legal entities
- Rules for validating that required information is entered before a product version is activated (readiness checks)
- Improved product lifecycle management through fine-grained control over when a released product can be used in specific business processes
- Engineering change requests that are supported by workflows
- Engineering change orders that are supported by workflows

The preceding video ([Change management capabilities in Dynamics 365 Supply Chain Management](#)) is included in the [Finance and Operations playlist](#) available on YouTube.

Turn on the engineering change management and version dimension features for your system

Before you can use engineering change management, you must enable both the *Engineering Change Management* feature and its configuration key. If you also want to track the version dimension of products in transactions (optional), then you must also enable the *Product version dimension* feature and its configuration key.

First, turn on the features by following these steps.

1. Go to [Feature management](#).
2. Check for updates.
3. Turn on the feature that is named **Engineering Change Management**.
4. If you want to use it, then also turn on the feature that is named **Product dimension version**.

Next, turn on the configuration keys by following these steps.

1. Put your system into maintenance mode, as described in [Maintenance mode](#).
2. Go to **System administration > Setup > License configuration**.

3. Expand the **Trade** node
4. Select the **Engineering Change Management** check box.
5. If you want to use it, then also select the **Product dimension - Version** check box.
6. Turn off maintenance mode, as described in [Maintenance mode](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Engineering change management feature walkthrough

2/18/2021 • 15 minutes to read • [Edit Online](#)

This topic provides an end-to-end walkthrough that shows how to work with engineering change management. It goes through each of the most important scenarios:

- Basic feature configuration
- How an engineering company creates a new engineering product
- How an engineering company releases an engineering product to a local company
- How a local company can review and accept a product that has been released to it by an engineering company
- How a local company can use an engineering product in standard transactions
- How to add an engineering product to a sales order
- How to request changes to an engineering product by creating an engineering change request
- How to schedule and implement requested changes by creating an engineering change order
- How to release a product that has been changed

All the exercises in this topic use the standard sample data that is provided for Microsoft Dynamics 365 Supply Chain Management. Additionally, each exercise builds on the previous exercise. Therefore, we recommend that you work through the exercises in order, from beginning to end, especially if you've never used the engineering change management feature before. In this way, you will gain a complete understanding of the feature.

Set up for the sample scenario

To follow the sample scenario that is provided in this topic, you must first prepare the feature by making demo data available and adding a few custom records.

Before you try to do any of the exercises in the rest of this topic, follow the instructions in all the following subsections. These subsections also introduce several important settings pages that you will use when you set up engineering change management for your own organization.

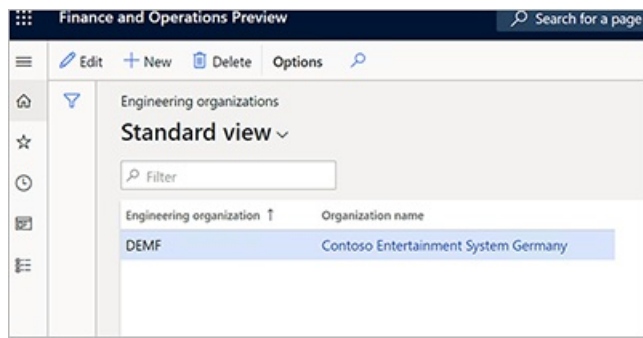

Make standard demo data available

Work on a system where the [standard demo data is installed](#). The standard demo data adds data for several demo legal entities (companies and organizations). As you work through the exercises, you will use the company picker on the right side of the navigation bar to switch between one company (*DEMF*) that is set up as an *engineering organization* and another company (*USMF*) that is set up as an *operational organization*.

Set up an engineering organization

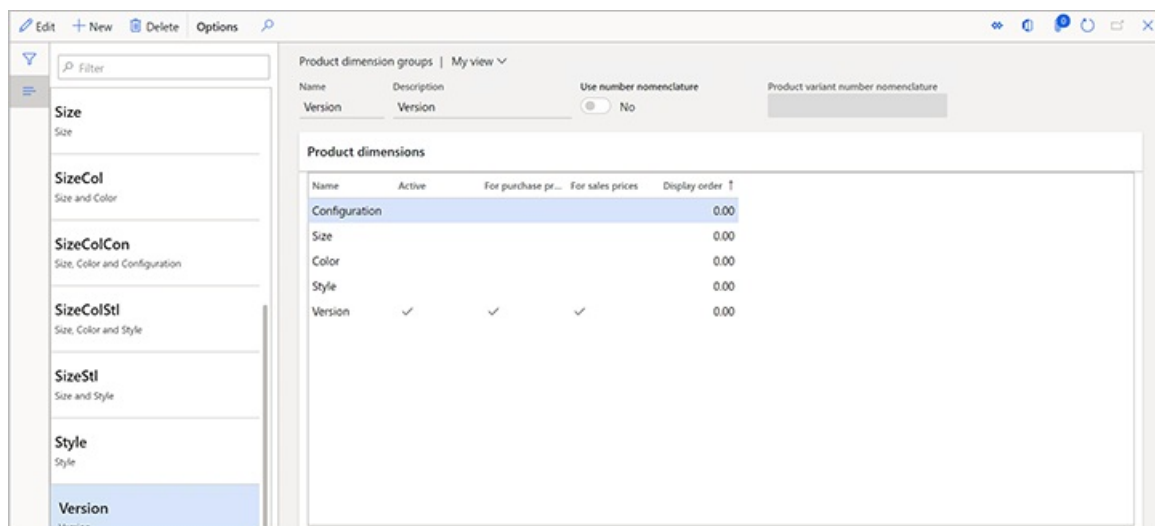

An engineering organization owns the engineering data, and is responsible for product design and product changes. To set up your engineering organizations, follow these steps.

1. Go to **Engineering change management > Setup > Engineering organizations**.
2. Select **New** to add a row to the grid, and set the following values for it:
 - **Engineering organization:** *DEMF*
 - **Organization name:** *Contoso Entertainment System Germany*

Set up the version product dimension group

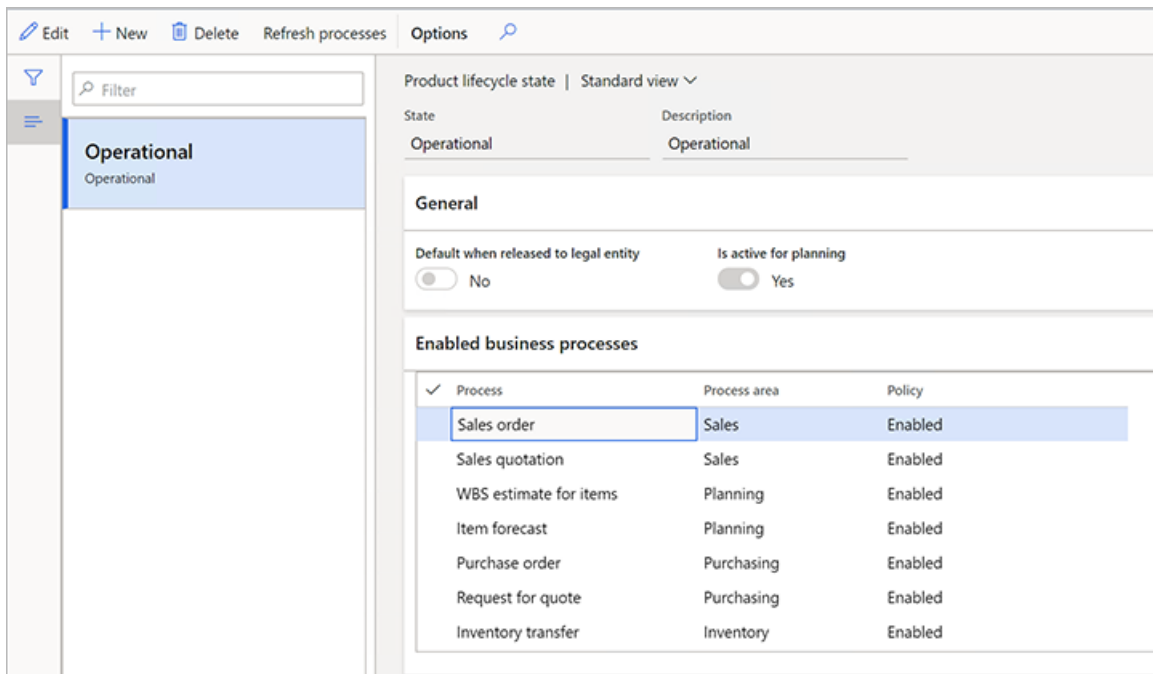

1. Go to **Product information management > Setup > Dimensions and variant groups > Product dimension groups**.
2. Select **New** to create a product dimension group.
3. Set the **Name** field to *Version*.
4. Select **Save** to save the new dimension and load values onto the **Product dimensions** FastTab.
5. On the **Product dimensions** FastTab, set **Version** as an active product dimension.

Set up product lifecycle states

As an engineering product goes through its lifecycle, it's important that you be able to control which transactions are allowed for each lifecycle state. To set up the product lifecycle states, follow these steps.

1. Go to **Engineering change management > Setup > Product lifecycle state**.
2. Select **New** to add a lifecycle state, and set the following values for it:
 - **State:** *Operational*
 - **Description:** *Operational*
3. Select **Save** to save the new lifecycle state and load values onto the **Enabled business processes** FastTab.
4. On the **Enabled business processes** FastTab, select the business processes that should be available. For this example, leave the **Policy** field set to *Enabled* for all business processes.

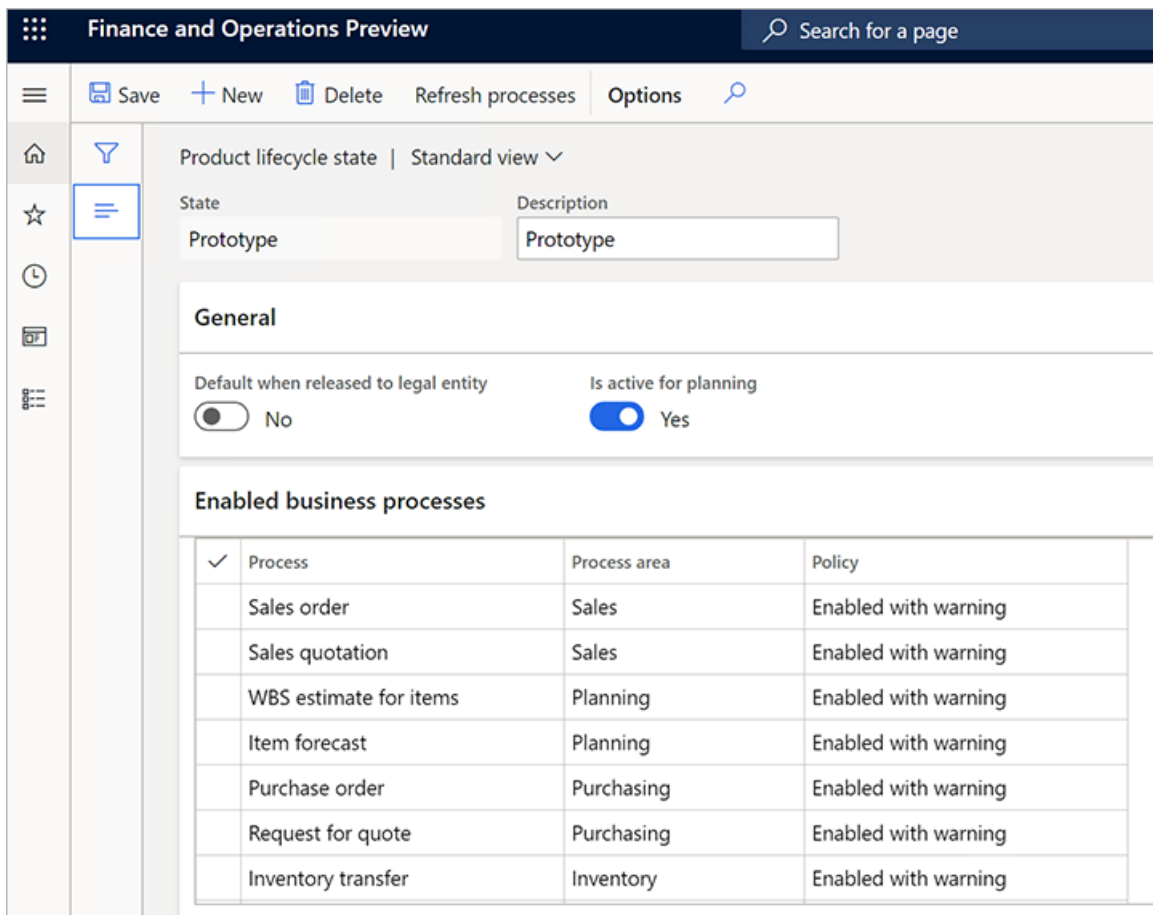

5. Select **New** to add another lifecycle state, and set the following values for it:

- **State:** *Prototype*
- **Description:** *Prototype*

6. Select **Save** to save the new lifecycle state and load values onto the **Enabled business processes** FastTab.

7. On the **Enabled business processes** FastTab, select the business processes that should be available. For this example, set the **Policy** field to *Enabled with warning* for all business processes.

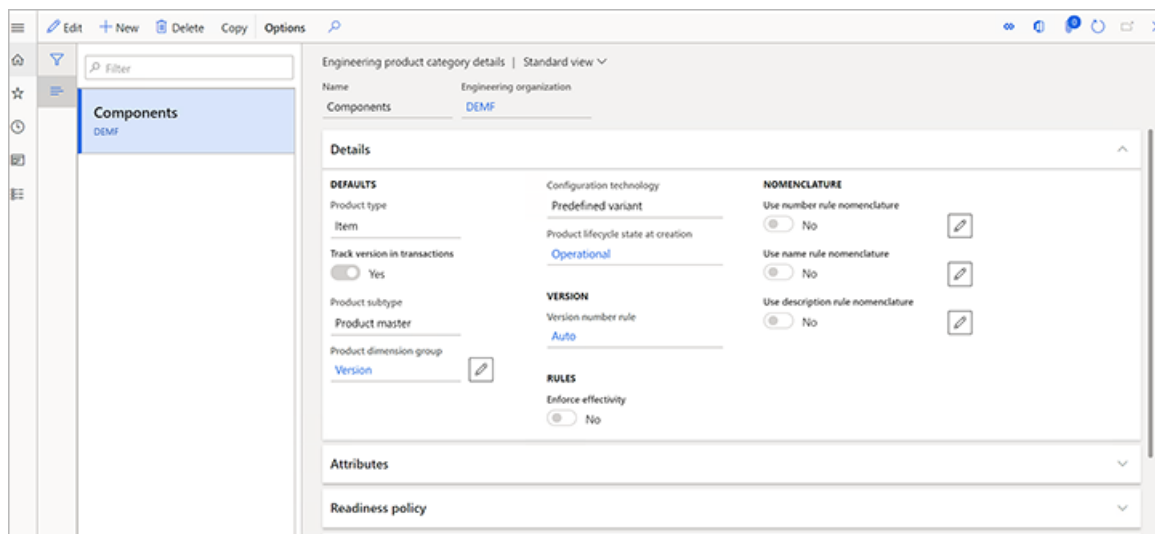

Set up a version number rule

Set up an engineering product category

Engineering product categories provide the basis for creating engineering products (that is, products that are versioned and controlled through engineering change management). To set up engineering product categories, follow these steps.

1. Go to **Engineering change management > Engineering product category details**.
2. Select **New** to create a category.
3. On the **Details** FastTab, set the following values:
 - **Name:** *Components*
 - **Engineering organization:** *DEMF*
 - **Product type:** *Item*
 - **Track version in transactions:** *Yes*
 - **Product dimension group:** *Version*
 - **Product lifecycle state at creation:** *Operational*
 - **Version number rule:** *Auto*
 - **Enforce effectivity:** *No*
 - **Use number rule nomenclature:** *No*
 - **Use name rule nomenclature:** *No*
 - **Use description rule nomenclature:** *No*
4. On the **Release policy** FastTab, set the **Product release policy** field to *Components*.
5. Select **Save**.

Set up product acceptance conditions

1. Use the company picker on the right side of the navigation bar to switch to the *USMF* legal entity (company).
2. Go to **Engineering change management > Setup > Engineering change management parameters**.
3. On the **Release control** tab, in the **Product acceptance** section, set the **Product acceptance** field to *Manual*.

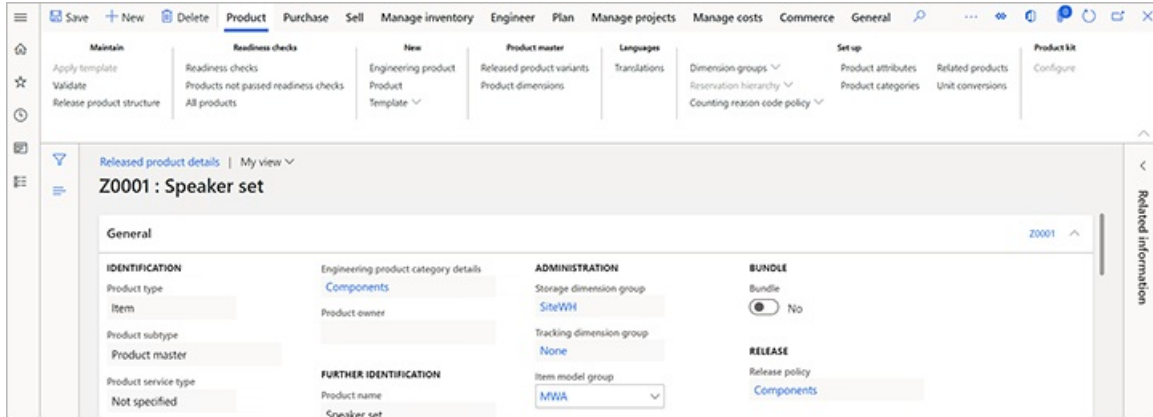

Create a new engineering product

An engineering product is a product that is versioned and controlled through engineering change management. In other words, you can control the changes during its life, and the change information will be saved using engineering change orders. To create engineering products, follow these steps.

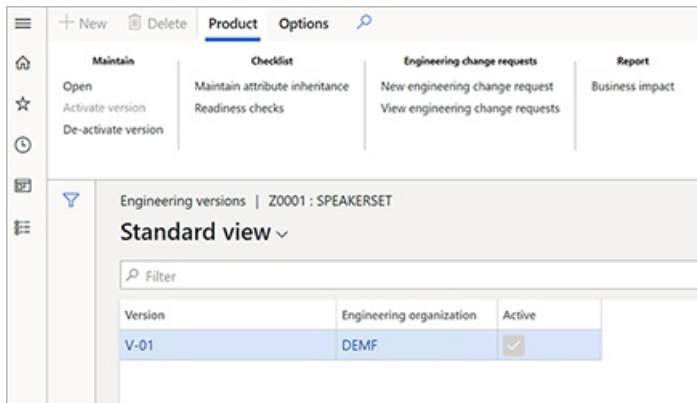

1. Make sure that you're in the legal entity of your engineering organization (*DEMF* for this example). Use the company picker on the right side of the navigation bar as required.
2. Open the **Released products** page by following one of these steps:
 - Go to **Product information management > Products > Released products**.
 - Go to **Engineering change management > Common > Released products**.
3. On the Action Pane, on the **Product** tab, in the **New** group, select **Engineering product**.
4. In the **New product** dialog box, set the following values:
 - **Engineering Product Category:** *Components*
 - **Product number:** *Z0001*
 - **Product name:** *Speaker set*

Note that the **Version** field is automatically set by using the product version number rule that you set up earlier.

- Select **OK** to create the product and close the dialog box.
- The details page for the new product is opened. Notice that values are already filled in for some fields, such as **Storage dimension group**, **Tracking dimension group**, and/or **Item model group**. These fields were automatically set because the product is being released in the *DEMF* legal entity and uses the *Components* product release policy, which is associated with the *Components* engineering product category. Because you previously used item *D0006* as a template to set up a line for the *DEMF* legal entity, the values that were filled in were taken from item *D0006*.

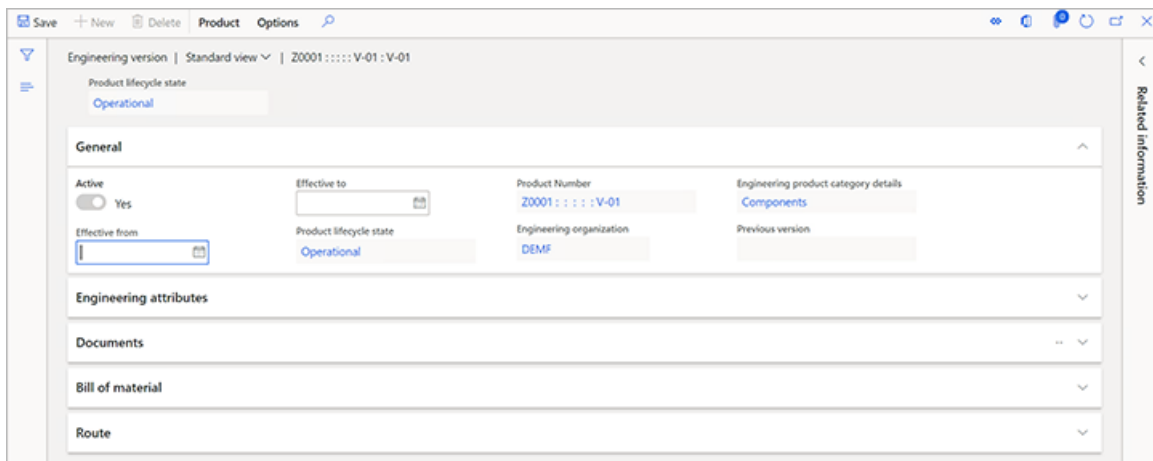

- On the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Engineering versions** to view the versions of the product.

- On the **Engineering versions** page, notice that there is only one version for the product, and it's active.

- Select the version to view its details.

- On the **Engineering version** page, on the **Bill of material** FastTab, select **Create BOM**.

- In the **Create BOM** dialog box, set the following values:

- **BOM number:** Z0001

- Name: Speaker set
- Site: 1

12. Select **OK** to add the BOM and close the dialog box.

13. On the **Bill of materials** FastTab, select **Bill of material**.

14. On the **Bill of materials** page, on the **Bill of materials lines** FastTab, add three lines, one each for item numbers *D0001*, *D0003*, and *D0006*.

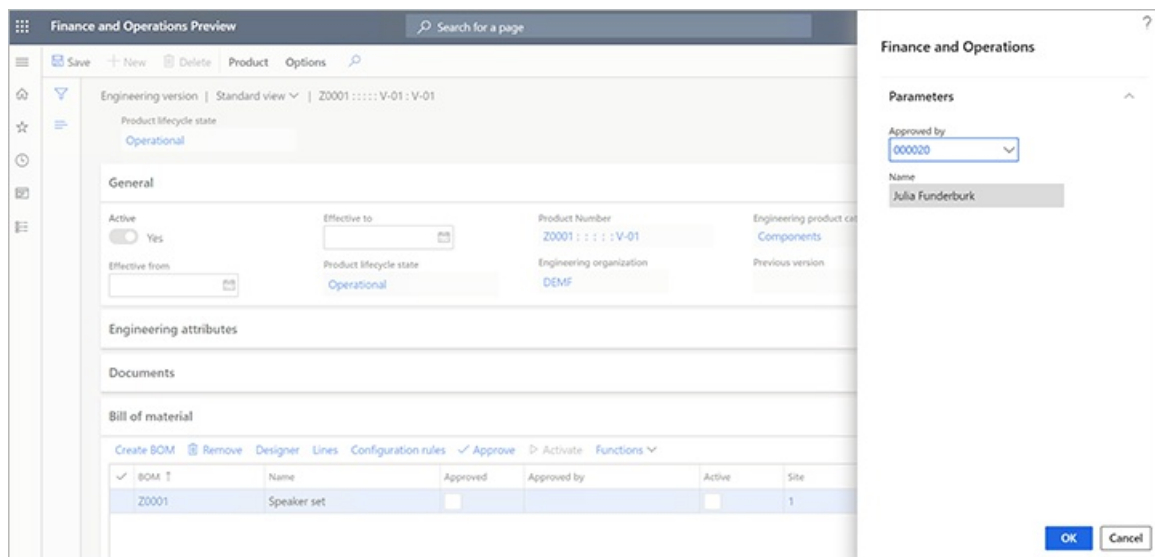

Item number	Configuration	Size	Color	Style	Version	Warehouse	Resource cons.
D0006	Default						<input type="checkbox"/>
D0001						11	<input type="checkbox"/>
D0003						11	<input type="checkbox"/>

15. Select **Save**.

16. Close the page.

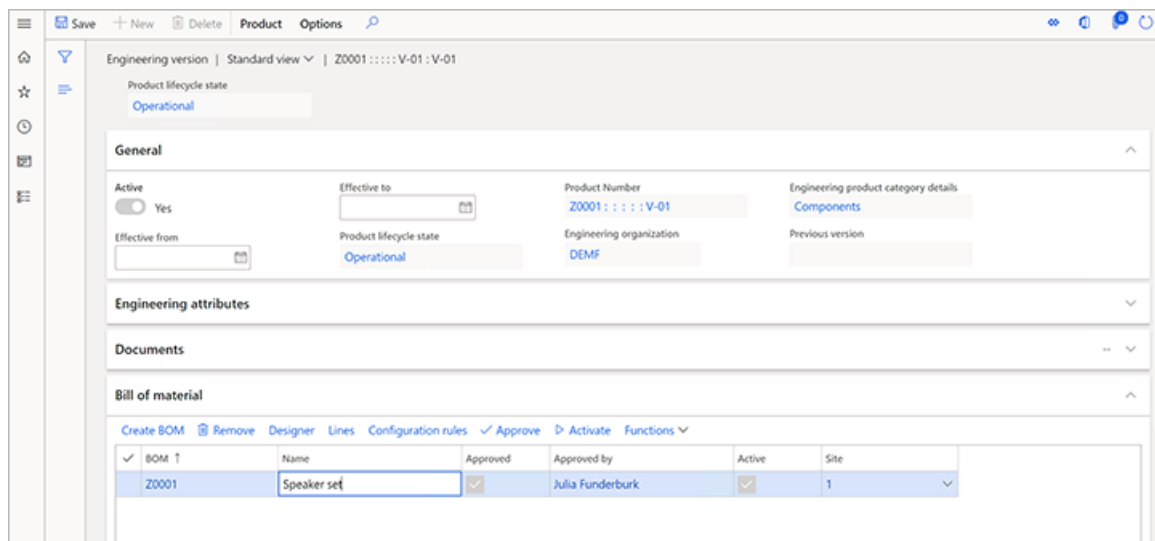

17. On the **Engineering version** page, on the **Bill of material** FastTab, select **Approve**.

18. In the dialog box that appears, select **OK**.

19. On the **Engineering version** page, on the **Bill of material** FastTab, select **Activate**.

20. Notice that the **Active** and **Approved** check boxes are selected for the BOM.

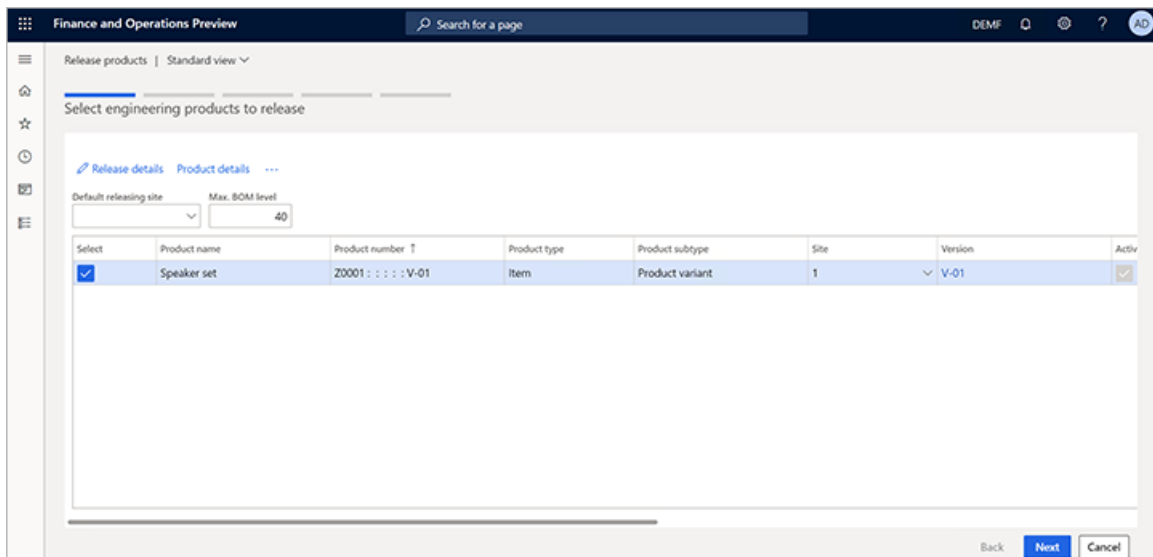

21. Close the page.

Release an engineering product to a local company

The product has now been designed by the Engineering department. For this example, the product is a prototype that engineering has designed for a customer. Because the customer is a customer of the *USMF* legal entity, the product must be released to that legal entity.

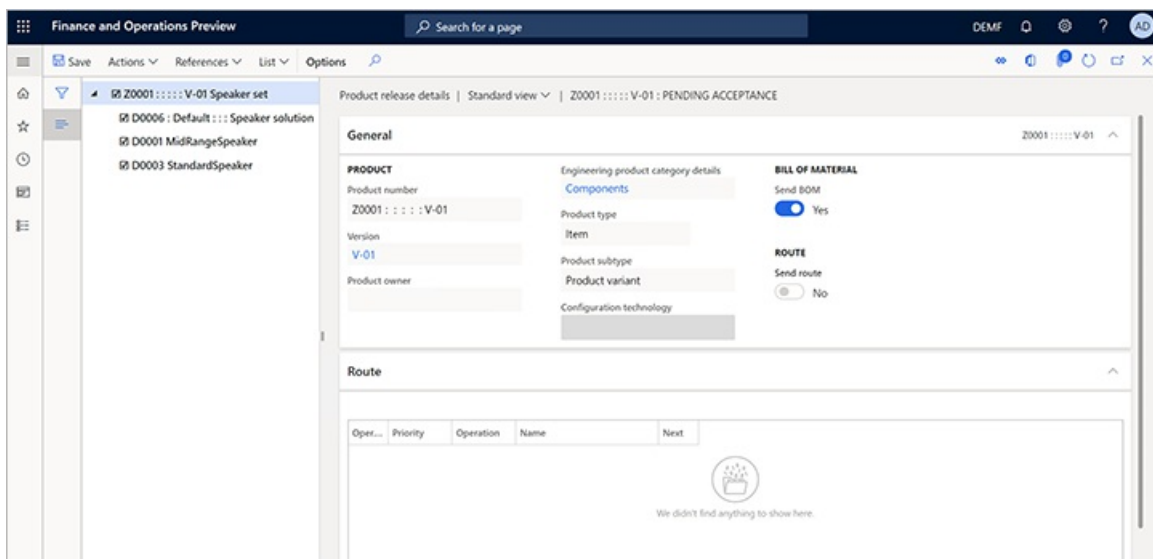

1. Keep the legal entity set to *DEMF*. (Use the company picker on the right side of the navigation bar as required.)
2. Go to **Product information management > Products > Released products**.
3. Select product *Z0001*.
4. On the Action Pane, on the **Product** tab, in the **Maintain** group, select **Release product structure** to open the **Release products** wizard.
5. On the **Select engineering products to release** page, select the **Select** check box for product *Z0001*.

6. Select **Release details**.

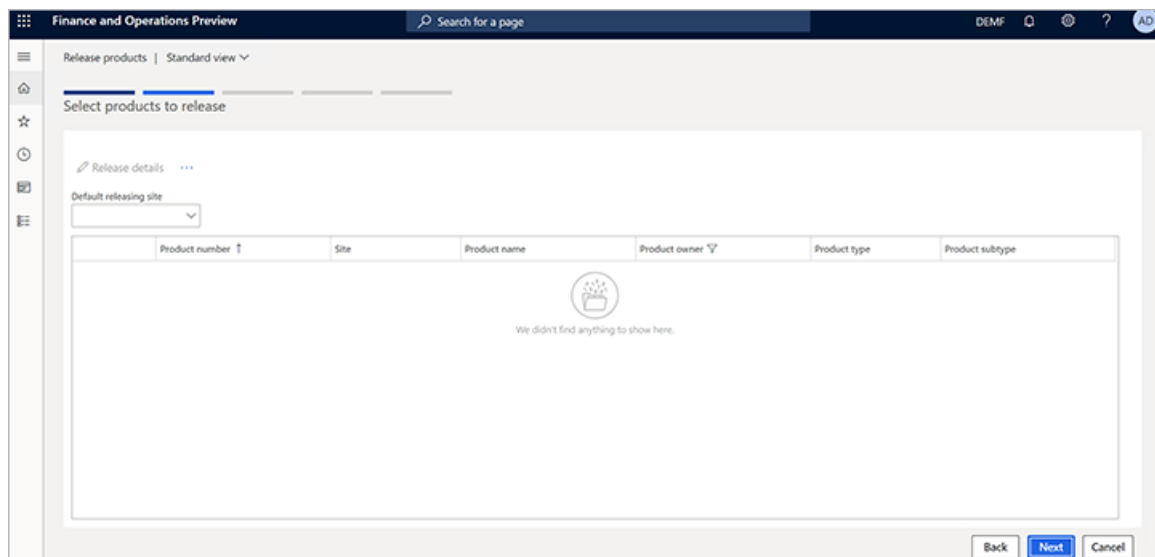

7. The **Product release details** page appears, where you can review the details of the product that will be released, and its product structure. Notice that the **Send BOM** option is set to **Yes**. Therefore, both product *Z0001* and all its child items from the BOM will be released.

You can select any child item in the left pane to review its details. If any child item has a BOM, you can also select to release the BOM of that child item.

8. Close the page to return to the **Release products** wizard.

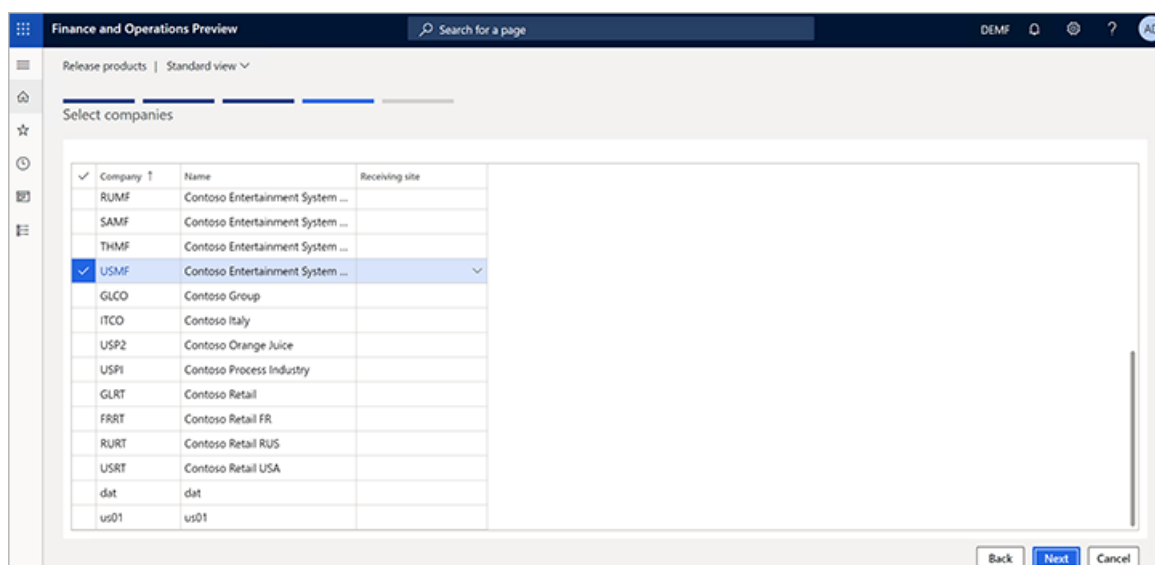

9. Select **Next** to open the **Select products to release** page. If you had selected any standard (non-engineering) products, they would appear on this page. Note that when you release a standard product by selecting **Release product structure**, its BOM and route are also released.

10. Select **Next** to open the **Select product variants to release** page. For this example, there aren't any variants.

11. Select **Next** to open the **Select companies** page.

12. Select the companies that the product should be released to. For this example, select the check box for **USMF**.

13. Select **Next** to open the **Confirm selection** page.

14. Select **Finish**.

Review and accept the product before you release it in the local company

The Engineering department has now released the information to the local companies where the product will be used. For this example, the local company is *USMF*.

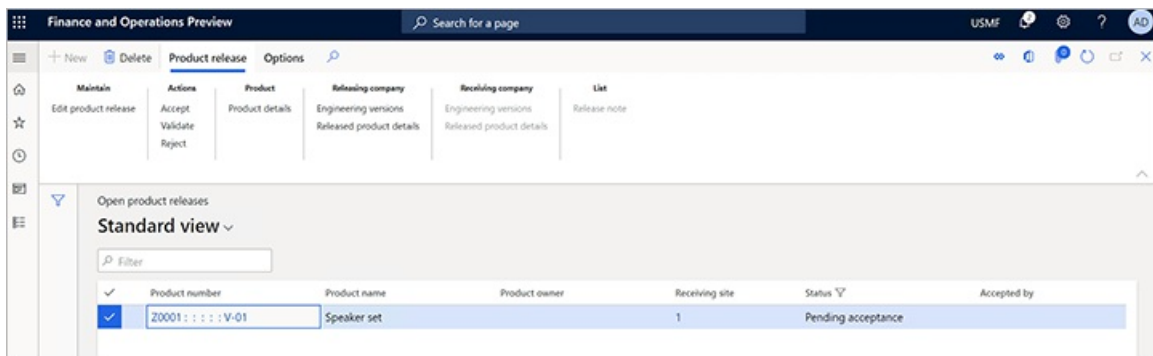

Because you set the **Product acceptance** field to *Manual* on the **Engineering change management parameters** page for the *USMF* company, products must be manually accepted before they are released to that company. In other words, they must be reviewed and accepted before they become released products.

To review the product and release it in the *USMF* company, follow these steps.

1. Set the legal entity to *USMF*. (Use the company picker on the right side of the navigation bar.)

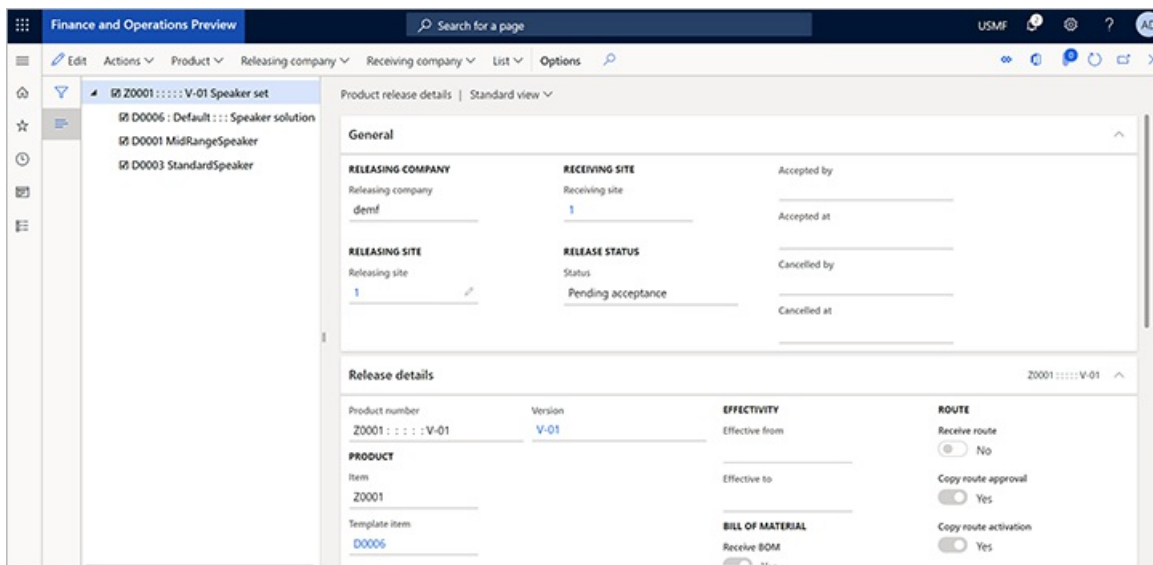

- Go to **Engineering change management > Common > Product releases > Open product releases**.

The **Open product releases** page shows product *Z0001*, which has a status of *Pending acceptance*.

- Select the value in the **Product number** column to open the **Product release details** page. Notice the following details:

- The **General** FastTab shows information about the product release, such as the releasing company (*DEMF* for this example), the releasing site (*1*), and the receiving site (*1*). Because you didn't specify a receiving site in the **Release products** wizard, the releasing site value is copied to the receiving site.
- The **Release details** FastTab shows information about the product and the version that was released. Here, you can modify settings such as the effectivity dates.
- The **Route** FastTab shows the route of the product. However, for this example, you didn't release any routes.

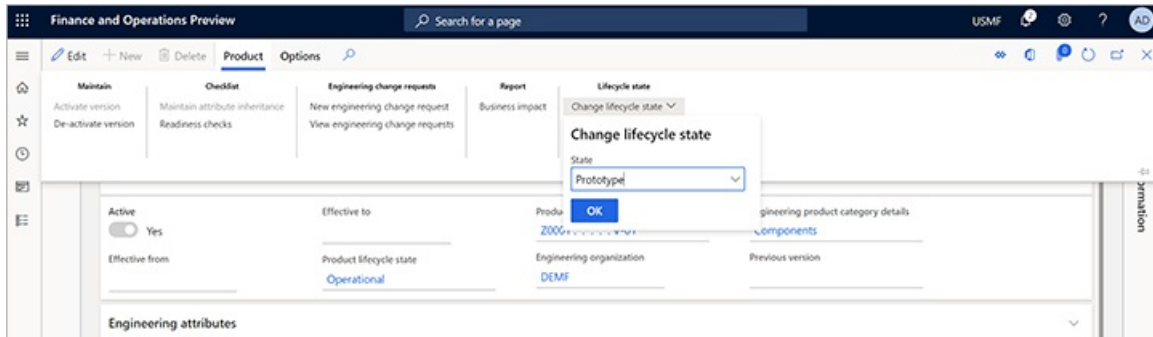

- When you've finished reviewing the information, you're ready to accept the product and, in this way, release it in the *USMF* company. On the Action Pane, select **Actions > Accept**.
- The product is now released in the *USMF* company. Go to **Product information management > Products > Released products**. You should see item *Z0001*.

Use the product in transactions in the local company

The master data manager for the *USMF* company wants to make sure that the product is in a *Prototype* state, to ensure that users will be warned if they accidentally add it to processes that they are working on.

- Go to **Product information management > Products > Released products**.
- Select product *Z0001* to open its details page. (You can use the filter to find the product.)

3. On the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Engineering versions**.
4. On the **Engineering versions** page, select version number *V-01* to open its details page.
5. On the Action Pane, on the **Product** tab, in the **Lifecycle state** group, select **Change lifecycle state**.
6. In the **Change lifecycle state** drop-down dialog box, set the **State** field to *Prototype*, and then select **OK**.

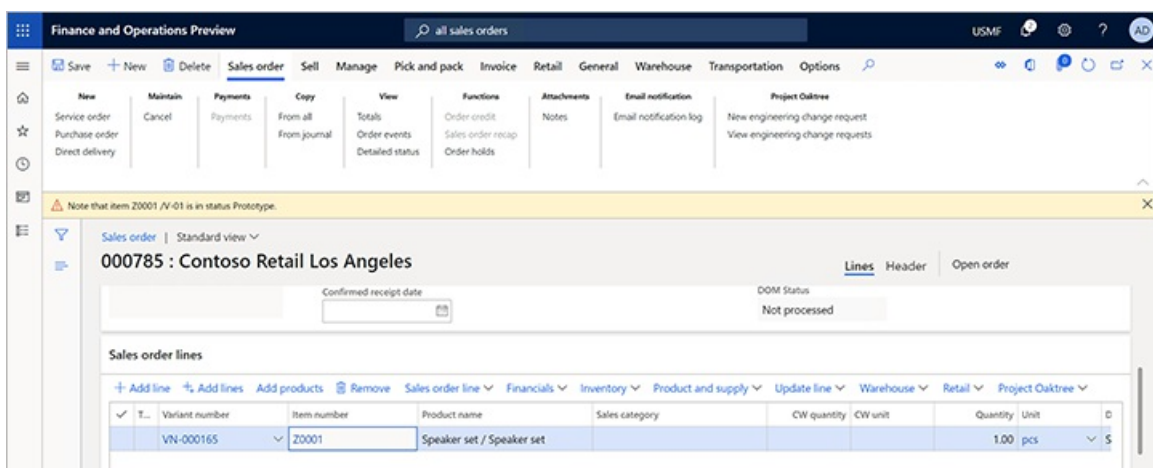

Add the engineering product to a sales order

The product can now be sold to a customer. To add the product to a sales order, follow these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the **Customer account** field to *US-0002*, and then select **OK**.
4. The new sales order is opened. On the **Sales order lines** FastTab, add a row, and set the **Item number** field to *Z000* for it.
5. On the Action Pane, select **Save**.

You receive a warning message that informs you that the item has a status of *Prototype*. However, because the message is just a warning, the sales order was still created.

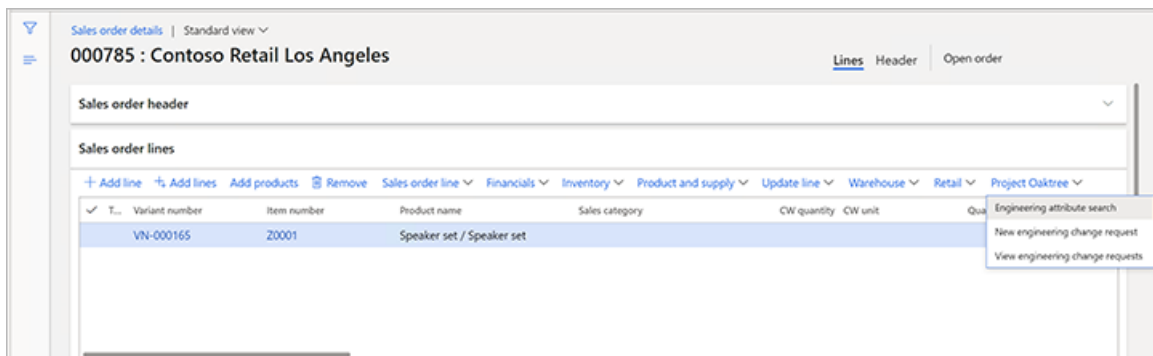

Request changes in the engineering product

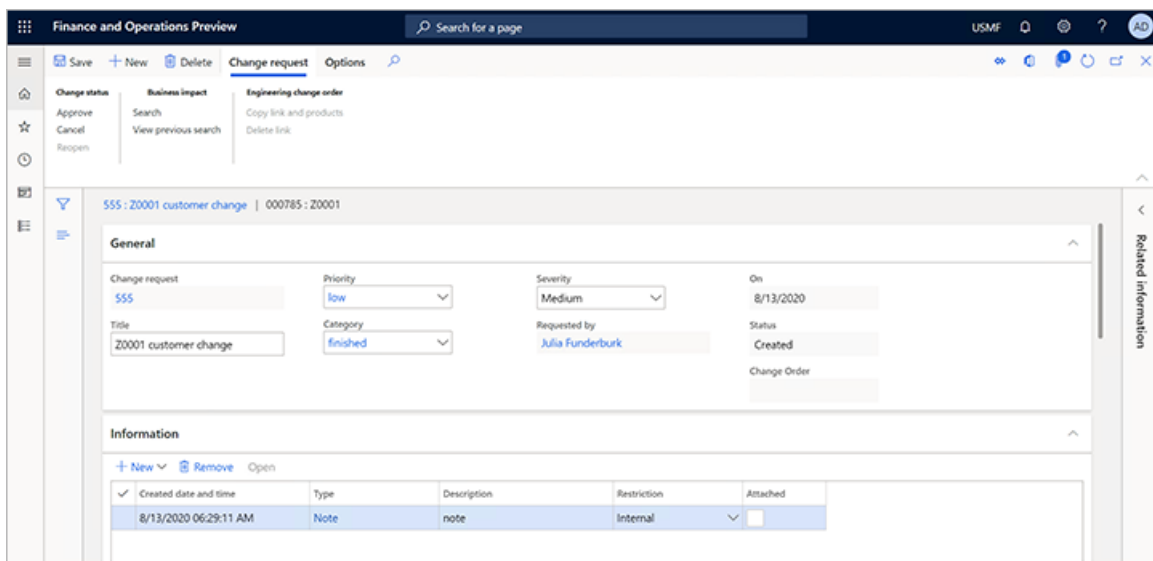

The product was sent to a customer, but the customer wasn't completely satisfied and provides feedback that includes suggestions for improvement. While the customer is speaking with a sales clerk on the phone, the sales clerk can request the changes that the customer is describing.

1. Go to **Sales and marketing > Sales orders > All sales orders**.

- Find and open the sales order that you created in the previous exercise.
- On the **Sales order lines** FastTab, select **Engineering change management > New engineering change request**.

- Fill in the engineering change request, based on the customer's feedback. For this example, set the following values:
 - **Change request:** *555*
 - **Title:** *Z0001 customer change*
 - **Priority:** *low*
 - **Category:** *set change*
 - **Severity:** *Medium*
- On the **Information** FastTab, select **New > Note** to add a note to the grid.
- In the **Description** field for the new note, indicate that item *D0003* should be deleted from the BOM. If you must add more information for the note, you can enter text in the **Notes** field.

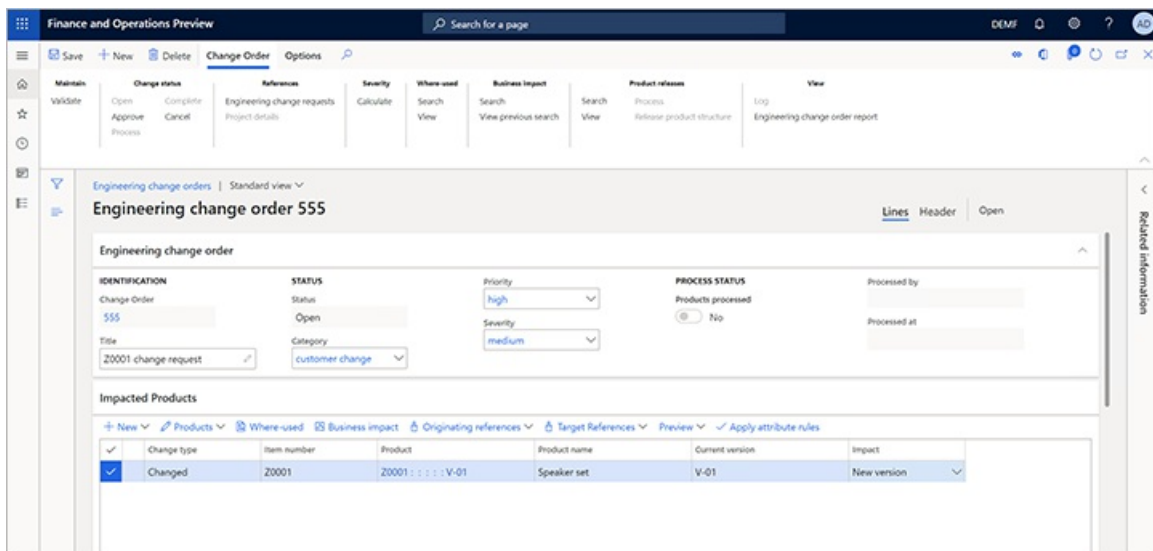

- On the **Action** Pane, select **Save**.
- Notice that the item has automatically been added on the **Products** FastTab, and that the source of the engineering change request (the sales order) has been added on the **Source** FastTab.

Make changes to the product by using an engineering change order

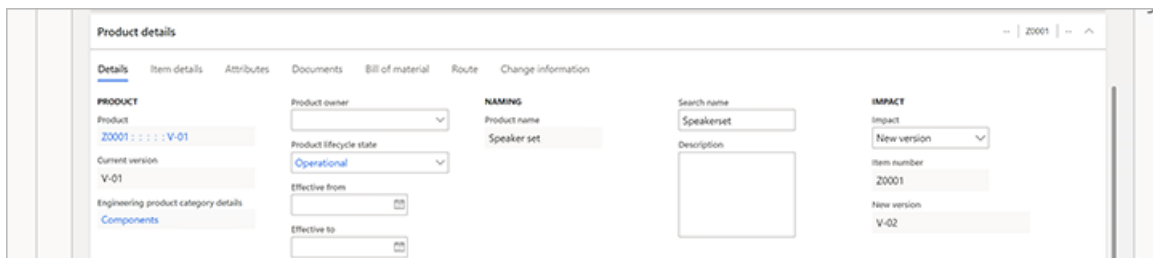

The sales clerk knows that the product is important and was designed especially for the customer. Therefore, the sales clerk calls an engineer in the *DEMF* company to notify them about the change request. In this way, the engineer can speed up the process.

The engineer now reviews the request from the customer and creates a change order for the product.

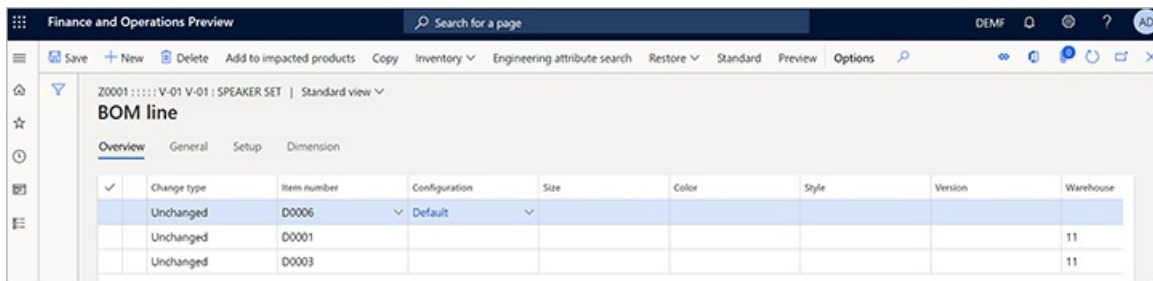

1. Because the engineer works in the *DEMF* company, set the legal entity to *DEMF*. (Use the company picker on the right side of the navigation bar.)
2. Go to **Engineering change management > Common > Engineering change requests**.
3. Open change request *555*.
4. Review the information, and then approve the change. On the Action Pane, on the **Change request** tab, in the **Change status** group, select **Approve**.
5. Go to **Engineering change management > Common > Engineering change orders**.
6. On the Action Pane, select **New** to create a change order, and set the following values for it:
 - **Change order:** *555*
 - **Title:** *Z0001 customer change*
 - **Category:** *Customer change*
 - **Priority:** *Low*
 - **Severity:** *Medium*
7. On the **Impacted products** FastTab, select **New > Add existing product** to add a row to the grid, and set the following values for it:
 - **Product:** *Z0001*
 - **Impact:** *New version*

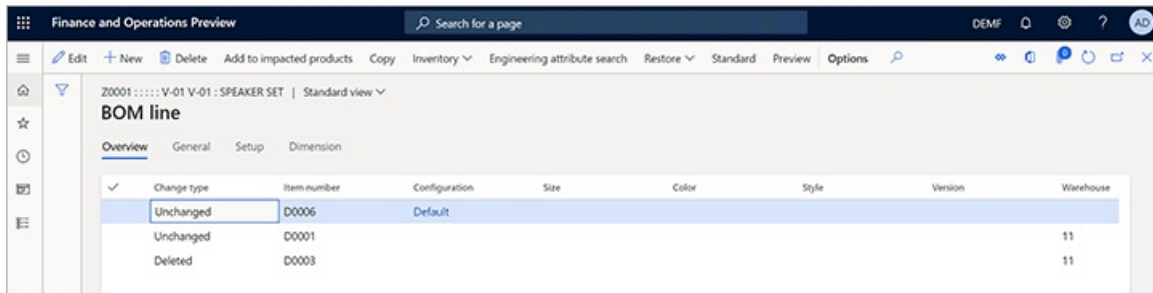

8. Notice that, because you set the **Impact** field to *New version*, the **New version** field on the **Details** tab of the **Product details** FastTab shows what the new version number will be (*V-02* for this example).

9. On the Action Pane, select **Save**.
10. On the **Product details** FastTab, on the **Bill of material** tab, select **Lines** to open the BOM for version *V-01* of product *Z0001*.

- Select the line for item number *D0003*, and then, on the Action Pane, select **Delete**. The value of the **Change type** field for this line changes to *Deleted*.
- On the Action Pane, select **Save**.

- Close the **BOM line** page to return to the **Engineering change order** page.
- On the **Product details** FastTab, on the **Bill of material** tab, notice that the value of the **Change type** field for BOM *Z0001* is now *Changed*.

The order must now be approved before the changes can be processed. When the changes are processed, the products are updated with the changes that are included in the engineering change order. For this example, the person who creates the engineering change order has been specified as the approver.

- On the Action Pane, on the **Change order** tab, in the **Change status** group, select **Approve**.
- Select **Process** to update the product's information.
- Select **Complete** to mark the change order as completed.

Release the changed product

The product can now be released again to the *USMF* company and then sent to the customer. To release the product directly from the engineering change order, follow these steps.

- Open the engineering change order that you created in the previous exercise, if it isn't already open.
- On the Action Pane, on the **Change order** tab, in the **Product releases** group, select **Search**.
- The search results show which companies the affected products have been released to. Close the search results.
- On the Action Pane, on the **Change order** tab, in the **Product releases** group, select **View** to open the **Releases** dialog box, where you can view the results of the previous search.
- Select each company that you want to release products to.
- Select **OK** to close the **Releases** dialog box and return to the change order.

7. On the Action Pane, on the **Change order** tab, in the **Product releases** group, select **Process** to release the affected products to the selected companies. Alternatively, select **Release product structure** to start the release process.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Engineering change management parameters

2/18/2021 • 3 minutes to read • [Edit Online](#)

The **Engineering change management parameters** page contains setup parameters that change the default behavior that is related to the release product structure and engineering change management processes.

