
Before a production order is ended, actual costs are calculated for the quantity that was produced. All estimated costs of material, labor, and overhead are reversed and replaced with actual costs. The overall cost of the finished item is debited from the inventory Receipt account and credited to the inventory Issues account. If you select the **End job** check box when you run the cost calculation, the status of the production order is changed to **Ended**. This status prevents any additional costs from being unintentionally posted to a completed production order. You can specify that the value of error quantities that are reported during reporting as finished should be allocated to the good quantities that are reported as finished. Alternatively, you can specify that the value of error quantities should be posted to a dedicated scrap account.

Controlling the level of ledger posting

In the **Production control parameters**, you can use the **Ledger posting** field to set the level of ledger posting for production processes. The following values are available:

- **Item and resource** – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from resource or resource group from the route operations.
- **Item and category** – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from the cost categories that are associated with the route

operations.

- **Production groups** – Use the ledger accounts that are set up on the production groups for both material and time consumption. The production groups are associated with the released products and copied to the production orders when those orders are created. The posting on the production orders will then follow the production groups that are associated with the production order.

Note: If the standard method for calculating the cost of the finished item was used, the final transactions reflect this fact. If actual costs and the costs that are calculated by using the standard method differ, the difference is posted to the account that shows profit or loss.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Time and attendance registration overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

Time registration workers can enter different types of time registrations, for example, clock in, clock out, register indirect activities, and absence registration. This topic describes registrations, their calculation, approval, and the use of workflow to add structure and automated approval to the process of approving timesheets.

Registrations

In companies that use Time and attendance, workers must register the time that they spend at work, as well as their attendance. Some companies may only require workers to register clocking-in and clocking-out times. In other companies, workers may also be required to register time consumption on the actual activities they perform as well as the breaks they take. The intended users of Time and attendance are:

- Workers, who are required to register time and attendance at regular intervals, for example daily, weekly or bi-weekly.
- Supervisors, managers, and payroll officers who calculate, approve, and transfer worker registrations for further processing.

NOTE

If you run Time and attendance together with Manufacturing execution, all registrations on projects, project activities, indirect activities, absence codes, and overtime and flex time will be recorded and are used to calculate payroll in both modules.

Time registrations workers

To be able to register time and absence, workers must be set up as time registration workers in the company they are employed in.

After setup, the workers can enter different types of registrations.

- Clocking in- and out when arriving or leaving work.
- Time and item consumption on production jobs.
- Time used on a machine on the shop floor, if the machine has been defined as a resource.

NOTE

A worker can be automatically assigned the time registrations that are made on a particular machine on the shop floor, if the worker chooses to work as an assistant to the machine when he or she starts the production job.

- Time registrations on projects and project activities.
- Registering project fees and item consumption via the respective project fee journals and project item journals.
- Planned absence.
- Absence when arriving late to work or leaving earlier than planned.
- Work breaks, either manually registered or automatically calculated by the system.
- Indirect activities, which are non-productive activities a worker might engage in during a workday. Examples of these activities include meetings or cleaning their workspace.
- Overtime, which can be registered either as extra hours, flextime, or overtime.

Adding clock-out registrations

If a worker forgets to clock-out at the end of their workday, the missing registration can be added by running a batch job. The system will compare the clock-in time and the clock-out time according to the associated profile of the worker, and automatically insert the missing clock-out registration to match the profile's end time. Both the clock-in and clock-out registrations are vital for the subsequent calculation and approval of time registrations before they can be transferred to payroll.

Calculating registrations

When a registration worker is assigned a calculation group that typically relates to a specific team, shift, or work group. The team manager or supervisor typically validates the registrations made by the workers, and is therefore also the responsible person to run the calculation for the respective calculation groups on a daily basis. As part of the calculation process the team manager or supervisor is able to:

- Correct erroneous registrations. For example, change switch codes and adjust feedback on production jobs.
- Add missing registrations. For example, create clock-out registrations and create absence transactions.
- Delete incorrect registrations.

Because the registered time must match the worker's time profile prior to calculating the registrations, you must override the work time profile for any worker who has an exception to his standard work time profile. In the case, where the worker profile is day shift, and the worker has agreed to work a night shift with no overtime pay, the team manager or supervisor must override the default worker profile in order to calculate the working time at the standard night rate and not as overtime. The calculation will also display an error if an absence registration is missing. It must be added before the calculation can be completed.

Approving registrations

Just as you assign a calculation group to a time registration worker, you must assign an approval group as well. Typically the group will be specific to a team, shift, or work group. You must approve the time registrations that were calculated correctly – this means doing a calculation without errors – before pay items can be generated that afterward can be transferred to a payroll system. The payroll administrator will typically do the approval of registrations, and prior to the approval he is able to:

- Override pay agreements for individual workers.
- Add manual premiums.
- Enter additional information about absence registrations.

NOTE

If overtime has been calculated for specific workers, the overtime can be allocated to specific jobs during the day. This is relevant if job cost is calculated based on worker pay.

Approving registrations using workflow

You can set up a workflow approval process that automatically approves registrations which comply with workflow rules, leaving only deviations to be handled manually. If workflow approval is activated, the team manager or supervisor submits the calculated registrations for approval. The workflow process will generate the appropriate approvals and tasks, and then assign them to the right users and roles as identified in the workflow. There are two workflow approvals for time and attendance.

WORKFLOW	PURPOSE	REGISTRATION TYPE
Time and attendance days total	The workflow validates registrations against, for example, the expected number of work hours for the day.	
Time and attendance journal registration.	The workflow validates each registration type for the date of the registration.	Time and attendance • Clock-in • Clock-out • Absence • Break • Switch code • Project • Project activity • Indirect activity Production jobs • Queue before • Setup • Process • Overlap • Transport • Queue after • Start assistance • Stop assistance

Transferring approved registrations

After approval of the registrations you can transfer them to a periodic payroll job. A transferred registration is posted to an activity or job that it relates to, for example, a production order or a project. Payroll transactions are generated for each worker based on the registrations.

Reversing transferred registrations

The task of reversing transactions – rolling them back – can be done until the time when the payroll period's pay transfer is run. This means that payroll data has been transferred to an external file. When reversed, all registrations are withdrawn, and any transactions posted on production orders or projects are offset and neutralized.

NOTE

The external file can be imported into a payroll system.

Registrations in electronic timecards

Workers with job tasks that do not require immediate feedback, as is the case with production jobs, but who work on project activities, can benefit from using the electronic timecard. Electronic timecards offer the flexibility to enter registrations any time and in the best way for your business schedule – daily, weekly, or when a worker is in the office again after being away. To use electronic timecards or these workers, you must specify, Use timecard, in the worker details. Electronic timecards enable the worker to register:

- Date
- Registration type
- Job reference, such as project, indirect activity, or production order
- Job identification
- Time consumption
- Project fees
- Project items

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Pay based on registrations

2/18/2021 • 27 minutes to read • [Edit Online](#)

This topic explains, in detail, how pay is calculated based on worker registrations. It includes examples that show how the various combinations of setup options that are available for the calculation affect the result. Here are some of the areas that will be covered:

- Flex time
- Overtime
- Breaks
- Switch codes
- Pay items
- Pay agreements
- Time and attendance calculation parameters
- Absence

The use of flex time

Periods of flex time are set up in the time profiles that are used in Time and attendance. There are two flex profile types: **Flex+** and **Flex-**. When a worker registers time in a Flex+ period, the worker's flex balance is increased by the hours that were worked. The worker doesn't receive any compensation for the hours that were worked during the Flex+ period. However, the worker can take time off during the Flex- periods and be compensated with the hours from his or her flex balance. Therefore, time off during the flex periods is considered an absence by the system.

Scenarios based on flex periods

The two scenarios that follow are based on a flex profile that represents a workday. For both scenarios, pay is calculated according to the flex period where the worker clocks in and out.

Flex profile for one workday

PROFILE TYPE	START	END	DAY
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Scenario 1: A worker registers clock-in during a Flex+ period and clock-out during a Flex- period

The worker's registrations for the day looks like this.

JOURNAL REGISTRATION TYPE	START	END
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	02:45 PM
Clock out	02:45 PM	02:45 PM

The worker's registrations for the day are calculated and transferred to pay on the **Approve** page (**Time and attendance > Review and approve > Approve**). After the registrations have been calculated, the result of the calculation can be viewed on the **Times** tab.

To understand this scenario, see the following fields.

FLEX +	FLEX -	TIME	PAY TIME
0.50	0.75	8.25	8.50

Calculation of Flex+

According to the flex profile, the time between 06:00 AM and 07:00 AM is a Flex+ period. Therefore, if the worker clocks in at 06:30 AM, he earns 0.5 hours. This amount of time is added to the worker's flex account.

Calculation of Flex-

According to the flex profile, the Flex- period starts at 02:30 PM and ends at 03:30 PM. Therefore, if the worker clocks out at 02:45 PM, the 45 minutes (0.75 hours) that remain in the Flex- period are registered as pay time, and the same amount of time is deducted from the worker's flex account. The 45 minutes are included in pay time because the worker will be granted pay for the remaining 45 minutes in the Flex- period. If the worker is absent during the Flex- period, the 45 minutes will be deducted from his flex account.

Calculation of Time

Time is calculated as the time between clock-in and clock-out, that is, 06:30 AM to 14:45 PM with equals 8.25 hours.

Calculation of Pay time

Pay time is the time that a worker is granted pay during. In this scenario, the worker is at work for 8.25 hours (**Time**). However, **Pay time** is calculated as 8.50 hours because the worker is granted pay during the Flex- period after he clocked out. The pay time equals the planned work hours because Flex+ time is added to the worker's flex account, not to the pay time. The absence time during the Flex- period is compensated for by the pay time and deducted from the worker's flex account.

TIME	REGISTRATION TYPE	PAY TIME (HOURS)
6:30 AM - 7:00 AM	Flex+	0
7:00 AM – 2:45 PM	Standard time	7.75
2:45 PM – 3:30 PM	Flex-	0.75 (Absence period)
	Total	8.50

Scenario 2: A worker works during the whole Flex- period and also works overtime

The worker's registrations for the day look like this.

JOURNAL REGISTRATION TYPE	START	END
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	05:00 PM
Clock out	05:00 PM	05:00 PM

After you've calculated the journal registrations on the **Approve** page, you can view the calculation result on the **Times** tab. To understand this scenario, see the following fields.

FLEX +	FLEX -	TIME	PAY TIME	PAY OVERTIME
0.50	0.00	10.50	10.00	1.50

Calculation of Flex+

According to the flex profile, the time between 06:00 AM and 07:00 AM is a Flex+ period. Therefore, if the worker clocks in at 06:30 AM, she earns 0.5 hours of Flex+ time on her flex balance.

Calculation of Flex-

Because the worker is working during the Flex- period, Flex- isn't calculated. Flex- is calculated only if the worker is absent during the Flex- period. From a payment perspective, if the worker works during the Flex- period, she is granted the pay rate that is defined for standard time. If the worker is absent during the Flex- period, the 45 minutes are deducted from her flex account.

Calculation of Time

Time is calculated as the time between clock-in at 06:30 AM and clock-out at 05:00 PM, or 10.50 hours.

Calculation of Pay time

In this scenario, the worker works 10.50 hours (Time). However, Pay time is calculated as 10.00 hours because the worker isn't granted pay during the Flex+ period.

Calculation of Pay overtime

TIME	REGISTRATION TYPE	PAY TIME (HOURS)
6:30 AM - 7:00 AM	Flex+	0
7:00 AM – 2:30 PM	Standard time	7.50
2:30 PM – 3:30 PM	Flex-	1.00
3:30 PM – 05:00 PM	Overtime	1.50
	Total	10.00

Generation of pay items

Worker registrations for the day can be transferred from the **Approve** page. During the transfer process, pay items and transferred registrations are generated. Pay items represent a breakdown of pay time into standard time, overtime, paid break time, and so on.

To open the list of pay items, select **Time and attendance > Review and approve > Approve**. Then select **Inquiry > Transferred registrations**.

The pay items are the basis for a worker's pay. You can generate a file that includes the information from the pay items and transfer that file to a payroll system.

As part of the transfer process, time and cost from production and project activities are transferred to production and project journals to account for the time and cost spend. The transferred registrations are the basis for time and cost price per hour for production orders and projects. You can open the transferred registrations by using the **Inquiry** menu on the **Approve** page.

For example, for scenario 2, the following pay items are generated.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE	TOTAL COST
Standard time	1201	10.0	10	100
Overtime	1301	1.50	5	7.50
			Total	107.50

The pay item for standard time has a pay unit of 10 hours that covers standard time, Flex- time, and overtime. Standard time, Flex- time, and overtime are consolidated into one pay item because all the types are calculated as standard time, based on the default setting of a parameter on the **Calculation parameters** page (**Time and attendance > Setup > Calculation parameters**). The overtime is calculated on top of the standard time by using an additional rate of 5.

If you want to clearly distinguish standard time and overtime, so that the pay units for the pay types cover only the actual time spend on standard time and overtime, the pay units for standard time must be calculated as 8.50, and the pay units for overtime must be calculated as 1.50.

To configure the system to clearly distinguish standard time and overtime, you must exclude overtime from the standard time. You must also change the setup of the pay type for overtime so that the pay rate for overtime covers all payments for the hours that were spent on overtime.

Exclude overtime from the standard time

On the **Calculation parameters** page, select **Overtime** as the profile specification type, and set the **Pay time** option to **No**, as shown here.

REG. SPECIFICATION	PROFILE SPECIFICATION TYPE	CALCULATION		PAID	
Working time	Overtime	Standard time	Yes	Pay time	No
		Pay time	Yes	Pay overtime	Yes

After you adjust the calculation parameters, the following pay items are generated.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE	TOTAL COST
Standard time	1201	8.50	10	85.0
Overtime	1301	1.50	15	22.50
			Total	107.50

NOTE

The calculation parameters have a recommended standard setting. In general, you should be careful when you change these parameters. To restore the recommended standard settings, on the **Calculation parameters** page, select **Restore values**.

Allow a deviation from the standard pay profiles

On the **Profiles** page (**Time and attendance > Setup > Time profiles > Profiles**), you can set up profile types that include switch codes and breaks.

Switch codes

You can use switch codes to allow workers to deviate from their profile type by changing a different profile type. For example, you can allow a worker to change from Flex+ time to overtime. A worker can add a switch code during registration, or you can assign the task of adding a switch code to the approver of the registrations.

Before a switch code can be used, you must define it as a type of indirect activity. You must then add the switch code to the time profile for the period where you want to allow a change of profile type. For example, follow these steps to create a switch code that allows the Flex+ period to be changed from 06:00 AM to 07:00 AM to overtime.

1. Create a switch code that is named **OTBCI (Convert flex to overtime before clock-in)**. Select **Time and attendance > Manage indirect activities > Indirect activities**.
2. In the **Switch code** column, add OTBCI to the Flex+ line in the time profile.
3. In the **Secondary** column, add the **Overtime** profile type.

Consider the following flex profile that represents a workday.

PROFILE TYPE	START	END	DAY
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

JOURNAL REGISTRATION TYPE	START	END
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	02:45 PM
Clock out	05:00 PM	05:00 PM

The following pay items are generated after the transfer.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE	TOTAL COST
Standard time	1201	8.50	10	85.0
Overtime	1305	1.50	15	22.50
			Total	107.50

On the **Approve** page, undo the transfer, and then use the **Switch code** menu to apply the **OTBCI** switch code. When you transfer the registrations a second time, the following pay items are generated.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE	TOTAL COST
Standard time	1201	8.50	10	80.0
Overtime	1305	2.00	15	30.0
			Total	107.50

NOTE

When you apply the switch code, overtime is increased by 0.5 hour, from 1.50 to 2.00. The 0.5 hour is the conversion of the Flex+ time that is registered, from 6:30 AM to 07:00 to overtime.

Breaks

Breaks from work affect the calculation of worker pay. Breaks are defined as a type of indirect activity. They can be defined as either **Paid**, to allow the break to add to the worker's pay, or **Unpaid**, to prevent the break from adding to the worker's pay. A break can also be defined as either **Planned** or **Registered**.

Planned breaks

If a company has a fixed break time, such as a fixed break for lunch, the break can be predefined in the time profile. In this case, the worker doesn't have to register the break on the job card pages. Instead, the break is automatically accounted for when the worker's registrations are calculated on the **Approve** page.

Registered breaks

If a company doesn't use planned breaks, workers can register breaks during the workday. Registered breaks can be used, for example, if a worker is working against a flex time profile that has no defined clock-in and clock-out times. Registered breaks are a type of indirect activity. The worker registers the break on the **Job card** terminal page or on the **Job card** device page. On both these pages, the user can select the type of break in a list of predefined break activities.

Paid and unpaid breaks

Break activities can be set up as **Paid** or **Unpaid**. A paid break is included in the calculation of pay time, and the system uses the pay type that is defined in the pay agreement for the **Break** registration type.

Example of a planned break

Consider the following time profile that includes an unpaid break for lunch.

PROFILE TYPE	START	END	DAY
Over time	00:00 AM	06:00 AM	Monday

PROFILE TYPE	START	END	DAY
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	12:00 PM	Monday
Break	12:00 PM	12:30 PM	Monday
Standard time	12:30 PM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

JOURNAL REGISTRATION TYPE	START	END
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	02:45 PM
Clock out	05:00 PM	05:00 PM

After you've calculated the journal registrations on the **Approve** page, you can view the calculation result on the **Times** tab. To understand this scenario, see the following fields.

FLEX +	FLEX -	TIME	PAY TIME	NON-PAID BREAK TIME	PAY OVERTIME
0.50	0.00	10.50	9.50	0.5	1.50

NOTE

The system calculated 0.5 hours of unpaid break time, and that time isn't part of the pay time.

Example of a registered break

Consider the following time profile that doesn't include planned breaks.

PROFILE TYPE	START	END	DAY
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday

PROFILE TYPE	START	END	DAY
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

JOURNAL REGISTRATION TYPE	START	END
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	05:00 PM
Break	12:03 PM	12:32 PM
Clock out	05:00 PM	05:00 PM

When the registrations are calculated, the time for the activities is calculated.

JOURNAL REGISTRATION TYPE	START	END	TIME
Clock in	06:30 AM	06:30 AM	
Production job	06:30 AM	05:00 PM	10.00
Break	12:03 PM	12:32 PM	0.50
Clock out	05:00 PM	05:00 PM	

NOTE

The time for the break runs in parallel with the time for the activity (a production job, in this example). This behavior is always used for break activities. When the registrations are calculated, the break time is subtracted from the activity time. In this case, the production job has a duration of 10.50 hours, but the time is calculated as 10 because 0.5 hours of break time are subtracted from the activity time.

After you've calculated the journal registrations on the **Approve** page, you can view the calculation result on the **Times** tab. To understand this scenario, see the following fields.

FLEX +	FLEX -	TIME	PAY TIME	NON-PAID BREAK TIME	PAY OVERTIME
0.50	0.00	10.50	9.50	0.5	1.50

If the planned break had been paid instead of unpaid, the calculation result would look like this.

FLEX +	FLEX -	TIME	PAY TIME	PAID BREAK TIME	PAY OVERTIME
0.50	0.00	10.50	10.00	0.5	1.50

Pay items and paid breaks

When you transfer registrations on the **Approve** page, pay items are generated. A separate pay item is generated for paid breaks.

The pay rate for a paid break is determined by the pay type that is set up in the pay agreements for the break. Instead of using a pay type, you can set up the cost price per hour on the break for a defined date interval.

Consider the following time profile.

PROFILE TYPE	START	END	DAY
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

JOURNAL REGISTRATION TYPE	START	END	TIME
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	03:00 PM	7.5
Break (Paid)	12:00 PM	12:30 PM	0.5
Clock out	03:00 PM	03:00 PM	

For this example, the pay type for standard time is set to **1201**, and a pay rate of **10** is set up in the pay agreement. The paid break has a pay type of **1301** and a pay rate of **8**. When the registrations are transferred, the following pay items are generated.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	7.50	10
Flex-	1201	0.50	10
Break (Paid)	1301	0.50	8

How the cost of paid breaks is allocated to projects and production orders

The hourly cost on project activities and production jobs can be set up so that it's determined either by the pay rates that are calculated in Time and attendance or by the cost categories that are defined for the activities.

To set up the cost category, select **Production control > Setup > Manufacturing execution > Production order defaults**, and set the **Cost category** field to either **Yes** or **No**.

- **No** – Cost is calculated based on pay rates that are defined for Time and attendance registration types.
- **Yes** – Cost is calculated based on cost categories for production and project activities.

Cost calculation based on pay rates that are calculated in Time and attendance

The following example shows how the hourly cost is calculated when the cost is set up so that it's calculated based on pay rates.

The hourly cost rate that is used for production orders and projects is calculated during the transfer process. To view the hourly rate per activity, open the **Approve** page in Time and attendance, and then select **Inquiry > Transferred registrations**. You can find the hourly cost rate per registration on the **Cost prices** tab.

Consider the following registrations that use the same time profile as the previous example.

JOURNAL REGISTRATION TYPE	START	END	TIME
Clock in	07:00 AM	07:00 AM	
Process (Order: 4711)	07:00 AM	11:00 AM	4
Process (Order: 4712)	11:00 AM	03:00 PM	3.50
Break (Paid)	12:00 PM	12:30 PM	0.50
Clock out	03:00 PM	03:00 PM	

After the registrations are transferred, the following transferred registrations are generated.

REGISTRATION TYPE	TIME	COST PRICE PER HOUR
Clock-in	0.00	0.00
Process (Order: 4711)	4.00	10.00
Process (Order: 4712)	3.50	11.14
Break (Paid)	0.50	0.00
Clock out	0.00	0.00

The calculation of the cost price per hour for the paid break depends on a setting for the direct payroll costs. Select **Time and attendance > Setup > Time and attendance parameters**. On the **Cost price** tab, under **Direct payroll costs**, in the **Standard time** field, you can select **Yes**, **No**, or **Allocation**.

- **Yes** – This value is used for the preceding example. The cost is allocated to the production or project activity that runs in parallel with the paid break activity. In the example, this activity is the production job

for order 4712. As you can see, the cost price per hour for the paid break is 0 (zero), and it's allocated to the job that runs in parallel with the break.

The paid break has a duration of 0.5 hour, and the pay rate is 8. Therefore, the total cost for the paid break is 4. The total cost is then allocated to the 3.5-hour process job. Therefore, the paid break contributes 1.14 per hour to the cost ($4 \div 3.5 = 1.14$).

- **Allocation** – The paid break is equally distributed to the jobs that are registered for the day. If this value is used for the preceding example, the following transferred registrations are generated.

REGISTRATION TYPE	TIME	COST PRICE PER HOUR
Clock-in	0.00	0.00
Process (Order: 4711)	4.00	10.53
Process (Order: 4712)	3.50	10.53
Break (Paid)	0.50	0.00
Clock out	0.00	0.00

The total process time for the two production jobs is 7.5 hours, and the total cost of the paid break is 4. Therefore, the cost of the break is calculated as 0.53 ($= 4 \div 7.5$).

- **No** – The cost of the paid break doesn't increase the hourly cost of the process activities.

REGISTRATION TYPE	TIME	COST PRICE PER HOUR
Clock-in	0.00	0.00
Process (Order: 4711)	4.00	10.00
Process (Order: 4712)	3.50	10.00
Break (Paid)	0.50	0.00
Clock out	0.00	0.00

Absence

An absence code is used to register the period of a worker's absence. Like breaks and switch codes, an absence code is a type of an indirect activity. Absence time can be either planned or registered, and absence can be either legal or illegal. Examples of legal absence include a doctor's appointment, a seminar, or jury duty. Illegal absence is absence that has no good reason, such as when a worker is late for work. Usually, legal absence doesn't cause a deduction in a worker's pay, whereas illegal absence does cause a deduction.

Planned absence

You can create planned absence for workers on the **Create planned absence** page (**Time and attendance > Create planned absence**). There, the planned absence is registered as an absence job for a specified date and time interval.

The job is based on a query. Therefore, you can create planned absence for multiple workers, such as workers who belong to the same calculation group. If the planned absence is for a single worker, the registration can be

entered from either the **Attendance** page or the **Time registration workers** page.

- To enter an absence registration from the **Attendance** page, select **Time and attendance > Inquiries and reports > Attendance > Attendance**, and then select **Absence registration**.
- To enter an absence registration from the *Time registration workers* page, select **Time and attendance > Setup > Time registration workers**, and then, on the **Time** tab, under **Time assignment**, select **Absence registrations**.

You can use the **Planned absences** report to see an overview of planned absences for workers. To open this report, select **Time and attendance > Inquiries and reports > Absence reports > Planned absences**.

Registered absence

In general, workers are considered absent if they aren't at work for any period between their planned clock-in time and their planned clock-out time. If workers clock in later than planned, or if they clock out earlier than planned, they are prompted to select an absence code to indicate the reason for the absence. An absence code can be set up so that it's applicable to registration. Only applicable codes will be available for selection in the list.

Scenarios based on various combinations of work hour registrations

The following scenarios show the pay items and entries for approval that are generated for workers based on their registrations. All the scenarios are based on the following time profile.

PROFILE TYPE	START	END	DAY
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Scenario 1: The worker clocks in later than planned

The worker clocks in at 08:30 AM. Because his planned clock-in time is 07:00 AM, he is 1.50 hour late for work. Because the 1.50 hour is considered absence time, the worker is prompted to select an absence code. The worker leaves work at 03:30 PM, which is the planned clock-out time. When the worker's registrations are calculated and approved, the absence registration, together with the absence code that the worker selected at clock-in, appears for the time between 07:00 AM and 08:30 AM.

In the time profile, you can configure the **Clock-in** registration type so that there is a tolerance when workers are late for work. For example, if you set up a tolerance of 5, the worker is prompted for an absence code only if he clocks in later than 07:05 AM.

In this case, because the worker doesn't have a good reason for being late for work, he selects an absence code that is defined for illegal absence. An absence code is considered applicable to illegal absence if the setting for overtime deduction is enabled for the absence group that the absence code belongs to. To set the setting, select **Time and attendance > Setup > Groups > Absence groups**, and then select the **Deduct overtime** check box.

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

JOURNAL REGISTRATION TYPE	START	END	TIME
Absence (illegal - late for work)	07:00 AM	08:30 AM	1.5
Clock in	08:30 AM	08:30 AM	
Production job	07:30 AM	03:30 PM	7.0
Clock out	03:30 PM	03:30 PM	

Here is the resulting pay item after the registrations are transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	7.00	10

Scenario 2: The worker clocks out before the planned clock-out time during a standard-time period

The worker clocks in at 07:00 AM and clocks out early at 01:00 PM. Because 01:00 PM is before planned clock-out at 03:30 PM, and 01:00 AM is in a standard-time period, the worker is prompted to select an absence code. The worker selects an absence code for a doctor's appointment, which is defined as legal absence. The pay rate for legal absence is defined in the pay agreements for the **Absence** registration type (**Time and attendance > Setup > Payroll > Pay agreements**).

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

JOURNAL REGISTRATION TYPE	START	END	TIME
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	01:00 PM	4.0
Clock out	01:00 PM	01:00 PM	
Absence (legal – doctor's appointment)	01:00 PM	03:30 PM	3.5

Here is the resulting pay item after the registrations are transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	7.50	10

Scenario 3: The worker clocks out before the planned clock-out time during a Flex- period

The worker clocks in at 07:00 AM and clocks out at 02:15 PM, which is in the planned Flex- period. The time between the actual clock-out time and the planned clock-out time isn't considered absence, and the worker isn't prompted to select an absence code. The amount is deducted from the worker's flex account, and the worker is granted pay during the remaining part of the Flex- period, from 02:15 to 03:30 PM.

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

JOURNAL REGISTRATION TYPE	START	END	TIME
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	02:15 PM	7.25
Clock out	02:15 PM	02:15 PM	

Here is the resulting pay item after the registrations are transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	8.50	10

Scenario 4: The worker clocks in late and clocks out after the planned clock-out time during an overtime period

The worker clocks in late at 09:30 AM and then, to compensate for his late attendance, he works overtime and clocks out at 05:00 PM. Because the worker came in late and compensated by working longer, the company doesn't want to grant the worker overtime pay for the hours that he worked between the planned clock-out at 03:30 PM and his actual clock-out at 05:00 PM, even though this period is defined as overtime in the time profile.

To handle this scenario, the absence code can be set up to reduce overtime hours by any hours of illegal absence that the worker has on the same day. Select **Time and attendance > Setup > Groups > Absence groups**, and select the **Deduct overtime** check box to deduct overtime from hours of illegal absence.

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

JOURNAL REGISTRATION TYPE	START	END	TIME
Absence (illegal - late for work)	07:00 AM	09:30 AM	1.5
Clock in	09:30 AM	09:30 AM	
Production job	09:30 AM	05:00 PM	7.5
Clock out	05:30 PM	05:30 PM	

If the **Deduct overtime** check box is selected for the selected absence code, the overtime payment is deducted by the hours that the worker was illegally absent. In this case, the following pay items are generated after the registrations are transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	9.00	10
Overtime	1301	0.5	15

Here, the 1.5 hours of illegal absence, from 07:00 AM to 09:30 AM, deduct the 2.0 hours of overtime, from 03:30 PM to 05:30 PM. The result of the registration is 1.5 hours of standard time and 0.5 hours of overtime.

By contrast, if the **Deduct overtime** check box is cleared for the selected absence code, the overtime payment

is granted to the worker, even though he was late and had an illegal absence. In this case, the following pay items are generated after the registrations are transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	7.50	10
Overtime	1301	2.0	15

Scenario 5: The worker clocks out before the planned clock-out time and can convert the absence period to a Flex- period

The following example shows how a worker's flex account can be reduced by converting the absence period to a Flex- period.

The worker clocks in at 07:00 AM and clocks out at 01:00 PM. She has reached an agreement with her supervisor that she can go home for the weekend if she deducts these hours from her flex account. When the worker clocks out at 01:00 PM, she is prompted to select an absence code, because the period of absence for the remaining part of the workday that is affected isn't in a planned Flex- period. To convert the remaining part of the workday to a Flex- period, the worker can select an absence code that is set up to reduce her flex account.

To reduce the balance of flexible hours for workers who register absence on a workday, select **Time and attendance > Setup > Groups > Absence groups**, and select the **Reduce flex** check box.

Here is how the worker's registrations for the day appear on the **Approve** page before calculation.

JOURNAL REGISTRATION TYPE	START	END	TIME
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	01:00 PM	6.0
Clock out	01:00 PM	01:00 PM	

If the worker selects an absence code for illegal absence, here is how the resulting pay item will look after the registration is transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	6.00	10

If the worker selects an absence code for legal absence, and the absence code is set up to reduce her flex account, here is how the resulting pay items will look after the registrations are transferred.

WAGE TYPE	PAY TYPE	PAY UNITS	RATE
Standard time	1201	8.50	10

In this case, the worker's flex balance is reduced by the hours between the actual clock-out time and the planned clock-out time (that is, the 2.5 hours from 01:00 PM to 03:30 PM).

NOTE

We don't recommend that you select both the **Deduct flex** check box and the **Deduct overtime** check box for an absence code, because this setup will deduct the illegal hours from the worker's overtime hours and at the same time reduce the worker's flex account.

Scenario 6: There is no planned absence for the day and no worker attendance for the day

If the worker doesn't show up for work on a workday, and there is no planned absence for the worker on that day, a default absence code is used for the calculation of the worker's registrations. To define default absence codes, select **Time and attendance > Time and attendance parameters**. You can then select an absence code in the following fields:

- Auto insert Flex-
- Auto insert absence

When the daily registrations are calculated for a worker who is enabled for flexible hours, the absence code that is specified in the **Auto insert flex-** field is used as a default absence code. If the worker isn't enabled for flexible hours, the absence code that is specified in the **Auto insert absence** field is used. If a company has a combination of workers who are enabled for flexible hours and workers who aren't enabled for flexible hours, both parameters must be set up.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Absence registration in Time and attendance

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the concepts for absence and explains how to handle absence in Time and attendance.

Absence that is based on regular work hours

Workers are considered absent for any hours that they don't work during their regular work hours. Regular work hours are defined in a worker's standard time profile.

For example, a worker is working on a day profile that has clock-in at 7:00 AM and clock-out at 3:00 PM. If the worker clocks in at 9:00 AM, he is considered absent from 7:00 AM to 9:00 AM on that day.

In this case, workers are prompted to enter a reason for their absence. They can specify a reason by selecting an absence code.

Absence codes

Absence codes define the various types of absence. Absence codes are defined by the company.

Various rules can be applied to absence codes. For example, an absence code can be configured to deduct or grant pay.

For example, a company defines a **Late** absence code that workers use if they come in late and don't have a good reason. The company also defines an **Internal course** absence code that workers use for time that they spend attending internal courses. These absence codes can be set up so that **Late** deducts from a worker's pay but **Internal course** doesn't deduct from a worker's pay.

You can set up automatic absence codes. These absence codes can be used to calculate a worker's time when no absence is registered. The worker's time profile determines whether the absence code for standard time or flex time is used.

Set up standard time and flex time

- Configure the parameters for standard time and flex time by using the **Auto insert absence** and **Auto insert Flex-** options on the **Time and attendance parameters** page.

Absence groups

Absence codes are grouped into absence groups. You use absence groups to group absence codes that have common characteristics. Examples include absence codes for a legal absence, or absence because of a doctor's appointment, jury duty, or a sick child.

Planned absence

If you know that a worker will be absent for a period, such as an upcoming vacation, you can use planned absence. You set up planned absence by configuring the absence code so that it considers the planned absence. When you set up a planned absence, you aren't prompted for an absence code during the absence period when user time registrations are calculated. Planned absence can be defined for a single worker, or you can define a batch job to bulk update the planned absence for workers.

Set up planned absence

1. Select **Human resources > Workers > Employees**, and select an employee.

2. Select **Time > Time assignments > Time Absence registration**, and set up the planned absence.

Interrupted planned absence

If you apply the **Interrupt** option when you set up a planned absence, the planned absence will be interrupted if the worker signs in during the planned absence period. The planned absence will be marked as **Interrupted** and won't have any effect on future calculations.

Set up a planned absence for interruption

1. Open the **Time Absence registration** page as described in the procedure for setting up planned absence.
2. Select **Interrupt**.

The **Interrupt** option applies when time is registered through the shop floor terminal or the shop floor device. The option doesn't apply if the registrations are entered on the calculation and approval pages, or on the **Electronic timecard** page.

Examples of the use of absence in a flex profile

The following three examples show how absence is calculated in a profile that has flex periods.

The examples use the following profile.

CLOCK-IN	STANDARD TIME	BREAK	STANDARD TIME	FLEX-	CLOCK-OUT	FLEX+
8 AM	9 AM to 11:30 AM	11:30 AM to 12 PM	12 PM to 3 PM	3 PM to 4 PM	4 PM	4 PM to 6 PM

Example 1: Signing out during a Flex- period

The worker clocks in at 8:00 AM and clocks out at 3:30 PM. In this case, because the worker clocks out during a Flex- period, no absence is calculated, and half an hour is deducted from the worker's flex balance.

Example 2: Signing out in during Standard time period

The worker clocks in at 8:00 AM and clocks out at 2:30 PM. In this case, because the worker clocks out during the Standard time period, absence is calculated from 2:30 PM to 4 PM, and an absence period of 1.5 hours is registered. An absence code for that period is required.

Example 3: Signing out during a Flex+ period

The worker clocks in at 8:00 AM and clocks out at 4:30 PM. In this case, because the worker clocks out during a Flex+ period, no absence is calculated, and half an hour is added to the worker's flex balance.

Absence in the calculation and approval process

Worker time registrations must be calculated and approved before they can be transferred to a payroll system as pay items.

An approver can change a worker's time registrations. The approver can even change any absence that the worker has registered. If the approver manually enters a time period that has an absence code, the absence code for that period isn't overridden by the default absence code from the Time and attendance parameters.

For example, a worker clocks in at 10 AM and selects an absence code that indicates that she is late. Later, the worker informs her supervisor that she had a doctor's appointment from 8 AM to 10 AM. A doctor's appointment should not cause a deduction in the worker's pay. Therefore, in this case, the supervisor can adjust the two hours of absence from 8 AM to 10 AM by manually entering an absence code that indicates illness for those two hours.

Calculate and approve absence

- Select **Time attendance** > **Review and approve** > **Approve or Calculate**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Flex groups

2/18/2021 • 8 minutes to read • [Edit Online](#)

Flexible working hours let companies minimize payments for overtime by offering workers extra time off during periods when the workload is low. This feature is relevant, for example, in segments that experience seasonal changes in workload.

You can use flex groups to set the following rules and principles for a worker's flexible hours:

- Rules for flex regulations
- Principle for calculating the worker's flex balance

Set up flexible working hours in flex groups

- Select **Time and attendance** > **Setup** > **Groups** > **Flex groups** to set up flex groups for flexible hours.

Associate workers with flex groups

- Select **Time and attendance** > **Setup** > **Time registration workers**.

Rules for flex regulations

You can use rules for flex regulations to define flex limits, or the minimum and maximum number of hours that are allowed in the worker's flex account. The flex limits are set up on the flex group. When the flex limits are exceeded, a worker's flex balance and pay can be adjusted.

If a worker's allowed flex minimum is exceeded (that is, if the number of hours in the flex account is below the specified minimum), you can use these methods to adjust the worker's flex balance by making a flex regulation:

- The worker's flex account can be adjusted to the specified allowed minimum, but without deducting the worker's pay for the number of hours that the flex account is below the allowed minimum.
- The worker's pay can be deducted for the number of hours that the flex account is below the allowed minimum. This deduction is done by generating pay items for a specific pay type that have a negative or positive pay unit.

If the worker's allowed flex maximum is exceeded, you can use these methods to adjust the worker's flex balance by making a flex regulation:

- The worker's flex account can be adjusted back to the specified allowed maximum, but without compensating the worker's pay for the number of hours that the worker worked above the allowed maximum.
- The number of hours that the worker worked above the allowed maximum can be converted to pay. This conversion is done by generating pay items for a specific pay type.

You can adjust a flex balance at the following times:

- When a payment file that is based on payroll data is exported by using the **Transfer pay** job. The payroll data is generated when you transfer the worker's registration from the **Approve** page.
- When the **Adjust flex balance** job is processed.

NOTE

Flex regulations don't occur during the daily approval and transfer of worker registrations on the **Approve** page.

Principle for calculating a worker's flex balance

The principle for calculating the hours that the worker's flex balance are adjusted by is set up on the flex group. Select **Time and attendance > Setup > Groups > Flex groups**.

The following two principles can be used:

- **Time** – The worker's flexible hours are calculated only from the worker's registered time for the day. When the worker's daily registrations are calculated, the number of Flex+ and Flex- hours for the day is calculated from the Flex+ and Flex- zones that are defined in the worker's time profile.
- **Pay types** – The worker's flexible hours are calculated based on earnings of the pay types for Flex+ and Flex- that are defined in the worker's pay agreement. The pay agreement is associated with the time registration worker. You might want to use pay types to manage flex accounts if, for example, you want to increase a worker's flex account by a specific factor in one or more flex zones.

Scenario 1: Adjusting a worker's pay and flex account because the allowed flex minimum is exceeded

A worker who can work flexible hours has a negative flex account.

- **Flex account:** -4

The worker is associated with a flex group that has the following configuration:

- **Flex minimum:** -0.5
- **Minimum pay type:** 1302
- **Pay type factor:** -1.00

As the difference between the worker's flex account and his allowed flex minimum indicates, the worker has exceeded his allowed flex minimum by 3.5 hours.

When the payroll administrator transfers the worker's pay data by running the **Transfer to pay** or **Flex adjustment** job, the following adjustments are made:

- The worker's flex account is adjusted by 3.5 hours. Therefore, the flex balance of -4.0 hours becomes adjusted to the worker's allowed flex minimum of -0.5 hours.
- A pay item for pay type 1302 is created. This pay item has a pay unit of -3.5 hours that will be deducted from the worker's pay. In this case, the pay unit is a negative number, because the positive adjustment of 3.5 hours is multiplied by the negative pay type factor of -1.0 that is defined on the flex group. This pay item will be part of the pay file that is generated by the **Transfer to pay** job.

Scenario 2: Adjusting a worker's pay and flex account because the allowed flex maximum is exceeded

A worker who can work flexible hours has a positive flex account.

- **Flex account:** 6

The worker is associated with a flex group that has the following configuration:

- **Flex maximum:** 2.0
- **Minimum pay type:** 1302
- **Pay type factor:** -1.0

As the difference between the worker's flex account and her allowed flex maximum indicates, the worker has exceeded her allowed flex maximum by 4.0 hours.

When the payroll administrator transfers the worker's pay data by running the **Transfer to pay** or **Flex adjustment** job, the following adjustments are made:

- The worker's flex account is adjusted by -4.0 hours. Therefore, the flex balance of 6.0 hours becomes adjusted to the worker's allowed flex maximum of 2.0 hours.
- A pay item for pay type 1302 is created. This pay item has a pay unit of 4.0 hours that will be added to the worker's pay. In this case, the pay unit is a positive number, because the negative adjustment of 4.0 hours is multiplied by the negative pay type factor of -1.0 that is defined on the flex group. This pay item will be part of the pay file that is generated by the **Transfer to pay** job.

Scenario 3: Managing a worker's flex balance based on pay types

As we explained earlier, flex accounts can be managed based either on the time that is registered in the Flex+ and Flex- zones that are defined the worker's time profile, or on the pay types that are defined in the worker's pay agreements. If pay types are used, a worker's flex account is adjusted by the pay items that are generated when you transfer the worker's registration from the **Approve** page. You might want to use pay types to manage flex accounts if, for example, you want to increase a worker's flex account by a specific factor in one or more flex zones.

This scenario uses the following flex profile that represents a workday.

PROFILE TYPE	START	END
Flex+	12:00 AM	08:00 AM
Clock in	08:00 AM	08:00 AM
Flex-	08:00 AM	09:00 AM
Standard time	09:00 AM	11:30 AM
Paid break	11:30 AM	12:00 PM
Flex-	12:00 PM	04:00 PM
Clock out	04:00 PM	04:00 PM
Flex+	04:00 PM	12:00 AM

In this case, you want to be able to manage the worker's flex balance based on pay types. Therefore, you must set the **Based on pay types** option to **Yes** on the worker's flex group.

To account for the flexible hours, you must also define a new pay type. For this scenario, the pay type is named **FlexCnt**.

PAY TYPE	DESCRIPTION
FlexCnt	Flex counter

Next, follow these steps to set up a pay type and add lines of the new type to a pay profile.

1. Select **Time and attendance > Setup > Groups > Flex groups**, and then select **New**.
2. In both the **Flex+** field and the **Flex-** field, specify the new pay type, **FlexCnt**.
3. Select **Time and attendance > Setup > Pay agreements**, and then select **Agreement lines**.

4. For **Monday**, for the **Flex+** profile type, add the following three lines.

PAY TYPE	DESCRIPTION	FROM TIME	TO TIME	MINIMUM	MAXIMUM	FACTOR
FlexCnt	Flex counter	12:00 AM	06:00 PM	00.00	00.00	1.00
FlexCnt	Flex counter	06:00 PM	12:00 AM	00.00	02.00	1.50
FlexCnt	Flex counter	06:00 PM	12:00 AM	02.00	06.00	2.00

NOTE

Each line is used for a different time interval and has a different factor. The flexible hours that the worker works in a time interval are multiplied by the factor for that line. For example, hours that are worked from 06:00 PM to 08:00 PM are multiplied by 1.50. The factor is specified in the **Factor** field on the **General** tab of the **Pay agreement lines** page.

The worker enters the following registrations for the day.

JOURNAL REGISTRATION TYPE	START	END
Clock in	07:00 AM	07:00 AM
Production job	07:00 AM	09:00 PM
Clock out	09:00 PM	09:00 PM

The amount that must be paid is calculated on the **Approve** page, based on the worker's registration. After the registration is calculated, you can view the result on the **Times** tab. For this scenario, you're interested in the following fields.

FLEX +	FLEX -	TIME	PAY TIME
6.00	0.00	13.50	08.00

The amount of Flex+ time is six hours, and the calculation is based on the flex zones in the time profile. This amount consists of one hour of Flex+ time from 07:00 AM to 08:00 AM and five hours of Flex+ time from 04:00 PM to 09:00 PM.

When you transfer the registrations, you will notice that the amount of Flex+ time is changed from 6.0 hours to 8.0 hours.

FLEX +	FLEX -	TIME	PAY TIME
8.00	0.00	13.50	08.00

This change occurs after the transfer because the flexible hours have been calculated based on pay types instead of time. The following table shows how the eight hours are calculated.

FROM	TO	TIME	FACTOR	FLEX ACCOUNT
07:00 AM	08:00 AM	1	1	1

FROM	TO	TIME	FACTOR	FLEX ACCOUNT
04:00 PM	06:00 PM	2	1	2
06:00 PM	08:00 PM	2	1.5	3
08:00 PM	09:00 PM	1	2	2
			Total	8

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot discrete manufacturing

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with discrete manufacturing.

I receive the following error message: "Warehouse management processes are currently being used. If work lines are not yet registered, you can cancel the created work and any load or shipment lines, and then continue with the picking or shipping process."

Issue description

This issue occurs if you try to reserve or release work for a line, but the inventory transaction has a status of *Picked*, which indicates that the material has been picked.

Issue resolution

To fix this issue, follow one of these steps.

- Change the status of the production order back to *Estimated* or *Released*.
- Open the details page for the relevant production order. On the Action Pane, on the **Warehouse** tab, in the **Stop** group, select **Stop and unpick** to unpick all picked transactions. Then select **Remove stop** to process the production order.

Here is an explanation of the *Unpick* and *Stop* functions:

- **Unpick** – This function reverses the status of inventory transactions for bill of materials (BOM) lines and formula lines that have a status from *Picked* through *On order*. When work for raw material picking is completed, the status of the lines is set to *Picked*. This status prevents the production order from being reset to *Created* status. In this case, you can use the *Unpick* function to revert the transactions from *Picked* status and then reset the production order to *Created* status.
- **Stop** – This function sets a **Stopped** flag on the production order to prevent any status update on the order. You can find the **Stopped** flag on the **Warehouse** FastTab of the production order details page.

NOTE

- The buttons are visible only when the production order is created for items that are enabled for warehouse processes.
- The **Stop** group is visible only on the **Warehouse** tab on the Action Pane of the production order details page. It isn't visible on the **Warehouse** FastTab of the **Production orders** list page.

The matching resource name isn't updated after I change a worker name in the global address book.

Issue description

If you change a worker name in the global address book, the matching resource name isn't updated in the resource group master.

Issue resolution

This scenario isn't currently supported. To fix the issue, you must manually update the resource name.

When I create a new production order, I don't receive the following message: "Insert the active version of bill of material and route?"

Issue description

When you create a new production order, after you enter the item number, the **Site** and **Warehouse** fields are automatically set to the default site and warehouse that are defined on the **Default order settings** page for the finished goods item. Additionally, the active BOM number and route number are automatically entered. You don't receive the following message that prompts you for those values:

```
Insert active version for bill of material and route?
```

Issue resolution

You aren't prompted to insert BOM and route numbers if you select a product that a site and warehouse are defined for on the **Default order settings** page. You're prompted only if those values aren't defined for the selected product.

Production orders aren't shown on the Marking page.

Issue description

Some production orders aren't shown on the **Marking** page.

Issue resolution

Products that have the following configuration aren't available for marking. Therefore, they won't be shown on the **Marking** page:

- The products are defined as products of the *catch weight* type.
- They are enabled for the advanced warehouse processes.
- They are configured to be controlled by the *Standard cost* principle.

When I try to end a production order, I receive the following error message: "Calculating BOM consumptionCost value must be negative upon issue from inventory."

This issue was fixed in release 10.0.15.

When the status of a production order is changed from Reported as finished to End, I receive the following error messages: "Update conflict. The standard cost does not match with the financial inventory value after the update" and "A critical error has occurred in function InventCostMovement.checkVariance."

This issue occurs because the underlying data was changed by another process. The process will try to update the data up to five times. If the conflict still exists after five attempts, you will receive the following error messages:

```
Update conflict. The standard cost does not match with the financial inventory value after the update.
```

```
A critical error has occurred in function InventCostMovement.checkVariance.
```

This behavior is by design. To mitigate the issue, resume the batch job. It should finish running.

If the batch job consistently fails after you resume it, verify that the rounding precision for the ledger's default currency is compliant with the rounding that is applied to values in the InventSum table. If the rounding precision has been changed to a non-compliant value, you probably must change it back to a compliant value. Look for **ModifiedDateTime**. In this case, the value will typically show that the rounding precision was recently changed.

When I release to a warehouse, I receive the following error message: "Item RM could not be fully reserved. Ensure that the full quantity is available, or reserve the items manually if the Reservation field on the BOM line is set to Manual or Started. Could not release the order to warehouse because some materials could not be reserved." However, the status is updated to Released.

Issue description

If not all BOM line items are physically available when a production order is released, and the **Release to warehouse** policy is set to *Require full reservation* on the production order, you will receive the following error message:

Item RM could not be fully reserved. Ensure that the full quantity is available, or reserve the items manually if the Reservation field on the BOM line is set to Manual or Started. Could not release the order to warehouse because some materials could not be reserved.

Issue resolution

This behavior is by design and is working as expected.

When I try to end a production order and report as finished, I receive the following error message: "Total good quantity reported as finished for the production will be %1. Feedback for the last operation is 0.00 in total."

Issue description

When you try to post a report as finished journal on a production order, you receive the following error message:

Total good quantity reported as finished for the production will be %1. Feedback for the last operation is 0.00 in total.

Possible cause

This issue occurs if the quantities that were posted in the last operations were incorrect. For example, if production is started, but the quantity that must be started isn't allocated, the route card journal will be posted without any lines. To confirm the situation, open the production order, and then, on the Action Pane, on the **View** tab, select **Route card**.

Workaround

You can fix this issue by posting additional journals for the operations that the journals weren't correctly posted for. Restart the production order, and select to post the additional journals. This action won't start the production order, but it will post the journals. The route card should then show the quantities that were posted, and you should be able to end the production orders successfully.

Can I report a production order as finished while I report the error quantity, but not while I report the time or material quantity?

You can't report the error quantity on a production order unless you also report the good quantity. This scenario is **not** supported. The report as finished update will eventually fail when you try to end the production order, and you will receive the following error message:

Missing report as finished quantity.

Can I trace the serial numbers of finished goods against the serial numbers of consumed goods?

You can't trace the serial numbers of finished goods against the serial numbers of material that a production order consumes to make those finished goods. This scenario isn't currently supported. The workaround is to create production orders for a quantity of 1.

Lean manufacturing overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides an overview and description of the lean manufacturing features in Dynamics 365 Supply Chain Management.

Lean manufacturing offers tools that you can use to model lean operations. These tools support and promote the following concepts and business activities:

- Create a lean manufacturing foundation by modeling manufacturing and logistics processes as production flows.
- Implement a lean pull system by using kanbans to signal demand requirements.
- Monitor and maintain kanban jobs.

The lean manufacturing architecture consists of production flows, activities, and kanban rules. These structures are fully integrated with Supply Chain Management processes. You can use lean manufacturing in a mixed-mode manufacturing environment that combines various supply, production, and sourcing strategies. These strategies include production orders, batch orders for process industries, purchase orders, and transfer orders.

IMPORTANT

You can use Supply Chain Management to support the implementation of lean manufacturing with kanbans. However, a successful implementation of lean principles depends on the internal business processes that you use, and the actual production conditions and environment.

Modeling manufacturing and logistics processes as production flows

To create a lean manufacturing foundation, model the manufacturing and logistics processes as production flows. This activity consists of the following tasks:

1. Identify the processes for which you want to implement a lean replenishment strategy, and then model these processes as production flows. You can then analyze and streamline the processes. One of the goals of a lean implementation is to reduce waste by improving the flow of material and information.
2. Define a production flow as a sequence of activities that describes the flow of material. A transfer activity defines the movement of a product or products from one location to another. A process activity defines a value-added operation that is applied to a product.
3. Create a version of the production flow that defines the requirements for takt time. These requirements are used to calculate the cycle times of each activity in the production flow. You can create multiple versions of production flows, and then use these versions to improve processes.

Using kanbans to signal demand requirements

A pull system produces goods only when goods are needed. This practice reduces delivery lead times and excess inventory. You can use kanbans to plan, track, and process requirements that are based on production flows. To create a kanban framework, create kanban rules that define when kanbans are created, and how the requirements are fulfilled. You can create two types of kanban rules. Manufacturing rules create process kanban jobs, and withdrawal kanban rules create transfer kanban jobs. You can set up the following replenishment strategies:

- **Fixed quantity** kanban rules are related to a fixed number of handling units, which means that the numbers of active kanbans are constant. Whenever all the products from a Kanban are consumed and the handling

units are manually emptied, a new kanban of the same type is created. When you create fixed quantity kanban rules, you can calculate the optimal kanban quantities and the product quantities that are used. The calculation takes into account forecast, actual demand from open orders, lead time to replenish items, and historical demands.

- **Scheduled** kanban rules replenish requirements that are calculated by master planning. Master planning generates planned kanbans that can be firmed to kanbans.
- **Event** kanban rules replenish requirements that originate from sales order lines, production BOM lines, kanban lines, or minimum inventory settings. When event kanbans are generated, they are pegged to the source requirements.

When kanbans are created, one or more kanban jobs are generated based on the kanban flow activities that are defined in the kanban rules.

Monitoring and maintaining kanban jobs

Lean manufacturing provides visibility into the current status of manufacturing and logistics activities that are governed by the kanban rules. As a result, you can plan and prioritize the following tasks:

- Gain an overview of the current kanban job schedule.
- Plan and reschedule kanban jobs.
- Track and register the status of kanban jobs.

The following list describes the specialized kanban boards:

- Kanban job scheduling – Provides an overview of the kanban jobs. The board displays kanban jobs and their status for one or multiple work cells. The jobs are listed according to the planning periods (days or weeks) that are defined in the production flow model. The board also displays the capacity consumption for each planning period, so that you can monitor the scheduled load. You can change the status of kanban jobs, reschedule kanban jobs to different planning periods, and perform other tasks.
- Kanban board for transfer jobs – This board provides an overview of the current transfer jobs. You can update and register picking lists, start and complete transfer jobs, and perform other tasks.
- Kanban board for process jobs – This board is designed to support the normal production flow and give an overview of the current situation in one or multiple work cells. From this board Kanbans can be prioritized, picked, or manufactured. The board is also designed to support barcode scanning for the reporting of Kanbans.

Kanban jobs and integration with Supply Chain Management processes

Kanban jobs are fully integrated with current processes for inventory transactions in Supply Chain Management.

- You can perform picking activities to replenish material that is used to fulfill the requirements of kanban jobs.
- You can print kanban cards, circulating kanban cards, and picking lists to support the use of kanbans. These documents are used to represent, track, and register kanban jobs in the warehouse and on the production floor.
- You can register the picking and transfer activities in inventory by scanning bar codes.

In addition, lean manufacturing supports the purchasing and invoicing processes for services that are referenced by subcontracted activities.

- You can assign purchase agreement lines and services to subcontracted activities.
- You can create periodic purchase orders and receipt advices to support the purchase and invoicing of the services.

Activity-based subcontracting

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes, in detail, how to use subcontracted activities in a production flow for lean manufacturing.

In Microsoft Dynamics 365 Supply Chain Management, there are two approaches for subcontracting: production orders and lean manufacturing. In the lean manufacturing approach, the subcontracting work is modeled as a service that is related to an activity of a production flow. A special type of cost group type that is named **Direct outsourcing** has been introduced, and the subcontracting services are no longer part of a bill of materials (BOM). The cost accounting of subcontracted work is fully integrated into the costing solution for lean manufacturing.

Production flows that involve subcontractors

The basic principle of a production flow doesn't change when activities are subcontracted. Material still flows between locations, process activities convert material to products, and transfer activities move material or products from one location to another. You can model locations and work cells as vendor-managed by assigning the vendor account to a warehouse or to a resource of a resource group.

Based on these capabilities, lean manufacturing doesn't require any specific features in order to support the flow of material and products. All possible scenarios that involve vendors as providers of production or transport services can be modeled based on the architecture of production flow and activities.

For example, a subcontractor works out of a supermarket that is located at the subcontractor. When handling units are emptied at the subcontractor, the kanban cards are returned to the assembly cell together with the next shipment. The supermarket at the subcontractor is then replenished. The transfers to and from the subcontractor can be modeled as explicit transfer activities to support a picking and shipment process. If an explicit registration isn't required in order to support the physical transport, the transfer activities can be omitted.

A subcontractor can be used to load balance the overall capacity of the production flow. For example, a production flow is modeled by using scheduled kanban rules. The planner uses the kanban scheduling board to schedule and load level both work cells on demand. The planner also monitors the consolidated supply schedule for the supermarket on the **Supply schedule** page. Multiple subcontractors can be modeled in one or multiple production flows, and there might be multiple kanban rules that can be used to supply the same product to the same location through different activities. The planner can convert kanbans to an alternative kanban rule to reschedule a kanban that was originally created for internal production to an alternative process. In fact, the subcontracted nature of the work cell has no impact on the production flow. The same working principle applies for two parallel internal work cells or for two subcontracted cells.

Like any other activity in a production flow, subcontracted activities can consume and supply inventoried, non-inventoried (work in process [WIP]), and semi-finished material and products. In all cases, the processes for scheduling and executing subcontracted activities are the same. Additionally, these processes are the same as the processes for internal work.

Purchase process for subcontracted activities (services)

The purchase process for subcontracted activities is based on the physical material flow that is registered by kanban job progress, for example, Start or Complete. The financial flow, for example, cost of subcontracted work, is a secondary flow that follows the physical flow. At the same time, the purchase process is an independent process that allows for manual adjustment of the purchase documents at every step. Here is the purchase

process for subcontracted activities:

1. Create a purchase agreement. The purchase agreement is created for the service and connected to the activity of the production flow.
2. Create a purchase order. A release purchase order can be created for the service, based on the scheduled kanban jobs. Jobs for the same service can be grouped to purchase order lines by day, week, or month. The purchase order lines can be created at any time after the kanban jobs are created. Purchase order lines can even be created after the fact. This option is usually selected if a subcontractor provides services without additional notice, based on the kanbans or kanban cards that the subcontractor receives. In this case, deviations between the purchase order and the invoice can be minimized.
3. Generate kanban cards, material, and a picking list to send to the subcontractor to prepare for processing. Based on the detailed modeling of the production flow, the preparation is done on the kanban board for process activities by using the picking list and the preparation function. Alternatively, the preparation is done on the kanban board for transfer jobs by using the picking list and start or completion. For inventoried material, both processes can be supported by a WMS-Picking and Shipment process. A bill of lading can be created on demand.
4. Generate kanban handling units and kanban cards. After processing, cards are returned from the subcontractor. Usually, the cards include a delivery note that specifies the physical material that has been shipped. A reference to the provided services isn't required. The arrival of the material or product at the customer is registered on the kanban board, depending on the kanban cards. (Either the kanban board for process activities or the kanban board for transfer jobs is used, depending on the modeled activities.).
5. Create a receipt advisory. The receipt advisory can be used to replace a packing slip document for the received services. Receipt advisories can be generated based on the completed kanban jobs for the subcontracting activity for a selected period. For each job receipt, advisories are created for the related purchase order line. The receipt advisory can be printed and sent to the subcontractor as confirmation of receipt.
6. Generate an invoice.

The process ends when the subcontractor is invoiced for a period. The invoice match is done against the receipt advisories that are created. Because the receipt advisories represent the exact physical receipt of material, the three-way matching is simplified.

Configuring activities for subcontracting

The following sections describe how to configure activities for subcontracting.

Subcontracted services

The payment item that is used in activity-based subcontracting must be a product that has the following properties:

- **Product type:** Service
- **Inventory model group:** Non stocked

This requirement enforces the use of the first in, first out (FIFO) inventory model. **Note:** Cost calculation of the products requires that the standard cost of the service be defined. A purchase agreement with the vendor is required. Otherwise, the service can't be used for activity-based subcontracting.

Subcontracted process activities

To configure a process activity as a subcontracted activity, follow these steps.

1. Configure a subcontracted work cell. To configure a work cell as subcontracted, you must create a resource of the **Vendor** type and associate it with the work cell (resource group). A runtime cost category of the **Direct outsourcing** cost group type should be assigned to the work cell. The cost categories for setup and quantity aren't required.

2. After a process activity is created and related to a subcontracted work cell, you must configure a service for the activity before the production flow version can be activated. You complete this step on the **Activity details** page. For activities that are associated with a subcontracted work cell, the **Service terms** FastTab is shown. On this FastTab, add a default service that is valid for all output items. If specific output items require different services or different service calculation parameters (for example, a different service ratio), you can add other services to the activity.

Subcontracted transfer activities

A transfer activity is configured as a subcontracted activity, depending on the **Freighted by** setting of the transfer activity. The following options are available:

- **Shipper** – The activity is subcontracted if the transfer from the warehouse is managed by a vendor (as defined by a property of the warehouse). All selected purchase agreements for services must have the same vendor ID as the warehouse.
- **Recipient** – The activity is subcontracted if the transfer to the warehouse is managed by a vendor (as defined by a property of the warehouse). All selected purchase agreements for services must have the same vendor ID as the warehouse.
- **Carrier** – The activity is subcontracted to any vendor that provides the service. To be valid, a carrier must be created for warehouse management and must have an assigned vendor account.

As for process activities, you must configure a default service for subcontracted transfer activities on the **Service terms** FastTab of the **Activity details** page.

Service quantity calculation

The whole purchase process is based on an item reference for a service. This item reference is measured in a unit of measure of a service. Services are usually measured either in the number of services (units) or in time. To calculate the service quantity, based on the registered completion of kanban jobs, you can use the following methods:

- **Calculation that is based on the number of jobs** – One kanban job equals n units of service, regardless of the product quantity that is supplied. In lean manufacturing, one job corresponds to one handling unit. This calculation method applies to all services that have a fixed price per handling unit. Therefore, this method usually applies to transfer activities. However, it can also apply to process activities that process whole handling units.
- **Calculation that is based on the product quantity** – The service quantity is relative to the product quantity that is scheduled/supplied. When the supplied product quantity is calculated, error quantities can be either included or excluded. This calculation method applies to all cases where the service price per unit of processed product is agreed upon.
- **Calculation that is based on the activity time** – The theoretical activity times are calculated, based on the processing time of the activity, the total processed quantity, and the throughput ratio of the processed product. This calculation method applies to services that are paid by the hour and have a variance in time per processed product.

Cost accounting of subcontracted services

When the receipt advisory or a vendor packing slip on a purchase order that was created for a production flow (in other words, a purchase order that was generated based on kanban jobs for subcontracted activities) is posted, the value of the receipt is accounted in the WIP accounts of the production flow. Deviations of invoices are also accounted to the production flow. A cost category for subcontracted work has been introduced. This cost category enable transparent tracking of the value of subcontracted work that is allocated to WIP and consumed per period.

The backflush costing for lean manufacturing at the end of a costing period calculates the actual variances of the products that are produced from the production flow during the costing period.

Modeling transfers as subcontracted activities

People often consider transport nonproductive and think that it adds no value. However, when the cost of subcontracting is compared to the cost of internal production, the cost of additional transport activities must be considered. A production flow that spans multiple locations and requires transport services should model the transport cost as part of the cost of supplying the products to the customer.

Activity-based subcontracting in lean manufacturing lets you integrate carriers and transport vendors that move material and products between the locations of a production flow. By modeling a transfer activity, you can assign a carrier or vendor. The transfer activities/job is based on a service and purchase agreement, and you can create purchase orders and receipt advisories, based on the actual transfer jobs. This functionality is the same as the functionality for subcontracted process activities.

Supply Chain Management now supports BOM calculation that includes transport services, the creation of related purchase orders, integrated receipt registration, and the integration of transport service costs into the production flow costing.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Modeling a lean organization

2/18/2021 • 4 minutes to read • [Edit Online](#)

The article provides information about the key concepts in modeling a lean organization.

Typically, a lean manufacturing scenario is more than just a collection of unrelated kanban rules or material supply policies. The flow of material and products throughout work cells and locations for a specific production or supply scenario can be described as a sequence or small network of process or transfer activities. This sequence or network is known as a production flow.

Production flows in lean manufacturing

In production scenarios that are based on production orders, material is issued to a specific production order. During a sequence of operations that is based on a bill of materials (BOM) and routes, products are created and are finally received at the supplied location. The throughput time of production orders varies from minutes to weeks. All related cost, material, and labor are accumulated on the production order.

To reduce the delivery lead times and excess inventory between work centers that batch production causes, lean manufacturing introduces kanban replenishment and supermarkets in manufacturing and warehouse replenishment. Typically, these features disrupt the production of partially independent kanban cycles. The replenishment of a kanban for a semi-finished product is no longer triggered by an order for a finished product.

To re-establish a production and cost context for the various kanban scenarios that are proposed, activity-based production flows have been introduced as the backbone of lean manufacturing. All kanban rules refer to this predefined structure. The activity-based model supports the setup of a wide range of scenarios. However, this model doesn't add complexity for the shop floor workers, because all scenarios use the same activity-based user interface.

Semi-finished products (non-BOM levels)

Lean manufacturing integrates kanbans for inventoried products and semi-finished products in a single framework, and therefore offers a unified user experience for all cases. Because of this architecture, additional BOM levels no longer have to be introduced to enable kanbans to be used for semi-finished products. This architecture also helps reduce inventory transactions to a minimum.

Products and material in work in progress

The reduction of batch sizes to the ideal state of a single piece flow in lean manufacturing can cause a dramatic increase in inventory transactions if each picking process or kanban registration causes transactions for the consumed items. The production flow architecture allows for the transfer of material to the production flow, together with the withdrawal kanbans in storage or transport handling unit sizes. The value of the issued material is added to the work in progress (WIP) account that is related to the production flow. This behavior resembles the behavior for material that is issued to a production order. The same principle can be applied to products and semi-finished products. Unless these products are created, transferred, or consumed within a production flow, inventory transactions are optional. After the products are posted to inventory, the WIP account for the production flow is reduced by deducting by the related standard cost.

Value streams and value stream mapping

The architecture of Lean manufacturing is inspired by the five Lean principles that were formulated by Womack and Jones: Customer value, Value stream, flow, pull, and perfection. One approved method for implementing

lean manufacturing solutions in the physical world of manufacturing is value stream mapping (VSM). This method was introduced by Rother and Shook in their publication "Learning to See" at the Lean Manufacturing Institute.

The future-state value stream can be modeled as a production flow version. All processes of the value stream are modeled as process activities. Movements or transfers can be modeled as transfer activities if the transfer status must be registered, or if integration with inventory picking or consolidated shipments is required.

The value stream itself is modeled as an operating unit. Therefore, the value stream can be used as a financial dimension.

For more information about operating units, see [Create an operating unit](#).

Costing for lean manufacturing based on the production flow

The periodic consolidation of the cost for a production flow corrects the related WIP account and enables variances to be determined for the products that are supplied by the production flow.

Continuous improvement

To better support continuous improvement, the production flows are implemented in time-effective versions. Therefore, an existing production flow version, together with all related kanban rules, can be copied to a future version of the production flow. In addition, the future-state production flow can be modeled before it's validated and activated for production. To help guarantee a seamless material flow on the transition date and beyond, existing kanbans from old production flow versions are automatically related to the new version.

Simplicity

For the implementation of Lean manufacturing, we choose a production flow and activity approach that enables simple and complex production scenarios to be modeled in a single scalable architecture. A closer look at the activity concept reveals a new simplicity for those users who require it: the shop floor and logistics workers. By reporting against activity-based jobs instead of inventory transactions, a unified user interface for all lean manufacturing variants transfers the business complexity from the user interface to where it belongs: the production flow as the backbone of lean manufacturing.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Operations resources

2/18/2021 • 9 minutes to read • [Edit Online](#)

Operations resources perform the activities of a project or a production process. They can be of different types, and can have different capabilities.

Operations resources

Operations resources are the machines, tools, workers, facilities, physical areas or vendors that perform the activities of a project or a production process. They can be of different types and can have different capabilities.

- **Vendor** – An external resource that performs project activities or production operations. An example is a subcontractor. By linking vendor resources to a vendor account, you can generate purchases for subcontractors, based on the bill of materials (BOM) lines or production lines.
- **Human resources** – A project or production worker that perform an activity, either alone or as an operator of a tool or a machine. If you're using the Human resources functionality, you can link human resources to a worker. The scheduling engine can then allocate the resources, based on the competencies that are defined for the corresponding worker.
- **Machine** – A machine or other production equipment that is required in production.
- **Tool** – An instrument or device that is typically used together with another resource to perform an activity in a project or in production.
- **Location** – A physical location of a specific size that is required in order to perform an activity. An example is an assembly area.
- **Facility** – A building or fixed structure that is required in order to perform an activity.

Calendars

A calendar can be assigned to an operations resource and describes the capacity (in hours) of that resource. The working times of the operations resource are determined by the calendar that is assigned to the resource group that the operations resource is part of. You can set an effective date and an expiration date for the assigned calendar. You can then assign more than one calendar to an operations resource. However, the dates of the assigned calendars can't overlap, and the operations resource can be assigned only one calendar at a time.

Note: If there are no effective working calendars for a resource group (for example, if the last assigned calendar or the only assigned calendar has expired), you can no longer access the operations resources that are assigned to the resource group for production planning and operations scheduling. You can also assign a calendar to a resource group to specify the working times for both the resource group and all the operations resources that are assigned to the resource group. The capacity of the resource group is calculated as the sum of the capacities of each operations resource that is assigned to that resource group. The calendar that is assigned to a resource group can change over time.

Resource capabilities

A capability is the ability of an operations resource to perform a particular activity. You can assign one or more capabilities to an operations resource. The scheduling engine will then allocate resources by matching the resource requirements of each activity to the capabilities of the available operations resources. Capabilities can be assigned to all types of operations resources (**Tool**, **Vendor**, **Machine**, **Human resources**, **Location**, or **Facility**). To assign capabilities to operations resources for a limited time, define a start date and an expiration date on the capability assignment. For more information, see [Resource capabilities](#).

Resource groups

A resource group is a set of operations resources that represents the granularity at which you want to schedule resources when you use the operations scheduling method. Therefore, resource groups typically correspond to the physical organization of work cells that is demarcated by yellow lines on the production shop floor. The resource group defines the site, production unit, and warehouse context for operations resources that are assigned to the group. When you assign an operations resource to a resource group, the resource can be scheduled at the site where the resource group is located. You don't have to assign the operations resources that you create to a resource group. However, an operations resource must be assigned to a resource group before it can be scheduled to perform work. An operations resource can be assigned to a resource group for a limited time. You can also assign an operations resource to multiple resource groups, so that you can then share the resource across sites. However, the effective dates and expiration dates can't overlap. In other words, you can't assign an operations resource to two resource groups at the same time. Changes in resource group assignments are effective only for new resource allocations. Capacity reservations for jobs, operations, and project hour forecasts that are already scheduled won't be affected. **Note:** When you assign operations resources of the **Vendor** type to a resource group, all operations resources that are assigned to that resource group must be of the **Vendor** type and must be linked to the same vendor account.

Production units

A production unit is an administrative unit that is a collection of resource groups. A production unit can contain multiple resource groups, but a resource group can be assigned to only one production unit. A production unit reflects the physical layout of production resources, and has no effect on transactions or how they are processed. You must associate a production unit with a site. You can also assign a picking warehouse and a storage warehouse to a production unit. You can use a production unit to consolidate and filter production-related data. For example, a shop floor manager can see an overview of the outstanding workload and the available capacity for a particular production unit. You can change the production unit that is assigned to a resource group. You can also delete a production unit. However, these changes to the production unit are effective only for new orders that are created after master scheduling is run. If you want to apply the production unit change to existing orders, you must make this change manually.

Resource scheduling

Operations resources are assigned to activities when a project or a production is scheduled. Two scheduling methods are available: operations scheduling and job scheduling. When you use operations scheduling, each operation or project activity is scheduled on the resource group that contains operations resources that match the resource requirements that are specified for the operation. If a specific operations resource is required for the operation, scheduling reserves capacity only on a specific operations resource in the group. Job scheduling is a more detailed form of scheduling than operations scheduling. It breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route or project activities. If you're working with finite capacity, the schedule depends on the availability of the operations resources that are required in order to complete the activity. For operations scheduling, the capacity of the resource group is the sum of the available capacity of the operations resources that are part of that group. Capacity reservations that already exist for the operations resources are considered unavailable capacity. If there isn't enough available capacity for production, the production orders can be delayed or even stopped. On the **Resources** page, you can define several properties that control how capacity reservations are made:

- **Capacity** – Specify the operations resource's capacity per hour in terms of the capacity unit of measure.
- **Batch capacity** – Specify the maximum number of pieces that the operations resource can process per run.
- **Efficiency percentage** – Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the

resource. The lead times for the operations that use the operations resource are also adjusted accordingly. Here is the formula that is used for the calculation: $\text{Scheduling time} = \text{Time} \times 100 \div \text{Efficiency percentage}$. *Time* includes both the run time and setup time.

- **Operations scheduling percentage** – Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling. To allow for flexibility in capacity during job scheduling, you should set this percentage to less than 100 percent.
- **Finite capacity** – Set this option to **Yes** if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to **No**, the operations resource is assumed to have infinite capacity, and the resource might therefore be overbooked.
- **Finite property** – Set this option to **Yes** if you want the operations resource to be scheduled based on the actual capacity that is available with respect to the required working time scheduling properties.
- **Exclusive** – Set this option to **Yes** if you don't want the operations resource to be available for another job or operation until the current production is completed. In this case, the operations resource can't be used even if there are gaps in the resource's run time.
- **Bottleneck resource** – Define the operations resource as a bottleneck resource. A bottleneck resource is scheduled by using finite capacity when the **Finite capacity** and **Bottleneck scheduling** options on the **Master plans** page are selected.

To schedule multiple operations resources at the same time to perform, for example, an operation in production, you must specify the requirements for the various resources by using primary and secondary operations. You can then also reserve multiple operations resources that have different capacity. The operations resource that are scheduled for the primary operation determine the duration of the activity.

Lean work cells

You can specify that a resource group is a lean work cell. The resource group can then be part of a production flow. By specifying a resource group as a lean work cell, you also prevent the resource group and the assigned operations resources from being allocated to the operations of a production order or a project hour forecast. For each resource group that acts as a lean work cell, you must specify the following information:

- **Calendar** – The working calendar of the work cell, which must have the property of a standard workday.
- **Input warehouse and location** – The default location that is used to pick material for an activity.
- **Output warehouse and location** – The default location where all output of the work cell is put.
- **Runtime cost category** – This category must be defined for the work cell if direct labor is tracked in costing.

When a resource group is used as a lean work cell, the capacity of the work cell is specified directly on the resource group. Therefore, you don't have to assign operations resources to the resource group. Only when the work cell is managed by a subcontractor, an operations resource of the **Vendor** type must be assigned to the work cell. If you assign an operations resource to a resource group that is marked as a work cell, the capacity of the work cell isn't affected.

Costing resources

When you define an activity such as a route operation or a project hour forecast, you can specify the requirement for a specific operations resource or resource group. However, you can also specify the requirement for an operations resource of a specific type, or an operations resource that has a specific capability or competency. For this reason, the actual resource assignment isn't made until the activity is scheduled and capacity is reserved. Therefore, on a route operation, you can specify that estimation and BOM calculation must be based on a specific operations resource. This operations resource is referred to as the costing resource. You can also transfer cost categories and operation times from the costing resource to the activity. When the operation is scheduled, estimation and BOM calculation are done by using the operations resource that is

actually scheduled.

Define lean manufacturing work cells

2/18/2021 • 5 minutes to read • [Edit Online](#)

A work cell is a specific form of resource groups that can be used in lean manufacturing process activities. Work cells have input and output locations and a capacity definition based on a production flow model. To learn more about the basic concepts of lean manufacturing work cells and capacity calculations, see the white papers on Lean manufacturing. The demo data company used to create this procedure is USMF

Create a work cell.

1. Go to Organization administration > Resources > Resource groups.
2. Click New.
3. In the Resource group field, type a value.
 - The work cell ID is typically a systematic code and has to be unique for the legal entity.
4. In the Description field, type a value.
 - The description contains the name or title of the work cell.
5. In the Site field, click the drop-down button to open the lookup.
 - A work cell is located at one specific site. Both input and output warehouse and location have to be located on this site.
6. In the list, click the link in the selected row.
7. In the Production unit field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
 - Select a production unit that this work cell belongs to.
9. Select the Work cell check box.
 - To use a resource group as a lean work cell, the Work cell check box has to be selected. Note that this property cannot be changed after resource group is created.
10. In the Input warehouse field, click the drop-down button to open the lookup.
11. In the list, click the link in the selected row.
 - For accounting and material control, the material staged on the shop floor is typically allocated to a specific virtual warehouse. However, if you want to replenish the locations using warehouse work, they must be part of the receptive raw material warehouse.
12. In the Input location field, click the drop-down button to open the lookup.
13. In the list, click the link in the selected row.
 - Note that for a process activity, the input location can be overwritten in general or for a specific product or product variant by defining picking activities that feed to the process activity. The input locations of a work cell cannot be license plate controlled.
14. In the Output warehouse field, click the drop-down button to open the lookup.
15. In the list, find and select the desired record.
 - In multiple activity production flows or production lines, this is often the input warehouse of the next work cell or the sales or transit warehouse where a product is typically transferred to after the production process. Remember when modeling lean manufacturing processes, transport is usually waste, as is reporting transport.
16. In the list, click the link in the selected row.
17. In the Output location field, click the drop-down button to open the lookup.
 - In a production flow with multiple process activities this is often the input location of the next work cell.

18. In the list, find and select the desired record.
19. In the list, click the link in the selected row.
20. Expand or collapse the Operation section.
 - A Run time category must be provided to enable cost calculation and processing of lean kanban jobs.
21. In the Run time category field, click the drop-down button to open the lookup.
22. In the list, find and select the desired record.
 - The run time cost category is used in standard cost calculation and on backflush costing.
23. In the list, click the link in the selected row.
24. Expand or collapse the Calendars section.
25. Click Add.
26. In the Calendar field, click the drop-down button to open the lookup.
27. In the list, find and select the desired record.
 - Typically work cells of a given site use the same working time calendar. If work cells can have individual working times, you might need to create a specific working time calendar for the work cell. Note that the calendar should have a standard working time defined when used for a lean work cell, because the capacity definition is usually related to the standard working time of a work day.
28. In the list, click the link in the selected row.
29. Expand or collapse the Work cell capacity section.
30. Click Add.
31. In the Production flow model field, click the drop-down button to open the lookup.
32. In the list, find and select the desired record.
 - This procedure requires production flow model type Throughput, to show the definition of throughput capacity.
33. In the list, click the link in the selected row.
34. In the Capacity period field, select an option.
 - The options include: Standard workday - The capacity is expressed by the length of the standard workday of the working time calendar for the work cell. For each day, the actual working time is determined from the calendar and the effective available capacity is calculated based on that. Week - Allows a weekly capacity. There is no adjustment done by the actual working time. Month - Allows a monthly capacity. There is no adjustment done by the actual capacity. Typically, the standard workday is used for daily periods and the weekly capacity is used for weekly capacity periods.
35. In the Average throughput quantity field, enter a number.
 - Note that a lean operation is never set up for the maximum possible capacity in an ideal environment. Instead the capacity should always be defined for operations running under typical circumstances.
36. In the Unit field, click the drop-down button to open the lookup.
37. In the list, click the link in the selected row.
38. ResolveChanges the Unit.

Add a financial dimension

1. Expand or collapse the Financial dimensions section.
 - Note that financial dimensions defined on the production flow override the financial dimension of a given work cell. The financial dimensions that can be selected depend on the configuration of the financial dimensions of your system. The following steps correspond to the Demo data set in company USMF. When using different data, the steps might not be applicable.
2. In the CostCenter field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.
 - The dimensions that need to be selected on lean work cells depend on the implementation of financial dimensions in the accounting model for a specific legal entity.

4. In the list, click the link in the selected row.
5. In the ItemGroup field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.

Save

1. Click Save.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define lean schedule groups

2/18/2021 • 2 minutes to read • [Edit Online](#)

Lean schedule groups are defined to group and distinguish products in kanban scheduling. The grouping can be done as generic association per company or specific to a work cell. Each group has a color code assigned for visual indication in the kanban scheduling listpage. The demo data company used to create this procedure is USMF.

Define lean scheduling group

1. Go to Product information management > Lean manufacturing > Lean schedule groups.
2. Click New.
3. In the Schedule group field, type a value.
 - A schedule group can be defined as global group or specific to a work cell. In this simple example, we define a global group, and the work cell is kept empty. The settings of this group apply to all work cells that do not have specific schedule groups.
4. Select a color from the color selection.
 - The colors are used to highlight the jobs on the kanban schedule list page or the kanban process board.
5. In the list, mark the selected row.
6. In the list, click the link in the selected row.

Associate product

1. Associate a specific product
 - There are two ways to associate products to lean schedule groups, either as a specific product (Item relation type = Item) or as part of an item allocation key (item relation type = group).
2. In the Item relation type field, select Item
3. In the Item number field, type a value.
4. In the Throughput ratio field, enter a number.
 - The default Throughput ratio is 1, which means that the related products consume exactly the capacity specified in the process activities of the production flows. Throughput ratio > 1 defines a higher resource consumption, Throughput ratio < 1 defines a lower resource consumption. The ratio is used in the cost calculation and in the calculation of the kanban job consumption.

Associate item allocation key

1. Associate an item allocation key
 - Add an association to an item allocation key by using the Item relation type Group. Note that for this process, you need a forecast item allocation key defined in your data.
2. In the Item relation type field, select Group
3. In the Item allocation key field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.

Visual scheduling for lean manufacturing

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides information about the Kanban schedule board, which the production planner can use to control and optimize the production plan for kanban jobs.

This topic provides information about the Kanban schedule board, which the production planner can use to control and optimize the production plan for kanban jobs.

The Kanban schedule board lets the production planner control and optimize the production plan for kanban jobs. It makes the flow of kanban jobs transparent, and gives the production planner a tool that optimizes and adjusts the production plan for the lean manufacturing work cell.

Visual scheduling of kanban jobs

A kanban job can consist of one or many kanban jobs. There are two types of kanban jobs:

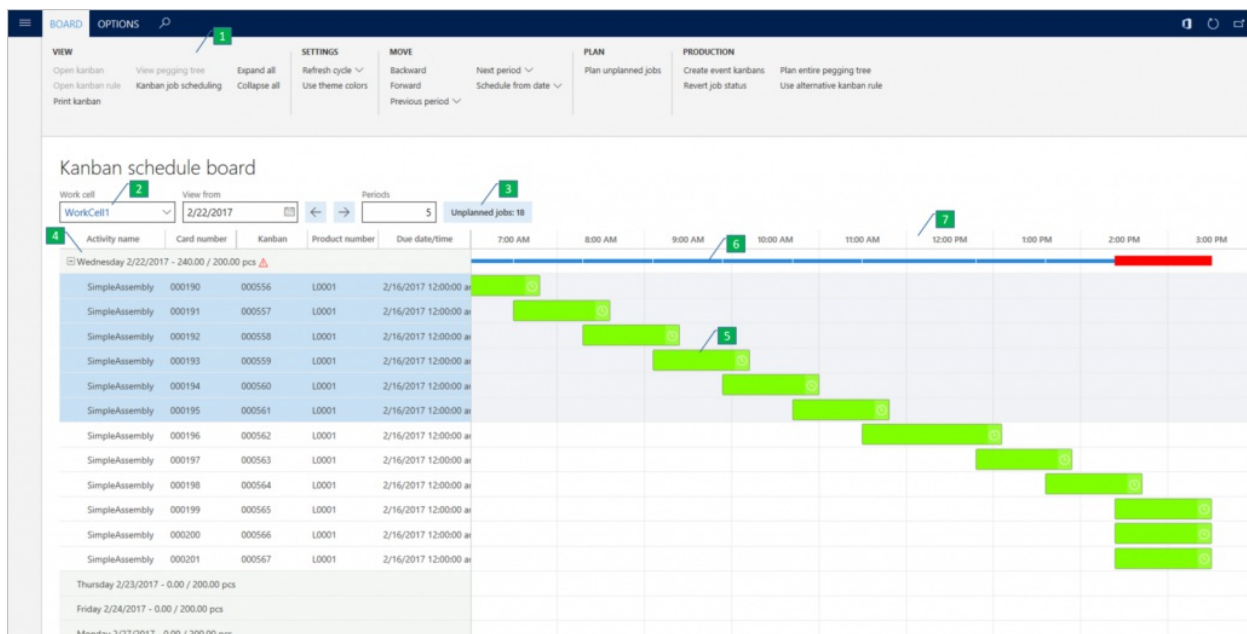

- Process
- Transfer

You can schedule only jobs of the **Process** type. The kanban job and its properties, such as the activity time, are defined in the production kanban flow. In the production kanban flow, the kanban job is also assigned to a work cell. The work cell's daily capacity is calculated based on the work cell capacity that is set on the resource group. It's adjusted by the daily working time in the related calendar. When a kanban job is scheduled, the job loads the capacity of the work cell. The Kanban schedule board provides the following main features:

- A graphical overview of the production plan in a lean work cell. This overview shows the planned kanban process jobs in the defined periods.
- A tool that lets you schedule unplanned kanban jobs and reschedule previously scheduled jobs.

Kanban schedule board

The **Kanban schedule board** page contains seven main elements, as shown in the following illustration.

1. Action Pane
2. Filter fields
3. Button for unplanned jobs
4. Period node
5. Kanban job
6. Capacity bar
7. Time scale

View the time scale

The board is divided into periods, each of which is represented as a node (4). The period nodes are listed on the vertical axis, and the horizontal axis represents a time scale (7) that shows the length of the period. A period has a length of either one day or one week. The period length is determined by the configuration of the work cell that is selected for the Kanban schedule board (2). For each period node, the Kanban schedule board indicates how much the scheduled kanban jobs are loading the period. There is also an indication of the maximum throughput for the period. If the scheduled throughput exceeds the maximum throughput, the period is considered as overloaded, and a red warning symbol appears. A scheduled kanban job appears in a period that has scheduled start and end times (5). The length of the job is equal to the activity time. Kanban jobs appear as overlapping in a period if their activity times exceed the task time of the work cell.

View job status

More information about a kanban job is available in the tooltip that appears when you hover the pointer over the job. A symbol provides information about the status of the job. For example, a clock symbol indicates that the kanban job is overdue.

Use colors to view the Kanban schedule board

To enhance the overview that the Kanban schedule board provides, you can use colors to distinguish kanban jobs. The color of a kanban job is configured in the lean schedule group, where you can aggregate the products that should be produced in the same sequence. The **Use theme colors** button on the **Board** tab of the Action Pane lets you switch between the application theme colors and the colors that are configured in the lean schedule group. For each period, a capacity bar (6) indicates how many of the available hours for the period have been loaded with kanban jobs. If the period is overloaded, the capacity bar appears thicker and in red. All these functions are available on the **Board** tab of the Action Pane (1) at the top of the **Kanban schedule board** page.

Plan unplanned jobs

You can schedule unplanned kanban jobs from the **Plan unplanned jobs** dialog box. To open this dialog box, click the **Unplanned jobs** button that shows the current number of unplanned jobs. Alternatively, click **Plan unplanned jobs** on the **Board** tab of the Action Pane. The dialog box shows a list of the unplanned kanban jobs for the work cell. You can use the **Filter** field to filter on all fields in the grid. For example, you can filter on kanban jobs for a specific product. After you have a filtered list of the jobs that you want to schedule, select them in the list, and then click **OK**. To use automatic planning to schedule the jobs, set the **Automatic planning** option to **Yes**. In this case, the jobs are scheduled into a period according to their due date. You can also schedule the jobs by period. Just select a period in the **Period** field. The following illustration shows an example of the **Plan unplanned jobs** dialog box.

The image shows two screenshots from a software interface. The left screenshot is the 'Kanban schedule board' for 'WorkCell1' on '2/22/2017'. It displays a grid of jobs with columns for 'Activity name', 'Card number', 'Kanban', 'Product number', 'Due date/time', and a time slot from 7:00 AM to 8:00 AM. The right screenshot is the 'Plan unplanned jobs' dialog, which is a table listing 18 jobs. The table has columns for 'Name', 'Card number', 'Kanban', 'Product number', 'Due date/time', and 'Job quantity'. Below the table are 'PLANNING SETTINGS' including 'Automatic planning' (set to 'No') and a 'Period' dropdown menu set to 'Wednesday 2/22/2017 - 240...'. 'OK' and 'Cancel' buttons are at the bottom right.

Name	Card number	Kanban	Product number	Due date/time	Job quantity
SimpleAssembly	000202	000568	L0001	2/16/2017 12:00:00 AM	20.00
SimpleAssembly	000203	000569	L0001	2/16/2017 12:00:00 AM	20.00

SimpleAssembly	000217	000583	L0002	2/16/2017 12:00:00 AM	10.00
SimpleAssembly	000218	000584	L0002	2/16/2017 12:00:00 AM	10.00
SimpleAssembly	000219	000585	L0002	2/16/2017 12:00:00 AM	10.00

Sequence kanban jobs within the same period

You can change the sequence of one or more selected jobs within a period. This capability can be useful if you want to prioritize some jobs within the period. Alternatively, you might want to sequence jobs that have the same product attributes, to optimize job execution. You can change the sequence through a drag-and-drop operation, or by using the **Backward** and **Forward** menu items on the **Board** tab of the Action Pane.

Reassign kanban jobs across periods

Jobs can be reassigned from one period to another. This capability can be useful if a period is overloaded and you want to level the load to periods that have spare capacity. You can reassign jobs through a drag-and-drop operation, or by using the **Next period** and **Previous period** menu items on the **Board** tab of the Action Pane.

Open the Kanban schedule board

You can open the Kanban schedule board by using the menu item on the following pages:

- Production area page
- Kanban jobs scheduling page
- Production flow visualization page

Kanban job scheduling for lean manufacturing

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides information about visual control over kanban job scheduling and various ways to schedule kanban jobs.

The **Kanban job scheduling** page provides visual control over the schedules of lean manufacturing work cells. It gives an overview of all kanban jobs and provides multiple filtering capabilities. From this page, you can move to all other pages that are related to kanban configuration and execution.

Automatic scheduling of kanban jobs

Scheduling can be triggered automatically if you set the **Automatic planning quantity** parameter on the kanban rule. If you set **Automatic planning quantity** to 1, each kanban job is planned immediately when it's created. The result is a series of first pull, first serve operations. If you set **Automatic planning quantity** to a value that is more than 1, kanban jobs are grouped before they are planned.

This concept enables kanban sizes to be reduced below the actual economic batch sizes. For example, the economic batch size for a specific item (or item family) is 30. Instead of creating kanbans that use the product quantity, 30, you can configure the kanban rule so that it has a product quantity of 10 and an **Automatic planning quantity** value of 3. Although automatic planning schedules the kanban jobs for the work cell only when three unplanned jobs exist, it's fully transparent to the planner and the shop floor supervisor that two unplanned jobs might be awaiting execution. The planner or shop floor manager can then take those two jobs into production by manually planning them or creating additional kanbans.

Manual scheduling

For manual scheduling, Microsoft Dynamics AX 2012 introduced the kanban scheduling board. Manual scheduling can be combined with automatic scheduling. The kanban scheduling board lets you plan and unplan jobs, moved them in sequence, or move them from period to period. Jobs that are based on a kanban rule where the **Automatic planning** value is more than 0 can be manually unplanned. However, these jobs will be replanned when the next automatic planning event occurs (that is, when a new kanban is created). The following options are available for manual scheduling:

- **Schedule** schedules the selected jobs according to their due date. (This option resembles automatic planning.)
- **Schedule forward from date** tries to schedule the selected jobs according to their due date but constrains the result by using the specified earliest start date.
- **Backward** moves the selected scheduled jobs back in the sequence within the period.
- **Forward** moves the selected scheduled jobs forward in the sequence with the period.
- **Previous period** moves the selected scheduled jobs to the start or end of the previous period.
- **Next period** moves the selected scheduled jobs to the start or end of the next period.
- **Plan > Revert job status** lets you unschedule a scheduled job.

Lean scheduling groups

Each color represents a lean scheduling group. Lean scheduling groups can be freely defined as generic groups or as groups that belong to a single work cell. Items and dimensions can be freely assigned to the scheduling groups. For example, in a Painting cell, a schedule group can represent a color of the product. In work that is driven by specific tooling requirements, items might be grouped by tool requirement, and a packaging work cell

might group items by packaging template. The use of colors for lean scheduling groups is optional but recommended. It improves visibility into the status of the plan. For example, it's very easy to see which colors are produced on which day, and you can tell at a glance how this work can be optimized.

Work cell capacity and period capacity

The capacity of a lean work cell is always concurrent capacity. In other words, multiple jobs can be active in a work cell at the same time. The capacity can be tracked in two modes: throughput and hours.

Throughput

The capacity of a work cell is defined by the average throughput quantity of a reference period (standard workday, week, or month). The actual capacity per day or week is then calculated based on the working times of the calendar that is assigned to the work cell. The capacity that is loaded by job is the quantity of the job, adjusted by the throughput ratio of the item in the work cell.

Hours

The available capacity by day or week is defined by the calendar that is assigned to the work cell. The capacity that is loaded by job is the cycle time of the activity, adjusted by the quantity (default activity quantity versus actual job quantity) and the throughput ratio of the item in the work cell.

Period capacity FactBox

The **Kanban job scheduling** list page contains a FactBox that shows the available and booked period capacity for the selected work cell. Depending on the selected schedule periods in the production flow model, the periods show days or weeks.

Job scheduling

2/18/2021 • 5 minutes to read • [Edit Online](#)

This article provides information about job scheduling, which is a more detailed form of scheduling than operations scheduling. You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment.

You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment. Job scheduling breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Job scheduling also lets you synchronize all jobs that are referenced by the selected job. You can specify a start date and time or end date and time for the job, and then run scheduling. The time that you specify can be the start time or the end time, depending on the scheduling direction. This functionality is useful when, for example, a job can be run only on one machine at a time, or when you want to optimize the job that is run for each resource.

Tasks in the job scheduling process

The job scheduling process includes the following tasks:

- Split operations into jobs.
- Schedule jobs, based on the dates and times for the resources that are specified for the related operation.
- Calculate start times and end times for each job. You can use finite capacity to make sure that there are no overlapping times.
- Determine which resources in the resource group to run the job on. This task requires that a resource group be specified for an operation. Job scheduling selects the resources or resource groups based on the shortest lead time, and also considers any previous reservations on the resources.
- Explode operations into jobs when you run job scheduling. The jobs are scheduled by date and time, according to the order that is specified by the production route. The setup of the operation determines the jobs that are exploded during the scheduling process. The route group that is assigned to the operation controls whether jobs are generated. A job is generated only if it has a specific duration. For example, a transport time job is generated if a transport time was specified for the selected operation.

Scheduling direction

You can schedule jobs either forward or backward.

- **Forward** – Use the forward scheduling direction to start the production as early as possible. This is also known as the push method, because the production is being pushed forward through the production process. The production is scheduled to start and end on the earliest possible dates.
- **Backward** – Use the backward scheduling direction to start the production as late as possible. This is also known as the pull method, because it's based on the date when the production must be completed. Backward scheduling counts backward to the latest possible date that the production can be started without missing its target deadline.

Finite capacity

You can schedule jobs by using finite capacity. When you use finite capacity, the capacity that is scheduled can't be larger than the capacity that is available for the resource. Available time is defined as the interval when the resource is available and there are no other reservations on capacity. Scheduling that is based on finite capacity makes sure that start times and end times for an operation on a specific date don't overlap. The resource

capacity that is already reserved is considered, and overlaps between the start times and end times are also considered. Finite capacity determines the amount of capacity that must be available for a resource in order to achieve optimal use of that resource. This determination is balanced against a calculation of the shortest possible lead time between operations.

Finite materials

Job scheduling that is based on finite materials makes sure that the required materials are available when the operation starts. The coverage rules for items define these limits. Scheduling uses requirement explosion to determine when the component items are available. If you schedule without setting finite materials, the system assumes that all items are available when they are required.

Finite properties

Job scheduling that is based on special properties requires that properties be specified for the operations on the production route. These properties must be fulfilled to reserve capacity.

References

Job scheduling schedules all productions that are referenced by the current production. If a production has one or more subproductions, the subproductions should be scheduled at the same time as the main production, because the main production can't be started until the related subproductions are completed.

Schedule resources

The scheduling engine examines combinations of resources to identify those combinations that can satisfy requirements. You can specify selection criteria by selecting one of the following values in the **Primary resource selection** field on the **Scheduling parameters** page:

- **Duration** – The scheduling engine selects the resource that has the shortest lead time. **Note:** Scheduling by duration can cause decreased performance when the same resource group contains many resources and secondary operations are used. You can schedule a maximum of 32 resources per operation. If you exceed this quantity, an Infolog message is displayed, and job scheduling doesn't find the best alternative resource.
- **Priority** – The scheduling engine selects the resource that has the highest priority if two or more resources have identical capabilities and levels. The resource that has the lowest numeric value in this field has the highest priority.

When job scheduling is run, the system plans the resources, based on the limitations that are defined in the resource parameters. You can control the capacity of the resources by using calendar settings. The system calculates loads for resources during the scheduling process. **Note:** For productions that use the operations scheduling function, you can run job scheduling after operations scheduling. If you aren't using operations scheduling, you can run job scheduling alone.

Maximum capacities for resources per job order

Resources are assigned to jobs through job scheduling. You can establish maximum capacities for resources per job order. For example, you can set up the system to schedule no more than 50 percent of total capacity for a production order. This setup gives you more control over the scheduling of resources on the job scheduling level. Therefore, it can help prevent issues if not enough capacity is available to perform simultaneous productions.

Resource efficiency

Job scheduling considers the efficiency percentages that are specified for the resources. Efficiency percentages

reduce or increase the time that is reserved for the resource. Therefore, lead time is also increased or decreased. The following formula is used for the calculation: $\text{Scheduling time} = \text{Time} \times 100 \div \text{Efficiency percentage}$ In this formula, *Time* includes both the run time and the setup time.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Kanban transfer board support for barcode scanners

2/18/2021 • 2 minutes to read • [Edit Online](#)

The Kanban transfer board supports scanner input from a widget barcode scanner to Select, Start, Complete, and Empty a kanban job.

Registration modes

On the **Scanner registration** FastTab you can select the registration mode, which controls the action when you scan a kanban card number or manually type the number in the Kanban card number field.

SET REGISTRATION MODE	DESCRIPTION
Start	Registers a Kanban transfer job as in progress.
Complete	Registers a Kanban transfer job as completed.
Empty	Registers the material handling unit that is referenced by a Kanban card as empty.
Select	Registers a Kanban card number and automatically selects the referenced job in the Kanban list.

Registration mode Select

When you use a bar code reader to select a job, the display mode of the kanban board changes. In this mode, the following conditions apply:

- Only the scanned kanban job is displayed.
- The details of the selected job are displayed in the **Details** FastTab.
- The **Messages** FastTab displays messages only for the selected job.
- You can change the status of the job by using the functions that are available on the Action Pane. The Kanban transfer board continues to display only a single job during this time.
- You can update the information in the list of jobs manually by clicking **Refresh** (Shift+F5) on the Action Pane. After you refresh the information, the full results for the job filter are displayed again.

Job status and possible actions

The status of the selected job and the status of any pegged jobs for event kanbans, determine whether you can process the job further. The following table displays information about these statuses and tasks:

- The statuses that are available for jobs, or for the handling units that are referenced by the jobs.
- Each task that you can perform for the job.

JOB TYPE	JOB STATUS OR HANDLING UNIT STATUS	UPDATE PICKING LIST	START	UPDATE REGISTRATI ON	COMPLETE	EMPTY	CREATE EVENT KANBANS
Transfer	<ul style="list-style-type: none"> • Not plan ned • No peg ged jobs , or peg ged jobs are Co mpl eted 	Yes	Yes	Yes	Yes	No	Yes
Transfer	<ul style="list-style-type: none"> • Not plan ned • The peg ged job is not Co mpl eted 	Yes	No	Yes	No	No	No
Transfer	In progress	Yes	No	Yes	Yes	No	No
Transfer	Completed	No	No	No	No	Yes	No
Transfer or process	Empty	No	No	No	No	No	No
Transfer or process	A kanban card is not found	No	No	No	No	No	No
Transfer or process	A kanban card is found, but it is not assigned to a kanban	No	No	No	No	No	No

JOB TYPE	JOB STATUS OR HANDLING UNIT STATUS	UPDATE PICKING LIST	START	UPDATE REGISTRATI ON	COMPLETE	EMPTY	CREATE EVENT KANBANS
Process	<ul style="list-style-type: none"> • Not plan ned • Pre pare d • In pro gres s 	No	No	No	No	No	No
Process	Completed	No	No	No	No	No	No

Production feedback

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about production feedback, which gives workers feedback about production jobs. The article includes information about the various ways that production feedback can be updated.

Production feedback gives workers feedback about production jobs. It records time and material consumption on production orders, operation quantities and status, and errors that cause a job or operation to fail. Production feedback can be updated in journals that are related to production orders. The **Production job card** and **Production route card** journals are used to report time and quantities per job or operation. For reporting about the last job or operation, quantities on the finished product can be reported as finished. Production feedback can also be updated on the **Job card terminal** and **Job card device** pages. These pages enable production feedback to be updated on the shop floor and are part of the manufacturing execution functionality in the **Production control** module. The **Job card terminal** page has a configurable user interface that shows a list of the released jobs in a prioritized order for a selected work area. It also offers advanced options such as job bundling and team work. The **Job card device** page has a touch-optimized user interface. Production feedback on both pages is updated from the production journals.

Create a production flow version

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on creating a new production flow version. For this procedure, the production parameters for lean manufacturing and the units of measurement for class time must be defined. You also need to define a value stream and a production group. To learn more about production flows and activities in lean manufacturing, see the white papers on Lean manufacturing for Microsoft Dynamics AX. The demo data company used to create this procedure is USMF.

Create a production flow

1. Go to Production control > Setup > Lean production flow > Production flows.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. In the Name field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
 - Select an operating unit of type value stream. A value stream is an operating unit that spans all activities and flows of the value stream. At this stage, operating units are limited to a legal entity and have no further functionality.
7. In the Production group field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
 - Select a production group for the production flow. Production groups allow the definition of material, labor, and WIP accounts for a production process. To associate the accounting context to a production flow, a production group must be selected.
9. Click Save.

Create a production flow version

1. Click Add.
2. In the Expiration date field, enter a date and time.
 - If required, define an Expiration date for the version. You can update it at any given time, even for active versions. You can use it to plan to phase out a version.
3. Click OK.
4. In the list, mark the selected row.
5. In the Unit field, type a value.
6. ResolveChanges the Takt unit.
7. In the Average takt time field, enter a number.
 - Define the Average takt time of the version. For the takt control of the production flow version, define a targeted average takt time. The takt is defined as quantity per time period. In the example, the takt time is 0.2 hours per 10 pieces. For a working time of 8 hours, this corresponds to a daily throughput capacity of 400 pieces.
8. In the Quantity per cycle field, enter a number.
 - Define the quantity per cycle related to the Average takt time.
9. Toggle the expansion of the Version details section.
10. In the Minimum takt time field, enter a number.

- Define the minimum takt time. The minimum takt time must be less than or equal to the average takt time.

11. In the Maximum takt time field, enter a number.

- The maximum takt time must be higher than or equal to the Average takt time.

12. In the Period for actual cycle time (days) field, enter a number.

- Enter the number of days in the Period for actual cycle time. The period for actual cycle time is the number of days that jobs are aggregated from the actual minute backwards to calculate the actual cycle time. The value can be changed at any time and is only used for the calculation of the actual cycle times.

13. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create process activities for lean manufacturing

2/18/2021 • 2 minutes to read • [Edit Online](#)

Create a process activity for lean manufacturing.

Prerequisites:

1. A production flow and version that is not active must be created.
2. A work cell must be created.

Find the production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.

Create a new activity

1. Click Activities.
 - Ensure that the selected production flow has a version in draft and select that version.
2. Click Create new plan activity.
3. Click Next.
4. In the Name field, type a value.
5. In the Name field, type a value.
 - Note that the name must be unique for a given production flow for all versions.
6. In the Process quantity field, enter a number.
 - Note that no matter what job quantity will be processed, this is the minimum quantity per job to calculate the labor cost. If job quantities deviate from this quantity, labor cost variance will be created.
7. Click Next.

Select the work cell

1. In the Work cell field, click the drop-down button to open the lookup.
2. In the list, click the link in the selected row.

Define the inventory updates

1. Select or clear the Update on hand receipt check box.
 - If Update On hand = No, you can define the activity to receive a semi-finished product (the activity does not reach the next BOM level). You can also select to consume semi-finished products.

Define the picking activities

1. Click Next.
2. In the list, mark the selected row.
 - A default picking activity is created for the input location of the selected work cell.
3. Click Add.
 - You can create additional picking activities for specific products, that are not staged at the work cell

input activity.

4. In the list, find and select the desired record.
5. In the Item number field, type a value.
6. In the Warehouse field, click the drop-down button to open the lookup.
 - With this definition, all materials consumed in the activity are picked from the default input warehouse and location except the item that is defined in the second picking activity. This item will be picked from a different warehouse and location.
7. In the list, find and select the desired record.
8. In the list, click the link in the selected row.
9. Select or clear the Register scrap check box.
10. Click Next.

Define the activity times

1. In the list, find and select the desired record.
 - The definition of a Runtime is required. The Runtime is used to calculate costs and the throughput times of the kanban jobs. Runtimes are not used to calculate capacity load and consumption, this is calculated by cycle time, derived from the production flow version task.
2. In the Time field, enter a number.
3. In the Unit field, type a value.
4. Select the Time unit.
5. In the Per quantity field, enter a number.
6. In the list, find and select the desired record.
 - Queue times are optional.
7. In the Time field, enter a number.
8. In the Unit field, type a value.
9. Select the Time unit.
10. In the Per quantity field, enter a number.
11. Click Next.
12. Click Finish.
13. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create transfer activities for lean manufacturing

2/18/2021 • 2 minutes to read • [Edit Online](#)

Create a transfer activity for lean manufacturing.

Prerequisites:

1. A production flow and version that is not active must be created.
2. The from and to warehouse and locations must be created. Optionally, the replenishing or the replenished work cell should be created.

Find the production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
 - Note that the production flow must have a version in draft status.
3. In the list, click the link in the selected row.

Create a new activity

1. Click Activities.
 - Ensure that the selected production flow has a version in draft and select that version.
2. Click Create new plan activity.
3. Click Next.
4. In the Name field, type a value.
5. In the Activity type field, select 'Transfer'.
6. In the Process quantity field, enter a number.
7. Click Next.

Select the Work cells

1. In the Replenishing field, click the drop-down button to open the lookup.
 - To use the work cell output location as the from location in the transfer activity, select a work cell. The same can be done with the replenished work cell, which sets the target location of the transfer activity.
2. In the list, click the link in the selected row.

Define the inventory updates

1. In the Product type field, select an option.
 - Note that a transfer does not change the type of product. You can transfer finished products or semi-finished products (transfer between two activities of a production flow and possibly a kanban flow). When transferring finished products, you can select if picking or receiving results in an inventory transaction.

Define the transfer locations

1. Click Next.
2. In the Warehouse field, click the drop-down button to open the lookup.

3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. In the Location field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. In the Freight by field, select 'Shipper'.
 - Options include: Shipper - the organization operating the shipping warehouse, Recipient - the organization operating the receiving warehouse, Carrier - a third party vendor. If the operating organization is a vendor, the transfer activity requires a subcontracting agreement.
8. Click Next.

Define the activity times

1. In the list, find and select the desired record.
 - The definition of a Runtime is required. The Runtime is used to calculate cost and the throughput times of the kanban jobs. Runtimes are not used to calculate capacity load and consumption, which is calculated by cycle time, derived from the production flow version task.
2. In the Time field, enter a number.
3. In the Unit field, type a value.
4. Select the Time unit.
5. In the Per quantity field, enter a number.
6. In the list, find and select the desired record.
 - Queue times are optional.
7. In the Time field, enter a number.
8. In the Unit field, type a value.
9. Select the Time unit.
10. In the Per quantity field, enter a number.
11. Click Next.
12. Click Finish.
13. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Validate a production flow and version

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a new production flow and a first version for lean manufacturing. Prerequisites: The production parameters for Lean manufacturing and the units of measure for class time must be defined. You need to define a Value stream and a Production group. Refer to the white papers on Lean manufacturing to familiarize yourself with the concepts of production flows and activities. This procedure refers to the legal entity USMF in demo data. However, assuming that the legal entity is configured for Lean manufacturing, other legal entities can be used.

Create a production flow

1. Go to Production control > Setup > Lean production flow > Production flows.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. In the Name field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
 - A value stream is an operating unit that spans over all activities and flows of the value stream. At this stage, operating units are limited to a legal entity and have no further functionality.
7. In the Production group field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
 - Production groups allow the definition of material, labor, and WIP accounts for a production process. To associate the accounting context to a production flow, a production group must be selected.
9. Click Save.

Create a production flow version

1. Click Add.
2. In the Expiration date field, enter a date and time.
 - You can update the Expiration date of the version at any given time, even for active versions. Use the expiration of the version to plan for a phase out of a version.
3. Click OK.
4. In the list, mark the selected row.
5. In the Unit field, type a value.
6. Select the Takt unit.
7. In the Average takt time field, enter a number.
 - For the takt control of the production flow version, define a targeted average takt time. The takt is defined as quantity per time period. In the given example, the takt time is 0.2 hours per 10 pieces. For a working time of 8 hours, this corresponds to a daily throughput capacity of 400 pieces.
8. In the Quantity per cycle field, enter a number.
9. Expand or collapse the Version details section.
10. In the Minimum takt time field, enter a number.
 - The minimum takt time must be less than or equal to the average takt time.
11. In the Maximum takt time field, enter a number.
 - The maximum takt time must be higher than or equal to the Average takt time.

12. Enter a number of days in the Period for actual cycle time

- The period for actual cycle time is the number of days that jobs are aggregated from the actual minute backwards to calculate the actual cycle time. The value can be changed at any time and is only used for the calculation of the actual cycle times.

13. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Activate a production flow version

2/18/2021 • 2 minutes to read • [Edit Online](#)

Before kanban jobs can be created and activities can be processed for a production flow version, you should activate the version. As a best practice, activate the version before its effective start date and time expire. To complete this task, you must have a production flow version that has the Draft status in order to activate the version.

Find and activate a production flow version

1. Go to Production flows.
2. In the list, find and select the desired record.
 - Select a production flow version that has Draft in the Plan status field.
3. In the list, click the link in the selected row.
4. In the list, find and select the desired record.
 - Select a production flow version that has Draft in the Plan status field.
5. Click Activate.
6. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create activity relation - Successor

2/18/2021 • 2 minutes to read • [Edit Online](#)

The flow of activities in a lean production flow is documented through activity relations. This recording shows how to create an activity relation.

Prerequisites:

- A production flow and version in draft mode.
- Two activities that follow each other in the production flow are created but not related.

Find the production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the list, mark the selected row.
5. In the list, select a draft version.
 - Activity relations can be added to both draft or active versions of a production flow.

Open the activity overview

1. Click Activities.
 - Note that the form shows all activities of the production flow that are allocated to the Version of the production flows that you are working in.

Add a Successor

1. Click Add successor.
2. In the Activity field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. Select the Constraint check box.
6. In the Constraint value field, enter a number.
 - The constraint time is the time to be scheduled between the scheduled end of the predecessor (due date and time) and the scheduled start of the successor.
7. In the Units field, type a value.
8. In the Cycle time ratio field, enter a number.
 - If both activities run at the same takt, the cycle time ratio should be 1. If the predecessor runs at the double speed of the successor, the ratio should be 2. The cycle time ratios are used to calculate the individual cycle times of the production flow activities.
9. Click OK.
10. Close the page.
11. Click the GridPanel tab.
12. Close the page.
13. Refresh the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add a predecessor to a production flow activity

2/18/2021 • 2 minutes to read • [Edit Online](#)

In a production flow version, all activities must be sequenced. An activity can have one or multiple predecessors or successors.

This procedure shows how to associate a predecessor to an activity.

To perform this task, you need a production flow that has the Draft version with at least two activities that can be connected.

To learn more, read the white paper "Production flows and activities in lean manufacturing."

Find the production flow and version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the list, find and select the desired record.
5. Click Activities.

Select an activity and add a predecessor

1. In the list, find and select the desired record.
2. Click Add predecessor.
3. In the Activity field, enter or select a value.
4. In the Cycle time ratio field, enter a number.
 - The default cycle time ratio of an activity relation is 1. This assumes that both activities run at the same pace or takt time. If the predecessor runs at a higher pace (lower takt time), the ratio should be lower than 1, if the predecessor runs at a slower pace (higher takt time) the cycle time ratio is greater than 1.
5. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a value stream

2/18/2021 • 2 minutes to read • [Edit Online](#)

Value streams are operating units, that group one or multiple production flows. To define a production flow, you first must define a value stream.

Open the form

1. Go to Production control > Setup > Lean production flow > Value streams.

Create a new value stream

1. Click New to open the drop dialog.
2. In the Name field, type a value.

Select a value stream manager

1. In the Manager field, click the drop-down button to open the lookup.
 - The value stream manager is defined to document the organization.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.

Save and close

1. Click Save.
2. Close the page.
3. Refresh the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Lean pegging from sales orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on validating the pegging tree from a sales line where the item is produced with kanbans. After validating the pegging tree, all the kanban jobs are planned. This is useful for order scenarios where the order taker needs to ensure that production can start right away. The demo data company used to create this procedure is USMF. This procedure is intended for the advanced order taker working in a lean company.

Create a sales order for a kanban controlled item

1. Go to All sales orders.
2. Click New.
3. In the Customer account field, enter or select a value.
 - Use US-001.
4. Click OK.
5. In the Item number field, type 'L0001'.
6. Set Quantity to '30'.
 - It is important that the quantity is higher than 24 in order to trigger the event kanban rule.

Open a pegging tree

1. Click Product and supply.
2. Click View pegging tree.
 - Notice that the pegging tree shows all levels of the pegging needed for the sales order line. In this case, there are two levels of kanbans and all the required components.

Plan the pegging tree

1. In the tree, select 'Sales line 000832\Kanban 000558'.
2. Expand the Kanban jobs section.
 - Notice that the job status for the kanban job is Not planned.
3. Click Plan entire pegging tree.
 - This will plan all kanban jobs in the pegging tree, changing the Job status from Not planned to Planned.
4. Refresh the page.
 - Notice that the kanban Job status changed from Not planned to Planned.
5. In the tree, select 'Sales line 000832\Kanban 000558\Issue for L0001\Kanban 000559'.
 - The job for the second kanban is also planned, because the entire pegging tree is planned. Notice that the kanban job status is changed from Not planned to Planned.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a subcontracted work cell for lean manufacturing

2/18/2021 • 2 minutes to read • [Edit Online](#)

To model subcontracted work for lean manufacturing, you must create a work cell that is associated with the vendor that provides the work. A subcontracted work cell is linked to the vendor through the association of a resource of the Vendor type. If you play this recording in the USMF demo company, you can select vendor account ID 1002 and site 1.

Create a vendor resource

1. Go to Resources.
2. Click New.
3. In the Resource field, type a value.
4. In the Description field, type a value.
5. In the Type field, select 'Vendor'.
6. In the Vendor field, click the drop-down button to open the lookup.

Create the resource group

1. Go to Resource groups.
2. Click New.
3. In the Resource group field, type a value.
4. In the Description field, type a value.
5. In the Site field, click the drop-down button to open the lookup.
 - Select the site that the work cell should be allocated to. In theory, a site can represent a single site that is operated by a vendor. However, in most cases, subcontracted resources are just allocated to the site that orders the subcontracted work. Note that the input and output warehouses of subcontracted work cells must be on the same site.
6. In the Site field, type a value.
7. @SysTaskRecorder:_RequestClose
8. Select or clear the Work cell check box.
9. In the Input warehouse field, click the drop-down button to open the lookup.
 - Select the warehouse and location that are used to stage the material for the vendor-managed work cell. In many cases, the warehouse and location are modeled by using a separate warehouse per vendor and one location per work cell.
10. In the Input location field, click the drop-down button to open the lookup.
11. In the Output warehouse field, click the drop-down button to open the lookup.
 - Define the warehouse and location where the material is posted when the subcontracted activities of the work cell are posted. The warehouse and location can be at the vendor site if the vendor reports the kanban jobs. Alternatively, the warehouse and location can be the receiving location that is associated with the next step of the production flow.
12. In the Output location field, click the drop-down button to open the lookup.
13. Expand or collapse the Calendars section.
14. Click Add.

15. In the Calendar field, click the drop-down button to open the lookup.
 - Associate the working time calendar of the work cell with the resource group. For critical resources, we recommend that you define specific calendars that represent the exact working times and related capacities of the work cell or vendor site.
16. Expand or collapse the Resources section.
17. Click Add.
 - A subcontracted resource group must have an associated resource of the Vendor type that links the resource group to the vendor account.
18. In the Resource field, click the drop-down button to open the lookup.
 - Select or enter the vendor resource that you created in the previous sub-task.
19. Expand or collapse the Work cell capacity section.
20. Click Add.
 - A work cell must have a defined capacity. In this example, we create a throughput capacity of 100 pieces per standard workday.
21. In the Production flow model field, click the drop-down button to open the lookup.
22. In the Capacity period field, select an option.
23. In the Average throughput quantity field, enter a number.
24. In the Unit field, click the drop-down button to open the lookup.
25. ResolveChanges the Unit.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add a kanban quantity calculation policy to a kanban rule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on creating a kanban quantity calculation policy and adding it to a kanban rule to optimize the kanban size and quantities. The demo data company used to create this procedure is USMF. This procedure is intended for the value stream manager. This procedure is a prerequisite for creating the procedure Calculate kanban quantity suggestions.

Create a kanban quantity calculation policy

1. Go to Production control > Periodic tasks > Kanban quantity calculation > Kanban quantity calculation policies.
2. Click New.
3. In the Name field, type a value.
 - For example, type Speaker2016.
4. In the Master plan field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.
 - Select StaticPlan to calculate demand.
6. In the list, click the link in the selected row.
7. Click Save.
8. In the Minimum kanban quantity field, enter '1'.
 - This is the additional number of kanbans that is included in the kanban quantity calculation.
9. Set Safety factor to '1'.
 - This is the factor that is used to calculate additional quantity of safety stock.
10. In the Days ahead field, enter '30'.
 - This is the number of days prior to the kanban quantity calculation date that is included in the demand calculation.
11. In the Days behind field, enter '30'.
 - This is the number of days forward from the kanban quantity calculation date that is included in the demand calculation. The formula used for the calculation is shown with the actual values. For example, Kanban quantity = ((Average daily demand x lead time x 2.00) / Product quantity per handling unit) + 1
12. Close the page.

Add the kanban quantity calculation policy to a kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. In the list, find and select the desired record.
 - Select kanban rule 000020 for this procedure.
3. In the list, click the link in the selected row.
4. Toggle the expansion of the Kanban quantity calculation policies section.
5. Click Add.
 - Add the kanban quantity calculation policy that you have just created in the previous sub-task.
6. In the list, mark the selected row.

7. In the Name field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
 - Select the policy Speaker2016 that you have just created in the previous sub-task.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Calculate kanban quantity suggestions

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on optimizing the kanban size and quantities for a specific kanban rule by using the kanban quantity calculation. The demo data company used to create this procedure is USMF. This procedure is intended for the value stream manager. It is a prerequisite that you have completed the procedure Add a new kanban quantity calculation policy to a kanban rule.

Create a kanban quantity calculation

1. Go to Production control > Periodic tasks > Kanban quantity calculation > Calculate kanban quantity.
2. Click New.
3. In the Name field, type 'Speaker2016'.
4. In the Name field, click the drop-down button to open the lookup.
 - Select the policy that you have created in the procedure Add a new kanban quantity calculation policy to a kanban rule. For example, Speaker2016.
5. In the list, click the link in the selected row.
6. In the Rule active as of date field, set the date and time to '2012-12-17T08:00:00'.
 - This date serves as the basis for determining which fixed kanban rules are included in the kanban quantity calculation.
7. In the Fulfilled demand period start date field, set the date and time to '2012-11-17T09:00:00'.
 - The date from when past demand transactions are included to calculate the kanban quantity.
8. In the Fulfilled demand period end date field, set the date and time to '2012-12-17T07:59:59'.
 - The date until when past demand transactions are included to calculate the kanban quantity.
9. In the Demand period start date field, set the date and time to '2012-12-17T08:00:00'.
 - The date from when current demand transactions are included to calculate the kanban quantity.
10. In the Demand period end date field, set the date and time to '2013-01-16T07:59:59'.
 - The date until when current demand transactions are included to calculate the kanban quantity.

Generate kanban quantity proposal

1. Click Save.
2. Click Generate.
 - This generates a kanban quantity proposal line for the kanban rule 000020.

Run kanban quantity calculation

1. Click Calculate.
 - This calculates the kanban quantity proposal.
2. Click OK.
3. In the list, mark the selected row.
 - Notice the suggested kanban quantity is 2.

Change product quantity and calculate again

1. Set Product quantity to '5'.
2. Click Calculate.

3. Click OK.

- Notice that with a kanban quantity of 5, the suggestion is changed to a kanban quantity of 4.
- This is caused by the fact that with a lower product quantity, we need more kanbans to fulfill the demand.

Update kanban rule

1. In the Rule effective date field, enter a date and time.

- Set the 'Rule active as of date' to a date in the future. For example, today + one year.

2. Click Update.

3. Click OK.

4. Close the page.

Validate change on kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.

2. In the list, click the link in the selected row.

- Select the kanban rule that was created in the previous sub-task. This should be the first kanban rule in the list sorted by number.

3. Toggle the expansion of the Details section.

- Notice the effective date, which means that this rule is not activated until this date.

4. Toggle the expansion of the Quantities section.

- Notice this is the default quantity that you entered on the kanban quantity calculation.
- Notice this is the fixed kanban quantity of 4 from the kanban quantity calculation.

5. Click the ListPanel tab.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Change kanban rules for a process job

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on changing the used kanban rule for a given kanban. This is useful to level load resources or in case of breakdown. The demo data company used to create this procedure is USMF. This procedure is intended for the planner, working at a lean manufacturing company, responsible for the value stream.

Copy kanban rule

1. Go to Kanban rules.
2. In the list, find and select the desired record.
 - Select Event Kanban rule 000022 for L0001.
3. Click Duplicate kanban rule.
4. Click OK.

Change kanban rule

1. Close the page.
2. Go to Kanban job scheduling.
3. In the list, mark the selected row.
 - Select line with Kanban 000177.
4. Click Use alternative kanban rule.
5. Click Next.
6. In the Kanban rule field, enter or select a value.
 - Select the kanban rule that was created earlier. This is the kanban rule with the highest number.
7. Click Finish.
 - Now the kanban job is using an another kanban rule. This can be useful to level load work cells.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a BOM line event kanban rule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This task focuses on the setup needed to create an event kanban rule to ensure supply for production BOM lines in a mixed lean and classic production environment. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product.

Create a new kanban rule

1. Go to Production control > Periodic tasks > Kanban quantity calculation > Kanban rules.
2. Click New.
3. In the Type field, select 'Withdrawal'.
 - The Withdrawal type is used to create transfer kanbans.
4. In the Replenishment strategy field, select 'Event'.
 - The Event strategy is selected to create the transfer of kanbans based on an event. Later in the task guide, we will trigger it by estimating a production order.
5. In the First plan activity field, enter or select a value.
 - Enter or select ReplenishSpeakerComponents. This transfer activity has receipt (output) warehouse and location 12, which means that material will be moved to location 12 in warehouse 12.
6. Expand the Details section.
7. In the Product field, enter or select M0001.
8. Expand the Events section.
9. In the BOM line event field, select 'Automatic'.
 - With the BOM line event field set to Automatic, kanban will be created to fulfill material needs for production order BOM lines.
10. Close the page.

Create and modify a new production order

1. Go to Production control > Production orders > All production orders.
2. Click New production order.
3. In the Item number field, enter or select a value.
 - Enter or select 'L0001'. We use item L0001 because item M0001 is included in the BOM for item L0001.
4. Click Create.
5. In the list, click the link in the row for L0001
6. Click BOM.
7. In the list, click the link in the selected row.
8. Click Edit.
9. In the Line type field, select 'Pegged supply'.
 - Pegged supply is selected to trigger the supply creation of a kanban.
10. Select No in the Resource consumption field.
 - Clearing the check box of Resource consumption lets us change the warehouse.
11. Expand the Inventory dimensions section.
12. In the Warehouse field, type '12'.

- Warehouse is set to 12 because this is the output warehouse for the withdrawal activity.
13. In the Location field, type '12'.
 - Location is set to 12 because this is the output location of the withdrawal activity.
 14. Close the page.
 15. Close the page.

Estimate the production order and view the kanban created

1. Click Estimate.
 - Estimating the production order will trigger the creation of the associated kanban to supply item M0001.
2. Click OK.
3. Close the page.
4. Close the page.
5. Go to Product information management > Lean manufacturing > Kanban rules.
6. In the list, click the link in the selected row.
 - Select the event kanban rule created for item M0001.
7. Expand the Kanbans section.
8. In the list, mark the selected row.
 - Notice the kanban created to supply M0001 for the estimated production order.
 - This is the last step!

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a fixed quantity kanban rule for manufacturing

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on the setup needed to create a fixed manufacturing kanban rule for triggering transforming activities, at a work cell, in a lean environment. The demo data company used to create this procedure is USMF. This procedure is intended for the Process Engineer or the Value Stream Manager, as they prepare production of a new or modified product.

Create new kanban rule

1. Go to Kanban rules.
2. Click New.
 - Notice that the default Type is Manufacturing and Replenishment strategy is Fixed. You do not have to change these parameters.
3. In the First plan activity field, enter or select a value.
 - This is the activity that will be performed for kanbans created based on this kanban rule. Select 'SpeakerTestAndPackaging'.
4. Expand the Details section.
5. In the Product field, enter or select a value.
 - Select L0050.
6. In the Unit of measure field, enter or select a value.
 - Select minutes.
7. In the Lead time field, enter a number.
 - Enter 5.

Set quantities

1. Expand the Quantities section.
2. Set Default quantity to '10'.
 - This is the quantity that will be transferred for each kanban.
3. Select the Product quantity variance check box.
 - With this, selected kanbans can be completed with a variance from the default quantity. To allow kanbans to be completed with a quantity from 8 to 12, set both variances to 2.
4. Set Variance below to '2'.
 - This will allow completing down to $10 - 2 = 8$
5. Set Variance above to '2'.
 - This will allow completing up to $10 + 2 = 12$
6. In the Fixed kanban quantity field, enter a number.
 - This is the amount of kanbans that should be active. In this case, 5 kanbans processing 10 each.
7. In the Alert boundary minimum field, enter '2'.
 - Used to keep track of the minimum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.
8. In the Alert boundary maximum field, enter '4'.
 - Used to keep track of the maximum amount of full kanbans that should be at the destination. For

example, this is used on the kanban quantity overview.

9. In the Automatic planning quantity field, enter '1'.

- Setting this to 1 means that every kanban will be automatically planned. If we entered 3, the kanbans would not be planned until 3 empty kanbans are ready for planning. This is useful for grouping work and avoiding too much setup.

Create Kanbans

1. Expand the Kanbans section.

2. Click Save.

- The kanban rule needs to be saved before kanbans can be created.

3. Click Add.

- Note that there are no active kanbans, due to this the suggested 'Number of new kanbans' are 5. This is equal to the 'Fixed kanban quantity'.

4. Click Create.

- This will create 5 kanbans.
- Note that 5 kanbans, for 10 each, was created for this manufacturing kanban rule. This is the last step in this procedure.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a kanban rule using a kanban line event

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure creates a kanban rule by using the kanban line event setting to trigger pull from a process activity. The kanban rule is triggered by a kanban process activity, with a quantity equal to or greater than 25 each. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product in a lean environment.

Create a kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. Click New.
3. In the Replenishment strategy field, select 'Event'.
 - This generates kanbans directly from demand. It is used to set up rules that define a make-to-order scenario.
4. In the First plan activity field, enter or select a value.
 - Enter or select SpeakerAssemblyAndPolish. The first activity of a manufacturing kanban rule is a process activity in the production flow. When you select the activity, the validity dates of the activity are copied to the validity dates of the kanban rule.
5. Expand the Details section.
6. In the Product field, type 'L0001'.
7. Expand the Events section.
8. In the Kanban line event field, select 'Automatic'.
 - This generates event kanbans on demand. The field is used to configure kanban rules that replenish material that is required for a downstream process activity. When you select Automatic, the event kanbans are created with the demand. This setting is recommended if you expect to execute production on the same day.
9. Set Minimum event quantity to '25'.
 - Event kanbans are generated when the demand quantity is equal to or more than this field. This is useful if you want to produce an order quantity less than this field on one machine and more than this field on another machine.
10. Click Save.

Create sales order and trigger kanban chain

1. Go to Sales and marketing > Sales orders > All sales orders.
2. Click New.
3. In the Customer account field, enter or select a value.
 - Select Customer account US-003, Forest Wholesales.
4. Click OK.
5. In the Item number field, type 'L0001'.
 - L0001 is the item for which you created the kanban rule.
6. Set Quantity to '27'.
 - Because 27 is higher than the minimum quantity of 25 on the kanban rule, this will trigger an event kanban.
7. In the Site field, type '1'.

8. In the Warehouse field, enter or select a value.

- Select warehouse 13.

9. Click Save.

View the kanban generated by the kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.

2. In the list, find and select the desired record.

3. Expand the Kanbans section.

- Notice that a kanban for 27 was created to process the activity based on the created kanban rule.
- This is the last step.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a kanban rule using a minimum stock event

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on the setup needed to create a kanban rule using a minimum stock event to ensure that a specific product is always available at a specific location. A kanban rule is created to transfer material to the location when the inventory level drops below 200 pieces. By running the Pegging event processing, the needed kanbans are created. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product in a lean environment.

Create a new kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. Click New.
3. In the Type field, select 'Withdrawal'.
 - This type is used to create transfer kanbans.
4. In the Replenishment strategy field, select 'Event'.
 - The Event strategy is used to create the transfer kanbans based on an event. Later in the procedure, you will trigger transfer kanbans by using stock replenishment.
5. In the First plan activity field, enter or select a value.
 - Enter or select ReplenishSpeakerComponents. This transfer activity has receipt (output) warehouse and location 12, which means that materials will be moved to location 12 in warehouse 12.
6. Expand the Details section.
7. In the Product field, enter or select a value.
 - Select M0007.
8. Expand the Events section.
9. In the Stock replenishment event field, select 'Batch'.
 - This creates kanbans to fulfill material needs at the related location during Pegging event processing.

Set the minimum quantity for the item

1. Click to follow the link in the Product field.
2. Click to follow the link in the Item number field.
3. Expand the Product image FactBox.
4. On the Action Pane, click Plan.
5. Click Item coverage.
6. Click New.
7. In the list, mark the selected row.
8. In the Warehouse field, enter or select a value.
 - Set Warehouse to 12.
9. Set Minimum to '200'.

Run the batch event creation job

1. Go to Production control > Periodic tasks > Kanban job batch processing > Pegging event processing.
2. Click OK.

3. Go to Product information management > Lean manufacturing > Kanban rules.
4. In the list, click the link in the selected row.
 - Select the kanban rule that you created earlier.
5. Expand the Kanbans section.
 - Notice that a kanban was created to transfer the needed material to warehouse 12.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a kanban rule for multiple activities

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a kanban rule that includes multiple activities from a production flow. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product in a lean environment.

Create a new kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. Click New.
3. In the Replenishment strategy field, select 'Scheduled'.
4. In the First plan activity field, enter or select a value.
 - Select SpeakerAssemblyAndPolish.
5. Select the Multiple activities check box.
 - The purpose is to include more than one activity in the kanban rule. You choose a path in the production flow when you select the last plan activity.
6. In the Last plan activity field, enter or select a value.
 - Select SpeakerTestAndPackaging. After you select the value, a page automatically opens. Select the kanban flow SpeakerAssemblyAndPolish > SpeakerTestAndPackaging. Click OK.
7. Expand the Details section.
8. In the Product field, enter or select a value.
 - Select Item L0006.

Create kanban and view jobs

1. Expand the Kanbans section.
2. Click Add.
3. In the Number of new kanbans field, enter '1'.
 - This will create one kanban.
4. Set Product quantity to '3'.
 - Kanban will process 3 products.
5. In the Due date/time field, enter a date and time.
 - You can enter Today.
6. Click Create.
7. Click Details.
 - Notice that the kanban has two process jobs from the production flow. The first one is SpeakerAssemblyAndPolish, and the second one is SpeakerTestAndPackaging.
 - This is the last step!

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a new kanban rule by duplicating an existing kanban rule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on creating a duplicate of an existing kanban rule. This is useful if you want to create new kanban rules based on existing kanban rules. The demo data company used to create this procedure is USMF. This procedure is intended for the process engineer or the value stream manager as they prepare production for a changed production flow or a new replenishment rule.

Select a kanban rule

1. Go to Kanban rules.
2. In the list, find and select the desired record.
 - Select kanban rule 000017 for Product M0006.

Duplicate a kanban rule

1. Click Duplicate kanban rule.
 - When duplicating a kanban rule, it is possible to change type, dates, activities, and the product selection. Change the product for this procedure in the next step.
2. In the Product field, enter or select a value.
 - Select M0007.
3. Click OK.
 - Note that a duplicate of kanban rule 000017 is created.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a replacement kanban rule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on replacing an existing kanban rule with a new kanban rule on a specific date. This is useful when changes in the production flow or replenishment rules need to be coordinated and scheduled. The demo data company used to create procedure is USMF. This procedure is intended for the process engineer or the value stream manager when they prepare production for a changed production flow or a new replenishment rule. This task replaces kanban rule 000022 with a new rule and increases the maximum quantity from 48 to 100 for the new rule.

Select a kanban rule to replace

1. Go to Kanban rules.
2. In the list, find and select the desired record.
 - Select kanban rule 000022.

Create a replacement kanban rule

1. Click Replace kanban rule.
2. In the Effective date field, enter a date and time.
 - Select a date in the future, such as one week from now. This is the date and time when the new kanban rule becomes active and replaces the old kanban rule.
 - If the kanban rule changes the path in the production flow, another activity can be selected. In this procedure, we will keep the activity untouched.
3. Click OK.
 - Notice that a new kanban rule is created to replace kanban rule 000022.
 - The effective date is set according to the date chosen when you replace the kanban rule.
4. In the list, find and select the desired record.
 - Select the replaced kanban rule 000022.
 - Notice that the replaced kanban rule has the same date as the Expiration date because this is the date when it will expire.
5. In the list, select row 1.
 - Select the new kanban rule on top of the list. This is the kanban rule with the highest kanban rule number.
6. In the list, click the link in the selected row.
 - Click the kanban rule number to open the kanban rule.

Modify maximum quantity for the replacement kanban rule

1. Set Maximum quantity to '100'.
 - Expand the Quantities FastTab to see the Maximum quantity field. Changing the maximum quantity to 100 will allow up to 100 kanbans to be processed. This is the last step in this task.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a sales event kanban rule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on the setup needed to create a kanban rule that is triggered during sales order creation. The event kanban rule replenishes requirements that originate from sales order lines. The demo data company used to create this procedure is USMF. It is intended for the process engineer or the value stream manager as they prepare production of a new or modified product.

Create a new kanban rule

1. Go to Kanban rules.
2. Click New.
3. In the Replenishment strategy field, select 'Event'.
 - Selecting Event means that the kanban rule is triggered by an event, for example, creation of a sales order line. This is applied to areas where each kanban should cover a specific demand.
4. In the First plan activity field, enter or select a value.
 - Select Final assembly.
5. Expand the Details section.
6. In the Product field, enter or select a value.
 - Select L0050.

Define an event

1. Expand the Events section.
2. In the Sales event field, select 'Automatic'.
 - By selecting the sales event Automatic, this kanban rule will be triggered automatically when a sales line matches the product and receipt location. In this procedure, it is product L0050 on warehouse 13.
3. Set Minimum event quantity to '50'.
 - With a minimum event quantity of 50, the kanban rule will only be triggered by events with a quantity of 50 or more.
4. Expand the Production flow section.
 - Notice that the Receipt location is warehouse 13. This means that this kanban rule will be triggered for this location.
 - In this example, a sales line for product L0050, with a quantity of 50 or more, on warehouse 13, will trigger this kanban rule.

Create sales line to trigger event kanban rule

1. Go to All sales orders.
 - A warning is shown when the kanban rule is saved, which means that kanbans will be created in real-time during sales order creation.
2. Click New.
3. In the Customer account field, enter or select a value.
 - For example, select US-003.
4. Click OK.
5. In the Item number field, type 'L0050'.

6. In the Site field, type '1'.
 - Select Site 1 because Warehouse 13 is on Site 1.
7. In the Warehouse field, enter or select a value.
 - Set Warehouse to 13.
8. Set Quantity to '75'.
 - Enter a quantity of 50 or greater, to trigger the created kanban rule.

Verify that kanban is created

1. Click Product and supply.
2. Click View pegging tree.
 - Notice that a kanban with the same quantity as the sales line is created. You can also see the material issues needed to produce L0050. This is the last step in this procedure.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a withdrawal kanban rule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows the setup that is needed to create a withdrawal kanban rule for transferring material in a lean environment. The demo data company used to create this procedure is USMF. This procedure is intended for the Process Engineer or the Value Stream Manager, as they prepare replenishment of new or modified material.

Create new kanban rule

1. Go to Kanban rules.
2. Click New.
3. In the Type field, select 'Withdrawal'.
 - The Withdrawal type is used for kanban rules to transfer material or goods.
4. In the First plan activity field, enter or select a value.
 - Select ReplenishSpeakerComponents. This activity is set up to move components from warehouse 11, location 11 to warehouse 12, and location 12.
5. In the Product field, enter or select a value.
 - Select M0007.
6. In the Lead time field, enter a number.
 - For example, 60.
7. In the Unit of measure field, enter or select a value.
 - For example, Minutes.

Set quantities for kanban

1. Set Default quantity to '5'.
 - This is the quantity that will be transferred for each kanban.
2. In the Fixed kanban quantity field, enter '2'.
 - This is the amount of kanbans that should be active. In this case, 2 kanbans transferring 5 each.
3. In the Alert boundary minimum field, enter '1'.
 - Used to keep track of the minimum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.
4. In the Alert boundary maximum field, enter '2'.
 - Used to keep track of the maximum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.

Create kanbans

1. Click Save.
 - The kanban rule needs to be saved before kanbans can be created.
2. Click Add.
 - Note that there are no active kanbans because the suggested 'Number of new kanbans' is 2, which is equal to the 'Fixed kanban quantity'.
3. Click Create.
 - This will create two kanbans.

- Note that 2 kanbans, for 5 each, was created for this withdrawal kanban rule. This is the last step in this procedure.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Execute kanban process jobs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on executing kanban process jobs. The first job is completed with the expected quantity and has no errors. The second job is completed with errors. The demo data company used to create this procedure is USMF. This procedure is intended for the machine operator.

Select a kanban job

1. Go to Production control > Kanban > Kanban board for process jobs.
2. In the Work cell field, click the drop-down button to open the lookup.
3. Click the row with resource group 1250. This filters the Jobs list to display only the jobs for work cell 1250.
 - Mark the row that has the Planned job status.

Complete a job with expected quantity

1. Expand or collapse the Details section.
 - This section displays important information about card number, item number, quantity ordered, and activity name.
2. Expand or collapse the Production instructions section.
 - This section displays production instructions for the activity. The instructions can be text, pictures, drawings, and other documents.
3. Click Start.
 - Select a job that is not completed. Use status icons in the Job status field to view job status.
4. Click Complete.
 - The job is completed with the expected quality.

Complete a job with errors

1. Click Start.
 - When a job is completed, the next job on the list is selected automatically. This is why you don't need to select a job before you click Start.
2. On the Action Pane, click Manufacture.
3. Click Complete (details).
4. In the list, mark the selected row.
5. In the Error quantity field, enter a number.
6. In the Good quantity field, enter a number.
7. Click OK.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Move scheduled kanban jobs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on moving planned process kanban jobs to a different period. The demo data company used to create this procedure is USMF. This procedure is intended for the shop floor supervisor or production planner working with kanbans.

Select scheduled kanban jobs.

1. Go to **Production control > Kanban > Kanban job scheduling**.
2. In the **Work cell** field, click the drop-down button to open the lookup.
3. In the list, mark the selected row.
 - Select work cell 1250.
4. Click **Select**.
5. In the **Display job status** field, select **Scheduled**. This filters the job list to display only the scheduled kanban jobs.

Move kanban jobs to a different period.

1. In the list, find and select the desired record. Select a job that has the **Planned job** status, for example, a job scheduled on December 20, 2012 in the **Planned period** field. Then move the job to the previous period.
2. Click **Previous period**.
3. Click **End** to move the job to the end of the job list as the last job in the previous period.
4. In the list, find and select the desired record. Select a job that has the **Planned job** status, for example, a job scheduled on December 18, 2012 in the **Planned period** field. Then move the job to the next period.
5. Click **Next period**.
6. Click **Start** to move the job to the start of the job list as the first job in the previous period.

Move a job within a period.

1. In the list, find and select the desired record. Select a job that has the **Planned job** status, for example, the second job scheduled on December 19, 2012 in the **Planned period** field. Then move the job within the planned period.
2. Click **Forward**. Notice that the job is moved one line down on the list.
3. Click **Backward**. Notice that the job is moved one line up on the list.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Prepare a process kanban job when materials are available for the work cell

2/18/2021 • 2 minutes to read • [Edit Online](#)

This task focuses on preparing a process kanban job when all materials are available for the work cell. The demo data company used to create this task is USMF. This task is intended for the machine operator.

1. Go to Kanban board for process jobs.
2. In the Work cell field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.
 - Select work cell 1250 and click OK.
4. In the list, select row 4.
 - In the clean demo company, Kanban 000329 in row 4 is the first job that is not completed yet.
5. Toggle the expansion of the Picking list section.
 - Verify that the supply status is available for all items in the picking list.
 - If multiple jobs are selected, the picking list will show the sum of all items needed for the selected jobs.
6. Click Prepare.
 - The preparation process is now completed. The selected check box for all rows in the picking list indicates that the supply status is picked.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Prepare a process kanban job when materials are not available for the work cell

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on preparing a process kanban job when some materials are not available for the work cell, therefore it's necessary to pick materials from the warehouse. The procedure "Prepare a process kanban job when materials are available" is a prerequisite for creating this procedure. This procedure is intended for the machine operator. The demo data company used to create this procedure is USMF.

1. Go to Production control > Kanban > Kanban board for process jobs.
2. In the Work cell field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.
 - Select work cell 1250.
4. In the list, find and select the desired record.
 - Select Kanban 000356.
5. In the list, find and select the desired record.
 - In the list, deselect row 4. or Select row 4 if you haven't completed the task "Prepare a process kanban job when materials are available."
6. Toggle the expansion of the Picking list section.
 - The No entry icon in the supply status indicates that 48 ea of item P0002 are missing for the work cell.

Transfer materials to work cell

1. Toggle the expansion of the Transfer jobs section.
2. Use the Quick Filter to filter on the Item number field with a value of 'P0002'.
3. In the list, find and select the desired record.
4. Click Start.
 - Transfer is in progress.
5. Click Complete.
 - Item P0002 is now available in the picking list for the kanban job. This means that we can prepare the kanban with all the needed materials.
6. Click Prepare.
 - Notice that an icon in the Job status indicates that the job is now ready.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Remove a kanban job from the schedule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on removing a planned process kanban job from the schedule by reverting the job status to Not planned. The demo data company used to create this procedure is USMF. This procedure is intended for the shop floor supervisor or production planner.

Find a planned kanban job

1. Go to Production control > Kanban > Kanban job scheduling.
2. In the Work cell field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.
 - Select work cell 1250.
4. Click Select.
5. In the Display job status field, select 'Scheduled'.

Remove the planned kanban job from the schedule

1. In the list, find and select the desired record.
 - Select a job that has the Planned status, for example, a job from December 19, 2012.
2. On the Action Pane, click Plan.
3. Click Revert job status.
4. Click OK.
 - This will revert the current job status from 'Planned' to 'Not planned' and remove it from the process board.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Revert kanban job status

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on reverting an incorrect kanban job status. This is useful in case the machine operator updates the wrong job, or sets the wrong status by mistake. In this procedure, a kanban job is registered as prepared by mistake, and the status is reverted. The demo data company used to create this procedure is USMF. This procedure is intended for the shop supervisor or machine operator working in a lean manufacturing company.

Open process board for the work cell

1. Go to Kanban board for process jobs.
2. In the Work cell field, enter or select a value.
 - Select work cell 1260.

Prepare kanban job

1. Click Prepare.
 - If you can't click Prepare because it is grayed out, make sure that the selected kanban job has status Planned, which is indicated by the empty kanban icon. If Prepare fails, make sure that all materials in the Picking list are available.
2. In the list, select the prepared job.
 - Select the first job that you have just prepared.
 - Notice that the jobs status is prepared, which is indicated with a triangle inside the kanban icon.

Revert the status of the prepared kanban job

1. In the list, mark the selected row.
 - Select the first job that was prepared.
2. On the Action Pane, click Manufacture.
3. Click Revert status.
 - You can use an alternative kanban rule when the following conditions are true: - The replenishment strategy is the same for both rules. - The version of the production flow is the same for both rules. - The product that is supplied is the same for both rules. - Any downstream activities that are configured for the last activity of the kanban rules must be the same for both rules. - The same supplied inventory dimensions must be configured for both rules. - The status of the handling unit must be Not assigned. - The configuration for event kanbans must be the same.
 - Ensure that the new status is Planned.
4. Click OK.
5. In the list, unmark the selected row.
 - Select the same job.
 - Notice that the job status for the kanban job is reverted to Planned, which is indicated by an empty kanban icon.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule kanban jobs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on scheduling process kanban jobs for a specific work cell. The procedure "Prepare a process kanban job when materials are not available" is a prerequisite for creating this procedure. The demo data company used to create this procedure is USMF. This task is intended for the shop floor supervisor and production planner working with kanbans.

Select kanban jobs for a work cell

1. Go to Production control > Kanban > Kanban job scheduling.
2. Expand the Period capacity fact box
 - Expand the Kanban FactBox.
3. In the Work cell field, click the drop-down button to open the lookup.
4. In the list, mark the selected row.
 - Select work cell 1250. This will filter the view to display only the jobs for work cell 1250.
5. In the list, click the link in the selected row.
6. Click Select.

Schedule a kanban job in the first available period

1. In the list, mark the selected row.
 - Select the first row in the list that has the Not planned status. The dotted icon in the Job status field indicates not planned.
2. Click Schedule.
 - This will schedule the kanban job in the first available period.
 - Notice that the kanban job is moved to the end of the list because it has been added to the period starting from today.
 - If the period starting from today is fully booked, the job will be moved to the first available period.

Schedule two kanban jobs for a specific day

1. In the list, select row 1.
 - You should see that the first row has the Not planned status in the Job status field.
2. In the list, select row 2.
 - You should see that the second row has the Not planned status in the Job status field. Now you have the first two jobs selected.
3. Click Schedule from date to open the drop dialog.
4. Check or uncheck the Override capacity shortage reaction box.
 - This option allows you to override the default capacity shortage reaction.
5. In the Capacity shortage reaction field, select 'Add to the requested period'.
 - This option will ensure that the job is added to the requested period, regardless if the work cell might be overloaded.
6. Click Schedule.
 - Notice that both jobs are added to the desired period.
 - In the Period capacity section, you can see the load for each period. The Consumption field shows the

scheduled consumption in this period. If the scheduled consumption is higher than the available capacity in this period, the overloaded consumption will be selected.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transfer materials with kanban jobs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on executing a withdrawal kanban job to transfer materials. The demo data company used to create this procedure is USMF. This procedure is intended for the warehouse worker.

Display transfer jobs

1. Go to Production control > Kanban > Kanban board for transfer jobs.
2. Expand or collapse the Filters section.
 - In the Filters section, you can specify what jobs you want to see by filtering on Production flow, Activity name, From warehouse and location, and To warehouse and location.
3. In the From warehouse field, type '11'.
4. In the To location field, type '12'.

Start a transfer job

1. In the list, deselect the selected row - if any.
2. In the list, select row 4.
 - Select the first job with status Not planned. Make sure this is the only job selected.
3. Click Start.
 - Notice that an icon indicates that the job is started.

Select a second transfer job and change quantity

1. In the list, find and select the desired record.
 - You can have multiple jobs selected, but for now select row 5.
2. In the list, find and select the desired record.
 - Make sure the job in the previous step is the only one selected. Deselect all other jobs.
3. Note the value in the Job quantity field to reference later
4. Set Job quantity to '30'.
 - Notice the warning! You are not allowed to transfer 30. According to the setup of the kanban rule, you can only transfer the original quantity.
5. Use the value noted previously in the Job quantity field
 - Set the Job quantity to the previous value.

Start the second transfer job

1. Click Start.
 - This will start the transfer of the job in row 5.

Complete both transfer jobs

1. In the list, select row 4.
 - Now two transfer jobs are selected on row 4 and row 5.
2. Click Complete.
 - This will complete the transfer of both jobs.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Update kanban status

2/18/2021 • 2 minutes to read • [Edit Online](#)

When a kanban is emptied by mistake or a received kanban needs to be emptied, you need to update kanban status. The demo data company used to create this procedure is USMF. This procedure is intended for the shop supervisor.

Find the kanban.

1. Go to Production control > Kanban > Kanbans.
2. Open Handling unit status column filter.
3. Click Clear.
 - This resets the filters.
4. Use the Quick Filter to find records. For example, filter on the Card number field with a value of '000149'.

Change emptied status to received status

1. Click Reverse empty handling unit.
2. Click OK.
 - Notice that the Handling unit status is Received.

Change received status to emptied status

1. Click Empty kanban.
2. In the list, mark the selected row.
 - Notice that the Handling unit status is Emptied.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Bills of materials and formulas

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about bills of materials (BOMs) and formulas, which are a central part of the definition of products and product variants. BOMs and formulas specify the required materials or ingredients for a specific product. Formulas also specify the co-products and by-products that are received in a specific production context.

Bills of materials

A bill of materials (BOM) defines the components that are required in order to produce a product. The components can be raw materials, semi-finished products, or ingredients. In some cases, services can be referenced in a BOM. However, BOMs typically describe the *material resources* that are required.

When it's combined with a route or production flow that describes the operations and resources that are required in order to build a product, the BOM forms the foundation for calculating the estimated cost of the product.

A BOM is an individual entity that is described by the following information:

- BOM ID
- BOM name
- The BOM lines that describe the components and ingredients
- The BOM versions, which define the product and period that the BOM can be used for

A single BOM describes a single level that is identified by a unique ID. Components might have their own BOMs that are referenced by BOM versions. You can display and edit the complete hierarchy of BOMs for a specific product in the BOM designer.

Formulas, co-products, and by-products

A formula is a subtype of BOM that is typically used for process manufacturing. In addition to components and ingredients, a formula describes co-products and by-products. In the actual version, the definition of co-products and by-products for the formula requires the formula version. A formula is typically defined for one specific finished product (a formula or planning item) that is defined in the formula version.

BOMs in the product lifecycle

In the product lifecycle, many types of BOM might be created for various reasons:

- **Sketching/Draft BOM** – This BOM gives a draft estimation of required materials in an early design phase and helps you do a rough estimate of cost and estimated product attributes. This BOM isn't usually used in enterprise resource planning (ERP).
- **Engineering BOM** – This BOM is typically used when you design products that are based on existing product portfolios. Engineering BOMs are structured to simplify the design process and group complex products into engineering modules. For simple products, it might be possible to use engineering BOMs for the actual production process. However, for other products, the engineering BOM must be converted to an actual production BOM. Engineering BOMs are typically represented by phantoms in the BOM hierarchy. Although engineering BOMs can be used for the planning and execution of manufacturing operations, this approach can lead to inefficiencies, especially in repetitive operations where many orders are created.
- **Planning BOM** – This BOM is used to do planning for material requirements. The demand of components and ingredients is calculated based on the demand of the finished products. Like costing BOMs, planning BOMs might represent a specific mix of material that is used in a period.

- **Production BOM** – This is the actual BOM that is used for a specific production. A production BOM must take into account the actual resources that are used to produce the product. When a production order, batch order, or kanban is created, the multiple levels of BOMs that are represented by phantoms are collapsed into one level and distributed over the operations for the order.
- **Costing BOM** – This BOM is used to calculate the estimated cost of a product. For example, you can use a costing BOM when standard cost is used or the estimated planned cost of a given product is calculated. Costing BOMs can refer to a specific mix of materials and resources that is expected to be used. Therefore, you can use the costing BOM to create a representative estimated cost for a period and help avoid variances over time.

The types of BOM that are actually used in an implementation depend on the implementation, and also on the business scenarios and requirements. In simple implementations, a planning BOM, production BOM, and costing BOM can be modeled as one BOM. In environments that have frequent engineering changes and multiple alternative routes, a larger set of BOM types will probably be required.

Approval of BOMs and formulas

Each BOM and formula can be separately approved or unapproved. Typically, approval of a BOM or formula occurs when the first relevant BOM version is approved. However, in some business scenarios, these approvals might be different steps in the process and might involve different process owners.

Note that, if a BOM is unapproved, all related BOM versions are also unapproved.

BOM and formula versions

To relate a specific BOM or formula to a product variant that can be produced, you must create a BOM version or formula version. The validity of BOM versions and formula versions can be constrained by period, quantity, site, specific product dimensions, and other criteria. Formula versions have additional important attributes, such as yield, co-product and by-product definitions, and the cost distribution instructions for the formula.

Approval of BOM and formula versions

Before a BOM version can be used in the planning or manufacturing process, it must be approved. When a BOM version is approved, the related BOM can also be approved, depending on the user's selection and authentication rights. Note that a BOM version can be approved only if the related BOM itself is approved.

Activation of the default BOM or formula version

To set a specific BOM or formula as the default BOM version or formula version that will be used by master planning or used to create production orders, you must activate the version. When a version is activated, the uniqueness of the version for the given constraints (for example, period, site, or quantity) is verified. You receive an error message if the version that you're trying to activate conflicts with a version that is already active. You must then either inactivate the conflicting version or modify the version constraints (usually the period) to prevent an ambiguous activation.

Product change with case management

The product change case for approval and activation of new or changed BOMs and BOM versions provides an easy way to see an overview of the BOM version constraints. You can also approve and activate all BOMs and formulas that are related to a specific change for one activation date.

Alternative BOM versions

Sometimes, the active BOM version or formula version should not be used in forecasts, sales, or a parent product. In this case, you can select a specific approved BOM as part of the requirement (forecast line, sales line, or BOM line) if an approved BOM version or formula version exists for the alternative BOM or formula.

When planned orders, production orders, or kanbans are created, the planner or shop floor supervisor can use any approved BOM version that is valid on the requested planned production date to plan for or produce a

specific product. The BOM version that is used doesn't have to be activated as the default BOM version.

BOM and formula lines

A BOM line is created for each material, service, or ingredient. The line defines the planned consumption of the specified product variant and also defines the various attributes that are related to the planned consumption.

BOM lines can have the following line types: **Item**, **Phantom**, **Pegged supply**, **Vendor**.

Item

Select the **Item** line type for materials or services that are directly consumed, and that don't require further explosion or pegged supply.

Phantom

Select the **Phantom** line type when you want to explode any lower-level BOM items that are contained on the BOM line. In Master scheduling, in planned cost calculation, or on estimation of a production order that uses BOM lines of the **Phantom** type, the parent BOM line that refers to a product variant that has a phantom BOM is replaced by the component items that are listed as BOM lines in that BOM, as determined by the applicable active BOM version of that product variant. If the product variant has an applicable active route, the operations of that route are merged into the parent route.

Note that phantoms are typically used to simplify the engineering process. Extensive use of phantom BOMs in many levels has an effect on performance, especially in highly repetitive manufacturing scenarios. To improve performance, you should avoid deep hierarchies of phantoms. Instead, use pre-exploded production BOMs and routes.

Pegged supply

Select the **Pegged supply** line type when you want to create a subproduction, a BOM line event kanban, or a direct purchase order for any product variant that the BOM line references. The subproduction, event kanban, or purchase order is created when you estimate the production order. The required item quantities are automatically reserved for the consuming production order.

Vendor

Select the **Vendor** line type if the production process uses a subcontractor, and you want a subproduction or purchase order to be created automatically for the subcontractor.

Note about subcontracted operations in a BOM: The service or work that is performed by the subcontractor must be created as service item that is tracked in inventory. You must attach the service item to the parent item as a BOM line. The route must contain an operation that is assigned to the subcontractor's operations resource.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Formulas and formula versions

2/18/2021 • 6 minutes to read • [Edit Online](#)

A formula defines the materials, ingredients, and outcomes of a specific process in process manufacturing. Together with the corresponding route, the formula defines the whole process in process manufacturing. Formulas are used to plan and produce products in process manufacturing.

A formula consists of the ingredients and quantities that are required in order to produce a specific quantity of a formula item. Depending on the task that you perform, you can access formula functionality from Inventory and warehouse management or Product information management.

Formulas and formula lines

A formula consists of one or more formula lines that identify the ingredients or items that make up the formula. A formula line can contain Bill of materials (BOM) items, formula items, catch-weight items, purchased items, co-products, or by-products. Because many items are used in multiple products, an item can be used in more than one formula.

An example of a formula is the formula for a chocolate chip cookie. The ingredients for this formula use multiple lines, such as flour, sugar, eggs, butter, and chocolate chips. The formula for the chocolate chip cookie contains ingredients that are likely used in other formulas. While you make the chocolate chip cookies, there might be leftovers, such as crumbs, or some of the cookies might be overbaked or undercooked. These items can be set up as co-products or by-products, depending on the production operations.

When you create a formula line, you use the line type to indicate how the system should handle the line when you run master planning and produce batch orders. Each line type gives a different result. The following table describes the line types that you can select.

LINE TYPE	DESCRIPTION
Item	Select Item when the item is a raw material or a semi-finished item that is picked from inventory or when the item is a service.
Phantom	Select Phantom when you want to explode any lower-level formula items that are contained on formula lines. When you estimate the batch order, and the formula items are exploded, the component items are listed as formula lines on the batch order. Additionally, the corresponding routes are added to the production route. Formula items are exploded by using the current configuration. When you use the Phantom line type, you can handle production and measurement configurations that occur at different formula levels. If you select Phantom for a product on the Engineer FastTab of the Released product details page and then use this product in a formula, the line type of the formula line is changed to Phantom . You can't select Phantom for a catch-weight item, or for items where the production type is Co-product , By-product , or Planning item .

LINE TYPE	DESCRIPTION
Pegged supply	Select Pegged supply to create a batch order, production order, kanban, transfer order, or purchase order for the ingredient that is contained on the formula line. The related order is determined based on the default order settings and the production type of the ingredient, and is created when you estimate the batch order. The required ingredient quantities are reserved for the batch order.
Vendor	Select Vendor if the production process uses a subcontractor, and you want to create a sub-production or purchase order for the subcontractor. The service or work that the subcontractor performs must be created by using a formula item or service item. You can attach the item to the parent item as a formula line. The route must contain an operation that is assigned to the subcontractor's operations resource. This operation is attached to the formula line by using the Oper. No. field.

Formula versions

When you create a new formula, you must first create a formula version before you add the formula line items and their specific characteristics. Every formula must have at least one version. The **Approved** button on a formula version becomes available only after a version record has been successfully saved. Each formula version record is associated with one or many co-products and by-products that can be produced as you produce the finished product. Many products can be made from the same ingredients in different batch sizes, in multiples, or by using different yields. You can create as many versions of a formula as you require.

To manage multiple active formula versions, use effective date ranges or "from" quantity fields. Multiple active formula versions can exist only if the date range and "from" quantity don't overlap.

Unlike BOMs, where one BOM is often associated with many BOM versions, only one formula version typically exists per formula. Remember that only one formula version can be activated for the coverage dimensions and quantity for a given product. However, many formula versions might exist for other reasons, and you can manually select them when you create a batch order.

Approve and activate formulas and formula versions

Formulas and formula versions must be approved before they can be used for planning and production. Formulas are usually activated before they are used. However, during production, you can select a formula version that is approved, but that isn't activated.

To help secure a formula or formula version, you can set the **Block editing** and **Block removal of approval** parameters on the **Production control parameters** page.

If you select **Block editing**, and the formula is approved, no fields on the formula lines can be deleted or edited. However, if you remove the approval of the formula, you can delete and modify the formula lines. You can also create new formulas and new formula versions.

If you select **Block removal of approval**, you can't remove the approval of an approved formula or formula version. However, you can create new formulas and new formula versions, and you can remove the activation of the formula version.

You can add more levels of control by using the electronic signature functionality. When a user is set up so that an electronic signature is required at the time of formula approval, a **Signature** page appears when the formula is activated. The user must be authorized to sign electronically, and the certificate must be successfully validated

before the change can be committed. If the signature can't be authenticated, the approval or removal of approval is denied, and the change that initiated the approval or removal of approval is returned to its original state.

Use the Scalable feature

The Scalable feature is available only if all the item components in the formula are set to **Variable consumption**. The feature isn't available if item components are set to **Fixed consumption** or **Step consumption**. When the Scalable feature is used, if you change an ingredient in a formula, the quantity of the other ingredients that you select is adjusted. The size of the formula is also adjusted. Likewise, if you change the formula size, the quantity of all scalable ingredients is changed. This feature is intended specifically for formula creation and maintenance. It doesn't indicate whether the quantity of an ingredient will be scaled up or down on a batch order.

Use Step consumption

Step consumption eliminates the requirement that you must enter a quantity on the **Formula line** tab for an ingredient. Instead, Step consumption is configured so that it has a **From series** value and a **Quantity** value. The information from the Step consumption per series record that satisfies the quantity on the batch order is selected. Step consumption is useful when the consumption rate isn't linear with respect to the batch order size and only increases the requirement when a specific quantity threshold is met. To enable this feature for a new formula, under the **Consumption calculation** group, change the formula setting for the applicable ingredient from **Standard** to **Step**. You specify this consumption method on the **Setup** tab of the **Formula line** page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Operations resources

2/18/2021 • 9 minutes to read • [Edit Online](#)

Operations resources perform the activities of a project or a production process. They can be of different types, and can have different capabilities.

Operations resources

Operations resources are the machines, tools, workers, facilities, physical areas or vendors that perform the activities of a project or a production process. They can be of different types and can have different capabilities.

- **Vendor** – An external resource that performs project activities or production operations. An example is a subcontractor. By linking vendor resources to a vendor account, you can generate purchases for subcontractors, based on the bill of materials (BOM) lines or production lines.
- **Human resources** – A project or production worker that perform an activity, either alone or as an operator of a tool or a machine. If you're using the Human resources functionality, you can link human resources to a worker. The scheduling engine can then allocate the resources, based on the competencies that are defined for the corresponding worker.
- **Machine** – A machine or other production equipment that is required in production.
- **Tool** – An instrument or device that is typically used together with another resource to perform an activity in a project or in production.
- **Location** – A physical location of a specific size that is required in order to perform an activity. An example is an assembly area.
- **Facility** – A building or fixed structure that is required in order to perform an activity.

Calendars

A calendar can be assigned to an operations resource and describes the capacity (in hours) of that resource. The working times of the operations resource are determined by the calendar that is assigned to the resource group that the operations resource is part of. You can set an effective date and an expiration date for the assigned calendar. You can then assign more than one calendar to an operations resource. However, the dates of the assigned calendars can't overlap, and the operations resource can be assigned only one calendar at a time.

Note: If there are no effective working calendars for a resource group (for example, if the last assigned calendar or the only assigned calendar has expired), you can no longer access the operations resources that are assigned to the resource group for production planning and operations scheduling. You can also assign a calendar to a resource group to specify the working times for both the resource group and all the operations resources that are assigned to the resource group. The capacity of the resource group is calculated as the sum of the capacities of each operations resource that is assigned to that resource group. The calendar that is assigned to a resource group can change over time.

Resource capabilities

A capability is the ability of an operations resource to perform a particular activity. You can assign one or more capabilities to an operations resource. The scheduling engine will then allocate resources by matching the resource requirements of each activity to the capabilities of the available operations resources. Capabilities can be assigned to all types of operations resources (**Tool, Vendor, Machine, Human resources, Location, or Facility**). To assign capabilities to operations resources for a limited time, define a start date and an expiration date on the capability assignment. For more information, see [Resource capabilities](#).

Resource groups

A resource group is a set of operations resources that represents the granularity at which you want to schedule resources when you use the operations scheduling method. Therefore, resource groups typically correspond to the physical organization of work cells that is demarcated by yellow lines on the production shop floor. The resource group defines the site, production unit, and warehouse context for operations resources that are assigned to the group. When you assign an operations resource to a resource group, the resource can be scheduled at the site where the resource group is located. You don't have to assign the operations resources that you create to a resource group. However, an operations resource must be assigned to a resource group before it can be scheduled to perform work. An operations resource can be assigned to a resource group for a limited time. You can also assign an operations resource to multiple resource groups, so that you can then share the resource across sites. However, the effective dates and expiration dates can't overlap. In other words, you can't assign an operations resource to two resource groups at the same time. Changes in resource group assignments are effective only for new resource allocations. Capacity reservations for jobs, operations, and project hour forecasts that are already scheduled won't be affected. **Note:** When you assign operations resources of the **Vendor** type to a resource group, all operations resources that are assigned to that resource group must be of the **Vendor** type and must be linked to the same vendor account.

Production units

A production unit is an administrative unit that is a collection of resource groups. A production unit can contain multiple resource groups, but a resource group can be assigned to only one production unit. A production unit reflects the physical layout of production resources, and has no effect on transactions or how they are processed. You must associate a production unit with a site. You can also assign a picking warehouse and a storage warehouse to a production unit. You can use a production unit to consolidate and filter production-related data. For example, a shop floor manager can see an overview of the outstanding workload and the available capacity for a particular production unit. You can change the production unit that is assigned to a resource group. You can also delete a production unit. However, these changes to the production unit are effective only for new orders that are created after master scheduling is run. If you want to apply the production unit change to existing orders, you must make this change manually.

Resource scheduling

Operations resources are assigned to activities when a project or a production is scheduled. Two scheduling methods are available: operations scheduling and job scheduling. When you use operations scheduling, each operation or project activity is scheduled on the resource group that contains operations resources that match the resource requirements that are specified for the operation. If a specific operations resource is required for the operation, scheduling reserves capacity only on a specific operations resource in the group. Job scheduling is a more detailed form of scheduling than operations scheduling. It breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route or project activities. If you're working with finite capacity, the schedule depends on the availability of the operations resources that are required in order to complete the activity. For operations scheduling, the capacity of the resource group is the sum of the available capacity of the operations resources that are part of that group. Capacity reservations that already exist for the operations resources are considered unavailable capacity. If there isn't enough available capacity for production, the production orders can be delayed or even stopped. On the **Resources** page, you can define several properties that control how capacity reservations are made:

- **Capacity** – Specify the operations resource's capacity per hour in terms of the capacity unit of measure.
- **Batch capacity** – Specify the maximum number of pieces that the operations resource can process per run.
- **Efficiency percentage** – Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the

resource. The lead times for the operations that use the operations resource are also adjusted accordingly. Here is the formula that is used for the calculation: $\text{Scheduling time} = \text{Time} \times 100 \div \text{Efficiency percentage}$. *Time* includes both the run time and setup time.

- **Operations scheduling percentage** – Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling. To allow for flexibility in capacity during job scheduling, you should set this percentage to less than 100 percent.
- **Finite capacity** – Set this option to **Yes** if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to **No**, the operations resource is assumed to have infinite capacity, and the resource might therefore be overbooked.
- **Finite property** – Set this option to **Yes** if you want the operations resource to be scheduled based on the actual capacity that is available with respect to the required working time scheduling properties.
- **Exclusive** – Set this option to **Yes** if you don't want the operations resource to be available for another job or operation until the current production is completed. In this case, the operations resource can't be used even if there are gaps in the resource's run time.
- **Bottleneck resource** – Define the operations resource as a bottleneck resource. A bottleneck resource is scheduled by using finite capacity when the **Finite capacity** and **Bottleneck scheduling** options on the **Master plans** page are selected.

To schedule multiple operations resources at the same time to perform, for example, an operation in production, you must specify the requirements for the various resources by using primary and secondary operations. You can then also reserve multiple operations resources that have different capacity. The operations resource that are scheduled for the primary operation determine the duration of the activity.

Lean work cells

You can specify that a resource group is a lean work cell. The resource group can then be part of a production flow. By specifying a resource group as a lean work cell, you also prevent the resource group and the assigned operations resources from being allocated to the operations of a production order or a project hour forecast. For each resource group that acts as a lean work cell, you must specify the following information:

- **Calendar** – The working calendar of the work cell, which must have the property of a standard workday.
- **Input warehouse and location** – The default location that is used to pick material for an activity.
- **Output warehouse and location** – The default location where all output of the work cell is put.
- **Runtime cost category** – This category must be defined for the work cell if direct labor is tracked in costing.

When a resource group is used as a lean work cell, the capacity of the work cell is specified directly on the resource group. Therefore, you don't have to assign operations resources to the resource group. Only when the work cell is managed by a subcontractor, an operations resource of the **Vendor** type must be assigned to the work cell. If you assign an operations resource to a resource group that is marked as a work cell, the capacity of the work cell isn't affected.

Costing resources

When you define an activity such as a route operation or a project hour forecast, you can specify the requirement for a specific operations resource or resource group. However, you can also specify the requirement for an operations resource of a specific type, or an operations resource that has a specific capability or competency. For this reason, the actual resource assignment isn't made until the activity is scheduled and capacity is reserved. Therefore, on a route operation, you can specify that estimation and BOM calculation must be based on a specific operations resource. This operations resource is referred to as the costing resource. You can also transfer cost categories and operation times from the costing resource to the activity. When the operation is scheduled, estimation and BOM calculation are done by using the operations resource that is

actually scheduled.

Resource capabilities

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides information about resource capabilities. A capability is the ability of an operations resource to perform a particular activity. The article explains how capabilities and related concepts, such as proficiency level and priority, are used to select appropriate resources for an activity.

A capability is the ability of an operations resource to perform a particular activity. An operations resource can have more than one capability assigned to it, and a capability can be assigned to more than one resource. You can temporarily assign capabilities to resources by defining a start date and expiration date on the capability assignment. When the capability for a resource expires, the resource can't be scheduled for a project or a production that requires that capability. A capability that has expired can be renewed. You can delete capabilities, provided that they aren't on a route relation or on part of a production route of an active production order. In general, be careful when you delete capabilities. Instead, consider adjusting the expiration date on the resources that have the capability. Capabilities can be assigned to all types of resources: tool, vendor, machine, location, facility, or human resource.

Level

Multiple resources often have the same functional capability but at different levels of proficiency (for example, strength, processing speed, or accuracy). Therefore, when you assign a capability to a resource, you can specify a **Level** value. The level is a simple numeric value. If you specify that a capability is a resource requirement for a production route, you can also specify a **Minimum level needed** value for that capability. The scheduling engine then selects only resources that have the required capability at a level that is equal to or exceeds the minimum level that is specified in the resource requirement.

Priority

Operations resources that have the same capabilities can be assigned a priority. Then, if multiple resources have capabilities that satisfy the scheduling requirements at the required level, and have free capacity, the scheduling engine can select among those resources. If **Priority** is selected in the **Primary resource selection** field on the **Scheduling parameters** page, the resource that has the highest priority (the lowest numeric value in the **Priority** field) is selected first during scheduling.

Resource requirements

When you define resource requirements for a production route, you can specify one or more capabilities as requirements. During production scheduling, the capabilities that are defined in the resource requirements on the route operation are matched with the capabilities that are defined for the resources. Resources that have capabilities that satisfy the requirements are selected. If multiple resources have the same functional capability but different proficiencies (such as strength, processing speed, or accuracy), you can either define multiple capabilities or use the capability level to qualify the capability of the resource. Here is an example:

- On a route, the drilling process time is set to 10 units per hour, but the requirement itself is defined as Drilling.
- You have two drilling machines, M1 and M2.
- The Drilling capability is assigned to both resources, the M1 machine and the M2 machine.
- The M1 machine can drill two units per hour, and the M2 machine can drill 11 units per hour.

In this example, both machines can be selected by the scheduling engine, because both satisfy the basic

capability requirement (Drilling). However, the M1 machine can drill only two units per hour. Because this rate is much less than the 10 units per hour that are specified on the route, the M1 machine will cause production problems if it's selected. There are two ways to resolve this issue and make sure that the M2 machine is selected instead:

- Create two separate capabilities: Low-speed drilling and High speed drilling. Define Low-speed drilling as drilling that has a process time of one to nine units per hour. Define High-speed drilling as drilling that has a drilling process time of 10 to 19 units per hour. Then assign the M1 machine the Low-speed drilling capability, and assign the M2 machine the High-speed drilling capability. Finally, change the resource capability requirement on the route to High-speed drilling. The scheduling engine will then select the correct machine (M2).
- Use the capability level to qualify the Drilling capability that is assigned to the drilling machines. Specify that the M1 machine has the Drilling capability at a level of 2.0, and that the M2 machine has the Drilling capability at a level of 11.0. Then specify that 10.0 is the minimum level that is required for the Drilling capability requirement on the route. The scheduling engine will then determine that only the M2 machine satisfies the resource requirements.

Competencies for human resources

When you have operations resources of the **Human resources** type that are linked to workers in Human resources, you can also take advantage of the competencies of workers when you define the resource requirements for a production route. In other words, you can also specify requirements for specific skills, courses, certificates, or titles. The scheduling engine can then select resources that are linked to workers, and the selection will be based on the competencies of those workers. The competencies are set up in Human resources, not on the **Resource capabilities** page. When you define skills, courses, certificates, or titles as resource requirements, you must use the Human resources functionality and link each resource of the **Human resources** type to a corresponding worker. If you aren't using the Human resources functionality, you can define capabilities on the **Resource capabilities** page that resemble or duplicate the competencies from Human resources. However, the **Resource capabilities** page doesn't contain the functionality that is required in order to maintain skills, courses, certifications, or titles.

Batch attributes

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides information about batch attributes. Batch attributes are characteristics of raw materials and finished products that make up inventory batches. The topic also explains how to assign batch attributes, and how you can search on them when you reserve batches.

Batch attributes are characteristics of raw materials and finished products that make up inventory batches. Batch attributes can vary, depending on factors such as environmental conditions, the quality of the raw materials that are used to produce the batch, or the outcome of the finished product. The number and types of batch attributes that are used can vary widely from one industry to another. Here are two examples that show how to use batch attributes:

- In the cheese industry, milk, which is one of the raw materials that are used to produce the cheese, can have attributes such as fat content and percentage weight. The cheese that is produced from the milk can have other attributes, such as moisture and age.
- In the steel industry, the iron that is produced might have attributes such as the percentages of magnesium content, silver content, and zinc content.

To better manage the number and types of attributes, you can use batch attribute groups. In this way, you don't have to add each attribute individually.

Assign batch attributes

You can assign batch attributes to individual products that are held in inventory batches, or you can assign them to products that are associated with specific customers. Before you can assign a batch attribute at the customer level, you must assign it at the product level. The product must have the batch dimension set to **Active** in the tracking dimension group. To assign a batch attribute to an individual product, use the product-specific page. If the attribute is specific to a product for a customer, use the customer-specific page. When you add an attribute to a product, you also define other parameters. Here are some examples:

- The minimum and maximum ranges for an attribute of the **Integer** or **Fraction** type.
- The tolerance actions for an attribute of the **Integer** or **Fraction** type. If the value of the attribute falls outside the minimum and maximum range, the action can be either a warning message or an error message.
- The target value for the attribute. This value is the optimal value of the attribute, and it applies to all attribute types.

You can access the pages for products that you select on the **Released products** page in Product information management. After you assign batch attributes to a product, you can add specific values to the attributes on the **Inventory batch attributes** page.

Reserve batches

You can search on batch attributes when you do batch reservations for a sales order to fulfill a customer's order, or when you pick and reserve batches for a production order. The search helps locate an inventory batch that contains the product that has the batch attribute that you want. After you locate the batch or batches, you can reserve the product to the originating inventory transaction line.

Batch balancing

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes how the batch balancing process is supported.

For more information, watch a [video on batch balancing](#).

In the batch balancing process, the amount of ingredients to use in a production batch is calculated from the concentration of active ingredients in selected product batches.

Products that have an active ingredient

A product can be defined by its concentration of an active ingredient. The active ingredient of a product is modeled by using a product-specific batch attribute that has a minimum value, a maximum value, and a target level.

The target level of a batch attribute represents the estimated percentage of an active ingredient in a product. The minimum and maximum values represent the accepted deviation from the target level. They can be used, for example, as an accepted tolerance for batches at product receipt.

A product can have only one active ingredient. To specify the active ingredient of a product, you must first define a product-specific batch attribute. You then associate the attribute as a base attribute of the product.

On the product level, you must also specify how the level of the active ingredient for a batch of the product should be recorded: as part of the purchase receipt process or as part of a quality order process.

To associate a base attribute with a product, the following setup is required:

- The product must be batch-controlled. To make a product batch-controlled, you must assign a tracking dimension group to the product that has an active Batch dimension.
- The attribute that indicates the ingredient levels must be defined as a product-specific batch attribute for the product.

To look up and edit the actual value of the active ingredient for a batch:

1. Go to **Inventory management > Inquiries and reports > Tracking dimensions > Batches**.
2. Select a batch number from the grid.
3. On the Action Pane, open the **View** tab and then select **Inventory batch attributes**.

Ingredient types and how they interact in the batch balancing process

A formula line that is created can have one of these ingredient types:

- None
- Active
- Compensating
- Filler

The rest of this section provides examples that show how each ingredient type works. The examples are based on the following formula that has a total batch size of 100 liters.

INGREDIENT TYPE	ITEM NUMBER	FORMULA LINE QUANTITY	UNIT
None	A	20	Liter
Active	B	30	Liter
Compensating	C	10	Liter
Filler	D	40	Liter

The following table provides an overview of the results of each example.

ITEM NUMBER	INGREDIENT TYPE	ESTIMATED QUANTITY	BALANCED QUANTITY	ACTIVE QUANTITY	UNIT	BASE VALUE
A	None	20	20		Liter	
B	Active	30	25.71	9.00	Liter	30.00
C	Compensating	10	14.72		Liter	
D	Filler	40	39.57		Liter	

Active ingredients

When a product that has a base attribute is added to a formula line, it's referred to as an *active ingredient* of the formula. Batch orders that have formulas that include active ingredients can be used for the batch balancing process. For each ingredient in the formula, the batch balancing process estimates the amount that is required to produce the product. The estimate of amounts is based on the concentration of active ingredients in the selected batches.

Active ingredient example

Ingredient B has base attribute X and a target level of 30, and it's included in a formula that requires 30 liters of ingredient B for every 100 liters of the product. A batch order is created that has a batch size of 100 liters. The batch order is started, and during the batch balancing process, the user selects a batch of ingredient B that has a potency level of 35. Because the potency level of 35 is higher than the target level of 30, the balanced quantity of ingredient B is reduced by using the ratio of the potency value to the target level of the batch, which is multiplied by the estimated quantity. The calculation of the balanced quantity looks like this:

$$(30 \div 35) \times 30 \text{ liters} = 25.71 \text{ liters}$$

None ingredients

When you apply the batch balancing process when the **Ingredient type** is *None*, the estimated quantity and the balanced quantity of the formula line in the batch order are the same.

None ingredient example

Ingredient A is assigned to an ingredient of the *None* type and added to a formula for a finished product. The formula requires 10 liters of ingredient A for every 100 liters of the finished product. When a batch order requires 200 liters, both the estimated quantity and the balanced quantity of ingredient A are calculated as 20 liters.

Compensating ingredients

A compensating ingredient can either offset or complement the effect of the active ingredient in a product. Therefore, the quantity of a compensating ingredient that is consumed depends on the potency of the product:

- **Opposing effect** – If the amount of the active ingredient is more than anticipated, you must add less of the compensating ingredient.
- **Complementary effect** – If the amount of the active ingredient is less than anticipated, you must add more of the compensating ingredient.

The relation between an active ingredient and a complementary ingredient is set up on the **Compensating principle** page.

Follow these steps to set up relations between ingredients.

1. Select **Product information management > Bills and materials and formulas > Formulas**.
2. Open a formula line, and then select **Ingredients** to open the **Compensating principle** page.
3. Select the line that represents a compensating principle, and then select the active ingredient to compensate.

In the compensating principle, you also enter a positive or negative compensating factor to specify how much to compensate for, and whether the principle should be opposing or complementary. A positive factor indicates a complementary effect, and a negative factor indicates an opposing effect.

Compensating ingredient example

Ingredient B is an active ingredient that has base attribute X and a target level of 30. It's included in a formula that requires 30 liters of ingredient B for every 100 liters of the product. Ingredient C is a compensating ingredient, and a quantity of 10 is included in the same formula. A compensating factor of 1.10 is set up for the compensating principle. Therefore, the balanced quantity of the compensating ingredient will be reduced by the difference between the active ingredient's balanced quantity and the estimated required quantity multiplied by 1.10.

In the example for the *Active* ingredient type, the balanced quantity of the required active ingredient was calculated as 25.71, and the estimated required quantity was calculated as 30. In this case, the balanced quantity of the compensating ingredient will be calculated like this:

1. The difference between the estimated and the balanced quantity is determined:
 $25.71 - 30 = -4.29$
2. The result is multiplied by the compensating factor:
 $4.29 \times 1.10 = -4.72$
3. The estimated compensating quantity is reduced by -4.72 to determine the balanced compensating quantity:
 $10 - (-4.72) = 14.72$

Because 1.10 is a positive compensating factor, this compensating principle has a complementary effect. In this case, the active ingredient is more potent than anticipated. Therefore, more of the compensating ingredient is required.

Filler ingredients

A *filler ingredient* is a neutral ingredient that is used to reach the desired output quantity of the finished product. Adjustments to filler quantities are calculated based on variations in the active ingredient and the compensating ingredient compared to the standard quantity.

Filler ingredient example

You've formulated a product that includes ingredients A, B, C, and D for a formula size of 100 liters. You've calculated the balanced quantity of all the ingredient types except the *Filler* ingredient type that is used on one line. The balanced quantity of the filler ingredient is calculated as the difference between the batch size of 100 liters and the sum of ingredients A, B, and C:

$$100 - (20 + 25.71 + 14.72) = 39.57$$

The batch balancing process

The batch balancing process is performed from the **Batch balancing** page. Select **Cost management > Batch orders**, and then, on the **Process** tab, select **Batch balancing**. Batch balancing is available for batch orders that have a status of **Started**.

In general, batch balancing can be applied to batch orders if the formula has at least one formula line where the **Ingredient type** is *Active*. (For the exception to this rule, see the "Batch orders that aren't applicable for batch balancing" section later in this topic.)

The batch balancing process can be divided into two subprocesses:

1. Balance batch ingredients
2. Confirm and release the formula

Balance batch ingredients

In the Balance batch ingredients subprocess, the amount of ingredients to use for the production batch is calculated based on the selected batches that have active ingredients. As a rule, the calculation can be completed only if there is full coverage of all ingredients. You can't balance only part of the batch that the batch order is set up to produce.

NOTE

You can't save a calculation and then complete the batch balancing process later. If you close the **Batch balancing** page, you must repeat the calculation to complete the process.

Confirm and release the formula

After the ingredient quantities have been calculated, you can confirm and release the formula. The release process differs, depending on whether the products are enabled for the warehouse management processes:

- If a product is enabled for the warehouse management processes, the formula line is released to the warehouse according to the principles for the warehouse management processes. The formula line is released in quantities that match the balanced quantities, and it's released for the specific batches that are selected for the active ingredients.

NOTE

Formula lines can be released to warehouse only as part of the batch balancing process. Although there are other options for releasing materials for production to warehouse, those options can't be used for formula lines.

- If a product isn't enabled for the warehouse management processes, a production picking list is created for the product when you confirm and release the formula.

In a single formula, you can combine products that are enabled for the warehouse management processes and products that aren't enabled for the warehouse management processes. When the two types of products are included in one formula, the products that are enabled for the warehouse management processes are released to warehouse. For the products that aren't enabled for the warehouse management processes, a picking list is created when the formula is confirmed and released.

Batch orders that aren't applicable for batch balancing

There are two exceptions to the rule that batch orders are applicable for batch balancing if the formula has at least one formula line where the **Ingredient type** is *Active*.

1. If a formula contains an active ingredient for a product that is enabled for the warehouse management processes, but batch number is below location in the reservation hierarchy, the batch order isn't applicable

for batch balancing.

2. If the formula unit of measure is different from the inventory unit of measure of the active ingredient, the batch order isn't applicable for batch balancing.

A batch order that isn't applicable for batch balancing goes through the regular process cycle for batch orders.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Catch weight product processing with warehouse management

2/18/2021 • 15 minutes to read • [Edit Online](#)

Feature exposure

To use warehouse management to process catch weight products, you must use a license configuration key to turn on the functionality. Go to **System administration > Setup > License configuration**. Then, on the **Configuration keys** tab, expand **Trade > Warehouse and Transportation management**, and select the check box for **Catch weight for warehouse**.

NOTE

Both the **Warehouse and Transportation management** license configuration key and the **Process distribution > Catch weight** license configuration keys must also be turned on. To set the configuration keys for catch weight, you must also turn on the feature by using the **Feature management** workspace. The main feature that must be turned on is **Catch weight product processing with warehouse management**. Two related but optional features that you might want to turn on are **Inventory status changes for catch weight products** and **Use existing catch weight tags when reporting production orders as finished**.

After the license configuration key is turned on, when you create a released product, you can select **Catch weight**. You can also associate the released product with a storage dimension group that the **Use warehouse management processes** parameter is selected for.

Before you can use the product in Warehouse management, you must do some basic product-specific setup for catch weight:

- Define the nominal weight conversion between the catch weight unit (box) and the inventory unit (kilogram [kg]) as part of a unit conversion definition.
- Define the minimum and maximum weight tolerances as part of the catch weight unit setup.
- Set up a unit sequence group where the catch weight unit is defined as the lowest stock keeping unit (SKU).
- Set up a catch weight item handling policy.

For more information, see [Setting up and maintaining catch weight items](#).

Transaction adjustments

Because the weight of inventory when it comes into a warehouse can differ from the weight when the inventory is issued out of the warehouse, the catch weight product processing must adjust the inventory.

NOTE

Mobile device activity will trigger the transaction adjustments only if the Outbound weight variance method of the item's catch weight item handling policy is **Allow weight variance**.

Example 1

During a **Report as finished** production process, the inbound weight of a license plate that contains eight boxes of a catch weight product is captured as 80.1 kg. The license plate is then stored away in the finished

goods area, and during the storage period, some weight is lost into the air.

Later, as part of a sales order picking process, the weight of the same license plate is captured as 79.8 kg. Therefore, in the system, you now have a weight difference as part of the physical dimension set.

In this case, the system automatically adjusts the difference by posting a transaction for the missing 0.3 kg.

Example 2

In its definition, a product is set up to tolerate a minimum weight of 8 kg and a maximum weight of 12 kg for the **Box** catch weight unit.

You have two boxes of the product, and they have a registered weight of 16 kg. If a warehouse worker picks and weighs one of the boxes, and the weight is captured as 9 kg, the remaining box will weigh 7 kg. However, because 7 kg is below the minimum weight, the system does an automatic adjustment to increase the weight of the on-hand inventory by 1 kg.

To set up the accounts that these adjustments are posted to, go to **Cost management > Ledger integration policies setup > Posting**. Then, on the **Inventory** tab, define the following accounts:

- Catch weight loss account
- Catch weight profit account

Catch weight item handling policy

The catch weight item handling policy defines two primary warehouse management flows for the items: when the weight of the items is captured, and how it's captured.

You can define when the weight is captured for sales and transfer order processing. The weight can be captured during either of the following processes:

- **Picking** – The weight is captured during the initial pick work lines of order work.
- **Packing** – The weight is captured during manual packing. (You must send the items to a packing station.)

If the actual weight is captured at the packing station during the container packing processes, warehouse workers aren't prompted to capture the weight during picking work. Instead, the average weight of the physical inventory is used as the weight of the picked inventory that goes to the packing area. This concept also applies to catch weight items that are tracked by tags. For tag-tracked items, these parameters determine when the tag is captured. The tag can be captured either at picking time by using the mobile device or during manual packing.

NOTE

Because the **Packing** option causes inventory to be updated with the average picked weight, this could trigger a discrepancy that could cause a catch weight profit/loss adjustment and/or a difference between on-hand inventory weight and catch weight tag weight.

For internal warehouse management processes such as counting and adjustment corrections, you can define whether the weight should be captured. If it isn't captured, the nominal weight is used. Other options let you capture weight per catch weight unit and per counting quantity.

You can also define how the weight is captured. In one of the two main flows, catch weight tags are tracked and used to capture the weight. In the other flow, catch weight tags aren't tracked.

- **Yes** – The item uses catch weight tags. Each tag number represents one catch weight unit (box), and a weight and other information are associated with the tag. For outbound processes, the weight that is associated with the tag is used.
- **No** – The item doesn't use catch weight tags. The inbound and outbound weighing processes are based on

the actual weight that is captured during each process.

The process of tracking catch weight tags can be used for items that won't change weight during the storage period. The weight will be captured only during the inbound warehouse process. During the outbound process, the catch weight tags will just be scanned, and the weights that are associated with the tags will be used for the outbound transactional processing.

Another important parameter that is related to the processing of catch weight tags is **Catch weight tag dimension tracking method**. Tags can be either partially tracked or fully tracked. If a tag is partially tracked, it tracks product dimensions, tracking dimensions, and inventory status. If a tag is fully tracked, it tracks product dimensions, tracking dimensions, and **all** storage dimensions.

Additionally, when an item is tag-tracked, there is an **Outbound tag capturing method** parameter. You can set this parameter so that you're always prompted for the tag on outbound transactions from the mobile device. Alternatively, you can set the parameter so that you're prompted for tags only when they are required. For example, there are five catch weight tags in inventory on a given license plate, and you've indicated that you want to pick all five tags from the license plate. In this case, if the **Outbound tag capturing method** parameter is set to **Only prompt for tag when needed**, the five tags are automatically picked. You don't have to scan each tag. If the parameter is set to **Always prompt for tag**, you must scan each tag, even if all five tags are being picked.

NOTE

As a rule, tags are captured and updated only from the mobile device menu items. Nevertheless, there are a few scenarios where tags are captured somewhere else (for example, from the manual packing station). However, in general, the mobile device menu items should be used for all warehouse activity if tags are used.

How to capture catch weight

When catch weight tag tracking is used, a tag must always be created for every catch weight unit that is received, and every tag must always be associated with a weight.

For example, **Box** is the catch weight unit, and you receive one pallet of eight boxes. In this case, eight unique catch weight tags must be created, and a weight must be associated with each tag. Depending on the inbound catch weight tag, either the weight of all eight boxes can be captured, and the average weight can then be distributed to each box, or a unique weight can be captured for each box. When using the **Use existing catch weight tags when reporting production orders as finished** feature with the process enabled via a mobile device menu item, the inventory gets updated based on existing catch weight tag information. As a result, the warehouse app does not prompt for capturing the catch weight tag data as part of a production report as a finished operation.

When catch weight tag tracking isn't used, the weight can be captured for each dimension set (for example, for each license plate and tracking dimension). Alternatively, the weight can be captured based on an aggregated level, such as five license plates (pallets).

For the methods for capturing outbound weight, the **Per catch weight unit** option lets you specify that the weighing should be done for each catch weight unit (for example, per box). The **Per picking unit** option lets you specify that the weight should be captured based on the quantity that will be picked (for example, three boxes). Note that for the production line picking and internal movement processes, the average weight will be used if the **Not captured** option is used.

Multiple weight capturing methods are defined on the catch weight item handling policy. Each weight capturing method parameter is used by various transactions. The following table summarizes which parameters are used by which transactions.

METHOD	TRANSACTION
Outbound weight capturing method	Sales picking, Transfer picking
Production picking weight capturing method	Production picking, Production consumption
Movement weight capturing method	Movement
When to capture correction of weight	Adjustments, Counting
Counting weight capturing method	Counting
Warehouse transfer weight capturing method	Warehouse transfer

To prevent the warehouse management picking processes from capturing weights that cause catch weight profit/loss adjustments, you can use the Outbound weight variance method. The Outbound weight variance method applies during the following mobile device processes: sales picking, transfer picking, production picking, movements, counting, and warehouse transfers. You can use the **Restrict weight variance** option if the weight of the catch weight item doesn't fluctuate during warehouse storage, and if catch weight profit/loss adjustments aren't required. You can use the **Allow weight variance** option if the weight can fluctuate, and if catch weight profit/loss adjustments are required when a weight fluctuation is recorded.

Unsupported scenarios

Not all workflows support catch weight product processing with warehouse management. The following restrictions currently apply. They apply to all catch weight items, regardless of whether they are tagged.

Configuring catch weight products for warehouse management processes

- Only formula processing is supported for catch weight products (not bill of materials).
- Catch weight products can't be associated with a tracking dimension group by using the Owner dimension.
- Catch weight products can't be used as services.
- Catch weight products can be used as "stocked products" only as part the item model group.
- Catch weight products can't be used together with the functionality for tracking "Active in sales process."
- Catch weight products can't be used together with the functionality for capturing serial numbers. Therefore, products can't be transferred from a "blank" to a serial number as part of the picking/packing process.
- Catch weight products can't be used together with the functionality for registering serials before consumption.
- Catch weight products that are variant-enabled can't be used together with the functionality for converting variant units of measure.
- Catch weight products can't be marked as a commerce "product kit."
- Catch weight products can be used only with a unit sequence group that has catch weight handling units, and that has the catch weight unit as the lowest sequence.
- For catch weight products, the inventory unit can be converted to the catch weight unit only if the conversion produces a nominal quantity that is more than 1.
- The setup of bar codes for catch weight products doesn't support a variable weight setup.

Order processing

- The creation of advance ship notice (ASN/packing structures) doesn't support weight information.
- The order quantity must be maintained based on the catch weight unit.

Inbound warehouse processing

- Receiving license plates requires that weights be assigned during registration, because weight information isn't supported as part of the advance ship notice. When catch weight tag processes are used, the tag number must be manually assigned per catch weight unit.
- Inbound quality check work isn't supported for catch weight products. If configured, the quality check work will be skipped.

Inventory and warehouse operations

- Manual creation of quarantine orders isn't supported for catch weight products.
- Manual movement of inventory that is related to open work isn't supported for catch weight products.
- License plate loading to initialize warehouse stock isn't supported for catch weight products.
- Batch balancing processes aren't supported for catch weight products.
- Handling of negative physical inventory isn't supported for catch weight products.
- Inventory marking can't be used for catch weight products.

Outbound warehouse processing

- The functionality for cluster picking isn't supported for catch weight products.
- Pick and pack warehouse processing isn't supported for catch weight products.
- For catch weight products, work that is defined in a work template cannot be run automatically.
- For catch weight products, the system doesn't support manual packing station processing where packed container picking work is created after containers are closed.
- The functionality for pcs-by-pcs scanning isn't supported for catch weight products.

Production processing

- For catch weight products, only batch orders for formula products are supported.
- Kanban functionality isn't supported for catch weight products.
- For catch weight products, serial numbers can't be registered before consumption.
- The functionality for reversing license plates from production isn't supported for catch weight products.
- For catch weight products, reporting as finished can't be registered by serial number.

Transportation management processing

- Load building workbench processing isn't supported for catch weight products.
- Transport request lines aren't supported for catch weight products.

Other restrictions and behaviors for catch weight product processing with warehouse management

- During picking processes where the user isn't prompted to identify tracking dimensions, the weight assignment is done based on the average weight. This behavior occurs when, for example, a combination of tracking dimensions is used in the same location and, after a user processes picking, only one tracking dimension value is left in the location.
- When inventory is reserved for a catch weight product that is configured for warehouse management processes, the reservation is done based on the minimum weight that is defined, even if this quantity is the on-hand last handling quantity. This behavior differs from the behavior for items that aren't configured for warehouse management processes. There is one exception to this restriction. For production picking, when the last handling quantity of a catch weight product that is serial number-controlled is picked, the actual weight is used.
- Processes that use the weight as part of capacity calculations (wave thresholds, work maximum breaks, container maximums, location load capacities, and so on) don't use the actual weight of the inventory. Instead, the processes are based on the physical handling weight that is defined for the product.
- In general, Commerce functionality isn't supported for catch weight products.
- For catch weight products, inventory status can't be updated from **Warehouse status change**.

Catch weight tags

A catch weight tag can be created by using a warehouse app process, it can be manually created in the form, or it can be created by using a data entity process. If a catch weight tag is associated with an inbound source document line, such as purchase order line, the tag will be registered. If the line is used for outbound processing, the tag will be updated as shipped.

In addition to the restrictions that currently apply for catch weight products, tagged catch weight products have other restrictions that currently apply.

