Prerequisites for standard costs

- Prerequisites for standard costs overview

- Standard cost conversion overview

- Prerequisite for a standard cost conversion

- Manage standard cost updates

- Restrictions on costing versions for standard costs

- Information used in BOM calculations with standard costs

- Update standard costs in a manufacturing environment

- Update standard costs for a new manufactured item

- Update standard costs in a non-manufacturing environment

- Prepare to maintain standard costs for manufactured items

Costing versions

- Costing versions overview

- Costing sheets

- Simulate cost changes by using a costing version for planned costs

- Compare item prices storage report

Developer tools for creating and extending solutions

Analytics, aggregate measurements, and KPI modeling

Model aggregate data

Add financial dimensions to aggregate measurements

Create analytical reports using PowerBI Desktop

Add analytics to workspaces by using Power BI Embedded

Help secure analytical workspaces and reports using Power BI Embedded

Create reporting solutions

Customize App Suite reports by using extensions

Expand Application Suite report data sets

Extend report menu items to redirect user navigation

Create custom designs for business documents

Help prevent long-running reports from timing out

Electronic reporting

Electronic reporting overview

Configurations

Create configurations

Prepare components of the Electronic reporting solution

- Design domain specific data model

- Prepare application specific metadata

- Test the prepared ER solution in the target application

- Upgrade your format by adopting a new base version of that format

Formula designers in Electronic reporting

- Formula designer

- Advanced formula designer

Formula language and functions

- Formula language

- Functions

 - Date and time

 - List

 - Logical

 - Mathematical

 - Records

 - Text

 - Data collection

 - Other

 - Type conversion

Manage ER model mapping in separate ER configurations

Select data model definitions when you create formats

Enhanced filtering options for finding configurations in the Global repository

Generate reports by adding content as raw XML

(ER) Cross-company data sources in Electronic reporting

Design ER formats to generate outgoing electronic documents in various formats

- (ER) Design a configuration for generating reports in OPENXML format

- (ER) Design configurations to generate reports in Word format

- Design configurations to fill out PDF templates

Embed images and shapes

- (ER) Embed images and shapes in documents that you generate

Example of embedding images and shapes

Design configurations to generate reports in Office formats that have embedded images

Review configurations to generate reports in Office formats that have embedded images

Generate reports in Office formats that have embedded images

Modify Electronic reporting formats by reapplying Excel templates

Define the dependency of ER configurations on other components

Design an ER solution to use financial dimensions

Design data models to use financial dimensions as data sources

Map models to use financial dimensions as data sources

Design reports to use financial dimensions as data sources

Run reports that use financial dimensions as data sources

Design ER formats to perform counting and summing by using information from generated output

Create formats to perform counting and summing

Configure format to perform counting and summing

Use computations to generate the output for counting and summing

Run formats to perform counting and summing

Dynamically add columns to Excel reports as horizontally expandable ranges

Design formats to dynamically add columns to Excel reports as horizontally expandable ranges

Run formats to dynamically add columns to Excel reports as horizontally expandable ranges

Use Document management files in format outputs

Prepare data models to use Document management files in ER outputs

Extend data models to use Document management files in ER outputs

Create formats to use Document management files in ER outputs

Run formats to use Document management files in ER outputs

Modify and run formats to use Document management files in ER outputs

Update application data using Electronic reporting

Generate electronic documents and update application data

Import configurations to generate documents with application data

Design configurations to generate documents with application data

Modify models and mappings to generate documents with application data

Modify formats to generate documents with application data

Generate documents that have application data

Import data from incoming files by using ER solutions

Parse incoming documents in different formats

Configure data import from manually selected files

 Create configurations to import data from an external XML file

Configure data import in batch mode from SharePoint located files

Import files in XML format

 Import files in XML format with optional attributes

 Configure ER formats to import XML format files with optional attributes

Split generated XML files based on file size and content quantity

Support parameterized calls of ER data sources of Calculated field type

Configuration lifecycle

Manage configurations lifecycle

Upload configurations into lifecycle Services

Import configurations from Lifecycle Services

Download configurations from Lifecycle Services

Import configurations

Download ER configurations from the RCS repository

 Download configurations from the ER repository of the RCS type

 Import configurations from RCS

Tutorials

Use JOIN data sources to get data from multiple application tables

Configure country context dependent ER model mappings

Configure ER formats to use parameters that are specified per legal entity

Set up the parameters of an ER format per legal entity

Defer execution of ER format elements

 Defer execution of a sequence element

 Defer execution of a XML element

Use Electronic reporting solutions in Finance and Operations

Configure the framework

Configure the Electronic reporting framework

Back up and recover ER templates

Create configuration provides and mark them as active

Destinations

Destinations overview

Destination types

Configure destinations

Set up a reference to an ER format

Automatically validate generated reports

Trace generated report results and compare them with baseline values

Improvements in tracing results of generated ER reports and comparisons with baseline values

Automate testing with Electronic reporting

Automate business processes by using Electronic reporting configurations

Configure Electronic reporting to pull data into Power BI

Generate printable free text invoice (FTI) forms

Trace execution of ER formats to troubleshoot performance issues

Business document management

Business document management overview

New document user interface in Business document management

Add new fields to a business document template in Microsoft Excel

ER framework API

Extend the list of Electronic reporting functions

Electronic reporting framework API changes for Application update 7.3

Specify a custom storage location for generated documents

Inventory management

Inventory management overview

Arrival

Arrival overview

Set up an item arrival overview profile

Quality management

Quality management overview

Quality management processes

Quality management for warehouse processes

Nonconformance management

Set up prerequisites for management

Create and process a conformance

Quarantine orders

Set up quality orders

Inspect the quality of goods

Inventory blocking

Create and maintain inventory blocking

Inventory operations

Inventory journals

Inventory journal approval workflows

Inventory locations

Inventory statuses

Create a new warehouse layout

Maintain bar code types

Check the availability of stock

Inventory on-hand list

Initialize stock levels in the warehouse

Transfer physical inventory within the warehouse

Adjust stock levels in the warehouse (basic warehousing)

Inventory tag counting

Count inventory in a warehouse

Define inventory counting processes

Set up consignment

Change the ownership of consignment inventory based on production demand

Create a consignment replenishment order

Monitor consignment inventory using vendor collaboration

Item and raw material tracing in inventory, production, and sales

Trace an item or raw material

Merge inventory batch

Correct inventory tracking information

Register serial number in the sales process

Inventory on-hand mobile workspace

Troubleshoot inventory operations

Outbound process

Outbound process overview

Reserve inventory quantities

Reserve the same batch for a sales order

Inventory control

Inventory close

Running average cost price

Adjust on-hand inventory cost value

Tracking running average cost per inventory dimension

Inventory Visibility Add-in

IoT Intelligence

IoT Intelligence home page

Set up Azure resources

Message schema formats for IoT Hub

Install the add-in in LCS

Set up metrics

Monitor and manage

Master planning

Master planning home page

Migration to Planning Optimization for master planning

Planning Optimization

Planning Optimization overview

Get started with Planning Optimization

Planning Optimization fit analysis

Apply filters to a plan

Master planning with demand forecast

Master planning with purchase trade agreements

Safety margins

- Purchase requisitions
- Production planning
- Inventory marking with Planning Optimization
- Intercompany planning
- Exclude products with certain product lifecycle states
- Coverage time fences
- Approve planned orders
- Auto-firming with Planning Optimization
- Planning with negative on-hand quantities
- View plan history and planning logs
- Cancel a planning job
- Troubleshoot Planning Optimization
- Planning Optimization extensibility

Master plans

- Master plans overview
- Set up master plans
- Master planning setup wizard
- Coverage settings
- Define coverage rules for items
- Generate a constrained plan
- Create a material plan for co-products
- Maintain planned orders
- Safety stock fulfillment for items
- Delays
- Cancel a master planning job
- Use tracing for explosion
- Action messages
- Monitor a master planning run
- Create a schedule for a site
- Create a plan for a site
- Calendars and master planning
- Improve master planning performance

Improve scheduling engine performance

Master plans and multisite functionality

- Master planning and multisite functionality overview

- Master planning for site coverage, mandatory warehouse

- Master planning for site coverage, warehouse not mandatory

- Master planning for site and warehouse coverage, warehouse mandatory

- Master planning for site and warehouse coverage, warehouse not mandatory

- Determine the BOM version

- Explosion of a BOM version

Negative days and dynamic negative days

Create an intercompany plan

View outbound planned intercompany demand

Collaborate with internal supply chain customers

Demand forecasting

- Demand forecasting overview

- Demand forecasting setup

- Import historical data for demand forecasts

- Generate a statistical baseline forecast

- Make manual adjustment to the baseline forecast

- Authorize an adjusted forecast

- Monitor forecast accuracy

- Remove outliers from historical transaction data when calculating a demand forecast

- Reduction keys

- Create a baseline forecast

- Modify a demand forecast manually

Troubleshoot master planning

Warehouse management

Warehouse management overview

Inbound warehouse operations

- Warehouse handling of inbound loads for purchase orders

- Register items for an advanced warehousing enabled item using an item arrival journal

- Register items for a basic warehousing enabled item using an item arrival journal

- Cross-dock products from receiving warehouse to stores

- Set up a location directive for purchase order put-away

- Set up a work template for purchase orders

- Location product dimension mixing

- Putaway clusters

- Quality check

- Troubleshoot inbound warehouse operations

Outbound warehouse operations

Reservations in warehouse management

- Flexible warehouse-level dimension reservation policy

- Troubleshoot reservations in warehouse management

Partial release and partial shipment

- Partial shipment of a transport load

- Batch release of partially reserved transfer orders

- Troubleshoot partial releases and partial shipments

Picking and packing

- Set up cluster picking

- Cluster position full

- System-directed cluster picking
- Set different dimensions for packing and storage
- Set up containerization
- Batch and license plate confirmation
- Enable license plate label printing
- Create transfer orders from the warehouse app
- Piece picking confirmation
- Packing materials and fees
- Set up manual packing (February & May 2016 only)
- Set up short picking item reallocation
- Cancel warehouse work for exception handling
- System-directed work sequencing
- Pick line grouping
- Warehouse slotting
- Location directive inventory picking aging
- Outbound sorting
- Put to wall - put to store
- Outbound workload visualization
- Troubleshoot picking and packing

- [BOM calculation by using a costing sheet](#)

eLearning courses

For online courses and training, check out [Dynamics 365 Supply Chain Management on Microsoft Learn](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Before you buy

2/18/2021 • 3 minutes to read • [Edit Online](#)

New to Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce? We've put together step-by-step guidance whether you're still evaluating or ready to make a purchase.

Step one: Try out Finance and Operations free for 30 days

You can try Dynamics 365 for Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce for 30 days through a simple email signup. The trial version of Finance and Operations applications includes Getting started task guides that provide step-by-step instructions that allow you to view specific scenarios in action. The product is available to explore and exercise scenarios, but cannot be customized. Demo data is included to ease the use of the product and to make the experience more meaningful. A reminder email will be sent 3 days prior to the trial expiration. Get details at [Sign up for preview subscriptions](#).

Step two: Choose a deployment option

You can now deploy Finance and Operations applications in the cloud or on-premises. Cloud deployments offer an ERP service that is fully managed by Microsoft, while on-premises deployments are deployed locally within a customer's data center.

The following considerations must be taken when you choose on-premises as a deployment option:

- Regulatory and compliance needs that are not available in the cloud certifications.
- Disconnected business process with intermittent internet connectivity required to access Microsoft Dynamics Lifecycle Services (LCS) for application lifecycle management.
- [Comparison of cloud and on-premises features](#).
- [System requirements for on-premises deployments](#).

IMPORTANT

On-premises deployments are not supported on any public cloud infrastructure, including Microsoft Azure.

For more information, see [Deployment options](#).

Step three: Buy and manage a subscription

To explore subscription options, go to the [Dynamics 365 pricing](#) page. This page includes several different plans to fit your organization's needs.

There are many ways to buy a subscription:

- Buy through a Cloud solution provider (cloud only).
- Buy through a partner, and use volume licensing (cloud or on-premises).
- Buy through a partner from the Dynamics price list (on-premises only).

Buy through a Cloud solution provider (cloud-only)

A Microsoft Cloud Solution Provider can work closely with you to understand the needs of your business or organization. Use the [Microsoft Partner Center portal](#) to find a partner to fit your needs.

Buy through a Dynamics partner (on-premises)

You must work with a partner to purchase Finance and Operations on-premises. For more information, see [Buy Finance + Operations \(on-premises\)](#).

Buy through volume licensing (cloud or on-premises)

If your organization has 250 or more Dynamics 365 users, you may be interested in a [Volume licensing agreement](#).

In volume licensing, Finance and Operations applications are available through:

- Enterprise Agreement
- Enterprise Agreement Subscription
- Enrollment for Education Solutions (under the Campus and School Agreement)
- Microsoft Products and Services Agreement (MPSA)

Choose your support option

Microsoft provides flexible, industry-leading support, services, and resources that enable users to quickly address technical issues and maximize return on your Dynamics 365 investment. Choose a plan that best meets your business requirements.

For additional resources, see:

- [Dynamics 365 Support](#)
- [Quick Start Guide for Microsoft Dynamics Cloud Service Support Benefits](#) (PDF)

Step four: Learn about FastTrack and plan your deployment

Microsoft FastTrack for Dynamics 365 is our customer success service designed to help you move to Dynamics 365 smoothly and confidently, so you can realize business value faster. When you participate in the FastTrack program, you will receive guidance on best practices and how to plan for successful rollouts. You will also learn ways to enable new users and expand capabilities – all at your own pace. Additionally, you will have access to Microsoft engineering resources committed to make your experience with Dynamics 365 a success. For more information, see [Microsoft FastTrack](#).

If you are upgrading from Dynamics AX 2012 or migrating from AX 2009

If you are a customer who is upgrading from Microsoft Dynamics AX 2012 or migrating from Microsoft Dynamics AX 2009, you may be eligible for a longer trial. Contact daxcf@microsoft.com for more information.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Sign up for preview subscriptions

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to subscribe to the preview/partner offer and deploy an environment. The subscription that you create gives you a Microsoft Online Services test tenant and a Microsoft Dynamics Lifecycle Services (LCS) project where you can deploy an environment. This topic will also help you set up additional users in your Microsoft Online Services tenant and gain experience with service administration capabilities. Here are the skills that you will learn:

- Subscribe, and create a new Microsoft Online test tenant.
- Navigate to LCS projects.
- Use various features of LCS.
- Add users to Microsoft Azure Active Directory (Azure AD) and the client.
- View resources in your subscription email.

Key terms

- **Microsoft Online Services tenant** – A tenant is the group of all subscriptions and users for your organization. The tenant is created at the same time as your first subscription in Microsoft Online Services.
- **Subscription** – A subscription gives you an online cloud environment and experience. It also lets you see how customizations that you develop can be deployed to the cloud.
- **Microsoft Azure Active Directory** – The cloud environment includes Azure AD. Azure AD helps you manage users, groups, security roles, and licenses for online applications, much as you manage them for on-premise environments.
- **Users** – Users of the services that your organization has subscribed to are managed in Azure AD. Any users in your tenant can be added and assigned to security roles.
- **Developers and administrators** – Developers and administrators are users who also have access to LCS that lets them manage projects and environments. These users are also end users.
- **Organizational account** – Users receive Azure AD credentials. These credentials are separate from other desktop or corporate credentials. The Azure AD credentials are used to sign in to Microsoft 365 and other Microsoft cloud services. Users sign in by using their organizational account.

IMPORTANT

For this release, we ask that you not use any existing credentials that are associated with other online services, such as Microsoft 365 or Microsoft Dynamics CRM Online.

- **Microsoft account** – Microsoft accounts were formerly known as Passport accounts or Windows Live ID accounts. Currently, Microsoft accounts can't be used with Finance and Operations applications, Microsoft Dynamics 365 Commerce, or other Microsoft Online Services. However, Microsoft accounts are still required for Microsoft Connect and other Microsoft Business Solutions sites, such as CustomerSource, PartnerSource, Information Source, and Microsoft Dynamics Community. You will continue to use your Microsoft account to access these services.
- **Microsoft 365 admin center** – Microsoft 365 admin center is the subscription management portal

that Microsoft 365 provides for administrators. Microsoft 365 admin center is used to provide management functions for users and subscriptions.

- **Environments** – You can deploy as many single instances of a virtual machine (VM) as you require. We call these instances *environments*.

Prerequisites

1. You've received an email that invites you to participate in the preview.
2. If your company has an organizational account with Microsoft Online Services, and you're signed in, you must sign out before you continue. Alternatively, you can use **InPrivate Browsing** mode.
3. If you aren't sure whether you're signed in, delete your browser cookies, and then close your browser before you continue.

Subscribe

IMPORTANT

Only one person (tenant administrator) in an organization must perform this task. If you aren't the person who is subscribing to this release, wait until your organization has been signed up and you've received your user credentials. Then continue with the procedure.

1. Finance and Operations applications and Retail are available only to existing Microsoft Dynamics 365 channel partners and customers who are currently enrolled in the Business Ready Enhancement Plan (BREP) service plan. To subscribe, visit [PartnerSource Business Center](#).
2. On the **Account setup** page, in the **Country or region** field, select the country or region.
3. Follow the wizard and prompts to complete the sign-up, until you reach the last step.

You're ready to go... →

Start a new project in LCS

To use LCS to manage your environments, you must create a new project.

1. Go to <https://lcs.dynamics.com/Logon/Index>.
2. Select **Sign in**.
3. Sign in by using the account that you used to subscribe.
4. Select the plus sign (+) to create a new project.

Microsoft

5. Select the project type.
6. Enter the project information, and then select **Create**.

If you plan to evaluate Commerce, be sure to select **Microsoft Dynamics 365 Commerce** in the **Product name** field.

The new project for managing your instance is created.

Add users to LCS

You're already set up as a user of your LCS project. If you've also added other Microsoft 365 users, you must add them to this project. Other administrators and developers will then be able to deploy their own environments. These LCS users are team members who will actively work on the implementation. Don't confuse them with end users. Start on the project page in LCS.

1. Scroll to the right, and then, in the **More tools** section, select the **Project users** tile.
2. In the upper left, select the plus sign (+) to add a new user.
3. In the **Email** field, enter the email address of the user that you're adding. This email address should be the Microsoft 365 organization email address that you created earlier.
4. In the **Project role** field, select **Project Owner**.
5. Select **Invite**.
6. Repeat steps 2 through 5 for all users in your organization.

Deploy environments

Environments should be deployed to an existing Azure subscription.

NOTE

Each developer of an environment must deploy their own system to Azure. However, only the first project user must set up the Azure subscription for deployment.

You can create environments in two ways:

- Deploy to Microsoft cloud services (Azure).
- Download a local virtual hard disk (VHD).

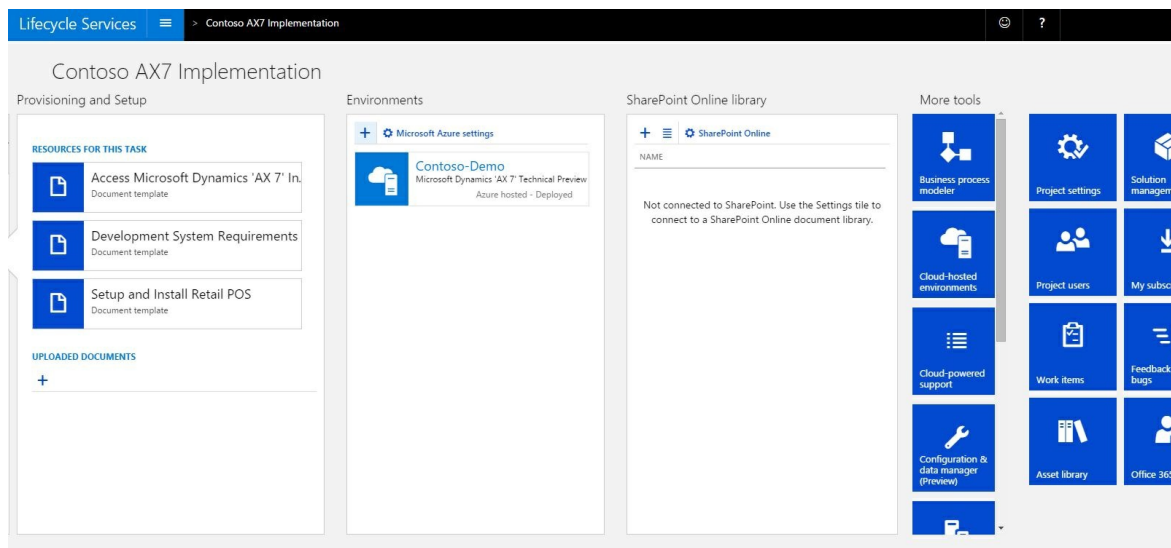

Start on the project page in LCS.

1. In the **Environments** section, select the plus sign (+). The **Microsoft Azure setup** dialog box appears.
2. Enter your Azure subscription ID. You can find your Azure subscription ID in Azure Portal (<https://ms.portal.azure.com/>), under **Settings** in the lower left.
3. Select **Next**.
4. Download the Azure Management Certificate to a local folder on your computer, and then upload it to Azure Management Portal by going to **Settings > Management Certificates**. This certificate will enable LCS to communicate with Azure on your behalf.
5. Return to LCS, and select **Next**.
6. Select the Azure region to deploy in. The **West US** region will have the fastest deployments, but it's important that you select a data center that is close to where you plan to use this system.
7. Select **Connect**.
8. In the list of available topologies, select the topology to deploy. You can select either the **Download** link to download the VHD or **Next** to deploy on Azure. Azure is the preferred path.
9. Enter the name of the environment.
10. Read the pricing and licensing terms, and then select the check box to indicate that you understand them.
11. Select **Next**.
12. Confirm the details, and then select **Deploy**.

NOTE

Developers and administrators who will use their own environments must sign in and repeat these steps.

After you deploy your environment, it's available in the **Environments** section.

13. Select the environment to view details about the deployment status. The first deployment will require a few hours, but each subsequent deployment will be much faster.
14. When the deployment status changes to **Deployed**, select **Login** to connect to the client, or select the name of the VM to connect to the development machine by using Remote Desktop. After the deployment is completed, you can find the base URL and the information that you require to connect to the environment via Remote Desktop.

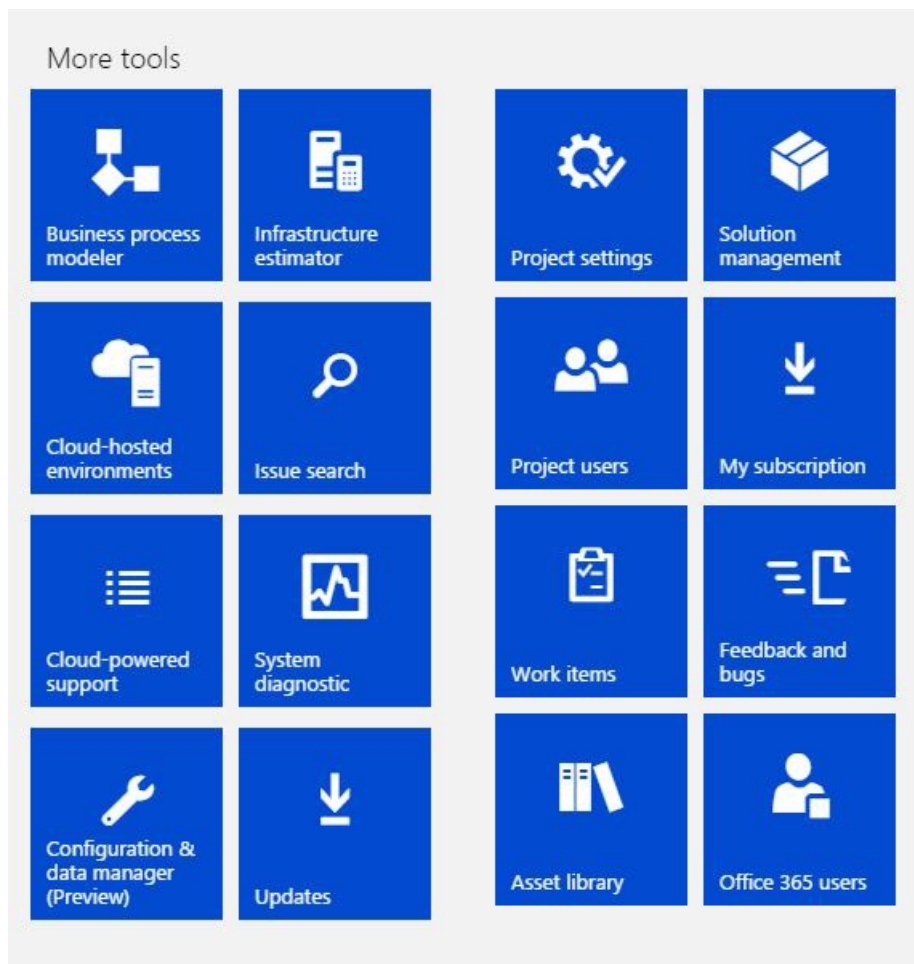

Use the features of LCS

LCS is the starting point for performing online administrative activities. Here are some of these activities:

- Deploy VMs on Azure.
- Access materials.
- Access downloads of tools and resources.

Explore the LCS project

1. Review the methodology, and complete the tasks and phases as you progress through the life cycle. The phases and task information lets you view tools and resources that are available throughout your enterprise resource planning (ERP) experience.
2. Scroll to the right, and review the tiles.

The available tiles include various tools and services in LCS. They also include the following additional tiles:

- **My subscription** – The Microsoft 365 subscription management portal is where you can view and work with your online subscriptions. By selecting **User and Groups** in the left navigation section of the page, you can also manage your online users.

NOTE

To access the page, you must be a member of the **Global Administrator** role for your organization's Microsoft Online Services tenant.

- **Feedback and bugs** – This tile opens the **General Feedback** page in Microsoft Connect. Use this page to record bugs, and to design change requests, feature requests, and suggestions.
- **Microsoft 365 users** – This tile opens the **Users and groups** page in Microsoft 365 admin center. You can add, update, and remove users, reset passwords, and assign licenses for other services.

NOTE

To access the page, you must be a member of the **Global Administrator** role for your organization's Microsoft Online Services tenant. The installing user is always a global administrator, but other users must be added to this role.

One Version service updates overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

The following set of topics provide information that is related to service updates for Microsoft Dynamics 365 for Finance and Operations version 8.1 (October 2018) and later. This is applicable for cloud releases only.

- [Service update availability](#) – This topic provides information about the release cadence and release process.
- [Software lifecycle policy and cloud releases](#) – This topic provides information about the service updates, availability, and end of service.
- [One Version service updates FAQ](#) – This topic answers questions about the update process, tools, planning, and Retail service updates.

The experience for service updates consists of four distinct steps:

1. Configure
2. Notice
3. Update
4. Validate

The rest of this topic describes each step and provides links to related topics.

Configure

Customers can select a maintenance window, based on their business constraints. In Microsoft Dynamics Lifecycle Services (LCS), use the fields in the **Production environment update cadence** section on the **Update settings** tab of the **Project settings** page, as shown in the following image. A calendar of upcoming updates is available to help you plan ahead.

The screenshot displays the 'Project settings' page in the Microsoft Dynamics Lifecycle Services (LCS) interface. The breadcrumb trail shows 'Lifecycle Services' and 'App81Servicing-2 (Microsoft Dogfood)'. The left sidebar lists navigation options: 'Project overview', 'Organizations and ownership', 'SharePoint Online library', 'Visual Studio Team Services', 'Azure connectors', and 'Update settings' (which is highlighted).

The main content area is titled 'Project settings' and is divided into two sections:

- SANDBOX UPDATE ENVIRONMENT**: A text block explains that the selected environment will be updated 7 days before the production environment. Below this is a dropdown menu with 'app81servicingsb2 (Selected)' chosen.
- PRODUCTION ENVIRONMENT UPDATE CADENCE**: A text block explains that the sandbox environment configured above will be updated seven calendar days prior to the day you select for Production updates. Below this are four dropdown menus: 'Every month', 'Cadence' (set to 'Second week (Selected)'), 'Time Zone' (set to 'Eastern Time (UTC - 5) (Se...'), 'Day of the week' (set to 'Saturday (Selected)'), and 'Time Slot' (set to '4 AM to 7 AM (Selected)').

Below the cadence settings, there is a summary line: 'Updates to **Production** are scheduled for the **Saturday in Second week** of every month during **4 AM to 7 AM Eastern Time (UTC - 5)**.' A link to 'View the update calendar.' is provided.

There is also a section for pausing updates: 'Temporarily **pause updates** from being applied by Microsoft to the environments within this project for the selected time window. When updates resume, the designated sandbox and production environment will be updated to the **latest service update before it can be paused again**.' Below this is a 'No' checkbox, which is currently unchecked.

A 'Save' button is located at the bottom of the configuration area. A footer note states: 'To learn more on how these settings impact your update experience, visit the [Microsoft initiated service updates](#) topic.'

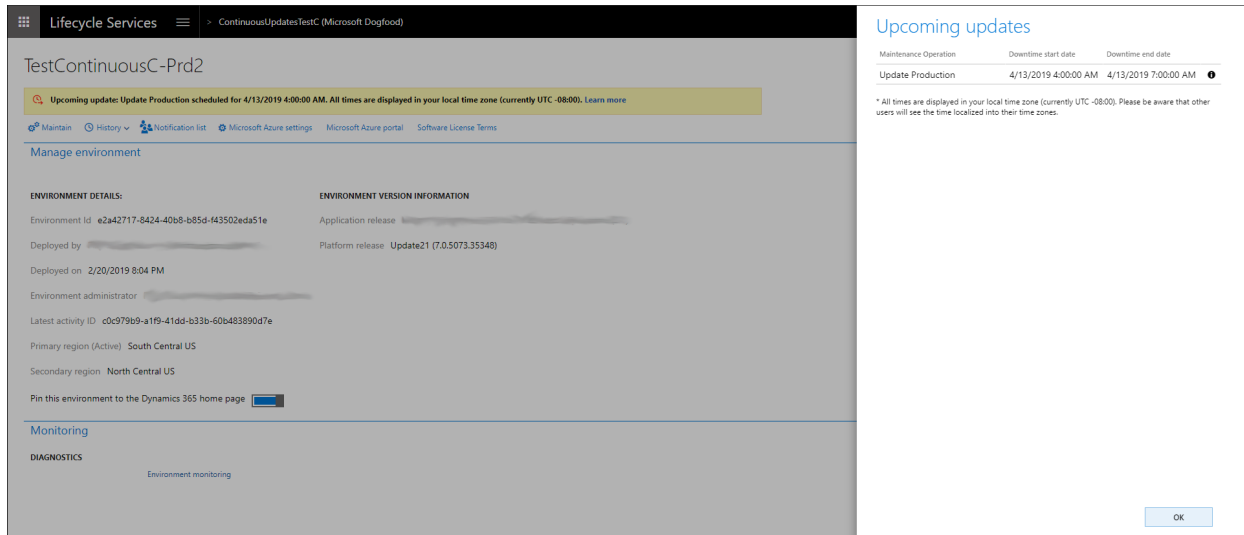

Users must opt in to new features and turn them on. All updates are applied first to the user acceptance testing (UAT) environment and then to the production environment. Therefore, customers have time to do any

validation that is required. Customers can select the environment that is updated. They can also pause an update for up to three months.

Notice

[Release plans](#) will be available to help you plan ahead and understand what is changing. You can learn about upcoming features up to three months in advance. The [What's new](#) topics provide details about the updates for specific months.

Additionally, a notification email will be sent five days in advance, and a notification will appear in LCS just before an update, as shown in the following illustration.

Update

After notifications have been sent, Microsoft will apply the update (**auto update**) during the designated maintenance window. After this operation is completed, a notification email will be sent to indicate the status of the update. Customers will also be able to **self-update** by using the standard update experience in LCS. For more information, see [Apply updates to cloud environments](#).

Customers who participate in the First release program will have an opportunity to update their sandbox environment and other environments early. To sign up for the First release program, go to <https://experience.dynamics.com>.

Customers will also be able to **self-update** by using the standard update experience in LCS, as shown in the following illustration.

Validate

After an update is completed in the UAT environment, a basic business process test can be executed to validate the environment. To support this effort, a no-code automation test tool for business process testing is available, as shown in the following illustration. For more information, see [Create and automate user acceptance tests](#).

Some customers have both external data integrations and internal data integrations. We recommend that these customers use the [Data task automation tool](#) for testing.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

One Version service updates FAQ

2/18/2021 • 18 minutes to read • [Edit Online](#)

In July 2018 we announced a [change to the way we deliver Dynamics 365 updates](#) that will help you stay current in a consistent, predictable, and seamless manner. In June 2019, based on customer feedback we announced [New flexible service updates being made available](#). This FAQ is intended to provide clarity on the service updates, processes, and tools you can use to prepare for it. We will continue to add additional information to this topic as needed.

Can the update be delayed, what is the policy?

Yes, the customer can pause, delay, or opt-out of an update via Update Settings in the Lifecycle Services projects. A customer can choose to pause up to 3 consecutive updates. The following is an example of a delayed update:

- The customer is currently on version 10.0.2.
- The customer can pause updates 10.0.3, 10.0.4, and 10.0.5.
- The customer must take the 10.0.6 update when it is available.

With a release date in early April, when will the general availability package be made available?

Production updates for a monthly release will be scheduled for the first, second, and third weeks in of the month. Depending on the configuration that you set up in Lifecycle Services (LCS), you will receive updates during that specific week.

For the April 10.0 release, Microsoft will perform updates during the weekends of April 6, April 13, or April 20 based on the configuration that you set up in LCS. Sandbox updates will always be scheduled a week before the update. The configuration setup is available in LCS.

Customers can always choose to apply the update at an earlier time, or if there is a more convenient time than the suggested times in Lifecycle Services. If the customer is on the latest version the auto update will be canceled.

Service updates

What product versions are impacted by service updates?

VERSION	DESCRIPTION
8.1 and later	All customers on 8.1 and later will be scheduled for automatic monthly updates with a combined application and platform update starting November 2018. You will be required to be on an update that's no older than 4 months or 3 service updates. To pause an update, refer to Pause service updates .
8.0	Customers on 8.0 can manually apply the monthly platform and financial reporting updates. You will be required to have an update that's no older than 4 months or 3 service updates. The 8.0 application lifecycle ends in April 2019. Customers on 8.0 must update by April 30, 2019 to stay supported. In order to be on a supported application, customers should follow the process to update to the latest version. For more information, see Update environments from version 8.0 to 10.0.X .

VERSION	DESCRIPTION
7.x	Customers on 7.x can manually apply the monthly platform and financial reporting updates. You will be required to have an update that's no older than 4 months and 3 service updates. Customers on 7.x must update by April 30, 2019 to stay supported. If customer stays on version 7.3 past April 30 they will still receive automated platform updates every month. You are required to upgrade to 8.1 by April 2019 (unless extensions are not available). The only overlaid version in market will be version 7.3.

What does the service update contain?

For release 8.1 and later, service updates will contain application (including financial, reporting, and Commerce) and platform changes that are critical improvements to the service including regulatory updates. New experiences will be configurable. The service updates are backward compatible. There will be a single version representing this update.

What is a regulatory update?

A regulatory update is a new feature or an existing feature change required by law (usually for a specific country/region). The regulatory update is always required by a specific law enforcement date (LED) and should be enabled by this date or earlier.

What's the upcoming schedule of updates?

Service updates are available since November 2018. You have the option to apply the update when it is convenient for you, or let Microsoft auto-apply the service updates based on the selected maintenance window. You are required to have an update no older than 4 months.

To see a targeted release schedule, see [Service update availability](#).

Are there any major updates post 8.1?

There will be 2 major updates in April and October where new experiences can be enabled. Major updates will not require code or data upgrade. Breaking changes will be communicated 12 months in advance such that customers can plan accordingly. Such a change will only be introduced during a major update. The 10.0 release, which will be available in April 2019, will also be an update and not an upgrade.

What does it mean when an update is backward compatible?

Backward compatibility covers binary and functional compatibility. Binary compatibility means that you can apply an update on any runtime environment without needing to recompile, reconfigure, or redeploy customizations. This also means that on a development environment at design time, X++ public and protected APIs and metadata are not modified or deleted. If Microsoft needs to break compatibility by removing obsolete APIs, it will be communicated 12 months in advance and follow a deprecation schedule. Functional compatibility is about user experience, all new experiences will be opt-in for a 12-month period.

Backward compatibility does not include non-X++/metadata APIs. Microsoft reserves the right to update versions of any dependencies the product uses, as well as remove dependencies without early warning. Microsoft does not commit to maintain backwards compatibility of dependent software libraries unless expressly stated.

For more information on deprecation guidelines and deprecated methods and metadata elements, see [Deprecation of methods and metadata elements](#).

Can I apply a Platform service update to my existing 8.1 or later environments?

Customers on version 8.1 or later will only be able to apply the 8.1.x or v10.x Service updates. Platform only service updates cannot be applied to version 8.1.x or later. Platform service updates can only be applied to versions 7.x or 8.0.

Will Platform updates be able to be scheduled and delay/pause by customers?

Yes, customers who are on version 7.3 are able to schedule platform updates directly in Lifecycle Services. A delay/pause experience is also available.

Service updates for on-premises deployments

The policy and schedule for service updates are now the same for both cloud and on-premises deployments. This includes, for example, the option to delay applying up to 3 consecutive updates. How to apply each of these updates remains slightly different. For more information, see [Apply updates to on-premises deployments](#).

Process

How will Microsoft ensure quality of releases?

Ensuring quality of the release is a fundamental principle that's enabled through a series of progressive, rigorous, automated validations as described in [Service update availability](#).

Can I select the day and time to update?

Customers can configure the day and maintenance time windows in LCS. The service update, which is based on your update settings, will start within 15 minutes. Email will be sent to customers who opt in to receive LCS notifications with instructions included on how to update. Customers will be able to select the designated tier 2/UAT sandbox for the update. Customers will have 7 calendar days for testing and validation.

Customers can optionally choose to apply the update earlier to all environments through LCS. The production-ready, deployable package will be made available to all customers via the Action Center in Lifecycle Services. Customers are responsible for deploying the update to any additional sandbox or developer/build (tier 1) environments. For more information, see [Configure service update](#).

A service update was applied to the environment, when looking at the tile in Lifecycle Services for this environment what does the number on the tile represent?

The same service update will be auto applied to all customers by Microsoft. Microsoft will continue to service the latest update. The tile in LCS for that environment represents the cumulative number of hotfixes that are available to be applied to your environment. Because Microsoft will only auto apply the same version to all customers, you will be responsible for apply the cumulative hotfix package if it is required.

How do I update to the latest version?

Users can update to the latest version using the tiles on the Environment details page in LCS. After the update is released by Microsoft, the tile will show the update available. Customers can choose to apply the update on their own by going through the update experience on their sandbox and production environments.

How do I update the production environment to the same version after Microsoft updates the sandbox environment?

When Microsoft updates a sandbox environment, the package that is used for the update is saved in the project's asset library. The name of the package is prefixed by the words "Service Update." Because the package was already applied to the sandbox environment, you can mark this package as a Release Candidate. You can then go to the production environment and schedule to apply the package, just as you might schedule to apply any other update.

What is the expected downtime?

The expected downtime for a successful update is 30 minutes to 1 hour. However, we ask for three hours of downtime in case issues occur while the update is applied. We are actively working to reduce the downtime that is required, and you should expect improvements in the next few months.

What's the process for deprecation?

Before any feature is removed from the product, the deprecation notice will be announced in the product documentation 12 months prior to the removal.

For breaking changes that only affect compilation time, but are binary compatible with sandbox and production environments, the deprecation time will be less than 12 months. Typically, these are functional updates that need to be made to the compiler.

Can I delay an update?

You can pause an update up to 4 months or 3 consecutive service updates by way of LCS configuration. After this period, an update will be scheduled and auto-applied by Microsoft. The update experience for a delayed update will incur additional downtime.

Can I delay an update for longer than 3 consecutive service updates due to seasonal activity or other business reason?

No, service updates will be automatically applied to the sandbox, then 7 days later the update will be applied to the production environment if the environments are more than 3 service updates old. A customer can only pause up to 3 consecutive updates in a row. For example, if a customer on version 10.0 chooses to pause updates 10.0.1, 10.0.2, and 10.0.3 then service update 10.0.4 will be auto applied to the sandbox.

What if I find an issue during the sandbox update?

If you find an issue when doing validations in a sandbox environment, you can request to skip the update through LCS directly by providing a valid support ticket number and a business justification.

What if I find a critical issue during sandbox testing and I am not able to pause the Production auto update?

Critical issues should always be submitted to the support team via Lifecycle Services as soon as they are identified. The support staff will work with you on the resolution to the critical issue.

How much time do I get for validation?

You will get 7 calendar days for validation after the update is applied to your sandbox environment. If you need more time, you can access the deployable package via the action center in Lifecycle Service and apply to your environments. This will provide you with additional time to test the update prior to a production roll-out.

What happens when the service update is complete?

Once the service update is applied by Microsoft you will receive a notification if the update was successful or if it was not able to be applied. There can be several reasons an update was unable to be applied:

- Pending Package Sign-off - If a package is pending signoff, Microsoft will not apply the service update to production.
- Deployment Failure - If there was a deployment failure, the environment will be rolled-back to the original state.

If there is a failure, can I reschedule the update to be auto applied?

You will not be able to reschedule the update per se, but you may apply the package when it is convenient for you, just as you might schedule to apply any other update.

Will critical hotfixes be automatically applied to my sandbox/ production environment during auto-update?

The service update that will be made generally available, and auto applied to all customers will contain hotfixes and potentially new functionality. If a critical issue is reported after the service update has been applied, customers can pull that cumulative hotfix update from the tile in Lifecycle Services.

How will my ISVs stay current?

Service updates to customer environments will be backward compatible and no action is required by the Independent software vendors (ISVs). ISVs develop on the minimum required platform release that their code depends on. Breaking changes will have a 12-month lead time to enable ISVs to include and validate. We recommend that the ISVs be part of our [Partner early access program](#), so that they can get early access to the platform bits and validate their solutions against the update before it's made generally available.

What about new features?

All new features will be opt-in for a 12-month period and will not require any change management until you choose to enable the feature.

Are batch jobs suspended during a service update?

Batch jobs are suspended during the maintenance windows and resume when the maintenance is completed.

Tools

How can I get early access to non-released platform updates?

You can join the [First release program](#), where Microsoft will keep your system always current with the latest updates. If you are not already a member of the Dynamics 365 Insider Program, you will need to:

1. Sign up for the Insider Program using this URL: <https://experience.dynamics.com>
2. Accept the terms and conditions to become a Dynamics 365 Insider.
3. After your application has been approved (approximately 24 hours) you can then sign back into the Insider Portal to find the different preview programs available for you to join.
4. Preview Early Access Program (PEAP) and First Release: The program requires that you accept additional terms and conditions to join. Please look for these programs within the Dynamics 365 Insider Program after your nomination has been accepted.

Is there tooling available to support testing the latest release?

The [Regression Suite Automation Tool](#) is [available now](#). This tool significantly reduces the time and cost of user acceptance testing. User acceptance testing is typically required before taking a Microsoft application update or applying custom code and configurations to your production environment. It enables functional power users to record business tasks using the Task recorder and convert them into a suite of automated tests without the need to write source code. Test libraries are stored and distributed in Lifecycle Services using the Business Process Modeler (BPM) libraries and fully integrated with Azure DevOps for test execution, reporting, and investigation. Test data parameters are decoupled from test steps and stored in Excel data files.

How can I test and validate that the integrations continue to work?

Data task automation lets you easily repeat many types of data tasks and validate the outcome of each task. You can also use automated testing of data entities by using task outcome validation. For more information, see the [Data task automation](#) topic.

How can I determine what's changed in a service update?

The What's new or Changed documentation is the primary source for the details contained in each service update. The [Release plans](#) are the primary source of information for all new features and changes for a future release. Features will also include help topics in docs.microsoft.com as needed. An impact analysis tool will be available in LCS to help you better understand the impact on the features that you use.

How will I know if there is a deprecated feature that will impact me if I'm not doing active development/recompile my code?

Deprecated features will be documented with each release. For more information, see [Removed or Deprecated features](#).

Preparing for One Version

How can I log an extensibility request?

Extensibility requests can be logged in LCS. Details are available in the [Extensibility requests](#) topic. Please note the following timelines to log and use the available extensions.

DATE	EXTENSIBILITY REQUESTS
January 2019	All extensibility requests must be logged by January 1, 2019. ISVs and customers are requested to analyze the code and make these requests by this time. We will not provide exceptions to stay on 7.3 after April 2019, if the request has not been filed by January 1, 2019.
December 2019	Extensions will be available on/ before December 31, 2019 for the requests logged by January 1, 2019. Customers using these extensions are required to move to current version by April 2020.

What does end of service mean?

Microsoft will not provide any fixes to issues on versions that have reached end of service. Microsoft will also not investigate or troubleshoot any issue that you may encounter on a version that's older than 3 service updates. If you encounter an issue on a version that has reached end of service, you will be required to update to the latest update and report the issue if it persists.

All environments will continue to be operated by Microsoft. All automatic processes around your environments, such as monitoring or self-healing, will also continue as long as the environment is on a supported version.

Will individual hotfixes be supported?

Individual hotfixes will not be supported after 8.1. Customers must update to the latest cumulative update available to apply the fix (such as 8.1.1). Critical fixes will also be cumulative and available through the LCS servicing experience.

Will you notify me about critical hotfixes released for the monthly update that I'm on?

Customer reported issues are searchable via Lifecycle Services Issue Search. You can sign up to be notified when an open issue is resolved.

How can I upgrade to 8.x?

Refer to the [Process for moving to the latest update](#) topic to learn how to upgrade to the latest application. Updating from 8.0 to 8.1 will not require any data upgrade and will be a self-serve update with much reduced downtime.

Commerce service updates

What options are available to minimize impact to my Commerce cloud components?

Commerce cloud components will require the same down time as your Dynamics 365 headquarters. In an upcoming release, the Retail Cloud Scale Unit (RCSU) will be available to reduce and further schedule updates to your deployment. Please refer to our published release information on our [documentation](#) and [release notes](#) sites for additional details on RCSU.

Will there be options to take individual hotfixes for my commerce solution components?

All fixes and updates for commerce components will be cumulative.

What are the maintenance downtime requirements that may impact channel operations?

For retailers with a business need for redundancy, Modern POS offline capability allows core POS operations to be available for use while disconnected from the internet or while the cloud environment is being updated. Stores operating with Commerce Scale Unit will also continue to operate with support for core POS operations during cloud maintenance windows. For more information, see [Online and offline point of sale \(POS\) operations](#).

When will I need to update my in-store components?

All in-store components must be running released software that is less than one year old in order to maintain support. Customers are responsible for updating self-hosted components (such as components installed in stores or in privately managed datacenters) and ensuring that the installed versions of these components are actively supported.

Will there continue to be backward compatibility for the in-store components?

Updates to components hosted in the cloud will continue to preserve backward compatibility with component versions self-hosted by the retailer (such as components installed in stores or in privately managed datacenters - Modern Point of Sale, Commerce Scale Unit, Hardware Station) for 12 months after the release date for that version. Self-hosted components do not need to be updated at the same time as cloud-hosted components and can be updated on a separate cadence allowing time to roll out updates to stores.

What options are available for updating in-store components across my organization?

Customers can choose to update self-hosted components manually at each store or use mass update tools such as Microsoft System Center Configuration Manager, Microsoft Intune, etc.

What options do I have to slowly enable new functionality across my channels?

Microsoft provides several mechanisms to progressively roll-out and enable functional enhancements across stores, devices, and users.

- **Screen layout designer** – Most visual elements in POS are configured and centrally managed by an administrative user in the customer organization. This means that new POS operations will not automatically be displayed on POS unless explicitly configured for inclusion in corresponding screen layouts. Screen layouts are configured using Screen layout designer and can be specific to a store or POS device. For more information, see [Screen layouts for the point of sale \(POS\)](#).
- **Functionality profiles, POS permissions, Commerce parameters** – Significant elements of functionality in POS are typically configurable by the user. This can be configured through functionality profiles, POS permissions, commerce parameters, or other controls which allow for device, register, store, or user-level functionality control in applicable scenarios.
- **Modern Point of Sale and Commerce Scale Unit** – Because Modern Point of Sale and Commerce Scale Unit are self-hosted by the retailer, topologies which include either of these components enable roll out of updates at a separate (and slower) cadence, and in a more granular fashion than with cloud-only topologies.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage Finance and Operations updates and your custom code lifecycle

2/18/2021 • 19 minutes to read • [Edit Online](#)

This topic describes application lifecycle use cases for Finance and Operations implementations. It's focused on the following scenarios:

- Managing your source code development branches
- Applying the next version of a Microsoft service update
- Applying a new version of your custom code

This topic applies to Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, Dynamics 365 Commerce, and Dynamics 365 Project Operations.

The main goal is to show how to complete the following tasks:

- Stay up to date and manage Microsoft service updates (or quality updates) for Finance and Operations apps (including Dynamics 365 Commerce) in incremental phases, independently of the lifecycle of your own customization. This approach simplifies the update process, and reduces the cost and risk of regressions that are associated with all-in-one upgrade projects.
- Take advantage of source code branches for version control of your custom code. By using version control, you can isolate the rollout of critical changes and hotfixes from the development of new features and capabilities.

This topic doesn't explain how to use the different tools in Azure DevOps and Microsoft Dynamics Lifecycle Services (LCS). Instead, it's focused on processes and best practices. The [Apply the next version of a Microsoft service update](#) and [Apply a new version of your custom code](#) sections contain both an overview of the phases and the steps of the process.

This topic includes the following sections:

- [Environments](#)
 - [Environments that run your current release](#)
 - [Environments that run the next version of your custom code](#)
- [Manage source code branches](#)
- [Apply the next version of a Microsoft service update](#)
 - [Backward compatibility of Microsoft updates](#)
 - [Runtime compatibility](#)
 - [Design-time compatibility](#)
 - [Phase 1: Update the Finance and Operations implementation](#)
 - [Track 1: Update your runtime environments](#)
 - [Update Test 1](#)
 - [Update UAT](#)
 - [Update Prod](#)
 - [Track 2: Update your development environments](#)

- Error situations
 - Case 1
 - Case 2
 - Case 3
- Phase 2: Update CSU to version 10.0.11
 - Phase 2 prerequisites
 - Track 1: Update your CSU runtime environments
 - Update Test 1
 - Update UAT
 - Update Prod
 - Track 2: Update your development environments
- Phase 3: Update POS to version 10.0.11
 - Phase 3 prerequisites
 - Update your Commerce development environment
 - Option 1: Store component updates that include only runtime changes
 - Option 2: Store component updates that include runtime and custom changes
 - Update Process
 - Update Test 1
 - Update UAT
 - Update Prod
- Apply a new version of your custom code
 - Create a hotfix of your code
 - Update your custom code from release N to release N+1
- Upload, update, and deploy store components

Environments

This section describes the collection of Finance and Operations environments that the application lifecycle management (ALM) scenarios in this topic rely on. This configuration is typical for organizations that have implementations that rely on custom code (extensions). This custom code includes customizations that are provided by independent software vendors (ISVs).

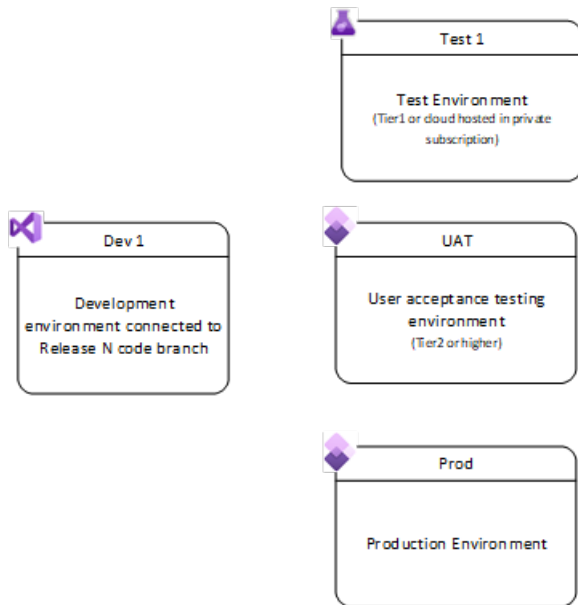

Environments that run your current release

The following environments are the environments in your current release:

- **Dev 1** – A development environment that runs the same version of Finance and Operations apps as the production environment. The Dev 1 environment uses Azure DevOps for version control of custom code. It's connected to the current release branch of your custom code. For more information, see the [Manage source code branches](#) section.
 - There are many options for development environments, both cloud and on-premises. For more information, see [Deploy and access development environments](#).
 - For build automation, use the new Azure DevOps Hosted Agents functionality. For more information, see [Build automation that uses Microsoft-hosted agents and Azure Pipelines](#).
- **Test 1** – A Tier-1 test environment that is used for functional and configuration testing. The Test 1

environment runs the same version of Finance and Operations apps as the production environment. It also runs the latest release version of your custom code extensions.

- **UAT** – A pre-production environment that is used for user acceptance testing. The UAT environment is a Tier-2 (Standard Acceptance Test) or higher environment. It runs the same version of Finance and Operations apps as the production environment. It also runs the latest release version of your custom code extensions. This environment is typically connected to a copy of the production database.
- **Prod** – Your live production environment that runs on your production database.

Environments that run the next version of your custom code

The following environments run the next version of your custom code:

- **Dev 2** – A development environment that is used for development of the next version of your custom code extensions. It uses Azure DevOps for version control of custom code. It's connected to the development branch (**main** branch) of your custom code. For more information, see the [Manage source code branches](#) section.
- **Test 2** – A functional test environment that is used for testing of the next version of your custom code extensions.

Manage source code branches

It's important that you follow best practices as you manage branches of custom code. In this way, you help minimize cost, and ensure the quality of your releases and updates.

The **main** branch (development branch) contains the latest functioning version of the next release of your code.

When you work on new features, create a new feature branch out of the **main** branch. Then, when the feature work is completed, integrate the feature branch back into the **main** branch.

The release branches contain the code base of your official releases. In the preceding illustration, the assumption is that you have only one release branch, **release/2020-April**. **2020-April** isn't a build. It's a source code branch. Because you will probably create hotfixes for your release, you will make changes and produce builds out of this release branch.

- Don't use release branches to develop new features. Use them only for critical fixes or changes that are required in your live environment.
- After you've made a change in a release branch, integrate the branch back into the **main** branch. In this way, you ensure that your next release also contains the fix.
- Among the example environments that were described earlier, the Dev 1 environment will be connected to the **release/2020-April** branch.

When you're ready to release a new version of your custom code, create a new release branch that is based on the **main** branch. For this example, you will create a new release branch that is based on **main** and named **2020-July**.

You might have private branches that individual developers work in while they work on a specific work item that is based on a specific branch of your code. Private branches are merged back into their parent branch when the work is completed. For more information, see [Learn about branching strategies for Team Foundation Version Control \(TFVC\) and how to select an effective strategy](#).

Apply the next version of a Microsoft service update

By using a phased approach, you help maximize the efficiency when service updates are taken. Each phase updates one component of your implementation.

1. **Phase 1** – Update your Finance and Operations environments.

Your current version of Commerce Scale Unit (CSU) and Point of Sale (POS) will work correctly with the new Finance and Operations update. For example, version 10.0.7 of CSU is compatible with version 10.0.11 of Finance and Operations apps.

2. **Phase 2** – Update CSU.

3. **Phase 3** – Update POS.

When you take a Microsoft update, you don't have to update your custom code to the next version. By taking

Microsoft updates without bundling them with custom code updates, you help simplify the update process. You also help reduce the cost and risk of regressions that are associated with all-in-one upgrade projects.

Backward compatibility of Microsoft updates

It's important that you understand what Microsoft means by *backward compatibility of service updates*, so that you have context for the next sections of this topic. Service and quality updates are *runtime* backward-compatible. However, they aren't always *design-time (compile-time)* backward-compatible.

Runtime compatibility

All Microsoft updates are intended to be runtime backward-compatible. This compatibility covers both binary compatibility and functional compatibility. Runtime compatibility means that customizations that exist in production and sandbox environments will continue to work after Microsoft service updates are deployed to those environments. Those updates include service updates and quality updates. Runtime compatibility also means that Microsoft updates are backward-compatible with customizations that were compiled on an earlier platform.

Binary compatibility is backward only. You can compile a customization on an older application version and platform version, and deploy it to an environment that is running a later version. However, you can't deploy code to an environment that is running a version that is earlier than the version that the code was compiled on.

Design-time compatibility

Design-time (compile-time) backward compatibility means that developers can apply updates to their development environments and successfully compile their code without having to make any changes.

Microsoft aims for design-time compatibility. However, some updates might include changes that aren't compatible at design time, but that are binary-compatible. Therefore, after an update is applied, new errors or warnings might occur when your code is compiled. Here are some examples of these changes:

- Microsoft makes an enumeration extensible.
- Microsoft marks an API as obsolete or internal.
- Microsoft introduces a new compiler error to help prevent unsafe coding practices.

All these changes might require work on your solution. Design-time breaking changes that are binary-compatible don't require a 12-month deprecation notice. These breaking changes are documented for each service update. For more information, see [What's new and changed in Platform updates](#).

Phase 1: Update the Finance and Operations implementation

This section summarizes the process that you use to update your Finance and Operations implementation to the latest service update. An update from version 10.0.7 to version 10.0.11 is used as an example.

This phase is divided into two tracks. These tracks can occur in parallel.

- **Track 1** – Update your runtime environments.
- **Track 2** – Update your development environments.

After you complete track 1, you will be live on version 10.0.11, unless you encounter one of the error situations that are described in the [Error situations](#) section.

Track 1: Update your runtime environments

By completing track 1, you essentially complete your Finance and Operations update to version 10.0.11, because your production environment will be live on version 10.0.11. You don't have to recompile your custom code as part of this track.

Update Test 1

The Test 1 environment is running version 10.0.7 together with the latest released version of your custom extension. Although an update of Test 1 isn't a prerequisite in this flow, it's recommended, because it adds another level of functional verification and predictability. This update should be completed before the UAT environment is updated. The sooner that you update Test 1 and validate on it, the more predictable your "real"

update (that is, the update of the UAT and Prod environments) will be.

1. Apply version 10.0.11 of Finance and Operations apps to Test 1.
2. Sign off on functional scenarios. You can use the [Regression Suite Automation Tool](#) to automate user acceptance testing on test and UAT environments.
3. If regressions are encountered, see the [Error situations](#) section.

Update UAT

The UAT environment is running version 10.0.7 together with a released version of your custom extension. (The UAT environment is the same as the Prod environment.)

1. Apply version 10.0.11 of Finance and Operations apps to UAT.

Your UAT environment might be configured so that it's automatically updated by Microsoft. However, you can always pull the update as soon as it's available.

2. Complete user acceptance testing, and sign off.
3. If regressions are encountered, see the [Error situations](#) section.

Update Prod

1. Apply version 10.0.11 of Finance and Operations apps to Prod.

Your Prod environment might be configured so that it's automatically updated by Microsoft. However, you can always pull the update as soon as it's available.

2. Sign off.

Track 2: Update your development environments

The purpose of track 2 is to update the Dev 1 environment to version 10.0.11. Dev 1 is your **main** development environment that is connected to the current release branch of your custom code. It's running version 10.0.7 of Finance and Operations apps. By completing track 2, you ensure that Dev 1 runs version 10.0.11 together with your latest release, and that it's ready for any future hotfixes that are required for your code.

1. Apply version 10.0.11 of Finance and Operations apps to Dev 1.
2. Compile your custom code, and do testing.
3. Make any required changes to your custom code.
4. Check code changes in to the release branch.
5. If you have more than one development environment, follow these steps for each environment:
 - a. Apply version 10.0.11 of Finance and Operations apps to the development environment.
 - b. Sync and compile your latest custom code from the target code branch.

Error situations

Case 1

During track 1, a bug is found that requires a Microsoft quality update. If Microsoft releases the update in a timely manner, use the new Microsoft update instead of the original service update to complete track 1.

Case 2

During track 1, a bug is found that requires a Microsoft service update. However, the update can't be released in a timely manner.

As a workaround for this issue, Microsoft proposes a change to your custom code.

1. Modify your code in Dev 1 (in the release branch), and test your updates.
2. Check code changes in to the release branch.
3. Create a new deployable package out of the release branch.

4. Apply the new deployable package to Test 1 and/or UAT.

NOTE

Custom code that is compiled on version 10.0.7 can be deployed to any runtime environment that is running version 10.0.7 or later. Therefore, you don't yet have to update Dev 1 to version 10.0.11. However, you might already have done that update as part of track 2.

Case 3

During track 1, a bug is found that requires a change to your custom code. This bug might be in either your code or the ISV code.

1. Modify your code in Dev 1 (in the release branch), and test your updates.
2. Check code changes in to the release branch.
3. Create a new deployable package out of the release branch.
4. Apply the new deployable package to Test 1 and/or UAT.

Phase 2: Update CSU to version 10.0.11

This section summarizes the process that you use to update your Commerce Scale Units to the latest service update. An update from release 10.0.7 (Commerce version 9.17) to release 10.0.11 (Commerce version 9.21) is used as an example.

Phase 2 prerequisites

Before you update your CSUs, you must update the Commerce headquarters environments (in the Finance and Operations app) to the same release or a later release. For this example, that release is 10.0.11.

This phase is divided into two tracks. These tracks can occur in parallel.

- **Track 1** – Update your CSU runtime environments.
- **Track 2** – Update your development environments.

After you complete track 1, you will be live on release 10.0.11 (Commerce version 9.21), unless you encounter one of the [error situations](#) that were described for phase 1.

Track 1: Update your CSU runtime environments

By completing track 1, you essentially complete your CSU update to version 10.0.11, because your production environment will be live on version 10.0.11. You don't have to recompile your custom code as part of this track.

Update Test 1

The software as a service (SaaS) components of Commerce aren't currently supported in Tier-1 environments (development/test environments). A copy of Retail Server runs locally in each Tier-1 environment, and the deployment of both Microsoft code for Retail Server and retail customizations will be done through the previous system, where application binary packages and retail deployable packages are applied against the infrastructure as a service (IaaS) instance.

Update UAT

The UAT environment is running CSU that corresponds to release 10.0.7, together with the same version of your retail extension that the production environment is running.

1. Update the Commerce Scale Unit. Select **9.21 (10.0.11)** as the target version. For more information, see [Phase 2: Update CSU to version 10.0.11](#)
2. Complete user acceptance testing, and sign off.
3. If regressions are encountered, see the [Error situations](#) section.

Update Prod

1. Update the Commerce Scale Unit. Select **9.21 (10.0.11)** as the target version. For more information, see [Phase 2: Update CSU to version 10.0.11](#)
2. Sign off.

Track 2: Update your development environments

1. Get the latest version of the Retail software development kit (SDK).
 - a. Apply the Finance and Operations service update for release 10.0.11 to Dev 1.
 - b. Get the updated version of the Retail SDK from %ServiceDrive%\RetailSDK\Update**<newest directory>**
2. In your **main** (development) branch, update the Retail artifacts from the new version of the Retail SDK.
3. Compile. The new version should be backward-compatible and should not require any changes to your code.
4. Commit the change that includes the Retail SDK update.
5. Make any required changes to your custom code.
6. Commit code changes to the target branch.
7. Optional: If you have more than one development environment, merge the latest changes from step 4, and compile the latest custom code.

Phase 3: Update POS to version 10.0.11

This section summarizes the process that you use to update your store components, such as Modern POS and Hardware Station, to the latest service update. An update from release 10.0.7 (Commerce version 9.17) to release 10.0.11 (Commerce version 9.21) is used as an example.

Unlike updates for Commerce headquarters (in the Finance and Operations app) and CSU, updates for store components are delivered in the same packages. After you update Commerce headquarters and CSU, you have the following options:

- **Option 0 (no operation is required)** – Leave the store components in their previous release if the version is supported and in-policy.
- **Option 1** – Update the store components runtime (Microsoft code) so that it matches the same release as CSU.
- **Option 2** – Update the store components runtime (Microsoft code) and customization together.

In the rest of this section, the assumption is that you want or have to update the store components (option 1 or option 2).

After you complete this phase, you will be live on release 10.0.11 (Commerce version 9.21) for store components, unless you encounter one of the [error situations](#) that are described for phase 1.

Phase 3 prerequisites

Phase 3 has the following prerequisites:

- The Commerce headquarters components (in the Finance and Operations app) were updated to the same release or a later release before the CSUs were updated. In this example, the version is 10.0.11.
- The CSUs were updated to the same release as, or a later release than, the store components. In this example, the release is 10.0.11.

Update your Commerce development environment

Follow the steps in the [Track 2: Update your development environments](#) section.

Option 1: Store component updates that include only runtime changes

This option generates a new retail deployable package that contains your store components. It includes changes only from the Microsoft code.

1. Update your release branch, which has the code that is currently being used in the production environment, to the Retail SDK that matches your target release. In this example, the version is 10.0.11 (9.21). Follow the

steps in the [Track 2: Update your development environments](#) section.

2. Generate a new build for the retail deployable package. This build contains the same set of customizations that is currently in the production environment, plus version 10.0.11 (9.21) of the Microsoft code.

Option 2: Store component updates that include runtime and custom changes

This option generates a new retail deployable package that contains your store components. It includes changes from both the Microsoft code and customizations.

1. Update your release branch, which has the code that is currently being used in the production environment, to the Retail SDK that matches your target release. In this example, the version is 10.0.11 (9.21). Follow the steps in the [Track 2: Update your development environments](#) section.
2. Commit changes.
3. Update custom code for store components, or update references to ISV-updated components.
4. Generate a new build for the retail deployable package. This build contains updated custom code plus version 10.0.11 (9.21) of the Microsoft code.

Update process

Update Test 1

The SaaS components of Commerce aren't currently supported in development or test one-box environments. A copy of Retail Server runs locally in each development or test one-box environment, and the deployment of both Microsoft code for Retail Server and retail customizations will be done through the previous system, where application binary packages and retail deployable packages are applied against the IaaS instance.

The Test 1 environment is running version 10.0.11 of Commerce headquarters and a local version of CSU from previous phases. An update of Test 1 isn't a prerequisite in this flow. Because there is no CSU in this environment, this step is mostly for verification.

1. Upload, update, and deploy the store components. For more information, see the [Upload, update, and deploy store components](#) section.
2. Sign off on functional scenarios.
3. If regressions are encountered, see the [Error situations](#) section.

Update UAT

Clients that point to the UAT environment are running applications (for example, Modern POS) for release 10.0.7 (the same version that is currently running in the production environment).

1. Upload, update, and deploy the store components. For more information, see the [Upload, update, and deploy store components](#) section.
2. Sign off on functional scenarios.
3. If regressions are encountered, see the [Error situations](#) section.

Update Prod

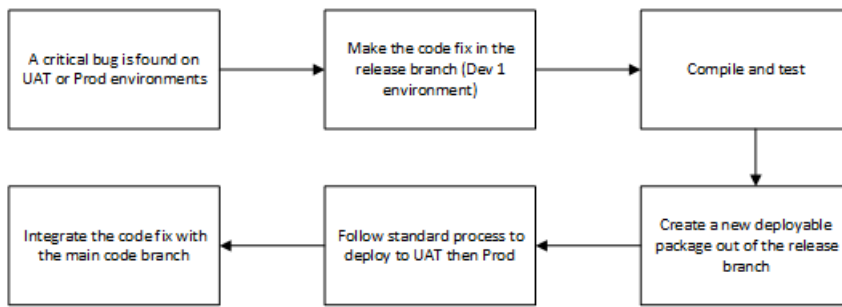

1. Upload, update, and deploy the store components.
2. Sign off.

Apply a new version of your custom code

This section describes the recommended flow for two use cases that require that you update your UAT and/or Prod environment with a new build of your custom extension.

Create a hotfix of your code

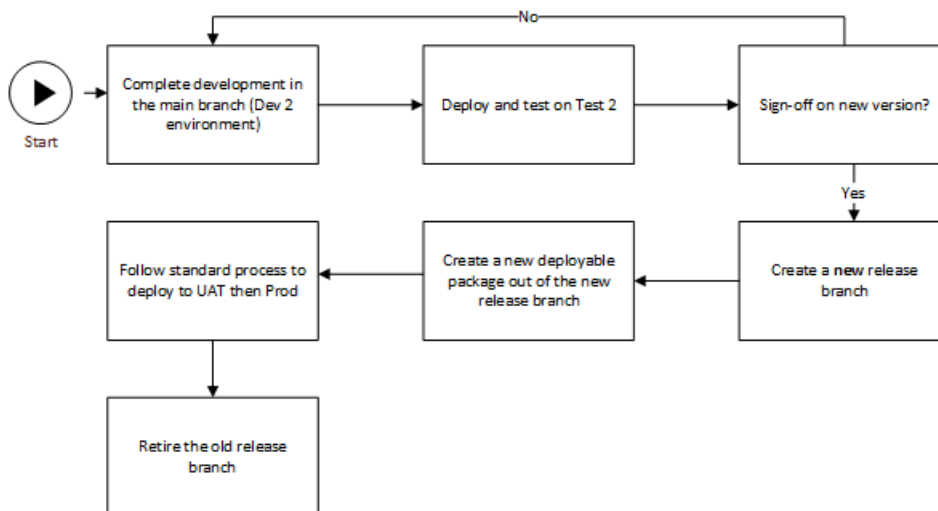

When a critical bug is found in the UAT or Prod environment, fix the bug in the release branch (not in the **main** or development branch), and use the standard process to apply a deployable package to UAT and Prod.

1. In Dev 1, make the code fix in the release branch. If the required fix is in ISV code, ask the ISV to send you a new build of the current release, not the next version of the solution.
2. Compile and test.
3. Create a new deployable package out of the release branch.
4. Deploy on Test 1, and sign off if sign-off is required.
5. Use the standard process to deploy custom code first to UAT and then to Prod.
6. Integrate the code fix with your **main** code branch.

Update your custom code from release N to release N+1

When you're ready to release the next version of your custom code, use the following process to create and deploy the new release.

1. In the Dev 2 environment, or another environment that is connected to the **main** branch, complete development in the **main** branch.
2. Deploy and test on Test 2.
3. Repeat steps 1 through 2 until the new version is signed-off on.
4. Create a **new** release branch.
5. Create a new deployable package out of the **new** release branch.
6. Use the standard process to deploy custom code first to UAT and then to Prod.
7. Retire the old release branch.

Upload, update, and deploy store components

1. Upload the retail deployable package to LCS.
2. Update Application Object Server (AOS) with the latest client.
3. Upload the retail deployable package to your Asset library:
 - Older deployments (earlier than version 10.0.11): Software deployable package
 - New deployments (version 10.0.11 and later): Retail self-service installers

4. Update Commerce headquarters with the new self-service installers for store components:
 - **Older deployments (earlier than version 10.0.11):** Deploy the retail deployable package to Commerce headquarters via LCS.
 - **New deployments (version 10.0.11 and later):** In Commerce headquarters, on the **Commerce parameters** form, on the **Channel deployment** tab, select **Check for package updates**. This update will bring in the packages that are available on the **Retail Self-service package** tab in the LCS Asset library.
5. Assign the client versions to your devices.
6. Download the installers for the desired client type and device.
7. Install in target device.
8. Test and validate.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Software lifecycle policy and cloud releases

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic outlines the lifecycle and support policies for the Finance and Operations online service.

Modern Lifecycle Policy

The Finance and Operations online service is covered by the Modern Lifecycle Policy. The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For more information about this policy, see [Modern Lifecycle Policy](#). Licensed customers must stay current with updates to the Finance and Operations online service in accordance with the following servicing and system requirements:

- Customers purchasing subscriptions of Finance and Operations and operating on the following application versions will experience continuous updates of the Platform and Financial Reporting. Microsoft will continually update these components with the option to postpone up to 3 consecutive service updates.
 - Dynamics 365 for Operations version 1611 (November 2016)
 - Dynamics 365 for Finance and Operations, Enterprise edition (July 2017)
 - Dynamics 365 for Finance and Operations, Enterprise edition 7.3
 - Dynamics 365 for Finance and Operations, version 8.0 (April 2018)
- Platform versions maintain backward compatibility with the application versions that are supported at the time of the platform release within the application support lifecycle. For more information about platform versions, see [Cloud platform monthly updates FAQ](#).
- Critical fixes and non-critical updates are handled in the following way:
 - **Critical fixes** – Critical fixes include security fixes and any fixes that are required to adhere to the availability service level agreement (SLA) that the service supports. Critical fixes will be made available in the latest platform update version and in the latest service update for customers operating on version 8.1. In addition, to help protect the customer and the online service, Microsoft might apply critical fixes directly to a customer's environment. If a critical fix must be applied, Microsoft will notify the customer about the required downtime window (if there will be any downtime) and apply the fix to the applicable environment. The critical fix will update the system to the latest update version.
 - **Non-critical updates** – Customers operating on the following application releases must update to the most current Finance and Operations platform and financial reporter version to deploy non-critical updates.
 - Dynamics 365 for Operations version 1611 (November 2016)
 - Dynamics 365 for Finance and Operations, Enterprise edition (July 2017)
 - Dynamics 365 for Finance and Operations, Enterprise edition 7.3
 - Dynamics 365 for Finance and Operations, version 8.0 (April 2018)

Customers operating on release 8.1 must update to the most current service update to deploy non-critical updates.

NOTE

Application and platform releases expire at the end of the month of their software lifecycle.

Microsoft will not provide any fixes to issues on versions that have reached end of service. Microsoft will also not investigate or troubleshoot any issue that you may encounter on an older version. If you encounter an issue on a version that has reached end of service, you will be required to update to the latest update and report the issue if it persists.

All environments will continue to be operated by Microsoft. All automatic processes around your environments, such as monitoring or self-healing, will also continue as is for supported versions.

Dates and versions for application and platform releases

Table 1: Continuous update releases

For information about the new features included in each release, click the links in the **Version** column.

RELEASE	MAJOR RELEASE OR SERVICE UPDATE	VERSION	BUILD NUMBER	AVAILABILITY	END OF SERVICE
Dynamics 365 for Finance and Operations	Major release	10.0	10.0.8	April 2019	Not applicable (continuously updated)*
Dynamics 365 for Finance and Operations	Major release	8.1	8.1.136	October 2018	Not applicable (continuously updated)*

* Indicates a major release is required to be updated through service updates. Service updates are cumulative in nature and may include updates for some or all of the following components: Platform, Application, Financial Reporting, Retail, and operating system updates. You will be required to have an update that's no older than 3 service updates. The 8.1.x version series will be replaced by version 10.0, which is targeted for release in April 2019. For more information, see [One Version service updates FAQ](#).

Table 2: Application releases

For information about the new features included in each release, select the links in the **Version** column.

RELEASE	MAJOR OR MINOR RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	END OF SERVICE
Dynamics 365 for Finance and Operations	Major release	8.0	8.0.30	April 2018	April 30 2019
Dynamics 365 for Finance and Operations, Enterprise edition	Major release	7.3	7.3.11971.56116	December 2017	April 30 2019*
Dynamics 365 for Finance and Operations, Enterprise edition	Major release	July 2017	7.2.11792.56024	June 2017	April 30 2019

RELEASE	MAJOR OR MINOR RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	END OF SERVICE
Dynamics 365 for Operations	Major release	1611	7.1.1541.3036	November 2016	April 30 2019
Dynamics AX	Minor release	7.0.1	7.0.1265.23014	May 2016	June 2017
Dynamics AX	Major release	7.0	7.0.1265.3015	February 2016	June 2017

* All customers must be on the latest version of Finance and Operations by April 2019. However, we are making an exception for customers who have unfulfilled [extension requests](#) that have been submitted to Microsoft. Those customers who submitted extensibility requests by January 1, 2019, will be supported on version 7.3 until their extensibility requests are fulfilled. Customers are expected to upgrade to the latest version within 90 days of the extensibility request being fulfilled. For more information, see [One Version service updates FAQ](#).

Table 3: Platform releases

For information about the new features included in each release, select the links in the **Release** column.

RELEASE	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE
Platform update 31	7.0.5457	January 2020	N/A (Continuously updated)

Platform update 1	7.0.4127.16103	May 2016	May 2017
Platform 7.0	7.0.4030.16079	February 2016	January 2017

** Platform updates 16, 17, 18, and 19 have not been made generally available.

* Platform updates 13 and 14 have not been made generally available.

Table 4: Application updates

The application updates listed below consist of a small subset of application enhancements released on top of Finance and Operations versions 8.0, 7.3, and 7.2 (July 2017). These updates do not affect the support lifecycle of the release--support is in-line with the policies for each release.

Note that application updates are not cumulative. The individual packages only contain the enhancements that were included in that specific release. However, if there is a dependency between two packages, then both packages will be included.

For information about the new features included in each update, click the links in the **Version** column.

RELEASE	VERSION	BUILD NUMBER	AVAILABILITY

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Software lifecycle policy and on-premises releases

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic outlines the lifecycle and support policies for Microsoft Dynamics 365 Finance + Operations (on-premises) releases.

Modern Lifecycle Policy

Finance + Operations (on-premises) software is covered by the Modern Lifecycle Policy. The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For more information about this policy, see [Modern Lifecycle Policy](#).

Licensed customers must stay current with updates to the Finance + Operations (on-premises) software in accordance with the following servicing and system requirements. This policy requires that the customer maintain Software Assurance (SA) or the Enhancement Plan, and deploy updates as noted later in this topic. Customers who want to use the Fixed Support Lifecycle Policy (5+5) must downgrade to Microsoft Dynamics AX 2012 R3. If a customer lapses on SA or the Enhancement Plan, the customer will be eligible only for the perpetual license rights to Microsoft Dynamics AX 2012 R3 and must uninstall Microsoft Dynamics 365 for Finance and Operations (on-premises) software.

On-premises software update policies

The customer is in full control of its on-premises deployments and must follow this policy. The customer is in control of installing updates in its on-premises environments. Microsoft will support the Finance + Operations (on-premises) software through December 31, 2027, at a minimum, but only if the customer keeps the deployed software current according to this policy.

Critical fixes and non-critical updates are handled in the following way:

- **Critical fixes** – Critical fixes include security fixes and any fixes that are required to support reliability and availability. Critical fixes will be made available in the latest platform update version.
- **Non-critical updates** – Customers must update to the most current Finance and Operations platform and financial reporter version to deploy non-critical updates.

Finance + Operations (on-premises) release dates

Continuous service updates

As of November 2018, on-premises service updates are released continuously. For more information about version numbers and availability dates, see [Software lifecycle policy and cloud releases](#). For more information about One Version service updates, see [One Version service updates FAQ](#).

Application releases

Application releases expire at the end of the month of their software lifecycle.

RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE	PRODUCT LIFE
Continuous service updates	-	-	-	-	-

RELEASE	VERSION	BUILD NUMBER	AVAILABILITY	EXPIRATION DATE	PRODUCT LIFE
Dynamics 365 for Finance and Operations (on-premises)	10.0	10.0.8	March 2019	June 2019	December 2027
Dynamics 365 for Finance and Operations (on-premises)	8.1	8.1.136	November 2018	April 2019	December 2027
Dynamics 365 for Finance and Operations, Enterprise edition (on-premises)	7.3	7.3.11971	March 2018	April 2020*	December 2027
Dynamics 365 for Finance and Operations, Enterprise edition (on-premises)	July 2017	7.2.11792	June 2017	April 2019	December 2027

* All customers must be on the latest version of Finance and Operations by April 30, 2019. However, we are making an exception for customers who have unfulfilled [extension requests](#) that have been submitted to Microsoft. Those customers can be on version 7.3 until April 2020. For more information, see [One Version service updates FAQ](#).

Platform releases

Platform releases expire at the end of the month of their software lifecycle.

RELEASE	BUILD NUMBER	AVAILABILITY	EXPIRATION	END OF LIFE
Continuous service updates	-	-	-	-
Platform update 20	7.0.5030	November 2018	February 2019	December 2027
Platform update 15	7.0.4841	June 2018	September 2018	December 2027
Platform update 12	7.0.4709.41182	March 2018	June 2018	December 2027
Platform update 11	7.0.4679.35176	October 2017	April 2018	December 2027
Platform update 10	7.0.4641.16233	August 2017	April 2018	December 2027
Platform update 9	7.0.4612.35162	August 2017	April 2018	December 2027
Platform update 8	7.0.4565.1612	July 2017	April 2018	December 2027

NOTE

Platform releases are cumulative in nature. Any fixes, critical or non-critical, will require customers to take the latest available version of the platform.

Downloadable virtual hard drive (VHD) releases

Use of the VHDs is subject to the [Software license terms](#).

RELEASE	VHD NAME	VHD EXPIRATION DATE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service update availability

2/18/2021 • 5 minutes to read • [Edit Online](#)

Microsoft is committed to delivering predictable service updates. These service updates will be made generally available for self-deployment approximately 2 weeks prior to Microsoft automatically applying the update.

Customers will be able to take up to 8 service updates per year and are required to take a minimum of 2 service updates per year. Customers can choose to pause up to 3 consecutive updates at a time. Pausing a service update can apply to the designated user acceptance testing (UAT) sandbox, production, or both environments. After the pause window has ended and if the customer has not self-updated to a supported service update, Microsoft will auto-apply the latest update based on the configuration selection made available in Lifecycle Services (LCS). To learn more about how to pause service updates, see [Pause service updates through Lifecycle Services](#).

NOTE

Service updates will not be provided during the months of March, June, September, and December.

Targeted release schedule (dates subject to change)

NOTE

Sandbox auto-update takes place 7 days prior to the production update. End of service indicates the date when no new cumulative service updates will be provided.

VERSION	PREVIEW AVAILABILITY (PEAP)	GENERALLY AVAILABLE (SELF-UPDATE)	AUTO-UPDATE SCHEDULE (VIA LCS UPDATE SETTINGS) PRODUCTION START DATE	END OF SERVICE
10.0.20	May 28, 2021	July 16, 2021	July 30, 2021	October 22, 2021
10.0.19	April 23, 2021	June 18, 2021	July 2, 2021	September 17, 2021
10.0.18	March 5, 2021	April 16, 2021	April 30, 2021	July 16, 2021

10.0.1/Platform update 25			May 1, 2019	June 10, 2019

NOTE

The [Software lifecycle policy](#) applies to customers enrolled in First Release and when the service update is made generally available.

Sign up for the PEAP program by joining the Insider Program available at <https://experience.dynamics.com>. After your nomination has been accepted, join the program.

Public previews are made available as a deployable package via the Shared Asset Library in Lifecycle Services. For more details, see [One Version service updates FAQ](#).

Service update overview

Service updates are continuous, touchless updates that provide new features and functionality. They eliminate the need to do expensive upgrades every few years. The service updates maintain backward compatibility, which means there is no need to 'merge your code'. We recommend leveraging tools such as the Regression suite automation tool (RSAT) for regression testing.

You are in control and manage how your organization receives these updates. For example, you can sign up for the First Release program so that your organization receives updates first. You can apply the updates to any of

your environments manually (self-update) or remain on the default release schedule and receive the auto-updates when you schedule them using LCS.

Service updates contain both application and platform changes that are critical improvements to the service, including regulatory updates.

Release processes

Each new release is designed and developed by the Dynamics 365 team. Any new release is first validated by the feature team, then by the Finance and Operations teams. During this time, extensive testing is done on various test topologies. A compatibility checker also runs tests to ensure backward compatibility. In addition, a [Release Validation Program](#) is available for customers to join. This program allows customers to share artifacts, such as databases and code, that is used for benchmarking and tested with automation to provide an additional layer of quality assurance.

Preview Early Access Program (PEAP) is available to partners, customers, and ISV's who opt in through the [PEAP Survey](#). As a participant in the PEAP program you will have first access and visibility into the preview for the upcoming service update. The preview service update is used to validate customizations, learn about new features, and provide feedback to Microsoft. During this phase, the service update must be deployed on a Dev/Test environment. This release cannot be used in production. To join the PEAP program, sign up via the [PEAP Survey](#).

The First Release program is open to all customers. Customers who join the First Release program will be the first, select group of customers to take the service update all the way to production. Microsoft will manage the deployment of this service update to a UAT sandbox and then 7 days later will auto-deploy the update to production. Customers participating in this program have the additional benefit of having dedicated Microsoft engineers closely monitoring the environments for any issues after updates have been applied. To join First Release, sign up via the [First Release Survey](#).

The service update will be made generally available using the action center in LCS. When the service update is available, it can be manually applied to all environments including production. If the service update has not been applied to the designated sandbox or production environment, Microsoft will auto-apply the update based on the Update settings for the LCS project. To learn more, see [Configure service updates through Lifecycle Services](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Apply updates to cloud environments

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes how you can use Microsoft Dynamics Lifecycle Services (LCS) to automatically apply updates to cloud environments.

IMPORTANT

Updates are applied using deployable packages. Applying updates causes system downtime. All relevant services will be stopped, and you won't be able to use your environments while the package is being applied. You should plan accordingly.

Supported environments

All environments deployed through Lifecycle Services are supported.

NOTE

If you have a build environment, you can only use LCS to apply Binary updates and Data upgrade packages. You can't use LCS to apply an Application Deployable package.

For other environments (listed below), you must use Remote Desktop Protocol (RDP) to connect to the environment and install from the command line. For information about manual package deployment, see [Install deployable packages from the command line](#).

- Local development environments (Downloadable virtual hard disk [VHD])
- Multi-box dev/test environments in Microsoft Azure (Partner and trial projects)

Key concepts

Before you begin, you should understand *deployable packages*, *runbooks*, and the *AXInstaller*. A deployable package is a unit of deployment that can be applied in any environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. The AXInstaller creates a runbook that enables installing a package. For more details, see [Packages, runbooks, and the AXUpdateInstaller in depth](#) at the end of this topic.

Supported package types

- **AOT deployable package** – A deployable package that is generated from application metadata and source code. This deployable package is created in a development or build environment.
- **Application and Platform Binary update package** – A deployable package that contains dynamic-link libraries (DLLs) and other binaries and metadata that the platform and application depend on. This is a package released by Microsoft. This is available from the **All binary updates** tile from LCS.
- **Platform update package** – A deployable package that contains dynamic-link libraries (DLLs) and other binaries and metadata that the platform depend on. This is a package released by Microsoft. This is available from the **Platform binary updates** tile from LCS.
- **Commerce deployable package** – A combination of various packages that are generated after the Commerce code is combined.
- **Merged package** – A package that is created by combining one package of each type. For example, you can

merge one binary update package and one AOT package, or one AOT package and one Commerce deployable package. The packages are merged in the Asset library for the project in LCS.

NOTE

A binary package and a Commerce deployable package can't be included in the same merged package.

For information about how to download an update from LCS and what you see in the tiles based on your environment version, see [Download updates from Lifecycle Services \(LCS\)](#).

If your environment is on an application version 8.1 and later, then the **Platform Update package** does not apply to your environment. Starting with 8.1 and later releases, **Application and Platform Binary update package** is the one that applies since application and platform will be combined into a single cumulative package and will be released by Microsoft. Also note that you will no longer be applying granular X++ hotfixes and will get all application and platform updates together. This means that on the environment details page, clicking on **View detailed version information** will not have details on the granular hotfixes or KBs applied as there is no way to apply them.

Prerequisite steps

- **Make sure that the package that should be applied is valid.** When a package is uploaded to the Asset library, it isn't analyzed. If you select the package, the package status appears in the right pane as **Not Validated**. A package must pass validation before it can be applied in an environment by using the following procedures. The status of the package will be updated in the Asset library to indicate whether the package is valid. We require validation to help ensure that production environments aren't affected by packages that don't meet the guidelines.

There are three types of validations:

- Basic package format validations
 - Platform version checks
 - Types of packages
- **Make sure that the package is applied in a sandbox environment before it's applied in the production environment.** To help ensure that the production environment is always in a good state, we want to make sure that the package is tested in a sandbox environment before it's applied in the production environment. Therefore, before you request that the package be applied in your production environment, make sure that it has been applied in your sandbox environment by using the automated flows.
 - **If you want to apply multiple packages, create a merged package that can be applied first in a sandbox environment and then in the production environment.** Application of a single package in an average environment requires about 5 hours of downtime. To avoid additional hours of downtime when you must apply multiple packages, you can create a single combined package that contains one package of each type. If you select a binary package and an application deployable package in the Asset library, a **Merge** button becomes available on the toolbar. By clicking this button, you can merge the two packages into a single package and therefore reduce the total downtime by half.
 - **Make sure that the Application binary update package is applied to your dev/build environment before it is applied to your sandbox and production environment** - If the application binary package is applied directly to your Tier 2+ sandbox environment but is not applied on your dev/build environment, the next time you move an AOT package from dev/build box (which does not have the same application binaries as your sandbox environment) to sandbox, some of the application binaries will be overwritten with what is in your dev/build environment. This could result in a regression of the version of your sandbox environment.

Apply a package to a non-production environment by using LCS

Before you begin, verify that the deployable package has been uploaded to the Asset library in LCS.

1. For a binary update, upload the package directly to the Asset library. For information about how to download an update from LCS, see [Download updates from Lifecycle Services \(LCS\)](#). For an application (AOT) deployable package that results from an X++ hotfix, or from application customizations and extensions, create the deployable package in your development or build environment, and then upload it to the Asset library.
2. Open the **Environment details** view for the environment where you want to apply the update.
3. Click **Maintain > Apply updates** to apply an update.
4. Select the package to apply. Use the filter at the top to find your package.
5. Click **Apply**. Notice that the status in the upper-right corner of the **Environment details** view changes from **Queued** to **In Progress**, and an **Environment updates** section now shows the progress of the package. You can refresh the page to check the status.
6. Continue to refresh the page to see the status updates for the package application request. When the package has been applied, the environment status changes to **Deployed**, and the servicing status changes to **Completed**.

Apply a package to a production environment by using LCS

In a production environment, customers can schedule a downtime for when they want the update to be applied.

IMPORTANT

An important prerequisite for applying a package to a production environment is that the package must be successfully applied to at least one sandbox environment in the same project.

1. After the update is successfully applied in a sandbox environment, go to the project's asset library. On the **Asset library** page, select the **Software deployable package** tab, select the package that you want to move to production, and click **Release candidate**. This indicates that this package is ready for production deployment.
2. Open the **Environment details** view for the production environment where you want to apply the package.
3. Select **Maintain > Apply updates** to apply the package.
4. Select the package to apply in your production environment, and then click **Schedule** to submit a request to apply it.

NOTE

The list of packages includes only the packages that have been successfully signed off in the sandbox environment, and that have been marked as release candidates.

5. Specify the date and time to schedule the package application. Click **Submit**, and then click **OK** to confirm. Note that your environments will be unavailable to perform business while the package is being applied.
6. At the scheduled downtime, package deployment will start.
7. After the environment is serviced, you can monitor the status. The **Servicing status** field indicates the status of package application. Additionally, a progress indicator shows the number of steps that have

been run, out of the total number of steps that are available.

8. After the deployment is successfully completed, the **Servicing status** field is set to **Completed**.
9. If package application isn't successfully completed, Microsoft will investigate the issue. The **Servicing status** field will indicate that package application has failed. The environment will be rolled back to a good state.

Troubleshoot package deployment failures

If package deployment fails, see the [Troubleshoot package application issues](#) topic.

Applying updates and extensions

If you are updating a Tier-2 Sandbox or Production environment on application version 8.1.2.x or newer and have initialized Cloud Scale Unit, you will also need to update Commerce channel components. For more information, see [Update Retail Cloud Scale Unit](#).

If you're using components (such as Modern POS), after you've applied updates and extensions in your environment, you must also update your in-store components. For more information, see [Configure, install, and activate Modern POS \(MPOS\)](#).

Packages, runbooks, and the AXUpdateInstaller in depth

Deployable packages, runbooks, and the AXUpdateInstaller are the tools you use to apply updates.

Deployable package – A deployable package is a unit of deployment that can be applied in an environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. Deployable packages downloaded from LCS or created in a development environment cannot be applied across product types. For example, a Finance deployable package cannot be applied in a Commerce app environment, and vice versa. If you have an existing customization for a Finance and Operations app that is compatible with the Commerce app, and you would like to apply it to a Commerce environment, you will need to re-package your source code in a Commerce development environment, and conversely if moving in the other direction.

Runbook – The deployment runbook is a series of steps that are generated in order to apply the deployable package to the target environment. Some steps are automated, and some steps are manual. AXUpdateInstaller lets you run these steps one at a time and in the correct order.

- Generated based on topology of deployments with multiples VMs
- Contains step by step information for applying deployable package
- Provides sequence of steps across VMs in multi-box/ HA environment
- Integration for apply automation scripts at each step
 - Stop/ start AOS service, batch service
 - Report deployment, DB sync, ...

AXUpdateInstaller – When you create a customization package from Microsoft Visual Studio or a Microsoft binary update, the installer executable is bundled together with the deployable package. The installer generates the runbook for the specified topology. The installer can also run steps in order, according to the runbook for a specific topology.

Install deployable packages from the command line

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Apply updates to on-premises deployments

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic explains how to apply supported updates to Dynamics 365 Finance + Operations (on-premises). All updates to on-premises environments are done through Microsoft Dynamics Lifecycle Services (LCS).

Search for and download updates

For more information about how to find the updates that you can apply to your on-premises environment, see [Issue search in Lifecycle Services \(LCS\)](#). For information about how to download updates from the tiles in the **Updates** section of the **Environment details** page in LCS, see [Download updates from Lifecycle Services \(LCS\)](#).

NOTE

When you are updating an on-premises environment, always select updates from the update tiles on the **Environment details** page. If you select updates from another location, the updates might not work.

Update an on-premises deployment

You can apply updates to an on-premises environment either during deployment or after the deployment is completed.

While an on-premises environment is being deployed, you can select to deploy a custom package in the **Advanced** settings. For more information about how to apply customizations or application X++ updates, see [Develop and deploy custom models to on-premises environments](#).

To apply updates to an on-premises environment after it has been deployed, in LCS, on the **Environment details** page for the environment, under **Maintain**, select **Apply updates**.

NOTE

You can apply updates after deployment only on environments that have Platform update 12 for Finance and Operations or later. The environment must also have the latest version of the local agent available in LCS. For more information, see [Update the local agent](#). If you're on a platform version that is older than Platform update 12, you can reconfigure an environment that is already deployed to update the customizations or update to the latest platform release. For more information about how to redeploy an environment, see [Redeploy on-premises environments](#).

Apply application or binary updates through LCS

The following steps can be used to apply X++, All Binary, or Platform binary updates.

IMPORTANT

The application of updates requires downtime for your environment. Therefore, no business transactions can be performed in the environment during the update. When you complete the following steps, verify that the system isn't being used, and that an official downtime notice has been communicated to all system users.

IMPORTANT

To move to the latest platform, always select the platform update from the **Platform Binary Updates** tile on the **Environment details** page. If you select updates from another location, the updates might not work.

Prerequisites

- Before you begin, complete a full backup of the Management Reporter (MR), Microsoft Dynamics AX, and Microsoft SQL Server Reporting Services (SSRS databases). Although the code is restored through LCS, the database must be manually restored to help guarantee that there is no data loss.
- Update your environment to the latest build of Platform update 12.
- Update the local agent to the latest version. For more information, see [Update the local agent](#).
- Depending on the type of update, complete the following steps to generate a deployable package:
 - **Platform binary updates** – Download or save the update directly to the Asset library in LCS by following the steps in [Download updates from Lifecycle Services \(LCS\)](#).
 - **Application binary updates** – Download or save the update directly to the Asset library in LCS by following the steps in [Download updates from Lifecycle Services \(LCS\)](#).
 - **Application X+ + updates** – Download the required hotfix to your development environment, and then follow the steps in [Create deployable packages of models](#).
 - **Customizations** – Follow the steps in [Develop and deploy custom models to on-premises environments](#).

Update a sandbox environment

1. In the LCS Asset library, upload the deployable package that was generated in the "Prerequisites" section of this topic to the **Software deployable packages** tab.
2. In LCS, open the on-premises implementation project, and then open the **Environment details** page of the environment to update.
3. Under **Maintain**, select **Apply updates**. A slider shows the updates that were uploaded to the Asset library. Note that only packages that are marked as **Valid** in the Asset library appear.

If you are on local agent version 2.1.0 and higher, complete the following steps.

1. Select the update, and then click **Prepare**. Clicking on **Prepare** will prepare your on-premises environment for servicing.

NOTE

During preparation, the environment state will be **Deployed** but the Deployment status field will show the progress of Preparation. Steps such as formatting the package and downloading the package are executed during preparation. The environment is not directly touched during preparation and hence there is no downtime during the preparation phase. Users can continue to use the system during preparation.

2. After the preparation is complete, you will see **Abort** and **Update Environment** buttons. To start applying the update, click **Update Environment**. If preparation fails, see the "Resolve a failed update application" section later in this topic.
3. In the confirmation message, select **Yes**. The servicing operation has started on this environment. This is the start of the downtime on your environment.
4. The environment state is changed from **Deployed** to **Deploying**.
5. After the update is completed, the environment state is changed back to **Deployed**. If application of the

update fails, the environment state is changed to **Failed**. For information about what to do if package application fails, see the "Resolve a failed update application" section later in this topic.

6. Open the **History** and **Environment details** pages to view the operations that were performed on the environment. You can also view a record of major actions that were performed on the environment, such as deployments, servicing, and rollbacks.

If you are on local agent version lower than 2.1.0, complete the following steps.

1. Select the update, and then click **Apply**.
2. In the confirmation message, select **Yes**. The servicing operation has started on this environment. This is the start of the downtime on your environment.
3. Environment state changes from **Deployed** to **Preparing**.

NOTE

During preparation, steps such as formatting the package and downloading the package are executed during preparation. The environment is not directly touched during preparation and hence there is no downtime during the preparation phase. Users can continue to use the system during preparation. However, we recommend that the downtime starts when the environment enters the **Preparing** state.

4. After preparation is complete, the environment state is changed from **Preparing** to **Deploying**.
5. After the update is completed, the environment state is changed back to **Deployed**. If application of the update fails, the environment state is changed to **Failed**. For information about what to do if package application fails, see the "Resolve a failed update application" section later in this topic.
6. Open the **History** and **Environment details** pages to view the operations that were performed on the environment. You can also view a record of major actions that were performed on the environment, such as deployments, servicing, and rollbacks.

Update a production environment

Before you update a production environment, you must successfully complete the package application update on a sandbox environment.

1. In the project for the sandbox environment that you applied the package to, open the Asset library, and then, on the **Software deployable packages** tab, select the package, and mark it as a **Release candidate**.
2. On the **Environment details** page, under **Maintain**, select **Apply updates**. In the dialog box, only packages that are marked as a **Release candidate** are shown.
3. Select the Release candidate package to be applied to the Production environment.
4. The rest of the Update flow is the same as that of a sandbox environment. Your update experience will differ based on the version of the local agent running on your environment. We recommend that you always run with the latest version.

Resolve a failed update application

When preparation fails, the environment state is **Deployed**. When the application of an update fails, the environment state is **Failed**. The first step is to determine why there is a failure. The location of the logs varies, depending on the stage where the failure occurred:

- **Preparation stage:** If the operation fails during the **Preparation** stage, the logs are uploaded to LCS. In the log files, select **Download logs** to download the log files. If the package has any merge issues, the error is included in the log file.
- **Deploying stage:** If the operation fails during the **Deploying** stage, the logs are located in the on-premises

environment. You must sign in to the environment, and then access the logs and event viewer.

For more information about how to use the troubleshooting logs, see [Troubleshoot on-premises deployments](#).

After you review the logs and determine the cause of the failure, complete one of the following operations to restore the environment to a healthy state. No actions can be performed on an environment that is in a **Failed** state. The environment must first be restored to a healthy state.

- **Retry failed operation** – If update application fails, select **Retry** to recover from the failed operation.
- **Abort failed operation** – Because there is no change made to the on-premises environment, if the preparation fails, you have the option to cancel the operation. Select **Abort** to cancel the preparation.
- **Roll back the update** – To roll back the update that failed, select **Rollback**. Before you start the rollback, you must restore the database to the last known good state. When you select **Rollback**, the environment is restored to the last known good state. The environment state is then changed to **Preparation**, then to **Deploying**, and then to either **Deployed** or **Failed**.

NOTE

The **Rollback** button doesn't roll back the database. You're responsible for restoring the database to the last known backup that was made before update application. This step is critical to help guarantee that there is no data loss.

- **Refresh the state** – If update application fails during the **Preparation** stage, the failure is on the LCS side, and update application hasn't yet started. Therefore, the on-premises environment is in a good state. To restore the LCS environment state to **Deployed**, on the project dashboard page, select **Refresh**.
- **Delete and redeploy an environment** – If the retry and rollback options don't work, you must delete and redeploy the environment. To delete the environment, on the project dashboard page, select **Delete**. You then see the option to configure the environment.

IMPORTANT

This option should **not** be used on a production environment. However, it can be used on a sandbox deployment to restore the environment to a healthy state.

Because this option requires that you do a fresh deployment of the environment, you lose any updates that were previously applied. Any customizations and binary updates must be reapplied to the environment.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure service updates through Lifecycle Services (LCS)

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Microsoft Dynamics Lifecycle Services (LCS), you can specify how and when you receive service updates from Microsoft for your environments.

IMPORTANT

This feature is available only to customers who are using **version 8.1 and later** or are using **version 7.3**, and who are **not** part of the [First release](#) program. Microsoft is working to make the feature available to First release customers. For customers who are on version 7.1, 7.2, or 8.0, you can take the update manually using the regular servicing flows.

Only users (customers or partners) who are assigned to the **Project owner** role in LCS can configure updates. Additionally, updates can be configured only for **implementation projects**.

Follow these steps to change your update settings.

NOTE

These settings apply only to service updates. They have no effect on the operating system-level security updates that are applied to your environments every month.

1. In LCS, in your implementation project, open the **Project settings** page.

This page has a new tab that is named **Update settings**.

2. On the **Update settings** tab, set the following configuration options as you require:

- **Update environment** – Select an alternate sandbox environment that should be updated before the production update.

By default, Microsoft first updates the Tier 2 Standard Acceptance Test (sandbox) environment that is included in the base offer. It then applies the update to the production environment. If you've purchased Tier 2 and higher sandbox add-on environments and want a different sandbox to be updated, you can use this field to change the default environment to an alternate environment.

IMPORTANT

The environment that you select here will be updated seven calendar days before the update cadence that is selected for the production environment.

- **Production environment update cadence** – Select a recurring cadence for updates to your production environment. The sandbox environment that is selected in the **Update environment** field will be updated seven calendar days before the selected cadence. The following options are available:
 - **Select the cadence** – Select whether to receive updates in the first, second, or third week of the month.
 - **Select one of the three time-zones** – Select the time zone that the production environment

should be updated in: Eastern Time (UTC – 5), Hong Kong Time (UTC + 8), or Greenwich Mean Time (UTC + 0).

- **Select a day of the week:** Select the day in the week when you want to receive updates.
- **Select a time slot:** Select the time slot when you want to receive updates.

NOTE

Currently, only a few options are available for the day of the week and time slot options. Microsoft will add more options soon, such as weekdays for customers.

IMPORTANT

If the above time slots do not meet your needs, you always have the option to do a self-update at a time that is convenient to you by taking the update and applying it to your environments using the regular servicing flows.

3. When you've finished setting the configuration options, select **Save**.

After you set the update environment and update cadence, Microsoft generates an update calendar for the next six months. This calendar shows exactly when the configured sandbox and production environments will be updated. Therefore, you will know when to expect each update. To view the calendar, select the **View update calendar** link under the **Production environment update cadence** options.

IMPORTANT

After the settings are saved, you can change them at any time. However, if there is an ongoing rollout, the new settings won't be used to update the existing rollout timings. Instead, they will start to be used in the next rollout. An ongoing rollout is defined by the 14-day period between the date when the email notification about the update of the sandbox environment is sent and the date when the production environment is updated.

For more information about how to pause updates to configured sandbox and production environments, see [Pause service updates through Lifecycle Services \(LCS\)](#).

For more information about One Version and Microsoft-managed service updates, see [One Version service updates FAQ](#).

Canceled updates

A scheduled update could be canceled for various reasons. Here are some of the common reasons that could cause a scheduled update to be canceled by Microsoft.

- An error was found during update preparation. The update preparation starts approximately 4 hours before the update to ensure that the environment is in a healthy state. If the environment was in a failed state or maintenance mode, the scheduled update will be canceled before it starts.
- An error was found while updating the environment. If there were issues during the update, the scheduled update will be canceled and the environment is rolled back to the previous state.
- The environment is already running on the latest version. There's no need to apply the update again, the scheduled update will be canceled before it starts.
- The target environment is not found. If the designated sandbox was deleted or the production environment has not been deployed, the scheduled update will be canceled before it starts.
- You're enrolled in the [First Release program](#). The First Release program has different release cadence so the previously scheduled updates will be canceled.

You can find the canceled updates via the **View recent canceled updates** in the update settings. It will show all canceled updates, if any, within the last 2 scheduled updates.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Pause service updates through Lifecycle Services (LCS)

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to pause updates to your sandbox and production cloud environments by using Microsoft Dynamics Lifecycle Services (LCS). This topic does not apply to on-premises environments.

IMPORTANT

This feature is available only to customers who are using **version 8.1 and later** or are using **version 7.3**, and who are **not** part of the [First release](#) program. Microsoft is working to make the feature available to First release customers. For customers who are on version 7.1, 7.2, or 8.0, you can take the update manually using the regular servicing flows.

Microsoft updates your configured sandbox and production environments to the latest service update that Microsoft has released. Microsoft notifies you about upcoming updates to your environments via email and through notifications in LCS. At that point, if you can't proceed with the update for some reason, you can pause it through LCS.

For more information about how to change the configured sandbox environment and set the production update cadence, see [Configure service updates through Lifecycle Services \(LCS\)](#).

Who can pause service updates?

Only users (customers or partners) who are assigned to the **project owner** role in LCS can pause updates. Additionally, updates can be paused only for **implementation projects**.

Staying current with service updates helps guarantee that customers always run on the latest set of fixes that Microsoft has released, so that they have the best service experience. Therefore, Microsoft doesn't allow updates to be paused indefinitely.

You can't use LCS to pause updates if you're three or more updates behind the latest update that Microsoft has released. For example, if the latest update that Microsoft has released is version 10.0.0, customers who are on version 8.1.3, version 8.1.2, and version 8.1.1 **can** pause updates. However, customers who are on version 8.1.0 **can't** pause updates, because they are more than three updates behind. Customers who are on version 7.3 can get only platform updates. For example, if the last platform update that Microsoft has released is Platform update 25, customers who are on Platform update 24, Platform update 23, and Platform update 22 **can** pause updates. However, customers who are on Platform update 21 **can't** pause updates.

What can I pause?

If you decide to pause updates, you have two options:

- Pause updates only to your production environment.
- Pause updates to both your sandbox environment and your production environment.

You can pause a maximum of three continuous updates at a time. For example, if you're using version 8.1.3, you can pause update version 10.0.0, 10.0.1 and 10.0.2. However, you can't pause update version 10.0.3. In addition, in the month of June, you can pause the next three updates. However, you will not be able to pause updates scheduled for October, November, December and later. Similarly, for customers on version 7.3 for platform only updates, if you're using Platform update 23 then you can pause update 24, update 25, and update 26, but you

cannot pause update 27. We will be releasing 8 updates in a year. We require you to take at least two updates in a year.

IMPORTANT

There is no way to pause more than three updates, regardless of your industry or business schedule. If you are more than three updates behind and you find a critical issue during validations in your sandbox environment after the update, you can contact Microsoft Support to pause the update to your production environment. This is only required if you are more than three updates behind and you are unable to use the pause updates functionality available in LCS to pause the update to production.

If you pause updates to your sandbox environment, updates are automatically also paused for your production environment, because Microsoft always updates configured sandbox environments before production environments.

How do I pause updates?

To pause updates, follow these steps.

1. In LCS, in your implementation project, open the **Project settings** page.

This page has a new tab that is named **Update settings**.
2. On the **Update settings** tab, set the **Pause updates** option to **ON**.
3. Select **Edit settings**.
4. In the dialog box that appears, select whether you want to pause updates to your production environment only, or to both your sandbox environment and your production environment.
5. Select **Next**.
6. Select your reason for pausing updates. If you select **Issue found during validations**, you must enter a valid support ticket number. You can add any additional details that will help Microsoft understand why you want to pause updates.
7. When you've finished, select **Confirm**.

You can also edit an existing pause. You can either extend the duration of the pause, so that updates are paused for a longer time, or cancel it, so that updates are resumed. To edit a pause, select **Edit settings**. The limitations about the number of updates that you can pause still apply.

To cancel a pause and resume updates to your environments, set the **Pause updates** option to **OFF**.

Any time that you pause updates or edit an existing pause, a notification appears at the top of the **Update settings** tab. This notification shows what has been paused. An email is also sent to all stakeholders (the project owner and environment manager), to notify them that service updates for the selected environments have been paused. If someone cancels an existing pause and resumes updates, the notification disappears, and an email is sent to inform the stakeholders that updates have resumed.

IMPORTANT

You can pause updates through LCS until four hours before the start of the downtime window.

You can cancel a pause and choose to resume updates only 7 days prior to the start of the downtime date. If you are past that date then you will not be able to cancel a pause.

What happens after the pause duration expires?

Cumulative service updates help guarantee that customers always run on the latest set of fixes that Microsoft has released, so that they have the best service experience. Therefore, Microsoft doesn't allow updates to be paused indefinitely.

There are two ways to cancel pauses, so that updates are resumed:

- Someone manually cancels an ongoing pause, as explained in the previous section.
- The duration that was set for the pause expires, and updates to the configured environments are automatically resumed.

In both cases, an email is sent to inform the stakeholders.

For more information about service updates, see [One Version service updates FAQ](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Get notified about service updates through Lifecycle Services (LCS)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how you can stay up to date about service updates from Microsoft.

Microsoft uses service updates to update your configured sandbox and production environments to the latest released version. Microsoft notifies you about upcoming updates to your environments via email and through notifications in Microsoft Dynamics Lifecycle Services (LCS).

Here are the different types of notifications that you will receive:

- **Notification when an update is made available:** When a new release is made generally available, Microsoft surfaces a notification in your implementation projects' action center. You can then save that update in your projects' asset library, if you want to apply the update to your environments before Microsoft does an automatic update. When Microsoft does an automatic update, it also saves a copy of the update in your projects' asset library.
- **Notification that is sent five days before the update:** Microsoft notifies you five days before it updates your environment. After you've configured your update cadence, you will receive notifications about upcoming updates five days before they occur. These notifications take three forms:
 - **Email notification:** Project owners, environment managers, and users who are listed as additional stakeholders for an environment are notified by email about the upcoming update.
 - **Notification bar on the environment details page:** A notification that appears on the environment details page in LCS informs the customer about the upcoming update.
 - **Upcoming update reflects the update:** On the environment details page in LCS, select **Maintain > Upcoming Update** to open a dialog box that contains details about the upcoming update.
- **Notification that is sent one hour before the update:** One hour before the start of the downtime window, users in the application receive a notification. This notification asks users to save their work, because the environment will be taken down for an update.
- **Notification that is sent when the update is completed:** After Microsoft has finished updating your configured environment, it notifies you by email about the outcome of the update. This email is always sent, regardless of whether the update was successfully applied. It's sent to project owners, environment managers, and users who are listed as the additional stakeholders for the environment. If Microsoft can't start the update for some reason, the email includes a reason to explain why the update wasn't started.

After you receive a notification, if you can't proceed with the update for some reason, you can pause it. For more information about how to pause updates to configured sandbox and production environments, see [Pause service updates through Lifecycle Services \(LCS\)](#).

For more information about One Version and Microsoft-managed service updates, see [One Version service updates FAQ](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Data task automation

2/18/2021 • 17 minutes to read • [Edit Online](#)

Data task automation lets you easily repeat many types of data tasks and validate the outcome of each task. Data task automation is very useful for projects that are in the implementation phase. For example, you can automate the creation and configuration of data projects. You can also configure and trigger the execution of import/export operations, such as the setup of demo data and golden configuration data, and other tasks that are related to data migration. You can also create automated testing of data entities by using task outcome validation.

IMPORTANT

Data task automation isn't currently supported for on-premises environments. The user who executes data task automation must be in the same tenant as the application environment and LCS project.

We recommend the following approach for data task automation.

1. Identify the data-related tasks that will benefit from automation.

We recommend that implementation teams review their configuration management plan and data migration plan to identify potential data tasks for automation, and also to identify data entity test cases.

2. Define tasks.

Tasks are defined in an XML manifest. You can keep your manifest under source control as part of configuration management in your application lifecycle management (ALM) strategy.

3. Put the data packages that are related to data task automation in the Shared asset library of Microsoft Dynamics Lifecycle Services (LCS). You can also use a specific LCS project as you require.

Data task automation manager can consume packages from any sandbox and/or production environment that is related to the LCS project.

IMPORTANT

- The user account that runs Data task automation manager must have access to LCS and to the LCS project that is referenced in the manifest for data packages.
- Although data task automation can be run in any environment in the cloud, we strongly recommend that you not run any import/export tasks that use integration application programming interfaces (APIs) in a production environment. Data task automation that involves integration APIs should be used only for automated testing.

4. Run the data tasks, and then review the outcomes.

Data task automation manager provides the success or failure outcome for each task. It also provides insights into the reason why a task failed.

IMPORTANT

Although data task automation can be run in any environments in the cloud, we recommend that you not run any import/export tasks that use integration APIs in a production environment. Data task automation that involves integration APIs should be used only for automated testing.

The following video is a 55-minute TechTalk that walks you through an early release of Data task automation manager: [Task automation framework](#).

Task manifest

A task must be defined in an XML manifest. This section describes the manifest. For guidance about how to name and design the manifest, see the "Best practices for manifest design" section later in this topic.

Manifest root

The `<TestManifest>` element is the root of the manifest. All other elements are children of this element.

```
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
  <SharedSetup />
    <JobDefinition ID='ImportJobDefinition_1' />
    <EntitySetup ID='Generic' />
  </SharedSetup>
  <TestGroup />
</TestManifest>
```

ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	ATTRIBUTE DESCRIPTION
<code><TestManifest></code>	1..1	name	The <i>name</i> helps to identify the purpose of the manifest.