Open the Engineering change management parameters page

To open the **Engineering change management parameters** page, go to **Engineering change management > Setup > Engineering change management parameters**. You can then set the fields as described in the remaining sections of this topic.

Release control tab

The following table describes the fields that are available on the **Release control** tab of the **Engineering change management parameters** page. These fields affect the release product structure process.

FIELD	DESCRIPTION
Item number rule	Select how the item number should be defined when the product is released to a legal entity. Select <i>Engineering product number</i> if the product number in the receiving legal entity should match the product number in the engineering company. Select <i>Local item number sequence</i> if the product should take the next number in the number sequence for product numbers in the receiving legal entity.
BOM name rule	Select how the name of the bill of materials (BOM) is defined when the product is received (released) in a legal entity. Select either <i>Engineering name</i> or <i>Receiving item number</i> .
Route name rule	Select how the route name should be defined when the route of a product is received (released) in a legal entity. Select either <i>Engineering name</i> or <i>Receiving item number</i> .
Run BOM check	Select whether a BOM check will be run when the product is received (released) in a legal entity.
Release behavior of inactive BOM	Select whether a product can be released if it has an inactive BOM. Select <i>Accept</i> , <i>Warning only</i> , or <i>Not allowed</i> .
Release behavior of inactive route	Select whether a product can be released if it has an inactive route. Select <i>Accept</i> , <i>Warning only</i> , or <i>Not allowed</i> .
Product acceptance	Select whether an additional step for acceptance is required before the product can be released in the legal entity. Select <i>Manual</i> to add the acceptance step. In this case, the Open product releases page will show the products. Select <i>Automatic</i> to show the product directly on the Released products page in the target legal entity immediately after the product is released together with its release product structure.

Engineering change management tab

The following table describes the fields that are available on the **Engineering change management** tab of the **Engineering change management parameters** page. These settings affect the engineering change management process.

FIELD	DESCRIPTION
Category	The default category that will be used when an engineering change request is created.
Priority	The default priority that will be used when an engineering change request is created.
Severity rule	Select how the severity of an engineering change order should be established. Select <i>Manual</i> if the user is expected to enter a value in the Severity field. Select <i>Calculate</i> to have the system calculate the value of the Severity field when you select Calculate severity on the Action Pane of the engineering change order. In this case, the system will use the severity rules that are defined on the Severity rule set page. Select <i>Calculate automatically</i> to have the value of the Severity field automatically calculated and filled in according to the severity rule sets.
Re-release impacted products	This field is applicable when you re-release products via an engineering change order. You can select whether all products or only the affected products should be proposed in the Releases dialog box.
BOM levels to release	The depth of the BOM level to release. If the BOM has more levels (that is, if it's deeper) than the value that is specified here, only the levels up through the specified value will be released.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Establish common values for engineering change management

2/18/2021 • 6 minutes to read • [Edit Online](#)

When you set up engineering change management, you must establish several collections of values that will be used to fill in drop-down lists in other parts of the user interface (UI). You should specify these values according to the types of products that you produce and your specific business needs.

Engineering change categories

You use engineering change categories to organize your engineering change orders, so that they are easier to manage and review. For example, you might find it useful to set up a workflow where, depending on the category, a specific department must review the proposed changes. Therefore, the engineering change order includes a **Category** field.

To establish the collection of engineering change categories that is used in your company, go to **Engineering change management > Setup > Engineering change management > Engineering change categories**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change priorities

You use engineering change priorities to indicate the importance or urgency of an engineering change order. They can help you keep track of the importance of an engineering change order, so that you can easily identify which orders should be processed first, and how quickly.

To establish the collection of engineering change priorities that is used in your company, go to **Engineering change management > Setup > Engineering change management > Engineering change priorities**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change reasons

Engineering change reasons indicate the cause or nature of the change in the change order.

To establish the collection of engineering change reasons that is used in your company, go to **Engineering change management > Setup > Engineering change management > Engineering change reasons**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Material disposal codes

You use material disposal codes to categorize materials that are used in your finished goods, or components that must be disposed of in a specific way or require some treatment before they can be added to your regular trash. When you add a relevant product to an engineering change order, you can assign a disposal code as part of the change details.

To establish the collection of material disposal codes that is used in your company, go to **Engineering change management > Setup > Engineering change management > Material disposal codes**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which

they should appear in the drop-down lists where they are shown.

Received customer approval

When you design products for a specific customer, the design and specifications often must be validated before the product can be set as ready. The **Received customer approval** field lets you indicate how far in the customer approval process the product is and/or whether the approval has been received.

To establish the collection of received customer approval values that is used in your company, go to **Engineering change management > Setup > Engineering change management > Received customer approval**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change – Environmental health and safety codes

If any standard environmental health and safety regulations, or company-specific regulations or procedures, must be considered in the manufacture of a product, you can use the environmental health and safety codes to define them. In the engineering change order, you can indicate which codes apply to the manufacture of a product while you edit the details of the affected product.

To establish the collection of health and safety values that is used in your company, go to **Engineering change management > Setup > Engineering change management > Engineering change - Environmental health and safety codes**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change severities

You use engineering change severities to indicate the level of impact that applies to the products in an engineering change order.

To establish the collection of engineering change severities that is used in your company, go to **Engineering change management > Setup > Engineering change management > Engineering change severities**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

You can establish rules that apply to each severity level that you create. For more information about how to assign these rules, see the next section.

Engineering change severity rule sets

You use engineering change severity rule sets to establish a group of rules that you can use to automatically calculate the severity of the change order, based on the type of changes in the affected products. To use the severity rules, open the **Engineering change management parameters** page, and set the **Severity rule** field to *Calculate* or *Calculate automatically*.

When the system evaluates severity, it processes the rules in the order in which they appear on the page, from top to bottom. For a rule to be selected and have its priority established, all the rules in a rule set must be met.

To set up the rules that apply to each change severity level that you've defined, go to **Engineering change management > Setup > Engineering change management > Engineering change severity rule sets**. Then follow one of these steps.

- To create a new rule set, select **New** on the Action Pane, and then set the fields as described later in this section.
- To edit an existing rule set, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described later in this section.

- To delete an existing rule set, select it in the list pane, and then select **Delete** on the Action Pane.
- To rearrange the list of rule sets, select a rule set in the list pane, and then use the **Up** and **Down** buttons on the Action Pane to reposition it.

For each rule set, set the following field:

- **Severity** – Select the severity level to establish rules for. You use the **Engineering change severities** page to create and name the levels. (For more information, see the previous section.)

Use the buttons on the **Rules** FastTab to add or remove a rule for the current severity setting. Each rule has a **Rule** field and a **Name** field. The rules are established by the system and indicate the types of changes that a product can have. The name indicates the type of change.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Engineering companies and data ownership rules

2/18/2021 • 4 minutes to read • [Edit Online](#)

Engineering companies and operational companies

To ensure that the master data for products is centrally created and maintained, you can use one or more *engineering companies*. An engineering company owns the engineering products and their engineering-relevant data. It's always connected to (based on) an existing *legal entity*, which is also a company. Through this connection, the system establishes a central entry point for all engineering-relevant data for engineering products in the engineering company. In this central entry point, engineering products are created, and engineering-relevant data is maintained. From it, the engineering products and engineering-relevant data will be released to *operational companies*, which are other legal entities. (For more information about the release management, see [Release product structures](#).) These operational companies will use the engineering data as it has been designed by the engineering company. Any logistical data is locally maintained by each engineering company and operational company.

To create an engineering company, go to **Engineering change management > Setup > Engineering organizations**. Select **New**, enter a name for the engineering company, and select the existing company (legal entity) that it's based on.

If you're integrating with external product lifecycle management (PLM) systems, you must create a business unit (type of company) that will become an external company.

Engineering product categories and engineering companies

Engineering product categories help ensure that engineering products are created according to your company's business rules and behave as required. For more information about engineering product categories, see [Engineering versions and engineering product categories](#).

Each engineering product category belongs to a specific engineering company and can create only products that belong to that company. Likewise, the right to maintain an engineering product also belongs to the company that is associated with that product's engineering product category.

Data that is owned by the engineering company

Because the engineering company owns the engineering-relevant data, it controls the following processes:

- **Creation of engineering products:** Each engineering company can only create new engineering products that are based on an engineering product category that it owns. In some cases, operational companies maintain their own local data that is related to those products.
- **Creation of engineering versions:** When a company creates a new engineering product, the system automatically creates an initial engineering version for it. Only the owning engineering company will be able to create new versions of that product.
- **Creation and maintenance of engineering attributes:** When a company creates a new engineering product, the system automatically adds engineering attributes to it. Only the owning engineering company will be able to create and maintain the values for those attributes. For more information about engineering attributes, see [Engineering attributes and engineering attribute search](#).
- **Creation and maintenance of bills of materials (BOMs) that are connected to the engineering versions:** The owning engineering company can directly connect a BOM to an engineering product

version. When these BOMs are released to other legal entities, changes to the engineering data on the BOMs are limited in the following ways:

- The operational company can't remove released BOM lines.
- The engineering fields on the BOM lines are read-only for the operational company. All other fields are logistical implementation fields and can be edited by the operational company.
- The operational company can add BOM lines to the same BOM. In this way, it can add local additions, such as packaging materials or lubrication fluids.
- The operational company can add a completely new, local BOM. This change might be required in cases where, for example, no BOM is provided during the release. The operational company owns and maintains these local BOMs. For more information about release management, see [Release product structures](#).
- All local BOMs and BOM lines are preserved when the engineering company updates its BOM.
- **Creation and maintenance of routes that are connected to the engineering versions:** The engineering company can directly connect a route to each engineering version. When these routes are released to other legal entities, changes to the data on the routes are limited in the following ways:
 - The other legal entities can't remove the engineering data on the routes.
 - The other legal entities can add operations to the route. In this way, they can add local route steps.
 - Operational companies can add completely new, local routes. This change might be required if, for example, you haven't included routes during the release. The operational companies own and maintain these local routes. For more information about release management, see [Release product structures](#).
 - All changes that are made locally are preserved when updates from the engineering company are released again to the routes.
- **Creation and maintenance of engineering documents:** The engineering company can attach engineering documents to each engineering version.
 - When these documents are released to other legal entities, the documents are protected from being removed by the operational company.
 - Other legal entities can add completely new, local documents. The operational company owns and maintains these local documents.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product owners

2/18/2021 • 2 minutes to read • [Edit Online](#)

The product owner is a group of users who are responsible for specific products. When a product owner group is assigned to a product, only the members of that group can release the product. The product owner can also be used in the approval workflow in engineering change management.

Product owners are global settings. Therefore, they are available to all legal entities.

Create a product owner group

To create a product owner group and add members to it, follow these steps.

1. Go to **Engineering change management > Setup > Product owners**.
2. On the Action Pane, select **New**.
3. In the **Product owner** field, enter a name for the group.
4. In the **Name** field, enter a description of the group.
5. On the **Members** FastTab, add the workers who should be members of the group.

Assign a product owner to a product

To assign a product owner to a product, follow these steps.

1. Open the **Product details** page for the relevant product or product master.
2. On the **General** FastTab, set the **Product owner** field to the name of the relevant product owner group.

While a product owner is assigned to a product, only the members of the product owner group can edit the **Product owner** setting.

The product owner is also visible on the **Released products** page.

Product owners and product releases

Only users from a product's product owner group can release that product. However, there is an exception when the product is a child item, and its parent is released by the parent's owner. In other words, if the product is part of the BOM of another product, the system doesn't check the product owner of each item in the BOM. It checks only the product owner of the parent item.

For example, product X is assigned to the *Design cabinets* product owner group. Product X is also part of the BOM of product Y, which is assigned to the *Design Speakers* product owner group. If a user from the *Design Speakers* product owner group releases product Y and its BOM, product X will be released together with product Y.

Product owners and approvals

Because product owners know whether specific engineering changes will benefit their products, it often makes sense to include them as part of the approval process in engineering change management. You can implement this approach by setting up the product owners as participant providers in the workflows that are used for engineering change management. The system will then assign approval tasks in the workflows, based on the products that are in engineering change requests and engineering change orders. For more information, see [Manage changes to engineering products](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Engineering attributes and engineering attribute search

2/18/2021 • 5 minutes to read • [Edit Online](#)

To ensure that all product master data can be registered in the system, you should use engineering attributes to specify all non-standard characteristics. You can then use engineering attribute search to easily find products, based on those registered characteristics.

Engineering attributes

Typically, engineering products have many characteristics and properties that you must capture. Although you can register some of the properties by using the standard product fields, you can also create new engineering properties as required. You can define your own *engineering attributes* and make them part of the product definition.

Create engineering attributes and attribute types

Each engineering attribute must belong to an *attribute type*. This requirement exists because each engineering attribute must have a *data type* that defines the types of values that it can hold. An engineering attribute type can be a standard type (such as free text, integer, or decimal) or a custom type (such as text that has a specific set of values to select from). You can reuse each attribute type with any number of engineering attributes.

Set up engineering attribute types

To view, create, or edit an engineering attribute type, follow these steps.

1. Go to **Engineering change management > Setup > Attributes > Attribute types**.
2. Select an existing attribute type in the list pane, or select **New** on the Action Pane to create a new attribute type.
3. Set the following fields:
 - **Attribute type name** – Enter a name for the attribute type.
 - **Type** – Select a standard data type (*Currency, DateTime, Decimal, Integer, Text, Boolean, or Reference*).
 - **Fixed list** – This option is available only if you set the **Type** field to *Text*. Set it to *Yes* to define specific values for attributes of this type. In this case, a drop-down list will be created. You use the **Value** FastTab to establish the values that are available for this attribute type. Set this option to *No* to allow users to enter any value. In this case, an input field will be created.
 - **Value range** – This option is available only if you set the **Type** field to *Integer, Decimal, or Currency*. Set it to *Yes* to establish minimum and maximum values that will be accepted for attributes of this type. You use the **Range** FastTab to establish the minimum and maximum values, and (for currency) the currency that applies for the limits that you entered. Set this option to *No* to accept any value.
 - **Unit of measure** – This field is available only if you set the **Type** field to *Integer or Decimal*. Select the unit of measure that applies for this attribute type. If no unit is required, leave this field blank.

Set up engineering attributes

To view, create, or edit an engineering attribute, follow these steps.

1. Go to **Engineering change management > Setup > Attributes > Engineering attributes**.
2. Select an existing attribute in the list pane, or select **New** on the Action Pane to create a new attribute.
3. Set the following fields:

- **Name** – Enter a name for the attribute. This name appears only on the **Engineering attributes** page. Everywhere else in the system, the value of the **Friendly name** field is usually shown to identify the attribute.
 - **Attribute type** – Select an attribute type that you defined in the previous section.
 - **Friendly name** – Enter a name that will identify the attribute in the system (except on the **Engineering attributes** page).
 - **Description** – Enter a description of the attribute.
 - **Help text** – Enter Help text that tells other users what the attribute is for.
 - **Default value** – Enter a default value for the attribute. The options that are presented depend on the attribute type that you selected.
 - **Currency** – If the attribute type that you selected is a currency, select the currency that the attribute will accept and show values in.
4. If the attribute type that you selected is an integer or a decimal, the **Range** FastTab is shown. On this FastTab, set the following fields as required:
- **Tolerance action** – Select how the system should respond if a user enters a value outside the specified range. If you select *Warning*, a warning is shown, but the user can save the value. If you select *Not allowed*, a warning is shown, and the value can't be saved until the user corrects it.
 - **Minimum** – Enter the minimum recommended or accepted value.
 - **Maximum** – Enter the maximum recommended or accepted value.

Connect engineering attributes to an engineering product category

Some engineering attributes apply to all products, whereas others are specific to individual products or product categories. For example, electrical attributes aren't required for mechanical products. Therefore, you can set up *engineering product categories*. An engineering product category establishes the collection of engineering attributes that must be part of the definition for products that belong to that category. You can also specify which engineering attributes are mandatory and whether there is a default value.

For more information about how to work with engineering product categories, including information about how to connect attributes to categories, see [Engineering versions and engineering product categories](#).

Set values for engineering attributes

The engineering attributes that are connected to an engineering product category are presented when you create a new engineering product that is based on that category. At that time, you can set values for the attributes. Later, those values can be changed on the **Engineering version** page or as part of engineering change management in an engineering change order. For more information, see [Manage changes to engineering products](#).

Create an engineering product

To create an engineering product, open the **Released products** page. Then, on the Action Pane, on **Product** tab, in the **New** group, select **Engineering product**.

You must specify the engineering category that the product belongs to. The category will set all the default values and characteristics for the product. It will also set the attributes that are applicable to the product. After the category is selected, values will be set for the attributes. You can then modify those values.

Search for products by using engineering attribute values

You can use engineering attribute search to find products by searching for their engineering attributes values. Therefore, you can easily find engineering products, based on their characteristics. You can search in the products that belong to an engineering product category, or you can search across all engineering products.

The search is available on product master data pages and from transactional items in the system, such as sales

orders. For a transactional item, you can use the **Engineering attribute search** page to search for a product. You can then use the **Add as new line** button to add the product to the sales order lines. Products in the search results can also be added directly to the order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Engineering versions and engineering product categories

2/18/2021 • 14 minutes to read • [Edit Online](#)

Engineering products evolve during their product lifecycle, for many reasons. For example, changes might be introduced to improve product serviceability, change a component because the supplier no longer offers it, respond to new insights, or fix mistakes in the initial design. There are also many reasons why these changes should be stored as part of an ongoing product, in such a way that previous data isn't overwritten. Here are some of these reasons:

- You want to keep track of the product as it was manufactured and delivered to your customers in previous lifecycle states.
- You need a lead time before you approve and apply the changes.
- You want to have a timestamp on each change, and you want to be able to deliver previously manufactured products separately from each other.

Engineering versions ensure that the various states of a product and its data are kept current and clear, and that they can be visualized in the system. This concept helps you maintain consistency, lock down the bill of materials (BOM) for production, eliminate variability, and easily identify changes.

Generally, the *form-fit-function* rule is applied to determine whether a change requires a new product, a new version, or an update to an existing version. Each of the three terms in the name of this rule refers to a specific aspect of a part, which helps engineers match parts to needs. The form-fit-function rule increases the flexibility of design changes, because minimal documentation and design cost are required to change a part, provided that the fit, form, and function of the product are maintained.

- **Fit** refers to the ability of the part or feature to connect to, mate with, or join to another feature or part in an assembly. The fit enables the part to meet the required assembly tolerances so that it can be useful.
- **Form** refers to characteristics of a part or assembly, such as the external dimensions, weight, size, and visual appearance. The form is the aspect that is most affected by an engineer's aesthetic choices. It includes the enclosure, chassis, and control panel, which become the outward "face" of the product.
- **Function** is a criterion that is met when the part effectively and reliably performs its stated purpose. For example, in an electronics product, function can depend on the solid-state components that are used, and the software or firmware. Often, it can also depend on the features of the selected enclosure. Two of the most common reasons that an enclosure can fail the function criterion are poorly placed or poorly sized ports, and misleading or missing labeling.

Engineering versions

When you use engineering products, each product has at least one engineering version. The initial engineering version is automatically created when you create an engineering product. Each engineering version stores the engineering-relevant data that is specific to that version. Here are some examples of this data:

- The version number and previous version number (if applicable)
- The effective-from and effective-to dates
- The product version active status, which indicates whether the version can be released and used in transactions (For more information, see [Product readiness](#).)
- The engineering company that created and owns the product (For more information, see [Engineering companies and data ownership rules](#).)

- Related engineering documents, such as an assembly manual, user instructions, pictures, and links
- The engineering attributes (For more information, see [Engineering attributes and engineering attribute search](#).)
- The engineering BOMs
- The engineering routes

You can update this data on an existing version, or create a new version, by using an *engineering change order*. (For more information, see [Manage changes to engineering products](#).) If you create a new version of a product, the system copies all engineering-relevant data to that new version. You can then modify the data for that new version. In this way, you can track specific data for each consecutive version. To compare the differences between consecutive engineering versions, inspect the engineering change order, which includes change types that indicate all changes.

As has been stated, the initial engineering version is automatically created when you create an engineering product. The version number for this version follows the version number rule that is defined in the engineering category for the product. To transition to a subsequent version, you must add the product to an engineering change order as a line, and you must set the **Impact** field to *New version*. The engineering change order will include the details of the change from the current version to the next version.

Note that an engineering product can be in only one engineering change order at a time. This restriction ensures data accuracy, and helps avoid overlapping or contradictory changes in the product. Also note that the **Engineer** field in the **Header** view of the engineering change order shows the engineer who is responsible for the change order. If the engineer belongs to a team that is defined in the system, the **Responsible** field shows the leader of that team.

Track versions in transactions

When you use engineering change management, your product master data always includes one or more engineering versions. In your setup of engineering products, you can choose whether the engineering version is also part of *logistical transactions*. (For more information, see the [Set up engineering product categories](#) section later in this topic.) If the logistical impact is relevant, it differs per product and per company. Sometimes, only the latest version of a product is used. Therefore, when you introduce a new version, the previous version can no longer be used. In other cases, the previous version is required in logistical transactions to overcome the following challenges:

- The Logistics department must ship two pieces of a product to a customer. In this case, you must decide whether you want or will allow two different versions to be shipped.
- It's later discovered that a problem occurs, and that it's related to a specific change. In this case, it might be beneficial to determine exactly which version was shipped in each order.
- Companies typically want to ship old versions first, to phase them out of inventory. Especially for low-volume products, this approach can often be managed by determining the effectivity dates of the new version in relation to predictions about when stock of the old version will be depleted. However, sometimes you might not be able to make this comparison, or you may consider the uncertainty of stock level predictions to be too high.

The decision about whether to make versions visible in inventory depends on factors such as those that were previously mentioned, plus company practice and other considerations that are specific to each company. You can specify the behavior for the *engineering product category*. It will then apply to all products that are created from that category, for all companies that the product is released to.

For products that are set up so that they have logistical impact, the engineering version must be specified on each transaction. Although the system will propose the *latest active version*, you can select among all the active versions that are available for the company. For products that are set up so that they don't have logistical impact, the engineering version isn't specified on transactions. However, the system uses the latest active version. For

example, when you add a product to a production BOM, the latest version will be used, and when you run master planning, the latest version will be assumed.

Set up engineering product categories

An engineering product category provides a basis for creating a specific engineering product. Each category establishes a set of default values and policies. Therefore, when you create an engineering product, you first select the category to create it from.

Note that a new category hierarchy type (*engineering product hierarchy*) is automatically set up for you. You can manually create the categories by going to **Engineering change management > Setup > Engineering product category details**.

Each engineering product category establishes the default behavior of the engineering products that are created based on that category. After you've created an engineering product, you can't change its engineering product category. However, if you select the incorrect category, you can delete the product and then re-create it.

When an engineering product category is created, you're prevented from changing the following settings:

- Engineering company
- Product type
- Product subtype
- Product dimension group
- Configuration technology
- Version number rule

Other settings might inherit default values that are set up for the engineering product category. However, according to the system rules, those values can be changed.

To work with engineering product categories, go to **Engineering change management > Setup > Engineering product category details**. Then follow one of these steps.

- To create a new category, select **New** on the Action Pane, and then set the fields as described in the following subsections.
- To edit an existing category, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing category, select it in the list pane, and then select **Delete** on the Action Pane.

Set the following fields on the header of an engineering product category.

FIELD	DESCRIPTION
Name	Enter a name for the engineering product category.
Engineering company	Select the engineering company where products in this engineering product category can be created and where they will be maintained.

Details FastTab

Set the following fields on the **Details** FastTab of an engineering product category.

FIELD	DESCRIPTION
Product type	Select whether the category applies to products or services.

FIELD	DESCRIPTION
Track versions in transactions	<p>Select whether the version of the product should be stamped on all transactions (logistical impact). For example, if you track the version in transactions, each sales order will show which specific version of the product was sold in that sales order. If you don't track the version in transactions, sales orders won't show which specific version was sold. Instead, they always show the latest version.</p> <ul style="list-style-type: none"> • If this option is set to <i>Yes</i>, a product master is created for the product, and each version of the product will be a variant that uses the <i>version</i> product dimension. The Product subtype field is automatically set to <i>Product master</i>, and you must select a product dimension group where the <i>version</i> dimension is active. Only product dimension groups where <i>version</i> is an active dimension will be shown. You can create new product dimension groups by selecting the Edit button (pencil symbol). • If this option is set to <i>No</i>, the <i>version</i> product dimension won't be used. You can then select whether to create a product or a product master that uses the other dimensions. <p>This option is often used for products that have a cost difference between versions, or products where different conditions apply in relation to the customer. Therefore, it's important to indicate which version was used in each transaction.</p>
Product subtype	<p>Select whether the category will hold products or product masters. For product masters, product dimensions will be used.</p>
Product dimension group	<p>The Track versions in transactions setting helps you select the product subtype. If you specified that you want to track the version in transactions, the product dimension groups where the <i>version</i> dimension is used will be shown. Otherwise, only product dimension groups where the <i>version</i> dimension isn't used will be shown.</p>
Product lifecycle state at creation	<p>Set up the default product lifecycle state that an engineering product should have when it's first created. For more information, see Product lifecycle states and transactions.</p>
Version number rule	<p>Select the version number rule that applies to the category:</p> <ul style="list-style-type: none"> • Manual – You choose the version number for each new version. • Automatic – The system sets the version number, based on a format that you define. When you set up the format, use a number sign (#) to represent a digit and any other character to represent a constant value. For example, if you define the format as <i>V-##</i>, the first version will be "V-01," the second version will be "V-02," and so on. • List – The system takes the next number from a predefined list of custom values that you define.

FIELD	DESCRIPTION
Enforce effectivity	<p>Select whether the effectivity dates of engineering versions must be contiguous, or whether there can be gaps and overlaps. This setting affects the way that you can use the Effective from and Effective to fields for each engineering version where the category applies.</p> <ul style="list-style-type: none"> If this option is set to <i>Yes</i>, an Effective from value must be specified for each version, and neither overlaps nor gaps are allowed between versions. The date range for each engineering version is connected directly to the previous and next engineering versions, if they exist. In this scenario, the newest version is always used, and older versions are no longer used. If this option is set to No, there are no restrictions on the effectivity date fields for engineering versions, and both overlaps and gaps are allowed. In this scenario, multiple versions can be active at the same time, and you can work with any active version. <p>This option also affects BOMs and routes that are connected to a product version. For more information, see the Connect BOMs and routes to engineering versions section later in this topic.</p>
Use number rule nomenclature	<p>Set this option to <i>Yes</i> to enable rules for defining a product number by using number sequences, engineering attribute names and values, and text constants as segments. To create or modify rules, select the Edit button.</p>
Use name rule nomenclature	<p>Set this option to <i>Yes</i> to enable rules for defining a name by using the engineering attribute names, engineering attribute values, and text constants as segments. To create or modify rules, select the Edit button.</p>
Use description rule nomenclature	<p>Set this option to <i>Yes</i> to enable rules for defining the description by using the engineering attribute names, engineering attribute values, and text constants as segments. To create or modify rules, select the Edit button.</p>

Attributes FastTab

Use the grid on the **Attributes** FastTab to set up the engineering attributes that apply to products that belong to this category. For information about how to create engineering attributes, see [Engineering attributes and engineering attribute search](#).

Use the buttons on the **Attributes** FastTab to add, remove, and arrange attributes in the grid.

If you change the selection of attributes for an engineering category, and products already exist that are based on that category, you must decide whether to apply your changes to those products. If you want existing products to reflect the changes, select **Update existing products** on the **Attributes** FastTab.

For each row that you add to the grid, set the following fields.

FIELD	DESCRIPTION
Name	Select the attribute to add.

FIELD	DESCRIPTION
Value	Select the default value for the attribute.
Mandatory	For attributes of the <i>Boolean</i> type, if this option is set to <i>Yes</i> , users must set the attribute to <i>Yes</i> . If this option is set to <i>No</i> , users can set the attribute to either <i>Yes</i> or <i>No</i> . For other data types, the setting of this option is just informational.
Batch attribute	Select whether the attribute should be propagated through the batch functionality.

Readiness policy FastTab

Use the **Product readiness policy** field to select the readiness policy that applies to products that belong to this category. For more information, see [Product readiness](#).

Release policy FastTab

Use the **Product release policy** field to select the release policy that applies to products that belong to this category. For more information, see [Release product structures](#).

Connect BOMs and routes to engineering versions

The setting of the **Enforce effectivity** option is important for the connection of BOMs and routes to each engineering version. You can activate multiple BOMs or routes per product only if there is a difference in any of the following settings:

- Product dimension
- Quantity
- Site
- Effectivity dates

Engineering BOMs and routes are created from the engineering version where they apply. They can be recognized by the check mark in the **Engineering controlled** check box. When you work with engineering BOMs and routes, you won't typically design them by using different quantities. You also won't typically design different BOMs per site. Additionally, for engineering BOMs and routes, the effectivity dates are always taken from the engineering version. Therefore, an engineering version, its BOM, and its route will all have the same effectivity dates.

For products where you're using the *version* product dimension (together with logistical impact on the transactions), the version is also added to the BOMs and routes. This behavior helps differentiate the BOMs and routes of consecutive versions, regardless of the **Enforce effectivity** setting.

For products where you aren't using the *version* product dimension (without logistical impact on the transactions), the version isn't added to the BOMs or routes. Therefore, there will be no difference between the BOMs and routes of consecutive versions. In this case, we highly recommend that you set the **Enforce effectivity** option to *Yes*. In this way, you help prevent engineering versions from overlapping, and you can also activate the BOM and route of a newer version without first having to inactivate the BOM and route of the previous version. If you do set the **Enforce effectivity** option to *Yes* in this case, you must manually inactivate the BOMs and routes of older versions before you can activate the latest version.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Enable change management on existing products

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic explains how you can enable change management for existing products. It also describes cases where your ability to enable change management is limited.

When you enable change management for an existing product, you can create versions of that product and trace changes that are made to it throughout its life. Therefore, you can track those changes by using change orders. To enable change management, you must convert the relevant products to *engineering items* (also referred to as engineering products). Engineering products are products that are versioned and managed through change management. A wizard is provided to guide you through the conversion process.

Turn on the feature in your system

To use this capability, you must complete the following tasks:

1. Enable the Engineering change management feature and its configuration key as described in [Engineering change management overview](#).
2. Turn on the *Enable change management on existing products* feature in feature management. For more information, see [Feature management overview](#).

Restrictions and limitations

Not all product types can be converted to all other types. The following restrictions and limitations apply:

- When you convert a product to an engineering product, it remains a *product*. It doesn't become a *product master*.
- When you convert a product master that has a specific set of dimensions, those dimensions are maintained after the change. For example, if you convert a product master that has the size dimension, it will keep the size dimension.

Therefore, if you have a distinct product, you can change it only to an engineering product that doesn't track the product dimension in transactions (that is, the version dimension isn't used). See the remaining sections of this topic for more information about these issues.

Prepare for conversion by creating all required engineering product categories

An *engineering product category* must be assigned to every engineering product. You will do this assignment when you run the **Convert to engineering product** wizard. Engineering product categories must exist for all relevant standard products *before* you can convert those products.

The engineering product category provides a basis for creating an engineering product, and it establishes a set of default values and policies. The engineering product category must match the product that you assign it to. For example, the product type and dimension group must match both the product and its engineering product category. For more information, see [Engineering versions and engineering product categories](#).

IMPORTANT

The **Convert to engineering product** wizard can convert product only to engineering products where the version isn't tracked in transactions. Therefore, the **Track version in transactions** option must be set to *No* for engineering product categories that you create to convert existing products.

For information about how to create engineering product categories, see [Engineering versions and engineering product categories](#).

Run the Convert to engineering product wizard

The **Convert to engineering product** wizard helps you convert one or more existing products to engineering products. It converts the products into engineering products (versioned products) where the version isn't tracked in transactions (that is, the version dimension isn't used). After the conversion is completed, you can manage the products by using Engineering change management.

The conversion is permanent. Therefore, you won't be able to reverse it later.

Each converted engineering product will continue to be released in the same companies that the original product was released in. However, the engineering bill of materials (BOM) and routes won't automatically be released to those companies.

Follow these steps to run the **Convert to engineering product** wizard and convert a product to an engineering product.

1. Go to **Product information management > Products > Released products**.
2. In the grid, select the check box for each product that you want to convert.
3. On the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Convert to engineering product** to open the wizard.
4. The first page of the wizard is the **Welcome** page. If you aren't already familiar with the conversion process, carefully read the information on this page. When you're ready to continue, select **Next**.
5. The **Select details for the products to be converted** page shows each product that you selected before you opened the wizard. Inspect the list. Use the **New** and **Delete** buttons on the toolbar to add or remove products as you require.
6. Use the following fields at the top of the grid to assign default values to every product that is listed. (You will be able to change these values for individual products after the conversion is completed.) Default values won't be assigned to products where a relevant value has already been assigned.
 - **Default engineering category** – Select an initial engineering product category to assign to every listed product. The category that you select will be applied only to products that are compatible with it.
 - **Default version** – Enter the initial product version to assign to every listed product. Every engineering product has at least one engineering version.
 - **Default lifecycle state** – Select the initial product lifecycle state to assign to every listed product.
 - **Current BOM will be part of the engineering product** – Select this check box if the current BOM for each listed product should be used as a BOM for the engineering product.

For more information about product settings, see the next step.

7. Review each product that is listed in the grid, and evaluate how well the default values that you assigned apply to it. For each row, review the following information and set any relevant fields:
 - **Product number** – The product number.

- **Product name** – The name of the product.
 - **Engineering category** – Select the engineering product category that the product should belong to after it's converted. An appropriate category must already exist for each product, as was explained in the previous section of this topic. You must assign a category to every product.
 - **Version** – Enter the product version to assign to the product after it's converted. For example, you might select a number that fits in the number sequence that your category already uses. Each engineering version stores the engineering-relevant data that is specific to that version. For more information, see [Engineering versions and engineering product categories](#).
 - **Product lifecycle state** – Select the product lifecycle state that the product should be in after it's converted. The product lifecycle state lets you to control which transactions are allowed for a given engineering version. For more information, see [Product lifecycle states and transactions](#).
 - **Has BOM** – A selected check box indicates that the product has a BOM. The setting of this check box can help you decide how to set the **Current BOM will be part of the engineering product** check box.
 - **Current BOM will be part of the engineering product** – Select this check box if the current BOM of the product should be used as a BOM for the engineering product. That BOM will then be managed by Engineering change management. If the product doesn't have a BOM, or if you prefer to manually create a BOM for the converted product later, clear this check box.
 - **Has errors** – A selected check box indicates that the product setup has one or more errors. For example, the product type or the dimension group might not match in the category. Products that have errors will be skipped and won't be converted.
8. When you've finished, select **Validate** on the toolbar to validate the product setup. For each row, the **Has errors** check box will be updated to indicate the product's status. Adjust the values until the setup of every product is free of errors.
 9. When all the products are set up correctly, select **Next** to continue.
 10. The **Confirm selection** page shows the number of products that have no errors in their setup and are therefore ready for conversion. It also shows the number of products that will be skipped because of errors. To run the conversion as a batch job, set the **Run in batch** option to *Yes*.
 11. Select **Finish** to apply your settings and start to convert the products to engineering products.

NOTE

If your system is set up to manually accept products before they are released, you must accept each converted product by using the **Open product releases** page in the appropriate companies. For more information, see [Review and accept the product before you release it in the local company](#).

Product lifecycle states and transactions

2/18/2021 • 4 minutes to read • [Edit Online](#)

As an engineering product goes through its lifecycle, it's important that you be able to control which transactions are allowed for each lifecycle state. For example, products that aren't yet in a mature state should not be put on a sales order. Alternatively, if a product is reaching its end-of-life state, you might want to control the inflow of that product.

For an engineering product, changes to the lifecycle state are connected to the product's engineering versions. Therefore, the product's lifecycle state can also be connected to its engineering versions. When the product lifecycle state is connected to an engineering version, you can use the lifecycle state to control which transactions are allowed for the engineering version.

Create and manage product lifecycle states

To work with product lifecycle states, go to **Engineering change management > Setup > Product lifecycle state**. Then follow one of these steps.

- To create a new lifecycle state, select **New** on the Action Pane, and then set the fields as described in the following subsections.
- To edit an existing lifecycle state, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing lifecycle state, select it in the list pane, and then select **Delete** on the Action Pane.

NOTE

Engineering products use the same product lifecycle states as standard (non-engineering) products. You can also open the **Product lifecycle state** page that is described in this topic by going to **Product information management > Setup > Product lifecycle state**. For more information about product lifecycle states, for both engineering products and standard products, see [Product lifecycle state overview](#).

Set the following fields on the header of a product lifecycle state.

FIELD	DESCRIPTION
State	Enter a name for the product lifecycle state.
Description	Enter a description of the product lifecycle state.

General FastTab

Set the following fields on the **General** FastTab.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
Default when released to a legal entity	<p>For standard products, set this option to <i>Yes</i> if this lifecycle state should be applied to all products by default when they are first released. Set it to <i>No</i> if this lifecycle state will be manually applied later.</p> <p>This setting isn't applicable to engineering products. The lifecycle state of an engineering product version after it's created in the engineering company is specified in its engineering change category. When the product is released to an operational company, the lifecycle state of the product is copied. In other words, when an engineering product is released to an operational company, it has the same lifecycle state that it had in the engineering company. The lifecycle state can be overwritten in the operational company.</p>
Is active for planning	<p>Set this option to <i>Yes</i> to include products that are in this lifecycle state in calculations at the master planning and bill of materials (BOM) levels. Set it to <i>No</i> to exclude products that are in this lifecycle state from the calculations.</p>

Enabled business processes FastTab

Use the **Enabled business processes** FastTab to control which of the available business processes can be used with products in the current lifecycle state. The processes that are listed on this FastTab are automatically found in the following way:

- The first time that you save a new lifecycle state, the page loads the business processes that are currently available.
- If you add new business processes to your system, you can update the list on the **Enabled business processes** FastTab for an existing lifecycle state by selecting **Check for updates** on the Action Pane.

The following fields are available for each process that is listed on the **Enabled business processes** FastTab.

FIELD	DESCRIPTION
Process	This read-only field shows the name of an existing business process.
Process area	This read-only field shows the name of an existing process area.

FIELD	DESCRIPTION
Policy	<p>Select one of the following values to control whether and how the current process will be permitted for products that are in this lifecycle state:</p> <ul style="list-style-type: none">• Enabled – The business process is allowed.• Blocked – The process isn't allowed. If a user tries to use the process on a product that is in this lifecycle state, the system will block the attempt and show an error instead. For example, you might block end-of-life products from being purchased.• Enabled with warning – The process is allowed, but a warning will be shown. For example, you might want a prototype product to be put on a production order that is created by the Research and Development department. However, other departments should be aware that they should not produce the product yet.

If you're adding more lifecycle state rules as a customization, you can view those rules in the user interface (UI) by selecting **Refresh processes** in the upper pane. The **Refresh processes** button is available only to administrators.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage changes to engineering products

2/18/2021 • 12 minutes to read • [Edit Online](#)

Engineering change management provides structured processes for managing changes to engineering products. You can use the *engineering change request* process to propose and request changes, and then use the *engineering change order* process to actually make those changes. Users can create engineering change requests or engineering change orders, and there is then a process for reviewing and approving them, assessing their impact on existing transactions, and following up on them.

Engineering change requests

The engineering change request process lets you capture requests for changes from all the relevant departments in your company. It doesn't matter whether you work as an engineer, or in the Manufacturing, Sourcing, Warehouse, or Sales department: anybody can use an engineering change request to request a change. This change might be an idea for a new product, an issue that you discovered while you were working with an existing product, a suggestion for improving an existing product, or something else.

After someone submits a request for change, the *review and approval* process is managed by a workflow that identifies who must approve the change (for example, the product owner).

To set up a workflow for engineering change orders or engineering change requests, go to **Engineering change management > Engineering workflows**. Select **New**, select whether the workflow will be used to review engineering change orders or engineering change requests, and then configure the workflow.

For more information about workflows see [Workflow system overview](#). For more information about product owners, see [Product owners](#).

Create a new engineering change request

To create an engineering change request, follow one of these steps.

- Go to **Engineering change management > Common > Engineering change management > Engineering change requests**, and then select **New** on the Action Pane.
- Open the **Product details** page for an existing engineering product. Then, on the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Engineering change request > New engineering change request**.

A new change request is created. You can now set the fields on each FastTab, as described in the following subsections.

General FastTab

The **General** FastTab lets you provide a basic description of the change request. The following table describes the fields on this FastTab.

FIELD	DESCRIPTION
Change request	Enter a name for the engineering change request.
Title	Enter text that briefly describes or identifies the changes in the request.

FIELD	DESCRIPTION
Priority	Select a value to indicate how high the priority of the change is. You can customize the available values for your company, as required. (For more information, see Establish common values for engineering change management .)
Category	Select a value to describe the type of change that you're requesting. You can customize the available values for your company, as required. (For more information, see Establish common values for engineering change management .)
Severity	Select a value to indicate the severity of the issue that should be fixed by implementing the request. You can customize the available values for your company, as required. (For more information, see Establish common values for engineering change management .)
Requested by	The name of the user who created the request.
On	The date when the request was created.
Status	The status of the request. When a request is first created, the status is <i>Created</i> . When the request is approved, the status changes to <i>Approved</i> . If a related change order has been created for the request, the status changes to <i>Followed up</i> .
Change order	The change order number, if the change request was followed up on via a change order.

Information FastTab

The **Information** FastTab lets you add more information about the request.

To add a row to the grid, select **New** on the toolbar above the grid, and then select one of the following options:

- **File** – Upload a file.
- **Image** – Upload an image file.
- **Note** – Enter a note directly in the grid.
- **URL** – Enter a URL directly in the grid.

The following table describes the fields on each row.

FIELD	DESCRIPTION
Created date and time	The date and time when the row was created.
Type	The type of information that the row was created for (file, image, note, or URL).
Description	Enter a description for the row.
Restriction	A value that indicates whether the information that has been added came from an internal or external source.

FIELD	DESCRIPTION
Attached	A selected check box indicates that the row includes an attachment (file or image). To download the attachment, select the row, and then select Open on the toolbar above the grid.

Products FastTab

The **Products** FastTab lets you list each product that is affected by the change request. You can use the buttons on the toolbar to add products to the grid, or to remove products.

This list is for informational purposes only. Therefore, you can add as many related products as you consider relevant. If you create a change request from the **Product details** page for an existing product, that product should be listed on the **Products** FastTab after you save the request record.

Source FastTab

The **Source** FastTab lets you track the starting point of the change request. It's useful if, for example, you want to see whether the change request was created from a sales order, who created it, and which company it was created in.

Evaluate the business impact of a change request

When you review a request for change, you can search for dependencies. In this way, you can assess the impact of the requested change on open transactions, such as sales orders, production orders, and on-hand inventory.

1. Go to **Engineering change management > Common > Engineering change management > Engineering change requests**.
2. Either open an existing change request, or select **New** on the Action Pane to create a new change request.
3. On the Action Pane, on the **Change request** tab, in the **Business impact** group, select one of the following buttons:
 - **Search** – Scans all open transactions, and then open the **Business impact to open transactions** dialog box, which lists all transactions that will be affected by the change.
 - **View previous search** – Open the **Business impact to open transactions** dialog box, which lists the results of the previous search. (A new search isn't done.)
4. If the issue that requires a change is found to be critical, you can block the open transactions or notify the responsible user by using the buttons on the toolbar in the **Business impact to open transactions** dialog box.

Create a change order from a change request

An engineer who is reviewing an engineering change request can create an engineering change order directly from the **Engineering change requests** page. On the Action Pane, on the **Change request** tab, in the **Engineering change order** group, select **Copy link and products**.

Engineering change orders

Engineering change orders provide a structured process for making changes to engineering products. You propose changes by using a copy of the engineering-relevant data. The real master data isn't affected. For more information about engineering-relevant data, see [Engineering versions and engineering product categories](#).

You can create an engineering change order that is based on an approved engineering change request. Engineers can also create engineering change orders from scratch. You can include multiple products on a single engineering change order by following any of these steps:

- Manually select products.

- Use the bill of materials (BOM) to include products that are lower in the product structure (that is, children).
- Use a where-used search to include products that are higher in the product structure (that is, parents).

After the proposal for changes is completed, the review and approval process will be handled by a workflow. You can set up different workflows, based on priority and severity.

To set up a workflow for engineering change orders or engineering change requests, go to **Engineering change management > Engineering workflows**. Select **New**, select whether the workflow will be used to review engineering change orders or engineering change requests, and then configure the workflow.

For more information about workflows, see [Workflow system overview](#).

Here are some typical stakeholders who might have to approve an engineering change order:

- **Product owners** – For more information about product owners, see [Product owners](#).
- **Responsible team lead** – The **Engineer** field in the **Header** view of the engineering change order shows the engineer who created the engineering change order. If the engineer belongs to a team that is defined in the system, the **Responsible** field shows the leader of that team.
- **Finance department** – The Finance department might have to review cases where the change involves high costs.

You can choose whether the engineering change order should be processed directly after it's approved, as part of the workflow, or whether the processing should be done later, as a manual step. During processing of an engineering change order, engineering data on the actual product is updated.

While you're reviewing a request for change, on the Action Pane, on the **Change request** tab, in the **Business impact** group, select **Search** to assess the impact of the proposed change on open transactions, such as sales orders, production orders, and inventory on-hand. The results are shown in the **Business impact to open transactions** dialog box, where you can select impacted transactions and then use commands in the toolbar to view more information, notify the responsible user, or block the transaction.

Engineering change orders in engineering or operational companies

As is described in [Engineering companies and data ownership rules](#), the product data that you can edit varies, depending on the type of legal entity that you're working in (an engineering company versus an operational company). Data ownership rules are also applied to engineering change orders. Therefore, depending on the legal entity where you create an engineering change order, different types of changes can be made. Here are some examples:

- For engineering change orders in an **engineering company**, you can make basic changes to the engineering data. For example, you can create new versions of a product, change a product's structure via the BOM, and change engineering attribute values. For each affected product, select one of the following values in the **Impact** field:
 - **None** – Update the existing product version (in-version update).
 - **New version** – Create a new version that is based on the selected product version.
 - **New product** – Create a completely new product or product variant that is based on the selected product version.
- For engineering change orders in an **operational company**, you can change the logistical data of the product. For example, you can enrich the existing BOM with settings for sourcing, add local routes or local BOMs, and even enrich a BOM by adding new BOM lines for local packaging materials, lubrication fluids, or instructions in the local language. Enrichments that users make in the operational company will be preserved when new updates are sent from the engineering company. For more information, see [Engineering companies and data ownership rules](#).

When engineering change orders are processed in the engineering company, the products are created and/or updated only in the engineering company. Therefore, if the product master data should also be

updated, you must also release the products to operational companies.

- You can release products directly from engineering change orders. Open the change order, and then, on the Action Pane, on the **Change order** tab, in the **Product releases** group, select **Release product structure**. The process works just as it works when you release products from the **Released products** page. For more information, see [Release product structures](#).
- You can have products automatically released from engineering change orders, based on the following factors:
 - Re-releases to companies where products were previously released. Select **Search** to scan all previous releases, and then select **View** to view the results. The **View** page shows the previous product releases, and you can select which products you want to re-release. Then close the **View** page, and select **Process** to re-release the selected products.
 - Automatic release settings in the release control of the engineering product category. You can do this release as part of the workflow. When the **collect release proposal** block is used, the release proposal will be filled with re-releasing proposals (see the previous list item), and products will be released to companies if the **Auto release** check box is selected in the release control of the engineering product category. You can select **View** to view the results, as described in the previous list item. The products will also be released when the **process release proposal** block is used. If you choose only to collect the release proposal as part of the workflow, you can manually start the release by selecting **Process**, as described in the previous list item.

Follow up on an engineering change request via an engineering change order

As soon as an engineering change request is approved, you can follow up on it via an engineering change order. You can combine multiple engineering change requests into a single engineering change order. A single engineering change order can even include multiple products. (Typically, you use this approach when the same change must be applied to multiple products.) However, you can't create multiple engineering change orders from a single engineering change request.

To follow up on a change request via a change order, open the change request, and then, on the Action Pane, on the **Change order** tab, in the **Engineering change order** group, select **Copy link and products**. You can then select an existing engineering change order to connect the change request to, or you can create a new engineering change order for that specific request.

Engineering change order report

Engineering change order reports describe the changes that were made in an engineering change order. They are useful both during and after the review and approval process.

To view an engineering change order report, open the relevant change order, and then, on the Action Pane, on the **Change order** tab, in the **View** group, select **Engineering change order report**.

Fields on an engineering change order

Most of the fields on engineering change orders are the same as the fields for released products, engineering versions, documents, BOMs (lines) and routes (operations). However, the fields in the following table are unique to change orders.

FIELD	DESCRIPTION
Engineering change reasons	Select the reason for changing the affected product.

FIELD	DESCRIPTION
Change description	Enter a description of the change.
Required special tooling	Specify whether special tooling is required to apply the change.
Engineering material disposition	Select a material disposition code for any waste that is produced when the change is applied.
Customer approval required	Specify whether customer approval is required before the change can be applied.
Received customer approval	Specify the status of the customer approval.
Environmental health and safety	Specify whether environmental health and safety rules are applicable to the change. If they are, you can then select the applicable rules.

You can use the **Maintain/copy change information** button to copy change information between affected products.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Product readiness

2/18/2021 • 9 minutes to read • [Edit Online](#)

You can use readiness checks to ensure that all the required master data has been specified for a product before it's used in transactions. When readiness checks are used, a user or team is made responsible for validating specific predefined product-related data. If there is an open readiness check for a product, the product can't be released or used in transactions.

The **Active** check box for an engineering product, variant, or version is available only after all the required data has been entered and verified, and after all the readiness checks have been processed. At that point, the product, version, or variant can be released to other companies and used in transactions. You can create readiness checks for new products, new variants, and new engineering versions.

Types of readiness checks

There are three types of readiness checks:

- **System check** – The system verifies whether there is a valid record. For example, the record might be an active bill of materials (BOM).
- **Manual check** – A user verifies whether the record is valid. For example, a readiness check might require validation of the default order settings. In some cases, such as when the product is still being designed and therefore won't be placed in stock, no default order settings are required. However, default order settings might be required for another product of the same type, because the product can be held in stock. The user is responsible for knowing how to correctly decision whether a readiness check is required.
- **Checklist** – The user answers a series of questions from a checklist, and the system determines whether the answers meet expectations. The checklist can have any subject. For example, it can be used to determine whether marketing materials or product documentation is completed.

How readiness checks are created for a new product, variant, or version

When you create a new engineering **product**, the system determines whether a readiness check policy has been set up for the engineering product category. (Readiness check policies can be applied on the released product level, the released variant level, and the engineering version level.) If a policy has been set up, the following events occur:

- Readiness checks are created for the product, according to the applicable policy.
- The engineering version is set to inactive to block the product from being used. All the versions for the specific product that is involved are set to inactive.

If a new **variant** is created for a product, the system checks whether readiness checks have been set up on the engineering product category. (Readiness checks can be applied on released variant level and the engineering version level.) If a readiness check has been set up, the following events occur:

- Readiness checks are created for the product.
- The engineering version is set to inactive to block the product from being used.

If a new engineering **version** is created for a product, the system checks whether readiness checks have been set up on the engineering product category. (Readiness checks can be applied on the engineering version level.) If a readiness check has been set up, the following events occur:

- Readiness checks are created for the product.
- The engineering version is set to inactive to block the product from being used.

View readiness checks

View open readiness checks for a product or product version

To find the open readiness checks for a product, open the **Released products details** page. Then, on the Action Pane, on the **Product** tab, in the **Readiness checks** group, select **Readiness checks**.

To find the open readiness checks for a product version, open the **Engineering versions** page for a released product and choose a version. Then, on the Action Pane, on the **Product** tab, in the **Checklist** group, select **Readiness checks**.

View open readiness checks that are assigned to you

To view the open readiness checks that are assigned to you, follow one of these steps.

- Go to **Engineering change management > Common > Product readiness > My open readiness checks**.
- Go to **Product information management > Workspaces > Product readiness for discrete manufacturing**.

The setup that specifies who a readiness check is assigned to is done for the engineering product category. Readiness checks can be assigned to a person or a team. If a readiness check is assigned to a team, there is one person on the team who must process the readiness check. For more information, see [Engineering versions and engineering product categories](#).

Process open readiness checks

Process system and manual readiness checks

After you open the **Readiness checks** page, you can view the subject of system and manual readiness checks by selecting **View related information** on the Action Pane. You can then complete and/or validate the data for the readiness check. Open readiness checks have a **Status** value of *Pending*. This status indicates that the readiness check must still be processed. To process a readiness check, follow one of these steps.

- On the Action Pane, select **Check/complete** to review and complete the readiness check. When you've finished, the **Status** field is updated to *Passed*.
- On the Action Pane, select **Skip** if you want to skip a readiness check that isn't mandatory. For example, you set up a readiness check for price calculations. However, you decide to skip this check while the product is still in the design phase. In this case, the **Status** field is updated to *Skipped*.

Depending on the configuration of the readiness policy, when the **Status** field for a readiness check is updated to *Passed*, an extra step might be required to approve the readiness check. In this case, select **Approval** to complete the readiness check. This approval step is always mandatory when the readiness check is skipped.

When all the open readiness checks for a new product, variant, or version have been processed and approved as required, the item automatically becomes active and therefore ready to use.

Process checklist readiness checks

To open a checklist, open the **Readiness checks** page, and then, on the Action Pane, select **Start checklist**. When you've completed the checklist, the system validates whether the readiness check is passed, based on the settings in the questionnaire. If the check is passed, the **Status** field is updated to *Passed*. If the readiness check isn't mandatory, you can skip it. In this case, the **Status** field is updated to *Skipped*.

Depending on the configuration of the readiness policy, when the **Status** field for a readiness check is updated to *Passed*, an extra step might be required to approve the readiness check. In this case, select **Approval** to

complete the readiness check. This approval step is always mandatory when the readiness check is skipped.

When all the open readiness checks for a new product, variant, or version have been processed and approved as needed, the item automatically becomes active and therefore ready to use.

Create and manage product readiness policies

Use product readiness policies to manage the readiness checks that apply to a product. Because a readiness policy is assigned to the engineering category, all the checks in the readiness policy apply to all the engineering products that are based on the engineering category. For more information, see [Engineering versions and engineering product categories](#).

Each readiness policy contains a set of readiness checks. When a readiness policy is assigned to an engineering product category, all the products that are created from that engineering product category will have the readiness checks that are indicated in the readiness policy.

To work with product readiness policies, go to **Engineering change management > Setup > Product readiness policies**. Then follow one of these steps.

- To create a new policy, select **New** on the Action Pane, and then set the fields as described in the following subsections.
- To edit an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then, on the **General** FastTab, make sure that the **Active** option is set to *No*. Then select **Delete** on the Action Pane.

Set the following fields on the header of a product readiness policy.

FIELD	DESCRIPTION
Name	Enter a name for the policy.
Description	Enter a description of the policy.

General FastTab

Set the following fields on the **General** FastTab of a product readiness policy.

FIELD	DESCRIPTION
Product type	Select whether the policy applies to products of the <i>Item</i> or <i>Service</i> type. You can't change this setting after you save the record.
Active	Use this option to help maintain your readiness policies. Set it to <i>Yes</i> for all readiness policies that you use. Set it to <i>No</i> to mark a readiness policy as inactive when it isn't used. Note that you can't inactivate a readiness policy that is assigned to an engineering product category, and you can delete only inactive release policies.

Readiness control FastTab

For each type of readiness check that you want to include in the policy, add a row on the **Readiness control** FastTab. Use the following buttons on the FastTab toolbar to add and remove rows as you require:

- **Add check** – Add a standard readiness check to the policy. When you select this button, the **Add check** dialog box appears. There, you can select from a list of available checks.

- **Add existing questionnaire** – Add a blank row to the grid. You can then assign an existing questionnaire by setting the fields in the following table.
- **Copy** – Add a copy of the selected row to the grid.
- **Delete** – Delete the selected row from the grid.

For each row that you add, set the following fields.

FIELD	DESCRIPTION
Process area	Select the area that the check is related to.
Type	Select whether the check is a system check, a manual check, or a checklist (questionnaire).
Name	If the check is a checklist, enter a name. For system and manual checks, this field is automatically set.
Description	If the check is a checklist, enter a description. For system and manual checks, this field is automatically set, and the description explains the focus of the check.
Apply checks on	Select whether the row should generate readiness checks in response to a new released product, released variant, or released version.
Execute in	Select whether readiness checks that the row generates apply to all companies or a single company.
Company	If you set the Execute in field to <i>Single company</i> , select the company.
Owner type	Select whether readiness checks that the row generates should be assigned to a person or a team.
Owner	Select the person or team that readiness checks that the row generates should be assigned to.
Questionnaire	Select the questionnaire that should be used for the checklist. The checklist is a local checklist in the company where the readiness check is done. The system must be able to evaluate whether the checklist is correctly answered. Therefore, the checklist must be set up so that an evaluation is done based on correct answers. For more information about how to create questionnaires, see Using questionnaires and its related topics.
Automatic approval	Readiness check records include an Approved check box that indicates the approval status. Select the Automatic approval check box for checks that should be set to approved immediately after the assigned user completes them. Clear this check box to require explicit approval as an extra step.
Mandatory	Select this check box for checks that must be completed by the assigned user. Mandatory checks can't be skipped.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Release product structures

2/18/2021 • 10 minutes to read • [Edit Online](#)

To ensure that engineering-relevant product data can easily be reused in different legal entities, you can release complete product structures in addition to releasing products together with their engineering versions. Therefore, you can release multilevel bill of materials (BOM) structures together with the parent in a single release action. In this case, the BOM and the lower-level products are also released.

Engineering products are created and maintained by their engineering company in such way that they meet quality requirements as they are designed. Each operational company that manufactures a product needs the same product and underlying BOM. Depending on the production facility, the route might be created locally. In this case, you won't release a route together with the product. For legal entities that will sell the products but won't manufacture them, the BOM might not be required.

To make the process more efficient, all engineering-relevant data can be released to other operational companies at the same time. This data includes the product structure. During the release process, you can choose which part of the product data should be released.