- All manual updates to inventory (that is, updates that aren't done using a mobile device) must include corresponding manual updates to the associated catch weight tags because these updates aren't done automatically. For example, manual adjustment journals will update inventory but not the associated catch weight tags.
- You must manually update catch weight tags to reflect replenishment work movements. This is because the system can't capture weights while processing replenishment work and therefore records the average weight instead.
- Mixed licensing place receiving isn't currently supported for tagged catch weight items.
- The processing of sales return order receiving can record catch weight tags. However, the process doesn't validate that the returned tag is the same tag that was originally shipped for a sales order.
- The mobile device menu item that has the **Register material consumption** activity code doesn't currently support recording catch weight tags.
- Although counting processes are supported for tagged catch weight items, they are limited. For example, you can use the mobile device options for counting tagged catch weight items, and the average weight is used. However, catch weight tags aren't automatically updated by the counting transaction. After the counting transaction is completed, the catch weight tags must be manually updated so that they reflect the inventory. If items that weren't originally in a location are counted into that location, the nominal weight is used.
- License plate consolidation doesn't currently support tagged catch weight items.
- Reverse work functionality isn't supported for catch weight items that are tag number-tracked.

NOTE

The preceding information about catch weight tags is valid only if the catch weight product has a catch weight tag dimension tracking method that is fully tracked (that is, if the **Catch weight tag dimension tracking method** parameter on the catch weight item handling policy is set to **Product dimensions, tracking dimensions and all storage dimensions**). If the catch weight item is only partially tag-tracked (that is, if the **Catch weight tag dimension tracking method** parameter on the catch weight item handling policy is set to **Product dimensions, tracking dimensions and Inventory Status**), additional restrictions apply. Because visibility is lost between the tag and inventory in this case, some additional scenarios aren't supported.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Copy a formula

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on creating a formula that includes the same ingredients as an existing formula, but with minor differences. To create the formula lines, you can use the Copy function to copy an existing formula that has most of the ingredients that you need. You can then make any necessary changes to the individual lines in the new version. By using the Copy function, you do not have to create multiple formulas that are almost identical. The demo data company used to create this task is USP2.

Create a formula

1. Go to Product information management > Bills of materials and formulas > Formulas.
2. Click New.
3. In the Formula field, type a value.
4. In the Name field, type a value.
 - Type a meaningful name for the formula.
5. In the Site field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. In the Item group field, click the drop-down button to open the lookup.
8. In the list, find and select the desired record.
9. In the list, click the link in the selected row.
10. Click Save.

Copy formula lines

1. On the Action Pane, click Formula.
2. Click Copy.
3. In the Item number field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. In the Formula version field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. Click OK.

Adjust copied formula lines

1. In the list, mark the selected row.
2. Click Delete.
3. Click Yes.

Approve formula

1. On the Action Pane, click Formula.
2. Click Approve formula.
3. In the Approved by field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. Click Select.

6. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Copy co-products from an existing formula version

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to copy co-products from an existing formula version to a different formula version for a released product. It is a prerequisite that there is at least one formula version associated with co-products. The demo data company USP2 is used to create this procedure.

Find a released product

1. Go to Released products.
2. Click Show filters.
 - You are about to add the field Production type in the filter dialog box.
3. Click Add a filter field to add the field Production type.
 - In the next step, you need to manually enter Formula in the Production type field before you select Apply. This sets the filter on the list of released products.
4. Manually enter Formula in the Production type field.
5. Click Apply.

Select a released product

1. In the list, find and select the desired record.
2. Click Formula versions.
 - On the Engineering Action Pane, click Formula versions.

Copy co-products

1. On the Action Pane, click Formula version.
2. Click Co-products.
3. Click Copy.
4. In the Item number field, enter or select a value.
5. In the Formula version field, enter or select a value.
6. Click OK.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a formula by copying from an existing formula

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to quickly create a new formula by copying from an existing formula. You can use the demo data companies USMF, USP2, or USPI to create this procedure.

Create a new formula

1. Go to Formulas.
2. Click New.
3. In the Formula field, type a value.
4. In the Name field, type a value.
5. In the Site field, enter or select a value.
6. In the Item group field, enter or select a value.
7. Click Save.

Copy from an existing formula

1. Click Copy.
2. In the Item number field, enter or select a value.
3. In the Formula version field, enter or select a value.
4. Click OK.

Revise the copied formula

1. In the list, find and select the desired record.
2. Click Delete.
3. Click Yes.

Approve formula

1. Click Approve formula.
2. In the Approved by field, enter or select a value.
3. Click OK.
4. Close the page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production parameters in Manufacturing execution

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about the setup of production parameters in Manufacturing execution.

The **Manufacturing execution** module is intended primarily for manufacturing companies. It can be used to register time and item consumption on production jobs or projects. Before you start to use Manufacturing execution for job registrations, you must set up various production parameters that define how and when registrations are posted during the production process. The settings of production parameters affect inventory management, production management, and cost calculation.

Before workers start to make registrations on production jobs, you should carefully consider all settings on the **Production parameters** page. Click **Production control > Setup > Manufacturing execution > Production order defaults**. If your company uses the multisite functionality, you might want to set up different production parameters for each site. The parameters for integration with the **Production** module are set up on the following tabs on the **Production parameters** page:

- **General** – General parameter settings for production jobs in Manufacturing execution.
- **Start** – Parameters that are used when production operations are started.
- **Operations** – Parameters that are applied to production operations and feedback about operations during the production process.
- **Report as finished** – Parameters that are used when items are reported as finished on the last operation of a production order.
- **Quantity validation** – Parameters that are used to validate start and feedback quantities on production orders.

Types of production jobs

On the **Operations** tab, you select which types of production jobs require registration on the **Job registration** page.

Typically, workers make registrations on setup jobs and process jobs. However, if job scheduling is applied, you can select other job types that workers must make registrations on when production orders are processed. For example, you can require registrations on transport jobs.

IMPORTANT

Make sure that you select all relevant job types. Otherwise, jobs might not be available for registration on the **Job registration** page. Your selections should match the selections in the **Job management** column on the **Setup** tab of the **Route groups** page (**Production control > Setup > Routes > Route groups**).

If **Job management** is selected on the route group, this job type is reported as finished on the production order when the job is reported as finished in Manufacturing execution. When all job types that **Job management** is selected for have been reported as finished on an operation, Manufacturing execution reports the operation as finished.

NOTE

Some job types can be manually reported through production journals. In this case, select **Job management** for the job type, but don't select the job type for registration on the **Operations** tab on the **Production parameters** page in Manufacturing execution.

BOM consumption and picking list journals

A consistent setup for bill of materials (BOM) consumption is important, because it helps guarantee that inventory management is efficient. For example, if BOM consumption parameters aren't set up correctly in Manufacturing execution, materials might be deducted from inventory two times or not at all.

On the **Production parameters** page, automatic BOM consumption is set up in three stages:

- At the start of a production. Set up this stage on the **Start** tab.
- During the production process when an operation is completed. Set up this stage on the **Operations** tab.
- When a production order is reported as finished. Set up this stage on the **Report as finished** tab.

For each stage, the **Automatic BOM consumption** field lets you select one of three methods for picking items for a production order:

- **Flushing principle** – This option is used in combination with an option that is defined for the BOM in the **Production** module. Click **Production control > Common > Production orders > All production orders**. On the **All production orders** page, select a production order in the list, and then, on the Action Pane, click **BOM**. On the **BOM** page, on the **Setup** tab, in **Flushing principle** field, select one of the following options:
 - **Start**
 - **Finish**
 - **Manual**
 - Blank (No option is selected.)
 - **Available at location**

In Manufacturing execution, if **Flushing principle** is selected in the **Automatic BOM consumption** field on the **Start** tab, all materials that are set to **Start** in the BOM are deducted from inventory when the operation is started. The **Available at location** option is used for products that are enabled for advanced warehouse processes. If you select this flushing principle, material is flushed when warehouse work for raw material picking is completed. Material is also flushed when a BOM line that uses this flushing principle is released to warehouse and the material is available at the production input location.

NOTE

If the **Flushing principle** field is set on the **Start** tab in Manufacturing execution, you must select the same principle on either the **Operations** tab or the **Report as finished** tab. This requirement helps guarantee that materials are deducted from inventory on BOMs that use **Finish** as a flushing principle on the production order. If the same flushing principle isn't selected on either the **Operations** tab or the **Report as finished** tab, materials might be deducted from inventory two times.

- **Always** – If you select this option for a stage, materials are always deducted from inventory at that stage. For example, materials for the production are deducted when the production order is started. This setting requires that **Never** be selected on the **Operations** and **Report as finished** tabs. This requirement

helps prevent items from being deducted from inventory two times.

- **Never** – If you select this option for a stage, no BOM consumption occurs at that stage. For example, if you select **Never** on all three tabs (**Start**, **Operations**, and **Report as finished**), materials must be manually deducted from inventory.

IMPORTANT

Carefully consider your setup of the production parameters, and make sure that the parameters that are selected on the various tabs of the **Production parameters** page don't contradict each other.

The following examples illustrate parameter settings that support various BOM consumption principles. The parameters are set up on the **Production parameters** page in Manufacturing execution.

Example 1: Backflushing on operations

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on an operation.

TAB	FIELD	SETTING
Start	Update start on-line	Status or Status + quantity
Start	Automatic BOM consumption	Never
Operations	Automatic BOM consumption	Always
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status + quantity

Example 2: Backflushing on production

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on the production order.

TAB	FIELD	SETTING
Start	Update start on-line	Status or Status + quantity
Start	Automatic BOM consumption	Never
Operations	Automatic BOM consumption	Never
Report as finished	Automatic BOM consumption	Always
Report as finished	Update finished report on-line	Status + quantity

Example 3: Flushing principle

Use the following settings if picking list journals and BOM item consumption should be generated according to the flushing principle that is set for the BOM items.

TAB	FIELD	SETTING
Start	Update start on-line	Status + quantity
Start	Automatic BOM consumption	Flushing principle
Operations	Automatic BOM consumption	Flushing principle
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status + quantity

Example 4: Deduction of materials during startup of a production order

Use the following settings if picking list journals and BOM item consumption should be generated when a production is started.

TAB	FIELD	SETTING
Start	Update start on-line	Status + quantity
Start	Automatic BOM consumption	Always
Operations	Automatic BOM consumption	Never
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status or Status + quantity

Based on the selections that are described earlier in this section, picking list journals are posted at various stages of the production order process:

- When an operation is started
- When quantity feedback is reported on an operation
- When items are reported as finished on the production order

Example 5: Manual BOM consumption

You can use the following settings if materials should always be manually deducted from inventory. In this case, picking list journals aren't posted.

TAB	FIELD	SETTING
Start	Update start on-line	Status
Start	Automatic BOM consumption	Never
Operations	Automatic BOM consumption	Never
Report as finished	Automatic BOM consumption	Never
Report as finished	Update finished report on-line	Status

Production setup requirements

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about setup requirements before you can work with Production control.

Production control is integrated with features in other modules. This interconnectivity lets you change production orders and make sure that they are automatically updated in all other related processes and calculations in the system. The following setup processes are listed in the order that you should complete them in.

Required baseline setup in other modules

Information in other modules must be set up before you can work with Production control. This setup includes the following tasks:

- Set up general company information.
- Set up the general ledger.
- Define item groups.
- Set up ledger accounts for item groups.
- Set up the inventory item table in Inventory management.
- Create bills of materials (BOMs) and BOM versions in Inventory management.

Required calendar and resource setup

Before you use Production control, open Organization administration, and create and define the calendar and operations resources in the following order:

1. **Working time templates** – Set up working time templates to define the times that are available for production scheduling.
2. **Calendars** – Set up working time calendars to define the days of the year that are available for production scheduling.
3. **Resource groups** – Set up resource groups to group the operations resources, so that you can get an overview of any free capacity when you run scheduling. You don't have to set up resource groups before you set up operations resources. However, we recommend that you understand how to group resources when you set up Production control.
4. **Resources** – Set up operations resources to define the resources that are used to complete the production process and plan for capacity.

Required production parameters setup

Production control parameters – Set up basic production parameters to define how the system handles and processes production orders. Define how production orders are created, estimated, scheduled, and consumed. You can also select what kind of feedback you want and how cost accounting is done.

Required journal name identification

Production journal names – Specify the production journal names that are used to record and post transactions.

Setup if you use operations

Operations represent the specific activities that are completed to produce the finished product. **Note:** You must know the types of activities that are required in order to produce your item, and the order and priorities of those activities. You must also know which resources are involved, and how many.

1. **Operations** – Set up operations to represent the tasks that must be completed to produce the finished item.
2. **Relations** – Set up operation relations to establish detailed properties. To define operation relations, click **Relations** on the **Operations** page.

Setup if you use routes

If you're working with routes, operations must be defined for every production route that you set up. The route represents the path that the item takes from operation to operation, from the start of the production process to the end.

1. **Cost categories** – Set up cost categories to define the cost per hour of specified processes and setup times.
2. **Cost groups** – Set up cost groups to create and maintain different types of costing.
3. **Route groups** – Set up route groups to define parameters that are related to groups of routes. You must set up route groups before you can create production routes.
4. **Routes** – Set up production routes, and define default settings to control scheduling, costing, and pricing of route operations, and to control progress reporting.
5. **Route version** – Set up route versions to enable item variations in production.

Optional advanced settings

1. **Production groups** – Set up production groups to establish relationships between the production order and ledger accounts. The ledger accounts are used to post or group orders for reporting.
2. **Production pools** – Create production pools to group production orders so that you can process urgent production orders, or delete and post groups of orders.
3. **Properties** – Define properties to create special attributes that you can assign to your resources to control the order of productions. These attributes are connected to the working time template.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Operations scheduling

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic provides information about operations scheduling. You can use operations scheduling to provide a general estimate of the production process over time.

You can schedule production at the operation level and the job level. Unlike job scheduling, operations scheduling doesn't explode the operations for the production route into jobs. If you want to include more detail in the scheduling, such as information about current capacity, you can run job scheduling after you run operations scheduling. You can also run job scheduling only. Job scheduling is typically used to schedule individual jobs on the shop floor for an immediate or short-term time frame.

Components of operations scheduling

The main components of operations scheduling are the scheduling direction, the capacity of resources, and materials optimization. By using operations scheduling, you can achieve the following goals:

- Control the planning method by scheduling forward or backward from a given date.
- Optimize the use of resources by scheduling productions based on the capacity of the resources. This approach also helps identify when alternative resources should be used.
- Optimize the use of materials by scheduling productions based on the availability of the required materials.
- Schedule and synchronize reference productions. The dates of the reference productions are adjusted when the production order's schedule is changed.

You must estimate the cost of a production order before you can run operations scheduling. If you haven't run an estimate, it's automatically run before operations scheduling is started. An operations schedule specifies the following information:

- The product that is planned for production
- The configuration of the product
- The quantities that are involved in the production
- The dates when the production will start and end
- The capacity reservations for the resources that perform the production activities

The setup time, process time, and run time are set for operations in the production. After you run operations scheduling, the status of the production order is **Scheduled**, and all operations are scheduled in the order that is specified by the production route. However, only the duration of the operation is considered. Start times and end times aren't scheduled.

Scheduling direction and date

The scheduling direction is fundamental to the scheduling process. Production can be scheduled forward or backward from any date, depending on timing and scheduling requirements.

- **Forward from the scheduling date** – You can schedule production to start as early as possible. Production can be started today, tomorrow, or on any date in the future. The production is scheduled forward in time to the earliest possible end date.
- **Backward from the scheduling date** – You can schedule production to start as late as possible. Backward scheduling is based on the date when the production must be completed. The schedule counts backward from that date to the latest possible date that the production can be started and still be completed on time.

Resource scheduling

When you run an operations schedule, each operation in the production route is scheduled for the resource that is specified for the operation. Additionally, the duration of each operation is specified on the production route. If a resource group is specified for an operation, the scheduling reserves capacity on the group. However, unlike job scheduling, operations scheduling doesn't select the specific resources in the group. If you're working with finite capacity, the schedule depends on the availability of the resources that are required in order to complete production. Operations scheduling follows the sequence of operations that is specified on the production route. The scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The sum of available capacity on the resources that are involved determines the capacity for the resource group. Capacity reservations that already exist for the resources are considered unavailable capacity. If there isn't enough available capacity for the production, the production orders can be delayed or even stopped. You can also specify the efficiency that you expect from the resources that are involved in the production. You specify the efficiency as a percentage on the resource. The efficiency percentage adjusts the throughput of the resource. This adjustment affects the time that is reserved for the resource. The lead times for the operations that use the resource are also adjusted accordingly.

Operations scheduling and master planning

The operations schedule also drives master planning and determines calculations for material requirements. Operations scheduling considers the following information:

- **Backlogged productions** – Products that are planned, released, or started
- **Material availability** – Inventory, subproductions, suppliers, and vendors
- **Capacity availability** – Resources that are required for production

NOTE

If you're using multi-threaded master planning and operations scheduling, finite capacity will not be considered.

Cancellations

When you run operations scheduling, you can cancel specific parts of the routing. These parts include the queue time, setup time, process time, overlap time, and transport times.

Finite materials

If you're working with finite materials, scheduling also depends on the availability of the materials that are required for production. If there aren't enough available components for the production, production can be delayed. You can base scheduling on the use of materials by specifying the materials that must be available for production. When you optimize on both resource capacity and the availability of materials, production is calculated according to these restrictions. A production order can't be scheduled to start until capacity and materials are available at the same time and in the required quantities.

Operations scheduling options

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic describes the options for operations scheduling. You can use operations scheduling to provide a general estimate of the production process over time.

Operations scheduling calculates the following information for a production order:

- Start and end dates are set for the production order and each operation.
- Resources are assigned to operations.

Several settings determine how production schedules are calculated. You define these settings on the **Operations scheduling** page. The following information describes the scheduling options.

Operations scheduling

Scheduling direction

The scheduling direction is fundamental to the scheduling process. A production can be scheduled forward or backward from any date, depending on timing and scheduling requirements.

- **Forward scheduling** – You can schedule a production to start as early as possible. The production can be started today, tomorrow, or on any specific date in the future. The production is scheduled to start on the earliest possible date and is planned forward in time to the earliest possible end date.
- **Backward scheduling** – You can schedule a production to start as late as possible. The schedule is based on the date when the production must be completed and counts backward to the latest possible date that the production can be started without missing its target deadline.

The following options are available:

- **Forward from today** – Schedule forward from the current date. (The current date is the system date.)
- **Forward from planned start** – Schedule forward from an earlier start date. If there is no previous scheduling, the scheduling direction is forward from the current date.
- **Forward from scheduling date** – Schedule forward from the date that is specified in the **Scheduling date** field. If you don't specify a scheduling date, the scheduling direction is forward from the current date.
- **Backward from delivery date** – Schedule backward from the delivery date that is specified for the production order. If you select this option, but no delivery date is specified, the delivery date is the current date.
- **Backward from planned end** – Schedule backward from a previously calculated end date. If there is no previous scheduling, the end date is the current date.
- **Backward from scheduling date** – Schedule backward from the date that is specified in the **Scheduling date** field. If you don't specify a scheduling date, the current date is used. Backward from scheduling date is calculated for the production order the last time that a requirement was calculated. If no date is specified for the production order, the current system date is used.
- **Backward from futures date** – Schedule backward from the futures date that was calculated for the production order the last time that a requirement was calculated. If no futures date is specified for the production order, the current system date is used.
- **As last scheduling** – For operations scheduling and job scheduling, the selected scheduling direction and date are saved. Therefore, you can select this option for subsequent scheduling. If there is no previous scheduling of the production order, scheduling is backward from the current system date.
- **Forward from tomorrow** – Schedule forward from the current date plus one day.

- **Forward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, the production order is scheduled forward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.
- **Backward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, planned orders are scheduled backward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.

Scheduling date

This date is used for the **Forward from scheduling date** and **Backward from scheduling date** scheduling directions. Scheduling is backward or forward from this date. For more information, see the previous section, "Scheduling direction."

Recalculate BOM levels

When you select **Recalculate BOM levels**, the selected bill of materials (BOM) levels will be recalculated to help guarantee the correct scheduling order.

Limitations

Finite capacity

Scheduling depends on the availability of the resources that are required in order to complete production. If there isn't enough capacity, production orders can be delayed or even stopped. If finite capacity is applied to operations scheduling, existing capacity reservations that are made on the resources are considered, and that capacity is seen as unavailable. The production order is scheduled based on the availability of capacity on the resources that are required. Operations scheduling uses the specified sequence of operations to determine the order of operations in the production route. Operations scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The capacity of the resource groups is the sum of available capacity on all the resources in the resource groups.

Finite material

Scheduling also depends on the availability of the materials that are required for production. Insufficient component availability can also cause production delays. Scheduling can also be based on the use of materials. Just specify the materials that must be available for production instead of the materials that aren't critical. This type of scheduling is known as scheduling with finite material. When you specify finite materials, production is scheduled based on whether materials are available. **Note:** When you optimize on both capacity and materials, production is calculated to meet both restrictions. The availability of capacity and materials is considered, and the production order's operations can't be scheduled to start until capacity and materials are available at the same time and in the required quantities. Select this check box if materials should be considered limited during scheduling. If the materials are limited, the material's coverage for that time will be considered. In other words, scheduling considers the futures dates that are calculated for the items. Scheduling reserves raw materials and explodes the current production. If scheduling occurs several times, only the first scheduling runs an explosion and makes reservations. If you make changes in the production BOM or route, the next scheduling runs an explosion. For the explosion, it's assumed that the materials are required on the same day. Because the production isn't scheduled at the time of the master schedule explosion, the current date is the best estimate of when the items will be available. The explosion then checks whether the items are available. If the items are available, the production requirement can be fulfilled. If the items aren't available by the current date, a planned order is generated, and an offset selection is made for the planned order. If automatic firming is set for the planned order, the planned order is firmed automatically for purchase or production. The production status is automatically changed to the status that is specified in the **Requested production status** field in the **Coverage groups** dialog box. If the check box is cleared, the materials are always considered available. Therefore, scheduling doesn't consider whether the materials are available at the time of requirement.

Finite property

Select this check box if the job scheduling should include property requirements.

Keep production unit

Select whether the scheduling engine should schedule only resources that are already specified on the production unit.

Keep warehouse from resource

Select whether the scheduling engine should schedule only resources that are associated with the input warehouse that is specified on the resource.

References

Schedule references

When references depend on production orders, they are also known as subproductions. Subproductions can be scheduled as part of the scheduling of a production order. Select this check box if the scheduling of subproductions should be based on the scheduling of the main production. In relation to the main production, overlying productions are scheduled forward, and underlying productions are scheduled backward. You can view production order references can be viewed in the **Reference level** field on the **Production orders** page.

Synchronize references

You can synchronize references with the production order. If this option is selected, the dates of the subproductions are moved and aligned when changes are made to the production order's schedule. If a production order has one or more subproductions, you might want to schedule the subproductions together with the main production. In this case, the main production can't be started until the related subproductions have been completed. Therefore, select this check box if the scheduling of subproductions should be based on the start and end times of the selected production. You can select this check box only if the **Schedule references** check box is also selected.

Cancellation

Cancel queue time

Select this check box to exclude queue time from the scheduling.

Cancel setup

Select this check box to exclude setup time from the scheduling.

Cancel process

Select this check box to exclude run time from the scheduling.

Cancel overlap

Select this check box to exclude overlap time from the scheduling.

Cancel transport

Select this check box to exclude transit time from the scheduling.

Set default

You can save the current values as default values. There are two options:

- Set as my default
- Set as default for everyone

Job scheduling

2/18/2021 • 5 minutes to read • [Edit Online](#)

This article provides information about job scheduling, which is a more detailed form of scheduling than operations scheduling. You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment.

You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment. Job scheduling breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Job scheduling also lets you synchronize all jobs that are referenced by the selected job. You can specify a start date and time or end date and time for the job, and then run scheduling. The time that you specify can be the start time or the end time, depending on the scheduling direction. This functionality is useful when, for example, a job can be run only on one machine at a time, or when you want to optimize the job that is run for each resource.

Tasks in the job scheduling process

The job scheduling process includes the following tasks:

- Split operations into jobs.
- Schedule jobs, based on the dates and times for the resources that are specified for the related operation.
- Calculate start times and end times for each job. You can use finite capacity to make sure that there are no overlapping times.
- Determine which resources in the resource group to run the job on. This task requires that a resource group be specified for an operation. Job scheduling selects the resources or resource groups based on the shortest lead time, and also considers any previous reservations on the resources.
- Explode operations into jobs when you run job scheduling. The jobs are scheduled by date and time, according to the order that is specified by the production route. The setup of the operation determines the jobs that are exploded during the scheduling process. The route group that is assigned to the operation controls whether jobs are generated. A job is generated only if it has a specific duration. For example, a transport time job is generated if a transport time was specified for the selected operation.

Scheduling direction

You can schedule jobs either forward or backward.

- **Forward** – Use the forward scheduling direction to start the production as early as possible. This is also known as the push method, because the production is being pushed forward through the production process. The production is scheduled to start and end on the earliest possible dates.
- **Backward** – Use the backward scheduling direction to start the production as late as possible. This is also known as the pull method, because it's based on the date when the production must be completed. Backward scheduling counts backward to the latest possible date that the production can be started without missing its target deadline.

Finite capacity

You can schedule jobs by using finite capacity. When you use finite capacity, the capacity that is scheduled can't be larger than the capacity that is available for the resource. Available time is defined as the interval when the resource is available and there are no other reservations on capacity. Scheduling that is based on finite capacity makes sure that start times and end times for an operation on a specific date don't overlap. The resource

capacity that is already reserved is considered, and overlaps between the start times and end times are also considered. Finite capacity determines the amount of capacity that must be available for a resource in order to achieve optimal use of that resource. This determination is balanced against a calculation of the shortest possible lead time between operations.

Finite materials

Job scheduling that is based on finite materials makes sure that the required materials are available when the operation starts. The coverage rules for items define these limits. Scheduling uses requirement explosion to determine when the component items are available. If you schedule without setting finite materials, the system assumes that all items are available when they are required.

Finite properties

Job scheduling that is based on special properties requires that properties be specified for the operations on the production route. These properties must be fulfilled to reserve capacity.

References

Job scheduling schedules all productions that are referenced by the current production. If a production has one or more subproductions, the subproductions should be scheduled at the same time as the main production, because the main production can't be started until the related subproductions are completed.

Schedule resources

The scheduling engine examines combinations of resources to identify those combinations that can satisfy requirements. You can specify selection criteria by selecting one of the following values in the **Primary resource selection** field on the **Scheduling parameters** page:

- **Duration** – The scheduling engine selects the resource that has the shortest lead time. **Note:** Scheduling by duration can cause decreased performance when the same resource group contains many resources and secondary operations are used. You can schedule a maximum of 32 resources per operation. If you exceed this quantity, an Infolog message is displayed, and job scheduling doesn't find the best alternative resource.
- **Priority** – The scheduling engine selects the resource that has the highest priority if two or more resources have identical capabilities and levels. The resource that has the lowest numeric value in this field has the highest priority.

When job scheduling is run, the system plans the resources, based on the limitations that are defined in the resource parameters. You can control the capacity of the resources by using calendar settings. The system calculates loads for resources during the scheduling process. **Note:** For productions that use the operations scheduling function, you can run job scheduling after operations scheduling. If you aren't using operations scheduling, you can run job scheduling alone.

Maximum capacities for resources per job order

Resources are assigned to jobs through job scheduling. You can establish maximum capacities for resources per job order. For example, you can set up the system to schedule no more than 50 percent of total capacity for a production order. This setup gives you more control over the scheduling of resources on the job scheduling level. Therefore, it can help prevent issues if not enough capacity is available to perform simultaneous productions.

Resource efficiency

Job scheduling considers the efficiency percentages that are specified for the resources. Efficiency percentages

reduce or increase the time that is reserved for the resource. Therefore, lead time is also increased or decreased. The following formula is used for the calculation: $\text{Scheduling time} = \text{Time} \times 100 \div \text{Efficiency percentage}$ In this formula, *Time* includes both the run time and the setup time.

Consolidated batch orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes the concept of consolidated batch orders.

A bulk item that is produced is considered a parent item, whereas a packed item is considered a child item. The relation between the bulk item and the packed item is expressed in a bulk item conversion. This bulk item conversion is defined on the bulk item itself.

Packed items can be packaged into containers of either a single size or multiple sizes that are considered one unit. By consolidating the orders for a bulk item, you can see all the related batch orders in a single view that can help you determine any remaining work that must be completed.

A consolidated batch order can contain any combination of the following orders:

- A single bulk order and multiple packed orders
- Multiple bulk orders and multiple packed orders
- Multiple bulk orders and a single packed order
- Only packed orders

Batch order lifecycle from create to start

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure takes you through the first part of the life cycle of a batch order.

From creation, cost estimation, and over production job scheduling to the actual start of a batch order.

The demo data company used to create this procedure is USMF.

The prerequisites for running the procedure with another dataset are a released product with an active formula and route version.

Create a batch order

1. Go to All production orders.
2. Click New batch order.
3. In the Item number field, enter or select a value.
4. Click Create.
5. Use the Quick Filter to filter on the Production field with a value of 'b'.

View production formula and expected co-products

1. On the Action Pane, click Production order.
2. Click Formula.
3. Close the page.
4. Click Co-products.
5. Close the page.

Estimate the batch order

1. Click Estimate.
2. Click OK.
3. On the Action Pane, click Manage costs.
4. Click View calculation details.
5. Close the page.

Release the batch order

1. On the Action Pane, click Production order.
2. Click Release.
3. Click OK.

Schedule production jobs

1. On the Action Pane, click Schedule.
2. Click Schedule jobs.
3. Select No in the Finite capacity field.
4. Select No in the Finite material field.
5. Click OK.

6. On the Action Pane, click Production order.
7. Click All jobs.
8. Close the page.

Start the batch order

1. Click Start.
2. Click the General tab.
3. Select No in the Post picking list now field.
4. Click OK.
5. On the Action Pane, click View.
6. Click Picking list.
7. In the list, click the link in the selected row.
8. Close the page.
9. Close the page.
10. Click Route card.
11. In the list, click the link in the selected row.
12. Close the page.
13. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Sequence production jobs for process manufacturing

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure uses paint products as an example to show how to sequence planned orders according to the priority of color and package size. The demo data company used to create this procedure is USPI. This procedure is intended for the production planner.

Run master planning for USPI

1. Go to Master planning > Master planning > Run > Master planning.
2. In the Master plan field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.
 - Select MasterPlan.
4. Click OK.
 - This starts Master Planning, including the sequence process. This process can take a few minutes.

View planned orders for the paint products

1. Go to Master planning > Master planning > Planned orders.
2. Expand the Item details FactBox.
3. Expand the Schedule details FactBox.
4. In the Plan field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.
 - Select MasterPlan.
6. In the list, click the link in the selected row.
7. Use the Quick Filter to filter on the Item number field with a value of 'P300'.
 - Unlock to scroll to the right to see the order date and delivery date. Notice that these items have an order date of Today and the delivery dates for the planned orders are not sequenced after the priority of color and package size, as shown in the product name. You can hover over an item number to see the product name and priority.

Sequence planned orders for paint

1. Close the page.
2. Go to Master planning > Master planning > Sequenced planned orders.
3. Expand the Item details FactBox.
4. Expand the Schedule details FactBox.
 - Note: Here you see that the Start date/time for the planned orders are sequenced according to color and package size within a bucket period of 28 days. These periods are defined by a number in the field Campaign. The sequenced planned order form acts like the typical planned order form, and the production planner can firm the planned orders here.
5. Mark all rows.
6. Click Accept.
 - This will update the planned orders with the selected sequence action of either Postpone or Advance.

Verify the sequence of the planned orders

1. Close the page.
2. Go to Master planning > Master planning > Planned orders.
3. Expand the Item details FactBox.
4. Expand the Schedule details FactBox.
5. In the Plan field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
 - Select MasterPlan.
7. In the list, click the link in the selected row.
8. Use the Quick Filter to filter on the Item number field with a value of 'P300'.
 - Notice that the orders now are sequenced according to the priority of color and size and the planned orders start at the earliest order date and delivery date. Validate the Order date column or the Start date in the Schedule details FactBbox.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Material substitution in manufacturing

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to substitute materials during the production process.

There are three methods for substituting materials during the production process:

- By date, when one material is substituted for another after a specific date
- During master planning, when a material in a formula is substituted with a different material, because it's out of stock
- During production, when a material is unexpectedly out of stock and is substituted with a different material

Substituting material by date

Consider following scenario: A machine that a company is manufacturing contains a component that will expire from the vendor's catalog in two months. From the expiration date onward, the vendor will offer a new component that can be substituted for the old component. From and to validity dates can be set up on bill of materials (BOM) lines. For this example, you set up the old component to expire by entering the expiration date in the **To-date** field. Then, on the BOM, you set up the new, replacement component so that it's valid from the day after the old component expires. To do this, enter the start date in the **From-date** field.

Substituting material by planning

You can substitute materials during planning only when you're using formulas, not when you're using a BOM. Consider following scenario: A food manufacturing company is making a sauce from a formula that has 20 ingredients. One ingredient in the formula can be substituted by one of two other ingredients. However, because these two ingredients are more expensive than the preferred ingredient, substitution is used only if the preferred ingredient is out of stock. The material that can be substituted is called A, whereas the two materials that can replace it are called B and C. Material substitution by planning is controlled by the **Plan group** and **Priority** fields on the formula lines. For this example, you create formula lines for the three materials, and associate the formula lines with the same plan group. In the setup, the formula line for material A has the highest priority (lowest number), the formula line for material C has the lowest priority, and the formula line for material B has a priority that is between the priority of the other two lines. If you have demand for the finished item, master planning first determines whether the demand for material A can be covered. If the demand can't be covered, master planning looks at materials B and C, in order of priority. If material B is on hand, it will be used after a planned batch order is firmed for the formula. If none of the materials are on hand, master planning creates a planned order for material A. **Note:** When you set up formula lines in a plan group, you should specify a quantity only on the material that has the highest priority. This quantity will be used to calculate the demand of all materials in the plan, even the materials that have lower priority. You can't specify different quantities on lower-priority items in the plan group.

Substituting material during production

Consider the following scenario: A piece of metal plate is required for a welding operation. During the operation, a warehouse worker informs the machine operator that the plate is out of stock. However, it's decided that the plate can be substituted with a plate that is slightly thicker. That way, the operation can be finalized. Material can be added to the BOM for an open production order. If the production order has a status of **Started**, users are asked to re-estimate the order when they add a new item to the production BOM. After the material is added, a new picking list can be created for the new item. You don't have to add the new material to the production BOM. Instead, you can add it directly to the production picking list. Then, when the picking list is posted, the system

adds the material to the production BOM.

Registration for manufacturing execution

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes key concepts and terms that you need to understand to configure and use manufacturing execution.

Manufacturing execution is intended to be used primarily by manufacturing companies. Workers can register time and item consumption on production jobs by using the **Job registration** page. All registrations are approved and are later transferred to the relevant modules. Continuous approval and transfer of registrations lets managers easily track actual costs on production orders.

Manufacturing execution and registration terminology

The following table contains terms that pertain to manufacturing execution and related registration tasks.

TERM	DESCRIPTION
Manufacturing execution	A function that is used to register time, material consumption, costs on production jobs, projects, and indirect activities. Registration is done in a manufacturing execution registration client.
Job list	On the Job registration page, workers are shown the list of jobs that they must perform on a specific resource, such as a machine. A worker can register time and item consumption on each job or task in the job list.
Job bundling	If a worker starts more than one job at the same time on the Job registration page, this is called job bundling. The time that is spent on bundled jobs can be allocated to the individual jobs in various ways by using allocation keys.
Pilot/assistant registrations	A worker can register as an assistant to a resource, and can create a small team where several workers work on the same production jobs. Resources that workers are connected to as assistants are called pilots. Only the pilot resource must make registrations. All assistants automatically get the same registrations. For example, if a machine acts as the pilot, workers who have registered as assistants to that machine can make registrations on the Job registration page, and both the machine and the workers who are connected as assistants will receive the same registrations.
Indirect activity	An activity or task that isn't directly related to a production job or a project, such as a department meeting, a cleaning job, or a maintenance job on the shop floor. Workers can make registrations on indirect activities, in the same way that they can register on production jobs and projects.

Registrations in manufacturing execution

Workers can make various types of registrations in manufacturing execution for work that is performed on production jobs. Depending on the system setup, workers might also be able to make registrations on project activities and nonproductive tasks, such as breaks, absences, and indirect activities. Here are the registration

types:

- **Clock-in/clock-out** (available with time and attendance) – Workers clock in when they arrive at work and clock out when they leave to go home.
- **Register on production jobs** – Workers can make registrations, such as starting a job and reporting feedback for a job, on the production jobs that appear in their job list. Workers can start several jobs at the same time. This is referred to as job bundling.
- **Register on inventory** – Workers can make registrations on materials that are used on the shop floor, but that aren't directly related to production jobs. Examples include grease, lubricants, or other materials that are used to keep machinery running. Registration is performed in an inventory journal.
- **Register on projects** (available with time and attendance) – Workers can make registrations, such as starting and finishing work on the projects or project activities that appear in their job list.
- **Register project fees and project items** (available with time and attendance) – Workers can register fees (expenses) that are associated with a project in a project fee journal, such as mileage and bridge toll. Workers can also register item consumption on projects. This is done in a project item journal.
- **Register as assistant to another worker** – If two or more workers will work together on a production job or a project, a worker can register as an assistant to a machine, or to another worker, who will then act as the pilot. The pilot can select another worker as the pilot, as required.
- **Register absence** (available with time and attendance) – Workers can register time on various absence codes that are set up. Absence can be indicated if a worker arrives late, requires absence during the work day, or leaves earlier than expected according to the standard work time profile.
- **Register breaks** (available with time and attendance) – During the work day, workers can register that they are leaving their workstation to take a break. Several break types can be set up. When a worker returns and logs on again, the system registers that the worker is back, and the break registration stops.
- **Register indirect activities** (available with time and attendance) – Indirect activities are nonproductive activities that workers might engage in during a workday, such as a department meeting, a team meeting, or a maintenance job that is performed on the shop floor. Workers can make registrations on the indirect activities that are set up.
- **Register overtime** (available with time and attendance) – Workers who have been asked to work longer hours can select whether the extra hours should be registered as flextime or overtime.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production feedback

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about production feedback, which gives workers feedback about production jobs. The article includes information about the various ways that production feedback can be updated.

Production feedback gives workers feedback about production jobs. It records time and material consumption on production orders, operation quantities and status, and errors that cause a job or operation to fail. Production feedback can be updated in journals that are related to production orders. The **Production job card** and **Production route card** journals are used to report time and quantities per job or operation. For reporting about the last job or operation, quantities on the finished product can be reported as finished. Production feedback can also be updated on the **Job card terminal** and **Job card device** pages. These pages enable production feedback to be updated on the shop floor and are part of the manufacturing execution functionality in the **Production control** module. The **Job card terminal** page has a configurable user interface that shows a list of the released jobs in a prioritized order for a selected work area. It also offers advanced options such as job bundling and team work. The **Job card device** page has a touch-optimized user interface. Production feedback on both pages is updated from the production journals.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Time and attendance registration overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

Time registration workers can enter different types of time registrations, for example, clock in, clock out, register indirect activities, and absence registration. This topic describes registrations, their calculation, approval, and the use of workflow to add structure and automated approval to the process of approving timesheets.

Registrations

In companies that use Time and attendance, workers must register the time that they spend at work, as well as their attendance. Some companies may only require workers to register clocking-in and clocking-out times. In other companies, workers may also be required to register time consumption on the actual activities they perform as well as the breaks they take. The intended users of Time and attendance are:

- Workers, who are required to register time and attendance at regular intervals, for example daily, weekly or bi-weekly.
- Supervisors, managers, and payroll officers who calculate, approve, and transfer worker registrations for further processing.

NOTE

If you run Time and attendance together with Manufacturing execution, all registrations on projects, project activities, indirect activities, absence codes, and overtime and flex time will be recorded and are used to calculate payroll in both modules.

Time registrations workers

To be able to register time and absence, workers must be set up as time registration workers in the company they are employed in.

After setup, the workers can enter different types of registrations.

- Clocking in- and out when arriving or leaving work.
- Time and item consumption on production jobs.
- Time used on a machine on the shop floor, if the machine has been defined as a resource.

NOTE

A worker can be automatically assigned the time registrations that are made on a particular machine on the shop floor, if the worker chooses to work as an assistant to the machine when he or she starts the production job.

- Time registrations on projects and project activities.
- Registering project fees and item consumption via the respective project fee journals and project item journals.
- Planned absence.
- Absence when arriving late to work or leaving earlier than planned.
- Work breaks, either manually registered or automatically calculated by the system.
- Indirect activities, which are non-productive activities a worker might engage in during a workday. Examples of these activities include meetings or cleaning their workspace.
- Overtime, which can be registered either as extra hours, flextime, or overtime.

Adding clock-out registrations

If a worker forgets to clock-out at the end of their workday, the missing registration can be added by running a batch job. The system will compare the clock-in time and the clock-out time according to the associated profile of the worker, and automatically insert the missing clock-out registration to match the profile's end time. Both the clock-in and clock-out registrations are vital for the subsequent calculation and approval of time registrations before they can be transferred to payroll.

Calculating registrations

When a registration worker is assigned a calculation group that typically relates to a specific team, shift, or work group. The team manager or supervisor typically validates the registrations made by the workers, and is therefore also the responsible person to run the calculation for the respective calculation groups on a daily basis. As part of the calculation process the team manager or supervisor is able to:

- Correct erroneous registrations. For example, change switch codes and adjust feedback on production jobs.
- Add missing registrations. For example, create clock-out registrations and create absence transactions.
- Delete incorrect registrations.

Because the registered time must match the worker's time profile prior to calculating the registrations, you must override the work time profile for any worker who has an exception to his standard work time profile. In the case, where the worker profile is day shift, and the worker has agreed to work a night shift with no overtime pay, the team manager or supervisor must override the default worker profile in order to calculate the working time at the standard night rate and not as overtime. The calculation will also display an error if an absence registration is missing. It must be added before the calculation can be completed.

Approving registrations

Just as you assign a calculation group to a time registration worker, you must assign an approval group as well. Typically the group will be specific to a team, shift, or work group. You must approve the time registrations that were calculated correctly – this means doing a calculation without errors – before pay items can be generated that afterward can be transferred to a payroll system. The payroll administrator will typically do the approval of registrations, and prior to the approval he is able to:

- Override pay agreements for individual workers.
- Add manual premiums.
- Enter additional information about absence registrations.

NOTE

If overtime has been calculated for specific workers, the overtime can be allocated to specific jobs during the day. This is relevant if job cost is calculated based on worker pay.

Approving registrations using workflow

You can set up a workflow approval process that automatically approves registrations which comply with workflow rules, leaving only deviations to be handled manually. If workflow approval is activated, the team manager or supervisor submits the calculated registrations for approval. The workflow process will generate the appropriate approvals and tasks, and then assign them to the right users and roles as identified in the workflow. There are two workflow approvals for time and attendance.

WORKFLOW	PURPOSE	REGISTRATION TYPE
Time and attendance days total	The workflow validates registrations against, for example, the expected number of work hours for the day.	
Time and attendance journal registration.	The workflow validates each registration type for the date of the registration.	Time and attendance • Clock-in • Clock-out • Absence • Break • Switch code • Project • Project activity • Indirect activity Production jobs • Queue before • Setup • Process • Overlap • Transport • Queue after • Start assistance • Stop assistance

Transferring approved registrations

After approval of the registrations you can transfer them to a periodic payroll job. A transferred registration is posted to an activity or job that it relates to, for example, a production order or a project. Payroll transactions are generated for each worker based on the registrations.

Reversing transferred registrations

The task of reversing transactions – rolling them back – can be done until the time when the payroll period's pay transfer is run. This means that payroll data has been transferred to an external file. When reversed, all registrations are withdrawn, and any transactions posted on production orders or projects are offset and neutralized.

NOTE

The external file can be imported into a payroll system.

Registrations in electronic timecards

Workers with job tasks that do not require immediate feedback, as is the case with production jobs, but who work on project activities, can benefit from using the electronic timecard. Electronic timecards offer the flexibility to enter registrations any time and in the best way for your business schedule – daily, weekly, or when a worker is in the office again after being away. To use electronic timecards or these workers, you must specify, Use timecard, in the worker details. Electronic timecards enable the worker to register:

- Date
- Registration type
- Job reference, such as project, indirect activity, or production order
- Job identification
- Time consumption
- Project fees
- Project items

Allocate time to jobs in a job bundle

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Manufacturing execution, you can bundle jobs. You can then start multiple jobs at the same time on the Job list page.

If you bundle jobs, you must define how the total registered time for all the jobs should be allocated to each job. You define the allocation by selecting one of the following options in the **Bundle type** field on the **Allocation keys** page:

- **Estimation** – Time is divided among the jobs, based on the estimated time for the jobs.
- **Jobs** – Time is divided according to total jobs that are bundled and how much time was spent finishing all the jobs.
- **Net time** – Time is divided equally among the jobs that are in the bundle at any time.
- **Real time** – Actual job time is allocated. The cost can be calculated based on the actual payroll cost. **Note:** The **Real time** allocation key is available only if your company uses the payroll functionality in Time and attendance.

The following examples show the results of the various allocation keys.

Example scenario

Three jobs in your job queue must be completed. You start the first job, and then, while that job is in progress, you start the second and third jobs. Therefore, there is a bundle of three jobs. The following table shows the estimated production time for each job.

JOB	PRODUCTION TIME
Job 1	1 hour
Job 2	3 hours
Job 3	4 hours
Total	8 hours

The following table shows the actual work hours that are spent on each job.

JOB	START TIME	END TIME	BUNDLE TIME
Job 1	09:00	11:00	2 hours
Job 2	10:00	13:00	3 hours
Job 3	10:00	15:00	5 hours
Bundle	09:00	15:00	6 hours

The following sections describe the results of the calculated time for each allocation key.

Estimation allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time × (Estimated job time ÷ Total estimated time)

JOB	FORMULA	ALLOCATED TIME
Job 1	$6 \times (1 \div 8)$ hours	0.75 hour
Job 2	$6 \times (3 \div 8)$ hours	2.25 hours
Job 3	$6 \times (4 \div 8)$ hours	3.00 hours

Jobs allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time ÷ Number of jobs

JOB	FORMULA	ALLOCATED TIME
Job 1	$6 \div 3$	2 hours
Job 2	$6 \div 3$	2 hours
Job 3	$6 \div 3$	2 hours

Net time allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Calculated time per reporting = Bundle time ÷ Number of jobs

	09:00–10:00 (1 HOUR)	10:00–11:00 (1 HOUR)	11:00–13:00 (2 HOURS)	13:00–15:00 (2 HOURS)	ALLOCATED TIME
Number of jobs in the bundle	1	3	2	1	Not applicable
Job 1	$1 \div 1 = 1$ hour	$1 \div 3 = 0.33$ hour	Not applicable	Not applicable	1.33 hours
Job 2	Not applicable	$1 \div 3 = 0.33$ hour	$2 \div 2 = 1$ hour	Not applicable	1.33 hours
Job 3	Not applicable	$1 \div 3 = 0.33$ hour	$2 \div 2 = 1$ hour	$2 \div 1 = 2$ hours	3.33 hours

Real time allocation key

If you want production costs to be calculated based on real costs, you must clear the **Cost category** option on the **Production order defaults** page. The following table illustrates the formula for calculating allocated time. Here is the formula: Actual time per job = Actual time in bundle

JOB	ACTUAL TIME
Job 1	2 hours
Job 2	3 hours
Job 3	5 hours

Consider the three jobs that are performed by a worker who has an hourly wage of USD 12.00. No overtime bonus or premium was earned in the time that was spent on the jobs. The worker worked on the three bundled jobs for a total of six hours. Therefore, the salary cost is $6 \times \text{USD } 12.00 = \text{USD } 72.00$. When you use real-time allocation, the cost per hour is recalculated by using the factor from the Net time formula. The actual time that was spent on each job is then transferred together with the corrected cost price per hour. In the example, six hours are spent, although 10 hours were allocated. The following table illustrates the formula for calculating cost. Here is the formula: $\text{Cost per hour} = (\text{Total bundle time per job (Net time)} \div \text{Actual time per job}) \times \text{Standard cost price per hour}$

JOB	CALCULATION OF CORRECTED COST PER HOUR	CORRECTED COST PER HOUR	ALLOCATED TIME	TOTAL COST OF JOB
Job 1	$(1.33 \div 2) \times \text{USD } 12.00$	USD 8.00	2 hours	USD 16.00
Job 2	$(1.33 \div 3) \times \text{USD } 12.00$	USD 5.33	3 hours	USD 16.00
Job 3	$(3.33 \div 5) \times \text{USD } 12.00$	USD 8.00	5 hours	USD 40.00

The corrected cost per hour and the job time are posted in a production journal. **Note:** If you select the **Cost category** option on the **General** tab on the **Production order defaults** page, the actual time for each job is transferred to a production journal, where the cost is applied to the cost category of the specific job.

Calculate material consumption

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about various options that are related to the calculation of material consumption.

The following options that are related to the calculation of material consumption are available on the **Setup** and **Step consumption** tabs on the **Line details** FastTab of the **Bill of materials** page.

Variable and constant consumption

In the **Consumption is** field, you can select whether consumption should be calculated as a constant quantity or a variable quantity. Select **Constant** if a fixed quantity or volume is required for the production, regardless of the quantity that is produced. Select **Variable**, which is the default setting, if the required amount of material in the finished goods is proportional to the number of finished goods that are produced.

Calculating consumption from a formula

In the **Formula** field, you can set up various formulas for calculating material consumption. If you use the default value, **Standard**, the consumption isn't calculated from a formula. The following formulas work together with the **Height**, **Width**, **Depth**, **Density**, and **Constant** fields:

- Height * Constant
- Height * Width * Constant
- Height * Width * Depth * Constant
- (Height * Width * Depth / Density) * Constant

Rounding up and multiples

Together, the **Rounding up** and **Multiples** fields let you round up the material consumption value. For example, you can round up the value according to the handling unit in which the raw material is picked for production. The following options are available in the **Rounding up** field: **Quantity**, **Measurement**, and **Consumption**.

Quantity

If you select **Quantity** as the rounding-up mechanism, the quantity must be a multiple of the specified quantity. For example, if whole numbers are required, select **1** in the **Multiples** field. Numbers are then rounded up to a quantity that is divisible by 1.

Measurement

Typically, you select **Measurement** as the rounding-up mechanism when the raw material comes in specific dimensions. For example, a piece of 2-meter metal tube is required for a finished good, and the metal tube is stored in 4.5-meter lengths. In this case, the **Measurement** rounding-up mechanism can be used to calculate how many metal tubes are required to produce a specific number of pieces of the finished good. For this example, the **Formula** field is set to **Height * Constant**. The **Height** field is set to **2** to indicate the length of the tube that is required for the finished good. The **Multiple** field is set to **4.5** to indicate that the tube is picked in lengths of 4.5 meters. Here is the calculation:

1. Number of multiples that are required for 10 pieces of the finished good: $10 \div 2 = 5$ pieces
2. Total consumption: $4.5 \times 5 = 22.5$ meters of metal tube

It's assumed that 0.5 meter of tube is scrapped for every five pieces of tube that are consumed.

Consumption

Typically, you select **Consumption** as the rounding-up mechanism when raw material must be picked in whole quantities of a specific handling unit of the product. For example, 2 quarts of paint are used to produce one piece of a finished good, and the paint is picked in 25-quart cans. In this case, the **Consumption** rounding-up mechanism can be used to round up consumption to whole numbers of 25-quart cans. Here is the calculation for the amount of paint that is required if 180 pieces of the finished good must be produced:

1. Paint that is required, excluding scrap: $180 \times 2 = 360$ quarts
2. Number of cans: $360 \div 25 = 14.4$, which is rounded up to 15
3. Paint that is required, including scrap: $15 \times 25 = 375$ quarts

Step consumption

Step consumption is used to calculate constant consumption in quantity intervals. If you select **Step consumption** in the **Formula** field on the **Setup** tab, you can add information about the steps on the **Step consumption** tab. The fixed consumed quantity can be set up in intervals of the produced quantity. For example, step consumption is set up as shown in the following table.

FROM SERIES	QUANTITY
0.00	10.0000
100.00	20.0000
200.00	40.0000

The bill of materials (BOM) quantity is 1, and the production quantity is 110. The formula for the consumption is From series (Quantity) = Consumption. Because the production quantity is 110, it falls into the "From 100 series." Therefore, the quantity is 20.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Production posting

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about different types of postings in the production process.

Production posting activities follow production processes that are described in the sections below.

Material consumption

Materials are registered as consumed during production when the production picking list journal is posted. This process generates issue transactions that deduct the on-hand inventory. In the production parameters, you can specify whether the value of raw materials that are in progress (work in process [WIP]) should be posted in the ledger. The value of raw materials that are in progress (WIP) is then posted to a dedicated Picking list account and a dedicated Picking list offset account.

Time consumption

The time that workers spend on production jobs is recorded in the Route card journal or the Job card journal. When these journals are posted, ledger posting to a dedicated account for resources that are in progress (WIP) is processed. This posting represents the value of the time that is spent on the production order. After the production order is registered as ended, the WIP accounts are settled.

Reporting finished goods and error quantities

When a production order is reported as finished, the quantity of the finished goods that have been completed is updated in Inventory management through the Report as finished journal. If you're using WIP accounting, which can be set up in the production parameters, a ledger journal is made to reduce the WIP accounts and increase the inventory of the finished goods. The journal uses the standard cost that is defined for the product.

Ending the production order

Before a production order is ended, actual costs are calculated for the quantity that was produced. All estimated costs of material, labor, and overhead are reversed and replaced with actual costs. The overall cost of the finished item is debited from the inventory Receipt account and credited to the inventory Issues account. If you select the **End job** check box when you run the cost calculation, the status of the production order is changed to **Ended**. This status prevents any additional costs from being unintentionally posted to a completed production order. You can specify that the value of error quantities that are reported during reporting as finished should be allocated to the good quantities that are reported as finished. Alternatively, you can specify that the value of error quantities should be posted to a dedicated scrap account.

Controlling the level of ledger posting

In the **Production control parameters**, you can use the **Ledger posting** field to set the level of ledger posting for production processes. The following values are available:

- **Item and resource** – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from resource or resource group from the route operations.
- **Item and category** – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from the cost categories that are associated with the route

operations.

- **Production groups** – Use the ledger accounts that are set up on the production groups for both material and time consumption. The production groups are associated with the released products and copied to the production orders when those orders are created. The posting on the production orders will then follow the production groups that are associated with the production order.

Note: If the standard method for calculating the cost of the finished item was used, the final transactions reflect this fact. If actual costs and the costs that are calculated by using the standard method differ, the difference is posted to the account that shows profit or loss.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot process manufacturing

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with process manufacturing.

When I use the job card device to report a partial quantity on the last job in a production order, all the previous jobs on that order that have a status of In progress are automatically ended.

This behavior is by design. On the **Production order defaults** page, on the **Report as finished** tab, there is an option that is named **End-mark route**. If this topic is set to *Yes*, a route card journal is posted when a worker uses the job card device or job card terminal to report the last operation. This journal marks all the operations as completed and ends all the production jobs. When the **End-mark route** option is set to *Yes*, the system doesn't consider the job status that the worker selected when they reported the last operation. The system also doesn't consider whether the worker is reporting a full or partial quantity.

When I attempt a stock closing, I receive the following warning message: "No execution of Backflush costing calculation with a date %1 matching period end has been registered."

In releases before release 10.0.13, if you aren't using the lean production costing flow, you receive the following erroneous warning message during inventory closing:

You are about to execute an Inventory close with a date %1. No execution of Backflush costing calculation with a date %1 matching period end has been registered. Please remember to execute a Backflush costing calculation with a date of %1 matching period end. The valuation of inventories, cost of goods sold and variances might not be correct in Subledger or General ledger until this has been executed.

This issue has been fixed in release 10.0.13 and later. For more information, see [KB 4582468](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

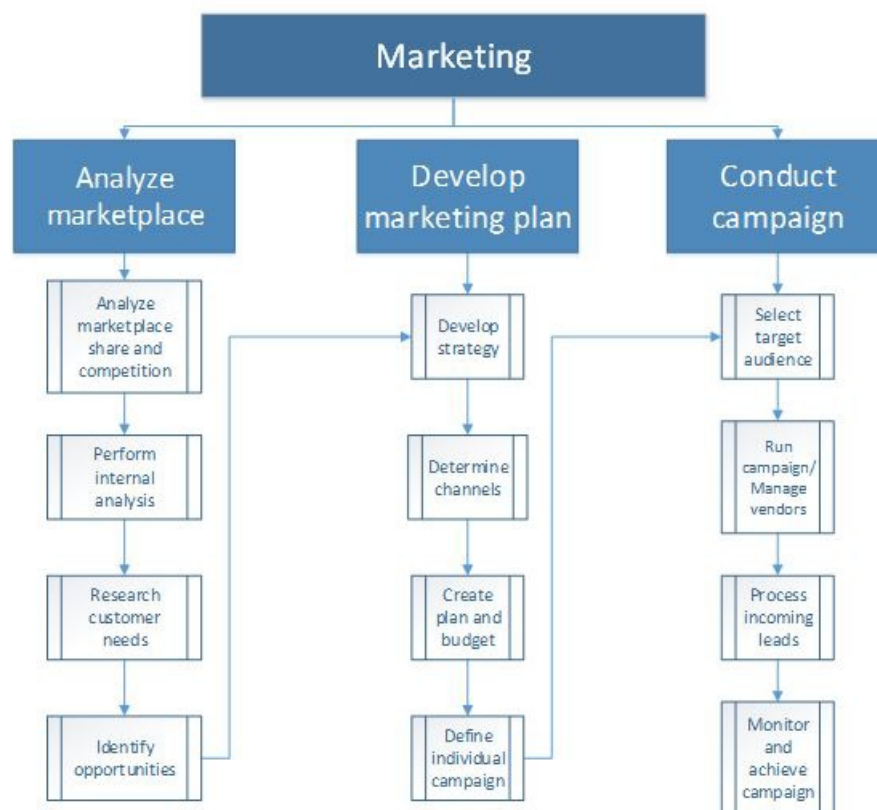

Sales and marketing overview

2/18/2021 • 7 minutes to read • [Edit Online](#)

You can use Sales and marketing to obtain, store, and use various types of data in the sales flow. This data includes the original sales initiative, future follow-up action, and additional sales.

Marketing

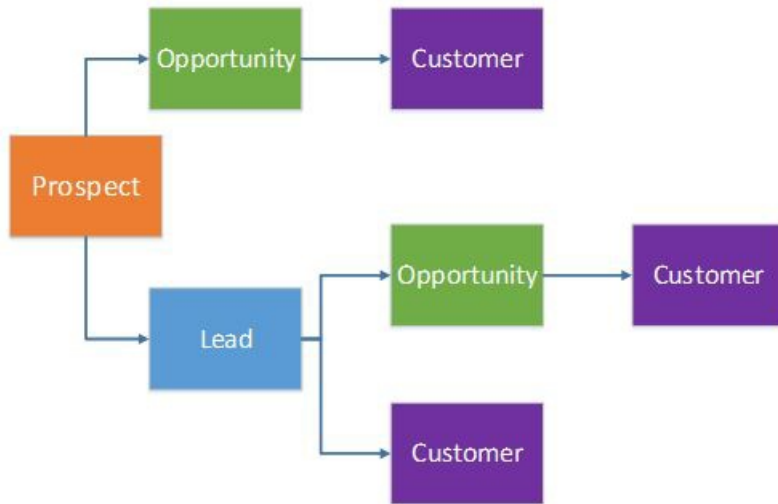

You use marketing campaigns and activities to find and build relationships with potential customers, so that initial interactions can develop into sales relationships. The following process flow shows the business process

for marketing.

Relationships

In sales and marketing, the initial interactions that you have with potential customers can occur in various situations. For example, you might find a prospective customer while you're attending a trade show, or you might have a possible lead with a customer after your organization runs a mass mailing campaign. It's very important that you understand the flow of a party's entity before that party becomes a customer. The following graphic shows the flow of entity relationships as a potential customer becomes an actual customer.

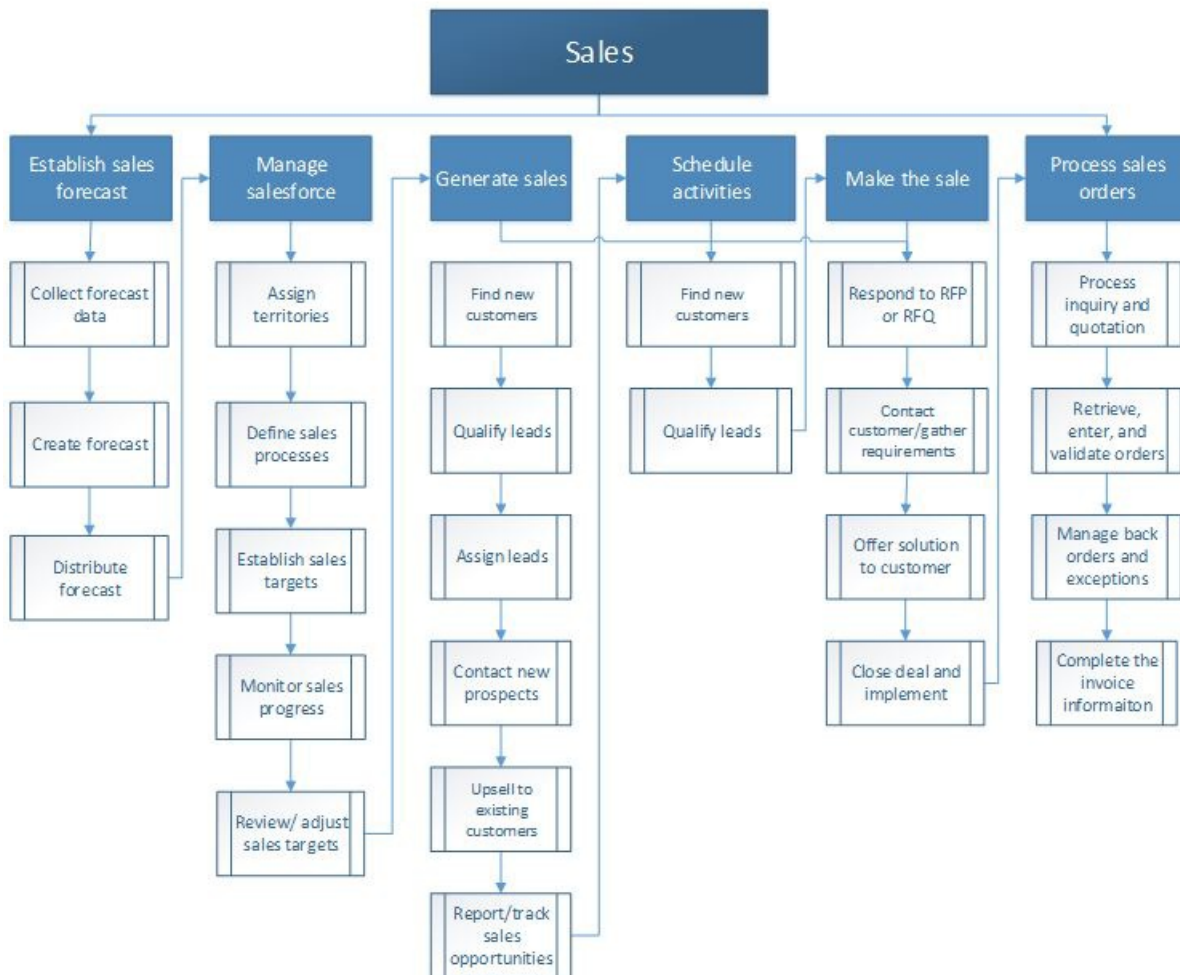

Campaigns

A campaign targets the contacts for prospects, leads, opportunities, and customers that have been selected to participate in the campaign. In Supply Chain Management, you can create several types of campaigns, such as telemarketing, mailing, and email campaigns, to maximize your customer potential. As your campaign progresses and you receive positive responses, you can begin the sales process with those recipients who have responded positively to the campaign.

Sales

You use the sales functionality to create quotations, up-sell and cross-sell to new and existing customers, create sales orders, and create sales invoices for customers. The following process flow shows the business process for sales.

Sales quotations

You create sales quotations to present customers an offer of the goods or services that you will be providing. A customer might request a quotation, or you might create a quotation in response to a request from a potential or existing customer. When the customer approves the sales quotation, you can convert it to a sales order.

Up-sell/cross-sell

Up-selling and cross-selling are techniques for selling products when an order is entered for a customer. In up-selling, another product is suggested instead of the current product. In cross-selling, a product is suggested in addition to the current product. When you set up product lists, you can create specific rules to indicate when a product should be suggested as a cross-sell or up-sell product.

Sales orders

When you create a new sales order, you must select the type of sales order to create. You have five options.

Note: After you create a sales order, any order type can be changed, except the **Items requirements** type if the sales order has a status of **Delivered**.

SALES ORDER TYPE	DESCRIPTION
Journal	Use this type as a draft for a sales order. This type has no effect on the stock quantities and doesn't generate item transactions.

SALES ORDER TYPE	DESCRIPTION
Subscription	Use this type for recurring orders. When the order is invoiced, the order status is automatically set to an open order. The delivered quantity that was invoiced and the remaining deliveries are updated. You can't use this sales order type if you're using the Warehouse management functionality.
Sales order	Use this type when a customer has placed or confirmed an order.
Returned order	Use this type when a customer returns an item. A return-item number (RMA number) is assigned automatically.
Item requirements	This type is created automatically when you make an item sale through a project.

Sales agreements

A sales agreement is a contract that commits the customer to buy a product in a specific quantity or for a specific amount over time, in exchange for special prices and discounts. The prices and discounts of the sales agreement overrule any prices and discounts that are stated in any trade agreements that exist. A sales agreement is valid for a defined period. The requested ship date that is specified for a sale on the **Sales order** page should be in the valid period. By default, a sales agreement is on hold. You can order from a sales agreement only when it's set to **Effective**.

Backorders

When you enter and validate orders, you might have to manage backorders and exceptions before the sale can be completed. Backorders are either purchase orders that haven't yet been delivered from a vendor or sales orders that haven't yet been delivered to a customer. It's important that you follow up on backorders. For example, if products are delayed from a vendor, you might have to change the date of delivery to a customer and then inform the customer of the delay. You can view backorders by item, customer, or vendor.

Viewing backorders by item

When you view backorders by item, you can follow up on the expected future flow of transactions for a specific item. For example, you can check the following information:

- The number of sales orders that are placed for an item
- Whether deliveries of the item from vendors are still missing
- Whether more items should be ordered, so that you can deliver all sales orders in a timely manner

By doing this check, you can respond to requests from customers about the timing of the item delivery. In addition, you can prioritize the sales backorders and split the items that are on-hand between the orders.

Viewing backorders by customer

When you view back orders by customer, you can view the status of the customer's remaining orders. This check is useful when you must respond to customers who are waiting for items that have been delayed.

Viewing backorders by vendor

When you view backorders by vendor, you can follow up on missing deliveries and expected dates of delivery. This check also helps you prioritize the backorders when products arrive from vendors and the sales orders must be picked for delivery.

Invoices

You can create three types of invoices during the sales process:

- Customer invoice
- Free text invoice
- Pro forma invoice

Customer invoice

A customer invoice is a bill that an organization gives to a customer in connection with a sale. You create this kind of customer invoice based on a sales order that includes a header and one or more lines for items or services. The customer invoice completes the sales order, packing slip, and sales invoice cycle.

You can post and print a single customer invoice, based on either a sales order or the packing slip and date. You can also post and print multiple customer invoices together, based on the packing slips and dates. When you post a single customer invoice by using the sales order, the **Invoiced remainder** quantity for each item is updated with the total of the invoiced quantities from the selected sales order.

If both the **Invoiced remainder** and **Deliver remainder** quantities for all items on the sales order are 0 (zero), the status of the sales order is changed to **Invoiced**. If the quantity of either field isn't 0, the status of the sales order isn't changed, and you can enter additional invoices. If you plan to post and print one or more customer invoices based on the packing slips, you must have already posted at least one packing slip for each sales order. The customer invoice is based on the packing slips and reflects the quantities that are listed.

You can create a customer invoice that is based on the packing slip line items that have been shipped to date, even if all the items for a particular sales order haven't yet been shipped. You might do this if, for example, your legal entity issues one invoice per customer per month to cover all the deliveries that you ship during that month. Each packing slip represents a partial or complete delivery of the items on the sales order.

When you post the invoice, the **Invoice remainder** quantity for each item is updated with the total of the delivered quantities from the selected packing slips. If the **Invoice remainder** and **Deliver remainder** quantities for all items on the sales order are 0 (zero), the status of the sales order is changed to **Invoiced**. If the quantity isn't 0, the status of the sales order isn't changed, and you can enter additional invoices. Inventory transactions are updated with the invoice number, and the status on the sales order line is changed to **Invoiced**.

Free text invoice

A free text invoice is an invoice that isn't related to a sales order. It contains order lines that include ledger accounts, free-text descriptions, and a sales amount. You can't enter an item number on this kind of invoice, and you must enter the appropriate sales tax information. A main account for the sale is indicated on each invoice line. The customer balance is posted to the summary account from the posting profile that is used for the free text invoice.

Pro forma invoice

A pro forma invoice is an invoice that is prepared as an estimate of the actual invoice amount before the invoice is posted. You can print a pro forma invoice for either a customer invoice or a free text invoice.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Order promising

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic provides information about order promising. Order promising helps you reliably promise delivery dates to your customers and gives you flexibility so that you can meet those dates.

Order promising calculates the earliest ship and receipt dates, and is based on the delivery date control method and transport days. You can select among four delivery date control methods:

- **Sales lead time** – Sales lead time is the time between creation of the sales order and shipment of the items. The delivery date calculation is based on a default number of days, and does not consider stock availability, known demand, or planned supply.
- **ATP (available-to-promise)** – ATP is the quantity of an item that is available and can be promised to a customer on a specific date. The ATP calculation includes uncommitted inventory, lead times, planned receipts, and issues.
- **ATP + Issue margin** – The shipping date is equal to the ATP date plus the issue margin for the item. The issue margin is the time that is required to prepare the items for shipment.
- **CTP (capable-to-promise)** – Availability is calculated through explosion.

NOTE

When a sales order is updated, the order promising information is only updated if the existing order promising date can't be fulfilled, as illustrated in the following examples:

- **Example 1:** The current order promising date is July 20, but due to increased quantity, you won't be able to deliver until July 25. Because the current date can no longer be met, order promising is triggered.
- **Example 2:** The current order promising date is July 20, but due to decreased quantity, it is now possible to deliver on July 15. However, because the current date can still be fulfilled, order promising is not triggered, and July 20 remains the order promising date.

ATP calculations

The ATP quantity is calculated by using the "cumulative ATP with look-ahead" method. The main advantage of this ATP calculation method is that it can handle cases where the sum of issues among receipts is more than the latest receipt (for example, when a quantity from an earlier receipt must be used to meet a requirement). The "cumulative ATP with look-ahead" calculation method includes all issues until the cumulative quantity to receive exceeds the cumulative quantity to issue. Therefore, this ATP calculation method evaluates whether some of the quantity from an earlier period can be used in a later period.

The ATP quantity is the uncommitted inventory balance in the first period. Typically, it's calculated for each period in which a receipt is scheduled. The program calculates the ATP period in days and calculates the current date as the first date for the ATP quantity. In the first period, ATP includes on-hand inventory minus customer orders that are due and overdue.

ATP is calculated by using the following formula:

ATP = ATP for the previous period + Receipts for the current period – Issues for the current period – Net issue quantity for each future period until the period when the sum of receipts for all future periods, up to and including the future period, exceeds the sum of issues up to and including the future period.

Notice that the ATP calculation does not include information around expiry date and beyond the ATP time fence

that the system expects when any quantity can be promised.

When there are no more issues or receipts to consider, the ATP quantity for the following dates is the same as the latest calculated ATP quantity.

If not all the dimensions that are used for an item are given when the ATP check is completed, they can still be specified on the issue and receipts. In this case, in the ATP calculation, the receipts and issues must be aggregated to the existing dimensions to reduce the number of receipt and issue lines that are used in the ATP calculation.

The ATP quantity that is shown is always greater than or equal to 0 (zero). If the calculation returns a negative ATP quantity (for example, if the quantity that was previously promised exceeds the available quantity), the quantity is automatically set to 0.

Example

The **ATP backward demand time fence** field controls how far back in time to look for delayed demand orders or inventory issues. The **ATP backward supply time fence** field controls how far back in time to look for delayed supply orders or inventory receipts. For example, if orders that are delayed by only seven days should be considered in the ATP calculation, both fields should be set to 7.

The **ATP delayed demand offset time** and **ATP delayed supply offset time** fields control when the delayed demand or supply will be considered in the ATP calculation. For example, if the delayed supply and demand should be considered in the ATP calculation the day after tomorrow, both fields should be set to 2. A value of 2 means that the quantity of an item on a delayed purchase order that should be considered in the ATP calculation will be seen as available two days after the current date.

For the following example, 7 is entered in the **ATP backward demand time fence** and **ATP backward supply time fence** fields, and 1 is entered in the **ATP delayed demand offset time** and **ATP delayed supply offset time** fields.

A purchase order for 200 pieces of a product that should have been received three days ago hasn't been received yet. Therefore, a sales order line for 75 pieces of the same product that should have been shipped yesterday hasn't been shipped.

A customer calls and wants to order 150 pieces of the same product. When you verify the availability of the product, you find that another purchase order for 100 pieces of the product will be delivered 10 days later.

You create a sales order line for the product and enter 150 as the quantity.

Because the delivery date control method is ATP, the ATP data is calculated to find the earliest possible ship date. Based on the settings, the delayed purchase order and sales order are considered, and the resulting ATP quantity for the current date is 0. Tomorrow, when the delayed purchase order is expected to be received, the ATP quantity is calculated as more than 0 (in this case, it's calculated as 125). However, 10 days from now, when the additional purchase order for 100 pieces is expected to be received, the ATP quantity becomes more than 150.

Therefore, the ship date is set to 10 days from now, based on the ATP calculation. Therefore, you tell the customer that the requested quantity can be delivered 10 days from now.

Order entry deadlines

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides information about order entry deadlines. An order entry deadline is a cut-off time that determines whether a customer order is treated (and fulfilled) as if it was received on the current day or the next day.

In many companies, only sales orders that are received before a certain time of day are treated as if they were received on that day. Any orders that are received after that time are treated as if they are received on the next business day. This cut-off time for orders is known as the order entry deadline.

Order entry deadlines are used as input for order promising. Therefore, they help you manage customer expectations about order deliveries. For example, customers can see that, if they place an order with you before a specific time, you will commit to shipping the goods on the same day. However, if they miss that deadline, they can expect the shipment only on the next business day. You set order entry deadlines based on your warehouse capabilities and shipping carrier schedules.

On the **Order entry deadlines** page, you set up order entry deadline times for all the days of the week. If orders are received after the specified times, they are treated as if they are received on the next day. By default, these times are set to 23:59 (that is, one minute before midnight at the end of the relevant day). You can change the default times so that they coincide with actual ship or receipt deadline times.

You can define order entry deadlines for a specific group of customers. For example, you might want a specific group of customers to have order entry deadlines that are later than those of other customers. In this case, you first define groups for order entry deadlines on the **Order entry deadline groups** page. You then assign the groups to customers on the **Customers** page.

If your company consists of several sites, you can set up order entry deadlines for each site. If the sites are located in different time zones, the order entry deadlines are set up in each site's time zone. However, when you work with sales orders and sales quotations, the order entry deadline is converted to your time zone on the **Available ship and receipt dates** page.

On the **Activate order entry deadline combinations** page, you define the combinations of sites and order entry deadline groups that are allowed.

Example: Order entry deadline

The order entry deadline on Tuesdays has been set to 16:00. On a particular Tuesday, at 17:00, you try to set the current date as the ship date. (Note that there is no lead time for this example.) If the **Delivery date control** check box is selected, you receive a warning that states that the date isn't valid. This warning appears on the **Available ship and receipt dates** page, where you can then select alternative dates.

Example: Different order entry deadlines per site

Your company consists of two sites. The sites are located in different time zones, as shown in the following table.

SITE A	SITE B
California	Florida
PST (Pacific Standard Time)	EST (Eastern Standard Time)

Sites A and B have defined the following order entry deadlines.

DAY OF THE WEEK	A: ORDER ENTRY DEADLINES (PST)	B: ORDER ENTRY DEADLINES (EST)
Monday	13:00	14:00
Tuesday	13:00	14:00
Wednesday	13:00	14:00
Thursday	13:00	14:00
Friday	13:00	14:00

You're an order processor in Utah, where the time zone is MST (Mountain Standard Time). Therefore, provided that you place orders with site A before 14:00 MST and place orders with site B before 12:00 MST, you meet the order entry deadlines for both sites.

The following table shows how the order entry deadlines for sites A and B are converted to MST time.

SITE A: PST	SITE A: MST	SITE B: EST	SITE B: MST
13:00	14:00	14:00	12:00

Note: If adjustment for daylight saving time is in effect, the order entry deadlines are adjusted accordingly.

Example: Same order entry deadline per site

Your company consists of two sites. The sites are located in different time zones, as shown in the following table.

SITE A	SITE B
California	Florida
PST (Pacific Standard Time)	EST (Eastern Standard Time)

Sites A and B have defined the following order entry deadlines.

DAY OF THE WEEK	PST AND EST
Monday	13:00
Tuesday	13:00
Wednesday	13:00
Thursday	13:00
Friday	13:00

You're an order processor in Utah, where the time zone is MST. Therefore, provided that you place orders with site A before 14:00 MST and place orders with site B before 11:00 MST, you meet the order entry deadlines for both sites.

The following table shows how the order entry deadlines for sites A and B are converted to MST time.

SITE A: PST	SITE A: MST	SITE B: EST	SITE B: MST
13:00	14:00	13:00	11:00

Note: If adjustment for daylight saving time is in effect, the order entry deadlines are adjusted accordingly.

Delivery alternatives

2/18/2021 • 6 minutes to read • [Edit Online](#)

Sales order takers can use the **Delivery alternatives** page to discover alternative order fulfillment options.

The **Delivery alternatives** page layout gives an overview of all alternative options. It also lets order takers look beyond the current company for fulfillment opportunities. They can now view both intercompany opportunities and opportunities from external vendors. By sorting the options by delivery date, sales order takers can view an intelligent list of delivery alternatives. In addition, parameters help them better manage the suggested deliveries. Because transport time can affect delivery dates, sales order takers can explore the various transportation choices that carriers offer. Because detailed information is shown for each suggestion, order takers can make informed decisions directly from the **Delivery alternatives** page.

Open the Delivery alternatives page

You can open the **Delivery alternatives** page from the sales order line.

1. Select **Products and supply > Delivery alternatives**.
2. Select **Line details > Delivery > Delivery alternatives**.

You can also open the **Delivery alternatives** page by opening the **Sales order processing and inquiry** workspace, and then selecting **Orders and favorites > Delayed order lines > Delivery alternatives**

Note: You can open the **Delivery alternatives** page only if both the following conditions are met:

- All mandatory sales line information is filled in.
- The **Delivery date control** field is set to a value other than **None**.

Delivery date control methods

The delivery date control method determines how the system establishes delivery dates, how delivery alternatives are calculated, and what information is shown. Note that delivery date control takes calendars into consideration. Therefore, the following calendars can affect the suggested receipt date: Warehouse calendar, Transport calendar, Vendor calendar, and Customer calendar. The following table describes each method for delivery date control.

Method	Description
None	<ul style="list-style-type: none">• Delivery alternatives for sales lines aren't supported. This option turns off delivery date control.
Sales lead time	<ul style="list-style-type: none">• Delivery alternatives are calculated based on the predefined sales lead time. The transport days are calculated based on the mode of delivery.• Delivery alternatives include warehouses that have on-hand inventory, and supply/demand orders.

ATP	<ul style="list-style-type: none"> • Delivery alternatives are calculated based on available to promise (ATP) logic. The current availability and expected future availability are considered. The transport days are calculated based on the mode of delivery. • Delivery alternatives include warehouses that have on-hand inventory, and supply/demand orders.
ATP + Issue margin	<ul style="list-style-type: none"> • Delivery alternatives are calculated as for the ATP method, but the issue margin is included in the calculation.
CTP	<ul style="list-style-type: none"> • Delivery alternatives are calculated based on the capable to promise (CTP) logic. MRP explosion is used to determine availability. Note that, at a minimum, CTP offsets delivery dates to the sales lead time. The transport days are calculated based on the mode of delivery. • Delivery alternatives include suggestions for the following warehouses: <ul style="list-style-type: none"> ◦ Current warehouse ◦ Default warehouse ◦ All warehouses that have available on-hand inventory ◦ All warehouses that have supply orders ◦ All warehouses that have active bill of materials (BOM) versions

View information about delivery alternatives

This section describes the information about delivery alternatives that is available on each FastTab of the **Delivery alternatives** page.

The Product FastTab

This FastTab shows a summary of the product and details of the current sales line.

The Delivery alternatives FastTab

This FastTab shows a list of delivery alternatives that is sorted by receipt date. Above the list, you can select which options to base the suggestions on. You can also select the mode of delivery, which determines the transport days. The following options are available:

- **Include other product variants** - This option is available for products that have product variants. It will include delivery alternatives for other variants of the product. This option isn't available for CTP.
- **Include partial quantity** - By default, only suggestions that fulfill the full quantity of the sales line are included. Select this option to include suggestions that only partially fulfill the order line. This option is useful when the customer requests an earlier delivery date and accepts partial delivery.
- **Include later dates** - By default, only suggestions that are better (earlier) than the current dates on the sales line are shown. Select this option to include later dates. This option can be useful in situations where parameters other than the date have priority. For example, a specific vendor or warehouse might be preferred.
- **Mode of delivery** - Select the preferred mode of delivery to optimize transport time and cost. You will immediately see the effect on the suggested delivery alternatives. Therefore, it's easy to compare the alternatives.
- **Include procurement** - When procurement is selected, the suggested delivery alternatives include options

to procure from both external vendors and other companies in the enterprise (intercompany). The **Include procurement** option is supported for ATP and ATP + Issue margin delivery date control. Procurement options from the default purchase vendor for the product and all approved vendors for the product are included.

- For external vendors, the calculation is based on the purchase lead time.
- For intercompany, the calculation considers what is available from the sourcing company, based on delivery date control in the sourcing company.
- **Delivery type** (Relevant for procurement)
 - **Stock** - Products are shipped from the sourcing warehouse to the site/warehouse on the sales line. They are then shipped from that warehouse to the customer.
 - **Direct delivery** - Products are shipped directly from the sourcing warehouse to the customer.

The Availability information FastTab

Information on this FastTab is related to the delivery alternative line that is selected. The following information is shown, depending on the delivery date control for the sales line:

- **Sales lead time**
 - **Available today** - Show the current physical on-hand, physical reserved, and available physical inventory.
 - **Parameters** - Show the inventory unit and sales lead time.
- **ATP and ATP + Issue margin**
 - **Available today** - Show the current physical on-hand, physical reserved, and available physical inventory.
 - **Parameters** - Show the inventory unit and sales lead time.
 - **Future availability** - Show a graphical representation of current and future availability for the selected site and warehouse under **Delivery alternatives**. You can select the chart columns to see more detailed information about the future availability of the product. The slider shows a list of relevant demand and supply orders within the ATP time fence.
- **CTP**
 - **Available today** - Show the current physical on-hand, physical reserved, and available physical inventory.
 - **Parameters** - Show the inventory unit and sales lead time.
 - **Explosion** - Show a supply explosion of the selected delivery alternative. You can use **Setup** to change the fields and inventory dimensions that are shown in the explosion.

The Impact of selected alternative FastTab

This FastTab highlights the impact of the selected delivery alternative. If you select **OK**, the sales line is updated with the highlighted values in the **SELECTED** columns. Note that, if the quantity on the selected delivery alternative is less than quantity on the sales line, a delivery schedule is created, and the order line is split into two lines: one line for the selected quantity and one line for the remaining quantity. You can also update the commercial line so that it matches the schedule lines and affects the pricing.

Direct deliveries

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides information about direct deliveries. Direct deliveries are deliveries that are sent directly from the vendor to your customer.

Direct deliveries save delivery time and reduce the costs that are associated with carrying inventory, because you don't hold the products in your warehouse before you ship them to the customer.

You can create direct deliveries from the **Sales order** page. First, create a sales order and order lines. Then, on the Action Pane, on the **Sales order** tab, select **Direct delivery**. Finally, specify the lines that must be handled as a direct delivery. A link is now created between the sales order lines for the direct delivery and the corresponding purchase order lines.

Note: If part of the ordered quantity has already been delivered, you must split the remaining quantity. Create a new line for the quantity that must be directly delivered, and subtract that quantity from the quantity on the original line. For example, if the original quantity was 15, and five have been delivered, you must create a new line for the remaining quantity, 10, and then reduce the original quantity by that amount.

After you create the direct delivery link between the sales order lines and the purchase order lines, you can update the sales order by using a packing slip. Run either a packing slip update or an invoice update from the purchase order. You must invoice-update the sales order from the **Sales order** page. An invoice update can't cause the quantity on the sales order to exceed the quantity that has been registered as received. For example, a sales order line has 10 pieces, but only five pieces from the sales order line have been updated by using a packing slip. If you select **All** in the **Quantity** list when you invoice-update the sales order, only those items that have been physically received, or updated by using a packing slip, are invoice-updated. The whole sales order line isn't updated.

Delivery date

When you update the **Requested receipt date** field on the sales order line, the **Delivery date** field on the corresponding purchase order line is also updated. Similarly, when you update the **Confirmed** field on the purchase order line, the **Confirmed receipt date** and **Confirmed ship date** fields on the corresponding sales order line are also updated.

Delivery address

Typically, the delivery address for a purchase order is the company's address. However, when you create a direct delivery, you enter the customer's address as the delivery address. If you change the delivery address on a purchase order line that has a delivery type of **Direct delivery**, the delivery address on the corresponding sales order line is also updated. Similarly, if you change the delivery address on the sales order line, the delivery address on the purchase order line is also updated.

Deleting order lines

If you try to delete a sales order line that has a delivery type of **Direct delivery**, a message box states that purchase order lines are attached to the line. If the sales order line has been partially delivered, you can't delete the sales order line or the purchase order lines that are attached to it.

Warehouse

When you create a direct delivery, the items that you sell never physically arrive at your warehouse. However, you must still specify a warehouse on the sales order line. Similarly, picking requirements might be specified on the item model group for the item. However, because the items never physically arrive at your warehouse, these requirements are ignored when the sales order is a direct delivery.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Delivery schedules

2/18/2021 • 2 minutes to read • [Edit Online](#)

Delivery schedules allow you to track order line quantity when you are using multiple deliveries for a single sales order, sales quotation, or purchase order.

Use a delivery schedule when the total quantity on an order or quotation line must be delivered in multiple shipments. Individual shipments are represented by delivery lines. Two or more delivery lines make up one delivery schedule. The delivery lines can have different delivery dates, quantities, modes of delivery, and storage dimensions, such as site and warehouse.

Example of a delivery schedule

Total order (original order line)	600 chairs
Requested delivery schedule	100 chairs per month
Requested time frame for delivery	6 months, on the first day of each month

In this scenario, the customer requests delivery of 600 chairs in batches of 100 chairs over a period of six months. To keep track of the delivery requirements, you create a delivery schedule. On the delivery schedule page, you create six separate delivery lines. Each delivery line contains 100 chairs and indicates the delivery date for those 100 chairs. In this case, each line is offset on the first of the month for six consecutive months.

When you create a delivery schedule, the type of the original order line is automatically changed to **Order line with multiple deliveries**. A line of this type is referred to as a commercial line and is marked by an icon. The delivery line is marked by a different icon. If you change a quantity on a delivery line, the commercial line is updated to the total quantity of the delivery schedule. If a trade agreement has defined a total discount for the order, the delivery schedule ensures that your order is eligible for the total order discount, even when the order is split into separate deliveries.

Orders that have a delivery schedule are processed against the delivery lines. Processing includes the posting of packing slips, product receipts, and invoicing.

Document printouts of orders and quotations that have a delivery schedule show only the delivery lines. They don't show the original lines (commercial lines). **Note:** In addition, only the delivery lines are shown when you perform these actions:

- Post
- Copy pages
- Browse list pages and reports

When you confirm sales quotations, the resulting sales orders show the whole delivery schedule, even the order lines that have multiple deliveries. In addition, the whole delivery schedule is shown on all the major pages, such as sales orders, sales quotations, and purchase orders.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create delivery schedule

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to create a delivery schedule for a sales order. A delivery schedule is used when a quantity on an order or a quotation is requested to be delivered in multiple shipments. You can run this procedure in demo data company USMF or on your own data.

Create delivery schedule

1. Go to All sales orders.
2. Click New.
3. In the Customer account field, enter or select a value.
4. Click OK.
5. In the Item number field, enter or select a value.
6. In the Quantity field, enter a number that is bigger than 1.
7. Click Sales order line.
8. Click Delivery schedule.
 - The Delivery schedule page is the place where you can specify the number of shipments in which the total quantity of the order line will be delivered to the customer.
 - By default, the system copies the total quantity and other delivery details of the original sales line into the first delivery schedule line. In this example, we'll create a schedule for two shipments, with the second shipment's date offset by a week from the first one.
9. In the Quantity field, enter a number that is part of the total quantity.
10. Click New.
11. In the Quantity field, enter the remaining quantity.
12. In the Requested ship date field, enter a date a date that is one week ahead from the date of the first delivery line.
 - The two options on the Charges conversion FastTab control how you want the charges to be distributed across the delivery schedule lines, once they've been assigned to the original order line. If you select Copy gross amounts, the same charge amount is copied to each line. The Allocate to delivery lines option divides the charge equally across the delivery lines.
 - Only fixed charges can be divided, whereas variable charges will still be copied to the lines.
13. Move the cursor away from the second delivery line to update the page.
 - You can keep track of the total quantity that's allocated to the delivery schedule lines by looking at the Total and Remaining fields. When the remaining quantity is zero, the full quantity from the original line has been allocated to the schedule.
14. Click OK.
 - The delivery schedule has now been copied to the order lines.
 - The original order line, referred to as a Commercial line, has been converted to an Order line with multiple deliveries. It is marked with a distinct icon and acts as a header for the delivery lines.
 - The two new lines, referred to as delivery lines, make up one delivery schedule. The order will be processed against these lines and not the original line. If documents such as confirmation slips, picking lists, packing slips, or invoices are printed, only the delivery lines are shown.
 - The delivery lines can have different delivery dates, quantities, modes of delivery, and storage dimensions, such as site and warehouse. However, the product dimensions must always match the ones on the commercial line and can't be changed.

15. In the Quantity field, enter a number that's bigger than the current one.
16. Select the commercial line to see the effect of the quantity recalculation.
17. On the Action Pane, click Pick and pack.
18. Click Post packing slip.
19. Expand the Parameters section.
20. In the Quantity field, select 'All'.
 - Note that the packing slip will be created for the two delivery schedule lines and not the original order line.
21. Select Yes in the Print packing slip field.
22. Click OK.
23. Click Yes.
24. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Working with serialized items

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic explains how you can register serial numbers on packing slips or invoices during the sales process. This functionality is useful if a company wants to capture serial numbers for service and warranty purposes, but doesn't have to maintain serial numbers in inventory from receipt to issue.

Many companies just want to capture serial numbers for service and warranty purposes, and don't have to maintain serial numbers in inventory from receipt to issue. In these scenarios, you can register the serial numbers on the packing slips or invoices when products are sold. If products are later returned, you can trace each product to an invoice to determine whether you sold the product, and whether the service or warranty obligations are valid.

You must enable serial numbers for the sales process by selecting the **Active in sales process** option on the **Tracking dimension groups** page. The following events then occur in Supply Chain Management:

- On the **Serial numbers** FastTab, the **Serial number control** option is selected. When this option is selected, you must register one serial number for each item on the packing slip or invoice.
- All selections on the tracking dimension group for serial numbers are cleared, except the **Blank issue allowed** option. You can select the **Blank issue allowed** option to override the serial number control, and allow products to be packed and invoiced without registering serial numbers.

When do I register serial numbers during the sales process?

You can register serial numbers either on the packing slip for a sales order or on the invoice. When you prepare an invoice for a serialized item that was shipped together with a packing slip, you can select which serial numbers on the packing slip to invoice. The number of registered serial numbers must not exceed the quantity of items that were shipped. If you're creating a partial invoice, you can select fewer serialized items than were registered on the packing slip. When you print a packing slip or an invoice, the serial numbers that were registered are included.

Can I enter serial numbers by scanning them, or do I have to type them?

You can either scan or type serial numbers. When you use a scanner, the scan mode determines whether the serial numbers are added to or removed from the list of serial numbers on the invoice or packing slip. If you want to scan serial numbers by using, for example, a hand-held bar code scanner, configure the scanner to send an Enter or TAB command after the serial number. This command will indicate the end of the data stream. Otherwise, you must press Enter or TAB on the keyboard after you scan each serial number.

If I enable serial numbers for the sales process, do I have to register all serial numbers for all items?

The setup of the tracking dimension group that is assigned to the product determines whether serial numbers must be registered for all items on a packing slip or invoice. When you enable serial numbers for the sales process, the **Serial number control** option is automatically selected. You must then register one serial number, or register a blank registration for an unreadable number, for each item on the packing slip or invoice. If you don't want to require a serial number for each item, select the **Blank issue allowed** option on the tracking dimension group that is assigned to the item. You can then register fewer serial numbers than the quantity of items that are being shipped. If you register more serial numbers than the quantity of items that are being

shipped, you won't be able to post the packing slip or invoice.

Can I register serial numbers for partial invoices and partial shipments?

You can create partial invoices and packing slips for sales orders, and register only the serial numbers for the items that those invoices and packing slips include. If you want to create a partial invoice, and you have more than one packing slip for the sales order, you can include serial numbers from more than one packing slip. However, there can be only one packing slip that doesn't include all serial numbers. For example, if you have three packing slips, and each packing slip includes two serialized items, you can't create a partial invoice for one item from each packing slip.

What do I do when a serial number isn't readable?

If a serial number can't be read or scanned, you can create a blank line for the item by clicking **Not readable** on the **Serial numbers** page. If the serial number becomes available later, you can update the invoice or packing slip. For more information, see the next section, "Can I correct or change the serial numbers I have registered for a sales order?"

Can I correct or change the serial numbers that I have registered for a sales order?

Yes, you can correct serial numbers if the following conditions are met:

- **Invoices** – You can change the serial numbers for items that you haven't yet invoiced. The packing slip is then also updated. However, if a sales order line was corrected by registering a negative quantity, you can't change serial numbers for the sales order line.
- **Packing slips** – You can't partially correct a packing slip line that contains serialized items. You must reverse the full quantity for the line. If a packing slip has been canceled or corrected, you don't have to register the reversed serial numbers again when you create a new packing slip for the same serialized items. The numbers that were registered will be used.

Can I view the serial numbers that were shipped together with a specific packing slip, or that were included on an invoice?

Yes, you can run an inquiry on the packing slip journal line or invoice journal line to view a list of all serial numbers that were included in the document.

Can I view the serialized items that I have on hand?

No, you can't view the serialized items that you have on hand, because serial numbers aren't registered for items until the items are sold.

Can I register serial numbers for catchweight items?

No, you can't register serial numbers for catch-weight items during the sales process. Additionally, if a product is set up as a catch-weight item, you can't assign the product to a tracking dimension group that is set up to use serial numbers only during the sales process.

Can I register serial numbers at the retail POS?

Yes, the retail point of sale (POS) will prompt the user to enter a serial number when the user sells an item that is assigned a tracking dimension group that is set up to use serial numbers only during the sales process.

What security roles are required in order to register serial numbers during the sales process?

This functionality is available to all roles that can maintain sales packing slips and sales invoices. The following duties let workers correct serial numbers, and register blank entries for serial numbers that can't be read or scanned:

- Maintain serial number corrections
- Maintain registration of non-readable serial numbers

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reserve the same batch for a sales order

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article explains how to set up a product to allow reservation of inventory against a single batch of inventory.

Same batch reservation lets you reserve inventory for a sales order line against a single batch of inventory. For example, a customer who orders wallpaper can request that the whole order be filled from the same batch or lot, to avoid inconsistencies among the rolls. To set up a product to use same batch reservation, the following settings must be active in the item model group, tracking dimension group, and storage dimension group that you assign to the product:

- **Item model groups** – The item model group must have the **Same batch selection** and **Consolidate requirement** fields selected in the **Reservation** field group for inventory policies.
- **Tracking dimensions groups** – The tracking dimension group must have the **Coverage plan by dimension** field selected for the batch number.
- **Storage dimensions groups** – The storage dimension group must have the **Coverage plan by dimension** field selected for **Site** and **Warehouse**.

When you reserve inventory for a product on a sales order line that is set up for same batch selection, the system tries to reserve the ordered quantity from a single inventory batch. Any specific batch attribute requirements are also considered. If the quantity can't be filled from a single batch, the **Same batch reservation conflict** page appears. This page describes the issues and also the actions that you can take to continue with the reservation. The following conditions might prevent the batch from being reserved:

- The batch disposition code has **Block reservation** for sales flagged as **Blocked**.
- The batch has expired, based on the expiration date and any applicable customer sellable days. The item can still be considered for reservation if the item model group for the item is First Expiry First Out (FEFO) date-controlled, and if the best-before date is selected as the pick criterion.
- The batch doesn't have enough shelf-life days remaining, based on the expiration date and best-before date, plus any customer sellable days.

For items associated with a storage dimension group that has **Use warehouse management processes** enabled, you can reserve specific batch numbers by using a reservation hierarchy with the batch number inventory dimension defined above the location dimension. The **Batch reservation** page for sales and transfer order lines also lets you select and reserve multiple lines based on the available batch numbers. For more information about what to do if you are using a reservation hierarchy that has the batch number dimension below the location, see [Flexible warehouse-level dimension reservation policy](#).

Sales orders mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Sales orders** mobile workspace. This workspace helps you stay up to date about your sales orders anywhere and anytime.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Sales orders** mobile workspace lets you view detailed information about each sales order. This information includes the status of the order, contact information for the customer, and contact information for the order taker. The **Sales orders** mobile workspace provides an instant view of sales orders. You can view all sales orders, view sales orders by customer, or view information about a specific sales order.

The mobile workspace provides two views to help you analyze sale orders in depth.

View all sales orders

This view lists all sales orders.

- Use one of the following filters to select the sales orders to view:
 - Search by sales order
 - Search by customer account
 - Search by customer name
 - Search by status
 - Search by release status
 - Search by created date and time
- After you select sales orders, you can view the details of specific orders. Specifically, you can view the following information:
 - Customer name and address information
 - Various dates for the sales order, such as the requested ship date and the confirmed ship date
 - Contact information for the order taker
 - Customer contact information
 - Order lines
 - Shipments that show how and when a sales order was shipped

View orders for a customer

This view lists sales orders by customer.

- Use one of the following filters to view orders for a customer:
 - Search by name
 - Search by account
- After you select a customer, you can view the following information:
 - Customer name and group
 - Customer contact information
 - Customer sales orders and details about those sales orders:

- Customer name and address information
- Various sales order dates
- Contact information for the order taker
- Customer contact information
- Order lines
- Shipments that show how and when a sales order was shipped

Prerequisites

The prerequisites differ, based on the version of Microsoft Dynamics 365 that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Sales orders** mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use Dynamics 365 for Operations version 1611 with platform update 3 or later

If Dynamics 365 for Operations version 1611 with platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Sales orders mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none"> 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS). 2. Install the metadata hotfix. 3. Create a deployable package that contains the SCM Mobile model, and then upload the deployable package to LCS. 4. Apply the deployable package.
Publish the Sales orders mobile workspace.	System administrator	See Publish a mobile workspace .

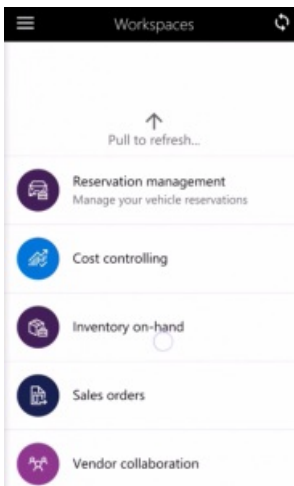

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company is shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View information about sales orders for a customer by using the Sales order mobile workspace

1. On your mobile device, select the **Sales orders** workspace.
2. Select **View orders for a customer**.
3. Use account or customer name information to find the customer.
4. Select the customer.
5. Select **Contact information** or **Sales orders**. If you select **Sales orders**, a list of sales orders for the customer is shown.
6. Select **Sales order**. You can now view information about sales order lines, information about shipments, customer contact information, and contact information for the order taker.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Ship orders as direct deliveries

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic demonstrates how to create a direct delivery for a sales order. You use direct delivery when you want to ship goods to the customer directly from your vendor, instead of shipping them to your own warehouse first. You can run this procedure in demo data company USMF or on your own data. To successfully complete the second sub-task "Create direct deliveries from the workbench", make sure that the item that you choose on the sales order has a default Vendor specified on the Purchase FastTab of the Released product master.

Set an individual order for direct delivery

1. Go to **Navigation pane > Modules > Accounts receivable > Orders > All sales orders**.
2. Select **New**.
3. Enter or select a value in the **Customer account** field, then select **OK**.
4. Enter or select values in the **Item number** and **Site** fields, then select **Save**.
5. On the Action Pane, select **Sales order**, then select **Direct delivery**. The Create delivery page lists all the open sales order lines as copied from the sales order. You can review the order details, and if required, you can modify details such purchase quantity and pricing terms before you create the direct delivery.
6. Select **Yes** in the **Include all** field.
 - If you want to generate a direct delivery for only a subset of the sales order lines, select these individually.
 - The **Vendor account** field may or may not already be populated with a vendor number. If the default vendor is set up for the product (on the associated Item coverage) then this vendor will be copied to the line. Otherwise, you must enter a vendor manually. In this example, we'll select a new vendor in the next step, even if one is already populated.
7. Enter or select a value in the **Vendor account** field, then select **OK**. The message informs you that the purchase order has now been created.
8. Expand the **Line details** section.
9. Select the **Delivery** tab and verify that the **Direct delivery** field is set to **Yes**.
10. On the Action Pane, select **General**.
11. Select **Related orders**.
12. Select the link in the **Purchase order** field.
13. Expand the **Line details** section and select the **Address** tab.
 - The delivery address for this purchase order line is the customer's delivery address and not your company's address.
 - If you change the delivery address on either the purchase order line or the originating sales order line, the address on the corresponding order line will be automatically updated.
14. Select the **Delivery** tab.
 - Like the sales order line, the associated purchase order line type is also set to Direct delivery.
 - The purchase order line's Delivery date and the Confirmed delivery date are set to the Requested receipt date and Confirmed receipt date of the originating sales order line respectively.
 - If you update any of these dates on either the purchase line or the sales line, the dates on the corresponding order will be automatically updated.
 - The purchase order that is set to deliver goods directly to the customer is linked to the originating sales order by means of a special association. This association imposes the rule that the packing slip update of the sales order can't be done from the sales order itself and must be done by using the

purchase order. However, customer invoicing must be carried out from the sales order.

15. On the Action Pane, select **Purchase**.
16. Select **Confirmation**.
17. Select **OK**.
18. On the Action Pane, select **Receive**.
19. Select **Product receipt**.
20. In the **Product receipt** field, type a value.
21. Select **OK**.
22. On the Action Pane, select **General**.
23. Select **Related orders** and highlight the desired record.
 - After the purchase order has been updated as received, or in other words, after the vendor has shipped the goods to your customer's address, the status of the originating sales order is automatically updated to Delivered.
 - The sales order can now be invoiced.
24. Select **OK**.
25. Close the page.
26. Select **OK**. Close the pages and return to the home page.

Create direct deliveries from the workbench

1. Go to **Navigation > Modules > Accounts receivable > Orders > All sales orders**.
2. Select **New**.
3. Enter or select a value in the **Customer account** field, then select **OK**.
4. Enter or select a value in the **Item number** and **site** fields.
5. Expand the **Line details** section, then select the **Delivery** tab. Instead of creating a direct delivery as part of the sales order processing as in the previous procedure, you can choose to hand over this task to a purchasing professional. To include the sales order line in the direct delivery handling process, you must mark the line for direct delivery.
6. Select **Yes** in the **Direct delivery** field.
 - If the item has already been set up for direct delivery by default, the field will automatically be set to Yes at the order line entry. You can set up an item for direct delivery on the Released product's master by setting the Direct delivery option to Yes and selecting a default Direct delivery warehouse.
 - Because the purchase order has not yet been created, the Direct delivery status is set to "To be direct delivered".
7. Select **Save**.
8. Close pages until you return to the home page.
9. Enter **Direct delivery** in the search bar.
 - The Direct delivery page acts as a workbench that provides the purchasing agent with an overview of all the sales order lines that are to be direct delivered and it allows them to create the respective purchase orders. In addition, they can view the open direct delivery orders and the confirmed orders on the Confirmation and Delivery tabs.
 - After you have created a direct delivery order, it automatically moved to the Confirmation tab. You can choose to confirm the order directly from this page. When the purchase is confirmed, it will automatically move to the Delivery tab, from which you can registered its receipt.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Ship sales orders without warehousing

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to update a sales order when products are shipped to the customer. The guide is applicable to the fulfillment flow that is not set up for warehouse management (neither basic or advanced warehousing), and therefore does not require product picking to be registered before shipment. You can run this procedure on your own data or in demo data company USMF. In both cases, before you start this task, create a sales order for an inventoried product with a quantity of greater than 1. To avoid a posting error, you need to check that the product's on-hand quantity in the site and warehouse that you've selected on the order covers the order quantity.

Post packing slip for an order

1. In the navigation pane, go to **Modules > Sales and marketing > Sales orders > All sales orders**.
2. In the list, find and select the order you have created for this task.
3. On the Action Pane, select **Pick and pack**.
4. Select **Post packing slip**.
5. Expand or collapse the **Parameters** section.
6. In the **Quantity** field, select **All**.
 - Other options include **Deliver now** and **Picked**. If the order line is to be shipped partially and the **Deliver now** field on the order line contains a quantity, you would select **Deliver now**. If your organization's fulfillment flow includes picking as a separate process that is managed by and registered with a picking list, you would select **Picked**.
 - Check that the **Posting** option is set to **Yes**.
7. Set the **Print packing slip** option to **Yes**. The **Overview** tab contains a list of packing slips to be generated in this posting. If you are shipping an individual order, there will typically be one packing slip. However, if that order's lines are to be shipped from different sites, posting will automatically be split into the appropriate number of documents. This is a mandatory condition that cannot be changed. Similarly, the posting will also be split into multiple documents if the order's lines are to be shipped to different delivery addresses, and the shipping policy is set up to require a split.
8. On the **Lines** tab, select the row for the order line to be shipped.
9. In the **Update** field, enter a number lower than the original quantity.
10. Select **OK**.
11. Select **Yes**.
12. Close the page.
13. On the Action Pane, select **Options**.
14. Select **Change view**.
15. Select **Header view**.
 - If all of the lines on the order have been fully shipped, the order status changes from Open to Delivered.
 - In this example, the order line has been shipped partially. This is why the the order status remains Open.
 - The **Document status** field is set to Packing slip because at least one of the order lines have been shipped.
16. On the Action Pane, select **General**.
17. Select **Line quantity**.

18. Close the page.
19. On the Action Pane, select **Pick and pack**.
20. Select **Packing slip**. The **Packing slip journal** page contains all the packing slip documents that were generated for your order. You can review details of each document and print them, if you wish.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Automatic allocation of charges

2/18/2021 • 9 minutes to read • [Edit Online](#)

Based on the customer that you're working with or the item that you're selling, you might want to apply specific additional charges. The *charges* feature in Microsoft Dynamics 365 Supply Chain Management helps you automatically allocate charges to purchase orders or sales orders.

Automatic charges, or auto charges, are automatically applied when you create a sales order or a purchase order. You can define auto charges for specific vendors, customers, groups of vendors, or items. You can also define auto charges that apply to all vendors, customers, or items.

Set up charges codes

To allocate charges, you must first define charges codes.

1. Follow one of these steps:

- For purchase orders: Go to **Accounts payable** > **Charges setup** > **Charges code**.
- For sales orders: Go to **Accounts receivable** > **Charges setup** > **Charges code**.

2. On the Action Pane, select **New** to create a charges code.

3. In the header of the new record, set the following fields:

- **Charges code** – Enter a code for the charges.
- **Description** – Enter a description of the charges.
- **Item sales tax group** – Select an item sales tax group, if applicable.
- **Prorate** – Set this option to *Yes* if you want to prorate your charges. This option is available only for sales orders.
- **Maximum amount** – Enter the maximum amount that is allowed for the charges code. This field is used to validate charges for vendor invoices. It's available only for purchase orders.

NOTE

To turn on the functionality for validating charges for purchase orders, go to **Accounts payable** > **Setup** > **Accounts payable parameters**. On the **Invoice validation** FastTab, in the **Invoice validation** section, set the **Enable invoice matching validation** option to *Yes*.

4. The **Posting** FastTab includes **Debit** and **Credit** sections. Set the following fields, depending on the ledger that you want to post the charges to:

- **Type** – Select the type of account that you're posting to (*Ledger, Customer, or Item*).
- **Posting** – Select the type of postings to create (such as *Broker fee* or *Customer settlement*).
- **Account** – Select the account to post the charge for.

5. On the Action Pane, select **Save**.

Create charge groups

Charge groups automatically allocate specific charges to a group of customers or vendors. The following subsections describe how to create and assign these charge groups.

Charge groups for purchase orders

To create charge groups for purchase orders, follow these steps.

1. Go to **Accounts payable > Charges setup > Vendor charges group**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
 - **Charges group** – Enter the name of the charge group.
 - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.
4. Go to **Accounts payable > Vendors > All vendors**, and either open an existing vendor or create a new vendor.
5. On the **Purchase order defaults** FastTab, in the **Purchase order** section, set the **Charges group** field to the charge group that you just created.

Charge groups for sales orders

To create charge groups for sales orders, follow these steps.

1. Go to **Accounts receivable > Charges setup > Customer charge groups**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
 - **Charges group** – Enter the name of the charge group.
 - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.
4. Go to **Accounts receivable > Customers > All customers**, and either open an existing customer or create a new customer.
5. On the **Purchase order defaults** FastTab, in the **Sales order** section, set the **Charges group** field to the charge group that you just created.

Define auto charges

After your charges codes are set up, follow these steps to define the auto charges.

1. Follow one of these steps:
 - For purchase orders: Go to **Procurement and sourcing > Setup > Charges > Automatic charges**.
 - For sales orders: Go to **Accounts receivable > Setup > Charges setup > Auto charges**.
2. In the list pane, in the **Level** field, select the level where your auto charge applies:
 - *Main* – Apply charges to the order header.
 - *Line* – Apply charges to the order lines.
3. Select an existing auto charge to edit it, or select **New** to define a new auto charge.
4. In the **Account code** list, select one of the following values to specify the scope of accounts that will be affected:
 - *Table* – Assign charges to a specific customer or vendor.
 - *Group* – Assign charges to a miscellaneous charges group.
 - *All* – Assign charges to all customers or vendors.
5. In the **Customer relation** or **Vendor relation** field, select a specific customer or vendor if you set the **Account code** field to *Table*. If you set the **Account code** field to *Group*, select a customer or vendor

charges group.

6. In the **Item code** field, select one of the following values to specify the scope of items that will be affected. You can select an item code only when you define auto charges at the line level.
 - *Table* – Assign charges to a specific item.
 - *Group* – Assign charges to an item charges group.
 - *All* – Assign charges to all items.
7. In the **Item relation** field, select a specific item if you set the **Item code** field to *Table*. If you set the **Item code** field to *Group*, select an item charges group.
8. **For sales orders only:** In the **Mode of delivery code** field, select one of the following values to specify the scope of delivery modes that will be affected:
 - *Table* – Assign charges to a specific mode of delivery.
 - *Group* – Assign charges to a mode of delivery group.
 - *All* – Assign charges to all modes of delivery.
9. **For sales orders only:** In the **Mode of delivery relation** field, select a specific mode of delivery if you set the **Mode of delivery code** field to *Table*. If you set the **Mode of delivery code** field to *Group*, select a mode of delivery group.
10. On the **Lines** FastTab, define the charges and the charges rates that will be used when the current auto charge is applied. You can use the toolbar on this FastTab to add as many lines as you require. For each line, set the following fields:
 - **Currency** – Select the currency that should be used to calculate the charge.
 - **Charges code** – Select the code for the charge.
 - **Category** – Select one of the following values:
 - *Fixed* – The charge is entered as a fixed amount on the line. Fixed charges can be used on charges both in the order header and on the order lines.
 - *Pcs* – The charge is based on the unit. These charges can be used only on order lines. They will appear when you calculate the order total.
 - *Percent* – The charge is entered as a percentage on the line. Percentage charges can be used on charges both in the order header and on the order lines.
 - *Intercompany percent* – The charge is entered as a percentage on the line for intercompany orders. Intercompany percentage charges can be used only on order lines.
 - *External* – The charge is calculated by a third-party service that is associated with one or more shipping carriers.
 - **Charges value** – Enter the charge value, based on the category that you selected.
 - **Charges currency code** – Specify a currency for the charge if you want to use a currency other than the currency that you specified in the **Currency** field. You can use a different currency only if the **Debit type** or **Credit type** field is set to either *Ledger account* or *Item* for the selected charges code.
 - **From amount** – Specify a starting amount to apply the auto charge to. In this context, the amount refers to the order total.
 - **To amount** – Specify the ending amount to apply the auto charge to. In this context, the amount refers to the order total.
 - **Sales tax group** – Specify a sales tax group.
 - **Site and Warehouse** – Specify a site and warehouse if charges should be applied only for a

specific site and warehouse.

- **Keep** – Select this check box to keep the charges transactions after invoicing is completed, so that the charge will be applied every time that you create a new invoice for the selected customer account.

11. **For sales orders only:** If you want to calculate tiered charges, see [Tiered charges on sales orders](#) for information.

Allocate charges from the header to a line

The following procedure shows how to allocate header-level charges to a line. Before you start this procedure, you should already have a header-level charge of the *fixed amount* type and an order where that charge is applied. Additionally, the order should already include at least one line item.

1. Open the purchase order or charge order.
2. On the Action Pane, follow one of these steps:
 - For purchase orders: On the **Purchase** tab, in the **Charges** group, select **Allocate charges**.
 - For sales orders: On the **Sell** tab, in the **Charges** group, select **Allocate charges**.
3. In the **Allocate charges to order lines** dialog box, set the following fields:
 - **Charges allocation** – Select one of the following values to specify how the charges should be allocated:
 - *Net amount* – Allocate charges according to each line amount relative to the total net amount.
 - *Quantity* – Allocate charges according to the number of units for each line relative to the total number of units.
 - *Per line* – Allocate charges equally among the total number of lines.
 - **Allocate charges to lines** – Select a value to specify whether charges should be allocated to all lines, to positive lines only, or to negative lines only.
 - **Allocate all** – Select this check box to allocate charges to order lines even if the charges code has a debit type other than *Item*.
 - **Received** – Select this check box to allocate charges only to received order lines.
 - **Stocked** – Select this check box to allocate charges to only inventoried order lines.
 - **Show selections and clear specific lines** – Select this check box to exclude specific lines from this allocation. When you select this check box, the **Choose lines to exclude from allocation** grid is opened. This grid includes only lines that match the criteria that are defined by the **Allocate charges to lines** and **Stocked** settings. For example, if you set the **Allocate charges to lines** field to *Positive lines* and select the **Stocked** check box, the grid shows only lines that are both positive and inventoried. In addition, the grid automatically filters out any lines that the full quantity has already been received for. While the grid is open, clear the **Include** check box for each line that should be excluded from allocation.
4. Select **Allocate** to apply your settings and close the dialog box.

IMPORTANT

When you work with the **Choose lines to exclude from allocation** grid, be sure to leave the grid open until you select **Allocate**. If you close the grid before you select **Allocate**, your settings in the grid will be lost. Therefore, charges will be allocated based on the criteria that you previously defined.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a purchase order from a sales order

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows you how to create a purchase order that is based on a sales order. The product's quantities on the purchase order are then designated to fulfill the demand of the originating sales order. Fulfilling sales demand this way is an alternative to a more comprehensive and optimized method of Distribution Requirements Planning. You can run this procedure in demo data company USMF or on your own data.

Create a purchase order from a sales order

1. Go to **Navigation pane > Modules > Sales and marketing > Sales orders > All sales orders**.
2. Click **New**.
3. In the **Customer account** field, click the drop-down button to open the lookup.
4. In the list, find and select the desired record.
5. Click **OK**.
6. In the **Item number** field, click the drop-down button to open the lookup.
7. In the list, find and select the desired record. If you're using USMF, you could select D0001.
8. In the **Quantity** field, enter a number.
9. Click **Add line**.
10. In the **Item number** field, click the drop-down button to open the lookup.
11. In the list, find and select the desired record. If you're using USMF, you could select T0020.
12. In the list, click the link in the selected row.
13. In the **Quantity** field, enter a number.
14. Click **Save**.
15. On the **Action Pane**, click **Sales order**.
16. Click **Purchase order**. The **Create purchase order** page lists all the open sales order lines which have been copied from the sales order. You can review the order details, and if required, you can modify selected details such purchase quantity and pricing terms, before you create the purchases.
17. Select the **Include all option**.
 - If you want to generate purchase orders for only a subset of the sales order lines, select these individually.
 - The **Vendor account** field may or may not already be populated with a vendor number. If the default vendor is set up for the product (on the associated Item coverage) then this vendor will be copied to the line. Otherwise, you must enter a vendor manually. In this guide, regardless of whether the **Vendor account** field already contains a value or not, the following steps instruct you to select a new vendor which is different for each line.
18. In the **Vendor account** field, click the drop-down button to open the lookup.
19. In the list, find and select the desired record.
20. In the list, click the link in the selected row.
21. Select the second order line.
22. In the **Vendor account** field, click the drop-down button to open the lookup.
23. In the list, find and select the desired record.
24. In the list, click the link in the selected row.
25. Click **Validate**.
26. Click **OK**. The message informs you that one or more purchase orders have been created. The system

generates a separate purchase order for each vendor that you specified for the sales order lines. This means that if several sales order lines are to be supplied by the same vendor, a single purchase order with multiple lines will be generated.

Review purchase orders created from sales orders

1. On the **Action Pane**, click **General**.
2. Click **Related orders**. The **Related orders** page lists all the orders that were created from the sales order. In this example, there are two purchase orders generated for two different vendors respectively.
3. Click to follow the link in the **Purchase order** field. Each purchase order line is associated with the sales order line that led to the purchase. The relation to the sales order is indicated on the **Product tab** in the **Line details** Fasttab, in the **Reference type**, **Reference number**, and **Reference lot** fields.
4. Expand or collapse the **Line details** section.
5. Click the **Product** tab.
 - The **Reference lot** guarantees that the costs from the current purchase are charged on the attached sales order.
 - You can navigate to the originating sales order by opening the link in the **Reference number** field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create sales orders

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows you how to create a sales order. You can use the procedure in demo data company USMF. Sales orders are typically created by a sales order processor.

Enter sales order header details

1. Go to **Navigation pane > Modules > Sales and marketing > Sales orders > All sales orders**.
2. Select **New**.
3. In the **Customer account** field, select the drop-down button to open the lookup.
4. In the list, find and select the customer record.
 - For this example, select customer number US-004.
5. Select **OK**.

Enter sales order line details

The products sold by your organization may come in variants differentiated by dimensions, such as configuration, color, size, and style. Also, products may be set up to use storage dimensions, such as site, warehouse, and pallet, and tracking dimensions, such as batch and serial numbers. When these dimensions are assigned, you must select the values for those dimensions on the order line. To improve order entry efficiency, you may want to add the respective dimension fields to the order grid.

1. Under the **Sales order lines** section, select the **Sales order line**.
2. Select **Dimensions**.

For this example, select the Color, Site and Warehouse dimensions. The dimensions you select here will appear in the sales order grid. If you want your selections to persist, set the **Save setup** option to Yes.

3. Select **OK**.
4. In the **Item number** field, select the drop-down button to open the lookup.
5. For this example, select item number T0004.
 - If the item is part of a sales category, the item name will automatically appear in the Sales category field.
 - If product dimension fields already contain a value, this is because the value was copied from the product record where it is defined as a default product dimension. You can change the default value at any time.
6. In the **Color** field, select the drop-down button to open the lookup.
7. In the list, find and select the desired record.
8. In the **Quantity** field, enter a number.
 - If the item is sold in different units than when it's purchased, produced, and stored, and a sales unit of measure is set on the product record, this value will be shown in the **Unit** field. You can change the value at any time.
 - If the **Site** field already contains a value, the value was copied from the order header or from the order settings that are associated with the product. You can change the value at any time. If the field is

empty, select a value.

- If the **Unit price** field already contains a value, the value was copied from a valid trade agreement, or from the product record. (The unit price can also originate from a sales agreement, but the process for creating sales orders from sales agreements is different to the one shown here.) If the field is empty, enter a value.
- The **Discount** field contains a discount amount per product unit. To calculate the total line discount amount, the discount value is multiplied by line quantity. If the **Discount** field already contains a value, the value was copied from a valid trade agreement. If the field is empty, and you want to give the customer a line discount, enter a value.
- The **Discount percent** field contains a percentage value by which the total line gross amount is to be reduced. If the **Discount percent** field already contains a value, it was copied from a valid trade agreement. If the field is empty, and you want to give the customer a line discount, enter a value.
- The **Net amount** field contains a value that is calculated based on the line's quantity and unit price adjusted by discounts. You can override the calculated value to a different one.

Review the order totals

1. On the **Action Pane**, select **Sales order**.
2. Select **Totals**.

The **Totals** page displays details about the entire order. This includes the subtotal amount, which is a sum of all line net amounts adjusted for eventual line discounts, the total invoice amount, which is a subtotal amount adjusted for eventual order-level discount, charges, and sales tax, the customer credit limit situation, and more. The invoice amount is the amount that will appear on the customer's invoice document.

3. Select **OK**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage order holds

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to place customer sales orders on hold, how to work with order hold checkouts, and how to remove order holds. An order might be placed on hold for a variety of reasons. For example, you might hold an order until a customer address or payment method can be verified or until a manager can review the customer's credit limit. While the order on hold, it cannot be processed by the warehouse for shipping.

You can run this procedure in demo data company USMF or on your own data.

Set up order holds

1. Go to **Navigation pane > Modules > Sales and marketing > Setup > Sales orders > Order hold codes**.
2. Click **New**.
3. In the **Hold code** field, type a value. For example, type 'Call back'.
4. In the **Description** field, type a value.
 - For example, Order held waiting for customer callback.
 - Optionally, select the **Remove reservations** check box to remove any physical reservations from the order when this hold code is added.
5. Click **Save**.

Place order on hold

1. Go to **Navigation pane > Modules > Sales and marketing > Sales orders > All sales orders**.
2. Click **New**.
3. In the **Customer account** field, enter or select a value.
4. Click **OK**.
5. In the **Item number** field, enter or select a value.
6. In the **Quantity** field, enter a number.
7. On the **Action Pane**, click **Sales order**.
8. Click **Order holds**.
9. Click **New**.
10. In the **Hold code** field, select the code you have created in the previous subtask.
11. Click **Save**.
12. Close the page.
13. Go to **Sales and marketing > Sales orders > All sales orders**.
14. In the list, mark the selected row. Orders that are currently on hold have the "Do not process" and "Hold" fields marked.
15. On the **Action Pane**, click **Pick and pack**.

Manage order holds

1. Go to **Sales and marketing > Sales orders > Open orders > Order holds**. **Order holds** page functions as a workbench where you can get an overview of all the current and processed holds, and handle them and associated sales orders.

2. In the list, mark the selected row.
3. On the **Action Pane**, click **Hold checkout**.
4. Click **Check out**.
5. In the list, unmark the selected row. The **Checkout out to** field now shows your user ID.
6. Click **Clear checkout**.
7. On the **Action Pane**, click **Clear hold**.
 - When you are ready to remove the hold and allow the order to proceed to the next fulfilment step, you must clear the hold. If the order requires no changes, you can run the Clear holds action. However, you can use the Clear and modify action if, when clearing a hold, the order has to be updated.
 - The **Clear and submit** action is only applicable when you use Call center functionality.
8. Click **Clear holds**. The hold has now been cleared from the order and removed from the list of Active holds. To see all the holds or their subset according to a specific status, change the value in the Show field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Confirm sales orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to confirm sales orders. You'll be shown how to confirm a single order, and how to confirm multiple orders at once. These tasks would typically be carried out by a sales order processor. You can use this procedure in demo data company USMF or on your own data. Before you start, make sure there are several open sales orders for the same customer. If you're using USMF, you can use customer US-027.

Confirm a single sales order

1. Go to **Navigation pane > Modules > Sales and marketing > Sales orders > All sales orders**.
2. In the list, find and select the order that you want to confirm.
3. Click the link on the sales order number to open the selected order.
4. On the **Action Pane**, click **Sell**.
5. Click **Confirm sales order**.
6. Expand the **Parameters** section. Make sure that the **Posting** option is set to 'Yes'.
7. Set the **Print confirmation option** to 'Yes'. The **Check credit limit** field specifies the method that's used to calculate a customer's remaining credit. By default, it's copied from the Accounts receivable parameters page. If you want to skip the credit limit check when confirming a specific sales order, set the **Check credit limit** to 'None'. However, you should be aware that even with if this field is set to 'None', the credit limit check will still be performed if the **Mandatory credit limit** option is selected on the customer master data.
8. Click **OK**.
9. Click **Yes**.
10. Close the page.
11. On the **Action Pane**, click **Options**.
12. Click **Change view**.
13. Click **Header view**. When an order is confirmed, the **Document status** is set to 'Confirmation'.
14. On the **Action Pane**, click **Sell**.
15. Click **Sales order confirmation**.
16. Close the page.

Confirm multiple sales orders at once

1. Go to **Sales and marketing > Sales orders > Order confirmation > Confirm sales order**.
2. Click **Select**.
3. In the list on the **Range** tab, find and select the record that references the **Customer account** field.
4. In the **Criteria** field, click the drop-down button to open the lookup.
5. In the list, find and select the customer account that has multiple orders which you want to mass confirm. If you're using USMF, you can select account US-027.
6. Click **OK**.
 - The **Overview** tab displays a list of the orders that match the query criteria. These will be included in the confirmation.
 - The **Summary update for** field in the **Parameters** section specifies the parameter by which multiple orders are to be summarized into one confirmation document. By default, the option is copied from the **Default values for summary update setting** on the **Accounts receivable parameters** page.
7. In the **Summary update for** field, select 'Order'. The minimum parameters that are required to create

summary updates are **Invoice account** and **Currency**. This means that summary updates that have different invoice accounts and different currencies are not allowed. Additional parameters can be set up in the **Summary update parameters** page which is accessible from the **Accounts receivable parameters** page.

8. In the **Sales order** field, click the drop-down button to open the lookup.
9. In the list, select the order number that you want to be the summary order.
10. Click **Arrange**.
11. Click **OK**.
12. Click **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot sales orders

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with sales orders.

The tax information isn't updated if I change the location on a sales order header.

Issue description

If the site, warehouse, or delivery address is changed either on a sales order header or at the line level, the case tax information isn't automatically updated for the lines.

Issue resolution

This behavior is by design. The issue occurs because the delivery address, site, and warehouse aren't automatically changed at the line level either. You must update them manually.

If there are two trade agreements for the same period or overlapping periods, the same agreement line is always selected.

Issue description

If two trade agreements are defined for the same period or overlapping periods, the same trade agreement seems to be selected every time when you create sales order lines that contain those items.

Issue resolution

If there is more than one trade agreement for a given date, the trade agreement that has the lowest price is always selected. For more information, download the following white paper: [Trade agreements in Microsoft Dynamics AX 2012](#).

Can I link a purchase order to a sales order to fulfill demand?

You can create a purchase order from a sales order. For more information, see [Create a purchase order from a sales order](#).

I can't cancel or delete a return order or a sales order.

You can cancel only sales orders and return orders that are in a *Created* state. For more information, see [Cancel a return order](#).

When I try to cancel a sales order, I receive a "Reservations cannot be removed because there is work created which relies on the reservations" error.

Error code: WAX4661

If work is associated with a sales order, you can't cancel the sales order until the work is canceled and reversed. This requirement applies even if the work that is associated with the sales order is closed.

To fix this issue, follow these steps.

1. Cancel the work, and put inventory back into the desired location. Go to the relevant load of the sales order, and select either **Reduce picked quantity** on the load line or **Reverse work** on the Action Pane.

The work now has a status of *Canceled*, and new inventory movement work is automatically created and processed to put inventory back into the location that was described at the time of reversal.

2. Delete the load. The shipment is also deleted.
3. You should now be able to go to the sales order and cancel it.

I can't cancel an intercompany purchase order that is linked to a sales order.

Issue description

If you try to cancel an intercompany purchase order that is linked to a sales order, you might receive the following error message: "Quantity cannot be reduced because the remaining update quantity changes sign."

Issue resolution

This issue was fixed in Microsoft Dynamics 365 Supply Chain Management version 10.0.13. In that version and later versions, you can now cancel an intercompany purchase order that is linked to a sales order.

Can I restore an invoiced sales order that was deleted?

Issue description

An invoiced sales order was deleted by mistake, and you want to restore it or view its details.

Issue resolution

If the deleted sales order has already been invoiced, go to **Customer account > Transactions > Original document > View details**. Find the invoice that you're looking for, and select it to view its details. These details include the sales order reference. You should also be able to access the sales order details from that page.

The deadline of a sales order header can't be found in the SalesOrderHeaderV2Entity data entity.

The deadline field doesn't exist on the *SalesOrderHeaderV2Entity* entity.

I must delete orphaned sales order records.

To clean up orphaned sales order records, run the *Sales order deletion* periodic job by going to either of the following places:

- Sales and marketing > Periodic tasks > Clean up > Delete sales orders
- Retail and commerce > Retail and commerce IT > Clean up > Delete sales orders

Is there a way to calculate commissions on invoices that have already been posted?

Supply Chain Management doesn't currently support the calculation of commissions for posted invoices.

A bundle item isn't supported in an intercompany process.

The bundle item isn't available for the purchase order because, if you examine the sales order lines for the bundle item, you will notice that the quantity is 0 (zero) and the status is *Canceled*. This behavior is by design. The sales order buys only the components of the bundle item. It doesn't buy the bundle item itself.

If you must buy a bundle, consider whether you have to mark it as bundle item, because this functionality is designed for revenue recognition scenarios. For more information about bundle items, see [Bundles](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Sales agreements overview

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic provides information about sales agreements. A sales agreement is a contract that commits the customer to buy products in a specific quantity or for a specific amount over time, in exchange for special prices and discounts.

A sales agreement is a contract that commits the customer to buy products in a specific quantity or for a specific amount over time, in exchange for special prices, special discounts, and other special terms, such as payment and delivery terms. The prices and discounts of the sales agreement override the prices and discounts that are stated in any trade agreements that exist.

The validity period of a sales agreement is defined by the **Effective date** and **Expiration date** fields on the agreement. A customer's sales order qualifies for the agreement terms if the requested ship date of the order is within the validity period. All sales order lines that are linked to a sales agreement contribute to fulfillment of that sales agreement.

You can create a sales order directly from a sales agreement by using the **Release order** action. Alternatively, you can select an effective sales agreement when you're taking orders (see the "Applying sales agreements in the ordering process" section of this article).

[Note!] In earlier versions, sales agreements were referred to as blanket sales orders.

Commitment types

Each line in a sales agreement expresses a commitment to sell something. In general, there are two categories of commitment:

- **Value commitment** – The customer agrees to buy products for a specific amount.
- **Quantity commitment** – The customer agrees to buy a specific quantity of products.

In addition, a contract can commit the customer to buy a specific product or products in a product category. By combining these two factors (value versus quantity, and specific products versus product categories), we get four types of commitment:

- **Product quantity commitment** – The customer agrees to buy a specific quantity of products. Lines that use this commitment type are defined by an item number, and by the quantity and unit that were agreed on. The **Amount** field isn't available.
- **Product value commitment** – The customer agrees to buy specific products for a specific amount. Lines that use this commitment type are defined by an item number and the amount that was agreed on. The **Quantity** and **Unit** fields aren't available.
- **Product category value commitment** – The customer agrees to buy products from a specific sales category for a specific amount. Lines that use this commitment type are defined by a sales category in the hierarchy of sales categories and an amount. The **Quantity** and **Unit** fields aren't available.
- **Value commitment** – The customer agrees to buy any product or products in any procurement category for a specific amount. The **Quantity** and **Unit** fields aren't available.

Lines in the same sales agreement can have different types of commitments.

Pricing terms for sales agreements

Pricing terms can vary, depending on the type of commitment. On a sales order that is linked to a sales agreement, the pricing terms from that sales agreement override any other pricing terms that apply based on trade agreements. The following table describes the price-related fields that are affected by each commitment type. "Yes" indicates that the field can be updated on an order line.

COMMITMENT TYPE	UNIT PRICE	PRICE UNIT	DISCOUNT PERCENT	CASH DISCOUNT AMOUNT
Product quantity commitment	Yes	Yes	Yes	Yes
Product value commitment			Yes	
Product category value commitment			Yes	
Value commitment			Yes	

Policies for sales agreements

The following policies affect the way that the link between a sales agreement commitment and the corresponding sales order lines works:

- **Max is enforced** – The total quantity or amount for all order lines can't exceed the quantity or amount that is specified on the related commitment.
- **Price and discount is fixed** – The price on an order line and the price on the related commitment can't differ. If the price is changed on the order line, the link to the commitment is broken. If the link is broken, the order line doesn't contribute to fulfillment of the commitment.
- **Minimum release amount and Maximum release amount** – If an amount is specified, a message is displayed if you make any change to an order line that causes the order line to differ from the related commitment.

Fulfillment calculations for sales agreements

The **Fulfillment** tab on the **Line details** FastTab on the **Sales agreements** page shows fulfillment quantities and amounts.

In the **Fulfillment** area, you can view the total quantities and amounts for all order lines that are linked to the specified sales agreement. You can also view the remaining amount or quantity that is required to fulfill the commitment.

In the **Agreement** area, you can view the quantities and amounts from the specified sales agreement. These quantities and amounts are the total quantities and amounts that were committed.

Confirmations and version history for sales agreements

When you confirm a sales agreement, the current version of the sales agreement is stored in a history table. If you change the sales agreement, you can confirm it again to store another version of the sales agreement in the history.

If you don't confirm a sales agreement, you can still use it to create sales orders. However, history information for the sales agreement isn't stored.

You can preview or print all revisions of the confirmations. You can then share the revisions with your customer

to obtain approval.

Applying sales agreements during the ordering process

If you don't release sales orders directly for a sales agreement, you can still link a sales agreement to an order during the order entry process. When you're creating a new sales order and select a sales agreement, the terms of that agreement, such as the payment terms, delivery terms, and delivery address, are applied to the order header, and the link between the agreement and the order is created. Then, on the order lines, when you can select products and categories that are specified in the sales agreement, the prices and discounts are copied from that agreement. The same sales order can include both lines that aren't related to a sales agreement and lines that have a commitment for a sales agreement.

Modifying sales orders that are linked to sales agreements

If you've created (released) a sales order against a sales agreement, some fields on that sales order lines can be modified only if you remove the link to the associated sales agreement lines. The following table lists some of these fields.

FIELD	DESCRIPTION
Requested ship date	If you change the requested ship date to a date that is earlier than the Effective date value on the sales agreement line, you must remove the link to the sales agreement line before you can save the changed ship date. If you change the requested ship date to a date that is later than the Expiration date value on the sales agreement line, you must remove the link to the sales agreement line before you can save the changed ship date.
CurrencyDiscount, percentDiscountUnit, pricePrice, unitNet amount	If you change the value in any of these fields, and if the Price and discount is fixed check box is selected on an associated sales agreement line, a message box prompts you to save the change. Click Yes to remove the link to the sales agreement line and recalculate the price. Click No to remove the link to the sales agreement line without recalculating the price.
Net amount	If you specify an amount that exceeds the amount that is specified on a sales agreement line where the Max is enforced check box is selected, a message box prompts you to save the changed amount. Click Yes to remove the link to the sales agreement line and recalculate the price. Click No to remove the link to the sales agreement line without recalculating the price.
Quantity	If you specify a quantity that exceeds the quantity that is specified on a sales agreement line where the Max is enforced check box is selected, a message box prompts you to save the changed quantity. Click Yes to remove the link to the sales agreement line and recalculate the price. Click No to remove the link to the sales agreement line without recalculating the price.

Returning an item that was ordered from a sales agreement

When a customer returns a product that was ordered from a sales agreement, Supply Chain Management can find and automatically update the related sales agreement commitment to reflect the change in quantity or

amount. By creating a return order that is based on the original sales order that is linked to a sales agreement, you establish a relation between the sales agreement commitment, the sales order line, and the return order invoice.

If you don't want to deduct the returned item quantity from the sales agreement commitment, you can use the **Remove link** control on the **Return order** page to remove the link between the return order and the sales agreement commitment. If you must reestablish the link later, click **Create link**.

Note: A return order can be linked to only one sales agreement. If a customer returns multiple products that were ordered from multiple sales agreements, you must create a new return order for each product and create a link to the corresponding sales agreement.

Automatic search for sales agreements

In some situations where sales orders are created indirectly, such as when you create a credit note or intercompany sales orders, you can control whether the system automatically searches for applicable sales agreements.

Financial dimensions on sales agreements

You can copy financial dimensions to either document headers or individual lines of a sales agreement. You can change the dimensions on an agreement header or agreement line at any time. In this case, the dimensions are automatically copied to the release header or release line of release orders.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Enter sales agreements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create a sales agreement that commits one of your customers to buy a product for an agreed amount over time in exchange for special discounts. You can run this procedure in demo data company USMF or on your own data.

Set up sales agreement header

1. In the navigation pane, go to **Modules > Sales and marketing > Sales agreements > Sales agreements**.
2. Select **New**.
3. In the **Customer account** field, select the desired record from the drop-down menu.
4. In the **Sales agreement classification** field, select the desired record from the drop-down menu.
5. Expand the **General** section.
6. In the **Default commitment** field, select **Product value commitment**. A commitment type is a mandatory criterion that you must assign to the agreement to define how the agreement contract will be fulfilled. The four predefined types let you set up the customer's commitment target, expressed as a quantity or a value. The quantity commitment type can only be applied to a specific product, but the value-based types are applicable to sales of both specific and non-specific products.
7. In the **Expiration date** field, set the date to a future date when you want the agreement to expire.
8. Select **OK**.

Set up product value commitment lines

1. Select **Add line**.
2. In the **Item number** field, select the desired record from the drop-down menu. The type of commitment that you have chosen for the agreement affects the kind of information you can enter for the agreement lines. For example, for a value-based agreement you must specify the total net amount (in the agreed currency) for which the customer commits to buy goods from you. In this example the **Quantity** and **Unit** fields on the line are unavailable because you're creating an agreement for the customer to buy a specific value of a product.
3. In the **Net amount** field, enter the monetary amount that the customer has committed to buying.
4. In the **Discount percent** field, enter a percentage value that will apply to the customer's sales order lines that are linked to this agreement.
5. Expand the **Line details** section.
6. Select **Yes** in the **Max is enforced** field.
 - Selecting **Max is enforced** means that the total amount of all the sales order lines that use the commitment's special prices, discounts and/or payment terms must not exceed the amount specified on the commitment.
 - The minimum and maximum release amounts specify a range of values that must be sold on each sales order that uses the selected agreement.
7. Expand the **Sales agreement header** section. Unless the status of the agreement is set to **Effective**, sales orders cannot be associated with the agreement and can therefore not contribute to the fulfillment of that agreement. You can change the status manually at this stage. However, the status would normally be changed when you confirm the agreement for the customer.
8. On the Action Pane, select **Sales agreement**.

9. Select **Confirmation**. Make sure that the **Mark agreement as effective** option is set to **Yes**.
10. Select **Yes** in the **Print report** field.
11. Select **OK**.
12. Close the page. The agreement is now effective. You can start linking the customer's orders to the agreement to offset against the committed target.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Fulfill sales agreements

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows you how to fulfill a sales agreement by associating sales orders with it. You can run this procedure in demo data company USMF or on your own data. Before starting this guide, make sure you have an effective sales agreement of type "Product value commitment". Alternatively, you can run the task guide called "Create sales agreements".

Release a sales order from the agreement

1. Go to Sales and marketing > Sales agreements > Sales agreements.
2. In the list, open the agreement against which you want to release the order.
3. On the Action Pane, click Sales agreement.
4. Click Release order.
 - As the text on top of the Create release order page points out, the details required for the sales order lines will differ depending on whether the agreement is quantity- or value-based.
 - The agreement in this guide is of type "Product value commitment". This is why the Lines section of this page is blank. If the commitment was based on quantity, the line information would be copied from the agreement.
5. Click Create.
 - The message informs you that a sales order has been created. Since the order does not contain any lines, you must add order line details to complete the release process.
6. Close the page.
7. Close the page.
8. Go to Sales and marketing > Sales orders > All sales orders.
9. In the list, find and open the order that was created as the result of the order release in the previous task.
10. Click Add line.
11. In the Item number field, click the drop-down button to open the lookup.
12. In the Item number field, type or select the item that is specified on the associated sales agreement.
13. In the Quantity field, enter a number.
 - Make sure that you enter a quantity that brings the Net amount under the value of the associated sales agreement.
 - Notice that because the sales order is linked to the agreement, the negotiated discount percent is applied to the order line.
14. Click Update line.
15. Click Attached.
 - The Attached agreement page shows the ID and terms of the agreement from which the line is released.
16. Close the page.
17. On the Action Pane, click General.
18. Click Attached sales agreement.
19. Expand the Line details section.
20. Click the Fulfillment tab.
 - The Fulfillment tab shows a summary of all the sales order lines that are associated with this commitment, and their fulfillment state, as well as the amount or quantity that has not yet been

released.

21. Close the page.
22. Close the page.
23. Close the page.

Apply sales agreement in the order process

1. Go to Sales and marketing > Sales orders > All sales orders.
2. Click New.
3. In the Customer account field, click the drop-down button to open the lookup.
4. In the list, find and select the customer specified on the sales agreement.
5. In the list, click the link in the selected row.
6. Expand the General section.
7. In the Sales agreement ID field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
9. Click Yes.
10. Click OK.
11. In the list, mark the selected row.
12. In the Item number field, click the drop-down button to open the lookup.
13. In the Item number field, type or select the item that is specified on the associated sales agreement.
14. In the list, click the link in the selected row.
15. Click Save.
16. On the Action Pane, click Pick and pack.
17. Click Post packing slip.
18. Expand the Parameters section.
19. Select Yes in the Posting field.
20. Click OK.
21. Click OK.
22. On the Action Pane, click General.
23. Click Attached sales agreement.
24. Click the Fulfillment tab.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Generate and process customer rebates

2/18/2021 • 5 minutes to read • [Edit Online](#)

This procedure demonstrates how to process customer rebates from claim generation to the point of passing them as accruals to Accounts receivable. It walks you through a specific example to explain how the various conditions on the rebate lines affect the final amounts that will be credited to the customer. You need to use the USMF demo data company, and carry out the following tasks before you start the guide: (1) Go to the Accounts receivable parameters page, and expand the Prices tab and then the Price details tab, and check that the Enable price details option is set to Yes. (2) Go to the Rebate agreements page and select the customer rebate agreement: USMF-000001. If the Workflow approval status field is not set to Approved, you need click Validation on the Action Pane to approve it.

Review a customer rebate agreement

1. Go to **Navigation pane > Modules > Sales and marketing > Customer rebates > Rebate agreements**.
 - The next few steps look at the conditions of agreement USMF-000001. This makes it easier to understand how the customer credit values are calculated later in the procedure.
 - The agreement is for an individual customer, in this example customer US-009.
 - Rebates are given to the customer when they purchase a specific product. In this case, the product has item number T0020.
 - The customer's sales performance, against which the rebate amounts are estimated, is to be accumulated on a weekly basis.
 - The setting for "Price taken from" is Gross, which means that line's sales amount on which basis the claim is estimated is not reduced by the line discount.
 - The Rebate line break type field shows the method for calculating rebates. In this case, the sales target against which the rebates are to be estimated is set to Quantity.
 - The agreement's lines specify the rebate amount type, the actual rebate value, and the thresholds. In this example, the customer will qualify for a rebate of 20 USD per unit sold, if their weekly purchases of the product fall within 1 to 50 units; and a rebate of 40 USD per unit sold, if they purchase above 50 units.
2. Close the page.

Generate rebate claims

1. Go to **Navigation pane > Modules > Sales and marketing > Sales orders > All sales orders**.
2. Click **New**. To mimic the way in which rebate claims would be generated, the next task is to create a sales order, where the product and quantity will qualify the customer in question for a rebate.
3. In the **Customer account** field, enter or select a value.
4. Click **OK**.
5. In the **Item number** field, enter or select a value.
6. Set **Quantity** to '40'.
7. Under the **Sales order lines** section, click **Sales order line**.
8. Click **Price details**. If you don't see this option, it's because you didn't set the **Enable price details option** to 'Yes' before you started the guide.
9. Expand the **Rebates** section. The **Rebates** tab lists all the rebate agreements that are applicable to the current order line and shows the estimated rebate amount. Note that the displayed amounts are only

indications of what future rebate claims may be. The actual rebate amounts may be different depending on: the total sales volume achieved by the customer under a periodic rebate agreement; whether the customer had returned all or partial quantities; and whether the applicable sales order was invoiced.

10. Close the page.
11. Click **Add line**.
12. In the **Item number** field, enter or select a value.
13. Set **Quantity** to '60'.
14. Click **Save**.
15. On the **Action Pane**, click **Invoice**.
16. Click **Invoice**.
17. Expand the **Parameters** section.
18. In the **Quantity** field, select 'All'.
19. Click **OK**.
20. Click **OK**.

Process rebate claims

1. Go to **Navigation pane > Modules > Sales and marketing > Customer rebates > Rebates**.
 - The Rebates page acts a workbench in which you can review, approve, and process rebate claims. You'll now process the claims that were created as a result of invoicing a sales order for customer US-009, who is the subject of the rebate agreement USMF-000001.
 - The first line represents a rebate claim for 800 USD, which is based on the sales of 40 units of product T0020, calculated at 20 USD per unit. This matches the conditions of the first quantity break in the rebate agreement.
 - The second claim is for 2,400 USD, which is based on the sales of 60 units of product T0020, calculated at 40 USD per unit, as per the second quantity break in the agreement.
 - Both claims are in the "To be calculated" state. This means that they are associated with an agreement that tracks the customer's sales performance on periodic basis and that they have to be re-calculated to account for the total sales volume within the respective period.
2. Click **Cumulate**.
3. In the **Customer** field, enter or select a value.
4. In the **Start date** field, select today's date.
5. Click **OK**. As a result of running the **Cumulate** function, the estimated claim amount has now been adjusted to account for the fact that the customer's total sales volume in the relevant period is higher than when the first rebate was generated. More specifically, because the total purchased quantity has reached 100 units, the customer now qualifies for 40 USD per unit (as per the agreement's second quantity break), or 400 USD of total rebate amount. The difference is recorded as a new claim "adjustment" for the additional 800 USD. The status of the rebate claims that were included in the Cumulate update are now set to Calculated.
6. In the list, mark all rows.
7. Click **Approve**.
8. Click **Process**.
9. In the **Customer** field, enter or select a value.
10. Click **OK**. A message shows that the rebate was processed successfully, and the status of the claims has been changed to Mark. This means that as a result of a Rebate accrual journal being posted:
 - The claims have now been transferred to the temporary customer balance as deductions.
 - The Rebate accrual account has been credited to represent the future liability towards the customer.
 - The Rebate expense account has been debited, in recognition of the cost incurred in connection with the sales.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Process rebates for payment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to convert approved and processed customer rebates to credit notes. You can use this guide in the USMF demo company. The precondition for this guide is to have one or more rebate claims which have a status of Mark. If you're using USMF you should run the "Generate and process customer rebates" guide before you start this guide.

Convert rebate claims to credit note

1. Go to All customers.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. On the Action Pane, click Collect.
5. Click Settle transactions.
6. Click Functions.
7. Click Rebate program.
 - The Rebate page lists the rebate claims that you have processed in the customer rebate workbench and that are in status Mark.
8. Click Edit.
 - Set checkmarks in the Mark field for the claims that you want to include into credit note.
9. Click Functions.
10. Click Create credit note.
 - A message appears to inform you that a journal has been posted (This is the Accounts receivable consumption journal, as specified in the Accounts receivable parameters page). This causes the real liability (credit) amount to be moved to the customer balance. This means that the customer's account has been credited, and the Rebate accrual account has been debited.
11. Close the page.
12. Click Cancel.
 - This refreshes the page so that you can see the updates.
13. On the Action Pane, click Collect.
14. Click Settle transactions.
 - Note that a transaction for negative amount, representing the total rebate amount, without invoice reference has been added to the customer balance.
15. Click Cancel.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Look up applicable prices and discounts

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to find the price and/or discount for a product which is currently valid for a specific customer, without creating a sales order. The procedure walks through a specific example, and you need follow the example using the USMF demo company in order to select the necessary values.

Find the applicable price

1. Go to Sales and marketing > Prices and discounts > Find prices.
2. In the Customer account field, click the drop-down button to open the lookup.
3. In the list, find and select customer US-001.
4. In the list, click the link in the selected row.
5. In the Item number field, type 'T0004'.
 - By default, the Quantity field is set to 1. However, if you know the size of the order that the customer intends to place for the product in question, then enter this value instead. This information is relevant if the trade agreements with the customer have quantity breaks, that is, the product's price depends on the minimum quantity purchased.
6. In the Date field, enter a date for when the customer expects to place an order.
 - The date can be today's date or any date in the future.
 - The system now returns the price that is valid for the selected product when bought by the selected customer on the selected date with a specified quantity. In this example, if the customer US-001 bought 1 unit of product T0004 today, they would be charged 350 CAD a unit. This price comes from an existing and active trade agreement with the customer. Other fields on the page provide more details about the product price and product cost (if set up on the product master), and calculated profitability.
 - If the Show related product variants option is selected, it means that there are additional trade agreements for product's variants.
7. Click the Show related product variants checkbox.
 - A list of the product variants is shown, with information about their dimensions.
8. In the list, mark the line representing color White.
 - Notice, that the product price is now different from the one displayed previously when it was not specified per dimension.
9. Click View sales prices.
 - The Price (sales) page displays all the trade agreements applicable to the product, including its variants.
10. Close the page.

Find the applicable discount

Make sure the Customer account field contains customer number US-001

1. In the Item number field, type 'T0012'.
 - Make sure the Quantity field is set to 1.
 - The following pricing details shown for product T0012 come from one or more trade agreements: The unit price is 1,000 CAD and the discount percentage is 5.
2. Set Quantity to '20'.

- The increased order quantity causes the line discount that will be offered to the customer to change from 5 to 7 percent.
- The Net amount is calculated based on the unit price, discount and the total quantity.

3. Click View line discount.

- There are two line discount agreements for product T0012, specifying a 5 percent discount for an order line quantity from 1 to 10, and 7 percent discount for order quantities above 10. Note that the discounts are applied to a group of products, in this example, Group code 01, of which product T0012 is a member.

4. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Price simulation

2/18/2021 • 7 minutes to read • [Edit Online](#)

This article provides information about price simulation for quotations. Price simulation helps you to evaluate the effect of deductions on the future sales price during the quotation process, before you commit to a specific price.

A price simulation for a quotation shows a new total amount, based on a proposed new price. A price simulation can also show a new amount for a specific line that is created in an existing quotation. You can enter a price simulation and apply it later. Alternatively, you can use the original quotation without a price simulation and make more changes as you work through the sales process with your customer.

A price simulation doesn't change the price in the quotation. If the price simulation is applied to a whole quotation, it's treated as a special discount on the quotation header. If the price simulation is applied to specific items, it's treated as a special discount on the quotation lines. The unit sales price on a quotation line that is created doesn't change when a price simulation is applied. Instead, a discount percentage that corresponds to the price reduction of the quotation line is applied. When a price simulation is applied, the unit sales price and the discount percentage are transferred to the quotation line or the quotation header.

[Note!] When you run a price simulation, only the current sales currency is used to create the simulation. However, when you view the quotation totals, you see a combination of the company currency and the sales currency.

Supplementary items that are added to quotation lines might trigger line discounts or multiline discounts. They might also trigger total discounts that change the contribution margins and contribution ratios of the quotation lines and the whole discount.

You can run multiple price simulations to track the effects of price adjustments on the targets of a quotation. By running these simulations, you can adjust the overall price of the quotation, or the price of one or more specific lines in the quotation, and then apply the price simulation that is most likely to help you close the sale.

When you create a quotation, you can set up an alert. Here are some of the ways that alerts are used:

- They can keep you informed about the status of quotations in the organization.
- They can trigger a review of a specific quotation or inform you when discount limits are exceeded.

Price simulation and discounts

To guarantee that discounts and prices are calculated correctly, be careful when you run price simulations on quotations that have discounts. Because all price simulations are treated as special discounts on the active quotation line or the whole quotation, you must track the differences in the discounts.

Types of discounts in trade agreements

Trade agreements in Supply Chain Management can have four types of price discounts. These discounts can be set up for different items, customers, or price groups, and they can be limited by date. To avoid miscalculations, you must consider trade agreements when you run price simulations. Here are the four types of discounts in trade agreements:

- **Sales price** – Separate sales prices can be specified for items. When quotation lines are created, the program searches for the correct sales price for an item and transfers it to the quotation lines. Therefore, a trade agreement that has this kind of discount doesn't affect the price simulation. The sales price that is used

in the quotation line reflects the trade agreement.

- **Line discount** – Special discounts are specified for items, depending on the quantity that is ordered. Line amounts are typically reduced by the line discount before a price simulation is run. Therefore, a trade agreement that has this kind of discount affects the price simulation.
- **Multiline discount** – If the combined quantities exceed the limit that you've defined, predefined combinations of ordered items trigger a discount on the whole order. Line amounts are typically reduced by the line discount before a price simulation is run. Therefore, a trade agreement that has this kind of discount affects the price simulation.
- **Total discount** – If the combined amounts exceed the limit that you've defined, predefined ordered items trigger a discount on the whole order. The total discount is generated by the quotation lines. However, because the total discount is applied to the quotation total as a discount, it reduces the total amount of the quotation. Therefore, a trade agreement that has this kind of discount affects the price simulation.

Quotation lines and trade agreements

When you create or adjust a quotation line, line discounts are automatically calculated. The relevant sales price is found for the item, based on the trade agreement.

Price simulation examples

The following examples use price simulation for quotation headers and single line items.

Price simulation for quotation headers

You create a quotation that has the following lines:

- 10 units of item BR-12 (cost price per unit: USD 9.52, sales price per unit: USD 15.32)
- 12 units of item BR-14 (cost price per unit: USD 7.48, sales price per unit: USD 13.75)

The following table shows the quotation lines.

	CALCULATION	RESULT
Sales quantity	10 units + 12 units	22 units
Sales value in USD	$(10 \times 15.32) + (12 \times 13.75)$	318.20
Cost value in USD	$(10 \times 9.52) + (12 \times 7.48)$	184.96
Contribution margin in USD	$318.20 - 184.96$	133.24
Contribution ratio	$[(318.20 - 184.96) \div 318.20] \times 100$	41.87%

You run a price simulation and apply a 15-percent total discount for the whole quotation, or the quotation header. The following table shows the new totals of the quotation after the price simulation is run.

	CALCULATION	RESULT
Sales quantity	10 units + 12 units	22 units
Old sales value in USD	$(10 \times 15.32) + (12 \times 13.75)$	318.20
Old cost value in USD	$(10 \times 9.52) + (12 \times 7.48)$	184.96
Old contribution margin in USD	$318.20 - 184.96$	133.24

	CALCULATION	RESULT
Old contribution ratio	$[(318.20 - (10 \times 9.52)) \div 318.20] \times 100$	41.87%
Price simulation of 15-percent total discount in USD	$(15 \times 318.2) \div 100$	47.73
New sales value in USD	$318.20 - 47.73$	270.47
New contribution margin in USD	$270.47 - 184.96$	85.51
New contribution ratio	$[(270.47 - 184.96) \div 270.47] \times 100$	31.61%

Price simulation for single line items

You create a quotation that has the following lines:

- 10 units of item BR-12 (cost price per unit: USD 9.52, sales price per unit: USD 15.32)
- 12 units of item BR-14 (cost price per unit: USD 7.48, sales price per unit: USD 13.75)

The following table shows the quotation lines.

	CALCULATION	RESULT
Sales quantity	10 units + 12 units	22 units
Sales value in USD for BR-12	10×15.32	153.20
Sales value in USD for BR-14	12×13.75	165.00
Cost value in USD for BR-12	10×9.52	95.20
Cost value in USD for BR-14	12×7.48	89.76
Contribution margin in USD for BR-12	$153.20 - 95.20$	58.00
Contribution margin in USD for BR-14	$165.00 - 89.76$	75.24
Contribution ratio in USD for BR-12	$[(153.20 - 95.20) \div 153.20] \times 100$	37.86
Contribution ratio in USD for BR-14	$[(165.00 - 89.76) \div 165.00] \times 100$	45.60
Total sales value in USD	$(10 \times 15.32) + (12 \times 13.75)$	318.20
Total cost value in USD	$(10 \times 9.52) + (12 \times 7.48)$	184.96
Total contribution margin in USD	$318.20 - 184.96$	133.24
Total contribution ratio	$[(318.20 - 184.96) \div 318.20] \times 100$	41.87%

You run a price simulation and apply a 10-percent total discount to the BR-12 units. The following table shows the new totals of the quotation after the price simulation is run for the single line item.

	CALCULATION	RESULT
Sales quantity	10 units + 12 units	22 units
Old sales value in USD for BR-12	10×15.32	153.20
Price simulation of 10-percent discount for BR-12	$(10 \times 15.32) \div 100$	15.32
New sales value in USD for BR-12	$(10 \times 15.32) - 15.32$	137.88
Sales value in USD for BR-14	12×13.75	165.00
Cost value in USD for BR-12	10×9.52	95.20
Cost value in USD for BR-14	12×7.48	89.76
New contribution margin in USD for BR-12	$137.88 - 95.20$	42.68
Contribution margin in USD for BR-14	$165.00 - 89.76$	75.24
New contribution ratio in USD for BR-12	$[(137.88 - 95.20) \div 137.88] \times 100$	30.95
Contribution ratio in USD for BR-14	$[(165.00 - 89.76) \div 165.00] \times 100$	45.60
New total sales value in USD	$[(10 \times 15.32) - 15.32] + (12 \times 13.75)$	302.88
Total cost value in USD	$(10 \times 9.52) + (12 \times 7.48)$	184.96
New total contribution margin in USD	$302.88 - 184.96$	117.92
New total contribution ratio	$[(302.88 - 184.96) \div 302.88] \times 100$	38.93%

The price simulation affects only the line that it's applied to and reduces the total for that line.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Mass create sales quotations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure demonstrates how to efficiently create quotations offering a set of products or services that are to be sent to multiple customers. This mass quotation creation is based on quotation templates. You can run this procedure on your own data or in demo data company USMF.

Create a quotation template

1. Go to Sales and marketing > Setup > Quotations > Template groups.
2. Click New.
3. In the Group ID field, type an ID of your choice.
4. In the Description field, type a value.
5. Click Save.
6. Close the page.
7. Go to Sales and marketing > Sales quotations > All quotations.
8. Click New.
9. In the Account type field, select 'Customer'.
10. In the Customer account field, enter or select a value.
11. Click OK.
 - For a quotation to become a template you must carry out setup steps on the quotation header. This must be done before you add lines to the quotation.
12. On the Action Pane, click Options.
13. Click Change view.
14. Click Header view.
15. Expand the Setup section.
16. In the Group ID field, enter or select a value.
17. In the Template name field, type a value.
18. Select Yes in the Active field.
 - Only active templates can be used when you apply a template to a new sales quotation.
19. On the Action Pane, click Options.
20. Click Change view.
21. Click Line view.
22. In the Item field, enter or select a value.
23. In the Item field, type a value.
24. Close the page.
25. In the Discount percent field, enter a number.
26. Click Add line.
27. In the Item field, enter or select a value.
28. In the Item field, type a value.
29. Close the page.
30. In the Unit price field, enter a new price or change the current one.
31. Click Add line.
32. In the Item field, enter or select a value.
33. In the Item field, type a value.

34. Close the page.
35. In the Quantity field, enter a number.
36. In the Discount field, enter a number.
37. Click Save.

Apply the template to create a single quotation

1. Go to Sales and marketing > Sales quotations > All quotations.
 - Note that the quotation you have just created is marked as template.
2. Click New.
3. In the Account type field, select 'Customer'.
4. In the Customer account field, enter or select a value.
5. Expand the Template section.
6. In the Group ID field, enter or select a value.
7. In the Template name field, enter or select a value.
8. In the Calculation method field, select 'Based on template values'.
9. Click OK.
 - The new quotation has now been created, based on the data and terms of the template.
10. Close the page.
11. Close the page.

Apply the template to mass create quotations

1. Go to Sales and marketing > Sales quotations > Quotation update > Mass create quotations.
2. In the Account type field, select 'Customer'.
3. In the Group ID field, enter or select a value.
4. In the Template name field, enter or select a value.
5. In the Calculation method field, select 'Based on template values'.
6. Expand the Records to include section.
7. Click Filter.
8. In the Criteria field, set the filter to cover a range of customers you want to include in this mass quotation creation. Use the following format "Customer1..CustomerN".
 - For example, you could set the filter to: US-001..US-004
9. Click OK.
10. Click OK.
11. Go to Sales and marketing > Sales quotations > All quotations.
 - Verify that quotations have been created for all the customers specified in the mass update routine, as based on the selected template.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create and edit sales quotations

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure demonstrates how to create and update a sales quotation. You can run this procedure on your own data or in demo data company USMF.

Create a sales quotation

1. Go to **Navigation pane > Modules > Sales and marketing > Sales quotations > All quotations**.
2. Click **New**.
3. In the **Account type** field, select 'Prospect'.
4. In the **Prospect** field, enter or select a value.
5. Expand the **General** section. Because you chose to create a quotation from the Sales and Marketing area, the type is automatically set to 'Sales quotation'. To create a quotation for a project you must access it from the **Project management and accounting** module.
6. Click **OK**. The fields and actions on the quotation lines are very similar to the ones on the sales order lines. Like sales orders, quotations can be created for a specific item or, when item number is not known or does not exist at the time of quotation creation, quotations can be created for a sales category.
7. In the **Item** field, enter or select a value.
8. In the **Site** field, type a value.
9. In the **Quantity** field, enter a number. If there are valid trade agreements for the item selected on the line, the applicable price and discounts will be automatically copied to the quotation line. Make sure that the Unit price field contains a value and you can also enter discount values if you want to.
10. Click **Save**.
11. On the **Action Pane**, click **Sales quotation**.
12. Click **Totals**.
13. Click **OK**.
14. Select the sales quotation line.
15. On the **Action Pane**, click **Quotation**.
16. Click **Price simulation**.
 - In the **Run price simulation** page you can experiment with adjusting the expected revenue or profitability of your quotation based on the desired unit price, discount amount, discount percentage, total amount, margin, or contribution ratio. When you are satisfied with the target figures, you apply the suggestion to the quotation line, and its price-related fields will be updated accordingly.
 - You can create as many price simulations as you wish. When you click **New**, the price conditions from the current quotation line are copied to the page. You can then modify values in any of the price-related fields to the target ones. A change in one of the fields will trigger recalculation in all the other fields. In order for the system to calculate the sales margin and contribution ratio, the product's unit cost has to be known. Use the Simulated prices tab for a detailed view of the original prices, proposed changes and their effect on the quotation totals. As a general rule, when a simulation that sets a new amount is applied to the quotation line, the system recalculates and enters a new value in the Unit price field. If the simulation is based on a new margin or a new contribution ratio, only the Net amount field is updated, and the Unit price is blank. In both cases, any discounts that were on the quotation line before simulation will be deleted.
17. On the **Action Pane**, click **Quotation**.
18. Click **Send quotation**.

19. Select 'Yes' in the **Print quotation** field.
20. Click **OK**. The report may take a minute to generate. Don't close the page until it does so.

Update a sales quotation

1. Go to **Navigation pane > Modules > Sales and marketing > Sales quotations > All quotations**.
2. On the **Action Pane**, click **Follow up**.
3. Click **Convert to customer**.
4. In the **Customer account** field, type a value.
5. Click **Check**. Make sure you see a message that the account number you typed in is free to use.
6. Click **OK**. The system has now created a new customer account for the prospect on the quotation.
7. Close the page.
8. On the **Action Pane**, click **Follow up**.
9. Click **Confirm**.
10. In the **Reason** field, enter or select a value.
11. Click **OK**.
12. On the **Action Pane**, click **General**.
13. Click **Sales orders**.
14. Close the page.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot sales quotations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix issues that you might encounter while you work with sales quotations.

I can't change the sales quantity of a sales quotation for a service item.

Issue description

If you try to set a sales quantity (**SalesQty** field) for an item of the *Service* type on a sales quotation line, you will receive the following message: "Update not allowed for field Quantity."

Issue resolution

You can't set a sales quantity for products that are service items. For example, if you offer a service to install an item, it doesn't make sense to record a quantity, because there is no physical item. There is only a service.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Sales returns

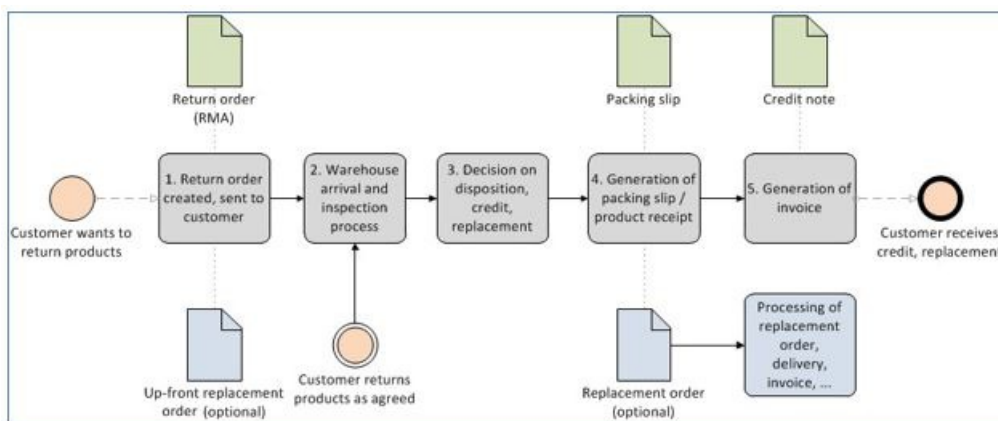

2/18/2021 • 23 minutes to read • [Edit Online](#)

This topic provides information about the process for return orders. It includes information about customer returns and their effect on costing and on-hand inventory quantities.

Customers can return items for various reasons. For example, an item might be defective, or it might not meet the customer's expectations. The return process starts when a customer issues a request to return an item. After the customer's request is received, a return order is created.

Return order process

The following illustration gives an overview of the return order process.

There are two types of return order process: physical return and credit only.

- **Physical return** – The return order authorizes the physical return of products.
- **Credit only** – The return order authorizes a customer credit but doesn't require that the customer physically return the products.

Physical return order process

1. **Create a return order.** Formally document the authorization for the customer to return any defective or unwanted products. The return order doesn't require that the company accept the returned products or provide a credit for the customer. If the return is accepted, you can authorize a replacement item to be sent before the defective item has been returned.
2. **Arrive at warehouse for inspection.** Complete an initial inspection and validation against the return order document. The return order also supports quarantine of the returned items for additional inspection and quality control.
3. **Determine disposition.** Finalize the inspection process, and decide what should be done with the returned products. As part of this step, decide whether you will credit the customer, reject the product return, or accept the product return, scrap the product, and then send a replacement product to the customer.
4. **Generate a packing slip.** Generate a packing slip, and commit the disposition decision that you made in step 3. Finalize the logistics processes.
5. **Generate an invoice.** Close the return order.

Credit only process

1. **Create a return order.** Formally document the authorization for the customer to receive a credit without returning the defective or unwanted products. The **Credit only** disposition code authorizes the decision to

credit the customer without physical return.

2. **Generate an invoice.** Generate the credit note, and then close the return order.

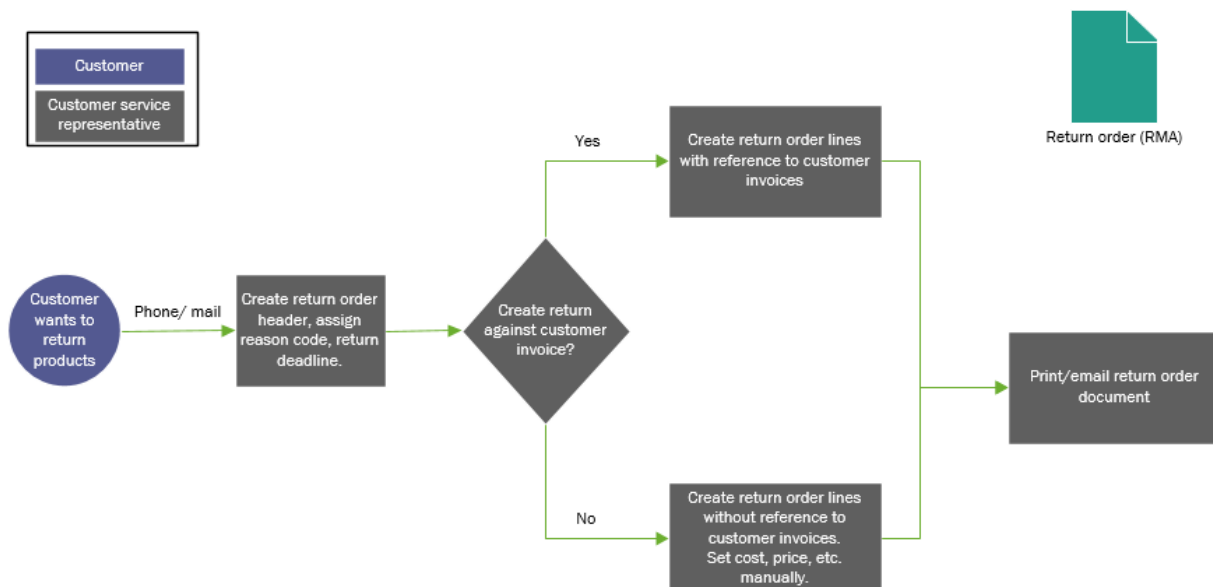

Return material authorization

Return Material Authorization (RMA) processing builds on sales order functionality. An RMA is registered as a return order, which is created as a sales order, and may have another sales order associated with it, called a replacement order. Both sales orders link to the originating RMA number.

- **Return order** – To register an RMA, you create a return order, which is a sales order that has the assigned type, **Returned order**. Any changes that you make to the RMA information is automatically updated in the sales order. Until the return order has the status **Open**, it will not appear in the list of sales orders. You use RMA to handle the arrival and receipt of the returned items, as well as to authorize a credit only disposition action (see section **Disposition codes and disposition actions**). All other follow-up processes must be handled in the sales order.
- **Replacement order** – When a replacement order must be shipped to the customer, the RMA can include a second associated sales order. You can manually create the replacement order for the RMA to support immediate shipment. Alternatively, the replacement order can be created automatically after the arrival, inspection, and receipt are completed for the RMA line item that has a disposition code that indicates replacement. The replacement order has the same functionality that is associated with a sales order. For example, you can use it to configure a custom product as the replacement item, create a production order to repair a returned item, create a direct delivery purchase order to send the replacement from a vendor, or support other purposes.

Create a return order

The return order process starts when a customer contacts your organization to return a defective or unwanted product and/or to be credited. After your organization accepts the return, the return is documented by a return order. This return order becomes the focal point of the internal processing of the returned product. The following illustration shows the procedure for creating a return order.

Create a return order header

When you create a return order, the information in the following table must be included.

FIELD	DESCRIPTION	COMMENTS
Customer account	A reference to the Customers table	You must provide an existing customer account.
Delivery address	The address that the item is returned to	By default, the organization's address is used. If a specific warehouse is selected on the header, the delivery address is changed to the delivery address of the warehouse. You can change this address on the Return order details page.
Site/warehouse	The site or warehouse that receives the returned product	The delivery address for the return order is determined based on the delivery address of the site or warehouse.
RMA number	The ID that is assigned to the return order	The RMA number is used as an alternate key throughout the return order process. The RMA number that is assigned is based on the RMA number sequence that is set up on the Accounts receivable parameters page.
Deadline	The last date that an item can be returned	The default value is calculated as the current date plus the period of validity. For example, if a return is valid for only 90 days from date when the return order is created, and the return order was created on May 1, the value in the field is 30-July . The period of validity is set on the Accounts receivable parameters page.
Return reason code	The customer's reason for returning the product	The reason code is selected in the list of user-defined reason codes. You can update this field at any time.

Create return order lines

After you complete the return header, you can create return lines by using one of the following methods:

- Manually enter the item details, quantity, and other information for every return line.
- Create a return line by using the **Find sales order** function. We recommend that you use this function when you create a return order. The **Find sales order** function establishes a reference from the return line to the invoiced sales order line, and retrieves line details such as item number, quantity, price, discount, and cost values from the sales line. The reference helps guarantee that, when the product is returned to the company, it's valued at the same unit cost that it was sold at. The reference also validates that return orders aren't created for a quantity that exceeds the quantity that was sold on the invoice.

[Note!] Return lines that have a reference to a sales order are handled as corrections to, or reversals of, the sale. For more information, see the "Post to the ledger" section, later in this topic.

Charges

Fees and charges can be added to the return order through one or more of the following methods:

- You can manually add charges to the return order header, the return order line, or both.
- Charges can be automatically added to the return order header as a function of the return reason code.
- Charges can be automatically added to the return order line, based on the disposition code of the line.

Charges are automatically added after a return reason code or disposition code is assigned to the line. If the reason code is changed later, the existing charge entry won't be removed, but a new charge entry might be added, based on the new reason code. When you add charges to return order lines, charges that are calculated as a percentage of the line or order value become negative when the line or line order is negative, unless the percentage is also a negative number. A charge that has a negative value represents a credit to the customer.

Return reason codes

By applying reason codes to returns, you can help make return patterns easier to analyze. Reason codes provide information about why a customer wants to return items. Some organizations have many reason codes. These organization might group the reason codes into reason code groups to gain a better overview and for accumulated reporting.

Disposition codes and disposition actions

An important step in the return order process is the assignment of a disposition code to the return order line as part of arrival registration. The disposition code determines the following information:

- **The financial implications** – Should the customer be credited for the returned items, and should any charges be added to the return order line?
- **The disposition of the returned item** – Should the item can be added back to inventory, should it be scrapped, or should it be returned to the customer?
- **The logistics of the returned item** – Should a replacement item be issued to the customer?

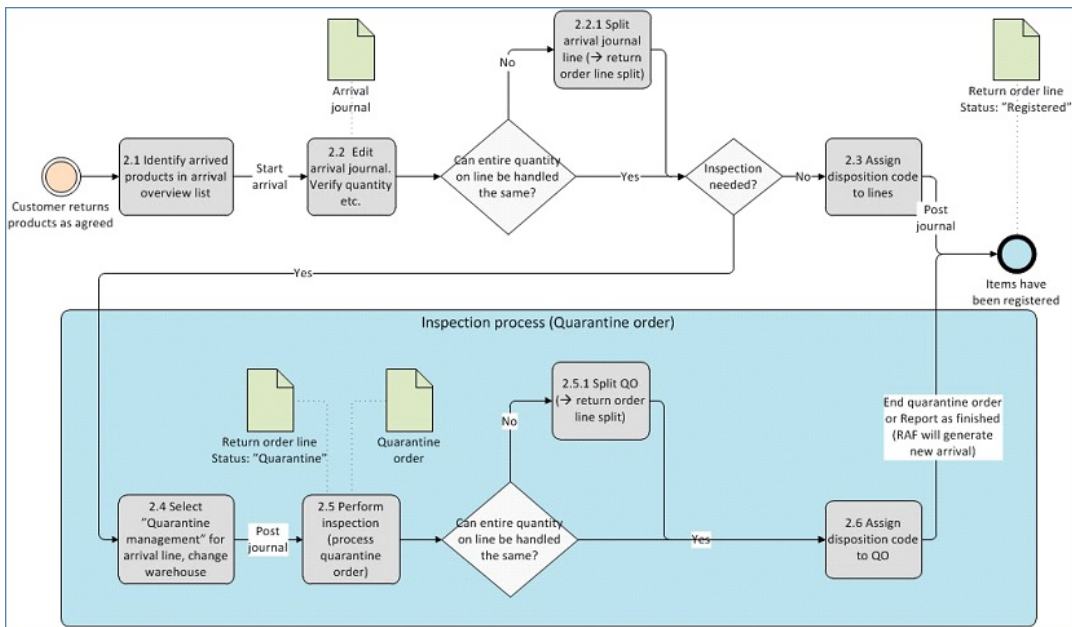

In addition to determining how the returned goods are disposed of, disposition codes can cause charges to be applied to the return line. They can also be used to group returns for statistical analysis. Disposition codes are defined as part of the setup of return orders. However, each disposition code must reference one of the built-in disposition actions. The following table lists the built-in disposition codes and their actions. **Important:** If an item should not be returned, but the customer should still be credited, assign the **Credit only** disposition code to the return line.

DISPOSITION CODE	FINANCIAL IMPLICATIONS	IMPLICATIONS FOR LOGISTICS
Credit only	<ul style="list-style-type: none"> • The customer is credited the sales price minus any fees or charges. • Loss from scrapping the item is posted to the ledger. 	<p>The item should not be returned. This disposition action is used for the following cases:</p> <ul style="list-style-type: none"> • There is sufficient trust among the parties. • The cost of returning the defective item is prohibitive. • The items can't be allowed back into inventory. Because of other conditions, a physical return isn't required.
Credit	<ul style="list-style-type: none"> • The customer is credited the sales price minus any fees or charges. • The inventory value is increased by the cost of the returned item. 	<p>The item is returned and is added back into inventory.</p>

DISPOSITION CODE	FINANCIAL IMPLICATIONS	IMPLICATIONS FOR LOGISTICS
Replace and credit	<ul style="list-style-type: none"> • The customer is credited the sales price minus any fees or charges. • Inventory value is increased by the cost of the returned item. • A separate sales order for a replacement is created and is handled separately. 	The item is returned and is added back into inventory.
Replace and scrap	<ul style="list-style-type: none"> • Customer is credited the sales price, less any fees or charges. • Loss from scrapping the item is posted to the ledger. • A separate sales order for a replacement is created and is handled separately. 	The item is returned and scrapped.
Return to customer	None, except any fees or charges.	The item is returned but is sent back to the customer after inspection. This disposition action might be used if the item has been deliberately damaged, or if the warranty has been voided.
Scrap	<ul style="list-style-type: none"> • The customer is credited the sales price minus any fees or charges. • Loss from scrapping the item is posted to the ledger. 	The item is returned or scrapped.

Arrival at the warehouse for inspection

Before you can physically receive returned items into inventory by posting a packing slip, the items must go through arrival registration and an optional inspection. The following illustration gives an overview of the arrival process. The sections that follow describe each step that is shown in the illustration.

The process has several other variations that aren't covered in this topic. Here are some of these variations:

- Don't use the **Arrival overview** list to create an Arrival journal. Instead, manually create the Arrival journal. Return orders will have **Sales order** as the reference.
- If you're using Warehouse management, generate pallet transports. The return line will have a status of **Arrived** during pallet transport.
- Register the arrival of the returned item directly from the return order line, by using the **Registration** function.

During the arrival process, returns are integrated with the general process for warehouse arrivals. The arrival process also supports the creation of quarantine orders for returned items that must undergo a separate inspection.

Identify products in the Arrival overview list

The **Arrival overview** page lists all the planned incoming arrivals.

[Note!] Arrivals from return orders must be processed separately from other types of arrival transactions. After you've identified an incoming package on the **Arrival overview** page (for example, by using the accompanying RMA document), on the Action Pane, click **Start arrival** to create and initialize an Arrival journal that matches the arrival.

Edit the Arrival journal

By setting the **Quarantine management** option to **Yes**, you can create a quarantine order for the return line. If a line has been sent to quarantine for inspection, you can't specify a disposition code.

If you set the **Quarantine management** option to **Yes** in the item's inventory model group, the **Quarantine management** option on the **Journal lines** page will be marked for the Arrival journal line and can't be changed. If the line is sent to quarantine, you must specify the appropriate quarantine warehouse.

If the arrival line isn't sent for inspection, the warehouse arrival clerk must specify the disposition code directly on the Arrival journal line and then post the Arrival journal. If the same disposition code should not be assigned to the whole quantity of the return line, or if the full quantity of the line hasn't been received, you must split the line. When you split an Arrival journal line, you also split the return line (**SalesLine**) and create a new lot ID. You can split the line by reducing the quantity of the Arrival journal line. When the journal is posted, a new return line is created that has a status of **Expected** for the remaining quantity. You can also split the line by clicking

Process the quarantine order

If the returned products are sent for inspection at the quarantine warehouse, any additional processing is completed in a quarantine order. One quarantine order is created for each arrival line that is sent to quarantine. The disposition code indicates the result of the inspection process.

You can split a quarantine order, just as you can split the Arrival journal. If you split the quarantine order, you cause a corresponding split of the return line. After the disposition code is entered, complete the quarantine order by using either the **End** function or the **Report as finished** function. If you select **Report as finished**, a new arrival is created in the designated warehouse. You can then process this arrival by using the **Arrival overview** page.

If the arrival originates from a quarantine order, you can't change the disposition code that is assigned during inspection. If you complete the quarantine order by using the **End** function, the lot is automatically registered. Sometimes, an item might be sent back from quarantine to the Shipping and receiving department. For example, the quarantine inspector might not know where to store the item in inventory. In this case, the corresponding packing slip must be updated to correctly register and act on the disposition code that is specified because of the quarantine.

Acknowledgment of receipt can be sent to the customer when the return line is registered. The **Return acknowledgement** report resembles the return order document. The **Return acknowledgement** report isn't journalized or otherwise registered in the system, and it isn't a required step in the return order process.

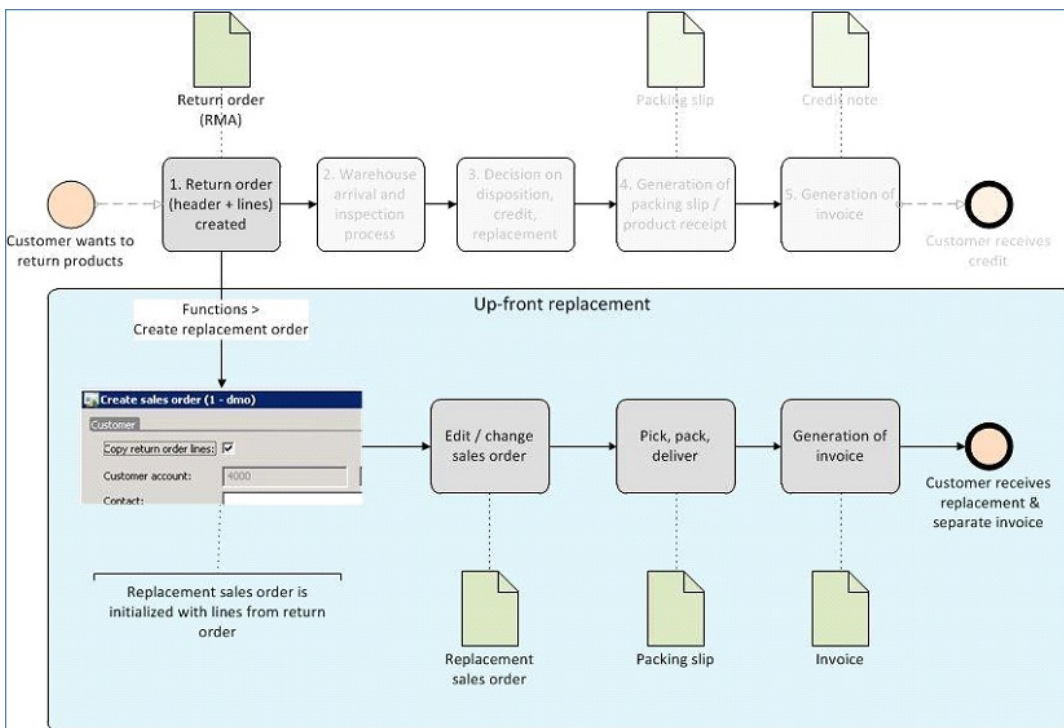

Replace a product

There are two methods for managing product replacement:

- **Up-front replacement** – Replace a product before the returned product is received from the customer.
- **Replacement by disposition code** – Automatically create a new replacement order line.

Up-front replacement

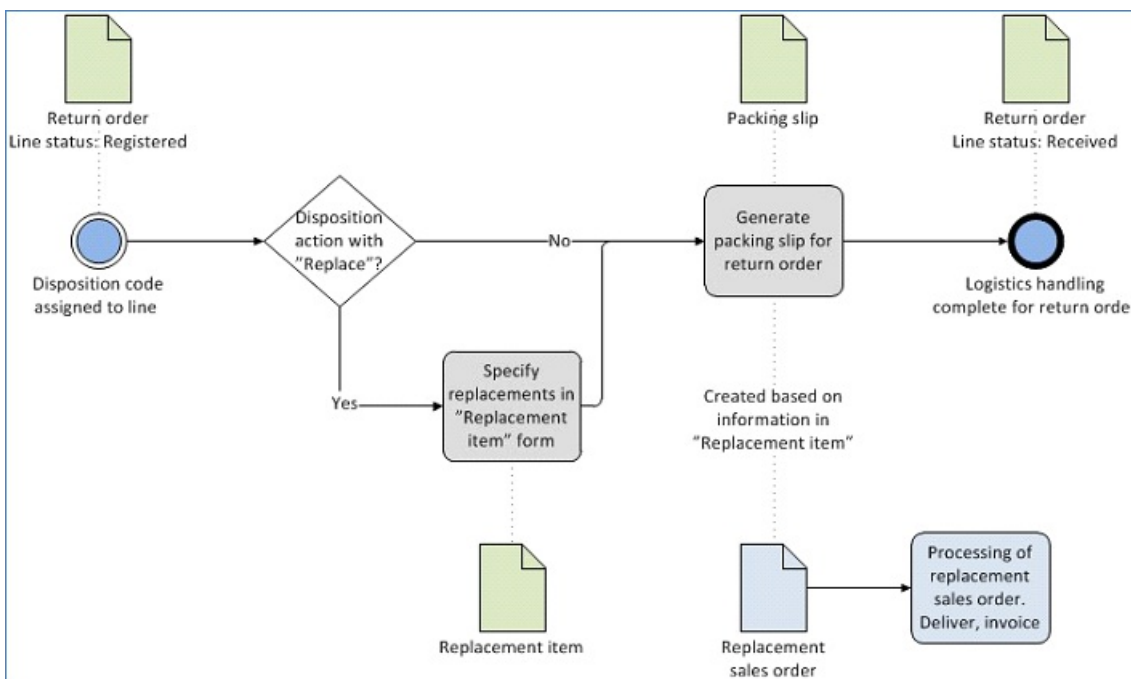

In up-front replacement, the replacement item can be delivered to the customer before the item is returned. This method is useful if, for example, the item is a machine part that can't be removed unless a spare part is available to take its place, or if you just want your customer to have the replacement product as soon as possible. The up-front replacement order is an independent sales order. The header information is initialized from the customer, and the line information is initialized from the return order. You can edit, process, and delete the replacement order independently of the return order. When you delete a replacement order, you receive a message that the order was created as a replacement order. The following illustration shows the process for up-front replacement.

The return order includes a reference to the replacement order. If an up-front replacement order is created for a return order before the defective item is returned, you can't select disposition codes for replacement after the defective item has been returned.

Replacement by disposition code

If you ship a replacement item to the customer, and you use the **Replace and scrap** or **Replace and credit** disposition action on the return order, use the process that is shown in the following illustration.

The replacement item will be delivered by using an independent sales order, the replacement sales order. This sales order is created when the packing slip for the return order is generated. The order header uses information from the customer that is referenced on the return order header. The line information is collected from the information that is entered on the **Replacement item** page. The **Replacement item** page must be filled in for lines that have disposition actions that start with the word "replace." However, neither the quantity nor the identity of the replacement item is validated or limited. This behavior allows for cases where the customer wants the same item but in a different configuration or size, and also cases where the customers wants a completely

different item. By default, an identical item is entered on the **Replacement item** page. However, you can select a different item, provided that the function has been set up.

[Note!] You can edit and delete the replacement sales order after it's created.

Generate a packing slip

Before returned items can be received into inventory, you must update the packing slip for the order that the items belong to. Just as the invoice update process is the update of the financial transaction, the packing slip update process is the physical update of the inventory record. In other words, this process commits the changes to inventory. In the case of returns, the steps that are assigned to the disposition action are implemented during the packing slip update. When you generate the packing slip, the following events occur:

- In the warehouse, the standard process is used to perform a physical receipt. Ledger postings are generated if the inventory model group (**Post physical inventory**) and the Accounts receivable parameters (**Post packing slip in ledger**) are set appropriately.
- Items that have been marked with a disposition action that contains the word "scrap" are scrapped, and the inventory loss is posted to the ledger.
- Items that have been marked with the **Return to customer** disposition action are received and delivered to the customer. These items have no net effect on inventory.
- A replacement sales order is created. This sales order is based on information on the **Replacement item** page.

You can generate the packing slip only for lines that have a return status of **Registered**, and only for the full quantity on the return line. If several lines on the return order have the **Registered** status, you can generate the packing slip for a subset of the lines by deleting the other lines from the **Post packing slip** page.

Partial returns are defined in terms of return order lines, not in terms of return order shipments. Therefore, if you receive the full quantity that is indicated on one return order line, but you receive nothing from the other lines on the return order, the delivery isn't a partial delivery. However, if a return order line requires that 10 units of an item be returned, but you receive only four units, the delivery is a partial delivery. If not all the expected return items have arrived, you can set the shipment aside and wait for the rest of the returned quantity to arrive. Alternatively, you can register and post the partial quantity. As part of the process for posting packing slips, you can associate the packing slip reference number from the customer's shipping documents with the order lines. This association is optional and is for reference only. It doesn't create any transactional updates.

In general, you can skip the packing slip process and go directly to invoicing. In this case, the steps that you would have performed during packing slip generation are completed during invoicing.

Generate an invoice

Although the **Return order** page contains the information and actions that are required in order to handle the special logistical aspects of the return order, you must use the **Sales order** page to complete the invoicing process. Your organization can then invoice return orders and sales orders at the same time, and the same person can complete the invoicing process, as required. To view the return order from the **Sales order** page, click the link for the sales order number to open the associated sales order. You can also find the return order on the **All Sales orders** page. Return orders are sales orders that have an order type of **Returned order**.

Credit correction

As part of the invoicing process, verify that any miscellaneous charges are correct. To cause the ledger postings to become corrections (Storno), consider using the **Credit correction** option on the **Other** tab of the **Posting invoice** page when you post the invoice/credit note.

[Note!] By default, the **Credit correction** option is activated if the **Credit note as correction** option on

the **Accounts receivable parameters** page has been enabled. However, we recommend that you not post returns with Storno.

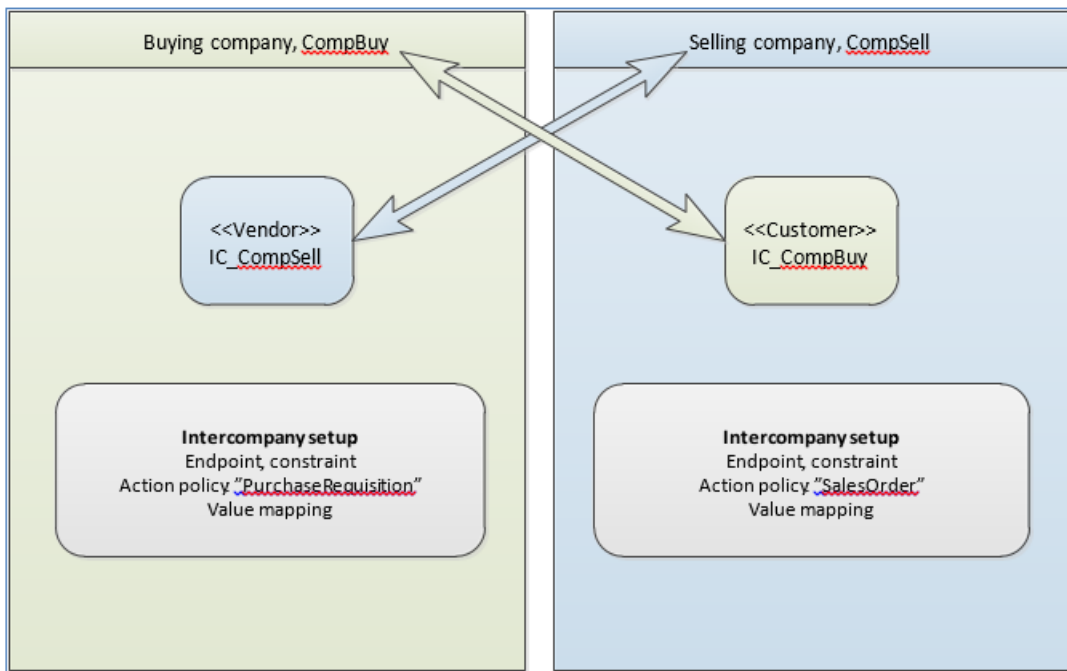

Create intercompany return orders

Return orders can be completed between two companies within your organization. The following scenarios are supported:

- Simple intercompany returns between two companies that participate in an intercompany relation
- An intercompany chain that is established when a customer return order is created in the selling company
- An intercompany chain that is established when a vendor return order is created in the buying company
- Direct delivery shipment returns between an external customer and two companies that participate in an intercompany relation

Setup

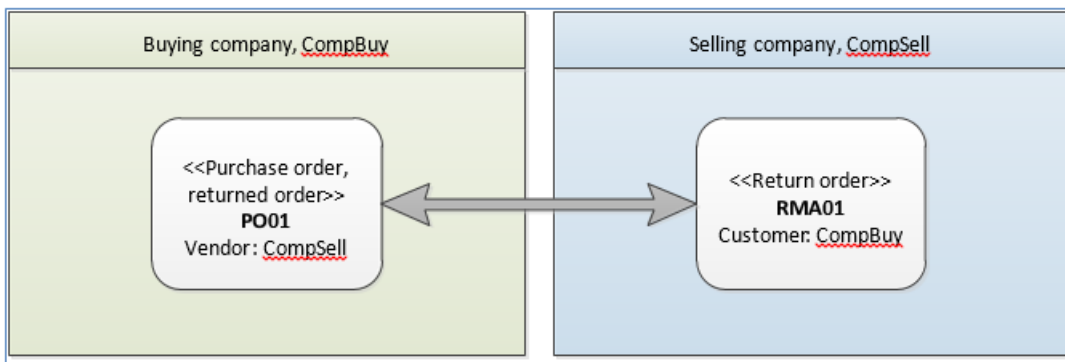

The following illustration the minimum setup that is required for two companies to participate in an intercompany relation and take advantage of intercompany trade.

In the following scenario, CompBuy is the buying company, and CompSell is the selling company. Usually, the selling company ships goods either to the buying company or, in direct delivery shipment scenarios, directly to the end customer. In CompBuy, the vendor IC_CompSell is defined as an intercompany endpoint that is associated with the company CompSell. At the same time, in CompSell, the customer IC_CompBuy is defined as an intercompany endpoint that is associated with the company CompBuy. The appropriate action policy details and value mappings must be defined in both companies. In a direct delivery shipment scenario, an intercompany return order, which is also an intercompany sales order, is created in the selling company. The RMA number of the intercompany return order can be picked from the RMA number sequence in CompSell, or it can be copied from the RMA number that is assigned to the original return order in CompBuy. The RMA number settings on the **PurchaseRequisition** action policy in CompBuy determine these actions. If the RMA number is synchronized, you should plan to mitigate the risk of number clashes if the two companies use the same number sequence.

Simple intercompany returns

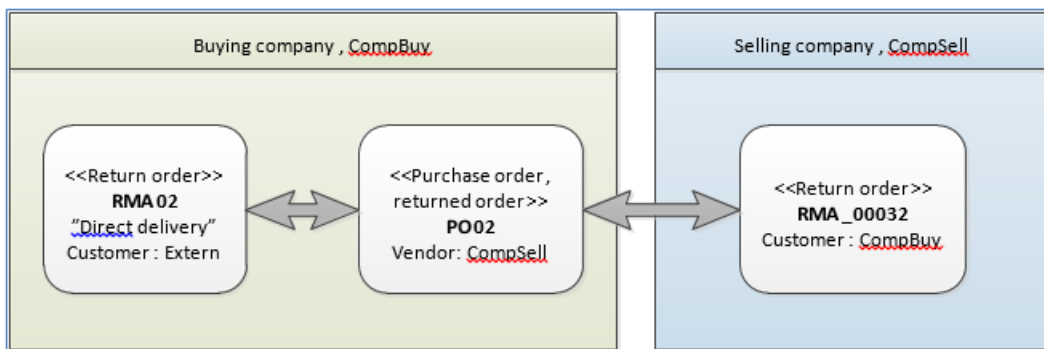

This scenario involves two companies in the same organization, as shown in the following illustration.

The order chain can be established when a vendor return order is created in the buying company or a customer return order is created in the selling company. The corresponding order is created in the other company and makes sure that the header and line information on the vendor return order reflects the settings on the customer return order. The return order that is established can either include or exclude the reference (**Find sales order**) to an existing customer invoice. The packing slips and invoices of the two orders can be processed individually. For example, you don't have to generate a packing slip for the vendor return order before you generate the packing slip for the customer return order.