Shared setup

The **Shared setup** section defines general task parameters and behaviors for all tasks in the manifest.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	ATTRIBUTE DESCRIPTION
<code><TestManifest></code>	<code><SharedSetup></code>	1..1	-	This element takes no attributes.

Data files

`<DataFile>` elements define the data packages and data files that the tasks in the manifest will use. The data files must be either in the LCS asset library of your LCS project or in the Shared asset library.

```
<DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared' assetType='Data package'
lcsProjectId='' />
<DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS' assetType='Data package'
lcsProjectId='' />
<DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH' assetType='Data package'
lcsProjectId='' />
<DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB' assetType='Data package'
lcsProjectId='' />
```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	ATTRIBUTE DESCRIPTION
<SharedSetup>	<DataFile>	1..n	-	-
	<DataFile>	-	ID	
	<DataFile>	-	name	Name of the asset that represents the data file.
	<DataFile>	-	assetType	The asset type in LCS asset library that stores the data file. This is the asset type name as shown in LCS asset library.
	<DataFile>	-	lcsProjectId	The LCS project that has the data file in its asset library. If the project ID is specified as " " then, it indicates the Shared asset library.

Data project definition

The <JobDefinition> element defines the data project definition. There can be more than one job definition in a manifest.

```

<JobDefinition ID='ImportJobDefinition_1'>
  <Operation>Import</Operation>
  <ConfigurationOnly>No</ConfigurationOnly>
  <Truncate></Truncate>
  <Mode>Import async</Mode>
  <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
  <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
  <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
  <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
  <SupportedDataSourceType>Package</SupportedDataSourceType>
  <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
  <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
  <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
  <LegalEntity>DAT</LegalEntity>
  <PackageAPIExecute>true</PackageAPIExecute>
  <PackageAPIOverwrite>false</PackageAPIOverwrite>
  <PackageAPIReexecute>false</PackageAPIReexecute>
  <DefinitionGroupID>TestExport</DefinitionGroupID>
  <PackageName>TestExportPackage</PackageName>
</JobDefinition>

```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
<SharedSetup>	<JobDefinition>	1..n	ID	The job definition ID is used in the tasks to reference the definition to be used for the data project.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
<JobDefinition>	<Operation>	1..1	-	The operation to be performed is specified by the following values: - Import - Export
	<Truncate>	1..1	-	This is a Boolean field with possible values of Yes or No. This is applicable only when operation is set to <i>Import</i> .
	<Mode>	1..1	-	The mode specifies the method using which the operation must be performed. The possible values are: - Import async - Export async - Recurring batch: This uses the enqueue API. Dequeue API is not supported yet. Package API supports both export and import.
	<ConfigurationOnly>	0..1	-	This is a Boolean field with possible values of Yes or No. This must be set to Yes if the task is only to configure the data project but not to perform the specified operation.
	<BatchFrequencyInMinutes>	1..1	-	This specifies the frequency in which the batch must be scheduled. This is applicable only when mode is set to <i>recurring batch</i> .
	<NumberOfTimesToRunBatch>	1..1	-	This is used to set a limit to how many times the scheduled batch should run. This is applicable only when mode is set to <i>recurring batch</i> .

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<UploadFrequencyInSeconds>	1..1	-	This is used to control the rate at which a file is uploaded to the recurring batch job for import. This must be used only for automated testing of recurring integrations in non-production environments. This is applicable only when mode is set to <i>recurring batch</i> and operation is set to <i>Import</i> .
	<TotalNumberOfTimesToUpload>	1..1		This controls the total number of times the file should be uploaded to the recurring batch. This must be used only for automated testing of recurring integrations in non-production environments. This is applicable only when mode is set to <i>recurring batch</i> and operation is set to <i>Import</i> .
	<SupportedDataSourceType>	1..1		This must be used to specify if a file is being sent to the recurring batch or a package. This is only applicable when mode is set to 'recurring batch'.
	<ProcessMessagesInOrder>	1..1		This is a Boolean field with possible values of Yes or No. This is applicable only when mode is set to <i>recurring batch</i> and operation is <i>Import</i> .
	<PreventUploadWhenZeroRecords>	1..1		This is a Boolean field with possible values of Yes or No. This is applicable only when mode is set to <i>recurring batch</i> and operation is <i>Export</i> .

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<UseCompanyFrom Message>	1..1		This is a Boolean field which can be set to Yes or No. This is applicable only when mode is set to <i>recurring batch</i> and operation is <i>Import</i> .
	<LegalEntity>	1..1		This is used to specify the legal entity in which the import/export job must be executed.
	<PackageAPIExecute >	1..1		Refer to package API documentation to understand this parameter. This is a Boolean field which takes 'true' or 'false'.
	<PackageAPIOverwrite>	1..1		Refer to package API documentation to understand this parameter. This is a Boolean field which takes 'true' or 'false'.
	<PackageAPIReexecute>	1..1		Refer to package API documentation to understand this parameter. This is a Boolean field which takes 'true' or 'false'.
	<DefinitionGroupID>	1..1		Refer to package API documentation to understand this parameter. This is a string field.
	<PackageName>	1..1		Refer to package API documentation to understand this parameter. This is a string field.

Entity setup

The **Entity setup** section defines the characteristics of an entity that a task in the manifest will use. There can be more than one definition, one for each entity that is used by the tasks in the manifest.

```

<EntitySetup ID='Generic'>
  <Entity name='*'>
    <SourceDataFormatName>Package</SourceDataFormatName>
    <ChangeTracking></ChangeTracking>
    <PublishToBYOD></PublishToBYOD>
    <DefaultRefreshType>Full push only</DefaultRefreshType>
    <ExcelWorkSheetName></ExcelWorkSheetName>
    <SelectFields>All fields</SelectFields>
    <SetBasedProcessing></SetBasedProcessing>
    <FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
    <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
    <DisableEntity>No</DisableEntity>
    <SkipStaging>Yes</SkipStaging>
    <ParallelProcessing>
      <Threshold></Threshold>
      <TaskCount></TaskCount>
    </ParallelProcessing>
    <MappingDetail StagingFieldName='RoundingRulePrices' AutoGenerate='Yes' AutoDefault='No'
    DefaultValue='' IgnoreBlankValues='No' TextQualifier='No' UseEnumLabel='No'/>
  </Entity>
</EntitySetup>

```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
<SharedSetup>	<EntitySetup>	1..n	ID	An identification that will be used by tasks to reference an entity definition to be used.
<EntitySetup>	<Entity>	1..1	name	The entity element is identified by the entity's name. However, to facilitate easy manifest definition, this element also supports * as a wild card which will mean all entities being used in a task. This comes in very handy when using data packages with hundreds of entities in a task.
<Entity>	<SourceDataFormat Name>	1..1	-	This is the file format to be used for the entity.
	<ChangeTracking>	1..1	-	This is a Boolean field with possible values of Yes or No. It enables or disables change tracking on the entire entity.
	<PublishToBYOD>	1..1	-	This is a Boolean field with possible values of Yes or No.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<DefaultRefreshType>	1..1	-	This sets the default refresh rate on the entity. The possible values are <i>Incremental push only</i> or <i>Full push</i> .
	<ExcelWorkSheetName>	1..1	-	This is used to specify the worksheet to be used for the entity.
	<SelectFields>	1..1	-	This can be used to specify the fields to be included in the template for an export operation.
	<SetBasedProcessing>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable set based processing on an entity.
	<FailBatchOnErrorForExecutionUnit>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable failure at execution unit level on an entity.
	<FailBatchOnErrorForLevel>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable failure at execution level on an entity.
	<DisableEntity>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to enable or disable an entity in a data project.
	<SkipStaging>	1..1	-	This is a Boolean field with possible values of Yes or No. It is used to skip staging table for an entity during exports.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<ParallelProcessing>	1..1	-	This is used to define the parallel processing set up for an entity. The task will delete these settings if already exists at the beginning of the task and it will delete the created settings at the end of its execution.
<ParallelProcessing>	<Threshold>	1..1	-	This specifies the threshold for the parallel processing rule.
	<TaskCount>	1..1	-	This is used to specify the number of parallel tasks to be used for parallel processing.
<Entity>	<MappingDetail>	0..n	-	Allows to configure the <i>auto generate</i> , <i>auto default</i> and other settings on the mapping for an entity.
	<MappingDetail>	-	StagingFieldName	This attribute is used to identify the entity column for which the settings are to be specified.
	<MappingDetail>	-	AutoGenerate	This is a Boolean field with possible values of Yes or No for enabling/disabling auto generate option.
	<MappingDetail>	-	AutoDefault	This is a Boolean field with possible values of Yes or No for enabling/disabling auto default option.
	<MappingDetail>	-	DefaultValue	This is the default value to be used if auto defaulting is enabled.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTE	DESCRIPTION
	<MappingDetail>	-	IgnoreBlankValues	This is a Boolean field with possible values of Yes or No for enabling/disabling this option.
	<MappingDetail>	-	TextQualifier	This is a Boolean field with possible values of Yes or No for enabling/disabling this option.
	<MappingDetail>	-	UseEnumLabel	This is a Boolean field with possible values of Yes or No for enabling/disabling this option.

Test groups

Test groups can be used to organize related tasks in a manifest. There can be more than one test group in a manifest.

```

<TestGroup name='Set up Financials'>
  <TestCase Title='Import shared set up data package' ID='3933885' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='SharedSetup' />
    <JobDefinition RefID='ImportJobDefinition_1' />
    <EntitySetup RefID='Generic' />
  </TestCase>

  <TestCase Title='Import financials for HQUS' ID='3933886' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='FinancialsHQUS' />
    <JobDefinition RefID='ImportJobDefinition_1'>
      <LegalEntity>HQUS</LegalEntity>
    </JobDefinition>
    <EntitySetup RefID='Generic' />
  </TestCase>

  <TestCase Title='Import financials for PICH' ID='3933887' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='FinancialsPICH' />
    <JobDefinition RefID='ImportJobDefinition_1'>
      <LegalEntity>PICH</LegalEntity>
    </JobDefinition>
    <EntitySetup RefID='Generic' />
  </TestCase>

  <TestCase Title='Import financials for PIFB' ID='3933888' RepeatCount='1' TraceParser='off'
  Timeout='20'>
    <DataFile RefID='FinancialsPIFB' />
    <JobDefinition RefID='ImportJobDefinition_1'>
      <LegalEntity>PIFB</LegalEntity>
    </JobDefinition>
    <EntitySetup RefID='Generic' />
  </TestCase>
</TestGroup>

```

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	DESCRIPTION
<TestManifest>	<TestGroup>	1..n	-	-
	<TestGroup>	1..1	Name	This is the name for the group to identify its functional reason.
<TestGroup>	<TestCase>	1..n	-	The task is defined in this element. The task can refer to the shared set up to inherit task parameters and task behavior. The task can also override parameters and behavior at its level thus making the management of the manifest simple.
	<TestCase>	-	Title	This is the title for the task.
	<TestCase>	-	ID	This is the ID for the task. This can be alphanumeric with a max character limit of 10.
	<TestCase>	-	RepeatCount	This is a placeholder for a future functionality. However, this must be specified with a value of <i>1</i> .
	<TestCase>	-	TraceParser	This is a placeholder for a future functionality. However, this must be specified with a value <i>off</i> .
	<TestCase>	-	Timeout	This is the maximum duration a task will be monitored by the task automation manager. If the task is still active beyond the timeout specified, the manager will proceed to the next task in the manifest.

PARENT ELEMENT	ELEMENT	ELEMENT CARDINALITY	ATTRIBUTES	DESCRIPTION
<TestCase>	<DataFile>	1..n	-	This element is used to define the file or data package to be used by the task. This can reference to an already declared file or a data package in the shared section of the manifest. A task can have more than one data file specified for recurring batch import scenarios only. For other scenarios, even if more than one files are specified, the first file is what will be used by the task.
	<JobDefinition>	1..1	-	This element is used to define the data project to be used by the task. This can reference to an already declared job definition in the shared section of the manifest. The task can override elements of job definition to a new value than what is defined in the shared set up.
	<EntitySetup>	1..1	-	This element is used to define the entity set up for entities used by the task. This can reference to an already declared entity set up in the shared section of the manifest. The task can override elements of entity setup to a new value than what is defined in the shared set up.

Best practices for manifest design

You can define a manifest in many ways. Here are a few pointers that you should consider when you design a manifest.

Granularity

We recommend that you determine the granularity of your manifest as a functional decision. Your team must

decide whether it wants to manage many manifests or manage changes in a single manifest.

- Start with as many manifests as your team thinks you logically need. Later, when the team actually starts to run the manifests, it might find that it uses fewer manifests than it expected, and it might want to merge them. In this case, you can merge manifests.
- Consider separation of duties. For example, you might have one manifest for the setup of demo data and another manifest for the setup of the golden configuration for your environment. In this way, you can make sure that team members use only the manifests that they are supposed to use.
- Consider user access to LCS. For example, larger and globally distributed implementation teams might have multiple instances of the application or multiple LCS projects.

Inheritance

The manifest schema supports inheritance of common elements that will apply to all tasks in the manifest. A task can override a common element to define a unique behavior. The purpose of the **Shared setup** section is to minimize repetition of configuration elements, so that elements are reused as much as possible. The goal is to keep the manifest concise and clean, to improve maintenance and readability.

Source control

Manifests that must be used by all the members of an implementation team should be stored in source control in the Application Object Tree (AOT). This approach not only provides the benefits of source control, but also enables a process to distribute or make manifests available to all users in a consistent manner. This approach also enables configuration management for data projects that are related to data management, if manifests are used for configuration.

Number of job definitions and entity definitions

For most of the use cases, one job definition in a manifest should be enough, because inheritance can be used to change the behavior at the task level. This principle also applies to entity definitions.

Validations

Data task automation manager performs validations, based on the setup of a task. If a task fails, you can quickly determine the reason for the failure by viewing the validations after the task is completed. The level of information that Data task automation manager provides is optimized to facilitate initial discovery. For detailed investigation, you must look at the corresponding data project and its execution details.

The following data validations are currently supported:

- **Job status** – This validation checks whether the job was successful.
- **Batch status** – This validation checks whether the batch was successful.
- **Message status** – If the test is about integrations, the message status is validated.
- **Truncation** – If truncation is enabled, this validation checks whether truncation occurred.
- **Skip staging** – If **Skip staging** is enabled on a test, this validation checks whether staging was skipped.

Example 1: Configuration management for data projects

The `<ConfigurationOnly>` element can be used to create configuration tasks for data projects. When `ConfigurationOnly` is set to `Yes`, the data projects are only created but not executed. This allows for managing data projects across environments in an automated manner.

```
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
  <SharedSetup>
    <DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS' assetType='Data package'
```

```

lcsProjectId='' />
  <DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH' assetType='Data package'
lcsProjectId='' />
  <DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB' assetType='Data package'
lcsProjectId='' />

  <JobDefinition ID='ImportJobDefinition_1'>
    <ConfigurationOnly>Yes</ConfigurationOnly>
    <Operation>Import</Operation>
    <Truncate>No</Truncate>
    <Mode>Import async</Mode>
    <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
    <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
    <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
    <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
    <SupportedDataSourceType>Package</SupportedDataSourceType>
    <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
    <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
    <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
    <LegalEntity>DAT</LegalEntity>
  </JobDefinition>

  <EntitySetup ID='Generic'>
    <Entity name='*'>
      <SourceDataFormatName>Package</SourceDataFormatName>
      <ChangeTracking>No</ChangeTracking>
      <PublishToBYOD>No</PublishToBYOD>
      <DefaultRefreshType>Full push only</DefaultRefreshType>
      <ExcelWorkSheetName></ExcelWorkSheetName>
      <SelectFields>All fields</SelectFields>
      <SetBasedProcessing>No</SetBasedProcessing>
      <FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
      <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
      <FailBatchOnErrorForSequence>No</FailBatchOnErrorForSequence>
      <ParallelProcessing>
        <Threshold></Threshold>
        <TaskCount></TaskCount>
      </ParallelProcessing>
    </Entity>
  </EntitySetup>
</SharedSetup>

  <TestGroup name='Set up import jobs for Financials'>
    <TestCase Title='Set up import job for shared set up data package' ID='3933885' RepeatCount='1'
TraceParser='off' TimeOut='20'>
      <DataFile RefID='SharedSetup' />
      <JobDefinition RefID='ImportJobDefinition_1' />
      <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Set up import job for financials HQUS' ID='3933886' RepeatCount='1'
TraceParser='off' TimeOut='20'>
      <DataFile RefID='FinancialsHQUS' />
      <JobDefinition RefID='ImportJobDefinition_1'>
        <LegalEntity>HQUS</LegalEntity>
      </JobDefinition>
      <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Set up import job for financials PICH' ID='3933887' RepeatCount='1'
TraceParser='off' TimeOut='20'>
      <DataFile RefID='FinancialsPICH' />
      <JobDefinition RefID='ImportJobDefinition_1'>
        <LegalEntity>PICH</LegalEntity>
      </JobDefinition>
      <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Set up import job for financials PIFB' ID='3933888' RepeatCount='1'

```

```

TraceParser='off' Timeout='20'>
  <DataFile RefID='FinancialsPIFB' />
  <JobDefinition RefID='ImportJobDefinition_1'>
    <LegalEntity>PIFB</LegalEntity>
  </JobDefinition>
  <EntitySetup RefID='Generic' />
</TestCase>
</TestGroup>
</TestManifest>

```

Example 2: Automated setup of demo data

The following manifest shows the setup of demo data for three legal entities when the demo data packages are stored in the Shared asset library. The difference in this example from the previous example is the actual execution of the data projects to set up the demo data. This is accomplished by not using the ConfigurationOnly option or setting it to No to use it for consistency of the manifest.

```

<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
  <SharedSetup>
    <DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH' assetType='Data package'
lcsProjectId='' />
    <DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB' assetType='Data package'
lcsProjectId='' />

    <JobDefinition ID='ImportJobDefinition_1'>
      <Operation>Import</Operation>
      <Truncate></Truncate>
      <Mode>Import async</Mode>
      <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
      <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
      <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
      <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
      <SupportedDataSourceType>Package</SupportedDataSourceType>
      <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
      <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
      <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
      <LegalEntity>DAT</LegalEntity>
    </JobDefinition>

    <EntitySetup ID='Generic'>
      <Entity name='*'>
        <SourceDataFormatName>Package</SourceDataFormatName>
        <ChangeTracking></ChangeTracking>
        <PublishToBYOD></PublishToBYOD>
        <DefaultRefreshType>Full push only</DefaultRefreshType>
        <ExcelWorkSheetName></ExcelWorkSheetName>
        <SelectFields>All fields</SelectFields>
        <SetBasedProcessing></SetBasedProcessing>
        <FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
        <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
        <FailBatchOnErrorForSequence>No</FailBatchOnErrorForSequence>
        <ParallelProcessing>
          <Threshold></Threshold>
          <TaskCount></TaskCount>
        </ParallelProcessing>
      </Entity>
    </EntitySetup>
  </SharedSetup>

  <TestGroup name='Set up Financials'>

```

```
<TestCase Title='Import shared set up data package' ID='3933885' RepeatCount='1' TraceParser='off'
TimeOut='20'>

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Delivering ISV solutions using One Version

2/18/2021 • 17 minutes to read • [Edit Online](#)

Thanks to One Version, new updates are now automatically broadcast, downtime is minimal, and customers enjoy the benefits of staying current with recent features and fixes without having to go through expensive upgrades.

Feature management lets customers control when new features are applied. Therefore, as an independent software vendor (ISV) partner, you can innovate together with Microsoft to take advantage of new features without having to handle the waiting times that come with long release cycles. When all your customers run on current versions, you have fewer versions to maintain. You can focus instead on building quality into the solutions that you provide for your customers.

The process of servicing current versions is also more seamless and safer than it was in earlier versions. Previously, patching required that individual fixes be combined and merged into a customer environment.

Extensibility allows for deployment of side-by-side solutions that give customers more choices about how they configure their solutions.

In the One Version model, customer user acceptance testing (UAT) environments and production environments are updated every month. It's critical that updates not cause issues. However, Microsoft acknowledges that both technical issues and functional issues may arise when environments are updated.

- Technical issues include breaking changes in application programming interfaces (APIs) that customizations in your solutions use.
- Functional issues that customers experience can be caused by the untimely introduction of new features. Microsoft will put any new functionality that might affect existing processes under feature management. In this way, customers can control when new functionality is adopted. Therefore, they have time to validate, document, and train their users about the new features.
- Functional issues might also be unintended changes that cause functional regressions.

Prevention of technical and functional issues is difficult and requires close coordination between Microsoft and you as an ISV partner. The Microsoft goal is that you will adopt practices that resemble Microsoft practices. This topic explains how you and Microsoft can achieve this goal together. Over the next several months, Microsoft will release new practices and tools to help you. This topic will be updated as the tools and practices evolve.

This topic includes the following sections:

- [Servicing customers](#)
- [Compatibility](#)
 - [Runtime compatibility](#)
 - [Design-time compatibility](#)
- [Developing new releases](#)
 - [Designing for extensibility](#)
 - [Data upgrade](#)
 - [Feature exposure](#)
- [Branches and builds](#)
- [Testing](#)

- [Deploying updates](#)
- [ISV solutions as part of One Version automated deployment](#)
- [Should I release binaries or source code?](#)

Servicing customers

Dynamics 365 Finance and Operations apps run on Microsoft Azure. Therefore, it's a solution that runs as a service. Microsoft services companies 24/7, either proactively from alerts that report unusual behavior, or from support tickets that are submitted by customers or their partners. Microsoft has a range of tools to help support the services that are running. These tools include usage data that is collected from the services. To help safeguard customer data, Microsoft is also careful about who can access customer systems.

When Microsoft analyzes an issue, it might determine that the issue is related to your ISV solution. Microsoft reports this type of issue to you, so that you can follow up offline.

Companies can opt out of updates for two consecutive service updates before the next service update is applied to their environments. Therefore, at any time, Microsoft can expect that companies will be running one of the last three monthly updates.

When Microsoft resolves an issue that requires a code fix, it generally includes that code fix in the next monthly update. However, very critical issues that are reported, such as production outage, might require that a fix be provided for the version that customers are currently running.

Similar policies apply to your ISV solution, and you might also have to provide a code update. For your solution to be binary-compatible with all your customers, it must be built on the oldest platform release that you want to support. All new updates that Microsoft releases are intended to be binary backward-compatible. This compatibility gives you the option of maintaining only one servicing version of your solution that is based on the oldest of the three most recent updates. Therefore, you must maintain just one released solution. You can then use that solution to update all your customers, regardless of which of the three most recent updates they are running. As your customers adopt new Microsoft updates, you can rebase your maintained solution to a newer release to remain current with the three most recent updates.

This recommendation applies to servicing and maintaining your released solution. You will use a different approach to develop new releases of your solution. For more information, see the [Developing new releases](#) section of this topic.

Compatibility

Microsoft diligently tries to guarantee compatibility with existing customizations. To achieve this goal, Microsoft uses strict practices in its engineering processes, together with tool and automation support that helps identify API contracts that are unintentionally broken. Telemetry lets Microsoft engineers determine customizations that reference or extend a Microsoft API.

Updates to Finance and Operations apps that are applied to customer environments are intended to be functionally compatible and binary-compatible with existing customizations. This compatibility covers not only APIs, but also functionality and the user experience. Customers must explicitly opt in to all new experiences.

Any deprecation or breaking change in binary or functional compatibility will be announced 12 months in advance. Therefore, you will have enough time to align your customizations with an alternative design. You must pay attention to the monthly updates to Microsoft documentation, and you must review the APIs that are marked as obsolete (deprecated) or internal. In this way, you will be able to manage changes in a timely manner.

The following sections define and describe the aspects of backward compatibility: runtime compatibility and design-time compatibility.

Runtime compatibility

All new updates are intended to be runtime backward-compatible. This compatibility covers both binary compatibility and functional compatibility. Runtime compatibility means that customizations that exist in production and sandbox environments will continue to work after new updates are deployed in those environments. These updates include both service updates and quality updates.

Runtime compatibility also means that changes made by Microsoft to the platform will be backward-compatible with customizations that were compiled on an earlier platform.

Binary compatibility is backwards only. You can compile a customization on an older platform, and deploy it to a customer environment that has been updated to a later version. You cannot deploy code compiled on a later version than the one running on the environment you deploy to.

Design-time compatibility

Design-time backward compatibility (that is, compile-time compatibility) means that developers can apply updates to their development environments and successfully compile their code without having to make any changes.

You must be aware of how APIs in your solution are used in your customers' implementations, and how you can use these APIs without causing breaking changes. As part of this effort, you must pay careful attention to what is changed and rely on engineering best practices. For examples of changes that you should avoid, see [Breaking changes](#).

You should try to meet a bar that resembles the bar that Microsoft sets. In that way, both you and Microsoft can help avoid creating regressions.

All Microsoft updates are intended to be binary (runtime) compatible, and Microsoft also aims for design-time compatibility. However, there is one category of required changes that is **not** design time-compatible but remains binary-compatible. After an update is applied, new errors or warnings might occur when your code is compiled. Here are some examples of these changes:

- Microsoft makes an enumeration extensible.
- Microsoft marks an API as obsolete or internal.
- Microsoft introduces a new compiler error to help avoid unsafe coding practices.

All these changes might require work on your solution.

Design-time breaking changes that are binary-compatible don't require a 12-month deprecation notice.

Developing new releases

Together, One Version and the fact that the Finance and Operations apps run as a service provides a great vehicle for collecting feedback. Feedback is useful, because it helps Microsoft decide which new features it should add to upcoming updates. Historically, the Microsoft approach has been to release major releases that include many new features. However, the new model encourages a different approach. Therefore, Microsoft has moved to a series of continuous updates that gradually build on the available capabilities of the system. In many cases, one update contains an initial small feature that Microsoft then enriches in later updates. In some cases, Microsoft must provide staging for new features, and must use feature exposure to hide the new features or control modifications to them.

We recommend that you follow a similar approach for your ISV solutions. You will benefit from quicker integration and extension of new standard features.

As the following illustration shows, the frequency of your new releases can be independent of Microsoft releases. You should consider adopting a strategy for source code branching, as described in the [Branches and builds](#) section of this topic.

What is essential is the quality of every update that is released. Although testing helps guarantee quality, quality must also be built in during the design and implementation phases. In the One Version model, there are some new dimensions to consider, as described in the following sections.

Designing for extensibility

To design your solution for extensibility, you must consider now only how you will customize by extending the standard application, but also how you will enable customization of your ISV solutions by your customers and partners.

Make sure that customizations are additive instead of intrusive, and follow the guidance on the [Extensibility home page](#).

Don't be too creative about the way that you build your customization. Otherwise, you might extend an API that is questionable and increase the risk that later updates will break your solution. Instead, log an [extensibility request](#), and ask that Microsoft create a more explicit API that is more resilient to breakage.

Design solutions that are extensible. For inspiration, see [Write extensible code](#).

Design for backward compatibility to avoid breaking customer implementations. A good strategy is to be explicit about what you offer for hooking and wrapping extension code. The way that you decorate your methods gives you lots of control over which methods you enable extensions for. For more information, see [Attributes that make methods extensible](#).

Data upgrade

The types of data upgrade jobs that existed in earlier versions are no longer supported. This change was made because Microsoft wants to provide minimum downtime while a production environment is updated.

Database synchronization is still run during upgrade, and it supports basic operations such as adding new tables, field, and indexes.

To prevent downtime, Microsoft is introducing new ways of driving data upgrade that are run asynchronously. For example, data upgrade will sometimes be triggered when a feature is turned on through a feature flag. This new approach for data upgrade differs significantly from earlier approaches and will become available in upcoming updates. Documentation resources will also be available.

Feature exposure

In the One Version model, updates are managed by Microsoft and pushed to customer environments. Pushed updates should not require that customers adjust to functional changes, or that they train their users about new or changed features every month. Pushed updates also should not cause customers to delay updates to their environment.

Feature management is a new concept that puts customers in control of deciding when new or changed features are used. Customers can review, validate, and document new or changed features before they are adopted. They can also train users before new or changed processes are adopted, to reduce the impact on daily operations.

Feature management will be released in upcoming monthly updates.

You should consider using feature management with your ISV solution to let customers control when new features are adopted.

Branches and builds

As an ISV, you should plan on a minimum of two source code branches: a servicing branch and a development branch.

Servicing branch

The servicing branch is used to produce bug fixes for your ISV solution. As the ISV, you specify the frequency of releases from the branch and distribution of the releases. The expectation is that these releases from the servicing branch will be binary cumulative releases.

The base Microsoft version that you use to build your ISV solution should match the oldest version that customers use with the solution. In the One Version model, that version starts with version 8.1 and is a maximum of three months old.

Development branch

The development branch is used to develop new capabilities for the ISV solution. As the ISV, you determine the frequency of releases from the development branch. You don't have to synchronize your releases with the monthly Microsoft releases. The best approach might be to decouple your release schedule from the Microsoft release schedule and deliver releases less often. A quarterly or biannual cadence is a good starting point.

The base Microsoft version in the development branch should be either the latest released version that is available or the released version that you plan to use for servicing when your new release goes out. The goals are that you innovate together with Microsoft by staying as current as is feasible, and that your development model allows for uptake of recent feature work.

Testing

Microsoft has several checks and balances in its development process to help guarantee functional and binary compatibility. ISV solutions must be validated with each Microsoft release to help guarantee this compatibility. The expectation is that you will do this validation during the Partner Early Access Program (PEAP) phase of each release.

It's very important that you provide quick turnaround for feedback, so that you will have time to fix any issues before the monthly updates are deployed in customer environments.

Test automation is important for quick validation of new updates. Microsoft plans to release the test framework and libraries to support you as you build your test automation.

Microsoft has an extensive suite of tests that support our validation. The expectation is that you, as an ISV, will create your own suites of automated tests.

In addition to the SysTest automation framework that is aimed at developers, the [Regression Suite Automation Tool \(RSAT\)](#) enables automation of business processes without requiring that code be written. Functional users can use the RSAT to record their critical tests and automate part of their UAT. You can also use the RSAT as you start to build your test automation.

Recently, Microsoft released the [Acceptance test library resources](#) and accompanying libraries. This framework is aimed at developers and lets them build tests that are more comprehensive than unit tests. The libraries that accompany the framework help make it a seamless way to build suites of tests.

Currently released products – Testing binary and functional compatibility

The currently released product that is maintained in the servicing branch should first be tested for binary and functional compatibility. Your suite of automated developer tests, automated functional tests, and manual tests for your ISV solution should be run on an environment that has the new version from Microsoft and your existing ISV solution. Because this test run is testing for binary and functional compatibility, the ISV solution should **not** be recompiled.

If the testing is successful, this step will validate that a customer installation of the current version of your ISV solution won't have to be updated when Microsoft broadcasts the new release to the customer.

If the testing isn't successful, you, as the ISV, must immediately notify Microsoft through the [PEAP communication process](#). This process uses Yammer and an issue notification process. The issue will require either a fix from Microsoft or a fix in your ISV solution. A fix in your solution might, in turn, require that customers be updated from the servicing branch. In both cases, Microsoft must know about the issue, so that it can become more proactive in its processes for future releases.

Currently released products – Testing design-time compatibility

Next, the currently released product that is maintained in the servicing branch should be tested for design-time compatibility. To do this testing, you should compile the solution against a deployment of the new Microsoft release. Although the goal of Microsoft is to minimize design-time compatibility issues, they might occur in some situations. One example is when Microsoft makes an enumeration extensible, and the solution uses it in a manner that assumes an underlying integer representation (for example, it uses the enumeration value in a logical comparison or mathematical function). Although the code will continue to work in a customer deployment because the underlying values are maintained, a compiler error is generated and addressed in future releases. Another example of a design-time compatibility issue is when Microsoft introduces a new compiler error to protect against unsafe coding patterns. To learn about more categories of design-time compatibility issues, see [Breaking changes](#).

You should run your suite of automated developer tests, automated functional tests, and manual tests on an environment that has the new version from Microsoft and your compiled ISV solution.

If the testing is successful, this step will validate that your ISV solution won't have to be updated even if source code is supplied to the customer and the customer recompiles the ISV solution.

If the testing isn't successful, and the issue isn't one of the categories that are described in [Breaking changes](#), you, as the ISV, must immediately notify Microsoft through the [PEAP communication process](#). This process uses Yammer and an issue notification process. The issue will require either a fix from Microsoft or a fix in your ISV solution. A fix in your solution might, in turn, require that customers be updated from the servicing branch. In both cases, Microsoft must know about the issue, so that it can become more proactive in its processes for future releases.

Currently released products – Updating the base build

As Microsoft updates your customers to new releases, you should periodically update the base build, so that it matches the oldest version that is used by customers who run your ISV solution.

Solutions that are in development

You validate your new solution development on either the latest released version or the released version that you plan for to use for servicing when your new release goes out. However, in both cases, consider doing validation on the most current version. This validation will help with early discovery of issues or uptake work that you must do.

If an unexpected break occurs, then you, as the ISV, must immediately notify Microsoft through the [PEAP communication process](#). This process uses Yammer and an issue notification process.

Deploying updates

For Microsoft standard platform and application updates, One Version servicing includes a process for automated updates of customer environments. However, this automation isn't currently available for ISV solutions. For more information, see [ISV's as part of One Version service updates](#).

ISV solutions are manually updated, and you control your release cadence. The binary backward compatibility allows for safe updates of the standard platform and application.

The update process includes database synchronization (for example, the addition of new fields and indexes).

ISV solutions as part of One Version automated deployment

Although Microsoft doesn't currently plan to release ISV solutions as part of the One Version automated deployment process, this option might become available at some point. However, Microsoft must first align engineering processes to make this option feasible.

Here are some areas where alignment will be required:

- **Feature management** – The user must be able to control when a new feature is turned on.
- **Backward compatibility and compliance** – Compliance with API customization usage is required.
- **Feature deprecation** – Advanced notice about deprecation of features or APIs must be provided.
- **Test automation suite**
- **Testing during the preview phase**
- **ISV solution sign-off and upload**
- **Automated deployment scripts**
- **Zero downtime** – Deployment of updates must be instantaneous.
- **Data migration without downtime**
- **Support for on-call duty, for servicing of critical production issues**

Should I release binaries or source code?

Binary compatibility is supported, provided that you don't recompile. We recommend that your ISV solution not be compiled in customer environments. Instead, you should deploy precompiled binaries that you've prepared and validated. Your solution binaries can then be created from your servicing branch, based on an earlier version, when this approach is practical.

If an implementation partner or customer compiles your solution in an updated environment, new warnings and errors might occur, as was mentioned in the [Design-time compatibility](#) section of this topic. Therefore, we recommend that implementation partners not compile your solution. However, this recommendation doesn't mean that you shouldn't share your source code to help support debugging, for example. You should just consider taking steps to avoid compilation of your code, so that implementation partners aren't exposed to design-time issues.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create and automate user acceptance tests

2/18/2021 • 8 minutes to read • [Edit Online](#)

You can use Task recorder and Business process modeler (BPM) to create user acceptance test libraries. Task recorder is a powerful tool to record test cases and organize them by business process using BPM. As a Microsoft partner you can use BPM to distribute test libraries to your customers via LCS and LCS solutions. If you are a customer, use BPM to author and distribute test libraries across different projects and team.

Because BPM can be synchronized with Azure DevOps (formerly known as Visual Studio Team Services), you can automatically create test cases (including test steps) in your Azure DevOps project. Azure DevOps can then serve as your test configuration and test management tool where you can create targeted test plans and test suites, manage the execution of tests and investigate results. For more information about testing with Azure DevOps, see [What are test plans, test suites, and test cases?](#)

This topic walks through the process of creating and executing acceptance test suites to be used for manual or automated testing.

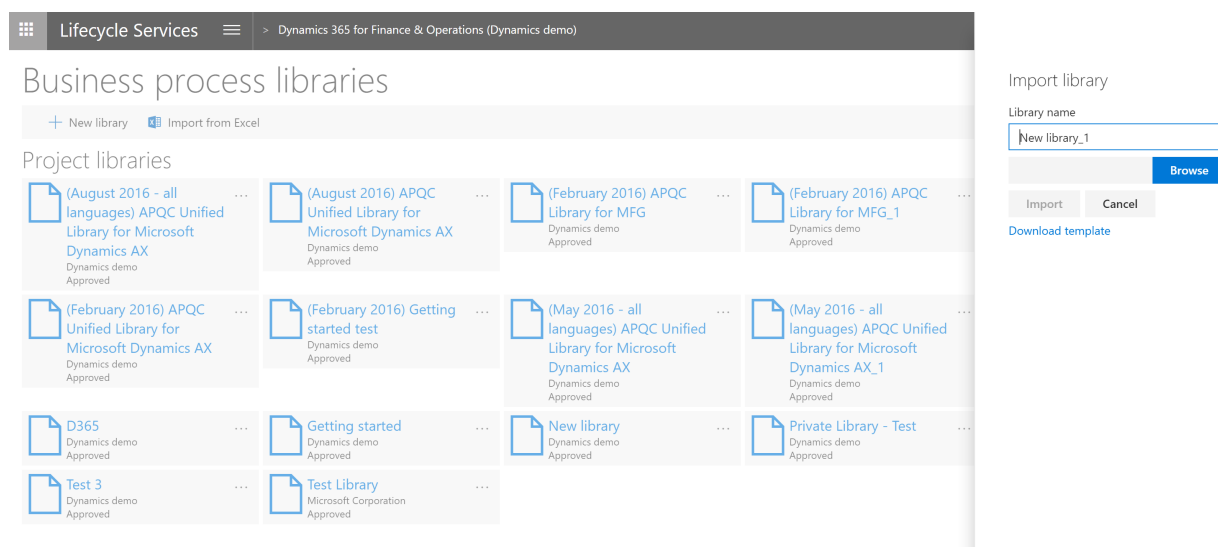

Create a Scenario Acceptance Testing BPM library

BPM is a great LCS tool to describe a hierarchy of business processes and user tasks. LCS also allows Microsoft partners and customers to author and distribute BPM libraries across LCS projects via the Asset library. This section describes how to take advantage of BPM to define your acceptance test library.

Create a BPM library

There are several ways to create a Business process modeler (BPM) library. For more information about how to create libraries in BPM, see [Create, edit, and browse Business process modeler \(BPM\) libraries](#).

For illustration purposes, this topic uses a library that contains common business processes, such as create an expense report and approve order requests. The library was created by using the Excel import functionality.

The screenshot displays the Lifecycle Services interface for Dynamics 365 for Finance & Operations. The main area shows a grid of 'Business process libraries' with various titles like '(August 2016 - all languages) APQC Unified Library for Microsoft Dynamics AX' and 'Getting started test'. On the right, an 'Import library' dialog is open, showing a text input field with 'New library_1' and buttons for 'Browse', 'Import', 'Cancel', and 'Download template'.

Record test cases and save to BPM

After you have created a BPM library, you'll need to use Task recorder to create your test cases and then upload the cases to BPM. There are several ways to do this.

If you're using a BPM library that already has all of the necessary task recordings (test cases) attached, you can skip this step. Otherwise, follow the instructions below to create new task recordings.

Create and save a new task recording

1. Open the client and sign in.
2. Select the company that you want to use while recording.
3. Go to **Settings > Task recorder**.

4. Click **Create a new recording**.
5. Enter a name for the recording, and then click **Start**. Recording begins the moment that you click **Start**.
6. When the recording is complete, in the Task recorder pane, click **Stop**.
7. To save the task recording to an attached BPM, click **Save to Lifecycle Services**.

8. Select the library that you want to save the recording to, and then click **Save**. Otherwise, select **Save to Disk** and follow the steps in the next section, "Upload an AXTR file to BPM."

NOTE

To enable the effective execution of your tests using automation tools, make sure all of your task recordings start on the main dashboard of your application. For end-to-end processes that are performed by more than one user, we recommend that you divide your task recordings into user-specific tasks. This simplifies the maintenance of test cases and allows you to execute test cases in the context of security roles, which is a best practice.

Upload an AXTR file to BPM

If you have saved your recordings (AXTR files) to disk, follow these steps to upload them to BPM.

1. In Lifecycle Services (LCS), in your project, on the **Business process libraries** page, select the library to upload the task recording to.
2. Click **Author and edit** and in the lines, locate and select the process to upload the task recording to.

3. In the right pane, click **Upload**.

(August 2016) APQC Unified Library for Microsoft Dynamics AX

The screenshot shows the APQC Unified Library interface. On the left, there is a search bar and a list of processes. The 'Develop Vision and Strategy' process is selected. On the right, there is a detailed view of this process, including its name, description, and metadata.

Process	Diagrams	Reviewed
Develop Vision and Strategy	18	0/4
Develop and Manage Products and Services	31	0/2
Develop and Manage Customer Experience	11	0/5
Market and Sell Products and Services	18	0/5
Market Products and Services	5	0/2
Deliver Products and Services	128	0/6
Merchandise Products and Services	9	0/2
Manage Customer Service		0/3
Deliver Products	6	0/4
Develop and Manage Human Capital	36	0/6
Manage Information Technology	13	0/7
Manage Financial Resources	267	0/10
Acquire, Construct, and Manage Assets	1	0/4
Manage Enterprise Risk, Compliance, and Resiliency		0/3
Manage External Relationships		0/5
Develop and Manage Business Capabilities	4	0/6

Overview Requirements

Name: Develop Vision and Strategy

Description: Develop vision and strategy establishes a direction and vision for an organ defining the business concept and long-term vision, as well as developing strategy and managing strategic initiatives. Processes in this category focus vision, a mission, and strategic objectives, which culminate in creating mea that the organization is moving in the desired direction.

Modified by:

Modified at: 08/30/2016, 2:09 PM PDT

APQC ID: 10002

APQC hierarchy ID: 1

Keywords:

4. Click **Browse** to find and select the file to upload, and then click **Upload**.

The screenshot shows the same APQC Unified Library interface as above, but with an 'Upload AXTR' dialog box open on the right. The dialog box has a 'Browse' button and 'Upload' and 'Cancel' buttons.

Save an existing task recording to BPM

1. To attach an existing task recording, sign in to the client.
2. Go to **Settings > Task recorder**.
3. Select **Edit Task Recording** and attach the file by either saving directly to LCS or downloading the AXTR and then uploading to BPM.

Guidelines for recording test cases

Follow these guidelines when authoring and recording your test cases, especially if you are planning to automate test execution. The process and tools described in this article apply to business process acceptance tests. They are not meant to replace component and unit testing that is typically owned by developers.

- Author a limited number of test cases that, when combined, cover complete end-to-end processes.
- Focus on business processes that have been customized.
- An individual test case (recording) should cover one or two business tasks only, typically executed by one person. This simplifies task recording maintenance. Do not combine a complete end-to-end business process such as "Procure to Pay" or "Order to Cash" into one large task recording. For example, instead of having RFQ > Purchase Order > Product Receipt > Vendor Invoice > Vendor Payment as one test case, divide the process into three or four test cases. You will have the opportunity to combine these tests into an ordered

test suite later.

- A test case should have at least one validation. Try to validate critical fields that cover the impact of other fields. For example: Validation of totals on sales or purchase orders cover the unit price/quantity/discount/tax ...etc.
- Avoid printing a report in a test case. If a test case needs to print a report, it should be selected on screen.
- 80+% of test cases should be of transactions or source documents. Master data should be limited to up to 20% of test cases only.

Synchronize and configure your test plan in Azure DevOps

An acceptance test library is your starting point. It typically contains all test cases (task recordings) of a particular application organized by business process. During a particular test pass, you usually do not need to execute all test cases. What test cases you select depends on the phase of your implementation or the nature of the update you are planning to apply to your production environment. Azure DevOps enables you to organize your test cases in test plans and test suites. A test plan contains one or more test suites (A subset of your test library); test cases can belong to more than one test suite.

Once you have selected your acceptance testing BPM library, synchronize it with Azure DevOps and create your test plan and test suites.

Sync with Azure DevOps

Synchronize your BPM library with your Azure DevOps project. For more information, see [Synchronize BPM libraries with Azure DevOps](#).

After configuration is complete, synchronize the BPM library with a Azure DevOps project.

1. On the **Business process libraries** page, on the tile for the library that you want to synchronize, select the ellipsis button (...), and then select **Azure DevOps sync**.

You can also start Azure DevOps synchronization from the toolbar in a BPM library. Select the ellipsis button (...), and then select **Azure DevOps sync**.

2. After Azure DevOps synchronization is complete, select the ellipsis button (...), and then select **Sync test cases**.

DemoLibrary

	Test case name
3780	[DemoLibrary] Create Expense Report

In addition to the test steps, the task recording XML file is attached to the Azure DevOps test case. This file will be needed if you want to automate test execution.

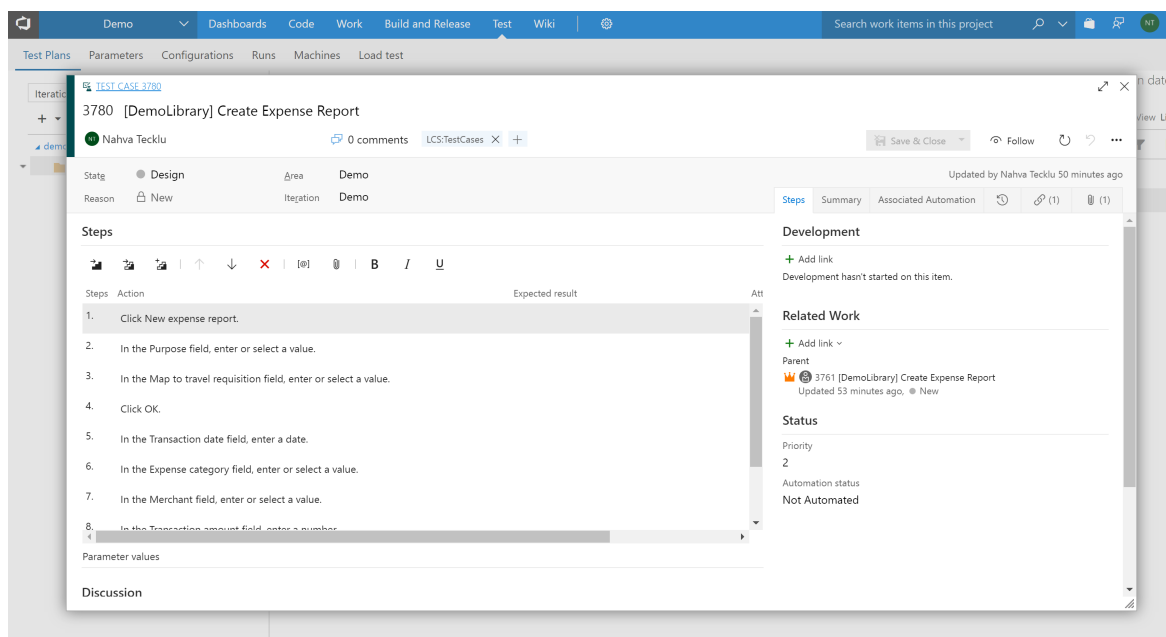

Create a test suite in Azure DevOps

Next, you will need to create a test plan and test suite in Azure DevOps. This will allow you to execute an ordered suite of test cases and easily manage, investigate, and track the results.

1. Sign in to Azure DevOps and select the project and test plan that you want to test in.
2. On the toolbar, select **Test > Test Plans**.
3. In the left pane, select **+**, and then select **Static suite**.
4. Enter a name for the suite.
5. Click **Add existing** and query the tag **LCS:Test Cases**.
6. Click **Run > Add test cases**.

7. Select the test case to view details and the attached XML file.

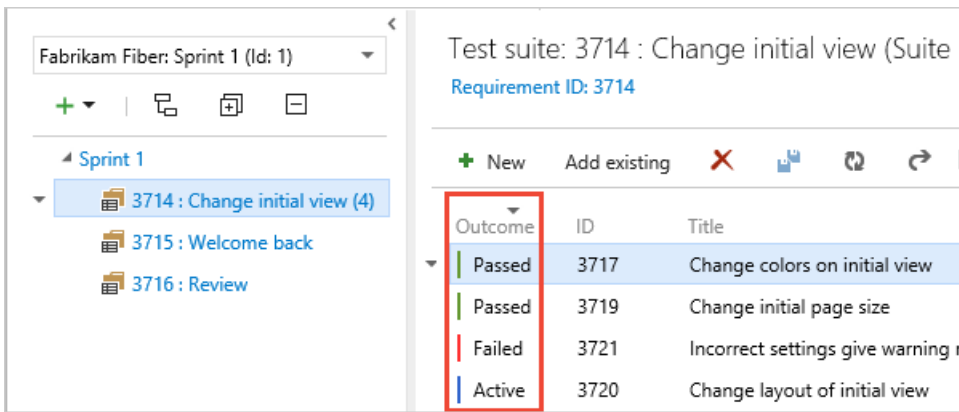

NOTE

This example shows how to create one comprehensive acceptance test suite with all test cases added. Instead, you should create various test suites under the same test plan and then use custom queries to add specific test cases to a test suite. A test case can belong to more than one test suite.

Execute your tests

Run manual test cases

After you have a test suite, you are ready to use it for regression testing after updates have been made to your application in a sandbox or test environment. You can run the test cases in your test suite manually or play the task recordings that are part of the test suite and use Azure DevOps to mark the test cases as passed or failed.

Azure DevOps also provides a tool, **Test Runner**, to manage manual test case execution. For more information about using Test Runner, see [Run manual tests](#).

We recommend that you take advantage of Azure DevOps as it provides a rich set of management features not only for testing, but result management and mitigation.

Run automated test cases

The platform for Finance and Operations provides developers with tools to author test cases based on task recordings and use Azure DevOps to manage the automated execution of these test cases.

Developers can use the build and test automation capabilities of **build and test** environments. For details, see the [Continuous delivery home page](#).

Functional power users can automate the execution of their test cases using the **Regression suite automation tool**. For more information, [download the tool](#) and read the [Regression suite automation tool](#).

Investigate test runs

Once an automated run is complete, on the Azure DevOps toolbar, select **Test > Runs** (or **Test Plans > Runs**) to investigate your test run. Select the desired test run to investigate test case failures and errors. You can also go to your test suite in Azure DevOps to see the latest results associated with your test cases. For more information on testing and test management in Azure DevOps, see the [Azure DevOps documentation](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Deploy a demo environment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to deploy a demo environment on Microsoft Azure using Microsoft Dynamics Lifecycle Services (LCS). This topic applies to deploying a demo environment for:

- Dynamics 365 Finance
- Dynamics 365 Supply Chain Management
- Dynamics 365 Commerce

Prerequisites

Before you begin your deployment, the following prerequisites must be in place:

- Verify that you have an Azure subscription, and that you are a co-administrator on it.
- Verify that you have access to an LCS project and permissions to deploy an environment.
- Verify that you've connected your Azure subscription to your LCS project by using the information in the [Complete the Azure Resource Manager \(ARM\) onboarding process](#) topic.

Deploy a demo environment

Use this procedure to deploy a demo environment on Azure using LCS.

1. In LCS, open your project, and then, in the **Environments** section, click the plus sign (+).
2. Select the Azure environment topology, and then select **Demo**.
3. Select a topology.
 - For Finance and Operations, select the most recent Azure Resource Manager (ARM) topology for Finance and Operations.
 - For Commerce, select **Dynamics 365 for Commerce - Demo**.
4. In the **Deploy environment** dialog box, enter the name of the environment. This name should be unique in the Azure subscription. To make environments easy to identify, consider forming an acronym using the user's name and the topology.
5. Select the size of the virtual machine (VM). You must use **Ev3-series sizes** for Finance and Operations workloads. We recommend **Ev3**. If you experience allocation failures, see the [Azure troubleshooting guide](#).
6. Set the **Instances** field to 1.

NOTE

The size of the VM and the number of instances affect the cost of your subscription. For more information, see [Azure pricing](#).

7. Click **Advanced settings** to add customizations to your deployment. For the demo environment, we recommend that you keep the default settings.
8. Agree to the licensing and pricing terms, and then click **Next**.

9. In the **Confirm** message box, click **Deploy**.
10. Open the **Cloud hosted environments** page to view the status of the deployment. After the deployment is successfully completed, the environment will be ready.

Log on to your demo environment

To log on to your demo environment, do the following.

1. In LCS, open the **Cloud-hosted environments** page, and select the demo environment that you just deployed.
2. Scroll to the right and in the **Environment details** pane, under **Cloud services**, click the appropriate link:
 - **Log on to Finance and Operations**
 - **Log on to Commerce**

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Deployment options

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can deploy Finance and Operations apps in the cloud or on-premises. Cloud deployments offer an ERP service that is fully managed by Microsoft, while on-premises deployments are deployed locally within a customer's data center.

IMPORTANT

On-premises deployments are not supported on any public cloud infrastructure, including Azure.

The following table provides a comparison of the capabilities provided by the two deployment options.

Dynamics 365 deployment options		
Capability	Cloud	On-premises
Infrastructure and data location	<ul style="list-style-type: none">Full Microsoft managed cloud serviceMicrosoft managed data centers	<ul style="list-style-type: none">Customer or partner managed infrastructureDisconnected data centerLocal data residency

Why cloud

Cloud deployments provide a cloud service that is easy to scale up or down as needed, as well as data centers that are fully managed by Microsoft. The time spent implementing Finance and Operations apps can be significantly shortened, fewer customizations may be required, and the costs of IT hardware and infrastructure are lower.

Cloud deployments include high availability, disaster recovery, sandbox environments, and application lifecycle management combined with cloud-based systems of intelligence, infrastructure, compute, and database services in a single offering. When needed, data failover in the cloud, automated deployment and continuous updates, and elastic compute capacity are available. A cloud deployment also provides data aggregation, financial reporting, and intelligence.

The cloud service provides customers with the greatest value, the broadest range of functionality, the best application lifecycle experience, the easiest and broadest integration with Microsoft Azure services, the best option for business insights and intelligence, and the most value for customers' technology investments.

Why on-premises

With an on-premises deployment, existing data center investments can be leveraged. Customers can also configure their enterprise preferences to meet the regulatory and compliance needs of their business, comply with data sovereignty rules in regions where there are no Azure Data Centers, or ensure business continuity in areas with limited public infrastructure.

A customer's business data and processes are disconnected from the cloud and are stored and run locally in the customer's or their partner's data center. Some connectivity is required for system management and updates which are enabled through Microsoft Dynamics Lifecycle Services (LCS), a cloud-based application lifecycle management service. Customer data that is related to the configuration and application customization may be stored in the cloud.

For customers who choose to run Finance and Operations apps in their own data center, the on-premises deployment option will have a similar user-interface and application functionality as other deployment options. However, customers must take on the following responsibilities:

- Stand up their own infrastructure.
- Configure their own high-availability and disaster recovery solutions.
- Stand up sandbox environments.
- Manage their infrastructure, including scheduling operating system updates.

The additional costs to deploy and manage these capabilities might lead to higher deployment costs and a greater Total Cost of Ownership (TCO). Tools for deploying the Finance and Operations apps and updates will be available to partners and customers via Lifecycle Services. Unlike the cloud deployment option, Advanced Analytics and Azure Machine Learning are not included in the on-premises deployment option.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Comparison of cloud and on-premises features

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic shows a comparison of features available in cloud vs. on-premises for the following applications:

- [Dynamics 365 Finance](#)
- [Dynamics 365 Supply Chain Management](#)
- [Dynamics 365 Commerce](#)
- [Dynamics 365 Human Resources](#)

Information about the [development and administration features](#) is included, as well.

The following tables list the application areas. Cloud and on-premises support is listed for the feature as a whole. Where specific features differ from the area overall, the features are listed on a separate line in the Feature column.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cloud deployment overview

2/18/2021 • 15 minutes to read • [Edit Online](#)

Working with Microsoft to deploy Finance and Operations apps in the cloud requires that you understand the environment and subscription that you are deploying to, who can perform which tasks, and the data and customizations that you need to manage. We recommend that you sign up for the Full Microsoft FastTrack for Dynamics 365 to help speed your deployment and implementation - it's a program that provides training and consulting to help you realize business value faster. For more information, see [Microsoft FastTrack](#). If you choose to use the Essentials FastTrack program instead, you will be using the Implementation Project Methodology in Lifecycle Services (LCS) to help you manage your implementation project.

Customer lifecycle, subscriptions, and environment types

Microsoft assumes that all customers will follow a lifecycle similar to the following for all cloud deployments, and therefore need different environment topologies at each phase.

- Evaluate
- Develop customizations, if needed.
- Curate a "golden configuration" environment that contains only module configurations without master or transactional data. This is to be the baseline for your data migration testing and eventual go live.
- Install and test customizations and partner solutions on a tier-1 sandbox (Development or test environment).
- Test customizations, partner solutions and data configuration on a tier-2 sandbox environment.
- Deploy customizations and data configurations to a production environment with high availability.

At some phases of a project, you may have all of the environments live at once. For more information, about the default licenses and tiers that are available, see the [Dynamics 365 Licensing Guide](#).

You may notice the terms cloud hosted or Microsoft subscriptions. A *cloud hosted subscription* means that the customer or partner brings their own Azure subscription and deploys Finance and Operations apps to it, for evaluation and development purposes only. The customer or partner pays for the resources deployed to their Azure subscription based on the Azure price list. A *Microsoft subscription* means that the customer purchases Finance and Operations licenses, which will then allow them to deploy environments to an Azure subscription which is managed by Microsoft, therefore, the customer has no separate Azure billing.

With each Enterprise offer, two environments are included by default:

- One Tier 2 sandbox (multi-box environment) for user acceptance testing (UAT).
- One production environment with high availability (HA).

Additional environments may be purchased as add-ons. For information about licensing and what is included in Microsoft Dynamics 365, see the [Dynamics 365 Licensing Guide](#).

Here's how the lifecycle maps to the available environments. If you already have environments deployed in your Lifecycle Services project, you can find the Environment Type and Environment Sub type on each environment's details page.

LIFECYCLE PHASE	ENVIRONMENT TIER	SUBSCRIPTION	ENVIRONMENT TYPES	ENVIRONMENT SUB-TYPE
Evaluation and analysis	Tier 1 Sandbox	Cloud hosted	Customer Managed	Demo

LIFECYCLE PHASE	ENVIRONMENT TIER	SUBSCRIPTION	ENVIRONMENT TYPES	ENVIRONMENT SUB-TYPE
Customize	Tier 1 Sandbox	Cloud hosted or VHD	Customer Managed	Develop
Golden configuration	Tier 1 Sandbox	Cloud hosted	Customer Managed	Develop
User acceptance testing (UAT)	Tiers 2-5 Sandbox	Microsoft	Microsoft Managed or Self-service	Not applicable
Go live	Production	Microsoft	Microsoft Managed or Self-service	Not applicable

Tiers 2-5 can be purchased to increase performance of the environment. The higher the tier, the more compute and database capacity is reserved for your use. For more information about Self-service environment types, check out the [Self-service deployment overview](#).

Environment lifecycle operations

Users with the Environment Administrator or Project Owner roles in Lifecycle Services can perform various lifecycle operations on their environments. These operations often involve downtime on the environment until the task is finished. Each of these operations are located under or next to the **Maintain** button on each environment details page.

LIFECYCLE OPERATION	DESCRIPTION	LEARN MORE
Apply software	Install Microsoft updates, ISV solutions, or your own customization packages.	Apply updates to cloud environments
Enable access	Allow list your IP for Remote Desktop or database access	See the Remote Desktop section later in this topic
Restart services	Ability to restart components of your environment	Restart environment services
Move database	Full data lifecycle management	Database movement operations
Maintenance mode	Ability to change configuration with only admin access	Maintenance mode
Upgrade	Upgrade code and data from 7.x to the latest version	Process for moving to the latest update
Deallocate	Ability to turn off an environment not being used, or to troubleshoot a failed action	Not applicable
Start	Ability to turn on an environment for use	Not applicable
Delete	Ability to delete an environment previously deallocated	Not applicable

Security and compliance

Finance and Operations is PA-DSS 3.1 certified which means that all communications between components are secured out-of-the-box.

All Finance and Operations front-end virtual machines in Microsoft Azure are configured during deployment to only accept TLS 1.2.

IMPORTANT

Customers who have administrator access to Microsoft-managed sandboxes, including any add-on sandboxes purchased, must follow these guidelines:

- By default, automatic Windows update is enabled for all Tier 1 - 5 sandboxes and should NOT be disabled. This ensures that any time that Microsoft pushes security or critical infrastructure updates to your environment, your environment receives the latest set of updates and is updated each month with the operating system fixes that Microsoft releases.
- Admin passwords on these environments should NOT be changed. Environments that have admin passwords changed will be flagged by Microsoft. Microsoft reserves the right to, and will reset the admin password.
- Adding new user accounts to any Microsoft managed VM is NOT permitted. Microsoft reserves the right to, and will remove the newly added user accounts without providing notice.

Finance and Operations is not covered by a FedRAMP ATO at this time. If Finance and Operations is provisioned in the United States, all customer data at rest is stored in data centers located in the United States, as described in [International availability of Dynamics 365](#). Finance and Operations does not support any other Dynamics 365 US Government or Microsoft 365 GCC compliance attributes (for example, access by US screened personnel, and support for CJIS and IRS 1075).

Remote Desktop

Microsoft-managed environments

WARNING

Microsoft will be removing the use of Remote Desktop by customers and partners. Each environment will first have administrator access removed, but still allow non-administrator access to the virtual machines. After this, all access will be removed. For each step of this phased removal, an email notification will be sent to the Notification list setup for each environment. All Remote Desktop access will be removed by November 2020.

Customers are required to complete additional setup to connect to virtual machines (VMs) through Microsoft Remote Desktop (RDP). This additional setup applies to all Microsoft-managed environments, including Tier 1 through Tier 5 sandboxes and add-ons. In order to connect to Tier 1 through Tier 5 sandbox environments, you must explicitly enable access (safe list) from your organization's IP address space. This can be done by a Lifecycle Services (LCS) user who has access to the **Environment** page (**Maintain** > **Enable Access**) where they can enter the IP address space that will be used to connect to the virtual machines through Remote Desktop. Access rules are either a single IP address (example: 10.10.10.10) or an IP address range (example: 192.168.1.0/24). You may add multiple entries at once as a semi-colon(;) separated list (example: 10.10.10.10;20.20.20.20;192.168.1.0/24). These entries are used to configure the Azure Network Security Group that is associated with your environment's virtual network. For more information, see [Security rules](#).

IMPORTANT

Customers need to ensure that RDP endpoints are secured through explicit IP safe list rules as mentioned above. The IP safe list rules must adhere to the following conditions.

- IP safe list rules must NOT use asterisk/zero.
- Wide IP address ranges must NOT be used.
- IP address ranges must restrict to the customer's CORPNET.
- If computers outside the customer's CORPNET (such as a home office) are used to connect to sandbox environments, only the specific IP addresses of the computers used to connect to the sandbox environments must be added.
- Azure Datacenter IP address ranges must NOT be added.
- Public IP addresses, such as a coffee shop location, must NOT be added.
- IP safe list rules should be removed when not in use. Periodic review of environment IP safe list rules is recommended.

Microsoft will run periodic tests on the Microsoft Managed environments validating that the environments are sufficiently restricted. Microsoft reserves the right to and will remove any IP Address safe list rules that violate the above guidelines, immediately without providing notice.

Partner/Customer managed environments

By default, Remote Desktop is enabled for all non-Microsoft managed environments. We recommend that customers restrict access to any environments that belong to their subscriptions. This can be done by configuring Network Security Group rules on the environments directly in Azure Portal.

Windows Remoting (WinRM)

Windows Remoting (WinRM) is disabled on all environments. Although you can enable WinRM on environments that belong to your subscriptions through Azure Portal, we strongly recommend that you do not do this.

WARNING

Exceptions to enable WinRM will not be granted for any Microsoft-managed environments.

Availability

The guaranteed uptime for Finance and Operations apps is 99.9%. Planned downtime occurs once a month and lasts no longer than eight hours. Because the work completed during the downtime doesn't always take eight hours, we will always communicate the estimated amount of time that your environments will be down. For more information, see [Get support for Finance and Operations apps or Lifecycle Services \(LCS\)](#).

High-availability features

To ensure service availability, all production environments are protected by using default Azure high availability (HA) features. HA functionality provides ways to avoid downtime caused by the failure of a single node within a datacenter, and DR features protect against outages broadly impacting an entire datacenter. Azure availability sets are used to prevent single-point-of-failure events. For more information about Azure availability sets, see [Use availability zones to protect from datacenter level failures](#). High availability for databases is supported through Azure SQL. For more information, see [Overview of business continuity with Azure SQL Database](#).

Disaster recovery features

Production environments are configured with Azure disaster recovery support that includes the following:

- Azure SQL active-geo replication is configured for the Finance and Operations database of the production

environment. For more information about SQL replication, see [Compare geo-replication with failover groups](#).

- Geo-redundant copies of Azure blob storage (containing document attachments) in other Azure regions. For more information, see [Azure Storage redundancy](#).
- Same secondary region for the Azure SQL and Azure blob storage replication.

Only primary data stores are supported by replication. The Financial reporting services and Entity store database use transformed data from the primary database and must be generated after the recovery site has been set up and the Finance and Operations service has started.

Service availability in Azure Regions

Finance and Operations apps can be deployed into a subset of Microsoft Azure datacenters using Dynamics Lifecycle Services (LCS). Azure is generally available in datacenters and geographical locations around the world. With Finance and Operations apps, customers can specify the region or datacenter where their customer data will be stored. Microsoft may replicate data to other regions for data durability, but we will not replicate or move customer data outside the geographical location. For more details, see the [Service description white paper](#).

IMPORTANT

Regardless of where customer data is stored, Microsoft does not control or limit the locations from which customers or their end-users may access it. For more information, see [International availability of Dynamics 365](#).

Upcoming changes to region availability

Dynamics 365 solutions consist of a collection of multiple services. Looking across Dynamics 365 applications, the Power Platform and the Azure services that they both depend on, the required matrix of services is quite large and growing. We have locked on a strategy of selecting a subset of data center regions across the globe to simplify ensuring that we have availability of the full portfolio of required services. Our plan is to optimize to have minimal latency between the component services of a solution and as a result, we are focused on having the full portfolio of services available in each of the designated data centers.

Additionally, the Finance and Operations architecture is being enhanced to build on self-service for greater elasticity, stronger reliability, and more seamless maintenance. Customers gain material efficiency by having deeper self-service deployments in fewer data centers. This transition also benefits from selecting a subset of Azure regions. To that effect, the regional availability of Finance and Operations apps will now be **limited to East US, West US, and Central US in North America** for all new projects. For a list of the latest supported regions, see [International availability of Dynamics 365](#).

Support for East US2, West US2, West Central US, North Central US, and South Central US will continue to be available for projects and environments that currently have their data stored in those regions on Microsoft-managed environments.

NOTE

Microsoft will work with customers to move them to an appropriate data center beginning October 19, 2020. This will happen in a phased approach. Select customers will receive advance notification before we migrate them to a supported region.

If there are other customer workloads that are not part of the Dynamics 365 or Power Platform family that also require proximity to the Dynamics 365 and Power Platform services, Microsoft will work with customers to coordinate a plan for the overall migration. For more information, see [Cloud deployment overview: Frequently asked questions](#).

Frequently asked questions

Why does the status display 'Maintenance' on my environment in LCS?

To provide the best experience and performance, Microsoft performs maintenance operations on your environment. During some of these maintenance operations, your environment status may display one of the following statuses:

- Preparing for maintenance
- Prepared for maintenance
- Maintenance in progress

While your environment is in this state and until the status returns to 'Deployed', you will not be able to perform any lifecycle operations, such as package applications. There will be no impact to Finance and Operations apps. Users can continue with normal operations without any service interruption. You will receive an email notification before any maintenance operation puts your environment in this state.

How do I connect to the SQL database on my Sandbox environment?

To connect to the SQL database in your Sandbox environment, follow the steps in [Enable just-in-time access](#).

How do I access a development instance?

For information about how to access development instances, configure on-premises development VMs, and find configurations settings for developers and administrators, see [Deploy and access development environments](#).

How do I deploy a demo environment?

A demo environment includes only Microsoft demo data. You can use a demo environment to explore default features and functionality. For more information, see [Deploy a demo environment](#).

How do I move my customizations between environments?

To move customizations from a development to a sandbox or production environment, see [Create deployable packages of models](#)

Can I bring my own domain name?

You can bring your own domain name if it is running Azure Active Directory (AAD), and the administrator of your AAD instance has enabled the Finance and Operations apps within their AAD. This is usually done through the office email, after you buy a license. When you click the link to accept the offer, AAD is set up for you.

Can I add guest AAD accounts as users?

You can add guest AAD accounts if you have correctly configured them within Azure Active Directory, and enabled the Finance and Operations apps within your AAD.

Why am I no longer able to see the Private AOS machines in one or more of my Tier 2 through Tier 5 Sandbox environments?

The Private AOS VMs were part of your environment configuration as they were needed to secure communication between the AOS and BI machines in the past. With recent updates, all communication between AOS and BI machines are secure directly and no longer need the intermediary Private AOS machines. Therefore, we are in the process of rolling out removing the Private AOS machines. As we are removing the machines in batches, you may notice that only some of your environments have the Private AOS machines removed. This change will not impact functionality or security in any way and will be transparent to you.

Why am I no longer able to Remote Desktop into one or more of my Tier 1 through Tier 5 Microsoft managed Sandbox environments?

Microsoft managed Tier 1 through Tier 5 sandbox environments require Remote Desktop management endpoints to be restricted to specific IP Address sets (safe list). Microsoft regularly validates that the environments are sufficiently restricted. Microsoft reserves the right to immediately remove any IP Address safe list rules that violate the above guidelines without notice. You may not be able to Remote Desktop into your

environment for one of these reasons:

- Your current IP address is not in the safe list.
- Your IP has changed from the IP address listed in the safe list.
- Microsoft deleted the rule containing your IP address from the safe list because it violated a guideline.

To regain access to the environment, you will need to add the IP address of the computer from which you are connecting to. To do this, complete the steps [Remote Desktop](#) section earlier in this topic.

When will the availability of reduced regions go into effect for new onboarding?

Beginning August 1, 2020, new projects for Finance and Operations will be onboarded to the following regions:

- East US
- West US
- Central US

My environments are currently in the regions that will be deprecated. How will this change affect me?

We will deprecate support for the following regions only for new projects that will be onboarded on or after August 1, 2020:

- East US2
- West US2
- West Central US
- North Central US
- South Central US

This will not affect any environments that have their data stored in the deprecated regions before August 2020. In the near future there is a transition plan to move customers in the deprecated regions into the reduced regions.

I'm unable to redeploy an environment after deleting it, the environment slot is missing.

This is due to the license expiring, which means that you no longer have the minimum required licenses to obtain an environment slot. Please review your [subscription status](#) and then reactivate the expired license to enable the redeployment.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

System requirements for cloud deployments

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic lists the system requirements for the current version of Dynamics 365 Finance and Dynamics 365 Supply Chain Management for cloud deployments. If this step is appropriate, before you install one of these apps, you should verify that the system that you're working with meets or exceeds the minimum network, hardware, and software requirements.

Supported web browsers

Users can access the apps by using the most recent versions of these popular browsers:

- Microsoft Edge (recommended: [Chromium-based Edge](#))
- Google Chrome
- Apple Safari
- Internet Explorer 11 (deprecated, not recommended)

NOTE

For optimal performance and an optimal experience, we recommend that you use the latest version of a modern browser, especially Microsoft Edge. Support for Internet Explorer 11 is deprecated. For more information, see the [Internet Explorer deprecation announcement](#).

To find the latest release for each web browser, go to the software manufacturer's website.

NOTE

- To enable Task Recorder to capture screenshots and include them in Microsoft Word documents that are generated, you must install a pre-release Chrome extension.
- The Workflow Editor and Report Designer for Financial reporting are started as ClickOnce applications. They require a 64-bit-compatible operating system. Only Microsoft Edge and Internet Explorer (on a supported version of Microsoft Windows) support ClickOnce applications out of the box. If you're using Chrome, you must install a ClickOnce extension, such as [Meta4](#) to use ClickOnce applications. If you use Chrome in incognito mode, make sure that the ClickOnce extension is also enabled for incognito mode.
- To preview PDF files, we recommend that you use browsers such as Microsoft Edge (latest publicly available version) on Windows 10, or Google Chrome (latest publicly available version) on Windows 10, Windows 8.1, Windows 8, Windows 7, or Google Nexus 10 tablet.

Network requirements

- The app is designed for networks that have a latency of 250–300 milliseconds (ms) or less. This latency is the latency from a browser client to the Microsoft Azure datacenter that hosts the app. We recommend that you test network latency at [AzureSpeed.com](#).
- Bandwidth requirements for the app depend on your scenario. Most typical scenarios require a bandwidth that is more than 50 kilobytes per second (KBps). However, we recommend more bandwidth for scenarios that have high payload requirements, such as scenarios that involve workspaces or extensive customization.

In general, the app is optimized for the internet. The number of round trips from a browser client to the Azure datacenter is very small, and the whole payload is compressed.

WARNING

Don't calculate bandwidth requirements from a client location by multiplying the number of users by the minimum bandwidth requirements. The concurrent usage of a given location is very difficult to calculate. Customers who are concerned about bandwidth requirements should use a preview version of the app.

.NET Framework requirements

The app requires the Microsoft .NET Framework version 4.6.2 for all ClickOnce applications, such as the document routing agent. For installation instructions, see [Install the .NET Framework for developers](#).

Supported Microsoft Office applications

The following Microsoft Office applications are supported in cloud:

- To run the Microsoft Excel and Word add-ins, you must have Microsoft Office 2016 for Windows installed. For more information about version requirements, see [Troubleshoot the Office integration](#).
- To view documents that are generated by the Export to Excel or Export to Word functionality, you must have Microsoft Office 2007 or later installed.

Requirements for development on local VMs

For information about the requirements for development on local virtual machines (VMs), see [VM that is running locally](#).

Database collation

The only supported collation for application databases in the cloud is `SQL_Latin1_General_CP1_CI_AS`. Please ensure that your SQL Server and database collations in development environments are set to this. Also ensure that any configuration environments that are published to Sandbox have this same collation.

Additional resources

[Get evaluations copies](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

On-premises deployment home page

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can deploy Dynamics 365 Finance + Operations (on-premises). When you choose an on-premises deployment type, the system requirements, hardware sizing, and functionality differ from a cloud deployment. This topic provides links to content that contains information specific to on-premises deployments.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

System requirements for on-premises deployments

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic lists the system requirements for the current version of Microsoft Dynamics 365 Finance + Operations (on-premises) deployments. Before you install, when this step is appropriate, verify that the system that you're working with meets or exceeds the minimum network, hardware, and software requirements.

IMPORTANT

Dynamics 365 Finance + Operations (on-premises) deployments are not supported on any public cloud infrastructure, including Azure.

Network requirements

Dynamics 365 Finance + Operations (on-premises) can work on networks that use Internet Protocol Version 4 (IPv4) or Internet Protocol Version 6 (IPv6). Consider the network environment when you plan your system, and use the following guidelines.

Network response time

The following table lists the minimum network requirements for the connection between the web browser and Application Object Server (AOS), and for the connection between AOS and the database in an on-premises system.

VALUE	WEB BROWSER TO AOS	AOS TO DATABASE
Bandwidth	50 kilobytes per second (KBps) per user	100 megabytes per second (MBps)
Latency	Less than 250–300 milliseconds (ms)	Less than 1 ms (local area network [LAN] only). AOS and the database must be co-located.

- Finance + Operations is designed for networks that have a latency of 250–300 milliseconds (ms) or less. This latency is the latency from a browser client to the datacenter that hosts Finance + Operations.
- Bandwidth requirements depend on your scenario. Typical scenarios require a bandwidth of more than 50 KBps between the browser and the server. However, we recommend higher bandwidth for scenarios that have high payload requirements, such as scenarios that involve workspaces or extensive customization. The specific amount of bandwidth depends on use.

Deployments where AOS and the Microsoft SQL Server database are in different datacenters aren't supported. AOS and the SQL Server database must be co-located.

In general, Finance + Operations is optimized to reduce browser-to-server round trips. The number of round trips from a browser client to the datacenter is either zero or one for each user interaction, and the payload is compressed.

WARNING

Don't calculate bandwidth requirements from a client location by multiplying the number of users by the minimum bandwidth requirements. The concurrent usage of a given location is very difficult to calculate. We recommend that you use a real-life simulation against a non-production environment as the best gauge of performance for your specific case.

LAN environments

In LAN environments, Microsoft Remote Desktop in Microsoft Windows Server isn't required in order to connect to Finance + Operations. However, Remote Desktop might be required for servicing operations on the virtual machines (VMs) that make up the server deployments.

WAN environments

In wide area network (WAN) environments, Remote Desktop in Windows Server isn't required in order to connect to Finance + Operations.

Internet connectivity requirements

Finance + Operations doesn't require internet connectivity from user workstations. However, some features won't be available if there is no internet connectivity.

Browser client	An intranet scenario without internet connectivity is a design point for the on-premises deployment option. Some features that require cloud services won't be available, such as Help and Task guide libraries in Microsoft Dynamics Lifecycle Services (LCS).
Server	The AOS or Microsoft Azure Service Fabric tier must be able to communicate with LCS. The on-premises browser-based client doesn't require internet access.
Telemetry	Telemetry data might be lost if there are long interruptions in connectivity. Interruptions in connectivity to LCS don't affect the on-premises application functionality.
LCS	Connectivity to LCS is required for deployment, code deployment, and servicing operations.

Telemetry data transfer to the cloud

Most telemetry data is stored locally and can be accessed by using Event Viewer in Microsoft Windows. A small subset of telemetry events is transferred to the Microsoft telemetry pipeline in the cloud for diagnostics. Customer data and user-identifiable data aren't part of the telemetry data that is sent to Microsoft. VM names are sent to Microsoft to help with environment management and diagnostics from the LCS portal.

Domain requirements

Consider the following domain requirements when you install Finance + Operations:

- VMs that host Finance + Operations components must belong to an Active Directory domain. Active Directory Domain Services (AD DS) must be configured in native mode.
- VMs that run Finance + Operations components must have access to each other. This access is configured in AD DS.
- The domain controller must be Microsoft Windows Server 2012 R2 or later, and the domain functional level must be 2012 R2 or more.

Full 2-way trust

For compatibility with corporate domain controllers on Windows Server 2008 R2 domain functional level (DFL), a full 2-way trust between the Windows Server 2008 R2 DFL user domain and the Windows Server 2012 R2 DFL Finance + Operations service domain is supported in Platform update 33 and later.

This means that users of the Finance + Operations (on-premises) application will come from the Windows Server 2008 R2 DFL domain, and the resources and service accounts hosting the Finance + Operations (on-premises) infrastructure and services will come from the Windows Server 2012 R2 DFL domain.

Examples for a full 2-way trust setup could be.

Known limitations with using the full 2-way trust setup

- Import of security groups from the Windows Server 2008 R2 user domain is not supported.

Hardware requirements

This section describes the hardware that is required in order to run Finance + Operations.

The actual hardware requirements vary, based on the system configuration, the data composition, and the features that you decide to use. Here are some of the factors that can affect the choice of appropriate hardware:

- The number of transactions per hour
- The number of concurrent users

Minimum infrastructure requirements

Finance + Operations uses Service Fabric to host the AOS, Batch, Data management, Management reporter, and Environment orchestrator services.

SQL Server must have a high-availability HADRON setup that has at least two nodes for production use.

The following illustration shows the minimum number of nodes that is recommended for your Service Fabric cluster.

Processor and RAM requirements

The following tables list the number of processors and the amount of random-access memory (RAM) that are required for each role that is required in order to run this deployment option. For more information, see the recommended minimum requirements for a Service Fabric standalone cluster in [Plan and prepare your Service Fabric cluster](#).

NOTE

If other Microsoft software is installed on the same computer, the system must also comply with the hardware requirements for that software. If other server applications are installed on the same computer as AOS, we recommend that you limit those server applications 1 gigabyte (GB) of RAM.

Sizing by role and topology type

TOPOLOGY	ROLE (NODE TYPE)	RECOMMENDED PROCESSOR CORES	RECOMMENDED MEMORY (GB)
Production	AOS, Data management, Batch	8	24
	Management Reporter	4	16
	SQL Server Reporting Services	4	16
	Orchestrator	4	16
	SQL Server	8	32
Sandbox	AOS, Data management, Batch	4	24
	Management Reporter	4	16

TOPOLOGY	ROLE (NODE TYPE)	RECOMMENDED PROCESSOR CORES	RECOMMENDED MEMORY (GB)
	SQL Server Reporting Services	4	16
	Orchestrator	4	16
	SQL Server	8	32

Minimum sizing estimates for production and sandbox deployments

TOPOLOGY	ROLE	NUMBER OF INSTANCES
Production	AOS (Data management, Batch)	3
	Management Reporter	2
	SQL Server Reporting Services	1
	Orchestrator**	3
	SQL Server	2
Sandbox	AOS, Data management, Batch	2
	Management Reporter	1
	SQL Server Reporting Services	1
	Orchestrator	3
	SQL Server	1
<i>Summary for production and sandbox topologies</i>		<i>19</i>

* The numbers in this table are being validated by our preview customers and might be adjusted based on the feedback from those customers.

** Orchestrator is designated as the primary node type and will also be used to run the Service Fabric services.

Initial estimates for the back-end SQL Server and AD DS

	ROLE	VMS/INSTANCES	CORES	TOTAL CORES	MEMORY PER INSTANCE (GB)	TOTAL MEMORY (GB)
Shared infrastructure	SQL Server*	2	8	16	32	64

	ROLE	VMS/INSTANCES	CORES	TOTAL CORES	MEMORY PER INSTANCE (GB)	TOTAL MEMORY (GB)
	File server/Storage area network/Highly available storage	The back-end storage must be based on solid-state drives (SSDs) on a runtime storage area network (SAN). Size and input/output operations per second (IOPS) throughput is based on the size of the workload.				
	Active Directory	3	4	12	16	48
<i>Summary for shared infrastructure</i>		5		28		112

* SQL Server sizes are highly dependent on workloads. For more information, see [Hardware sizing requirements for on-premises environments](#). Separate SQL Server machines for sandbox and production environments must be used. However, SQL Server can be shared in all sandbox environments.

Storage

- AOS – Finance + Operations uses a Server Message Block (SMB) 3.0 share to store unstructured data. For more information, see [Storage Spaces Direct in Windows Server 2016](#).
- SQL – The following options are viable:
 - A highly available SSD setup
 - A SAN that is optimized for online transaction processing (OLTP) throughputs
 - High-performance direct-attached storage (DAS)
- SQL Server and data management IOPS – The storage for both data management and SQL Server should have at least 2,000 IOPS. Production IOPS depends on many factors. For more information, see [Hardware sizing requirements for on-premises environments](#).
- VM IOPS – Each VM should have at least 100 write IOPS.

Virtual host requirements

When you set up the virtual hosts for an environment, see the guidelines in [Plan and prepare your Service Fabric cluster](#) and [Describing a service fabric cluster](#). Each virtual host should have enough cores for the infrastructure that is being sized. Multiple advanced configurations are possible, where SQL Server resides on physical hardware but everything else is virtualized. If SQL Server is virtualized, the disk subsystem should be a fast SAN or the equivalent. In all cases, make sure that the basic setup of the virtual host is highly available and redundant. In all cases, when virtualization is used, no VM snapshots should be taken.

Finance + Operations falls under Microsoft's standard support policy regarding operation on non-Microsoft virtualization platforms – specifically VMWare. For more information, read [Support policy for Microsoft software](#). In short, we support our products in this environment, but if we are asked to investigate an issue, we may ask the customer to first reproduce the problem without the virtualization platform or on the Microsoft virtualization platform.

Software requirements for all server computers

The following software must be present on a computer before any Finance + Operations components can be

installed:

- The Microsoft .NET Framework. See [Deployment setup](#) for version information.
- Service Fabric

For more information, see [Plan and prepare your Service Fabric cluster](#).

Supported server operating systems

The following table lists the server operating systems that are supported.

OPERATING SYSTEM	NOTES
Microsoft Windows Server 2016 Datacenter or Standard	These requirements are for the database and the Service Fabric cluster that hosts AOS. Only en-US OS installations are supported.

Software requirements for database servers

- Only 64-bit versions of SQL Server 2016 are supported.
- Only `SQL_Latin1_General_CP1_CI_AS` is valid for the server and database collation. For more information about how to select a collation for a SQL Server database, see the [SQL Server documentation](#).
- In a production environment, we recommend that you install the latest cumulative update (CU) for the version of SQL Server that you're using.

The following table lists the SQL Server versions that are supported for the databases. For more information, see the minimum hardware requirements for [SQL Server](#).

REQUIREMENT	NOTES
Microsoft SQL Server 2016 Standard Edition or Enterprise Edition	For the hardware requirements for SQL Server 2016, see Hardware and Software Requirements for Installing SQL Server 2016 .

Software requirements for Application Object Server (AOS)

- SQL Server Integration Services (SSIS)

Software requirements for Reporting Server (BI)

- SQL Server Reporting Services (SSRS)

Software requirements for client computers

Users can access Finance + Operations by using the most recent versions of these popular browsers:

- Microsoft Edge (recommended: [Chromium-based Edge](#))
- Google Chrome
- Apple Safari
- Internet Explorer 11 (deprecated, not recommended)

NOTE

For optimal performance and an optimal experience, we recommend that you use the latest version of a modern browser, especially Microsoft Edge. Support for Internet Explorer 11 is deprecated. For more information, see the [Internet Explorer deprecation announcement](#).

Software requirements for Active Directory Federation Services

Active Directory Federation Services (AD FS) on Windows Server 2016 is required.

The domain controller must be Windows Server 2012 R2 or later, and the domain functional level must be 2012 R2 or more. For more information about domain functional levels, see the following pages:

- [What Are Active Directory Functional Levels](#)
- [Understanding Active Directory Domain Services Functional Levels](#)
- [Full 2-way trust](#)

Supported Microsoft Office applications

The following Microsoft Office applications are supported in on-premises deployments:

- To run the Microsoft Excel and Microsoft Word add-ins, you must have Microsoft Office 2016 for Windows (or newer) installed. For more information about version requirements, see [Troubleshoot the Office integration](#).
- To view documents that are generated by the Export to Excel or Export to Word functionality, you must have Microsoft Office 2007 or later installed.

Hardware and software requirements for Commerce components

Currently, Finance + Operations doesn't include the Commerce components.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Buy Finance + Operations (on-premises)

2/18/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Dynamics 365 Finance + Operations (on-premises) offers a variety of license types to best suit the needs of your organization. To better understand how Finance + Operations (on-premises) is licensed, please work with your partner, who can access the [Licensing guide](#) on PartnerSource. When you are ready to purchase licenses for your organization, work with your partner to follow the steps outlined in this topic.

IMPORTANT

On-premises environments are not supported on any public cloud infrastructure, including Azure.

Purchase client access licenses

To run on-premises environments, you must obtain the proper number of client access licenses (CALs) for your organization per the licensing guide. The CAL purchased for an individual user determines the functionality that the user has the rights to use. User CALs can be purchased from the [Microsoft Volume Licensing Service Center](#).

Purchase server licenses

A server license is required for every server running Finance + Operations (on-premises). After purchasing your server licenses, work with your partner to download a license file from the [PartnerSource Business Center](#). Keep this license file handy, as the details it contains will be used when setting up your Lifecycle Services (LCS) project.

Partners can download a customer's Finance + Operations (on-premises) license file from the PartnerSource Business Center using these steps:

1. Log on to the [PartnerSource Business Center](#).
2. Enter the customer name or account number in the **Find A Customer** field, and then click **Search**.
3. Click the company name of the customer. This opens the **Customer Summary** page.
4. Under **Registered Products**, click **Registration Keys**.
5. Select **version 07** in the **Request and Display License Keys For Version** field.
6. Click **Display License Keys**.
7. On the **Request License Keys** page, select **Download Current License/Registration Key**.
8. Click **Save As** in the **File Download** dialog box, select the folder where you want to download the license file to in the **Save As** dialog box, and then click **Save**.

NOTE

If you cannot see registration keys in PartnerSource Business Center, you will need to ensure that your PartnerSource Business Center Profile has **Can See Registration Keys** set to **Yes**.

Get started with Lifecycle Services (LCS)

To purchase Finance + Operations (on-premises) you must have a Microsoft Online Services ID. The Microsoft Online Services ID is used to provision an LCS project that contains the necessary artifacts for on-premises environments. LCS is the service where on-premises environments will be provisioned, Business Process Model

created/uploaded, hotfixes are made available, support cases are entered and managed, license key serial number activation submitted, etc.

The Microsoft Online Services ID is required to provision and register Finance + Operations (on-premises) into entity-owned hardware and environment. See the Provisioning guide (linked to below) to complete the provisioning and registration process. If a Microsoft Online Services ID already exists, the process must be completed by the Global Administrator. If creating a Microsoft Online Services ID for the first time, the person initiating the process will be the Global Administrator.

If you have an existing Microsoft Online Services trial or paid subscription, you already have a Microsoft Online Services ID that was created at the time of sign-up. When you click a link below, choose to sign in with this account if you want to use this same Azure Active Directory (AAD) tenant for the on-premises environment.

Access to the Provisioning guide can be found here:

- [Provisioning guide on CustomerSource](#)
- [Provisioning guide on PartnerSource](#)

After you have logged into LCS, a project will be automatically provisioned for you. The LCS project will allow you to deploy an on-premises environment. For more details on getting started with your LCS project, see [Set up on-premises projects in Lifecycle Services \(LCS\)](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure the Warehousing app for on-premises deployments

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to configure Dynamics 365 for Finance and Operations – Warehousing app for on-premises deployments.

Prerequisites

The Warehousing app is available on Android and Windows operating systems. To use the app for on-premises deployments, at a minimum, it must be version 1.1.1.0. You must also have one of the following supported versions of Dynamics 365 Finance + Operations (on-premises). Use the information in the following table to evaluate if your hardware and software environment supports the configuration.

PLATFORM	VERSION
Android	4.4 and up
Windows (UWP)	Windows 10 (all versions)
App version	1.1.1.0 and above
Dynamics 365	Dynamics 365 Finance + Operations (on-premises) with Platform update 11

To be able to reach your on-premises resources with the app, you will need to create DNS records for your AOS and for Active Directory Federation Services (AD FS). For guidance, see [Create DNS zones, and add a record](#).

Create an application entry in AD FS

For a successful authentication exchange between AD FS and Finance + Operations, an application entry must be registered in AD FS under an AD FS application group. To create this application entry, run the following Windows PowerShell commands on a machine where the AD FS is installed. The user account must have enough permissions to administer AD FS.

1. Enter the following command in the Windows PowerShell console to create the application entry.

```
Add-AdfsClient -Name 'Dynamics 365 for Finance and Operations - Warehousing' -ClientId ([guid]::NewGuid()) -ClientType Confidential -GenerateClientSecret -RedirectUri '\<Resource URL\>' -ADUserPrincipalName '\<Admin user\>'
```

- The <Resource URL> can, for example, be `https://ax.d365ffo.onprem.contoso.com` (where `https://ax.d365ffo.onprem.contoso.com` is the URL to access Finance + Operations).
- The <Admin user> can be any user with admin access to the AD FS machine.

2. Save the values that you received.

3. Run the following command to grant permission to the application.