For more information about engineering companies and operational companies, see [Engineering companies and data ownership rules](#).

Note that you can release both standard products and engineering products together with the release product structure. During this process, the whole product structure will be released, even the BOM and route from the company that the products are being released in.

For an example of how to release a product, see [Release an engineering product to a local company](#)

Released data for a product when the release product structure is used

The following data is included in the release of engineering products:

- **Product data** – A new released product is created.
- **Engineering version data** – The engineering version and its data are created or updated. Note that if you release the same engineering version again to an operational company, the engineering data will be overwritten.
- **Engineering attributes** – The engineering attributes and their values are created or updated.
- **Engineering bill of materials** – The engineering BOM and its lines can be created or updated. For more information about data ownership, see [Product owners](#).
- **Engineering routes** – The engineering routes and their operations can be created or updated. For more information about data ownership, see [Product owners](#).
- **Engineering documents** – The engineering documents that are connected to the engineering version are created or updated.

When you turn on engineering change management on your system, the release product structure is available. In addition, standard products will include their BOMs and routes when they are released.

Product acceptance

Product acceptance is a key parameter that influences the release process. You can set this parameter for each company by going to **Engineering change management > Setup > Engineering change management**

parameters. For more information, see [Engineering change management parameters](#).

Automatic product acceptance

Each release of engineering products starts when somebody from the engineering company selects a product to release. When the **Product acceptance** parameter is set to *Automatic*, the user at the engineering company decides which product data should be automatically released to the operational companies. The product will then automatically be released to the companies that are selected in the release wizard.

Manual product acceptance

Each release of engineering products starts when somebody from the engineering company selects a product to release. When the **Product acceptance** parameter is set to *Manual*, the user at the engineering company decides which product data should be released to the operational companies. A user from each operational company then reviews the product data and decides whether to accept the release. The user at the operational company can set the following options when the data is received:

- If the products (updates) aren't relevant for the operational company, the user can choose not to accept the release.
- The user can change the item template for new products.
- The user can choose whether the product should be released together with their BOMs and/or routes, and whether they should be released as approved and active.
- The user can change the effective-from dates of the products.

For an example of how to accept a product, see [Review and accept the product before you release it in the local company](#).

NOTE

For standard products, you can release from any legal entity to any other legal entity. For engineering products, the only legal entity that you can release from is the engineering company.

Release policies

Not all operational companies need the same product data. In general, operational companies that manufacture engineering products require a BOM, whereas operational company that only sell engineering products don't require a BOM. You can use release policies to establish the parameters that are used for the release of products.

For engineering products, the release policy is assigned in the engineering product category, and the field is mandatory. For standard products, the policy is assigned to the shared product, and the field is optional.

For more information about engineering product categories, see [Engineering versions and engineering product categories](#).

During the release process, you can influence the settings.

Create and manage product release policies

To work with product release policies, go to **Engineering change management > Setup > product release policies**. Then follow one of these steps.

- To create a new policy, select **New** on the Action Pane, and then set the fields as described in the following subsections.
- To edit an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then, on the **General**

FastTab, make sure that the **Active** option is set to *No*. Then select **Delete** on the Action Pane.

Set the following fields on the header of a product release policy.

FIELD	DESCRIPTION
Name	Enter a name for the policy.
Description	Enter a description of the policy.

General FastTab

Set the following fields on the **General** FastTab of a product release policy.

FIELD	DESCRIPTION
Product type	Select whether the policy applies to products of the <i>Item</i> or <i>Service</i> type. You can't change this setting after you save the record.
Apply templates	Select one of the following options to specify whether and how product release templates should be applied when the policy is used: <ul style="list-style-type: none">• Always – A template released product must always be used for releases. If you select this option, use the All products FastTab to specify the template that is used for each company that you release to. If you don't specify a template for each company that is listed on the All products FastTab, you will receive an error when you try to save the policy.• Optional – If a template released product is specified for a company that is listed on the All products FastTab, that template will be used when you release to that company. Otherwise, no template will be used. If you select this option, you can save the policy without assigning templates to all companies. (No warning will be shown.)• Never – No template released product will be used for any companies that you release to, even if a template is specified for companies that are listed on All products FastTab. The template columns will be unavailable.
Active	Use this option to help maintain your release policies. Set it to <i>Yes</i> for all release policies that you use. Set it to <i>No</i> to mark a release policy as inactive when it isn't used. Note that you can't inactivate a release policy that is assigned to an engineering product category, and you can delete only inactive release policies.

All products FastTab

On the **All products** FastTab, add a row for each operational company that you want to use this policy to release to. Use the buttons on the **All products** FastTab to add and remove rows as you require. For each row that you add, set the following fields.

NOTE

The settings on the **All products** FastTab apply to both engineering products and standard products.

FIELD	DESCRIPTION
Company accounts ID	Select the company that the row applies to. The parameters on the row will apply when products are released to this company.
Template released product	Add a template for the product.
Copy BOM approval	Select this check box to copy the BOM approval status to the receiving company.
Copy BOM activation	Select this check box to copy the BOM activation status to the receiving company.
Copy route approval	Select this check box to copy the route approval status to the receiving company.
Copy route activation	Select this check box to copy the route activation status to the receiving company.

Option parameters for engineering products FastTab

Every time that you add a row on the **All products** FastTab, a row that has a matching **Company accounts ID** value is also created on the **Option parameters for engineering products** FastTab. Then, if you remove a row from the **All products** FastTab, the row that has a matching **Company accounts ID** value is also removed from the **Option parameters for engineering products** FastTab.

For each row that is shown on the **Option parameters for engineering products** FastTab, set the following fields.

NOTE

The settings on the **Option parameters for engineering products** FastTab apply only to engineering products.

FIELD	DESCRIPTION
Template BOM	When a product that has a BOM is released, the lines of the specified template BOM will be added. This field is useful for adding local components, such as packaging or instructions in the local language.
Template route	When a product that has a route is released, the lines of the specified template will be added.
Copy effectivity	Select whether effectivity dates should be copied from the engineering company to the operational company when you release products.
Automatically add to release proposal	Select this check box for products that should automatically be released on the engineering change order. In this way, products that belong to engineering product categories that use this release policy can automatically be released to operational companies where this option is set up. (For more information, see Manage changes to engineering products.)

Review each product when you release it

When engineering products that have BOMs or routes are released, the parameters will be set to default values, as indicated in the release policy. As a user, you can influence this behavior on the releasing side when you use the release product structure.

To release engineering products, on the **Released products** page, select the products to release, and then select **Release product structure** to open the release wizard. The **Select engineering products to release** page shows the products. Select a single product, and then select **Release details** to review the release details for the product.

On the **Release details** page, you can change the value of the **Receive BOM**, **Copy BOM approval**, **Copy BOM activation**, **Receive BOM**, **Copy route approval** and **Copy route activation** fields. In the push-pull scenario, you can change the value of the same fields on the receiving side, provided that the BOM and route are released.

Product owners and product releases

Because product owners know which legal entities need their products, a product can be released only by the members of that product's product owner group. Other users can't release products that they don't own.

This behavior applies only when a product is directly selected for release. Products that are part of another product's structure via a BOM *can* be released by non-owner users when they release the parent product, provided that they own the parent product.

For example, product X is assigned to the *Design cabinets* product owner group. Product X is also part of the BOM of product Y, which is assigned to the *Design speakers* product owner group. If a user from the *Design speakers* product owner group releases product Y and its BOM, product X will be released together with product Y.

For more information, see [Product owners](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production process overview

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic gives an overview of the production processes. It describes the various stages of production orders, batch orders, and kanbans, from order creation to closing of the financial period.

The production of products, a process that is also known as the production life cycle, follows specific steps that are required to complete the manufacture of an item. The life cycle begins with the creation of the production order, batch order, or kanban. It ends with a finished, manufactured item that is ready for either a customer or another phase of production. Each step in the life cycle requires different kinds of information to complete the process. As each step is completed, the production order, batch order, or kanban shows a change in the production status. Different types of products require different manufacturing processes.

The **Production control** module is linked to other modules, such as **Product information management**, **Inventory management**, **General ledger**, **Warehouse management**, **Project accounting**, and **Organization administration**. This integration supports the information flow that is required to complete the manufacturing of a finished item.

The production process is typically influenced by the cost accounting and inventory valuation methods that are chosen for a specific production process. Supply Chain Management supports both actual cost (first in, first out [FIFO]; last in, first out [LIFO]; moving average; and periodic weighted average) and standard cost methods. Lean manufacturing is implemented based on the backflush costing principle.

The choice of the cost measurement methods also defines the requirements for reporting about material and resource consumption during the production process. Typically, actual cost methods require accurate reporting on the job level, whereas periodic costing methods allow for less granular reporting of material and resource consumption.

Mixed mode manufacturing

Different products and production topologies require the application of different order types. Supply Chain Management can apply the various order types in a mixed mode. In other words, all order types can occur during the end-to-end process of producing one finished product.

- **Production order** – This is the classic order type to produce a specific product or product variant in a given quantity on a specific date. Production orders are based on bills of materials (BOMs) and routes.
- **Batch order** – This order type is used for process industries and discrete processes where the manufacturing conversion is based on a formula, or where co-products and by-products can be end products, either in addition to or instead of the main product. Batch orders use **Formula** type BOMs and routes.
- **Kanban** – Kanbans are used to signal repetitive lean manufacturing processes that are based on production flows, kanban rules, and BOMs.
- **Project** – A manufacturing project combines products and services with a given schedule and budget. The manufacturing part of a project can be delivered through any of the other order types.

Manufacturing principles

To select the manufacturing principle that best applies to a particular product and related market, you must consider the requirements of production and logistics, and also customer expectations about delivery lead times.

- **Make to stock** – This is the classic manufacturing principle, where products are produced for stock, based on forecast or minimum stock refill (the latter is typically calculated based on forecast or historic consumption).
- **Make to order** – Standard products are made to order or finished to order. Although pre-production might be done by using the Make to stock principle, expensive steps of the value chain, or steps that create variants, are triggered by a sales order or transfer order.
- **Configure to order** – As for the Make to order principle, the final operations of the value chain are made to order. The actual product variant that is produced isn't predefined but is created at the time of order entry, based on the configuration model of the sales product. The Configure to order principle requires a certain level of process unification for a given product line.
- **Engineer to order** – Engineer to order processes are typically addressed by a project and usually start with the engineering phase. During the engineering phase, the actual products that are required fulfill the order are designed and described. Production orders, batch orders, or kanbans can then be created to produce the products.

Overview of the production life cycle

The following steps in the production life cycle can occur for all order types of mixed mode manufacturing. However, not all of them are represented as an explicit order status.

1. **Created** – You can create a production order, batch order, or kanban manually, or you can configure the system to generate them based on various demand signals. Master planning creates production orders, batch orders, or kanbans by firming planned orders. Other demand signals are sales orders or pegged supply signals from other production orders or kanbans. For fixed-quantity kanbans, demand signals are generated when kanbans are registered as empty.
2. **Estimated** – You can calculate estimates for material and resource consumption. The estimation generates inventory transactions for raw materials that have a status of **On order**. The receipts for main products, co-products, and by-products are generated when production orders or batch orders are estimated. If the BOM contains lines of the **Pegged supply** type, purchase orders for materials or subcontracted operation services are generated and pegged to the production order or batch order. Items or orders are reserved according to the reservation strategy of the production order, and the price of the finished goods is calculated based on parameter settings.
3. **Scheduled** – You can schedule production based on operations, individual jobs, or both.
 - **Operations scheduling** – This scheduling method provides a rough, long-term plan. By using this method, you can assign start and end dates to production orders. If the production orders are attached to route operations, you can assign them to cost center groups.
 - **Job scheduling** – This scheduling method provides a detailed plan. Each operation is broken down into individual jobs that have specific dates, times, and assigned operations resources. If finite capacity is used, jobs are assigned to operations resources based on availability. You can view and change the schedule in a Gantt chart.
 - **Kanban schedule** – Kanban jobs are scheduled on the kanban schedule board or automatically scheduled based on the automatic planning configuration of the kanban rules.
4. **Released** – You can release the production order or batch order when the schedule is finished and the material is available to be picked or prepared. The material availability check helps the shop floor supervisor assess the availability of material for the production orders or batch orders. You can also print the production order documents, such as the pick lists, job card, route card, and route job. When the production order is released, the status of the order changes to indicate that the production can begin. When warehouse management is used, release of the production order or batch order releases the production BOM lines to warehouse management. Warehouse waves and warehouse work are then generated according to the setup of the warehouse.

5. **Prepared/Picked** – When all materials and resources have been staged at the production location, the production BOM lines or kanban lines are updated to a status of **Picked**. Pegged supply orders and related warehouse work are typically completed at this stage. The kanban cards or job cards that are required to report production progress should be assigned and printed.
6. **Started** – When a production order, batch order, or kanban is started, you can report material and resource consumption against the order. The system can be configured to automatically post the material and resource consumption that are allocated to the order when the order is started. This allocation is known as preflushing, forward flushing, or autoconsumption. You can manually allocate materials to production orders or batch orders by creating additional picking list journals. You can also manually allocate labor and other route costs to the order. If you're using operations scheduling, you can allocate these costs by creating a route card journal. If you're using job scheduling, you can allocate the costs by creating a job card journal. Production orders or batch orders can be started in batches of the requested final quantity. Within a production order, batch order, or kanban, the jobs that are created can be started and reported separately through journals, the manufacturing execution terminal (MES Terminal), or the kanban boards.
7. **Report progress/Complete jobs** – Use the MES Terminal, production journals, kanban boards, or mobile scanning capabilities to report the production progress by job or resource. Material and resource consumption will be posted, and the status of the related kanbans, production orders, and batch orders might be updated to **Received** or **Reported as finished**. Put-away work for the warehouse might be created, depending on the warehouse configuration.
8. **Reported as finished** (the product receipt) – When a production order or batch order is reported as finished, the quantity of the finished goods that were completed is updated in inventory. This quantity includes the quantity of relevant co-products and by-products. If you're using work-in-process (WIP) accounting, a ledger journal is generated to reduce the WIP accounts and increase the inventory of the finished goods. When the cost of a production order is calculated, the actual cost of the production is posted. If the material and labor costs that are associated with a production aren't already allocated in a journal or by preflushing, they can be automatically allocated through back-flushing. Allocation through back-flushing involves the post-deducting of inventory transaction processes. If the production order is completed, select the **End job** check box to change the remaining status to **Ended**. Otherwise, leave the field empty to enable reporting of additional quantities that are produced.
9. **Quality assessment** – A product receipt can trigger the creation of quality orders, depending on the configuration of test processes and the quality rules that are established for specific products. Because a quality order can update the inventory status or the batch attributes of the tested products, quality assessment is a mandatory process in many industries.
10. **Put away and Ship to order** – After product receipt and quality assessment, optional put-away work directs the received products to the next point of consumption, to a finished goods warehouse, or to a shipment zone if there are ship-to-order requirements.
11. **Ended** – Before production is ended, actual costs are calculated for the quantity that was produced. All estimated costs of material, labor, and overhead are reversed and replaced with actual costs. If you select the **End job** check box when you run the cost calculation, the production order status changes to **Ended**. This status prevents any additional costs from being posted to a completed production order.
12. **Period closure** – Some cost accounting principles, such as periodic average, back-flush costing, FIFO, or LIFO, require periodic activities to close the inventory or financial period. Typically, the system tries to report all material and resource consumption, and also corrections of inventory and scrap, before the periods are closed. This reporting is typically done by using inventory movement journals or adjustment journals. The goal is to assess the economic performance of operating units per period. In some cases, when long-running production orders are used that span the financial reporting periods, production journals are used to report the production progress and resource consumption by the end of the period.

Mixed mode planning - Combine discrete, process, and lean sourcing

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about mixed mode planning. In mixed mode planning, you can model your supply chain based on the material flow. Dynamics 365 Supply Chain Management makes sure that the material flow follows your models, regardless of the supply policy that is selected (kanbans, production orders, purchase orders, batch orders, or transfer orders).

You can select your overall strategy for supplying a product, regardless of the product structure.

For example, you can have kanban control in the assembly, where materials are sourced for the assembly area by production orders, kanbans, transfers, batch orders, or any combination that is appropriate for the characteristics of your supply chain, but you can still have full visibility across supplies. This capability leads to optimized supply chain processes and enhanced visibility into your supply chain.

The granularity of the supply policies that are used in master scheduling depends on the storage dimensions that are enabled as coverage dimensions. To enable master scheduling to control the replenishment and supply of different types of locations (for example, by separating the production floor for different production units, or by separating different types of material and finished goods warehouses), we recommend that you enable Site and Warehouse as coverage dimensions. Alternatively, Warehouse can be omitted as a coverage dimension. In that case, when you use advanced warehouse management, all movements inside a warehouse are controlled by warehouse work, whereas all movements across warehouses can be controlled by withdrawal kanbans.

Supply policies

Mixed mode planning controls how a product is supplied and, based on the supply, how derived requirements (consumption of items from a bill of materials [BOM]) are issued. Based on the order type, the system automatically sources materials to match the requirements.

Supply policies can be defined at the product level or at any granularity that supports your requirements. You define the granularity of supply policies on the **Default order settings** page.

Supply policies can be controlled by product, item dimensions (configuration, color, and size), site, and warehouse. This setup is done on the **Item coverage** page.

The default order type controls what order master planning generates.

Regardless of how the supply chain is modeled, Supply Chain Management supports your mix of supply policies. You can have production orders that are sourced from kanbans. Alternatively, you can have a batch order that requires a product that is supplied by transfers or by kanbans.

Supply Chain Management makes sure that the material flow follows the model.

The warehouse for picking material is assigned dynamically at run time, after the supply policy has been defined.

Typically, kanbans aren't created for future dates, because a kanban has a short life cycle. To maintain full visibility into the supply chain, we have introduced the new planning concept of a "planned kanban," which is used to calculate derived requirements and helps guarantee that the requirements are sourced based on the same logic that is used when the actual kanban is created.

The same logic is present for all other supply policy types. Therefore, long-term materials planning is based on

the same logic that you expect to run with the actual orders after production and supply are approved.

Materials allocation cross-supply policy – Resource consumption on BOMs

Resource consumption is an important functionality. Resource consumption enables a warehouse for picking materials to be selected dynamically, based on the supply policy (order type), and also makes maintenance of base data easier.

Resource consumption requires that the warehouse that materials are picked from be assigned based on the way that the product is supplied. In other words, at run time, the system finds the resources that should be used for manufacturing. Based on those resources, the system then finds the picking warehouse.

For work that is independent of a supply policy, you don't have to change information on the BOM if the supply is changed. For ad-hoc changes, Supply Chain Management makes sure that materials are sourced from the right warehouse.

Process manufacturing – The production type

For full flexibility in mixed mode, we recommend that you use production type BOMs for all products. You can then use production orders, kanbans, transfer orders, or purchase orders to supply a product. For process manufacturing, you must use a production type of **Formula**, **Co-product**, **By-product**, or **Planning item**. Kanbans and production orders can't be used for these production types.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage subcontracting work in production

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how subcontracted operations are managed in Dynamics 365 Supply Chain Management. In other words, it explains how production operations that are allocated to a resource are managed by a vendor.

In [production processes](#), work can be done by resources that are owned or administered by vendors. Typically, vendor resources are used to level periodic excess demand that surpasses the available capacity of a company's own resources. The vendor might also be able to offer specific [resource capabilities](#) or resources at a lower price.

Depending on the vendor resources that are used in a production process, a [route](#) often has additional logistic requirements, because the material and semi-finished products must first be transported to the vendor's site. Then the result of the subcontracted operation must be transported either to the location that is allocated to the next operation or to a finished goods warehouse.

When subcontracting operations or activities are used, they affect all stages of operations, from the definition of the operations that are required in production, costing, forecasting, planning, and scheduling, to the management of logistics for materials, semi-finished products, and finished goods. Finally, these resources require their own processes for accounting and cost control.

For internal resources, a fixed cost rate is typically allocated for a period. By contrast, the cost of subcontracted resources is based on the purchase price of the related service. The service is defined as another product, and is used to drive the procurement and purchase processes for a given subcontracted operation.

Currently, there is no explicit concept of semi-finished products in Supply Chain Management. For a production order that requires more than one operation in order to transform raw materials into a finished good, the finished good is posted back into inventory only in the last operation. The semi-finished products that the earlier operations produce are accounted in work in progress (WIP), but they aren't posted or tracked in inventory. Although you can split the routes and bills of materials (BOMs) into multiple smaller units, this approach increases the number of products, BOMs, and routes that must be managed.

There are two methods for modeling subcontracting work for production operations. These methods differ in the way that the subcontracting process can be modeled, the way that semi-finished products are represented in the process, and the way that cost control is managed.

- Subcontracting of route operations in production orders or batch orders
 - The service product must be a stocked product, and it must be part of the BOM.
 - This method supports first in, first out (FIFO) or standard cost.
 - Semi-finished products are represented by the service product in the process.
 - Cost control allocates the costs that are associated with subcontracted work to the material costs.
- Subcontracting of production flow activities in a lean production flow
 - The service is a non-stocked service product, and it isn't part of the BOM.
 - This method uses purchase agreements as service agreements.
 - This method uses backflush costing.
 - This method allows for aggregated and asynchronous procurement. (Material flow is independent of the procurement process.)
 - Cost control allocates subcontracted work in its own cost breakdown block.

Subcontracting of route operations

To use subcontracting of route operations for production or batch orders, the service product that is used for the procurement of the service must be defined as a product of the **Service** type. Additionally, it must have an item model group that has the **Stocked product** option under **Inventory policy** set to **Yes**. This option defines whether a product is accounted as inventory on product receipt (**Stocked product = Yes**), or whether the product is expensed on a profit and loss account (**Stocked product = No**). Although this behavior might seem contradictory, it's based on the fact that only products that have this policy will create inventory transactions that can be used in cost control to calculate planned cost and determine the actual cost when a production order is ended.

To be considered in planning and cost calculation, the service must be added to the BOM. The BOM line must be of the **Vendor** type, and it must be allocated to the route operation that the service is allocated to. This route operation must have a costing resource and resource requirement that point to a resource of the **Vendor** type that connects the operation and the related service to the corresponding vendor account.

When this configuration is used, a purchase order is created for the related service product, based on estimation of a production order. The purchase order of the service is used as an anchor for the subcontracted operations. The subcontracted work can be managed through the **Subcontracted work** list page in Production control. The subcontracted work is used to ship raw material and, eventually, a semi-finished product to the vendor in preparation for the operation. It's also used to receive the resulting product of the subcontracted operation in item arrival, where the service product is used to identify the arrival of the semi-finished product. When the purchase order line is received, the production operation is updated as completed.

A production order can have many operations, and each operation can be allocated to a different vendor. Therefore, an end-to-end production order might trigger multiple purchase orders.

Subcontracting of production flow activities

The [lean manufacturing](#) solution models the subcontracting work as a service that is related to an activity of a [production flow](#) (Task guide topic). Therefore, this type of subcontracting is also referred to as [activity-based subcontracting](#). A special cost group type, **Direct outsourcing**, has been introduced, and the subcontracting services aren't part of the BOM of the finished goods. When you use lean manufacturing, all activities are defined by kanbans that can be related to one or multiple production flow activities. So far, that explanation sounds just like an explanation of production orders. However, whereas production orders must always end with a finished product, you can create kanbans to supply a semi-finished product. You don't have to introduce a new product and BOM level.

Because kanban rules can be very dynamic, you can model different variants of supply for the same product on a production flow. When you use lean subcontracting, the material flow and the financial flow are strictly separated. All material flow is represented by kanban activities. The purchase orders for the service products and the receipt postings of those services can be automated, based on the status of kanban jobs in the production flow. Kanban jobs can be started and completed even before the purchase orders are created. The subcontracting documents (purchase order and purchase receipt of the service) can be aggregated by period and service. Therefore, the number of purchase documents and lines can be kept small, even in highly repetitive operations where vendors provide subcontracted services in a single-piece flow.

Modeling subcontracting in a production flow

In a [lean production flow](#), a process activity can be defined as subcontracted when it's allocated to a work cell (resource group) that has a single vendor resource. When a work cell is subcontracted, the related process activities must be linked to an active purchase agreement line that contains the service item and the price of the service. The service agreement of the activity also defines the calculation ratio between the product quantity of the kanban job and the resulting service quantity. You can select whether the service quantity is calculated based on the number of jobs, the good product quantity that is reported on the jobs, or the total product quantity (this total quantity includes scrapped products).

Transfer activities can also be defined as subcontracted. This definition occurs implicitly when you select the

responsible party for the shipping in the transfer activity. When you select **Shipper** or **Recipient**, if the corresponding source or target warehouse is a vendor-managed warehouse, the activity is considered subcontracted. When you select **Carrier**, the activity is always subcontracted. Like subcontracted process activities, a subcontracted transfer activity must be connected to a service agreement before the production flow can be activated.

Backflush costing

The cost accounting of subcontracted work is completely integrated into the costing for the lean manufacturing solution (backflush costing). When the purchase order receipt of the service is posted, or when invoicing occurs, the cost of the service is allocated to the production flow. For backflush costing, the variance of subcontracted services is calculated by offsetting the subcontracting block of the standard cost of the received products against the actual received and invoiced service quantities.

Material supply for subcontracted operations

Semi-finished products and other related materials must be transferred to the location where the work is physically performed. When you use subcontracted operations and activities, this transfer is often related to additional transport to a vendor-operated site. By allocating material in the BOM to the subcontracted operation, you declare that the material must be staged at the input location of the resource group for the allocated resource. Master planning or lean replenishment then provisions the material to that location.

To model the inventory that is located at a vendor site, it's a best practice in the industry to define a vendor-managed warehouse. You can easily define a vendor-managed warehouse by creating a new warehouse and assigning the vendor account. To document that material must be transferred to the vendor before an operation can be performed, you should allocate the vendor-managed warehouse to the input warehouse of the resource group that holds the resource.

To replenish material at this warehouse, you can use multiple strategies:

- Transfer orders
- Transfer journals
- Withdrawal kanbans
- Direct purchase to the vendor location

Semi-finished products are the exception to this rule. To transfer semi-finished products, you're limited to these options:

- For production and batch orders, semi-finished products can only be transferred logically by using the Picking list journal from the **Subcontracted work** list page. This journal will create a delivery note document that can be used to transfer semi-finished and raw material to the vendor.
- For subcontracted operations in production flows, the transfer of semi-finished products is documented by the receipt of withdrawal or production kanbans at the vendor location. To model an explicit transfer activity, you can end a production kanban with an additional transfer activity.

Note: A production route for a single production order can't cross multiple sites. This rule also applies to the subcontracted work. Therefore, the warehouses that represent the vendor-managed material locations must be defined in the same site as the internal resources that are used in the route. Although production flows can cross sites, they can't transport semi-finished products from one site to another, because that operation implies a change of cost context.

Typically, the output warehouse and location of a subcontracted resource group are directly allocated to the warehouse and location of the next step of the operation in the route or production flow. This setup helps reduce the amount of job reporting that occurs or the number additional transfer operations that must be modeled.

Production setup requirements

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about setup requirements before you can work with Production control.

Production control is integrated with features in other modules. This interconnectivity lets you change production orders and make sure that they are automatically updated in all other related processes and calculations in the system. The following setup processes are listed in the order that you should complete them in.

Required baseline setup in other modules

Information in other modules must be set up before you can work with Production control. This setup includes the following tasks:

- Set up general company information.
- Set up the general ledger.
- Define item groups.
- Set up ledger accounts for item groups.
- Set up the inventory item table in Inventory management.
- Create bills of materials (BOMs) and BOM versions in Inventory management.

Required calendar and resource setup

Before you use Production control, open Organization administration, and create and define the calendar and operations resources in the following order:

1. **Working time templates** – Set up working time templates to define the times that are available for production scheduling.
2. **Calendars** – Set up working time calendars to define the days of the year that are available for production scheduling.
3. **Resource groups** – Set up resource groups to group the operations resources, so that you can get an overview of any free capacity when you run scheduling. You don't have to set up resource groups before you set up operations resources. However, we recommend that you understand how to group resources when you set up Production control.
4. **Resources** – Set up operations resources to define the resources that are used to complete the production process and plan for capacity.

Required production parameters setup

Production control parameters – Set up basic production parameters to define how the system handles and processes production orders. Define how production orders are created, estimated, scheduled, and consumed. You can also select what kind of feedback you want and how cost accounting is done.

Required journal name identification

Production journal names – Specify the production journal names that are used to record and post transactions.

Setup if you use operations

Operations represent the specific activities that are completed to produce the finished product. **Note:** You must know the types of activities that are required in order to produce your item, and the order and priorities of those activities. You must also know which resources are involved, and how many.

1. **Operations** – Set up operations to represent the tasks that must be completed to produce the finished item.
2. **Relations** – Set up operation relations to establish detailed properties. To define operation relations, click **Relations** on the **Operations** page.

Setup if you use routes

If you're working with routes, operations must be defined for every production route that you set up. The route represents the path that the item takes from operation to operation, from the start of the production process to the end.

1. **Cost categories** – Set up cost categories to define the cost per hour of specified processes and setup times.
2. **Cost groups** – Set up cost groups to create and maintain different types of costing.
3. **Route groups** – Set up route groups to define parameters that are related to groups of routes. You must set up route groups before you can create production routes.
4. **Routes** – Set up production routes, and define default settings to control scheduling, costing, and pricing of route operations, and to control progress reporting.
5. **Route version** – Set up route versions to enable item variations in production.

Optional advanced settings

1. **Production groups** – Set up production groups to establish relationships between the production order and ledger accounts. The ledger accounts are used to post or group orders for reporting.
2. **Production pools** – Create production pools to group production orders so that you can process urgent production orders, or delete and post groups of orders.
3. **Properties** – Define properties to create special attributes that you can assign to your resources to control the order of productions. These attributes are connected to the working time template.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Bills of materials and formulas

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about bills of materials (BOMs) and formulas, which are a central part of the definition of products and product variants. BOMs and formulas specify the required materials or ingredients for a specific product. Formulas also specify the co-products and by-products that are received in a specific production context.

Bills of materials

A bill of materials (BOM) defines the components that are required in order to produce a product. The components can be raw materials, semi-finished products, or ingredients. In some cases, services can be referenced in a BOM. However, BOMs typically describe the *material resources* that are required.

When it's combined with a route or production flow that describes the operations and resources that are required in order to build a product, the BOM forms the foundation for calculating the estimated cost of the product.

A BOM is an individual entity that is described by the following information:

- BOM ID
- BOM name
- The BOM lines that describe the components and ingredients
- The BOM versions, which define the product and period that the BOM can be used for

A single BOM describes a single level that is identified by a unique ID. Components might have their own BOMs that are referenced by BOM versions. You can display and edit the complete hierarchy of BOMs for a specific product in the BOM designer.

Formulas, co-products, and by-products

A formula is a subtype of BOM that is typically used for process manufacturing. In addition to components and ingredients, a formula describes co-products and by-products. In the actual version, the definition of co-products and by-products for the formula requires the formula version. A formula is typically defined for one specific finished product (a formula or planning item) that is defined in the formula version.

BOMs in the product lifecycle

In the product lifecycle, many types of BOM might be created for various reasons:

- **Sketching/Draft BOM** – This BOM gives a draft estimation of required materials in an early design phase and helps you do a rough estimate of cost and estimated product attributes. This BOM isn't usually used in enterprise resource planning (ERP).
- **Engineering BOM** – This BOM is typically used when you design products that are based on existing product portfolios. Engineering BOMs are structured to simplify the design process and group complex products into engineering modules. For simple products, it might be possible to use engineering BOMs for the actual production process. However, for other products, the engineering BOM must be converted to an actual production BOM. Engineering BOMs are typically represented by phantoms in the BOM hierarchy. Although engineering BOMs can be used for the planning and execution of manufacturing operations, this approach can lead to inefficiencies, especially in repetitive operations where many orders are created.
- **Planning BOM** – This BOM is used to do planning for material requirements. The demand of components and ingredients is calculated based on the demand of the finished products. Like costing BOMs, planning BOMs might represent a specific mix of material that is used in a period.

- **Production BOM** – This is the actual BOM that is used for a specific production. A production BOM must take into account the actual resources that are used to produce the product. When a production order, batch order, or kanban is created, the multiple levels of BOMs that are represented by phantoms are collapsed into one level and distributed over the operations for the order.
- **Costing BOM** – This BOM is used to calculate the estimated cost of a product. For example, you can use a costing BOM when standard cost is used or the estimated planned cost of a given product is calculated. Costing BOMs can refer to a specific mix of materials and resources that is expected to be used. Therefore, you can use the costing BOM to create a representative estimated cost for a period and help avoid variances over time.

The types of BOM that are actually used in an implementation depend on the implementation, and also on the business scenarios and requirements. In simple implementations, a planning BOM, production BOM, and costing BOM can be modeled as one BOM. In environments that have frequent engineering changes and multiple alternative routes, a larger set of BOM types will probably be required.

Approval of BOMs and formulas

Each BOM and formula can be separately approved or unapproved. Typically, approval of a BOM or formula occurs when the first relevant BOM version is approved. However, in some business scenarios, these approvals might be different steps in the process and might involve different process owners.

Note that, if a BOM is unapproved, all related BOM versions are also unapproved.

BOM and formula versions

To relate a specific BOM or formula to a product variant that can be produced, you must create a BOM version or formula version. The validity of BOM versions and formula versions can be constrained by period, quantity, site, specific product dimensions, and other criteria. Formula versions have additional important attributes, such as yield, co-product and by-product definitions, and the cost distribution instructions for the formula.

Approval of BOM and formula versions

Before a BOM version can be used in the planning or manufacturing process, it must be approved. When a BOM version is approved, the related BOM can also be approved, depending on the user's selection and authentication rights. Note that a BOM version can be approved only if the related BOM itself is approved.

Activation of the default BOM or formula version

To set a specific BOM or formula as the default BOM version or formula version that will be used by master planning or used to create production orders, you must activate the version. When a version is activated, the uniqueness of the version for the given constraints (for example, period, site, or quantity) is verified. You receive an error message if the version that you're trying to activate conflicts with a version that is already active. You must then either inactivate the conflicting version or modify the version constraints (usually the period) to prevent an ambiguous activation.

Product change with case management

The product change case for approval and activation of new or changed BOMs and BOM versions provides an easy way to see an overview of the BOM version constraints. You can also approve and activate all BOMs and formulas that are related to a specific change for one activation date.

Alternative BOM versions

Sometimes, the active BOM version or formula version should not be used in forecasts, sales, or a parent product. In this case, you can select a specific approved BOM as part of the requirement (forecast line, sales line, or BOM line) if an approved BOM version or formula version exists for the alternative BOM or formula.

When planned orders, production orders, or kanbans are created, the planner or shop floor supervisor can use any approved BOM version that is valid on the requested planned production date to plan for or produce a

specific product. The BOM version that is used doesn't have to be activated as the default BOM version.

BOM and formula lines

A BOM line is created for each material, service, or ingredient. The line defines the planned consumption of the specified product variant and also defines the various attributes that are related to the planned consumption.

BOM lines can have the following line types: **Item**, **Phantom**, **Pegged supply**, **Vendor**.

Item

Select the **Item** line type for materials or services that are directly consumed, and that don't require further explosion or pegged supply.

Phantom

Select the **Phantom** line type when you want to explode any lower-level BOM items that are contained on the BOM line. In Master scheduling, in planned cost calculation, or on estimation of a production order that uses BOM lines of the **Phantom** type, the parent BOM line that refers to a product variant that has a phantom BOM is replaced by the component items that are listed as BOM lines in that BOM, as determined by the applicable active BOM version of that product variant. If the product variant has an applicable active route, the operations of that route are merged into the parent route.

Note that phantoms are typically used to simplify the engineering process. Extensive use of phantom BOMs in many levels has an effect on performance, especially in highly repetitive manufacturing scenarios. To improve performance, you should avoid deep hierarchies of phantoms. Instead, use pre-exploded production BOMs and routes.

Pegged supply

Select the **Pegged supply** line type when you want to create a subproduction, a BOM line event kanban, or a direct purchase order for any product variant that the BOM line references. The subproduction, event kanban, or purchase order is created when you estimate the production order. The required item quantities are automatically reserved for the consuming production order.

Vendor

Select the **Vendor** line type if the production process uses a subcontractor, and you want a subproduction or purchase order to be created automatically for the subcontractor.

Note about subcontracted operations in a BOM: The service or work that is performed by the subcontractor must be created as service item that is tracked in inventory. You must attach the service item to the parent item as a BOM line. The route must contain an operation that is assigned to the subcontractor's operations resource.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

BOM designer functionality

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how you can use the BOM designer page to design and work with tree structures for bills of materials (BOMs). You can click Setup to select different configurations and specify what information appears on the lines of the tree.

When you open the **BOM designer** page from the **Released products** page, it displays the hierarchy of bills of materials (BOMs) that are active and approved for the selected item, the default order site of the item, and the actual date.

Click **Filter** to change the initial selection in the view. By setting the display principle to **Selected/Active or Selected**, you can select individual BOM or route versions to use in the view. You can select non-approved and non-active BOM versions to show or maintain in the BOM designer.

Note: If you open the BOM designer from the **Bills of materials** list page, it doesn't display route information. Currently, the selection of a BOM or route version is a property of the BOM and route version, and applies to all instances of the BOM designer.

The following sections describe the functionality that is available on the various tabs of the BOM designer.

Analyzing a BOM structure by using the BOM designer

The BOM designer has two sections:

- The tree view of the BOM structure.
- The details section, which shows details of the selected data. When you select a node in the tree view, the FastTabs in the details section are updated based on that node:
 - **BOM line details** – Shows the details of the BOM line that is selected in the tree view.
 - **Item data** – Shows the details of the main item or the item that is used in the selected node. You can click **Edit released product** to maintain the selected item.
 - **BOM** – Shows the header of the BOM that is related to the selected node.
 - **Route** – Shows the header of the route that is related to the selected node.
 - **Route operations** – Shows a preview of the operations for the route. When a BOM line that is assigned to a specific operation is selected, the operation is marked as **Component needed at operations**.

Selecting a BOM and route

The filter that is applied for the BOM and route is displayed in the header of the BOM designer. You can change the filter by using the **Filter** dialog box. The following table describes the fields in this dialog box.

FIELD	DESCRIPTION
Product dimensions	If the selected finished product is a product master, you can define the active product dimensions for the main selection. Note: If you open the BOM designer for a product that isn't a product master, no product dimensions can be selected in the Filter dialog box.

FIELD	DESCRIPTION
Site	Change the site that the BOM tree is displayed for. The default site is the default inventory site of the finished item.
Display principle	Select the version display principle that applies to the current BOM structure and the current route: <ul style="list-style-type: none"> • When the principle is set to Active or Selected/Active, the valid BOM or route version for this date is found. • When the principle is set to Selected/Active or Selected, you can select a BOM version or route version by clicking BOM > BOM versions or Route > Route versions.
Version date	Enter the version date for the BOM and route. The version identifies which BOM version is used on a specific date, as determined by the version dates in the BOM version setup.
From quantity	Filter the versions by selecting a specific from quantity. If you set a value, different BOM and route versions might be selected.
Show valid only	When you select the check box, the tree structure shows only BOM lines that have valid dates. Right-click or double-click a BOM line to open the Edit BOM line page, where you can see the validity dates for that BOM line.

When you use the BOM designer to review or edit BOMs that consist of one or more levels of phantoms, the route that is associated with the top item typically spans the complete BOM hierarchy. To simplify the overview, you can lock the top-level route in the display by clicking **View > Lock route**. To unlock the route, click **View > Unlock route**.

Adding and editing BOMs and BOM lines

Use the **BOM lines** or **BOM** functions to modify the BOM lines or BOM. When you select a node in the tree, the type of the node determines that functions that are available.

FUNCTION	DESCRIPTION	NODE TYPE AND CONDITIONS
BOM lines > Edit	Open a dialog box where you can edit the BOM line attributes.	This function is available when a BOM line node is selected.
BOM lines > Delete	Delete a BOM line from the selected BOM.	This function is available when a BOM line node is selected, and the BOM isn't locked for editing.
BOM lines > Add before line	Open a dialog box where you can select a product variant to include before the selected BOM line.	This function is available when a BOM line node is selected.

FUNCTION	DESCRIPTION	NODE TYPE AND CONDITIONS
BOM lines > Add to component BOM	Open a dialog box where you can select a product variant to include at the end of the selected BOM.	This function is available when the node that is selected has a selected BOM. If this function isn't available, a BOM version might be missing for the selected item variant. In this case, you can click BOM > Create version to create the missing version for the selected node.
BOM lines > Add after line	Open a dialog box where you can select a product variant to include after the selected BOM line.	This function is available when a BOM line node is selected.
BOM > Create version	Create a new BOM version or BOM for the product variant of the selected node.	This function is available when the BOM line node that is selected is linked to an item that has a production type of BOM or Formula .
BOM > Calculation	Open a dialog box where you can run the cost or sales price calculation for the selected product variant.	This function is available when the node that is selected is related to a BOM version.
BOM > Check	Validate and check the selected BOM.	This function is available when the node that is selected is related to a BOM version.

Configuring the tree view

Click **Setup** to customize the information that is shown in the tree view of the BOM designer.

FIELD GROUP	DESCRIPTION
BOM	Use the check boxes to select the criteria that are shown in the tree structure. The BOM designer displays the selected criteria at the bottom of both tabs.
Route	Use the check boxes to select the criteria that are shown for the routes.

Override the default reservation principle for materials in production

2/18/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

The *Override default production reservation* feature lets you set a default reservation principle for each item model group. Therefore, different reservation principles can automatically be applied for each item that is part of a production bill of materials (BOM) or batch order formula. You can select whether each item model group should override the default reservation principle that is set for an order, and what reservation principle should be used instead (*manual, estimation, scheduling, release, or start*).

When you create a new production order or batch order, you're prompted to select the reservation principle that should be applied to that order and all its BOM lines or formula lines. When the *Override default production reservation* feature is used, some or all of the BOM or formula lines can override that reservation principle and instead use the reservation principle that is set for the relevant item model group.

For example, if you have raw materials or ingredients that require pick work, BOM or formula lines that are created for those products require a physical reservation, because physical reservation is a prerequisite for the generation of warehouse work. Typically, if you want the reservation to occur automatically, you select one of the following reservation principles: *estimation, scheduling, release, or start*. On the other hand, if you have materials or ingredients that don't require pick work, because they are consumed directly from a location, you typically select the *manual* reservation principle, which doesn't make any physical reservations or generate any pick work.

Turn on the feature

Before you can use the feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Production control*
- **Feature name:** *Override default production reservation*

Assign a production reservation policy to an item model group

1. Go to **Cost management > Inventory accounting policies setup > Item model groups**.
2. Create or select an item model group.
3. On the **Inventory policies** FastTab, select the **Override item production reservation** check box.
4. In the **Reservation** field, select the reservation principle for items that belong to the selected model group. (Those items include items that are on a BOM or formula line.)
 - **Manual** – Items in the model group won't automatically be physically reserved for production. However, they can still be manually reserved as required.

- **Estimation** – Items in the model group will be physically reserved during estimation of the production order.
- **Scheduling** – Items in the model group will be physically reserved during scheduling of the production order.
- **Release** – Items in the model group will be physically reserved when the production order is released.
- **Start** – Items in the model group will be physically reserved at the start of the production order.

Example: Using reservation principles in a bulk/pack scenario

A bulk lubricant material is produced in a 1,000-liter mixer. After the bulk material is ready, it's pumped out to several filling stations, where bottles of different sizes are filled. After filling is completed, the bottles are packed into boxes. Those boxes are then packed onto pallets.

In this scenario, a batch order to make 1,000 liters of bulk material is created. (This order is the bulk order.) When this batch order is completed, it's reported as finished to the material input location of the filling stations. A batch order to fill and pack each bottle size is then created. (These orders are the pack orders.) The pack orders have a formula that consists of the bulk material, an empty bottle, a label, and other packing materials. Because the bulk material flows directly from the mixer tank to the filling stations, no warehouse work is required to pick this ingredient, and the bulk material is consumed directly from the input location. Therefore, the reservation principle is set to *manual*. The other materials are staged to the filling station by pick work. Therefore, the reservation principle for these lines is set to *release*, for example, so that the reservation automatically occurs when the pack order is released.

Phantom items

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes, in detail, how the Phantom line type can be used for the lines of a bill of materials (BOM) and a formula. In the following illustration, (a) is the BOM for product H and parts F and G, and (b) is the route sheet for products H and part F.

This illustration shows an example of a BOM structure in two levels. Finished product H represents a product for a machine assembly. The machine assembly consists of two parts, an electrical unit (F) that has two materials (A and B) and a group of packaging materials (G) that also has two materials (C and D). Another material (E) is used during the general assembly of the machine.

The preceding illustration represents the Engineering BOM for product H. This structure provides a good overview of the parts and components of the overall machine assembly. However, although product designers might prefer to see the BOM represented in this way, this structure might not correctly represent the way that the machine is built on the shop floor.

For example, the Engineering BOM in the preceding illustration indicates that electrical unit F is assembled as a separate part on a separate work order. However, on the shop floor, it might be judged more optimal to assemble the electrical unit as part of the overall machine assembly, not as a separate work order.

This Engineering BOM also indicates that part G is a separate part. However, in this structure, part G doesn't represent a physical part but a collection of packaging materials.

Therefore, although an Engineering BOM provides great value for the design of a product and maintenance of that design, it might not be the most logical way to support the manufacturing execution process of the product. By contrast, a Manufacturing BOM represents the best way to build a product.

The following illustration shows how the preceding Engineering BOM is transitioned into a Manufacturing BOM. In this illustration, (a) is the BOM for product H, and b is the route sheet for product H.

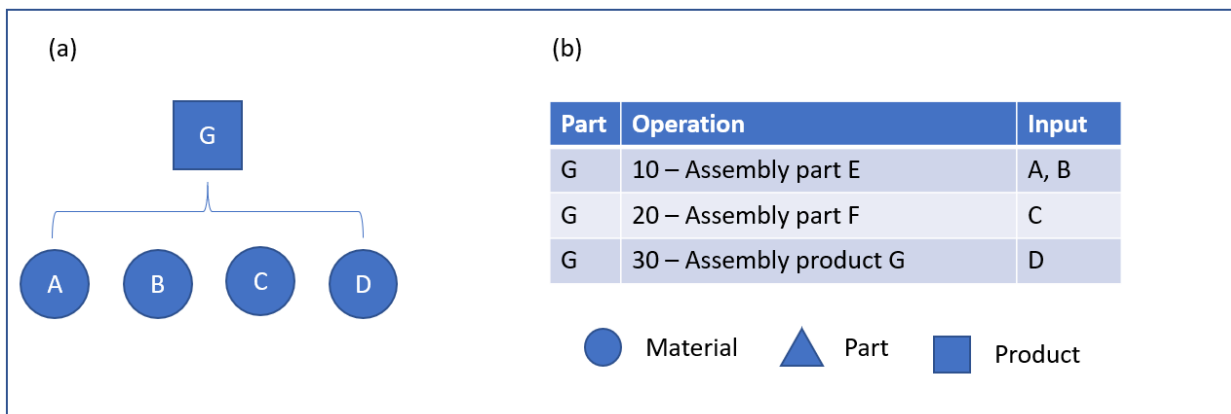

In this structure, you can see that there is no notion of parts F and G, and the materials that these parts consist of have been elevated to the next BOM level.

Unlike the Engineering BOM, which had two operations sheets, the Manufacturing BOM has only one operations sheet. The packaging operation that was linked to part G has also been elevated and is now part of the operations sheet for product H. The assembly of the electrical unit is the first operation. This order makes good sense, because this unit is used in the next operation, which is the machine assembly. The last operation is the packaging operation, which consumes two packing materials (C and D).

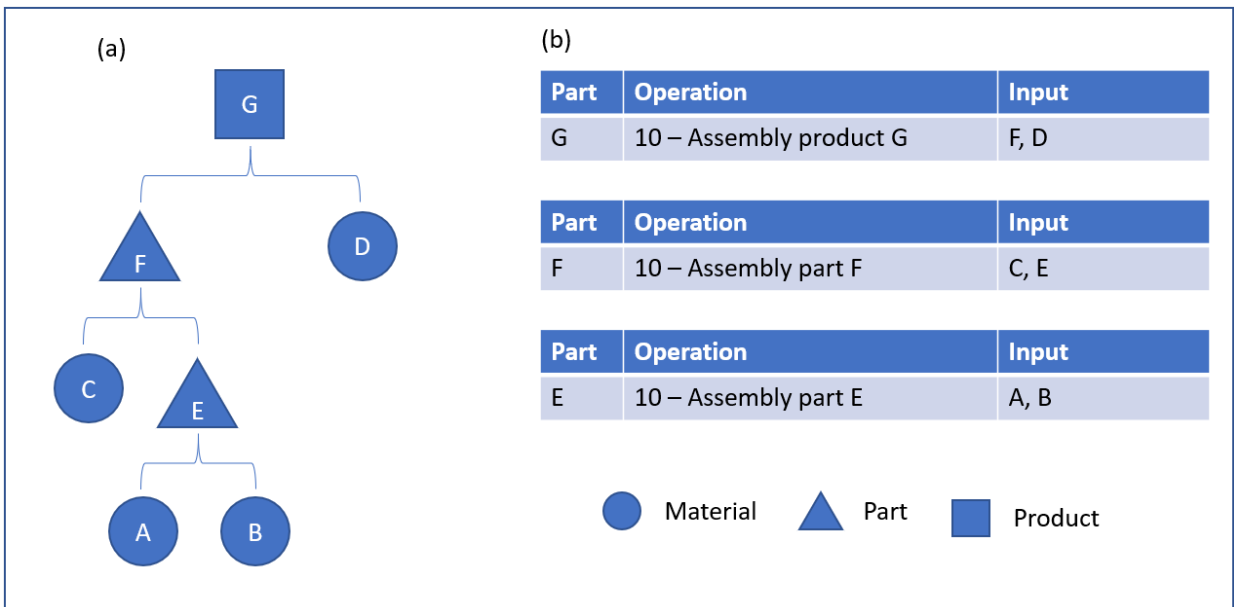

The transition between the Engineering BOM and the Manufacturing BOM is enabled through the Phantom BOM line type. As the term “phantom” indicates, parts F and G have disappeared during the transition between the two BOM types. In this example, the Phantom line type is applied to the BOM lines for parts F and G in the Engineering BOM. When a production or batch order is created, the Engineering BOM is copied to the production or batch order. Then, when the order is estimated, the transition from the Engineering BOM to the Manufacturing BOM occurs, as shown in the preceding illustrations. From the operations sheet in the second illustration, packaging materials C and D are input for the operation.

Multilevel phantom BOM structures

The Phantom line type can be used in multilevel BOM structures, as shown in the following illustration. In this illustration, (a) is the BOM for product G, and (b) is the route sheet for parts E and F and product G.

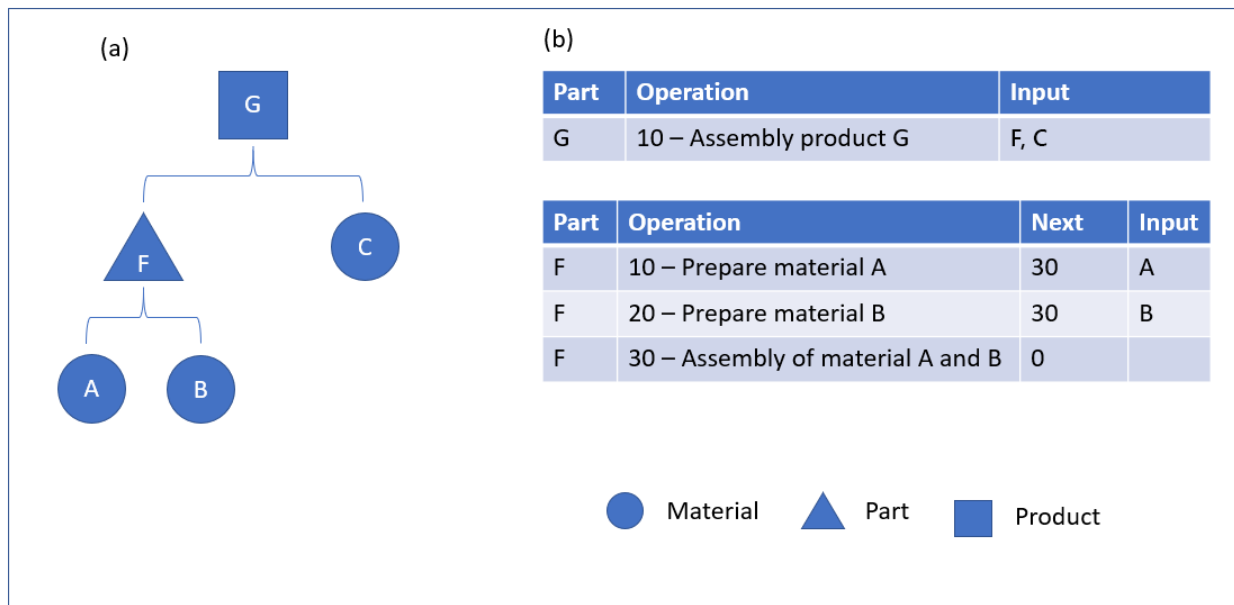

The following illustration shows the resulting Manufacturing BOM and route sheet if the BOM lines for parts E and F are configured so that the line type is Phantom. In this illustration, (a) is the BOM for product G, and (b) is the route sheet for product G.

Phantom and route network

Phantom BOMs can also be used for a BOM that has a route network. In a route network, one or more operations run in parallel. The following illustration shows an example of a route network that is used in a multilevel BOM. In this illustration, (a) is the BOM for product G and part F, and (b) is the route sheet for product G and part F, which has a route network.

In the following illustration, (a) is the BOM for product G and part F, and (b) is the route sheet for product G and part F.

(a)

(b)

Part	Operation	Next	Input
G	10 – Prepare material A	30	A
G	20 – Prepare material B	30	B
G	30 – Assembly of material A and B	40	C
G	40 – Assembly product G	0	

● Material ▲ Part ■ Product

BOM calculations

2/18/2021 • 9 minutes to read • [Edit Online](#)

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the **Calculations** page. This topic provides information about BOM calculations.

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the **Calculations** page. You use the **Calculations** page to perform the following tasks:

- Calculate the cost of a manufactured item, and generate an associated item cost record within a costing version.
- Calculate the sales price of a manufactured item, and generate an associated item sales price record within a costing version.

The way that you use the **Calculations** page varies slightly, depending on how you initiate the BOM calculations. The way that you use the **Calculations** page also depends on whether the BOM calculations involve a costing version for standard costs or planned costs, and on several policies that are defined in the costing version that is used in the BOM calculations. **Note:** A variation of the **Calculations** page is used in the context of a sales order, sales quotation, or service order line item. These calculations are known as order-specific BOM calculations. An order-specific BOM calculation doesn't generate an item cost record within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation details** page. The calculation record includes a calculated cost and a calculated sales price. The **Calculations** page can be opened for a single manufactured item or for a costing version:

- To calculate costs for a single manufactured item, you initiate BOM calculations from the **Item price** page. The **Calculations** page inherits the item identifier. The costing version, BOM version, route version, calculation quantity, calculation date, and site must be specified.
 - By default, the BOM version and route version are set to the active versions for the item, site, date, and calculation quantity. However, you can override the default values with approved versions.
 - By default, the calculation quantity is set to the item's standard order quantity. However, you can override the default value.
 - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version. A future calculation date determines how pending cost records are used. BOM calculations use a pending cost record that has the nearest from-date that is on or before the calculation date.
- To calculate costs for all manufactured items or selected items, or to update items on a where-used basis, you initiate BOM calculations from the **Costing version setup** page or the **Costing version maintenance** page. The **Calculations** page inherits the costing version.
 - For the calculations, it's assumed that the active BOM version and route version are used for a manufactured item (and for the related site, date, and quantity), unless a manufactured component has a specified sub-BOM or subroute.
 - For the calculations, it's assumed that the standard order quantity is used for manufactured items. The standard order quantity provides the basis for calculating component quantities, determining the relevant BOM versions and route versions (when you use quantity-sensitive BOMs and routes), and amortizing constant costs. However, when a manufactured component has a BOM line type of **Production** or **Vendor**, or when you use a make-to-order explosion mode for the BOM calculations, this assumption doesn't apply, because quantities reflect the specified calculation quantity.
 - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version.

Other variations in BOM calculations reflect the costing type and restrictions of the costing version:

- BOM calculations that use standard costs must be restricted by costing version policies, because the restrictions help guarantee that standard costing principles are used. Standard costing principles require the enforcement of restrictions about the use of standard costs for purchased items, a single-level explosion mode, and the inclusion of miscellaneous charges in unit costs.
- BOM calculations that use planned costs don't have to follow standard costing principles. These BOM calculations can use different explosion modes, alternative sources of cost data for purchased items, and optional enforcement of restrictions within the costing version.

BOM calculations that use standard costs

Policies within the costing version (for standard costs) can mandate enforcement of five BOM calculation policies. The **Recording restriction** option in the costing version mandates one of these policies, where miscellaneous charges must be included in the unit price. Miscellaneous charges for purchased items can be entered manually, whereas miscellaneous charges for manufactured items reflect the calculated amortization of constant costs. The **Calculation restriction** option in the costing version mandates the other four BOM calculation policies:

- The source of cost contributions for purchased items must be based on standard costs. In other words, BOM calculations must use the item cost records within the specified costing version, or within the fallback that contains standard costs.
- To help guarantee accurate and consistent calculation of standard costs, the explosion mode must be single-level.
- To help guarantee consistent results when the sales price of the items is calculated, the profit setting must be mandated. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle must be mandated, and can be set to **None**, **Active** (for active cost records), or **Costing version** (for a specified costing version).