Direct delivery shipment returns among three parties

This scenario can be established if a previous sale of the **Direct delivery** type has been completed, and if an invoice against the customer exists in the company that interacts with the customer. In the following illustration, the company CompBuy has previously sold and invoiced products to the customer Extern. The products were shipped directly from the company CompSell to the customer via an intercompany order chain.

If the customer Extern wants to return the products, a return order (RMA02) is created for the customer in the company CompBuy. To establish the intercompany chain, the return order must be marked for direct delivery. When you use the **Find sales order** function to pick the customer invoice to return, an intercompany order chain that consists of the following documents is established:

- **Original return order:** RMA02 (company CompBuy)
- **Purchase order:** PO02 (company CompBuy)
- **Intercompany return order:** RMA_00032 (company CompSell)

After the direct delivery intercompany chain is created, all physical handling and processing of the returns must occur in context of the intercompany return order, RMA_00032 in the company CompSell. The products can't be received in the company CompBuy. When a disposition code is assigned to the intercompany return order, it's synchronized with the original return order to allow for proper invoicing of the original order.

Post to the ledger

The ledger postings that are generated when the return order is invoiced are influenced by a few important settings and parameters:

- **Return cost price** – For inventory models other than **Standard cost**, the **Return cost price** parameter

determines the cost of the item when it's accepted back into inventory or scrapped. To calculate a correct valuation of inventory, it's important that you set the **Return cost price** parameter correctly. If you use the **Find sales order** function to create a return order line that has a reference to a customer invoice, the **Return cost price** value is equal to the cost price of the item that is sold. Otherwise, the cost price value comes from the item setup or can be entered manually.

- **Credit correction/Storno** – The **Credit correction** parameter on the **Posting invoice** page determines whether postings should be recorded as positive (DR/CR) entries or as correcting, negative entries.

In the examples that follow, the return cost price is represented as **Inv. Cost price**.

Example 1: The return order doesn't reference a customer invoice

The return order doesn't reference a customer invoice. The returned item is credited. The **Credit correction** parameter isn't selected when the return order invoice, or credit note, is generated.

Case 1	Qty	Unit price	Inv. Cost price	Line discount	Revenue		Discount		Consumption		Accounts receivable		Inventory issue	
					DR	CR	DR	CR	DR	CR	DR	CR	DR	CR
Sales order invoice	3	10	5	6%		30	1,8		15		28,2			15
Return order invoice	3	10	4	0%	30				12		30		12	

[Note!] The item master price is used as the default value for the **Return cost price** parameter. The default price differs from the cost price at the time of inventory issue. Therefore, the implication is that a loss of 3 has been incurred. Additionally, the return order doesn't include the discount that was given to the customer on the sales order. Therefore, an excessive credit occurs.

Example 2: Credit correction is selected for the return order

Example 2 is the same as example 1, but the **Credit correction** parameter is selected when the return order invoice is generated.

Case 2	Qty	Unit price	Inv. Cost price	Line discount	Revenue		Discount		Consumption		Accounts receivable		Inventory issue	
					DR	CR	DR	CR	DR	CR	DR	CR	DR	CR
Sales order invoice	3	10	5	6%		30	1,8		15		28,2			15
Return order invoice	3	10	4	0%		-30			-12		-30			-12

[Note!] The ledger postings are entered as negative corrections.

Example 3: The return order line is created by using the Find sales order function

In this example, the return order line is created by using the **Find sales order** function. The **Credit correction** parameter isn't selected when the invoice is created.

Case 3	Qty	Unit price	Inv. Cost price	Line discount	Revenue		Discount		Consumption		Accounts receivable		Inventory issue	
					DR	CR	DR	CR	DR	CR	DR	CR	DR	CR
Sales order invoice	3	10	5	6%		30	1,8		15		28,2			15
Return order invoice	3	10	5	6%	30		1,8		15		28,2		15	

[Note!] Discount and **Return cost price** are set correctly. Therefore, an exact reversal of the customer invoice occurs.

Register sales commissions

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how sales commissions are calculated and registered. You can run this procedure in demo data company USMF or on your own data. Before starting this guide, run the guide called "Set up sales commission rules" to make sure that you have all the necessary commission calculation setup.

Take note of the customer and item numbers that you have chosen for the commission process and use them when asked to create a sales order in this guide.

Invoice a sales order that qualifies a salesperson for a commission

1. In the navigation pane, go to **Modules > Sales and marketing > Sales orders > All sales orders**.
2. Select **New**.
3. In the **Customer account** field, select the desired record from the drop-down menu.
4. Select **OK**.
5. On the Action Pane, select **Options**.
6. Select **Change view**.
7. Select **Header view**.
8. Expand the **Setup** section.
 - The value in the **Sales group** field represents a group with one or more sales representatives assigned to it. The people in the group are the ones who will receive commissions when the order is invoiced, as per predefined rates and distribution.
 - The value is copied from the Customer card, but you can change it if you wish.
 - The Sales group is also copied to the sales order line. You can change it so that it can differ from the one in the header and/or between lines.
 - The value in the **Commission group** field represents a group that you have created for one or more customers with the purpose of tracking commissions.
 - The value is copied from the Customer card, but you can change it if you wish.
9. On the Action Pane, select **Options**.
10. Select **Change view**.
11. Select **Line view**.
12. In the drop down menu of the **Item number** field, select the item you have set up for commissions.
13. In the **Quantity** field, enter a number. Take note of the line's Net amount. It represents the sales revenue, which in this example is the basis for commission calculation.
14. Select **Save**.
15. On the Action Pane, select **Invoice**.
16. Select **Invoice**.
17. Expand the **Parameters** section.

18. In the **Quantity** field, select **All**.
19. Select **Yes** in the **Posting** field.
20. Select **OK**, then select **OK** in the next pane. It may take a minute or so to post the transaction. Allow the processing to complete and don't close the page.

Review the registered sales commissions

1. On the Action Pane, select **Invoice**, then select **Invoice** again.
2. On the Action Pane, select **Invoice**, then select **Commission transactions**.
 - The **Overview** tab displays lines representing the commission amounts payable to sales representatives who are associated with the invoiced sales order. Let's review the details.
 - If you used the "Set up sales commission rules" guide to set up the **Commission sales** group, there are two sales people to receive a sales commissions, and the commission is split equally between them.
 - In this example, the total amount of the commission is calculated as a percentage of the sales revenue (the net amount of order line).
3. Close the page.
4. Select **Voucher**. You can review the voucher transactions for the commission amounts that have been posted to the predefined commission expense and commission payable accounts.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up sales commission rules

2/18/2021 • 4 minutes to read • [Edit Online](#)

This procedure shows you how to set up and enable sales commission calculation and tracking. The procedure shows how to create both customer and item commission groups, and then how to link a selected customer and product to the respective groups. Those groups are then used in the commission calculation setup to create a customer, item, and sales representatives combination that must be matched by the sales order to entitle the sales people to a commission. Creating customer and item commission groups are optional, as the calculation of commission can also be done for an individual customer and/or item. You can run this procedure in demo data company USMF or on your own data.

Set up commission groups and commission rates

1. Go to **Navigation pane > Modules > Sales and marketing > Commissions > Customer groups for commission**.
2. Select **New**.
3. In the **Group** field, type a value.
4. In the **Name** field, type a value.
5. Select **Save**.
6. Close the page.
7. Go to **Navigation pane > Modules > Sales and marketing > Commissions > Item groups**.
8. Select **New**.
9. In the **Group** field, type a value.
10. In the **Name** field, type a value.
11. Select **Save**.
12. Close the page.
13. Go to **Sales and marketing > Commissions > Sales groups**.
 - A Commission sales group specifies the employees in sales representative roles who are eligible to receive a commission when a customer associated with the relevant sales group buys certain items.
 - In the USMF demo data company, there is a sales group called "Sales reps US."
14. On the **Action Pane**, select **General**.
15. Click **Sales rep..** The Sales rep. page displays a list of the company's sales people who are associated with a specific commission group. You can assign multiple sales representatives to the same group and define their respective share of the total commission fee as a percentage value. The total commission share across all employees must not exceed 100.
16. In the list, mark the selected row.
17. Select **Edit**.
18. Set **Commission share** to '50'.
19. Click **New**.
20. In the **Name** field, click the drop-down button to open the lookup.
21. Use the **Quick Filter** to find records. For example, filter on the Name field with a value of 'Susan Burk'.
22. Click **Select**.
23. Set **Commission share** to '50'.
24. Click **Save**.
25. Go to **Sales and marketing > Commissions > Commission calculation**. In the **Commission**

calculation page, you define the commission rate that the employee is to receive for a sales transaction when it contains the pre-set combination of customer and product. As part of the commission rate setup, you must specify the commission calculation basis and whether it should include or exclude discounts. You can also enter a validity period for when the commission rate is active.

26. Click **New**.
27. In the **Item code** field, select 'Group'.
28. In the **Item relation** field, click the drop-down button to open the lookup.
29. In the list, find and select the group that you created earlier.
30. In the **Customer code** field, select 'Group'.
31. In the **Customer relation** field, click the drop-down button to open the lookup.
32. In the list, select the group that you set up earlier.
33. In the **Sales rep. relation** field, click the drop-down button to open the lookup.
34. In the list, find and select the desired record.
 - Keep the "Before line discount" option.
 - Keep the "Revenue" option as the basis for commission value calculation.
35. In the Commission percentage field, enter a number.
36. Click **Save**.

Setting up commission posting

1. Go to **Navigation pane > Sales and marketing > Commissions > Commission posting**.
Commission fees are payable to the employees and must therefore be set up to ensure correct financial posting to the appropriate accounts in the **General ledger**. This is done in the **Commission posting** page. Review the setup that is available for the current company. Typically, the commission amounts are posted to a dedicated expense account and are offset to a dedicated payable account. If you don't have the commission posting rules set up, the system will fail to complete invoicing of a sales order which has eligible commissions.
2. Close the page.

Assign a commission group to a customer and a product

1. Go to **Navigation pane > Modules > Sales and marketing > Customers > All customers**.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click **Edit**.
5. Expand the **Sales order defaults** section.
6. In the **Commission group** field, click the drop-down button to open the lookup.
7. In the list, select the group that you created earlier.
8. In the **Sales group** field, click the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. Click **Save**.
11. Go to **Navigation pane > Modules > Product information management > Products > Released products**.
12. Use the **Filter** to find records. For example, filter on the Item number field with a value of 'T0020 '.
13. In the list, click the link in the selected row.
14. Click **Edit**.
15. Expand the **Sell** section.
16. In the **Commission group** field, click the drop-down button to open the lookup.
17. In the list, select the commission group that you created earlier.

18. Select **Save**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Customer portal for Dynamics 365 Supply Chain Management overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

What is the Customer portal?

Modern supply chain systems rely on integration. They require that inventory, customer demand, and sales departments be integrated instead of residing in separate silos. The Customer portal helps organizations that run Microsoft Dynamics 365 Supply Chain Management enhance this integration and more effectively keep their customers informed.

The Customer portal is a [Power Apps portals](#) template that lets companies create an externally facing business-to-business (B2B) website for scenarios that are related to sales order processing. The template uses [dual-write](#), Supply Chain Management, and Power Apps portals to enable external enterprise customers to view and create data from the company's Dynamics 365 environment.

The Customer portal template has all the customization capabilities that the portals feature of Power Apps offers. The template can easily be modified to represent the company's brand, add increased functionality, and change the user experience. All the functionality that the template offers out of the box can be modified as desired.

IMPORTANT

By itself, the template isn't expected to be completely functional. It just serves as an enabler for customers who want to create an externally facing website so that enterprise customers can engage with data from Supply Chain Management.

NOTE

The Customer portal documentation is directed at admins, customizers, and system integrators who will set up the Customer portal for a Supply Chain Management installation. It uses the terms *customer* and *user* to describe people who are customers of the organization that is running Supply Chain Management, and who will use the final portal itself.

Video

The [Overview of the Customer portal template in Dynamics 365 Supply Chain Management](#) video (shown above) is included in the [Finance and Operations playlist](#) available on YouTube.

Who should use it?

The Customer portal is designed for companies that run Supply Chain Management and have these characteristics:

- They want to build an externally facing website that communicates order processing information (such as order status or account information) directly from their Supply Chain Management system to their enterprise customers.
- They are transitioning from Dynamics AX 2012 to Supply Chain Management and previously used the [AX 2012 Customer self-service portal](#).

The following types of organizations are **not** good candidates for implementing the Customer portal:

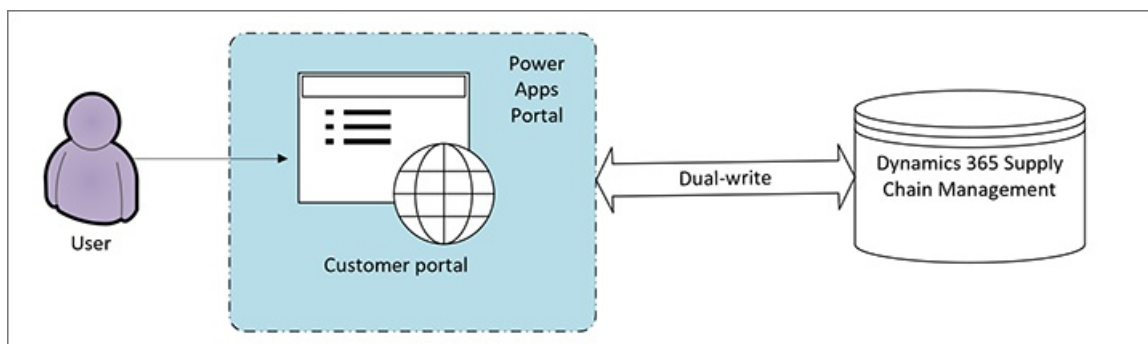

- Companies that want to build a website for non-enterprise customers. These companies should consider creating a [Dynamics 365 Commerce e-commerce website](#).
- Companies that are already using an existing Power Apps portals website for a similar purpose. These companies won't receive any additional benefits from the Customer portal. The Customer portal is delivered as a template that acts as a guide and a starting point for customers who want to "connect the dots" between dual-write, Supply Chain Management, and Power Apps portals. If you've already set up a website that serves this purpose, you might not gain much value from using the Customer portal template to re-provision that website.

How does it work?

The Customer portal is provided as a Power Apps portals template. It depends on Power Apps portals and dual-write.

[Power Apps portals](#) is a feature that lets users create an externally facing website that people from outside the organization can sign in to. Little to no coding is required to make portals. The Customer portal is one of many [Dynamics 365 portal templates](#) that are available from Microsoft.

[Dual-write](#) is an out-of-box infrastructure product that provides near-real-time interaction between customer engagements apps and Finance and Operations apps. Dual-write provides bidirectional integration between Finance and Operations apps and Microsoft Dataverse. Therefore, it provides an integrated user experience across the apps. The Customer portal depends on tables that are synced with dual-write. Before data from Supply Chain Management can be surfaced in the Customer portal, dual-write must be enabled for all the appropriate tables.

The Customer portal acts as a starting point for organizations that want to use Power Apps portals to build an externally facing website that uses data from their Supply Chain Management installation. It helps organizations connect dual-write, Supply Chain Management, and Power Apps portals.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Install, set up, and update the Customer portal

2/18/2021 • 2 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

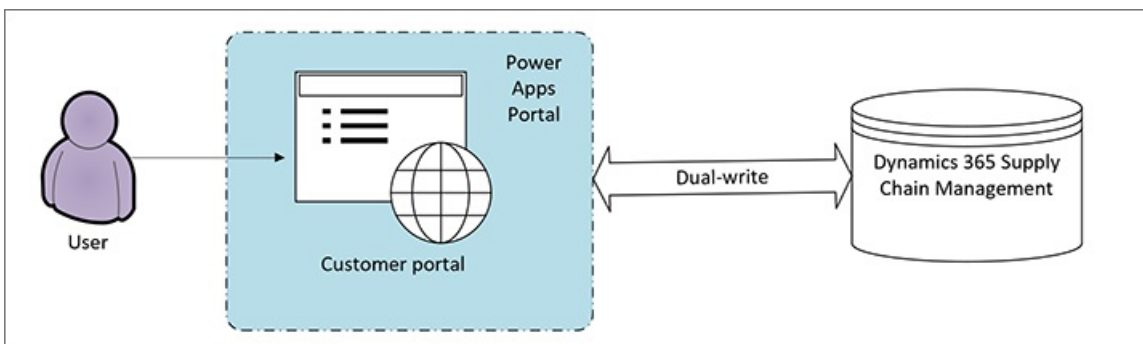

Licensing requirements

To implement the Customer portal, you must have the following licenses:

- **Power Apps portals** – This license is required to host the Customer portal. Portals are licensed based on usage. For more information, see the [Power Apps portals licensing requirements](#).
- **Dual-write** – You must have the necessary licenses to enable dual-write for Supply Chain Management tables. For more information, see the [system requirements for dual-write](#).

Dependencies on dual-write and Power Apps portals

The Customer portal depends on Power Apps portals and dual-write, as shown in the following illustration.

Unlike other features from Supply Chain Management, the Customer portal template resides in Power Apps portals. Therefore, the Customer portal is limited by the functionality and capabilities that are provided by Power Apps portals and the tables in dual-write.

Required setup to enable the Customer portal

After you've made sure that you have the required licenses, you can set up dual-write as described in the [dual-write initial synchronization instructions](#).

Be sure to enable the following table mappings in dual-write:

- Sales Order Header
- Sales Order Details
- Accounts
- Contacts

- [Products](#)

After this setup is completed, you can provision the Customer portal template.

Provision the Customer portal

Before you begin, make sure that you've already completed the [required setup](#). Then follow these steps to provision the Customer portal.

1. Go to make.powerapps.com.
2. Make sure that you're using the environment where you enabled dual-write.
3. On the **Create** tab, scroll down to the **Start from template** section, and select the template that is named **Customer Portal**.
4. Follow the on-screen instructions.

After provisioning is completed, you can access the Customer portal in the **Your apps** section of the **Home** page.

NOTE

If the dual-write solution isn't installed in the environment that you're working in, you will receive an error message, and the Customer portal won't be provisioned.

Update the Customer portal

More functionality might be added to the Customer portal later. Any changes that Microsoft makes to the underlying solution components will automatically appear in your environment. However, the website that is provisioned in your environment won't automatically reflect changes that are made to the configuration data. You will have to manually apply those changes by getting the code from the new template and merging it with the provisioned website.

Additional resources

To learn how you can set up and customize the Customer portal, you should start by reviewing the following documentation for the underlying technologies:

- [Power Apps portals documentation](#)
- [Dual-write documentation](#)

To effectively manage your portals, you must understand the Power Apps portals and Microsoft Dataverse lifecycle. For more information, see the following resources:

- [About portal lifecycle](#)
- [Upgrade a portal](#)
- [Migrate portal configuration](#)
- [Solution Lifecycle Management: Dynamics 365 for Customer Engagement apps](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create and manage Customer portal users

2/18/2021 • 4 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

In the out-of-box implementation, there is no way for users to self-register for websites that are created by using the Customer portal. To sign in and use a website, users must be invited by the admin. Microsoft has intentionally blocked the ability of users to self-register.

Before a user can use a website, a contact record must be created for that user. This record indicates which customer account and legal entity the user belongs to. This information is essential for ensuring that the user can create and view sales orders.

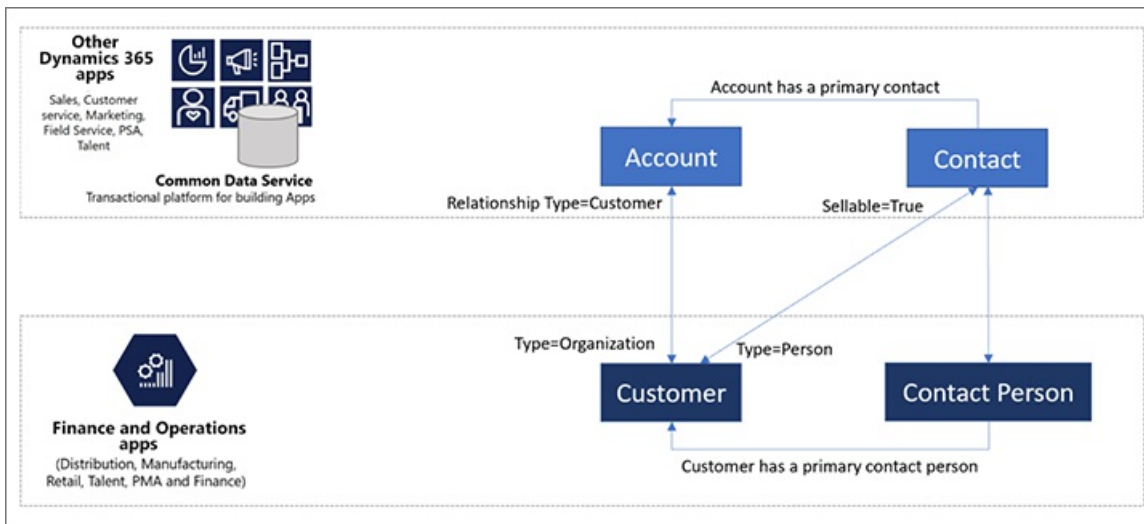

When users self-register, contact records are automatically created for them. Therefore, you can't ensure that a user selects the correct customer account and legal entity. On the other hand, the invitation process lets an admin assign the correct customer account and legal entity to the contact record before an invitation is sent. If you're thinking about customizing the solution so that users can self-register, be sure to consider the possible consequences.

Video

The [Invite customers to register and use your customer portal](#) video (shown above) is included in the [Finance and Operations playlist](#) available on YouTube.

Prerequisite setup

Contacts in Power Apps portals are stored as records in the **Contacts** table in Microsoft Dataverse. Dual-write then syncs these records to Microsoft Dynamics 365 Supply Chain Management as required.

Before you start to invite new customers, make sure that you've enabled the **Contact** table mapping in dual-write.

The invitation process

To invite an existing contact to the Customer portal, follow the steps in [Invite contacts to your portals](#) in the Power Apps portals documentation.

Before you invite a customer to join the Customer portal, make sure that the customer's [contact record](#) is available and set up in the following way:

1. Set the **Company** field to the legal entity that you want the customer to belong to in Supply Chain Management.
2. Set the **Account Number** field to the customer account number that you want the user to have in Supply Chain Management.

After a contact is created, you should be able to see it in Supply Chain Management.

For more information, see [Configure a contact for use on a portal](#) in the Power Apps portals documentation.

Out-of-box web roles and table permissions

User roles in Power Apps portals are defined by [web roles](#) and [table permissions](#). A few roles are defined for the Customer portal out of the box. You can create new roles, and you can modify or remove existing roles.

Out-of-box web roles

This section describes the web roles that are delivered with the Customer portal.

For more information about how to modify the out-of-box user roles, see [Create web roles for portals](#) and [Add record-based security by using table permissions for portals](#) in the Power Apps portals documentation.

Administrator

The administrator oversees and maintains the website. This person will provision and set up the Customer portal. The administrator maintains the IT and security aspects of the portal, and makes sure that everything runs smoothly. The administrator might also customize and/or change the portal by adding new functionalities, creating new roles, and more.

Customer representative

A customer representative works for a customer company and is responsible for managing the orders that the company places. The customer representative can see all the orders that have been placed for the company and the users who placed them. Additionally, the customer representative can see information about the overall account and which contacts can place orders on behalf of that account.

Authorized users

Authorized users can place orders and view the status of the orders that they have placed. However, they can't view the status of orders that other users in their company have placed.

Unauthorized users

Unauthorized users can't view any data. They can see only public information, such as terms and conditions, and details about the company that is running the Customer portal.

Example

The following table shows which sales orders the users in each web role can see in the system.

SALES ORDER	ADMINISTRATOR	CUSTOMER REPRESENTATIVE FOR CUSTOMER X	AUTHORIZED USER: JANE	AUTHORIZED USER: SAM	UNAUTHORIZED USER: MAY
Customer X Orderer: Jane	Yes	Yes	Yes	No	No
Customer X Orderer: Sam	Yes	Yes	No	Yes	No
Customer Y Orderer: May	Yes	No	No	No	No

NOTE

Even though both Sam and Jane are contacts who work for customer X, they can see only the orders that they themselves have placed and nothing else. Although May has an order in the system, she can't see that order in the Customer portal, because she is an unauthorized user. (Additionally, she must have placed the order through some channel other than the Customer portal.)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Customize and use the Customer portal

2/18/2021 • 7 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

This topic describes the different pages that are available in the Customer portal out of the box. It explains what the pages do and how you can customize them.

The Customer portal offers a few webpages and actions out of the box. The following site map provides an overview of those webpages and actions, and the roles that can perform the actions.

Typical customizations

The following topics will help you learn the basics about Power Apps portals and how you can customize portals:

- [Work with templates](#) – This topic provides a general overview of how Power Apps portals works and how you can do simple customizations of portals.
- [Manage portal content](#) – This topic explains how you can manage and customize the content that you surface in your portal.
- [Edit CSS](#) – This topic helps you make more complex customizations to the user interface (UI) of your portal.
- [Create a theme for your portal](#) – This topic helps you create a UI theme for your portal.
- [Create and expose portal content easily](#) – This topic helps you manage the underlying data and tables that you use for your portal.
- [Configure a contact for use on a portal](#) – This topic explains how to create and customize user roles, and how security and authentication work in Power Apps portals.
- [Configure notes for table forms and web forms on portals](#) – This topic explains how to add documents and additional storage to your portal.

- [Error handling for portal website](#) – This topic explains how to view portal error logs and store them in your Microsoft Azure Blob storage account.

Customize the order creation process

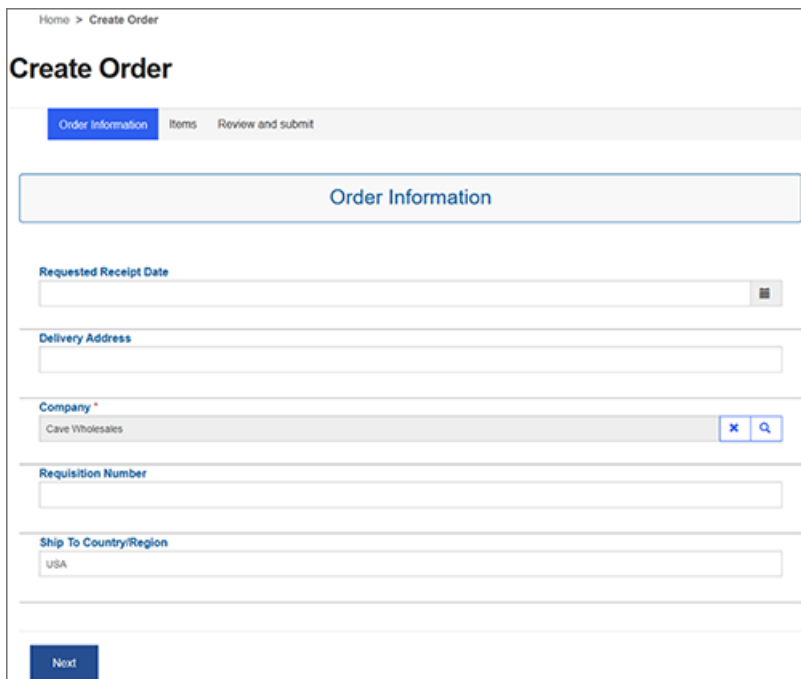

When a user submits an order by using the Customer portal, the order is automatically synced to the corresponding Dynamics 365 Supply Chain Management environment. Because the user is an external customer, some required information is intentionally hidden from him or her. This information will automatically be filled in when the form is submitted.

This section shows how you should set up contacts to avoid errors. It explains fields that are automatically set and how you can modify the value of those fields if you must.

The out-of-box order creation process

Here are the standard steps for submitting an order from the Customer portal.

1. On the home page, select the **Create order** tile to open the **Create Order** wizard.
2. On the **Order Information** page, set the following fields:
 - **Requested receipt date** – Specify the date of delivery.
 - **Delivery address** – Enter the address that the order should be delivered to.
 - **Company** – Select the name of the customer company. This field is automatically set for non-admin users.
 - **Requisition number** – Enter the requisition number of the order. This field isn't required.
 - **Ship to country/region** – Enter the country or region that the items will be delivered to. This field is automatically set for non-admin users.

The screenshot shows the 'Create Order' wizard in Dynamics 365. The breadcrumb is 'Home > Create Order'. The title is 'Create Order'. There are three tabs: 'Order Information' (selected), 'Items', and 'Review and submit'. Below the tabs is a section titled 'Order Information' containing several input fields: 'Requested Receipt Date' (with a calendar icon), 'Delivery Address', 'Company' (with a dropdown menu showing 'Cave Wholesales' and search icons), 'Requisition Number', and 'Ship To Country/Region' (with a dropdown menu showing 'USA'). At the bottom left is a blue 'Next' button.

3. Select **Next**.
4. On the **Items** page, select **Add Item**.

5. In the **Item Information** dialog box, set the following fields:

- **Product Name** – Find and select a product to add to the order.
- **Quantity** – Enter the quantity of the selected product.
- **Unit** – Specify the unit of measure (for example, **ea.**, **kgs**, or **box**).
- **Estimated net amount** – The value is calculated as the estimated price of the item × the quantity for the selected unit.

6. Select **Submit** to add the item to the order.

7. Repeat steps 4 through 6 until you've added all the items that you want to order.

8. When you've finished adding items, select **Next** on the **Items** page.

9. The **Order Information** page provides a summary of the order. Review the order contents and delivery details. If everything looks correct, select **Submit** to submit the order.

Previous Submit

Standard data setup

To help ensure a smooth user experience, the Customer portal automatically fills in values for several required fields. These values are based on information in the contact record of the customer who is submitting the order.

For each [contact row](#) that belongs to a customer who will use the Customer portal to submit orders, values must be specified for the following required fields. Otherwise, errors will occur.

- **Company** – The legal entity that the order belongs to
- **Potential customer** – The customer account that is associated with the order
- **Price list** – The custom price list for the customer
- **Currency** – The currency of the price
- **Ship to country/region** – The country or region that the items will be delivered to

The following fields are automatically set for the sales order table:

- **Language** – The language of the order (By default, the value is taken from the contact record.)
- **Ship to country/region** – The country or region that the items will be delivered to (By default, the value is taken from the contact record.)
- **Contact person** – The user who can be contacted for information about the order (By default, the value is taken from the contact record.)
- **Company** – The legal entity that the order belongs to (By default, the value is taken from the contact record.)
- **Potential customer** – The customer account that is associated with the order (By default, the value is taken from the contact record.)
- **Invoice customer** – The billing account of the order (The default value is the potential customer from the contact record.)
- **Sales order name** – The name of the sales order (The default value is **sales order**.)
- **Currency** – The currency of the price (By default, the value is taken from the contact record.)
- **Price list** – The custom price list for the customer (By default, the value is taken from the contact record.)
- **Delivery address description** – The delivery address of the sales order (The default value is **delivery address description**.)

Modify the order creation process

You can freely modify the appearance and UI of the Customer portal if you don't change the basic order creation process. If you want to change the order creation process, there are a few points that you must keep in mind.

Don't remove the following columns from the sales order table in Microsoft Dataverse, because they are required to create a sales order in dual-write:

- **Company** – The legal entity that the order belongs to
- **Name** – The name of the sales order
- **Currency** – The currency of the price
- **Price list** – The custom price list for the customer
- **Ship to country/region** – The country or region that the items will be delivered to
- **Potential customer** – The customer account that is associated with the order
- **Language** – The language of the order (Typically, this language is the language of the potential customer.)
- **Delivery address description** – The delivery address of the sales order

For items, the following columns are required:

- **Product** – The product to order
- **Quantity** – The quantity of the selected product
- **Unit** – The unit of measure (for example, **ea.**, **kgs**, or **box**)
- **Ship to country/region** – The country or region of delivery
- **Delivery address description** – The delivery address of the order

You must make sure that your Customer portal somehow submits values for all these columns.

If you want to add columns to the page, or remove columns, see [Create or edit quick create forms for a streamlined data entry experience](#).

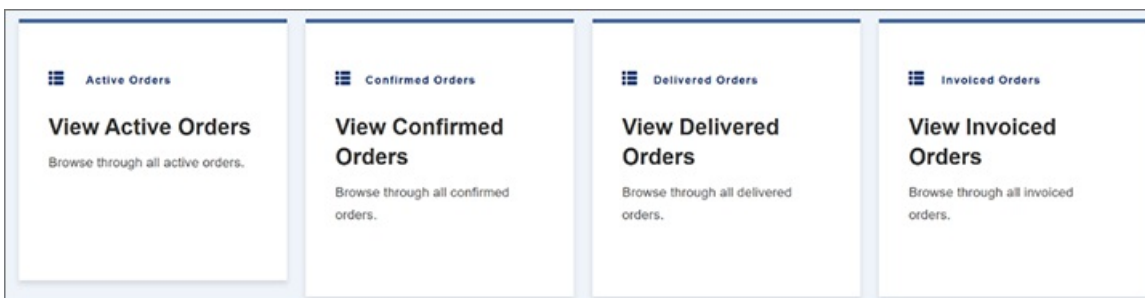

If you want to change how columns are preset and how values are set when the page is saved, see the following information in the Power Apps portals documentation:

- [Prepopulate field](#)
- [Set Value On Save](#)

Customize the home page

All the controls in the Customer portal are built-in Power Apps portals controls. You can customize them by following the steps in [Compose a page](#) in the Power Apps portals documentation.

The only custom control that is included in the Customer portal template is used to create the tiles on the home page.

To modify the tiles, follow these steps.

1. Open the [Portal Management app](#).

2. In the navigation pane on the left, select **Page Templates**.

3. Select the page template that is named **Home**.

4. In the **Web Template** field, select the **Home** link to open the source code for that page.

5. You should now see all the source code for the home page and can modify it as you require.

Resources

To learn more about how you can set up and customize the Customer portal, see the following resources:

- [Power Apps portals documentation](#)
- [Dual-write documentation](#)
- [About portal lifecycle](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Trade allowance management

2/18/2021 • 11 minutes to read • [Edit Online](#)

Trade allowance management helps companies manage sales promotion programs that offer "pay-for-performance" monetary rewards to customers that achieve volume and behavioral goals. The feature's capabilities are designed for companies that focus on comprehensive promote-to-profit processes, from promotion fund budgeting and allocation, to allowance contract setup, to claims creation and processing, to payment processing, to promotion effectiveness analysis.

This article will provide a broad overview of the Trade allowance management feature and will familiarize you with the typical set of tasks that are involved in managing a sales promotion program. Several types of users who have operational and decision making responsibilities are expected to use this functionality to achieve their respective goals:

- Allocating discretionary funds to the selected accounts, and setting up trade allowance agreements for promotions, based on bill-backs and one-off lump sum payments (for an agreed service)
- Running the negotiated promotion contracts through ongoing sales and generating bill-back claims
- Calculating, approving, and processing the generated claims, and passing them on to Accounts receivable (A/R) as deductions for payment settlement
- Reconciling the customer's short-pay with the deduction that is due
- Tracking use of the promotional fund, and evaluating program profitability and effectiveness

Audience and purpose

The information in this document is intended for business decision makers in enterprise companies, in positions such as purchase manager, chief financial officer (CFO), and accounting manager, who have the following responsibilities:

- High-level budgets and fund allocation
- Planning and analyzing sales promotions
- Managing staff that processes bill-back claims, runs payments based on merchandizing events, and settles short-pays and deductions

People in these roles are looking for ways to achieve these goals:

- Better use marketing promotional funds.
- Flexibly accommodate different types of promotion programs and allowances.
- Reduce the administrative burden and errors that are associated with monitoring promotion performance and processing claims.
- Improve cash flow forecasts by accruing for future liability.
- Have a quantified basis for ongoing and future negotiations with customers about promotions.

Promotional fund and Trade allowance agreement

A trade allowance agreement is an incentive program where pay-for-performance monetary rewards are offered to customers that achieve specific volume targets and/or behavioral goals. Promotional funds are budgeted expenditures. In that way, the promotional campaigns can be captured.

Promotional fund

Funds that are allocated to trade allowance agreements are recorded on the **Funds** page. To open the **Funds**

page, select **Sales and marketing > Trade allowances > Funds > Funds**.

Funds

Fund ID: Promo_Loyalty | Description: Loyalty promotion

General

Type: Discretionary | From date: 1/1/2014 | Fund budgeted: 1,000,000.00 | Usage: []

Status: Approved | To date: 12/31/2014 | Notes: []

BUDGETED	1,000,000.00	300,000.00	1,000,000.00
DISTRIBUTED	1,000,000.00	0.00	1,000,000.00

Items

+ Add line | Add products | Remove | Display dimensions

Item number	Product name
T0020	TelevisionD30042*

On the **Funds** page, you can view the details of promotional funds.

The **General** FastTab shows the period that the fund is valid for and its budgeted amount. In order for the fund to be allocated to the promotion agreement, the **Status** field must have a value of **Approved**.

The **Customers** FastTab shows the customer hierarchy. To select the customers that the fund targets, drag them so that they are under **Fund customers**. This FastTab also shows how the total amount of the fund is distributed.

The **Items** FastTab shows the items that are included in the promotion.

Trade allowance agreement

After the fund definition is in place, the next step in promotion planning is to register promotion contracts (which are known as trade allowance agreements), allocate funds, and define performance goals for each merchandizing event.

Trade allowance agreements are recorded on the **Trade allowance agreements** page. To open the **Trade allowance agreements** page, select **Sales and marketing > Trade allowances > Trade allowance agreements**.

TRADE ALLOWANCE AGREEMENTS

Items v

Funds v

Select **Header** to switch to the Header view.

On the **General** FastTab, the **Order to** and **Order from** fields define the period when the agreement is valid. An approval status of **Internal approved** for the agreement indicates that the agreement isn't yet valid and can't be applied during sales order processing.

The **Analysis** section of the **General** FastTab contains important fields that define the quantities and costs that are used for promotion evaluation:

- The **Base units** field specifies the quantity of products that must be sold to the selected customers before the promotion is applied.
- The **Calculated ship quantity** value is calculated based on the **Lift percent** value, which is a planned target increase for this promotion.
- The **Trade allowance cost** field is calculated based on the quantities of the various events in the trade allowance agreement.

On the **Customers** FastTab, in the list on the left, you can select and view customer groups, which are set up as predefined hierarchies. You can then select the whole hierarchy or specific accounts as targets for the allowance agreement.

On the **Items** FastTab, as on the **Items** FastTab of the **Funds** page, products are added to the agreement to associate its sales with the allowance that was agreed on.

On the **Funds** FastTab, you can view the promotion funds that are associated with this contract. You can also view the contract's event cost allocation. An event cost allocation of 100 percent means that this promotion will be financed exclusively from one fund. Alternatively, a promotion agreement can draw on several funds, and can use equal or differential percentage allocation.

Lines

Next, select **Lines** to switch to the Lines view.

The **Merchandizing events** tab shows the types of events covered by an agreement. There are three types: bill back, lump sum and off-invoice.

When you select the merchandizing event and then select the **Amounts** tab, the details for the event are found.

Unit type Inventory unit	LIMITS	TAX	ACCOUNTS
Unit ea	Minimum quantity 1	Taxable No <input type="checkbox"/>	Rebate program ID Loyalty
	Minimum amount 0.00		Rebate program accrual account 200210
	Rebate line break type Quantity		Rebate program expense account 601700

In the **Trade allowance lines** section, you specify the quantity or amount ranges that the customer must achieve for definitions to obtain the rewards.

In the case of a merchandizing event of the **Bill back** type, the upper section the **Amounts** tab defines the rules that the bill back will be applied, generated, and paid under. For example, the rules may specify the following conditions for the bill back claim:

- It's based on the creation date of the sales order (the **Calculation date type** value is **Created**).
- It's calculated based on the sales order line's amount before discounts, not the net amount, which includes discounts (the **Taken from** value is **Gross**).
- It's based on the volume of the sold products, not the amount (the **Rebate line break type** value is **Quantity**).
- It's calculated per period of a month (the **Cumulate sales by** value is **Month**).
- It's settled as a deduction, not by using A/P (the **Payment type** value is **Customer deductions**).

In the case of a merchandizing event of the **Lump sum** type, the **Amounts** tab shows the quantity that will be paid to the customer in the form of a deduction when the customer achieves specific performance. An approval status of **Open** indicates that the lump sum hasn't yet been paid.

To apply the agreement to sales orders that meet the agreement's conditions, the agreement's status must be **Confirmed**.

Perform sales under the planned merchandising event and generate bill-back claims

When you create a sales order that has lines that fulfill the requirements of the agreement, you can view the related information on the **Sales order** page by selecting **Sales order line > View > Price details**.

On the **Price details** page, on the **Rebates** FastTab, the sales clerk can see a bill back from the valid trade allowance agreement (the rebate program ID is shown) and the total amount that is applied to the line. This amount is also shown in the **Rebate amount** field in the **Margin estimation** section of the **Price details** page.

When the sales invoice is posted, a corresponding bill-back claim is generated for each invoice line.

NOTE

To see the **Price details** page, on the **Accounts receivable parameters** page, on the **Prices** tab, select the **Enable price details** check box. |

Process claims and pass them as deductions to A/R

The next steps in the process for handling bill-backs are to review, calculate, and approve claims, and then convert them into deductions.

The Bill back workbench is where the promotion agreement owner periodically reviews and processes the claims that are generated. It's also where the A/R administrator converts the approved claims into deductions or regular payments, depending on the payment method for the claim.

On the **Bill back workbench** page, you can review the claim lines. If the claims are in **To be recalculated** status, they must be recalculated for any cumulative effect.

Recalculate claims

To recalculate the claims, on the Action Pane, select **Cumulate**. Then, in the **Cumulate rebates** dialog box, select the customer.

As a result of the recalculation, the program generates new claims for the amounts to adjust the original claims to the qualifying amount per unit. One adjustment claim is generated for each unique combination of a customer, an item, a currency, a unit of measure, inventory dimensions, financial dimensions, and a sales tax group. These adjustment claims have the same reference to the sales order and invoice number as the claims that are being adjusted (that is, the claims that were originally created from the sales document). Unlike the original claim, the adjustment claim doesn't have values in the fields that describe the original sales order line's amounts and quantity.

After the recalculation is completed, the status of the claims is changed to **Calculated**. To approve the claims, on the Action Pane, select **Approve**.

Process claims and pass them to A/R

The claims are now ready for A/R processing. To process them, on the Action Pane, select **Process**.

Upon processing the claims, the status has changed to **Mark** and indicates that a journal posting (the journal that is posted is the Rebate accrual journal, as specified in the A/R parameters) has caused the following events to occur:

- The claims have been transferred to the temporary customer balance as deductions.
- The rebate accrual account has been credited to represent the future liability for the customer.
- The rebate expense account has been debited to recognize the cost that was incurred in connection with the sales.

To complete the process, the A/R clerk must now handle the accrual deductions by transferring them to the customers balance as a credit note (liability).

To start the task, on the Action Pane of the **Customer** page, select **Collect > Settle transactions**. Then, on the **Settle transactions** page, select **Functions > Bill back program**. This rebate page shows all the bill-back claims that were previously processed.

If you want to create a credit note, select the **Mark** check box for all lines, and then select **Functions > Create credit note**.

Upon credit note creation, a journal is posted. (The journal that is posted is the AR consumption journal, as specified in the A/R parameters.) As a result, the real liability (credit) amount has been moved to the customer balance. Financially, this situation implies that the following events have occurred:

- The customer's receivable account has been credited.
- The rebate accrual account has been debited.

To approve a merchandising event of the **Lump sum** type, select the event on the **Trade allowance agreements** page, and then, on the **Amount** tab, select **Approve**.

Settle the deduction that is due and the customer short-pay by using the Deduction workbench

Often, in anticipation of bill-backs, customers choose to short-pay selected invoices. To prevent payment reconciliation issues in the future, the A/R clerk registers those short-pays as deductions when he or she records the actual customer payments. Then, on the Deduction workbench, those customer deductions can easily be settled against the claim amounts that are due from the company.

To register a customer's short-pay in the Payment journal, select **Accounts receivable > Payments > Payment journal**, and create a new payment journal. Then, on the Action Pane, select **Deductions**. On the **Deduction** page, you can create and track the amount that was short-paid.

The collection manager is now responsible for settling the open credit note transaction and the short-pay transaction against each other in the Deduction workbench.

To manage deductions, select **Sales and marketing > Trade allowances > Deductions > Deduction workbench**. The upper section of the page contains lines that represent the short-pays from the customer. The lower section of the page contains the customers open credit transactions.

To settle the deduction against the open transaction, mark the deduction line, and then, on the Open transactions tab, mark the line. On the Action Pane, click **Maintain > Match**.

The status of the originating claims is now set to **Completed**.

Analyze the effectiveness of the promotion and fund consumption

To get an overview of the program's key statistics and fund use, you can use several reports and analytical views that are available in Trade allowance management.

On the **Trade allowance activity** page, the **Overview** tab shows the main details of the trade allowance agreement. The other tabs show more specific details about the associated documents, payments, and other events that are related to the program.

The **Summary** tab shows the total quantity of products that have been sold under the promotion, the sales amount that has been invoiced, and the bill-backs and lump sums that have been paid.

The **Bill back credits** tab contains the details of individual bill-backs that have been credited to the customer.

To get a more analytical overview of the various performance measures for the promotion, you can use the Analysis view. To go to the Analysis view, click **Sales and marketing > Trade allowances > Trade allowance agreements**. On the Action Pane, click **Analysis**.

To get a more analytical overview of the various performance measures for the promotion, you can use the Analysis view. To go to the Analysis view, click **Sales and marketing > Trade allowances > Trade allowance agreements**. On the Action Pane, click **Analysis**.

Create a new trade agreement

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create a trade agreement where you register a new product sales price that you've agreed with a specific customer. You can run this procedure in demo data company USMF or on your own data. If you're using your own data, before you start this guide you need to make sure that a Trade agreement journal name exists where the Default relation is set to "Price (sales)".

Create and post a new trade agreement journal

1. Go to **Navigation pane > Modules > Sales and marketing > Prices and discounts > Trade agreement journals**.
2. Click **New**.
3. In the **Name** field, click the drop-down button to open the lookup.
4. In the list, find and select the desired record.
5. On **Action Pane**, click **Lines**.
6. In the **Account code** field, select 'Table'.

In this example, you're updating the price for a specific customer, which means you need to choose Table. If you were updating the product's list price, you would select 'All', so that the new price is valid for all customers. If you were differentiating prices among different customer segments, then you would select Group. To select Group, you must have set up Customer price groups.

7. In the **Account selection** field, click the drop-down button to open the lookup.
8. In the list, find and select the desired record.
9. In the **Item code** field, select 'Table'.

When you are entering a trade agreement of type 'Price (sales)', you must only select 'Table' in the **Item code** field. This is because a price is an absolute value and cannot be same for all products or a group of products.
10. In the **Item relation** field, click the drop-down button to open the lookup.
11. In the list, select the product you want to include in the agreement. Make a note of which product you've selected.
12. In the **From** field, enter a minimum quantity.
 - If the customer has to order a minimum quantity before they can qualify for the new price, then you need to specify that quantity here.
 - Enter a value in the **To** field to specify the maximum quantity above which the agreement's price will not be valid. If you offer prices and discounts based on multiple quantity breaks, then specify each quantity bracket as a pair of minimum and maximum quantity in the **From** and **To** fields respectively.
13. In the **Amount in currency** field, enter a price.
14. Under the **Details** section, in the **From date** field, enter a date from which this agreement will be valid.
15. Click **Save**.

16. Click **Validate**.
17. Click **Validate selected lines**.
18. Click **OK**.
19. Click **Post**.
20. Click **OK**.

View trade agreements for a product

1. Go to **Navigation pane > Modules > Product information management > Products > Released products**.
2. In the list, find and select the product whose price you have just updated.
3. On the **Action Pane**, click **Sell**.
4. Click **View trade agreements**.

Review the details of the price trade agreement you have just created.

5. Close the page.

Service management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use **Service management** to establish service agreements and service subscriptions, handle service orders and customer inquiries, and to manage and analyze the delivery of services to customers. You can use service agreements to define the resources that are used in a typical service visit. You can also use service agreements to view how those resources are invoiced to the customer. A service agreement can also include a service level agreement that specifies standard response times, and offers tools to record the actual time.

You can create service orders to manage information about scheduled and unscheduled visits by a service technician to a customer site. Service orders include information such as:

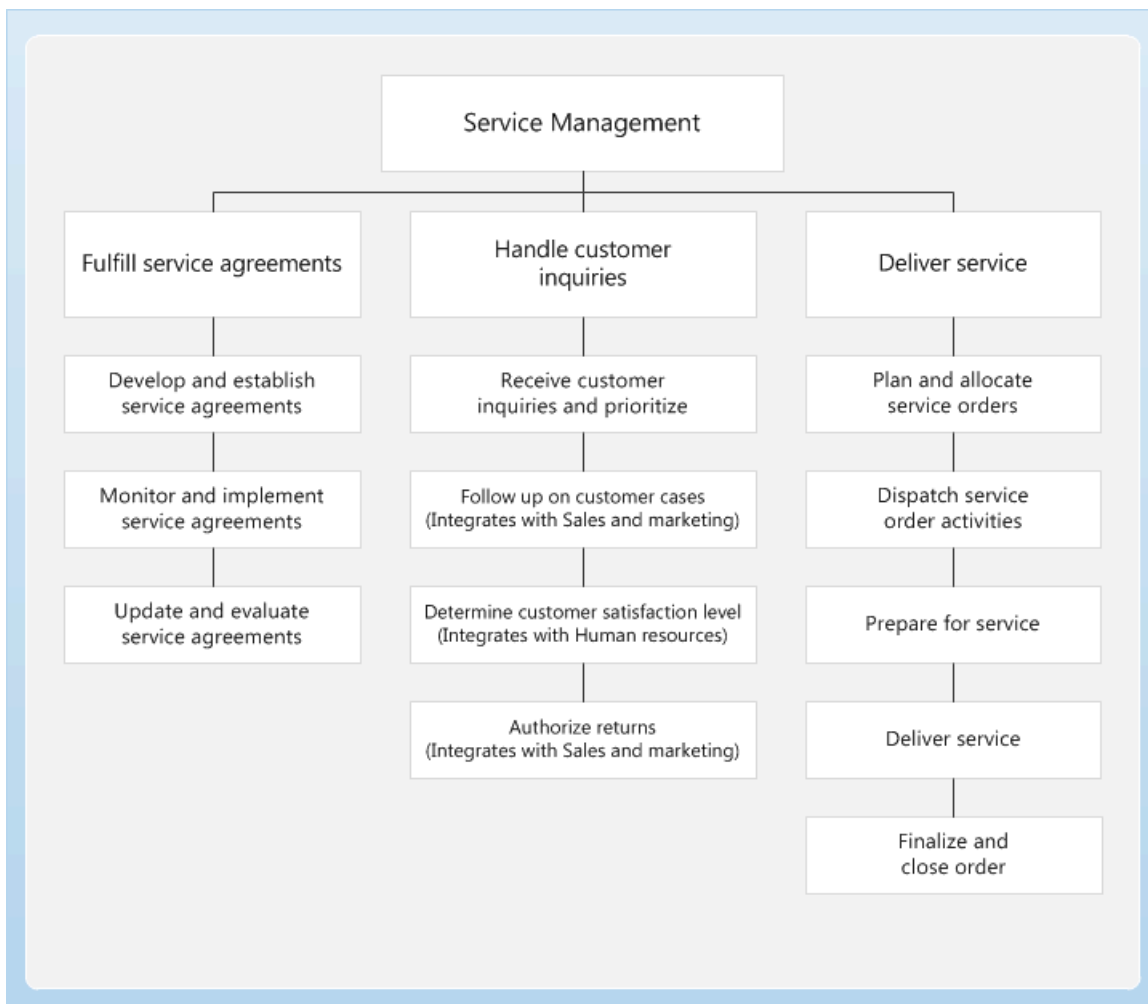

1. The hours of work that the service technician will perform
2. The type of service or repair
3. The item to repair, including details about the symptoms and diagnosis
4. Any expenses and fees related to the service or repair

You can receive, process, and dispatch service requests. After you have created a service order, you can use service stages to monitor progress and specify rules that control what actions are enabled in each stage. When a service order is complete, you can sign off on the order to confirm that it is complete, and then post the order to start the invoice process.

Use the reporting tools to monitor service order margins and subscription transactions, and print work descriptions and work receipts.

Business processes

The following diagram illustrates the high level business processes for **Service management**, and shows where service processes integrate with other modules.

Service management at a glance

IMPORTANT TASKS	PRIMARY PAGES	POPULAR REPORTS
Fulfill service agreements	Service agreements	Service order margin
Handle customer inquiries	Service orders	Work description
	Dispatch board	Transaction - subscription
		Subscription fee transactions

Integration of Service management

Service management can be integrated with the following modules:

Service agreements overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Service agreement groups are useful for sorting and filtering service agreements. Use service agreement groups to group service agreements by, for example, company size, geographical location, or industry type. Alternatively, you can use agreement groups to group service agreements by the level of service offered to a customer.

In the **Service agreement group** field in the **Service management parameters** page, you can define a default service agreement group. This group is suggested when you create a new service agreement.

Example

- You can group your service agreements according to the level of service offered.
- The three agreement groups you have set up in your company are Gold, Silver, and Bronze.
- A new service account manager has been employed in your company. The service manager is responsible for dealing with all clients in the Gold agreement group. You can filter agreement records on the Gold agreement group to find all of the agreements for which you must specify the new service manager as the person in charge.

Create service agreements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to use features in the Service management and the Project management and accounting modules to create service agreements.

Create a service agreement from Service management

1. Navigate to **Service management**.
2. Select **Service agreements** to create a new service agreement line in the page header.
3. Select **New**. Enter a description, select a reference to a project in the **Project ID** field, and fill in the rest of the fields and lines for the service agreement. Select **Save**.
4. On the **Relations** tab, select **Service objects** or **Service tasks** to create service object relations or service task relations for the service agreement. The service objects and tasks that you have created relations for can be attached on the lines of the service agreement.
5. In the lower half of the page, create service agreement lines by copying lines from a service template, another service agreement, or manually creating the service-agreement lines.

NOTE

If you copy lines into the service agreement from another service agreement, you can indicate whether you also want to copy service object and service task relations. If you copy these relations, they are added to any existing relations on the service agreement. If you copy service-agreement lines from a service template, the service-object and service-task relations are automatically copied as service-object relations and service-task relations on the new service-agreement lines.

Create service agreement lines manually

1. From the **Service agreements** page, add a service agreement line in the lines grid.
2. Enter the appropriate information for the service agreement line.
3. Select **Save** to save the line, and then close the page.

Create a service agreement from Project

1. Select **Project management and accounting**.
2. Select **All projects**.
3. Select the project from the list.
4. On the **Action Pane**, select **Manage**. In the **New** Action group, select **Service** and select **Service agreement**.
5. Follow the steps in the section titled **Create a service agreement** as described earlier in this topic to enter the project reference.

Service intervals

2/18/2021 • 2 minutes to read • [Edit Online](#)

The service agreement interval indicates the frequency with which service order lines are created for service agreement lines when you create service orders automatically.

When you create service orders automatically, service order lines are created according to the interval that you have specified for the service agreement line from the start date of the agreement line.

If the **Interval** field of a service agreement line in the **Service agreements** page is blank, the line is a one-time event, and it is not used to create service orders repeatedly.

Example

This example illustrates how a service interval will affect service agreement lines and service order lines on a service order.

Create a service agreement

First, you create a service agreement and set the **Combine service orders** option to **By service agreement**.

1. Click **Service agreements**
2. On the **Action Pane**, on the **Service agreement** tab, in the **New** group, click **Service agreement** to create a new service agreement.
3. Enter a description, select a project in the **Project ID** field, and enter a date in the **Start date** field.
4. In the **Combine service orders** field, select **By service agreement**.

You have now created the following service agreement:

PROJECT	START DATE
Your project	The date you specified for the project. In this example, the current date is used.

Create a service agreement line

Next, you create a service agreement line that has the transaction type **Hour**.

To complete this part of the example, you must create a service interval of 10 days in the **Service intervals** page.

1. Select the service agreement that you just created.
2. On the **Lines** FastTab, click the **Add** button to create a new line in the lower pane of the **Service agreements** page.
3. In the **Transaction type** field, select **Hour**.
4. In the **Worker** field, select the worker who will deliver the service.
5. In the **Service interval** field, select the 10 days interval.

You have now created a service agreement line with the following information:

TRANSACTION TYPE	START DATE	SERVICE INTERVAL
Hour	The current date.	Every 10 days

TRANSACTION TYPE	START DATE	SERVICE INTERVAL
Worker	The worker who will perform the service.	

There is no time window specified for the line.

Create planned service orders

You can now create planned service orders and service order lines for the coming month.

1. In the **Service agreements** page, on the **Action Pane**, on the **Deliver** tab, click **Planned service orders**.
2. In the **Create service orders** page, enter the current date in the **From date** field and a date that is one month from the current date in the **To date** field.
3. Set the **Hour** slider to **Yes**.
4. Click **OK**.

Because there is no grouping on the service order (defined by the **By service agreement** option in the **Combine service orders** field), one service order line is created per service order.

Service orders created

Three service order lines have been created within the time frame that you specified in the **Create service orders** dialog box. You can view the service order lines in the **Service agreements** page (**Action Pane** > **Deliver** tab > **View** button).

Set up service intervals

2/18/2021 • 2 minutes to read • [Edit Online](#)

Service interval indicates the frequency with which service order lines are created for service agreement lines when you create service orders.

1. Click **Service management > Setup > Service agreements > Service intervals**.
2. Create a new service interval.
3. Enter the ID and description of the service interval.
4. In the **Range** field, select the range.
5. In the **Frequency** field, type the frequency. The frequency is the factor by which you must multiply the range to obtain the interval for a service agreement.
6. Press **Alt+S** to save the service interval.

Example

You want to create a service interval of 10 days.

Create a 10-day service interval

1. Click **Service management > Setup > Service agreements > Service intervals**.
2. Create a new service interval.
3. Enter the ID and description of the service interval.
4. In the **Range** field, select **Daily**.
5. In the **Frequency** field, type 10.
6. Press **Alt+S** to save the service interval.

Time windows

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use time windows to optimize the scheduling of service order lines. You can set up the system so that it automatically creates service orders. Based on the criteria specified by a time window, you can connect as many service order lines as possible to as few service orders as possible.

Time windows specify how far a service order line can move from its calculated date. The calculated date is the date when the service order line was scheduled to occur. The date is based on its interval setting and the service period that you defined in the **Create service orders** page. You define a time window by using the values in the following table.

METHOD	DESCRIPTION
Week	The date that the service order line can be moved to any open day in the same week as the initial calculated date.
Month	The date that the service order line can be moved to any open day in the same month as the initial calculated date. For example, the calculated date for a service order line is February 15, 2017. The service order line can be scheduled for any weekday between February 1 and February 28, 2017.
Manual	You define the maximum number of days before or after the initial calculated date that the service order line can be moved.

If you do not specify a time window for a service agreement line, the service order line that is derived from the service agreement must be on the exact date for which it was originally scheduled.

Create a service template group

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use service template groups to sort and filter service templates.

1. Click **Service management** > **Setup** > **Service agreements** > **Service template groups**.
2. Create a new service template group.
3. Enter the group ID, a description, and a parent service template group, if there is one.
4. Save the service template group.
5. Set the **Tree control** slider to **Yes** to open the tree view and view the service template groups either as a hierarchy in a tree view or as an overview.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service tasks overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use service tasks to describe the task to be completed during a service order. Both technicians and customers can see this information.

You create service tasks in the **Service tasks** page, and you associate service tasks with a specific service agreement or service order by creating service task relations. Every time that you create a service task relation, you can create the following:

- Internal notes for the task, such as detailed technical requests for the task that are important for the technician to know.
- External notes that the customer can see. These might provide a less technical explanation of the task that is being completed, according to the agreement between the customer and the service company.

When you have set up a service task relation between a service task and a service order or service agreement, you can specify this service task when you create service order lines or service agreement lines for the current service order or service agreement.

When you generate service orders from a service agreement, you can use the service tasks that are assigned to each service agreement line to group service order lines into service orders.

Create a service task

1. Click **Service management > Setup > Service tasks**.
2. Create a new line.
3. Enter the service ID and description.

Example

A technician must complete two jobs on a gearbox (service object GB-1234) at a customer site. A service agreement is created for the customer, and several transactions are associated with the jobs. The service agreement and service agreement lines for the two jobs are as follows:

Service agreement

PROJECT	SERVICE AGREEMENT	DESCRIPTION	GROUP
9012	000008_001	Inspection and routine replacement – GB-1234	Premium

Service agreement lines

DESCRIPTION	TRANSACTION TYPE	SERVICE OBJECT	SERVICE TASK
Inspection and cleaning	Hour	GB-1234	I/C - GB1234
Travel	Expense	GB-1234	I/C - GB1234
Materials	Item	GB-1234	I/C - GB1234

DESCRIPTION	TRANSACTION TYPE	SERVICE OBJECT	SERVICE TASK
Routine replacement	Hour	GB-1234	RR - GB1234
GR-1	Item	GB-1234	RR - GB1234
GR-5	Item	GB-1234	RR - GB1234

The service agreement lines for the two jobs have two service tasks attached to them. The service tasks determine the transactions that belong to each job. In the first case, service task I/C - GB1234 identifies all the service agreement lines that are involved in the inspection and cleaning of object GB-1234. In the second case, service task RR - GB1234 identifies all the service agreement lines that are involved in completing a routine replacement job.

The service task relations that connect the service tasks to the specific agreement are as follows:

Service tasks

SERVICE TASK	DESCRIPTION	INTERNAL NOTE	EXTERNAL NOTE
I/C - GB1234	Inspection of gearbox GB-1234	Visual and mechanical inspection and cleaning of gearbox GB-1234	Routine inspection of gearbox
RR - GB1234	Routine replacement of parts in GB-1234	Routine service replacement of GR-1 and GR-5 components (for gearboxes manufactured before 2002, also replace GR-2 component)	Routine replacement of parts

Group service orders

When you create service orders automatically, you can use service tasks as grouping criteria. To group service orders by service tasks, define on the service agreement that service orders that are based on the service agreement should be grouped by service task ID as their initial grouping criteria.

Group by service task

1. Click **Service management > Common > Service agreements > Service agreements**.
2. On the **Setup** tab, select **By service task** in the **Combine service orders** field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create service task relations

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can associate service tasks with service agreements or service orders in order to describe the service task to be completed for the agreement or order. This information is available to service technicians and customers.

Create a relation with a service agreement

1. Go to **Service management > Common > Service agreements > Service agreements**.
2. Select an existing service agreement, or create a new service agreement.
3. On the Action Pane, select the **Service tasks** button.
4. On the **Service tasks** form, select **New** to create a new line, and then select a service task from the **Service task** list to attach the service task to the service agreement.
5. On the **Description** tab, enter any internal or external note descriptions in the free text fields.
6. Close the form to save the record.

Repeat this procedure until you have created all the necessary service task relations for the service agreement. You can now specify these service tasks for any attached agreement lines.

A service tasks relation that is created on a service agreement is available from all service orders that are attached to the service agreement.

Create a relation with a service order

1. Go to **Service management > Common > Service orders > Service orders**.
2. Select an existing service order, or create a new service order.
3. On the Action Pane, select the **Service tasks** button.
4. From the **Service tasks** form, select **New** to create a new line, and then select a service task from the **Service task** list to attach the service tasks to the service order.
5. On the **Description** tab, enter any internal or external note descriptions in the free text fields.
6. Close the form to save the record.

Repeat this procedure until you have created all the necessary service task relations for the service order. You can now select the service task for which you have created the relation when you create service order lines.

Service task relations that are created on a service order are available on the specific service order.

Service objects overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Service objects are a customer's assets and products for which you can perform a service. Depending on the type of service you provide, objects can be tangible or intangible:

- Tangible objects are things, such as a machine or a building, on which you can perform a physical service task.

A tangible service object can also be an inventory item that you create in the Released product details form. Depending on the inventory dimension group that you attach to the item, you can create a service object to a level of detail that includes the item serial number. This is useful when you must keep track of the exact item that the service object represents.

A tangible service object can also be an item that is not directly related to a company's direct production or supply chain. For example, a tool kit that is used for repairs in a service order can be a service object that is not included in inventory. In this case, you don't register it as an inventory item.

- Intangible objects are nonphysical things, such as a set of accounts or a legal document, on which you can perform a service task.

Example of an intangible service object

Company A maintains the financial records for several small companies. One of Company A's clients is the local football team, for which Company A does the weekly bookkeeping and annual audit of the club's accounts. The club's accounts are set up in the Service objects form and specified as the object in the service agreement. There are two service agreement lines for the object. Line 1 is weekly bookkeeping with a weekly interval assigned to the line, and line 2 is the annual audit with a yearly interval assigned to it.

Create service task relations

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can associate service tasks with service agreements or service orders in order to describe the service task to be completed for the agreement or order. This information is available to service technicians and customers.

Create a relation with a service agreement

1. Go to **Service management > Common > Service agreements > Service agreements**.
2. Select an existing service agreement, or create a new service agreement.
3. On the Action Pane, select the **Service tasks** button.
4. On the **Service tasks** form, select **New** to create a new line, and then select a service task from the **Service task** list to attach the service task to the service agreement.
5. On the **Description** tab, enter any internal or external note descriptions in the free text fields.
6. Close the form to save the record.

Repeat this procedure until you have created all the necessary service task relations for the service agreement. You can now specify these service tasks for any attached agreement lines.

A service tasks relation that is created on a service agreement is available from all service orders that are attached to the service agreement.

Create a relation with a service order

1. Go to **Service management > Common > Service orders > Service orders**.
2. Select an existing service order, or create a new service order.
3. On the Action Pane, select the **Service tasks** button.
4. From the **Service tasks** form, select **New** to create a new line, and then select a service task from the **Service task** list to attach the service tasks to the service order.
5. On the **Description** tab, enter any internal or external note descriptions in the free text fields.
6. Close the form to save the record.

Repeat this procedure until you have created all the necessary service task relations for the service order. You can now select the service task for which you have created the relation when you create service order lines.

Service task relations that are created on a service order are available on the specific service order.

Attach inventory items to service objects

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to attach an inventory item to a service object. When you attach an item to a service object, you can control and report the service activities that are performed for the item.

Before you can attach items to service objects, you must create the items in the **Released product details** form.

Use the following steps to attach an inventory item to a service object:

1. Click **Service management > Setup > Service objects > Service objects**.
2. In the **Item number** field, select the item to attach to the service object.
3. Save the service object.

The item is now attached to the service object, and any inventory dimensions specified for the item are also copied to the service object.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service object groups

2/18/2021 • 2 minutes to read • [Edit Online](#)

Object groups are useful for sorting and filtering the data about objects for reports and statistics. For example, you can group objects by geographical location or by type.

Group by geographical location

You can use this grouping method to show where the various different objects that your company services are located. Grouping objects by geographical location can also be useful if, for example, you must identify the objects that your company already provides services for in a particular country/region.

Example

A customer from Belgium calls your service center and wants to create a service agreement for an object, ABC. You have attached an object group for geographical location, Belgium, to all objects that are serviced in Belgium. By using this group as a filter, you can quickly search to see whether you already have a record for ABC in the program, or whether you must set up a new object.

Group by type

You can use this grouping method to show the types of objects that your company services. Grouping objects by type can also be useful if, for example, you want to create a new object based on similar objects that already exist in the program.

Example

A customer calls and wants to set up a service agreement for an air conditioning machine, HIJ. You do not already have a record for this machine. However, you have set up an object group titled Air Conditioners, and you have attached this group to all air conditioning objects. Therefore, you can quickly search for and identify all other air conditioning machines and use the template information from these objects to create service agreement lines for HIJ. By using object groups in this manner, you can quickly set up new objects and determine the service tasks that must be performed on them.

Create service object groups

Create groups that you can assign service objects to. Service objects are inventory items and other products for which services are performed. By grouping service objects, you can create reports for similar and related service objects. For example, a service object group might consist of two service objects: One service object is a kit, and the second service object is the service to install the kit.

To create service object groups, follow these steps:

1. Click **Service management > Setup > Service objects > Service object groups**.
2. Click **New** to create a new service object group.
3. Enter a unique name for the service object group and, optionally, a description.

You can assign service objects to the group by using the **Service objects** form.

Set up template to represent objects at customer site

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to set up a template that represents objects at a customer site.

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Double-click a service agreement, or click **Service agreement** to create a new service agreement.
3. Click the **Setup** tab.
4. Click **Service objects** to attach a template bill of materials (BOM) to the service agreement.
5. In the **Service objects** form, select a service object, and then click **Functions > Attach template BOM**.
6. In the **Select template BOM** form, select a template BOM in the **Template BOM** field, and then click **OK**.
7. In the **Service objects** form, click **Designer** to modify the template BOM so that the BOM represents the objects that you want.
8. Close the forms to save your changes.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service object relations

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create service object relations between a service object and a service agreement or service order. When you create a relation, you attach the service object to the service agreement or service order.

After the relation is created, you can attach the service object to any lines on the service agreement or service order.

Template BOMs

You can also specify a template BOM for the object relation. The template BOM is a bill of materials for the object on which you perform service. If you replace a component part of the service object during a service visit, you can register this change in the service BOM by using the Service objects form.

Example

You create a service agreement for servicing two elevators at a customer site. The service agreement has the identifier ID SAL-001.

The elevators are set up in the Service objects form as objects, EL-S/1000 and EL-L/1000.

You attach the service objects, EL-S/1000 and EL-L/1000, to the service agreement.

You want to register changes in the BOM for the service object as you replace component parts of the object, so you attach a service BOM to the service object relation, as described in the following table.

SERVICE OBJECT	RELATION – SERVICE AGREEMENT	SERVICE BOM
EL-S/1000	ID SAL-001	BOM-EL-S/1000
EL-L/1000	ID SAL-001	BOM-EL-L/1000

Because there are service object relations for the agreement, you can now create service agreement lines with these objects, as shown in the following table.

TRANSACTION TYPE	CATEGORY	SERVICE OBJECT
Hour	Inspection	EL-S/1000
Hour	Gear box cleaning	EL-S/1000
Item	Cleaning materials	EL-S/1000
Hour	Inspection	EL-L/1000
Hour	Gearbox cleaning	EL-L/1000
Item	Cleaning materials	EL-L/1000

On a service visit, you have to replace the gearbox for elevator EL-S/1000. To replace a component part of the

object, you can access the BOM Designer by using the service object relation that you set up for the current service agreement.

Access the BOM Designer by using a service object relation

1. Service agreements
2. Double-click a service agreement, or click Service agreement to create a service agreement.
3. Click the Setup tab.
4. Click Service objects to attach a template BOM to the service agreement.
5. In the Service objects form, click Designer to open the Designer form to modify the template BOM.

Automatically created service orders

If you automatically create service orders for a service agreement, the service object relations in the agreement are also created in the service orders.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create service object relations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create service object relations for a service agreement and a service order. When you create a service object relation, you associate the service object to a service agreement or service order. When a customer requests service for an item that is a service object, you can select the service object from the list of service object relations.

Create a service object relation for a service agreement

Use the following steps to create a service object relation for a service agreement:

1. Click **Service management > Common > Service agreements > Service agreements**.
2. In the **Service agreements** list, select an existing service agreement, or click **New** to create a new service agreement.
3. In the **Service agreements** form, on the **Action Pane**, on the **Service agreement** tab, in the **Relations** group, click **Service objects**.
4. In the **Service objects** form, click **New**, and then select a service object for this service agreement.
5. To assign a template bill of materials (BOM) to the service agreement, click **Functions**, and then select **Attach template BOM**. In the **Select template BOM** form, in the **Template BOM** field, select a template.

Create a service object relation for a service order

Use the following steps to create a service object relation for a service order:

1. Click **Service management > Common > Service orders > Service orders**.
2. In the **Service orders** list, select an existing service order, or create a new service order.
3. In the **Service orders** form, on the **Action Pane**, on the **Service order** tab, in the **Relations** group, click **Service objects**.
4. In the **Service objects** form, click **New**, and then select a service object for this service order.
5. To assign a template BOM to the service agreement, click **Functions**, and then select **Attach template BOM**. In the **Select template BOM** form, in the **Template BOM** field, select a template.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Template BOMs

2/18/2021 • 4 minutes to read • [Edit Online](#)

A template bill of materials (BOM) provides you with a standardized list of components for service objects that are serviced regularly. The components that are listed in the template BOM represent the individual subcomponents of the service object. By applying a template BOM to a service object, you can keep a record of the subcomponents that have been replaced on the service object.

To apply a template BOM to a service agreement or a service order, you attach it to a service object relation.

NOTE

You can apply only one template BOM to a service object.

Create a template BOM

The following table contains information about the various methods that you can use to create a template BOM.

METHOD	DESCRIPTION
Production	The template BOM is based on a production order. This option is applicable only if you operate in a production environment. The benefit is that you have a current, detailed listing of the components that make up an item.
Item BOM	The template BOM is based on an item BOM. The item BOM, unlike the production BOM, is a static list of the components that make up an item.
Existing template	The template is based on an existing template BOM.
Manual	If you know what spare parts are typically replaced on a service object, you can create your template BOM manually. This method helps make sure that the components that are included in the template reflect the actual requirements of your workplace.

Apply the template BOM to a service agreement or service order

You can apply a template BOM to a service agreement, a service order, or both. The service agreement usually covers a long-term relationship with a customer. The history of replacements that is recorded in the service BOM is useful data to have for the service agreement.

You can also apply a template BOM to a service order to record the history of the service that has been performed on a service object.

Copy the history of a service BOM

You can copy the history of a service BOM line from one service agreement to another service agreement. By copying the service history between service agreements, you can preserve the record of replacements for an item.

Example

You have set up a three-year service agreement for a customer's car. During that period, the customer becomes accustomed to the good service that the company provides. Therefore, after the agreement expires, the customer wants to set up a new one. You are now able to negotiate a more favorable agreement for the company. Because the record of replaced components might be useful in the future, you copy the history of the service BOM to the new agreement.

Modify the template BOM

If a template BOM has not been attached to a service object, you can modify or delete lines in it. After the template BOM is attached to a service object, you can modify only the local version of the BOM. If you want to duplicate the setup of a local version of a template BOM, you can create a new template BOM based on the local version. For more information, see [Modify a Service BOM](#).

If you replace an item in the BOM, you can register the replacement on the BOM line in the BOM designer. Optionally, you can create a service order line for the replacement object. If you create a service order line, you can invoice the replacement item. If you do not create a service order line for a replacement, the replacement registration is kept to track the history of the service object.

Change how information on the BOM line is displayed

You can change the way that information on the BOM line is displayed for all template and service BOMs. The changes are applied to all template BOMs and service BOMs. This includes those that are attached to service objects.

Set up number sequences for template BOMs

To use template BOMs, you must set up two number sequences. Set up one number sequence for the template BOM and one for the BOM history line number.

NOTE

Number sequences are used to allocate identifiers to records that require them. Before you can assign a number sequence to a template BOM or a BOM history line number, you must set up number sequences codes.

Set up number sequences

1. On the **Number sequences** list page, create number sequences for template BOMs and the BOM history line number.
2. Click **Service management > Setup > Service management parameters**.
3. Click **Number sequences**, and then select a number sequence code for the number sequence references that you created in the **Number sequences** form.
4. Close the form to save your changes.

NOTE

The BOM history line number is used by the system to associate the transactions in the BOM history with a service agreement or service order. The number is not displayed in the user interface.

Create a template BOM

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create a template BOM by using any of the following methods. For all methods, the **From date** and **To date** fields are optional and for information only.

Create a template BOM manually

1. Go to **Service management > Setup > Service objects > Template BOMs**.
2. Select **New** to open the **Create template BOM** form.
3. Under **Copy BOM lines from reference**, select the **Manual** option.
4. In the **Item number** field, enter an item of the type **BOM**.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new, blank template BOM is created.

Create a template BOM based on another template BOM

1. Select **Service management > Setup > Service objects > Template BOMs**.
2. Select **New** to open the **Create template BOM** form.
3. Under **Copy BOM lines from reference**, select the **Template BOM** option.
4. In the **Reference number** field, select an existing template BOM to copy to your new template BOM.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new template BOM is created by using lines that correspond to the lines in the original template BOM.

Create a template BOM based on an item BOM

1. Select **Service management > Setup > Service objects > Template BOMs**.
2. Select **New** to open the **Create template BOM** form.
3. Under **Copy BOM lines from reference**, select **BOM**.
4. In the **Reference number** field, select a BOM version. An item of the type BOM is copied to the **Item number**.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new template BOM is created by using lines that correspond to the lines of the BOM listed in **Bills of materials**.

Create a template BOM based on a production BOM

1. Select **Service management > Setup > Service objects > Template BOMs**.
2. Select **New** to open the **Create template BOM** form.
3. Under **Copy BOM lines from reference**, select **Production**.
4. In the **Reference number** field, select a production BOM.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new template BOM is created by using lines that correspond to the lines of the BOM listed in **BOM**.

Attach templates to service objects

2/18/2021 • 2 minutes to read • [Edit Online](#)

A template bill of materials (BOM) can be attached to a service object relation. The service object relation can then be associated with either service orders or service agreements.

1. Click **Service management > Setup > Service objects > Service objects**.
2. Select a service object.
3. Click **Service agreements** or **Service orders** to display the service agreements or service orders that the service object has been associated with.
4. Select a service agreement or a service order, click **Functions**, and then click **Attach template BOM**.
5. Select the template BOM to attach to the object.

TIP

To move an attached BOM to another service object or to delete an attached BOM, in the **Service objects** form, click **Functions**, and then click **Move service BOM** or **Delete service BOM**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reason codes for service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use reason codes to help explain the status of a service order when the stage of a service order is updated. For example, if you cancel a service order, you can select a reason code for the cancellation.

To view information about reason codes that are used to track the progress of service orders, run the Service order progress report. This report lists all service orders, regardless of their stage, and the reason codes that are specified when a service order stage is updated.

Turn reason codes on or off

Reason codes are optional. You can decide whether to require a reason code when you update a service order to a specific service stage.

1. Click **Service management > Setup > Service orders > Service stages**.
2. In the **Service stages** form, select a service stage, and then select the **Reason** check box for the service stage.
3. Close the form to save your changes.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service order stages

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can set up stages for a service order to define the tasks that must be completed, the order in which they are completed, and the workers who are responsible for completing them. By defining the stages for a service order and assigning them to workers, you can control the flow of a service order through the tasks that various people perform in the service organization. The sequence of stages must include an initial stage.

You can also define the actions that are permitted at each stage. For example, if you clear the **Post** check box for all stages except the final stage, you prevent any service orders from being posted before the service orders are processed through the complete sequence of stages.

Branching in service order stages

When you set up a service stage, you can create multiple options, or branches, to select from for the next service stage. All the branches that you create are available to select from when the initial stage is completed. For example, you set up **Planning** as an initial stage. You create two stages named **In process** and **Cancel**, and then select **Planning** as the parent for them. You assign the **Planning** stage to sales order. When the planning stage for the sales order is completed, you can select the **In process** stage if the sales order is ready to work on, or you can select the **Cancel** stage if the sales order is canceled.

Set up service order stages

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Go to **Service management** > **Setup** > **Service orders** > **Service stages**.
2. Select **New** to create a new record.
3. In the **Service stage** and **Description** fields, specify a service stage ID and description.
4. Select the appropriate parameters for the stage.
5. Select the parent stage for the current stage or leave the **Parent** field blank if the stage is the initial stage in the stage setup.

NOTE

You cannot modify the **Parent** field after you save the stage. Instead, you can delete the record and create the record again with a different selection in the **Parent** field.

Also, you can only create one stage with a blank **Parent** field. That is, only one initial stage is permitted.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create reason codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Go to **Service management** > **Setup** > **Service orders** > **Stage reason codes**.
2. Select **New** to create a new reason code.
3. Select **Save** to save the reason code.

When you are prompted for a reason code to explain why you are updating a stage of the service order, you can select any of the reason codes that you create here.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service level agreements overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

A service level agreement (SLA) is an agreement between a service company and a service customer. In a SLA, the customer agrees to a minimum response time based on when the service company records the issue and when the issue is resolved.

A SLA enforces a standard level of service that is offered to customers, and also makes it transparent to a service company when a service job should be completed.

Any number of SLAs can be created to offer service customers different levels of service.

Create a service level agreement

1. Click **Service management > Setup > Service agreements > Service level agreements**.
2. Type a name for the service level agreement in the **Service level agreement** field.
3. Type the time that you want to allow for completion of service calls that are attached to the service level agreement. Then select a calendar if you want to base the service level agreement on a specific calendar.

Apply a service level agreement

The SLA is applied directly to a service agreement.

Service orders that you create manually and attach to a service agreement that has an SLA are measured against that SLA.

Service orders that you create automatically are not attached to an SLA.

Apply the service level agreement to the service agreement

1. Click **Service management > Common > Service agreements > Service agreements**. Select the service agreement that you want to apply the SLA to, and then click **Edit** on the **Action Pane**.
2. In the **Service level agreement** field, select the SLA that you want to assign.

Apply the service level agreement to the service agreement group

1. Click **Service management > Setup > Service agreements > Service agreement groups**.
2. In the **Service level agreement** field, select the SLA that you want to assign.

Track time on a service order against an SLA

When you create a new service order for a service agreement that an SLA is assigned to, the time interval for the delivery of the service is initiated, and the system starts to track the delivery time. Additionally, you can set the following options:

- You can start and stop time recording on the service order to register the total amount of time that is spent on service orders.
- You can monitor compliance with the time interval that is set in the service level agreement.

- You can define reason codes that must be set if the time interval of the service level agreement is exceeded.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Subscription sales prices

2/18/2021 • 3 minutes to read • [Edit Online](#)

When you create a subscription, the sales price is derived from the sales price setup that was created in the **Sales price (subscription)** form.

In the **Sales price (subscription)** form, you can create sales prices for a specific subscription or you can create sales prices that apply more broadly. For a sales price to be applied to a subscription, the period code and the currency of the subscription must be identical to the period code and the currency of the sales price.

If the period code and currency are identical for the subscription and the sales price, subscription sales prices are selected on the basis of the priorities listed in the following table. A blank cell in the table indicates an empty field and an X indicates a value that is equal to the value in the subscription from which the transaction is generated.

PRIORITY	CATEGORY	PROJECT ID	SUBSCRIPTI ON	SALES CURRENCY	PERIOD CODE
1	X	X	X	X	X
2		X	X	X	X
3	X		X	X	X
4			X	X	X
5	X	X		X	X
6		X		X	X
7	X			X	X
8				X	X

When a subscription fee is created, the sales price with the greatest level of detail, as noted in the table above, is selected as the subscription sales price.

Update and index subscription sales prices

You can update the subscription sales price by updating the base price or the index. You can update by a percentage or to a new value.

Subscription fee sales prices

When you create a subscription fee, the sales price is based on the sales price setup of the subscription. You can

either use the base price from the subscription price setup or create indexed sales prices.

Example

You want to set up subscription sales prices of EUR 500 for a new project 9030. In the **Sales price (subscription)** form, you create a subscription sales price line as indicated in the following table.

VALID FROM	CATEGORY	PROJECT	SUBSCRIPTION	PERIOD CODE	SALES CURRENCY	SALES PRICE
28-08-2006		9030		Month	EUR	500

Note that the **Category** and **Subscription** fields are empty.

You then create the following subscriptions.

SERVICE SUBSCRIPTION	PROJECT	SUBSCRIPTION GROUP	CATEGORY	CURRENCY	PERIOD CODE
00020_135	9030	Sub1	SubCat1	EUR	Monthly
00021_135	9030	Sub1	SubCat2	EUR	Monthly

Now you create subscription fees for both subscriptions in the subscription group Sub1:

1. Click **Service management > Setup > Service subscriptions > Subscription groups**.
2. In the **Subscription groups** form, click **Function > Create subscription fee**.
3. In the **Create subscription fee** form, enter the appropriate information. For more information, see [Create subscription fee transactions](#).

Subscription fees that have a sales price of EUR 500 are created for both subscriptions, as shown in the following table.

PROJECT DATE	SERVICE SUBSCRIPTION	PROJECT	CATEGORY	START DATE	END DATE	SALES CURRENCY	SALES PRICE
28-08-2006	00020_135	9030	SubCat1	01-01-2007	31-03-2007	EUR	500
28-08-2006	00021_135	9030	SubCat2	01-01-2007	31-03-2007	EUR	500

Later, you decide that you want to specify sales prices for the category SubCat1 for project 9030. Therefore, you create a new sales price line that has a sales price of EUR 550 for the combination of project 9030 and fee category SubCat1. There are now two subscription sales price lines for project 9030, as shown in the following table.

VALID FROM	CATEGORY	PROJECT	SUBSCRIPTION	PERIOD CODE	CURRENCY	SALES PRICE
28-08-2007		9030		Month	EUR	500
28-08-2007	SubCat1	9030		Month	EUR	550

You repeat the procedure described above to create subscription fees for both subscriptions in the subscription group Sub1. The following table shows the transactions that are created for each subscription that is attached to the subscription group.

PROJECT DATE	SUBSCRIPTION	PROJECT	CATEGORY	START DATE	END DATE	SALES CURRENCY	SALES PRICE
28-07-2007	00020_135	9030	SubCat 1	01-01-2008	31-03-2008	EUR	550
28-07-2008	00021_135	9030	SubCat 2	01-01-2008	31-03-2008	EUR	500

In the first transaction for subscription 00020_135, the sales price of EUR 550 derives from the subscription sales price that is set up for the combination of the specific project and category. In the second transaction for subscription 00021_135, the sales price of EUR 500 is used as the project subscription sales price because there is no price set up for the combination of project 9030 and category SubCat2.

Subscription groups

2/18/2021 • 2 minutes to read • [Edit Online](#)

Subscriptions share the following information, which is defined for the subscription group:

- Number sequence code for the subscription, if any.
- The invoicing period for which subscription transactions are created. For example, if the **Invoicing** period code in the **Subscription groups** form is set to **Quarterly**, transactions for all subscriptions that are attached to the subscription group are created on a quarterly basis.
- How frequently the subscription is to be accrued, if at all.

You can also complete the following tasks for all subscriptions that are attached to the subscription group:

- Create subscription transactions.
- Update the base price or the index for the subscriptions.
- Post accrued revenue for subscription transactions.

Use stage reason codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

You use a reason code to indicate why a service level agreement (SLA) has been canceled, or why a service order has exceeded the time limit that is you define in the SLA.

You can also specify that a reason code is required when an SLA is canceled, or when the time limit exceeds the time that is specified in the SLA for the service order.

If you have specified that a reason code is required, you must enter a reason code in the following situations:

- When a service order is moved to a stage that stops time recording against the SLA for the service order.
- When the service order is signed off.
- When time recording is manually stopped.

Set up reason codes

1. Click **Service management > Setup > Service orders > Stage reason codes**.
2. In the **Stage reason codes** form, click **New** to create a new reason code.
3. In the **Stage reason code** field, enter a unique stage reason code.
4. In the **Description** field, enter a description of the stage reason code.
5. Close the form to save your changes.

Require reason codes when a service level agreement is canceled

1. Click **Service management > Setup > Service management parameters**.
2. In the **Service management parameters** form, click the **General** link, and then select the **Reason code on canceling** check box.

Require reason codes when the a service order exceeds the time limit that is set by the service level agreement

1. Click **Service management > Setup > Service management parameters**.
2. In the **Service management parameters** form, click the **General** link, and then select the **Reason code on exceeding time** check box.

Integration for service agreements and projects

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you work with service agreements and service agreement lines, you use data that is set up in the following areas in **Project management and accounting**.

Project prices

The cost and the sales price for a service agreement transaction are derived from the cost price setup that applies to the project that is attached to the service agreement. Cost and sales prices can be set up by project, employee, and category.

Project validation

The projects, employees, and categories that are available for selection on a service agreement line can be limited by the validation setup in **Project management and accounting**. By using the validation setup, you can combine employees, projects, and categories for control access.

Project line properties

A line property is entered automatically for a service agreement line.

Line properties are created in the **Line properties** form in **Project management and accounting**. The line property that is entered on a service agreement is attached to the project that is selected for the service agreement and inherited subsequently by the service agreement line.

Default offset accounts

If you enter an expense transaction, a default expense offset account is selected automatically for the transaction. The default expense account is set up for the project that is attached to the current service agreement.

Project categories

The categories that are available for service agreement lines are set up in the **Project categories** form in **Project management and accounting**.

NOTE

Categories that have the **Active in journals** check box selected on the **Project** tab in the **Project categories** form are available for selection. However, if the **Inactive categories** check box is selected on the **Journals** tab in the **Project management and accounting parameters** form, all categories are available for selection.

Project parameters

If the **Terminated workers** field on the **Journals** tab in the **Project management and accounting parameters** form is selected, you can select inactive employees and active employees in the **Service agreements** and **Service orders** forms.

Also, you can enable the **Start time** and **End time** fields on the **Project** tab in the **Service orders** form to enter starting and ending times on service order lines.

Enable the starting and ending time feature for service orders

1. Click **Project management and accounting > Setup > Project management and accounting parameters**.
2. Click the **Journals** tab, and then select the **Show start/end times** check box.
3. Click **Project management and accounting > Setup > Journals > Journal names**.
4. Select the journal name that is attached to the service order.
5. Click the **General** tab, and then select the **Show start/end times** check box.

NOTE

Select the journal name for the service order in the **Hour** field on the **Journals** tab in the **Service management parameters** form.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Repair management

2/18/2021 • 3 minutes to read • [Edit Online](#)

For repair management you can group problems systematically. This is to help with the suggestion of solutions that have been successful in the past.

You set up symptoms, diagnosis, and resolution settings. All these can later be applied when you receive a similar item for repair. You can also set up repair stages that can follow the progress of a repair issue.

Setting up repair management

Use the following setup forms to enter information that will be used to specify the symptoms, the diagnosis, and the resolution, of the repair.

- **Service management > Setup > Repair > Conditions.**
- **Service management > Setup > Repair > Symptom areas.**
- **Service management > Setup > Repair > Diagnosis areas.**
- **Service management > Setup > Repair > Resolutions.**
- **Service management > Setup > Repair > Repair stages.**

Symptoms and conditions

Symptoms are how the customer characterizes the problem. Symptoms include the customer observations that indicate the need for repair.

You can set up symptom areas, symptom codes, and conditions. The symptom area covers the area of malfunction, and the symptom code covers the malfunction symptom. The condition describes the situation or environment that is present when the problem occurs.

Example

A computer is brought in for repair because the hard drive fails after an extended period of use. The hard drive failure causes a blue screen error. The technician who receives the computer enters the following symptoms and conditions:

1. The symptom area is the hard drive
2. The symptom code is the blue screen error
3. The condition is that the hard drive fails after extended use

Diagnosis and resolutions

The diagnosis and resolution fields are statements from the repair perspective. These are the steps that a technician went through to investigate the problem.

The diagnosis area covers the operation that must occur to solve the issue. The diagnosis code is how the problem was handled, and the resolution could be that the item was repaired, replaced, or the order was canceled by the customer. For example, if the computer is repaired, the diagnosis area could be "defective part," the diagnosis code could be "new video card installed," and the resolution could be "replaced."

Repair stages

Repair stages state the progress of the repair process. The repair stage has a **Finished** sign-off parameter that indicates that the repair line has been completed, and the finishing date and time has been recorded.

Applying repair management

To apply repair management to an item, the item must be set up with a service object relation on a service order. From the service order you can then create a repair line with information about the current issue. On the repair line you define the service object that is in repair and information about symptoms, diagnosis, and execution. You can also create a note for the repair line.

You can create repair lines for each step in the repair process.

Create a repair line on a service order

1. Go to **Service management > Common > Service orders > Service orders**.
2. Select the service order with the service object that needs repair.
3. Select **Repair > Repair lines** to open the **Repair lines** form.
4. Select **New** to create a new line.
5. Select a service object. You can select any service object that has been set up with an object relation on the service order.
6. Select any of the preset symptoms, diagnosis, and execution values that are relevant in the repair line and then select the **Note** tab to create a note on the repair line, if needed.
7. Select **Save** to save the new repair line. The **Created date and time** field in the **General** tab of the **Repair lines** form is updated with the time of saving.

Tracking progress and resolving a repair issue

You can set the repair stages of a repair line to track the progress of the repair.

When a repair issue is resolved, you can close the repair line. Set the repair stage to a stage with a **Finished** property enabled. The current date and time is registered as the finish time on the line.

Close a repair line for a resolved issue

1. Open the **Repair lines** form. Follow the procedure earlier in this topic to create a repair line.
2. Select the repair line with the repair issue that you want to close.
3. In the **Repair stage** field, select a stage with the **Finished** property enabled.

NOTE

Customer returns overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Create and use return reason codes and disposition codes to support the process for returning products.

Use a return reason code to describe the reason that the customer wants to return an item. You can assign a reason code in the **Create return orders** form.

Assign a disposition code when an item is received or during the physical inspection of a returned item. You can use disposition codes to describe the condition of the item. You can also use disposition codes to indicate whether additional action is required for the transaction. For example, create disposition codes for the following actions:

- Scrap the returned item and provide a replacement item to the customer.
- Return the item to inventory and credit the customer for the cost of the item.
- Repair the item and return it to the customer.

Set up disposition codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can set up disposition codes to specify how to process an item that is returned by a customer. For example, create a disposition code named **Repair and return** to indicate that the returned item will be repaired and then returned to the customer. For more examples of disposition codes that are typically used for items that are returned by customers, see [Specify how to dispose of returned items](#).

You can also set up a reason code to help explain why an item was returned. For more information about reason codes, see [Set up return reason codes](#).

1. Go to **Sales and marketing > Setup > Sales orders > Returns > Disposition codes**.
2. Select **New** to create a new disposition code.
3. Enter a unique, descriptive name, select an action, and enter a description for the disposition code.
4. If you want to associate any customer charges with this disposition code, select the **Charges** button to open the **Set up charges** form.
5. If you want to define any external codes to match with the company's own disposition codes, select the **External codes** button to open the **External codes** form.

Set up return reason codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

Set up return reason code groups

1. Go to **Sales and marketing > Setup > Sales orders > Returns > Return reason code groups**.
2. Select **New** to create a line for a new return reason code group.
3. In the **Return reason code group** field, type an identifier for this group.
4. In the **Description** field, type a brief phrase to explain how this group will be used.

Set up return reason codes

This procedure helps you set up return reason codes that you can use to indicate why a product was returned by the customer.

1. Go to **Sales and marketing > Setup > Sales orders > Returns > Return reason codes**.
2. Press CTRL + N to create a new return reason code line.
3. In the **Return reason code** field, enter text to identify this code.
4. In the **Description** field, enter text to describe the return reason code.
5. Use the **Return reason code group** drop-down list to add the code to a return reason code group.

See also

[Return reason code groups \(form\)](#)

[Return reason codes \(form\)](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Specify how to dispose of returned items

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you handle a return order, you must specify a reason return code to identify why the product is being returned. You must also specify a disposition code and a disposition action to determine what should be done with the returned product itself.

A disposition code can be applied when you create the return order, register item arrival or packing-slip update an item arrival, and end a quarantine order.

You can define any disposition codes that you need in order to support the business processes. The following table provides a set of typically used codes to assign return-item disposition.

DISPOSITION TYPE	COMMON CODE	DESCRIPTION
Disposal	SC	Scrap/Destroy
Disposal	DC	Donate to Charity
Disposal	TD	Third-Party Disposal
Disposal	SL	Salvage
Disposal	TS	Third-Party Sale (Secondary Markets)
Repair/Modify	RW	Rework
Repair/Modify	RF	Remanufacture/Refurbish
Repair/Modify	MD	Modify
Repair/Modify	RP	Repair
Repair/Modify	RV	Return to Vendor
Other	AI	Use as is
Other	RS	Resale
Other	EX	Exchange

Other	MS	Miscellaneous

For each disposition code that you define, you must select a disposition action. The disposition action determines the physical and financial implications of the disposition codes. For example, the disposition action determines the physical handling of the returned item, the financial effect of the returned item, and if a replacement item must be sent to the customer. You can define an unlimited number of disposition codes according to your business needs, but there are only six predefined disposition actions that you can select from. The following table provides the disposition actions and their definitions.

DISPOSITION ACTION	DESCRIPTION
Credit	Return the item to inventory and credit the customer.
Credit only	Credit the customer without requiring or expecting the item to be returned.
Scrap	Scrap the item and credit the customer.
Replace and credit	Return the item to inventory, create a replacement order, and credit the customer.
Replace and scrap	Scrap the item, create a replacement order, and credit the customer.
Return to customer	Reject the returned item and return it to the customer.

Select a disposition code for a quarantine order

1. Click **Inventory management > Periodic > Quality management > Quarantine orders**.
2. For an existing quarantine order, select an action from the **Disposition code** field on the **Overview** tab.

Work with customer service overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Customer service supports professional, service-based companies and manufacturing service organizations.

Customer service includes the following functionality:

- Key processes for service management, such as service agreements, service orders, and return management
- An advanced setup for repair management that includes tracking of repairs and versioning for bills of materials (BOMs)
- Support for employee roles, such as service manager, dispatcher, and service technician or service consultant
- Service subscriptions, which can generate periodic streams of revenue that are independent of the frequency of service
- Service-level agreements that support a differentiated customer base

The topics in this section provide an overview of the Customer service business process and each business process component. They also list the forms that are associated with each business process component, and they discuss the tasks that are associated with each business process component.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Develop and establish service agreements overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Service agreements let you define the resources that are used in a typical service visit and how those resources are invoiced to the customer.

Every service agreement is attached to a project through which transactions are posted and invoiced. However, you can also invoice service order transactions directly through the project without first having to connect the service order to a service agreement. You might decide to do this if the service order is for a one-time-only service visit and the need for processing the service transactions quickly outweighs the need for maintaining detailed service-agreement information about the customer over a period of time.

Service agreement

In each service agreement, you must specify a project, a service-agreement ID, and a service-agreement group. The service-agreement group can be used to sort and organize service agreements.

A service agreement header contains settings that apply to all attached agreement lines:

- Whether the service agreement is suspended. If the service agreement is suspended, you cannot generate service orders from the service agreement.
- The duration of the service agreement.
- How service-order lines are to be combined into service orders.
- Whether the service agreement is a template.

In the service-agreement header, you also set up all the service objects and service tasks that can be used with the service agreement by entering the specific service tasks or service objects that are to be attached to the various lines of the agreement.

From the service-agreement header, you can also copy service-agreement lines or service-template lines into the current service agreement.

You can suspend service agreements and stop individual service agreement lines.

If you select the **Suspended** check box on a service agreement, you cannot:

- Create service orders automatically or manually from the service agreement.

If you select the **Stopped** check box on a service agreement line, you cannot:

- Create service orders automatically or manually from the service agreement line.
- Copy the service agreement line into another service agreement or service order.

NOTE

If a service agreement is suspended, all the attached lines are stopped, regardless of their individual status.

Service-agreement lines

Each service-agreement line describes in detail the content of the proposed service work. The lines contain the following settings:

- The transaction type and the description of the transaction type.
- The employee who performs the service work.
- The objects on which service must be performed for the service agreement.
- The frequency with which work is performed and associated item, expense, and fee transactions are registered.
- The time window within which service-order lines can be grouped into a service order.
- The service tasks that are used to group sets of agreement lines together into work tasks and to summarize for service technicians and customers what service task is to be provided.
- Whether a line is stopped. If a line is stopped, you cannot create service orders for that individual line.
- Project settings, such as the category and the line property.

Create service agreements

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to use features in the Service management and the Project management and accounting modules to create service agreements.

Create a service agreement from Service management

1. Navigate to **Service management**.
2. Select **Service agreements** to create a new service agreement line in the page header.
3. Select **New**. Enter a description, select a reference to a project in the **Project ID** field, and fill in the rest of the fields and lines for the service agreement. Select **Save**.
4. On the **Relations** tab, select **Service objects** or **Service tasks** to create service object relations or service task relations for the service agreement. The service objects and tasks that you have created relations for can be attached on the lines of the service agreement.
5. In the lower half of the page, create service agreement lines by copying lines from a service template, another service agreement, or manually creating the service-agreement lines.

NOTE

If you copy lines into the service agreement from another service agreement, you can indicate whether you also want to copy service object and service task relations. If you copy these relations, they are added to any existing relations on the service agreement. If you copy service-agreement lines from a service template, the service-object and service-task relations are automatically copied as service-object relations and service-task relations on the new service-agreement lines.

Create service agreement lines manually

1. From the **Service agreements** page, add a service agreement line in the lines grid.
2. Enter the appropriate information for the service agreement line.
3. Select **Save** to save the line, and then close the page.

Create a service agreement from Project

1. Select **Project management and accounting**.
2. Select **All projects**.
3. Select the project from the list.
4. On the **Action Pane**, select **Manage**. In the **New** Action group, select **Service** and select **Service agreement**.
5. Follow the steps in the section titled **Create a service agreement** as described earlier in this topic to enter the project reference.

[Develop and establish service agreements overview](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service subscriptions

2/18/2021 • 2 minutes to read • [Edit Online](#)

Subscriptions are based on a time-and-materials project. You can create subscriptions from a project, from the **Service subscriptions** page, or by using a service subscription group.

For each subscription, you can create an optional number of subscription fees. The subscription fees are the transactions that you invoice to the customer.

A period code indicates the extent of the subscription fee period, or the intervals at which the subscription should be invoiced.

The period code is defined in the service subscription group. It is defined for the subscriptions through the service subscription group. Any new subscription fee that you create has a suggested start date. This is the start date of the period, if it is the first period that is created, or the end of the previous period, if it is the second or later period.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service templates

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can define a service agreement as a template and copy the lines of the template later into another service agreement or into a service order.

Example

A customer for whom you provide service has identical service elevators at five different locations.

You want to set up five service agreements for the customer, one for each site. To limit repetitive setup work, and to make sure that the setup information in the service agreements is identical, you create a service agreement and specify it as a template for the service work on the elevators.

You can now copy the template lines into the five new service agreements, so that each service agreement is populated with the lines from the template.

Create a template

When you create a service template, you create a service agreement, create the required lines on it, and attach the service agreement to a service-template group.

NOTE

A service agreement can be defined as a template only if it has no service orders attached to it. Also, no service orders can be generated from a service agreement that is defined as a template.

Copy template lines

You can copy template lines from a service template into another service agreement or into a service order.

When you copy template lines into your service orders or service agreements, your template groups are displayed in a tree view in which each group can be expanded. This display lets you view each template and template line.

It is easier to determine the service-template lines that you want to copy if you have grouped the templates under names that reflect the use of the templates.

Related topics

Copy service templates lines

2/18/2021 • 2 minutes to read • [Edit Online](#)

Template information can be copied to either a service agreement or a service order.

Copy service template lines into a service agreement

1. Click **Service agreements**.
2. Double-click a service agreement to open the **Service agreements** page.
3. Click **Template lines** to open the **Copy service template lines** page.
4. On the **Tree control** tab, expand the tree, find the template that contains the lines that you want to copy to the service agreement, and then select the service template.
5. On the **Lines** tab, select the **Select** check box for the service template lines that you want to copy.
6. Click **OK**.
7. Close the pages to save your changes.

The service template lines are now copied to the service agreement, together with the attached service object and service task relations.

Copy service template lines into a service order

1. Click **Service orders**.
2. Double-click a service order to open the **Service orders** page.
3. Click **Copy > Copy template lines** to open the **Copy service template lines** page.
4. On the **Tree control** tab, expand the tree, find the template that contains the lines that you want to copy to the service order, and then select the service template.
5. On the **Lines** tab, select the **Select** check box for the service template lines that you want to copy.
6. Click **OK**.
7. Close the pages to save your changes.

The service template lines are now copied to the new service order, together with the attached service object and service task relations.

Manage template BOMs on object relations

2/18/2021 • 2 minutes to read • [Edit Online](#)

Attach a template BOM to a service object

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Double-click the service agreement in which you want to attach a template BOM to an object relation.
3. Click **Setup > Service objects**.
4. In the **Service objects** form, select the object to attach a template BOM to, and then click **Functions > Attach template BOM**.
5. In the **Select template BOM** dialog box, select a template BOM, and then click **OK**.
6. Close the forms to save your changes.

Delete a service BOM from a service object

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Double-click the service agreement in which you want to delete a service BOM from an object relation.
3. Click **Setup > Service objects**.
4. In the **Service objects** form, select the object that has the service BOM to delete, and then click **Functions > Delete service BOM**.
5. Close the forms to save your changes.

Move the service BOM history from one service agreement to another

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Double-click the service agreement to move a service BOM from.
3. Click **Setup > Service objects**.
4. In the **Service objects** form, select the object that has the service BOM to move, and then click **Functions > Move service BOM**.
5. In the **Select service object relation** form, select the service object relation to move the service BOM to, and then click **OK**.
6. Close the forms to save your changes.

Modify the information displayed for a BOM line

1. Click **Service management > Setup > Service objects > Template BOMs**.
2. Select a template BOM, and then click **Designer**.
3. Click the **Setup** tab. In the **BOM** area, select the check boxes for the information to display on the BOM lines of your service BOMs and template BOMs.

4. Close the forms to save your changes.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Delete a service BOM

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Common** > **Service agreements** > **Service agreements**. Select the service agreement that you want to delete a service bill of materials (BOM) from.
2. On the **Action Pane**, click **Service objects**.
3. In the **Service objects** form, select the service object that you want to delete a service BOM from. Click **Functions**, and then select **Delete service BOM**.
4. Click **Yes**.

NOTE

If you have not applied a template BOM, the service BOM can be deleted from the **Template BOMs** form. If you have applied a template BOM, the service BOM cannot be deleted by using this method.

Indexed sales prices

2/18/2021 • 2 minutes to read • [Edit Online](#)

You set up the index for a subscription sales price when you create a subscription fee.

In the **Create subscription fee** form, set the **Get pricing from** field to **Indexed base price**, and then multiply the base price by the percentage in the **Percent price change** field to get the sales price of the subscription transaction.

For example, if the base price is EUR 1,000, and the index is 110, the sales price is EUR 1,100.

See also

[Create subscription fee transactions](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reduce the days on subscription fees

2/18/2021 • 2 minutes to read • [Edit Online](#)

To reduce the number of days of an existing subscription fee, you can create a new transaction in which you remove the period of time that should no longer be part of the subscription fee interval.

Reduce the days on a subscription fee

1. Click **Service management > Common > Service subscriptions > All service subscriptions**.
Select the service subscription, and on the Action Pane, click **Subscription fees**
2. In the **Subscription type** field, select **Reduction days**.
3. Use the **From date** field and the **To date** fields to define the date interval of the subscription fee that you want to remove from the subscription fee period, and then click **OK**.

To view the transaction that was created, in the **Subscription** form, click **Fee transactions**.

Example

If a subscription transaction period runs from January 1 to January 31, and you want to reduce the period by 10 days, create a new transaction in which the reduction period is January 1 to January 10. (The reduction period could also be January 5 to January 15, or any other ten day period).

Also, if the **From date** on the reduction period is January 21 (31 minus 10), you could set the **To date** to any date after January 31, and 10 days will still be removed from the fee transaction period.

See also

[Reduction days example](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reduction days example

2/18/2021 • 2 minutes to read • [Edit Online](#)

You have created a subscription transaction for a customer's maintenance subscription, as described in the following table.

FROM DATE	TO DATE	SUBSCRIPTION	SUBSCRIPTION TYPE	PROJECT	CATEGORY	SALES CURRENCY	SALES PRICE
March 01, 2011	March 31, 2011	NR-2	Regular	9013	SubCat 2	EUR	200.00

The customer reports that it does not need service coverage for two days (March 10 and March 11). You agree to reduce the subscription by these two days.

You create a new transaction of the **Reduction days** type, as described in the following table.

FROM DATE	TO DATE	SUBSCRIPTION	SUBSCRIPTION TYPE	PROJECT	CATEGORY	SALES CURRENCY	SALES PRICE
March 10, 2011	March 11, 2011	NR-2	Reduction days	9013	SubCat 2	EUR	-12.90

When the transactions for March 2011 are invoiced, the sales price of EUR 200 is reduced by EUR 12.90. The chargeable amount for the subscription transaction is therefore EUR 187.10, and two transactions are invoiced at a total of EUR 187.10.

Update and index subscription sales prices

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Common** > **Service subscriptions** > **All service subscriptions**.
2. Select the subscription to update the index or base price for.
3. Click **Index**. In the **Change** field, indicate how to update the base price or index, and whether the update must use a percentage or a new value. You can select from the following options:
 - **Index by a percentage**
 - **Index to**
 - **Base price by percentage**
 - **Base price to**
4. Click **OK**.

The base price or index of the subscription is updated with the specified value.

Fulfill service agreements overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of the tasks to fulfill service agreements. The topic also lists the forms that are associated with each business process component and discusses the tasks that are associated with each business process component.

Forms for the Fulfill service contracts business process components

The following table lists the forms that support the Fulfill service contracts business process components. The table entries are organized first by task, and then alphabetically by the name of the form.

NOTE

To open some of the forms in the following table, you must enter information or parameter settings.

BUSINESS PROCESS COMPONENT TASK	FORM NAME	USAGE
Develop and establish agreement	Service agreements	Create and maintain service agreements.
	Subscription	Create and maintain service subscriptions.
Monitor and implement agreement	Change service stage	Select the next stage in the workflow for a service order.
	Service orders	Create and maintain service orders.
	Cancel service level agreement	Cancel the service level agreement on a service order.
	Cancel service orders	Cancel service orders, or reverse the Canceled status of service orders.
	Index subscription	Update the base prices and indexes for subscriptions.

Start and stop time recording on a service order

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to start and stop time recording for a service order for which a service level agreement is defined.

Start time recording

1. Click **Service management > Common > Service orders > Service orders**.
2. Click the **Service order** tab. On the **Action Pane**, in the **Service level agreement** group, click **Start**.
3. Enter the date and time that the time recording should be started.

Stop time recording

1. Click **Service management > Common > Service orders > Service orders**.
2. Click the **Service order** tab. On the **Action Pane**, in the **Service level agreement** group, click **Stop**.
3. Enter the date and time that the time recording should be stopped.
4. Select **Add a revocation reason**, and select a reason code in the **Stage reason code** list to provide a reason for stopping the time recording.

NOTE

If **Reason code on exceeding time** is selected in the **Service management parameters** form, you must provide a reason code before you can stop the time recording.

View the start time and duration of a service order

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can view when the work on the service order was started and when the service order is going to be completed.

You can also view when the time recording for a service order was started and stopped. When a service order is stopped, the time at which the service order must be completed is postponed.

View the start time for a service order

1. Click **Service management > Common > Service orders > Service orders**. Select and double-click an order to open the details form.
2. On the **General** tab, view the time that the work was started for a service order in the **Start time** field.

View the time remaining to complete a service order

1. Click **Service management > Common > Service orders > Service orders**. Select and double-click an order to open the details form.
2. On the **General** tab, view the time remaining to complete a service order in the **Latest completion time** field.

View the start time and stop time recording entries for a service order

1. Click **Service management > Common > Service orders > Service orders**. Select and double-click an order to open the details form.
2. On the **Action Pane**, click the **Dispatch** tab > **Time recording** to open the **SLA time recording** form and view the time recording entries for the service order.

Customer returns overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Create and use return reason codes and disposition codes to support the process for returning products.

Use a return reason code to describe the reason that the customer wants to return an item. You can assign a reason code in the **Create return orders** form.

Assign a disposition code when an item is received or during the physical inspection of a returned item. You can use disposition codes to describe the condition of the item. You can also use disposition codes to indicate whether additional action is required for the transaction. For example, create disposition codes for the following actions:

- Scrap the returned item and provide a replacement item to the customer.
- Return the item to inventory and credit the customer for the cost of the item.
- Repair the item and return it to the customer.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Return cost price and return lot ID

2/18/2021 • 5 minutes to read • [Edit Online](#)

The cost of products that are returned to inventory is calculated by using the current cost of the products. However, you might want the cost of the returned products to equal the cost of the products at the time when you sold the products to the customer. You can do this by using the **Return lot ID** field on the **Line details** FastTab in the **Sales order** form.

For example, consider the following scenario. You invoice a customer. Then, the customer returns the delivered products to you. You return the products to stock. In this case, when you credit the customer for the returned products, the cost of those products is calculated by using the current cost of the products. However, if you use the **Return lot ID** field, the cost of the returned products is calculated by using the cost on the invoice of the original sale to the customer.

To use a cost other than the current cost for returns from a customer, use one of the following methods.

Method 1: Manually enter the return cost price

By default, when you add items to a return order, the items are returned to inventory at the current cost price. To specify a different return cost price, follow these steps.

1. Click **Sales and marketing > Common > Return orders > All return orders**.
2. On the **Action Pane**, in the **New** group, click **Return order**.
3. In the **Create return order** form, select a customer account, and then click **OK**.
4. In the **Return order - RMA number: %1, %2** form, select an item, and then enter a negative quantity in the **Quantity** field.
5. Click the **Line details** FastTab.
6. On the **General** tab, enter a value in the **Return cost price** field. This value is used when the goods are returned to inventory. If you do not enter a value, the current cost price is used when the goods are returned to inventory.

Method 2: Automatically generate the cost price based on the customer invoice line

This is the preferred method to use to create return lines. To use the cost of the products at the time when you sold the products to the customer, create a return order and specify a sales line to return.

1. Click **Sales and marketing > Common > Return orders > All return orders**.
2. On the **Action Pane**, in the **New** group, click **Return order**.
3. In the **Create return order** form, select a customer account, and then click **OK**.
4. In the **Return order - RMA number: %1, %2** form, on the **Action Pane**, click **Find sales order**.
5. In the **Find sales order** form, select the invoice line to return, and then click **OK**.

On the **Line details** FastTab, on the **General** tab, the **Return lot ID** field displays the value from the original sales line. Additionally, the **Return cost price** field displays the cost value from the original sales line.

Cost calculation example

When you use the **Return lot ID** field on a return order line to specify the return cost price, the cost on the return order line is used. If you run the inventory close or recalculation functionality, the cost is adjusted on the original sales line. The cost on the return order line is automatically adjusted to reflect the same cost per piece.

1. Create and release a product that is named Test. In the **Released product details** form, specify the following information:
 - a. On the **Manage costs** FastTab, in the **Item group** field, select the **Parts** group.
 - b. On the **General** FastTab, in the **Item model group** field, select **DEF**.
 - c. On the **Purchase** FastTab, in the **Price** field, type 10.00 as the cost price of the item.
 - d. On the **Action Pane**, click **Dimension groups**. In the **Storage dimension group** field, select **Site and Warehouse only**. In the **Tracking dimension group** field, select **No active tracking dimensions**.
2. Create a purchase order for 10 pieces of the Test item at 6.00 per piece, and then post an invoice for the purchase order.

Create a second purchase order for 10 pieces of the Test item at 8.00 per piece, and then post an invoice for the purchase order.
3. Post an invoice for a sales order to sell five pieces of the Test item.

In this case, the sales order line is costed at 35.00 (5 pieces * 7.00 average cost per piece).
4. Create a return order for the customer. In the **Find sales order** form, select the invoice line, and then click **OK**.
5. In the **Return order - RMA number: %1, %2** form, verify that a return order is generated to return the Test item. The quantity of the return order is set to -5.00.

The **Return lot ID** field displays a lot ID. This lot ID is taken from the original sales order of the item that was sold to the customer. The **Return cost price** field displays the cost price from the original sales line.
6. Register the receipt of the returned items.
7. Post a packing slip for the returned items.
8. Post an invoice for the return order. On the **All sales orders** list page, select a sales order for which **Returned order** is the order type.
9. Open the **Inventory transactions** form. Verify that the return is costed at 7.00 per piece by using the value in the **Return cost price** field, for a total of 35.00 in the **Cost amount** field. You can open the **Inventory transactions** form from the **Return order - RMA number: %1, %2** form. In the **Lines** grid, click **Inventory > Transactions**.
10. In Inventory and warehouse management, use the **Closing and adjustment** form to run the **3. Close** procedure.

This action adjusts the cost on the original sales line that was costed at -35.00 (5 pieces * 7.00) to -30.00 (5 pieces * 6.00). This is because the inventory model group uses First in, First out (FIFO), and 6.00 per piece is the FIFO cost from the first purchase order. Additionally, the action adjusts the cost on the return sales line to match the cost per piece on the original sales line. Therefore, the cost of the return line is adjusted from 35.00 to 30.00.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cancel a return order

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can cancel a return order, instead of deleting it, when you want to save a record of the planned return.

NOTE

Only return orders that have a **Created** status can be canceled. Return orders with an **Open** or **Closed** status cannot be canceled.

1. Click **Sales and marketing > Common > Return orders > All return orders**.

–or–

Click **Sales and marketing > Common > Return orders > Created return orders**.

2. Select the return order to cancel.

3. Click **Cancel order**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an item replacement order

2/18/2021 • 2 minutes to read • [Edit Online](#)

Item replacement orders are usually created after a product is returned and inspected. However, when an item must be replaced before it has been returned, or when the original item will not be returned, you can create an item replacement order immediately after you create a return order.

Create a replacement order after you receive an item that is returned

1. Click **Sales and marketing > Common > Return orders > All return orders**.
2. Create a new return order, or select a returned order from the list to open the **Return order - RMA number: %1, %2** form.
3. Click **Return line**, and then select **Replacement item**.
4. Select the item to replace the returned item with. Enter the item specifications, and then click **Apply**.
5. Click **Packing slip** to generate the packing slip for the return order. A sales order is generated for the replacement item that you selected.

After the sales order is created for the replacement item, sales agreements are automatically searched and if there is an applicable sales agreement, it is applied to the sales order.

Create a replacement order before you receive an item that will be returned

1. Click **Sales and marketing > Common > Return orders > All return orders**.
2. Create a new return order, or select a return order from the list to open the **Return order - RMA number: %1, %2** form.
3. Click **Find sales order** if you want to identify the sales order for the returned item. Complete the **Find sales order** form and then click **OK** to close the form and return to the **Return order - RMA number: %1, %2** form. The sales order line for the returned item is copied to the return order.
4. Click **Replacement order** to open the **Create sales order** form.
5. Select the **Copy return order lines** check box to transfer details from the return order you selected on the **Return order - RMA number: %1, %2** form to this sales order.
6. Enter or modify details, as required.

If you identified the sales order in step 3, and if the sales order line for the returned item is linked to a sales agreement, the identifier of the applicable sales agreement for the item replacement order will be automatically displayed in the **Sales agreement ID** field.

7. Click **OK** to close the **Create sales order** form and open the **Sales order** form, where you can continue to enter information for the new sales order. Any applicable return order lines will be copied to the new sales order.

If the identifier of the sales agreement is automatically displayed in the **Sales agreement ID** field, then the sales agreement has been linked to the sales order header for the item replacement order. If there is an applicable commitment in the sales agreement that has not been fulfilled yet, and the sales order is

created before the sales agreement expires, a link is established between the sales agreement line and the sales order line. Therefore, information from the sales agreement, such as item price, is copied to the new sales order line.

NOTE

Delete a return order

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use the **Delete return order** form to delete multiple return orders.

1. Click **Sales and marketing > Periodic > Clean up > Delete return orders**.
2. Click **Select** to open the **Sales update** form.
3. Specify the criteria, and then click **OK** to return to the **Delete return order** form. Return orders that have been created in the legal entity are displayed, based on the specified criteria.
4. Select the return order line to delete, and then click **OK**.
5. Click **Yes** to delete the return orders.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Pass returned items on to inspection

2/18/2021 • 2 minutes to read • [Edit Online](#)

When registering a returned item, you may determine that an item should be sent for inspection before it is returned to inventory or disposed of in some other way.

1. Click **Inventory management > Journals > Item arrival > Item arrival**.

-or-

Click **Inventory management > Journals > Item arrival > Production input**.

2. On the **Location journal** form, register the receipt of an item as usual.

NOTE

For information about registering the receipt of returned items, see [Register the receipt of returned items](#)

3. On the **Default values** tab, in the **Mode of handling** area, select the **Quarantine management** box.

This will prompt the system to create a quarantine order, and the person or department that performs inspections will respond to this order using the **Quarantine order** form.

Post arrival journal for returned products

2/18/2021 • 2 minutes to read • [Edit Online](#)

To process a return, first validate the return quantity, update the quantity field in the item arrival journal. Then select a disposition code or indicate that the returned items have to be inspected. After completing these steps, you can post the item arrival journal for the return order.

1. Click **Inventory management > Periodic > Arrival overview**.
2. In the **Setup name** filter, select **Return order**.
3. If the list of receipts is long, use the fields in the **Range** area to narrow the list.
4. Locate the line of the return order that you want to post, select its **Select for arrival** box, and then click **Start arrival**.
5. Click **Journals > Show arrivals from receipts** to open the **Location journal** form.

TIP

To view detailed information, select a journal, and then click **Lines**.

6. Make any necessary updates, and then click **Post**.

After the journal is posted, the returned items are registered in inventory, and the **Return orders** form indicates that the items have arrived at the warehouse.

Receive partial deliveries of returned items

2/18/2021 • 2 minutes to read • [Edit Online](#)

Partial deliveries are defined in terms of return order lines, not return order shipments.

This means that if you receive the full quantity that is indicated on one return order line, but you receive nothing from the other lines in the return order, the delivery is not a partial delivery. However, if a return order line requires 10 units of a particular item to be returned, but you receive only four, it is a partial delivery.

If a return shipment contains less than the full quantity of a return order line, you can set the shipment aside and wait for the rest of the returned quantity to arrive, or you can register and post the partial quantity.

Register and post a partial quantity

1. After you select a return order for arrival on the **Arrival overview - Warehouse: %1, Dock: %2, Journal name: %3** form, click **Start arrival** to create the arrival journal, and then click **Journals > Show arrivals from receipts** to open the **Location journal** form.
2. Select the line of the journal that you want to work with, and then click **Lines** to open the **Journal lines, locations** form.
3. Select the line of the item number for which only a partial quantity has arrived, and then click **Functions > Split** to open the **Split** form.
4. In the **Split quantity** field, enter the quantity for the total number of items that have been received, and then click **OK**.
5. On the **Journal lines, locations** form, select the line for the quantity of items that has arrived, and then click **Post**. You can post the line for the additional quantity after the items have arrived.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Receive returned items

2/18/2021 • 2 minutes to read • [Edit Online](#)

When a return shipment arrives, you match it to a return order that has already been created.

Depending on company policies, the items in the return shipment can be sent to quarantine for additional inspection or they can be returned to inventory.

See also

[Register the receipt of returned items](#)

[Post arrival journal for returned products](#)

[Take returned items through inspection](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Register the receipt of returned items

2/18/2021 • 3 minutes to read • [Edit Online](#)

There are two methods for registering the receipt of returned items. The first method is a warehouse receiving process that uses the **Arrival overview** form. The second uses the **Registration** form.

Register the receipt of returned items in the Arrival overview form

You can use the **Arrival overview** form to identify a return shipment by its Return Material Authorization (RMA) number. If a journal name is defined on the **Setup** tab, and journal lines that correspond to the lines selected on the **Arrival overview** form exist, a new journal header is created when you click **Start arrival**.

1. Click **Inventory management > Periodic > Arrival overview**.
2. In the **Setup name** field, select **Return order**, and then click **Update**.

TIP

You can use the **Range** fields to narrow the search results. You can type or select the RMA number in the **RMA number** field for an exact result. To define and save a set of filters that will restrict which incoming arrivals are displayed, click the **Setup** tab. The available filters include types, warehouses, and docks.

WARNING

Return orders cannot be mixed with other arrival types in the **Arrival overview** form. Therefore, the reference will always be sales order, but no sales order ID will be specified on the journal header.

3. In the **Receipts** grid, locate the line that matches the item being returned, and then select the check box in the **Select for arrival** column.
4. To exclude certain lines from the return receipt, such as items from the original order that were not included in the return shipment, clear the associated **Select for arrival** check boxes in the **Lines** table in the lower part of the form.
5. Click the **Start arrival** button to create an arrival journal.

NOTE

You can select multiple return orders and include them all in a single arrival process. Each return order line will be copied into a corresponding item arrival journal line.

NOTE

You can also manually create an arrival journal by using the **Item arrival** form.

6. Click **Inventory management > Journals > Item arrival > Item arrival**.
7. Select the arrival journal that you just created and then click **Lines** to open the **Journal lines, locations** form.

8. On the **General** tab, adjust the number in the **Quantity** field, if it is required, and then assign a disposition code in the **Disposition code** field.

Alternatively, you can select the **Quarantine management** check box to have the returned items sent through an inspection process in the context of a quarantine order.

NOTE

If you send the returned items through quarantine, you cannot specify a disposition code.

9. Click the **Validate** button.
10. If there are no errors in the validation process, click **Post**.

Register the receipt of returned items in the Registration form

As an alternative to using the **Arrival overview** form, you can use the **Registration** form to register the arrival of returned items.

1. Click **Sales and marketing > Common > Return orders > All return orders**. Create a new return order or open the return order from the list. On the **Lines** FastTab, select the return order line. Click **Update line**, and then click **Registration**.
2. Assign a disposition code in the **Disposition code** field, and then click **OK**.

NOTE

It is not possible to send the item for inspection as a quarantine order using the **Registration** form.

3. In the **Transactions** grid, select the transaction to be registered.
4. In the **Register now** grid, click **Add**. Repeat the previous two steps until all of the returned items appear in the **Register now** grid.
5. Click **Post all**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Take returned items through inspection

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Inventory management > Periodic > Quality management > Quarantine orders**.
2. Locate the order line that corresponds to the returned item that you are inspecting.

NOTE

A quarantine order can be associated with just a single item number. If 10 items that have different item numbers are returned in a single shipment and sent to quarantine, 10 individual quarantine orders are created.

3. After examining the item, make a selection in the **Disposition code** field to indicate what should be done with the item and how to handle the related financial transaction. Examples include returning the item to stock and refunding the customer, scrapping the item and sending a replacement to the customer, or returning the item to the customer without credit.

NOTE

If multiple returned items in a single item number batch cannot be assigned the same disposition code, you must split the quarantine order (**Functions > Split**) to assign a different disposition code to each sub-batch.

4. When you are finished with the inspection, click **Report as finished** to release the returned items and create an item arrival journal entry. The person or department that receives the items then processes the journal for the items to be returned to inventory.

–or–

End the quarantine order, and move the items back into inventory directly by using one of the **Inventory** functions.

5. Close the form to save your changes.

Packing slip updates for returns

2/18/2021 • 2 minutes to read • [Edit Online](#)

Before returned items can be received into inventory, the packing slip for the order to which they belong must be updated. Just as the invoice update process is the update to the financial transaction, the packing slip update process is the physical update of the inventory record, which means that it commits the changes to inventory. In the case of returns, the steps that are assigned to the disposition action are implemented during the packing slip update.

The packing slip update can be processed in either the item arrival journal or the return order.

As part of the process for posting packing slips, the packing slip reference number from the customer's shipping documents can be associated with the order lines. This association is optional and for reference only. It does not create any transactional updates.

If not all of the expected return items have arrived, you should include only the quantity that has been received in the packing slip update. Leave the remaining items on the order until the rest of the return shipment has arrived.

If an item is sent back from quarantine to the Shipping and Receiving department, such as when the quarantine inspector does not know where to store the item in inventory, the corresponding packing slip must be updated to correctly register and act on the disposition code that is specified as a result of the quarantine.

When you update a packing slip for a returned item that is from a sales agreement, the sales agreement commitment for that item is automatically updated to reflect the change in the quantity or the amount.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Perform invoice updates for returns

2/18/2021 • 2 minutes to read • [Edit Online](#)

A return order is a type of sales order that is marked as a returned order. Therefore, the **All sales orders** list page is used to generate invoices for return orders instead of the **Return orders** form. This functionality supports the business processes of organizations that choose to have return orders and sales orders invoiced at the same time and by the same person.

Because the invoice for a returned item is for a negative amount, it is called a credit note.

When you set up the invoice update for batch processing, the sales order of type **Returned order** must have a return line status of **Received**, which indicates that the order's packing slip has been updated.

Post an invoice for a return order

1. Click **Accounts receivable > Common > Sales orders > All sales orders**.
2. Select a sales order for which **Returned order** is displayed in the **Order type** field.
3. On the Action Pane, on the **Invoice** tab, in the **Generate** group, click **Invoice**.
4. On the **Parameters** tab, select the **Posting** check box.
5. Review information in the form and make any changes that are needed.
6. Click **OK**. The credit note is posted.

Service orders

2/18/2021 • 4 minutes to read • [Edit Online](#)

A service order represents a visit that a service technician makes to a customer site on a specific date. Each service order consists of one or more service order lines. Service order lines represent the hours of work that must be performed by the service technician, and the related items, expenses, and fees.

You can attach tasks and objects to a service order line. You can then group service order lines by task or by object. You can also attach items that are listed in inventory to service order lines.

Create service orders

You can create service orders based on a service agreement and the lines that are contained in that agreement. However, you can create service orders that are associated with a service agreement only in the period that is specified in the agreement. For example, if a service agreement is valid for the 2011 calendar year, you can create service orders for the agreement from January 1, 2011, and December 31, 2011.

You can also create service orders individually, without associating them with an agreement. These service orders can be used to handle unscheduled or one-time service visits. For example, in the month of March, your customer wants service to be performed on two machines, in addition to the machines that are specified in the service agreement. For this task, you create service orders but do not associate them with an agreement.

NOTE

To create service orders that are not associated with a service agreement, you must select the **Allow without service agreement** check box in the **Service management parameters** form.

Scenario

The following scenario describes another situation where it is useful to create a service order that is not associated with a service agreement.

The company dispatcher receives a call requesting emergency service on an elevator. There is no time to set up a service agreement and a project for the service. Therefore, the dispatcher creates a service order directly in the **Service orders** form, attaches the service order to an existing project, and creates the service order lines. The dispatcher also creates a task or object relation for an existing service order, to record work that is not related to the service agreement. For more information, see [Create service orders manually](#) and [Create service task relations](#).

Monitor the progress of service orders

To monitor the progress of a sales order through the different teams and work processes, you can set up a system of stages and reason codes for service orders. For each stage, you can specify the actions that are allowed. For more information, see [Create reason codes](#).

Example

A service order is approved by the dispatcher. The dispatcher updates the stage of the service order and specifies a reason code that indicates that the service order has been released to the service technician. The technician goes to the customer site and performs the service.

Specify item requirements for service orders

You can specify the inventory items that are required for service orders. However, the service order must be associated with a project. Item requirements for service orders are processed through a project.

Example

The service orders that are created from the service agreement are processed by the dispatcher. For the first service order, the dispatcher realizes that the service technician requires an important spare part that is not in the on-hand inventory. Therefore, the dispatcher creates an item requirement for the spare part directly from the service order.

Move and post lines

A service technician returns from a service visit, and then modifies and updates the service order lines. During the service visit, the technician performed a service job that was scheduled for the next service visit. Therefore, the technician moves the lines from the next service visit to the current service visit. The technician then posts the service order. For more information, see [Move service order lines](#).

Cancel service orders

One of the other service orders that was generated for the month of January becomes obsolete, because the job is canceled. Therefore, the service dispatcher cancels the service order. For more information, see [Cancel service orders](#).

Post from projects

At the end of each week, the dispatcher wants to post all service orders that are attached to a specific project. Therefore, the dispatcher locates the relevant project in the **Projects** form and posts the service orders that have been completed. For more information, see [Post service orders \(class form\)](#).

Delete service orders

During the second half of the year, your customer decides that the service visits are too infrequent. You must create a new, more frequent series of service visits for the remaining time on the service agreement. Therefore, you must delete the existing service orders and create new service orders. For more information, see [Delete service orders](#).

See also

[Service orders \(form\)](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Automatically create service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can generate service orders that are based on a service agreement for the valid period of the service agreement.

The service orders that you generate from a service agreement are all attached to the service agreement.

Service orders are generated automatically from the following settings:

- The service agreement interval that is set up in the service agreement lines. The service agreement interval indicates the frequency that service-order lines are created. For more information, see [Service intervals](#).
- The period that you specify to define the service period in the **From date** and **To date** fields in the **Create service orders** form. For more information, see [Create service orders automatically](#).
- The **Combine service orders** option on the service agreement header. This option defines whether service order lines generated from a service agreement, combines service orders according to employee, service task, service object, or service agreement. For more information, see [Combine service orders](#).
- The **Time window** option on the service agreement line. The time window defines how far a service order line can move with regard to its calculated date. For more information, see [Time windows](#).

NOTE

If the day that is specified for a service order is not open in the calendar that you have selected in the **Service management parameters** form, a message will indicate that there is a calendar conflict. You can safely ignore the message; the service order will be created, even though the day is closed on the calendar.

Example 1

The service agreement lasts from January 1, 2012 until December 31, 2012. If the service period that you specify in the **Create service orders** form is from November 1, 2012 until February 1, 2013, service orders are created from November 1, 2012 until December 31, 2012.

Example 2

The service agreement lasts from January 1, 2012 until December 31, 2012. Two service agreement lines are attached to the service agreement. The first service agreement line has a starting date on January 2, 2012 and an ending date on March 1, 2012. The second service agreement line has a starting date on April 1, 2012 and an ending date on December 31, 2012. You specify a period in the **Create service orders** form that is from October 1, 2012 until December 31, 2012. Therefore, service orders are generated only for the second agreement line, because the starting date and ending date of the first agreement line are before the period that you specified for the service order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service status and progress field interaction

2/18/2021 • 2 minutes to read • [Edit Online](#)

In the **Service orders** form, the **Progress** field on the service order header reflects the status of the whole service order, and the **Status** reports the status of individual service order lines.

PROGRESS	LINE 1 STATUS	LINE 2 STATUS	LINE 3 STATUS
In process	Created	Created	Created
In process	Canceled	Created	Created
In process	Created	Canceled	Posted
Canceled	Canceled	Canceled	Canceled
Posted	Posted	Posted	Posted
Posted	Posted	Canceled	Canceled

The progress of a service order is in process if all lines have the status **Created**; it is still in process if some of the lines have a status of **Canceled** or **Posted**.

If all lines in a service order are marked as **Posted**, the progress of the status order is **Posted**. If some lines are **Posted** and some are **Canceled**, the progress is still **Posted**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create service orders automatically

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create service orders for one service agreement or for several service agreements. When they are created, you can view your service orders in the **Service orders** form.

Service orders are created only for the valid period of the service agreement. If the interval that you specify in the **Create service orders** form is before the starting date or after the ending date of the service agreement, service orders are created only for the part of the interval that is within the service agreement dates.

When you create service orders manually or automatically from the service agreement line, the service order must be in the time interval that is defined by the starting and ending dates for the line, unless you do not specify an ending date on the line.

Create service orders automatically for a service agreement

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Select a service agreement.
3. Click the **Deliver** tab, and then click **Planned service orders**.
4. Specify dates in the **From date** and **To date** fields to define the service period.
5. Select the **Show InfoLog** check box to display a list of the service orders that are created.
6. Select transaction types in the **Include transaction types** field group. The transaction types represent the lines that are created in the service agreement, and each transaction type that you select generates several service orders, depending on the service interval that is specified on the service agreement line.
7. To create any service orders that are missing from continuous series of service orders, select the **Continuous** check box.
8. Click **OK**.

Create service orders automatically for several service agreements

1. Click **Service management > Periodic > Service orders > Create service orders**.
2. Click **Select** to make selections to add or remove criteria to use to create service orders.
3. Click **OK**.

Create item requirements for service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create a service order to track and manage services that you provide to your customers. If you need to reserve specific items for a service order, you can create inventory item requirements for it. An item requirement can be immediately consumed from inventory, or it can initiate a production order for the item.

By using an item requirement instead of an item transaction, you can plan for delivery just before the item is actually used, create a purchase order, include the item in the trade-agreement framework, and include the item requirement in production planning.

Item requirements for service orders are processed through a project. To create an item requirement on a service order, the service order must be assigned to a project. After you create an item requirement for a service order, you can view the item requirement in the **Projects** form for the selected project.

Create an item requirement for a service order

1. Click **Service management > Common > Service orders > Service orders**.
2. Select the service order that you want to create an item requirement for.
3. On the **Action Pane**, on the **Dispatch** tab, click **Item requirement**.
4. In the **Item requirements** form, enter information for the required item. For more information about the specific fields, see [Item requirements \(form\)](#).

Create an item requirement for a service agreement

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Open the service agreement for which you want to create an item requirement.
3. On the **Lines** FastTab, click **Add** to create a new line.
4. In the **Transaction type** field, select **Item**.
5. In the **Item setup** field, select **Item requirement**.
6. In the **Item number** field, select the item that is required for the service agreement.
7. On the **Line details** FastTab, on the **Product dimensions** tab, in the **Site** field, select the inventory site for the item.
8. To create a service order from the agreement line, on the **Lines** FastTab, click **Create service orders**, and then enter the relevant information in the **Create service orders** form.

Service order item requirements

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create a service order to track and manage services that you provide to your customers. If you need to reserve specific items for a service order, you can create inventory item requirements for it. An item requirement can be immediately consumed from inventory, or it can initiate a production order for the item.

By using an item requirement instead of an item transaction, you can plan for delivery just before the item is actually used, create a purchase order, include the item in the trade-agreement framework, and include the item requirement in production planning.

Item requirements for service orders are processed through a project. To create an item requirement on a service order, the service order must be attached to a project.

As soon as an item requirement is created for a service order, it can be viewed from **Project** in the individual service order or through the **Sales order** form.

View an item requirement from a service order

1. Click **Service management > Common > Service orders > Service orders**.
2. Click **Dispatch**, and then click **Item requirement** to open the **Item requirements** form.
3. Click the **Project** tab, and check the **Service order** field to see the service orders of the item requirement.

Delete service orders with item requirements

If an item requirement is created on a service order, you cannot delete the service order. You must delete the item requirement before you can delete the service order.

1. Click **Service management > Common > Service orders > Service orders**.
2. Click **Dispatch**, and then click **Item requirement** to open the **Item requirements** form. This form lists the item requirements that are created on the service order.
3. Select the item requirement to delete, and then click **Delete**.

–or–

1. Click **Project management and accounting > Common > Projects > All projects**.
2. Open the project that has the service order in which an item requirement is created.
3. In the **Projects** form, in the right pane, click **Item requirements**. The **Item requirements** form lists the item requirements that are associated with the selected project.
4. Select the item requirement to delete, and then click **Delete**.

Subscription workflow overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

You are the subscriptions administrator for a light company that offers subscriptions for lighting rig maintenance. A customer contacts your company to purchase a yearly subscription for lighting rig maintenance.

Setting up subscriptions

To set up a subscription, you must first create a subscription group for the new service agreement or verify that a subscription group exists. If a subscription group exists, you must set it up to invoice the customer yearly and to accrue sales revenue every month of the year. For more information about how to set up subscriptions, see [Set up subscription groups](#).

After the subscription group is created, you can create the subscription. For more information about how to create service subscriptions, see [Create service subscriptions from a subscription group](#).

Create and modify subscription transactions

After you set up the subscription, you create the subscription fee transaction for the first invoicing period, which is one year. The transactions are of the **Regular** type. Therefore, you can only create subscription transactions where the from date and the to date correspond to periods that were previously created in the **Period types** form. For more information about fee transactions, see [Create subscription fee transactions](#).

After you set up the subscription for your customer, you remember that they have negotiated a 10 percent discount on all list prices for service offerings. Therefore, you must reduce the price of the transaction fee that you created.

Later in the day, your customer contact calls to say that, although they still want the service agreement for the lighting rig, they plan to introduce a new lighting rig later in the year. Therefore, they only need maintenance coverage until October 2013. To reduce the number of months for the customer's subscription, you create a new subscription fee transaction of the **Reduction days** type. For more information about how to reduce days, see [Reduce the days on subscription fees](#).

Invoice and accrue subscription transactions

You have now finished setting up the subscription, and you are ready to invoice your customer for it. For more information about how to invoice subscriptions, see [Invoice subscription transactions](#).

Two days later, your customer calls to say that the subscription should be invoiced in U.S. dollars, not Euros. Therefore, you create a credit note, and you also create a new subscription transaction in the correct currency. For more information about how to credit subscription transactions, see [Credit subscription transactions](#).

At the end of each month, one month's revenue can be accrued from the customer's subscription to the profit and loss account and the WIP accounts. For more information about how to accrue revenue for subscriptions, see [Accrue subscription revenue](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Combine service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you create service order lines automatically in the **Service agreements** form, you can choose one of the following options to specify how you want to group them:

- **By service agreement**
- **By service task**
- **By employee**
- **By service object**

Example

You create a service agreement that has a start date on 03-31-2007. In the **Combine service orders** field, you specify **By service object**. You then create the following service agreement lines:

AGREEMENT LINE NUMBER	TRANSACTION TYPE	DESCRIPTION	INTERVAL	SERVICE OBJECT	START DATE
1	Hour	SAL1	Weekly	X-1	04-01-2007
2	Hour	SAL2	Biweekly	X-2	04-01-2007
3	Hour	SAL3	Weekly	X-2	04-01-2007

You do not specify time windows for any of the service agreement lines. Therefore, the service order lines will not move from the calculated day on which they fall.

Next, you generate service order lines from the **Create service orders** form from 04-01-2007 until 04-30-2007.

In total, 10 service orders are created. Because the combined setting that you selected was **By service object**, all service orders that are created have only service order lines with one specific service object. Service order lines that are generated from the service agreement and have the same service date and object are combined on the same service order.

NOTE

In this example, the calendar that is specified in the **Service management parameters** form has no closed days.

Additional grouping of service order lines into service orders occurs according to any time window that you specify on the service agreement lines.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create service subscriptions from a subscription group

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Select **Service management** > **Setup** > **Service subscriptions** > **Subscription groups**.
2. Select a subscription group.
3. Select the **Service subscriptions** button.
4. Select **New** to create a new subscription. The subscription group field displays information from the subscription group in the **Subscription** form.
5. Enter information in the remaining fields.
6. Close the form to save your changes.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Project attached to service agreement

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can attach service agreements to projects of every type except the **Time project** type.

You register and post all service order transactions through the project that you attach to the service agreement. You specify the journals in which these transactions are registered and posted on the **Journals** link in the **Service management parameters** form.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create service subscriptions from a project

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create a service subscription from a project in **Project management and accounting**.

1. Click **Project management and accounting** > **Common** > **Projects** > **All projects**. Open the project that you want to create a subscription for.
2. On the **Projects** form, on the **Action Pane**, on the **Manage** tab, click **Service** > **Service subscription**.
3. On the **Subscription** form, in the **Service subscription** field, enter a unique identification number. The project number is entered automatically into the subscription for the selected project.
4. Enter the remaining information in the form.

You can now create subscription transactions for the subscription.

NOTE

If you have set up a number sequence for the subscription group, a subscription ID is generated automatically for the subscription when you specify the subscription group.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Dispatch board

2/18/2021 • 2 minutes to read • [Edit Online](#)

A dispatch board is the central location from which you can view the status of activities in a service order. You can perform the following tasks in a dispatch board:

- Filter and view service activities in a certain date range.
- Identify the priority of a service activity, and distinguish among service priority levels based on a color scheme that you set up.
- Review the workers that are assigned to a dispatch team.
- Modify the service times and assigned technicians for a service activity.
- Review the list of service activities that have not been dispatched.

For information about how to perform specific tasks in a dispatch board, see the topics in the **See also** section.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a preferred technician

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can select any worker as a preferred technician for a service agreement or service order. However, it is a good idea to add the worker to the appropriate dispatch team so that the worker is included on the **Dispatch board**.

Assign employee to a dispatch team

1. Click **Human resources > Common > Workers > Workers**. Double-click a worker to open the worker details page. On the **Action Pane**, click **Setup > Dispatch team** to open the **Dispatch workers** form.
2. In the **Dispatch team** field, select the team to assign the worker to.

Assign a preferred technician to a service agreement

1. Click **Service management > Common > Service agreements > Service agreements**. Double-click a service agreement to open the details form.
2. On the **General** tab, select the **Preferred technician** field, and then select a member of the appropriate dispatch team as the preferred technician for the service agreement.

Assign a preferred technician to a service order

1. Click **Service management > Periodic > Dispatch board**.

NOTE

In the **Dispatch board** form, specify a date range for dispatch activities to view. Also, specify whether to display closed activities and whether to limit the dispatch activity list to teams that you belong to or are authorized to monitor. Click **OK** to open the **Dispatch board**.

2. Select the line of the service activity to modify.
3. On the **Related** tab, use the **Worker** list to assign a member of the appropriate dispatch team as the preferred technician for the service call.

Set up dispatch teams

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a dispatch team. After you create a dispatch team, you can assign workers to the team. When you create a service order, you can then relate a member of a dispatch team to an activity in the service order.

1. Click **Service management > Setup > Dispatch teams**.
2. In the **Dispatch teams** form, click **New** to create a new team.
3. In the **Dispatch team** field, enter a unique name for the dispatch team.
4. In the **Owner** field, select the employee who is responsible for this team.

NOTE

You can select only employees in this field. You can't select vendors.

5. Optional: In the **Description** field, enter a brief description for this dispatch team.

NOTE

You can assign a worker to this dispatch team in the **Worker** form. For more information about how to assign a worker to a dispatch team, see [Dispatch workers \(form\)](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Prioritize service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Periodic** > **Dispatch board**.
2. Click **Advanced** to display the Gantt chart at the top of the form and the tabs in the lower pane.
3. Expand each dispatch team list.
4. Select the color-coded graphic that represents a service activity.
5. On the **All** tab, **Team** tab, **Undispatched** tab, or **Related** tab, change the selection in the **Priority** field.
6. Click **Save**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

View the status of service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use the **Dispatch board** form to view the status of service activities in service orders.

More information about service orders

The form also provides tools to track the flow of service orders and includes additional details to help you evaluate the urgency of a service order, such as the service agreement and service level agreement that it is associated with.

In order to help you quickly gauge the urgency of a service order, the Gantt chart supports the use of colors. Colors are used to distinguish the priority of a service call. By default, these colors are red for high priority, yellow for typical priority, and green for low priority.

TIP

You can change the colors on the **Dispatching** tab in the **Service management parameters** form.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Monitor service activities

2/18/2021 • 2 minutes to read • [Edit Online](#)

The **Dispatch board** form provides an at-a-glance status update for the various scheduled service activities, and tools for tracking the general flow of service orders in your company.

TIP

To view details about a service activity, select it in the Gantt chart at the top of the **Dispatch board** form, right-click, and then click **Information**.

By using the tools in this form, you can sort service orders by date, priority, or type of service activity, view the priority levels that are assigned to service orders, and review which activities are assigned to individual service orders.

If you must redistribute service activity assignments, you can move the graphical representation of a service activity to assign it to a different employee or a different date and time.

Example

While monitoring the day's service activity, you notice that John, a service technician, is running behind schedule on assigned service calls. You also notice that the last call in his list must be completed by the end of the day to meet service level agreement requirements. By using the drag-and-drop functionality of the Gantt chart, you can reassign that service call to Meg, who has completed her own service calls ahead of schedule.

Open the Dispatch board form

Click **Service management** > **Periodic** > **Dispatch board**.

Reassign activities

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to reassign service activities from one worker to another worker. You can reassign service activities from one worker to another worker even if those workers are assigned to different dispatch teams.

Use the following steps to reassign an activity to another worker:

1. Click **Service management** > **Periodic** > **Dispatch board**.
2. In the **From date** and **To date** fields, enter dates to define the time period to view activities for.
3. Select whether to view closed activities and dispatch information for related teams, and then click **OK**.
4. In the **Dispatch board** form, click **Advanced** to display only the Gantt chart at the top of the page. Click **Simple** to display the Gantt chart and the tabs in the form.
5. Expand each dispatch team list.
6. Use either of the following steps to reassign an activity:
 - Select a color-coded graphic that represents the service activity to reassign. Press the SHIFT key, and then move the color-coded graphic to the row for another employee.
 - On the **All** tab, **Team** tab, **Undispatched** tab, or **Related** tab, in the **Worker** field, enter the name of the worker who is replacing the current worker for the activity.

Reverse changes in a dispatch board

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to reverse unsaved modifications that you make in a dispatch board. For example, you assign a worker to a service activity, save the information, and then later decide to assign a different worker to the service activity. You modify the worker in the dispatch board, and then, before saving the change, learn that the worker just assigned is not available. You can reverse the unsaved modification so that the original worker is reassigned to the service order.

Use the following steps to reverse unsaved changes in a dispatch board:

1. Click **Service management > Periodic > Dispatch board**.
2. In the **Dispatch board** form, enter relevant information in the fields, and then click **OK**.
3. To reverse the most recent change that is not saved, click **Undo**.
4. To reverse a series of changes that are not saved, continue clicking **Undo** until each change that you want to discard is reversed.

View undispatched service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to view activities in a service order that don't have a worker assigned to them from a dispatch team.

1. Click **Service management** > **Periodic** > **Dispatch board**.
2. In the **Dispatch board** window, enter the start date and end date for the period to view dispatch activity for.
3. Optional: Select whether to include closed activities and related teams in the results.
4. Click **OK** to view the results.

NOTE

In the **Dispatch board** form, the **Advanced** view is automatically displayed. In this view, the Gantt chart at the top of the page and the tabs at the bottom of the page are displayed. Click **Simple** to display only the Gantt chart.

5. To view a list of service orders that don't have a dispatch team assigned, click the **Undispatched** tab.

Modify a Service BOM

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can record the history of an element in a service BOM. Every time that you update a BOM line, a history line is created in the **History** pane. The history line shows the current state of the BOM line.

Update a service BOM element

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Click **Edit** to open the **Service agreements** details form.
3. On the **Action Pane**, click **Service objects** to open the **Service objects** form.
4. Select the object to update a BOM line for, and then click **Designer**.
5. In the **Designer** form, select the BOM line to update, and then click **Edit BOM line**.

NOTE

On the **Setup** tab, select the **Edit when adding** check box if you want the **Edit BOM line** form to open when you drag a line into the service BOM.

6. In the **Quantity** field, enter the quantity.
7. If you want to create a service order line for the replacement item, which can then be invoiced, select the **Create service order line** check box.
8. Click **OK** to close the form.

Delete a service BOM line

1. Click **Service management > Common > Service agreements > Service agreements**.
2. Click **Edit** to open the **Service agreements** details form.
3. On the **Action Pane**, click **Service objects** to open the **Service objects** form.
4. Select the object to delete a service BOM line from, and then click **Designer**.
5. In the **Designer** form, select the BOM line to delete, and then click **Delete BOM line**.

Credit subscription transactions

2/18/2021 • 2 minutes to read • [Edit Online](#)

Credit subscription transactions

1. Click **Service management** > **Common** > **Service subscriptions** > **All service subscriptions**.
2. Select the subscription attached to the subscription transaction for which you want to create a credit note.
3. Select the **Analyze** tab, and then click the **Fee transactions** button on the Action Pane.
4. From the **Fee transactions** form, select the transaction for which you want to create a credit note.
5. Click **Functions** > **Select for credit note**.
6. From the **Select for credit note** form, select the transaction that you want to credit and then click **OK**.

NOTE

When you create the credit note, make sure that you select **Credit notes**. This is found in the **Invoicing method** list in the **Create invoice** dialog box.

If the **Reverse accruals on crediting** field in the **Service management parameters** form is set to **Manual**, you have to reverse each accrued revenue transaction individually before you create a credit note proposal for the transaction.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create subscription fee transactions

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Common** > **Service subscriptions** > **All service subscriptions**.
2. On the **All service subscriptions** list page, select the subscription for which you want to create a subscription fee transaction.
3. On the **Action Pane**, on the **Subscription** tab, click **Subscription fees**.
4. On the **Create subscription fee** form, enter the appropriate information in the fields.
5. Click **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Accruing subscriptions

2/18/2021 • 2 minutes to read • [Edit Online](#)

With service subscriptions, you manually accrue revenue in the periods following the date when you invoiced a fee transaction.

Accrual periods are created for the invoice period that you set up for the subscription fee, and the accrual periods are based on the period code of the subscription.

You can accrue and reverse accrued revenue.

Reverse accruals of credit amounts

If you credit invoiced subscription amounts, you can use two methods to reverse the accrual amounts:

- You can reverse each accrued revenue transaction individually before you create the credit note proposal for the transaction. This is the manual method. (manual)
- You can have the accrued amounts reversed on the date where the credit note is posted or on the original posting date of the accrual.

For more information, see [Subscription parameters \(form\)](#).

Setup requirements

To accrue revenue, make sure that the following data requirements are met:

Account setup

The **WIP - subscription** and the **Accrued revenue - subscription** accounts must be set up in the **Project** module.

When you post accrued revenue, the **WIP - subscription** account is debited with the accrual amount, and the **Accrued revenue - subscription** account is credited with the accrual amount.

Set up accounts for accrual of subscription revenue

1. Click **Project management and accounting > Setup > Posting > Ledger posting setup**.
2. Click the **Revenue accounts** tab, and select **WIP - subscription** or **Accrued revenue - subscription** to set up the accounts.

Subscription group setup

To be able to accrue revenue for subscriptions, the **Accrue revenue** check box must be selected. This is found on the **Subscription groups** form for the group that is attached to the subscription. Click **Service management > Setup > Service subscriptions > Subscription groups**.

Enable revenue accrual on a subscription group

1. Click **Service management > Setup > Service subscriptions > Subscription groups**.

Periods

You must set up an invoicing period code. Unless you want to accrue revenue in the same time intervals as you use for invoicing, you must also set up an accrual period.

The following table provides an overview of which accrual periods can be set up for each invoicing period:

INVOICING PERIOD	ACCRUAL PERIOD
Years	<ul style="list-style-type: none">• Years• Quarter• Month• Day
Quarter	<ul style="list-style-type: none">• Quarter• Month• Day
Month	<ul style="list-style-type: none">• Month• Day
Week	<ul style="list-style-type: none">• Day
Day	<ul style="list-style-type: none">• Day

Setting up the invoicing period is a mandatory part of the overall subscription group setup. You can decide whether to also set up an accrual period for the subscription group. If you set up an accrual period for the subscription group, this period is suggested in the **Period code** field. This field is found in the **Accrue subscription revenue** form, when you accrue subscription revenue. However, the accrual period is optional information about the subscription group.

NOTE

Use the following path to open the **Accrue subscription revenue** form. Click **Service management > Periodic > Service subscriptions > Accrue subscription revenue**.

Transactions

You can control the number of ledger transactions that are created when you post accrued revenue. On subscriptions, define if the ledger transactions should be created as a total or per line.

Specify the level of posting details to display for accrued transactions

1. Click **Project management and accounting > Setup > Project management and accounting parameters**.
2. On the **Financial** tab, in the **Invoice** field, select **Total** or **Line**.

Move service order lines

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Common** > **Service orders** > **Service orders**.
2. Double-click the service order that contains the lines that you want to move to another service order.
3. In the **Service orders** form, on the Action Pane, click the **Move lines** button.
4. In the **Move service order lines** form, in the **Service order** field, select the service order that you want to move the lines to.
5. Select the **Delete empty service order** check box to delete the service order that you moved the service order lines from.
6. Click **OK**.

NOTE

You can move service order lines only between service orders that are attached to the same service agreement.

See also

[Service orders](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cancel service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can cancel a service order or service order line from the service order itself, or you can cancel multiple service orders by running a periodic job.

NOTE

Service orders cannot be canceled if the stage of the service order does not allow cancellation, if the service order has item requirements, or if the service order has already been posted.

Cancel a service order in the Service orders form

1. Click **Service management > Common > Service orders > Service orders**. Select the service order, and on the Action Pane, click **Cancel order**.

Cancel a service order line

1. Click **Service management > Common > Service orders > Service orders**. Double-click the service order that contains the line you want to cancel.
2. Select the service order line that you want to cancel, and then click **Cancel order line** to change the status of the line to **Canceled**.

TIP

To reverse the cancellation of a service order line and change the status back to **Created**, click **Revoke cancel**.

Cancel multiple service orders

1. Click **Service management > Periodic > Service orders > Cancel service orders**.
2. Click the **Select** button.
3. In the **Inquiry** form, in the **Criteria** column, select the service orders that you want to cancel.
4. Click **OK** to close the **Inquiry** form.
5. Select the **Show Infolog** check box to generate an Infolog that lists the canceled service orders.
6. Select the **Revoke cancel** check box if you want to reverse the **Canceled** status of a service order.
7. Click **OK**.

The selected service orders are either canceled or their progress status of **Canceled** has been reversed to **In process**.

NOTE

If you select the **Revoke cancel** check box, service orders with a progress status of **Canceled** are reversed and service orders with a progress status of **In process** are not canceled.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create service orders manually

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create service orders manually by using a service agreement or by using the **Service orders** form. You can also create a service order from a project.

TIP

You can use automated processes to create service orders.

Create a service order manually from a service agreement

1. Select **Service management > Common > Service agreements > Service agreements**.
2. Select a service agreement or create a new service agreement.
3. Select the **Deliver** tab and in the **Create** group select **Planned service orders** to open the **Create service orders** form.

Create a service order manually in the Service orders form

1. Select **Service management > Common > Service orders > Service orders**.
2. Select **New** to create a new service order.
3. Create service order lines for the service order.

NOTE

If the **Allow without service agreement** check box in the **Service management parameters** form is selected, you can post the transactions from the service order lines without attaching the service order to a service agreement. If the check box is cleared, you must attach the manually created service order to a project before posting the service order lines.

Create a service order from a project

1. Go to **Project management and accounting > Common > Projects > All projects**.
2. In the **Projects** form, on the **Action Pane**, select the **Manage** tab > select **Service > Service orders**.
3. Follow the previous procedure to create a service order manually in the **Service orders** form. The **Project ID** field displays the project reference.

NOTE

If the **Allow without service agreement** check box in the **Service management parameters** form is selected, you can post the transactions from the service order lines without attaching the service order to a service agreement. If the check box is cleared, you must attach the manually created service order to a project before posting the service order lines.

Create a service order from the Sales order form

You can create a service order from the **Sales orders** form by using the **Create a new service order based on the sales order** wizard.

1. Go to **Sales and marketing > Common > Sales orders > All sales orders**.
2. Open the relevant sales order.
3. On the **Sales order** tab, select **Service order** to start the **Create a new service order based on the sales order** wizard.
4. Select **Next >**, and then complete the following steps on the **Select agreement for service order** page:
 - Use the **Service agreement** field to select the service agreement with which the new service order should be associated.
 - Optional: Use the **Project ID** field to associate this service order with a particular project.
5. Select **Next >**, and then complete the following steps on the **Create service order** page:
 - Enter a date and time for the service call to begin in the **Preferred service time** field.
 - Optional: Modify the text in the **Description** field. By default, this field contains the description of the service agreement that you selected on the previous page.
 - In the **Responsible** field, select the ID of the employee who is responsible for the agreement, and if you know what it is, enter the ID of the customer's preferred technician for the service call.
 - In the **Contact ID** field, select the person in the customer's company who should be contacted regarding this service order.
6. Select **Next >**, and then select **Finish**.

Accrue subscription revenue

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Periodic** > **Service subscriptions** > **Accrue subscription revenue**.
2. In the **Period code** field, select a period code. Revenue is posted for all subscription fee transactions that have the selected period code.
3. In the **Posting date** field, enter a posting date, and then click **OK**.

NOTE

You cannot post accrued revenue until the fee transactions are invoiced.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Delete service orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

1. Click **Service management** > **Periodic** > **Service orders** > **Delete service orders**.
2. On the **Delete service orders** form, click **Select** to specify the criteria to select the service orders to be deleted, and then click **OK**.
3. Select the **Show Infolog** check box to generate an Infolog that displays the deleted service orders.
4. Click **OK**.

NOTE

If you do not specify any criteria to select the service orders, all service orders are deleted. However, when you exit the **Delete service orders** form, you will have the option to delete all service orders.

Also, you can only delete service orders with a stage that lets you delete them.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

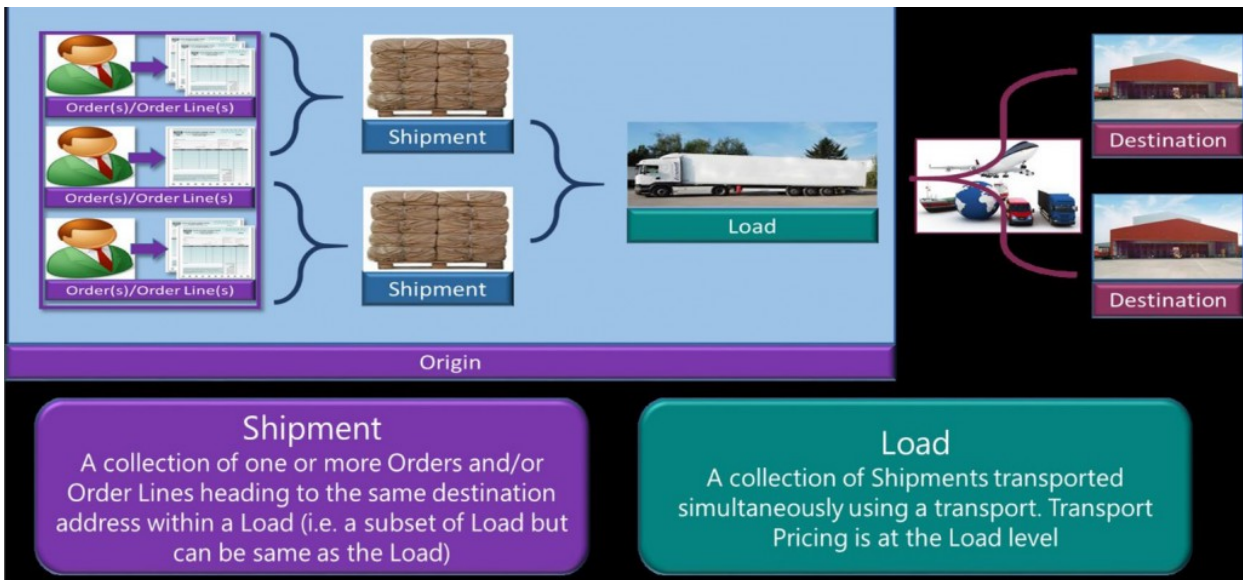

This topic gives an overview of the transportation management functionality in Supply Chain Management.

Transportation management lets you use your company's transportation, and also lets you identify vendor and routing solutions for inbound and outbound orders. For example, you can identify the fastest route or the least expensive rate for a shipment. The following table describes the main scenarios for using Transportation management.

SCENARIO	HOW TRANSPORTATION MANAGEMENT CAN HELP
Use external logistics providers for transportation activities.	Use Transportation management for inbound and/or outbound transportation.
The company's own fleet is available for delivery/pickup, and delivery charges are passed on to customers.	For the outbound processes, you can use Transportation management to determine the transportation charges and pass them on to customers. However, the carrier invoice reconciliation process isn't required.
The company's own fleet is available for delivery/pickup, but delivery charges aren't passed on to customers, because product prices include transportation.	A lot of the Transportation management functionality isn't required. However, you can use Transportation management to determine the transportation rates and adjust the sales price accordingly.
Logistics service is provided by another legal entity in the same company.	<ul style="list-style-type: none">You can use Transportation management by treating the other legal entity like any other shipping carrier. You can't automate the economic transactions between legal entities. Therefore, you must handle these transactions manually (for example, by creating a purchase order).In the legal entity that provides the logistics services, Transportation management can be used to determine transportation rates.

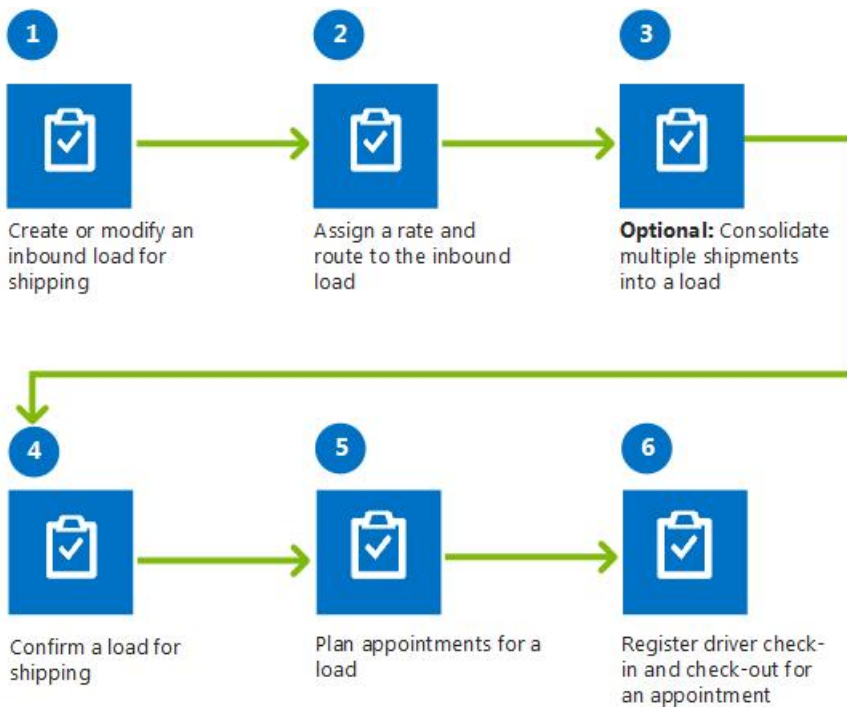

Planning transportation in Supply Chain Management

In Transportation management, transportation planning can be based either on orders or on the shipments that are created based on those orders. The shipments always exist at some point in time but aren't required for transportation planning. Transfer orders are part of the outbound scenario and can be planned together with sales orders.

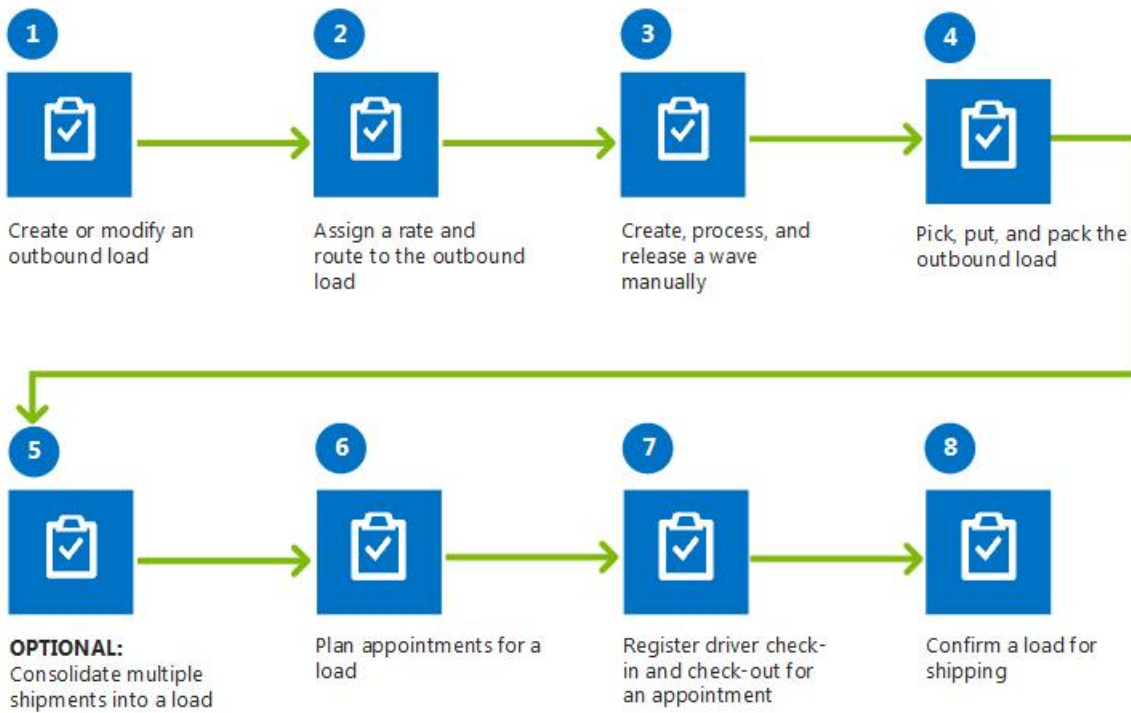

Inbound transportation

When you order items from a vendor, and the items must be delivered to your warehouse, you might want to arrange the transport of the items yourself. You can use Supply Chain Management to plan the transportation and receipt of the inbound load. The following illustration shows the business process flow for planning transportation for an inbound load.

Outbound transportation

You can plan and process an outbound load to ship specific items from a company's warehouse to a customer. You can use Supply Chain Management to plan the transportation and shipping of an outbound load. The following illustration shows the business process flow for planning and processing outbound loads for shipping.

Load building

Supply Chain Management provides a load building strategy that is named the Volume-based load building strategy. This strategy lets you use the maximum values that are specified for height and weight in the load template, or you can override the settings by entering new values. To use this strategy, select it in the **Load building strategy** field on the **Setup** FastTab on the **Load building workbench** page. In addition, you can add your own load-building strategies by creating a new class in the Application Object Tree (AOT).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management engines

2/18/2021 • 5 minutes to read • [Edit Online](#)

Transportation management engines define the logic that is used to generate and process transportation rates in Transportation management.

A transportation management engine calculates tasks, such as the carrier's transportation rate. The engine system lets you change calculation strategies at runtime, based on data in Supply Chain Management. A transportation management engine resembles a plug-in that is related to a particular carrier contract.

What engines are available?

The following table shows the transportation management engines that are available.

TRANSPORTATION MANAGEMENT ENGINE	DESCRIPTION
Rate engine	Calculates rates.
Generic engine	Simple auxiliary engines that are used by other engines that do not require data from Supply Chain Management, for example, an apportionment engine. Apportionment engines are used to reduce the final costs of transportation to specific orders and lines, based on dimensions, such as volume and weight.
Mileage engine	Calculates the transportation distance.
Transit time engine	Calculates the time that is required to travel from the start to the end destination.
Zone engine	Calculates the zone based on the current address and calculates the number of zones that must be crossed in order to travel from address A to address B.
Freight bill type	Standardizes the freight invoice and the freight bill lines and is used for automatic freight bill matching.

What engines must be configured to rate a shipment?

To rate a shipment using a specific carrier, you must configure multiple transportation management engines. The **Rate engine** is required, but other transportation management engines may be required to support the **Rate engine**. For example, the **Rate engine** can be used to retrieve data from the **Mileage engine** to calculate the rate based on mileage between the source and the destination.

What's required to initialize a transportation management engine?

A transportation management engine requires that you set up initialization data in order to function in a specific way. The setup can include the following types of data:

- References to other transportation management engines. For details, see the configuration example in this section.

- References to .NET types that are used by the transportation management engine.
- Simple configuration data.

In most cases, you can click the **Parameters** button in the transportation management engine's setup forms to configure the initialization data. **Example of the configuration of a rate engine that references a mileage engine** The following example shows the setup that is required for a rate engine that is based on the .NET engine type Microsoft.Dynamics.Ax.Tms.Bll.MileageRateEngine and references a mileage engine.

PARAMETER	DESCRIPTION
<i>RateBaseAssigner</i>	The .NET type that interprets the rate base assignment data for a particular schema. The syntax of the parameter value consists of two segments delimited by a vertical bar (
<i>MileageEngineCode</i>	Mileage engine code that identifies the mileage engine record in the database.
<i>ApportionmentEngine</i>	Generic engine code that identifies the apportionment engine in the database.

How is metadata used in transportation management engines?

Transportation management engines that rely on data that is defined in Supply Chain Management can use different data schemas. The transportation management system enables different transportation management engines to use the same generic physical database tables. To make sure that run-time interpretation of engine data is correct, you can define metadata for the database tables. This reduces the cost of building new transportation management engines because additional table and form structures are not required in Operations.

What can be used as search data in rate calculations?

The data that you use when you calculate rates is controlled by the metadata configuration. For example, if you want to search for rates based on postal codes you must set up metadata based on the lookup type of a postal code.

Do all engine configurations require metadata?

No, transportation management engines that are used to retrieve the data that is required for rate calculation from external systems don't need metadata. The rate data for these engines can be retrieved from external transportation carrier systems, usually through a web service. For example, can use a mileage engine that retrieves data directly from Bing maps so that you don't need a metadata for this engine.

NOTE

The transportation management engines that are delivered with Supply Chain Management rely on data that is retrieved from the application. Engines that connect to external systems are not included with Operations. However, the engine-based extensibility model lets you build extensions using Visual Studio Tools.

How do I configure metadata for a transportation management engine?

Metadata for transportation management engines is configured differently for the different types of engines.

TRANSPORTATION MANAGEMENT ENGINE	METADATA CONFIGURATION
Rate engine	Requires a Rate base type . The rate base type contains metadata for the rate base data and the rate base assignment data. The structure of rate base metadata is determined by the type of rate engine. The structure of the rate base assignment metadata is determined by the type of rate base assigner that is associated with that rate engine. You set up the rate base type of a rate engine on the Rate engine page and on the Rate master page.
Zone engine	Requires metadata to be set up directly on the zone master.
Transit time engine and Mileage engine	Retrieves the metadata directly from the mileage engine's configuration setup form.

Example of metadata for a rate engine The transportation management engine requires identification of the origin address, the destination state and country/region, and the start and end point of the shipment. By using these requirements, the metadata would look like the data in the following table. The table also includes information about what type of input data is required.

- Define this information in **Transportation management > Setup** on the **Rate base type** page.

SEQUENCE	NAME	FIELD TYPE	DATA TYPE	LOOKUP TYPE	MANDATORY
1	Origin postal code	Assignment	String	Postal Code	Selected
2	Destination state	Assignment	String	State	
3	Destination start postal code	Assignment	String	Postal Code	Selected
4	Destination end postal code	Assignment	String	Postal Code	Selected
5	Destination country	Assignment	String	Country/region

Create a new transportation management engine

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to create a new transportation management engine in Dynamics 365 Supply Chain Management.

Transportation management (TMS) engines define the logic that is used to generate and process transportation rates in Transportation management. Supply Chain Management provides several different engine types that calculate different parameters, such as rates, transit times, and the number of zones that will be crossed during transit. This article explains how to use the Microsoft Visual Studio development environment together with Supply Chain Management development tools to create and deploy a new TMS engine, and then how to set up the engine in Operations. For more information about the engines, see [Transportation management engines](#).

Create a new TMS engine

This section explains how to create a class library that has a TMS engine implementation, and how to reference it from a Supply Chain Management model.

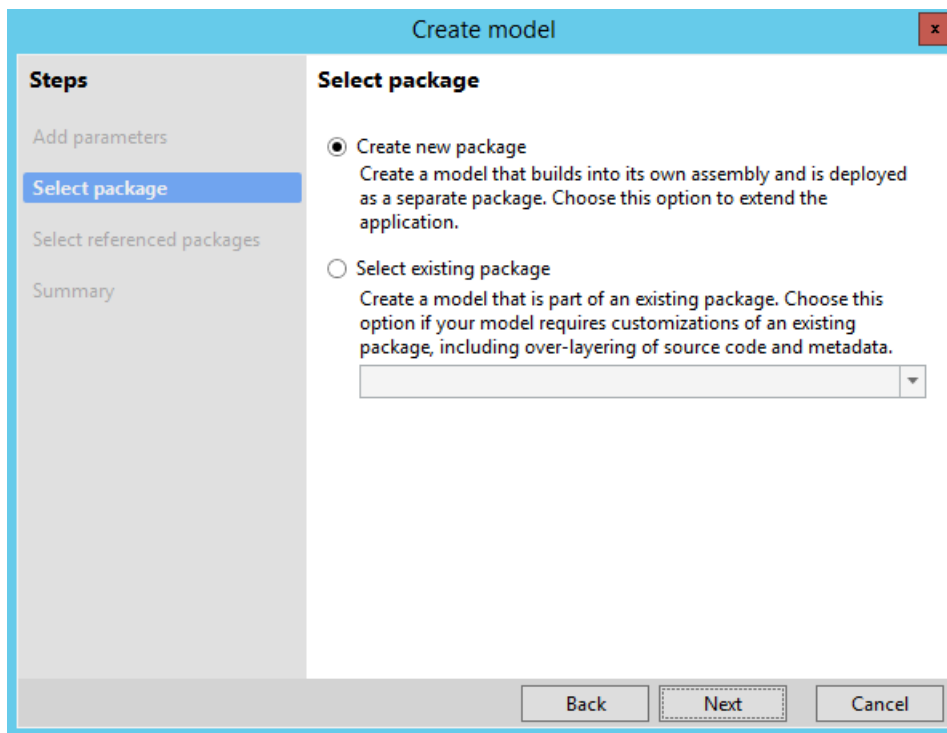

1. To deploy your new engines, you must have a model that will contain the engines. On the **Dynamics 365 > Model Management** menu, click **Create model** to create a new model. On the first page of the **Create model** wizard, name the model **TMSEngines**.

The screenshot shows the 'Create model' wizard interface. On the left, a 'Steps' sidebar lists 'Add parameters', 'Select package', 'Select referenced packages', and 'Summary'. The 'Add parameters' step is currently selected and highlighted. The main content area is titled 'Add parameters' and contains the following fields:

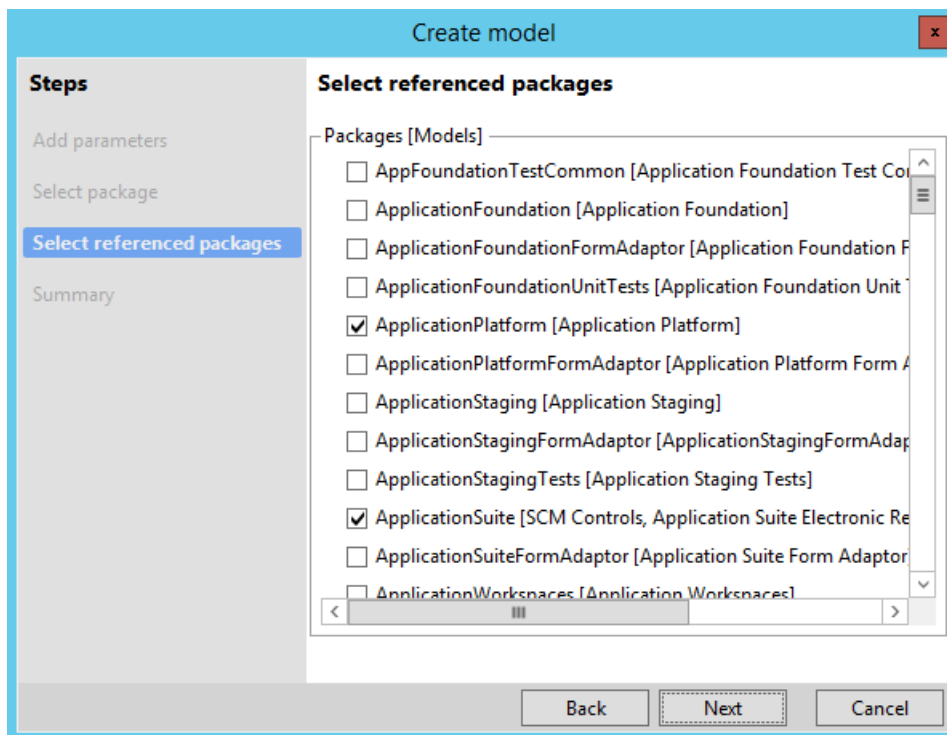

- Model name:** TMSEngines
- Model publisher:** TMSEnginesPublisher
- Layer:** usr (with a dropdown arrow)
- Version:** 1.0.0.0
- Model description:** (empty text area)
- Model display name:** TMSEngines

At the bottom of the wizard, there are three buttons: 'Back', 'Next' (which is highlighted with a dashed border), and 'Cancel'.

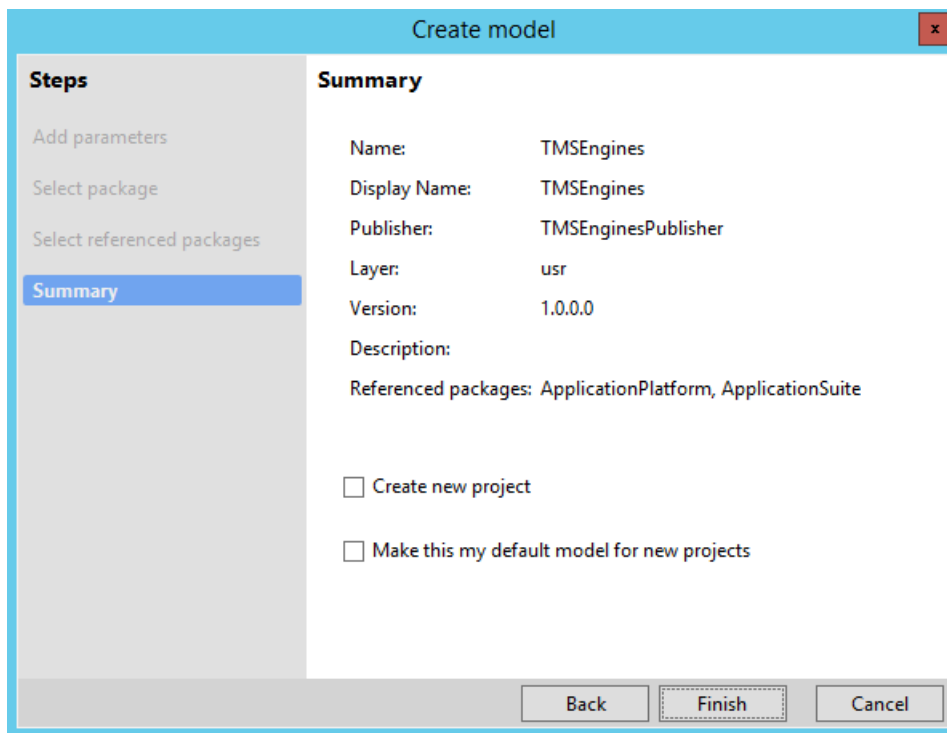

2. On the next page, select **Create new package**.

3. On the next page, select the **ApplicationSuite** model to reference. (The **ApplicationPlatform** model is preselected.)

4. On the next page, click **Finish** to confirm the creation of a new model.

5. In a new solution, create a new Supply Chain Management project, and name it **TMSThirdParty**. In the project properties, set the project's model to **TMSEngines**.
6. Add a new C# class library to your solution, and name it **ThirdPartyTMSEngines**.
7. In the ThirdPartyTMSEngines project, add references to Supply Chain Management–specific assemblies:
 - Application assemblies that enable X++ types to be referenced. These assemblies can be found in the following locations. [Packages root] is the path of the location where all the deployed assemblies are placed, such as C:\Packages.

```
[Packages root]\ApplicationPlatform\bin\Dynamics.AX.ApplicationPlatform.dll
[Packages root]\ApplicationFoundation\bin\Dynamics.AX.ApplicationFoundation.dll
[Packages root]\ApplicationSuite\bin\Dynamics.AX.ApplicationSuite.dll
```

- Framework assemblies that enable access to data, LINQ, and auxiliary functions. All these assemblies can be found in [Packages root]\bin.

```
Microsoft.Dynamics.ApplicationPlatform.Environment.dll
Microsoft.Dynamics.AX.Data.Core.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.AdoNet.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Interface.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Msil.dll
Microsoft.Dynamics.AX.Server.Core.dll
Microsoft.Dynamics.AX.Xpp.AxShared.dll
Microsoft.Dynamics.AX.Xpp.Support.dll
```

- The core TMS assembly (which contains engines) and the TMS base assembly (which contains helpers, constants, data transfer class definitions, and so on). These assemblies can be found in the following locations.

```
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.dll
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.Base.dll
```

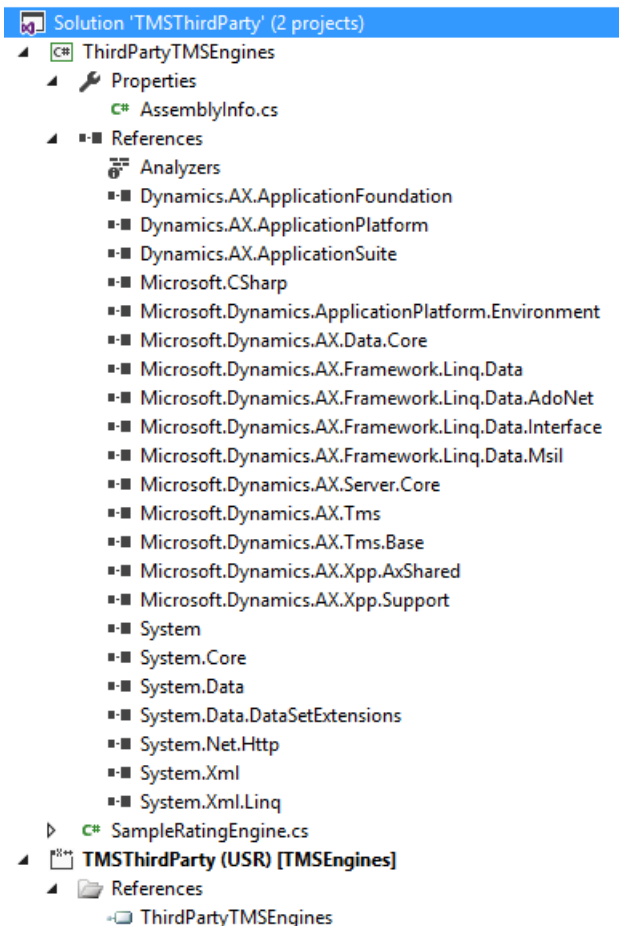

8. Rename the C# class that is automatically generated in the ThirdPartyTMSEngines project to

SampleRatingEngine.

- Implement the engine. Because we are creating a rate engine in this example, we inherit from the base class for rate engines. The base class implements most of the rate engine interface (**TMSFwkIRateEngine**). We just have to implement the rate method. To keep this example simple, we will make this method register a hard-coded rate of 100. You can create engines that implement any of the engine interfaces, such as **TMSFwkIAccessorialEngine**. All the engine interfaces are defined in X++.

```
namespace ThirdPartyTMSEngines
{
    using Dynamics.AX.Application;
    using Microsoft.Dynamics.Ax.Tms.Base.Data;
    using Microsoft.Dynamics.Ax.Tms.Base.Utility;
    using Microsoft.Dynamics.Ax.Tms.Bll;
    using System.Xml.Linq;
    public class SampleRatingEngine : BaseRateEngine
    {
        public override RatingDto rate(TmsTransactionFacade transactionFacade, XElement shipment,
TMSRateMasterCode rateMasterCode)
        {
            XElement re = shipment.RetrieveOrCreateRatingEntity(this.RatingDto);
            re.AddRate(TmsRateType.Rate, 100);
            return this.RatingDto;
        }
    }
}
```

- Build the solution.
- Add a new reference to the TMSThirdParty project. The reference should point to the ThirdPartyTMSEngines project. When you've finished, your solution should look like this.

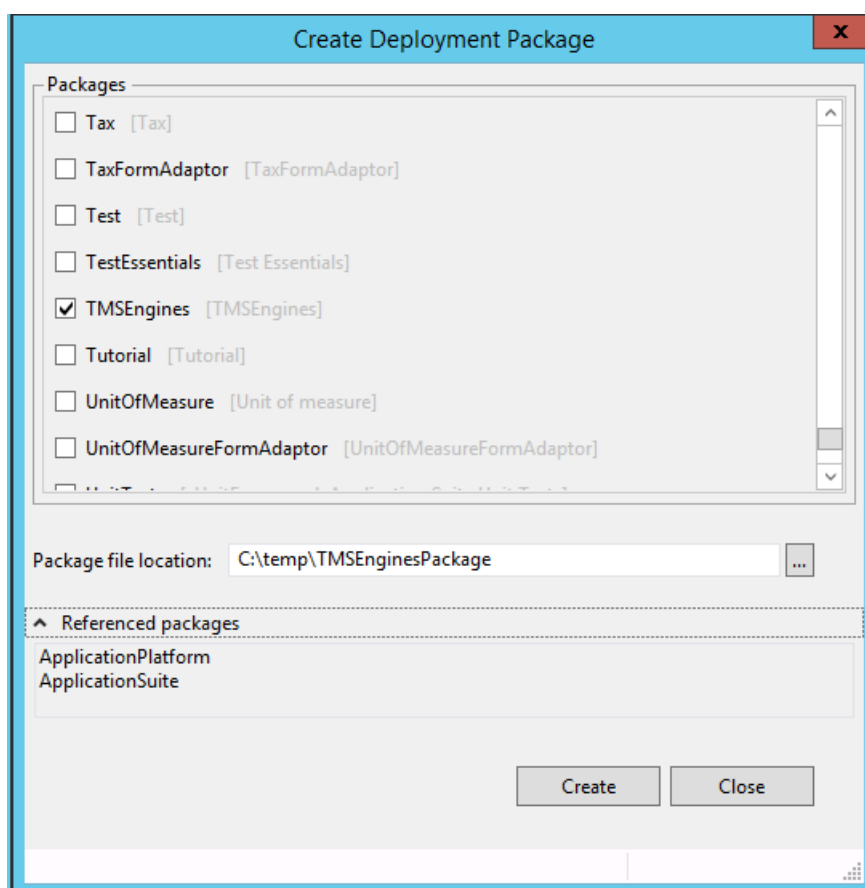

- Build the solution. Verify that the new library appears in the **References** node in Application Explorer.

Deploy the TMS engine as a package

One way to deploy third-party TMS engines is through a deployment package. This approach is recommended in a production environment. In a development environment, you can manually copy the assemblies, as described in the next section, "Set up a TMS engine in Supply Chain Management." To deploy the engine as a package, follow these steps.

1. On the **Dynamics 365 > Deploy** menu, click **Create Deployment Package**.
2. In the **Create Deployment Package** dialog box, select the TMSEngines model, and enter the path where you want to store your package files.

3. You can now deploy the package to the target environment. For a tutorial, see [Install a deployable package](#).

Set up the TMS engine in Supply Chain Management

This section explains how to set up Supply Chain Management to use a TMS engine, and shows how the new engine that we have created is used in rate shopping. The example in this section uses the USMF demo data company.

1. Create a new engine as described in the "Create a new TMS engine" section.
2. Build your solution.
3. Copy the resulting assembly into the binary location of the Supply Chain Management server,

[AOSWebRoot]bin. **Note:** This step is relevant only in a development environment. In a production environment, you should deploy through a deployment package. For instructions, see the previous section, "Deploy the TMS engine as a package."

- In Supply Chain Management, on the **Rate engines** page, create a new rating engine. The engine should point to the engine assembly that is produced by building the engine class library and the engine class that you implemented.

Rate engines

Filter

Rate engine ↑	Name	Rating metadata ID	Engine assembly	Engine class
Sample	Sample Engine	▼	ThirdPartyTMSEngines.dll	ThirdPartyTMSEngines.SampleRatingEngine

- Create a shipping carrier that uses the Sample rate engine. Because our engine doesn't use any data, you don't have to assign a rate master.

Shipping carriers

Shipping carrier: SampleCarrier | Name: Sample carrier | Mode: Ground ▼

Overview

Activate shipping carrier: Yes | Tracking URL: | Transportation tender type: None ▼ | Pro number sequence: ▼

Website URL: | Vendor: ▼ | SCAC: | Activate carrier rating: No

Services

+ New Delete

✓	Carrier service	Name	Load template ID	Transportation method	Mode of delivery	External code
✓	Default	Default	▼	Ground	▼	Sampl-Defa

Addresses

Rating profiles

+ New Delete Rate master Transit time engine

✓	Rating profile ↑	Name	Site	Warehouse	Rate engine	Rate master
✓	Default	Default	▼	▼	Sample	▼

- On the **Rate route workbench** page, click **Rate shop**. You should see a rate of 100.00 from SampleCarrier, as shown in the following screen shot. In this example, we are rate shopping for a route from warehouse 24 to customer US-004. However, but because the rate is hard-coded, you will always see a rate of 100.00.

Rate route workbench

			SampleCarrier	Default	Ground	100.00	100.00	100.00	USD

Tips and tricks

- If you're using development tools for Supply Chain Management, it's useful to add a new project to your solution. If you set this project as your startup project and start a debugging session, you can debug both

X++ and C# code in the same debugging session.

- Every time that you change and recompile your ThirdPartyTMSEngines project, you must manually copy the resulting assembly to the binary location or deploy through a deployment package. Otherwise, you might run by using a stale assembly.
- After you execute TMS-specific operations in Supply Chain Management, the Internet Information Services (IIS) worker process might lock the ThirdPartyTMSEngines assembly so that the assembly can't be updated. In this case, restart the w3svc process.

Associate a fuel index with a carrier as an accessorial charge

2/18/2021 • 2 minutes to read • [Edit Online](#)

This guide shows how to create an accessorial assignment, carrier accessorial charge, accessorial master for fuel surcharge, and associate a carrier fuel index with a carrier. You need to have set up a carrier fuel index before you run this guide. You can use the "Set up a carrier fuel index" guide to do this. These setup tasks are typically done by a Logistics manager. The demo data used to create this procedure is USMF.

Create an accessorial master

1. Go to Transportation management > Setup > Rating > Accessorial masters.
2. Click New.
3. In the Accessorial master field, type a value.
4. In the Name field, type a value.
5. Click Save.

Create a carrier accessorial charge

1. Go to Transportation management > Setup > Rating > Carrier accessorial charges.
2. Click New.
3. In the Carrier accessorial ID field, type a value.
4. In the Shipping carrier field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.
 - In this example, choose Truck Carrier.
6. In the list, click the link in the selected row.
7. In the Carrier service field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
9. In the Accessorial master field, click the drop-down button to open the lookup.
10. In the list, find and select the desired record.
 - In this example, choose the newly created Accessorial master.
11. Click Save.

Create an accessorial assignment

1. Click Accessorial assignments.
2. Click New.
3. In the Name field, type a value.
4. Toggle the expansion of the Criteria section.
 - In the criteria, you can choose to always apply the fuel surcharge or for this example choose that it only applies within a certain region.
5. In the ZIP/postal code from field, type a value.
6. In the ZIP/postal code to field, type a value.
7. Toggle the expansion of the Calculation section.
 - In the calculation section you can specify how to calculate the fuel surcharge. This calculation depends

on the Accessorial unit that you chose as the base for your calculation.

8. In the Accessorial fee type field, select 'Fuel surcharge'.
9. In the Accessorial unit field, select 'Mileage'.
10. In the Region field, click the drop-down button to open the lookup.
11. In the list, click the link in the selected row.
12. Click Save.

Update the carrier rating profile

1. Go to Transportation management > Setup > Carriers > Shipping carriers.
2. In the list, find and select the desired record.
3. Toggle the expansion of the Rating profiles section.
4. Click Edit.
5. In the Carrier fuel index field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. Click Save.

USMCA certification of origin

2/18/2021 • 7 minutes to read • [Edit Online](#)

This feature lets you print the certification of origin documents required by the United States-Mexico-Canada Agreement (USMCA).

The *USMCA certification of origin document* contains the minimum data elements required for declaration. Some data elements can be pre-filled before printing while others must be filled in manually after printing. To obtain preferential tariff treatment, the document must be completed and in the possession of the importer at the time the declaration is made. The document may be completed by the importer, exporter, or producer.

You can print the document for a single shipment from the **All shipments** list page or from the **Shipment details** page.

The document is only accessible when the country on the primary address for the legal entity is the United States.

Depending on the document print selection, the document can be pre-filled with data from your system. It is possible to change or add data to the printed document by exporting the printed document to an editable format, such as Microsoft Word. After export, you can apply any required changes before a declaration is made.

Turn on the USMCA feature

Before you can use the USMCA feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Transportation management*
- **Feature name:** *USMCA certification of origin document*

Document content

The USMCA certification of origin document contains the following data elements:

- Address elements
- Role of the certifying party
- Single shipment
- Invoices
- Blanket period
- Item details
- Certifier signature
- Number of pages

For more information about each of these elements and how their values are found, see the remaining sections in this topic.

Print a USMCA certification of origin document

To print a USMCA certification of origin document for a shipment, do the following:

1. Do one of the following:

- Go to **Transportation management > Shipments > All shipments** and select the shipment you want to print the document for.
 - Open the **Shipment details** page for the shipment you want to print the document for (there are several ways to get here, including from the **All shipments** page).
2. On the Action Pane, open the **Shipments** tab and, from the **Print** group, select **USMCA certificate of origin**.
 3. The **Certificate or origin** dialog box opens. Make the settings described in the following subsections and then select **OK** to generate the document.
 4. A preview of the document opens. Use the commands provided on the Action Pane to print or export the document as needed.

Certifying party

Use the **Certifying party** drop-down list to identify the type of party that is printing the document. Specify whether the certifying party is the *Exporter*, *Exporter and Producer*, *Producer*, or *Importer*, or leave it blank if the certifying party is none of these. The option you select determines what is printed in the address sections of the document.

The **Certifying party** that you choose will be included in the printed document.

The document can be printed for both inbound and outbound shipments. Select *Importer* as **Certifying party** for inbound shipments only.

The following table describes the types of information that are included in the document based on the **Certifying party** that you choose.

CERTIFYING PARTY	DESCRIPTION
<i>[Blank]</i>	<p>Adds the following details to the document:</p> <ul style="list-style-type: none"> • Certifier details: Uses the address details for the shipping warehouse, if available; otherwise it uses the shipping site address, if available; otherwise it uses the address of the legal entity (company) selected in Supply Chain Management. • Exporter details: Blank • Producer details: Blank • Importer details: Blank
<i>Exporter</i>	<p>Adds the following details to the document:</p> <ul style="list-style-type: none"> • Certifier details: Uses the address details for the shipping warehouse, if available; otherwise it uses the shipping site address, if available; otherwise it uses the address of the legal entity (company) selected in Supply Chain Management. • Exporter details: Uses the address details for the legal entity. • Producer details: Blank • Importer details: Uses the invoice account for the related sales order.