```
Grant-AdfsApplicationPermission -ClientRoleIdentifier '\<Client ID received in previous steps\>' -
ServerRoleIdentifier '\<Resource URL\>' -ScopeNames 'openid'
```

Create and configure a user account

To enable Finance + Operations to use your AD FS application, you must create a user account in Microsoft Dynamics 365 with the same user credentials as the user of the Warehousing app:

1. Create a user in Finance + Operations and assign the Warehousing mobile device user role to the user.
 - a. Go to **System administration > Common > Users**.
 - b. Create a new user.
 - c. Assign the warehouse mobile device user role, as shown in the example screenshot.

USERS
WMAPP : WMAPP

User details

User ID WMAPP	Email WMAPP@contoso.net	Person [Dropdown]
User name WMAPP	Telemetry ID {00000000-0000-0000-0000-00...}	Enabled Yes <input checked="" type="checkbox"/>
Provider https://sts.windows-ppe.net/	Company [Dropdown]	

User's roles

+ Assign roles Remove role Assign organizations

Roles

- System user
 - Warehouse mobile device user

2. Associate your AD FS application with the Warehousing app user.
 - a. In Finance + Operations, click **System administration > Setup > Azure Active Directory applications**.
 - b. Create a new line.
 - c. Enter the client ID that you obtained when you created an application entry in AD FS (step 2 in "Create an application entry in AD FS"). Enter a name, and select the Warehousing app user.

Dynamics 365 Operations System administration > Setup > Azure Active Directory applications

Save + New Delete OPTIONS 🔍

Azure Active Directory applications

Filter

✓	Client Id	Name	User ID
✓	aaaaaaaa-1234-bbbb-5678-cccccccccc	Device 1	WMAPP [Dropdown]

Certificates

Make sure that the devices with the app installed have the correct certificates to access the resources. If you are using self-signed certificates, these will need to be installed on each device by importing star(AX) and AD FS to the trusted route of the computer account/user account. For more information, see [Create and export a self-signed certificate](#).

IMPORTANT

Environments with self-signed certificates will not be accessible from Android devices. If you need to access the environment from an Android device, use publicly trusted certificates for AD FS and Finance + Operations. Alternatively, you can also use AD CS to generate the certificates for AD FS and Finance + Operations. However, if you do this you will have to manually import the certificate authority certificate into your Android device.

Configure the application

You must configure the Warehousing app on the device to connect to the server through the AD FS application.

1. In the app, open **Connection settings**.
2. Enter the following information:
 - a. **Active Directory Client ID** - The client ID that you obtained when you created an application entry in AD FS (step 2 in "Create an application entry in AD FS").
 - b. **Active Directory Client Secret** - The client secret obtained when you created an application entry in AD FS.
 - c. **Active Directory Resource** - The DNS URL for the AOS. Append the URL with '/namespaces/AXSF'.
For example: `https://ax.d365ffo.onprem.contoso.com/namespaces/AXSF`
 - d. **Active Directory Tenant** - The DNS URL for the AD FS machine. Append the URL with '/adfs/oauth2'.
For example: `https://adfs.d365ffo.onprem.contoso.com/adfs/oauth2` Make sure to use the CNAME of the ADFS machine (in the example the CNAME is `https://adfs.d365ffo.onprem.contoso.com`)
3. **Company** - Enter the legal entity to which you want the application to connect.
4. Select the **Back** button in the top-left corner of the application.

The application will now connect to your server and the log-in screen for the warehouse worker will display.

5. If you do not have a telemetry ID for the Warehouse app, you might encounter some errors. This is a known issue. The workaround is to sign in to an existing client to get a Telemetry ID. This issue will be fixed in a future release.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Dynamics 365 Finance and Dynamics 365 Supply Chain Management - operated by 21Vianet in China

2/18/2021 • 4 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

Microsoft Dynamics 365 online services operated by 21Vianet is designed to comply with regulatory requirements in China. The services are a physically separated instance of cloud services operated and transacted by a local operator, Shanghai Blue Cloud Technology Co., Ltd (“21Vianet”). This is a wholly owned subsidiary of Beijing 21Vianet Broadband Data Center Co., Ltd. located in mainland China.

Microsoft strives to maintain functional parity between our commercially available service and Finance and Operations apps operated by 21Vianet in China. However, there are notable exceptions to this, which are affected by dependent service or partner-solution availability, market priorities, or compliance regulations.

Provisioning

Customers in China have two options from which to select how they want to access Finance and Supply Chain Management apps.

- Services operated by 21Vianet in China - 21Vianet operates and offers Finance and Supply Chain Management services in China. This option provides a consistent application experience that is the same as global offerings. This option also meets the demands of customers who prefer to use online services provided by a local company that stores their data within China. These services are subject to Chinese laws.
- Services operated by Microsoft – This option is for Finance and Supply Chain Management customers that prefer to use services managed and delivered by Microsoft. For all new customers and existing customers, if the customer purchases Microsoft Azure, Dynamics 365, and Office using an Enterprise Agreement, Microsoft 365 and/or Dynamics 365 can co-exist on the tenant.

For information on provisioning environments, see [Create and manage environments in the Power Platform Admin center](#).

Features not available

Due to certain technical dependencies, the following features listed will not be available for general availability of the Dynamics 365 Services operated by 21Vianet. For information about future feature availability, see [Business applications and platform release plans](#).

- **Development, build, and testing of customizations** will be unavailable in **Azure DevOps** in

Mainland China. However, use of Azure DevOps on-premises will be available in China in April 2019. Also, Azure DevOps can be used in other regions. For more information, see [Developer guide for Azure China 21Vianet](#).

- [Set up and maintain vendor collaboration](#) will be unavailable due to Azure Active Directory limitations.
- Certain **mobile apps** (e.g., [Install and configure the Warehousing app overview](#) and [Project time entry mobile workspace](#)) will be unavailable due to the Google Play Store not being available in China; however, alternatives are being considered.
- The **mobile platform** will not be available because certain App store dependencies are unavailable in China.
- The following **Microsoft Dynamics Lifecycle Services (LCS)** features will have a different experience or will be unavailable due to the dependencies that are not available:
 - **APQC Business process modeler (BPM) Library** will be unavailable. However, base Business process modeler (BPM) functionality will be available for custom models in April 2019. Search functionality in the BPM will be unavailable in China.
 - **Electronic reporting (ER) overview assets** will not be available automatically, but can be manually uploaded from the LCS global asset library.
 - **Code upgrade** will be unavailable for upgrades from Dynamics AX 2012.
 - **Service and Support requests** will be available through LCS but 21Vianet is the service operator. For more information, see [Support for Dynamics 365 Finance and Operations apps operated by 21Vianet in China](#).
 - **Extensibility requests** will be unavailable.
 - Hotfix requests will be unavailable.
 - [Dynamics 365 Translation Service overview](#) will not be available.
 - **Embedded Power Apps** and connectivity to Microsoft Power Apps and Microsoft Power Automate will be unavailable.
 - [Data integration using Dataverse overview](#) will be unavailable.

NOTE

The Lifecycle Services URL for implementations operated by 21Vianet in China is lcs.dynamics.cn.

- The following features will not be available due to certain **current Azure Active Directory limitations** in China:
 - The **System administration > Setup > B2B Invitation configuration** page will not be available due to business-to-business (B2B) being unavailable in Azure Active Directory in China. For more information, see [What is guest user access in Azure Active Directory B2B](#).
- **Conditional access** is an Azure Active Directory feature that is available for the Azure Active Directory Premium 2 SKU. This is unavailable in China.
- The Microsoft Dynamics 365 Payment Connector for PayPal is not available in China.

Finance and Operations apps in France

2/18/2021 • 2 minutes to read • [Edit Online](#)

As of July 2019, Finance and Operations apps, Power Apps, and Power Automate are available in France's datacenters. This new deployment option serves customers in regulated industry and commercial organizations that do business with entities in France that require local data residency. Power BI has been available since March 2019.

The deployment of the Dynamics 365 services in France, are built upon the foundational principles of security, privacy, compliance, transparency, and reliability, offering French organizations a complete cloud infrastructure and platform, as well as familiar productivity and business application tools. All of this means that customer data stays resident within France.

Microsoft strives to maintain functional parity between our commercially available service and Dynamics 365 offerings in France. However, there are few exceptions affected by dependent service or partner-solution availability, market priorities, or compliance regulations. For more information about these exceptions or for questions about services in France, contact [Microsoft Dynamics Online support](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Preview of Dynamics 365 Supply Chain Management 10.0.17 (April 2021)

2/18/2021 • 4 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This topic lists features that are either new or changed in the Microsoft Dynamics 365 Supply Chain Management preview of version 10.0.17. This version has a build number of 10.0.761 and is available as follows:

- **Preview of release:** February 2021
- **General availability of release (self-update):** March 2021
- **General availability of release (auto-update):** April 2021

Features included in this release

The following features are included in this release. Some of the listed features are still in preview, while others may already be generally available. Follow the links to the [release plan](#) to see the official release dates for each feature.

Most of these features must be enabled using [Feature management](#) before you can use them.

Asset management

- [Apply rules for grouping work orders while running a maintenance plan](#)
 - For more information, see [Creating work orders](#).
- [Bill customers for maintenance work](#)
 - For more information, see [Bill for maintenance on customer-owned assets](#).
- [Plan maintenance based on accumulated asset counter values](#)
 - For more information, see [Maintenance plans](#).

Inventory and logistics

- [Integration framework for material handling equipment for automated warehouse processes \(previously MHAX\)](#)
- [Landed cost](#)
- [Packing vs. storage dimensions](#)
 - For more information, see [Set different dimensions for packing and storage](#).
- [Saved views for inventory and logistics](#)
 - For more information, see [Standard saved views for Supply Chain Management](#).
- [Schedule warehouse work creation](#)
 - For more information, see [Schedule work creation during wave](#).
- [Set default financial dimensions for inventory standard cost revaluation vouchers](#)
 - For more information, see [Manage standard cost updates](#).

- [Small parcel shipping \(SPS\)](#)
 - For more information, see [Small parcel shipping](#).
- [Warehouse execution with scale units in the cloud](#)
 - For more information, see [Warehouse management workloads for cloud and edge scale units](#) and [Warehouse orders for cloud and edge scale units](#).
- [Warehouse management mobile application](#)
 - For more information, see [Install and connect the Warehouse Management app](#) and [Mobile device user settings](#).

Manufacturing

- [Asset management capabilities in the production floor execution interface](#)
 - For more information, see [How workers use the production floor execution interface](#).
- [Override the default reservation principle for materials in production](#)
 - For more information, see [Override the default reservation principle for materials in production](#).
- [Saved views for production control](#)
 - For more information, see [Standard saved views for Supply Chain Management](#).
- [Manufacturing execution with scale units in the cloud](#)
 - For more information, see [Manufacturing execution workloads for cloud and edge scale units](#).

Planning

- [Coverage time fence support for Planning Optimization](#)
 - For more information, see [Coverage time fences](#).
- [Forecast submodel support for Planning Optimization](#)
 - For more information, see [Master planning with demand forecasts](#).
- [Purchase requisition support for Planning Optimization](#)
 - For more information, see [Purchase requisitions](#).
- [Saved views for planned orders](#)
 - For more information, see [Standard saved views for Supply Chain Management](#).

Product information management

- [Enable change management on existing products](#)
 - For more information, see [Enable change management on existing products](#).

New and updated documentation resources

We have recently added or significantly updated the following help topics. They aren't necessarily related to the new features added for this release, as listed in the previous section, but they may help you to get more out of existing features.

Cost management

- [Troubleshoot cost management](#)

Asset management

- [Set up the Asset management mobile workspace](#)

Inventory and logistics

- [Configure product filters for warehouse transactions](#)
- [Partial location cycle counting](#)

- [Pick line grouping](#)
- [Troubleshoot inventory operations](#)
- [Warehouse slotting](#)

Manufacturing

Platform updates for Finance and Operations apps

Microsoft Dynamics 365 Supply Chain Management 10.0.17 includes platform updates. To learn more, see [Platform updates for version 10.0.17 of Finance and Operations apps \(April 2021\)](#).

Bug fixes

For information about the bug fixes included in each of the updates that are part of 10.0.17, sign in to Lifecycle Services (LCS) and view the [KB article](#).

Dynamics 365: 2021 release wave 1 plan

Wondering about upcoming and recently released capabilities in any of our business apps or platform?

Check out the [Dynamics 365: 2021 release wave 1 plan](#). We've captured all the details, end to end, top to bottom, in a single document that you can use for planning.

Removed and deprecated Supply Chain Management features

The [Removed or deprecated features in Dynamics 365 Supply Chain Management](#) topic describes features that have been or are scheduled to be removed or deprecated for Supply Chain Management.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature is not in active development and may be removed in a future update.

Before any feature is removed from the product, the deprecation notice will be announced in the [Removed or deprecated features in Dynamics 365 Supply Chain Management](#) topic 12 months prior to the removal.

For breaking changes that only affect compilation time, but are binary compatible with sandbox and production environments, the deprecation time will be less than 12 months. Typically, these are functional updates that need to be made to the compiler.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

What's new or changed in Dynamics 365 Supply Chain Management 10.0.16 (February 2021)

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic lists features that are either new or changed in Microsoft Dynamics 365 Supply Chain Management version 10.0.16. This version has a build number of 10.0.689 and is available as follows:

- **Preview of release:** November 2020
- **General availability of release (self-update):** January 2021
- **General availability of release (auto-update):** February 2021

Features included in this release

The following features are included in this release. Some of the listed features are still in preview, while others may already be generally available. Follow the links to the [release plan](#) to see the official release dates for each feature.

- [Customizable shop floor execution interface](#)
 - For more information, see [Set up a device to run the production floor execution interface](#).
- [Inventory Visibility Add-in for Dynamics 365 Supply Chain Management](#)
 - For more information, see [Inventory Visibility Add-in](#)
- [Validate license plates on source document lines](#)
 - For more information, see [Warehouse configuration overview](#).
- [Warehouse management outbound workload visualization](#)
 - For more information, see [Outbound workload visualization](#)

Most of these features must be enabled using [Feature management](#) before you can use them.

New and updated documentation resources

We have recently added or significantly updated the following help topics. They aren't necessarily related to the new features added for this release, as listed in the previous section, but they may help you to get more out of existing features.

- [Attribute-based sales prices for constraint-based product configuration](#)
- [Automatic allocation of charges](#)
- [Hazardous materials overview](#) (and related topics)
- [Migration to Planning Optimization for master planning](#)
- [Purchasing cXML Enhancements](#)
- [Troubleshoot cost management](#)
- [Troubleshoot inbound warehouse operations](#)
- [Troubleshoot load building and shipments](#)
- [Troubleshoot master planning](#)
- [Troubleshoot outbound warehouse operations](#)
- [Troubleshoot partial releases and partial shipments](#)
- [Troubleshoot the product configurator](#)

- [Troubleshoot product information](#)
- [Troubleshoot procurement and sourcing workflows](#)
- [Troubleshoot purchase orders](#)
- [Troubleshoot prices, discounts, agreements, and rebates](#)

What's new or changed in Dynamics 365 Supply Chain Management 10.0.15 (January 2021)

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic lists features that are either new or changed in Microsoft Dynamics 365 Supply Chain Management version 10.0.15. This version has a build number of 10.0.644 and is available as follows:

- **Preview of release:** October 2020
- **General availability of release (self-update):** November 2020
- **General availability of release (auto-update):** January 2021

Features included in this release

The following features are included in this release. Some of the listed features are still in preview, while others may already be generally available. Follow the links to the [release plan](#) to see the official release dates for each feature.

- **Cloud and edge scale unit management with manufacturing and warehouse execution workloads**
 - For more information, see [Cloud and edge scale units for manufacturing and warehouse management workloads](#).
- **Create and process transfer orders from the warehouse app**
 - For more information, see [Create transfer orders from the warehouse app](#).
- **Default RFQ reply fields for vendor bidding**
 - For more information, see [Requests for quotation \(RFQs\) overview](#).
- **Engineering Change Management Add-in for Dynamics 365 Supply Chain Management**
 - For more information, see [Engineering change management overview](#).
- **Mixed-reality Guides for manufacturing**
 - For more information, see [Provide mixed-reality Guides for workers in production](#).
- **New user experience for production floor execution**
 - For more information, see [How workers use the production floor execution interface](#).
- **Process warehouse app events**
 - For more information, see [Warehouse app event processing](#).
- **Saved views for the Released products page**
 - For more information, see [Saved views](#).
- **USMCA certification of origin document**
 - For more information, see [USMCA certification of origin](#).

Most of these features must be enabled using [Feature management](#) before you can use them.

Removed or deprecated features in Dynamics 365 Supply Chain Management

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic will be updated as new removed or deprecated features are documented for Dynamics 365 Supply Chain Management.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature is not in active development and may be removed in a future update.

This list is intended to help you consider these removals and deprecations for your own planning.

NOTE

Detailed information about objects in Finance and Operations apps can be found in the [Technical reference reports](#). You can compare the different versions of these reports to learn about objects that have changed or been removed in each version of Finance and Operations apps.

Features removed or deprecated in the Supply Chain Management 10.0.15 release

Internet Explorer 11 support for Dynamics 365 is deprecated

Reason for deprecation/removal	Effective December 2020, Microsoft Internet Explorer 11 support for all Dynamics 365 products is deprecated, and Internet Explorer 11 won't be supported after August 2021. This will impact customers who use Dynamics 365 products that are designed to be used through an Internet Explorer 11 interface. After August 2021, Internet Explorer 11 won't be supported for such Dynamics 365 products.
Replaced by another feature?	We recommend that customers transition to Microsoft Edge.
Product areas affected	All Dynamics 365 products
Deployment option	All
Status	Deprecated. Internet Explorer 11 won't be supported after August 2021.

Use of built-in Supply Chain Management master planning engine for manufacturing scenarios

--	--

Reason for deprecation/removal	To enhance performance and minimize the SQL database load during master planning runs, the built-in Supply Chain Management master planning engine is being replaced by Planning Optimization. Planning Optimization allows for fast planning runs that can be performed even during office hours. This enables planners to react immediately to changes in demand or planning parameters.
Replaced by another feature?	Yes, Planning Optimization will replace the existing built-in Supply Chain Management master planning engine.
Product areas affected	Supply Chain Management - Master planning
Deployment option	Cloud only. Planning Optimization is not supported with on-premises deployments.
Status	Deprecated. By October 1, 2021, manufacturing scenarios will no longer be supported with the built-in Dynamics 365 Supply Chain Management master planning engine. For manufacturing scenarios, customers must use Planning Optimization for master planning calculations. For more information, see Planning Optimization documentation . Customers with on-premises deployments of Dynamics 365 Supply Chain Management may continue to use the Supply Chain Management master planning engine for manufacturing scenarios after October 2021. However, no more feature enhancements will be provided.

Features removed or deprecated in the Supply Chain Management 10.0.11 release

Use of built-in Supply Chain Management master planning engine for distribution scenarios

Reason for deprecation/removal	To enhance performance and minimize the SQL database load during master planning runs, the built-in Supply Chain Management master planning engine is being replaced by Planning Optimization. Planning Optimization allows for fast planning runs that can be performed even during office hours. This enables planners to react immediately to changes in demand or planning parameters.
Replaced by another feature?	Yes, Planning Optimization will replace the existing built-in Supply Chain Management master planning engine.
Product areas affected	Supply Chain Management - Master planning
Deployment option	Cloud only. Planning Optimization is not supported with on-premises deployments.

Status	Deprecated. By April 1, 2021, distribution scenarios will no longer be supported with the built-in Dynamics 365 Supply Chain Management master planning engine. For distribution scenarios, customers must use Planning Optimization for master planning calculations. For more information, see Planning Optimization documentation . Customers with on-premises deployments of Dynamics 365 Supply Chain Management may continue to use the Supply Chain Management master planning engine for distribution scenarios after April 2021. However, no more feature enhancements will be provided.
---------------	---

Previous announcements about removed or deprecated features

To learn more about features that have been removed or deprecated in previous releases, see [Removed or deprecated features in previous releases](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Removed or deprecated features in previous releases

2/18/2021 • 51 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

IMPORTANT

This topic is no longer updated. To see a current list of features that have been removed or deprecated from Finance and Operations apps, search for "**Removed or deprecated features**" content that relates to the app you're using.

This topic describes features that have been removed or deprecated from Dynamics 365 for Finance and Operations and previous releases of that product.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature is not in active development and may be removed in a future update.

This list is intended to help you consider these removals and deprecations for your own planning.

Detailed information about objects in Finance and Operations apps can be found in the [Technical reference reports](#). You can compare the different versions of these reports to learn about objects that have changed or been removed in each version of Finance and Operations apps.

Finance 10.0.7 with Platform update 31

Chinese voucher types without Account groups selection

Reason for deprecation/removal	Changed to the feature with account groups selection.
Replaced by another feature?	Yes
Product areas affected	Application
Deployment option	All
Status	Deprecated: By December 1, 2020, we plan to no longer support Chinese voucher types setup without Account groups selection. Find more details about new feature design in What's new in 10.0.7

Finance and Operations 10.0.6 with Platform update 30

DimensionHash.getHash(str_message)

Reason for deprecation/removal	Windows is deprecating the use of SHA1, as documented in Windows Enforcement of SHA1 Certificates .
Replaced by another feature?	Yes
Product areas affected	Application
Deployment option	All
Status	Deprecated: By April 1, 2020, developers must use the platform APIs found in the class HasFunction .

Hash.ComputeSHA1Hash(string message)

Reason for deprecation/removal	Windows is deprecating the use of SHA1, as documented in Windows Enforcement of SHA1 Certificates .
Replaced by another feature?	Yes
Product areas affected	Platform
Deployment option	All
Status	Deprecated: By April 1, 2020, developers must use the platform APIs found in the class HasFunction .

FormDateTimeControl.setUtcString()

Reason for deprecation/removal	We are retiring the setUtcString() method, because a better replacement method is available.
Replaced by another feature?	Yes
Product areas affected	Platform
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the setUtcString() method. Developers should be using the setUtcDateTime() method instead.

Reason for deprecation/removal	Not legally required.
Replaced by another feature?	No
Product areas affected	Italian localization
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the Blacklist report (IT) – Feature reference IT-00001 .

Domestic tax report – Feature reference IT-00003

Reason for deprecation/removal	Not legally required.
Replaced by another feature?	No
Product areas affected	Italian localization
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the Domestic tax report – Feature reference IT-00003 .

Finance and Operations 10.0.5 with Platform update 29

US Payroll tax updates

Reason for deprecation/removal	We are retiring tax updates for the US Payroll functionality due to low usage and enhanced functionality that is now offered via strategic integrations.
Replaced by another feature?	Yes
Product areas affected	Payroll
Deployment option	All
Status	Deprecated: By July 31, 2024, we plan to no longer provide tax updates to US Payroll customers. The functionality will remain in the product, but enhancements will no longer keep the functionality up to date, and any product defects will be evaluated on a case-by-case basis.

NOTE

This represents a change from the original discontinuation date of October 1, 2021. For more information, see [Tax updates being retired for US Payroll feature in Microsoft Dynamics 365 for Finance and Operations](#).

Data management staging clean up

Reason for deprecation/removal	Does not meet the core requirements that are needed for scheduling periodic cleanup.
Replaced by another feature?	Yes, the Job history cleanup feature is being added to meet the scenarios holistically.
Product areas affected	Data management
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is December 2020.

Finance and Operations 10.0.4 with Platform update 28**France: FEC Accounting data export in XML**

Reason for deprecation/removal	Replaced by TXT format, French FEC audit file is available through General ledger > Periodic tasks > Data export .
Replaced by another feature?	Yes
Product areas affected	General ledger
Deployment option	All
Status	Deprecated. Target timeframe for the functionality to be removed is July 2020.

Legacy navigation bar

Reason for deprecation/removal	Header alignment with other Dynamics and Office products. For more details, see Updated navigation bar that aligns with the Office header .
Replaced by another feature?	Starting in Platform update 24, a restyled navigation bar that features search was introduced.
Product areas affected	Web client

Deployment option	All
Status	Deprecated: Starting in April 2020, the legacy navigation bar will no longer be available. Until that point, customers can revert to the legacy navigation bar through the Client performance options page.

Finance and Operations 10.0.2 with Platform update 26

Legacy default action behavior

Reason for deprecation/removal	The legacy behavior for default actions in grids results in an unexpected column having the default action link after grid columns have been reordered via personalization. The new sticky default action feature corrects this. For more details, see Sticky default actions in grids .
Replaced by another feature?	Starting in Platform update 21, a feature for "sticky default actions" was introduced. This feature can be enabled on the Client performance options page.
Product areas affected	Grids in the web client
Deployment option	All
Status	Deprecated: Starting in April 2020, sticky default actions will be the default behavior, without a mechanism to revert to the legacy behavior.

Legacy "is one of" filtering experience

Reason for deprecation/removal	The "is one of" filtering experience went through a redesign in Platform update 22, with the plan for this to eventually be the only "is one of" filtering experience.
Replaced by another feature?	Starting in Platform update 22, an improved "is one of" filtering experience became available on the Client performance options page. For more information, see Optimized is one of filtering experience .
Product areas affected	Web client
Deployment option	All
Status	Deprecated: Starting in April 2020, the improved "is one of" experience will be the default behavior, without a mechanism to revert to the legacy behavior.

Parameter to enable sales orders with multiple project contract funding sources

Support for creating project-based sales orders where the project contract has multiple funding sources is

enabled with the Project management parameters setting **Allow sales orders for project with multiple funding sources**. By default, this parameter is not enabled.

Reason for deprecation/removal	The functionality will always be enabled after the parameter is removed.
Replaced by another feature?	No. The functionality to support project-based sales orders with multiple funding sources will always be enabled.
Product areas affected	The Allow sales orders for projects with multiple funding sources parameter will be removed. The following methods will be modified when the parameter is removed: ctrlSalesOrderTable method in ProjStatusType class, validate method for ProjId field, and run method in SalescreateOrder form. The following methods will be deprecated when the parameter is removed: IsSalesOrderAllowedForMultipleFundingSources in ProjTable table file, IsAllowSalesOrdersForMultipleFundingSourcesParam Enabled method in ProjTable table file, AllowSalesOrdersForMultipleFundingSources data field in ProjParameters form and ProjParameterEntity files, IsAssociatedToMultipleFundingSourcesContract private method in ProjTable table file.
Deployment option	All
Status	Deprecation is planned for the April 2020 release wave.

Legacy workflow reports for tracking and instance status

Reason for deprecation/removal	The legacy workflow reports for tracking and instance status are being deprecated because they are no longer referenced from the navigation. The report names are WorkflowWorkflowInstanceByStatusReport and WorkflowWorkflowTrackingReport .
Replaced by another feature?	The workflow history form can be used instead.
Product areas affected	Web client
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is April 2020.

Finance and Operations 10.0.1 with Platform update 25

Deprecated APIs and potential breaking changes

Deriving from internal classes is deprecated

Reason for deprecation/removal	Before Platform update 25, it was possible to create a class or table that derives from an internal class/table that is defined in another package/module. This is not a safe coding practice. As of Platform update 25, the compiler will display a warning.
Replaced by another feature?	The compiler warning will be replaced by an error in Platform update 26. This change is backward compatible at runtime, which means that Platform update 25 or newer can be deployed on any sandbox or production environment without the need to modify custom code. This change only affects development and compile time.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning will become a compilation error in Platform update 26.

Overriding internal methods is deprecated

Reason for deprecation/removal	Before Platform update 25, it was possible to override an internal method in a derived class that is defined in another package/module. This is not a safe coding practice. As of Platform update 25, the compiler will display a warning.
Replaced by another feature?	This warning will be replaced by a compile error in Platform update 26. This change is backward compatible at runtime, which means that Platform update 25 or newer can be deployed on any sandbox or production environment without the need to modify custom code. This change only affects development and compile time.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning will become a compilation error in Platform update 26.

Finance and Operations 10.0.0 with Platform update 24

Renaming released products

Reason for deprecation/removal	When you use the Rename primary key function to change the ItemId of a released product, only direct foreign key references are updated. Any other references to the released product, such as from production orders, will retain the old ItemId. As a result, there could be inconsistent data that will eventually block business processes.

Replaced by another feature?	No.
Product areas affected	Product information management
Deployment option	All
Status	Removed as of Finance and Operations 10.0.0 with Platform update 24.

Finance and Operations 8.1.3 with Platform update 23

SQL Server Reporting Services ReportViewer Control

Customers can use the **Export** action provided by the embedded SQL Server Reporting Services (SSRS) ReportViewer control to download documents produced by Finance and Operations applications. This HTML-based presentation of the report offers users a non-paginated preview of the document.

Reason for deprecation/removal	The non-paginated nature of the HTML-based preview experience does not deliver fidelity with the physical documents ultimately produced by Finance and Operations. By fully embracing PDF as the standard format for business documents, users are able to take advantage of a modern viewing experience with improved performance when producing application reports.
Replaced by another feature?	Going forward, PDF documents will be the default format for reports rendered by Finance and Operations.
Product areas affected	This change does not impact customer scenarios where reports are distributed electronically or sent directly to printers.
Deployment option	All
Status	Deprecated: A removal date has not been set for this feature. The functionality to automatically preview application reports using an embedded PDF viewer is planned for the May 2019 Platform update.

Client KPI controls

Embedded key performance indicators (KPIs) could be modeled in Visual Studio by a developer and further customized by the end user.

Reason for deprecation/removal	The native client controls used to define KPIs have low customer uptake and rely on a developer to add trackable metrics.

Replaced by another feature?	PowerBI.com service delivers world-class tooling for defining and managing KPIs based on data from external sources. In an upcoming release, we plan to enable you to embed solutions hosted on PowerBI.com in application workspaces.
Product areas affected	This update will prevent developers from introducing new KPI controls in Visual Studio designer.
Deployment option	All
Status	Deprecated: A removal date has not been set for this feature.

Deprecated APIs and future breaking changes

Field groups containing invalid field references

Reason for deprecation/removal	<p>It is possible for table metadata definitions to have field groups containing invalid field references. If deployed, this can cause runtime failures in Financial Reporting and SQL Server Reporting Services (SSRS). This issue is currently categorized as a <i>compiler warning</i> rather than an <i>error</i>, meaning that the deployable package creation and deployment can proceed without fixing the issue. To fix this issue:</p> <ol style="list-style-type: none"> 1. Remove the invalid field reference from the table field group definition. 2. Recompile. 3. Ensure any warnings or errors are addressed.
Replaced by another feature?	This warning will be replaced by a compile error in the future.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning is a compile-time error with platform updates for version 10.0.11 of Finance and Operations apps.

Complete list

To access the full list of APIs that are being deprecated, see [Deprecation of methods and metadata elements](#).

Finance and Operations 8.1 with Platform update 20

Batch transfer rules for subledger journal account entries

The Synchronous transfer mode is being deprecated in the General ledger parameters. This mode is replaced by Asynchronous and scheduled batch only, which already exist as options for transfer. For additional information, see the [General Ledger Parameters – Batch transfer rules](#) blog.

Reason for deprecation/removal	We are removing the synchronous option due to performance impact to the system.
Replaced by another feature?	Asynchronous and scheduled batch are options to use in place of Synchronous.
Product areas affected	General Ledger, Accounts payable, Accounts Receivable, Procurement, Expense
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is the 10.0 version.

Electronic reporting for Russia

Feature for configuring .txt and .xml file formats of declarations.

Reason for deprecation/removal	Replaced with Electronic reporting.
Replaced by another feature?	Yes.
Product areas affected	General Ledger
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Financial reports generator for Russia

A tool for setting up data collection for accounting and tax reports, and to export data to XLS and DOC report templates. Functional parts: Export data to XLS and DOC report templates, queries, fixed requisites are removed.

Reason for deprecation/removal	Removed parts are replaced with Electronic reporting.
Replaced by another feature?	Yes. Financial reports setup user interface should be used for setting up data collection rules by GL accounts or tax registers. Export data to various file types, fixed requisites and query-like data collection rules should be configured in Electronic reporting.
Product areas affected	General ledger.
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Integration with external providers for sending electronic reporting through communication channels for

Russia

Feature exporting generated electronic files of declarations to folder for further sending to official providers of electronic reporting as well as importing state back.

Reason for deprecation/removal	Replaced with electronic messages configurable feature.
Replaced by another feature?	Yes.
Product areas affected	General Ledger, Tax
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Profit tax register wizard

Feature for creating templates for new profit tax registers. This feature creates X++ objects for new registers, which are then created as templates with the appropriate calculation logic added in.

Reason for deprecation/removal	Feature is not compatible with the Finance and Operations extensibility model.
Replaced by another feature?	No
Product areas affected	Tax
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Finance and Operations 8.0 with Platform update 15

No features have been removed or deprecated with this release. Platform update 15 is cumulative and contains new or changed features from Platform update 13, Platform update 14, and Platform update 15.

Finance and Operations, Enterprise edition 7.3 with Platform update 12

Personalized product recommendations

Starting February 15, 2018, retailers will no longer be able to display personalized product recommendations on a point of sale (POS) device. For more information, see [Product recommendations overview](#).

Reason for deprecation/removal	We are removing the current version of the product recommendation service as we redesign this feature with a better algorithm and newer retail-oriented capabilities.

Replaced by another feature?	No. However, after Spring 2018, we plan to bring back this feature to leverage a new recommendation service.
Product areas affected	Personalized product recommendations in POS.
Deployment option	All
Status	Removed as of February 15, 2018. This affects customers running Dynamics 365 for Operations 1611 and later.

Extension of the list of Electronic reporting (ER) functions

The possibility to introduce custom functions to be used in the ER expression builder (for more information, see [Extend the list of Electronic reporting \(ER\) functions](#)) is not supported any more. Due to changes of the ER APIs, the API to call built-in functions from the ER expression builder became internal and can't be extended any longer.

Reason for deprecation/removal	Code sealing initiative
Replaced by another feature?	<p>None. Whenever a new built-in function is needed, a new extension request must be addressed to the ER framework team.</p> <p>As a temporary work around while the requested function is under development by the ER team, the required logic can be programmed as a method of a custom application class. This method can be accessed in an ER expression as a property of the added ER data source of the Application\Class type that refers to that custom application class.</p>
Product areas affected	Electronic reporting framework
Deployment option	All
Status	Removed as of Finance and Operations, Enterprise edition 7.3.

Inventory by item group and Inventory by inventory dimension aging reports

These two reports are no longer supported in Finance and Operations. Instead, the **Inventory aging** report can be used to improve the user experience.

Reason for deprecation	Duplicate functionality
Replaced by another feature?	Yes. The two reports have been replaced by the Inventory aging report.
Product areas affected	Inventory management, Cost management

Deployment option	All
Status	Deprecated: The menu items for the two reports have been removed in version 7.3. However, the code for the reports remains in the product. The plan is to remove the code in a future release.

Power BI content packs available on AppSource

The **Cost management**, **Financial performance**, and **Retail channel performance** content packs, available on the [Microsoft AppSource](#) site, are deprecated as a consequence of product updates in Microsoft Power BI. System administration forms used to deploy these content packs to PowerBI.com are also being deprecated in Finance and Operations.

Reason for deprecation/removal	Product updates in Microsoft Power BI.
Replaced by another feature?	The Cost management , Financial performance , and Retail channel performance content packs, available on the AppSource site, are being replaced by analytical applications which allow for solution integrations at the database level. For more information about analytical applications, see Embedded Power BI in workspaces .
Product areas affected	Cost management, Finance, and Retail
Deployment option	Cloud only (Integration with PowerBI.com is not supported in on-premises deployments.)
Status	Deprecated: Target timeframe for the functionality removal is Q2 2018.

Standard UI in data management workspace

The standard UI in data management is the legacy UI, which is the default UI presented to the users when they visit the data management workspace.

Reason for deprecation/removal	We are investing in providing new user experiences in the new UI.
Replaced by another feature?	The new UI called <i>Enhanced views</i> is replacing the old UI.
Product areas affected	Data management workspace
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is Q2 2018.

Excise, Sales Tax, Service Tax for India

These taxes have been subsumed into Indian GST.

Reason for removal or deprecation	These taxes have been subsumed into Indian GST.
Replaced by another feature?	Indian GST
Product areas affected	Tax
Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

File Validation Utility (FVU) for India

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Indian withholding tax
Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

TDS/TCS certificate for India

Users can download this from the government portal.

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Indian withholding tax
Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

Export/import (EXIM) incentive scheme for India

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Import and export

Deployment option	All modules
Status	Deprecated: A removal date has not been set for this feature.

Dynamics 365 for Retail 7.2

Personalized product recommendations

Starting February 15, 2018, retailers will no longer be able to display personalized product recommendations on a point of sale (POS) device. For more information, see [Product recommendations overview](#).

Reason for deprecation/removal	We are removing the current version of the product recommendation service as we redesign this feature with a better algorithm and newer retail-oriented capabilities.
Replaced by another feature?	No. However, after Spring 2018, we plan to bring back this feature to leverage a new recommendation service.
Product areas affected	Personalized product recommendations in POS.
Deployment option	All
Status	Removed as of February 15, 2018. This affects customers running Dynamics 365 for Retail 7.2 and later.

Finance and Operations, Enterprise edition July 2017 with Platform update 8

Currency conversion for accounting and reporting currencies

Currency conversion for accounting and reporting currencies was introduced when the euro was introduced.

Reason for deprecation/removal	Limited usage and addition of the Copy legal entity functionality as a replacement.
Replaced by another feature?	No, but the Copy legal entity and Configurations features were added to make it easier to move to a company that has changing core requirements.
Product areas affected	Financial management
Status	Deprecated: A removal date has not been set for this feature.

Warehouse mobile devices portal

Warehouse mobile devices portal (WMDP) was a standalone component that was intended for on-premises self-deployment. This component is no longer supported in Finance and Operations. A native app that improves the user experience has replaced the functionality of WMDP.

Reason for deprecation/removal	Duplicate functionality.
Replaced by another feature?	Yes. This feature has been replaced by Finance and Operations - Warehousing. For more information about setup and prerequisites, see Install and configure the Warehousing app overview .
Product areas affected	Warehouse management, Transportation management
Deployment option	Warehouse mobile devices portal (WMDP) was a standalone component that was intended for on-premises self-deployment.
Status	Deprecated: Target timeframe for the functionality to be removed is Q4 2019.

Advanced bank reconciliation matching rule for manual matching

A matching rule was used to select and mark a bank document when documents were manually matched in the reconciliation worksheet.

Reason for deprecation/removal	Limited usage.
Replaced by another feature?	No. Column filtering capabilities should be used to find documents for reconciliation.
Product areas affected	Cash and bank management
Deployment option	All
Status	Removed as of July 2017.

Dynamics 365 for Operations 1611 with Platform update 3

AEB payment formats for Spain

The Consejo Superior Bancario payment formats were used to send remittance files to the bank for customer payments and vendor payments. The content of these formats was determined by the Asociación Española de Banca. It covers Cuaderno 19, 32, 58, 34.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer and Direct debit payment formats for Spain
Product areas affected	Accounts payable, Accounts receivable

Status	Deprecated: A removal date has not been set for this feature.

Bank payments transfer for Lithuania

Bank payment transfers were generated and printed by using the Payment transfer (LT) export format for Lithuania. The Lithuanian market began to use LITAS, the unified electronic banking system, in 2005.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Lithuania
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

BBS Direkte Remitting payment formats for Norway

BBS Direkte Remitting payment formats include customer payment collection export (direct debit) and return message import.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	The AvtaleGiro customer payment format for Norway can be used to generate direct debit messages. Return message import will be implemented in future releases.
Product areas affected	Accounts payable, Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Chart of Accounts tool for Spain

This tool is used when a chart of accounts in Spain requires major changes. Users can import a new chart of accounts in Microsoft Excel or text format, and can also import financial statements.

Reason for deprecation/removal	Limited usage
Replaced by another feature?	No
Product areas affected	General ledger
Status	Deprecated: A removal date has not been set for this feature.

Dom80 payment format for Belgium

Legacy Belgian payment format for payment collection (direct debit).

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Direct debit payment format for Belgium
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

DTA/EZAG payment formats for Switzerland

DTA/EZAG formats are integrated into the ESR system, because they can carry on the reference number. Because the reference number isn't mandatory, these formats can be used to process any vendor payments. These formats are used by companies that have a bank account in a location other than "Postfinance."

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Switzerland
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

EDIFACT-DIRDEB payment format for Austria

EDIFACT-DIRDEB payment format for payment collection (direct debit).

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Direct debit payment format for Austria
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

EDIVAT for Belgium

EDIVAT is an obsolete Belgian standard for electronic declaration via secure mail. Dynamics AX 2012 retains the read-only solution to enable access to the historical data.

Reason for deprecation/removal	The functionality is no longer used.
Replaced by another feature?	No

Product areas affected	General ledger
Status	Deprecated: A removal date has not been set for this feature.

eGiro EDIFACT CREMUL payment import format for Norway

eGiro is based on the international UN EDIFACT CREMUL (Multiple Credit Advice Message) standard that is used for automatic posting of customer payments. In Dynamics AX, eGiro is implemented as a customer payment import format.

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.054 notification import.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

External inventory for Poland

Evidence of goods that are taken from a vendor for sales without purchase. Goods that are handled in external inventory don't affect standard inventory, and can be sold and then purchased automatically. This process creates real inventory movements.

Reason for deprecation/removal	Replaced by another feature
Replaced by another feature?	Yes, the core Inbound consignment functionality
Product areas affected	Accounts payable, Inventory management
Status	Deprecated: A removal date has not been set for this feature.

Financial reports generator for Eastern Europe

A tool is used to set up data collection for accounting and tax reports, and to export data to XLS and DOC report templates.

Reason for deprecation/removal	Limited usage
Replaced by another feature?	No. The tool will be replaced by Electronic reporting configurations in future releases.
Product areas affected	General Ledger

Status	Deprecated: A removal date has not been set for this feature.

Import of customer payment transactions for Finland

You can select an import format for Finnish payments to import customer payment transactions from an external file that the bank provides.

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.054 notification import.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Import of payment transactions into a general ledger journal for Finland

A format that is specific to Finland is used to import accounting transactions into the general ledger.

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.053 bank statement import using Advanced Bank Reconciliation.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Integration with Isabel synchronized (CIS) for Belgium

Isabel is the framework for electronic banking in Europe and is a de-facto standard in Belgium.

Reason for deprecation/removal	Integration with Isabel client has been discontinued.
Replaced by another feature?	No. The payment formats that are no longer used are replaced by ISO20022 Credit transfer payment format for Belgium.
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

Modifications in the chart of accounts and accounting rules for Spain

This feature is used for changes in the chart of accounts and accounting rules in Spain. It maps accounts to help

transform the old chart of accounts into the new chart of accounts, and compares the previous fiscal year with the new fiscal year, even if they were posted to different account numbers.

Reason for deprecation/removal	Limited usage
Replaced by another feature?	No
Product areas affected	General ledger
Status	Deprecated: A removal date has not been set for this feature.

Pagamento Fornitori vendor payment format

Legacy Italian payment format for credit transfers.

Reason for deprecation/removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Italy
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

Payment export formats for Estonia

The Telehansa and Teleservice formats are used for bank payment export.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Estonia
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

Payment file archive for Norway

When payment files are generated, the file archive automatically archives all files that are created, even files that were previously written or read.

Reason for deprecation/removal	Replaced by another feature
Replaced by another feature?	Yes, Electronic reporting archived jobs

Product areas affected	Accounts payable, Accounts receivable, Organization administration
Status	Deprecated: A removal date has not been set for this feature.

Payment import formats for Estonia

The Telehansa and TeleTeenus formats are used for bank payment import.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.054 bank notification import.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Payroll information in Human Resources

Human Resources Payroll information

Reason for deprecation/removal	This functionality has been replaced by core Payroll and Human Resources pages.
Replaced by another feature?	Benefits, Earnings , and other related pages that were previously in US Payroll have been reconfigured, and are now part of the core Human Resources configuration to help support external payroll processing. This functionality is accessed by using the Human Resources 1 > Payroll configuration key.
Product areas affected	Human Resources, Payroll
Status	Removed as of Dynamics 365 for Operations version 1611.

Performance management goal workflow

Performance management includes goal management and integration with performance reviews.

Reason for deprecation/removal	Performance management was redesigned, and the number of goal pages was reduced to simplify the process.
Replaced by another feature?	No. Goals are visible to managers through the Manager Self Service portal, and can be changed and viewed by the manager.
Product areas affected	Human capital management

Status	Removed as of Dynamics 365 for Operations version 1611.

Postgirot and Postgirot Utland payment formats for Sweden

Postgirot and Postgirot Utland payment formats for Sweden.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Sweden
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

Radio frequency identifier

Radio Frequency Identification (RFID) is a data-collection technology that uses electronic tags to store identification data and a no-line-of-sight requirement reader to capture the identification data.

Reason for deprecation/removal	Low customer usage and a limited feature set.
Replaced by another feature?	No
Product areas affected	Inventory management
Status	Removed as of Dynamics 365 for Operations 1611.

Report about state invoices numbering for Latvia

Latvian legislation provides specific rules about the numbering of sales invoices. The functionality lets you assign specific numbers to sales invoices, based on the user or user group. You can then generate a report or an XML file. You can also print a report about invoice numbers that are used.

Reason for deprecation/removal	The state invoice numbering no longer has to be maintained. The report about used invoice numbers is no longer required.
Replaced by another feature?	No
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Set up the names of the manager and general accountant of a company for Lithuania

The names of the manager and the general accountant of a company can be specified in the company

information and used in different local report printouts.

Reason for deprecation/removal	Replaced by another feature
Replaced by another feature?	Yes, the setup of officials can be used for the same purpose.
Product areas affected	Accounts payable, Accounts receivable, Cash and bank management
Status	Deprecated: A removal date has not been set for this feature.

Shipping carrier interface

Reason for deprecation/removal	Duplicate functionality
Replaced by another feature?	Partially replaced by Transportation management
Product areas affected	Sales and marketing, Inventory management
Status	Removed as of Dynamics 365 for Operations version 1611.

Telepay payment formats for Norway

Telepay payment formats include vendor payment export (credit transfer) and customer payment collection (direct debit).

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format and AvtaleGiro customer payment format for Norway, as well as pain.002 and camt.054 bank notification return files import.
Product areas affected	Accounts payable, Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Vendor payment export formats for Finland

Two formats for exporting payments are available for Finland. LM02 (FI) is used for domestic payments, and LUM2 (FI) is used for foreign payments.

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Finland

Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

Warehouse management II

Reason for deprecation/removal	The Warehouse management II solution (WMS II) that was available in the Inventory management module duplicates functionality that is in the Warehouse management module that was released in Dynamics AX 2012 R3.
Replaced by another feature?	The Warehouse management module that was released in AX 2012 R3, Dynamics AX 2012 R3 CU8, and Dynamics AX 2012 R3 CU9 replaces the Warehouse management II features. The new module has more advanced features and more flexible warehouse management processes than Warehouse management II.
Product areas affected	Inventory management, Sales and marketing, Procurement and sourcing
Status	Removed as of Dynamics 365 for Operations version 1611.

Worker reminders in Human Resources

Human Resources Payroll information

Reason for deprecation/removal	Low usage
Replaced by another feature?	No
Product areas affected	Human resources
Status	Removed as of Dynamics 365 for Operations version 1611

Workflow for creating goals

A workflow for managing the creation of employee goals is one of several workflows that were available to help coordinate the performance management process.

Reason for deprecation/removal	Performance management has been completely redesigned in Finance and Operations.

Replaced by another feature?	The redesigned Performance management feature gives more control over the content of the goals, the measurements that are used to track progress, and the attachment of supporting documentation. Goals can be stored as templates and then reused. This feature can help you set up additional goals for your employees more quickly.
Product areas affected	Human capital management
Status	Removed as of Dynamics 365 for Operations version 1611.

Dynamics AX 7.0

Ability to cancel changes to a vendor invoice

Reason for deprecation/removal	Performance enhancement
Replaced by another feature?	No
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

AIF, AxD, and AxBC integrations

In Application Integration Framework (AIF), data can be exchanged with external systems through business logic that is exposed as services. Dynamics AX includes services that are based on documents and .NET Business Connector (AxBC). A document is created by using XML. The XML includes header information that is added to create a *message* that can be transferred into or out of Dynamics AX. Examples of documents include sales orders and purchase orders. However, almost any entity, such as a customer, can be represented by a document. Services that are based on documents use the **Axd <Document>** classes.

Reason for deprecation/removal	The architecture of AIF and AxDs could not be scaled to a cloud service. There were performance issues around bulk import.
Replaced by another feature?	This feature is replaced by the Data Import/Export framework, which supports recurring bulk import/export. For AxBC, we recommend that you use the actual tables.
Product areas affected	AxDs, AxBCs, and AIF
Status	Removed as of Dynamics AX 7.0.

Billing code rate scripts

Billing scripts were used to calculate billing rates for billing codes. This scripts required custom development in the C Sharp or Visual Basic programming language. In the current version of Dynamics AX, the **billing code rate scripts** are not supported.

Reason for deprecation/removal	The support for the custom C Sharp or Visual Basic scripts was not added in Dynamics AX 7.0.
Replaced by another feature?	No
Product areas affected	Public sector, Accounts receivable
Status	Removed as of Dynamics AX 7.0.

BOMs without BOM versions

When the **BOM versions** configuration key was disabled, bill of materials (BOM) versions were hidden in all forms, and the system forced a 1:1 relationship between released products and BOMs. In the current version of Dynamics AX, the **BOM versions** configuration key can't be disabled.

Reason for deprecation/removal	Using a configuration key to control BOM versions doesn't scale in a cloud environment.
Replaced by another feature?	No
Product areas affected	Product information management, Inventory management
Status	Removed as of Dynamics AX 7.0.

Brazilian Bordero

Specific method of payment for Brazilian companies

Reason for deprecation/removal	Support for the Brazilian Bordero method of payment has been discontinued from Brazilian localization
Replaced by another feature?	No
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

Brazilian Sintegra statement

Federal tax statement for ICMS tax

Reason for deprecation/removal	This statement is no longer applicable in some Brazilian states.
Replaced by another feature?	No. Users can use Generic Electronic reporting tool to configure the statement if required under specific situations.

Product areas affected	Fiscal books
Status	Deprecated: A removal date has not been set for this feature.

Brazilian SCAN contingency mode for NF-e

(SCAN) contingency environment is used to generate, export, and import the status of a Nota Fiscal eletrônica (NF-e) when the environment of Secretaria da Fazenda (SEFAZ) is not available.

Reason for deprecation/removal	This method of contingency is no longer applicable in all Brazilian states
Replaced by another feature?	No
Product areas affected	Accounts receivable
Status	Deprecated: A removal date has not been set for this feature.

Business Analyzer

This mobile application let users review key business metrics.

Reason for deprecation/removal	This functionality has been replaced by another feature.
Replaced by another feature?	The Monitor financial performance content pack for Microsoft Power BI will include key financial metrics that were previously available in Business Analyzer.
Product areas affected	General ledger
Status	Deprecated: The use of Business Analyzer has been deprecated.

Business statistics

The setup of business statistics inquiries that can help you analyze the performance of the organization

Reason for deprecation/removal	Legacy approach to business intelligence (BI), low customer usage, and a limited feature set
Replaced by another feature?	New BI solutions for the current version of Dynamics AX
Product areas affected	Procurement and sourcing, Accounts payable, Sales and marketing, Accounts receivable
Status	Removed as of Dynamics AX 7.0.

Change document date function in Invoice approval journal

Reason for deprecation/removal	Low usage
Replaced by another feature?	Yes. The document date on the posted vendor transaction can be changed.
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

ClieOp03 payment format for the Netherlands

Reason for deprecation/removal	The format is no longer applicable in the Netherlands, because it has been replaced by SEPA functionality.
Replaced by another feature?	SEPA payments export
Product areas affected	All modules
Status	Deprecated: A removal date has not been set for this feature.

Compliance Center

The Compliance Center was an Enterprise Portal site for managing the documentation requirements for compliance initiatives that are related to the Sarbanes-Oxley law.

Reason for deprecation/removal	Lack of customer usage. Microsoft SharePoint includes the same capability that was available in the Compliance Center.
Replaced by another feature?	No
Product areas affected	Compliance and internal controls
Status	Removed as of Dynamics AX 7.0.

Connector for Microsoft Dynamics

This tool was used to integrate key data from Microsoft Dynamics CRM to Dynamics ERP applications.

Reason for deprecation/removal	This functionality has been replaced by another feature.
Replaced by another feature?	Dataverse
Product areas affected	Connector for Dynamics

Status	Removed as of Dynamics AX 7.0.

Container unit and multi dimension on-hand

Reason for deprecation/removal	Duplicate functionality
Replaced by another feature?	Yes. Since AX 2012, this functionality has been replaced by the consolidated batch orders feature set. This feature set includes the consolidated on-hand view.
Product areas affected	Product information management, Production control, Inventory management, Sales and marketing
Status	Removed as of Dynamics AX 7.0.

Cue group metadata

Reason for deprecation/removal	Cue groups were used to display one or more Cues in the FactBox area. There was limited uptake, and there were also performance concerns, because a record change in a parent form caused one query per Cue in the Cue group.
Replaced by another feature?	No
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Cue metadata

Reason for deprecation/removal	Cue metadata was limited to count or sum information.
Replaced by another feature?	Tile metadata was introduced to provide more flexibility for modeling. For example, you can model current counts, navigation, and key performance indicators (KPIs). Count tile metadata is the direct replacement of the Cue metadata.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0

Danish check format

--	--

Reason for deprecation/removal	Support for the Danish check format layout has been discontinued, and the report has been removed from DK localization.
Replaced by another feature?	No
Product areas affected	All modules
Status	Deprecated: A removal date has not been set for this feature.

Data partitions

Data partitions provide a logical separation of data in the Dynamics AX database.

Reason for deprecation/removal	Data partitions were introduced in Dynamics AX 2012 R2 to enable data isolation. In a common scenario, a company has subsidiaries, and the data from one subsidiary should not be visible to another subsidiary, even though both subsidiaries are managed by the same IT department. However, extra scripts and management overhead throughout the program were required in order to create new partitions and populate them with data, and to back up partition data. In the cloud, where we have access to platform as a service (PaaS) database services (Microsoft Azure SQL Database), it's much more efficient to use a database as the isolation container than to do isolation in the program. Regardless of whether data partitioning is required for subsidiaries, for multiple tenants, or just for scale, we believe that the scenarios can be handled better through multiple instances of Finance and Operations.
Replaced by another feature?	Customers using data partitions must use multiple instances of Finance and Operations if database level separation is a critical issue.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Database and file share storage for attachments

Dynamics AX 2012 allowed storage of attachments in the database and in file shares. Both of those options are no longer supported.

--	--

Reason for deprecation/removal	Files share storage is no longer supported because cloud-hosted environments cannot communicate with local file shares. Database storage has been deprecated in favor of Azure Blob storage. Azure Blob storage is equivalent to storage in the database, as documents can only be accessed through Finance and Operations client forms. This provides the added benefit of providing storage that doesn't negatively affect the performance of the database. Blob storage is the default storage mechanism for Document Management and works immediately.
Replaced by another feature?	Database storage has been deprecated in favor of Azure Blob storage.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Delimitation

Reason for deprecation/removal	No use of the functionality was found.
Replaced by another feature?	No
Product areas affected	Time and attendance
Status	Removed as of Dynamics AX 7.0.

Desktop client

Reason for deprecation/removal	The Dynamics AX client experience has been redesigned to improve usability across multiple platforms and devices.
Replaced by another feature?	The new web client is based on the desktop Form metadata and programming model that have been modified to provide a rich web platform.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Direct database connection

In Dynamics AX 2012 R3, Retail Modern POS could connect directly to the Channel DB in similar fashion to Enterprise POS. This was in addition to the standard communication method of Retail Modern POS communicating through Retail Server.

--	--

Reason for deprecation/removal	Direct database connectivity required lower security protocols and was primarily used to achieve the highest levels of performance. Due to the performance and security enhancements that have occurred in Finance and Operations, this functionality now causes more issues than it solves.
Replaced by another feature?	No. Only standard Retail Server communication is now supported.
Product areas affected	Channel DB/Retail Modern POS
Status	Removed as of Dynamics AX 7.0.

Dutch SWIFT MT940

Reason for deprecation/removal	Generic functionality is now used instead of localized functionality.
Replaced by another feature?	Yes, this functionality has been replaced by Advanced bank reconciliation functionality.
Product areas affected	All modules
Status	Deprecated: A removal date has not been set for this feature.

eBilanz (XBRL for Germany)

This functionality provided eXtensible Business Reporting Language (XBRL) output that is intended specifically for the German eBilanz taxonomy.

Reason for deprecation/removal	Lack of customer usage
Replaced by another feature?	This feature hasn't been replaced by another feature, but multiple specialized XBRL packages that provide rich XBRL functionality are available for the German market.
Product areas affected	Management Reporter
Status	Deprecated: A removal date has not been set for this feature.

Enterprise Portal client

Reason for deprecation/removal	A single client platform has been provided.

Replaced by another feature?	The new web client is based on the desktop form metadata and programming model that have been modified to provide a rich web platform.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Environmental sustainability

Reason for deprecation/removal	Low customer usage and a limited feature set
Replaced by another feature?	No
Product areas affected	Compliance and internal controls, Accounts payable
Status	Removed as of Dynamics AX 7.0.

Form ActiveX and Managed Host controls

Reason for deprecation/removal	The ActiveX and Managed Host controls are based on the deprecated desktop client.
Replaced by another feature?	The extensible control framework supports building new controls that are based on HTML, CSS, and JavaScript, and is a first-class control in the Microsoft Visual Studio Tooling environment.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Generate prenotes by using a batch

Prenote generation can't be done by using a batch, but it can still be done by a user.

Reason for deprecation/removal	No form exists to persist and display the resulting prenote file when it's generated by using a batch.
Replaced by another feature?	Prenotes can still be generated, and the user has control over the location where the file is saved.
Product areas affected	Accounts payable, Accounts receivable, Cash and bank management
Status	Removed as of AX 7.0.

German DTAUS payment export and account statement import (totals and transactions)

Reason for deprecation/removal	The format is no longer applicable in Germany, because it has been replaced by Single Euro Payments Area (SEPA) functionality.
Replaced by another feature?	Yes, this functionality has been replaced by SEPA payment export and advanced bank reconciliation functionality for importing account statements.
Product areas affected	All modules
Status	Deprecated: A removal date has not been set for this feature.

German DTAZV payment format in domestic Currency

Reason for deprecation/removal	The format is no longer applicable in Germany, because it has been replaced by SEPA functionality.
Replaced by another feature?	SEPA payments export
Product areas affected	Accounts payable
Status	Deprecated: A removal date has not been set for this feature.

German MT940 import

Reason for deprecation/removal	Generic functionality is now used instead of localized functionality.
Replaced by another feature?	Yes, this functionality has been replaced by Advanced bank reconciliation functionality.
Product areas affected	All modules
Status	Deprecated: A removal date has not been set for this feature.

German XML EU Sales list

Reason for deprecation/removal	The XML format for German EU Sales List reporting is no longer supported. Only the ELMA5 text file format can be used to submit the EU Sales List report to the German Tax Office.
Replaced by another feature?	No

Product areas affected	Tax
Status	Deprecated: A removal date has not been set for this feature.

GL SSRS reports

Reports that include the following menu items have been removed: **Summary trial balance**, **Detailed trial balance**, **Chart of accounts**, **Audit trail**, **Balances**, and **Balance list**.

Reason for deprecation/removal	Financial Microsoft SQL Server Reporting Services (SSRS) reports have been replaced by Management Reporter capabilities and default reports.
Replaced by another feature?	Management Reporter (labeled Financial reporting in the current version of Dynamics AX)
Product areas affected	General ledger
Status	Removed as of Dynamics AX 7.0.

InfoPart and FormPart metadata

Reason for deprecation/removal	InfoPart and FormPart metadata enabled the creation of FactBoxes for two different clients.
Replaced by another feature?	InfoPart metadata, which was a simplified form definition, is converted into a Form by upgrade tooling. FormPart metadata, which referenced a Form, is replaced by a more direct reference that is created by upgrade tooling.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Main account list page

A list of accounts for the legal entity and related balance information

Reason for deprecation/removal	Balance information is available on the Trial balance list page by account and dimension.
Replaced by another feature?	Main accounts contains the same list of accounts that the Main account list page contained. The grid view in Main accounts also shows an even smaller, grid-like view.
Product areas affected	General ledger

Status	Removed as of Dynamics AX 7.0.

Malaysia and Singapore bank cash flow report

This feature let the user print a cash flow report that shows transactions and details of the cash inflows and outflows for a specific date range for selected bank accounts.

Reason for deprecation/removal	The same information can be obtained from the Inquiry bank transaction.
Replaced by another feature?	The Inquiry bank transaction
Product areas affected	Cash and bank management
Status	Deprecated: A removal date has not been set for this feature.

Mexican CFD electronic invoice

This feature enabled the generation of Mexican electronic invoices by using the Comprobante Fiscal Digital (CFD) method, where the company signs the invoice by requesting the related authorization from the government. This feature also provides a monthly report that includes all electronics invoices that were issued in the period.

Reason for deprecation/removal	The method is no longer applicable. The generation of electronic invoices by using the CFD method was deprecated by the tax authorities and replaced by the Comprobante Fiscal Digital a través de Internet (CFDI) method, where the signing is delegated to the third-party provider (PAC). The monthly report has been removed, and an inquiry option lets users inquire about historical transactions.
Replaced by another feature?	No
Product areas affected	Account receivables, Project
Status	Deprecated: A removal date has not been set for this feature.

Mexico realized and unrealized VAT

Dynamics AX 2012 managed unrealized value-added tax (VAT) by using Mexico-specific functionality for unrealized tax.

Reason for deprecation/removal	Duplicate functionality
Replaced by another feature?	Yes, this functionality has been replaced by standard conditional sales tax functionality that is provided by Core.

Product areas affected	Tax
Status	Deprecated: A removal date has not been set for this feature.

Microsoft Outlook integration

Reason for deprecation/removal	This functionality has been replaced by Microsoft Exchange Server integration.
Replaced by another feature?	Yes
Product areas affected	Sales and marketing
Status	Removed as of Dynamics AX 7.0.

Private blocking of inventory and warehouse management journals

The inventory and warehouse journals no longer support the ability to mark a journal as private for a selected user. Only the process of blocking journals as private for user groups and blocking during editing is supported.

Reason for deprecation/removal	No use of the functionality was found.
Replaced by another feature?	No
Product areas affected	Inventory management
Status	Removed as of Dynamics AX 7.0.

Product builder

Product builder was used to dynamically configure items from a sales order, purchase order, production order, sales quotation, project quotation, or item requirement. Based on a product model that had modeling variables, the user could select values to meet the customer requirements and get a unique product variant that had a BOM and route.

Reason for deprecation/removal	Product builder exposed X++ code to end users and isn't supported in the current version of Dynamics AX. It has been removed to avoid duplicate maintenance efforts on overlapping, sizeable codebases.
Replaced by another feature?	Yes. The constraint-based configuration was introduced in Dynamics AX 2012 where the depreciation of Product builder in future versions was already announced. The constraint-based configuration technology is selected on the product masters to enable the configuration. To learn more, see Product configuration overview .

Product areas affected	Product information management, Sales and marketing
Status	Removed as of Dynamics AX 7.0.

Production Floor app

This is the app for tablet devices running Windows 8.1 RT and Windows 8.1 Pro.

Reason for deprecation/removal	With the change to a web-based client, it is possible to deliver similar functionality through the native Dynamics AX 7.0 client. The Job Card Device provides a production floor user interface that is optimized for touch and tablet form factors.
Replaced by another feature?	Yes. The Job Card Device, which is a native part of Dynamics AX 7.0.
Product areas affected	Production control
Status	Deprecated: A removal date from the Microsoft store has not yet been set for this feature.

Rename product dimension

This feature let you change the name of one of the three standard product dimensions (size, color, or style) to a name that better suited your business requirements. Renaming included all the labels where the product dimension name was used.

Reason for deprecation/removal	The current version of Dynamics AX doesn't support label changes at run time.
Replaced by another feature?	No
Product areas affected	Product information management
Status	Removed as of Dynamics AX 7.0.

Retail Server connectivity using HTTP

In Dynamics AX 2012 R3, the Retail Server could function using HTTP communication (non-secured). This was in addition to the standard communication using HTTPS.

Reason for deprecation/removal	Due to new security requirements, only secured communication using TLS 1.2 (or above, as available) is now supported. The self-service installer will automatically configure the computer for this communication.
Replaced by another feature?	No. Only standard HTTPS communication is now supported.

Product areas affected	Retail Server
Status	Removed as of Dynamics AX 7.0.

Role Center pages

Reason for deprecation/removal	Role Center pages were built on the deprecated Enterprise Portal platform, which has been replaced by the new web client platform in the current version of Dynamics AX.
Replaced by another feature?	The new Workspace form pattern provides users with a process-centered design that provides easy access to commonly used tasks within that process.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0

Sales tax jurisdictions

Reason for deprecation/removal	Low customer usage and a limited feature set
Replaced by another feature?	No
Product areas affected	US sales tax
Status	Removed as of Dynamics AX 7.0.

Sites Services

Sites Services let you build websites that extend your business processes to the Internet without IT support.

Reason for deprecation/removal	The Microsoft Azure infrastructure that is used by Dynamics AX has new capabilities that can be used instead (for example, Azure sites).
Replaced by another feature?	No
Product areas affected	HR recruiting, Case management, Request for quotes, Vendor registration, Collaborative workspaces for opportunities and campaigns
Status	Removed as of Dynamics AX 7.0.

SSAS demand forecasting strategy

Reason for deprecation/removal	The design of the feature cannot be supported in the new cloud architecture.
Replaced by another feature?	Azure Machine Learning demand forecasting strategy
Product areas affected	Master planning
Status	Removed as of Dynamics AX 7.0.

Vendor invoice pool excluding posting details

Reason for deprecation/removal	Low usage. This functionality has been replaced by the Invoice journal that has workflow functionality.
Replaced by another feature?	Workflow capabilities of the Invoice journal.
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

Virtual company accounts

The virtual companies feature is no longer supported in Dynamics AX. The virtual companies feature let users set up tables that could be shared by a set of companies. For a description of the feature, see [Company accounts and Virtual company accounts](#). The feature works by grouping tables into collections that are assigned to virtual companies, which are groups of existing “real” companies. Queries are created so that all the companies in the virtual company can access the data in the tables of the associated table collections.

Reason for deprecation/removal	<ul style="list-style-type: none"> - Virtual companies must be set up before data is stored in the tables. Retrofitting virtual companies onto an existing implementation is very difficult. - Because there has been so much data normalization in the current version of Dynamics AX, it has become difficult to know what to add to the table collections. For example, it's difficult to know which tables to share. All the tables referenced from tables that are in a virtual company must also be added. Because of table normalization, even simple master data that is spread across multiple tables must be part of the virtual company. Any mistake that is made here will cause functional issues. - When a table is part of a virtual company, it loses information about the origin of the data, and only the virtual company is recorded.
Replaced by another feature?	Global tables can be used to make tables accessible from all companies. Currently, there is no replacement.
Product areas affected	All modules

Status	Removed as of Dynamics AX 7.0.

Windows 8 tablet app

The Windows 8 tablet app provided functionality for expense entry and approval.

Reason for deprecation/removal	Finance and Operations is compatible with tablets. The tablet app is no longer required.
Replaced by another feature?	No.
Product areas affected	Expense management
Status	Removed: This functionality is only available for Dynamics AX 2012 R3.

Workplanner

Reason for deprecation/removal	Low usage
Replaced by another feature?	No, but the Profile relation page, which is opened from the Profile groups page, supports the same business scenario as the deprecated Workplanner page.
Product areas affected	Time and attendance
Status	The code has not been removed. However, the form, JmgWorkPlanner, was not migrated.

X++ financial statements

Reason for deprecation/removal	This functionality has been replaced by another feature.
Replaced by another feature?	Management Reporter (labeled Financial reporting in the current version of Dynamics AX)
Product areas affected	General ledger
Status	Removed as of Dynamics AX 2012

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

AX 2012 features that were postponed

2/18/2021 • 11 minutes to read • [Edit Online](#)

This topic lists features of Microsoft Dynamics AX 2012 that were postponed. These features weren't implemented in Microsoft Dynamics AX 7.0. In the following table, the **Current status** column indicates whether the feature has been implemented since the AX 7.0 release.

For a detailed list of the release date for each version, see [Software lifecycle policy and cloud releases](#).

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
Absence management in Human resources	Functionality for entering absence transactions isn't included. Additionally, functionality for approving absence transactions as a manager isn't included. Setup capabilities that are required for integration with other modules are available through the Human Resources 2 configuration key.	Implemented in Dynamics 365 Human Resources
Alerts	Alerts help users keep track of data changes in the system.	Implemented in Platform update 15
Bank payment order for Latvia and Lithuania	You can print a payment order for Latvia and Lithuania. This feature will be available in a future update.	Not implemented
Bankgirot AP return format for Sweden	The Bankgirot return format is used to import bank return messages. This feature will be available in a future update.	Not implemented
Client drag-and-drop	The web client controls have application programming interfaces (APIs) for drag-and-drop operations, but these APIs are based on the deprecated desktop client technology and they require a redesign so that they work on the new web client platform. APIs that support drag-and-drop operations will be reviewed for inclusion in a future update.	Not implemented
Client right-to-left (RTL) layout	RTL layout is now supported.	Implemented in Platform update 2

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
Cost accounting	The Cost accounting module is designed to meet the requirements of internal costs and profitability reports at multiple organizational levels. To define the cost object level, the module depends on a correct mapping of financial dimensions. The module lets you perform advanced allocations of cost origin from expenditures that are registered in the general ledger or budget. It also lets you compare realized costs and budgeted costs.	Implemented in version 1611
Customer self-service (CSS)	CSS lets you create approved customer records. It also allows users to view selected product catalogs, order items, and view the status of invoices. Additionally, CSS lets you create and follow return orders.	Not implemented
Customizable help topics	The ability to create customized help topics has not yet been implemented. Custom task guides and custom field help are available. This feature will be available in a future update.	Not implemented
Employee self-service (ESS)	ESS shows employees several tiles that have task-related and career-related information on a single page. Employees can view pending work items and click links that open pages where they can take action on their tasks. ESS pages also show employees the status of their certifications, when their next performance reviews are scheduled, skills, goals, and compensation information, and other information, such as balances for vacation and sick time. Employees can also access a company directory from their ESS page.	Implemented in version 1611
External questionnaire and recruiting functionality	Functionality for externally posting questionnaires and open jobs will be added to Human Resources in a future update.	External questionnaire functionality hasn't been implemented. Recruiting functionality is available in Microsoft Dynamics 365 Talent: Attract.
Fiscal printers for Poland	Integration with Polish fiscal printers enables the required information to be sent to the fiscal printer in the correct format during invoice posting. Examples of Polish fiscal printers include the Posnet Thermal and Elzab Omega printer types. This feature will be available in a future update.	Not implemented

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
General budget reservations	The General budget reservations document is sometimes referred to as a commitment. Public sector entities often use this document to set aside or earmark budgeted funds so that they aren't available for other purposes.	Implemented in version 8.1
Graphics tab on the Fixed asset value model and Depreciation book profile pages	The chart shows the depreciation, accumulated depreciation, and net book value over time. Users can click the Data tab to view more detailed information than the chart shows. This chart will be redesigned in a future update.	Not implemented
Intelligent Data Management Framework (IDMF)	IDMF is an add-on tool that lets system administrators optimize performance. IDMF assesses the health of the application, analyzes current usage patterns, and helps reduce database size.	Not implemented
Microsoft Project client integration	The Microsoft Project client is integrated with projects.	Implemented in version 7.2 (July 2017 update)
Procurement site	In previous versions, the Employee self-service procurement site lets you enter requisitions for employees, view the status of an order (created, received, or receipt confirmed), and request onboarding of a new vendor. You could configure different procurement catalogs to show on the site depending on policy. You could also design procurement catalogs by adding new nodes. In the current version, procurement catalog capabilities are reduced and are used only to limit the products that can be ordered for an organization. The structure is always based on the Procurement categories hierarchy. Additionally, on the procurement site the employee could approve a vendor invoice and confirm receipts in relation to the requisitions and derived purchase orders.	Not implemented
Secure global address book	The ability to help secure the global address book by legal entity and address book is not available. This feature will be available in a future update.	Not implemented
Specifications for Electronic reporting (ER) payment formats	Currently, you must enter the payment format specifications manually. In a future update, you will be able to select payment format specifications in	Not implemented

AX 2012 FEATURE THAT WAS POSTPONED

a list. The following payment specifications are currently supported per payment format.

CURRENT STATUS (AS OF FEBRUARY 2019)

US Payroll	US Payroll provides gross-to-net processing for employees in the United States. In Payroll, you can set up, enter, and maintain all payroll records and transactions.		Implemented in version 1611		

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
Vendor collaboration (Vendor Portal)	<p>Dynamics AX 2012 provided vendor portal capabilities via Enterprise Portal. Financial and Operations also provides these capabilities. In version 7.1 (also known as Dynamics 365 for Operations 1611), a vendor could view and respond to purchase orders.</p> <p>In version 7.3, the vendor can view and respond to RFQs. Vendors can also view and edit selected information from the vendor record such as addresses, contact information, and contact persons, and they can upload documents in relation to their certifications.</p>	Implemented in version 7.3
Vendor requests - external request to become a new vendor	<p>Dynamics AX 2012 provided the ability for an anonymous user to sign up to be a vendor in the system, which could lead to a vendor request for adding a new vendor to the vendor master. In version 7.3, the anonymous request from a prospective vendor can be imported via an entity (Data Management/OData), which can lead to inviting the vendor - or the vendor's contact person - to register more details about the prospective vendor. The information provided is included in a new vendor request that can be reviewed and approved via a workflow process. An approval of the vendor request leads to creation of a new vendor account.</p>	Implemented in version 7.3
Vendor requests in general	<p>Dynamics AX 2012 had a concept of vendor requests that served various purposes related to updating vendor-related information, such as requesting new procurement categories for the vendor, internal employees requesting new vendors, or requesting to add a vendor to another company. Only the vendor's request of being added as a vendor has been implemented in version 7.3.</p>	Not implemented

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
[Russia] Tax registers	<p>Legal entities can use registers to disclose their revenues and expenses. The registers are used to track revenue and expense data from the time that primary documents, such as sales invoices and delivery notes, are first entered by using the calculation of cost prices for production. The data from the registers is used to confirm the declared profit of the legal entity. This functionality includes the following features:</p> <ul style="list-style-type: none"> • Current period incomes • Tax expenses • Other expenses of current period • Unrealized expenses of current period • Other unrealized expenses • Accounts receivable debt – inventory • Bad debts reserve calculation • Bad debts reserve movement • Accounts receivable movement • Procedure for writing-off AR bad debts • Accounts payable debt - inventory • Accounts payable debt movement • Procedure for writing-off AP bad debts • Goods cost calculation • FA object information • IA object information • FA depreciation • IA depreciation • FA/IA sale • Depreciation bonus recovery 	Implemented in version 8.1.3
[Russia] Electronic export/import format for Client-Bank interface and reconciliation procedure	Electronic formats for export of outgoing payments, and import of incoming payments.	Implemented in version 8.1.3
[Russia] VAT declaration	Electronic format of VAT declaration.	Implemented in version 10.0.1
[Russia] Cash Flow Management	The functionality which obtains a cash flow forecast and performs an analysis, manages payments on a daily basis using payment schedule journals, controls the company's cash position, and maintains the company's cash flows with centralized control,	Implemented in version 10.0.1

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
[Russia] Accounting reporting format	Electronic format of the following accounting reports: BalanceSheet, IncomeStatement, CashFlow, EquityStatement, TargetUsageMoney	Implemented in version 10.0.1
[Russia] Assessed tax reporting	Assessed tax declaration.	Implemented in version 10.0.1
[Russia] Land tax reporting	Land tax declaration. Creation of Land tax declaration by separate divisions.	Implemented in version 10.0.1
[Russia] Transport tax reporting	Transport tax declaration.	Implemented in version 10.0.1
[Russia] Indirect tax return (VAT and Excise) on import of goods	Indirect (withholding) tax return (VAT and Excise) on import of goods from state members of Customs union.	Implemented in version 10.0.1
[Russia] Journal of Alcohol sales in Retail	Daily Alcohol journal.	Implemented in version 10.0.1
[Russia] Optional posting of transfer orders to General ledger	Option to post/not post transactions to General ledger when posting a transfer order.	Implemented in version 8.1.2
[Russia] Inventory owner	Inventory dimension used to track owner of inventory (consignment stock, bailment, tolling, etc.).	Implemented in version 10.0.1
[Russia] AP/AR - Third-party miscellaneous charges	Registration of third-party miscellaneous charges and allocation by the following regimes: Inclusion into cost of purchased goods (allocation to invoices lines from other vendors), and redrawing to other parties re-allocation to other expense accounts.	Implemented in version 8.1.1
[Russia] Goods in transit from vendor	Registering goods in transit from vendor by special posting profile with Item type "purchased items en route". Creating Act of inventory holdings en route. (INV-6)	Implemented in version 8.1.2
[Russia] Goods in transit - sales to customer with postponed passing of property	Post sales invoice with postponed property transfer: no customer debts posted, all outgoing taxes are posted, items are transferred to transit warehouse. Register passing of property with posting debts and items sale from transit warehouse.	Implemented in version 8.1.2
[Russia] Bailment - accounting at bailee side	Accounting of inventory receipt for bailment as required by the Law and generation of primary form MX-1. Accounting of inventory return from bailment and generation of primary form MX-3. Bailment costs calculation from bailee side.	Implemented in version 8.1.2

AX 2012 FEATURE THAT WAS POSTPONED	DESCRIPTION	CURRENT STATUS (AS OF FEBRUARY 2019)
[Russia] Bailment - accounting at owner side	Accounting of inventory transfer to bailment and inventory return from bailment on goods owner side under bailment service contract.	Implemented in version 8.1.2
[Russia] Localization of Process Industries solution	Basic localization in two areas: correspondence of accounts for all new general ledger postings, and functional coexistence of Process Industries features and Russian country context (no issues when both Process Industries and Russian country context are enabled).	Implemented in version 10.0.1
[Russia] Alcohol sales declarations: Application 6, 7, 8 for wholesale. Applications 11, 12 for retail	Keeping track of alcoholic beverages types including producers, unit of measures, licenses for retail and wholesale trade. Preparing data for alcoholic beverages activities, including printing declarations and exporting them in XML format through e-reporting.	Implemented in version 10.0.1

End of mainstream support for Microsoft Dynamics AX 2009, Dynamics AX 2012, and Dynamics AX 2012 R2

2/18/2021 • 4 minutes to read • [Edit Online](#)

Mainstream support for Dynamics AX 2009 Service Pack 1 (SP1), Dynamics AX 2012, and Dynamics AX 2012 R2 ends on October 9, 2018. After that date, only security hotfixes will continue to be provided for these three versions through the extended support period that continues until October 12, 2021. For more information, see support.microsoft.com.

Mainstream support for Dynamics AX 2012 R3 continues through October 12, 2021. Microsoft will continue making security hotfixes, non-security hotfixes, and regulatory updates for Dynamics AX 2012 R3 throughout that mainstream support period. The source code for these non-binary, non-security hotfixes and regulatory updates will continue to be available for customers, and their partners, active on the Enhancement Plan or Software Assurance.

Dynamics AX 2009 SP1, Dynamics AX 2012, and Dynamics AX 2012 R2 customers can selectively integrate those changes as required. Customers and partners can get the source code from packages attached to relevant Dynamics AX 2012 R3 KB articles published on Lifecycle Services (LCS) and discoverable through Issue Search.

Customers are advised to upgrade to the latest version of Finance and Operations apps, such as Dynamics 365 Finance, Supply Chain Management, Retail, and Human Resources:

- Dynamics AX 2009 Service Pack 1 customers should use the [migration tool](#) that is available.
- Dynamics AX 2012 and Dynamics AX 2012 R2 customers should upgrade to Finance and Operations apps through Dynamics AX 2012 R3 using the upgrade tool that is available. Additional upgrade information is available in the [Upgrade from AX 2012 to Finance and Operations apps](#) topic.

Frequently asked questions

When does the mainstream support for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 end?

Mainstream support ends on October 9, 2018.

Was the information of the end date of the mainstream support for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 available before?

Yes, it was always publicly available on the Microsoft Support Lifecycle site at support.microsoft.com.

Can customers on Premier Extended Hotfix Support or on Unified Support Advanced and Performance Levels get a non-security hotfix or regulatory update?

No. Neither non-security hotfixes nor regulatory updates will be available for the Dynamics AX products during the Extended Support phase of the product lifecycle (Dynamics AX 2009 SP1, Dynamics AX 2012, or Dynamics AX 2012 R2).

While the ability to request a non-security hotfix for select products is included with Unified Support Advanced and Performance Levels, Microsoft has determined that non-security hotfixes cannot be provided with a *commercially reasonable* effort for these products. As a result, no requests for non-security hotfixes or regulatory updates will be accepted. However, Microsoft will continue making security hotfixes, non-security hotfixes, and regulatory updates for Dynamics AX 2012 R3 throughout that mainstream support period. The source code for these non-binary, non-security hotfixes and regulatory updates will continue to be available for

customers, and their partners, active on the Enhancement Plan or Software Assurance. Dynamics AX 2009 SP1, Dynamics AX 2012, and Dynamics AX 2012 R2 customers can selectively integrate those changes as required. Customers and partners can get the source code from packages attached to relevant Dynamics AX 2012 R3 KB articles published on LCS and discoverable through LCS Issue Search.

I knew about the regulatory change before October 9, 2018, but it has the law enforcement date after October 9, 2018. Will I still get a regulatory update for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2?

No, we will only provide regulatory updates for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 for regulatory changes with the law enforcement dates on or earlier than October 9, 2018.

A customer or partner can already download a fix through LCS and inspect the code by installing it into a test Dynamics AX 2012 R3 environment. Is there any difference with the approach that you have proposed?

No, there is no difference.

What happens if a new bug is found by a customer in Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, or Dynamics AX 2012 R2?

The bug must be reproducible in Dynamics AX 2012 R3. If it is reproducible and accepted, then a hotfix will be provided for Dynamics AX 2012 R3 and the customers can elect to integrate this hotfix in their version themselves, or work with their partners to integrate the changes.

How are binary hotfixes handled for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2?

If a hotfix is needed for a part of the system where Microsoft does not provide the source code and it is not a security bug, the hotfix will not be provided.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Help system

2/18/2021 • 6 minutes to read • [Edit Online](#)

Users of the following apps can access context-sensitive Help and other content that is based on the same Help system:

- Microsoft Dynamics 365 Commerce
- Dynamics 365 Finance
- Dynamics 365 Human Resources
- Dynamics 365 Supply Chain Management

In all these apps, you can access product-specific Help from the **Help** pane.

The screenshot displays the Microsoft Dynamics 365 interface. The main window shows a sales order for 'Contoso Retail San Diego' with a table of sales order lines. The Help pane is open on the right side, showing a search bar and a list of help topics.

T...	Variant number	Item number	Product name	Sales category	CW quantity	CW unit	Quantity	Unit	Delivery type
		D0001	MidRangeSpeaker	Speakers			20.00	ea	Stock
		L0001	MidRangeSpeaker2	Speakers			29.00	ea	Stock
		P0001	AcousticFoamPanel				123.00	ea	Stock
		D0003	StandardSpeaker	Speakers			22.00	ea	Stock
		T0001	SpeakerCable / Speaker cable 10	Accessories			61.00	ea	Stock
		D0004	HighEndSpeaker / High End Spe...	Speakers			20.00	ea	Stock
		T0004	TelevisionM120377 / Television ...	Television			61.00	ea	Stock
		T0002	ProjectorTelevision	Television			37.00	ea	Stock
		T0005	TelevisionHDTVX59052 / Televisi...	Television			25.00	ea	Stock
		T0003	SurroundSoundReceive	Receivers			37.00	ea	Stock

The Help pane on the right contains a search bar and a list of help topics, including 'Create sales orders', 'Prospect to cash', 'Generate and process customer rebates', 'Credit card setup, authorization, and capture', 'Confirm sales orders', 'Working with serialized items', 'Create a purchase order from a sales order', and 'Manage order holds'. It also includes a 'RESOURCES' section with links to 'Help', 'Ask the community', and 'CustomerSource'.

Help on docs.microsoft.com

The docs.microsoft.com site (docs.microsoft.com/dynamics365) is the default source for product documentation for the previously listed apps. This site offers the following features:

- **Access to the most up-to-date content** – The site gives Microsoft a faster and more flexible way to create, deliver, and update product documentation. Therefore, you have easy access to the latest technical information.
- **Content that is written by experts** – Content on the site is open to contributions by community members both inside and outside Microsoft.

You can find content on docs.microsoft.com by using any search engine. For the best results, we recommend that you use a site search, such as `site:docs.microsoft.com dynamics 365 "search term"`.

Get notified about changes through an RSS feed

To subscribe to a Really Simple Syndication (RSS) feed of all updates that are to the content on docs.microsoft.com, use the following link:

[RSS feed](#)

Leave us feedback

If you have feedback or questions about a topic, leave us a comment at the bottom of the page.

1. Select **Feedback** to get to the comments at the bottom of the page. Then, select either **Product feedback** or **Sign in to give documentation feedback**.
2. Start typing your comments, and then select **Submit feedback**.

Feedback

We'd love to hear your thoughts. Choose the type you'd like to provide:

Our new feedback system is built on GitHub Issues. Read about this change in [our blog post](#).

Title

Leave a comment

NOTE

If you want to submit documentation feedback, you must sign in by using a GitHub account. For more information, see [Setting up and managing your GitHub profile](#).

Contribute to the documentation

You can contribute and make edits to the documentation. To get started, select the **Edit** button (pencil symbol) on a topic. The following video shows how you can contribute to our documentation.

The [How to contribute to the Microsoft Dynamics 365 documentation](#) video (shown above) is included in the Microsoft Dynamics 365 channel on YouTube.

For more information, see the [Docs contributor guide](#), which is published by the team that built the docs.microsoft.com site.

NOTE

We only accept contributions to our English content at this time.

Task guides

A task guide is a controlled, guided, interactive experience that leads you through the steps of a task, or business process. You can open (play) a task guide from the **Help** pane. When you first select a task guide, the **Help** pane

will show the step-by-step instructions for the task. Localized task guides are available.

Microsoft released task guide libraries for product versions through the December 2017 release of Dynamics 365 for Finance and Operations. The [Accessing task guides from the Help pane](#) section of this topic explains how to find the correct task guides for your product.

To begin the guided, interactive experience, select **Start task guide** at the bottom of the Help pane. A black pointer shows you where to go first. Follow the instructions that appear in the user interface (UI), and enter data as directed.

IMPORTANT

The data that you enter when you play a task guide is real. If you're in a production environment, the data will be entered in the company that you're currently using.

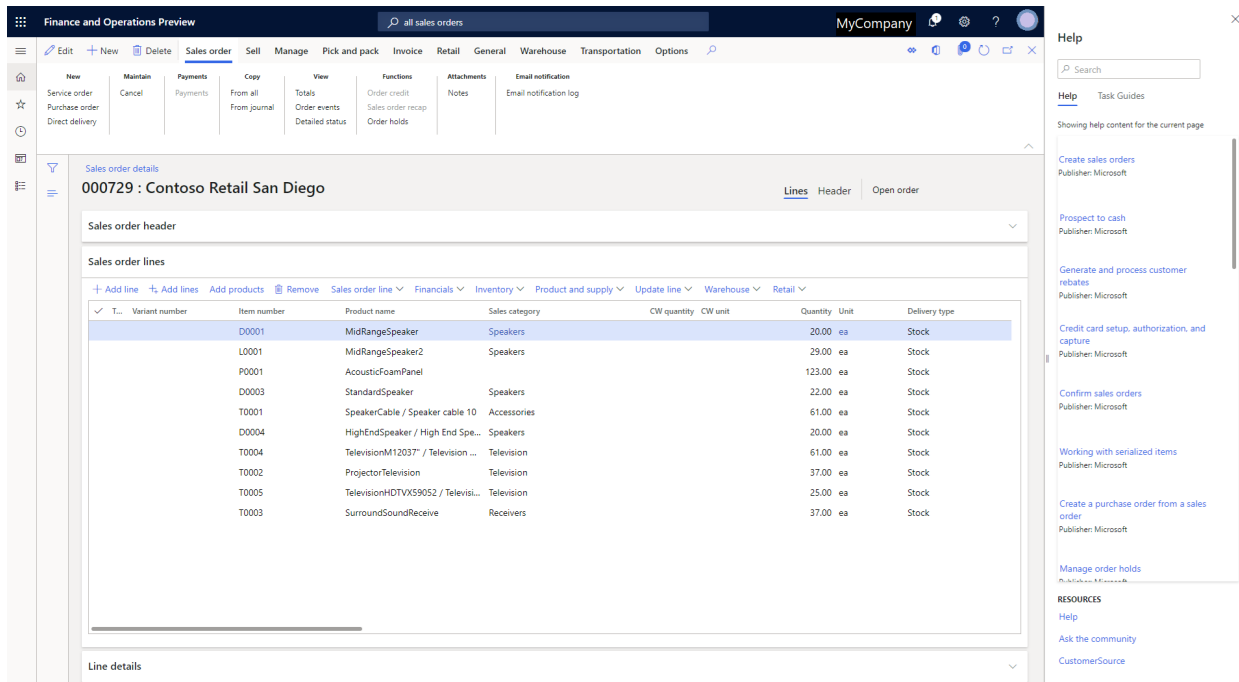

You can use Task recorder to create your own custom task guides. For more information, see [Create documentation or training with Task Recorder](#).

In-product Help

Some fields have field descriptions to help users get unblocked when they are uncertain about the data that the

field contains, for example. Additionally, the in-product **Help** pane provides context-sensitive access to content that can help users get started, get unblocked, and learn more.

To access Help content, select the **Help** button (?), and then select **Help**. Alternatively, press **Ctrl+Shift+?**. In both cases, the **Help** pane appears. From the **Help** pane, you can access conceptual topics or task guides that are relevant to the area of the product that you're currently in.

Accessing Help topics from the Help pane

From the **Help** pane, you can access topics that apply to the client. When you first open the **Help** pane, the **Help** tab shows the topics that apply to the page that you're currently on. If no topics are found, you can enter keywords to refine your search. When you select a topic in the **Help** pane, it's opened on a new tab in your browser.

IMPORTANT

This section does not apply to Dynamics 365 Human Resources. The Help system for Human Resources is automatically connected to task guides for the product. Also, you cannot create custom task guides for Human Resources.

Accessing task guides from the Help pane

Before you can access task guides from the **Help** pane, a system admin must configure some settings on the **System parameters** page in Finance, Supply Chain Management, or Commerce. For more information, see [Adding task guides](#).

After a System administrator has completed these steps, you can open the **Help** pane and select the **Task guides** tab. You'll now see the task guides that apply to the page that you're currently on. If no task guides are found, you can enter keywords to refine your search. After you select a task guide in the **Help** pane, the **Help** pane shows the step-by-step instructions, and you can play the task guide.

Where are the translated task guides for Microsoft libraries?

Translated task guides are released in libraries that have "All languages" in the title. To view localized task guide Help, make sure that you're connected to an appropriate library. Each user can change the language that a task guide appears in by changing the language settings under **Options > Preferences**.

- If a task guide has been translated, when you open that task guide all the text of the task guide will appear in your selected language.
- If a task guide has not yet been translated, when you open it, only the text of the controls will appear in your chosen language.

Creating custom Help

You can create Help for your users by creating custom task guides or connecting your own website to the **Help** pane. For more information, see the following topics:

- [Task recorder resources](#)
- [Custom Help overview](#)

Additional resources

The following table lists our websites. Sites that have an asterisk (*) next to the name require that you sign in by using an account that is associated with a service plan.

SITE	DESCRIPTION
Docs.microsoft.com	This site hosts or links to all product documentation for Dynamics 365.
Microsoft Learn	This site is the free Microsoft eLearning site.

SITE	DESCRIPTION
Microsoft Dynamics Lifecycle Services (LCS)*	This site provides a cloud-based collaborative workspace that customers and partners can use to manage projects from pre-sales to implementation and operations. It's useful in all phases of an implementation.
Support blog	This site provides tips and tricks that are posted by the Support team.
Docs.microsoft.com/previous versions	This site hosts content from previous releases.
Dynamics Community	This site hosts blogs, forums, and videos.
Microsoft.com/dynamics365	This site provides evaluation and sales information.
CustomerSource*	This site hosts training resources, downloadable reports, and white papers, and is the primary support site for service plan holders. Access to some resources on this site might require a service plan.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

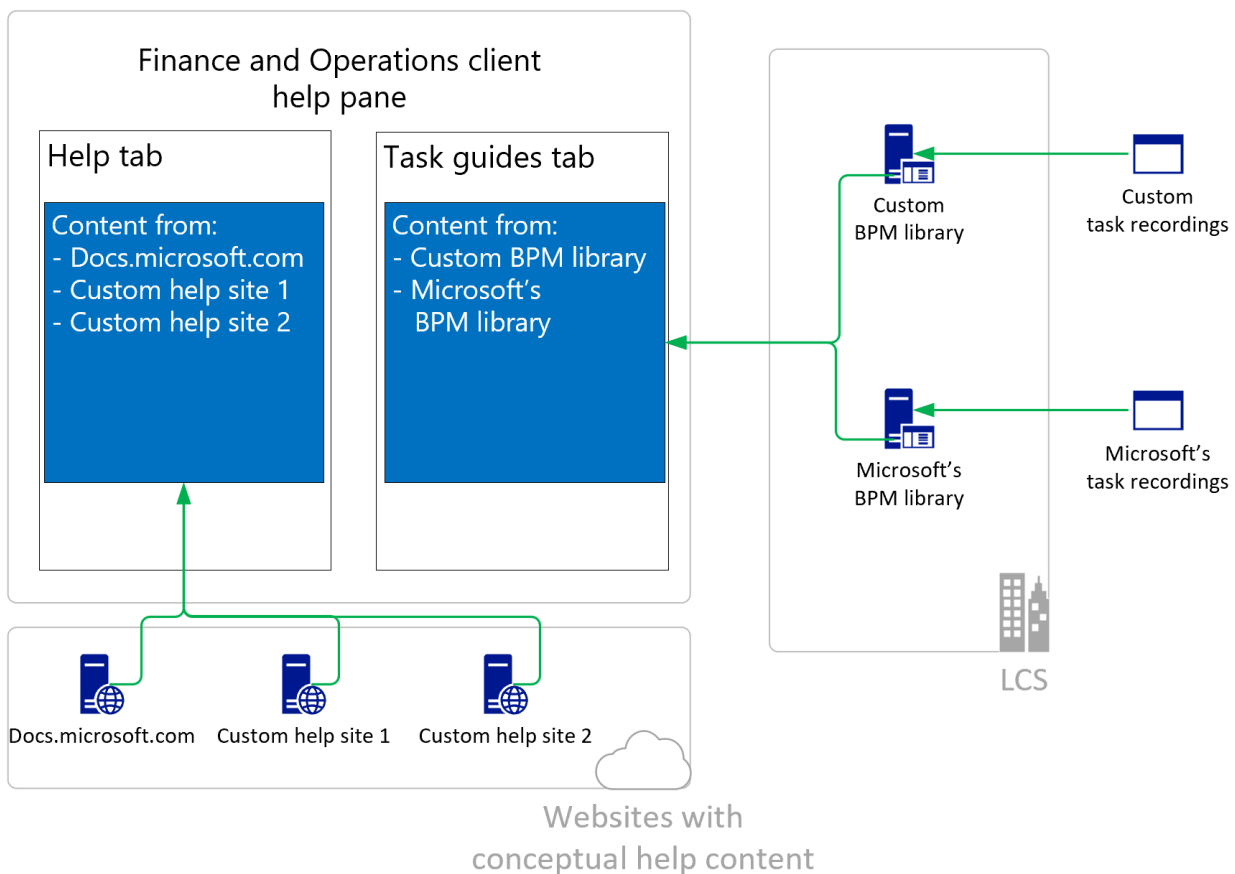

Configure the Help experience for Finance and Operations apps

2/18/2021 • 4 minutes to read • [Edit Online](#)

In this topic, you will find an overview of the components of the Help system for Finance and Operations apps, such as Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, Dynamics 365 Commerce, and Dynamics 365 Human Resources. The topic also explains how to connect these components and provides a summary of the process for creating custom Help.

Help architecture

Finance and Operations apps include conceptual overviews and other topics that are published to the <https://docs.microsoft.com/dynamics365> site. This content can then be accessed from the in-product **Help** pane. The following illustration shows the parts of the Help system.

The in-product Help system pulls articles from docs.microsoft.com and other connected websites. It also pulls in task guides that are stored in Business process modeler (BPM) in Microsoft Dynamics Lifecycle Services (LCS).

Adding task guides

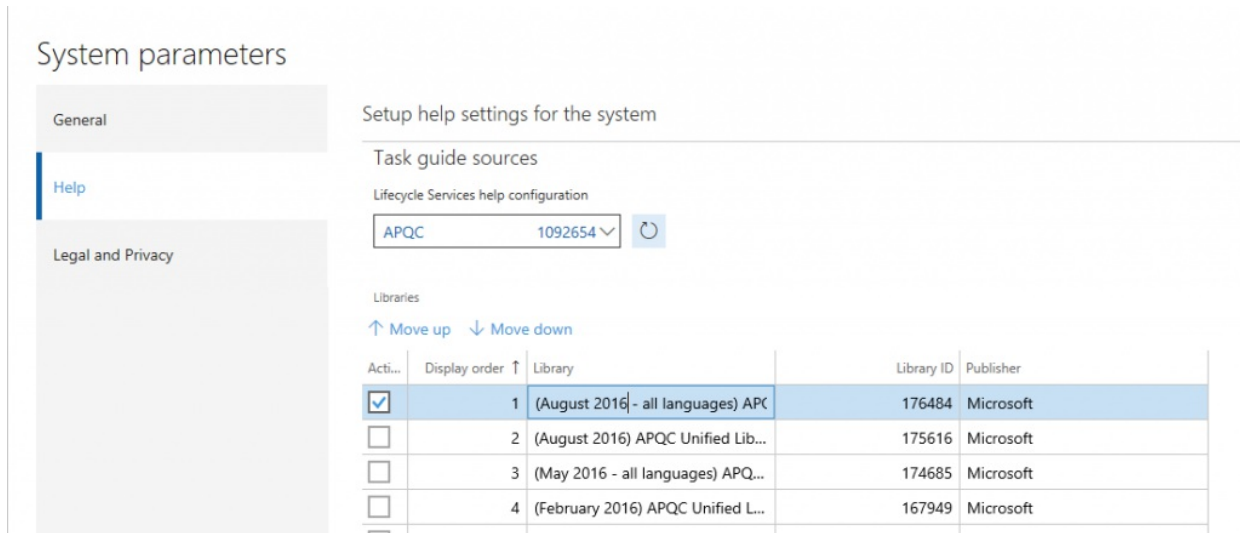

NOTE

The **Task guides** tab isn't currently available in Human Resources or Commerce. However, the task guides in the Getting Started experience in Human Resources remain available to cover basic functionality. For both Human Resources and Commerce, procedural Help is available on the <https://docs.microsoft.com/dynamics365> site.

On the **System parameters** page, system admins can configure access to the relevant task guide libraries for an implementation.

NOTE

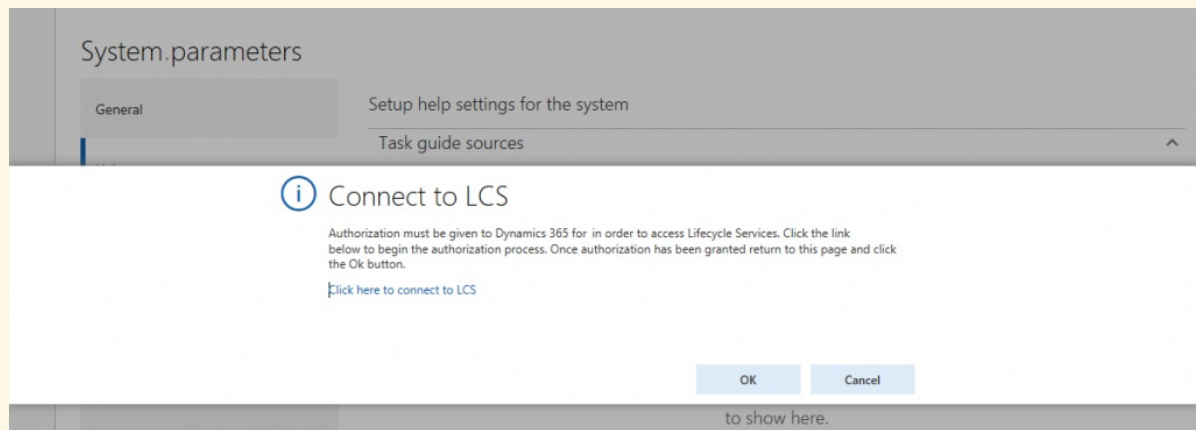

- To configure Help, you must sign in by using an account in the same tenant as the tenant where the app is deployed.
- An LCS library can't be connected from an instance of the app that is running on a local virtual hard drive (VHD).

To configure task guides for a solution, follow these steps on the **System parameters** page.

IMPORTANT

The first time that you open the **Help** tab, you must connect to Lifecycle Services. Be sure to select the link in the middle of the form, wait for the connection, close the dialog box, and then select **OK** to get to the **System Parameters** page.

1. Select the Lifecycle Services project to connect to.
2. Select the BPM libraries (within the selected project) to retrieve task recordings from.
3. Set the display order of the BPM libraries. The display order defines the order in which task recordings from the libraries will appear in the **Help** pane.

After you complete these steps, you can open the **Help** pane and select the **Task guides** tab. You'll now see the task guides that apply to the page that you're currently on in Finance and Operations apps. If no task guides are found, you can enter keywords to refine your search.

Showing translated task guides

Translated task guides were first released in the May 2016 APQC Unified Library and in the Getting Started library. To view localized task guide Help, make sure that your Dynamics 365 solution is connected to the May

2016 library. Users can change the language that a task guide appears in by changing the language settings under **Options > Preferences**.

NOTE

Although many task guides have been translated, the client doesn't currently show the translated task guide names. Additionally, in the May 2016 library, translations are available only for the task guides that were released in February 2016. Microsoft will release an updated library that includes additional translations.

- If a task guide has been translated, when you open that task guide all the text of the task guide will appear in your selected language.
- If a task guide has not yet been translated, when you open it, only some of the text (the text of the controls) will appear in your selected language.

Adding custom Help

You can use task guides to create custom Help, or you can connect a custom Help website to the **Help** pane.

Create custom Help by using task guides

You can create custom Help for the supported apps by creating task recordings that reflect your implementation and then saving them to a Business process library in LCS. You can't create custom task guides for Human Resources.

If you're a partner, and you promote a library to a corporate library and include it in a solution, it will be available to your customers. You can also make a copy of the APQC Unified Library, and then open the task recordings in the copy, edit them, and save your changes. For more information, see [Task recorder resources](#).

Connect a custom Help site

Finance and Operations apps are rarely used in their out-of-box form. Instead, the solution is customized and extended to fit the organization's needs. You can also customize and extend the Help experience. For example, you can add custom Help to the in-product **Help** pane.

Microsoft has provided a toolkit to help you deploy and connect custom Help to the **Help** pane. For information about how you can set up a custom Help solution that is connected to the **Help** pane, see [Custom Help overview](#).

If you want to collaborate with Microsoft on tools and processes for customizing Help, fill in the form at <https://aka.ms/customhelpfeedback>.

[Custom Help GitHub repository](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Custom Help overview

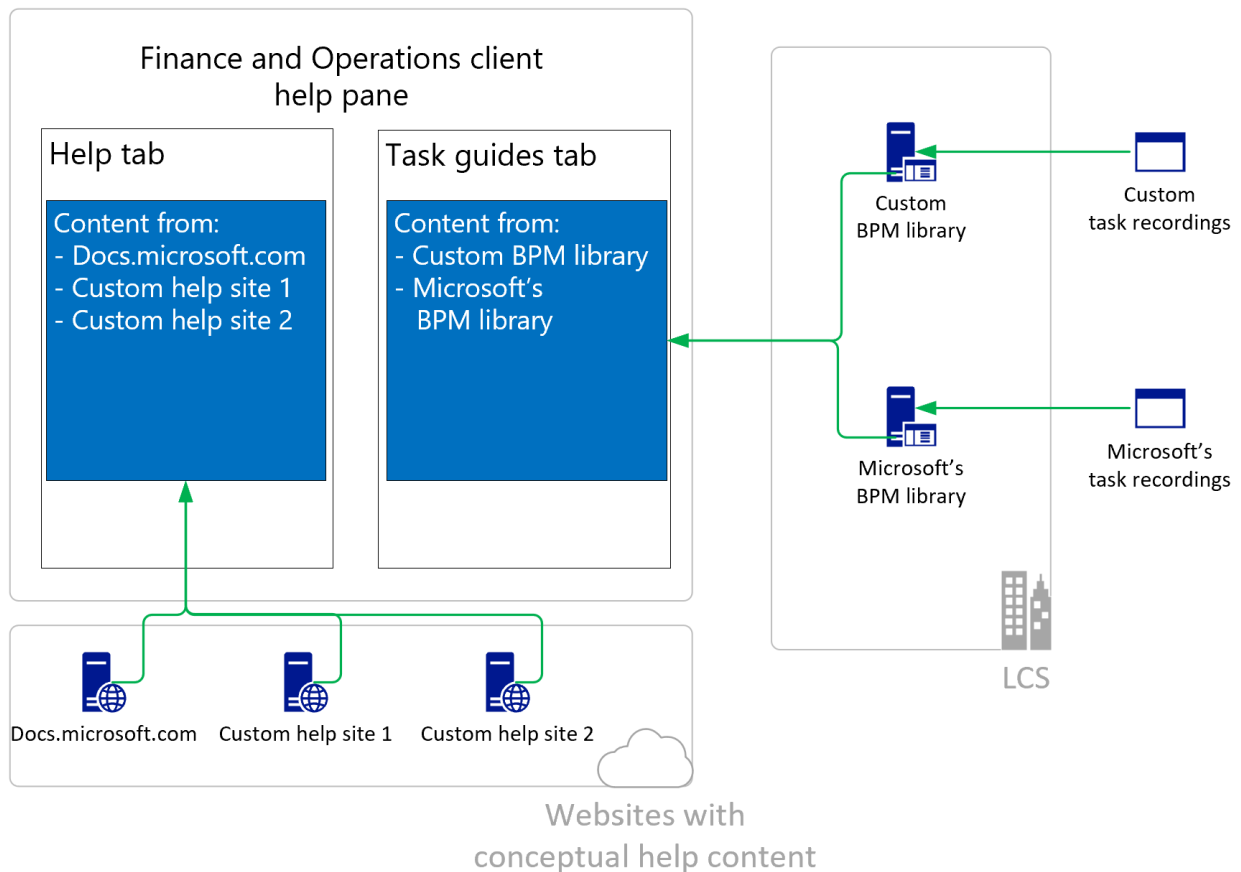

2/18/2021 • 4 minutes to read • [Edit Online](#)

Finance and Operations apps are often customized and extended to fit an organization's needs. If your solution is based on Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce, you can connect solution-specific and customer-specific Help content to the [Help pane](#) in the Finance and Operations client. This topic describes the main steps and decision points.

NOTE

Users of Finance and Operations apps can create custom task guides to supplement conceptual content that describes the functionality of their solution. These conceptual descriptions are also referred to as Help and can be provided by Microsoft, partners, and an organization itself. For more information, see [Help system](#).

The following illustration, and this topic in general, use the term *Help* for conceptual descriptions that either include or exclude how-to guides. The term *task guides* refers to in-product task guides.

Custom Help content

Custom Help content typically originates from one of three sources:

- Microsoft documentation repositories (repos)

You can use the [HTMLFromRepoGenerator](#) tool from the Custom Help Toolkit to clone content from any of the Finance and Operations repositories and generate corresponding HTML files. Those files can then be updated with content that is specific to your solution.

- Existing customized Dynamics AX content

You can [convert Dynamics AX custom Help content so that it can be used in Dynamics 365](#).

- HTML files that are created specifically for your solution

[Learn more about the metadata](#) that must be added to your HTML files for context-sensitive Help and search to work correctly.

Process

The end-to-end process depends on the actual customer solution and the users' expectations. A typical process involves the following steps:

1. Create the custom Help content.
2. Publish the content on a website.
3. Index the content by using a search service.
4. Connect the custom **Help** pane to the website and the search service.

Microsoft provides a [toolkit](#) that can help you generate HTML files from the Microsoft Help repositories, generate JavaScript Object Notation (JSON) files for search services, and change the locale of HTML files so that it matches the locale of your solution.

You're welcome to share your knowledge by contributing to this documentation through the link at the bottom of the page or by joining the [Dynamics 365 community](#).

The following table outlines the main objectives that admins typically have for configuring the Help experience.

OBJECTIVE	LEARN MORE
I want to give my users a customized in-product Help experience that reflects their actual solution.	See the Custom Help websites section of this topic and Create documentation or training with Task Recorder .
I want to use the Microsoft Help content as a baseline for Help content that is specific to my solution.	See Custom Help Toolkit: The HtmlFromRepoGenerator tool .
I want to contribute to the Microsoft Help content.	See Extend, customize, and collaborate on the Help .
I want to reuse my existing Dynamics AX content.	See Convert Dynamics AX custom Help for use in Dynamics 365 .
I want to set up a website for my Help content.	See the Custom Help websites section of this topic.
I want to add my content to the Help pane.	See Connect a custom Help website to the Help pane .
Our technical writers want guidance that will help them convert our earlier content into Markdown so that it becomes easier for them to customize the Microsoft content.	See Moving to Markdown .

Custom Help websites

Before the product can connect to your Help content, you must customize the in-product **Help** pane so that it shows your content. The following conditions must be met:

- Your content must be available on a website.

You can deploy your content to an existing website, or you can set up a dedicated website to host your

content. The website can be private or public, but we recommend that users **not** be required to sign in to access your content.

- Your content must be indexed by a search service.

If you use the [AzureSearchCustomHelp](#) solution that is part of the [Custom Help Toolkit](#) for context-sensitive Help, the **Help** pane will generate a query that must be run against the search service's index. The query depends on specific metadata in the Help topics. For more information, see [Metadata requirements for custom Help topics](#).

The [Deploy custom Help to Azure](#) topic describes an approach for hosting content on Azure. It includes information about how to set up a search service that indexes your content so that it can be found by the in-product **Help** pane. If you don't have an [Azure subscription](#), create an account before you begin. You can start with a free account for 12 months. For more information, see [Create your Azure free account today](#).

View and export field descriptions

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article describes how to view field descriptions and how to use the Field descriptions page to export descriptions.

Some of the more complex fields have field descriptions. These descriptions appear when you hover over a field. You can also view and export descriptions on the **Field descriptions** page.

Not all pages have field descriptions. We want to provide descriptions only for the more complex fields, not where the use of the field is obvious. Therefore, some pages don't have any field descriptions, some pages have a few descriptions, and some of the more complex pages, such as many of the parameters pages, have many descriptions.

If you have access to the development environment, you can add new field descriptions and customize existing descriptions. For example, you can add company-specific information to a field description. For more information, see [Customize field descriptions](#).

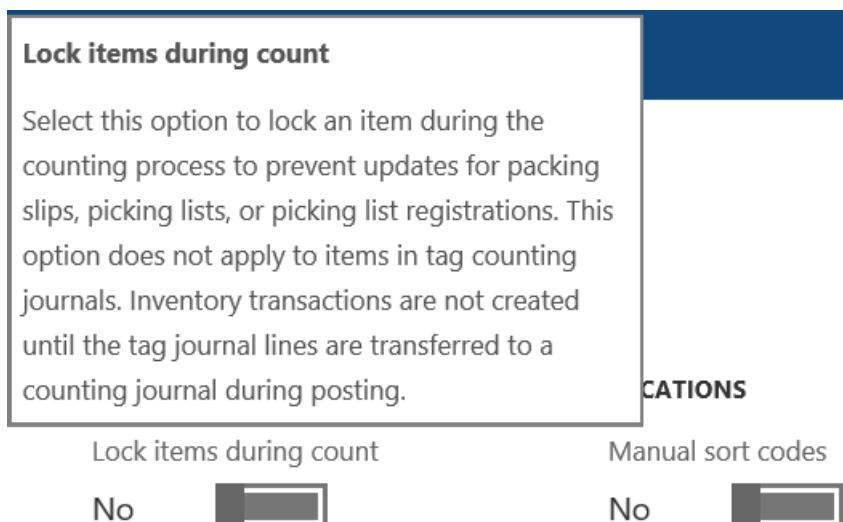

See field descriptions in the user interface

You can view field descriptions by hovering over a field. If no description is available, you see the field name when you hover over the field.

NOTE

In Dynamics AX 7.0 (February 2016), field descriptions can be viewed only on the **Field descriptions** page.

The following illustration shows the field description that appears when you hover over the **Lock items during count** field.

Use the Field descriptions page to view and export field help

The **Field descriptions** page lets you view and export field descriptions. You can see the descriptions that are available for one page at a time.

View the descriptions for a page

To view the descriptions for a page, follow this step.

- In the **Select a page** field, type the name of the page. Alternatively, click the arrow to open a list of all the pages, and then browse or filter the list.

You can use either the name of the page that is shown in the user interface (UI) (for example, **Customers**) or the code name (AOT name) that's available when you right-click a page (for example, **CustTable**).

For information about the various ways to filter the list of pages, see the "Searching for a page" section later in this article.

If you set the **Include fields without a description** option to **Yes**, all the fields on the page are shown, even if they don't have a field description.

Export the descriptions for a page

To export the descriptions for a page, follow these steps.

1. In the **Select a page** field, select a page.
2. Click the **Open in Microsoft Office** button in the upper-right corner, and then click **FieldDescriptionTmp**.

Searching for a page

There are several ways to search for a page in the **Select a page** field. In many cases, you must click the arrow in the **Select a page** field to open the drop-down list, and then select from a filtered list of pages.

- Type part of the name, and then open the drop-down list to select from a filtered list of pages.
- Open the drop-down list, and then click either the **Page name** heading at the top of the list or the **Page AOT name** heading. A dialog box appears, where you can use advanced filtering options, such as **Page name begins with**.
- Type the full name of the page. When you use this option, it's best to open the drop-down list and see what else is in the list, even if field descriptions are shown.
 - If there is a single exact match to the name, the field descriptions for that page are shown.
 - If there is more than one exact match, no descriptions are shown. You must open the drop-down list and select the page that you want.
 - If the name that you typed is part of the name of another page, you see the descriptions for your page. However, if you open the drop-down list, you see additional pages that contain that name.

For example, no descriptions are shown when you type **Counting** in the **Select a page** field. You open the drop-down list, and see that there are two pages that have the name **Counting** and several pages that contain the word "Counting" in the name. If you select the page that has the AOT name **InventJournalCount**, the field descriptions are shown for that page. However, if you open the drop-down list again, you will see that the list now contains all pages that have "InventJournalCount" as part of their AOT name.

Troubleshooting

This section provides information to help you troubleshoot issues that you might encounter when you use field descriptions.

I can't find a field description

We're in the process of adding descriptions for the more complex fields. If you require help for a particular field, let us know by adding a comment for this topic.

The field description isn't helpful

Let us know by adding a comment for this topic. If you can, describe the additional information that you require.

I can't find a field on the Field descriptions page

To show all the fields on a page, set the **Include fields without a description** option to **Yes**. Click the **Select a page** field to verify that you've selected the correct page. If the name that you typed is part of another field name, you might have selected the page that has the longer name.

I can't find a page on the Field descriptions page

For information about the various way to find pages, see the "Searching for pages" section earlier in this article. If you've typed the exact name of the page, the field descriptions might not be shown if more than one page has the same name. Click the arrow in the **Select a page** field to open a filtered list of the pages that are available.

Additional resources

[Customize field descriptions](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Task recorder resources

2/18/2021 • 33 minutes to read • [Edit Online](#)

This topic describes how to use Task recorder to record business processes.

Overview

Task recorder

Task recorder for Finance and Operations apps is a utility that lets users record business processes for several different use cases. Here are some examples:

- Step-by-step guided tours of a specific business process in the application itself
- Documentation of a business process as a Microsoft Word document that can optionally include screenshots
- Regression tests for a business process
- Automatic playback of a business process in the application

Task recorder for Finance and Operations apps boasts high responsiveness, a flexible extensibility application programming interface (API), and seamless integration with consumers of business process recordings. Task recorder is also integrated with the [Business process modeler \(BPM\)](#) tool in Microsoft Dynamics Lifecycle Services (LCS), so that users can continue to organize their recordings. However, users can no longer produce business process diagrams from recordings.

Task recorder can automatically generate application regression tests from business process recordings and play back previously recorded processes. These features also include test-specific gestures that let users take full advantage of Task recorder.

Architecture

Task recorder can record user actions in the client with exact fidelity, because every control is instrumented to notify Task recorder about the execution of user actions. The control notifies Task recorder that an event has occurred and passes all the relevant information about the corresponding user action in real time. From this information, Task recorder can capture the type of user action (for example, a button click, value entry, or navigation) and any data that is related to the user action (for example, the input data value and type, form context, or record context). Task recorder persists the information with enough detail to ensure that a playback of the recording can run the recorded actions exactly as they were performed by the user.

Basic configuration

Task recorder is included with every Finance and Operations app, and lets users begin to record business processes immediately after they open the client for the first time.

IMPORTANT

The **Task guides** tab is currently not available in Commerce or Human Resources. We are currently working to enable this functionality in a future release. Task guides in the Getting Started experience in Human Resources remain available to cover basic functionality. Procedural help is also available on the docs.microsoft.com site (<https://docs.microsoft.com/dynamics365/>) for both Commerce and Human Resources.

Start a new recording

The following steps show how to use Task recorder to start a new recording.

1. Open the product, and sign in. It's a good practice to refresh the browser before each new recording. A refresh creates a new user session and restarts Task recorder. Therefore, it provides the most stable recording experience.
2. Select the company that you want to use while recording. If this is your first time using Task recorder, you can follow along as this tutorial creates a sample recording based on a Fleet Management business process. You will need to load the Fleet demo data to follow along:
 - a. Go to **Dashboard > Fleet Management > Fleet setup**.
 - b. Click **Load demo data**.
 - c. When the data is finished loading, click **Close**.
 - d. Go back to the **Dashboard** by clicking the product name in the navigation bar.
3. Go to **Settings > Task recorder**.
4. The **Task recorder** pane is opened. You can click the **Close** button (X) in the upper-right corner to close the **Task recorder** pane before you begin a new recording. You can reopen the pane by following the previous steps.
5. Click **Create recording**.
6. Enter a name for the recording and click **Start**. Recording begins the moment **Start** is clicked. For the Fleet example in this tutorial, we'll use the name "Create a new rental reservation."

While you're recording, you can click the **Close** button (X) in the upper-right corner to hide the **Task recorder** pane without stopping the recording. You can reopen the pane by clicking the **Task recorder** button that appears at the top of the page. This button appears only while recording is in progress.

NOTE

If the **Saved views** feature is turned on, recordings should be created by using either published views or the standard view, to ensure that recordings work reliably for users.

7. Task recorder enters **recording mode**. The pane shows information and controls that are related to the process of recording.

Now you're ready to record a business process using Task recorder. If you're following this guide as a first-time user, you may complete the following Fleet Management scenario as an example. Otherwise, you can record your own application scenario.

Record a Fleet Management scenario

1. In the **Task recorder** pane, click **Start sub-task**.
2. Set **Name** to "Create a new rental customer". Leave the **Comment** field blank.
3. Click **OK**. The task is added to the step list.
4. Go to **Dashboard > Fleet Management > Reservation Management**.
5. Go to **All customers** under the **Summary** tab.
6. In the Action Pane, click **New**.
7. Enter a first and last name for the customer.
8. Click **Save**.
9. In the **Task recorder** pane, click **End sub-task**.
10. Return to the **Reservation Management** workspace by clicking the browser back button twice.
11. In the **Task recorder** pane, click **Start sub-task**. Name the task "Rent a vehicle to the new customer". Click **OK**.
12. Click (+) **Rental** under **Summary**.

13. Under **Information**, select a "1975 Litware McKinley" as the vehicle.
14. Under **Information**, set the customer to the one just created.
15. Expand the **Discounts** section.
16. Click **Add** under **Discounts** and add the Frequent Customer discount. Click **OK**.
17. In the Action Pane, click **Start Rental**.
18. Set the return date to some date in the future.
19. Click **OK**.
20. In the **Task recorder** pane, click **End sub-task**.
21. Click **Stop** at the very top of the page.

Recording a business process

After you've started your recording, you can perform your business process just as you would typically perform it by using the web client. As you interact with the product, new steps are added to the step list in the **Task recorder** pane. In this section, you will learn about other actions that you can perform while you're recording a business process, to take full advantage of Task recorder's capabilities.

Stop

Stop is used to end the recording session. Before you click **Stop**, you should make sure that the recording is completed, because this action isn't reversible. When you click **Stop**, you're taken to the download options screen.

Start/End sub-task

Start/End sub-task lets a user specify the beginning and end of a set of grouped steps in a recording. Click the **Start sub-task** button to add a "Sub-task" step to the end of the current list of recorded steps. The sub-task will include all steps that you perform from this point until you click the **End sub-task** button. When you click the **End sub-task** button, an "End sub-task" step is also added to the list of recorded steps.

NOTE

You must start a sub-task before you perform/record the steps that you want to include in the task. Then, after you've performed/recorded all the steps that you want to include in the task, you must end the sub-task.

Sub-tasks are purely an organization tool, and consumers of business process recordings can interpret the task groupings in useful ways. Because tasks can be nested inside other tasks, they provide the flexibility to organize very long and complex business processes.

Delete/Restore step

Delete/Restore step enables a user to remove steps from the recording, or undo the removal of a step from the recording. You must first select the step in the Steps list that you want to delete/restore, and then click the **Delete/Restore step** button.

NOTE

The behavior of the **Delete** button changes when you play back a recording. In playback mode, a deleted step can't be restored after playback has passed the point where it would have run the deleted step. For example, you load a recording that contains three steps, and then you delete step 2 before you start playback. You can restore step 2 only as long as playback hasn't run step 3. After you start playback, and playback has "skipped" step 2 (because you deleted it) and run step 3, you won't be able to restore step 2. Because step 2 wasn't run and therefore wasn't recorded, it can't be retroactively added back into the recording at its previous position.

Add developer placeholder

Add developer placeholder lets the user add a placeholder step to the list of recorded steps. This placeholder step doesn't appear when the task guide is viewed, and it isn't run during maintenance of a recording. It's used only by the [Regression suite automation tool \(RSAT\)](#) or the X++ code generator that enables an X++ test to be created from a task recording. When the code generator creates an X++ test, it automatically adds a method stub to the generated code. The developer can then add X++ code into this method stub. The automated code will call the validation when the generated test is run at the point in the recording where this placeholder was added.

Enriching steps in a recording

There are various options for enriching a step in a recording. For example, you can adjust the text that is associated with a step and add information about a specific step. This section describes the step enrichment capabilities that are available. To access these options, click the **Edit step** button on a specific step of a recording.

Step instruction

The **Step instruction** is the primary text that is displayed for this step in the task guide. There are usually 2-3 alternative options for step instructions, and they appear in the following order when editing the annotation.

Step instruction

- In the First name field, type 'John'.
- In the First name field, type a value.
- In the First name field, { your example text }.

This image shows the annotation options for changing a step.

- **Preferred value instruction** This type of instruction will direct the user to enter the same data that was used when the step was recorded. *Example:* In the First name field, enter 'John'.
- **Example value label** This type of instruction will direct the user to enter their own data, indicating that the data that was used when the step was recorded was only *Example* data. *Example:* In the First name field, enter a value.

If users click the **See more** button on this step when they play the recording as a task guide, they will be able to see the data that was used when the step was recorded. This recorded data value will be labeled as an *Example* data value.

NOTE

Steps that are not related to fields, such as clicking buttons, opening forms, or selecting records from a lookup, do not set *Example value label* as an option when annotating.

- **User-supplied value label** This step instruction contains placeholder text, which the author can fill in with their own text. For steps which have an **Example value label** option, the placeholder allows substituting the text which normally specifies the data to enter. This is useful for scenarios where neither the **Preferred value label** nor the **Example value label** sufficiently express the data that should be used for this step.
 - *Example label:* In the First name field, enter *{your example text}*.
 - *Example label after supplying the placeholder text:* In the First name field, enter the customer's name.
- For steps which do not have an **Example value label** option, the placeholder allows substituting all of the label text. Steps associated with buttons, for example, do not have **Example value labels**, so you may replace the entire label text with your own text.
- *Example label before replacement:* Click Post.
 - *Example label after replacement:* To post the order, click Post.

Titles and notes

Titles and notes provide places for user-specified text to be associated with a step in a task guide.

- **Title** – The title lets you specify the text that appears above the step instruction for this step in the task guide. The title a good place to put text that you want users to read before they complete the action that is indicated by the step instruction.
- **Note** – You can use a note to specify text that appears in the expandable section of the pop-up for this step in the task guide. A note is a good place to put optional reading material or other information that might be useful to users, but that they aren't required to read to complete the action that is indicated by the step instruction.

Change recorded values

Starting in version 10.0.12, you can adjust the values that are recorded in basic input controls (for example, simple text, numeric, date, and picklist fields), without having to re-record those steps. Note that lookup controls and reference groups aren't currently supported.

Hide from task guide

The **Hide this step** option lets the author prevent specific steps from appearing in the task guide. This option is useful for hiding steps that are required for the task recording to run in playback mode, but that should not be seen by users. Examples of these steps include copy steps, system-generated steps, and data clean-up steps. If you hide a sub-task, all the steps that are recorded inside that sub-task will also be hidden.

Using control gestures

The basic recording capability lets a user record an end-to-end business process by using Task recorder, but without adding overhead to the process. In some circumstances, more advanced recording features can be used to create even richer business process recordings. Each of the following gestures is found under the **Task recorder** option on the shortcut menu (also known as a right-click menu or context menu) for a control and causes a step to be added to the recording. If the gesture isn't supported for a control, it won't appear on the shortcut menu for that control.

Copy

The **Copy** gesture lets you copy the value for the current control to the Task recorder "clipboard." That value can then be used later as part of a **Paste** or **Validate** gesture. Because values from multiple controls might have to be pasted, the Task recorder clipboard maintains a list of all control values that have been copied in the recording.

Paste

The **Paste** gesture lets you paste a value from a previous **Copy** gesture in the same recording. The Task recorder

paste function works like the standard paste function that users might be familiar with, but it has an additional benefit when it's used during recordings. Because Task recorder will replay the recorded **Copy** and **Paste** commands during playback, if the copied control has a different value than it had during recording, Task recorder will paste the current value instead of the value that the copied control had during recording. This feature is useful in scenarios where the copied control has a value that can change between environments (for example, reclD values or number sequences).

There is an additional benefit from using the **Copy** and **Paste** gestures when test code is generated. For any control where the value is set via the **Paste** command, Task recorder doesn't have to create a parameterized input variable for that control's value, because it's set based on another control's value. This feature can be very useful in scenarios where an entity such as a customer is created, and an identifier for that entity is frequently entered during the recording. Instead of manually re-entering the customer name or ID throughout the scenario, and causing Task recorder to generate a parameterized input variable for each entry, the user can copy the customer name or ID one time, and then repeatedly paste it. In this case, Task recorder will generate a single parameterized input variable to represent the customer name or ID. This feature can make it much easier to change the input data for a generated test.

Validate

The **Validate** gesture lets you insert a step that validates the value of the targeted control. This gesture always uses equality to validate the control value. *Validations aren't currently run during recording playback.* Instead, they are run only when the generated test code is run. Two kinds of validation are available:

- **Current value validation** will capture the targeted control's value at the time of recording and use it to generate an assertion in the test code. In the list of validation options on the shortcut menu, **Current value** is always first.
- **Reference value validation** will use the value of a previously copied control when generating an assertion in the test code. This allows creating assertions that are resilient to changes in the data, since the value is not hardcoded into the test code. In the list of validation options on the shortcut menu, **Reference value validation** follows the format [AOT name of copied control: current copied value].

Additional options are available in version 10.0.13 and later. Here are some examples:

- **Enabled/Disabled** validates that the targeted control's state is enabled (or disabled), and then uses that validation step to generate an assertion in the test code.
- **Read-only/Editable** validates that the targeted control's state is read-only (or editable), and then uses that validation step to generate an assertion in the test code.

Add info step

The **Add info step** gesture lets you insert a step and supply your own text for it. This feature is useful primarily for creating task guides. An **informational step** (or **info step** for short) is a task guide step where the instruction text for the step is user-specified. Info steps are useful for describing actions that are a part of the scenario but must occur outside the client. For example, a scenario might require the user to search for item inventory or check an email for information.

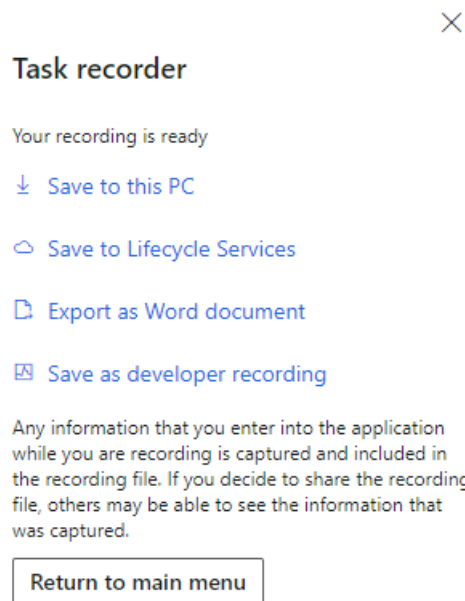

You can specify where an info step should appear in the task guide. The info step can point to a control on the page, if the step is associated with the control. Alternatively, the info step can appear in the upper right of the page, if the step is external to the client, or if it's an explanation that applies to the whole page.

NOTE

Because info steps are manually specified steps and are not automatically recorded by Task recorder when the user takes an action on a control, the info step does not have the capability to automatically progress when a user completes the step in the task guide. Because the info step is not associated with taking an action in the client, there is no action for a task guide to detect that the user has completed in order to automatically progress to the next step.

Options after a recording is completed

After you click **Stop** to end your recording session, several options are shown so that you can save the files that are related to the completed recording. Select **Save to this PC**, and save the task recording package to your desktop. You will use this file later.

Save to this PC

One option after you finish your recording is to download the task recording package (an .axtr file) to your computer. This file can be loaded later via the **Task recorder** pane, so that the recording can be played as a task guide or edited.

Save to Lifecycle Services (LCS)

When you save your recording to an LCS library, it's published on the specified business process in a BPM library. If the selected LCS library is set as a Help library, you will be able to find the task guide for the recording by searching the **Help** menu.

NOTE

To be able to save a recording to an LCS library, the user must be in the Azure Active Directory (Azure AD) tenant that the environment was deployed from.

Export as Word document

The Microsoft Word document for your recording contains the recorded steps as well as any screenshots that were captured.

Save as developer recording

The raw recording file (developer recording) is useful for developer scenarios, such as test code generation and scenarios where **RSAT** is used.

Playing back a recording

The **playback** functionality of Task recorder can automatically run the steps of an existing recording by using the pages and values that were originally recorded. Playback mode can be used to update an existing recording if changes were made to the underlying application, and those changes altered the business process steps that are required for the scenario. It's important to remember that, in this mode, Task recorder simultaneously re-

records the steps and plays them back. When the playback is completed, a new recording is produced that reflects both the steps that were run from the existing recording and any new steps that the user manually performed. Any steps that aren't run either by the user or automatically by Task recorder aren't included in this new recording.

To play back an existing recording, follow these steps.

1. Refresh the browser tab.

NOTE

It's a good practice to refresh the browser before each new recording.

2. Open the **Task recorder** pane.
3. Click **Playback recording**.
4. Click **Open from this PC** to load a recording from a previously downloaded Task recorder package (.axtr file).
 - If you're reading this guide for the first time and following along, choose the "Create a new rental reservation" file that you downloaded previously.
5. Click **Start**.

When you play back a recording, additional actions are available in the **Task recorder** pane.

Play next pending step

Play next pending step runs the next step in the recording. This action is useful because it gives you more control over the playback speed when you want to analyze the effects of a single step. This action has a side-effect that it's important to be aware of. When you click **Play next pending step**, any open lookups, drop-down dialog boxes, or Action Pane tabs might be dismissed, because this action removes focus from those elements. For these situations, we recommend that you use **Play all pending steps** instead.

Play all pending steps

Play all pending steps begins sequential execution of the remaining steps in the recording, and continues until either playback is paused or all steps have been run. During playback, the **Play all pending steps** button is replaced by a **Pause** button that can be used to pause playback. If playback can't successfully run a step for any reason (for example, because it can't find a button that has been renamed), Task recorder will skip that step, and playback will automatically be paused. In this way, the user has an opportunity to replace the obsolete step by completing the new steps in the client. Task recorder will record the new steps and ignore the step that was skipped. The user can then click **Play all pending steps** to continue playback for the remaining steps. After the recording is completed, the user can download the updated recording. This recording will contain all the steps of the original recording, but will exclude any skipped steps and include any new steps.

Play to selected step

Play to selected step behaves like **Play all pending steps**, but it lets you play only a subset of the steps instead of all the steps. In the list, select the step that you want playback to stop at, and then click **Play to selected step**. Task recorder will begin to run the steps in the list and will stop when it has run the step that you selected.

Editing a recording

Although you can edit a recording through the playback functionality, there is also a mode that lets you make simple edits to a recording without having to replay the whole recording. To access this feature, click **Edit recording** after you open the **Task recorder** pane. You can use this feature to make the following edits:

- Insert steps into a recording without re-recording the whole file.
- Move steps under a sub-task without re-recording the whole file.
- Adjust the name and description of the recording.

Insert steps without re-recording the entire file

You can add a step anywhere in a task recording without playing back or re-recording the whole file.

1. Select the step after which you want the new step to be inserted. Make sure the step is highlighted.

In order for task recorder to insert a step, you must have the correct page open. The correct page is the page on which the new step occurs. Task recorder has a mechanism that determines what the active page is, and will disable the functionality if the correct page isn't open.

When you are on the correct page, **Insert step** becomes available.

2. Click **Insert step**.

When you click **Insert step**, Task recorder switches to recording mode. Any action that is performed in the user interface (UI) will now be recorded and inserted into the recording as steps.

3. Click **Stop**.

Recording mode is stopped, and you can now continue to edit the recording. For example, you can repeat this process to insert steps in other places in the recording, or you can move sub-tasks as described in the next section.

4. When you've finished editing the task recording, click **Done editing**, and then select one of the options to save or publish the recording.

Move steps under a sub-task without re-recording the entire file

You can move steps under a sub-task without playing back or re-recording the entire file. You can also move the sub-task step or the end sub-task step if you want to group an existing block of steps.

1. Select the step or sub-task step that you want to move. Make sure that the step is highlighted.
2. Click **Move step after**. To access this command, you might have to select the ellipsis (...) button.

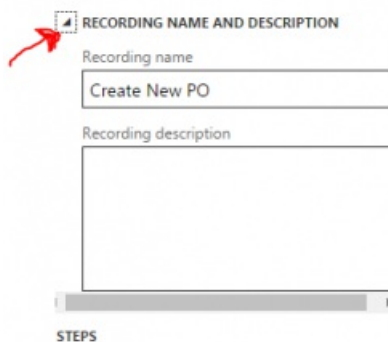

3. Select the step or sub-task step that you want to move the step or sub-task step after. Task recorder will move the step.
4. To move the end sub-task step, select it, click **Move step after**, and then select the step that you want the end sub-task step to be after.

If you want the first step in the task guide to be within a sub-task, create a sub-task step as the second step, and then move the first step into it. You can add or move as many steps or sub-tasks as needed.

5. When you've finished editing the task recording, click **Done editing**, and then select one of the options to save or publish the recording.

Adjust the recording name and description

You can adjust values of the **Recording name** and **Recording description** fields. If you want to see more steps in the Task recorder editing pane, you can also collapse the section that shows the recording name and description.

Playing a task guide

A **task guide** is a user-focused experience that lets the user follow a guided step-by-step set of instructions to complete a business scenario by using a task recording. The user is instructed to complete each step through an animated pop-up prompt that will move across the page and point to the UI element that the user should interact with. The prompt will also tell the user how to interact with the element. For example, it might state, "Click here" or "In this field, enter data." Each step that the user is instructed to complete is based on a step that was originally recorded in the task recording. Because the task recording file contains the data that describes the step that was originally recorded, the task guide can automatically determine when the user has completed the step as expected. It then automatically moves on to the next step.

NOTE

One way that the task guide determines that a user has completed a step is by detecting when the value in a field has changed. Although the task guide doesn't require that a specific value be set, it does require that the field value be changed in order to determine that the step was completed. The user must change the field value, and then press the **Tab** key or click in an area outside the UI element. Only at that point does the client detect that the field value has changed, and it can then proceed to run any required application validation or business logic. Therefore, before the task guide can determine that the step was completed by the user, it relies on the client to detect that the field value has changed.

What can a task guide allow a user to do?

When a user is completing a task guide, the client behaves in the same manner, with the same data, security, and validation rules as it does when the user is not completing a task guide. There is no difference of behavior in the client that would allow a user to take an action that they cannot otherwise take when they are not completing a task guide. When a user is completing a task guide:

- Any data the user enters is subject to the same data validation rules as when not playing the task guide.
- Any data the user enters may be saved, and the user may modify data according to the same restrictions and rules as when not playing the task guide.
- Any security mechanisms the user encounters behave the same as when the user is not playing the task guide.
- Any forms or controls the user accesses are subject to the same security and access mechanisms as when the user is not playing the task guide.

The "On-rails" feature of task guides

By default, when a user begins a task guide, they are placed "on-rails". These "rails" prevent the user from *clicking* on elements other than the element the task guide is pointing to. When the user tries to click on something outside of the UI element that the task guide is pointing to, the task guide pop-up will animate to let the user know that they cannot progress until they complete the current step of the task guide.

While a user is prohibited from *clicking* on other elements, the user is not prevented from tabbing through the other controls on the form, and the user is not prevented from using keyboard shortcuts. This is by design, as the "on-rails" feature is designed for and targeted at first-time users, who are expected to primarily use the mouse as they become familiar with the application.

More advanced or experienced users can turn off the "on-rails" feature when they complete a task guide. At any point during the task guide, these users can turn off the rails by clicking the **Unlock** button that appears on the Task recorder toolbar at the top of the page. This button can also be used to restore the rails at any point during the task guide. In some situations, the task guide might automatically turn off the "on-rails" feature. When the rails are turned off, the user can click UI elements just as they do when the task guide isn't running. The "on-rails" feature might be automatically turned off in the following situations:

- The user is being directed to go to a page by using the navigation pane or navigation search.
 - Because the user can use either entry point, the task guide doesn't point to a specific entry point, and it doesn't prevent the user from using either entry point.
- The task guide enters an error state (see the next section for a list of error states).
- The task guide is showing an info step.

Error detection

An *error state* occurs when the task guide is not able to point to the UI element that is associated with the current step because the UI element is not visible on the screen. When the task guide detects that the current step requires the user to interact with a UI element that is not visible, then the task guide pop-up will move to the upper-right side of the screen. These causes of an error state can be simplified into two categories.

The control is not visible on the form

This error state usually occurs when the user has opened or closed the incorrect tab, FastTab, collapsible section, FactBox, or pop-out menu.

Because the UI element that is needed for the current step is somewhere on the current form, but it is not visible on the screen, the task guide pop-up will simply move to the upper-right side of the screen while displaying the same instruction that informs the user of the action they need to take.

Because the task guide can't find the UI element on the screen, the user must manually determine what is causing the UI element to be hidden and then make the element visible on the screen. The task guide pop-up will automatically detect that the UI element is visible and will reposition itself so that it's pointing at the now-

visible element.

The control is not on the form

This error state usually occurs when the user has gone to the wrong form, either by navigating to the wrong form or by leaving the correct form.

Because the UI element is not visible on the screen, the task guide pop-up will move to the upper-right side of the screen. In addition, when the task guide detects the user is on the wrong form, the task guide pop-up text will change to inform the user of the form they should navigate to.

In some cases, the task guide pop-up will not mention the form by name. This is because the user may need to navigate to a dynamic form. A dynamic form is a form that is not modeled, frequently known as a runtime-generated form. These sorts of forms do not have a proper name. Some examples of runtime-generated forms include simple and custom lookups. The way for a user to navigate to a lookup form is to re-open the lookup.

Next step and Previous step

The **Next step** and **Previous step** buttons appear in the task guide pop-up and let a user manually control the flow of the task guide. When these buttons are clicked, the task guide will go to the next or previous step. The task guide doesn't verify that the user has completed a step before it goes to the next or previous step.

The task guide **never** automatically completes any step for the user, even when the **Next step** and **Previous step** buttons are used. Use of these buttons can cause an error state if the previous or next step refers to a UI element that isn't on the current page. When the user is completing an info step, the only way to proceed is to use the **Next step** button. This action is required because an info step doesn't represent an action that was recorded on any UI element. Because no action was recorded in the task recording, the task guide doesn't have the necessary information to determine what action it should expect the user to complete.

The See more button

When the **See more** button is clicked, the task guide pop-up expands to show additional information that is related to the step. The additional information is often optional reading material that isn't required for the user to successfully complete the step. The following information might be included:

- **An Example value**
 - The Example value is the value that was originally used when the task recording was created.
 - Example values appear only for steps that use non-lookup fields. These fields include text fields, number fields, date fields, combo boxes, and check boxes.
- **A Note**
 - A Note may contain scenario-specific information that will help provide context to the user about the current step of the task guide.

Taking screenshots in Task recorder

By using a **pre-release** Chromium browser extension that works for both the new (Chromium-based) Microsoft Edge browser and Google Chrome, Task recorder can take screenshots of the browser as a user records a business process. After the user completes the recording, Task recorder can use these screenshots to generate Microsoft Word documents. To turn on this functionality, follow these steps to install the pre-release Chromium extension that enables Task recorder to take screenshots during recording.

1. Download the **FMLabTaskRecorderScreenshot** folder that contains the extension from GitHub, at <https://github.com/Microsoft/FMLab>.
2. **On-premises deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace <hostname> with the base URL for your environment.