BOM calculations that use planned costs

Policies within the costing version (for planned costs) can optionally mandate enforcement of five BOM calculation policies. Alternatively, the policies can just provide default values. The **Recording restriction** option in the costing version determines whether the BOM calculation policy about miscellaneous charges will be mandated or act as a default value. Miscellaneous charges can optionally be included in the unit price. The **Calculation restriction** option in the costing version determines whether the other four BOM calculation policies will be mandated or act as default values:

- The source of cost contributions for a purchased item can be the item cost records within a costing version. Alternatively, the source can be defined by the BOM calculation group that is assigned to the item. For example, the BOM calculation group can define purchase price trade agreements as the source of cost contribution data.
- The explosion mode can be single-level, multilevel, or make-to-order, or it can be based on the BOM line item. The explosion mode for the BOM line type replicates the cost calculation logic for production order estimates.
- The profit setting can be mandated, or it can be a default value. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle can be mandated, or it can be a default value. The fallback principle can be set to **None**, **Active** (for active cost records), or **Costing version** (for a specified costing version).

BOM calculations generate warning messages and other types of messages. Several BOM calculation policies determine the types of messages. The warning conditions are defined in the BOM calculation group that is assigned to items. However, you can override these warning conditions when you initiate a BOM calculation. When the fallback principle is used, it's often helpful if the fallback is shown as an information message. When

you're trying to update calculated costs for items that have missing cost records, it's also helpful if the information message identifies items that weren't updated.

BOM calculations that use the fallback principle

The following situations illustrate two uses of the fallback principle:

- **Two-version approach to standard cost updates** - A costing version can contain the incremental changes to standard costs, such as pending cost records that represent new items or cost changes. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.
- **Simulation of the effect of cost changes by using planned costs** - A costing version for planned costs can contain incremental changes for simulation purposes. This costing version will include pending cost records that represent the simulated cost changes to items, cost categories, and calculation formulas for indirect cost. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.

BOM calculation of a suggested sales price

When you use a cost-plus-markup approach, the calculated sales price for an item reflects the set of profit-setting percentages that is specified for the BOM calculation, and the costs that are associated with the item's component items, routing operations, and applicable manufacturing overheads. The markup reflects profit-setting percentages that are assigned to cost groups, and the cost groups that are assigned to items, cost categories for routing operations, and the indirect cost calculation formulas for manufacturing overheads. The sets of profit-setting percentages are labeled **Standard**, **Profit 1**, **Profit 2**, and **Profit 3**. Within the Profit 1 set, for example, a profit-setting percentage of 50 percent can be defined for a cost group that is assigned to purchased material, and a profit-setting percentage of 80 percent can be defined for a cost group that is assigned to cost categories for routing operations. The context of the BOM calculation determines how the results of a calculated sales price are handled:

- **BOM calculation for an item and specified costing version** - The BOM calculation generates a pending sales price record within the costing version. This sales price record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). The sales price record acts mainly as reference information and isn't used as the basis for a sales price on sales orders.
- **Order-specific BOM calculation** - A variation of the **BOM calculation** page is used in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation doesn't generate a record in the within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation results** page. This calculation record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). Information about a selected calculation record can be transferred to the originating line item. For example, the calculated sales price can be transferred to a sales order line item.

Order-specific BOM calculations

An order-specific BOM calculation represents a variation of a BOM calculation for a manufactured item. The order-specific BOM calculation is performed in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation generates a calculation record that appears on the **BOM calculation results** page. The calculation record includes a calculated weight, a calculated cost that is based on active cost records, and a calculated sales price. The calculation record that each order-specific BOM calculation for an item generates on the **BOM calculation results** page is uniquely identified by a calculation number. The results of a calculation record can be optionally transferred to the originating line item. An order-specific BOM calculation differs from a BOM calculation for a manufactured item in two ways:

- An order-specific BOM calculation doesn't generate an item cost record within a costing version. Therefore,

the BOM calculation policies aren't applied when an item cost record is created, or when a cost record is overwritten.

- An order-specific BOM calculation always uses the active cost records for components, cost categories, and indirect cost calculation formulas.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage unit of measure

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to define a unit of measure, provide translations for the unit and its description, and define conversion rules for related units. You can walk through this procedure using demo data, or using your own data.

1. Go to **Navigation pane > Modules > Product information management > Released product maintenance**.
2. Click **Units**.

Create a unit of measure

1. Click **New**.
2. In the **Unit** field, type a value. Enter the ID or symbol to use when referring to the unit of measure.
3. In the **Description** field, type a value. Enter a descriptive name for the unit of measure in the system language.
4. In the **Unit class** field, select an option. The unit class defines what logical grouping, such as area, mass, or quantity, the unit of measure is part of.
5. In the **Decimal precision** field, enter a number. Specify the number of decimals that the converted unit of measure must be rounded to when a calculation is completed for the unit of measure.
6. Click **Save**.

Define unit translations

1. On the **Action Pane**, click **Unit texts**.
2. Click **New**. Use unit text to create a translation of the ID or a symbol representing the unit of measure for use on external documents in customer- or vendor-specific languages.
3. In the **Language** field, enter or select a value.
4. In the **Text** field, type a value.
5. Click **Save**.
6. Close the page.
7. On the **Action Pane**, click **Translated unit descriptions**.
8. Click **New**. Define language-specific descriptions for the unit of measure.
9. In the **Language** field, enter or select a value.
10. In the **Description** field, type a value.
11. Click **Save**.
12. Close the page.

Define unit conversion rules

1. On the **Action Pane**, click **Unit conversions**. Define rules for converting the unit of measure to and from other units of measure in the selected unit class.
2. Click **New** to open the drop dialog.
3. In the **Factor** field, enter a number. Conversion factor between the From unit and the To unit. For example, the conversion factor from centimeter to meter is 100 because there are 100 centimeters in one meter.
4. In the **To unit** field, enter or select a value.

5. In the **Rounding** field, select an option. Define how the converted value should be rounded.
6. Click **OK**.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production parameters in Manufacturing execution

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about the setup of production parameters in Manufacturing execution.

The **Manufacturing execution** module is intended primarily for manufacturing companies. It can be used to register time and item consumption on production jobs or projects. Before you start to use Manufacturing execution for job registrations, you must set up various production parameters that define how and when registrations are posted during the production process. The settings of production parameters affect inventory management, production management, and cost calculation.

Before workers start to make registrations on production jobs, you should carefully consider all settings on the **Production parameters** page. Click **Production control > Setup > Manufacturing execution > Production order defaults**. If your company uses the multisite functionality, you might want to set up different production parameters for each site. The parameters for integration with the **Production** module are set up on the following tabs on the **Production parameters** page:

- **General** – General parameter settings for production jobs in Manufacturing execution.
- **Start** – Parameters that are used when production operations are started.
- **Operations** – Parameters that are applied to production operations and feedback about operations during the production process.
- **Report as finished** – Parameters that are used when items are reported as finished on the last operation of a production order.
- **Quantity validation** – Parameters that are used to validate start and feedback quantities on production orders.

Types of production jobs

On the **Operations** tab, you select which types of production jobs require registration on the **Job registration** page.

Typically, workers make registrations on setup jobs and process jobs. However, if job scheduling is applied, you can select other job types that workers must make registrations on when production orders are processed. For example, you can require registrations on transport jobs.

IMPORTANT

Make sure that you select all relevant job types. Otherwise, jobs might not be available for registration on the **Job registration** page. Your selections should match the selections in the **Job management** column on the **Setup** tab of the **Route groups** page (**Production control > Setup > Routes > Route groups**).

If **Job management** is selected on the route group, this job type is reported as finished on the production order when the job is reported as finished in Manufacturing execution. When all job types that **Job management** is selected for have been reported as finished on an operation, Manufacturing execution reports the operation as finished.

NOTE

Some job types can be manually reported through production journals. In this case, select **Job management** for the job type, but don't select the job type for registration on the **Operations** tab on the **Production parameters** page in Manufacturing execution.

BOM consumption and picking list journals

A consistent setup for bill of materials (BOM) consumption is important, because it helps guarantee that inventory management is efficient. For example, if BOM consumption parameters aren't set up correctly in Manufacturing execution, materials might be deducted from inventory two times or not at all.

On the **Production parameters** page, automatic BOM consumption is set up in three stages:

- At the start of a production. Set up this stage on the **Start** tab.
- During the production process when an operation is completed. Set up this stage on the **Operations** tab.
- When a production order is reported as finished. Set up this stage on the **Report as finished** tab.

For each stage, the **Automatic BOM consumption** field lets you select one of three methods for picking items for a production order:

- **Flushing principle** – This option is used in combination with an option that is defined for the BOM in the **Production** module. Click **Production control > Common > Production orders > All production orders**. On the **All production orders** page, select a production order in the list, and then, on the Action Pane, click **BOM**. On the **BOM** page, on the **Setup** tab, in **Flushing principle** field, select one of the following options:
 - **Start**
 - **Finish**
 - **Manual**
 - Blank (No option is selected.)
 - **Available at location**

In Manufacturing execution, if **Flushing principle** is selected in the **Automatic BOM consumption** field on the **Start** tab, all materials that are set to **Start** in the BOM are deducted from inventory when the operation is started. The **Available at location** option is used for products that are enabled for advanced warehouse processes. If you select this flushing principle, material is flushed when warehouse work for raw material picking is completed. Material is also flushed when a BOM line that uses this flushing principle is released to warehouse and the material is available at the production input location.

NOTE

If the **Flushing principle** field is set on the **Start** tab in Manufacturing execution, you must select the same principle on either the **Operations** tab or the **Report as finished** tab. This requirement helps guarantee that materials are deducted from inventory on BOMs that use **Finish** as a flushing principle on the production order. If the same flushing principle isn't selected on either the **Operations** tab or the **Report as finished** tab, materials might be deducted from inventory two times.

- **Always** – If you select this option for a stage, materials are always deducted from inventory at that stage. For example, materials for the production are deducted when the production order is started. This setting requires that **Never** be selected on the **Operations** and **Report as finished** tabs. This requirement

helps prevent items from being deducted from inventory two times.

- **Never** – If you select this option for a stage, no BOM consumption occurs at that stage. For example, if you select **Never** on all three tabs (**Start**, **Operations**, and **Report as finished**), materials must be manually deducted from inventory.

IMPORTANT

Carefully consider your setup of the production parameters, and make sure that the parameters that are selected on the various tabs of the **Production parameters** page don't contradict each other.

The following examples illustrate parameter settings that support various BOM consumption principles. The parameters are set up on the **Production parameters** page in Manufacturing execution.

Example 1: Backflushing on operations

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on an operation.

TAB	FIELD	SETTING
Start	Update start on-line	Status or Status + quantity
Start	Automatic BOM consumption	Never
Operations	Automatic BOM consumption	Always
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status + quantity

Example 2: Backflushing on production

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on the production order.

TAB	FIELD	SETTING
Start	Update start on-line	Status or Status + quantity
Start	Automatic BOM consumption	Never
Operations	Automatic BOM consumption	Never
Report as finished	Automatic BOM consumption	Always
Report as finished	Update finished report on-line	Status + quantity

Example 3: Flushing principle

Use the following settings if picking list journals and BOM item consumption should be generated according to the flushing principle that is set for the BOM items.

TAB	FIELD	SETTING
Start	Update start on-line	Status + quantity
Start	Automatic BOM consumption	Flushing principle
Operations	Automatic BOM consumption	Flushing principle
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status + quantity

Example 4: Deduction of materials during startup of a production order

Use the following settings if picking list journals and BOM item consumption should be generated when a production is started.

TAB	FIELD	SETTING
Start	Update start on-line	Status + quantity
Start	Automatic BOM consumption	Always
Operations	Automatic BOM consumption	Never
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status or Status + quantity

Based on the selections that are described earlier in this section, picking list journals are posted at various stages of the production order process:

- When an operation is started
- When quantity feedback is reported on an operation
- When items are reported as finished on the production order

Example 5: Manual BOM consumption

You can use the following settings if materials should always be manually deducted from inventory. In this case, picking list journals aren't posted.

TAB	FIELD	SETTING
Start	Update start on-line	Status
Start	Automatic BOM consumption	Never
Operations	Automatic BOM consumption	Never
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Operations resources

2/18/2021 • 9 minutes to read • [Edit Online](#)

Operations resources perform the activities of a project or a production process. They can be of different types, and can have different capabilities.

Operations resources

Operations resources are the machines, tools, workers, facilities, physical areas or vendors that perform the activities of a project or a production process. They can be of different types and can have different capabilities.

- **Vendor** – An external resource that performs project activities or production operations. An example is a subcontractor. By linking vendor resources to a vendor account, you can generate purchases for subcontractors, based on the bill of materials (BOM) lines or production lines.
- **Human resources** – A project or production worker that perform an activity, either alone or as an operator of a tool or a machine. If you're using the Human resources functionality, you can link human resources to a worker. The scheduling engine can then allocate the resources, based on the competencies that are defined for the corresponding worker.
- **Machine** – A machine or other production equipment that is required in production.
- **Tool** – An instrument or device that is typically used together with another resource to perform an activity in a project or in production.
- **Location** – A physical location of a specific size that is required in order to perform an activity. An example is an assembly area.
- **Facility** – A building or fixed structure that is required in order to perform an activity.

Calendars

A calendar can be assigned to an operations resource and describes the capacity (in hours) of that resource. The working times of the operations resource are determined by the calendar that is assigned to the resource group that the operations resource is part of. You can set an effective date and an expiration date for the assigned calendar. You can then assign more than one calendar to an operations resource. However, the dates of the assigned calendars can't overlap, and the operations resource can be assigned only one calendar at a time.

Note: If there are no effective working calendars for a resource group (for example, if the last assigned calendar or the only assigned calendar has expired), you can no longer access the operations resources that are assigned to the resource group for production planning and operations scheduling. You can also assign a calendar to a resource group to specify the working times for both the resource group and all the operations resources that are assigned to the resource group. The capacity of the resource group is calculated as the sum of the capacities of each operations resource that is assigned to that resource group. The calendar that is assigned to a resource group can change over time.

Resource capabilities

A capability is the ability of an operations resource to perform a particular activity. You can assign one or more capabilities to an operations resource. The scheduling engine will then allocate resources by matching the resource requirements of each activity to the capabilities of the available operations resources. Capabilities can be assigned to all types of operations resources (**Tool**, **Vendor**, **Machine**, **Human resources**, **Location**, or **Facility**). To assign capabilities to operations resources for a limited time, define a start date and an expiration date on the capability assignment. For more information, see [Resource capabilities](#).

Resource groups

A resource group is a set of operations resources that represents the granularity at which you want to schedule resources when you use the operations scheduling method. Therefore, resource groups typically correspond to the physical organization of work cells that is demarcated by yellow lines on the production shop floor. The resource group defines the site, production unit, and warehouse context for operations resources that are assigned to the group. When you assign an operations resource to a resource group, the resource can be scheduled at the site where the resource group is located. You don't have to assign the operations resources that you create to a resource group. However, an operations resource must be assigned to a resource group before it can be scheduled to perform work. An operations resource can be assigned to a resource group for a limited time. You can also assign an operations resource to multiple resource groups, so that you can then share the resource across sites. However, the effective dates and expiration dates can't overlap. In other words, you can't assign an operations resource to two resource groups at the same time. Changes in resource group assignments are effective only for new resource allocations. Capacity reservations for jobs, operations, and project hour forecasts that are already scheduled won't be affected. **Note:** When you assign operations resources of the **Vendor** type to a resource group, all operations resources that are assigned to that resource group must be of the **Vendor** type and must be linked to the same vendor account.

Production units

A production unit is an administrative unit that is a collection of resource groups. A production unit can contain multiple resource groups, but a resource group can be assigned to only one production unit. A production unit reflects the physical layout of production resources, and has no effect on transactions or how they are processed. You must associate a production unit with a site. You can also assign a picking warehouse and a storage warehouse to a production unit. You can use a production unit to consolidate and filter production-related data. For example, a shop floor manager can see an overview of the outstanding workload and the available capacity for a particular production unit. You can change the production unit that is assigned to a resource group. You can also delete a production unit. However, these changes to the production unit are effective only for new orders that are created after master scheduling is run. If you want to apply the production unit change to existing orders, you must make this change manually.

Resource scheduling

Operations resources are assigned to activities when a project or a production is scheduled. Two scheduling methods are available: operations scheduling and job scheduling. When you use operations scheduling, each operation or project activity is scheduled on the resource group that contains operations resources that match the resource requirements that are specified for the operation. If a specific operations resource is required for the operation, scheduling reserves capacity only on a specific operations resource in the group. Job scheduling is a more detailed form of scheduling than operations scheduling. It breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route or project activities. If you're working with finite capacity, the schedule depends on the availability of the operations resources that are required in order to complete the activity. For operations scheduling, the capacity of the resource group is the sum of the available capacity of the operations resources that are part of that group. Capacity reservations that already exist for the operations resources are considered unavailable capacity. If there isn't enough available capacity for production, the production orders can be delayed or even stopped. On the **Resources** page, you can define several properties that control how capacity reservations are made:

- **Capacity** – Specify the operations resource's capacity per hour in terms of the capacity unit of measure.
- **Batch capacity** – Specify the maximum number of pieces that the operations resource can process per run.
- **Efficiency percentage** – Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the

resource. The lead times for the operations that use the operations resource are also adjusted accordingly. Here is the formula that is used for the calculation: $\text{Scheduling time} = \text{Time} \times 100 \div \text{Efficiency percentage}$. *Time* includes both the run time and setup time.

- **Operations scheduling percentage** – Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling. To allow for flexibility in capacity during job scheduling, you should set this percentage to less than 100 percent.
- **Finite capacity** – Set this option to **Yes** if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to **No**, the operations resource is assumed to have infinite capacity, and the resource might therefore be overbooked.
- **Finite property** – Set this option to **Yes** if you want the operations resource to be scheduled based on the actual capacity that is available with respect to the required working time scheduling properties.
- **Exclusive** – Set this option to **Yes** if you don't want the operations resource to be available for another job or operation until the current production is completed. In this case, the operations resource can't be used even if there are gaps in the resource's run time.
- **Bottleneck resource** – Define the operations resource as a bottleneck resource. A bottleneck resource is scheduled by using finite capacity when the **Finite capacity** and **Bottleneck scheduling** options on the **Master plans** page are selected.

To schedule multiple operations resources at the same time to perform, for example, an operation in production, you must specify the requirements for the various resources by using primary and secondary operations. You can then also reserve multiple operations resources that have different capacity. The operations resource that are scheduled for the primary operation determine the duration of the activity.

Lean work cells

You can specify that a resource group is a lean work cell. The resource group can then be part of a production flow. By specifying a resource group as a lean work cell, you also prevent the resource group and the assigned operations resources from being allocated to the operations of a production order or a project hour forecast. For each resource group that acts as a lean work cell, you must specify the following information:

- **Calendar** – The working calendar of the work cell, which must have the property of a standard workday.
- **Input warehouse and location** – The default location that is used to pick material for an activity.
- **Output warehouse and location** – The default location where all output of the work cell is put.
- **Runtime cost category** – This category must be defined for the work cell if direct labor is tracked in costing.

When a resource group is used as a lean work cell, the capacity of the work cell is specified directly on the resource group. Therefore, you don't have to assign operations resources to the resource group. Only when the work cell is managed by a subcontractor, an operations resource of the **Vendor** type must be assigned to the work cell. If you assign an operations resource to a resource group that is marked as a work cell, the capacity of the work cell isn't affected.

Costing resources

When you define an activity such as a route operation or a project hour forecast, you can specify the requirement for a specific operations resource or resource group. However, you can also specify the requirement for an operations resource of a specific type, or an operations resource that has a specific capability or competency. For this reason, the actual resource assignment isn't made until the activity is scheduled and capacity is reserved. Therefore, on a route operation, you can specify that estimation and BOM calculation must be based on a specific operations resource. This operations resource is referred to as the costing resource. You can also transfer cost categories and operation times from the costing resource to the activity. When the operation is scheduled, estimation and BOM calculation are done by using the operations resource that is

actually scheduled.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an operations resource

2/18/2021 • 2 minutes to read • [Edit Online](#)

An operations resource performs the activities of a project or a production process. This procedure shows you how to define an operations resource. You can walk through this procedure in demo data company USMF, or using your own data.

1. Go to Resources.
2. Click New.
3. In the Resource field, type a value.
4. In the Description field, type a value.

Define capacity and consumption parameters

1. Expand the Operation section.
2. In the Scrap percentage field, enter a number.
3. In the Setup category field, enter or select a value.
 - Specify the cost category that defines how to account for the cost of setup.
4. In the Run time category field, enter or select a value.
 - Specify the cost category that defines how to account for the cost of run time.
5. In the Quantity category field, enter or select a value.
 - Specify the cost category that defines how to account for the resource cost based on the output quantity.
6. In the Capacity unit field, select an option.
 - Specify the unit in which to express the capacity of the operations resource.
7. In the Capacity field, enter a number.
8. In the Efficiency percentage field, enter a number.
 - Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the resource.
9. In the Operations scheduling percentage field, enter a number.
 - Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling.
10. Select Yes in the Finite capacity field.
 - Set this option to Yes if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to No, the operations resource is assumed to have infinite capacity, and the resource might be overbooked.
11. Select Yes in the Bottleneck resource field.

Define working times

1. Expand the Calendars section.
2. Click Add.
3. In the Calendar field, enter or select a value.
 - Specify the working time calendar that defines the capacity (in hours) of the resource.
4. In the list, find and select the desired record.
5. In the list, click the link in the selected row.

Define resource capabilities

1. Expand the Capabilities section.
2. Click Add.
 - A capability is the ability of an operations resource to perform a particular activity. The scheduling engine allocates resources by matching the resource requirements of each activity to the capabilities of the available operations resources.
3. In the Capability field, enter or select a value.
4. In the Level field, enter a number.
 - Specify the level of proficiency by which the resource processes the capability.
5. In the Priority field, enter a number.
 - Specify the priority of the operations resource with respect to the capability. When scheduling by priority, the operations resource with the highest priority (lowest numeric value) is selected first.

Assign resource to resource group

1. Expand the Resource groups section.
2. Click Add.
 - The resource group defines the site, production unit, and warehouse context for operations resources. The operations resource can only be scheduled when assigned to a resource group, and only on the site where the resource group is located.
3. In the Resource group field, enter or select a value.
4. In the Input location field, enter or select a value.
 - Specify the warehouse location from where the operations resource is consuming materials.

Resource capabilities

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides information about resource capabilities. A capability is the ability of an operations resource to perform a particular activity. The article explains how capabilities and related concepts, such as proficiency level and priority, are used to select appropriate resources for an activity.

A capability is the ability of an operations resource to perform a particular activity. An operations resource can have more than one capability assigned to it, and a capability can be assigned to more than one resource. You can temporarily assign capabilities to resources by defining a start date and expiration date on the capability assignment. When the capability for a resource expires, the resource can't be scheduled for a project or a production that requires that capability. A capability that has expired can be renewed. You can delete capabilities, provided that they aren't on a route relation or on part of a production route of an active production order. In general, be careful when you delete capabilities. Instead, consider adjusting the expiration date on the resources that have the capability. Capabilities can be assigned to all types of resources: tool, vendor, machine, location, facility, or human resource.

Level

Multiple resources often have the same functional capability but at different levels of proficiency (for example, strength, processing speed, or accuracy). Therefore, when you assign a capability to a resource, you can specify a **Level** value. The level is a simple numeric value. If you specify that a capability is a resource requirement for a production route, you can also specify a **Minimum level needed** value for that capability. The scheduling engine then selects only resources that have the required capability at a level that is equal to or exceeds the minimum level that is specified in the resource requirement.

Priority

Operations resources that have the same capabilities can be assigned a priority. Then, if multiple resources have capabilities that satisfy the scheduling requirements at the required level, and have free capacity, the scheduling engine can select among those resources. If **Priority** is selected in the **Primary resource selection** field on the **Scheduling parameters** page, the resource that has the highest priority (the lowest numeric value in the **Priority** field) is selected first during scheduling.

Resource requirements

When you define resource requirements for a production route, you can specify one or more capabilities as requirements. During production scheduling, the capabilities that are defined in the resource requirements on the route operation are matched with the capabilities that are defined for the resources. Resources that have capabilities that satisfy the requirements are selected. If multiple resources have the same functional capability but different proficiencies (such as strength, processing speed, or accuracy), you can either define multiple capabilities or use the capability level to qualify the capability of the resource. Here is an example:

- On a route, the drilling process time is set to 10 units per hour, but the requirement itself is defined as Drilling.
- You have two drilling machines, M1 and M2.
- The Drilling capability is assigned to both resources, the M1 machine and the M2 machine.
- The M1 machine can drill two units per hour, and the M2 machine can drill 11 units per hour.

In this example, both machines can be selected by the scheduling engine, because both satisfy the basic

capability requirement (Drilling). However, the M1 machine can drill only two units per hour. Because this rate is much less than the 10 units per hour that are specified on the route, the M1 machine will cause production problems if it's selected. There are two ways to resolve this issue and make sure that the M2 machine is selected instead:

- Create two separate capabilities: Low-speed drilling and High speed drilling. Define Low-speed drilling as drilling that has a process time of one to nine units per hour. Define High-speed drilling as drilling that has a drilling process time of 10 to 19 units per hour. Then assign the M1 machine the Low-speed drilling capability, and assign the M2 machine the High-speed drilling capability. Finally, change the resource capability requirement on the route to High-speed drilling. The scheduling engine will then select the correct machine (M2).
- Use the capability level to qualify the Drilling capability that is assigned to the drilling machines. Specify that the M1 machine has the Drilling capability at a level of 2.0, and that the M2 machine has the Drilling capability at a level of 11.0. Then specify that 10.0 is the minimum level that is required for the Drilling capability requirement on the route. The scheduling engine will then determine that only the M2 machine satisfies the resource requirements.

Competencies for human resources

When you have operations resources of the **Human resources** type that are linked to workers in Human resources, you can also take advantage of the competencies of workers when you define the resource requirements for a production route. In other words, you can also specify requirements for specific skills, courses, certificates, or titles. The scheduling engine can then select resources that are linked to workers, and the selection will be based on the competencies of those workers. The competencies are set up in Human resources, not on the **Resource capabilities** page. When you define skills, courses, certificates, or titles as resource requirements, you must use the Human resources functionality and link each resource of the **Human resources** type to a corresponding worker. If you aren't using the Human resources functionality, you can define capabilities on the **Resource capabilities** page that resemble or duplicate the competencies from Human resources. However, the **Resource capabilities** page doesn't contain the functionality that is required in order to maintain skills, courses, certifications, or titles.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define resource capabilities

2/18/2021 • 2 minutes to read • [Edit Online](#)

Resource capabilities describe what operations resources can do. During scheduling, the requirements of each job and operation are matched against the capabilities of the available resources. This task guide will help you create a resource capability and assign it to a resource. The demo data company used to create this task is USMF.

Create a resource capability

1. Go to Resource capabilities.
2. Click New.
3. In the Capability field, type the ID of the resource capability.
 - For a given operation, you use the capability ID to specify that resources must have this capability to perform the operation.
4. In the Description field, enter a description of the capability.

Assign capability to a resource

1. Click Add.
2. In the Resource field, type the ID of the resource.
 - A resource capability can be assigned to one or more resources.
3. In the Expiration field, enter a date.
 - You can use this field to specify that a resource has the capability for only a limited time.
4. In the Priority field, enter a number.
 - When you schedule jobs and operations, you can specify whether to select resources by priority. If you choose to do this, and more than one resource can perform the job or operation by the requested date, the resource that has the lowest priority with respect to the required capability is selected.
5. In the Level field, enter a number.
 - When you specify that a job or operation requires a particular capability, you can also specify the minimum level that is required. Use the capability level to differentiate resources that can perform the same job, but at different speeds, strengths, sizes, and so on.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Routes and operations

2/18/2021 • 19 minutes to read • [Edit Online](#)

This topic provides information about routes and operations. A route defines the process for producing a product or product variant. It describes each step (operation) in the production process and the order that these steps must be performed in. For each step, the route also defines the required operations resources, the required setup time and run time, and how the cost should be calculated.

Overview

A route describes the order of operations that is required in order to produce a product or product variant. For each operation, the route also defines the operations resources that are required, the time that is required in order to set up and perform the operation, and how the cost should be calculated. You can use the same route to produce multiple products, or you can define a unique route for each product or product variant. You can even have multiple routes for the same product. In this case, the route that is used varies, depending on factors such as the quantity that must be produced. The definition of a route in Supply Chain Management consists of four separate elements that, together, describe the production process:

- **Route** – A route defines the structure of the production process. In other words, it defines the order of operations.
- **Operation** – An operation identifies a named step in a route, such as **Assembly**. The same operation can occur in multiple routes and can have different operation numbers.
- **Operation relation** – An operation relation defines the operational properties of an operation, such as the setup time and run time, cost categories, consumption parameters, and resource requirements. The operation relation enables the operational properties of an operation to vary, depending on the route that the operation is used in or the products that are being produced.
- **Route version** – A route version defines the route that is used to produce a product or product variant. Route versions enable routes to be reused across products or changed over time. They also enable different routes to be used to produce the same product. In this case, the route that is used depends on factors such as the location or the quantity that must be produced.

Routes

A route describes the order of operations that is used to produce a product or product variant. Each operation is assigned an operation number and a successor operation. The order of operations forms a route network that can be represented by a directed chart that has one or more starting points and a single end point. In Supply Chain Management, routes are distinguished based on the type of structure. The two types of routes are simple routes and route networks. In the Production control parameters, you can specify whether only simple routes can be used, or whether the more complex route networks can be used.

Simple routes

A simple route is sequential, and there is only one starting point for the route.

If you enable only simple routes in the Production control parameters, Supply Chain Management automatically generates the operation numbers (10, 20, 30, and so on) when you define the route.

Route networks

If you enable the more complex route networks in the Production control parameters, you can define routes that have multiple starting points and operations that can be run in parallel.

NOTE

- Each operation can have only one successor operation, and the entire route must end in a single operation.
- This does not ensure that multiple operations that have the same successor operation (for example, operations 30 and 40 in the preceding illustration) will actually be run in parallel. The availability and capacity of resources might put constraints on the way that operations are scheduled.
- You can't use 0 (zero) as the operation number. That number is reserved and is used to specify that the last operation in the route has no successor operation.

Parallel operations

Sometimes, a combination of multiple operations resources that have different characteristics is required in order to perform an operation. For example, an assembly operation might require a machine, a tool, and one worker for every two machines to oversee the operation. This example can be modeled by using parallel operations, where one operation is designated as the primary operation and the others are secondary.

Typically, the primary operation represents the bottleneck resource and dictates the run time for the secondary operations. However, during scheduling that involves finite capacity, the resources that are scheduled for both the primary operation and the secondary operations must be available and have free capacity at the same time.

Both the primary operation and the secondary operations must have the same operation number (30 in the preceding illustration).

In the preceding example, the resource requirement for the primary operation (30) is the machine, whereas the resource requirements for the secondary operations (30' and 30'') are the tool and the worker. A fifty-percent load helps guarantee that the scheduled worker can oversee two machines at the same time.

Approval of routes

A route must be approved before it can be used in the planning or manufacturing process. Approval indicates that the route design has been completed. The same released product or released product variant can have

multiple approved routes. Typically, approval of a route occurs when the first relevant route version is approved. However, in some business scenarios, the approval of the route and the route version are separate activities that might involve different process owners.

Each route can be approved or unapproved separately. However, note that, when a route is unapproved, all related route versions are also unapproved. In the Production control parameters, you can specify whether routes can be unapproved, and whether approved routes can be changed.

If you must keep a log that records who approves each route, you can require electronic signatures for route approval. Users will then have to confirm their identity by using an [electronic signature](#).

Operations

An operation is a step in the production process. Each operation has an ID and a simple description. The following tables shows typical examples of operations from a machine shop.

OPERATION	DESCRIPTION
PipeCut	Pipe cutting
TIGweld	TIG welding
JigAssy	Jig assembly
Inspection	Quality inspection

The operational properties of the operation, such as the setup time and run time, resource requirements, costing information, and consumption calculation, are specified on the operation relation. (For more information about operation relations, see the next section.)

Operation relations

The following operational properties of an operation are maintained on the operation relation:

- Cost categories
- Consumption parameters
- Processing times
- Processing quantities
- Resource requirements
- Notes and instructions

You can define multiple operation relations for the same operation. However, each operation relation is specific to one operation, and stores properties that are specific to a route, a released product, or a set of released products that are related to an item group. Therefore, the same operation can be used in multiple routes that have different operational properties. In addition, you can more easily maintain your master data if you use standard operations that have the same operational properties, regardless of the route that is used and product that is produced. The scope of the operation relation is defined through the **Item code**, **Item relation**, **Route code** and **Route relation** properties, as shown in the following table.

ITEM CODE	ITEM RELATION	ROUTE CODE	ROUTE RELATION	SCOPE OF THE OPERATION RELATION
-----------	---------------	------------	----------------	---------------------------------

ITEM CODE	ITEM RELATION	ROUTE CODE	ROUTE RELATION	SCOPE OF THE OPERATION RELATION
Table	<Item ID>	Route	<Route ID>	The operational properties of an operation when it's used in the route where Route number = <route ID> to produce the released product where Item number = <item ID>.
Table	<Item ID>	All		The default operational properties of an operation when it's used to produce the released product where Item number = <item ID>. In other words, these operational properties apply when there is no route-specific operation relation for the released product.
Group	<Item group ID>	Route	<Route ID>	The operational properties of an operation when it's used in the route where Route number = <route ID> to produce released products that are associated with item group <item group ID>, unless there is a route-specific operation relation for the released product.
Group	<Item group ID>	All		The default operational properties of an operation when it's used to produce released products that are associated with item group <item group ID>, unless a more specific operation relation exists.

ITEM CODE	ITEM RELATION	ROUTE CODE	ROUTE RELATION	SCOPE OF THE OPERATION RELATION
All		Route	<Route ID>	The default operational properties of the operation when it's used in the route where Route number = <route ID>. In other words, these operational properties apply when there is no operation relation for this route that is specific to either the released product or its associated item group.
All		All		The default operational properties of an operation. These operational properties apply when a more specific operation relation doesn't exist.

You can also specify that an operation relation is specific to a site. In this way, the operational properties of an operation can vary, depending on the location (that is, the site) where the operation is performed. For configured products, you can also specify different operational properties for each product configuration.

Operation relations give you lots of flexibility when you define your routes. Additionally, the ability to define default properties helps reduce the amount of master data that you must maintain. However, this flexibility also means that you must be aware of the context that you modify an operation relation in.

NOTE

Because the operational properties are stored in operation relations per operation for each route, all occurrences of the same operation (for example, Assembly) have the same setup time, run time, and resource requirements. Therefore, if two occurrences of an operation must occur in the same route but have different run times, you must create two separate operations, such as Assembly1 and Assembly2.

Modifying product-specific routes

When you open the **Route** page from the **Released product details** page, the route versions that are associated with the selected released product are shown. In this context, for each operation, Supply Chain Management shows the operational properties from the operation relation that best matches the route version. You will notice that the list of operations includes the **Item code** and **Route code** properties from the operation relation. Therefore, you can determine which operation relation is shown.

On the **Route** page, you can modify the operational properties of the operation, such as the run time or the cost categories. Your changes are stored on the operation relation that is specific to the route and released product that are referenced in the current route version. If the operation relation that is shown isn't specific to the route and the released product, before your changes are stored, the system creates a copy of the operation relation.

This copy *is* specific to the route and released product. Therefore, your changes won't affect other routes or released products. To verify which operation relation is being modified on the **Route** page, look at the **Item code** and **Route code** fields.

You can also manually create an operation that is specific to a route and released product by using the **Copy and edit relation** function.

NOTE

If you add a new operation to a route on the **Route** page, an operation relation is created only for the current released product. Therefore, if the route is also used to produce other released products, no applicable operation relation will exist for those released products, and the route can no longer be used for those released products.

Maintaining operation relations per route

When you open the **Route details** page from the **Routes** list page, a list of all the operation relations that apply to the selected route is shown. Therefore, you can easily verify which operational properties are used for which products. You can modify both default property values and product-specific property values.

If you add a new operation relation on the **Route details** page, the **Route code** field is automatically set to **Route**, and the **Route relation** field is set to the route number of the current route.

Maintaining operation relations per operation

From the **Operations** page, you can open the **Operation relations** page. On this page, you can modify all operation relations for a specific operation. You can even modify operation relations that contain default values.

If your business uses standard operations, and if the operational parameters are the same across all products and processes, the **Operation relations** page provides a convenient way to maintain the default operational properties of those operations.

Applying operation relations

In some cases, Supply Chain Management must find the operational properties for an operation. For example, when a purchase order is created, the operational properties of each operation must be copied from the operation relations to the production route. In these situations, Supply Chain Management searches the relevant operation relations from the most specific combination to the least specific combination.

When Supply Chain Management searches for the most relevant operation relation for a released product, an operation relation that matches the item ID of the released product is preferred over an operation relation that matches the item group ID. In turn, an operation relation that matches the item group ID is preferred over the default operation relation. The search is done in the following order:

1. **Item code=Table** and **Item relation**= <item ID>
2. **Item code=Group** and **Item relation**= <item group ID>
3. **Item code=All**
4. **Route code=Route** and **Route relation**= <route ID>
5. **Route code=All**
6. **Configuration**= <configuration ID>
7. **Configuration**=
8. **Site**= <site ID>
9. **Site**=

Therefore, an operation should be used only one time for each route. If the operation occurs multiple times in the same route, all occurrences of that operation will have the same operation relation, and you won't be able to have different properties (for example, run times) for each occurrence.

Route versions

Route versions are used to accommodate variations in the production of products or provide greater control over the production process. They define which route should be used when a specific released product or released product variant is produced. You can use the following constraints to define which route is used for a released product:

- Product dimensions (size, color, style, or configuration)
- Production quantity
- Production site
- Production date

When you're producing the product at a specific site, in a specific quantity, or in a specific period, you can designate a specific route version as the default route version. However, note that only one active route is allowed for a given released product and a given set of constraints.

In the Production control parameters, you can require that the validity period of a route version always be specified.

Approval of route versions

Before a route version can be used in the planning or manufacturing process, it must be approved. When you approve a route version, you can also approve the related route. However, note that a route version can be approved only if the related route is also approved.

Activating the default route version

When you activate a route version, you designate it as the default route version that master planning will use, or that will be used to create production orders. You can have only one active route version for a given set of constraints (for example, period, site, or quantity). If the version that you're trying to activate conflicts with a version that is already active, you receive an error message. To prevent an ambiguous activation, you must then either inactivate the conflicting version or modify the constraints (usually the period) on the route version.

Electronic signatures

If you must keep a log that records who approves and activates each route version, you can require electronic signatures for these tasks. Users who approve and activate route versions will then have to confirm their identity by using an [electronic signature](#).

Product change that uses case management

The product change case for the approval and activation of new or changed routes and route versions gives you an easy way to see an overview of the route version constraints. You can also approve and activate all routes that are related to a specific change in one operation and document the results in the product change case.

Maintaining routes

Depending on your business requirements, you might be able to reduce the effort that is required in order to maintain your process definitions.

Making routes independent of resources

In many systems, the operations resource or resource group that should perform an operation must be specified in the route. However, in Supply Chain Management, you can define a set of requirements that an operations resource must meet to be applicable for the operation. Therefore, the specific operations resource or resource group that should be used doesn't have to be determined until the operation is actually scheduled. This functionality is especially useful when you have many workers or machines that can perform the same operation.

For example, you specify that an operation requires an operations resource of the **Machine** type that has a

Stamping capability of 20 tons. The scheduling engine will then resolve these requirements to a specific operations resource or resource group when the operation is scheduled. Because you can just specify these requirements instead of binding the operation to a specific machine, you have much more flexibility. Additionally, maintenance is easier when resources are moved or new resources are added.

For more information about the various types of resource requirements and how to use them, see [Operations resource requirements](#) and [Resource capabilities](#).

Sharing routes across sites

If you produce the same product at more than one production site, and if the steps for producing the product are the same at all sites, you can often design a shared route that is used across all production sites. To create a shared route, don't specify a site on the route itself. However, you must still create a route version that associates the shared route with the product at each site.

You must also make sure that the resource requirements for each operation in the route don't call for specific operations resources or resource groups, but are instead expressed in terms of the characteristics of the required resources. The scheduling engine will then be able to assign the appropriate operations resources from the site that the production is scheduled on. For example, if there are small differences in the run time, or if the setup time for a certain operation is site-specific, you can specify this information by adding an additional operation relation for that site.

To take full advantage of the benefits of shared routes, you should also use resource consumption on the corresponding bill of materials (BOM). When you set the flag for resource consumption on the BOM line, the warehouse and location that raw materials should be consumed from is inferred from the operations resource that the operation is scheduled on. Therefore, the warehouse and location don't have to be determined until the production is actually scheduled. In this way, you can make both the BOM and the route independent of the physical location where the product is produced.

Standard operation relations

If your business uses standardized operations throughout production, and if there is little or no variation in the setup time, run time, consumption calculation, cost calculation, and so on, you might benefit from creating default operation relations for all operations. In this case, avoid creating operation relations that are specific to any route or released product.

If you also express resource requirements in terms of skills and capabilities, and make your routes site-independent, you can help keep the ongoing maintenance of your business processes to a minimum.

When you use this approach, the **Operation relations** page becomes your primary destination for maintaining run times and other properties.

Resource-specific process times

If you don't specify an operations resource or resource group as part of the resource requirements for an operation, the applicable resources might operate at different speeds. Therefore, the time that is required in order to process an operation might vary. To resolve this issue, you can use the **Formula** field on the operation relation to specify how the process time is calculated. The following options are available:

- **Standard** – (Default option) The calculation uses only the fields from the operation relation and multiplies the specified run time by the order quantity.
- **Capacity** – The calculation includes the **Capacity** field from the operations resource. Therefore, the time is resource-dependent. The value that is specified on the operations resource is capacity per hour. The **Process time** is calculated as **Order quantity** divided by **Capacity**.
- **Batch** – A batch capacity is calculated by using information from the operation relation. The number of batches and, therefore, the process time can then be calculated based on the order quantity.
- **Resource batch** – This option is basically the same as the **Batch** option. However, the calculation includes the **Batch capacity** field from the operations resource. Therefore, the time is resource dependent.

Set up route groups

You can define the route groups and the setup for its route or job types under **Production control > Setup > Routes > Route groups**. For each Route/job type in the route group, you can select or clear the following options:

- **Activation** - Select this option to enable calculations and scheduling for the selected job type, and to receive job feedback when you run job scheduling. You need to select this option to enable the job type and then, select the rest of the options for that job type. If the activation is not selected, that job type will not be enabled, regardless of the selection of the other options.
- **Job management** - Select this option to include the job type in job management when you run job scheduling.
- **Working time** Select this option to schedule the job type according to the working time calendar that is defined for the operations resource, otherwise the Gregorian calendar is used. Working time can be scheduled either according to the Gregorian calendar or the defined working calendar. If you select this option, scheduling is based on the defined working time calendar. Additionally, the job of the job type is scheduled from midnight on the date that is defined as the job's starting date.
- **Capacity** - Select this option to reserve capacity for the job type when you run job scheduling. If you select this option, capacity is reserved when scheduling is run for the selected job type. This gives you an overview of which job types in each route group use the operations resources. For example, in a situation where drying resources are bottleneck resources, these resources must be specified as bottlenecks. Drying operations that are assigned to queue time job types will reserve drying resources.

For each of the job types, you first need to activate or de-activate it. When de-activated, none of the other setup (Job management, working time, and capacity) will be considered, as the job type will not be active.

Among the job types you can find Overlap. Overlap allows different jobs to be performed at the same time. When jobs are overlapping, the resources can be used but cannot be reserved for the specific jobs. Therefore, when Activation is selected for Overlap, the rest of the settings (Job management, Working time, and Capacity) do not make any impact in the route group.

NOTE

When you upgrade versions, you might encounter the following error: "CRL Error occurred while invoking the scheduling engine". If you receive this error, go to the **Route groups** page and for all the routes where you have activated **Overlap**, clear the **Job management**, **Working time**, and **Capacity** options.

Work policies

2/18/2021 • 13 minutes to read • [Edit Online](#)

This topic explains how to set up the system and the warehouse app so that they support work policies. You can use this functionality to quickly register inventory without creating putaway work when you receive purchase or transfer orders, or when you complete manufacturing processes. This topic provides general information. For detailed information that is related to license plate receiving, see [License plate receiving via the warehouse app](#).

A work policy controls whether warehouse work is created when a manufactured item is reported as finished, or when goods are received by using the warehouse app. You set up each work policy by defining the conditions where it applies: the work order types and processes, the inventory location, and (optionally) the products. For example, a purchase order for product *A0001* must be received in location *RECV* in warehouse *24*. Later, the product is consumed in another process at location *RECV*. In this case, you can set up a work policy to prevent putaway work from being created when a worker reports product *A0001* as received in location *RECV*.

NOTE

- For a work policy to be active, you must define at least one location for it on the **Inventory locations** FastTab of the **Work policies** page.
- You can't specify the same location for multiple work policies.
- The **Print label** option for mobile device menu items won't print a license plate label unless work was created.

Activate the features in your system

To make all the functionality that is described in this topic available in your system, turn on the following two features in [Feature management](#):

- License plate receiving enhancements
- Work policy enhancements for inbound work

The Work policies page

To set up work policies, go to **Warehouse management > Setup > Work > Work policies**. Then, on each FastTab, set the fields as described in the following subsections.

The Work order types FastTab

On the **Work order types** FastTab, add all the work order types, and the related work processes, that the work policy applies to. The following work order types and related work processes are supported for work policies.

WORK ORDER TYPE	WORK PROCESS
Raw material picking	All related processes
Co-product and by-product put away	All related processes
Finished goods putaway	All related processes
Transfer receipt	License plate receiving (and putaway)

WORK ORDER TYPE	WORK PROCESS
Purchase orders	<ul style="list-style-type: none"> • License plate receiving (and putaway) • Load item receiving (and putaway) • Purchase order line receiving (and putaway) • Purchase order item receiving (and putaway)

To set up a work policy so that it applies to several work processes of the same work order type, add a separate line for each work process to the grid.

For each line in the grid, set the **Work creation method** field to one of the following values:

- **Never** – The work policy will prevent warehouse work from being created for the selected work order type and related work process.
- **Cross docking** – The work policy will create cross-docking work by using the policy that you select in the **Cross docking policy name** field.

The Inventory locations FastTab

On the **Inventory locations** FastTab, add all the locations where this work policy should be applied. If no location is associated with a work policy, the work policy won't be applied to any process.

You can't specify the same location for multiple work policies.

You can use a warehouse location that is assigned to a location profile where the **Use license plate tracking** option is turned off. In this case, workers will directly register the on-hand inventory.

The Products FastTab

On the **Products** tab, set the **Product selection** field to control which products the policy should apply to:

- **All** – The policy should apply to all products.
- **Selected** – The policy should apply only to products that are listed in the grid. Use the toolbar on the **Products** FastTab to add products to the grid or remove them from the grid.

Default and custom "to" locations

NOTE

To make the functionality that is described in this section available in your system, you must turn on the *License plate receiving enhancements* and *Work policy enhancements for inbound work* features in [Feature management](#).

Previously, the system supported receiving only at the default location that is defined for each warehouse. However, mobile device menu items that use the following work creation processes now provide the **Use default data** option. This option lets you assign a custom "to" location to one or more menu items. (This option was already available for some other types of menu items.)

- License plate receiving (and putaway)
- Load item receiving (and putaway)
- Purchase order line receiving (and putaway)
- Purchase order item receiving (and putaway)

The **To location** setting for a menu item overrides the default receiving location for the warehouse, for all orders that are processed by using that menu item.

To set up a mobile device menu item to support receiving at a custom location, follow these steps.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select or create a menu item that uses one of the work creation processes that are listed earlier in this section.
3. On the **General** FastTab, set the **Use default data** option to **Yes**.
4. On the Action Pane, select **Default data**.
5. On the **Default data** page, set the following values:
 - **Default data field:** Set this field to *To location*.
 - **Warehouse:** Select the destination warehouse to use with this menu item.
 - **Location:** This field lists all the location IDs that are available for the selected warehouse. However, the setting of this field doesn't actually have any effect. Therefore, you can leave it blank. Nevertheless, you can use the list to confirm the ID that you must enter in the **Hardcoded value** field.
 - **Hardcoded value:** Enter the location ID for the receiving location that applies to this menu item.

TIP

A work policy can be applied only if all the receiving locations are listed in the relevant work policy setup. This requirement applies regardless of whether you're using the default warehouse receiving location or a custom "to" location.

Example scenario: Warehouse receiving

All products that are received by the *Purchase order item receiving (and putaway)* process must be registered in location *FL-001*, and they must be available in warehouse *24*. However, work should not be created. Products that are received by any other process (that is, by using other mobile device menu items) should be registered at the default warehouse receiving location (*RECV*), and work should be created as usual. (This scenario doesn't show the default receiving setup.)

This scenario requires the following elements:

- A work policy for the *Purchase order item receiving (and putaway)* process in location *FL-001*, for all products
- A mobile device menu item that has default data, and that sets the **To location** field to *FL-001*

Prerequisites

To make the functionality that is described in this scenario available in your system, you must turn on the *License plate receiving enhancements* and *Work policy enhancements for inbound work* features in [Feature management](#).

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the **USMF** legal entity.

Set up a work policy

1. Go to **Warehouse management > Setup > Work > Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No purchase item putaway work*.
4. Select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:

- **Work order type:** *Purchase orders*
 - **Work process:** *Purchase order item receiving (and putaway)*
 - **Work creation method:** *Never*
 - **Cross docking policy name:** Leave this field blank.
6. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
 - **Warehouse:** *24*
 - **Location:** *FL-001*
 7. On the **Products** FastTab, set the **Product selection** field to *All*.
 8. Select **Save**.

Set up a mobile device menu item to change the receiving location

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. In the left pane, select the existing **Purchase receive** menu item.
3. On the **General** FastTab, set the **Use default data** option to *Yes*.
4. Select **Save**.
5. On the Action Pane, select **Default data**.
6. On the **Default data** page, on the Action Pane, select **New** to add a row to the grid, and then set the following values for the new row:
 - **Default data field:** *To location*
 - **Warehouse:** *24*
 - **Location:** Leave this field blank.
 - **Hardcoded value:** *FL-001*
7. Select **Save**.

Receive a purchase order without creating work

The example in this section shows how to receive a purchase order item, but without creating work, at a location that differs from the default receiving location that is set up for the warehouse. This example uses the work policy and mobile device item that you created earlier in this scenario.

Create a purchase order

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
2. Select **New**.
3. In the **Create purchase order** dialog box, set the following values:
 - **Vendor account:** *US-101*
 - **Site:** *2*
 - **Warehouse:** *24*
4. Select **OK** to close the dialog box and open the new purchase order.
5. On the **Purchase order lines** FastTab, set the following values for the empty row:
 - **Item number:** *A0001*
 - **Quantity:** *1*
6. Select **Save**.
7. Make a note of the purchase order number.

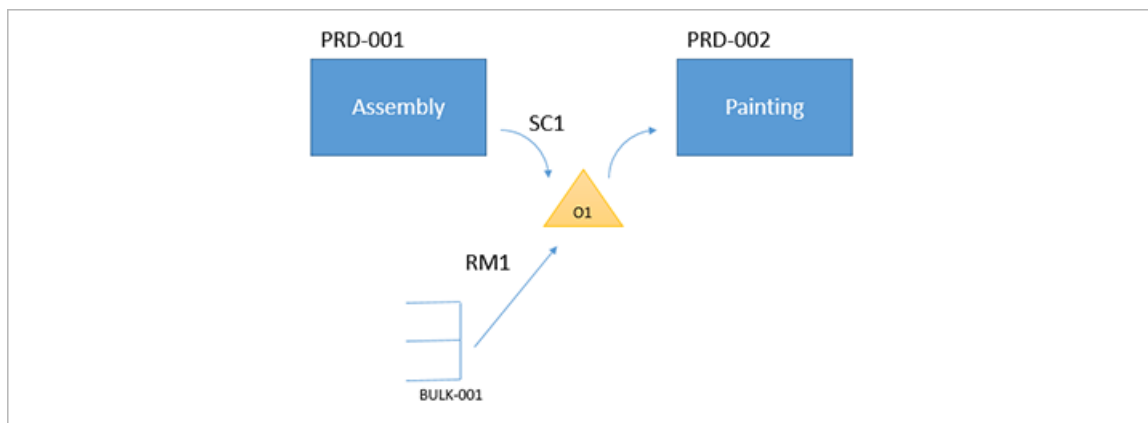

Receive a purchase order

1. On the mobile device, sign in to warehouse *24* by using *24* as the user ID and *1* as the password.
2. Select **Inbound**.
3. Select **Purchase receive**. The **Location** field should be set to *FL-001*.
4. Enter the purchase order number for the purchase order that you created in the previous procedure.
5. In the **Item number** field, enter *A0001*.
6. Select **OK**.
7. In the **Quantity** field, enter *1*.
8. Select **OK**.

The purchase order is now received, but no work is associated with it. The on-hand inventory has been updated, and a quantity of *1* of item *A0001* is now available at location *FL-001*.

Example scenario: Manufacturing

In the following example, there are two production orders, *PRD-001* and *PRD-002*. Production order *PRD-001* has an operation that is named *Assembly*, where product *SC1* is being reported as finished to location *001*. Production order *PRD-002* has an operation that is named *Painting* and consumes product *SC1* from location *001*. Production order *PRD-002* also consumes raw material *RM1* from location *001*. Raw material *RM1* is stored in warehouse location *BULK-001* and will be picked to location *001* by warehouse work for raw material picking. The picking work is generated when production *PRD-002* is released.

When you're planning to configure a warehouse work policy for this scenario, you should consider the following points:

- Warehouse work for putaway of finished goods isn't required when you report product *SC1* as finished from production order *PRD-001* to location *001*. The reason is that the *Painting* operation for production order *PRD-002* consumes product *SC1* at the same location.
- Warehouse work for raw material picking is required to move raw material *RM1* from warehouse location *BULK-001* to location *001*.

Here is an example of a work policy that you can set up, based on these considerations:

- **Work policy name:** *No putaway work*
- **Work order types:** *Finished goods put away* and *Co-product and by-product put away*
- **Inventory locations:** Warehouse *51* and location *001*
- **Products:** *SC1*

The following example scenario provides step-by-step instructions for setting up the warehouse work policy for this scenario.

Example scenario: Report as finished to a location that isn't license

plate-controlled

This scenario shows an example where a production order is reported as finished to a location that isn't license plate-controlled.

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the USMF legal entity.

Set up a warehouse work policy

Warehouse processes don't always include warehouse work. By defining a work policy, you can prevent the creation of work for raw material picking and putaway of finished goods for a set of products at specific locations.

1. Go to **Warehouse management > Setup > Work > Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No putaway work*.
4. On the Action Pane, select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
 - **Work order type:** *Finished goods put away*
 - **Work process:** *All related work processes*
 - **Work creation method:** *Never*
 - **Cross docking policy name:** Leave this field blank.
6. Select **Add** again to add a second row to the grid, and then set the following values for the new row:
 - **Work order type:** *Co-product and by-product put away*
 - **Work process:** *All related work processes*
 - **Work creation method:** *Never*
 - **Cross docking policy name:** Leave this field blank.
7. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
 - **Warehouse:** *51*
 - **Location:** *001*
8. On the **Products** FastTab, set the **Product selection** field to *Selected*.
9. On the **Products** FastTab, select **Add** to add a row to the grid.
10. In the new row, set the **Item number** field to *L0101*.
11. On the Action Pane, select **Save**.

Set up an output location

1. Go to **Organization administration > Resources > Resource groups**.
2. In the left pane, select resource group **5102**.
3. On the **General** FastTab, set the following values:
 - **Output warehouse:** *51*
 - **Output location:** *001*
4. On the Action Pane, select **Save**.

NOTE

Location *001* isn't a license plate–controlled location. You can set up an output location that isn't license plate–controlled only if an applicable work policy exists for the location.

Create a production order and report it as finished

1. Go to **Production control > Production orders > All production orders**.
2. On the Action Pane, select **New production order**.
3. In the **Create production order** dialog box, set the **Item number** field to *L0101*.
4. Select **Create** to create the order and close the dialog box.

A new production order is added to the grid on the **All production orders** page.

Keep the new production order selected.

5. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Estimate**.
6. In the **Estimate** dialog box, read the estimate, and then select **OK** to close the dialog box.
7. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Start**.
8. In the **Start** dialog box, on the **General** tab, set the **Automatic BOM consumption** field to *Never*.
9. Select **OK** to save your setting and close the dialog box.
10. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Report as finished**.
11. In the **Report as finished** dialog box, on the **General** tab, set the **Accept error** option to *Yes*.
12. Select **OK** to save your setting and close the dialog box.
13. On the Action Pane, on the **Warehouse** tab, in the **General** group, select **Work details**.

When the production order is reported as finished, no work is generated for putaway. This behavior occurs because a work policy is defined that prevents work from being generated when product *L0101* is reported as finished to location *001*.

More information

For more information about mobile device menu items, see [Set up mobile devices for warehouse work](#).

For more information about license plate receiving and work policies, see [License plate receiving via the warehouse app](#).

For more information about inbound load management, see [Warehouse handling of inbound loads for purchase orders](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create working time scheduling properties

2/18/2021 • 2 minutes to read • [Edit Online](#)

Working time scheduling properties are used to categorize working time intervals and define the settings that operators must take into account. This procedure shows how to define a working time scheduling property and associated property values. You can walk through this procedure in demo data company USMF, or using your own data.

1. Go to All workspaces > Resource lifecycle management.
2. Click Properties.

Create property

1. Click New.
2. In the Property field, type a value.
3. In the Name field, type a value.

Create property values

1. In the list, mark the selected row.
2. In the Name field, type a value.
3. In the Value field, type a value.
4. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create working time templates

2/18/2021 • 2 minutes to read • [Edit Online](#)

Working time templates define the working hours throughout a week and are used to generate working times for a period of time. This procedure shows you how to define a working time template using working time scheduling properties for categorizing working time intervals. You can walk through this procedure in demo data company USMF, or using your own data.

1. Go to All workspaces > Resource lifecycle management.
2. Click Working time templates.

Create working time template

1. Click New.
2. In the Working time template field, type a value.
3. In the Name field, type a value.
4. Expand the Monday section.
5. Click Add.
6. In the From field, enter a time.
 - Specify the time when work begins in the morning.
7. In the To field, enter a time.
 - Specify the time when workers break for lunch.
8. Click Add.
9. In the From field, enter a time.
 - Specify the time when work resumes after lunch.
10. In the To field, enter a time.
 - Specify the end of the work day.