CERTIFYING PARTY	DESCRIPTION
<i>Exporter and Producer</i>	<p>Adds the following details to the document:</p> <ul style="list-style-type: none"> • Certifier details: Uses the address details for the shipping warehouse, if available; otherwise it uses the shipping site address, if available; otherwise it uses the address of the legal entity (company) selected in Supply Chain Management. • Exporter details: Uses the address details for the legal entity. • Producer details: Uses the address details for the legal entity. • Importer details: Uses the invoice account for the related sales order.
<i>Importer</i>	<p>Adds the following details to the document:</p> <ul style="list-style-type: none"> • Certifier details: Uses the address details for the shipping warehouse, if available; otherwise it uses the shipping site address, if available; otherwise it uses the address of the legal entity (company) selected in Supply Chain Management. • Exporter details: Blank • Producer details: Blank • Importer details: Uses the address details for the legal entity.
<i>Producer</i>	<p>Adds the following details to the document:</p> <ul style="list-style-type: none"> • Certifier details: Uses the address details for the shipping warehouse, if available; otherwise it uses the shipping site address, if available; otherwise it uses the address of the legal entity selected in Supply Chain Management. • Exporter details: Blank • Producer details: Uses the address details for the legal entity. • Importer details: Blank

Has various producers

The **Certifying party** drop-down list controls the text to be used for the producer details in the document.

Choose one of the following:

- *Various producers* - Prints the text "Various" in the producer details.
- *Available upon request* - Prints the text "Available upon request by the importing authorities" in the producer details.

When the **Certifying party** is set to *Exporter and Producer* or *Producer*, then the **Has various producers** setting is overruled, and the producer address details will be the same as the certifier.

Blanket period

Use the **Blanket period from** and **Blanket period to** settings to establish a blanket period, during which the document will cover multiple shipments of identical goods, even though the document is printed for only one shipment. You can set the blanket period dates without any constraints, and it will be added to the document. You can also leave these settings blank or set them in the past.

Is single shipment

In the **Certificate of origin** dialog box, set **Is single shipment** to one of the following:

- *Yes* - Adds "Single Shipment: Yes" next to the invoice number.
- *No* - Adds nothing.

Other information included in the document

In addition to the optional elements that you select using the **Certificate of origin** dialog box, the USMCA certification of origin document will include the information and custom fields summarized in the following subsections. Some of this information must be entered manually after you generate the document.

Invoice number

The IDs of sales invoices related to shipments are printed on the document irrespective of the blanket period. Invoice numbers are printed irrespective of the **Is single shipment** selection.

Item details

The document provides several sections that list specific item details, which are:

- **SKU number**: Prints the item number of the released product.
- **Description**: Prints either the description or name for the released product. If a description in the user's language exists, then this is printed. If no such description exists, then the name in the user's language is printed. If that name doesn't exist, then the item name is printed.
- **Harmonized System (HS) Tariff Classification**: Prints the Harmonized Tariff Schedule associated to the product. You can set up these schedules by going to **Transportation Management > Setup > Transportation standard > Harmonized Tariff Schedules**.
- **Origin criterion**: You must manually enter data in this section the first time you release the document.
- **Country of origin**: Prints the country of origin, which you apply by going to **Product information management > Setup > Product compliance > Country of origin** (see also [Country of origin](#)). The ISO code for the country of origin is printed based on the country/region of destination in the shipment delivery address and the item. If no country of origin data has been set up, then this value reverts back to the setting found at **Released product > Foreign trade > Origin**. If still no country of origin data is found, then you must manually enter the country of origin after generating the document.

Certifier signature and date

You must enter this manually after generating the document.

Consists of number of pages

The user signing the certification must manually enter the number of pages (for verification) after generating the document.

Page numbers

Current page and number of pages printed at the bottom of the document.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a bill of lading

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to create a bill of lading when using warehouse management processes.

A bill of lading is a legal document between the company that ships the items and the carrier. The document accompanies the shipped items, and it serves as a receipt of shipment when the items are delivered at the destination. If you're using warehouse management, there are two ways to generate a bill of lading:

- Create the report manually, using the **Bill of lading** page.
- Generate the report from the **Load planning workbench**.

If you generate the bill of lading from the **Load planning workbench**, the load status must be **Shipped**. If there's more than one shipment in the load, a bill of lading is created for each shipment. After a bill of lading has been created you can make changes to it on the **Bill of lading** page.

Master bill of lading

If there's more than one shipment in the load, you can generate a master bill of lading. This has the same layout and information as a bill of lading, but contains the summarized content for all the shipments. If the **Create a master bill of lading when there's more than one shipment on a load** option is set to **Yes** on the **Transportation management parameters** page, a master bill of lading is automatically generated if you create a bill of lading from the **Load planning workbench**, and there's more than one shipment. You can also get a list of the bills of lading by clicking **Related information** > **Bill of lading**. If you're creating bills of lading manually, you can create a master bill of lading on the **Bill of lading** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Plan freight transportation routes with multiple stops

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes the various elements that you use to plan transportation routes in Dynamics 365 Supply Chain Management.

You can use route plans and route guides for complex transportation routes that have multiple stops. If the same route will be used on a regular basis, you can set up a scheduled route.

Route plans

A route plan contains route segments that provide information about the stops that are visited on the route and the carriers that are used for each segment. You must define the stops on the route as hubs. A hub can be a vendor, a warehouse, a customer, or even just a reloading place where you change carrier. For each segment, you can define "spot rates" for various charges. Here are some examples:

- Charges for travelling to the given segments
- Charges for a picking up the goods
- Charges for dropping off the goods

Each route plan must be associated with a route guide.

Route guides

A route guide defines the criteria for matching a load to a specific route plan. For example, you can specify an origin hub and a destination hub, limits for the container volume or weight, and a shipping carrier, service, or group. Route guides are available on the **Rate route workbench** page, where loads can be matched to routes either manually or automatically. If the route guide is for a scheduled route, it's also available on the **Load building workbench** page.

Scheduled routes

A scheduled route is a predefined route plan that has a schedule for the shipping dates. Scheduled routes and non-scheduled routes differ in the way that loads are assigned to them. If you assign a non-scheduled route by using the Rate route workbench, only the load and the route guide are validated. If you assign a scheduled route, the dates and addresses from the orders and the hubs, and the date on the route plan, are also considered. You don't have to use the Rate route workbench page to manually assign loads to a scheduled route. Instead, you can use the Load building workbench to suggest that loads be built based on the customer addresses and delivery dates from sales orders for a given scheduled route. For scheduled routes, the route plan will have fixed origin and destination hubs. Typically, the shipping carrier and service will be the same for all segments, but they can differ. The destination hubs are created by using the postal codes of the customers that are visited on the route. Several route schedules can be defined for one route plan. The route plan must be associated with a route guide. However, for scheduled routes, the plan can be associated with only one route guide. The route schedule is used only to create the actual routes on the **Route schedule** page. You can use the default load template when you propose loads on the Load building workbench.

Load building workbench

The Load building workbench uses the customer addresses and delivery dates from sales orders, and the scheduled routes that are available, to propose a load. By default, the values from the route are entered on the workbench. However, you can select a "from" date that is earlier than the "from" date on the route. When a load is proposed, the delivery address and delivery date of all open sales orders are checked. If the postal code of the delivery address matches the postal code of a hub in the route plan, and if the delivery date is within the range that is selected in the criteria, the sales order is proposed for the load. The capacity of the load template is also considered. Only one load is proposed at a time. If you have a sales order that isn't included, you might have to use a different load template (for example, a load template for a bigger truck or container) or plan an extra delivery.

Plan loads using hub consolidation overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article describes the feature for consolidating shipments in a hub when you deliver goods from different warehouses to the same customer, or when you receive goods from multiple vendors in the same warehouse.

It can be useful to consolidate shipments in a hub when you deliver goods from different warehouses to the same customer, or when goods are delivered from multiple vendors to the same warehouse.

Building loads

Before you can use hub consolidation, you must enable the **In transit planning** option on the **Transportation management parameters** page. You must also create the hubs where consolidation will occur. The following diagram shows an example of hub consolidation. In this case, sales orders from different warehouses are going to the same customer. The basic loads are created based on sales orders in the usual way, by using the **Load planning workbench** page. To consolidate the two loads in a hub before they are delivered to the customer, on the **Load planning workbench** page, in the **Transportation** field, select **Hub consolidation**. When you select the correct hub for each load, the loads will have the hub as the "drop off" destination. You will also have two "transportation request lines" in the **Supply and Demand** section on the **Load planning workbench** page. You can then add these two lines to a new load. This new load will have both sales order lines, and will also have the hub as the "pick up" address and customer A as the "drop off" destination. The three loads are then ready to be rated and routed like any other load. You can select whatever shipping carrier the system suggests for each load.

You can also use the same method to consolidate loads for multiple transfer orders. In this case, customer A in the preceding diagram is a warehouse. Alternatively, you can consolidate loads for multiple purchase orders, where the loads are delivered from different vendors to the same warehouse. You can have more than one consolidation hub, and can consolidate in multiple hubs for more loads that come from different warehouses. After you build your basic loads and use the hub consolidation option, you build the new loads by using the consolidated transportation request lines. You then rate and route your loads.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Plan loads and shipments using the Load planning workbench

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows how to use the load planning workbench to create a load for a sales order. As a prerequisite we'll create the sales order first. This procedure is part of the daily work for the transportation coordinator. The demo data company used to create this procedure is USMF.

Create a sales order

1. Go to the **Navigation pane > Modules > Accounts receivable > Orders > All sales orders**.
2. Select **New**.
3. In the **Customer account** field, select the drop-down button to open the lookup.
4. Select account **US-004**.
5. Select **OK**.
6. In the **Item number** field, select the drop-down button to open the lookup.
7. Select item **A0001**. **A0001** is enabled for transportation management.
8. In the **Site** field, select the drop-down button to open the lookup, then select an item.
9. In the **Quantity** field, enter a number.
10. In the **Warehouse** field, type '24' for this example. This warehouse is enabled for transportation management and advanced warehouse management.
11. Select **Save**.
12. Close the page.

Create a new load

1. Go to the **Navigation pane > Modules > Transportation management > Planning > Load planning workbench**.
2. Select the **Sales lines** tab. Now you'll build the load for the sales order that you just created. Loads can be built based on supply and demand from purchase orders, transfer orders, and sales orders.
3. On the Action Pane, select **Supply and demand**.
4. Select **To new load**.
5. In the **Load template ID** field, select the drop-down button to open the lookup. The Load template defines maximum measurements for weight and volume of the entire load. For example, the load template might represent the size of a container or truck. Select an item.
6. Select **OK**.

Rate and route the load

1. Select **Rating and routing**.
2. Select **Rate route workbench**.
3. Select **Rate shop**.
4. In the list, find and select the desired record.
5. Select **Assign**.
6. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Include container weight and volume on load

2/18/2021 • 2 minutes to read • [Edit Online](#)

The functionality for including the container weight and volume on a load gives a clear representation of the total weight and volume of containers and items that are going on a load.

A load contains a single shipment or multiple shipments, and these shipments contain distinct items that belong to a single sales order or multiple sales orders. The items are stored inside a container, and containers are loaded on a load. Items that are outside a container can also be part of a load. Based on these conditions, the system calculates values for the weight and volume on the load by considering the weight and volume of both containers and items.

If the calculated values aren't precise, you can adjust them by entering the actual values for the weight and volume on the load. The values for the weight and volume are used in transportation management processes. For example, the values are used in the rate route workbench, where they help define the rate and route for loads, and they are also used for transportation tenders and driver check-in.

Where it applies

The functionality for including the container weight and volume on a load applies in transportation management processes, such as the rate route workbench, transportation tenders, and driver check-in.

How it is set up

The number of containers that should be considered for a load is calculated based on the weight and volume of the container, and on the percentage of the container is used.

- To set the weight and volume for a container, click **Warehouse management > Setup > Containers > Container types**.
- To set the container utilization percentage, click **Warehouse management > Setup > Containers > Container groups**, and then enter a value in the **Container utilization percentage** field.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reconcile freight manually

2/18/2021 • 2 minutes to read • [Edit Online](#)

1

This procedure shows how to reconcile freight manually. This is typically done by a transportation coordinator. You can use this procedure in the USMF demo data company.

Select a load to reconcile

1. Go to Transportation management > Planning > Load planning workbench.
2. Clear the Hide shipped and received check box.
3. In the list, select the load that has load ID 00006.

Create a carrier invoice

If you reconcile freight manually and don't receive carrier invoices automatically, you can create an invoice based on the freight bill.

1. Click Related information.
2. Click Freight bill details.
3. Click Generate freight bill invoice.
4. In the Invoice field, type a value.
5. Click OK.

Reconcile the invoice

When you reconcile a carrier invoice and a freight bill, this is done line by line.

1. Click Match freight bills and invoices.
2. Expand the Invoice details section.
3. Expand the Unmatched freight bill details section.
4. In the list, mark the selected row.
5. Click Match.
6. Expand the Matched freight bill details section.

Submit the invoice for approval

1. Click Submit for approval.
2. Close the page.
3. Clear the Hide approved check box.
4. Click Vendor invoice journals.
5. Click to follow the link in the Reference journal number field.
6. Click Lines.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reconcile freight in transportation management

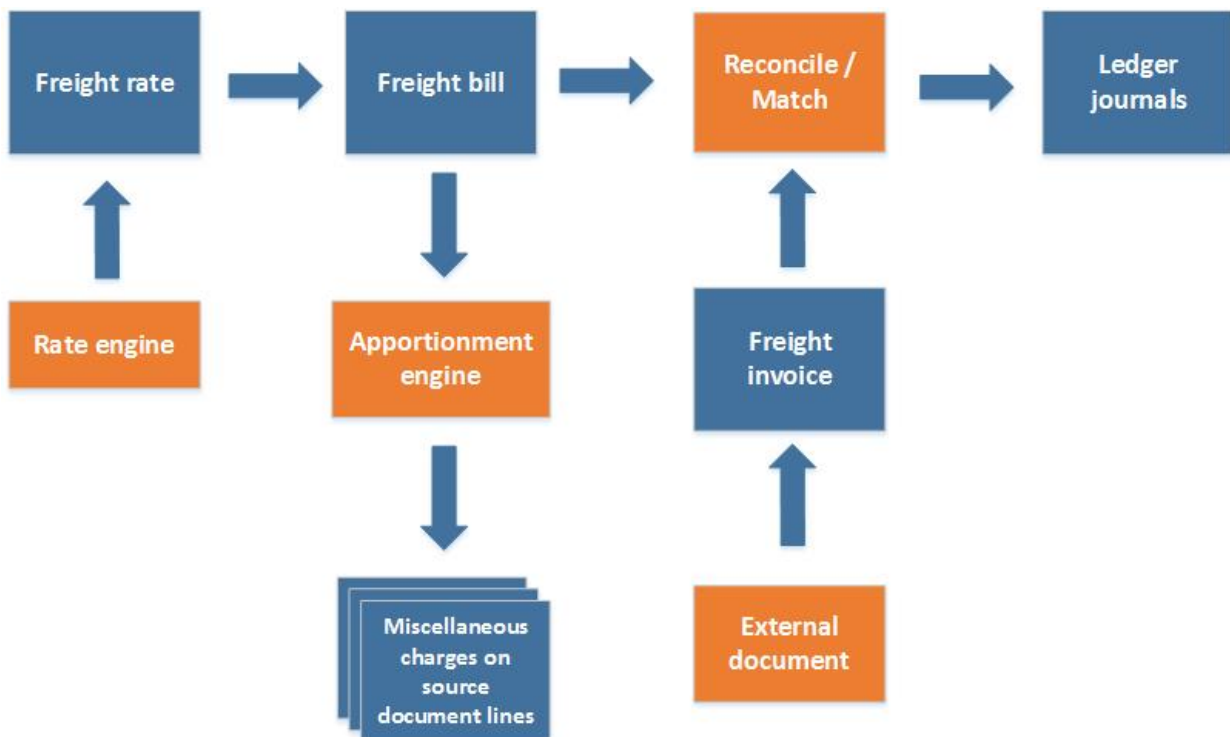

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the freight reconciliation process.

Freight reconciliation can be done manually, or it can be set up to occur automatically. To use automatic freight reconciliation, you must set up an audit master where you can define criteria that determine which freight bills are matched automatically.

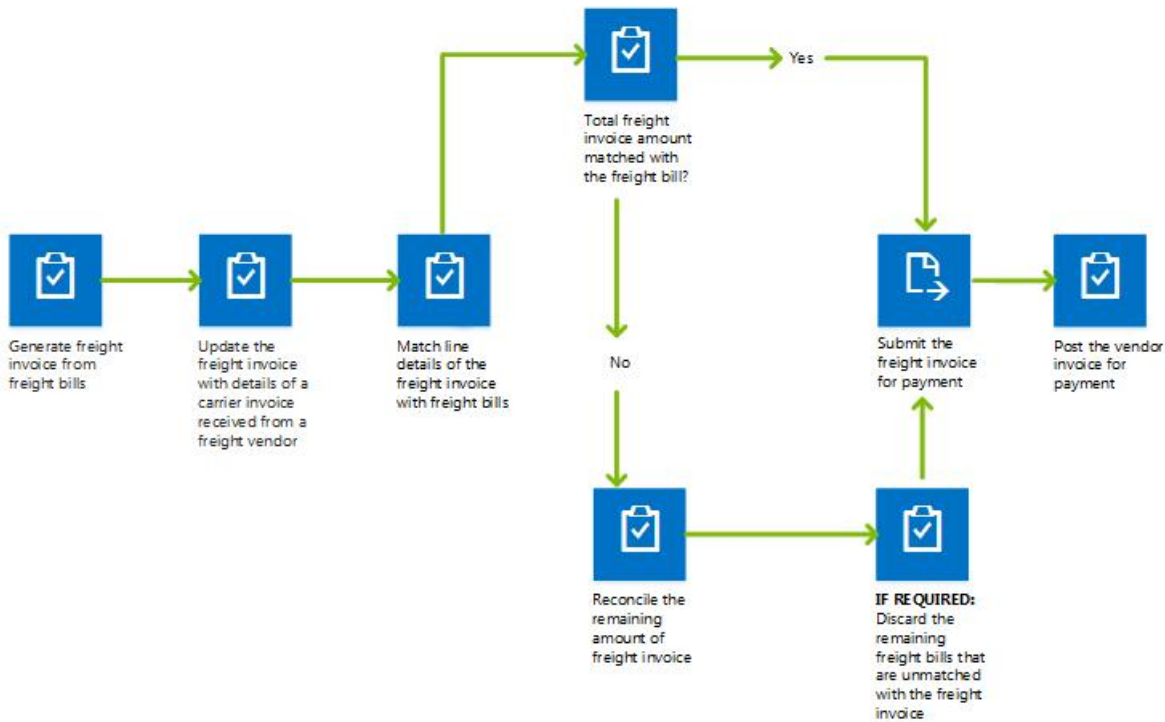

The freight reconciliation process

Freight rates are calculated by the rate engine that is associated with the relevant shipping carrier. When a load is confirmed, a freight bill is generated, and the freight rates are transferred to it. The freight rates are apportioned as miscellaneous charges to the relevant source document (purchase order, sales order, and/or transfer order), depending on the setup that is used for the regular billing process. The freight reconciliation process (which is also known as the matching process) can start as soon as the freight invoice arrives from the shipping carrier. The invoice can be received electronically or on paper. If the invoice is received on paper, you can generate an electronic invoice by using the freight bill as a template.

Manual reconciliation

If you're reconciling freight manually, you must match each invoice line with the freight bill line or lines for the load that is being invoiced. You do this matching on the **Freight bill and invoice matching** page. If the amount on the invoice line doesn't match the freight bill amount, you must select a reconciliation reason for the difference. If there are multiple reasons for reconciliation, you can split the unmatched amount across them. The reconciliation reason determines how the difference amounts are posted in the general ledger. When the reconciliation of the whole invoice amount is accounted for, it's submitted for approval, and then the journal is posted. The following illustration shows how to generate a freight invoice and do freight reconciliation.

Automatic reconciliation

To use automatic reconciliation, you must specify the schedule for reconciliation, and the invoices and shipping carriers to use. The matching of the invoice lines and freight bills is done according to the setup of the audit master and freight bill type. After you run the automatic reconciliation, you must handle any invoices that the system can't match. You must then process these invoices manually before you can post all the invoices for payment.

Match freight bills with freight invoices using automatic or manual reconciliation

Matching is the process of finding the freight bills that correspond to each freight invoice. This can be done by matching the invoice lines one-by-one (manual matching), or by matching all available invoices at once (auto matching).

Auto matching

When matching multiple freight invoices to the same freight bill, the process for auto matching works as follows:

1. All freight invoices not matched are sorted by amount, with largest amount first.
2. The freight invoices are matched one-by-one, until the freight bill has no positive amount remaining.
3. Depending on the setup of the audit master and the remaining amount on the freight invoices, the remaining amount is set.

Manual matching

All freight bills with positive amounts will be available for matching. Similar to auto matching, the user will only be able to match freight invoices with negative amounts to freight bills not fully matched.

Example

Suppose that you have a freight bill (FB) for an amount of 1500 and you have created three freight invoices for the freight bill with one invoice line for each invoice with following settings:

- Original freight bill (FB): Amount 1500
- Invoice 1 (Inv1): Amount 1000
- Invoice 2 (Inv2): Amount 600
- Invoice 3 (Inv3): Amount -100

Automatic matching result

Auto matching will execute in following order:

1. Sort all freight invoices descending by amount: Inv1 -> Inv2 -> Inv3.
2. Match Inv1 with FB. Inv1 has 1000 matched and FB has 500 amount remaining, so the status is set to *Partially matched*.
3. Match Inv2 with FB. Inv2 has 500 matched and FB has 0 remaining, so the status is set to *Fully matched*.
4. Because FB is now fully matched, Inv3 won't be processed.

Manual matching result

For manual matching, the results vary depending on the order of the matching, as illustrated in the following example cases.

Manual matching case 1

One way to do manual matching for this example is to proceed as follows:

1. Match FB with Inv1. FB has 500 amount remaining, so the status set to *Partially matched*.
2. Match Inv2 with FB. Inv2 has 500 matched and FB has 0 remaining, so the status is set to *Fully matched*.
3. When manually matching Inv3, you won't find any unmatched freight bills.

This case is essentially the same as auto matching

Manual matching case 2

Another way to do manual matching for this example is to proceed as follows:

1. Match Inv3 with FB. Now FB has amount remaining 1600, which is the same as subtracting negative 100 on top of 1500. Both FB and Inv3 have a matched quantity of -100.
2. Match Inv1 and Inv 2 with FB one after another. FB is fully matched.

As this example shows, matching freight invoices with negative amounts should only be done manually. This will ensure that it is always possible to match the freight invoices with negative amounts to a freight bill not fully matched because that enables you to control the matching sequence.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Register driver check-in and check-out for an appointment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to register a driver check-in and a driver check-out. This is typically done by a transportation coordinator. You can use this procedure in the USMF demo data company. Before you start, there must be an appointment set up for a load. To create an appointment, you can run the "Set up an appointment for a load" procedure as a prerequisite.

Select an appointment

1. Go to Transportation management > Planning > Dock appointment scheduling > Driver check-in and check-out.
2. Select an appointment.

Register driver check-in

1. Click Driver check-in.
2. In the Trailer number field, type a value.
3. In the Driver name field, type a value.
4. In the Driver license field, type a value.
5. Click OK.

Register driver check-out

1. Click Driver check-out.
2. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management discounts

2/18/2021 • 2 minutes to read • [Edit Online](#)

Transportation management lets you set up discounts to be applied on top of the transportation price calculated by the rating engine. You can specify each discount either as a percentage of charges or as a fixed amount.

To set up discounts for transportation management, go to **Transportation management > Setup > Rating > Discounts**.

You can choose whether to pass the discount on to your customer (by setting the discount type to customer) or to retain it in the company (by setting the discount type to shipper). This lets you define a setup in which you earn a margin on the calculated freight charges.

You can set up multiple qualifiers for each discount, such as carrier, carrier service, delivery terms, customer, destination, and more.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management miscellaneous charges

2/18/2021 • 2 minutes to read • [Edit Online](#)

As with all miscellaneous charges, transportation-generated charges must be associated with a charge code. Otherwise, they won't be added back to the order as a miscellaneous charge. The **Charges code** determines how the charge is accounted for in relation to the order and order line where it is added.

Go to **Transportation management > Setup > Rating > Miscellaneous charges** to define the qualifying criteria that determine when a specific **Charges code** is applied to a charge.

You should have at least one setup for each relevant **Charges module** setting (*Customer* and *Vendor*) where the **Miscellaneous charge type** is set to *None*. If this is missing, the miscellaneous charge will *not* be added to the order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management modes and methods

2/18/2021 • 2 minutes to read • [Edit Online](#)

The transportation management mode represents the type of transport that the carrier uses for freight deliveries, such as less than load (LTL), truckload (TL), or parcel. The transportation method represents the form of transport that the carrier uses for freight deliveries, such as air, ground, ocean, or rail.

Modes and transportation methods are used in several contexts. Only modes are used in route plans, while both modes and transportation methods are used when setting up shipping carriers and carrier services. No explicit relationship or hierarchy exists between modes and transportation methods.

Create a mode

To create a mode, follow these steps:

1. Go to **Transportation management > Setup > Carriers > Mode**.
2. Select **New** to create a new mode.
3. Enter a unique ID and a descriptive name for the mode.
4. Close the page.

Create a transportation method

To create a transportation method, follow these steps:

1. Go to **Transportation management > Setup > Carriers > Transportation methods**.
2. Select **New** to create a new transportation method.
3. Enter a unique ID and descriptive name for the transportation method.
4. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management number sequence

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use the **Number sequences** page in the transportation management module to set up various pro numbers. Pro numbers are used by carriers to organize and track the progress of each shipment.

Create a number sequence for a pro number

To create a number sequence for a pro number, do the following:

1. Go to **Transportation management > Setup > Carriers > Number sequences**.
2. Select **New** to create a new number sequence.
3. Enter a unique ID and descriptive name for the number sequence.
4. In the **Number sequence type** field, *Pro number* is the only option.
5. In the **Check digit** field, *Check digit* is the only option and is set up as a generic engine.
6. On the **Sequence** FastTab, provide information about the sequence.
7. Close the page.

Link a number sequence to a shipping carrier

To link a number sequence to a carrier, do the following:

1. Go to **Transportation management > Setup > Carriers > Shipping carriers**.
2. Select a shipping carrier.
3. Select **Edit**.
4. On the **Overview** FastTab, select an option in the **Pro number sequence** field.
5. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management statuses

2/18/2021 • 2 minutes to read • [Edit Online](#)

Set up master codes for transportation statuses to interpret codes that are provided by your shipping carriers. This lets you integrate with shipping carriers to provide a status. The transportation status that you provide for a transportation master status code can help you track the status of a load, shipment, or container. The specific transportation status for a load, shipment, or container can only be updated through data integration and not manually through the user interface.

Create a transportation status

To create a transportation status, follow these steps:

1. Go to **Transportation management > Setup > Transportation status masters**.
2. Select **New** to create a transportation status master.
3. In the **Transportation status master** field, enter a unique code for the transportation status.
4. In the **Transportation type** field, select either *Shipping carrier* or *Hub* as the type of transportation.
5. Enter a name and transportation status.
6. Close the page.

Map a transportation status to a carrier status

To map a transportation status to a carrier status, follow these steps:

1. Go to **Transportation management > Setup > Carriers > Carrier transportation status**.
2. Select **New** to map a code from a shipping carrier to a transportation status master code.
3. Select the unique ID for the shipping carrier and the carrier service.
4. Select the transportation status code that you want to map to the selected shipping carrier's code.
5. Enter the external code that is used by the shipping carrier.
6. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Transportation management zone master

2/18/2021 • 2 minutes to read • [Edit Online](#)

Transport management lets you divide geographic locations into zones. Dividing locations into zones can help to:

- **Simplify transportation pricing** – Zone-wise pricing can be simpler than individual location-based pricing, especially when transportation locations are scattered.
- **Optimize load planning** – By consolidating loads by zones.
- **Optimize route planning** – By assigning specific route plans to specific zones.

You define zones based on the metadata field values (such as country, zip code range, or carrier service) that qualify each zone. Zone definitions aren't required if your transportation pricing doesn't employ a zone concept.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Carrier groups

2/18/2021 • 2 minutes to read • [Edit Online](#)

A carrier group is a collection of shipping carriers and carrier services. Each carrier group specifies the preferred sequence for the shipping carriers and carrier services that belong to it.

When multiple shipping carriers and carrier services exist for the same route segment, you can specify a carrier group instead of a specific shipping carrier and carrier service in the route plan or route guide.

Create a carrier group

1. Go to **Transportation management > Setup > Carriers > Carrier group**.
2. Select **New**.
3. In the **Carrier group** field, enter a unique identifier (ID) for the group.
4. In the **Name** field, enter a descriptive name for the group.
5. On the **Details** FastTab, add a row, and select a shipping carrier and a carrier service for it. Repeat this step until you've added as many carriers as you require for the group.
6. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Load building workbench

2/18/2021 • 2 minutes to read • [Edit Online](#)

The load building workbench lets you apply load building strategies when you create loads.

Create a load building strategy

You use load building strategies to automatically build loads. This capability can be beneficial in the following situations:

- If you regularly ship a specific set of products, load strategies help save time, because you don't have to build the same load every time.
- If you want to avoid half-full loads to maximize efficiency, load strategies can help fill each load as much as possible.

A load building strategy class that is named `TMSLoadBuildingVolumeStrategy` provides a load building strategy that is named *Volume-based load building strategy*. This strategy lets you use the maximum values that are specified for height and weight in the load template, or you can override the settings by entering new values. This strategy is the only strategy that is included out of the box. (However, you might have some custom strategies.)

To use the out-of-box *Volume-based load building strategy* strategy, select it in the **Load building strategy** field on the **Load building workbench** page (**Transportation management > Planning > Load building workbench**).

To create a load building strategy, follow these steps.

1. Go to **Transportation management > Setup > Load building > Load building strategies**.
2. On the Action Pane, select **Generate class list** to make sure that you have the latest versions of all available classes.
3. On the Action Pane, select **New**.
4. Enter a unique name for the strategy, select the load building strategy class for it, and enter a description.
5. On the Action Pane, select **Save**.
6. On the Action Pane, select **Parameters**.
7. On the **Load building strategy parameters** page, select **Volume capacity** in the list, and then, in the **Value** field, enter the percentage of the load's total volume capacity that should be applied for the new load building strategy.
8. Select **Weight capacity** in the list, and then, in the **Value** field, enter the percentage of the load's total weight capacity that should be applied for the new load building strategy.
9. Close the **Load building strategy parameters** page.
10. Close the **Load building strategies** page.

You can now assign the load building strategy to a load building template. Alternatively, you can use it directly in the load planning workbench.

Use a load building strategy in the load building workbench

1. Go to **Transportation management > Planning > Load building workbench**.
2. Follow one of these steps:

- Select a strategy in the **Load building strategy** field.
 - If you've defined a load building template and assigned the load building strategy to it, on the Action Pane, on the **Manage templates** tab, select **Apply template**. Then, in the **Apply load building template** drop-down dialog box, select a template in the **Load building template name** field.
3. On the **Load templates sequence** FastTab, select one or more [load templates](#). The workbench will try to fit the load into these types of containers, in the sequence that is specified here. Typically, you should put the smallest containers at the top of the list to ensure that the smallest possible container is selected first.
 4. On the Action Pane, select **Propose loads**.
 5. Review the proposed loads and proposed load lines.
 6. On the Action Pane, select **Create loads** to create loads that are based on the source document lines on the **Proposed load lines** FastTab.
 7. Close the **Load building workbench** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Load templates

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you create a new load, you can assign a load template. The load template contains information about equipment, and about measures such as the height, width, depth, and volume of the load.

This topic describes how to set up load templates, and how to associate a load template with a new load.

Set up a load template

1. Go to **Transportation management > Setup > Load Building > Load template**.
2. On the Action Pane, select **New** to add a new template or **Edit** to edit an existing template.
3. In the row for the new or existing template, set the following fields:
 - **Load template ID** – Enter a unique identifier (ID) for the load template.
 - **Equipment** – Select the equipment that should be used to ship the load.
 - **Load height, Load width, and Load depth** – Enter the dimensions of the load.
 - **Max. allowed load volume and Max. allowed load weight** – Enter the maximum allowed volume and weight of the load.
 - **Maximum allowed gross weight** – Enter the maximum allowed gross weight of the load. A load's gross weight includes both its tare weight and its loading weight.
 - **Maximum number of freight pieces allowed** – Enter the maximum number of freight pieces that the load can contain.
 - **Stack load on floor** – Select this check box to use floor loading. In a floor loading scenario, boxes are stacked floor to ceiling and wall to wall inside the container, to maximize capacity.
4. On the Action Pane, select **Save**.

Associate a load template with a new load

1. Go to **Transportation management > Planning > Load planning workbench**.
2. In the upper part of the page, select one of the following tabs, depending on the type of source document that you're creating a load for: **Shipments, Sales lines, Transfer lines, or Purchase order lines**.
3. Select the specific document to plan the load for.
4. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To new load**.
5. In the **Load template** dialog box, in the **Load template ID** field, select the template to apply.
6. Select **OK** to apply the template.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Rating profiles

2/18/2021 • 2 minutes to read • [Edit Online](#)

A rating profile resembles a logistics contract (but not a legal contract). It's used to determine transportation tariffs for loads.

Each rating profile is unique to a shipping carrier. In the profile, you associate the shipping carrier with a rate master. The rate master defines the rate base assignment and the rate base. The rate base determines the rate of the carrier.

You can set up a rating profile by using a generic page that shows an overview of all existing rating profiles. Alternatively, you can set up a rating profile directly from the shipping carrier. In both cases, the information that you set up for the rating profile is the same.

Create or edit a rating profile on the Rating profiles page

On the **Rating profiles** page, you can review all available rating profiles. You can also edit existing profiles and create new profiles.

1. Go to **Transportation management > Setup > Rating > Rating profile**.
2. On the Action Pane, select **New** to add a new rating profile to the grid, or select **Edit** to edit an existing profile.
3. In the row for the new or existing rating profile, set the following fields:
 - **Rating profile** – Enter a unique identifier (ID) for the rating profile.
 - **Name** – Enter a descriptive name for the rating profile.
 - **Shipping carrier** – Select a shipping carrier. The rating profile that you're setting up will also be shown on the **Shipping carriers** page for the selected carrier.
 - **Site and Warehouse** – Select a site and warehouse.
 - **Rate engine** – Select the rate engine for the rating profile.
 - **Rate master** – Select the rate master for the rating profile. You can use the rate master to define a rate base type and a rate base. For more information, see [Set up rate masters](#).
 - **Transit time engine** – Select the transit time engine for the rating profile.
 - **Carrier fuel index** – Select the carrier fuel index for the rating profile.
 - **Effect start date and time** and **Effective end date and time** – Define the period when the rating profile should be active.
4. On the Action Pane, select **Save**.

Create a rating profile directly on the Shipping carriers page

1. Go to **Transportation management > Setup > Carriers > Shipping carriers**.
2. Select a shipping carrier in the list.
3. On the **Rating profiles** FastTab, select **New** to create a rating profile.
4. Set the fields for the new rating profile. These fields correspond to the fields on the **Rating profiles** page, as described in previous section of this topic.

NOTE

Profiles that are created on the **Shipping carriers** page are also shown on the **Rating profiles** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a carrier fuel index

2/18/2021 • 2 minutes to read • [Edit Online](#)

This guide shows how to create a fuel index region, a fuel index and a carrier fuel index. The fuel index region specifies which region the fuel index should apply to, and the fuel index specifies a fuel price for a particular period of time. To reflect the change in fuel prices over time, you can associate multiple fuel indexes with a carrier. These tasks are normally done by a transportation coordinator. You can use this procedure in demo data company USMF or using your own data.

Create a fuel index region

1. Go to Transportation management > Setup > Fuel indexes > Fuel index regions.
 - First you have to create the different regions, where you operate and calculate different fuel surcharges.
2. Click New.
3. In the Region field, type a value.
4. In the Name field, type a value.
5. Click Save.

Create a fuel index

1. Go to Transportation management > Setup > Fuel indexes > Fuel indexes.
 - For the regions you have set up you need to enter the current prices for the fuel.
2. Click New.
3. In the Region field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. In the Price per gallon field, enter a number.
6. In the Effective start date and time field, enter a date and time.
7. Click Save.

Create a Carrier fuel index

1. Go to Transportation management > Setup > Fuel indexes > Carrier fuel indexes.
2. Click New.
3. In the Carrier fuel index field, type a value.
4. In the Description field, type a value.
5. Click New.
6. In the Effective start date and time field, enter a date and time.
7. In the PPG From field, enter a number.
 - In this example, you can set PPG From field to 1.95.
8. In the PPG To field, enter a number.
 - In this example you can set the PPG To field to 2.
9. In the Percentage field, enter a number.
 - In this example you can set the percentage to 3.
10. In the Currency field, click the drop-down button to open the lookup.
11. In the list, find and select the desired record.

12. In the list, click the link in the selected row.

13. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a transportation tender

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to set up a transportation tender. This is typically done by a transportation coordinator. You can use this procedure in the USMF demo data company.

Select a route

1. Go to Transportation management > Planning > Load planning workbench.
2. Clear the Hide shipped and received check box.
3. Select the line with Load ID 00006.
4. Click Rating and routing.
5. Click Routes.

Create the transportation tender

1. Click Transportation tenders.
2. Click New.
3. Expand the General section.
4. In the Requested rates field, enter a number.
5. Click Save.
6. Click Update status.
7. Click Submit.
8. Select a route.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up accessorial assignments

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to set up an accessorial assignment. This is typically done by a transportation coordinator. Before you use this guide you need to run the "Set up hub accessorial charges and accessorial masters" guide.

Set up Accessorial assignment

1. Go to Transportation management > Setup > Rating > Accessorial assignments.
2. Click New.
3. In the Name field, type a value.
4. Toggle the expansion of the Details section.
5. In the Hub field, click the drop-down button to open the lookup.
6. In the list, select the Hub that you created an accessorial master for when you ran the "Set up hub accessorial charges and accessorial masters" guide.
7. In the Hub accessorial ID field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
9. Toggle the expansion of the Criteria section.
 - In the Criteria section you can choose the exact criteria for when the charge should apply, based on the different values offered here.
10. Set the Always apply option to Yes.
11. In the Accessorial assignment level field, select an option.
12. Toggle the expansion of the Calculation section.
13. In the Accessorial fee type field, select 'Flat'.
 - The Accessorial fee type determines how to calculate the actual charge. In this example it's a flat charge.
14. In the Accessorial fee field, enter a number.
15. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up an appointment for a load

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to set up and plan a dock appointment for a load. This is typically done by a transportation coordinator. You can use this procedure in the USMF demo data company.

Select the load

1. Go to Transportation management > Planning > Load planning workbench.
2. Clear the Hide shipped and received check box.
3. In the list, select the load that has a status of Shipped.
4. Click Transportation.
5. Click Appointment scheduling.

Create an appointment

1. Click New.
2. In the Appointment rule field, enter or select a value.
3. Click Save.
4. Click Update status.
5. Click Firm.
6. Click Save.
7. Close the page.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up automatic freight reconciliation

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to set up data for automatic freight reconciliation. This is typically done by a warehouse manager. You can use this procedure in demo data company USMF.

Set up the freight bill type

1. Go to Transportation management > Setup > Freight reconciliation > Freight bill type.
 - The freight bill type defines how freight bills and carrier invoices should be matched.
2. Click New.
3. In the Freight bill type field, type a value.
4. In the Engine assembly field, type 'Microsoft.Dynamics.Ax.Tms.dll'.
 - This is the standard Transportation management matching engine code library.
5. In the Engine class field, type 'Microsoft.Dynamics.Ax.Tms.Bll.GenericNormalizer'.
 - This is the standard Transportation management matching engine class.
6. Click New.
7. In the Description field, choose the value that should match on the freight bill and the carrier invoice.
8. In the Match required field, select 'Yes'.
 - If you set this field to Yes this means that the value selected in the Description field needs to match on both the freight bill and the carrier invoice. If you set it to No, the field can be blank on one of these.
9. Click Save.

Set up the freight bill type assignment

1. Close the page.
2. Go to Transportation management > Setup > Freight reconciliation > Freight bill type assignments.
 - The freight bill type assignment is used to specify which freight bill type is used for a particular carrier.
3. Click New.
4. In the Mode field, enter or select a value.
5. In the Shipping carrier field, enter or select a value.
6. In the Freight bill type field, select the freight bill type that you created earlier.
7. Close the page.

Set up the audit master

1. Go to Transportation management > Setup > Freight reconciliation > Audit master.
 - The audit master defines the tolerance limits for automatic freight reconciliation. It specifies by how much the monetary amounts on the freight bill and the carrier invoice can differ and still allow reconciliation to occur. It also defines how to handle discrepancies.
2. Click New.
3. In the Audit master ID field, type a value.
4. In the Shipping carrier field, select the same shipping carrier as you did earlier.
5. In the Freight bill type field, select the freight bill type that you created earlier.
6. Expand the Tolerance section.
7. In the Minimum tolerance level field, enter a number.

8. In the Maximum tolerance level field, enter a number.
9. Expand the Result section.
10. In the Overpayment reason code field, enter or select a value.
 - If the monetary amounts differ on the freight bill and the carrier invoice, the overpayment and underpayment reason codes specify the accounts that the difference should be registered on, as long as the difference is within the tolerance levels.
11. In the Underpayment reason code field, enter or select a value.
12. Close the page.

Set up hub accessorial charges and accessorial masters

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create an accessorial master for a hub and use that master to create a hub accessorial charge. The procedure uses the USMF dataset. This set up will typically be done by a transportation coordinator.

Set up a hub master

1. Go to Transportation management > Setup > Rating > Accessorial masters.
2. Click New.
3. In the Accessorial master field, type a value.
4. In the Name field, type a value.
5. In the Accessorial type field, select 'Hub'.
6. Click Save.
7. Close the page.

Set up a hub accessorial charge

1. Go to Transportation management > Setup > Rating > Hub accessorial charges.
2. Click New.
3. In the Hub accessorial ID field, type a value.
4. In the Hub field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.
6. In the Hub position field, select an option.
 - You can either create the charge as a pickup or drop-off. Depending on your selection the charge will be applied to the corresponding transportation segment on your route.
7. In the Accessorial master field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
 - Select the master you just created.
9. Click Save.
10. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up rate masters

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows you how to set up a rate master. The logistic manager usually sets up rate masters, depending on the contracts signed with the carriers. In this scenario you will set up a rate master for an air carrier. The demo data company used to create this procedure is USMF.

Set up break master

1. Go to **Transportation management > Setup > Rating > Break master**. Break masters are used to define the pricing structure and its breakpoints. The pricing structure uses tiered pricing that is based on physical dimensions.
2. Select **New**.
3. In the **Break master** field, enter a value.
4. In the **Name** field, enter a value.
5. In the **Data type** field, select the data type.
6. In the **Comparison** field, enter the kind of comparison requested (using operators).
7. In the **Break unit** field, enter the break unit.
8. In the **Details** section, create as many breaks as needed for the pricing structure.
9. Select **Save**.

Set up rate master

1. Go to **Transportation management > Setup > Rating > Rate master**.
2. Select **New**.
3. In the **Rate master** field, type a value.
4. In the **Name** field, type a value.
5. In the **Rating metadata ID** field, select the drop-down button to open the lookup. The rating metadata ID will determine the data needed for the rate master, as it defines the metadata expected by the transportation management engine using this rate master.
6. For this example, select the P2P option. This is already defined in the demo data.
7. In the list, select the link in the selected row.
8. Select **Save**.

Set up rate base

1. Select **Rate base**.
 - The rate base determines the rate of the carrier, and can be used to set up a tariff structure as it structures the rates in the breakpoints defined in the break master.
2. Select **New**.
3. In the **Rate base** field, type a value.
4. In the **Name** field, type a value.
5. In the **Break master** field, select the drop-down button to open the lookup.
 - Break masters are used to define the pricing structure and its breakpoints. The pricing structure uses tiered pricing that is based on physical dimensions.
6. For this example, use weight. This is already defined in the demo data.

7. In the list, select the link in the highlighted row.
8. Expand the **Details** section.
9. Select **New**.
10. In the **Drop-off Postal Code From** field, type "30301".
11. In the **Drop-off Postal Code To** field, type "30318".
12. In the **Drop-off Country Region** field, type "USA".
13. In the **<1.00 Lbs** field, type "100".
 - Insert the rate per pounds if the total weight of the load is less than 1 pound.
14. In the **<5.00 Lbs** field, type "300".
 - Insert the rate per pounds if the total weight of the load is less than 5 pounds.
15. In the **<20.00 Lbs** field, type "500".
 - Insert the rate per pounds if the total weight of the load is less than 20 pounds.
16. In the **<100.00 Lbs** field, type "1000".
 - Insert the rate per pounds if the total weight of the load is less than 100 pounds.
17. In the **<1,000.00 Lbs** field, type "3000".
 - Insert the rate per pounds if the total weight of the load is less than 1000 pounds.
18. Select **Save**.
19. Close the page.

Assign rate base

1. Expand the **Rate base assignments** section.
2. Select **New**.
 - You can have several rate base assignments for each rate master. This makes it possible to create several different price points for each carrier depending on destinations, services, or different rate bases. In this procedure you will only create one rate base assignment.
3. In the **Name** field, type a value.
4. In the **Rate base** field, select the drop-down button to open the lookup.
5. In the list, select the link in the highlighted row.
6. In the **Service** field, select the drop-down button to open the lookup.
7. In the list, find and select the desired record.
8. In the list, select the link in the highlighted row.
9. In the **Pick-up Postal Code** field, type "98052".
 - Specify which postal code this rate base assignment should be valid from.
10. In the **Pick-up Country Region** field, type "USA".
11. Select **Save**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up shipping carriers

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows how to set up a shipping carrier and define details such as service, shipment mode, transportation tender, transportation constraints, and shipping rate. A transportation coordinator can then assign a shipping carrier to an inbound or outbound load.

Create a new shipping carrier

1. Go to **Navigation pane > Modules > Transportation management > Setup > Carriers > Shipping carriers**.
2. Select **New** on the Action Pane.
3. In the **Shipping carrier** field, type a value.
4. In the **Name** field, type a value.
5. In the **Mode** field, select an option from the drop-down menu.

Fill in the general information for the shipping carrier

1. Toggle the expansion of the **Overview** section.
2. Check or uncheck the **Activate shipping carrier** checkbox.
3. In the **Vendor account** field, select an option from the drop-down menu. Select the vendor account to assign the shipping carrier to.
4. In the **Transportation tender type** field, select an option. Select **Manual** to use the Transportation Tender page, or select **EDI** to update the tender by using Electronic Data Interchange (EDI).
5. Check or uncheck the **Activate carrier rating** checkbox.

Create the necessary services for the shipping carrier

1. Toggle the expansion of the **Services** section.
2. Select **New**.
3. In the **Carrier service** field, type a value.
4. In the **Name** field, type a value.
5. In the **Transportation method** field, select an option from the drop-down menu.

Set up the address for the carrier (optional)

1. Toggle the expansion of the **Addresses** section.
2. Select **New**.
3. In the **Name or description** field, type a value.
4. In the **Country/region** field, select an option from the drop-down menu.
5. In the **ZIP/postal code** field, select an option from the drop-down menu.
6. In the **Street** field, type a value.
7. Select **OK**.

Set up the rating profile for the shipping carrier

1. Toggle the expansion of the **Rating profiles** section.

2. Select **New**.
3. In the **Rating profile** field, type a value.
4. In the **Name** field, type a value.
5. In the **Site** field, select an option from the drop-down menu.
6. In the **Warehouse** field, select an option from the drop-down menu.
7. In the **Rate engine** field, select an option from the drop-down menu. Select the Rate engine that is in accordance with the contract that you have with the carrier.
8. In the **Rate master** field, select an option from the drop-down menu.
9. In the **Transit time engine** field, select an option from the drop-down menu.
10. Select **Save**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up transportation constraints for an item

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure will set up a transportation constraint to prevent a selected item from being transported through a selected hub. This task would typically be carried out by a Transportation coordinator. You can use this procedure in the USMF demo data company or on your own data.

Create an item constraint

1. Go to Constraints.
2. Click New.
3. In the Item constraint field, type a value.
4. In the Name field, type a value.
5. In the Site field, enter or select a value.
6. In the Warehouse field, enter or select a value.
7. In the Item number field, enter or select a value.
8. In the Hub field, enter or select a value.
9. In the Constraint action field, select an option.
10. Click Save.
11. Close the page.

NOTE

Warehouse management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

The Warehouse management module lets you manage warehouse processes in manufacturing, distribution, and retail companies. This module has a wide range of features to support the warehouse facility at an optimal level, at any time. Warehouse management is fully integrated with other business processes such as transportation, manufacturing, quality control, purchase, transfer, sales, and returns.

Get started

To start working with Warehouse management, you need to complete the setup of the general warehouse parameters to support the business processes of your company.

- Go to the **Warehouse management parameters** page under **Warehouse management > Setup** to set up general warehouse parameters.

You must configure components for inbound and outbound warehouse process workflows according to business requirements. The most important components that you must configure are wave templates, work templates, work pools, and location directives.

- [Warehouse configuration overview](#)
- [Control warehouse work by using work templates and location directives](#)
- [Set up mobile devices for warehouse work](#)
- [Set up a location directive for purchase order put-away](#)
- [Set up a work template for purchase orders](#)

Warehouse management processes

- Integrated support for source documents for sales orders, returns, transfer orders, production orders, and kanban
- Flexible, inbound and outbound material workflow support based on queries
- Full integration with the Manufacturing and Transportation offerings
- Full control of location stocking limits and location volumetrics
- Inventory properties controlled by inventory status
- Full batch and serial item support
- Various item receiving capabilities
- Multiple picking strategies
- Out-of-the-box support for the next generation of barcode scanners
- Pallet/container types for warehouse processes
- Advanced counting capabilities
- Label printing and label routing with Zebra ZPL support
- Business intelligence integration into Power BI
- Manual and automatic movement of inventory
- Fully-integrated quality control (QMS)
- Full traceability of workers' material handling
- Outbound wave processing
- Manual packing and automatic containerization support

- Cluster picking
- Simple cross docking

Warehouse handling of inbound loads for purchase orders

2/18/2021 • 35 minutes to read • [Edit Online](#)

This topic describes the warehouse handling process for inbound loads for purchase orders.

For each inbound load, your system should already include a related sales order, and it might also contain a related load specification and/or transportation plan. For more information about how to create and manage inbound loads, see [Business process: Planning transportation for inbound loads](#).

Overview: How inbound loads are created, registered, and received

The following illustration shows the typical flow for handling inbound loads that have purchase order quantities when they arrive at your warehouse.

1. The vendor confirms the purchase order.

The process begins when a purchase order is entered into the system and then delivered to a vendor, who confirms the order. The purchase order must exist before you can create an inbound load record.

However, you can create the inbound load even if the order hasn't been confirmed. For more information, see [Approve and confirm purchase orders](#).

2. An inbound load record is created to plan the arrival and its contents.

The inbound load record represents a vendor shipment of one or more purchase orders. The load is expected to arrive at the warehouse as one physical transportation unit (such as a truckload). The inbound load record is used for planning purposes and lets the logistics coordinator track the load's progress from the vendor. It's also used to register order line quantities and manage progress through warehouse operations, such as arrival and put-away work. Loads can be created either automatically or manually, and they can be based on either a purchase order or an advanced shipment notice (ASN) from the vendor. For more information, see [Create or modify an inbound load](#).

3. The vendor confirms load dispatch.

When the vendor dispatches the load, the logistics coordinator at the receiving warehouse confirms the load shipment. If the receiving company is using the **Transportation management** module, inbound shipment confirmation will trigger other load management processes that are associated with the inbound loads. For more information, see [Confirm a load for shipping](#).

4. The load arrives at the warehouse, and workers register quantities.

When a truckload arrives at the warehouse receiving dock, warehouse workers register the load quantities. When the **Warehouse management** module is used, workers do the registration by using mobile devices. For more information, see [Product receipt against purchase orders - registration](#) and the [Register item quantities that arrive on an inbound load](#) section.

5. Registered load quantities are posted against purchase orders.

After the load quantities have been registered as arrived, those quantities must be product receipt–posted to the company's inventory ledger to record the physical stock increase. For more information, see [Product receipt against purchase orders - product receipt](#) and [Post registered product quantities against purchase orders](#).

Register item quantities that arrive on an inbound load

Microsoft Dynamics 365 Supply Chain Management supports several operational approaches to recording the arrival of ordered products. Therefore, you can configure the system to match your specific business requirements. This section describes how to register incoming item quantities by using a mobile device when advanced warehouse management is turned on in the system. However, there is an alternative flow that is based on using the item arrival journal instead of a mobile device. For more information about that flow, see [Register items for an advanced warehousing enabled item using an item arrival journal](#).

When an inbound load first arrives at the warehouse, warehouse workers must register the item quantities that are included in the shipment. Typically, they use handheld scanners. This workflow is available only if the following items are present in the system:

- **An inbound load record that describes the item quantities that are expected in the shipment**

Typically, the vendor confirms the inbound load record before the shipment arrives at the warehouse. Therefore, the load has a status of *Shipped*. However, warehouse workers can also register items quantities for loads that have a status of *Open* or *Received*.

- **A mobile device menu that is configured to support load receiving**

The [warehouse app](#) for mobile devices supports the following work creation processes:

- Load item receiving
- Load item receiving and put away
- Mixed license plate receiving, where the **Source document line identification method** field for the mobile device menu item is set to *Load item receiving*. For more information, see [Mixed license plate receiving](#).
- Mixed license plate receiving and put away, where the **Source document line identification method** field for the mobile device menu item is set to *Load item receiving*. For more information, see [Mixed license plate receiving](#).

NOTE

Regardless of the process, the system will generate work to take quantities that are registered in the receiving location and put them away in the regular storage location. When the *Load item receiving and put away* or *Mixed license plate receiving and put away* process is used, the worker who registered the load quantity will also be instructed by the device to do the put-away work as part of the registration task. By contrast, for the *Load item receiving* and *Mixed license plate receiving* processes, the assumption is that put-away work will be done separately from the registration task.

- **A work template that defines pick and put work for incoming loads**

This item is related to the previous items. You must have at least one work template for the *Purchase order* work order type, and it must contain a set of pick/put work types.

The mobile device guides the warehouse receiving clerk through the flow for load quantity registration. At a minimum, this flow includes the following steps for each load ID:

1. Enter the load ID.
2. Enter the item number for a received item.

3. Enter the quantity of that item number that is received.
4. Enter the license plate number for the item's initial location, if the system isn't set up to generate this number automatically.
5. Tap **OK**.

After the worker completes these steps, the system makes the following updates on the appropriate entities, provided that the purchase order line quantity arrived on one load and all load quantities have been registered:

ENTITY	UPDATES	NOTE
Load	The Work created quantity field on the load line is updated to show the registered quantity.	The Load status value remains <i>Shipped</i> or <i>Open</i> if no shipment confirmation has been run for the load. If at least one line of put-away work has been started, it's changed to <i>In process</i> .
Inventory transaction of a purchase order that associated load quantities have been registered for	The following fields are updated: <ul style="list-style-type: none"> • The Receipt field is set to <i>Registered</i>. • The Location field is updated with the receiving dock location code. (This code is specified in the Default receipt location field for each warehouse.) • The License plate field is updated with the license plate number that was entered or generated during the registration. • The Load ID field is updated with the number of the load that the quantity has been registered against. (See the note.) 	The ability to link between the purchase order inventory transaction and the quantities that are registered against the load was introduced in version 10.0.9 as an optional feature that was named <i>Associate purchase order inventory transactions with load</i> . This feature is especially beneficial for operational flows where a single order of purchased goods is delivered as multiple loads, or when a load contains quantities for multiple purchase orders.
Warehouse put-away	Work is created based on a work template, to instruct the worker to move the registered quantities from the receiving location to a regular storage location.	The choice of the storage location is controlled by the Put location directive. If no location directive has been defined, the put away location on the work is empty.

Note that warehouse workers can register the receipt of a purchase order with one or more associated loads without using the *Load item receiving* process. The following methods are available:

- **On the mobile device:** Use the *Purchase order line receiving* and *Purchase order line receiving and put away* processes. (If more than one load exists for the purchase order line quantity, the worker can't use the *Purchase order line receiving* process. Instead, the worker will be instructed to use the device action that is associated with the *Load item receiving* process.)
- **On the client:** Use the item arrival journal.
- **On the client:** Use the **Registration** action that can be accessed from the purchase order line.

NOTE

If the purchase order receipt is registered by using any of the preceding methods, no link is created between the purchase order inventory transaction and the load, even when the *Associate purchase order inventory transactions with load* feature is turned on. One exception to this rule is when you use the **Purchase order line receiving** option, and only one load has a status other than *Received* for the order line.

Handle discrepancies during registration of inbound load quantities

Warehouse workers can do a partial load quantity receipt registration. Each partial load quantity receipt then creates a separate inventory transaction that has a receipt status of *Registered* for the registered quantity, and the lot ID refers to the originating purchase order line.

Load under-receiving

When a load arrives, if the item quantities are less than the quantities that are stated on the load record, warehouse receiving personnel can work directly in the client to acknowledge this discrepancy by reducing the quantity on the load line so that it matches the actual quantity that arrived and was registered.

Load over-receiving

Over-receiving occurs when a load arrives, and the item quantities exceed the expected load line quantity. You can control whether and to what degree over-receiving is allowed during load registration.

Use the **Load over receipt** field for the relevant mobile device menu items to control what occurs when a warehouse worker tries to register an overdelivery. This field is available for mobile device menu items that use the following types of work creation processes:

- Load item receiving
- Load item receiving and put away
- Mixed license plate receiving (when the **Source document line identification method** field is set to *Load item receiving*)
- Mixed license plate receiving and put-away (when the **Source document line identification method** field is set to *Load item receiving*)

The following table explains the options that are available for the **Load over receipt** field.

VALUE	DESCRIPTION
Allow	Workers can register the receipt of quantities that exceed the remaining unregistered quantity for a selected load, but only if the total registered quantity doesn't exceed the quantity of the purchase order line that is associated with the load (after adjustment for the overdelivery percentage).

VALUE	DESCRIPTION
Block	<p>Workers can't register the receipt of quantities that exceed the remaining unregistered quantity for a selected load (after adjustment for the overdelivery percentage). A worker who tries to do register the receipts will receive an error and won't be able to continue until he or she registers a quantity that is equal to or less than the remaining unregistered load quantity.</p> <p>By default, the value of the overdelivery percentage on a load line is copied from the associated purchase order line. When the Load over receipt field is set to <i>Block</i>, the system uses the overdelivery percentage value to calculate the total quantity that can be registered for a load line. However, that value can be overwritten for individual loads as required. This behavior becomes relevant during receiving flows where some or all of the excess quantity that represents the order line overdelivery percentage is distributed disproportionately across multiple loads. Here is an example scenario:</p> <ul style="list-style-type: none"> • There are multiple loads for one purchase order line. • The purchase order line has an overdelivery percentage that is more than 0 (zero). • Quantities have already been registered against one or more loads without taking the overdelivery percentage into account. • The overdelivery quantity arrives on the last load. <p>In this scenario, a mobile device can be used to register the excess quantity for the last load only if the warehouse supervisor increases the overdelivery percentage for the relevant load line from the default value to a value that is large enough so that the full overdelivery can be registered with the final load.</p>
Block for closed loads only	Workers can over-receive load line quantities for open loads, but not for loads that have a status of <i>Received</i> .

NOTE

The default value of the **Load over receipt** field is *Allow*. When this value is used, the behavior matches the standard behavior that was available before the *Over receipt of load quantities* feature was introduced in version 10.0.11.

Put away the registered quantities

When registration is completed on the mobile device, the *Quantity receipt registration* action updates the inventory and warehouse records to indicate that the quantities are now in the receiving dock location and available for reservation. However, a company's warehouse operations typically require that the quantities be moved from the receiving dock to the regular warehouse storage, so that the subsequent picking processes can occur. Instructions for the put-away are captured in the put-away work that is automatically generated when the inbound load is registered as received.

When the warehouse worker has completed the put-away work, the system records and tracks the result by updating updates several entities, as summarized in the following table.

ENTITY	UPDATES	NOTE
Load	<p>The following fields are updated:</p> <ul style="list-style-type: none"> • The Load status value is changed to <i>In process</i>. • The Work status value is changed to <i>100.00% of work completed</i>. 	The Load status value is changed to <i>In process</i> when the worker starts the put-away task for at least one line of put-away work.
Inventory transactions of work that associated quantities have been put away for	The Receipt and Location fields, and other relevant fields, are updated to reflect the movement from the receiving location to the storage location.	The Receipt state value of the purchase order inventory transaction remains <i>Registered</i> .
Warehouse put-away	The Work status value is changed to <i>Closed</i> .	

Post registered product quantities against purchase orders

After inbound product quantities are registered in the system, they become available for reservation in connection with sales and other outbound and internal operations. However, the system doesn't yet update the inventory (interim) accounts. This update can occur only when the operations team posts the registered product receipts.

To open a page where they can post a product receipt, members of the operations team can follow any *one* of these steps:

- Open the relevant load record, and then select the **Product receipt** action.
- Go to **Warehouse management > Periodic tasks > Update product receipts**, and then, in the **Load ID** field, specify the load to post.
- Open the relevant purchase order, and then select the **Product receipt** action.
- Go to **Procurement and sourcing > Purchase orders > Receiving products > Posting product receipt job**.

The **Product receipt** action that is available on the **Load** page (and on the equivalent page for the update job, the **Update product receipts** page) can update product receipt quantities only on purchase order quantities that have a status of *Registered*. However, the **Product receipt** action that is available on the **Purchase order** page can include quantities in both processing statuses (*Ordered* and *Registered*). It can also control the scope of product receipt posting through additional parameters, such as *Receive now quantity* and *Registered quantity and services*.

Only orders that have a status of *Confirmed* can be product receipt–posted. For non-confirmed purchase orders, the **Product receipt** action will appear as unavailable.

Post registered quantities from the Load page

To product receipt–post registered quantities from the **Load** page, the following prerequisites must be in place:

- The load must have at least one quantity unit that has a status of *Registered*.
- The load status must be *Shipped*.
- The purchase order that is associated with the load must have a status of *Confirmed*.

NOTE

If the load status hasn't been set to *Shipped*, the system will automatically confirm the load before it runs the product receipt update. (The load status is set to *Shipped* when a user registers the load's inbound shipment.)

To product receipt–post the arrival registrations that are associated with a selected load, the worker selects the **Product receipt** action on the **Load** page. The page that is opened has the following key details:

- The **Quantity** field in the **Parameters** section on the **Settings** tab shows the *registered quantity*. No other options are available here.
- The grid on the **Overview** FastTab lists all the purchase orders that are included in the selected load.
- The grid on the **Lines** FastTab lists all the order lines that have a registered quantity.

NOTE

Quantities for order lines that appear on the **Line** tab are calculated differently, depending on whether the *Allow multiple product receipt per load* feature is available and turned on in your version of Supply Chain Management.

VERSION	CALCULATION
Versions before version 10.0.10, and newer versions where the <i>Allow multiple product receipt per load</i> feature isn't turned on	The line quantity is the total of all registered quantities <i>for that purchase order line</i> , regardless of whether registration was done over multiple loads, independently of the load, from a mobile device, or from the client.
Version 10.0.10 and later, where the <i>Allow multiple product receipt per load</i> feature is turned on	The line quantity is the total of all registered quantities <i>for the load record</i> that the Product receipt posting action was initiated from.

When the user selects **OK** to confirm product receipt posting, the system does the following key updates on appropriate entities.

ENTITY	UPDATES
Inventory transaction of the purchase order for which line quantities have been included in the posting scope	The following fields are updated (but note that there are also multiple other updates): <ul style="list-style-type: none"> • The Receipt field is set to <i>Received</i>. • The Physical date field is updated with the date of the posting.
Load that the user posted the product receipt from	Updates to the loads will depend on the version that is used and the setting of the Allow multiple product receipt per load field. The rules are described in the table that appears later in this section.

The **Allow multiple product receipt per load** field lets companies choose an inbound load receiving policy. Depending on their operational flows, companies might choose to allow or disallow multiple product receipt postings for the same load. We recommend that the logistics manager set the **Allow multiple product receipt per load** field to one of the following values:

- **No** – Select this value if warehouse receiving clerks always register all order quantities that arrive with each load within a designated time frame. If any load quantities aren't registered, the system assumes that they didn't arrive or were not on the load, and therefore should not be considered part of the load. The product receipt posting that is run from a load uses the same assumption. In addition to product receipt–updating all

the registered quantities (its main function), it declares the load complete and closed for additional processing. In this case, all load line quantities are automatically updated to the registered quantities, load lines that have no registered quantities are deleted, and the load status is changed to *Received*.

- **Yes** – Select this value if warehouse receiving clerks require more time to register all the quantities on the load that arrived, but, in the meantime, you must product receipt–post the quantities that have already been registered. In this case, the logistics manager will want to keep a load open even after the product receipt posting job is run, so that remaining load quantities can be registered and product receipt–updated to the ledger on an ongoing basis.
- **Prompt** – Select this value if your load receiving practices are mixed, and a decision is required each time that product receipt posting is run.

The following table summarizes the effects of the **Allow multiple product receipt per load** setting.

ALLOW MULTIPLE PRODUCT RECEIPT PER LOAD	LOAD QUANTITY	LOAD STATUS	NOTE
When this field isn't available (versions before 10.0.10)	<p>The load quantity is set so that it equals the registered quantity.</p> <p>If the load quantity is updated to 0 (zero), which means that no registration has been done, the load line is deleted.</p> <p>If there are no load lines on the load, the load is deleted.</p>	<i>Received</i>	If multiple loads exist for the order line's registered quantity, only the status of the load that the receipt was posted from is updated to <i>Received</i> .
No	<p>The load quantity is set so that it equals the registered quantity that is associated with the load ID.</p> <p>If no load ID is recorded for the inventory transaction, the behavior matches the behavior in versions before 10.0.10.</p>	<i>Received</i>	
Yes	No updates	<i>Received</i> , if the total registered load quantity is equal to or more than the load quantity	
Yes	No updates	<i>Shipped</i> or <i>In process</i> , if the total registered load quantity is less than the load quantity	

After the **Load status** field is set to *Received*, no more product receipt postings can be done for that load. However, the worker can register the remaining order quantity against the received load under the following conditions. (For more information, see the [Load over-receiving](#) section earlier in this topic.)

- The version of Supply Chain Management is older than version 10.0.11.
- The *Over receipt of load quantities* feature is turned on, and the **Load line quantity over receipt** field on the mobile device menu item for the load item receiving action is set to *Allow*.

To product receipt–post additional registered load quantities against a load that has a status of *Received*, the user must run the posting action from the associated purchase order.

Post registered quantities from the Purchase order page

To product receipt–post registered quantities from the **Purchase order** page, the user completes the following tasks before he or she selects the **Product receipt** action:

- Set the **Quantity** field in the **Parameters** section on the **Settings** tab to *Registered quantity*.
- In the **Product receipt** field, enter the numbers of the purchase orders that are included in the posting.

NOTE

The line quantity that will be included in the posting scope is the total of all registered quantities for the order line, regardless of whether quantity registration has been done over multiple loads, independently of the load, from a mobile device, or from the client. The same rule applies when product receipt posting is run from a load, if it's done where the **Allow multiple product receipt per load** field either isn't available or isn't enabled.

When the user selects **OK** to confirm product receipt posting, the system does the following key updates on appropriate entities.

ENTITY	UPDATES
Inventory transaction of the purchase order for which line quantities have been included in the posting scope	<p>The following fields are updated (but note that there are also multiple other updates):</p> <ul style="list-style-type: none"> • The Receipt field is set to <i>Received</i>. • The Physical date field is updated with the date of the product receipt posting action.
Load	<p>Updates to the loads depend on whether the Allow multiple product receipt per load field is available and enabled. The rules are described in the next table.</p>

The following table summarizes the effects of the **Allow multiple product receipt per load** setting.

ALLOW MULTIPLE PRODUCT RECEIPTS PER LOAD	LOAD QUANTITY	LOAD STATUS	NOTE
When this field is either disabled or unavailable (in versions before 10.0.10)	No updates	No updates are done. (The status remains <i>Open</i> , <i>Shipped</i> , or <i>In process</i> .)	Because the product receipt posting is initiated from a purchase order, the updating logic doesn't have information about the association between the registered quantities within its scope and the loads that the registration was recorded against. Therefore, it can't select the load for the status update.

ALLOW MULTIPLE PRODUCT RECEIPTS PER LOAD	LOAD QUANTITY	LOAD STATUS	NOTE
Enabled	No updates	<p>One of the following actions occurs:</p> <ul style="list-style-type: none"> The status is changed to <i>Received</i> if the total received and purchased quantities of the purchase order inventory transactions are more than or equal to the quantity of the load that they are associated with. The status remains <i>Open, Shipped, or In process</i> if the previous condition isn't met for all the lines in the load. 	

Select the appropriate product receipt posting option for your logistics operations

As was previously described, the system offers two product receipt posting options. The options can be accessed in the following places:

- On the **Load** page, or from the **Warehouse management > Periodic tasks** menu as an update job
- On the **Purchase order** page, or from the **Procurement and sourcing > Purchase orders > Receiving products** menu as an update job

Companies that use loads to plan and manage transportation and warehouse handling of their inbound orders are advised to use the following functions, which are designed to work with loads:

- Load item receiving** actions on their warehouse mobile devices, to register the product quantity arrival against the load
- Product receipt posting** actions that are initiated from a load, to update the inventory ledger

NOTE

Other quantity registration and product receipt posting functions can be used to support the corresponding inbound operational processes. However, if you use them interchangeably with or instead of the dedicated load-focused functions, you might compromise the data accuracy of the load records and therefore the seamlessness of the load management flows.

Example scenarios

Prepare your system to run the sample scenarios

To work through the sample scenarios that are described in this section, you must first make sure that all the required features are turned on in your system. The required demo data must also be available in the system.

Turn on the required features

These scenarios require the *Multiple product receipt postings per load* feature and its prerequisite feature.

Admins can turn on those features by following these steps.

1. Open the **Feature management** workspace. (For complete details about how to find and use this workspace, see [Feature management overview](#).)
2. Turn on the *Associate purchase order inventory transactions with load* feature, which is listed in the following way:
 - **Module:** *Warehouse management*
 - **Feature name:** *Associate purchase order inventory transactions with load*
3. Turn on the *Multiple product receipt postings per load* feature, which is listed in the following way:
 - **Module:** *Warehouse management*
 - **Feature name:** *Multiple product receipt postings per load*

Enable sample data

To work through these scenarios by using the specified sample records and values, you must be using a system where the standard demo data is installed. You must also select the **USMF** legal entity before you begin.

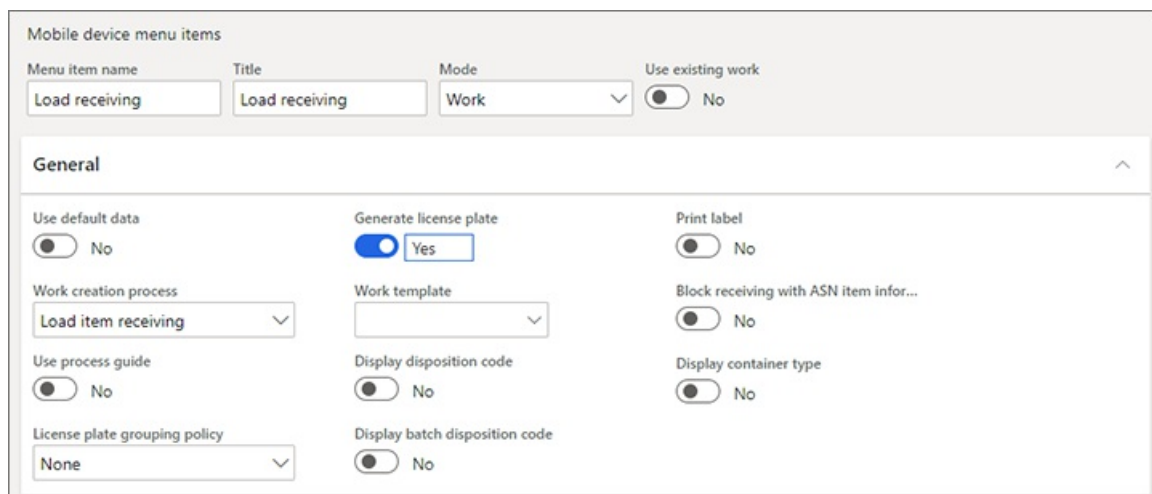

Add a menu item for receiving load items when a mobile device is used

Before warehouse receiving clerks can use a mobile device to register inbound inventory that is linked to a load, you must create a mobile device menu item for that purpose.

In this section, you will create a mobile device menu item and add it to an existing menu. A warehouse worker can then select the menu item in the warehouse app.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**, and make sure that your mobile device menu includes a menu item that has the following settings:
 - **Mode:** *Work*
 - **Work creation process:** *Load item receiving*
 - **Generate license plate:** *Yes*

You can leave all other settings at their default values.

Menu item name	Title	Mode	Use existing work
Load receiving	Load receiving	Work	<input type="radio"/> No

General		
Use default data	Generate license plate	Print label
<input type="radio"/> No	<input checked="" type="radio"/> Yes	<input type="radio"/> No
Work creation process	Work template	Block receiving with ASN item infor...
Load item receiving		<input type="radio"/> No
Use process guide	Display disposition code	Display container type
<input type="radio"/> No	<input type="radio"/> No	<input type="radio"/> No
License plate grouping policy	Display batch disposition code	
None	<input type="radio"/> No	

For more information about how to set up mobile device menu items, see [Set up mobile devices for warehouse work](#).

2. After you've finished setting up the menu item, go to **Warehouse management > Setup > Mobile device > Mobile device menu**, and add it to the menu structure for your mobile devices.

Example scenario 1: Register a load where some items are missing

This scenario shows how to register quantities for an inbound load where not all the expected quantities are present. It then shows how to post the product receipt for the purchase order.

Create a load to plan receipt of a purchase order

In this procedure, you will manually create a purchase order and an associated load. You will then update the load to simulate that it has been shipped from the vendor (which updates the load status). Warehouse planners can then filter loads by **Load status** to find expected incoming loads.

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
2. Select **New**.
3. In **Create purchase order** dialog box, set the **Vendor account** field to *1001*.
4. Select **OK** to close the dialog box and create the purchase order.
5. The new purchase order already includes a line under **Purchase order lines**. Set the following values for this line:
 - **Item number:** *A0001*
 - **Warehouse:** *24*
 - **Quantity:** *10*
6. On the Action Pane, on the **Purchase** tab, select **Actions > Confirm**. The order status is now *Confirmed*.
7. On the Action Pane, on the **Warehouse** tab, select **Actions > Load planning workbench**.
8. On the **Load planning workbench** page, on the Action Pane, on the **Supply and demand** tab, select **Add > To new load**.
9. In the **Load template assignment** dialog box, set the **Load template ID** field to *20' Container*.
10. Select **OK** to close the dialog box and return to the workbench.
11. In the **Loads** section, select **Load ID** to open the newly created load.
12. Review the load header and line details, and notice the following points:
 - On the **Load FastTab**, the **Load status** field is set to *Open*.
 - In the **Load lines** section, there is a single line where the **Quantity** field is set to *10* and the **Work created quantity** field is set to *0* (zero).

Invalid	Order number	Shipment ID	Item number	Overdelivery	Undelivery	Quantity	Unit	Work created quantity	Unit	Packing quantity	Ready to ship	Reference	Direction	Product name
<input checked="" type="checkbox"/>	0000102	USMF-000005	A0001	0.00	0.00	10.00	Pcs	0.00	Pcs	1.00	2/18/2020 12:00:00 AM	Purchase order	Inbound	HDMI 6' Cables

13. On the Action Pane, on the **Ship and receive** tab, select **Confirm > Inbound shipment**. Notice that the **Load status** has changed to *Shipped*.
14. Make a note of the **Load ID** value, so that you can use it in the next procedure.

Register receipt of the quantities that arrived on the load

When the load arrives at the warehouse receiving dock, a receiving clerk registers the load quantities on a mobile device.

1. Use your mobile device to sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)

2. Select the *Load item receiving* menu item that you created for this scenario.
3. Follow the data entry instructions on the screen to enter the following values. (The order might vary, depending on the mobile device or emulator that you're using.)
 - **Load** – Enter the load ID that you created in the previous procedure.
 - **Item** – Enter *A0001*, which is the item that is expected for this load.
 - **Qty** – Enter *9* as the actual quantity that is present on the load. Note that this quantity is less than the expected quantity.
4. Continue to go through the workflow, leaving all other fields blank or set to their default values, until your device informs you that the work is completed.

The load receiving task is now completed, and the receiving clerk can move on to his or her next task. However, warehouse receiving personnel will eventually review the load record and will be able to see that the received quantity was less than the expected quantity. They will then complete the following procedure by using the web client.

1. Go to **Warehouse management > Loads > All loads**.
2. In the list, find the load that you just received. (You might have to select the **Show closed** check box to include the inbound loads that have a load status of *Shipped*.) Then select the link in the **Load ID** column to open the load.
3. In the load record, notice that the **Load status** value remains *Shipped*, but the **Work created quantity** value on the load line has changed to *9*.
4. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
5. In the list, find the purchase that you just received, and then select the link in the **Purchase order** column to open the order.
6. On the **Purchase order lines** FastTab, select **Inventory > View > Transactions**.
7. Review the details of the two purchase order transactions. (You might have to personalize the **Inventory transactions** page to see the **Load ID** field to the grid.) You should see two transactions:
 - The transaction that has a receipt in *Registered* status represents the registration quantity of *9* that was run against a specific load by using the mobile device. The **Load ID** is associated with the transaction in question.
 - The transaction that has a receipt in *Ordered* status represents the remaining unregistered order line quantity of *1*.

Product receipt–post the registered load quantities against purchase orders

In this procedure, you will product receipt–post the inventory that you registered for a load. As a result, the received inventory and its related costs will be added to the company's general ledger.

1. Go to **Warehouse management > Loads > All loads**.
2. In the list, find the load that you received. (You might have to select the **Show closed** check box to include the inbound loads that have a load status of *Shipped*.) Then select the link in the **Load ID** column to open the load.
3. On the Action Pane, on the **Ship and receive** tab, select **Receive > Product receipt**. If you're prompted to confirm the action, select **Yes**.
4. In the **Posting product receipt** dialog box, on the **Lines** FastTab, inspect the grid. You should see the purchase order line for which the quantity has been registered against the selected load.

NOTE

In versions where the *Multiple product receipt postings per load* feature isn't available or isn't enabled, the default quantity that is shown in the **Load lines** grid will be the total quantity that has been registered across all loads that are associated with the purchase order line.

5. On the **Overview** FastTab, inspect the **Product receipt** field in the grid. Notice that it's set to a number that includes the ID of the selected load.
6. Select **OK** to post the product receipt and close the **Posting product receipt** dialog box.
7. You're returned to the load details. Notice the following points:
 - The **Load status** field is now set to *Received*.
 - On the load line, the **Quantity** value for the load has changed from *10* to *9* pcs to match the registered quantity, but the **Work created quantity** value remains *9*.

If the purchasing team doesn't expect the vendor to deliver the remaining order quantity of 1, it can close the order by updating the line's delivery remainder to *0*. However, if it's soon found that the missing piece arrived on the original load, warehouse personnel can perform one of the following actions:

- Register the quantity against the same load. In this case, the **Load status** field will be reset to *Shipped*, and the **Work created quantity** value will be updated to *10*. This choice is available only in the following situations:
 - The *Over receipt of load quantities* feature isn't available or isn't enabled.
 - The *Over receipt of load quantities* feature is available and enabled, and the **Load line quantity over receipt** field is set to *Allow*.
- Add the quantity to a new or existing load, and process it in the usual way.
- Register and/or receive the quantity in a way that doesn't involve load handling.

Example scenario 2: Register quantities that arrive on multiple inbound loads where some items are missing

In this scenario, an inbound shipment that is related to a single purchase order line will be split into two loads. For example, a purchase order line might be split into multiple loads because of physical load constraints on weight and/or volume.

This scenario also shows how to process multiple product receipt postings for the same load. You will register quantities that arrive on multiple inbound loads, but the quantities won't match the expected quantities. The cost updates that occur via the product receipt posting will be done multiple times for the same load.

Set up load receiving policies

In this procedure, you will enable multiple product receipt postings from the same load.

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **Loads** tab, set the **Allow multiple product receipt per load** field to *Yes*.

Create two loads to plan receipt of a purchase order

In this procedure, you will create a purchase order and two loads. You will then manually update each load to simulate that it has been shipped by the vendor (which updates the load status). Warehouse planners can then filter loads by **Load status** to find expected incoming loads.

You will also learn how to set the purchase order line so that you can receive a quantity that is 20 percent more than the quantity that is specified for the line.

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.

2. Select **New**.
3. On the **Vendor** FastTab, set the **Vendor account** field to *1001*, and then select **OK**.
4. Your new purchase order is opened and includes a blank line in the **Purchase order lines** grid. Set the following values for this order line:
 - **Item number:** *A0001*
 - **Warehouse:** *24*
 - **Quantity:** *10*
5. On the **Line details** FastTab, on the **Delivery** tab, set the **Overdelivery** field to *20*.
6. On the Action Pane, on the **Purchase** tab, select **Actions > Confirm**. The order status is now *Confirmed*.
7. On the Action Pane, on the **Warehouse** tab, select **Actions > Load planning workbench**.
8. On the **Load planning workbench** page, on the Action Pane, on the **Supply and demand** tab, select **Add > To new load**.
9. In the **Load template assignment** dialog box, set the **Load template ID** field to *20' Container*. On the **Details** tab, change the **Quantity** value from *10* to *5* to partially add the purchase order line quantity.
10. Select **OK** to apply your settings and close the dialog box.
11. Repeat steps 8 through 10 to create a second load. This time, the **Quantity** field should already be set to *5*.
12. On the **Load planning workbench** page, in the **Loads** grid, select the **Load ID** value for the first load that you created. The **Load details** page appears and shows the selected load. Follow these steps:
 - a. On the Action Pane, on the **Ship and receive** tab, select **Confirm > Inbound shipment**.
 - b. Notice that the **Load status** value has changed to *Shipped*.
 - c. Select the close button to return to the **Load planning workbench** page.
13. Repeat the previous step for the second load that you created.
14. Make a note of the two **Load ID** values that appear in the **Loads** grid.

Register partial receipt of the quantities that arrived on the first load and post the registered load quantities

When loads arrive at the warehouse receiving dock, a receiving clerk registers the load quantities on a mobile device. The registered inventory that is linked to a load is then cost-updated in the company's general ledger by posting the purchase order product receipt, based on the load.

This procedure shows how a receiving clerk will register load quantities on a mobile device.

1. Use your mobile device to sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)
2. Select the *Load item receiving* menu item that you created for this scenario.
3. Follow the data entry instructions on the screen to enter the following values. (The order might vary, depending on the mobile device or emulator that you're using.)
 - **Load** – Enter the first load ID that you created in the previous procedure.
 - **Item** – Enter *A0001*, which is the item that is expected for this load.
 - **Qty** – Enter *3*. Note that this quantity is less than the expected quantity. For this scenario, imagine that you, as the receiving clerk, don't have time to register all quantities for this load. Later in this procedure, you will register the remaining pieces by repeating this step and setting the **Qty** field to *2*.
4. Continue to go through the workflow, leaving all other fields blank or set to their default values, until your device informs you that the work is completed.

5. In the web client, go to **Warehouse management > Loads > All loads**.
6. In the list, find the load that you just received, and select the **Load ID** value to open the load. Notice that the **Load status** value remains *Shipped*, but the **Work created quantity** value on the load line has changed to 3.
7. On the Action Pane, on the **Ship and receive** tab, select **Receive > Product receipt**. If you're prompted to confirm the action, select **Yes**.
8. In the **Posting product receipt** dialog box, review but don't change the values that are shown, and then select **OK**.
9. You're returned to the **Load details** page for your selected load. Notice the following points:
 - The **Load status** field remains set to *Shipped*.
 - On the load line, the **Quantity** value for the load remains 5 pcs, which is the original load quantity, and the **Work created quantity** value remains 3.
10. Complete the registration of the remaining quantity on this load by repeating this procedure. However, in step 3, set the **Qty** field to 2.

The receiving task for the first load is now completed. Two product receipt journals have been created, one for each of the two product receipt updates that you ran.

Register receipt of the quantities that arrived on the second load and account for the overdelivered quantity

For this scenario, the receiving clerk will inbound-register a quantity that exceeds the quantity that exists on the load. Over-receiving will be permitted because the system is set up to allow overdelivery.

1. Use your mobile device to sign in to warehouse 24. (In the standard demo data, sign in by using 24 as the user ID and 1 as the password.)
2. Select the *Load item receiving* menu item that you created for this scenario.
3. Follow the data entry instructions on the screen to enter the following values. (The order might vary, depending on the mobile device or emulator that you're using.)
 - **Load** – Enter the second load ID that you created earlier.
 - **Item** – Enter *A0001*, which is the item that is expected for this load.
 - **Qty** – Enter 7, which is the remaining quantity that the vendor is authorized to deliver as part of total purchase order quantity of 12 (where 10 is the original order quantity, and 2 is the allowed overdelivery quantity of 20 percent). Remember that 5 pcs have already been registered against the first load.

The second load has now been updated with the quantity of 7 and can be product receipt–updated based on this quantity.

Register items for an advanced warehousing enabled item using an item arrival journal

2/18/2021 • 3 minutes to read • [Edit Online](#)

This procedure shows you how to register items using the item arrival journal when you are using advanced warehouse management processes. This would usually be done by a receiving clerk.

You can run this procedure in demo data company USMF, or on your own data. You need to have a confirmed purchase order with an open purchase order line before you start this guide. The item on the line must be stocked, and it must not use product variants, and must not have tracking dimensions. And the item needs to be associated with a warehouse management process enabled storage dimension group. The warehouse that's used must be enabled for warehouse management processes and the location that you use for receiving must be license plate controlled. If you're using USMF, you can use company account 1001, Warehouse 51, and item M9200 to create your PO.

Make a note of the number of the purchase order that you create, and also note the item number and the site that you used for your purchase order line.

Create an item arrival journal header

1. Go to Item arrival.
2. Click New.
3. In the Name field, type a value.
 - If you are using USMF, you can type WHS. If you're using other data, the journal whose name you choose has to have the following properties: Check picking location must be set to No, and Quarantine management must be set to No.
4. In the Number field, type a value.
5. In the Site field, type a value.
 - Select the site that you used for your purchase order line. This will serve as a default value, which will default to all lines in the journal. If you used warehouse 51 in USMF, choose site 5.
6. In the Warehouse field, type a value.
 - Select a valid warehouse for the site that you've selected. This will serve as a default value, which will default to all lines in the journal. If you're using the example values in USMF, select 51.
7. In the Location field, type a value.
 - Select a valid location in the warehouse that you've selected. The location has to be associated with a location profile, which is license plate controlled. This will serve as a default value, which will default to all lines in the journal. If you're using the example values in USMF, select Bulk-008.
8. Right-click on the drop-down arrow in the License plate field and then select View details.
9. Click New.
10. In the License plate field, type a value.
 - Make a note of the value.
11. Click Save.
12. Close the page.
13. In the License plate field, type a value.
 - Enter the value of the license plate that you just created. This will serve as a default value, which will default to all lines in the journal.

14. Click OK.

Add a line

1. Click Add line.
2. In the Item number field, type a value.
 - Enter the item number that you used on the purchase order line.
3. In the Quantity field, enter a number.
 - Enter the quantity that you want to register.
 - The Date field determines the date on which the on-hand quantity of this item will be registered in the inventory.
 - The lot ID will be populated by the system if it can be uniquely identified from the information provided. Otherwise you will have to add this manually. This is a mandatory field, which links this registration to a specific source document line.

Complete the registration

1. Click Validate.
 - This checks that the journal is ready to be posted. If the validation fails you will need to fix the errors before you can post the journal.
2. Click OK.
 - After you clicked OK, check the message. There should be a message saying that the journal is OK.
3. Click Post.
4. Click OK.
 - After you have clicked OK, check the message bar. There should be a message saying that the operation completed.
5. Close the page.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Register items for a basic warehousing enabled item using an item arrival journal

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to register items using the item arrival journal when you are using "basic warehousing" in the Inventory management module. This would usually be done by a receiving clerk. You can run this procedure in demo data company USMF with the example values that are shown. If you are not using USMF, you need to have a confirmed purchase order with an open purchase order line before you start this guide. The item on the line must be stocked. And the item needs to be associated with a storage dimension group, where site and warehouse are active.

Create item arrival journal header

1. Go to Inventory management > Journal entries > Item arrival > Item arrival.
2. Click New.
3. In the Name field, type a value.
 - If you are using USMF, you can type WHS. If you're using other data, the journal whose name you choose has to have the following properties: cheque picking location must be set to No, and Quarantine management must be set to No.
4. In the Packing slip field, type a value.
 - This is the packing slip ID from the packing slip issued by the vendor. Add a unique number.
5. In the Number field, In the Number field, select the purchase order..
6. Click OK.

Add lines to item arrival journal

1. Click Functions.
2. Click Create lines.
 - The lines can be entered manually into this journal or created automatically. This will show you how to create this automatically.
3. Check or uncheck the Initialize quantity checkbox.
 - This will initialize the quantity on the journal lines with the quantity not registered from the purchase order line.
4. Click OK.

Post the journal

1. Click Post.
2. Click OK.

Generate the product receipt

1. Click Functions.
2. Click Product receipt.
3. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cross-dock products from receiving warehouse to stores

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure walks through the steps to create and process a Cross-dock to distribute products from the receiving location of a purchase order to one or many stores. The user can define multiple configurations and have the system suggest how to distribute the products, or manually enter where the products are distributed to and how much gets distributed to each store. The procedure doesn't include setup of data that can be used in the Cross-dock, such as replenishment rules, organizational hierarchies, and store weights. The procedure uses the USRT demo company.

1. Go to All purchase orders.
2. Select a purchase order in the list and click the link to open the order.
3. On the Action Pane, click Retail and Commerce.
4. Click Cross docking.
5. Click Edit.
 - The category can be used to filter the items in the Lines section.
6. In the list, find and select the desired record.
7. In the Cross docking quantity field, type a value to specify how much of the quantity being purchased of the selected product should be distributed.
8. In the Additional cross docking quantity field, enter a value to specify the quantities to distribute for the available products being purchased
9. In the Distribution field, enter 'Location weight'.
 - You can select the other types to use different rules for the distribution.
10. In the Replenishment hierarchy field, select a value.
11. Select Yes in the Respect assortments field.
12. Click Calculate quantities.
13. Click Create order.
14. Click Yes.
15. In the list, find and select a warehouse that received products
16. Click Order to view the orders that got created for the selected warehouse

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a location directive for purchase order put-away

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to set up a simple location directive. The example that's shown creates a location directive to be used to determine where to put items that have been received for a purchase order. You can play this task guide with the data mentioned using demo data company USMF. Pre-conditions: You need to create a disposition code. In this procedure we use a disposition code called Relabel. If you're creating a location directive in your own data, you need to have set up advanced warehouse management for your warehouse and items. This procedure is intended for the warehouse manager.

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Location directives**.
2. In the **Work order type** field, select **Purchase orders**.

Create a location directive header

1. Select **New**.
2. In the **Sequence number** field, enter a number. This is the sequence in which the location directive is processed for the selected work type. You can also modify the sequence, if needed.
3. In the **Name** field, type a value. This is the unique identifier for this directive.
4. In the **Work type** field, select **Put**. Select the type of work to be performed. For directive with work order type Purchase order, **Put** is the only supported value.
5. In the **Site** field, type a value.
6. In the **Warehouse** field, type a value. Leave the Directive code blank. Directive codes are used to link a work order line of type Put to a specific directive. For purchase orders, the location of the last work order line of type Put is resolved before the work template is determined. Therefore it is not possible to connect the last line of a work template to a specific directive.
7. In the **Disposition code** field, type a value. The Disposition code limits the use of the location directive, so the location directive is only used if the warehouse worker enters this specific value during registration of the item using a mobile device.
8. Select **Save**.

Edit the query for directive

1. Select **Edit query**. The use of this directive is already limited to be used for items registered in the warehouse that you specified, and with the disposition code that you specified. You can add other constraints using the query.
2. Select **OK**.

Add directive lines

1. Select **New**. This is the sequence in which the location directive lines are processed for the selected work type. You can also modify the sequence, if needed.
2. In the **From quantity** field, enter a number. This is the lowest quantity that this directive line is valid for.
3. In the **To quantity** field, enter a number.
4. In the **Unit** field, type a value. The unit the From quantity and To quantity is expressed in. If you leave this field blank the inventory unit from the item is used.

5. In the **Locate quantity** field, select an option.
 - None, or license plate quantity: The quantity registered on each license plate.
 - Unitized quantity: The entire quantity that's been registered.
 - Remaining quantity: The quantity that is yet to be registered from the purchase order line.
 - Expected quantity: The total quantity that is specified on the purchase order line.
6. Check or uncheck the **Restrict by unit** checkbox. If you select this option, and specify the unit on the **Restrict by unit** page, only items with that unit of measurement can be put into the location. For example, if the unit of measurement is PL (pallets), only items in pallets can be put into the specified location.
7. Check or uncheck the **Allow split** checkbox. This allows the directive to split the quantity across multiple locations.
8. Select **Save**.

Restrict the directive line to a specific unit

1. Select **Restrict by unit**. This button is only available when you press **Save** after you have selected the **Restrict by unit** check box.
2. In the **Unit** field, type a value.
3. Close the page.

Add a location directive action line

1. Select **New**. This is the sequence in which the location directive action lines are processed for the selected work type. You can also modify the sequence, if needed.
2. In the **Name** field, type a value. This is the unique identifier for this directive action.
3. In the **Fixed location usage** field, select an option.
 - Fixed and non-fixed locations: All non-fixed locations are valid as well as the product's own fixed location, within the range specified in the query.
 - Only fixed location for the product: Fixed locations for the product are valid, and all product variants share the same set of fixed locations.
 - Only fixed location for the product variants: Only fixed locations specified for each product variant are valid.
4. In the **Strategy** field, select an option. Work orders of type Purchase order support the following strategies:
 - None: the item is placed at the first location that's found.
 - Consolidate: The item is placed in a location where similar items are already available.
 - Empty location with no incoming work: the item is placed in the first empty location that's found. A location is considered to be empty if it has no physical inventory and no expected incoming work.
5. Select **Save**.

Edit the query for directive action line

1. Select **Edit query**.
2. Select **Add**.
3. In the **Field** field, type `location profile ID`. In this example, we'll restrict the possible locations using a location profile ID.
4. In the **Criteria** field, type a value.
5. Select **OK**. You can continue to add directive lines and directive actions until you have covered all the possible scenarios in your warehouse.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a work template for purchase orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set up a simple work template to be used when putting away received items. Work templates determine the set of instructions presented to the warehouse worker on a mobile device when moving items from the receiving area. You can use this procedure with the data mentioned in demo data company USMF. Before you start this guide, create a work pool ID. In this example, a work pool ID called Inbound is used. This procedure is intended for the warehouse manager.

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Work > Work templates**.
2. In the **Work order type** field, select **Purchase orders**.

Create a work template header

1. Select **New**.
2. In the **Sequence number** field, enter a number. This is the sequence in which the work templates are evaluated. You can modify the sequence, if needed.
3. In the **Work template** field, type a value. This is the unique identifier for this template.
4. In the **Work template description** field, type a value.
 - The **Valid** option will not be checked until you've completed all the information that's needed by the template and have then selected **Save**.
 - A work order of type **Purchase order** cannot be automatically processed, so leave the **Automatically process** option set to **No**.
5. In the **Work pool ID** field, type a value. Work pool IDs allow you to organize work into groups. The value that you set here will be the default value for any work that's created using this template.
6. In the **Work priority** field, enter . This indicates the importance of the work, and the value that you set here will be the default for any work created using this template.
7. Select **Save**. You must save the work template header before the **Edit Query** button becomes available.

Set up the query for the work template

1. Select **Edit query**. We'll set a limitation that the template can only be used within a specific warehouse.
2. Select **Add**.
3. In the **Field** field of the new row, type .
4. In the **Criteria** field, type a value.
5. Select **OK**.
6. Select **Yes**.

Set work template details

1. Select **New**.
2. In the **Work type** field, select **Pick**.
3. In the **Work class ID** field, type . The work class that you set here will be the default on all work lines of type Pick that are created using this template. The work class cannot be overridden from the work order lines. Work classes are used to direct and/or limit the type of work order lines a warehouse worker can process on a mobile device.

4. Select **New**.
5. In the **Work type** field, select **Put**.
6. In the **Work class ID** field, type a value. The pick and put instructions are a set. Each pick/put set must have the same work class. Use the same work class that you provided for the pick instruction.
7. Select **Save**. Note that the **Valid** checkbox is now checked.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Location product dimension mixing

2/18/2021 • 8 minutes to read • [Edit Online](#)

Location product dimension mixing is location profile functionality that helps improve location management when product variants or products that have dimensions are used, such as in the fashion industry. It lets you decide whether configurations, colors, styles, and sizes can be mixed for a specific location profile, or whether just one of these dimensions or a combination of them can be put to the same location.

Turn on the Location product dimension mixing feature

Before you can use location product dimension mixing, the feature must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Location product dimension mixing*

Setup

Every location in the warehouse needs to have a location profile associated with it that describes the properties of the location. Therefore, all locations that use the same location profile will be able to allow product dimension mixing after it has been set up.

Configure location profiles to allow product dimension mixing

1. Go to **Warehouse management > Setup > Warehouse > Location profiles**.
2. In the list of location profiles, select **BULK**.
3. On the Action Pane, select **Edit**.
4. On the **General** FastTab, set the **Enable location product dimension specific mixing** option to *Yes*.

NOTE

You can set this option to *Yes* only if the **Allow mixed items** option is set to *No*.

5. On the **Allowed product dimension mixing** FastTab, set the **Size** option to *Yes*. In the scenario that is described in this topic, mixing can be done only for products that have different **Size** dimensions. However, other options are also available.
6. Select **Save**.

Create a new product master and product variants

1. Go to **Product information management > Products > Product masters**.
2. On the Action Pane, select **New** to create a product master.
3. In the **New product** dialog box, set the following values:
 - **Product type:** *Item*
 - **Product subtype:** *Product master*
 - **Product number:** *B0001*

- **Product name:** *B0001 Size*
- **Product dimension group:** *Size*
- **Configuration technology:** *Predefined variant*

4. Select **OK**.

5. On the **Product details** page, on the **General** FastTab, set the following values:

- **Generate variants automatically:** *Yes*
- **Size group:** *CASUALDHIR*

6. To view the predefined variants, on the Action Pane, select **Product variants**.

The **Product variants** page appears and shows a list of variants from the configuration of the size group.

Release products to the USMF company

1. On the Action Pane, select **Release products**.

2. On the **Select products to release** page, confirm that product number *B0001* is in the list, and then select **Next**.

3. Select **Next** to confirm the product variants to release.

4. On the **Select companies to release to** page, select *USMF*, and then select **Next** to confirm the selection.

5. On the **Confirm selection** page, select **Finish** to complete the release.

You receive an "Operation completed" message.

Update a released product in the USMF company

1. Make sure that you're signed in to the **USMF** company.

2. Go to **Product information management > Products > Released products** to finish creating the released product.

3. Find and select item number *B0001* to open the **Released product details** page.

4. On the Action Pane, select **Edit**.

5. On the **General** FastTab, make sure that the **Item model group** field is set to *FIFO*.

6. On the Action Pane, on the **Product** tab, in the **Set up** group, select **Dimension groups**.

7. Set the following values:

- **Storage dimension group:** *Ware*
- **Tracking dimension group:** *None*

8. Select **OK**.

9. On the Action Pane, on the **Product** tab, in the **Set up** group, select **Reservation hierarchy**.

10. Set the **Reservation hierarchy** field to *Default*, and then select **OK**.

11. On the **General** FastTab, in the **Administration** section, notice that your selections have been updated.

12. On the **Purchase** FastTab, in the **Price** field, enter *10*.

13. On the **Manage costs** FastTab, in the **Item group** field, enter *Audio*.

14. On the **Purchase** FastTab, in the **Price** field, enter *10*.

15. On the **Warehouse** FastTab, in the **Unit sequence group ID** field, enter *ea*.

16. Select **Save**.

Create a location directive

1. Go to **Warehouse management > Setup > Location directives**.

2. In the left pane, in the **Work order type** field, select *Purchase orders*.

3. In the list, select the location directive that is named *24 PO Direct*.

4. On the **Location Directive Actions** FastTab, select **New** to add a line to the grid.

5. On the new line, set the following values:

- **Sequence number:** *1*

The new line should be in front of the previously existing line. To make the change, use the **Move up** and **Move down** buttons on the toolbar, or change the existing line's **Sequence number** value to *2*.

- **Name:** *Put to BULK Location profile*
- **Fixed location usage:** *Fixed and non-fixed locations*
- **Allow negative inventory:** *Clear this check box (=No)*
- **Batch enabled:** *Clear this check box (=No)*
- **Strategy:** *None*

6. While the new line is still selected, select **Edit query** above the grid.

7. In the query dialog box, on the **Range** tab, select **Add** to add a line to the grid.

8. On the new line, set the following values:

- **Table:** *Locations*
- **Derived table:** *Locations*
- **Field:** *Location profile ID*
- **Criteria:** *BULK*

9. Select **OK**.

10. On the **Location directives** page, on the Action Pane, select **Save**.

NOTE

On the **Location Directive Actions** FastTab **Strategy** field, if you use the *Consolidate* location strategy, the setup of the **Allowed product dimension mixing** FastTab on the **Location profiles** will be overridden, and items will be put to the same location even if this behavior isn't allowed by the setup.

Create a mobile device menu item

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.

2. On the Action Pane, select **New** to create a menu item to use for sorting.

3. In the header, set the following values:

- **Menu item name:** *PO line receiving*
- **Title:** *PO line receiving*

- **Mode:** *Work*
 - **Use existing work:** *No*
4. On the **General** FastTab, set the following values:
- **Work creation process:** *Purchase order line receiving and putaway*
 - **Generate license plate:** *Yes*
5. Select **Save**.

Configure the mobile device menu

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
2. In the list of menus, select **Inbound**.
3. On the Action Pane, select **Edit**.
4. In the **Available Menus And Menu Items** list, find and select the **PO line receiving** menu item.
5. Select the right arrow button to move the **PO line receiving** menu item to the **Menu Structure** list. In this way, you add your new menu item to the selected menu.
6. Select **Save**.

Scenario

This demo scenario shows how two different product variants can be put to the same location when the location profile doesn't allow for mixed items, but the *Location product dimension mixing* feature is enabled. In this case, you will use the **Size** variant as the criterion.

Before you begin, make sure that there are empty locations in warehouse *24* that use the *BULK* location profile.

Create a purchase order

You will create a purchase order that has three lines: two lines for the same product number but different **Size** variants, and a third line for a different product that has no variants.

1. Go to **Accounts payable > Purchase orders > All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Create purchase order** dialog box, set the following values:
 - **Vendor account:** *1001*
 - **Warehouse:** *24*
4. Select **OK**.
5. The purchase order is created, and a new line is added on the **Purchase order lines** FastTab. Make a note of the purchase order number.
6. On the new line, set the following values:
 - **Item number:** *B0001*
 - **Size** *L*
 - **Quantity:** *2*
7. Select **Add line** above the grid to add a second purchase order line, and set the following values:
 - **Item number:** *B0001*
 - **Size** *XL*
 - **Quantity:** *2*
8. Select **Add line** to add a third purchase order line, and set the following values:
 - **Item number:** *A0001*

- **Quantity:** 1

1. Select **Save**.

Receive purchase order lines in the warehouse app

1. Sign in to the warehouse app as a user who is enabled for warehouse 24.
2. Select the **Inbound** menu.
3. Select **PO Line receiving**.
4. Select the **PONUM** field, and then enter the purchase order number.
5. Confirm your entry by selecting the confirm button (✓) at the bottom of the page.
6. Enter the line number from the purchase order that is being received. Select the **LINENUM** field, and then use the number pad to enter 1.
7. Confirm your entry.
8. Enter the quantity to receive. Select the plus sign (+) button two times to increase the value in the **Qty** field to 2.
9. Register your entry by selecting the button (✓) at the bottom of the page, and then confirm your entry by selecting the button (✓) again.
10. View the information on the **Purchase orders: Put** page. This page shows the work that has been created for the put-away (Work 1).

The location where the received item will be put away, the license plate, the item, the size, and the quantity of the **PO Line receiving** task that you just completed are shown.
11. Confirm the put-away work.
12. Repeat the steps 4 through 11 for the purchase order line 2. However, in step 8, specify a quantity of 1.

New put-away work (Work 2) is created for the same location as Work 1.
13. Repeat the steps 4 through 11 again for purchase order line 2. In step 8, specify the remaining quantity of 1.

New put-away work (Work 3) is created for the same location as Work 1 and Work 2. This behavior occurs because the *Consolidate* location directive strategy is used, and the **Allowed product dimension mixing** FastTab on the *Bulk Location profiles* setup allows the **Size** variant to be mixed on a location.
14. Repeat the steps 4 through 11 for purchase order line 3. In step 8, specify a quantity of 1 for item number *A0001*.

New put-away work (Work 4) is created for a different location than the location that is used for purchase order lines 1 and 2. This behavior occurs because the location profile doesn't allow for mixed products, but it does allow for mixed dimensions of the same product master.
15. Select the Menu button at the top of the page (sometimes referred to as the hamburger or the hamburger button), and then select **Cancel** to exit **PO Line receiving**.

TIP

You can repeat this scenario, but this time, set *Size - No* under the **Allow product dimension mixing** FastTab on the *BULK Location profiles*, so that none of the product dimensions can be mixed. In this case, when you receive the purchase order, each product variant will be put to a new location.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Putaway clusters

2/18/2021 • 9 minutes to read • [Edit Online](#)

Putaway clusters offer a way to pick multiple license plates at the same time and then take them for putaway in different locations. This process is often referred to as a *milk run*. Putaway clusters can be very useful for retail businesses, where license plates typically aren't full pallets of inventory.

Turn on the cluster putaway feature

Before you can use this feature, it must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Cluster putaway feature*

Setup for the example scenario

Cluster profiles

The putaway cluster profile determines where an item will go, based on the location that is assigned to the item at the time of receipt. If different clusters are required, different putaway clusters should be created, one for each mobile device menu item.

1. Go to **Warehouse management > Setup > Mobile device > Cluster profiles**.

2. On the Action Pane, select **New**.

3. In the **Header** view, set the following values:

- **Putaway cluster profile ID:** *Cluster putaway*
- **Putaway cluster profile ID Name:** *Cluster putaway*
- **Cluster type:** *Putaway*
- **Sequence number:** Accept the default value.

4. Select **Save** to make the required fields on the **General** FastTab available.

5. On the **General** FastTab, set the following values:

- **Cluster assignment timing:** *At receipt*

This field defines whether the putaway cluster should be assigned immediately when the inventory is received, or whether it should be sorted later.

- **Cluster assignment rule:** *Manual*

This field defines whether the cluster assignment should be determined automatically by the system or manually by the user.

- **Directive code:** Leave this field blank.

- **Putaway cluster locate:** *Receipt*

The following values are available:

- **Receipt** – A location is found immediately during receipt.

- **Cluster close** – A location is found when the cluster is closed.
- **User directed** – A location is found when the license plate is picked from the cluster for putaway. In this case, no location is specified when the putaway work is created. During the putaway itself, the user must scan the license plate or work ID to initiate the put step. The system then finds the put location again and tells the user where to put the picked quantity.

- **Putaway cluster per user:** *No*

This field defines whether each cluster should be unique per user when clusters are automatically assigned. It's available only when the **Cluster assignment rule** field is set to *Automatic*.

- **Unit restriction:** Leave this field blank.

This field defines the unit that must be received for the profile to be valid. If it's left blank, all units are valid.

- **Work unit break:** *Individual*

This field defines whether all inventory should be consolidated (by using the cluster ID and the license plate) onto one license plate when a cluster is closed, and whether it should be put away as a single license plate or separately on the license plates that were received. This field is unavailable when the **Putaway cluster locate** field is set to *Receipt*.

- **Cluster persists as Parent License Plate:** *No*

If this option is set to *Yes*, when the put step is completed, the cluster ID will become a parent license plate, and all items on the cluster ID will be linked to that parent license plate.

6. On the **Cluster sorting** FastTab, you can define putaway sorting criteria. Select **New** on the toolbar to add a line, and then set the following values:

- **Sequence number:** Accept the default value.
- **Field name:** *WMSLocationId*

This field defines the field that this line should use as a sorting criterion.

- **Sorting:** *Ascending*

This field defines whether sorting should be done in ascending or descending order.

7. On the **Cluster work template** FastTab, select **New** on the toolbar to add a line, and then set the following values:

- **Work order type:** *Purchase orders*
- **Work template:** *61 PO Direct*

8. On the Action Pane, select **Save**, and then select **Edit query**.

9. In the **Cluster putaway** dialog box, on the **Range** tab, select **Add** to add a second line to the query. Then update the query lines as shown in the following table.

TABLE	DERIVED TABLE	FIELD	CRITERIA
Work	Work	Warehouse	<i>61</i>
Work	Work	Work ID	Leave this field blank.

10. Select **OK** to save the query and close the dialog box.

11. On the Action Pane, select **Save**, and close the page.

IMPORTANT

Fields in the cluster profile that appear dimmed when **Generate cluster ID** is set to *Yes* are unavailable and won't be considered when this feature is used.

Mobile device menu items

Two new mobile device menu items are available for this feature. The **Receive and sort cluster** menu item is used to sort the received inventory into a putaway cluster upon receipt. The **Cluster putaway** menu item is used to put the cluster away after it has been assigned.

Receive and sort cluster

Create a new mobile device menu item for receiving inventory and sorting into a cluster. This menu item will create inbound work after inventory is received, which indicates that the receiving menu item will be used for putaway clusters.

NOTE

The **Receive and sort cluster** menu item can be used with the following receiving menu items:

- Purchase order line receiving
- Purchase order item receiving
- Load item receiving

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.

2. On the Action Pane, select **New**.

3. In the **Header** view, set the following values:

- **Menu item name:** *Receive and sort cluster*
- **Title:** *Receive and sort cluster*
- **Mode:** *Work*
- **Use existing work:** *No*

4. On the **General** FastTab, set the following values:

- **Work creation process:** *Purchase order item receiving*
- **Generate license plate:** *Yes*
- **Assign putaway cluster:** *Yes*

NOTE

The **Assign putaway cluster** option is available only for the one-step *Work creation process* activity for receiving.

Accept the default values for the remaining fields.

5. On the Action Pane, select **Save**.

Cluster putaway

Create a new mobile device menu item for putting the cluster away after it has been assigned.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.

2. On the Action Pane, select **New**.

3. In the **Header** view, set the following values:

- **Menu item name:** *Cluster putaway*
- **Title:** *Cluster putaway*
- **Mode:** *Work*
- **Use existing work:** *Yes*

4. On the **General** FastTab, set the **Directed by** field to *Cluster putaway*. Accept the default values for the remaining fields.

5. On the **Work classes** FastTab, set up the valid work class for this mobile device menu item:

- **Work class ID:** *Purchase*
- **Work order type:** *Purchase orders*

6. On the Action Pane, select **Save**.

Mobile device menu

Add the menu items that you just created to the inbound menu of the mobile app.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. In the menu list, select **Inbound**.
4. In the **Available menus and menu items** list, find and select **Receive and sort cluster**.
5. Select the right arrow button to move the selected menu item to the **Menu structure** list.
6. Use the up arrow or down arrow button to move the menu item into the desired position in the menu.
7. On the Action Pane, select **Save**.
8. Repeat steps 4 through 7 to add the remaining menu items:
 - Assign cluster
 - Cluster putaway

Example scenario

This scenario simulates putaway cluster processing.

Create a purchase order

1. Go to **Accounts payable > Purchase orders > All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Create purchase order** dialog box, set the following values:
 - **Vendor account:** *1001*
 - **Warehouse:** *61*
4. Select **OK**.

The **All purchase orders** page appears.

5. On the **All purchase orders** page, on the **Purchase order lines** FastTab, use the **Add line** button to add the following lines:

- Purchase order line 1:
 - **Item number:** *A0001*

- **Quantity:** 10
- Purchase order line 2:
 - **Item number:** A0002
 - **Quantity:** 20
- Purchase order line 3:
 - **Item number:** M9215
 - **Quantity:** 30

6. On the Action Pane, select **Save**.

7. Make a note of the purchase order number.

Receive inventory and put it away from the mobile device

Receive and sort the inventory into a cluster

1. Sign in to the warehouse app as a user who is set up for warehouse 61.
2. On the main menu, select **Inbound**.
3. On the **Inbound** menu, select **Receive and sort cluster**.
4. In the **Ponum** field, enter the purchase order number.
5. Select **OK** (the check mark button).
6. Select the **Item** field, enter item number A0001, and then select **OK**.
7. Select the **Qty** field, enter 10 by using the number pad, and then select the check mark button.
8. On the **Qty** task page, select **OK** (the check mark button) to confirm the quantity that you entered.
9. On the **Item** task page, select **OK** to confirm that item A0001 was entered.
10. Select the **Cluster ID** field, and enter a value to assign an ID for the cluster that you're creating.

The ID that you enter here will be used when the two remaining items on the purchase order are received.

11. Select **OK**.

The **Ponum** task page appears and shows a "Work completed" message.

Item A0001 has now been received into the *RECV* location and assigned to the cluster ID that you entered in step 10.

12. Repeat steps 4 through 11 to receive the remaining two items from the purchase order and assign them to the cluster ID:
 - A quantity of 20 for item A0002
 - A quantity of 30 for item M9215

Close the cluster

Before the items in the cluster can be put away, the cluster must be closed.

1. In Supply Chain Management, go to **Warehouse management > Work > Outbound > Work clusters**.
2. On the **Work clusters** page, in the **Work cluster** section, search the **Cluster ID** field for the cluster ID that you entered earlier.
3. If the cluster isn't shown, it might already have been closed. To determine whether the cluster was closed,

select the **Show closed work** check box, and search for the cluster ID that you entered earlier. Then follow one of these steps:

- If the cluster has been closed, skip the remaining steps of this procedure, and move on to the next procedure, [Put the cluster away](#).
- If the cluster hasn't been closed, follow the remaining steps of this procedure to manually close the cluster. Then move on to the next procedure.

4. In the **Work cluster** section, select the cluster ID that you entered earlier.

5. On the Action Pane, select **Close cluster**.

After the cluster has been closed, it's no longer shown in the **Work cluster** section (unless the **Show closed work** check box is selected).

Put the cluster away

1. Sign in to the warehouse app as a user who is set up for warehouse *67*.

2. On the main menu, select **Inbound**.

3. On the **Inbound** menu, select **Cluster putaway**.

4. Select **Cluster ID**, and enter the cluster ID that you entered earlier for the closed cluster.

5. Select **OK**.

The **Cluster putaway: Pick** page appears. It shows the cluster ID, the picking location, the items (the value *Multiple* will be shown), and the total quantity in the cluster that must be picked.

6. Select **OK**.

The **Cluster putaway: Put** page appears. The **Put** instructions identify the cluster ID, the put location, the items, the total quantity, and the license plate IDs for the items that have been received on the cluster.

You have the standard options to override or pass this step.

7. Select **OK** to confirm the putaway of the cluster.

A "Cluster completed" message is shown.

Notes and tips

For cases where the cluster ID becomes the parent license plate for a nested pallet, the put position is automatically given when the cluster ID is scanned. No further license plate must be scanned, even if license

plate generation is set to manual.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Quality check

2/18/2021 • 15 minutes to read • [Edit Online](#)

The *Quality check* feature lets warehouse workers do quick spot checks for quality while they receive items to the inbound dock area. These spot checks are beneficial when workers inspect packaging or other easily recognizable parts of an item. The feature guides workers to take a quick look to see whether anything is obviously faulty or damaged before they stock the inventory in its putaway location.

This feature is an alternative to the standard quality check process. It offers more flexibility and faster processing.

When you use this feature, the arrival and quality check occur in the following way:

1. When a shipment arrives, a warehouse worker registers the arrival. The worker also scans a license plate to register the location.
2. The worker does a quick quality check and records the result (pass or fail) for that license plate.
3. One of the following actions occurs:
 - If the quality check is passed, the license plate is accepted and guided to a receiving location, as usual.
 - If the quality check is failed, the license plate is rejected, and existing putaway work for it is redirected to an alternate location for further inspection. A new quality order is created. To view the quality order that is created from the failed quality check, go to **Inventory management > Periodic tasks > Quality management > Quality orders**.

This process can also be set up so that all scanned license plates are immediately diverted to the quality check location.

Turn on the Quality check feature

Before you can use the *Quality check* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Quality check*

Set up the feature for the example scenario

This section provides guidelines and an example that shows how to set up the *Quality check* feature and prepare sample data for the example scenario that is provided later in this topic.

Make sample data available

To work through the [example scenario](#) by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

Quality check template

The quality check template defines the rules for doing quick spot checks for quality at the time of receiving.

1. Go to **Warehouse management > Setup > Work > Quality check template**.

2. Select **New** to add a template to the grid.
3. Set the following values to define the new template:

- **Quality check template name:** *Dock check*

Enter a name that identifies the policies applied for this template.

- **Acceptance policy:** *Prompt user*

Specify whether users should be prompted to accept or reject the quality of the inventory while they process the work, or whether the quality should automatically be rejected. The available options are *Auto reject* and *Prompt user*.

- **Quality processing policy:** *Create quality order*

Select the policy that should be used when the quality of the inventory is rejected. The following options are available:

- *Create work only* – Just create work to facilitate inventory movement.
- *Create quality order* – Create a quality order to facilitate quality tests.

- **Test group:** *Enclosure*

Specify the test group that should be used in the quality order that is created. Test groups are set up in the **Inventory management** module.

Leave the **Destructive text** option turned off for the test group. This option defines whether the sample will be destroyed as part of the tests in the test group. If a destructive test is used, the system generates an inventory transaction when a quality order is created for an item. The new inventory transaction predicts the inventory reduction for the test quantity. The inventory reduction occurs when the quality order is completed through the validation step. The inventory transaction is identified as a quality order.

Work class – Quality check

Work classes are used to direct and/or limit the type of work order lines that warehouse workers can process on a mobile device.

1. Go to **Warehouse management > Setup > Work > Work classes**.

2. Select **New** to create a work class.

3. In the header, set the following values:

- **Work class ID:** *QC Check*

Enter a name that identifies the work class.

- **Description:** *QC Check*

Enter a short description that indicates what the work class is used for.

- **Work order type:** *Quality in quality check*

Select the type of work order that is created by the work class. When you set up quality control work, always select *Quality in quality check*.

4. On the **Valid put location types** FastTab, leave the **Location type** field blank.

If you select a location type, you limit the locations where items can be put after they are picked. This field is used when a location directive tries to resolve the location, or when a warehouse worker manually specifies the location for the mobile device menu item.

For more information about work classes and how to create them, see [Create a work class](#).

Work template

Work templates let you define the work operations that must be performed in the warehouse. Typically, warehouse work operations consist of a pair of actions: a warehouse worker picks on-hand inventory up in one location and then puts the picked inventory down in another location. A work template for quality control defines the work operations for doing quality checks.

Purchase orders

1. Go to **Warehouse management > Setup > Work > Work templates**.
2. In the header, set the **Work order type** field to *Purchase orders*.
3. On the Action Pane, select **Edit**.
4. Select a work template that should include a quality check step. In the **Overview** section, in the **Work template** field, select *51 PO Receipt*.
5. In the **Work template details** section, notice that the grid has two existing lines: one for *Pick* and one for *Put*.
6. In the **Work template details** section, select **New** to add a row for quality control to the grid. Notice that the **Line number** field for the new line is set to *3*.
7. On the new line, set the following values. Accept the default values for the remaining fields.

- **Work type:** *Quality check*
- **Work class ID:** *Purchase*
- **Quality check template name:** *Dock check*

Select the unique ID for the work class. You use this value to configure the menu items on the mobile device and the types of work that those menu items can process.

8. On the Action Pane, select **Save** to save your work so far.

You receive an informational message that states, "Invalid - Quality check must come directly after a pick." Therefore, you must change the **Line number** value for the line that you just added.

9. Follow these steps to change the **Line number** value for the new line:
 - a. In the **Work template details** section, select the line where the **Work type** field is set to *Quality check*.
 - b. Select the **Move up** or **Move down** button to move the *Quality check* line so that it's after the *Pick* line.
10. On the Action Pane, select **Save**.

Quality in quality check

Next, create a work template for the quality check.

1. In the header of the **Work templates** page, change the value of the **Work order type** field to *Quality in quality check*.
2. On the Action Pane, select **New** to add a row to the grid in the **Overview** section.
3. In the new row, set the following values:
 - **Work template:** *51 Quality Check*

Enter a name for the template.

- **Work template description:** *51 Quality Check*

4. On the Action Pane, select **Save** to make the **Work template details** section available.
5. While the new template is still selected in the **Overview** section, select **New** in the **Work template details** section to add a row to the grid there.

6. In the new row, set the following values:

- **Work type:** *Pick*
- **Work class ID:** *QC Check*

Select the name of the [work class](#) that you created earlier for quality control work.

7. In the **Work template details** section, select **New** again to add another row.

8. In the new row, set the following values:

- **Work type:** *Put*
- **Work class ID:** *QC Check*

Select the name of the [work class](#) that you created earlier for quality control work.

9. On the Action Pane, select **Save**.

For more information about work templates, see [Control warehouse work by using work templates and location directives](#)

Location directive – Quality failures

Location directives are rules that help identify pick and put locations for inventory movement. For example, in a sales order transaction, a location directive determines where the items will be picked and where the picked items will be put. You must configure a location directive rule to define how failed quality checks will be handled.

1. Go to **Warehouse management > Setup > Location directives**.
2. In the left pane, set the **Work order type** field to *Purchase orders* to work with location directives of that type.
3. On the Action Pane, select **New** to create a location directive for quality checks.

4. In the header, set the following values:

- **Sequence number:** Accept the default value.
- **Name:** *51 To Quality*

5. On the **Location directives** FastTab, set the following values. Accept the default values for the remaining fields.

- **Work type:** *Put*
- **Site:** *5*
- **Warehouse:** *51*

6. On the Action Pane select **Save** to save your directive and make the **Lines** FastTab available.

7. On the **Lines** FastTab, select **New** to add a line to the grid.

8. On the new line, set the following values. Accept the default values for the remaining fields.

- **From quantity:** *1*
- **To quantity:** *1000000*

9. On the Action Pane, select **Save** to save the new line and make the **Location directive actions** FastTab

available.

10. While the new line is still selected on the **Lines** FastTab, select **New** on the **Location directive actions** FastTab to add a row to the grid there, so that you can set up an action for the line.
11. In the new row, set the **Name** field to *Quality*. Accept the default values for the remaining fields.
12. On the Action Pane, select **Save** to make the **Edit query** button on the **Location directive actions** FastTab available.
13. While the line that you just added is still selected on the **Location directive actions** FastTab, select **Edit query** to open a dialog box where you can edit the query for the action.
14. On the **Range** tab, select **Add** to add a row to the query.
15. In the new row, set the following values:
 - **Table:** *Locations*
 - **Derived table:** *Locations*
 - **Field:** *Location*
 - **Criteria:** *QMS*The *QMS* location is a warehouse location for quality.
16. Select **OK** to close the dialog box.
17. You must now change the sequence of purchase order location directives for warehouse *51*. Save the new *51 To Quality* location directive, refresh the page, and select the location directive in the list. Then use the **Move up** and **Move down** buttons on the Action Pane to put the location directive for warehouse *51* in the following order. (Before you select **Move up** or **Move down**, you must select a location directive in the list.)
 - a. 51 To Quality
 - b. 51 PO Direct
 - c. 51 QMS

Mobile device menu items

Configure a menu item so that mobile devices can perform the **Quality Check** function.

Purchase putaway

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. In the list, select the **Purchase put-away** menu item.
3. On the Action Pane, select **Edit**.
4. In the **Work classes** section, select **New** to add a row to the grid.
5. In the new row, set the following values:
 - **Work class ID:** *QC Check*
Enter the name of the [work class](#) that you created earlier for quality control work.
 - **Work order type:** *Quality in quality check*
6. On the Action Pane, select **Save**.

Purchase order line receiving

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. On the Action Pane, select **New**.

3. In the header, set the following values:

- **Menu item name:** *PO line receiving*
- **Title:** *PO line receiving*
- **Mode:** *Work*
- **Use existing work:** *No*

4. On the **General** FastTab, set the following values. Accept the default values for the remaining fields.

- **Work creation process:** *Purchase order line receiving and put away*
- **Generate license plate:** *Yes*
- **Work template:** *51 PO Receipt*

5. On the Action Pane, select **Save**.

Add the menu item to a mobile device menu

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.

2. In the left pane, select the **Inbound** menu.

3. On the Action Pane, select **Edit**.

4. In the **Available menus and menu items** column, select the new **PO line receiving** menu item.

5. Select the right arrow button to move **PO line receiving** to the **Menu structure** column.

6. In the **Menu structure** column, select **PO line receiving**, and then select the up arrow or down arrow button to move the menu item to the desired position on the mobile device menu.

7. On the Action Pane, select **Save**.

Example scenario

After you've made all the previously described sample data available and set it up, you can work through this scenario to try out the *Quality check* feature. The values that are shown in this scenario assume that you're working with the standard demo data, that you selected the **USMF** legal entity, and that you prepared the sample records that are described earlier in this topic. This scenario also serves as an example that shows how the feature can be used in a production setting.

Create a purchase order

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.

2. On the Action Pane, select **New**.

3. In the **Create purchase order** dialog box, set the following values:

- **Vendor account:** *104*
- **Warehouse:** *51*

4. Select **OK** to close the dialog box and open the new purchase order.

5. On the **Purchase order lines** FastTab, the grid contains a new, blank line. On this line, set the following values:

- **Item number:** *M9203*
- **Quantity:** *3*
- **Unit:** *PL*

6. On the Action Pane, select **Save**.

Process quality check receiving

After the purchase order has been created, it can be received by using the **PO line receiving** menu item and the functionality of the *Quality check* feature.

Receive pallet 1

1. Sign in to the warehouse app as a user for warehouse *51*. (Enter *51* as the user ID and *1* as the password.)
2. Go to **Inbound > PO line receiving**.
3. In the **PONUM** field, enter the purchase order number.
4. Confirm the purchase order number.
5. In the **LINENUM** field, enter the number of the purchase order line that is being received. Because the order has only one line in this scenario, you will enter *1* in the **LINENUM** field for each receiving step.
6. Confirm the line number.
7. In the **QTY** field, enter the quantity to receive. Because the purchase order is for three pallets (*PL*) in this scenario, and there are three receiving steps, you will enter *1* in the **QTY** field for each receiving step.
8. Confirm the quantity.

The **Quality check** page that appears has no entry fields. It has only the confirmation (check mark) button at the bottom and the Menu button (☰) at the top. (The Menu button is sometimes referred to as the hamburger or the hamburger button.) To expedite the quality check process, when the pallet passes the quality check, the user just confirms the **Quality check** page.

9. Select the confirmation button to pass the quality check for pallet 1 from line 1.

The **Purchase orders: Put** page that appears shows details of the put work:

- **LOC:** The system determined location
This location is the designated putaway location for purchase order receiving.
- **LP:** The system-generated License plate ID
- **Item:** *M9203*
- **Qty:** *1 PL: 100 ea*

The item description is also shown.

10. Confirm the putaway work.

On the **Task** page for purchase order line receiving, you receive a "Work Completed" message. The **LINENUM** field is available so that you can start to receive the next pallet.

Receive pallet 2

For this scenario, pallet 2 will be rejected.

1. In the **LINENUM** field, enter *1*, and confirm the line number.
2. The **QTY** field is now available. Enter *1*, and confirm the quantity.

The **Quality check** page appears. For this receipt, the pallet will be rejected for quality, and it will be put into the *QMS* quality location.

3. Select the Menu button (☰) at the top of the page, and then, on the menu, select **Reject**.
4. On the **Task** page that appears, enter **QMS** as the *Put* location to send the pallet to for further inspection.

The **Quality in quality check: Put** page that appears shows details of the put work:

- **LOC:** *QMS*

This location is the designated putaway location for rejected quality receiving.

- **LP:** The system-generated License plate ID
- **Item:** *M9203*
- **Qty:** *1 PL: 100 ea*

The item description is also shown.

5. Confirm the putaway work.

On the **Task** page for purchase order line receiving, you receive a "Work Completed" message. The **LINENUM** field is available so that you can start to receive the next pallet.

You've now completed the quality check and created a quality order for the rejected pallet. To view the order that was created, go to **Inventory management > Periodic tasks > Quality management > Quality orders**.

Quality order testing can now be processed. Quality testing isn't covered in this topic.

For more information about quality management, see [Quality management overview](#)

Receive pallet 3

For this scenario, pallet 3 will be accepted.

1. In the **LINENUM** field, enter *1*, and confirm the line number.
2. The **QTY** field is now available. Enter *1*, and confirm the quantity.

The **Quality check** page appears. For this receipt, the pallet will be accepted for quality, and it will be put into a bulk putaway location.

3. Select the confirmation button to pass the quality check.

The **Purchase orders: Put** page that appears shows details of the put work:

- **LOC:** The system determined location

This location is the designated putaway location for purchase order receiving.

- **LP:** The system-generated License plate ID
- **Item:** *M9203*
- **Qty:** *1 PL: 100 ea*

The item description is also shown.

4. Confirm the putaway work.

On the **Task** page for purchase order line receiving, you receive a "Work Completed" message. The **LINENUM** field is available so that you can start to receive the next pallet.

5. Select the Menu button (☰) at the top of the page, and then, on the menu, select **Cancel** to return to the menu.

You can now close the mobile app.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot inbound warehouse operations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with inbound warehouse operations in Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "Quality order %1 has been generated. Cluster profile could not be found please check your configuration."

Issue description

This error message is related to a receiving process where quality management (QMS) is turned on. Depending on the configurations in your environment, additional details about the transaction that is generating the error message might help fix the issue.

Issue resolution

First, review the [cluster picking](#) setup, and make sure that your cluster profiles are set up correctly. You can't use a mobile device menu item for cluster picking unless cluster profiles are set up. Depending on your environment, you might also have to review other related configurations.

Mixed license plate receiving doesn't work for any disposition code except Credit.

Issue description

When the **Action** field for a disposition code is set to *Credit* or *Scrap*, you can use only the [Mixed license plate receiving](#) menu item to process returned items.

Issue resolution

Microsoft has evaluated this issue and has determined that it's a feature limitation. Currently, only [disposition codes](#) where the **Action** field is set to *Credit* or *Scrap* are supported for mixed license plate receiving.

When I run the Update product receipts periodic task, unconfirmed purchase orders are confirmed.

Issue description

After you run the *Update product receipts* periodic task, the system automatically confirms unconfirmed purchase orders that have an inventory transaction status of *Registered*.

Issue resolution

A new inbound load handling feature, *Over receipt of load quantities*, fixes this issue. To turn on this feature, go to [Feature management](#), and turn on the following features (in the order that they are listed in):

1. Associate purchase order inventory transactions with load
2. Over receipt of load quantities

For more information, see [Post registered product quantities against purchase orders](#).

NOTE

Flexible warehouse-level dimension reservation policy

2/18/2021 • 37 minutes to read • [Edit Online](#)

When an inventory reservation hierarchy of the "Batch-below[location]" type is associated with products, businesses that sell batch-tracked products and run their logistics as operations that are enabled for the Microsoft Dynamics 365 Warehouse Management System (WMS) can't reserve specific batches of those products for customer sales orders.

In a similar way, specific license plates can't be reserved for products on sales orders when those products are associated with the default reservation hierarchy.

This topic describes the inventory reservation policy that lets these businesses reserve specific batches or license plates, even when the products are associated with a "Batch-below[location]" reservation hierarchy.

Inventory reservation hierarchy

This section summarizes the existing inventory reservation hierarchy.

The inventory reservation hierarchy dictates that, as far as storage dimensions are concerned, the demand order carries the mandatory dimensions of site, warehouse, and inventory status, whereas the warehouse logic is responsible for assigning a location to the requested quantities and reserving the location. In other words, in the interactions between the demand order and the warehouse operations, the demand order is expected to indicate where the order must be shipped from (that is, what site and warehouse). The warehouse then relies on its logic to find the required quantity in the warehouse premises.

However, to reflect the operational model of the business, tracking dimensions (batch and serial numbers) are subject to more flexibility. An inventory reservation hierarchy can accommodate scenarios where the following conditions apply:

- The business relies on its warehouse operations to manage picking of quantities that have batch or serial numbers after the quantities have been found in the warehousing storage space. This model is often referred to as *Batch-below[location]*. It's typically used when a product's batch or serial number identification isn't important to the customers who place the demand with the selling company.
- If batch or serial numbers are part of a customer's order specification, and they are recorded on the demand order, the warehouse operations that find the quantities in the warehouse are constrained by the specific requested numbers and aren't allowed to change them. This model is referred to as *Batch-above[location]*.

In these scenarios, the challenge is that only one inventory reservation hierarchy can be assigned to each released product. Therefore, for the WMS to handle tracked items, after the hierarchy assignment determines when the batch or serial number should be reserved (either when the demand order is taken or during the warehouse picking work), this timing can't be changed on an ad-hoc basis.

Flexible reservation for batch-tracked items

Business scenario

In this scenario, a company uses an inventory strategy where finished goods are tracked by batch numbers. This company also uses the WMS workload. Because this workload has well-equipped logic for planning and running warehouse picking and shipping operations for batch-enabled items, most of the finished items are associated with a "Batch-below[location]" inventory reservation hierarchy. The advantage of this type of operational setup

is that decisions (which are effectively reservation decisions) about which batches to pick and where to put them in the warehouse are postponed until the warehouse picking operations start. They aren't made when the customer's order is placed.

Although the "Batch-below[location]" reservation hierarchy serves the company's business goals well, many of the company's established customers require the same batch that they previously purchased when they reorder products. Therefore, the company is looking for flexibility in the way that the batch reservation rules are handled, so that, depending on the customers' demand for the same item, the following behaviors occur:

- A batch number can be recorded and reserved when the order is taken by the sales processor, and it can't be changed during warehouse operations and/or taken by other demands. This behavior helps guarantee that the batch number that was ordered is shipped to the customer.
- If the batch number isn't important to the customer, the warehouse operations can determine a batch number during picking work, after sales order registration and reservation have been done.

Allowing reservation of a specific batch on the sales order

To accommodate the desired flexibility in the batch reservation behavior for items that are associated with a "Batch-below[location]" inventory reservation hierarchy, inventory managers must select the **Allow reservation on demand order** check box for the **Batch number** level on the **Inventory reservation hierarchies** page.

Name	Reservation hierarchy level	Allow reservation on demand order
Site	1	<input type="checkbox"/>
Warehouse	2	<input type="checkbox"/>
Inventory status	3	<input type="checkbox"/>
Location	4	<input type="checkbox"/>
License plate	5	<input type="checkbox"/>
Batch number	6	<input checked="" type="checkbox"/>

When the **Batch number** level in the hierarchy is selected, all dimensions above that level and up through the **Location** level will be automatically selected. (By default, all dimensions above the **Location** level are preselected.) This behavior reflects the logic where all dimensions in the range between the batch number and location are also automatically reserved after you reserve a specific batch number on the order line.

NOTE

The **Allow reservation on demand order** check box applies only to reservation hierarchy levels that are below the warehouse location dimension.

Batch number and **License plate** are the only levels in the hierarchy that are open for the flexible reservation policy. In other words, you can't select the **Allow reservation on demand order** check box for the **Location** or **Serial number** level.

If your reservation hierarchy includes the serial number dimension (which must always be below the **Batch number** level), and if you've turned on batch-specific reservation for the batch number, the system will continue to handle serial number reservation and picking operations, based on the rules that apply to the "Serial-below[location]" reservation policy.

At any point, you can allow batch-specific reservation for an existing "Batch-below[location]" reservation hierarchy in your deployment. This change won't affect any reservations and open warehouse work that were created before the change occurred. However, the **Allow reservation on demand order** check box can't be

cleared if inventory transactions of the **Reserved ordered**, **Reserved physical**, or **Ordered** issue type exist for one or more items that are associated with that reservation hierarchy.

NOTE

If an item's existing reservation hierarchy doesn't allow batch specification on the order, you can reassign it to a reservation hierarchy that does allow batch specification, provided that the hierarchy level structure is the same in both hierarchies. Use the **Change reservation hierarchy for items** function to do the reassignment. This change might be relevant when you want to prevent flexible batch reservation for a subset of batch-tracked items but allow it for the rest of the product portfolio.

Regardless of whether you've selected the **Allow reservation on demand order** check box, if you don't want to reserve a specific batch number for the item on an order line, default warehouse operations logic that is valid for a "Batch-below[location]" reservation hierarchy will still apply.

Reserve a specific batch number for a customer order

After a batch-tracked item's "Batch-below[location]" inventory reservation hierarchy is set up to allow reservation of specific batch numbers on sales orders, sales order processors can take customer orders for the same item in one of the following ways, depending on the customer's request:

- **Enter order details without specifying a batch number** – This approach should be used when the product's batch specification isn't important to the customer. All existing processes that are associated with handling an order of this type in the system remain unchanged. No additional considerations are required on the part of users.
- **Enter order details and reserve a specific batch number** – This approach should be used when the customer requests a specific batch. Typically, customers will request a specific batch when they are reordering a product that they previously purchased. This type of batch-specific reservation is referred to as *order-committed reservation*.

The following set of rules is valid when quantities are processed, and a batch number is committed to a specific order:

- To allow reservation of a specific batch number for an item under the "Batch-below[location]" reservation policy, the system must reserve all dimensions up through location. This range typically includes the license plate dimension.
- Location directives aren't used when picking work is created for a sales line that uses order-committed batch reservation.
- During warehouse processing of work for order-committed batches, neither the user nor the system is allowed to change the batch number. (This processing includes exception handling.)

The following example shows the end-to-end flow.

Example scenario: Batch number allocation

For this example, demo data must be installed, and you must use the **USMF** demo data company.

Set up an inventory reservation hierarchy to allow batch-specific reservation

1. Go to **Warehouse management > Setup > Inventory > Reservation hierarchy**.
2. Select **New**.
3. In the **Name** field, enter a name (for example, **BatchFlex**).
4. In the **Description** field, enter a description (for example, **Batch below flexible**).
5. In the **Selected** field, select **Serial number** and **Owner**, and then select the left arrow button to move them to the **Available** field.

6. Select **OK**.
7. In the row for the **Batch number** dimension level, select the **Allow reservation on demand order** check box. The **License plate** and **Location** levels are automatically selected, and you can't clear the check boxes for them.
8. Select **Save**.

Create a new released product

1. Set the product's three master data parameters by using these values:
 - In the **Storage dimension group** field, select **Ware**.
 - In the **Tracking dimension group** field, select **Batch-Phy**.
 - In the **Reservation hierarchy** field, select **BatchFlex**.
2. Create two batch numbers, such as **B11** and **B22**.
3. Add item quantities to on-hand stock by using the following values.

WAREHOUSE	BATCH NUMBER	LOCATION	LICENSE PLATE	QUANTITY
24	B11	BULK-001	None	10
24	B11	FL-001	LP11	10
24	B22	FL-002	LP22	10

Enter sales order details

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New**.
3. On the sales order header, in the **Customer account** field, enter **US-003**.
4. Add a line for the new item, and enter **10** as the quantity. Make sure that the **Warehouse** field is set to **24**.
5. On the **Sales order lines** FastTab, select **Inventory**, and then, in the **Maintain** group, select **Batch reservation**. The **Batch reservation** page shows a list of batches that are available for reservation for the order line. For this example, it shows a quantity of **20** for batch number **B11** and a quantity of **10** for batch number **B22**. Note that the **Batch reservation** page cannot be accessed from a line if the item on that line is associated with "Batch-below[location]" reservation hierarchy unless it is set up to allow batch-specific reservation.

NOTE

To reserve a specific batch for a sales order, you must use the **Batch reservation** page.

If you enter the batch number directly on the sales order line, the system will behave as though you entered a specific batch value for an item that is subject to the "Batch-below[location]" reservation policy. When you save the line, you will receive a warning message. If you confirm that the batch number should be specified directly on the order line, the line won't be handled by the regular warehouse management logic.

If you reserve the quantity from the **Reservation** page, no specific batch will be reserved, and the execution of warehouse operations for the line will follow the rules that are applicable under the "Batch-below[location]" reservation policy.

In general, this page works and is interacted with in the same way that it works and is interacted with for items that have an associated reservation hierarchy of the "Batch-above[location]" type. However, the

following exceptions apply:

- The **Batch numbers committed to source line** FastTab shows the batch numbers that are reserved for the order line. The batch values in the grid will be shown throughout the fulfillment cycle of the order line, including the warehouse processing stages. By contrast, on the **Overview** FastTab, regular order line reservation (that is, reservation that is done for the dimensions above the **Location** level) is shown in the grid up to the point when warehouse work is created. The work entity then takes over the line reservation, and the line reservation no longer appears on the page. The **Batch numbers committed to source line** FastTab helps guarantee that the sales order processor can view the batch numbers that were committed to the customer's order at any point during its lifecycle, up through invoicing.
 - In addition to reserving a specific batch, a user can manually select the batch's specific location and license plate instead of letting the system automatically select them. This capability is related to the design of the order-committed batch reservation mechanism. As was mentioned earlier, when a batch number is reserved for an item under the "Batch-below[location]" reservation policy, the system must reserve all dimensions up through location. Therefore, warehouse work will carry the same storage dimensions that were reserved by the users who worked with the orders, and it might not always represent the item storage placement that is convenient, or even possible, for picking operations. If order processors are aware of the warehouse constraints, they might want to manually select the specific locations and license plates when they reserve a batch. In this case, the user must use the **Display dimensions** functionality on the page header, and must add the location and license plate in the grid on the **Overview** FastTab.
6. On the **Batch reservation** page, select the line for batch **B11**, and then select **Reserve line**. There is no designated logic for assigning locations and license plates during automatic reservation. You can manually enter the quantity in the **Reservation** field. Notice that, on the **Batch numbers committed to source line** FastTab, batch **B11** is shown as **Committed**.

000810 : BATCH_BELOW_FLEX								
Batch reservation								
Reference	Number	Item number	Unit symbol	Physical reserved	Ordered reserved	On order		
Sales order	000810	Batch_below_flex	ea	10.00				
Batch numbers committed to source line								
Batch number	Committed							
B11	10.00							
Overview								
Site	Warehouse	Batch number	Inventory status	Physical inventory	Physical reserved	Available physical	Available for reservation	Reservation
2	24	B11	Available	20.00	10.00	10.00	10.00	10.00
2	24	B22	Available	10.00		10.00	10.00	

NOTE

Reservation of the quantity on a sales order line can be done across multiple batches. Likewise, reservation of the same batch can be done against multiple locations and license plates (if license plates are enabled for the locations).

Reservation of a specific batch for the quantity on a sales order line can also be partial. For example, the total quantity of 100 units can be reserved so that a specific batch is committed to 20 units, whereas 80 units are reserved at the site and warehouse levels for any available batch. In this case, the WMS will handle picking operations by using two separate work lines.

7. Go to **Product information management > Products > Released products**. Select your item, and then select **Manage inventory > View > Transactions**.

Reference	Number	Issue	Quantity	Unit	Site	Warehouse	Location
Sales order	000810	Reserved physical	-10.00	ea	2	24	
Order-committed reservation	000810	Reserved physical	-10.00	ea	2	24	BULK-001

8. Review the item's inventory transactions that are related to the sales order line reservation.
 - A transaction where the **Reference** field is set to **Sales order** and the **Issue** field is set to **Reserved physical** represents the order line reservation for the inventory dimensions above the **Location** level. According to the item's inventory reservation hierarchy, those dimensions are site, warehouse, and inventory status.
 - A transaction where the **Reference** field is set to **Order-committed reservation** and the **Issue** field is set to **Reserved physical** represents the order line reservation for the specific batch and all inventory dimensions above it. According to the item's inventory reservation hierarchy, those dimensions are batch number and location. In this example, the location is **Bulk-001**.
9. On the sales order header, select **Warehouse > Actions > Release to warehouse**. The order line is now waved, and a load and work are created.

Review and process warehouse work that has order-committed batch numbers

1. On the **Sales order lines** FastTab, select **Warehouse > Work details**.

The work that handles the picking operation for batch quantities that are committed to the sales order line has the following characteristics:

- To create work, the system uses work templates but not location directives. All the standard settings that are defined for work templates, such as a maximum number of pick lines or a specific unit of measure, will be applied to determine when new work should be created. However, the rules that are associated with location directives for identifying pick locations aren't considered, because the order-committed reservation already specifies all the inventory dimensions. Those inventory dimensions include the dimensions at the warehouse storage level. Therefore, the work inherits those dimensions without having to consult location directives.
- The batch number isn't shown on the pick line (as is the case for the work line that is created for an item that has an associated "Batch-above[location]" reservation hierarchy.) Instead, the "from" batch number and all other storage dimensions are shown on the work line's work inventory transaction that is referenced from the associated inventory transactions.

USMF-000119 : 1.0000000000

Work inventory transactions

Overview **Inventory dimensions**

FROM INVENTORY DIMENSIONS	TO INVENTORY DIMENSIONS
Configuration <input type="text"/>	Configuration _____
Size _____	Size _____
Color _____	Color _____
Style _____	Style _____
Site 2	Site 2
Warehouse 24	Warehouse 24
Batch number B11	Batch number _____
Location BULK-001	Location _____
Serial number _____	Serial number _____
Inventory status Available	Inventory status Available
License plate _____	License plate _____
Owner _____	Owner _____

- After work is created, the item's inventory transaction where the **Reference** field is set to **Order-committed reservation** is removed. The inventory transaction where the **Reference** field is set to **Work** now holds the physical reservation on all the quantity's inventory dimensions.

Warehouse operations can proceed to handle execution of the work in the usual manner. However, the instructions on the mobile device will instruct the worker to pick a specific batch number. In warehouse environments where locations are license plate–controlled, after a worker reaches a location that stores the same batch on multiple license plates, he or she can pick from any license plate that isn't already reserved (for example, by another order-committed reservation or work that originates from a reservation of that type.)

If it turns out to be impractical to pick from the location that is specified on the work line, the warehouse operators can use one of the following actions to redirect picking of the specific batch from a more convenient location:

- The standard **Override location** action on a mobile device (provided that the warehouse worker's **Allow pick location override** setting is enabled)
- The **Change location** action on the **Work list details** page.

2. On the mobile device, finish picking and putting the work.

The quantity of **10** for batch number **B11** is now picked for the sales order line and put in the **Baydoor** location. At this point, it's ready to be loaded onto the truck and dispatched to the customer's address.

Flexible license plate reservation

Business scenario

In this scenario, a company uses warehouse management and work processing, and handles load planning at the level of individual pallets/containers outside Supply Chain Management before work is created. These containers are represented by license plates in the inventory dimensions. Therefore, for this approach, specific

license plates must be pre-assigned to sales order lines before picking work is done. The company is looking for flexibility in the way that the license plate reservation rules are handled, so that the following behaviors occur:

- A license plate can be recorded and reserved when the order is taken by the sales processor, and it can't be taken by other demands. This behavior helps guarantee that the license plate that was planned is shipped to the customer.
- If the license plate isn't already assigned to a sales order line, warehouse personnel can select a license plate during picking work, after sales order registration and reservation are completed.

Turn on flexible license plate reservation

Before you can use flexible license plate reservation, two features must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the features and turn them on if they are required. You must turn on the features in the following order:

1. **Feature name:** *Flexible warehouse-level dimension reservation*
2. **Feature name:** *Flexible order-committed license plate reservation*

Reserve a specific license plate on the sales order

To enable license plate reservation on an order, you must select the **Allow reservation on demand order** check box for the **License plate** level on the **Inventory reservation hierarchies** page for the hierarchy that is associated with the relevant item.

Name	Description
FlexibleLP	Flexible LP reservation

Hierarchy		
Name	Reservation hierarchy level	Allow reservation on demand order
Site	1	<input type="checkbox"/>
Warehouse	2	<input type="checkbox"/>
Inventory status	3	<input type="checkbox"/>
Location	4	<input type="checkbox"/>
License plate	5	<input checked="" type="checkbox"/>

You can enable license plate reservation on the order at any point in your deployment. This change won't affect any reservations or open warehouse work that were created before the change occurred. However, you can't clear the **Allow reservation on demand order** check box if open outbound inventory transactions that have an issue status of *On order*, *Reserved ordered*, or *Reserved physical* exist for one or more items that are associated with that reservation hierarchy.

Even if the **Allow reservation on demand order** check box is selected for the **License plate** level, it's still possible *not* to reserve a specific license plate on the order. In this case, the default warehouse operations logic that is valid for the reservation hierarchy applies.

To reserve a specific license plate, you must use an [Open Data Protocol \(OData\)](#) process. In the application, you can do this reservation directly from a sales order by using the **Order-committed reservations per license plate** option of the **Open in Excel** command. In the entity data that is opened in the Excel add-in, you must enter the following reservation-related data and then select **Publish** to send the data back to Supply Chain Management:

- Reference (Only the *Sales order* value is supported.)
- Order number (The value can be derived from the lot.)
- Lot ID
- License plate
- Quantity

If you must reserve a specific license plate for a batch-tracked item, use the **Batch reservation** page, as described in the [Enter sales order details](#) section.

When the sales order line that uses an order-committed license plate reservation is processed by warehouse operations, location directives aren't used.

If a warehouse work item consists of lines that equal a complete pallet and have license plate-committed quantities, you can optimize the picking process by using a mobile device menu item where the **Handle by license plate** option is set to *Yes*. A warehouse worker can then scan a license plate to complete a pick instead of having to scan the items from the work one by one.

The screenshot shows the 'Mobile device menu items' configuration page. At the top, there are fields for 'Menu item name' (Sales Picking - by LP), 'Title' (Sales Picking - handl...), 'Mode' (Work), and a 'Use existing work' toggle set to 'Yes'. Below this is a 'General' section with four options: 'Directed by' (User directed), 'Use process guide' (No), 'Generate license plate' (No), and 'Handle by license plate' (Yes).

Because the **Handle by license plate** functionality doesn't support work that covers multiple pallets, it's better to have a separate work item for different license plates. To use this approach, add the **Order-committed license plate ID** field as a work header break on the **Work template** page.

NOTE

For the order-committed work creation process, an "order-committed inventory dimension" value will be assigned to the picking work lines, and it won't be possible to view the license plate value directly. Only the *User directed* process is supported when setting up a mobile device menu item.

Example scenario: Set up and process an order-committed license plate reservation

This scenario shows how to set up and process an order-committed license plate reservation.

Make demo data available

This scenario refers to values and records that are included in the standard demo data that is provided for Supply Chain Management. If you want to work through the scenario by using the values that are provided here, be sure to work on an environment where the demo data is installed. Additionally, set the legal entity to **USMF** before you begin.

Create an inventory reservation hierarchy that allows for license plate reservation

1. Go to **Warehouse management > Setup > Inventory > Reservation hierarchy**.
2. Select **New**.
3. In the **Name** field, enter a value (for example, *FlexibleLP*).
4. In the **Description** field, enter a value (for example, *Flexible LP reservation*).
5. In the **Selected** list, select **Batch number**, **Serial number**, and **Owner**.
6. Select the **Remove** button  to move the selected records to the **Available** list.
7. Select **OK**.
8. In the row for the **License plate** dimension level, select the **Allow reservation on demand order** check box. The **Location** level is automatically selected, and you can't clear the check box for it.
9. Select **Save**.

Create two released products

1. Go to **Product information management > Products > Released products**.
2. On the Action Pane, select **New**.

3. In the **New released product** dialog box, set the following values:
 - **Product number:** *Item1*
 - **Item number:** *Item1*
 - **Item model group:** *FIFO*
 - **Item group:** *Audio*
 - **Storage dimension group:** *Ware*
 - **Tracking dimension group:** *None*
 - **Reservation hierarchy:** *FlexibleLP*
4. Select **OK** to create the product and close the dialog box.
5. The new product is opened. On the **Warehouse** FastTab, set the **Unit sequence group ID** field to *ea*.
6. Repeat the previous steps to create a second product that has the same settings, but set the **Product number** and **Item number** fields to *Item2*.
7. On the Action Pane, on the **Manage inventory** tab, in the **View** group, select **On-hand inventory**. Then select **Quantity adjustment**.
8. Adjust the on-hand inventory of the new items as specified in the following table.

ITEM	WAREHOUSE	LOCATION	LICENSE PLATE	QUANTITY
Item1	24	FL-010	LP01	10
Item1	24	FL-011	LP02	10
Item2	24	FL-010	LP01	5
Item2	24	FL-011	LP02	5

NOTE

You must create the two license plates and use locations that allow for mixed items, such as *FL-010* and *FL-011*.

Create a sales order and reserve a specific license plate

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New**.
3. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-001*
 - **Warehouse:** *24*
4. Select **OK** to close the **Create sales order** dialog box and open the new sales order.
5. On the **Sales order lines** FastTab, add a line that has the following settings:
 - **Item number:** *Item1*
 - **Quantity:** *10*
6. Add a second sales order line that has the following settings:
 - **Item number:** *Item2*
 - **Quantity:** *5*
7. Select **Save**.

8. On the **Line details** FastTab, on the **Setup** tab, make a note of the **Lot ID** value for each line. These values will be required during reservation of specific license plates.

NOTE

To reserve a specific license plate, you must use the **Order-committed reservations per license plate** data entity. To reserve a batch-tracked item on a specific license plate, you can also use the **Batch reservation** page, as described in the [Enter sales order details](#) section.

If you enter the license plate directly on the sales order line and confirm it to the system, warehouse management processing won't be used for the line.

9. Select **Open in Microsoft Office**, select **Order-committed reservations per license plate**, and download the file.
10. Open the downloaded file in Excel, and select **Enable editing** to enable the Excel add-in to run.
11. If you're running the Excel add-in for the first time, select **Trust this Add-in**.
12. If you're prompted to sign in, select **Sign in**, and then sign in by using the same credentials that you used to sign in to Supply Chain Management.
13. To reserve an item on a specific license plate, in the Excel add-in, select **New** to add a reservation line, and then set the following values:
 - **Lot ID:** Enter the **Lot ID** value that you found for the sales order line for *Item 1*.
 - **License plate:** *LP02*
 - **ReservedInventoryQuantity:** *10*
14. Select **New** to add another reservation line, and set the following values:
 - **Lot ID:** Enter the **Lot ID** value you found for the sales order line for *Item 2*.
 - **License plate:** *LP02*
 - **ReservedInventoryQuantity:** *5*
15. In the Excel add-in, select **Publish** to send the data back to Supply Chain Management.

NOTE

The reservation line will appear in the system only if publishing is completed without errors.

16. Go back to Supply Chain Management.
17. To review the item's reservation, on the **Sales order lines** FastTab, on the **Inventory** menu, select **Maintain > Reservation**. Notice that, for the sales order line for *Item 1*, inventory of *10* is reserved, and for the sales order line for *Item 2*, inventory of *5* is reserved.
18. To review inventory transactions that are related to the sales order line reservation, on the **Sales order lines** FastTab, on the **Inventory** menu, select **View > Transactions**. Notice that there are two transactions that are related to the reservation: one where the **Reference** field is set to *Sales order* and one where the **Reference** field is set to *Order-committed reservation*.

NOTE

A transaction where the **Reference** field is set to *Sales order* represents the order line reservation for inventory dimensions that are above the **Location** level (site, warehouse, and inventory status). A transaction where the **Reference** field is set to *Order-committed reservation* represents the order line reservation for the specific license plate and location.

19. To release the sales order, on the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

Review and process warehouse work with order-committed license plates assigned

1. On the **Sales order lines** FastTab, on the **Warehouse** menu, select **Work details**.

As when reservation is done for a specific batch, the system doesn't use location directives when it creates the work for the sales order that uses license plate reservation. Because the order-committed reservation specifies all the inventory dimensions, including the location, location directives don't have to be used, because those inventory dimensions are just entered in the work. They are shown in the **From inventory dimensions** section on the **Work inventory transactions** page.

NOTE

After the work is created, the item's inventory transaction where the **Reference** field is set to *Order-committed reservation* is removed. The inventory transaction where the **Reference** field is set to *Work* now holds the physical reservation for all the quantity's inventory dimensions.

2. On the mobile device, finish picking and putting the work by using a menu item where the **Handle by license plate** check box is selected.

NOTE

The **Handle by license plate** functionality helps you process the whole license plate. If you must process part of the license plate, you can't use this functionality.

We recommend that you have separate work generated for each license plate. To achieve this result, use the **Work header breaks** feature on the **Work template** page.

License plate *LPO2* is now picked for sales order lines and put to the *Baydoor* location. At this point, it's ready to be loaded and dispatched to the customer.

Exception handling of warehouse work that has order-committed batch numbers

Warehouse work for picking order-committed batch numbers is subject to the same standard warehouse exception handling and actions as regular work. In general, the open work or work line can be canceled, it can be interrupted because a user location is full, it can be short-picked, and it can be updated because of a movement. Likewise, the picked quantity of work that has already been completed can be reduced, or the work can be reversed.

The following key rule is applied to all these exception handling actions: the batch number that was reserved for the customer can never be replaced with a different batch number, but its storage dimensions (location and license plate) can be changed through either a manual update by the user or an automatic update by the system. The automatic update is based on the same random assignment of storage dimensions that applied when a specific batch was automatically reserved but no storage dimensions were specified.

Example scenario

An example of this scenario is a situation where previously completed work is being unpicked by using the **Reduce picked quantity** function. This example assumes that you've already completed the steps that are described in [Example scenario: Batch number allocation](#). It continues from that example.

1. Go to **Warehouse management > Loads > Active loads**.
2. Select the load that was created in connection with the shipment of your sales order.
3. From the **Load order lines** FastTab, select **Reduce picked quantity**.
4. On the **Reduce picked quantity** page, in the **Move to location** field, select FL-001.
5. In the **Move to license plate** field, select LP33.
6. In the grid, in the **Inventory quantity to unpick** field, enter 10.
7. Select **OK**.

Here are the results of the unpicking action:

- The status of the previously closed work is set to **Canceled**.
- New work of the **Inventory movement** type is created for the unpicked quantity of 10 for batch number **B11**. This work represents the movement from the **Baydoor** location to license plate **LP33** in location **FL-001**. The status is set to **Closed**.
- The system re-reserves the batch number that was originally ordered, and assigns the location and license plate IDs. (This process is equivalent to running the **Reserve line** function for the order line for a given batch number). As a result, batch **B11** is shown as committed on the **Batch numbers committed to source line** FastTab of the **Batch reservation** page, and the **Reservation** field contains a quantity of 10 for batch number **B11**. Additionally, the **Location** field is set to **FL-001**, and the **License plate** field is set to **LP11**. (You can add these fields to the grid if they aren't visible.)

The following tables provide an overview that shows how the system handles order-committed batch reservation for specific warehouse actions. To interpret the content in the tables, assume that each warehouse action is run in the context of existing warehouse work that originates from an order-committed batch reservation, or that execution of each warehouse action affects work of that type.

NOTE

In these tables, the "Batch quantity is available" column indicates whether a batch quantity is available in addition to the quantity that is either already reserved for the current order-committed reservations or already reserved by the warehouse work that originates from reservations of that type.

Override the pick location on the open work

KEY SETUP PARAMETER	BATCH QUANTITY IS AVAILABLE	KEY USER STEPS	WAREHOUSE WORK	ORDER-COMMITTED BATCH RESERVATION
---------------------	-----------------------------	----------------	----------------	-----------------------------------

KEY SETUP PARAMETER	BATCH QUANTITY IS AVAILABLE	KEY USER STEPS	WAREHOUSE WORK	ORDER-COMMITTED BATCH RESERVATION
<p>The Allow pick location override option is enabled on the worker.</p>	Yes	<ol style="list-style-type: none"> 1. Select the Override location menu item on the warehouse app when you start picking work. 2. Select Suggest. 3. Confirm the new location that is suggested based on batch quantity availability. 	<p>On the current work, the following actions occur:</p> <ul style="list-style-type: none"> • The location on the pick line is updated to the new location. (If the location is license plate-controlled, a random license plate is assigned to the work inventory transaction, and the worker can pick from any license plate that has available quantity.) • If the quantity is found on more than one license plate in the new location, the original pick line is split into multiple lines to match each license plate. 	Not applicable
	No	<ol style="list-style-type: none"> 1. Select the Override location menu item on the warehouse app when you start picking work. 2. Manually enter a location. 	The Override location action isn't possible. It fails, and an error is thrown.	Not applicable

	No	See the previous row.	Inventory status changes aren't allowed for quantities that are reserved for work.	Inventory status changes aren't allowed.

Limitations

- The flexible warehouse-level dimension reservation functionality doesn't support the following features:
 - Catch weight management
 - Physical negative inventory
 - Reservation against ordered supply
 - Transfer orders and raw material picking
- The container consolidation rule for packing by directive unit has limitations. For order-committed reservations, we recommend that you not use container build templates where the **Pack by directive unit** field is enabled. In the current design, location directives aren't used when warehouse work is created. Therefore, only the lowest unit in the unit sequence group (the inventory unit) is applied during the containerization wave step.

Troubleshoot reservations in warehouse management

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with warehouse reservations in Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "Reservations cannot be removed because there is work created which relies on the reservations."

Issue description

You can't unreserve inventory on a sales line, because there is open work against the line.

Issue resolution

Investigate whether open packing group work exists to bring the item from a packing station to another location (such as *Baydoor*). Review the records on the **Work creation history log** and **Work details** pages to determine what is physically reserving the inventory, and then complete or delete the work to free up the reservation.

I receive the following error message: "Inventory quantity -%1 could not be updated due to insufficient inventory transactions for item %2...."

Issue description

This issue can occur if the system can't update an inventory quantity because there aren't enough inventory transactions that have the specified dimensions. Here is the full text of the full error message:

```
Inventory quantity -%1 could not be updated due to insufficient inventory transactions for item %2 with dimensions Size=%3, Color=%4, Additions=%5, Site=%6, Warehouse=%7, Location=%8, Inventory status=Available, License plate=%9, Batch number=%10 for reference ID %11 on Lot ID %12.
```

Issue resolution

Make sure that no inventory transactions are physically reserving the quantity. For example, these transactions might open quality orders, inventory blocking records, or output orders.

I receive the following error message: "Physical on-hand...cannot be reserved because only 0.00 are available in the inventory."

Issue description

This issue can occur if the system can't update an inventory quantity because there aren't enough inventory transactions that have the specified dimensions. Here is the full text of the full error message:

```
Physical on-hand Site=%1, Warehouse=%2, Inventory status=Available, Batch number=%3, Owner=%4: %5 cannot be reserved because only 0.00 are available in the inventory.
```

Issue resolution

This issue is probably caused by open work. Either complete the work or receive without work creation. Make sure that no inventory transactions are physically reserving the quantity. For example, these transactions might be open quality orders, inventory blocking records, or output orders.

I receive the following error message: "To be assigned to wave, load lines must specify the dimensions above the location. To assign these dimensions, reserve and recreate the load line."

Issue description

When you use an item that has a "batch above" reservation hierarchy (with the **Batch number** dimension placed *above* the **Location** dimension), the **Release to warehouse** command on the **Load planning workbench** page for a partial quantity doesn't work. You receive this error message, and no work is created for the partial quantity.

However, if you use an item that has a "batch below" reservation hierarchy (with the **Batch number** dimension placed *below* the **Location** dimension), you can release a load from the **Load planning workbench** page for a partial quantity.

Issue resolution

This behavior is by design. If you put a dimension above the **Location** dimension in the reservation hierarchy, it must be specified before the release to the warehouse. Microsoft has evaluated this issue and has determined that it's a feature limitation during releases to the warehouse from the load planning workbench. Partial quantities can't be released if one or more dimensions above **Location** aren't specified.

For more information, see [Flexible warehouse-level dimension reservation policy](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Partial shipment of a transport load

2/18/2021 • 2 minutes to read • [Edit Online](#)

By setting up partial shipment of loads, you can handle loads where the capacity can't be determined until all the sales lines have been added to a load. The process can then be finalized when the exact pallet count is known. Therefore, you don't have to decide which pallets will be assigned to which transport until the moment when a transport is being physically loaded out of the staged inventory.

This feature offers an alternative to the enforcement of a more rigid structure, where you must determine which pallets will be assigned to which transport before picking work or loading work can be created. Instead, users can configure individual loads for a partial shipment confirmation. The transport loading processes for those loads can then occur. Therefore, the transportation planning department can plan loads without having to consider the capacity of individual transports.

At the time of loading, workers can define a new transport load that a pallet can be loaded to. Alternatively, they can identify an existing transport load. This data can be recorded via a mobile device. Therefore, several warehouse workers can load inventory from the same loads or different loads onto the same truck. The loads can then be fully or partially shipped.

NOTE

In order to load inventory from a load to a specific transport load and partially ship the load, work must be generated by using a loading class in a work template. Ordinary picking work of the **Picking** type can't be loaded to a transport load such as a truck.

Set up transport loads for partial shipment

The setup for partial shipment of loads consists of the following two procedures.

Set the loading strategy

You must enable partial loading by setting the loading strategy. You can set the loading strategy after you've created a load.

1. Select **Warehouse management > Loads > All loads**.
2. Select a load, and then click **Header**.
3. In the **Loading strategy** field, select **Partial load shipping allowed**.

Create a menu item for loading of transport loads

You must create a new menu item that enables transport loads to be loaded. A transport load lets you group work lines from one load or multiple loads. Everything that is added to the transport load can then be shipped by using a mobile scanner.

1. Select **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select **New**, and then, in the **Mode** field, select **Work**.
3. Set the **Use existing work** option to **Yes**.
4. On the **General** tab, in the **Directed by** field, select **Transport loading**.
5. To enable shipment confirmation on a mobile scanner, in the **Allowed ship confirmation type** field, select **Transport load**.

Confirm shipment of a transport load from the client

This setup lets you confirm a transport load that includes a full load or a partially loaded load to be shipped.

1. Select **Warehouse management** > **Loads** > **Transport loads**.
2. On the Action Pane, on the **Ship and receive** tab, in the **Confirm** group, select **Transport**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Batch release of partially reserved transfer orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

The functionality for batch release of partially reserved transfer orders lets you partially release transfer orders to a warehouse by using a batch job. Because you have the option to release a partial quantity, you don't have to wait for the whole order quantity to be available in the warehouse before you release an order.

The release of orders to a warehouse is an advanced warehouse management process. This process involves activities, such as picking, packing, and shipping, that a warehouse worker can perform by using a mobile device.

Where it applies

For this functionality, transfer orders are released to a warehouse by using a batch job. This functionality is useful when you don't have enough inventory in the warehouse, but you still want to transfer items from one warehouse to another.

How it is set up

Specify fulfillment criteria for transfer orders and sales orders

Before an order can be partially released to a warehouse in a batch, the fulfillment criteria must be met. These fulfillment criteria are determined by the fulfillment policy.

Fulfillment policies for transfer orders and sales orders are specified at the company level. Depending on the setup of the fulfillment policy, the release of orders in a batch will be accepted or rejected. The orders will then be processed accordingly.

- To create fulfillment policies for transfer orders and sales orders, click **Warehouse management > Setup > Release to warehouse > Fulfillment policy**, and then create a fulfillment policy by entering a name and a description.
- To specify a fulfillment rate, a value type, and the message that is shown if the fulfillment policy is violated, click **Warehouse management > Setup > Release to warehouse > Fulfillment policy**, and then set the **Fulfillment rate**, **Value type**, and **Fulfillment violation message** fields.

Set the fulfillment policies for transfer orders and sales orders

- To set the fulfillment policies for transfer orders, click **Inventory management > Setup > Inventory and warehouse management parameters > Transfer orders > Warehouse management**, and then select a transfer order fulfillment policy.
- To set the fulfillment policies for sales orders, click **Accounts receivable > Setup > Accounts receivable parameters > Warehouse management**, and then select a sales order fulfillment policy.

Allow release in a batch and specify the quantity that should be release in a batch

A batch job is used to release orders to a warehouse in a batch. The parameters that distinguish the orders that should be run in a batch job are set on the batch job itself.

The **Quantity** parameter specifies whether the whole quantity or the physically reserved quantity should be released in the batch. The **Allow release of partially released orders** parameter determines whether orders

in the batch should be accepted or rejected if they were partially released earlier.

- To set the **Quantity** and **Allow release of partially released orders** parameters for transfer orders, click **Warehouse management > Release to warehouse > Automatic release of transfer orders**.
- To set the **Quantity** and **Allow release of partially released orders** parameters for sales orders, click **Warehouse management > Release to warehouse > Automatic release of sales orders**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot partial releases and partial shipments

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with partial releases and partial shipments in Microsoft Dynamics 365 Supply Chain Management.

The release status of a sales order remains Partially released even after the sales order is invoiced.

Issue description

A sales order is a delivery order, but one or more items on it have a different mode of delivery. After the order is invoiced, it still has a release status of *Partially released*.

For example, a sales order has two items: one for delivery and one for pickup. Both the delivery and the pickup have been done. Therefore, both lines have been invoiced. However, the release status is still shown as *Partially released*, which is misleading.

Issue resolution

The release status applies only to order lines where the items are enabled for warehouse management. Therefore, the release status remains *Partially released* in this scenario. Microsoft has evaluated this issue and has determined that it's a feature limitation. An extension could be added as part of the packing slip and invoicing process to update the release status.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up cluster picking

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to enable workers to use their mobile devices to group picking work into clusters, so that they can pick items from a single location for multiple work orders at the same time. This is called *cluster picking*.

About cluster picking

After work orders are released to the warehouse, the worker can use a mobile device to assign the orders to a cluster. The cluster will organize the picking work for the worker. When a work order is assigned to a cluster, the worker must use cluster picking to perform the picking work for the order. The worker cannot use other picking methods. If a work order is assigned to a cluster by mistake, the worker must break the cluster and then re-create it.

If needed, a worker can pass a cluster to another worker. This changes the cluster status to Passed. When the worker uses a mobile device to indicate that the picking and put away work is completed, the shipment or load must be confirmed in the client.

Enable cluster picking

To enable cluster picking, you must set up the following:

- **Cluster profiles** – Specify whether to automatically generate cluster IDs, the number of positions to use, when to break clusters, and how to sequence and verify the picking work.
- **Work templates** – Define how to create the picking work for cluster picking.
- **Location directives** – Specify where to pick items from, and where to put them.
- **Mobile device menu items** – Configure a mobile device menu item to use existing work that is directed by cluster picking. You must then add the menu item to a mobile device menu so that it is displayed on mobile devices.
- **Warehouse management parameters** – Specify the number sequence to use if you want to generate identifiers for clusters.

Set up a cluster profile

To set up a cluster profile, follow these steps:

1. Click **Warehouse management > Setup > Mobile device > Cluster profiles**.
2. Click **New** to create a new profile.
3. Click **Create cluster** and, under **Cluster sorting**, click **New** to set up the sorting criteria for the cluster. The sorting criteria control the order in which the worker will perform the picking work. You can add as many criteria as needed.
4. In the **Sequence number** field, enter a number to define the order in which the sorting criteria are processed.
5. In the **Field name** field, select the field that will determine the sorting. For example, if you select the **WMSLocationId** field, the work will be sorted by location.

6. In the **Sorting** field, select one of the following options.

OPTION	DESCRIPTION
Ascending	Picking work is sequenced in ascending order based on the sorting criteria. For example, if you use the WMSLocationId field as sorting criteria, and your location IDs are 1, 2, 3, and 4, you will pick from location 4 first.
Descending	Picking work is sequenced in descending order based on the sorting criteria. For example, if you use the WMSLocationId field as sorting criteria, and your location IDs are 1, 2, 3, and 4, you will pick from location 1 first.

Item confirmation

When cluster picking is applied, item confirmation is crucial to verify the items that are added to clusters. You can verify items in cluster picking during the cluster picking process. The setup is based on the product bar code setup.

Set up item verification with cluster picking

1. On a mobile device menu item, open the setup form for work confirmation: **Warehouse management > Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. From the mobile device menu item, open **Work confirmation setup**. The **Product confirmation** option allows you to verify each piece of inventory from the mobile device when scanned.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cluster position full

2/18/2021 • 10 minutes to read • [Edit Online](#)

The *Cluster position full* feature offers an alternative to more rigid enforcement of work break rules when cluster picking is used, because it enables a larger margin of error in the volumetric constraints of containers or totes. In a common scenario, not all items on a work order fit into a selected container. Warehouse workers who are cluster picking have few options in this scenario: they must either change to a larger container size or work with their supervisor to come up with a different solution.

This feature introduces the ability to run the **Full** button on one of the work units in a cluster. In older versions, this option was available only for regular order picking, not for cluster picking. However, this feature differs from the standard **Full** button in that it cancels the remaining work. It doesn't suggest that the user add another bin to the same cluster, and it doesn't automatically create new work.

Turn on the Cluster position full feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Cluster position full*

Setup

This section provides guidelines, and an example that shows how to set up and use the *Cluster position full* feature.

Make sample data available

To work through the [example scenario](#) by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use the example scenario as guidance for working with this feature on a production system. However, in that case, you must substitute your own values for the settings that are described here.

Cluster profiles

You must specify whether cluster IDs are automatically generated, how many positions are used, when clusters are broken, and how the picking work is sequenced and verified.

1. Go to **Warehouse management > Setup > Mobile device > Cluster profiles**.
2. In the list pane, select the **Create Cluster** record.
3. On the **General** FastTab, verify the following values:
 - **Generate cluster ID:** *Yes*
 - **Activate positions:** *Yes*
 - **Number of positions:** *2*
 - **Position name:** *Numeric*
 - **Break cluster at:** *Put*
 - **Sort verification type:** *Position scan*

4. In the **Cluster sorting** FastTab. The grid should be blank (that is, it should contain no lines).

Work templates

You must define how the picking work for cluster picking is created.

1. Go to **Warehouse management > Setup > Work > Work templates**.
2. At the top of the page, set the **Work order type** field to *Sales orders*.
3. Make sure that the following work templates from the demo data are listed. If they aren't available, you won't be able to complete the scenario.
 - 61 SO Stage
 - 61 SO Cluster pick

Location directives

You must specify where items are picked from and where they are put.

1. Go to **Warehouse management > Setup > Location directives**.
2. In the list header, set the **Work order type** field to *Sales orders*.
3. Make sure that the following sales order directives from the demo data are listed. If they aren't available, you won't be able to complete the scenario.
 - 61 Cluster pick
 - 61 SO Pick order

Mobile device menu items

You must configure a mobile device menu item to use existing work that is directed by cluster picking. In the mobile device menu item for cluster picking, the **Allow splitting of work** parameter must be turned on, and the *SO Pick* work class must be added.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. In the list pane, select the **Cluster Pick Create** record.
3. Select **Edit** in the Action pane.
4. On the **General** FastTab, set the following values:
 - **Directed by:** *Cluster picking*
 - **Generate license plate:** *Yes*
 - **Allow splitting of work:** *Yes*
 - **Cluster profile ID:** *Create Cluster*Accept the default values for all other fields.

5. On the **Work classes** FastTab, add the following two lines, as required:
 - Line 1 (usually present in demo data):
 - **Work class ID:** *Sales*
 - **Work order type:** *Sales orders*
 - Line 2 (probably not present in demo data):
 - **Work class ID:** *SO Pick*
 - **Work order type:** *Sales orders*
6. Go to **Work confirmation setup** in the Action pane.

7. Select **Edit**.
8. Enter the following values on the line in grid.
 - **Work type** - *Pick*
 - **Product confirmation** - *Select the check box*
9. Select **Save** in the Action pane and close the page.

Create picking work

Before you can start cluster picking, you must create some outbound work. The cluster profile that you created earlier specifies two cluster positions. Therefore, at least two work IDs must be created for sales order picking. For this scenario, transactions will occur in warehouse *61*, and they will use items *L0101* and *T0100*. The demo data should have enough on-hand inventory of these items. Make sure that you have enough inventory to complete the transactions.

Create sales order 1

1. Go to **Sales and Marketing > Sales orders > All sales orders**.
2. Select **New** to create sales order 1.
3. In the **Create sales order** dialog box, set the following values:
 - **Customer account**: *US-010*
 - **Warehouse**: *61*
4. Select **OK**.
5. The new sales order is opened. On the **Sales order lines** FastTab, add a line that has the following settings:
 - **Item number**: *T0100*
 - **Quantity**: *5*
6. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
7. On the **Sales order lines** FastTab, add a second line that has the following settings:
 - **Item number**: *L0101*
 - **Quantity**: *20*
8. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
9. For each line that you just added, follow these steps to reserve inventory:
 - a. Select the line to reserve.
 - b. On the **Sales order lines** FastTab, select **Inventory > Reservation**.
 - c. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
 - d. Close the **Reservation** page.
10. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

When the release is completed, you receive informational messages that show the wave and load IDs that were created.

Create sales order 2

1. Go to **Sales and Marketing > Sales orders > All sales orders**.
2. Select **New** to create sales order 2.
3. In the **Create sales order** dialog box, set the following values:

- **Customer account:** *US-011*
 - **Warehouse:** *61*
4. Select **OK**.
 5. The new sales order is opened. On the **Sales order lines** FastTab, add a line that has the following settings:
 - **Item number:** *L0101*
 - **Quantity:** *20*
 6. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
 7. On the **Sales order lines** FastTab, add a second line that has the following settings:
 - **Item number:** *T0100*
 - **Quantity:** *2*
 8. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
 9. For each line that you just added, follow these steps to reserve inventory:
 - a. Select the line to reserve.
 - b. On the **Sales order lines** FastTab, select **Inventory > Reservation**.
 - c. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
 - d. Close the **Reservation** page.
 10. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

When the release is completed, you receive informational messages that show the wave and load IDs that were created.

Get work IDs and license plate numbers

Two work IDs should have been created, each of which has two pick lines. Follow these steps to find the work IDs and license plate assignments.

1. Go to **Warehouse management > Work > Work details**.
2. In the **Overview** grid, search the **Order number** column for the two sales orders that you just created. For each sales order, make a note of the corresponding work ID.
3. Select the row for each sales order to show related information in the **Lines** grid. Make a note of the location that each item will be picked from.
4. Go to **Inventory management > Inquiries and reports > On-hand list**.
5. On the Action Pane, select **Dimensions** to open the **Dimension display** dialog box.
6. Make sure that the **License plate**, **Warehouse**, and **Item number** check boxes are selected, and then select **OK**.
7. In the **Filter** pane, set the following filters:
 - **Item number – is one of** – *L0101* and *T100*
 - **Warehouse – begins with** – *61*
8. Make a note of the **License plate** values that are shown.

Example scenario

Mobile device flow execution – Work confirmation setup for the product

1. Sign in to the warehouse app as a user in warehouse *61*.

2. Go to **Outbound > Cluster pick create**.

The **TASK: Assign work to Cluster** page appears.

3. Enter the work ID for sales order 1 to assign it to cluster position 1.

4. Select **OK** (check mark symbol).

5. Enter the work ID for sales order 2 to assign it to cluster position 2.

6. Select **OK** (check mark symbol).

The **TASK: Cluster Pick Create: Pick** page appears and shows *Item L0101 2 PL*.

Because the cluster profile set the number of positions to 2, the system automatically directs you to the first consolidate pick: two pallets (PL) of item *L0101*.

At any time during the following steps, you can select the **Details** tab to view additional information about the task, such as the picking location.

1. Set the **ITEM** field to *L0101*. This confirms the item number, which is required for this menu item (you configured this earlier by selecting **Work confirmation setup** from the **Mobile device menu item** page when you created this menu item).

2. Enter the license plate number that is associated with the item in the location that is being picked. You will pick two pallets.

3. Set the **LP** field to *LP_PICK_01*.

4. Select **OK** (check mark symbol).

The **TASK: Sort: Cluster Pick Create** page appears. Here, you will sort the two picked pallets into a pick position. This position might be a tote or container that is used to separate the picked inventory by sales order.

5. View the details that are shown for the item (*L0101*) and quantity (*20 ea*) that will be sorted into position 1 (for sales order 1).

6. Set the **POSITION NA** field to *1*.

7. Select **OK** (check mark symbol).

8. View the details that are shown for the item (*L0101*) and quantity (*20 ea*) that will be sorted into position 2 (for sales order 2).

9. Set the **POSITION NA** field to *2*.

10. Select **OK** (check mark symbol).

The **TASK: Cluster Pick Create: Pick** page appears and shows *Item T0100 7 ea*.

In this scenario, position 1 can't accept the full quantity of items that must be picked to fulfill sales order 1. A position must be marked as full. In this scenario, you will do a partial pick of the second item. The second item will be partially picked for position 1, and new work will be created to pick the remaining quantity to fulfill the order.

1. Select the Menu button (sometimes referred to as the hamburger or the hamburger button), and then select **Position full**.

2. Identify the position that is full, and select *1*.

3. Select **OK** (check mark symbol).

4. Enter the pick quantity that can still be picked into position 1. The system can determine which item number is being picked.
5. Enter 2.
6. Select **OK** (check mark symbol).
7. Confirm the item number to complete the pick of the remaining item into position 2.
8. Set the **ITEM** field to *T0100*.
9. Select **OK** (check mark symbol).
10. Enter the license plate that the item is being picked from by setting the **LP** field to *LPREPL04*.
11. Select **OK** (check mark symbol).
12. View the details that are shown for the item (*T0100*) and quantity (2 ea) that will be sorted into position 2 (for sales order 2).
13. Set the **POSITION NA** field to 2.
14. Select **OK** (check mark symbol).
15. View the details that are shown for the item (*T0100*) and quantity (2 ea) that will be sorted into position 1 (for sales order 1).
16. Set the **POSITION NA** field to 1.
17. Select **OK** (check mark symbol).

The **TASK: Cluster Pick Create: Put** page appears.

In this scenario, the cluster pick has been completed, and the user is directed to put away the picked items from position 1 and position 2 into staging location *STAGE01*.

1. Review the information on the page. It shows that a total quantity of 44 will be put to the staging location.
2. Select **OK** (check mark symbol).

You receive a "Cluster Completed" message.

You can now use the **Sales Picking** menu item to pick the remaining quantity. You can then use the **Sales loading** menu item to move the items from the staging location to the loading dock.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

System-directed cluster picking

2/18/2021 • 9 minutes to read • [Edit Online](#)

Cluster picking is a piece picking process that lets you pick items for multiple orders at the same time by clustering them into pick clusters. You then have to visit the pick location only one time. Typically, this functionality is used with small order picking or quantities that are less than case quantities.

When system-directed cluster picking is set up, you can cluster-pick work headers, based on a system-generated cluster. The system cluster-picks orders up to the number of positions that is specified in the cluster profile. Therefore, you can pick multiple orders at the same time without having to manually create a cluster.

System-directed cluster picking offers an alternative to manual cluster building, where a cluster profile is used to create a cluster. Several setup-related lines must be defined in the cluster profile before it's used:

- **Number of positions** corresponds to the number of orders that will be put on a cluster. Therefore, it corresponds to the number of totes.
- **Break cluster** determines when the cluster should be broken.
- **Generate cluster ID** controls whether the cluster ID will be generated by the system or entered by the user.
- **Sort verification type** determines whether position verification is required.

A new mobile device menu item is used for system-directed cluster picking. The **Cluster profile ID** must be specified for the selected **Directed by** option. Additionally, the system-directed work sequence queries can group orders based on company-specific criteria. Therefore, you can further optimize the assignment of work orders by specifying customized sorting criteria using the system-directed work sequence queries.

When system-directed cluster picking is enabled, warehouse workers are presented with a cluster where picking orders have been preassigned to cluster positions. Therefore, workers can start to pick an item for multiple work orders by visiting the pick location only one time. The picking process for system-directed cluster picking is the same as the process for user-directed cluster picking.

Enable the System-directed cluster picking feature

Before you can use this feature, it must be enabled on your system. Administrators can use the [feature management](#) page to check the feature status and enable it if needed. Here, the feature is listed as:

- **Module** - Warehouse management
- **Feature name** - System directed cluster picking

This feature also requires enabling a dependent feature. The dependent feature is:

- **Module** - Warehouse management
- **Feature name** - Organization-wide system directed work sequencing

Set up system-directed cluster picking

Create cluster profiles

Cluster profiles control how the system creates each cluster. If different clusters are required, a different cluster profile should be created for each mobile device menu item.

1. Go to **Warehouse management > Setup > Mobile device > Cluster profiles**.
2. Select **New**.

3. In the **Cluster profile ID** field, enter **2 Position**.
4. In the **Name** field, enter **2 Position**.
5. On the **General** FastTab, enter the following information:
 - **Generate cluster ID** - Select **Yes**. This option determines whether the cluster ID is automatically created by the system, or whether the user will create it at the start of picking.
 - **Activate positions** - Select **Yes**. This option determines whether the position names are automatically generated based on the position name setup. If this option is set to **No**, the license plate ID for the position is used.
 - **Number of positions** - Select **2**. This field determines the maximum number of positions that the cluster can have (that is, the maximum number of boxes, totes, and so on).
 - **Position name** - Select **Numeric** so that positions are named by using continuous numbers. If you select **Alphabetical**, the positions are named in alphabetical order.
 - **Break cluster at** - Select **Put**. This field determines when the cluster is broken.
 - **Sort verification type** - Select **Position scan**. This field determines whether the put-to-position step is verified.
6. On the **Cluster sorting** FastTab, you define sorting criteria by creating a new line and enter the following information:
 - **Sequence number** - Select **1**. This field determines the sequence that the system sorts by. A value is entered automatically, but you can change it if needed.
 - **Field name** - Enter **WMSLocationId**. This field determines the field that the line uses for sorting criteria.
 - **Sorting** - Select **Ascending**. This field defines whether the sorting is done in ascending or descending order.

Create a mobile device menu item

To create a new mobile device menu item for system-directed cluster picking and link the cluster profile ID to the mobile device menu item, follow these steps.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select **New**.
3. In the header section, enter the following information:
 - **Menu item name** - SD Cluster
 - **Title** - SD Cluster
 - **Mode** - Work
 - **Use existing work** - Yes
4. On the **General** FastTab, enter the following information:
 - **Directed by** - System directed cluster picking
 - **Generate license plate** - Yes
 - **Cluster profile ID** - 2 Position
5. On the **Work classes** FastTab, set up the valid work class for this mobile device menu item by setting the following fields:
 - **Work class ID** - Sales
 - **Work order type** - Sales orders
6. In the **Mobile device menu items** Action Pane, select **System directed work sequence queries** and follow these steps to specify a new system-directed work sequence query:

- Select **New** in the Action Pane.
- **Sequence number** - 1
- **Description** - Work priority – Work ID

7. On the Action Pane select **Edit query**

8. Select the **Sorting** tab

9. Select **Add** to add a new line, then enter the following:

- **Table** - Work
- **Derived table** - Work
- **Field** - Work priority
- **Search direction** - Ascending

10. Select **Add** to add a second line, then enter the following:

- **Table** - Work
- **Derived table** - Work
- **Field** - Work ID
- **Search direction** - Ascending

11. The system will now sort work IDs in the cluster, first by work priority and then by work ID.

Set up a mobile device menu

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
2. Add the **SD Cluster** menu item that you just created to a Mobile device menu.
3. Select the **Outbound** menu.
4. Select **Edit** from the Action Pane.
5. Scroll until you find **SD Cluster**.
6. Select **SD Cluster**, the arrow pointing to the **Menu Structure** list will be enabled.
7. Select the **arrow** button to move the **SD Cluster** menu item into the **Outbound** menu structure.
8. Select **SD Cluster** from the **Menu Structure** list, then select the **UP** or **DOWN** arrows to move the menu item into the desired position on the mobile device menu.

Scenario

Create picking work

Before you can set up system-directed cluster picking, you must create eligible outbound work. The cluster profile that you created earlier specifies two cluster positions. Therefore, you must create at least two work IDs. In this scenario you will create two sales orders, reserve inventory, release the sales orders to the warehouse, and then manually process the wave.

1. Go to **Sales and Marketing > Sales orders > All sales orders**.
2. Select **New** in the Action Pane to create the first sales order.
 - The **Create sales order** menu opens, enter the following information:
 - On the **Customer** FastTab, enter **Customer account - US-004**.
 - On the **General** FastTab, enter **Warehouse - 62**.
 - Select **OK** to close the menu and create the sales order.
 - On the **Sales order lines** FastTab, select **Add line** if a new line is not automatically added and enter the following:
 - **Item number** - A0001
 - **Quantity** - 1
 - Select **Add line** to add a second line.

- **Item number** - A0002
 - **Quantity** - 3
 - Reserve inventory for both of the lines that you just created.
 - Select **Line 1**.
 - On the **Sales order lines** Action Pane, select **Inventory**, and then select **Reservation** from the list.
 - On the **Reservation** form, select **Reserve lot** to reserve the inventory.
 - Close the **Reservation** form when the reservation is completed.
 - Repeat these steps to reserve inventory for **Line 2**.
3. Select **New** in the Action Pane to create the second sales order
- The **Create sales order** menu opens, enter the following information:
 - On the **Customer** FastTab, enter **Customer account** - US-005.
 - On the **General** FastTab, enter **Warehouse** - 62.
 - Select **OK** to close the menu and create the sales order
 - On the **Sales order lines** FastTab, select **Add line** if a new line is not automatically added and enter the following information:
 - **Item number** - A0001
 - **Quantity** - 4
 - Select **Add line** to add a second line.
 - **Item number** - A0002
 - **Quantity** - 2
 - Reserve inventory for both lines that you just created.
 - Select **Line 1**.
 - On the **Sales order lines** Action Pane, select **Inventory**, and then select **Reservation** from the list.
 - On the **Reservation** form, select **Reserve lot** to reserve the inventory.
 - Close the **Reservation** form when the reservation is completed.
 - Repeat these steps to reserve inventory for **Line 2**.
 - Close the sales order and return to the **All sales orders** list page.
4. Find the two sales orders you just created (you may need to refresh the page). In the table, select both sales orders using the section check mark.
- In the **All sales orders** Action Pane, select the **Warehouse** tab.
 - In the **Actions** group, select **Release to warehouse** to release both sales orders to the warehouse.
5. When the release to warehouse process is completed, an informational message will be displayed.
- Shipments will be created for each sales order.
 - A wave will be created and both shipments will be assigned to the wave. Make note of the **Wave ID**.
6. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
- In the **All waves** list find and select the **Wave ID** that you created in the previous step.
 - In the Action Pane, select the **Wave** tab,
 - In the **Wave** group, select **Process** to process the wave and create **Work**.
 - Informational messages will be generated when processing has been completed, indicating that work has been created and the wave has been posted.
7. **Optional:** Go to **Warehouse management > Work > Work details** to view the work created. Two different work IDs are created. Each work ID has two pick lines.

Run the mobile device flow

1. Sign in to the mobile device for a user in warehouse 62.

2. On the **Main Menu**, select **Outbound**.
3. On the **Outbound** menu, select **SD Cluster** to initiate the pick.
 - A cluster is created, and the two work IDs that you created earlier are attached. If you created more than two work IDs, only the first two are added to the cluster. Notice that the work IDs are added to the cluster in ascending order, as you specified in the query setup.

NOTE

The new cluster is automatically created only if enough additional work IDs were previously created. Otherwise, the following message is shown: "Not enough work can be found for cluster."

- After you select the menu, the first pick screen appears. The system aggregates all matching pick lines from the two work IDs and directs you to visit the pick location one time, so that you can satisfy both orders by using one pick. This process is done in the same way as the process for user-directed cluster picking.
4. Confirm the first picking location and item by selecting **OK**.
 - The quantity of the pick will be the total of the item displayed on the sales orders in the cluster.
 5. Enter the position name (Numeric or Alphabetical) to confirm that the item quantity picked for the position were put in the correct position.
 6. Repeat this process until all item quantities have been picked and put in the correct position.
 7. The last step on the mobile device is to **Put** the cluster in the final location. Select **OK**
 - When the put operation is confirmed, the cluster is closed and broken, based on the value that you set for the **Break cluster at** field in the cluster profile. Work IDs are also closed.
 8. A "Cluster complete" message is shown on the mobile device.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set different dimensions for packing and storage

2/18/2021 • 4 minutes to read • [Edit Online](#)

Some items are packed or stored in such a way that you may need to track physical dimensions differently for each of several different processes. The *Packaging product dimensions* feature lets you set up one or several types of dimensions for each product. Each dimension type provides a set of physical measurements (weight, width, depth, and height), and establishes the process where those physical measurement values apply. When this feature is enabled, your system will support the following types of dimensions:

- *Storage* - Storage dimensions are used along with location volumetrics to determine how many of each item can be stored in various warehouse locations.
- *Packing* - Packing dimensions are used during containerization and the manual packing process to determine how many of each item will fit in various container types.
- *Nested packing* - Nested packing dimensions are used when the packing process contains multiple levels.

Storage dimensions are supported even when the *Packaging product dimensions* feature isn't enabled. You set these up using the **Physical dimension** page in Supply Chain Management. These dimensions are used by all processes where the packing and nested packing dimensions aren't specified.

Packing and *nested packing* dimensions are set up using the **Physical product dimensions** page, which is added when you enable the *Packaging product dimensions* feature. This topic provides a scenario that illustrates how to use this feature.

Turn on the packaging product dimensions feature

Before you can use this feature, it must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Packaging product dimensions*

Example scenario

Set up the scenario

Before you can run the example scenario, you must prepare your system as described in this section.

Enable demo data

To work through this scenario using the demo records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the *USMF* legal entity before you begin.

Add a new physical dimension to a product

Add a new physical dimension for a product by doing the following:

1. Go to **Product information management > Products > Released products**.
2. Select the product with **Item number** *A0001*.
3. On the Action Pane, open the **Manage inventory** tab and, from the **Warehouse** group, select **Physical product dimensions**.
4. The **Physical product dimensions** page opens. On the Action Pane, select **New** to add a new dimension to the grid with the following settings:

- Physical dimension type - *Packing*
- Physical unit - *pcs*
- Weight - *4*
- Weight unit - *kg*
- Depth - *3*
- Height - *4*
- Width - *3*
- Length - *cm*
- Volume unit - *cm3*

The **Volume** field is automatically calculated based on your **Depth**, **Height**, and **Width** settings.

Create a new container type

Go to **Warehouse management > Setup > Containers > Container types** and create a new record with the following settings:

- Container type code - *Short Box*
- Description - *Short Box*
- Maximum net weight - *50*
- Volume - *144*
- Length - *6*
- Width - *6*
- Height - *4*

Create a container group

Go to **Warehouse management > Setup > Containers > Container groups** and create a new record with the following settings:

- Container group ID - *Short Box*
- Description - *Short Box*

Add a new line to the **Details** section. Set the **Container type** to *Short Box*.

Set up a container build template

Go to **Warehouse management > Setup > Containers > Container build templates** and select **Boxes**. Change the **Container group ID** to *Short Box*.

Run the scenario

After you have prepared your system as described in the previous section, you are ready to run the scenario as described in the next section.

Create a sales order and create a shipment

In this process you will create a shipment based on the item *packing* dimensions, for which the height is less than 3.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:
 - Customer account: *US-001*
 - Warehouse: *63*
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines**

FastTab. On this line, set the following values:

- **Item number:** *A0001*
- **Quantity:** *5*

6. On the **Sales order lines** FastTab, select **Inventory > Reservation**.
7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
8. Close the page.
9. On the Action Pane, open the **Warehouse** tab and select **Release to warehouse** to create work for the warehouse.
10. On the **Sales order lines** FastTab, select **Warehouse > Shipment details**.
11. On the Action Pane, open the **Transportation** tab and select **View containers**. Confirm that the item was containerized into the two *Short Box* containers.

Place an item into storage

1. Open the mobile device, sign in to warehouse 63 and go to **Inventory > Adjust In**.
2. Enter **Loc** = *SHORT-01*. Make a new license plate with **Item** = *A0001* and **Quantity** = *1 pcs*.
3. Select **OK**. You will receive the error "Location SHORT-01 failed because item A0001 does not fit in location's specified dimensions." This is because the *Storage* type dimensions of the product are larger than the dimensions specified on the location profile.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up containerization

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to automate the containerization of loads in Warehouse management. Automated containerization creates containers and the picking work for shipments when a wave is processed and work lines can be split into quantities that fit the containers. This helps warehouse workers to pick the items directly into the chosen container. Compared to the manual packing process, tasks such as creating containers, assigning items, and closing containers are automated by the system. This procedure uses the USMF demo company and is performed by a Warehouse manager.

Set up a wave template

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Waves > Wave templates**.
2. Select **New**.
3. In the **Wave template name** field, type a value.
4. In the **Wave template description** field, type a value.
5. In the **Site** field, enter or select a value.
6. In the **Warehouse** field, enter or select a value.
7. Expand the **Methods** section. The **Selected methods** pane lists the methods for the selected wave template type. The wave template must include the containerize method.
8. In the **Wave step code** field, type a value. Enter a Wave step code for the added method, which can be any code. It's possible to add the method more than once and assign different wave step codes. To do this, select **Repeatable for this method** in the **Wave process methods** page.
9. Select **Save**.
10. Close the page.