```

...
"content_scripts": [
  {
    "matches": ["https://*.dynamics.com/*", "<hostname>"],
    "js": ["screenshot.js"]
  }
]
...

```

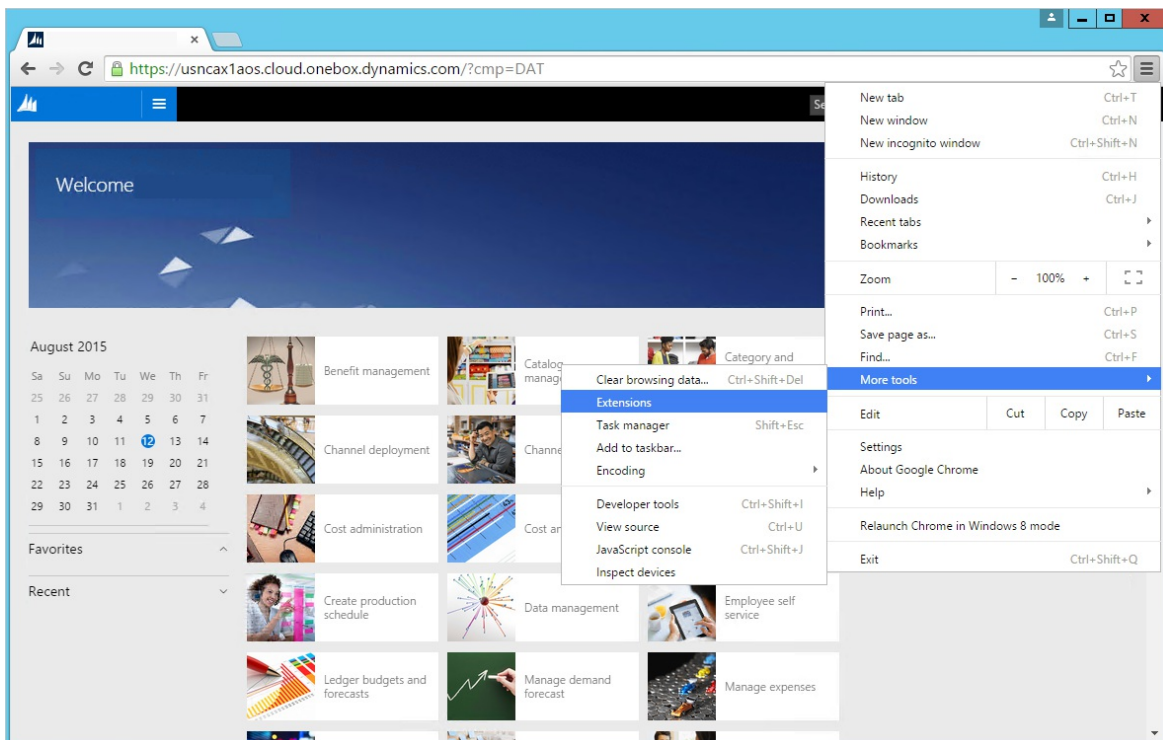

3. **21Vianet deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace `.com` with `.cn`

```

...
"content_scripts": [
  {
    "matches": ["https://*.dynamics.cn/*"],
    "js": ["screenshot.js"]
  }
]
...

```

4. Open the latest Microsoft Edge browser or Google Chrome.
5. Select **Settings and more > Extensions** in Microsoft Edge (or **Customize and control Google Chrome > More tools > Extensions** in Google Chrome).

6. Select **Developer mode**.
7. Click **Load unpacked extension**.
8. Browse to the folder that contains the Task recorder extension by using the path **FMLab-master > FMLab > TaskRecorderScreenshot**, and then select **Select Folder**.
9. Make sure that **Enabled** is selected so that extension is turned on.
10. Restart the browser.

Task recorder will now take screenshots of the tab where the client is running. These screenshots are available for one week after the recording has been played. (If you're running a platform version that is earlier than

Platform update 16, the screenshots are available for only 15 minutes.) If the screenshots have expired, you can regenerate them by playing the task recording again.

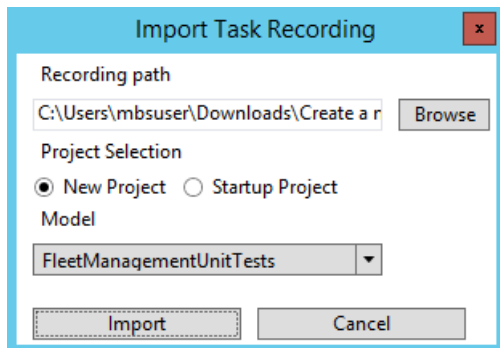

Note that Task recorder **does not** capture screenshots from other tabs or of the user's desktop.

Generating tests from a recording

After a business process recording has been completed by using Task recorder, a developer can import the raw developer recording file (.xml file) into Visual Studio to create an X++ test. The import tool generates a human-readable X++ test from the recording, and translates any control gestures, validations, or tasks into the appropriate test code.

Import a recorded test

1. Open Visual Studio by using the Finance and Operations development tools.
2. Go to **Dynamics 365 > Addins > Import task recording**.
3. In the **Import task recording** menu, use the **Browse** button to locate a previously downloaded recording file.
4. Optionally, choose to have the generated test code be added to the startup project. This requires that a solution containing a project is set as the startup project. This will place the generated X++ test into the same model as the project.
5. If you're creating a new project, select the model for the project. The generated X++ test will be put in this model. For the generated test to be successfully built, the model must have references to the **TestEssentials** model.
6. Click **Import**.

7. In the **New Project** dialog box, provide a name for the project.
8. After the project is created, the user can open and inspect the generated code.
9. To run the test, build the project.
10. Go to **Test > Windows > Test Explorer**.

Appendix

Controls that are known to have incomplete support for Task recorder

- Table
- Filter pane, which is the filter that pops out from the left side
 - When adding filters to the filter pane, the steps are delayed. The steps do not get recorded until the user clicks "Apply" on the Filter pane.
- Enhanced previews
 - No planned support for recording gestures inside of enhanced previews. While recording, enhanced

previews will be disabled.

- No extensible controls are supported out of the box, except Segmented Entry.
 - Extensible control owners need to individually build support for Task recorder.

Controls that can be recorded, but have limited support for the Copy/Paste/Validate gestures

- Date/Time
 - Doesn't support copy/pasting "Never" as a value.
- Image
 - No ability to copy/paste/validate an image value.
- Filter pane
 - Copy/Paste works, but the UI will not show the pasted data. You can proceed as if it pasted correctly.
- Message box
 - You cannot validate the text in the message box.

Controls that are known to have incomplete support for being used in a task guide

- Quick Filter, which is the filter control that appears above lists
 - Does not support displaying a "generic value" during the task guide. Currently displays the value that was used during recording.
- Filter pane, which is the filter that pops out from the left side
 - The task guide does not point to the individual elements within the Filter pane that need to be clicked on.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create documentation or training with Task Recorder

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic explains what Task recorder and task guides are, how to create task recordings, and how to customize Microsoft task guides and include them in your Help.

IMPORTANT

You can record your own task guides for Dynamics 365 Human Resources, but you won't be able to save them to a Business Process Modeler (BPM) library or open them from the Help pane at this time. You can save them locally or to a network location, and then open and replay them using Task recorder.

Learn about Task recorder

Task recorder is a tool that you can use to record actions that you take in the product user interface (UI). When you use Task recorder, all of the events that you perform in the UI that are executed against the server—including adding values, changing settings, removing data—are captured. The steps that you record are collectively called a *task recording*. Task recordings can be used in many ways:

- **Task recordings can be played as task guides.** Task guides are an integral piece of the Help experience. A task guide is a controlled, guided, interactive experience through the steps of a business process. The user is instructed to complete each step by way of a pop-up prompt (or "bubble"), which will animate across the UI and point to the UI element that the user should interact with. The "bubble" also provides information about how to interact with the element, such as "Click here" or "In this field, enter a value." A task guide runs against the user's current data set and the data that is entered is saved in the user's environment.
- **Task recordings can be saved as Word documents.** This allows you to easily produce printable training guides.

You can create your own task recordings, play task recordings provided by Microsoft, or modify Microsoft-provided task recordings to reflect your configuration. For more information about Task recorder, see [Task recorder](#).

Plan your task recording

Whether you're creating a new task recording or basing your recording on a Microsoft task recording, keep the following information in mind.

- Plan your recording like you would a video. Make all your decisions ahead of time.
- Walk through the business process once or twice without recording it to understand the steps.
- When you walk through the process before you record, notice where you use shortcut keys or the **Enter** key, so that you can avoid using them during the actual recording.
- Identify the following:
 - Do you want to group steps together into sub-tasks? Sub-tasks visually set apart sections of a process. For example, if you are creating a recording for "Creating and releasing a product," you may want to group together the steps that are required to create a product, and then group together the steps that are required to release the product. Sub-tasks also make longer processes easier to read.

- Do you want to add annotations, and if so, where? See "Understand the different types of annotations" below for more information.
- What values will you add in the various fields as you complete the steps of the business process? It is a good idea to know what you'll select or enter as you proceed so that you don't backtrack or fix mistakes as you're recording.

Write your description and annotations ahead of time

- At the beginning of each task recording, there's a description field that allows you to enter an introduction to the recording. It is a good idea to write and save the description ahead of time in a separate document so you can copy and paste it into the task recording when you are recording. That way, you can spend time refining the text when you aren't in the process of recording. Cutting and pasting the text makes the recording process go more quickly and smoothly.
- For each step in a task recording, you can create annotations. During playback of a task guide, annotations appear in the "bubble" as notes above or below the text for the step. When viewed as text in the Help pane, annotations appear as text inline in the step. As with the description, it is a good idea to write and save your annotations in a separate document. When you're recording the task recording, cut and paste the annotations in from that document.

Understand the different types of annotations All annotations are optional. Only add them when they'll provide helpful information to the user.

- **Title:** A title annotation will appear before the step text that task recorder automatically generates. In the task guide, the title annotation appears above the automatically generated text. Use this type of annotation to explain why the user is doing the step or to give additional context.

This is the editing pane that you see when you add an annotation as you create your recording. Enter a title annotation in the **Title** box.

Task recorder ×

Hide from task guide
No

Step instruction

Click OK.
 { standard example text }
 { your example text }

Title

Double-check the information before proceeding. You are about to commit the new product to the system.

Notes

This is what the title annotation looks like in the "bubble" in the task guide.

New product

Product type: Product name:

Product subtype: Search name:

IDENTIFICATION

Product number: Retail category:

CATCH WEIGHT

No

Double-check the information before proceeding. You are about to commit the new product to the system.

Click OK.

[Previous step](#) [Next step](#)

- **Notes:** A notes annotation will appear after the step text that task recorder automatically generates. In the task guide it will only be visible if the user clicks the **Show more** link in the task guide bubble. Use this type of annotation to describe anything that a user needs to know to complete the step.

This is the editing pane that you see when you add an annotation as you create your recording. Enter a notes annotation in the **Notes** box.

Task recorder ✕

Hide from task guide
No

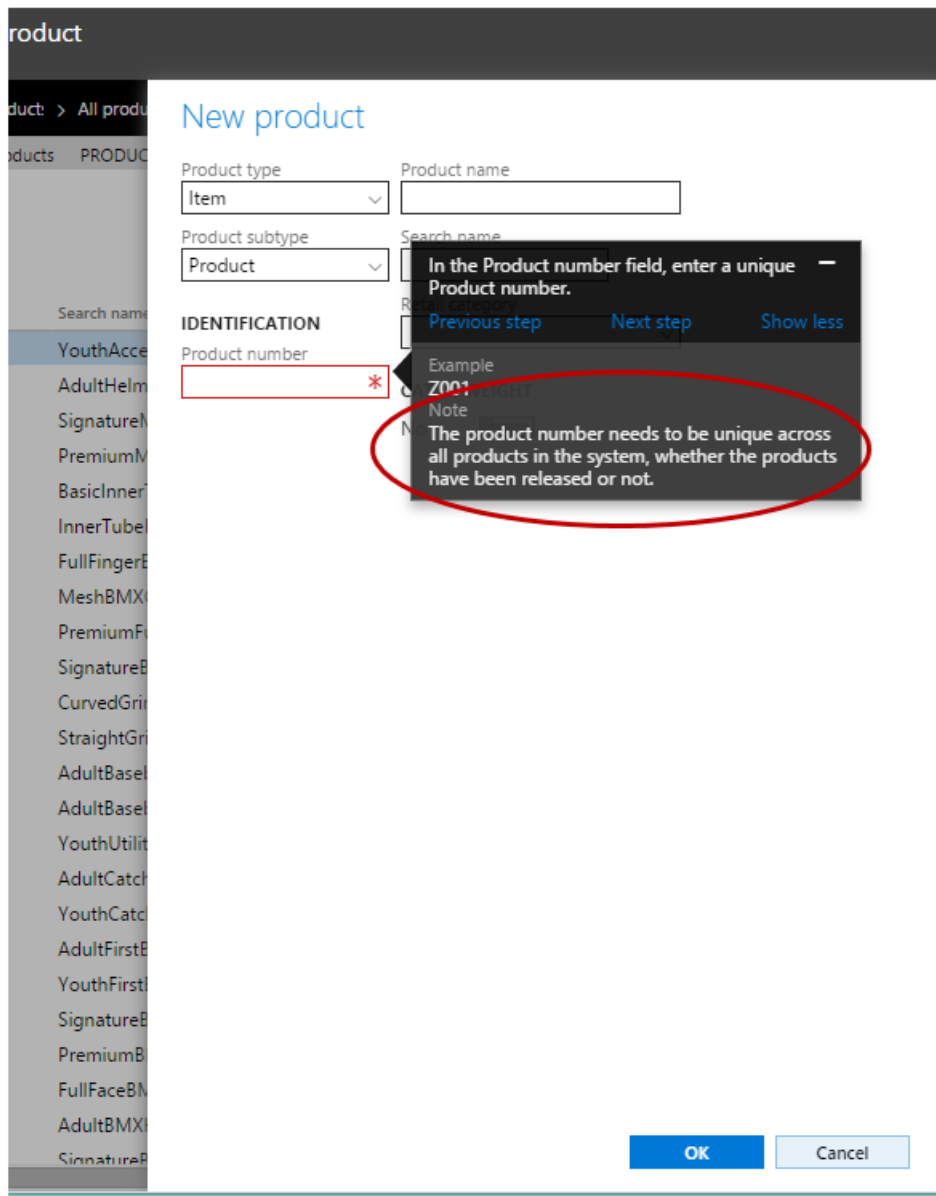

Step instruction

- In the Product number field, ...
- In the Product number field, ...
- In the Product number field, ...

Title

Notes
The product number needs to be unique across all products in the system, whether the products have been released or not.

This is what the notes annotation looks like in the "bubble" in the task guide.

- **Info step:** These annotations are created by right clicking on a control or anywhere on a form < **Task recorder** < **Add info step**. Info steps appear as a numbered step at whatever point you insert it, even though no action was recorded in the UI. You can add a form-level info step or an info step associated with a control. When an info step is associated with a form, the task guide “bubble” will appear someplace on the form, with no pointer; when the task guide is played. When an info step is associated with a control, the task guide “bubble” will point to the control when the task guide is played. In the Help pane, an info step annotation will appear as a numbered step with whatever text you entered. Use info steps to prepare the user for the next steps, to describe steps that need to be done outside of the application, or to refer to other recordings (although you cannot create hyperlinks in annotations).

Determine how long to make your recording

- The user will generally either read or play the recording from start to finish, so don't combine steps or tasks that are better done separately.
- Try not to record a long scenario that spans multiple sub-processes. For example, “Operate in-store customer service desk” is too broad; break it up into shorter tasks such as “Accept returns” and “Add to gift card.”
- If a task can be carried out as part of several different business processes, create a separate recording for it, and you can refer to it in the other recordings.
- If the process involves multiple tasks that the person likely does all at once, you can keep the tasks in one

recording, for example, "Set up and assign functionality profiles."

- If it is something someone does once (such as configuration) and then another task that they can do immediately afterward but may do repeatedly, and on its own, break them up into two task recordings.

Decide where, in the UI, to start a recording The page that you are on when you start recording a task recording affects which page the task guide is displayed for. For example, if you want your task recording to be listed in the Help pane when a user clicks Help on the General ledger parameters page, you must start your recording on the General ledger parameters page. **Save recordings as .axtr files** When you are done creating or editing a task recording, you are presented with several options for how you want to download, or save the recording. You can download the file as a task recording package (.axtr), download it as a raw recording file (.xml), download it as a Word document, or save the file to an LCS library. It is a good idea to always save your task recording as a task recording package file (.axtr). This will help make maintenance of the file easier if procedures or annotations need to change later. If you want to download the file as a Word document, also save it as a task recording package file.

Create your task recording

For detailed walk-through steps, see [Task recorder resources](#).

Copy and customize Microsoft's task recordings

You can download and edit Microsoft's task recordings to use them for your own Help documentation or training materials. To download a Microsoft task recording, follow these steps:

1. Open Task recorder. Task recorder is located in the **Settings** menu.
2. In the Task recorder pane, click **Maintain a recording**.
3. Under **Where is the recording**, click **It is in an LCS library**.
4. Click **Select the LCS library**.
5. Select the Microsoft global library.
6. In the tree, select the business process library node that the task recording is associated with.
7. Click **OK**.
8. Click **Start**.
9. At this point, step through the recording, changing any steps as you go to re-record it. **Note:** If you only need to change the text of a recording, you can open the recording in **Edit a recording's annotations** mode, and then save it.
10. After the recording has played to the end, click **Stop** in the task recorder bar at the top of the screen.
11. Choose how you want to save the task recording.

Glossary

2/18/2021 • 15 minutes to read • [Edit Online](#)

This glossary defines key terms and concepts in Finance and Operations apps.

A

accounting journal

A journal that is used to record the financial consequences of accounting events in an accounting system.

accounting rule

A rule in an accounting system that controls the principles, methods, and procedures for classifying, recording, and reporting the financial consequences of accounting events.

ACH (Automated Clearing House)

An electronic funds transfer system available in the United States that facilitates the transfer of funds between receiving party and originating party bank accounts.

actual quantity

The measured quantity that is input into or output from an activity.

address verification

The service that is provided by a credit card processor that validates that the billing address provided by a card holder matches the information on file with the issuing bank.

aging

The process of classifying time periods by age.

aging period

The number of days in a time period used to report an overdue customer payment balance.

B

balance sheet

A statement of the financial position of an organization that reports the state of assets, liabilities, and equity on a specified date.

balance sheet account

An account that describes the changes in value reported on a balance sheet.

bank reconciliation

A practice of reconciling a ledger account that represents a bank account by matching ledger account entries to bank statement entries.

batch attribute

A product attribute of a process batch or a transfer batch.

best-before date

A recommended date for obtaining the optimum quality or characteristic of a product.

best-before period

The time period in which to obtain the optimum quality or characteristic of a product.

bill of exchange

A source document that documents an unconditional request for a third-party to pay a second party on demand.

blocking

The action of placing a document or product on hold.

BOM (bill of materials)

A list of products and their quantities that are required to produce one product.

budget control

A practice of authorizing expenditure only when budget funds can be reserved to meet future payment commitments.

budget control dimension

A combination of active financial dimensions values used to allocate budget funds to pay for planned activities.

budget control rule

The encoding of a business decision to check committed and actual expenditure against available budget funds allocated for detailed or aggregate activities defined by valid budget control dimension value combinations.

budget cycle time span

A time period specified as a number of fiscal calendar periods. The budget period can be different from the accounting period.

budget group

A set of financial dimension values in a budget dimension hierarchy that is used to calculate aggregate budget funds allocated to superordinate financial dimension values by summing budget funds allocated to subordinate financial dimension values.

budget model

A planning structure used to schedule budget fund allocations and expenditures.

bulk item

A formula item input into a product delivery activity.

bundle

The combination of a number of products for sale as one unit.

business unit

A semi-autonomous operating unit that is created to meet strategic business objectives.

C

capacity load

The maximum amount of scheduled work that a work center can perform at a required capacity level.

capacity planning

A procedure for determining the resource capacity requirements that meet the demand of future output during specific time periods.

carry-forward budget

The budget that is transferred from one fiscal year to the next and that is reserved for open purchase orders in the new fiscal year.

cash-generating unit

The smallest group of classifiable assets that generates cash independently of other assets within an organization. These groups of assets are used to measure impairment losses that will be incurred.

catch weight

The actual or nominal weight of a sales item or inventory item.

chart of accounts

A list of main accounts.

COGS (cost of goods sold)

An accounting category used to sum the financial consequences of manufacturing products and carrying inventory.

contractor

A role assumed by a person who participates in a contractor-employer relationship with a legal entity.

co-product

An item produced jointly with another item.

cost center

An operating unit whose managers are accountable for budgeted and actual expenditures.

cost variance

The difference between an expected cost and an actual cost.

costing

The process of calculating, assigning, and allocating the cost of economic resources acquired, produced, or delivered by an organization.

CTP (capable-to-promise)

The portion of product output from available operations resources and available input product required to fulfill a specific customer requirement.

currency code

An alphanumeric identifier that represents a currency unit.

cycle time

The time taken to complete an activity.

D

dashboard

The typical start page in Finance and Operations apps. On the dashboard, users see a section for each workspace that they have access to. Each section displays the tiles from the summary sections in the related workspace. The dashboard consists of a name and sections with tiles.

data entity

An information structure that represents the data characteristic of an entity.

delegate

A delegate is a type that represents references to methods with a particular parameter list and return type.

delivery note

A business document that documents the delivery of products between two parties.

demand forecast

A prediction of future product demand.

demand forecasting

A business process that estimates future demand and creates demand forecasts based on historical transaction data.

deployable package

The vehicle used for deployment on User Acceptance Test (UAT) and production environments.

designer

A Visual Studio tool that you used to create, update, and inspect your model elements.

dimension-based product configuration

A configuration technology used to create product variants by selecting values for product dimensions.

distinct product

A uniquely identifiable product.

document management system

An application service for storing and handling an organization's documents.

duty

In the security model, a set of application access privileges that are required for a user to carry out their responsibilities.

E

EFT (electronic funds transfer)

A networked system for transferring funds from one bank account to another.

event

An event lets a class or object to notify other classes or objects when something of interest occurs.

EPE (Every Product Every)

A lean concept that is used to establish a regular repeating production cycle.

extension

Customizing an application by adding functionality to existing code.

F

financial dimension

A financial data classifier created from the parties, locations, products, and activities in an organization and used for management reporting.

financial dimension value

A data element in the domain of a financial dimension.

financial statement

A report that documents the financial information and financial position of an organization.

fixed cost

A cost that does not vary with changes in product delivery throughput or output.

fixed currency

A currency that has a fixed exchange rate in relation to another currency.

fixed quantity kanban

A type of kanban that is used when the number of kanbans that are assigned to a kanban rule is constant.

formula

A numeric relationship among production process inputs and production process outputs.

formula item

An output of a batch process controlled by a formula.

G

general budget reservation

A document that is often used by public sector entities to set aside or earmark budgeted funds so that those funds are not available for other purposes.

grace period

The time period beyond a specified date during which an obligation can be fulfilled without penalty.

GST (goods and services tax)

A value-added tax levied in some countries/regions.

I

intercompany

Occurring between or relating two or more legal entities that are part the same organization that consolidates the accounts of all legal entities.

invoice matching

A practice of matching vendor invoice prices and product quantities to purchase orders and product receipts.

item allocation key

A product family grouping that is used for forecast and demand scheduling.

item relation

A reference to the item allocation group or the item and its product dimensions in a kanban rule.

K

kanban

A signal that communicates a requirement for a quantity of product.

kanban flow

Defines the sequence of activities that are performed for kanbans that are created for a kanban rule.

kanban job

A process or transfer activity in a production flow that is triggered by a Kanban.

kanban job consumption

The withdrawal of product components from inventory in order to complete the kanban production jobs.

kanban rule

A rule in a lean manufacturing system that realizes material planning and replenishment policies by controlling

how process and transfer activities are coordinated in production flows.

L

lean manufacturing

A philosophy in which manufacturing operations promote lean production flows and business activities.

lean schedule group

A way in which to aggregate items for production, for example, based on a setup group, shipping group, or transport group.

ledger account

A classifier created from the combination of main account value and other financial dimension values listed in a chart of accounts and used to classify the financial consequences of economic activity.

license code

An alphanumeric key that grants a party the right to use software or software components as prescribed in the terms of the license agreement, and that activates and inactivates software modules, software capabilities, and software functions.

liquidity

The ability of a party to use current assets to settle current liabilities.

M

master scheduling

The process for generating a timetable for matching supply with demand.

model

A model contains code elements and reference metadata. It is created and inspected in Visual Studio.

model element

A model is a group of elements (source files and metadata) that constitutes a distributable software solution. The model is a design-time concept.

N

NBV (net book value)

The value of a fixed asset calculated as the difference between the original cost of the fixed asset minus its accumulated depreciations.

O

object permission

A permitted create, read, update, delete, or execute operation on a securable object.

operating unit

An organization that divides the control of economic resources and operational processes among people who have a duty to maximize the use of scarce resources, to improve processes, and to account for their performance.

output product

The physical products that result from an activity.

overlaying

A method of customizing source code by providing new source code that overrides the default source code.

P

package

A package is a compilable and deployable unit of one or more models.

party

A person or organization that participates in economic activities.

pegging

The process of tracing the quantity of a required item to its source.

pegging event

A resource flow event that signals the demand for a product.

planned intercompany demand

Predicted demand for a product by a legal entity that assumes the role of a vendor. The planned demand is generated from planned demand for the product from a downstream legal entity.

post

To record the monetary value of an economic event in a specific account, or to summarize and reclassify general and subsidiary journal account entries into general and subsidiary ledger account entries.

preparer

The person who creates a source document to initiate a request for economic resources.

procurement catalog

A listing of product offerings that are grouped by procurement category. A procurement catalog is used to request products for internal use by an organization.

product dimension

The size, color, or configuration product attributes that are used for dimension-based product configuration.

product family

A unique grouping of items, services, or rights that either participates in the same production or delivery activities or that are offered to the same market segments. The grouping is represented by using a forecast allocation key.

product master

A standard or functional product representation that is the basis for configuring product variants.

product receipt

A source document that documents the receipt of products ordered, the receipt of products returned, or the receipt of products received on consignment.

product variant

A configuration of a product master.

production flow

A production process designed using Lean principles.

production flow model

A representation of the production capacity provided by a group of work cells in a production flow process.

production order

A source document that documents the requirements for producing items to meet a demand.

production schedule

A schedule to produce a specific item and item quantity at a specific time and by specific human and operational resources.

prospect

A participant that has the existing and potential ability to provide a service or probable future economic benefit to a legal entity.

purchase agreement policy

A policy that authorizes parties to modify purchase agreement terms.

purchase order policy

A policy that authorizes parties to modify purchase order terms and to control order processing.

purchase quotation

A source document that documents an offer to purchase a quantity of product for a specified price and by a specified date in response to a request for quotation in a procurement process.

purchase requisition

A source document that documents product requests so that they can be submitted for review and be used to authorize purchasing by a purchasing organization.

Q

quantity variance

The difference between an ordered product quantity and a received product quantity when no more receipts are expected.

R

receipt advice

A business document that documents a summary of the products a buyer receives from a vendor.

reconciliation

A practice of adjusting two or more accounts or statements so that the figures agree.

reduction key

A method that is used to increase or decrease forecast requirements in master planning, based on user defined percentages that are applied during specific periods.

register

A record that is used to record the operational, legal, and financial consequences of resource flow events in an accounting system.

RFQ (request for quotation)

A source document that documents an invitation to bid on supplying a quantity of product for a specified price and by a specified date.

requester

The person who requests the economic resources.

S

sales agreement

A source document that documents an agreement between two or more parties based on an understanding that a selling party will commit to selling a specific quantity or value of product over a period of time in exchange for favorable prices and discounts.

sales agreement policy

A policy that authorizes parties to modify sales agreement terms.

sales order policy

A policy that authorizes parties to modify sales order terms and to control order processing and payment processes.

sales quotation

A source document that documents an offer to supply a quantity of product for a specified price and by a specified date in response to a request for quotation in a sales process.

security role

A defined set of application access privileges. The security role assigned to a user determines which tasks the user can perform and which parts of the user interface the user can view. All users must be assigned at least one security role in order to access the system.

segregation of duties

A design principle used to reduce the risk of fraud, irregularities, and errors that separates the recording, verification, authorization, custody of assets, and periodic review duties of people who participate in, document, or record the financial consequences of economic transactions.

sequencing

The order in which jobs are processed or operations are performed at a manufacturing facility to achieve objectives.

shared asset

An asset that is used by more than one cash-generating unit (CGU). An example is a distribution center that is used to store items before they are transported to different markets that share that same distribution center.

single use kanban

A type of kanban that is used with a fixed quantity kanban rule to meet exceptionally high demand. A single use kanban does not trigger a new kanban when it is discarded.

smart rounding

A marketing practice to use odd numbers that are marginally less than their nearest round number to set prices.

source requirement

The product quantity documented on a source document line that creates a pegging requirement.

statistical baseline forecast

An estimate of future demand that is created by applying a forecasting algorithm to historical transaction data.

T

takt time

The time that it takes to produce one unit of a product.

Task guide

A controlled, guided experience through the steps in a Task recording. A Task guide leads the user through the experience that was recorded. All security, data, and application behaviors are the same when completing a Task guide as they are without the Task guide. The Task guide uses the same instrumentation as Task recorder to know when a user has completed the intended step, so that it can prompt the user to take the next step in the recording.

Task recorder

A tool that is pre-installed in Finance and Operations apps. When recording, it records all events that the user enters in the user interface that get executed against the server—including values added, settings changed, data removed, etc.

Task recording

A file that contains the actions and annotations that are captured when Task recorder is run.

three-way matching policy

A matching policy that requires one or more vendor invoice prices to match with one or more purchase order prices and that requires one or more vendor invoice quantities to match with one or more product receipt quantities.

transfer batch

The quantity of one or more items that is transferred or that can be transferred.

two-way matching policy

A matching policy that requires one or more vendor invoice prices to match with one or more purchase order prices.

V

value stream

An operating unit that controls one or more production flows.

variant configuration technology

A method of modeling product masters and searching for product variant configurations.

VAT (value-added tax)

A tax on products at each stage of their production based on the value added during that stage.

vendor catalog

A listing of product offerings that are available for purchase from a vendor.

vendor invoice

A source document that documents a vendor payment request. A vendor invoice can refer to one or more purchase orders. When the vendor invoice is authorized, a payment can be made to the vendor.

W

work cell

A resource group that participates in a production flow activity.

worker

A person who assumes the role of an employee or a contractor and is paid in exchange for services.

workspace

A page that provides an overview of one of the activities that the user performs. The page uses tiles, lists, and charts to display pending work and related data from multiple sources, and the page surfaces frequent tasks related to this data. Tiles shown in the summary section of the workspace are also displayed in the related section in the dashboard.

Learning catalog for business decision makers considering Dynamics 365 Supply Chain Management

2/18/2021 • 2 minutes to read • [Edit Online](#)

Do you decide whether to invest in new technologies?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know, so that you can choose the training format that best meets your needs.

Get started

CONTENT	DESCRIPTION	FORMAT	LENGTH
Learn the business value of Microsoft Dynamics 365 and the Power Platform	Are you interested in learning about business applications? Perhaps you don't know where to begin with Microsoft Dynamics 365 and Power Platform applications? Learn how the power of business applications can help transform your business.	Free, self-paced online learning path	7 hours
Dynamics 365 and Power Platform Fundamentals	Are you interested in learning about business applications? Start with this learning path to see how Dynamics 365 apps are used. Learn about cloud concepts, Power Platform, and how to get started with Dynamics 365 apps.	Free, self-paced online learning path	5.5 hours
Get started with Finance and Operations apps	Learn how Finance and Operations apps support businesses to manage their global financial systems, operational business processes, and streamlined supply chains to empower people to make fast, informed decisions. As the first step in your career of working with Finance and Operations apps, you must familiarize yourself with its features and functionality, whatever your desired role.	Free, self-paced online learning path	2 hours

CONTENT	DESCRIPTION	FORMAT	LENGTH
Course MB-900T01-A: Dynamics 365 fundamentals	This course will familiarize the learner with Dynamics 365 functionality and business value. The course will cover Dynamics 365 applications, the Power Platform, cloud concepts, the security model, and licensing considerations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Get started with Asset Management for Dynamics 365 Supply Chain Management	Asset Management is a module for managing assets and maintenance jobs in Dynamics 365 Supply Chain Management. Asset Management enables you to efficiently manage and carry out tasks related to managing and servicing many types of equipment in your company, for example, machines, production equipment, and vehicles. Asset Management supports solutions across numerous industries.	Free, self-paced online learning module	1 hour

Exam

CONTENT	DESCRIPTION	FORMAT
Dynamics 365 Fundamentals	Prove that you understand Microsoft Dynamics 365, the Power Platform, cloud concepts, licensing options, and deployment and release options.	Exam, cost varies by region

Configure your organization in Finance and Operations apps	As a functional consultant who works with Finance and Operations apps, you must understand how to set up an organization for your customer. This learning path shows you, amongst other tasks, how to set up legal entities, implement security settings, personalize the user interface for users, design, and build mobile apps, and implement common integrations.	Free, self-paced online learning path	12 hours
Configure and work with analytics and reporting in Finance and Operations apps	Business leaders can make important decisions in their company if they have accurate insight into the underlying financial and operational data. A business user can also configure, and use the electronic reporting tool without a single line of code, to adopt new regulatory requirements and generate business documents in the required format to electronically exchange information with government bodies, banks, and other parties.	Free, self-paced online learning path	4 hours

Supply chain management

CONTENT	DESCRIPTION	FORMAT	LENGTH
---------	-------------	--------	--------

CONTENT	DESCRIPTION	FORMAT	LENGTH
<p>Configure and manage products and inventory in Dynamics 365 Supply Chain Management</p>	<p>Product information is the pillar of supply chain and retail applications across all industries. In the various modules of a business solution, product-specific information and configuration are required to manage the business processes that are related to products, product families, bills of materials, and product categories. Inventory reports show you in a variety of ways how much inventory you have and explain how to be more effective in your inventory investments. Master planning helps you streamline your planning based on predetermined factors, so you can efficiently plan what materials need to be purchased, transferred, or manufactured.</p>	<p>Free, self-paced online learning path</p>	<p>14 hours</p>
<p>Configure and manage procurement and vendors in Dynamics 365 Supply Chain Management</p>	<p>The process of finding and working with vendors, purchasing products, and ensuring the quality of goods and services are all important factors that impact a company's reputation and success.</p>	<p>Free, self-paced online learning path</p>	<p>14 hours</p>
<p>Configure and manage sales, and customers in Dynamics 365 Supply Chain Management</p>	<p>The process of working with customers, understanding the life cycle of the sales process, and setting up sales agreements are all important factors that impact a company's success.</p>	<p>Free, self-paced online learning path</p>	<p>7 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Master planning in Dynamics 365 Supply Chain Management	Master planning allows companies to identify and balance the raw materials and capacity required to meet their future goals. Master planning assesses which raw materials and capacities are currently available, and which raw materials and capacities are required to complete production. For example, it identifies what must be manufactured, purchased, transferred, or set aside as safety stock before you can complete production..	Free, self-paced online learning path	5 hours
Configure and work with warehouse management in Dynamics 365 for Finance and Operations	Warehouse management in Dynamics 365 Supply Chain Management helps optimize and streamline warehouse processes according to your individual needs and provides the insight into your inventory and the tools to help increase customer satisfaction and reduce costs.	Free, self-paced online learning path	8.5 hours
Configure and work with transportation management in Dynamics 365 Supply Chain Management	The Transportation management module in Dynamics 365 Supply Chain Management helps you find the most efficient way to deliver goods to your customers. Transportation management calculates the least expensive and fastest way of delivering goods and lets you identify vendor and routing solutions for inbound and outbound orders.	Free, self-paced online learning path	3 hours
Work with Asset Management for Dynamics 365 Supply Chain Management	Asset Management is an add-in to Dynamics 365 Supply Chain Management, that is used to manage assets that are used in the daily operation of your company. Some examples of these types of assets are machinery, production equipment, and fork lifts.	Free, self-paced online learning path	12.5 hours

Manufacturing

CONTENT	DESCRIPTION	FORMAT	LENGTH
<p>Configure and use discrete manufacturing in Dynamics 365 Supply Chain Management</p>	<p>If a company only produces simple products, production can be scheduled manually with the correct bill of materials (BOM) parts arriving on the production floor, at the correct time, and at the proper resource. As a functional consultant for manufacturing, you need to know how to configure Dynamics 365 Supply Chain Management for discrete manufacturing, so your customer can perform and control the production lifecycle.</p>	<p>Free, self-paced online learning path</p>	<p>16.5 hours</p>
<p>Configure and use lean manufacturing in Dynamics 365 Supply Chain Management</p>	<p>Lean manufacturing is a journey of continuous improvement. The goal is to produce exactly what the customer wants, when the customer wants it, and to do it economically. You can use lean manufacturing in a unified (mixed-mode) manufacturing environment that combines various supply, production, and sourcing strategies. These strategies include production orders, batch orders for process industries, purchase orders, and transfer orders. The lean manufacturing architecture in Dynamics 365 Supply Chain Management consists of production flows, activities, and Kanban rules.</p>	<p>Free, self-paced online learning path</p>	<p>12.5 hours</p>
<p>Configure and use process manufacturing in Dynamics 365 Supply Chain Management</p>	<p>Process manufacturing is associated with formulas and manufacturing recipes, in contrast with discrete manufacturing, which uses discrete units, and bills of materials. Process manufacturing is used in manufacturing environments where production is completed in batch or semi-continuous processes.</p>	<p>Free, self-paced online learning path</p>	<p>10.5 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH

Finance and Operations: Onboarding to Dynamics 365 (DYN542PAL2)	<p>FastTrack offers an Onboarding service to every Dynamics 365 for Finance and Operations project. In this TechTalk, we will explain the Onboarding process, walk through the content of the Onboarding session with you, and unveil how we are making Onboarding more efficient and convenient in the near future. This session is especially relevant to everybody who works with customers in the early stages of a project, between closing the license deal and initiation of the implementation project.</p>	Tech Talk (recorded webinar)	62 minutes
On-Premises (Local Business Data) Deployment (DYN382PAL2)	<p>Please join this tech talk for an overview of the on-premises deployment option for Dynamics 365 for Finance and Operations, Enterprise Edition. In this session, we will look at the solution architecture of an on-premises deployment, ALM aspects, system requirements, and how to provision the Life Cycle Services project.</p>	Tech Talk (recorded webinar)	48 minutes
Go-live Planning (DYN458PAL2)	<p>We will discuss the go-live process in detail, and how best to prepare for it, in order to make it as smooth as possible for the customer, partner and Microsoft.</p>	Tech Talk (recorded webinar)	60 minutes
Environment Planning (DYN450PAL2)	<p>Please join us for this tech talk on Environment Planning. Learn about the standard environments, what other environments you might need, the options and timing for acquiring and deploying them, and the expected code and data flows between environments.</p>	Tech Talk (recorded webinar)	53 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Feature Management (DYN641PAL2)	<p>Tech Talk on the Feature management experience. It provides a workspace where you can view, enable, disable, and schedule features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them. Attend this meeting to see what is delivered in 10.0.3 and our plans for future releases.</p>	<p>Tech Talk (recorded webinar)</p>	<p>47 minutes</p>
Finance And Operations: Microsoft Managed Continuous Updates (DYN610PAL)	<p>The Continuous Update cadence for Finance and Operations has started! Please join us during this hour to discuss Microsoft Managed Continuous updates, the user experience already available in Lifecycle Services, and forthcoming updates.</p>	<p>Tech Talk (recorded webinar)</p>	<p>61 minutes</p>
Microsoft Managed Continuous Updates: What's new (DYN543PAL2)	<p>During this hour we will explain what is new since our initial announcements about Microsoft Managed Continuous updates. We will discuss the cadence of updates, how we have responded to your valuable feedback on the process, and take a look at the forthcoming Lifecycle Services user experience, through which you will be able to manage your updates.</p>	<p>Tech Talk (recorded webinar)</p>	<p>56 minutes</p>
Monitoring, Optimization Advisor & Critical KBs (DYN456PAL2)	<p>We will discuss monitoring capabilities and what Microsoft monitors for you in your production environment, the optimization advisor and how it can be extended, the "Critical X++ updates" experience in LCS, and best practices for the "Report production outage" option in LCS.</p>	<p>Tech Talk (recorded webinar)</p>	<p>40 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Visual Studio Team Services (VSTS) Setup (VIR782PAL)	<p>This Tech Talk will walk thru the necessary steps to configure a VSTS instance and project to connect to LCS implementation project for Dev/Test environment configuration.</p>	<p>Tech Talk (recorded webinar)</p>	<p>41 minutes</p>
Copy Into Legal Entity (DYN383PAL)	<p>In this session, we will discuss a new feature in the data management framework, Copy into legal entity. We will first briefly review the new features added to the data management framework in platform 8 for the workspace, templates, and data projects and then discuss the additional functionality added for Copy into legal entity.</p>	<p>Tech Talk (recorded webinar)</p>	<p>54 minutes</p>
Regression Suite Automation Tool (DYN480PAL)	<p>We will discuss the Regression Suite Automation Tool. It significantly reduces the time and cost of user acceptance testing, when taking a Microsoft update, or before applying custom code and configurations to your Dynamics 365 for Finance and Operations production environment. It enables functional power users to record business tasks, using the Finance and Operations task recorder, and convert them into a suite of automated tests, without the need to write source code.</p>	<p>Tech Talk (recorded webinar)</p>	<p>61 minutes</p>
Finance and Operations: Regression Suite Automation Tool -- Background & Setup (DYN646PAL)	<p>This is the first of a two-part series on Regression Suite Automation Testing (RSAT). In this session, we will cover how to keep pace with continuous updates using automated testing via RSAT. Learnings and recommendations on creating task recordings and executing tests using RSAT will be covered, along with a step-by-step walkthrough of the installation and setup.</p>	<p>Tech Talk (recorded webinar)</p>	<p>70 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Regression Suite Automation Tool -- Testing Lifecycle Demo (DYN647PAL)	<p>This is the second of a two-part series on Regression Suite Automation Testing (RSAT). This session will cover a demo of the whole cycle of creating and saving task recordings from Finance and Operations to the BPM library in LCS, synchronizing the BPM library to create test cases in Azure DevOps, grouping the test cases into test suites, and loading and executing the test suites in RSAT.</p>	Tech Talk (recorded webinar)	70 minutes
Performance Testing Approach (DYN449PAL2)	<p>Please join us for this tech talk on how to approach Performance Testing. Learn about the fundamentals, best practices for testing, available tools and techniques for executing tests and measuring performance, and how to use the results for optimization.</p>	Tech Talk (recorded webinar)	45 minutes
How to upgrade to 7.2 (July 2017) from 7.0 (RTW)/7.1 (Release 1611) (DYN338PAL2)	<p>In this session we will explain how to upgrade from Dynamics 365 Finance and Operations application v7.0 (RTW) and v7.1 (1611) to v7.2 (July 2017). We make a clear differentiation between Live customers and ongoing projects (not live yet).</p>	Tech Talk (recorded webinar)	58 minutes
Finance and Operations: Upgrading from 7.x to 8+ (DYN519PAL2)	<p>Please join us for our next TechTalk, during which we will cover the 7.X to 8.X upgrade process. We will discuss various scenarios and steps to execute for code upgrade and data upgrade. We will also cover extensibility request scenarios and how to raise them where appropriate. Part 1 of 2.</p>	Tech Talk (recorded webinar)	61 minutes
AX2012 to Dynamics 365 for Operations Upgrade (VIR817PAL2)	<p>This Tech Talk will provide an overview on how to upgrade code and data from Dynamics AX 2012 to Dynamics 365 for Operations.</p>	Tech Talk (recorded webinar)	45 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Analytics & Reporting Options: Printing and the Document Routing Agent	Please join us for this tech talk on two related topics. First we will discuss Analytics and Reporting solution patterns and tools for Dynamics 365 for Finance and Operations, Enterprise Edition. Secondly, we will discuss printing scenarios and the Document Routing Agent.	Tech Talk (recorded webinar)	45 minutes
Course MB-300T01-A: Core common features of Dynamics 365 for Finance and Operations	This course discusses core common features of Microsoft Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Course MB-300T02-A: Core configuration in Dynamics 365 for Finance and Operations	This course discusses core configuration tasks for Microsoft Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Course MB-300T03-A: Data migration and preparing for go-live with Dynamics 365 for Finance and Operations	This course discusses data migration and go-live preparation for Microsoft Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Implementation Lifecycle home page	These topics describe the programs, tools, and processes available related to the implementation lifecycle of your Microsoft Dynamics 365 for Finance and Operations project.	Documentation

CONTENT	DESCRIPTION	FORMAT	LENGTH
<p>Use Lifecycle Services to design and plan an implementation of Finance and Operations apps</p>	<p>Lifecycle Services (LCS) is a collaborative workspace that customers and their partners use to manage Finance and Operations apps projects from pre-sales to the implementation phase and finally to the production environment. It provides checklists and tools that help you manage the project, including pre-build methodologies to help with implementation and regularly updated services.</p>	<p>Free, self-paced online learning path</p>	<p>2 hours</p>
<p>Configure your organization in Finance and Operations apps</p>	<p>As a functional consultant who works with Finance and Operations apps, you must understand how to set up an organization for your customer. This learning path shows you, amongst other tasks, how to set up legal entities, implement security settings, personalize the user interface for users, design, and build mobile apps, and implement common integrations.</p>	<p>Free, self-paced online learning path</p>	<p>12 hours</p>
<p>Migrate data and go live with Finance and Operations apps</p>	<p>As a functional consultant, you must understand how to prepare your customer's data for migration, work with data management, and perform user acceptance testing to go live with Finance and Operations apps.</p>	<p>Free, self-paced online learning path</p>	<p>4 hours</p>
<p>Work with analytics and reporting in Finance and Operation</p>	<p>Business leaders can make important decisions in their company if they have accurate insight into the underlying financial and operational data. Without data visibility, business leaders are challenged with a nearly impossible task. By using analytics and reporting in Finance and Operations apps, you can empower every business user, depending on their security rights, to get the insights they need to make those important decisions.</p>	<p>Free, self-paced online learning path</p>	<p>1.5 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Manage an implementation project for Finance and Operations	<p>Learn the most important elements and the best practices to manage a successful Finance and Operations implementation project. From the first step where you are planning and designing your project methodology, the use of FastTrack services, the development strategy, data management and more, to the best ways for maintaining and monitoring your operations after Go-live.</p>	<p>Free, self-paced online learning path</p>	<p>11.5 hours</p>
System administration home page	<p>This topic points to content for system administrators of Microsoft Dynamics 365 for Finance and Operations. This content will help you configure the system so that it works smoothly and effectively for your organization.</p>	<p>Documentation</p>	
Finance and Operations: Onboarding to Dynamics 365 (DYN542PAL2)	<p>FastTrack offers an Onboarding service to every Dynamics 365 for Finance and Operations project. In this TechTalk, we will explain the Onboarding process, walk through the content of the Onboarding session with you, and unveil how we are making Onboarding more efficient and convenient in the near future. This session is especially relevant to everybody who works with customers in the early stages of a project, between closing the license deal and initiation of the implementation project.</p>	<p>Free recording of a web conference</p>	<p>62 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
On-Premises (Local Business Data) Deployment (DYN382PAL2)	Please join this tech talk for an overview of the on-premises deployment option for Dynamics 365 for Finance and Operations, Enterprise Edition. In this session, we will look at the solution architecture of an on-premises deployment, ALM aspects, system requirements, and how to provision the Life Cycle Services project.	Free recording of a web conference	48 minutes
Copy Into Legal Entity (DYN383PAL)	In this session, we will discuss a new feature in the data management framework, Copy into legal entity. We will first briefly review the new features added to the data management framework in platform 8 for the workspace, templates, and data projects and then discuss the additional functionality added for Copy into legal entity.	Free recording of a web conference	54 minutes

Core development

CONTENT	DESCRIPTION	FORMAT	LENGTH
Data Management (DYN757PAL2)	Please join us for this TechTalk on Data Management. Learn about the options available and the scenarios for which they are recommended. We will cover the Data Management framework, templates, database copying, cross-company data sharing, and performance considerations.	Free recording of a web conference	58 minutes

Migration and upgrade

CONTENT	DESCRIPTION	FORMAT	LENGTH
---------	-------------	--------	--------

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Upgrading from 7.x to 8+ (DYN519PAL2)	Please join us for our next TechTalk, during which we will cover the 7.X to 8.X upgrade process. We will discuss various scenarios and steps to execute for code upgrade and data upgrade. We will also cover extensibility request scenarios and how to raise them where appropriate.	Free recording of a web conference	61 minutes
How to upgrade to 7.2 (July 2017) from 7.0 (RTW)/7.1 (Release 1611) (DYN338PAL2)	In this session we will explain how to upgrade from Dynamics 365 Finance and Operations application v7.0 (RTW) and v7.1 (1611) to v7.2 (July 2017). We make a clear differentiation between Live customers and ongoing projects (not live yet).	Free recording of a web conference	58 minutes
AX2012 to Dynamics 365 for Operations Upgrade (VIR817PAL2)	This Tech Talk will provide an overview on how to upgrade code and data from Dynamics AX 2012 to Dynamics 365 for Operations.	Free recording of a web conference	45 minutes
AX2009 Migration Tool	This session will cover tooling available to assist you with migrating from AX2009 to D365 for Operations.	Free recording of a web conference	55 minutes

Servicing

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Feature Management (DYN641PAL2)	Tech Talk on the Feature management experience. It provides a workspace where you can view, enable, disable, and schedule features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them. Attend this meeting to see what is delivered in 10.0.3 and our plans for future releases.	Free recording of a web conference	47 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Servicing, Supporting and Maintaining Production (DYN651PAL2)	Tech Talk on how to efficiently support, maintain and service your Dynamics 365 for Finance and Operations production environment.	Free recording of a web conference	53 minutes
Finance And Operations: Microsoft Managed Continuous Updates (DYN610PAL)	The Continuous Update cadence for Finance and Operations has started! Please join us during this hour to discuss Microsoft Managed Continuous updates, the user experience already available in Lifecycle Services, and forthcoming updates.	Free recording of a web conference	61 minutes
Microsoft Managed Continuous Updates: What's new (DYN543PAL2)	During this hour we will explain what is new since our initial announcements about Microsoft Managed Continuous updates. We will discuss the cadence of updates, how we have responded to your valuable feedback on the process, and take a look at the forthcoming Lifecycle Services user experience, through which you will be able to manage your updates.	Free recording of a web conference	56 minutes
Microsoft Managed Continuous Updates (DYN474PAL2)	We will discuss Microsoft's plans for keeping your system up-to-date with the latest release. We will cover timelines, the cadence for major and minor updates, the planned procedures, the implications, and what you should do for optimal results.	Free recording of a web conference	62 minutes
Monitoring, Optimization Advisor & Critical KBs (DYN456PAL2)	We will discuss monitoring capabilities and what Microsoft monitors for you in your production environment, the optimization advisor and how it can be extended, the "Critical X++ updates" experience in LCS, and best practices for the "Report production outage" option in LCS.	Free recording of a web conference	40 minutes

Testing

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Regression Suite Automation Tool -- Background & Setup (DYN646PAL)	<p>This is the first of a two-part series on Regression Suite Automation Testing (RSAT). In this session, we will cover how to keep pace with continuous updates using automated testing via RSAT. Learnings and recommendations on creating task recordings and executing tests using RSAT will be covered, along with a step-by-step walkthrough of the installation and setup.</p>	Free recording of a web conference	70 minutes
Finance and Operations: Regression Suite Automation Tool -- Testing Lifecycle Demo (DYN647PAL)	<p>This is the second of a two-part series on Regression Suite Automation Testing (RSAT). This session will cover a demo of the whole cycle of creating and saving task recordings from Finance and Operations to the BPM library in LCS, synchronizing the BPM library to create test cases in Azure DevOps, grouping the test cases into test suites, and loading and executing the test suites in RSAT.</p>	Free recording of a web conference	70 minutes
Finance and Operations: Performance Troubleshooting Tools for Dynamics 365 (DYN541PAL2)	<p>In this Tech Talk, we will present the different tools that can be used to troubleshoot Microsoft Dynamics 365 for Finance and Operations performance issues. This session will contain some scenario-based demonstrations and initial guidance on how to approach typical performance issues.</p>	Free recording of a web conference	64 minutes

Exam

CONTENT	DESCRIPTION	FORMAT
Dynamics 365 Fundamentals	<p>Prove that you understand Microsoft Dynamics 365, the Power Platform, cloud concepts, licensing options, and deployment and release options.</p>	Exam, cost varies by region

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Learning catalog for Dynamics 365 Supply Chain Management developers

2/18/2021 • 11 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

Do you need to write code to integrate with other data sources, extend core system functionality, or build a complex application?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know, so that you can choose the training format that best meets your needs.

Get started

CONTENT	DESCRIPTION	FORMAT	LENGTH
Get started with Finance and Operations apps	Learn how Finance and Operations apps support businesses to manage their global financial systems, operational business processes, and streamlined supply chains to empower people to make fast, informed decisions. As the first step in your career of working with Finance and Operations apps, you must familiarize yourself with its features and functionality, whatever your desired role.	Free, self-paced online learning path	2.2 hours

Core development concepts

CONTENT	DESCRIPTION	FORMAT	LENGTH
---------	-------------	--------	--------

CONTENT	DESCRIPTION	FORMAT	LENGTH
Introduction to developing with Finance and Operations apps	<p>As a developer working with Finance and Operations apps, it's important to have a firm grasp of the main architecture components of the Dynamics 365 ecosystem and Finance and Operations apps. Knowledge of core developer concepts, including technical capabilities, source code, testing frameworks, and reporting tools, will support your further efforts in building development skills that you can apply to Finance and Operations apps.</p>	<p>Free, self-paced online learning path</p>	<p>7.75 hours</p>
Build Finance and Operations apps	<p>Developing in Finance and Operations apps requires a basic understanding of the tasks required to build new elements and customize Finance and Operations apps. The tasks include understanding X++ code and Visual Studio, as well as being able to create and modify the basic elements of the system.</p>	<p>Free, self-paced online learning path</p>	<p>13 hours</p>
Extend Finance and Operations apps	<p>Extensions allow developers to make changes to the user experience in Finance and Operations apps by implementing modifications to the code that do not affect the base code. Among other benefits, extensions let developers update Finance and Operations apps to adhere to business processes and required changes.</p>	<p>Free, self-paced online learning path</p>	<p>2.5 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Connect to Finance and Operations apps	<p>Integration and the ability to access your data in Finance and Operations apps are important capabilities. Developers who have learned to build and extend code in Finance and Operations apps can enhance their knowledge of development by learning about data integration and how connecting to data can have positive impacts on users.</p>	<p>Free, self-paced online learning path</p>	<p>5.75 hours</p>
Migrate data and go live with Finance and Operations apps	<p>As a functional consultant, you must understand how to prepare your customer's data for migration, work with data management, and perform user acceptance testing to go live with Finance and Operations apps.</p>	<p>Free, self-paced online learning path</p>	<p>4 hours</p>
Finance And Operations: Development ALM (DYN766PAL)	<p>This TechTalk discusses Development Application Lifecycle Management concepts, tools and the best practices we recommend. We cover how Lifecycle Services, Visual Studio, and Azure DevOps work together to enable business-process focused continuous delivery of your solution's code base, and servicing of your environments.</p>	<p>Free recording of a web conference</p>	<p>52 minutes</p>
Finance and Operations: Extending Dynamics 365 for Finance and Operations with PowerApps (DYN558PAL2)	<p>Understand the simplicity of Microsoft PowerApps and how it can integrate with Dynamics 365 for Finance and Operations to digitally transform businesses and increase user productivity.</p>	<p>Free recording of a web conference</p>	<p>43 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Extensibility (DYN518PAL2)	We will provide an overview and update on Microsoft's extensibility plans. We will discuss in detail the various ways of extending a solution, looking deep into the metadata extensibility features as well as the ability to augment and extend code, including via the powerful Chain of Command feature.	Free recording of a web conference	50 minutes
Visual Studio Team Services (VSTS) Setup (MIR782PAL)	This Tech Talk will walk thru the necessary steps to configure a VSTS instance and project to connect to LCS implementation project for Dev/Test environment configuration.	Free recording of a web conference	41 minutes
Dataverse Data Integrator (DYN451PAL2)	Please join us for this tech talk on the capabilities of Microsoft Dataverse Data Integrator. We will discuss integration options between Dynamics 365 Customer Engagement and Dynamics 365 Finance and Operations, as well as integrating with other, third-party solutions.	Free recording of a web conference	61 minutes
Integration Between Dynamics 365 for Sales and Dynamics 365 for Finance & Operations via Dataverse (DYN340PAL)	In this Tech talk we will introduce the integration scenario known as Prospect to cash, with sales and marketing activities in Dynamics 365 for Sales and fulfillment in Dynamics 365 for Finance and Operations. We will also take a look at the Data integrator and how to modify the integration.	Free recording of a web conference	54 minutes
Data Management (DYN757PAL2)	Please join us for this TechTalk on Data Management. Learn about the options available and the scenarios for which they are recommended. We will cover the Data Management framework, templates, database copying, cross-company data sharing, and performance considerations.	Free recording of a web conference	58 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Azure Integration Tools for Dynamics 365 for Finance and Operations (DYN386PAL)	This TechTalk will cover the types of tools one might consider while integrating with Dynamics 365 for Finance & Operations and when to choose which integration tool. The session will also walk-through some of integration scenarios orchestrated using Azure integration services.	Free recording of a web conference	63 minutes
Integration Frameworks within Dynamics 365 for Finance & Operations (DYN385PAL)	This session will provide an overview of the integration frameworks within Dynamics 365 for Finance & Operations and discuss the consideration under which these frameworks could be used.	Free recording of a web conference	64 minutes
Copy Into Legal Entity (DYN383PAL)	In this session, we will discuss a new feature in the data management framework, Copy into legal entity. We will first briefly review the new features added to the data management framework in platform 8 for the workspace, templates, and data projects and then discuss the additional functionality added for Copy into legal entity.	Free recording of a web conference	54 minutes
How To Extend or Build New Analytical Workspaces (DYN321PAL)	This Tech Talk will provide a walk through on how to extend or build new Analytical Workspaces.	Free recording of a web conference	59 minutes
Mobile Framework (VIR824PAL)	This tech talk will walk through the mobile framework capabilities for building apps in Dynamics 365 for Operations. The session will also demonstrate some recently built apps.	Free recording of a web conference	58 minutes

Servicing

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Servicing, Supporting and Maintaining Production (DYN651PAL2)	<p>Tech Talk on how to efficiently support, maintain and service your Dynamics 365 for Finance and Operations production environment.</p>	<p>Free recording of a web conference</p>	<p>53 minutes</p>
Finance and Operations: Feature Management (DYN641PAL2)	<p>Tech Talk on the Feature management experience. It provides a workspace where you can view, enable, disable, and schedule features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them. Attend this meeting to see what is delivered in 10.0.3 and our plans for future releases.</p>	<p>Free recording of a web conference</p>	<p>47 minutes</p>
Finance And Operations: Microsoft Managed Continuous Updates (DYN610PAL)	<p>The Continuous Update cadence for Finance and Operations has started! Please join us during this hour to discuss Microsoft Managed Continuous updates, the user experience already available in Lifecycle Services, and forthcoming updates.</p>	<p>Free recording of a web conference</p>	<p>61 minutes</p>
Microsoft Managed Continuous Updates: What's new (DYN543PAL2)	<p>During this hour we will explain what is new since our initial announcements about Microsoft Managed Continuous updates. We will discuss the cadence of updates, how we have responded to your valuable feedback on the process, and take a look at the forthcoming Lifecycle Services user experience, through which you will be able to manage your updates.</p>	<p>Free recording of a web conference</p>	<p>56 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Microsoft Managed Continuous Updates (DYN474PAL2)	We will discuss Microsoft's plans for keeping your system up-to-date with the latest release. We will cover timelines, the cadence for major and minor updates, the planned procedures, the implications, and what you should do for optimal results.	Free recording of a web conference	62 minutes

Migration and upgrade

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Upgrading from 7.x to 8+ (DYN519PAL2)	Please join us for our next TechTalk, during which we will cover the 7.X to 8.X upgrade process. We will discuss various scenarios and steps to execute for code upgrade and data upgrade. We will also cover extensibility request scenarios and how to raise them where appropriate. Part 1 of 2.	Free recording of a web conference	61 minutes
AX2012 to Dynamics 365 for Operations Upgrade (VIR817PAL2)	This Tech Talk will provide an overview on how to upgrade code and data from Dynamics AX 2012 to Dynamics 365 for Operations.	Free recording of a web conference	45 minutes
AX2009 to Dynamics 365 for Operations Migration Tools (VIR809PAL)	This session will cover tooling available to assist you with migrating from AX2009 to D365 for Operations.	Free recording of a web conference	55 minutes

Testing

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Acceptance Test Library (DYN650PAL2)	Tech Talk on how to efficiently support, maintain and service your Dynamics 365 for Finance and Operations production environment.	Free recording of a web conference	61 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
<p>Finance and Operations: Regression Suite Automation Tool -- Background & Setup (DYN646PAL)</p>	<p>This is the first of a two-part series on Regression Suite Automation Testing (RSAT). In this session, we will cover how to keep pace with continuous updates using automated testing via RSAT. Learnings and recommendations on creating task recordings and executing tests using RSAT will be covered, along with a step-by-step walkthrough of the installation and setup.</p>	<p>Free recording of a web conference</p>	<p>70 minutes</p>
<p>Finance and Operations: Regression Suite Automation Tool -- Testing Lifecycle Demo (DYN647PAL)</p>	<p>This is the second of a two-part series on Regression Suite Automation Testing (RSAT). This session will cover a demo of the whole cycle of creating and saving task recordings from Finance and Operations to the BPM library in LCS, synchronizing the BPM library to create test cases in Azure DevOps, grouping the test cases into test suites, and loading and executing the test suites in RSAT.</p>	<p>Free recording of a web conference</p>	<p>70 minutes</p>
<p>Finance and Operations: Performance Benchmark for Dynamics 365 (DYN550PAL2)</p>	<p>In this Tech Talk, we will describe an approach for preparing and delivering a performance benchmark on Microsoft Dynamics 365 for Finance and Operations. We will present the process, main concepts and tools before illustrating a simple case with a demonstration.</p>	<p>Free recording of a web conference</p>	<p>68 minutes</p>
<p>Finance and Operations: Performance Key Patterns and Anti-patterns for Dynamics 365 (DYN549PAL)</p>	<p>In this Tech Talk, we will present efficient performance patterns that we have seen project teams implement successfully. We will also describe anti-patterns that can lead to serious performance degradation of the Microsoft Dynamics 365 for Finance and Operations environment.</p>	<p>Free recording of a web conference</p>	<p>58 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Performance Troubleshooting Tools for Dynamics 365 (DYN541PAL2)	<p>In this Tech Talk, we will present the different tools that can be used to troubleshoot Microsoft Dynamics 365 for Finance and Operations performance issues. This session will contain some scenario-based demonstrations and initial guidance on how to approach typical performance issues.</p>	<p>Free recording of a web conference</p>	<p>64 minutes</p>
Task Automation Framework for Data Management (DYN447PAL2)	<p>Please join us for this tech talk on the new Task Automation Framework for Data Management. Learn how the framework facilitates testing of data entities & integrations, validation of the resulting data, and automation of other tasks in the Data Management Framework.</p>	<p>Free recording of a web conference</p>	<p>55 minutes</p>
Finance and Operations: Warehouse App Task Validation Framework	<p>This talk will introduce and explain the new Warehouse App Task Validation Framework, which is designed to allow for the automation of warehouse tasks within the standard Dynamics 365 Warehousing application. This new framework bridges the gap between the Regression Suite Automation Tool (RSAT) and the warehouse functionality so that end-to-end regression tests can be built, including both core Dynamics workflows as well as distribution scenarios utilizing the advanced warehousing module. The talk will walk through the setup and configuration of the framework and show how it can be utilized to automate a warehouse process through RSAT.</p>	<p>Free recording of a web conference</p>	<p>66 minutes</p>

Exam

CONTENT	DESCRIPTION	FORMAT
Exam MB-500: Microsoft Dynamics 365: Finance and Operations Apps Developer	This exam measures your ability to accomplish the following technical tasks: plan architecture and solution design; apply developer tools; design and develop AOT elements; develop and test code; implement reporting; integrate and manage data solutions; and implement security and optimize performance.	Exam, cost varies by region

CONTENT	DESCRIPTION	FORMAT	LENGTH
Use Lifecycle Services to design and plan an implementation of Finance and Operations apps	Lifecycle Services (LCS) is a collaborative workspace that customers and their partners use to manage Finance and Operations apps projects from pre-sales to the implementation phase and finally to the production environment. It provides checklists and tools that help you manage the project, including pre-build methodologies to help with implementation and regularly updated services.	Free, self-paced online learning path	2 hours
Configure your organization in Finance and Operations apps	As a functional consultant who works with Finance and Operations apps, you must understand how to set up an organization for your customer. This learning path shows you, amongst other tasks, how to set up legal entities, implement security settings, personalize the user interface for users, design, and build mobile apps, and implement common integrations.	Free, self-paced online learning path	12 hours
Migrate data and go live with Finance and Operations apps	As a functional consultant, you must understand how to prepare your customer's data for migration, work with data management, and perform user acceptance testing to go live with Finance and Operations apps.	Free, self-paced online learning path	4 hours

CONTENT	DESCRIPTION	FORMAT	LENGTH
Configure and work with analytics and reporting in Finance and Operations apps	<p>Business leaders can make important decisions in their company if they have accurate insight into the underlying financial and operational data. A business user can also configure, and use the electronic reporting tool without a single line of code, to adopt new regulatory requirements and generate business documents in the required format to electronically exchange information with government bodies, banks, and other parties.</p>	<p>Free, self-paced online learning path</p>	<p>4 hours</p>
Implement Finance and Operations apps	<p>Learn the most important elements and the best practices to manage a successful Finance and Operations implementation project. From the first step where you are planning and designing your project methodology, the use of FastTrack services, the development strategy, data management and more, to the best ways for maintaining and monitoring your operations after Go-live.</p>	<p>Free, self-paced online learning path</p>	<p>11.5 hours</p>
Finance and Operations: Onboarding to Dynamics 365 (DYN542PAL2)	<p>FastTrack offers an Onboarding service to every Dynamics 365 for Finance and Operations project. In this TechTalk, we will explain the Onboarding process, walk through the content of the Onboarding session with you, and unveil how we are making Onboarding more efficient and convenient in the near future. This session is especially relevant to everybody who works with customers in the early stages of a project, between closing the license deal and initiation of the implementation project.</p>	<p>Tech Talk (recorded webinar)</p>	<p>62 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
On-Premises (Local Business Data) Deployment (DYN382PAL2)	<p>Please join this tech talk for an overview of the on-premises deployment option for Dynamics 365 for Finance and Operations, Enterprise Edition. In this session, we will look at the solution architecture of an on-premises deployment, ALM aspects, system requirements, and how to provision the Life Cycle Services project.</p>	<p>Tech Talk (recorded webinar)</p>	<p>48 minutes</p>
Go-live Planning (DYN458PAL2)	<p>We will discuss the go-live process in detail, and how best to prepare for it, in order to make it as smooth as possible for the customer, partner and Microsoft.</p>	<p>Tech Talk (recorded webinar)</p>	<p>60 minutes</p>
Environment Planning (DYN450PAL2)	<p>Please join us for this tech talk on Environment Planning. Learn about the standard environments, what other environments you might need, the options and timing for acquiring and deploying them, and the expected code and data flows between environments.</p>	<p>Tech Talk (recorded webinar)</p>	<p>53 minutes</p>
Finance and Operations: Feature Management (DYN641PAL2)	<p>Tech Talk on the Feature management experience. It provides a workspace where you can view, enable, disable, and schedule features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them. Attend this meeting to see what is delivered in 10.0.3 and our plans for future releases.</p>	<p>Tech Talk (recorded webinar)</p>	<p>47 minutes</p>

Finance And Operations: Microsoft Managed Continuous Updates (DYN610PAL)	<p>The Continuous Update cadence for Finance and Operations has started! Please join us during this hour to discuss Microsoft Managed Continuous updates, the user experience already available in Lifecycle Services, and forthcoming updates.</p>	<p>Tech Talk (recorded webinar)</p>	<p>61 minutes</p>
Microsoft Managed Continuous Updates: What's new (DYN543PAL2)	<p>During this hour we will explain what is new since our initial announcements about Microsoft Managed Continuous updates. We will discuss the cadence of updates, how we have responded to your valuable feedback on the process, and take a look at the forthcoming Lifecycle Services user experience, through which you will be able to manage your updates.</p>	<p>Tech Talk (recorded webinar)</p>	<p>56 minutes</p>
Monitoring, Optimization Advisor & Critical KBs (DYN456PAL2)	<p>We will discuss monitoring capabilities and what Microsoft monitors for you in your production environment, the optimization advisor and how it can be extended, the "Critical X++ updates" experience in LCS, and best practices for the "Report production outage" option in LCS.</p>	<p>Tech Talk (recorded webinar)</p>	<p>40 minutes</p>
Visual Studio Team Services (VSTS) Setup (VIR782PAL)	<p>This Tech Talk will walk thru the necessary steps to configure a VSTS instance and project to connect to LCS implementation project for Dev/Test environment configuration.</p>	<p>Tech Talk (recorded webinar)</p>	<p>41 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Copy Into Legal Entity (DYN383PAL)	<p>In this session, we will discuss a new feature in the data management framework, Copy into legal entity. We will first briefly review the new features added to the data management framework in platform 8 for the workspace, templates, and data projects and then discuss the additional functionality added for Copy into legal entity.</p>	<p>Tech Talk (recorded webinar)</p>	<p>54 minutes</p>
Regression Suite Automation Tool (DYN480PAL)	<p>We will discuss the Regression Suite Automation Tool. It significantly reduces the time and cost of user acceptance testing, when taking a Microsoft update, or before applying custom code and configurations to your Dynamics 365 for Finance and Operations production environment. It enables functional power users to record business tasks, using the Finance and Operations task recorder, and convert them into a suite of automated tests, without the need to write source code.</p>	<p>Tech Talk (recorded webinar)</p>	<p>61 minutes</p>
Finance and Operations: Regression Suite Automation Tool -- Background & Setup (DYN646PAL)	<p>This is the first of a two-part series on Regression Suite Automation Testing (RSAT). In this session, we will cover how to keep pace with continuous updates using automated testing via RSAT. Learnings and recommendations on creating task recordings and executing tests using RSAT will be covered, along with a step-by-step walkthrough of the installation and setup.</p>	<p>Tech Talk (recorded webinar)</p>	<p>70 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Regression Suite Automation Tool -- Testing Lifecycle Demo (DYN647PAL)	<p>This is the second of a two-part series on Regression Suite Automation Testing (RSAT). This session will cover a demo of the whole cycle of creating and saving task recordings from Finance and Operations to the BPM library in LCS, synchronizing the BPM library to create test cases in Azure DevOps, grouping the test cases into test suites, and loading and executing the test suites in RSAT.</p>	Tech Talk (recorded webinar)	70 minutes
Performance Testing Approach (DYN449PAL2)	<p>Please join us for this tech talk on how to approach Performance Testing. Learn about the fundamentals, best practices for testing, available tools and techniques for executing tests and measuring performance, and how to use the results for optimization.</p>	Tech Talk (recorded webinar)	45 minutes
How to upgrade to 7.2 (July 2017) from 7.0 (RTW)/7.1 (Release 1611) (DYN338PAL2)	<p>In this session we will explain how to upgrade from Dynamics 365 Finance and Operations application v7.0 (RTW) and v7.1 (1611) to v7.2 (July 2017). We make a clear differentiation between Live customers and ongoing projects (not live yet).</p>	Tech Talk (recorded webinar)	58 minutes
Finance and Operations: Upgrading from 7.x to 8+ (DYN519PAL2)	<p>Please join us for our next TechTalk, during which we will cover the 7.X to 8.X upgrade process. We will discuss various scenarios and steps to execute for code upgrade and data upgrade. We will also cover extensibility request scenarios and how to raise them where appropriate. Part 1 of 2.</p>	Tech Talk (recorded webinar)	61 minutes
AX2012 to Dynamics 365 for Operations Upgrade (VIR817PAL2)	<p>This Tech Talk will provide an overview on how to upgrade code and data from Dynamics AX 2012 to Dynamics 365 for Operations.</p>	Tech Talk (recorded webinar)	45 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Analytics & Reporting Options: Printing and the Document Routing Agent	This session will discuss various printing scenarios in D365 for Operations, including tips and tricks for Document Routing Agent.	Tech Talk (recorded webinar)	60 minutes
Course MB-300T01-A: Core common features of Dynamics 365 for Finance and Operations	This course discusses core common features of Microsoft Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Course MB-300T02-A: Core configuration in Dynamics 365 for Finance and Operations	This course discusses core configuration tasks for Microsoft Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Course MB-300T03-A: Data migration and preparing for go-live with Dynamics 365 for Finance and Operations	This course discusses data migration and go-live preparation for Microsoft Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Implementation Lifecycle home page	These topics describe the programs, tools, and processes available related to the implementation lifecycle of your Microsoft Dynamics 365 for Finance and Operations project.	Documentation	

Manufacturing

CONTENT	DESCRIPTION	FORMAT	LENGTH
Configure and use discrete manufacturing in Dynamics 365 Supply Chain Management	If a company only produces simple products, production can be scheduled manually with the correct bill of materials (BOM) parts arriving on the production floor, at the correct time, and at the proper resource. As a functional consultant for manufacturing, you need to know how to configure Dynamics 365 Supply Chain Management for discrete manufacturing, so your customer can perform and control the production lifecycle.	Free, self-paced online learning path	16.5 hours

CONTENT	DESCRIPTION	FORMAT	LENGTH
Configure and use lean manufacturing in Dynamics 365 Supply Chain Management	<p>Lean manufacturing is a journey of continuous improvement. The goal is to produce exactly what the customer wants, when the customer wants it, and to do it economically. You can use lean manufacturing in a unified (mixed-mode) manufacturing environment that combines various supply, production, and sourcing strategies. These strategies include production orders, batch orders for process industries, purchase orders, and transfer orders. The lean manufacturing architecture in Dynamics 365 Supply Chain Management consists of production flows, activities, and Kanban rules.</p>	<p>Free, self-paced online learning path</p>	<p>12.5 hours</p>
Configure and use process manufacturing in Dynamics 365 Supply Chain Management	<p>Process manufacturing is associated with formulas and manufacturing recipes, in contrast with discrete manufacturing, which uses discrete units, and bills of materials. Process manufacturing is used in manufacturing environments where production is completed in batch or semi-continuous processes.</p>	<p>Free, self-paced online learning path</p>	<p>10.5 hours</p>
Master planning in Dynamics 365 Supply Chain Management	<p>Master planning allows companies to identify and balance the raw materials and capacity required to meet their future goals. Master planning assesses which raw materials and capacities are currently available, and which raw materials and capacities are required to complete production. For example, it identifies what must be manufactured, purchased, transferred, or set aside as safety stock before you can complete production.</p>	<p>Free, self-paced online learning path</p>	<p>5 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Use warehouse management in manufacturing in Dynamics 365 Supply Chain Management	Using warehouse management in manufacturing processes in Dynamics 365 Supply Chain Management helps optimize and streamline warehouse processes in your manufacturing environment, according to your company's needs.	Free, self-paced online learning path	10.5 hours
Course MB-320T01-A: Configure and use discrete manufacturing in Dynamics 365 for Finance and Operations	This course discusses how to configure and use discrete manufacturing in Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	2 days
Course MB-320T02-A: Configure and use lean manufacturing in Dynamics 365 for Finance and Operations	This course discusses how to configure and use lean manufacturing in Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Course MB-320T03-A: Configure and use process manufacturing in Dynamics 365 for Finance and Operations	This course discusses how to configure and use process manufacturing in Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Microsoft Certified: Dynamics 365 for Finance and Operations, Manufacturing Functional Consultant Associate	Microsoft Certified: Dynamics 365 for Finance and Operations, Manufacturing Functional Consultants integrate digital and physical systems; improve visibility, manufacturing efficiency and flexibility; and lower costs for their clients.	Certification, cost varies by region	

Supply chain management

CONTENT	DESCRIPTION	FORMAT	LENGTH
---------	-------------	--------	--------

CONTENT	DESCRIPTION	FORMAT	LENGTH
<p>Configure and manage products and inventory in Dynamics 365 Supply Chain Management</p>	<p>Product information is the pillar of supply chain and retail applications across all industries. In the various modules of a business solution, product-specific information and configuration are required to manage the business processes that are related to products, product families, bills of materials, and product categories. Inventory reports show you in a variety of ways how much inventory you have and explain how to be more effective in your inventory investments. Master planning helps you streamline your planning based on predetermined factors, so you can efficiently plan what materials need to be purchased, transferred, or manufactured.</p>	<p>Free, self-paced online learning path</p>	<p>14 hours</p>
<p>Configure and manage procurement and vendors in Dynamics 365 Supply Chain Management</p>	<p>The process of finding and working with vendors, purchasing products, and ensuring the quality of goods and services are all important factors that impact a company's reputation and success.</p>	<p>Free, self-paced online learning path</p>	<p>14 hours</p>
<p>Configure and manage sales, and customers in Dynamics 365 Supply Chain Management</p>	<p>The process of working with customers, understanding the life cycle of the sales process, and setting up sales agreements are all important factors that impact a company's success.</p>	<p>Free, self-paced online learning path</p>	<p>7 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Master planning in Dynamics 365 Supply Chain Management	<p>Master planning allows companies to identify and balance the raw materials and capacity required to meet their future goals. Master planning assesses which raw materials and capacities are currently available, and which raw materials and capacities are required to complete production. For example, it identifies what must be manufactured, purchased, transferred, or set aside as safety stock before you can complete production.</p>	<p>Free, self-paced online learning path</p>	<p>5 hours</p>
Configure and work with warehouse management in Dynamics 365 for Finance and Operations	<p>Warehouse management in Dynamics 365 Supply Chain Management helps optimize and streamline warehouse processes according to your individual needs and provides the insight into your inventory and the tools to help increase customer satisfaction and reduce costs.</p>	<p>Free, self-paced online learning path</p>	<p>8.5 hours</p>
Configure and work with transportation management in Dynamics 365 Supply Chain Management	<p>The Transportation management module in Dynamics 365 Supply Chain Management helps you find the most efficient way to deliver goods to your customers. Transportation management calculates the least expensive and fastest way of delivering goods and lets you identify vendor and routing solutions for inbound and outbound orders.</p>	<p>Free, self-paced online learning path</p>	<p>3 hours</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Warehousing Mobile App (VIR816PAL)	This Tech Talk will discuss the Advanced Warehousing system in Dynamics 365 for Operations and what the future holds for the advanced warehousing mobile interface. We will examine the new mobile application that has been released and how it compares to the legacy WMDP. We will learn what is required to install, configure, and operate this mobile application and how it can be used to benefit your implementations.	Free recording of a web conference	54 minutes
Vendor Collaboration (DYN327PAL)	This Tech Talk will provide a walk through on the Vendor Collaboration feature including the Consumption of Response from Vendor feature that is included in the July (spring) release.	Free recording of a web conference	58 minutes
Item And Warehouse Migration Process To Use Advanced Warehouse Management (DYN316PAL)	In this Tech Talk, we will teach you how to migrate existing warehouse setup and items with open transactions to the advanced warehouse management, by using the new capabilities to change the storage dimension group for items and enable warehouses to use the advanced warehouse management processes.	Free recording of a web conference	54 minutes
Supply chain management home page	This topic provides a list of the help topics and other resources for the supply chain management features in Microsoft Dynamics 365 for Finance and Operations.	Documentation	
Demand Replenishment for Raw Material Picking (DYN333PAL2)	This TechTalk will cover raw material picking and demand replenishment for raw material picking.	Free recording of a web conference	38 minutes
Course MB-330T01-A: Configure and use supply chain management in Dynamics 365 for Finance and Operations	This course discusses how to configure and use supply chain management in Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	2 days

CONTENT	DESCRIPTION	FORMAT	LENGTH
Course MB-330T02-A: Use quality management, intercompany trading and master planning in Dynamics 365 for Finance and Operations	This course discusses how to use quality management, intercompany trading and master planning in Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Course MB-330T03-A: Configure and use warehouse, and transportation management in Dynamics 365 for Finance and Operations	This course discusses how to configure and use warehouse and transportation management in Dynamics 365 for Finance and Operations.	Instructor-led in person or online training, cost varies by region and partner	1 day
Configure Asset Management for Dynamics 365 Supply Chain Management	Asset Management is an add-in for Dynamics 365 Supply Chain Management, that is used to manage assets that are used in the daily operation of your company. Some examples of these types of assets are machinery, production equipment, and fork lifts.	Free, self-paced online learning path	7 hours
Work with Asset Management for Dynamics 365 Supply Chain Management	Asset Management is an add-in to Dynamics 365 Supply Chain Management, that is used to manage assets that are used in the daily operation of your company. Some examples of these types of assets are machinery, production equipment, and fork lifts.	Free, self-paced online learning path	12.5 hours
Microsoft Certified: Dynamics 365 for Finance and Operations, Supply Chain Management Functional Consultant Associate	Microsoft Certified: Dynamics 365 for Finance and Operations, Supply Chain Management Functional Consultants streamline cost accounting, inventory management, master planning, and warehouse management for their clients. Exams

CONTENT	DESCRIPTION	FORMAT
---------	-------------	--------

CONTENT	DESCRIPTION	FORMAT
Exam MB-300: Microsoft Dynamics 365 Unified Operations Core	This exam measures your ability to accomplish the following technical tasks: use common functionality and implementation tools; configure security, processes, and options; perform data migration; and validate and support the solution.	Exam, cost varies by region
Exam MB-330: Microsoft Dynamics 365 for Finance and Operations, Supply Chain Management	This exam measures your ability to accomplish the following technical tasks: implement product information management; implement inventory management; implement and manage supply chain processes; and implement warehouse management and transportation management and perform business processes.	Exam, cost varies by region
Exam MB-320: Microsoft Dynamics 365 for Finance and Operations, Manufacturing	This exam measures your ability to accomplish the following technical tasks: set up and configure manufacturing; create and manage production and lean orders; and create, process, and manage production batch orders.	Exam, cost varies by region

Learning catalog for Dynamics 365 Supply Chain Management solution architects

2/18/2021 • 12 minutes to read • [Edit Online](#)

NOTE

Effective November 2020:

- Common Data Service has been renamed to Microsoft Dataverse. For more information, see [Power Automate Blog](#).
- Some terminology in Microsoft Dataverse has been updated. For example, *entity* is now *table* and *field* is now *column*. For more information, see [Terminology updates](#).

This topic will be updated soon to reflect the latest terminology.

Do you design solutions that meet your customers' needs and budgets?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know, so that you can choose the training format that best meets your needs.

Get started

CONTENT	DESCRIPTION	FORMAT	LENGTH
Dynamics FastTrack Architect Bootcamp	The Dynamics FastTrack Architect Bootcamps are EXCLUSIVELY for solution integrator partners commencing customer implementations that are governed by the Microsoft Dynamics 365 FastTrack customer success program. The FREE intensive Bootcamps are SPECIFICALLY for solution integrator partner architects assigned to FastTrack engagements and are led by senior architects from the Dynamics 365 engineering team.	Free instructor-led in-person training. Qualifications apply.	5 days

CONTENT	DESCRIPTION	FORMAT	LENGTH
Becoming a Solution Architect for Dynamics 365 and Power Platform	A Solution Architect is responsible for the successful design, implementation, deployment, and adoption of an overall solution. A Solution Architect ensures that the solution meets the customer's needs now and in the future. While the Solution Architect may not "click the buttons" during a deployment, they are ultimately responsible for the solution and work closely with the deployment team.	Free, self-paced online learning path	4 hours

Core platform knowledge

CONTENT	DESCRIPTION	FORMAT	LENGTH
Implement Finance and Operations apps	Learn the most important elements and the best practices to manage a successful Finance and Operations implementation project. From the first step where you are planning and designing your project methodology, the use of FastTrack services, the development strategy, data management and more, to the best ways for maintaining and monitoring your operations after Go-live.	Free, self-paced online learning path	11.5 hours
Go-live Planning (DYN458PAL2)	We will discuss the go-live process in detail, and how best to prepare for it, in order to make it as smooth as possible for the customer, partner, and Microsoft.	Free recording of a web conference	60 minutes
Environment Planning (DYN450PAL2)	Join us for this tech talk on Environment Planning. Learn about the standard environments, what other environments you might need, the options and timing for acquiring and deploying them, and the expected code and data flows between environments.	Free recording of a web conference	53 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Demo Data Packages (DYN443PAL)	Join us for this tech talk on the recently released demo data packages. You can use them to customize the demo data you need for your scenarios, and then load just what you need into an environment.	Free recording of a web conference	40 minutes
On-Premises (Local Business Data) Deployment (DYN382PAL2)	Join this tech talk for an overview of the on-premises deployment option for Dynamics 365 for Finance and Operations, Enterprise Edition. In this session, we will look at the solution architecture of an on-premises deployment, ALM aspects, system requirements, and how to provision the Life Cycle Services project.	Free recording of a web conference	48 minutes
Reduce Data Import and Export Time Using Configurations (DYN315PAL)	In this Tech Talk, we will discuss the new configuration feature in Dynamics 365 for Finance and Operations, Enterprise edition. We will show how you can set up configurations using predefined templates, copy configuration data from a legal entity to a data project and export it, and then import it into another legal entity.	Free recording of a web conference	52 minutes
Reporting Options in Dynamics 365 for Operations (VIR810PAL)	This session will discuss various printing scenarios in D365 for Operations, including tips and tricks for Document Routing Agent.	Free recording of a web conference	60 minutes
Analytics & Reporting Options: Printing and the Document Routing Agent	Join us for this tech talk on two related topics. First we will discuss Analytics and Reporting solution patterns and tools for Dynamics 365 for Finance and Operations, Enterprise Edition. Secondly, we will discuss printing scenarios and the Document Routing Agent.	Free recording of a web conference	45 minutes

Core development concepts

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Acceptance Test Library (DYN650PAL2)	<p>Microsoft recently made the Acceptance Test Library (ATL) publicly available. ATL is a library of around 5,000 classes that helps you author readable, performant, quality X++ tests and consistent test data, while hiding the complexity of setting up prerequisites. These are the same classes Microsoft uses internally for testing. The ATL framework's fluent API facilitates the Test Driven Development and Specification By Example software engineering approaches. Join us for this Tech Talk to learn more about it.</p>	<p>Free recording of a web conference</p>	<p>61 minutes</p>
Finance and Operations: Extending Dynamics 365 for Finance and Operations with PowerApps (DYN558PAL2)	<p>Tech Talk that discusses in detail and demonstrates extending talent applications using Microsoft PowerApps and Flow.</p>	<p>Free recording of a web conference</p>	<p>43 minutes</p>
Data Management (DYN757PAL2)	<p>Join us for this TechTalk on Data Management. Learn about the options available and the scenarios for which they are recommended. We will cover the Data Management framework, templates, database copying, cross-company data sharing, and performance considerations.</p>	<p>Free recording of a web conference</p>	<p>58 minutes</p>
Azure Integration Tools for Dynamics 365 for Finance and Operations (DYN386PAL)	<p>This TechTalk will cover the types of tools one might consider while integrating with Dynamics 365 for Finance & Operations and when to choose which integration tool. The session will also walk through some of integration scenarios orchestrated using Azure integration services.</p>	<p>Free recording of a web conference</p>	<p>63 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Extensibility (DYN384PAL2)	<p>This session will provide an overview of the extensibility plans Microsoft has announced and the recommended path forward for partners and customers who have overlaid code. We will discuss the various methods of extending a solution, looking deep into the metadata extensibility features as well as the ability to augment and extend code. The powerful new Chain of Command feature will be demonstrated, and we will show how many extensibility features are unblocked by this technology.</p>	<p>Free recording of a web conference</p>	<p>55 minutes</p>
Integration Frameworks within Dynamics 365 for Finance & Operations (DYN385PAL)	<p>This session will provide an overview of the integration frameworks within Dynamics 365 for Finance & Operations and discuss the consideration under which these frameworks could be used.</p>	<p>Free recording of a web conference</p>	<p>64 minutes</p>
Integration Between Dynamics 365 for Sales and Dynamics 365 for Finance & Operations via Dataverse (DYN340PAL)	<p>In this Tech talk we will introduce the integration scenario known as Prospect to cash, with sales and marketing activities in Dynamics 365 for Sales and fulfillment in Dynamics 365 for Finance and Operations. We will also take a look at the Data integrator and how to modify the integration.</p>	<p>Free recording of a web conference</p>	<p>54 minutes</p>
Mobile Framework (VIR824PAL)	<p>This tech talk will walk through the mobile framework capabilities for building apps in Dynamics 365 for Operations. The session will also demonstrate some recently built apps.</p>	<p>Free recording of a web conference</p>	<p>58 minutes</p>
Integration (VIR806PAL)	<p>This Tech Talk will discuss different integration options for Dynamics 365 for Operations including code samples and demonstrations.</p>	<p>Free recording of a web conference</p>	<p>58 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Visual Studio Team Services (VSTS) Setup (VIR782PAL)	This Tech Talk will walk through the necessary steps to configure a VSTS instance and project to connect to LCS implementation project for Dev/Test environment configuration.	Free recording of a web conference	41 minutes

Migration and upgrade

CONTENT	DESCRIPTION	FORMAT	LENGTH
Updates and upgrades for Finance and Operations apps	The world of enterprise resource planning (ERP) is continuously evolving and helping customers scale up in productivity and streamline their operations. The evolution of Finance and Operations encourages customers to upgrade their previous Microsoft Dynamics AX versions to the Finance and Operations cloud service.	Free, self-paced online learning module	1 hour
Finance and Operations: Upgrading from 7.x to 8+ (DYN519PAL2)	Join us for our next TechTalk, during which we will cover the 7.X to 8.X upgrade process. We will discuss various scenarios and steps to execute for code upgrade and data upgrade. We will also cover extensibility request scenarios and how to raise them where appropriate. Part 1 of 2.	Free recording of a web conference	61 minutes
How to upgrade to 7.2 (July 2017) from 7.0 (RTW)/7.1 (Release 1611) (DYN338PAL2)	In this session, we will explain how to upgrade from Dynamics 365 Finance and Operations application v7.0 (RTW) and v7.1 (1611) to v7.2 (July 2017). We make a clear differentiation between Live customers and ongoing projects (not live yet).	Free recording of a web conference	44 minutes
AX2012 to Dynamics 365 for Operations Upgrade (VIR817PAL2)	This Tech Talk will provide an overview on how to upgrade code and data from Dynamics AX 2012 to Dynamics 365 for Operations.	Free recording of a web conference	45 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
AX2009 Migration Tool	This Tech Talk will cover the installation, configuration, estimation, migration methodology, and customization aspects of AX2009 Data Migration Tool.	Free recording of a web conference	57 minutes

Servicing

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Servicing, Supporting and Maintaining Production (DYN651PAL2)	Tech Talk on how to efficiently support, maintain, and service your Dynamics 365 for Finance and Operations production environment	Free recording of a web conference	53 minutes
Finance and Operations: Feature Management (DYN641PAL2)	Tech Talk on the Feature management experience. It provides a workspace where you can view, enable, disable, and schedule features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them. Attend this meeting to see what is delivered in 10.0.3 and our plans for future releases.	Free recording of a web conference	47 minutes
Finance And Operations: Microsoft Managed Continuous Updates (DYN610PAL)	The Continuous Update cadence for Finance and Operations has started! Join us during this hour to discuss Microsoft Managed Continuous updates, the user experience already available in Lifecycle Services, and forthcoming updates.	Free recording of a web conference	61 minutes
Finance And Operations: Microsoft Managed Continuous Updates: What's new - November 1, 2018 (DYN533cust)	During this hour, we will discuss updates to the Microsoft Managed Continuous update cadence as well as take a look at the user experience in Lifecycle Services.	Free recording of a web conference	59 minutes

CONTENT	DESCRIPTION	FORMAT	LENGTH
Microsoft Managed Continuous Updates: What's new (DYN543PAL2)	During this hour, we will explain what is new since our initial announcements about Microsoft Managed Continuous updates. We will discuss the cadence of updates, how we have responded to your valuable feedback on the process, and take a look at the forthcoming Lifecycle Services user experience, through which you will be able to manage your updates.	Free recording of a web conference	56 minutes
Microsoft Managed Continuous Updates (DYN474PAL2)	We will discuss Microsoft's plans for keeping your system up to date with the latest release. We will cover timelines, the cadence for major and minor updates, the planned procedures, the implications, and what you should do for optimal results.	Free recording of a web conference	62 minutes
Monitoring, Optimization Advisor & Critical KBs (DYN456PAL2)	We will discuss monitoring capabilities and what Microsoft monitors for you in your production environment, the optimization advisor and how it can be extended, the "Critical X++ updates" experience in LCS, and best practices for the "Report production outage" option in LCS.	Free recording of a web conference	40 minutes
Microsoft Managed Continuous Updates (DYN474PAL2)	This Tech Talk will provide a walk-through on punch out functionality and will cover the setup of an external catalog via purchase requisition scenario.	Free recording of a web conference	42 minutes

Testing

CONTENT	DESCRIPTION	FORMAT	LENGTH
---------	-------------	--------	--------

CONTENT	DESCRIPTION	FORMAT	LENGTH
Microsoft Managed Continuous Updates (DYN474PAL2)	<p>After all customer requirements have been handled by either configuration, customization, and integration, you need to know how to perform user acceptance testing (UAT) in Finance and Operations apps to validate the solution. User acceptance testing is an important step in the go-live preparation.</p>	<p>Free, self-paced online learning module</p>	<p>1 hour</p>
Finance and Operations: Regression Suite Automation Tool - Background & Setup (DYN646PAL)	<p>This is the first of a two-part series on Regression Suite Automation Testing (RSAT). In this session, we will cover how to keep pace with continuous updates using automated testing via RSAT. Learnings and recommendations on creating task recordings and executing tests using RSAT will be covered, along with a step-by-step walkthrough of the installation and setup.</p>	<p>Free recording of a web conference</p>	<p>70 minutes</p>
Finance and Operations: Regression Suite Automation Tool - Testing Lifecycle Demo (DYN647PAL)	<p>This is the second of a two-part series on Regression Suite Automation Testing (RSAT). This session will cover a demo of the whole cycle of creating and saving task recordings from Finance and Operations to the BPM library in LCS, synchronizing the BPM library to create test cases in Azure DevOps, grouping the test cases into test suites, and loading and executing the test suites in RSAT.</p>	<p>Free recording of a web conference</p>	<p>70 minutes</p>
Finance and Operations: Performance Benchmark for Dynamics 365 (DYN550PAL2)	<p>In this Tech Talk, we will describe an approach for preparing and delivering a performance benchmark on Microsoft Dynamics 365 for Finance and Operations. We will present the process, main concepts, and tools before illustrating a simple case with a demonstration.</p>	<p>Free recording of a web conference</p>	<p>68 minutes</p>

CONTENT	DESCRIPTION	FORMAT	LENGTH
Finance and Operations: Performance Key Patterns and Anti-patterns for Dynamics 365 (DYN549PAL)	In this Tech Talk, we will present efficient performance patterns that we have seen project teams implement successfully. We will also describe anti-patterns that can lead to serious performance degradation of the Microsoft Dynamics 365 for Finance and Operations environment.	Free recording of a web conference	58 minutes
Regression Suite Automation Tool (DYN480PAL)	We will discuss the Regression Suite Automation Tool. It significantly reduces the time and cost of user acceptance testing, when taking a Microsoft update, or before applying custom code and configurations to your Dynamics 365 for Finance and Operations production environment. It enables functional power users to record business tasks, using the Finance and Operations task recorder, and convert them into a suite of automated tests, without the need to write source code.	Free recording of a web conference	61 minutes
Performance Testing Approach (DYN449PAL2)	Join us for this tech talk on how to approach Performance Testing. Learn about the fundamentals, best practices for testing, available tools, and techniques for executing tests and measuring performance, and how to use the results for optimization.	Free recording of a web conference	45 minutes

Exam

CONTENT	DESCRIPTION	FORMAT
Exam MB-700: Microsoft Dynamics 365: Finance and Operations Apps Solution Architect	This exam measures your ability to accomplish the following technical tasks: identify solution requirements; design solution components; and define solution testing and management strategies.	Exam, cost varies by region

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

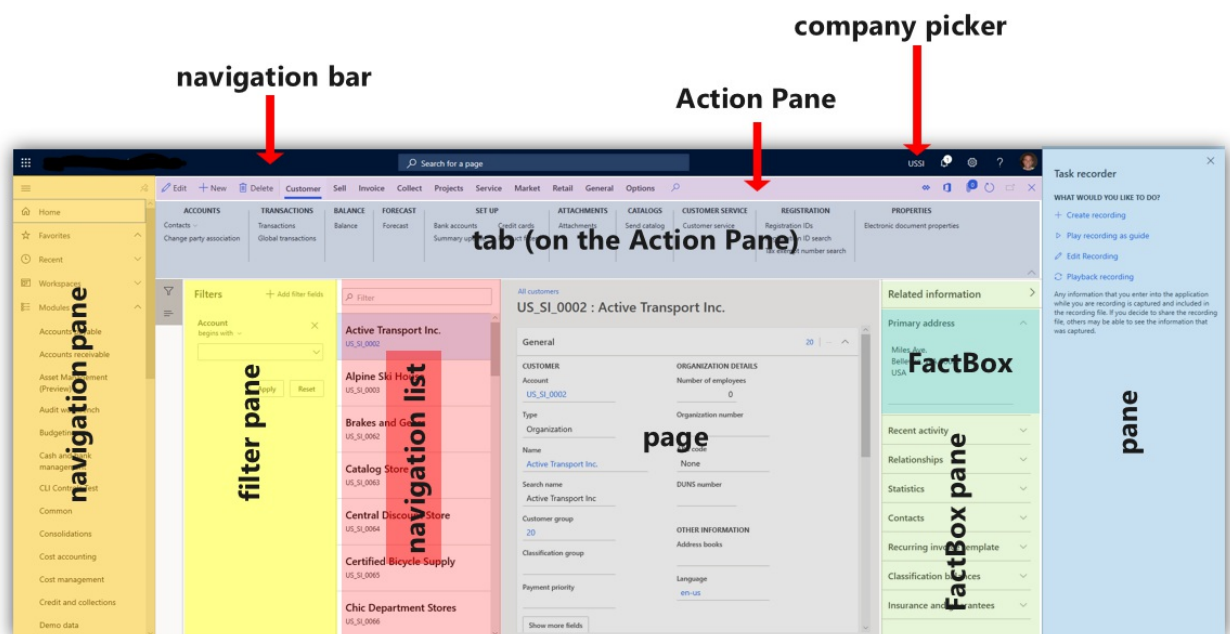

User interface elements

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes the user interface (UI) elements used in the app. Before users can navigate the interface, it's important to know the names and functions of the elements that make up the interface.

Overview

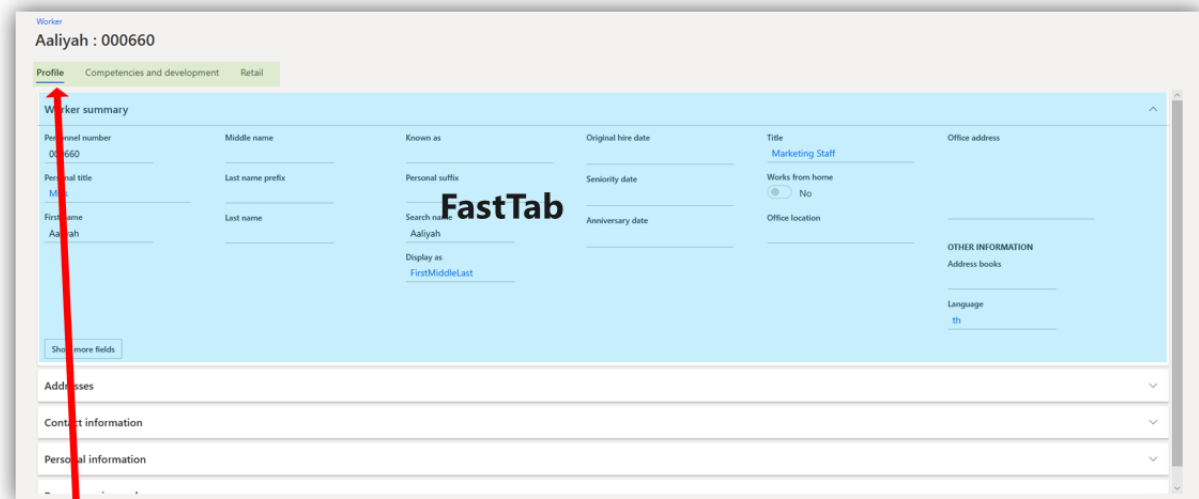

- **Action Pane** - The bar beneath the navigation bar. Here, you can select tabs to change records shown in the page. You can edit and save the records here.
- **FactBox** - You can see information and follow the activities of certain records in this pane.
- **FactBox pane** Here, you can scroll through different aspects of a record to view in the FactBox.
- **Filter pane** - On some pages, you can select **Show filters** to open this pane. It allows you to narrow the results visible to you on the page.
- **Navigation bar** - The bar at the top of the interface. It contains the **Dynamics 365 portal**, **Search**, **company picker**, **Action center**, **Settings**, **Help & Support**, and the user profile.
- **Navigation list** - On some pages, you can scroll through this pane to find a specific record. When selected, the details of the record will appear in the page.
- **Navigation pane** - The left-most pane. From here, you can find any page in the product.
- **Page** - The central focus of the interface. Selections made on the other UI components will affect what records are shown here.
- **Pane** - The right-most pane. This will open in some cases when aspects of a record need to be changed and saved.
- **Tab** - When referring to the Action Pane, it's a menu of options that appears when you select a given option in the Action Pane.

Tabs, fields, and sections

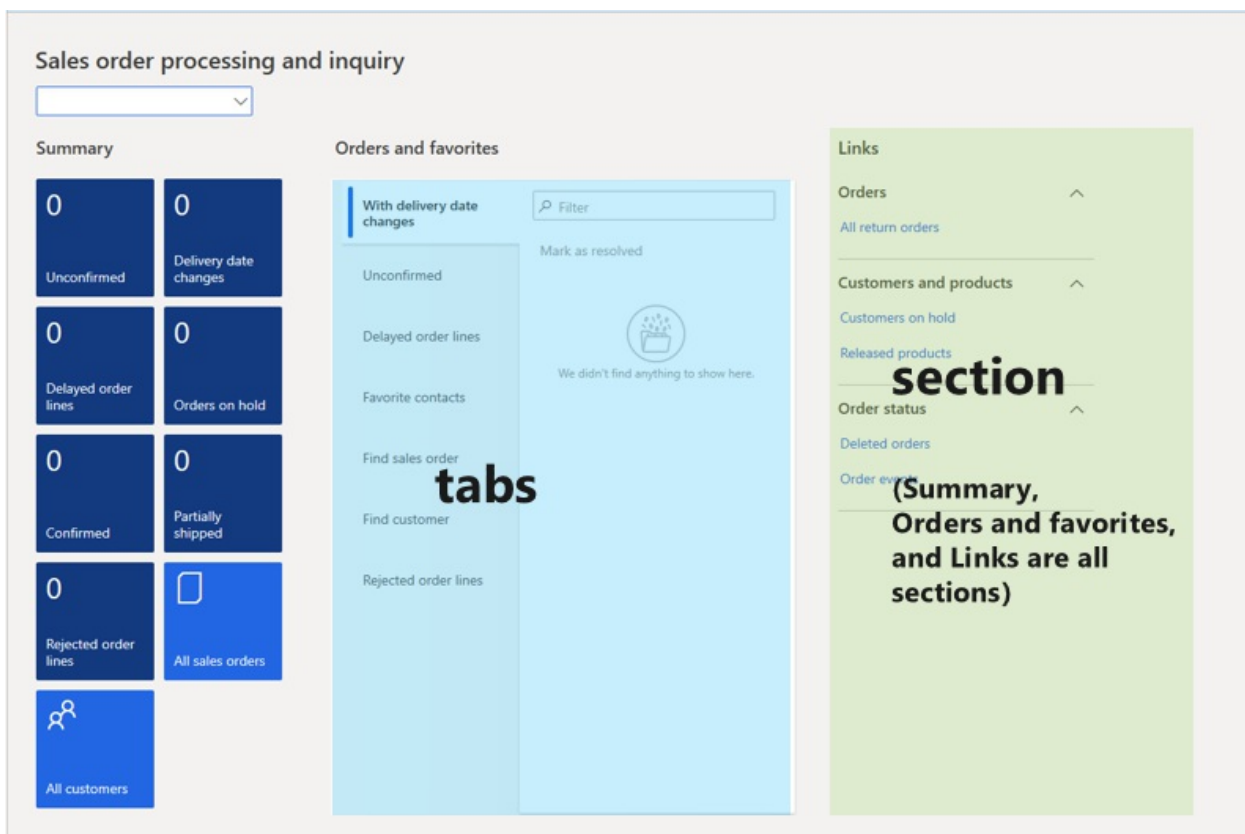

A *tab* is a selection made on the page that opens a different aspect of a record on the same page. Often, it will allow you to change certain *fields*, or UI elements that allow typed input.

A *FastTab* is a tab with the added benefit of allowing multiple tabs to be visible at the same. You can expand a FastTab by selecting the downward-pointing arrow on the right end of it.

tabs

A *section* is similar to a tab. The word "section" is often used to describe any area of a page that organizes a specific category of information. In the following image, Summary, Orders and favorites, and Links are all examples of sections.

Dialog boxes and drop-down menus

A *dialog box* is a pane that opens when certain selections are made to change or create a record. Dialog boxes contain fields that allow you to enter typed input. Sometimes, a given field will allow you to select a downward facing arrow that opens a list of options to choose from. This is called a *drop-down menu*. In the following image, the **Type** and **Customer group** fields contain the option to open a drop-down menu.

In some cases, a dialog box will open near a given button when you select it. This is called a *drop-down dialog box*. In the following image, the **As of date** button was selected, which opened a drop-down dialog box.

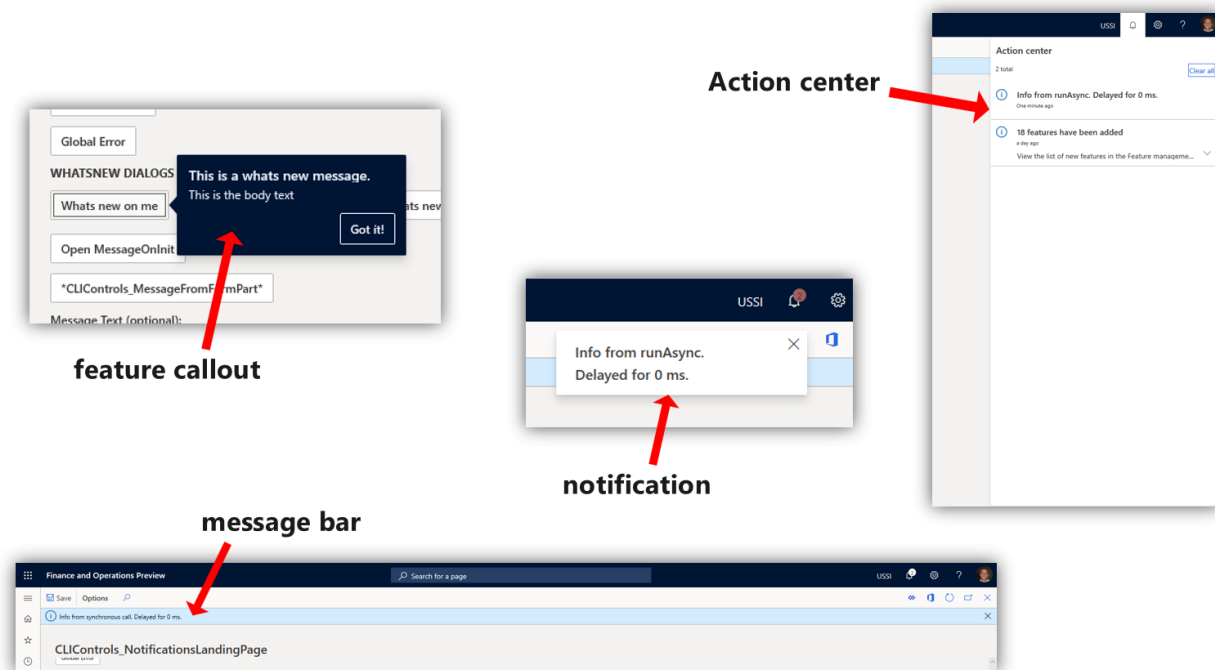

Notifications

Certain changes to the objects you oversee will appear as *notifications*. Notifications may notify you when a specific customer's information has been changed, or it may alert you when the system can't accept inputs you've added in certain fields. You can learn how to customize what you receive notifications about in the [Alerts overview](#).

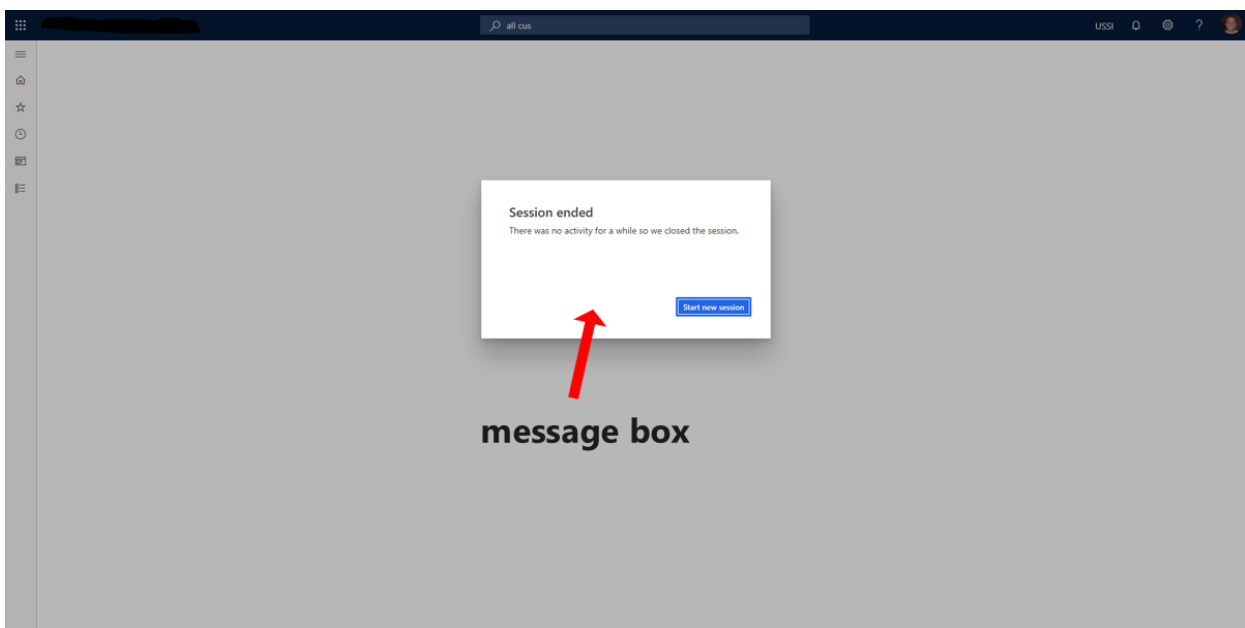

Notifications appear in a variety of ways.

- **Feature callout** - This will appear next to a field, tab, or other button to offer an explanation of what the feature is used for.
- **Action center** - A box that contains the notification will appear next to the Action center button on the navigation bar. You can see details about the notification by selecting **Action center**.
- **Message bar** - This will appear beneath the Action Pane.

The following image shows examples of these types of notifications.

- **Message box** - This will appear over the interface and must be interacted with before you can continue to use the product.

Toolbars, grids, and lists

A *toolbar* contains tools, such as the ability to add fields or remove records. Sometimes, a toolbar will appear on the page above a *grid*. This area, *grid*, is a name given to rows of records with various columns of data. Not all grids have toolbars above them.

A *list* is the name given to a collection of records that you can scroll through. You can bring these records into the page by selecting them. Often, this will open a grid.

toolbar

The screenshot displays the Dynamics 365 Finance and Operations Preview interface. At the top, there is a navigation bar with various menu items like 'Edit', 'New', 'Delete', 'Sales order', 'Sell', 'Manage', 'Pick and pack', 'Invoice', 'Retail', 'General', 'Warehouse', 'Transportation', and 'Options'. Below this is a secondary navigation bar with categories such as 'NEW', 'MAINTAIN', 'PAYMENTS', 'COPY', 'VIEW', 'FUNCTIONS', 'ATTACHMENTS', and 'EMAIL NOTIFICATION'. The main content area shows a sales order for '000768 : Contoso Retail San Diego'. On the left, there is a list of other sales orders, with the word 'list' overlaid on it. The central part of the screen features a table of sales order lines with columns for 'Item number', 'Product name', 'Sales category', 'Quantity', 'Unit', and 'Delivery type'. The word 'grid' is overlaid on this table. At the bottom, there is a section for 'Line details'. A red arrow points from the word 'toolbar' above to the top navigation bar.

T.	Variant number	Item number	Product name	Sales category	CW quantity	CW unit	Quantity	Unit	Delivery type
		T0001	SpeakerCable / Speaker cable 10	Accessories			-58.00	ea	Stock
		T0004	TelevisionMT2037 / Television ...	Television			-58.00	ea	Stock
		T0002	ProjectorTelevision	Television			-35.00	ea	Stock
		T0005	TelevisionHDTVXS9052 / Televis...	Television			-23.00	ea	Stock
		T0003	SurroundSoundReceive	Receivers			-35.00	ea	Stock

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Accessibility features

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the functionality that is designed to help users who have various disabilities use this app. For example, there are features for people who use sight-assistive technologies such as Microsoft Windows Narrator.

Windows Narrator and keyboard-only access

Every field and control has a label and a description of applicable shortcuts. A screen reader can read the label and description.

Shortcuts for the most frequently performed actions

For most users, everyday system use involves lots of data entry and keyboard interaction. To enhance the user experience, we have created shortcuts to help you "jump" around the screen and shortcuts for specialized actions. For more information, see [Keyboard shortcuts](#).

Navigation search

Any page that is accessed by using the Navigation pane menu, the left-most pane, is also available from the Search box. Press Alt+G to move focus to the Search box, and then type the name or description of the page.

For more information, see [Navigation search](#).

NOTE

You can navigate directly to top-level pages only. Secondary pages rely on information or context from their parent page.

Action search for keyboard-only users or for heads-down data entry

Every action that is provided on a page can be accessed from a keyboard, via the tab sequence. Information about the tab sequence is provided later in this topic. To run actions more directly, you can use the action search functionality.

Example

You want to run the **Email notification log** action that appears in the **Email notification** group on the **Sales order** tab on the Action Pane.

One option is to use your keyboard. Press Ctrl+F6 to move focus to the Action Pane, and then press Tab repeatedly to move through all the tabs and actions, until the **Email notification log** action has focus.

However, you can also run the action more directly. From anywhere on the page, press Ctrl+Apostrophe (') to show the search box for actions.

In the search box, type words that describe the action. The action is made available to you, and you can run it directly. For example, by typing **email**, **notific** (a partial word), or **log**, you can "jump" to the Email notification log functionality.

When you've finished, you can press Ctrl+Apostrophe again to return focus to the field that you were working with before you ran the action search.

For more information, see [Action search](#).

Tab sequence

In everyday system use, not every field is required in order to perform typical tasks. Therefore, by default, the tab sequence is "optimized." Tab stops are set only on those fields that are essential for typical scenarios.

However, you might find that some fields that you often use to perform tasks aren't included in the default tab sequence. In this case, if you use Windows Narrator, you can use Windows Narrator's keyboard actions to access those fields and inspect their content. Alternatively, you can turn on the **Enhanced tab sequence** option on the **Options** page. This option makes all editable and read-only fields part of the tab sequence. You can then use page personalization to create a custom tab sequence and omit fields that don't have to be part of the tab sequence. For more information about personalization, see [Personalize the user experience](#).

Accessibility

Enhanced tab sequence
Yes

Form patterns

Almost 90 percent of the pages in the app are based on a small set of patterns. These patterns are referred to as *form patterns*. Each form pattern is used to provide the actions that are most often performed on the page. A form pattern helps guarantee familiarity and ease of understanding, because frequently used actions and data are always presented in the same location on different pages. Because of the small number of form patterns, users can easily learn the system, regardless of the number of pages in it, and can confidently use it after they recognize the form patterns.

To learn more about form patterns, see [Form styles and patterns](#).

Responsive layout

The product is designed to work on various devices and form factors, from the smallest screens to large screens that have the highest resolution. Our responsive layout engine lets users zoom in to a magnification level of 200 percent (or, in some scenarios, more than 200 percent).

On smartphones and other small screens, the controls and the form layout will responsively adapt to ensure that the core data is favored. These responsive behaviors can also include reducing the number of columns in groups and tabs to a single column, hiding shell elements, and collapsing the Action Pane.

Guidance to help developers and customers incorporate accessible thinking in their customizations

To learn more about Microsoft best practices for enabling accessibility, see [Accessibility in forms, products, and controls](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Feature management overview

2/18/2021 • 13 minutes to read • [Edit Online](#)

Features are added and updated in every release. The Feature management experience provides a workspace where you can view a list of features that have been delivered in each release. By default, new features are turned off. You can use the workspace to turn them on and view the documentation for them.

The Feature management workspace

You can open the **Feature management** workspace by selecting the appropriate tile on the dashboard. You will see a page that shows a list of features for all releases that are supported by the Feature management experience. Over time, Microsoft will enhance the Feature management experience so that it includes more functionality to help you manage features.

The feature list includes the following information:

- **Feature name** – A description of the feature that was added.
- **Enabled status** – A symbol indicates whether a feature has been turned on (check mark), hasn't been turned on (blank), is scheduled to be turned on (clock), is mandatorily turned on (lock), requires attention before you turn it on (warning), or can't be enabled (X). The setting that is shown is used for all legal entities. Note that even when a feature has been turned on, it's still controlled by security. Therefore, the feature will be available only to users who have access to it, based on their security role. It will also be available only in legal entities that the user has access to.
- **Enable date** – The date when the feature was turned on or is scheduled to be turned on.
- **Feature added** – The date when the feature was added to your environment. This date is automatically entered when you update your environment during the monthly release cycles.
- **Module** – The module that is affected by the new feature.

When you select a feature, more information appears in the details pane to the right of the feature list. At the top of the pane, you will see the feature name, the date when the feature was added, the module that is affected by the feature, and a **Learn more** link. Select this link to view the documentation for the feature. If documentation isn't available, you're taken to a temporary page. The details pane also includes a **Comments** field where you can add your own comments about the feature.

The **Feature management** workspace also has several tabs, each of which shows a list of features.

- **New** – This tab shows all features that have been added since the last monthly update. If you've skipped any monthly updates, the tab shows all the new features that have been added since the last time that you updated. The newest features appear at the top of the list. The total number of new features is also shown on a tile at the top of the page.
- **Not enabled** – This tab shows all features that haven't been turned on. The newest features appear at the top of the list. The total number of new features that haven't been turned on is also shown on a tile at the top of the page.
- **Scheduled** – This tab shows all features that have been scheduled to be turned on in the future. The features that have the earliest scheduled date appear at the top of the list. The total number of schedule new features is also shown on a tile at the top of the page.
- **All** – This tab shows all features. The newest features appear at the top of the list.

Turn on a feature

If a feature hasn't been turned on, an **Enable Now** button appears in the details pane. You can use this button to

turn on the feature.

- Select the feature to turn on, and then, in the details pane, select **Enable Now**. The feature is turned on.

Some features can't be turned off after you turn them on. If the feature that you're trying to turn on can't be turned off, you receive a warning. At that point, you can select **Cancel** to cancel the operation and leave the feature turned off. However, if you select **Enable** to turn on the feature, you won't be able to turn it off later.

Some features will display a message that provides additional information before you turn them on. These features are indicated by a yellow warning symbol. You should read the additional information carefully to better understand what will happen when the feature is enabled. However, you can still select **Enable** to turn on the feature.

Some features will display a message that the feature can't be enabled until an action is taken. These features are indicated by a red X symbol. You must take the actions described in the description before the feature is enabled. For example, if you can't use a feature until a configuration key is disabled, then you must disable the configuration key first and then return to Feature management to enable the feature.

After a feature is turned on, a message appears below the **Learn more** link in the details pane. This message either states that the feature was turned on or it indicates that the future date when the feature is scheduled to be turned on. It appears every time that you select the feature in the feature list.

Features that are scheduled to be turned on in the future appear on the **Scheduled** tab. A batch process will turn them on at midnight on the specified date, based on the time zone that is represented by the system date.

Reschedule a feature

If a feature has been scheduled to be turned on in the future, a **Schedule** button appears in the details pane. You can use this button to change the **Enable date** value to a different date.

1. Select the scheduled feature to reschedule, and then, in the details pane, select **Schedule**.
2. In the dialog box that appears, in the **Enable date** field, specify the new date when the feature should be turned on.
3. Select **Enable** to reschedule the feature or **Disable** to cancel the schedule.

Turn off a feature

If a feature has already been turned on, a **Disable** button appears in the details pane. You can use this button to turn off the feature. The **Disable** button isn't available if the feature can't be turned off after it's turned on.

- Select the feature to turn off, and then, in the details pane, select **Disable**. The feature is turned off, and the **Enable date** field is cleared.

After a feature is turned off, a message appears below the **Learn more** link in the details pane. This message states that the feature hasn't yet been turned on. It appears every time that you select the feature in the feature list. Features that haven't been turned on appear on the **Not enabled** tab.

Features that must be turned on

Sometimes, a critical feature is delivered that must be turned on automatically when you do an update. These features will be turned on automatically on the date that is specified in the **Enable date** field. For these features, a message appears below the **Learn more** link in the details pane. This message either states that the feature was turned on or indicates the future date when the feature will be turned on. It appears every time that you select the feature in the feature list.

Enable all features

By default, all features that are added to your environment are turned off. You can enable all features by

selecting the **Enable all** button.

When you select **Enable all**, an option will appear where you need provide the following information:

- A list of all features that require confirmation before they can be enabled. If you want to enable the features in the list, select **Yes** for the **Enable features requiring confirmation** button.
- A list of all features that can't be enabled will be shown. Those features will not be enabled.

All features that can be enabled will be enabled. If a feature is already scheduled to be enabled in the future, the schedule will not change.

Turn on all features automatically

By default, all features that are added to your environment are turned off, unless they are mandatory features. However, if you want to automatically turn on all new features, you can use the drop-down list under the workspace title to change what occurs when new features are added.

- Select `Enable new features automatically` to automatically turn on all new features when they are added to your environment.
- Select `Do not enable new features automatically` to default all new features to off when they are added to your environment.

When you enable all feature automatically, it will enable all of the features that would be enabled when you click the **Enable all** button. It will not enable the features that require confirmation or the features that can't be enabled until an action is taken.

Check for updates

Features are added to your environment after each update. However, you can manually check for updates by clicking on the **Check for updates** button. Any feature that was added to the system after the update will be added to the list of features. For example, if a flighted feature is enabled after a release, then you can check for updates and the feature will be added to your list.

Assigning roles

The **Feature management** workspace can be opened by system admins, and also by users who are assigned to the Feature manager role or the Feature viewer role. These two roles were created to support the Feature management experience. Users in the Feature manager role can turn any feature on or off. They can also update the **Comments** field for the feature. Users in the Feature viewer role can only view the **Feature management** workspace. They can't turn features on or off.

The Feature manager role and Feature viewer role don't override the existing security that a user has. They just control whether the user can turn features on and off. They don't provide access to the features themselves.

Features that use configuration keys

If a feature uses a configuration key, but the configuration key isn't turned on, the **Feature management** workspace doesn't show the feature in the list of available features. After you turn on the configuration key, you must update the feature list by using the **Check for update** menu item. The feature then appears in the feature list.

If you turn off the configuration key, the feature isn't removed from the feature list.

Data entities

A data entity that is named **Feature management** lets you export the Feature management settings from one environment and then import them into another environment. This entity updates only existing features. The

business logic in the entity also helps guarantee that the same rules that are used on the **Feature management** workspace will be applied when the import is done. For example, you can't override a mandatory feature setting by removing the date during import.

The following examples describe what occurs when you use the **Feature management** entity to import data.

- If you change the value of the **Enabled** field to **Yes**, the feature is turned on, and the **Enable date** field is set to the current date.
- If you change the value of the **Enabled** field to **No** or leave the **EnableDate** field blank, the feature is turned off, and the **Enable date** field is cleared. You can't turn off a mandatory feature or a feature that can't be turned off after it's turned on.
- If you change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If you change the value of the **Enabled** field to **Yes** and change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If you change the value of the **Enabled** field to **No**, but you also change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If a feature is turned on, and you add an **EnableDate** field that is set to a future date, the feature remains turned on. To reschedule the feature, you must change the **Enabled** field to **No**.

Feature management and flighting

Feature management lets you control the features that are delivered in each release. Flighting lets Microsoft teams release features to a limited number of customers, so that those features can be tested and validated without affecting all customers. Feature management doesn't control the flighting of any features.

New features are optional for 12 months

When a new non-critical feature is installed, it will be optional for a 12-month period. This allows you and your organization time to plan ahead for when to uptake a feature and have it tested against your daily operations. For more information, see [One Version service updates FAQ](#).

Using Feature management to turn on ISV features or custom features

Feature management is currently unavailable for features from independent software vendors (ISVs) and custom features. However, Microsoft is adding more functionality to enhance Feature management. After those enhancements are completed, Microsoft will make Feature management available to all features and provide instructions for updating your features to use it.

Frequently asked questions (FAQ)

When are features added, removed, or changed?

Features are added, removed, and changed through code changes. Environments need to be updated to receive those changes.

Does a feature become mandatory automatically?

No, a feature becoming mandatory is not an automatic action. The product teams need to make a code change.

When do features become mandatory?

The policy is that all new features will be opt-in for a 12-month period and will not require any change management until you enable the feature. The product teams can choose whether to make a feature mandatory after that period has ended.

Why isn't there a specific 'mandatory-enabled date'?

Update release timing is variable, environment update timing is variable, and customers can opt to skip some updates. As a result, specific dates are difficult to determine.

Where's the documentation for features that are being made mandatory?

This documentation comes from the application teams. Often, these will be mentioned in [Removed or deprecated features](#).

Is there an in-product notification or signal that a feature is going to be mandatory-enabled?

A notification mechanism related to making a feature mandatory does not exist today.

Do features ever get enabled without the customer knowing about it?

Yes, if features don't have a functional impact then they can be enabled by default.

What is feature flighting and how does it relate to feature management?

Feature flights are real-time on/off switches that Microsoft controls. They are separate from the customer control provided by Feature Management.

- Private Preview features will not be listed in Feature Management until they are flighted on. In production, the customer needs to agree to be part of a special program for that to occur.
- Public Preview and Released (generally available) features will be listed in Feature Management unless they are flighted off. Flighting a feature off is considered a last resort option for product teams if a critical issue is found and would usually be a per-customer operation.

Do features ever get flighted off without the customer knowing about it?

Yes, if a feature is impacting the functioning of an environment that doesn't have a functional impact then they can be enabled by default.

How can feature enablement be checked in code?

Use the `isFeatureEnabled` method on the `FeatureStateProvider` class, passing it an instance of the feature class. Example:

```
if (FeatureStateProvider::isFeatureEnabled(BatchContentionPreventionFeature::instance()))
```

How can feature enablement be checked in metadata?

The `FeatureClass` property can be used to indicate that some metadata is associated with a feature. The class name used for the feature should be used, such as `BatchContentionPreventionFeature`. This metadata is visible only in that feature. The `FeatureClass` property is available on menus, menu items, enum values, and table/view fields.

What is a feature class?

Features in Feature Management are defined as *feature classes*. A feature class implements `IFeatureMetadata` and uses the feature class attribute to identify itself to the Feature Management workspace. There are numerous examples of feature classes available that can be checked for enablement in code using the `FeatureStateProvider` API and in metadata using the `FeatureClass` property. Example:

```
[ExportAttribute(identifierStr(Microsoft.Dynamics.ApplicationPlatform.FeatureExposure.IFeatureMetadata))]  
internal final class BankCurrencyRevalGlobalEnableFeature implements IFeatureMetadata
```

What is the IFeatureLifecycle implemented by some feature classes?

`IFeatureLifecycle` is a Microsoft-internal mechanism for indicating the feature lifecycle stage. Features can be:

- `PrivatePreview` - Needs a flight to be visible.
- `PublicPreview` - Shown by default but with a warning that the feature is in preview.
- `Released` - Fully released.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Client FAQ

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides answers to frequently asked questions about the Finance and Operations client.

Why aren't symbols loaded?

The security settings on your browser might prevent the symbols from being loaded correctly. To resolve this issue, try the following steps:

- If you're experiencing this issue in Internet Explorer, click **Tools**, and then click **Internet Options**. In the Internet Options dialog box, on the **Privacy** tab, click **Custom level**, and make sure the **Font download** option is selected.
- Otherwise, you might have to add the app site to the list of trusted sites.

I miss the ribbon from Dynamics AX 2012. Can I keep Action Pane tabs open all the time?

We are planning to implement this feature soon. Users will then be able to choose to keep the tabs on Action Panes open all the time. Otherwise, the tabs will be collapsed when they aren't being used, to gain more screen space for the page.

Why do I sometimes see different shortcut menus when I right click?

If you right-click in an editable field (or if text is selected), the browser's shortcut menu is displayed. This menu gives you access to the **Cut**, **Copy**, and **Paste** commands. We can't embed these commands into the shortcut menus because, for security reasons, browsers don't allow us to programmatically access the system clipboard.

If you right-click a field label or the value of a read-only control, you'll see the shortcut menu.

To make keyboard access easier, we plan to implement a keyboard shortcut in the future that will open the shortcut menu.

Where is the View details functionality?

The **View details** option is available in a couple of ways:

- If a control has **View details** capabilities, and if the control has a value, that value is displayed as a hyperlink. You can click the hyperlink to open a page that contains additional details.
- **View details** is also an option on shortcut menus. For more information about when shortcut menus are displayed when you right-click, see the previous section.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

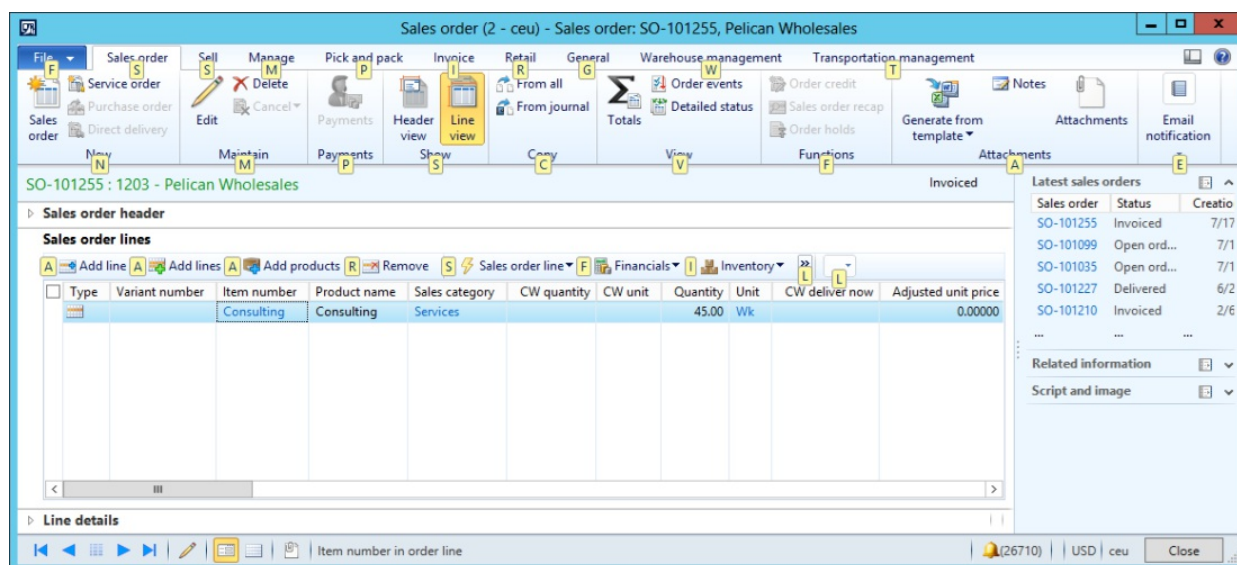

Action search

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article describes the action search functionality. Action search will help you find and run actions on a page.

Introduction

Pages primarily expose commands on Action Panes, both the standard Action Pane that appears at the top of a page and the toolbars that appear in various sections of the page. In previous versions, a Key Tips feature let you quickly access any button on an Action Pane by pressing the Alt key and then a series of letters.

The action search feature replaces Key Tips, which are no longer available. This new feature lets you quickly search for and run a button from any visible Action Pane.

Using action search

To use the action search feature, follow these steps.

1. On the Action Pane, click in the **action search** field. (The **action search** field contains a magnifying glass icon.)
2. Type all or part of the name of the button that you want to run. You can also search by using words from the button's "path." (For more information, see the next section of this article.) Typically, a button will appear near the top of the results list after you've typed two to four characters.
3. Find and run the button in the results list (by using your mouse or keyboard).

After the button is run, the focus is returned to your last position on the page, so that you can continue to work.

You can also start action search by pressing Ctrl+/, or Alt+Q. Press the keyboard shortcut again to return the focus to your last position on the page.

Understanding the results list

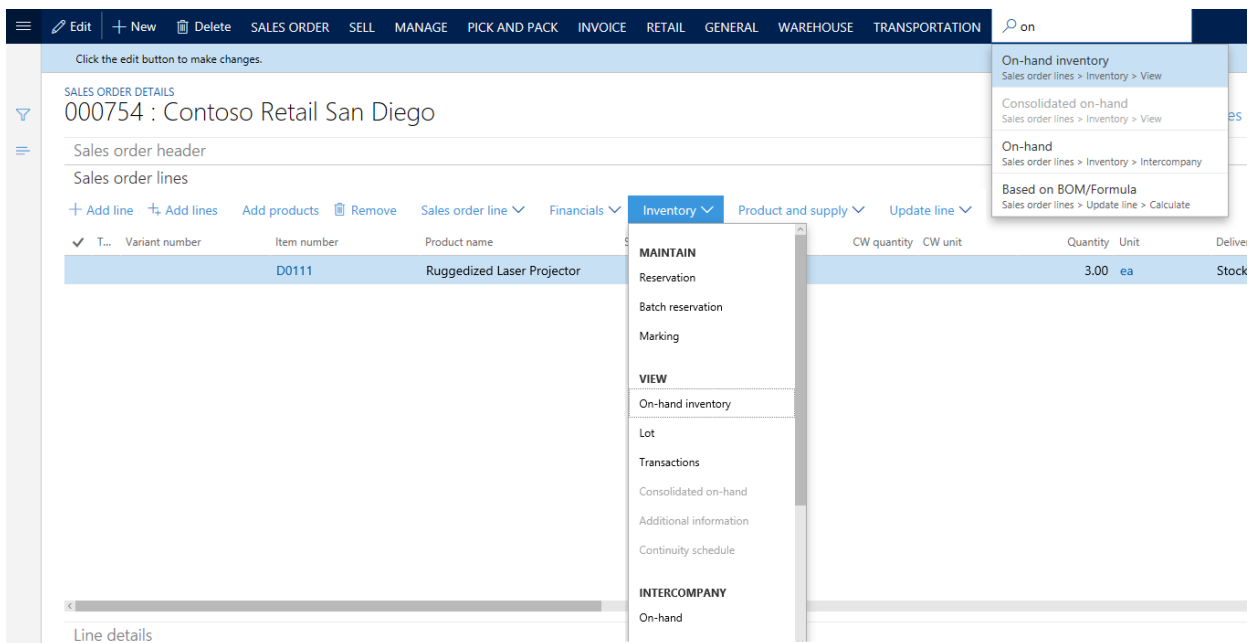

Often, you must know both the location and the context of a button to fully understand the purpose of that button. Therefore, the results list shows additional information to help you understand exactly which buttons appear in the list. In particular, the "path" of the button is shown. This path might include the labels of the following UI elements, as relevant:

- Action Pane tab
- Button group
- Menu button (if the button is inside a menu button)
- Menu separator (if the button is inside a named group inside a menu button)
- Group or tab on the page (for example, the name of a FastTab)

For example, you typed **tot** in the **action search** field and are now examining the results list. The first entry, for a button that is named **Totals**, is highlighted. A button path of **Sales order > View** is also shown. The **Sales order** part of the path corresponds to the **Sales order** tab on the Action Pane, and the **View** part of the path corresponds to the **View** group on that tab. Similarly, the path of the **Total discount** button (**Sell > Calculate**) informs you that this button is located in the **Calculate** group on the **Sell** tab of the Action Pane. Therefore, this information helps you understand exactly which button will be triggered by action search (if you select that button in the results list).

In the previous example, action search showed results from the standard Action Pane at the top of a page. However, action search also shows results from visible toolbars that are in other places on the page. For example, you're searching for the **On-hand inventory** button that is on the **Sales order lines** FastTab. In this case, the button path in the results list (**Sales order lines > Inventory > View**) informs you that this button is under the **View** heading on the **Inventory** menu button on the **Sales order lines** FastTab.

NOTE

There are some buttons that do not show up in Action search. These include drop dialog buttons and buttons from subforms.

Action search vs. Navigation search

Whereas action search is intended to find and run actions on a page, there is a separate search mechanism for finding and navigating to pages. For more information about that feature, see the [Navigation search](#) article.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Advanced filtering and query syntax

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes the filtering and query options that are available when you use the Advanced filter/sort dialog or the **matches** operator in the Filter pane or grid column header filters.

Advanced query syntax

SYNTAX	CHARACTER DESCRIPTION	DESCRIPTION	EXAMPLE
<i>value</i>	Equal to the value that is entered	Type the value to find.	Smith finds "Smith".
! <i>value</i> (exclamation point)	Not equal to the value that is entered	Type an exclamation point and then the value to exclude.	!Smith finds all values except "Smith".
<i>from-value..to-value</i> (double period)	Between the two values that are separated by double periods	Type the from-value, then two periods, and then the to-value.	1..10 finds all values from 1 through 10. However, in a string field, A..C finds all values that start with "A" and "B", and values that are exactly equal to "C". For example, this query won't find "Ca". To find all values from "A" <i>through</i> "C", type A..D .
<i>..value</i> (double period)	Less than or equal to the value that is entered	Type two periods and then the value.	..1000 finds any number that is less than or equal to 1000, such as "100", "999.95", and "1,000".
<i>value..</i> (double period)	Greater than or equal to the value that is entered	Type the value and then two periods.	1000.. finds any number that is greater than or equal to 1000, such as "1,000", "1,000.01", and "1,000,000".
> <i>value</i> (greater than sign)	Greater than the value that is entered	Type a greater than sign (>) and then the value.	> 1000 finds any number that is greater than 1000, such as "1000.01", "20,000", and "1,000,000".
< <i>value</i> (less than sign)	Less than the value that is entered	Type a less than sign (<) and then the value.	< 1000 finds any number that is less than 1000, such as "999.99", "1", and "-200".
<i>value*</i> (asterisk)	Starting from the value that is entered	Type the starting value and then an asterisk (*).	S* finds any string that starts with "S", such as "Stockholm", "Sydney", and "San Francisco".

SYNTAX	CHARACTER DESCRIPTION	DESCRIPTION	EXAMPLE
* <i>value</i> (asterisk)	Ending with the value that is entered	Type an asterisk and then the ending value.	*east finds any string that ends with "east", such as "Northeast" and "Southeast".
* <i>value</i> * (asterisk)	Containing the value that is entered	Type an asterisk, then a value, and then another asterisk.	*th* finds any string that contains "th", such as "Northeast" and "Southeast".
? (question mark)	Having one or more unknown characters	Type a question mark at the position of the unknown character in the value.	Sm?th finds "Smith" and "Smyth".
<i>value,value</i> (comma)	Matching the values that are separated by commas	Type all your criteria, and separate them by using commas.	A, D, F, G finds exactly "A", "D", "F", and "G". 10, 20, 30, 100 finds exactly "10, 20, 30, 100".
"" (two double quotes)	Matching a blank value	Type two consecutive double quotes to filter for blank values in that field.	Two consecutive double quotes ("") finds rows with no value for the current column.
(Finance and Operations query) (Finance and Operations query between parentheses)	Matching a defined query	Type a query as an SQL statement between parentheses using the Finance and Operations query language.	((AccountNum LIKE "US*") && (DirPartyTable.Name LIKE "Cont*")) as an example of syntax for a filter condition on a field from the root datasource as well as a field from a different datasource (for the All customers page)
T	Today's date	Type T.	T matches today's date.

SYNTAX	CHARACTER DESCRIPTION	DESCRIPTION	EXAMPLE
(methodName(parameters)) (SysQueryRangeUtil method between parentheses)	Matching the value or range of values that are specified by the parameters of the SysQueryRangeUtil method	Type a SysQueryRangeUtil method that has parameters that specify the value or range of values.	<ol style="list-style-type: none"> 1. Click Accounts receivable > Invoices > Open customer invoices. 2. Press Ctrl+Shift+F3 to open the Inquiry page. 3. On the Range tab, click Add. 4. In the Table field, select Open customer transactions. 5. In the Field field, select Due date. 6. In the Criteria field, enter (yearRange(-2,0)). 7. Click OK. The list page is updated and lists the invoices that match the criterion that you entered. For this example, invoices that were due in the previous two years are listed. <p>See the table in the next section for additional details about SysQueryRangeUtil date methods, and several examples.</p>

Advanced date queries that use SysQueryRangeUtil methods

METHOD	DESCRIPTION	EXAMPLE
Day (_relativeDays=0)	Find a date relative to the session date. Positive values indicate future dates, and negative values indicate past dates.	<ul style="list-style-type: none"> • Tomorrow – Enter (Day(1)). • Today – Enter (Day(0)). • Yesterday – Enter (Day(-1)).
DayRange (_relativeDaysFrom=0, _relativeDaysTo=0)	Find a range of dates relative to the session date. Positive values indicate future dates, and negative values indicate past dates.	<ul style="list-style-type: none"> • Last 30 days – Enter (DayRange(-30,0)). • Previous 30 days and next 30 days – Enter (DayRange(-30,30)).
GreaterThanDate (_relativeDays=0) GreaterThanUtcDate (_relativeDays=0)	Find all dates after the specified relative date.	<ul style="list-style-type: none"> • More than 30 days from now – Enter (GreaterThanDate(30)).

METHOD	DESCRIPTION	EXAMPLE
GreaterThanOrEqualTo ()	Find all date/time entries after the current time.	<ul style="list-style-type: none"> • All future date/times – Enter (GreaterThanOrEqualTo()).
LessThanDate (_relativeDays=0) LessThanOrEqualToDate (_relativeDays=0)	Find all dates before the specified relative date.	<ul style="list-style-type: none"> • Less than seven days from now – Enter (LessThanDate(7)).
LessThanOrEqualTo ()	Find all date/time entries before the current time.	<ul style="list-style-type: none"> • All past date/times – Enter (LessThanOrEqualTo()).
MonthRange (_relativeFrom=0, _relativeTo=0)	Find a range of dates, based on months relative to the current month.	<ul style="list-style-type: none"> • Previous two months – Enter (MonthRange(-2,0)). • Next three months – Enter (MonthRange(0,3)).
YearRange (_relativeFrom=0, _relativeTo=0)	Find a range of dates, based on years relative to the current year.	<ul style="list-style-type: none"> • Next year – Enter (YearRange(0, 1)). • Previous year – Enter (YearRange(-1,0)).

Configure and filter workspaces

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides an overview about how to configure and filter workspaces.

Configuring a workspace

You can change the appearance and behavior of some workspaces by updating settings that apply to the whole workspace. When a workspace can be configured, the Action Pane includes a button that instructs you to click it to make configuration changes. For example, in the following illustration, the button is named **Configure my workspace**.

When you click the button, a dialog appears, where you can modify the predefined settings for the workspace. The specific settings that you see in this dialog vary by workspace, and depend on the specific controls and business data that are available in the workspace.

Configure my workspace

[Restore default values](#) [View default values](#)

WHAT INFORMATION WOULD YOU LIKE TO SEE IN THE DETAIL

Expense dimension set

Expense budget threshold percent

Revenue dimension set

Revenue budget threshold percent

Filtering a workspace

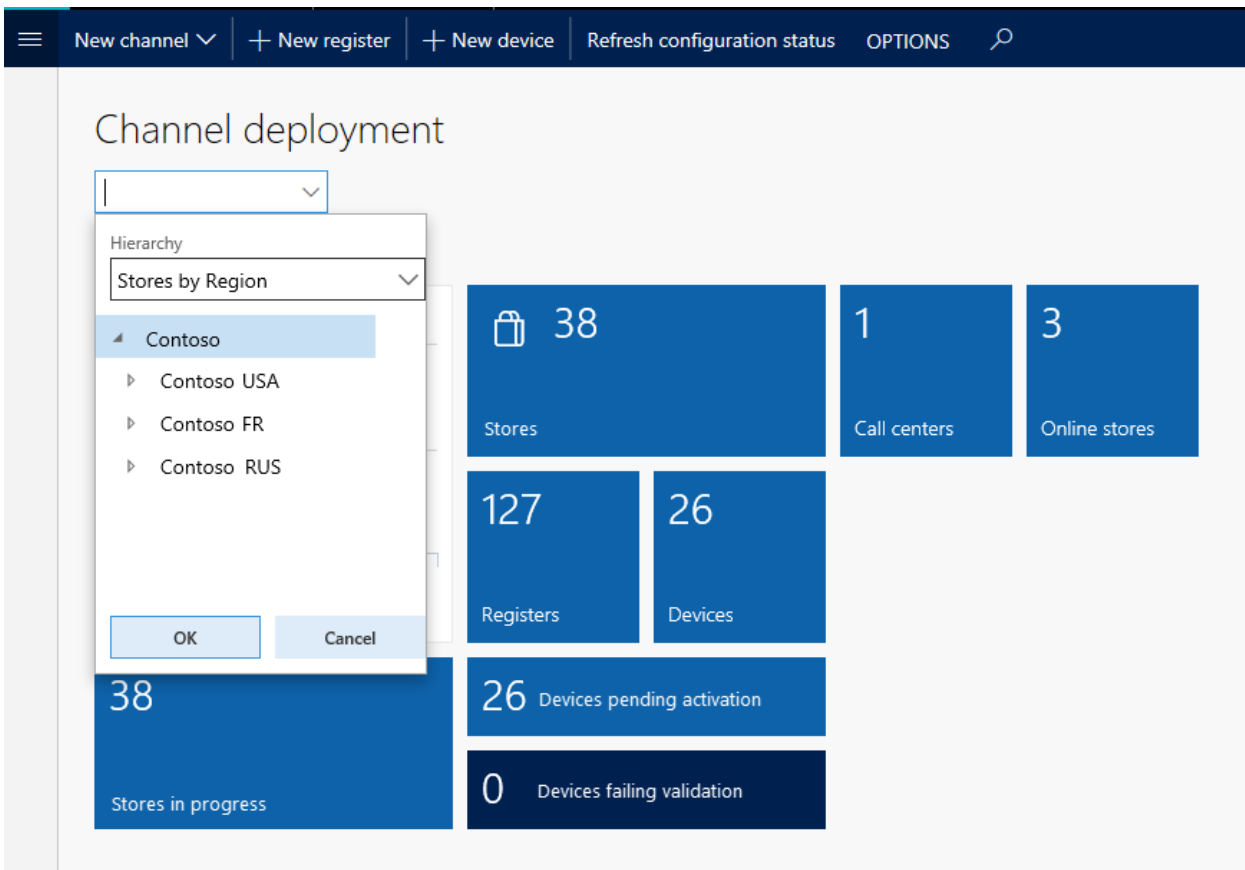

Many workspaces let you filter the content that appears in them. The controls that are available might let you filter all the content in the workspace or only the content in a specific section of the workspace. The filters on workspaces can be lookups, combo boxes, free-form text fields, or other types of controls. However, every type of filter has the same effects, as described in the following sections.

Workspace-wide filters

You can filter the whole workspace by using a workspace-wide filter. A workspace-wide filter appears in the upper-left corner of the workspace. When you select a specific value in the drop-down list, the contents of the workspace are filtered based on that selection.

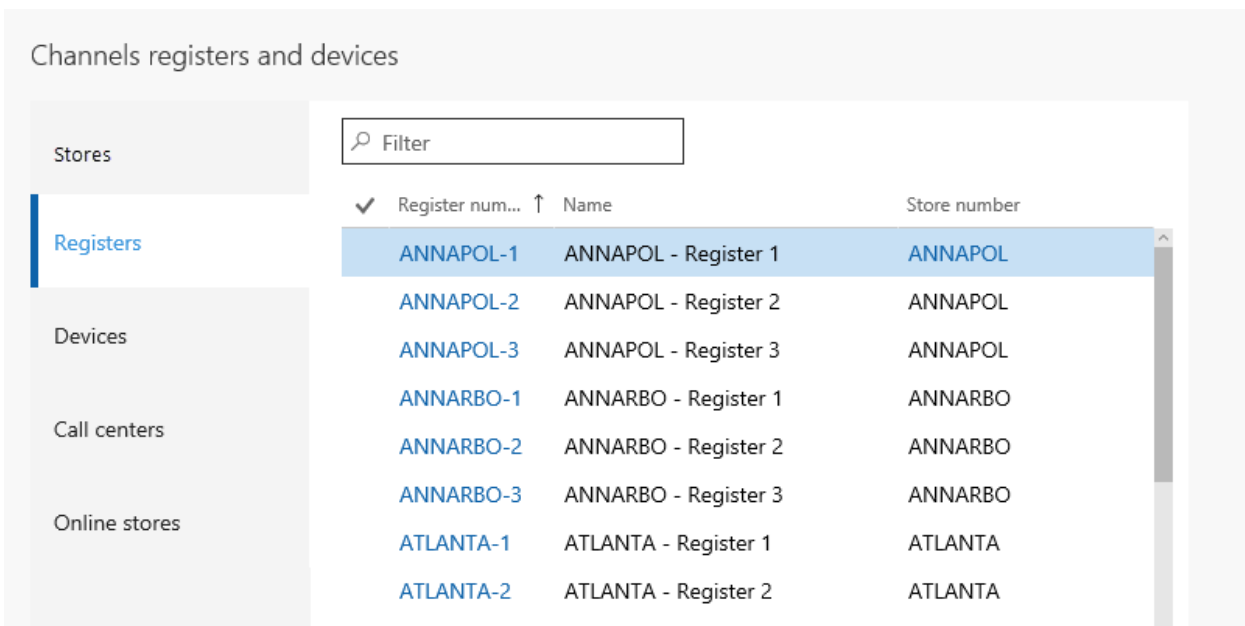

When you click to open the filter, you're presented with several options.

Select an option to filter the workspace based on that option.

Workspace section filters

If individual sections of the workspace have filters, you can filter each section separately. In the following illustration, the filter (the field that contains the text "Filter") is an example of a free-form text field filter.

As with a workspace-wide filter, select or enter a value in the field to filter the contents of the section.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Show pages side-by-side using the Open in new window feature

2/18/2021 • 2 minutes to read • [Edit Online](#)

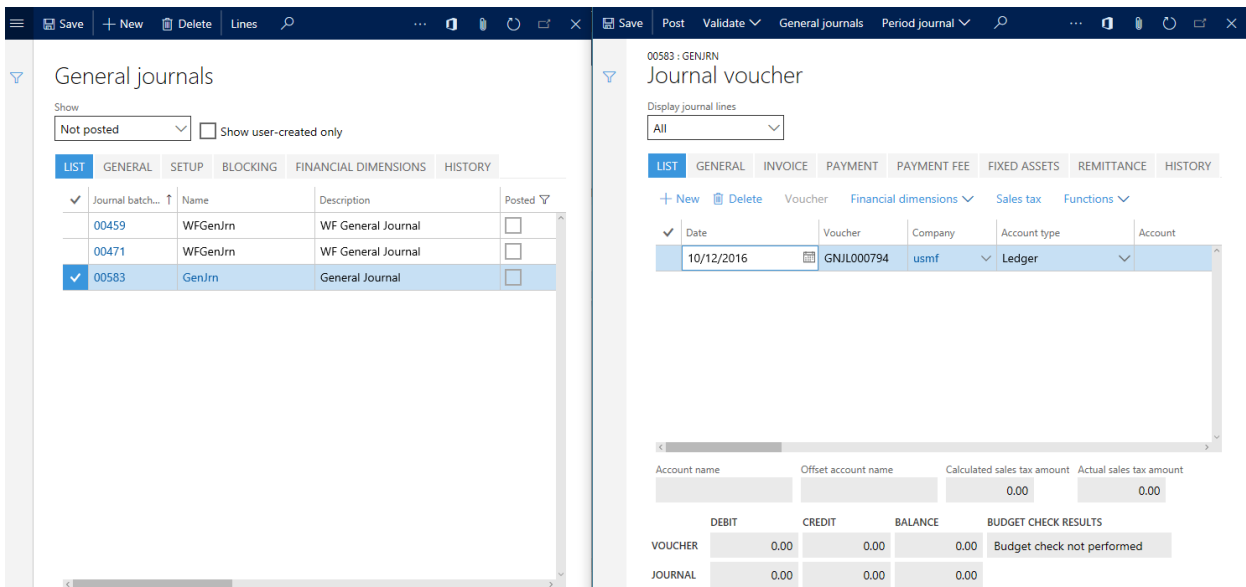

This article explains how to display pages side by side.

You may want to view multiple pages side by side to complete tasks quickly. As an example, you might want to validate or enter lines in more than one journal. Typically, to validate or enter lines in more than one journal, you would have to go back and forth between the page that displays a list of journals, and the page that displays lines for a given journal. However, the **Open in new window** feature enables you to display these pages side-by-side so that you can perform your tasks quickly.

Continuing with the example mentioned above, when viewing the lines, you can click the **Open in new window** icon.

Clicking the **Open in new window** icon opens the lines page in a new, pop-up browser, and then navigates the original browser back in history to the page that displayed the list of journals. You can then display both pages side by side. After viewing a journal, you can change the selected journal on the journal list page, and the lines page in the pop-up window will automatically display the lines of the newly selected journal.

The dynamic linking and refreshing happens due to the relations that exist between the data that is backing these pages. If the system is not aware of the relation between the data, the pop-up window will not refresh automatically in response to a change in the window it originated from.

Some pages have multiple views such as the Grid view, Header view, and Details view. The **Open in new window** icon causes the entire page to open in the new browser window. Therefore, you cannot keep two views of the same page side by side using the **Open in new window** feature. Almost all such pages have a

navigation list that you can use to switch between records and achieve a similar experience.

Before using the **Open in new window** feature, you should configure your browser's pop-up blocker to allow pop-ups from the URL of the site. As an example, you could allow pop-ups from "*.dynamics.com".

The **Open in new window** feature is only available when there is more than one page open in the window. Also, the pop-up window automatically closes when there are no more pages open (that is, when you close the last page in that window). The system also closes open pages when you navigate to a different area in the application. Therefore, if you have pop-up windows open and navigate to a different area in the application, the pop-up windows close automatically because the system closed the pages in those windows.

The top bar in the pop-up windows displays information about the company the page was opened in and is read-only. The pop-up windows also rely on the main browser window. If the main window is closed or refreshed, all open pop-up windows will become read only. If this situation occurs, you can still view the information in these windows, but you will not be able to interact with it.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Keyboard shortcuts

2/18/2021 • 9 minutes to read • [Edit Online](#)

The following keyboard shortcuts can help you quickly and efficiently enter data in Finance and Operations apps

NOTE

The keyboard shortcuts described here refer to the United States keyboard layout. Keys on other keyboard layouts might not correspond exactly to the keys on a US keyboard.

Some of the shortcuts on this page are *key chords*, meaning they require two consecutive sets of key combinations (separated by a comma) that need to be independently pressed to trigger the required action. For example, the shortcut "Alt+M,A" requires the user to first press "Alt+M", release the keys, and then press "A".

Finding a shortcut

As of Platform update 11, users can discover currently available shortcuts directly from the user interface. Simply right-click on a control and select **View shortcuts**. This will open a dialog box showing the shortcuts you can use based on where you are on the page.

Action shortcuts

TO DO THIS	PRESS
Open action search	Ctrl+' or Alt+Q
Move to the standard Action Pane	Alt+M,A or Ctrl+F6
Open a tab on the Action Pane or a menu	Enter or Space or Alt+Down arrow
Move to next/previous option in a menu	Down arrow / Up arrow
Close a tab on the Action Pane or a menu	Esc
Simulate a right-click	Shift+F10
Open the context menu	Ctrl+F10
Execute the default button on a form/dialog box	Alt+Enter
Click a button or tile	Enter or Space
View refresh information for a count tile	Alt+Up arrow
View currently available shortcuts	Alt+Shift+K

Date picker shortcuts

TO DO THIS	PRESS
Open the date picker	Alt+Down arrow
Move between dates in the date picker	Ctrl+Arrow keys
Move to the next/previous month	Page down / Page up
Move to the next/previous year	Ctrl+Shift+Page down / Ctrl+Shift+Page up
Move to today	Ctrl+Home
Pick today's date	T
Clear the selected date	C
Pick Never (or the max date)	N

FactBox shortcuts

TO DO THIS	PRESS
Open the FactBox pane (or move focus to the FactBox pane if it is already open)	Alt+M,B or Ctrl+F2
Close the FactBox pane (with focus in the FactBox pane)	Esc
Move to the next/previous FactBox (with focus in the FactBox pane)	Alt+Shift+Down arrow / Alt+Shift+Up arrow
Move to the <n>th FactBox (with focus in the FactBox pane)	Alt+<n> (<n> = 1-9)
Expand a FactBox (with focus on the FactBox header)	Space or Enter
Collapse the current FactBox	Alt+0

Filtering shortcuts

TO DO THIS	PRESS
Open grid filtering for the current column	Ctrl+G
Close grid filtering for the current column	Esc
Open the Filter pane (or switch focus between the Filter pane and the main form if the Filter pane is already open)	Alt+M,F or Ctrl+F3
Close the Filter pane (with focus in the Filter pane)	Esc
Open advanced filtering/sort	Ctrl+Shift+F3

Form shortcuts

TO DO THIS	PRESS
Create a new record	Alt+N
Delete a record	Alt+Del or Alt+F9
Save record	Alt+S or Ctrl+S
Revert (restore)	Ctrl+Shift+F5
Data refresh	Shift+F5
Move to the visible first field on the form	Alt+Shift+F
Toggle edit mode	F2
Attach a document	Ctrl+Shift+A
Export to Excel	Ctrl+Shift+E
Move to the previous record (outside a grid)	Ctrl+Up arrow
Move to the next record (outside a grid)	Ctrl+Down arrow
Move to the first record (outside a grid)	Ctrl+Home
Move to the last record (outside a grid)	Ctrl+End
Close the form (click Back)	Esc
Close the form with explicit save	Shift+Esc
Close the form discarding any unsaved changes	Alt+Shift+Q

Form navigation shortcuts

TO DO THIS	PRESS
Move to the next/previous field	Tab / Shift+Tab
Move to the next/previous tab	Alt+Shift+Right arrow / Alt+Shift+Left arrow
Move to the <n>th tab	Alt+Shift+<n> (<n> = 1-9)
Move to the next/previous FastTab	Alt+Shift+Down arrow / Alt+Shift+Up arrow
Move to the <n>th FastTab	Alt+<n> (<n> = 1-9)
Move to the next/previous blade (vertical tab)	Alt+Shift+Right arrow / Alt+Shift+Left arrow

TO DO THIS	PRESS
Move to the <n>th blade (vertical tab)	Alt+Shift+<n> (<n> = 1-9)
Expand a FastTab (with focus on the FastTab header)	Space or Enter
Collapse the current FastTab	Alt+0
Switch to grid view	Ctrl+Shift+G
Switch to details view	Ctrl+Shift+D
Switch to header view	Ctrl+Shift+H
Switch to lines view	Ctrl+Shift+L

Grid shortcuts

TO DO THIS	PRESS
Move to the next/previous column	Tab / Shift+Tab
Move to the next/previous row	Down arrow / Up arrow
Move to the next/previous row without selecting <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Ctrl+Up arrow / Ctrl+Down arrow
Select/clear the current row <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Ctrl+Space / Ctrl+Click
Add the next/previous row to the selected set <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Shift+Space
Add a range of rows to the selected set <div style="border: 1px solid #ccc; padding: 2px; margin-top: 5px;"> <p>[!NOTE] This shortcut applies to multi-select scenarios only.</p> </div>	Shift+Click
Go to the next/previous page of data	Page up / Page down
Create a new row at the bottom of the grid	Down arrow (from the last row)
Move to the first record	Ctrl+Home

TO DO THIS	PRESS
Move to the last record	Ctrl+End
Select or clear all rows	Ctrl+Shift+M
Move to the first marked row	Alt+Shift+M, F
Move to the next marked row	Alt+Shift+M, L
Move to the previous marked row	Alt+Shift+M, P
Moved to the last marked row	Alt+Shift+M, N
Execute the default action in a grid <div style="border: 1px solid gray; padding: 5px; margin: 5px 0;"> <p>[!NOTE] This shortcut is enabled when focus is on a cell containing a hyperlink and all cells in that column have hyperlinks.</p> </div>	Enter
Toggle focus between the selected row and the header row	Alt+Shift+H
Make the current column larger/smaller (with focus in the header row)	Right arrow / Left arrow
Open grid filtering for the current column (with focus in the header row)	Enter

Input control shortcuts

TO DO THIS	PRESS
Open the hyperlink	Ctrl+Enter
Enter the session date in a date field	D
Enter the current date in a date field	T
Open lookup, combo box, date picker, drop dialog box	Alt+Down arrow
Close lookup, combo box, date picker, drop dialog box	Esc
Move focus into a lookup (when the lookup is already open)	Alt+Down arrow
Open the control's enhanced preview	Alt+Up arrow
Select text in the current field	Ctrl+A
Enter/leave the text area in an HTML editor control	Alt+Down arrow / Alt+Up arrow
Switch focus between the text area and the toolbar in an HTML editor control	F6

Messaging shortcuts

TO DO THIS	PRESS
Go to the Message Center	Ctrl+Shift+F7
Go to the Message Bar	Ctrl+F7

Navigation shortcuts

TO DO THIS	PRESS
Go to the dashboard	Alt+Shift+Home
Move to the navigation bar	Alt+M,N or Alt+Shift+F1
Move to the company picker	Ctrl+Shift+O
Search for a page	Ctrl+/ or Alt+G
Open the help pane	Ctrl+?
Open the trace parser	Alt+Shift+T
Move to the navigation pane	Alt+F1
Add/remove form as a favorite (with focus on a form in the navigation pane)	Shift+F
Move to the standard Action Pane	Alt+M,A or Ctrl+F6
Move to the Filter pane (which may include opening it)	Alt+M,F or Ctrl+F3
Move focus to the page content (with focus in the Filter pane)	Alt+M,M or Ctrl+F3
Move to the navigation list on Details form (which may include opening it)	Alt+M,S or Ctrl+F8
Move focus to the page content (with focus in the navigation list)	Alt+M,M or Ctrl+F8
Close the navigation list on Details form (with focus in the navigation list)	Esc
Move to the main page content (with focus in another pane)	Alt+M,M
Move to the FactBox pane (which may include opening it)	Alt+M,B or Ctrl+F2

Personalization shortcuts

TO DO THIS	PRESS
Transition the page into personalization mode	Ctrl+Shift+P
Use the Select tool (when in personalization mode)	S
Open the selected control's quick personalization dialog box (when using the Select tool)	Space or Enter
Use the Move tool (when in personalization mode)	M
Select the current control as the one to move (when using the Move tool and no control has been selected to move yet)	Space or Enter
Clear the control to move (when using the Move tool)	Esc
Move to the next position for the selected control (when using the Move tool)	Tab or Right arrow or Down arrow
Move to the previous position for the selected control (when using the Move tool)	Shift+Tab or Left arrow or Up arrow
Use the Hide tool (when in personalization mode)	H
Switch whether the current control is visible or hidden (when using the Hide tool)	Space or Enter
Use the Skip tool (when in personalization mode)	K
Switch whether the current control is in the tab sequence (when using the Skip tool)	Space or Enter
Use the Edit tool (when in personalization mode)	E
Switch whether the current control is editable or read-only (when using the Edit tool)	Space or Enter
Use the Summary tool (when in personalization mode)	U
Switch whether the current control is a summary field in the current fast tab (when using the Summary tool)	Space or Enter
Use the Add tool (when in personalization mode)	A
Select the control whose container will be used to insert the new fields (when using the Add tool)	Space or Enter
Import a personalization (when in personalization mode)	I
Export a personalization (when in personalization mode)	X
Clear this page's personalizations (when in personalization mode)	Ctrl+C

TO DO THIS	PRESS
Move focus between the personalization toolbar and the page (when in personalization mode)	T
Exit personalization mode (when in personalization mode)	Esc

Segmented entry shortcuts

TO DO THIS	PRESS
Open the drop-down list (when the drop-down list is closed)	Alt+Down arrow
Move focus into the input field for the current segment in the drop-down list (when the drop-down list is already open)	Alt+Down arrow
Close the drop-down list	Alt+Up arrow
Close/open the right portion of the drop-down list	Alt+Left arrow / Alt+Right arrow
Switch between "Show valid" and "Show all" modes	Alt+W
Select the value from drop-down list and move to the next segment	Enter
Move to the next/previous control on the page (when focus is in input control)	Tab / Shift+Tab
Move to the next/previous input field in the flyout (when focus is in the drop-down list)	Tab / Shift+Tab
Move up/down a row in the lookup	Up arrow / Down arrow
Move up/down a page in the lookup	Page up / Page down
Move to the top/bottom of the lookup	Home / End

Task recorder shortcuts

TO DO THIS	PRESS
Stop the recording (while recording)	Alt+R,S
Toggle the visibility of the Task recorder pane (while recording)	Alt+R,T
Toggle Rails mode (while playing a task guide)	Alt+R,L
Go to the previous step (while playing a task guide)	Alt+R,P
Go to the next step (while playing a task guide)	Alt+R,N

TO DO THIS	PRESS
Toggle focus between the page and the animated pop-up prompt (while playing a task guide)	Alt+R,F
Expand/collapse the animated pop-up prompt (while playing a task guide)	Alt+R,C
Show more/less information in the animated pop-up prompt (while playing a task guide)	Alt+R,M

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Change the banner or logo

2/18/2021 • 2 minutes to read • [Edit Online](#)

The following procedure lists the steps that system administrators can use to update the banner or logo image that is displayed for a legal entity. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane > Modules > Organization administration > Organizations > Legal entities**.
2. In the list on the left, select the legal entity for which you want to update the banner or logo. If it is already selected, go to the next step.
3. Expand **Dashboard image** tab.
4. Select **Change**.

The ideal resolution for a banner image is 1920 x 281 pixels. The ideal width for a logo image is 350 pixels.

5. Select **Save**.
6. Go to **Navigation pane > Modules > Common > Common > Default dashboard**. You should see the new banner or logo image on the dashboard.

You may need to change your company, using the company picker, to the one you uploaded the banner for.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Navigation search

2/18/2021 • 2 minutes to read • [Edit Online](#)

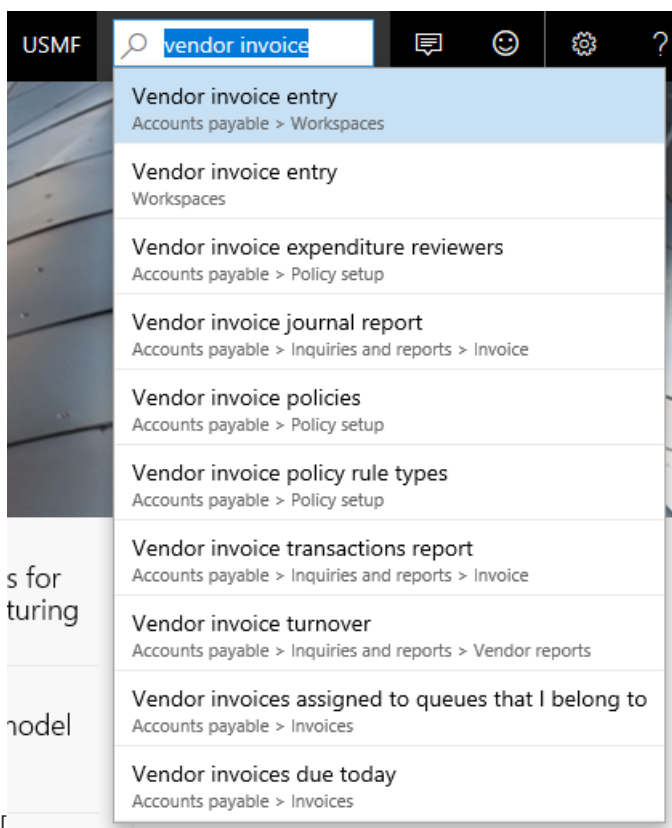

This topic explains how to use the search functionality to navigate to pages.

The application includes a number of areas and pages to help you perform various tasks. To quickly find the pages that you need to complete your tasks, use the navigation search feature.

To use this feature, click the **Search** icon to display the **Search** box. You can then type one or more words in the box. The system instantly searches for relevant pages in the application that match the words that you entered. For example, you could type "vendor invoice" as the input, and then the system displays results that match that input.

NOTE

The **Search** box helps you find and navigate to pages. It will not help you find specific data or actions.

Quickly navigate to a particular page

The navigation search feature also serves as a great way for you to quickly navigate to a particular page. For example, if you are an accounts payable clerk who frequently uses the **Payment journal** page, you could enter "payment journal" in the **Search** box. Because the input is an exact match for the page title, the page is listed at the top of the search results, and you can quickly navigate to it.

The search results list displays the page title as well as the navigation path. This shows the location of the page in the application. It also helps you differentiate between two or more similar pages in the results.

When you search for a page, your input is matched against the page title, as well as its navigation path. For

example, if you enter "receivable" in the **Search** box, you will see results for the pages available to you in the Accounts receivable area – even though the page titles do not include the word "receivable."

Quickly navigate to a page based on the technical form name

The navigation search functionality also includes a much-requested feature for power users: the ability to quickly navigate to a page based on the technical form name. Many users are so familiar with the system that they know the exact form names they work with. If you are one of these users, you can enter **form:** followed by the name of the form you are looking for. For example, if you enter **form: vendinvoice**, the search results will show all pages where the form name starts with **vendinvoice**.

Administration and security

From an administration and security perspective, the navigation search functionality only surfaces two types of results:

- Pages that are enabled in the current configuration (via configuration keys).
- Pages that the user has access to based on the user's role.

The list of search results is limited to 10 items. If you do not find what you're looking for in the results, you should try refining or updating the input.

Development

From a development perspective, the navigation search functionality is easy to leverage because there is virtually no delay between the deployment of menu items and their ability to show up in search results. As long as the menu items are linked to from either the navigation pane or the dashboard, they will automatically become searchable.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Personalize the user experience

2/18/2021 • 22 minutes to read • [Edit Online](#)

This topic explains how you can personalize the app and covers the following subjects:

- **System-wide options** – These personalization options are made on a setup page and are available to all users. Examples include the color theme and time zone.
- **Restricted personalization access** – At this access level, user actions that are associated with typical page usage are automatically saved by the app and restored the next time that you visit the page. For example, the app stores the width of grid columns if you adjust them, and the expanded or collapsed state of FastTabs.
- **Full personalization access** – At this access level, users have access to all personalization capabilities in the app. In particular, they have access to the **Personalization** toolbar.
- **Sharing personalizations** – Users who have full personalization access can export their page personalizations and share them with other users.
- **Administration of personalizations** – Privileged users can access the **Personalization** administration page to manage all personalizations at an organizational level.

System-wide options for the current user

The **User options** page contains several system-wide settings for the current user. These options are available to all users, even users who haven't been given any access to personalization. To open the **User options** page, select the **Settings** button on the navigation bar, and then select **User options**. The **User options** page has four tabs that contain various user settings:

- **Visual** – Select a color theme and the default size of elements on pages.
- **Preferences** – Select default values that are used every time that you open the system. These values include the default company, the initial page, and the default view/edit mode. (The view/edit mode determines whether a page is locked for viewing or opened for editing every time that you open it.) This tab also includes options for the language, the time zone, and date, time, and number formats. Finally, this tab includes several miscellaneous preferences that vary from release to release.
- **Account** – View or adjust your user name and other account-related options.
- **Workflow** – Select workflow-related options.

In addition to changing your user settings, you can also view and delete your usage data and personalizations from the **User options** page. To see your usage data, select **Usage data** on the Action Pane. On the **Personalization** tab, you can view and manage the personal changes that you've made to pages in the system. On this tab, you can also reset feature callouts (that is, the pop-up windows that introduce new system features). You will then be alerted again about previously encountered features.

NOTE

If the [Saved views](#) feature is turned on, you can view and manage your personalizations by selecting **Personalization** on Action Pane on the **User options** page.

Restricted personalization access (formerly implicit personalizations)

At the **restricted personalization access** level, user actions that are associated with typical page usage are automatically saved by the app and restored the next time that you visit the page. No explicit save action is required.

Here is a list of the actions that fall under typical page usage and are covered by restricted personalization access:

- **Grid column widths** – You can adjust the width of a column in a grid by selecting the sizing bar to the left or right of the column header, and then sliding it left or right until the column is the desired width. The app stores the width that you set for a column. Then, the next time that you open that page, the column will be resized to that width.
- **Grid footer and column totals** – (*Available only when the new grid control is turned on*) You can decide whether a total should be shown at the bottom of any numeric column in a grid, and whether the grid footer should be visible. The app stores these preferences and applies them the next time that you open the page. For more information, see [Grid capabilities](#).
- **FastTabs** – Some pages have expandable sections that are known as *FastTabs*. The app stores information about the FastTabs that you've expanded or collapsed. The next time that you open the page, the same FastTabs will be either expanded or collapsed, based on your last interaction with the page. In some cases, you can help improve system performance by collapsing a FastTab, because the app doesn't have to retrieve the information for FastTabs until they are expanded. As is explained later in this topic, you can also change the order of the FastTabs on a page.
- **FactBoxes** – Some pages have a **Related information** pane that shows read-only information that is related to the current subject of the page. Each section in the **Related information** pane is known as a *FactBox*. You can expand or collapse the **Related information** pane, and you can also expand or collapse individual FactBoxes. The app stores these preferences. The next time that you open the page, the **Related information** pane and the individual FactBoxes will be either expanded or collapsed, based on your last interaction with the page. In some cases, you can help improve system performance by collapsing the **Related information** Pane or a FactBox, because the app doesn't have to retrieve the information for FactBoxes until they are expanded.
- **Action Panes** – An *Action Pane* appears near the top of most pages. The Action Pane contains buttons for many of the actions that you can perform on the current page. These buttons are often organized on tabs. You can *pin* the whole Action Pane open, or you can have it collapsed by default. The next time that you open the page, the Action Pane will be either open or collapsed, based on your last interaction with the page. If you pinned the Action Pane open, the last tab that you were using will be shown.
- **QuickFilters** – A *QuickFilter* appears above many grids. The QuickFilter lets you filter the grid based on a single column that you select. The app stores the column that you filtered on. Then, the next time that you open that page, the grid will use that same column for filtering by default. However, you can still select a different column to filter the grid on.
- **Column header filters** – When you filter a grid by using *column header filters*, you can change the filter operator as you require to find the data that you want. For example, you can change the operator from **begins with** to **is exactly**. Every time that you use a column header filter and change the filter operator, the app stores the change. Then, the next time that you filter on that column, the filter operator will be restored.
- **Navigation pane** – You can open the *navigation pane* by selecting the **Expand the navigation pane** button in the upper left of any page. (This button is sometimes referred to as the *Menu button*, *hamburger*, *hamburger menu*, or *hamburger button*.) You can pin the navigation pane open, or you can have it collapsed by default. After you pin the navigation pane open, the app will keep it open until you collapse it.

Full personalization access (formerly explicit personalizations)

At the **full personalization access** level, users have access to all the personalization capabilities that the app provides. Because different people and companies have different needs when they interact with the app, especially in terms of utilized fields, personalization provides tools that let users and organizations tailor the way that information is ordered and interacted with in the app. These capabilities are key to providing simplified, optimized experiences in the app that are tailored to you and your organization.

If the [Saved views](#) feature is turned on, an explicit save is required to persist these changes to the user

experience for a specific view. When the **Saved views** feature is turned off, these changes are automatically saved.

The following sections cover the extent of personalization capabilities that are available to users at the **full personalization access** level. Here are some of these capabilities:

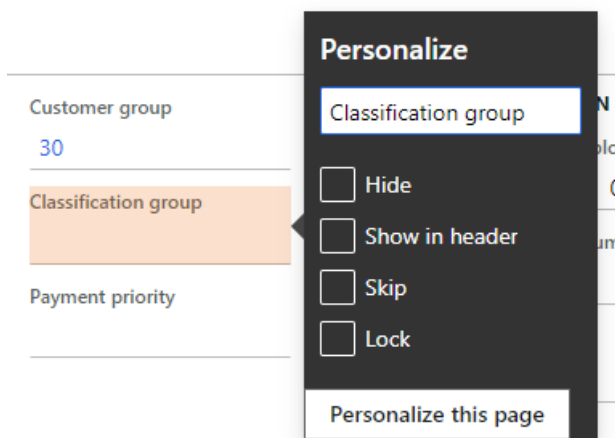

- Shortcut menu options
- The **Personalization** toolbar
- Adding tiles, lists, and links to workspaces
- Adding a summary from a workspace to a dashboard
- Personalizing the dashboard

Shortcut menu options

Shortcut menus provide one way to change a page's interface so that it better meets your requirements or the requirements of your organization. (A shortcut menu is also known as a *right-click menu* or a *context menu*.)

Some of the most typical and important changes that can be made to a page are available directly as options on a shortcut menu. For example, if you want to add or hide columns in a grid, just right-click a column header, and then select **Insert columns** or **Hide this column**.

Additionally, the most basic types of personalizations are available by right-clicking an element and then selecting **Personalize**. (Note that not all elements on your page can be personalized.) When you use this personalization method, the element's *property window* appears.

You can use the property window to personalize an element in the following ways:

- Change the element's label.
- Hide the element so that it isn't shown on the page. The data in the field isn't deleted or modified. The information just isn't shown on the page any longer.
- Include the information in the FastTab's summary section (if the element is on a FastTab).
- Skip the field so that it never receives focus when you tab through the page.
- Prevent data in the field from being edited (for any record).
- Designate a field to be required for data entry. If no value has been entered in this field, it will appear with a red border and an asterisk to indicate this state. This option is only available starting in version 10.0.11 when the [Saved views](#) and **Designate fields as required using personalization** features are turned on.

The property window might include other personalization capabilities, depending on the element. For example, the property window for a tile might let you promote that tile to a dashboard, and property windows for elements on the default dashboard might let you create a new custom workspace.

The Personalization toolbar

If you want to make multiple changes to a page, or changes that aren't available through other mechanisms (for

example, if you want to reorder elements), you can use the **Personalization** toolbar. To open the **Personalization** toolbar, follow one of these steps:

- Select **Ctrl+Shift+P** from any element on the page.
- Select **Personalize this page** in an element's property window.
- Select **Personalize this page** in the **Personalize** group on the **Options** tab of any page's Action Pane.
- Select the **Settings** button (the gear symbol) on the navigation bar, and then select **Personalize**.

Navigating the page

When the **Personalization** toolbar is open, the underlying page is read-only (in other words, you can't edit data), but it's still interactive. Specifically, you can expand or collapse the **Related information** pane, switch tabs, and expand or collapse sections, just as you would usually perform those actions on the page. To apply a personalization to a collapsible section or tab (for example, to hide a FastTab), you just have to select the button that appears next to that section or tab when it gains keyboard focus or when you hover over it.

Personalization tools

The following tools are available on the **Personalization** toolbar:

- Use the **Select** tool to select and change the properties of an element. To use this tool, select the **Select** button on the toolbar, and then select the desired element. The element's property window appears, where you can change any of the properties of that element. You can repeat the process for other elements that can be personalized on the page. Note that some personalization properties might not be available in some scenarios. For example, you can't lock a field that is required.
- Use the **Hide** tool to hide an element on the page. To use this tool, select the **Hide** button on the toolbar, and then select the element to hide. When you use the **Hide** tool, all elements that are currently hidden are made visible, but they are shown in a shaded container. You can then make an element visible by selecting it. To see how the page will look when elements are hidden, switch to another personalization tool or close the personalization toolbar.
- Use the **Add fields** tool to add fields to your page. When you use this tool, you can add only fields that are part of the page definition. For information about how to create new fields that aren't part of the current page definition, see [Create and work with custom fields](#). After you select the **Add fields** button on the toolbar, you must first select the grid or section where you want to add a field. A dialog box will show the list of fields that are related to the selected grid or section. In the dialog box, select one or more fields to add, and then select **Update**. To remove a field that you previously added, repeat the process, but clear the selection of the field in the dialog box.
- Use the **Move** tool to move an element to a different location in the current group of elements. Note that you can't move an element outside its parent group. To use this tool, select the **Move** button on the toolbar, and then select the element to move. When you select an element, the app determines the locations where the element is allowed to be moved. These locations are known as *drop zones*. As you drag the element around in the current group, each drop zone is shown as a colored, bold line next to the area where the element can be dropped.
- Use the **Skip** tool to remove an element from the page's keyboard tab sequence. When you select the **Skip** button on the toolbar, all elements that are currently skipped are shown in a shaded container. You can interactively remove or add fields to the tab sequence.
- Use the **Show in header** tool when you want a field to appear in the FastTab's summary section. When

you select the **Show in header** button on the toolbar, all fields that have been selected as summary fields are shown in a shaded container. You can interactively add fields to the FastTab summary and remove fields from the summary by selecting the fields.

- Use the **Require** tool to designate an element as required for data entry. When you select the **Require** button on the toolbar, all elements that have been personalized to make them required are shown in a shaded container. You can then make them not required again. This option is available in version 10.0.12 and later when the **Designate fields as required using personalization** feature is turned on.
- Use the **Lock** tool to mark an element as either editable or noneditable. When you select the **Lock** button on the toolbar, all elements that are currently noneditable are shown in a shaded container. You can then make them editable again. Note that some fields are required and can't be made noneditable. A padlock symbol appears next to those fields.
- Use the **Add an app from Power Apps** tool to embed an app that was created by using Microsoft Power Apps into the page. For detailed information about how to embed an app from Power Apps into a page, see [Embed apps from Power Apps](#). This option is available only when the [Saved views](#) feature is turned off.
- Use the **Add an app** button to embed an app, either one created from Microsoft Power Apps or a third-party, into the page. This option is only available when the [Saved views](#) feature is turned on.
- Use the **Clear** tool to reset the page to its default, installed state. All personalizations on the current page will be cleared. You can't undo this action. Therefore, use this tool only if you're sure that you want to reset the page. When the **Saved views** feature is turned on, this tool clears the personalizations for the current view.
- Use the **Import** tool to load a personalization from a file that you or someone else previously created.
 - When the **Saved views** feature is turned off, you can choose whether to add or replace your existing personalizations with the personalizations that are being imported for the page. You can't undo this action. Therefore, after you import personalizations, you must manually clear or undo any changes that you don't want.
 - When the **Saved views** feature is turned on, the imported personalizations will become a view on the page. If the view already exists, you will have the option to skip the import, replace the current view that has the same name, or rename the imported view.
- Use the **Export** tool to save your personalizations for the page to a file. You can then share your personalizations with other users. Those users just have to import the file that contains your personalizations for the page. When the **Saved views** feature is turned on, this tool saves your current view to a file for sharing.
- Select the **Close** button to close the **Personalization** toolbar and return the page to its previous interactive state.

Traditionally, when the **Personalization** toolbar is used, your personalizations take effect as soon as you make them. However, if the [Saved views](#) feature is turned on, you must explicitly save personalizations to a view that you choose.

In some cases, when you select a tool, a padlock symbol appears next to an element. This symbol indicates that you can't modify the element properties that are related to the selected tool, because changes to those properties will prevent the page from working correctly.

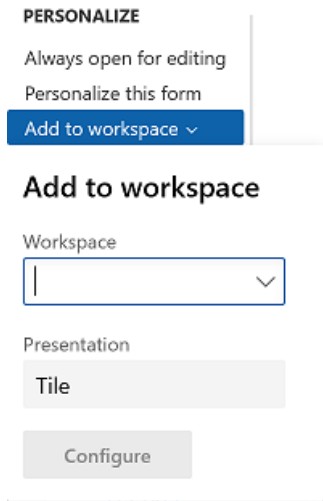

Adding tiles, lists, and links to a workspace

For some pages that include lists, the **Add to workspace** personalization feature is available in the **Personalize** group on the **Options** tab of the Action Pane. This feature lets you push relevant information from the current list to a specific workspace. The information that appears in the workspace can be based on either

the whole list, or a filtered and sorted version of the list. You can also specify whether the information appears in the workspace as a list, a summary tile that can show the number of items in the list, or a link.

NOTE

If the [Saved views](#) feature is turned on, the content that you push to a workspace is directly linked to a view. The view's query is used to retrieve data into the workspace, and the corresponding tile or link in the workspace opens the page to that view, so that the view's query and personalizations are applied to it. If the view is updated, the corresponding workspace elements will be adjusted to the new view definition.

- To add a list to a workspace, first sort or filter the list on the page so that it shows the information as you want it to appear in the workspace. (If the **Saved views** feature is turned on, you can't continue until you save a view that has these conditions.) Then select **Add to workspace**. Select a workspace, and then, in the **Presentation** field, select **List**. After you select **Configure**, a dialog box appears, where you can select the columns that should appear in the list in the workspace. You can also specify the label that is used for the list in the workspace.
- To add a tile to a workspace, first filter the list on the page so that it shows the data that should be summarized or that you want quick access to. (If the **Saved views** feature is turned on, you can't continue until you save a view that has these conditions.) Then select **Add to workspace**. Select a workspace, and then, in the **Presentation** field, select **Tile**. After you select **Configure**, a dialog box appears, where you can specify the label that should be used for the tile in the workspace. You can also specify whether the tile should show a count. After the tile is added to the workspace, you can select it to open the current page from the workspace. You can then view the filtered list that is associated with the tile.
- To add a link to a workspace, first filter the list on the page so that it shows the data that you're interested in. (If the **Saved views** feature is turned on, you can't continue until you save a view that has these conditions.) Then select **Add to workspace**. Select a workspace, and then, in the **Presentation** field, select **Link**. After you select **Configure**, a dialog box appears, where you can specify the label that should be used for the link. You can also optionally specify a label for a new section that contains this link.

After you've added a list, tile, or link to a workspace, you can open that workspace and rearrange the elements in it as you want.

Adding a summary from a workspace to a dashboard

Some workspaces contain count tiles (that is, tiles that have numbers on them), and you might want those tiles to appear on your dashboard too. In a workspace, right-click a count tile, select **Personalize**, and then, in the tile's property window, select **Pin to dashboard**. The next time that you open and refresh the dashboard, the count will appear below the navigation tile for that workspace. You can select that count to go directly to the data that it represents.

Personalizing your dashboard

The dashboard is often the first page that you see when you open the app. It can be personalized like any other page in the system, by using the same mechanisms that are described earlier in this topic.

WARNING

Currently, when you hide content on the dashboard, it's important that you directly target a tile, not the space around it. If you hide the group around a tile, there could be unexpected results if more tiles are added later, or if the system is switched to a different language.

One unique personalization capability that is available on the dashboard is the ability to add tiles.

- If the **Full-page apps** feature is turned off, you add a new tile by right-clicking an element on the dashboard and then selecting **Add a workspace**. A new workspace tile is created at the bottom of the dashboard. You can rename this new workspace tile as you want. You can also add lists, tiles, and links to the workspace, as described in the [Adding tiles, lists, and links to a workspace](#) section of this topic.
- If the **Full-page apps** feature is turned on, you add a new tile by right-clicking an element on the dashboard and then selecting **Add an app**. In the dialog box, select whether you want to add a tile for a new workspace or a tile that has content from Power Apps or a website. Then follow the steps to configure the option that you selected. A new tile is created at the bottom of the dashboard.

Sharing personalizations

After you personalize a page, you can share your personalizations with other users by exporting the personalized page. You can then ask other users to import the personalization file. Alternatively, you can give your personalizations to a user who has admin privileges. That user can then apply your personalization file to many users at the same time by using the **Personalization** administration page.

Administration of personalizations

The **Personalization** page is the central hub for managing personalizations at an organizational level. The content and capabilities on this page depend on whether the **Saved views** feature has been turned on.

For customers who have turned on the **Saved views** feature, see the "Managing views globally" section in the [Saved views](#) topic.

For customers who haven't yet turned on the [Saved views](#) feature, this page has four tabs:

- **Apply** – You can import or select a personalization for one or more users. To apply a personalization to one or more users, first select a role and users who have that role. Then either select an existing personalization to apply to the selected users, or import a personalization file. The personalization is validated and will be applied to all the selected users the next time that they open the selected page.
- **Clear** – You can clear all personalizations for a page or workspace for one or more users. First select a page or workspace to see a list of the users who have personalized it. Then select the users who should have personalizations for that page or workspace cleared, and select **Clear**. All personalizations that the selected users have applied to the selected page or workspace are deleted. This action can't be undone. However, if a personalization was saved for the page or workspace, that personalization can be reimported.
- **Users** – Select a user to see a list of the pages that the user has personalized. You can then turn that user's ability to use personalizations for specific pages, or for the whole system, on or off. You can also import, export, or clear a personalization for the user. In addition, you can reset feature callouts for the user. In this case, if the user previously dismissed any pop-up windows that introduce new features, they will appear again the next time that the user encounters those features.
- **System** – You can temporarily turn off personalization for all users in the system. In this case, all

personalizations are deleted for all users, and all pages are reset to their default state. If you turn personalization back on later, all personalizations are reapplied. You can also permanently delete all personalizations for all users in the system. Personalizations that have been deleted can't be recovered. Therefore, before you perform this task, be sure to export any personalizations that you might want later.

Personalizing inventory dimensions

When you personalize the setup of inventory dimensions on a page, consider the settings that have been created by using the **Display dimension** option. For example, you use personalization to hide a column for the Batch number inventory dimension, but the column appears the next time that the page is opened. This behavior occurs because the **Dimension display** settings control the inventory dimension columns that are shown. The **Dimension display** settings apply across all pages and override any personalized setup of inventory dimension fields on individual pages.

Therefore, in the preceding example, if you don't want the column for the Batch number inventory dimension to appear on a page, you must clear that dimension as part of the **Display dimensions** option for that page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Saved views

2/18/2021 • 20 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [Service update availability](#).

Introduction

Personalization plays an important role in allowing users and organizations to optimize the user experience to meet their needs. For more details on personalization, see [Personalize the user experience](#).

Traditional personalization let users have only one set of personalizations per page. The **Saved views** feature expands on personalization in several important ways:

- Views permit users to have multiple named sets of personalizations per form, which they can quickly switch between as needed. This allows a user to create multiple optimized views of a page, where each view has been tailored to fit the needs of performing a particular business task.
- Views created for particular page types can also include user-added filters or sorts, which allows users to quickly return to commonly filtered datasets. See the [What pages support views](#) section for more details.
- Views can be published to users in specific security roles and specific legal entities. Therefore, any user who has a specified role and access to a specified legal entity can access and use that view, even if that user doesn't not have permission to personalize. This publish capability lets organizations define corporate, standard views that are optimized for their business. For more information, see the [Managing personalizations at an organizational level with views](#) section.
- Unlike traditional personalization, views aren't automatically saved when a user performs personalizations or filters a list. Explicit saves are required to give users the flexibility to create a view before or after the changes that are associated with that view have been made. This requirement also ensures that view definitions aren't unintentionally changed by filters or personalizations that aren't intended for long-term use. Items that the system automatically stores as part of typical page usage (for example, column widths, or the expanded or collapsed state of sections) will be saved per view.
- Views can be added to workspaces as tiles, lists, or links. Therefore, a filtered data set can be surfaced in a workspace, and users can associate a set of personalizations that is relevant to that data set with a tile or link.

Switching between views

After views have been made available for an environment, the top of any page that supports views will include a collapsed view selector control that shows the name of the current view.

There are two size variations to the view selector:

- **Large view selectors** – Pages that prominently feature a list will have a larger view selector for a few reasons. Most importantly, the larger view selector indicates the pages where the view can include user-defined filters. Because filters are included in the views, the larger selector size is also warranted as the view names will often be the best description of the data shown on the screen and the expectation is that users will switch between views more often on these page types.
- **Small view selectors** – All other full-screen pages (except workspaces and the dashboard) have a smaller view selector that appears next to the page caption. Views on these pages include only personalizations, not

user-defined filters. On these pages, the caption or record title is often the most important information at the top of the page. The smaller size of the view selector also reflects the lower frequency of view switching that is expected on these pages.

If you select the view name, the view selector is opened and shows the list of available views for the page.

- **Standard view** – The **Standard** view is the out-of-box view of the page, where no personalizations are applied.
- **Personal views** – The views without padlocks represent your personal views. These are views that either you have created or that an administrator has given to you.
- **Locked views** – Some views (such as the **Standard** view and any views that are published to your role) have a padlock symbol next to them in the view selector. This symbol indicates that you can't edit those views. However, changes that reflect page usage are automatically saved. These changes include changes to the width of a grid column, and changes to the expanded or collapsed state of a FastTab. Nevertheless, if you have personalization privileges, you can use the **Save as** action to make a personal view that is based on a locked view.
- **New views** – Published views that haven't yet been opened have a spark symbol to the left of the view name.

To switch to a different view, first open the view selector and then select the view that you want to load.

Creating and modifying views

Unlike traditional personalization, views aren't automatically saved when a user personalizes the page, or when a user applies a filter to a list or sorts it. An explicit action is required to save these changes to a view. This requirement gives users the flexibility to create a view before or after the changes that are associated with that view have been made. It also ensures that view definitions aren't unintentionally changed by one-time filters or personalizations. Note that typical page usage items (for example, column widths, or the expanded or collapsed state of sections) are automatically saved to the current view, even for locked views.

To ensure that the current state of the view is known, when you start to change a view by personalizing or filtering it, an asterisk (*) appears next to the current view name. This symbol indicates that you're looking at an unsaved, modified version of that view.

If you want to save those changes, follow these steps.

1. Select the view name to open the view selector.
2. To modify the existing view, select **Save**. Note that this action isn't available for locked views.
3. To create a new view:
 - a. Select **Save as**.
 - b. Enter a view name and (optionally) a description.
 - c. Select **Save**.

Changing the default view

The default view is the view that the system tries to open when you first open the page. You should set the default view to the view that you expect to use most often.

NOTE

There is a single, global default view across companies. If you change the default view, that view will be opened by default, regardless of the legal entity that you're currently in.

To change the default view for a page, follow these steps:

1. Switch to the view that you use as the default.
2. Select the view name to open the view selector.
3. Select **More** and then **Pin as default**.

Alternatively, when you create a new view (by using the **Save as** action), you can make that new view the default view by setting the **Pin as default** option before you save the view.

Note that, in some cases, the query that is associated with the default view isn't run when you first open a page. For example, if you open the page through a tile, the tile's query will be run, regardless of the query that is associated with the default view. Additionally, if you open a page that has a **Standard** view that already has a defined query, the original query will be run instead of the default view's query. In this case, you will receive an informational message when the view is loaded. If you switch views after the page has been loaded, the view query should be able to be run as expected. In version 10.0.10 and later, the informational message that you receive will have an embedded action that lets you load the default view's query directly.

Managing personal views

The **Manage my views** dialog box gives you basic maintenance capabilities over your personal views and the order of views in the view selector. To open this page, select the view name to open the view selector drop-down menu, select **More**, and then select **Manage my views**.

For a list of available views for that page, the following set of actions are available.

- **Change the default view** – Use the **Pin as default** action to make the currently selected view the default view for this page.
- **Reorder your views** – Use the **Move up** and **Move down** actions to rearrange your views in a specific order.
- **Rename a view** – Use the **Rename** action to change the name of the currently selected personal view. This action is turned off for locked views.
- **Delete a view** – Use the **Delete** action to permanently delete the currently selected view from the page. There is no way to recover a view after you remove it.

Any changes made in this dialog box will take effect after you select the **Save** button.

Managing personalizations at an organizational level with views

To help you understand how saved views help improve management of personalizations at an organizational level, this section describes some differences in personalization management with and without the **Saved views** feature.

Without views, administrators would apply a set of personalizations for a page to a user or a group of users via the Personalization page. If those users had personalization rights, the personalizations would be applied to that page. However, there was no ability to prevent users from further personalizing the page, which meant the organization could not ensure that its users had a consistent user interface. If any of those users didn't have personalization rights, the personalizations given to them by an administrator were not loaded. Further, if new users were hired into an organization, administrators needed to manually load a set of personalizations for the user. There was no automatic mechanism for specifying that a certain set of personalizations should be available for users in that role.

The **Saved views** feature makes organizational management of personalizations much easier, primarily because views can be published to groups of users. After a view has been published, any user who has one of the defined security roles and access to one the specified legal entities can see and use the view, even if that user doesn't have access to personalization. Although every user has a copy of the published view, where page usage

items are automatically applied, no user can save personalizations or query updates to a published view. In other words, published views are locked. Additionally, if new users are assigned to roles in legal entities that views were published to, they will automatically see the views that are associated with their roles and legal entities. No additional action is required by the admin. Likewise, if users change roles in an organization or are given access to different legal entities, they might no longer be able to access the views that were previously published to them. Again, no additional action is required by the admin.

Updates to a published view can easily be distributed to users by republishing the view to the appropriate security roles and legal entities.

The publish capability allows organizations to define corporate standard views that are optimized for their business, targeted at users in specific security roles.

Publishing views

During the publishing process, views can be assigned to one or more security roles for one or more legal entities. Therefore, any user who has access to a legal entity and is assigned to one of those roles can access and use the views. However, the user can't edit the views. By default, system admins have access to the **Publish** action in the view selector drop-down menu. However, other trusted users in your organization can also be given access to view publishing via the new **Saved views administrator** role.

To publish a view, follow these steps:

1. Create and save a personal copy of the view that you want to publish.
2. With that view currently loaded, select the view name to open the view selector drop-down menu.
3. Select the **More** button and then select **Publish**. The Publish dialog box will open.
4. Enter a name for the view. The name that you enter is the name that users who receive this view will see in their view selectors. The names of published views for a page must be unique. No duplicate names are allowed, even if the list of roles or legal entities that the views are applied to differ.
5. **Update 10.0.17 or later:** If the **(Preview) Translation support for organization views** feature is turned on, you can add translations for your view name in as many languages as your organization requires by selecting the **Translations** button next to the **Name** field. The view name will then be shown to users in their current language. You can also set the default language to specify the translation that will be shown to users who are running languages that no translation is defined for.
6. Optional: Enter a description for the view, so that users who receive this view can better understand its purpose.
7. Determine whether the view should be published as the default view for the selected users. When a view is made the default view, users will see it the next time that they open the target page. The single, global default view of every targeted user will be changed. However, users can still change their default view after publishing has occurred.
8. Add the security roles that correspond to the users who are being targeted by this view.
9. Determine whether you want to publish the view to the child roles of each security role that is selected. If you do, select the **Include child roles** check box in the row for the appropriate security roles. Note that this check box isn't available for roles that don't have child roles.
10. Add the legal entities that this view should be available for.
11. Select **Publish**.

Note that in some environments, it may take some time (up to an hour) before users see the published view.

NOTE

Be aware of the following expectations when you publish a view to a legal entity, or when you publish a view as the default view.

- If you publish a view as the default view to all or some legal entities, you change the single, global default view of every targeted user. If a user has roles where multiple views are published as the default view, the last view that was published will be used as the user's default view.
- If you publish a view to a legal entity, but you don't publish it as the default view, users will initially see the view in the view selector only for the specified legal entities. However, after the view is loaded for the first time, it will always be in the user's view selector for that page, regardless of the legal entity.

Modifying a published view

After you publish a view, you might find that you want to change it. Although you can't make live changes to a published view, because these views are locked for editing for all users (including publishers), you can republish a view to update it.

If the changes that you want to make to a published view only involve the publish parameters (the name and description of the view, or the security roles the view is published to), do the following:

1. Switch to the published view for the parameters that you want to update.
2. On the view selector drop-down menu, select **Republish**. If you're using version 10.0.12 or earlier, you must select **Publish** and then **Yes** to update the existing view.
3. Update the name, description, security roles, and legal entities for the view.
4. Select **Publish**. If you originally selected this published view as the default view, it will be the default view for users again after you republish it.

If the changes to the published view involve modifications of the personalizations or filters that are associated with the view, follow these steps.

1. Load the published view that you want to change.
2. Make the required changes to the local draft.
3. On the view selector drop-down menu, select **Republish**.
4. Select **Yes** to indicate that you want to publish the view together with its unsaved changes.
5. Adjust any publishing parameters that require adjustment, and then select **Publish**.

Managing published views

Like managing personal views, the **Manage my views** dialog box gives users with publish privileges basic maintenance capabilities over that page's published views (in addition to their own personal views). To open this page, select the view name to open the view selector drop-down menu, select **More**, and then select **Manage my views**.

Although all users have a **My views** tab that show their personal views, users who have publish privileges also have an **Organization views** tab that shows all the published and unpublished views for that page. Because several users might be publishing views, it's important that you be able to manage the full list of published views, even if you aren't the user who published a given view.

For the list of all published views for the page, the following set of actions are available.

- **Republish** – Use the **Republish** action to republish a view after publishing parameters (name, description, security roles, or legal entities) are changed.
- **Publish** – Use the **Publish** action to publish a view that is currently unpublished.

- **Unpublish** – Use the **Unpublish** action to make a view inactive. The view will still be available in the system, but users won't see it in the view selector until the view is published again.
- **Save as personal** – Use the **Save as personal** action to create a personal draft copy of the published view. This capability can help you understand the contents of a view that wasn't published to you or that hasn't yet been published. You can also use it to edit and then republish a view.
- **Delete** – Use the **Delete** action to permanently delete a published or unpublished view. This action also removes the view for all users in the system. The removal of published views takes effect after the **Save** button is selected. After a view is deleted, it can't be recovered.

Managing views globally

Although some management capabilities are surfaced on every page, as indicated in this topic, **system administrators** and **saved view administrators** can manage views more holistically for the system via the **Personalization** page. In particular, this page has the following sections and capabilities:

- **Published views** – This section lists all views that have been published for your organization. From here, you can republish a view after you adjust the security roles or legal entities that the view targets. You can also export, delete, or unpublish views. You can use the **Save as personal** action to create a personal copy of a view, so that you can update the view or gain a better understanding of its contents.
- **Unpublished views** – This section lists all the organization views in your system that aren't currently published. These views most often come into the system through the import capability. You can publish, export, or delete these views. The **Quick publish** action that was added in version 10.0.12 enables multiple views from this section to be published in one action, by using the existing security role and legal entity configurations. You can use the **Save as personal** action to create personal copies of these views, so that you can gain a better understand their contents.
- **Personal views** – This section lists all views that have been created by users in the system. From here, you can publish a personal view to the organization, or copy one or more of these views to other users. You can also export or delete these views as required.
- **User settings** – Select a user to view, or adjust the user's ability to use personalization either for the whole system or for specific pages that the user has visited. You can view and interact with the user's personalizations in the system. You can also delete all personalizations for that user or reset feature callouts for the user. If feature callouts are reset, any pop-up windows that introduced new features and that the user previously dismissed will appear again the next time that the user encounters those features.
- **System settings** – You can temporarily turn off personalization for all users in the system. In this case, no personalizations are applied for any user, and all pages are reset to their default state. If you turn personalization back on later, all personalizations are reapplied. You can also permanently delete all personalizations for all users in the system. Personalizations that have been deleted can't be recovered. Therefore, before you perform this task, be sure to export any personalizations that you might want later.

Users who have access to the **Personalization** page can also import personal or organization views by using the **Import views** button on the Action Pane. For organization views, you can select **Publish immediately** to make the views available to users without an additional explicit publish.

Known issues

For a list of known issues with saved views, please see [Build forms that fully utilize saved views](#).

Frequently asked questions

How do I enable saved views in my environment?

NOTE

The **Saved views** feature requires the Personalization system in Finance and Operations to be enabled. If personalization is turned off for the entire environment, views will be disabled even if you follow steps below.

You can turn the **Saved views** feature on and off through Feature management in any environment. After it's turned on, saved views will be enabled in all subsequent user sessions.

What happens to existing personalizations when views are enabled?

When views are enabled, any existing personalizations for a user and form are saved into a new view called **My view** that is automatically set as the default view. This is meant to ensure that there is a consistent user experience before and after views are enabled, except for the view selector control appearing on forms.

What pages support views?

Views are available on most, but not all pages. Specifically, views are currently available on all full-screen pages except for dashboards and workspaces. Non-full-screen pages, which include dialog boxes, drop-down dialogs, lookups, enhanced previews, currently do not support views. View support for additional page types, such as workspaces and dialog boxes, may be considered for a future update.

Who is allowed to publish views?

Only system admins and users who have been assigned to the **Saved views administrator** role have the rights to publish views.

Why am I not able to save filters with this view?

There are a few reasons why a filter may not appear to save with a view:

- The page may not support saving filters as part of the view definition. Note that only pages with large view selectors allow personalizations and query modifications to be saved as a view. See the **Switching views** section for more information.
- The page in question may not properly support views, as it may ignore the view query completely or may operate on a temporary table whose data is not persistent.

What data will I see when I visit a page?

For pages that have small view selectors (only personalizations can be saved to the view), you will see the same data as you always have when you visit the page.

For pages that have large view selectors (both personalizations and queries can be saved to the view), you will typically see the data that is linked to the query that is associated with your default view. There are two main exceptions:

- If you navigate to a page from a tile, the tile query will execute regardless of the query associated with the default view. If you created that tile after views have been enabled, selecting a tile will open the page with the view associated with that tile.
- If you navigate to a page and that entry point includes a query, the original query will execute originally in place of the default view's query. You should be alerted when this occurs via an informational message when the view is loading. You can also confirm by switching to this view after the page loads, as that should allow the view query to execute regardless.

Standard saved views for Supply Chain Management

2/18/2021 • 6 minutes to read • [Edit Online](#)

Microsoft Dynamics 365 Supply Chain Management includes several saved views that you can enable and use as needed. Some of these standard saved views are optimized and named for a specific role or task (for example, "Quality control" or "Receiving"). Others are optimized so that they include only the fields and settings that Microsoft usage statistics indicate are most often used by customers. These saved views are typically referred to as *simplified* views. This topic describes the standard saved views that are available, and explains how to enable and customize them.

For complete details about how to work with saved views, including the standard saved views, after you enable them, see [Saved views](#).

Customizing the standard saved views

You can customize the standard saved views, just as you can customize your own saved views. However, when you customize a standard saved view, we strongly recommend that you save your custom version under a new name. Otherwise, your customizations could be overwritten when you update Supply Chain Management.

For more information about how to customize and rename saved views, see [Saved views](#).

Available saved views and how to enable them

To use the saved views feature, regardless of whether you will use the standard saved views, you must turn on the *Saved views* feature in [Feature management](#).

The remaining sections of this topic provide tables that describe the standard saved views that are currently available for each relevant module. Each table shows the name of each saved view, the page where you can find it, and a description of it. Each table also shows the name of the feature that includes the saved view. To see a standard saved view in your system, you must turn on the specified feature in [Feature management](#).

Saved views for the Inventory management module

The following table describes the saved views available for the Inventory management module.

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
On-hand list	Financials	This simplified view lets you focus on financial information while you manage on-hand inventory.	Saved views for Inventory management
On-hand list	Quality control	This simplified view lets you focus on quality control while you manage on-hand inventory.	Saved views for Inventory management

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
On-hand list	Receiving	This simplified view lets you focus on receiving operations while you manage on-hand inventory.	Saved views for Inventory management
On-hand list	Shipping	This simplified view lets you focus on shipping operations while you manage on-hand inventory.	Saved views for Inventory management
Transactions	Simplified	This simplified view lets you review inventory status without being distracted by financial information and other fields that are used less often.	Saved views for Inventory management
Transfer orders	Shipping	This simplified view lets you focus on shipping operations while you manage transfer orders.	Saved views for Inventory management
Transfer orders	Receiving	This simplified view lets you focus on receiving operations while you manage transfer orders.	Saved views for Inventory management
Transfer orders	Quality control	This simplified view lets you focus on quality control while you manage transfer orders.	Saved views for Inventory management
Transfer orders	Financials	This simplified view lets you focus on financial information while you manage transfer orders.	Saved views for Inventory management

Saved views for the Master planning module

The following table describes the saved views available for the Master planning module.

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
Planned orders: Planned order details page	Simplified	This simplified view includes only the fields that are most often used to work with the details of a single planned order. In this way, it provides a quicker overview and a streamlined work process.	Saved views for planned orders

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
Planned orders: Planned orders list page	Simplified	This simplified view includes only the fields that are most often used to work with the list of planned orders. In this way, it provides a quicker overview and a streamlined work process.	Saved views for planned orders

Saved views for the Procurement and sourcing module

The following table describes the saved views available for the Procurement and sourcing module.

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
Purchase order details	Order creation	This simplified view is optimized for creating new purchase orders.	Saved views for purchase orders
Purchase order details	Inventory management	This simplified view is optimized for performing inventory-related activities, such as following up on inventory that has been received, receiving inventory, checking net requirements, and adjusting order quantities.	Saved views for purchase orders
Purchase order details	Financial management	This simplified view is optimized for performing finance-related activities, such as invoicing and checking prices, totals, and charges.	Saved views for purchase orders
Purchase order details	Order approval	This simplified view is optimized for approving purchase orders.	Saved views for purchase orders

Saved views for the Production control module

The following table describes the saved views available for the Production control module.

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
Production order BOM page	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved views for production control

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
Production order details page	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved views for production control
Production order picking list page	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved views for production control
Production orders list page	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved views for production control

Saved views for the Sales and marketing module

The following table describes the saved views available for the Sales and marketing module.

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
Packing slip journal	Journal review	This simplified view includes only the fields that are most often used to review packing slip journals.	Saved views for sales and marketing
Sales order	Order creation	This simplified view includes only the fields that are most often used to create sales orders.	Saved views for sales and marketing
Sales order	Order review	This simplified view includes only the fields that are most often used to review sales orders.	Saved views for sales and marketing
Sales quotation	Quote creation	This simplified view includes only the fields that are most often used to create sales quotations.	Saved views for sales and marketing

Saved views for the Warehouse management module

The following table describes the saved views available for the Warehouse management module.

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
------	-----------	------------------	--------------

PAGE	VIEW NAME	VIEW DESCRIPTION	FEATURE NAME
All loads	Inbound processing	This simplified view includes only the fields that are most often used to process inbound loads.	Saved views for load processing
All loads	Outbound processing	This simplified view includes only the fields that are most often used to process outbound loads.	Saved views for load processing
All shipments	Inbound processing	This simplified view includes only the fields that are most often used to process inbound shipments.	Saved views for shipment processing
All shipments	Outbound processing	This simplified view includes only the fields that are most often used to process outbound shipments.	Saved views for shipment processing
All waves	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved view for wave processing
Load planning workbench	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved view for the work planning workbench
Work details	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.	Saved view for the work details page

Grid capabilities

2/18/2021 • 21 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [Service update availability](#).

The new grid control provides several useful and powerful capabilities that you can use to enhance user productivity, construct more interesting views of your data, and get meaningful insights into your data. This article will cover the following capabilities:

- Calculating totals
- Typing ahead of the system
- Evaluating math expressions
- Grouping tabular data (enabled separately using the **(Preview) Grouping in grids** feature)
- Freezing columns

Calculating totals

In Finance and Operations apps, users have the ability to see totals at the bottom of numeric columns in grids. A footer section at the bottom of the grid shows these totals.

Showing the grid footer

There is a footer area at the bottom of every tabular grid in Finance and Operations apps. The footer can show valuable information that is related to the data that appears in the grid. Here are some examples of this information:

- The number of selected rows in the table (when you select more than one record)
- Grand totals at the bottom of configured, numeric columns
- The number of rows in the dataset

This footer is hidden by default but you can turn it on. To show the footer for a grid, right-click on a column header in the grid and select the **Show footer** option. After you turn on the footer for a particular grid, that setting will be remembered until the user opts to hide the footer. To hide the footer, right-click on a column header and select **Hide footer**. (The placement of the **Show footer/Hide footer** action might move to a new location in a future update.

Specifying columns with totals

Currently, no columns show totals by default. Instead, this is considered a one-time setup activity, similar to adjusting the widths of columns in grids. Once you specify that you want to see totals for a column, that setting will be remembered the next time you visit the page.

There are two ways to configure a column to show a total:

- Right-click in the column that you want to see a total for, and then select **Total this column**. This action causes three events to occur:
 1. The footer becomes visible.
 2. Your preference for seeing a total for this column is saved.

3. A calculation of totals is initiated for this column and any other columns that you previously configured to see totals for. The time that is required to show a total depends on the size of the dataset that you're totaling.
- After the footer is visible, select **Show total** in the footer area at the bottom of the column that you want to see a total for. If there are no configured columns, the **Show total** button will be available for all numeric columns.

After at least one column is configured for totals, the **Show total** buttons will be available only on hover or focus. The action of selecting **Show total** just saves your preference for seeing a total in this column, so that the preference is applied during future visits to the page. In the footer, this state is indicated by a dash that appears in the column. (Alternatively, if the dataset is small enough, a total is immediately shown.)

If you make a mistake and no longer want to see a total in a particular column, right-click on the column and select **Hide total** or select the **Hide total** button in the footer in that column. This preference will also be saved for future visits to the page.

Calculating totals

When you come to a page with the footer visible and columns already configured for totals, totals may or may not be shown in the footer. The behavior is dependent on the size of the dataset on the page. If the dataset is sufficiently small, totals will be shown automatically, along with the number of rows in the dataset. If there are dashes in the footer under the columns you configured for totals, then the dataset is too large for the system to show totals immediately, and an explicit action is needed to calculate the totals. To do this, click the **Calculate** button in the footer, or right-click on a column you want a total for and select **Total this column**.

If the calculation is taking too long, you can cancel the operation by selecting the **Cancel** button. Sometimes, however, the dataset will be too large to calculate totals (a limit imposed by your organization), and you will instead be notified to filter your data more.

Totals will update automatically as you update, delete, or create rows in the dataset.

Typing ahead of the system

In many business scenarios, the ability to quickly enter data into the system is very important. Before the new grid control was introduced, users could change data only in the current row. Before they could create a new row or switch to a different row, they were forced to wait for the system to successfully validate any changes. In an attempt to reduce the amount of time that users wait for these validations to be completed, and to improve user productivity, the new grid adjusts these validations so that they are asynchronous. Therefore, the user can move to other rows to make changes while previous row validations are pending.

To support this new behavior, a new column for the row status has been added to the right of the row selection column when the grid is in edit mode. This column indicates one of the following statuses:

- **Blank** – No status image indicates that the row has been successfully saved by the system.
- **Processing pending** – This status indicates that the changes in the row haven't yet been saved by the server but are in a queue of changes that must be processed. Before you take action outside the grid, you must wait for all the pending changes to be processed. Additionally, the text in these rows is italicized to indicate the unsaved status of the rows.
- **Invalid state** – This status indicates that some warning or message was triggered during the processing of the row, and it might have prevented the system from saving the changes in that row. In the old grid, if the save operation was unsuccessful, you were forced back into the row to fix the issue immediately. However, in the new grid, you're notified that a validation issue was encountered, but you can decide when you want to fix any issues in the row. When you're ready to fix an issue, you can manually move focus back to the row. Alternatively, you can select the **Fix this issue** action. This action immediately moves focus back to the row that has the issue, and lets you make edits inside or outside the grid. Note that the processing of subsequent

pending rows is stopped until this validation warning is resolved.

- **Paused** – This status indicates that processing by the server is paused because validation of the row triggered a pop-up dialog box that requires user input. Because the user might be entering data in some other row, the pop-up dialog box isn't immediately presented to that user. Instead, it will be presented when the user chooses to resume processing. This status is accompanied by a notification that informs the user about the situation. The notification includes a **Resume processing** action that will trigger the pop-up dialog box.

When users are entering data ahead of the place where the server is processing, they can expect a few degradations in the data entry experience, such as a lack of lookups, control-level validation, and entry of default values. Users who need a drop-down list to find a value are encouraged to wait for the server to catch up to the current row. Control-level validation and entry of default values will also occur when the server processes that row.

Pasting from Excel

Users have always been able to export data from grids in Finance and Operations apps to Excel by using the **Export to Excel** mechanism. However, the ability to enter data ahead of the system enables the new grid to support copying tables from Excel and pasting them directly into grids in Finance and Operations apps. The grid cell that the paste operation is initiated from determines where the copied table begins to be pasted in. The contents of the grid are overwritten by the contents of the copied table, except in two cases:

- If the number of columns in the copied table exceeds the number of columns that remain in the grid, starting from the paste location, the user is notified that the extra columns have been ignored.
- If the number of rows in the copied table exceeds the number of rows in the grid, starting from the paste location, the existing cells are overwritten by the pasted content, and any extra rows from the copied table are inserted as new rows at the bottom of the grid.

Evaluating math expressions

As a productivity booster, users can enter mathematical formulas in numeric cells in a grid. They don't have to do the calculation in an app outside the system. For example, if you enter $=15*4$ and then press the **Tab** key to move out of the field, the system will evaluate the expression and save a value of **60** for the field.

To make the system recognize a value as an expression, start the value with an equal sign (=). For more information about the supported operators and syntax, see [Supported math symbols](#).

Grouping tabular data

Business users often need to perform ad-hoc analysis of data. While this can be done by exporting data to Microsoft Excel and using pivot tables, the **Grouping in grids** feature, which is generally available in version 10.0.16/Platform update 40 and is dependent on the new grid control feature, allows users to organize their tabular data in interesting ways within Finance and Operations apps. Because this feature extends the **Totals** feature, **Grouping** allows you to get meaningful insights into the data by providing subtotals at the group level.

To use this feature, right-click the column that you want to group by, and select **Group by this column**. This action will sort the data by the selected column, add a new **Group by** column to the beginning of the grid, and insert "header rows" at the beginning of each group. These header rows provide the following information about each group:

- Data value for the group
- Column name (this information is especially useful when you have multiple levels of grouping)
- Number of data rows in this group
- Subtotals for any column configured to show totals

With [Saved views](#) enabled, this grouping can be saved by personalization as part of a view for quick access the next time you visit the page.

Multiple levels of grouping

After you've grouped data by a single column, you can group the data by a different column by selecting **Group by this column** on the desired column. This process can be repeated until you have 5 nested levels of grouping, which is the maximum supported depth. At this point, you will no longer be able to group by additional columns.

At any point, you can remove the grouping on any column by right-clicking that column and selecting **Ungroup**. You can also remove the grouping from all columns by selecting **Grid options** and then **Ungroup all**.

Note, prior to version 10.0.16/Platform update 40, only one level of grouping is supported. In these versions, if the data is grouped and you select **Group by this column** for a different column, the original grouping is replaced.

Expanding and collapsing groups

The initial grouping of data will have all groups expanded. You can create summarized views of the data by collapsing individual groups, or you can use group expanding and collapsing to assist in navigating through the data. To expand or collapse a group, select the chevron (>) button in the corresponding group header row. Note that the expand/collapse state of individual groups is **not** saved in personalization.

Selecting and unselecting rows at the group level

In the same way that you can select (or unselect) all rows in the grid by selecting the check box at the top of the first column in the grid, you can also quickly select (or unselect) all the rows in a group by selecting the check box in the corresponding group header row. The check box in the group header row will always reflect the current selection state of rows in that group, regardless of whether all rows are selected, no rows are selected, or only some rows are selected.

Hiding column names

When grouping data, the default behavior is to show the column name in the group header row. Starting in version 10.0.14/Platform update 38, you can choose to suppress the column name in group header rows by selecting **Grid options > Hide group column name**.

Freezing columns

Some columns in a grid might be important enough for context that you don't want them to scroll out of view. Instead, you want the values in those columns always to be visible. In version 10.0.17, the **Freeze columns in grid** feature provides this flexibility to users.

To freeze a column, right-click in the column's header, and then select **Freeze column**. The first time that you complete this step, the selected column becomes the first column and will no longer scroll out of view. Any subsequent column that you freeze will be added to the right of the last frozen column. You can use the standard Move functionality to reorder frozen columns as you require. However, frozen columns can't be moved so that they appear among the set of unfrozen columns. Likewise, unfrozen columns can't be moved so that they appear among the set of frozen columns.

To unfreeze a column, right-click in the frozen column's header, and then select **Unfreeze column**.

Note that the row selection and row status columns in the new grid are always frozen as the first two columns. Therefore, when these columns are included in a grid, they will always be visible to users, regardless of the horizontal scroll position in the grid. These two columns can't be reordered.

Frequently asked questions

How do I enable the new grid control in my environment?

10.0.9 / Platform update 33 and later

The **New grid control** feature is available directly in Feature management in any environment. Like other public preview features, enabling this feature in production is subject to the [Supplemental Terms of Use Agreement](#).

10.0.8 / Platform update 32 and 10.0.7 / Platform update 31

The **New grid control** feature can be enabled in Tier 1 (Dev/Test) and Tier 2 (Sandbox) environments in order to provide additional testing and design changes by following the steps below.

1. **Enable the flight:** Execute the following SQL statement:

```
INSERT INTO SYSFLIGHTING (FLIGHTNAME, enabled, FLIGHTSERVICEID, PARTITION)
VALUES('CLIRectGridEnableFeature', 1, 0, 5637144576);
```

2. **Reset IIS** to flush the static flighting cache.

3. **Find the feature:** Go to the **Feature management** workspace. If **New grid control** does not appear in the list of all features, select **Check for updates**.

4. **Enable the feature:** Find the **New grid control** feature in the list of features, and select **Enable now** on the details pane. Note that a browser refresh is required.

All subsequent user sessions will start with the new grid control enabled.

[Developer] Opting out individual pages from using the new grid

If your organization discovers a page that has some issues utilizing the new grid, an API is available starting in version 10.0.13/Platform update 37 to allow an individual form to use the legacy grid control while still permitting the rest of the system to utilize the new grid control. To opt out an individual page from the new grid, add the following call post `super()` in the `run()` method for the form.