Replicate working times to all week days

1. Click Copy day.
 - Copy the working times definitions from Monday to Tuesday.
2. Click OK.
3. Click Copy day.
 - Copy the working times definitions from Monday to Wednesday.
4. In the To weekday field, select an option.
5. Click OK.
6. Click Copy day.
 - Copy the working times definitions from Monday to Thursday.
7. In the To weekday field, select an option.
8. Click OK.
9. Click Copy day.
 - Copy the working times definitions from Monday to Friday.
10. In the To weekday field, select an option.
11. Click OK.

Define time slots for special operations

1. Expand the Friday section.
2. In the list, find and select the desired record.
3. In the Property field, enter or select a value.
4. In the list, find and select the desired record.
5. In the Property field, enter or select a value.

Mark weekend days as closed for pickup

1. Expand the Saturday section.
2. Select Yes in the Closed for pickup field.
3. Expand the Sunday section.
4. Select Yes in the Closed for pickup field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define discrete manufacturing resource group

2/18/2021 • 2 minutes to read • [Edit Online](#)

A resource group is a set of operations resources that typically correspond to the physical organization of work cells, defined by yellow lines on the production shop floor. This procedure shows you how to define a resource group for use in discrete production. You can walk through this procedure in demo data company USMF, or use your own data.

1. Go to Resource groups.
2. Click New.
3. In the Resource group field, type a value.
4. In the Description field, type a value.
5. In the Site field, enter or select a value.
6. In the Production unit field, enter or select a value.

Define default operational parameters

1. Expand the Operation section.
2. In the Scrap percentage field, enter a number.
3. In the Setup category field, enter or select a value.
4. In the Run time category field, enter or select a value.
5. In the Operations scheduling percentage field, enter a number.

Define operating hours

1. Expand the Calendars section.
2. Click Add.
3. In the Calendar field, enter or select a value.

Add operations resources

1. Expand the Resources section.
2. Click Add.
3. In the Resource field, enter or select a value.
4. Click Add.
5. In the Resource field, enter or select a value.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add an existing activity to a production flow version

2/18/2021 • 2 minutes to read • [Edit Online](#)

When creating new versions of production flows, you can choose to add activities created for the older versions, to the new version. This procedure shows how a new version is created for an existing production flow, without copying the activities. In the next step, an existing activity is added to the new version.

This task requires production flow with version and activities already created.

Create a new production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click Edit.
5. In the list, mark the selected row.
6. In the Expiration date field, enter a date and time.
 - Note that before you create a new production flow version, make sure to check the expiration date and time of the active version. The new version will be created with an effective start date, which connects to the expiry date of the selected version.
7. Click Add.
8. Select No in the Copy from version field.
 - Select No to start with an empty version if most of the activities of the copied version will be replaced by new activities. Add the unchanged activities to the Add existing function in the activity form manually.
9. Select No in the Duplicate kanban rules field.
 - When the activities are not copied to the new version, it is not possible to copy the kanban rules at the time of creation of the new version. Instead you will use the create replacement kanban function later in the kanban rule form, to replace kanban rules of the old production flow version with kanban rules using the activities of the new version.
10. Click OK.
11. In the list, find and select the desired record.

Add an existing activity

1. Click Activities.
2. Click Add existing to open the drop dialog.
 - Find and select an existing activity to be added to the new production flow version. Note that the list shows all activities that have been created for this production flow for all previous versions of the flow.
3. In the Activity field, enter or select a value.
4. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Deactivate a production flow version

2/18/2021 • 2 minutes to read • [Edit Online](#)

When an active production flow version is no longer needed, it can be deactivated. You should only use this option if all kanban rules and activities have ended and will not be activated again. Note that the expiry date of all kanban rules related to this production flow version will be updated with the current date and time.

To modify an active production flow version, consider setting an expiry date for the active version and create a new version. This will allow you to continue your production operations while preparing the new version and related kanban rules.

To expire an active production flow version, you need to set an expiry date. In that sense, deactivation is more like an exception than a rule.

For this procedure you need a production flow with a version that can be deactivated. Do not try this in a production environment unless you are 100% positive that the version is fully obsolete.

Deactivate a production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the list, find and select the desired record.
5. Click Deactivate.
 - Do not proceed if you are not 100% positive that this production flow version is obsolete. Clicking Ok will expire all active kanban rules and put an immediate stop to all production and replenishment activities of this production flow version.
6. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define an expiry date for a production flow version

2/18/2021 • 2 minutes to read • [Edit Online](#)

To end the validity and the processing of a production flow version on a given date, or to plan replacement of an active version with a new version, you have to set an expiry date on the version. It is not necessary to deactivate the version.

Set an expiration date to end a production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
 - Select any production flow that has a version that is already defined.
3. In the list, click the link in the selected row.
4. Click Edit.
5. In the list, mark the selected row.
6. In the Expiration date field, enter a date and time.
 - For the expiration date, a new version will not start or become activated. It will also no longer be possible to create or start jobs for this production flow. You can still complete started jobs after the expiration date.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define production flow models

2/18/2021 • 2 minutes to read • [Edit Online](#)

Production flow models describe how the capacity of lean manufacturing work cells is calculated and maintained. Therefore the definition of a production flow model is a prerequisite of the definition of work cells. The demo data company used to create this procedure is USMF.

Define a production flow model.

1. Go to Production control > Setup > Lean production flow > Production flow models.
2. Click New.
3. In the Production flow model field, enter an ID for the production flow model.
4. In the Model type field, select an option.
 - There are two model types: Throughput type and Hours type. For Throughput type, the capacity of work cells that use this production flow model will be expressed and calculated in product quantities. For Hours type, the capacity of work cells that uses this production flow model will be expressed and calculated in hours. Note that this property can't be changed for an existing production flow model. After a work cell has capacity reservations, the production flow model type can't be changed.
5. Enter the number of days in the EPE Cycle.
 - The interval describes the period when every part produced by a production flow or work cell will be produced at least once. The shorter the EPE cycle, the more flexible the production process is. If EPE Cycle = 0, all demand can be produced in the same day. The EPE Cycle is used to schedule lean process jobs. When scheduling a job on a work cell with EPE Cycle = 5, the scheduling process will look for capacity on the work cell at Due date - EPE Cycle (5 days ahead of the due date) to ensure that the product can be produced in that cycle. The inventory lead time of a product is usually equal to or greater than the EPE Cycle of the related production process.
6. In the Planning period type field, select an option.
 - After a work cell has capacity reservations, the planning period type cannot be changed. You can only select production flow models with the same period type for this given work cell.
7. In the Planning time fence field, enter a number.
 - The planning time fence describes the number of days where capacity reservations can be made for the related work cells. In the Planning time fence, enter the number of days. Kanban process jobs that fall outside of this period are not planned with automatic planning. The planning time fence is typically two times the average inventory lead time of the products produced in a production flow or work cell. The EPE Cycle should not be more than half the planning time fence.
8. In the Capacity shortage reaction field, select an option.
 - The options include: Postpone - Postponing the full demand of the scheduling event on the next available production day, with available throughput. Cancel - End the automatic planning for the scheduling event and leave the related jobs unplanned. Add to requested day - Plan the requested jobs for the requested period. This overloads the cell for this day and requires the planner to review and to a manual interaction. Distribute to available periods - Distribute the different jobs of the scheduling event to all available production days, beginning from the first available day. The minimum distribution quantity is the kanban job quantity. The distribution assigns the minimum planning quantity (kanban quantity) to every day with enough available throughput.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Operations scheduling

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic provides information about operations scheduling. You can use operations scheduling to provide a general estimate of the production process over time.

You can schedule production at the operation level and the job level. Unlike job scheduling, operations scheduling doesn't explode the operations for the production route into jobs. If you want to include more detail in the scheduling, such as information about current capacity, you can run job scheduling after you run operations scheduling. You can also run job scheduling only. Job scheduling is typically used to schedule individual jobs on the shop floor for an immediate or short-term time frame.

Components of operations scheduling

The main components of operations scheduling are the scheduling direction, the capacity of resources, and materials optimization. By using operations scheduling, you can achieve the following goals:

- Control the planning method by scheduling forward or backward from a given date.
- Optimize the use of resources by scheduling productions based on the capacity of the resources. This approach also helps identify when alternative resources should be used.
- Optimize the use of materials by scheduling productions based on the availability of the required materials.
- Schedule and synchronize reference productions. The dates of the reference productions are adjusted when the production order's schedule is changed.

You must estimate the cost of a production order before you can run operations scheduling. If you haven't run an estimate, it's automatically run before operations scheduling is started. An operations schedule specifies the following information:

- The product that is planned for production
- The configuration of the product
- The quantities that are involved in the production
- The dates when the production will start and end
- The capacity reservations for the resources that perform the production activities

The setup time, process time, and run time are set for operations in the production. After you run operations scheduling, the status of the production order is **Scheduled**, and all operations are scheduled in the order that is specified by the production route. However, only the duration of the operation is considered. Start times and end times aren't scheduled.

Scheduling direction and date

The scheduling direction is fundamental to the scheduling process. Production can be scheduled forward or backward from any date, depending on timing and scheduling requirements.

- **Forward from the scheduling date** – You can schedule production to start as early as possible. Production can be started today, tomorrow, or on any date in the future. The production is scheduled forward in time to the earliest possible end date.
- **Backward from the scheduling date** – You can schedule production to start as late as possible. Backward scheduling is based on the date when the production must be completed. The schedule counts backward from that date to the latest possible date that the production can be started and still be completed on time.

Resource scheduling

When you run an operations schedule, each operation in the production route is scheduled for the resource that is specified for the operation. Additionally, the duration of each operation is specified on the production route. If a resource group is specified for an operation, the scheduling reserves capacity on the group. However, unlike job scheduling, operations scheduling doesn't select the specific resources in the group. If you're working with finite capacity, the schedule depends on the availability of the resources that are required in order to complete production. Operations scheduling follows the sequence of operations that is specified on the production route. The scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The sum of available capacity on the resources that are involved determines the capacity for the resource group. Capacity reservations that already exist for the resources are considered unavailable capacity. If there isn't enough available capacity for the production, the production orders can be delayed or even stopped. You can also specify the efficiency that you expect from the resources that are involved in the production. You specify the efficiency as a percentage on the resource. The efficiency percentage adjusts the throughput of the resource. This adjustment affects the time that is reserved for the resource. The lead times for the operations that use the resource are also adjusted accordingly.

Operations scheduling and master planning

The operations schedule also drives master planning and determines calculations for material requirements. Operations scheduling considers the following information:

- **Backlogged productions** – Products that are planned, released, or started
- **Material availability** – Inventory, subproductions, suppliers, and vendors
- **Capacity availability** – Resources that are required for production

NOTE

If you're using multi-threaded master planning and operations scheduling, finite capacity will not be considered.

Cancellations

When you run operations scheduling, you can cancel specific parts of the routing. These parts include the queue time, setup time, process time, overlap time, and transport times.

Finite materials

If you're working with finite materials, scheduling also depends on the availability of the materials that are required for production. If there aren't enough available components for the production, production can be delayed. You can base scheduling on the use of materials by specifying the materials that must be available for production. When you optimize on both resource capacity and the availability of materials, production is calculated according to these restrictions. A production order can't be scheduled to start until capacity and materials are available at the same time and in the required quantities.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Job scheduling

2/18/2021 • 5 minutes to read • [Edit Online](#)

This article provides information about job scheduling, which is a more detailed form of scheduling than operations scheduling. You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment.

You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment. Job scheduling breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Job scheduling also lets you synchronize all jobs that are referenced by the selected job. You can specify a start date and time or end date and time for the job, and then run scheduling. The time that you specify can be the start time or the end time, depending on the scheduling direction. This functionality is useful when, for example, a job can be run only on one machine at a time, or when you want to optimize the job that is run for each resource.

Tasks in the job scheduling process

The job scheduling process includes the following tasks:

- Split operations into jobs.
- Schedule jobs, based on the dates and times for the resources that are specified for the related operation.
- Calculate start times and end times for each job. You can use finite capacity to make sure that there are no overlapping times.
- Determine which resources in the resource group to run the job on. This task requires that a resource group be specified for an operation. Job scheduling selects the resources or resource groups based on the shortest lead time, and also considers any previous reservations on the resources.
- Explode operations into jobs when you run job scheduling. The jobs are scheduled by date and time, according to the order that is specified by the production route. The setup of the operation determines the jobs that are exploded during the scheduling process. The route group that is assigned to the operation controls whether jobs are generated. A job is generated only if it has a specific duration. For example, a transport time job is generated if a transport time was specified for the selected operation.

Scheduling direction

You can schedule jobs either forward or backward.

- **Forward** – Use the forward scheduling direction to start the production as early as possible. This is also known as the push method, because the production is being pushed forward through the production process. The production is scheduled to start and end on the earliest possible dates.
- **Backward** – Use the backward scheduling direction to start the production as late as possible. This is also known as the pull method, because it's based on the date when the production must be completed. Backward scheduling counts backward to the latest possible date that the production can be started without missing its target deadline.

Finite capacity

You can schedule jobs by using finite capacity. When you use finite capacity, the capacity that is scheduled can't be larger than the capacity that is available for the resource. Available time is defined as the interval when the resource is available and there are no other reservations on capacity. Scheduling that is based on finite capacity makes sure that start times and end times for an operation on a specific date don't overlap. The resource

capacity that is already reserved is considered, and overlaps between the start times and end times are also considered. Finite capacity determines the amount of capacity that must be available for a resource in order to achieve optimal use of that resource. This determination is balanced against a calculation of the shortest possible lead time between operations.

Finite materials

Job scheduling that is based on finite materials makes sure that the required materials are available when the operation starts. The coverage rules for items define these limits. Scheduling uses requirement explosion to determine when the component items are available. If you schedule without setting finite materials, the system assumes that all items are available when they are required.

Finite properties

Job scheduling that is based on special properties requires that properties be specified for the operations on the production route. These properties must be fulfilled to reserve capacity.

References

Job scheduling schedules all productions that are referenced by the current production. If a production has one or more subproductions, the subproductions should be scheduled at the same time as the main production, because the main production can't be started until the related subproductions are completed.

Schedule resources

The scheduling engine examines combinations of resources to identify those combinations that can satisfy requirements. You can specify selection criteria by selecting one of the following values in the **Primary resource selection** field on the **Scheduling parameters** page:

- **Duration** – The scheduling engine selects the resource that has the shortest lead time. **Note:** Scheduling by duration can cause decreased performance when the same resource group contains many resources and secondary operations are used. You can schedule a maximum of 32 resources per operation. If you exceed this quantity, an Infolog message is displayed, and job scheduling doesn't find the best alternative resource.
- **Priority** – The scheduling engine selects the resource that has the highest priority if two or more resources have identical capabilities and levels. The resource that has the lowest numeric value in this field has the highest priority.

When job scheduling is run, the system plans the resources, based on the limitations that are defined in the resource parameters. You can control the capacity of the resources by using calendar settings. The system calculates loads for resources during the scheduling process. **Note:** For productions that use the operations scheduling function, you can run job scheduling after operations scheduling. If you aren't using operations scheduling, you can run job scheduling alone.

Maximum capacities for resources per job order

Resources are assigned to jobs through job scheduling. You can establish maximum capacities for resources per job order. For example, you can set up the system to schedule no more than 50 percent of total capacity for a production order. This setup gives you more control over the scheduling of resources on the job scheduling level. Therefore, it can help prevent issues if not enough capacity is available to perform simultaneous productions.

Resource efficiency

Job scheduling considers the efficiency percentages that are specified for the resources. Efficiency percentages

reduce or increase the time that is reserved for the resource. Therefore, lead time is also increased or decreased. The following formula is used for the calculation: $\text{Scheduling time} = \text{Time} \times 100 \div \text{Efficiency percentage}$ In this formula, *Time* includes both the run time and the setup time.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Gantt chart for job scheduling

2/18/2021 • 11 minutes to read • [Edit Online](#)

The Gantt chart is designed to empower production planners to control and optimize the production plan. The Gantt chart makes the flow of operations transparent and makes it easy to adjust the production schedule while taking into account material or resource shortages. This helps planners make the best use of available resources, minimize work in progress, and optimize throughput times for production orders.

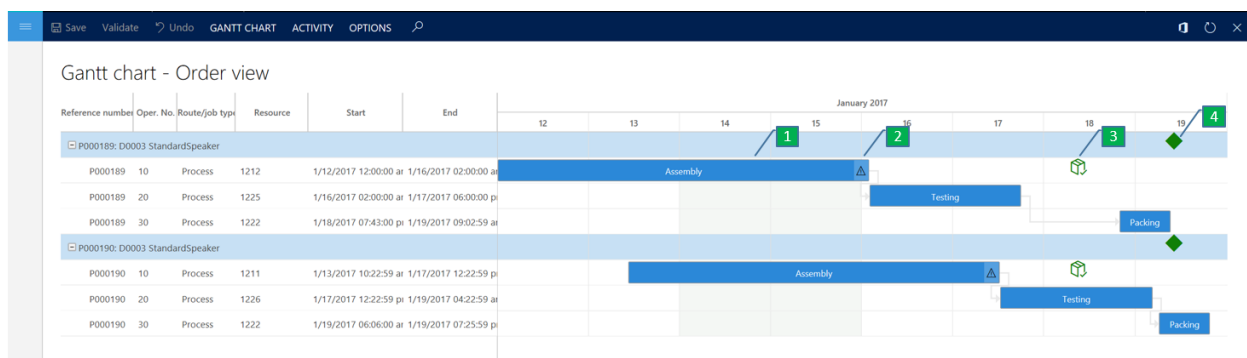

A Gantt chart is a visual representation of scheduled activities within a defined time interval. The activities are scheduled on resources that have capacity defined by a capacity calendar. The following types of activities can be shown in the Gantt chart.

- Jobs from production orders that are job scheduled.
- Jobs from planned production orders.
- Job scheduled project activities of type Hour forecasts.

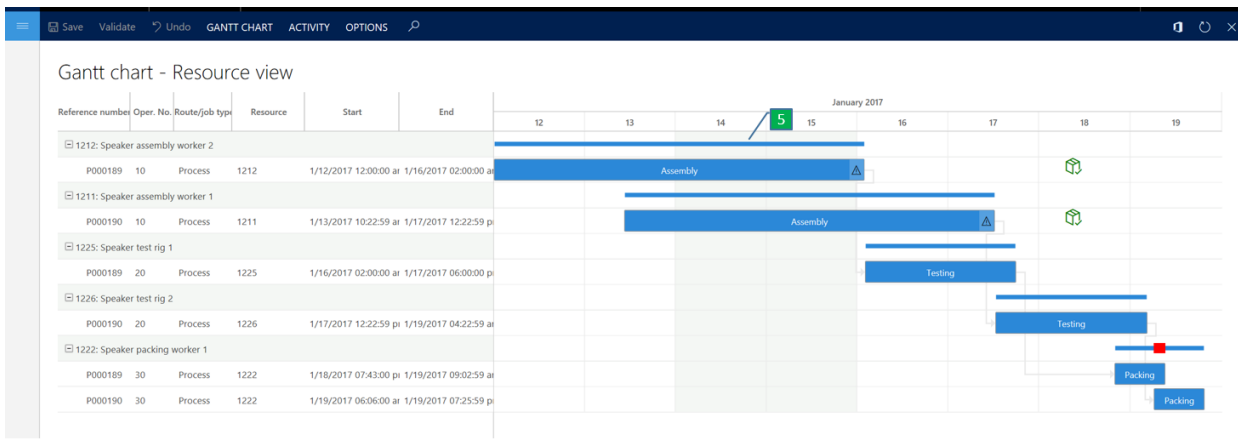

The Gantt chart can be opened in two different views, **Order view** and **Resource view**. In **Order view**, activities are grouped under production orders. This can be useful, for example, if you want to maintain an overview of all the jobs belonging to the same orders. In **Resource view** all jobs are grouped under individual resources. This view can be useful when optimizing the plan at a resource level, for example, a machine or a group of machines. The Gantt charts shown in the illustrations below show **Order view** and **Resource view** with these key elements:

1. Gantt chart activity
2. Material shortage icon
3. Material availability icon
4. Order delivery date icon
5. Capacity bar

Order view

Resource view

Activities

The activities appear as bars and are organized in a time scale grid with a scheduled start and end time, making the length of the bars proportional to the time that is necessary to complete the activity. The activities are shown according to a time scale. You can adjust the time scale on the menu where you select a start and end date and a time unit, for example, hours or days. By adjusting the time scale you can set focus on a time interval in which you want to manage activities.

To get a better overview, there are different options for controlling the color of the activities. You can configure an individual color for activities, use the theme color that is the general color theme used for the application, or set up the color to be controlled by the color code for production orders.

The time interval for activities has a background shade. Periods with a white shade indicate a time interval with defined capacity on the resource for the activity, whereas periods with a grey shade indicate time intervals with no capacity defined.

On the left side of the chart there is additional information about the activity, for example, the resource on which the activity is scheduled and production order number. The connection between jobs belonging to the same order is shown with an arrow.

You can get more information about an activity in the activity dialog box. To open the dialog box, double-click the activity or select the **information** menu. In the activity dialog you can see the scheduled start and end date, and time information about which materials the activity is planned to consume.

The activities can be grouped in Grouping levels. The Grouping levels are hierarchical and can be used to make a logical grouping of activities. For example, if you have a layout where manufacturing activities are grouped by Site, Production units, Resource groups, and Resources, you can use the Grouping levels to group the activities according to that layout. The grouping levels can be expanded and collapsed either on the individual grouping level or for all levels in the chart by using the **Expand all** and **Collapse all** buttons on the menu. You can also configure the grouping levels to be expanded or collapsed when the chart is opened.

Material availability

The Gantt chart can be set up to provide the planner with detailed information about material status for the individual activities. For example, this can be helpful if material is delayed and is affecting the production plan. In this case, the material issues will be highlighted in the Gantt chart to help the planner to understand consequences and make necessary adjustments.

A job will appear with a material shortage icon if the schedule start date of the job is later than the material availability date for materials consumed by the job. The material availability date is calculated based on the pegging information in the dynamic master plan. The material shortage icon will for example appear on a job that is consuming a material that is pegged against a purchase order that has a receipt that is later than the planned start date of the job.

Indicator of material availability date

When you set up the chart to show jobs with material shortages an icon for showing the material availability date for the job can also be shown. The icon will only be shown if the material availability date is within the defined time interval of the chart. If the material availability date lies outside the defined time interval, then more detailed material availability information can be retrieved from the material list in the job dialog box. In the list there is also an icon showing late materials for the job. You can reschedule a job using the material availability date as a start date.

Indicator of order delivery date

This icon indicates the delivery date for a production order. The icon is only visible in the Order view.

Capacity bar

You can configure the chart to show a resource capacity bar. This bar provides an overview of the resource capacity for an activity in the defined time interval of the chart. The capacity bar is not shown for periods of the time where the resource is not booked. In periods where the resource is booked to capacity, the capacity bar is shown as a solid bar. In periods where the resource is overbooked, the bar will appear thicker and in a red color. For example, if two jobs overlap, the capacity bar will indicate an overbooking in the time interval where there is an overlap. The capacity bar is updated dynamically when you schedule a job. You enable the capacity bar on the **Show capacity bar** menu. It can only be shown in **Resource view**. If you want to get a more detailed view of the capacity load on a resource, use the **Capacity load** chart, which can be opened from the menu or the context menu for a selected activity.

Job scheduling in the Gantt chart

The Gantt chart offers different options for making adjustments to the production plan. In the Gantt chart, you can re-schedule activities as a drag-and-drop interaction or from a schedule menu. In the planning process, you can take resource capacity, resource capabilities, and material constraints into account.

Schedule a job as a drag-and-drop interaction

You can re-schedule job within the defined time interval as a drag-and-drop interaction. You can only re-schedule the job on the same resource, and you can only schedule one job at a time.

Schedule a job from the menu

On the **Schedule jobs** menu, you can schedule one or more selected job in the chart based on a scheduling direction and a scheduling date time. There are three available schedule directions.

- Forward from scheduling date
- Backward from scheduling date
- Forward from material availability date

It is not possible to schedule a job outside the defined time interval of the Gantt chart. If you do that, the job will be left unscheduled and you will receive the error message, "Could not schedule the job within the loaded time period."

Schedule previous jobs

In a network of activities, such as jobs belonging to the same production order, you can use the **Schedule previous jobs** function to schedule the previous jobs relative to a selected job in the network. In the following example, the highlighted activity is the selected job. The diagram shows before a previous job is scheduled and after the previous job is scheduled.

Schedule next jobs

You can use the **Schedule next jobs** function to schedule the next jobs relative to a selected job in a network of activities. In the following example, the highlighted activity is the selected job. The diagram shows before the next job is scheduled and after the next job is scheduled.

Schedule around job

You can use the **Schedule around job** function to schedule the next job and the previous job relative to a selected job in a network of activities. In the following example, the highlighted activity is the selected job. The diagram shows before a job is scheduled and after the job is scheduled.

Arrange jobs

You can use the **Arrange** function to arrange selected activities on the same resource. These activities can be in the same network of activities, but can also belong to different networks. When you use the arrange function the time gaps between the selected activities will be eliminated. You can use this function to optimize the capacity utilization of the resources. The diagram shows before a job is scheduled and after the job is scheduled.

Reassign activities from one resource to another

You can reassign a job from one resource to another. This can be useful in situations where a machine is out of order or overbooked, and you need to find another available resource that can do the job.

Reassigning an activity as a drag-and-drop interaction

In the **Resource** view, you can reassign an activity to a different resource in the Gantt chart as a drag-and-drop interaction. You do that by selecting the row in which the activity is scheduled. After the row is selected you can drag the row to the resource in the chart grouped under a different resource grouping level.

Reassigning an activity from the **Schedule jobs** menu

You can reassign a job from the **Schedule job** dialog box opened from the **Schedule job** menu. From this menu you can only reassign a job to a resource that is already loaded to the Gantt chart. If you only select one job, then the drop down for the resource will be sorted by applicable resources. If you select more jobs, then

there will be no information about applicable resources from the resource list.

Load additional resources to the Gantt chart

In the **Resource view**, you have an option to load additional resources to the Gantt chart. This can be useful if you want to find an alternative resource for a job that is scheduled on a machine that is overbooked or broken down. On the **Load additional resources** page, you will get a list of resources that are date efficient as of the date the list is opened. Applicable resources, relative to a selected job in the Gantt chart, will be listed first. If you have multiple jobs selected, prior to opening the list, no indication of applicable resources will be shown. On the **Load additional resources** page, you can select one or more resources, that will be loaded to the Gantt chart when you confirm your selection. If there are no jobs scheduled on the selected resource in the time interval of the Gantt chart, then the resource will be placed under a resource grouping level in the bottom of the list of activities in the Gantt chart.

Access the Gantt chart

The Gantt chart can be opened from the following pages.

PAGE	DESCRIPTION
Production order list and detail	On the Production order list and detail page, you can open the Gantt chart from one or more selected orders. Opening the chart from the Gantt chart menu item will load all jobs related to the selected production orders, but also jobs from other production orders that are scheduled on the same resources. Opening the chart from the Gantt chart – Fast view menu item will only load jobs related to the selected production orders. In this view, it is not possible to schedule jobs.
Resource	On the Resource page, you can open the Gantt chart from the menu item Gantt chart . When selected, all the jobs scheduled on the resource in a selected time interval will be loaded to the chart.
Resource group	On the Resource group page, you can open the Gantt chart from the menu item Gantt chart . When selected, all the jobs scheduled on the resources in the resource group will be shown in a selected time interval.
Gantt charts	On the Gantt charts page you can configure Gantt charts by resources and resource groups. For example, if you want to control production activities for specific sets of resources or resource groups, then you can make individual configurations of those on the Gantt charts page. You can then open the Gantt chart from each configuration.
Hour forecasts (project)	Project activities of type Hour forecast can be job scheduled on resources. On the Hour forecast page on the Scheduling menu you can open the Gantt chart on an order to see job scheduled project activities of type hour forecast.
Job to complete (List in Production floor management workspace)	The Jobs to complete list in the Production floor management workspace shows jobs from production and batch orders that are in progress on the selected resources for the workspace. On the Gantt chart menu item you can open the Gantt chart, where all the jobs selected in the list will be loaded to the chart.

PAGE	DESCRIPTION
Production orders to release (Opened from the Production floor management workspace)	The production orders to release page is opened from the Production floor management workspace. This page shows scheduled production and batch orders pending release. On this page you can open the Gantt chart for selected production orders.

Operations scheduling options

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes the options for operations scheduling. You can use operations scheduling to provide a general estimate of the production process over time.

Operations scheduling calculates the following information for a production order:

- Start and end dates are set for the production order and each operation.
- Resources are assigned to operations.

Several settings determine how production schedules are calculated. You define these settings on the **Operations scheduling** page. The following information describes the scheduling options.

Operations scheduling

Scheduling direction

The scheduling direction is fundamental to the scheduling process. A production can be scheduled forward or backward from any date, depending on timing and scheduling requirements.

- **Forward scheduling** – You can schedule a production to start as early as possible. The production can be started today, tomorrow, or on any specific date in the future. The production is scheduled to start on the earliest possible date and is planned forward in time to the earliest possible end date.
- **Backward scheduling** – You can schedule a production to start as late as possible. The schedule is based on the date when the production must be completed and counts backward to the latest possible date that the production can be started without missing its target deadline.

The following options are available:

- **Forward from today** – Schedule forward from the current date. (The current date is the system date.)
- **Forward from planned start** – Schedule forward from an earlier start date. If there is no previous scheduling, the scheduling direction is forward from the current date.
- **Forward from scheduling date** – Schedule forward from the date that is specified in the **Scheduling date** field. If you don't specify a scheduling date, the scheduling direction is forward from the current date.
- **Backward from delivery date** – Schedule backward from the delivery date that is specified for the production order. If you select this option, but no delivery date is specified, the delivery date is the current date.
- **Backward from planned end** – Schedule backward from a previously calculated end date. If there is no previous scheduling, the end date is the current date.
- **Backward from scheduling date** – Schedule backward from the date that is specified in the **Scheduling date** field. If you don't specify a scheduling date, the current date is used. Backward from scheduling date is calculated for the production order the last time that a requirement was calculated. If no date is specified for the production order, the current system date is used.
- **Backward from futures date** – Schedule backward from the futures date that was calculated for the production order the last time that a requirement was calculated. If no futures date is specified for the production order, the current system date is used.
- **As last scheduling** – For operations scheduling and job scheduling, the selected scheduling direction and date are saved. Therefore, you can select this option for subsequent scheduling. If there is no previous scheduling of the production order, scheduling is backward from the current system date.
- **Forward from tomorrow** – Schedule forward from the current date plus one day.

- **Forward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, the production order is scheduled forward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.
- **Backward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, planned orders are scheduled backward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.

Scheduling date

This date is used for the **Forward from scheduling date** and **Backward from scheduling date** scheduling directions. Scheduling is backward or forward from this date. For more information, see the previous section, "Scheduling direction."

Recalculate BOM levels

When you select **Recalculate BOM levels**, the selected bill of materials (BOM) levels will be recalculated to help guarantee the correct scheduling order.

Limitations

Finite capacity

Scheduling depends on the availability of the resources that are required in order to complete production. If there isn't enough capacity, production orders can be delayed or even stopped. If finite capacity is applied to operations scheduling, existing capacity reservations that are made on the resources are considered, and that capacity is seen as unavailable. The production order is scheduled based on the availability of capacity on the resources that are required. Operations scheduling uses the specified sequence of operations to determine the order of operations in the production route. Operations scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The capacity of the resource groups is the sum of available capacity on all the resources in the resource groups.

Finite material

Scheduling also depends on the availability of the materials that are required for production. Insufficient component availability can also cause production delays. Scheduling can also be based on the use of materials. Just specify the materials that must be available for production instead of the materials that aren't critical. This type of scheduling is known as scheduling with finite material. When you specify finite materials, production is scheduled based on whether materials are available. **Note:** When you optimize on both capacity and materials, production is calculated to meet both restrictions. The availability of capacity and materials is considered, and the production order's operations can't be scheduled to start until capacity and materials are available at the same time and in the required quantities. Select this check box if materials should be considered limited during scheduling. If the materials are limited, the material's coverage for that time will be considered. In other words, scheduling considers the futures dates that are calculated for the items. Scheduling reserves raw materials and explodes the current production. If scheduling occurs several times, only the first scheduling runs an explosion and makes reservations. If you make changes in the production BOM or route, the next scheduling runs an explosion. For the explosion, it's assumed that the materials are required on the same day. Because the production isn't scheduled at the time of the master schedule explosion, the current date is the best estimate of when the items will be available. The explosion then checks whether the items are available. If the items are available, the production requirement can be fulfilled. If the items aren't available by the current date, a planned order is generated, and an offset selection is made for the planned order. If automatic firming is set for the planned order, the planned order is firmed automatically for purchase or production. The production status is automatically changed to the status that is specified in the **Requested production status** field in the **Coverage groups** dialog box. If the check box is cleared, the materials are always considered available. Therefore, scheduling doesn't consider whether the materials are available at the time of requirement.

Finite property

Select this check box if the job scheduling should include property requirements.

Keep production unit

Select whether the scheduling engine should schedule only resources that are already specified on the production unit.

Keep warehouse from resource

Select whether the scheduling engine should schedule only resources that are associated with the input warehouse that is specified on the resource.

References

Schedule references

When references depend on production orders, they are also known as subproductions. Subproductions can be scheduled as part of the scheduling of a production order. Select this check box if the scheduling of subproductions should be based on the scheduling of the main production. In relation to the main production, overlying productions are scheduled forward, and underlying productions are scheduled backward. You can view production order references can be viewed in the **Reference level** field on the **Production orders** page.

Synchronize references

You can synchronize references with the production order. If this option is selected, the dates of the subproductions are moved and aligned when changes are made to the production order's schedule. If a production order has one or more subproductions, you might want to schedule the subproductions together with the main production. In this case, the main production can't be started until the related subproductions have been completed. Therefore, select this check box if the scheduling of subproductions should be based on the start and end times of the selected production. You can select this check box only if the **Schedule references** check box is also selected.

Cancellation

Cancel queue time

Select this check box to exclude queue time from the scheduling.

Cancel setup

Select this check box to exclude setup time from the scheduling.

Cancel process

Select this check box to exclude run time from the scheduling.

Cancel overlap

Select this check box to exclude overlap time from the scheduling.

Cancel transport

Select this check box to exclude transit time from the scheduling.

Set default

You can save the current values as default values. There are two options:

- Set as my default
- Set as default for everyone

Schedule a production order with operations and job scheduling

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic focuses on scheduling a production order with operations scheduling and job scheduling. No jobs are created with operations scheduling whereas jobs are created with job scheduling. The demo data company used to create this task is USMF. This procedure is intended for the production manager, production planner, or shop floor supervisor working in a discrete manufacturing environment.

Create a production order

1. In the navigation pane, go to **Modules > Production control > Production orders > All production orders**.
2. Select **New production order**.
3. In the **Item number** field, enter or select a value. Select Item number **D0001**.
4. Select **Create**.

Schedule operations for the production order

1. Mark the newly created row.
2. On the Action Pane, select **Schedule**.
3. Select **Schedule operations**.
4. In the **Scheduling direction** field, select **Forward from scheduling date**.
5. In the **Scheduling date** field, enter a date. Select a future date, for example, today plus one week. With the selected Scheduling direction, the production order will be scheduled forward from this date.
6. Select **OK**.
7. In the list, mark the selected row. Note that the status is changed to **Scheduled**.
8. Select **All jobs**. Note that no jobs are created with operations scheduling.
9. Close the page.

Schedule jobs for the production order

1. On the Action Pane, select **Schedule**.
2. Select **Schedule jobs**.
3. In the **Scheduling direction** field, select **Forward from scheduling date**.
4. In the **Scheduling date** field, enter a date. Select a date in the future, for example, today plus one week. With the selected Scheduling direction, the production order will be scheduled forward from this date.
5. Select **OK**.
6. On the Action Pane, select **Production order**.
7. Select **All jobs**. Note that based on the active route, 5 jobs are created with job scheduling.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production order lifecycle overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

When a production order is created, a request is initiated to start producing an item. The production order contains information about what will be produced, the quantity to produce, and the planned finish date. It also contains information about which materials to consume and which process to follow to produce the item.

A production order passes through stages of the production life cycle. When an order is created, it is assigned the status **Created**. When an order is finished, it is assigned the status **Ended**. A parameter setting in each stage allows a user to configure each step. The setting can be set up for a single user or for all users.

The production bill of material and the production route are the main entities of the production order. They are copied to the production order based on the selected item and quantity that are going to be produced. Before the production order is started, the production bill of material and route can be edited.

A production order can be created in the following scenarios:

- Created by master planning execution based on material demand.
- Created directly from a sales order line or when a higher-level production order is created and estimated (pegged supply).
- Created manually.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a production order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a production order. The demo data company used to create this procedure is USMF. This is the first procedure out of seven which explains the production order lifecycle.

Create a production order

1. Go to Production control > Production orders > All production orders.
2. Click New production order.
3. In the Item number field, type 'D0001'.
4. In the Delivery field, enter a date.
 - The delivery date indicates when the production order should end in order to deliver on time. This date can be used in the scheduling process. For example, you can schedule the order backward from the delivery date.
5. Set Quantity to '20'.
 - Note: The BOM number field automatically displays the number of any active BOM for the current item, but you can change the BOM for the production order by selecting an active BOM from the list of approved BOM versions. The Route number field automatically displays the number of any active Route for the current item, but you can change the Route for the production order by selecting an active Route from the list of approved Route versions.
6. Click Create.

Validate the production order

1. In the list, click the link in the selected row.
 - Click the link for the production order number that you have just created. This will open the details page for the order.
2. Click Edit.
3. In the Delivery field, enter a date.
 - For example, you can change the delivery date for the production order.
4. Click Save.
5. Close the page.

Update the BOM

1. On the Action Pane, click Production order.
2. Click BOM.
 - Open the BOM page to validate the BOM data that was copied from the default data when the production order was created. In this procedure, you need to update the quantity for a BOM.
3. Click Edit.
4. In the Quantity field, enter a number.
 - Changing the quantity on the BOM line affects the cost estimate of material consumption for the production order.
5. Click Save.
6. Close the page.

Update the production route

1. On the Action Pane, click Production order.
2. Click Route.
 - Open the Route page to validate the data of the production route that was copied from the default data when the order was created. In this procedure, you need to update the quantity for one of the operations in the production route.
3. In the list, find and select the desired record.
4. Click Edit.
5. In the Process qty. field, enter a number.
 - Changing the process time affects the estimated route consumption and the cost of the production order.
6. Click Save.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Estimate a production order

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can run this procedure by using the USMF demo data company or your own data set. In both cases, you need to have an open production order that has the Created status. This is the second procedure out of seven which explains the production order lifecycle.

Estimate a production order

1. Go to Production control > Production orders > All production orders.
2. Select an order that has the Created status in the grid.
3. On the Action Pane, click Production order.
4. Click Estimate.
 - In this step, the estimated costs of a single production order is calculated.
5. Click OK.

View the calculation details

1. On the Action Pane, click Manage costs.
2. Click View calculation details.
 - This page displays the cost breakdown. For example, you can view the total cost price per unit for the finished product in the first row. The subsequent rows contain costs according to the bill of materials, production route, and indirect costs.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule a production order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to schedule a production order. The demo data company used to create this procedure is USMF. This is the third procedure out of seven which explains the production order lifecycle.

Schedule a production order

1. Go to Production control > Production orders > All production orders.
 - Select a production order that has the Estimated status.
2. On the Action Pane, click Schedule.
3. Click Schedule jobs.
 - The parameters for scheduling are set up on this page. You can set up the parameters for specific users or all users.
4. In the Scheduling direction field, select 'Forward from today'.
5. In the Scheduling date field, enter a date.
6. Select or clear the Finite capacity check box.
7. Select or clear the Finite material check box.
8. Click OK.

View the scheduling results

1. On the Action Pane, click Production order.
2. Click All jobs.
 - This page displays the scheduled jobs that you have just generated.
3. Expand or collapse the Scheduling section.
 - On the Scheduling FastTab, you can view the scheduled date and time.
4. Click Inquiries.
5. Click Capacity load.
 - The Capacity load page displays the capacity that is reserved through job scheduling, the total number of hours that are currently reserved on the resource, and the number of hours that remain available for job scheduling on the resource.
6. Close the page.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Release a production order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to release a production order. The demo data company used to create this procedure is USMF. This is the fourth procedure out of seven which explains the production order lifecycle.

1. Go to Production control > Production orders > All production orders.
 - In the grid, select a production order that has the Scheduled status.
2. On the Action Pane, click Production order.
3. Click Release.
 - On this page, you can confirm the release of the selected range of production orders. Click Select if you want to add orders.
 - The Release step indicates when the production order is released to the production shop floor so that the shop floor operators can report progress on the production jobs. Production papers that contain relevant information about processing the jobs can be issued. The warehouse work for raw material picking is generated for the items that are set up for the warehouse process.
4. Click the General tab.
 - Select which production reports should be printed. The Job card report prints a page for each scheduled job and requires the production order to be scheduled at the job level. The report contains information about the scheduled start and end time, the quantity to produce, and which resource processes the job. The Route job report collects the same information on the same page, but does not print a page for each job. The Route card report only shows the operations but not the jobs. Therefore, this report does not require job scheduling, but can be used when production orders are scheduled at the operation level.
5. Click the Print route card checkbox.
6. Click OK.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Start a production order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to start a production order on the shop floor. Time and material consumption are reported in this process. The demo data company used to create this procedure is USMF. This is the fifth procedure out of seven which explains the production order lifecycle.

Start a production order

1. Go to Production control > Production orders > All production orders.
 - Select a production order that has the Released status.
2. On the Action Pane, click Production order.
3. Click Start.
 - On this page, you can confirm the start of the production order.
4. Click the General tab.
5. In the From Oper. No. field, enter '10'.
6. In the Automatic route consumption field, select 'Always'.
7. Click the Post route card now checkbox.
8. In the Automatic BOM consumption field, select 'Always'.
9. Click the Post picking list now checkbox.
10. Click the Print picking list checkbox.
11. Click OK.
 - This is the printed picking list that shows the materials used for the production order.
12. Close the page.

Validate the picking list

1. On the Action Pane, click View.
2. Click Picking list.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. Click Edit.
6. In the Consumption field, enter a number.
7. Click Post.
8. Click OK.
 - In the picking list journal, the materials consumed by the production order are posted. Before posting the journal, you can make adjustments if there is a difference between the estimated quantity and the actual consumed quantity.
9. Click the GridPanel tab.
10. Close the page.

Verify the route card journal

1. On the Action Pane, click View.
2. Click Route card.
3. In the list, find and select the desired record.

4. In the list, click the link in the selected row.
5. Click Edit.
6. In the Hours field, enter a number.
7. Click Post.
8. Click OK.
 - In the Route card journal, the time spent on the individual operations is recorded. Good and error quantity can also be reported.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Report a production order as finished

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to report a production order as finished. The demo data company used to create this procedure is USMF. This is the sixth procedure out of seven which explains the production order lifecycle.

Report a production order as finished

1. Go to Production control > Production orders > All production orders.
 - Select a production order that has the Started status.
2. On the Action Pane, click Production order.
3. Click Report as finished.
 - On this page, you can confirm the quantity of the finished product to be reported as finished.
4. Click the General tab.
5. Set Good quantity to '18'.
6. Set Error quantity to '2'.
7. In the Error cause field, select 'Material'.
8. Select or clear the End job check box.
9. Select or clear the Accept error check box.
10. Click OK.

Verify the Report as finished journal

1. On the Action Pane, click View.
2. Click Reported as finished.
3. In the list, mark the selected row.
4. In the list, click the link in the selected row.
 - The Report as finished journal is posted. If you want to make adjustments to the journal, you can manually create a new journal where you can make changes.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

End a production order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to end a production order. The demo data company used to create this procedure is USMF. This is the final procedure out of seven which explains the production order lifecycle.

End a production order

1. Go to Production control > Production orders > All production orders.
 - Select a production order that has the status Reported as finished.
2. On the Action Pane, click Production order.
3. Click End.
 - On this page, you can confirm that you want to end the production order.
4. Click the General tab.
5. In the Date field, enter a date.
6. In the Scrap method field, select 'Allocation'.
 - When you select the Allocation method, costs from the scrapped materials are added to the finished goods.
7. Click OK.

Validate calculation results

1. On the Action Pane, click Manage costs.
2. Click View cost comparison.
 - After you have ended the production order, you can compare the estimated cost price against the realized cost price to get an overview of the production variances.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Release production orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

A released production order is an order that has been authorized for production. The term Released is used to describe a state in the production order life cycle, where the production order is available for execution on the production shop floor and for warehouse processes.

Characteristics of the Released state

The **Released** state is one state in the production order life cycle. Production orders that are in the **Released** state are available for execution on the production shop floor and for warehouse processes. The **Released** state has the following characteristics:

- A production order can be changed to the **Released** state either from the production order or by using a batch process. The production order can also be updated automatically from planned production orders that are firmed by using the **Firming time fence** field on the **Master plan** page.
- The **Released** state is the signal for the shop floor operators (operators) to start executing the production jobs on the shop floor.
- Production papers, such as route cards, route jobs, and jobs cards provide information about production jobs and can be issued.
- For materials that are physically reserved, warehouse work is generated to pick materials for the production order.

Releasing jobs to the shop floor

After a production order is released, production jobs that are related to the order are visible and ready for registration. The operators can make job registrations, such as Start, Stop, and Completion, on either the **Job card terminal** page or the **Job card device** page. The registered time and quantity are automatically transferred from the registration pages to production journals to keep track of the consumed time and quantity.

Route cards

A route card provides an overview of information that comes from route and operation setups, and from operation and job scheduling methods.

Route jobs

A route job lists each job of an operation in detail, and includes setup, process, queue, and transportation times. For example, an operation such as painting might require individual jobs, such as setup time, run time for the painting process, and queue time for drying.

Job cards

A job card lists the individual job numbers of a particular operation. One job appears on each page. The jobs that are included on a job card, and their estimated times, come from the route and operation setup information. From a job card, you can open the **Production journal lines, job card** page. People who run operations resources can provide feedback about the production process. There are fields where you can enter consumption statistics and information such as the error quantity.

Warehouse work for raw material picking

Work for raw material picking is generated during release. Work is generated only for the quantity of materials that was physically reserved for the production order before the order was released. The following setup is required to generate warehouse work for raw material picking:

- A location directive for raw materials picking that determines which warehouse location to pick the materials in
- A wave template for raw materials, where policies for the execution of warehouse work are configured
- A production input location that determines where materials are put

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Report production orders as finished

2/18/2021 • 2 minutes to read • [Edit Online](#)

Report as finished is a production stage. At this stage, a finished product is reported and moved from the production order to the inventory.

When a quantity of the finished goods is reported as finished on a production order it is updated as on-hand in the inventory. Partial quantities of the originally planned order quantity can be reported as finished. It is also possible to report error quantities with an associated error reason when reporting quantities as finished. When the production order reach the stage Reported as finished it indicates that no more quantity is going to be reported at the production order. The following characteristics are also associated with the **Report as finished** process:

- It is possible to set up consumption of raw material and time that are proportional to the reported quantity (back-flushing)
- Put-away work can be generated for items that are enabled for warehouse processes.
- The planned or standard cost value of the finished goods can be set up to be reported to ledger accounts.
- A quality order can be created for the reported quantity based on the setup of a quality association.

The quantity is reported to the output location. Warehouse work is then generated to move the quantity from the output location to its final destination defined by the location directive for the put-away work.

- A quality order can be created when a production order is reported as finished if a quality association has been set up.

Set a production order to Reporting as finished

You can set a production order to **Report as finished** through the standard production order update function, or through the route and job card journals, or through the journal **Report as finished**. You can also update the stage to **Report as finished** through the job card terminal and job card device pages, when you report on the last job of the production order. Finally, you can enable the **Report as finished** option as a process for the handheld warehouse device solution.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure the production floor execution interface

2/18/2021 • 7 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

Shop floor workers use the production floor execution interface to register their daily work, such as when they start a job, report feedback about jobs, register indirect activities, and report absence. These registrations are the basis for tracking progress and cost on production orders, and for calculating the basis for the workers' pay.

When you open the production floor execution interface, it automatically loads a selected configuration and job filter that are specific to the browser and device. In the configuration, you set the policies that must be applicable for a specific usage. Here are some usage examples:

- On a device in the company hall, employees clock in when they come into the office, and they clock out when they leave for the day.
- On a device on the shop floor, machine operators register when they start and complete jobs. They also register breaks and indirect activities.

This topic describes the various options for configuring job card devices.

Turn on the production floor execution interface and its related optional features

The production floor execution interface itself, plus several of the optional settings that are described in this topic, must be turned on in your system before you can use them. Use the [Feature management](#) page to turn on any or all of the features described in the following subsections as required.

The production floor execution interface

This is the primary feature described in this topic. It adds the production floor execution interface to your system. To enable it, turn on the following feature in [feature management](#):

- Production floor execution

Generate license plates

These features make license plate functionality available to the production floor execution interface. If you'd like to use them, turn on the following features in [feature management](#) (in this order):

1. License plate for reporting as finished added to the Job Card Device
2. Enable automatic generation of license plate number when reporting as finished in the job card device

Print labels

These features make label printing functionality available to the production floor execution interface. If you'd like to use them, turn on the following features in [feature management](#) (in this order):

1. License plate for reporting as finished added to the Job Card Device
2. Print label from Job Card Device

Allow locking the touch screen

This feature adds a button to the production floor execution interface that enables workers to sanitize the touch screen. If you'd like to use it, turn on the following feature in [feature management](#):

- Feature for locking job card device and job card terminal so that they can be sanitized

Asset management functionality for the production floor execution interface

This feature adds an asset management tab to the production floor execution interface. Workers can use this tab to select an asset that is connected to a machine resource that is within the selected filter of the job list. For the selected machine asset, the worker can view the state and health of the asset from counter values for up to four selected counters. If you'd like to use this feature, turn on the following feature in [feature management](#):

- Asset management functionality for the production floor execution interface

Work with production floor execution configurations

To create and maintain device configurations, go to **Production control > Setup > Manufacturing execution > Configure production floor execution**. The **Configure production floor execution** page shows a list of existing configurations. On this page, you can perform the following actions:

- Select any production floor configuration that is listed in the left column to view and edit it.
- Select **New** on the Action Pane to add a new device configuration to the list. Then, in the **Configuration** field, enter a name to identify the new configuration. The name that you enter must be unique among all device configurations, and you won't be able to edit it later.

Next, configure the various settings for the selected device configuration. The following fields are available:

- **Report quantity at clock-out** – Set this option to *Yes* to prompt workers to report feedback about jobs that are in progress when they clock out. When this option is set to *No*, workers won't be prompted.
- **Lock employee** – When this option is set to *No*, workers will be signed out immediately after they make a registration (such as a new job). The device will then return to the sign-in page. When this option is set to *Yes*, workers will stay signed in to the job card device. However, a worker can manually sign out so that another worker can sign in while the job card device continues to run under the same system user account. For more information about these types of accounts, see [Assigned users](#).
- **Use the actual time of registration** – Set this option to *Yes* to set the time for each new registration to the exact time when the worker submitted the registration. When this option is set to *No*, the sign-in time is used instead. You will usually want to set this option to *Yes* if you've set the **Lock employee** and/or **Single worker** option to *Yes* in cases where workers often remain signed in for longer periods.
- **Single worker** – Set this option to *Yes* if only one worker uses each job card device where this configuration is active. When this option is set to *Yes*, the **Lock employee** option is automatically set to *Yes*. In addition, this setting removes the requirement (and ability) for the worker to sign in by using a badge ID (or another similar ID). Instead, the worker signs in to Microsoft Dynamics 365 Supply Chain Management by using a system user account that is linked to a *time registered worker* (from the *workers* table), and gets signed in to the job card device as that worker at the same time.
- **Allow locking the touchscreen** – Set this option to *Yes* to allow workers to lock the touchscreen of the job card device so that they can sanitize it. When this option is set to *Yes*, a **Lock screen for sanitizing** button is added to the device sign-in page. When a worker selects this button, the touchscreen is temporarily locked to prevent unintended input. A countdown timer is also shown. The worker can then safely clean the device and the screen. When the countdown is completed, the touchscreen is automatically unlocked.
- **Screen lock duration** – When the **Allow locking touchscreen** option is set to *Yes*, use this option to specify the number of seconds that the touchscreen should be locked for sanitizing. The duration must be between 5 and 120 seconds.
- **Generate license plate** – Set this option to *Yes* to generate a new license plate every time that a worker uses the job card device to report as finished. The license plate number is generated from a number sequence that is set up on the **Warehouse management parameters** page. When this option is set to *No*,

workers must specify an existing license plate when they report as finished.

- **Print label** – Set this option to *Yes* to print a license plate label when a worker uses the job card device to report as finished. The configuration of the label is set up in document routing, as described in [Document routing layout for license plate labels](#).
- **Tab selection** – Use the settings in this section to choose which tabs should be displayed by the production floor execution interface when the current configuration is active. You can design as many tabs as you need and then add and arrange them here as required. For details about how to design tabs and work with the settings here, see [Design the production floor execution interface](#).

Clean up job configurations

When the shop floor supervisor sets up the production floor execution interface, they select a configuration and a job filter. These selections are stored in a reference table in Supply Chain Management, and the browser uses an ID that is stored in a local cookie to find the correct row in that table. The table also logs the date and time that a worker last signed in to each device.

A batch job periodically cleans entries in the references table for devices that haven't logged any activity in the last 60 days. You can also manually clean the entries at any time by following these steps.

1. Go to **Production control > Setup > Manufacturing execution > Configure production floor execution**.
2. On the Action Pane, select **Clean up client configurations**.
3. In the **Clean up client configuration** dialog box, set the **Number of days** field to the number of days of inactivity (before today) to consider. You will remove all configurations and sign-in records for devices that haven't been active during that time.
4. Select **OK** to clean up the relevant configurations, based on the **Number of days** setting.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Design the production floor execution interface

2/18/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

You can design the content of the user interface for each configuration used by the production floor execution interface. For example, workers in one work cell might need to be able to open job instructions on the production floor, while in another work cell, instructions are not needed. In that case, two configurations should be created, one with a button for opening document attachments and one without this button.

Design a tab

On the **Configure production floor execution** page, you can create and configure tabs by selecting **Design tabs** on the Action Pane.

Each tab is divided into four sections, as shown in the following illustration.

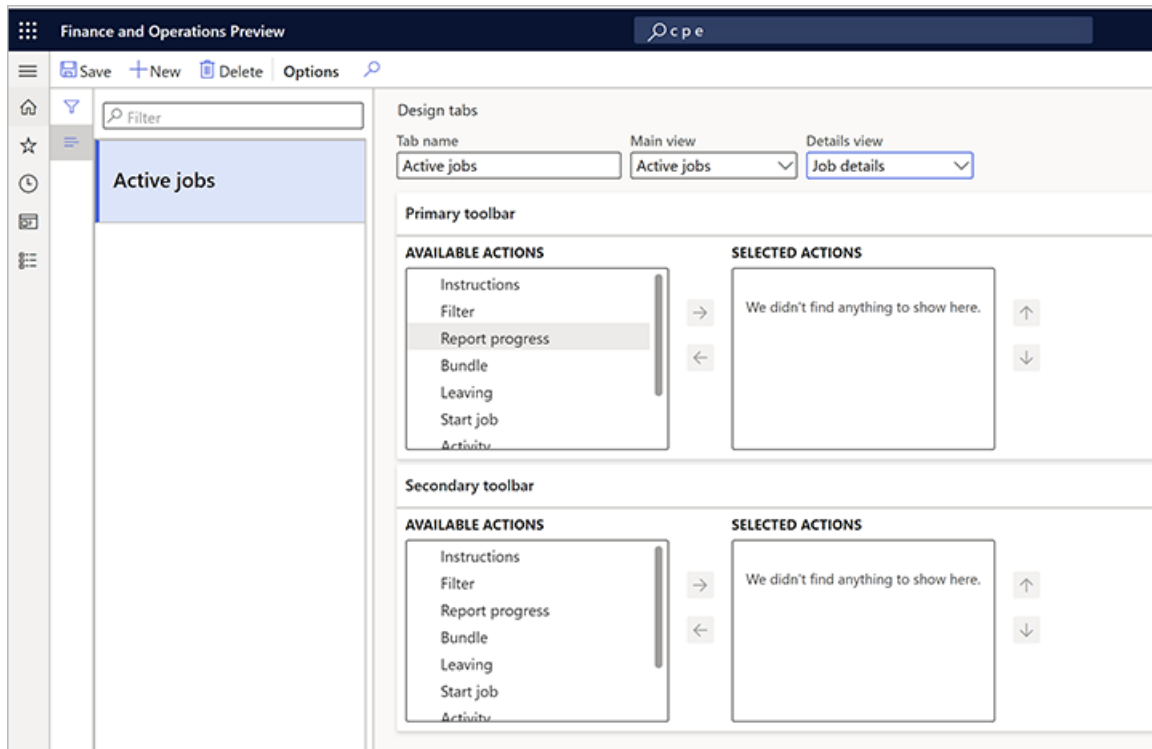

The following elements are shown in the illustration:

1. Primary toolbar
2. Secondary toolbar
3. Main view
4. Detailed view

To create and configure a new tab, follow these steps:

1. Go to **Production control > Setup > Manufacturing execution**.
2. Select **Design tabs** on the Action Pane to open the **Design tabs** page.