Set up a container type

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Containers > Container types**. You can define your containers in the **Container types** page. You can configure the physical dimensions of containers including tare weight, maximum weight, maximum volume, length, width, and height. In this example, we have three different sizes of boxes.
2. Select **New**.
3. In the **Container type code** field, type a value.
4. In the **Tare weight** field, enter a number.
5. In the **Maximum weight** field, enter a number.
6. In the **Volume** field, enter a number.
7. In the **Length** field, enter a number.
8. In the **Width** field, enter a number.
9. In the **Height** field, enter a number.
10. In the **Description** field, type a value.
11. Select **Save**.
12. Repeat steps 2-11 two more times to make three total container types.
13. Close the page.

Set up a container group

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Containers > Container groups**.
2. On the Action Pane, select **New**. You can set up logical groups of container types. For each group, you can specify the sequence in which to pack the containers and the percentage of the containers to fill. The size dimensions of the item is used to determine whether it will fit in a container. The container that is closest to the size dimensions of the item is used. If you have multiple container types in a group, we recommend that you arrange the sequence by size, so that the largest container is first, number 1 in the sequence, and the smallest container is last.
3. In the **Container group ID** field, type a value that you created earlier.
4. In the **Description** field, type a value.
5. Repeat steps 2-4 for all three container types you created earlier.
6. Select **Save**.
7. Close the page.

Set up a container build template

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Containers > Container build templates**.
2. Select **New**. The container build template is based on which of the containerization processes are performed. Each container build template defines one containerization process that will be used by a wave template. The **Edit query** option allows you to define the conditions on which the selected template will be processed. For example, you may want to only run containerization for specific customers, products, or warehouses or you can add the corresponding query ranges to the template. The **Wave step code** field is how a container build template is linked to steps in a wave template. When a wave is executed, it determines which container build template(s) are used to initiate containerization. The Base query type field determines what to pack and what to base the filter query on.
3. In the **Container template ID** field, type a value.
4. In the **Container group ID** field, enter or select a value.
5. In the **Wave step code** field, type a value.
6. Select the **Allow split picks** check box.
7. Select **Save**.
8. Select **Container mixing constraints**. Mixing logic breaks allows you to set up rules for packing allocation lines in containers. For example, if you add the **Item number field**, when items are assigned to containers, a new container will be created when there is a new item number. This will prevent workers from packing allocations lines for two different customers in the same container.
9. Select **New**.
10. In the **Table** field, select an option.
11. In the **Field Select** field, enter or select a value.
12. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Batch and license plate confirmation

2/18/2021 • 2 minutes to read • [Edit Online](#)

Batch confirmation allows you to confirm that the correct batch is being picked from the mobile device. On the initial pick of work for batch above-items only, where batch above indicates that batch ranges higher than location in the search hierarchy, you must verify that the batch that is picked matches the batch on the work line.

License plate confirmation allows you to confirm that the correct license plate is being picked from the mobile device. When picking work from a stage location, you must verify that the license plate that is picked matches the license plate that is associated with the work. If the work is started by scanning a license plate, this confirmation step will be skipped.

Where it applies

Confirmation applies in the following scenarios:

- Batch confirmation applies to the initial picks of work for batch above-items.
- License plate confirmation applies to picks from stage locations.

IMPORTANT

Replenishment is not supported for license plate confirmation. When executing replenishment work, no license plate confirmation step is created.

Set up batch and license plate confirmation

You can configure batch and license plate confirmation from the mobile device menu items.

1. From the mobile device menu items, enter the work confirmation setup.
2. Select the option for either batch or license plate confirmation. Both options are available for work type picks that do not have automatic confirmation enabled.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Enable license plate label printing

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic shows how to enable the automatic printing of a Serial shipping container code (SSCC) label after the last item is picked from inventory in a sales picking work process. You can run this procedure in demo data company USMF. If you're run it using your own data, you need to have a number sequence set up for license plates. You need to set up a label printer before you begin this task. Go to Organization administration > Setup > Network printers. On the Action Pane, click Options, and then click the Download document routing agent installer button. Run the installer and make sure that you have a working network printer set to Active before you continue with the procedure.

Set up the GS1 company prefix

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse management parameters**.
2. In the **GS1 company prefix** field, enter the 7 numbers for your GS1 company number.
3. Select **Save**.
4. Close the page.

Setup the SSCC license plate number sequence

1. Go to **Navigation pane > Modules > Organization administration > Number sequences > Number sequences**.
2. In the **Area** field, select an option.
3. In the **Reference** field, select an option.
4. In the **Company** field, type a value.
5. Expand the **Segments** section.
6. Select **Edit**.
7. In the **Segments** table, select the first row
8. Select **Remove**.
9. Select **Remove**.
10. Select **Save**.
11. Close the page.

Create the document route layout

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Document routing > Document routing layouts**. Enable the SSCC layout.
2. Select **New**.
3. In the **Layout ID** field, type a value.
4. In the **Description** field, type a value.
5. Select **Insert at end of text**.
6. Select **Save**.
7. Close the page.

Set up the document routing

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Document routing > Document routing**.
2. In the **Work order type** field, select an option.
3. Select **New**.
4. In the **Warehouse** field, type a value.
5. In the **Name** field, type a value.
6. Select **New**.
7. In the **Layout ID** field, enter or select a value.
8. In the **Name** field, enter the printer name that you want to use.
9. Select **Save**.
10. Close the page.

Create mobile device menu

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, type a value.
4. In the **Title** field, type a value.
5. In the **Mode** field, select an option.
6. Select **Yes** in the **Use existing work** field.
7. Select **Yes** in the **Generate license plate** field.
8. Expand the **Work classes** section.
9. Select **New**.
10. In the **Work class ID** field, type a value.
11. Select **Save**.
12. Close the page.
13. Go to **navigation pane > Modules > Warehouse management > Setup > Mobile device > Mobile device menu**.
14. In the tree, select the menu item that you created before.
15. Select **Edit**.
16. Select the arrow to add the menu item to the menu.
17. Select **Save**.
18. Close the page.

Update a work template

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Work > Work templates**.
2. Select **Edit**.
3. Select **New**.
4. In the **Work type** field, select **Print**.
5. In the **Work class ID** field, enter or select a value.
6. Select **Move up**.
7. Select **Save**.
8. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create transfer orders from the warehouse app

2/18/2021 • 18 minutes to read • [Edit Online](#)

This feature lets warehouse workers create and process transfer orders directly from the warehouse app. The warehouse workers start by selecting the destination warehouse and then they can scan one or more license plates using the app to add license plates to the transfer order. When the warehouse worker selects **Complete order**, a batch job will create the required transfer order and order lines based on the on-hand inventory registered for those license plates.

Enable the create transfer orders from Warehouse app feature

Before you can use this feature, both it and its prerequisites must be enabled on your system. Administrators can use the [feature management](#) page to check the feature status and enable it if needed.

1. First enable the [Process warehouse app events](#) feature, which is listed in [feature management](#) as:
 - **Module** - Warehouse management
 - **Feature name** - Process warehouse app events
2. Then enable the *Create transfer orders from the warehouse app* feature, which is listed as:
 - **Module** - Warehouse management
 - **Feature name** - Create and process transfer orders from the warehouse app
3. To automate the processing of the outbound shipments, you must also enable the [Confirm outbound shipments from batch jobs](#) feature. This feature is listed as:
 - **Module** - Warehouse management
 - **Feature name** - Confirm outbound shipments from batch jobs

Set up a mobile device menu item to create transfer orders

Here are general guidelines for setting up a mobile device menu item for creating a transfer order. Depending on your business requirements for the level of automation to be set when users create transfer orders from the floor, different configurations will be enabled. The scenario in this document will describe one such configuration.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select **New** to add a new menu item. Then make the following settings to get started:
 - **Menu item name** - Assign a name as it should appear in Supply Chain Management.
 - **Title** - Assign a menu name as it should be presented to workers in the warehouse app.
 - **Mode** - Set to *Indirect* (this warehouse app will not create work).
 - **Activity code** - Set to *Create transfer order from license plates* to enable the warehouse workers to create a transfer order based on one or more scanned license plates.
3. Use the **Transfer order line creation policy** setting to control how transfer order lines will be created by this menu item. The lines will be created/updated based on the on-hand inventory registered for the scanned license plates. Choose one of the following values:
 - **No reservation** - The transfer order lines will not be reserved.
 - **License plate guided with line reservation** - The transfer order lines will be reserved and use the License plate guided strategy option, which stores the relevant license plate IDs associated with the order lines. Located license plate ID values can therefore be used as part of the work creation process

for the transfer order lines.

4. Use the **Outbound shipment policy** setting to add more automation to the outbound transfer order shipment process, as needed. When a worker selects the **Complete order** button, the app creates the *Complete order* warehouse app event, which will save the value you choose here in the **Outbound shipment policy** field for each line in the current transfer order. Later, when the event queue is processed by a batch job to create the transfer order, the value stored in this field can be read by the batch job, and may therefore control how that job processes each line. Choose one of the following:

- **None** - No automated processing is done.
- **Release to warehouse** - Automates the release to warehouse process.
- **Ship confirm** - Automates the ship confirmation process.
- **Release and ship confirm** - Automates both the release to warehouse and ship confirmation processes.

Add the mobile device menu item to a menu

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**
2. Select **Edit**.
3. Select an existing menu following selection of the new menu item under **Available menus and menu items**. Add the menu item by selecting the right-arrow button.

Create a transfer order based on license plates

The warehouse app has a simple process for creating transfer orders based on license plates. To do this, the worker does the following using the warehouse app:

1. Create the transfer order and identify the destination warehouse.
2. Identify each license plate to be shipped.
3. Select **Complete order**.

NOTE

It is possible for multiple workers to assign license plates intended for the same transfer order by using the **Select transfer order** button to select an existing, unprocessed, transfer order number from the warehouse app event queue. For information about how to find the transfer order number values, see [Inquire the warehouse app events](#).

Example scenario

This scenario provides an overview of the process for getting transfer orders created and automatically processed based on the on-hand inventory registered on the selected license plates.

To work through this scenario using the values suggested, you must work on a system with demo data installed and select the *USMF* legal entity before you begin.

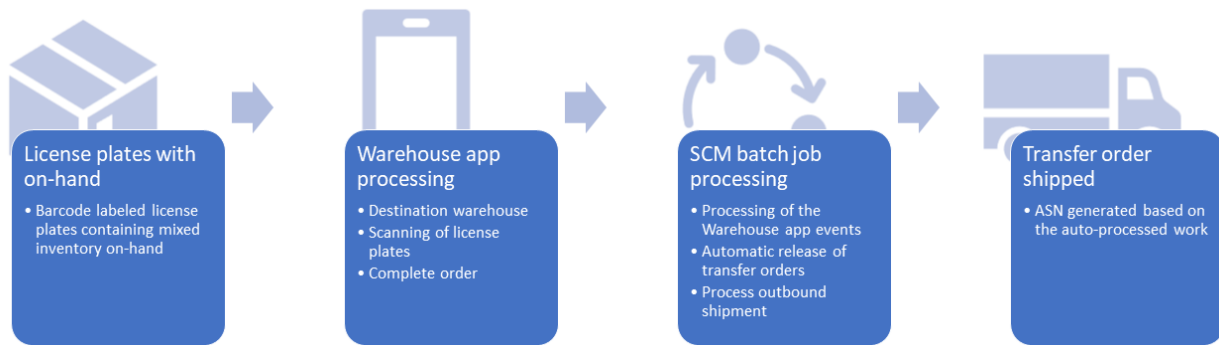

This scenario assumes that you have already enabled both the [Create and process transfer orders from the warehouse app feature](#), and the [warehouse app event processing](#) capability.

In addition to setting up the create transfer order in the mobile device menu items, additional templates, location directives, and batch jobs must also be set up and enabled.

Example Scenario blueprint

You are a retailer and have multiple license plates, each containing a mix of items placed at a specific location within one of your warehouses (*Warehouse 51*). You would like to enable the process that allows workers to create a transfer order to another warehouse (*Warehouse 61*) for a collection of scanned license plates. You will

automatically ship-update the transfer order as soon as the last license plate for the order has been identified.

Create a mobile device menu item for creating transfer orders

This section explains how to create a new mobile device menu item for creating transfer orders. Set the **Mode** to *Indirect* and the **Activity code** to *Create transfer order from license plates*.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, enter the name *Create TO*.
4. In the **Title** field, enter the description *Create TO*.
5. In the **Mode** field, select *Indirect*.
6. In the **Activity code**, select *Create transfer order from license plates*.
7. In the **Order line creation policy**, select *License plate guided with line reservation*.
8. In the **Outbound shipment policy**, select *Release and ship confirm*.
9. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
10. Select **Edit**.
11. Select the existing **Inventory** menu and then select the new menu item under **Available menus and menu items**. Add the menu item into to **Inventory** menu by selecting the right-arrow button.

Set up work templates to auto process and break work by located license plate

This section explains how to enable a work template to automatically process the work created by the template when a wave is released.

1. Go to **Warehouse management > Setup > Work > Work templates**.
2. In the **Work order type** field, select *Transfer issue*.
3. Select **New** to create a new work template.
4. In the **Work template** field, enter *51 Auto process LP*.
5. In the **Work template description** field, enter *51 Auto process LP*.
6. Select the **Automatically process** check box. This must be selected in order for any automation steps to be processed.
7. In the demo data, there already exists a work template *51 Transfer*, edit the **Sequence number** field so that the new work template has a lower sequence number than the existing work template *51 Transfer*.
8. Select **Save** in the toolbar to enable the **Work Template Details** FastTab.
9. In the **Work Template Details** FastTab, select **New** in the toolbar. You will add two lines.
10. In the **Work type** field, select *Pick*.
11. In the **Work class ID** field, select *TransfOut*.
12. Select **New** in the **Work Template Details** toolbar.
13. In the **Work type** field, select *Put*.
14. In the **Work class ID** field, select *TransfOut*.
15. Select **Save** to enable the **Directive code** field.

16. On the **Work type** *Put* line, select **Directive code** *Baydoor*. Make sure this new work template gets the lowest **Sequence number**.
17. In the toolbar, select **Edit query** to open the query editor.
18. In the **Range** tab, select **Add**.
19. On the line added, in **Field** select *Warehouse*.
20. In the **Criteria** field, select *51*.
21. Select the **Sorting** tab.
22. Select **Add** and set **Field** to *Located license plate ID*. Selecting this field will enable the toolbar button **Work header breaks**.
23. Select **OK** followed by **Yes** to reset the grouping and return to the **Work templates** page.
24. Select **Work header breaks** and enable the **Group by this field** for the **Located license plate ID** and close.

NOTE

Not all setup can be auto processed, for example, catch weight items and the use of mixed tracking dimensions.

Set up location directives for the license plate guided strategy

This section explains how to set up a location directive pick process to use the **License plate guided** strategy.

1. Go to **Warehouse management > Setup > Location directives**.
2. Select **Edit**.
3. In the navigation list header, select the **Work order type** *Transfer issue*.
4. In the navigation list, select the existing location directive *51 TO Pick*.
5. In the **Lines** FastTab, select the **Allow split** checkbox.
6. In the **Location Directive Actions** FastTab select **New** to add a new action line.
7. In the **Name** field, enter *LP Guided*.
8. In the **Strategy** field, select *License plate guided*. This action needs the lowest sequence number.
9. Select **Save** in the toolbar.
10. Select the **Refresh** page icon from the toolbar.
11. In the **Location Directive Actions** FastTab, select the line *TOPick*.
12. In the **Location Directive Actions** toolbar, select **Move down** to change the sequence number to be greater than the sequence number for the *LP Guided* action just created.

NOTE

The License plate guided strategy will try to reserve and create picking work against the locations holding the requested license plates that have been associated with the transfer order lines. But if this isn't possible and you still would like to create picking work, you should fall back to another location directive action strategy, and perhaps also search for inventory in another area of the warehouse, depending on your business process needs.

Set up a batch job to process warehouse app events

This section explains how to set up a scheduled batch job to process warehouse app events.

1. Go to **Warehouse management > Periodic tasks > Process warehouse app events**.
2. In the dialog box, enable **Batch processing** under the **Run in background** section.
3. Select **Recurrence** and set up the batch job to process based on the interval needed for your business.
4. Select **OK** to return to the main dialog.
5. Select **OK** in the main dialog to add the job to the batch queue.

Set up a batch job to release transfer orders automatically

This section explains how to set up a scheduled batch job to release the transfer orders that have been marked as "ready to release".

1. Go to **Warehouse management > Release to warehouse > Automatic release of transfer orders**.
2. In the dialog box, expand the **Records to include** section.
3. Select **Filter** under the **Records to include** section.
4. In the **WHSTransferAutoRTWQuery** query page, **Range** tab, select **Add** to add a new line to the query.
5. In the new line **Table** field, select the drop-down menu and select the table **Transfer line release to warehouse**.
6. In the **Field** drop-down menu, select **Outbound shipment policy**.
7. In the **Criteria** field, select **Release and ship confirm**.
8. In the line where **Field** is set to *From warehouse*, in the **Criteria** field, select *51*.
9. Select **OK** to return to the main dialog box.
10. Expand the **Run in the background** section to set up batch processing.
11. Enable **Batch processing** under the **Run in background** section.
12. Select **Recurrence** and set up the batch job to process based on interval needed for your business.
13. Select **OK** to return to the main dialog.
14. Select **OK** in the main dialog to have the batch job added to the batch queue.

Set up the "Process outbound shipment" batch job

This section explains how to set up a scheduled batch job to run the outbound shipment confirmation for loads ready to ship related to transfer order lines that are "ready to ship".

1. Go to **Warehouse management > Periodic tasks > Process outbound shipments**.
2. Expand the **Records to include** section.
3. Select **Filter**.
4. In the **WHSLoadShipConfirm** query, select the **Joins** tab.
5. Expand the table hierarchy so that **Loads** and **Load details** have been expanded.
6. Select the **Load details** table.
7. Select the **Add table join** button.
8. In the list of table relations, filter or search on the **Relation** column for *Transfer order lines (Reference)*.
9. Focus on the table relation in the list then press the **Select** button.
10. Select the **Transfer order lines** table.
11. Select the **Add table join** button.
12. In the list of table relations, filter or search on the **Relation** column for *Invent Transfer Additional Fields (Record-ID)*.
13. Focus on the table relation in the list then press the **Select** button.
14. Select the **Range** tab.
15. In the **Range** query tables, you will set up three query criteria ranges. Select the **Add** button to add a line.
16. Add a range for the table **Loads**. Set **Field** to *Load status* and set **Criteria** to *Loaded*.
17. Add another range for the table **Invent Transfer Additional Fields**. Set **Field** to *Outbound shipment policy* and set **Criteria** to *Release and ship confirm*.
18. Add another range for the table **Load details**. Set **Field** to *Reference* and set **Criteria** to *Transfer order shipment*.
19. Select **OK** to return to the main dialog box.
20. Expand the **Run in the background** section.
21. Enable **Batch processing**.
22. Select **Recurrence** and set up the batch job to process based on interval needed for your business.

23. Select **OK** to return to the main dialog.
24. Select **OK** in the main dialog to have the batch job added to the batch queue.

NOTE

For more information, see [Confirm outbound shipments from batch jobs](#).

Processing the example for "Create transfer order from the warehouse app"

Add on-hand on a license plate

As a starting point for this scenario you will need to have a license plate containing physical available inventory on hand.

ITEM	WAREHOUSE	INVENTORY STATUS	LOCATION	LICENSE PLATE	QUANTITY
A0001	51	Available	LP-010	LP10	1
A0002	51	Available	LP-010	LP10	2

Add physical inventory on hand quantities by using the following values:

NOTE

You will need to create the license plate and use locations that allow you to carry mixed items, like LP-010.

Create and process transfer orders from the warehouse app

1. Open the app and sign in as user *51*. Current user warehouse will be *51*.
2. Select the menu item **Create TO** from the menu location you added it to during setup.
3. Start the creation of a transfer order by entering the destination warehouse (To warehouse) in the **Warehouse** field, enter *61*. The new transfer order will be going from current warehouse *51* (From warehouse) to the destination warehouse *61*.
4. Select **OK**.
5. Scan a license plate ID in the **License plate** field. Enter the license plate of the inventory added in an earlier step, *LP10*.
6. Select **OK**.
7. Select the menu button and then select **Complete order** to finalize the warehouse app transfer order creation.

For the mentioned example, two **Warehouse app events** (*Create transfer order* and *Complete transfer order*) are used.

Inquire the warehouse app events

You can view the event queue and events messages generated by the warehouse app by going to **Warehouse management > Inquiries and reports > Mobile device logs > Warehouse app events**.

The *Create transfer order* event messages will receive the status *Waiting*, which means that the **Process warehouse app events** batch job will not pick up and process the event messages. As soon as the event message updates to status *Queued*, the batch job will process the events. This will happen at the same time as the creation of the *Complete transfer order* event (when a worker selects the **Complete order** button on the warehouse app). When the *Create transfer order* event messages has been processed, the status is updated to

Completed or *Failed*. When the *Complete transfer order* status is updated to *Completed*, all the related events are deleted from the queue.

Because the **Warehouse app events** for the creation of transfer order data will not be processed by the batch job before the messages are updated to status *Queued*, you will need to look up the requested transfer order numbers as part of the **Identifier** field. The **Identifier** field is in the header of the **Warehouse app events** page.

As part of the warehouse event processing, the creation of the transfer order line might fail. In this case, the state of the event message is updated to *Failed* and you can use the **Batch log** information to learn why and take action to correct any problems.

Typical issues could be related to missing setup for the process, like a missing transit warehouse for the *Create transfer order* event. In an example like this, you would add a transit warehouse to the shipping warehouse and use the **Reset** option to change the status for all the warehouse app event messages from *Failed* to *Queued*, which means that the batch job will process the event messages again after the correction of the setup data.

Within production environments, the exceptions would be more process related, such as having a requested license plate, which at the batch job processing time is empty and thereby no transfer order lines are created. This failed event message can either be removed by using the **Delete** option or you can add the needed physical on-hand on the license plate and use the **Reset** option for all the related event messages.

For more information, see [Warehouse app event processing](#).

Follow up on the example scenario processing

During this scenario, the following occurred:

1. Using the warehouse app, you selected a menu item that uses the activity code **Create transfer order from license plates**.
2. The app prompted you to select the destination warehouse for the transfer order. The source warehouse is always the one you currently are signed into as a Worker.
3. On the selection of the destination warehouse, the system reserved an ID number for the upcoming transfer order (based on the transfer-order number sequence defined on your system) but didn't create the transfer order yet.
4. When you scanned the license plate *LP10* containing on-hand inventory that should be moved to the new warehouse, a **Warehouse app event** was added to the events queue to be processed later. The warehouse event contained message details about the scan, including the intended transfer-order number.
5. On the warehouse app when the **Complete order** button is selected, a new warehouse app event, **Complete transfer order**, is created and the related existing event, **Create transfer order**, changed status to **Queued**.
6. On the back end, the **Process warehouse app events batch job** picked up the **Queued** event and collected the on-hand related to the scanned license plate. Based on the on-hand the actual transfer order record and associated lines got created. The job also populated the **Outbound shipment policy** field for the transfer order with the value based to configured *Release and ship confirm* and linked the license plate against the lines for the **License plate guided** strategy.
7. Based on the transfer order line **Outbound shipment policy** field value the **Automatic release of transfer orders batch job** query now resulted in releasing the transfer order to the shipping warehouse. And due to the setup for the used **Wave template**, **Work template**, and **Location directives** the work got auto processes resulting on the **Load status** got updated to *Loaded*.
8. The **Process outbound shipment batch job** is executed for the load, resulting in the transfer order being shipped and the Advance Shipment Notice (ASN) is generated.
9. The timing of all these events is dependent on the **Recurrence** settings for the batch jobs created.

Frequently asked questions

Mobile device menu item setup

Why can't I see "Create transfer order from license plate" in the menu item work activity drop-down list?

The feature *Create and process transfer orders from the warehouse app* must be enabled. For more information, see [Enable the create transfer orders from Warehouse app](#).

Warehouse app processes

Why can't I see the menu button "Complete order"?

You must have at least one license plate assigned to the transfer order.

Can several warehouse app users add license plates to the same transfer order at the same time?

Yes, several warehouse workers can scan license plates into the same transfer order.

Can the same license plate be added to different transfer orders?

No, a license plate can only be added to one transfer order at the time.

After having selected the "Complete order" button, can I then add more license plates for that transfer order?

No, you can't add more license plates to a transfer order that has a **Complete transfer order** warehouse app event.

How can I find existing transfer orders to be used via the "Select transfer order" button in the warehouse app, if the order has not yet been created in the backend system?

Currently, you can't look up transfer orders in the app, but you can find the transfer order numbers on the [Warehouse app events](#) page. For more information, see [Inquire the warehouse app events](#).

Can I manually select the transfer order number to be used from the warehouse app?

Only autogenerated transfer order numbers via number sequences are supported.

Background processing

How should I clean up records in my warehouse app events queue message tables?

You can view and maintain this on the [Warehouse app events](#) page. For more information, see [Inquire the warehouse app events](#).

Why is the transfer order "Receipt date" not updated according to my "Delivery date control" setup?

The transfer orders are created without using the **Delivery date control** capabilities.

Can I use a license plate having physical negative inventory on hand?

The feature only supports positive physical on-hand quantities. Make sure that you have positive physical on-hand quantities at the warehouse and inventory status level before assigning license plates to a transfer order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Piece picking confirmation

2/18/2021 • 2 minutes to read • [Edit Online](#)

Piece picking allows you to confirm each piece of inventory through picking or counting work on a mobile device. For picks, you can confirm the quantity of work to be processed up to the quantity that is specified on work to be picked. For counting work, you can scan the inventory that you are counting and track the total amount.

When you enable piece picking, product confirmation is automatically selected. For work-type picks, a maximum number of pieces is enabled. This allows you to set a maximum to the number of pieces that must be confirmed during the work process. The maximum quantity is based on the current work unit that is being processed. The counting work type does not allow a maximum.

You can also use the quantity and unit of measure (UOM) that is associated with a scanned bar code. This will work for receiving on inbound flows including mixed license plate receiving, purchase order item, transfer order item, and load item. It also works for piece picking where scanning the bar code will add the quantity to the total number of confirmed pieces converting between the UOM on the bar code and the work unit. If, when counting the UOM on the bar code, it is confirmed that the quantity is allowed for counting on the sequence group, the quantity will be added to the total count.

Where it applies

Piece picking works for all counting work and for the initial pick for any type of work. Piece picking does not apply if the item is controlled by serial numbers or if it is a production or kanban pick from a license plate (LP) location and the item is set to staging.

Set up piece picking

1. On a mobile device menu item, open the setup form for work confirmation: Warehouse management > **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. From the mobile device menu item, open Work confirmation setup.

The following options become available for selection when the work type is pick or counting.

OPTION	DESCRIPTION
Piece picking confirmation	Available for pick and counting work types. Product confirmation is automatically selected. Allows you to confirm each piece of inventory from the mobile device.
Maximum number of pieces	Available for pick work if piece picking confirmation is enabled. Sets a limit to the number of pieces that you must confirm.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Packing materials and fees

2/18/2021 • 6 minutes to read • [Edit Online](#)

Packing material fees are paid to a recycling company at specific intervals. An amount is paid, per unit of weight, for each material that a packing unit consists of. Although packing material fees are calculated and reported, no ledger transactions are posted, because the fees aren't considered taxes that must be paid to an authority.

Packing material weights and fees are calculated for sales order lines and purchase order lines.

You can define one or more packing units for a single item, a group of items (packing group), or all items. A packing unit consists of the packing materials, their weights, and the number of items that are included in the packing unit. A packing material code is assigned to each type of packing material that is defined. Based on the packing material code, you can specify a price for a specific period. The packing material fee is calculated based on this information.

NOTE

Even if your company doesn't pay packing material fees, you can use the functionality to calculate statistics for the weights of packing materials.

Set up packing material allocation

Before you can calculate packing material weights, packing material fees, or both, you must turn on the calculation and define which materials and fees apply to which items.

1. Go to **Inventory management > Setup > Inventory and warehouse management parameters**.
2. On the **General** tab, in the **Packing material** section, set the **Calculate packing material fees** option to **Yes**.
3. Go to **Inventory management > Setup > Packing material > Packing groups**, and create all the packing groups that you use. All the items in a packing group will use the same packing material allocation. If you don't use packing groups, you can skip this step.

TIP

After you've created your packing groups, can assign a group to each product as you require. Go to **Product information management > Products > Released products**, select a product, and then, on the **Manage inventory** FastTab, in the **Packing group** field, select the appropriate packing group.

4. Go to **Inventory management > Setup > Packing material > Packing material codes**, define each type of packing material that you use, and specify the unit that the packing material is consumed in when you prepare shipments.
5. Go to **Inventory management > Setup > Packing material > Packing material fees**, and set a fee for each type of packing material that you just defined. Fees are calculated based on the price per unit that is consumed.
6. To allocate packing materials to items, go to **Inventory management > Setup > Packing material > Packaging material allocation**, and create allocations. You can create as many allocations as you require. You can allocate packing materials for individual items, groups of items (packing groups), or all

items, depending on how detailed your allocations should be.

For each allocation that you create, follow these steps.

a. On the **General** FastTab, set the following fields:

- **Item code** – Select the scope of the allocation:
 - **Table** – Create an allocation for a single specific item.
 - **Group** – Create an allocation for all the items that belong to a packing group that is defined on the **Packing groups** page.
 - **All** – Create an allocation for all items.

NOTE

Usually, you should make all your allocations at the same level (**Table**, **Group**, or **All**). If you use more than one level, the most specific matching allocation will be used for each item. (The **Table** level takes precedence over the **Group** level, and both those levels take precedence over the **All** level.)

- **Item relation** – If you're allocating for a single item, select the item. If you're allocating for a group of items, select the packing group. If you're allocating for all items, leave this field blank.
- **Configuration, Size, Color, and Style** – Enter values for these dimensions as you require, to further define the item that you're allocating for.
- **Packing unit** – Select the unit that the item is packaged in when the packing material is used. This unit might differ from the unit that the item is purchased and stored in.
- **Packing unit factor** – Enter the conversion factor that is used to convert from the inventory unit to the packing unit. (The conversion uses the formula $Packing\ units = Item\ units \times Packing\ unit\ factor$.)

b. On the **Packing material** FastTab, add a line for each piece of packing material that is required for the current allocation. On each line, specify the type of material (as defined on the **Packing material codes** page) and the amount of it that is consumed for each shipped unit of the current item.

Packing units on sales order lines

After you've [turned on the calculation for packing material fees and set up your allocations](#), the system verifies that packing units are specified for each item that is added to a sales order. It then calculates any fees that are required. When an item is added to a sales order, one of the following steps occurs:

- **If a packing allocation applies to the item:** The system updates the sales order line with the specified packing unit and the packing unit quantity. (The packing unit quantity is calculated by using the formula $Packing\ unit\ quantity = Ordered\ quantity \div Number\ of\ items\ in\ the\ selected\ packing\ unit$.)
- **If no packing allocation applies to the item:** You can manually enter a packing unit and a packing unit quantity on the sales order line.

You can also change the packing unit and the packing unit quantity when you post the sales order line. This capability is relevant if the sales order line is only partly delivered or partly invoiced.

When you invoice the sales order, the system creates packing material transactions. Packing material transactions contain the weights of the packing materials for the sales line. You can modify the transactions after you invoice them. You can then create new transactions.

Packing units on purchase order lines

The system doesn't create packing material transactions for purchase order lines. Instead, you manually create transactions for invoiced purchase order lines on the **Packing material transactions** page.

Set up license numbers for customers that are charged packing material fees

If the sales orders for a specific customer should include charges for the packing materials that are used for each order, follow these steps.

1. Go to **Accounts receivable > Customers > All customers**.
2. Select the customer that should be charged for packing materials.
3. On the **Invoice and delivery** FastTab, set the following fields:
 - In the **Sales tax** section, in the **Packing duty license number** field, enter the company's license number.
 - In the **Packing material fee** section, in the **License number** field, enter the company's license number.

Now, when you create and invoice a sales order that includes one or more items that use packing materials, the invoice will show the packing material fees.

For customers that should not pay packing material fees, follow these same steps, but clear the license numbers from the **Packing duty license number** and **License number** fields. Invoices for customers that don't pay packing material fees show the weights of the packing materials, but they don't show the fees.

To generate a report that shows all the packing material fees that your company will owe for a specific period, go to **Inventory management > Inquiries and reports > Packing material reports > Packing material fee calculation**, specify a range of dates, and then select **OK**.

Print packing material weights on invoices

You can print packing material weights on an invoice and indicate who pays the related fees. The weights are summarized by packaging code.

1. Go to **Accounts receivable > Setup > Accounts receivable parameters**.
2. On the **Updates** tab, on the **Invoice** FastTab, set the **Print packing material weight** option to **Yes**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up manual packing (February 2016 & May 2016)

2/18/2021 • 3 minutes to read • [Edit Online](#)

The packing process allows you to validate and pack products into containers. In this process, warehouse workers pick products from the storage locations and move them to a packing station where they check the item quantities and types, and assign them to appropriate containers. When a container is fully packed, they can close it and move it to the outbound docks, and the products are ready to ship. This procedure uses the USMF demo company. This procedure is for the February 2016 & May 2016 versions of Dynamics 365 for Operations only.

Set up location profiles

1. Go to Warehouse management > Setup > Warehouse > Location profiles.
2. Click New.
 - The location profile is used for packing stations and contains information and rules for a location.
3. In the Location profile ID field, type a value.
4. In the Name field, type a value.
5. In the Location format field, enter or select a value.
6. In the Location type field, enter or select a value.
7. Select Yes in the Allow mixed items field.
8. Select Yes in the Allow mixed inventory statuses field.
9. Select Yes in the Override rules for batch days field.
10. Close the page.

Set up warehouse management parameters

1. Go to Warehouse management > Setup > Warehouse management parameters.
2. Click the Packing tab.
3. In the Profile ID for packing location field, enter or select a value.
 - Select the location profile that you want to use for packing.
4. Close the page.

Set up container types

1. Go to Warehouse management > Setup > Containers > Container types.
2. Click New.
 - You can define the types of containers to use. You can specify the physical dimensions of the container, including tare weight, maximum weight, maximum volume, length, width, and weight. The Attributes are customized fields that allow you to add extra dimensions on the container type.
3. In the Container type code field, type a value.
4. In the Description field, type a value.
5. In the Tare weight field, enter a number.
6. In the Maximum weight field, enter a number.
7. In the Volume field, enter a number.
8. In the Length field, enter a number.
9. In the Width field, enter a number.

10. In the Height field, enter a number.
11. Click Save.
12. Close the page.

Set up packing profiles

1. Go to Warehouse management > Setup > Packing > Packing profiles.
2. Click New.
3. In the Packing profile ID field, type a value.
4. In the Description field, type a value.
5. In the Container closing profile ID field, enter or select a value.
 - A container closing profile ID is optional and is the default close container profile for this packing profile.
6. In the Container ID mode field, select an option.
 - This option determines whether a container ID will be automatically generated when a container is created or if a container ID will be created manually.
7. In the Container type field, enter or select a value.
 - The container type will be used by default when a new container is created.
8. Select the Autocreate container at container close check box.
9. Click Save.
10. Close the page.

Set up container closing profiles

1. Go to Warehouse management > Setup > Containers > Container closing profiles.
 - Container closing profiles define what happens when a container is closed. You can set up multiple close container profiles.
2. Click New.
3. In the Container closing profile ID field, type a value.
4. In the Description field, type a value.
5. In the Manifest at field, select an option.
 - Specify whether manifesting will occur when closing containers or when confirming the shipment. Note that manifesting requires Transportation management. Manifesting must be implemented in the transportation engines in order for it work.
6. In the Warehouse field, enter or select a value.
7. In the Default location for final shipment field, enter or select a value.
 - This will be location to which products will be moved after the containers are closed. This location must have a location profile defined on Warehouse parameters.
8. In the Weight unit field, enter or select a value.
9. Click Save.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up short picking item reallocation

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to enable warehouse workers to quickly find alternative locations if there isn't sufficient inventory at the location they've been directed to.

The reallocation process is controlled by a **Work exception** and used by the warehouse **worker**.

It is possible to use Automatic, Manual, or both reallocation processes:

- Automatic reallocation - Location directives are used to determine if the goods are available at another location. If possible, the work will be updated and the warehouse user will be directed to the alternative location.
- Manual reallocation - Allows the warehouse user to select from one or more locations with unreserved quantities of goods.
- Automatic and manual - If the system is unable to perform an automatic reallocation, and locations are available with unreserved quantities, the user will be prompted to select a location.

Set up work exceptions

It's possible to define several work exceptions with different item reallocation policies to enable the warehouse worker to choose one based on the needs of the shipment that they are processing.

The USMF demo data company was used to create this procedure.

1. In the **Navigation pane**, go to **Warehouse management > Setup > Work > Work exceptions**.
2. Click **New**
3. In the **Work exception code** field, type a value. This will be the title of this exception . For example, Short picking manual.
4. In the **Description** field, type a value. This will be a short description of the usage of this exception. For example, Short picking - item not available.
5. In the **Exception type** field, select **Short pick**.
6. Select the **Adjust inventory** check box. If selected, inventory will automatically be adjusted to 0 at the short picked location.
7. In the **Default adjustment type code** field, enter or select a value. For example, in USMF you can select **Remove Res Adj Out**. Each Adjustment type code contains four characteristics: name, description, inventory journal name, and **Remove reservations**. If **Remove reservations** is enabled, the short-picked order line's reservations will be removed.
8. In the **Item reallocation** field, select a value, such as Manual. If you select Manual, or Automatic and Manual, the warehouse worker needs to be enabled to use manual reallocation.

Set up a worker to use manual item reallocation

The USMF demo data company was used to create this procedure.

1. Close the page.
2. In the **Navigation pane**, go to **Warehouse management > Setup > Worker**.
3. Click **Edit**.
4. In the list, select worker. For example, Julia Funderburk.
5. Expand the **Users** FastTab.

6. In the list, select a **User ID**. For example, 24.
7. Expand the **Work** FastTab.
8. Select **Yes** in the **Allow manual item reallocation** field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cancel warehouse work for exception handling

2/18/2021 • 2 minutes to read • [Edit Online](#)

The Cancel work functionality in Microsoft Dynamics 365 Supply Chain Management lets the admin user cancel specific warehouse work that is currently in progress, but that is blocked by the system or can't be completed because of exceptional circumstances. This functionality is an attractive and secure alternative to SQL corrective scripts that fix inconsistent data. However, whereas these scripts are typically requested from IT professionals, the Cancel work functionality can be used by users in the company who have admin rights.

You can access the Cancel work functionality at **Warehouse management > Periodic tasks > Clean up > Cancel work**. In the **Cancel work** dialog box, specify the work ID of the work to cancel, and then select **OK**.

Warehouse work that can be canceled

During warehouse picking operations, a worker might encounter situations where they have registered quantities as picked from a storage location to their user location, but then they can't register the put operation. Inconsistent warehouse data is often, but not always, the reason why work is blocked.

Unlike the regular Cancel functionality that can be accessed by using the **Cancel** button on the work header, the Cancel work functionality doesn't require that the last completed work line be a work line of the **put** type. In other words, for the Cancel work functionality, cancellation logic can be run even if the item quantity on a work line is in a user location.

NOTE

For work that must be canceled for operational reasons, warehouse users must continue to use the regular Cancel functionality on the work page.

Only work of the **Sales**, **Transfer issue**, **Raw material picking**, or **Replenishment** type can be canceled by using the Cancel work functionality. Cancellation logic won't be run for frozen raw material picking work or work that can be canceled by using the regular Cancel functionality (see the preceding note).

To unblock the work, the system cancels any remaining work lines and fixes the warehouse data that is associated with the work ID that the user specified. Any regular warehouse-handling operations that involve the affected item quantity can then resume.

To put the affected item in a specific location after the work is canceled, the user must use an inventory movement or quantity adjustment operation on a mobile device.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

System-directed work sequencing

2/18/2021 • 11 minutes to read • [Edit Online](#)

System-directed work sequencing lets you sort and filter the work orders that the system presents to users for execution. It's helpful in scenarios where additional criteria (such as the time of shipping, the picking zone, the location profile, or a combination of various criteria) are required to drive the warehouse picking process.

This functionality extends the current system-directed picking functionality by adding a system-directed query order, where users can set up a sequence and one or more queries that will evaluate all work orders that are created. Only work orders that meet the criteria that are specified in the setup of the mobile device menu item will be captured and presented.

Therefore, this functionality allows for further optimization of warehouse picking processes as it identifies work orders that match the specified criteria, assigns them to the correct mobile device menu item, and then presents them to a worker, based on a specific skill set, picking equipment, or other requirement.

NOTE

If different criteria are needed, multiple mobile device menu items must be used.

Turn on the Organization-wide system directed work sequencing feature

Before you can use system-directed work sequencing, the feature must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Organization-wide system directed work sequencing*

Setup

Make demo data available

To work through the scenario by using the values that are presented in this topic, you must work on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity. The scenario uses warehouse *51* from the demo data.

IMPORTANT

Before you release the orders to the warehouse, make sure that the pick locations have enough inventory for all the items on the orders.

Default USMF data should support this scenario. If you aren't using demo data, review the **Location directive** setting to learn which picking locations are used for sales order picking. If you must adjust the inventory, you can create manual movements, use replenishment, or use any other flow.

Set up a mobile device menu item

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. In the list of mobile device menu items, select **Sales Picking – System**. The required menu item should

already exist.

3. Confirm the following settings:

- On the **General** FastTab, the **Directed by** field should be set to *System directed*.
- The **Work classes** FastTab should show the following settings.

WORK CLASS ID	WORK ORDER TYPE
Sales	Sales orders
SO Pick	Sales orders

4. On the Action Pane, select **System directed work sequence queries**.

5. Select **Edit**.

6. Delete the existing line, and then confirm the action by selecting **Yes**.

7. On the Action Pane, select **New** to create a line.

8. On the new line, set the following values:

- **Sequence number:** 1
- **Description field:** *Work quantity less than 20 and Descending*

9. Select **Save**.

10. On the Action Pane, select **Edit Query**.

11. On the **Joins** tab, expand the join hierarchy to show the **Work lines** table.

12. Select the **Work lines** table join.

13. Select **Add table join**.

14. In the list that appears, find and select the row that has the following settings:

- **Join mode:** *n:1*
- **Relation:** *Locations (Location)*

15. Select **Select**.

Locations are added to the table join.

16. On the **Sorting** tab, select **Add** to add a line.

17. On the new line, set the following values:

- **Table:** *Work lines*
- **Derived table:** *Work lines*
- **Field:** *Work quantity* (In the message box that appears, select **Yes** to add sorting to this field.)
- **Search direction:** *Descending*

18. Select the **Range** tab.

If only specific work criteria should be included in the sequencing, you can specify them on the **Range** tab. In this example, you want to include only work where the quantity is less than 20 ea (the lowest unit of measure).

Notice that some lines are already included. Those lines should not be removed.

19. Select **Add** to add a line.

20. On the new line, set the following values:

- **Table:** *Work lines*
- **Derived table:** *Work lines*
- **Field:** *Inventory work quantity*
- **Criteria:** *<20* (less than 20)

21. Select **Add** to add another line.

22. On the new line, set the following values:

- **Table:** *Work lines*
- **Derived table:** *Work lines*
- **Field:** *Work type*
- **Criteria:** *Pick*

23. Select **Add** to add another line.

24. On the new line, set the following values:

- **Table:** *Locations*
- **Derived table:** *Locations*
- **Field:** *Location profile ID*
- **Criteria:** *!STAGE*

IMPORTANT

Be sure to include the exclamation point (!) in front of *STAGE*.

25. Select **OK** to save and close the query.

26. Select **Save**.

27. Close the page to return to the **Mobile device menu items** page.

NOTE

This setup defines the criteria that will be used to feed eligible work to the mobile device menu item. If you add more criteria lines to the query, the system will use the query line that has lowest sequence number first. In other words, all eligible work for sequence number 1 will be presented to the user first, and then all work for sequence number 2. Therefore, if a specific range and sorting must be used together, they should be specified in the same system-directed work sequence query.

This setup will capture any work that has at least one line where the quantity is less than 20 ea. Therefore, if the work has a line where the quantity is exactly 20 ea or more than 20 ea, it will be valid, provided that it also has at least one line where the quantity is less than 20 ea.

Location directives

If you're using default Contoso data, the query for the location directive action won't require changes. However, to make sure that the location directives will capture the items on the sales orders when you apply the feature in a non-Contoso environment, create a new location directive. To verify the settings in the demo environment, follow these steps.

1. Go to **Warehouse management > Setup > Location directives**.

2. In the **Work order type** field, select *Sales orders*.
3. Select the location directive that is named *51 Pick*.
4. On the **Location Directive Actions** FastTab, select the line for the **Pick** action.
5. Select **Edit query** above the grid.
6. Review the **Range** query.
 - a. Find the line where the **Field** field is set to *Location*.
 - b. Make sure that the **Criteria** field is blank (that is, there are no restrictions).

Scenario

Create sales order picking work

Before system-directed picking is run, some outbound work should be created. For this scenario, you will create four sales orders that are based on the specified system-directed work sequence queries.

You will reserve inventory quantities for each sales order. Therefore, reserved inventory can't be withdrawn from the warehouse for other orders unless the inventory reservation, or part of the inventory reservation, is canceled.

You will then release each sales order to the warehouse to create the outbound work.

Sales order 1

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New** to create sales order 1.
3. In the **Create sales order** dialog box, set the following values:
 - In the **Customer** section, set the **Customer account** field to *US-004*.
 - In the **General** section, set the **Warehouse** field to *51*.
4. Select **OK** to close the dialog box. Make a note of the sales order number.
5. Add a line to the new sales order, and set the following values:
 - **Item number:** *M9200*
 - **Quantity:** *20*
6. On the **Inventory** menu above the grid, select **Reservation**.
7. On the **Reservation** page, select **Reserve lot** to reserve the inventory.
8. Close the **Reservation** page.
9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse** to create work for the warehouse.

You receive informational messages that show the wave ID and shipment IDs that were created for the sales order.

Sales order 2

1. On the Action Pane, select **New** to create sales order 2.
2. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-007*
 - **Warehouse:** *51*
3. Select **OK** to close the dialog box. Make a note of the sales order number.

4. Add a line to the new sales order, and set the following values:
 - **Item number:** *M9200*
 - **Quantity:** *5*
5. Select **Add line** to add a second line, and set the following values:
 - **Item number:** *M9201*
 - **Quantity:** *1*
6. Reserve inventory for both lines.
7. Release the order to the warehouse.

Sales order 3

1. On the Action Pane, select **New** to create sales order 3.
2. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-009*
 - **Warehouse:** *51*
3. Select **OK** to close the dialog box. Make a note of the sales order number.
4. Add a line to the new sales order, and set the following values:
 - **Item number:** *M9200*
 - **Quantity:** *7*
5. Select **Add line** to add a second line, and set the following values:
 - **Item number:** *M9202*
 - **Quantity:** *8*
6. Reserve inventory for both lines.
7. Release the order to the warehouse.

Sales order 4

1. On the Action Pane, select **New** to create sales order 4.
2. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-010*
 - **Warehouse:** *51*
3. Select **OK** to close the dialog box. Make a note of the sales order number.
4. Add a line to the new sales order, and set the following values:
 - **Item number:** *M9200*
 - **Quantity:** *25*
5. Select **Add line** to add a second line, and set the following values:
 - **Item number:** *M9202*
 - **Quantity:** *10*
6. Reserve inventory for both lines.
7. Release the order to the warehouse.

Get work IDs for the work that was created

1. Go to **Warehouse management > Work > Work details**.
2. Filter on the **Warehouse** field so that only work for warehouse *51* is shown.

3. Four work IDs should have been created. Make a note of the work ID for each sales order.

SALES ORDER ID	WORK ID	WORK QUANTITY
Sales Order 1	Work ID 1	20 ea
Sales Order 2	Work ID 2	6 ea (sum of both lines)
Sales Order 3	Work ID 3	15 ea (sum of both lines)
Sales Order 4	Work ID 4	35 ea (sum of both lines)

Before you run the flow on the mobile device, make sure that only the work that you just created is in *Open* status for warehouse *51* and the *Sales order* work order type. Otherwise, the results of the test might vary, because the system-direct picking will include all eligible work.

1. Go to **Warehouse management > Work > Outbound > Open sales work**.
2. In the **Open sales work** grid, filter on the **Warehouse** field so that only work for warehouse *51* is shown.
3. Confirm that only the four work IDs that you created earlier are shown.
4. Close the **Work** page.

Mobile device flow execution

Based on the setup, the system will feed the user work that is sorted from the highest work line quantity to the lowest. The quantity on every line will be less than 20 ea.

Remember that this setup will capture any work that has at least one line where the quantity is less than 20 ea. Therefore, if the work has another line where the quantity is exactly 20 ea or more than 20 ea, it will also be valid.

Mobile app

1. Sign in to the warehousing app as a user in warehouse *51*.
2. Go to **Outbound > Sales Picking - System**.

The pick step for work ID *4* is presented. This work ID is presented first because of the setup of the system-directed query order, where you specified that work should be sequenced based on descending work line quantity.

3. Complete the required pick and put to close the work ID.

Next, work ID *3* is presented. One of its work lines is next in the sequence, based on the work line quantity.

4. Complete the pick and put to close the work ID.

Next, work ID *2* is presented. This work's pick line is next in the sequence.

5. Complete the pick and put to close the work ID.

No further work should be presented to you. Work ID *1* isn't eligible for this mobile device menu item, because the query specifies that work headers are considered only if the quantity on the work lines is less than 20 ea.

Tips

The system-directed work sequence queries are *inclusive*. It's important that you remember this fact for some setups. For example, you want a specific menu item to process only work where the work unit is *ea*, and you

specify that restriction on the **Range** tab of the query. In this case, all work where at least one work line has the work unit set to *ea* will be fed to the worker. Therefore, this work might also include work where work lines have a work unit other than *ea* (such as *box* or *pallet*). The query will exclude only work where no work line has the work unit set to *ea*.

Therefore, in the example from this scenario, work ID 4 was also captured by the query. When it was created, two lines were added: one for 25 ea and another for 10 ea. The work was still presented to the user, because at least one work line has a quantity of less than 20 ea.

Depending on the scenario, you can prevent this behavior by using work breaks.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Pick line grouping

2/18/2021 • 6 minutes to read • [Edit Online](#)

Pick line grouping enables multiple work lines that have the same item and location to be combined into a single pick that is presented to the user on the mobile device. Therefore, warehouse workers can receive the most efficient instructions, but required work line separation (for different containers, orders, and so on) can still be maintained in the system.

Turn on the pick line grouping feature

Before you can use this feature, it must be turned on in your system. Administrators can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Pick line grouping*

Set up pick line grouping

Create a mobile device menu item

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the **Menu item name** field, enter *Sales group line picking*.
4. In the **Title** field, enter *Sales group line picking*. This title will be shown on the mobile device menu.
5. In the **Mode** field, select *Work*.
6. Set the **Use existing work** option to *Yes*.
7. On the **General** FastTab, set the following values:
 - In the **Directed by** field, select *User directed*.
 - Set the **Generate license plate** option to *Yes*.
 - Set the **Group pick** option to *Yes*.
 - Accept the default values for the remaining options.
8. Follow these steps to configure the valid work classes for the mobile device menu item:
 - a. On the **Work classes** FastTab, elect **New**.
 - b. In the **Work class ID** field, you can select either *Sales* or *SO Pick*, depending on the warehouse that you will use. For this scenario, select *SO Pick*.

The **Work order type** field is automatically set to *Sales orders*.

Set up a mobile device menu

Follow these steps to add the menu item that you just created to the **Outbound** menu.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. The list pane shows all existing mobile device menus. Select *Outbound* in the list.

4. In the **Available menus and menu items** list, find and select the *Sales group line picking* menu item that you created.
5. Select the right arrow button to move the *Sales group line picking* menu item to the **Menu structure** list.
6. Use the up arrow and down arrow buttons to move the menu item into the desired position in the menu structure.
7. On the Action Pane, select **Save**.

Set up a work template

1. Go to **Warehouse management > Setup > Work > Work templates**.
2. In the **Work order type** field, select *Sales orders*.
3. In the **Overview** grid, find and select the work template that should be used with this function. For this scenario, select the *51 Pick to stage* template.
4. On the Action Pane, select **Edit query**.
5. In the query editor dialog box, on the **Sorting** tab, select **Add**, and then set the following values for the new row:
 - In the **Table** column, select *Temporary work transactions*.
 - In the **Derived table** column, select *Temporary work transactions*.
 - In the **Field** column, select *Item number*.
 - In the **Search direction** column, select *Ascending*.
6. Select **OK** to close the dialog box and save your selection.
7. You receive the following message: "Grouping will be reset, continue?" Select **Yes** to continue.

IMPORTANT

For the pick line grouping functionality to work, the work lines must be sorted by item ID. If lines that have the same items aren't sequenced one after another, they won't be grouped.

Example

Create picking work

Before you can set up pick line grouping, you must create some eligible outbound work.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New** to create a sales order.
3. In the **Customer account** field, select *US-004*.
4. On the **General** FastTab, in the **Warehouse** field, select *51*.
5. Select **OK**.
6. On the **Sales order lines** FastTab, add the following six lines:
 - **Line 1:** In the **Item number** field, select *M9200*. In the **Quantity** field, enter *3*.
 - **Line 2:** In the **Item number** field, select *M9201*. In the **Quantity** field, enter *3*.
 - **Line 3:** In the **Item number** field, select *M9202*. In the **Quantity** field, enter *2*.
 - **Line 4:** In the **Item number** field, select *M9200*. In the **Quantity** field, enter *1*.
 - **Line 5:** In the **Item number** field, select *M9200*. In the **Quantity** field, enter *3*.
 - **Line 6:** In the **Item number** field, select *M9202*. In the **Quantity** field, enter *7*.

Here is a summary of the total quantities for each item:

- **Item M9200:** 7 each
- **Item M9201:** 3 each
- **Item M9202:** 9 each

7. Before you release the orders to the warehouse, you must make sure that the pick locations have enough inventory for all the items on all the orders. Review the **Location directive** setting to determine which picking locations are used for sales order picking. If you're using the Contoso demo data environment for warehouse 51, confirm that there is available inventory.

You must now reserve the inventory for each line.

8. On the **Sales order lines** FastTab, select one of the lines that must be reserved.
9. On the **Inventory** menu above the grid, select **Reservation**.
10. On the **Reservation** page, on the Action Pane, select **Reserve lot** to apply the reservation. Then close the page.
11. Repeat steps 8 through 10 for the remaining lines that must be reserved.

You must now release the sales order to the warehouse.

12. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

You receive a message that states that a shipment and a wave have been created, and that the wave has been submitted to run in a batch.

When the wave and all downstream jobs have been completed, a work ID is created for work that has six lines. The lines are sorted by item number.

13. Go to **Warehouse management > Work > All work** to view the work that was created. Make a note of the **Work ID** value, because you will need it in the next procedure.

Initiate picking from the mobile device

1. Sign in to the mobile device as a user who is set up for warehouse 51.
2. On the mobile device, select the menu that includes the new mobile device menu item. For this scenario, select **Outbound**.
3. Select the **Sales group line picking** menu item to initiate the pick.
4. Enter the **Work ID** value that you made a note of in the previous procedure.

You should see a pick step where all pick lines for item *M9200* are grouped, and you should receive an instruction to pick 7 each of item *M9200*.

IMPORTANT

On the mobile device, the pick work for the three pick work lines has been aggregated into one picking step for the user.

5. Confirm the pick step.
6. Go to the work page for the work ID, and notice that all three pick lines for item *M9200* were closed simultaneously.
7. Go back to the mobile device, and continue to pick. Work line 4 for item *M9201* should be presented. Because there was only one work line on the order, there is nothing to aggregate.

8. Confirm the pick step.
9. The last pick step on the mobile device aggregates the last two pick lines from the work order.
10. Complete the pick step for 9 each of item *M9202*.
11. Confirm the put step and any additional pick/put pairs to complete the work.

IMPORTANT

- Work lines can be grouped only if they are in sequence.
- The following functionality isn't supported:
 - Catch-weight items

If there are any catch-weight items on the work, you receive an error message before you start to pick.

- Piece picking
- Work lines that have unfinished replenishment work
- Over-picking
- Short picking with item reallocation

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warehouse slotting

2/18/2021 • 13 minutes to read • [Edit Online](#)

Several warehouse slotting features are available to help warehouse managers intelligently plan picking locations before they release orders to the warehouse and create picking work.

The *Warehouse slotting feature* lets you consolidate demand by item and unit of measure from orders that have a status of *Ordered*, *Reserved*, or *Released*. Generated demand can then be applied to locations that will be used for picking, based on quantity, unit, physical dimensions, fixed locations, and more. After the slotting plan has been established, replenishment work can be created to bring the appropriate amount of inventory to each location.

The *Warehouse slotting for transfer orders* feature lets warehouse managers replenish picking locations, based on demand from transfer orders that aren't yet released to the warehouse. It ensures that picking locations will include all the items that are required for the transfer orders after they are released to warehouse. This feature requires that you also turn on the *Warehouse slotting feature* feature.

The *Warehouse slotting allocation enhancements* feature adds an option for the template lines that are used by the *Warehouse slotting feature* feature. The option enables the system to consider existing on-hand inventory at a target location. Therefore, fewer replenishments might be generated for slotting. The *Warehouse slotting allocation enhancements* feature requires that you also turn on the *Warehouse slotting feature* feature. It can optionally be used together with the *Warehouse slotting for transfer orders* feature.

Turn on the warehouse slotting features

Before you can use these features, they must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the features and turn them on if they are required. Turn on the following features as required:

- Warehouse slotting feature
- Warehouse slotting for transfer orders

IMPORTANT

The *Warehouse slotting feature* feature must be turned on before this feature.

- Warehouse slotting allocation enhancements

IMPORTANT

The *Warehouse slotting feature* feature must be turned on before this feature.

Set up warehouse slotting

To use warehouse slotting, you must set up the following elements in your system:

- Slotting unit of measure tiers
- Directive codes
- Slotting templates

- Location directives

Create unit-of-measure tiers for slotting

Unit-of-measure tiers enable multiple units of measure to be grouped together for the purposes of slotting. For example, if multiple sizes of boxes are all picked from the same box picking area, one tier can be created for all the sizes. **A line must be created for each unit of measure that should be part of the tier.**

1. Go to **Warehouse management > Setup > Replenishment > Slotting unit of measure tiers**.
2. Select **New**.
3. In the header, set the following values:
 - **Unit of measure tier:** *EaBoxPl*
 - **Description:** *Each box pallet*
4. Select **Save**.
5. On the **Units of measure** FastTab, select **New** to add a line to the grid.
6. On the new line, set the following values:
 - **Unit:** *Box*
 - **Description:** Leave this field blank. It will be filled in automatically when you save your changes.
 - **Unit class:** *Quantity*
7. Select **New** to add a second line to the grid.
8. On the new line, set the following values:
 - **Unit:** *ea*
 - **Description:** Leave this field blank. It will be filled in automatically when you save your changes.
 - **Unit class:** *Quantity*
9. Select **New** to add a third line to the grid.
10. On the new line, set the following values:
 - **Unit:** *PL*
 - **Description:** Leave this field blank. It will be filled in automatically when you save your changes.
 - **Unit class:** *Quantity*
11. Select **Save** to save the tier.

Create a directive code for slotting

You must select the directive code that should be associated with a template.

1. Go to **Warehouse management > Setup > Directive codes**.
2. On the Action Pane, select **New**.
3. In the **Directive code** field, enter *Slotting*.
4. In the **Directive description** field, enter *Slotting*.

Set up slotting templates

Each slotting template controls how inventory is assigned to locations for a specific warehouse. Each template must include a line for each slotting specification. Use the procedures in this section to set up slotting templates.

1. Go to **Warehouse management > Setup > Replenishment > Slotting templates**.
2. Select **New** to create a template.

Next, you must set up the template header, slotting specifications, and location directives, as explained in the following subsections. The setup for slotting for transfer orders resembles the setup for slotting for sales orders,

but the **Demand type** field is set *Transfer orders* instead of *Sales order*.

Set up the header for a sales order slotting template

1. In the header for the template, set the following values:

- **Slotting template:** *61*
- **Description:** *61*
- **Demand type:** *Sales order*

NOTE

Currently, *Sales orders* and *Transfer orders* are the only demand types that are supported. You can select *Transfer orders* only if the *Warehouse Slotting for transfer orders* feature is turned on.

- **Demand strategy:** *Ordered*

The following values are available in this field:

- **Ordered** – The full ordered quantity on the sales order should be considered demand.
- **Reserved** – Only the sales order line quantities that are reserved (physical and ordered) should be considered demand.
- **Released** – The released quantity should be considered demand.
- **Warehouse:** *61*
- **Allow wave demand to use unreserved quantities:** *Yes*

You can also specify a query to narrow the scope of the demand that is evaluated.

Set up slotting specifications for each template

For each sales order template that you create, follow these steps to add a line for each slotting specification.

1. On the **Slotting template details** FastTab, select **New** to create a template line.

2. On the new line, set the following values:

- **Sequence:** *1*
- **Description:** *Fixed location*
- **Minimum quantity:** *1*

This field defines the minimum quantity of demand that is required for the line.

- **Maximum quantity:** *1000000*

This field defines the maximum quantity of demand that is valid for the line.

- **Unit:** Leave this field blank.

This field defines the unit of measure that the minimum and maximum quantities refer to.

- **Unit of Measure Tier:** *EaBoxPI*

This field defines the units of measure of demand that are valid for the line. (For more information, see the [Set up unit-of-measure tiers for slotting](#) section earlier in this topic.)

- **Assign slot criteria:** *Consider qty*

The following values are available in this field:

- **Assume empty** – This system should assume that all locations in the picking area are empty and should not check those locations for inventory.
- **Consider qty** – The system should check the locations in the picking area for inventory and should skip any locations that aren't empty.
- **Consider on-hand** – The system should check whether any target location contains unreserved quantities for the item on the demand line. If the quantity is large enough to satisfy at least one unit of the demand line, the generated slotting plan record is reduced by the available amount. For example, if the demand is 10 cases, and one case is on hand, the located demand will be nine cases. If the demand is 10 cases, and one each is on hand, the located demand will be 10 cases. This value is available only when the *Warehouse slotting allocation enhancements* feature is turned on.

- **Directive code:** *Slotting*

This field defines the location directive that is used to find the picking location of the replenishment work.

- **Overflow location:** Leave this field blank.

This field defines the location that inventory that is put to if a location can't be found for the quantity when the line is processed.

- **Allow let up:** *Yes*

When this option is set to *Yes*, if any demand can't be slotted, movement work will be created to take inventory out of locations where there is inventory, but where nothing was slotted. The template is then run again. This time, it ignores the inventory in the locations. This functionality works best when the **Assign slot criteria** field is set to *Consider qty*.

- **Fixed location usage:** *Only fixed locations for the product*

The following values are available in this field:

- **Fixed and non-fixed locations** – The system should not be limited to using only fixed locations.
- **Only fixed locations for the product** – The system should slot only to locations that are fixed locations for the product.
- **Only fixed locations for the product variant** – The system should slot only to locations that are fixed locations for the product variant.

NOTE

If the slotting template contains at least one line where the **Assign slot criteria** field is set to *Consider on-hand*, let-ups are no longer allowed for any line in the template.

1. Select **Save**.
2. Select **New** to create a second template line.
3. On the new line, set the following values:
 - **Sequence:** *2*
 - **Description:** *Other*
 - **Minimum Qty:** *1*
 - **Maximum Qty:** *1000000*
 - **Unit:** Leave this field blank.

- **Unit of measure tier:** *EaBoxPl*
- **Assign slot criteria:** *Consider qty*
- **Directive code:** *Slotting*
- **Overflow location:** Leave this field blank.
- **Allow let up:** *Yes*
- **Use fixed locations:** *Fixed and non-fixed locations*

In the query for the second line, you will now specify the criteria that are used to determine what locations the demand for that line can be slotted to.

4. Select the line where the **Sequence** field is set to 2.
5. Select **Edit query**.
6. On the **Range** tab, select **Add** to add a line to the grid.
7. On the new line, set the following values:
 - **Table:** *Locations*
 - **Derived table:** *Locations*
 - **Field:** *Location profile ID*
 - **Criteria:** *Pick-06* (Select the double plus sign [++] in the field to expand the list, and then select *Pick-06 - Picking Site 6*.)
8. Select **OK**.

Set up location directives

At least one location directive must be set up to support slotting picks. Use the procedures in this section to set up a new *replenishment location directive* for slotting picks.

1. Go to **Warehouse management > Setup > Location directives**.
2. In the left pane, in the **Work order type** field, select *Replenishment*.
3. On the Action Pane, select **New**.
4. In the header for the new location directive, in the **Name** field, enter *61 Slotting pick*.
5. In the **Sequence number** field, accept the default value.

Configure the Location directives FastTab

1. On the **Location directives** FastTab, set the following values. Accept the default values for all other fields.
 - **Work type:** *Pick*
 - **Site:** *6*
 - **Warehouse:** *61*
 - **Directive code:** *Slotting*
2. Select **Save** to make the **Lines** FastTab available.

Configure the Lines FastTab

1. On the **Lines** FastTab, select **New** to create a line.
2. On the new line, set the following values.
 - **From quantity:** *0*
 - **To quantity:** *1000000*
3. Accept the default values for the remaining fields.
4. Select **Save** to make the **Location Directive Actions** FastTab available.

Configure the Location Directive Actions FastTab

1. On the **Location Directive Actions** FastTab, select **New** to create a line.
2. On the new line, set the following values. Accept the default values for all other fields.
 - **Sequence number**: Accept the default value.
 - **Name**: *Bulk*
 - **Strategy**: *None*
3. Accept the default values for the remaining fields.
4. Select **Save** to make the **Edit query** button available.

Edit the query

1. On the **Location Directive Actions** FastTab, select **Edit query**.
2. On the **Range** tab, select **Add** to add a line to the grid.
3. On the new line, set the following values:
 - **Table**: *Locations*
 - **Derived table**: *Locations*
 - **Field**: *Zone ID*
 - **Criteria**: *Bulk* (Select the double plus sign [+ +] in the field to expand the list, and then select *Bulk*.)
4. Select **OK**.

Scenario

Set up the scenario

For this scenario, use the built-in sample data, and create the records that are described in this section.

Use the USMF sample data

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

Create demand

Follow these steps to create the demand that you will apply slotting to.

1. Go to **Sales and marketing > Sales orders > All sales order**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, in the **Customer account** field, select *US-007*.
4. In the **Warehouse** field, select *61*.
5. Select **OK**.
6. The new sales order is opened. It includes an empty line on the **Sales order lines** FastTab. On this line, set the following values:
 - **Item**: *L0101*
 - **Quantity**: *20*
7. Select **Add line** to add a new line, and set the following values:
 - **Item**: *T0100*
 - **Quantity**: *8*
8. Select **Save**.
9. Select **New** to create a second sales order.

10. In the **Create sales order** dialog box, in the **Customer account** field, select *US-008*.
11. In the **Warehouse** field, select *61*.
12. The new sales order is opened. It includes an empty line on the **Sales order lines** FastTab. On this line, set the following values:
 - **Item:** *T0100*
 - **Quantity:** *1*
13. Select **Save**.

Walk through a typical slotting scenario

After all the prerequisite elements are in place, as described in the previous section, you're ready to try out the feature by working through each exercise in this section.

Generate demand

1. Go to **Warehouse management > Setup > Replenishment > Slotting templates**, and select the slotting template that you created earlier.
2. On the Action Pane, select **Generate demand**. This command evaluates all demand that is in the system, and that matches the slotting template query. The total demand across all orders is then consolidated onto one line per quantity/unit of measure. An informational message appears when the process is completed.

Slotting demand

The *slotting demand* shows the results of demand generation, based on the setup of the slotting template.

- On the Action Pane, select **Slotting demand** to view the results from the **Generate demand** command. The lines in the slotting demand can be edited. You can delete a line, add a new line, or edit the line details.

NOTE

You can edit demand manually, or you can import it from an external system by using data management. Whatever is in the slotting demand will be used in the next step, regardless of where it came from.

Locate demand

After demand has been generated, you must use the **Locate demand** command to generate the *slotting plan*.

- On the Action Pane, select **Locate demand**. The slotting process runs. An informational message appears when the process is completed.

Slotting plan

The slotting plan shows the location that each item/quantity was assigned to, whether overflow was used, whether let-up work was created, and the template line that was used. *Any demand that could not be slotted is highlighted in red.*

- On the Action Pane, select **Slotting plan** to view the results.

NOTE

- The **Generate demand**, **Locate demand**, and **Run replenishment** processes are now run in a sandbox. (These processes are available from the Action Pane on the **Slotting templates** page.)
- The **Generate demand**, **Locate demand**, and **Run replenishment** processes have a lock to ensure that they can't be triggered at the same time. Otherwise, the data that is used could be deleted.
- The **Generate demand** and **Locate demand** processes show a warning if the run didn't generate records, or if the records are missing information.
- When you select **Slotting plan**, the page doesn't have **New**, **Edit**, or **Delete** buttons on the Action Pane, because the data source can't be edited.
- When you select **Run replenishment**, the system validates the selected slot template and processes.

Create replenishment

After the slotting plan has been created, you must create *replenishment work*, based on the plan.

- On the Action Pane, select **Run replenishment**. An informational message appears when the process is completed. This message indicates the number of headers that were created for the work build ID.

Location directives that will be used are identified based on the directive code that is specified on each template line.

Tips

Set up automatic slotting

After all the required elements are in place, you can set up slotting to run automatically by following these steps.

1. Go to **Warehouse management > Replenishment > Run slotting**.
2. Specify the slotting steps to run. Select one or more of the following slotting steps:
 - Generate demand
 - Locate demand
 - Create replenishment work

NOTE

The slotting steps are progressive. If you want to select *Locate demand*, you must first select *Generate demand*.

3. Specify the slotting template to use.
4. Set the recurrence to run automatically, if you want.

For the exercises in the scenario, do **not** set up automatic slotting.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Location directive inventory picking aging

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to use first in, first out (FIFO) and last in, first out (LIFO) location directive strategies during picking. These strategies work in conjunction with the aging dates that are recorded for locations to track when inventory first entered the warehouse. The *Location directive inventory picking aging* feature uses the date on the location to determine aging. The *Warehouse location status* feature updates the date on the location, based on the date from the license plate.

You can use FIFO and LIFO strategies to ship both batch-tracked items and non-batch-tracked items, based on the date when the inventory entered the warehouse. This capability can be especially useful for non-batch-tracked inventory, where an expiration date isn't available to use for sorting.

When inventory is first received or created in the warehouse, the system updates the relevant license plate so that the current date is shown as the aging date. This date is then used by the location directive strategies to identify the oldest or newest inventory in the warehouse. If inventory is moved to a location that isn't tracked by license plate, the location itself is updated with aging information, and this information will then be used by the strategies.

Turn on the feature

To make this feature available, turn on the following features in [feature management](#), in this order:

1. Warehouse location status
2. Location directive inventory picking aging

Feature requirements

To use this feature, you must set the **Enable location status** option set to *Yes* for every [location profile](#) that is used to store inventory. To set this option for a location profile, go to **Warehouse management > Setup > Warehouse > Location profiles**, and select the location profile. You can find the option on the **General** FastTab.

Feature scenarios

This section provides examples that show how to set up and use FIFO and LIFO strategies.

TIP

This section provides two scenarios, one for FIFO and one for LIFO. The procedures that are provided assume that you will do both scenarios, in order. We recommend that you do both scenarios, so that you can experience the differences between the two strategies.

Make sample data available

To work through these scenarios by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use these scenarios as guidance for using the feature on a production system. However, in that case, you must substitute your own values for each setting that is described here.

Set up the scenarios

The demo data requires setup and inventory adjustments to support the scenarios. Follow these steps to create the inventory data that is required to work through the FIFO and LIFO scenarios.

1. Sign in to a system where demo data is installed, and select the **USMF** legal entity.
2. Go to **Warehouse management > Setup > Warehouse > Location profiles**.
3. On the Action Pane, select **Edit**.
4. In the list of location profiles, select **FLOOR-05**.
5. On the **General** FastTab, set the **Enable location status** option to *Yes*.
6. Select **Save**.
7. Go to **Warehouse management > Setup > Location directives**.
8. In the list of location directives, select **63 Pick containerization**.
9. Select **Edit** to put the page into edit mode.
10. On the **Location directive actions** FastTab, find the line where the **Sequence number** field is set to *1*, and follow one of these steps:
 - If you're setting up a FIFO scenario, change the value of the **Strategy** field to *Location aging FIFO*.
 - If you're setting up a LIFO scenario, change the value of the **Strategy** field to *Location aging LIFO*.
11. On the **Location directive actions** FastTab, select **Edit query**.
12. In the query dialog box, on the **Range** tab, select **Add** to add a line, and then set the following values:
 - **Table:** *Locations*
 - **Derived table:** *Locations*
 - **Field:** *Zone ID*
 - **Criteria:** *Floor*
13. Select **OK** to apply your settings and close the query dialog box.
14. Select **Save** to save your changes to the location directive.
15. On a mobile device or in the *Dynamics 365 for Finance and Operations - Warehousing* app on your PC, follow these steps to remove existing inventory from the warehouse location to support the scenarios:
 - a. Sign in to warehouse *63* by using the appropriate user ID and password.
 - b. On the main menu, select **Quality**.
 - c. On the **Quality management** menu, select **Scrap**.
 - d. On the **Scrap** page, select the **LOC/LP** field, and then enter *63_1*.
 - e. Select **Enter** or **OK**.
 - f. Confirm the **Scrap** details for **Adjustment out** by selecting **Enter** or **OK**.

When the license plate inventory is adjusted out, you receive a "Work Completed" message.

These steps leave inventory in two locations in the demo data. Each location has a different aging date. Location *FL-001* has an aging date of April 15, 2017, and location *FL-002* has an aging date of January 29, 2017. Both locations contain item *A0001*.

To view this data, go to **Inventory management > Inquiries and reports > On-hand list**, and then filter on warehouse *63* and item *A0001*. In the rows where the **Location** field is set to *FL-001* or *FL-002*, select a line that has a positive **Physical inventory** value, and then, on the Action Pane, select **Transactions**. The **Physical date** field will show a date that corresponds to one of the previously

mentioned aging dates.

Scenario 1: Set up and use FIFO location aging

The FIFO strategy finds the location that contains the oldest aging date, and it allocates picking based on that aging date.

1. If you haven't already done so, [prepare the sample data](#) that is required for this scenario.
2. Go to **Sales and marketing > Sales order > All sales orders**.
3. Select **New**.
4. In the **Create sales order** dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer** account field to *US-001*.
 - On the **General** FastTab, set the **Warehouse** field to *63*.
5. Select **OK** to create the sales order and close the dialog box.
6. The new sales order is opened. It includes a new, empty row in the grid on the **Sales order lines** FastTab. For this order line, set the **Item number** field to *A0001* and the **Quantity** field to *1*.
7. On the **Inventory** menu above the grid, select **Reservation**.
8. On the **Reservation** page, select **Reserve lot** to reserve the ordered quantity of this item from inventory at the selected warehouse.
9. Close the **Reservation** page.
10. On the **Sales order** page, on the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**. You receive informational messages. The system creates a shipment, adds it to a new load, and creates the required work.
11. On the **Sales order lines** FastTab, on the **Warehouse** menu, select **Work details** to open the work that was created for this sales order. Notice that the line where the **Work type** value is *Pick* shows a **Location** value of *FL-002*. This location contains the license plate that has the oldest aging date (FIFO).
12. Select **Warehouse > Shipment details**.
13. On the ***General** FastTab, make a note of the wave ID, so that you can use it in scenario 2.

Scenario 2: Set up and use LIFO location aging

The LIFO strategy finds the location that contains the newest aging date, and it allocates picking based on that aging date. In scenario 2, you will edit the setup for scenario 1 (FIFO), and reuse the sales order and wave that were created during that scenario.

1. Before you start this scenario, set up and complete the full FIFO scenario as described in the [previous section](#). In this scenario, you will reuse the wave and most of the setup that were created for that scenario.
2. Edit the **63 Pick containerization** location directive so that it uses the *Location aging LIFO* strategy, as described in the first part of the [Set up the scenarios](#) procedure.

Next, you will modify the wave that was created for the sales order in scenario 1, so that it uses the *Location aging LIFO* strategy.

3. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
4. Select and open the wave that contains the order that you created for the FIFO scenario.
5. On the Action Pane, on the **Work** tab, select **Cancel** to cancel the work that you created for the FIFO scenario.

6. On the Action Pane, on the **Wave** tab, in the **Wave** group, select **Process**.
7. When the processing is completed, on the Action Pane, on the **Wave** tab, in the **Related information** group, select **Work** to open the work that was created for this wave.
8. On the **Work** page, on the **Overview** tab, there should be two lines. Select the line where the **Work status** field is set to *Open*.
9. Notice that the line where the **Work type** value is *Pick* shows a **Location** value of *FL-001*. This location contains the license plate that has the newest aging date (LIFO).

In these scenarios, you've seen how the location aging strategy directs work to the inventory location that has either the oldest inventory or the newest inventory, depending on the selected strategy.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Outbound sorting

2/18/2021 • 24 minutes to read • [Edit Online](#)

This functionality makes it easier to handle small containers and helps warehouse workers better plan and organize pallet capacity in the truck. When you use outbound sorting, you can sort packed containers to the correct pallet after they have been at a packing station. You can also build a packing hierarchy.

This functionality lets you build pallets from containers that are packed through the packing functionality. The container isn't sent to the final shipping location as it is in the original packing flow. Instead, workers can close the container and move it to a sort type location. They can then sort containers to positions, each of which has a license plate (LP). After the containers have been sorted, work can be created to send the whole LP to the final shipping dock or stage locations, based on location directives or your own requirements. Additionally, the action of closing of the sort position can immediately move the inventory to the final shipping location and pick it to the order.

Turn on the Outbound sorting feature

Before you can use the feature, it must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Outbound sorting*

Setup

For this scenario, you must use standard **USMF** demo data and warehouse *62*. You must also complete the setup that is described in the following subsections.

Set up a wave template

This setup automatically processes the wave and creates work when a line is released to the warehouse.

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. In the template list, select **Warehouse 62**.
3. On the **General** FastTab, make sure that the **Process wave at release to warehouse** option is set to *Yes*.

Set up a worker

The packing station is considered a location. Warehouse workers who sign in at the packing station see and work on only shipments and containers that are planned at that specific packing location. A user who signs in to Microsoft Dynamics 365 must be set up as a worker in Warehouse management. If the user's name doesn't appear in the list of work users, use the following procedure to add it.

NOTE

These steps assume that the user already exists in the system and has been associated as an employee or worker in the **Human Resources** module.

1. Go to **Warehouse management > Setup > Worker**.
2. Select **New**.

3. In the **Worker** field, select the target user in the list of employees.
4. Select **Select**.
5. On the Action Pane, select **Save**.
6. On the **Users** FastTab, select **New** to create a mobile device account, and set the following values for it:
 - **User ID:** Enter a unique ID.
 - **User name:** Enter a name for the ID.
 - **Default warehouse:** *62*
 - **Menu name:** *Main*
7. On the Action Pane, select **Save**.
8. The **Set password** dialog box appears, where you can create a simple password that the user can use to sign in to the mobile app. Set the following values:
 - **Password:** Enter a simple password.
 - **Confirm password:** Enter the same password again.
9. Select **Set password**.

A notification in the Action Center informs you that the password has been set for the user that you created.

Create a location type

1. Go to **Warehouse management > Setup > Warehouse > Location types**.
2. On the Action Pane, select **New** to create a location type, and set the following values for it:
 - **Location type:** *SORT*
 - **Description:** *Sort*
3. On the Action Pane, select **Save**.

Set up Warehouse management parameters

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **General** tab, on the **Location types** FastTab, set the **Sorting location type** field to *SORT*.
3. On the Action Pane, select **Save**.

Set up a location profile

1. Go to **Warehouse management > Setup > Warehouse > Location profiles**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
 - **Location profile ID:** *Sorting*
 - **Name:** *Sorting*
4. On the **General** FastTab, set the following values:
 - **Location format:** *ASRB* (Aisle-Rack-Shelf-Bin)
 - **Location type:** *SORT*
 - **Use license plate tracking:** *Yes*
 - **Allow mixed items:** *Yes* (When you set this option to *Yes*, the **Allow mixed inventory batches** option is automatically set to *Yes* and can't be changed independently.)
5. Select **Save**.

Set up a location

1. Go to **Warehouse management > Setup > Warehouse > Locations**.
2. In the header, clear the **Generate check digits for location** check box.
3. On the Action Pane, select **New** to create a location, and set the following values for it:
 - **Warehouse:** *62*
 - **Location:** *SORT*
 - **Location profile ID:** *SORTING*
4. Select **Save**.

Set up an outbound sorting template

The outbound sorting template determines whether work is created out of the sort location, and whether sorting is done manually or automatically.

For this scenario, you will create an outbound sorting template to build pallets after the packing station.

1. Go to **Warehouse Management > Setup > Packing > Outbound sorting template**.
2. On the Action Pane, select **New**.
3. In the header of the new template, set the following values:
 - **Outbound sorting template ID:** *AutoWork*
 - **Description:** *Auto Work Creation*
 - **Outbound sorting template type:** *Container*
 - **Warehouse:** *62*
 - **Location:** *SORT*
4. On the **General** FastTab, set the following values:
 - **Sort verification:** *Position scan*
 - **Create work on position close:** *Yes*

If this option is set to *Yes*, when the position is closed, work will be created to move inventory to the final shipping location. If it's set to *No*, inventory will immediately be picked to the order when the position is closed.
 - **Position assignment:** *Automatic*

If this field is set to *Manual*, the user must always indicate which position the inventory should be sorted to. If it's set to *Automatic*, the system will automatically guide the inventory to a position whenever it can, based on the sort template breaks.
5. Select **Save** to make the **Edit query** button on the Action Pane available.
6. On the Action Pane, select **Edit Query**.
7. In the query editor, on the **Sorting** tab, add a line that has the following values:
 - **Table:** *Shipments*
 - **Derived table:** *Shipments*
 - **Field:** *Carrier service*

When you select this value, you might receive the following message: "Field Carrier service is not an index field. Do you want to add sorting on this?" Select **Yes**.
 - **Search direction:** *Ascending*

8. Select **OK**.
9. You might receive the following message: "Grouping will be reset, continue?" Select **Yes**.
The **Outbound sorting template breaks** button on the Action Pane becomes available.
10. On the Action Pane, select **Outbound sorting template breaks**.
11. In the **Outbound sorting criteria** dialog box, set the following values:
 - **Reference table name:** *Shipments*
 - **Reference field name:** *Carrier service*
 - **Group by field:** Select this check box to group shipments by carrier service.
12. Select **OK** to save your settings and close the dialog box.

Set up container packing policies

1. Go to **Warehouse management > Setup > Containers > Container packing policies**.
2. On the Action Pane, select **New**.
3. In the header of the new policy, set the following values:
 - **Container packing policy:** *Sort*
 - **Description:** *Sort*
4. On the **Overview** FastTab, set the following values:
 - **Warehouse:** *62*
 - **Default location for sorting:** *SORT*
 - **Weight unit:** *kg*
 - **Container closing policy:** *Automatic release*
 - **Container release policy:** *Assign container to outbound sorting position*
5. Select **Save**.

Set up packing profiles

Create a new packing profile that will be used together with the sorting functionality.

1. Go to **Warehouse management > Setup > Packing > Packing profiles**.
2. On the Action Pane, select **New** to create a line, and set the following values for it:
 - **Packing profile ID:** *Sort*
 - **Description:** *Sort*
 - **Container packing policy:** *Sort*
 - **Container ID mode:** *Auto*
 - **Container type:** *Box-Large*
 - **Auto create container at container close:** Cleared (= *No*)
3. Select **Save**.

Set up work classes

Set up a work class that will be used together with sorting.

1. Go to **Warehouse management > Setup > Work > Work classes**.
2. On the Action Pane, select **New** to create a work class for sorting, and set the following values for it:
 - **Work class ID:** *Sort*
 - **Description:** *Sort*

- **Work order type:** *Sorted inventory picking*

3. Select **Save**.

Set up mobile device menu items

Set up a new pallet menu item

Create a mobile device menu item to build pallets during sorting.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.

2. On the Action Pane, select **New**.

3. In the header, set the following values:

- **Menu item name:** *Pallet build*
- **Title:** *Pallet build*
- **Mode:** *Indirect*
- **Use existing work:** *No*

4. On the **General** FastTab, set the following values:

- **Activity code:** *Outbound sorting*

When this field is set to *Outbound sorting*, the **Outbound sorting template ID** field is shown.

- **Use process guide:** *Yes*

When the **Activity code** field is set to *Outbound sorting*, this option is automatically set to *Yes*.

- **Outbound sorting template ID:** *AutoWork*

5. Select **Save**.

Set up a new loading menu item

Next, create a menu item that lets users move the sorted inventory items to the shipping location.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.

2. On the Action Pane, select **New**.

3. In the header, set the following values:

- **Menu item name:** *Load from Sorting*
- **Title:** *Load from Sorting*
- **Mode:** *Work*
- **Use existing work:** *Yes*

4. On the **General** FastTab, set the **Directed by** field to *User directed*.

5. On the **Work classes** FastTab, select **New**, and then set the following values:

- **Work class ID:** *SORT*
- **Work order type:** *Sorted inventory picking*

6. Select **Save**.

Set up the mobile device menu

You must now add the new menu items to the mobile device menu.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.

2. Select the **Outbound** menu.

3. On the Action Pane, select **Edit**.

4. In the **Available menus and menu items** column, find and select **Pallet build**.

5. Select the right arrow button to move **Pallet build** to the **Menu structure** column.
6. Use the up arrow and down arrow buttons to put the **Pallet build** menu item in the desired position on the mobile device menu.
7. Select **Save**.
8. Repeat this procedure to add the **Load from Sorting** menu item to the **Outbound** menu.

Set up location directives

Location directives are rules that help identify pick and put locations for inventory movement. You must now create a rule to manage the sorting work.

Set up a single-SKU directive

1. Go to **Warehouse management > Setup > Location directives**.
2. In the left pane, change the value of the **Work order type** field to *Sorted inventory picking*.
3. On the Action Pane, select **New**.
4. In the header, set the following values:
 - **Sequence:** 1
 - **Name:** *Baydoor*
5. On the **Location directives** FastTab, set the following values:
 - **Work type:** *Put*
 - **Site:** 6
 - **Warehouse:** 62
 - **Multiple SKU:** *No*
6. Select **Save** to make the toolbar on the **Lines** FastTab available.
7. On the **Lines** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.
 - **Sequence:** 1
 - **From:** 0
 - **To:** 1,000,000
8. Select **Save** to make the toolbar on the **Location Directive Actions** FastTab available.
9. On the **Location Directive Actions** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.
 - **Sequence:** 1
 - **Name:** *Baydoor*
10. Select **Save**.
11. On the **Location Directive Actions** FastTab, select **Edit query**.
12. In the query editor, on the **Range** tab, find the row where the **Field** field is set to *Location*. Set the **Criteria** field for this row to *Baydoor*.
13. Select **OK** to save your settings and close the query editor.

Set up a multiple-SKU directive

1. Go to **Warehouse management > Setup > Location directives**.
2. In the left pane, change the value of the **Work order type** field to *Sorted inventory picking*.
3. On the Action Pane, select **New**.

4. In the header, set the following values:

- **Sequence:** 2
- **Name:** *Baydoor Multi*

5. On the **Location directives** FastTab, set the following values:

- **Work type:** *Put*
- **Site:** 6
- **Warehouse:** 62
- **Multiple SKU:** *Yes*

6. Select **Save** to make the toolbar on the **Lines** FastTab available.

7. On the **Lines** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.

- **Sequence:** 1
- **From:** 0
- **To:** 1,000,000

8. Select **Save** to make the toolbar on the **Location Directive Actions** FastTab available.

9. On the **Location Directive Actions** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.

- **Sequence:** 1
- **Name:** *Baydoor Multi*

10. Select **Save**.

11. On the **Location Directive Actions** FastTab, select **Edit query**.

12. In the query editor, on the **Range** tab, find the row where the **Field** field is set to *Location*. Set the **Criteria** field for this row to *Baydoor*.

13. Select **OK** to save your settings and close the query editor.

Set up work templates

1. Go to **Warehouse management > Setup > Work > Work templates**.

2. Change the value of the **Work order type** field to *Sorted inventory picking*.

3. On the Action Pane, select **New** to create a work template.

4. On the **Overview** tab, set the following values:

- **Sequence:** 1
- **Work template:** *Sort*
- **Work template description:** *Sort*

5. Select **Save** to make the **Work Template Details** FastTab available.

6. On the **Work Template Details** FastTab, select **New** to add a line, and then set the following values for it:

- **Work type:** *Pick*
- **Work class ID:** *SORT*

7. Select **New** again to add a second line, and then set the following values for it:

- **Work type:** *Put*
- **Work class ID:** *SORT*

8. Select **Save**.

Scenario

This scenario simulates a situation where packed containers should automatically be sorted to different positions (pallets) after the packing station, depending on the shipping carrier service. After all items from the load are packed and sorted by address, the pallets will be moved to the bay door.

Create sales orders and picking work

Create sales order 1

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-005*
 - **Warehouse:** *62*
4. Select **OK** to close the dialog box.

The new sales order is opened.
5. Switch to the **Header** view.
6. On the **Delivery** FastTab, in the **Transportation** section, set the following values:
 - **Shipping carrier:** *Air cargo*
 - **Carrier service:** *Air*
7. Switch to the **Lines** view.
8. If a new, empty line isn't automatically added to the grid on the **Sales order lines** FastTab, select **Add line** to add one.
9. On the new order line, set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *2*
10. While the new order line is still selected on the **Sales order lines** FastTab, on the **Inventory** menu above the grid, select **Reservation**.
11. On the **Reservation** page, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
12. Close the **Reservation** page to return to the sales order.
13. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
14. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID and shipment ID numbers.

Sales order 2

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-006*
 - **Warehouse:** *62*

4. Select **OK** to close the dialog box.
5. The new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines** FastTab. Set the following values on this order line:
 - **Item:** *A0001*
 - **Quantity:** *1*
6. On the **Line details** FastTab, on the **Delivery** tab, set the **Mode of delivery** field to *Flowe-STD*.
7. On the **Sales order lines** FastTab, select **Add line**, and then set the following values on the second order line:
 - **Item:** *A0002*
 - **Quantity:** *1*
8. On the **Line details** FastTab, on the **Delivery** tab, change the value of the **Mode of delivery** field to *Air C-Air*.
9. On the **Sales order lines** FastTab, select the first order line. Then, on the **Inventory** menu above the grid, select **Reservation**.
10. On the **Reservation** page, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
11. Close the **Reservation** page to return to the sales order.
12. On the **Sales order lines** FastTab, select the second order line. Then, on the **Inventory** menu above the grid, select **Reservation**.
13. On the **Reservation** page, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
14. Close the **Reservation** page to return to the sales order.
15. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
16. You receive an informational message that shows the shipment and wave for this order. Notice that two wave ID numbers and two shipment ID numbers have been created, one for each mode of delivery for the sales order lines.

Get the work IDs from the work details

1. Go to **Warehouse management > Work > Work details**.
2. The page shows the work IDs that have been created from sales orders. Use the wave IDs and shipment IDs from the sales orders that you created to find the work ID for each wave and shipment. Make a note of those work IDs, because you will need them in the next steps. Notice that two work IDs were created for the second sales order. If different items are picked from different locations, separate work IDs are generated.

Pick items for the sales orders

Complete the created work by using the mobile device to move the items to the pack station.

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Sales Picking**.
4. In the **ID** field, enter the work ID that was created for sales order 1.
5. Select **OK**.

6. On the **Sales orders - Pick** page, enter a target LP that was created for sales order 1. Notice that the picking location (*bulk-001*), item (*A0001*), and quantity (*2 pcs*) are shown.
7. Select **OK**.
8. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *Pack* location.
9. Select **OK**.

On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message, which indicates that the work ID from sales order 1 has been completed.

You will now pick sales order 2.

10. In the **ID** field, enter the work ID that was created for sales order 2, where line 1 has item *A0001*.
11. Select **OK**.
12. On the **Sales orders - Pick** page, enter a target LP. Notice that the picking location (*bulk-001*), item (*A0001*), and quantity (*1 pcs*) are shown.
13. Select **OK**.
14. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *Pack* location.
15. Select **OK**.

On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message. This message indicates that the work ID from line 1 of sales order 2 has been completed.

16. In the **ID** field, enter the work ID that was created for sales order 2, where line 2 has item *A0002*.
17. Select **OK**.
18. On the **Sales orders - Pick** page, enter a target LP. Notice that the picking location (*bulk-002*), item (*A0001*), and quantity (*1 pcs*) are shown.
19. Select **OK**.
20. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *Pack* location.
21. Select **OK**.

On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message. This message indicates that the work ID from line 2 of sales order 2 has been completed.

Pack sales orders into containers

Pack sales order 1 into containers

1. Go to **Warehouse management > Packing and containerization > Pack**.

The **Select packing station** dialog box appears. By default, the **Worker** field should be set to the name of the worker that you set up earlier.

2. Set the following values to view and work on shipments and containers that are planned at the specific packing location:
 - **Site:** 6
 - **Warehouse:** 62
 - **Location:** *Pack*

- **Packing profile ID:** *Sort*

3. Select **OK** to close the dialog box.
4. On the **Pack** page, in the **License plate or shipment** field, enter the target LP for sales order 1. Then select the **Tab** or **Enter** key on your keyboard to move out of the field.
5. On the Action Pane, select **New container**.
6. Accept all the default settings, and select **OK**. Make a note of the container ID.
7. On the **Item packing** FastTab, set the following values:
 - **Quantity:** *1*
 - **Identifier:** Item *A0001*
8. On the Action Pane, select **Close container**.
9. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.
10. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.
11. Create a second container to add the second item from the LP for sales order 1 to a new container.
12. On the Action Pane, select **New container**.
13. Accept all the default settings, and select **OK**. Make a note of the container ID.
14. On the **Item packing** FastTab, set the following values:
 - **Quantity:** *1*
 - **Identifier:** Item *A0001*
15. On the Action Pane, select **Close container**.
16. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.
17. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.

Pack sales order 2 into containers

1. On the **Pack** page, in the **License plate or shipment** field, enter the target LP for line 1 of sales order 2. Then select the **Tab** or **Enter** key on your keyboard to move out of the field.
2. On the Action Pane, select **New container**.
3. Accept all the default settings, and select **OK**. Make a note of the container ID.
4. On the **Item packing** FastTab, set the following values:
 - **Quantity:** *1*
 - **Identifier:** Item *A0001*
5. On the Action Pane, select **Close container**.
6. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.
7. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.
8. In the **License plate or shipment** field, enter the target LP for line 2 of the sales order 2. Then select the **Tab** or **Enter** key on your keyboard to move out of the field.
9. On the Action Pane, select **New container**.

10. Accept all the default settings, and select **OK**. Make a note of the container ID.
11. On the **Item packing** FastTab, set the following values:
 - **Quantity:** 1
 - **Identifier field:** Item *A0002*
12. On the Action Pane, select **Close container**.
13. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.
14. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.

To view the container details, go to **Warehouse management > Packing and containerization > Containers**, and search for the container IDs that were created during packing.

Sort the containers

IMPORTANT

When you access the **Pallet build** menu item on the mobile app to do outbound sorting, you will see a button that is labeled **Full**. *Don't use the Full button to sort or close the position.*

The **Full** button is provided by default and can't be disabled or removed from the page. It isn't used for the *Outbound sorting* feature.

Sort the first container

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Pallet build**.
4. In the **LP/Con** field, enter the first container ID that is associated with sales order 1.
5. Select **OK**.
6. Because no sort positions currently exist, you must specify one. In the **Sort position ID** field, enter *SP01*.
7. Because no LP is currently associated with sort position *SP01*, you must specify one. In the **LP** field, enter *PLP01*.
8. Select **OK**.
9. Because sort position validation is turned on, you must enter the sort position ID again. In the **Sort Position ID** field, enter *SP01*.
10. Select **OK**.

You receive a "Work completed" message.

TIP

To view the sort position and the LP in it, go to **Warehouse management > Packing and containerization > Outbound sorting position assignments**.

The **Outbound sorting position assignments** page shows all the sort positions that are currently active. The **Sort position transactions** field shows the LP that is associated with each sort position, and the containers that are in the sort position. Notice that one sort position currently exists, and that the **Sort position criteria** FastTab shows a criterion of **Shipment – Carrier service - Air**.

Sort the remaining containers

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Pallet build**.
4. In the **LP/Con** field, enter the second container ID that is associated with sales order 1.
5. Select **OK**. Because the sorting template is set up to sort automatically, and a sort position that has matching criteria already exists, you're automatically directed to the correct sort position.
6. Select **OK**.
7. Confirm the sort position ID to indicate that the inventory is in the correct place. In the **Sort Position ID** field, enter *SP01*.
8. Select **OK**.

Work is completed on the second container from sales order 1. You will now sort the remaining containers from sales order 2.

9. In the **LP/Con** field, enter the container ID of the container from sales order 2 that holds item *A0001*. Because the carrier service differs, you're prompted to enter a new sort position and assign an LP to that position. Use sort position *SP02* and LP *PLP02*.
10. Select **OK**.
11. Confirm the sort position by entering *SP02* in the **Sort Position ID** field.
12. Select **OK**.

Work is completed on the container.

13. In the **LP/Con** field, enter the container ID for the remaining container from sales order 2 that holds item *A0002*. Because the carrier service is the same as the carrier service for sales order 1, the system shows the existing sort position that has matching criteria.
14. Select **OK**.
15. Confirm the sort position by entering *SP01* in the **Sort Position ID** field.
16. Select **OK**.

Work is completed on the container.

Close the outbound sorting positions

When all inventory has been sorted, the position must be closed before work can be created. Sorted inventory picking work will be created to take the inventory to the bay door.

Close a position from the mobile device

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Pallet build**.
4. In the **LP/Con** field, enter a container ID that was sorted to sort position *SP01*.
5. Select **OK**.
6. You receive the following message: "The container is already sorted to position SP01. Close the position?" Select **Close**.

Work is completed.

Close a position from outbound sorting position assignments

1. Go to **Warehouse management > Packing and containerization > Outbound sorting position assignments**.
2. In the left column, select **SP02**. This outbound sorting position row is the one that you will close.
3. On the Action Pane, select **Close position**. The sorting position record is closed and is no longer shown.

TIP

To show all closed position records, select the **Show closed** check box.

Sorted inventory picking

You must complete the sorted inventory picking work. When it's completed, the inventory will be picked to the sales order. At that point, all other warehouse processes apply.

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Load from Sorting**.
4. Enter the target LP ID from the first sort position, *SP01*. Set the **ID** field to *PLP01*.
5. Select **OK**.
6. The **Sorted inventory picking: Pick** page shows the pick work that must be done. Pick from the *SORT* location and target LP *PLP01*, which has multiple items and a quantity of *3*.
7. Select **OK**.
8. The **Sorted inventory picking: Put** page shows the put work that must be done. Put to the *Baydoor* location and target LP *PLP01*, which has multiple items and a quantity of *3*.
9. Select **OK**.

Work is completed.

10. Enter the target license plate ID from the second sort position, *SP02*. Set the **ID** field to *PLP02*.
11. Select **OK**.
12. The **Sorted inventory picking: Pick** page shows the pick work that must be done. Pick from the *SORT*

location and target LP *PLP02*, which has multiple items and a quantity of *1*.

13. Select **OK**.

14. The **Sorted inventory picking: Put** page shows the put work that must be done. Put to the *Baydoor* location and target LP *PLP02*, which has multiple items and a quantity of *1*.

15. Select **OK**.

Work is completed.

From this point forward, all other warehouse processes apply.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Put to wall - put to store

2/18/2021 • 19 minutes to read • [Edit Online](#)

The *Put to wall - put to store* functionality lets you handle scenarios where you must consolidate a product to a prepack staging area, based on configurable criteria. Because this functionality allows for picking to a single target license plate and can use more put positions than cluster picking, companies that ship to stores or handle small items will benefit from decreased picking time.

The workflow for this functionality directs picked product to a sorting location for distribution into various types of containers. Generally, each sorting location includes multiple sort positions. Each sort position is assigned according to the criteria that are set by the business process. Typical criteria are the final destination, shipment, or load. After a product arrives, it's distributed to each sort position, based on the quantity that is associated with the order, destination, shipment, or load. When a container is full or complete, it's moved to a staging location or a shipping location for further handling, depending on the business process.

This warehousing functionality is also referred to by other names, such as put-to-light and break opens.

Turn on the Outbound sorting feature

Before you can use the *Put to wall - put to store* functionality, the *Outbound sorting* feature must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Outbound sorting*

The *Outbound sorting* feature can be used in conjunction with the *Organization wide wave step code* feature if it's turned on. You must also turn on this feature if you will use predefined codes that are set up in wave step codes. In the **Feature management** workspace, this feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Organization wide wave step code*

Setup

For this demo, standard Contoso data and warehouse *62* are used. Some additions that are noted later are also used.

Location type

1. Go to **Warehouse management > Setup > Warehouse > Location types**.
2. On the Action Pane, select **New** to create a location type for sorting.
3. Set the following values:
 - **Location type:** *SORT*
 - **Description:** *Sort*
4. Select **Save**.

Warehouse management parameters

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **General** tab, on the **Location types** FastTab, in the **Sorting location type** field, enter *SORT*.

3. Select **Save**.

Location profile

1. Go to **Warehouse management > Setup > Warehouse > Location profiles**.

2. On the Action Pane, select **New** to create a location profile for the sorting location.

3. In the header, set the following values:

- Location profile ID: *Sort*
- Name: *Sort*

4. On the **General** FastTab, set the following values:

- Location format: *PACK*
- Location type: *SORT*
- Use license plate tracking: *Yes*
- Allow mixed items: *Yes*
- Allow mixed inventory statuses: *Yes*

5. Select **Save**.

Locations

1. Go to **Warehouse management > Setup > Warehouse > Locations**.

2. Clear the **Generate check digits for location** check box.

3. On the Action Pane, select **New**, and then set the following values:

- Warehouse: *62*
- Location: *Sort*
- Location profile ID: *Sort*

4. Select **Save**.

Packing profiles

1. Go to **Warehouse management > Setup > Packing > Packing profiles**.

2. On the Action Pane, select **New**, and then set the following values:

- Packing profile ID: *Sort*
- Description: *Sort*
- Container packing policy: Leave this field blank.
- Container ID mode: *Auto*
- Container type: *PALLET 48X48*
- Autocreate container at container close: Leave this field blank.

3. Select **Save**.

Wave step codes

If you turned on the *Organization wide wave step code* feature, set up the following code.

1. Go to **Warehouse management > Setup > Waves > Wave step codes**.

2. On the Action Pane, select **New**, and then set the following values:

- Wave step code: *Sort*
- Wave step description: *Sort*
- Wave step type: *Sort template*

3. Select **Save**.

Outbound sorting template

The sorting template controls whether sort positions are created, what criteria are used, and other attributes of the sorting process.

1. Go to **Warehouse management > Setup > Packing > Outbound sorting template**.
2. On the Action Pane, select **New** to create a sorting template.
3. In the header of the new template, set the following values:

- **Outbound sorting template ID:** *Wave Sort*
- **Description:** *Wave sort*
- **Sort template type:** *Wave demand*

This field defines the process that the sorting template is used for. The following values are available:

- **Wave demand** – The sorting template is used for the *Put to wall* process. This template type is used to bypass the pack station and process inventory directly out of the wave. You can use this type only if the **sorting** wave process method is included in the wave template.
- **Container** – The sorting template is used for the *Pallet building after packing* process. This template type is used to process containers that are closed at the pack station and must be sorted onto pallets.

- **Warehouse:** *62*
- **Location:** *Sort*

4. On the **General** FastTab, set the following values:

- **Sort verification:** *Position scan*

This field defines the verification that is required during sorting. The following values are available:

- None
- License plate scan
- Position scan

- **Create work on position close:** *Yes*

If this option is set to *Yes*, when the position is closed, work will be created to move inventory to the final shipping location. If it's set to *No*, inventory will immediately be picked to the order when the position is closed.

- **Position assignment:** *Manual*

This field defines the type of position assignment. The following values are available:

- **Manual** – The user must always indicate which position the inventory should be sorted to.
- **Automatic** – The system will automatically guide the inventory to a position whenever it can, based on the sort template breaks.

- **Assign sort position criteria:** *Only use empty position*

This field controls whether inventory that is already present on sort positions is taken into account when a position is assigned for the demand. The following values are available:

- **Only use empty position** – Positions that already have inventory associated with them will be taken into account
- **Assume position empty** – Any inventory that is already on the position will be disregarded

during assignment. All available positions will be used.

- **Wave step code:** *Sort*

If the *Organization wide wave step code* feature is turned on, the *Sort* wave step code must also be set up in wave step codes.

- **Auto close sort position:** *Yes*

If this option is set to *Yes*, the sort position will automatically be closed when all work that comes to the position has been completed.

- **Number of sort positions:** *3*

This field defines the maximum number of sort positions that the system will create.

- **Sort position prefix:** *SP-*

This field defines the prefix that the system assigns before the position number.

- **Auto pack sort position:** *Yes*

If this option is set to *Yes*, the inventory on the sort position will be packed into a container when the position is closed.

- **Packing profile ID:** *Sort*

This field defines the packing profile that will be used when the sort position is packed into a container.

5. On the Action Pane, select **Edit query** to specify the criteria that are used for this sorting template.

6. In the query dialog box, on the **Sorting** tab, select **New** to add a line, and then set the following values:

- **Table:** *Load details*
- **Derived table:** *Load details*
- **Field:** *Shipment ID*
- **Search direction:** *Ascending*

7. Select **OK**.

8. You might receive the following message: "Grouping will be reset, continue?" Select **Yes**.

The **Outbound sorting template breaks** button on the Action Pane becomes available.

9. On the Action Pane, select **Outbound sorting template breaks**.

10. Select the **Group by field** check box to group by shipment ID.

This setting will create one sort position per shipment that is a container in the wave.

11. Select **OK**.

Wave process methods

1. Go to **Warehouse management > Setup > Waves > Wave process methods**.

2. On the Action Pane, select **Regenerate methods**.

The **sorting** method is added to the list of available methods, and the *Shipping* wave template type is selected for it.

Wave templates

Edit the wave template that is used for wave demand sorting.

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. In the **Wave template type** field, select *Shipping*.
3. Select the existing **62 Shipping default** template.
4. On the Action Pane, select **Edit**.
5. On the **General** FastTab, make the following changes:
 - Set the **Process wave at release to warehouse** option to *No*.
 - Set the **Assign to open waves** option to *Yes*.
6. On the **Methods** FastTab, set up the **sorting** method:
 - a. In the **Remaining Methods** grid, select **sorting**.
 - b. Select the right arrow button to move **sorting** to the **Selected Methods** grid.
 - c. In the **Selected Methods** grid, select **sorting**.
 - d. Set the **Wave step code** field to *Sort*.
7. Select **Save**.

Mobile device menu items

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
 - **Menu item name:** *Sort*
 - **Title:** *Sort*
 - **Mode:** *Indirect*
 - **Use existing work:** *No*
4. On the **General** FastTab, set the following values:
 - **Activity code:** *Outbound sorting*
 - **Use process guide:** *Yes* (default value)
 - **Outbound sorting template ID:** *Wave Sort*
5. Select **Save**.

Mobile device menu

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
2. In the list of menus, select **Outbound**.
3. On the Action Pane, select **Edit**.
4. In the **Available Menus And Menu Items** grid, find and select the **Sort** menu item that you just created.
5. Select the right arrow button to move **Sort** to the **Menu Structure** grid. In this way, you add the menu item to the **Outbound** menu.
6. Select **Save**.

Location directives

You must create location directives to guide the work that is created after the sorting is completed.

1. Go to **Warehouse management > Setup > Location directives**.
2. In the **Work order type** field, select *Sorted inventory picking*.
3. On the Action Pane, select **New**.

4. In the header, set the following values:

- **Sequence:** 1
- **Name:** *Put to Baydoor*

5. On the **Location directives** FastTab, set the following values:

- **Work type:** *Put*
- **Site:** 6
- **Warehouse:** 62
- **Directive code:** Leave this field blank.
- **Multiple SKU:** *No*

6. Select **Save** to make the **Lines** FastTab available.

7. On the **Lines** FastTab, select **New**, and then set the following values. Accept the default values for all the other fields.

- **Sequence number:** 1
- **From quantity:** 0
- **To quantity:** 1000000

8. Select **Save** to make the **Location Directive Actions** FastTab available.

9. On the **Location Directive Actions** FastTab, select **New**, and then set the following values. Accept the default values for all the other fields.

- **Sequence number:** 1
- **Name:** *Baydoor*

10. Select **Save** to make the **Edit query** button on the **Location Directive Actions** FastTab available.

11. On the **Location Directive Actions** FastTab, select **Edit query**.

12. In the query dialog box, on the **Range** tab, find the row where the **Field** field is set to *Location*. Set the **Criteria** field for this row to *Baydoor*.

13. Select **OK** to confirm the edit.

Work classes

1. Go to **Warehouse management > Setup > Work > Work classes**.

2. On the Action Pane, select **New**.

3. In the header, set the following values:

- **Work class ID:** *Sorting*
- **Description:** *Sorting*
- **Work order type:** *Sorted inventory picking*

4. Select **Save**.

Work templates

1. Go to **Warehouse management > Work > Work templates**.

2. In the **Work order type** field, select *Sales orders*.

3. In the grid, select the 62 **Pick to pack** work template.

4. On the Action Pane, select **Work header breaks**.

5. On the Action Pane, select **Edit**.

6. On the line where the **Field name** field is set to *Shipment ID*, clear the **Group by this field** check box.
7. Select **Save**, and then close the **Work header breaks** dialog box.
8. In the **Work order type** field, select *Sorted inventory picking*.
9. Select **New** to create a work template.
10. In the **Overview** section, set the following values. Accept the default values for all the other fields.
 - **Work template:** *Sorted picking*
 - **Work template description:** *Sorted picking*
11. Select **Save** to make the **Work Template Details** section available.
12. In the **Work Template Details** section, you will create two lines. Select **New**, and then set the following values for line 1:
 - **Work type:** *Pick*
 - **Mandatory:** Selected (= *Yes*)
 - **Work class ID:** *Sorting*
13. Select **New** again, and then set the following values for line 2:
 - **Work type:** *Put*
 - **Mandatory:** Selected (= *Yes*)
 - **Work class ID:** *Sorting*
14. Select **Save**.

Example scenario

This scenario simulates a situation where the warehouse stores small items in locations and must pack them into boxes before they are shipped, and where packing station functionality isn't really suitable. Workers pick orders for multiple customers and different addresses at the same time to increase the picking speed. After picking has been completed, the workers arrive at the sorting location, where the picked items can be sorted to the correct box, based on required criteria. In this example, the shipment ID will be used to determine the correct box, because each shipment has a different address. After all items from the load are packed and sorted by shipment, the boxes will be moved to the staging area and eventually loaded onto a truck.

Before you start the scenario, make sure that all standard warehouse functionality is set up correctly for your warehouse. Standard Contoso warehouse 62 is used for this purpose. Standard configurations haven't been changed, besides what is described in the setup.

Create demand

Before the functionality can be demonstrated, you must create some demand. For this scenario, you will create three sales orders for three different customers to simulate different delivery addresses. In this way, you will create three separate shipments.

Before you create sales orders and shipments, make sure that the pick locations have enough inventory for all the items on the orders. Review the location directive settings to confirm the picking locations that are used for sales order picking. If you must adjust the inventory, you can create manual movements, use replenishment, or use any other flow. Then reserve the inventory.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New** to create a sales order for order 1.
3. In the **Create sales order** dialog box, set the following values:

- **Customer:** *US-001*
 - **Warehouse:** *62*
4. Select **OK**.
 5. A new line is added to the **Sales order lines** FastTab. Set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *5*
 6. Select **Add line** to add a second line, and set the following values:
 - **Item number:** *A0002*
 - **Quantity:** *10*
 7. Repeat the following steps for each sales line on the order to reserve inventory for it:
 - a. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
 - b. On the **Reservation** page, select **Reserve lot**, and then close the page.
 - c. Select **Save**.
 8. Select **New** to create a sales order for order 2.
 9. In the **Create sales order** dialog box, set the following values:
 - **Customer:** *US-004*
 - **Warehouse:** *62*
 10. Select **OK**.
 11. A new line is added to the **Sales order lines** FastTab. Set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *7*
 12. Select **Add line** to add a second line, and set the following values:
 - **Item number:** *A0002*
 - **Quantity:** *3*
 13. Repeat the following steps for each sales line on the order to reserve inventory for it:
 - a. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
 - b. On the **Reservation** page, select **Reserve lot**, and then close the page.
 - c. Select **Save**.
 14. Select **New** to create a sales order for order 3.
 15. In the **Create sales order** dialog box, set the following values:
 - **Customer:** *US-007*
 - **Warehouse:** *62*
 16. Select **OK**.
 17. A new line is added to the **Sales order lines** FastTab. Set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *8*
 18. Follow these steps to reserve inventory for the sales line:
 - a. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
 - b. On the **Reservation** page, select **Reserve lot**, and then close the page.
 - c. Select **Save**.

Complete the following procedure to release each sales order to the warehouse. Three different shipments will be created. You will then add all three shipments to one new wave.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. In the grid, select the first sales order that you created.
3. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

You receive an informational message that shows the wave ID and shipment ID that were created.

4. Repeat the previous steps to release sales orders 2 and 3 to the warehouse. Notice that the informational message that you receive indicates that a shipment has been added to the wave that was created when you released sales order 1.

5. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.

6. Select the wave ID that was created from the release of the sales orders to open the **Waves** page. This page shows the wave details. The **Wave lines** FastTab shows the shipments that were created.

You must now create work to bring items from the picking locations to the sorting location.

7. On the Action Pane, select **Process**.

During wave processing, the sorting method will use the sorting template to assign the inventory to sort positions. When wave processing is completed, you receive an informational message that states that the wave has been posted and work has been created.

8. On the Action Pane, on the **Wave** tab, in the **Related information** group, select **Work** to view the work that was created. Make a note of the work ID.

9. Go to **Warehouse management > Packing and containerization > Outbound sorting position assignments**.

10. In the left column, you can view the outbound sorting position that was created for each shipment.

11. On the **Sort position criteria** FastTab, you can view the shipment ID for that position.

One work ID has been created to bring inventory from the picking locations to the sorting location. To complete the work, you will need the work ID that was created during wave processing.

Sales order picking to the sorting location

1. Sign in to the mobile app as a worker in warehouse 62.
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Sales Picking**.
4. Select the **ID** field, and then enter the work ID from the wave processing.
5. Confirm your entry.

Next, you're prompted to enter a target license plate (LP). Notice that line 1 from sales order 1 is what must be picked and added to the target license plate. The item number, quantity, item description, and pick location are shown.

6. In the **Target LP** field, enter a license plate number.

You will pick all lines that were created from the processed wave onto the same target license plate.

7. Confirm your entry.

The mobile app now presents a series of **Pick** pages that point you to the picking location, and to the

item and quantity that must be picked. After the picked item is added to the license plate, you will confirm the pick work. The last page will be the work to put the picked items into the sorting location.

8. Confirm the first pick work.
9. The next pick work is shown. Confirm the pick.
10. Continue to confirm the remaining pick work.
11. The last step is to complete the put work. Confirm the put-away to the sorting location.

You receive a "Work completed" message.

12. Exit **Sales Picking** on the mobile app.

Sorting/put-to-wall

Now that all inventory has been put to the sorting location, it must be sorted to the correct sort position.

1. Sign in to the mobile app.
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Sort** to start to sort the items.
4. In the **LP/CON** field, enter the target license plate of the picked sales order work.
5. Confirm your entry.
6. Enter the item number to sort first.
7. The system determines the first sort position that should be shown. Confirm the sort position.
8. You're prompted to assign a license plate to the sort position. Select the **LP** field, enter a license plate number, and then confirm your entry.

Because the sort position is related to the shipment ID, you will sort the picked items into a license plate that is specific to the outbound shipment and sales order.

The next page shows the item ID, quantity, sort position ID, and the "from" (picking) and "to" (sorting) license plate IDs. The information on this page instructs you to sort the specified item and quantities from the picking license plate into the sorting license plate.

9. Confirm the sort position.
10. Sort the items in the first sort position. When you've finished, the system directs you to the next sort position.
11. Repeat this process for all picked lines on the work order. You should also use this process when there are multiple pick lines that have the same item number.

As you repeat this process for all items, the system evaluates the criteria from the next scanned item (work line) and determines which sorting position it should be put to. You're automatically directed to put the item to the correct sort position. Depending on the confirmation setup, you're also directed to confirm this action by entering the position number or license plate ID.

NOTE

If automatic sorting is turned on, manual override isn't available.

12. When you've finished, in Microsoft Dynamics 365 Supply Chain Management, open the **Outbound sorting position assignments** page to review the status of the positions.

- If positions are closed automatically, select **Show closed** to show the closed positions.
- Notice that sort position transactions are shown. The item and quantity that were processed through the position are shown.

When you set up the outbound sorting template, you set the **Auto close sort position** option to *Yes*. Therefore, the position is automatically closed after the last expected inventory is put to it. The sort positions are in **Closed** status, and work has been created to move the sorted inventory to *Baydoor* location.

13. Complete the sorted inventory picking work to move the inventory to the shipping location. When the inventory is ready, ship-confirm it.

NOTE

For sorted inventory picking work to be processed correctly, a mobile device menu item that has a work class ID where the **Work order type** field is set to *Sorted inventory picking* should be used for the movement and loading process.

Manually close a position (optional)

If sort positions should be closed manually, the **Auto close sort position** option for the outbound sorting template must be set to *No*, and closing must be done before inventory can be moved to the bay door area. Positions can be closed in various ways:

- Via the warehouse app:
 - The user can scan one of the items that are already on the position and then select **Close** to close the position.
 - If the user scans a container that has already been sorted container, an error message is shown. However, the user can still continue to close the position.
- From the Microsoft Dynamics 365 Supply Chain Management **Outbound sorting position assignments** page:
 - The user can select the outbound sorting position record and then select **Close position** on the Action Pane.

Tips

- Items can't be moved between positions after they have been assigned to one. The system evaluates how many of each item should go to a specific position.
- Sorts template can be configured to automatically create containers when positions are closed. This approach will create standard container ID structure that is based on the specified packing profile.

IMPORTANT

After movement work has been created from the sorting location, you must not cancel the work. Otherwise, the position and the containers in it will be deleted from the system and unavailable for further processing. The inventory will also be removed.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Outbound workload visualization

2/18/2021 • 5 minutes to read • [Edit Online](#)

Advanced setup capabilities that are accessible from the **Outbound workload visualization** page let warehouse managers and supervisors create custom workload charts that can be used to monitor the progress of current work and the amount of it that remains. Warehouse managers can create multiple views and set up automatic refresh as they require. Outbound workload visualizations are suitable for display on warehouse performance pages.

This functionality can be used to track the progress of picking work. The feature is integrated with labor management, and if labor management is set up, outbound workload visualizations can show a calculation of the number of hours that remain for the picking work that is shown (filtered).

Turn on the Outbound workload visualization feature

Before you can use this feature, it must be turned on in your system. Admins can use the [Feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Outbound workload visualization*

Set up outbound workload visualizations

To set up your visualizations, you create a collection of filters (views) and design each filter so that it shows a different type of analysis. You use the **Configure filters** page to design the filters.

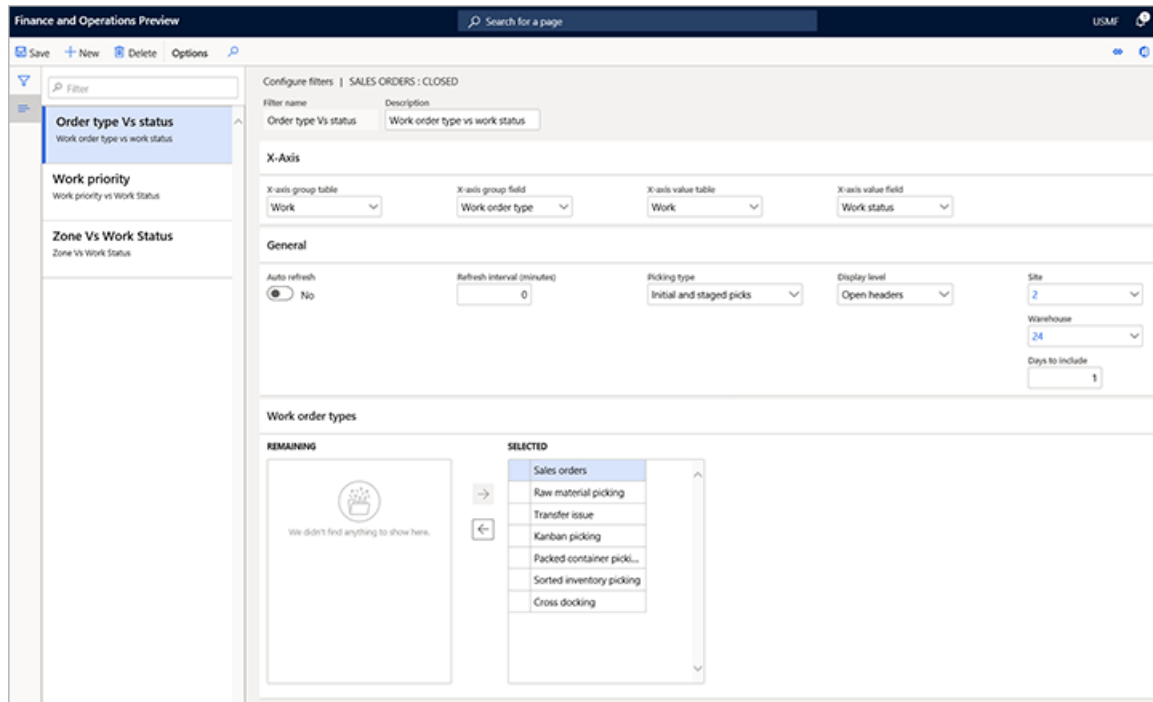

To set up an outbound workload visualization, follow these steps.

1. Go to **Warehouse management > Warehouse monitoring reports > Outbound workload visualization**.

The **Outbound workload visualization** page appears. After you create some filters, this page will show your visualization. You can create as many filters as you want. All the filters that you create are saved under your user account, so that you can use them later. In other words, each user will have their own set of filters that they created. Those filters won't be shared with other users.

2. On the **Outbound workload visualization** page, on the Action Pane, on the **Filters** tab, select **Configure filters**.
3. On the **Configure filters** page, on the Action Pane, select **New** to add a filter, and then set the following fields for it:
 - **X-axis group table** – Select the table that contains the field that should be used to group the X-axis values.
 - **X-axis group field** – From among the fields of the table that you selected in the **X-axis group table** field, select the field that should be used to group the X-axis values.
 - **X-axis value table** – Select the table that contains the field that should be used to further analyze the groups.
 - **X-axis value field** – From among the fields of the table that you selected in the **X-axis value table** field, select the field that provides the values that should be analyzed for each group.
 - **Auto-refresh** – Select whether the visualization should automatically be refreshed.

- **Refresh interval (minutes)** – Enter the number of minutes between automatic refreshes.
- **Display level** – Select whether the chart should show open lines or open header counts.
- **Picking type** – If you set the **Display level** field to *Open lines*, select whether the count of open work lines in the chart should include initial picks, staged picks, or both initial picks and staged picks.
- **Site** – Select the site to load the chart for.
- **Warehouse** – Select the warehouse to load the chart for.
- **Days to include** – Enter the number of days in the past that the chart should be generated for.
- **Work order type** – Select the outbound work order types to filter on.

4. Close the **Configure filters** page to return to the **Outbound workload visualizations** page.

The **Outbound workload visualizations** page now shows data, based on your new filter settings. Your new filter is now available and is selected in the **Filter** field. The following fields are available at the top of the chart:

- **Filter** – This field includes all the filters that you've created so far. Select a filter to view its data in the chart.
- **Last refreshed** – This field shows the date and time when the information in the chart was last updated.
- **Estimated/actual time** – If labor standards are set up in your system, set this option to *Yes* to show accumulated estimated picking times at the top of each column in the chart. If you aren't using labor standards, this option is unavailable.

5. Select any bar in the chart to view the associated work line details.

Work ID	Work creation number	Work status	Work order type	Order number	Site	Warehouse	Work in process	Cloud work	Ter
USMF-000001	USMF-00000001	Open	Sales orders	000745	2	24			
USMF-000002	USMF-00000002	Open	Sales orders	000752	2	24			
USMF-000014	USMF-00000013	Open	Sales orders	000776	6	63			
USMF-000015	USMF-00000013	Open	Sales orders	000776	6	63			
USMF-000217	USMF-00000005	Open	Purchase orders	00000100	2	24			00

Example: Outbound workload visualization for zones

For this example, you want to set up a visualization that shows work lines for each zone, and the status of each work line (*Open*, *Closed*, or *Canceled*). In this case, you can set up a filter that has the following settings:

- **Filter name** – Enter a name for this filter (such as *Zone vs. work status*).
- **Description** – Enter a short description for this filter (such as *Zone vs. work status*).
- **X-axis group table** – Select *Locations*.
- **X-axis group** – Select *Zone ID*.
- **X-axis value table** – Select *Work*, because you want to view work per zone.
- **X-axis value field** – Select *Work status*, because you want to view work status.
- **Auto refresh** – Select whether the visualization should automatically be refreshed.
- **Picking type** – Select *Initial picks and staged picks*, because you want to include both initial picks and picks from staging locations. In other words, you essentially want to include all the pick work lines that you have.
- **Display level** – Select *Open lines*, because you want to view the information per line, not per work header.

The following illustration shows an example of the resulting chart.

This chart shows two zones that are named **FLOOR** and **BULK**, plus a zone that is named **Blank**. The **Blank** zone represents all work lines that aren't members of any zones. The chart always shows all unrelated filtered data as **Blank**, to provide as much visibility as possible. In the **FLOOR** zone, the chart shows three closed lines and four open lines. In the **BULK** zone, the chart shows four closed lines, one open line, and 24 canceled lines. Finally, the chart shows eight closed lines that aren't part of any zone and are therefore listed as **Blank**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot picking and packing

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you pick and pack in Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "Dimension location can't be left blank if dimension serial number is set."

Issue description

You receive this error message if you create a transfer order for a serial item by using a warehouse that is enabled for advanced warehouse management (WMS), and then, after the work is completed, you try to confirm the shipment.

Issue resolution

The **Default receipt location** field is blank for a transit warehouse of the "from" warehouse. To fix this issue, specify a default receipt location in the transit warehouse. Make sure that this location is license plate-controlled.

I receive the following error message: "Invalid license plate."

Issue description

You receive this error message in the warehouse app when you scan a license plate ID.

Issue resolution

Make sure that the license plate ID exists in the license plates table, and that the items and quantities on the license plate are available (in other words, they aren't blocked).

I receive the following error message: "Field 'Load weight' (=-%1) can only contain positive numbers. Update has been canceled."

Issue description

You receive this error message if there is open work when you process work from packing locations to staging locations, or from staging locations to dock locations.

Issue resolution

To fix this issue, go to **System administration > Periodic tasks > Database > Consistency check**, and run the process for **Warehouse load weight consistency check**.

I receive the following error message: "The quantity is not valid for unit %1."

Issue description

You receive this error message when you try to perform a *split pick* across multiple batches.

Issue resolution

The warehouse worker must use the *Short picking* process in the warehouse app. If you're trying to pick multiple batches from the same location, you can also use the **Full** option in the warehouse app.

I can't move inventory to a location that is license plate–controlled.

Issue description

You can't reduce picked quantities on a load.

Issue resolution

In earlier versions, you can't reduce picked quantities on a load. However, you can now unpick to a license plate–controlled location. You must specify both a **Location** value and a **License plate** value for the load line on the **Reduce picked quantity** page.

Can I print a delivery note or packing content by warehouse?

Issue description

You want to print a delivery note or packing content by warehouse or site on the **Work audit template line update** page.

Issue resolution

When you print a document by using Print management settings, limit the scope (site/warehouse) through Print management instead of by selecting **Edit print settings** on the **Work audit template line update** page.

I can't cancel a packing slip after it's posted from a sales order.

Issue description

When picking and shipping processes are enabled for WMS, you can't cancel a packing slip after it's posted from a sales order.

Issue resolution

To correct posted packing slips for items that are enabled for WMS, the posting must occur from the load, not from the order. Microsoft has evaluated this issue and has determined that it's a feature limitation. In general, a sales order that has been picked and shipped through warehouse management processes can be packing slip–updated from the load or shipment and the sales order document itself. However, if you packing slip–update the sales order from the sales order document, packing slip reversal still can't be done from the load or sales order. Therefore, we recommend that you use the packing slip posting from the load. In this case, the reversal that must be done from the load will be enabled.

I receive the following error message: "Not enough work can be found for cluster."

Issue description

When you use the *System directed cluster picking* process, if you configure a cluster profile where, for example, 10 positions can be picked, the process works as planned when there is enough work to pick to 10 positions. However, if there are only eight positions to pick, you receive this error message, because there isn't enough work for one cluster.

Issue resolution

To fix this issue, edit the cluster profile, and set the **Activate positions** option to *No*.

Replenishment overview

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the replenishment strategies that are available for warehouses that use the functionality that is available in Warehouse management. The information in this topic doesn't apply to the warehousing solution that is available in Inventory management.

The following replenishment strategies are available:

- **Wave demand replenishment** – This strategy creates replenishment work for outbound orders or loads if inventory isn't available when the wave creates work. For example, replenishment work can be created if the quantity that is required for a sales order isn't available when a wave is processed.
- **Min/Max replenishment** – This strategy uses minimum and maximum stocking limits to determine when locations should be replenished. The item and location criteria define the inventory that is evaluated for replenishment. Min/Max replenishment templates are the primary mechanism for maintaining optimal levels in picking locations. To help guarantee that enough pick face inventory is available to meet wave demand, you can use demand replenishment as a supplement between Min/Max replenishment cycles.
- **Load demand replenishment** – This strategy sums the demand for several loads and creates the replenishment work that is required in order to stock the relevant picking locations. This strategy helps guarantee that the loads that are created can be picked in the warehouse after they are released.
- **Immediate replenishment** – This strategy replenishes inventory before a wave is run if allocation fails for a location directive line that has a replenishment template.

All four strategies create replenishment work, based on a replenishment template.

Wave demand replenishment

Wave demand replenishment creates replenishment work, based on demand, if the quantity that is required for production orders, kanbans, outbound orders, or loads isn't available when a wave creates work. The replenishment template contains information about the item criteria, the unit of measure, the demand increment, and the location.

Location directives are used to determine which location should be replenished. You link these location directives to the replenishment template by using the **Directive code** field. If the **Directive code** field isn't set, queries are used to determine which location directive should be used. Note that if a directive code isn't specified in the replenishment template, and the location directive has a directive code, the location directive will be ignored, even if the query on the location directive is correct. Pick location directives are used to determine where to get inventory for the replenishment.

In addition to creating a template, you must specify some replenishment settings in the wave template. The wave template should contain a wave step for replenishment that is run only if an item isn't successfully allocated. This replenishment wave step uses a wave step code to determine which replenishment template should be used. In addition to having a wave step for replenishment, you must make sure that **Replenish** is selected in the **Methods** section of the wave template.

The **Replenishment template** page includes an **Allow wave demand to use unreserved quantities** check box. Select this check box if demand replenishment should be able to deduct unreserved quantities from work that is generated from the selected replenishment template. To enable demand replenishment templates to use this logic, select this check box for every existing replenishment template. When demand replenishment is triggered in the warehouse, it will deduct the demand from existing replenishment work that has unreserved quantities, if the work originates from replenishment templates where the **Allow wave demand to use**

unreserved quantities check box is selected.

Replenishment unit is the minimum unit to replenish. This must be a whole number that is a multiple of the unit. The system will round up to the highest unit possible when creating work.

Demand replenishment is supported for sales orders, transfer orders, production orders, and kanbans.

Min/Max replenishment

In Min/Max replenishment, stock is replenished so that it's between the minimum and maximum limits that have been set. Typically, this process occurs one time every day, to help guarantee that all picking locations are filled to the maximum level before picking starts.

The minimum and maximum amounts are set in a replenishment template. Many of the other settings in the template resemble the settings in templates that are used in Wave demand replenishment. The template should contain one line for each item and location. When you run replenishment by using the batch job, the system evaluates whether replenishment is required by using the sequence that the lines are organized in.

Note that the Min/Max replenishment strategy can't replenish an empty location unless the location is set as the fixed location for the item. If the location that must be replenished isn't a fixed location, the system can't determine which item should be replenished. Therefore, at least some on-hand quantity is required before replenishment occurs.

Load demand replenishment

Load demand replenishment sums the demand for several loads and creates the replenishment work that is required in order to stock the relevant picking locations. Load demand replenishment resembles Wave demand replenishment in many ways. The main difference is how and when Load demand replenishment and Wave demand replenishment are run. Like Min/Max replenishment, Load demand replenishment is run by using a batch job. To set up the batch job, on the **Load demand replenishment** page, select the replenishment template to use, and set a filter query to specify which loads are used to determine the demand. The location query defines the locations that any available quantity will be subtracted from to meet the aggregated demand of the loads.

Immediate replenishment

Instead of having to sum demand at the end of an allocation process and do replenishment on the basis of the summed up quantity, you can apply the Immediate replenishment strategy. When you use this strategy, the inventory can be replenished immediately after a location directive line fails. Therefore, you can set up the replenishment so that it's restricted by specific units, and so that it uses quantities that are set for specific locations.

Replenishment prerequisites

PREREQUISITE	DESCRIPTION
Item	The item must be enabled for warehouse management processes.
Warehouse	The warehouse must be enabled for warehouse management processes. To enable a warehouse for warehouse management processes, on the Warehouses page, select the warehouse, and then select the Use warehouse management processes option.

PREREQUISITE	DESCRIPTION
Replenishment templates	At least one replenishment template must be set up for Min/Max replenishment, Wave demand replenishment, or Load demand replenishment.
Locations	Locations must be created and connected to a location profile.
Location profiles	Location profiles are required in order to create locations.
Location directives	Location directives are required in order to guide work to the locations where replenishment is required and to the locations that inventory is sourced from.
Work templates	Work templates of the Replenishment type are required in order to create replenishment work so that inventory can be moved to the desired locations.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Immediate replenishment

2/18/2021 • 2 minutes to read • [Edit Online](#)

Immediate replenishment lets you replenish inventory immediately after a location directive line fails to allocate inventory. The replenishment is based on a single line in the setup of the location directive. If inventory isn't on hand in the unit of measure that is specified by that line, replenishment of that unit of measure occurs immediately.

Immediate replenishment provides an alternative to the method where the allocation of inventory is based on more lines in the location directive, and where the demand is summed at the end of the allocation and replenished in the unit of measure that is specified by the last line in the location directive.

The benefits of using immediate replenishment are that replenishment can be limited by specific units and the quantity can be directed to specific locations.

Business scenario

For example, you have a warehouse that has separate picking areas for the "box" and "each" units of measure. You want to optimize the picking process by picking as many boxes as possible and then picking any remaining quantity that is less than a box from the "each" area.

In this case, you can use immediate replenishment. In the location directive, you can set up immediate replenishment for boxes so that demand replenishment is used as soon as there is a shortage of boxes that can be picked for the demand quantity. In this way, you optimize the picking process so that picking includes as many boxes as possible. Immediate replenishment will generate replenishment of the boxes, and the demand won't be passed on so that the quantities are picked in the "each" unit of measure. In other words, only the quantities that are supposed to be picked in the "each" unit of measure (that is, quantities that are less than a box) will be picked from the "each" area. If a shortage occurs in the "box" area, you can pick as many boxes as possible out of the total demand. The remaining quantities will then be picked from the "each" area.

Where it applies

Immediate replenishment is used during wave execution if allocation fails for a location directive line that a replenishment template is set for.

Set up immediate replenishment

- Go to **Warehouse management > Setup > Location directives**, and then, on the **Lines** tab, in the **Immediate replenishment template** list, select a replenishment template for wave demand.

The replenishment template is applied if the location directive line fails to allocate a dedicated unit of measure.

Troubleshooting

If immediate replenishment is selected for a location directive line, but no replenishment work is generated when you use demand replenishment templates for that location directive line, two main causes must be investigated:

- Make sure that the demand replenishment template that is applied is set up to use the correct location templates and work templates of the **Replenishment** type.
- Make sure that there is enough on-hand inventory at the locations where the demand replenishment

template searches for on-hand inventory for replenishment.

Replenishment with withdrawal kanbans

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how the withdrawal kanban is used for material replenishment for manufacturing activities.

Workflow for material replenishment that uses the withdrawal kanban

The withdrawal kanban can be used to move a kanban of a single item between warehouses and production locations where the material is consumed. The withdrawal kanban supports a pull-based solution for material replenishment, where a pull signal is required in order to trigger supply for a specific demand.

The following scenario shows a pull-based replenishment system where a pull signal triggers the creation of a kanban to replenish material for a production process.

1. Withdrawal kanban
2. Kanban "from" location and put location for warehouse work
3. Kanban "to" location and production input location
4. Manufacturing process
5. Warehouse work for kanban picking
6. Warehouse locations for raw material
7. Material warehouse
8. Manufacturing warehouse

In this scenario, a manufacturing process (4) consumes material from a production input location (3) in the manufacturing warehouse (8). When a handling unit of the material (kanban) is consumed, it's registered as empty. A replenishment signal is created for the item origin, and a new kanban (1) is created. In this case, the item origin consists of locations in the material warehouse (7). The material for the kanban is picked and put to a location (2) in the same warehouse. When the material is picked, it's ready to be transferred from location 2 to the production input location (3) in the manufacturing warehouse (8).

Configure warehouse work for kanban picking for the withdrawal

kanban

To enable raw material picking for the withdrawal kanban, configure wave templates, work templates, and location directives for the **Kanban picking** work order type. This work order type doesn't just support the picking process for the withdrawal kanban. It also supports the picking process for the manufacturing kanban. However, you can configure a separate picking process for each type of kanban by separating the wave templates, work templates, and location directives. To separate the wave templates, work templates, and location directives, set criteria on the activity type (**Process** or **Transfer**) in the queries for those entities.

Configure the withdrawal kanban

The transfer activity that is used for the withdrawal kanban is configured as part of an activated activity plan in a Lean production flow. As part of the configuration of the transfer activity, you specify the "from" and "to" locations for the transfer. After you configure the transfer activity, you can assign it to a kanban rule of the **Withdrawal** type. The kanban rule sets the policies and configurations for the withdrawal kanban. The quantity of the kanban defines how many units of the handling unit the kanban carries during the transfer process. The fixed kanban quantity is used when the Fixed replenishment strategy is selected. This quantity defines how many kanbans that are required in order to prevent stock or build inventory from running out at the source of demand. The fixed quantity can be calculated based on actual demand, historical demand, and service levels. The following two scenarios describe how you can manage material replenishment that uses the withdrawal kanban.

Scenario 1: Replenish a production input location by using a fixed withdrawal kanban

A manufacturing process consumes a purchased raw material from a production input location that is in the production warehouse. When the raw material is received from the vendor, it's stored in locations in the material warehouse. Because the demand for the material is considered stable over a period, it's set up to supply the production in a fixed quantity kanban flow. When a kanban is consumed at the production input location, an empty signal is registered, and a new kanban of the same type is added to the flow.

The empty signal can be configured to occur automatically when a kanban is completed. Alternatively, the empty signal can be set up as a manual interaction that is given either from the Kanban transfer board or from a menu on the hand-held device. The Kanban transfer board is the workspace where all activities in the kanban life cycle are managed.

When the kanban is created, a wave line for the raw material is added to a kanban wave for the material warehouse. In the picking list section of the Kanban transfer board, the status of the material and related warehouse processes can be monitored from wave creation to work creation, until the material is on-hand in the "transfer from" location and is ready to be transferred to the production input locations. The kanban can be completed either from the Kanban transfer board or from a menu on the hand-held device.

In this scenario, the picking work in the material warehouse is processed as one activity. The transfer activity between the material warehouse and the production warehouse is processed as a separate activity. This approach can be useful if, for example, there is a large physical distance between the two warehouses. In this case, the kanban transfer activity can represent a truck load.

If the distance between the warehouse locations and the production input location is small, it might be more efficient to include the transfer activity in the picking process. Then, after the material is picked, it can be put directly to the production input location. To support this process, you configure the transfer activity so that it's automatically completed when the pick work of the withdrawal kanban is processed.

Scenario 2: Automatically complete the transfer activity when kanban picking work is processed

In the following scenario, the transfer activity of the withdrawal kanban is configured to transfer between two locations in the same warehouse. The transfer activity of the withdrawal kanban is set up so that it's completed automatically.

1. Shared warehouse for raw materials and production
2. Warehouse locations for raw materials
3. Kanban "from" location and put location for warehouse work
4. Withdrawal kanban
5. Production input location
6. Manufacturing process

After a kanban is consumed at the production input location, the kanban is reported as empty, and a new kanban is added to the flow. When the kanban is created, a wave line is added to a kanban wave. When the kanban wave is processed, warehouse work for kanban picking is created. The warehouse worker processes the work for kanban picking and is directed by the work to pick the material for the kanban in a warehouse location. As this warehouse worker confirms the pick, the kanban is automatically completed, and the warehouse worker is guided to the put the material to the production input location.

Set up a min-max replenishment process

2/18/2021 • 6 minutes to read • [Edit Online](#)

This procedure shows you how to set up a new replenishment process which uses the minimum/maximum replenishment strategy. When inventory falls below the minimum level, work will be created to replenish the location. The procedure also shows how to use fixed picking locations to allow restocking even if inventory falls below the minimum level, and how to enable the replenishment process to run regularly using a batch job. These tasks would typically be carried out by a warehouse manager. You can run this procedure in the USMF demo data company using the example values below, or can run it on your own data. If you're using your own data, make sure that you have a warehouse that's enabled for Warehouse management processes.

Create a fixed picking location

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse > Fixed locations**. This is an optional task for min-max replenishment, but if you use fixed picking location, this allows stock to be replenished even if it falls below the minimum level, because the system can determine which items need to be replenished, even if there aren't any left.
2. Click **New**.
3. In the **Item number** field, enter or select a value. If you're using USMF, you can select item A0001.
4. In the **Site** field, enter or select a value. If you're using USMF, you can select site 2.
5. In the **Warehouse** field, enter or select a value. If you're using USMF, you can select warehouse 24.
6. In the **Location** field, enter or select a value. If you're using USMF, you can select CP-003.
7. Close the page.

Create a replenishment location directive

1. Go to **Warehouse management > Setup > Location directives**. Location directives are used to determine where items should be picked from in the replenishment process.
2. In the **Work order type** field, select 'Replenishment'.
3. On the **Action Pane**, click **New**.
4. In the **Name** field, type a value.
5. In the **Work type** field, select 'Pick'.
6. In the **Site** field, enter or select a value. If you're using USMF, you can select site 2.
7. In the **Warehouse** field, enter or select a value. If you're using USMF, you can select warehouse 24.
8. Click **Save**.
9. In the **Lines** section, click **New**.
10. In the list, mark the selected row.
11. In the **To quantity** field, enter a number. For example, you can set it to 9999.
12. Select the **Allow split** check box. If you select this option, the work creation process will allow work line quantities to be split across multiple locations.
13. Click **Save**.
14. In the **Location directive Actions** section, click **New**.
15. In the list, mark the selected row.
16. In the **Name** field, type a value.
17. Click **Save**.
18. On the **Action Pane**, click **Edit query**. You can edit this query to add restrictions where inventory can be

selected from in the replenishment process. For example, it could be that inventory should only be used from the Bulk area of the warehouse.

19. Click **OK**.
20. Close the page.

Create a replenishment work template

1. Go to **Warehouse management > Setup > Work > Work templates**. The work template is used to guide the system as to how the min/max replenishment work must be created. As a minimum, there must be a work template line for a pick and a put. The work template will say that it's Invalid until all the necessary information has been filled in.
2. In the **Work order type** field, select 'Replenishment'.
3. On the **Action Pane**, click **New**.
4. In the **Work template** field, type a value.
5. Click **Save**.
6. In the **Work template details**, click **New**.
7. In the **Work type** field, select 'Pick'.
8. In the **Work class ID** field, enter or select a value. This should be a work class related to replenishment. If you're using USMF, select Replenish.
9. In the **Work template details**, click **New**.
10. In the list, mark the selected row.
11. In the **Work type** field, select 'Put'.
12. In the **Work class ID** field, enter or select a value.
13. Click **Save**.
14. Close the page.

Create a new replenishment template

1. Go to **Warehouse management > Setup > Replenishment > Replenishment templates**. The replenishment template is used to define the items and quantities, and the location to replenish.
2. On the **Action Pane**, click **New**.
3. In the **Replenish template** field, type a value. Give the template a name to indicate that it's for min/max replenishment.
4. In the **Description** field, type a value.
5. Select the **Allow wave demand to use unreserved quantities** check box. If you select this option, it enables wave demand replenishment to consume quantities that are related to min/max replenishment. For example, this might be useful if the min/max replenishment work isn't processed immediately, to avoid unnecessary demand replenishment work from being created.
6. In the **Replenishment template details**, click **New**.
7. In the **Sequence number** field, enter a number.
8. In the **Description** field, type a value.
9. In the list, mark the selected row.
10. In the **Replenishment unit** field, enter or select a value. For example, select pcs. This setting is mandatory. It allows you to specify a different unit of measurement for replenishment work compared to the unit specified for the minimum and maximum stock levels in this template.
11. In the **Work template** field, enter or select a value. Choose the work template that you created earlier.
12. In the **Minimum quantity** field, enter a number. Select the minimum quantity that should trigger the replenishment. For example, set this to 50. It is possible to leave this set to zero, if you're replenishing a fixed location and the **Replenish empty fixed locations** option is set to 'Yes'. We also recommend that you

select the **Replenish only fixed locations** option for performance reasons.

13. In the **Maximum quantity** field, enter a number. For example, set this to 100.
14. In the **Unit** field, enter or select a value. Assign the unit for the minimum and maximum quantities. For example, set this to pcs.
15. Select the **Replenish empty fixed locations** check box. Select this check box to replenish fixed locations when they are empty. Otherwise, only the locations where there is a quantity on hand will be replenished.
16. Select the **Replenish only fixed locations** check box.
17. Click **Select products**. This is the place to define which products should be replenished. If the Fixed picking locations option is selected, you also need to define the locations in this query. Variant-specific queries are available as well product-specific queries.
18. Select the **Items** row.
19. In the **Criteria** field, type a value. Select the items that should be replenished at the fixed locations. For example, type A* to select all item numbers beginning with A.
20. Click **Add**. Add the Location entity (unless it already exists) to be able to restrict the replenishment work to the fixed picking locations within a specific area of the warehouse.
21. In the list, mark the selected row.
22. Set the **Table** field to 'Locations'.
23. In the **Field** field, select 'Location profile ID'.
24. In the **Criteria** field, enter or select a value.
25. Click **OK**.
26. Close the page.

Set the replenishment process to run as a batch job

1. Go to **Warehouse management > Replenishment > Replenishments**. The Replenishments page allows you to set up replenishment to run as a batch job, or to require that it's started manually.
2. Click **Filter**.
3. In the list, mark the selected row.
4. In the **Criteria** field, enter or select a value.
5. Click **OK**.
6. Expand the **Run in the background** section.
7. Set the **Batch processing** option to 'Yes'.
8. Click **Recurrence**.
9. Select the **No end date** option.
10. Set the **Recurrence pattern**. For example, select Days.
11. Click **OK**.
12. Click **OK**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Zone threshold replenishment

2/18/2021 • 13 minutes to read • [Edit Online](#)

Zone-based replenishment uses a minimum/maximum (min/max) [replenishment](#) strategy, but it evaluates whole warehouse zones instead of just individual locations. Therefore, warehouse managers can more quickly learn when additional inventory is required in a picking zone.

The setup for this feature resembles the setup for location-based replenishment. However, when you set up a template for min/max replenishment, you can also specify whether the threshold should be evaluated per location or per zone. If you set up evaluation that is based on zones, you must add specific zones to the zone selection query.

Like location-based min/max replenishment, zone-based min/max replenishment is based the setup of a minimum inventory threshold that triggers the creation of replenishment work for selected items. This replenishment work will increase inventory up to the specified maximum threshold for the zone.

NOTE

Zone replenishment processes for product variants aren't supported in the current release.

Unlike location-based min/max replenishment, zone-based min/max replenishment doesn't require fixed locations to evaluate whether locations should store a specific item. Therefore, zone-based replenishment lets you use min/max replenishment even if you don't have fixed locations for each item or item variant in the warehouse. When a quantity in the zone falls below the specified minimum threshold, replenishment work is created. Location directives will determine which specific location the inventory should be put into.

Turn on the Zone threshold replenishment feature

Before you can use the *Zone threshold replenishment* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Zone threshold replenishment*

Set up zone-based replenishment

To set up zone-based replenishment, you must configure several parts of the system. This section introduces the various settings and provides demo data values that you can enter if you want to work through the scenario at the end of this topic.

Set up directive codes

[Directive codes](#) let you be more specific when you define the location template that is used in a work template. Each code establishes a common value that you can refer to when you configure each type of template.

View and edit directive codes

To view or edit your directive codes, go to **Warehouse management > Setup > Directive codes**.

Prepare demo data directive codes

This example shows how to prepare a directive code. If you're planning to work through the scenario at the end of this topic, use the demo data values that are provided here. Otherwise, use your own values.

1. Select the **USMF** legal entity to work with the demo data.
2. Go to **Warehouse management > Setup > Directive codes**.
3. On the Action Pane, select **New** to add a row to the grid.
4. In the new row, set the following values:
 - **Directive code:** *Zone replen*
 - **Directive description:** *Zone replenishment*
5. Select **Save** to save the new code.

Set up replenishment templates

[Min/max replenishment templates](#) are the primary mechanism for maintaining optimal levels in picking locations. In these templates, you must set up the rules that will be used to replenish inventory in the warehouse. The replenishment that the templates can be used for includes zone-based replenishment.

View and edit replenishment templates

A replenishment template is a set of rules that control when and how a location is replenished. You select a template to control when and how replenishment is done. To view or edit your replenishment templates, go to **Warehouse management > Setup > Replenishment > Replenishment templates**.

Prepare a demo data replenishment template

This example shows how to prepare a replenishment template. If you're planning to work through the scenario at the end of this topic, use the demo data values that are provided here. Otherwise, use your own values.

1. Select the **USMF** legal entity to work with the demo data.
2. Go to **Warehouse management > Setup > Replenishment > Replenishment templates**.
3. Select **Edit** to put the page into edit mode.
4. On the Action Pane, select **New** to add a row to the **Overview** grid.
5. In the new row, set the following values. Accept the default values for all other fields.
 - **Replenish template:** *Zone min/max replen*
 - **Description:** *Zone min/max replenishment*
 - **Replenishment type:** *Minimum or maximum*
6. Select **Save**.
7. While the new row is still selected in the **Overview** grid, select **New** above the **Replenishment Template Details** grid to add a row that is associated with the *Zone Min/Max replen* replenishment template that you just created.
8. In the new row, set the following values:
 - **Sequence number:** Enter *1*.
 - **Description:** Enter *Pick zone replenishment*.
 - **Replenishment unit:** Select *ea*.
 - **Request type:** Leave this field blank.
 - **Directive code:** This field links the replenishment template with a location directive. Select the demo data directive code that you created earlier (*Zone replen*).
 - **Work template:** Leave this field blank.
 - **Minimum quantity:** This field sets the quantity that replenishment will be triggered at. Enter *50*.
 - **Maximum quantity:** This field sets the maximum quantity of an item that can be present in a zone. Generated replenishment work will increase inventory to this quantity. Enter *150*.

- **Unit:** This field sets the unit for the minimum and maximum values. Select *ea*.
- **Demand increment:** Select *Round up*.
- **Replenish empty fixed locations:** Select this check box.
- **Replenish only fixed locations:** Clear this check box.
- **Product query mode:** Select *Product query*.
- **Replenishment threshold scope:** This field defines whether the template should evaluate by zone or by specific location. Select *Zone*.
- **Warehouse:** Select *61*.

9. Select **Select products** above the **Replenishment Template Details** grid.
10. In the **Product query** dialog box, on the **Range** tab, select **Add** to add a row to the grid.
11. In the new row, set the following values:
 - **Table:** *Items*
 - **Derived table:** *Items*
 - **Field:** *Item number*
 - **Criteria:** *A0001*
12. Select **OK** to save your query and close the dialog box.
13. Select **Select zones to replenish** above the **Replenishment Template Details** grid.
14. In the **Zone query** dialog box, on the **Range** tab, add a row to the grid.
15. In the new row, set the following values:
 - **Table:** *Warehouse zone*
 - **Derived table:** *Warehouse zone*
 - **Field:** *Zone ID*
 - **Criteria:** *FLOOR*
16. Select **OK** to save your query and close the dialog box.

Set up location directives

Unlike location-based min/max replenishment, zone-based min/max replenishment requires that you set up both pick location directives and put location directives, because the system evaluates the whole zone instead of just the pick location for outbound work.

View and edit location directives

To view or edit your location directives, go to **Warehouse management > Setup > Location directives**.

For examples that show how to use the settings to create the required pick location directives and put location directives, see the next section.

Prepare demo data location directives

To prepare demo data so that it can be used in the scenario at the end of this topic, you must create two location directives: one for pick and one for put.

Create a replenishment pick directive

1. Select the **USMF** legal entity to work with the demo data.
2. Go to **Warehouse management > Setup > Location directives**.
3. In the left pane, set the **Work order type** field to *Replenishment*.
4. On the Action Pane, select **New** to create a new directive.
5. Set the following values:

- **Sequence number:** Accept the default value.
 - **Name:** Enter *Zone pick*.
 - **Work type:** Select *Pick*.
 - **Site:** Select *6*.
 - **Warehouse:** Select *61*.
 - **Directive code:** Leave this field blank.
 - **Multi SKU:** Set this option to *No*.
6. Select **Save** to create a directive that has the settings that you've configured so far.
 7. On the **Lines** FastTab, select **New** to add a line to the grid.
 8. On the new line, set the following values:
 - **Sequence number:** Enter *1*.
 - **From quantity:** Enter *0*.
 - **To quantity:** Enter *10000000*.
 - **Unit:** Leave this field blank.
 - **Locate quantity:** Select *None*.
 - **Restrict by unit:** Clear this check box.
 - **Round up to unit:** Clear this check box.
 - **Locate packing quantity:** Clear this check box.
 - **Allow split:** Select this check box.
 9. Select **Save** to save the new line.
 10. While your new line is still selected in the **Lines** grid, select **New** on the **Location Directive Actions** FastTab to add a row to the grid.
 11. In the new row, set the following values:
 - **Sequence number:** Enter *1*.
 - **Name:** Enter *Pick from bulk*.
 - **Fixed location usage:** Select *Fixed and non-fixed locations*.
 - **Allow negative inventory:** Clear this check box.
 - **Batch enabled:** Clear this check box.
 - **Strategy:** Select *None*.
 12. Select **Save** to save the new action.
 13. While your new action still selected, select **Edit query** above the **Location Directive Actions** grid.
 14. A query dialog box appears, where you can select the locations to replenish from. On the **Range** tab, select **Add** to add a row to the grid.
 15. In the new row, set the following values:
 - **Table:** *Locations*
 - **Derived table:** *Locations*
 - **Field:** *Zone ID*
 - **Criteria:** *BULK*
 16. Select **OK** to save your query and close the dialog box.
 17. Select **Save** to save your location directive.

Create a replenishment put directive

1. On the **Location directives** page, in the left pane, make sure that the **Work order type** field is still set

to *Replenishment*.

2. On the Action Pane, select **New** to create another new directive.
3. Set the following values:
 - **Sequence number**: Accept the default value.
 - **Name**: Enter *Zone put*.
 - **Work order type**: Select *Put*.
 - **Site**: Select *6*.
 - **Warehouse**: Select *61*.
 - **Directive code**: Select *Zone replen* to link this location directive with the replenishment template that you created earlier by using the code that you created earlier.
 - **Multi SKU**: Set this option to *No*.
4. Select **Save** to create a directive that has the settings that you've configured so far.
5. On the **Lines** FastTab, select **New** to add a line to the grid.
6. On the new line, set the following values:
 - **Sequence number**: Enter *1*.
 - **From quantity**: Enter *0*.
 - **To quantity**: Enter *10000000*.
 - **Unit**: Leave this field blank.
 - **Locate quantity**: Select *None*.
 - **Restrict by unit**: Clear this check box.
 - **Round up to unit**: Clear this check box.
 - **Locate packing quantity**: Clear this check box.
 - **Allow split**: Select this check box.
7. Select **Save** to save the new line.
8. While your new line is still selected in the **Lines** grid, select **New** on the **Location Directive Actions** FastTab to add a row to the grid.
9. In the new row, set the following values:
 - **Sequence number**: Enter *1*.
 - **Name**: Enter *Zone put*.
 - **Fixed location usage**: Select *Fixed and non-fixed locations*.
 - **Allow negative inventory**: Clear this check box.
 - **Batch enabled**: Clear this check box.
 - **Strategy**: Select *Consolidate*.
10. Select **Save** to save the new action.
11. While your new action is still selected, select **Edit query** above the **Location Directive Actions** grid.
12. A query dialog box appears, where you can select the zone to replenish to. This zone should be the same zone that is specified in the replenishment template. On the **Range** tab, select **Add** to add a row to the grid.
13. In the new row, set the following values:
 - **Table**: *Locations*
 - **Derived table**: *Locations*
 - **Field**: *Zone ID*

- **Criteria:** *FLOOR*

14. Select **OK** to save your query and close the dialog box.

15. Select **Save** to save your location directive.

Scenario

This section provides a sample scenario that shows how to work with the feature.

Prepare the sample data that is required for the sample scenario

Before you start to work through the scenario, you must activate sample data and set up the feature as described in this section and in the previous sections of this topic.

Use the USMF legal entity

To work through the scenario by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

Prepare additional sample data

After you've selected the **USMF** legal entity, add the additional sample data that is required, as described in the [Set up zone-based replenishment](#) section earlier in this topic.

Check your on-hand inventory

Follow these steps to make sure that your system includes enough inventory to support the sample scenario.

1. Make sure that there is on-hand inventory for item *A0001* at two different locations in the pick zone (*FLOOR*) that is specified in the replenishment template. However, the total inventory should be less than the required minimum quantity (*50*) that is specified on the replenishment template. In this way, you can simulate how the calculation occurs for the whole zone instead of just for a single location. **Use any of the warehouse processes to adjust inventory as required.**
2. Make sure that there is enough inventory for item *A0001* at a bulk location that is specified in the zone pick location directive where the replenishment work should pick the items from zone ID *BULK*. The total inventory must be more than the required maximum quantity (*150*) that is specified in the replenishment template.
3. Optional but recommended: Follow these steps to create an inventory adjustment journal:
 - a. Go to **Inventory management > Journal entries > Items > Inventory adjustment**.
 - b. Select **New**.
 - c. In the **Create inventory journal** dialog box, in the **Warehouse** field, select *61*.
 - d. Select **OK**.
 - e. On the **Journal lines** FastTab, use the **New** button to add three lines to the grid, and set the following values. After you've finished setting up each line, select **Save**.

- **Line 1:**

- **Item number:** *A0001*
- **Site:** *6*
- **Warehouse:** *61*
- **Location:** *02A01R1S1B*
- **License plate:** Select an existing license plate in the list, or create a new license plate.
- **Quantity:** *1000*

- **Line 2:**

- **Item number:** *A0001*
- **Site:** *6*
- **Warehouse:** *61*
- **Location:** *07A01R2S1B*
- **License plate:** Select an existing license plate in the list, or create a new license plate.
- **Quantity:** *15*
- **Line 3:**
 - **Item number:** *A0001*
 - **Site:** *6*
 - **Warehouse:** *61*
 - **Location:** *07A01R1S1B*
 - **License plate:** Select an existing license plate in the list, or create a new license plate.
 - **Quantity:** *10*

f. On the Action Pane, select **Validate**. Address any errors that are found before you move on to the next step.

g. On the Action Pane, select **Post** to post the inventory to the warehouse.

Sample scenario: Run zone-based min/max replenishment

After all the prerequisite sample data is in place, you can trigger replenishment by following these steps.

1. Go to **Warehouse management > Replenishment > Replenishments**.
2. In the **Replenishment** dialog box, on the **Records to include** FastTab, select **Filter**.
3. In the **Inquiry** dialog box, on the **Range** tab, edit the default table row in the following way:
 - **Table:** Select *Replenishment templates*.
 - **Derived table:** Select *Replenishment templates*.
 - **Field:** Select *Replenishment template*.
 - **Criteria:** Select *Zone min/max replen*. This replenishment template is the replenishment template that you created while you were preparing the demo data for this scenario.
4. Select **OK** to save the query and go back to the **Replenishment** dialog box.
5. Select **OK** to run the replenishment template.

Replenishment work is now created to pick inventory from the *BULK* zone and replenish it to the *FLOOR* zone.

Notes and tips

Here are a few notes and tips for working with the feature:

- To set up replenishment work that goes to the desired zone, you can link the replenishment template lines and location directives in either of the following ways:
 - Edit the location directive header query, and filter the selected replenishment template lines.
 - Use a directive code on the replenishment template line, and match it to the put location directive.
- If you're using dynamic locations, replenishment work will be created either for the first available location or for a location that already contains inventory, if the location directive action is set up to use the **Consolidate** strategy.
- If you're using fixed locations instead of zones, you should use [standard min/max replenishment](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Replenishment strategies

2/18/2021 • 5 minutes to read • [Edit Online](#)

The templates that are defined on the **Replenishment templates** page include wave demand replenishment template lines that let you select how replenishment is done. Each line now includes a **Replenishment strategy** field.

The *Wave demand quantity* strategy is the default strategy. It's the replenishment strategy that was used before the introduction of the **Replenishment strategy** field. It uses the replenishment location directives to find locations that can be replenished. It then replenishes those locations until the demand is covered.

The *Maximum location capacity* strategy introduces some new functionality. Like the *Wave demand quantity* strategy, this strategy uses the replenishment location directives to find locations that can be replenished, and then it replenishes those locations until the demand is covered. It differs from the *Wave demand quantity* strategy in that all the replenished locations are replenished to their maximum capacity, as defined by the location stocking limits. The *Maximum location capacity* strategy tries to create work to bring in the requested quantity, plus some extra quantity, to fill the locations that are being replenished. However, in some cases, that attempt might fail. For example, the bulk locations might not have enough inventory to cover the extra quantity. In these cases, the system detects the failure and tries to recover.

Peak season is one example of a situation where the *Maximum location capacity* strategy is preferable to the *Wave demand quantity* strategy. During peak season, some items might be selling at high volume. Therefore, you might want to proactively replenish the relevant picking locations as much as possible, to reduce the number of work IDs that are created for replenishment.

IMPORTANT

To take full advantage of the *Maximum location capacity* strategy, you must redefine the stocking limits for the relevant locations. Otherwise, this strategy works just like the *Wave demand quantity* strategy.

Turn on the Replenish to max based on stocking limits feature

Before you can use this feature, it must be turned on in your system. Administrators can use the [Feature management](#) workspace to check the status of this feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Replenish to max based on stocking limits*

Set up replenishment strategies

To access the templates, go to **Warehouse management > Setup > Replenishment > Replenishment templates**. In the **Overview** section, select or create a wave demand replenishment template where the **Replenishment type** field is set to *Wave demand*. Then set up the replenishment template lines in the **Replenishment template details** section. For each line, in the **Replenishment strategy** field, select the replenishment strategy that you want to use.

The screenshot shows the SAP Replenishment templates interface. It is divided into two main sections: 'Overview' and 'Replenishment Template Details'.

Overview Table:

Replenish template	Description	Replenishment type	Wave step code	Allow wave demand to use unreserved quantities	Cancel replenishment if demand has...
Demand Replenish	Wave demand replenishment	Wave demand	1	<input type="checkbox"/>	<input type="checkbox"/>
Min-Max Replenish	Min-Max Replenishment	Minimum or maximum		<input type="checkbox"/>	<input type="checkbox"/>
Min-Max Variant	Min-Max Replenishment for v...	Minimum or maximum		<input type="checkbox"/>	<input type="checkbox"/>

Replenishment Template Details Table:

Sequence nu...	Description	Replenishment unit	Request type	Directive code	Work template	Replenishment strategy	Product query mode
1	Wave demand replenishment	ea				Maximum location capacity	Product query

If the **Replenishment strategy** column doesn't appear in the grid in the **Replenishment template details** section, make sure that the feature has been turned on, and that the selected replenishment template has a replenishment type of *Wave demand*.

NOTE

The *Wave demand quantity* strategy is the default strategy. Therefore, you just have to update the replenishment template lines where you want to use the *Maximum location capacity* strategy instead.

Example scenarios

Example 1

For this example, there is only one replenishment template that has only one replenishment template line.

You create a sales order for 130 pieces (pcs) of item A0001. Before you release the order to the warehouse, the warehouse is set up in the following way:

- There is only one bulk location, and it has 500 pcs of available on-hand inventory.
- There are three pick locations, each of which has a stocking limit of 100 pcs. (Remember that stocking limits are required for the *Maximum location capacity* strategy.)
- The replenishment put locations are the same as the sales pick locations.
- The replenishment unit is a box (1 box = 20 pcs).

At the time of the order, the following inventory is on hand at the sales pick locations:

- **Pick-001:** 20 pcs (1 box)
- **Pick-002:** 0 pcs
- **Pick-003:** 0 pcs

Initially, the replenishment strategy is set to *Wave demand quantity*.

After you release the sales order to the warehouse, and wave processing runs for the wave, you get the following replenishment work:

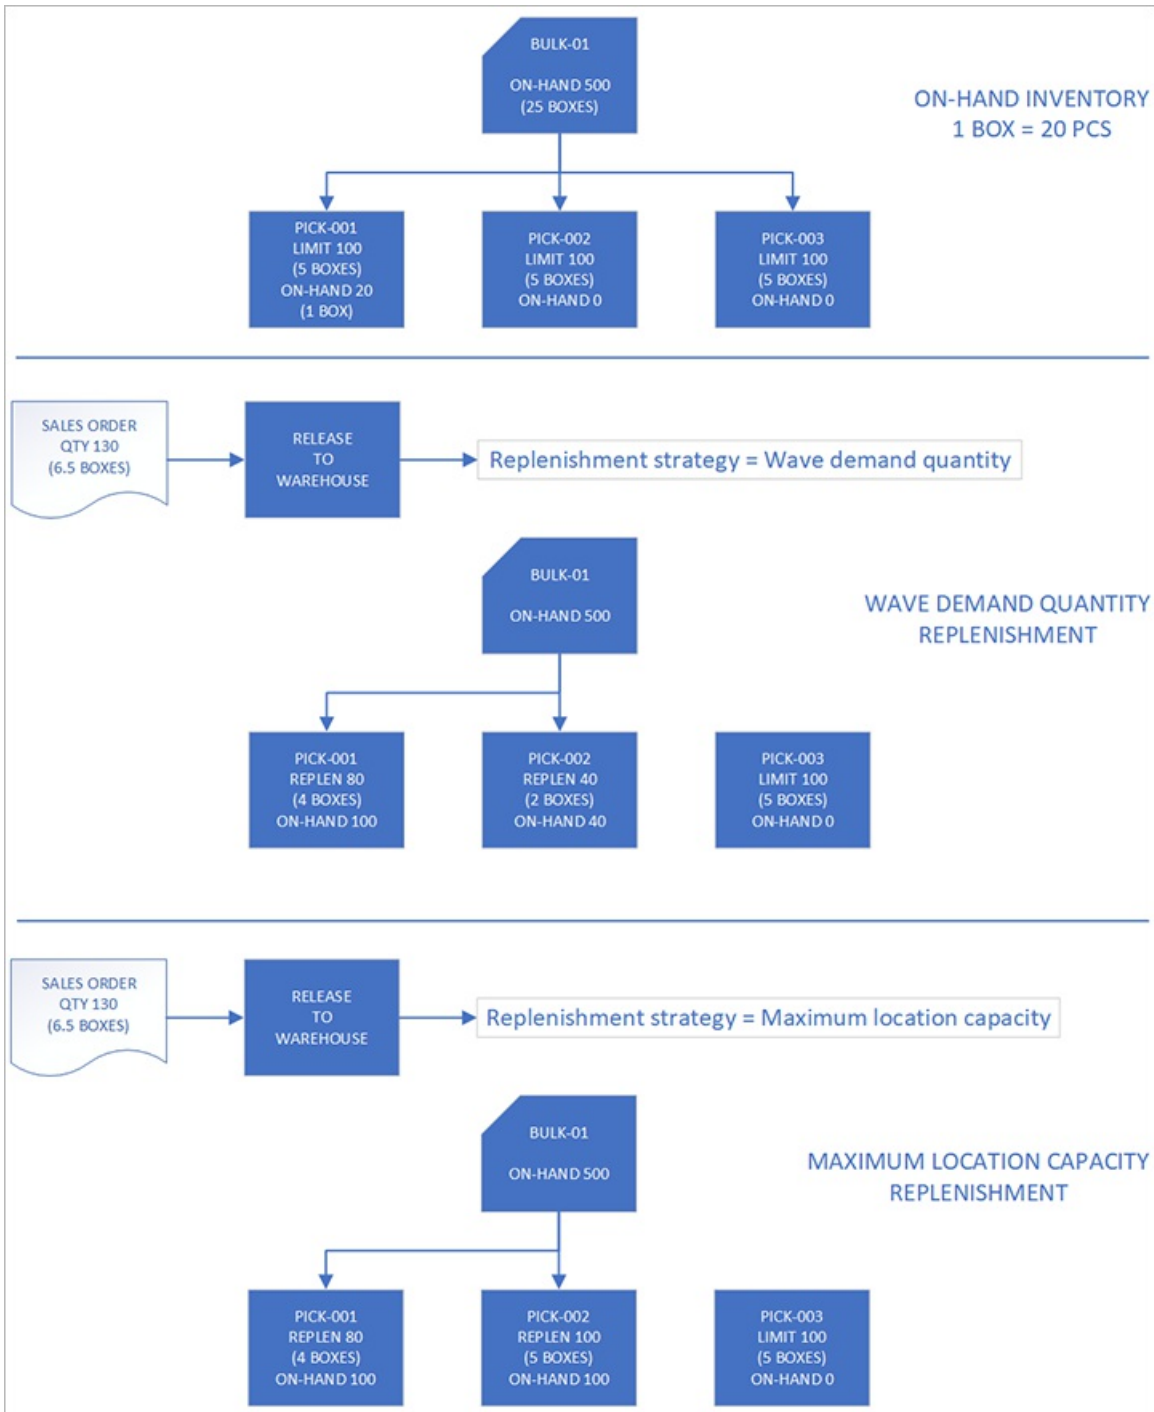

- **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
- **Replenishment work 2:** Pick 2 boxes from the bulk location, and put them in location pick-002.

You get two replenishment work IDs because you must replenish two locations, and multi-puts aren't supported.

If you set the replenishment strategy to *Maximum location capacity* instead, you get the following replenishment work:

- **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.

- **Replenishment work 2:** Pick 5 boxes from the bulk location, and put them in location pick-002.

Example 2

This example shows what happens when the bulk location doesn't have enough inventory to cover the extra quantity. It uses the same scenario as example 1, but the bulk location has 160 pcs (8 boxes).

The *Wave demand quantity* strategy creates the same work that it did in example 1.

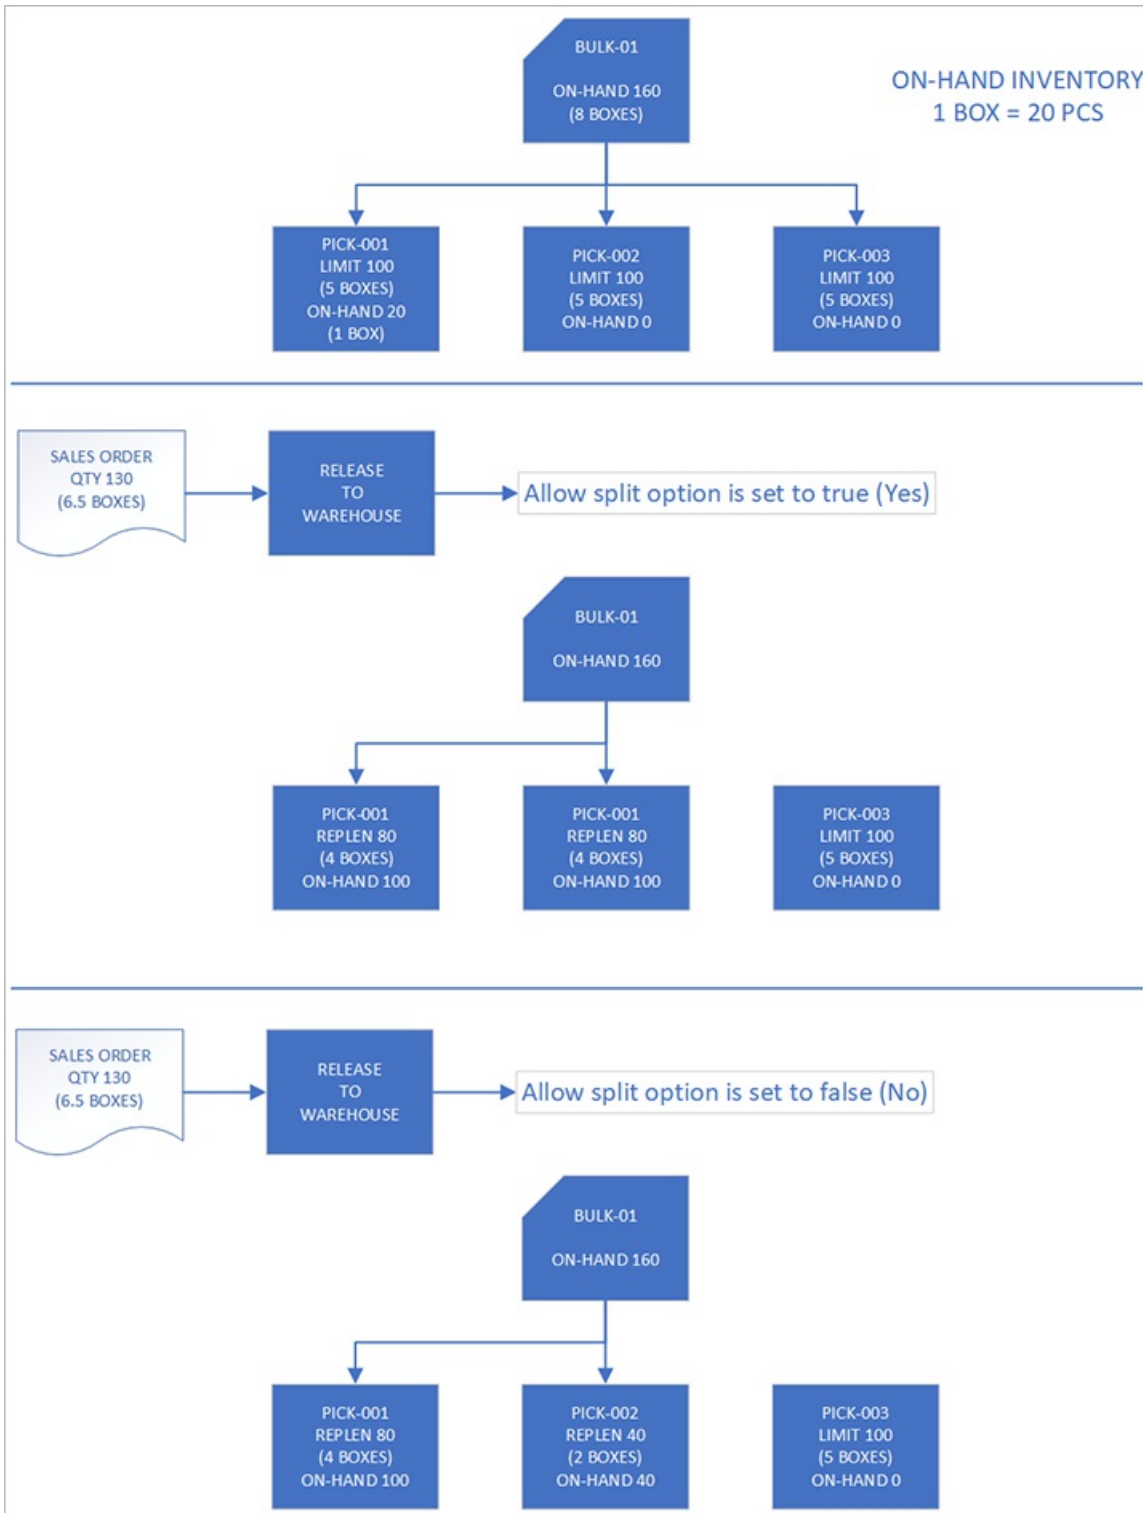

However, because the *Maximum location capacity* strategy tries to create the work IDs as it did in example 1, it might fail. At that point, the system tries to recover.

Depending on the setting of the **Allow split** option on the location directives for replenishment picking, two outcomes are possible:

- If the **Allow split** option is set to *Yes*, the following replenishment work is created:
 - **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
 - **Replenishment work 2:** Pick 4 boxes from the bulk location, and put them in location pick-002.

- If the **Allow split** option is set to *No*, the following replenishment work is created:
 - **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
 - **Replenishment work 2:** Pick 2 boxes from the bulk location, and put them in location pick-002.

The outcomes differ because of the information that is available when you create the work. When the **Allow split** is set to *Yes* on the location directives for replenishment picking, you know that you managed to find 160 pcs. Therefore, you can create work for that quantity. However, when the **Allow split** option is set to *No*, you don't know about the existence of the 160 pcs. Because the extra quantity that you decided to replenish was 3 boxes, you drop that extra quantity and try the original quantity again.

Therefore, to get the maximum quantity to the replenished locations, you should set the **Allow split** option to *Yes* on the location directives for replenishment picking.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Replenishment over location capacity

2/18/2021 • 16 minutes to read • [Edit Online](#)

Some high-volume or space-constrained warehouses must ship more quantity of an item in a day than will fit in the picking location. The *Replenishment over location capacity* feature enables all replenishment work that will be required for the day to be created and manages availability of that replenishment work to ensure that the picking location neither runs out of inventory nor goes above capacity.

The feature enables more replenishment work to be created than will fit in a location, and it blocks replenishment work from being completed when the location is full. As inventory in the picking location drops below a configurable threshold, more replenishment work is made available.

Turn on the Replenishment over location capacity feature

To make this feature available, turn on the following features in [feature management](#) (in this order):

1. Organization-wide work blocking
2. Replenishment over location capacity

Set up the feature for the example scenario

This section provides guidelines and an example that shows how to set up this feature and prepare sample data for the example scenario that is provided later in this topic.

Enable sample data

To work through the [example scenario](#) by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

Location profile

Enable the replenish over capacity functionality on the location profile.

1. Go to **Warehouse management > Setup > Warehouse > Locations profiles**.
2. In the left pane, select **PICK-06**.
3. On the Action Pane, select **Edit**.
4. On the **Replenishment** FastTab, set the following values:

- **Exceed Location Capacity:** *Yes*

When enabled, the maximum capacity of the location will be allowed to be exceeded by replenishment work. This also enables other fields on the **Replenishment** FastTab.

- **Work availability threshold type:** *Quantity*

This field defines the method that is used to determine when more work should be released. You can release by either quantity or a percentage:

- *Percent*– Select this option to use percentage capacity that is based on stocking limits or volumetrics. Selecting this option enables the **Overflow percentage** field, and disables the two quantity related fields, **Overflow quantity** and **Overflow unit**.

You can use this option if the picking locations use volumetrics.

If this option is selected, set the **Overflow percentage** field to the percentage at which more replenishment work will be made available.

- **Quantity** – Select this option to use a specific quantity value. Selecting this option disables the **Overflow percentage** field and enables **Overflow quantity** and **Overflow unit** fields.

Use this option when you aren't using volumetrics for the locations that are being replenished, or when you have consistent quantities at which you want more inventory to be brought to the location.

If this option is selected, set the **Overflow quantity** and **Overflow unit** fields to the quantity and unit at which more replenishment work will be made available.

- **Overflow quantity: 0.65**

This field defines the quantity at which the location overflows.

Work will be available whenever the sum of the on-hand quantity in the location and the work quantity is below this value. Any replenishment work above this value will be blocked and must be manually unblocked.

Location stocking limits are considered when the work quantity is calculated.

- **Overflow unit: PL**

This field defines the unit that is associated with the overflow quantity.

In this case, more replenishment work will be made available when the location gets down to 0.65 pallet (PL).

- **Overflow percentage**

This field defines the percentage at which the location overflows.

Work will be available whenever the sum of the on-hand quantity in the location and the work quantity is below this percentage. Any replenishment work quantity percentage above this value will be blocked and must be manually unblocked.

Location stocking limits are considered when the work quantity percentage is calculated. If no location stocking limits are defined, the work quantity percentage is calculated by volume if volume constraints are defined for the location profile.

IMPORTANT

If you're using the demo data for the **USMF** legal entity and previously turned on the *Location license plate positioning* feature, you must turn off the **Enable license plate positioning** setting for the **BULK-06** location profile to complete the mobile steps in the example scenario.

Wave step code

NOTE

To set up a wave step code as described here, you might first have to use [feature management](#) to turn on the feature that is named *Organization wide wave step code*.

1. Go to **Warehouse Management > Setup > Waves > Wave step codes**.

2. Select **New**, and set the following values:

- **Wave step code:** *Replen*
- **Wave step description:** *Replenishment*
- **Wave step type:** *Replenishment*

3. Select **Save**.

Replenishment template

Replenishment templates are a set of rules that control when and how a location is replenished.

1. Go to **Warehouse management > Setup > Replenishment > Replenishment templates**.
2. On the Action Pane, select **Edit**.
3. In the **Overview** section, select the line where the **Replenish template** field is set to *Demand replenish*.
4. Set the following values:
 - **Wave step code:** *Replen*
 - **Allow wave demand to use unreserved quantities:** *Yes*
5. Select **Save**.

Wave template

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. In the left pane, set the **Wave template type** field to *Shipping*.
3. Select template **61 Shipping** in the list.
4. On the Action Pane, select **Edit**.
5. On the **General** FastTab, set the **Automate replenishment work release** option to *Yes*.

Set this option to *Yes* to create demand-based replenishment work and release it automatically. You must add the replenishment wave method to the wave template and create a replenishment template of the **Wave demand** type. Set up a replenishment template on the **Replenishment templates** page. To set up a replenishment template, you must add the replenish method to the wave template.

6. On the **Methods** FastTab, in the **Selected methods** column, find the following line:
 - **Method name:** *replenish*
 - **Name:** *Replenishment*
7. Set the **Wave step code** field for this line to *Replen*.
8. Select **Save**.

Example scenario

After you've made all the previously described sample data available and set it up, you can work through this scenario to try out the *Replenishment over location capacity* feature. The values that are shown in this scenario assume that you're working with the standard demo data, that you selected the **USMF** legal entity, and that you prepared the sample records that are described earlier in this topic. This scenario also serves as an example that shows how the feature can be used in a production setting.

Create replenishment work

Create sales order 1

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New** to open a dialog box for creating a new sales order.

3. In the dialog box, set the following values:
 - **Customer account:** *US-007*
 - **Warehouse:** *61*
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order is opened. It includes a new, empty line on the **Sales order lines** FastTab. On this line, set the following values:
 - **Item number:** *T0100*
 - **Quantity:** *40*
6. On the **Sales order lines** FastTab, select **Inventory > Reservation**.
7. On the **Reservation** page, select **Reserve lot**.
8. Close the page.
9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

You receive informational messages that show the wave and shipment IDs that were created. A replenishment wave is also created.

You also receive a warning message that states, "Work ID XXXX cannot be unblocked because it has unfinished replenishment work."

Create sales order 2

1. On the **All sales orders**, page, on the Action Pane, select **New** to open a dialog box for creating a new sales order.
2. In the dialog box, set the following value:
 - **Customer account:** *US-001*
 - **Warehouse:** *61*
3. Select **OK** to create the sales order and close the dialog box.
4. The new sales order is opened. It includes a new, empty line on the **Sales order lines** FastTab. On this line, set the following values:
 - **Item number:** *T0100*
 - **Quantity:** *60*
5. On the **Sales order lines** FastTab, select **Inventory > Reservation**.
6. On the **Reservation** page, select **Reserve lot**.
7. Close the page.
8. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

You receive informational messages that show the wave and shipment IDs that were created. A replenishment wave is also created.

You also receive a warning message that states, "Work ID XXXX cannot be unblocked because it has unfinished replenishment work."

Create sales order 3

1. On the **All sales orders** page, on the Action Pane, select **New** to open a dialog box for creating a new sales order.
2. In the dialog box, set the following values:

- **Customer account:** *US-004*
 - **Warehouse:** *61*
3. Select **OK** to create the sales order and close the dialog box.
 4. The new sales order is opened. It includes a new, empty line on the **Sales order lines** FastTab. On this line, set the following values:
 - **Item number:** *T0100*
 - **Quantity:** *30*
 5. On the **Sales order lines** FastTab, select **Inventory > Reservation**.
 6. On the **Reservation** page, select **Reserve lot**.
 7. Close the page.
 8. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

You receive informational messages that show the wave and shipment IDs that were created. A replenishment wave is also created.

You also receive a warning message that states, "Work ID XXXX cannot be unblocked because it has unfinished replenishment work."

View work details

1. Go to **Warehouse management > Work > Work details**.
2. In the **Overview** section, filter the **Warehouse** column for warehouse *61*.
3. You should see that seven work IDs were created for the three demand sales orders.
 - Three of the seven work IDs have a **Work order type** value of *Replenishment*, and four have a **Work order type** value of *Sales orders*.
 - All three work IDs that have a **Work order type** value of *Replenishment* have the same *Pick* and *Put* locations in the **Lines** section:
 - **Pick:** *02A01R5S1B*
 - **Put:** *06A01R2S1B*
 - Two work IDs were created for sales order 1.
4. Make a note of the work IDs for the sales orders.

Depending on your on-hand quantities, the work quantities that are created might vary slightly. However, overall, the work headers that are created should match this scenario example.

On-hand inventory license plate ID

Later in this scenario, you will use the warehouse app (or an emulator), where you must identify the license plate to complete the picking and replenishment scenarios.

To find the license plate IDs that you will need later, follow these steps.

1. Go to **Inventory management > Inquiries and reports > On-hand list**.
2. Select the **Show filters** button to open the filter pane.
3. Enter the following filtering criteria to get the license plates for the scenario. Use the *begins with* filter.
 - **Item number:** *T0100*
 - **Warehouse:** *61*
4. Select **Apply**.

5. On the Action Pane, select **Dimensions**.
6. In the **Dimensions display** dialog box, in the **Storage Dimensions** section, select all the values.
7. In the **Transactions** section, select **Item number** and **Quantity < > 0**.
8. When you've finished, select **OK** to close the dialog box.
9. The **On-hand** grid shows the license plate numbers for item *T0100* in each location. Make a note of the license plate that is in each location, because you will need this information later.
10. Close the page.

Process steps

You will perform the warehouse location replenishment for the first two work IDs. Work on the third replenishment work will be blocked until the inventory level in the picking location falls below the threshold.

Replenishment

1. Sign in to the warehouse app as a user in warehouse *61*. (Enter *61* as the user ID and *1* as the password.)
2. Go to **Inventory > Replenishment**.

You're prompted to complete the first replenishment work. The item number, quantity, and location to pick from are shown.

3. In the **LP** field, enter the license plate number for the item in the location that is shown.
4. Select the **OK** button (check mark symbol).

The system generates a target license plate number for the new license plate for the picked item.

5. Select **OK** to confirm the value.

Put work is shown that instructs the user to put the target license plate into the replenishment location. The *Put* location should be **06A01R2S1B**.

6. Confirm the put details, and select **OK**.

You receive a "Work Completed" message, and the details of the next replenishment pick task are shown: the item number, quantity, and location to pick from. The picking location will be the same as the first replenishment location. Therefore, the license plate will have the same license plate ID that was used for the first replenishment work task.

7. Repeat the preceding steps to complete the replenishment work for the second work task. The quantity and target license plate will differ from the quantity and target license plate for the first work task.

After the second replenishment work is completed, you receive a "Work Completed" message. The mobile device also informs you that there is no work available, even though some replenishment work remains. This behavior occurs because the replenishment work has an availability status of *Held* and is therefore marked as **Blocked**.

The *Held* status was triggered because the location profile for the picking location that the work is being assigned to has an **Overflow quantity** value of *0.65 PL*. The two previous replenishment work tasks filled the location almost to its overflow limit for item *T0100*. (The unit conversion for the item is *1 PL = 100 ea*.) Therefore, the remaining replenishment work would cause the location to exceed its overflow limit.

Until enough inventory is picked from the location to bring it below the work release threshold on the mobile device menu item, this replenishment work will remain blocked.

Sales order pick

Before the remaining replenishment work task can be completed, the picking location must be depleted of

inventory to a level where the remaining replenishment work can be unblocked. In other words, the sum of the quantity of on-hand inventory in the location and the replenishment quantity can't exceed the **Overflow quantity** value. When this sum is less than the overflow quantity, the remaining replenishment work will be unblocked.

1. Sign in to the warehouse app as a user in warehouse *61*. (Enter *61* as the user ID and *1* as the password.)
2. Go to **Outbound > Sales Picking**.
3. Enter the first work ID for sales order 1.

Refer to the work IDs for sales orders that you made a note of earlier, on the **Work details** page. The work ID that you enter here will generate pick work for a quantity of 10 ea from two separate locations.

4. Select **OK**.

The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from for the first location.

5. In the **LP** field, enter the license plate number for the item in the location that is shown.
6. Select the **OK** button (check mark symbol).

The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from for the next location.

7. In the **LP** field, enter the license plate number for the item in the location that is shown.
8. Select the **OK** button (check mark symbol).

The **Sales orders: Put** page instructs you to put away both the completed picking works to the outbound staging location.

9. Select **OK**.

You receive a "Work Completed" message.

10. Enter the second work ID for sales order 1.

There is only one pick task for this work ID.

11. Select **OK**.

The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from.

12. In the **LP** field, enter the license plate number for the item in the location that is shown.

The license plate that you specify will be one of the system-generated license plates from the replenishment work tasks. To make sure that you capture the correct license plate ID, check the inventory on the **On-hand list** page for the item, location, and quantity.

13. Select the **OK** button (check mark symbol).
14. Confirm the instructions for the put task to the outbound staging location.
15. Select **OK**.

You receive a "Work Completed" message.

Sales order 2 is blocked from picking because the replenishment task that it's linked to isn't completed. Currently, there is still a quantity of 30 ea in the picking location, and the replenishment quantity for sales order 2 is 60 ea. The sum of the on-hand inventory and the replenishment inventory (90 ea) exceeds the overflow quantity of 0.65 PL (or 65 ea). Before the replenishment work can be completed, sales order 3 must be picked.

1. Enter the work ID for sales order 3.

There is only one pick task for this work ID.

2. Select **OK**.

The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from.

3. In the **LP** field, enter the license plate number for the item in the location that is shown.

The license plate that you specify will be one of the system-generated license plates from the replenishment work tasks. To make sure that you capture the correct license plate ID, check the inventory on the **On-hand list** page for the item, location, and quantity.

4. Select the **OK** button (check mark symbol).
5. Confirm the instructions for the put task to the outbound staging location.
6. Select **OK**.

You receive a "Work Completed" message.

As soon as the sum of the on-hand quantity in the picking location and the replenishment quantity is below the threshold, you will be able to process the remaining replenishment work.

Return to the **Work details** page, and notice that the replenishment work availability for the final piece of replenishment (for sales order 2) is *Open*, because there is now enough space in the location to accept the replenishment.

You can now process this replenishment work via the mobile device.

1. Go to **Inventory > Replenishment**.

You're prompted to complete the remaining replenishment work. The item number, quantity, and location to pick from are shown.

2. In the **LP** field, enter the license plate number for the item in the location that is shown.
3. Select the **OK** button (check mark symbol).

The system generates a target license plate number for the new license plate for the picked item.

4. Select **OK** to confirm the value.

Put work is shown that instructs the user to put the target license plate into the replenishment location. The *Put* location should be **06A01R2S1B**.

5. Confirm the put details, and select **OK**.

You receive "Work Completed" and "No Work Available" messages.

You can now pick sales order 2. It became unblocked when the replenishment work that is linked to the sales order was completed.

1. Enter the work ID for sales order 2.

There is only one pick task for this work ID.

2. Select **OK**.

The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from.

3. In the **LP** field, enter the license plate number for the item in the location that is shown.

The license plate that you specify will be the system-generated license plate from the replenishment work task. To make sure that you capture the correct license plate ID, check the inventory on the **On-hand list** page for the item, location, and quantity.

4. Select the **OK** button (check mark symbol).
5. Confirm the instructions for the put task to the outbound staging location.
6. Select **OK**.

You receive a "Work Completed" message.

Notes and tips

- This functionality works with all types of replenishment: wave demand, min/max, load demand, and slotting.
- You can manually override the replenishment work availability for each work header from the **Work details** page if you want.
- When the system sets the replenishment work availability, it considers any inventory that is already in the location before any work is completed
- Each piece of sales order work is linked to a specific replenishment work. There is no corresponding sales work availability functionality.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot warehouse replenishment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with warehouse replenishment in Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "Work %1 cannot be unblocked because it has unfinished replenishment work."

Issue description

Picking work is blocked because of dependent replenishment work.

Issue resolution

When you use wave demand replenishment, if a picking location must be replenished to fulfill the source order demand, the system creates both the replenishment work and the picking work. However, it blocks the picking work until the replenishment work is completed. This behavior is intentional, because the picking location won't have enough inventory unless the replenishment work is completed. Complete the replenishment work, and then process the picking work.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Confirm and transfer

2/18/2021 • 14 minutes to read • [Edit Online](#)

The *Confirm and transfer* feature lets users ship loads out of the warehouse before they complete all the work that is associated with those loads. When a shipment is received that includes load lines that weren't fully picked, the confirming user is prompted either to split the remaining quantities onto a new load or to cancel the incomplete quantities.

Systems that are set up to allow load splitting support scenarios where planned and partially loaded loads must be adapted because of new or changing circumstances.

The client includes logic that enables a partially loaded load to be closed and confirmed as shipped. All remaining shipments and load lines (including full or partial line quantities) are then rolled over to a newly created load and shipment, if this rollover is required and the setup allows for it. New shipments and loads are automatically created based on the initial criteria for shipment and load creation, and their main attributes remain unchanged. There is also an option to automatically cancel remaining quantities if a work order hasn't yet been created and the user deems this cancellation necessary.

This functionality supports scenarios where the full load doesn't fit onto a single truck, or where some of the load should leave the warehouse before the rest of the load is ready for shipment. In these scenarios, the remaining products can be transferred to a new load and therefore to a new truck. Because this feature can be used with loads that are otherwise intended to require full-load shipment, it provides extra flexibility so that transport managers can solve nonstandard or unforeseen scenarios.

When a load is split, the *Confirm and transfer* feature performs the following actions:

- New loads and shipments are created as they are required. Each load or shipment will have most of the same attributes as the original load or shipment. The exception is the load status, which will be recalculated based on the work status.
- The user is informed that a new load has been created. The user is also notified about the ID of the new load.
- The load lines, work headers, and work lines that were split are updated with the new load and shipment information.
- If a whole shipment is being split, the shipment is maintained, and only the load references are updated. If the shipment must be split, a new shipment is created.

When remaining quantities are canceled, any load line quantities that haven't been picked and that don't have non-canceled work associated with them are removed from the load. If any work is in process, the user can only split the load. Remaining quantities can't be canceled.

You can split only loads that meet all the following criteria:

- One or more load lines have picked quantities.
- The load status is less than loaded.
- There is no load line data. (This data is created through license plate consolidation on the staging location, and the *Confirm and transfer* feature doesn't support license plate consolidation.)
- No inventory is currently awaiting packing at a packing location. (The *Confirm and transfer* feature doesn't support inventory that has been picked to the pack station but hasn't yet been packed.)

NOTE

This functionality differs from the transport load functionality, which should be used in warehouses that can never plan and create loads before picking, but that instead load the available transportation space after picking is completed.

Use the *Confirm and transfer* feature in situations where loads are usually planned and created ahead of time, but where exceptions sometimes occur in which the load doesn't fit the available transport (such as a truck).

Turn on confirm and transfer

Before you can use the *Confirm and transfer* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Confirm and transfer*

Set up confirm and transfer

To use the *Confirm and transfer* feature, you must turn it on in every relevant load template. In addition, depending on your requirements, you might want to prepare your work templates to support the feature. If you want to work through the example scenario that is provided later in this topic, set up your system as described in this section. (That scenario is based on USMF demo data.)

Prepare your load templates

1. Go to **Warehouse management > Setup > Load > Load templates**.
2. On the Action Pane, select **Edit** to put the page into edit mode.
3. Select the **Allow load split during ship confirm** check box for each existing template where you want to turn on the feature. Alternatively, select **New** to create a new template, and configure it as you require. Every load that you create by using that template will inherit this functionality. (If you're working with the USMF demo data, turn on the feature for the **20' Container** load template.)

Prepare your work templates

This setup isn't required in all situations. The example that is shown here ensures that work can be broken by shipment to support the example scenario that is provided later in this topic. There are also other ways to achieve this result.