```
this.forceLegacyGrid();
```

This API will be honored until the October 2021 release, when the new grid control becomes mandatory. If any issues require that this API be used, report them to Microsoft.

[Developer] Size-to-available-width columns

If a developer sets the **WidthMode** property to **SizeToAvailable** for columns inside the new grid, those columns initially have the same width that they would have if the property were set to **SizeToContent**. However, they stretch to use any extra available width inside the grid. If the property is set to **SizeToAvailable** for multiple columns, all those columns share any extra available width inside the grid. However, if a user manually resizes one of those columns, the column becomes static. It will remain at that width and will no longer stretch to take up extra available grid width.

Known issues

This section maintains a list of known issues for the new grid control.

Open issues

- After enabling the **New grid control** feature, some pages will continue to utilize the existing grid control. This will happen in the following situations:
 - A card list exists on the page that is rendered in multiple columns.
 - A grouped card list exists on the page.

- A grid column with a non-react extensible control.

When a user first encounters one of these situations, a message will display about refreshing the page. After this message appears, the page will continue to utilize the existing grid for all users until the next product version update. Better handling of these scenarios, so that the new grid can be utilized, will be considered for a future update.

- [KB 4582758] Records are blurry when you change zoom from 100 to any other percentage
- [KB 4592012] Unexpected client error in IE11 when pasting multiple lines from Excel
 - Microsoft is not pursuing a fix for this issue

Fixed as part of 10.0.16

- [KB 4598335] Multi-line string controls do not respect their DisplayHeights in lists/cards
- [KB 4591891] Invoice proposal lines disappear when unmarking lines
- [KB 4592104] Unable to edit records after clicking "Fix issue" and moving to a different row without fixing the validation issue
- [KB 4594449] "Never" and "Clear" buttons missing inside the date picker
- [KB 4594448] Entering time is treated differently with the new grid
- [KB 4600059] Unexpected client error with email throttling
- [KB 4574584] Expense attachment preview not available when hovering over the receipt icon

Fixed as part of 10.0.15

- (Quality update) [KB 4594444] Unexpected client error with preview for segmented entry control
- [KB 4582723] Display options not showing when done later in the form life cycle
- [KB 4591988] Issues using the keyboard to select a value from a ReferenceGroup lookup
- [KB 4588958] Regression Suite Automation Tool (RSAT) test fails with error: TypeError: Cannot read property 'text' of undefined
- [KB 4591970] Unexpected client error when pasting from Excel was done immediately after clicking into the grid
- [KB 4591904] Data changes are not saved if after editing a control the user immediately clicked and opened the lookup of a different control
- [KB 4584752] Unexpected client error with Project invoice proposals page
- [KB 4584540] Unable to leave the grid after pasting a single row into a journal line
- [KB 4591908] When creating a new row, focusing is staying in the column you were in

Fixed as part of 10.0.14

- (Quality update) [KB 4584752] Unexpected client error with Project invoice proposals page
- [KB 4583880] Regression Suite Automation Tool (RSAT) tests fail on OpenLookup action with "Cannot read property RowIndex of undefined"
- [KB 4583847] Unexpected client error when navigating through lookups

Fixed as part of 10.0.13

- (Quality update) [KB 4584752] Unexpected client error with Project invoice proposals page
- (Quality update) [KB 4583880] Regression Suite Automation Tool (RSAT) tests fail on OpenLookup action with "Cannot read property RowIndex of undefined"

- [KB 4569434] Refreshing the Legal entities form results in fewer records
- [KB 4575297] Focus keeps moving to the task recorder pane when editing and tabbing through a grid
- [KB 4566773] Correction transactions not showing as negative on voucher transactions inquiry
- [KB 4575288] Focus resets to the active row when selecting the border between rows in a simple list
- [KB 4575287] Focus doesn't return to the first column when using the down arrow to create a new row in journals
- [KB 4564819] Cannot delete lines in a free text invoice (because the datasource ChangeGroupMode=ImplicitInnerOuter)
- [KB 4563317] Tooltips/enhanced previews aren't shown for images

Fixed as part of 10.0.12

- [KB 4558545] Table controls don't update the contents of displayed items.
- [KB 4558570] Items are still shown on the page after the record has been deleted.
- [KB 4558572] Styling that is associated with the List Panel **ExtendedStyle** isn't applied.
- [KB 4558573] Validation errors can't be fixed when the required change is outside the grid.
- [KB 4558584] Negative numbers aren't rendered correctly.
- [KB 4560726] An "unexpected client error" occurs after swapping between lists is done by using a List View control.
- [KB 4562141] Grid indices are off after a new record is added.
- [KB 4562151] The **Validate** and **Copy** task recorder options aren't available for date/number controls.
- [KB 4562153] Multi-select check boxes aren't visible on list/card grids.
- [KB 4562646] You sometimes can't click outside the grid after you multi-select rows in the grid.
- [KB 4562647] Focus is reset to the first control in the **Publish** dialog box after a new row is added in the security roles grid.
- [KB 4563310] The enhanced preview isn't closed after a row is changed.
- [KB 4563313] An "unexpected client error" occurs in Internet Explorer when a value is selected in a lookup.
- [KB 4564557] Lookups and drop-down menus won't open in Internet Explorer
- [KB 4563324] Navigation doesn't work after the **Personnel management** workspace is opened.

Fixed as part of 10.0.11

- [Issue 432458] Empty or duplicated lines are shown at the beginning of some child collections.
- [KB 4549711] Lines in a payment proposal can't be removed correctly after the new grid control is enabled.
- [KB 4558374] Records that require a polymorphic selector dialog box can't be created.
- [KB 4558375] Help text isn't shown on columns in the new grid.
- [KB 4558376] List Panel grids aren't rendered at the correct height in Internet Explorer.
- [KB 4558377] Combo box columns that have **SizeToAvailable** width aren't rendered on some pages.
- [KB 4558378] Drill-through sometimes opens the wrong record.
- [KB 4558379] An error occurs when lookups are opened where **ReplaceOnLookup=No**.
- [KB 4558380] The available space in the grid isn't filled immediately after part of the page is collapsed.
- [KB 4558381] Negative numbers aren't rendered correctly / Users sometimes become stuck after validation issues are encountered.
- [KB 4558382] Unexpected client errors occur.
- [KB 4558383] Controls outside the grid aren't updated after the last record is deleted.
- [KB 4558587] Reference groups that have combo boxes for replacement fields don't show values.
- [KB 4562143] Fields aren't updated after a row change / Grid processing becomes stuck after row deletion.
- [KB 4562645] An exception occurs when a lookup is opened while Regression Suite Automation Tool (RSAT) tests are running.

Fixed as part of 10.0.10

- [Issue 414301] Some data from previous lines disappears when new lines are created.
- [Bug 417044] There is no empty grid message for list-style grids.
- [KB 4539058] Some grids (typically on FastTabs) sometimes aren't rendered (but they will be rendered if you zoom out).
- [KB 4549734] Active rows aren't treated as marked if the marking column is hidden.
- [KB 4549796] Values can't be edited in a grid when it's in view mode.
- [KB 4558367] Text selection is inconsistent when rows are changed.
- [KB 4558368] Multi-select via the keyboard is allowed in single-select scenarios.
- [KB 4558369] Status images disappear in the hierarchical grid.
- [KB 4558370] A new row isn't scrolled into view.
- [KB 4558372] The new grid becomes stuck in processing mode if the number of columns in content that is pasted in exceeds the number of remaining columns in the grid.
- [KB 4562631] Time values aren't formatted correctly.

Quality update for 10.0.9/Platform update 33

- [KB 4550367] Time values aren't formatted correctly.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create and work with custom fields

2/18/2021 • 7 minutes to read • [Edit Online](#)

While there is an extensive set of fields out-of-the-box for managing a broad range of business processes, sometimes there is a need for a company to track additional information in the system. While programmers can be used to add those fields as extensions in the developer tools, the custom fields feature allows fields to be added directly from the user interface, thereby allowing you to tailor the application to fit your business using your web browser.

The ability to add custom fields is available in platform update 13 and later. Only users with special permissions have access to this feature.

This video shows how easy it is to add a custom field to a page: [Adding custom fields](#).

Creating custom fields

After you've identified additional information that you would like to track in the application, you can create the custom field on the appropriate table and expose that new field on a page.

The following steps describe the process for creating a custom field and placing that field on a form.

1. Navigate to the form where the new field is needed.
2. Because the end goal is to expose the custom field on a form, the entry point for creating custom fields exists inside the personalization experience. Open the personalization toolbar by selecting **Options**, and then **Personalize this form**.
3. Click **Insert** and then **Field**.
4. Select the region of the form where you want to expose the new field. After selection, the **Insert fields** dialog box will display a list of existing fields that can be inserted into the selected region of the form.
5. Ensure that the field you are interested in does not already exist in the list. If it does, you can simply select that field in the list and click **Insert**.
6. Click the **Create new field** button above the list to initiate the process of creating a custom field. This will open the **Create new field** dialog box.

If you do not see the **Create new field** button, you do not have the necessary permissions to use this feature.

7. In the **Create new field** dialog box, enter the following information.
 - a. Select the database table where this field should be added. Note that only tables that support custom fields will appear in the drop-down list. See the section below for technical details on supported tables.
 - b. Select the data type for the new field. The available data types are checkbox, date, date time, decimal, number, picklist, and text.
 - If you choose the text data type, you can also specify the maximum length of the text that can be entered in this field.
 - If you choose the picklist data type, you can also select the set of valid values for the field.
 - c. Provide a name, label, and help text for the field. The name corresponds to the physical field name

in the database, whereas the label and help text are the text used to represent this field in the user interface.

8. If this is the only field that you need to create for this form, click **Save**. If you need to create additional fields, click **Save and new** and go back to step 7. Note that there is currently a limit of **20 custom fields per table**.
9. Leaving the **Create new field** dialog box will return you to the **Insert fields** dialog box. Any custom fields that were just added will be automatically marked in the field list to be inserted into the form.
10. Click **Insert** to insert the marked fields into the selected region of the form.
11. **Optional:** Enable **Move** mode from the personalization toolbar to move the new fields to their desired location in the selected region. See [Personalize the user experience](#) for more information about how to use the various personalization capabilities to optimize a form for your personal usage.

Sharing custom fields with other users

After you have created a custom field and exposed it on a form, you might want to provide this updated page view that includes the new field to other users in the system. This can be accomplished in two different ways using the personalization capabilities of the product:

- The recommended route is through the system administrator, who can push a personalization to all users or a subset of users. See [Personalize the user experience](#) for more details.
- Alternatively, you can export your changes (called *personalizations*), send them to one or more users, and have each of those users import your changes. The **Manage** option on the personalization toolbar enables you to export and import personalizations.

Managing custom fields

Management of all the custom fields in the system can be accomplished through the **Custom fields** page in the System administration module. This page allows users access to many capabilities, including:

- Viewing a list of all custom fields in the system.
- Limited editing of existing custom fields.
- Deleting custom fields.
- Exposing custom fields on data entities.
- Providing translations of custom field labels and help text.

Viewing all custom fields

The **Custom fields** page provides visibility to all the custom fields that have been defined in the system. Simply select the table that you are interested in, and the page will update to show a list of the custom fields associated with that table. Choosing a custom field from the list will allow you to view all the details about the field.

Editing custom fields

After a custom field has been created, only certain pieces of information about the custom field can be modified on the **Custom fields** page.

You *can* modify these attributes:

- Label
- Help text
- Length, for Text fields

You *cannot* edit the following attributes:

- Field name
- Data type

Additionally, for picklist fields, the set of valid values for the custom field can be reordered, and new values can be added; however, existing values for the picklist field cannot be removed. Remember to click **Apply changes** when you are done editing fields for a particular table so the changes are saved.

Exposing custom fields on data entities

It may also be important to allow custom fields to be visible on data entities. Data entities are utilized in the [Office integration overview](#) feature, as well as for data import/export scenarios.

Follow these steps to expose a custom field on a data entity:

1. Select the custom field on the **Custom fields** form.
2. Expand the **Entities** section to view the set of relevant entities.
3. Click the **Edit** button.
4. Modify the **Enabled** field to be selected for each entity that should expose this field.
5. Click **Apply changes** to save your selections.

Allowing custom fields to be displayed in other languages

Because custom fields may need to be accessed by users in a variety of languages, the **Custom fields** page provides a mechanism to allow the label and help text for a custom field to be translated into other languages.

The following steps describe the process for translating custom fields in other languages:

1. Select the custom field on the **Custom fields** page.
2. Select the **Translations** button in the Action Pane. This will open a drop-down menu with existing translations for this field.
3. The **Language** drop-down menu shows the set of languages for which translations have already been provided.

If you want to edit an existing translation, select the desired language from the menu and modify the values for the label and help text.

Otherwise, click the **Add language** button, select the desired language from the menu, and then provide translated values for the label and help text.

4. Click **OK** when you are finished.

Deleting custom fields

In some rare cases, you may decide that a custom field is no longer needed. When this occurs, a system administrator can choose to delete the field from the **Custom fields** page. To do this, ensure the correct field is selected, click **Delete**, click **Yes** to confirm the deletion, and finally click **Apply changes**.

NOTE

This action cannot be undone, and will result in the data associated with the field being permanently deleted from the database.

Appendix

Who can create custom fields?

As a safeguard to the system, only system administrators are able to create custom fields by default. However, those power users whom the organization deems necessary can be given rights to create custom fields by a

system administrator using the **Runtime customization power user** security role. Users without this security role will not be able to create custom fields, but will still be able to see and interact with custom fields added by other users in the system.

What tables support custom fields?

For performance and technical reasons, only tables that meet the following conditions currently allow custom fields to be added.

- The table must be tagged as one of these groups:
 - Group
 - WorksheetHeader
 - Main
 - Miscellaneous
 - Parameter
 - Reference
 - TransactionHeader
- The table cannot extend another table.
- The table cannot be marked as a system table.
- The table cannot be a temporary table.

Can I reference custom fields from the developer tools?

Custom fields can only be managed through the user interface and cannot be referenced by code.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Embed canvas apps from Power Apps

2/18/2021 • 8 minutes to read • [Edit Online](#)

Microsoft Power Apps is a service that lets developers and non-technical users build custom business apps for mobile devices, tablets, and the web without writing code. Finance and Operations apps support integration with Power Apps. Canvas apps that you, your organization, or the broader ecosystem develop can be embedded into Finance and Operations apps to augment the product's functionality. For example, you might build a canvas app from Power Apps to supplement a Finance and Operations app with information that is retrieved from another system.

To learn more about embedding Power Apps, watch the short [How to embed Power Apps](#) video.

Adding an embedded canvas app from Power Apps to a page

Overview

Before you embed a canvas app from Power Apps into the client, you must find or build an app that has the desired visuals or functionality. This topic doesn't include a detailed description of the process for building apps. If you're new to Power Apps, see the [Power Apps documentation](#).

There are two ways to access a specific canvas app on a page when you're ready to embed the app. You can choose whichever approach fits your scenario better. The first approach uses the **Power Apps** button that has been added to the standard Action Pane. Apps that you add by using this approach appear as items on the **Power Apps** menu button. When you select one of these items, a side pane that contains the embedded app appears. Alternatively, you can embed an app directly on a page as a new tab, FastTab, or blade, or as a new section in a workspace.

When you configure your embedded canvas app, you can select a single field that you want to send as context to the app. This step enables the app to be responsive, based on the data that you're currently viewing.

NOTE

You can't currently use this mechanism to embed modeled apps.

Details

The following procedure shows how to embed a canvas app from Power Apps into the web client.

1. Go to the page where you want to embed the canvas app. This page will be the page that contains data that must be passed to the app as input.
2. Open the **Add an app from Power Apps** pane:
 - Click **Options**, and then select **Personalize this page**. Under the **Insert** menu, choose **Power Apps**. Finally, select the region where you would like to add the app. If you want to embed the app under the Power Apps menu button, choose the Action Pane. If you want to embed the app directly onto the page, choose the appropriate tab, FastTab, blade, or section (if you're on a workspace).
 - If the app will be accessed using the Power Apps menu button, you can alternatively click the **Power Apps** menu button in the standard Action Pane, and then select **Add an app**.
3. Configure the embedded app:
 - The **Name** field indicates the text shown for the button or tab that will contain the embedded app. Oftentimes, you may want to repeat the name of the app in this field.

- The **App ID** field indicates the globally unique identifier (GUID) for the canvas app that you want to embed. To retrieve this value, find the app on make.powerapps.com, and then look in the **App ID** field under **Details**.
 - For **Input context for the app**, you can optionally select the field that contains the data that you want to pass to the app as input. See the section later in this topic titled [Building an app that leverages data sent from Finance and Operations apps](#) for details on how the app can access the data sent from Finance and Operations apps.
 - Choose the **Application size** that matches the type of app that you're embedding. Select **Thin** for apps built for mobile devices, and **Wide** for apps built for tablets. This ensures a sufficient amount of space is allotted for the embedded app.
 - The **Legal entities** FastTab provides the ability to choose which legal entities the app is available for. The default is to make the app accessible to all legal entities. This option is only available when the [Saved views](#) feature is disabled.
4. After confirming that the configuration is correct, click **Insert** to embed the Power App on the page. You will be prompted to refresh the browser in order to see the embedded app.

Sharing an embedded app

After you've embedded a canvas app on a page and confirmed that it's working correctly with any data context that is passed from that page, you might want to share the app with other users in the system. To share an embedded canvas app, follow these steps.

1. [Share the canvas app](#) with the appropriate users, so that they can access the app in Power Apps.
2. Make sure that the targeted users have the appropriate personalizations, so that the embedded app appears when those users view the page. You can use either of the following approaches:
 - Recommended: Use the [Saved views](#) feature to create and publish a view that includes the embedded app. This approach ensures that all users who have the security roles that are targeted by the published view will see the app in Finance and Operations apps.
 - If you don't have the Saved views feature turned on, you can have the system admin push a personalization that includes the embedded app to all users or a subset of users. Alternatively, you can export your page's personalizations, and send them to one or more users. Each of those users can then import the personalizations. The personalization toolbar has actions that let you export and import personalizations.

NOTE

If the canvas app has been shared with external users, those users can't use the embedded app inside Finance and Operations apps. However, they can access the app directly inside Power Apps. External users include guests and users who don't belong to the Microsoft 365 Azure Directory where the Finance and Operations app is deployed.

See [Personalize the user experience](#) for more details about the personalization capabilities in the product and how to use them.

Building a canvas app that uses data that is sent from Finance and Operations apps

When you build a canvas app that will be embedded in a Finance and Operations app, one important part of the process is to use the input data from that Finance and Operations app. From the Power Apps development experience, the input data that is passed from a Finance and Operations app can be accessed by using the `Param("EntityId")` variable.

For example, in the OnStart function of the app, you could set the input data from Finance and Operations apps to a variable like this:

```
If(!IsBlank(Param("EntityId")), Set(FinOpsInput, Param("EntityId")), Set(FinOpsInput, ""));
```

Viewing a canvas app

To view an embedded canvas app on a page in Finance and Operations apps, just go to a page that has an embedded app. Remember that apps can be accessed by using the **Power Apps** button on the standard Action Pane. Alternatively, they can appear directly on the page as a new tab, or FastTab, or blade, or as a new section in a workspace. When users first try to load an app on a page, they will be prompted to sign in. This step ensures that the users have the appropriate permissions to use the app.

Editing an embedded app

After an app has been embedded onto a page, you may need to make some changes to the configuration of the app. For example, perhaps you want to modify the label associated with the embedded app or a new version of the app has been created and you need to update the App ID to point at the latest.

Follow these steps to edit the configuration of an embedded app:

1. Go to the **Edit the app** pane.
 - If the embedded app is accessed through the Power Apps menu button, right-click on the Power Apps menu button and select **Personalize**. Select the app that you want to configure from the **Select an app** drop-down menu.
 - If the embedded app appears directly on the page, select **Options**, and then select **Personalize this page**. Using the **Select** tool, click the embedded app.
2. Make the needed modifications to the app configuration, and then click **Save**.

Removing an app

After an app has been embedded onto a page, there are two ways to remove it if needed:

- Go to the **Edit an app** pane using the instructions from the [Editing an embedded app](#) section earlier in this topic. Confirm that the pane displays information for the embedded app that you would like to remove, and then click the **Delete** button.
- Because the embedded app is saved as personalization data, clearing your page's personalization will also remove any embedded apps on that page. Note that clearing the page's personalization is permanent and cannot be undone. To remove your personalizations on a page, select **Options**, and then **Personalize this page**, and finally the **Clear** button. After refreshing your browser, all the previous personalizations for this page will be removed. See [Personalize the user experience](#) for more information about how to optimize pages using personalization.

Appendix

[Developer] Specifying where an app can be embedded

By default, users can embed apps on any page, either under the Power Apps menu button or directly on the page as a tab, FastTab, blade or as a new section in a workspace. However, if required, developers can also configure this feature to only allow embedding of apps on certain pages by implementing the following methods:

- **isPowerAppPersonalizationEnabled** – If this method returns false for a specific page, then the Power

Apps menu button will not be shown, and users will not be able to embed apps anywhere on this page, including as a tab.

- **isPowerAppTabPersonalizationEnabled** – If this method returns false for a specific page, then users will not be able to embed apps directly on the page as a tab, FastTab, or panorama section. Users will still be able to embed apps through the Power Apps menu button if embedding is allowed on the page.

The following example shows a new class with the two methods needed to configure where apps can be embedded.

```
[ExtensionOf(classStr(FormRunConfigurationPowerAppsConfiguration))]  
  
public final class ClassTest_Extension  
{  
    public static boolean isPowerAppPersonalizationEnabled(str pageName)  
    {  
        var result = next isPowerAppPersonalizationEnabled(pageName);  
        return result;  
    }  
  
    public static boolean isPowerAppTabPersonalizationEnabled(str pageName)  
    {  
        var result = next isPowerAppTabPersonalizationEnabled(pageName);  
        return result;  
    }  
}
```

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Find information by using lookups

2/18/2021 • 4 minutes to read • [Edit Online](#)

Many fields have lookups that can help you easily find the correct or desired value. Several enhancements have been added to lookups that make these controls more usable and make users more productive. In this topic, you will learn about these new lookup features and will receive some helpful tips to get the optimal use out of lookups in the system.

Responsive lookups

In previous versions, when interacting with a lookup control, a user would have to take an explicit action to open the drop-down menu. This may have been by typing an asterisk (*) in the control to filter the lookup based on the current value of the control, clicking the drop-down button, or by using the **Alt+Down arrow** keyboard shortcut. Lookup controls have been modified in the following ways to better align with current web practices:

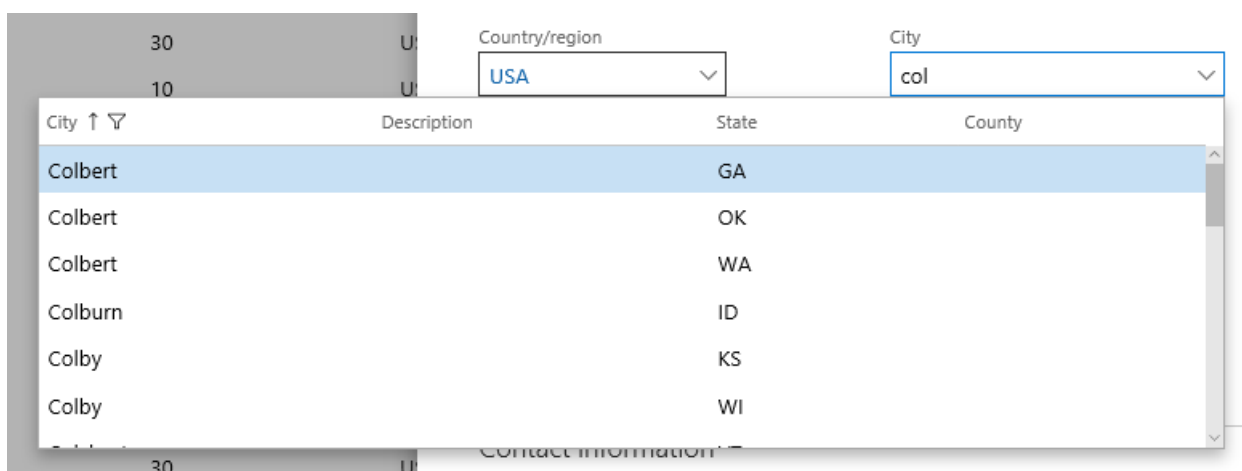

- Lookup drop-down menus will now open automatically after a slight pause in typing, with the drop-down menu contents filtered based on the lookup control's value.

Note that the old behavior of automatic opening of the dropdown after typing an asterisk (*) has been deprecated.

- After the lookup drop-down menu has opened, the following will occur:
 - The cursor will stay in the lookup control (instead of focus moving into the drop-down menu) so you can continue to make modifications to the control's value. However, the user can still use the **Up arrow** and **Down arrow** to change rows in the drop-down menu, and enter to select the current row in the drop-down menu.
 - The contents of the drop-down menu will adjust after any modifications are made to the lookup control's value.

For example, consider a lookup field called **City**.

When focus is in the **City** field, you can start looking for the city that you want by typing a few letters, like "col." After you stop typing, the lookup will open automatically, filtered to those cities that begin with "col".

At this point, the cursor is still in the lookup field. If you continue typing so the value is "colum," the lookup contents adjust automatically to reflect the latest value in the control.

Even though focus is still in the lookup control, you can also use the **Up arrow** or **Down arrow** keys to highlight the row that you want to select. If you press **Enter** the highlighted row will be selected from the lookup and the control's value will be updated.

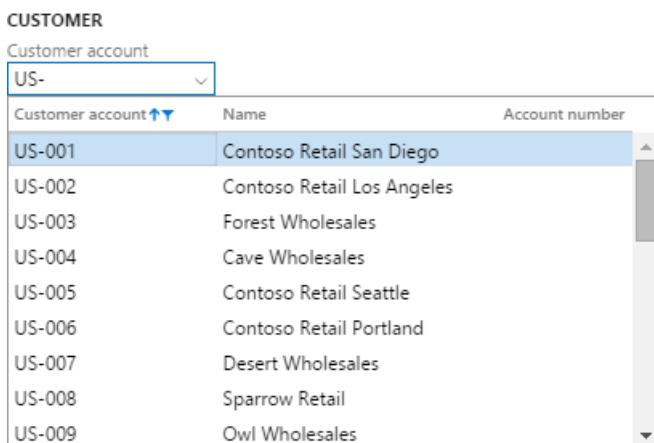

Typing in more than IDs

When entering data, it's natural for users to attempt to identify an entity, such as a customer or vendor, in terms of the name rather than an identifier representing the entity. Many (but not all) lookups now allow contextual data entry. This powerful feature allows the user to type the ID or the corresponding name into the lookup control.

For example, consider the **Customer account** field when creating a sales order. This field shows the **Account ID** for the customer, but a user would typically prefer to enter an **Account name** instead of an **Account ID** for this field when creating a sales order, such as "Forest Wholesales" instead of "US-003."

If the user started to enter an **Account ID** into the lookup control, the drop-down menu would automatically open as described in the previous section and the user would see the lookup as shown below.

However, the user can also now enter the beginning of an **Account name** as well. If this is detected, then the user will see the following lookup. Notice how the **Name** column is moved to be the first column in the lookup, and how the lookup is sorted and filtered based on the **Name** column.

CUSTOMER

Customer account

Conto

Name ↑	Customer account	Account number
Contoso Europe	DE-001	
Contoso Retail Chicago	US-015	
Contoso Retail Dallas	US-011	
Contoso Retail Detroit	US-018	
Contoso Retail Los Angeles	US-002	
Contoso Retail Miami	US-028	
Contoso Retail New York	US-012	
Contoso Retail Portland	US-006	
Contoso Retail San Diego	US-001	

Using grid column headers for more advanced filtering and sorting

The lookup enhancements discussed in the previous two sections greatly improve a user's ability to navigate the rows in a lookup based on a "begins with" search of the ID or **Name** field in the lookup. However, there are situations in which more advanced filtering (or sorting) is needed to find the correct row. In these situations, the user needs to use the filtering and sorting options in the grid column headers inside the lookup. For example, consider an employee entering a sales order line who needs to locate the right "cable" as the product. Typing "cable" into the **Item number** control isn't helpful, as there are no product names that begin with "cable."

Sales order lines

+ Add line + Add lines Add products Remove Sales order line Financials Inventory Product and supply Update line Warehouse

Instead, the user needs to clear the value of the lookup control, open the lookup drop-down menu, and filter the drop-down menu using the grid column header, as shown below. A mouse (or touch) user can simply click (or touch) any column header to access the filtering and sorting options for that column. For a keyboard user, the user simply needs to press **Alt+Down arrow** a second time to move focus into the drop-down menu, after which the user can tab to the correct column, and then press **Ctrl+G** to open the grid column header drop-down menu.

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Change the date for a session

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to change the date for a session. By default, the current date is used when entering and posting journal entries or source documents. You can change the date that is used for your current session. Use this feature to back-date journal entries or source documents, as necessary.

1. In the navigation pane, go to **Modules > Common > Common > Session date and time**.
2. In the **Date** field, enter a date.
3. Select **OK**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set a user's preferred time zone

2/18/2021 • 2 minutes to read • [Edit Online](#)

The following topic explains how a user in the System Administrator role can set the time zone for a user.

1. Go to **Navigation pane > Modules > System administration > Users > Users**.
2. In the list, find and select the desired record.
3. Select **User options**.
4. Select the **Preferences** tab.
5. In the **Time zone** field, select an option from the drop-down list.
6. Select **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Lifecycle Services (LCS) for Finance and Operations apps customers

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic is intended for customers who have signed up for the current versions of Finance and Operations apps. Partners who are working with customers to help them move through the lifecycle of their Lifecycle Services (LCS) project will also find this information useful.

LCS workspace for the current versions of the Finance and Operations apps

When you sign up for the current versions of Finance and Operations apps, your subscription includes an Implementation project workspace. After you activate the service, the tenant administrator must sign in at <https://lcs.dynamics.com> by using the tenant account. The project workspace is automatically created for your organization. The workspace includes the following elements:

- Enabled features, based on the offer that you selected
- Environments that are deployed and managed by Microsoft
- Guidance that is provided through the Action center to help you complete required actions
- A new methodology experience that includes tasks that lock as you move through the implementation
- A more complete history that specifies who completed each methodology phase and task
- Milestones that you can use to track critical project dates
- Various services to help you with your implementation

Methodologies

As a customer, you must complete the steps that are outlined in the methodology to gain access to the production environment. Before a phase can be marked as completed, you must complete the specified mandatory tasks. Locked tasks, such as tasks 1.6 and 1.9 in the following screenshot, are unlocked after you've completed the required actions. To learn which actions must be completed before a specific task can be unlocked, click the lock icon for that task.

Before kicking off, complete the required configuration for LCS to ensure the best experience. This includes to key areas, Sharepoint and Visual Studio Team Services.

Visual Studio Team Services :

Milestones

High-level milestones must be defined for a project. Milestones can help you track the deliverables that must be completed and your progress toward the milestone goals. Color indicators help you quickly learn whether you're behind schedule. For example, in the following screenshot, the milestones are yellow. To enter or update the milestone dates, click the diamond shape in the methodology, and then click the Edit button (pencil icon). You can change milestone dates at any time.

Created	Shefy Manayil Kare...	2/18/2016 7:10 PM

Description

After you have captured the business processes and requirements, a thorough analysis of the each requirement is required to assess if it can be met by the standard product.

Subscription estimator

You can use the Subscription estimator tool to evaluate your subscription requirements for the current versions of the Finance and Operations apps. To use Subscription estimator, download the usage profile, which is a Microsoft Excel workbook. Then, in the workbook, complete the following worksheets:

- Deployment details
- Instance Characteristics
- Retail & Commerce

After you've completed the worksheets, enter the data from the summary sheet into Subscription estimator by clicking + **New estimate**. You must make one estimate the active estimate. Make sure that the estimate that you mark as active is same as the offer that you bought through the VL or CSP channel.

New deployment experience

To provision your environment, you must to complete a configuration checklist. As you make progress through the methodology, environments become available to you. Click **Configure** to add deployment information.

The screenshot displays a project management interface. At the top, a sprint timeline shows Sprints 2, 3, and 4, with dates 1/11/2016, 2/21/2016, and 7 respectively. Below the timeline is a 'Task history' section with a 'Description' of project planning sessions. A 'Task history' dropdown menu is also visible. On the right side, there is a list of environments under the heading 'ENVIRONMENTS'. The environments listed are:

- PRODUCTION:** Environment Prod-1 is deployed (Full details)
- SANDBOX: PREMIER PERFORMANCE TEST (ADD-ON):** Configure
- SANDBOX: STANDARD PERFORMANCE TEST (ADD-ON):** Configure
- SANDBOX: PREMIER ACCEPTANCE TEST (ADD-ON):** Configure
- SANDBOX: PREMIER ACCEPTANCE TEST (ADD-ON):** Configure
- SANDBOX: STANDARD ACCEPTANCE TEST:** Configure
- SANDBOX: STANDARD ACCEPTANCE TEST (ADD-ON):** Configure
- SANDBOX: DEVELOP AND TEST:** Environment kranthi is deploying... (Full details)
- SANDBOX: DEVELOP AND TEST (ADD-ON):** Configure

Because the information that you enter determines your experience, carefully review your input. After you've entered all the required information, sign-off is required for the deployment request. The user who completes the sign-off becomes the system administrator on the instance. Verify that the correct user completes the sign-off for the deployment. After the sign-off is completed, the Microsoft site reliability engagement team reviews the request. After the team has reviewed the information that you entered, it initiates the provisioning. If the information isn't correct, the team will contact you. After the provisioning is completed, the status is updated to indicate that the environment has been deployed, as shown in the following screenshot. If the provisioning takes longer than expected, the Microsoft site reliability engagement team reviews the status and takes appropriate actions. These actions might include contacting you. After the environment is provisioned, click **Full details** to open the **Detailed environment** page, where you can sign in to the system, view the monitoring status, or view relevant updates.

SANDBOX: DEVELOP AND TEST

✓ Environment DynDemoDevTest is deployed

Finance and Operations application architecture

2/18/2021 • 4 minutes to read • [Edit Online](#)

The Finance and Operations application cloud architecture contains all the elements that are common to all Microsoft cloud offerings, as described in [Subscriptions, licenses, accounts, and tenants for Microsoft's cloud offerings](#). Beyond this, it also includes services that automate software deployment and provisioning, operational monitoring and reporting, and seamless application lifecycle management.

The cloud architecture consists of these conceptual areas:

- **Subscription** – A subscription to Finance and Operations apps gives you an online cloud environment (or multiple environments) and experience.
- **Licenses** – Customers must purchase subscription licenses (SLs) for their organization, or for their affiliates' employees and on-site agents, vendors, or contractors who directly or indirectly access Finance and Operations apps. These apps are licensed through Microsoft Volume Licensing and the Microsoft Cloud Solution Provider (CSP) program. For more information, download the latest [Microsoft Dynamics 365 Licensing Guide from Dynamics 365 pricing](#).
- **Tenant** – In Microsoft Azure Active Directory (AAD), a tenant represents an organization. It's a dedicated instance of the AAD service that an organization receives and owns when it creates a relationship with Microsoft (for example, by signing up for a Microsoft cloud service, such as Azure, Microsoft Intune, or Microsoft 365). Every AAD tenant is distinct and separate from other AAD tenants. For more information

about AAD tenants, see [How to get an Azure Active Directory Tenant](#).

A tenant houses the company's user information. This information includes passwords, user profile data, permissions, and related information. The tenant also contains groups, applications, and other information that pertains to an organization and its security.

The tenant is created when customers sign up for their first subscription to any Microsoft online service, such as Microsoft 365, Microsoft Dynamics 365, or Azure. Any later subscriptions to the same online services or other online services can be grouped within the same tenant.

An organization can have multiple AAD tenants. If there are multiple tenants, make sure that any subscriptions for Finance and Operations apps are associated with the correct tenant.

- **Azure Active Directory (AAD)** – AAD is the multi-tenant, cloud-based directory and identity management service from Microsoft that combines core directory services, application access management, and identity protection in a single solution. For more information, see [Azure Active Directory](#). Finance and Operations apps use AAD as the store for identity. Access to AAD is provided as part of a subscription to Finance and Operations apps.
- **Microsoft 365 admin center** – Microsoft 365 admin center is the subscription management portal that Microsoft 365 provides for administrators. It's used to provide management functions for users (AAD) and subscriptions. As part of these management functions, it provides information about service health. For more information, see [About the Microsoft 365 admin center](#).

NOTE

You don't have to have an Microsoft 365 license to deploy Finance and Operations apps. However, you might require a license for specific Office integration scenarios. For more information, see [Office integration overview](#).

- **Microsoft Dynamics Lifecycle Services (LCS)** – LCS is a collaboration portal that provides an environment and a set of regularly updated services that can help you manage the application lifecycle of your implementations. For more information, see [Lifecycle Services resources](#). After you purchase and activate a subscription for a Finance and Operations app, an **Implementation project** workspace is provisioned in LCS when the tenant administrator signs in for the first time.

NOTE

An implementation project is an LCS project for the cloud service. As a Microsoft partner, you can also provision non-implementation LCS projects for your own purposes. For more information, see [Lifecycle Services \(LCS\) for Finance and Operations apps partners](#).

- **Finance and Operations apps** – Finance and Operations apps are deployed through LCS. Various topologies are available: development/test/build, acceptance test, performance test, and high-availability production. For more information about the various topologies, download the [latest Microsoft Dynamics 365 Licensing Guide from Dynamics 365 pricing](#).
- **Microsoft Azure DevOps** – Azure DevOps is used primarily for code version control, development, and to deploy a build environment. Azure DevOps is also used to track support incidents, such as work items in Azure DevOps that are submitted to Microsoft through Cloud-powered support, and to integrate the Business process modeler (BPM) library hierarchy into your Azure DevOps project as a hierarchy of work items. Azure DevOps is also used during code upgrade.

"Under the hood," Finance and Operations apps use many features of the Azure platform, such as Azure Storage, networking, monitoring, and Azure SQL Database, to name just a few. Shared services put into operation and orchestrate the application lifecycle of the environments for participants. Together, Azure functionality and LCS

offer a robust cloud service.

NOTE

Although many features of the Azure platform are used, you don't have to have an Azure subscription to deploy Finance and Operations apps in the Microsoft-managed cloud. You must have an Azure subscription only if you want to deploy Finance and Operations apps cloud-hosted environments in your own Azure subscription.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Onboard an implementation project

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to onboard a Finance and Operations project by using Microsoft Dynamics Lifecycle Services (LCS).

Microsoft 365 Admin Center

After your organization has purchased a subscription to Finance and Operations, it must be activated on your organization's Azure Active Directory (Azure AD) tenant by your Tenant Administrator, who completes the following steps:

1. Open an InPrivate/Incognito browser session and go to the [Microsoft 365 Admin Center](#).
2. Sign in with the Tenant Administrator credentials.
3. Go to **Billing > Products & services** and confirm that there is an active subscription for the application that you want to deploy.

NOTE

If you do not see an active subscription, consult with your Licensing Partner to confirm the status of the subscription transaction as well as the tenant for the subscription. By default, all Microsoft Online Services should be running on the same Azure AD tenant.

4. If the subscription in question is shown as active, proceed to the next step by signing in to LCS to trigger the Implementation Project creation flow.
5. Open another private browser tab and go to [Lifecycle Services](#). Select **Login** to access LCS with your current Tenant Admin credentials.
6. Accept and confirm any other prompts displayed to complete the Implementation Project provisioning.
7. The Tenant Administrator is assigned the Project Owner security role in the provisioned Implementation Project.

NOTE

If the Tenant Administrator will not be a participant in the implementation, at least one additional Project Owner must be assigned to the implementation project.

For an overview of LCS user management, including the security roles that can be assigned to users, see [Configure Lifecycle Services \(LCS\) security](#).

LCS implementation project workspace

After the Tenant Administrator has completed the Finance and Operations subscription activation and added additional project owners as appropriate, those team members can access the **Implementation project** workspace.

The first step to be completed in LCS is **Project onboarding**. This step is required for all LCS implementation projects that are created **on or after August 22, 2019, PST**, prior to deploying any of the Microsoft-managed

environments. You can access the **Project onboarding** feature using the action center notification or the LCS Implementation project menu. You must be assigned to the Project owner security role to access **Project onboarding** in LCS.

To get started with LCS, see [Lifecycle Services \(LCS\) for Finance and Operations apps customers](#).

FastTrack onboarding services

After the LCS **Implementation project** workspace is provisioned, the Microsoft FastTrack team will monitor your onboarding progress. If project onboarding is not completed within a few weeks after creating an LCS **Implementation project**, a reminder will be sent to the project team.

For more information about the FastTrack program and the services provided, see [Microsoft FastTrack](#).

For more information about LCS project onboarding, see [LCS project onboarding](#).

NOTE

All onboarding-related emails from the FastTrack team will originate from Dynamics 365 Onboarding (ond365@microsoft.com), so please ensure that any spam blocker/filter allows email from this address.

Key data to keep current in LCS

We recommend that you add key project members (such as project managers) from the customer and partner teams to the LCS implementation project. Be sure to include each person's work email address. In this way, you help us work best with you and help ensure that project members don't miss important communication from us.

Be sure to keep the milestone dates in your LCS project current. In this way, you help us connect with you at different project stages. When you're closer to your go-live date, we will contact you for a project Go-live assessment before we deploy your production environment.

Milestone dates are stored in the LCS implementation methodology. For more information, see the [Methodologies](#) section of the "LCS for Customers" topic.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Environment planning

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic provides an overview of various aspects that you must consider while you plan for your project's environment. To help guarantee a successful cloud implementation, it's important that you discuss and plan your environment early in the project.

Environment planning overview

To begin, here are a few important concepts:

- **Environment purpose** – The reasons why the environment exists. Examples include development, system testing, user acceptance testing (UAT), and operations.
- **Environment topology** – The composition of the environment and the purpose. Examples include **Develop** and **Build and Test** for Tier-1 environments.
- **Environment tier** – The type or category of the environment. Examples include Tier-1 environments and Tier-2 environments.

For more information, about the various environments and tiers, see [Cloud deployment overview](#) and download the latest *Microsoft Dynamics 365 Licensing Guide* from [Dynamics 365 pricing](#).

Environment types

You can use the following environment types for your project:

- **Standard** – This environment is included in the standard offer and is managed by Microsoft in a Microsoft subscription. Standard environments include the production environment and a Tier-2 Standard Acceptance Test environment.
- **Add-on** – The add-on environments are in a Microsoft-managed subscription that the customer has purchased in addition to the standard offer. For example, an add-on environment might be an additional Tier-4 environment for performance testing.
- **Cloud-hosted** – Cloud-hosted environments are additional environments that are managed by the customer or partner in a customer or partner Microsoft Azure subscription. A cloud-hosted environment can include a Tier-1 demo environment.
- **Environment image (VHD)** – These additional Tier-1 environments are hosted on-premises by using a virtual hard disk (VHD) that can be downloaded from [Microsoft Dynamics Lifecycle Services \(LCS\)](#).

IMPORTANT

In a *customer or partner Azure subscription*, the customer or partner brings its own Azure subscription, and deploys environments to that subscription for evaluation and development purposes only. The customer or partner pays for the resources that are deployed to its Azure subscription. The amount that the customer or partner pays is based on the Azure price list. By contrast, in a *Microsoft subscription*, the customer purchases licenses that allow the customer to deploy environments to an Azure subscription that is managed by Microsoft. Therefore, the customer has no separate Azure billing.

Tier-1 vs. Tier-2 and higher

TIER-1	TIER-2 AND HIGHER
Single-box environment	Multi-box environment

TIER-1	TIER-2 AND HIGHER
All components are installed on the same server. These components include Application Object Server (AOS), the database, Dynamics 365 Commerce, and Management Reporter.	Components are installed on multiple servers.
Microsoft SQL Server is used.	Azure SQL Database is used.
The architecture differs from the architecture of the production environment to maximize efficiency and cost of the development team.	The architecture is the same as the architecture of the production environment, even though this type of environment has a different sizing and isn't enabled for disaster recovery.
The environment can be cloud-hosted, or it can be deployed as an environment image (VHD).	The environment can be deployed only as a standard environment or an add-on environment. It can't be cloud-hosted.
The environment isn't suitable for UAT or performance testing.	The environment is suitable for UAT and performance testing.

Standard cloud offer

The standard cloud offer includes two environments:

- **Tier-2 environment: Standard Acceptance Testing** – One Standard Acceptance Testing (UAT) instance is provided for the duration of the subscription. This instance is a non-production multi-box instance that customers can use for UAT, integration testing, and training. Additional sandbox/staging instances can be purchased separately as an optional add-on.
- **Production environment** – One production instance is provided per tenant. The production multi-box instance includes disaster recovery and high availability. It will be provisioned when the implementation approaches the Operate phase, after the required activities in the Microsoft Dynamics Lifecycle Services (LCS) methodology and a successful go-live assessment are completed. Additionally, some file storage and database storage are included in the offer:
 - **File storage:** Every customer receives a certain amount of file/Azure blob cloud storage for files and binary data. Additional file/blob storage can be purchased.
 - **Database storage:** Every subscription includes a certain amount of Azure SQL Database storage per customer at no additional charge. Additional storage capacity is provided at no charge as an organization increases the number of user and device service licenses. For more information about the various environments and the various types of storage, as well as the currently included free file and storage capacity, download the latest *Microsoft Dynamics 365 Licensing Guide* from [Dynamics 365 pricing](#).

IMPORTANT

Microsoft promises service and data high availability as well as minimal servicing downtime guarantees as part of the Dynamics 365 software license agreement (SLA) for production environments. The SLA goals do not apply to non-production environments.

Provisioning of standard environments

The standard environments are provisioned at different times. The following table shows the suggested timing for the environments in the standard cloud offer.

ENVIRONMENT	WHEN DOES PROVISIONING OCCUR?	IS IT SELF-SERVICE?
Tier-2 Standard Acceptance Test	Immediately after project onboarding has been completed in LCS	Yes
Production	At production system readiness	A Go-live assessment must be completed prior to configuring the production deployment request in LCS.

IMPORTANT

Always deploy environments by using an **unnamed** account. This account must be from the customer domain, such as `dynadmin@customer.com` or `dynadmin@customer.onmicrosoft.com`. We strongly recommend using the same dedicated environment admin account on all environments. ISV licenses must be issued to the domain of the account used for environment deployment, therefore using both `dynadmin@customer.com` and `dynadmin@customer.onmicrosoft.com` on different environments can lead to problems with ISV licenses.

Production system readiness

The production environment can be deployed when the project is ready for the initial go-live. For more information, see [Prepare for go-live](#).

Production system readiness includes, but isn't limited to, the following conditions:

- An up-to-date subscription estimate is activated, as described in [Subscription estimator in Lifecycle Services \(LCS\)](#).
- Code, configuration, and data are ready for cutover.
- An engineering process is in place to manage critical fixes.
- The customer has signed off on the solution and UAT.
- A cutover plan is in place.

Customers should use the production environment to **operate** the solution, not build it. The production environment is sized to run your business. The sizing is based on the subscription estimate and diagnostic data from performance testing. After deployment, customers can and should do a mock cutover and a final round of validation on the production environment. Before the final cutover, customers can request a Point in time restore to restore the production environment to a clean snapshot (maximum 28 days in the past).

To select the appropriate data center for the production environment, consider the latency from the geographic locations where the business operates. Use tools such as [PsPing](#) and [Azure Speed Test](#) to test latency to Azure data centers.

The following illustrations shows the environment planning process.

Additional environments

Additional environments can be purchased as add-ons, or they can be deployed as cloud-hosted environments. The following illustration shows a *sample* overview of standard and additional environments, based on the complexity of the implementation.

Environment purpose	Tier	Standard project	Medium complexity project	Complex project
Build	1	X	X	X
Test (e.g. system integration testing or UAT)	2	X	X	X
Production	Based on the sizing	X	X	X
Development	1	X	X	X
Golden configuration	1 or 2		X	X
Pre-production / data migration	2		X	X
Performance testing	4 or 5			X
Training	2 or 3			X
System integration testing	2 or 3			X
Other / ad-hoc	...			X

IMPORTANT

Always deploy environments by using an **unnamed** account, such as `dynadmin@customer.com`. Assign the environments an owner who will be responsible for their status and maintenance. We strongly recommend using the same dedicated environment admin account on all environments. After go-live, if you plan to work on new releases, get an additional Tier-2 or higher environment to support production.

Deployment considerations for development environments

For development environments, there are two deployment options:

- **Cloud-hosted** – The environments are managed by the customer/partner in a customer/partner Azure subscription.
- **Environment image (downloadable VHD)** – The environments are hosted on-premises.

NOTE

You must allocate one development environment per developer.

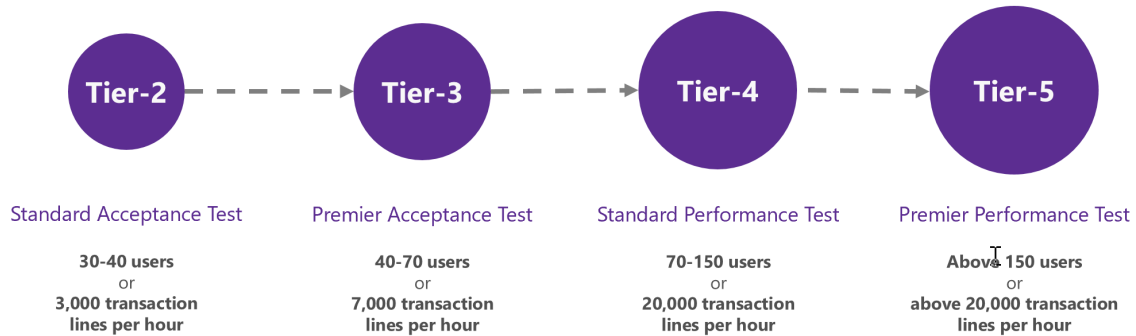

The following table compares the deployment options.

CAPABILITY	CLOUD-HOSTED	ENVIRONMENT IMAGE
Public URL	✓	Not supported
Integration development	✓	Extra setup is required. (For example, run the admin user provisioning tool.)
Azure DevOps	✓	Extra setup is required. (For example, rename the computer.)
Applying deployable packages from LCS	Automated	Command line runbooks (AxUpdateInstaller.exe tool)
Deploying data packages from LCS	✓	Not supported
Maintenance	Managed by the customer/partner	Managed by the customer/partner

CAPABILITY	CLOUD-HOSTED	ENVIRONMENT IMAGE
Cost model	Pay as you go (If the environment is on for eight hours, you pay for eight hours.). Cost is based on selected Virtual Machine size, disk size and settings, and premium storage settings	Hardware-related
Limitations	None. You have full control over VM specs, disk size and storage settings. You have administrator access to the VM.	None

Selecting the correct Tier-2 or higher environment

It's important that you select the correct Tier-2 or higher environment, depending on the purpose of the environment. The guidance that is provided in the following illustration is a *baseline*. You must work with your implementation partner to adjust this guidance, based on your specific business scenarios and factors such as type of users, complexity, and volumes.

After a subscription estimate is activated, you can view transaction lines per hour in LCS, as shown in the following illustration.

Subscription estimator

What is subscription estimator?
Subscription estimator provides an automated estimate of the subscription needed for your production instance. It uses the subscription licenses and transaction details to infer your subscription needs. While you can have multiple estimates, you need to mark one estimate as 'Active'.

The active estimate is currently locked because there is a production environment that is active or has been signed off for deployment. To mark a different estimate as active, please clear the signoff or contact support.

[+ New estimate](#) [Delete estimate](#) [Mark active](#) [Subscription\(s\)](#) [Sample usage profile](#)

Name	Estimated by	Created on
80	SA Solutions Architect	7/14/2018 1:25 AM

80

Specifications

The subscription license(s) are recorded at the time of an estimate's creation. If the subscription licenses have changed recently, please create a new estimate to refresh this data.

[Usage profile](#)

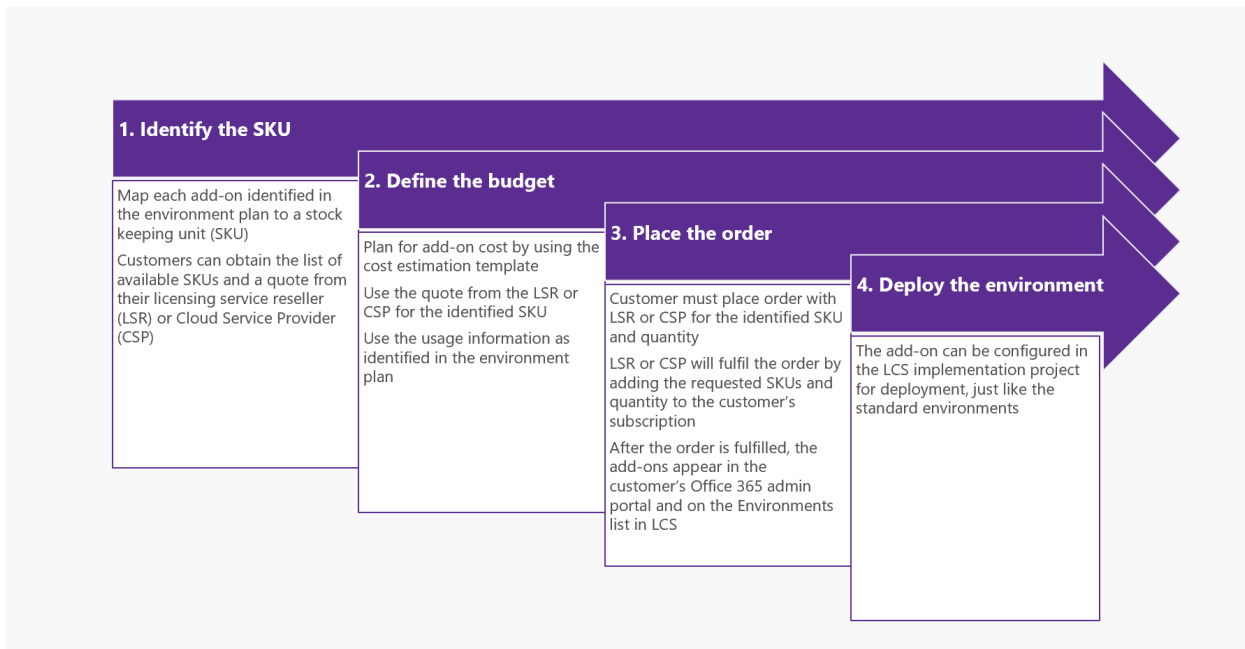

Operations user count: 32

Transaction lines per hour (Non-POS): 7327

Purchasing add-on environments

If you want to purchase add-on environments, we recommend that you work closely with your Cloud Solution Provider or License Service Reseller. Consider the potential lead time that occurs between the time when the order is placed and the time when the environment is deployed.

The following illustration shows the process for purchasing add-on environments.

IMPORTANT

If you have a Microsoft Volume Licensing agreement, you can subscribe to add-on environments on a monthly basis through the Microsoft Products and Services Agreement (MPSA) licensing program. Alternatively, you can subscribe to them through the Microsoft Cloud Solution Provider (CSP) program. For more information about the various environments and tiers, download the latest *Microsoft Dynamics 365 Licensing Guide* from [Dynamics 365 pricing](#).

Environments plan

Create the environments plan early in your implementation.

1. Identify the project activities that require an environment. These activities include, but aren't limited to, development of customizations and maintenance of golden configuration data.
2. Determine the *activities lifecycle* to determine the *environments lifecycle*. Here are some examples of the questions that you should ask during this step:
 - When and for how long do you require the environment?
 - Do you require the environment before or after go-live?
3. Determine the type and topology of the required environments.
4. Summarize the list of required environments in a matrix.

After you've identified the environments, the environments plan can be used to structure the Application Lifecycle Management (ALM) flows. For example, after you finalize your environments plan, you can define the flows for building and moving the code and the data across environments.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

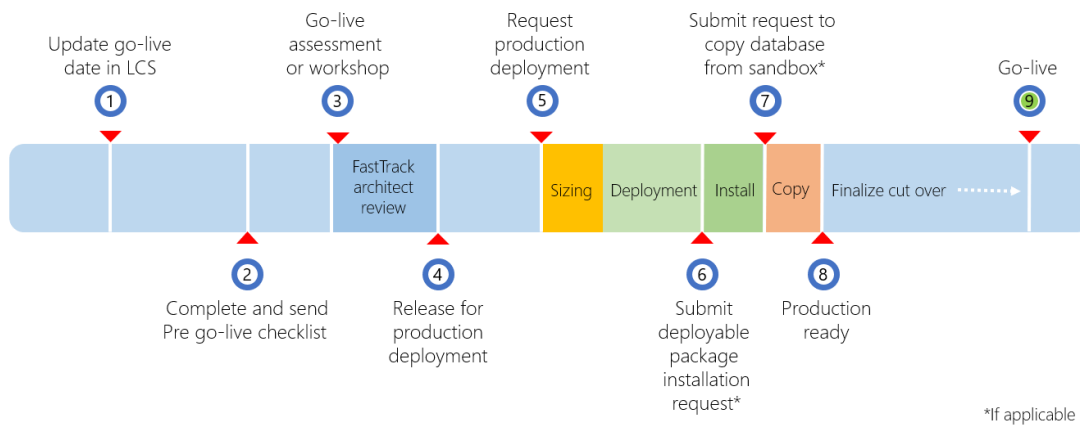

Prepare for go-live

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic describes how to prepare to go live with a project by using Microsoft Dynamics Lifecycle Services (LCS).

Production and Sandbox can only be deployed in two different [types of environments](#): Microsoft Managed or Self-Service. Both follow the same preparation for go-live, but the service level agreements (SLA) and some of the process steps are different.

This graphic and the following table list the phases of the go-live process, the environment type to which each phase applies with the expected duration, and who is responsible to take the action.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
1	Update Go-live date in LCS	Both	At the latest 2-3 months in advance	Customer/Partner	The milestone dates should be kept up to date on an ongoing basis.
2	Complete and send pre go-live checklist	Both	After user acceptance testing (UAT) complete	Customer/Partner	Follow the instructions provided in the "FastTrack Go-live Assessment" section later in this topic.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHEE N	WHO	NOTES
3	Project Go-Live assessment (FastTrack Essentials)	Both	3-business days for initial report, plus additional time for mitigation, if required	Microsoft-FastTrack Solution Architect	Solution Architect delivers assessment after checklist is received and continues review until questions are clarified and mitigations are in place, if applicable.
	Go-live Assessment workshop (FastTrack)	Both	To coordinate with architect assigned	Microsoft-FastTrack Solution Architect	
4	Release for production deployment	Microsoft Managed	Immediate upon successfully completed assessment	Microsoft-FastTrack Solution Architect	Do not submit production request until the assessment is successfully completed.
		Self-Service	Immediate upon successfully completed assessment and Configure button is enabled	Microsoft-FastTrack Solution Architect	For Self-Service deployment, the Configure button remains disabled until the assessment is complete.
5	Production deployment request	Microsoft Managed	Self-service	Customer/Partner	The production deployment request should only be submitted after the FastTrack Architect has finished the assessment.
		Self-Service	Self-service	Customer/Partner	After the assessment is complete, the Configure button will be enabled and customer will be able to request the production deployment.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
	Sizing	Both	Immediate in case of automatic sizing. Could require further clarifications of the subscription estimate.	Microsoft-Dynamic Service Engineering (DSE)	Automatic sizing based on subscription estimate by default, manual sizing by exception.
	Deployment	Microsoft Managed	48 hours	Microsoft-Dynamic Service Engineering (DSE)	Status in LCS reflects the deployment progress. If there are any questions about your request, they will be posted as Comments on the service request.
		Self-Service	An average of 30 minutes	Microsoft-FastTrack Solution Architect	The deployment could take an average of 30 minutes after the assessment has completed and the production environment has been requested. For more information, see Deploy a new environment .
6	Deployable package installation request	Both	Self-service	Customer/Partner	Follow the instructions in Apply updates . The packages must contain all the models and binaries consolidated in an All-in-one deployable package.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
	Package installation	Both	Minimum 5 hours lead time and 4 hours downtime	Microsoft-Dynamic Service Engineering (DSE)	Generally, 95% of updates are applied in less than one hour, however we still recommend that you provide a downtime window of four hours in case a rollback is required for any reason. When the package deployment succeeds, the environment will be available as soon as the package deployment has finished, which means that the longer downtime window does not have any negative effect on the availability of the system.
7	Database copy from Sandbox request (if applicable)	Both	Self-service	Customer/Partner	Follow the instructions Self-service database refresh . If you have a golden configuration you can review Golden configuration promotion .
	Copy database	Both	Five hours lead time and four hours downtime	Microsoft-Dynamic Service Engineering (DSE)	Generally, the database copy is completed in less than one hour. We still recommend that you provide a downtime window of four hours in case a rollback is required for any reason.

PHASE	ACTION	ENVIRONMENT TYPE	DURATION/WHE N	WHO	NOTES
8	Production ready	Both	After all previous steps have been completed	Customer/Partner	Customer can take control of the production environment.
	Cutover activities	Both	Depends on the project	Customer/Partner	
9	Go live	Both	Depends on the project	Customer/Partner	

Completing the LCS methodology

A major milestone in each implementation project is the cutover to the production environment.

To ensure that the production environment is used for live operations, Microsoft will provision the production instance only when the implementation is approaching the **Operate** phase, after the required activities in the LCS methodology are complete. For more information about the environments in your subscription, see the [Licensing guide](#).

Customers must complete the **Analysis, Design and Develop**, and **Test** phases in the LCS methodology before the **Configure** button that is used to request the production environment becomes available.

NOTE

For Self-Service environments, the **Configure** button will only become available after the Solution Architect has signed off on the assessment.

To complete a phase in LCS, you must first complete every required step in that phase. When all the steps in a phase are completed, you can complete the whole phase. You can always reopen a phase later if you must make changes. If you require more help, see [Lifecycle Services \(LCS\) for Finance and Operations apps customers](#).

The process of completing a step has two parts:

- Do the actual work, such as a fit-gap analysis or user acceptance testing (UAT).
- Mark the corresponding step in the LCS methodology as completed.

It's good practice to complete the steps in the methodology as you make progress with the implementation. Don't wait until the last minute. Don't just click through all the steps so that you can get a production environment. It's in the customer's best interest to have a solid implementation.

UAT completion and solution sign off

During the UAT phase, you must test all the business processes that you've implemented, and any customizations that you've made, in a Sandbox, or Standard Acceptance Test, environment in the implementation project. To help ensure a successful go-live, you should consider the following as you complete the UAT phase:

- Test cases cover the entire scope of requirements.
- Test by using migrated data. This data should include master data and opening balances, even if they aren't yet final.
- Test by using the correct security roles (default roles and custom roles) that are assigned to users.

- Make sure that the solution complies with any company-specific and industry-specific regulatory requirements.
- Run the [Customization Analysis Report \(CAR\)](#) and resolve critical issues.
- Complete performance testing.
- Document all features, and obtain approval and sign-off from the customer.

Regardless of whether the environment is a cloud-hosted environment or a downloaded virtual hard disk (VHD), testing can't be considered complete when you test only in an environment that is a developer or demo topology. Here are the reasons:

- The topology of the Tier-1 environments differs from the topology of your production environment. It's important that you test all functionality on a Tier-2 or higher sandbox environment in the Microsoft-managed subscription. It's especially important that you test integrations, printing functionality, workflow functionality, and warehouse and commerce devices in the sandbox environment.
- System performance can't be measured when you do the UAT on local virtual machines (VMs) or VMs that are privately hosted.
- To prevent delays during the cutover process, it's important that the team experience the servicing in LCS during the implementation. This servicing includes the processes of applying deployable packages, creating service requests, and moving database between environments.

FastTrack Go-live assessment

All customers must complete a go-live review with the Microsoft FastTrack team before their production environment can be deployed. This assessment should be successfully completed before you request your production environment. If you aren't familiar with Microsoft FastTrack, see [Microsoft FastTrack](#).

About eight weeks before go-live, the FastTrack team will ask you to fill in a go-live checklist.

You can download the checklist from [Dynamics 365 Community](#) on the [Go-live Planning TechTalk](#) page.

The project manager or a key project member must complete the go-live checklist during the pre-go-live phase of the project. Typically, the checklist is completed four to six weeks before the proposed go-live date, when UAT is completed or almost completed.

When you've completed the go-live checklist, email it to **Dynamics 365 FO Go-Live** d365fogl@microsoft.com. Always include a key stakeholder from the customer and the implementation partner on the email.

After the checklist is submitted, a Microsoft solution architect will review the project and provide an assessment that describes the potential risks, best practices, and recommendations for a successful go-live of the project. In some cases, the solution architect might highlight risk factors and ask for a mitigation plan. When the assessment is completed, the solution architect will indicate that you're ready to request the production environment in LCS.

For Microsoft Managed environments, if you request the production environment before the assessment is completed, the deployment will remain in the **Queued** state until the assessment is successfully completed. For Self-Service environments, the **Configure** button to request production will be only enabled after the assessment is completed.

You can cancel an environment deployment request while it is in a **Queued** state by following these steps:

1. Select **Queued**.
2. On the **Customer sign-off** tab, select **Clear sign-off**.

This will set the environment back into a state of **Configure** and allow you to make changes to the configuration, such as selecting a different data center or environment topology.

Requesting the production environment

NOTE

The production environment is used exclusively for running your business operations and shouldn't be used for testing. You will be able to perform the cutover, and if planned, to mock the cutover in production. To test the solution, you must use a UAT environment, which is designed with the necessary elements and services for testing.

After you've completed the analysis, design and develop, and test phases in the LCS methodology, and the go-live assessment has concluded that the project is ready, you can request your production environment.

We recommend that you select a service account, for example a generic user account, as the Admin user of the environments that you deploy. If you use a named user account, you might not be able to access an environment if that user isn't available. Here are some scenarios where the Admin user must access an environment:

- **First sign-in to any environment after initial deployment** – In this case, the Admin user is the only user who can access the environment.
- **First sign-in to a sandbox environment after a database refresh from the production environment** – In this case, all user accounts except the Admin account are unable to sign in.

Your production environment should be deployed to the same datacenter where your sandbox environments are deployed.

After you've signed off on the request for the production environment, Microsoft is responsible for deploying the production environment for you. For **Microsoft Managed** environments, the Microsoft service level agreement (SLA) for deployment of a production environment is 48 hours. The production environment can be deployed at any time within 48 hours after you submit the request, provided that your usage profile doesn't require additional information. For **Self-Service** environments, the deployment will take around 30 minutes after the production request has been submitted. You can view the progress of the deployment in LCS. Typically, the status of the production environment request remains **Queued** for a few hours before it's changed to **Deploying**.

When you submit the deployment request, a service request for the Microsoft Dynamics Service Engineering (DSE) team is automatically created. You can view this service request in the **Service requests** list in LCS. If the DSE team has questions that prevent them from deploying the production environment, they will add a comment to the service request. For example, the DSE team might ask that you update the subscription estimate or change the datacenter. In some cases, you might have to clear the sign-off from the production deployment request to make changes.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Go-live for implementation projects FAQ

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic lists frequently asked questions about how to go live with an implementation project.

When can I configure and request my production environment?

Typically, a production environment is deployed after all customizations are code-complete, user acceptance testing (UAT) is completed, the customer has signed off on the solution, and there are no blocking issues for go-live.

When you're at this stage, the Microsoft FastTrack team will work with the project team to do a Go-live assessment/review.

What are the prerequisites to deploy a production environment?

For a list of the prerequisites, see [Prepare for go-live](#).

What is a Go-live assessment/review, and why is it required?

The Go-live assessment/review is part of the [Microsoft FastTrack program](#). During this review, a solution architect assesses whether an implementation project is ready for a successful cutover and go-live. This review is mandatory for every implementation project before you can request to go live in a production environment.

I want to request my production environment. Who do I contact for a Go-live assessment/review?

If a FastTrack solution architect is assigned to your project, contact him or her directly. Otherwise, based on the go-live date that is specified in Microsoft Dynamics Lifecycle Services (LCS), you will receive an email that instructs you to fill out the Pre-go-live checklist and send it to d365fogl@microsoft.com a few weeks before the go-live date. If you haven't received an email, and you're ready for go-live, you can download the checklist from [Dynamics 365 Community](#) on the [Go-live Planning TechTalk](#) page, complete it, and send it to d365fogl@microsoft.com.

The Production button isn't available in LCS. How do I request my production environment?

The **Production** button in LCS is available only after you've completed the **Analysis, Design & develop**, and **Test** phases of the LCS implementation methodology. For more information about how to complete these phases, see [Lifecycle Services \(LCS\) for Finance and Operations apps customers](#).

NOTE

Your production environment won't be deployed until the Go-live assessment/review has been completed.

My sandbox environment is currently on an update that is set to expire in two months. Can I request a production environment that has the latest update?

No. We will deny any request for a production environment that is on a different version than your sandbox environment. When you configure a production environment, the versions that you select must match the versions of the sandbox environment where you signed off on your solution. Therefore, you must first apply the latest update to your sandbox environment, test it, and sign off.

For more information, see [Software lifecycle policy and cloud releases](#).

Our sandbox environments are deployed in the Central US datacenter, but we want our production environments to be deployed in the West US datacenter. Can I select West US as the datacenter in my production configuration?

No. We will deny any request for a production environment that is in a different datacenter than your sandbox environment. We require that all your environments reside in the same datacenter. If you want your production environment to reside in the West US datacenter, you must first redeploy your sandbox environments to the West US datacenter, test them, and sign off.

For information that can help you select the correct datacenter, see the [Network requirements](#) section of the "System requirements" topic.

How will my production environment be sized?

Your production environment will be sized based on the current user license count and the information in the subscription estimate that is active when you request the production environment.

NOTE

If you add additional users later, you must create a support ticket to activate a new subscription estimate. Your production environment might have to be resized, depending on the number of users, the type of user licenses, and the expected peak transaction volume. Downtime is required in order to resize a production environment.

I submitted the request for a production environment, but I made a mistake. Can I still change it?

Yes. As long as the status of the production environment is **Queued**, you can clear the sign-off flag, make changes, and then sign off again.

How long does it take to deploy my production environment?

After the Go-live assessment with the Microsoft FastTrack team is completed and the production request is submitted, deployment of the production environment should be completed within 48 hours.

What level of access do I have in my production environment? Can I sign in to the VM?

No. Access to the production environment is limited. You can't access the virtual machine (VM) or Microsoft Internet Information Services (IIS). You also can't access the database through Microsoft SQL Server Management Studio.

How often is my production database backed up?

Databases are protected by automatic backups. Full database backups are done weekly, differential database

backups are done hourly, and transaction log backups are done every five minutes. Automatic backups are retained for 35 days.

For more information, see [Learn about automatic SQL Database backups](#).

Can I request a copy of the backup of my production database?

No. However, you can submit a database refresh service request to copy your production database to your Tier 2 and higher sandbox environment. After the copy request is completed, you can back up your sandbox environment.

My golden configuration database is in a Tier 1 sandbox environment. How can I copy and restore it to my production environment?

To copy and restore your database, follow the instructions in the topic, [Golden configuration promotion](#).

NOTE

If your golden configuration is in data packages, you must manually import the data packages to the production environment.

After go-live, can I apply new code changes to the production environment?

Yes. In LCS, you can submit a service request to apply a deployable package to your production environment. Application of one deployable package to a production environment involves a lead time of five hours and downtime of approximately five hours.

For more information, see [Apply updates to cloud environments](#).

What should I do if my production environment is down?

To report a production outage, follow the process described in the topic, [Report a production outage](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Submit service requests to the Dynamics Service Engineering team

2/18/2021 • 7 minutes to read • [Edit Online](#)

A service request is a ticket that you use to request that the Dynamics Service Engineering (DSE) team perform a predefined set of tasks on your environments.

NOTE

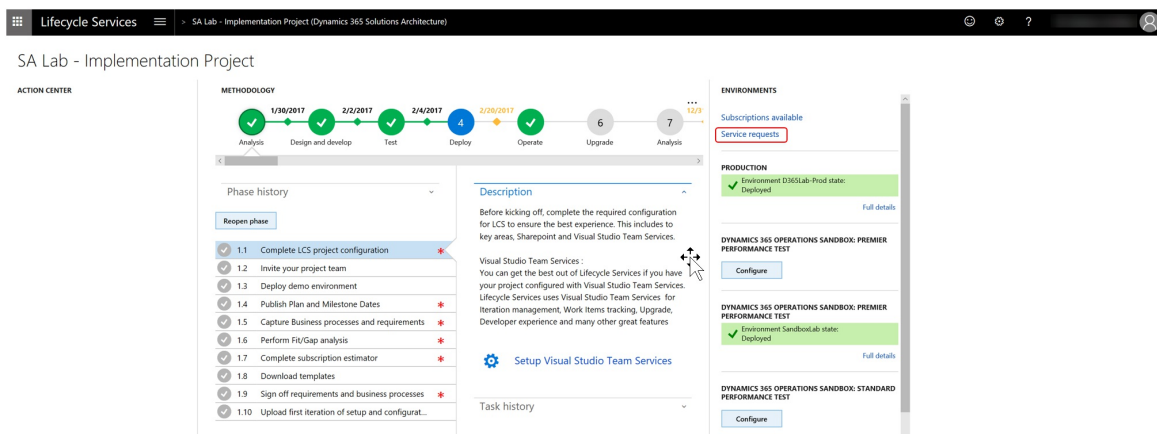

Don't use service requests for product issues. If you encounter a situation that doesn't fit into any of the tasks that are described in this topic, submit a support ticket instead. For more information about support tickets, see [Get support for Finance and Operations apps](#) or [Lifecycle Services \(LCS\)](#).

You can use Microsoft Dynamics Lifecycle Services (LCS) to submit service requests directly to the DSE team. You can also view which requests have been submitted, executed, and canceled for your environments.

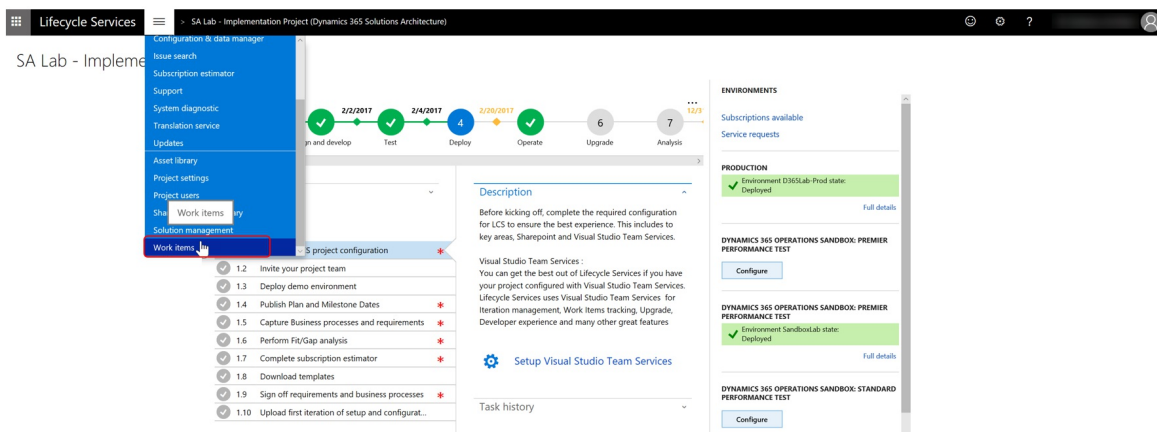

View service requests

There are two ways to view service requests:

- On the project dashboard, in the **Environments** section, select **Service requests**.

- Select the **Menu** button and select **Work items**. On the **Work items** page select the **Service requests** tab.

By default, the **Service requests** tab on the **Work items** page lists all requests that are currently active and requests that have been denied. However, you can use the filter options to show canceled and finished requests too.

Work items

Open work items: + Add, View environment details, Reschedule, Cancel

Support issues: Filter

Service requests: Show cancelled requests (No), Show finished requests (No)

ID	Service request type	Environment name	Service request status	Actionable by	Downtime start date	Downtime end date	Created by	Modified by	Created at	Modified at
34679	New deployment	D36580PU15Lab	Requested	Microsoft	4/3/2018 4:37:41 AM (UTC +02:00)		SA Solutions Architect	SA Solutions Architect	4/3/2018 4:37 AM	4/4/2018 1:59 AM
27563	Other	D36572UAT	Request denied	Customer / Partner	4/1/2018 5:30:00 AM (UTC +02:00)	4/2/2018 8:00:00 AM (UTC +02:00)	SA Solutions Architect	Microsoft SRE Tier1 gr...	2/1/2018 12:16 AM	4/1/2018 5:45 AM
24209	Upgrade environment	D36572PUAT	Request denied	Microsoft	3/20/2018 2:00:00 AM (UTC +02:00)	3/21/2018 2:00:00 AM (UTC +02:00)	SA Solutions Architect	SA Solutions Architect	1/3/2018 1:33 PM	3/2/2018 9:12 PM

After you submit a request, it has a status of **Requested**. Before the DSE team acts on the request, it might ask for clarification by entering a comment in the **Comment** field. For example, you might receive a comment from the DSE team if you request deployment of a production environment, but the data center differs from the data center where your sandbox environments are deployed. Carefully review the comments, and provide any required clarification in your own comment. To view the details of a specific request, or to submit comments for a service request, select the request ID.

If you signed up for LCS notifications, you receive an email when the status of a service request changes or a comment is entered.

If you submit a service request to the DSE team, and the action is outside the team's scope, the service request will be denied. In this case, the reason for the denial and suggestions for further action are provided. For some typical examples of service requests that the DSE team will deny, see the "Denied service requests" section later in this topic.

Create service requests

There are two ways to create a service request: automatically and on demand.

- **Automatically** – A service request is automatically created when you request deployment of an environment, or an application of a package.
- **On demand** – A service request is manually created when you enter a request for a database point-in-time restore, and some other services.

Automatically create a service request

- **Environment deployment** – To set up deployment options and submit a request to the DSE team to deploy a new environment, in the **Environments** section, select **Configure**.
- **Package application** – To apply a package to the production environment, on the **Environment details** page, select **Maintain**, select the package to apply, and then select **Schedule**. For more information, see [Apply updates to cloud environments](#).

IMPORTANT

If your scheduled time overlaps with a [planned maintenance window](#), you will receive the following warning message.

 **There is a high likelihood that maintenance activity may be scheduled for this environment during this time. Overlapping environment operations with maintenance activity will cause issues and possibly cause extended downtime. Would you like to proceed with this operation?**

[Show diagnostic information](#)

Yes

No

If you choose to continue deploying the package, the package deployment operation will be rolled-back in the event of conflict, as planned maintenance takes priority.

This restriction is applicable to **Microsoft-managed IAAS environments** only.

Create a service request on demand

Service requests that are created on demand aren't explicitly accepted by the DSE team. They will be addressed during the specified downtime window unless the DSE team has entered a comment in the request or has had to deny the request. For details, review the comments in the service request.

Microsoft frequently reviews all incoming service requests. By selecting the correct type of service request for your scenario, you help the DSE team handle the request in a timely manner.

1. On the **Work items** page, on the **Service requests** tab, select **Add**.
 2. In the **Create request** dialog box, select the type of service request to create. The options on the page then reflect the specific type of request that you selected.
- **Sandbox point-in-time restore request** – Select this request type to restore a *non-production* database to a specific point in time. For more information, see [Database movement operations home page](#).

NOTE

If you need to restore a *production* database to a previous point-in-time during the cutover phase, select the **Production point-in-time restore request** type. If you need to restore a production database when you're already live in operations, submit a support ticket through LCS.

- **Database refresh request** – Select this request type to refresh a database from a production environment to a sandbox environment, or from one sandbox environment to another. For more information, see [Refresh database](#). *This request type is being retired on January 31, 2019.*

NOTE

If you need to refresh a database from a sandbox environment to a production environment during the cutover phase, select the **Sandbox to Production** type.

- **Sandbox to Production** - Perform a database refresh of your configuration data to a production

environment during the cutover phase. For more information, see [Database movement operations home page](#).

- **Other request** – You need to use the **Other request** type exactly as described here. If you word a request in a way that isn't clear to the DSE team, the team will enter a comment to ask for clarification, and your request will be delayed. If you use the **Other request** type for any request that isn't listed below, the request will be denied. Select this request type to request that the DSE team perform one of the following actions:
 - Turn on maintenance mode in a production environment. For more information, see [Maintenance mode](#).
 - Tenant move of a live Production environment. Request the Microsoft Service Engineering team to move the Production database and Azure Blob Storage from the old tenant to the new tenant if you are moving tenant on a live Production environment. Make sure that you only request this service when you are ready with all prerequisites. For more details, see [Move LCS implementation projects to different Azure AD tenants](#).
 - Define explicit Internet Protocol (IP) safe list rules in a production environment.

NOTE

Support for explicit safe list rules is deprecated for self-service environments. For more information, see [Removed or deprecated platform features](#).

- Request that Microsoft Power BI Embedded be activated in a sandbox environment, Standard Acceptance Test environment, or production environment if you receive the following message: "Power BI embedded isn't enabled. Please contact your system administrator."

Commonly denied service requests

Here are some typical examples of service requests that will be denied:

- You submit a request of the **Other request** type for one of the following actions, but you should have submitted a support ticket instead:
 - You want to activate a new subscription estimate after you're live in production or after you've requested a production environment.
 - You want to reset the Financial reporting data mart in a release that is earlier than Microsoft Dynamics 365 for Finance and Operations Financial reporting release 7.2.6.0.
 - You want to restore a production database after go-live.
 - You encountered an issue after the DSE team did an application upgrade.
- You submit a request of the **Other request** type for an action that you should have requested through a different request type. Examples include a database refresh in a non-production environment.
- You submit a request of the **Other request** type for an action that you should perform yourself. Examples include a database upgrade in a development environment.

Service request types and SLAs

SERVICE REQUEST TYPE	APPLICABLE ENVIRONMENTS	REQUESTED SERVICE	LEAD TIME	DOWNTIME
----------------------	-------------------------	-------------------	-----------	----------

SERVICE REQUEST TYPE	APPLICABLE ENVIRONMENTS	REQUESTED SERVICE	LEAD TIME	DOWNTIME
Environment deployment	Any	Environment deployment	Service level agreement (SLA): within two business days	
Package application	Production	Deployable package application	Five hours	Five hours
Sandbox point-in-time restore	Any Tier 2 or higher sandbox	Database point-in-time restore	Five hours	Four hours
Production point-in-time restore	Production	Database point-in-time restore	Based on data volume	Based on data volume
Sandbox to Production	Tier 2 or higher sandbox to Production	Sandbox to Production	Five hours	Four hours
Other	Production	Maintenance mode	Five hours	Not applicable, because the customer indicates in the service request when the environment should be taken out of maintenance mode again
	Production	IP safe list rules	Five hours	Two hours
	Production	Power BI Embedded	Five hours	Two hours

Subscriptions, LCS projects, and Azure Active Directory tenants FAQ

2/18/2021 • 3 minutes to read • [Edit Online](#)

When customers subscribe through a Microsoft Volume Licensing agreement or a Microsoft Cloud Solution Provider (CSP) agreement, they usually have one Microsoft Azure Active Directory (Azure AD) tenant, one Microsoft Dynamics Lifecycle Services (LCS) Implementation project and any number of sandbox environments that are deployed to one data center of the customer's choice, and one production environment. For more information about these core concepts, see [Finance and Operations application architecture](#). Although this setup works well for most projects, more advanced scenarios are sometimes required, or changes during the implementation lifecycle must be accommodated.

This topic provides answers to frequently asked questions about subscriptions and licenses, Azure AD tenants, and LCS Implementation projects.

For more information, see the following topics:

- [Move environments between data centers](#)
- [Move licenses between agreement types](#)
- [Move LCS implementation projects to different Azure AD tenants](#)
- [Multiple LCS projects and production environments on one Azure AD tenant](#)

Do I have to move Azure AD tenants when I move from a CSP agreement to a Volume Licensing agreement?

No. You can keep the existing Azure AD tenant, but you must make sure that the Volume Licensing subscriptions are purchased against the same Azure AD tenant as the CSP subscriptions.

Do I get a new LCS Implementation project when I move from a CSP agreement to a Volume Licensing agreement?

No. The LCS project remains the same.

Can I keep the existing LCS Implementation project when I move to different Azure AD tenant?

No. A new LCS project will be created.

How long does it take to move from a CSP agreement to a Volume Licensing agreement?

For a Volume Licensing purchase, it can take a few days for the order to be processed and the subscriptions to be activated. Redeployment of add-on environments has a service level agreement (SLA) of two business days. It takes a few hours to deallocate and delete old add-on environments.

What if I forget to delete the existing environments before I suspend the existing subscription?

If you don't deallocate and delete the existing environments before you suspend the subscriptions, the environments will remain in a **Deployed** state. However, if you try to access the full details of these environments, you will receive an error message.

Can I have a CSP agreement and a Volume Licensing agreement in parallel?

Yes. However, you must maintain the minimum required number of licenses under each program.

How can I find the Tenant name and Tenant ID within LCS?

1. Go to project home page in LCS.
2. In the **Environments** section, select **Subscriptions available**.
3. On the **Subscriptions available** page, you will find the **Tenant name** and the **Tenant ID**.

How can I find the subscription status?

1. Go to the project home page in LCS.
2. In the **Environments** section, select **Subscriptions available**.
3. On the **Subscriptions available** page, you'll find all **Service plans** available to the tenant.
4. The **Assigned date** indicates the date that service plan status was changed.

How would the subscription status impact the environment?

Some of the environment's operations may be impacted by the subscription status:

- **Active** - Your subscription is in an operative state. You should be able to perform all environment operations.
- **In Grace Period** - Your subscription has expired, but is within the grace period. You should renew your subscription soon. The subscription status won't impact your license quantity, ability to deploy a new environment, or to perform environment operations.
- **Suspended** - Your subscription has expired beyond the grace period. This subscription status may reduce the license quantity, impact your ability to deploy a new environment, or impact your ability to perform environment operations.
- **Deleted** - Your subscription has been deleted. This will impact your ability to deploy a new environment or perform environment operations.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Move environments between data centers

2/18/2021 • 3 minutes to read • [Edit Online](#)

Occasionally, you must move environments that are managed by Microsoft to a different Microsoft Azure data center. Here are some scenarios where this move might be required:

- The data center that you planned to use wasn't available when the environments were originally deployed.
- The project creators didn't do enough research to determine the best data center before the environments were originally deployed.
- The customer moves the physical location of its operations, and the wide area network (WAN) connection is now closer to a data center that provides lower latency.

Microsoft asks that you keep all your environments in the same data center. When you move environments to a different data center, you should plan to eventually have all environments deployed in the same data center.

You can verify the data center that an environment is deployed to on the **Manage environments** page in Microsoft Dynamics Lifecycle Services (LCS).

To change the data center, you must redeploy all environments. The process differs for sandbox environments (sandbox standard acceptance test environments, and sandbox develop and test environments) and production environments.

Move sandbox environments

Because this move is a self-service action, the partner and/or customer must move the existing sandbox environments without Microsoft involvement. Although this action requires little effort on the part of the partner or customer resources, completion of the end-to-end process might require a few days. To streamline the data movement between environments, you should develop a plan to determine the best sequence before you begin the move.

Save data

Before you begin the move, you must save your data.

- **Tier 1 environment database that is based on Microsoft SQL Server:** Make a backup of the database.
- **Tier 2 and higher environments that are based on Azure SQL Database:** Choose one of the following options:
 - **Option 1:** Review the processes that are listed in the [Database movement operations home page](#) topic.
 - **Option 2:** If you have an Azure subscription, save a copy of the Azure SQL database under that subscription.
 - **Option 3:** If you have multiple Azure SQL database environments, redeploy one environment, leave the remaining environments in the old data center, and then request a database refresh between the environments.
 - **Option 4:** Save data as data packages, and then import the packages after the redeployment is completed.

Move the environments

After you've saved your data, follow these steps.

1. Verify that all code packages have been uploaded to the Asset library in LCS.
2. For each environment, follow these steps:
 - a. In LCS, select **Full details**.
 - b. Stop the environment, and then, when the environment has stopped, select **Deallocate**.
 - c. After the deallocation is completed, select **Delete**.
 - d. After the environment is deleted, select **Configure** to redeploy the environment.
 - e. In the **Geography/location** field, select the data center to use.
 - f. After the environment is deployed, apply the code packages.
 - g. If the redeployed environment is used as the build environment, complete the required configurations that are described in [Deploy and use an environment that supports continuous build and test automation](#).
 - h. Restore the data.

NOTE

- The movement of files that are stored in Azure Blob Storage isn't supported in sandbox environments.
- Commerce customers should be aware that extra steps are required for components to work correctly after a move. For more information, see [Data management overview](#).

Move production environments

If you already have a production environment deployed, you must open a Support request to move the production environment to another data center after you've finished moving all the sandbox environments. This scenario is rare, and there is no automated/self-service action to complete the move. In this scenario, files that are stored in Azure Blob Storage will also be moved. For information about the maintenance window and downtime that are required in order to move a production environment to a different data center, see [Service Description](#) and the related service-level agreement (SLA) documents.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Move licenses between agreement types

2/18/2021 • 3 minutes to read • [Edit Online](#)

Sometimes, a customer who originally purchased subscriptions through a Microsoft Cloud Service Provider (CSP) agreement decides to change to a Microsoft Volume Licensing agreement with Microsoft after the Microsoft Dynamics Lifecycle Services (LCS) Implementation project has been created. The customer can make this change even after the project has gone live in production.

Less often, a customer who originally purchased the subscriptions through a Volume Licensing agreement with Microsoft decides to change to a CSP agreement. In this case, the change must align with the renewal date of the Volume Licensing agreement.

The process of moving subscriptions from one type of agreement to another is primarily a commercial process. The technical implications for the LCS Implementation project are minimal.

NOTE

The movement of subscriptions between agreement types isn't the same as the movement of an Azure Active Directory (Azure AD) tenant. If the contractual changes in the agreements require that an Azure AD tenant be moved, you must also follow the process that is described in [Move LCS implementation projects to different Azure AD tenants](#).

Subscriptions come with two standard environments: a production environment and a Tier-2 Standard Acceptance Test environment. These environments aren't affected by the movement of subscriptions between agreement types. Action might be required in LCS only if the customer has additional add-on environments. In this case, action that is related to the add-on environments requires minimal effort on the part of partner or customer resources. To streamline the movement of data between environments, you should plan in advance to determine the best sequence.

The customer has only default environments

If the customer has only the two standard environments that come with the Microsoft-managed subscription, and didn't purchase any add-on environments through the original CSP agreement or Volume Licensing agreement, the activities that are required are purely commercial.

1. The customer places the order for subscriptions under the new agreement with the Volume Licensing reseller or the CSP.

IMPORTANT

Make sure that the subscriptions are purchased against the same Azure AD tenant that is used on the original agreement.

2. The customer activates the subscriptions.
3. In Microsoft 365 Admin center, the customer verifies that both the new and subscriptions and the existing subscriptions are active.
4. When the new subscriptions are active, the customer requests that the Volume Licensing reseller or the CSP suspend the existing subscriptions. Typically, there is an overlap to help guarantee continuity and avoid disruption of service.

The customer has add-on environments

If the customer purchased add-on environments through the original CSP agreement or Volume Licensing agreement, those environments should be redeployed.

Prerequisites

Before you begin the move, you must complete the following tasks:

- Save the data from your existing environments. Follow one of the options described in [Database movement operations home page](#).
- Verify that all code packages have been uploaded to the Shared asset library in LCS.

Commercial activities

1. The customer places the order for the subscriptions under the new agreement with the Volume Licensing reseller or the CSP. These subscriptions include the subscriptions for the add-on environments.

IMPORTANT

Make sure that the subscriptions are purchased against the existing Azure AD tenant.

2. The customer activates the subscriptions.
3. In Microsoft 365 Admin center, the customer verifies that both the new subscriptions and the existing subscriptions are active.

Deploy new environments

1. When the new subscriptions are active, additional add-on environments that you can configure appear in LCS. Deploy the add-on environments, and configure them as appropriate.
2. Apply the deployable packages, and restore the data.

Delete environments under the obsolete agreement

Follow these steps for every environment that was deployed under the old agreement. After you've deleted the environments, don't use or redeploy them again.

1. In LCS, on the **Environment details** page, select **Full details**.
2. Stop the environment, and when the environment has stopped, select **Deallocate**.
3. When the deallocation is completed, select **Delete**.
4. When the environment has been deleted, select **Configure**.

Update environments

1. The Volume Licensing reseller or the CSP suspends the existing subscriptions.
2. Any original add-on environments no longer appear in LCS.

NOTE

Until physical redeployment of the add-on environments is completed, both existing subscriptions and new subscriptions must be kept in an active state.

- The movement of files that are stored in Azure Blob storage isn't supported in sandbox environments.
- Commerce customers should be aware that extra steps are required in order for components to work correctly after the move. For more information, see [Data management overview](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Move LCS implementation projects to different Azure AD tenants

2/18/2021 • 10 minutes to read • [Edit Online](#)

You can move your subscriptions and your Microsoft Dynamics Lifecycle Services (LCS) Implementation project to a different Microsoft Azure Active Directory (Azure AD) tenant. Here are some scenarios where this move might be required:

- Subscriptions were accidentally purchased against the incorrect Azure AD tenant.

NOTE

If you're a cloud service provider, and you sell subscriptions for Finance and Operations apps to an existing customer, you must request a reseller relationship with that customer to put the subscriptions on the customer's existing Azure AD tenant. If you create a new customer record for the customer in Microsoft Partner Center, you create a new Azure AD tenant for the customer.

- The customer changes the structure of the Azure AD tenant after the subscription is purchased.

The process for moving your subscriptions and all related artifacts has four main steps, as shown in the following illustration.

Activate subscriptions on the new tenant

Work with your cloud service provider or volume license reseller to activate the subscriptions against the new Azure AD tenant. All subscriptions for users, and for add-on environments, must be activated.

Cloud service provider

If you're licensed through a Microsoft Cloud Solution Provider (CSP) agreement, purchase the required subscriptions against the new tenant from your cloud service provider. If the new tenant already exists, the cloud service provider must request a reseller relationship. Alternatively, in Partner Center, the cloud service provider must create a new customer that has the desired default domain name, *.onmicrosoft.com (for example, contoso.onmicrosoft.com).

Ask the cloud service provider not to suspend the existing subscriptions at this time.

Volume Licensing

If you're licensed through a Microsoft Volume Licensing agreement, you must call the [Volume Licensing support center](#) and ask that the subscriptions be remapped from the old tenant to the new tenant. You can contact Volume Licensing Support through Microsoft 365 Admin center. Request a grace period, when the subscriptions will be active on both tenants. Because of customer privacy concerns, this request must be made by the customer. You should have the following information available:

- Public customer number.
- Enrollment number.
- The current tenant domain that the subscriptions are currently provisioned on.
- The destination tenant domain that the customer wants the subscriptions provisioned under.
- A detailed explanation of why the customer must have its Volume Licensing subscriptions migrated to a different tenant.
- The total number of paid subscriptions that must be moved to the new tenant, together with the subscription type and seat count.

IMPORTANT

It's crucial that the subscriptions be active on both tenants in parallel for a few weeks, until you've finished decommissioning LCS on the old tenant.

Configure LCS on the new tenant

On the new tenant, you will get a new LCS project that you must initiate and set up.

1. Complete the Project Onboarding wizard. For more information, see [LCS project onboarding](#). When completing the wizard, you must indicate on the **Project Overview** page that you are **Moving existing LCS project from another tenant** and provide the source LCS project ID.
2. Fully configure LCS. As part of this configuration, you must:
 - a. Upload and activate a subscription estimator. If you are already live in the source LCS project, you need to ensure that the estimates match.
 - b. Add your deployable package to the asset library.
 - c. Update your Business process modeler (BPM) library.

IMPORTANT

During this period, you will have two parallel LCS projects. You can verify the name and ID of the Azure AD tenant that is associated with an LCS project on the [Subscriptions available](#) page in LCS.

Move your sandbox environments to the new tenant

1. Deploy the non-production environments in the new LCS project.
2. Apply the required code packages to the environments. Make sure that the target is running the same application version as the source. We recommend using [All-in-one deployable packages](#) and include any ISV licenses, if applicable.
3. Upload data to the environments. You can move the data through data packages or by restoring the database. If you restore the database, additional steps are required in order to remap some properties to the new tenant.
4. Update your user information.
 - a. Remove all user accounts except the admin user.
 - b. Fix the admin user record in USERINFO.

```
UPDATE USERINFO
SET SID='mysid', NETWORKALIAS='myalias/email', NETWORKDOMAIN='https://sts.windows.net'
WHERE ID = 'Admin'
...
```

5. Re-import all other users that have the correct security identifier (SID) and identity provider.
6. Run the following commands to update the tenant ID in the appropriate tables. You can verify the Azure AD tenant ID that is associated with an LCS project on the **Subscriptions available** page in LCS.

```
Update POWERBICONFIG set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update PROVISIONINGMESSAGETABLE set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update B2BINVITATIONCONFIG set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update RETAILSHAREDPARAMETERS set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
```

7. Fully configure the environments. As part of this step, configure the integration endpoints.
8. Perform smoke tests on the user acceptance testing (UAT) environment in the new LCS project. These tests should focus on user sign-in, integrations, workflows, printing, reporting, and similar processes that depend on configuration and user information.

Depending on your solution and scope, you might have to perform additional steps on the new Azure AD tenant. These steps might include registering applications (for recurring integrations and warehouse management), adding domains, and setting up directory synchronization to enable single sign-on (SSO).

Note that calls to web services are allowed only from the **home** tenant for the environment. For example, the original tenant was `companya.com`, and integration ran as `services\@companya.com`. In this case, when you switch tenants to `companyb.com`, you can no longer use `services\@companya.com` for web service calls, even if you update `userInfo.networkdomain` to `https://sts.windows.net/companyb.com`.

IMPORTANT

On your sandbox environments, you will lose any document handling attachments that are stored in Azure Blob storage. Blob storage will be moved by Microsoft only for production environments.

Move your production environment to the new tenant

If you do not have a production environment deployed already on the old tenant, you can skip this section.

If you already had a production environment deployed on the old tenant, Microsoft will move your database and Azure Blob storage from your old production environment to the new one. As a pre-requisite, you must complete the additional steps below after you've finished moving all the sandbox environments and completed UAT. The process of moving a production environment to a new tenant requires a downtime.

Before requesting the production environment, ensure that all pre-requisites are completed:

1. Get all required licenses that are needed to correctly license all users on the production environment.
2. When the licenses are in place, upload a subscription estimator to the new LCS project. It should match the subscription estimator that is active in the source LCS project, and it must correctly reflect peak transaction volumes.
3. Send an email to Dynamics 365 FO Go-Live (d365fogl@microsoft.com) stating that your new LCS project is ready for Microsoft to move your production database and Azure Blob Storage. To ensure that the process will run smoothly, provide the following details in the email. We suggest that copy the following list to your email, and then answer all of the information line by line.

Lifecycle Services

- Provide the LCS IDs (number in the LCS project URL) for source and target LCS project.
- Confirm that the go-live date is set correctly in the target LCS project.
- Confirm that the update schedules are set in the target LCS project (**LCS > Menu > Project settings > Update settings**).
- Confirm if you are using Azure Blob Storage for document attachments.
- Confirm that your project is identified as a tenant move in the Project Onboarding wizard.

Testing

- Confirm that the smoke testing is completed on the sandbox environment (Tier-2 or higher) in the target LCS project.

Code Management

- Confirm that your deployable package is marked as a release candidate in the target LCS project.
- List the ISV solutions you are using.
- Confirm which version your old production environment is running on.
- Confirm that non-standard code to be applied in the new production environment will be exactly the same as the non-standard code present in the old production environment in order to prevent database copy issues.
- Confirm if there were any non-typical actions taken on your old production environment which need to be considered on the new production environment, like installation of a custom font or environment upscale.

Environment

- Share which environment version you plan to deploy your new production environment.
 - Describe how you will conduct your cut over.
 - Confirm the dates when the source LCS environments and project will be deallocated and deleted.
4. The Dynamics 365 FO Go-Live team will reply to you within 2 business days and a FastTrack Solution Architect will work with you on the assessment of the project readiness for production deployment.
 5. When the tenant move assessment is successfully completed, the FastTrack Solution Architect will approve your production request for deployment.
 6. Create the production deployment request on the new LCS project.
 - It is not possible to select the same name for the new production environment, as it is in use for your old production environment. You will need to choose a new environment name so that a new URL will be generated.
 - Make sure you select the same application version that is used by your current production environment.
 - In the Production configuration wizard, select a generic user account, not a named user, as Environment Administrator.
 7. After the production environment has been deployed, verify that source and target environments have exactly the same code, otherwise migration will fail. If necessary, deployable packages must be installed on the target production environment.
 8. Request to copy database and blob storage from the old production environment to the new production environment.
 - **Cloud deployment to self-service deployment:** [Submit a service request](#) of type **Other** to request that the Microsoft Service Engineering team copy the database and blob storage, if applicable, from the old production environment to the new production environment. Be sure to include LCS IDs and environment IDs from source and target projects in the service request.

- **Both projects (old and new) are self-service deployments:** Submit a **support ticket** requesting a copy of the database and blob storage, if applicable, from the old production environment to the new production environment. Be sure to include LCS IDs and environment IDs from source and target projects in the support ticket.
 - a. This process will require interaction between Microsoft and the implementing project team. Ensure that you follow the email notifications or notifications directly in the service request.
 - b. After Microsoft has completed the activity and provided you with updated information, you will need to validate the new production environment.
 - c. If you encounter an issue after the migration, file a support ticket.

Tear down the LCS project on the old tenant

After the new LCS project on the new Azure AD tenant is fully functional, you must stop, deallocate, and delete the environments on the old LCS project. When you've finished, the **Configure** button becomes available for each environment. If you already had a production environment on the old tenant, you must file a support ticket to have it deleted.

You should save any remaining artifacts from the Asset library that you might require later.

After all environments have been deleted and all artifacts saved, an Organization Administrator on the old tenant must delete the LCS project. Microsoft reserves the right to disable the customer's account and delete the customer data after the service has been suspended for an extended period.

Suspend subscriptions on the old tenant

After all the environments have been deleted, and you've saved the LCS artifacts that you require, work with your cloud service provider or Volume Licensing Support to suspend all the licenses on the old Azure AD tenant.

- **Cloud service provider** - Suspend the existing subscriptions against the old tenant.
- **Volume Licensing Support** - Call Volume Licensing Support to confirm that you've completed the work and that the subscriptions can now be suspended against the old tenant.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Move LCS implementation projects from on-premises to the cloud

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains how to move your Microsoft Dynamics 365 Finance + Operations (on-premises) environments that are hosted on your own infrastructure to the Azure cloud.

Cloud subscription licenses

If you don't already have cloud subscription licenses, work with your cloud service provider or volume license reseller to get and activate the required subscriptions on your Azure Active Directory (Azure AD) tenant. All subscriptions for users and add-on environments must be activated.

Configure LCS cloud implementation project

If no Finance and Operations cloud-named user subscription licenses have previously been activated on the Azure AD tenant, a new Microsoft Dynamics Lifecycle Services (LCS) cloud implementation project is automatically provisioned. Otherwise, you must open a support request to have an LCS cloud implementation project created. For more information, see [Multiple LCS projects and production environments on one Azure AD tenant](#).

After your LCS cloud implementation project has been created, you must fully configure it. As part of this configuration, you must add users, an Azure DevOps association, and subscription estimates, fill in the Asset library and Business process modeler (BPM), and more.

NOTE

While you're onboarding your project, you must select **AX 2012 Upgrade** as the source system, so that a singleton Azure SQL database will be used for your sandbox instead of an elastic pool. Eventually, a more appropriate option will be available, such as **On-premises Finance and Operations**.

Complete development and testing of updated integrations

You will probably have to make some changes to the integration design patterns that you used for interfaces with your Finance + Operations (on-premises) environment. These changes can be substantial, and a detailed discussion of them is beyond the scope of this topic. Nevertheless, you must evaluate all your interfaces and make the appropriate changes to them.

You should consider developing your updated interfaces in such a way that they can coexist in the same code base as the original interfaces. This approach will simplify code lifecycle management during the period of your transition from on-premises to cloud. If this approach isn't possible, you must manage a new development branch through your cloud go-live. To simplify management of this new branch during the transition period, we recommend that you freeze other code changes as much as you can. Additionally, in your detailed cut-over plan, you should carefully document the steps for inactivating your old interfaces and activating the new interfaces.

Do a trial migration and resolve issues

1. Deploy a tier-2 environment.

2. Apply the same code package that is applied in your on-premises production environment (or, as appropriate, in the current build from the cloud integration development branch that was discussed in the previous section). This code package should be a single, complete deployable package that includes any independent software vendor (ISV) solutions and licenses.
3. In SQL Server Management Studio (SSMS), run the following Transact-SQL (T-SQL) commands against the sandbox database to preserve the current Admin account, Azure AD tenant ID information, and Data management framework (DMF) shared working directory in that database. Save the results.

```
SELECT SID,NETWORKKALIAS,NETWORKDOMAIN,IDENTITYPROVIDER from USERINFO WHERE ID = 'Admin'  
SELECT VALUE from SYSSERVICECONFIGURATIONSETTING where name = 'TENANTID'  
SELECT TENANTID from POWERBICONFIG  
SELECT TENANTID from PROVISIONINGMESSAGETABLE  
SELECT TENANTID from B2BINVITATIONCONFIG  
SELECT TENANTID from RETAILSHAREDPARAMETER  
SELECT SHARED_FOLDERPATH from DMFPARAMETERS
```

4. Copy the database from on-premises to online. The export and import process that you use is the same process that is described in the [Golden configuration promotion](#) database movement tutorial. However, in this case, the source database is the existing on-premises production SQL database, and you must use the sqlpackage.exe approach that is described for importing into a developer environment. If you use the LCS self-service database import option instead, some data won't be imported, as noted in the warnings about data elements that are cleaned up. The target database information that is available in the LCS environment details must be used instead of the placeholders that are shown in the following code.

```
SqlPackage.exe /a:import /sf:D:\BacpacToImport\my.bacpac /tsn:<Azure SQL database server> /tdn:  
<target database name> /tu:<axdbadmin user from LCS> /tp:<axdbadmin password from LCS>  
/p:CommandTimeout=1200
```

5. Restore the Admin account, Azure AD tenant ID, and DMF shared directory values. Also remove the SF schema and its tables, if they are present.

```
UPDATE USERINFO SET SID='<preserved SID>', NETWORKKALIAS='<preserved NETWORKKALIAS>',  
NETWORKDOMAIN='<preserved NETWORKDOMAIN>', IDENTITYPROVIDER='<preserved IDENTITYPROVIDER>' WHERE ID =  
'Admin'  
UPDATE SYSSERVICECONFIGURATIONSETTING set VALUE='<preserved VALUE>' where name = 'TENANTID'  
UPDATE POWERBICONFIG SET TENANTID='<preserved TENANTID>'  
UPDATE PROVISIONINGMESSAGETABLE SET TENANTID='<preserved TENANTID>'  
UPDATE B2BINVITATIONCONFIG SET TENANTID='<preserved TENANTID>'

```

6. Reimport all other users, and assign the appropriate security roles.
7. Direct printing in a cloud environment is done via the Document Routing Agent (DRA). Set up sandbox DRAs as described in [Install the Document Routing Agent to enable network printing](#), so that regression testing can include your printing scenarios.
8. Copy document handling attachments to the cloud. Document handling attachments aren't stored in the database. If they must be preserved, you must move them separately. For instructions, see the [Migrate document handling attachments to your sandbox](#) section later in this topic.
9. Run a complete regression test cycle. This cycle should include testing of integrations.

10. Resolve any issues that are discovered during testing. For each issue, document and keep track of the correcting adjustments that you make in the sandbox, and repeat them in the on-premises source. If any change must not be made in the on-premises environment, because it's incompatible with the correct functioning of that environment, we recommend that you create a DMF data package for it instead of manually applying it for each iteration of the migration process.
11. Repeat steps 2 through 10 until all tests have been passed, and no further changes are being made to code or the configuration.

Repeat the migration to production

1. Deploy the new production environment. Note that the regular prerequisites apply. For example, you must have an active subscription estimator, complete the LCS methodology phases before the operate phase, and complete the FastTrack readiness review. For more information, see [Prepare for go-live](#).
2. Apply the final version of the software deployable package to production.
3. Stop making data changes to the on-premises production environment.
4. Repeat steps 3 through 6 in the [Do a trial migration and resolve issues](#) section to copy the final/up-to-date on-premises production database to the cloud sandbox.
5. Repeat step 8 in the [Do a trial migration and resolve issues](#) section to copy the final/up-to-date document handling attachments to the cloud sandbox.
6. Request a database refresh from sandbox to production. (The process is the same as the process that is used to promote a golden configuration database to production.)
7. Open a support request to have Dynamics Support Engineering copy the document handling attachments from the sandbox storage account to the production storage account and update the references in the production database's DocuValue and DocuDeletedValue tables. After the request has been completed, validate that the attachments are available for a sample of document handling records.
8. Set up DRAs for production. If you're reusing any of the DRAs that were previously installed as part of your trial migration, remember to update their configuration so that they connect to the production URL instead of the sandbox URL.
9. Reconcile your cloud and on-premises production environments, as detailed in your cut-over plan.
10. Obtain sign-off for the go-live.
11. Activate cloud production interfaces, batch jobs, and so on.
12. Start to transact in your cloud production environment.

Migrate document handling attachments to your sandbox

Document handling attachments for Finance + Operations (on-premises) environments are stored in a file share. However, the cloud version doesn't support this file share. You can use the following procedure to copy the attachments to the Azure storage account for your sandbox environment and update the corresponding metadata in the database. For subsequent promotion to production, you can request that Dynamics Support Engineering copy the attachments from your sandbox to production.

1. Upload a copy of the document handling attachment files from the on-premises production file share to a temporary folder on one of the sandbox instances of Application Object Server (AOS). For example, you can upload a zip file of the attachments and unpack it on the target. If you don't have remote desktop access (for example, for a self-service environment), you can use a different virtual machine (VM) instead. For reasonable conversion performance, this VM should be in the same Azure datacenter as the target sandbox. If you aren't using the AOS instance, you must add the VM to an allow list for access to the sandbox's SQL database instance.
2. Open a support request to get the name of the sandbox Azure storage account and a time-limited shared access signature token for the documents container. Update the corresponding placeholders in the Windows PowerShell script that is run in the next step. Also update the placeholders for your temporary

folder, and for your Finance and Operations transactional database, by using the environment details in LCS.

3. Run the following Windows PowerShell script on the sandbox AOS instance or other VM to upload the document handling files to the storage account and create the required metadata for each file.

```
#Upload F&O on-prem document handling attachments to Azure storage account
#
$filePath = "<TEMP_ATTACHMENTS_FOLDER_PATH>"
$dbHostName = "<DATABASE_SERVER>.database.windows.net"
$dbName = "<DATABASE_NAME>"
$dbUsername = "<DATABASE_USER>"
$dbPassword = "<DATABASE_PASSWORD>"
$storageAccountName = "<STORAGE_ACCOUNT_NAME>"
$sasToken = "<SAS_TOKEN>"

[Reflection.Assembly]::LoadWithPartialName("System.Security.Cryptography") #Load crypto
$cryptoObj = [System.Security.Cryptography.SHA256]::Create()
$storageContext = New-AzStorageContext -StorageAccountName $storageAccountName -SasToken $sasToken
foreach ($file in Get-ChildItem $filePath)
{
    try
    {
        $blob = (Set-AzStorageBlobContent -Context $storageContext -Container documents -File
$file.FullName -Blob "$($file.Name)" -Force).ICloudBlob
    }
    catch
    {
        Write-Host "Could not upload $($file.Fullname) to blob"
        Write-Host $_
    }
    if($blob)
    {
        #Write-Host "Processing $($file.Fullname)..."
        #FileHash:
        $fileBytes = [System.IO.File]::ReadAllBytes($file.FullName)
        $hashBytes = $cryptoObj.ComputeHash($fileBytes)
        $encodedHash = [System.Convert]::ToBase64String($hashBytes)
        #FullFileName:
        $origFileName = (Invoke-Sqlcmd -Query "SELECT ORIGINALFILENAME FROM DOCUVALUE WHERE FILEID =
'$($file.Name)'" -ServerInstance $dbHostName -Database $dbName -Username $dbUsername -Password
$dbPassword).ORIGINALFILENAME
        if ($origFileName.Length -eq 0)
        {
            $origFileName = (Invoke-Sqlcmd -Query "SELECT ORIGINALFILENAME FROM DOCUDELETEDVALUE
WHERE FILEID = '$($file.Name)'" -ServerInstance $dbHostName -Database $dbName -Username $dbUsername -
Password $dbPassword).ORIGINALFILENAME
        }
        if ($origFileName.Length -eq 0)
        {
            Write-Host "Missing DOCUVALUE $($file.Name)"
        }
        else
        {
            $nameBytes = [System.Text.Encoding]::UTF8.GetBytes($origFileName)
            $encodedName = [System.Convert]::ToBase64String($nameBytes)
            #Write-Host "Base64 encoded original filename $encodedName."
            $blob.Metadata["FileHash"] = $encodedHash
            $blob.Metadata["FileSize"] = $file.Length
            $blob.Metadata["FullFileName"] = $encodedName
            $blob.SetMetadata()
            Write-Host "Uploaded $($file.Fullname)"
        }
    }
}
}
```

4. In SSMS, run the following T-SQL commands to update the DocuValue and DocuDeletedValue records so that they reference the target storage location.