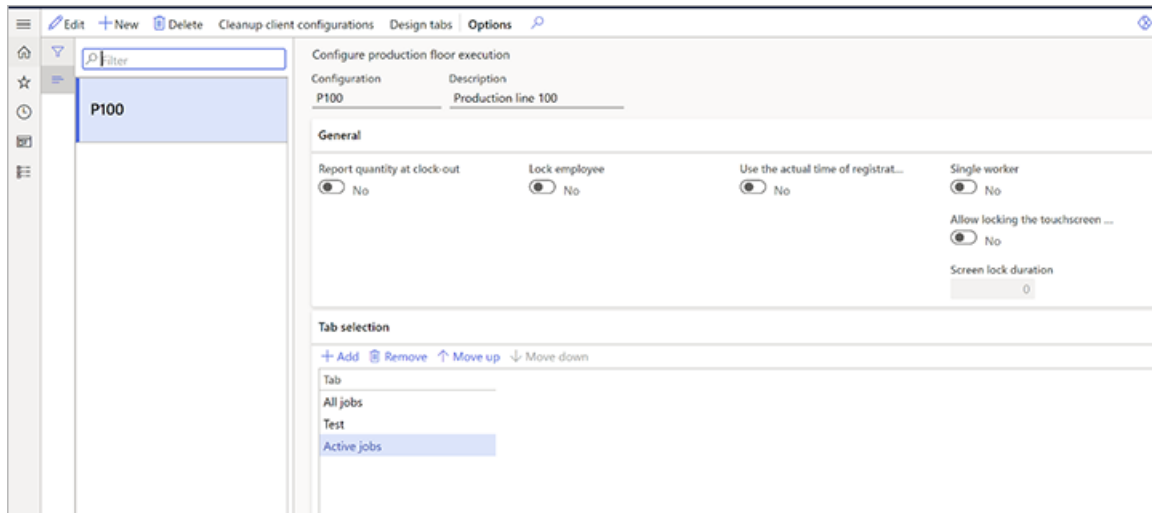

3. Select **New** on the Action Pane.
4. Make the following settings in the header of the page:
 - **Tab name** - Specify a name for the tab.
 - **Main view** - Select between the two pre-defined job lists (*Active jobs*, *All jobs*, or *My machine*).
 - **Details view** - Select between a blank value or **Job details**. If you select the blank value, there will be no detailed view in the tab. If you select **Job details**, the detailed view will contain a detailed description of the job selected in the job list in the main view.
5. In the **Primary toolbar** section, choose which buttons should be available in the primary toolbar. The **Available actions** column shows a list of all the buttons that can be added. The **Selected actions** columns shows a list of all the buttons that are included in the current configuration. Use the buttons between the columns to move selected items between the columns as needed. Use the up and down buttons next to the **Selected actions** column to control the order in which the buttons are presented in the user interface.
6. In the **Secondary toolbar** section, choose which buttons should be available in the secondary toolbar. The **Available actions** column shows a list of all the buttons that can be added. The **Selected actions** columns shows a list of all the buttons that are included in the current configuration. Use the buttons between the columns to move selected items between the columns as needed. Use the up and down buttons next to the **Selected actions** column to control the order in which the buttons are presented in the user interface.

Associate a tab with a configuration

After you designed all the tabs you need, you can associate them with a configuration.

1. Go to **Production control > Setup > Configure production floor execution**.

2. On the **Tab selection** FastTab, select **Add**.
3. A new row is added to the grid. For this new row, select the name of a tab that you want to add to the configuration.
4. Continue to add additional tabs as needed.
5. Use the **Move up** and **Move down** buttons on the toolbar to arrange the tabs as needed. The tabs will be displayed from left to right in the order shown in the above screenshot (the tab at the top is shown on the left).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a device to run the production floor execution interface

2/18/2021 • 4 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

The production floor execution interface is set up for every device on the production floor. Companies typically set up each device differently, depending on the purpose that the device serves. For example, a company might have one device in the reception area, where workers clock in and clock out, and another on the shop floor, where workers manage their jobs.

Set the configuration and filters for a specific device

To set the configuration and job filters for a device, sign in to the **Production floor execution** page by using an account that has a security role that includes the *Maintain time supervisor* duty. (Among the out-of-box security roles, only *Shop floor supervisor* has this duty.) Then follow these steps.

1. Go to the device that you want to set up, and sign in to Microsoft Dynamics 365 Supply Chain Management as a shop floor supervisor. (Use an account that includes the *Maintain time supervisor* duty.)
2. Make sure that a configuration is available for the device that you're setting up. If no configuration already exists, a default configuration is provided. For more information about how to set up a configuration, see [Configure the production floor execution interface](#).
3. Go to **Production control > Manufacturing execution > Production floor execution**.

If the production floor execution interface has already been configured at least one time on the current device, a sign-in page appears. Otherwise, a welcome page appears.

4. On either the sign-in page or the welcome page, select **Configure**.
5. Select a configuration in the list.
6. Select **Next**.
7. Select one or more filters to apply to the current device. These filters will help ensure that only relevant jobs are shown on the device. To set a filter, select the filter type to open a list of values, and then select the value to filter on. The following filters are available:
 - **Production unit** – This filter is the highest-level filter. It typically refers to a large work area that has several resource groups and individual resources in it.
 - **Resource group** – This filter is a mid-level filter. It typically refers to a collection of related resources in a limited area of the workspace. If you select a **Production unit** filter first, the list of resource groups shows only groups from that unit. Otherwise, it shows all available resource groups.
 - **Resource** – This filter is the most specific filter. It typically refers to a specific machine or other single resource. If you select a **Resource group** and/or **Production unit** filter first, the list of resources shows only resources from that group and/or unit. Otherwise, it shows all available resources.

8. Select **OK**.
9. The sign-in page appears, and your device is ready for use.

Allow a worker to override the default filters

You can give specific workers permission to change the filter settings on any device that they use. For workers who have this permission, the production floor execution interface provides a **Filter** button on the **All jobs** and **Active job** pages.

NOTE

If a worker changes a filter, the new filter applies from that point forward, for all users who sign in to the device.

To allow a worker to override the default job filters that have been set up for a device, follow these steps.

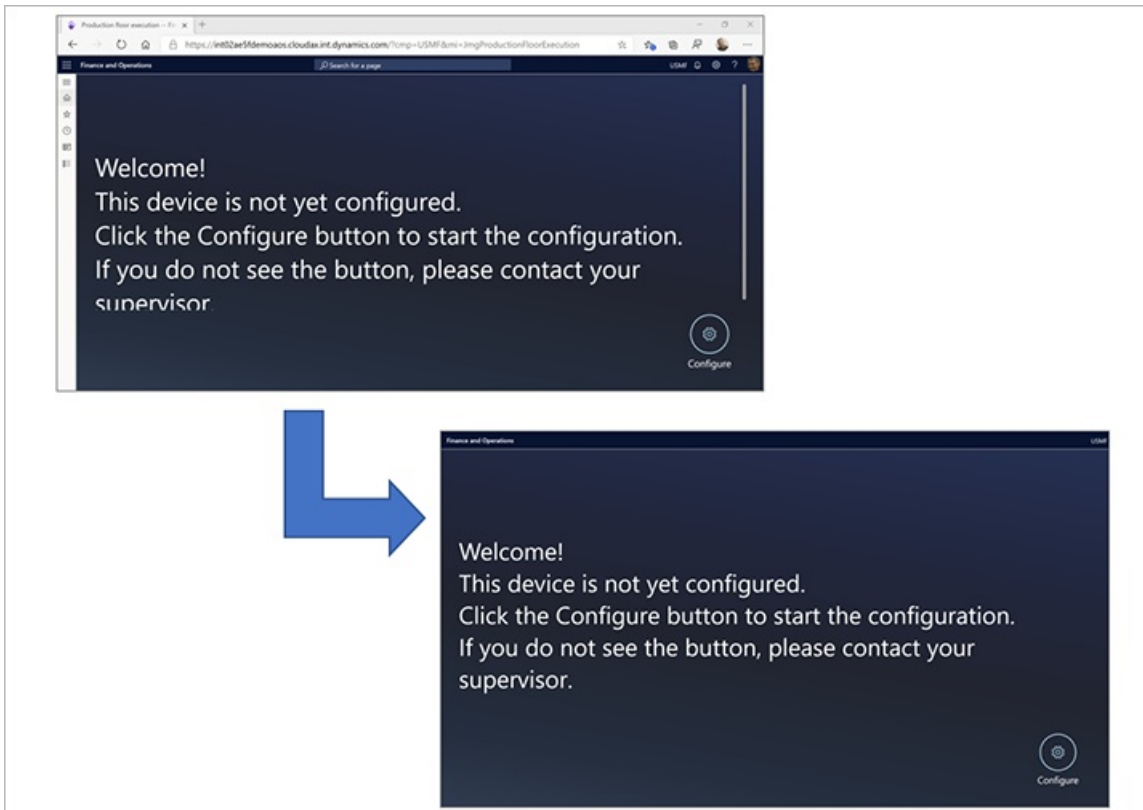

1. Go to **Time and attendance > Setup > Time registration workers**.
2. Select a worker in the list to open that worker's **Time registration workers** page.
3. On the **Time registration** tab, set the **Set filters** option to *Yes*.

Run the interface in full-screen mode

Often, you will run the production floor execution interface on a device that is used exclusively for that purpose. Therefore, it might make sense to run the interface in full-screen mode, without showing any navigation and/or browser chrome.

- To hide the navigation pane that is shown in Supply Chain Management, add the following text to the end of the URL in the browser's address bar: `&limitednav=true`.
- To also hide the browser's address bar, use the browser's native full-screen mode. (For instructions, see your browser's documentation.)

The upper part of the following illustration shows how the interface looks by default. The lower part shows how it looks in full-screen mode when the navigation pane is hidden.

Extend the session past 12 hours

By default, the production floor execution interface automatically signs out if nobody uses it for 12 hours. A Supply Chain Management user must then sign in again. However, you can extend the time-out limit to up to 90 days.

To extend the time-out limit, sign in to Supply Chain Management, and go to **System administration > Users > Session extensions**. Specify the Supply Chain Management user account that is used to sign in to the device, and the number of hours that the session should stay active for.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

How workers use the production floor execution interface

2/18/2021 • 12 minutes to read • [Edit Online](#)

IMPORTANT

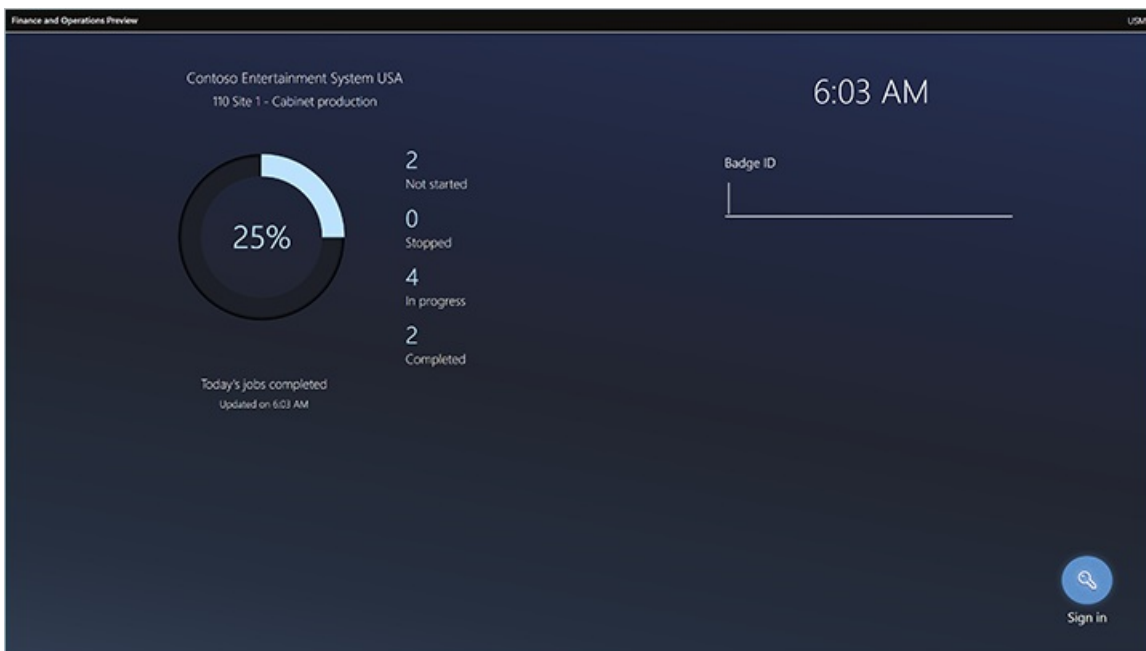

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

The production floor execution interface is optimized for touch interaction. Its design provides visual contrast that meets accessibility requirements for shop floor environments. It offers all the same functional capabilities as the job card device. However, it also enables multiple jobs to be started in parallel from a job list. (This capability is also known as *job bundling*.) Additionally, from a job list, workers can open a guide that was created in Microsoft Dynamics 365 Guide. In this way, they can get visual instructions on a HoloLens.

Sign in to the production floor execution interface as a worker

Before workers can start to use the device, a supervisor or technical staff must prepare it and open the correct page in Dynamics 365 Supply Chain Management. For more information about how to set up the device, see [Set up a device to run the production floor execution interface](#).

After the device has been prepared, the sign-in page appears on it. This page shows information about the status of jobs for the local work cell. This information is updated periodically. On the page, workers use their badge IDs to sign. Although workers don't have to have a user account for Supply Chain Management, they must have a *time registered worker* account that they can use when they sign in.

The remaining sections of this topic describe how workers interact with the interface.

All jobs tab

The **All jobs** tab provides a job list that shows all the production jobs that have a status of *Not started*, *Stopped*,

or *Started*. (This tab name is customizable and may be different for your system.)

The job list has the following columns. The numbers correspond to the numbers in the previous illustration.

1. **Selection column** – The leftmost column uses check marks to indicate jobs that have been selected by the worker. Workers can select multiple jobs in the list at the same time. To select all the jobs in the list, select the check mark in the column header. When a single job is selected, details about that job are shown in the lower part of the page.
2. **Job status column** – This column uses symbols to indicate the status of each job. Jobs that have no symbol in this column have a status of *Not started*. A green triangle indicates jobs that have a status of *Started*. Two yellow vertical lines indicate jobs that have a status of *Stopped*.
3. **High priority column** – This column uses exclamation marks to indicate jobs that have high priority.
4. **Order** – This column shows the production order number for a job.
5. **Description** – This column shows a description of the operation that a job is part of.
6. **Requested** – This column shows the quantity that a job is planned to produce.
7. **Started** – This column shows the quantity that has already been started for a job.
8. **Completed** – This column shows the quantity that has already been completed for a job.
9. **Scrapped** – This column shows the quantity that has already been scrapped for a job.
10. **Remaining** – This column shows the quantity that remains to be completed for a job.

Active jobs tab

The *Active jobs* tabs shows a list of all jobs that the signed-in worker has already started. (This tab name is customizable and may be different for your system.)

Instructions

The active jobs list has the following columns:

- **Selection column** – The leftmost column uses check marks to indicate jobs that have been selected by the worker. Workers can select multiple jobs in the list at the same time. To select all the jobs in the list, select the check mark in the column header. When a single job is selected, details about that job are shown in the lower part of the page.
- **Order** – This column shows the production order number for a job.
- **Description** – This column shows a description of the operation that a job is part of.
- **Requested** – This column shows the quantity that a job is planned to produce.
- **Started** – This column shows the quantity that has already been started for a job.
- **Completed** – This column shows the quantity that has already been completed for a job.
- **Scrapped** – This column shows the quantity that has already been scrapped for a job.
- **Remaining** – This column shows the quantity that remains to be completed for a job.

My machine tab

The **My machine** tab lets workers select an asset that is connected to a machine resource within the filter set on the **All jobs** tab. The worker can then view the state and health of the selected asset by reading values for up to four selected counters and lists of recent maintenance requests and registered downtimes. The worker can also request maintenance for the selected asset and register and edit machine downtime. (This tab name is customizable and may be different for your system.)

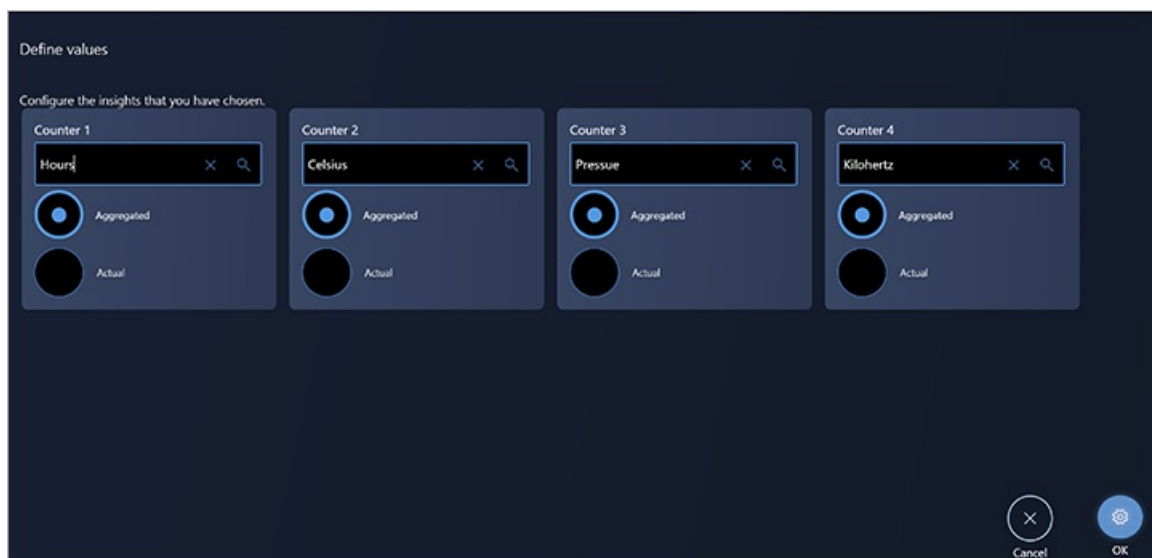

The **My machine** tab has the following columns. The numbers correspond to the numbers in the previous illustration.

1. **Machine asset** – Select the machine asset that you want to track. Start typing a name to select from a list of matching assets, or select the magnifying-glass icon to select from a list of all assets associated with the resources that are within the filter of the job list.

NOTE

Supply Chain Management users can assign a resource to each asset as needed using the **All assets** page (on the **Fixed asset** tab, using the **Resource** drop-down list). For more information, see [Create an asset](#).

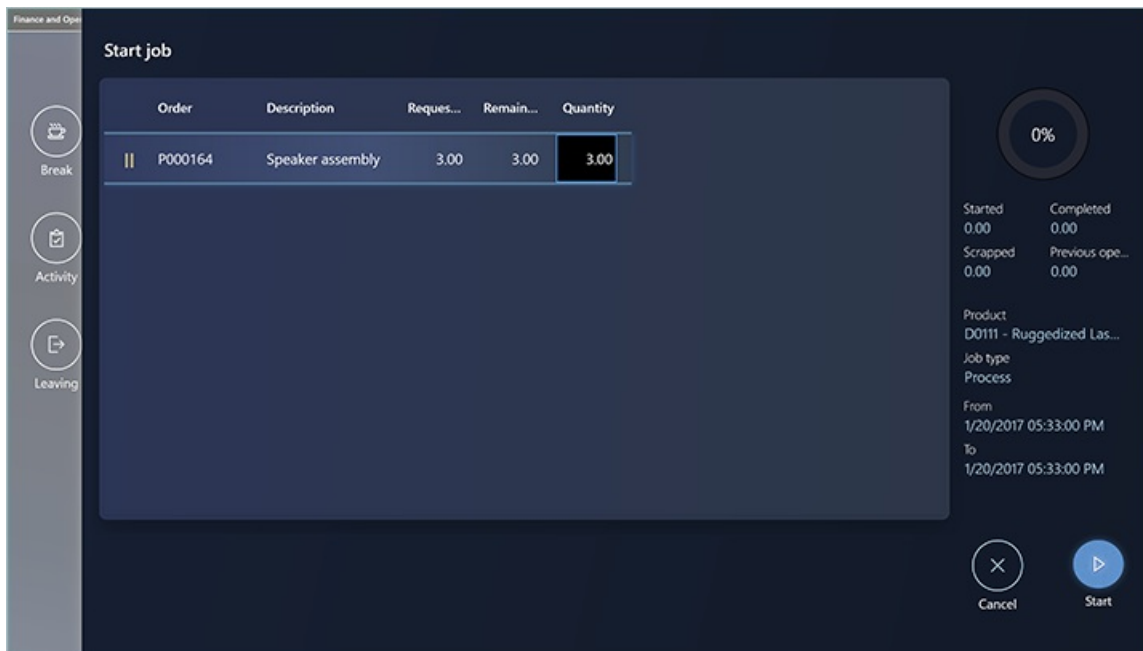

2. **Settings** – Select the gear icon to open a dialog box where you can choose which counters to view for the selected machine asset. Values for these counters are shown at the top of the **Asset management** tab. The **Settings** menu (shown in the following screenshot) lets you enable up to four counters. For each counter that you want to enable, use the lookup field at the top of the tile to select a counter. The lookup field lists all of the counters associated to the asset selected at the top of the **Asset management** page. Set each counter to monitor either the **Aggregated** value or the latest **Actual** value for the counter. For example, if you set a counter that tracks how many hours the machine has been running, then you should set it to **Aggregated**. If you set a counter to measure the latest updated temperature or pressure, then you should set it to **Actual**. Select **OK** to save your settings and close the dialog box.

3. **Request maintenance** – Select this button to open a dialog box where you can create a maintenance request. You'll be able to provide description and a note. The request will be brought to the attention of a Supply Chain Management user, who will then be able to convert the maintenance request to a maintenance work order.
4. **Register downtime** – Select this button to open a dialog box where you can register machine downtime. You'll be able to select a reason code and enter a date/time span for the downtime. The machine downtime registration is used for calculating the efficiency of the machine asset.
5. **View or edit** – Select this button to open a dialog box where you can edit or view existing downtime records.

Starting and completing production jobs

Workers start a production job by selecting a job on the **All jobs** tab and then selecting **Start job** to open the **Start job** dialog box.

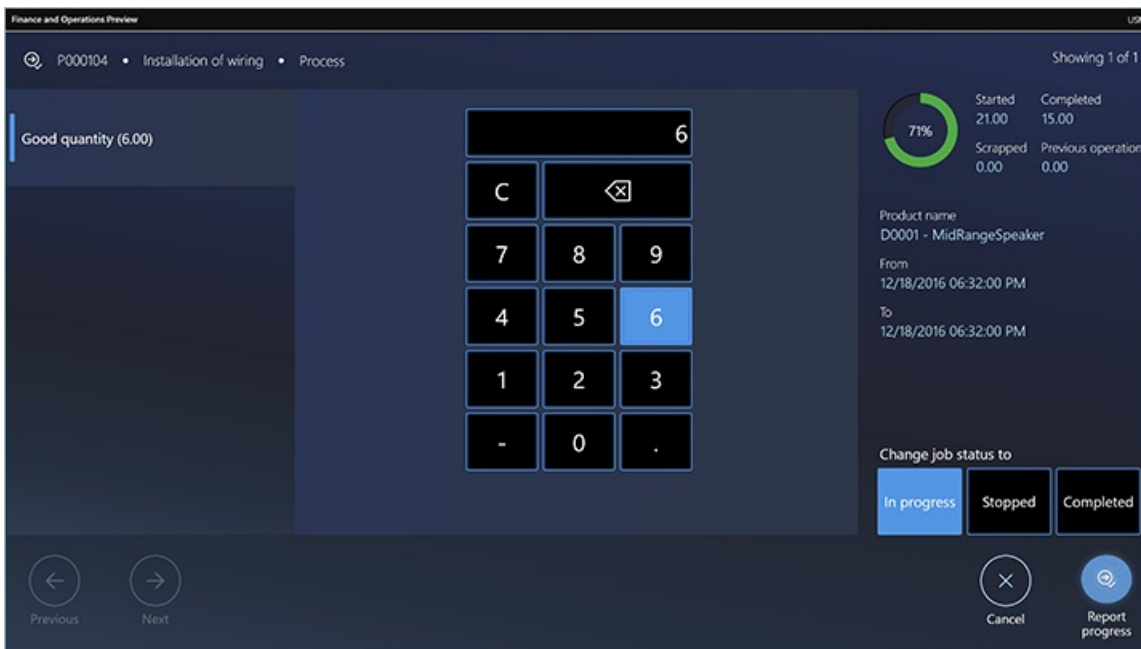

Workers use the **Start job** dialog box to confirm the production quantity and then start the job. Workers can adjust the quantity by selecting the **Quantity** field and then using the numeric keyboard that appears. Workers then select **Start** to start to work on the job. The **Start job** dialog box is closed, and the job is added to the **Active jobs** tab.

Workers can start a job that is in any status. When a worker starts a job that has a status of *Not started*, the **Quantity** field in the **Start job** dialog box initially shows the full quantity. When a worker starts a job that has a status of *Started* or *Stopped*, the **Quantity** field initially shows the remaining quantity.

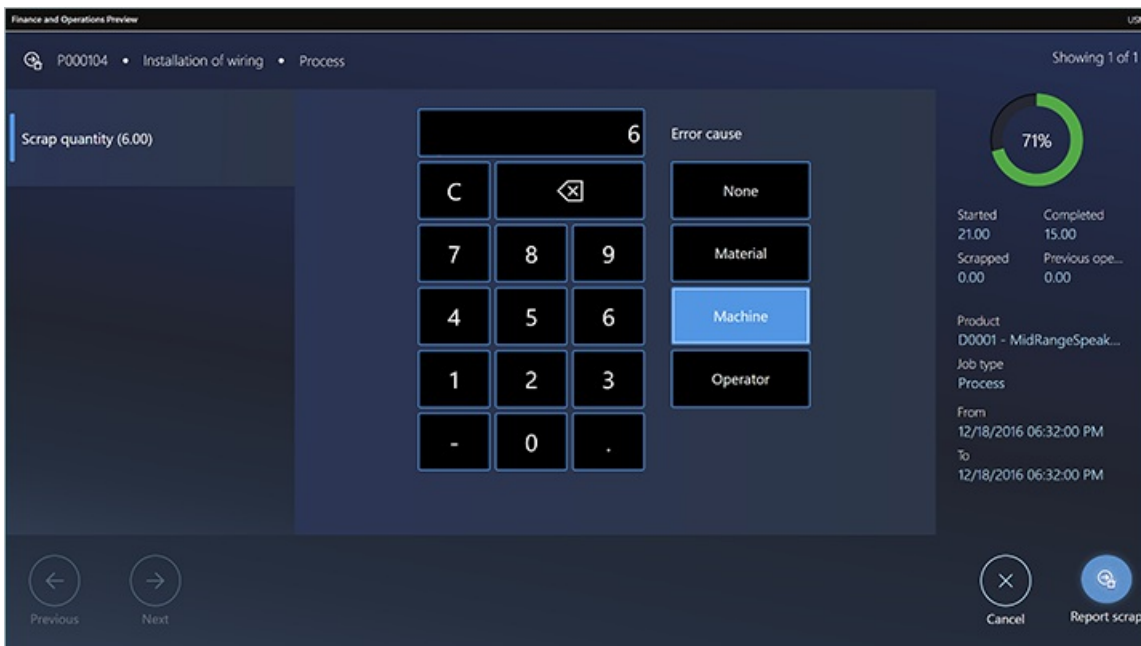

Reporting good quantities

When a worker completes or partially completes a job, they can report good quantities that were produced by selecting a job on the **Active jobs** tab and then selecting **Report progress**. Then, in the **Report progress** dialog box, the worker enters the good quantity by using the numeric keyboard. The quantity is blank by default. After a quantity is entered, the worker can update the status of the job to *In progress*, *Stopped*, or *Completed*.

Reporting scrap

When a worker completes or partially completes a job, they can report scrap by selecting a job on the **Active jobs** tab and then selecting **Report scrap**. Then, in the **Report scrap** dialog box, the worker enters the scrap quantity by using the numeric keyboard. The worker also selects a reason (*None*, *Machine*, *Operator*, or *Material*).

Completing a job and starting a new job

Usually, workers complete a job by selecting one or more current jobs on the **Active jobs** tab and then selecting **Report progress**. They then enter the quantity that was produced (the good quantity) and set the status to *Complete*. If more than one job was selected, a worker then uses the **Previous** and **Next** buttons to move among them. To start a new job, the worker selects it on the **All jobs** tab and then selects **Start job**.

A worker can also start a new job while their previous job is still open. Once again, the worker selects the new job on the **All jobs** tab and then selects **Start job**. However, in this case, the **Start job** dialog box informs the worker that they are currently working on a job, and that they must therefore either stop or complete that job before they start the new job.

Working on multiple jobs in parallel

One worker can work on multiple jobs at the same time (that is, in parallel). In this case, the collection of jobs that the worker is working on is called a *job bundle*. The worker can add new jobs to the bundle, or complete one or more jobs in the bundle. The following two scenarios show how a worker can work on jobs in parallel.

Scenario 1: A worker who has no active jobs wants to start two jobs and work on them in parallel

The worker selects the two jobs on the **All jobs** tab and then selects **Start job**. The **Start job** dialog box shows both selected jobs, and the worker can adjust the quantity to start on each job. The worker then confirms the dialog box and can start both jobs.

Scenario 2: A worker who has two active jobs that are in progress wants to start a third job and work on it in parallel with the other two

The worker selects the third job on the **All jobs** tab and then selects **Bundle**. In the **Bundle** dialog box, the worker can adjust the quantity to start. The worker then confirms the dialog box by selecting **Bundle**.

Working on indirect activities

Indirect activities are activities that aren't directly related to a production order. Indirect activities can be flexibly defined, as described in [Set up indirect activities for time and attendance](#).

For example, Shannon, a floor worker at Contoso, wants to attend a company meeting, and meetings are considered an indirect activity. One of the following two scenarios applies:

- **Shannon is working on one or more active jobs.** Shannon selects **Activity**, identifies the activity (meeting), and confirms her selection. A message that appears informs her that she has jobs that are in progress. From the message, Shannon can choose to complete or stop the jobs that she is working on before she goes to the meeting.
- **Shannon doesn't have any active jobs.** Shannon selects **Activity**, identifies the activity (meeting), and she confirms her selection. She is now registered as being at the meeting.

In both scenarios, after Shannon confirms her selection, she goes to either the sign-in page or a page that will wait for her to confirm that she has returned from her indirect activity. The page that appears depends on the configuration of the production floor execution interface. (For more information, see [Configure the production floor execution interface](#).)

Registering breaks

Workers can register breaks. Breaks can be flexibly defined, as described in [Pay based on registrations](#).

A worker registers a break by selecting **Break** and then selecting the card that represents the break type (such as lunch). After the worker confirms the selection, the device shows either the sign-in page or a page that will wait for the worker to confirm that they have returned from the break. The page that appears depends on the configuration of the production floor execution interface. (For more information, see [Configure the production floor execution interface](#).)

Opening instructions

Workers can open a document that is attached to a job by selecting **Instructions**. The **Instructions** button is available only if a document is associated with the job in the master data. For example, a document that is attached to a product on the **Released products** page in Supply Chain Management will be available for workers to open in the shop floor execution interface.

Opening mixed-reality guides for HoloLens

[Dynamics 365 Guides](#) can help empower workers by providing hands-on learning that uses mixed reality. You can define standardized processes where step-by-step instructions guide workers to the tools and parts that they need and show how to use those tools in real work situations. Here is an overview of the process.

1. Every time that a worker opens a job list in the shop floor execution interface, the interface finds all relevant guides for the jobs that are shown.
2. The worker selects **Guides** to view the list of guides.
3. The worker selects a relevant guide in the list.
4. The shop floor execution interface shows a QR code for the selected guide.
5. The worker puts on a HoloLens and glances at the QR code to start the guide.
6. The worker works through the guide to learn the task.

For more information about how to create, assign, and use guides for HoloLens, see [Provide mixed-reality Guides for workers in production](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure job card for devices

2/18/2021 • 7 minutes to read • [Edit Online](#)

The job card device is used by the shop floor workers to register their daily work, such as when jobs are started, reporting feedback on jobs, registering indirect activities, and reporting absence. These registrations are the basis for tracking progress and cost on production orders and for calculating the basis for the workers' pay. This topic describes the various options for configuring job card devices.

Enable new features in feature management

A few of the settings described in this topic must be enabled on your system before they will be available to you. Use the [feature management](#) page to enable any or all of the following features as required.

Generate license plate

To make this feature available, enable the following features in [feature management](#) (in order):

1. License plate for reporting as finished added to the Job Card Device
2. Enable automatic generation of license plate number when reporting as finished in the job card device

Print label

To make this feature available, enable the following features in [feature management](#) (in order):

1. License plate for reporting as finished added to the Job Card Device
2. Print label from Job Card Device

Allow locking of touch screen

To make this feature available, enable the following feature in [feature management](#):

- (Preview) Feature for locking job card device and job card terminal so that they can be sanitized

Manage your device configurations

To set up your device configurations, go to **Production control > Setup > Manufacturing execution > Configure job card for devices**. The **Configure job card for devices** page opens, which shows a list of existing configurations. From here, you can do the following:

- Select any device configuration listed in the left column to view and edit it.
- Select **New** on the Action Pane to add a new device configuration to the list. Then enter a name in the **Configuration** field to identify the new configuration. The value you enter here must be unique among all device configurations, and you won't be able to edit it later.

Refer to following sections for details about each of the settings for configuring job card devices.

General settings

The **General** FastTab lets you configure each of the various options available for the selected device configuration. The following settings are available:

- **Report quantity at clock-out** - Set this to **Yes** to prompt workers to report feedback on jobs in progress when clocking out. When set to **No**, workers won't not be prompted.
- **Lock employee** - When this option is set to **No**, each worker will be logged out immediately after they make a registration (such as a new job), and then the device will return to the log-in page. When this option

is set to **Yes**, each worker will stay logged in to the job card device. However, the worker will still be able to log out manually to allow another worker to log in while the job card device remains running under the same system user account. For more information about these types of accounts, see [Assigned users](#).

- **Barcode scanner** - Set this to **Yes** to provide an option on the job card device that allows workers register the start of a new job by scanning a bar code.
- **Use the actual time of registration** - Set this to **Yes** to set the time for each new registration to be equal to the exact time that registration was submitted by a worker. Set to **No** to use the log-in time instead. You'll usually want to set this to **Yes** if you have enabled the **Lock employee** and/or **Single worker** options, where workers often remain logged in for longer periods.
- **Single worker** - Set this option to **Yes** if only one worker uses each job card device where this configuration is active. When this option is selected, the **Lock employee** option is automatically set to **Yes**. In addition, this option removes the requirement (and ability) for the worker to log in using a badge ID (or similar). Instead the worker signs in to Supply Chain Management using a system user account linked to a *time registered worker* (from the *workers* table) and gets logged in to the job card device as that worker at the same time. For more information about these types of accounts, see [Assigned users](#).
- **Allow workers to set personal filters** - Set this option to **Yes** to allow workers to filter the jobs shown to them on the device. The worker can modify values for any of the three filter criteria: **Production unit**, **Resource group** and **Resource**. Only jobs that are scheduled on resources matching the selected filter criteria will be shown on the device. You can also assign default values for any or all of these criteria, and those will apply even with this option is not selected.
- **Allow locking the touchscreen** - Set this option to **Yes** to allow workers to lock the job card device touchscreen so they can sanitize it. When enabled, a **Lock screen for sanitizing** button is added to the device log-in page. When a worker selects this button, the touchscreen temporarily locks to prevent unintended input and a countdown timer is shown. The worker can now safely clean the device and the screen. When the countdown completes, the touchscreen automatically unlocks again.
- **Screen lock duration** - When the **Allow locking touchscreen** option is enabled, use this option so specify number of seconds the touchscreen should be locked for sanitizing. The duration must be between 5 and 120 seconds.
- **Production unit** - Select a production unit to be applied as a default filter criterion for the list of jobs shown to each worker. Only jobs that are scheduled on resources grouped under the selected production unit will initially be displayed by the device. If **Allow workers to set personal filters** is enabled, workers will be able to edit this value, otherwise this filter will always apply when this device configuration is active.
- **Resource group** - Select a resource group to be applied as a default filter criterion for the list of jobs shown to each worker. Only jobs that are scheduled on resources grouped under the selected resource group will initially be displayed by the device. If **Allow workers to set personal filters** is enabled, workers will be able to edit this value, otherwise this filter will always apply when this device configuration is active.
- **Resource** - Select a resource to be applied as a default filter criterion for the list of jobs shown to each worker. Only jobs that are scheduled on the selected resource will initially be displayed by the device. If **Allow workers to set personal filters** is enabled, workers will be able to edit this value, otherwise this filter will always apply when this device configuration is active.
- **Generate license plate** - Set this option to **Yes** to generate a new license plate each time a worker uses the job card device to report as finished. The license plate number is generated from a number sequence set up on the **Warehouse management parameters** page. When set to **No**, workers must specify an existing license plate when reporting as finished.
- **Print label** - Set this option to **Yes** to print a license plate label when a worker uses the job card device to report as finished. The configuration of the label is set up in document routing, as described in [Document routing layout for license plate labels](#).

Assigned users

Use the **Assigned users** FastTab to associate one or more system users with the current device configuration.

Each system user can only be assigned one job device configuration.

When setting up a device, an IT worker typically signs in to Supply Chain Management using a system user account. Thereafter, the job device configuration associated with that system user applies for as long as that system user remains signed in. These system user accounts are typically limited to allow access only to the job card device page and no other part of Supply Chain Management.

After the system user is signed in and the job device configuration is loaded, workers can then log in to the job card device using their *time registered worker* account (for example, by scanning a bar code on their badge) so they can start new jobs and make other kinds of registrations. Various workers can log in and out during the day, while the same device configuration remains in effect on that machine because the system user remains signed in to Supply Chain Management for the day.

However, as mentioned previously, when you use a device configuration with the **Single worker** option, workers themselves typically sign in to Supply Chain Management using a system user linked to their own *time registered worker* account, so they load the device configuration and log in as a worker on the job card device at the same time.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Report as finished from the job card device

2/18/2021 • 10 minutes to read • [Edit Online](#)

Workers use the **Report progress** page on the job card device to report quantities that have been completed for a production job. This topic describes how to set up various options that establish how workers can report as finished using this page and what happens next. Options include:

- Control whether and how quantities that are reported as finished are added to inventory.
- Control whether and how batch numbers are generated and applied when reporting as finished.
- Control whether and how serial numbers are generated and applied when reporting as finished.
- Control whether and how to report as finished to a license plate.

Control whether quantities that are reported as finished are added to inventory

To control whether and how the quantities that are reported as finished on the last operation should be added to inventory, follow these steps.

1. Go to **Product control > Setup > Manufacturing execution > Production order defaults**.
2. On the **Report as finished** tab, set the **Update finished report on-line** field to one of the following values:
 - **No** – No quantity will be added to inventory when quantities are reported on the last operation. The status of the production order will never change.
 - **Status + Quantity** – The status of the production order will change to *Reported as finished*, and the quantity will be reported as finished to inventory.
 - **Quantity** – The quantity will be reported as finished to inventory, but the status of the production order will never change.
 - **Status** – Only the status of the production order will change. No quantities will be added to inventory when quantities are reported on the last operation.

NOTE

Quantities aren't tracked in inventory if the operations that they are reported as finished on aren't defined as the last operation. However, those quantities can be used to view progress. They can also be included in rules that control whether workers can start the next operation before a defined threshold of reported quantities on the previous operation is reached. You can define these rules on the **Quantity validation** tab on the **Production order defaults** page.

For more information about how to work with the **Production order defaults** page, see [Production parameters in Manufacturing execution](#).

Report batch-controlled items as finished

The job card device supports three scenarios for reporting on batch items. These scenarios apply both to items that are enabled for advanced warehouse processes and to items that aren't enabled for advanced warehouse processes.

- **Manually assigned batch numbers** - Workers enter a custom batch number. This batch number might come from an external source that isn't known to the system.

- **Predefined batch numbers** - Workers select a batch number in a list of batch numbers that the system automatically generates before the production order is released to the job card device.
- **Fixed batch numbers** - Workers don't enter or select a batch number. Instead, the system automatically assigns a batch number to the production order before it's released.

Enable the feature on your system

To enable your job card devices to accept a batch number during reporting as finished, you must use [feature management](#) to turn on the following features (in this order):

1. Improved user experience for the Report progress dialog in the Job Card Device
2. Enable to enter batch and serial numbers while reporting as finished from the Job Card Device (Preview)

Configure products that require batch number reporting

To enable a product to support any of the available batch-controlled scenarios, follow these steps:

1. Go to **Product information management > Products > Released products**.
2. Select the product to configure.
3. On the **Manage inventory** FastTab, in the **Batch number group** field, select the tracking number group that is set up to support your scenario.

NOTE

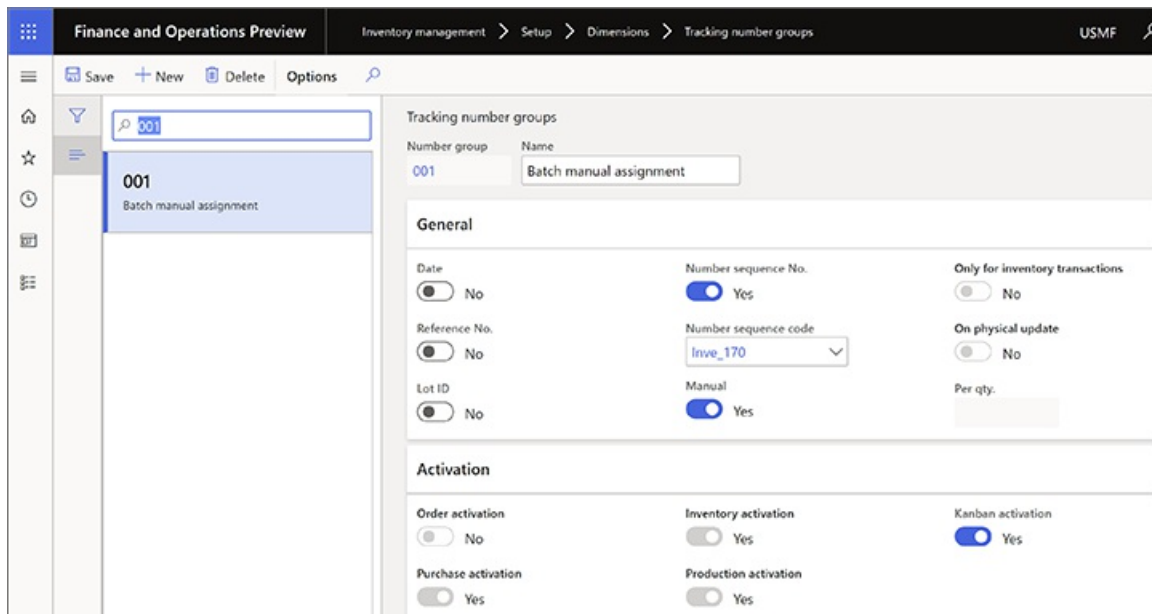

By default, if no batch number group is assigned to a batch-controlled product, the job card device provides manual entry for the batch number during reporting as finished.

The following sections describe how to set up tracking number groups to support each of the three scenarios for reporting on batch items.

Set up a tracking number group that lets workers manually assign a batch number

To allow for manually assigned batch numbers, follow these steps to set up a tracking number group.

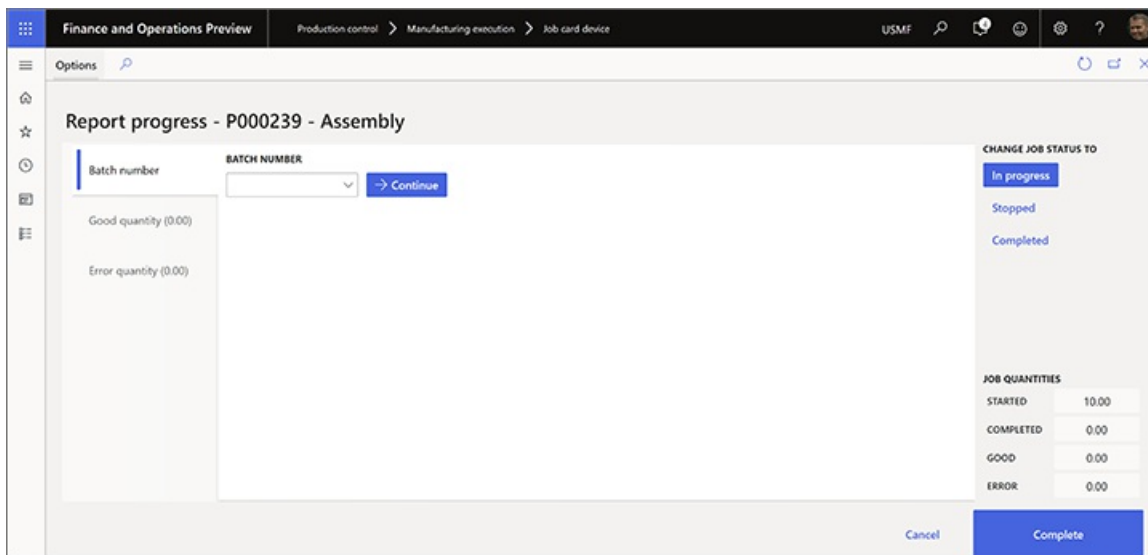

1. Go to **Inventory management > Setup > Dimensions > Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Manual** option to **Yes**.

4. Set other values as you require, and then select this tracking number group as the batch number group

for released products that you want to use this scenario for.

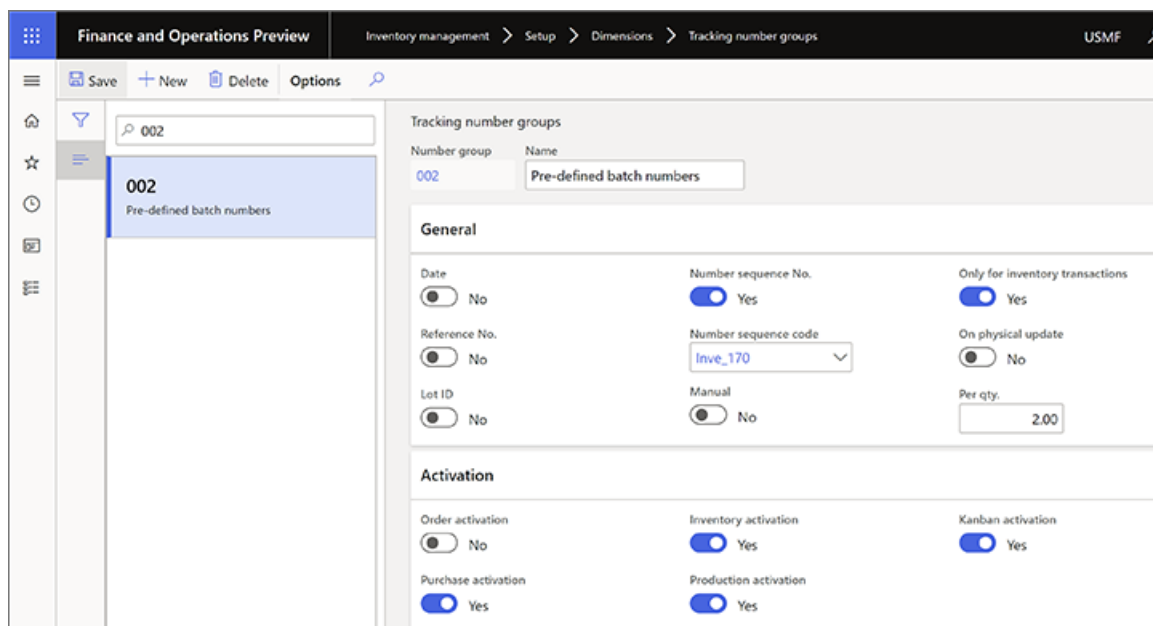

When you use this scenario, the **Batch number** field that the **Report progress** page on the job card device provides is a text box where workers can enter any value.

Set up a tracking number group that provides a list of predefined batch numbers

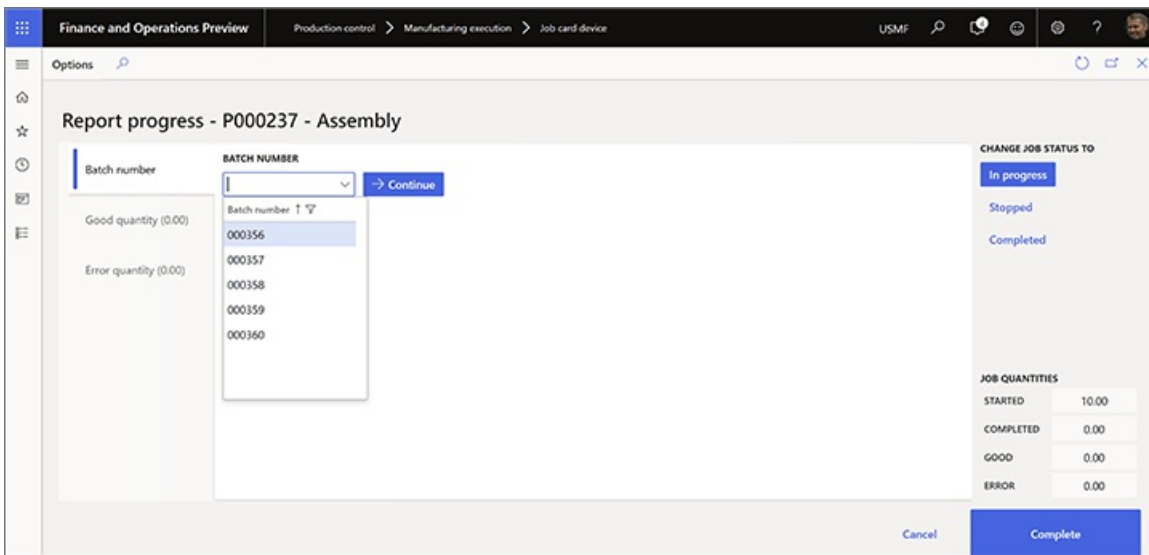

To provide a list of predefined batch numbers, follow these steps to set up a tracking number group.

1. Go to **Inventory management > Setup > Dimensions > Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **Yes**.
4. Use the **Per qty** field to split batch numbers per quantity, based on the value that you enter. For example, you have a production order for ten pieces, and the **Per qty** field is set to 2. In this case, five batch numbers will be assigned to the production order when it's created.

5. Set other values as you require, and then select this tracking number group as the batch number group for released products that you want to use this scenario for.

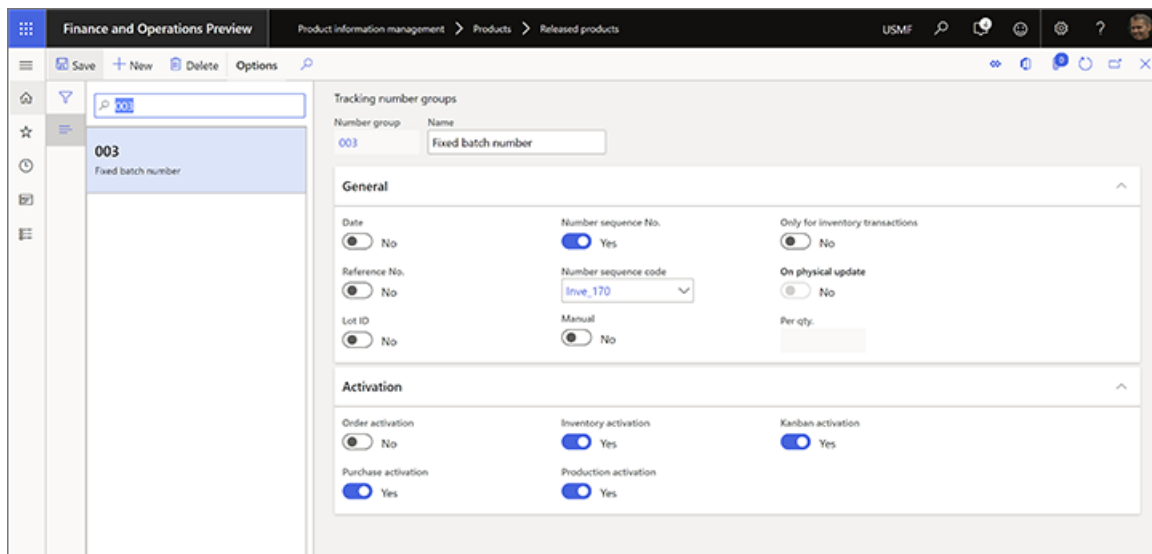

When you use this scenario, the **Batch number** field that the **Report progress** page on the job card device provides is a drop-down list where workers must select a predefined value.

Set up a tracking number group that automatically assigns batch numbers

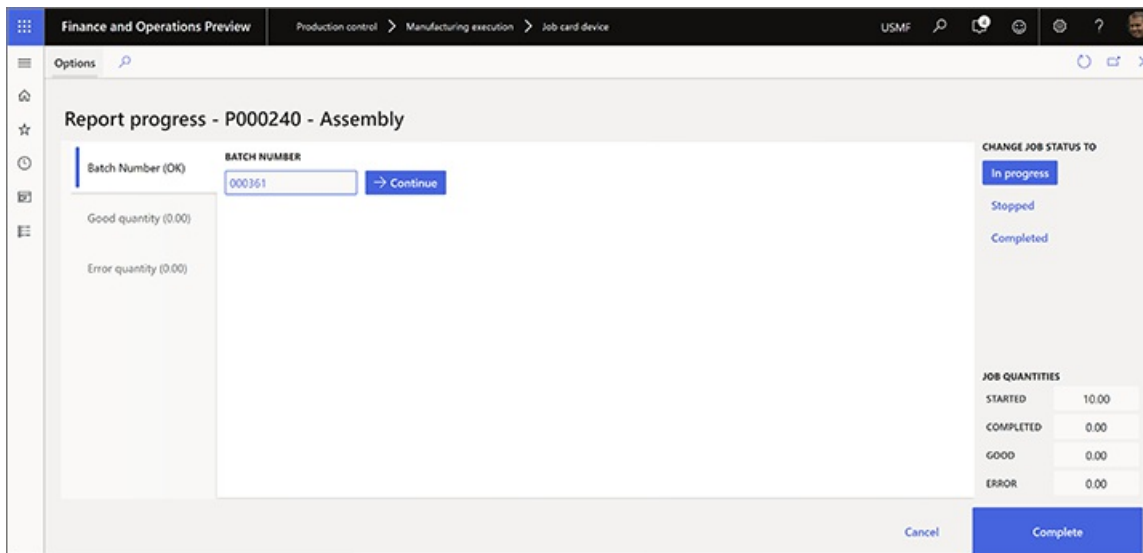

If batch numbers should be assigned automatically, without worker input, follow these steps to set up a tracking number group.

1. Go to Inventory management > Setup > Dimensions > Tracking number groups.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **No**.
4. Set the **Manual** option to **No**.

5. Set other values as you require, and then select this tracking number group as the batch number group for released products that you want to use this scenario for.

When you use this scenario, the **Batch number** field that the **Report progress** page on the job card device provides shows a value, but workers can't edit it.

Report serial-controlled items as finished

The job card device supports three scenarios for reporting on serial-controlled items. These scenarios apply both to items that are enabled for advanced warehouse processes and to items that aren't enabled for advanced warehouse processes.

- **Manually assigned serial numbers** - Workers enter a custom serial number. This serial number might come from an external source that isn't known to the system.
- **Predefined serial numbers** - Workers select a serial number in a list of serial numbers that the system automatically generates before the production order is released to the job card device.
- **Fixed serial number** - Workers don't enter or select a serial number. Instead, the system automatically assigns a serial number to the production order before it's released.

Enable the feature on your system

To enable your job card devices to accept a serial number during reporting as finished, you must use [feature management](#) to turn on the following features (in this order):

1. Improved user experience for the Report progress dialog in the Job Card Device
2. Enable to enter batch and serial numbers while reporting as finished from the Job Card Device (Preview)

Configure products that require serial-number reporting

To enable a product to support any of the available serial-controlled scenarios, follow these steps:

To enable each scenario, follow these steps.

1. Go to **Product information management > Products > Released products**.
2. Select the product to configure.
3. On the **Manage inventory** FastTab, in the **Serial number group** field, select the tracking number group that is set up to support your scenario.

NOTE

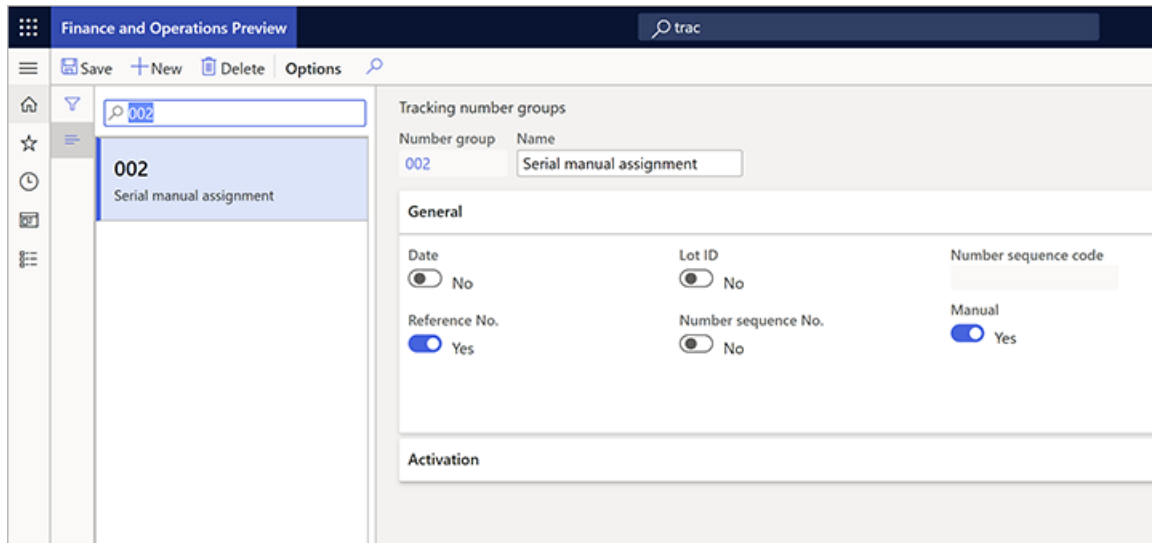

By default, if no serial number group is assigned to a serial-controlled product, the job card device provides manual entry for the serial number during reporting as finished.

The following sections describe how to set up tracking number groups to support each of the three scenarios for reporting on serial-controlled items.

Set up a tracking number group that lets workers manually assign a serial number

To allow for manually assigned serial numbers, follow these steps to set up a tracking number group.