1. Go to **Warehouse management > Setup > Work > Work templates**.
2. In the grid in the upper part of the page, select an existing work template where you want to set up the *Confirm and transfer* feature. (If you're working with the USMF demo data, select the **51 Pick to stage** work template.) Alternatively, create a new work template.
3. On the Action Pane, select **Edit query** to open the **Sales** dialog box.
4. In the **Sales** dialog box, on the **Sorting** tab, select **Add** to add a row to the grid.
5. In the new row, set the following values:
 - **Table:** *Temporary work transactions*
 - **Derived table:** *Temporary work transactions*
 - **Field:** *Shipment ID*
 - **Search direction:** *Ascending*
6. Select **OK** to save your settings and close the **Sales** dialog box.

7. If you receive a message that states that grouping will be reset, select **Yes** to continue.
8. In the grid in the upper part of the **Work templates** page, select the template that you just edited, and then, on the Action Pane, select **Work header breaks**.
9. On the Action Pane, select **Edit** to put the page into edit mode.
10. In the grid, set the following values:
 - **Table name:** *Temporary work transactions*
 - **Field name:** *Shipment ID*
 - **Group by this field:** Select this check box.
11. On the Action Pane, select **Save**.
12. Close the page.

Scenario

This scenario shows an example where the picking process isn't yet completed, but the items that have been picked so far must be loaded onto a truck and shipped anyway. Therefore, the user can split the unpicked load lines onto a new load. All the data relationships will then automatically be updated.

NOTE

The specific values that are described in this scenario are based on the **USMF** demo data. We recommend that you use this demo data while you're demonstrating or learning how to use the feature. If you aren't using the **USMF** demo data, substitute your own values as required.

Step 1: Create a load that has multiple load lines

Before you can use this functionality, you must have a load that contains multiple load lines. You must also make sure that the pick locations have enough inventory for all the items on the sales orders that you will create. Review the setup of the location directive (**Warehouse management > Setup > Location directives**), and make a note of the picking locations that are used for sales order picking. If you must adjust the inventory, create manual movements, use replenishment, or use any other flow, as required.

To create a qualifying load, first create three sales orders by following these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New** to open the **Create sales order** dialog box.
3. In the **Create sales order** dialog box, set the following values (at a minimum):
 - On the **Customer** FastTab, set the **Customer account** field to *US-004 (Cave Wholesales)*.
 - On the **General** FastTab, set the **Warehouse** field to *51*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. Your new sales order is opened. In the **Sales order lines** grid, add a line that has the following values:
 - **Item number:** *M9200*
 - **Quantity:** *40*
 - **Unit:** *ea*
6. On the **Inventory** menu above the grid, select **Reservation**.
7. On the Action Pane, select **Reserve lot** to open the **Reservation** page.
8. Reserve the inventory on the sales line, and then close the **Reservation** page.

9. Repeat steps 1 through 4 to add a second sales order for the same customer and warehouse.
10. Add two sales lines that have the following values. After you add each line, reserve inventory for it as described in steps 6 through 8.
 - **Line 1:** Set the **Item number** field to *M9200*, the **Quantity** field to *30*, and the **Unit** field to *ea*.
 - **Line 2:** Set the **Item number** field to *M9201*, the **Quantity** field to *20*, and the **Unit** field to *ea*.
11. Repeat steps 1 through 4 to add a third sales order for the same customer and warehouse.
12. Add two sales lines that have the following values. After you add each line, reserve inventory for it as described in steps 6 through 8.
 - **Line 1:** Set the **Item number** field to *M9201*, the **Quantity** field to *20*, and the **Unit** field to *ea*.
 - **Line 2:** Set the **Item number** field to *M9202*, the **Quantity** field to *60*, and the **Unit** field to *ea*.

Load planning workbench

The load planning workbench will use the load template ID to build the shipments and release the sales order lines to the warehouse.

1. Go to **Warehouse management > Loads > Load planning workbench**.
2. In the **Warehouse** field, select *57*.

You will now build the load for the sales orders that you just created.
3. On the **Sales lines** tab, in the grid, select the sales lines for the new sales orders.
4. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To new load**.
5. In the **Load template assignment** dialog box, in the **Load template ID** field, select *20' Container*.
6. Select **OK**.
7. In the **Loads** section of the **Load planning workbench** page, in the grid, find the newly created load ID for warehouse *57*. Scroll right until you see the **Allow load split during ship confirm** column. The check box should be selected for your load.
8. Select the load.
9. On the **Release** menu above the grid, select **Release to warehouse** to create work.
10. In the **Release load to warehouse** dialog box, verify that the **Records to include** FastTab shows your load ID.
11. Select **OK**.

You might receive a "Processing operation" message while the system creates the shipments and work.
12. In the **Loads** section of the **Load planning workbench** page, your load should now have a load status of *Waved*. Select the load, and then, on the **Related information** menu above the grid, select **Wave details** to view the shipment IDs that were created. When you've finished, close the **Waves** page.
13. In the **Loads** section of the **Load planning workbench** page, select the load, and then, on the **Related information** menu above the grid, select **Work details** to view the work that was created for the sales orders.
14. Make a note of the work IDs that were created. You might have to scroll right to see the sales order number and shipment ID that are associated with the work ID.

Step 2: Set up the execution flow for mobile devices

Mobile device tasks will require user input of information, such as the work ID or license plate ID. In the fields,

this information is typically provided for warehouse users in the form of bar codes that are found on documentation, packaging, or racking. To complete the mobile device steps for scenarios, make sure that you've identified the work IDs for the transactions, and the license plate IDs for the item and location in the transactions.

1. Sign in to the mobile device by using a user ID and password for warehouse 51.
2. Select **Outbound**.
3. Select **Sales Picking**.
4. You have the option to enter the work ID or the license plate ID. Enter the work ID for the first sales order, and then select **Enter**.
5. In the **Loc** field, enter the location that is shown to confirm the picking location. Then select **Enter**.
6. In the **LP** field, enter the license plate ID. The license plate ID must be a match for the item, warehouse, and location of the item that is being picked from the selected location. When you've finished, select **Enter**.
7. In the **Item** field, enter the item number to confirm the item that is being picked, and then select **Enter**.
8. In the **Qty** field, enter the quantity of the item that is being picked, and then select **Enter**.
9. In the **Target LP** field, enter a target license plate ID. Target license plates are user-defined. Be sure to enter a license plate ID that you will remember. We recommend that you use the current date plus a two-digit sequence (YYMMDD##) as the format, such as 19112301. When you've finished, select **Enter**.
10. Review information that is shown. This information is the *Pick* information that will now become the *Put* data for the put transaction. When you've finished, select **Enter**.
 - You receive a **Work Completed** message.
11. Repeat steps 4 through 10 for the work ID of the second sales order.

The next step is to load the two picked license plates to the truck.

1. Sign in to the mobile device by using a user ID and password for warehouse 51.
2. Select **Outbound**.
3. Select **Sales Loading**.
4. Enter the user-defined target license plate ID that you created for the first work ID in the previous procedure. Then select **Enter** to put the target license plate into the **STAGE** location.
5. Enter the target license plate ID again, and then select **Enter** to put the license plate into the **BAYDOOR** location.
6. Repeat steps 4 through 5 for the target license plate ID that you created for the second work ID.

The two work IDs will now be closed (loaded).

Step 3: Confirm the outbound shipment

In this step, you will confirm the two sales orders and work that have been completed for the load to ship the picked items of the load and create a new load for the unpicked items. Outbound shipment confirmation must be done on the **Load details** page.

1. Go to **Warehouse management > Loads > Load planning workbench**.
2. In the **Loads** section, in the grid, select the row for the load ID that you created.
3. Select the load ID link to open the **Load details** page.
4. On the **Load details** page, on the Action Pane, on the **Ship and receive** tab, in the **Confirm** group,

select **Outbound shipment** to initiate the confirmation.

5. In the **Ship confirm** dialog box, in the **Load split method during ship confirm** field, select *Split quantity to new load*.
6. Select **OK**.

You might receive a "Processing operation" message.

You receive informational messages that indicate that the shipment for your load has been confirmed, and that a new load has been created from the split quantity.

Refresh the **Load planning workbench** page to see the newly created load.

You can also confirm that transaction relations have been updated in the following ways:

- The remaining (unprocessed) shipment and shipment lines are updated with the new load ID.
- The sales order is linked to the new load ID.
- The original load doesn't include the remaining load lines.
- The remaining work has been updated with the new load ID.
- The wave remains the same.
- The status of the new load is correctly updated. (If the work status is *In process*, the load status should also be *In process*.)

Notes and tips

- You can also turn on the **Allow load split during ship confirm** parameter after the load has been created with the **Load template** parameter turned off but before the loading process has started. Go to the desired load, and then, in the header view, turn on the parameter.
- The **Split quantity to new load** option also works when some of the remaining work headers have a status of *In process*. Therefore, you can still use the functionality even if workers are already running the pick orders.
- If you select **Cancel unfulfilled quantity** while there is remaining work that has a status of *Open* or *In progress*, you receive the following error message: "Unable to cancel remaining qty for load. Work exists for load."
- If you select **Cancel unfulfilled quantity** when there is no remaining work but there are unreleased load lines on the load, you receive the following error message: "The shipment for load could not be confirmed because the quantity for item exceeds the percentage that is defined for under delivery." To avoid the error, you can set the **Under delivery** percentage on the unreleased load line to 100 percent. Unreleased lines won't be moved to a new load, but the current load will be confirmed with under-delivery. In this case, you won't be able to re-release the original order. Therefore, so you will have to handle it in some other way.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Confirm outbound shipments from batch jobs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to set up a batch job that automatically confirms outbound transfer-order shipments for ready-to-ship loads. The batch job described here only applies to transfer order shipments, not to sales orders.

Enable the Confirm outbound shipments from batch jobs feature

Before you can use this feature, it must be enabled on your system. Administrators can use the [Feature management](#) page to check the feature status and enable it if needed. The feature is listed as:

- **Module** - *Warehouse management*
- **Feature name** - *Confirm outbound shipments from batch jobs*

Process outbound shipments

To set up a scheduled batch job to run the outbound shipment confirmation for loads that are ready to ship:

1. Go to **Warehouse management** > **Periodic tasks** > **Process outbound shipments**.
2. The **Confirm shipment** dialog box opens. On the **Records to include** FastTab, select **Filter**.
3. The query editor dialog box opens. On the **Range** tab, add a row with the following values:
 - **Table** - *Loads*
 - **Derived table** - *Loads*
 - **Field** - *Load status*
 - **Criteria** - *Loaded*
4. Select **OK** to return to the **Confirm shipment** dialog box.
5. On the **Run in the background** FastTab, set **Batch processing** to **Yes**.
6. On the **Run in the background** FastTab, select **Recurrence**.
7. The **Define recurrence** dialog box opens. Set the run schedule as needed for your business.
8. Select **OK** to return to the **Confirm shipment** dialog box.
9. Select **OK** on the **Confirm shipment** dialog box to add the batch job to the batch queue.

For more information, see [Batch processing overview](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Advanced load building during wave

2/18/2021 • 13 minutes to read • [Edit Online](#)

Advanced wave load building automatically assigns shipments to existing waves during wave execution. Therefore, you can create meaningful loads that represent trucks without having to use the load planning workbench. This capability is useful for businesses that want to use the concept of loads to track and plan the shipment of goods in a truck/trailer, but that don't want to manually create those loads every day.

During wave processing, the system usually creates a new load for each shipment that no load is assigned to. However, when advanced wave load building is turned on, the system assigns each unassigned shipment to an existing load (if an appropriate load exists), and new loads are created only when they are required. Advanced wave load building automatically creates the new loads, based on criteria that you define.

To use the feature, you must set up the system in the following way:

- Create *wave templates* that include the new **buildLoads** method. This method makes advanced wave load building available for waves that use those templates.
- Set up *load build templates*, each of which is linked to a specific wave template and method. Load build templates control which load (existing or new) the load lines that are being waved are added to. You can combine or separate shipments, based on criteria such as the load template, equipment, and other field values on the load line.
- Define *load mix groups* to control which items should and should not be combined on a single load. You also specify whether the restriction should produce a warning or an error, and whether the volumetric restriction of the load template should be evaluated.

Turn on advanced wave load building in your system

Before you can use advanced wave load building, two features must be turned on in your system. Admins can use the [feature management](#) settings to check the status of these features and turn them on if they are required. In the **Feature management** workspace, the features are listed in the following way:

- Wave load building feature:
 - **Module:** *Warehouse management*
 - **Feature name:** *Wave load building feature*
- Organization wide wave step code:
 - **Module:** *Warehouse management*
 - **Feature name:** *Organization wide wave step code*

Make sample data available

To work through this demo by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this demo as guidance for using this feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Make sure that the scenario setup includes enough available inventory

If you're working with the **USMF** demo data, you must first make sure that your system is set up so that there is enough inventory at each relevant location. For this demo, the expectation is that the following inventory is

available in warehouse 62:

- **Item A0001:** 10 pcs
- **Item A0002:** 10 pcs
- **Item M9200:** 10 ea

Item **M9200** must be added to the warehouse. Complete the procedures in the following subsections to add the item inventory.

Create a new license plate ID

1. Go to **Warehouse management > Setup > Warehouse > License plates**.
2. On the Action Pane, select **New**.
3. In the new row, in the **License plate** field, enter *LP6203*.
4. Select **Save**.

Create a standard cost for item M9200 in site 6

1. Go to **Product information management > Products > Released products**.
2. Search on **M9200**.
3. Select the row for the item, and then, on the Action Pane, on the **Manage costs** tab, in the **Set up** group, select **Item price**.
4. On the **Item price** page, select the **Pending prices** tab.
5. On the Action Pane, select **New**.
6. On the new line, set the following values:
 - **Costing type:** *Planned cost*
 - **Price type:** *Cost*
 - **Version:** *10*
 - **Site:** *6*
 - **Price:** *1.60*
7. On the Action Pane, select **Save**.
8. On the Action Pane, select **Activate pending price(s)**.
9. Select the **Active prices** tab to verify that the new cost price for site 6 has been added.

Create inventory in warehouse 62

1. Go to **Inventory management > Journal entries > Items > Inventory adjustment**.
2. On the Action Pane, select **New**.
3. In the **Create inventory journal** dialog box, on the **Overview** FastTab, in the **Warehouse** field, enter *62*. Accept the default values in all the other fields.
4. Select **OK** to close the dialog box.
5. The **Inventory adjustment** page is opened. On the **Journal lines** FastTab, select **New** to add a line.
6. On the new line, set the following values. Accept the default values in all the other fields.
 - **Item number:** *M9200*
 - **Location:** *bulk-003*
 - **Quantity:** Change the value to *10*.
7. On the Action Pane, select **Save**.

8. On the Action Pane, select **Validate** to check for errors.
9. In the **Check journal** dialog box, select **OK** to start the check. You receive a message when the check is completed.
10. On the Action Pane, select **Post** to commit the inventory adjustment.
11. In the **Post journal** dialog box, select **OK** to start the posting. You receive a message when the posting is completed.

Set up advanced wave load building

Regenerate wave process methods

You might have to regenerate your wave process methods to make the load building method (**buildLoads**) available.

1. Go to **Warehouse management > Setup > Waves > Wave process methods**.
2. Verify that **buildLoads** is present in the list. If it isn't present, select **Regenerate methods** on the Action Pane to add it.

Set up wave templates

To take advantage of advanced wave load building, you must include the **buildLoads** method in each relevant [wave template](#).

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Select a wave template.

If you're working with the **USMF** demo data, select the **62 Shipping Default** template.
3. On the Action Pane, select **Edit** to put the page into edit mode.
4. On the **Methods** FastTab, in the **Remaining methods** grid, select the **buildLoads** method.
5. Select the right arrow button to move the **buildLoads** method to the **Selected methods** grid.
6. To assign a **Wave step code** value for the **buildLoads** method, you must first create a code on the **Wave step codes** page. You can use any value that you want, but be sure to make a note of it, because you will need it later. Follow these steps to create code **WSC2112**:
 - a. In the row for the **buildLoads** method, right-click the down arrow in the **Wave step code** field, and then select **View details**.
 - b. On the **Wave step codes** page, on the Action Pane, select **New**.
 - c. In the **Wave step code** field, enter *WSC2112*.
 - d. In the **Wave step description** field, enter *WSC2112*.
 - e. In the **Wave step type** field, select *Load Building*.
7. Select **Save**, and close the page.
8. In the row for the **buildLoads** method, in the **Wave step code** field, select the code that you just created (**WSC2112**).
9. On the Action Pane, select **Save**.

NOTE

Wave step codes are codes that users can set up and use to link specific instances of wave methods to corresponding templates. The templates include templates for replenishment, containerization, label printing, load building, and sorting.

When wave step codes aren't used, users must enter free text to reference a specific template from the wave method instance. Free text is prone to errors, because users must make sure that the wave step text that they add for a specific wave step method in a wave template exactly matches the wave step text in the target template.

Wave step codes for a specific wave step type are set up on a separate page. For every instance of a wave step method in a wave template that requires a wave step code, the wave step code must be selected in a drop-down list. Selection in a drop-down list replaces free text entry and helps reduce the risk and impact of human error. Setup codes are used to link a wave step method in a wave template to a target template for the method.

Set up load mix groups

Load mix groups establish rules for the types of items that can be combined on a single load. You can set up as many load mix groups as you require. However, to use advanced wave load building, you must have at least one. Follow these steps to create a load mix group.

1. Go to **Warehouse management > Setup > Load > Load mix groups**.
2. On the Action Pane, select **New** to create a load group.
3. In the **Load mix group ID** field, enter a name for the new group.

If you're working with the **USMF** demo data, set the following values:

- **Load mix group ID:** *TV*
- **Description:** *TV*

4. On the Action Pane, select **Save** to make the **Load mix group criteria** FastTab available.
5. On the **Load mix group criteria** FastTab, select **New** to add a row to the grid.
6. In the new row, set the desired values in each field. These values determine the item groups that are considered for the load mix.

If you're working with the **USMF** demo data, select *TV&Video* in the **Item group** field.

7. On the Action Pane, select **Save** to make the **Load mix group constraints** FastTab available.
8. On the **Load mix group constraints** FastTab, select **New** to add a row to the grid.
9. In the new row, set the desired values in each field.

If you're working with the **USMF** demo data, set the following values:

- **Item group:** *CarAudio*
- **Load build action:** *Restrict* (This value will prevent items that belong to the **CarAudio** item group from being on the same load as items that belong to the **TV&Video** item group.)

10. Continue to work with the rules until you've added all the criteria and constraints that you require for the load mix group.

If you're working with the **USMF** demo data, you've now finished this setup.

Set up load build templates

You can set up as many load build templates as you require. However, to use advanced wave load building, you must have at least one. Follow these steps to create a load build template.

1. Go to **Warehouse Management > Setup > Load > Wave load building templates**.

2. On the Action Pane, select **New** to add a row to the grid.

3. In the new row, set the following values.

FIELD	DESCRIPTION	VALUE IN THE USMF DEMO DATA
Sequence number	The order that the template will be evaluated in.	1
Load build template name	Enter the unique identifier of the load build template. You should enter the name of the template that you created or updated earlier in this setup.	<i>62 Shipping Default</i>
Wave step code	Enter the wave step code to use to link the template to a wave method. You should enter the code that you selected for the buildLoads method when you set up the wave template earlier in this setup.	<i>WSC2112</i>
Load template ID	Select the load template to use when new loads are created and to match against when assigning to existing loads. The load template defines the maximum weight and volume that are permitted for the whole load.	<i>Std Load Template</i>
Equipment	The equipment to match against when assigning to existing loads and to enter on new loads that are created.	Leave this field blank.
Load mix group ID	Select the load mix group to use if the item is allowed on the load. The mix group establishes rules for the types of items that can be combined on a single load. You should select one of the mix groups that you created earlier in this setup.	<i>TV</i>
Use open loads	Select whether existing open loads should be added. The following options are available: <ul style="list-style-type: none"> • None – Don't add open loads to any existing loads. • Any – Add open loads to any existing loads that are valid for the line. • Assigned – Add open loads to the load that is assigned to the wave. 	<i>Any</i>
Create loads	Specify whether new loads should be created if no existing loads match the criteria.	Selected (= Yes)

FIELD	DESCRIPTION	VALUE IN THE USMF DEMO DATA
Allow shipment line split	Specify whether a single load line can be split across multiple loads if the full line exceeds the maximum capacity of the load template.	Cleared (= No)
Validate volumetrics	Specify whether load building should check the weight and volume as each load line is added, to ensure that the volumetric limits of the load template are respected.	Cleared (= No)

4. On the Action Pane, select **Save** to make the **Edit query** option available.
5. On the Action Pane, select **Edit query** to open a dialog box for editing the query.
6. In the dialog box, on the **Sorting** tab, select **Add** to add a row to the grid.
7. In the new row, define the sorting rules that you want to use. For example, set the following values to sort the search results in ascending order by order number:
 - **Table:** *Load details*
 - **Derived table:** *Load details*
 - **Field:** *Order number*
 - **Search direction:** *Ascending*
8. Select **OK** to save your changes and close the dialog box.
9. On the **Break by** FastTab, set rules to control how your loads are split up. Typically, you might break on custom fields that have been extended onto the load line, such as **Route**, **Tour**, or **Run**. For example, to create one load per order number, select the **Break by** check box for the row that has the following values:
 - **Reference table name:** *Load details*
 - **Reference field name:** *Order number*

Scenario

This scenario shows how the settings that were described earlier in this topic affect warehouse operations while a sales order is processed. This scenario uses the **USMF** demo data together with other demo values that are provided in those setup instructions.

Create sales orders

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New** to open the **Create sales order** dialog box.
3. In the dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer account** field to *US-007*.
 - On the **General** FastTab, set the **Warehouse** field to *62*.
4. Select **OK** to create the sales order and close the dialog box.
5. Your new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines** FastTab. On this new line, set the **Item number** field to *A0001* and the **Quantity** field to *1*.
6. On the **Inventory** menu above the grid, select **Reservation**.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot**.
8. Select the **Close** button (X) in the upper-right corner of the page to return to the sales order.
9. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**. The system creates a shipment and adds it to a new load, because no existing load contains load lines that have this order number.

You receive informational messages that indicate the work, wave, and shipment that are created for this order.
10. To confirm the load, shipment, and work details on the sales line, select the line, and then, on the **Warehouse** menu above the grid, select **Load details**, **Shipment details**, or **Work details**.
11. In the sales order that you just created, on the **Sales order lines** FastTab, select **Add line** to add another line.
12. On the new line, set the **Item number** field to *A0002* and the **Quantity** field to *1*.
13. Repeat lines 6 through 9 to reserve the line and release it to the warehouse. The system creates a **new** shipment for the line that you added. However, because you're using advanced wave load building, the system adds that shipment and load line to the existing wave. If you weren't using advanced wave load building, the system would create a new load for the shipment.
14. In the sales order that you just created, on the **Sales order lines** FastTab, select **Add line** to add another line.
15. On the new line, set the **Item number** field to *M9200* and the **Quantity** field to *1*.
16. Repeat lines 6 through 9 to reserve the line and release it to the warehouse. As before, the system creates a **new** shipment for the line that you added. However, because the item is from the **CarAudio** item group, it **fails to pass the constraints that you set up for the load mix group**. Therefore, it's **added to a new load**. If you hadn't specified a load mix group on the load build template, this shipment would have been added to the first load.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Release to warehouse rule

2/18/2021 • 6 minutes to read • [Edit Online](#)

The *Release to warehouse rule* feature provides flexibility during release to the warehouse. It adds a configuration option for each warehouse. You can use this option to specify whether partially reserved order lines can be released for that warehouse. The feature works together with advanced cross-docking functionality in situations where part of an order line quantity is marked against a supply source, but the remaining part can be processed in the warehouse. Therefore, the line can be released so that warehouse processing of the available inventory quantity can continue.

Turn on and initialize the Release to warehouse rule feature

Turn on the feature

Before you can use the *Warehouse release rule* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Warehouse release rule*

Initialize the feature

After the feature is turned on in your system, you must initialize it to set the rule to the correct initial state for all warehouses.

- For warehouses that aren't enabled for warehouse management, the rule is initially set to **Not applicable**.
- For warehouses that are enabled for warehouse management, the rule is initially set to **Allow partial reservation**

To initialize the feature and set the release to warehouse rule for all warehouses, follow these steps.

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **Warehouse management parameters** page, on the **General** tab, in the **Company information** section, select the link for the **Initialize release to warehouse rule**. (If this link isn't shown, either the feature isn't turned on or it has already been initialized.)
3. When you're prompted to confirm the action, select **Yes** to initialize the feature.

Set the release to warehouse rule for each warehouse

After the feature is turned on and initialized, all your warehouses will have an initial setting, as described in the previous section. You can change this setting for individual warehouses by following these steps.

1. Go to **Warehouse management > Setup > Warehouse > Warehouses**.
2. Select the warehouse to configure.
3. Select **Edit** to put the page into edit mode.
4. On the **Warehouse** FastTab, in the **Reservations** section, the **Requirement for inventory reservation** field controls whether partial release of orders is allowed. Select one of the following values:
 - **Not applicable** – When the feature is first turned on and initialized, this value is automatically

assigned to all warehouses that aren't enabled for warehouse management. It can't be changed. This value isn't available for warehouses that are enabled for warehouse management.

- **Allow partial reservation** – Orders can be released when any quantity is reserved. The system will evaluate whether the unreserved quantity should be marked for advanced cross-docking and will mark that quantity as required. If no marking exists, the system will create work only for the reserved quantity. When the feature is first turned on and initialized, this value is automatically assigned to all warehouses that are enabled for warehouse management. This value isn't available for warehouses that aren't enabled for warehouse management.
- **Require full reservation** – Orders can be released only if the whole quantity is reserved. They can't be released if the total quantity isn't either physically reserved or planned for cross-docking. This value isn't available for warehouses that aren't enabled for warehouse management.

5. Select **Save**.

Scenarios

This section provides two scenarios that you can work through to learn what the feature does and how to use it.

Make sample data available

To work through these scenarios by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use these scenarios as guidance for the feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Scenario 1: Require full release (no planned cross-docking)

This scenario shows how the feature works for warehouses that are set to **Require full reservation**.

1. Go to **Warehouse management > Setup > Warehouse > Warehouses**.
2. For warehouse *62*, set the **Requirement for inventory reservation** field to **Require full reservation**, as described in the [Set the release to warehouse rule for each warehouse](#) section earlier in this topic.
3. Go to **Sales and marketing > Sales orders > All sales orders**.
4. Select **New** to create a sales order.
5. In the **Create sales order** dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer account** field to *US-004*.
 - On the **General** FastTab, set the **Warehouse** field to *62*.
6. Select **OK** to create the new sales order and close the dialog box.
7. Your new sales order is opened. It includes an empty line in the grid in the **Sales order lines** section. On this line, set the following values:
 - **Item number**: *A0001*
 - **Quantity**: *2*
8. Select **Add line** to add a new line, and set the following values:
 - **Item number**: *A0002*
 - **Quantity**: *2*
9. Select the first order line, and then, on the **Inventory** menu above the grid, select **Reservation**.

10. On the **Reservation** page, select **Reserve lot** to reserve the selected line's full quantity in the warehouse.
11. Close the **Reservation** page to return to the sales order.
12. Don't reserve the second order line.
13. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.
14. Notice that you receive the following error message: "The full quantity must be physically reserved." Therefore, the system doesn't create any work, shipment, or load for the order.

NOTE

You will receive the same error message if you partially reserve the second line.

Scenario 2: Allow partial release

This scenario shows how the feature works for warehouses that are set to **Allow partial release**.

1. Go to **Warehouse management > Setup > Warehouse > Warehouses**.
2. For warehouse *62*, set the **Requirement for inventory reservation** field to **Allow partial reservation**, as described in the [Set the release to warehouse rule for each warehouse](#) section earlier in this topic.
3. As you did in the [previous scenario](#), go to **Sales and marketing > Sales orders > All sales orders**, and create a sales order for customer account *US-004* from warehouse *62*. Add the following two order lines:
 - **Line 1:** Set the **Item number** field to *A0001*, the **Quantity** field to *2*, and the **Unit** field to *Pcs*.
 - **Line 2:** Set the **Item number** field to *A0002*, the **Quantity** field to *2*, and the **Unit** field to *Pcs*.
4. As you did in the [previous scenario](#), reserve the full quantity for order line 1, but don't reserve order line 2.
5. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.
6. Notice that you don't receive an error message this time. Instead, the system creates work, shipments, and loads as required, and shows the results.
7. To view the shipment, load, and work information, use the options on the **Warehouse** menu above the grid:
 - **Line 1:** Three options are available: **Shipment details**, **Load details**, and **Work details**. Select each option to view the details of the shipment, load, and work that were created when the order was released to the warehouse.
 - **Line 2:** Only the **Work details** option is available. Select it, and notice that no work has been created, because no inventory was reserved. Therefore, no shipment or load was created either.

NOTE

The same result is expected when the second line is partially reserved. In this case, work will be created for the reserved line quantity but not for the unreserved quantity.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Wave template grouping

2/18/2021 • 8 minutes to read • [Edit Online](#)

Wave template grouping enables the system to use [wave template](#) setups to determine, based on criteria that you define, how it should split released lines and assign them to new or existing waves. This feature can be useful in warehouses where waves are created based on specific criteria, but where managers prefer to create waves automatically instead of manually. It enables the system to add each newly released shipment to the first wave that it finds that has matching grouping field values. If no match is found, the system creates a new wave for the new shipment.

IMPORTANT

Wave template grouping isn't supported for the work types *production raw material picking* or *Kanban picking*. This is because wave grouping is based on shipments and these work types don't use shipments.

Turn on the Wave template grouping feature

Before you can use the *Wave template grouping* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Wave template grouping*

Set a wave template to use wave template grouping

To make wave template grouping available, follow these steps to set up your [wave template](#).

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. In the left pane, select the wave template to set up. If you're preparing to work through the scenario later in this topic by using demo data, select the **62 Shipping default** template.
3. Select **Edit** to put the page into edit mode.
4. On the **General** FastTab, set the following values:
 - **Automate wave creation:** *Yes*
 - **Assign to open waves:** *Yes*
 - **Process wave at release to warehouse:** *No*
5. On the Action Pane, select **Edit query** to open the query dialog box.
6. In the query dialog box, on the **Sorting** tab, review the sorting criteria, and make sure that there is a rule that includes the field that you want to use to group your waves.

If you're preparing to work through the scenario by using demo data, add a row that has the following values:

- **Table:** *Shipments*
- **Derived table:** *Shipments*
- **Field:** *Carrier service*

NOTE

After you select this value, you might receive the following message: "Field Carrier service is not an index field. Do you want to add sorting on this?" Select **Yes** to add sorting.

- **Search direction:** *Ascending*

7. Select **OK** to save your changes and close the query dialog box.
8. On the Action Pane, select **Wave template grouping**.
9. On the **Wave template grouping** page, select the **Group by** check box for each row that you want to use to group your order lines into waves, as required. If you're preparing to work through the scenario by using demo data, select the **Group by** check box for the *Carrier service* row.
10. Select **Save**.
11. Close the **Wave template grouping** page.
12. Select **Save** to save your template.

Scenario

This section provides a script that you can work through to learn what this feature does and how to work with it.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard **demo data** is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this scenario as guidance for using the feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Scenario: Wave template grouping

This scenario shows how to use wave template grouping to automatically create multiple waves, based on grouping criteria that are defined in a wave template. In this scenario, the wave template is set up in the system to create one wave per carrier service.

Before you begin, prepare your wave template as described in the [Set a wave template to use wave template grouping](#) section earlier in this topic. If you will be working with demo data for this scenario, be sure to use the demo data values that are suggested in that procedure. This setup will group your waves according to the carrier service that is set for each sales order.

Create sales order 1

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer account** field to *US-004*.
 - On the **General** FastTab, set the **Warehouse** field to *62*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. The new sales order is opened in the **Lines** view. Make a note of the sales order number.
6. Switch to the **Header** view.

7. On the **Delivery** FastTab, in the **Transportation** section, set the following values:
 - **Shipping carrier:** *Air cargo*
 - **Carrier service:** *Air*
8. Switch back to the **Lines** view.
9. In the **Sales order lines** section, select **Add line** to add a line to the grid.
10. On the new line, set the following values:
 - **Item number:** *A0002*
 - **Quantity:** *2*
11. Select the new order line, and then, on the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
13. Close the **Reservation** page to return to the sales order.
14. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
15. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID number and the shipment ID numbers.

View the wave that was created from sales order 1

1. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
2. Select the wave ID that was created from the sales order.
3. Select the wave ID link to open the wave details page.
4. Notice that the shipment has been added to the **Wave lines** FastTab.

Create sales order 2

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer account** field to *US-005*.
 - On the **General** FastTab, set the **Warehouse** field to *62*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. The new sales order is opened in the **Lines** view. Make a note of the sales order number.
6. Switch to the **Header** view.
7. On the **Delivery** FastTab, in the **Transportation** section, set the following values:
 - **Shipping carrier:** *Flower moving*
 - **Carrier service:** *Std*
8. Switch back to the **Lines** view.
9. In the **Sales order lines** section, select **Add line** to add a line to the grid.
10. On the new line, set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *1*
11. Select the new order line, and then, on the **Inventory** menu above the grid, select **Reservation**.

12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
13. Close the **Reservation** page to return to the sales order.
14. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
15. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID number and the shipment ID numbers. Notice that the wave ID differs from the wave ID of the first sales order.

View the wave that was created from sales order 2

1. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
2. Select the wave ID that was created from the second sales order.
3. Select the wave ID link to open the wave details page.
4. Notice that the shipment has been added to the **Wave lines** FastTab.

A new wave was created for this shipment, because it uses a different carrier service than the first sales order.

Create sales order 3

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer account** field to *US-006*.
 - On the **General** FastTab, set the **Warehouse** field to *62*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. The new sales order is opened in the **Lines** view. Make a note of the sales order number.
6. Switch to the **Header** view.
7. On the **Delivery** FastTab, in the **Transportation** section, set the following values:
 - **Shipping carrier:** *Air Cargo*
 - **Carrier service:** *Air*
8. Switch back to the **Lines** view.
9. In the **Sales order lines** section, select **Add line** to add a line to the grid.
10. On the new line, set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *1*
11. Select the new order line, and then, on the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
13. Close the **Reservation** page to return to the sales order.
14. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
15. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID number and the shipment ID numbers. The shipment has been assigned to the existing wave from the first sales order.

View the wave for sales orders 1 and 3

1. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
2. Select the wave ID that was created from the third sales order.
3. Select the wave ID link to open the wave details page.
4. Notice that the shipment has been added to the **Wave lines** FastTab, together with the shipment for the first sales order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Reprint and void wave labels

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how to manage labels that are generated by wave processing. (For a detailed description and configuration instructions, see [Configure wave label printing](#).)

You can reprint wave labels at any time. For example, you might have to print a single label if an existing label was lost or damaged. Alternatively, a warehouse worker or supervisor might have to reprint a whole roll of labels if the number and/or composition of a whole series of wave labels has changed (for example, because of inventory shortage or other reasons). Often, even if only the number of cartons has changed, the whole roll must be reprinted to keep the total number accurate in the "Carton X of Y" section of each label.

The reprint wave labels feature supports the following functionality:

- Reprint labels from both the warehousing app and the rich client.
- Void labels and simultaneously reprint them. (The ability to void labels is embedded in short pick scenarios, for example.)
- Clean up the wave label history.

This topic presents a collection of scenarios that show, through examples, how to work with the reprint wave labels feature.

IMPORTANT

To work through the scenarios that are presented in this topic, you must first turn on and configure the relevant wave printing features, as described in [Configure wave label printing](#). Several of the scenarios in this topic also require that you first work through the scenarios in that topic to generate prerequisite sample data.

Scenario 1: Reprint labels from the web client

You can view and reprint wave labels from the following pages. On the Action Pane of each page, on the **Shipments** tab, in the **Related information** group, select **Wave labels**.

- All shipments > Shipment details
- All loads > Load details
- All waves
- Wave labels
- Wave label history

To reprint a wave label from the web client, follow these steps.

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave to reprint labels from.
3. On the Action Pane, on the **Wave** tab, in the **Print** group, select **Wave labels**.
4. Follow one or both of the following steps:
 - To reprint the label, select a printer in the **Printer name** field. (Leave this field blank if you just want to update the wave label details, without reprinting the label.)
 - To update the label, select the **Update wave label details** check box. (Leave this check box cleared if

you just want to reprint the previous label.)

NOTE

Every time that a wave label is printed or reprinted, its data is converted through the appropriate wave label layout, and all placeholders are replaced with actual values. The resulting string is stored as a record in the wave label history. If the **Update wave label details** check box is cleared, the stored Zebra Programming Language (ZPL) data is used when a label is reprinted. If the **Update wave label details** check box is selected, a new string is generated. The existing wave labels are also recalculated, and any excess labels (for example, if the related work lines have been canceled or modified) are marked as **Voided** and aren't reprinted.

5. Select **OK** to confirm your selection.

Scenario 2: Reprint labels from the warehousing app

This scenario typically applies if a label roll has been lost or damaged. It provides an example that shows how to set up mobile device menu items that will let workers reprint single and multiple labels. It then shows how to use those new menu items while you're working on a mobile device.

Set up the required menu items and menu for the mobile device

Before workers can reprint labels from a mobile device, you must set up menu items to provide this functionality and then add those items to the warehousing app menu.

Create new mobile device menu items

Follow these steps to create a new collection of menu items for reprinting labels from the warehousing app.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Create a menu item, and set the following values for it:
 - **Menu item name:** *Reprint single wave label*
 - **Title:** *Reprint single wave label*
 - **Mode:** *Indirect*
 - **Activity code:** *Reprint single wave label*
3. Create a second menu item, and set the following values for it:
 - **Menu item name:** *Reprint labels (Item)*
 - **Title:** *Reprint wave labels (Item)*
 - **Mode:** *Indirect*
 - **Activity code:** *Reprint multiple wave labels*
 - **Display work list grouping filter:** *Yes*
 - **System grouping field:** *ShipmentID*
 - **System grouping label:** *Shipment ID*
 - **Print mode:** *Product*
4. On the Action Pane, select **Field list** to open a page where you can select the fields that will be shown to help workers identify the correct label roll.
5. You can show up to seven fields. Use the drop-down lists to select the field that is shown in each available position. Leave any fields that you don't require blank.

Here is an example:

- **Display field:** *LabelItemID*
- **Display field 2:** *LabelItemName*
- **Display field 3:** *InventQty*

- **Display field 4:** *LabelUnitId*
6. Close the page.
 7. Create a third menu item, and set the following values for it:
 - **Menu item name:** *Reprint labels (Enum)*
 - **Title:** *Reprint wave labels (Enum)*
 - **Mode:** *Indirect**
 - **Activity code:** *Reprint multiple wave labels*
 - **Display work list grouping filter:** *Yes*
 - **System grouping field:** *ShipmentID*
 - **System grouping label:** *Shipment ID*
 - **Print mode:** *Enumeration*
 8. On the Action Pane, select **Field list**, and then use the drop-down lists to select the fields that will be shown to help workers identify the correct label roll (for example, *LabelItemId*, *LabelItemName*, *InventQty*, *LabelUnitId*, and *NumberOfLabels*).
 9. Close the page.
 10. Create a fourth menu item, and set the following values for it:
 - **Menu item name:** *Reprint labels (by last)*
 - **Title:** *Reprint wave labels (by last)*
 - **Mode:** *Indirect*
 - **Activity code:** *Reprint multiple wave labels*
 - **Display work list grouping filter:** *Yes*
 - **System grouping field:** *ShipmentID*
 - **System grouping label:** *Shipment ID*
 - **Print mode:** *Last good wave label ID*
 11. On the Action Pane, select **Field list**, and then use the drop-down lists to select the fields that will be shown to help workers identify the correct label roll (for example, *LabelItemId*, *LabelItemName*, *InventQty*, *LabelUnitId*, and *NumberOfLabels*).
 12. Close the page.

Set up the mobile device menu

Follow these steps to add your new menu items to the warehousing app menu.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu**.
2. Select an existing **Outbound** menu.
3. In the list on the left, find the reprint menu items that you just created, and then use the right arrow button to add them to the list on the right.
4. Close the page.

Use cases

The use cases that are provided here give examples that show how to use the various mobile device menu items that you set up to enable workers to reprint wave labels.

Before you work through these use cases, the following prerequisites must be in place:

- Demo data must be installed, and you must select the **USMF** legal entity.
- Wave label printing must be configured, and some labels must be generated, as described in [Configure wave label printing](#).

Use case 2.1: A single wave label is scratched and must be reprinted.

1. Sign in to the warehousing app as a user who access to warehouse 62. (In the standard demo data, you can sign in by using the user ID 62 and the password 1.)
2. Go to **Outbound > Reprint single wave label**.
3. Enter or scan the wave label ID.
4. Select the printer to reprint on.
5. Select **OK** to confirm the action.

Use case 2.2: Several labels for boxes of the same item were damaged and must be reprinted. Each label has a product bar code, but no enumeration or SSCC number.

1. Sign in to the warehousing app as a user who has access to warehouse 62. (In the standard demo data, you can sign in by using the user ID 62 and the password 1.)
2. Go to **Outbound > Reprint labels (Item)**.
3. Enter or scan the shipment ID.
4. Select the tile that has the correct label roll to reprint from.
5. Scan the product bar code from an existing label to confirm that the correct line has been selected.
6. Enter the number of labels to reprint.
7. Select the printer to reprint on.
8. Select **OK** to confirm the action.

Use case 2.3: Several labels for boxes weren't printed because of a printer jam. Because the labels have enumeration, you can define the carton range to reprint.

1. Sign in to the warehousing app as a user who has access to warehouse 62. (In the standard demo data, you can sign in by using the user ID 62 and the password 1.)
2. Go to **Outbound > Reprint labels (Enum)**.
3. Enter or scan the shipment ID.
4. Select the tile that has the correct label roll to reprint from.
5. Enter the first carton to reprint a label for.
6. Enter the last carton to reprint a label for. Alternatively, leave this field blank to reprint labels for all cartons after the specified first carton.
7. Select the printer to reprint on.
8. Select **OK** to confirm the action.

Use case 2.4: Several labels for boxes weren't printed because of a printer jam. The last good label has a wave label ID that is printed as a bar code.

1. Sign in to the warehousing app as a user who has access to warehouse 62. (In the standard demo data, you can sign in by using the user ID 62 and the password 1.)
2. Go to **Outbound > Reprint labels (by last)**.
3. Enter or scan the shipment ID.
4. Select the tile that has the correct label roll to reprint from.
5. Enter or scan the wave label ID of the last good wave label. The app identifies the next label in the sequence as the first carton that a label will be reprinted for.
6. Enter the last carton to reprint a label for. Alternatively, leave this field blank to reprint labels for all cartons after the specified first carton.
7. Select the printer to reprint on.
8. Select **OK** to confirm the action.

Scenario 3: Short pick and reprint

Before you work through this scenario, the following prerequisites must be in place:

- Demo data must be installed, and you must select the **USMF** legal entity.
- Wave label printing must be configured, and some labels must be generated, as described in [Configure wave](#)

[label printing](#).

Set up work exceptions

Work exceptions control the behavior of short picking. Follow these steps to set up a work exception.

1. Go to **Warehouse management > Setup > Work > Work exceptions**.
2. Create a record that has the following settings:
 - **Work exception code:** *Short pick and print*
 - **Exception type:** *Short pick*
 - **Suggest wave labels reprint:** *Yes*

Void and reprint after a short pick

1. Sign in to the warehousing app as a user who has access to warehouse 62. (In the standard demo data, you can sign in by using the user ID 62 and the password 1.)
2. Open a work processing flow for the sales order work that was created when wave labels were originally printed.
3. Select **Short pick**.
4. Select the work exception code that you created for this scenario.
5. If you selected the correct exception, the **Void and reprint** check box should be available. Select this box and confirm. When confirmed, the label roll sequence identified by the **Label build ID** field is recalculated based on the changed work line quantity. It's then reprinted on the specified printer.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Small parcel shipping

2/18/2021 • 10 minutes to read • [Edit Online](#)

The small parcel shipping (SPS) feature enables Microsoft Dynamics 365 Supply Chain Management to interact directly with shipping carriers by providing a framework for communication through carrier APIs. This functionality is useful when you're shipping individual sales orders via commercial shipping carriers instead of using container shipping or less-than-truckload (LTL) shipping.

The SPS feature interacts with your shipping carrier through a dedicated *rate engine*. Your organization must develop this rate engine in collaboration with your carrier or carrier hub service. The rate engine enables Supply Chain Management to submit details about a packed container to your carrier, and then receive a shipping label, shipping rate, and tracking number back from that carrier.

The shipping rate that is returned is added to the associated sales order as a miscellaneous charge. The shipping label that is returned can then automatically be printed by using a Zebra Programming Language (ZPL) printer and applied to the shipment. The carrier will scan this shipping label when it picks up the packages at your warehouse.

Prepare your system to support SPS

Before you can start to use SPS functionality, you must turn on the SPS feature in Feature management, add your rate engine, and set up the **Transportation management** and **Warehouse management** modules to support it.

Turn on the SPS feature

Before you can use the SPS feature, it must be turned on in your system. Administrators can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Transportation management*
- **Feature name:** *Small parcel shipping*

Deploy and set up rate engines

Supply Chain Management doesn't include any rate engines. You must obtain or create any rate engines that you require, and then add them to your system. However, Microsoft provides a demo rate engine that you can use for testing.

Download and deploy the demo rate engine

Follow these steps to get the demo rate engine.

1. On GitHub, download the [dynamic-link library \(DLL\) for the demo rate engine](#).
2. On your Supply Chain Management server, save the DLL in the `\AOSService\PackagesLocalDirectory\ApplicationSuite\bin` folder.

Create and deploy functional rate engines

For information about how to create and deploy functional rate engines so that they can be used in a production or test environment, see the following topics:

- [Create a new transportation management engine](#)
- [Set up transportation management engines](#)

For more information about how to create an SPS rate engine, see the following blog post: [Small Parcel](#)

[Shipping: How to leverage small parcel shipping functionality in Microsoft Dynamics 365.](#)

Set up a rate engine in Supply Chain Management

After you've created and deployed a rate engine for SPS, follow these steps to set it up.

1. Go to **Transportation management > Setup > Engines > Rate engine**.
2. On the Action Pane, select **New** to add a row to the grid.
3. In the new row, set the following fields:
 - **Rating engine** – Enter a unique name for the rate engine. If you're using the demo rate engine, enter *Demo rate engine*.
 - **Name** – Enter a short description of the rate engine. If you're using the demo rate engine, enter *Demo rate engine*.
 - **Rating metadata ID** – Select the basis that should be used to calculate your rate. For example, your rate might be calculated based on distance. If you're using the demo rate engine, you can leave this field blank.
 - **Engine assembly** – Enter the file name of the DLL package that you deployed. If you're using the demo rate engine, enter *TMSSmallParcelShippingEngine.dll*.
 - **Engine class** – Enter the class name that was established for your rate engine. If you're using the demo rate engine, enter *TMSSmallParcelShippingEngine.SmallParcelShippingRateEngine*.

Example scenario

This example scenario shows how to set up and use SPS after you've prepared your system as described earlier in this topic. This scenario uses the previously mentioned demo rate engine.

Make demo data available

To work through this scenario by using the demo records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

Set up the scenario

For this example scenario, you must have a demo carrier, carrier group, packing policy, and packing profile. The following subsections explain how to prepare the records that are required for the scenario. In a production scenario, the setup process typically resembles the process that is described here. However, you will set different values.

Set up carriers

Follow these steps to set up a carrier.

1. Go to **Transportation management > Setup > Carriers > Shipping carriers**.
2. On the Action Pane, select **New** to add a carrier.
3. On the header, set the following values:
 - **Shipping carrier:** *Demo Carrier*
 - **Name:** *Demo Carrier*
 - **Mode:** *Ground*
4. On the **Overview** FastTab, set the following values:
 - **Activate shipping carrier:** *Yes*
 - **Activate carrier rating:** *Yes*
5. On the **Services** FastTab, select **New** to add a service to the grid.

6. Set the following values for the new service:

- **Carrier service:** *Demo carrier service*
- **Name:** *Demo carrier service*
- **Transportation method:** *Ground*

Enter arbitrary values for all the other fields, as required. (When you save the new shipping carrier record, a new mode of delivery will be created, and the **Mode of delivery** field will be set automatically.)

7. On the **Rating profiles** FastTab, select **New** to add a rating profile to the grid.

8. Set the following values for the new profile:

- **Rating profile:** *Demo carrier service*
- **Name:** *Demo carrier service*
- **Rate engine:** *Demo rate engine*

Enter arbitrary values for all the other fields, as required.

9. On the Action Pane, select **Save**.

For more information about how to set up carriers, see [Set up shipping carriers](#).

Set up carrier service accounts

Follow these steps to set up a carrier service account.

1. Go to **Transportation management > Setup > Rating > Carrier service account**.

2. On the Action Pane, select **New** to add a carrier service account.

3. Set the following values for the new account:

- **Shipping Carrier:** *Demo Carrier*
- **Carrier service:** *Demo carrier service*
- **Carrier customer account number:** The carrier customer account number that is used to verify and authenticate the connection to the shipping carrier. Your carrier will provide this value. If you're using the demo service, you can enter an arbitrary value.
- **Site:** *6*
- **Warehouse:** *62*

NOTE

Often, the **Carrier customer account number** value is the only value that is required to authenticate the connection. However, if your carrier requires additional authentication parameters, your organization should customize this page to add extra fields as appropriate.

Set up a container packing policy

Follow these steps to set up a container packing policy.

1. If you haven't already set up a ZPL printer definition, use the Document Routing Agent application to set it up. For more information, see [Document printing overview](#) and related topics.

2. Go to **Warehouse Management > Setup > Containers > Container packing policies**.

3. On the Action Pane, select **New** to add a container packing policy.

4. On the header of the new policy, set the following values:

- **Container packing policy:** *Demo packing policy*
- **Description:** A description of the policy

5. On the **Overview** FastTab, set the following values:

- **Warehouse:** *62*
- **Default location for final shipment:** *Baydoor*
- **Weight unit:** *KG*
- **Container closing policy:** *Automatic release*
- **Container release policy:** *Make available at final shipping location*

6. On the **Container manifest** FastTab, set the following values:

- **Automatic manifest at container close:** *Yes*
- **Manifest requirements for container:** *Transportation management*
- **Print container contents:** *No*

7. On the **Carrier label printing** FastTab, set the following values:

- **Print container shipping label:** *Always*
- **Printer name:** The name of the ZPL printer that should print shipping labels

Set up a packing profile

Follow these steps to set up a packing profile.

1. Go to **Warehouse Management > Setup > Packing > Packing profiles**.

2. On the Action Pane, select **New** to add a packing profile to the grid.

3. Set the following values for the new profile:

- **Packing profile ID:** *Demo packing profile*
- **Description:** A description of the profile
- **Container packing policy:** *Demo packing policy*
- **Container ID mode:** *Auto*
- **Container type:** *SmallBox*

Set up a customer to use the SPS carrier

Follow these steps to set up a customer so that it can use the carrier that you created.

1. Go to **Accounts receivable > customers > All customers**.

2. In the grid, find and select customer *US-027*.

3. On the Action Pane, on the **General** tab, in the **Set up** group, select **Carrier customer accounts**.

4. On the **Carrier customer accounts** page, on the Action Pane, select **New** to add an account to the grid.

5. Set the following values for the new account:

- **Shipping carrier:** *Demo Carrier*
- **Carrier customer account number:** *12345* (The value isn't important for this scenario, but it will be referred to in the next section.)

Go through the example scenario

After you've set up all the sample data as described in the previous section, you're ready to go through the example scenario.

Create a sales order and process the work

Follow these steps to create a sales order.

1. Go to **Sales and marketing > Sales orders > All sales orders**.

2. Select **New** to create a sales order.

3. In the **Create sales order** dialog box, set the **Customer account** field to *US-027*.
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order is opened. On the **Sales order header** FastTab, set the **Carrier customer account number** field to the value that you selected for this customer earlier (*12345*).
6. In the **Sales order lines** section, add a sales line, and set the following values for it:
 - **Item number:** *A0002*
 - **Quantity:** *1*
 - **Site:** *6*
 - **Warehouse:** *62*
7. Switch to the **Header** view.
8. On the **Delivery** FastTab, set the following values:
 - **Shipping carrier:** *Demo Carrier*
 - **Carrier service:** *Demo carrier service*
9. Switch back to the **Lines** view. If you're prompted to update the mode of delivery for the sales lines, select **Yes**.
10. In the **Sales order lines** section, select the order line that you set up earlier, and then select **Inventory > Reservation**.
11. On the **Reservation** page, select **Reserve lot** to reserve the selected line's full quantity in the warehouse.
12. Close the **Reservation** page to return to the sales order.
13. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

Work is created to move items from the picking location to the packing station.
14. In the **Sales order lines** section, select **Warehouse > Shipment details**.
15. On the **Shipment details** page, make a note of the shipment ID. You will need it when you pack the pack the shipment at the packing station.
16. Close the **Shipment details** page to return to the sales order.
17. Make a note of the sales order number, and then go to **Warehouse management > Work > All work**.
18. Use the sales order number to find and select the work that was created for the order.
19. On the Action Pane, on the **Work** tab, select **Complete work**.
20. On the **Work completion** page, in the **User ID** field, select a user ID. Then, on the Action Pane, select **Validate work**.
21. If the work passes validation, select **Complete work** on the Action Pane.

The work is marked as completed to simulate the movement of items to the packing station.

Pack the shipment

Follow these steps to pack the shipment.

1. Go to **Warehouse management > Setup > Worker**, and make sure that your user account is associated with a worker account for warehouse management.
2. Go to **Warehouse management > Picking and containerization > Pack**.

3. In the **Select packing station** dialog box, set the following values:

- **Site:** 6
- **Warehouse:** 62
- **Location:** Pack
- **Packing profile ID:** Demo packing profile

4. Select **OK**.

5. The **Pack** page appears. In a production scenario, a worker will scan a license plate or shipment ID. However, for this scenario, open the **All shipments** page, and look up the shipment number for the shipment that you just created. Then enter this value in the **License plate or shipment** field on the **Pack** page. Alternatively, enter the shipment ID that you made a note of earlier.

6. On the Action Pane, select **New container**.

7. The dialog box that appears shows details about the new container. Leave the default values, and then select **OK**.

8. On the **Pack** page, on the **Item packing** FastTab, in the **Identifier** field, select *A0002* to pack that item. The item is added to the container.

9. On the Action Pane, select **Containers for shipment**.

The **Containers for shipment** page that appears has a row for the container that you just created. However, the **Container manifest ID** field in that row is currently blank, because you haven't yet received the shipping label and tracking number from the carrier.

10. On the Action Pane, select **Close container**.

11. In the **Close container** dialog box, set the **Gross weight** field to *1 kg*, and then select **OK**.

The shipping label should now be printed on the ZPL printer that you selected earlier. It should resemble the following example.

12. Notice that the **Container manifest ID** and **Total freight** values have been added as received from the carrier.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot load building and shipments

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with load building and shipments in Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "You can't create a load line for this order line because it contains inventory dimensions that are invalid..."

Issue description

You receive the following error message when you try to release a return sales order to the warehouse:

You can't create a load line for this order line because it contains inventory dimensions that are invalid. You can't reference inventory dimensions that are located below the location dimension in the reservation hierarchy. Remove the invalid dimensions from the order line.

Issue resolution

Unfortunately, the product doesn't support load processing for a sales return process. Therefore, you can't release the return sales order to the warehouse.

On sales order transactions, you can't reference inventory dimensions that are located below the **Location** dimension in the reservation hierarchy. The resolution is to remove the invalid dimensions from the order line.

I receive the following error message: "One of the lines is already on a load. Unable to release to warehouse."

Issue description

If you manually create loads, or if you set up the process so that loads are already created before sales order line entry occurs, the assumption is that the subsequent release will be done manually, and that the route and rating from the load will be used.

In another possible scenario, you're trying to do an automatic release to the warehouse, but the wave process failed to create work. Therefore, an open shipment or load is still created. This open shipment or load then blocks subsequent attempts to automatically release the order until you either delete the open shipment or load, or manually reprocess the wave.

Issue resolution

You can release from the sales order page, or automatic release can be done from the release sales order page, only if no load exists before the release to the warehouse. The load will automatically be created after the wave is processed.

I receive the following error message: "The delivery note correction can't be processed. The delivery note only contains items that are subject to warehouse management processes, as these are not supported by Delivery Note correction."

Issue description

After you post a delivery note, you can't cancel it, because the **Cancel** button is unavailable. You also can't correct the delivery note. If you try, you receive this error message.

Issue resolution

To correct posted packing slips for items that are enabled for advanced warehouse management (WMS), you must do the posting from the load, not directly from the order.

How can I create work from outbound loads instead of waves?

Issue description

Here is one way to reproduce this issue.

1. Create an outbound load by using a sales order or transfer order.
2. Release the load to the warehouse.
3. Notice that no picking work has yet been generated.

Issue resolution

If work must be generated immediately when the load is released, you must configure the wave template accordingly. On the wave template, set the following options to *Yes*:

- Automate wave creation
- Process wave at release to warehouse
- Automate wave release

I can't re-release a partially shipped load.

Issue description

You can't release a partially shipped load to the warehouse. When you do the release to the warehouse, an "Operation complete" message appears, but nothing happens, and no work is created for the remaining quantity. This issue occurs when you use transport load functionality and there is an incomplete reservation.

Issue resolution

[KB issue 470069](#) ("Partially shipped loads can be re-waved and re-processed") is fixed in [release 10.0.15](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Shipment consolidation policies

2/18/2021 • 10 minutes to read • [Edit Online](#)

The shipment consolidation process that uses shipment consolidation policies allows for automated shipment consolidation during automated and manual release to the warehouse. The automated consolidation that was available before this feature was introduced had hard-coded fields and was based on the **Consolidate shipment at release to warehouse** field that was set for a warehouse.

Shipment consolidation policies are used for the following functionality:

- The automated release-to-warehouse batch job
- The **Release to warehouse** command in a sales order or transfer order
- The dedicated **Release to warehouse** page
- The **Release to warehouse** command on the **Load planning workbench** page
- The manual consolidation of shipments on the **Consolidate shipments** and **Shipment consolidation workbench** pages

Before shipment consolidation policies were introduced, the consolidation function existed as a setting at the warehouse level. All orders for all customers from a single warehouse were treated as though they had the same consolidation requirements. Shipment consolidation policies add support for scenarios where different organizations have different requirements for shipment consolidation.

Queries are used to identify the shipment consolidation policy that applies, and then an editable set of fields determines how the load lines are grouped at the shipment level. (This pattern resembles the pattern that wave templates follow.) In addition, a **Consolidate with existing shipments** option has been added to each policy. When this option is turned on, the *Release to warehouse* procedure finds shipments for consolidation by searching among existing shipments that were created based on the same consolidation policy. In this case, the system will select an existing shipment or load instead of creating a new one. However, the system will only consolidate with existing shipments that have a status of *Open*; shipments that belong to a wave release with a status of *Released* or higher won't be considered as targets for consolidation.

When shipment consolidation policies are made available, the **Consolidate shipment at release to warehouse** setting that was previously available on the **Warehouses** setup page is hidden. To help you transition to the new shipment consolidation feature, a function on the **Shipment consolidation policies** page creates a default policy that automatically includes the old setting for existing warehouses. After that default policy is created, the **Consolidate shipment at release to warehouse** setting on the **Warehouses** setup page will no longer be considered.

You can use the **Release to warehouse** page to manually override the applicable consolidation policy in the same way that you can override fulfillment policies.

You can use the **Release > Release to warehouse** command on the **Load planning workbench** page to build outbound loads that are based on sales order and transfer order lines before you do the release to the warehouse. These loads use the same consolidation logic that was introduced together with the consolidation of shipment policies.

You can use the **Shipment consolidation workbench** page to consolidate existing shipments that haven't yet been confirmed but have already been released to the warehouse. This functionality supports scenarios where the automated release process, which has its own shipment consolidation, is run multiple times a day, but potential additional consolidations are manually identified before the shipment to carriers is completed during the confirmation process. This functionality lets you consolidate outbound shipments that are created from sales

order or transfer order lines at any time after the shipments are released to the warehouse but before they are confirmed.

The **Shipment consolidation workbench** page works like the load building workbench, where you can assess multiple shipments at the same time and assign a non-consolidated order to a specific shipment. You can apply shipment consolidation templates to assess proposed consolidations multiple times and confirm them. Some rules are implemented to prevent unauthorized consolidation and to warn you about possible errors.

Overview of new functionality

This section describes the pages, commands, and features that are changed or added when you turn on and use the *Shipment consolidation policies* feature.

Shipment consolidation policies page

Policies are differentiated by work order type. The **Sales orders** type represents *Sales order* shipments, and the **Transfer orders** type represents *Transfer issue* shipments.

Every shipment consolidation policy has a query that defines when it's applied and a sequence number that determines the execution order. Consolidation is applied for each unique combination of the selected fields. An additional parameter that is provided is used for consolidation with existing (open) shipments. The policies are evaluated and applied every time that a new shipment is created (before wave processing).

If a policy is missing any mandatory fields, or if it includes any prohibited fields, the policy is marked as not valid in the **Selected** section. The lists of mandatory and prohibited fields are hard-coded and can be extended.

The following list shows the mandatory fields. Because shipments are always split based on these fields, you can't group multiple shipments that have different values for these fields.

- For sales orders:
 - **Account number:** *WHSShipmentTable.AccountNum*
 - **Delivery recipient:** *WHSShipmentTable.DeliveryName*
 - **Postal address (ReclD):** *WHSShipmentTable.DeliveryPostalAddress*
 - **Warehouse:** *WHSShipmentTable.InventLocationId*
- For transfer orders:
 - **From warehouse:** *InventTransferTable.InventLocationIdFrom*
 - **To warehouse:** *InventTransferTable.InventLocationIdTo*

The following fields are unavailable for all document types. These fields aren't visible in the user interface (UI), and they can't be used for consolidation.

- **Shipment ID:** *WHSShipmentTable.ShipmentId*
- **Status:** *WHSShipmentTable.ShipmentStatus*
- **Shipment consolidation policy:** *WHSShipmentTable.ShipConsolidationPolicyName*
- **Work transaction type:** *WHSShipmentTable.WorkTransType*
- **Wave ID:** *WHSShipmentTable.WaveId*
- **Load ID:** *WHSShipmentTable.LoadId*
- **Shipment ID:** *WHSLoadLine.ShipmentId*
- **Load ID:** *WHSLoadLine.LoadId*

By default, when you create a policy, the set of mandatory fields is used as the consolidation fields. However, you can modify the list by using left arrow and right arrow buttons. (The process resembles the process for selecting methods in wave templates.)

The values that users select for these fields will be used for all newly created shipments, or they will be added to

existing shipments during consolidation with those shipments. When two shipments have the same value for a field that is selected for consolidation of those shipments, the shipments are consolidated. The same principle applies for all subsequent consolidation fields that are selected. If the values differ, the second shipment is discarded and will be selected for a new shipment. The automated consolidation process consists of creating all the unique combinations of values for the shipment consolidation fields and then assigning a shipment to the relevant combination.

Unselected fields are ignored during the consolidation process. If two shipments have different values for an unselected field, the field is cleared (that is, it's set to blank). If both shipments have the same value for an unselected field, the field is filled in.

The list of consolidation fields (that is, fields that will be cleared if they have different values) is hard-coded. The list contains all fields that are initialized from a sales order or transfer order line when a new shipment is created. In other words, if a field isn't initialized from a sales order or transfer order line, it's ignored when new data is added to an existing shipment.

Release to warehouse page

- A new field in the lower grid shows the consolidation policy that was applied.
- A new button lets you manually select and/or override the consolidation policy.

Release to warehouse command on the Load planning workbench page

- The logic was adjusted so that it uses applied consolidation policies.
- Shipments are now consolidated only within a single load.

Consolidate shipments page

- The search for similar shipments (that is, candidates for consolidation) was changed so that it uses fields that are selected in the shipment consolidation policy.
- Fields that have different values in different shipments are now set to blank. (Previously, the values from the selected "base" shipment were used.)

Shipment consolidation workbench page

- New functionality replicates the process of manual consolidation on a larger scale.
- You can now open this page from the **Release to warehouse** menu in the **Warehouse management** module.
- The algorithm analyzes existing shipments that haven't yet been shipped. It then proposes consolidation, based on fields that are selected in the consolidation policies.

Comparison of functionality

The following table summarizes how shipment consolidation works when you don't use shipment consolidation policies and when you do use them.

WITHOUT SHIPMENT CONSOLIDATION POLICIES	WITH SHIPMENT CONSOLIDATION POLICIES
Not applicable	Sales or transfer shipments that are selected for consolidation must have the same consolidation policy as the shipment that is being created, or they must be assigned to an open shipment (when the Consolidate with existing shipments option is turned on).

WITHOUT SHIPMENT CONSOLIDATION POLICIES	WITH SHIPMENT CONSOLIDATION POLICIES
<p>The <i>Release to warehouse</i> procedure doesn't search among existing shipments to find a shipment for consolidation. Only shipments that are created by a current instance of the <i>Release to warehouse</i> procedure are used to find a shipment for consolidation.</p>	<p>If the Consolidate with existing shipments option is turned on for a consolidation policy that is currently being used, the <i>Release to warehouse</i> procedure searches among existing shipments that were created based on the same consolidation policy to find a shipment for consolidation. Therefore, if you have two policies, a shipment that is being created based on policy 2 will never be consolidated with a shipment that was created based on policy 1.</p>
<p>Not applicable</p>	<p>If a list of consolidation policy fields is empty, or if a policy can't be found, a new shipment is created for each sales order or transfer order line.</p>
<p>The following consolidation field defines the unique combination of values that is used to consolidate shipments for a <i>transfer line</i>. (All other fields are ignored.)</p> <ul style="list-style-type: none"> • Order number (OrderNum) 	<p>The following consolidation fields define the unique combination of values that is used to consolidate shipments for a <i>transfer line</i>. (All other fields are ignored.)</p> <ul style="list-style-type: none"> • Order number (OrderNum) • Delivery recipient (DeliveryName) • Postal address (DeliveryPostalAddress) • ISO country code (CountryRegionISOCode) • Address (Address) • Site (InventSiteId) • Warehouse (InventLocationId) • Shipping carrier (CarrierCode) • Carrier service (CarrierServiceCode) • Mode of delivery (ModeCode) • Carrier group (CarrierGroupCode) • Delivery terms (DlvTermId) <p>These fields are the only fields that are available and initialized when a new shipment is created.</p>
<p>The following consolidation fields define the unique combination of values that is used to consolidate shipments for a <i>sales line</i>. (All other fields are ignored.)</p> <ul style="list-style-type: none"> • Order number (OrderNum) • Customer reference (CustomerRef) • Customer requisition (CustomerReq) • Delivery terms (DlvTermId) 	<p>The following consolidation fields define the unique combination of values that is used to consolidate shipments for a <i>sales line</i>. (All other fields are ignored.)</p> <ul style="list-style-type: none"> • Order number (OrderNum) • Account number (AccountNum) • Delivery recipient (DeliveryName) • Postal address (DeliveryPostalAddress) • ISO country code (CountryRegionISOCode) • Address (Address) • Site (InventSiteId) • Warehouse (InventLocationId) • Shipping carrier (CarrierCode) • Carrier service (CarrierServiceCode) • Mode of delivery (ModeCode) • Carrier group (CarrierGroupCode) • Broker ID (BrokerCode) • Direction (LoadDirection) • Delivery terms (DlvTermId) • Customer reference (CustomerRef) • Customer requisition (CustomerReq) <p>These fields are the only fields that are available and initialized when a new shipment is created.</p>

WITHOUT SHIPMENT CONSOLIDATION POLICIES	WITH SHIPMENT CONSOLIDATION POLICIES
Not applicable	<p>The following consolidation fields are mandatory for a <i>sales line</i> and can't be removed:</p> <ul style="list-style-type: none"> • Account number (AccountNum) • Delivery recipient (DeliveryName) • Postal address (DeliveryPostalAddress) • Warehouse (InventLocationId) <p>By default, these fields will be assigned when a new policy is created. They can't be removed.</p>
<p>The <i>Release of loads to warehouse</i> procedure on the Load planning workbench page uses its own separate code to create shipments and waves.</p>	<p>Shipment consolidation policies are applied to determine which fields should be evaluated for consolidation. Shipments are consolidated only within a single load.</p>
<p>You manually select Consolidate shipments on the All shipments page and then select a target "base" shipment. The filter will suggest any existing shipments that have matching values for several key fields.</p>	<p>You manually select Consolidate shipments on the All shipments page and then select a target "base" shipment. The system will suggest other existing shipments by matching the values of several key fields that are configured for the relevant shipment consolidation policies.</p>
<p>You can use the Consolidate shipments command on the All shipments page for only a single shipment.</p>	<p>The Shipment consolidation workbench page helps you find a set of shipments that aren't yet in a shipped state. These shipments are analyzed based on several key fields that are configured in your shipment consolidation policies. Any shipments where the values of these fields match are suggested for consolidation.</p> <p>You can manually maintain the consolidation by removing shipments from suggested consolidations and/or by adding shipments to them. Several types of errors can occur, but you can override some of them.</p>
<p>Design note: The <i>Automatic release of sales orders to warehouse</i> procedure splits sales lines into groups. Each group has its own unique ReleaseToWarehouseId value and is processed separately by the <i>Release to warehouse</i> procedure. This procedure creates new work regardless of the work break setup.</p>	<p>Design note: The <i>Automatic release of sales orders to warehouse</i> procedure assigns the same ReleaseToWarehouseId value to all sales lines that are being processed. All sales lines are processed by the <i>Release to warehouse</i> procedure at the same time. To ensure the earlier behavior, you must configure work break per shipment ID.</p>

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure shipment consolidation policies

2/18/2021 • 16 minutes to read • [Edit Online](#)

The shipment consolidation process that uses shipment consolidation policies allows for automated shipment consolidation during automated and manual release to the warehouse. After you turn on this feature, you must configure your initial policies. If no policies are configured, each sales line will generate a separate shipment that has a single load line.

The scenarios that are presented in this topic show how to set up default and custom shipment consolidation policies.

Turn on the Shipment consolidation policies feature

IMPORTANT

In the [first scenario](#) that is described in this topic, you will first set up a warehouse so that it uses the earlier shipment consolidation feature. You will then make shipment consolidation policies available. In this way, you can experience how the upgrade scenario works. If you plan to use a demo data environment to go through the first scenario, don't turn on the feature before you do the scenario.

Before you can use the *Shipment consolidation policies* feature, you must turn it on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Consolidate shipment*

Make demo data available

Each scenario in this topic references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Scenario 1: Configure default shipment consolidation policies

There are two situations where you must configure the minimum number of default policies after you turn on the *Shipment consolidation policies* feature:

- You're upgrading an environment that already contains data.
- You're setting up a completely new environment.

Upgrade an environment where warehouses are already configured for cross-order consolidation

When you start this procedure, the *Shipment consolidation policies* feature should be turned off, to simulate an environment where the basic cross-order consolidation feature was already used. You will then use feature management to turn on the feature, so that you can learn how to set up shipment consolidation policies after the upgrade.

Follow these steps to set up default shipment consolidation policies in an environment where warehouses have already been configured for cross-order consolidation.

1. Go to **Warehouse management > Setup > Warehouse > Warehouses**.
2. In the list, find and open the desired warehouse record (for example, warehouse 24 in the USMF demo data).
3. On the Action Pane, select **Edit**.
4. On the **Warehouse** FastTab, set the **Consolidate shipment at release to warehouse** option to *Yes*.
5. Repeat steps 2 through 4 for all other warehouses where consolidation is required.
6. Close the page.
7. Use [feature management](#) to turn on the *Shipment consolidation policies* feature. In the **Feature management** workspace, the feature is named *Consolidate shipment*.
8. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**. You might have to refresh your browser to see the new **Shipment consolidation policies** menu item after you turn on the feature.
9. On the Action Pane, select **Create default setup** to create the following policies:
 - A **CrossOrder** policy for the *Sales orders* policy type (provided that you have at least one warehouse that is set up to use the earlier consolidation feature)
 - A **Default** policy for the *Sales orders* policy type
 - A **Default** policy for the *Transfer issue* policy type
 - A **CrossOrder** policy for the *Transfer issue* policy type (provided you have at least one warehouse that is set up to use the earlier consolidation feature)

NOTE

- Both **CrossOrder** policies consider the same set of fields as the earlier logic, except for the field for the order number. (That field is used to consolidate lines into shipments, based on factors such as the warehouse, transportation mode of delivery, and address.)
- Both **Default** policies consider the same set of fields as the earlier logic, including the field for the order number. (That field is used to consolidate lines into shipments, based on factors such as the order number, warehouse, transportation mode of delivery, and address.)

10. Select the **CrossOrder** policy for the *Sales orders* policy type, and then, on the Action Pane, select **Edit query**.
11. In the query editor dialog box, notice that warehouses where the **Consolidate shipment at release to warehouse** option is set to *Yes* are listed. Therefore, they are included in the query.

Create default policies for a new environment

Follow these steps to set up default shipment consolidation policies in a brand-new environment.

1. Use [feature management](#) to turn on the *Shipment consolidation policies* feature, if you haven't already turned it on. In the **Feature management** workspace, the feature is named *Consolidate shipment*.
2. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
3. On the Action Pane, select **Create default setup** to create the following policies:
 - A **Default** policy for the *Sales orders* policy type
 - A **Default** policy for the *Transfer issue* policy type

NOTE

Both **Default** policies consider the same set of fields as the earlier logic, including the field for the order number. (That field is used to consolidate lines into shipments, based on factors such as the order number, warehouse, transportation mode of delivery, and address.)

Scenario 2: Configure custom shipment consolidation policies

This scenario shows how to set up custom shipment consolidation policies. Custom policies can support complex business requirements where shipment consolidation depends on several conditions. For each example policy later in this scenario, a short description of the business case is included. These example policies should be set up in a sequence that ensures a pyramid-like evaluation of the queries. (In other words, the policies that have the most conditions should be evaluated as having the highest priority.)

Turn on the feature and prepare master data for this scenario

Before you can go through the exercises in this scenario, you must turn on the feature and prepare the master data that is required to do the filtering, as described in the following subsections. (These prerequisites also apply to the scenarios listed in [Example scenarios of how to use shipment consolidation policies](#).)

Turn on the feature and create the default policies

Use feature management to turn on the feature, if you haven't already turned it on, and create the default consolidation policies that are described in [scenario 1](#).

Create two new product filter codes

1. Go to **Warehouse management > Setup > Product filters > Product filters**, and add two product filters:
 - Product filter 1:
 - **Filter code:** *Flammable*
 - **Filter title:** *Code 4*
 - Product filter 2:
 - **Filter code:** *Explosive*
 - **Filter title:** *Code 4*
2. Go to **Product information management > Products > Released products**.
3. Open the product that has item number *M9200*. (The product that you select must be enabled for advanced warehouse [WMS] processes, and this product is pre-enabled for WMS processes in the **USMF** demo data.)
4. On the **Warehouse** FastTab, set the **Code 4** field to *Flammable*.
5. Close the page.
6. Open the product that has item number *M9201*. (This product is also pre-enabled for WMS processes in the in the **USMF** demo data.)
7. On the **Warehouse** FastTab, set the **Code 4** field to *Explosive*.
8. Close the page.

Create a new transportation mode of delivery

1. Go to **Transportation management > Setup > Carriers > Mode**.
2. Create a transportation mode that will be used in consolidation queries, and name it *Airways*.

3. Go to **Transportation management > Setup > Carriers > Shipping carriers**.
4. Create a carrier that has the following settings:
 - **Shipping carrier:** *Airways*
 - **Name:** *Airways*
 - **Mode:** *Airways*
5. On the **Services** FastTab for the new carrier, add a row that has the following settings:
 - **Carrier service:** *Air*
 - **Transportation method:** *Air*
6. On the Action Pane, select **Save**.

NOTE

When you save the new carrier, the **Mode of delivery** field for the new row in the **Services** grid is automatically set to *Airwa-Air*. When you use the *Airwa-Air* mode of delivery for a sales order, the *Airways* transportation mode will be used for related shipments.

Create an order pool

1. Go to **Sales and marketing > Setup > Sales orders > Order pools**.
2. Create an order pool that will be used for the consolidation query. This order pool should have the following settings:
 - **Pool:** Enter an integer that isn't already used by any other pool.
 - **Name:** *ShipCons*
3. Go to **Sales and marketing > Customers > All customers**.
4. Open the customer that has account number *US-003*.
5. On the **Sales order defaults** FastTab, set the **Sales order pool** field to the order pool that you just created.
6. Close the page, and then repeat the steps 4 and 5 for the customer that has account number *US-004*.

Create example policy 1

In this example, you will create a *Customer+Mode* policy that can be used for the following business case:

- The policy will query for a specific customer account (*US-001*) and a specific mode of delivery (*Airwa-Air*).
- Consolidation with open shipments is turned off.
- Consolidation is done per order ID. (In other words, there will be separate shipments per order, warehouse, and so on.)

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
 - **Policy name:** *CustomerMode*
 - **Policy description:** *Customer account and mode of delivery*
4. Leave the **Consolidate with open shipments** option set to *No*.

5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button  to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Range** tab, in the grid, find the row where the **Field** field is set to *Customer account*, and set the **Criteria** field for that row to *US-001*.
10. Select **Add** to add a row that has the following settings to the grid:
 - **Table:** *Order lines*
 - **Derived table:** *Order lines*
 - **Field:** *Mode of delivery*
 - **Criteria:** *Airwa-Air*
11. Select **OK** to close the dialog box.

NOTE

For this business case, order lines for customer *US-001* that use the *Airwa-Air* mode of delivery won't be consolidated across orders. This policy is intended to be used first in a sequence, in cases where shipments for all other modes of delivery are consolidated for this customer.

Create example policy 2

In this example, you will create a *Hazardous goods* policy that can be used for the following business case:

- The policy will query for a specific filter code (*hazardous*) and a specific mode of delivery (*Airwa-Air*).
- Consolidation with open shipments is turned on.
- Consolidation is done across orders. (In other words, there will be separate shipments per account, warehouse, and so on, but only within the item group that is specified in the query.)

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
 - **Policy name:** *Item type*
 - **Policy description:** *Consolidate the same type of item across orders*
4. Set the **Consolidate with open shipments** option to *Yes*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button  to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Joins** tab, expand and select **Tables > Load details** in the tree.
10. Select **Add table join**.

11. In the grid of relations that appears, find and select the row where the **Relation** field is set to *Warehouse item number (Item number)*, and then select **Select**.
12. On the **Range** tab, select **Add** to add a row that has the following settings to the grid:
 - **Table:** *Warehouse item number*
 - **Derived table:** *Warehouse item number*
 - **Field:** *Code 4*
 - **Criteria:** *Flammable*
13. Select **OK** to close the dialog box.

NOTE

For this business case, all order lines where items have a specific filter code (that is, the filter code where the **Code 4** field is set to *Flammable*) will be consolidated with other items of the same type across orders. If there is an open shipment for the same account, warehouse, and group of items, the new lines will be attached to it.

Create example policy 3

In this example, you will create a *Customers' requirements* policy that can be used for the following business case:

- The policy will query for a specific customer account.
- Consolidation with open shipments is turned on.
- Consolidation is done across orders but is based on customer requisitions. (In other words, multiple orders will be grouped into shipments, based on the same customer requisition number and warehouse.)

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
 - **Policy name:** *CustomerOrderNo*
 - **Policy description:** *Consolidate lines based on customer PO*
4. Set the **Consolidate with open shipments** option to *Yes*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Customer requisition*.
7. Select the **Add** button  to move the field to the **Selected fields** list.
8. In the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
9. Select the **Add** button  to move the field to the **Selected fields** list.
10. On the Action Pane, select **Edit query**.
11. In the query editor dialog box, on the **Range** tab, find the row where the **Field** field is set to *Customer account*, and set the **Criteria** field for that row to *US-001*.
12. Select **OK** to close the dialog box.

NOTE

For this business case, all order lines where sales orders have the same customer requisition number will be consolidated into one shipment, regardless of the sales order number. (The customer requisition number is used as the customer's purchase order [PO] number.) If there is an open shipment for the same account, warehouse, and customer requisition, the new lines will be attached to it. This policy can be used if the customer sends additional order lines that have the same PO number several times during a day and wants all the lines to be grouped into one shipment. (In other words, there will be one bill of lading and one packing slip.)

Create example policy 4

In this example, you will create a *Customers allowing consolidation* policy that can be used for the following business case:

- The policy will query for a specific order pool to identify customers who accept consolidated shipments.
- Consolidation with open shipments is turned off.
- Consolidation is done across orders using the fields selected by default CrossOrder policy (to replicate the previous **Consolidate shipment at release to warehouse** check box).
- You can override the rule on a sales order by selecting a different order pool.

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
 - **Policy name:** *Order pool*
 - **Policy description:** *Consolidate across orders based on order pool*
4. Leave the **Consolidate with open shipments** option set to *No*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button  to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Range** tab, select **Add** to add a row that has the following settings to the grid:
 - **Table:** *Sales orders*
 - **Derived table:** *Sales orders*
 - **Field:** *Pool*
 - **Criteria:** *ShipCons*
10. Select **OK** to close the dialog box.

NOTE

For this business case, all order lines where sales orders belong to the same order pool will be consolidated into one shipment across sales orders for the same account, warehouse, and transportation mode of delivery. Instead of the order pool, you can use any other field to distinguish a group of customers and use the sales order header by default. You can use this approach if the customer, not the warehouse, is driving the need for consolidation. (In the earlier consolidation logic, the warehouse drove the need for consolidation.)

Create example policy 5

In this example, you will create a *Warehouses allowing consolidation* policy that can be used for the following business case:

- The policy will query for a specific order pool to identify warehouses that can consolidate shipments.
- Consolidation with open shipments is turned off.
- Consolidation is done across orders using the fields selected by default CrossOrder policy (to replicate the previous **Consolidate shipment at release to warehouse** check box).

Typically, this business case can be addressed by using the default policies that you created in [scenario 1](#). However, you can also manually create similar policies by following these steps.

1. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
 - **Policy name:** *Cross-order*
 - **Policy description:** *Cross-order consolidation for specific warehouses*
4. Leave the **Consolidate with open shipments** option set to *No*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** field, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button  to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Range** tab, find the row where the **Field** field is set to *Warehouse*, and set the **Criteria** field for that row to *61, 63*.
10. Select **OK** to close the dialog box.

Set the order

Now that you've created all your policies, you must establish the order that they will be applied in. To use a pyramid-like approach, where the policies that have the most conditions are evaluated as having the highest priority, follow these steps.

1. Go to **Warehouse management > Setup > Release to warehouse > Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. Select each policy that is listed in the left column, and then use the **Move up** and **Move down** buttons on the Action Pane to arrange the policies in the following order:

- a. CustomerMode
- b. Item type
- c. CustomerOrderNo
- d. Order pool
- e. Cross-order
- f. Default

Example scenarios of how to use shipment consolidation policies

The following scenarios illustrate how you could use the shipment consolidation policies that you created while reading this topic. Each scenario walks you through a shipment consolidation process that uses shipment consolidation policies during automated or manual release to the warehouse:

- Scenario 1: [Consolidate shipments when they are released to the warehouse by using Automatic release of sales orders](#)
- Scenario 2: [Consolidate shipments when the shipment consolidation policy is overridden from the Release to warehouse page](#)
- Scenario 3: [Consolidate shipments by using Release to warehouse from the load planning workbench](#)
- Scenario 4: [Consolidate shipments by using the shipment consolidation workbench](#)
- Scenario 5: [Consolidate shipments manually by using the Consolidate shipments page](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Consolidate shipments when they are released to the warehouse by using Automatic release of sales orders

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic presents a scenario where multiple orders are released to the warehouse in the same automated release-to-warehouse periodic procedure. The orders will automatically be consolidated into shipments, based on rules that are defined as shipment consolidation policies.

During the scenario, you will create sets of sales orders and release each set to the warehouse. You will then review the shipments that are created or updated during shipment consolidation, based on the configured policies.

Make demo data available

The scenario in this topic references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to USMF before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in [Configure shipment consolidation policies](#), and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable > Orders > All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create order set 1

Sales order 1-1

1. Create a sales order that has the following settings:
 - **Customer account:** *US-001*
 - **Mode of delivery:** *Airwa-Air*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*

Sales order 1-2

1. Create a sales order that has the following settings:
 - **Customer account:** *US-001*

- **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*

Sales order 1-3

1. Create a sales order that has the following settings:

- **Customer account:** *US-001*
- **Mode of delivery:** *10*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*

3. Add a second order line that has the following settings:

- **Item number:** *A0002* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*
- **Mode of delivery:** *Airwa-Air*

Create order set 2

Sales orders 2-1 and 2-2

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-002*

2. Add an order line that has the following settings:

- **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
- **Quantity:** *1.00*

3. Add a second order line that has the following settings:

- **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
- **Quantity:** *1.00*
- **Mode of delivery:** *Airwa-Air*

Create order set 3

Sales order 3-1

1. Create a sales order that has the following settings:

- **Customer account:** *US-002*

2. Add an order line that has the following settings:

- **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
- **Quantity:** *1.00*

3. Add a second order line that has the following settings:

- **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
- **Quantity:** *1.00*
- **Mode of delivery:** *Airwa-Air*

NOTE

This order is identical to the two orders that you created for order set 2. However, it's listed as its own order set because you will release it separately later in this scenario.

Create order set 4

Sales order 4-1

1. Create a sales order that has the following settings:
 - Customer account: *US-001*
 - Customer requisition: *1*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*

Create order set 5

Sales orders 5-1 and 5-2

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-001*
 - Customer requisition: *2*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*

Sales order 5-3

1. Create a sales order that has the following settings:
 - Customer account: *US-001*
 - Customer requisition: *1*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*

Create order set 6

Sales orders 6-1 and 6-2

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-003*
 - Customer requisition: *2*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*

Sales orders 6-3 and 6-4

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-004*
 - Customer requisition: *1*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*

Sales orders 6-5 and 6-6

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-007*

- **Site:** 6
- **Warehouse:** 61
- **Pool:** *ShipCons*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*

Sales orders 6-7 and 6-8

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-007*
- **Site:** 6
- **Warehouse:** 61
- **Pool:** Leave this field blank.

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*

Automatic release of sales orders to the warehouse

For each set of sales orders that you created earlier, you will complete a procedure for automatic release to the warehouse. In each case, you will work through the [basic release-to-warehouse procedure](#) that is provided here.

Basic release-to-warehouse procedure

For each set of sales orders that you created earlier, you will complete the three procedures that are outlined in the following subsections.

Update the wave template that will be used during release

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Set the **Wave template type** field to *Shipping*.
3. Find and select the wave template that is associated with the warehouse that you used in the order sets that you created for this scenario. For example, if you used warehouse *24*, select the **24 Shipping Default** wave template. If you used warehouse *61*, select the **61 Shipping** wave template.
4. On the Action Pane, select **Edit**.
5. Set the **Process wave at release to warehouse** option to *No*.

Release to the warehouse

1. Go to **Warehouse management > Release to warehouse > Automatic release of sales orders**.
2. Set the **Quantity to release** field to *All*.
3. On the **Records to include** FastTab, select **Filter** to open the query dialog box.
4. On the **Range** tab, select **Add** to add a row that has the following settings to the grid:
 - **Table:** *Sales order*
 - **Derived table:** *Sales order*
 - **Field:** *Sales order*
 - **Criteria:** Enter a comma-separated list of the sales order numbers from the desired order set.
5. Select **OK** to save your query.
6. Select **OK** to start the *Automatic release to warehouse* procedure.

Review the shipment that is created or updated

1. Go to **Warehouse management > Shipments > All shipments**.
2. Find and select the required shipment.
3. If a consolidation policy was used when the shipment was created or updated, you should see it in the **Shipment consolidation policy** field.

Release sales orders from order set 1

Follow the [basic release-to-warehouse procedure](#) to release the sales orders from order set 1.

When you've finished, you should see that two shipments were created:

- The first shipment contains three lines and was created by using the *CustomerMode* shipment consolidation policy.
- The second shipment, which doesn't use the *Airways* transportation mode of delivery, was created by using the *CustomerOrderNo* shipment consolidation policy.

Release sales orders from order set 2

Follow the [basic release-to-warehouse procedure](#) to release the sales orders from order set 2.

When you've finished, you should see that three shipments were created:

- The first shipment contains *Flammable* items.
- Each of the other two shipments contains one line that has the *Explosive* item.

Release sales orders from order set 3

Follow the [basic release-to-warehouse procedure](#) to release the sales orders from order set 3.

When you've finished, you should see that the following actions occurred:

- One existing shipment (the shipment that was created when order set 2 was released to the warehouse) was updated. A line that has the *Flammable* item was added.
- One new shipment was created that contains the *Explosive* item.

Release sales orders from order set 4

Follow the [basic release-to-warehouse procedure](#) to release the sales orders from order set 4.

When you've finished, you should see that one existing shipment (where the **Customer requisition** field is set to 1) was updated. One new line was added to it.

Release sales orders from order set 5

Follow the [basic release-to-warehouse procedure](#) to release the sales orders from order set 5.

When you've finished, you should see that the following actions occurred:

- One existing shipment (where the **Customer requisition** field is set to 1) was updated. A line from sales order 5-3 (where the **Customer requisition** field is set to 1) was added to it.
- One new shipment was created, where lines from sales orders 5-1 and 5-2 are grouped into one shipment.

Release sales orders from order set 6

Follow the [basic release-to-warehouse procedure](#) to release the sales orders from order set 6.

When you've finished, you should see that four shipments were created:

- Lines from two orders for customer *US-003* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from two orders for customer *US-004* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 6-5 and 6-6 for customer *US-007* were grouped into one shipment by using the

Order pool shipment consolidation policy.

- Lines from sales orders 6-7 and 6-8 for customer *US-007* were grouped into one shipment by using the *CrossOrder* shipment consolidation policy.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Consolidate shipments when the shipment consolidation policy is overridden from the Release to warehouse page

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic presents a scenario where one or more sales lines must be manually released to the warehouse from the **Release to warehouse** page, and the system-defined shipment consolidation policy must be overridden before the release. An override of the shipment consolidation policy might be required if, for example, an order that isn't usually consolidated with open shipments must be consolidated with open shipments.

During the scenario, you will create a set of sales orders and then override the default shipment consolidation policy before you release the orders to the warehouse.

Make demo data available

The scenario in this topic references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in [Configure shipment consolidation policies](#), and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

1. Go to **Accounts receivable > Orders > All sales orders**, and create three identical sales orders that have the following settings:
 - **Customer account:** *US-002*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Release the sales orders from the Release to warehouse page

Follow these steps to override the shipment consolidation policy during the release to the warehouse.

1. Go to **Warehouse management > Release to warehouse > Release to warehouse**.
2. In the upper pane, select the first sales order that you created for this scenario.
3. Select **Add** to add the line to the release to the warehouse. Notice that the *Default* shipment consolidation policy is applied in the bottom pane.
4. In the bottom pane, select **Select new shipment consolidation policy**.

5. Select a policy that allows for consolidation with other open shipments of the same policy. For example, select the *CustomerOrderNo* policy.
6. Select **Release to warehouse**.
7. Select the second and third sales orders that you created for this scenario.
8. Select **Add** to add the lines to the release to the warehouse. Notice that the *Default* policy is applied in the bottom pane.
9. Select the second line, and then, in the **Select new shipment consolidation policy** field, select the *CustomerOrderNo* policy.
10. Select **Release to warehouse** for both lines.

Verify the shipments

Two shipments should have been created:

- The first shipment contains two lines and was created by using the *CustomerOrderNo* shipment consolidation policy.
- The second shipment contains one line and was created by using the *Default* shipment consolidation policy.

Follow these steps to review the shipments that were created.

1. Go to **Warehouse management > Shipments > All shipments**.
2. Find and select the required shipment.
3. In the **Shipment consolidation policy** field, review the consolidation policy that was used when the shipment was created.

Additional resources

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Consolidate shipments by using Release to warehouse from the load planning workbench

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic presents a scenario where multiple orders are released to the warehouse in the same load and are then automatically consolidated into shipments.

Make demo data available

The scenario in this topic references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to USMF before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in [Configure shipment consolidation policies](#), and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable > Orders > All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create order set 1

Sales order 1-1

1. Create a sales order that has the following settings:
 - **Customer account:** *US-001*
 - **Mode of delivery:** *Airwa-Air*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales order 1-2

1. Create a sales order that has the following settings:
 - **Customer account:** *US-001*
 - **Mode of delivery:** *Airwa-Air*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)

- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales order 1-3

1. Create a sales order that has the following settings:

- **Customer account:** *US-001*
- **Mode of delivery:** *10*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

- **Item number:** *A0002* (an item that no **Code 4** filter is assigned to)
- **Quantity:** 1.00
- **Mode of delivery:** *Airwa-Air*

5. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 2

Sales orders 2-1 and 2-2

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-002*

2. Add an order line that has the following settings:

- **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

- **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
- **Quantity:** 1.00
- **Mode of delivery:** *Airwa-Air*

5. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 3

Sales orders 3-1 and 3-2

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-001*
- **Customer requisition:** *1*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order

line.

Sales orders 3-3 and 3-4

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-001*
 - Customer requisition: *2*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Create order set 4

Sales orders 4-1 and 4-2

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-003*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-3 and 4-4

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-004*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-5 and 4-6

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-007*
 - Site: *6*
 - Warehouse: *61*
 - Pool: *ShipCons*
2. Add an order line that has the following settings:
 - Item number: *A0001* (an item that no **Code 4** filter is assigned to)
 - Quantity: *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-7 and 4-8

1. Create two identical sales orders that have the following settings:
 - Customer account: *US-007*
 - Site: *6*

- **Warehouse:** 61
 - **Pool:** Leave this field blank.
2. Add an order line that has the following settings:
 - **Item number:** A0001 (an item that no **Code 4** filter is assigned to)
 - **Quantity:** 1.00
 3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Use the load planning workbench to create loads and release them to the warehouse

Follow these steps to create a load for each order set that you created for this scenario and then release it to the warehouse.

1. Go to **Warehouse management > Loads > Load planning workbench**.
2. On the **Sales lines** tab, find and select all the sales order lines from one of the order sets that you created for this scenario.
3. On the Action Pane, on the **Supply and demand** tab, select **Add > To new load** to add the selected order lines to a new Load.
4. In the **Load template assignment** dialog box, in the **Load template ID** field, select a load template, such as *Std Load Template*.
5. Select **OK** to close the dialog box.
6. In the **Loads** section, find and select the load that you just created.
7. Select **Release > Release to warehouse** to release the selected load to the warehouse.
8. Repeat this procedure for the other three order sets that you created for this scenario.

Verify the shipments

The following procedure lets you verify the shipments that have been created or updated as a result of shipment consolidation. Use it to review each order set that you created for this scenario, and then review the subsections that follow to make sure that you've obtained the expected results.

1. Go to **Warehouse management > Shipments > All shipments**.
2. Find and select the required shipment.
3. If a consolidation policy was used when the shipment was created or updated, you should see it in the **Shipment consolidation policy** field.

Release order set 1 in one load

Two shipments should have been created:

- The first shipment contains three lines and was created by using the *CustomerMode* shipment consolidation policy.
- The second shipment, which doesn't use the *Airways* transportation mode of delivery, was created by using the *CustomerOrderNo* shipment consolidation policy.

Release order set 2 in one load

Three shipments should have been created:

- The first shipment contains the *Flammable* items.
- Each of the other two shipments contains one line that has the *Explosive* item.

Release order set 3 in one load

Two shipments should have been created:

- The first shipment contains order lines from the sales order where the **Customer requisition** field is set to 1.
- The second shipment contains order lines from sales order where the **Customer requisition** field is set to 2.

Release order set 4 in one load

Four shipments should have been created:

- Lines from two orders for customer account *US-003* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from two orders for customer account *US-004* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-5 and 4-6 for customer account *US-007* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-7 and 4-8 for customer account *US-007* were grouped into one shipment by using the *CrossOrder* shipment consolidation policy.

Consolidate shipments by using the shipment consolidation workbench

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic presents a scenario where multiple orders are released to the warehouse and then consolidated into shipments later by using the shipment consolidation workbench.

Make demo data available

The scenario in this topic references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to USMF before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in [Configure shipment consolidation policies](#), and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Turn on the manual shipment consolidation feature

Before you can use the *Manual shipment consolidation* feature, you must turn it on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Manual shipment consolidation*

As was mentioned in [Configure shipment consolidation policies](#), you must also turn on the *Consolidate shipment* feature before you can create policies. However, you should already have completed that step.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable > Orders > All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create order set 1

Sales orders 1-1 and 1-2

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-001*
 - **Mode of delivery:** *Airwa-Air*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)

- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales order 1-3

1. Create a sales order that has the following settings:

- **Customer account:** *US-001*
- **Mode of delivery:** *10*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

- **Item number:** *A0002* (an item that no **Code 4** filter is assigned to)
- **Quantity:** 1.00
- **Mode of delivery:** *Airwa-Air*

5. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 2

Sales orders 2-1 and 2-2

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-002*
- **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

- **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

- **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
- **Quantity:** 1.00
- **Mode of delivery:** *Airwa-Air*

5. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 3

Sales orders 3-1 and 3-2

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-001*
- **Customer requisition:** *1*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** 1.00

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 3-3 and 3-4

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-001*
 - **Customer requisition:** *2*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Create order set 4

Sales orders 4-1 and 4-2

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-003*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-3 and 4-4

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-004*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-5 and 4-6

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-007*
 - **Site:** *6*
 - **Warehouse:** *61*
 - **Pool:** *ShipCons*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-7 and 4-8

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-007*

- **Site:** 6
 - **Warehouse:** 61
 - **Pool:** Leave this field blank.
2. Add an order line that has the following settings:
 - **Item number:** A0001 (an item that no **Code 4** filter is assigned to)
 - **Quantity:** 1.00
 3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Release the orders to the warehouse

Follow these steps to release each sales order that you created for this scenario to the warehouse.

1. Go to **Accounts receivable > Orders > All sales orders**.
2. Find and select the sales order to release.
3. On the Action Pane, on the **Warehouse** tab, select **Actions > Release to warehouse** to release the selected sales order.
4. Repeat this procedure for every other sales order that you created for this scenario.

Consolidate the shipments by using the shipment consolidation workbench

1. Go to **Warehouse management > Release to warehouse > Shipment consolidation workbench**.
2. On the Action Pane, select **Edit query**.
3. In the query editor dialog box, on the **Range** tab, select **Add** to add a row that has the following settings to the grid:
 - **Table:** Sales orders
 - **Field:** Sales order
 - **Criteria:** Enter a comma-separated list of the sales order numbers for each order set that you created for this scenario.
4. Select **OK** to save your query and close the dialog box.
5. On the Action Pane, select **Consolidate shipments**.
6. Select all the shipments, and then, on the Action Pane, select **Consolidate**.

Verify the shipments

The following procedure lets you verify the shipments that have been created or updated as a result of shipment consolidation. Use it to review each order set that you created for this scenario, and then review the subsections that follow to make sure that you've obtained the expected results.

1. Go to **Warehouse management > Shipments > All shipments**.
2. Find and select the required shipment.
3. If a consolidation policy was used when the shipment was created or updated, you should see it in the **Shipment consolidation policy** field.

Related shipments for order set 1

Two shipments should have been created:

- The first shipment contains three lines and was created by using the *CustomerMode* shipment consolidation policy.
- The second shipment, which doesn't use the *Airways* transportation mode of delivery, was created by using the *CustomerOrderNo* shipment consolidation policy.

Related shipments for order set 2

Three shipments should have been created:

- The first shipment contains *Flammable* items.
- Each of the other two shipments contains one line that has the *Explosive* item.

Related shipments for order set 3

Two shipments should have been created:

- The first shipment contains order lines from the sales order where the **Customer requisition** field is set to *1*.
- The second shipment contains order lines from sales order where the **Customer requisition** field is set to *2*.

Related shipments for order set 4

Four shipments should have been created:

- Lines from two orders for customer *US-003* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from two orders for customer *US-004* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-5 and 4-6 for customer *US-007* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-7 and 4-8 for customer *US-007* were grouped into one shipment by using the *CrossOrder* shipment consolidation policy.

Consolidate shipments manually by using the Consolidate shipments page

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic presents a scenario where multiple orders are released to the warehouse and then consolidated later by using the **Consolidate shipments** page.

Make demo data available

The scenario in this topic references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in [Configure shipment consolidation policies](#), and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable > Orders > All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create sales orders 1 and 2

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-007*
 - **Pool:** *ShipCons*
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*
3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Create sales orders 3 and 4

1. Create two identical sales orders that have the following settings:
 - **Customer account:** *US-007*
 - **Pool:** Leave this field blank.
2. Add an order line that has the following settings:
 - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
 - **Quantity:** *1.00*

3. Select **Inventory > Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Release the orders to the warehouse

Follow these steps to release each sales order that you created for this scenario to the warehouse.

1. Go to **Accounts receivable > Orders > All sales orders**.
2. Find and select the sales order to release.
3. On the Action Pane, on the **Warehouse** tab, select **Actions > Release to warehouse** to release the selected sales order.
4. Repeat this procedure for every other sales order that you created for this scenario.

Consolidate shipments

1. Go to **Warehouse management > Shipments > All shipments**.
2. Find and select a shipment that was created when sales order 1 was released to the warehouse. (Its **Shipment consolidation policy** field should be set to *Order pool*.)
3. On the Action Pane, on the **Shipments** tab, select **Shipments > Consolidate shipments**.
4. Verify the shipments that are suggested for consolidation. Only one shipment that has the same policy should be suggested for consolidation.
5. Close the **Shipment consolidation** page.
6. Find and select a shipment that was created when sales order 3 was released to the warehouse. (Its **Shipment consolidation policy** field should be set to *Default*.)
7. On the Action Pane, on the **Shipments** tab, select **Shipments > Consolidate shipments**.
8. Verify that no shipments are suggested for consolidation.
9. Select **Show filters**.
10. In the **Filters** pane, remove the **Order number** filter, and then select **Apply**.
11. Verify the shipments that are suggested for consolidation. Only one shipment that has the same policy should be suggested for consolidation.

Troubleshoot outbound warehouse operations

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with outbound warehouse operations in Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "Sales order could not be released."

Issue description

This issue can occur for several reasons. For example, the order is on credit management hold, and no shipments can be created until a valid postal address is entered for all sales lines that are associated with a sales order. Alternatively, there is an order hold that must be addressed before the order can be released to the warehouse. This hold might be order-specific, or it might be on the customer account.

Issue resolution

Add or update the address on the sales order and order lines, and then release the order to the warehouse. Orders can be released to the warehouse only if they have a valid delivery address (per the address format setup in the **Organization administration** module).

Investigate the order hold, and address the issues. Then remove the hold from the order or customer, and release the order to the warehouse.

I receive the following message: "The shipment for load 1% has been confirmed." However, no lines are posted.

Issue description

A shipment on a load was confirmed, but no further posting occurred.

Issue resolution

Shipment confirmation doesn't affect posting. It just updates the shipment and load status. Posting must occur in a separate process.

I receive the following error message: "Direct delivery is not able to process for warehouse 1% as it has warehouse management enabled. Please specify another warehouse that is not enabled for warehouse management."

Issue description

An item is added to a sales line for direct delivery from a warehouse that is enabled for warehouse management (WMS). You receive this error message when the sales line is updated.

Issue resolution

Microsoft has evaluated this issue and has determined that it's a feature limitation. Currently, WMS doesn't support direct delivery. Therefore, to use direct delivery, you must select a non-WMS item and warehouse.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work policies

2/18/2021 • 13 minutes to read • [Edit Online](#)

This topic explains how to set up the system and the warehouse app so that they support work policies. You can use this functionality to quickly register inventory without creating putaway work when you receive purchase or transfer orders, or when you complete manufacturing processes. This topic provides general information. For detailed information that is related to license plate receiving, see [License plate receiving via the warehouse app](#).

A work policy controls whether warehouse work is created when a manufactured item is reported as finished, or when goods are received by using the warehouse app. You set up each work policy by defining the conditions where it applies: the work order types and processes, the inventory location, and (optionally) the products. For example, a purchase order for product *A0001* must be received in location *RECV* in warehouse *24*. Later, the product is consumed in another process at location *RECV*. In this case, you can set up a work policy to prevent putaway work from being created when a worker reports product *A0001* as received in location *RECV*.

NOTE

- For a work policy to be active, you must define at least one location for it on the **Inventory locations** FastTab of the **Work policies** page.
- You can't specify the same location for multiple work policies.
- The **Print label** option for mobile device menu items won't print a license plate label unless work was created.

Activate the features in your system

To make all the functionality that is described in this topic available in your system, turn on the following two features in [Feature management](#):

- License plate receiving enhancements
- Work policy enhancements for inbound work

The Work policies page

To set up work policies, go to **Warehouse management** > **Setup** > **Work** > **Work policies**. Then, on each FastTab, set the fields as described in the following subsections.

The Work order types FastTab

On the **Work order types** FastTab, add all the work order types, and the related work processes, that the work policy applies to. The following work order types and related work processes are supported for work policies.

WORK ORDER TYPE	WORK PROCESS
Raw material picking	All related processes
Co-product and by-product put away	All related processes
Finished goods putaway	All related processes
Transfer receipt	License plate receiving (and putaway)

WORK ORDER TYPE	WORK PROCESS
Purchase orders	<ul style="list-style-type: none"> • License plate receiving (and putaway) • Load item receiving (and putaway) • Purchase order line receiving (and putaway) • Purchase order item receiving (and putaway)

To set up a work policy so that it applies to several work processes of the same work order type, add a separate line for each work process to the grid.

For each line in the grid, set the **Work creation method** field to one of the following values:

- **Never** – The work policy will prevent warehouse work from being created for the selected work order type and related work process.
- **Cross docking** – The work policy will create cross-docking work by using the policy that you select in the **Cross docking policy name** field.

The Inventory locations FastTab

On the **Inventory locations** FastTab, add all the locations where this work policy should be applied. If no location is associated with a work policy, the work policy won't be applied to any process.

You can't specify the same location for multiple work policies.

You can use a warehouse location that is assigned to a location profile where the **Use license plate tracking** option is turned off. In this case, workers will directly register the on-hand inventory.

The Products FastTab

On the **Products** tab, set the **Product selection** field to control which products the policy should apply to:

- **All** – The policy should apply to all products.
- **Selected** – The policy should apply only to products that are listed in the grid. Use the toolbar on the **Products** FastTab to add products to the grid or remove them from the grid.

Default and custom "to" locations

NOTE

To make the functionality that is described in this section available in your system, you must turn on the *License plate receiving enhancements* and *Work policy enhancements for inbound work* features in [Feature management](#).

Previously, the system supported receiving only at the default location that is defined for each warehouse. However, mobile device menu items that use the following work creation processes now provide the **Use default data** option. This option lets you assign a custom "to" location to one or more menu items. (This option was already available for some other types of menu items.)

- License plate receiving (and putaway)
- Load item receiving (and putaway)
- Purchase order line receiving (and putaway)
- Purchase order item receiving (and putaway)

The **To location** setting for a menu item overrides the default receiving location for the warehouse, for all orders that are processed by using that menu item.

To set up a mobile device menu item to support receiving at a custom location, follow these steps.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select or create a menu item that uses one of the work creation processes that are listed earlier in this section.
3. On the **General** FastTab, set the **Use default data** option to **Yes**.
4. On the Action Pane, select **Default data**.
5. On the **Default data** page, set the following values:
 - **Default data field:** Set this field to *To location*.
 - **Warehouse:** Select the destination warehouse to use with this menu item.
 - **Location:** This field lists all the location IDs that are available for the selected warehouse. However, the setting of this field doesn't actually have any effect. Therefore, you can leave it blank. Nevertheless, you can use the list to confirm the ID that you must enter in the **Hardcoded value** field.
 - **Hardcoded value:** Enter the location ID for the receiving location that applies to this menu item.

TIP

A work policy can be applied only if all the receiving locations are listed in the relevant work policy setup. This requirement applies regardless of whether you're using the default warehouse receiving location or a custom "to" location.

Example scenario: Warehouse receiving

All products that are received by the *Purchase order item receiving (and putaway)* process must be registered in location *FL-001*, and they must be available in warehouse *24*. However, work should not be created. Products that are received by any other process (that is, by using other mobile device menu items) should be registered at the default warehouse receiving location (*RECV*), and work should be created as usual. (This scenario doesn't show the default receiving setup.)

This scenario requires the following elements:

- A work policy for the *Purchase order item receiving (and putaway)* process in location *FL-001*, for all products
- A mobile device menu item that has default data, and that sets the **To location** field to *FL-001*

Prerequisites

To make the functionality that is described in this scenario available in your system, you must turn on the *License plate receiving enhancements* and *Work policy enhancements for inbound work* features in [Feature management](#).

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the **USMF** legal entity.

Set up a work policy

1. Go to **Warehouse management > Setup > Work > Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No purchase item putaway work*.
4. Select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:

- **Work order type:** *Purchase orders*
 - **Work process:** *Purchase order item receiving (and putaway)*
 - **Work creation method:** *Never*
 - **Cross docking policy name:** Leave this field blank.
6. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
 - **Warehouse:** *24*
 - **Location:** *FL-001*
 7. On the **Products** FastTab, set the **Product selection** field to *All*.
 8. Select **Save**.

Set up a mobile device menu item to change the receiving location

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. In the left pane, select the existing **Purchase receive** menu item.
3. On the **General** FastTab, set the **Use default data** option to *Yes*.
4. Select **Save**.
5. On the **Action Pane**, select **Default data**.
6. On the **Default data** page, on the **Action Pane**, select **New** to add a row to the grid, and then set the following values for the new row:
 - **Default data field:** *To location*
 - **Warehouse:** *24*
 - **Location:** Leave this field blank.
 - **Hardcoded value:** *FL-001*
7. Select **Save**.

Receive a purchase order without creating work

The example in this section shows how to receive a purchase order item, but without creating work, at a location that differs from the default receiving location that is set up for the warehouse. This example uses the work policy and mobile device item that you created earlier in this scenario.

Create a purchase order

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
2. Select **New**.
3. In the **Create purchase order** dialog box, set the following values:
 - **Vendor account:** *US-101*
 - **Site:** *2*
 - **Warehouse:** *24*
4. Select **OK** to close the dialog box and open the new purchase order.
5. On the **Purchase order lines** FastTab, set the following values for the empty row:
 - **Item number:** *A0001*
 - **Quantity:** *1*
6. Select **Save**.
7. Make a note of the purchase order number.

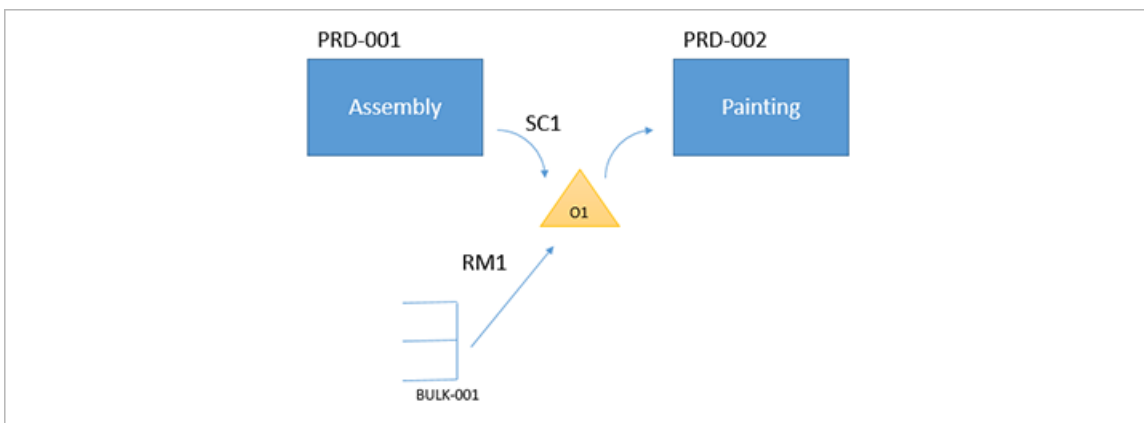

Receive a purchase order

1. On the mobile device, sign in to warehouse 24 by using 24 as the user ID and 1 as the password.
2. Select **Inbound**.
3. Select **Purchase receive**. The **Location** field should be set to *FL-001*.
4. Enter the purchase order number for the purchase order that you created in the previous procedure.
5. In the **Item number** field, enter *A0001*.
6. Select **OK**.
7. In the **Quantity** field, enter *1*.
8. Select **OK**.

The purchase order is now received, but no work is associated with it. The on-hand inventory has been updated, and a quantity of 1 of item *A0001* is now available at location *FL-001*.

Example scenario: Manufacturing

In the following example, there are two production orders, *PRD-001* and *PRD-002*. Production order *PRD-001* has an operation that is named *Assembly*, where product *SC1* is being reported as finished to location *001*. Production order *PRD-002* has an operation that is named *Painting* and consumes product *SC1* from location *001*. Production order *PRD-002* also consumes raw material *RM1* from location *001*. Raw material *RM1* is stored in warehouse location *BULK-001* and will be picked to location *001* by warehouse work for raw material picking. The picking work is generated when production *PRD-002* is released.

When you're planning to configure a warehouse work policy for this scenario, you should consider the following points:

- Warehouse work for putaway of finished goods isn't required when you report product *SC1* as finished from production order *PRD-001* to location *001*. The reason is that the *Painting* operation for production order *PRD-002* consumes product *SC1* at the same location.
- Warehouse work for raw material picking is required to move raw material *RM1* from warehouse location *BULK-001* to location *001*.

Here is an example of a work policy that you can set up, based on these considerations:

- **Work policy name:** *No putaway work*
- **Work order types:** *Finished goods put away* and *Co-product and by-product put away*
- **Inventory locations:** Warehouse 51 and location *001*
- **Products:** *SC1*

The following example scenario provides step-by-step instructions for setting up the warehouse work policy for this scenario.

Example scenario: Report as finished to a location that isn't license

plate-controlled

This scenario shows an example where a production order is reported as finished to a location that isn't license plate-controlled.

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the USMF legal entity.

Set up a warehouse work policy

Warehouse processes don't always include warehouse work. By defining a work policy, you can prevent the creation of work for raw material picking and putaway of finished goods for a set of products at specific locations.

1. Go to **Warehouse management > Setup > Work > Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No putaway work*.
4. On the Action Pane, select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
 - **Work order type:** *Finished goods put away*
 - **Work process:** *All related work processes*
 - **Work creation method:** *Never*
 - **Cross docking policy name:** Leave this field blank.
6. Select **Add** again to add a second row to the grid, and then set the following values for the new row:
 - **Work order type:** *Co-product and by-product put away*
 - **Work process:** *All related work processes*
 - **Work creation method:** *Never*
 - **Cross docking policy name:** Leave this field blank.
7. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
 - **Warehouse:** *51*
 - **Location:** *001*
8. On the **Products** FastTab, set the **Product selection** field to *Selected*.
9. On the **Products** FastTab, select **Add** to add a row to the grid.
10. In the new row, set the **Item number** field to *L0101*.
11. On the Action Pane, select **Save**.

Set up an output location

1. Go to **Organization administration > Resources > Resource groups**.
2. In the left pane, select resource group **5102**.
3. On the **General** FastTab, set the following values:
 - **Output warehouse:** *51*
 - **Output location:** *001*
4. On the Action Pane, select **Save**.

NOTE

Location *001* isn't a license plate–controlled location. You can set up an output location that isn't license plate–controlled only if an applicable work policy exists for the location.

Create a production order and report it as finished

1. Go to **Production control > Production orders > All production orders**.
2. On the Action Pane, select **New production order**.
3. In the **Create production order** dialog box, set the **Item number** field to *L0101*.
4. Select **Create** to create the order and close the dialog box.

A new production order is added to the grid on the **All production orders** page.

Keep the new production order selected.
5. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Estimate**.
6. In the **Estimate** dialog box, read the estimate, and then select **OK** to close the dialog box.
7. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Start**.
8. In the **Start** dialog box, on the **General** tab, set the **Automatic BOM consumption** field to *Never*.
9. Select **OK** to save your setting and close the dialog box.
10. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Report as finished**.
11. In the **Report as finished** dialog box, on the **General** tab, set the **Accept error** option to *Yes*.
12. Select **OK** to save your setting and close the dialog box.
13. On the Action Pane, on the **Warehouse** tab, in the **General** group, select **Work details**.

When the production order is reported as finished, no work is generated for putaway. This behavior occurs because a work policy is defined that prevents work from being generated when product *L0101* is reported as finished to location *001*.

Movement of inventory with associated work in Warehouse management

2/18/2021 • 2 minutes to read • [Edit Online](#)

Using movement of inventory, you can decide which warehouse workers are allowed to move reserved inventory. This provides a flexibility in regulated warehouses where you can decide to not allow a worker to choose a new pick location for pick work that is already created. It also allows a warehouse manager to control which capabilities some less experienced workers should have.

The flexibility to manage the daily operations of warehouse workers can be useful in scenarios such as these:

Scenario 1

A company has a relatively small receiving area, and it's congested with pallets and boxes awaiting put away. A large shipment is expected on the current day, so the receiving clerk decides to clear up the receiving area by moving some of the pallets to a secondary inbound staging area.

Scenario 2

An experienced warehouse worker notices an opportunity in a warehouse to consolidate items in one location instead of having them divided across 3 nearby locations with little quantity on each. The worker wants to consolidate the quantity by moving items from each of these locations into the same location and onto the same license plate.

Scenario 3

A pallet is awaiting shipment in a staging location, such as STAGE01, which is near BAYDOOR01. However, due to a change of plans the truck is scheduled to arrive at BAYDOOR04. The shipping clerk is aware of this and needs to ensure that the truck does not have to wait to be loaded from STAGE01. The shipping clerk decides to move the items in that shipment from STAGE01 to STAGE04, which is closer to the new destination.

Current limitations

The work reservations that you can move are limited to Sales order, Transfer order issue, Transfer order receipt, Purchase order, and Replenishment work.

Moving items is restricted to prevent splitting of work lines. This means that if you have a work line for 100 pcs of item A from location Loc1, you won't be able to move only 30 pcs of item A from there to another location. This would lead to a split of the existing work line to 30 and 70, because the locations are now different.

For staging scenarios, where the license plate you move the goods from or the license plate you move the goods to, are set as a Target LP for a work order, only movement of the entire LP is allowed, so as not to break up the Target LP. Only the ad hoc movement is currently supported. That means that you will not be able to move reserved inventory through the movement by template mobile device menu items.

Set up permission to move reserved inventory for individual workers

For the worker who should be allowed to move reserved inventory, select the **Allow movement of inventory with work associated** check box under **Warehouse management > Setup > Worker**.

Backported

This feature has also been back-ported to Microsoft Dynamics AX 2012 R3 and will be available as part of CU12.

It can also be downloaded individually through KB number 3192548.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a work class

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to set up a work class. Work classes are used to direct and/or limit the type of work order lines that a warehouse worker can process on a mobile device. The lines that a worker can process are determined from the work classes on the mobile device menu items that the warehouse worker has access to and the work class that's specified on the work lines. Work classes can also be used to validate the put location for a work order line. You can run this procedure in demo data company USMF or on your own data. This procedure is intended for the warehouse manager.

1. Go to Warehouse management > Setup > Work > Work classes.
2. Click New.
3. In the Work class ID field, type a value.
4. In the Description field, type a value.
5. In the Work order type field, select an option.
6. Click New.
7. In the Location type field, type a value.
 - If you select a location type, this sets a restriction on where items can be put after they've been picked. This setting is used when a location directive tries to resolve the location, or if a warehouse worker manually provides the location for the mobile device menu item.
8. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage warehouse workers

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes how you can use the warehouse app to help control and monitor the work that's carried out by employees in your warehouses.

If you're using the functionality in Warehouse management, all warehouse worker operations are referred to as *work*. Work such as picking, moving, and counting on-hand inventory is recorded by using mobile devices. Before a warehouse worker can perform work, he or she must be associated with a worker in Human resources. Each **Worker** account can have multiple warehouse work users associated with it. Those work users can work in different warehouses and can have different levels of access to the various mobile device menus. You can think of the warehouse work users as multiple logons for the selected worker. Each work user has a default warehouse, and specific workflows are exposed by the menu items that are available to that work user.

To create a new work user, on the **Workers** page, on the **General** tab, in the **Warehouses** section, click **Worker**. You must specify a user ID, a user name, a default warehouse, and a menu name. This menu is loaded when the user signs in to the Warehouse Mobile Device Portal, and lets you define which menu items the user has access to.

As part of the setup for each work user, you can also define specific process workflows. For example, you can use the **Is a cycle count supervisor** field to specify whether the user can process adjustments to cycle counting discrepancies during a counting operation, or whether these adjustments must first be reviewed by another person.

Defining labor standards

The **Labor standards** page lets you define the calculation methods that the system uses to calculate the estimated time that a particular type of work should require. This definition can be set on a generic level or on a specific level. For example, you can define the time that should be required in order to process a sales order pick per weight for a specific unit definition when a specific picking process is used. At the same time, you can record the time, based on another calculation method, for the put operation of the on-hand inventory that is picked.

To enable the labor standards that you've defined, you must select the **Allow labor standards** option for each warehouse where labor standards will be used.

Monitoring and controlling warehouse work

The **All work** page lets you monitor and maintain all work that is planned, in progress, and completed. From this page, you can update various processes, such as warehouse work user assignments and work priority. You can also drill down into the details that are related to the work header and work lines to gain an understanding of the expected or completed work processes.

If you enable the **Labor standards** option, you can see the calculated estimated time for the work. Then, when the work is processed, the actual time will also be shown for each work operation. In this way, you can compare the estimated time calculations to the actual time.

Additionally, you can use the estimated time in the rules for automatically splitting work during work creation. In this way, you can load balance work, based on the expected time to complete the tasks.

Analysis of the time that is used to process work items can help drive improvements in the warehouse workers' efficiency. The following reports are available to help with this analysis:

- **Labor by user** – This report shows worker productivity, based on actual times against expected times.
- **Labor by work transaction type** – You can use this report to investigate inefficiencies in specific warehouse processes. For example, you notice that picks for transfer orders are taking longer this week than in previous weeks. You can then use this information for further investigation.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Deferred processing of warehouse work

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes the functionality that makes deferred processing of put operations for warehouse work available in Dynamics 365 Supply Chain Management.

The deferred processing functionality lets warehouse workers continue to do other work while the put operation is processed in the background. Deferred processing is useful when many work lines must be processed and the worker can let that work be processed asynchronously. It's also useful when the server can have ad-hoc or unplanned increases in processing time, and the increased processing time might affect the user's productivity.

Background processing is achieved by using the SysOperation framework. For more information, see [SysOperation Framework Overview](#).

Configuring the work processing policies

To use deferred processing, you must configure and use a work processing policy.

Policies are configured on the **Work processing policies** page. The following table describes the fields on that page.

FIELD	DESCRIPTION
Work processing policy name	The name of the work processing policy.
Work order type	The work order type that the policy is applied to.
Operation	The operation that is processed by using the policy.
Work processing method	The method that is used to process the work line. If the method is set to Immediate , the behavior resembles the behavior when no work processing policies are used to process the line. If the method is set to Deferred , deferred processing that uses the batch framework is used.
Deferred processing threshold	A value of 0 (zero) indicates that there is no threshold. In this case, deferred processing is used if it can be used. If the specific threshold calculation is below the threshold, the Immediate method is used. Otherwise, the Deferred method is used if it can be used. For sales and transfer-related work, the threshold is calculated as the number of associated source load lines that are being processed for the work. For replenishment work, the threshold is calculated as the number of work lines that are being replenished by the work. By setting a threshold of, for example, 5 for sales, smaller works that have fewer than five initial source load lines won't use deferred processing, but larger works will use it. The threshold has an effect only if the work processing method is set to Deferred .
Deferred processing batch group	The batch group that is used for processing.

For deferred put-processing, the following work order types are supported: sales order, transfer order issue, and replenishment.

Assigning the work creation policy

The work creation policy can be assigned in the warehouse management parameters. It can also be assigned at the level of individual warehouses. If the policy is assigned to a warehouse, it's applied only to work that is created for that warehouse. If no policy is assigned at the warehouse level, the policy from the warehouse management parameters is applied.

Viewing the deferred put processing tasks

You can view deferred put processing tasks on the **Deferred put processing tasks** page.

By default, the **Completed** tasks are shown.

FIELD	DESCRIPTION
Status	The status of the task.
Batch job status	The status of the related batch job. If the batch job has been processed, the batch history contains the log and information from the batch job.

Here is an explanation of the possible statuses:

- **Awaiting** – The related batch job is awaiting processing on the batch server.
- **Failed** – The processing failed. The task can be reprocessed by using the **Process deferred put** action, or it can be canceled by using the **Cancel deferred put** action.
- **Completed** – The job was completed.

Impact on closed work dates

When deferred put processing is used, the closed work date is set as the created date/time of the deferred put processing tasks. The closed work date is used because it's the best estimate for when the put operation was completed.

Reprocessing a failed task

You can reprocess a failed task by selecting it on the page and then selecting **Process deferred put**.

Reprocessing corresponds to a situation where the user completes the put-away from the mobile device as if it was set for immediate processing.

Canceling failed tasks

Only failed tasks can be canceled. When you cancel a task, you can assign it to a new user. Alternatively, the task can remain assigned to the user who processed the work. Cancellation corresponds to a situation where the work is brought back to the mobile device as if the last pick step was just completed and the work must be put away. However, the user will be able to determine that the work is "different," because it will have only a put-away step, and the location will correspond to the location that the first user who processed the work had as a final put location.

When a task is canceled, the work is no longer blocked by the deferred put processing blocking reason. It can be reprocessed by using the mobile device.

The task record is deleted when the task canceled.

Configuring the mobile device menu to skip the deferred processing

policy

You can configure the mobile device menu item so that the deferred processing policy isn't used. The work is then processed as it is when no deferred processing policy is used. This functionality lets a supervisor use a specific menu item where deferred put isn't used. To configure it, set the **Deferred put processing policy** field to **Override settings and process put synchronously**.

Restrictions when the deferred put processing isn't applied

There are several scenarios where deferred put processing isn't applied even though the policy is configured. Here are some examples:

- Manual work completion is used.
- The work is completed by using auto-completion.
- Audit templates are used.

Monitoring the deferred processing tasks from the Outbound work monitoring workspace

The **Outbound work monitoring** workspace has two tiles that help you monitor deferred put processing tasks:

- **Failed deferred put processing tasks** – This tile shows the number of failed tasks. If there are failed tasks, the warehouse manager must either reprocess them or cancel them, because they won't be reprocessed automatically.
- **Awaiting deferred put processing tasks** – This tile shows the number of tasks that have been in the **Awaiting** status for more than 10 minutes. If the tile shows a number, it might indicate that an issue occurred during batch processing. You can manually process the **Awaiting** tasks. If the batch job for a task is processed later, it will just fail, because it has already been processed. There will be no impact.

Deleting completed tasks

You can delete deferred put processing tasks that have been completed by selecting them and deleting them on the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cross-docking from production orders to outbound docks

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes how to manage the process of cross-docking material that is being reported as finished from a production line to an outbound transportation dock.

Introduction

Cross-docking from production to an outbound location is relevant for manufacturers who produce high volume and ideally want to ship the finished products as soon as they are reported as finished from the production lines. The purpose is to ship the products to distribution centers that are physically located close to the customer demand, rather than build up inventory at the manufacturing site.

In case there is no immediate demand for a product, it must be put away to warehouse locations on the manufacturing site. This process is also known as *opportunistic cross-docking*, which indicates that if there is a demand for shipping the product, then this opportunity should be used instead of putting the product away for internal storage.

The following example shows three variations of a flow that starts at the end of the production line (2).

A product is reported as finished to the production output location (3) and a fork lift driver will pick up the pallet at this location (3).

- If there is a planned activity (6) for transferring the product from manufacturing (1) to a distribution center (7), then the truck driver will be directed by the system to put the pallet by a bay-door location (4).
- If a trailer is already assigned to the bay door, the truck driver will be directed to load the product directly to the trailer.
- If there is no planned activity for transferring the product, the fork lift driver will be directed to put the product away to a location in the internal warehouse (5).

Configure cross-docking

You configure the cross-docking process in **work policies**. A work policy includes a work order type, location,

and product. In the following example, cross-docking is configured for product X and location Y.

Work order types

- Work order type: Finished goods put way
- Work creation method: Cross docking
- Cross docking policy name: Transfer orders

Inventory locations

- Warehouse: 51
- Location: Y

Products

- Item number: X

Currently, cross-docking can be configured for only two work order types:

- Finished goods put away
- Co-product and by-product put away

In the **cross-docking policy**, you define which document types are applicable for cross-docking. Currently, the only document type that is supported is **Transfer orders**. The following example shows the configuration of a cross-docking policy.

Cross-docking policy name: Transfer order

- Sequence number: 10
 - Work order type: Transfer issue
- Cross docking demand requires location: False
- Cross docking strategy: Date and time

Sequence number

The **sequence number** indicates the priority of the document type. Currently, **Transfer issue** is the only type that is supported. Therefore, the sequence number will become relevant only when more work order types are supported.

Cross-docking policy

The cross-docking policy also sets the policy for the prioritization of transfer order demand. For example, if multiple transfer orders exist for the same product, the scheduled date and time that are set on the load, and associated with the transfer order, determine the prioritization between the orders. The scheduled date and time can be set directly on the load, or they can be set on an **appointment schedule** that is associated with the load. The prioritization is determined by the cross-docking strategy. Currently, there is only one strategy: **Date and time**.

Cross-docking demand requires location

In the cross-docking policy, you can set up a criterion to require that transfer orders have an assigned location in order to be eligible for cross-docking. This criterion is set in the **Cross docking demand requires location** field. The location on the appointment schedule that is associated with the load is used as the final location for the goods that are being cross-docked. The final location for the goods that are being cross-docked is determined by the location directive for **Transfer issue** for the **Put** work order type. You might find it useful to set the **Cross docking demand requires location** field in a scenario where the finished goods should be cross-docked only if a trailer is assigned to a bay door. In this scenario, the goods are moved directly from the production line into the trailer. When a trailer is assigned to the bay door, a user will assign the location to the appointment schedule and will therefore make the location applicable for cross-docking. The following sections walk you through two examples.

Scenario 1 – Cross-docking from production to transfer orders

After a product is reported as finished at the production line it is transferred to a bay-door location where it is loaded to a truck and transferred to a distribution center. Use company USMF.

1. Enable a new number sequence for cross-docking. Go to the **Number sequences** page, and select the **Generate** button. A wizard will guide you through the process.
2. Create a cross-docking policy. Go to the **Cross docking policy** page, and create a new policy that is named **Cross docking to transfer order**. Note that the only work order type that you can select is **Transfer issue**, and the only cross-docking strategy that is available is **Date and time**.
3. Create a work policy. Go to the **Work policies** page, and create a new work policy that is named **Cross Dock L0101**.
4. Set up loads so that they are created automatically for transfer orders. In the warehouse parameters, set up loads so that they are created automatically when transfer orders are created. A load is a prerequisite for making the transfer order eligible for cross-docking.
5. Set up the item load mapping. Go to the **Item load mapping** page, and set up a standard load template for the **CarAudio** item group. This mapping will automatically insert the load template on the load when the transfer order is created.
6. Create a transfer order. Create the transfer order for item number L0101. Quantity = 20.
7. Release the transfer order from the load planning workbench. On the **Ship** tab, select the menu item for the load planning workbench and on the **Release** menu of the load line, select **Release to warehouse**. An open wave line of type **Transfer issue** now exists for the transfer order.
8. Create a production order. Go to the **Production order** list page, and create a production order for product L0101. Quantity = 20. Estimate and start the production order. Note that the **Post picking list now** field remains set to **No**.
9. Report as finished from the mobile device. Go to the mobile device portal and select menu item **Report as finished and put away**. Now report as finished L0101 from the handheld device. Quantity = 10. Note that the put location is **BAYDOOR**. This location is found from the **Transfer issue** location directive for the **Put** work order type. Also notice that work of the type **Transfer issue** has been created and completed. Go to the transfer order work details to verify the work.
10. Now report additional 10 pieces from the mobile device. Note that the put location again is **BAYDOOR**. Also notice that a new work of type **Transfer issue** has been created for the 10 pieces.
11. Now try to start 20 pieces more on the production order and then try to report 20 ea as finished by using the handheld device. This time, location **LP-001** is suggested as the put location. This location is found from the location directive for **Finished goods put away**. This location directive is being used, because no opportunity for cross-docking exists. The transfer order for LP-001 was completely fulfilled by the two cross-docking activities in step 9 and 10. Notice that work of the type **Finished goods put away** was created and processed.

Scenario 2 - Cross-docking from production to transfer orders with an appointment schedule

After a product is reported as finished at the production line it is transferred to a bay-door location that is identified by an appointment schedule for the bay-door locations. Use company USMF.

1. Change the cross-docking policy. Change the cross-docking policy that you created in scenario 1 by selecting the **Cross docking demand requires location** check box.
2. Create a new transfer order.
3. Open the **Load planning workbench**.
4. From the load planning workbench, go to the **Loads** section, and select **Appointment schedule** on the **Transportation** menu to create a new appointment schedule. Note that the appointment schedule has a reference to the transfer order in the **Order number** field. In the **Planned start date/time at location** field, you can set the date and time for the appointment. This date and time will be used when cross-docking demand is prioritized during the cross-docking process. The date and time that you set in this field will update the **Scheduled load shipping date and time** field on the corresponding load. The location on the **Shipping details** FastTab determines the location that the transfer order is shipped on.

5. On the **Load planning workbench** release to the warehouse.
6. Create a production order for item number **L0101**, and set the status to **Started**, with a quantity of 20.
7. Report as finished from the mobile device.
8. Go to the mobile device portal, and select the **Report as finished and put away** menu item.
9. Report item number **L0101** as finished from the handheld device. Note that the put location is now **BAYDOOR 2**. This location is found from the appointment schedule instead of the **Transfer receipt** location directive.

Additional information

- The cross docking scenario is supported for batch and serial controlled items, both with the batch and serial number dimensions defined above and below location in the reservation hierarchy.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Auto-release shipment for cross-docking

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic describes a cross-docking strategy that lets you automatically release a demand order to the warehouse when the production order that supplies the demand quantity is reported as finished. In this way, the quantity that is required for fulfillment of the demand order is moved directly from the production output location to the outbound location.

Cross-docking is a warehouse handling flow where the quantity that is required to fulfill an outbound order is directed to the order's outbound dock or staging area from the location where the inbound order was received. (The inbound order can be a purchase order, a transfer order, or a production order.) Whereas the Advanced cross-docking feature supports all supply and demand orders, and it requires that the outbound demand be released before the cross-dock opportunity is identified, the Auto-release shipment feature has these characteristics:

- It supports only production orders as supply, and only sales orders and transfer orders as demand.
- The cross-docking operation can be started even if the demand order wasn't released to the warehouse before the supply receipt was registered (that is, before the production was reported as finished).

This cross-docking functionality has two advantages:

- The warehouse operations can skip the step of putting away quantities of finished goods to the regular warehouse storage area if those quantities will just be picked up again to fulfill the outbound order. Instead, the quantities can be moved one time, from the output location to a packing/shipping location. In this way, the functionality helps minimize the number of times that stock is handled and, ultimately, helps maximize time and space savings on the warehouse shop floor.
- The warehouse operations can postpone the release of sales orders and transfer orders to the warehouse until the output of finished goods for the associated production order is reported as finished. This advantage might be especially relevant in make-to-order production environments, where manufacturing lead times tend to be longer than the lead times in make-to-stock environments.

Prerequisites

PREREQUISITE	DESCRIPTION
Item	The item must be enabled for warehouse management processes. Note: Catch-weight-enabled items can't be included in the cross-docking processes.
Warehouse	The warehouse must be enabled for warehouse management processes.
Cross-docking templates	At least one cross-docking template that uses the At supply receipt demand release policy must be set up for a given warehouse.
Work class	A cross-docking work class ID must be created for the Cross docking work order type.

PREREQUISITE	DESCRIPTION
Work templates	Work templates of the Cross docking work order type are required to create cross-docking pick and put work.
Location directives	Location directives of the Cross docking work order type are required to guide put work in the locations where sales order quantities will be packed and shipped.
Marking between a demand order and a production order	The warehouse system can trigger automatic release of the outbound order shipment and create cross-docking work from the output location at the report-as-finished action only if sales orders and transfer orders are reserved and marked against a production order.

Example cross-docking flow

A typical cross-docking flow consists of the following main steps.

1. A sales order taker creates a sales order for a make-to-order product. Typically, the requested quantity isn't on hand and must first be produced.
2. The sales order taker creates a production order directly from the sales order line. In this way, the sales order taker reserves and marks the sales order quantity against the production order quantity.

Alternatively, a production planner specifies that the marking must be updated when planned orders are being firmed.

3. The production order goes through the following steps:
 - a. A production planner estimates and releases the production order. (Estimation includes raw material reservation, and the release includes the release to a warehouse.)
 - b. A warehouse worker starts and completes raw material picking from the storage location to the production input location, according to the production pick work.
 - c. A shop floor operator starts the production order.
 - d. In the last operation, a machine operator uses the mobile device to report the production order as finished.
4. The system uses the setup to identify the cross-docking event for the two linked orders and then completes these tasks:
 - a. Automatically release the associated sales order to a warehouse to create a shipment.
 - b. Automatically create cross-docking work that has instructions to pick the finished goods from the output location and move them to the outbound location that the cross-docking location directives assigned to the sales order.
 - c. Prompt a machine operator to complete the cross-docking work immediately after the production order is reported as finished.
5. After the cross-docking work is completed, and quantities are loaded onto the vehicle, an outbound warehouse planner confirms the sales shipment.

Example scenario

For this scenario, you must have demo data installed, and you must use the **USMF** demo data company.

Set up cross-docking that uses the auto-release shipment feature

Cross-docking template

1. Go to **Warehouse management > Setup > Work > Cross docking templates**.
2. Select **New**.
3. In the **Sequence number** field, enter **1**.
4. In the **Cross docking template ID** field, enter a name, such as **XDock_RAF**.
5. In the **Demand release policy** field, select **At supply receipt**.
6. In the **Warehouse** field, enter the number of the warehouse where you want to set up the cross-docking process. For this example, select **51**.

NOTE

As soon as you select **At supply receipt** as the demand release policy for the template, all other fields on the page become unavailable. Likewise, you can't define any supply sources. This behavior occurs because cross-docking that uses the auto-release shipment feature supports only production orders as supply sources, and it requires that a marking exist between sales orders and production orders. If you select **Before supply receipt** as the demand release policy, the fields on the **Planning** and **Supply sources** tabs are available and can be edited.

Work classes

1. Go to **Warehouse management > Setup > Work > Work classes**.
2. Select **New**.
3. In the **Work class ID** field, enter a name, such as **CrossDock**.
4. In the **Work order type** field, select **Cross docking**.

To limit the types of locations where cross-docked finished goods can be put, you can specify one or more valid location types.

Work templates

1. Go to **Warehouse management > Setup > Work > Work templates**.
2. In the **Work order type** field, select **Cross docking**.
3. Select **New**.
4. In the **Sequence number** field, enter **1**.
5. In the **Work template** field, enter a name, such as **CrossDock_51**.
6. Select **Save**.
7. In the **Work Template Details** section, select **New**.
8. For the new line, in the **Work type** field, select **Pick**. In the **Work class ID** field, select **CrossDock**.
9. Select **New**.
10. For the new line, in the **Work type** field, select **Put**. In the **Work class ID** field, select **CrossDock**.

Location directives

A standard put-away process for finished goods requires a **Put** location directive to guide the movement of picked production quantities to a regular storage space. Likewise, you must set up a cross-docking **Put** location directive to instruct the work to put the finished quantity in a designated outbound location that services the shipment of the associated sales order.

For cross-docking, as for regular put-away of finished goods, you don't have to create a location directive for the pick work action, because the output location is given. Additionally, this output location is expected to be set up either as the default output location on one of the resource-related records (that is, the resource, resource group relation, or resource group) or as a default production finished goods location for a warehouse.

1. Go to **Warehouse management > Setup > Location directives**.
2. In the **Work order type** field, select **Cross docking**.

3. Select **New**.
4. In the **Sequence number** field, enter **1**.
5. In the **Name** field, enter a name, such as **Baydoor**.
6. In the **Work type** field, select **Put**.
7. In the **Site** field, select **5**.
8. In the **Warehouse** field, select **51**.
9. On the **Lines** FastTab, select **New**.
10. In the **To quantity** field, enter the maximum quantity of the range, such as **1000000**.
11. Select **Save**.
12. On the **Location Directives Actions** FastTab, select **New**.
13. In the **Name** field, enter a name, such as **Baydoor**.
14. Select **Save**.
15. You can use the standard query facility to limit put locations to one or more specific locations. Select **Edit query**, and select **51** as the criterion for the **Warehouse** field in the **Locations** table.

Cross-dock finished goods to the outbound location

To cross-dock the quantity of finished goods to the outbound location of the associated sales order, follow these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New**.
3. For the sales order header, select customer account **US-001** and a warehouse that is set up for cross-docking that uses the auto-release shipment feature.
4. Add a line for a finished product, and enter **10** as the quantity.
5. In the **Sales order lines** section, select **Product and supply > Production order**.
6. In the **Create production order** dialog box, review the default values, and then select **Create**. A new production order is created and linked to the sales order (that is, it's reserved and marked).
7. Optional: Change the value of the **Quantity** field so that it's more than the value that is required to fulfill the sales order. When the production quantity is reported as finished, the system will create cross-docking work for the marked quantity and put-away work for the remaining quantity, according to the regular procedure for handling the put-away of finished goods.

As was mentioned earlier, a marking must exist between the sales order and the production order. Otherwise, the cross-docking won't work. A marking can be created in the multiple ways:

- The system can automatically create the marking in the following situations:
 - The production order is manually created directly from the sales order line (see step 6).
 - Planned production orders are firmed, and the **Update marking** field is set to **Standard**.
- The user can manually create the marking by opening the **Marking** page from the demand order line.

NOTE

A marking can't be manually created for items that are set up to use standard and weighted average as inventory models.

8. On the **Production order** page, on the Action Pane, on the **Production order** tab, in the **Process** group, select **Estimate**, and then select **OK**. The order is estimated, and the raw material quantity is

reserved for the production.

9. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Release**, and then select **OK**. Warehouse pick work is created for the raw materials.
10. Open and review the work. On the Action Pane, on the **Warehouse** tab, in the **General** group, select **Work details**. Make a note of the work ID.
11. Sign in to the warehouse app to run work in warehouse 51.
12. Go to **Production > Production pick**.
13. Enter the work ID to start and complete the raw material picking.

After the work is reported as finished, the quantity of raw materials is available in the production input location (**005** in USMF demo data), and execution of the production order can start.

14. On the **Production order** page, on the Action Pane, on the **Production order** tab, in the **Process** group, select **Start**, and then select **OK**.
15. In the app, go to **Production > RAF and put away**.
16. In the **Prod ID** field, enter the production order number and other mandatory details, and then select **OK**.

Notice that the following events occur:

- The release to a warehouse is triggered for the linked sales order.
- Based on the release, shipment and cross-docking work is created. This work instructs the warehouse operator to pick the quantities that are required to fulfill the sales order line and put them in the outbound location that specified in the cross-docking location directive.
- If the production order quantity is more than the quantity that is required by the sales order, regular put-away work is created. This work instructs the warehouse operator to pick the quantity of finished goods that remains after cross-docking and move it to regular storage, according to the location directive.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Planned cross-docking

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic describes advanced planned cross-docking. Cross-docking is a warehouse process where the inventory quantity that is required for an order is directed straight from receipt or creation to the correct outbound dock or staging area. All remaining inventory from the inbound source is directed to the correct storage location through the regular put-away process.

Cross-docking lets workers skip inbound put-away and outbound picking of inventory that is already marked for an outbound order. Therefore, the number of times that inventory is touched is minimized, where possible. Additionally, because there is less interaction with the system, time and space savings on the warehouse shop floor are increased.

Before cross-docking can be run, the user must configure a new cross-docking template, where the supply source and other sets of requirements for cross-docking are specified. As the outbound order is created, the line must be marked against an inbound order that contains the same item.

At the time of inbound order receiving, the cross-docking setup automatically identifies the need for cross-docking and creates the movement work for the required quantity, based on the setup of the location directive.

NOTE

Inventory transactions are **not** unregistered when crossing-dock work is canceled, even if the setting for this capability is turned on in Warehouse management parameters.

Turn on the Planned cross docking feature

Before you can use advanced planned cross-docking, the feature must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Planned cross docking*

Setup

Regenerate load posting methods

Planned cross-docking is implemented as a load posting method. After you turn on the feature, you must regenerate the methods.

1. Go to **Warehouse management > Setup > Load posting methods**.
2. On the Action Pane, select **Regenerate methods**.

When regeneration is completed, you should see a method that has a **Method name** value of *planCrossDocking*.

3. Close the page.

Create a cross-docking template

1. Go to **Warehouse management > Setup > Work > Cross docking templates**.

2. On the Action Pane, select **New** to create a template.

3. In the header, set the following values:

- **Sequence:** *1*

This field defines the order that templates are evaluated in.

- **Cross docking template ID:** *51*
- **Description:** *Warehouse 51*
- **Demand release policy:** *Before supply receipt*
- **Warehouse:** *51*

4. The setup on the **Planning** FastTab controls how the template works. Set the following values:

- **Demand requirements:** *None*

This field defines the requirements of the demand inventory. If the demand must be linked to the supply before release, select *Marking*. If the demand must be order-reserved against the supply before release, select *Order reservation*.

- **Locating type:** *Shipment locations*

This field defines whether the cross-docking work should use the staging/load locations from the shipment, or whether it should use location directives to find its own staging/load locations.

- **Work template:** Leave this field blank.

This field defines the work template that should be used when cross-docking work is created.

- **Revalidate on supply receipt:** *No*

This option defines whether the supply should be revalidated during receipt. If this option is set to *Yes*, both the maximum time window and the expiration days range are checked.

- **Validate time window:** *Yes*

This option defines whether the maximum time window should be evaluated when a supply source is selected. If this option is set to *Yes*, the fields that are related to the maximum and minimum time windows become available.

- **Maximum time window:** *5*

This field defines the maximum period that is allowed between supply arrival and demand departure.

- **Maximum time window unit:** *Days*

- **Minimum time window:** *0*

This field defines the minimum period that is allowed between supply arrival and demand departure.

- **Minimum time window unit:** *Days*

- **Expiration days range:** *0*

First expiry first out (FEFO) criteria: This field defines the maximum number of days between the expiration date of the first-expiring batch that is currently in the warehouse and the batch that is being received.

5. On the **Supply sources** FastTab, you specify the types of supply that are valid for this template. Select **New**, and then set the following values:

- **Sequence number:** 1
- **Supply source:** *Purchase order*

Create a work class

1. Go to **Warehouse management > Setup > Work > Work classes**.

2. On the Action Pane, select **New** to create a work class.

3. Set the following values:

- **Work class ID:** *CrossDock*
- **Description:** *Cross Dock*
- **Work order type:** *Cross docking*

Create a work template

1. Go to **Warehouse management > Setup > Work > Work templates**.

2. Set the **Work order type** field to *Cross docking*.

3. On the Action Pane, select **New** to add a line to the **Overview** tab.

4. On the new line, set the following values:

- **Sequence number:** 1
- **Work template:** *51 Cross Dock*
- **Work template description:** *51 Cross Dock*

5. Select **Save** to make the **Work Template Details** FastTab available.

6. On the **Work Template Details** FastTab, select **New** to add a line to the grid.

7. On the new line, set the following values:

- **Work type:** *Pick*
- **Work class ID:** *CrossDock*

8. Select **New** to add another line, and set the following values on it:

- **Work type:** *Put*
- **Work class ID:** *CrossDock*

9. Select **Save**, and confirm that the **Valid** check box is selected for the *51 Cross Dock* template.

NOTE

The work class IDs for the *Pick* and *Put* work types must be the same.

Create location directives

1. Go to **Warehouse management > Setup > Location directives**.

2. In the left pane, set the **Work order type** field to *Cross docking*.

3. On the Action Pane, select **New**, and set the following values:

- **Sequence number:** 1
- **Name:** *51 Cross Dock Put*
- **Work type:** *Put*

- **Site:** 5
 - **Warehouse:** 51
4. Select **Save** to make the **Lines** FastTab available.
 5. On the **Lines** FastTab, select **New** to add a line to the grid.
 6. On the new line, set the following values:
 - **From quantity:** 1
 - **To quantity:** 1,000,000
 7. Select **Save** to make the **Location Directive Actions** FastTab available.
 8. On the **Location Directive Actions** FastTab, select **New** to add a line to the grid.
 9. On the new line, set the following values:
 - **Name:** *Baydoor*
 - **Fixed location usage:** *Fixed and non-fixed locations*
 10. Select **Save** to make the **Edit query** button on the **Location Directive Actions** toolbar available.
 11. Select **Edit query** to open the query editor.
 12. On the **Range** tab, make sure that the following two lines are configured:
 - Line 1:
 - **Table:** *Locations*
 - **Derived Table:** *Locations*
 - **Field:** *Warehouse*
 - **Criteria:** 51
 - Line 2:
 - **Table:** *Locations*
 - **Derived Table:** *Locations*
 - **Field:** *Location*
 - **Criteria:** *Baydoor*
 13. Select **OK** to close the query editor.

Create a mobile device menu item

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. In the list of menu items in the left pane, select **Purchase Put-away**.
3. Select **Edit**.
4. On the **Work classes** FastTab, select **New** to add a line to the grid.
5. On the new line, set the following values:
 - **Work class ID:** *CrossDock*
 - **Work order type:** *Cross docking*
6. Select **Save**.

Scenario

Create a purchase order

Follow these steps to create a purchase order as a source of supply.

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Create purchase order** dialog box, set the following values:
 - **Vendor account:** *104*
 - **Warehouse:** *51*
4. Select **OK**, and make a note of the order number.
5. A new line is added to the **Purchase order lines** FastTab. On this line, set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *5*

Create a sales order

Follow these steps to create a sales order as a source of demand.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-002*
 - **Warehouse:** *51*
4. Select **OK**.
5. A new line is added to the **Sales order lines** FastTab. On this line, set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *3*

Create planned cross-docking

Follow these steps to create the planned cross-docking from the sales order.

1. In the **Sales order details** page for the sales order that you just created, on the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

The release to warehouse action creates a shipment and load line for the sales order line, and tries to allocate inventory.

You receive an informational message. You also receive the following warning message: "No work was created for wave XXXX. See the work creation history log for details." This behavior is expected, because there is no inventory in the warehouse.

2. On the **Sales order lines** FastTab, on the **Warehouse** menu, select **Shipment details**.

The **Shipment details** page appears and shows the shipment that was created for the sales order.

3. On the **Load lines** FastTab, notice that the **Planned cross docking quantity** field is set to *3*. Because no inventory was available in the warehouse, but a valid supply source will arrive within the time window that is defined in the cross-docking template, the cross-docking quantity was created.
4. On the **Load lines** FastTab, select **Planned cross docking** to view the details of the cross-docking that was created.

Process the cross-docking

Purchase order receiving on the warehousing mobile app

The system will receive the quantity of 5 from the purchase order into the receiving location and create two pieces of work.

The first work ID that is created has a **Work order type** value of *Cross docking* and is linked to the sales order. It has a quantity of 3 and is directed to the final shipping location so that it can be shipped out immediately.

The second work ID that is created has a **Work order type** value of *Purchase orders* and is linked to the purchase order. It has the remaining quantity of 2 that wasn't cross-docked and is directed to put-away to storage.

1. Sign in to the mobile device as a user in warehouse 51.
2. Go to **Inbound > Purchase Receive**.
3. In the **PONum** field, enter your purchase order number.
4. In the **Qty** field, enter 5.
5. Select **OK**.
6. On the next page, set the **Item** field to *A0001*.
7. Select **OK**.
8. On the next page, confirm the **PONum**, **Item**, and **Qty** values by selecting **OK**.

You receive a "Work Completed" message.

9. Select **Cancel** to exit.

Put-away to cross-docking and bulk

Currently, both work IDs have the same target license plate. To complete the next steps, you must get the work ID and the target license plate ID. You can get this information from the work details for the purchase order line and the sales order line. Alternately, you can go to **Warehouse management > Work > Work details** and filter for work where the **Warehouse** value is 51.

1. On the mobile device, go to **Inbound > Purchase put-away**, and enter the target license plate from the work.
2. In the **ID** field, enter the target license plate ID from the work details.

The cross-docking pick page shows the picking location (*RECV*), target license plate (*license plate*), item (*A0001*), and quantity (*3*).

3. Select **OK**.
4. In the **Target LP** field, enter a target license plate for the license plate ID that should be put (cross-docked) to the shipping location. You can select any license plate ID of your choice.
5. Select **OK**.
6. On the next page, in the **ID** field, enter the target license plate ID.
7. Select **OK**.
8. Confirm the work for picking the remaining quantity of 2, and then select **OK**.
9. On the next page, select **Done** to end the picking process and begin the put-away process.

The mobile app presents you with the location and license plate to put the item to.

10. Confirm the bulk storage **Put** by selecting **OK**.

11. On the next page, confirm the cross-docking **Put** by selecting **OK**.

You receive a "Work Completed" message.

12. Select **Cancel** to exit.

The following illustration shows how the completed cross-docking work might appear in Microsoft Dynamics 365 Supply Chain Management.

The screenshot shows the 'Work' interface in Microsoft Dynamics 365 Supply Chain Management. It is divided into two main sections: 'Overview' and 'Lines'.

Overview Tab:

Work priority	Lock...	Work ID ↑	Work status	Site	War...	W...	Target license plate ID	Work order type	Order number	Load ID	Ship
50		USMF-000077	Closed	5	51		CD-001	Cross docking	000876	USMF-000071	USN
50		USMF-000078	Closed	5	51	<input type="checkbox"/>	000USMF-0000000086	Purchase orders	00000266	USMF-000069	USN

Lines Tab:

Work status	Work type	Location	Item number	Product name	Work quantity	Remaining q...	Unit	U
Closed	Pick	RECV	A0001	HDMI 6' Cables	2.00	0.00	pcs	5
Closed	Put	BULK-002	A0001	HDMI 6' Cables	2.00	0.00	pcs	5

Reason codes for inventory counting

2/18/2021 • 5 minutes to read • [Edit Online](#)

Reason codes let you analyze the results of a counting process and any discrepancies that occur during that process. You can specify the reason for doing the count, such as a broken pallet or a stock adjustment that is based on inventory samples.

Recommendation

Before you set up the system, we recommend that you define a strategy for working with reason codes. For example, try to answer the following questions:

- Should reason codes be mandatory on warehouses?
- Should reason codes be mandatory or optional on some items?
- How many reason codes do you require?
- How should users of barcode scanners use reason codes? Should the reason codes be preselected, mandatory, or not editable?
- Do warehouse workers require different reason code behavior on mobile scanners? If the answer is yes, you can create more menu items and assign them to different people.

Where reason codes apply

You can create multiple reason code policies, and each reason code policy can have two counting reason code policies. The counting reason code policies can be used at the warehouse level or the item level.

Set up reason code policies

1. Select **Inventory management > Setup > Inventory > Counting reason code policies**, and create a new reason code policy.
2. In the **Counting reason code type** field, select either **Mandatory** or **Optional** to specify whether selection of a reason code should be an optional or mandatory action in one of the following counting journals:
 - Cycle Count (mobile device)
 - Spot Count (mobile device)
 - Threshold Count (mobile device)
 - Adjustment In (mobile device)
 - Adjustment Out (mobile device)
 - Counting Journal (rich client)

You can also set up reason codes for individual warehouses and for products. The reason code setup for products can disregard the setup for warehouses.

Mandatory reason codes

If the **Mandatory** parameter is set in the configuration of reason codes for warehouses or items, the counting journal can't be completed and closed until a reason code is provided.

Set up reason codes for warehouses

1. Select **Inventory Management > Setup > Inventory breakdown > Warehouses**.
2. On the **Warehouse** tab, in the **Counting reason code policy** field, select one of the following options:
 - **Blank** – The parameter that is set up for the item is used to determine whether counting journals are mandatory for the product.
 - **Mandatory** – A reason code is always required on counting journals for the warehouse.
 - **Optional** – A reason code isn't required on counting journals for the warehouse.

Set up reason codes for products

1. Select **Product information management > Products > Released products**.
2. On the **Product** tab, select **Counting reason code policy**, and then select one of the following options:
 - **Blank** – The parameter that is set up for the warehouse is used to determine whether counting journals are mandatory for the product.
 - **Mandatory** – A reason code is always required on counting journals for the product. This setting overrides any reason code setting at the warehouse level.
 - **Optional** – A reason code isn't required on counting journals for the product. This setting overrides any reason code setting at the warehouse level.

Use reason codes in counting journals

In a counting journal, you can add reason codes for counts of the following types:

- Cycle Count
- Spot Count
- Threshold Count
- Adjustment In
- Adjustment Out

Reason codes are added to the journal lines in counting journals of the **Counting journal** type.

1. Select **Inventory management > Journal entries > Item counting > Counting**.
2. In the line details of the counting journal, in the **Counting reason code** field, select an option.

View the counting history as it's recorded by reason codes

- Select **Inventory management > Inquiries and reports > Counting history**, and then, in the **Counting reason code** field, view the counting history that has been recorded through a reason code.

Use a reason code for a quantity adjustment

1. On the **On-hand inventory** page, select **Adjust quantity**. You can open the **On-hand inventory** page in several ways. For example, select **Inventory management > Inquiries and reports > On-hand inventory**.
2. Select **Adjust quantity**, and then, in the **Counting reason code** field, select a reason code.

Configure reason codes for mobile device menu items

You can configure reason codes for any type of count on a mobile device menu item. The configuration of the mobile device menu item includes the following information:

- Whether the reason code is shown to the mobile device worker during counting.
- The default reason code that is shown on a mobile device menu item.
- Whether the user can edit the reason code.

Set up reason codes on a mobile device

1. Select **Warehouse management > Setup > Mobile device > Mobile device menu items**.

2. On the **Cycle count** tab, select **Cycle counting**.
3. In the **Default counting reason code** field, set the default reason code that should be recorded when counting is done by using the mobile device menu item.
4. In the **Display counting reason code** field, select **Line** to show the reason code after each variance is recorded. Alternatively, select **Hide** if the reason code shouldn't be shown.
5. Set the **Edit counting reason code** option to either **Yes** or **No**. If you set this option to **Yes**, the worker can edit the reason code when it's shown on the mobile device during counting.

NOTE

The **Cycle counting** button can be enabled on any mobile device menu item where counting can be done. Example include the menu items for spot counts, user-directed work, and system-directed work.

Cycle count approvals

Before a count is approved, the user can change the reason code that is associated with the count. When the count is approved, the reason code is entered on the counting journal lines.

Modify cycle count approvals

1. Select **Warehouse management > Cycle counting > Cycle count work pending review**.
2. Select **Cycle counting**, and then, in the **Reason code** field, select a new reason code.

Modify the mobile device menu item for Adjustment in and Adjustment out

1. Select **Warehouse management > Setup > Mobile device > Mobile device menu items**, and then select **Adjustment in and out**.
2. Set the **Use existing work** option to **No**.
3. In the **Work creation process** field, select **Adjustment in**.

The following fields will be added to the mobile device menu item when **Adjustment in** or **Adjustment out** is selected during the work creation process:

- Default counting reason code
- Display counting reason code
- Edit counting reason code

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inventory blocking

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of inventory blocking, which is part of the quality inspection process in Supply Chain Management. You can use inventory blocking to prevent items from being processed or consumed.

You can block inventory items in the following ways:

- Manually
- By creating a quality order
- By using a process that generates a quality order
- By using inventory status blocking

Blocking items manually

You can block a quantity of an item by creating a transaction on the **Inventory blocking** page. Only items that are available as on-hand inventory can be blocked manually. For manually blocked quantities, you must decide whether planning activities include expected receipts as an expected on-hand quantity. Expected receipts are blocked items that you expect to be available as on-hand inventory after inspection is completed. You can maintain the expected date. By default, the **Expected receipts** option is selected for items that are blocked through a quality order. You can cancel a manual block on a quantity by deleting the transaction on the **Inventory blocking** page.

Blocking items by creating a quality order

You can specify items that must be inspected by creating a quality order on the **Quality orders** page. When you create a quality order, the quantity that you specify for an item is blocked. The sampling plan that is associated with a quality order controls only the quantity of items that must be inspected, not the quantity that is blocked. The quantity that is entered on the quality order is the quantity that is blocked, regardless of the quantity that the sampling plan specifies should be sent for inspection.

NOTE

Using both the batch expiry date and blocking inventory status features is not supported by master planning. This could result in double exclusion of on-hand inventory, which can occur during master planning. We recommend that you rely on batch disposition codes, instead of inventory status, for blocking expired batches.

Blocking items by using a process that generates a quality order

If a quality process specifies that an item must be inspected, a quantity of the item is blocked automatically. Therefore, when a quality order is generated automatically, the item sampling plan that is associated with the quality order controls the both quantity of items that is blocked and the quantity that must be inspected. If the **Full blocking** option on the **Item sampling** page is selected, the full quantity of, for example, a purchase order line is blocked during inspection, regardless of the item sampling quantity.

Example

In the following example, a quality order is generated when a purchase order packing slip is posted. On the **Quality associations** page, you specified that posting of a purchase order packing slip is the process that activates a quality order.

SETUP	USER ACTION	RESULT
<p>A quality association specifies that a quality order must be generated when a purchase order packing slip is posted. The item sampling setup of the quality order specifies that 10 percent of the quantity on the purchase order line must be inspected. Furthermore, because the Full blocking option selected in the item sampling setup, the full quantity of the purchase order line must be blocked during inspection, regardless of the quantity that is sent for inspection.</p>	<p>The packing slip is posted.</p>	<p>A quality order is generated. Ten percent of the purchase order quantity for the item is sent to inspection. The full quantity of the purchase order line is blocked.</p>

Blocking items by using inventory status blocking

You can specify which inventory statuses are blocking statuses by using the **Inventory blocking** parameter on the **Inventory statuses** page. You can't use inventory statuses as blocking statuses for production orders, sales orders, transfer orders, outbound transactions, or project integrations. For outbound work, use items that have an available inventory status. If items have a status of **Broken**, and master planning is run on those items, the items are considered missing, and inventory is automatically replenished.

Cycle counting

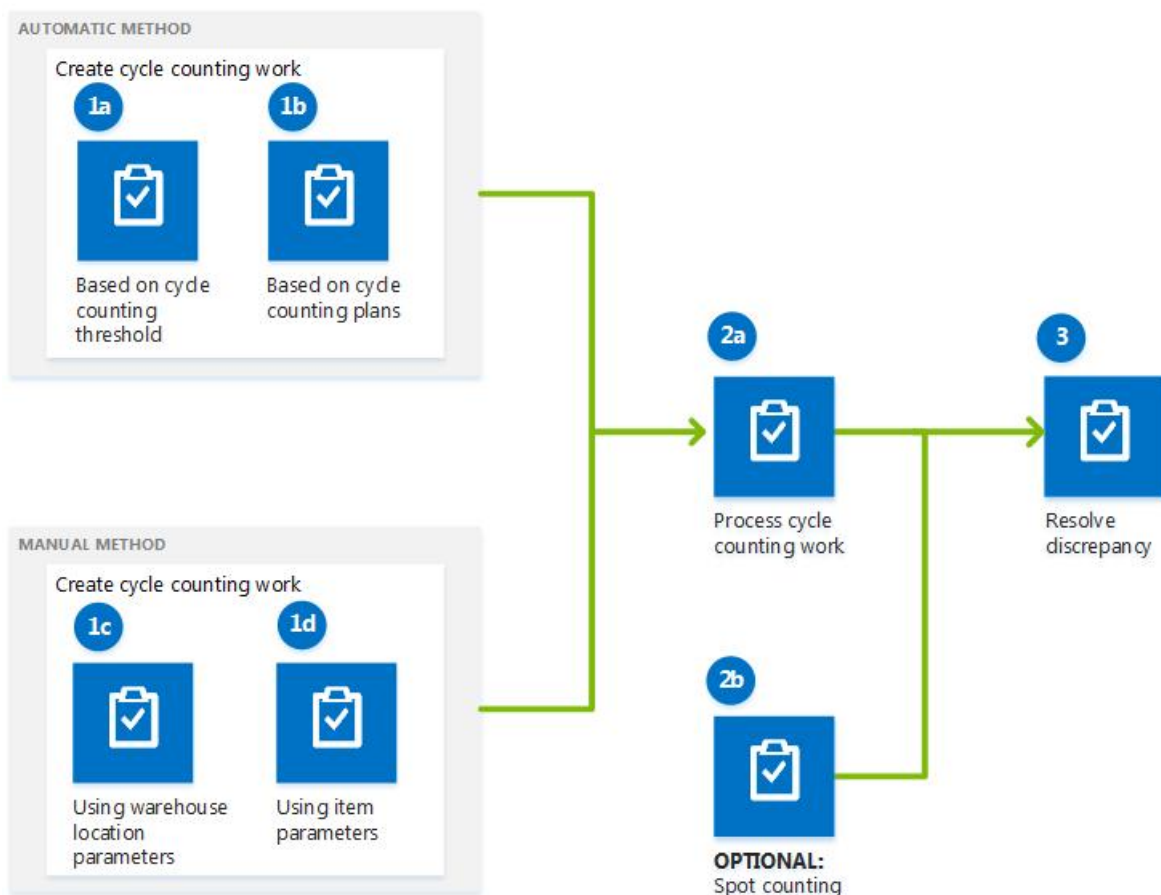

2/18/2021 • 6 minutes to read • [Edit Online](#)

This article describes how you can use cycle counting with the warehousing solution that is available in Warehouse management. This article doesn't apply to the warehousing solution that's available in Inventory management.

Cycle counting is a warehouse process that you can use to audit on-hand inventory items. The cycle counting process can be described in three steps:

1. **Create cycle counting work** – Cycle counting work can be created automatically, based on threshold parameters for items or by using a cycle counting plan. Alternatively, you can manually create cycle counting work by using the item or warehouse parameters on the **Cycle count work by item** page or the **Cycle count work by location** page.
2. **Process the cycle count** – After cycle counting work is created, you do the cycle counting work by counting items in a warehouse location and then using a mobile device to enter the result in Dynamics 365 Supply Chain Management. Alternatively, you can count items in a warehouse location without creating cycle counting work. This process is referred to as *spot cycle counting*.
3. **Resolve differences in the counted value** – After a cycle count, any items that have differences in the counted value will have a work status of **Pending review** on the **All work** page. You can resolve these differences on the **Cycle count work pending review** page.

The following illustration shows the cycle counting process.

Cycle counting prerequisites

The following table shows the prerequisites that must be in place before you can use cycle counting.

PREREQUISITE	DESCRIPTION
Item	The item must be enabled for warehouse management processes.
Warehouse	The warehouse must be enabled for warehouse management processes. To enable the warehouse for warehouse management processes, on the Warehouses page, select the warehouse, and then select the Use warehouse management processes option. To enable workers to move pallets during a cycle count, on the Warehouse management FastTab, select the Allow pallet moves during cycle counting option.
Work pools	Optional: Create a work pool to segregate the warehouse work, based on the type of work (in this case, cycle counting work).
Locations	Enable cycle counting for locations. To enable cycle counting for a warehouse location, on the Location profiles page, select the Allow cycle counting option.
Warehouse management parameters	Set up parameters for cycle counting. On the Warehouse management parameters page, specify the default adjustment type code, work class ID, and work priority for cycle counting.
Mobile device	<ul style="list-style-type: none"> • Create a menu item for one of the following methods on the Mobile device menu items page: <ul style="list-style-type: none"> ◦ User directed cycle counting ◦ System directed cycle counting ◦ Cycle count grouping ◦ Spot cycle counting • Set up a menu for the mobile device. • Create a work user account, and assign a mobile device menu to the work user ID.
Related setup task	Set up a cycle counting plan for a warehouse location.

Automatically create cycle counting work

There are two ways to schedule recurring creation of cycle counting work: set up cycle counting thresholds or set up cycle counting plans.

- A cycle counting threshold indicates the quantity or percentage limit of inventory items. Cycle counting work is automatically created when the threshold limit is reached.
- A cycle counting plan creates cycle counting work either immediately or periodically through a batch job. When cycle counting work is created, the counting work line includes information about the location to count. The on-hand inventory that is associated with this location isn't blocked, and is therefore available for reservation and outbound processing, even though open counting work exists.

Create cycle counting work, based on threshold parameters for items

Cycle counting work can be created when the number of items falls below a specific threshold value in a location. For example, there are 60 items in a location that has a cycle counting threshold of 40. During a sales

order transaction, 25 items are picked from the location and put in a staging location. Because the new item count, 35, is less than the threshold quantity, cycle counting work is automatically created for the location.

Schedule cycle counting work

You can schedule cycle counting plans to create cycle counting work immediately or periodically. By setting up cycle counting plans, you can control the work pool that cycle counting work is created for, the maximum number of cycle counts that are created for items in different locations, and the number of days before a warehouse location is counted again. For example, an item is available in three locations in the warehouse, and the maximum number of cycle counts is set to 2. In this case, when you run the cycle counting plan, two cycle counts are created for the two locations where the item is present. As another example, you set the number of days between cycle counts to 5. In this case, cycle counting work is created every five days. However, if cycle counting work is processed on day 3, the next cycle counting work will be created five days after the last cycle counting was processed, on day 8.

Create cycle counting work manually

To create cycle counting work manually, you can use the **Cycle count work by item** or **Cycle count work by location** page. You can specify the maximum number of cycle counts to create. For example, if the warehouse manager specifies a value of 5, cycle counting work is created for five locations, even if the item is present in 10 locations. You can also select a work pool ID to assign the cycle counting work IDs that are created to. When a work pool ID is processed for cycle counting, the cycle counting work IDs that are assigned to the work pool are processed as a group.

Perform a cycle count by using a mobile device

There are several methods for processing cycle counting work by using Supply Chain Management on a mobile device:

- **User directed** – The worker can specify a cycle counting work ID that has a status of **Open**.
- **System directed** – Supply Chain Management assigns a cycle counting work ID to the worker.
- **Cycle count grouping** – The worker can group cycle counting work IDs that are specific to a particular location, zone, or work pool.
- **Spot cycle counting** – The worker can count items in a warehouse location at any time, without creating cycle counting work. To perform spot cycle counting in a location, the worker enters the location ID.

The following example shows how you can perform spot cycle counting by using a mobile device. The instructions that the worker sees on the device vary, depending on the setup of the menu item for spot cycle counting.

1. On the mobile device, select the menu item to process spot cycle counting work.
2. Register the location to perform spot cycle counting for.
3. Register and confirm the item number and the counted item quantity. **Note:** The status of the cycle counting work is updated to either **Pending review** or **Closed** on the **All work** page, depending on the parameters that are set on the **Worker** page.
4. Optional: Repeat step 3 for the remaining items in the location, and confirm that no additional items are available for counting.

Resolve cycle counting differences

A cycle counting difference occurs in the following scenarios if the **Is a cycle count supervisor** option is set to **No** for a work user ID:

- The counted value isn't within the deviation limits that are specified in the **Maximum percentage limit** or **Maximum quantity limit** fields on the **Work users** page. For example, the on-hand inventory quantity in a

location is 50, and the deviation limit for the work user is 10. If the work user enters a value that isn't between 40 and 60, a difference occurs.

- The counted value differs from the on-hand inventory quantity, and no deviation limits are set.

You can adjust differences in the counted value and then accept the counted value on the **Cycle count pending review** page. You can verify the modified count of the item quantity on the **On hand by location** page. The counted value is rejected if the difference can't be approved.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define cycle counting

2/18/2021 • 3 minutes to read • [Edit Online](#)

Cycle counting is a warehouse process that you can use to audit on-hand inventory items. This task recording shows how to set up the default counting work priority, enable a mobile device menu item to process both picking and counting operations, enable a counting threshold trigger when a location becomes empty, and enable a cycle counting plan for a specific item in a specific warehouse. Typically, these tasks are performed by a warehouse manager. You can go through this procedure in the USMF demo data company or in your own data.

Set the priority of counting work

1. In the **Navigation pane**, go to **Modules > Warehouse management > Setup > Warehouse management parameters**.
2. Click the **Cycle counting** tab.
3. In the **Default cycle count work priority** field, enter a number. This step changes the priority of cycle counting work compared to other types of work in the warehouse. By entering a number that is lower than the number for other types of work, you raise the priority of the cycle counting work.
4. Click **Save**.
5. Close the page.

Enable the mobile device

1. In the **Navigation pane**, go to **Modules > Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Click **New**.
3. In the **Menu item name** field, type a value.
4. In the **Title** field, type a value.
5. In the **Mode** field, select 'Work'.
6. Set the **Use existing work** option to Yes. When you set this option to Yes, the system will look for existing work when the mobile device menu item is used.
7. In the **Directed by** field, select 'System directed'. When "System directed" is selected, the warehouse worker will be directed to open work that is in defined work classes. (We will create these work classes next.)
8. Expand the **Work classes** fastTab. Next, we will create two work classes that will be used with this mobile device menu item. When the menu item is used, these work classes will be queried, and the work that has the highest priority will be shown to the user.
9. Click **New**.
10. In the **Work class ID** field, select a value.
11. Click **New**.
12. In the **Work class ID** field, select a value.
13. In the **Action Pane**, click **Save**.
14. Close the page.
15. In the **Navigation pane**, go to **Modules > Warehouse management > Setup > Mobile device > Mobile device menu**.
16. In the list, find and select the desired record.
17. In the tree, select 'the menu item that you just created'.
18. Click **Edit**.

19. Click the arrow to add the menu item to the menu.
20. Click **Save**.

Create a counting threshold

1. In the **Navigation pane**, go to **Modules > Warehouse management > Setup > Cycle counting > Cycle count thresholds**.
2. Click **New**.
3. In the **Cycle counting threshold ID** field, type a value.
4. Set the **Process cycle counting immediately** option to **Yes**.
5. In the **Description** field, type a value.
6. Click **Save**.
7. Click **Select locations**.
8. In the list, mark the selected row.
9. In the **Criteria** field, select a value.
10. Click **OK**.
11. Close the page.

Create a cycle count plan

1. In the **Navigation pane**, go to **Modules > Warehouse management > Setup > Cycle counting > Cycle count plans**.
2. Click **New**.
3. In the **Cycle counting plan ID** field, type a value.
4. In the **Description** field, type a value.
5. In the **Maximum number of cycle counts** field, enter a number.
6. Click **Save**.
7. Click **Select locations**.
8. In the list, mark the selected row.
9. In the **Criteria** field, select a value.
10. Click **OK**.
11. In the **Days between cycle counting** field, enter a number. For example, if the **Days between cycle counting** field is set to 5, cycle counting work will be created every five days. However, if cycle counting work is processed on day three, the next cycle counting work will be created five days after the last cycle counting was processed, on day 8.
12. Click **Save**.
13. Click **New**.
14. In the **Sequence number** field, enter a number. The sort is from the smallest number to the largest number. The value must be more than 0 (zero).
15. In the list, mark the selected row.
16. In the **Description** field, type a value.
17. Click **Save**.
18. Click **Define product** query.
19. In the list, mark the selected row.
20. In the **Criteria** field, enter or select a value.
21. Click **OK**.
22. Close the page.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Partial location cycle counting

2/18/2021 • 3 minutes to read • [Edit Online](#)

Cycle count plans guide the actual counting operations. You can request that only specific products and product variants be counted instead of all on-hand inventory in a location.

By using cycle count plans to create counting work, you can guide the actual counting operations. You can request that only specific products and product variants be counted instead of all on-hand inventory in a location. By filtering on specific products, the warehouse manager can reduce review overhead, avoid consolidation mistakes, and save time.

How to configure partial location cycle counting

When you use the warehouse work process for counting operations, a work header is created for each location. When you define the cycle count plan, you can use the **Select locations** query to limit the cycle counting work that is created. When you select products for the cycle count plan, you can select both product and product variant queries to refine what is counted.

You can associate a **work template** with a cycle count plan to define how the cycle count work should be created. The work template for counting operations is directly referenced from the cycle count plan.

When you define the work template details, you can use the **Work line breaks** option to specify whether the counting work lines must be grouped by item number or product variant number. This setup is required if you want to count on-hand inventory only for specific products in a location. The cycle counting work lines that are created will have the level of information that you define here, and the guided counting operation will be handled based on this level.

If you associate cycle count plans with work templates by using the **Work lines breaks** option, the **Partial cycle count** field is selected for the cycle counting work that is created, and multiple cycle counting work lines will be created based on the definition of the work template.

Before partial cycle count work can be processed, you must, at a minimum, select **Display item number** for the mobile device menu item as part of the cycle counting setup. The warehouse operator will be asked to record only counting information that is related to the counting lines (item numbers and product dimensions). All other on-hand inventory will be ignored for this counting process.

For the partial cycle count process, the **Last cycle count** date/time won't be updated for the location, even though all the items on hand at a given location are counted. The partial cycle count doesn't consider the parameter **Days between cycle counting** on the **Cycle count plans** page. Partial cycle count doesn't support simultaneous counting of multiple items at the same location. Partial cycle count functionality may result in the same location being counted multiple times for an item when **Process cycle counting plan** is run. To avoid that scenario, specify filters in the **Select locations** field.

NOTE

The warehouse app doesn't provide the **Add LP or item** button when you use the partial cycle count process.

Example

For this example, only item number A0001 must be counted in warehouse 61.

1. A new work template for cycle counting is created. The **Work line breaks** option is used to group counting work lines by item number. Therefore, the cycle counting work that is created will have lines per item number. You can also group the lines by product variant number.
2. A new cycle counting plan is created that references the newly created work template. The cycle counting plan includes all locations in warehouse 61 (**Select locations** query) that hold inventory for item number A0001. The selection of specific products is defined in the **Cycle count product selections** section.
3. You can select products for cycle counting plans by setting the **Empty locations** field to **Exclude empty**. When the cycle counting plan is processed, partial cycle count work for item number A0001 is created. The actual counting process can be performed by using a mobile device menu item for guided cycle counting.

Define partial location cycle counting process

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you use cycle count plans to create counting work, you can guide the actual counting operations by requesting that only specific products and product variants be counted instead of all on-hand inventory at the location. By filtering on specific products, the warehouse manager can reduce review overhead, help prevent consolidation mistakes, and save time. Typically, a warehouse manager performs the setup tasks. You can go through this procedure in the USMF demo data company or in your own data.

Create a cycle counting work template

1. Go to Warehouse management > Setup > Work > Work templates.
2. In the Work order type field, select 'Cycle counting'.
3. Click New.
4. In the Sequence number field, enter a number.
 - The sort order is from the smallest number to the largest number. The value must be more than 0 (zero).
5. In the list, mark the selected row.
6. In the Work template field, type a value.
7. In the Work template description field, type a value.
8. In the Work pool ID field, enter or select a value.
9. In the Work priority field, enter a number.
10. Click Save.
11. Click New.
12. In the list, mark the selected row.
13. In the Work type field, select 'Counting'.
14. In the Work class ID field, enter or select a value.
15. Click Save.
16. Click Work line breaks.
17. Click New.
18. In the Sequence number field, enter a number.
 - The sort order is from the smallest number to the largest number. The value must be more than 0 (zero).
19. Click Save.
20. Close the page.
21. Close the page.

Create a cycle counting plan

1. Go to Warehouse management > Setup > Cycle counting > Cycle count plans.
2. Click New.
3. In the Cycle counting plan ID field, type a value.
4. In the Description field, type a value.
5. In the Maximum number of cycle counts field, enter a number.
6. In the Work template field, enter or select a value.

7. Click New.
8. In the Sequence number field, enter a number.
 - The sort order is from the smallest number to the largest number. The value must be more than 0 (zero).
9. In the Description field, type a value.
10. Click Save.
11. Click Define product query.
12. In the list, mark the selected row.
13. In the Criteria field, enter or select a value.
14. Click OK.
15. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warehouse management on-hand entries cleanup job

2/18/2021 • 4 minutes to read • [Edit Online](#)

The performance of queries that are used to calculate on-hand inventory is affected by the number of records in the tables that are involved. One way to help improve the performance is to reduce the number of records that the database must consider.

This topic describes the on-hand entries cleanup job, which deletes unneeded records in the `InventSum` and `WHSInventReserve` tables. These tables store on-hand information for items that are enabled for warehouse management processing. (These items are referred to as WHS items.) Deletion of these records can significantly improve the performance of on-hand calculations.

What the cleanup job does

The on-hand entries cleanup job deletes any records in the `WHSInventReserve` and `InventSum` tables where all the field values are 0 (zero). These records can be deleted because they don't contribute to the on-hand information. The job deletes only records that are below the `Location` level.

If negative physical inventory is allowed, the cleanup job might not be able to delete all the relevant entries. The reason for this limitation is that the job must allow for a special scenario where a license plate has multiple serial numbers, and one of those serial numbers has become negative. For example, the system will have zero on hand at the license plate level when a license plate has +1 pcs of serial number 1 and -1 pcs of serial number 2. For this special scenario, the job does a breadth-first deletion, where it tries to delete from lower levels first.

Schedule and configure the cleanup job

The on-hand entries cleanup job is available at **Inventory management > Periodic tasks > Clean up > Warehouse management on-hand entries cleanup**. Use the standard job settings to control the scope and schedule for running the job. In addition, the following settings are provided:

- **Delete if not updated for this many days** – Enter the minimum number of days that the job should wait before it deletes an on-hand entry that has dropped to zero quantity. Use this setting to help reduce the risk of deleting on-hand entries that are still being used. If you want cleanup to occur as soon as possible, either enter 0 (zero) or leave the field blank.
- **Maximum execution time (hours)** – Enter the maximum execution time of the cleanup job, in hours. If the job isn't completed before this time passes, it will save the work that it has completed so far and then close itself. This capability is especially relevant for implementations that have high inventory use. In these cases, you should schedule the job to run at times when the system load is as light as possible. If you want the batch job to continue to run until it's completed, either enter 0 (zero) or leave the field blank. This setting is available only if the related feature has been [turned on in your system](#).

Although you can run the job during regular business hours, we recommend that you run it outside working hours. In this way, you help prevent conflicts that can occur if a user is working with a record that is also being cleaned up.

If the job tries to delete a record for an item while that record is being used by another user, a deadlock error occurs for either the cleanup job or the user.

When the job runs, it has a commit size of 100. In other words, it will try to commit one time for every 100

deletions. However, because some deletions are set-based, there might be scenarios where more than 100 records can be deleted in the same transaction. Therefore, lock escalations can still sometimes occur.

Possible user impact

Users might be affected if the on-hand entries cleanup job deletes all the records for a given level (such as the license plate level). In this case, the functionality for seeing that inventory was previously available on-hand at a license plate might not work as expected because the relevant on-hand entries are no longer available. This can, for example, be experienced in the following situations:

- On the **On-hand list**, when the user deselects the condition **Quantity < > 0** or selects the condition **Closed transactions** in the **Dimensions display** settings.
- In a **Physical inventory by inventory dimension** report for past periods, when the user sets the **As of date** parameter.

However, the performance improvement that the cleanup job provides should make up for these small losses in functionality.

Make the Maximum execution time setting available

By default, the **Maximum execution time** setting isn't available. If you want to use it, you must use [feature management](#) to turn on the related feature in your system. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Maximum execution time for the warehouse management on-hand entries cleanup job*

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inventory journals

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how you can use inventory journals to post various types of physical inventory transactions.

The inventory journals in Supply Chain Management are used to post physical inventory transactions of various types, such as the posting of issues and receipts, inventory movements, the creation of bills of materials (BOMs), and the reconciliation of physical inventory. All these inventory journals are used in a similar way, but they are divided into different types.

Types of inventory journals

The following types of inventory journals are available:

- Movement
- Inventory adjustment
- Transfer
- BOM
- Item arrival
- Production input
- Counting
- Tag counting

Movement

When you use an inventory movement journal, you can add cost to an item when you add inventory, but you must manually allocate the additional cost to a particular general ledger account by specifying a general ledger offset account when you create the journal. This inventory journal type is useful if you want to overwrite the default posting accounts.

Inventory adjustment

When you use an inventory adjustment journal, you can add cost to an item when you add inventory. The additional cost is automatically posted to a specific general ledger account, based on the setup of the item group posting profile. Use this inventory journal type to update gains and losses to inventory quantities when the item should keep its default general ledger offset account. When you post an inventory adjustment journal, an inventory receipt or issue is posted, the inventory values are changed, and ledger transactions are created.

Transfer

You can use transfer journals to transfer items between stocking locations, batches, or product variants without associating any cost implications. For example, you can transfer items from one warehouse to another warehouse within the same company. When you use a transfer journal, you must specify both the "from" and "to" inventory dimensions (for example, for Site and Warehouse). The on-hand inventory for the defined inventory dimensions is changed accordingly. Inventory transfers reflect the immediate movement of material. In-transit inventory isn't tracked. If in-transit inventory must be tracked, you should use a transfer order instead. When you post a transfer journal, two inventory transactions are created for each journal line:

- An inventory issue at the "from" location.
- An inventory receipt at the "to" location.

BOM

When you report a BOM as finished, you can create a BOM journal. By using a BOM journal, you can post the

BOM directly. This posting generates an inventory receipt of the product, together with an associated BOM and an inventory issue of the products that are included in the BOM. This inventory journal type is useful in simple or high-volume production scenarios where routes aren't required.

Item arrival

You can use the item arrival journal to register the receipt of items (for example, from purchase orders). An item arrival journal can be created as part of arrival management from the **Arrival overview** page, or you can manually create a journal entry from the **Item arrival** page. If you enable the item arrival journal name to check for picking locations, Supply Chain Management looks for a location for received items and, if there is room, generates location destinations for the incoming items.

Production input

Production input journals work like the item arrival journals but are used for production orders.

Counting

Counting journals let you correct the current on-hand inventory that is registered for items or groups of items, and then post the actual physical count, so that you can make the adjustments that are required to reconcile the differences. You can associate counting policies with counting groups to help group items that have various characteristics, so that those items can be included in a counting journal. For example, you can set up counting groups to count items that have a specific frequency, or to count items when stock falls to a particular level. For information about how to define counting groups, see [Define inventory counting processes](#).

Tag counting

Tag counting journals are used to assign a numbered tag to a count lot. The tag should contain a tag number, item number, and item quantity. To ensure that a tag is used only one time, and that all tags are used, every item number should have a unique set of tags that has its own number sequence. Three status values can be set for each tag:

- **Used** – The item number is counted for this tag.
- **Voided** – The item number is voided for this tag.
- **Missing** – The item number is missing for this tag.

When you post a tag counting journal, a new counting journal is created, based on the tag counting journal lines. For more information about tag counting, see [Inventory tag counting](#).

Working with journals

A journal can be accessed by only one user at a time. If several users must access journals at the same time to create journal lines, those users must select journals that aren't currently being used, to prevent information from being overwritten. In situations where multiple departments use the same journal type, it's helpful to create multiple journal names (for example, one per department). It can also be helpful to divide journals so that each posting routine is entered in its own unique inventory journal. For posting routines that are associated with inventory transactions, create one journal for periodic inventory adjustments and another for inventory counting.

Posting journal lines

You can post the journal lines that you create at any time until you've locked an item from additional transactions. The data that you enter in a journal remains in that journal, even if you close the journal without posting the lines.

Data entity support for inventory journals

Data entities support the following types of integration scenarios:

- Synchronous service (OData)
- Asynchronous integration

For more information, see [Data entities](#).

NOTE

Not all inventory journals are OData-enabled, therefore you cannot use the Excel data connector to get data published, updated, and imported back to Supply Chain Management.

Another difference between the journal data entities is the ability to use composite entities that include both the header and line data. Currently, you can use the composite entities for:

- Inventory adjustment journal
- Inventory movement journal

These two inventory journals only support the *Initialize stock* scenario as part of a data management import project:

- When a journal header number is not specified, but a number sequence is specified for the journal type, the import job will automatically create journal headers per 1000 lines. For example, importing 2020 lines will result in the following three journal headers:
 - Header 1: will contain 1000 lines
 - Header 2: will contain 1000 lines
 - Header 3: will contain 20 lines
- It is assumed that unique line information exists per inventory dimension, which can be a product, storage, and tracking dimension. Therefore, it's not possible to import journal lines where only the date field differs on the lines within the same import project.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inventory locations

2/18/2021 • 2 minutes to read • [Edit Online](#)

Inventory locations are used with basic warehousing (WMS I) to determine where items are stored and where items are picked from in a WMS I warehouse.

This topic applies to features in the Inventory management module. It does not apply to features in the Warehouse management module.

The term location refers to the place that items are stored and drawn from.

For each location, the place where the item is inserted can also be specified. By default, they are the same. Items are usually inserted and drawn from the same side of a location, but not always. For example, items that are stored in live storage racks are inserted from one aisle and drawn from another. The main input is given by a location name, which is usually determined by its coordinates: warehouse, aisle, rack, shelf, and bin. This name or ID can be entered manually or generated from the location coordinates—for example, 01-02-03-4 for aisle 1, rack 2, shelf 3, bin 4 in the Inventory locations page. Location properties

A location has the following characteristics:

- Size (height, width, depth, and thereby volume)
- Warehouse, aisle, rack, shelf, and bin position
- Location type (bulk location, picking location, inbound dock, outbound dock, production input location, inspection location, or kanban supermarket)

Check text can be used in online systems to verify that the operator has selected the correct location for a specific item. This check text can be created manually or by default.

Sort codes

Use sort codes to optimize the handling of picking lines, which describe the information that is required for picking items from inventory, including the picking order. Sort codes can be specified by the aisle and other coordinates, or assigned manually for the location.

Blocked locations

Occasionally, you might want to indicate that a location is blocked for a period of time, for example, to allow for repairs. At other times, you may want to indicate blocking of only the input or only output.

Tree structure

In the Inventory locations page, you can view the warehouse layout in a tree structure based on the coordinates of inventory locations, in a defined display format.

Maintain inventory locations via the warehouse form

It is possible to copy locations from one warehouse to another and to create locations via a wizard. Before you run the wizard you should make sure that you have defined the default location names on the Warehouse page.

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inventory statuses

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article describes how you can use inventory statuses to categorize and keep track of inventory.

Set up and use inventory statuses

You can use inventory statuses to categorize inventory. You can then initiate appropriate actions, such as replenishment or put-away work.

Here are some examples of ways that you can use inventory statuses:

- Create inventory statuses for on-hand inventory, inbound transactions, and outbound transactions.
- Specify a default inventory status for warehouse transactions.
- Change an inventory status for items before arrival, during arrival, or when the items are put away during inventory movement.
- Use an inventory status to price items that are returned and to plan item coverage during master planning.

An inventory status is one of the dimensions in the storage dimension group. Inventory statuses can be categorized as available or unavailable, and you can use the **Inventory blocking** parameter to block items that have an unavailable inventory status. Items that have a blocked status are considered physical inventory, and they can't be used on a production order, sales order, transfer order, or outbound transaction.

You can use warehouse items that have either available or unavailable inventory statuses for inbound work. For example, you create an available status that is named *Ready*, an unavailable status that is named *Damaged*, and a blocked status that is named *Blocked*. When you create a purchase order for received or returned items, if any items are damaged or broken, you can change the inventory status of those items to *Damaged* on the purchase order line. After these items are received, the status is automatically set to *Blocked*. If you scan the damaged items by using a mobile device, Supply Chain Management can use location directives and work templates to show information about an appropriate location or range of locations where you can put away those items. For returned items, an issue type of *Reservation* is created on the **Inventory transactions** page.

NOTE

You can't change the status of inventory at locations where open work exists. For example, if you did a purchase receive for an item, but didn't do the putaway step, then open work would exist for the receiving location and you would get an error if you tried to change the status of inventory at that location. Completing or cancelling the related work would allow you to change the status.

For outbound work, use items that have an available inventory status. If you have items that have a status of *Broken*, and master planning is run on these items, the items are considered missing, and inventory is automatically replenished.

After you set up inventory statuses, you can set the default inventory status for a site, item, and warehouse. You can also set a default status for sales, transfer, and purchase orders. The default status for sales orders and outbound transfer order can't have the **Inventory blocking** option set to *Yes*. The inventory status that is inherited from the default settings on a site, warehouse, item, purchase order, transfer order or sales order can be changed by using the mobile device, or on the purchase order, sales order, or transfer order line.

To plan coverage for items that have an available inventory status, select the **Coverage plan by dimension** option for a storage dimension on the **Storage dimension groups** page. When you open the **Item Coverage**

wizard, items that have an available status appear on the **Status** page. To create coverage settings for these items, select the inventory status ID for the available inventory statuses. Based on the coverage settings, you can calculate the item requirements and forecast the supply and demand of available items during master planning. You can't create an item coverage setup that has a blocked inventory status. Alternatively, use the **Item coverage** page to create or modify the item coverage parameters.

Change inventory statuses

You can change inventory statuses either by using the **On-hand by location** page or by using the *Inventory status change* periodic task.

- When using the *Inventory status change* periodic task, you can select which records to include and set the task to run in the batch at the desired interval.
- To change inventory status as an ad-hoc process, go to **On-hand by location** page, select the relevant records, and then select the **Inventory status change** button.

NOTE

The *Change the inventory status of items controlled by tracking dimensions* feature allows you to change the inventory status of items controlled by tracking dimensions, including the ability to update only selected records. Use [feature management](#) to enable the feature as needed. When the feature is enabled, you'll be able to do the following:

- On the **On-hand by location** page, you can group lines based on shown dimensions using the **Display dimensions** button and change the status for the selected lines.
- On the **On-hand by location** page, you can select multiple records and then use the **Inventory status change** button to change all of them at once.
- On the **Inventory status change** periodic task you will be able to filter by tracking dimensions.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inventory tag counting

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides information about tag counting, which you use to compare the actual contents of a warehouse with the on-hand inventory.

By creating lines on the **Tag counting** page, you place a tag number on each inventory item, such as a number from 1 to 500. During the count, you enter the item number and the quantity on a corresponding tag. This tag can then be used as the basis for input in the tag counting journal. After you post the tag counting journal, a new counting journal is created on the **Counting** page. The new journal is based on the tag counting journal lines that you created. To tag-count items by a specific inventory dimension, select the dimension on the **Display dimension** page that is displayed when you create the tag counting journal. For example, to count items in a specific warehouse, select the **Warehouse** check box. If the **Lock items during count** slider on the **Inventory and warehouse management parameters** page is selected, items can't be physically updated during counting. However, items in tag counting journals aren't locked during counting. Inventory transactions aren't created until the tag counting lines are posted and transferred to a counting journal. If tags are entered randomly, and you want to identify missing tags, click the **Tag** column header to sort the lines by tag.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work line details

2/18/2021 • 6 minutes to read • [Edit Online](#)

The **Work line details** page shows a comprehensive, sortable, and filterable list of the individual work lines in your system. It provides a complete overview of work that is being planned and executed in the warehouse. You can easily switch between viewing all work lines and viewing only open work lines. Details that are provided for each line include the work status, item number, location, work quantity, load ID, and shipment ID.

Turn on the work line details feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Work line details*

Open and use the Work line details page

To view the list of work line details, go to **Warehouse management > Work > Work line details**. From here, you can perform the following actions:

- Use the **Filter** field to search for lines that have a specific value for any available parameter. (Available parameters include many parameters that aren't shown as columns in the grid.)
- Use the **Show closed** check box to show or hide closed lines.
- Select **Display dimensions** to open the **Dimensions display** dialog box, where you can choose to show or hide various dimension columns in the grid.
- Select any column heading to open a menu where you can choose to sort or filter the list by values in that column.
- Select a work line, and then select **Change location** to open a dialog box where you can change the location for that work line. The location that you specify will override the setup of the location directive.
- Select a work line, and then select **Cancel work line** to open a dialog box where you can partially or fully reduce the quantity of that work line.
- Adjust quantities.
- View the transactions behind any work line.

Try out the feature

This section provides a three-part demo that shows how to work with work line details.

Make sample data available

To work through this demo by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this demo as guidance when you work on a production system. However, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Verify that the scenario setup includes enough available inventory

If you're working with the USMF demo data, you should first make sure that your system is set up so that enough inventory is available at each relevant pick location. For this demo, the expectation is that you have the following inventory available:

- **Item M9200:** 45 ea. (or more)
- **Item M9202:** 10 ea. (or more)

Follow these steps to verify that enough inventory is available and to make any adjustments that are required.

1. Go to **Warehouse management > Setup > Location directives**, and determine which picking locations are used for sales order picking at warehouse 51. (For more information, see [Control warehouse work by using work templates and location directives](#).)
2. Check the inventory levels at the relevant locations.
3. Adjust inventory as required. You can create manual movements, use replenishment, or apply any other flow to adjust the inventory.

Part 1: Create picking work

Before you start to create work, make sure that your warehouse is set up to respond to work requests in the expected manner.