```
update DOCUVALUE
set ACCESSINFORMATION = replace(ACCESSINFORMATION, 'file://<SOURCE_PREFIX>/documents/',
'https://<STORAGE_ACCOUNT>.blob.core.windows.net/documents/'), STORAGEPROVIDERID = 1
where STORAGEPROVIDERID = 4 --4 for LBD filesystem, 1 for Azure blob
and ACCESSINFORMATION like 'file://<SOURCE_PREFIX>/documents/%'

update DOCUDELETEDVALUE
set ACCESSINFORMATION = replace(ACCESSINFORMATION, 'file://<SOURCE_PREFIX>/documents/',
'https://<STORAGE_ACCOUNT>.blob.core.windows.net/documents/'), STORAGEPROVIDERID = 1
where STORAGEPROVIDERID = 4 --4 for LBD filesystem, 1 for Azure blob
and ACCESSINFORMATION like 'file://<SOURCE_PREFIX>/documents/%'
```

5. Test a sample of the document handling attachments to make sure that they can now be accessed in the sandbox environment.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Multiple LCS projects and environments on one Azure AD tenant

2/18/2021 • 4 minutes to read • [Edit Online](#)

For any new cloud project, one Microsoft Dynamics Lifecycle Services (LCS) Implementation project is instantiated on a Microsoft Azure Active Directory (Azure AD) tenant that provides access to one production instance. In rare cases, to handle the requirements of a specific implementation, you might require multiple production instances that run in parallel. By creating multiple LCS projects against the same Azure AD tenant, you can have multiple production instances. Here are the most common scenarios where multiple production instances might be required:

- A global implementation's requirements for data residency, latency, or data volume can't be met by one instance.
- Different business units in an organization are implementing the product separately as independent applications.

Manual intervention by the Microsoft Dynamics Service Engineering (DSE) team is required in order to create additional LCS projects on a shared Azure AD tenant. This approach should be used only if a single-instance strategy truly isn't feasible. Before additional LCS projects can be created, customers must provide the business justification and confirm that they understand all the implications of the approach. This process should be started as early in the implementation lifecycle as possible. Customers who decide to proceed should inform the FastTrack solution architect who is assigned to their project that they require additional LCS projects. If no solution architect is assigned to their project, customers should open a support ticket.

Licensing requirements

Every LCS Implementation project that runs on the same Azure AD tenant must satisfy the minimum licensing requirements. For example, if there are three LCS Implementation projects on the same Azure AD tenant, a customer must purchase no less than three times the minimum number of subscription licenses. Currently, the minimum license requirement is 20 full user licenses. Therefore, to run three LCS Implementation projects on the same Azure AD tenant, the customer must purchase at least 60 licenses.

Because the licenses are associated with the Azure AD tenant, the **Subscriptions available** page for every LCS project will show the total number of licenses, even though a given LCS project can use only the portion of licenses that has been allocated to it. This allocation of license to LCS projects must be documented outside the system.

Users who access multiple environments in parallel must be licensed separately for each environment. A user can only be assigned one license for each product for each Azure AD tenant. This allocation of licensing requirements for LCS projects for specific users must be documented outside the system. For additional information about licensing, download the [Licensing guide](#).

Disadvantages of multiple LCS projects

There are some disadvantages to having multiple LCS projects. Here are some of them:

- Master data isn't shared.
- Intercompany transactions aren't supported.
- Integrations must be configured in each LCS project.
- Each LCS project requires a separate Bring your own database (BYOD) instance

- User acceptance testing (UAT) must be done on each instance, even if the code is the same. UAT is required on each instance, because differences can occur across the LCS projects, even if they share a code base. One source of differences can be the integration setup and BYOD configuration that must be done separately in each LCS project and therefore must be tested in each LCS project. Additionally, there might be data variations, different application configurations per region might affect functionality, and different data centers might support a different set of Azure services.
- Microsoft Azure DevOps must be configured in each LCS project. When customizations and code are shared, it makes sense to use the same Azure DevOps project.

Advantages of multiple LCS projects

There are also advantages to having multiple LCS projects. Here are some of them:

- Data centers can be selected per LCS project to provide the best latency experience.
- Data centers can be selected per LCS project to satisfy statutory requirements for data residency.
- There is more flexibility to schedule servicing operations, such as code deployments and upgrades.

Requesting multiple LCS projects on the same Azure AD tenant

If your solution requires multiple LCS projects on the same Azure AD tenant, all LCS projects except the original project must be provisioned on demand by the DSE team. You should inform the DSE team about this requirement as early as possible, ideally when the project is being onboarded. For more information, see [Onboard an implementation project](#). To request additional LCS Implementation projects, the customer must create a support request by using the Support portal in LCS. In this request, the customer must provide the following information:

- The business justification.
- The enterprise and project structure. This information includes the following details:
 - The name of the Implementation project
 - The breakdown of licenses per LCS project
- Confirmation that the customer understands the implications of multiple LCS projects on the same Azure AD tenant.

Online deployments in China sovereign cloud

If your implementation includes China deployment/rollout, be informed that Dynamics 365 Finance online deployment became available in Mainland China starting in April 2019. For more information, see [Finance and Operations apps - operated by 21Vianet in China](#). This deployment is designed to comply with regulatory requirements in China and the services include a physically separated instance of a cloud service with a different tenant (Azure Active Directory) that is operated and transacted by 21Vianet.

This is a single organization in multiple clouds with different tenant (Azure Active Directory). The advantages and disadvantages of multi-Lifecycle Services projects or production environments described above are still applicable, but the licensing requirement and requesting procedure are different. Work with your Microsoft Account Executive or your implementation partners for any process assistance.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Globalization resources

2/18/2021 • 2 minutes to read • [Edit Online](#)

Local and regional deployments

If your government regulations require data to be stored differently or serviced differently than is required for other countries/regions, there might be country/region requirements you must consider during deployment. Consider the following resources that might be relevant to you:

[Finance and Operations apps operated by 21Vianet in China](#)

Localization and regulatory features

Finance and Operations apps include functionality for the country/regions documented in the [Product localization and translation availability guide](#). This functionality is enabled based on the primary address of the active legal entity.

This topic includes lists of resources that can help you do the following:

- Learn more about developing country/region-specific solutions.
- Get country/region specific updates.
- Submit and review regulatory alerts.
- Learn how to use country/region specific functionality.

Developing localized solutions

The following resources provides guidance and information that can help developers and ISVs who are creating country/region-specific customizations or are creating a solution for a country that Microsoft does not support.

- [Separation of localization models](#)
- [Apply country/region context](#)
- [Regulatory certification information in feature titles](#)
- [Classification of localization features](#)
- [Country Codes - ISO 3166](#)

Regulatory updates and communication

The following resources provide information about planned and new localization features.

Regulatory updates

- [Regulatory updates](#)
- [Localization portal](#) (Updated weekly)
- [Issue search in Lifecycle Services \(LCS\)](#) (Updated daily)

Communication and alerts

- [Regulatory watch and communication of regulatory updates](#)
- [Submit alerts about country/region-specific regulatory features](#)

Dynamics 365 release plans

The [Dynamics 365 release plans](#) provide descriptions of new and enhanced capabilities that are planned for Dynamics 365 business applications and application platforms.

Finance and Operations apps what's new

The [What's new or changed in Finance and Operations home page](#) lists the features that are included in specific

releases of the Finance and Operations apps.

Electronic reporting

The Electronic reporting (ER) tool allows you to configure formats for electronic documents in accordance with the legal requirements of various countries/regions. ER lets you manage these formats during their lifecycle. For more information, refer to one of the following topics:

- [Electronic reporting \(ER\) overview](#)
- [Manage the Electronic reporting \(ER\) configuration lifecycle](#)
- [Create Electronic reporting \(ER\) configurations](#)
- [Extend the list of Electronic reporting \(ER\) functions](#)
- [Electronic reporting \(ER\) destinations](#)
- [Download Electronic reporting configurations from Lifecycle Services](#)
- [Import Electronic reporting \(ER\) configurations](#)
- [Configure Electronic reporting \(ER\) to pull data into Power BI](#)
- [Generate electronic documents and update application data by using ER](#)

Task guides

Task guides are available from the product help pane and they provide a guided walk-through of key business processes. You can open a task guide to read the steps of a business process or you can play a task guide to walk through a business process and enter data.

To find task guides, navigate to a page in the application and click Help. Task guides that use the page are listed in the help pane. You can also use the help pane to search for task guides by title.

To learn more, see [Help system](#).

Country/region specific help content

- [Australia](#)
- [Austria](#)
- [Belgium](#)
- [Brazil](#)
- [China](#)
- [The Czech Republic](#)
- [Estonia](#)
- [Europe](#)
- [France](#)

- [Russia](#)
- [Saudi Arabia](#)
- [Singapore](#)
- [Spain](#)
- [Sweden](#)
- [Switzerland](#)
- [Thailand](#)
- [United Kingdom](#)
- [United States](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Regulatory updates

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic lists the regulatory updates that are planned and released in Dynamics 365 Finance supported localizations. Delivery timelines might change, and projected functionality might be different or might not be released. For more information, see [Microsoft policy](#).

Regulatory updates are features that are implemented to support new or changed country-specific legislation. For additional information about planned and released country-specific features, refer to the [Dynamics 365 and Power Platform release plans](#).

Microsoft strives to implement new regulatory requirements as early as possible. The actual delivery date depends on the law announcement date, availability of the requirement details from the local authorities, the availability of the validation tools, and on the size and complexity of the change.

We plan to deliver regulatory updates in One Version service updates that are released in time for customers to update and be ready for the enforcement date (for transactional regulatory updates), or for the first mandatory reporting deadline (for regulatory updates related to reporting). Customers and partners can preview the new regulatory updates in the Preview Early Adoption Program (PEAP).

In case of late announcement dates, late availability of requirement details or validation tools, or exceptionally large and complex changes, it might not be possible to make a regulatory update available by the General Availability date of a monthly update. In these cases, the regulatory update will be shipped as hot fixes for relevant available monthly updates.

Regulatory updates that are released as part of the monthly updated are indicated by release version only. Regulatory updates that are delivered either as hot fixes or as part of a release preview can be identified through the abbreviations HF and PEAP, respectively.

For the latest regulatory update plans, refer to the following table.

COUNTRY	RELEASE DATE	RELEASE VERSION	REGULATORY UPDATE
Austria	September 2020	10.0.15	VAT declaration format U30 has been updated for 2020 reporting
Belgium	December 2020	10.0.16	Belgium: "Export ledger transactions" report performance improvement in Dynamics 365 Finance
Brazil	November 2020	10.0.15HF	SPED Fiscal ICMS/IPI - Record C176 - RS state
Brazil	October 2020	10.0.16, 10.0.15HF	NF-e NT2019.001 v1.51 - Adoption of the validation rules upon Benefit code by Distrito Federal
Brazil	October 2020, November 2020	10.0.16, 10.0.15HF	SPED Fiscal - Layout 015

COUNTRY	RELEASE DATE	RELEASE VERSION	REGULATORY UPDATE
Brazil	October 2020	10.0.16	DRCST declaration SC - SEF 262/2020
Brazil	October 2020	10.0.16	SPED Fiscal ICMS / IPI record C176
Brazil	December 2020	10.0.17, 10.0.16HF, 10.0.15HF	NF-e NT2020.006 - Identification of the digital platform intermediary (Layout and validation rules updates)
Europe	January 2021	10.0.17, 10.0.16HF, 10.0.15HF	Brexit - Northern Ireland Protocol impact to Intra-community trade reporting in EU countries
Germany	January 2021	10.0.16HF	ELSTER UstVA VAT advance notification format was extended with two new boxes 37,50 for unrecoverable debts writing off
Germany	January 2021	10.0.17	Changes in ELSTER VAT advance notification XML structure (UstVA)
Global	January 2021	10.0.16	Enable reverse charge mechanism for VAT/GST scheme
India	December 2020	10.0.16, HF, 10.0.15HF	TCS on Sales of Goods Section 206 9(1H) change based on CBDT press release
Latvia	December 2020	10.0.17	Intrastat format is updated starting from 2021
Mexico	December 2020	10.0.17, 10.0.16, 10.0.15	Attribute "Monto" Update
Netherlands	October 2020	10.0.16	Intrastat format is updated starting from 2021
Netherlands	December 2020	10.0.167	New version of Dutch taxonomy NT15
Poland	September 2020	10.0.15	Voluntarily split payment enhancements
Poland	November 2020	10.0.16, 10.0.15	JPK-V7M (VDEK) - Sales document type FP and RO for Retail transactions

COUNTRY	RELEASE DATE	RELEASE VERSION	REGULATORY UPDATE
Poland	September 2020	10.0.15	Poland: JPK-V7M (VDEK) - unlock possibility to run the report generation by parts
Poland	October 2020	10.0.16	JPK-V7M (VDEK) report - 'Voluntarily split payment' parameter uptake
Poland	November 2020	10.0.16, 10.0.15HF	Retail - Issue invoice for retail customer per request
Poland	January 2021	10.0.17, 10.0.16HF , 10.0.15HF	Poland: JPK_KR (SAF Accounting books) clarifications, effective from January 2021
Russia	November 2020	10.0.16	VAT declaration format is updated to version 5.07 starting from the reporting for Q4 2020
Russia	October 2020	10.0.16	Changes in PBU18 for accounting reporting for 2020
Russia	January 2021	10.0.17	A new format of the property tax declaration (technical version 5.07 instead of 5.06) for the 2020 reporting
Spain	November 2020	10.0.17	SII update validation and errors v.2.1(bis) from January 1, 2021
United Kingdom	December 2020	10.0.17, 10.0.16, 10.0.15	Company tax registration in customer invoices (Brexit - Northern Ireland Protocol)
United Kingdom	December 2020	10.0.17, 10.0.16HF. 10.0.15HF	Brexit - Northern Ireland Protocol impact on companies trading goods in both GB and NI locations

Additional resources

- Find all planned and released regulatory updates on [Lifecycle Service - Issue search](#) (sign in required).
- For a list of the localizations that are supported, see the [International availability guide](#).

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Stock transfer orders for India

2/18/2021 • 6 minutes to read • [Edit Online](#)

You can use transfer orders to process inventory transfers between warehouses. In India, if the shipping and receiving branches of the organization have different tax registration numbers, the India Goods and Services Tax (GST) should be calculated and posted for the transfer order. The tax base may be defined as the current cost price of the item being transferred or a special transfer price. The tax amount should be posted as GST payable for the transfer shipment and as GST recoverable upon the transfer receipt. An **Interim transit** account is used as an offset account for the posting and is nullified when the transfer order is fully received.

The **Stock transfer** functionality that is available for India supports this process.

Set up stock transfers

Enable stock transfer functionality

Enable the following features in the **Feature management** workspace:

- (India) Improvements in unit price and cost price handling in Stock transfer orders
- (Stock transfer for India) Set up the default transfer type and price type for transfer orders created from Master planning
- Enable uniform tax amount and GST transaction ID for both shipment and receipt transaction of a stock transfer order

For more information, see [Feature management overview](#).

You also need to configure the India GST functionality to enable GST calculation for stock transfer orders. For more information, see [India Goods and Services Tax \(GST\) overview](#).

Set up default transfer type and price type for transfer orders

You can define a default transfer order type and a default price type for transfer orders that are created manually. On the **Inventory and warehouse management parameters** page, on the **Transfer orders** tab, select **Stock transfer** in the **Transfer type** field to enable the **Stock transfer** functionality for all newly created transfer orders. In the **Price type** field, select a default price type for newly created stock transfer orders:

- **Cost price** – The cost price, or the on-hand price, of the item will be used for stock transfer orders.
- **Transfer price** – The transfer price that is set up for the item will be used for stock transfer orders.

Configure Master planning parameters

You can define a default transfer order type and a default price type for transfer orders that are created when confirming planned orders in the **Master planning** module. On the **Master planning parameters** page, on the **Standard update** tab, select **Transfer type** and **Price type** in the **Firm - Transfer** group.

NOTE

These parameters are only available if the "(Stock transfer for India) Set up the default transfer type and price type for transfer orders created from Master planning" feature is enabled in the **Feature management** workspace. Otherwise, default transfer type and price type are defined by corresponding parameters on the **Inventory and warehouse management parameters** page.

Set up item master parameters

To calculate GST for an item in a stock transfer order, you need to configure certain parameters on the **Released product details** page, such as **HSN codes** and **Tax rate type**. For more information, see [Assign HSN codes and SACs to products](#).

Configure transfer pricing

You can configure the prices that will be used when processing stock transfers for an item. To do this, open the **Transfer price** page from the **Released product details** page.

Configure stock transfer posting

You must configure the **Interim transit** account, which is done on the following pages:

- In the **Inventory management** module, on the **Posting** page, on the **Transfer order** tab, specify the **Interim transit** account.
- On the **Tax setup** page, click **Setup**, and on the **Setup** page specify the **Interim transit for stock transfer** account for all GST components that may be created for GST on stock transfer. For more information, see [Define main accounts](#).

NOTE

The accounts that are used to post interim transit amounts should have **Interim transit** specified in the **Posting type** field on the **Posting validation** tab of the **Main accounts** page.

You must also set up main accounts to post inventory cost for transfer orders to. Specify the following accounts from the **Inventory** tab on the **Posting** page in **Inventory management**:

- **Inventory issue**
- **Inventory receipt**
- **Inter-unit payable**
- **Inter-unit receivable**
- **Inventory expenditure, loss**

NOTE

The **Inventory expenditure, loss** account is required to post the scrap amount when receiving a transfer order with scrap.

Create and post a stock transfer order

1. Go to **Inventory management > Outbound orders > Transfer order** and create a new transfer order.
2. In the **From warehouse** field, select the supply warehouse that the items are dispatched from.
3. In the **To warehouse** field, select the receiving warehouse that the items are delivered to.
4. In the **Transfer type** field, select **Stock transfer** to apply GST to the transfer of items.

NOTE

If you select **Transfer order** in the **Transfer type** field, the transfer order will be posted based on the standard transfer order process.

5. In the **Price type** field, select a default price type for transfer order lines.

6. On the **Transfer order lines** tab, create a new line and in the **Item number** field, select the item to transfer.
7. In the **Transfer quantity** field, enter the quantity of the items to transfer, and in the **Unit** field, modify the default unit of measurement, if required.
8. In the **Price type** field, select the price type for the transfer order line, from the following options:
 - **Cost price** – The cost price, or the on-hand price, of the item is used for the transfer order line.
 - **Transfer price** – The transfer price that is set up for the item is used for the transfer order line.

NOTE

If the **Price type** is set to **Transfer price**, the quantity of the items that are defined for the combination of item and dimension on the **Transfer price** page is displayed in the **Transfer quantity** field, but it can be modified.

9. In the **Unit price** field, enter the cost price or the transfer price for one unit of the item.
10. Select the **Tax information** tab to set up taxes for the transfer order and enter details. You can change the default information that is displayed in the fields.
11. Select **Ship** > **Ship transfer order**, and on the **Shipment** page, post the transfer order shipment.
12. Select **Receive** > **Receive**, and on the **Receive** page, post the transfer order receipt.

NOTE

If the "Enable uniform tax amount and GST transaction ID for both shipment and receipt transaction of a stock transfer order" feature is enabled in the **Feature management** workspace, it is only possible to receive a previously posted shipment. You need to select **Shipment** in the **Update** field when posting a receipt and select a previously posted shipment in the **Shipment voucher** field.

You can also cancel a previously posted stock transfer order shipment if no receipts have been posted for this order. On the **Transfer orders** page, select **Transfer order** > **Transfer order history**. On the **Transfer order history** page, select a previously posted shipment. Select **Cancel**, and confirm the cancellation of the shipment. The shipment will be canceled, and all inventory movements and GST that was posted for the shipment will be reversed. The "Transfer Order Cancellation" feature in the **Feature management** workspace must be enabled to cancel transfer order shipments.

NOTE

Goods in transit from vendor (Russia)

2/18/2021 • 6 minutes to read • [Edit Online](#)

The item counting process (INV-6) is used to identify the quantity and value of inventory items that are in transit when inventory is counted.

The item counting process is done in the context of nomenclatures, shipping documents, and vendors.

Set up an inventory profile for a transferable item

To reflect the goods and materials that are in transit, you can set the kind of inventory for the **Basic** kind of activity. The **Kind of inventory** field can have the following values:

- Common
- Purchased items in route

1. Go to **Inventory management > Setup > Dimensions > Inventory profiles**.
2. Select **New** to create an inventory profile for an item.
3. In the **Inventory profile** field, enter the name of the inventory profile.
4. In the **Name** field, enter a description of the inventory profile.
5. On the **Setup** FastTab, in the **Kind of activity** field, select **Basic**.
6. Set the **Don't match** option to **Yes** to prevent on-hand inventory that uses this inventory profile from being automatically matched with a compatible inventory profile.
7. In the **Kind of inventory** field, select **Purchased items in route**. The **Initialize dimension** and **Control dimension in purchase order** options are automatically set to **Yes**.

NOTE

The **Kind of inventory** field is available only if you select **Basic** in the **Kind of activity** field.

8. On the **Matching priority** FastTab, select **Up** or **Down** to change the order of the inventory profile.
9. Select **Save**, and close the page.

The screenshot displays the 'Inventory profiles' setup page in Dynamics 365 Finance and Operations. The page is divided into several sections:

- Inventory profiles:** A table with columns for 'Inventory profile' and 'Name'. The profile name is 'For a transferable item'.
- Setup:** A grid of configuration options:
 - Kind of activity:** Basic
 - Kind of inventory:** Purchased items in route
 - Prohibit cost adjustment:** No
 - Initialize dimension:** Yes
 - Control dimension in purchase order:** Yes
 - Tax receivable processing:** Standard
 - Don't match:** Yes
 - Alcohol activity type:** None
 - Prohibit misc. charges on customer/...:** No
 - Split customer invoice:** No
 - Control dimension in sales order:** No
 - Tax payable processing:** Standard
- Matching priority:** A table with columns for 'Inventory profile', 'Name', and 'Kind of activity'. It contains one entry: 'For a transferable item' with 'Basic' as the kind of activity.
- Compatible inventory profiles:** A section for defining compatible profiles, currently empty.

Set up a number sequence for the Counting act (INV-6) report

1. Go to **Inventory management > Setup > Inventory and warehouse management parameters**.

2. On the **Number sequences** tab, in the **Number sequence code** field, select a number sequence for the **Counting act (INV-6)** reference.
3. Select **Save**, and close the page.

Set up an inventory journal name for the Counting act (INV-6) report

1. Go to **Inventory management > Setup > Journal names > Inventory**.
2. Create a journal name.
3. In the **Name** field, enter the inventory journal name.
4. In the **Description** field, enter a description.
5. In the **Journal type** field, select **Counting**.
6. On the **Reports** FastTab, in the **Available** field, select **Counting act (INV-6)**, and then select the left arrow button to move the report to the **Selected** field.

NOTE

If the **Available** field is blank, select **Update** on the Action Pane to update the list of available reports.

7. Select **Save**, and close the page.

The screenshot displays the 'Inventory Journal Names' configuration page. On the left, a list of journal names includes 'Инвент', 'Коррект', 'Перенос', 'Проводка', and 'Специф'. The main area shows the configuration for the 'Инвент' journal name. The 'Name' field contains 'Инвент', the 'Description' is 'Журнал инвентаризации', and the 'Journal type' is 'Counting'. The 'General' section includes fields for 'VOUCHER' (Voucher series: Проводка), 'Posting' (Selection by: Posting, Detail level: Details), 'Delete lines after posting' (No), 'INVENTORY' (Reservation: Manual), 'BLOCKING' (Private for user group), and 'COUNTING' (Counting status registration policy: Enable counting status regist...). The 'Reports' section shows a list of available reports on the left, including 'Counting list (INV-5)', 'Counting list (INV-3)', 'Collation statement', 'Requirement slip', and 'Certificate of unservice...'. The 'Counting act (INV-6)' report has been moved to the 'SELECTED' list on the right.

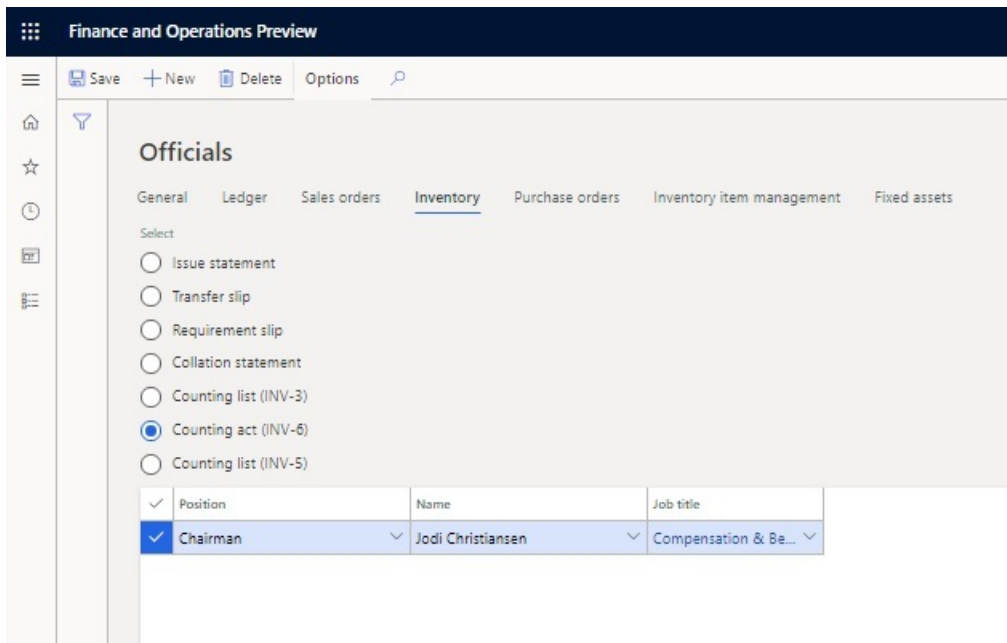

Add officials to the Counting act (INV-6) report

You can specify the company officials who are involved in the item counting process for the **Counting act (INV-6)** report.

1. Go to **Organization administration > Setup > Contacts > Officials**.
2. On the **Inventory** tab, select the **Counting act (INV-6)** option.
3. Select **New** to create an official for the **Counting act (INV-6)** report.
4. In the **Position** field, select the designation of the official.
5. In the **Name** field, enter the name of the official.
6. In the **Job title** field, select the job title of the official.

NOTE

By default, the job title is copied from the selected employee's record.

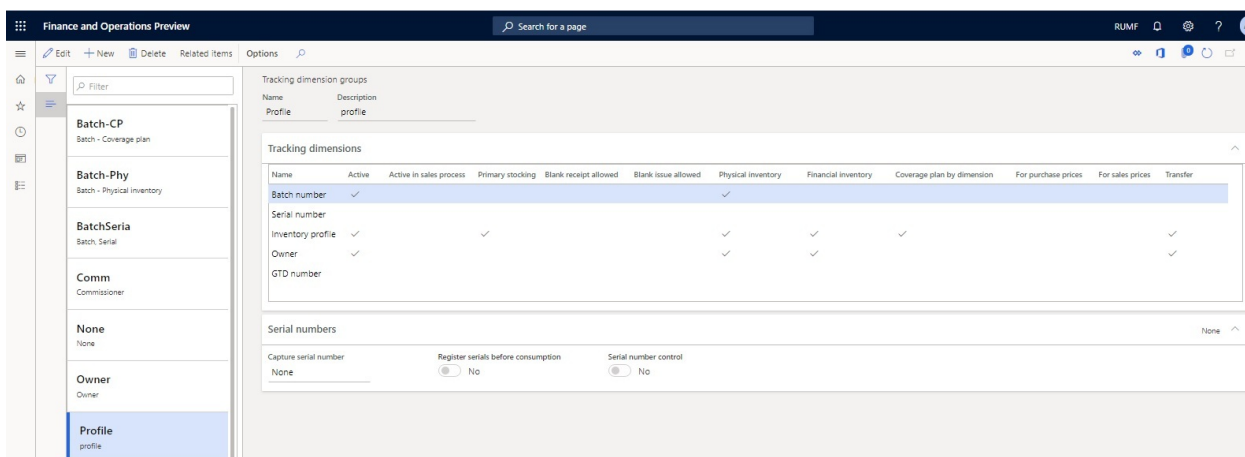

7. Select **Save**, and close the page.

Create an inventory tracking dimension group for the Counting act (INV-6) report

1. Go to **Product information management > Setup > Dimension and variant groups > Tracking dimension groups**.
2. Select **New** to create a dimension group.
3. In the **Name** field, enter the name of the dimension group.
4. In the **Description** field, enter a description.
5. On the **Tracking dimensions** FastTab, on the **Inventory profile** line, select the **Active**, **Primary stocking**, **Physical inventory**, **Financial inventory**, **Coverage plan by dimension**, and **Transfer** check boxes.
6. On the **Owner** line, select the **Active**, **Physical inventory**, **Financial inventory**, and **Transfer** check boxes.

NOTE

To make the report reflect the details of shipping and payment documents, on the **Batch number** line, select the **Active** and **Physical inventory** check boxes.

7. Select **Save**.

Create a purchase agreement

1. Go to **Accounts payable > Purchase orders > Purchase agreements**.

2. Select **New** to open the **Create purchase agreement** dialog box.
3. On the **Vendor** FastTab, in the **Vendor account** field, select the vendor account.
4. In the **Purchase agreement classification** field, select **Blanket purchase agreement**.
5. On the **General** FastTab, in the **Document** section, in the **Purchase agreement** field, enter the ID of the purchase agreement.
6. Specify other details, and then select **OK**.
7. On the **Purchase agreements** page, switch to the **Header** view, and then, on the **Financial** FastTab, in the **Inventory profile** section, set the following fields:
 - In the **Kind of activity** field, select **Basic**.
 - In the **Inventory profile** field, select the inventory profile that you created earlier.

8. On the Action Pane, on the **Purchase agreement** tab, in the **Generate** group, select **Confirmation** to update the status of the purchase agreement to **Effective**.

Add an inventory owner to the Counting act (INV-6) report

1. Go to **Inventory management > Setup > Dimensions > Inventory owners**.
2. Select **New** to add an inventory owner.
3. In the **Owner** field, enter the owner code.
4. In the **Account type** field, select **Vendor**.
5. In the **Account** field, select the principal code. The **Name** field is filled in automatically.
6. In the **Agreement ID** field, select the purchase agreement that you created earlier. In this way, you associate the new owner with the agreement.

7. Select **Save**.

Register goods and materials that are in transit

1. Create a new purchase order. In the **Purchase agreement** field, select the purchase agreement that you created earlier, and then, on the purchase order line, in the **Item number** field, select the item number.

NOTE

The **Tracking dimension** field for the item should be set to the inventory profile that you created earlier.

2. On the **Line details** FastTab, on the **Product** tab, in the **Tracking dimension** section, validate that the **Inventory profile** field is set to the inventory profile that you created earlier.
3. In the **Owner** field, select the record that you created earlier.

4. Post the invoice in the usual way.

Generate a Counting act (INV-6) report

You can use the **Print of counting act (INV-6)** dialog box to generate a **Counting act (INV-6)** report as a Microsoft Excel file. You must generate this report to track items that are transferred between warehouses and to create a counting list of the items in the transfer that have been purchased. The counting list can contain on-hand inventory holdings.

1. Go to **Inventory management > Journal entries > Item counting > Counting**.
2. Select **New** to open the **Dimensions display** dialog box.
3. On the **Overview** FastTab, validate that the **Name** field is set to the inventory journal name that you created earlier.
4. In the **Store inventory** section, set the **Site** and **Warehouse** fields.
5. On the **Counting by** FastTab, validate that the **Inventory profile** and **Owner** options are set to **Yes**.

NOTE

You can also set the **Batch number** and **Warehouse** options to **Yes**, if those dimensions are applicable.

6. Select **OK** to create an inventory counting journal for the items in the transfer.
7. On the **Counting** page, in the **Journal lines** FastTab, create a line, and select the item number that you created earlier.
8. On the **Line details** FastTab, on the **Inventory dimensions** tab, in the **Inventory profile** and **Owner** fields, select the records that you created earlier. The **On-hand** field on the journal line is automatically updated.
9. On the **Journal lines** FastTab, select **Functions > Create counting list** to create a counting list. For each line, the **Counted** field is updated with the value that is specified in the **On-hand** field.

10. On the Action Pane, select **Print > Counting act (INV-6)** to open the **Print of counting act (INV-6)** dialog box.
11. In the **Date of act completion** field, select the date when the counting process is scheduled to be completed.
12. In the **Start date** and **End date** fields, select the start and end dates of the inventory counting period.
13. In the **Order number** field, enter the order number that you're generating the **Counting act INV-6** report for.
14. In the **Resolution date** field, select the transaction date of the order that you're generating the **Counting act INV-6** report for.

NOTE

The values in the **Journal**, **Dimension number**, and **Kind of inventory** fields are based on the inventory counting transactions. To change the values of these fields, select **Filter**. For example, you can modify these values to generate the report for a different journal or a different dimension.

Cloud and edge scale units for manufacturing and warehouse management workloads

2/18/2021 • 9 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

Cloud and edge scale units enable distribution of shop floor and warehouse execution workloads among different environments. This functionality can help improve performance, prevent service interruptions, and maximize uptime. It's provided by the following add-ins:

- Cloud Scale Unit Add-in for Dynamics 365 Supply Chain Management
- Edge Scale Unit Add-in for Dynamics 365 Supply Chain Management

Companies that work with manufacturing and distribution must be able to run key business processes 24/7, without interruption and at scale. Cloud and edge scale units enable companies to run key mission-critical manufacturing and warehouse processes without interruption, even when faced with occasional network connectivity or latency issues.

Public preview information

The preview provides one environment that functions as a cloud-based hub of your Dynamics 365 Supply Chain Management environment and one environment that functions as a cloud scale unit.

Preview availability

The preview for cloud and edge scale units becomes available for existing customers of Supply Chain Management in October 2020.

To access the October preview release 10.0.15/Platform update 39 for deployment in your [Microsoft Dynamics Lifecycle Services \(LCS\)](#) environment, you must be part of the preview early access program (also known as PEAP) for Supply Chain Management. You can join PEAP if you're already a member of the broader [Dynamics Insider Program](#). Just select the specific program that is named "Finance & Operations: Preview early access program (PEAP)."

IMPORTANT

The scale unit capability for Supply Chain Management is made available only if you agree to the [Cloud + Edge Preview for Finance and Operations terms](#).

Data processing for the preview

During the public preview, some management services will only be hosted in the United States. However, when the feature becomes generally available, these management services will be available in all geographies supported by Supply Chain Management. This affects the transfer and storage of administrative information used by the scale unit manager, including:

- Your tenant names and IDs
- Your LCS project IDs

- Administrator emails used to sign in
- Environment IDs for hub and scale units
- Workload configurations
- Collected metrics (such as latency and throughput) which are displayed on the map analysis page

Data transferred to and stored in the US data centers will be deleted when your preview environments are shut down.

Sign up for the preview

To sign up for the cloud and edge preview for Supply Chain Management, your organization must already have a live Supply Chain Management cloud environment.

The scale unit capabilities are currently in public preview. When you sign up, you must use a user account on the specific tenant. You must also be a project owner or an environment admin in LCS for an active Dynamics 365 LCS project in that tenant.

When you sign up for the preview, you will select a tenant and go through the sign-up steps. As soon as Microsoft can allocate preview capacity, we will send you an email that includes the provisioning details and the promotion (promo) codes for two environments (a hub and a scale unit) for the appropriate LCS project. You will then be able to deploy the two environments as tier-2 sandbox environments. Those environments will be valid 60 days from the creation date of the promo codes. You should not use the two environments until the step that is described in the next paragraph is completed.

After you confirm with Microsoft that the two environments have been deployed by using the promo codes, one of the environments will be configured to work as a hub, and the other will be configured to work as a scale unit. You can then configure the scale units and deploy selected warehouse management and manufacturing workloads by using the [Scale Unit Manager portal](#).

Preview environments will automatically be deleted after 60 days. However, they might be deleted sooner if it appears that they aren't being used. After your preview environments have been deleted, you can sign up and queue up for a new preview deployment.

To sign up for the preview, go to the [Scale Unit Manager portal](#).

Limitations that apply during the preview period

IMPORTANT

For the initial phase of the preview program for this feature, Microsoft is supporting only hubs that have cloud scale units, not hubs that have edge scale units. Edge scale units are installed on-premises and are expected to become available during an upcoming phase of the program.

Because cloud and edge scale units are a preview feature, services that are related to them are currently available in limited countries and regions. By enabling cloud and edge scale units, you affirm that you understand that some data that is related to the configuration and processing of cloud and edge scale units might be stored in a data center that is located in the United States. By enabling cloud and edge scale units, you also agree to the [Cloud + Edge Preview for Finance and Operations terms](#). To learn more about cloud and edge scale units, see the [documentation](#).

Your privacy is important to Microsoft. To learn more, read our [Privacy Statement](#).

IMPORTANT

Some business functionality isn't fully supported in the public preview when workloads are used on scale units. For more information about the functional workloads, see the sections later in this topic.

Scale units and dedicated workloads

Scale units extend your central Supply Chain Management hub environment by adding dedicated processing capacity. Scale units can run in the cloud. Alternatively, they can run on the edge at your local facility premises. Scale units can temporarily be disconnected from the hub environment. When they are connected, scale units receive all the information that is required to run the dedicated processing for assigned workloads.

For the public preview, you can configure a hub environment with selected workloads on a cloud scale unit by using the Scale Unit Manager portal. Preview participants who have access to a Local Business Data (LBD) on-premises environment can also configure the LBD environment as an edge scale unit.

A workload is a defined set of business functionality that can be factored out and delegated to a scale unit. Currently, the preview features two types of workloads:

- Manufacturing execution
- Warehouse management

You can assign one of each type of workload per scale unit.

Dedicated manufacturing execution workload capabilities in a scale unit

For manufacturing execution, cloud and edge scale units deliver the following capabilities, even when the edge units aren't connected to the cloud:

- Machine operators and shop floor supervisors can access the operational production plan.
- Machine operators can keep the plan up to date by running discrete and process manufacturing jobs.
- The shop floor supervisor can adjust the operational plan.
- Workers can access time and attendance for clock-in and clock-out on the edge, to ensure correct worker pay

calculation.

For more information, see the [manufacturing scale unit workload details](#).

Dedicated warehouse management workload capabilities in a scale unit

For warehouse management, cloud and edge scale units deliver the following capabilities, even when edge units aren't connected to the cloud:

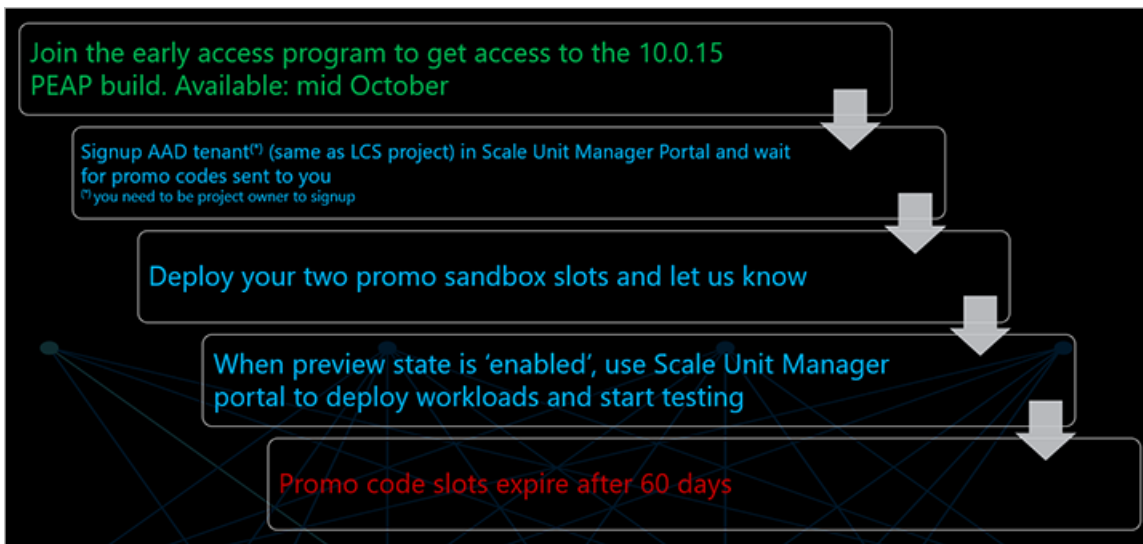

- Processing of selected wave methods is enabled for sales orders and demand replenishment.
- Warehouse workers can run sales and demand replenishment warehouse work by using the warehouse app.
- Warehouse workers can inquire into on-hand inventory by using the warehouse app.
- Warehouse workers can create and run inventory movements by using the warehouse app.
- Warehouse workers can register purchase orders and do putaway by using the warehouse app.

For more information, see the [warehouse scale unit workload details](#).

Onboard scale units for your Supply Chain Management environment

Deploy the preview for cloud and edge scale units

The following illustration shows the sign-up and provisioning flow for the public preview for cloud scale units.

Select your LCS project tenant and the detailed preview process

In the public preview, the [Scale Unit Manager portal](#) shows the list of tenants that your account is part of, and where you're an owner or environment admin for an LCS project.

If the tenant that you're looking for isn't in this list, go to [LCS](#), and make sure that you're either an environment admin or a project owner of the LCS project for that tenant. Note that only Azure Active Directory (Azure AD) accounts from the selected tenant are authorized to complete the sign-up experience.

NOTE

After you apply changes to LCS, it might take up to 30 minutes for the list of tenants to reflect the changes.

For each tenant, the list shows the sign-up status.

Scale Unit Manager for Dynamics 365 Supply Chain Management | Dynamics 365 Tenants

Your Dynamics 365 Tenants

Filter by name

Tenant	Status
Contoso Pharmaceuticals	Enabled
Contoso Ltd.	Click here to sign up
Contoso Headquarters	Sign up required. Only users from this tenant can sign up.
Contoso Suites Management	Pending

If you do not find the tenant you want, return to Microsoft Dynamics Lifecycle Services (LCS) and confirm you are either an environment admin or a project owner for a LCS project of that tenant. Only user accounts from the tenant are authorized sign up for the preview.

Select the **Click here to sign up** link to sign up your LCS tenant to participate in the preview. You must accept the terms. You must also supply a business email address where Microsoft can send communications that are related the preview sign-up process.

By clicking this box, I agree to the Microsoft [Preview Terms](#) and [Privacy Statement](#).

To learn more about cloud and edge scale units please consult the [documentation](#).

Please enter one or more email addresses for users in your organization (separated by ';') for us to send them information about your preview project.

[Sign up](#) [Back](#)

Microsoft will review your request and inform you about the next steps by sending an email to the address that you supplied on the sign-up form.

After you've been granted access to the preview program, you will receive two promo codes for your LCS project. You can now use those promo codes to deploy two environments in LCS. The environments must use PEAP release 10.0.15 or later. When you've finished applying the promo codes, notify Microsoft (as instructed), so that we can finish enabling the environments for the preview features. Microsoft will let you know when this configuration step is completed.

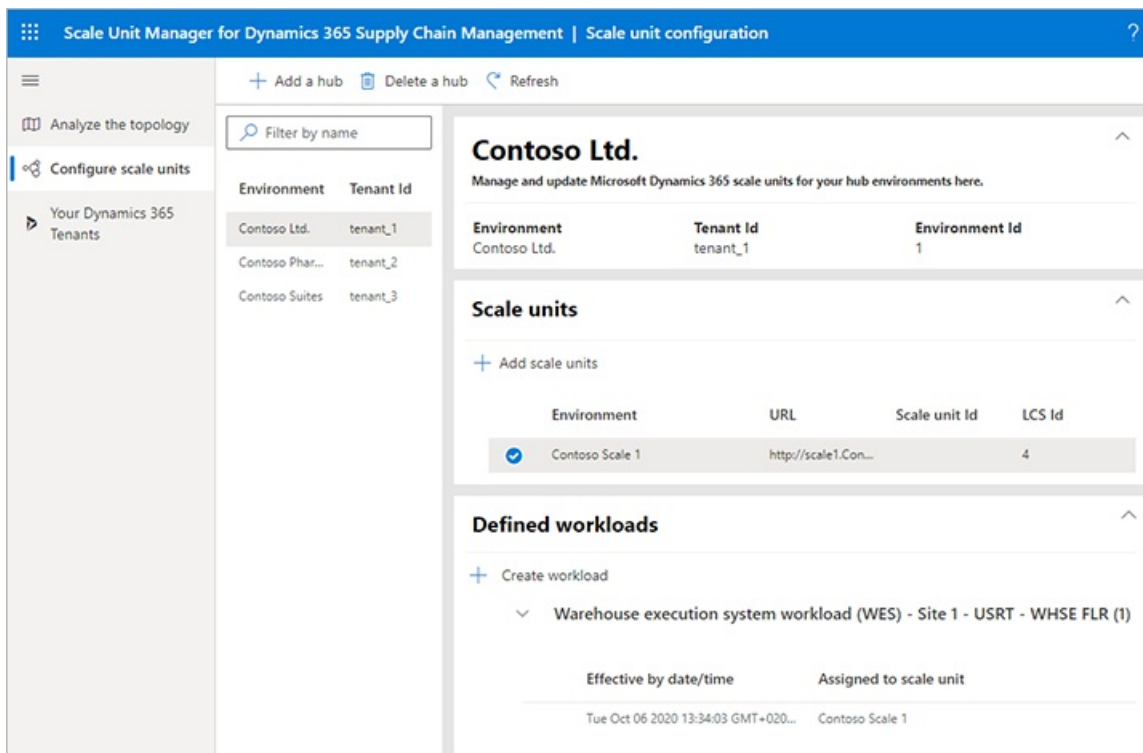

You can now start to configure scale units and workloads in your preview environment.

IMPORTANT

When you configure cloud scale units, you can [do all the required steps in the Scale Unit Manager portal](#).

Manage cloud scale units and workloads by using the Scale Unit Manager portal

Go to the [Scale Unit Manager portal](#), and sign in by using your tenant account. On the **Configure scale units** page, you can add a hub environment if it isn't already listed. You can then select the hub that you want to configure with scale units and workloads.

To add one or more scale units that are available in your topology, select **Add scale units**. In the preview, you should see the cloud scale unit that you deployed from one of the promo codes that you received as part of the preview program.

On the **Defined workloads** tab, use the **Create workload** button to add a warehouse management or manufacturing execution workload to one of your scale units. For each workload, you must specify the context of the processes that will be owned by the workload. For warehouse management workloads, the context is a specific warehouse in a specific site and legal entity. For manufacturing execution workloads, the context is a specific site in a legal entity.

Define workloads

Select the type of workload you want to define. Based on the selection you might see different configuration options.

Environment *
Contoso Scale 1

Workload type *
Warehouse execution system workload (WES)

Site *
Select

Legal Entity *
Select

Warehouse *
Select

Add **Cancel**

IMPORTANT

The Scale Unit Manager portal in the preview doesn't let you remove workloads from scale units or unassign a scale unit from a hub after the assignment is made. If you must remove an assignment, reach out to your contact person for preview program management.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manufacturing execution workloads for cloud and edge scale units

2/18/2021 • 5 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

WARNING

Some business functionality isn't fully supported in the public preview when workload scale units are used.

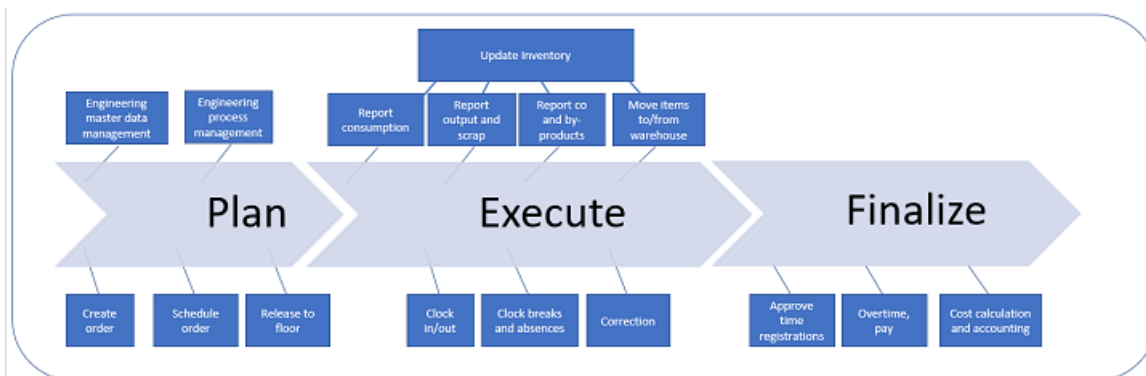

In manufacturing execution, cloud and edge scale units deliver the following capabilities, even when edge units aren't connected to the hub:

- Machine operators and shop floor supervisors can access the operational production plan.
- Machine operators can keep the plan up to date by running discrete and process manufacturing jobs.
- The shop floor supervisor can adjust the operational plan.
- Workers can access time and attendance for clock-in and clock-out on the edge, to ensure correct worker pay calculation.

This topic describes how manufacturing execution workloads work with cloud and edge scale units.

The manufacturing lifecycle

As the following illustration shows, the manufacturing lifecycle is divided into three phases: *Plan*, *Execute*, and *Finalize*.

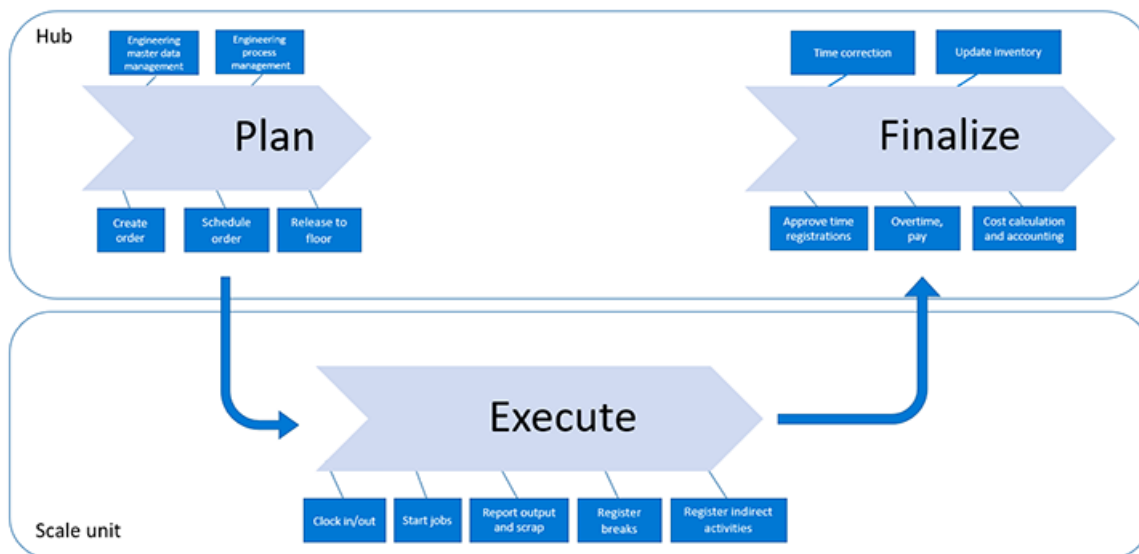

The *Plan* phase includes product definition, planning, order creation and scheduling, and release. The release step indicates the transition from the *Plan* phase to the *Execute* phase. When a production order is released, the production order jobs will be visible on the production floor and ready for execution.

When a production job is marked as completed, it moves from the *Execute* phase to the *Finalize* phase. In the *Finalize* phase, the registrations from the *Execute* phase go through an approval workflow, where they are calculated, approved, and transferred. At that point, the production order is completed. Therefore, the basis for the workers' pay is generated.

Splitting the Execute phase into a separate workload

As the following illustration shows, when scale units are used, the *Execute* phase is split out as a separate workload.

The model now goes from a single-instance installation to a model that is based on the hub and scale units. The *Plan* and *Finalize* phases run as back-office operations on the hub, and the manufacturing execution workload runs on the scale units. Data is transferred asynchronously between the hub and scale units.

When a production order is released on the hub, all data that is required to process production jobs is transferred to the scale unit. This data includes production orders, production routes, bills of materials, and products. Data that isn't related to a production order (such as indirect activities, absence codes, and production parameters) is also transferred from the hub to the scale unit. As a rule, data that originates from the hub and that is transferred to the scale unit can be created or updated only on the hub. For example, a new absence code or indirect activity can't be created on the scale unit—they can be used only for registration. The registrations that are made on the scale unit during execution are then transferred to the hub, where time and attendance approval, inventory, and financial updates are processed.

Manufacturing execution tasks that can be run on workloads

The following manufacturing execution tasks can currently be run on workloads when scale units are used:

- Clock-in, log-in, clock-out, and absence
- Start job
- Bundle jobs
- Report progress
- Report scrap
- Indirect activity
- Break

Working with manufacturing execution workloads on the hub

Usually, the processes that are required to run manufacturing execution workloads run automatically to keep the hub and all the scale units in sync, as needed. However, if you're having trouble, you can manually trigger the processing of raw registrations that are received from workloads and/or check the registration processing log.

Manually process raw registrations

A batch job in Supply Chain Management runs automatically to process all the registrations that have been

received from the workloads. This job creates the required production journals and logbook entries when a registration is processed for a completed job on the workload.

Although the job usually runs automatically, you can run it manually at any time by signing in to the hub and going to **Production control > Periodic tasks > Backoffice workload management > Process raw registrations**.

Check the raw registration processing log

To review the registration processing log, sign in to the hub, and go to **Production control > Periodic tasks > Backoffice workload management > Raw registration processing log**. The **Raw registration processing log** page shows a list of processed raw registrations and the status of each registration.

The screenshot shows the 'Raw registration processing log' page. It features a table with columns: Message state, Type of registration, Created date and time, Job, Operation/A..., Description, Production unit, and Resource group. Below the table is a 'Processing details' section with columns: StartDateTime, EndDateTime, Processing result, and Created by.

Message state	Type of registration	Created date and time	Job	Operation/A...	Description	Production unit	Resource group
Processed	Stop job	9/25/2020 11:45:20 AM	005847	Packing	Packing	120	1220
Processed	Start job	9/25/2020 11:44:47 AM	005847	Packing	Packing	120	1220
Processed	Stop job	9/25/2020 11:42:57 AM	005846	TestOpr	Operating the speaker test an...	120	1220
Processed	Start job	9/25/2020 11:42:34 AM	005846	TestOpr	Operating the speaker test an...	120	1220
Processed	Stop job	9/25/2020 11:40:38 AM	005844	Assembly	Speaker assembly	120	1210
Processed	Start job	9/25/2020 11:39:35 AM	005844	Assembly	Speaker assembly	120	1210

StartDateTime	EndDateTime	Processing result	Created by
9/29/2020 10:53:36 AM	9/29/2020 10:59:10 AM	Failed	Admin
9/29/2020 10:53:26 AM	9/29/2020 10:56:16 AM	Failed	Admin
9/29/2020 10:46:50 AM	9/29/2020 10:52:31 AM	Failed	Admin
9/29/2020 10:46:01 AM	9/29/2020 10:49:22 AM	Failed	Admin
9/29/2020 10:38:51 AM	9/29/2020 10:44:54 AM	Failed	Admin
9/29/2020 10:38:45 AM	9/29/2020 10:41:52 AM	Failed	Admin
9/29/2020 10:34:43 AM	9/29/2020 10:37:38 AM	Failed	Admin

You can work on any registration in the list by selecting it and then selecting one of the following buttons on the Action Pane:

- **Process** – Manually process the selected registration. This action can be useful if the *Process raw registrations* job hasn't run, or if it failed.
- **Cancel** – Cancel the selected registration.

Working with manufacturing execution workloads on a scale unit

Usually, the processes that are required to run manufacturing execution workloads run automatically to keep the hub and all the scale units in sync, as needed. However, if you're having trouble, you can check the history of orders that have been processed on a scale unit or manually run the *Manufacturing hub to scale unit message processor* job.

View the history of manufacturing jobs that have been processed on a scale unit

To review the history of manufacturing jobs that have been processed on a scale unit, sign in to the scale unit machine, and go to **Production control > Periodic tasks > Backoffice workload management > Manufacturing jobs processing history**. The **Manufacturing jobs processing history** page shows the processing history of the production orders on the scale unit. You can work on any production order in the list by selecting it and then selecting one of the following buttons on the Action Pane:

- **Process** – Manually process the selected production order.
- **Cancel** – Cancel the selected production order.

Manufacturing hub to scale unit message processor job

The *Manufacturing hub to scale unit message processor* job processes data from the hub to the scale unit. This job is automatically started when the manufacturing execution workload is deployed. However, you can run it manually at any time by going to **Production control > Periodic tasks > Backoffice workload**

management > Manufacturing hub to scale unit message processor.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warehouse management workloads for cloud and edge scale units

2/18/2021 • 13 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

WARNING

Not all warehouse management business functionality is fully supported for warehouses running a workload on a scale unit. Be sure to use only the processes that this topic explicitly describes as supported.

Warehouse execution on scale units

This feature enables scale units to run selected processes from the warehouse management capabilities. Cloud scale units run their workloads in the cloud by using dedicated processing capacity in your selected Microsoft Azure region. For edge scale units, you can run some workloads independently on premises, even while the scale units are temporarily disconnected from the cloud.

In this topic, warehouse management executions in a warehouse that is defined as a scale unit are known as a *Warehouse execution system (WES)*.

Prerequisites

You must have a Dynamics 365 Supply Chain Management hub and a scale unit that has been deployed with the warehouse management workload. For more information about the architecture and deployment process, see [Cloud and edge scale units for manufacturing and warehouse management workloads](#).

How the WES workload works on scale units

For the processes in the warehouse management workload, the data is synced between the hub and the scale units.

A scale unit can maintain only the data that it owns. The data ownership concept for scale units helps prevent multi-master conflicts. Therefore, it's important that you understand which processes are owned by the hub and which are owned by the scale units.

The scale units own the following data:

- **Wave processing data** – Selected wave process methods are handled as part of the scale unit wave processing.
- **Work processing data** – The following types of work order processing are supported:
 - **Inventory movements** (manual movement and movement by template work)
 - **Purchase orders** (putaway work via a warehouse order when purchase orders are not associated with loads)

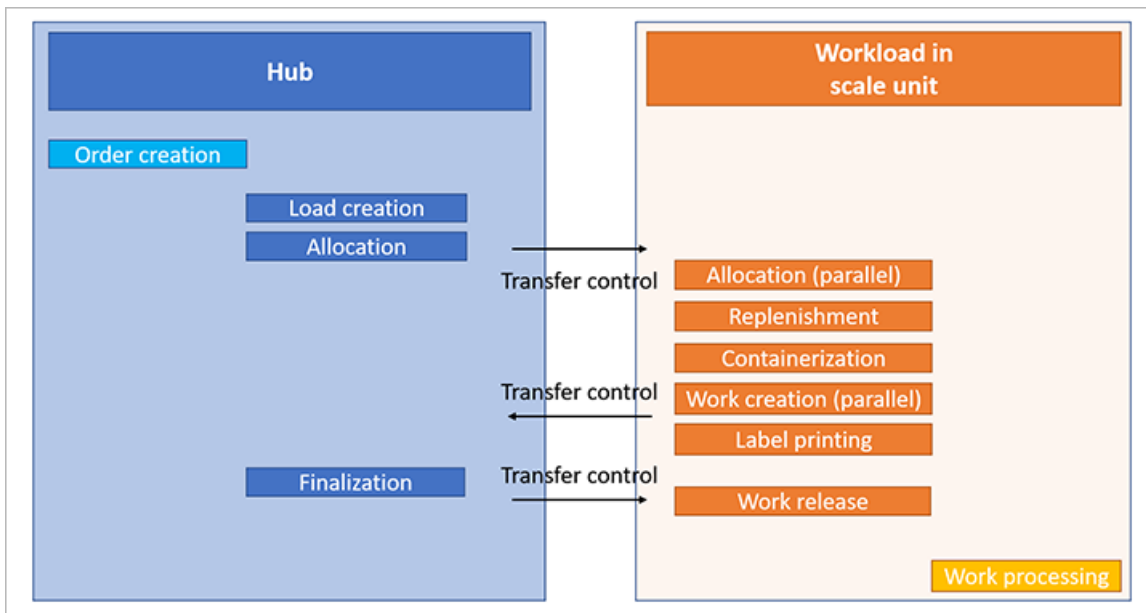

- **Sales orders** (simple picking and loading work)
- **Transfer orders** (only outbound with simple picking and loading work)
- **Warehouse order receipt data** – This data is used only for purchase orders that are manually released to a warehouse.
- **License plate data** – License plates can be created on the hub and the scale unit. Dedicated conflict handling has been provided. Note that this data isn't warehouse-specific.

Outbound process flow

The hub owns the following data:

- All source documents, such as sales orders and transfer orders
- Order allocation and outbound load processing
- The release to warehouse, shipment creation, wave creation, and wave finalization processes

The scale units own the actual wave processing (such as work allocation, replenishment work, and demand work creation) after the release of the wave. Therefore, warehouse workers can process outbound work by using a warehouse app that is connected to the scale unit.

Inbound process flow

The hub owns the following data:

- All source documents, such as purchase orders and sales return orders
- Inbound load processing
- All cost and financial updates

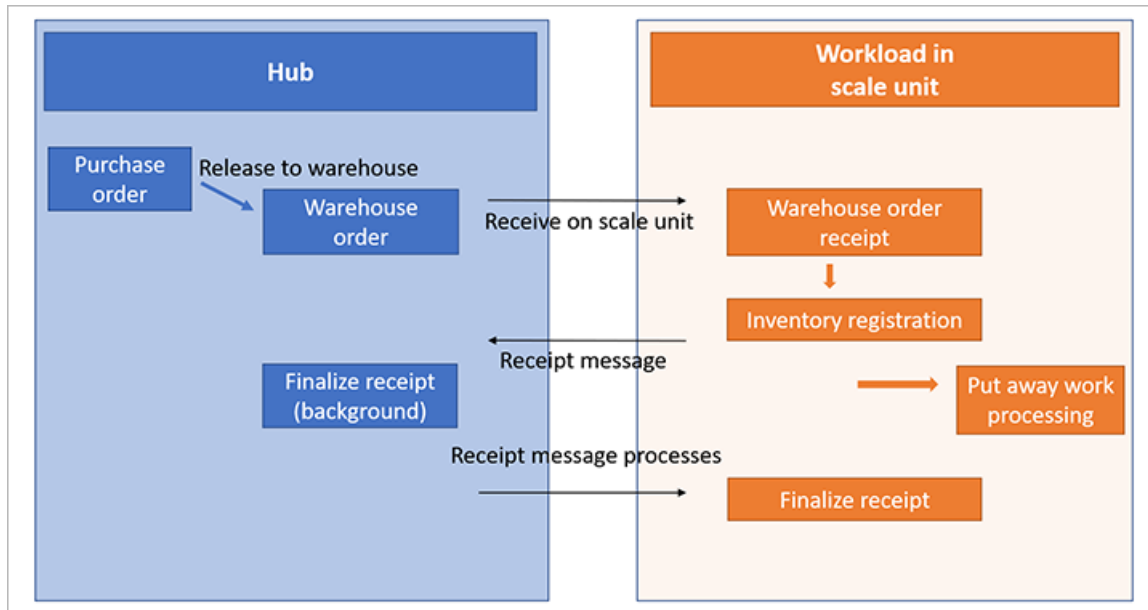

NOTE

The inbound purchase order flow is conceptually different from the outbound flow. You can operate the same warehouse on either the scale unit or the hub depending on whether the purchase order has been released to warehouse or not. Once you have released an order to the warehouse, you can only work with that order while signed in on the scale unit.

If you're using the *release to warehouse* process, *warehouse orders* are created, and ownership of the related receiving flow is assigned to the scale unit. The hub won't be able to register inbound receiving.

The worker can run the receiving process by using a warehouse app that is connected to the scale unit. The data is then recorded by the scale unit and reported against the inbound warehouse order. The creation and processing of the subsequent putaway will also be handled by the scale unit.

If you aren't using the *release to warehouse* process, and therefore aren't using *warehouse orders*, the hub can process warehouse receiving and work processing independently from scale units.

Supported processes and roles

Not all warehouse management processes are supported in a WES workload on a scale unit. Therefore, we recommend that you assign roles that match the functionality that is available to each user.

To facilitate this process, a sample role that is named *Warehouse manager on workload* is included in the demo data at **System administration > Security > Security configuration**. The purpose of this role is to enable warehouse managers to access the WES on the scale unit. The role grants access to the pages that are relevant in the context of a workload that is hosted on a scale unit.

User roles on a scale unit are assigned as part of the initial data synchronization from the hub to the scale unit.

To modify the roles that are assigned to a user, go to **System administration > Security > Assign users to roles**. Users who act as warehouse managers only on scale units should be assigned only the *Warehouse manager on workload* role. This approach will ensure that those users have access only to the supported functionality. Remove any other roles that are assigned to those users.

Users who act as warehouse managers on both the hub and scale units should be assigned the existing *Warehouse worker* role. Be aware that this role grants warehouse workers access to features (such as transfer order receiving processing) that appear in the user interface (UI) but aren't currently supported on scale units.

Supported WES processes

The following warehouse execution processes can be enabled for a WES workload on a scale unit:

- Selected wave methods for sales and transfer orders (allocation, demand replenishment, containerization, work creation, and wave label printing)
- Processing sales and transfer order warehouse work using the warehouse app (including replenishment work)
- Querying on-hand inventory by using the warehouse app
- Creating and running inventory movements by using the warehouse app

- Registering purchase orders and doing putaway work by using the warehouse app

The following work order types are currently supported for WES workloads on scale unit deployments:

- Sales orders
- Transfer issue
- Replenishment
- Inventory movement
- Purchase orders (linked to warehouse orders)

No other types source-documents processing or warehouse work are currently supported on scale units. For example, for a WES workload on a scale unit, you can't perform a transfer order receiving process (transfer receipt) or process cycle counting work.

NOTE

Mobile device menu items and buttons for unsupported functionalities aren't shown in the *warehouse app* when it is connected to a scale unit deployment.

WARNING

When you run a workload on a scale unit, you can't run unsupported processes for that specific warehouse on the hub. The tables provided later in this topic document the supported capabilities.

Selected warehouse work types can be created both on the hub and on scale units, but can only be maintained by the owning hub or scale unit (the deployment which created the data).

Even when a specific process is scale unit supported, be aware that all the needed data might not get synchronized from the hub to the scale unit, or from the scale unit to the hub, which risks resulting in unexpected system processing.

Examples being:

- If you use a location directive query that joins a data table record that only exists at the hub deployment.
- If you use location status and/or location volumetric load functionalities. This data will not get synchronized between the deployments and will therefore only work when updating location inventory on-hand on one of the deployments.

The following warehouse management functionality isn't currently supported for scale unit workloads:

- Inbound processing of purchase order lines assigned to a load
- Inbound processing of purchase orders for a project
- Inbound and outbound processing for items that have active tracking dimensions **Owner** and/or **Serial number**
- Processing of inventory that has a blocking status value
- Changing of an inventory status during any work movement process
- Order-committed flexible warehouse-level dimension reservations
- Use of *Warehouse location status* functionality (the data isn't synced between the deployments)
- Use of *Location license plate positioning* functionality
- Use of *Product filters* and *Product filter groups*, including the **Number of days to mix batches** setting
- Integration with quality management
- Processing with catch-weight items
- Processing with items only enabled for Transportation management (TMS)
- Processing with negative on-hand inventory
- Warehouse work processing with custom work types
- Warehouse work processing with shipment notes

- Warehouse work processing with cycle counting threshold triggering
- Warehouse work processing with material handling/warehouse automation
- Use of product master data image (for example, on the warehouse app)

WARNING

Some warehouse functionality won't be available for warehouses running the warehouse management workloads on a scale unit, and also isn't supported on the hub or on the scale unit workload.

Other capabilities can get processed on both, but will require careful use in some scenarios, such as when inventory on-hand gets updated for the same warehouse on both the hub and scale unit due to the asynchronous data update process.

Specific functionalities (such as *block work*) which are supported on both the hub and scale units will only be supported for the owner of the data.

Outbound (supported only for sales and transfer orders)

The following table shows which outbound features are supported, and where they are supported, when the warehouse management workloads are used in cloud and edge scale units.

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT
Source document processing	Yes	No
Load and transportation management processing	Yes	No
Release to warehouse	Yes	No
Planned cross docking	No	No
Shipment consolidation	Yes	No
Shipment wave processing	Yes, but only initialization and finalization of the wave is handled in the hub. This means that outbound transfer and sales order processing only can get handled by the scale unit.	No, initialization and finalization gets handled by the hub and the Load building and sorting are not supported Note: Access to the hub is required to finalize the wave status as part of the wave processing.
Maintain shipments for wave	Yes	No
Warehouse work processing (incl. license plate print)	No	Yes, but only for the above mentioned supported capabilities.
Cluster picking	No	Yes

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT
Manual packing processing, incl. 'Packed container picking' work processing	No Some processing can be done after a initial picking process handled by a scale unit, but not recommended due to following blocked operations.	No
Remove container from group	No	No
Outbound sorting processing	No	No
Printing of load related documents	Yes	No
Bill of lading and ASN generation	Yes	No
Shipment confirm	Yes	No
Shipment confirmation with "Confirm and transfer"	No	No
Packing slip and invoicing processing	Yes	No
Short picking (sales and transfer orders)	No	No
Over picking (sales and transfer orders)	No	No
Change of work locations (sales and transfer orders)	No	Yes
Complete work (sales and transfer orders)	No	Yes
Print work report	Yes	No
Wave label	No	Yes
Work split	No	Yes
Work processing - Directed by 'Transport loading'	No	No
Reduce picked quantity	No	No
Reverse work	No	No
Reverse shipment confirmation	Yes	No

Inbound

The following table shows which inbound features are supported, and where they are supported, when the warehouse management workloads are used in cloud and edge scale units.

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT (ITEMS MARKED "YES" APPLY ONLY FOR WAREHOUSE ORDERS)
Source document processing	Yes	No
Load and transportation management processing	Yes	No
Inbound shipment confirmation	Yes	No
Purchase order release to warehouse (warehouse order processing)	Yes	No
Cancellation of warehouse order lines Note that this only is supported when no registration has happened against the line	Yes	No
Purchase order item receiving and put away	Yes, when there isn't a warehouse order No, when there is a warehouse order	Yes, when a purchase order isn't part of a <i>load</i>
Purchase order line receiving and put away	Yes, when there isn't a warehouse order No, when there is a warehouse order	Yes, when a purchase order isn't part of a <i>load</i>
Return order receiving and put away	Yes	No
Mixed license plate receiving and put away	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
Load item receiving	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
License plate receiving and put away	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
Transfer order item receiving and put away	Yes	No

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT (ITEMS MARKED "YES" APPLY ONLY FOR WAREHOUSE ORDERS)
Transfer order line receiving and put away	Yes	No
Cancel work (inbound)	Yes, when there isn't a warehouse order No, when there is a warehouse order	Yes, but only when the Unregister receipt when canceling work option (on the Warehouse management parameters page) is cleared
Purchase order product receipt processing	Yes	No
Purchase order receiving with underdelivery	Yes, when there isn't a warehouse order No, when there is a warehouse order	No, because you can only cancel the full warehouse order line quantities
Purchase order receiving with overdelivery	Yes, when there isn't a warehouse order No, when there is a warehouse order	Yes
Receiving with creation of <i>Cross docking</i> work	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
Receiving with creation of <i>Quality order</i> work	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
Receiving with creation of <i>Quality item sampling</i> work	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
Receiving with creation of <i>Quality in quality check</i> work	Yes, when there isn't a warehouse order No, when there is a warehouse order	No

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT (ITEMS MARKED "YES" APPLY ONLY FOR WAREHOUSE ORDERS)
Receiving with quality order creation	Yes, when there isn't a warehouse order No, when there is a warehouse order	No
Work processing - Directed by <i>Cluster putaway</i>	Yes	No
Work processing with <i>Short pick</i>	Yes	No
License plate loading	Yes	No

Warehouse operations and exception handling

The following table shows which warehouse operations and exception handling features are supported, and where they are supported, when the warehouse management workloads are used in cloud and edge scale units.

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT
License plate inquire	Yes	Yes
Item inquire	Yes	Yes
Location inquire	Yes	Yes
Change warehouse	Yes	Yes
Movement	Yes	Yes
Movement by template	Yes	Yes
Warehouse transfer	Yes	No
Create transfer order from warehouse app	Yes	No
Adjustment (in/out)	Yes	No
Inventory status change	Yes	No
Cycle counting and Counting discrepancy processing	Yes	No
Reprint label (license plate printing)	Yes	Yes
License plate build	Yes	No
License plate break	Yes	No

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT
Pack to nested license plates	Yes	No
Driver check in	Yes	No
Driver check out	Yes	No
Change batch disposition code	Yes	Yes
Display open work list	Yes	Yes
Consolidate license plates	Yes	No
Min/max and zone threshold replenishment processing	Yes Recommendation is not to include the same locations as part of the queries	Yes
Slotting replenishment processing	Yes	Yes Note that the setup must be done on the scale unit
Block and unblock work	Yes	Yes
Change user	Yes	Yes
Change work pool on work	Yes	Yes
Cancel work	Yes	Yes

Production

Warehouse management production scenarios aren't currently supported on scale unit workloads, as indicated in the following table.

PROCESS	HUB	WES WORKLOAD ON A SCALE UNIT
<p>All warehouse management processes that are related to production. Here are some examples:</p> <ul style="list-style-type: none"> • Release to warehouse • Production wave processing • Raw material picking • RAF and finished goods put away • Co-product and by-product put away • Kanban put away • Kanban picking • Start production order • Production scrap • Production last pallet • Register material consumption • Empty kanban 	Yes	No

Maintaining scale units for WES

Several batch jobs run on both the hub and scale units.

On the hub deployment, you can manually maintain the batch jobs. You can manage the following batch jobs at **Warehouse management > Periodic tasks > Back-office workload management**:

- Process work status update events
- Scale unit to hub message processor
- Register source order receipts
- Complete warehouse orders
- Process quantity update responses for warehouse order lines

On the workload in scale units, you can manage the following batch jobs at **Warehouse management > Periodic tasks > Workload management**:

- Process wave table records
- Warehouse hub to scale unit message processor
- Process quantity update requests for warehouse order lines

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warehouse orders for cloud and edge scale units

2/18/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Some or all of the functionality noted in this topic is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

WARNING

Not all business functionality is fully supported in the public preview when scale unit workloads are used. If you're using scale units, be sure to use only those processes that this topic explicitly describes as supported.

What are warehouse orders?

Warehouse orders are a type of order that was created to support hub and scale unit warehouse deployments. They let you receive inventory when you're running a warehouse workload on a scale unit. They are currently used only with purchase orders.

Warehouse orders are used as part of warehouse management processing, such as when the warehouse app is used to register physical on-hand inventory during processing of an inbound purchase order. Warehouse orders are created as part of the *Release to warehouse* process that is available for purchase orders that specify a scale unit warehouse and items that are enabled to use warehouse management processes.

IMPORTANT

Warehouse orders are available only in deployments that use [warehouse management workloads for cloud and edge scale units](#).

Create a warehouse order

To create a warehouse order, follow these steps.

1. Sign in to the instance of Microsoft Dynamics 365 Supply Chain Management that is running on the hub. (You must initiate the *Release to warehouse* process while you're signed in on the hub.)
2. Go to **Procurement and sourcing > Purchase orders > All purchase orders**.
3. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
4. To view the related warehouse order lines, open the relevant purchase order, select a line in the **Purchase order lines** section, and then, on the toolbar, select **Warehouse > Warehouse order lines**. To view all the lines, go to **Warehouse management > Inquiries and reports > Warehouse order lines**.

Cancel a warehouse order

As part of the *Release to warehouse* process, purchase order inventory transactions are linked to warehouse orders and locked from being updated by the hub. If you released to the warehouse by mistake, or if you have some other reason to reverse the creation of warehouse order lines, you can request to cancel warehouse order lines.

To cancel warehouse order lines, follow these steps.

1. Sign in to the Supply Chain Management instance that is running on the hub.
2. Go to **Warehouse management > Inquiries and reports > Warehouse order lines**.
3. Select the relevant line.
4. On the Action Pane, select **Cancel warehouse order lines**.

NOTE

The request to cancel lines will be denied for any lines that are already pending cancellation or that are actively being processed at a warehouse that is running its workload on a scale unit.

Monitor a warehouse order

In the **Warehouse order lines** view, you can monitor the progress of inbound receiving by reviewing the values in the **Quantity left to receive** column. To view details that are related to work that is done by using the warehouse app, follow one of these steps.

- Go to **Warehouse management > Inquiries and reports > Warehouse order lines**, and use the filter to find the lines that you're looking for.
- Go to **Procurement and sourcing > Purchase orders > All purchase orders**, and open the relevant purchase order. In the **Purchase order lines** section, select one or more lines, and then, on the toolbar, select **Warehouse > Warehouse receipt entries**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

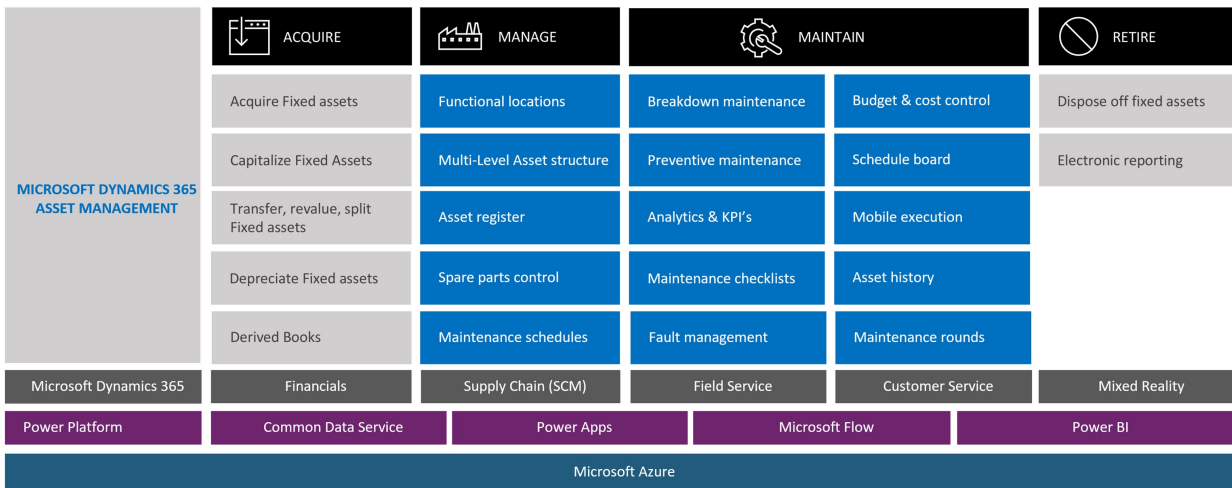

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset management overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

Asset Management is an advanced module for managing assets and maintenance jobs in Dynamics 365 Supply Chain Management. Asset Management integrates seamlessly with several modules in Finance and Operations apps.

The image below is an illustration of the interfaces to other modules in Finance and Operations.

Asset Management enables you to efficiently manage and carry out tasks related to managing and servicing many types of equipment in your company, for example, machines, production equipment, and vehicles. Asset Management supports solutions across numerous industries.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Functional locations and assets

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes functional locations and assets in Asset Management. Asset Management is an advanced module for managing assets and maintenance jobs in Dynamics 365 Supply Chain Management.

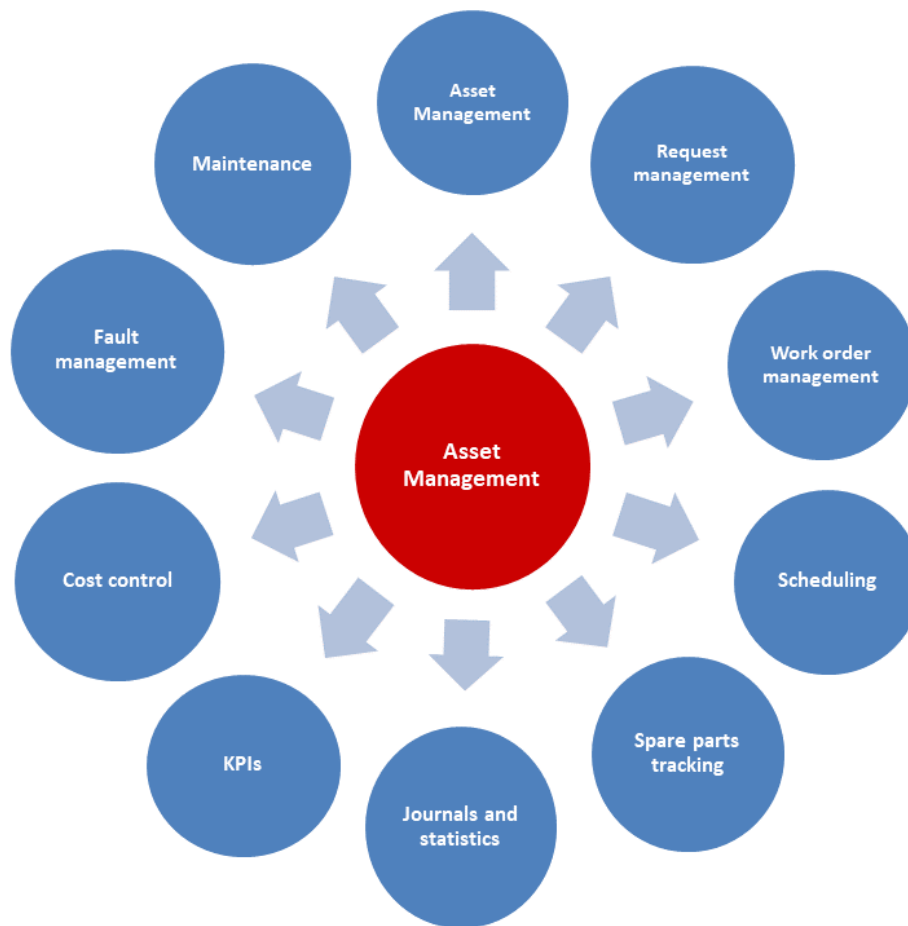

Overview

Asset Management is integrated seamlessly with several modules with other Finance and Operations apps. The following illustration shows the interfaces with other modules.

Asset Management lets you efficiently manage and perform all tasks that are related to managing and servicing many types of equipment in your company. This equipment includes machines, production equipment, and vehicles. Asset Management also supports solutions across numerous industries.

The following illustration shows an overview of the main functionality that is covered by Asset Management.

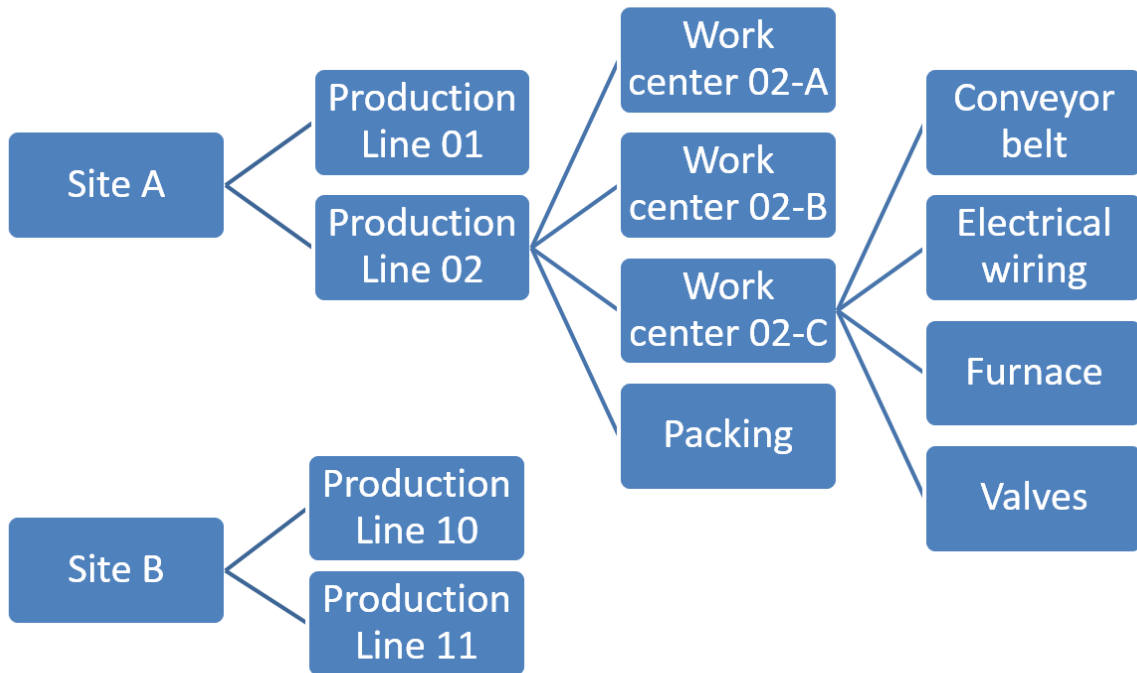

Functional locations and assets

Functional locations are used to manage assets on locations. This management includes tracking of asset costs on functional locations. Functional locations are structured hierarchically, and locations can have sub-locations. The structure of functional locations is static. In other words, locations can't change place. Assets can be installed on functional locations and, as required, can be installed on other functional locations later.

Asset costs always follow the location of the asset. In other words, if you install an asset on a new functional location, the asset automatically uses the financial dimensions that are related to the new functional location. Therefore, asset costs are always related to the functional location that the asset is currently installed on. This automatic handling of financial dimensions helps guarantee complete tracking of costs when your company does project controlling and reporting on functional locations.

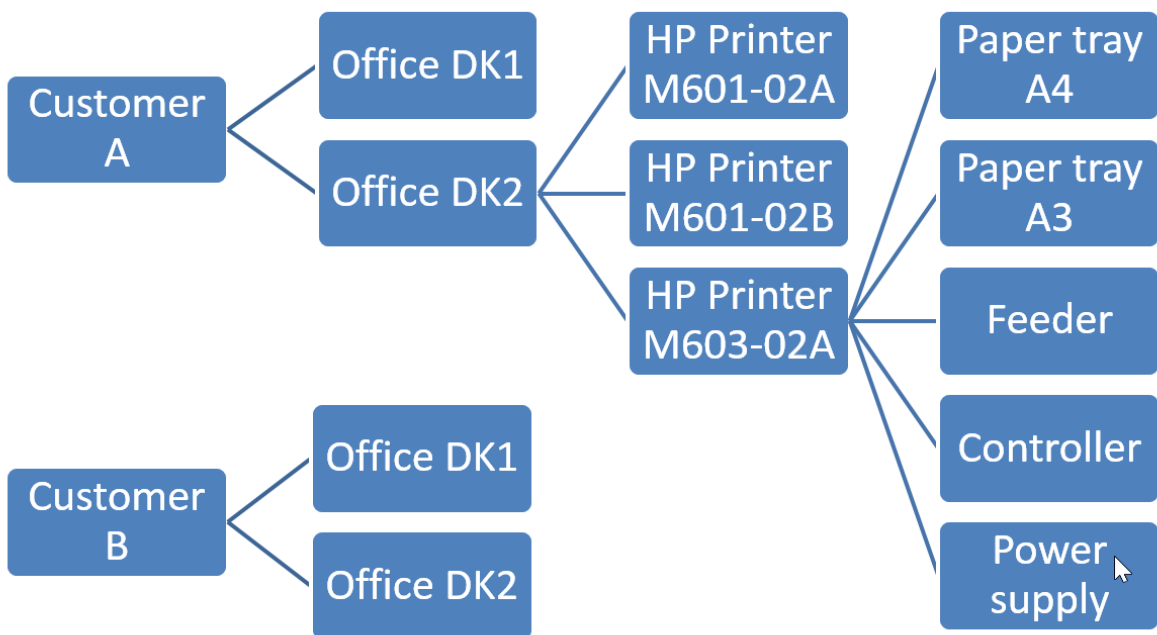

The way that you build your hierarchy of functional locations depends on your company's requirements for maintaining internal equipment or servicing customer equipment. The following figure shows an example of functional locations that are based on geographical locations.

Functional location based on sites

The following figure shows an example of functional locations that are based on customers.

Functional location based on customers

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

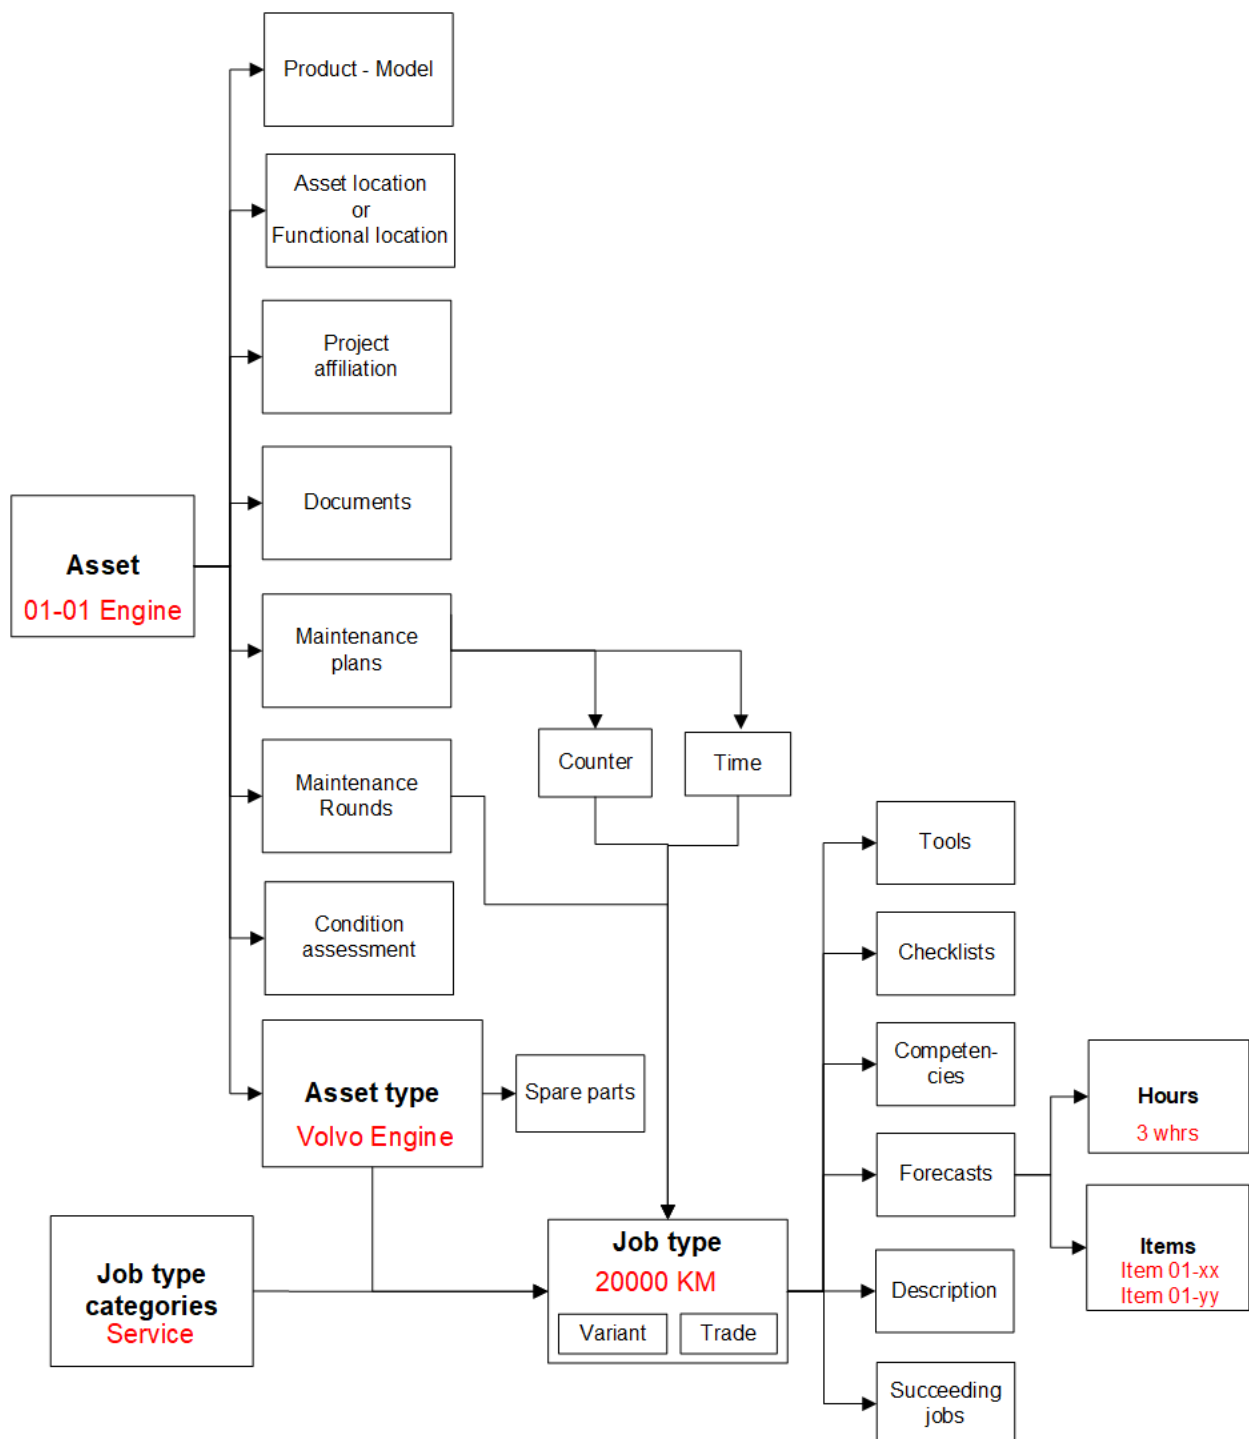

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Assets and work orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes assets and work orders in Asset Management. Assets and work orders are the central parts of Asset Management. An *asset* is a machine or machine part that requires continuous maintenance and service. Assets can be created in a hierarchical structure, and they can be related to functional locations. Maintenance jobs can be planned at all levels in the asset structure.

Various data, such as product information and asset specification, and required maintenance plans are set up on each asset. The following illustration shows an overview of asset data and the affiliation of assets to job types. Red text is used for examples that show inheritance and dependencies.

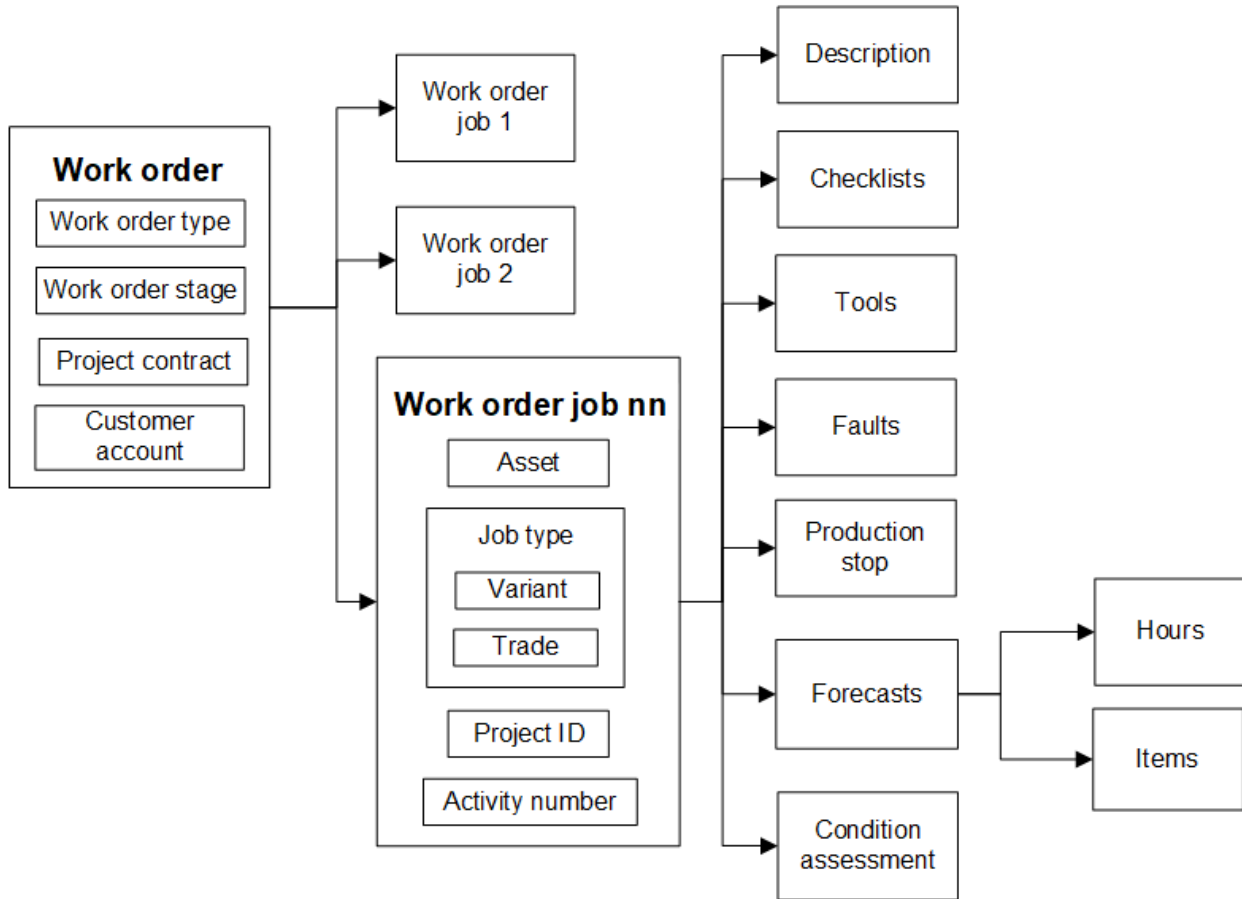

Every work order has a work order type, such preventive maintenance, corrective maintenance, or inspection.

The work order contains one or more work order jobs. Every work order job defines a job that must be performed on an asset and a related job type. Examples of related job types include 10,000 km, 50,000 km, 1-year overhaul, and safety inspection. One work order can be related to multiple assets.

The following illustration shows an overview of the key data in a work order.

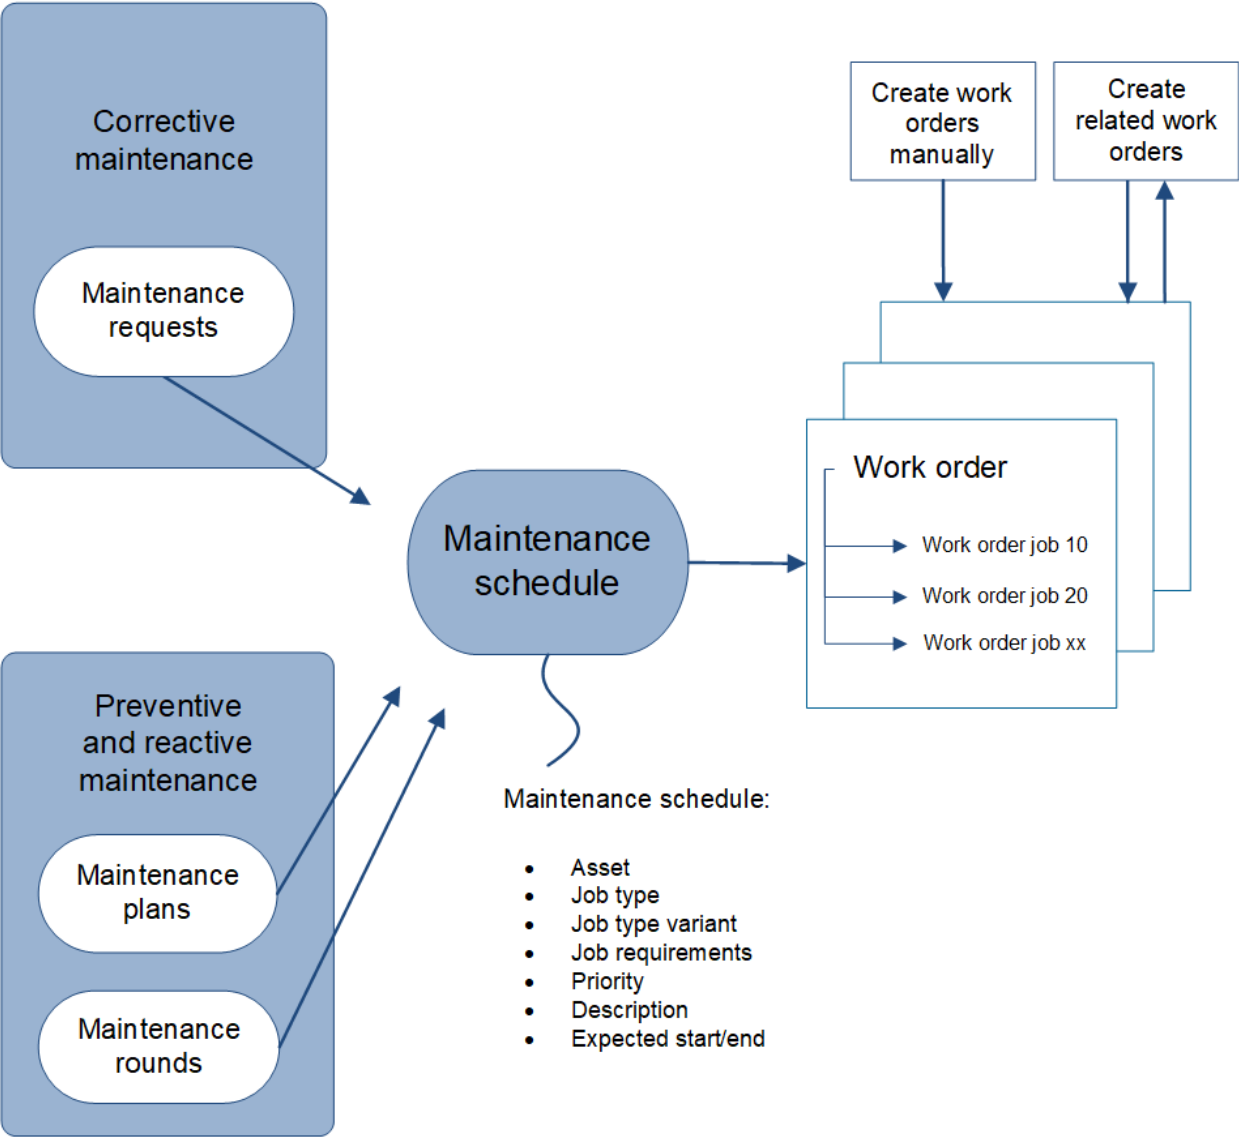

Work Order: Overview

A work order can be related to another work order, and job types can contain succeeding jobs that create a work order. In general, there are no dependencies between work orders. Therefore, they can change their work order lifecycle state and can be scheduled independently of each other.

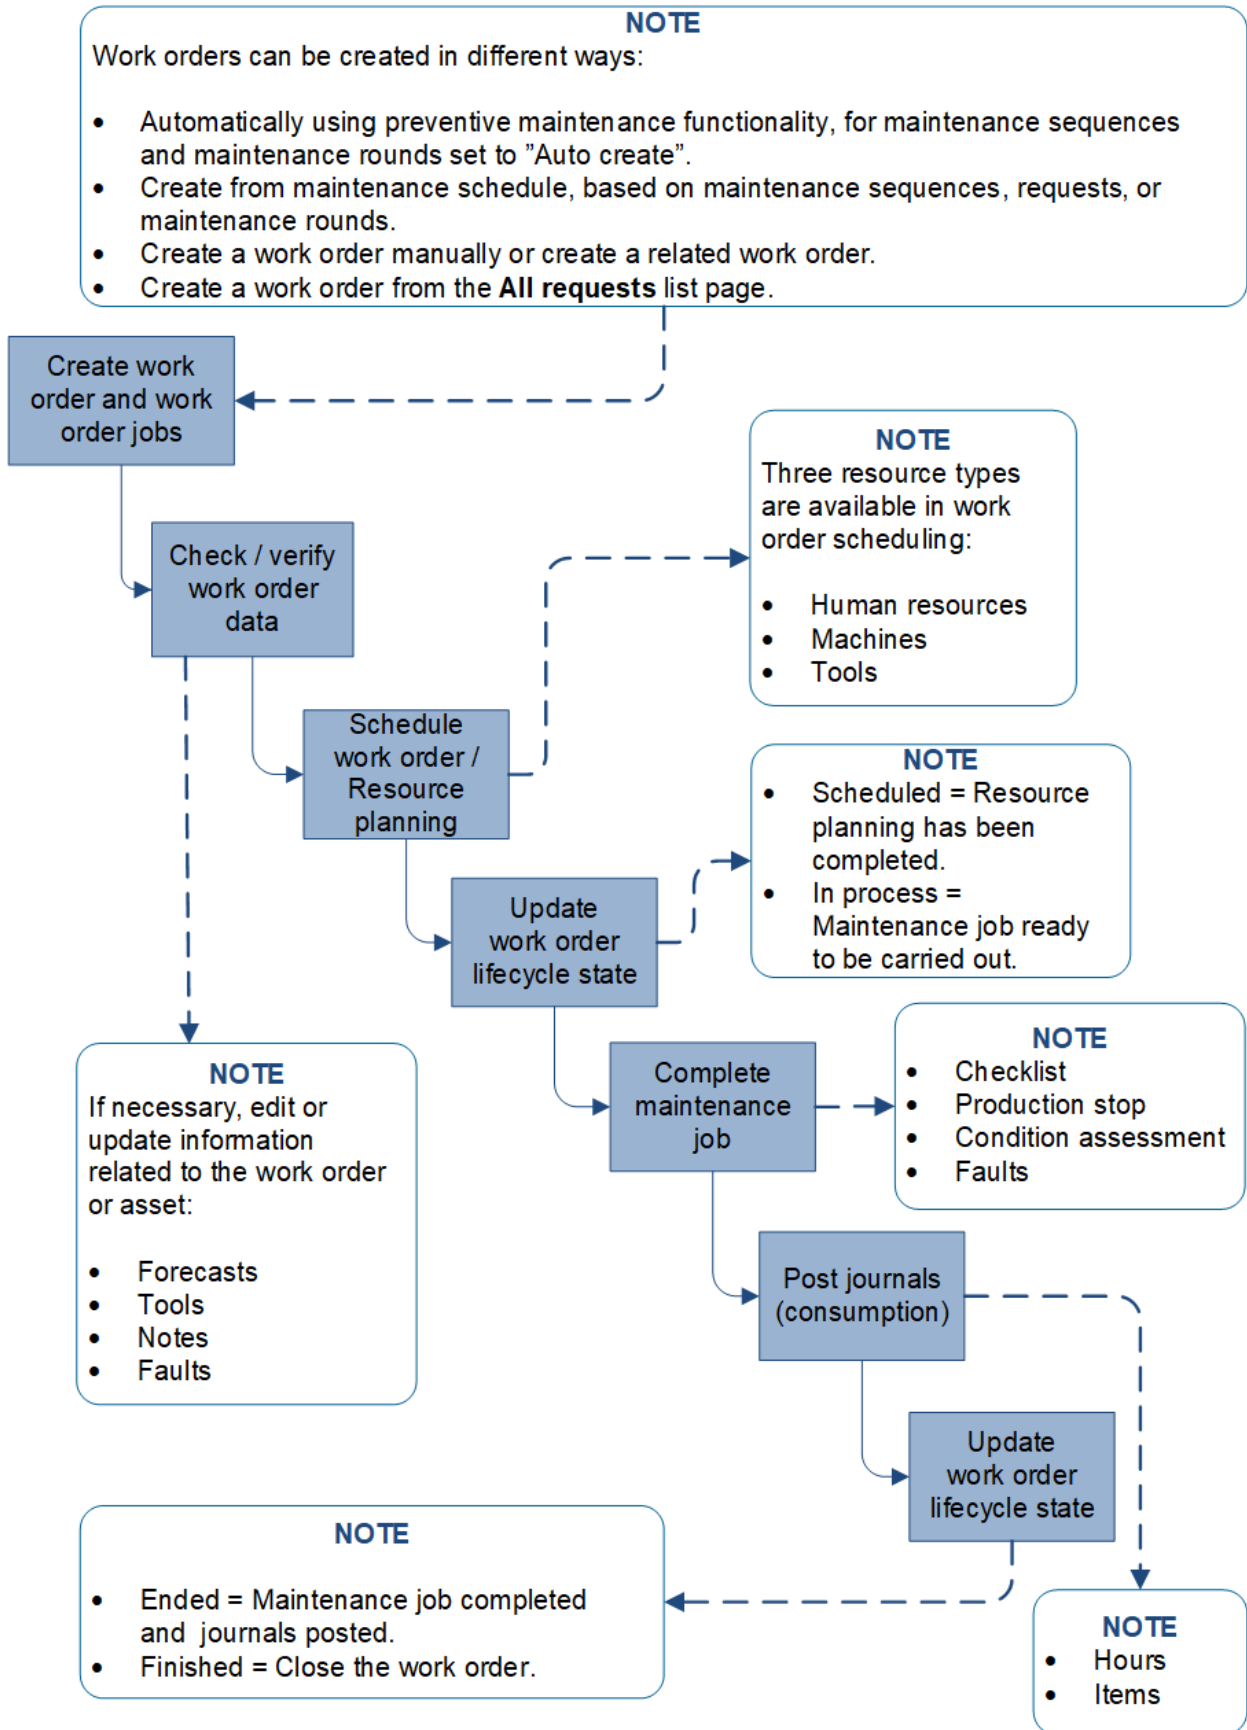

Work orders can be created in various ways that are related to corrective, preventive, or reactive maintenance. You can also create work orders manually. The following illustration shows an overview of the process for automatic or manual creation of work orders.

Process flow – Creating work orders

Several steps must be completed when you want to schedule and run a maintenance job on a work order. The following illustration shows an overview of the processing for a work order.

Work Order - Flow Diagram

NOTE

In general, when you work in Dynamics 365 Supply Chain Management and the **Asset Management** module, you select **New** to create a new record, you select **Edit** to update an existing record, and you select **Save** to save new or edited data.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Functional location lifecycle states

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to set up functional location lifecycle states and lifecycle models in Asset Management. Functional location lifecycle states define the states that a functional location can go through, for example, created, active, and ended. You are able to view all functional locations, regardless of their lifecycle state, in the **All functional locations** list page. You can change the state of a functional location by selecting it in the **All functional locations** list page and selecting **Update functional location state**.

Set up functional location lifecycle states

1. Select **Asset management > Setup > Functional locations > Lifecycle states**.
2. Select **New** to create a new functional location state.
3. Insert the state ID in the **Lifecycle state** field and a name for the functional location state in the **Name** field. In the **Lifecycle models** field, you can see the number of functional location lifecycle models that uses the functional location state.
4. On the **General** FastTab, select "Yes" on the **Active** toggle button if the functional location should be active at this state.
5. Select "Yes" on the **Create assets** toggle button if it should be possible to automatically create an asset with the same name as the functional location and install it on the functional location at this state.

NOTE

This toggle button relates to the **Asset type** field on the **General** FastTab in the **Functional location types** form (**Asset management > Setup > Functional locations > Functional location types**). 6. Select "Yes" on the **Rename location** toggle button if it should be possible to change the name of the functional location at this state. 7. Select "Yes" on the **New sub locations** toggle button if it should be possible to add new sub locations to the functional location at this state. 8. Select "Yes" on the **Install assets** toggle button if it should be possible to install assets on the functional location at this state. 9. Select "Yes" on the **Delete functional location** toggle button if it should be possible to delete the functional location at this state. 10. Select an asset state in the **Lifecycle state** field if you want the asset lifecycle state for all assets installed on the functional location to be automatically updated at this state. Example: If you close down a functional location, and set the functional location lifecycle state to "Ended", you may want to automatically change the lifecycle state of the assets installed on that functional location to "Not in use".

NOTE

Functional location lifecycle states, lifecycle models, and types are related and used in the same way as work order lifecycle states, work order lifecycle models, and work order types.

Set up functional location lifecycle models

When you have created the lifecycle states required for your functional locations, they can be divided into groups. This is done to create the lifecycle model flow that may be used for different types of functional locations. As a minimum, one standard functional location lifecycle model should be created.

1. Select **Asset management > Setup > Functional locations > Lifecycle models**.
2. Select **New** to create a new lifecycle model.
3. Insert the lifecycle model ID in the **Lifecycle model** field and a name for the lifecycle model in the **Name**

field. In the **Functional location types** and **Lifecycle states** fields, you can see the number of functional location types that uses the lifecycle model and the number of states selected in the lifecycle model.

4. On the **Lifecycle states** FastTab, select the states that should be included in the model. This is done by clicking on a state in the **Lifecycle states remaining** section and clicking the  button.
5. If you want to select all the available states for a model, click the  button. All states are transferred to the **Lifecycle states selected** section.
6. If you want to remove a selected state from the model, select the state in the **Lifecycle states selected** section and then select the  button.
7. Select **Lifecycle state updates** to define which lifecycle states can follow a selected state.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance attribute types

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create attribute types in Asset Management. Attributes are used to describe the properties of various elements. You can set up attributes on the following elements:

- [Functional location types](#)
- [Create functional locations](#)
- [Asset types](#)
- Assets

The attributes that you can set up vary, depending on the element. For example, for a functional location, you can set up attributes for the configuration and physical size of the location. For an asset type or an asset, you can set up attributes for engine volume, power consumption, and maximum load capacity under different conditions.

Create attribute types

You can create your own attribute types. Additionally, you can transfer product dimensions to the **Attribute types** page.

1. Select **Asset management > Setup > Attribute types**.
2. The first time that you set up attribute types, select **Create product dimensions** to automatically transfer standard product dimensions.
3. Select **New** to create a new attribute type.
4. In the **Attribute type** field, enter a name for the attribute type.
5. In the **Description** field, enter a description.
6. In the **Unit** field, select the relevant attribute unit, as required.
7. In the **Data type** field, select a data type for the unit.
8. If you selected **String** as the data type, follow these steps to create values for the attribute type:
 - a. Select the attribute type, and then select **Values**.
 - b. In the **Attribute values** field, select **New**.
 - c. In the **Attribute type** field, select an attribute type (dimension).
 - d. In the **Value** field, enter a related value.
 - e. In the **Description** field, enter a description.
 - f. Save the record.
 - g. Return to the **Attribute types** page.
9. Save the record.

The **Functional location types** field shows the number of functional locations that are using the attribute type. The **Asset types** field shows the number of asset types that are using it.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Functional location types

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes how to create functional location types in Asset Management. Functional location types are used to manage requirements for functional locations, including how assets are installed on a functional location. You can set up asset types, maintenance plans, functional location attributes, and asset attribute requirements to be used on a functional location that uses the specific functional location type. When you create a functional location, the functional location type is mandatory.

NOTE

In order to work with functional locations, you must create a default functional location to be used only for the purpose of creating new assets. For that default functional location, you should create a default functional location type that is really simple and allows multiple assets to be installed on the default functional location. See [Create functional locations](#) for more information on how to set up functional locations.

Create a default functional location type

This procedure shows how to create a default functional location type to be used for a default functional location.

1. Select **Asset management** > **Setup** > **Functional locations** > **Functional location types**.
2. Select **New** to create a functional location type.
3. Insert a functional location type ID in the **Functional location type** field, for example, "Default", and a name in the **Name** field.
4. Select a lifecycle model in the **Functional location lifecycle model** field.
5. Select "Yes" on the **Multiple assets** toggle button to allow more assets to be installed on a functional location (the default functional location) using this type.

Now, the default functional location type to be used only on a default functional location is created. You should not add any more requirements or restrictions to this default functional location type.

Create Functional Location Types

1. Select **Asset Management** > **Setup** > **Functional locations** > **Functional location types**.
2. Select **New** to create a functional location type.
3. Insert a functional location type ID in the **Functional location type** field and a name in the **Name** field.
4. Select a lifecycle model in the **Functional location lifecycle model** field. Refer to [Functional location lifecycle states](#) for more information on functional location lifecycle states and lifecycle models.
5. Select "Yes" on the **Multiple assets** toggle button if it should be possible to install several assets on a functional location using this functional location type. If you select "No", you can only install *one* asset on a functional location using this functional location type.
6. Select "Yes" on the **Update asset dimension** toggle button if you want assets installed on a functional location of this type to automatically use the financial dimensions related to the functional location. This means that if you change financial dimensions in the [Create functional locations](#) form, and the functional location uses a functional location type with this toggle button set to "Yes", financial dimensions are automatically updated on all assets installed on that functional location.
7. The **Asset type** field is used if you want to automatically create *one* asset for the functional location with the

same ID and name as the functional location you are creating. For example, this may be relevant if you create a static functional location, such as a building or a pipeline. In that case, select the asset type you want to use for the automatically created asset. Remember that if you make a selection in this field, the **Multiple assets** toggle button must be set to "No".

8. On the **Asset types** FastTab, select the asset types to be related to the functional location type. Select **Add line** and select the asset types. If you add asset types here, only assets using those asset types can be installed on a functional location using this functional location type. If no asset types are selected on the **Asset types** FastTab, all asset types may be installed.
9. On the **Maintenance plans** FastTab, select the maintenance plans that should automatically be set up on new functional locations using this functional location type. Select **Add line** and select the maintenance plans. If you add maintenance plans here, only those plans can be used on a functional location using this functional location type.
10. On the **Asset attribute requirements** FastTab, set up the asset attributes that should automatically be set up on new functional locations using this functional location type. Select **Add line** and select the attribute. These attribute requirements function as guidelines. They are not validated against attributes set up on an asset (**Asset management > Common > Assets > All assets > select asset in the list page > General tab > Attributes** button). The attribute requirements are shown when you install assets on functional locations.
11. On the **Permitted types** FastTab, select the functional location types that should be valid for sub functional location types related to a parent functional location type, which uses the selected functional location type.
12. On the **Attributes** FastTab, select the functional location attributes that should automatically be set up on functional locations using this functional location type. Select **Add line** and select the attribute.

NOTE

On the **General** FastTab, you can get an overview of the number of asset types, maintenance plans, asset attribute requirements, permitted types, attributes, and functional locations set up on the functional location type. The **Functional locations** field shows the number of functional locations that use the functional location type. You can use the **Copy** button to copy settings from a functional location type to the selected functional location type.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Introduction to functional locations

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of functional locations in Asset Management. Functional locations are elements of a technical structure, such as the functional units in a system. Functional locations are created hierarchically, and you install assets on them. The setup of functional locations in your company depends on the company's requirements.

Here are some examples of how you can use functional locations:

- **Functional** – The functional locations can be user-oriented and used to manage assets that have similar behavior.
- **Process-related** – The functional locations can be workflow-oriented.
- **Spatial** – The functional locations can represent geographical locations or sites.

Each functional location is managed independently in Asset Management. Here are some of the useful features of functional locations:

- Set up functional location specifications.
- Set up asset specification requirements.
- Set up maintenance sequences for preventive and reactive maintenance.
- Manage installed assets.
- Track active requests and work orders that are related to installed assets.
- Track faults that are registered on assets.
- Track maintenance costs on the assets that are related to a functional location at any given time.

Functional locations provide traceability of assets in relation to requests, work orders, fault registrations, condition assessments, production stop registrations, and asset counter registrations.

NOTE

Even if an asset is installed on various functional locations during its lifetime, the costs can be related to each location. In other words, asset costs are always related to the functional location that the asset was installed on at a given time.

Functional locations are **not** flexible. Therefore, after you set up a functional location hierarchy, you can't move locations around in it.

After you create a functional location hierarchy, the next step is to install assets on it. For more information, see [Install assets on functional locations](#).

All functional locations

Select **Asset management > Common > Functional locations > All functional locations** to open the **All functional locations** list page. This page shows all functional locations and some of the information that is related to each. To view only active functional locations, select **Active functional locations**. To view only the functional locations that you're related to as a worker, select **My active functional locations**. (This relation is set up on the **Workers** page. For more information, see [Maintenance workers and worker groups](#).)

On the **All functional locations** list page, select a link in the **Functional location** column to view the details of the selected record. To edit the functional location, select the **Edit** button. The details view shows detailed

information that is related to the location. It also includes a **Related information** pane on the right. This pane shows the functional location hierarchy. You can expand and collapse the **Related information** pane.

The buttons on the Action Pane are organized on tabs. The following table briefly describes the buttons that are related to Asset Management.

BUTTON NAME	DESCRIPTION
Edit	Switch between edit mode and view mode for the page.
New	Create a new functional location.
Delete	Delete the selected functional location.
Rename	Rename the selected functional location.
Copy functional location structure	Copy the functional location hierarchy.
Install asset	Install an asset, including child assets, on the functional location.
Replace asset	Replace the asset hierarchy with another asset hierarchy on the functional location.
Cost control	Open the Functional location cost control page, where you can do a cost calculation for the selected functional location.
Hour control	Open the Functional location hour control page, where you can do a cost calculation for the selected functional location.
Assets	Open the All assets page, where you can view a list of assets that are related to the selected functional location.
Requests	Open the Active requests page, where you can view a list of requests that are related to the selected functional location.
Work orders	Open the Active work orders page, where you can view a list of work orders that are related to the selected functional location.
Faults	Open the Asset faults page, where you can view a list of asset fault registrations that are related to the selected functional location.
Update functional location state	Update the stage of the selected functional location.
Lifecycle state log	View a log that shows the stages of the selected functional location.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create functional locations

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to create a functional location in Asset Management.

When you create a functional location structure, be aware once you have created a functional location, you cannot move it from the original location. This means that you should carefully consider the structure of your functional locations before you start creating them in Asset Management. If you regret a functional location, you can delete it, provided that it has not yet been taken into use.

To be able to work with functional locations, you start by creating two "categories" of functional locations:

- Create *one* default functional location with not sub locations. This functional location is used only as the standard location for assets when you create new assets.
- Create the functional location structures required for managing maintenance jobs in your company.

Create a default functional location

When you use functional locations, start by creating one default location to be used when you create new assets. This functional location is the one you select in **Asset management > Setup > Asset management parameters > Assets link > Default functional location** field. The default functional location can be used when you create new assets, and you have not yet set up a functional location structure for those assets.

1. Select **Asset management > Common > Functional locations > All Functional locations**.
2. In **All functional locations**, select **New**.
3. Insert an ID in the **Functional location** field, for example, "0000" or "Default", to indicate that this is a special functional location.
4. Insert name for the default functional location in the **Name** field.
5. Do *not* select a parent in the **Parent** field – leave this field blank.
6. In the **Functional location type** field, select the functional location type to be used for the default functional location. See [Functional location types](#) for more information on how to set up functional location types.
7. Select **OK**. You should not add further data to this functional location as it is only used as a temporary location for new assets until you install the assets on the functional locations used by your company.

Create functional locations

The following procedure describes how you create the functional locations required for maintenance management in your company.

1. Select **Asset management > Common > Functional locations > All Functional locations**. You can create a functional location from grid view or details view.
2. Select the **New** button.
3. Insert an ID in the **Functional location** field.
4. Insert a name for the functional location in the **Name** field.
5. If the functional location is a sub location in a structure, select the parent location in the **Parent** field.
6. Select a type in the **Functional location type** field.
7. Select **OK**.
8. Select the functional location and click the **Edit** button to add further information.

NOTE

Depending on your setup of functional location lifecycle states, you may have to create all sub locations for a functional location, and then change the functional location lifecycle state before you can start installing assets. See [Install assets on functional locations](#) for more information on asset installation. See [Functional location lifecycle states](#) to learn more about setup of functional location lifecycle states.

In Details view, you will see FastTabs on which you can add and edit information about the functional location.

General Information

This section provides an overview of parent and child information in the functional location structure. In the **Details** section, you can see the number of asset attributes, maintenance plans, and assets related to the functional location. In the **Inventory** section, you can select the site and warehouse to which the functional location is related. Site and warehouse is used in connection with work order item forecasts. When creating an item forecast, site and warehouse information from the functional location of the asset is automatically used. In the **Lifecycle state** section, information about the functional location lifecycle state is displayed.

Installed assets

Refer to [Install assets on functional locations](#) for more information on asset installation. You can use the **View** button on this FastTab to show more fields on the FastTab. The **Valid from** and **Sub asset** fields can be shown in the grid.

Asset attribute requirements

On this FastTab you can add specific attribute requirements for the assets that you install on the functional location. These requirements are for information purposes only. They do not prevent you from installing assets with other attribute requirements. Select **Add line** and select the attribute type. Then you insert the relevant **Value**, select a threshold in the **Threshold criteria** field and save the record.

Maintenance plans and Maintenance rounds

Here you can add maintenance plans and maintenance rounds to the functional location, including a start date. The assets installed on a functional location may have other maintenance plans set up. All maintenance plans and maintenance rounds can be used for scheduling asset calendar entries for a functional location and its currently installed assets.

NOTE

If you update the setup of asset types, asset brands, and asset models on maintenance plans in **All functional locations** detail view > **Maintenance plans** FastTab after you have scheduled maintenance plans, existing maintenance schedule entries related to that functional location are automatically deleted. In order to create new schedule entries, which correspond with the updated maintenance plan setup on the functional location, you must run a new maintenance plan schedule for that functional location.

Address

Insert the functional location address on the **Address** FastTab. Addresses on functional locations are inherited, meaning if a sub location has no address defined, the address of the parent location is used.

Workers

On this FastTab, you can add workers affiliated with the functional location, and you can select a functional location as primary for the worker.

Attributes

On this FastTab, you can set values for functional location attributes. These attributes can be used to describe properties or characteristics pertinent to the functional location, for example, structural properties, building type, area descriptions, or location above or under ground.

Select **Add line** and select the attribute type. Next, insert the **Value** related to the attribute type and save the record.

Financial dimensions

You can select financial dimensions for the functional location. [Functional location types](#) can be set up to allow for automatic update of financial dimensions from a functional location. This means that assets installed on a financial dimension automatically get the financial dimensions for the functional location. This is useful if you want different cost centers, depending on locations.

When data regarding **Site, Warehouse, Address, and Financial dimensions** are updated on a parent functional location, the related sub functional locations can be updated accordingly if you make that selection during the update. A dialog opens, providing you with the update options.

Copy a functional location structure

If your company has several functional locations with similar location structures, you can use the copy function in Asset Management to quickly create a number of similar location hierarchies. When you copy a specific functional location or an entire structure, the new location or structure has the same name as the one you copied. After the copy procedure is done, you can easily change the name or other settings on the new functional location, provided that the functional location lifecycle state selected for the new functional location allows it.

1. In **All functional locations**, select the functional location you want to copy. For example, you select a top location (parent) if you want to copy the entire functional location structure including sub locations.
2. Select the **Copy functional location structure** button. The location you selected in the list page is shown in the **Copy from** field.
3. Insert the name of the new location in the **New functional location** field.
4. In the **Parent to paste under** field, you should only insert a parent ID if the location you are creating should be part of an existing functional location structure.
5. Click **OK**. The new functional location structure is shown in **All functional locations**.

NOTE

When you copy a functional location structure, functional location lifecycle states in the new structure are set to the "first state" that you have created for functional locations. Whether you can rename or delete a functional location using the **Rename** and **Delete** buttons in **All functional locations**, depends on the current lifecycle state of the functional location.

Delete a Functional Location

A functional location with related sub locations can be deleted if no assets have been installed on any of the functional locations you are trying to delete, and if the current functional location lifecycle state allows it.

1. In **All functional locations**, select the functional location you want to delete.

2. If required, update the functional location to a functional location lifecycle state that allows deletion of a functional location.
3. Select **Delete**.

NOTE

If you cannot delete a functional location, instead you can handle deletion by setting up a functional location lifecycle state for this purpose. For example, you can set up a "Scrapped" or "Deleted" stage, which should not be an active stage, in the **Functional location lifecycle states** form.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Install assets on functional locations

2/18/2021 • 4 minutes to read • [Edit Online](#)

After you've created functional location structures, the next step is to install assets on the relevant functional locations. This topic explains how to install assets on those functional locations in Asset Management. For information about how to create assets, see [Introduction to assets](#).

If you've created an asset structure, the whole asset structure must be installed on a functional location. Therefore, only parent assets (top-level assets that have no parent asset) can be selected on a functional location. All related child assets (sub-assets) will also be installed on the functional location. When you install assets on a functional location, the financial dimensions of the functional location might be automatically transferred to them, depending on the setup on the functional location type that is selected for the functional location. For more information about how to set up functional location types, see [Functional location types](#).

NOTE

You can set up asset types on the functional location type that is used for a functional location. In this case, when you install assets on the functional location, only parent assets that have the same asset type are shown in the list of assets that can be installed on the functional location.

After you've installed assets on a functional location, you can replace a parent asset or an asset structure as you require. As when you install assets, you select a parent asset to replace. All related child assets will also be replaced.

Install an asset structure on a functional location

1. Select **Asset management** > **Common** > **Functional locations** > **All Functional locations** or **Active functional locations**.
2. Select the functional location to install an asset on.
3. Select **Install asset**.

The **Attributes** section shows a list of the asset attribute requirements that are set up on the functional location type that is selected for the functional location. The attributes are for informational purposes only. The system doesn't validate the attributes against the asset attributes that are set up on the asset that you're installing. You must do that validation after you select an asset in the **Asset** field.

4. In the **Asset** field, select the parent asset to install. All related child assets are automatically included in the installation.

The **Asset attributes** section to the right of the asset list shows the asset attributes that are related to the selected asset.

5. In the **Effective** field, select the date and time that the asset installation is valid from. After that date and time, costs for the asset and related sub-assets will be related to the functional location.

NOTE

The asset attributes that are set up on the asset are added to the **Attributes** section. For example, the **Weight** attribute requirement has been added as a requirement on both the asset and the functional location. If the asset has attribute requirements of the same type as the functional location, the values of the asset's attribute requirements are entered in the **Value** fields. Therefore, you can validate the asset values against the attribute requirements that are set up on the functional location. The attribute requirements that are set up on the functional location are marked with a check mark.

6. Select OK.

NOTE

To change the installation of an asset by installing it on a new functional location, follow steps 1 through 6 of this procedure. When you install an asset on a new functional location, the asset is automatically uninstalled from the previous functional location. Any active maintenance requests or work orders that were created on the asset before you installed it on a new functional location are **not** automatically transferred to the new functional location. If those maintenance requests and work orders are still required for the asset, you must manually re-create them after the asset is installed on the new location.

7. To view a list of all the assets, including sub-assets, that are installed on the functional location, select the functional location on the **All Functional locations** page, and then select **Assets**.
8. To view a list of active maintenance requests, active work orders, or fault registrations that are related to the assets that are installed on a functional location, select the functional location on the **All Functional locations** page, and then select **Requests**, **Work orders**, or **Faults**.

NOTE

When asset-related data is changed, it's automatically updated on the functional location that the asset is installed on. This automatic update pertains to changes to maintenance requests, work orders, asset fault registrations, maintenance downtime registrations, and asset measure registrations.

Automatically create one asset on a functional location

You can set up functional location stages and functional location types to handle the automatic creation of *one* asset on a functional location. The asset gets the same ID and name as the functional location. This functionality might be useful when you're handling maintenance on a large, static asset, such as a building.

Before you can automatically create an asset on a functional location, the following setup data must be available:

- Create a functional location type to handle the automatic creation of an asset. In the **Asset type** field, select an asset type. For more information, see [Functional location types](#).
- Create a functional location lifecycle state to handle the automatic creation of an asset. Set the **Create asset** option to **Yes**. For more information, see [Functional location lifecycle states](#).

After the setup data is available, you're ready to create an asset.

1. On the **All Functional locations** page, make sure that the functional location where you want the asset to be automatically created uses the functional location type that you created for this purpose.
2. Select the functional location in the list.