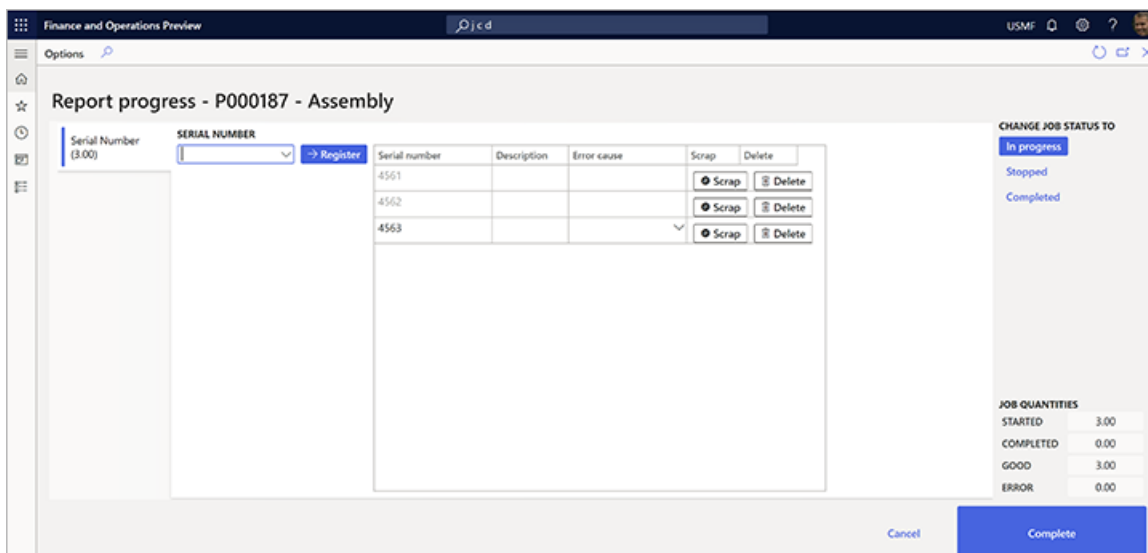

1. Go to **Inventory management > Setup > Dimensions > Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Manual** option to **Yes**.

4. Set other values as you require, and then select this tracking number group as the serial number group for released products that you want to use this scenario for.

When you use this scenario, the **Serial number** field that the **Report progress** page on the job card device provides is a text box where workers can enter any value for the serial number. On entering a value, it is added to the serial number list. In this list, workers can do the following:

- To mark a serial number as scrapped, select the **Scrap** button for the appropriate row. The worker will be prompted to provide an **Error cause**.
- To delete a serial number, select the **Delete** button for the appropriate row.

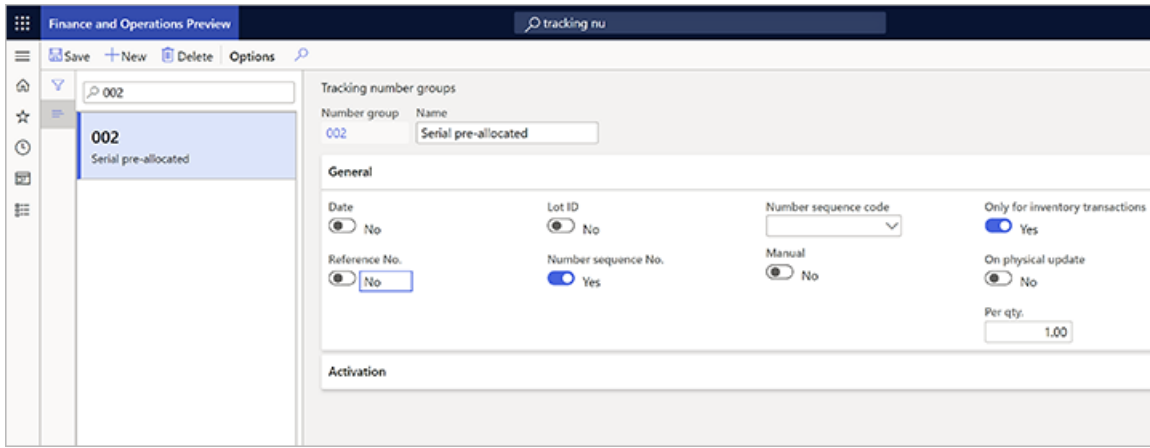

Set up a tracking number group that provides a list of predefined serial numbers

To provide a list of predefined serial numbers, follow these steps to set up a tracking number group.

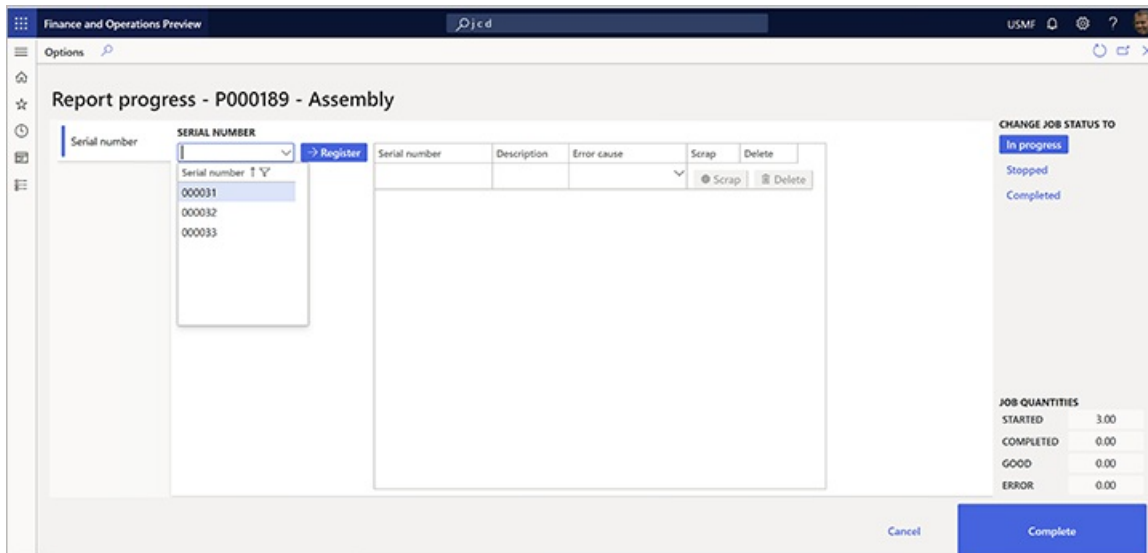

1. Go to **Inventory management > Setup > Dimensions > Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **Yes**.

4. Use the **Per qty** field to split serial numbers per quantity of one.

5. Set other values as you require, and then select this tracking number group as the serial number group for released products that you want to use this scenario for.

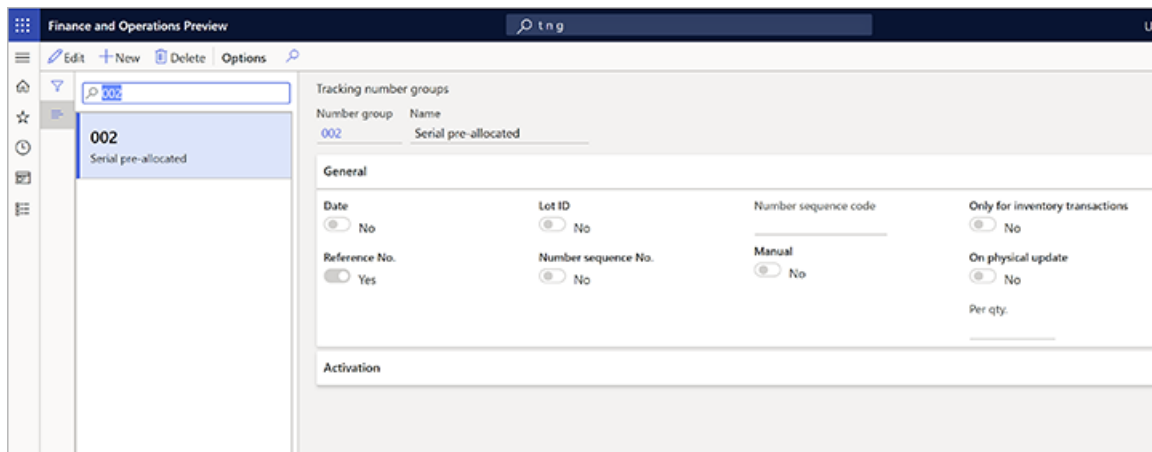

When you use this scenario, the **Serial number** field that the **Report progress** page on the job card device provides is a drop-down list where workers must select a predefined value.

Set up a tracking number group that automatically assigns serial numbers

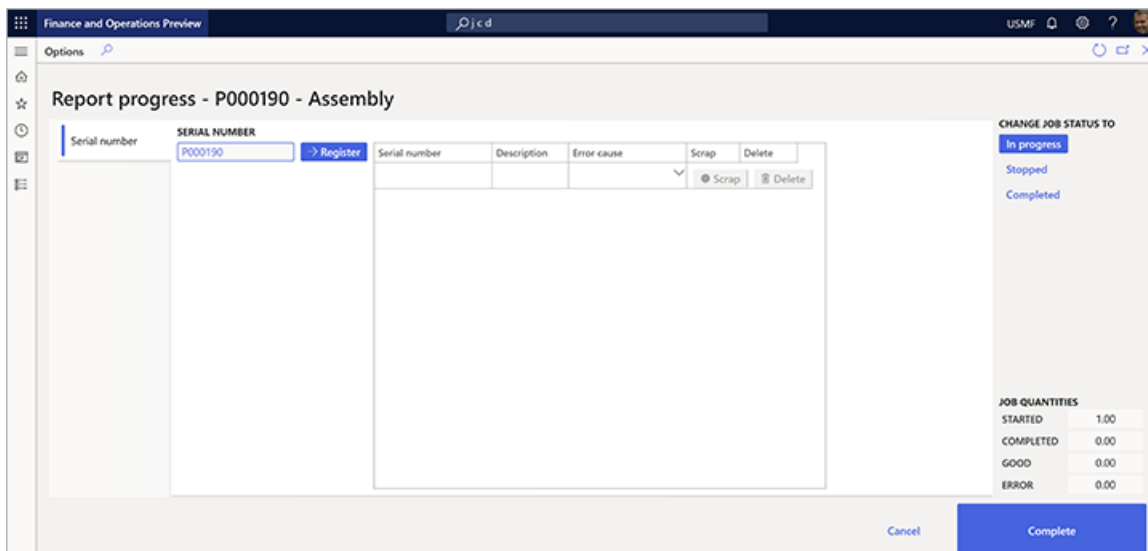

If a serial number should be assigned automatically, without worker input, follow these steps to set up a tracking number group.

1. Go to **Inventory management > Setup > Dimensions > Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **No**.
4. Set the **Manual** option to **No**.

5. Set other values as you require, and then select this tracking number group as the serial number group for released products that you want to use this scenario for.

When you use this scenario, the **Serial number** field that the **Report progress** page on the job card device provides shows a value, but workers can't edit it. This scenario is only relevant when a production order is created for a quantity of one piece of a serial number-controlled item.

Report as finished to a license plate

Advanced warehouse processes can use the license plate dimension to track inventory on warehouse locations that have been set up for this purpose. In this case, the license plate number is required when a worker reports quantities as finished.

Enable license plate reporting and label printing

To use the features that are described in this section, you must use [feature management](#) to turn on the following features (in this order):

1. License plate for reporting as finished added to the Job Card Device
2. Enable automatic generation of license plate number when reporting as finished in the job card device
3. Print label from Job Card Device

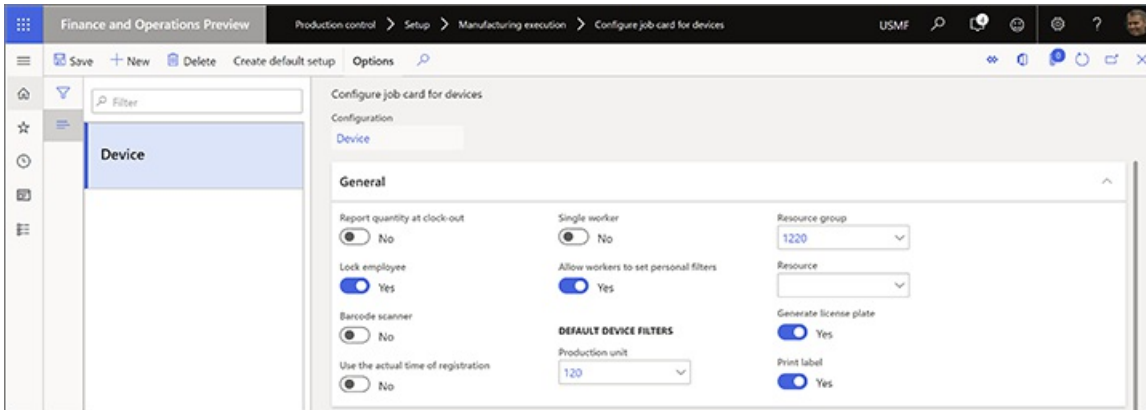

Set up reporting as finished to a license plate

To control whether workers should reuse an existing license plate or generate a new license plate when they report quantities as finished, follow these steps.

1. Go to **Production control > Setup > Manufacturing execution > Configure job card for devices**.

2. Set the following options for each device:

- **Generate license plate** – Set this option to **Yes** to generate a new license plate for each report as finished. Set it to **No** if an existing license plate should be used for each report as finished.
- **Print label** – Set this option to **Yes** if the worker must print a license plate label for each report as finished. Set it to **No** if no label is required.

NOTE

To configure the label, go to **Warehouse management > Setup > Document routing > Document routing**. For more information, see [Enable license plate label printing](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Provide mixed-reality Guides for workers in production

2/18/2021 • 15 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

Workers in production processes will benefit from relevant instructions that are provided at the right time in the context of their work. *Instructions* apply in several domains of work, including: assembly, service, operations, certification, and safety. Across all of these core business functions, ongoing training instructions can help empower workers to achieve more and work better.

Introduction

You can provide instructions in different ways. One efficient system that ships out of the box uses [Dynamics 365 Guides](#).

Dynamics 365 Guides can help empower your employees with hands-on learning. You can define standardized processes with step-by-step instructions that guide your employees to the tools and parts they need and show employees how to use these tools in real work situations.

You can attach guides to various aspects of production control including:

- [Resources](#)
- [Resource groups](#)
- [Released products](#)
- [Formulas](#)
- [Formula versions](#)
- [Bills of material \(BOMs\)](#)
- [BOM versions](#)
- [Routes](#)
- [Route versions](#)
- [Route operation relations](#)

NOTE

You can also attach Guides with Asset Management. For more information about that option, see [Integrate Dynamics 365 Supply Chain Management \(Asset Management\) with Dynamics 365 Guides](#).

When a first-line worker chooses a job on the shop floor through Supply Chain Management, the worker can see [the relevant guides](#) on the job card. When the worker chooses a specific guide, a QR code for that guide is

shown on the screen. The worker then uses their HoloLens to scan the QR code, which launches Guides and shows the required instructions.

The following subsections describe a few selected scenarios where companies across industries can see the biggest value when using Guides to present instructions for manufacturing.

Assembly

Instructions in assembly operations show workers the tools and parts they need and how to use them in real work situations.

Production managers can create and assign Guides, for example, for [production routes](#), [operation relations](#), or [bills of material](#). Workers will find the relevant instructions on the respective operation experience on the shop floor.

Service

Equip technicians with guided instructions at the job site, eliminating the need to schedule additional visits.

Service managers can assign Guides, for example, to specific [products](#) that walk through routines of quality assessment.

Quality

Rollout new processes and ensure increased consistency by turning employee knowledge into a repeatable tool.

Quality assurance managers can assign guides, for example, to [products](#) that walk through routines of quality assessment.

Certifications

Ensure every employee meets high standards by quickly identifying who needs help and where.

Safety

Provide instructions that walk through dangerous procedures virtually before attempting in the physical environment. With a mixed reality approach, workers can experience dangerous procedures virtually.

Production managers can provide dedicated handling instructions for hazardous material handling or delicate handling procedures by assigning instructions to [product items](#), [routes](#), and [operations](#).

Get started with instructions and Guides

To enable instructions in production processes, Supply Chain Management provides an out-of-the-box integration with Dynamics 365 Guides. A licensed and installed application instance of Guides is required to build, maintain, and assign mixed reality instructions to production assets and work.

Prerequisites

To use this feature, your system must include the following:

- Dynamics 365 Supply Chain Management version 10.0.15 or later
- [Dual-write](#) for Supply Chain Management apps.
- [Dynamics 365 Guides](#) version 400.0.1.48 or later

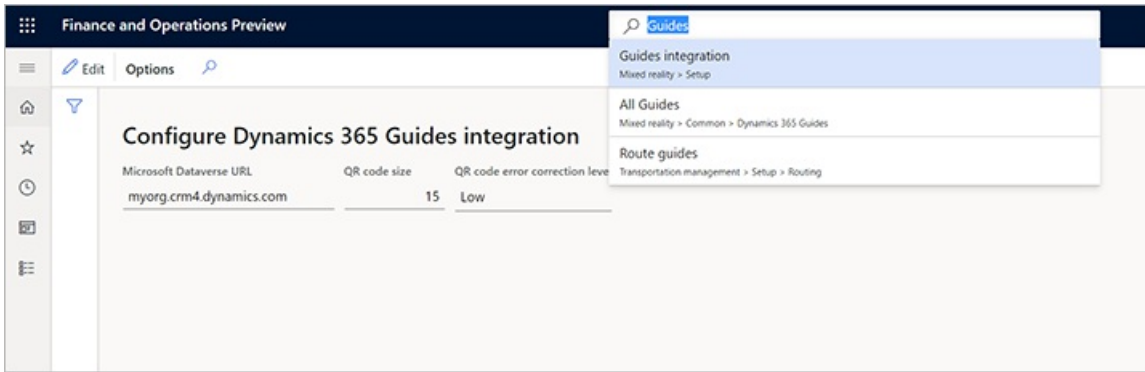

Turn on the feature

To make the feature available on your system, you must enable its configuration keys. You only need to do this once. To do this, an administrator must do the following:

1. Place your system into maintenance mode as described in [Maintenance mode](#).
2. Go to **System administration** > **Setup** > **License configuration**.
3. Expand the **Mixed reality** section and then select the **Mixed reality guide** check box.
4. Expand the **Production management** section and then select the **Production instructions** check box.
5. Turn off maintenance mode as described in [Maintenance mode](#).

Configure how Guides appear on the shop floor

To configure how Guides appear on the shop floor, go to **Mixed Reality > Dynamics 365 Guides > Configure Guides integration**.

Set the following fields:

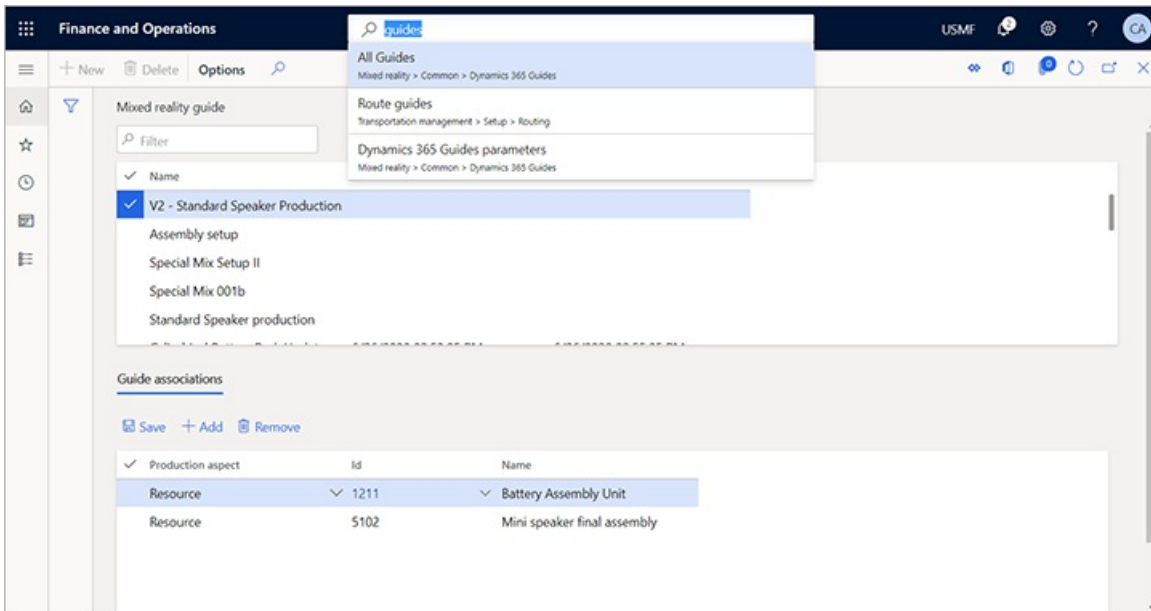

- **Microsoft Dataverse URL** - Specify the URL for the Microsoft Dataverse environment where you create your Guides. The format is "contoso.crm4.dynamics.com", where the first part of the URL is typically named after your organization (such as "contoso."), the second part is specific to the data region of your environment (such as "crm4."), and the last part is the domain (such as "dynamics.com"). One way to find the right URL is to go to home.dynamics.com and then open your Guides app. When Guides opens, you will see the URL in the address bar of your browser (only take the base URL, which should resemble the previous example). This value is used to compose addresses for your guides and will be encoded into the QR codes."
- **QR code size** - Set the size of the rendered QR code. We recommend choosing a size that will fill most of your display screen, but not more. Typically, *15* is a good value.
- **QR code error correction level** - Set the granularity of the QR code. Higher granularity can help increase the code's reliability, but your **QR code size** must be large enough to support the level of detail required by your selected correction level.

TIP

- QR codes sizes that are too large for your display will take a bit longer to render and then be scaled down to fit your display. These do not provide a benefit.
- QR code sizes that are too small may decrease the ability of HoloLens to read the code properly in some environments.
- We recommend that you test the settings for each device that will display QR codes for HoloLens users. Choose settings that provide sufficient readability in your shop floor environment.

Get an overview of all Guide assignments

Use the **All Guides** page to see the list of all available Guides in your organization and all assignments to your production processes and resources. To open it, go to **Mixed reality > Guides > All Guides**. The list at the top shows all the available Guides and you can use the field here to filter the list. The list at the bottom shows all Guide assignments and provides a toolbar for managing them.

The following sections describe the types of objects that you can assign Guides to. Each assigned guide provides instructions that are automatically attached to the respective production jobs and will be available on the shop floor.

Associate a Guide to a resource

Add a Guide to a [resource](#) to offer the Guide in the context of relevant production jobs.

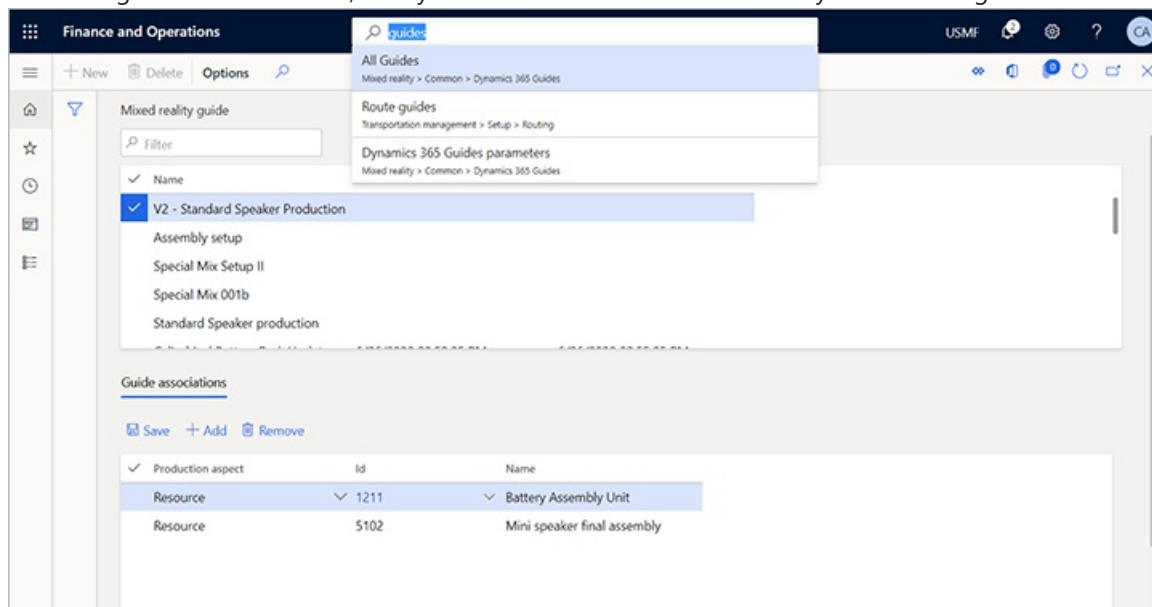

Typical scenario using resources

For example, you could attach a Guide with general machine security or handling instructions to a resource of type machine. Then, the Guide will be available on every job that is performed on the machine.

Add a Guide to a resource

To add a Guide to a resource:

1. Go to **Production control > Setup > Resources > Resources**.
2. From the list pane, select the resource you want to assign a Guide to.
3. Expand the **Associated Guides** FastTab.
4. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
5. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign. If you have a large number of Guides, then you can filter the list to find the one you are looking for.

Associate a Guide to a resource group

You can add a guide to [resource groups](#) if you use them to manage groups of machines, production lines, or work cells.

Typical scenarios using resource groups

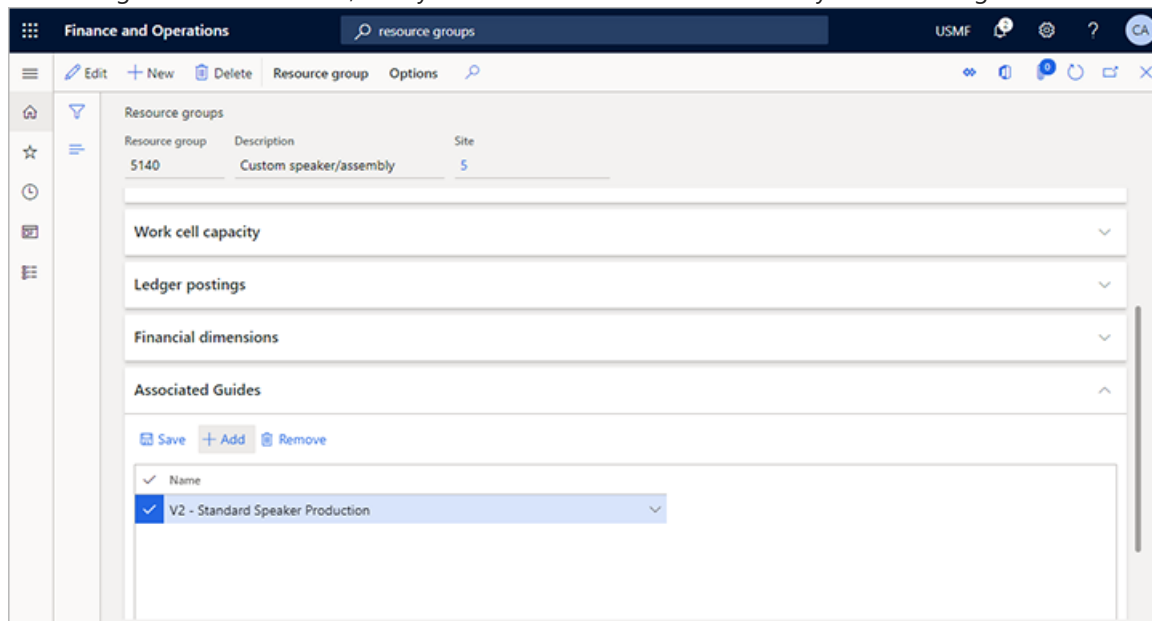

Example 1: You have defined a resource group for several machines of the same model. Instead of assigning the relevant handling instruction guide for the machine model to every relevant resource, you could instead assign the Guide to the resource group that reflects that machine model.

Example 2: You have defined a resource group for a work cell that contains different machines and you have a Guide that provides general instructions for how to maintain the work cell. The Guide applies to any production activity in this work cell.

Add a Guide to a resource group

To add a Guide to a resource group:

1. Go to **Production control > Setup > Resources > Resource groups**.
2. From the list pane, select the resource group you want to assign a Guide to.
3. Expand the **Associated Guides** FastTab.
4. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
5. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign. If you have a large number of Guides, then you can filter the list to find the one you are looking for.

Associate a Guide to a released product

You can add a guide to any [released product](#).

Typical scenario using released products

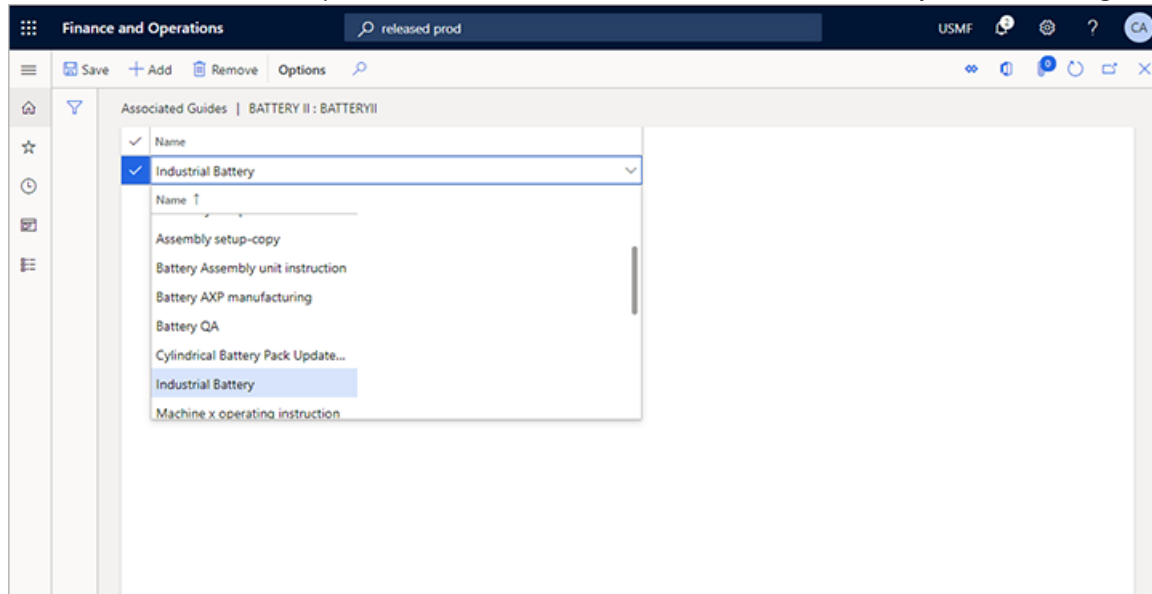

Product-level Guides help shop floor workers with instructions relevant to operating or handling a specific released product or item.

Add a Guide to a released product

To add a Guide to a released product:

1. Go to **Production information management > Products > Released products**.
2. Open the product you want to assign a Guide to.
3. On the Action Pane, open the **Engineer** tab and from the **View** group, select **Associated Guides**.

- The **Associated Guides** page opens for your selected product.
- Select **Add** on the Action Pane to add a new line to the grid.
- For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a formula

You can add a guide to any [formula](#).

Typical scenario using formulas

Formula-level Guides provide shop floor workers with guided handling instructions in the context of a formula or recipe. Guides can also be assigned to versions of a formula.

NOTE

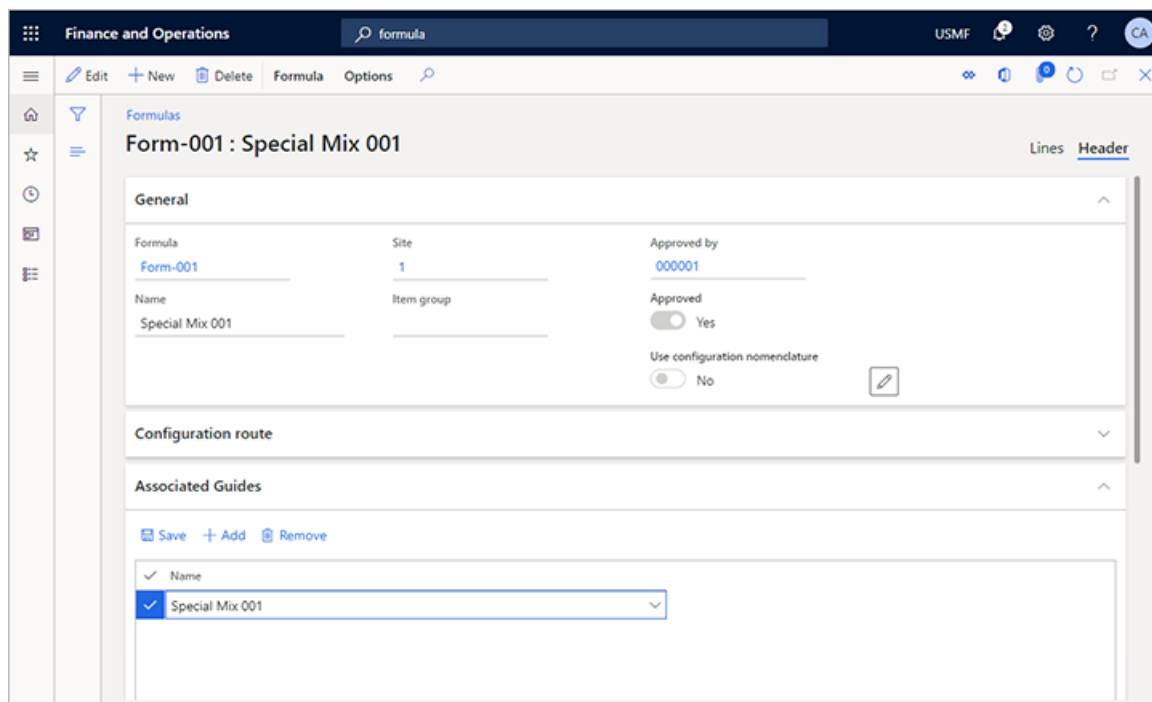

You can assign guidance relevant for production processes based on a formula to a route, route version, or route operation relations.

Guides can't currently be attached to individual formula lines.

Add a Guide to a formula

To add a Guide to a formula:

- Go to **Production information management > Bills of materials and formulas > Formulas**.
- Open the formula you want to assign a Guide to.
- Open the **Header** tab above the top FastTab.
- Expand the **Associated Guides** FastTab.
- Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
- For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a formula version

You can add a guide to any [formula version](#).

Typical scenario using formula versions

Guides attached to an individual version of a formula provide shop floor workers with instructions that walk through the production of that version of the formula recipe.

TIP

You can assign guidance relevant for production processes based on this formula version to a route, route version, or route operation relations.

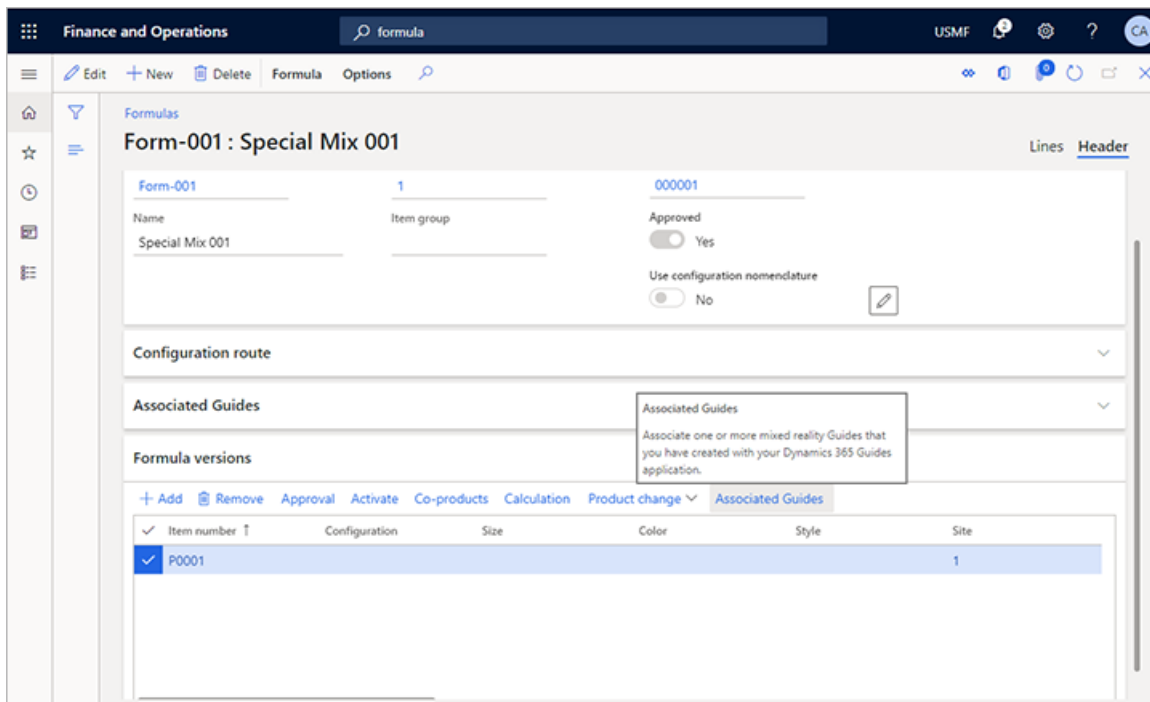

NOTE

Guides can't currently be attached to individual formula lines.

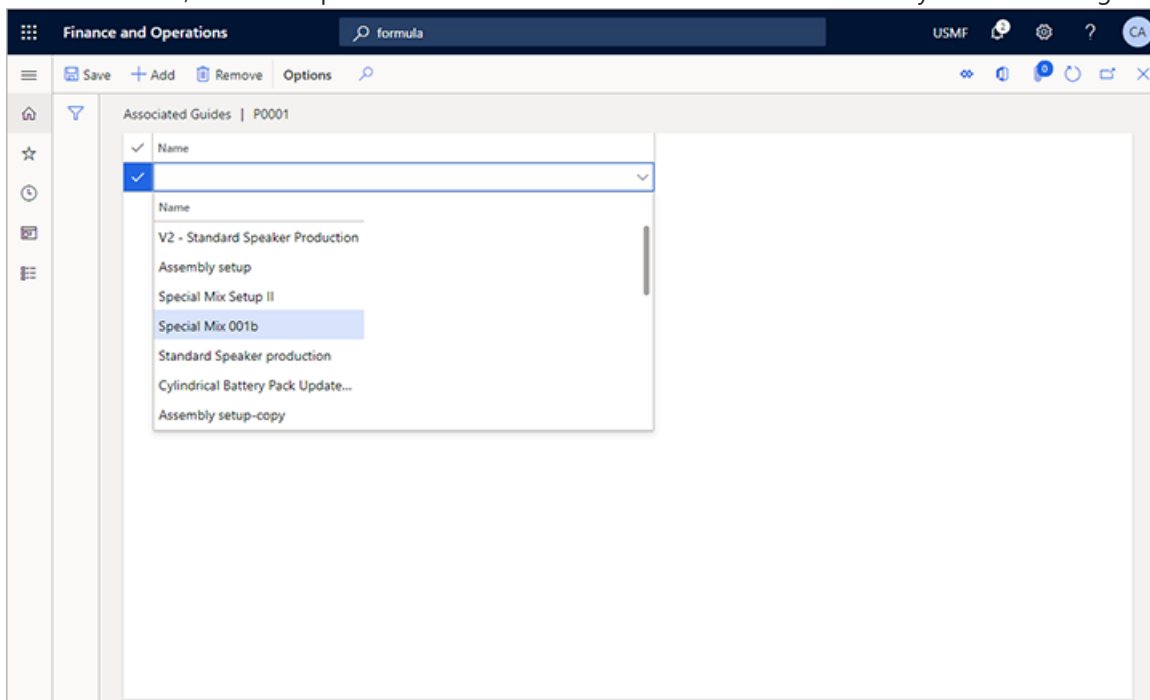

Add a Guide to a formula version

To add a Guide to a formula version:

1. Go to **Production information management > Bills of materials and formulas > Formulas**.
2. Open the formula that includes a version that you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. On the **Formula versions** FastTab, select the version you want to assign a Guide to.
5. On the **Formula versions** toolbar, select **Associated Guides**.

6. The **Associated Guides** page opens for your formula version.
7. Select **Add** on the Action Pane to add a new line to the grid.
8. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a bill of materials

You can add a guide to any [bill of materials](#) (BOM).

Typical scenario using bills of materials

Guides attached to a BOM provide shop floor workers with instructions that explain how to prepare and handle material from a BOM. Guides can also be assigned to versions of a BOM.

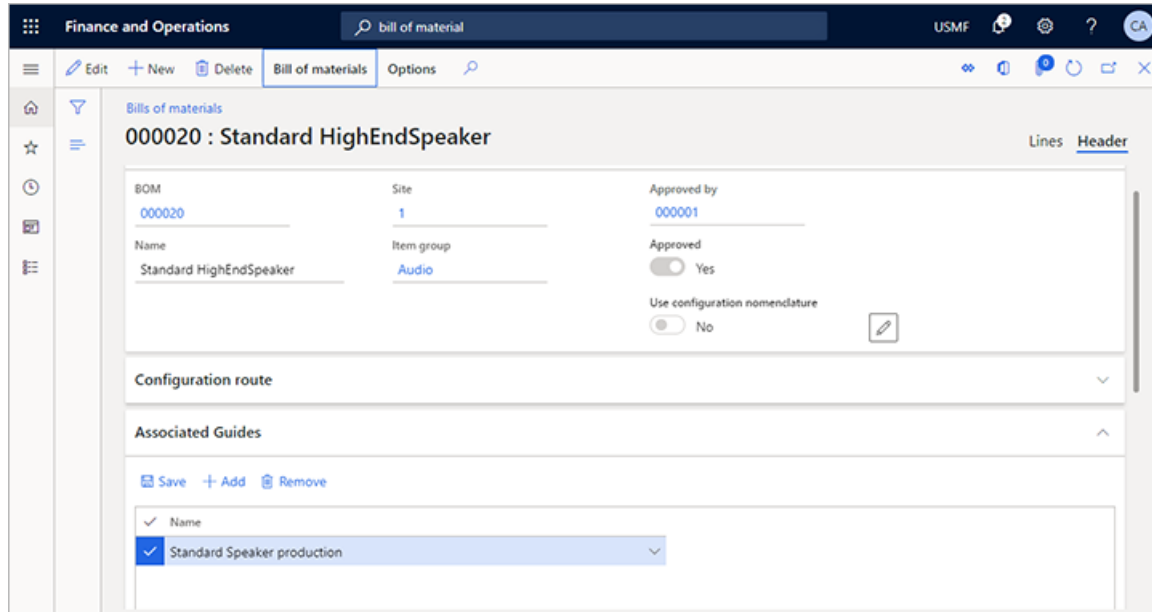

NOTE

Guides can't currently be attached to individual BOM lines.

Add a Guide to a bill of materials

To add a Guide to a bill of material:

1. Go to **Production information management > Bills of materials and formulas > Bills of materials**.
2. Open the bill of materials that you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. Expand the **Associated Guides** FastTab.
5. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
6. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a bill of materials version

You can add a guide to any [bill of materials version](#).

Typical scenario using bill of materials versions

Guides attached to an individual BOM version provide shop floor workers with instructions that explain how to prepare and handle material for a version of a BOM that is different from the generic BOM or other versions of it.

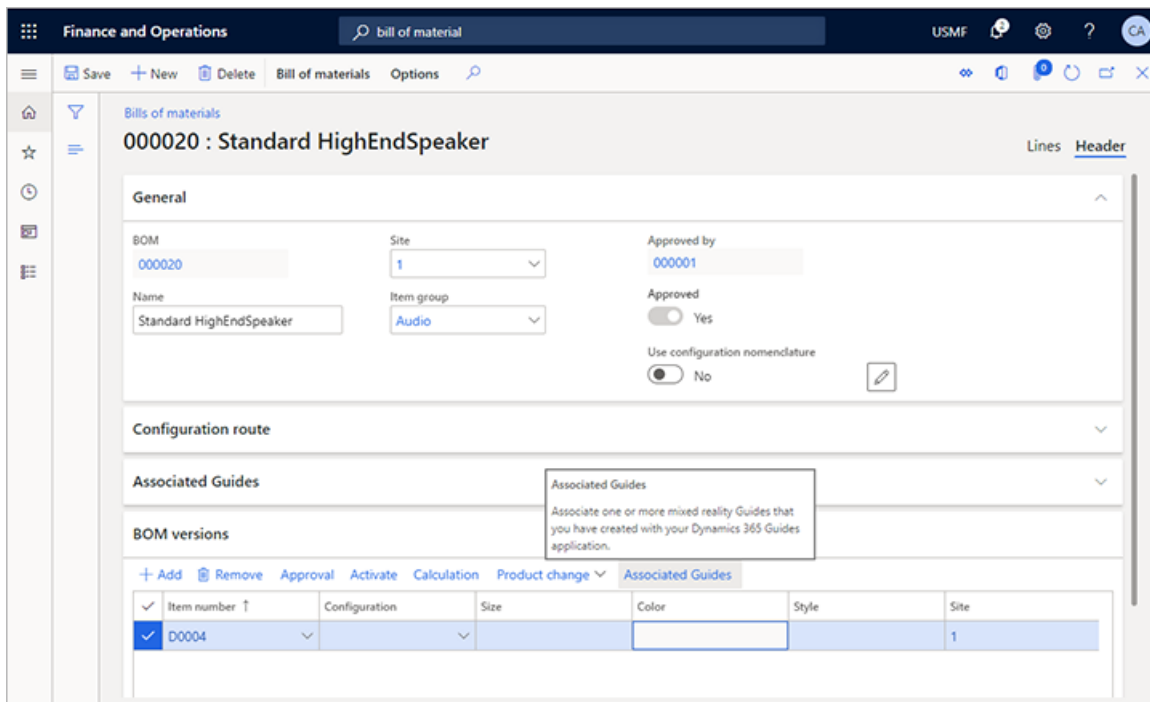

NOTE

Guides can't currently be attached to individual BOM lines.

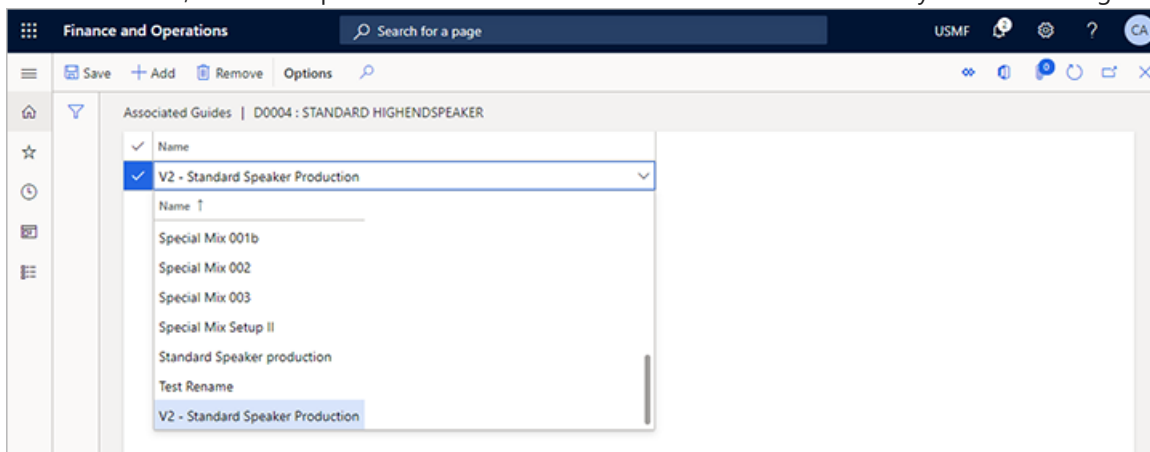

Add a Guide to a bill of materials version

To add a Guide to a bill of materials version:

1. Go to **Production information management > Bills of materials and formulas > Bills of materials**.
2. Open the BOM that includes a version that you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. On the **BOM versions** FastTab, select the version you want to assign a Guide to.
5. On the **BOM versions** toolbar, select **Associated Guides**.

6. The **Associated Guides** page opens for your BOM version.
7. Select **Add** on the Action Pane to add a new line to the grid.
8. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a route

You can add a guide to any [route](#).

Typical scenario using routes

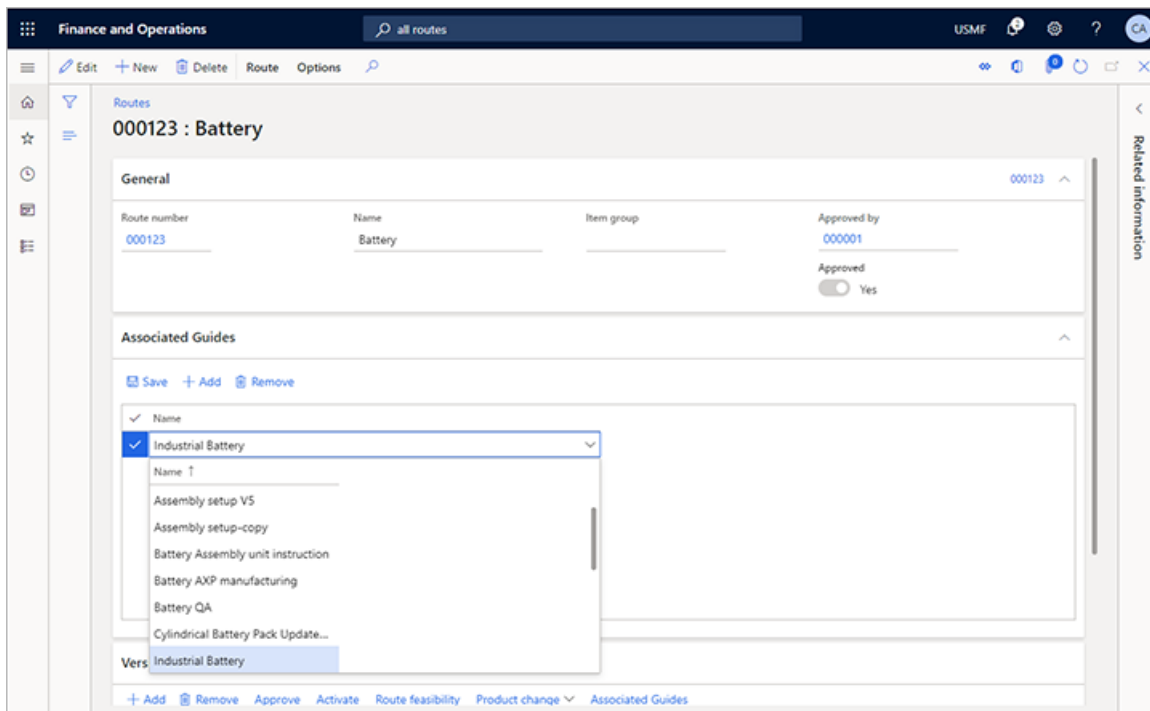

Routes are typically used to specify how a certain released product shall be produced based on a BOM or BOM version and with a set of resources or resource groups.

Assign a Guide to a route to provide step-by-step instructions for the respective production process.

Add a Guide to a route

To add a Guide to a route:

1. Go to **Production control > All routes**.
2. Open the route that you want to assign a Guide to.
3. Expand the **Associated Guides** FastTab.
4. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
5. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a route version

You can add a guide to any [route version](#).

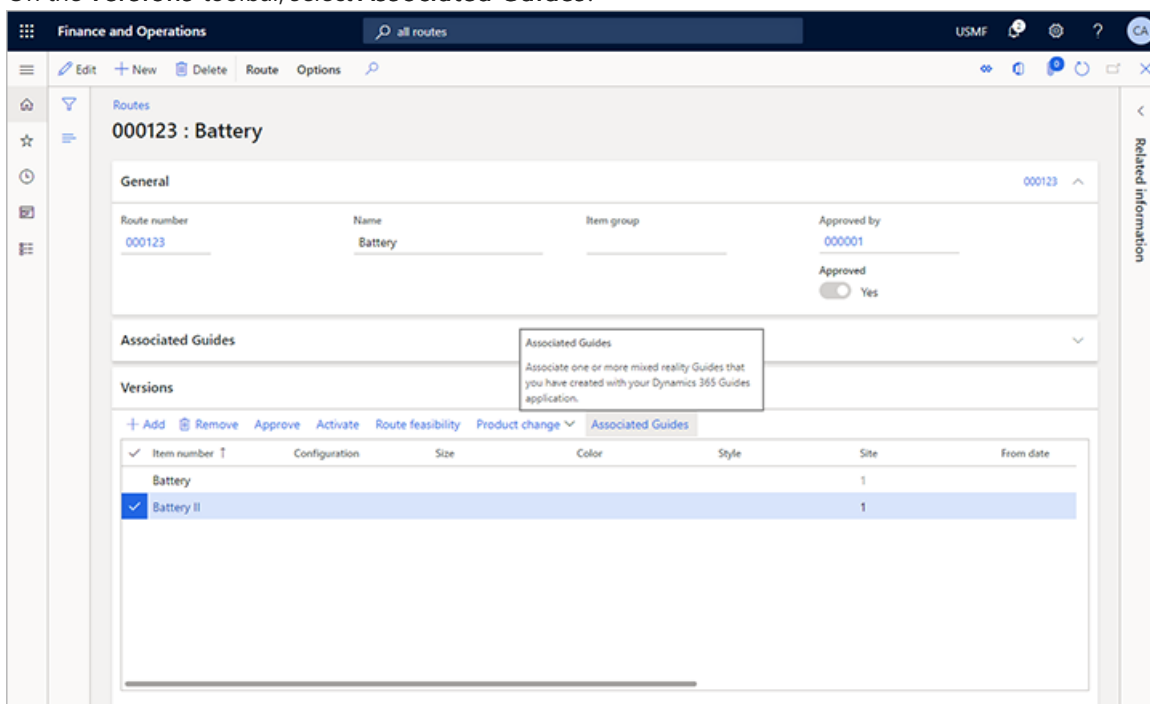

Typical scenario using route versions

Routes versions are typically used to specify variants of production processes based on an existing route. You can assign different Guides to each route version.

Add a Guide to a route version

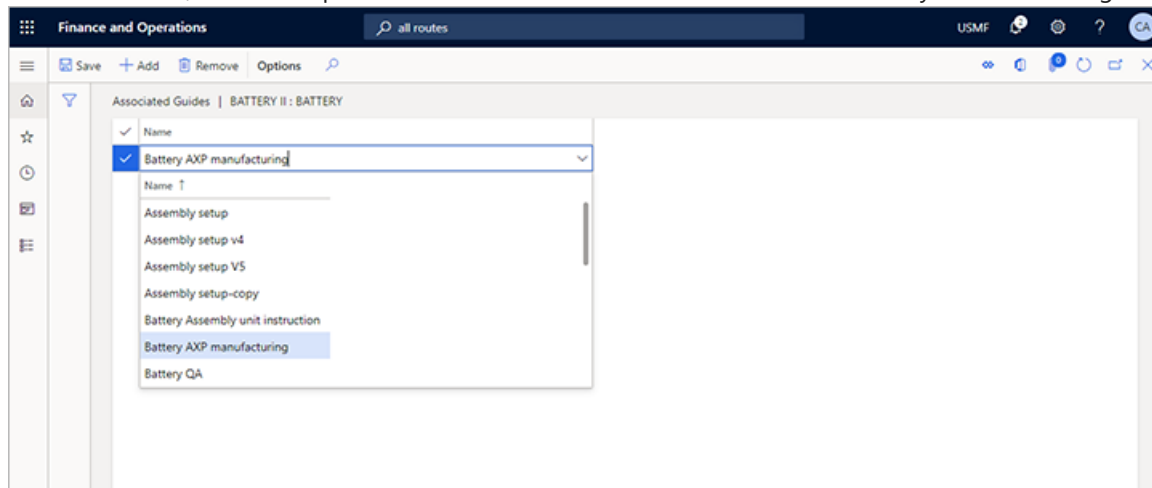

To add a Guide to a route version:

1. Go to **Production control > All routes**.
2. Open the route that you want to assign a Guide to.
3. On the **Versions** FastTab, select the version you want to assign a Guide to.
4. On the **Versions** toolbar, select **Associated Guides**.

5. The **Associated Guides** page opens for your BOM version.

6. Select **Add** on the Action Pane to add a new line to the grid.
7. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.

Associate a Guide to a route operation relation

You can add a guide to any [route operation relation](#).

Typical scenario using route operation relations

Operation relations are the most specific way to add guidance to a product process and its related operations. You can specify guidance for each operation in a route and specify different guidance for any type of relation context specified for a route, such as for specific items, configurations, and more. You can also specify to which stages in the operation the guidance applies (such as setup, queueing, process, or transport).

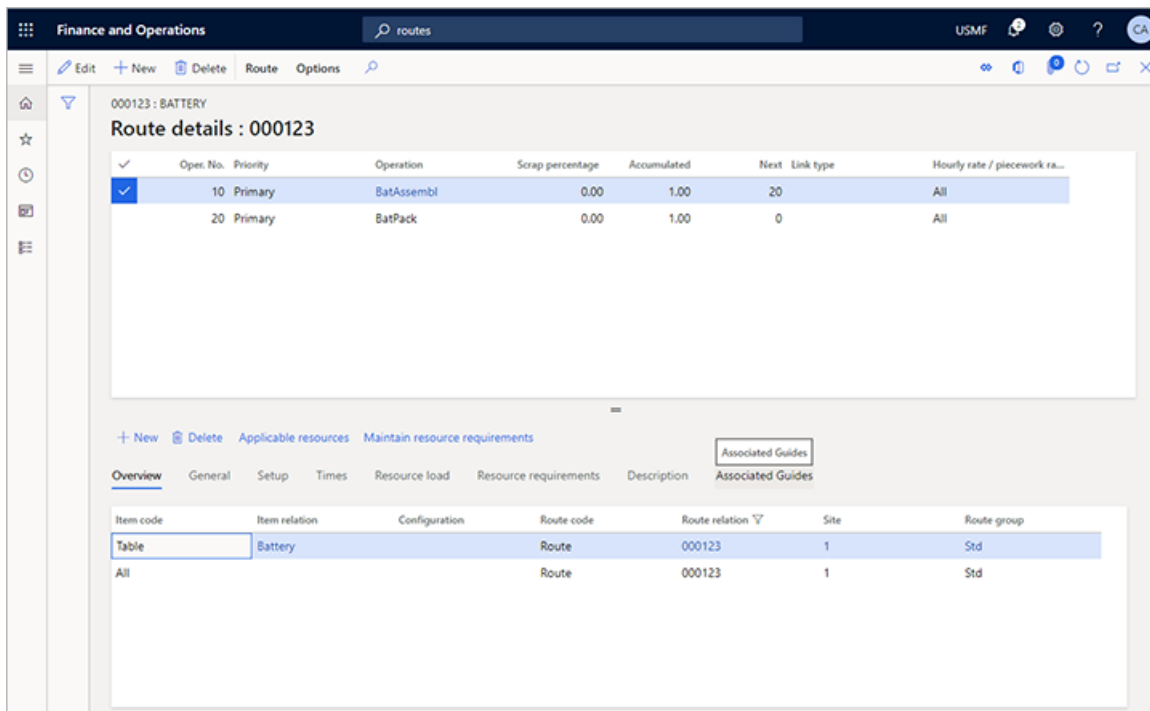

NOTE

If you specify guides for several operation relations of a route, among those guides, only the guide from the most specific relation will be show on the shop floor for the generated job.