Follow these steps to create some picking work.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select **New** to open the **Create sales order** dialog box.
3. In the **Create sales order** dialog box, set the following values:
 - On the **Customer** FastTab, set the **Customer** account field to *US-001*.
 - On the **General** FastTab, set the **Warehouse** field to *51*.
4. Select **OK** to create the sales order and close the dialog box.
5. Your new sales order is opened. It includes a new, empty row in the **Sales order lines** grid. On this order line, set the following values:
 - **Item number:** *M9200*
 - **Quantity:** *20*
 - **Unit:** *ea*
6. Select the new order line, and then, on the **Inventory** menu, select **Reservation** to open the **Reservation** page.
7. On the **Reservation** page, select **Reserve lot** to reserve the selected line's full quantity in the warehouse.
8. Close the **Reservation** page to return to the sales order.
9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**. The system creates a shipment, adds it to a new load, and creates the required work.
10. Create a second sales order for the same customer account and warehouse that you used for the first order. Add the following two order lines to this order:
 - **Line 1:** Set the **Item number** field to *M9200*, the **Quantity** field to *25*, and the **Unit** field to *ea*.
 - **Line 2:** Set the **Item number** field to *M9202*, the **Quantity** field to *10*, and the **Unit** field to *ea*.
11. Repeat steps 6 through 8 to reserve the inventory for each order line (one at a time), and then repeat step 9 to release the order to the warehouse.

Part 2: Change the location for a work line

1. Go to **Warehouse management > Work > Work line details**.
2. Find and select one of the work lines that you created for this demo.
3. Select **Change location** to open the **Select new location** dialog box.
4. In the **Select new location** dialog box, in the **Location** field, select a new location for the work line.
5. Select **OK** to apply your change and close the dialog box.

IMPORTANT

You can submit location changes only if the new location has enough inventory available (for a pick), or if it passes location-type validation (for a put).

Part 3: Change the quantity of a work line or cancel a work line

1. Go to **Warehouse management > Work > Work line details**.
2. Find and select one of the work lines that you created for this demo. Note that you can cancel or change quantities only for work lines where the work type is *pick*.
3. Select **Cancel work line** to open the **Quantity to cancel** dialog box.
4. In the **Quantity to cancel** dialog box, change the value in the **Quantity** field to specify the quantity that should be *subtracted from* the quantity that is currently specified for the line. By default, the **Quantity** field shows the full quantity.
 - If you cancel the full quantity, the **Work status** value will be changed to *Canceled*, but the **Work quantity** field will still show the original value.
 - If you cancel just part of the quantity, the **Work quantity** field will be updated to show the new value, but the **Work status** value won't change.
5. Select **OK** to apply your change and close the dialog box.

IMPORTANT

If you cancel just part of the quantity for a work line, you must also remove the obsolete quantity from the load line. Otherwise, unless under-delivery is set up correctly, the load line can't be ship-confirmed.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Location license plate positioning

2/18/2021 • 10 minutes to read • [Edit Online](#)

License plate location positioning lets you see where a license plate is located in a multi-pallet location, such as a location that uses double-deep pallet racking.

The feature adds a sequence number to each license plate that is put into a storage location. This sequence number is used to order the license plates in the storage location. Therefore, the feature intelligently supports scenarios where customers are using a gravity racking system and must know, for picking purposes, which license plate is front-facing.

This topic presents a scenario that shows how to set up and use the feature.

Turn on the Location license plate positioning feature

Before you can use license plate location positioning, the feature must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Location license plate positioning*

Example scenario

Make sample data available

To work through this scenario by using the values that are suggested here, you must work on a system where sample data is installed. Additionally, you must select the **USMF** legal entity before you start.

Set up the feature for this scenario

Complete the following procedures to set up the *Location license plate positioning* feature for the scenario that is presented in this topic.

Location profiles

The feature must be turned on in the location profile for every location where it will be used.

1. Go to **Warehouse management > Setup > Warehouse > Location profiles**.
2. In the list of location profiles in the left pane, select **BULK-06**.
3. On the **General** FastTab, two new options have been added by the feature. Set the following values:

- **Enable license plate position:** *Yes*

When this option is set to *Yes*, the license plate position will be maintained for license plates in the location.

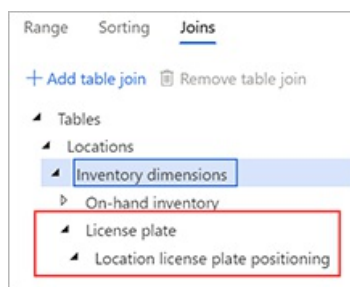

- **Display mobile device LP position:** *Yes*

When this option is set to *Yes*, the license plate position will be shown to mobile device users during adjustment and counting. You can change the setting of this option only when the feature is turned on.

4. Select **Save**.

Location directives

1. Go to **Warehouse management > Setup > Location directives**.
2. In the left pane, make sure that the **Work order type** field is set to *Sales orders*.
3. In the list of location directives, select **61 SO Pick order**.
4. On the Action Pane, select **Edit**.
5. On the **Lines** FastTab, select the line that has a **Sequence number** value of 2.
6. On the **Location Directive Actions** FastTab, select the line that has a **Name** value of *Pick for less than pallet* (it should be the only line), and change its **Sequence number** value to 2.
7. Select **New** above the grid to add a line for a new location directive action.
8. On the new line, set the following values:
 - **Sequence number:** 1
 - **Name:** *Pick position 1*
9. While the new line is still selected, select **Edit query** above the grid.
10. In the query editor, select the **Joins** tab.
11. Expand the **Locations** table join to show the join to the **Inventory dimensions** table.
12. Expand the **Inventory dimensions** table join to show the join to the **On-hand inventory** table.
13. Select **Inventory dimensions**, and then select **Add table join**.
14. In the list of tables that appears, in the **Relation** column, select **License plate (License plate)**. Then select **Select** to add **License plate** to the **Inventory dimensions** table join.
15. While **License plate** is still selected, select **Add table join**.
16. In the list of tables that appears, in the **Relation** column, select **Location license plate positioning (License plate)**. Then select **Select** to add **Location license plate positioning** to the **Inventory dimensions** table join.

17. Select **OK** to confirm the updated joined tables and close the query editor.
18. On the **Location Directive Actions** FastTab, select **Edit query** again to reopen to the query editor.
19. On the **Range** tab, select **Add** to add a line to the grid.
20. On the new line, set the following values:
 - **Table:** *Location license plate positioning*
 - **Derived table:** *Location license plate positioning*
 - **Field:** *LP Position*
 - **Criteria:** 1

Range Sorting Joins			
+ Add Remove			
✓ Table	Derived table	Field	Criteria
Locations	Locations	Warehouse	61
Locations	Locations	Location	
On-hand inventory	On-hand inventory	Physical inventory	>0
On-hand inventory	On-hand inventory	No open quantities	No
On-hand inventory	On-hand inventory	Item number	
Location license plate positioning	Location license plate positioning	LP Position	1

21. Select **OK** to confirm your changes and close the query editor.

Set up sample data for this scenario

For this scenario, the user must sign in to the warehousing mobile app by using a worker who is set up for warehouse *61* to perform work. The user must also complete transactions.

Because the *Location license plate positioning* feature adds a new identifier for license plate positions in a location, you must first create some data to support the scenario.

Spot-count the first location

1. Open the warehousing mobile app, and sign in to warehouse *61*.
2. Go to **Inventory > Spot Counting**.
3. On the **Spot Counting** page, set the **Location** field to *01A01R1S1B*.
4. Select **OK**.

The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

5. Select **Refresh** to add a count in the location.
6. On the **Cycle Count: Add New LP or Item** page, select the **Item** field, and then enter the value *A0001*.
7. Select **OK**.
8. On the **Cycle Count: Add New LP or Item** page, select the **LP** field, and then enter the value *LP1001* (or any other license plate number of your choice).

The **Cycle Count: Add New LP or Item** page shows **License Plate Position 1**.

9. Select **OK**.

You must now specify the quantity of the item that is counted on the license plate.

10. Set the **Qty** field to *10*.
11. Select **OK**.

The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

12. Select **Refresh** to add another count in the location.
13. On the **Cycle Count: Add New LP or Item** page, select the **Item** field, and then enter the value *A0002*.
14. Select **OK**.
15. On the **Cycle Count: Add New LP or Item** page, select the **LP** field, and then enter the value *LP1002* (or any other license plate number of your choice, provided that it differs from the license plate number that you specified earlier).

16. Change the license plate position by setting the **LP Position** field to *2*.

17. Select **OK**.

18. Specify the quantity of the item that is counted on the license plate by setting the **Qty** field to *10*.

19. Select **OK**.

The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

20. Select **OK**.

Work is now completed.

Spot-count the second location

1. On the **Spot Counting** page, set the **Location** field to *01A01R1S2B*.

2. Select **OK**.

The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

3. Select **Refresh** to add a count in the location.

4. On the **Cycle Count: Add New LP or Item** page, select the **Item** field, and then enter the value *A0002*.

5. Select **OK**.

6. On the **Cycle Count: Add New LP or Item** page, select the **LP** field, and then enter the value *LP1003* (or any other license plate number of your choice, provided that it differs from the both the license plate numbers that you specified in the previous procedure).

The **Cycle Count: Add New LP or Item** page shows **License Plate Position 1**.

7. Select **OK**.

8. Specify the quantity of the item that is counted on the license plate by setting the **Qty** field to *10*.

9. Select **OK**.

The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

10. Select **OK**.

Work is now completed.

Work details

NOTE

Spot counts from the mobile app create cycle counting work in Microsoft Dynamics 365. The work requires that the counts be accepted before they are posted to inventory.

1. Sign in to Dynamics 365 Supply Chain Management.

2. Go to **Warehouse management > Work > Work details**.

3. On the **Overview** tab, look for the lines that have the following values:

- **Work order type:** *Cycle counting*
- **Warehouse:** *61*

- **Work status:** *Pending review*

Two work IDs should have been created for these lines. The counts for both these work IDs must be accepted.

4. In the grid, select the first work ID for the *Cycle counting* work order type.

5. On the Action Pane, on **Work** tab, in the **Work** group, select **Cycle counting**.

Two lines are shown, one for each item and license plate. The values in the **Counted quantity**, **Location**, **License plate**, and **Item** fields should match the count entries that you created on the mobile device. If any of these fields aren't visible, select **Display dimensions** on the Action Pane to add them to the grid.

6. Select both lines.

7. On the Action Pane, select **Accept count**.

8. You receive a "Posting - Journal" message. Select **Message details** to view the posted journal number.

9. Close the message details.

10. Refresh the **Work** page.

The first work ID has been closed and is no longer shown.

TIP

To view closed work, select the **Show closed** check box above the grid.

You will now accept the work for the license plate in the *01A01R1S2B* location.

11. On the **Overview** tab, select the second work ID for the *Cycle counting* work order type.

12. On the Action Pane, on **Work** tab, in the **Work** group, select **Cycle counting**.

One line is shown, for the item and license plate. The values in the **Counted quantity**, **Location**, **License plate**, and **Item** fields should match the count entries that you created on the mobile device.

13. Select the line.

14. On the Action Pane, select **Accept count**.

15. You receive a "Posting - Journal" message. Select **Message details** to view the posted journal number.

16. Close the message details.

17. Refresh the **Work** page.

The second work ID has been closed and is no longer shown.

TIP

To view closed work, select the **Show closed** check box above the grid.

On-hand by location

1. Go to **Warehouse management > Inquiries and reports > On-hand by location**.

2. Set the following values:

- **Site:** *6*
- **Warehouse:** *61*

- **Refresh across locations:** *Yes*

3. Notice that location *01A01R1S1B* has two license plates:

- **A0001**, where the **LP Position** field is set to *1*
- **A0002**, where the **LP Position** field is set to *2*

4. Notice that location *01A01R1S2B* has one license plate:

- **A0002**, where the **LP Position** field is set to *1*

Sales order scenario

Now that the *Location license plate positioning* feature has been set up, and the inventory has been staged, you must create a sales order to generate picking work that will direct the warehouse worker to pick item *A0002* from the inventory location where the pallet ID is in position *1*.

1. Go to **Sales and marketing > Sales orders > All sales orders**.

2. On the Action Pane, select **New**.

3. In the **Create sales order** dialog box, set the following values:

- **Customer account:** *US-004*
- **Warehouse:** *61*

4. Select **OK**.

5. A new line is added to the grid on the **Sales order lines** FastTab. On this new line, set the following values:

- **Item number:** *A0002*
- **Quantity:** *1*

6. On the **Inventory** menu above the grid, select **Reservation**.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve inventory for the order line.

8. Close the **Reservation** page.

9. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

You receive an informational message that indicates the wave ID and shipment ID that were created for the order.

10. On the **Sales order lines** FastTab, on the **Warehouse** menu above the grid, select **Work details**.

11. The **Work** page appears and shows the work that was created for the sales line. Make a note of the work ID that is shown.

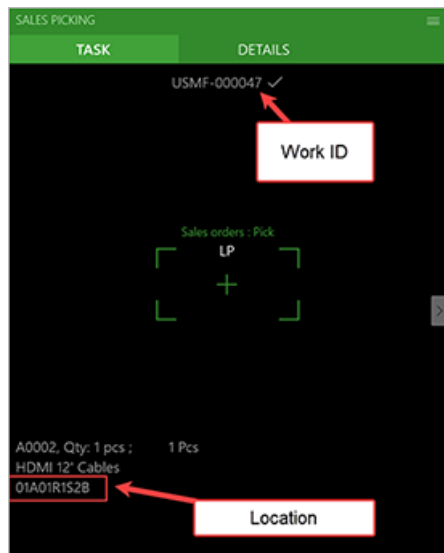

Sales picking scenario

1. Open the mobile app, and sign in to warehouse *61*.

2. Go to **Outbound > Sales picking**.

3. On the **Scan a work ID / license plate ID** page, select the **ID** field, and then enter the work ID from the sales line.

4. Notice that the picking work directs you to pick item *A0002* from location *01A01R1S2B*. You receive this instruction because item *A0002* is on a license plate that is in position *1* in that location.

5. Enter the license plate ID that you created for the location, and then follow the prompts to pick the sales order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Change work pool on work

2/18/2021 • 5 minutes to read • [Edit Online](#)

You can use work pools to organize work into groups. For example, you can create a work pool to classify work that occurs in a specific warehouse location.

The *Change work pool on work* feature adds a **Change work pool** button to the Action Pane for work items. Therefore, warehouse managers can easily change the work pool of existing work. This feature lets managers react quickly to changes on the warehouse shop floor, and it helps improve their ability to adapt to changing situations and the need to transfer work to another work pool.

Turn on the Change work pool on work feature

Before you begin to set up or use this feature, you must make sure that it's available in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Change work pool on work*

Set up the Change work pool on work feature

To use this feature, you must have some work pools set up. You might also set up your work templates so that they automatically assign a pool. If you want to work through the example scenario that is provided later in this topic, set up your system as described in this section.

Set up work pools

Work pools let you organize work items by type. To work with the *Change work pool on work* feature, you must have at least two work pools available. To view and add work pools, follow these steps.

1. Go to **Warehouse management > Setup > Work > Work pools**.
2. If you're working with demo data from the **USMF** company and will work through the example scenario later in this topic, add two work pools that have the following settings:
 - Work pool 1:
 - **Work pool ID:** *Webshop*
 - **Description:** *Web Shop*
 - Work pool 2:
 - **Work pool ID:** *CallCenter*
 - **Description:** *Call Center*
3. On the Action Pane, select **Save**.

Set up work templates

For each of your work templates, you can set a default work pool, as you require. For each relevant template, you assign a work pool in the **Work pool ID** column. In this case, all work items that are generated by using a given template automatically inherit the assigned work pool. If you're working with the demo data from the **USMF** company and will work through the example scenario later in this topic, follow these steps.

1. Go to **Warehouse management > Setup > Work > Work templates**.

2. On the Action Pane, select **Edit** to put the page into editing mode.
3. Edit the template by setting the following values:
 - **Work template:** *62 Pick to pack*
 - **Work pool ID:** *Webshop*
4. Select **Save**.

Example scenario

This scenario shows how to change the stream of processing for an existing work item by changing its work pool. It uses demo data from the USMF company and the settings that were suggested earlier in this topic.

Create a sales order and release it to the warehouse

1. Confirm that there is enough on-hand inventory for items *A0001* and *A0002* in warehouse *62*. Go to **Inventory management > Inquiries and reports > On-hand list**, and edit the filters as shown here:
 - The **Warehouse** value begins with *62*.
 - The **Item number** value is either *A001* or *A002*.Demo data should have a quantity of 10 each.
Next, you must create a sales order.
2. Go to **Sales and marketing > Sales orders > All sales orders**.
3. On the Action Pane, select **New**.
4. In the **Create sales order** dialog box, set the following values:
 - **Customer account:** *US-007*
 - **Warehouse:** *62*
5. Select **OK** to create the sales order and close the dialog box.
6. The new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines** FastTab. On this line, set the following values:
 - **Item number:** *A0001*
 - **Quantity:** *2*
7. On the **Inventory** menu above the grid, select **Reservation**.
8. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
9. Close the page.
10. On the **Sales order lines** FastTab, select **Add line** to add another line to your sales order. On this line, set the following values:
 - **Item number:** *A0002*
 - **Quantity:** *2*
11. On the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
13. Close the page.
14. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.
15. You receive informational messages that show the wave ID and shipment ID that were created from the

release. Make a note of the wave ID.

Review the outbound wave

1. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
2. In the grid, search for the wave ID that was created from the release of the sales order.
3. Select the wave ID to view the details.
4. On the **Wave lines** FastTab, make sure that a shipment ID is shown for the sales order.

TIP

If the **Process wave at release to warehouse** option is set to *No* in the setup for the shipping wave template, you must manually process the wave by selecting **Process** from the **Wave** tab on the Action Pane to create work.

5. Make sure that the wave has been processed. This processing creates the required work.

View work details and change the work pool

You can use the **Work details** page to view the work that was created and to manage the work pool.

1. Go to **Warehouse management > Work > Work details**.
2. Select the row for the work that was just created. The **Order number** column will show the sales order number.

The **Work pool ID** field will be set to the work pool ID that was set up in the work template.

TIP

If you don't see the **Work pool ID** field, add the column to the grid, and then refresh the page.

3. To change the work pool that is associated with the work ID, on the Action Pane, on the **Work** tab, select **Change Work pool ID**.
4. In the **Change work pool** dialog box, on the **Parameters** FastTab, in the **Work pool ID** field, select *CallCenter*.
5. Select **OK** to apply your change.
6. Notice that the value of the **Work pool ID** field has now been changed to *CallCenter*.

IMPORTANT

When the **Change work pool** dialog box appears, the **Work pool ID** field might be blank by default. If the field is blank when you select **OK** to apply changes, you will remove the work pool completely from the work.

In addition to switching work pools, you can use this procedure to add a work pool to any work item that doesn't have one, or to remove a work pool from any work item that does have one.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Item consolidation - location utilization

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic provides information about functionality that makes it easy for warehouse managers to view and filter the volumetric utilization of locations across the warehouse. Managers can select locations and create inventory movement work directly from the **Item Consolidation** page to consolidate items and therefore make better use of warehouse space.

Turn on the features

Before you can use the features that are described in this topic, you must turn them on in your system. Admins can use the [Feature management](#) workspace to check the status of the features and turn them on if they are required. Turn on both the following features, in the order that they are listed in. (Both features are for the **Warehouse management** module.)

1. Warehouse location status
2. Item consolidation location utilization

Warehouse location status

The *Warehouse location status* feature adds four new fields to the **Locations** page to track additional information about the current state of the location:

- **Item number** – The item that is currently in the location. If the location contains multiple items, this field will be blank.
- **Last activity date and time** – The timestamp of the last warehouse transaction that was performed against the location.
- **Aging date** – The date when the inventory in the location was brought into the warehouse. This date is calculated based on the license plate aging date. Although this date is accurate for license plate-tracked locations, it might not be accurate for locations that aren't license plate-tracked.
- **Location status** – The status of the location. Four values are available:
 - **Undetermined** – The location profile doesn't track status. Therefore, the current status is unknown.
 - **Empty** – No inventory is currently in the location.
 - **Picking** – Outbound transactions have been performed against the location after it was last empty.
 - **Storage** – Only inbound transactions have been performed since the location was last empty.

These fields let warehouse managers get a better overview of the status of the locations in the warehouse. They also allow for more advanced reporting and filtering.

Set up item consolidation and location utilization

This section describes how to prepare your system to use item consolidation and location utilization. The procedures use sample values from the standard demo data. If you plan to work through the example scenario that is provided later in this topic, select the **USMF** legal entity (which contains the standard demo data), and create each record that is described in this section. If you don't plan to work through the example scenario, the values that are provided here can be considered examples of the types of setup that you must complete to use the features.

Released product

1. Go to **Product information management > Products > Released products**.
2. In the **Item number** field, select *M9201*, and open the details page.
3. On the Action Pane, on the **Manage inventory** tab, in the **Warehouse** group, select **Physical dimensions**.
4. On the **Physical dimension** page, on the Action Pane, select **New**.
A new line is added to the grid. The **Item number** field is preset.
5. In the **Unit** field, select *ea*. The remaining fields on the line are automatically set.
6. Select **Save**, and close the page.

Location profile

1. Go to **Warehouse management > Setup > Warehouse > Location profiles**.
2. In the list of location profiles, select **FLOOR-05**.
3. On the Action Pane, select **Edit**.
4. On the **General** FastTab, make sure that both the following options are set to *Yes*:
 - **Enable item in location**
 - **Enable location status**
5. Select **Save**.

IMPORTANT

If the **Enable item in location** and **Enable location status** options were already set to *Yes*, skip ahead to the instructions for setting up the **Dimensions** FastTab in step 10. If the options weren't already set to *Yes*, you must run a consistency check for the **Warehouse management** module after you manually set them. In this case, continue to the next step.

6. To run the consistency check, go to **System administration > Periodic tasks > Database > Consistency check**.
7. In the **Consistency check** dialog box, set the following values:
 - **Module:** *Warehouse management*
 - **Check/Fix:** *Check*
 - **From date:** Leave this field blank.
 - **Warehouse location status consistency check:** Select this check box.
8. Select **OK**.

TIP

When the consistency check is completed, you receive a notification. Open the [Action Center](#) to view the message. Select **Message details** to view the details.

If the message for the consistency check states, "Incorrect location status information found for location XXXX in warehouse XX," you must run the consistency check again. This time, set the **Check/Fix** field to *Fix error*. View the messages to make sure that no errors were found.

9. You must now finish setting up the location profile. Go back to **Warehouse management > Setup >**

Warehouse > **Location profiles**, select location profile **FLOOR-05**, and then, on the Action Pane, select **Edit**.

10. On the **Dimensions** FastTab, set the following values:

- **Volume utilization percentage:** *100*
- **Volumetric method used for inventory location:** *Use location volume*
- **Actual location height:** *10*
- **Actual location width:** *10*
- **Actual location depth:** *10*
- **Maximum weight:** *100*

11. Select **Save**.

Mobile device menu items

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New** to create a menu item for sorting.

3. In the header, set the following values:

- **Menu item name:** *Adjust In*
- **Title:** *Adjust In*
- **Mode:** *Work*
- **Use existing work:** *No*

4. On the **General** FastTab, set the following values:

- **Work creation process:** *Adjustment in*
- **Inventory adjustment types:** *Adjust in*

5. Select **Save**.

Mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.

2. In the list of menus, select **Inventory**.

3. On the Action Pane, select **Edit**.

4. In the **Available Menus And Menu Items** list, find and select the **Adjust In** menu item.

5. Select the right arrow button to move **Adjust In** to the **Menu Structure** list. In this way, you add the new menu item to the selected menu.

6. Select **Save**.

Movement types

1. Go to **Warehouse management** > **Setup** > **Inventory** > **Movement types**.

2. On the Action Pane, select **New**, and then set the following values:

- **Movement type code:** *CONSOLIDATE*
- **Description:** *Consolidate locations*
- **Work class ID:** *InvMov*

3. Select **Save**.

Example scenario

The following scenario uses the warehouse app on a mobile device to make an inventory *adjustment in* to two locations in the warehouse.

Add inventory to locations

1. Sign in to the mobile device as a user who is set up for warehouse *51*.
2. Go to **Inventory > Adjust In**.

You will now enter the first location adjustment.
3. In the **Adjustment in** task, select the location to make the inventory adjustment for. In the **LOC** field, select *LP-001*.
4. Confirm the location.
5. Create a license plate ID for the item that will be added to the location. In the **LP** field, enter *LP00101*.
6. Confirm the license plate.
7. Enter the item that will be added to the license plate. In the **ITEM** field, enter *M9201*.
8. Confirm the item.
9. Enter the quantity of the item that will be added. In the **QTY** field, enter *10*.
10. Confirm the quantity.

You receive a "Work Completed" message. You will now enter the second location adjustment.

11. In the **Adjustment in** task, select the location to make the inventory adjustment for. In the **LOC** field, select *LP-002*.
12. Confirm the location.
13. Create a license plate ID for the item that will be added to the location. In the **LP** field, enter *LP00201*.
14. Confirm the license plate.
15. Enter the item that will be added to the license plate. In the **ITEM** field, enter *M9201*.
16. Confirm the item.
17. Enter the quantity of the item that will be added. In the **QTY** field, enter *15*.
18. Confirm the quantity.

You receive a "Work Completed" message.

19. Select the Menu button (sometimes referred to as the hamburger or the hamburger button), and then select **Cancel** to exit the **Adjustment in** task.

Consolidate locations

1. Go to **Warehouse management > Periodic tasks > Item consolidation**.
2. In the header, select a warehouse to do the consolidation for. In the **Warehouse** field, enter *51*.

A record is shown for each location where item *M9201* was adjusted. The **Utilization percentage** column shows the volumetric utilization of each location.
3. To consolidate inventory, select all the locations that must be consolidated, and then, on the Action Pane, select **Consolidate Inventory**.
4. In the **Consolidate inventory** dialog box, specify the location and movement type that should be used to create the work for inventory movement. Set the following values:

- **Location:** *LP-001*

- **Movement type code:** *CONSOLIDATE*

5. Select **OK**.

6. You receive an informational message that shows the movement work that was created. Make a note of the movement work ID.

View movement work

1. Go to **Warehouse management > Work > Work details**.

2. View the work that was created. Use the movement work ID from the inventory consolidation to filter or search the work grid.

In this scenario, an existing location that had inventory was used as the inventory consolidation location. Therefore, only one work ID was created.

NOTE

The system creates one work ID for each move that must be completed. If you specify a location that already contains inventory, only one work ID is created. If you specify a new location, two work IDs are created.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot warehouse work

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you work with warehouse work in Microsoft Dynamics 365 Supply Chain Management.

I can't move license plates that have serial number items when blank issue and blank receipt are allowed on the tracking dimension group.

Issue description

You can't move a license plate by using a **Movement** menu item if the serial number has settings of *Blank issue allowed* and *Blank receipt allowed* on the tracking dimension group, and if there are multiple license plates in the same location, some of which have serial numbers and some of which don't have them.

Issue resolution

This issue will be fixed by changes that are deployed in [KB 4571546](#). Those changes will make the **Serial number** field optional when blank receipt and blank issue are allowed.

I receive the following error message in the warehouse app when I process movements: "The inventory owner %1 is not allowed in this process."

Issue description

The **Owner** tracking dimension is missing when the warehouse app is used to make movements. A regular inventory transfer journal from the Supply Chain Management client appears to work as intended and can be posted only if the **Owner** dimension is filled in.

Issue resolution

Microsoft has evaluated this issue and has determined that it's a feature limitation. Currently, warehouse management processes support only inventory that is owned by the legal entity.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work split

2/18/2021 • 7 minutes to read • [Edit Online](#)

Work split functionality lets you split large work IDs (that is, work orders that have several lines) into several smaller work IDs that you can then assign to multiple warehouse workers. In this way, the same work creation number can be picked simultaneously by several warehouse workers.

IMPORTANT

You can split only work orders that have a status of *Open* or *In-progress*.

Turn on the work split functionality

Before you can use the work split functionality, you must turn on the feature and its prerequisite feature in your system. Administrators can use the [feature management](#) settings to check the status of the features and turn them on as required.

First, turn on the prerequisite *Organization-wide work blocking* feature if it isn't already turned on. In the **Feature management** workspace, this feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Organization-wide work blocking*

NOTE

When this feature is activated, a data upgrade is automatically applied after the feature is turned on across all legal entities.

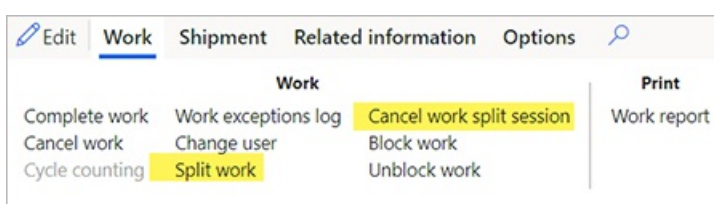

Next, turn on the *Work split* feature, which is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Work split*

Enhancements to the Work details and All work pages

The *Work split* feature adds the following two buttons to the **Work** tab on the Action Pane of the **Work details** and **All work** pages:

- **Split work** – Split the current work ID into multiple smaller work IDs that can be processed by separate workers.
- **Cancel work split session** – Cancel the work split session, and make the work available for processing.

IMPORTANT

The **Split work** button won't be available if any of the following conditions are met:

- The work status is something other than *Open* or *In progress*.
- A container ID is associated with the work ID. (A container can't be systematically split, because it requires physical actions.)
- The work is associated with a cluster.
- The work order type is something other than one of the following types:
 - Sales orders
 - Raw material picking
 - Transfer issue
- The work is currently being split by another user. If you try to open the splitting page for work that is already being split by another user, you receive the following error message: "The work with ID #### is currently being split. Retry in a few minutes. If you continue to receive this message, contact a supervisor."

A new work blocking reason, *Split work*, indicates when the work ID is in the process of being split. It's shown both on the **Split work** page and in the warehouse app if a user tries to run the work. When blocking reasons are used, the name of the **Blocked wave** field from the work ID is changed to **Blocked**.

Initiate a work split

The feature adds a new **Split work** page that lets users split work lines from the work ID. When the page is first opened, it shows lines that have a work status of *Open* and that are available to be split. On the Action Pane, select **Split work** to process the selected work.

To split work, follow these steps.

1. Open one of the following work pages:
 - **Work details** (Warehouse management > Work > Work details)
 - **All work** (Warehouse management > Work > All work)
2. In the grid, select a work ID to split. The **Work order type** field must be set to one of the following values:
 - Sales orders
 - Raw material picking
 - Transfer issue
3. On the Action Pane, on the **Work** tab, in the **Work** group, select **Split work**.

The **Split work** page appears and shows the work lines that are open and available to be split. By default, only available work lines are shown. To view all lines for the work ID (for example, lines that have a work type of *Put*), select the **Show all lines** check box above the grid.

The following message is shown: "Users can't process lines of the work until you finish splitting and close this page."

The **Work blocking reason** field for the current work will be set to *Split work*, and the work will be blocked.

Work			
<input type="checkbox"/> Show closed			
Overview General Blocking reasons			
<input checked="" type="checkbox"/> Work blocking reason	Description	Created date and time	Created by
<input type="checkbox"/> Split work	The work is currently being split.		

4. Select the lines to remove from the current work ID and add to a new work ID. The following events occur:

- When you split the work, the selected line or lines from the original work ID are canceled and then copied to a new work ID.
- The existing work template structure and the location of the put (and also future pick/put pairs) are preserved. Values for the following work ID fields are copied from the original work to the new work:
 - Load ID
 - Shipment ID
 - Work order type
 - Order number
 - Site
 - Warehouse
 - Work priority
 - Work pool ID
 - Wave ID
 - Work creation number
- The following fields aren't copied to the new work ID:
 - **Work ID** – A new work ID is generated from the appropriate number sequence.
 - **Work status** – This field is set to *Open*.
 - **Locked by** – This field is initially set to blank.
 - **Target license plate ID** – This field is left blank.
 - **Created date and time** – This field is set to the current date and time.
 - **Blocked wave/frozen** – This field is recomputed for the original work ID and the new work ID.

5. On the Action Pane, select **Split work**.

While the work is being split, the following message is shown: "Processing operation - Split work". While this message is visible, you can cancel the operation by selecting **Cancel** in the message box.

If the **Show all lines** check box is cleared, the line that was split off and canceled will no longer appear in the grid. If the check box is selected, you should see that the value of the **Work status** field for that line has changed to *Canceled*.

The following notification is shown to indicate that the new work ID has been created: "Work ##### has been created by splitting off from original work #####."

Other work lines from the original work ID (such as *Put* lines) will be adjusted as required to reflect the lines of work that have been canceled. For example, if the original work ID had a *Put* line for a quantity of 15, and *Pick* lines that have a total quantity of 10 were canceled, the new *Put* quantity on the original work ID will now be 5.

The new work won't immediately be assigned to any user. However, you can assign it to a user now, as required, by using the standard functionality of the **Work details** page.

IMPORTANT

You can split only work IDs that contain two or more available work lines. If you select **Split work** when there is only one work line, you will receive the following error message: "At least one work line must remain on initial work." In this case, no splitting will occur.

Finish a work split

To finish splitting work, the *Split work* blocking reason must be removed. There are two ways to complete this step:

- The user who is splitting the work closes the **Split work** page by selecting the **Close** button (X) in the upper-right corner. When the page is closed, the *Split Work* blocking reason will be removed. The *Blocked* state of this work will be recomputed and, if there are no remaining blocking reasons for this work, the work will be unblocked.
- Any user opens the work ID and selects the **Cancel work split session** button on the Action Pane. The *Split work* blocking reason will be removed, and the *Blocked* state of this work will be recomputed, just as when the **Split work** page is closed.

After the *Split work* blocking reason is removed, the work can be run on the mobile device, provided that the **Blocked** state is set to *No* on the work ID.

User blocking on the warehouse app

If you try to use the warehouse app to run picking work against a work ID that is being split, you will receive the following error message: "The work with ID ##### is currently being split." If you receive this message, select **Cancel**. You can then continue to process other work.

Other blocked operations

Any operations that modify work lines, work inventory transactions, or replenishment links that are related to work that is being split will fail, and the following error message will be shown: "The work with ID ##### is currently being split."

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warehouse configuration overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

This article explains how to configure a warehouse. It includes information about how to enable a warehouse layout and warehouse processes.

NOTE

This article applies to features in the **Warehouse management** module (advanced warehousing). It doesn't apply to warehouse features in the **Inventory management** module.

Warehouse layout

The Warehouse management system in Supply Chain Management gives you flexible ways to define your warehouse layout to meet changing needs, so that you can achieve optimal warehouse efficiency.

- You can establish high-priority and low-priority storages areas for optimum placement of goods.
- You can divide your warehouse into zones to accommodate various storage needs, such as temperature requirements, or various turnover rates for items.
- You can specify warehouse locations on any level (for example, site, warehouse, aisle, rack, shelf, and bin position).
- You can group locations by using physical capacity constraint settings.
- You can control how items are stored and picked, based on query-defined rules.

To use warehouse management in Supply Chain Management, you must create a warehouse and enable it for more advanced or specialized warehouse management activities. On the **Warehouses** page, select the **Use warehouse management processes** option.

Zone groups, zones, location types, and locations

As part of the process for enabling a warehouse layout, you must define warehouse zone groups, and zones, location profiles, location types, and locations.

- **Zone groups** – A logical or physical grouping of zones within a warehouse.
- **Zones** – A logical or physical grouping of locations within a warehouse.
- **Location profiles** – A logical or physical grouping of locations that have the same warehouse location process policies (for example, a mix of different item numbers can be stored there, and the same physical capacity constraints apply).
- **Locations types** – A logical or physical grouping of the warehouse locations. For example, you can create a location type for all staging locations. Mandatory settings on the **Warehouse management parameters** page drive the process of defining staging location types and the final shipping location type.
- **Locations** – The lowest level of location information. Locations are used to track where the on-hand inventory is stored and picked in a warehouse.

The entities that you create to define your warehouse layout are used in the queries that you set up in work templates to drive work orders in the warehouse. Therefore, when you define the zones, location types, and so on, consider how different areas in the warehouse are used for different processes. Additionally, consider factors such as the physical characteristics of a particular area. For example, there might be areas where you can use only a certain type of forklift truck. Or, if your company has both production and finished goods within the same facility, you might want to create a single warehouse in Supply Chain Management but then separate the two

operations by creating two zone groups. Give your entities descriptive names, so that it's easy to identify them when you use them in template queries.

Location stocking limits, location profiles, and fixed picking locations

You must consider the physical layout of the warehouse, both to determine storage capacities (location stocking limits and location profiles) and as part of your attempts to achieve optimal warehouse processes.

Location stocking limits help guarantee that work isn't created to request that inventory be put in a location that doesn't have the physical capacity to carry the inventory. For example, if some locations within a warehouse can hold only one pallet per location, location stocking limits can be enabled. The **Quantity** value can be set to **1**, and the **Unit** value can be set to **PL** within a specific location profile grouping.

If more advanced calculations are required to control the location capacity constraints, the location profile settings can be used. In this case, the weight and volume are considered when capacity calculations are done.

To achieve optimal outbound processes, you should evaluate whether to use fixed picking locations and/or packing locations. Often, minimum/maximum replenishment is used for replenishment processes from a bulk area to the fixed picking locations, and multiple fixed picking locations can be enabled within the same warehouse and for product variants. Consider the flexibility that can you achieve by enabling dedicated demand replenishment overflow locations that are used only for wave/load replenishment processing.

Location setup wizard

To quickly create the locations within a warehouse, you can use the **Location setup** wizard. As part of this process, you can easily maintain the format of the location names.

Warehouse processes

As part of the configuration of the warehouse, it's important that you enable warehouse processes according to business requirements. The most important components that you must configure are wave templates, work templates, work pools, and location directives.

Wave templates

Wave templates help enable the outbound "Release to warehouse" process. As soon as order lines are released (either directly from source documents, via batch job processes, or via loads that have already been created), the wave template functionality is used.

You can create three types of wave templates:

- **Shipping**
- **Production order**
- **Kanban**

Parameters are used to define how far the system should automatically go in the outbound work processing. A wave template is selected based on the wave template sequence and criteria that are specified in the template. If a template is listed at the top of the sequence, the criteria in that template are checked first. If the criteria can be met, the wave template is processed. Otherwise, the criteria in the next template are checked, and so on.

Therefore, it's a good idea to put the template that has the most specific criteria at the top of the wave template sequence list, so that it's processed first. For example, you want to process all the work for a specific carrier today and temporarily delay processing of the work for other carriers. In this case, the wave template that selects work for that carrier should be listed higher in the sequence than other templates. Otherwise, the work for other carriers might be processed before the work for that carrier is completed.

You must specify the wave process methods in each wave template. The methods that are available vary, depending on the wave template type.

Work templates

Work template definitions play an important role in the definition of warehouse management work processes. They define what work is performed, and how the work is done. Templates can also contain a directive code that links to a location directive to determine where work is performed. Work templates include a query that specifies the criteria for the work. Each template must include at least one Pick operation and one Put operation to drive the basic work operation of transferring on-hand inventory from one location to another.

If multiple workers must be able to process work for some of your warehouse operations, you might want to use the concept of *staging* for the inventory and separate the work execution into different work classes.

Work pools

Work pools are used to organize work into groups. For example, you can create a work pool to classify work that occurs in a particular warehouse location. For all work types except counting, you can assign a work pool to a work template. For cycle counting, you can assign a work pool on the following pages:

- Cycle count plans
- Cycle count thresholds
- Cycle count work by location
- Cycle count work by item

When you use work templates to create work, the work pool is automatically assigned to the work.

Work pool IDs can also be used to limit the type of work that is directed to a particular warehouse worker, provided that this functionality is configured on the relevant mobile device menu item.

Location directives

As the name suggests, location directives are used to direct the work transactions to the appropriate locations in the warehouse. In other words, they define where to pick and put.

To make it easier and quicker to define the actions that are associated with each location directive line, use one of the predefined strategies. For example, you can use the **Empty location with no incoming work** strategy to search for free locations in a warehouse, or you can use **FEFO batch reservation** strategy for outbound sales picking.

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a warehouse by using a warehouse configuration template

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to set up a warehouse by using a warehouse configuration template. There are several predefined configuration templates that you can use. For information about how to use these templates, see [Configuration data templates](#).

Scenarios where configuration templates can be helpful

Configuration templates can be helpful in many scenarios. Here are some examples:

- You've completed and tested a configuration setup in a test environment, and you now want to copy the setup to a production environment.
- You want to roll the warehouse setup out to several legal entities or create a new warehouse in the same legal entity.
- You want to quickly prepare for a demo of the warehouse functionality.
- You want existing items and warehouses to use the functionality in Warehouse management instead of the functionality in Inventory management.

This topic focuses on the first of these scenarios. It shows how you can use a configuration template to copy a configuration setup from a test environment to a production environment.

Copy a configuration setup from a test environment to a production environment

For this scenario, the configuration setup for a warehouse and some transaction processes already exist in a test environment. You now want to copy the configuration setup for the warehouse from the test environment to a production environment.

NOTE

It's important that you include other related setup data when you copy a configuration setup. For example, you want to set up products by copying the setup from a test environment. However, you can't set up a fixed picking location for a product before that product is created. Although individual configuration templates don't support this type of dependency, there are default data templates that support it. You can easily include these default data templates in a configuration process.

Export a default warehouse template

1. Open the **Data management** workspace.

NOTE

If you're using this workspace for the first time, you must load all the data entities before you continue.

2. Select the **Templates** tile, and then select **Load default templates** to load the default templates.

NOTE

Load default templates is available only in the **Enhanced** view. Select **Framework parameters**, and then, in the **View defaults** field, select **Enhanced view**.

3. After the default templates are loaded, you can change them so that they meet your business requirements.

NOTE

To load default templates and import templates, you must have system administrator access. This requirement helps guarantee that all entities are correctly loaded into the template.

4. Make sure that you're in the legal entity that you want to export the company-specific data from.
5. In the workspace, select **Export**.
6. Create a new export project.
7. Select **+ Add template**, and find the **400 - WMS** default warehouse template. This template adds data entities for warehouse configuration.

NOTE

If the data that you're exporting must be filtered (for example, you want to export only the data that is related to a specific warehouse), you must evaluate each data entity and add filtering via a query. Alternatively, you can export all data and then delete the records that aren't required in the destination files.

8. Select **Export**. Data that is related to all the data entities in the project is exported.

You can download a zip file for the data package. This file contains all the data in the selected format (for example, Excel format). As has been mentioned, some records in the data package files might have to be updated before you can import them into the production environment. If you update a record, make sure that you don't change the file name.

Import a warehouse configuration setup

1. In the destination environment, make sure that you're in the company that you want to import the warehouse data into.

NOTE

Before you do the import, you should identify any data dependencies. For example, the **Warehouse management** template includes a data entity that is named **Warehouse disposition codes**. This entity contains data that is related to the **Disposition codes** setup page (**Warehouse management** > **Setup** > **Mobile device** > **Disposition codes**). If an existing setup already handles the return process for sales orders, the **Return disposition code** field contains a value. The disposition code in this field is related to the **Disposition code** data entity, which is part of the **Sales and marketing** template. If the data from the **Disposition code** data entity isn't imported before the data from the **Warehouse disposition codes** field, the import will fail.

2. In the **Data management** workspace, select **Import**.
3. Create a new import project.
4. Select **+ Add file**, and upload the zip file for the data package.

5. Select **Import**. In the **Enhanced** view, you can use the **Filter** option to quickly get an overview of issues that might occur during the import.

The **View execution** log provides detailed information about each data entity that is imported. You can use the staging data view to quickly get to the target data. In this way, you can see what the imported data looks like on the related pages in the application. When you use the default data templates, the import sequence for each data entity works in the predefined manner, to help guarantee that all dependent data is imported first. If custom data entities are part of the project, you must make sure that the correct sequence is defined. For more information, see [Configuration data templates](#).

To learn more about how to use warehouse template to copy the configuration of a warehouse from one company to a new company within the same instance, see this 3-minute video on YouTube about [how to use warehouse template to copy the configuration for Finance and Operations](#).

Control warehouse work by using work templates and location directives

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to use work templates and location directives to determine how and where work is carried out in the warehouse.

The instructions that warehouse workers receive on a mobile device are determined by the Dynamics 365 Supply Chain Management work templates that you set up to define the various warehouse processes and tasks. Work templates determine how the work is performed for each warehouse process. By linking a location directive to work templates, you can help guarantee that work occurs in specific physical areas of the warehouses.

Work templates

The **Work templates** page lets you define the work operations that must be performed in the warehouse. Typically, warehouse work operations consist of a pair of actions: a warehouse worker picks up on-hand inventory in one location and then puts the picked inventory down in another location.

Work templates consists of a header and associated lines. Each work template is for a specific *work order type*. Many work order types are associated with source documents, such as purchase or sales orders. However, other work order types represent separate warehouse processes, such as cycle counting. The *work pool ID* lets you organize work into groups.

Use the settings in the work header definition to determine when a new piece of work should be created. For example, you can set a maximum number of pick lines and a maximum expected pick time. Then, if the work for a sales order picking process exceeds either of those values, that work is split into two pieces of work.

Use the **Work header breaks** button to define when the system should create new work headers. For example, to create a work header for each *order number*, select **Edit query** on the Action Pane, and then add the **Order number** field to the **Sorting** tab of the query editor. Fields that are added to the **Sorting** tab are available for selection as *grouping fields*. To set your grouping fields, select **Work header breaks** on the Action Pane, and then, for each field that you want to use as a grouping field, select the check box in the **Group by this field** column.

The work lines represent the physical tasks that are required to process the work. For example, for an outbound warehouse process, there might be one line for picking up the items in the warehouse and another line for putting those items into a staging area. There can then be an additional line for picking the items from staging and another line for putting the items into a truck as part of the loading process. You can set a *directive code* on work template lines. A directive code is linked to a location directive, and therefore helps ensure that the warehouse work is processed in the correct location in the warehouse.

You can set up a query to control when a particular work template is used. For example, you can set a limitation so that a particular template can be used for work only in a specific warehouse. Alternatively, you might have several templates that create work for outbound sales order processing, depending on the sales origin. The system uses the **Sequence number** field to determine the order that the available work templates are assessed in. Therefore, if you have a very specific query for a particular work template, you should give it a low sequence number. That query will then be evaluated before the other, more general queries.

NOTE

To prevent the system from automatically overwriting work template *sequence numbers* after a template has been deleted, turn on the *Preserve work template sequence numbers on delete* feature in [Feature management](#).

To stop or pause a work process, you can use the **Stop work** setting on the work line. In that case, the worker who is performing the work won't be asked to perform the next work line step. To move on to the next step, that worker or another worker must select the work again. You can also separate the tasks within a piece of work by using a different *work class ID* on the work template lines.

Location directives

Location directives are rules that help identify pick and put locations for inventory movement. For example, in a sales order transaction, a location directive determines where the items will be picked, and where the picked items will be put. Location directives consist of a header and associated lines, and you create them on the **Location directives** page.

On the header, each location directive must be associated with a *work order type* that specifies the type of inventory transaction that the directive will be used for, such as sales orders, replenishment, or raw material picking. The *work type* specifies whether the location directive will be used for picking or putting work, or for some other warehouse process, such as counting or inventory status changes. You must also specify a *site* and a *warehouse*. A *directive code* that you specify on the header can be used to link the location directive to one or more work templates.

As for work templates, you can set up a query to determine when a particular location directive is used. For example, you can specify that when e-commerce is the origin of a sales order, the inventory must be picked up from a dedicated area in the warehouse. The system uses the **Sequence number** field to determine the order that the available location directives are assessed in.

The location directive lines set additional restrictions on the application of the location finding rules. You can specify a minimum quantity and a maximum quantity that the directive should apply to, and you can specify that the directive should be for a specific inventory unit. For example, if the unit of measure is pallets, the items in pallets can be put in a specific location. You can also specify whether the quantity can be split across multiple locations. Like the location directive header, each location directive line has a sequence number that determines the order that the lines are assessed in.

Location directives have one additional level of detail: *location directive actions*. You can define multiple location directive actions for each line. Once again, a sequence number is used to determine the order that the actions are assessed in. On this level, you can set up a query to define how to find the best location in the warehouse. You can also use predefined **Strategy** settings to find an optimal location.

For more information about how to create and configure location directives, see [Create a location directive](#).

How location directives work

Location directives determine *where* items should be picked and *where* they should be put. The system evaluates a location directive against each work line and then selects a location, based on the work line details. The system first finds all location directives that match a particular work line (for example, they are for the correct warehouse and match the query). It then sequentially evaluates the directives that it has found.

NOTE

There are special cases where the pick location or put location is pre-selected. For example, during *purchase registration*, the first pick is always from the location where the registration occurs. Another example is *inventory movement by template*, where the warehouse worker selects the pick location, and only the put locations are found through location directives.

Work with location directives

2/18/2021 • 21 minutes to read • [Edit Online](#)

Location directives are rules that help identify pick and put locations for inventory movement. For example, in a sales order transaction, a location directive determines where the items will be picked, and where the picked items will be put. Location directives consist of a header and associated lines. They are created for specific *work order types*.

NOTE

This topic applies to features in the **Warehouse management** module. It doesn't apply to features in the [Inventory management](#) module.

You can use location directives to perform the following tasks:

- Put away incoming items.
- Pick and stage items for outbound transactions.
- Pick and put raw materials for production.
- Replenish locations.

Prerequisites

Before you can create a location directive, you must follow these steps to make sure that the prerequisites are in place.

1. Make sure that the required license key is turned on. Go to **System administration > Setup > License configuration**, expand the **Trade** license key, and then select the **Warehouse and Transportation management** configuration key. Note that admin access is required for this step.
2. Go to **Warehouse management > Setup > Warehouse > Warehouses**.
3. Create a warehouse.
4. On the **Warehouse** FastTab, set the **Use warehouse management processes** option to *Yes*.
5. Create locations, location types, location profiles, and location formats. For more information, see [Configure locations in a WMS-enabled warehouse](#).
6. Create sites, zones, and zone groups. For more information, see [Warehouse set up](#) and [Configure locations in a WMS-enabled warehouse](#).

Work order types for location directives

Many of the fields that can be set for location directives are common to all work order types. However, other fields are specific to particular work order types.

Location directives

Work order type

Sales orders

Purchase orders

Sales orders

Raw material picking

Finished goods put away

Co-product and by-product put away

Transfer issue

Transfer receipt

Inventory movement

Canceled work

Cycle counting

Replenishment

Return orders

Kanban put away

Kanban picking

Counting discrepancies accepted

Packed container picking

NOTE

Two work order types, *Canceled work* and *Cycle counting*, are used only by the system. Location directives can't be created for these work order types.

The tables in the following subsections list the common and worker order type-specific fields that are available when you set up a location directive.

Fields that are common to all work order types

The following table lists the fields that are common to all work order types.

FASTTAB	FIELD
Location directives	Work type
Location directives	Site
Location directives	Warehouse
Location directives	Directive code
Location directives	Multiple SKU
Lines	Sequence number
Lines	From quantity
Lines	To quantity
Lines	Unit
Lines	Locate quantity
Lines	Restrict by unit
Lines	Round up to unit
Lines	Locate packing quantity

FASTTAB	FIELD
Lines	Allow split
Location Directive Actions	Sequence number
Location Directive Actions	Name
Location Directive Actions	Fixed location usage
Location Directive Actions	Allow negative inventory
Location Directive Actions	Batch enabled
Location Directive Actions	Strategy

Fields that are specific to work order types

The following table lists the fields that are specific to particular work order types.

FASTTAB	FIELD	WORK ORDER TYPE
Location directives	Locate by	Purchase orders
Location directives	Applicable disposition code	Purchase orders
Location directives	Disposition code	Purchase orders
Location directives	Applicable disposition code	Finished goods put away
Location directives	Disposition code	Finished goods put away
Location directives	Applicable disposition code	Return orders
Location directives	Disposition code	Return orders
Location directives	Applicable disposition code	Kanban put away
Location directives	Applicable disposition code	Kanban picking
Lines	Immediate replenishment template	Sales orders
Lines	Immediate replenishment template	Raw material picking
Lines	Immediate replenishment template	Transfer issue
Lines	Immediate replenishment template	Kanban picking

Open the Location directives page

To open the **Location directives** page, go to **Warehouse management > Setup > Location directives**.

From there, you can view, create, and edit your location directives by using the commands on the Action Pane. See the remaining sections of this topic for information about how to use all the fields that are available on the

page.

Action Pane

The Action Pane on the **Location directives** page contains buttons that you can use to create, edit, and delete directives (**Edit**, **New**, and **Delete**). It also contains the following buttons that let you adjust the sequence that the location directive is processed in and configure a query that defines the criteria for applying the location directive:

- **Move up** – Move the selected location directive up in the sequence. For example, you can move it from sequence number 4 to sequence number 3.
- **Move down** – Move the selected location directive down in the sequence. For example, you can move it from sequence number 4 to sequence number 5.
- **Edit query** – Open a dialog box where you can define the conditions that the selected location directive should be processed under. For example, you might want it to apply only to a specific warehouse.

Location directives header

The location directive header includes the following fields for the sequence number and descriptive name of the location directive:

- **Sequence number** – This field indicates the sequence that the system tries to apply each location directive in for the selected work order type. Low numbers are applied first. You can change the sequence by using the **Move Up** and **Move Down** buttons on the Action Pane.
- **Name** – Enter a descriptive name for the location directive. This name should help identify the general purpose of the directive. For example, enter *Sales order picking in warehouse 24*.

Location directives FastTab

The fields on the **Location directives** FastTab are specific to the work order type that is selected in the **Work order type** field in the list pane.

- **Work type** – Select the type of work that must be performed. The available values depend on the type of inventory transaction that you selected in the **Work order type** field. Select one of the following values:
 - **Put** – The location directive will try to find the most ideal location to put or locate inventory that comes into the system from receiving, production, or inventory adjustments. It can also be used to define the put to the stage location or the final bay door shipping location.
 - **Pick** – The location directive will try to find the most ideal locations to physically reserve inventory from (that is, create work). The pick can be completed (that is, the pick work line can be closed) even if the work isn't completed. The user can complete physical picking. In the system, that action is a pick step. The user can then cancel from the mobile device and complete the work later. However, the work header is first closed when the final put is completed.

IMPORTANT

The other values in the **Work type** field aren't relevant for location directives. They appear only because the field isn't filtered to match the selected work order type.

- **Site** – This field is mandatory, because the location directive must be able to determine the site and warehouse that it's valid for.
- **Warehouse** – This field is mandatory, because the location directive must be able to determine the site and warehouse that it's valid for.

- **Directive code** – Select the directive code to associate with a work template or replenishment template. On the **Directive code** page, you can create new codes that can be used to connect work templates or replenishment templates to location directives. Directive codes can also be used to establish a link between any work template line and a location directive (such as the bay door or stage location).

TIP

If a directive code is set, the system won't search location directives by sequence number when work must be generated. Instead, it will search by directive code. In this way, you can be more specific about the location template that is used for a particular step in a work template, such as the step for staging the materials.

- **Multiple SKU** – Set this option to *Yes* to enable multiple stockkeeping units (SKUs) to be used on a location. For example, multiple SKUs must be enabled for the bay door location. If you enable multiple SKUs, your put location will be specified in work, as expected. However, the put location will be able to handle only a multi-item put (if work includes different SKUs that must be picked and put). It won't be able to handle a single-SKU put. If you set this option to *No*, your put location will be specified only if your put has just one kind of SKU.

IMPORTANT

To be able to do both multi-item puts and single-SKU puts, you must specify two lines that have same structure and setup, but you must set the **Multiple SKU** option to *Yes* for one line and *No* for the other. Therefore, for put operations, you must have two identical location directives, even if you don't have to distinguish single SKUs and multiple SKUs on a work ID. Often, if you don't set up both these location directives, unexpected business process locations will come from the applied Location directive. You must use a similar setup for location directives that have a **Work type** of *pick* if you need to process orders that include multiple SKUs.

Use the **Multiple SKU** option for work lines that handle more than one item number. (The item number will be blank in the work details, and it will be shown as **Multiple** on the processing pages in the warehouse app.)

In a typical example scenario, a work template is set up so that it has more than one pick/put pair. In this case, you might want to search for a specific staging location to use for lines with a **Work type** of *Put*.

NOTE

If the **Multiple SKU** option is set to *Yes*, you can't select **Edit query** on the Action Pane, because the query can't evaluate at the item level when there are multiple items. To ensure that the desired location directive is selected, use the **Directive code** field to guide the selection of the location directive that is related to the put lines where that directive code is assigned in the work template.

Unless you always work with either single-item or mixed-item operations, it's important that you define two location directives for the *Put* work type: one where the **Multiple SKU** option is set to *Yes* and one where it's set to *No*.

- **Applicable disposition code** – Specify whether the disposition code of the location directive must match the disposition code that is applied when the item is received, or whether the location directive can be selected based on any disposition code. If you select *Exact match*, and the **Disposition code** field is blank, only blank disposition codes will be considered for this location directive.

NOTE

This field is available only for selected work order types where replenishment is permitted. For a complete list, see the [Fields that are specific to work order types](#) section earlier in this topic.

- **Locate by** – Specify whether the putaway quantity should be the whole quantity on the license plate, or whether it should be item by item. Use this field to help ensure that all the contents on a license plate is put into one location, and that the system doesn't suggest that you split the contents into several locations for **ASN** (license plate receiving), **Mixed license plate** receiving, and **Cluster** receiving processes. (The **Cluster** receiving process requires that the *Cluster putaway feature* feature be turned on.) The behavior of the location directive query, the lines, and the location directive actions will vary, depending on the value that you select. The **Lines** FastTab is only used when the **Locate by** is set to *Item*.

NOTE

This field is available only for selected work order types where replenishment is permitted. For a complete list, see the [Fields that are specific to work order types](#) section.

- **Disposition code** – This field is used for location directives that have a work order type of *Purchase orders*, *Finished goods putaway*, or *Return orders*, and a work type of *Put*. Use it to guide the flow to use a specific location directive, depending on the disposition code that a worker selected in the warehouse app. For example, you can direct returned goods to an inspection location before they are returned to stock. A disposition code can be linked to an inventory status. In this way, it can be used to change the inventory status as part of a receiving process. For example, you have a disposition code, *QA*, that sets the inventory status to *QA*. You can then have a separate location directive to move that inventory to a quarantine location.

NOTE

This field is available only for selected work order types where replenishment is permitted. For a complete list, see the [Fields that are specific to work order types](#) section.

Lines FastTab

Use the **Lines** FastTab to establish conditions for applying the related actions that are specified on the **Location directive actions** FastTab. For each line, you can specify the minimum quantity and maximum quantity that the actions should apply to. You can also specify that the actions should apply to a specific inventory unit.

- **Sequence number** – Enter the sequence that each location directive line should be processed in for the selected work type. You can change the sequence as you require by using the **Move up** and **Move down** buttons on the toolbar.
- **From quantity** – Specify the start of the range of quantities that the line applies to. Specify the quantity in the unit of measure that is selected in the **Unit** field.
- **To quantity** – Specify the end of the range of quantities that the line applies to. Specify the quantity in the unit of measure that is selected in the **Unit** field.
- **Unit** – Select the unit of measure for the items. You can specify a minimum quantity and a maximum quantity that the directive should apply to, and you can specify that the directive should be for a specific inventory unit. The **Unit** field is used *only* for quantity evaluation. To determine whether the location directive line is applicable at all, the system uses the quantity in the unit that is specified on that line. Every time that it reaches a location directive line, the system tries to convert the demand unit to the unit

that is specified on the line. If the unit of measure conversion doesn't exist, the system moves on to the next line.

- **Locate quantity** – This field is used only during attempts to put or locate items in the warehouse. (Therefore, it applies only when the **Work type** field is set to *Put*). Select one of the following values to specify the quantity that is used to evaluate whether a quantity is within the **From quantity to To quantity** range:
 - **License plate quantity** – Use the quantity on the license plate that is being received.
 - **Unitized quantity** – Use the quantity that is used during the transaction. For example, you receive a quantity of 1,000 in a warehouse and break it into 10 license plates, each of which has a quantity of 100. In this case, you can use a quantity of 1,000 items instead of the license plate quantity of 100.
 - **Remaining quantity** – Use the quantity that must still be received on the purchase order line that is being processed.
 - **Expected quantity** – Use the total quantity of the purchase order line, regardless of what has already been received.
- **Restrict by unit** – This check box lets you make the location directive line specific to a unit of measure or multiple units of measure. Select it to restrict the units of measure that are considered valid selection criteria for the location directive lines. This functionality works only for location directives where the **Work type** field is set to *Pick*.

For example, when you reserve quantities, you want to reserve pallets only from a specific set of locations. In this case, the lines will restrict that sequence to pallets in such a way that any quantity that is less than a pallet won't be selected for the location directive.

Note that the **Restrict by unit** check box doesn't control the unit or units that are applied on work lines. The unit restriction applies only to the units that are made available via the unit sequence group. For example, an item is associated with a unit sequence group that includes both the *pallets* unit and the *pcs* units. A unit of measure has been defined, where 1 pallet = 100 pcs, and the location directive uses the **Restrict by unit** functionality only for pallets. Furthermore, a work template has been defined that limits the work header creation to 50 pcs. In this case, work lines of 50 pcs will be created. To specify the unit of measure for restriction, follow these steps:

1. On the **Lines** FastTab, select **Restrict by unit** on the toolbar. (This button becomes available only after you select the **Restrict by unit** check box on the line and then select **Save**.)
2. On the **Restrict by units** page, in the **Unit** field, select the unit of measure that you want to restrict by for the pick and put processes.

- **Round up to unit** – This field works together with the **Restrict by unit** check box. For example, if **Restrict by unit** and **Round up to unit** are selected on the location directive line, the work that is generated from the directive for raw material picking should be rounded up to a multiple of one of the handling unit that is specified on the **Restrict by unit** page.

NOTE

This **Round up to unit** setup works only for the *Raw material picking* work order type, and only for location directives where the **Work type** field is set to *Pick*.

- **Locate Packing Qty** – If you specify a packing quantity on a sales order, transfer order, or production order, this check box lets you restrict the system so that it can select only locations that have at least that packing quantity.

NOTE

This functionality works only with location directives of the *Pick* type.

- **Allow Split** – Specify whether the location directive can split the quantity that is being received or reserved across multiple warehouse locations, or whether the whole quantity must be located in a single location or reserved from a single location to create work.
- **Immediate replenishment template** – Use this field to create a connection to a replenishment template, so that replenishment is started immediately if items aren't allocated. If you leave this field blank, item replenishment won't be started until all lines of the location directive have been processed.

NOTE

This field is available only for selected work order types where replenishment is permitted. For a complete list, see the [Fields that are specific to work order types](#) section.

Location directive actions FastTab

You can define multiple location directive actions for each line. Once again, a sequence number is used to determine the order that the actions are assessed in. At this level, you can set up a query to define how the best location in the warehouse is found. You can also use predefined **Strategy** values to find an optimal location.

- **Sequence number** – This field shows the sequence that the actions are processed in for the selected work type. You can change the sequence by using the **Move Up** and **Move Down** buttons on the toolbar.
- **Name** – Enter the name of the location directive action. Be specific, so that the action that is performed is clear from the name.
- **Fixed location usage** – Specify which locations the location directive should consider. Select one of the following values:
 - **Fixed and non-fixed locations** – The location directive will consider all locations.
 - **Only fixed locations for the product** – The location directive will consider only fixed locations for products.
 - **Only fixed locations for the product variant** – The location directive will consider only fixed locations for product variants.
- **Allow negative inventory** – Select this check box to allow negative inventory at the specified warehouse location in location directives.
- **Batch Enabled** – Select this check box to use batch strategies for items that are batch-enabled. It's important that you select this check box for processes that use location directives to find locations to pick batch number–tracked items from. In this way, the search for locations that hold batch number–tracked items is included. If this check box is selected, and the **Strategy** field is set to *None*, the system will move on to the next action line.
- **Strategy** – To more easily and quickly define the actions that are associated with each location directive line, you can select one of the following predefined strategies:
 - **None** – No strategy will be used.
 - **Match packing quantity** – This strategy verifies whether a pick location has the specified packing quantity. This strategy is valid only when the **Work type** field is set to *Pick*.
 - **Consolidate** – This strategy consolidates items in a specific location when similar items are already available. This strategy is valid only when the **Work type** field is set to *Put*. A typical setup for put tries

to consolidate on the first action line and then, on the second line, tries to put without consolidation. Consolidation of goods makes later picking more efficient.

- **FEFO batch reservation** – This strategy uses first expiry, first out (FEFO) batch reservations. Use it when inventory is located by using a batch expiration date and allocated for batch reservation. You can use this strategy only for batch-enabled items. It's valid only when the **Work type** field is set to *Pick*.
- **Round up to the full LP and FEFO batch** – This strategy combines the elements of the *FEFO batch reservation* and *Round up to a full LP* strategies. It's valid only for batch-enabled items and location directives that have a work type of *Pick*. The line must be batch-enabled to use the *FEFO batch reservation* strategy, and the *Round up to a full LP* strategy can be used only for replenishment. If this strategy is configured together with a location stocking limit, it can cause the selected put work location to be overloaded and stocking limits to be ignored.
- **Round up to a full LP** – This strategy is used to round up the inventory quantity so that it matches the license plate quantity that is assigned to the items that must be picked. You can use this strategy only for replenishment location directives of the *Pick* type. If this strategy is configured together with a location stocking limit, it can cause the selected put work location to be overloaded and stocking limits to be ignored.
- **License plate guided** – Use this strategy when you release the order to the warehouse to create the pick-and-put work. You can use this approach for multiple license plates. This strategy will try to reserve and create picking work against the locations that hold the requested license plates that have been associated with the transfer order lines. However, if these actions can't be completed, but you still want to create picking work, you should fall back to another strategy for location directive actions. Depending on your business process requirements, you might also want to search for inventory in another area of the warehouse.
- **Empty location with no incoming work** – Use this strategy to locate empty locations. A location is considered empty if it has no physical inventory and no expected incoming work. You can use this strategy only for location directives that have a work type of *Put*.
- **Location aging FIFO** – Use the first in, first out (FIFO) strategy to ship both batch-tracked items and non-batch-tracked items, based on the date when the inventory entered the warehouse. This capability can be especially useful for non-batch-tracked inventory, where no expiration date is available to use for sorting. The FIFO strategy finds the location that contains the oldest aging date, and then allocates picking based on that aging date.
- **Location aging LIFO** – Use the last in, last out (LIFO) strategy to ship both batch-tracked items and non-batch-tracked items, based on the date when the inventory entered the warehouse. This capability can be especially useful for non-batch-tracked inventory, where no expiration date is available to use for sorting. The LIFO strategy finds the location that contains the newest aging date, and then allocates picking based on that aging date.

Example: Using location directives

For this example, consider a purchase order process where the location directive must find free capacity within a warehouse for inventory items that have just been registered at the receiving dock. First, you need to find free capacity within the warehouse by consolidating with existing on-hand inventory. If consolidation isn't possible, then you need to find an empty location.

For this scenario, you must define two location directive actions. The first action in the sequence must use the *Consolidate* strategy, and the second should use the *Empty location with no incoming work* strategy. Unless you define a third action to handle an overflow scenario, two outcomes are possible when there is no more capacity in the warehouse: work can be created even though no locations are defined, or the work creation process can fail. The outcome is determined by the setup on the **Location directive failures** page, where you can choose whether to select the **Stop work on location directive failure** option for each work order type.

Next step

After you create location directives, you can associate each directive code with a work template code for work creation. For more information, see [Control warehouse work by using work templates and location directives](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure product filters for warehouse transactions

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic describes how to configure product filters and filter codes to categorize inventory items in a warehouse. You can also use filters to specify which customers can order a particular item and which items can be purchased from a particular vendor.

Additionally, you can set up and use product filters to automatically organize inventory items in a warehouse and combine filtered items into filter groups. Filters can be used to put items into categories for handling, purchasing, and selling processes. You might want to group items together or separate them from each other when the way that they are handled is based on weight or handling restrictions. You can also specify which customers or vendors an item can be purchased from or sold to.

Prerequisites

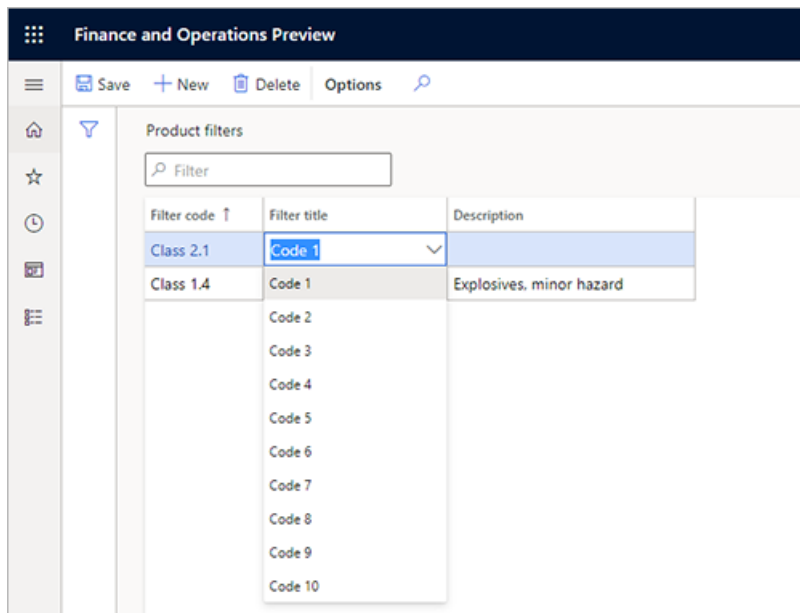

The following table shows the prerequisites that must be in place before you start.

PREREQUISITE	INSTRUCTIONS
Before you start to configure products on the Released product details page, you must turn on warehouse processing for the product's storage dimension group.	Go to Product information management > Setup > Dimension and variant groups > Storage dimension groups , and select or create a storage dimension group where the Use warehouse management processes option is set to <i>Yes</i> .
If you will use customer filters and/or vendor filters, you must enable their use in Warehouse management parameters.	Go to Warehouse management > Setup > Warehouse management parameters . On the Product filters tab, set the Enable customer filters and/or Enable vendor filters option to <i>Yes</i> .

Set up product filters

Product filters provide up to 10 **Filter title** characteristics, which are enumeration (enum) values. These enum values are available for selection when you create a product filter. The enum values *Code 1* through *Code 10* are system-defined and represent a specific characteristic or attribute of an item. For example, *Code 1* might represent items that have a hazardous material classification. *Code 2* might represent items that only vendors can purchase. Product filters then define the specific **Filter code** value that is associated with a **Filter title** value.

1. Go to **Warehouse management > Setup > Product filters > Product filters**.
2. On the Action Pane, select **New** to add a product filter to the grid.
3. In the **Filter title** field, select a value.
4. In the **Filter code** field, enter a value.

- In the **Description** field, enter a name for the code. For example, *Code 2* might represent vendors. You can then create a product filter for a specific vendor or group of vendors. For more information, see the [Setup vendor filter codes](#) section later in this topic.

Filter code ↑	Filter title	Description
Class 1.4	Code 1	Explosives, minor hazard
Class 2.1	Code 1	Flammable Gases
Class 3	Code 1	Flammable and combustible liquids
Class 4.1	Code 1	Flammable solids
Class 4.2	Code 1	Spontaneously combustible
Class 4.3	Code 1	Dangerous when wet
V1001	Code 2	Acme Office Supplies
V1002	Code 2	Lande Packaging Supplies
V1003	Code 2	Ade Supply Company

Set up product filter groups

You can use filter groups to group filter codes. This capability is helpful when a group is used in a query in a location directive, and you want to search for the group instead of a series of codes. Each filter group is associated with an item group.

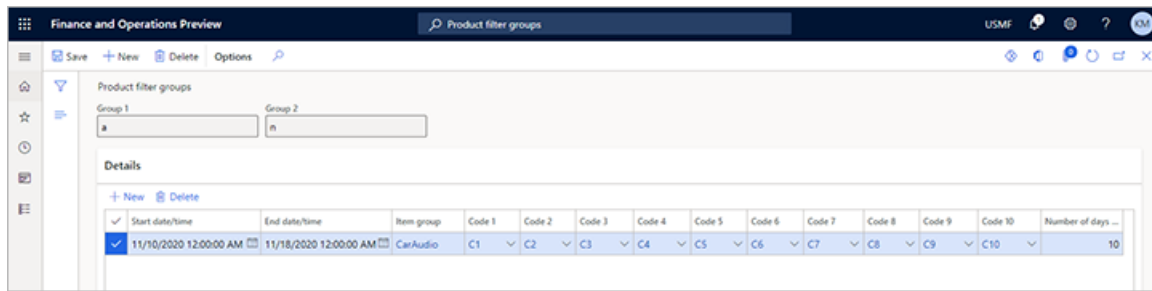

IMPORTANT

Not all product filter groups are available for filter codes that are higher than *Code 4* (that is, *Code 5* through *Code 10*). For example, for released products, although all the product filter codes will be added, the grouping of filter codes won't be updated. This behavior might be updated in later releases.

To set up filter groups, follow these steps.

- Go to **Warehouse management > Setup > Product filters > Product filter groups**.
- On the Action Pane, select **New**.
- In the **Group 1** and **Group 2** fields, enter the names that will be used to categorize items.
- On the **Details** FastTab, select **New** to add a line.

- In the **Start date/time** and **End date/time** fields, enter start and end dates for the filter group.
- In the **Item group** field, select the item group that the product filter should apply to.
- In the **Code 1** through **Code 10** fields, select the filter codes to include in the group, as required.

NOTE

If you receive an error message when you close the page, a code setup might be missing. On the **Item groups** page, you can make the codes mandatory for an item group by selecting the **Assign filter code 1 for item group**, **Assign filter code 2 for item group**, and so on, check boxes.

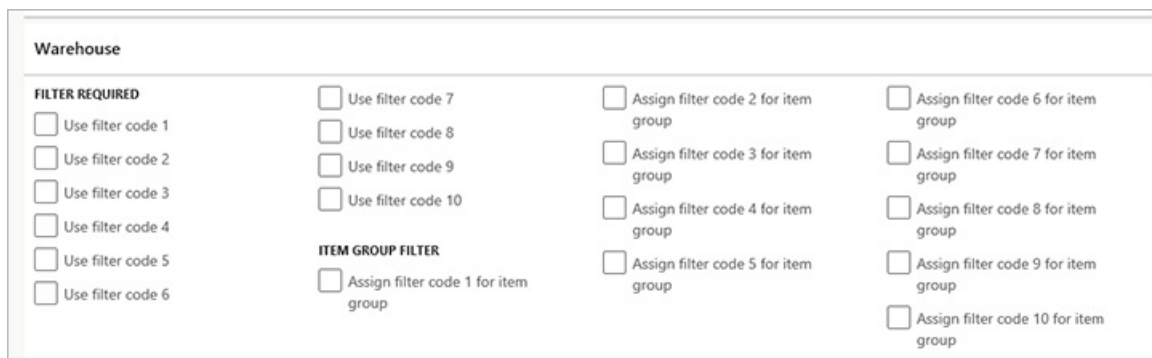

Set up filter codes on item groups

By setting up filter codes on an item group, you can make the codes that are required for products that are attached to that item group.

To set up filter codes on item groups, follow these steps.

- Go to **Inventory management > Setup > Inventory > Item groups**.
- On the Action Pane, select **New** to create an item group.
- In the **Item group** field, enter a name.
- In the **Name** field, enter a description.
- On the **Warehouse** FastTab, in the **Filter required** section, select the check boxes for the filter codes that must be specified for products that are associated with the item group.

To update a released product, open its **Released product details** page, and then, on the Action Pane, select **Edit**. The filters that are associated with codes then become available on the **Warehouse** FastTab.

- In the **Item group filter** section, select the check boxes for the filters that must match for the filter group to be the default filter group for an item.

For example, if the **Use filter code 1** and **Use filter code 2** check boxes are selected, both filter code 1 and filter code 2 of the item must match the setup of the filter group for the item group before the filter group can be selected. When you create a new item, the selected filter group will be the default filter

group in the **Group 1** and **Group 2** fields on the **Warehouse** FastTab of the **Released** product details page.

IMPORTANT

Product filter codes are enabled only for items that use advanced warehouse management.

Specify filter codes for released products

Follow these steps to specify filter codes for released products. For example, you can use filter codes to group hazardous products that specific vendors purchase.

1. Go to **Product information management > Products > Released products**.
2. On the Action Pane, select **New** to create a product.
3. In the **New released product** dialog box, enter the data that is required to create the base of a new product, and then select **OK**.

Product filter codes aren't enabled unless the item group that is attached to the product has been configured for filter codes.

For more information, see [Create a new product](#).

4. On the **Warehouse** FastTab, in the **Product filter codes** section, select filter codes for the **Code 1** through **Code 10** fields, as required, to specify filter codes for the product.

Set up generally available items

You can make specific inventory items available only for customers, only for vendors, or for both customers and vendors.

NOTE

Customer and vendor filters don't apply to any item that is set up as generally available.

To set up generally available items, follow these steps.

1. Go to **Warehouse management > Setup > Product filters > Generally available products**.
2. On the Action Pane, select **New** to create a record.
3. In the **Customer or vendor** field, select *Customer*, *Vendor*, or *All* to make the items available for customers, vendors, or both.
4. In the **Start date/time** field, enter the date and time when the item will become available.
5. In the **Item group** field, select an item group.
6. In the **Code 1** through **Code 10** fields, select the filter codes to limit the items that are generally available.

When you select an item group, you set that group of items as generally available. By selecting filter codes in these fields, you limit the items that are available.

Set up customer product filters

You can use this optional procedure to specify items that should be available for a customer in addition to the

items that are made available via the filter setup on the **Generally available items** page. You can set up multiple filters for a single customer.

To set up customer filter codes, follow these steps.

1. Go to **Sales and marketing > Customers > All customers**.
2. Select a customer.
3. On the Action Pane, on the **Customer** tab, in the **Set up** group, select **Product filters**.
4. On the **Product filter codes** page, on the Action Pane, select **New**.
5. In the **Start date/time** and **End date/time** fields, enter start and end dates for the selected item group.
6. In the **Item group** field, select an item group.
7. In the **Code 1** through **Code 10** fields, select the filter codes to use as criteria to limit the items that are available for customers in the selected item group. You must make a selection for every filter code that is set up for the item group.

Set up vendor product filters

You can use this optional procedure to specify items that should be available for a vendor in addition to the items that are made available via the filter setup on the **Generally available items** page. You can set up multiple filters for a single vendor.

To set up vendor filter codes, follow these steps.

1. Go to **Procurement and sourcing > Vendors > All vendors**.
2. Select a vendor.
3. On the Action Pane, on the **Vendor** tab, in the **Set up** group, select **Product filters**.
4. On the **Filter codes** page, on the Action Pane, select **New**.
5. In the **Start date/time** and **End date/time** fields, enter start and end dates for the selected item group.
6. In the **Item group** field, select an item group.
7. In the **Code 1** through **Code 10** fields, select the filter codes to use as criteria to limit the items that are available for vendors in the selected item group. You must make a selection for every filter code that is set up for the item group.

NOTE

The setup of vendor product filters applies to released products where warehouse management processes are enabled for the associated storage dimension group. The filter codes are used to determine whether the system will allow users to purchase a given item from a given vendor when they create purchase order lines. Microsoft Dynamics 365 Supply Chain Management has two methods for handling vendor approval. If one or more released products exist where the **Approved vendor check method** field is set to *Warning only* or *Not allowed*, both vendor approval methods could be enabled for those items. This situation might cause issues when users create purchase order lines.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Location stocking limits

2/18/2021 • 4 minutes to read • [Edit Online](#)

You can use the **Location stocking limits** page (**Warehouse management > Setup > Warehouse > Location stocking limits**) to control the load capacity at warehouse locations without having to use the more advanced processes for volumetric calculations of physical products.

The purpose of location stocking limits is to evaluate the maximum quantity that a location can contain. You can set up the feature on any of three levels, each of which has its own tab on the **Location stocking limits** page:

- Products
- Product variants
- Container types

For each level, you can define different field values. The system will then evaluate the capacity of a specific location, based on the **Quantity** and **Unit** values for each row. It will select the most detailed matching record first. For example, a row that has a value in the **Location profile ID** field will be evaluated before a row that has a value only in the **Warehouse** field. The remaining capacity will also be evaluated, based on the **Quantity** value for the location stocking limit record that is used.

In the **Products** section of the page, you can define the following field values for the search for location stocking limits:

- Warehouse
- Location profile ID
- Location
- Pack size category ID
- Item number
- Unit

NOTE

You don't have to define a **Unit** value for each location stocking limit record. The location capacity calculations will be based on the inventory unit quantities. If no unit conversion is defined for a value that is used, the location stocking limit record will be skipped, as if another **Item number** value is defined for it.

Example – Purchase order receiving

This example is based on a clean *USMF* demo data set, where the following values are set on the **Product variants** tab of the **Location stocking limits** page.

WAREHOUSE	LOCATION PROFILE ID	ITEM NUMBER	SIZE	QUANTITY	UNIT
24	FLOOR	D0013	M	300	Ea
24	FLOOR	D0013	L	240	Ea
24	FLOOR	D0013	S	360	Ea

Different unit of measure product variants are set up for the products. These variants are aligned with the location stocking limits for three pallets (PL):

- **Size M:** 1 PL = 100 each (Ea)
- **Size L:** 1 PL = 80 Ea
- **Size S:** 1 PL = 120 Ea

Therefore, each location where the **Location profile ID** value is set to *FLOOR* can carry *3 PL* of item number *D0013*.

Prepare for the example

In this example, you will run a purchase order receiving flow for two lines. However, you must first update the demo data in the following way to ensure that the locations allow mixed items to be carried, only the empty locations *FL-002* through *FL-004* are used, and there is no open inbound work.

1. For location *FL-001*, change the value of the **Location profile** field from *FLOOR* to *FLOOR-05*.
2. For the *FLOOR* location profile, set the **Allow mixed items** option to *Yes*.
3. Create a purchase order that has the following two lines.

WAREHOUSE	ITEM NUMBER	SIZE	QUANTITY	UNIT
24	D0013	S	4	PL
24	D0013	L	4	PL

Process the example

You will first receive a quantity of *4* of unit *PL* in size *S*, and review the put line locations for the work that is created. You will then receive a quantity of *4* of unit *PL* in size *L*, and review the put line locations for the work that is created.

1. In the warehouse app, sign in by using *24* as the user ID and *1* as the password.
2. Select **Inbound > Purchase Receive**.
3. Receive *4 PL* of item number *D0013* in size *S*.
4. Review the putaway work that was created. You should see the following result:
 - 3 PL -> FL-002
 - 1 PL -> FL-003
5. Receive *4 PL* of item number *D0013* in size *L*.
6. Review the putaway work that was created. You should see the following result:
 - 1 PL -> FL-003
 - 3 PL -> FL-004

Based on the results, you might conclude that the system failed to allocate the correct putaway locations. Otherwise, why did the system add only *1 PL* of size *L* to location *FL-003* in the last step, not *2 PL*? That is, why isn't there is a total of *3 PL* for putaway to that location?

To explain this apparent failure, you must understand the selection criteria for the location stocking limits. The system selects the most detailed matching record. In this example, the most detailed matching record is the line where the **Size** value is *L*, the **Quantity** value is *240*, and the **Unit** value is *Ea*. Because you already have open work from the previous receipt of a quantity of *120 Ea* of size *S*, the remaining capacity is calculated as $240 - 120 = 120 Ea$. Therefore, the remaining capacity can carry only *1 PL* of *80 Ea*.

NOTE

You can't use location stocking limits to control, for example, the replenishment of items that have different quantities in the same location. In this case, use a *replenishment template*.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Wave step codes

2/18/2021 • 3 minutes to read • [Edit Online](#)

Wave step codes are codes that users can set up and use to link specific instances of wave methods to a corresponding template. The templates include templates for replenishment, containerization, label printing, load building, and sorting.

When wave step codes aren't used, users must enter free text to reference a specific template from the wave method instance. Free text is prone to errors because users must make sure that the wave step text that they add for a specific wave step method in a wave template exactly matches the wave step text in the target template.

Wave step codes for a specific wave step type are set up on a separate page. For every wave step method instance in a wave template that requires a wave step code, the wave step code must be selected in a drop-down list. Selection in a drop-down list replaces free text entry and helps reduce the risk and impact of human error. Setup codes are used to link a wave step method in a wave template to a target template for the method.

NOTE

Use of the wave step codes feature is optional. It is enabled organization-wide for all legal entities.

Setup demo

For this demo, demo data must be installed, and you must use the **USMF** demo data company.

Enable wave step codes

Follow these steps to turn on the wave step codes feature.

1. Go to **Feature Management**.
2. Select to enable the feature called **Organization-wide Wave Step Code**.

All existing wave step free texts in all legal entities are upgraded to the new structure. After this upgrade is completed for all legal entities, then the feature is enabled. If the feature cannot be enabled for one or more legal entities, then the feature is not enabled for any legal entities.

During the enablement, validations are done during the data upgrade. If the upgrade fails, you receive an error message. An upgrade might fail because of the following conflicts:

- Duplicate wave step free texts exist.
- Customizations exist.
- A wave step free text that is associated with a wave step method instance doesn't match the expected template type.

After you've resolved any conflicts that are identified during the validations, you can retry to enable the feature.

When the feature has been enabled, the **Wave step codes** page (**Warehouse management > Setup > Waves > Wave step codes**) becomes available. This page lists the wave step codes that were upgraded when the Organization-wide Wave Step Code feature was enabled.

Create new wave step codes

You can use the **Wave step codes** page to create and delete wave step codes.

Every new wave step code and its associated ID must be unique across all wave step types, and they must be

defined for a specific wave step type.

Apply wave step codes

After you've defined the appropriate wave step codes, they can be applied to the wave process methods.

To apply wave step codes, go to the appropriate target template. Here are the target templates that the wave step codes are designated to point to:

- **Replenishment templates:** Warehouse management > Setup > Replenishment > Replenishment templates
- **Load build templates:** Warehouse management > Setup > Load > Load build templates
- **Sort templates:** Warehouse management > Setup > Packing > Outbound sorting templates
- **Containerization templates:** Warehouse management > Setup > Containers > Container build templates
- **Label printing templates:** Warehouse management > Setup > Document routing > Wave label templates

The templates in this list are applied when they are referenced from a wave process method that is selected in a wave template. When the wave step code on a wave process method in a wave template matches the wave step code in one of the templates types, the template is applied.

Sample scenario

The following procedure helps guarantee that the replenishment template that you created will be applied for the wave template.

1. Go to **Warehouse management > Setup > Waves > Wave step codes**, and create a wave step code for the **Replenishment** type.
2. Go to **Warehouse management > Setup > Replenishment > Replenishment templates**, and create a replenishment template.
3. In the replenishment template, select the wave step code that you created for the **Replenishment** type.
4. Go to **Warehouse management > Setup > Waves > Wave templates**, and select the wave template that you intend to use.
5. In the template, on the **Methods** FastTab, select the **Replenishment** method.
6. In the **Wave step code** field, select the wave step code that you selected in the replenishment template.

You perform these steps for each legal entity.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure wave processing

2/18/2021 • 4 minutes to read • [Edit Online](#)

This guide describes how to set up the criteria that determine what work is generated for a warehouse when a wave is processed, and whether waves are processed manually or automatically. You specify the criteria by setting up wave templates and queries that match a wave with released lines in sales orders, production orders, or kanban orders. Wave processing is used in warehouses that use the functionality in the Warehouse management module, and not those that use the functionality in the Inventory management module. You can run this procedure in demo data company USMF.

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Waves > Wave templates**.
2. Click **New**.
3. In the **Wave template name** field, type a value. When you set up a wave template, you specify the sequence in which the templates will be matched to released lines on sales orders, production orders, or kanbans. When a line is released to the warehouse or to production, it uses the first wave template that it meets the criteria for. We recommend that you put templates with the most specific criteria at the top of the list. The broader the criteria, the more likely it is for a line to meet the criteria, and this could lead to lines being assigned to the wrong wave.
4. In the **Wave template description** field, type a value.
5. In the **Site** field, enter or select a value. If you're using USMF, you can select site 2.
6. In the **Warehouse** field, enter or select a value. If you're using USMF, you can select warehouse 24.
7. Set the **Automate wave creation** field to **Yes**. Select this option to automatically create a wave when a sales order, production order, or kanban is released to the warehouse.
8. Set the **Process wave at release to warehouse** option to **Yes**. Select this option to automatically process the wave and create work when a line is released to the warehouse.
9. Set the **Automate wave release option** to **Yes**. Select this option to automatically release the wave. The picking work is created and made available on mobile devices.
10. Set the **Assign to open waves option** to **Yes**. Lines are assigned to waves based on the query filter for the wave template.
11. Set the **Process wave automatically at threshold option** to **Yes**. Select this option to automatically process the wave when its values reach the thresholds for weight, shipment, and lines specified in the Wave thresholds field group. This option is available only if Shipping is selected in the Wave template type field.
12. Set the **Automate replenishment work release option** to **Yes**. Select this option to create demand-based replenishment work and release it automatically. You must add the replenishment wave method to the wave template, and create a replenishment template of the type Wave demand.
13. Expand the **Methods** section.
 - Wave template methods allow you to control the sequence of activities that each wave is going through when it's processed. For example, you might have a method for wave replenishment. When you add a method, it's automatically listed in the appropriate location in the sequence of steps. If you've set the Automate replenishment work release option to Yes, you need to add the replenish

method here.

- Wave attributes act as filters, to restrict the kind of items that can use the wave. For example, you could specify an item group.

14. Click **Save**.
15. Close the page.
16. Go to **Warehouse management > Setup > Warehouse management parameters**.
17. Expand the **Wave processing** section.
18. In the **Wave processing batch group** field, enter or select a value.
19. Set the **Process waves in batch option** to **Yes**.
20. In the **Wait for lock (ms)** field, enter a number. Enter the time, in milliseconds, that an allocation step will wait for a system resource that is locked by another allocation step. When this time is exceeded, the wave is not processed and an error message is displayed.
21. Click **Save**.
22. Close the page.
23. Go to **Navigation pane > Modules > Production control > Setup > Production control parameters**.
24. In the **Release to warehouse** field, select an option.

For sales orders and kanban orders, inventory must be reserved before the order is released to the warehouse. Otherwise, the items or allocation lines cannot be processed in a wave. For production orders, you also have the option of choosing Allow partial reservation. For example, this is useful if you have the materials that you need to start production, and can then wait until the additional materials become available to finish the process. If you select this option, you must manually repeat the release to warehouse process when the additional materials become available.

25. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule work creation during wave

2/18/2021 • 4 minutes to read • [Edit Online](#)

Use the *Schedule work creation* feature as part of your waving process to help increase wave processing throughput by having the system create work using parallel processing.

When the functionality is enabled, planned work will automatically get created, which the system will eventually process to create actual work. If the number of wave load lines reaches a predetermined threshold, the system will create actual work more quickly by applying parallel, asynchronous processing.

Enable the Schedule work creation feature

Enable the feature in feature management

Before you can use the *Schedule work creation* feature, it must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Schedule work creation*

NOTE

The *Organization-wide work blocking* feature must be enabled before you can enable *Schedule work creation*.

Manually enable batch processing of waves

To take advantage of a parallel asynchronous method to create warehouse work, your wave process must be running in batch. To set this up:

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **General** tab, set **Process waves in batch** to *Yes*. Optionally, you can also select a dedicated **Wave processing batch group** to prevent your batch queue processing from running at the same time as other processes.
3. Set the **Wait for lock (ms) time**, which applies when the system is processing several waves at the same time. For most larger waving processes, we recommend a value of *60000*.

Manually enable the new wave step method for existing wave templates

Start by creating the new wave step method and enabling it for parallel asynchronous task processing.

1. Go to **Warehouse management > Setup > Waves > Wave process methods**.
2. Select **Regenerate method** and note that *WHSScheduleWorkCreationWaveStepMethod* has been added to the list of wave process methods you can use in your shipping wave templates.
3. Select the record with the **Method name** *WHSScheduleWorkCreationWaveStepMethod* and select **Task configuration**.
4. To add a new row to the grid, select **New** on the Action Pane and use the following settings:
 - **Warehouse** - Select the warehouse you will use to schedule work creation processing.
 - **Maximum number of batch tasks** - Specify a maximum number of batch tasks. In most cases,

this value should be in the range from 8-16, however we recommend that you experiment with the optimal setting based on your scenarios.

- **Wave processing batch group** - Select a dedicated wave processing batch group to optimize your batch queue processing.

Now you are ready to update an existing wave template (or create a new one) to use the *Schedule work creation* wave processing method.

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Select **Edit** on the Action Pane.
3. In the list pane, select the wave template you would like to update (if you are testing using demo data, then you could use *24 Shipping default*).
4. Expand the **Methods** FastTab and select the row with the **Name** *Schedule work creation* in the **Remaining methods** grid.
5. Select the arrow pointing to the **Selected methods** column to move the selected row to that column. (You can only have one selected method at a time that uses either *WHScheduleWorkCreationWaveStepMethod* or *createWork*, so the existing row with **Method name** *createWork* is automatically moved to the **Remaining methods** grid.)

Set wave task processing threshold data

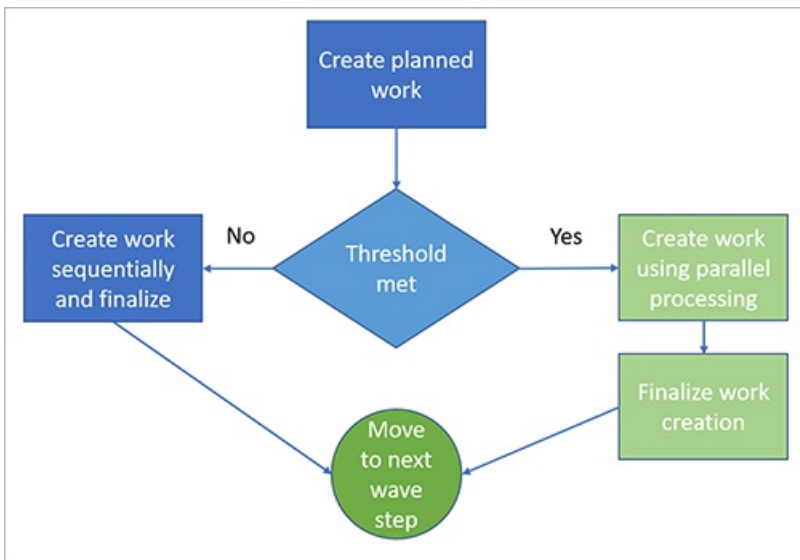

The system will create default wave task processing threshold data the first time a wave process runs using any task-based processing. The data is used to control when wave processing will run asynchronously and be task-based, which enables it to process and create work in parallel.

The default data will initially use a threshold value of 15 for the minimum number of load lines (MINIMUMWAVELOADLINES). This means that when the system processes a wave with more than 15 load lines, it will use asynchronous task processing. You can manually insert/update this data in the **WHSWaveTaskProcessingThresholdParameters** table in your test environments, but if you need to change this setting in a production environment, you must contact Microsoft Support to request the update.

Work with the feature

When the *Schedule work creation* functionality is enabled, wave processing will create planned work, which will eventually be used by the new work creation process. During work creation, the work will be blocked using the *Organization-wide work blocking* feature.

The following flowchart shows how planned work is created during wave processing.

Planned work

The **Planned work details** page (**Warehouse management > Work > Planned work details**) shows information about the planned work, which is initially created during wave processing. The following **Process status** values are available:

- **Queued** - The planned work is waiting to be used to create work.
- **Completed** - The planned work has been used to create work.
- **Failed** – The wave processing has failed. Note that the planned work can be in a **Failed** state with or without related actual work. When the actual work creation process fails, the actual work remains in status *Cancelled*.

Batch job for the work creation process

To view the batch jobs for processing waves, select **Batch jobs** on the Action Pane on the **All waves** page.

From here, you can view all the batch task details for each of the batch job IDs.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up and use wave label printing

2/18/2021 • 31 minutes to read • [Edit Online](#)

Wave label printing offers an alternative approach to label printing by introducing a new wave step method that lets you create and print labels directly from the wave template during wave execution. Therefore, the labels will already be available before workers run the work order on a mobile device. Workers can then attach the required labels during picking instead of after picking.

Wave label printing uses Zebra Programming Language (ZPL) to create label layouts. A label layout is divided into three sections (header, body, and footer) to allow for labels that have repeating structure. Wave label templates tell the system which label layout to use. Users can specify which printer is used. They can also print labels on several printers at the same time, as they require. The **Wave label history** page shows a record of all labels that have been created by using this setup.

You can print and collate labels based on work headers, you can print break labels per work header, and you can print container content labels, case labels, and other similar labels.

NOTE

This functionality doesn't replace existing label printing functionality that is based on document routing.

Wave label printing offers the following enhancements:

- Print labels according to the number of cartons on a single work line, without using containerization. (A "carton" is a unit that is designated on unit sequence group lines.)
- Print several different label sequences (for example, carton and pallet labels).
- Include label enumeration (for example, 1/124, 2/124, ... 124/124), and define the range of enumeration (for example, work line, load line, or shipment).
- Create and print a bill of lading ID on labels before the bill of lading is generated.
- Create a unique serial shipping container code (SSCC) for each carton, and include it on each label.
- Create GS1-compliant number sequences for bill of lading IDs and SSCCs.
- Reprint labels from both mobile devices and the rich client.
- Void labels (for example, in short pick scenarios), and reprint them.
- Clean up the wave label history.
- Improvements to document routing layouts are shared between document routing layouts and wave label layouts. (For more information, see [Document routing layout for license plates](#).)

These enhancements make it more efficient to label cartons before palletization. They especially benefit companies that ship to large retailers that automatically confirm order receipts by scanning each carton separately.

NOTE

You can implement the configuration scenarios that are described in this topic either separately or in combination, depending on your business requirements. You can design several wave label templates that work in sequence (as illustrated in scenario 3). For example, you can use scenario 1 to print carton labels and scenario 2 to print pallet labels (if pallets in stock vary in size and composition).

Turn on the Wave label printing feature

Before you can use the *Wave label printing* feature, it must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Wave label printing*

Scenario 1: Wave label printing where a single wave label is generated

This scenario shows how a company can print shipping labels for a large retailer that automatically confirms order receipts by scanning each carton separately.

This scenario shows the end-to-end flow.

Make demo data available

To follow this scenario, you must have demo data installed, and you must select the USMF legal entity.

Make sure that the wave label method is available

You might have to regenerate the wave process methods to make the wave label printing method available.

1. Go to **Warehouse management > Setup > Waves > Wave process methods**.
2. Confirm that `waveLabelPrinting` is in the list. If it isn't, select **Regenerate methods** on the Action Pane to add it.

Configure a wave template

Wave templates let you link specific instances of wave methods to a corresponding wave label template.

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Select a template, such as **62 Shipping Default**.
3. On the **Methods** FastTab, move the **Wave label printing** method to the **Selected methods** column.
4. In the **Selected methods** column, select the **Wave label printing** method, and set its **Wave step code** field to `PrintLabel`. For more information about wave step codes, see [Wave step codes](#).

Create a wave label layout

The label layout controls what information is printed on the label and how it's laid out. Here, you enter the ZPL code that is sent to the printer.

1. Go to **Warehouse management > Setup > Document routing > Wave label layouts**.
2. Create a record that has the following settings:

- **Label layout ID:** *Carton*
- **Description:** *Carton (SSCC)*

3. On the Action Pane, select **Save**.

4. On the Action Pane, select **Wave label row settings**.

The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.

5. Add a row that has the following settings:

- **Row Id:** *WaveLabel*
- **Row table name:** *WHSWaveLabel*
- **Row start position:** *0*

This field defines the vertical position where the row will begin on the label.

- **Row height:** 0

This field defines the height of each row (in points), according to the ZPL standard. The row height is positive for horizontal labels and negative for vertical labels. Because there is just one row in this example, you can set the value to 0 (zero).

- **Rows per page:** 1

This field defines the number of rows that can be printed on each label.

NOTE

This setup will cause a separate ZPL label to be printed for each record in the wave labels table.

6. Close the page.
7. On the Action Pane, select **Edit query**.
8. In the query editor dialog box, on the **Range** tab, add a row that has the following settings:
 - **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Work type*
 - **Criteria:** *Pick*

This query ensures that only pick-type work lines will be printed on the label, not put-type work lines.
9. If you want to be able to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.
10. Close the query editor dialog box.
11. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section** section, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

```

CT~~CD,~CC^~CT~
^XA~TA000~JSN^LT0^MNW^MTT^PON^PMN^LH0,0^JMA^PR8,8~SD15^JUS^LRN^CI0^XZ

^BY4,3,283^FT66,1115^BCN,,N,N
^FD>;>800$WHSWaveLabel.WaveLabelId$^FS
^FT194,439^A0N,28,28^FH\^FDof^FS
</Row>

```

13. In the **Body** section section, in the **Label footer** field, enter ZPL code for the required footer. Here is an example.

```

^PQ1^XZ

```

NOTE

This setup will print one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

Your label is now ready to use.

Create a wave label type

Wave label types are used to link wave label templates to a unit on unit sequence group lines.

1. Go to **Warehouse management > Setup > Document routing > Wave label types**.
2. Add a wave label type that has the following settings:
 - **Label type:** *Carton*
 - **Description:** *Carton*

Set up unit sequence groups

Next, set up the unit sequence group for the wave label type.

1. Go to **Warehouse management > Setup > Warehouse > Unit sequence groups**.
2. Select the **Ea Box PL** group.
3. For the **Box** line, set the **Wave level type** field to *Carton*.

Create a wave label template

Next, create the wave label template for the wave label type.

1. Go to **Warehouse management > Setup > Document routing > Wave label templates**.
2. Add a wave level template, and set the following values in the header:
 - **Label template name:** *Carton labels*
 - **Description:** *Carton labels*
 - **Wave step code:** *PrintLabel*
 - **Warehouse:** *62*
3. On the **General** FastTab, set the **Wave label type** field to *Carton*.
4. On the **Wave label template details** FastTab, add a new row that has the following settings:
 - **Label layout ID:** *Carton*
 - **Printer name:** Select an appropriate ZPL printer.
 - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)
5. On the Action Pane, select **Save**.
6. Optional: If you're setting up a customer-specific label design, you must create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row that has the following settings:
 - **Table:** *Shipments*
 - **Derived table:** *Shipments*
 - **Field:** *Account number*
 - **Criteria:** Enter the relevant customer account number.When you've finished, select **OK** to close the query editor dialog box.
7. On the Action Pane, select **Edit query** to open the query editor dialog box for the whole label template.

8. In the query editor dialog box, on the **Sorting** tab, add a row that has the following settings:
 - **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Reference load line id (Record-ID)*
 - **Search direction:** *Ascending*
9. Select **OK** to close the query editor dialog box.
10. A message box prompts you to confirm the grouping reset operation. Select **Yes** to continue.
11. On the Action Pane, select **Wave label template group**.
12. In the **Wave label template group** dialog box, select the row where the **Reference field name** field is set to *Reference load line id*, and then select the **Label build ID** check box for this row.

NOTE

This setup will create one label sequence ("Carton 1 of X") per load line throughout the wave, regardless of the work grouping setup. This label sequence can be printed on the label layout.

Configure number sequence extensions

Number sequence extensions control the GS1 compliance of specific number sequences. This configuration is optional for the current scenario. For more information and configuration instructions, see [Configure number sequence extensions](#).

Create a sales order and release it to the warehouse

1. Go to **Sales and marketing > Sales order > All sales orders**.
2. Create a sales order that has the following settings:
 - **Customer account:** *US-001*
 - **Warehouse:** *62*
3. Add two sales order lines that have the following settings:
 - Sales order line 1:
 - **Item number:** *A0001*
 - **Quantity:** *9024*
 - **Unit:** *ea* (9024 ea = 376 Box = 47 PL)
 - Sales order line 2:
 - **Item number:** *A0002*
 - **Quantity:** *9016*
 - **Unit:** *ea* (9016 ea = 322 Box = 46 PL)

NOTE

The items and quantities that are provided here are only examples. They must use the unit sequence group that you defined earlier, appropriate unit conversions from *ea* to *Box* to *PL* must be defined for them, and they must have stock in warehouse *62*. For more information, see [Unit of measure and stocking policies](#).

4. Select sales order line 1. Then, in the **Sales order line** section, on the **Inventory** menu, select **Reservations**.
5. On the **Reservation** page, on the Action Pane, select **Reserve lot**, and then close the page.

- Repeat steps 4 and 5 for sales order line 2.
- On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

The following events occur:

- The system processes the created shipment by using the template that includes the label printing step. The label layout will be used to define the format of the label, and the result will be a label that is printed on the printer that is selected in the label template.
- Wave labels are generated and printed. The number of labels will equal the number of cartons (in this example, 376 Box labels for line 1 and 322 Box labels for line 2).
- A new bill of lading ID is generated for the shipments. If you configured the number sequence extensions, the wave label IDs will follow the **SSCC-18** number format.

You can view and reprint wave labels from the following pages. On the Action Pane of each page, on the **Shipments** tab, in the **Related information** group, select **Wave labels**.

- All shipments > Shipment details
- All loads > Load details
- All waves
- Wave labels
- Wave label history

Scenario 2: Wave label printing for containerization (without wave label records)

This scenario lets you print wave labels when you use containerization to automatically split items into cartons and therefore don't require a wave label record. In this case, the container ID acts as a placeholder for the SSCC.

Here are the main differences between this scenario and scenario 1:

- Wave label templates:** You won't select a wave label type on the wave label template, and you won't require a label build grouping. Otherwise, you will configure the wave label template and link to the wave template in the same way that is described in scenario 1. You must leave the wave label type blank to prevent wave labels from being generated.
- Wave label layouts:** You will configure the wave label layout row settings for work lines instead of wave label records. You must configure the row setting for the label layout by using the **WHSWorkLine** table instead of the **WHSWaveLabel** table. The **Rows per page** setting controls the number of rows that the body section will have.

This configuration is also suitable for business scenarios where multiple different items are packed into one labeled box or into a pallet, and this packing process can be defined by work creation (for example, work that is grouped by shipment).

This scenario shows the end-to-end flow.

Make demo data available

To follow this scenario, you must have demo data installed, and you must select the **USMF** legal entity.

Make sure that the wave label method is available

You might have to regenerate the wave process methods to make the wave label printing method available.

- Go to **Warehouse management > Setup > Waves > Wave process methods**.
- Confirm that **waveLabelPrinting** is in the list. If it isn't, select **Regenerate methods** on the Action Pane to add it.

Set up a wave template

Wave templates let you link specific instances of wave methods to a corresponding wave label template.

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Select a template, such as **63 Containerization**.
3. On the **Methods** FastTab, move the **Wave label printing** method to the **Selected methods** column.
4. In the **Selected methods** column, select the **Wave label printing** method, and set its **Wave step code** field to *PrintLabel*. For more information about wave step codes, see [Wave step codes](#).

Create a wave label layout

1. Go to **Warehouse management > Setup > Document routing > Wave label layouts**.
2. Create a record that has the following settings:
 - **Label layout ID:** *Carton*
 - **Description:** *Carton (SSCC)*
3. On the Action Pane, select **Save**.
4. On the Action Pane, select **Wave label row settings**.

The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.

5. Add a row that has the following settings:

- **Row Id:** *WorkLine*
- **Row table name:** *WHSWorkLine*
- **Row start position:** *500*

This field defines the vertical position where the row will begin on the label.

- **Row height:** *-50*

This field defines the height of each row. The row height is positive for horizontal labels and negative for vertical labels.

- **Rows per page:** *5*

This field defines the number of rows that can be printed on each label.

NOTE

This setup will print several ZPL labels per work, where each page can hold up to five work lines. For example, if a label is printed for a container that has 12 lines, three labels will be printed. If you want to print a separate label for each pick line, set this value to *1*.

6. Close the page.
7. On the Action Pane, select **Edit query**.
8. In the query editor dialog box, on the **Range** tab, add a row that has the following settings:
 - **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Work type*
 - **Criteria:** *Pick*
9. If you want to be able to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join

the **Shipments** table to it.

- Close the query editor dialog box.
- The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section** section, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

```
CT~~CD,~CC^~CT~
^XA
^LH10,10
^F00,0 ^AT ^FD$WHSWorkTable.ContainerId$ ^FS
^F00,75 ^AT ^FD$WHSWorkLine.ShipmentId$ ^FS
^F00,150 ^AT ^FD$WHSWorkTable.BillOfLadingId$ ^FS
```

- In the **Body section** section, in the **Label body** field, enter ZPL code for the required body. Here is an example.

```
<Row name="WorkLine">
<Heading>
//Optional heading for section of rows
</Heading>
^F00,450 ^AT ^FDItem ^FS
^F0200,450 ^AT ^FDQuantity ^FS
^F00,[[YPos]] ^AT ^FD$WHSWorkLine.ItemId$ ^FS
^F0200,[[YPos]] ^AT ^FD$WHSWorkLine.QtyWork$ ^FS
</Row>
```

- In the **Body section** section, in the **Label footer** field, enter ZPL code for the required footer. Here is an example.

```
^PQ1^XZ
```

NOTE

This setup will print one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

Your label is now ready to use.

Create a wave label template

- Go to **Warehouse management > Setup > Document routing > Wave label templates**.
- Add a wave level template, and set the following values in the header:
 - Label template name:** *Container labels*
 - Description:** *Container labels*
 - Wave step code:** *PrintLabel*
 - Warehouse:** *63*
- On the **Wave label template details** FastTab, add a row that has the following settings:
 - Label layout ID:** *Container*
 - Printer name:** Select an appropriate ZPL printer.
 - Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)

4. On the Action Pane, select **Save**.
5. Optional: If you're setting up a customer-specific label design, you must create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row that has the following settings:

- **Table:** *Shipments*
- **Derived table:** *Shipments*
- **Field:** *Account number*
- **Criteria:** Enter the relevant customer account number.

When you've finished, select **OK** to close the query editor dialog box.

Configure number sequence extensions

Number sequence extensions control the GS1 compliance of specific number sequences. This configuration is optional for the current scenario. For more information and configuration instructions, see [Configure number sequence extensions](#).

Create a sales order and release it to the warehouse

1. Go to **Sales and marketing > Sales order > All sales orders**.

2. Create a sales order that has the following settings:

- **Customer account:** *US-001*
- **Warehouse:** *63*

3. Add five sales order lines:

- Sales order line 1:
 - **Item number:** *A0001*
 - **Quantity:** *10*
- Sales order line 2:
 - **Item number:** *A0002*
 - **Quantity:** *20*
- Sales order line 3:
 - **Item number:** *L0006*
 - **Quantity:** *20*
- Sales order line 4:
 - **Item number:** *L0100*
 - **Quantity:** *40*
- Sales order line 5:
 - **Item number:** *L0101*
 - **Quantity:** *50*

NOTE

The items and quantities that are provided here are only examples. They must have stock in the specified warehouse.

4. Select sales order line 1. Then, in the **Sales order line** section, on the **Inventory** menu, select **Reservations**.

5. On the **Reservation** page, on the Action Pane, select **Reserve lot**, and then close the page.
6. Repeat steps 4 and 5 for each additional sales order line.
7. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

The following events occur:

- The system processes the created shipment using the template that includes the label printing step. The label layout will be used to define the format of the label, and the end result will be a label that has five lines and that is printed on the printer that is selected in the label template.
- A new bill of lading ID is generated for the shipments. If you configured the number sequence extensions, the wave label IDs will follow the **SSCC-18** number format.

You can reprint these wave labels by going to **Warehouse management > Inquiries and reports > Wave label history**.

Scenario 3: Wave label printing for multi-tiered labels

This scenario shows how to use the wave label printing functionality when the warehousing processes require several tiers of shipping labels. For example, separate labels might have to be printed for cartons and pallets, and a break label might have to be printed for a whole shipment. Break labels are a separate type of label that can be used as a divider between rolls and containers, such as labels for the shipment ID and a barcode, so that the labels can easily be sorted after they are printed.

The main difference between the configuration of this scenario and the configuration of scenario 1, besides the fact that break labels are enabled, is that multiple wave label types must be associated with wave label templates and unit sequence group lines. To accomplish this configuration, you set up the following elements for this scenario:

- **Wave processing methods:** You will mark the wave label method as "repeatable," add it two (or more) times to the wave template, and set different wave step codes.
- **Wave label templates:** You will configure the wave label templates and link them to the wave template. Each wave label template has its own wave label type.
- **Wave label layouts:** You will create multiple wave label layouts. There will be a separate label layout for each "tier" of labels, and there will also be a break label layout.

This scenario shows the end-to-end flow.

Make demo data available

To follow this scenario, you must have demo data installed, and you must select the **USMF** legal entity.

Set up a wave process method

1. Go to **Warehouse management > Setup > Waves > Wave process methods**.
2. Confirm that **waveLabelPrinting** is in the list. If it isn't, select **Regenerate methods** on the Action Pane to add it.
3. For the **waveLabelPrinting** method, select the **Make method repeatable** check box.

Set up a wave template

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Select a template, such as **62 Shipping Default**.
3. On the **Methods** FastTab, move the **Wave label printing** method to the **Selected methods** column.
4. In the **Selected methods** column, assign a **Wave step code** value, such as *Carton*, to the **Wave label printing** method. For more information about wave step codes, see [Wave step codes](#).
5. Move the **Wave label printing** method to the **Selected methods** column a second time.

6. In the **Selected methods** column, assign a different **Wave step code** value, such as *Pallet*, to the second **Wave label printing** method. For more information about wave step codes, see [Wave step codes](#).

Create three wave label layouts

1. Go to **Warehouse management > Setup > Document routing > Wave label layouts**.
2. Create a record that has the following settings:
 - **Label layout ID:** *Carton*
 - **Description:** *Carton (SSCC)*
3. On the Action Pane, select **Save**.
4. On the Action Pane, select **Wave label row settings**.

The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.

5. Add a row that has the following settings:

- **Row Id:** *WaveLabel*
- **Row table name:** *WHSWaveLabel*
- **Row start position:** *0*

This field defines the vertical position where the row will begin on the label.

- **Row height:** *0*

This field defines the height of each row (in points), according to the ZPL standard. The row height is positive for horizontal labels and negative for vertical labels. Because there is just one row in this example, you can set the value to *0* (zero).

- **Rows per page:** *1*

This field defines the number of rows that can be printed on each label.

NOTE

This setup will cause a separate ZPL label to be printed for each record in the wave labels table.

6. Close the page.
7. On the Action Pane, select **Edit query**.
8. In the query editor dialog box, on the **Range** tab, add a row that has the following settings:
 - **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Work type*
 - **Criteria:** *Pick*

This query ensures that only pick-type work lines will be printed on the label, not put-type work lines.
9. If you want to be able to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.
10. Close the query editor dialog box.
11. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section**, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

```

CT~CD,~CC^~CT~
^XA~TA000~JSN^LT0^MNW^MTT^PON^PMN^LH0,0^JMA^PR8,8~SD15^JUS^LRN^CI0^XZ
^XA
^MMT
^PW812
^LL1218
^LS0

^FT107,580^A0N,28,28^FH\^FD$WHSWaveLabel.LabelItemName$^FS
^FT576,423^A0N,23,21^FH\^FD$WHSWaveLabel.LabelItemId$^FS
^FT252,1155^A0N,32,31^FH\^FD(00)$WHSWaveLabel.WaveLabelId$^FS
^BY4,3,283^FT66,1115^BCN,,N,N
^FD>;>800$WHSWaveLabel.WaveLabelId$^FS
^FT194,439^A0N,28,28^FH\^FDof^FS
</Row>

```

13. In the **Body** section section, in the **Label footer** field, enter ZPL code for the required footer. Here is an example.

```

^PQ1^XZ

```

NOTE

This setup will print one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

14. The first label is now ready to use.
15. Create a second layout record that has the following settings:
 - **Label layout ID:** *Pallet*
 - **Description:** *Pallet*
16. On the Action Pane, select **Save**.
17. On the Action Pane, select **Wave label row settings**.

The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.

18. Add a row that has the following settings:
 - **Row Id:** *WaveLabel*
 - **Row table name:** *WHSWaveLabel*
 - **Row start position:** *0*

This field defines the vertical position where the row will begin on the label.

- **Row height:** *0*

This field defines the height of each row (in points), according to the ZPL standard. The row height is positive for horizontal labels and negative for vertical labels. Because there is just one row in this example, you can set the value to *0* (zero).

- **Rows per page:** *1*

This field defines the number of rows that can be printed on each label.

NOTE

This setup causes a separate ZPL label to be printed for each record in the wave labels table.

19. Close the page.
20. On the Action Pane, select **Edit query**.
21. In the query editor dialog box, on the **Range** tab, add a row that has the following settings:
 - **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Work type*
 - **Criteria:** *Pick*

This query ensures that only pick-type work lines will be printed on the label, not put-type work lines.

22. If you want to be able to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.
23. Close the query editor dialog box.

24. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section** section, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

```
CT~~CD,~CC^~CT~
^XA
^LH10,10
^F00,0 ^AT ^FD$WHSWaveLabel.WaveLabelId$ ^FS
^F00,75 ^AT ^FD$WHSWorkLine.ShipmentId$ ^FS
^F00,150 ^AT ^FD$WHSShipmentTable.BillOfLadingId$ ^FS
```

25. In the **Body section** section, in the **Label body** field, enter ZPL code for the required body. Here is an example.

```
<Row name="WaveLabel">
^F00,450 ^AT ^FDItem ^FS
^F0200,450 ^AT ^FDQuantity ^FS
^F00,[[YPos]] ^AT ^FD$WHSWaveLabel.LabelItemId$ ^FS
^F0200,[[YPos]] ^AT ^FD$WHSWaveLabel.QtyWork$ ^FS
</Row>
```

26. In the **Body section** section, in the **Label footer** field, enter ZPL code for the required footer. Here is an example.

```
^PQ1^XZ
```

NOTE

This setup will print one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

27. The second label is now ready to use.
28. Create a third layout record that has the following settings:
- **Label layout ID:** *Break*
 - **Description:** *Break label*
29. On the Action Pane, select **Save**.
30. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section** section, in the **Label header** field, enter ZPL code for the required header. Here is an example.

```
CT~~CD,~CC^~CT~
^XA
^LH10,10
^F00,0 ^AT ^FD$WHSWorkLine.ShipmentId$ ^FS
```

31. This time, no body is required. Therefore, just enter the required text in the **Footer section** section. Here is an example.

```
^XZ
```

The third label is now ready to use.

NOTE

This third label is a break label that will be used as a divider between label rolls.

Create two wave label types

1. Go to **Warehouse management > Setup > Document routing > Wave label types**.
2. Create a record that has the following settings:
 - **Label type:** *Carton*
 - **Description:** *Carton*
3. Create a second record that has the following settings:
 - **Label type:** *Pallet*
 - **Description:** *Pallet*

Set up unit sequence groups

1. Go to **Warehouse management > Setup > Warehouse > Unit sequence groups**.
2. Select or create an **Ea Box PL** group.
3. For the **Box** line, set the **Wave level type** field to *Carton*.
4. For the **PL** line, set the **Wave level type** field to *Pallet*.

Create wave label templates

1. Go to **Warehouse management > Setup > Document routing > Wave label templates**.
2. Create a label template that has the following settings:
 - **Label template name:** *Carton labels*
 - **Description:** *Carton labels*
 - **Wave step code:** *Carton*
 - **Warehouse:** *62*
3. On the **General** FastTab, in the **Wave label type** field, select a value, such as *Carton*.
4. On the **Wave label template details** FastTab, add a row that has the following settings:
 - **Label layout ID:** *Carton*
 - **Printer name:** Select an appropriate ZPL printer.
 - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)
5. On the Action Pane, select **Save**.
6. Optional: If you're setting up a customer-specific label design, you must create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row that has the following settings:
 - **Table:** *Shipments*
 - **Derived table:** *Shipments*
 - **Field:** *Account number*
 - **Criteria:** Enter the relevant customer account number.When you've finished, select **OK** to close the query editor dialog box.
7. On the Action Pane, select **Edit query** to open the query editor dialog box for the whole label template.
8. In the query editor dialog box, on the **Sorting** tab, add a row that has the following settings:

- **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Reference load line id (Record-ID)*
 - **Search direction:** *Ascending*
9. Add a second row that has the following settings:
- **Table:** *Work lines*
 - **Derived table:** *Work lines*
 - **Field:** *Shipment ID*
 - **Search direction:** *Ascending*
10. Select **OK** to close the query editor dialog box.
11. A message box prompts you to confirm the grouping reset operation. Select **Yes** to continue.
12. On the Action Pane, select **Wave label template group**.
13. In the **Wave label template group** dialog box, for the row where the **Reference field name** field is set to *Shipment ID*, set the following values:
- **Print break label:** Select this check box.
 - **Label layout ID:** Select a break label. (For example, select the *Break* label layout that you created earlier in this scenario.)
 - **Printer name:** Select the printer for the break label. (Typically, for the purpose of splitting label rolls, you should select the same printer that is selected on the **Wave label template details** FastTab. However, other scenarios are possible.)
14. For the row where the **Reference field name** field is set to *Reference load line id*, select the **Label build ID** check box.

NOTE

This setup will create one label sequence ("Carton 1 of X") per load line throughout the wave, regardless of the work grouping setup. This label sequence can be printed on a label layout. Additionally, labels for different shipments will be separated by the selected break label.

15. Select **OK** to close the **Wave label template group** dialog box.
16. Create a second label template that has the following settings:
- **Label template name:** *Pallet labels*
 - **Description:** *Pallet labels*
 - **Wave step code:** *Pallet*
 - **Warehouse:** *62*
17. On the **General** FastTab, in the **Wave label type** field, select a value, such as *Pallet*.
18. On the **Wave label template details** FastTab, add a row that has the following settings:
- **Label layout ID:** *Pallet*
 - **Printer name:** Select an appropriate ZPL printer.
 - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)
19. On the Action Pane, select **Save**.
20. Optional: If you're setting up a customer-specific label design, you must create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row that has the following settings:

- **Table:** *Shipments*
- **Derived table:** *Shipments*
- **Field:** *Account number*
- **Criteria:** Enter the relevant customer account number.

When you've finished, select **OK** to close the query editor dialog box.

21. On the Action Pane, select **Edit query** to open the query editor dialog box for the whole label template.

22. In the query editor dialog box, on the **Sorting** tab, add a row that has the following settings:

- **Table:** *Work lines*
- **Derived table:** *Work lines*
- **Field:** *Reference load line id (Record-ID)*
- **Search direction:** *Ascending*

23. Add a second row that has the following settings:

- **Table:** *Work lines*
- **Derived table:** *Work lines*
- **Field:** *Shipment ID*
- **Search direction:** *Ascending*

24. Select **OK** to close the query editor dialog box.

25. A message box prompts you to confirm the grouping reset operation. Select **Yes** to continue.

26. On the Action Pane, select **Wave label template group**.

27. In the **Wave label template group** dialog box, for the row where the **Reference field name** field is set to *Shipment ID*, set the following values:

- **Print break label:** Select this check box.
- **Label layout ID:** Select a break label. (For example, select the *Break* label layout that you created earlier in this scenario.)
- **Printer name:** Select the printer for the break label. (Typically, for the purpose of splitting label rolls, you should select the same printer that is selected on the **Wave label template details** FastTab. However, other scenarios are possible.)

28. For the row where the **Reference field name** field is set to *Reference load line id*, select the **Label build ID** check box.

NOTE

This setup will create one label sequence ("Carton 1 of X") per load line throughout the wave, regardless of the work grouping setup. This label sequence can be printed on a label layout. Additionally, labels for different shipments will be separated by the selected break label.

Configure number sequence extensions

Number sequence extensions control the GS1 compliance of specific number sequences. This configuration is optional for the current scenario. For more information and configuration instructions, see [Configure number sequence extensions](#).

Create a sales order and release it to the warehouse

1. Go to **Sales and marketing > Sales order > All sales orders**.
2. Create a sales order that has the following settings:

- **Customer account:** *US-001*
- **Warehouse:** *62*

3. Add two sales order lines:

- Sales order line 1:
 - **Item number:** *A0001*
 - **Quantity:** *9024*
 - **Unit:** *ea* (9024 ea = 376 Box = 47 PL)
- Sales order line 2:
 - **Item number:** *A0002*
 - **Quantity:** *9016*
 - **Unit:** *ea* (9016 ea = 322 Box = 46 PL)

NOTE

The items and quantities that are provided here are only examples. They must use the unit sequence group that you defined earlier, appropriate unit conversions from *ea* to *Box* to *PL* must be defined for them, and they must have stock in warehouse *62*. For more information, see [Unit of measure and stocking policies](#).

4. Select sales order line 1. Then, in the **Sales order line** section, on the **Inventory** menu, select **Reservations**.
5. On the **Reservation** page, on the Action Pane, select **Reserve lot**, and then close the page.
6. Repeat steps 4 and 5 for sales order line 2.
7. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

The following events occur:

- The system processes the created shipment by using the template that includes the label printing step. The label layout will be used to define the format of the label, and the result will be a label that is printed on the printer that is selected in the label template.
- Wave labels are generated and printed. The number of labels will equal the number of cartons (in this example, 376 Box labels for line 1, 322 Box labels for line 2, 47 PL labels for line 1, 47 PL labels for line 2, and two break labels that have the shipment ID).
- A new bill of lading ID is generated for the shipments. If you configured the number sequence extensions, the wave label IDs will follow the **SSCC-18** number format.

You can view and reprint wave labels from the following pages:

- All shipments > Shipment details
- All loads > Load details
- All waves
- Wave labels
- Wave label history

For most of these pages, you can find the relevant function by selecting **Wave labels** in the **Related information** group on the **Shipments** tab of the Action Pane.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Shipment auto-updates

2/18/2021 • 9 minutes to read • [Edit Online](#)

The auto-update shipment functionality automatically updates quantities (both increases and decreases) on a load line that is associated with a shipment, after the load has been released to a warehouse. This functionality remains turned on until the load line on the shipment or load is processed on a wave. When it's used, order updates can automatically flow through to the warehouse, without requiring manual intervention, until warehouse work is created.

When the auto-update shipment functionality isn't used, only quantity decreases automatically flow until warehouse work is created. Users must manually update or delete lines, and they must then re-release lines if order quantities are increased or new order lines are added. By using the auto-update shipment functionality, businesses can seamlessly provide updates to the warehouse without having to worry that related shipments and loads won't reflect order line updates.

The auto-update shipment functionality applies to both sales order lines and transfer order lines, and it's turned on for a specific warehouse. Therefore, companies can apply different auto-update shipment policies across warehouses, as they require. By default, the auto-update shipment policy for quantity decreases is applied for all warehouses that use warehouse management processes. When this default policy setting is used, only quantity decreases automatically flow through to a shipment and load until warehouse work is created. This behavior resembles the behavior that was used before the auto-update shipment functionality was introduced.

Main elements of the functionality

The auto-update shipment functionality relies primarily on the shipment status to determine whether the quantity on a load line should be changed when a change is made on a sales order line or transfer order line. It also relies primarily on the shipment status to determine when a new load line should automatically be added to an existing load. When the shipment status is **Waved** or higher, no automatic update occurs.

Wave status is also considered for automatic updates. When the wave that is related to the load line has a status of **Held**, **Executing**, **Released**, **Picked**, or **Shipped**, if a user tries to reduce the quantity on a load line (via a quantity decrease on the sales order line or transfer order line), the following error message is shown: "Reservations cannot be removed because there is work created which relies on the reservations." Additionally, when the wave has one of the previously mentioned wave statuses, if a user tries to indirectly increase the load line quantity by increasing the quantity on the sales order line or transfer order line, the quantity on the load line isn't automatically increased. In this case, the load line must be manually updated.

Scenarios

The auto-update shipment functionality supports four scenarios: adding a new order line, increasing the quantity on an order line, decreasing the quantity on an order line, and removing an order line.

- **Add a new order line** – When the **Auto update shipment** field on the **Warehouse** FastTab of the **Warehouses** page (**Warehouse management > Setup > Warehouse > Warehouses**) is set to **Always**, if a shipment exists for the order, and a new order line is added to a sales order or transfer order after a load has already been created for the sales order, the existing load isn't updated. A new load line that has no reference to the existing load is created and associated with the existing shipment. The new line is added to the load and released.
- **Increase the quantity on an order line** – When the **Auto update shipment** field is set to **Always**, if a shipment exists for the order, and the quantity on an existing sales order line or transfer order line is

increased after a load has already been created for the sales order, the load line is increased by the same quantity as the order line. If the load was released, but no work was created, the load line is increased by the same quantity as the order line.

- **Decrease the quantity on an order line** – When the **Auto update shipment** field is set to **Always** or **On quantity decrease**, if a shipment exists for the order, and the quantity on an existing sales order line or transfer order line is decreased after a load has already been created for the sales order, the quantity on the associated load line is updated to match, unless the quantity on that load line already equals or is less than the new quantity on the order line. In that case, the load line isn't affected. If the load was released, but no work was created, the quantity on the associated load line is updated to match, unless the quantity on the load line already equals or is less than the new quantity on the order line. In that case, the load line is affected.
- **Remove an order line** – When the **Auto update shipment** field is set to **Always** or **On quantity decrease**, if the user tries to remove an order line that a load line exists for, an error message is shown.

Example scenario

For this scenario, you must have demo data installed, and you must use the **USMF** demo data company.

Turn on the auto-update shipment functionality

To turn on the auto-update shipment functionality, follow these steps.

1. Go to **Warehouse management > Setup > Warehouse > Warehouses**.
2. Select warehouse 24.
3. On the **Warehouse** FastTab, in the **Auto update shipment** field, change the value from **On quantity decrease** to **Always**.

After you change the value to **Always**, any increases or decreases in the quantities on sales order lines and transfer order lines, and any additions of new lines, are reflected on shipments and loads for the selected warehouse, given the previously mentioned update constraints.

Change the wave template so that load lines aren't automatically processed

To configure the wave template so that it doesn't automatically process load lines, follow these steps.

1. Go to **Warehouse management > Setup > Waves > Wave templates**.
2. Select wave template 24 **Shipping default**.
3. Select **Edit**.
4. On the **General** FastTab, set the **Automate wave creation** option to **Yes**, and make sure that all other options are set to **No**.

It's important that no work be automatically created and released as part of the wave creation process. After work is created that is related to the load line that was created for the sales order line, the load line is no longer automatically updated if the quantity on the sales order line is changed.

Create a sales order

To create a sales order, follow these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select customer **US-003**.
3. Create a line for item number **A0001**.
4. Enter a quantity of **10**. (Make sure that you're using warehouse 24.)
5. Select **Save**.
6. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**. A shipment and a wave are created.

Because you changed the wave template in the previous procedure, no load or work is created. The shipment status is **Open**, and the wave status is **Created**.

Decrease the quantity on a sales order line

To decrease the quantity on a sales order line, follow these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select the sales order that you just released to the warehouse.
3. Select the sales order line. In the **Quantity** field, change the value from **10** to **8**.
4. From the sales order line, select **Warehouse > Shipment details**. On the **Shipment details** page, on the **Load lines** FastTab, the quantity reflects the change on the sales order line.

Increase the quantity on a sales order line

To increase the quantity on a sales order line, follow these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select the sales order that you previously released to the warehouse.
3. Change the line quantity from **8** to **12**.
4. Select **Save**.
5. Go back to the **All sales orders** page, and select the sales order again.
6. On the Action Pane, on the **Warehouse** tab, in the **Related information** group, select **Shipment details**. On the **Shipment details** page, on the **Load lines** FastTab, the quantity reflects the change on the sales order line.

Although the quantity on the load line was increased from 8 to 12, only eight items remain reserved, unless automatic reservation is turned on. Because the quantity that was added to the existing shipment hasn't been reserved, if the wave is processed at this point, without reservation, work is created only for the quantity that has already been reserved.

NOTE

When the quantity on an order line is decreased, the quantity on the load line isn't affected if it already equals or is less than the new quantity on the order line. When the quantity on an order line is increased, the load line is increased by the same quantity as the order line. If the quantity on the order line differs from the quantity on the load line, the difference remains.

Add a sales order line

To add a sales order line, follow these steps.

1. Go to **Sales and marketing > Sales orders > All sales orders**.
2. Select the sales order that you previously released to the warehouse.
3. Create a line for item number **A0002**.
4. In the **Quantity** field, enter **10**. (Make sure that you're using warehouse **24**.) The new line is automatically added to the existing shipment.
5. Select **Save**.
6. Go back to the **All sales orders** page, and select the sales order again.
7. On the Action Pane, on the **Warehouse** tab, in the **Related information** group, select **Shipment details**. On the **Shipment details** page, on the **Load lines** FastTab, notice the second load line.

Because the sales order line that you just added to the existing shipment hasn't been reserved, if the wave is processed at this point, work is created only for the quantity on the first sales order line and the first load line.

Process a wave

To process the wave, follow these steps.

1. Go to **Warehouse management > Outbound waves > Shipment waves > All waves**.
2. Select the wave that you previously created.
3. On the Action Pane, on the **Wave** tab, in the **Wave** group, select **Process**.

The wave is processed and creates work for the reserved quantities on the load lines. The shipment status is updated from **Open** to **Waved**. As the shipment status is updated to **Waved**, any changes that occur, such as decreases or increases in line quantities, or the addition of new lines to the sales order, don't affect the existing load lines that are associated with the waved shipment.

If a shipment has a status of **Waved** or higher, updates to the quantity on a sales order line aren't reflected on or validated against a load line that is associated with the shipment. Changes to the quantity on a load line must be made directly on the load line.

Validation is done after work has been created for the load line and a reservation has been made. A decrease in the quantity on the sales order line is then validated against the work line reservation.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a location profile

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create a location profile in Dynamics 365 Supply Chain Management. Every location in the warehouse needs to have a location profile associated with it that describes the properties of the location, for example, whether the location allows mixed items. In this procedure we'll create a profile for a location that doesn't require license plate control. We'll enable mixed items, and mixed inventory statuses, and allow cycle counting. You can use this procedure in the USMF demo data company.

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Warehouse > Location profiles**.
2. Select **New**.
3. In the **Location profile ID** field, type a value.
4. In the **Name** field, type a value.
5. In the **Location format** field, enter or select a value.
6. In the **Location type** field, enter or select a value.
7. In the **Dock management profile ID** field, enter or select a value.
8. Select **Yes** in the **Allow mixed items** field.
9. Select **Yes** in the **Allow mixed inventory statuses** field.
10. Select **Yes** in the **Allow cycle counting** field.
11. Select **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure locations in a WMS-enabled warehouse

2/18/2021 • 8 minutes to read • [Edit Online](#)

This guide shows you how to configure the location setup for a new WMS-enabled warehouse (a warehouse that uses advanced warehouse management processes). The process is typically done by a warehouse manager. You can run this guide in demo data company USMF or on your own data. A precondition is that you have at least one site configured.

Create a new warehouse

1. Go to **Navigation pane > Modules > Inventory management > Setup > Inventory breakdown > Warehouses**.
2. Click **New**.
3. In the **Warehouse** field, type a value.
4. In the **Name** field, type a value.
5. In the **Site** field, type a value.
6. Expand the **Warehouse** section.
7. Set the **Use warehouse management processes** option to Yes. This setting allows you to run advanced warehousing processes using warehouse work and mobile devices.
8. Close the page.

Define a location format

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse > Location formats**. Location formats are a naming-system used to create unique and consistent names for the different location bin positions used within a warehouse. It can be useful to use separators as part of the location format to make it easier to identify components of the location such as the aisle number. In this example, we'll create a name with four components. For example, these could be aisle, rack, shelf, and bin.
2. Click **New**.
3. In the **Location format** field, type a value.
4. In the **Name** field, type a value.
5. In the **Segment description** field, type a value. This describes what the first component of the location name represents. For example, it could be 'Aisle'.
6. In the **Length** field, enter a number. This determines how many characters this part of the location name must have. Note that the total of all components in the name, including the separators, cannot exceed 10 characters.
7. In the **Separator** field, type a value. This determines which character or symbol is used between the first and second component of the name.
8. In the **Details** section, click **New**.
9. In the **Segment description** field, type a value.
10. In the **Length** field, enter a number.
11. In the **Separator** field, type a value.
12. In the **Details** section, click **New**.
13. In the **Segment description** field, type a value.
14. In the **Length** field, enter a number.
15. In the **Separator** field, type a value.

16. In the **Details** section, click **New**.
17. In the **Segment description** field, type a value.
18. In the **Length** field, enter a number.
19. Click **Save**.
20. Close the page.

Define location types

1. Go to **Navigation pane > Modules > Warehouse management > setup > Warehouse > Location types**. Location types can be used as filtering options to control the different warehouse management processes. As a minimum, you need to create staging and final shipping location types in order to define the outbound warehouse management process.
2. Click **New**.
3. In the **Location** type field, type a value.
4. In the **Description** field, type a value.
5. Close the page.

Define location profile

1. Go to **Navigation pane > modules > Warehouse management > Setup > Warehouse > Location profiles**. The definition of location profiles is very important. Grouped locations capacity can be controlled here, as well as the policies related to what inventory gets stored, and how it is stored. Location profiles can be used as filtering options to control the different warehouse management processes. As a minimum, you must create a user location profile in order to enable the warehouse management processes.
2. Click **New**.
3. In the **Location profile ID** field, type a value.
4. In the **Name** field, type a value.
5. In the **Location format** field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.
8. In the **Location type** field, click the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. In the list, click the link in the selected row.
11. Select or clear the **Allow mixed inventory statuses** check box. Enable this option if you want to allow mixed inventory status values in the locations that are going to be grouped by this location profile.
12. Select or clear the **Override rules for batch days** check box. Enable this option to override the rule for how many days the inventory batch expiration dates can differ, to allow mixing of inventory batches that don't obeying this rule.
13. Select or clear the **Allow cycle counting** check box. Enable this option to allow cycle counting processing in all the locations that are going to be grouped by this location profile.
14. Expand or collapse the **Dimensions** section. The Dimensions tab allows you to define parameters and methods to enable precise calculations of the load capacity within each of the locations.
15. Close the page.

Enable warehouse management parameters

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse management parameters**. To be able to process warehouse work, you need to set parameters for the user location profile the staging location type, and the final shipping location type. As soon as the outbound process ends at the final shipping location type that you define, the related outbound transactions will be

updated to "Picked".

2. Expand the **Location profiles** section.
3. In the **User location** field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. Expand the **Location types** section.
6. In the **Staging location type** field, click the drop-down button to open the lookup.
7. In the list, click the link in the selected row.
8. In the **Final shipping location type** field, click the drop-down button to open the lookup.
9. In the list, click the link in the selected row.
10. Close the page.

Define warehouse zone groups

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse > Warehouse zone groups**. Warehouse zones can be used as filters for options to control the different warehouse management processes. You need to create a zone group before you can define a zone.
2. Click **New**.
3. In the **Zone group ID** field, type a value.
4. In the **Zone group name** field, type a value.
5. Close the page.

Define Warehouse zones

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse > Zones**.
2. Click **New**.
3. In the **Zone ID** field, type a value.
4. In the **Zone name** field, type a value.
5. In the **Zone group ID** field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.
8. Close the page.

Create locations using the Location setup wizard

1. Go to **Navigation pane > Modules > Warehouse management > Setup > Warehouse > Location setup wizard**.
2. In the **Warehouse** field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. In the **Zone ID** field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.
8. In the **Location profile ID** field, click the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. In the list, click the link in the selected row.
11. In the list, mark the selected row.
12. In the **From number** field, enter a number. The From number and To number fields define how many locations will be created. For example, if you set From number to 1 and To number to 3 for all four lines in the location format, 81 locations will be created (3x3x3x3).

13. In the **To number** field, enter a number.
14. In the list, find and select the desired record.
15. In the **From number** field, enter a number.
16. In the **To number** field, enter a number.
17. In the list, find and select the desired record.
18. In the **From number** field, enter a number.
19. In the **To number** field, enter a number.
20. In the list, find and select the desired record.
21. In the **From number** field, enter a number.
22. In the **To number** field, enter a number.
23. Click Create.

Create locations manually

1. Go to **Warehouse management > Setup > Warehouse > Locations**. Manually creation of locations within a warehouse can easily be done. The location name and the location profile ID are mandatory values.
2. Click **New**.
3. In the **Warehouse** field, type a value.
4. In the **Location** field, type a value. Note that you're creating a new location here, so you need to type a new unique name, rather than selecting an existing one.
5. In the **Location profile ID** field, type a value.
6. Close the page.

Define Pack size categories

1. Go to **Warehouse management > Setup > Warehouse > Pack size categories**. Pack size categories can be used to group items that have similar physical packing sizes. In this example the pack size category will be used to control the capacity at the picking locations within a specific zone of the warehouse. Please note that the pack size category ID must be assigned to the released product entity in order to be used as part of the stocking limits processing.
2. Click **New**.
3. In the **Pack size category ID** field, type a value.
4. In the **Pack size category name** field, type a value.
5. Close the page.

Define location stocking limits

1. Go to **Warehouse management > Setup > Warehouse > Location stocking limits**. Location stocking limits help to make sure that work isn't created to request that inventory to be put in a location that doesn't have the physical capacity to carry the inventory.
2. Click **New**.
3. In the **Warehouse** field, type a value.
4. In the **Location profile ID** field, type a value.
5. In the **Pack size category ID** field, type a value.
6. In the **Quantity** field, enter a number.
7. Click **Save**.
8. Close the page.

Define fixed picking locations

1. Go to **Warehouse management > Setup > Warehouse > Fixed locations**. You can define the locations to be used per product or per product variant. It is possible to create multiple fixed locations for the same product within the same warehouse.
2. Click **New**.
3. In the **Item number** field, type a value.
4. In the **Warehouse** field, type a value.
5. In the **Location** field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warehouse location status

2/18/2021 • 8 minutes to read • [Edit Online](#)

Microsoft Dynamics 365 Supply Chain Management includes several location fields that give you flexibility when you work with and maintain locations. You can include location statuses in the location directive query to provide better control over warehouse flow.

The following four fields on the **Locations** page track information about the current status of a location. These fields let warehouse managers get an overview of the status of the warehouse locations. They also allow for advanced reporting and filtering.

- **Item number** – The item that is currently in the location. If the location contains multiple items, this field is blank.
- **Last activity date and time** – The timestamp of the last warehouse transaction that was performed against the location.
- **Aging date** – The date when the inventory in the location was brought into the warehouse. This value is calculated based on the aging date of the license plate. It's accurate for locations that are license plate-tracked, but it might not be accurate for locations that aren't license plate-tracked.
- **Location status** – The status of the location. There are four possible values:
 - **Undetermined** – The location profile can't track status. Therefore, the current status is unknown.
 - **Empty** – There is currently no inventory in the location.
 - **Picking** – Outbound transactions have been performed against the location since it was last empty.
 - **Storage** – Only inbound transactions have been performed against the location since the location was last empty.

Turn on the Warehouse location status feature

Before you can use the *Warehouse location status* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Warehouse location status*

Set up warehouse location status

Prepare the sample data that is required for the example scenario

Before you start to work through the scenario, you must activate sample data and set up the feature as described in this section. To complete the example scenario, you must use either the warehouse app or the browser-based emulator. The steps that are provided here use the warehouse app. The steps for the browser-based emulator are similar.

Use the USMF legal entity

To work through the example scenario by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. Additionally, you must select the **USMF** legal entity before you begin.

Set up location profiles

The example scenario requires that you prepare two location profiles.

1. Go to **Warehouse management > Setup > Warehouse > Location profiles**.
2. Select **Edit** to put the page into edit mode.
3. Select the **BULK-06** profile.
4. On the **General** FastTab, set the following values:
 - **Enable item in location:** Set this option to *Yes*.
 - **Enable location activity date and time:** Set this option to *Yes*.
 - **Enable location status:** Set this option to *Yes*.These options control whether the reference fields on the location are active.
5. Repeat steps 3 through 4 for the **PICK-06** profile.

NOTE

When the parameters on the location profile (**Enable item in location**, **Enable location activity**, **Enable location status**) are set to *Yes*, the system immediately updates the relevant locations by executing the *warehouse location status consistency check* job.

Scenario

1. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
2. Select **New**.
3. In the **Create purchase order** dialog box, on the **Vendor** FastTab, in the **Vendor account** field, select *104*.
4. On the **General** FastTab, in the **Warehouse** field, select *61*.
5. Select **OK**.
6. Your new purchase order (PO) is opened. It includes an empty line in the **Purchase order lines** grid. On this line, set the following values:
 - **Item number:** *A0002*
 - **Quantity:** *5*
7. On the Action Pane, on the **Purchase** tab, in the **Actions** group, select **Confirm** to confirm the purchase order.
8. On the mobile device, go to **Inbound > Purchase Receive**.
9. Select the **PONUM** field, enter the PO number, and confirm.
10. Select the **ITEM** field, enter *A0002* as the item number, and confirm.
11. On the **QTY** page, enter *5* as the quantity, and confirm.

You can enter the quantity in either of the following ways:

 - Select the plus sign (+) or minus sign (–) button to add or subtract a numerical value.
 - Select the blank field between the plus sign (+) and minus sign (–) buttons to open the number pad.
12. Confirm your selection of item number *A0002* and a quantity of *5*. A "Work Completed" message appears at the bottom of the page.
13. Select the Menu button (sometimes referred to as the hamburger or the hamburger button) in the upper-

right corner, and then select **Cancel** to exit **Purchase Receive** and return to the **Inbound** menu.

14. On the purchase order page, select **Work details** above the **Purchase order lines** grid.
15. On the **General** tab, notice the **Work ID** and **Target license plate ID** values that were created.
16. In the **Lines** section, notice the **Location** values for the *Pick* and *Put* work types.
17. On the mobile device, go to **Inbound > Purchase Put-away**.
18. Select the **ID** field, enter the work ID, and confirm.
19. Confirm once more to complete the *Pick* entry.
20. Select the Menu button in the upper-right corner, and then select **Done** to complete the *Pick* work.
21. Make a note of the Putaway location, and confirm. A "Work Completed" message appears at the bottom of the page.
22. Select the Menu button in the upper-right corner, and then select **Cancel** to exit **Purchase Put-away** and return to the **Inbound** menu.
23. Select **Back** to return to the main menu.
24. In Dynamics 365 Supply Chain Management, go to **Warehouse management > Setup > Warehouse > Locations**.
25. Filter on **Location**, and enter the putaway location from the purchase order work. You should see the following results:
 - The **Location status** column shows a value of *Storage*, because the last transaction against this location was a put.
 - The **Item number** column shows a value of *A0002*, because that item was received and put to the location.
 - The **Last activity date and time** column shows the timestamp for the date and time when the work was completed at the location.
26. On the mobile device, go to **Quality > Movement**.
27. Select the **LOC/LP** field, and enter the location you made note of in the previous steps.
28. Confirm the information that is shown. Make a note of the license plate number that is generated.
29. On the **To Information** screen, select the **LOC/LP** field, and enter *06A07R2S1B* as the location to move the item to.
30. On the **To Information** screen, confirm the LP value (the target license plate ID), which is automatically generated. A "Work Completed" message appears at the bottom of the page.
31. Select the Menu button in the upper-right corner, and then select **Cancel** to exit **Movement** and return to the **Quality Management** menu.
32. Select **Back** to return to the main menu.
33. In Dynamics 365 Supply Chain Management, go to **Warehouse management > Setup > Warehouse > Locations**.
34. Refresh the **Locations** page, and view the original putaway location again. Notice that the **Location status** field is now set to *Empty*, and the **Item number** column is blank.
35. View the record for location *06A07R2S1B*, and notice that the **Status** value has changed to *Storage*, and the **Item number** and **Last activity date and time** fields have been updated.

36. Go to **Sales and marketing > Sales orders > All sales orders**.
37. Select **New**.
38. In the **Create sales order** dialog box, in the **Customer account** field, select *US-002*.
39. In the **Warehouse** field, select *67*.
40. Select **OK**.
41. Your new sales order is opened. It includes an empty line in the **Sales order lines** grid. On this line, set the following values:
 - **Item number:** *A0002*
 - **Quantity:** *1*
42. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
43. On the **Reservation** page, select **Reserve lot** to reserve the order line. Then select the **Close** button (X) in the upper-right corner to close the page.
44. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
45. In the **Sales order lines** section, on the **Warehouse** menu, select **Work details**.
46. Copy the **Work ID** value that was created.
47. On the mobile device, go to **Outbound > Sales picking**.
48. Select the **ID** field, enter the work ID that you copied earlier, and confirm.
49. On the **Sales orders: Pick** page, the **LOC** field suggests the picking location as the putaway location that was created earlier. Make a note of the location.
50. Select the **LOC** field, enter the location, and confirm.
51. Select the **LP** field, enter the license plate number that you made a note of during the Movement activity, and confirm.
52. Select the **Item** field, enter the *A0002* as the item number, and confirm.
53. On the **QTY** page, enter *1* as the quantity, and confirm.

You can enter the quantity in either of the following ways:

 - Select the plus sign (+) or minus sign (–) button to add or subtract a numerical value.
 - Select the blank field between the plus sign (+) and minus sign (–) buttons to open the number pad.
54. Select the **TARGET LP** field, enter a user-defined target license plate ID, and confirm.
55. Confirm once more to complete the picking work. A "Work Completed" message appears at the bottom of the page.
56. Select the **Menu** button in the upper-right corner, and then select **Cancel** to complete the picking activity and return to the **Outbound** menu.
57. In Dynamics 365 Supply Chain Management, go to **Warehouse management > Setup > Warehouse > Locations**.
58. Filter on **Location**, and enter the pick location from the sales order work.
59. Notice that the **Location status** field for the location that the sales order work picked from is now set to *Picking*, and the **Last activity date and time** field has been updated.

NOTE

The location fields are updated only by warehouse transactions. If you move inventory by using a journal or other non-WHS processes, the fields won't be updated.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Additional location zones

2/18/2021 • 2 minutes to read • [Edit Online](#)

Three new zone fields are available in Microsoft Dynamics 365 Supply Chain Management. Warehouse managers can use them to define additional warehouse organizations or layouts. The new zone fields can be set either manually or by using the **Location setup** wizard. They can be used in any query or filtering that uses the Locations table.

No additional setup is required to use the zone fields.

Turn on the Additional location zone feature

Before you can use the *Additional location zone* feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Additional location zone*

Use location zones

1. Go to **Warehouse management > Setup > Warehouse > Location setup wizard**.
2. Set the following values:
 - In the **Warehouse** field, select *62*.
 - In the **Zone ID** field, select *FLOOR*.
 - In the **Additional Zone 1** field, select *PICKZONE1*.
 - In the **Additional Zone 2** field, select *WEBSHOP1*.
 - In the **Location profile ID** field, select *FLOOR*.
3. Select the **Floor** line.
4. In the **From number** field, enter *1*. In the **To number** field, enter *3*.
5. Select the **Aisle** line.
6. In the **From number** field, enter *1*. In the **To number** field, enter *5*.
7. Select **Create**.
8. You receive messages that state that new locations have been added. Select the **Show messages** button to view the messages.
9. Go to **Warehouse management > Setup > Warehouse > Locations**. The new locations appear in the list, and all zone fields are available (that is, the existing zone field and the new additional zone fields).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule load utilization

2/18/2021 • 3 minutes to read • [Edit Online](#)

You can schedule load utilization for selected location types, and you can also project the current and future load utilization. You can project the load for one or more sites, for the load units (zone or warehouse), or for a combination of a zone and a warehouse.

Schedule and view the load for a warehouse or site

To schedule the load for sites, warehouses, or zones, you create a space utilization setup and associate it with a master plan.

In the space utilization setup, you use location types, such as **Bulk location** and **Picking location**, to specify how space utilization should be projected. You also specify a storage load mode, such as **Zone**.

The projection of future space utilization is based on information that is calculated on the associated master plan. Master plans forecast the resource planning for incoming and outgoing orders for production and operations. The projection of available space is based on the relation between the space utilization setup and the selected master plan.

By using the storage load mode that you selected in the space utilization setup, you can specify whether the load should be projected for each warehouse or zone, or whether the projections should include information about both warehouses and zones. You also specify whether blocked locations should be excluded from the calculation of load utilization.

You can project the space utilization by generating the **Warehouse load utilization** report. When you generate this report, you can specify whether the load utilization should be projected for each site, across sites, or for the selected load unit, such as zone or warehouse.

Create a space utilization setup for a warehouse

1. Select **Inventory management > Setup > Warehouse monitoring > Space utilization**.
2. Select **New** to create a space utilization setup. Specify an ID and a name for the new setup.
3. In the **Storage load mode** field, select whether the overview of space utilization should show information by warehouse, zone, or warehouse and zone.
4. Set the **Exclude blocked locations** option to **Yes** to exclude blocked inventory locations from the calculation of available space. You can block an inventory location for input and output by specifying a blocking cause for the location in the **Input blocked** or **Output blocked** field on the **Other** FastTab on the **Inventory locations** page.
5. On the **Location type** FastTab, select the location types to include in the space utilization calculation. You must select at least one location type for the projection.

Associate a space utilization setup with a master plan

1. Select **Inventory management > Periodic tasks > Schedule load utilization**.
2. In the **Master plan** field, select a master plan.
3. In the **Number of days** field, specify the number of days to include in the projection of current and future workloads.
4. In the **Space utilization** field, select the space utilization setup to use for the projection of current and future workloads.

Specify the load utilization projection and view information

1. Select **Inventory management > Inquiries and reports > Physical inventory reports > Warehouse load utilization**.
2. In the **Show by** field, select the level of the space utilization projection:
 - **Site** – Project the space utilization for each site. This projection is useful if, for example, you want to view all the warehouses for a site so that you can balance the space utilization between the warehouses.
 - **Load unit** – Project the space utilization for zones or warehouses. The available space is then projected according to the value that you selected in the **Storage load mode** field on the **Space utilization** page when you created the space utilization setup.
3. Follow one of these steps, depending on the value that you selected in the previous step:
 - If you selected **Site** in the **Show by** field, the **Site** field is available. Select one or more sites to include in the projection.
 - If you selected **Load unit** in the **Show by** field, the **Load unit** field is available. Select the load unit.
4. In the **Load type** field, select **Volume** or **Weight** to specify the warehouse operating unit to project space for.
5. In the **Space utilization setup** field, select the space utilization setup that the projection should be based on.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule workload capacity

2/18/2021 • 3 minutes to read • [Edit Online](#)

You can schedule workload capacity for warehouses, and you can also project the current and future workloads for the workers in individual warehouses. You can project the workload for the whole warehouse, or you can project the workload separately for incoming and outgoing workloads.

To project workload output for selected warehouses, master scheduling data must be available for those warehouses. For more information, see [Master plans overview](#).

Schedule and view workloads for a warehouse

To schedule workload capacity for a warehouse, you create a workload setup for one or more warehouses, and then associate the workload setup with a master plan. In the workload capacity setup, you can define limits for the weight or volume for incoming and outgoing transactions. You can also create more than one setup for each warehouse and then associate the setup with individual master plans. For example, you might use this approach to accommodate seasonal changes in the workforce.

If the workers for a warehouse work with transactions for both incoming and outgoing workloads, you can configure the warehouse capacity setup so that the workload is projected in a combined view.

To schedule and view workloads for warehouses, you must complete the following tasks:

1. Create a workload capacity setup and define workload capacity limits for one or more warehouses.
2. Associate the workload capacity setup with a master plan to create workload projections and specify how long those projections will apply.

Create a workload capacity setup for a warehouse

1. Select **Inventory management > Setup > Warehouse monitoring > Workload capacity**.
2. On the Action Pane, select **New** to create a workload capacity setup.
3. On the **Warehouses** FastTab, select **New**, and then enter values on the line to associate a warehouse with the workload capacity setup.
4. Select the **Combined inbound and outbound workload** check box if the **Workload capacity** report should show the total workload for incoming and outgoing transactions in one view.
5. On the **Transaction types** FastTab, select the types of incoming and outgoing transactions that the workload limits will apply to.

NOTE

You must select at least one transaction type for both the incoming workload and the outgoing workload.

Define limits for volume or weight

You can set up limits for volume or weight, depending on the limitation that is relevant for the warehouse workforce. The limits that you specify are included in the workload capacity projection that you can view on the **Workload capacity** report.

To project information about volume and weight for items, the standard volume of one inventory item and the weight of one inventory item must be specified for all products. The fields that are required are available in the following field groups on the **Manage inventory** FastTab of the **Released product details** page:

- Handling
- Physical dimensions
- Weight measurements

If this information isn't specified correctly, you receive a message when you generate the **Workload capacity** report. From the report, you can then drill down to identify the missing information that is required in order to project the future workload.

Associate a workload capacity setup with a master plan

1. Select **Inventory management > Periodic > Schedule workload**.
2. In the **Master plan** field, select the master plan to use for workload projections.
3. In the **Number of days** field, specify the number of days that the workload projection covers.
4. In the **Workload** field, select the workload setup to associate with the master plan.

View workload capacity

1. Select **Inventory management > Inquiries and reports > Physical inventory reports > Workload capacity**.
2. In the **Number of columns** field, specify the number of columns to show on the report.
3. In the **Order type** field, select **Planned and confirmed**, **Planned**, or **Confirmed** to indicate the type of orders to project on the report.
4. In the **Load type** field, select a load type to specify whether the workload capacity should be projected for volume or weight.
5. In the **Workload capacity** field, select a workload capacity setup.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up dispositions codes

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure focuses on the setup of a disposition code that can be used on a mobile device for the return order receiving process. Disposition codes are a collection of rules that can be used when items are received. For example, when a work user uses a mobile device to receive items that were damaged, the user must scan a disposition code for damaged items. The inventory status of the goods received, the work template, and the location directive can be determined from the scanned disposition code. For the purchase order receiving process and the production order report as finished process, the use of a disposition code is optional. For the sales order return receiving process, if the items are registered using a mobile device, the use of disposition code is mandatory. This guide was created using the demo data company USMF. This procedure is intended for the warehouse manager.

1. Go to Warehouse management > Setup > Mobile device > Disposition codes.
2. Click New.
 - Create a new disposition code to use for customer returns.
3. In the Disposition code field, type a value.
4. In the Inventory status field, select an inventory status where there is inventory blocking.
 - If you're using USMF, select 'Blocking'. You can add an inventory status to the disposition code to override the default status that's on the order lines.
5. In the Work template field, type a value.
 - Optional: Select a work template code that is associated with a return order. If no value is provided, the work template will be resolved using the standard rules configured in your system. Selecting a work template will limit the processes this disposition code can be used with. For example, if a disposition code has a work template with a work order of type purchase order, it can't be used to register items that are returned by customers.
6. In the Return disposition code field, type a value.
 - The return disposition code determines the remainder of the return order process for the items registered. In this example, the customer should receive a credit note. Add a returns disposition code that contains an action Credit.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Unit of measure and stocking policies

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes how default units, unit sequences, and unit conversions are used in warehouse processes.

Unit sequence groups define the sequence of units that can be used in warehouse operations. They are created on the **Unit sequence groups** page. The sequence shows the relationship of the various units. For example, you store pallets that contain boxes that contain individual pieces of items. In this case, you must provide the three different units and the logical order of the layers. Unit sequence groups let you define the policies for the grouping of license plates, and the default units that should be used for various warehouse processes. This article applies to both the advanced warehousing solution that is available in Warehouse management and the more basic warehousing solution that is available in Inventory management.

Unit sequence groups for released products

If you want to use released products in warehouse work processes, a unit sequence group must be assigned to them. If you validate a product that is associated with a Storage dimension group, and the **Use warehouse management processes** option for the Storage dimension group is set to **Yes**, you receive an error message if a unit sequence group ID isn't defined for the product. If the unit sequence group that you use contains multiple lines (and therefore multiple units), you must set up a unit conversion between the units. You complete this setup on the **Unit conversions** page. The smallest unit in a sequence group that you associate with a released product must match the inventory unit that is defined for the corresponding product. The inventory unit is the unit that is used for base calculations of the on-hand inventory. You can also set up unit of measure conversions for product variants of product masters by using the **Enable unit of measure conversions** option.

License plate grouping

You can specify whether receipts of less than or more than a specific unit should be grouped into one license plate or divided into a license plate for each unit. To set up this behavior, use the **License plate grouping** option on the **Line details** tab of the **Unit sequence groups** page. If you want to use the license plate grouping when you process work by using a mobile device, the **License plate grouping** option must be selected on the **Mobile device** menu item. For example, you're using a mobile device to register an item that is associated with a unit sequence group that has two lines. The first line is for Pieces, and the **License plate grouping** option is set to **Yes**. The second line is for the Pallet unit, and the **License plate grouping** option is set to **No**. In this case, the system can automatically guide the split and creation of license plates per 100 pieces.

Units for cycle counting

To define which units should be used as part of the cycle counting processes, select the **Use unit for cycle counting** option on the **Unit sequence groups** page. You can select a maximum of four units in the sequence group. If you select more than four units, the additional units won't be shown on the mobile device.

Default units for mobile device receiving processes

To set the default units that should be used for receiving processes on mobile devices, enable the **Default unit for purchase and transfer** and **Default unit for production** options on the **Unit sequence groups** page. For example, you can specify that, by default, the system should use Pallet quantities when purchase order on-hand inventory is received by using a mobile device, but that the stock-keeping unit should be Pieces. To get the conversion for the number of pieces that each pallet contains, you must define a unit conversion, such as 100 Pcs = 1 PL.

Default order settings

As part of the creation of released products, you must select default units for purchases, sales, and inventory to process the various orders. You can set the default units and quantities for the various source documents by using the **Default order settings** and **Site specific order settings** pages. You can access these pages from the **Released products** page.

Warehouse performance Power BI content

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic describes what's included in the **Warehouse performance** Microsoft Power BI content. It explains how to access the Power BI reports, and provides information about the data model and entities that are used to build the content.

Overview

The **Warehouse performance** Power BI content was created so that warehouse and operations managers can monitor important inbound, outbound, and inventory metrics. It uses Warehouse management, product, and other transactional data from your system, and provides both an aggregate view of warehouse performance and a breakdown for vendors, product groups and products, and site and warehouses.

Warehouse managers can use the **Warehouse performance** Power BI content to measure the following three areas:

- **Inbound performance** – Measure how well a vendor is performing against customer requirements (in other words, measure delivery performance), and measure put-away performance, so that you can identify issues that involve workers or items over a period. It's important that you know whether vendors are delivering on time, early, or late, so that you can determine how vendor performance is affecting overall put-away performance. A vendor that delivers outside the dates that were agreed on can put extra pressure on the warehouse because of unexpected work, and can increase the average put-away time.
- **Shipping performance** – Measure whether your warehouse is shipping in full and on time to customers (in other words, measure outbound shipping and delivery performance), so that you can identify any issues that involve products, sites or warehouses, or dedicated customers. If you find that you're shipping late to specific areas or towns, you might have to pay more attention to transportation or account management.
- **Location inventory accuracy** – Inventory accuracy is important internal warehouse business intelligence (BI). It's very important that you determine how accurately you're counting in general. However, it's also important that you determine how accurate you are at storing items in the correct locations, and that you highlight discrepancy data, so that you can find better positions for items or initiate total counting on specific items. (Currently, the new item-based counting functionality is delivered as a hotfix.) If you're using this Power BI content to determine the correctness of on-hand inventory data per location, you can also identify theft in your shops. You can also determine whether any locations have on-hand quantities that differ from enterprise resource planning (ERP) data. Those locations might be too large, or they might be impossible to count. Alternatively, some of the physical positioning might be bad, so that it's difficult to keep a single type of item in sync with on-hand data.

Accessing the Power BI content pack

The **Warehouse performance** Power BI content is shown on the **Warehouse performance** page (**Warehouse management > Inquiries and reports > Warehouse performance analysis > Warehouse performance**).

Metrics that are included in the Power BI content

The **Warehouse performance** Power BI content includes a report. This report consists of a set of metrics that are visualized as charts, tiles, and tables. The following table provides an overview of the visualizations in the **Warehouse performance** Power BI content.

REPORT PAGE	CHARTS	DESCRIPTION
Inbound Performance	Total put aways	The number of put-away work lines that are processed during a given time.
Inbound Performance	Put away average time	The average time, in hours, for all purchase order put-away lines that are processed, from registration of the items until the last put is processed.
Inbound Performance	Received early	The number of purchase order lines that are received early.
Inbound Performance	Received on time	The number of purchase order lines that are received on time.
Inbound Performance	Received late	The number of purchase order lines that are received late.
Inbound Performance	On time by vendor	A view of the percentage of purchase order lines that are received from a vendor or vendor group early, on time, and late.
Inbound Performance	Dock to stock average put away (hours)	The average dock-to-stock put-away time in hours over time.
Inbound Performance	Average put away by worker	The average time, in hours, that a worker has been taking for put-away processing of purchase order lines.
Inbound Performance	Average put away hour by vendor	The average put-away time in hours by vendor or vendor group.
Inbound Performance	Average put away hour by product	The average put-away time in hours by item or item group.
Location inventory accuracy	Total count	The number of counting work lines that are processed for a given period.
Location inventory accuracy	Discrepancy rate	The total discrepancy rate as a percentage of all lines that are counted for a given period.
Location inventory accuracy	Count without discrepancy	Of the total number of counting work lines that are processed, the number of lines that are processed without any discrepancy.
Location inventory accuracy	Items counted over time	The percentage of items that are counted with and without discrepancy over time.

REPORT PAGE	CHARTS	DESCRIPTION
Location inventory accuracy	Item quantity discrepancy greater than %	A table view of counting lines that have discrepancies that exceed a specified percentage. The table includes information about locations, items, the average discrepancy, the total counting work lines that are counted, the number of counting lines that have discrepancies for the location, the average quantity that is counted, the expected total quantity that will be counted, and the actual item quantity that is counted.
Location inventory accuracy	Item count by worker	The counting performance of workers. Performance is expressed as a percentage of counting work lines that have and don't have discrepancies.
Location inventory accuracy	Item count by site / warehouse	Counting performance by the number of processed counting work lines by site or warehouse that have and don't have discrepancies.
Location inventory accuracy	Discrepancy rate by product	The discrepancy rate for counting performance. The rate is expressed as a percentage of processed counting work lines by item or item group.
Shipping performance	Lines shipped	The total number of shipment lines that are shipped over a given period.
Shipping performance	Early	The percentage of shipment lines that are shipped early.
Shipping performance	On time	The percentage of shipment lines that are shipped on time.
Shipping performance	Late	The percentage of shipment lines that are shipped late.
Shipping performance	Shipments over time	The percentage of shipment lines that are shipped on time, early, or late over a given period. A trend line shows the trend for lines that are shipped on time.
Shipping performance	Shipped late by city	A map visualization of cities and areas that are affected by late shipments.
Shipping performance	Shipped by product	The percentage that is shipped early, on time, or late by item or item group.
Shipping performance	Shipped by customer	The percentage that is shipped early, on time, or late by customer or customer group.

REPORT PAGE	CHARTS	DESCRIPTION
Shipping performance	Shipped by site / warehouse	The percentage that is shipped early, on time, or late by site or warehouse.

Understanding the data model and calculations

The following data is used to fill the report pages in the **Warehouse performance** Power BI content. This data is represented as aggregate measurements that are staged in the Entity store. The Entity store is a Microsoft SQL Server database that is optimized for analytics. For more information, see [Power BI integration with Entity store](#).

The following key aggregate measurements are used as the basis of the content.

REPORT PAGE	CHARTS	TABLES	CALCULATION DESCRIPTIONS
Inbound Performance	Total put aways	WHSWorkLine	The count of work lines where the work type is put .
Inbound Performance	Put away average time	WHSWorkLine	The sum of work lines max. time divided by the count of work lines max. time, where work lines max. time is the maximum gap between the work created date and the closed date.
Inbound Performance	Received early	WHSWorkLine	The count of work lines where the work created date is earlier than the delivery date that is used. If the delivery confirmed date isn't set, use the default delivery date.
Inbound Performance	Received on time	WHSWorkLine	The count of work lines where the work created date is equal to the delivery date that is used. If the delivery confirmed date isn't set, use the default delivery date.
Inbound Performance	Received late	WHSWorkLine	The count of work lines where the work created date is later than the delivery date that is used. If the delivery confirmed date isn't set, use the default delivery date.
Inbound Performance	On time by vendor	WHSWorkLine	Received early, Received on time, and Received late (see the descriptions earlier in this table).

REPORT PAGE	CHARTS	TABLES	CALCULATION DESCRIPTIONS
Inbound Performance	Dock to stock average put away (hours)	WHSWorkLine	Put away average time (see the description earlier in this table).
Inbound Performance	Average put away by worker	WHSWorkLine	Put away average time (see the description earlier in this table).
Inbound Performance	Average put away hour by vendor	WHSWorkLine	Put away average time (see the description earlier in this table).
Inbound Performance	Average put away hour by product	WHSWorkLine	Put away average time (see the description earlier in this table).
Location inventory accuracy	Total count	WHSWorkLineCycleCount	Cycle counts where the absolute discrepancy quantity is equal to or more than 0 (zero).
Location inventory accuracy	Discrepancy rate	WHSWorkLineCycleCount	Cycle counts that have discrepancies, divided by the total count. A cycle count is considered to have discrepancies if the absolute discrepancy quantity is more than 0 (zero).
Location inventory accuracy	Count without discrepancy	WHSWorkLineCycleCount	Cycle counts where the absolute discrepancy quantity is more than 0 (zero).
Location inventory accuracy	Count with discrepancy	WHSWorkLineCycleCount	Cycle counts where the absolute discrepancy quantity is equal to 0 (zero).
Location inventory accuracy	Items counted over time	WHSWorkLineCycleCount	Count without discrepancy and Count with discrepancy (See the descriptions earlier in this table.)

REPORT PAGE	CHARTS	TABLES	CALCULATION DESCRIPTIONS
Location inventory accuracy	Item quantity discrepancy greater than %	WHSWorkLineCycleCount	The average discrepancy is the absolute discrepancy quantity divided by the expected quantity where the absolute discrepancy quantity is more than 0 (zero). The average discrepancy quantity is the average absolute discrepancy quantity where the absolute discrepancy quantity is more than 0 (zero). Count with discrepancy, Total count, Expected quantity, and Counted quantity where the whole quantity is grouped by item and location (see the descriptions earlier in this table).
Location inventory accuracy	Item count by worker	WHSWorkLineCycleCount	Count without discrepancy and Count with discrepancy (see the descriptions earlier in this table).
Location inventory accuracy	Item count by site / warehouse	WHSWorkLineCycleCount	Count without discrepancy and Count with discrepancy (see the descriptions earlier in this table).
Location inventory accuracy	Discrepancy rate by product	WHSWorkLineCycleCount	Discrepancy rate (see the description earlier in this table).
Shipping performance	Lines shipped	SalesLine	The count of sales lines where sales lines are shipped.
Shipping performance	Early	CustPackingSlipOnTimeStat us	Sales lines where the ship date status is 1 (Early) . Early means that the ship date of the packing slip is earlier than the confirmed ship date of the sales line. If the confirmed ship date isn't set, use the requested ship date.

REPORT PAGE	CHARTS	TABLES	CALCULATION DESCRIPTIONS
Shipping performance	On time	CustPackingSlipOnTimeStat us	Sales lines where the ship date status is 2 (On time). On time means that the ship date of the packing slip is equal to the confirmed ship date of the sales line. If the confirmed ship date isn't set, use the requested ship date.
Shipping performance	Late	CustPackingSlipOnTimeStat us	Sales lines where the ship date status is 3 (Late). Late means that the ship date of the packing slip is later than the confirmed ship date of the sales line. If the confirmed ship date isn't set, use the requested ship date.
Shipping performance	Shipments over time	SalesLine CustPackingSlipOnTimeStat us	Orders that are fully shipped, where the whole quantity of the sales line is shipped, plus Early, On time, and Late (see the descriptions earlier in this table).
Shipping performance	Shipped late by city	CustPackingSlipOnTimeStat us	Late (see the descriptions earlier in this table).
Shipping performance	Shipped by product	CustPackingSlipOnTimeStat us	Early, On time, and Late (see the descriptions earlier in this table).
Shipping performance	Shipped by customer	CustPackingSlipOnTimeStat us	Early, On time, and Late (see the descriptions earlier in this table).
Shipping performance	Shipped by site / warehouse	CustPackingSlipOnTimeStat us	Early, On time, and Late (see the descriptions earlier in this table).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

System grouping on an open work list

2/18/2021 • 2 minutes to read • [Edit Online](#)

By using a system grouping field, you can filter an open work list without having to edit the mobile device menu item. Where it applies, system grouping works for filtering a work list on a single work header field. You cannot use system grouping to filter on line level fields.

Set up system grouping on an open work list

Use these steps to set up system grouping on an open work list.

- From a mobile device menu item, select **Mode: Indirect** and **Activity Code: Display open work list**. The following options become available. These options are required for system grouping on an open work list.

OPTION	DESCRIPTION
Allow system grouping	Enables system grouping for a selected work list menu item.
System grouping field	Available only if Allow system work is set to Yes . Select the field that determines how picking work will be grouped for workers. For example, if you select the ShipmentId field, the worker will scan the shipment ID to group the picking work. All work for the shipment is then assigned to the worker. This field requires that you create a menu item to use existing work that is grouped by the system. Use the System grouping label field to inform the worker what to scan.
System grouping label	Available only if Allow system work is set to Yes . Enter information for the worker about what to scan when picking work is grouped. For example, if you use the ShipmentId field to group picking work by shipment, you might enter Shipment ID in the field. This field requires that you create a menu item to use existing work that is grouped by the system. You must also select the field to group by in the System grouping field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Document routing layout for license plate labels

2/18/2021 • 3 minutes to read • [Edit Online](#)

The document routing layout defines the layout of license plate labels, and the data that is printed on them. You configure the printing trigger points when you set up mobile device menu items and work templates.

In a typical scenario, warehouse receiving clerks print license plate labels immediately after they record the contents of pallets that arrive in the receiving area. The physical labels are applied to the pallets. They can then be used for validation as part of the put-away process that follows and future outbound picking operations.

You can print highly complex labels, provided that the printing device can interpret the text that is sent to it. For example, a Zebra Programming Language (ZPL) layout that includes a bar code might resemble the following example.

```
^XA~TA000~JSN^LT0^MNW^MTD^PON^PMN^LH0,0^JMA^PR2,2~SD15^JUS^LRN^CI0^XZ
^XA
^MMT
^PW320
^LL0160
^LS0
^FT20,58^A0N,28,28^FH\^FDLabel:^FS
^FT20,81^AAN,18,10^FH\^FD$LicensePlateId$^FS
^BY1,3,17^FT20,106^BCN,,Y,N,N,A
^FD$LicensePlateId$^FS
^PQ1,,Y^XZ
```

As part of the label printing process, the text `$LicensePlateId$` in this example will be replaced with a data value.

To see the values that will be printed, go to **Warehouse management > Inquiries and reports > License plate labels**.

Several widely available label generation tools can help you format the text for the label layout. Many of these tools support the `$FieldName$` format. In addition, Microsoft Dynamics 365 Supply Chain Management uses special formatting logic as part of the field mapping for the document routing layout.

Custom number formats

You can customize the formatting of numerical field values that are printed by using codes that have the following format.

```
$FieldName:FormatString$
```

Here is an explanation of this format:

- `FieldName` is the name of the data field (such as **Qty**).
- `FormatString` defines how the data must be printed.

The following examples show how you can customize the work quantity (**Qty**) field:

- To always show four digits (by using zeros as placeholders), use `$Qty:0000$`. For example, if the quantity is 10, the label will show "0010."
- To always show two decimal places, use `$Qty:0.00$`. For example, if the quantity is 10, the label will show

"10.00."

For a complete list of the available number format strings, see [Custom numeric format strings](#).

Custom string formats

You can remove the first characters of a string by using the following field and format code.

```
$FieldName:##.$
```

Here, # specifies the number of characters to skip. For example, to print a Serial Shipping Container Code (SSCC) license plate number that doesn't include the first two characters, use `$LicensePlateId:2.$`. In this case, the license plate number 001111111111222221 will be printed as "1111111111222221."

Custom date/time formats

The following example shows how you can control the format that is used to print dates.

```
$PrintedDate:dd-MM-yyyy$
```

In this example, the date April 30, 2020, will be printed as "30-04-2020."

For a complete list of the available date/time formats, see [Custom date and time format strings](#).

Print individual lines from multiline data

If a data field contains multiple lines (that is, lines that are separated by line breaks), you can print an individual line by using the following format.

```
$FieldName[#]$
```

Here, # is the line number that you want to print. (Use 1 for the first line.)

For example, your system has an `AdditionalAddress` field that stores the following multiline address:

Contoso Inc.
123 Street Name
Some City, Some State

You can print this address, one line at a time, by using the following codes.

CODE	TEXT THAT IS PRINTED
<code>\$AdditionalAddress[1]\$</code>	Contoso Inc.
<code>\$AdditionalAddress[2]\$</code>	123 Street Name
<code>\$AdditionalAddress[3]\$</code>	Some City, Some State

Print and format from a display method

You can print from a display method by using the following format.

```
$DisplayMethod()$
```

You can combine this format with other types that were described earlier in this topic. For example, you have a display method that is named `DisplayListOfItemsNumbers()`, and you want to print the first item number of this method. In this case, you can use the following code.

```
$DisplayListOfItemsNumbers()[1]$
```

More information about how to print labels

For more information about how to set up and print labels, see [Enable license plate label printing](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Mobile barcode support

2/18/2021 • 2 minutes to read • [Edit Online](#)

Because Android is an open source project, any manufacturer of hardware for warehouse bar code scanners can build a device to run the Android operating system. A device is only Android-compatible if it can run apps that are written for the Android execution environment. However, a hardware vendor can modify and create overlays for the Android version that runs on their hardware. Microsoft cannot take any responsibility to ensure that a mobile bar code scanning app for Android is compatible with a manufacturer's bar code scanning hardware and the Android version that runs on it.

The Dynamics 365 Supply Chain Management - warehouse app has been tested with a selection of Android powered devices for bar code scanning. These tests only cover a sample of the devices that are available on the market.

As a customer, we recommend that you test the Warehouse mobile scanning app on selected hardware before you decide on the hardware that you want to buy.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up warehouses for transfer orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use warehouse levels to create a hierarchy that supports transfer orders between warehouses. Based on this setup, master scheduling calculates item requirements at the individual warehouse level and generates planned transfer orders from an assigned source warehouse to fulfill them.

1. Click **Inventory management > Setup > Inventory breakdown > Warehouses**.
2. Select the warehouse that you want to refill.
3. On the **Master planning** FastTab, select the **Refilling** check box.
4. In the **Main warehouse** field, select the warehouse that you want to assign as the refilling warehouse. Master scheduling calculates a transfer requirement for the selected warehouse and generates a planned transfer order from the assigned **Main warehouse**.

NOTE

If you clear the **Refilling** check box, the selected warehouse is assigned a warehouse level in regard to the **Main warehouse**, but the **Main warehouse** is not set up as a refilling warehouse.

5. Close the page to apply the new setup.

TIP

If you want to assign a warehouse for refilling, you must first set up the warehouse as a storage dimension on the **Storage dimension groups** page. On this page, select the **Active** field and the **Coverage plan by dimension** field for the warehouse.

Set up transport lead time

You must also set up the transport lead time between the warehouses on the **Transport days** page.

1. Go to **Inventory management > Setup > Distribution > Transport days**.
2. In the **Receiving point** field, select warehouse.
3. Select the **Shipping warehouse**, **Receiving warehouse**, and **Transport days**.
4. (Optional) You can also set transport time, depending on the mode of delivery, under the **Transport days per mode of delivery** tab.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot warehouse configuration

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you configure Microsoft Dynamics 365 Supply Chain Management.

I receive the following error message: "The license plate or location is not valid."

Issue description

You receive this error message when you scan a license plate ID or location.

Issue resolution

Make sure that the license plate ID isn't reserved by something else. This issue used to occur when the value that a user scanned in the warehouse app was both a valid location and a valid license plate ID. However, this issue was resolved in version 10.0.11.

I receive the following error message: "License plate must be specified for this location."

Issue description

You receive this error message if you create a transfer order by using a warehouse that is enabled for advanced warehouse management (WMS), and then, after the work is completed, you try to confirm the shipment.

Issue resolution

The **Default receipt location** field is blank for a transit warehouse of the "from" warehouse. To fix this issue, specify a default receipt location in the transit warehouse. Make sure that this location is license plate-controlled.

I receive the following error message: "You can't create a work template line for Inventory status change because the work type is not valid. Select a different work type."

Issue description

For a work template, you can't select *Inventory status change* in the **Work type** column of the **Work template details** section.

Issue resolution

This behavior is by design. The *Inventory status change* work type is used only by system processes. It can't be configured. Because the list of work types is fixed as an enumeration, the extra entries can't be filtered out of the **Work type** drop-down menu.

I receive the following error message: "The Quantity is not valid for unit 1%."

Issue description

The quantity isn't valid for the *ea* unit when there is picking work that has multiple license plates in one location.

Issue resolution

Verify that the **Unit sequence group ID** and **Unit conversions** fields on the released product or product variant are set correctly.

Note that the error message has been improved in version 10.0.15 (see [KB 4581627](#)). The new error message is, "The quantity is not valid. Expected %1 %2."

In location directives for sales order put work, the multiple SKU option doesn't evaluate multiple location directive actions.

Issue description

Location directives of the *Sales orders* work order type and the *Put* work type don't evaluate multiple location directive actions when the **Multiple SKU** option is selected. Only the first location directive action is evaluated.

Issue resolution

A new feature, *Evaluate all actions for Multi SKU location directives*, has been added in version 10.0.15 (see [KB 4579866](#)). This feature evaluates all actions for multi-SKU location directives. If you require this feature, use [Feature management](#) to turn it on.

I can't use the warehouse app to do partial picking.

Issue description

For sales and transfer orders, you can't skip items and do partial picking.

Issue resolution

On the **Mobile device menu items** page, for each menu item that is set up to process sales orders or transfer orders, set the **Allow splitting of work** option on the **General** FastTab to *Yes*.

How can I do an inventory status change for partial quantity work?

Issue description

You want to do an inventory status change for a partial quantity of a batch.

Issue resolution

To enable workers to make this change, you can create a menu item for the warehouse app. On the **Mobile device menu items** page, create (or edit) a menu item that has the following settings:

- **Mode:** *Work*
- **Use existing work:** *No*
- **Work creation process:** *Movement*
- **Display inventory status:** *Yes*

You can set other fields on the page as you require.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Install and connect the Warehouse Management mobile app

2/18/2021 • 15 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

NOTE

This topic describes how to configure the new Warehouse Management mobile app, which is currently in public preview. If you're looking for information about how to configure the old warehouse app, see [Install and connect the warehouse app](#).

The public preview of the Warehouse Management mobile app is available for download on Microsoft App Center. It's provided as a standalone component. Therefore, you must download it on each device and then configure it to connect to your Microsoft Dynamics 365 Supply Chain Management environment.

This topic explains how to install the Warehouse Management mobile app on each of your mobile devices and configure it to connect to your Supply Chain Management environment. You can configure each device manually, or you can import connection settings through a file or by scanning a QR code.

System requirements

The Warehouse Management mobile app is available for both Windows and Google Android operating systems. To use the app, one of the following operating systems must be installed on your mobile devices:

- Windows 10 (Universal Windows Platform [UWP]) October 2018 update 1809 (build 10.0.17763) or later
- Android 4.4 or later

Turn on the feature

Before you can use the app, a related feature must be turned on in your system. Admins can use the [Feature management](#) workspace to check the status of the feature and turn it on if it's required. There, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *User settings, icons, and step titles for the new warehouse app*

Get the Warehouse Management mobile app

Use one of the following links to download the app:

- **Windows (UWP):** [App Center preview program - Windows](#)

Because this app is a preview app, a few extra steps are required to install it. For details, see [Install a Build from App Center](#).

- **Android:** [App Center preview program - Android](#)

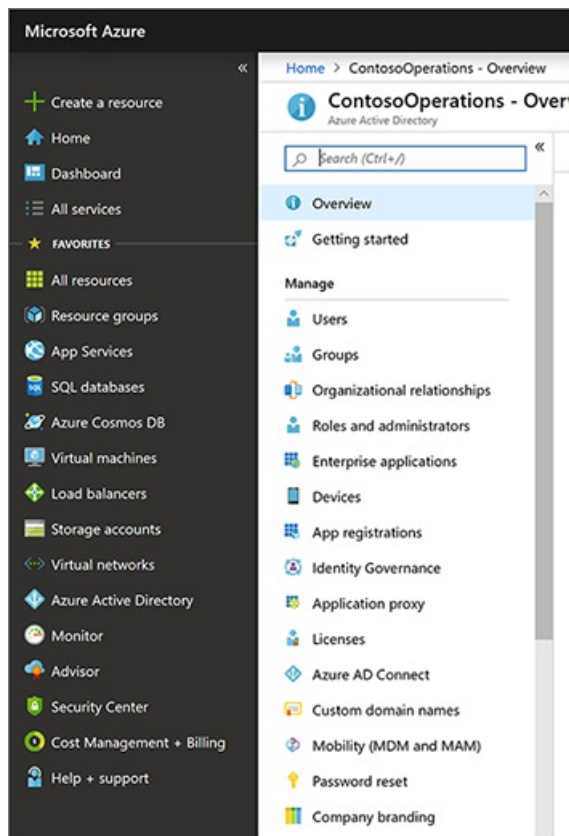

Because this app is a preview app, a few extra steps are required to install it. For details, see [Testing Android Apps](#).

For smaller deployments, you might want to install the app on each device from the relevant store and then manually configure the connection to the environments that you're using. However, you can also automate app deployment and/or configuration. You might find this approach convenient if you manage many devices, and you're using a mobile device management and mobile application management solution such as [Intune](#). For information about how to use Intune to add applications, see [Add apps to Microsoft Intune](#).

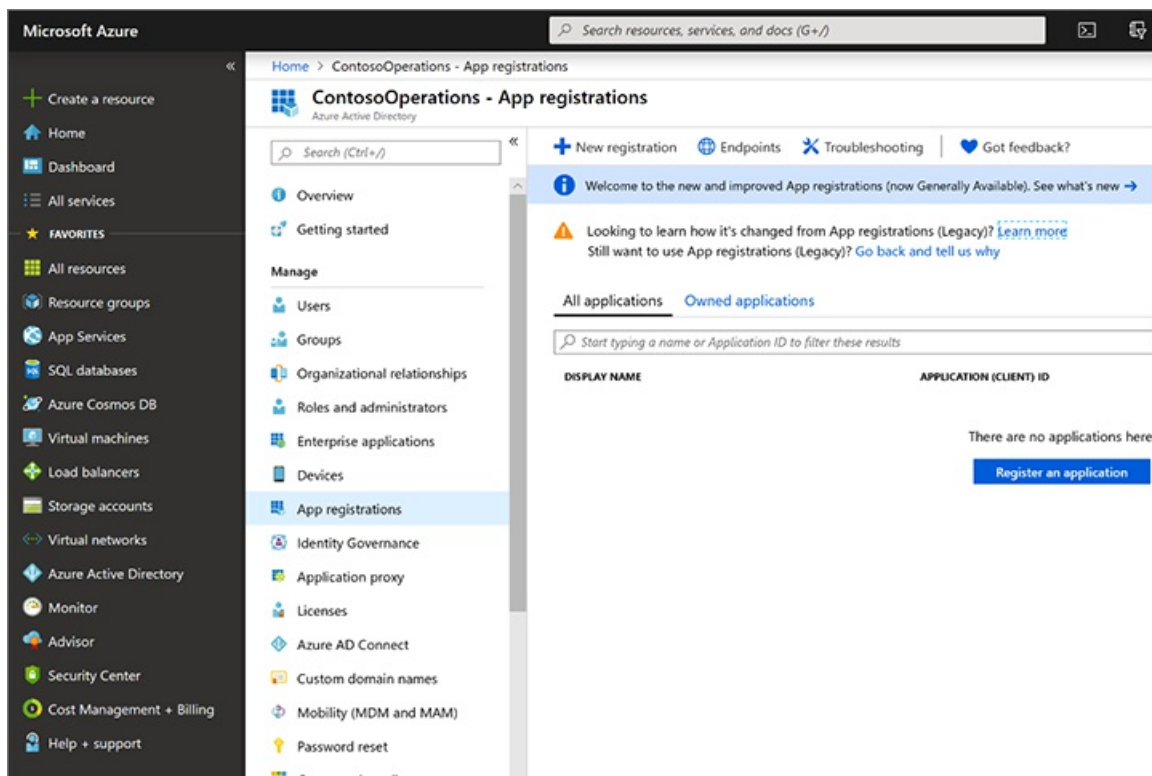

Create a web service application in Azure Active Directory

To enable the Warehouse Management mobile app to interact with a specific Supply Chain Management server, you must register a web service application for the Supply Chain Management tenant in Azure Active Directory (Azure AD). The following procedure shows one way to complete this task. For detailed information and alternatives, see the links after the procedure.

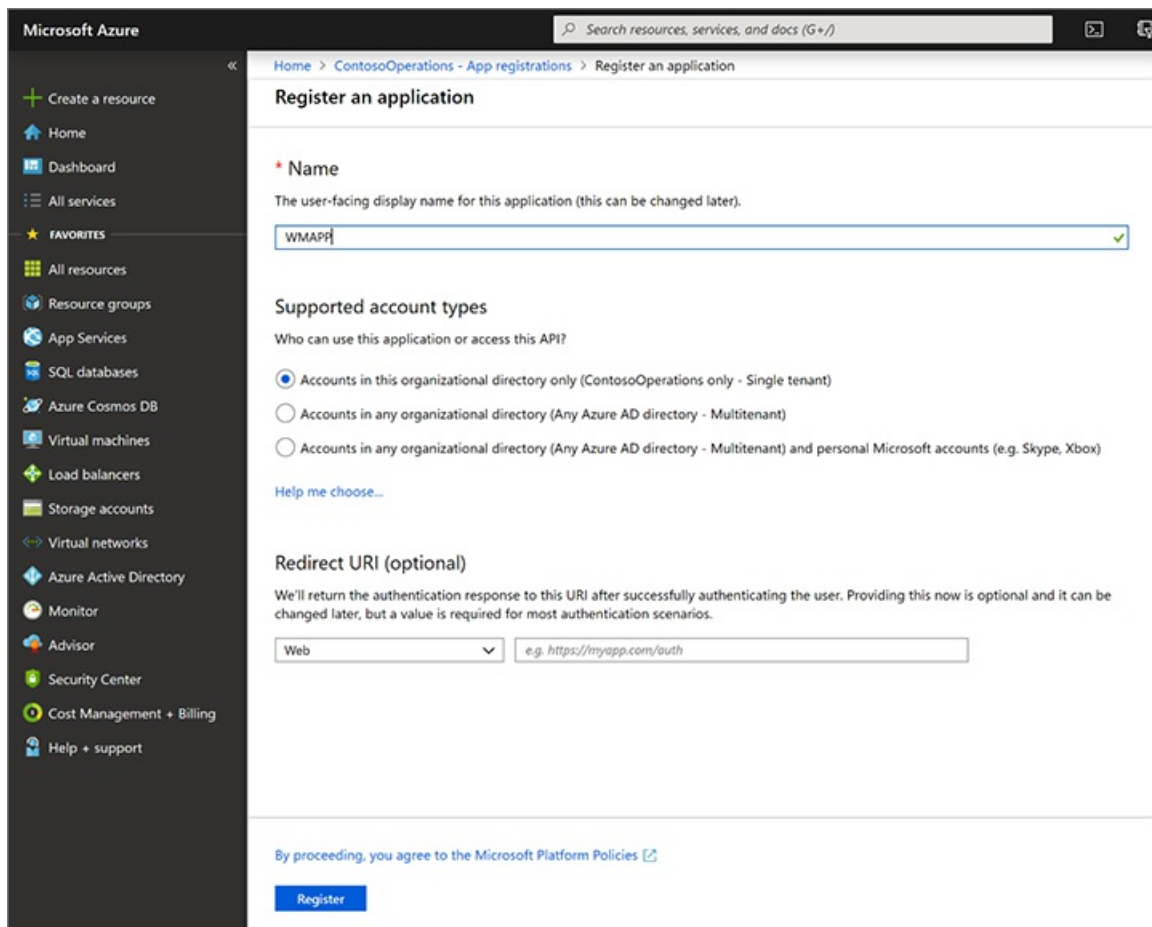

1. In a web browser, go to <https://portal.azure.com>.
2. Enter the name and password of the user who has access to the Azure subscription.
3. In the Azure portal, in the left navigation pane, select **Azure Active Directory**.

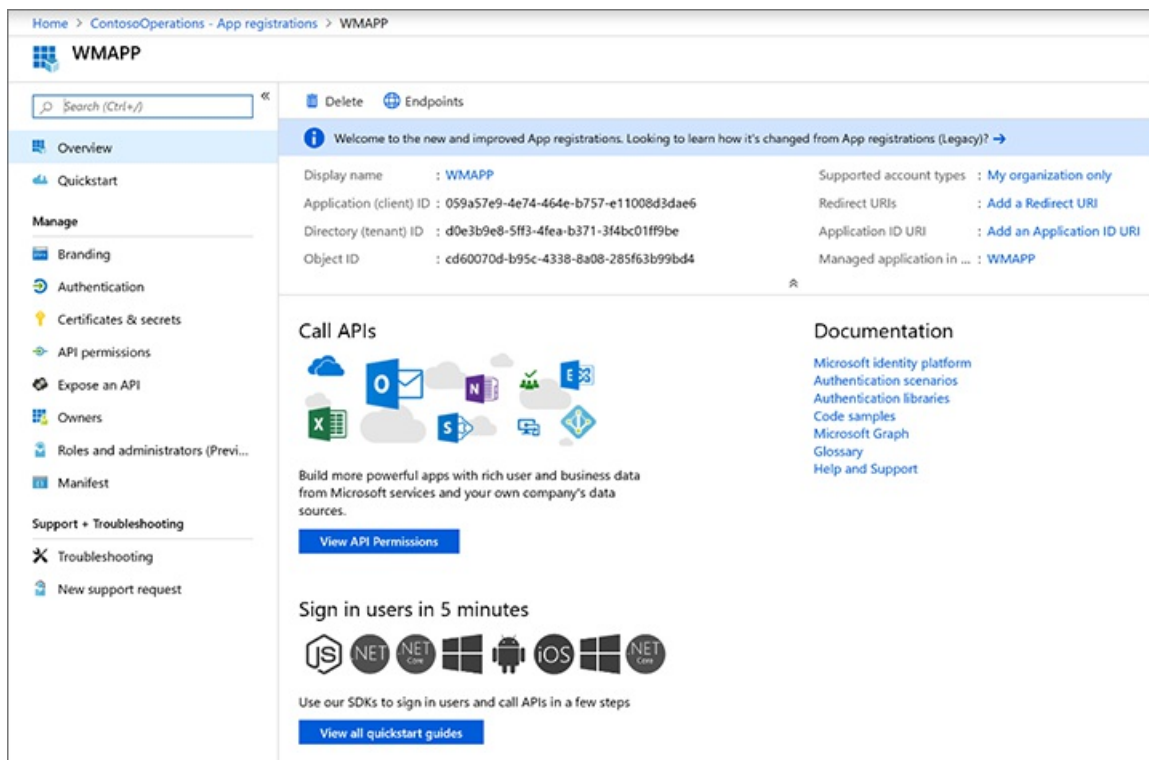

4. Make sure that you're working with the instance of Azure AD that is used by Supply Chain Management.
5. In the **Manage** list, select **App registrations**.

6. On the toolbar, select **New registration** to open the **Register an application** wizard.
7. Enter a name for the application, select the **Accounts in this organizational directory only** option, and then select **Register**.

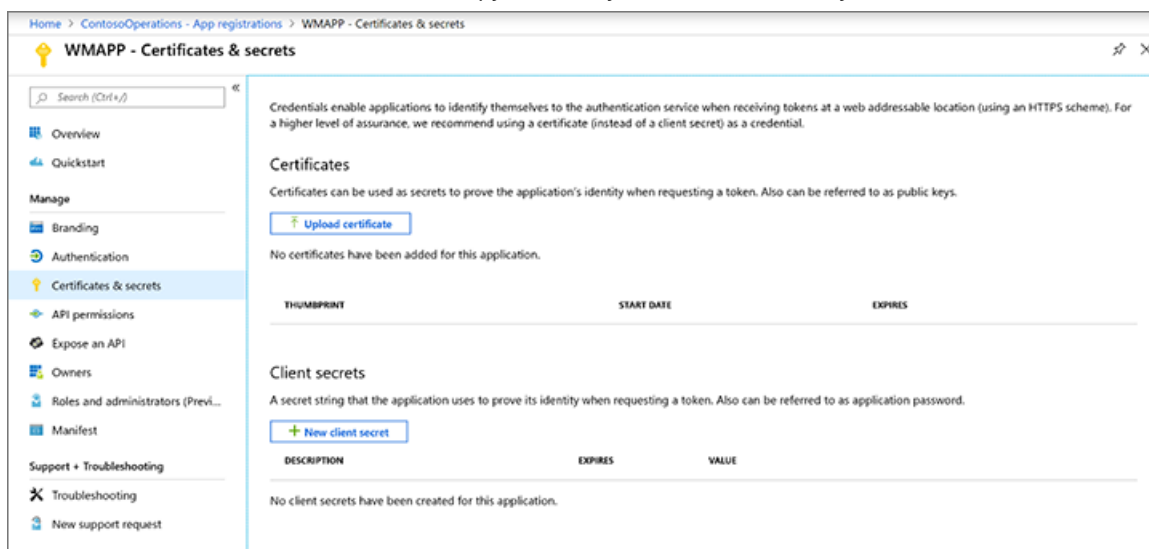

8. Your new app registration is opened. Make a note of the **Application (client) ID** value, because you will need it later. This ID will be referred to later in this topic as the *client ID*.

9. In the **Manage** list, select **Certificate & secrets**. Then select one of the following buttons, depending on how you want to configure the app for authentication. (For more information, see the [Authenticate by using a certificate or client secret](#) section later in this topic.)

- **Upload certificate** – Upload a certificate to use as a secret. We recommend this approach, because it's more secure and can also be automated more completely. If you're running the Warehouse Management mobile app on Windows devices, make a note of the **Thumbprint** value that is shown after you upload the certificate. You will need this value when you configure the certificate on Windows devices.
- **New client secret** – Create a key by entering a key description and a duration in the **Passwords** section, and then select **Add**. Make a copy of the key, and store it securely.