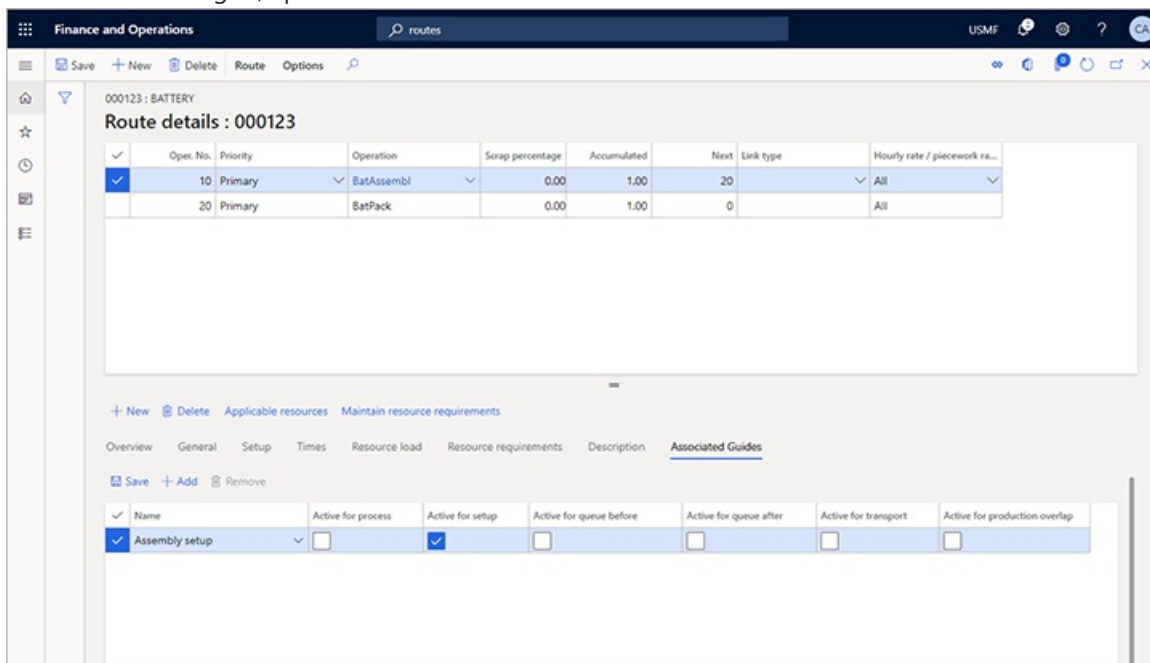

Add a Guide to a route operation relation

To add a Guide to a route operation relation:

1. Go to **Production control > All routes**.
2. Open the route that you want to assign a Guide to.
3. On the Action Pane, open the **Route** tab and from the **Maintain** group, select **Route details**.
4. The **Route details** page opens for your selected rout.
5. In the top grid, select the operation you want to provide guidance for.
6. In the bottom grid, select a specific relation (or the generic **All** relation).

7. Above the bottom grid, open the **Associated Guides** tab.

8. Select **Add** from the toolbar at the top of the bottom grid to add a new line to the grid.

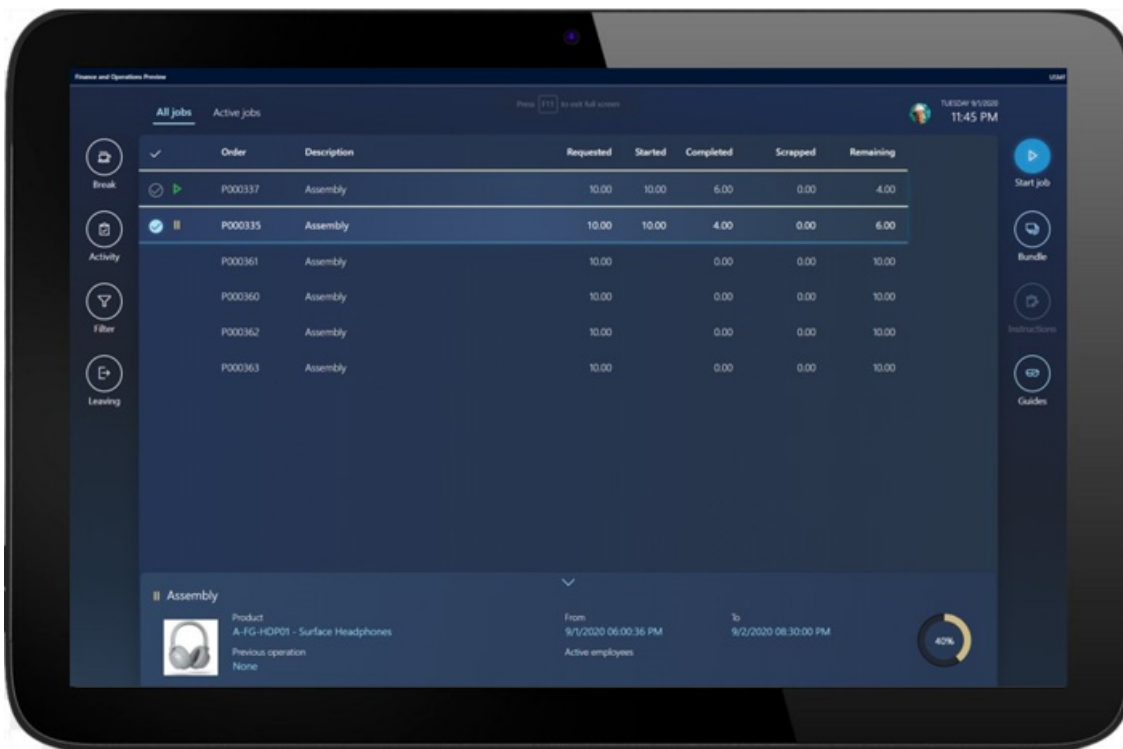

9. For the new row, use the drop-down list in the **Name** column to choose the Guide you want to assign. In the rest of the row, select the check box for each context where the selected Guide should be available.

NOTE

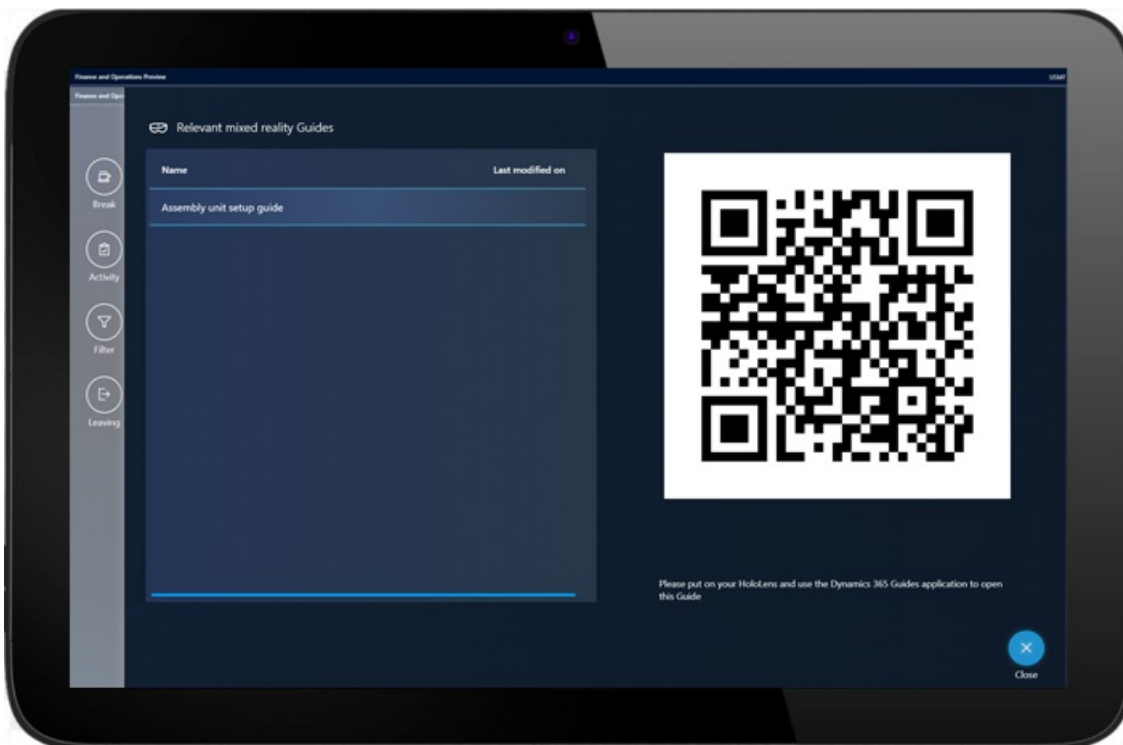

You can add one or more guides for each stage of each operation.

Select guides from the shop floor execution interface

When a worker opens a job list on the shop floor execution interface, Supply Chain Management finds the relevant guides for the jobs shown. Use the **Guides** button to view the relevant guides.

Then put on a HoloLens and access the respective guide by glancing at the QR code and activating the respective Guide.

Resolving the logic for selecting Guides

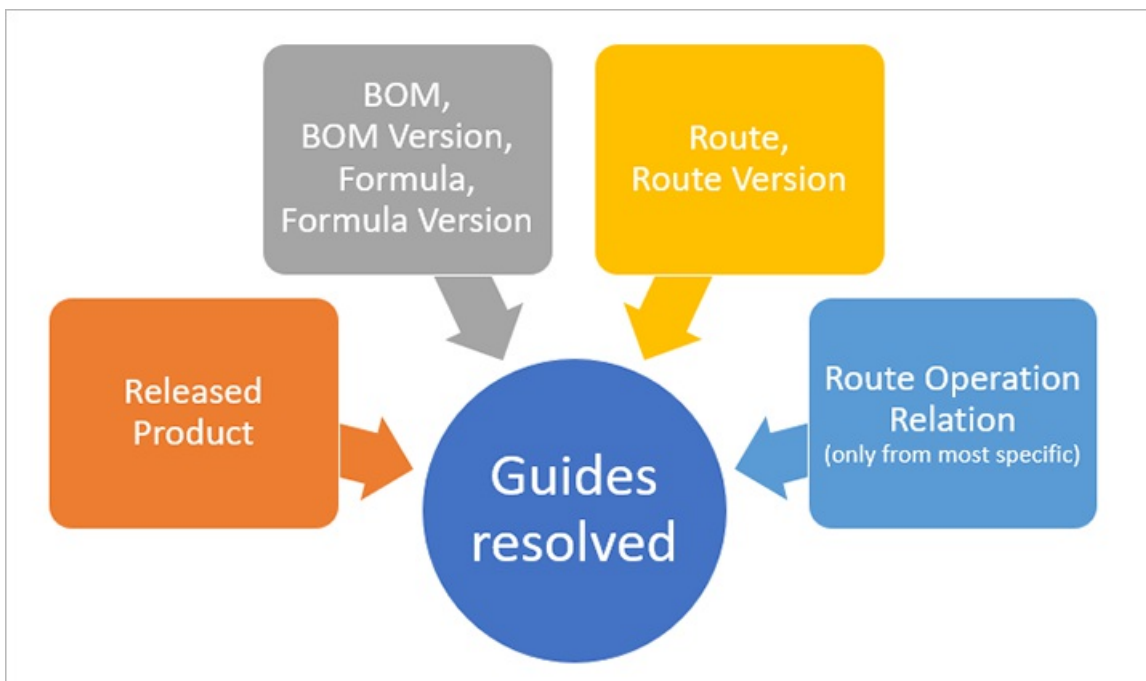

You can add Guides to the following production data:

- Resources
- Resource groups
- Released products
- Formulas
- Formula versions
- Bills of material (BOMs)

- [BOM versions](#)
- [Routes](#)
- [Route versions](#)
- [Route operation relations](#)

When Supply Chain Management generates the jobs for the production floor, it will collect the relevant Guides from those sources. Take note of the following important rules.

- If you attach a BOM version or formula version to a route or production order, then any Guides attached to this version, and also the Guides attached to the parent BOM or formula of that version, will be shown on the job.
- If you attach a route version to a production order, then any Guides attached to this version, and also the Guides attached to the parent route of that version, will be shown on the job.
- If you define several route operation relations that include the *All* relation and assign Guides to those, only the Guides from the most specific relation will be shown for the job.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reverse the production order status

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to reverse production order status.

If you reverse the status of a production order, the order and all operations that are associated with the routes revert to a previous step in the production life cycle. For example, a production order has a status of **Scheduled**, and you change the status back to **Created**. In this case, the system must first change the status to **Estimated**, which is the status that immediately precedes **Scheduled**. It can then change the status to the status that you want, **Created**. **Note:** If your order has reached the **Report as finished** status, you can still reverse it to an earlier status. However, you must re-run estimation and operations scheduling, job scheduling, or both types of scheduling, to update the information on the order. This step is required, because any reservations of remaining item consumption and operations resource consumption must also be reset. The rest of this article explains what occurs when you reverse the status of a production order in the following ways:

- From **Estimated** to **Created**
- From **Scheduled** to **Estimated**
- From **Released** to **Scheduled**
- From **Started** to **Released**

From Estimated to Created

When you reverse the status of a production order from **Estimated** to **Created**, the item consumption that was calculated for the items in the bill of materials (BOM) is removed. Inventory transactions on the production line are deleted, and the **Remain status** field on the production order's BOM lines is reset to **Ended**. When the **Derived purchases** and **Derived production** options are selected, any underlying purchase orders or production orders are deleted. If you estimated the costs of the production order, or if you manually reserved items so that they could be used in production, those transactions are removed.

From Scheduled to Estimated

When you reverse the status of a production order from **Scheduled** to **Estimated**, the scheduled start and end dates and times are removed. Capacity reservations that were made during scheduling are removed, and jobs that were created during job scheduling are deleted. All information that is recorded about operation scheduling and job scheduling on the **Production order details** page is reset.

From Released to Scheduled

When you reverse the status of a production order from **Released** to **Scheduled**, the only change that occurs is the value in the status field.

From Started to Released

When you reverse the status of a production order from **Started** to **Released**, all items that were reported as finished are reverted. If material has been picked, or if inbound and outbound deliveries have been made to production, those settings are reversed. The **Remain status** field on the production order's BOM lines is changed from **Ended** to **Material consumption**. If time has been registered, or if quantities have been reported as finished for the operations in the production route, those settings are reversed. The **Remain status** field is changed from **Ended** to **Route consumption** in the production route. The settings for all items that are posted as in process or work in process are reversed. On the **Production order details** page, fields that show

a quantity that was started or reported as finished are reset. The dates for those transactions are also reset.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Visibility into material exceptions

2/18/2021 • 4 minutes to read • [Edit Online](#)

In the **Production floor management** workspace, three tiles give you better visibility into exceptions for raw materials for production orders and batch orders:

- Unreleased material lines needing attention
- Unprocessed waves needing attention
- Open warehouse work needing attention

For all three tiles, the raw material date of the bill of materials (BOM) lines and formula lines is compared against the workspace date, and also against the filters for **Production unit**, **Resource group**, and **Resource** that are set on the **Configure my work space** menu. By default, the workspace date is set to the current date, but you can adjust it.

An unreleased BOM line or formula line requires attention if the raw material date of the line is the same as or earlier than the workspace date, and if it meets the criteria that are defined by the filters in the workspace.

In the following figure, the blue bar represents a production job that is scheduled on a resource. The job is scheduled to start on May 1, 2017 (2017/05/01). This date is the raw material date. In other words, the materials that are assigned to the job on the BOM and formula lines must be ready on this date. The other date in the figure, May 6, 2017 (2017/05/06), represents the workspace date. In this example, the raw material date is earlier than the workspace date. Therefore, the date when consumption of the raw material was supposed to start has passed, and the BOM and formula lines meet the criteria for requiring attention.

Unreleased material lines needing attention

A BOM or formula line can be released to the warehouse in three ways:

- As part of a production order or batch order release
- As a manual release
- Automatically through a batch job

For more information, see [Release BOM and formula lines to the warehouse](#).

If a BOM or formula line hasn't been released or has been only partly released, and if the date and filter criteria of the workspace are met, the line is included in the calculation of the number that appears on the **Unreleased material lines needing attention** tile.

When you select the tile, the **Release to warehouse** page is opened. This page shows the number of unreleased BOM and formula lines that is indicated by the number on the tile. The unreleased lines appear in the

upper grid. This grid shows the quantity that was originally estimated for the line, the quantity that has already been released, and the remaining quantity that must still be released. You can add lines from the upper grid to the lower grid. From the lower grid, you can then release the selected lines to the warehouse. From the lower grid, you can also adjust the quantity to release so that only a partial quantity is released.

Unprocessed waves needing attention

When a BOM or formula line is released, it's added to either a new production wave or an existing open wave, depending on the configuration of the production wave template. Through the configuration of the wave template, you can also set up a wave so that it's automatically processed when a BOM or formula line is released. When the wave is processed, warehouse work for raw material picking is generated. If the wave template is configured so that waves aren't processed at the time of release, the wave remains in an unprocessed state. The **Unprocessed waves needing attention** tile shows the number of BOM and formula lines that have been released to the warehouse on unprocessed waves, and that have a raw material date that is earlier than or the same as the workspace date. The lines must also be consumed by an operation resource that applies to the filter of the workspace.

When the tile is selected, the **All production waves** page is opened. This page is filtered by the number of open waves that contain wave lines from released BOM and formula lines that meet the criteria for the tile. From the **All production waves** page, you can manually process the wave.

Open warehouse work needing attention

The **Open warehouse work needing attention** tile shows the number of BOM and formula lines that have been released to the warehouse, that have unprocessed work, and that have a raw material date that is earlier than or the same as the workspace date. The lines must also be consumed by an operation resource that applies to the filter of the workspace.

When the tile is selected, the **All work** page is opened. This page is filtered by the number of open work headers that contain work lines from released BOM and formula lines that meet the criteria for the tile. From the **All work** page, you can manually process the work.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Release BOM and formula lines to the warehouse

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the process for releasing raw material for bill of materials (BOM) lines and formula lines to the warehouse. When you release a BOM or formula line to the warehouse, the system first determines whether material is already available at the production input location on the shop floor where the material will be consumed for the production process.

- If the material is available at the production input location, it's picked from that location immediately after the signal is given for the release of material to the warehouse.
- If the material isn't available at the production input location, the material release indicates that material must be moved from locations in the warehouse to the production input location. The material is moved via warehouse work for raw material picking. Therefore, warehouse processes for raw material picking must be configured. For more information, see [Replenishment overview](#) and [Control warehouse work by using work templates and location directives](#).

Methods for releasing BOM and formula lines

You can configure the release of BOM and formula lines so that it occurs as part of the release of a production order or batch order. Alternatively, the release can be controlled by a batch job or done as a manual interaction.

The method that is used to release BOM and formula lines is controlled by the **Production line release** parameter. You can find this parameter at **Production control > Setup > Production parameters**.

- **Release BOM and formula lines as part of production or batch order release** – In this method, BOM and formula lines for a production or batch order are released as part of the process of releasing the order. Usually, during the release of a production or batch order, production jobs are released to the shop floor workers, and production papers are printed. During this process, the status of the order is also changed to **Released**.
- **Release BOM and formula lines via a batch job or as a manual interaction** – In this method, BOM and formula lines can be released only through the **Automatic release of BOM and formula lines** batch job or as a manual interaction. To manually release BOM and formula lines, on the production order list page or the production order details page, on the Action Pane, select **Release to warehouse**.

For a quick demonstration of how to release BOM and formula lines to production by using a batch job, watch this short YouTube video: [Release production picking to the warehouse in batch](#).

Releasing the BOM and formula lines by using a batch job

The **Automatic release of BOM and formula lines** batch job goes through selected BOM and formula lines that have a remaining quantity to release. The job considers only orders that have a status of **Released**, **Started**, or **Reported as finished**. If a BOM or formula line has a remaining quantity to release, the job releases up to the quantity that can be covered by the quantity that has already been physically reserved and the quantity that is physically available.

Example of a batch job release

SCENARIO	REMAINING QUANTITY TO RELEASE	PHYSICALLY RESERVED QUANTITY	PHYSICALLY AVAILABLE QUANTITY	QUANTITY RELEASED BY THE BATCH JOB
1	100	20	90	100
2	100	20	70	90
3	100	0	90	90
4	100	0	110	100
5	100	20	0	20

Batch job setup

In the query for the **Automatic release of BOM and formula lines** batch job, you can set up a filter criterion to specify how many days ahead the job should look for lines that have unreleased quantities. In the query for the job, in the **Raw material date** field, use the **(LessThanDate())** function as a filter criterion.

The following illustration shows a production order that has two jobs, 10 and 20, that cover the assembly and packing for the production order. Each job is set up to consume a quantity of material. In this illustration, the release time fence that is indicated by the green arrow below the time line equals the number of days that has been specified in the **(LessThanDate())** criterion. For example, **(LessThanDate(2))** indicates that the job should look for unreleased quantities only within a time fence of two days.

Releasing material per operation number or in proportion to the amount of finished goods

If you release materials by using the **On production order release** parameter setting, when you do a manual release, you have two options for controlling the material release:

- Release material per operation number.
- Release material in proportion to the amount of finished goods.

Release material per operation number

To control the operations that material should be released to, use the **Release to warehouse** page.

- Select **Production control > Production orders > All production orders**, select a production order, and then, on the **Warehouse** tab, select **Release to warehouse**. Then use the **From Oper. No.** and **To Oper. No** fields to specify the range of operation numbers.

The following illustration shows a production order that has two operations, 10 and 20. In this example, if you limit the release to operation 10, only material M9203 will be released.

For a quick demonstration of how to release material in proportion to the amount of finished goods, watch this short YouTube video about [enhancements to the production order release process](#).

Release material in proportion to the amount of finished goods

You can release raw material for a partial quantity of finished goods or in a specific unit.

- To release raw material for a partial quantity of finished goods, select **Production control** > **Production orders** > **All production orders**, select a production order, and then, on the **Warehouse** tab, select **Release to warehouse**. Then enter a quantity in the **Quantity** field.

For example, a production order is created and scheduled for 1,000 pieces (pcs.). The shop floor supervisor is planning the production of 100 pcs. for the next shift and wants to release materials only for that shift. In this case, the supervisor can use the **Quantity** field to release materials for the 100 pcs. that are planned for the next shift.

- To release raw material in a specific unit, select **Production control** > **Production orders** > **All production orders**, select a production order, and then, on the **Warehouse** tab, select **Release to warehouse**. Then use the **Unit** field to select the unit of the finished good to release material in.

The units that are available are defined in the unit sequence group ID of the finished good.

For example, a finished good has the following unit conversion between pounds (lbs.) and pallet (PL): 1 PL = 100 lbs. To create a production order for 10,000 lbs. of the finished good, you can release raw materials for the number of pallets that you plan to produce. Select **PL** as the unit, and then select a corresponding number in the **Quantity** field.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Register material consumption using a mobile device

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes a workflow that enables registration of raw material consumption in production by using a handheld device.

Introduction

This workflow is relevant if there is a strict requirement for material traceability. In those cases, to maintain traceability of the materials, the exact time and quantity must be reported for the consumption. This process can be seen as opposed to pre- or back-flushing operations, where there is an offset between the time of registration and the time when the actual consumption takes place. This explains why a strategy of automatic consumption cannot be used for some materials with traceability requirements. Let's look at a simple scenario that explains how to set up a workflow to enable registration of raw material consumption in production by using a handheld device.

Scenario details

A continuous production process (5) consumes the batch-controlled raw material RM-100. The material is on-hand on location Bulk-001 (1) on license plate PL-1 with two batches, B1 and B2, both with a quantity of 100 lbs. Warehouse work (2) is released and processed for RM-100, and the material is picked from Bulk-001 to the production input location PIL-01 (3), which is defined as non-license plate controlled. The machine operator weighs out material from the production input location (3) and registers the weight and batch number as consumed (4). From the production input location, a portion of the material is manually added to the production process in defined time intervals. When the machine operator adds material, it is weighed on a scale and the batch number is registered.

Set up the workflow to register consumption using a handheld device

Create a finished-good product, FG-100, with a bill of material that has the batch-controlled raw material RM-100. Add two batches, B1 and B2, of RM-100 in a quantity of 100 to location: Bulk-001 on license plate: PL-1. The flushing principle on the bill of material line for RM-100 is set to **Manual**. Set the production input location to PIL-01. You can do that by selecting this location as the default production input location on warehouse 51.

1. Create a new mobile device menu item:

- **Menu item name** - Register material consumption.
- **Title** - Register material consumption.

- **Mode** - Indirect.
 - **Activity code** - Register material consumption.
2. Add the menu item to the **Production Mobile** device menu.
 3. Create a production order for the finished product:

- **Item number** - FG-100
- **Site** - 5
- **Warehouse** - 51
- **Quantity** - 150

The production order is **Estimated** and **Released** and warehouse work is created.

4. Complete the work using the workflow for raw material picking for the handheld device.

This will bring the material from the bulk location to the production input location PIL-01. After the work is completed, the material has the status **Picked on the production input location**. The status after work has been processed can be either **Picked** or **Reserved physical**. This is configured with the parameter **Issue status after put on the warehouse form**.

5. Start the production order either from the client or from the handheld device by using the **Production start** menu item.

After the production order has been started, you can register material consumption with the workflow for the handheld device. Let's start by registering consumption of 25 lbs of batch B1.

6. Select the **Register material consumption** menu item in the menu for the hand held device, enter the following details:

- The production order number.
- The location on which the material is going to be consumed, in this case PIL-01.
- Item number RM-100.
- Batch number B1.
- A quantity of 25.

7. Select **OK**.

Note that the message "Journal line is created" appears on the display. On the production order there is an open journal of the type **Production picking list** for item number RM-100 and batch number B1.

You can now choose to continue your registration, for example on batch number B2, and each time you select **OK**, a new journal line is added to the open journal.

After you have finished your registration, select **Done** to post the journal and end the workflow.

Additional comments

- If a user cancels the workflow after a journal line is created, the journal is in an unposted state but if the user at a later point uses the workflow for the same production order, then the lines will be added to the open journal rather than to a new journal.
- The new workflow also supports the registration of serial numbers.
- It is only possible to register an item number that is defined in the bill of material or in the formula for the selected production order or batch order.
- Material can be overconsumed. For example, if the material is estimated to be consumed with the quantity of 100 lbs, then it can be overconsumed with a quantity of, for example, 105 lbs.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Flushing principles

2/18/2021 • 3 minutes to read • [Edit Online](#)

The flushing principles reflect different consumption strategies for raw materials that are used in production processes. Consumption is the process that deducts material from the on-hand inventory and sets the value of the consumed materials to **Work in progress (WIP)** for production orders and batch orders. Raw materials are usually consumed from a location that is configured for the process that consumes the material. This location is known as the production input location.

Before material consumption, the materials are moved to the input location. The following illustration shows the process.

1. Material warehouse
2. Raw material picking
3. Production input location
4. Raw material consumption
5. Production process

Material consumption is controlled by the following four flushing principles:

- Manual
- Start
- Finish
- Available at location

The flushing principles are configured in a hierarchy of default values. The hierarchy starts at the released product, where the flushing principle has the value **Start**. On the bill of materials (BOM) or formula line, the flushing principle from the product can be overridden. The default flushing principle on the production BOM lines or batch order formula lines is taken from the product or the overridden value on the BOM or formulas.

Description of the flushing principles

Manual

The Manual flushing principle indicates that the registration of material consumption is a manual operation. This principle is relevant if, for example, you want to be able to track time, and the quantity of consumed batch numbers or serial numbers must be accounted for, for tracking purposes. Manual consumption is registered in a production picking list journal. For items that are enabled for advanced warehouse processes, a hand-held flow can be applied.

Start

The Start flushing principle indicates that material will be automatically consumed when the production order is started. The amount of material that is consumed is proportional to the quantity that is started. When the Start

flushing principle is used together with the manufacturing execution system, it can also be used to flush materials when an operation or a process job is started. This principle is relevant if, for example, the variance in the consumption is low, the materials are low-value materials, there are no tracking requirements, or there is a short run time on operations.

Finish

The Finish flushing principle indicates that material will be automatically consumed when the production order is reported as finished, or when an operation that is set up to consume the materials is registered as completed. The amount of material that is consumed is proportional to the quantity that is reported as finished. When the Finish flushing principle is used together with the manufacturing execution system, it can also be used to flush materials when an operation or a process job is completed. This principle is relevant in the same situations as the Start principle. However, the Finish principle is for operations that have a longer run time, where materials should not be set to WIP before the operation is completed.

Available at location

The Available at location flushing principle indicates that the material will be automatically consumed when it's registered as picked for production. The material is registered as picked from location when work for the raw material picking is completed, or when material is available on the production input location and the material line is released to the warehouse. The picking list that is generated during the process is posted in a batch job. This principle is relevant if, for example, you have many picking activities against one production order. In this case, you don't have to update the picking list manually, and you can get a current view of the WIP balance.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production output location

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the hierarchy that is used to identify the production output location.

The production output location is the location where a finished good is first stored after it's produced. Usually, this location is close to the production process that produces the finished good. The production output location is used as intermediate storage for the material before it's moved on to the shipment area, a storage location, a production input location for a downstream production process, and so on.

A default production output location is set when finished goods are reported on a production order or batch order. The following hierarchy is used to identify this output location:

1. Use the output location that is defined on the production order or batch order header.
2. If no location is found there, use the output location that is defined on the resource that is used by the last operation that is defined in the production route.
3. If no location is found there, use the output location that is defined on the resource group that is used by the resource for the last operation that is defined in the production route.
4. If no location is found there, use the output location that is defined on the warehouse that is defined for the production order.

A default production output location is set only for products that are set up by using advanced warehouse processes. When this type of item is reported as finished, warehouse work of the **Finished goods put away** or **Co-product and by-product put away** type is created. This type of work uses the production output location as the pick location. The put-away location is determined by the location directives.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Report BOMs as finished

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about reporting BOMs as finished.

The **Report as finished** and **Max. report as Finished** pages are used to report bills of materials (BOMs) as finished. Conceptually, the process for reporting a BOM as finished is the same as the process for reporting a production order as finished. This process can be used in, for example, simple assembly and kitting processes, where the more advanced capabilities of production orders aren't required. The **Report as finished** page lets you report multiple BOMs as finished in a batch. The **Max. report as Finished** page lets you report only one BOM as finished at a time. The **Report as finished** page is available from a menu item in Inventory management, and both pages are available as a menu items on the **Released products** page.

Report as finished page

If you open the **Report as finished** page from a released product, the page suggests that you report the standard inventory default quantity as finished. By default, the active BOM version is shown, but you can change the BOM version if there are other approved versions. The page also lets you delete records and create new records for released products that should be reported as finished. To use a query to select products, click the **Select** menu item. You can manually confirm reporting as finished for the selected products by clicking **OK**. Alternatively, you can set up the process to run in a batch. When the report as finished process is confirmed, the system generates a BOM journal where the posting to inventory is processed. This journal consists of one line item for the finished product and a line item for each BOM line. You can control whether the journal is automatically posted or whether it is left open for additional adjustments.

Max. report as finished page

On the **Max. report as finished** page, each BOM line indicates the number of pieces of the product that can be reported as finished. This calculation is based on the physical available on-hand inventory of each material line. In the following example, one piece of item number FG consumes two pieces of raw material RM10 and one piece of raw material RM20. Because there are only 10 pieces of RM10 on hand, the maximum quantity of FG that can be reported as finished is five pieces. This value is shown in the **Max. Report as finished** field.

LEVEL	ITEM NUMBER	QUANTITY	ON-HAND	MAX. REPORT AS FINISHED
0	FG	1	0	5
1	RM10	-2	10	5
1	RM20	-1	8	8

BOMs that have multiple levels

When a BOM has multiple levels, you can control how materials are accounted for at all levels by using the **Explosion** field. This field is available on both the **Report as finished** page and the **Max. report as Finished** page. The following options are available:

- **Never** – Underlying BOMs aren't exploded if there is a material shortage.
- **Always** – All underlying BOMs are fully exploded. Therefore, any free on-hand inventory for semi-finished

component items isn't used.

- **Shortage** – Underlying BOMs are exploded only if the full quantity of the material that is wanted isn't available.

Example

In this example, three pieces of the finished product (item number FG) are ready to be reported as finished. There is a two-level BOM, as shown here.

LEVEL	ITEM NUMBER	BOM-LINE QUANTITY	ON-HAND
0	FG		
1	COMP	1	2
1	RM	1	

The following tables show how the setting of the **Explosion** field affects the way that BOM journal lines are generated. **Explosion: Never**

LEVEL	ITEM NUMBER	QUANTITY
0	FG	3
1	COMP	-3

As the preceding table shows, only item number COMP is considered deducted in the journal. Item number RM, which is part of COMP, isn't exploded to the journal line, and the two on-hand pieces of COMP aren't considered.

Explosion: Always

LEVEL	ITEM NUMBER	QUANTITY
0	FG	3
1	RM	-3

In this case, item number COMP is exploded into its raw material, item number RM. The two on-hand pieces of COMP aren't considered in the quantity of RM to consume. **Explosion: Shortage**

LEVEL	ITEM NUMBER	QUANTITY
0	FG	3
1	COMP	-2
1	RM	-1

In this case, the two on-hand pieces of item number COMP are considered. However, because three pieces of item number FG are required, one piece of item number RM is also required in order to make the additional one piece of COMP.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Report as finished to a non-license plate controlled location (Application, May 2016)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This task guide shows an example of reporting as finished to a location that isn't license plate–controlled. An applicable work policy is the prerequisite for this task. A previous task guide showed the setup of the work policy. This task guide requires Dynamics AX application 7.0.1 or later.

Set up an output location

1. Go to Organization administration > Resources > Resource groups.
2. In the list, select resource group '5102'.
3. Click Edit.
4. In the Output warehouse field, enter '51'.
5. In the Output location field, enter '001'.
 - Location 001 isn't a license plate–controlled location. You can set up a non–license plate output location only if an applicable work policy exists for the location.

Create a production order and report it as finished

1. Close the page.
2. Go to Production control > Production orders > All production orders.
3. Click New production order.
4. In the Item number field, enter 'L0101'.
5. Click Create.
6. On the Action Pane, click Production order.
7. Click Estimate.
8. Click OK.
9. Click Start.
10. Click the General tab.
11. In the Automatic BOM consumption field, select 'Never'.
12. Click OK.
13. Click Report as finished.
14. Click the General tab.
15. Select Yes in the Accept error field.
16. Click OK.
17. On the Action Pane, click Warehouse.
18. Click Work details.
 - When the production order was reported as finished, no work was generated for put-away. This occurs because a work policy is defined that prevents work from being generated when product L0101 is reported as finished to location 001.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Report progress on a mobile job device

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to start and report progress on a production job in the job device registration form.

To be able to run this procedure you must have the System administrator or Machine Operator role associated with the user account.

1. Go to Production control > Manufacturing execution > Job card device.
2. In the WorkerTextField field, enter the badge of a worker. In the USMF demo data type '123' for Christina Portra..
3. Click Log in.
4. Click the Filter button.
5. Check or uncheck the Apply configuration filter check box. If you set a filter you can use production unit 110 in USMF.
6. In the Production unit field, select the resource group for which production jobs the worker can work on.
7. In the list, click the link in the selected row.
8. Click OK.
9. Click the Start job button.
10. Click OK.
11. Click the Report progress button.
12. Click OK.
13. Click the Next job button.
14. Click the Assigned to see an overview of all production jobs button.
15. Close the page.
16. Click the Break button.
17. In the list, find and select the desired record.
18. Click OK.
19. Click the Leaving button.
20. Select to log out.
21. Click OK.
22. In the WorkerTextField field, log in again. You can select worker '123' in USMF demo data.
23. Click Log in.
24. Click Stop break.
25. Click the Activity button.
26. Click Cancel.
27. Click the Leaving button.
28. Select to clock out.
29. Click OK.
30. Select a reason why you are clocking out early.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Use the safety stock journal to update minimum coverage

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to calculate minimum coverage proposals based on historical transactions and then update the item coverage with the proposals. This is done using the safety stock journal. The demo data company used to create this task is USMF. This task is intended for the production planner, to help maintain minimum coverage.

Create a new safety stock journal name

1. In the **Navigation** pane, go to **Master planning > Setup > Safety stock journal names**.
2. Click **New**.
3. In the **Name** field, type 'Material'.
4. In the **Description** field, type 'Material'.
5. Close the page.

Create a safety stock journal

1. In the **Navigation** pane, go to **Master planning > Master planning > Run > Safety stock calculation**.
2. Click **New**.
3. In the **Name** field, enter or select a value. Select the safety stock journal name that you created, for example, Material.
4. Click **Create lines**.
5. In the **From date** field, enter a date.
6. In the **To date** field, enter a date.
7. Click **OK**. This will create lines for the dimensions that have inventory transactions.

Calculate proposal

1. Click **Calculate proposal**.
2. Select the **Use average issue during lead time** option.
3. Set **Multiplication factor** to '10'. The Multiply factor is used to adjust the proposal. Because demo data only has a few transactions, you will need to set the factor to get a realistic proposal.
4. Click **OK**. Scroll down to find M0002 and M0003. View the **Calculated minimum** quantity column.

Update minimum quantity

1. In the **New minimum quantity** field, enter a number. Update the New minimum quantity to match the value in the Calculated minimum quantity. If the Calculated minimum is zero, you can enter the desired future value. For example, you can enter the Calculated minimum quantity in this field for M0002 that has warehouse 12.
2. In the list, find and select the desired record. For example, you can select M0002 that has warehouse 12.
3. In the **New minimum quantity** field, enter a number. Update the New minimum quantity to match the value in the Calculated minimum quantity. If the Calculated minimum is zero you can enter the desired future value.

Post the new minimum quantity and validate the result

1. Click **Post**.
2. Click **OK**.
3. Click to follow the link in the **Item number** field.
4. Click to follow the link in the **Item number** field.
5. On the **Action Pane**, click **Plan**.
6. Click **Item coverage**. Notice that the **Minimum quantity** has been updated with the new minimum quantity from the safety stock journal.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Material substitution in manufacturing

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to substitute materials during the production process.

There are three methods for substituting materials during the production process:

- By date, when one material is substituted for another after a specific date
- During master planning, when a material in a formula is substituted with a different material, because it's out of stock
- During production, when a material is unexpectedly out of stock and is substituted with a different material

Substituting material by date

Consider following scenario: A machine that a company is manufacturing contains a component that will expire from the vendor's catalog in two months. From the expiration date onward, the vendor will offer a new component that can be substituted for the old component. From and to validity dates can be set up on bill of materials (BOM) lines. For this example, you set up the old component to expire by entering the expiration date in the **To-date** field. Then, on the BOM, you set up the new, replacement component so that it's valid from the day after the old component expires. To do this, enter the start date in the **From-date** field.

Substituting material by planning

You can substitute materials during planning only when you're using formulas, not when you're using a BOM. Consider following scenario: A food manufacturing company is making a sauce from a formula that has 20 ingredients. One ingredient in the formula can be substituted by one of two other ingredients. However, because these two ingredients are more expensive than the preferred ingredient, substitution is used only if the preferred ingredient is out of stock. The material that can be substituted is called A, whereas the two materials that can replace it are called B and C. Material substitution by planning is controlled by the **Plan group** and **Priority** fields on the formula lines. For this example, you create formula lines for the three materials, and associate the formula lines with the same plan group. In the setup, the formula line for material A has the highest priority (lowest number), the formula line for material C has the lowest priority, and the formula line for material B has a priority that is between the priority of the other two lines. If you have demand for the finished item, master planning first determines whether the demand for material A can be covered. If the demand can't be covered, master planning looks at materials B and C, in order of priority. If material B is on hand, it will be used after a planned batch order is firm for the formula. If none of the materials are on hand, master planning creates a planned order for material A. **Note:** When you set up formula lines in a plan group, you should specify a quantity only on the material that has the highest priority. This quantity will be used to calculate the demand of all materials in the plan, even the materials that have lower priority. You can't specify different quantities on lower-priority items in the plan group.

Substituting material during production

Consider the following scenario: A piece of metal plate is required for a welding operation. During the operation, a warehouse worker informs the machine operator that the plate is out of stock. However, it's decided that the plate can be substituted with a plate that is slightly thicker. That way, the operation can be finalized. Material can be added to the BOM for an open production order. If the production order has a status of **Started**, users are asked to re-estimate the order when they add a new item to the production BOM. After the material is added, a new picking list can be created for the new item. You don't have to add the new material to the production BOM. Instead, you can add it directly to the production picking list. Then, when the picking list is posted, the system

adds the material to the production BOM.

Registration for manufacturing execution

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes key concepts and terms that you need to understand to configure and use manufacturing execution.

Manufacturing execution is intended to be used primarily by manufacturing companies. Workers can register time and item consumption on production jobs by using the **Job registration** page. All registrations are approved and are later transferred to the relevant modules. Continuous approval and transfer of registrations lets managers easily track actual costs on production orders.

Manufacturing execution and registration terminology

The following table contains terms that pertain to manufacturing execution and related registration tasks.

TERM	DESCRIPTION
Manufacturing execution	A function that is used to register time, material consumption, costs on production jobs, projects, and indirect activities. Registration is done in a manufacturing execution registration client.
Job list	On the Job registration page, workers are shown the list of jobs that they must perform on a specific resource, such as a machine. A worker can register time and item consumption on each job or task in the job list.
Job bundling	If a worker starts more than one job at the same time on the Job registration page, this is called job bundling. The time that is spent on bundled jobs can be allocated to the individual jobs in various ways by using allocation keys.
Pilot/assistant registrations	A worker can register as an assistant to a resource, and can create a small team where several workers work on the same production jobs. Resources that workers are connected to as assistants are called pilots. Only the pilot resource must make registrations. All assistants automatically get the same registrations. For example, if a machine acts as the pilot, workers who have registered as assistants to that machine can make registrations on the Job registration page, and both the machine and the workers who are connected as assistants will receive the same registrations.
Indirect activity	An activity or task that isn't directly related to a production job or a project, such as a department meeting, a cleaning job, or a maintenance job on the shop floor. Workers can make registrations on indirect activities, in the same way that they can register on production jobs and projects.

Registrations in manufacturing execution

Workers can make various types of registrations in manufacturing execution for work that is performed on production jobs. Depending on the system setup, workers might also be able to make registrations on project activities and nonproductive tasks, such as breaks, absences, and indirect activities. Here are the registration

types:

- **Clock-in/clock-out** (available with time and attendance) – Workers clock in when they arrive at work and clock out when they leave to go home.
- **Register on production jobs** – Workers can make registrations, such as starting a job and reporting feedback for a job, on the production jobs that appear in their job list. Workers can start several jobs at the same time. This is referred to as job bundling.
- **Register on inventory** – Workers can make registrations on materials that are used on the shop floor, but that aren't directly related to production jobs. Examples include grease, lubricants, or other materials that are used to keep machinery running. Registration is performed in an inventory journal.
- **Register on projects** (available with time and attendance) – Workers can make registrations, such as starting and finishing work on the projects or project activities that appear in their job list.
- **Register project fees and project items** (available with time and attendance) – Workers can register fees (expenses) that are associated with a project in a project fee journal, such as mileage and bridge toll. Workers can also register item consumption on projects. This is done in a project item journal.
- **Register as assistant to another worker** – If two or more workers will work together on a production job or a project, a worker can register as an assistant to a machine, or to another worker, who will then act as the pilot. The pilot can select another worker as the pilot, as required.
- **Register absence** (available with time and attendance) – Workers can register time on various absence codes that are set up. Absence can be indicated if a worker arrives late, requires absence during the work day, or leaves earlier than expected according to the standard work time profile.
- **Register breaks** (available with time and attendance) – During the work day, workers can register that they are leaving their workstation to take a break. Several break types can be set up. When a worker returns and logs on again, the system registers that the worker is back, and the break registration stops.
- **Register indirect activities** (available with time and attendance) – Indirect activities are nonproductive activities that workers might engage in during a workday, such as a department meeting, a team meeting, or a maintenance job that is performed on the shop floor. Workers can make registrations on the indirect activities that are set up.
- **Register overtime** (available with time and attendance) – Workers who have been asked to work longer hours can select whether the extra hours should be registered as flextime or overtime.

Production feedback

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about production feedback, which gives workers feedback about production jobs. The article includes information about the various ways that production feedback can be updated.

Production feedback gives workers feedback about production jobs. It records time and material consumption on production orders, operation quantities and status, and errors that cause a job or operation to fail. Production feedback can be updated in journals that are related to production orders. The **Production job card** and **Production route card** journals are used to report time and quantities per job or operation. For reporting about the last job or operation, quantities on the finished product can be reported as finished. Production feedback can also be updated on the **Job card terminal** and **Job card device** pages. These pages enable production feedback to be updated on the shop floor and are part of the manufacturing execution functionality in the **Production control** module. The **Job card terminal** page has a configurable user interface that shows a list of the released jobs in a prioritized order for a selected work area. It also offers advanced options such as job bundling and team work. The **Job card device** page has a touch-optimized user interface. Production feedback on both pages is updated from the production journals.

Enable the payroll process for time and attendance

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to enable the payroll process for time and attendance. The demo data company used to create this procedure is USMF.

Create a pay type with a related pay rate

1. Time and attendance > Setup > Payroll > Pay types
2. Click New.
3. In the Pay type field, type a value.
4. In the Description field, type a value.
5. Click Save.
6. Click Rates.
 - Rates for pay types are set up for specific time intervals, and individual rates can be created for workers. It is not always necessary to create rates for pay types in time and attendance. This information may already exist in the payroll system that is used to generate wages.
7. Click New.
8. In the list, mark the selected row.
9. In the Rate field, enter a number.
10. Click Save.

Create a pay agreement

1. Close the page.
2. Close the page.
3. Go to Pay agreements.
 - Time and attendance > Setup > Pay agreements
4. Click New.
5. In the Pay agreement field, type a value.
6. In the Description field, type a value.
7. Click Save.
8. Click Agreement lines.
9. Click New.
10. In the list, mark the selected row.
11. In the Profile type field, enter or select a value.
12. In the Pay type field, enter or select a value.

Set up pay agreement for time and registration worker

1. Close the page.
2. Close the page.
3. Go to Time registration workers.
 - Time and attendance > Setup > Time registration workers
4. In the list, click the link in the selected row.
5. Click the Employment tab.

6. Expand the Time registration section.
7. Click Edit.
8. In the Pay agreement field, enter or select a value.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure a worker using the mobile job device

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to assign the correct roles to the user account of a worker, and then enable the worker to do shop floor registrations.

Verify that a worker is assigned a certain role

For this example, verify that user "SHANNON" is assigned the machine operator role before you configure the worker account.

1. Go to **Navigation pane > Modules > System administration > Users > Users**.
2. Search for a user in the quick filter. For this example, enter .
3. Select the link in the **User ID** column of the user account that appears.
4. In the **User's roles** tree, select **Roles > Machine operator**.
5. Close the **user details** and **users** pages to return to the home page.

Configure worker account

1. Go to **Navigation pane > Modules > Human resources > Workers > Workers**.
2. Search for a user in the quick filter. For this example, enter .
3. Select the link in the **Name** column of the user account that appears.
4. Select the **Time registration** tab.
5. Select **Activate on registration terminals**.
6. Enter or select values in the following fields:
 - **Calculation group**
 - **Default calculation group**
 - **Approval group**
 - **Standard profile**
 - **Profile group**
7. Select **OK**.
8. Select **Edit** to enter a badge number for the new time registration worker. Enter a value in the **Badge ID** field.
9. Select **Save**.
10. Close the **Worker details** and **Workers** pages.

Assign worker to device group

1. Go to **Production control > Setup > Manufacturing execution > Configure job card for devices**.
2. Select **Add**.
3. In the list, select the desired worker. For this example, select **SHANNON**.
4. Select **OK**.
5. Select **Edit**.

6. In the **Production unit** field, you can set the default filter for the worker. This will ensure that only production jobs for the selected production unit are shown when the worker logs on to the device. Enter the desired value.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Allocate time to jobs in a job bundle

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Manufacturing execution, you can bundle jobs. You can then start multiple jobs at the same time on the Job list page.

If you bundle jobs, you must define how the total registered time for all the jobs should be allocated to each job. You define the allocation by selecting one of the following options in the **Bundle type** field on the **Allocation keys** page:

- **Estimation** – Time is divided among the jobs, based on the estimated time for the jobs.
- **Jobs** – Time is divided according to total jobs that are bundled and how much time was spent finishing all the jobs.
- **Net time** – Time is divided equally among the jobs that are in the bundle at any time.
- **Real time** – Actual job time is allocated. The cost can be calculated based on the actual payroll cost. **Note:** The **Real time** allocation key is available only if your company uses the payroll functionality in Time and attendance.

The following examples show the results of the various allocation keys.

Example scenario

Three jobs in your job queue must be completed. You start the first job, and then, while that job is in progress, you start the second and third jobs. Therefore, there is a bundle of three jobs. The following table shows the estimated production time for each job.

JOB	PRODUCTION TIME
Job 1	1 hour
Job 2	3 hours
Job 3	4 hours
Total	8 hours

The following table shows the actual work hours that are spent on each job.

JOB	START TIME	END TIME	BUNDLE TIME
Job 1	09:00	11:00	2 hours
Job 2	10:00	13:00	3 hours
Job 3	10:00	15:00	5 hours
Bundle	09:00	15:00	6 hours

The following sections describe the results of the calculated time for each allocation key.

Estimation allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time × (Estimated job time ÷ Total estimated time)

JOB	FORMULA	ALLOCATED TIME
Job 1	$6 \times (1 \div 8)$ hours	0.75 hour
Job 2	$6 \times (3 \div 8)$ hours	2.25 hours
Job 3	$6 \times (4 \div 8)$ hours	3.00 hours

Jobs allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time ÷ Number of jobs

JOB	FORMULA	ALLOCATED TIME
Job 1	$6 \div 3$	2 hours
Job 2	$6 \div 3$	2 hours
Job 3	$6 \div 3$	2 hours

Net time allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Calculated time per reporting = Bundle time ÷ Number of jobs

	09:00–10:00 (1 HOUR)	10:00–11:00 (1 HOUR)	11:00–13:00 (2 HOURS)	13:00–15:00 (2 HOURS)	ALLOCATED TIME
Number of jobs in the bundle	1	3	2	1	Not applicable
Job 1	$1 \div 1 = 1$ hour	$1 \div 3 = 0.33$ hour	Not applicable	Not applicable	1.33 hours
Job 2	Not applicable	$1 \div 3 = 0.33$ hour	$2 \div 2 = 1$ hour	Not applicable	1.33 hours
Job 3	Not applicable	$1 \div 3 = 0.33$ hour	$2 \div 2 = 1$ hour	$2 \div 1 = 2$ hours	3.33 hours

Real time allocation key

If you want production costs to be calculated based on real costs, you must clear the **Cost category** option on the **Production order defaults** page. The following table illustrates the formula for calculating allocated time. Here is the formula: Actual time per job = Actual time in bundle

JOB	ACTUAL TIME
Job 1	2 hours
Job 2	3 hours
Job 3	5 hours

Consider the three jobs that are performed by a worker who has an hourly wage of USD 12.00. No overtime bonus or premium was earned in the time that was spent on the jobs. The worker worked on the three bundled jobs for a total of six hours. Therefore, the salary cost is $6 \times \text{USD } 12.00 = \text{USD } 72.00$. When you use real-time allocation, the cost per hour is recalculated by using the factor from the Net time formula. The actual time that was spent on each job is then transferred together with the corrected cost price per hour. In the example, six hours are spent, although 10 hours were allocated. The following table illustrates the formula for calculating cost. Here is the formula: $\text{Cost per hour} = (\text{Total bundle time per job (Net time)} \div \text{Actual time per job}) \times \text{Standard cost price per hour}$

JOB	CALCULATION OF CORRECTED COST PER HOUR	CORRECTED COST PER HOUR	ALLOCATED TIME	TOTAL COST OF JOB
Job 1	$(1.33 \div 2) \times \text{USD } 12.00$	USD 8.00	2 hours	USD 16.00
Job 2	$(1.33 \div 3) \times \text{USD } 12.00$	USD 5.33	3 hours	USD 16.00
Job 3	$(3.33 \div 5) \times \text{USD } 12.00$	USD 8.00	5 hours	USD 40.00

The corrected cost per hour and the job time are posted in a production journal. **Note:** If you select the **Cost category** option on the **General** tab on the **Production order defaults** page, the actual time for each job is transferred to a production journal, where the cost is applied to the cost category of the specific job.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

Calculate material consumption

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about various options that are related to the calculation of material consumption.

The following options that are related to the calculation of material consumption are available on the **Setup** and **Step consumption** tabs on the **Line details** FastTab of the **Bill of materials** page.

Variable and constant consumption

In the **Consumption is** field, you can select whether consumption should be calculated as a constant quantity or a variable quantity. Select **Constant** if a fixed quantity or volume is required for the production, regardless of the quantity that is produced. Select **Variable**, which is the default setting, if the required amount of material in the finished goods is proportional to the number of finished goods that are produced.

Calculating consumption from a formula

In the **Formula** field, you can set up various formulas for calculating material consumption. If you use the default value, **Standard**, the consumption isn't calculated from a formula. The following formulas work together with the **Height**, **Width**, **Depth**, **Density**, and **Constant** fields:

- Height * Constant
- Height * Width * Constant
- Height * Width * Depth * Constant
- (Height * Width * Depth / Density) * Constant

Rounding up and multiples

Together, the **Rounding up** and **Multiples** fields let you round up the material consumption value. For example, you can round up the value according to the handling unit in which the raw material is picked for production. The following options are available in the **Rounding up** field: **Quantity**, **Measurement**, and **Consumption**.

Quantity

If you select **Quantity** as the rounding-up mechanism, the quantity must be a multiple of the specified quantity. For example, if whole numbers are required, select **1** in the **Multiples** field. Numbers are then rounded up to a quantity that is divisible by 1.

Measurement

Typically, you select **Measurement** as the rounding-up mechanism when the raw material comes in specific dimensions. For example, a piece of 2-meter metal tube is required for a finished good, and the metal tube is stored in 4.5-meter lengths. In this case, the **Measurement** rounding-up mechanism can be used to calculate how many metal tubes are required to produce a specific number of pieces of the finished good. For this example, the **Formula** field is set to **Height * Constant**. The **Height** field is set to **2** to indicate the length of the tube that is required for the finished good. The **Multiple** field is set to **4.5** to indicate that the tube is picked in lengths of 4.5 meters. Here is the calculation:

1. Number of multiples that are required for 10 pieces of the finished good: $10 \div 2 = 5$ pieces
2. Total consumption: $4.5 \times 5 = 22.5$ meters of metal tube

It's assumed that 0.5 meter of tube is scrapped for every five pieces of tube that are consumed.

Consumption

Typically, you select **Consumption** as the rounding-up mechanism when raw material must be picked in whole quantities of a specific handling unit of the product. For example, 2 quarts of paint are used to produce one piece of a finished good, and the paint is picked in 25-quart cans. In this case, the **Consumption** rounding-up mechanism can be used to round up consumption to whole numbers of 25-quart cans. Here is the calculation for the amount of paint that is required if 180 pieces of the finished good must be produced:

1. Paint that is required, excluding scrap: $180 \times 2 = 360$ quarts
2. Number of cans: $360 \div 25 = 14.4$, which is rounded up to 15
3. Paint that is required, including scrap: $15 \times 25 = 375$ quarts

Step consumption

Step consumption is used to calculate constant consumption in quantity intervals. If you select **Step consumption** in the **Formula** field on the **Setup** tab, you can add information about the steps on the **Step consumption** tab. The fixed consumed quantity can be set up in intervals of the produced quantity. For example, step consumption is set up as shown in the following table.

FROM SERIES	QUANTITY
0.00	10.0000
100.00	20.0000
200.00	40.0000

The bill of materials (BOM) quantity is 1, and the production quantity is 110. The formula for the consumption is From series (Quantity) = Consumption. Because the production quantity is 110, it falls into the "From 100 series." Therefore, the quantity is 20.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production posting

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about different types of postings in the production process.

Production posting activities follow production processes that are described in the sections below.

Material consumption

Materials are registered as consumed during production when the production picking list journal is posted. This process generates issue transactions that deduct the on-hand inventory. In the production parameters, you can specify whether the value of raw materials that are in progress (work in process [WIP]) should be posted in the ledger. The value of raw materials that are in progress (WIP) is then posted to a dedicated Picking list account and a dedicated Picking list offset account.

Time consumption

The time that workers spend on production jobs is recorded in the Route card journal or the Job card journal. When these journals are posted, ledger posting to a dedicated account for resources that are in progress (WIP) is processed. This posting represents the value of the time that is spent on the production order. After the production order is registered as ended, the WIP accounts are settled.

Reporting finished goods and error quantities

When a production order is reported as finished, the quantity of the finished goods that have been completed is updated in Inventory management through the Report as finished journal. If you're using WIP accounting, which can be set up in the production parameters, a ledger journal is made to reduce the WIP accounts and increase the inventory of the finished goods. The journal uses the standard cost that is defined for the product.

Ending the production order