For more information about how to set up web service applications in Azure AD, see the following resources:

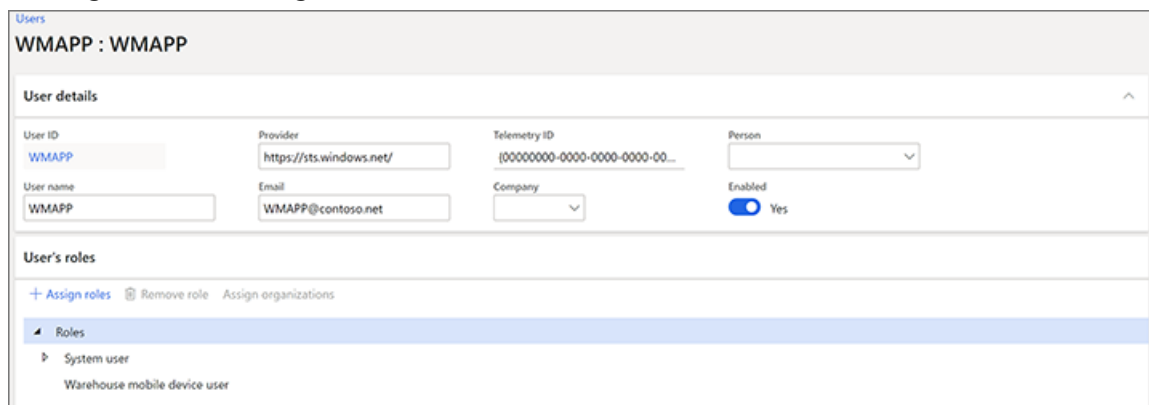

- For instructions that show how to use Windows PowerShell to set up web service applications in Azure AD, see [How to: Use Azure PowerShell to create a service principal with a certificate](#).
- For complete details about how to manually create a web service application in Azure AD, see the following topics:

- [Quickstart: Register an application with the Microsoft identity platform](#)
- [How to: Use the portal to create an Azure AD application and service principal that can access resources](#)

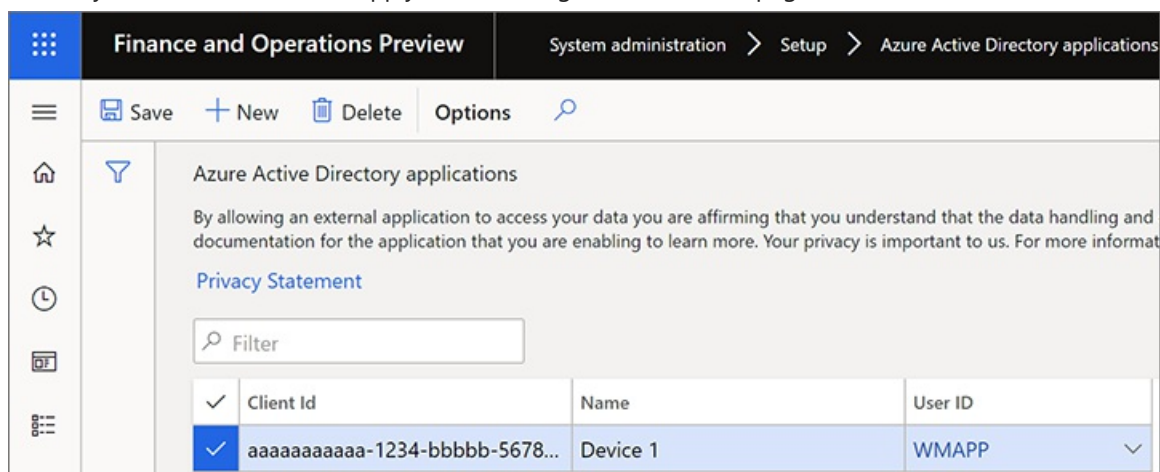

Create and configure a user account in Supply Chain Management

To enable Supply Chain Management to use your Azure AD application, follow these steps.

1. Create a user that corresponds to the user credentials for the Warehouse Management mobile app:
 - a. In Supply Chain Management, go to **System administration > Users > Users**.
 - b. Create a user.
 - c. Assign the warehousing mobile device user.

2. Associate your Azure AD application with the Warehouse Management mobile app user:
 - a. Go to **System administration > Setup > Azure Active Directory applications**.
 - b. Create a line.
 - c. Enter the client ID that you made a note of in the previous section, give it a name, and select the user that you just created. We recommend that you tag all your devices. Then, if a device is lost, you can easily remove its access to Supply Chain Management from this page.

Authenticate by using a certificate or client secret

Authentication with Azure AD provides a secure way of connecting a mobile device to Supply Chain Management. You can authenticate by using either a client secret or a certificate. If you will import connection settings, we recommend that you use a certificate instead of a client secret. Because the client secret must always be stored securely, you can't import it from a connection settings file or a QR code, as described later in this topic.

Certificates can be used as secrets to prove the application's identity when a token is requested. The public part

of the certificate is uploaded to the app registration in the Azure portal, whereas the full certificate must be deployed on each device where the Warehouse Management mobile app is installed. Your organization is responsible for managing the certificate in terms of rotation and so on. You can use self-signed certificates, but you should always use non-exportable certificates.

You must make the certificate available locally on each device where you run the Warehouse Management mobile app. For information about how to manage certificates for Intune-controlled devices if you're using Intune, see [Use certificates for authentication in Microsoft Intune](#).

Configure the application by importing connection settings

To make it easier to maintain and deploy the application on many mobile devices, you can import the connection settings instead of manually entering them on each device. This section explains how to create and import the settings.

Create a connection settings file or QR code

You can import connection settings from either a file or a QR code. For both approaches, you must first create a settings file that uses JavaScript Object Notation (JSON) format and syntax. The file must include a connection list that contains the individual connections that have to be added. The following table summarizes the parameters that you must specify in the connection settings file.

PARAMETER	DESCRIPTION
ConnectionName	Specify the name of the connection setting. The maximum length is 20 characters. Because this value is the unique identifier for a connection setting, make sure that it's unique in the list. If a connection that has the same name already exists on the device, it will be overridden by the settings from the imported file.
ActiveDirectoryClientAppld	Specify the client ID that you made a note of while you were setting up Azure AD in the Create a web service application in Azure Active Directory section.
ActiveDirectoryResource	Specify the root URL of Supply Chain Management.
ActiveDirectoryTenant	Specify the Azure AD tenant that you're using with the Supply Chain Management server. This value has the form <code>https://login.windows.net/<your-Azure-AD-tenant-ID></code> . Here is an example: <code>https://login.windows.net/contosooperations.onmicrosoft.com</code> .
Company	Specify the legal entity in Supply Chain Management that you want the application to connect to.
ConnectionType	(Optional) Specify whether the connection setting should use a certificate or a client secret to connect to an environment. Valid values are <code>"certificate"</code> and <code>"clientsecret"</code> . The default value is <code>"certificate"</code> . Note: Client secrets can't be imported.
IsEditable	(Optional) Specify whether the app user should be able to edit the connection setting. Valid values are <code>"true"</code> and <code>"false"</code> . The default value is <code>"true"</code> .

PARAMETER	DESCRIPTION
IsDefault	(Optional) Specify whether the connection is the default connection. A connection that is set as the default connection will automatically be preselected when the app is opened. Only one connection can be set as the default connection. Valid values are "true" and "false". The default value is "false".
CertificateThumbprint	(Optional) For Windows devices, you can specify the certificate thumbprint for the connection. For Android devices, the app user must select the certificate the first time that a connection is used.

The following example shows a valid connection settings file that contains two connections. As you can see, the connection list (named "ConnectionList" in the file) is an object that has an array that stores each connection as an object. Each object must be enclosed in braces ({}), and separated by commas, and the array must be enclosed in brackets ([]).

```
{
  "ConnectionList": [
    {
      "ActiveDirectoryClientAppId": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee",
      "ConnectionName": "Connection1",
      "ActiveDirectoryResource": "https://yourenvironment.cloudax.dynamics.com",
      "ActiveDirectoryTenant": "https://login.windows.net/contosooperations.onmicrosoft.com",
      "Company": "USMF",
      "IsEditable": false,
      "IsDefaultConnection": true,
      "CertificateThumbprint": "aaaabbbbccccdddeeeefffffgggghhhiiii",
      "ConnectionType": "certificate"
    },
    {
      "ActiveDirectoryClientAppId": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee",
      "ConnectionName": "Connection2",
      "ActiveDirectoryResource": "https://yourenvironment2.cloudax.dynamics.com",
      "ActiveDirectoryTenant": "https://login.windows.net/contosooperations.onmicrosoft.com",
      "Company": "USMF",
      "IsEditable": true,
      "IsDefaultConnection": false,
      "ConnectionType": "clientsecret"
    }
  ]
}
```

You can either save the information as a JSON file or generate a QR code that has the same content. If you save the information as a file, we recommend that you save it by using the default name, *connections.json*, especially if you will store it in the default location on each mobile device.

Save the connection settings file on each device

Typically, you will use a device management tool or script to distribute the connection settings files to each device that you're managing. If you use the default name and location when you save the connection settings file on each device, the Warehouse Management mobile app will automatically import it, even during the first run after the app is installed. If you use a custom name or location for the file, the app user must specify the values during the first run. However, the app will continue to use the specified name and location afterward.

Every time that the app is started, it reimports the connection settings from their previous location to determine whether there have been any changes. The app will update only connections that have the same names as the connections in the connection settings file. User-created connections that use other names won't be updated.

You can't remove a connection by using the connection settings file.

As has been mentioned, the default file name is *connections.json*. The default file location depends on whether you're using a Windows device or an Android device:

- **Windows:** `C:\Users\`
- **Android:** `Android\data\com.Microsoft.WarehouseManagement\files`

Usually, the paths are automatically created after the first run of the app. However, you can manually create them if you must transfer the connection settings file to the device before installation.

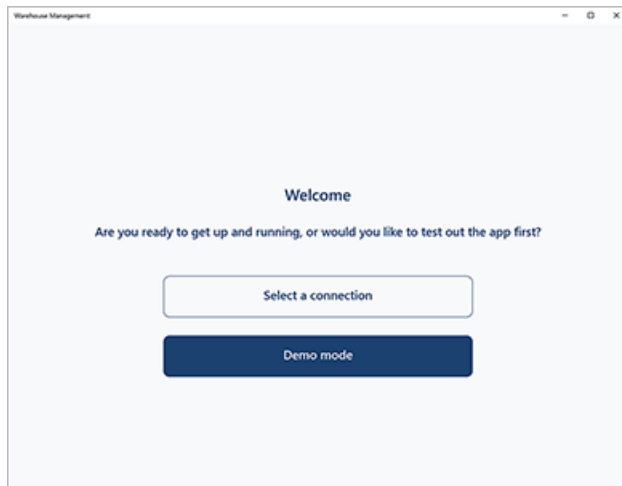

NOTE

If the app is uninstalled, the default path and its contents are removed.

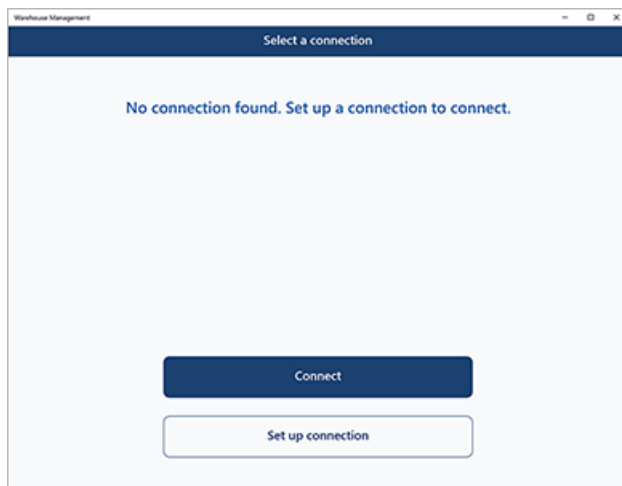

Import the connection settings

Follow these steps to import connection settings from a file or a QR code.

1. Start the Warehouse Management mobile app on your mobile device. The first time that you start the app, a welcome message is shown. Select **Select a connection**.

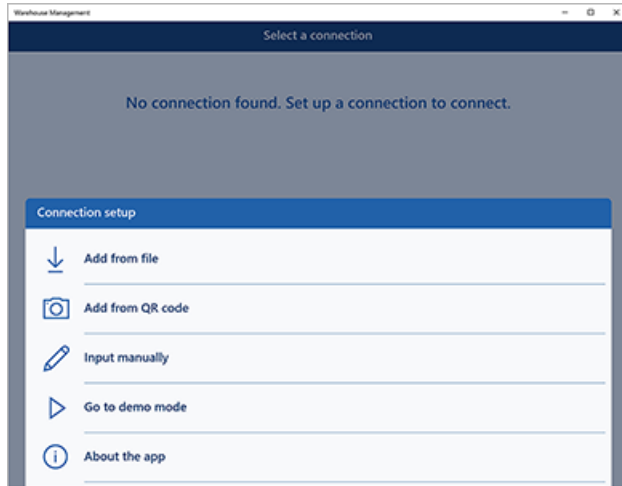

2. If you're importing the connection settings from a file, and the default name and location were used when the file was saved, the app might already have found the file. In this case, skip ahead to step 4. Otherwise, select **Set up connection**, and then continue to step 3.

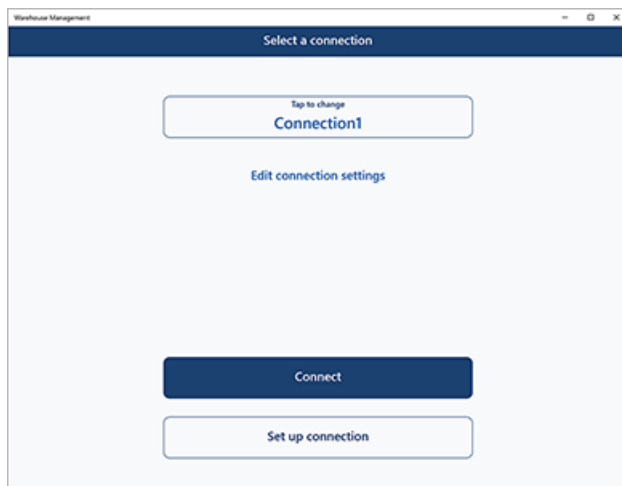

3. In the **Connection setup** dialog box, select **Add from file** or **Add from QR code**, depending on how you want to import the settings:
 - If you're importing the connection settings from a file, select **Add from file**, browse to the file on

your local device, and select it. If you select a custom location, the app will store it and automatically use it the next time.

- If you're importing the connection settings by scanning a QR code, select **Add from QR code**. The app prompts you for permission to use the device's camera. After you give permission, the camera is started, so that you can use it for scanning. Depending on the quality of the device's camera and the complexity of the QR code, you might find it difficult to get a correct scan. In that case, try to reduce the complexity of the QR code by generating only one connection per QR code. (Currently, you can use only the device's camera to scan the QR code.)

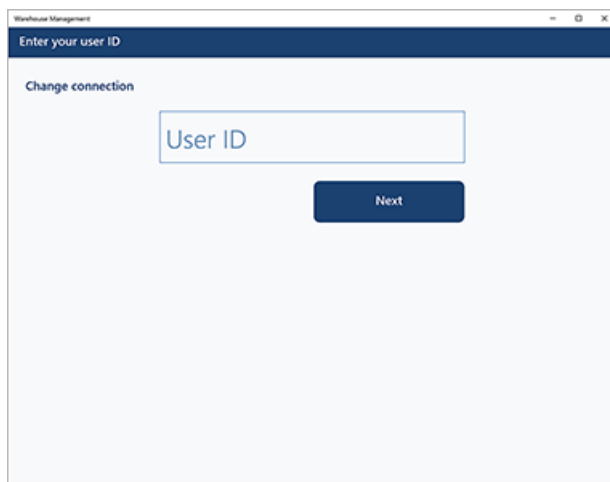

4. When the connection settings are successfully loaded, the selected connection is shown.

5. If you're using an Android device and are using a certificate for authentication, the device prompts you to select the certificate.

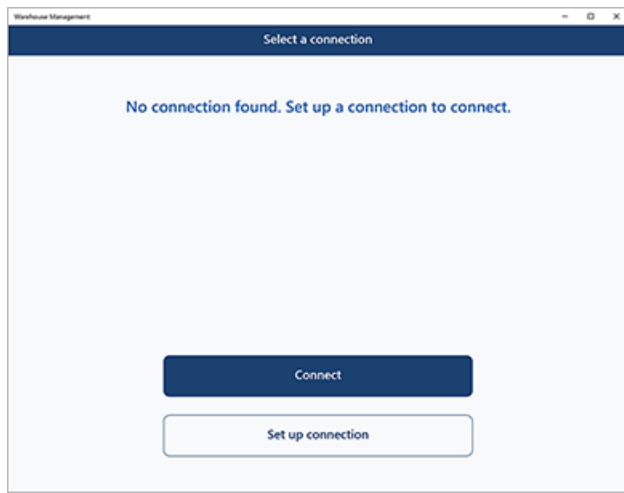

6. The app connects to your Supply Chain Management server and shows the sign-in page.

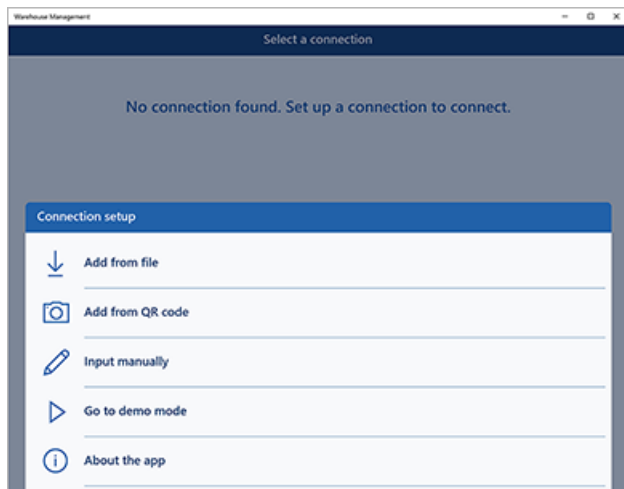

Manually configure the application

If you don't have a file or QR code, you can manually configure the app on the device so that it connects to the Supply Chain Management server through the Azure AD application.

1. Start the Warehouse Management mobile app on your mobile device.
2. If the app is started in **Demo mode**, select **Connection settings**. If the **Sign-in** page appears when the app is started, select **Change connection**.
3. Select **Set up connection**.

4. Select Input manually.

The **New Connection** page appears and shows the settings that are required to manually enter the connection details.

A screenshot of a web application window titled 'Warehouse Management'. The main heading is 'New Connection'. The form contains several input fields with labels: 'Authentication method' (with a dropdown menu showing 'Client secret'), 'Connection name', 'Azure AD client ID', 'Active Directory client secret', 'Azure AD resource', and 'Azure AD tenant'. Each field is represented by a white rectangular box with a blue border.

5. Enter the following information:

- **Use client secret** – Set this option to *Yes* to use a client secret to authenticate with Supply Chain Management. Set it to *No* to use a certificate for authentication. (For more information, see the [Create a web service application in Azure Active Directory](#) section earlier in this topic.)

- **Connection name** – Enter a name for the new connection. This name will appear in the **Select connection** field the next time that you open the connection settings. The name that you enter must be unique. (In other words, it must differ from all other connection names that are stored on your device, if any other connection names are stored there.)
- **Active directory client ID** – Enter the client ID that you made a note of while you were setting up Azure AD in the [Create a web service application in Azure Active Directory](#) section.
- **Active directory client secret** – This field is available only when the **Use client secret** option is set to *Yes*. Enter the client secret that you made a note of while you were setting up Azure AD in the [Create a web service application in Azure Active Directory](#) section.
- **Active directory certificate thumbprint** – This field is available only for Windows devices and only when the **Use client secret** option is set to *No*. Enter the certificate thumbprint that you made a note of while you were setting up Azure AD in the [Create a web service application in Azure Active Directory](#) section.
- **Active directory resource** – Specify the root URL of Supply Chain Management.

IMPORTANT

Don't end this value with a slash (/).

- **Active directory tenant** – Enter the Azure AD tenant that you're using with the Supply Chain Management server. This value has the form `https://login.windows.net/<your-Azure-AD-tenant-ID>`. Here is an example: `https://login.windows.net/contosooperations.onmicrosoft.com`.

IMPORTANT

Don't end this value with a slash (/).

- **Company** – Enter the legal entity (company) in Supply Chain Management that you want the application to connect to.

6. Select the **Save** button in the upper-right corner of the page.
7. If you're using an Android device and are using a certificate for authentication, the device prompts you to select the certificate.
8. The app connects to your Supply Chain Management server and shows the sign-in page.

Remove access for a device

If a device is lost or compromised, you must remove access to Supply Chain Management for it. The following steps describe the recommended process for removing access.

1. Go to **System administration > Setup > Azure Active Directory applications**.
2. Delete the line that corresponds to the device that you want to remove access for. Make a note of the client ID that is used for the device, because you will need it later.

If you've registered only one client ID, and multiple devices use the same client ID, you must push out new connection settings to those devices. Otherwise, they will lose access.

3. Sign in to the Azure portal at <https://portal.azure.com>.
4. In the left navigation pane, select **Active Directory**, and make sure that you're in the correct directory.

5. In the **Manage** list, select **App registrations**, and then select the application to configure. The **Settings** page appears and shows configuration information.
6. Make sure that the client ID of the application matches the client ID that you made a note of in step 2.
7. On the toolbar, select **Delete**.
8. In the confirmation message that appears, select **Yes**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Mobile device user settings

2/18/2021 • 6 minutes to read • [Edit Online](#)

The new Warehouse Management mobile app has a set of app-specific settings that help tailor the user experience. Because the app can be used on devices of different screen sizes and configurations (such as tablet, phone, or arm-held), it can be useful to centrally manage these settings from Microsoft Dynamics 365 Supply Chain Management.

The *mobile device user settings* feature lets you define global user settings that will be used on all devices. You can also define more granular user settings for individual device brands, device models, and/or workers. When a worker signs in to the Warehouse Management mobile app, the app fetches and applies the most specific settings profile that is stored in Supply Chain Management for the matching brand, device, and/or user ID.

This feature can help workers get started more quickly whenever they begin to use a new device. Here are some examples:

- Admins can establish a standard set of preferences that work best for devices from a specific manufacturer and/or for specific device models. Therefore, workers can get started with a new device without necessarily having to change the settings.
- If your company has a pool of identical devices that are shared among workers, workers will see their preferred setup every time that they sign in, even if they have never used the specific physical device that they selected on a given day.
- In Supply Chain Management, admins can view and edit all stored settings, even for individual workers. This capability can help them troubleshoot or fine-tune new features.

IMPORTANT

The *mobile device user settings* feature applies only to the new Warehouse Management mobile app. It doesn't work with the old warehouse app.

Turn on the mobile device user settings feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *User settings, icons, and step titles for the new warehouse app*

Create and manage user settings

Use the **Mobile device user settings** page to create, view, and manage settings profiles at all levels of granularity. The first time that a worker edits their user settings on a new device, a new profile is automatically added on this page, if it doesn't already exist. That profile is then updated every time that the worker makes a change.

You can also define a settings profile that applies to all device brands, device models, and/or workers. You can then increase the granularity by applying more specific settings for individual brands, models, and/or workers.

Follow these steps to create and manage user settings for your mobile devices.

1. Go to **Warehouse management > Mobile device > Mobile device user settings**.
2. Select an existing user settings profile in the list pane to open its record. Alternatively, select **New** on the Action Pane to create a new profile.

Each profile in the list pane is labeled to indicate the brand, model, and/or user ID that the profile applies to. More general profiles have a value of *All* for some or all of these characteristics.

3. In the header section of the record for the new or selected settings profile, set the following fields:
 - **Device brand name** – Select the device brand name that the profile should apply to. If the profile should apply to all brands, leave this field blank. The list of values includes all the brands that have been defined in your system. For information about how to define the list of brands, see the next section.
 - **Device model ID** – Select the device model that the profile should apply to. If the profile should apply to all models of the selected brand, leave this field blank. The list of values includes all the models that have been defined for the brand that is selected in the **Device brand name** field. For information about how to define the list of models for each brand, see the next section.
 - **User ID** – Select the user ID of the warehouse worker that the setting profile should apply to. If the profile should apply to all workers, leave this field blank.
4. On the **General** FastTab, set the following fields:
 - **Button position** – Select how buttons should be positioned on the device. Elements in the app will be moved to better fit the preference or handedness of the worker. The available options are *Bottom right (default)*, *Bottom left*, *Top right*, and *Top left*.
 - **Display orientation** – Select the display orientation that should be applied by default in the app.
 - **Scan with camera** – Set this option to *Yes* to use the device camera to scan input fields where the preferred input mode is set to *Scanning*. If your device has a built-in scanner, set this option to *No* to use the scanner instead.
 - **Show product photo** – Select whether product photos should be shown if they are available for the released product. For more information about how to add product images, see [Add an image to a product](#).
 - **Display color theme** – Select a color theme for the device.
 - **Sound level** – Select the sound level for the device. Select a value between 0 (zero) and 10. A value of 0 represents no sound, and a value of 10 represents maximum volume. The default value is 4.
 - **Vibration level** – Select the vibration level for the device. Select a value between 0 (zero) and 5. A value of 0 represents no vibration, and a value of 5 represents maximum vibration. The default value is 1.
 - **Text scale percentage** – Specify the text size as a percentage of the standard size. Enter a value between 70 and 400. A value of 70 represents the smallest text scale, and a value of 400 represents the largest text scale. The default value is 100.
 - **Button scale percentage** – Specify the button size as a percentage of the standard size. Enter a value between 50 and 200. A value of 50 represents the smallest button scale, and a value of 200 represents the largest button scale. The default value is 100.

Create and manage mobile device brands

Use the **Mobile device brands** page to view, create, and manage the device brands and models that can be used with your settings profiles. The mobile app automatically fetches and submits the local brand name and model ID the first time that a worker edits their settings on a given device. Therefore, most of these records will usually be automatically generated. However, you can also manage all the records on this page. For example, you can give more useful descriptions to each brand and model to help distinguish similar or cryptic model IDs.

Follow these steps to create and manage your mobile device brands and models.

1. Go to **Warehouse management > Mobile device > Mobile device brands**.
2. In the list pane, select a mobile device brand to open its record. Alternatively, select **New** on the Action Pane to create a new brand.
3. In the header section of the record for the new or selected device brand, set the following fields:
 - **Device brand name** – The brand name of the device, such as *Microsoft Corporation*.
 - **Description** – You can enter a description to help distinguish brand names.
4. The **Mobile device models** FastTab shows all the models for the selected device brand. Use the buttons on the toolbar to add rows to the grid or remove rows. For each row, you can set the following fields:
 - **Device model ID** – The device model ID, such as *Surface Book 2*.
 - **Description** – You can enter a description to help distinguish model IDs.

Install and connect the warehouse app

2/18/2021 • 14 minutes to read • [Edit Online](#)

NOTE

This topic describes how to configure the old warehouse app. If you're looking for information about how to configure the new Warehouse Management mobile app (currently in public preview), see [Install and connect the Warehouse Management mobile app](#).

NOTE

This topic describes how to configure the warehouse app for cloud deployments. If you're looking for information about how to configure the warehouse app for on-premises deployments, see [Warehousing for on-premises deployments](#).

The warehouse app is available from Google Play Store and Microsoft Store. It's provided as a standalone component. Therefore, you must download it on each device and then configure it to connect to your Microsoft Dynamics 365 Supply Chain Management environment.

This topic explains how to install the warehouse app on each of your mobile devices and configure it to connect to your Supply Chain Management environment. You can configure each device manually, or you can import connection settings through a file or by scanning a QR code.

System requirements

The warehouse app is available for both Windows and Android operating systems. To use the latest version of the app, you must have one of the following operating systems installed on your mobile devices:

- Windows 10 (Universal Windows Platform [UWP]) Fall creators update 1709 (build 10.0.16299) or later
- Android 4.4 or later

NOTE

If you must support older Windows devices that can't run the latest version of Windows, you can still download version 1.6.3.0 of the warehouse app from Microsoft Store. That version will run on Windows 10 (UWP) November Update 1511 (build 10.0.10586) or later. However, be aware that this version of the warehouse app doesn't support mass deployment of connection settings. Therefore, you must [manually configure the connection](#) on each device that runs this version of the app.

Get the warehouse app

Use one of the following links to download the app:

- **Windows (UWP):** [Dynamics 365 for Finance and Operations - Warehousing on Microsoft Store](#)
- **Android:** [Warehousing - Dynamics 365 on Google Play Store](#)

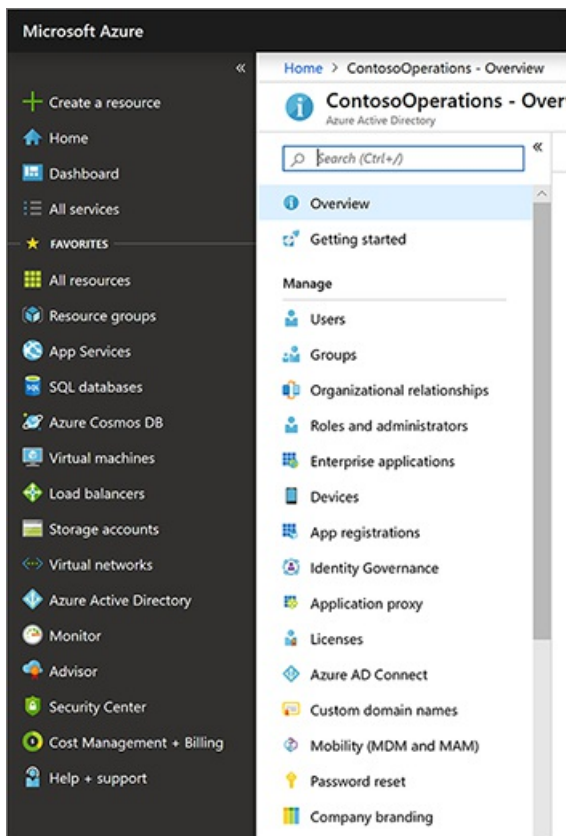

For smaller deployments, you might want to install the app from the relevant store on each device and then manually configure the connection to the environments that you're using. However, in version 1.7.0.0 and later of the warehouse app, you can also automate app deployment and/or configuration. You might find this approach convenient if you manage many devices, and you're using a mobile device management and mobile

application management solution such as [Microsoft Intune](#). For information about how to use Intune to add applications, see [Add apps to Microsoft Intune](#).

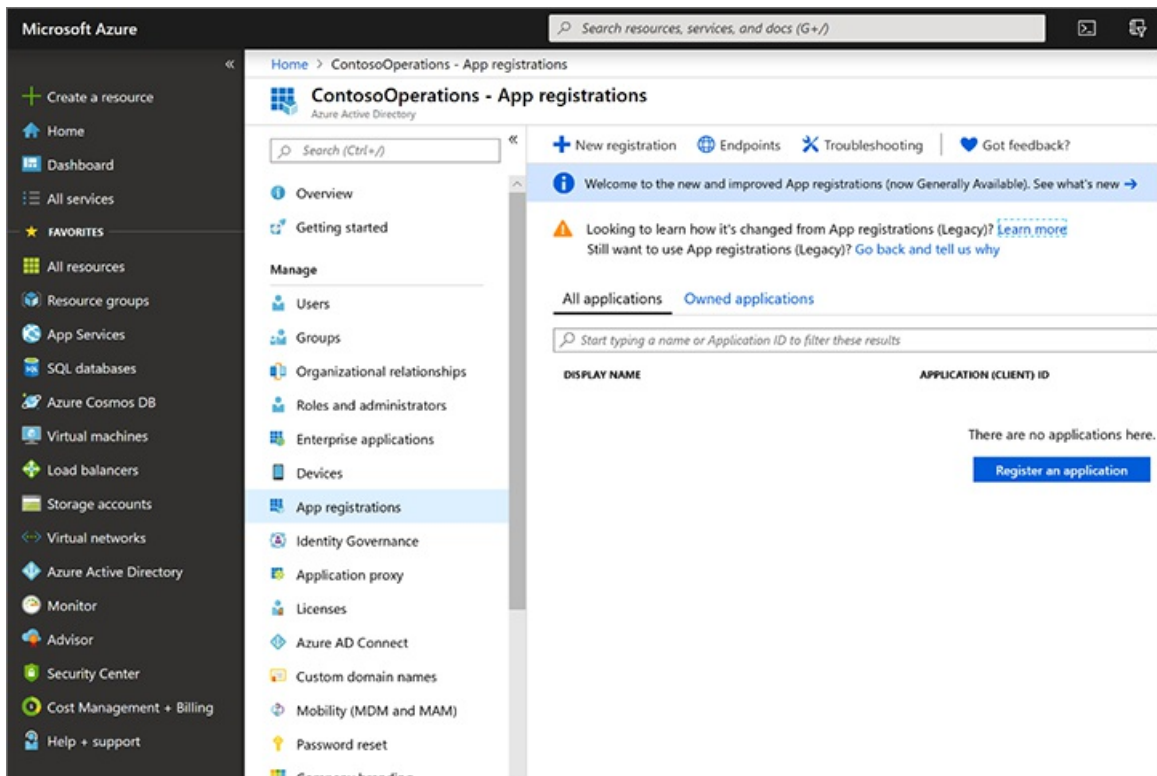

Create a web service application in Azure Active Directory

To enable the warehouse app to interact with a specific Supply Chain Management server, you must register a web service application for the Supply Chain Management tenant in Azure Active Directory (Azure AD). The following procedure shows one way to complete this task. For detailed information and alternatives, see the links after the procedure.

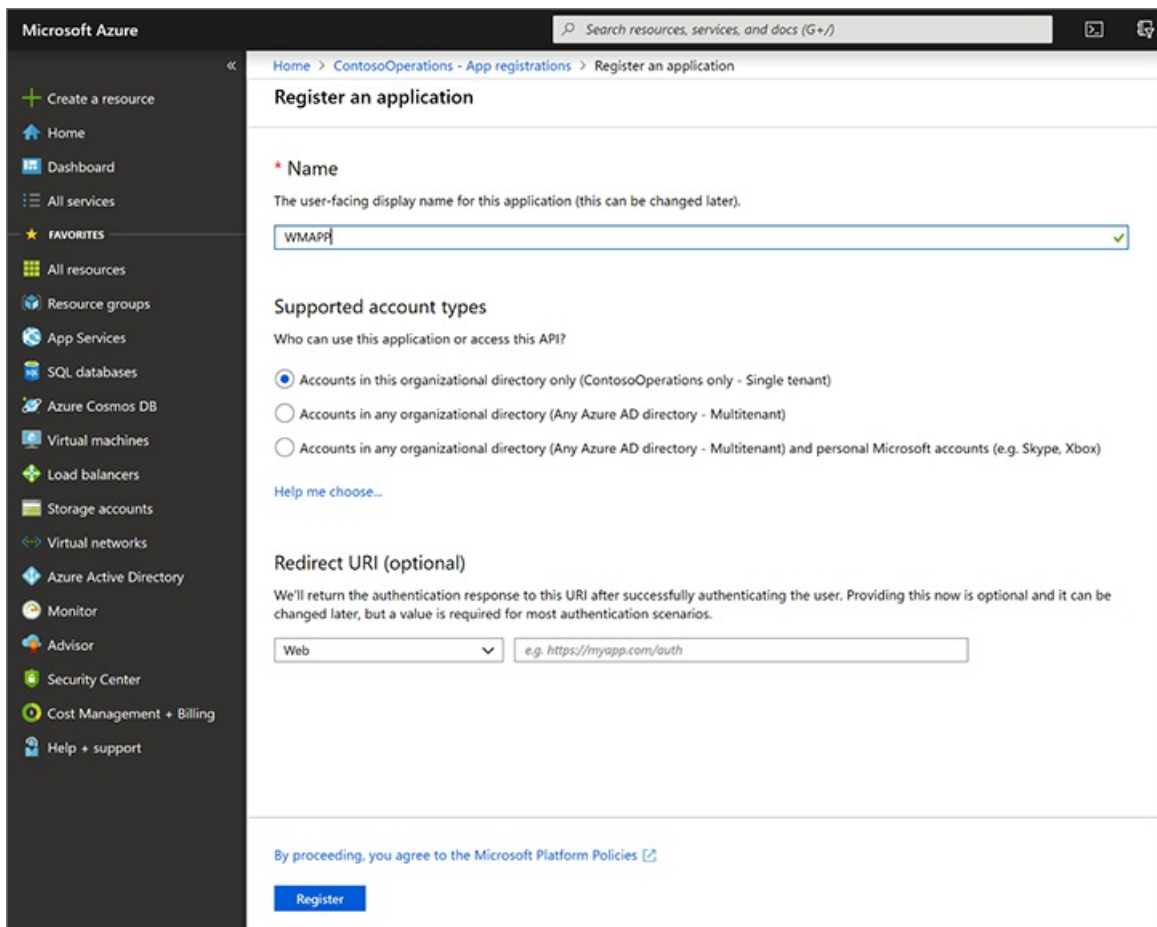

1. In a web browser, go to <https://portal.azure.com>.
2. Enter the name and password of the user who has access to the Azure subscription.
3. In the Azure portal, in the left navigation pane, select **Azure Active Directory**.

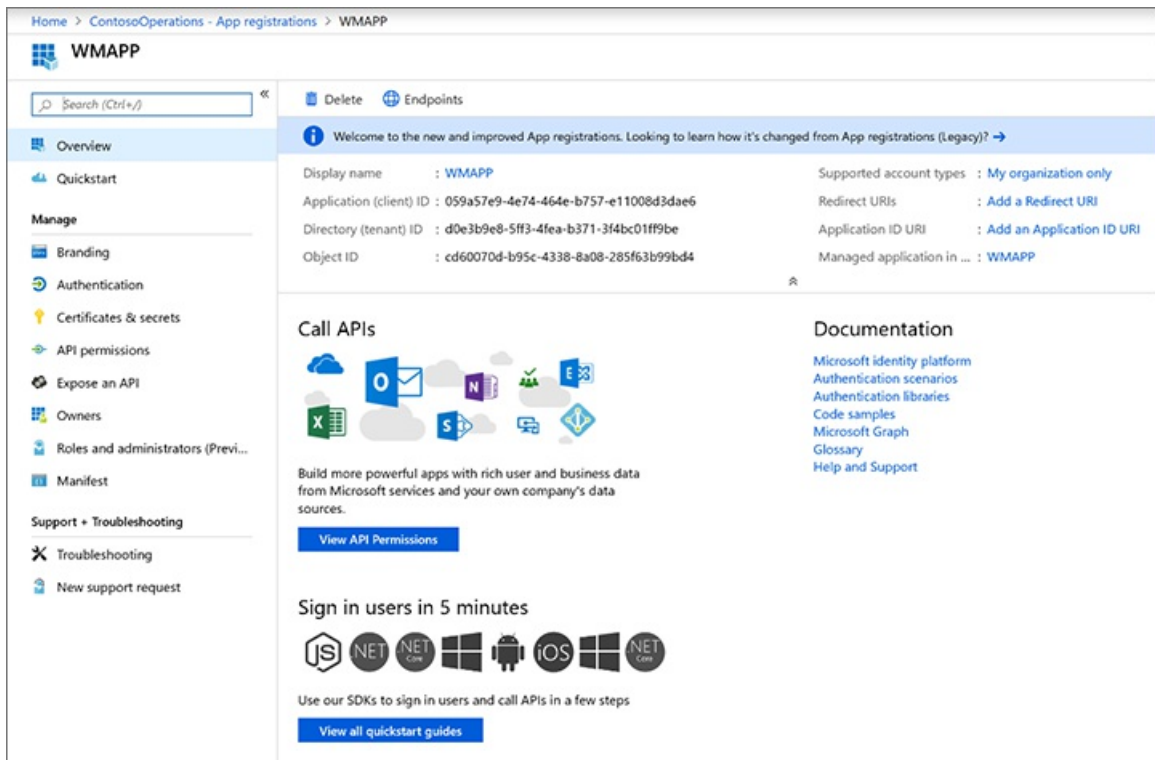

4. Make sure that you're working with the instance of Azure AD that is used by Supply Chain Management.
5. In the **Manage** list, select **App registrations**.

6. On the toolbar, select **New registration** to open the **Register an application** wizard.
7. Enter a name for the application, select the **Accounts in this organizational directory only** option, and then select **Register**.

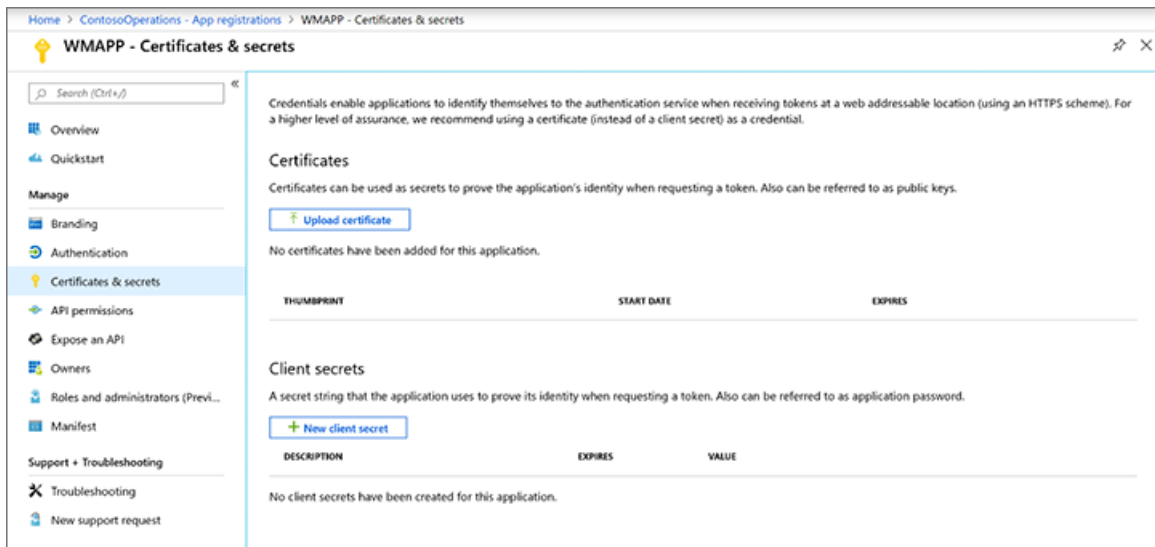

8. Your new app registration is opened. Make a note of the **Application (client) ID** value, because you will need it later. This ID will be referred to later in this topic as the *client ID*.

9. In the **Manage** list, select **Certificate & secrets**. Then select one of the following buttons, depending on how you want to configure the app for authentication. (For more information, see the [Authenticate by using a certificate or client secret](#) section later in this topic.)

- **Upload certificate** – Upload a certificate to use as a secret. We recommend this approach, because it's more secure and can also be automated more completely. If you're running the warehouse app on Windows devices, make a note of the **Thumbprint** value that is shown after you upload the certificate. You will need this value when you configure the certificate on Windows devices.
- **New client secret** – Create a key by entering a key description and a duration in the **Passwords** section, and then select **Add**. Make a copy of the key, and store it securely.

For more information about how to set up web service applications in Azure AD, see the following resources:

- For instructions that show how to use Windows PowerShell to set up web service applications in Azure AD, see [How to: Use Azure PowerShell to create a service principal with a certificate](#).
- For complete details about how to manually create a web service application in Azure AD, see the following topics:
 - [Quickstart: Register an application with the Microsoft identity platform](#)

- o [How to: Use the portal to create an Azure AD application and service principal that can access resources](#)

Create and configure a user account in Supply Chain Management

To enable Supply Chain Management to use your Azure AD application, follow these steps.

1. Create a user that corresponds to the user credentials for the warehouse app:
 - a. In Supply Chain Management, go to **System administration > Users > Users**.
 - b. Create a user.
 - c. Assign the warehousing mobile device user.

The screenshot shows the 'Users' page in Supply Chain Management. The user 'WMAPP : WMAPP' is selected. The 'User details' section includes fields for User ID (WMAPP), Provider (https://sts.windows.net/), Telemetry ID (00000000-0000-0000-0000-00...), Person (dropdown), User name (WMAPP), Email (WMAPP@contoso.net), Company (dropdown), and Enabled (Yes). The 'User's roles' section shows a list of roles, including 'System user' and 'Warehouse mobile device user'.

2. Associate your Azure AD application with the warehouse app user:
 - a. Go to **System administration > Setup > Azure Active Directory applications**.
 - b. Create a line.
 - c. Enter the client ID that you made a note of in the previous section, give it a name, and select the user that you just created. We recommend that you tag all your devices. Then, if they are lost, you can easily remove their access to Supply Chain Management from this page.

The screenshot shows the 'Azure Active Directory applications' page in Supply Chain Management. The page title is 'Finance and Operations Preview' and the breadcrumb is 'System administration > Setup > Azure Active Directory applications'. The page contains a table of applications with the following data:

Client Id	Name	User ID
aaaaa-1234-bbbbb-5678...	Device 1	WMAPP

Authenticate by using a certificate or client secret

Authentication with Azure AD provides a secure way of connecting a mobile device to Supply Chain Management. You can authenticate by using either a client secret or a certificate. If you will import connection settings, we recommend that you use a certificate instead of a client secret. Because the client secret must always be stored securely, you can't import it from a connection settings file or a QR code, as described later in this topic.

Certificates can be used as secrets to prove the application's identity when a token is requested. The public part of the certificate is uploaded to the app registration in the Azure portal, whereas the full certificate must be deployed on each device where the warehouse app is installed. Your organization is responsible for managing

the certificate in terms of rotation and so on. You can use self-signed certificates, but you should always use non-exportable certificates.

You must make the certificate available locally on each device where you run the warehouse app. For information about how to manage certificates for Intune-controlled devices if you're using Intune, see [Use certificates for authentication in Microsoft Intune](#).

Configure the application by importing connection settings

To make it easier to maintain and deploy the application on many mobile devices, you can import the connection settings instead of manually entering them on each device. This section explains how to create and import the settings.

Create a connection settings file or QR code

You can import connection settings from either a file or a QR code. For both approaches, you must first create a settings file that uses JavaScript Object Notation (JSON) format and syntax. The file must include a connection list that contains the individual connections that have to be added. The following table summarizes the parameters that you must specify in the connection settings file.

PARAMETER	DESCRIPTION
ConnectionName	Specify the name of the connection setting. The maximum length is 20 characters. Because this value is the unique identifier for a connection setting, make sure that it's unique in the list. If a connection that has the same name already exists on the device, it will be overridden by the settings from the imported file.
ActiveDirectoryClientAppId	Specify the client ID that you made a note of while you were setting up Azure AD in the Create a web service application in Azure Active Directory section.
ActiveDirectoryResource	Specify the root URL of Supply Chain Management.
ActiveDirectoryTenant	Specify the Azure AD tenant that you're using with the Supply Chain Management server. This value has the form <code>https://login.windows.net/<your-Azure-AD-tenant-ID></code> . Here is an example: <code>https://login.windows.net/contosooperations.onmicrosoft.com</code> .
Company	Specify the legal entity in Supply Chain Management that you want the application to connect to.
ConnectionType	(Optional) Specify whether the connection setting should use a certificate or a client secret to connect to an environment. Valid values are <code>"certificate"</code> and <code>"clientsecret"</code> . The default value is <code>"certificate"</code> . Note: Client secrets can't be imported.
IsEditable	(Optional) Specify whether the app user should be able to edit the connection setting. Valid values are <code>"true"</code> and <code>"false"</code> . The default value is <code>"true"</code> .

PARAMETER	DESCRIPTION
IsDefault	(Optional) Specify whether the connection is the default connection. A connection that is set as the default connection will automatically be preselected when the app is opened. Only one connection can be set as the default connection. Valid values are <i>"true"</i> and <i>"false"</i> . The default value is <i>"false"</i> .
CertificateThumbprint	(Optional) For Windows devices, you can specify the certificate thumbprint for the connection. For Android devices, the app user must select the certificate the first time that a connection is used.

The following example shows a valid connection settings file that contains two connections. As you can see, the connection list (named *"ConnectionList"* in the file) is an object that has an array that stores each connection as an object. Each object must be enclosed in braces ({}), and separated by commas, and the array must be enclosed in brackets ([]).

```
{
  "ConnectionList": [
    {
      "ActiveDirectoryClientAppId": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee",
      "ConnectionName": "Connection1",
      "ActiveDirectoryResource": "https://yourenvironment.cloudax.dynamics.com",
      "ActiveDirectoryTenant": "https://login.windows.net/contosooperations.onmicrosoft.com",
      "Company": "USMF",
      "IsEditable": false,
      "IsDefaultConnection": true,
      "CertificateThumbprint": "aaaabbbbccccdddeeeeffffgggghhhhhiiii",
      "ConnectionType": "certificate"
    },
    {
      "ActiveDirectoryClientAppId": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee",
      "ConnectionName": "Connection2",
      "ActiveDirectoryResource": "https://yourenvironment2.cloudax.dynamics.com",
      "ActiveDirectoryTenant": "https://login.windows.net/contosooperations.onmicrosoft.com",
      "Company": "USMF",
      "IsEditable": true,
      "IsDefaultConnection": false,
      "ConnectionType": "clientsecret"
    }
  ]
}
```

You can either save the information as a JSON file or generate a QR code that has the same content. If you save the information as a file, we recommend that you save it by using the default name, *connections.json*, especially if you will store it in the default location on each mobile device.

Save the connection settings file on each device

Typically, you will use a device management tool or script to distribute the connection settings files to each device that you're managing. If you use the default name and location when you save the connection settings file on each device, the warehouse app will automatically import it, even during the first run after the app is installed. If you use a custom name or location for the file, the app user must specify the values during the first run. However, the app will continue to use the specified name and location afterward.

Every time that the app is started, it reimports the connection settings from their previous location to determine whether there have been any changes. The app will update only connections that have the same names as the connections in the connection settings file. User-created connections that use other names won't be updated.

You can't remove a connection by using the connection settings file.

As has been mentioned, the default file name is *connections.json*. The default file location depends on whether you're using a Windows device or an Android device:

- **Windows:**

```
C:\Users\<User>\AppData\Local\Packages\Microsoft.Dynamics365forOperations-Warehousing_8wekyb3d8bbwe\LocalState
```

- **Android:** `Android\data/com.Microsoft.Dynamics365forOperationsWarehousing\files`

Usually, the paths are automatically created after the first run of the app. However, you can manually create them if you must transfer the connection settings file to the device before installation.

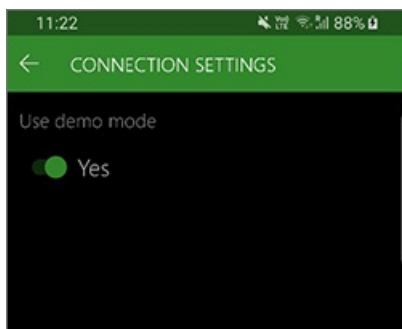

NOTE

If the app is uninstalled, the default path and its contents are removed.

Import the connection settings

Follow these steps to import connection settings from a file or a QR code.

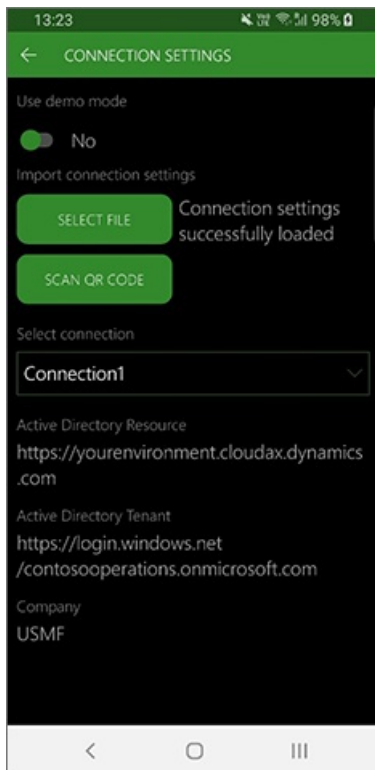

1. Open the warehouse app on your mobile device.
2. Go to **Connection settings**.
3. Set the **Use demo mode** option to *No*.

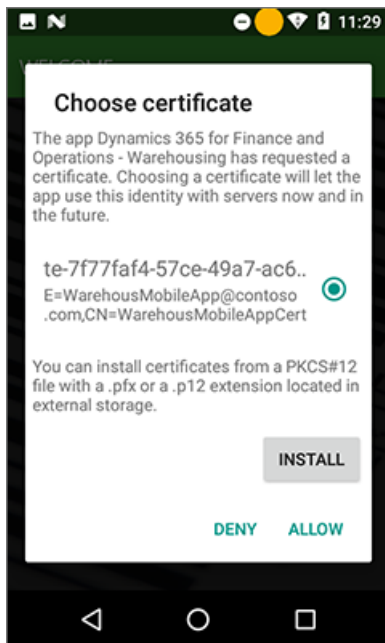

4. Select **Select file** or **Scan QR code**, depending on how you want to import the settings:
 - If you're importing the connection settings from a file, the app might already have found the file if the default name and the default location were used when it was saved. Otherwise, select **Select file**, browse to the file on your local device, and select it. If you select a custom location, the app will store it and automatically use it the next time.
 - If you're importing the connection settings by scanning a QR code, select **Scan QR code**. The app prompts you for permission to use the device's camera. After you give permission, the camera is started, so that you can use it for scanning. Depending on the quality of the device's camera and the complexity of the QR code, you might find it difficult to get a correct scan. In that case, try to reduce the complexity of the QR code by generating only one connection per QR code. (Currently, you can use only the device's camera to scan the QR code.)

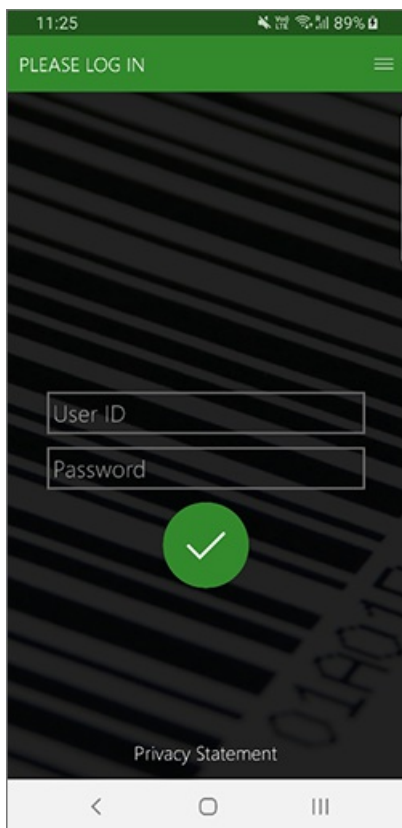

5. When the connection settings are successfully loaded, select the **Back** (left arrow) button in the upper-left corner of the page.

6. If you're using an Android device and are using a certificate for authentication, the device prompts you to select the certificate.

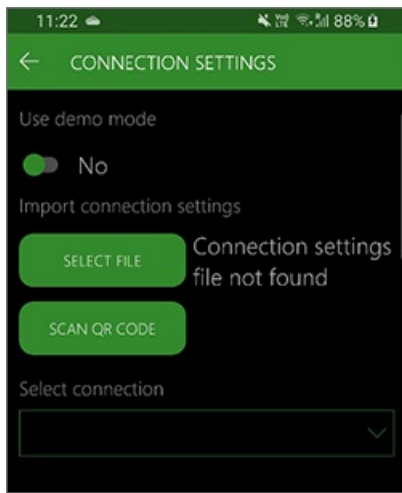

7. The app connects to your Supply Chain Management server and shows the sign-in page.

Manually configure the application

You can manually configure the app on the device so that it connects to the Supply Chain Management server through the Azure AD application.

1. Open the warehouse app on your mobile device.
2. Go to **Connection settings**.
3. Set the **Use demo mode** option to *No*.

4. Tap in the **Select connection** field to expand the settings that are required to manually enter the connection details.

5. Enter the following information:
 - **Use client secret** – Set this option to *Yes* to use a client secret to authenticate with Supply Chain Management. Set it to *No* to use a certificate for authentication. (For more information, see [Create a web service application in Azure Active Directory](#).)
 - **Connection name** – Enter a name for the new connection. This name will appear in the **Select connection** field the next time that you open the connection settings. The name that you enter must be unique. (In other words, it must differ from all other connection names that are stored on your device, if any other connection names are stored there.)
 - **Active directory client ID** – Enter the client ID that you made a note of while you were setting up Azure AD in the [Create a web service application in Azure Active Directory](#) section.
 - **Active directory client secret** – This field is available only when the **Use client secret** option is set to *Yes*. Enter the client secret that you made a note of while you were setting up Azure AD in the [Create a web service application in Azure Active Directory](#) section.

- **Active directory certificate thumbprint** – This field is available for Windows devices only when the **Use client secret** option is set to *No*. Enter the certificate thumbprint that you made a note of while you were setting up Azure AD in the [Create a web service application in Azure Active Directory](#) section.
- **Active directory resource** – Specify the root URL of Supply Chain Management.

NOTE

Don't end this value with a slash (/).

- **Active directory tenant** – Enter the Azure AD tenant that you're using with the Supply Chain Management server. This value has the form `https://login.windows.net/<your-Azure-AD-tenant-ID>`. Here is an example: `https://login.windows.net/contosooperations.onmicrosoft.com`.

NOTE

Don't end this value with a slash (/).

- **Company** – Enter the legal entity in Supply Chain Management that you want the application to connect to.

6. Select the **Save** button in the upper-right corner of the page.
7. If you're using an Android device and are using a certificate for authentication, the device prompts you to select the certificate.
8. The app connects to your Supply Chain Management server and shows the sign-in page.

Remove access for a device

In the event of a lost or compromised device, you must remove access to Supply Chain Management for the device. The following steps describe the recommended process for removing access.

1. Go to **System administration > Setup > Azure Active Directory applications**.
2. Delete the line that corresponds to the device that you want to remove access for. Make a note of the client ID that is used for the removed device, because you will need it later.

If you've registered only one client ID, and multiple devices use the same client ID, you must push out new connection settings to those devices. Otherwise, they will lose access.

3. Sign in to the Azure portal at <https://portal.azure.com>.
4. In the left navigation pane, select **Active Directory**, and make sure that you're in the correct directory.
5. In the **Manage** list, select **App registrations**, and then select the application to configure. The **Settings** page appears and shows configuration information.
6. Make sure that the client ID of the application matches the client ID that you made a note of in step 2.
7. On the toolbar, select **Delete**.
8. In the confirmation message that appears, select **Yes**.

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Scan bar codes using a camera in the warehouse app

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up the warehouse app to scan bar codes using a camera on a mobile device.

Prerequisites

To use this feature, you need to have version 1.2.0.0 of the warehouse app installed, and your device must have a camera. When you open the app after updating, you will be prompted to allow the app to use the camera. If your device doesn't have a camera, no prompt will be shown, and you will not be able to use a camera as a scanner.

Setup

In the Display settings of the warehouse application, you can select if the camera should be used for bar code scanning. If you enable **Use the camera as scanner**, you can use the camera on every input field that has the preferred input mode set to **Scanning**.

To control whether an input field should be scannable, on the **Warehouse app field names** page, set **Preferred input mode** to **Scanning**. When this option is selected, a camera can be used for scanning in the warehouse app. For information about how to configure app field names in Warehousing, see [Configure app field names in warehouse app](#).

Supported bar code formats

The most common bar code formats are supported, including Code 128, Code 39, Code 93, EAN-8, EAN-13, UPC-E, UPC-A, and QR codes.

Navigation

The camera page will be initiated on each page where the input field has the preferred input mode set to Scanning, when you are on the Camera page use the following options to navigate:

- Click the back button to go back to the Task and details page.
- Click the pencil on the Task and details page to go to the page where you can type input manually.
- Click the camera on the Task and details page to go back to the Camera page.

On the camera page, when you click the Camera button, it will appear dimmed while trying to identify a bar code. If a bar code is not identified within 5 seconds, the process will time out and the Camera button will become available again. You will then be able to try to scan a bar code again.

When you aim the camera at a bar code, keep the bar code aligned within the brackets for best result. When a bar code is scanned successfully, the result will be processed, and you will be taken to the next step. If the next step contains another input field with the preferred input mode set to Scanning, the camera page will start again. If the next step is not a scanning field, then the camera page will not be initiated.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure app field names in the warehouse app

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to define and configure warehouse app field names and priorities in Dynamics 365 Supply Chain Management.

NOTE

This topic applies to features in Warehouse management. It doesn't apply to features in Inventory management.

Warehousing is an application that you can use to perform warehouse tasks. You can define and configure the field names that are used in the app, as well as configure the priority to which the field names should be assigned. This topic explains how to define and configure these warehouse app field names and priorities, and how they are used in Warehousing. For detailed information about how to configure the connection to FWarehousing, refer to the tutorial [Install and configure the warehouse app overview](#).

Configure warehouse app field names

When you use Warehousing on your mobile device, you can configure how metadata should be displayed on your device on the **Warehouse app field names** page. In a new company, select **Create default setup** to generate all field names that will be used in the warehouse mobile device workflows, and then assign a preferred input mode and input type to them. After you have generated all field names, you can select the following input options.

OPTION	DESCRIPTION
Preferred input mode	This option defines whether a scanning field or a manual entry input field should be shown for the selected field name. This is useful to distinguish fields depending on if barcodes are used for the field. Note: For field names with preferred input mode set to Scanning , you can enter information manually if the barcode is unreadable or damaged.
Input type	This option defines what input type should be used for the selected field name. Four options are available: <ul style="list-style-type: none">• Selection - Contains a list of options to choose from. Field names with this option are not editable.• Date - Field names specified as date will show a date format with the label. This helps warehouse workers see in which format to enter the date. Field names with this option are not editable.• Alpha - If selected, the device keyboard will be used when entering information manually in the app. The keyboard experience can be changed depending on which device is used.• Numeric - For field names that use numeric input only, you can select this option to display a custom numeric keypad with the input field instead of the device keyboard.

Configure warehouse app field priority

On the **Warehouse app field priority** page, you can put field names into different priority groups. This makes it possible to decide what information should be displayed on the main task page when warehouse workers perform tasks using the app. If you click **Create default setup**, a default set of priority groups will be generated. It is possible to create as many priority groups as needed, but only three priority groups will be shown on the task page. When the system sends metadata to the app, it will assign each field a relative priority depending on its priority group, and the app will display the first three priority groups contained in the metadata on the task page. The rest of the overflowing metadata will be displayed on a secondary details page. The following table shows an example of five priority groups.

PRIORITY GROUP	ASSIGNED FIELDS
Priority 10	<ul style="list-style-type: none"> • Item • Quantity • Unit of measure
Priority 20	<ul style="list-style-type: none"> • Cluster position • Cluster
Priority 30	<ul style="list-style-type: none"> • Item description
Priority 40	<ul style="list-style-type: none"> • Configuration • Color • Size • Style
Priority 50	<ul style="list-style-type: none"> • Location • License plate

For example, when a warehouse worker is performing a task on a mobile device, if the metadata that will be displayed in the app consists of the following fields:

- Item
- Quantity
- Unit of measure
- Item description
- Size and Location

Based on the warehouse app field priority set up in the table above, the following 3 rows of information will be displayed on the task page:

- Row 1: Item, Quantity, Unit of measure
- Row 2: Item description
- Row 3: Size

The remaining metadata, for example, Location, will not be displayed on the task page, but will be displayed on a details page. To learn more and see examples of the user interface, refer to the blog post [Announcing Finance and Operations - Warehousing](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up mobile devices for warehouse work

2/18/2021 • 23 minutes to read • [Edit Online](#)

This topic describes how to configure the menu items that warehouse workers use to perform work on a mobile device.

NOTE

This topic applies to features in Warehouse management. It doesn't apply to features in Inventory management. The menu items that appear on the menus on a warehouse mobile device are configured on the **Mobile device menu items** page. Because the menu items can be put onto different menus, it's easy to configure menu structures so that only specific types of work are exposed to specific users. You can configure menu items to perform the following tasks:

- Process an inquiry or perform an activity, such as printing a label, generating license plate numbers, starting a production order, or quickly looking up information about items in a location.
- Create work that will be performed through another process. For example, receiving an item for a purchase order can create put-away work for another worker.
- Perform work that was created by another process (existing work), such as put-away work that was created when an item was received for a purchase order.

To create a menu item for an activity or inquiry, set the **Mode** field to **Indirect**. A list of **Activity code** options then becomes available, so that you can select the type of inquiry or activity that the menu item is for. To create a menu item to generate warehouse work, set the **Mode** field to **Work**. A list of **Work creation process** options then becomes available. To create a menu item to process existing warehouse work, set the **Mode** field to **Work**, and then set the **Use existing work** option to **Yes**.

NOTE

Additional fields might be available for menu items, depending on the mode that you select for the menu item, and whether the menu item is used to perform existing work. For information about the additional field selections, see the "Additional menu item options" section later in this topic.

Configure menu items for activities and inquiries

If the **Mode** field for a menu item is set to **Indirect**, you can create a menu item to perform a general activity or inquiry that doesn't create work. Examples include reprinting license plate labels and an inquiry about the items in a location. The following table lists the options that are available.

OPTION	DESCRIPTION
None	This default value doesn't enable an activity or inquiry.
About	View information about the system, such as the version number, the warehouse ID, and the worker who is currently logged on.
Change warehouse	Change the warehouse that a worker is logged on to.

OPTION	DESCRIPTION
Location inquiry	View information about all items and quantities for a location.
License plate inquiry	View the quantity of items on a license plate and the location of the license plate.
Start production order	Start a production order.
Production scrap	Enter the quantity of scrap that was created during production for each bill of materials (BOM) line.
Production last pallet	Indicate that the last pallet of items has been produced for a production order, and that the status of the production order must be updated to Reported as finished . The status of the raw materials that were not consumed during production is change back from Picked to On order , and the items can be returned to inventory.
Item inquiry	Scan an item to determine where it is in the warehouse. The inquiry returns all locations and quantities for the scanned item.
Reprint label	Reprint a license plate label.
License plate build	Create a parent license plate by combining multiple license plates in the same location. This option is useful if you move multiple license plates at the same time. After the parent license plate is moved, you must perform a license plate break before you can pick items from each license plate. Tip: To move a parent license plate, you must use a mobile device that is configured to create work for movements.
License plate break	Break up a license plate build so that you can pick items from the license plates that were in the build.
Driver check in	If you're using Transportation management, register the arrival of a driver by scanning the outbound load ID, appointment ID, or shipment ID. For this option, a load must be assigned to the appointment, and the status of the load must be Loaded .
Driver check out	Register that a driver has completed his or her appointment.
Flush number sequence cache	Delete number sequence numbers from the number sequence cache. This activity is typically performed by a system administrator to resolve caching issues when mobile devices are used.
Change batch disposition	Allow a worker to specify a batch disposition code for an item and batch. This selection updates the disposition code that is specified for the batch.

OPTION	DESCRIPTION
Display open work list	<p>Show a list of available work to a particular user. The user can then select work to perform and will be directed to it. This list is intended to be viewed on tablet devices that have a screen size of 7 inches or more. When you select this option, the Edit query and Field list menu items become available. The Edit query page lets you set up criteria for the work that appears in the list. The Field list page lets you select what fields appear in the work list. For example, you can reduce the number of fields that appear, so that the user can more quickly select the most appropriate work item. On the General FastTab, in the Records per page field, you can also select how many work records are shown per page. If the Allow users to filter work by transaction type option is selected, the work list will include a Filter work control that the user can use to filter by transaction type. In the work list, users will see only work that they have permission to access. You must make sure that users have permission for one or more user-directed menu items that support the specific work class types that they should be able to access. Permissions are verified when a user tries to perform work from the list.</p>
Create transfer order from license plates	<p>Allows warehouse workers create and process transfer orders directly from the warehouse app. The warehouse workers start by selecting the destination warehouse and can then scan one or more license plates using the app. When the warehouse worker selects Complete order, a batch job will create the required transfer order and order lines based on the on-hand inventory registered for those license plates. For more information, see Create transfer orders from the warehouse app</p>

Configure menu items to create work for another worker or process

You can set up a menu item that creates work for another worker after an initial action is performed on the mobile device. For example, when one worker uses a mobile device to receive an item, put-away work is created for another worker. To set up a menu item that creates work, on the **Mobile device menu items** page, in the **Mode** field, select **Work**. In the following table, the options in the **Work creation process** field are arranged by work order type.

WORK ORDER TYPE	OPTION	DESCRIPTION
Purchase order	Purchase order line receiving	Register the receipt of a quantity of an item by using the purchase order number and purchase order line number, and create put-away work for another worker.
	Purchase order line receiving and put away	Register the receipt of a quantity of an item by using the purchase order number and purchase order line number, and put the items away. The same worker performs both actions.

	Purchase order item receiving	Register the receipt of a quantity of an item for a purchase order by registering the purchase order number and item number, and create put-away work for another worker.
	Purchase order item receiving and put away	Register the receipt of a quantity of an item for a purchase order by registering the purchase order number, and put the item away. The same worker performs both actions.
	License plate receiving	Receive an inbound advance ship notice (ASN) by using the license plate ID.
	License plate receiving and put away	Receive and put away an inbound advance ship notice (ASN) by using the license plate ID.
	Load item receiving	Register the receipt of a quantity for a load by using the load ID, and create put-away work for another worker. The item number and product dimensions match the receipt to the purchase order lines.
	Load item receiving and put away	Register the receipt of a load by using the load ID, and put the items away. The item number and product dimensions match the receipt to the purchase order lines. The same worker performs both actions.
Return order	Return order receiving	Register the receipt of a quantity of an item by registering the RMA number, and create put-away work for another worker.
	Return order receiving and put away	Register the receipt of a quantity of an item by registering the RMA number, and put the items away. The same worker performs both actions.
Transfer order	Transfer order item receiving	Register the receipt of a quantity of an item, and create put-away work for another worker. Note: Use this option only if the items were shipped from a warehouse that isn't enabled for warehouse management processes.

	Transfer order item receiving and put away	Register the receipt of a quantity of an item, and put the items away. The same worker performs both actions. Note: Use this option only if the items were shipped from a warehouse that isn't enabled for warehouse management processes.
	Transfer order line receiving	Register the receipt of a quantity of an item, and create put-away work for another worker.
	Transfer order line receiving and put away	Register the receipt of a quantity of an item, and put the items away. The same worker performs both actions.
	License plate receiving	Receive an inbound advance ship notice (ASN) by using the license plate ID.
	License plate receiving and put away	Receive and put away an inbound advance ship notice (ASN) by using the license plate ID.
Production	Report as finished	Register a quantity of a finished item that has been finished for a production, and create put-away work for another worker. The quantity can be some or all of the quantity that was planned for production.
	Report as finished and put away	Register a quantity of a finished item that has been finished for a production, and put the items away. The quantity can be some or all of the quantity that was planned for production. The same worker performs both actions.
	Kanban	Indicate that a kanban is completed, and create put-away work for another worker.
	Kanban put away	Indicate that a kanban is completed, and put away the items. The same worker performs both actions.
Inventory	Movement	Register that items have been moved from one location to another. The worker specifies the location that the items are moved from and where they are moved to.
	Quarantine	Change the status of the on-hand inventory for a license plate or location to make damaged or missing inventory items unavailable.

	Movement by template	Move items from one location to another in a semi-automated manner. The worker selects the location to move items from, the system uses the location directive to determine where to move the items to.
	Warehouse transfer	Register that items have been transferred from one warehouse to another. This option requires that the worker be allowed to perform work in both warehouses. Note: This menu item requires a default inventory transfer journal where the Voucher draw field is set to Posting .
	License plate loading	Use this option when you're setting up your warehouse for the first time. Scan all the license plates in all locations in the warehouse. The locations must be license plate-controlled. You can't use this option if Serial number or Batch number is listed above Location in the inventory reservation hierarchy.
Cycle count	Adjustment in	Increase the quantity of items in inventory. Specify the location, license plate, item, quantity, unit of measure, and status.
	Adjustment out	Reduce the quantity of items in inventory. Specify the location, license plate, item, quantity, unit of measure, and status of the inventory.
	Spot cycle counting	Start a count for a location. The worker must count all items in the location. When the result of a count is less than the expected quantity, the missing quantity is considered a loss.

Configure menu items to process existing work

In addition to setting up menu items to create warehouse work, you can set up menu items to process work that has already been created. Set the **Mode** field to **Work**, and select the **Use existing work** option. Some additional options then become available on the **General** tab. You can control access to the menu item by assigning one or more work classes on the **Work class** FastTab. The work classes define the work that the menu item can process. The work class can also be used to grant access to specific user roles or to separate processing for different types of operations. The following table describes the options that are available. The option can be chosen under the **Directed by** field in the **Mobile device menu items** page.

OPTION	DESCRIPTION
None	This default value doesn't process work.

OPTION	DESCRIPTION
System directed	Supply Chain Management controls the type of work that is assigned to a worker and the order that the worker performs the work in. When you select this option, you can select System-directed work on the Action Pane to open the System-directed sorting order page, where you can set up sorting criteria for the work. The sorting criteria control the order that the worker performs the work in. You can add as many criteria as you require.
User directed	The worker selects the work to perform and the order to perform it in.
User grouping	The worker manually groups work. This option is useful when, for example, a worker can pick multiple items at the same time in a location. After the worker has finished picking all the required items, he or she can put the items away.
System grouping	Supply Chain Management groups work for the worker, based on a specified field. For example, picking work is grouped when a worker scans a shipment ID, load ID, or any value that can link each work unit. If you select this option, the following fields are required: <ul style="list-style-type: none"> • System grouping field – Select the field that the worker scans to group the work. • System grouping label – Enter text to instruct the worker what to scan to group the work.
Validated user directed	The worker selects the work to perform when work is associated with a larger entity, such as a load or shipment. The worker determines the order that the items are picked in. If you select this option, the following fields are required: <ul style="list-style-type: none"> • Validated user directed field – Select the field that the worker scans to group the work. • Validated user directed label – Enter text that instructs the worker what to scan when picking work is grouped by the system. <p>This option is useful when, for example, multiple pallets are staged for a load. If you select LoadId in the Validated User Directed field, the worker can pick any pallet that is associated with the load. The worker receives an error message if he or she scans an item that isn't associated with the load.</p>
Cluster picking	The worker groups work into clusters. Clusters lets workers pick items from a single location for multiple work orders at the same time.
Cycle count grouping	The worker selects a zone, work pool, or location, and Supply Chain Management assigns work, based on the selection. If you select this option, you can click Cycle counting on the Action Pane to specify additional information to display, and you can also specify the number of times that the worker must repeat the count if a difference is found.

OPTION	DESCRIPTION
Transport loading	This feature allows several warehouse workers to load inventory from the same or different loads onto the same truck, with loads that are fully or partially shipped.

Additional menu item options

Additional menu items options are available on the **Mobile device menu items** page. The options vary, depending on the process that you're configuring the menu item for.

The following table describes these options.

FIELD	DESCRIPTION
Allow splitting of work	Select this option to let users put items for a work order into more than one target license plate. This option is useful when, for example, a target license plate is full, and the worker must add the remaining items to another license plate. The worker can select Full to indicate that the license plate is full and stop receiving picking work for it. The put location for the picked items is then displayed, and the picking work that has already been completed is moved to a new work order. The remaining picking work for the target license plate stays on the original work order.
Anchoring	Select this option to let workers specify a location that overrides the suggested staging or loading location. All the remaining put-away work is directed to the new location. This option is useful when, for example, a worker who must put items for order 1 in a staging location by Dock 1 can't, because a previous load hasn't cleared the location. Instead of waiting for the Dock 1 staging location to become available, the worker can decide to use the staging location for Dock 2. In this case, the worker overrides the suggested staging location. The put location for all remaining items for the work order is then updated to the Dock 2 staging location. If you select this option, you must set the Anchor by field.
Anchor by	If you're using anchoring, you must specify whether to anchor by shipment or by load.
Audit template ID	Select the work audit template that will interrupt the work process for this menu item so that another operation can be performed. For example, if this menu item is for inbound work, the audit template might require that the worker check the temperature in the delivery container. The point at which the process is interrupted is specified on the audit template. This point can be, for example, when work is started or completed, or when its status changes.
Cluster profile ID	Select the cluster profile to use for cluster picking. The cluster profile includes settings such as whether to create clusters automatically, the names of positions and the number of work units that they can be assigned, when to break clusters into individual units, and whether verification is required. This field is available only if Cluster picking is selected in the Directed by field.

FIELD	DESCRIPTION
Count total item quantity first	Select this option to require that a worker count the total quantity first during a count. If a difference is found, the worker must provide additional information, such as the license plate number, batch number, and serial numbers.
Create movement	Select this option to let a worker create work for a movement, but without requiring that the worker perform the work immediately. This option is useful if, for example, a quality inspection has been completed, and the inspector wants the item to be moved from the quality inspection area.
Directive code	To use a specific location directive, select the directive code that is associated the location directive. This field is available when you create work and the work creation process is Movement by template .
Disable cycle count thresholds	Select this option to ignore the cycle count thresholds. If you select this option, cycle count work isn't created when threshold values are exceeded.
Display batch disposition code	<p>Select this option to display batch disposition codes. For example, you can display batch disposition codes when you receive a returned batch. Workers can then evaluate the status or quality of a batch, and select the appropriate code. The rules on the batch disposition code determine whether the batch will be available to other warehouse processes. If you don't select this option, one of the following batch disposition codes is used:</p> <ul style="list-style-type: none"> • If you receive a new batch number, the default batch disposition code that is specified on the item model group. • The batch disposition code that is already assigned to the batch.
Display disposition code	Select this option to display disposition codes. For example, you can display disposition codes when you receive return items. Workers can then evaluate the status or quality of the items, and select the appropriate code. The rules on the disposition code determine whether the items will be available to other warehouse processes.
Display inventory status	Select this option to display the status of items in inventory. This option is available for all menu items that use existing work, except cycle counting.
Display summary of pick screen	Select this option to display a summary of picking work for the selected work order. The summary is displayed until the first work line is processed for the work order.
Generate license plate	Select this option to generate a unique license plate number, based on the number sequence selection. For example, you can generate a license plate number for items that are received for purchase orders.

FIELD	DESCRIPTION
Group put away	Select this option to group the put-away work. This option is available when the work was grouped either by the worker or by Supply Chain Management. When the worker has finished all the picking work in the group, put-away work is created for the same group.
Inventory adjustment types	Select the inventory adjustment type that determines the inventory counting journal that is used to post the adjustment, and whether to remove reservations. This field is available only for the Adjustment in or Adjustment out work creation process.
Override batch number	Select this option to let workers who are reporting a quantity as finished for a production order enter a batch number that differs from the batch number that is assigned to the production order.
Override target license plate	Select this option to let workers specify a target license plate number that differs from the suggested target license plate. Use this option when the first pick for a work order is for the entire quantity of an item on a license plate. This option is useful when, for example, a pallet is reused.
Pick and pack	Select this option to let workers combine work for a sales order or load into a single work unit. A worker can perform work only for the sales order or load. This option is useful when, for example, you must increase a quantity for a sales order after the load, shipment, and work have been created for the sales order. This option is available when the menu item uses existing work, and the work is directed by the user or system.
Pick oldest batch	Indicate whether the worker must pick the oldest batch in a location first. The following options are available: <ul style="list-style-type: none"> • None – The worker can pick any batch in the location. The worker receives no message. • Warn – The worker can pick any batch in the location, but he or she receives a warning message if a batch isn't the oldest batch. • Force – The worker must pick the oldest batch in the location. The worker receives an error message if a batch isn't the oldest batch. Note: This option is relevant only if Batch number is lower than Location in the reservation hierarchy that is assigned to the item.
Print label	Select this option to let workers print license plate labels.
System grouping field	Select the field that determine how Supply Chain Management will group picking work for workers. For example, if you select the ShipmentId field, the worker will scan the shipment ID to group the picking work. All work for the shipment is then assigned to the worker. This field requires that you create a menu item to use existing work that is grouped by the system. You must also enter text in the System grouping label field to instruct the worker what to scan.

FIELD	DESCRIPTION
System grouping label	Enter the text that will instruct the worker what to scan when picking work is grouped by Supply Chain Management. For example, if you're using the ShipmentId field to group picking work by shipment, you might enter Shipment ID in the field. This field requires that you create a menu item to use existing work that is grouped by the system. You must also select the field to group by in the System grouping field.
Use default data	Select this option to enable the Default data button on the Action Pane, where you can select fields to display data that a worker typically requires in his or her daily work. This option is useful if, for example, a worker often picks items from the same location. You can select the From location field to display the location by default.
Validated User Directed Field	Select the field that the worker will scan to group the work. For example, if you select LoadId , a worker can pick any work that is associated with a selected load. You must also enter text in the Validated User Directed Label field to instruct the worker what to scan.
Validated User Directed Label	Enter the text that will instruct the worker what to scan when picking work is grouped by a validated user-directed field. For example, if you're using the LoadId field to group picking work for a load, you might enter Load ID in the field.
Work template code	Select the work template that will create the work for a process. For example, if you receive an item for a purchase order, the put-away work will be generated based on the work template. If you don't select a work template, Supply Chain Management assigns a template, based on query criteria. For more information about work templates, see Controlling warehouse work with work templates and location directives .
Show work line list	Select an option for how workers will be able to view and interact with the lines for the currently selected picking work. For more information about this option, see Set up a mobile device menu item to provide a pick line overview .

Require workers to confirm the product, location, or quantity when they pick items

You can set up work confirmations that require that a worker use a mobile device to register the location or quantity when they perform work in the warehouse. Work confirmations help ensure that the worker is at the correct location or is handling the correct quantity of items. You can also enable Supply Chain Management to automatically confirm the worker's registration. If you enable automatic confirmation, you can't also require confirmations for location or quantity. Work confirmations also include products and product variants.

Additionally, you can register confirmations by scanning a bar code. To confirm products and product variants, you must enter an ID for the product or product variant. This ID can be a product ID, product search ID, external ID, GTIN, or bar code. After you enter the ID or scan the bar code, the dimensions for the product variant are displayed on the mobile device.

The following table describes the various work types that you can use work confirmations with.

OPTION	DESCRIPTION
Pick	Require confirmation when items are picked.
Put	Require confirmation when items are put in a location.
Counting	Require confirmation during cycle counting.
Adjustments	Require confirmation when inventory quantities are adjusted.
Custom	Require confirmation for custom work.
Quarantine	Require confirmation when items are moved to quarantine.
License plate building	Require confirmation when items are consolidated to build a license plate.
Print	Require confirmation when license plate labels are printed.
Status change	Require confirmation when the status of inventory is changed.

NOTE

You can require product confirmation only for pick and put work types.

Warehouse app event processing

2/18/2021 • 3 minutes to read • [Edit Online](#)

Batch jobs running in Supply Chain Management can use data from a queue for processing events issued by the warehouse app to react as needed to the signaled events. This feature adds relevant events to the queue in response to certain types of actions taken by workers using the app. An example is when using the **Create and process transfer orders from the warehouse app** feature, the transfer order header and lines get created and updated in the back end when the system is running the **Process warehouse app events** batch job.

Enable the Process warehouse app events feature

Before you can use this feature, it must be enabled on your system. Administrators can use the [feature management](#) page to check the feature status and enable it if needed. The Process warehouse app events feature is listed as:

- **Module** - Warehouse management
- **Feature name** - Process warehouse app events

Set up a batch job to process warehouse app events

Process warehouse app events

Set up a scheduled batch job to process the warehouse app events for the transfer order creation and line updates.

1. Go to **Warehouse management > Periodic tasks > Process warehouse app events**.
2. The Process warehouse app events dialog box opens. Expand the **Run in background** FastTab and set **Batch processing** to **Yes**.
3. On the **Run in the background** FastTab, select **Recurrence**.
4. The **Define recurrence** dialog box opens. Set the run schedule as needed for your business.
5. Select **OK** to return to the **Process warehouse app events** dialog box.
6. Select **OK** in the **Process warehouse app events** dialog box to add the batch job to the batch queue.

Query warehouse app events

You can view the event queue and events messages generated by the warehouse app by going to **Warehouse management > Inquiries and reports > Mobile device logs > Warehouse app events**.

The standard event queue process

The warehouse apps events queue will typically be used with the following described flow:

1. An event gets added to the queue with an event message. The new message initially has an Event state of **Waiting**, which means that the **Process warehouse app events** batch job will not pick up and process this message.
2. As soon as the message state is updated to **Queued**, the **Process warehouse app events** batch job will pick up and process the event.
3. The batch job updates the event states to either **Completed** or **Failed**, depending on whether the requested process was possible.
4. When all the related event messages are **Completed**, the event is deleted from the queue.

For a detailed example, see [Create transfer order from warehouse app process](#).

Handle event errors

As part of the warehouse event processing, the requested message activity may not receive processes from the batch job. In this case, the event message will change to **Failed**. You can use the **Batch log** information to learn why and take needed action to correct any problems.

For a detailed example, see [Create transfer order from warehouse app](#).

To reset a failed warehouse app event message:

1. Go to **Warehouse management > Inquiries and reports > Mobile device logs > Warehouse app events**.
2. On the **Warehouse app event messages** FastTab, find and select a relevant event that is showing **Failed** in the **Event state** column.
3. Select **Reset** from the **Warehouse app event messages** toolbar.
4. Continue working until all relevant messages are reset.

You can also remove a **Failed** event message by using the **Delete** option on the **Warehouse app event messages** toolbar.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

License plate receiving via the warehouse app

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to set up the warehouse app so that it supports using a license plate receiving process to receive physical inventory.

You can use this functionality to quickly record the receipt of inbound inventory that is related to an advance ship notice (ASN). The system automatically creates an ASN when warehouse management processes are used to ship a transfer order. For the purchase order process, an ASN can be manually recorded, or it can be automatically imported by using an inbound ASN data entity process.

The ASN data is linked to loads and shipments via the *packing structures*, where pallets (parent license plates) can contain cases (nested license plates).

NOTE

To reduce the number of inventory transactions when packing structures that have nested license plates are used, the system records the physical on-hand inventory on the parent license plate. To trigger the movement of the physical on-hand inventory from the parent license plate to the nested license plates, based on the packing structure data, the mobile device must provide a menu item that is based on the *Pack to nested license plates* work creation process.

Warehousing mobile device app processing

When a worker scans an incoming license plate ID, the system initializes a license plate receiving process. Based on this information, the content of the license plate (data coming from the ASN) gets physically registered at the inbound dock location. The flows that follow will depend your business process needs.

Work policies

As with (for example) the *Report as finished* mobile device menu item process, the license plate receiving process supports several workflows based on the defined setup.

Work policies with work creation

When you register incoming items using a work policy that creates work, the system generates and saves put-away work records for each registration. If you use the *License plate receiving and put away* work process, then registration and put away are handled as a single operation using a single mobile device menu item. If you use the *License plate receiving* process, then the receiving and put-away processes are handled as two different warehouse operations, each with their own mobile device menu item.

Work policies without work creation

You can use the license plate receiving process without creating work. If you define work policies that have a work order type of *Transfer receipt* and/or *Purchase orders*, and you use the process for *License plate receiving (and put away)*, the following two Warehousing mobile app processes won't create work. Instead, they will just register the inbound physical inventory on the license plate at the inbound receiving dock.

- *License plate receiving*
- *License plate receiving and put away*

NOTE

- You must define at least one location for a work policy in the **Inventory locations** section. You can't specify the same location for multiple work policies.
- The **Print label** option for Warehousing mobile device menu items won't print a license plate label without work creation.

To make this functionality available on your system, you must turn on the *License plate receiving enhancements* feature in [feature management](#).

Receive inventory on a location that doesn't track license plates

It's possible to use a warehouse location that is assigned to a location profile even when **Use license plate tracking** isn't turned on. Therefore, when you receive inventory, you can directly register the on-hand inventory on a location without work creation.

Add mobile device menu items for each receiving location in a warehouse

The *License plate receiving enhancements* feature lets you receive at any location in a warehouse by adding location-specific license plate receiving (and put away) menu items to the Warehousing mobile app. Previously, the system supported receiving only at the default location that is defined for each warehouse. However, when this feature is turned on, mobile device menu items for license plate receiving (and put away) now provide the **Use default data** option, which lets you select a custom "to" location for each menu item. (This option was already available for some other types of menu items.)

To make this functionality available on your system, you must turn on the *License plate receiving enhancements* feature in [feature management](#).

Show or skip the receiving summary page

You can use the *Control whether to display a receiving summary page on mobile devices* feature to take advantage of an additional detailed Warehouse app flow as part of the license plate receiving process.

When this feature is turned on, mobile device menu items for license plate receiving or license plate receiving and put-away will provide a **Display receiving summary page** setting. This setting has the following options:

- **Display a detailed summary** – During license plate receiving, workers will see an extra page that shows the full ASN information.
- **Skip the summary** – Workers won't see the full ASN information. Warehouse workers also won't be able to set a disposition code or add exceptions during the receiving process.

To make this functionality available on your system, you must turn on the *Control whether to display a receiving summary page on mobile devices* feature in [feature management](#).

Prevent transfer order–shipped license plates from being used at warehouses other than the destination warehouse

A license plate receiving process can't be used if an ASN contains a license plate ID that already exists and has physical on-hand data at a warehouse location other than the warehouse location where the license plate registration occurs.

For transfer order scenarios where the transit warehouse doesn't track license plates (and therefore also doesn't track physical on-hand inventory per license plate), you can use the *Prevent transfer order shipped license plates from being used on other warehouses than the destination warehouse* feature to prevent physical on-

hand updates of license plates that are in transit.

To make this functionality available on your system, you must turn on the *Prevent transfer order shipped license plates from being used on other warehouses than the destination warehouse* feature in [feature management](#).

To manage the functionality when this feature is available, follow these steps.

1. Go to **Warehouse management > Setup > Warehouse management parameters**.
2. On the **General** tab, on the **License plates** FastTab, set the **Transit warehouse license plate policy** field to one of the following values:
 - **Allow reuse of non-tracked license plate** – The system works the same way that it works when the *Prevent transfer order shipped license plates from being used on other warehouses than the destination warehouse* feature isn't available. This value is the default setting when you first activate the feature.
 - **Prevent reuse of non-tracked license plate** – Only on-hand updates that are related to a shipped license plate will be allowed at the destination warehouse until the transfer order has been received.

More information

For more information about mobile device menu items, see [Set up mobile devices for warehouse work](#).

For more information about the *Report as finished* production scenario, see the [Warehouse work policies overview](#).

For more information about inbound load management, see [Warehouse handling of inbound loads for purchase orders](#).

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a mobile device menu item for completing work of type Purchase order

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic shows how to set up a Mobile device menu item. In this example, the menu item is used for performing work of type Purchase order. The work class that's associated with the menu item determines which work is valid. You can use this guide in demo data company USMF. This procedure is typically carried out by a warehouse manager.

Create a mobile device menu item

1. Go to **Mobile device menu items** by entering it in the search bar.
2. Select **New**.
3. In the **Menu item name** field, type a value. Enter a unique value. For example, you could type . Remember the value, you'll need it later.
4. In the **Title** field, type a value. This is the title which will be displayed on the mobile device. For example, you could type .
5. In the **Mode** field, select **Work**.
6. Select **Yes** in the **Use existing work** field.
 - This mobile device menu item is used to perform existing work. Therefore you must set this value to **Yes**.
 - The **Display inventory status** field determines whether the inventory status of the on-hand inventory will be displayed to the warehouse worker on the mobile device.
7. In the **Directed by** field, select **System grouping**. When you select something in the **Directed by** field, additional fields appear in the **General** section on this page. The fields that appear depend on what you selected. When you select **System grouping**, two new fields are added. These are explained below.
8. In the **System grouping** field, select **WorkPoolId**. When warehouse workers open this menu item, they'll be asked to scan a Work pool ID. All work orders with this Work pool ID and open work order lines with one of the work classes added to this menu item will be pushed to the user.
9. In the **System grouping label** field, type a value. This is the text displayed to the user on the mobile device. For example, you could type **Work pool**.
10. Select **Yes** in the **Override license plate during put** field. This option allows warehouse workers to override the target license plate when items are put down on a license plate controlled location.
11. Select **Yes** in the **Group put away** field.
 - If all the Put lines on the work order share the same location, the user will receive one combined Put instruction for all lines.
 - Audit template ID: A work audit template allows you to specify that the work process for a menu item should be interrupted so that another operation can be performed. For example, if this menu item is for inbound work, the audit template might require that the worker checks the temperature. The point at which the process is interrupted is specified on the audit template and can be, for example, when work is started or completed, or when its status changes.
12. Expand the **Work classes** section.
13. Select **New**.
14. In the **Work class ID** field, type . The work pool restricts the work that the menu item can be used for. In this case it will be used for open work order lines that have the Purchase work class ID.
15. Select **Save**.

Set up work confirmation

1. Select **Work confirmation setup**.
2. In the **Work type** field, select **Pick**.
3. Select the **Auto confirm** check box. The work instruction with work type Pick will be auto-confirmed. This instruction will not be presented to the user.
4. Select **New**.
5. In the **Work type** field, select 'Put'.
6. Select the **Location confirmation** check box. The warehouse worker will be asked to perform a confirmation scan of the location, when the item is put down.
7. Select **Save**.

Add the menu item to a mobile device menu

1. Go to **Mobile device** menu by entering it in the search bar.
2. Select **Edit**.
3. Use the Quick Filter to find records. For example, filter on the **Name** field with a value of **inbound**. You want to find the menu you use for inbound menu items. In USMF this is called **Inbound**.
4. In the tree, select **a value**.
5. Select the arrow that points to the right.
6. Select **Save**.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a mobile device menu item to register received items

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic focuses on the setup of a mobile device menu item. This menu item is used for registration of the receipt of items ordered via purchase orders.

You can use this guide in demo data company USMF. This procedure is intended for the warehouse manager.

Create a mobile device menu item

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, type a value. This is the unique identifier for this mobile device menu item. For example, you could type .
4. In the **Title** field, type a value. This is the title, which will be displayed to the user on the mobile device. For example, you could type .
5. In the **Mode** field, select **Work**. Registration of on-hand quantities received for a purchase order line will create work to move the items from the receiving area into the inventory. Work isn't created until the items are registered. Therefore, leave the **Use existing work** option set to **No**.
6. In the **Work creation process** field of the **General** section, select **Purchase order item receiving**.
 - A purchase order line must be uniquely identified before on-hand can be registered in the warehouse. In this scenario, the mobile device will register the purchase order number and item number, and this will allow the system to identify the PO line. Put away work will be created and can be picked up by another worker. The work creation method that you select determines which fields become available on the **General** FastTab.
 - If you select the **Use default data** option, the **Default data** button is enabled. Here you can select fields to display data that a worker typically needs in their daily work, so that these values are shown on the mobile device.
 - The **License plate grouping** parameter works in combination with the unit sequence group that's assigned to the item that's being received. You can specify whether receipts of less than or more than one pallet should be grouped into one license plate, or divided into a separate license plate for each unit.
 - If you select the **Generate license plate** option, this generates a unique license plate number based on the number sequence selection.
 - You can select the template that will be used when work is created. For example, if you register an item for a purchase order, the put away work will be generated based on the work template. If you don't select a work template here, the system will assign a template based on the query criteria that are associated with the templates.
 - If disposition codes are displayed on the mobile device, workers can evaluate the status or quality of the items, and select the appropriate code. The rules for the disposition code determine whether the items will be available to other warehouse processes. The rules also determine which location directive is used for the work that's created.
 - If you select the **Batch disposition codes** option, workers can evaluate the status or quality of a batch, and select the appropriate disposition code. The rules that are set on the batch disposition code determine whether the batch will be available to other warehouse processes.

- If you select the **Print labels** option, a license plate label will be printed automatically when items are received.
7. Select **Save**.
 8. Close the page.

Add the menu item to a mobile device menu

1. In the navigation pane, go to **Modules > Warehouse management > Setup > Mobile device > Mobile device menu**.
2. Use the **Quick Filter** to filter on the **Name** field with a value of .
3. Select **Edit**.
4. In the Available menus and items tree, select the menu item that you created before.
5. Select the arrow that points to the right.
6. Select **Save**.
7. Close the page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up a mobile device menu item to provide a pick line overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic explains how to configure options that are related to the pick line overview for mobile device menu items that are used to process picking work. The pick line overview lets warehouse workers view and select from a list of all the work lines that are related to their current task. This capability can help workers optimize their picking sequence. The feature provides options that replace the standard **Skip** button that lets workers cycle through the lines one at a time, in a fixed order. (However, the option to use that button is still available.)

Admins can configure each menu item individually to control how, when, and where the warehouse app presents the pick line overview.

Turn on the Work pick line overview feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Work pick line overview*

Configure menu items to show a list of all work lines

To set up a mobile device menu item to provide a pick line overview, follow these steps.

1. Go to **Warehouse management > Setup > Mobile device > Mobile device menu items**.
2. Select or create a menu item that is related to picking work, and set the following values:

- **Mode:** *Work*
- **Use existing work:** *Yes*
- **Directed by:** *User directed* or *System directed*

For more information about how to create menu items and use the various settings that are available on the **Mobile device menu items** page, see [Set up mobile devices for warehouse work](#).

3. On the **General** FastTab, configure the feature by setting the **Show work line list** field to one of the following values:
 - **Show only upon request** – Workers can choose to view the pick line list by selecting the **Skip to** button in the warehouse app.
 - **Show at the start of every pick** – Workers see the list every time that they start or finish a pick line. They can also view the list again by selecting the **Skip to** button in the warehouse app.
 - **Show at the start of the first pick only** – Workers see the list every time that they start new picking work, but not after each line. They can also view the list again by selecting the **Skip to** button

in the warehouse app.

- **Never show** – The standard **Skip** button appears in the warehouse app, and display of the work line list is turned off. The **Skip** button lets workers cycle through the lines one at a time, in a fixed order. They can also cycle through the list as many times as they require, until all lines have been processed.

4. On the Action Pane, select **Save**.

If you set the **Show work line list** field to any value except *Never show*, the **Field list** button on the Action Pane becomes available.

5. On the Action Pane, select **Field list**.

6. On the **Field list** page, configure the information that the warehouse app shows for each line in the list.

- The **Primary control** field is always set to *LineNum*. Therefore, each row in the list begins with a line number.
- Use the remaining **Display field** fields to add up to seven additional display fields, as you require. In each **Display field** field, select the name of a work line field. Each line will then show a value for that field. The values will be shown in the order that you select here. You can leave some of the **Display field** fields blank if you don't require all seven values.

7. On the Action Pane, select **Save**, and then close the **Field list** page.

Create a mobile device menu item for license plate consolidation

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows you how to create a mobile device menu item for license plate consolidation work. This enables warehouse workers to consolidate items on one license plate with items on another license plate within the same location. For example, they might use this if subsequent staging steps were the same on both work orders, so that the work only needs to be performed once for the merged items. You can use this procedure in demo data company USMF. The task would typically be carried out by a warehouse manager. This procedure is for a feature that was added in Dynamics 365 for Operations, version 1611.

1. Go to Warehouse management > Setup > Mobile device > Mobile device menu items.
2. Click New.
3. In the Menu item name field, type a value.
4. In the Title field, type a value.
5. In the Mode field, select 'Indirect'.
6. In the Activity code field, select 'Consolidate license plates'.

NOTE

Mixed license plate receiving

2/18/2021 • 2 minutes to read • [Edit Online](#)

Mixed license plate receiving allows you to build a license plate consisting of multiple items before you register and create put-away work.

A license plate that consists of multiple items does not have to be split at the receiving dock for you to register each item.

When using an item-related flow to identify the source document lines, you can scan bar codes on the item control. If the bar code has a quantity and a unit of measure (UOM) configured on it, the item and quantity will automatically be added to the mixed license plate, and you will be returned to the screen to scan another item. This allows you to quickly scan all the items without having to make a confirmation at each step.

In the flow for mixed license plate receiving, you can display the list of items that are already scanned to the license plate and from here you can modify or correct the quantity of an item.

Where it applies

Mixed license plate receiving is a mobile device receiving flow to register and create work for multiple lines/items at the same time. This is useful if you receive inbound license plates with multiple items.

How to set up mixed license plate receiving

Mixed license plate receiving is set up as a mobile device menu item.

You need to create a new menu item with mode work that does not use existing work and use one of the following methods:

- Mixed license plate receiving
- Mixed license plate receiving and put away

The options to identify the source document lines are purchase order item, purchase order line, return order, transfer order item, and transfer order line. These options can change the receiving order on a single license plate. The last option is by load item. You can add multiple items to a license plate, but you cannot switch between multiple loads.

Configure Display older batches within warehouse on a mobile device

2/18/2021 • 2 minutes to read • [Edit Online](#)

The **Display older batches within warehouse** configuration lets you display a list of locations with batches older than the current location of the work line. The list of locations that are displayed includes information about the older batches in the location with the expiration date and the physical inventory of each batch. You can choose to pick from a new location or to continue picking from the current location.

- Pick from a new location - If you select a new location to pick from, the current work line will be updated to use the new location and work will continue as usual with the new location. For the new location to be valid, it must have enough available quantity for the whole work line. If the required quantity is not available, the work line will not be updated, and the list will display.
- Continue picking from the current location - If you continue with the current work line location, the quantities for the work line will continue to be picked from the original location.

Where it applies

Display older batches within warehouse is configured on mobile device menu items and affects the pick for batch below items.

Set up Display older batches within warehouse

The **Display older batches within warehouse** configuration is available on mobile device menu items when the **Pick oldest batch** option is set to **Warn**.

- Under **Warehouse management > Setup > Mobile device > Mobile device menu items**, set **Use existing work** to **Yes** for the menu item, and select **Warn** in the **Pick oldest batch** field.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Pick oldest batch on a mobile device

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can access the configuration **Pick oldest batch** via a mobile device menu and it allows you to force or warn warehouse workers to pick the oldest batch in their current location.

Where it applies

Pick oldest batch is configured on mobile device menu items and effects the pick for batch below items.

How to set up the configuration for Pick oldest batch

For items that are set to use existing work, **Pick oldest batch** can be set to **None**, **Warn**, or **Force** from a mobile device menu.

None: Workers will not receive any messages and they will be allowed to pick any batch in their location.

Warn and **Force:** A list of the batch(es) with the oldest expiration date will be displayed above the batch control when the worker selects a batch. If the location is license plate controlled, a list of license plates that have the oldest batch will be displayed above the license plate control.

- **Warn:** If a worker chooses a license plate or batch that is not on the shown list, the control will be blanked and a warning will be shown that there is an older batch to select. To be allowed to continue the work, the worker can select the same license plate or batch again.
- **Force:** Workers will continue to receive the message that there is an older batch to pick.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Process guide framework

2/18/2021 • 22 minutes to read • [Edit Online](#)

This topic provides information about the process guide framework for developers who are extending the warehouse mobile processes in X++ . The warehouse mobile processes are extensible as a result of the processes being broken into small steps. The business logic and user interface building of each step has been extracted into individual classes, which allows for extensibility.

Overview of the existing design

The warehouse mobile execution flows are exposed through a single custom service endpoint. The request arrives from the mobile app in the form of an XML string, which contains the metadata of the user interface presented in the mobile app, as well as the values entered by the user.

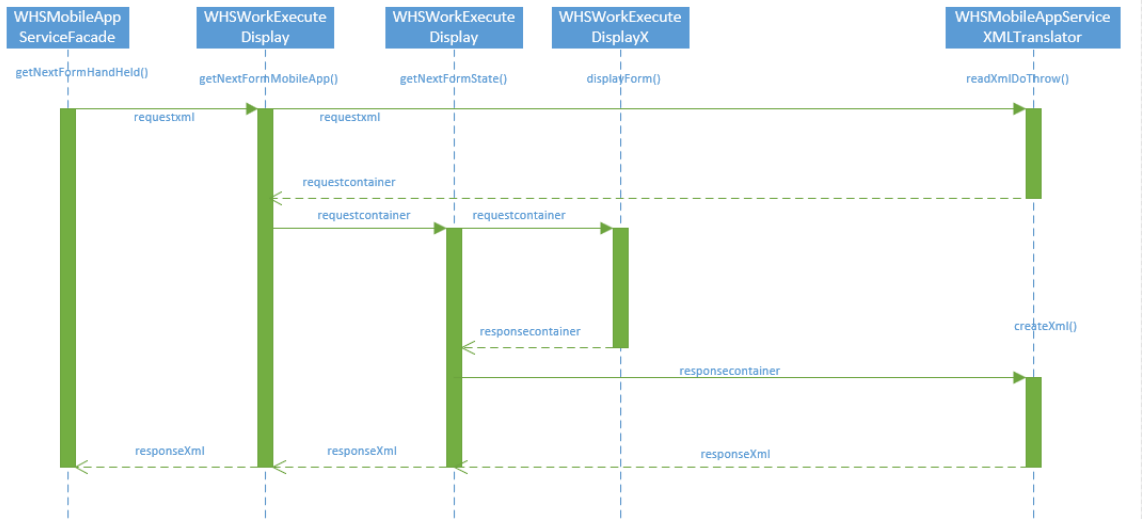

When the request is received, the first step is to deserialize this XML. The **WHSMobileAppServiceXMLTranslator** class converts the XML into a container, which contains both the control information, as well as session information.

Following this, the information in the container is used to deduce which warehouse process the user is working on, or about to start (represented by the **WHSWorkExecuteMode** enumeration), and accordingly instantiate a derived class of **WHSWorkExecuteDisplay**. The **displayform()** method is invoked, which then does the following:

- Processes the data from the user (delegated to the **WHSRFCControlData** class, but some processes implement specific logic by overriding the **processControl()** method).
- Executes business logic.
- Increments the step.
- Builds the container representing the new user interface (typically in a **build...()** method).

The container is then returned to the translator, which then serializes the XML, and sends it back as a response to the mobile device.

The following sequence diagram shows an overview of the execution flow. Note that the diagram is more of a schematic overview and is not a 1:1 representation of the actual code.

This is not an accurate representation of the code, but more of a schematic overview.

Reason for the redesign

The above design offers a very simple framework for building processes used in mobile flows. However, as is evident above, the **displayForm()** methods take over multiple responsibilities. It does delegate them to other methods and classes, but in the absence of concrete class responsibilities, it is done in an inconsistent manner across classes. Also, as the number of supported scenarios grows organically, some of those classes can become quite complex. To make matters more interesting, some of those classes/methods are overridden and re-used in multiple modes. The result is extremely long methods with high cyclomatic complexity. These have posed maintenance issues in the past. Fixing bugs in these methods has been risky and regression prone. For example, the **processWorkLine()** method in the **WhsWorkExecuteDisplay** class is referred from multiple processes (basically, anywhere where work execution is performed).

To make these extensible, one of the options would be to split the **displayForm** methods into smaller methods and introduce extensibility points. However, because of the scenario matrix, it would be challenging for partners to write extensions and validate against regressions. Not only that, because of the lack of structured responsibility distribution noted above, the code would keep growing in unpredictable ways over time, posing challenges in building quality extensions.

As a result, the redesign is the sustainable option, with a goal to have clearly defined classes having independent responsibilities. A class should have one responsibility, one reason to change, and one reason to be extended.

Design overview

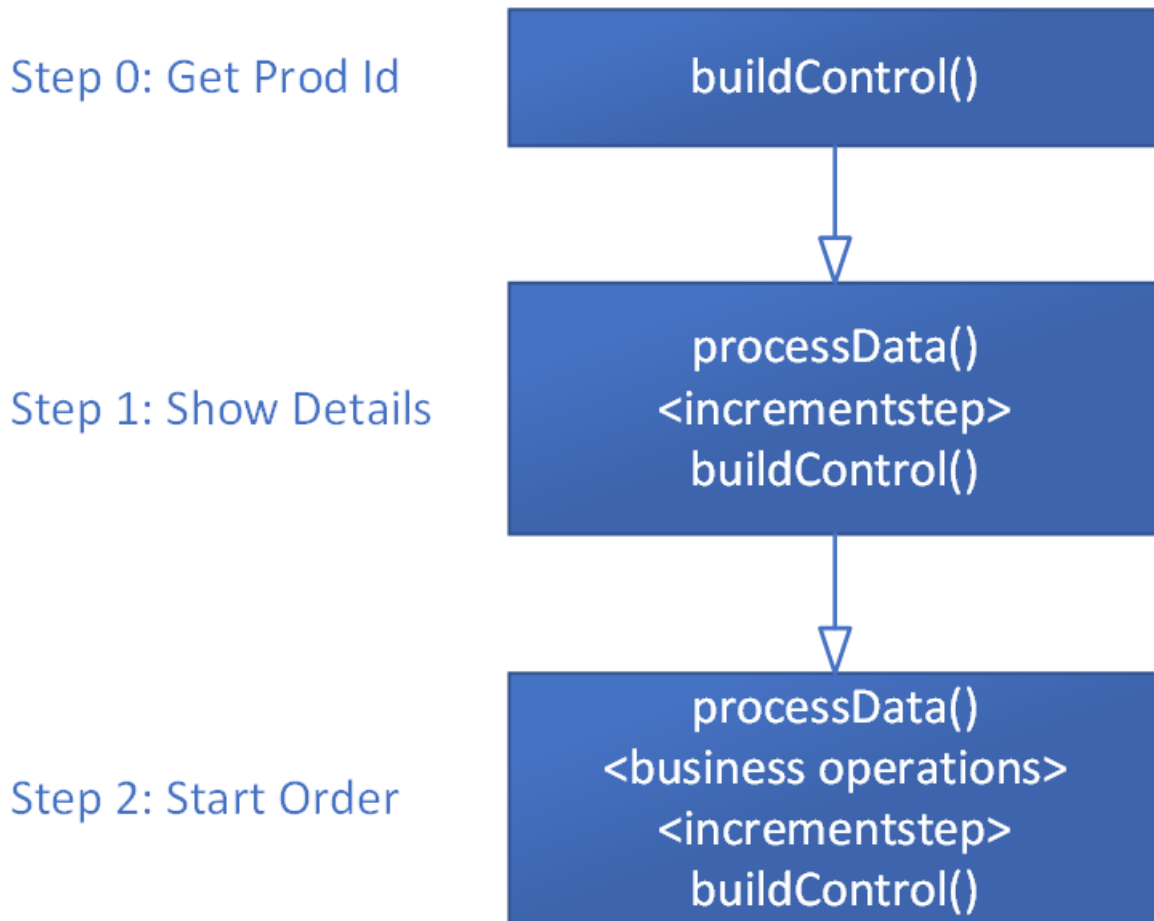

In the redesigned framework, the core strategy revolves around two principles: divide the execution flow into individual components with well-defined responsibilities and have well-defined extension points in each of the components.

The name for the new framework is "ProcessGuide". This is because the aim of these classes is to guide a user through a business process (as opposed to the rich client which is a form-based experiences where the user has more flexibility in how they interact with the data or in which order they perform tasks).

NOTE

One notable detail is the deliberate omission of the "WHS" prefix. While the mobile processes were initially introduced for warehousing, subsequently they have transcended boundaries to support various production and inventory management processes. As a result, the warehouse reference was excluded in the name of the framework.

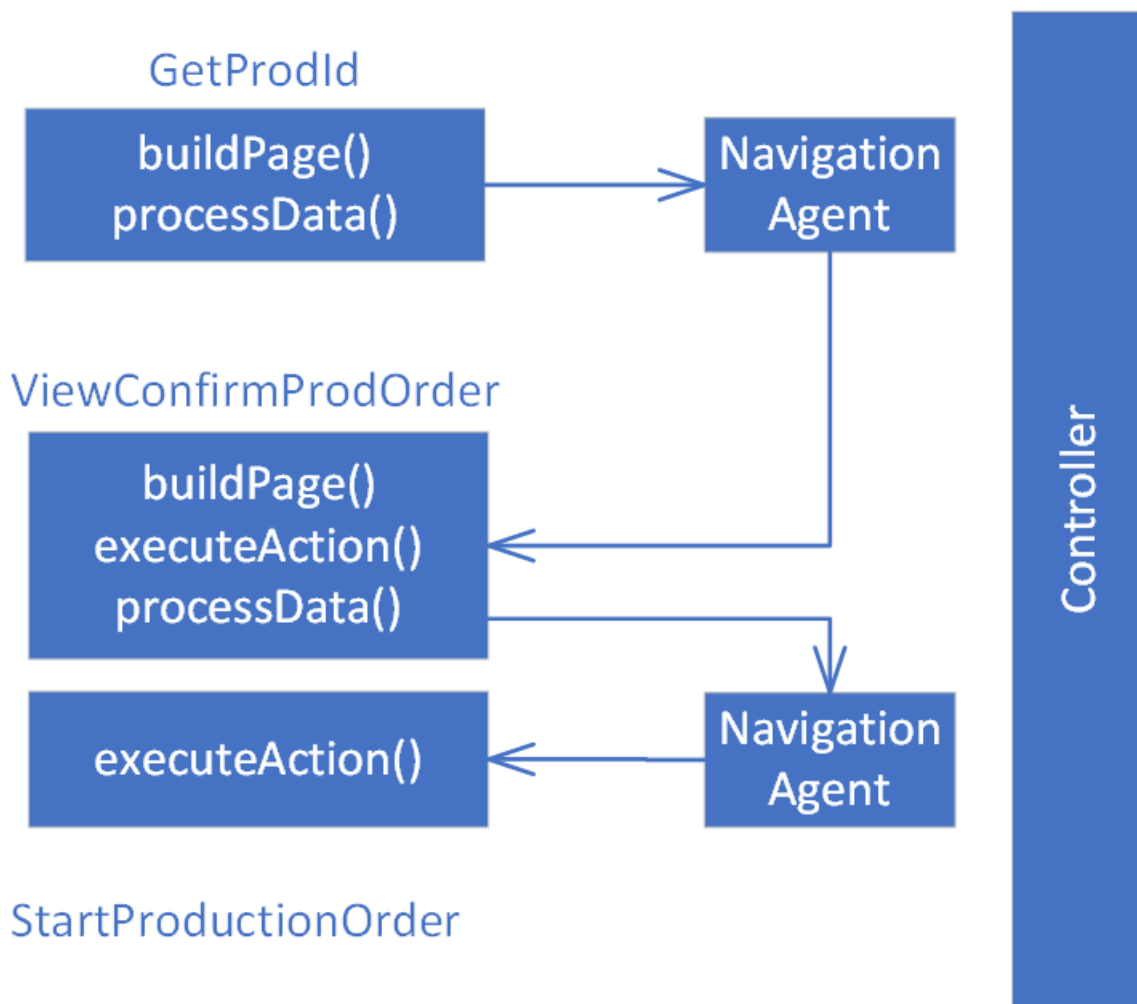

To identify the components, the first step is to look at the Production Start process (WhsWorkExecuteDisplayProdStart class). Here is a schematic of the process.

Looking at the control flow, the following are components needed:

- A controller to stitch through the entire business process.
- A step responsible for execution of a step in the process.
- A data processor for processing the data in a step.
- A page builder responsible for building the user interface for a step.
- A navigation agent responsible for step transition.
- A class responsible for executing the business process.

In the process flow diagram above, if you begin at step 1 and start processing the data from the previous step, and then end with building a UI, data would continue to be processed in the next step. This introduces a tight coupling between consecutive steps, as a result, our new high-level schematic would look like the following:

The following are the key components in the redesigned process:

- **ProcessGuideController** - This class orchestrates the overall execution of the business process. It defines the factories that instantiate the step and the navigation agent, which subsequently constitute the process execution, as well as the clean-up logic for cancellation or exiting the process.
- **ProcessGuideStep** - This class represents one single step in the business process. This class contains a definition of the factories that instantiate a page builder, actions, and data processors and is responsible for invoking them in the correct sequence.
- **ProcessGuideNavigationAgent** - This class is responsible for navigation between the steps. When a step is completed, the navigation agent is responsible for defining the next step and passes any parameters that the previous step may need to communicate to the next one.
- **ProcessGuidePageBuilder** - This class is responsible for instantiating the user interface.
- **ProcessGuideAction** - This class represents an action, shown as a button to the user.
- **ProcessGuideDataProcessor** - This class is responsible for processing the user entered data in a field.

Execution flow

The starting point of the execution flow remains unchanged. So, the request still arrives through the same endpoints, followed by deserializing the XML into the container. This container is then passed to `getNextFormState()`.

There are three important classes to note:

- **ProcessGuideSessionState** – This contains the session state information – mode, pass, controller, and step being executed, and so on.

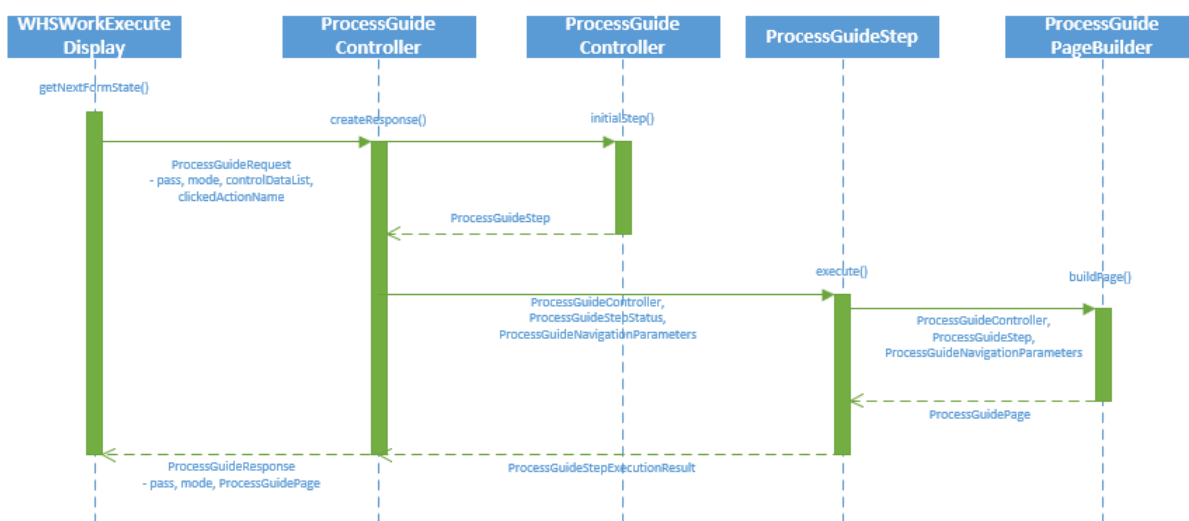

- **ProcessGuidePage** – This contains a strongly-typed representation of the user interface metadata.
- **ProcessGuideRequest** – This contains the above two as members and is a strongly-typed representation of the request received from the mobile device.

These classes are created using the container information (both state and user entered control data). This provides a type-safe way to access and manipulate the values. Compared to repeated access of the container during the process, this provides benefit both in terms of readability and performance.

The session state information is used to instantiate the correct **ProcessGuideController** class. Once instantiated, the **createResponse()** method in the **ProcessGuideController** class is invoked. This method is the entry point to the process guide logic, and after execution, comes back with the response (represented in the **ProcessGuideResponse** class). The response is then converted back to the container and handed back to the legacy logic, which then serializes it to the XML and sends the response back to the mobile device.

Next, the controller needs to find the next step to execute. If this is the start of a new process, the controller will call **initialStep()** to get the first step in the process. After that, it would call **execute()** method in the **ProcessGuideStep**. This method would then instantiate a **ProcessGuidePageBuilder** class and call **buildPage()**, which would return with a **ProcessGuidePage** object, which is a virtual representation of the user interface to be presented to the user. The step would then send the result back to the controller, which would then save the current session state and then return the result back to **getNextFormState()** in the form of the **ProcessGuideResponse** class. Thereafter, the response is converted back to the container, and subsequently serializes to XML and sends back the response to the mobile device.

The following sequence diagram explains this control flow. Note that this is the most common control flow, simplified for explaining the design.

When the user takes an action on the mobile device by clicking a button (or scanning a value – which typically triggers the default action) – the request arrives at the **createResponse()** method in the **ProcessGuideController** class through the same route. This time, however, the controller knows from the session state information which step the user is in. Accordingly, it instantiates the appropriate **ProcessGuideStep** class and invokes the execute method. The **ProcessGuideStep**, in turn, reads the action name invoked by the user and then instantiates the appropriate **ProcessGuideAction** class and calls **execute()**.

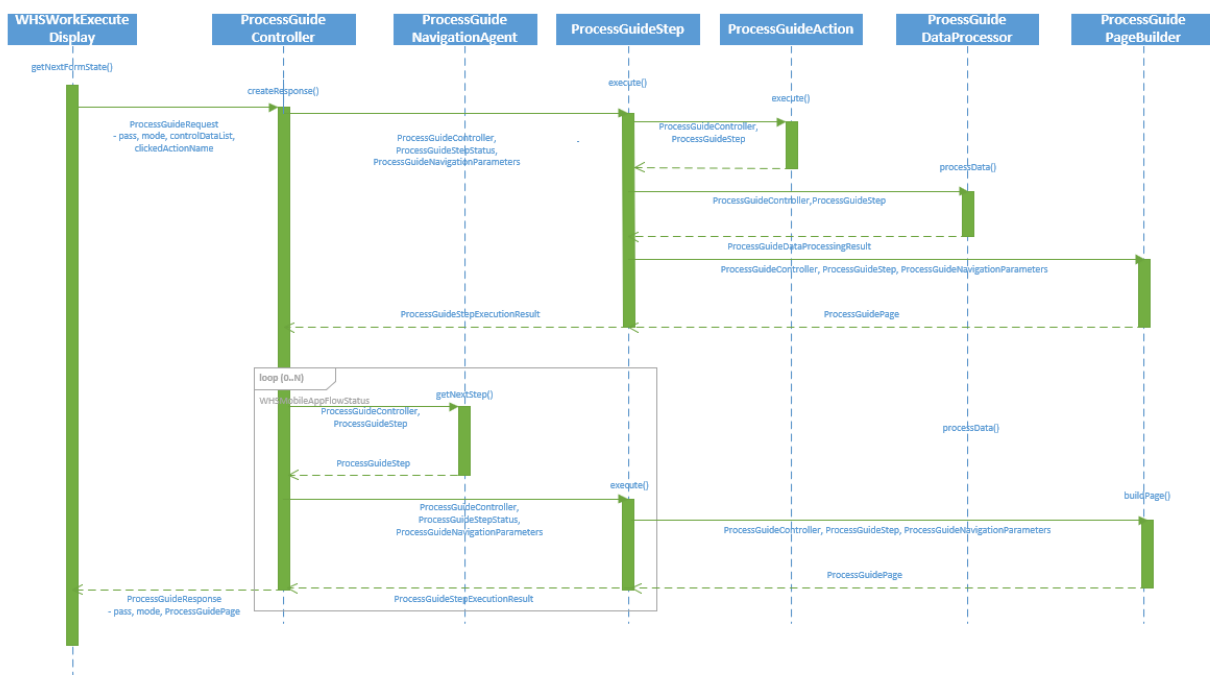

The **ProcessGuideAction** class is responsible for executing the specific action, however there are two notable exceptions.

The first one is the **ProcessGuideOKAction** class. This action implies that the user wants to confirm and move forward in the process. In accordance to that – this method actually does a callback to the **ProcessGuideStep** class, which means that the step invokes **processData()** in **ProcessGuideDataProcessor**. This processes the

data that the user has entered, and then updates the state of the step and sends the result back to the controller. Depending on the outcome of the processor, the step invokes the page builder to build the appropriate user interface or sets the status of the step as completed. This is reflected in the top half of the sequence diagram below.

The other exception is the cancellation action, implemented in the `ProcessGuideCancelResetProcessAction` and `ProcessGuideCancelExitProcessAction` classes. These actions represent an intent to cancel the process and go back to either the start of the process or exit the process altogether. Similar to the OK action, these actions also perform a callback to the step, which signals the intent to the `ProcessGuideController`. The controller then performs the necessary cleanup of state variables and either moves control to the initial step in the process or terminates the process altogether.

After the step is completed, if the status of the step is set to **Completed**, then the controller instantiates the `ProcessGuideNavigationAgent`, which returns the name of the next step. The controller then instantiates this step and invokes the `execute()` method – and the cycle continues. Most commonly, the new step invokes the corresponding `ProcessGuidePageBuilder` to build the user interface for the next screen to be presented to the user, which is then sent back. This flow is depicted in the lower half of the sequence diagram below.

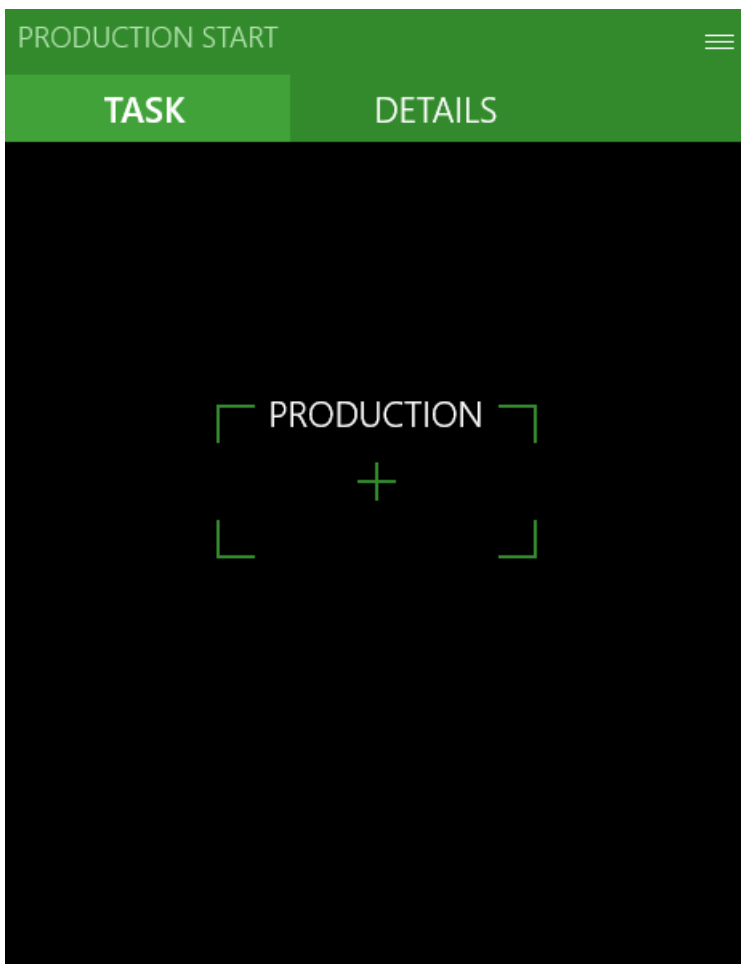

Building a new process using the ProcessGuide framework

The best way to explain the control flow is by using an example that exists in the application – the Production Start process.

Overview of the production start process

Let's start by understanding the process flow. In the first step, the user is prompted for production order ID.

When the user enters the production order ID, the order number is validated. Some of the validations that are run are based on whether the order is in the same warehouse as the user is signed in to, and the status of the order. If the validation fails, the user is shown an error message. If the validation succeeds, then the user is shown details of the production order and item.

The user can either cancel to go back to the start of the process or click **OK** to confirm. In the latter case, the production order is set to **Started** status, the corresponding journals are posted, the control moves back to the first step, and the "Work Completed" message is shown to the user.

Creating the controller

The first step in building the business process is creating the controller class, extending from the **ProcessGuideController** abstract class which implements the default behaviors of a controller. The new class name is **ProdProcessGuideProductionStartController** and decorated with the **WHSWorkExecuteMode** value of **StartProdOrder**. The same **SysExtension** based instantiation that was used in the **WHSWorkExecuteDisplay** classes is used, which helps instantiate the controller when the user executes a menu item for this mode.

```
[WHSWorkExecuteMode(WHSWorkExecuteMode::StartProdOrder)]  
public class ProdProcessGuideProductionStartController extends ProcessGuideController
```

NOTE

The naming pattern of the class is **<FunctionalArea>ProcessGuide<Businessprocessname>Controller**. This is the pattern that is used for the controller classes and to extend to other classes.

Building the first step

Next, to define the first step you create the `ProdProcessGuidePromptProductionIdStep` class, extending from `ProcessGuideStep`.

The task of instantiating the class is delegated to a step factory, which is invoked by the `ProcessGuideController` base class. The default implementation of the factory instantiates the step based on name. Therefore, to instantiate `ProdProcessGuidePromptProductionIdStep` as the first step in the controller, you must do two things:

- Decorate the `ProdProcessGuidePromptProductionIdStep` class with a `ProcessGuideStepName` attribute.

```
[ProcessGuideStepName(classStr(ProdProcessGuidePromptProductionIdStep))] public class ProdProcessGuidePromptProductionIdStep extends ProcessGuideStep
```

- In the controller class, implement the abstract method `initialStepName()` to return the step name.

```
protected final ProcessGuideStepName initialStepName()
{
    return classStr(ProdProcessGuidePromptProductionIdStep);
}
```

NOTE

The value in the `ProcessGuideStepName` attribute does not need to exactly match the class name as shown above. However, implementing this allows for uniformity and type-safety around cross-references when using the class. Using this naming convention is recommended.

The `ProcessGuideStepName` based instantiation of the step is implemented in the `ProcessGuideStepDefaultFactory` class. In the rare case that you want a different strategy for instantiating the step, you need to do the following:

- Create a new factory class inheriting from `ProcessGuidStepAbstractFactory`.
- Optionally, create a new parameter class implementing the `ProcessGuideIStepCreationParameters` interface, containing the parameters the factory would need.
- In your controller class, override the `stepFactory()` and `stepCreationParameters()` methods to return the above factory and parameters.

The next step is to implement the functionality of the `ProdProcessGuidePromptProductionIdStep` class. You need to implement the logic for building the user interface, processing the user-entered data, and determining when the step is complete.

Building the user interface for the first step

The user interface is built using a class inheriting from the `ProcessGuidePageBuilder` abstract class. For this step, name the class to represent what it does – `ProdProcessGuidePromptProductionIdPageBuilder`.

The instantiation mechanism of the class is similar to how the step was instantiated from the controller.

- Decorate the `ProdProcessGuidePromptProductionIdPageBuilder` class with a `ProcessGuidePageBuilderName` attribute.

```
[ProcessGuidePageBuilderName(classStr(ProdProcessGuidePromptProductionIdPageBuilder))] public class ProdProcessGuidePromptProductionIdPageBuilder extends ProcessGuidePageBuilder
```

- In the `ProdProcessGuidePromptProductionIdStep` class, implement the abstract method `pageBuilderName()` to return this name.

```
protected final ProcessGuidePageBuilderName pageBuilderName()
{
    return classStr(ProdProcessGuidePromptProductionIdPageBuilder);
}
```

TIP

Similar to the step factory, there is also an abstract factory pattern implemented for the page builder factory. So, in the rare case that you want a different strategy for instantiating the page builder, you can do the following:

- Create a new factory class inheriting from `ProcessGuidePageBuilderAbstractFactory`.
- Optionally, create a new parameter class implementing the `ProcessGuideIPageBuilderCreationParameters` interface, containing the parameters the factory would need.
- In your step class, override the `pageBuilderFactory()` and `pageBuilderCreationParameters()` methods to return the above factory and parameters.

To implement the user interface you need a page with one text box to enter the production order ID, plus an **OK** button and a **Cancel** button. The **Cancel** button should exit the process.

To implement this, you need to override two methods in the `ProdProcessGuidePromptProductionIdPageBuilder` class:

- Use the `addDataControls()` method to add the text box.

```
protected final void addDataControls(ProcessGuidePage _page)
{
    _page.addTextBox(ProcessGuideDataTypeNames::ProdId, "@SYS4398", extendedTypeNum(ProdId));
}
```

- Use the `addActionControls()` method to add the **OK** and **Cancel** buttons.

```
protected final void addActionControls(ProcessGuidePage _page)
{
    #ProcessGuideActionNames
    _page.addButton(step.createAction(#ActionOK), true);
    _page.addButton(step.createAction(#ActionCancelExitProcess));
}
```

This adds the data controls, followed by the buttons. However, if you want to build a screen with interspersed data controls and buttons, you can override the `addControls()` method instead for flexibility.

An additional scenario to consider is how to rebuild the page in case of validation failures, for example if the user enters an incorrect production order ID. The `ProcessGuidePageBuilder` base class implements the default behavior, which rebuilds the user interface, clears out the scanned value, and adds the error control with the error message. Because this is the default behavior that you want to use, you do not need to add any code for handling errors.

TIP

If you want to implement custom UI behavior for error situations, you can override one or more of the methods `rebuildFromRequestPage()`, `isErrorState()`, and `reuseRequestPageOnError()`.

Processing the user-entered data in the first step

The processing of the data is done in the **ProcessGuideDataProcessorDefault** class, which in turn invokes the legacy **WhsRfControlData** class. No changes are needed to this default behavior, and **WhsRfControlData** already has logic for validating the **ProdId** field, so you do not need to write any logic for handling this. In case of required extensions for the validation logic, consider using the **WhsControl** based extension mechanism.

Determine if the first step is complete

When the validation is successful, it is time to mark the step as completed. This is done in the base class, however, you need to implement the condition to determine the step completion. The following overridden method does that.

```
protected final boolean isComplete()
{
    WhsrfPassthrough pass = controller.parmSessionState().parmPass();
    ProdId prodId = pass.lookup(ProcessGuideDataTypesNames::ProdId);
    return (prodId != '');
}
```

Step two: View order details and confirm

In the second step in the process, the user is shown a screen with details about the order. The user can either click the **OK** button to confirm the start of the production order, or click **Cancel** to go back to the start of the process. For this example, name the step **ProdProcessGuideConfirmProductionOrderStep** and the page builder class **ProdProcessGuideConfirmProductionOrderPageBuilder**.

The **ProdProcessGuideConfirmProductionOrderStep** class looks like the following.

```
[ProcessGuideStepName(classStr(ProdProcessGuideConfirmProductionOrderStep))]
public class ProdProcessGuideConfirmProductionOrderStep extends ProcessGuideStep
{
    protected final ProcessGuidePageBuilderName pageBuilderName()
    {
        return classStr(ProdProcessGuideConfirmProductionOrderPageBuilder);
    }
}
```

Because the user does not enter any values here, you do not need to override the **isComplete()** method. The step is complete when the user clicks **OK**.

The page builder class overrides the **addDataControls()** method to add three labels. The first label shows the production order ID, the second contains item information (such as item ID, dimensions, or description) and the third contains the quantity and unit of measure.

The **addActionControls()** is then overridden to add 2 buttons – the **OK** button, and the **Cancel** button to cancel the process and go back to the start of the process.

```

/// <summary>
/// The <c>ProdProcessGuideConfirmProductionOrderPageBuilder</c> builds a page that allows the user to see
details of a production order
/// and then confirm.
/// </summary>
[ProcessGuidePageBuilderName(classStr(ProdProcessGuideConfirmProductionOrderPageBuilder))]
public class ProdProcessGuideConfirmProductionOrderPageBuilder extends ProcessGuidePageBuilder
{
    protected void addDataControls(ProcessGuidePage _page)
    {
        WhsrFpsthrough pass = controller.parmSessionState().parmPass();
        ProdTable prodTable = ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        UnitOfMeasureSymbol inventUOM = InventTableModule::find(prodTable.ItemId,
ModuleInventPurchSales::Invent).UnitId;

        _page.addLabel(ProcessGuideDataTypeNames::ProdIdLabelName, strFmt("@WAX1684", prodTable.ProdId),
extendedTypeEnum(ProdId));
        _page.addLabel(ProcessGuideDataTypeNames::ItemInfo,
this.generateItemInfoForProdId(pass.lookup(ProcessGuideDataTypeNames::ProdId)),
extendedTypeEnum(WHSRFUndefinedDataType));
        _page.addLabel(ProcessGuideDataTypeNames::QtyLabelName, strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartup::proposalStartupQty(prodTable.ProdId)), inventUOM),
extendedTypeEnum(WHSRFQuantityAndUOM));

        if (PdsGlobal::pdsIsCWItem(prodTable.ItemId))
        {
            _page.addLabel(ProcessGuideDataTypeNames::InventQtyLabelName, strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartup::pdsCWProposalStartupQty(prodTable.ProdId)),
PdsCatchWeightItem::pdsCWUnitId(prodTable.ItemId)), extendedTypeEnum(WHSRFQuantityAndUOM));
        }
    }

    protected void addActionControls(ProcessGuidePage _page)
    {
        #ProcessGuideActionNames
        _page.addButton(step.createAction(#ActionOK), true);
        _page.addButton(step.createAction(#ActionCancelResetProcess));
    }
}

```

NOTE

You can find the same source code for the X++ methods in this topic by using the Application Explorer. Filter on the class name, and then right-click the class name and select **View code**.

Step 3: Start the production order

The third step is where the business logic of starting the production order is executed. This step is somewhat different from the previous steps, in that, this step does not have a user interface. This step gets executed silently when the user clicks **OK** in the previous step.

The **ProcessGuideStepWithoutPrompt** abstract class implements the default behavior for such steps. The current step, therefore, should extend the **ProcessGuideStepWithoutPrompt** class and override the **doExecute()** method.

The following code example shows the class and the **doExecute()** method implementation. The method simply retrieves the order ID and user ID from the session state and invokes the method to start this production order.

```

/// <summary>
/// The <c>ProdProcessGuideStartProductionOrderStep</c> represents a step that starts a production order.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuideStartProductionOrderStep))]
public class ProdProcessGuideStartProductionOrderStep extends ProcessGuideStepWithoutPrompt
{
    protected final void doExecute()
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        WHSUserId userId = pass.lookup(ProcessGuideDataTypeNames::UserId);
        ProdTable prodTable = ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        WhsWorkExecute workExecute = WhsWorkExecute::construct();
        workExecute.prodStartUp(prodTable.ProdId, ProdUpdStartUp::proposalStartUpQty(prodTable.ProdId),
userId);

        this.addProcessCompletionMessage();

        super();
    }
}

```

In case of an exception, the framework exception handling logic ensures that the process is rolled back to the previous step.

NOTE

The invoke to `addProcessCompletionMessage()` adds the “Work completed” message to the navigation parameters. The next step (assuming it has a user interface) will display this message. The base classes handle this logic, and no specific code needs to be added to the process classes to achieve this behavior.

Building the navigation through the steps

The `ProcessGuideController` base class instantiates the `ProcessGuideNavigationAgentDefault` class, which relies on a pre-defined navigation route, which is a simple map of source and destination steps. For the production start scenario, because there is no conditional branching, this implementation would suffice. Therefore, you only need to override the `initializeNavigationRoute()` method to define the navigation route.

```

protected ProcessGuideNavigationRoute initializeNavigationRoute()
{
    ProcessGuideNavigationRoute navigationRoute = new ProcessGuideNavigationRoute();
    navigationRoute.addFollowingStep(classStr(ProdProcessGuidePromptProductionIdStep),
classStr(ProdProcessGuideConfirmProductionOrderStep));
    navigationRoute.addFollowingStep(classStr(ProdProcessGuideConfirmProductionOrderStep),
classStr(ProdProcessGuideStartProductionOrderStep));
    navigationRoute.addFollowingStep(classStr(ProdProcessGuideStartProductionOrderStep),
classStr(ProdProcessGuidePromptProductionIdStep));

    return navigationRoute;
}

```

There are processes where there will be conditional branching (based on user actions, or any other conditions). Such processes need to do the following:

- Implement specific navigation agents inherited from the `ProcessGuideNavigationAgent` class.
- Implement the specific navigation agent factory inherited from the `ProcessGuideNavigationAgentAbstractFactory` class, containing logic to instantiate the correct navigation agent based on current step, session state, user action, or other logic.

- Optionally, override `navigationAgentCreationParameters()` in the controller class to pass suitable parameters.
- Override `navigationAgentFactory()` in the controller to instantiate the navigation agent factory created above.

Action classes

Action classes represent user actions, so this example uses the **OK** action to show how the actions are created.

```
[ProcessGuideActionName(#ActionOK)]
public class ProcessGuideOKAction extends ProcessGuideAction
{
    public final str label()
    {
        return "@SYS5473";
    }
    protected final void doExecute()
    {
        step.executeOKAction();
    }
}
```

The class must implement 2 abstract methods:

- **label()**, which returns the label to be displayed in a button control tied to this action.
- **doExecute()**, which performs the action. As mentioned earlier, the **OK** button simply performs a callback to the step. However, other actions might have more complex logic here.

The actions are instantiated using **SysExtension** framework based on the **ProcessGuideActionName** attribute. Similar to the instantiation of page builders, the step class implements the default action factory, and it is possible to override that. The page builder adds a button control like this.

```
_page.addButton(step.createAction(#ActionOK), true);
```

In doing so, it asks the step to create an action class for the passed name and ties that action to the button.

Summary

To summarize everything that's been explained in this topic, here's a comprehensive summary of the code needed for the process:

1. **ProdProcessGuideProductionStartController**
 - a. Override `initialStepName()` to provide the name of the first step.
 - b. Override `initializeNavigationRoute()` to construct the navigation map.

```

/// <summary>
/// The <c>ProdProcessGuideProductionStartController</c> class is the controller class for the
production order start process guide.
/// </summary>
[WHSWorkExecuteMode(WHSWorkExecuteMode::StartProdOrder)]
public class ProdProcessGuideProductionStartController extends ProcessGuideController
{
    protected ProcessGuideStepName initialStepName()
    {
        return classStr(ProdProcessGuidePromptProductionIdStep);
    }

    protected ProcessGuideNavigationRoute initializeNavigationRoute()
    {
        ProcessGuideNavigationRoute navigationRoute = new ProcessGuideNavigationRoute();
        navigationRoute.addFollowingStep(classStr(ProdProcessGuidePromptProductionIdStep),
classStr(ProdProcessGuideConfirmProductionOrderStep));
        navigationRoute.addFollowingStep(classStr(ProdProcessGuideConfirmProductionOrderStep),
classStr(ProdProcessGuideStartProductionOrderStep));
        navigationRoute.addFollowingStep(classStr(ProdProcessGuideStartProductionOrderStep),
classStr(ProdProcessGuidePromptProductionIdStep));

        return navigationRoute;
    }
}

```

2. ProdProcessGuidePromptProductionIdStep

- a. Override **isComplete()** to specify when the step is considered complete.
- b. Override **pageBuilderName()** to specify the page builder to be used.

```

/// <summary>
/// The <c>ProdProcessGuidePromptProductionIdStep</c> represents a step that
/// that prompts the user for a production order id.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuidePromptProductionIdStep))]
public class ProdProcessGuidePromptProductionIdStep extends ProcessGuideStep
{
    protected boolean isComplete()
    {
        WhsrFassthrough pass = controller.parmSessionState().parmPass();
        ProdId prodId = pass.lookup(ProcessGuideDataTypeNames::ProdId);

        return (prodId != '');
    }

    protected ProcessGuidePageBuilderName pageBuilderName()
    {
        return classStr(ProdProcessGuidePromptProductionIdPageBuilder);
    }
}

```

3. ProdProcessGuidePromptProductionIdPageBuilder

- a. Override **addDataControls()** to add the Prod ID textbox.
- b. Override **addActionControls()** to add the OK and Cancel buttons.

```

/// <summary>
/// The <c>ProdProcessGuidePromptProductionIdPageBuilder</c> class builds a page
/// that prompts the user for a production order id.
/// </summary>
[ProcessGuidePageBuilderName(classStr(ProdProcessGuidePromptProductionIdPageBuilder))]
public class ProdProcessGuidePromptProductionIdPageBuilder extends ProcessGuidePageBuilder
{
    protected void addDataControls(ProcessGuidePage _page)
    {
        _page.addTextBox(ProcessGuideDataTypeNames::ProdId, "@SYS4398",
extendedTypeNum(ProdId));
    }

    protected void addActionControls(ProcessGuidePage _page)
    {
        #ProcessGuideActionNames
        _page.addButton(step.createAction(#ActionOK), true);
        _page.addButton(step.createAction(#ActionCancelExitProcess));
    }
}

```

4. ProdProcessGuideConfirmProductionOrderStep

- a. Override `pageBuilderName()` to specify the page builder to be used.

```

/// <summary>
/// The <c>ProdProcessGuideConfirmProductionOrderStep</c> class represents the step for
/// viewing production order
/// details and confirming the same.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuideConfirmProductionOrderStep))]
public class ProdProcessGuideConfirmProductionOrderStep extends ProcessGuideStep
{
    protected ProcessGuidePageBuilderName pageBuilderName()
    {
        return classStr(ProdProcessGuideConfirmProductionOrderPageBuilder);
    }
}

```

5. ProdProcessGuideConfirmProductionOrderPageBuilder

- a. Override `addDataControls()` to add the order, item, and quantity information labels.
- b. Override `addActionControls()` to add the OK and Cancel buttons.

```

/// <summary>
/// The <c>ProdProcessGuideConfirmProductionOrderPageBuilder</c> builds a page that allows the
user to see details of a production order
/// and then confirm.
/// </summary>
[ProcessGuidePageBuilderName(classStr(ProdProcessGuideConfirmProductionOrderPageBuilder))]
public class ProdProcessGuideConfirmProductionOrderPageBuilder extends ProcessGuidePageBuilder
{
    protected void addDataControls(ProcessGuidePage _page)
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        ProdTable prodTable = ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        UnitOfMeasureSymbol inventUOM = InventTableModule::find(prodTable.ItemId,
ModuleInventPurchSales::Invent).UnitId;

        _page.addLabel(ProcessGuideDataTypeNames::ProdIdLabelName, strFmt("@WAX1684",
prodTable.ProdId), extendedTypeNum(ProdId));
        _page.addLabel(ProcessGuideDataTypeNames::ItemInfo,
this.generateItemInfoForProdId(pass.lookup(ProcessGuideDataTypeNames::ProdId)),
extendedTypeNum(WHSRFUndefinedDataType));
        _page.addLabel(ProcessGuideDataTypeNames::QtyLabelName, strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartup::proposalStartupQty(prodTable.ProdId)),
inventUOM), extendedTypeNum(WHSRFQuantityAndUOM));

        if (PdsGlobal::pdsIsCWItem(prodTable.ItemId))
        {
            _page.addLabel(ProcessGuideDataTypeNames::InventQtyLabelName, strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartup::pdsCWProposalStartupQty(prodTable.ProdId
)), PdsCatchWeightItem::pdsCWUnitId(prodTable.ItemId)), extendedTypeNum(WHSRFQuantityAndUOM));
        }
    }

    protected void addActionControls(ProcessGuidePage _page)
    {
        #ProcessGuideActionNames
        _page.addButton(step.createAction(#ActionOK), true);
        _page.addButton(step.createAction(#ActionCancelResetProcess));
    }
}

```

NOTE

The `generateItemInfoForProdId()` method, which is used for generating the item information labels, is excluded from this topic. This method queries a few tables to get item ID, description, and dimensions. If you want a better understanding of `generateItemInfoForProdId()`, look at the source code.

6. ProdProcessGuideStartProductionOrderStep

- a. Override `doExecute()` to perform the production start process and add the process completion message.

```

/// <summary>
/// The <c>ProdProcessGuideStartProductionOrderStep</c> represents a step that starts a
production order.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuideStartProductionOrderStep))]
public class ProdProcessGuideStartProductionOrderStep extends ProcessGuideStepWithoutPrompt
{
    protected final void doExecute()
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        WHSUserId userId = pass.lookup(ProcessGuideDataTypeNames::UserId);
        ProdTable prodTable = ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        WhsWorkExecute workExecute = WhsWorkExecute::construct();
        workExecute.prodStartUp(prodTable.ProdId,
ProdUpdStartUp::proposalStartUpQty(prodTable.ProdId), userId);

        this.addProcessCompletionMessage();

        super();
    }
}

```

NOTE

Note that a lot of the common patterns (regeneration of UI on error, setting process completion message, **OK** and **Cancel** behavior) have been moved to the framework – thus saving the application developer from writing boilerplate code that is both error prone, and has a risk of inconsistent behavior across processes. Where the scenario needs to deviate from the common path, though, the application developer is provided the option of overriding suitable methods – but then that is an intentional deviation that is both explicit and trackable.

Extending a business process

So far, this topic has highlighted how to build a new process using the **ProcessGuide** framework. In this final section, you will find some examples of how this business process can be extended.

Add a step in a flow (using **ProcessGuideNavigationAgentDefault**)

Where to extend:

- Child of **ProcessGuideController** class for the process.

How to extend:

- Extend the **initializeNavigationRoute()** method in the controller class, and invoke **addFollowingStep()** in the **ProcessGuideNavigationRoute** class.

Add a step in a flow (using custom navigation agent)

Where to extend:

- Child of **ProdProcessGuideNavigationAgentFactory/ProdProcessGuideNavigationAgent**.

How to extend:

- Create a new child class of **ProcessGuideNavigationAgent** that returns the desired step name.
- Create a new class deriving from **ProcessGuideNavigationAgentFactory** that conditionally returns the navigation agent created above.
- Extend the **navigationAgentFactory()** method in the controller class to return the factory created above.

Add a new control in the UI of an existing step

Where to extend:

- Child of `ProdProcessGuidePageBuilder` for the step.

How to extend:

- Extend the `addDataControls()` method and add the additional control.

Complete overhaul of the user interface in an existing step

Where to extend:

- Child of `ProdProcessGuideStep`.

How to extend:

- Create a new child class of `ProdProcessGuidePageBuilder` class, and implement the desired user interface.
- Extend the `pageBuildName()` method in the step class to return the `ProcessGuidePageBuilderNameAttribute` for the class created above.

Alter logic when a step is considered complete

Where to extend:

- Child of `ProdProcessGuideStep`.

How to extend:

- Extend the `isComplete()` method to build the additional logic.

Troubleshoot warehouse app connection issues

2/18/2021 • 2 minutes to read • [Edit Online](#)

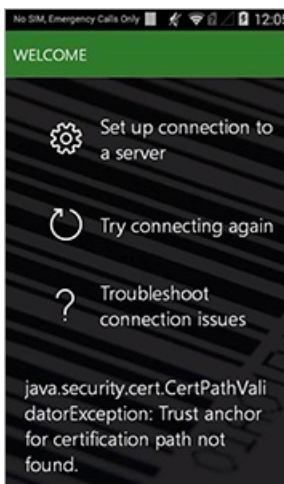

This topic describes how to fix common issues that you might encounter while connecting the Dynamics 365 for Finance and Operations - Warehousing application to Dynamics 365 Supply Chain Management.

NOTE

If you encounter issues that aren't listed on this page, please contact Microsoft Support and let us know so we can help you resolve the errors.

Trust anchor for certification path not found

This section explains what to do if the warehousing app shows a **Trust anchor for certification path not found** error when trying to connect to Supply Chain Management.

Scope

This issue can affect devices with the following properties:

- **OS version:** Android 4.4.x (such as Zebra TC55). This is not an issue on recent Android versions.
- **Supply Chain Management location:** Cloud
- **Connection mode:** Client secret or certificate

Possible root cause

Microsoft may have updated the server SSL certificates used by Supply Chain Management. As a result, the root certificate and/or one of the intermediate certificates may have changed, so the new certificate isn't on the list of trusted system certificates for the mobile device. Newer versions of Android automatically update the lists of trusted certificates, but Android 4.4.x doesn't.

Resolution

Do one of the following to resolve this issue:

- Use the workaround described in the next section to update each relevant device.
- It *might* be possible to contact Zebra or Google to get an update of the system trusted certifying authority (CA) certificates. However, we have not confirmed this.
- If possible, consider replacing older devices with devices that are running a more recent version of Android (where trusted CA certificates are updated automatically).

Workaround

Step 1: Export the new root certificate from Supply Chain Management

Manually download the new root certificate using your internet browser by doing the following:

1. Sign in to Dynamics Supply Chain Management and open the front page.
2. In the address bar of your browser, select the lock icon to open the **Location is secure** dialog box.
3. In the dialog box, select **Certificate (valid)** to open the **Certificate** window for that certificate.
4. Open the **Certification path** tab of the **Certificate** window.
5. Select the top certificate shown in the hierarchy (this is the root certificate).
6. Open the **Details** tab of the **Certificate** window.
7. Select the **Copy to file** button at the bottom of the **Details** tab.
8. The **Certificate export wizard** opens. Select **Next** to continue.
9. The **Export file format** page opens. Select **DER encoded binary X.509 (.CER)**. Then select **Next** to continue.
10. The **Files to export** page opens, specify a file name and location. Then select **Next** to continue.
11. The **Completing the certificate export wizard** page opens, showing the result of your export. Select **Finish**.

Step 2: Install the downloaded certificate onto the affected devices

Install the downloaded certificate by doing the following:

1. Transfer the certificate you downloaded in the previous step to the device you want to update. For example, you might use an SD card or network connection to make the file available to your device.
2. Open the security settings for your device and choose the menu option to install a certificate from a file. (The exact steps for this vary based on device and OS version.)
3. The new certificate should now be shown on the **User** tab for trusted certificates.
4. Repeat this procedure for each affected device.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Upgrade warehouse management from Microsoft Dynamics AX 2012 to Supply Chain Management

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic provides an overview of the process of upgrading from Microsoft Dynamics AX 2012 R3, running the WMSII module, to Supply Chain Management .

Supply Chain Management no longer supports the legacy **WMSII** module from Microsoft Dynamics AX 2012. Instead, you can use the **Warehouse management** module. In the WMSII module, the Location and Pallet ID inventory dimensions could be selected for financial inventory, however, the Pallet ID inventory dimension cannot be used for financial inventory in Supply Chain Management .

During an upgrade, all products that are associated with a storage dimension group that uses the Pallet ID inventory dimension are identified, marked as blocked, and not processed for upgrade.

Upgrading to Supply Chain Management when AX 2012 R3 WMSII is used

After the upgrade, you can use a set of options in the **Change storage dimension group for items** form to unblock products that were blocked during upgrade, and then process transactions for those products.

Enabling items in Supply Chain Management

This change is required because in Supply Chain Management, item tracking is part of the warehouse management processes. For these processes, all warehouses and their locations must be associated with a location profile. If you want to use warehouse management processes, the following must be configured:

- Existing warehouses must be enabled to use warehouse management processes
- Existing released products must be associated with a storage dimension group that uses warehouse management processes

If the source storage dimension groups use the Pallet ID inventory dimension, the locations of existing on-hand inventory that used the Pallet ID inventory dimension must be associated with a location profile in which the **Use license plate tracking** parameter is selected. If the existing warehouses should not be enabled to use warehouse management processes, you can change the storage dimension groups of the existing on-hand inventory to groups that handle only the Site, Warehouse, and Location inventory dimensions.

NOTE

You can change the storage dimension group for items even if open inventory transactions exist.

Find products that were blocked because of Pallet ID

To view the list of released products that were blocked during upgrade and can't be processed, click **Inventory management > Setup > Inventory > Items blocked for inventory updates**.

Change storage dimension group for blocked products

To be used as part of a warehouse management process, an item must be associated with a storage dimension group in which the Location inventory dimension is active, and the **Use warehouse management processes**

parameter is selected. When this setting is selected, the Site, Warehouse, Inventory status, Location, and License plate inventory dimensions become active.

To unblock products that were blocked during upgrade, you must select a new storage dimension group for the products. Note that you can change the storage dimension group even if open inventory transactions exist. To use items that were blocked during upgrade, you have two options:

- Change the storage dimension group for the item to a storage dimension group that uses only the Site, Warehouse, and Location inventory dimensions. As a result of this change, the Pallet ID inventory dimension is no longer used.
- Change the storage dimension group for the item to a storage dimension group that uses the warehouse management processes. As a result of this change, the License plate inventory dimension is now used.

Configure warehouse management processes

Before you can use released products in the **Warehouse management** module, the products must use a storage dimension group where the **Use warehouse management processes** parameter is selected.

Enable warehouses to use warehouse management processes

1. Create at least one new location profile.
2. Click **Warehouse management > Setup > Enable warehouse management processes > Enable warehouse setup**.
3. On the **Enable warehouse setup** page, add the warehouses that should be enabled. You can complete this step either directly on the page or by using the Microsoft Office integration.
4. Assign a location profile to all the locations. You can easily complete this step by using the Microsoft Office integration directly from the page. You can either export and import the data, or use the data entity processing in [Data management](#).
5. Validate the changes. As part of the validation process, various validations of data integrity occur. As part of a larger upgrade process, issues that occur might have to be adjusted on the source implementation. In this case, an additional data upgrade will be required.
6. Process the changes.

Change the storage dimension group for items, so that it uses warehouse management processes

1. Create a new **Inventory status** value, and assign it as the **Default inventory status ID** value in the **Warehouse management parameters** settings.
2. Create a new storage dimension group where the **Use warehouse management processes** parameter is selected.
3. On the **Reservation hierarchy** page, define a new reservation hierarchy according to the item's storage and tracking dimension groups.
4. Create one or more unit sequence groups that include at least the same units that are used for the items' inventory units.
5. Click **Warehouse management > Setup > Enable warehouse management processes > Change storage dimension group for items**.
6. On the **Change storage dimension group for items** page, add the item numbers, storage dimension groups, and unit sequence groups. You can complete this step directly on the page, by using the Microsoft Office integration, or by using the data entity process in [Data management](#).
7. Validate the changes. As part of the validation process, various validations of data integrity occur. As part of a larger upgrade process, issues that occur might have to be adjusted on the source implementation. In this case, additional data upgrade will be required.
8. Process the changes. An update of all the inventory dimensions can take a while. You can monitor the progress by using the batch jobs tasks.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Troubleshoot upgrade and migration to advanced warehouse management

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you upgrade and migrate to advanced warehouse management.

I receive the following error message:
"java.security.cert.certPathValidatorException: Trust anchor for certification path is not found."

Issue description

You receive this error message in the warehouse app, because self-signed certificates aren't trusted on Android 8+ in on-premises environments.

Issue resolution

Use an external (public) certifying authority (CA). A fix for this issue is available in version 1.9.0.0 of the warehouse app. For more information about this issue and how to fix it, see [Troubleshoot warehouse app connection issues](#).

What is the approved process for moving from basic warehousing to advanced warehousing?

Issue description

You're currently running under stock/inventory management and using basic stock functionality, and you want to move to advanced warehousing to take advantage of mobile devices, waves, and work. However, you're experiencing issues when you try to make this move. For example, you can't change your products so that they use storage dimensions (site, warehouse, and location), because the products have transactions against them. Therefore, you must learn the approved process for moving from basic warehousing to advanced warehousing.

Issue resolution

For more information about the process for moving from basic warehousing to advanced warehousing, see the following blog posts and documentation:

- [Enable warehouse management process for existing items and warehouses](#)
- [Migration of Microsoft Dynamics AX WMS to new R3 warehouse and transportation functionality](#)
- [WMS1/WMS2 item migration](#)
- [Upgrade warehouse management from Microsoft Dynamics AX 2012 to Supply Chain Management](#)

NOTE

Troubleshoot warehouse setup

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to fix common issues that you might encounter while you set up warehouses in Microsoft Dynamics 365 Supply Chain Management.

I can't use any role except administrator to access the mobile device app emulator.

Issue description

You can't use any role except the administrator role to access the mobile device app emulator.

Issue resolution

The mobile device app emulator is set to work only with the administrator account. For all testing and live process purposes, we recommend that you use the warehouse app itself.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Gantt control development guide

2/18/2021 • 5 minutes to read • [Edit Online](#)

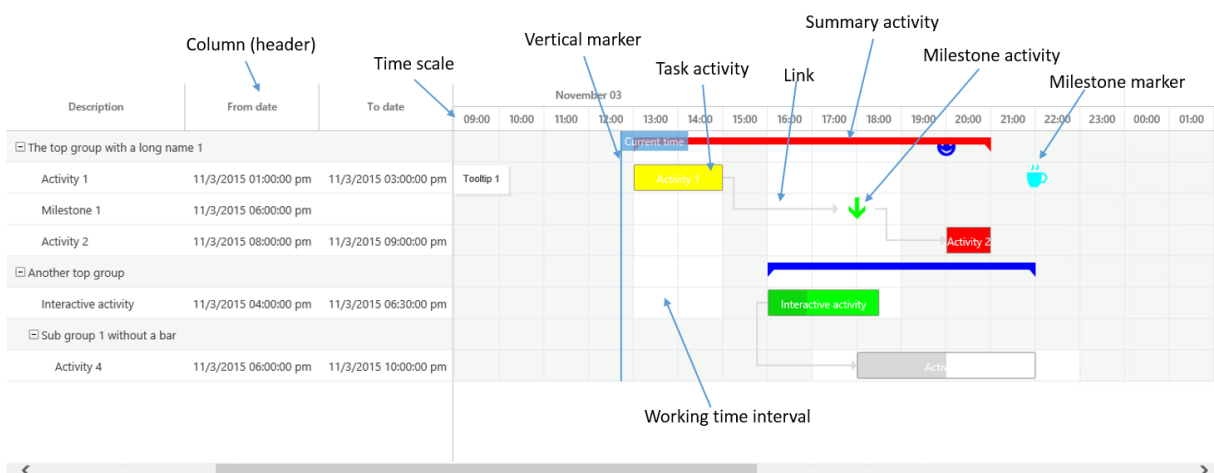

This topic describes how to create new forms by using the Gantt control. We highly recommend that you look at the code in the Tutorial_Gantt form. This code demonstrates the full capabilities of the Gantt control, and shows how to load data and work with the application programming interface (API).

What's new for Gantt

In Microsoft Dynamics AX 2012, the client was a Win32 application, and extensions used Microsoft ActiveX, WinForm, or Microsoft Windows Presentation Foundation (WPF) controls. ActiveX and ManagedHost controls can no longer be used to add custom controls, because they are incompatible with the HTML-based platform. Instead, a new extensible control framework lets you add controls by using HTML and JavaScript. The new Gantt control is implemented by using this framework. Note that, unlike in earlier versions, you don't have to pay an additional license fee to use the control in your own forms or to extend the control.

High-level overview of the control

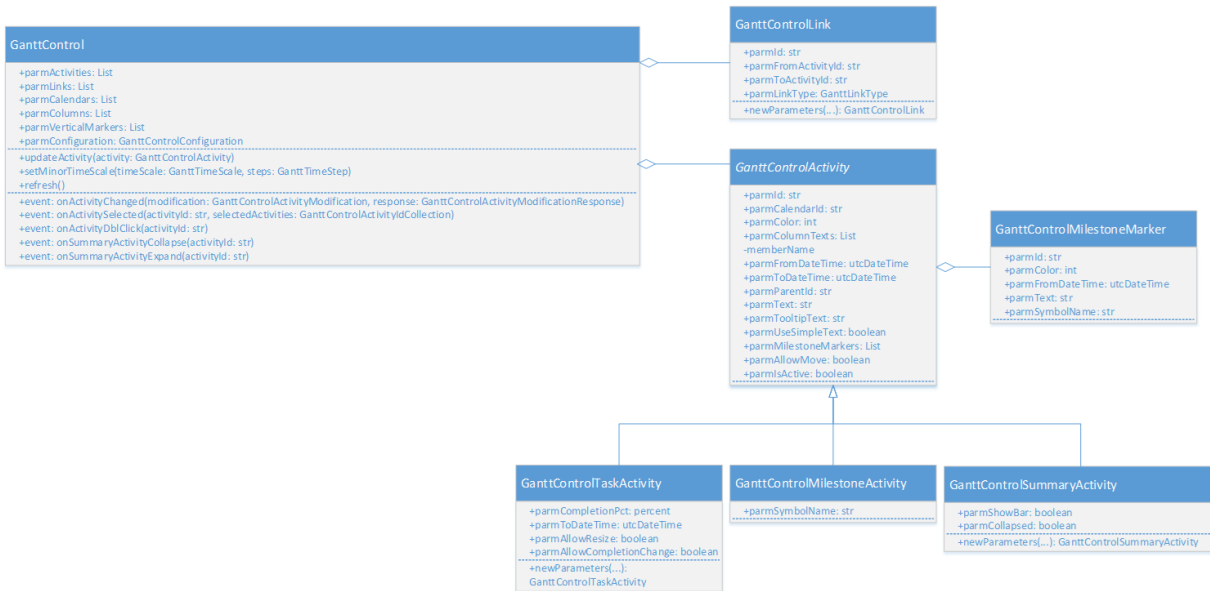

The following illustration shows the visual elements of the Gantt control.

To add the control to a new form, just right-click the top node in the form design, and then select **Add new > Gantt**. After you set the **Height** and **Width** properties to **SizeToAvailable**, there are no other properties that must be set in the designer. Unlike many other controls, Gantt controls can't be bound to data sources. Instead, you must add all data to the control from code.

Adding activities, links, and milestone markers

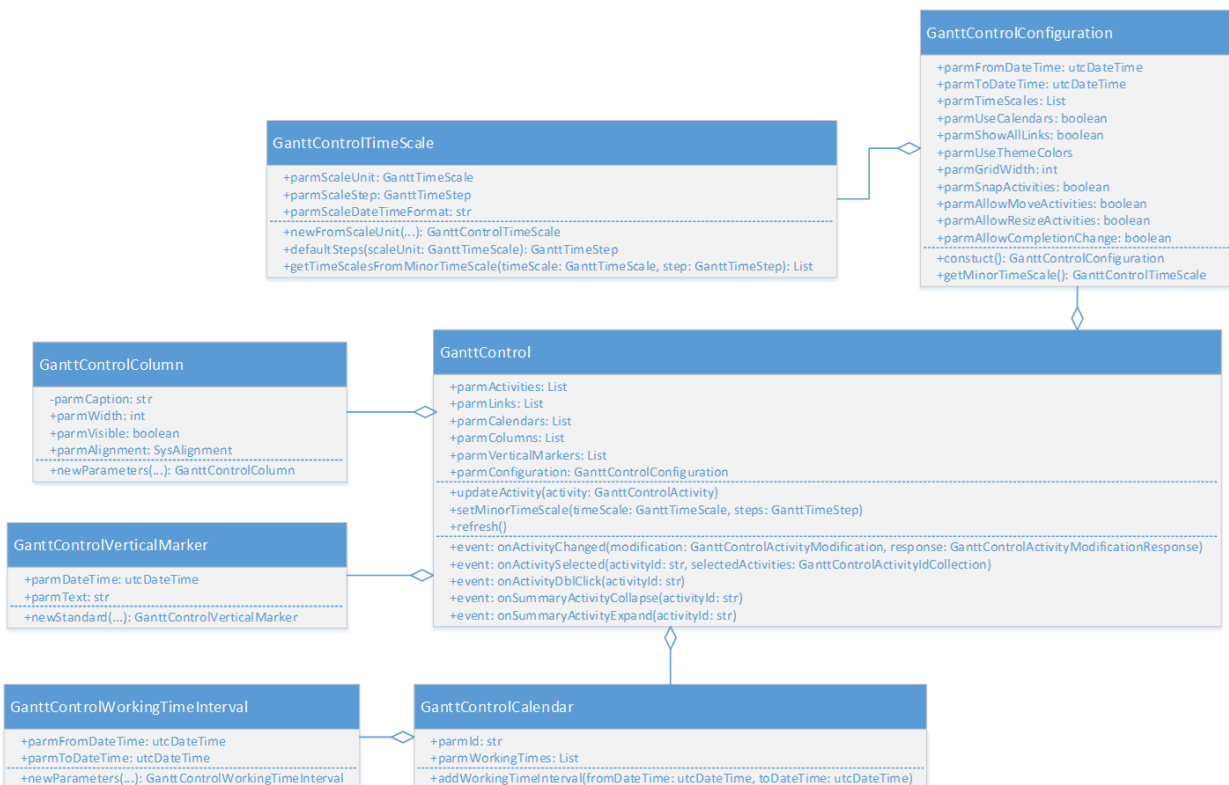

The most basic element of a Gantt chart is the task activity. Each activity is allocated its own row in the chart. Activities can form a hierarchy, like a tree, by referencing a parent activity. Additionally, any two activities can be connected to each other through links (across hierarchies). To add data to the control, you build up a list that contains the instances of the element that you want to add. You then assign the list to the control by using a **parm** method. Note that, when you modify data, you can't just modify the content of the list. To notify the client that data has changed, and to trigger a refresh, you must reassign the list to the control by using the **parm** method.

Each activity must have a unique ID across all activity types. This ID is required in order to build the hierarchy and the links. The ID is also used to identify the activity when the server is notified after a user interaction. There are two types of milestones: the milestone activity is a stand-alone activity that receives its own row in the chart and can be referenced from the links, whereas the milestone markers appear on the same row as the related activity. Both types of markers are represented by using symbols from the Dynamics Symbol font.

Column headers and content

In the "grid" on the left side of the control, you can arrange the data into columns. The column definitions are provided through the **GanttControl.parmColumns** property, which is a list of **GanttControlColumn** objects. The content of the columns is given as a simple **List** object that contains the text strings for an activity through the **GanttControlActivity.parmColumnTexts** property. Note that the values in the column list must be strings. Therefore, any formatting of numbers, enumerations, dates, and so on, must occur on the server side. The formatting of **utcdatetime** must take into account the user's preferred time zone, because that time zone will be used when the Gantt chart is rendered.

Working times

An activity can reference a calendar. A calendar is basically a list of working time intervals. A calendar is used to visually separate working time from non-working time by giving the “cells” (intersections of a row and a time scale interval) a different background color. Note that these working time intervals don't have to come from the standard calendar tables. The intervals are just data that you can load from anywhere. Although calendars are a nice feature that can give you a good overview, there are some performance issues that you must consider. When you turn calendars on (by setting **GanttControlConfiguration.parmUseCalendars** to **true**), each “cell” is rendered in HTML by using a DIV element. If a calendar shows lots of activities for a long period at a very granular minor timescale, there will be many DIV elements. Depending on the browser and hardware, the large number of DIV elements can cause performance issues for the user. In this case, you might have to turn calendars off. In this way, you significantly reduce the number of DIV elements that must be rendered. The control can't turn off calendars by itself to improve performance. Based on the specific scenario, you must determine what will be best for the user.

Color use

Elements such as the activities and milestone markers have a color property. Typically, either the int value for a specific color is calculated by using the **WinAPI::RGB2int** method, or the user sets the value by using the color picker (which is opened by calling **ColorSelection::selectColor**). Instead of controlling the colors yourself, you can specify that the colors should adhere to the current theme. When you set the **GanttControlConfiguration.parmUseThemeColors** option to **true**, if any color values have been set that aren't part of the current theme, they are overridden (no colors have to be specified manually). When theme colors are used, the **parmsActive** flag on an activity is used to determine whether the activity should appear in a dark color or a light color.

Interactions

Whenever the user interacts with the Gantt, an event is raised to notify the server-side code. The following events are currently available:

- **onActivitySelected**(str _activityId, GanttControlActivityIdCollection _allSelectedActivityIds)
- **onActivityDbClick**(str _activityId)
- **onSummaryActivityExpand**(str _activityId)
- **onSummaryActivityCollapse**(str _activityId)
- **onActivityChanged**(GanttControlActivityModification _modification, GanttControlActivityModificationResponse _response)

All these events are one-way notifications from the client. However, the **onActivityChanged** event is somewhat special, because you can set a response. Typically, when a user makes a modification (for example, dragging an activity to a new time), either other activities must also be updated or some adjustments must be made to the activity itself (for example, the column texts must be changed). In the **GanttControlActivityModificationResponse** response, you can provide a list of activities that must be updated. If the change that the user makes is just accepted as is, no response must be set. However, at the very least, the column texts of the current activity must be updated in most cases, to guarantee that the new from and to dates appear. On an activity, the **parmAllowMove** flag determines whether the activity can be moved. However, higher-level flags on **GanttControlConfiguration** determine whether any activity can be moved (**parmAllowMoveActivities**) or resized (**parmAllowResizeActivities**), or whether the completion percentage for the activity can be changed (**parmAllowCompletionChange**).

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a new transportation management engine

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic describes how to create a new transportation management engine in Dynamics 365 Supply Chain Management.

Transportation management (TMS) engines define the logic that is used to generate and process transportation rates in Transportation management. Supply Chain Management provides several different engine types that calculate different parameters, such as rates, transit times, and the number of zones that will be crossed during transit. This article explains how to use the Microsoft Visual Studio development environment together with Supply Chain Management development tools to create and deploy a new TMS engine, and then how to set up the engine in Operations. For more information about the engines, see [Transportation management engines](#).

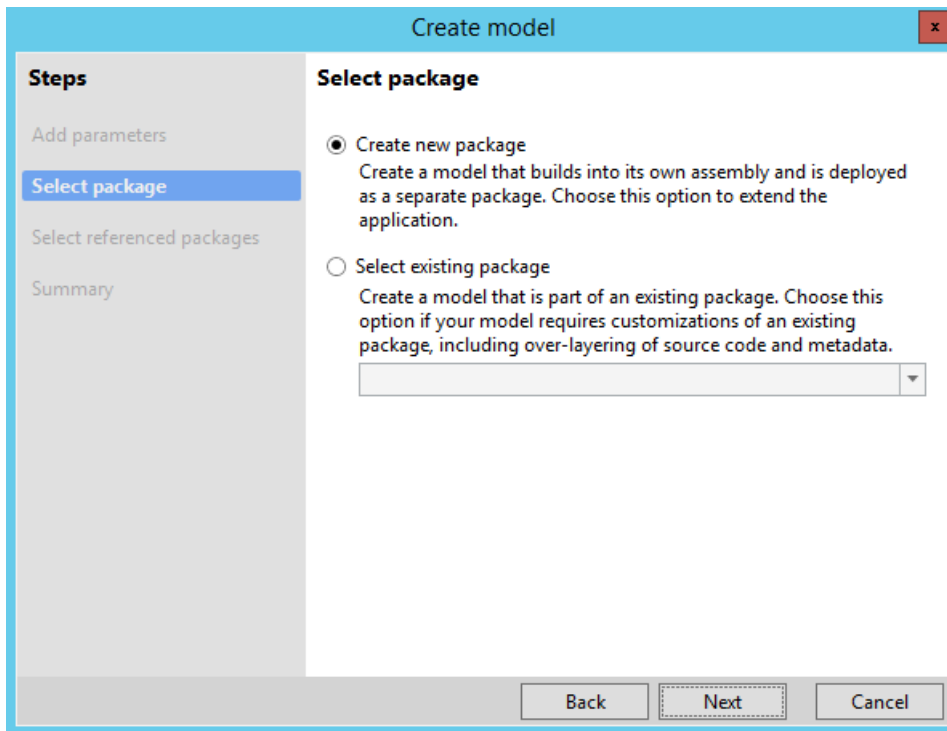

Create a new TMS engine

This section explains how to create a class library that has a TMS engine implementation, and how to reference it from a Supply Chain Management model.

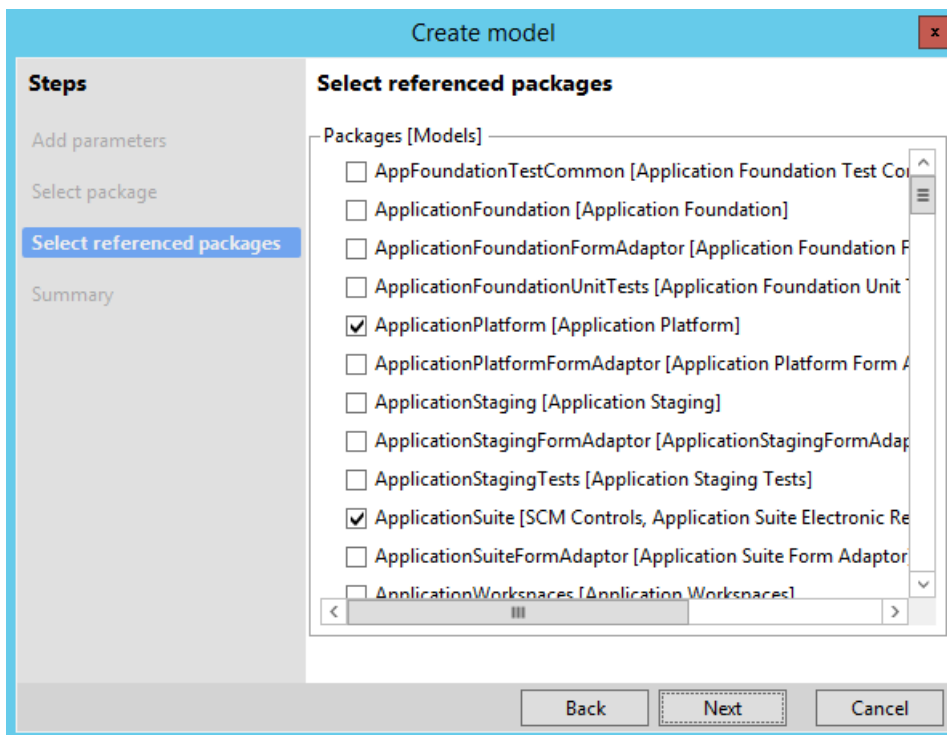

1. To deploy your new engines, you must have a model that will contain the engines. On the **Dynamics 365 > Model Management** menu, click **Create model** to create a new model. On the first page of the **Create model** wizard, name the model **TMSEngines**.

The screenshot shows the 'Create model' wizard interface. On the left, a 'Steps' pane lists 'Add parameters', 'Select package', 'Select referenced packages', and 'Summary'. The 'Add parameters' step is currently selected and highlighted. The main area is titled 'Add parameters' and contains several input fields: 'Model name' with the value 'TMSEngines', 'Model publisher' with 'TMSEnginesPublisher', 'Layer' with a dropdown menu showing 'usr', 'Version' with '1.0.0.0', 'Model description' with an empty text area, and 'Model display name' with 'TMSEngines'. At the bottom, there are three buttons: 'Back', 'Next' (which is highlighted with a dashed border), and 'Cancel'.

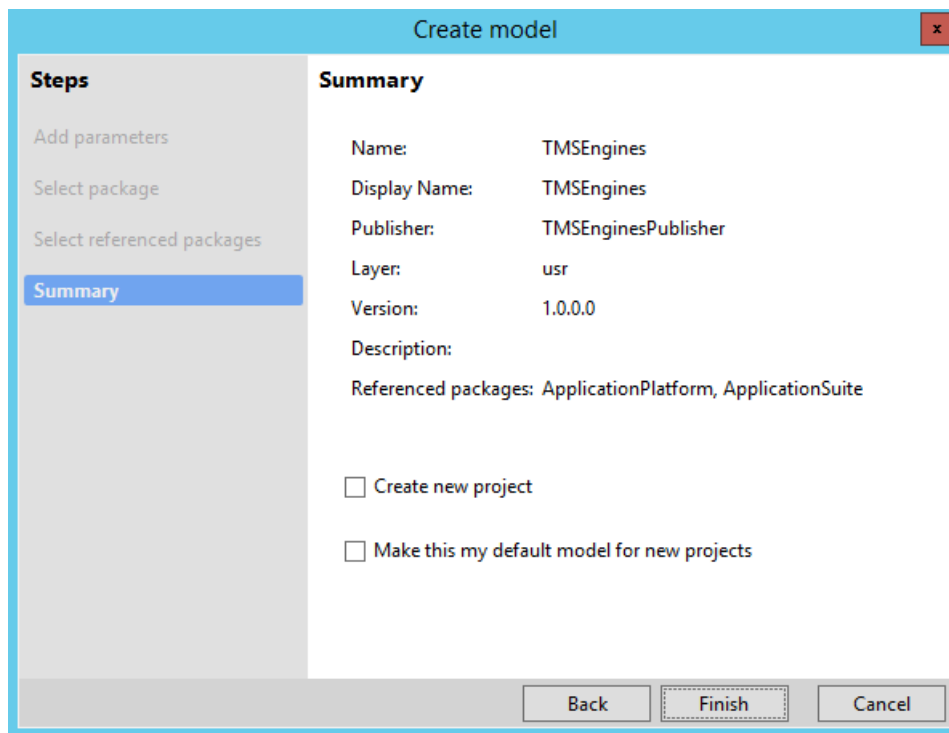

2. On the next page, select **Create new package**.

3. On the next page, select the **ApplicationSuite** model to reference. (The **ApplicationPlatform** model is preselected.)

4. On the next page, click **Finish** to confirm the creation of a new model.

5. In a new solution, create a new Supply Chain Management project, and name it **TMSThirdParty**. In the project properties, set the project's model to **TMSEngines**.
6. Add a new C# class library to your solution, and name it **ThirdPartyTMSEngines**.
7. In the ThirdPartyTMSEngines project, add references to Supply Chain Management–specific assemblies:
 - Application assemblies that enable X++ types to be referenced. These assemblies can be found in the following locations. [Packages root] is the path of the location where all the deployed assemblies are placed, such as C:\Packages.

```
[Packages root]\ApplicationPlatform\bin\Dynamics.AX.ApplicationPlatform.dll
[Packages root]\ApplicationFoundation\bin\Dynamics.AX.ApplicationFoundation.dll
[Packages root]\ApplicationSuite\bin\Dynamics.AX.ApplicationSuite.dll
```

- Framework assemblies that enable access to data, LINQ, and auxiliary functions. All these assemblies can be found in [Packages root]\bin.

```
Microsoft.Dynamics.ApplicationPlatform.Environment.dll
Microsoft.Dynamics.AX.Data.Core.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.AdoNet.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Interface.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Msil.dll
Microsoft.Dynamics.AX.Server.Core.dll
Microsoft.Dynamics.AX.Xpp.AxShared.dll
Microsoft.Dynamics.AX.Xpp.Support.dll
```

- The core TMS assembly (which contains engines) and the TMS base assembly (which contains helpers, constants, data transfer class definitions, and so on). These assemblies can be found in the following locations.

```
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.dll
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.Base.dll
```

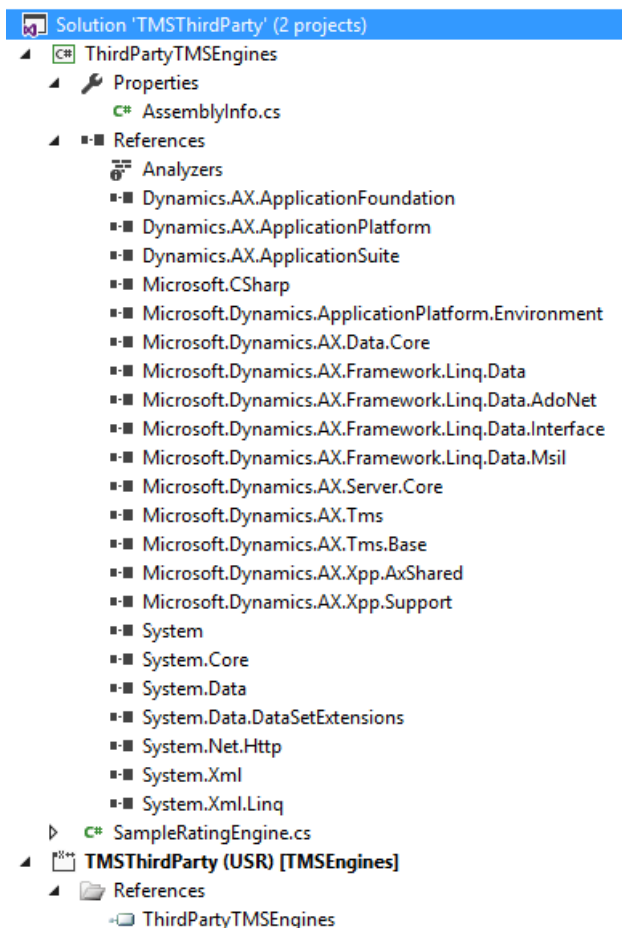

8. Rename the C# class that is automatically generated in the ThirdPartyTMSEngines project to

SampleRatingEngine.

- Implement the engine. Because we are creating a rate engine in this example, we inherit from the base class for rate engines. The base class implements most of the rate engine interface (**TMSFwkIRateEngine**). We just have to implement the rate method. To keep this example simple, we will make this method register a hard-coded rate of 100. You can create engines that implement any of the engine interfaces, such as **TMSFwkIAccessorialEngine**. All the engine interfaces are defined in X++.

```
namespace ThirdPartyTMSEngines
{
    using Dynamics.AX.Application;
    using Microsoft.Dynamics.Ax.Tms.Base.Data;
    using Microsoft.Dynamics.Ax.Tms.Base.Utility;
    using Microsoft.Dynamics.Ax.Tms.Bll;
    using System.Xml.Linq;
    public class SampleRatingEngine : BaseRateEngine
    {
        public override RatingDto rate(TmsTransactionFacade transactionFacade, XElement shipment,
TMSRateMasterCode rateMasterCode)
        {
            XElement re = shipment.RetrieveOrCreateRatingEntity(this.RatingDto);
            re.AddRate(TmsRateType.Rate, 100);
            return this.RatingDto;
        }
    }
}
```

- Build the solution.
- Add a new reference to the TMSThirdParty project. The reference should point to the ThirdPartyTMSEngines project. When you've finished, your solution should look like this.

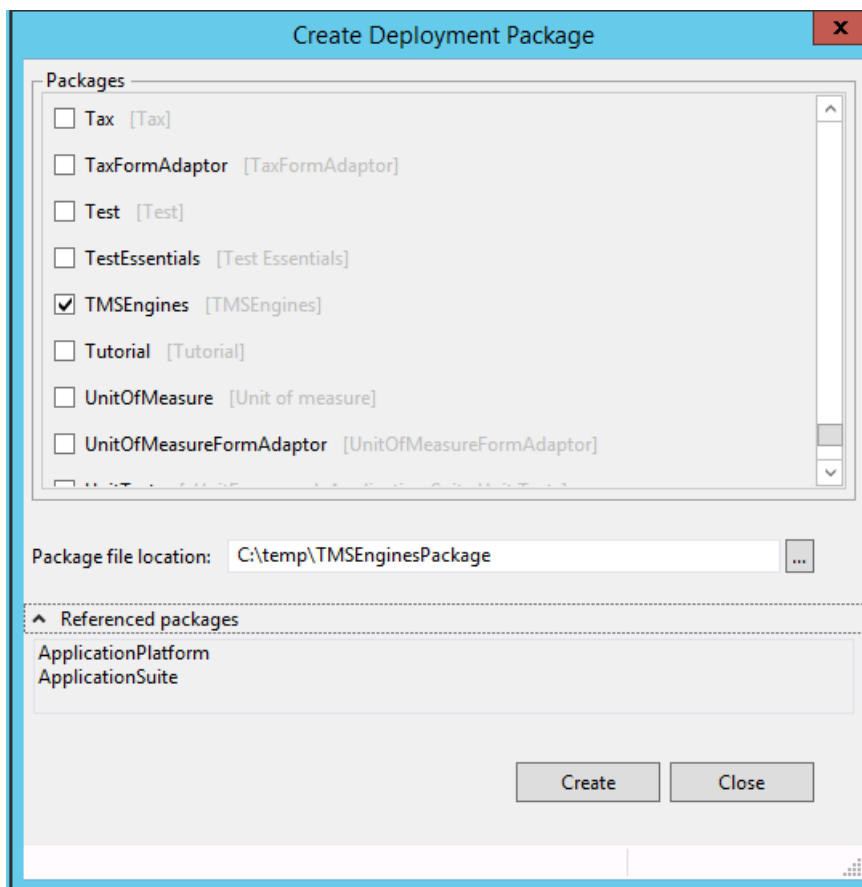

- Build the solution. Verify that the new library appears in the References node in Application Explorer.

Deploy the TMS engine as a package

One way to deploy third-party TMS engines is through a deployment package. This approach is recommended in a production environment. In a development environment, you can manually copy the assemblies, as described in the next section, "Set up a TMS engine in Supply Chain Management." To deploy the engine as a package, follow these steps.

1. On the Dynamics 365 > Deploy menu, click **Create Deployment Package**.
2. In the **Create Deployment Package** dialog box, select the TMSEngines model, and enter the path where you want to store your package files.

3. You can now deploy the package to the target environment. For a tutorial, see [Install a deployable package](#).

Set up the TMS engine in Supply Chain Management

This section explains how to set up Supply Chain Management to use a TMS engine, and shows how the new engine that we have created is used in rate shopping. The example in this section uses the USMF demo data company.

1. Create a new engine as described in the "Create a new TMS engine" section.
2. Build your solution.
3. Copy the resulting assembly into the binary location of the Supply Chain Management server,

[AOSWebRoot]bin. **Note:** This step is relevant only in a development environment. In a production environment, you should deploy through a deployment package. For instructions, see the previous section, "Deploy the TMS engine as a package."

- In Supply Chain Management, on the **Rate engines** page, create a new rating engine. The engine should point to the engine assembly that is produced by building the engine class library and the engine class that you implemented.

Rate engines

Filter

Rate engine ↑	Name	Rating metadata ID	Engine assembly	Engine class
Sample	Sample Engine	▼	ThirdPartyTMSEngines.dll	ThirdPartyTMSEngines.SampleRatingEngine

- Create a shipping carrier that uses the Sample rate engine. Because our engine doesn't use any data, you don't have to assign a rate master.

Shipping carriers

Shipping carrier

SampleCarrier Name: Sample carrier Mode: Ground ▼

Overview

Activate shipping carrier: Yes

Tracking URL:

Transportation tender type: None ▼

Pro number sequence:

Website URL:

Vendor:

SCAC:

Activate carrier rating: No

Services

+ New Delete

Carrier service	Name	Load template ID	Transportation method	Mode of delivery	External code

Addresses

Rating profiles

+ New Delete Rate master Transit time engine

Rating profile ↑	Name	Site	Warehouse	Rate engine	Rate master
<input checked="" type="checkbox"/> Default	Default	▼	▼	Sample ▼	▼

- On the **Rate route workbench** page, click **Rate shop**. You should see a rate of 100.00 from SampleCarrier, as shown in the following screen shot. In this example, we are rate shopping for a route from warehouse 24 to customer US-004. However, but because the rate is hard-coded, you will always see a rate of 100.00.

Rate route workbench

<input checked="" type="checkbox"/>		SampleCarrier	Default	Ground	100.00	100.00	100.00	USD

Tips and tricks

- If you're using development tools for Supply Chain Management, it's useful to add a new project to your solution. If you set this project as your startup project and start a debugging session, you can debug both

X++ and C# code in the same debugging session.

- Every time that you change and recompile your ThirdPartyTMSEngines project, you must manually copy the resulting assembly to the binary location or deploy through a deployment package. Otherwise, you might run by using a stale assembly.
- After you execute TMS-specific operations in Supply Chain Management, the Internet Information Services (IIS) worker process might lock the ThirdPartyTMSEngines assembly so that the assembly can't be updated. In this case, restart the w3svc process.

Extend inventory on-hand data entities

2/18/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Dynamics 365 Supply Chain Management provides [extensibility](#) features that let you [add fields to tables through extension](#). This topic provides an example that shows how to add extended fields to the `INVENTORSITEONHANDENTITY` and `INVENTWAREHOUSEONHANDENTITY` views, so that the capabilities of the inventory on-hand data entities can work with the extensions. For more information about data entities, see [Data management overview](#).

NOTE

Here is a list of some of the inventory on-hand data entities:

- Inventory on-hand by site
- Inventory on-hand by site V2
- Inventory on-hand by warehouse
- Inventory on-hand by warehouse v2

After you add fields to tables that are used by the `inventSiteOnHandView` view, you must sync the engine so that the extensions are correctly recognized.

1. Extend the `InventSiteOnHandView` view by adding the extension field.
2. Extend the `InventSiteOnHandAggregatedView` view with the extension fields.
3. Extend the `InventSiteOnHandAggregatedViewBuilder` viewBuilder class by modifying the `getExtensionFields()` method. In this way, you map old view fields to new view fields when viewBuilder synchronization is run.

For example, you've added the following four fields to the `InventTable` table through extension:

- Custom field 1
- Custom field 2
- Custom field 3
- Custom field 4

In the case, you must modify the `getExtensionFields()` method in the following way.

```
[ExtensionOf(classStr(InventSiteOnHandAggregatedViewBuilder))]  
public final class InventOnHandAggregatedViewBuilder_Extension  
{  
    protected Map getExtensionFields()  
    {  
        next getExtensionFields();  
        Map extensionFields = new Map(Types::Int64, Types::Int64);  
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 1),  
fieldNum(InventSiteOnHandAggregatedView, Custom field 1));  
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 2),  
fieldNum(InventSiteOnHandAggregatedView, Custom field 2));  
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 3),  
fieldNum(InventSiteOnHandAggregatedView, Custom field 3));  
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 4),  
fieldNum(InventSiteOnHandAggregatedView, Custom field 4));  
        return extensionFields;  
    }  
}
```

After you complete these steps, you can extend the inventory on-hand by site and inventory on-hand by warehouse data entities by adding the new fields. In this way, you ensure that the extended fields are recognized and included during data migration that uses those data entities.

Development and administration for Finance and Operations apps

2/18/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

Development and administration for Finance and Operations apps includes:

- Administrator experience and Lifecycle Services
- Developer experience
- Intelligence
- Mobile apps
- Data management and data entities
- Office integration

Developer experience

The developer experience is based on modern tooling using Visual Studio and .NET components.

- The development tools are decoupled from any running environment, which means that you develop against local, XML-based files, not the online database.
- Microsoft Visual Studio is the development environment. Finance and Operations customizes the Visual Studio environment to provide you with a smooth and familiar experience.
- The X++ compiler generates Common Intermediate Language (CIL) for all features. CIL is the same intermediate language used by other .NET-based (managed) languages, such as the C# programming language.
- You can leverage the browser-based client and design patterns for forms to provide an improved end-user experience.
- The Application Lifecycle Management (ALM) system supports build automation, test automation, and deployment of models to the cloud.

For more information, see [Develop and customize home page](#).

Administrator experience and Lifecycle Services

Finance, Supply Chain Management, and Commerce are cloud-hosted. As an IT professional, you can use Dynamics Lifecycle Services (LCS) to monitor and tune your environments, deploy features, and stay up to date with recent hotfixes. Within your deployment, you can configure security, and manage when processes run. You can also use LCS when you are called on to support business intelligence and reporting, mobile apps, Office, and other integrations.

BI & reporting

Finance and Operations provides five distinct reporting experiences. Specialized tools are provided to meet the complex and diverse reporting needs of various functions throughout the organization.

- Operational views – Designed to address the specific needs of a given business persona.
- Business documents – Static documents used to capture and exchange processed business data.
- Analytical tools and visualizations – Personalized presentations of logical calculations that allow the user to explore their data.
- Electronic reporting – Tool used to configure formats for electronic documents.
- Financial reporting – Designed to provide in-depth accounting management tools based on standard views of financial activities across legal entities.

Mobile apps

The Finance and Operations mobile app empowers your organization to mobilize its business processes. After your IT admin enables the mobile workspaces feature for your organization, users can sign in to the app and immediately begin to run business processes from their mobile devices. The Dynamics 365 for Finance and Operations mobile app includes the following features that can help increase productivity:

- Users can view, edit, and act on business data, even if they have intermittent network connectivity or their mobile devices are offline. When a device reestablishes a network connection, offline data operations are automatically synchronized with Finance and Operations.
- IT admins or developers can build and publish mobile workspaces that have been tailored to their organization. The app uses your existing code assets, so you don't have to re-implement your validation procedures, business logic, or security configuration.
- IT admins or developers can easily design mobile workspaces by using the point-and-click workspace designer that is included with the Finance and Operations web client.
- IT admins or developers can optionally optimize the offline capabilities of workspaces by using the Business logic extensibility framework. Because data continues to be processed while a device is offline, your mobile scenarios remain rich and fluid, even if devices don't have constant network connectivity.

Data management and data entities

Data from Finance and Operations can easily be integrated with Microsoft and non-Microsoft data sources using Dataverse, Power Apps, and Power BI. For more information, see [Data entities overview](#).

Office integration

The Microsoft Office integration capabilities provide users with a productive environment that helps them get the job done by using Office products. For more information, see [Office integration overview](#).

eLearning courses

Commerce home page

2/18/2021 • 2 minutes to read • [Edit Online](#)

Dynamics 365 Commerce—built on the proven Dynamics 365 Retail capabilities—delivers a comprehensive omnichannel solution that unifies back-office, in-store, call center, and digital experiences. Dynamics 365 Commerce enables you to build brand loyalty through personalized customer engagements, increase revenue with improved employee productivity, optimize operations to reduce costs and drive supply chain efficiencies, ultimately delivering better business outcomes.

This release enables the creation of digital experiences using built-in web authoring and development tools to produce engaging and intelligent digital storefronts. A connected marketing and headless commerce platform further enable the seamless management of content, assets, promotions, inventory, and pricing across all channels.

- **Everything to build and run digital commerce:** Streamline your business and end-to-end commerce solution that scales to your needs across traditional and emerging channels. Built-in web authoring and development tools enable you to create engaging intelligent digital storefronts, while a connected marketing and headless commerce platform enables seamless management of content, assets, promotions, inventory, and pricing across channels.
- **Build loyalty and exceed customer expectations:** Use clienteling tools to gain a comprehensive view of your customer and respond to their needs at every level of engagement, based on customer profile, history, and preferences that flow across physical and digital channels. Empower your employees to foster lasting relationships through AI-driven recommendations, customer insights, and loyalty programs that elevate brand appeal.
- **Flexible and intelligent omnichannel experience:** Unify physical and digital commerce by providing consistent experiences to customers across cloud search and discovery, product reviews, wish lists, inventory, gift cards, and loyalty. Allow customers to purchase when, how, and where they want, on any device—while providing choice around modern payment methods and product collection or delivery.
- **Streamline operations using AI in the cloud:** Drive omnichannel commerce experiences and integrated, optimized back-office operations through ingrained, pervasive, and context-aware cloud intelligence. Use advanced merchandising, inventory management, distributed order management, and pricing and promotion to innovate and stay ahead of competition. Derive insights by visualizing and analyzing comprehensive and consistent data across all aspects of your business. Use AI-driven technologies to provide accessible websites, protect your business against payment fraud, and efficiently moderate user-generated content like ratings and reviews.