3. Select **Update functional location state**, and then select the lifecycle state that you created for this purpose. One asset is now automatically installed on the functional location. This asset has the same name as the functional location.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset types

2/18/2021 • 7 minutes to read • [Edit Online](#)

This topic explains how to create asset types. It also describes the elements that are related to asset types. Asset types are used as general categories for assets. Examples include CNC machines, measuring equipment, and truck engines. Asset types are used to manage the maintenance job types (maintenance tasks), asset lifecycle states, counters, asset attributes, condition assessment templates, and asset models that can be selected for an asset. When you create an asset, you must specify the asset type.

For each asset type, variations of the asset type setup can be created. For example, if you have an asset type that is named **Trucks**, you can create variations of that asset type for different asset manufacturers and asset models. To each asset type setup, you can add the required spare parts and maintenance plans.

First, you set up the required asset types. Next, you create the asset models that should be related to the asset types. Finally, on the **Asset type defaults** page, you create all the variations of asset types that are required for your equipment.

Create an asset type

1. Select **Asset management > Setup > Asset types > Asset types**.
2. Select **New** to create an asset type.
3. In the **Asset type** field, enter an asset type ID.
4. In the **Name** field, enter a name.
5. In the **Asset lifecycle model** field, select an asset lifecycle model. For more information about asset lifecycle states and asset lifecycle models, see [Asset lifecycle states](#).
6. Set the **Total** option to **Yes** if summarized key performance indicator (KPI) values should be calculated for assets that have this asset type.
7. Select **Save**.
8. On the **Maintenance job types** FastTab, select the maintenance job types that should be related to the asset type:
 - To select a maintenance job type, select it in the **Maintenance job types remaining** field, and then select the right arrow button  to move it to the **Maintenance job types selected** section.
 - To select all available maintenance job types, select the  button. All maintenance job types are transferred from the **Maintenance job types remaining** field to the **Maintenance job types selected** field.
 - To cancel the selection of a maintenance job type, select it in the **Maintenance job types selected** field, and then select the left arrow button  to move it to the **Maintenance job types remaining** field.
9. You can also select the counters that should be related to the asset type. On the **Counters** FastTab, make your selections by using the methods that are described for maintenance job types in step 8. For more information about the setup of counters, see [Counters](#).
10. You can also select the attribute types that should be related to the asset type. On the **Attribute types** FastTab, make your selections by using the methods that are described for maintenance job types in step

8. Then, to create the preferred sequence of attribute types, select an attribute type in the **Attribute types selected** field, and use the up arrow and down arrow buttons to move it. The sequence of attribute types will be shown on assets that use this asset type. For more information about asset attributes, see [Maintenance attribute types](#).

NOTE

When you add new attribute types on the **Attribute types** FastTab, existing assets are automatically updated with that information.

11. You can also select the condition assessment templates that should be related to the asset type. On the **Condition assessments** FastTab, make your selections by using the methods that are described for maintenance job types in step 8. For more information about condition assessment templates and registrations, see [Condition assessment](#).
12. The **Asset model** FastTab shows all the combinations of asset manufacturers and models that are set up on the selected asset type. To see the combinations divided according to manufacturer, select **Asset model** to open the **Asset model** page.

On the **Asset model** page, you can add asset model–asset type relations. Additionally, on the **Asset types** page, you can add asset manufacturer–asset model relations directly to an asset type. Finally, on the **Asset model** page (**Asset management > Setup > Assets > Asset model**), you can create new asset manufacturer–asset model–asset type relations. Therefore, there are three ways to set up and edit asset manufacturer–asset model–asset type relations. All the available combinations are shown from different perspectives, and you can select your preferred point of entry when you work with the setup.

NOTE

- If you select counters on an asset type, the selections are automatically updated on the **Counters** page (**Asset management > Setup > Assets > Asset types > Counters**).
- The fields in the **Details** section on the **General** FastTab show the number of maintenance job types, counters, attributes, and so on, that are set up on the selected asset type.

Typically, work orders that are manually created are related to corrective maintenance, whereas work orders that are automatically created are related to preventive maintenance. When you manually create work orders, only the maintenance job types that are selected on the **maintenance job types** FastTab of the **Asset types** page can be used. However, automatically created work orders can use all the maintenance job types you create on the **Maintenance job types** page (**Asset management > Setup > Jobs > Maintenance job types**).

Create asset type setup lines

1. Select **Asset management > Setup > Assets > Asset types > Asset type setup**. Alternatively, select **Asset management > Setup > Assets > Asset types > Asset types**, select an asset type, and then select **Asset type setup**.
2. The first time that you use the **Asset type setup** page, you might find the **Create combinations** button useful. You can use this button to quickly create all combinations of an asset model on an asset type. Select **Create combinations**, select the asset type to create combinations for, and then select **OK**.

NOTE

If you won't use all the asset type setup combinations that were automatically created, you can delete a setup by selecting it and then selecting **Delete**.

3. Select **New** to manually create an asset type setup.
4. Depending on how specific the asset type setup should be, make selections in the **Asset type**, **Manufacturer**, and **Model** fields.
5. If a warranty agreement is related to the asset type, select the agreement in the **Vendor warranty** and **Customer warranty** fields.
6. On the **Spare parts** FastTab, select **Add** to add spare parts to the selected asset type setup.
7. To approve a spare part, select the spare part line, and then select **Approve**. You can select multiple lines for approval.
8. To see whether a spare part is used somewhere else in Asset Management (for example, in relation to assets and work orders), select the spare part line, and then select **Item where used** to open the **Item where used** page. To see all active spare parts in the list, select the **Active** check box. To see only approved spare parts, select the **Approved** check box.
9. On the **Maintenance plans** FastTab, select **Add** to add maintenance plans to the selected asset type setup.
10. To copy an asset type setup to another setup, you can use the Copy function. Select the asset type setup to copy a setup to, select **Copy setup**, and select the asset type setup to copy the setup from. The settings of the various options determine how much information is included. When you've finished, select **OK** to copy the setup.

NOTE

If you have many spare part lines and maintenance plan lines that you will reuse, the Copy function lets you quickly and easily set up data for many asset type setup combinations.

Spare parts on the asset type setup

As was described in the "Create asset type setup lines" section, spare parts are set up on asset models on the **Asset type setup** page. Therefore, when you open the **Asset type setup** page, you see only the spare parts that are related to the selected combination of an asset type, asset manufacturer, and asset model. To see a list of all spare part records, open the **Spare parts** page (**Asset management** > **Inquiries** > **Spare parts**).

On the **Spare parts** page, you can also create new spare parts for existing combinations of an asset type, asset manufacturer, and asset model. You can decide whether you prefer to create spare part records on the **Asset type setup** page or the **Spare parts** page. The **Asset type setup** page provides an overview of data on the selected combination of an asset type, asset manufacturer, and asset model, whereas the **Spare parts** page provides a complete overview of all asset type setup lines. If the **Spare parts** page contains many records, the **Asset type setup** page might give you a better overview.

To see whether the spare part on the selected line is used anywhere else in Asset Management (for example, in relation to assets and work orders), select **Item where used** to open **Item where used** page.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Condition assessment

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains how to create a condition assessment template and registration on an asset in Asset Management. Condition assessment is performed at regular intervals, and the primary objective is to create and maintain condition data on assets. Seen from a preventive maintenance perspective, it is important to monitor key information such as current condition, and remaining life span. Furthermore, if you carry out condition assessment at regular intervals, you will be able to monitor and compare conditions on the machinery in your factory.

Condition assessment can be used to measure and monitor many conditions on your equipment. Example: You could measure vibrations on your machinery. After you have registered vibration measurements in Asset Management on various types of equipment, you can search for the latest registered assessment and view vibration measurements.

Condition assessment is created on assets. You set up a condition assessment template on an asset type before you carry out the condition assessment procedure. The reason for using templates for condition assessment is to avoid variation of condition data on similar assets. The sequence for setting up and using condition assessment in Asset Management is: First you set up the required condition assessment templates. Next, you associate templates with asset types in the **Asset types** form. Finally, you can create condition assessment registrations on an asset in the **Asset** form.

Create a condition assessment template

1. Select **Asset management > Setup > Asset types > Condition assessment**.
2. Select **New** to create a new template.
3. Insert an ID for the template in the **Template** field.
4. Insert a name for the template in the **Name** field.
5. On the **Condition assessment lines** FastTab, add the lines required for the condition assessment, including selection of the appropriate condition type and measurement unit.
6. On the **Asset types** FastTab, add the asset types that should use the condition assessment template.
7. In the **Lines** and **Asset types** fields in the **Details** group at the top of the screen, you will see the number of assessment lines and asset types related to the selected condition assessment template.

Create condition assessment registration on an asset

1. Select **Asset management > Common > Assets > All Assets**.
2. In the list, select the asset for which you want to create a condition assessment registration.
3. On the **General** tab, click **Condition assessment**.
4. Click **New** to make a new registration.
5. Select the date for the condition assessment in the **Date** field.
6. Select the name of the worker who carried out the assessment registration in the **Worker** field.
7. In the **Lines** field, you see the number of assessment lines set up on the condition assessment.
8. Select a template for the condition assessment in the **Template** field. The name of the template is automatically inserted in the **Name** field, and the related registration lines are inserted on the **Condition assessment lines** FastTab.
9. You can insert notes relating to the selected condition assessment on the **Notes** FastTab.
10. For each condition assessment line, insert measurement data in the **Value** field.

11. You can insert a comment relating to the selected registration line on the **Condition assessment lines** FastTab > **Comments** field. If you add a comment on a line, the **Comment** check box is automatically selected.

After you have made a condition assessment registration on an asset, you can print a condition assessment report.

NOTE

You can also register condition assessment on a work order (**Asset management > Common > Work orders > All Work orders > Condition assessment** button.)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset manufacturers and models

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up asset manufacturers and related models in Asset Management. Models can be related to asset types.

Set up product-model relations

1. Select **Asset management > Setup > Assets > Manufacturer and model**.
2. Select **New** to create a new product.
3. In the **Manufacturer** field, enter a name for the asset manufacturer.
4. In the **Description** field, enter a description.
5. On the **Models** FastTab, select **Add** to create an asset model that should be related to the asset manufacturer.
6. In the **Model** field, enter a name for the asset model.
7. In the **Description** field, enter a description.
8. In the **Asset type** field, select the asset type that the manufacturer model should be related to.

NOTE

You can also set up relations for asset types, manufacturers, and models in the **Asset types** lookup. For more information, see [Asset types](#).

In the **Details** FastTab, the **Models** field shows the number of asset models that are set up on the selected asset manufacturer. The **Assets** field shows the number of assets that are using the selected manufacturer.

The **Assets** field shows the number of objects that are using the manufacturer model.

NOTE

An asset type can have no asset manufacturer model relations, it can be related to one asset manufacturer model, or it can be related multiple asset manufacturer models. If an asset type is related to at least one manufacturer model, only the combinations that are set up in the **Manufacturer model** lookup can be selected on those Asset Management pages where a combination of an asset type, manufacturer, and model can be set up. These pages include **All assets**, **Asset service levels**, **Job type defaults**, and **Maintenance budget lines**. If some asset types aren't related to any manufacturer model, only those asset types, and manufacturer models that also have no relation to asset types, are shown on the pages.

Select a manufacturer and model on an object

1. Select **Asset management > Common > Assets > All assets**.
2. In the **Asset** column, select the link for the asset. The **Details** page appears.
3. Select **Edit**.
4. On the **General** FastTab, select values in the **Manufacturer** and **Model** fields.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Counters

2/18/2021 • 3 minutes to read • [Edit Online](#)

The topic explains how to create counter types in Asset Management. Counter types are used to make counter registrations on assets, for example, regarding number of production hours, or quantity produced on the asset. Asset types are related to the counter types. This means that a counter can only be used on an asset if the counter is set up on the asset type used on the asset.

Before you can make counter registrations on assets, you first create the counter types you want to use in **Counters**. Next, you can create counter registrations on assets in **Counters**.

Counters can be used on maintenance plans. A maintenance plan line can be of type "Counter", for example, relating to number of production hours or quantity produced.

A counter registration can be updated manually or automatically based on production hours or quantity produced. A counter can be set up to use one of three update methods (selected in the **Update** field in **Counters**):

- Manual - you must manually register counter values.
- Production hours - the counter is automatically updated based on number of production hours.
- Production quantity - the counter is automatically updated based on number of quantity produced.

NOTE

If quantity produced is used, *all* registered items are included in the counter registration, good quantity as well as error quantity. It is always possible to make manual counter registrations, if required.

Create counter types for asset counter registrations

1. Select **Asset management > Setup > Asset types > Counters**.
2. Select **New** to create a new counter type.
3. Insert an ID in the **Counter** field, and a counter name in the **Name** field.
4. On the **General** FastTab, select a counter unit in the **Unit** field.
5. In the **Update** field, select the update method to be used for the counter.
6. Select "Yes" on the **Inherit counter values** toggle button if child assets in an asset structure should automatically inherit counter registrations made on the parent asset.
7. In the **Total aggregate** field, select the summation method to be used for a counter using this counter type. "Sum" is the standard selection used to continuously add registered values to the total value. "Average" can be used if a counter is set up to monitor a threshold, for example, regarding temperature, vibrations, or wear and tear on an asset.
8. In the **Deviation over** field, insert the upper level in percent for validating if manual counter registrations are within an expected range. The validation is based on a linear increase in existing counter registrations.
9. In the **Deviation under** field, insert the lower level in percent for validating if manual counter registrations are within an expected range. The validation is based on a linear decrease in existing counter registrations.
10. In the **Type** field, select the type of message (information, warning, error) to be shown if deviations outside the defined range occur when you make manual counter registrations.
11. On the **Asset types** FastTab, add the asset types that should be able to use the counter.
12. On the **Related asset counters** FastTab, add the counter that you want to be automatically updated when

this counter is updated.

NOTE

A related counter is automatically updated only if the related counter has the asset type, to which it is related, in the counter setup. For example: You set up a counter for "Production hours" and add the asset type "Truck Engine". When that counter is updated, a related counter "Oil" is also updated with the same counter values. The setup in **Counters** includes the setup on "Hours". Also, on the "Oil" counter, the asset type "Truck Engine" should be added to the **Asset types** FastTab to ensure the counter relation. See the screenshots below for an example of the setup on the Hours and Oil counters.

When asset types are added to a counter type in **Counters**, that counter is automatically added to the asset types on the **Counters** FastTab in **Asset types**.

The screenshot displays the Dynamics 365 Finance and Operations interface. The top navigation bar shows 'Finance and Operations' and a search bar. The left sidebar contains a list of counter types: Celsius (Temperature - °C), Fahrenheit (Temperature - °F), Hertz (Frequency - Hertz), Kelvin (Temperature - °K), Kilohertz (Frequency - Kilo hertz), Kilometers (Length - Kilometers), Miles (Length - Miles), ProdCl (Production liquid volume centiliter), and ProdCm (Production length centimeter). The main area shows the 'Celsius' counter setup. The 'General' tab is active, displaying the following information:

Counter	Name	Asset types
Celsius	Temperature - °C	2

The 'General' tab includes the following sections:

- SETUP**: Unit (°C), Update (Manual), Inherit asset counter values (Yes), Total aggregate (Average).
- VALIDATION**: Deviation over (0.00), Deviation under (0.00), Type (Information).
- Asset types**: A list of asset types with 'Car Engine' and 'Truck Engine' selected.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset Management parameters

2/18/2021 • 11 minutes to read • [Edit Online](#)

In Asset Management, general parameters relating to assets, work orders, and work order scheduling must be set up. This topic explains how to set them up. Select **Asset management > Setup > Asset management parameters** to open the page.

NOTE

If you'd like to set up a system that includes demo data for testing Asset Management features, see [Deploy a demo environment](#) for instructions.

The Assets tab

The **Assets** tab provides the following settings:

- **Default functional location** is the standard functional location, which is automatically selected on assets when you create new assets.
- In the **Standard calendar** field, select a calendar to be used for calculating asset KPIs if no resource is selected on an asset.
- In the **View** field, select the standard view that is shown when you open **Asset view (Asset management > Common > Assets > Asset view)**.
- **Default request type** is the standard maintenance request type, which is automatically selected when you create a new request.
- Forecasts on job types are stored on the project selected in the **Forecast project** field. For each job type, a new activity is automatically created on the forecast project. Forecasts on the job type are then saved on the forecast project.
- In the **Model** field, select the forecast model used on job type and work order forecasts.

The Work orders tab

The **Work orders** tab provides the following settings:

- **Default work order type** defines standard settings when creating a work order.
- **Preventive work order type** defines the work order type used when creating work orders from maintenance plans. If this field is left blank, the work order type in the **Default work order type** field is used.
- In the **Related work order mask** field, you define the maximum number of work orders that can be related to a work order. For example, **##** allows you to have up to 99 work orders related. If you define a mask as described here, related work orders will be numbered [work order ID of the work order to which a work order is related] -01, -02, -03, and so on. If you do not define a mask in this field, a related work order will get the next sequential work order ID.
- Select **Yes** for **Copy faults** if you want to automatically copy faults registered on work orders to related maintenance requests.
- In the **Level** field, you define the functional location level that is automatically inserted on a work order if all related work order jobs refer to the same functional location. If the work order jobs do not all relate to the same functional location on the defined level, the **Functional location** field is left blank on the work order. For example, if you insert the number "1" in this field, that is the top level in a functional location structure. If

you insert the number "0" in this field, you have not defined a specific functional location level, only that all work order jobs on a work order must be related to the same functional location for that functional location to be added to the work order.

- Journals used when posting consumption on a work order can be selected on the **General** FastTab in the **Hour**, **Item**, and **Expense** fields.
- In the **Product language source** field, select which language to use for product names in Asset management reports. You can select the language set up on the company account, or the language set up for the user currently logged in.
- Select **Yes** for **Real time update** if you want to automatically update changes to job type defaults, maintenance plans, and maintenance rounds.
 - If you select **No**, changes to job type defaults, maintenance plans, and maintenance rounds are not updated automatically in Asset Management.
 - Select **No** if you have large amounts of data being synchronized, for example, many assets or functional locations set up on maintenance plans or maintenance rounds, or a large number of maintenance plans or rounds.
 - If you make changes to job type defaults or maintenance plans or maintenance rounds, and you have selected **No** to real time update, a warning may not be shown if the changes influence:
 - Functional locations set up on maintenance plans or rounds
 - Objects set up on maintenance plans or rounds
 - Maintenance plans setup
 - Maintenance rounds setup
- On the **Category** FastTab, default categories relating to consumption on work orders can be defined.

The Work order scheduling tab

The **Work order scheduling** tab provides the following settings on the **General** FastTab:

- **Schedule time fence** defines period in days, calculated from the expected start date of the work order, during which work order jobs are planned.
- The **Master plan** relates to resources in the **Organization administration** module. If you select a master plan in this field, you will be able to see capacity reservations related to work orders in **Capacity reservations** (**Organization administration** > **Resources** > **Resources** > select resource > **Resource** tab > **Capacity reservations** button). If you leave this field blank, you will be able to see capacity load related to work orders in **Capacity load** (**Organization administration** > **Resources** > **Resources** > select resource > **Resource** tab > **Capacity load** button).

NOTE

The selection regarding using a master plan in the **Asset management** module, and the related form used to get an overview of capacity reservations or capacity load is the standard setup. Depending on your setup in the **Master plan** field, you will be able to access capacity information in either **Capacity reservations** or **Capacity load** in the **Organization administration** module. It is not possible to create a setup in which capacity reservations are shown in both views.

The fields described in the following list all relate to calculated rating scores, which are used to calculate work order priority during work order scheduling.

- **Priority** - A rating score calculated together with the rating score in the **Criticality** and **Start date** fields. The number in this field is divided by the number in the **Priority** field on a work order. For example, if the value "5.00" is inserted in this field, and a work order has priority "20", the rating score for priority is 0.25.
- **Criticality** - A rating score calculated together with the rating score in the **Priority** and **Start date** fields. The number in this field is multiplied by the number in the **Criticality** field on a work order. For example, if

the value "10.00" is inserted in this field, and a work order has criticality "5", the rating score for criticality is 50.

- **Start date** - A rating score calculated together with the rating score in the **Priority** and **Criticality** fields. This field indicates daily score as a negative value and is compared to the **Expected start** field on a work order. For example, if the value "10.00" is inserted in this field, and the expected start date of a work order is three days from now, the rating result is minus 30.00. Adding the results of 0.25 and 50 from the examples in the **Priority** and **Criticality** fields described above provides a total of plus 20.25. That number is compared to all other work order rating scores during work order scheduling, and the highest rating scores are then planned first.
- **Responsible worker** - A rating score calculated together with the **Responsible worker group**, **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** rating score values. If the value "50.00" is inserted in this field, and a responsible worker has been selected on a work order, the worker gets 50 points in the overall worker calculation during work order scheduling.
- **Responsible worker group** - A rating score calculated together with the **Responsible worker**, **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** rating score values. If the value "50.00" is inserted in this field, and a responsible worker has been selected on a work order, the worker gets 50 points in the overall worker calculation during work order scheduling.
- **Limit to responsible** - This limits the number of workers available for work order scheduling. Select **No** if you want to calculate a score for all workers, regardless if they are set up as responsible workers or part of a responsible worker group. Select **Yes** if you want to calculate a score for workers who are set up as responsible worker on the work order, and/or included in a responsible worker group selected on the work order.
- **Preferred worker** - A rating score calculated together with the **Responsible worker**, **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** rating score values. The four rating scores are calculated and added together to provide a score used for selecting which worker should be assigned to which work order during work order scheduling. If the value "10.00" is inserted in this field, and a worker has been selected as preferred worker on a work order, that worker gets 10 points in the overall worker calculation during work order scheduling.
- **Preferred worker group** - A rating score calculated together with the **Responsible worker**, **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** rating score values. If the value "10.00" is inserted in this field, and a worker has been assigned to a preferred worker group selected on a work order, that worker gets 10 points in the overall worker calculation during work order scheduling.
- **Limit to preferred** - This limits the number of workers available for work order scheduling. Select **No** if you want to calculate a score for all workers, whether they are set up as preferred workers or part of a preferred worker group. Select **Yes** if you only want to calculate a score for workers who are set up as preferred workers, and/or included in a preferred worker group.
- **Location** - A rating score calculated together with the **Responsible worker**, **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** rating score values. If the value "3,000.00" is inserted in this field, a worker gets 3,000 points in the calculation if the worker is located in the same factory or facility as the asset on which a job is to be scheduled.
 - If your company uses functional locations, workers get full score if they are located on the functional location related to the asset. If the functional location of the asset has a parent asset, workers on that functional location get 1/2 score. If that location also has a parent, workers on that location get 1/3 score. If that location also has a parent, workers on that location get 1/4 score, and so on.
 - If your company uses asset location, which we do not recommend, location, area, and zone are used to calculate location scores. Workers get full score if they are located in the location and area and zone related to the asset. If worker location only matches location and area, the rating score for the worker is 2/3 of the full score. If worker location only matches location, the rating score for the worker is 1/3 of the full score.
- **Limit to location** - This limits the number of workers available for work order scheduling. Select **No** if you want to calculate a score for all workers across all functional locations. Select **Yes** if you only want to

calculate a score for workers who are associated with the work order's functional location.

NOTE

The three "Limit to" fields increase the speed of work order scheduling by limiting the number of scores calculated for workers.

Worker's start date - A rating score calculated together with the **Responsible worker**, **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** rating score values. This field indicates daily score as a negative value and is compared to the **Expected start** field on a work order. If the value "10.00" is inserted in this field, and the expected start date of a work order is tomorrow, the rating result is minus 10.00.

- Assuming that no responsible worker and responsible worker group have been selected on a work order to be scheduled - you add and subtract the rating score values in the examples in the **Preferred worker**, **Preferred worker group**, **Asset location**, and **Start date** fields above, you get a total of 3,010.00. This means a high score for the worker who is already selected as preferred worker as well as included in the preferred worker group on the work order, and the worker is also located in the same facility as the asset for which a job needs to be scheduled. This means there is a good chance that the worker in question will be selected to complete the job during work order scheduling.
- If the value "0.00" is inserted in one of the eight fields above, that rating score will not be used during work order scheduling.

The Document types tab

Select the document types that should be available for printing attachments related to a work order report. This is done by selecting a document type in the **Available** section and selecting . If you want to remove a selected document type, select the document type in the **Selected** section and select .

The Number sequences tab

Select the required number sequences in this section. There are two number sequences for assets: one for manually created assets and one for assets created through pending assets.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset lifecycle states

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains asset lifecycle states and lifecycle models in Asset Management. Asset lifecycle states are used to define whether an asset is active or inactive. For example, you can set up asset lifecycle states such as **Created**, **Active**, and **Terminated**.

NOTE

- Request lifecycle states are linked to asset lifecycle states. Therefore, when a request is changed to a new request lifecycle state, the asset that is attached to the request is changed to a new asset lifecycle state. For example, if the lifecycle state of a request is changed to **Inbound**, the lifecycle state of the attached asset is changed to the lifecycle state that is selected in the **Inbound lifecycle state** field on the **Asset lifecycle state** FastTab of the **Asset lifecycle state models** page.

Asset lifecycle states can be set up in asset lifecycle models, where you can define the required lifecycle states for various types of assets. You first set up lifecycle states. You then create a lifecycle model and select lifecycle states for it.

1. Select **Asset management** > **Setup** > **Assets** > **Lifecycle states**.
2. Select **New** to create a new asset lifecycle state.
3. In the **Lifecycle state** field, enter the lifecycle state ID.
4. In the **Name** field, enter a description.

The **Lifecycle models** field shows the number of asset lifecycle models that use the asset lifecycle state.

5. Set the **Active** option to **Yes** if this lifecycle state should be an active lifecycle state (in other words, if work orders can be created for assets that are in this lifecycle state).
6. Set the **Delete open calendar lines** option to **Yes** if open asset calendar lines that have an asset lifecycle state of **Created** should be deleted when they are in this lifecycle state. This setting is useful if you want to clean up any open maintenance schedules that are no longer relevant for the asset (for example, if the asset is no longer active).

NOTE

Asset lifecycle states, asset lifecycle models, and asset types are related. They are used in the same way as work order lifecycle states, work order lifecycle models, and work order types.

After you've created the required asset lifecycle states, you can set up lifecycle states in asset lifecycle models.

1. Select **Asset management** > **Setup** > **assets** > **lifecycle models**.
2. Select **New** to create a new asset lifecycle model.
3. In the **Lifecycle model** field, enter the lifecycle model ID.
4. In the **Name** field, enter a description.

The **Lifecycle states** field shows the number of asset lifecycle states that are selected in the asset lifecycle model. The **Asset types** field shows the number of asset types that use the lifecycle model.

5. On the **Lifecycle states** FastTab, select the asset lifecycle states that should be included in the asset lifecycle model:
 - To use a lifecycle state for the model, select it in the **Lifecycle states remaining** section, and then select the right arrow button  to move it to the **Lifecycle states selected** section.
 - To use all the available lifecycle states for the model, select the **All available lifecycle states** button . All lifecycle states are transferred to the **Lifecycle states selected** section.
 - To remove a lifecycle state from the model, select it in the **lifecycle states selected** section, and then select the left arrow button  to move it to the **Lifecycle states remaining** section.
6. Select **Lifecycle state updates** to define the asset lifecycle states that can follow a selected lifecycle state.
7. You use the **Asset state** FastTab if you handle assets that you receive for repair. In the **Inbound/outbound** section, you can select asset lifecycle states to indicate the workflow of an asset that you receive for repair. If you offer loan assets to customers or departments, in the **Loan** section, you can select lifecycle states for loan assets.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset service levels

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains asset service levels in Asset Management. Asset service levels are related to assets, and are transferred to maintenance requests and work orders. They are used to calculate the priority of work orders during work order scheduling. Asset service levels can be changed, if changes are required.

For more information about the setup that is related to the calculation of rating scores for work order scheduling, see [Asset Management parameters](#). You must set up at least one default record for the asset service level. This default record is used if no other match is found during work order scheduling.

Example 1: The default service level that is used if no other match is found. In this record, you select only a service level.

Example 2: A high service level that is used to schedule jobs for a Volvo truck engine. In this record, you select a relevant asset type (such as **Truck Engine**), a manufacturer (**Volvo**), and a service level.

Set up asset service levels

1. Select **Asset management > Setup > Asset service levels**.
2. Select **New** to create a record.
3. Depending on the detail level that is required for the asset service level, make relevant selections in the **Functional location, Asset type, Manufacturer, Model, Asset, Work order type, and Service level** fields.

NOTE

When the asset service level is used for maintenance requests and work orders, Asset Management goes through all asset service level records to check for a possible match. It always checks the most specific combination first. In other words, Asset Management first checks for a match for the **Work order type** field. If no match is found, it checks for a match for the **Asset** field, and so on. As you can see in the layout of the **Asset service levels** page, this behavior means that, to find the most specific combination, Asset Management checks each record from right to left for a match. If no match is found, the default record that has no selections in those fields is used.

4. In the **Service level** field, select a number that indicates the service level (priority).

NOTE

If you change an asset service level record on the **Asset service levels** page after you've already used it on a work order, the service level on maintenance requests and work orders isn't updated accordingly.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset criticality types

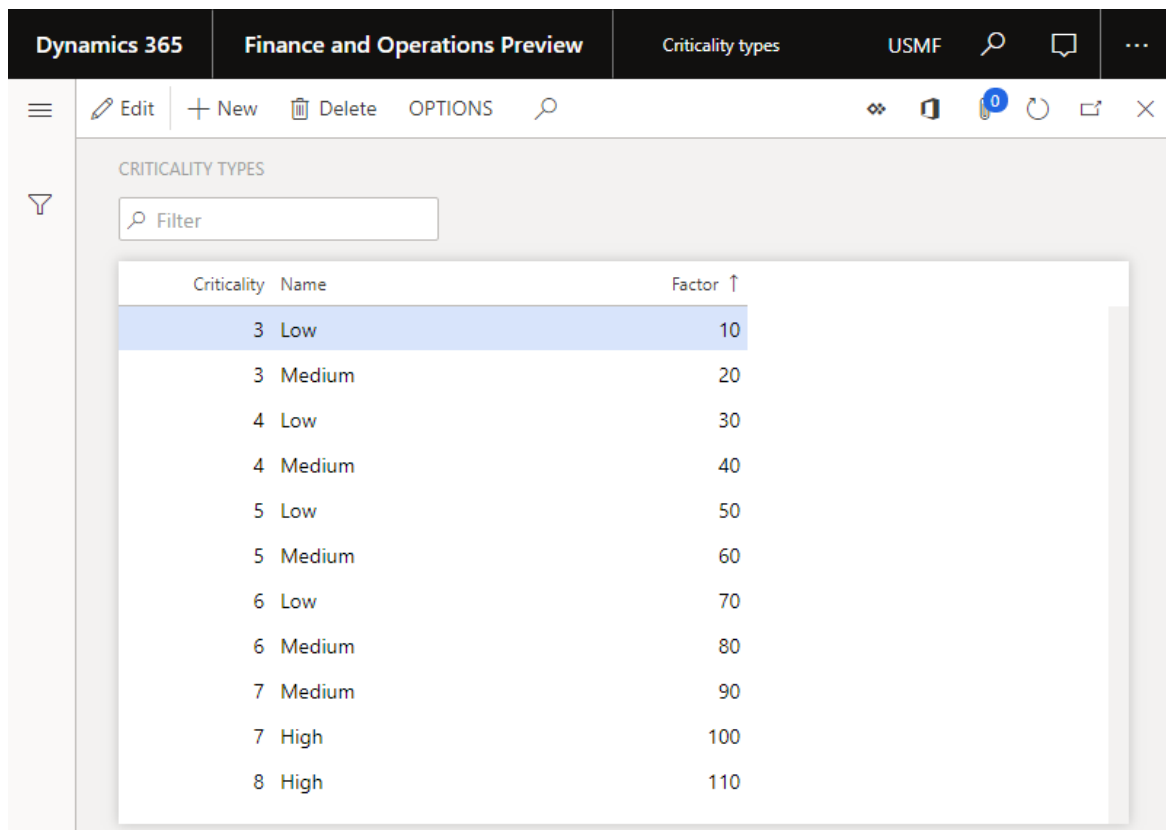

2/18/2021 • 2 minutes to read • [Edit Online](#)

The topic explains asset criticality types in Asset Management. Asset criticality is related to assets and is transferred to work orders. It can't be changed on a work order. Asset criticality is used to calculate work order criticality during work order scheduling. In other words, it's used to calculate the extent to which a maintenance job on an asset affects the production schedule and productivity in your company. For more information about the setup that is related to the calculation of rating scores for work order scheduling, see [Asset Management parameters](#).

To set up criticality, you first create the criticality types that should be used in the asset setup. You then set up asset criticalities.

Set up criticality types

1. Select **Asset management > Setup > Assets > Criticality types**.
2. Select **New** to create a record.
3. In the **Criticality** field, enter a number that indicates the criticality.
4. In the **Name** field, enter a name for the criticality type.
5. In the **Factor** field, enter a factor. This factor is used during the calculation of work order scheduling to determine the criticality record that should be used. (The record that has the highest factor is always used.) This setting is relevant if, as shown in the following illustration, criticality lines are created that have the same criticality value.

The screenshot shows the Dynamics 365 Finance and Operations Preview interface for the 'Criticality types' entity. The table displays the following data:

Criticality	Name	Factor ↑
3	Low	10
3	Medium	20
4	Low	30
4	Medium	40
5	Low	50
5	Medium	60
6	Low	70
6	Medium	80
7	Medium	90
7	High	100
8	High	110

Set up asset criticalities

1. Select **Asset management > Setup > Asset criticalities**.
2. Select **New** to create a record.
3. Depending on the required level of detail for asset criticality, make relevant selections in the **Functional location, Asset type, Manufacturer, Model, Asset, Job type category, Job type, Job type variant, and Job requirement** fields.

NOTE

When an asset criticality is selected, Asset Management goes through all asset criticality records to check for a possible match. It always checks the most specific combination first. In other words, Asset Management first checks **Job requirement**. If no match is found, it checks **Job type variant**. If no match is found, it checks **Job type**, and so on. As you can see in the layout of the page, this behavior means that, to find the most specific combination, Asset Management checks each record from right to left for a match. If no match is found, the "default" record that has no selections is used.

4. In the **Criticality** field, select one of the criticality values that you created in the previous procedure.

Notes about criticality setup

- If you change an asset criticality in this setup after you've already used it on a work order, the criticality on the work order isn't updated accordingly.
- The criticality on a work order is recalculated every time that a work order line is added to or deleted from the work order.
- If a work order contains several work order jobs, the highest criticality, according to the **Factor** field on the **Criticality types** page, is always used on the work order.
- Generally, asset criticality can change over a period. Criticality can be affected by the purchase of new equipment, refurbishments, and so on. Consider reevaluating your asset criticalities at regular intervals (for example, once per year or every other year) to make sure that your criticality definitions match your current production setup.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset documents

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains asset documents in Asset Management.

In Asset Management, you can set up documents so that they are automatically related to job types, asset manufacturers, asset types, or assets, for example. This functionality is useful when updated document versions are released. In that case, you just have to put the updated document in the standard location that you use for your Supply Chain Management documents, and attach the document to the asset document record that you've created. The updated document can then be accessed from the **All assets**, **Active assets**, **My active assets**, **All work orders**, and **Active work order jobs** menu items. The process for attaching documents to an asset document record uses the standard document handling system.

Example 1: A document that is related to a job type might describe a procedure for that job type.

Example 2: A document that is related to a combination of an asset type, manufacturer, and model might be the standard manual for the selected asset manufacturer model.

Create asset document relation

1. Select **Asset management** > **Setup** > **Asset documents**.
2. Select **New** to create an asset document record.
3. Depending on how specific you want the document relation to be, make relevant selections in one or more of the following fields: **Asset type**, **Manufacturer**, **Model**, **Asset**, **Job type category**, **Job type**, **Job type variant**, and **Job requirement**. The options that are available in the **Job type variant** and **Job requirement** fields depend on your selection in the **Job type** field.

NOTE

When the system searches for documents that should be related to an asset or a work order, Asset Management goes through all asset document records to check for a possible match. It always checks the most specific combination first. In other words, Asset Management first checks for a match for the **Job requirement** field. If no match is found, it checks for a match for the **Job type variant** field. If no match is found, it checks for a match for the **Job type** field, and so on. As you can see in the layout of the **Asset documents** page, this behavior means that, to find the most specific combination, Asset Management checks each record from right to left for a match. Several documents might be related to an asset or a work order. You can edit the service level on a maintenance request or a work order as you require.

4. Select **Attachments**. The standard **Document handling** page appears.
5. Set up the documents or notes that should be attached to the asset document record. After you attach documents, the **Attachments** field shows the number of documents that are related to the record.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance workers and worker groups

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic explains maintenance workers and worker groups in Asset Management. In Asset Management, you can connect maintenance workers to functional locations. (For more information about functional locations, see [Create functional locations](#).) This functionality might be useful if, for example, you're scheduling a maintenance job on a machine that is located in functional location 01, and you want to allocate maintenance workers from the same location to perform the job.

You can also create maintenance worker groups and associate maintenance workers with them. This functionality is useful when you do simple work order scheduling, and you want to schedule a group of maintenance workers on a work order. You can use maintenance workers and maintenance worker groups to set up preferred maintenance workers and responsible maintenance workers.

Create workers

1. Select **Asset management > Setup > Workers > Workers**.
2. Select **New** to add a worker to the list.
3. In the **Worker** field, select the worker.
4. Set the **Active** option to **Yes** to schedule the worker on work orders.

On the **General** FastTab, the **Resource** and **Description** fields are automatically filled in if a resource has been selected for the worker. The **Calendar** field is also automatically filled in, provided that you've set up the worker as a resource and allocated a calendar to that resource on the **Resources** page (**Organization administration > Resources > Resources**).

5. On the **Groups** FastTab, select **Add**, and then select a maintenance worker group for the worker. A worker can be affiliated with more than one group.
6. In the standard setup, a worker's affiliation with a group is effective from the date when you add the group, and it never expires. This date is shown in the **Effective** field. To see the **Effective** field, select **View > All**. If the worker's affiliation with a group should be limited to a specific period, use the **Effective** and **Expiration** fields to define the period.
7. On the **Functional locations** FastTab, select **Add**, and then select a functional location for the maintenance worker. Also specify which location is the primary functional location for the worker.

NOTE

When you add functional locations to a worker, all active assets that are related to those functional locations appear on various menu items, such as **My active assets** and **My active functional locations**. They also appear in the asset lookups that are shown when you create a new asset, maintenance request, or work order.

The fields on the **Details** FastTab show the number of maintenance worker groups and functional locations that the selected maintenance worker is related to.

Create worker groups

1. Select **Asset management > Setup > Workers > Maintenance worker groups**.

2. Select **New** to add a worker group to the list.
3. In the **Maintenance worker group** field, enter a group ID.
4. In the **Name** field, enter a name.
5. On the **Workers** FastTab, select **Add**, and then select a maintenance worker for the worker group. For information about the **Effective** and **Expiration** fields, see step 6 in the previous procedure.
6. If a resource group should be related to the selected maintenance worker group, select **Copy from resource group**. In the **Group** field, select the resource group to copy calendar settings from. Then, in the **Worker group** field, select the worker group to copy the resource group's calendar settings to. This step is relevant only if you want maintenance workers to use the calendar that is related to a resource (work center) during work order scheduling.

The field on the **Details** FastTab shows the number of maintenance workers that have been set up on the selected maintenance worker group.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Introduction to assets

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides an overview of assets in Asset Management. An *asset* is any type of equipment, such as a machine or a machine part, that requires maintenance, service, or repair.

An asset is automatically updated with related information. For example, this related information might be about new or updated work orders. You can create assets by using either the **All assets** menu item or the **Pending assets** menu item. This topic explains how to create assets by using the **All assets** menu item. For information about how to create assets by using the **Pending assets** menu item, see [Create assets based on purchase orders](#).

All assets

Select **Asset management > Common > Assets > All assets**. The **All assets** list page shows all assets and some of the information that is related to them. To view only active assets, select **Active assets**. To view only assets that are installed on the functional locations that you're related to as a maintenance worker, select **My active assets**. (This relation is set up on the **Workers** page. For more information, see [Maintenance workers and worker groups](#).)

In the **All assets** grid view, select a link in the **Asset** column to view the details of the selected record. To edit the record, select the **Edit** button. The details view shows detailed information that is related to the asset. A **Related information** pane on the right contains additional asset-related information. Expand the pane to show the related information for the selected asset.

The buttons on the Action Pane are organized on tabs. The following table briefly describes the buttons that are related to Asset Management.

BUTTON NAME	DESCRIPTION
Edit	Edit the selected asset.
New	Create a new asset.
Delete	Delete the selected asset.
Move asset	Move assets to another asset structure, or to another location in the same asset structure.
Replace asset	Replace one child asset in an asset hierarchy with another asset.
Install asset	Install an asset on a functional location.
Copy asset	Copy an asset hierarchy to another asset.
Requests	Open the Active requests list page, where you can view maintenance requests that have been created for the selected asset.

BUTTON NAME	DESCRIPTION
Event history	View an overview of the various registrations that have been made on the asset.
Asset BOM	View a list of all items (spare parts and other items) that are used on an asset.
Work orders	Open the Active work orders list page, where you can view work orders for the asset.
Checklist	View an overview of maintenance checklists and measurements that have been registered on the asset.
Maintenance downtime	Create or view maintenance downtime registrations on the asset.
Project transactions	View all posted transactions that are related to work orders that have been created for the asset.
Asset measures	Create or view asset measures on the asset.
Maintenance schedule	Open the Open maintenance schedule list page, where you can view maintenance plans, maintenance requests, and maintenance rounds that are associated with the asset, and that have a status of Created .
Update asset state	Update the asset lifecycle state. You can select multiple assets on the All assets list page and then update the asset lifecycle state for all of them at the same time.
Lifecycle state log	Open a log that shows the lifecycle states of the selected asset.
Asset documents	View a list of the documents that are attached to an asset. These documents are set up at Asset management > Setup > Asset documents .
Attributes	Create or view asset attributes.
Image	Select an image for the asset.
Parent assets	View parent asset history for the selected asset.
Functional locations	View functional location history for the selected asset.
Condition assessment	Register condition assessment measurements on the asset.
Faults	Open the Asset faults list page, where you can view faults that have been registered on the asset.
Cost control	Compare budget costs and actual costs on the asset.
Hour control	Compare forecast hours and actual hours on the asset.

BUTTON NAME	DESCRIPTION
Asset KPIs	Calculate and view key performance indicators (KPIs) for the asset.
Job types	View an overview of the current default job types for the asset.
Criticality types	View or update asset criticality types.
Spare parts	View a list of approved and alternative spare parts that can be used on the asset.
Asset consumption	Print a report that shows consumption registrations on the asset.
Asset fault	Print a report that shows fault registrations on the asset.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an asset

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes how to create an asset in Asset Management.

1. Click **Asset management** > **Common** > **assets** > **All assets** or **Active assets**.
2. Click the **New** button.
3. In the **Create assets** dialog, insert data regarding **Asset** (the asset ID) and the asset name. Select date and time for the asset in the **Effective** field. From that date, you are able to install the asset on a functional location as well as move and replace the asset in an asset structure.
4. In the **Asset type** field, select the asset type for the asset (mandatory field). If required, select **Asset manufacturer** and **Asset model** for the asset. If only one product has been set up, that product is automatically selected in the **Asset manufacturer** field. The selections available in the **Asset manufacturer** and **Asset model** fields depend on the setup in [Asset manufacturers and models](#).
5. In the **Parent asset** group, the **Asset** field is blank as default. If required, you can select a parent asset, and then all fields in the **Parent asset** group will automatically be filled out.

NOTE

When you select a parent asset, two or three tabs are available: The **My assets** tab contains assets related to the functional locations to which you (the maintenance worker who is logged on the system) may be allocated. If no functional locations are set up on a maintenance worker in the [Maintenance workers and worker groups](#) form, the **My assets** tab will not be visible. The **Active assets** tab contains a list of all assets with asset lifecycle state "Active". The **Asset view** tab displays a tree view of functional locations and assets installed on those locations.

6. The default functional location you have set up is suggested for the asset in the **Asset** group > **Functional location** field. Select another functional location, if required.

NOTE

After you have created an asset, you can install it on another functional location, if required. Only top-level assets (assets without a current parent asset) can be installed on a functional location. This means that you install the top level as well as any child assets on the selected functional location. Read more about installing assets on functional locations in [Introduction to functional locations](#).

7. Click **OK**.
8. Select the asset in the **All Assets** list and click the **Edit** button to add further information to the asset.

General information

The functional location to which the asset is related is shown in the **Functional location** field. If the asset is a parent asset, the number of children related to the asset is shown in the **Children** field. If the asset is a sub asset to an existing asset, the ID of the parent asset is shown in the **Parent** field.

You can edit **Asset manufacturer** and **Asset model** information on the asset, which is used to manage spare parts, alternative spare parts, and job type defaults. Refer to [Asset manufacturers and models](#) for more information. You can also add information about **Model year** and **Serial number**, if required.

Current lifecycle state is used to define if the asset is active or inactive. When creating an asset, the stage is always set to the first stage in the asset stage group. When you are ready to activate an asset, click **Update asset state**, and select the lifecycle state that you have defined as "asset active", and click **OK**.

Note: When an asset is set to "inactive", it is no longer possible to create work orders for the asset. Also, you cannot schedule preventive maintenance jobs for an inactive asset.

The **Service level** and **Criticality** fields relate to work orders created for the asset. The fields show the **Service level** and **Criticality** numbers calculated for the current setup for the asset. Refer to [Asset service levels](#) and [Asset criticality types](#) regarding setup of those values.

Asset

You can select a **Resource** for the asset. The resource selection determines which calendar is used for work order scheduling. Resource selection is often used for fixed assets. Resources and resource groups are set up in **Organization administration > Resources > Resource groups** or **Resources**.

In the **Fixed assets number** field, you can select a fixed asset to be related to the asset. This is relevant if your asset is related to an investment project.

- If the asset is related to a fixed asset, you can create a work order type to be used for work orders related to an investment project.
- Information about fixed assets for an asset is related to the **Fixed assets** module in Dynamics 365 Supply Chain Management. This means that in **Fixed assets > Fixed assets > Fixed assets**, you can get an overview of the Asset Management projects that may be related to a fixed asset by selecting the asset in the list and viewing the contents in the **Related information** pane > **Associated projects** section.

Details

In the **Active from** field, the date on which you updated the asset lifecycle state to an active state (refer to [Asset lifecycle states](#) regarding setup of asset lifecycle states), is shown. If the asset is no longer active, and you have updated the asset lifecycle state to an inactive lifecycle state, the date from which the asset is inactive is shown in the **Active to** field. If required, you can manually change those dates.

If required, you can insert an expected date for replacement of the asset in the **Replacement date** field. An estimated value for replacing the asset can be inserted in the **Replacement value** field. Example: You can use replacement information to compare it with the costs of maintaining an asset, and subsequently make a decision for purchasing a new asset if maintenance costs on the existing asset increase rapidly.

Notes

You can add notes related to the asset on the **Notes** FastTab. Click the **Add timestamp** button before you write the note, if you want to add user information and a date/timestamp to the note.

Attributes

On this FastTab, you can set values for asset attributes. These attributes can be used to describe properties or characteristics pertinent to the asset, for example, size, weight, or machine configuration.

Click **Add line** and select the attribute type. Next, insert the **Value** related to the attribute type and save the record.

NOTE

You can get an overview of asset attribute types and their relation to the assets in **Asset attribute** and **Asset attribute overview**. Refer to [Asset attribute overview](#) for more information.

Vendor

On the **Vendor** FastTab, select a vendor account for the asset. Also, if a vendor warranty has been granted, you can insert warranty information here.

Address

On the **Address** FastTab, you can insert the address of the equipment. If no address is inserted on the asset, the asset uses the address of a parent asset, if the parent asset has an address. If no address is related to the asset or any parents in the asset hierarchy, the address of the functional location on which the asset is installed may be used. If that functional location does not have an address related to it, the address of the parent functional location is used on the asset.

Asset management plans

Maintenance plans are used for scheduling preventive maintenance jobs at regular intervals on the asset. On this FastTab, you can set up maintenance plan lines for the selected asset. Maintenance rounds can be set up for various assets, on which you need to carry out a similar task at regular intervals. On the **Functional location maintenance plans** tab, you see the maintenance plans related to the functional location on which the asset is installed.

NOTE

If you delete a maintenance plan line or a maintenance round related to an asset in **All Asset**, you also automatically delete all maintenance schedules with status "Created" that have been created based on that maintenance plan or maintenance round.

Functional location maintenance plans

On this FastTab, you get an overview of the maintenance plans related to the functional location on which the asset is installed.

Maintenance rounds

On this FastTab, you can add or remove maintenance rounds, which are related to the asset.

Financial dimensions

You can select financial dimensions for the asset.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Multi-level assets

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to create and delete multi-level assets. You can create assets and related sub-assets in a hierarchical tree structure. In this way, you can show relations and dependencies among assets. Maintenance jobs can be related to all levels of the tree structure. Statistics can also be created for an individual level or as a sum of all sub-asset levels.

On the **All Assets** list page (**Asset management > Common > Assets > All assets**), the **Asset** column lists assets in hierarchical order. The **Parent** column shows the related parent. Additionally, if assets and sub-assets have already been created, the **Asset tree** section in the **Related information** pane shows the assets in a tree structure.

For information about how to create an asset, see [Create an asset](#). To create a sub-asset, select the parent asset in the **Parent** field on the **General** FastTab.

Copy an asset or asset structure

If your company has several similar asset structures, you can use the Copy function in Asset Management to quickly create them.

1. Select **Asset management > Common > Assets > All assets**.
2. On the **All assets** list page, select the asset to copy. For example, if you want to copy the whole asset structure, including sub-assets, select a parent asset.
3. Select **Copy asset**. In the **Copy from** section, the **Asset** field is set to the asset that you selected on the list page.
4. In the **Copy to** section, in the **Asset** field, enter the name of the new asset.
5. If the asset that you're creating should be part of an existing asset structure, in the **Parent asset** section, in the **Asset** field, select a parent ID.
6. Select **OK**. The new asset structure is shown on the **All assets** list page. All asset attributes, maintenance plans, and maintenance rounds that are related to the asset that you copied are transferred to the new asset or asset structure.

When you copy an asset structure, the sub-assets in the new structure have the same name as the sub-assets that you copied. After the copy procedure is completed, you can easily change the name and other settings for an asset. Select the asset on the **All assets** list page, and then select the **Edit** button.

NOTE

When you copy an asset or asset structure, the lifecycle state of the new assets is reset to whatever state you defined as the initial lifecycle state for assets. The functional location is reset to the default functional location.

Delete an asset or asset structure

If an asset has related sub-assets, you can delete it only if no maintenance requests, work order jobs, fault registrations, or condition assessments are registered on any of the assets.

1. On the **All assets** list page, select the asset to delete.
2. Select **Delete**.

NOTE

If you can't delete an asset by using this procedure, another way to handle deletion is to set up an asset lifecycle state for this purpose. For example, you can set up a **Scrapped** or **Deleted** lifecycle state on the **Asset lifecycle states** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Move, replace, and install assets

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic explains how to move, replace, and install assets in Asset Management. You can create individual assets that have no relations to other assets, or you can create an asset structure that includes a parent asset (top-level asset) and related child assets (sub-assets). In Asset Management, there are three approaches to moving and changing the location of an asset:

- **Move** – Move an asset either to another asset structure or to another location in the same asset structure.
- **Replace** – Temporarily remove an asset from an asset structure so that it can be repaired or refurbished, and then add the refurbished asset back to the asset structure later. Alternatively, permanently replace a used asset with a new asset.
- **Install** – Install a parent asset and any related child assets on a functional location.

NOTE

The asset that you move, replace, or install might be related to another functional location. In that case, the asset might use financial dimensions of the functional location. On the **Functional location types** page, you set up the handling of financial dimensions on functional locations.

Move asset

Use the **Move asset** function to move an asset either to another asset structure or to another location in the same asset structure. You can also move an asset out of an asset structure so that it becomes a standalone asset that has no structure relations.

NOTE

Don't use this function if assets are being repaired or temporarily replaced. Instead, use the **Replace asset** functionality that is described later in this topic.

1. Select **Asset management > Common > Assets > All assets** or **Active assets**.
2. In the list, select the asset to move. If the asset has child assets, you also move those assets.
3. Select **Move asset**.
4. To move the asset so that it becomes part of an asset structure, select the new parent asset in the **Parent asset** field. If you're moving a child asset, and you want to make it a standalone asset that has no structure relations, leave the **Parent asset** field blank.
5. By default, the **Effective** field is set to the current date and time. However, you can select a different date and time that the asset move is valid from.
6. Select **OK**.

Replace asset

Use the **Replace asset** function in connection with repairs, refurbishment, or permanent replacement of a worn-out asset by a new asset. This function is used to replace child assets in an asset structure. For parent assets (that is, assets that don't currently have a parent asset), this replacement is done on a functional location. For more information about how to replace parent assets on a functional location, see [Install assets on functional locations](#).

NOTE

If a repair shop is related to your production department, you can create functional locations such as **Repair**, **Scrap**, and **Storage** to handle the repair and replacement of assets.

1. Select **Asset management > Common > Assets > All assets** or **Active assets**.
2. In the list, select the child asset to replace. If the asset has child assets, you also replace those assets.
3. Select **Replace asset**.

The **Structure change** field shows the last date and time that the selected asset and related child assets were moved in the asset structure.

4. In the **Selected asset** section, in the **Target functional location** field, select the functional location to move the asset to. For example, select the **Repair** or **Scrap** location.

In the **Parent asset** section, the **Effective** field shows the last date and time that the parent asset and related child assets were installed or moved on the current functional location.

5. In the **New asset** section, in the **Asset** field, select the asset to insert as a temporary or permanent replacement for the selected asset. This asset might currently be located on another functional location, such as **Storage**.
6. In the **Effective from** section, the **Effective** field is set to the current date and time by default. However, you can select a different date and time that the asset replacement is valid from.
7. Select **OK**.

Install asset

Use the **Install asset** function to install an asset structure on a functional location.

NOTE

Always select a parent asset. The parent asset and related child assets will be moved to the selected functional location.

1. Select **Asset management > Common > Assets > All assets** or **Active assets**.
2. In the list, select the parent asset to install on another functional location.
3. Select **Install asset**.

The **Attributes** section shows the asset attributes that are set up on the parent asset.
4. In the **Functional location** field, select the new location.
5. By default, the **Effective** field is set to the current date and time. However, you can select a different date and time that the installation on the asset structure is valid from.
6. Select **OK**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create assets based on purchase orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how you can create a list of asset items that can be used as a basis for creating assets for maintenance jobs in Asset Management. Based on the asset items, you are able to view a list of the purchase order lines that have been created on those items. The purpose of this functionality is to easily create an asset in Asset Management based on a purchase order.

First, you set up the items to be used for creating assets from a purchase order in **Asset items**. After creating a purchase order line, you create the assets in **Pending assets**. It is possible to decide at which stage of the purchase order the asset should be created.

Select asset items

1. Click **Asset management > Setup > Assets > Items**.
2. Click **New** to create a new asset item.
3. Select the item in the **Item number** field. When you leave that field, the item name is automatically inserted in the **Product name** field.
4. On the **General** FastTab, select an asset type for the item.
5. Select asset manufacturer and model for the item.
6. Save the item.

Create assets from pending assets

1. Click **Asset management > Common > Assets > Pending Assets**.
2. You will see an updated list of the purchase orders based on the items selected in **Asset items**.
3. You can filter the status of purchase orders to select at which lifecycle state the asset should be created. For example, you may only want to create assets when a product receipt has been posted on a purchase order.
4. Select the **Reference number** link on a purchase order line to view detailed information about the item.
5. If you want to edit which dimensions are displayed on the **Inventory dimensions** FastTab, click the **Display Dimensions** button, and make your selections.
6. If you want to create an asset based on a purchase order line, select the check box in the **Mark** column for that line on the list page, and click **Create assets**. A message will be displayed informing you of the asset ID.
7. Select the asset in the **All assets** list and click **Edit** to add more information to the asset.
8. In **Pending assets**, if you want to delete a line because you don't want to create an asset, select the check box in the **Mark** column for that line, and click **Discard pending assets**. A message will be displayed informing you of the asset ID. You are not deleting the purchase order or sales order, just the record from which you could have created an asset in **Asset Management**.

NOTE

All product dimensions (size, color, configuration etc.) are automatically transferred to the asset attributes. Tracking dimensions (serial number) are stored directly on the asset when the asset is created.

Find pending assets

You can run a **Pending asset count** to check for pending assets. For example, this function can be used for receiving a notification each time a pending asset is ready to be created as an asset.

1. Click **Asset management** > **Periodic** > **Assets** > **Pending asset count**.
2. Click **OK** to run the job and update the list in **Pending assets**.
3. You can set up this job to run as a batch job, for example, once each day.

Caution: If data is changed on a purchase order *after* you have created an asset based on the appertaining item, those changes will not be reflected on the asset.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset BOMs

2/18/2021 • 4 minutes to read • [Edit Online](#)

This topic describes asset bills of materials (BOMs) in Asset Management. The **Asset BOM** page shows a list of all items (spare parts and other items) that are used on an asset during its whole lifetime. When you create a new asset, you should consider setting up an asset BOM as a part of the setup procedure. In this way, you can track item history for the asset from the creation date.

After you've completed a maintenance job, and item consumption has been registered on a work order, you can track consumption of spare parts and other items that are used on the asset. This functionality lets you keep a complete item consumption record for all your assets. For example, you can use the record to monitor whether a specific spare part is often replaced, or to keep track of the spare parts or other items that are currently used on an asset.

NOTE

On a work order, item consumption might include both spare parts and other, additional items, such as lubricants, bolts, and gaskets.

An asset BOM can be automatically updated based on the setup in Asset Management. If a work order lifecycle state has been created to handle finished or completed work orders, and if the **Update asset BOM** option for that work order lifecycle state is set to **Yes** on the **Work order lifecycle states** page, all items that are used on the work order will be automatically updated on the **Asset BOM** page when the work order is updated to that lifecycle state.

You can also manually update an asset BOM by creating new item lines on the **Asset BOM** page.

On the **Asset BOM** page, you can track spare parts history for assets after item consumption is registered on a work order. To use this functionality, you must select the item groups that should be used for spare parts registration on the **Spare parts item groups** page.

To use asset BOM functionality, you must first set up the required spare parts items groups. Then, if you want the asset BOM to be automatically updated when a work order is completed, you can set up a work order lifecycle state to handle that update.

Set up spare parts item groups

The setup of spare parts history is based on item groups that are created in the **Inventory and warehouse management** module. In Asset Management, you set up item groups so that you can track spare parts history for the items in the selected item groups.

1. Select **Asset management > Setup > Asset > Spare parts item groups**.
2. Select **New** to set up an item group.
3. In the **Item group** field, select the group. The name of the group is automatically entered in the **Name** field.

View and update asset BOMs

After you post item consumption on a work order, you can view the registered item consumption on the **Asset BOM** page.

1. Select **Asset management > Common > Assets > Active assets**. Select the asset in the list, and then

select **Asset BOM**.

NOTE

To view all item consumption registrations on all assets, select **Asset management > Inquiries > Assets > Asset BOM**.

2. Select **Update asset BOM**. You can add assets, asset types, and resources to the update as you require by selecting **Select**. Select **OK** to start the update. You can also set up the Update function as a batch job.
3. If you want to see more information that is related to the items, you can add inventory dimensions. Select **Inventory > Dimensions display**, and then select the check boxes for the dimensions that you want to see. To keep this setup for all assets on the **Asset BOM** page, set the **Save setup** option to **Yes**.
4. To get an overview of where in Asset Management the item on the selected line is used, in relation to assets, job type defaults, spare parts, and work orders, select **Item where used**.
5. If you want to see only active item lines, select **View > Current**. To see all item lines, including lines where the expiration date is earlier than the current date, select **View > All**.

NOTE

When you've completed a work order, if some items or spare parts that are related to the related asset have expired or have been replaced by other items or spare parts, we recommend that you update the asset BOM accordingly.

Create a new item line in an asset BOM

You can manually create item lines for assets.

1. On the **Asset BOM** page, select **New**.
2. In the **Asset** field, select the asset to add an item line for.
3. In the **Line number** field, enter a sequential line number.
4. In the **Effective** field, enter a start date for the item.
5. If the item will expire, in the **Expiration** field, enter an end date.
6. In the **Item number** field, select the item. The name is automatically entered in the **Product name** field.
7. In the **Quantity** field, enter the quantity that is used. The **Unit** field is automatically updated.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset event history

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to access asset event history in Asset Management. The **Asset event history** page shows the registration history that has been made during the lifetime of an asset. You can access this page from the **All assets**, **Active assets**, and **My active assets** menu items. Select an asset, and then select **Event history**.

On the **Details** FastTab of the **Asset event history** page, you can do a search on all the available information. For example, you can use the asset event history to find the following information:

- When a job type was last used on an asset
- When a specific worker entered a remark on a work order job

The timeline is updated every time that the page is opened. It contains the following information:

- Changes that have been made on the asset: asset location, asset ID, name, and vendor warranty
- Asset parent
- Asset bill of materials (BOM)
- Asset lifecycle state log
- Functional location
- Maintenance requests
- Work orders, including posted item and notes
- Faults
- Condition assessments

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset view

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the asset view in Asset Management. The **Asset view** page shows active assets and functional locations in a tree view. Therefore, you can easily get an overview of asset relations to functional locations. Additionally, you can view detailed information about functional locations, assets, and related bills of materials (BOMs). You can also get a quick overview of active maintenance requests and work orders that are related to an asset.

1. Select **Asset management > Common > Assets > Asset view**.
2. To change the view that is shown on the page, select a new value in the **View** field.

NOTE

The default view that is shown when you open the **Asset view** page depends on the value that is selected in the **View** field on the **Assets** tab of the **Asset management parameters** page (**Asset management > Setup > Asset management parameters**).

On the right side of the page, FastTabs shows details of the selected view.

The breadcrumb trail that appears above the tree view shows the current selection in the tree view. This breadcrumb trail uses the following format:

Functional location ID / Functional location ID (if there is more than one functional location) > Asset ID / Asset ID (if there is more than one asset) - Item number.

If you've selected an asset in the tree view, you can select **Active requests** or **Active work orders** to view the maintenance requests or work orders that are related to the asset. You can also select **Open > Functional location, Asset, or Asset BOM** to open the related view.

The **Asset functional locations** option that you can select in the **View** field is also available in any asset lookup where you can select an asset. The tree view is shown on an **Asset view** tab, for example, where you [create an asset](#), create a maintenance request, or create a work order.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset attribute overview

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of asset attributes in Asset Management. Asset attributes are properties that are related to an asset type or an asset. If you've set up [attribute types](#) and used them on assets, you can get an overview of the attribute values that are set up on the assets. This overview is shown on two pages in Asset Management: **Asset attribute overview** and **Asset attribute**.

The **Asset attribute overview** page shows a separate line for each asset. The line shows all attribute types that are related to that asset. Follow these steps to open and use the **Asset attribute overview** page.

1. Select **Asset management > Inquiries > Assets > Asset attribute overview**.
2. In the **Asset type** field, select an asset type.
3. Select **OK**. A list shows all the assets that use the selected asset type. For each asset, all related asset attribute types are shown on the same line.

The **Asset attribute** page shows a separate line for each attribute type that is used on an asset. To open this page, select **Asset management > Inquiries > Assets > Asset attribute**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance requests

2/18/2021 • 2 minutes to read • [Edit Online](#)

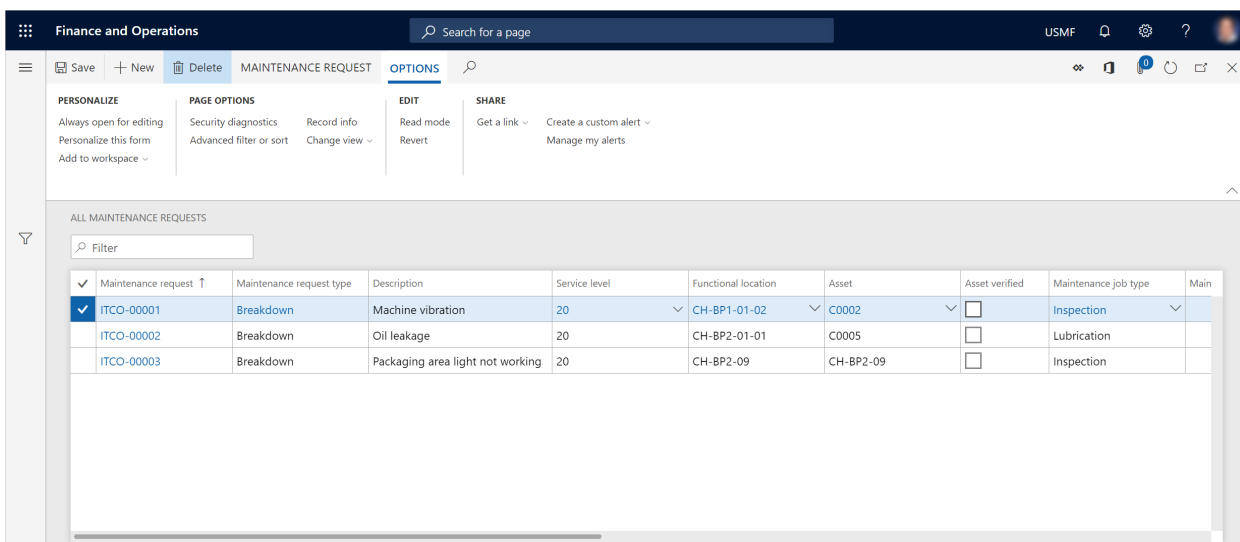

You can set up various types of requests to use in your company. Maintenance requests are one type. Maintenance requests are used to request that a work order be required for a specific job. A maintenance request can be created by any user who has access to Asset Management functionality. A planner or manager can then decide whether a maintenance request should be converted to a work order, or whether it should complete its own lifecycle.

View maintenance requests

- Select **Asset management > Common > Maintenance requests > All maintenance requests or Active maintenance requests**.

The **All maintenance requests** list page shows all maintenance requests, regardless of their lifecycle state. The **Active maintenance requests** lists page shows only maintenance requests that are in an active state.

The following illustration shows an example of the **All maintenance requests** list page.

Maintenance request	Maintenance request type	Description	Service level	Functional location	Asset	Asset verified	Maintenance job type	Main
ITCO-00001	Breakdown	Machine vibration	20	CH-BP1-01-02	C0002	<input type="checkbox"/>	Inspection	
ITCO-00002	Breakdown	Oil leakage	20	CH-BP2-01-01	C0005	<input type="checkbox"/>	Lubrication	
ITCO-00003	Breakdown	Packaging area light not working	20	CH-BP2-09	CH-BP2-09	<input type="checkbox"/>	Inspection	

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance request lifecycle states

2/18/2021 • 3 minutes to read • [Edit Online](#)

Maintenance request lifecycle states define the stages that a request can go through. Examples include **Created**, **Active**, and **Ended**. When a maintenance request is converted to a work order, the maintenance request lifecycle state should be updated to **Ended** or **Closed** to indicate that the maintenance request is no longer active. On the **All maintenance requests** list page, you can view all maintenance requests, regardless of their lifecycle state.

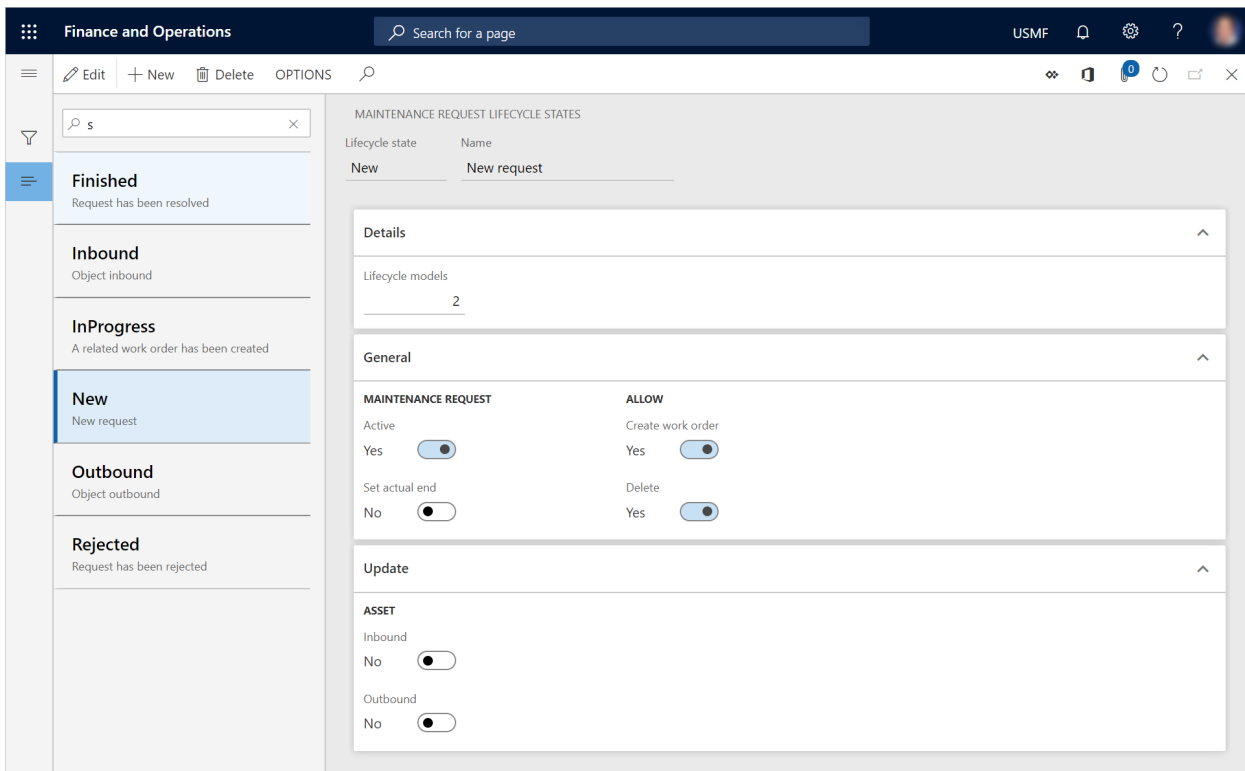

Set up maintenance request lifecycle states

1. Select **Asset management** > **Setup** > **Maintenance requests** > **Lifecycle states**.
2. Select **New** to create a maintenance request lifecycle state.
3. In the **Lifecycle state** field, enter an ID for the lifecycle state.
4. In the **Name** field, enter a name.

On the **Details** FastTab, the **Lifecycle models** field shows the number of maintenance request lifecycle models that use this lifecycle state.

5. On the **General** FastTab, set the **Active** option to **Yes** if a maintenance request should be active while it's in this lifecycle state.
6. Set the **Set actual end** option to **Yes** if an actual end date and time should automatically be entered on a maintenance request that is in this lifecycle state.
7. Set the **Create work order** option to **Yes** if a work order can be created from a maintenance request that is in this lifecycle state.
8. Set the **Delete** option to **Yes** if a maintenance request can be deleted while it's in this lifecycle state.
9. On the **Update** FastTab, the **Inbound** and **Outbound** options in the **Asset** section are relevant if you use depot repair. Set the appropriate option to **Yes** if the asset lifecycle state of assets that are selected on a maintenance request should automatically be updated to **Inbound** or **Outbound** when the maintenance request lifecycle state of that maintenance request is set to **Inbound** or **Outbound**.

The follow illustration shows an example of the **Maintenance request lifecycle states** page.

NOTE

Maintenance request lifecycle states, lifecycle state groups, and types are related to, and used in the same way as, work order lifecycle states, lifecycle state groups, and types.

Set up maintenance request lifecycle models

After you've created the lifecycle states that are required for your maintenance requests, they can be divided into lifecycle state groups, or lifecycle models. Maintenance request lifecycle models are used to create the flow that can be used for different types of maintenance requests. At a minimum, one standard maintenance request lifecycle model should be created.

1. Select **Asset management > Setup > Maintenance requests > Lifecycle models**.
2. Select **New** to create a maintenance request lifecycle model.
3. In the **Lifecycle model** field, enter an ID for the lifecycle model.
4. In the **Name** field, enter a name.

On the **Details** FastTab, the **Lifecycle states** shows the number of lifecycle states that are selected in this lifecycle model. The **Maintenance request types** field shows the number of maintenance request types that use this lifecycle model.

5. On the **Lifecycle states** FastTab, select the lifecycle states that should be included in the lifecycle model:
 - To include a lifecycle state in the lifecycle model, select it in the **Lifecycle states remaining** section, and then select the right arrow button  to move it to the **Lifecycle states selected** section.
 - To include all the available lifecycle states in the lifecycle model, select the **Select all available states** button . All lifecycle states are moved to the **Lifecycle states selected** section.
 - To remove a lifecycle state from the lifecycle model, select it in the **Lifecycle states selected** section, and then select the left arrow button  to move it to the **Lifecycle states remaining** section.
6. On the **General** FastTab, the fields in the **Updates** section are relevant if you use depot repair.

- In the **Lifecycle state for asset received** field, select the asset lifecycle state that assets that are selected on a maintenance request should automatically be updated to when they are received for depot repair.
- In the **Lifecycle state for asset delivered** field, select the lifecycle state that assets that are selected on a maintenance request should automatically be updated to when they are returned after repair.

The following illustration shows an example of the **Maintenance request lifecycle models** page.

The screenshot shows the 'MAINTENANCE REQUEST LIFECYCLE MODELS' page. The left sidebar has a 'Filter' box and two main sections: 'Depot repair' (Inbound outbound request stage group) and 'Standard' (Standard request stage group). The main content area is divided into several sections:

- Details:** Shows 'Maintenance request types' with a value of 2 and 'Lifecycle states' with a value of 4.
- Lifecycle states:** Contains two tables:

LIFECYCLE STATES REMAINING	
Inbound	Object inbound
Outbound	Object outbound

LIFECYCLE STATES SELECTED	
<input checked="" type="checkbox"/> New	New request
<input type="checkbox"/> Rejected	Request has been rejec...
<input type="checkbox"/> InProgress	A related work order h...
<input type="checkbox"/> Finished	Request has been resol...
- General:** Contains an 'UPDATES' section with two dropdown menus:
 - Lifecycle state for asset delivered
 - Lifecycle state for asset received

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance request types

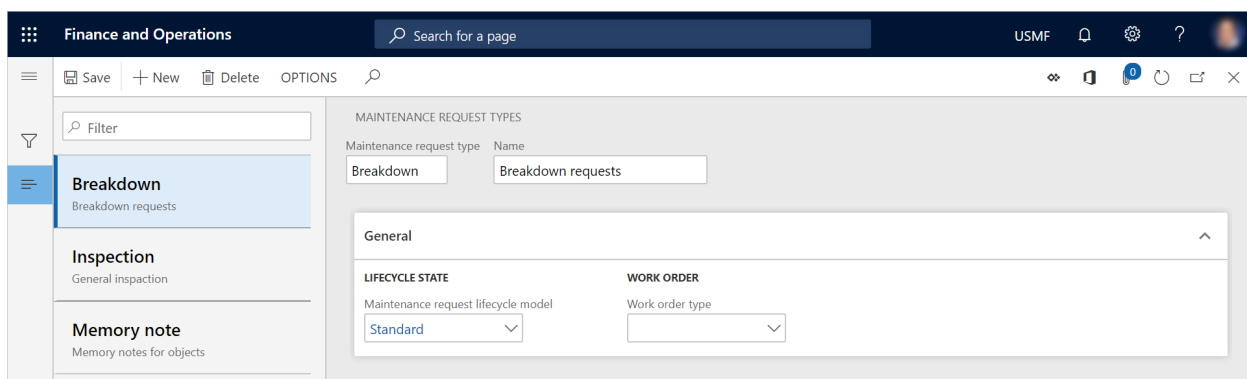

2/18/2021 • 2 minutes to read • [Edit Online](#)

Maintenance request types are used to categorize maintenance requests. For example, you might have maintenance request types that are related to preventive maintenance and corrective maintenance. Or you might have a special maintenance request type that is used to manage repair of assets (depot repair).

A maintenance request type defines the affiliation with a maintenance request lifecycle state group (maintenance lifecycle model). Maintenance request lifecycle models define the lifecycle states that can be set for a maintenance request. (Examples of maintenance request lifecycle states include **Created**, **Active**, and **Ended**.)

1. Select **Asset management > Setup > Maintenance requests > Maintenance request types**.
2. Select **New** to create a maintenance request type.
3. In the **Maintenance request type** field, enter an ID for the maintenance request type.
4. In the **Name** field, enter a name.
5. On the **General** FastTab, in the **Maintenance request lifecycle model** field, select a maintenance request lifecycle model.
6. In the **Work order type** field, select a work order type. When a maintenance request is converted to a work order, the work order automatically gets the work order type that is related to the maintenance request type.

The following illustration shows an example of the **Maintenance request types** page.

The screenshot shows the Dynamics 365 Finance and Operations interface for the 'Maintenance Request Types' page. The top navigation bar includes 'Finance and Operations', a search bar, and user information 'USMF'. The main area is divided into a left-hand navigation pane and a main content area. The left pane has a filter box and three sections: 'Breakdown' (Breakdown requests), 'Inspection' (General inspection), and 'Memory note' (Memory notes for objects). The main content area is titled 'MAINTENANCE REQUEST TYPES' and contains a table with two columns: 'Maintenance request type' and 'Name'. The first row shows 'Breakdown' and 'Breakdown requests'. Below the table is a 'General' FastTab with two sections: 'LIFECYCLE STATE' and 'WORK ORDER'. The 'LIFECYCLE STATE' section has a 'Maintenance request lifecycle model' dropdown menu set to 'Standard'. The 'WORK ORDER' section has a 'Work order type' dropdown menu.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Responsible maintenance workers

2/18/2021 • 2 minutes to read • [Edit Online](#)

Responsible maintenance workers can be related to asset types, assets, functional locations, maintenance job type categories, maintenance job types, maintenance job type variants, and trades. They can be used on work orders and maintenance requests to indicate a preference about the maintenance workers who should be responsible for a work order. (However, those maintenance workers aren't necessarily the same workers who are scheduled to carry out the work order.) Use of this functionality is optional. For example, it can be used to select responsible workers or worker groups for specific work types or work areas.

During a work order lifecycle or a maintenance request lifecycle, responsible maintenance workers can be changed or updated. This change or update might be related to, for example, a change in the maintenance request lifecycle state or the work order lifecycle state.

The setup on the **Responsible maintenance workers** page is *not* used during work order scheduling.

NOTE

In Asset Management, you can also set up *preferred* maintenance workers who might be allocated to work orders during work order scheduling.

Before you can set up responsible maintenance workers, you must set up the workers and maintenance worker groups that should be available for selection. For information about how to set up workers and maintenance worker groups, see [Maintenance workers and worker groups](#).

Set up responsible maintenance workers

1. Select **Asset management > Setup > Workers > Responsible maintenance workers**.
2. Select **New** to create a record.
3. First create a default responsible maintenance worker or responsible maintenance worker group setup, where you set only the **Responsible maintenance worker group** field and/or the **Responsible worker** field. Leave the remaining fields blank. This default setup will be used during work order scheduling if no other, more specific combination matches the contents of the work order.

NOTE

During creation of a maintenance request, when a responsible maintenance worker or responsible maintenance worker group is made available for selection on the **All maintenance requests** page, Asset Management goes through all responsible maintenance worker records to check for a possible match. It always checks the most specific combination first. In other words, Asset Management first checks for a match for the **Trade** field. If no match is found, it checks for a match for the **Maintenance job type variant** field. If no match is found, it checks for a match for the **Maintenance job type** field, and so on. As you can see in the layout of the page, this behavior means that, to find the most specific combination, Asset Management checks each record from right to left for a match (first **Trade**, then **Maintenance job type variant**, then **Maintenance job type**, then **Maintenance job type category**, then **Functional location**, then **Asset**, and finally **Asset type**). If no match is found, the default record that has no selections in those seven fields is used.

The following illustration shows an example of the **Responsible maintenance workers** page.

Maintenance requests

2/18/2021 • 2 minutes to read • [Edit Online](#)

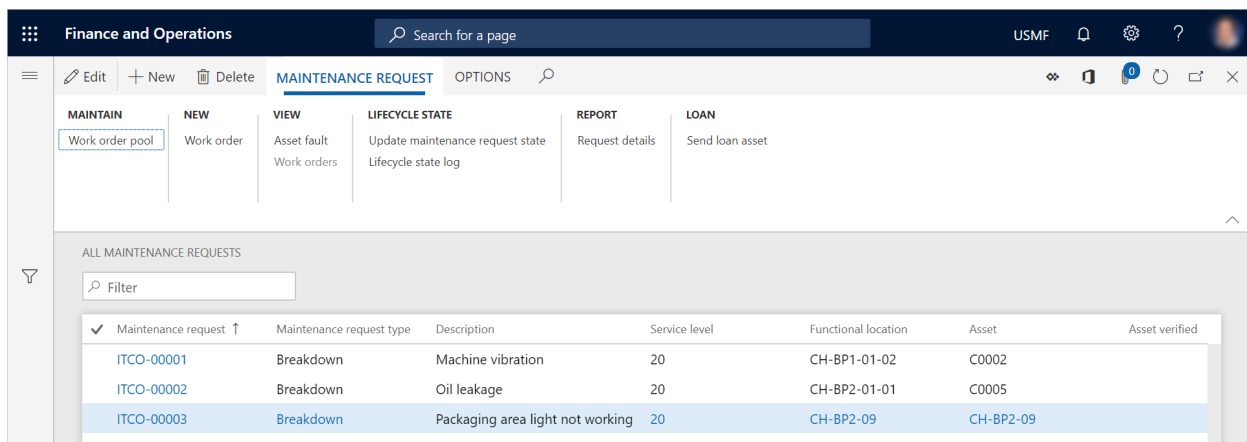

Maintenance requests are notes or declarations that are created to notify a manager or planner that an asset might require a maintenance or repair job, but without creating a work order. If the contents of a maintenance request are considered valid, a work order can then be created based on the maintenance request.

Maintenance requests can be created for any asset in Asset Management. Various types of maintenance requests can be created, depending on how your company uses maintenance requests. Here are some examples:

- Maintenance requests
- Notes
- Corrections or enhancements
- Investments
- Depot repair (This type is used when you receive assets from another location so that you can do a maintenance or repair job, and you then return the asset after the job is completed.)

View maintenance requests

To view maintenance requests, select **Asset management > Common > Maintenance requests > All maintenance requests**, **Active maintenance requests**, or **My functional location maintenance requests**. Each list page shows some of the information that is related to a maintenance request.

Maintenance request	Maintenance request type	Description	Service level	Functional location	Asset	Asset verified
ITCO-00001	Breakdown	Machine vibration	20	CH-BP1-01-02	C0002	
ITCO-00002	Breakdown	Oil leakage	20	CH-BP2-01-01	C0005	
ITCO-00003	Breakdown	Packaging area light not working	20	CH-BP2-09	CH-BP2-09	

NOTE

Use the **My functional location maintenance requests** list page to view a list of maintenance requests that contain either functional locations that you're related to as a worker or assets that are installed on functional locations that you're related to as a worker. (For information about how to set up functional locations on maintenance workers, see [Maintenance workers and worker groups](#).)

Although customer account information is available in Asset Service Management (external maintenance), it isn't available in Asset Management (internal maintenance).

To open the details view of a record, on the **All maintenance requests** list page, in the grid view, select a link in the **Maintenance request** column.

Create maintenance requests

2/18/2021 • 3 minutes to read • [Edit Online](#)

Maintenance requests can be used if maintenance workers or production workers discover that equipment requires repair, but the repair job can't be done right away.

Example: While a maintenance worker is making a repair, she discovers that another asset at the same location must be serviced. However, the maintenance worker doesn't have the time or the required spare parts to do the repair job. Therefore, she creates a maintenance request on the asset and enters a short description of the issue.

The **Active maintenance requests** section of the **Related information** pane on the right side of the **All assets** or **Active assets** page (**Asset management** > **Common** > **Assets** > **All assets** or **Active assets**) shows the active maintenance requests that are attached to the selected asset.

1. Select **Asset management** > **Common** > **Maintenance requests** > **All maintenance requests** or **Active maintenance requests**.
2. Select **New**.
3. In the **Create request** dialog box, in the **Maintenance request type** field, select the type of maintenance request. A default type is suggested.
4. In the **Description** field, enter a name or title that briefly describes the maintenance request.
5. In the **Functional location** and **Asset** fields, select a functional location or an asset, or a combination of a functional location and an asset, as you require. You can create a maintenance request without selecting an asset, and the asset can be added to the maintenance request later. If the maintenance worker who is signed in is related to a resource that is related to an asset, the **Asset** field is automatically set.

If a maintenance request is already attached to the selected asset, a message bar appears at the top of the **Create request** dialog box to notify you about the ID of the existing maintenance request. A message bar also notifies you if the asset is covered by a warranty agreement.
6. In the **Service level** field, select a service level that indicates the urgency of the request.
7. If you selected an asset in step 5, you can use the **Fault symptom**, **Fault area**, and **Fault type** fields to create a fault registration.
8. If the maintenance request has caused maintenance downtime, enter the start date and time of the downtime.

The **Started by** field is automatically set to your name.
9. The **Actual start** field is automatically set to the current date and time. However, you can change the value as you require.
10. In the **Notes** field, enter any additional notes that are required.
11. Select **OK**.

Subsequent processing of maintenance requests

After a maintenance request is created, but before it's converted to a work order, various information should be updated on it. Typically, a planner or another administrative employee completes this task.

- On the **All maintenance requests** or **Active maintenance requests** page, select the request to work with, and then select **Edit**.

In the details view, you can update various information. Here are some examples:

- Select and verify the asset. If you must select a different asset later, you can set the **Asset verified** option to **No**.
- Select a responsible maintenance worker group and/or a responsible maintenance worker. For more information about the required setup, see [Responsible maintenance workers](#).
- Select a maintenance job type and, if this information is relevant, a related maintenance job variant and a job trade.
- In the **Latitude** and **Longitude** fields, enter geographic coordinates. Any coordinates that are added to a maintenance request are automatically transferred to a related work order.

Create work orders from maintenance requests

2/18/2021 • 2 minutes to read • [Edit Online](#)

After you've created maintenance requests, you can easily convert them to work orders. This topic describes the quickest way to work with maintenance requests, update several maintenance requests at the same time, and then create a work order for several maintenance requests at the same time. On the **Active maintenance requests** or **My functional location maintenance requests** page, you can also work with one maintenance request at a time and convert one maintenance request to a work order.

NOTE

Every maintenance request can be related to only one work order. However, multiple maintenance requests can be included in one work order, even if the maintenance requests have different assets.

1. Select **Asset management > Common > maintenance requests > All maintenance requests**.
2. Before you can create a work order from maintenance requests, you must select, at a minimum, a maintenance job type for the maintenance requests, and also a maintenance job type variant and trade, if this information is relevant. In the grid view, you can easily update information for a maintenance request.
3. When you're ready to create a work order, select the maintenance requests to include in it.
 - If you select several maintenance requests to convert to a work order, both the **Asset** field and the **Maintenance job type** field must be set before you create the work order.
 - If you select one maintenance request to convert to a work order, only the **Asset** field must be set before you create the work order. However, when you create the work order, you can select a maintenance job type (and a related maintenance job type variant and trade, if this information is relevant) in the **Create work order** dialog box.
4. Select **Work order**.
5. In the **Create work order** dialog box, set the fields, and then select **OK**.

A message bar might notify you that a new work order has been created.

Additionally, when you create a work order that is based on a maintenance request, if the asset that is related to the maintenance request is included in a warranty agreement, a message bar notifies you about the warranty agreement.

6. Select **Asset management > Common > Work orders > All work orders**, and open the new work order.

Asset loans

2/18/2021 • 2 minutes to read • [Edit Online](#)

If your company receives assets for repair or maintenance jobs from either internal locations or customers, and if you temporarily loan assets to those locations or customers, Asset Management can track the asset loans.

Register asset loans on a maintenance request

1. Select **Asset management > Common > Maintenance requests > All maintenance requests or Active maintenance requests**.
2. Select the maintenance request to register an asset loan on, and then select **Edit**.
3. On the **Request** page, select **Send loan asset**.
4. Select the asset, and enter the expected return date.
5. Select **OK**.

NOTE

- You can send a loan asset only if an asset of the same asset type is available.
- The asset that you loan must have an asset lifecycle state that allows it to be used as a loan asset, such as **InStorage**. When the asset loan is registered, the asset lifecycle state of the asset is automatically updated to, for example, **OnLoan**.

To view a list of all the assets that you've loaned to other locations or customers, select **Asset management > Common > Asset loan > All asset loans**. If the **Ended** check box is selected for an asset, the asset has been registered as returned to your company.

Loan	Loan asset	Sent	Expected return	Returned	Asset
✓ GBSI-00001	C0008	7/19/2019 08:28:56 AM	7/26/2019 12:00:00 PM		C0007

On the **Active asset loans** page, you can view a list of all the loan assets that haven't yet been returned to your company.

Register loan assets as returned

1. Select **Asset management > Common > Asset loan > Active asset loans**.
2. Select the asset loan to register as returned, and then select **Return asset loan**.
3. In the **Returned** field, enter the date and time.
4. Select **OK**.
5. Refresh the **Active asset loans** list page, and notice that the asset loan no longer appears in the list.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inbound and outbound assets

2/18/2021 • 2 minutes to read • [Edit Online](#)

If your company does repair jobs or maintenance jobs on assets that are received from other locations or customers, Asset Management can track both inbound assets that are on their way to your company and outbound assets that are being returned.

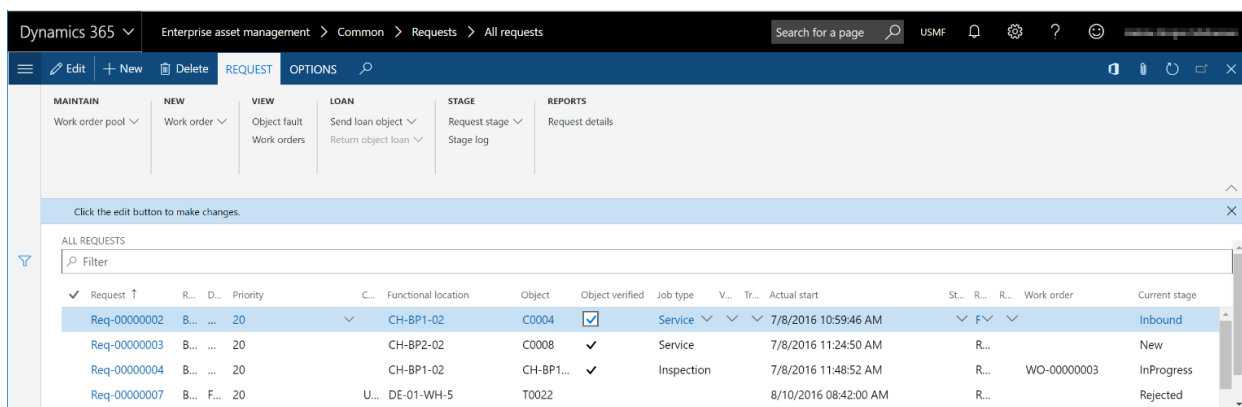

NOTE

If you want to use inbound and outbound lifecycle states to manage assets that are coming in and being returned, you must set up maintenance request lifecycle states and lifecycle models to support these actions. For more information, see [Maintenance requests](#).

The setup of Asset Management determines whether you can work with inbound and outbound assets.

Register assets as inbound

1. Select **Asset management > Common > Maintenance requests > Active maintenance requests**.
2. Select the maintenance request.
3. Select **Update maintenance request state**.
4. Select **Inbound** (or another lifecycle state that you've created for inbound assets), and then select **OK**.

The screenshot shows the Dynamics 365 interface for Enterprise asset management. The breadcrumb navigation is 'Enterprise asset management > Common > Requests > All requests'. The main area displays a table of 'ALL REQUESTS' with columns for Request ID, Priority, Functional location, Object, Object verified, Job type, Actual start, Work order, and Current stage. The first row is selected and highlighted in blue, showing 'Req-00000002' with 'Inbound' as the current stage.

Request	R...	D...	Priority	C...	Functional location	Object	Object verified	Job type	V...	Tr...	Actual start	St...	R...	R...	Work order	Current stage
Req-00000002	B...	...	20		CH-BP1-02	C0004	<input checked="" type="checkbox"/>	Service			7/8/2016 10:59:46 AM		F			Inbound
Req-00000003	B...	...	20		CH-BP2-02	C0008	<input checked="" type="checkbox"/>	Service			7/8/2016 11:24:50 AM		R...			New
Req-00000004	B...	...	20		CH-BP1-02	CH-BP1...	<input checked="" type="checkbox"/>	Inspection			7/8/2016 11:48:52 AM		R...		WO-00000003	InProgress
Req-00000007	B...	F...	20	U...	DE-01-WH-5	T0022					8/10/2016 08:42:00 AM		R...			Rejected

Register inbound assets as received

1. Select **Asset management > Common > Inbound/outbound > Inbound assets**.
2. Select the asset or maintenance request.
3. Select **Receive assets**.
4. In the **Received** field, enter the date and time. Then select **OK**. The record is removed from the **Inbound assets** list page.

Expected arrival	Request	Object	Name	Customer account	Object type	Current stage
9/22/2016 11:17:03 AM	Req-00000002	C0004	Conveyor Belt 0004		Conveyor	Inbound

Register assets as outbound

When you've completed the maintenance or repair job, you can register the asset as returned.

1. Select **Asset management > Common > Maintenance requests > Active maintenance requests**.
2. Select the maintenance request.
3. Select **Update maintenance request state**.
4. Select **Outbound** (or another lifecycle state that you've created for outbound assets), and then select **OK**.

Register outbound assets as delivered

1. Select **Asset management > Common > Inbound/outbound > Outbound assets**.
2. Select the asset or maintenance request.
3. Select **Deliver assets**.
4. In the **Delivered** field, enter the date and time. Then select **OK**. The record is removed from the **Outbound assets** list page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance request reports

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can generate two reports that are related to maintenance requests. One report shows details, and the other report provides a list that can be used for planning and follow-up.

Create a Maintenance request details report

The **Maintenance request details** report shows various information that is related to maintenance requests.

1. Select **Asset management > Reports > Maintenance requests > Maintenance request details**.
2. On the **Records to include** FastTab, you can select specific maintenance requests to include on the report.
3. On the **Run in the background** FastTab, you can set up report generation as a batch job, as you require.
4. Select **OK** to generate the report.

The following illustration shows an example of the **Maintenance request details** report.

The screenshot shows the 'Request details ITCO-00001' report. The report title is 'Request details ITCO-00001' with the subtitle 'Contoso Entertainment System USA'. The page number is 'Page 1 of 4' and the date/time is '7/19/2019 8:44 AM'. The report is organized into several sections:

Maintenance request	Maintenance request type	Description	Priority
ITCO-00001	Breakdown	Machine vibration	20

Responsible group	Responsible	Lifecycle state
Requests		New

Started by	Actual start
Julia Funderburk	7/17/2019 1:00:17 AM

Functional location	Asset	Name
CH-BP1-01-02	C0002	Conveyor Belt 0002

Asset type	Manufacturer	Model
Conveyor		

Asset verified	Verified by
No	

Maintenance downtime	Work order

Fault symptom	Fault area	Fault type	Fault date
Excessive Noise	Mechanical	Harmful	7/16/2019

There is also a 'Note' section at the bottom of the report.

Create a Maintenance request list report

The **Maintenance request list** report shows a list of all maintenance requests of the same request type.

1. Select **Asset management > Reports > Maintenance requests > Maintenance request list**.
2. On the **Records to include** FastTab, you can make selections to define which maintenance requests are included on the report.
3. On the **Run in the background** FastTab, you can set up report generation as a batch job, as you require.
4. Select **OK** to generate the report.

The following illustration shows an example of the **Maintenance request list** report for all active maintenance requests.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance job type categories and maintenance job types, maintenance job type variants, maintenance job trades, and maintenance checklists

2/18/2021 • 19 minutes to read • [Edit Online](#)

An asset type is attached to every asset. Asset types define the maintenance job types (and therefore, the maintenance jobs) that can be performed on assets. When you create a work order, you must select a maintenance job type. You can select only the maintenance job types that are related to the setup of the asset type that is used for the asset.

For a graphical overview of assets and maintenance job types, and their connection to work orders, see [Functional locations and assets](#).

Maintenance job type variants can be set up on a maintenance job type. Maintenance job type variants define variations of a job type, such as sizes (small, medium, or large), periods (weekly, biweekly, one month, or three months), and configurations (low standard, flexible, or high performance).

Maintenance job trades provide information about professional trades, such as mechanical, electrical, and hydraulic trades. Competency requirements can be set up on a maintenance job trade. All maintenance job trades can be used in relation to all maintenance job types. Selection of a maintenance job type variant and/or maintenance job trade on a work order is optional.

For each maintenance job type, variations of the maintenance job type setup can be created. For example, if you have a maintenance job type that is named **Service**, you can create the following variations for that maintenance job type: **Trucks 30,000 km**, **Cars 30,000 km**, and **Vans 30,000 km**.

Maintenance job type categories are used to collect a group of maintenance job types for overview purposes. Examples of maintenance job type categories might include **Calibration**, **Inspection**, **Overhaul**, and **Instrumentation**.

Maintenance checklist templates and maintenance checklist variables are used to set up maintenance checklists. Maintenance checklists are set up on maintenance job types and used on work orders.

You first set up the required maintenance job type categories, maintenance job type variants, and maintenance job trades. You then create maintenance job types. Finally, on the **Maintenance job type defaults** page, you create all the variations of maintenance job types that are required for your equipment. On that page, you can also set up forecasts, maintenance checklists, and tools for a combination of maintenance job types.

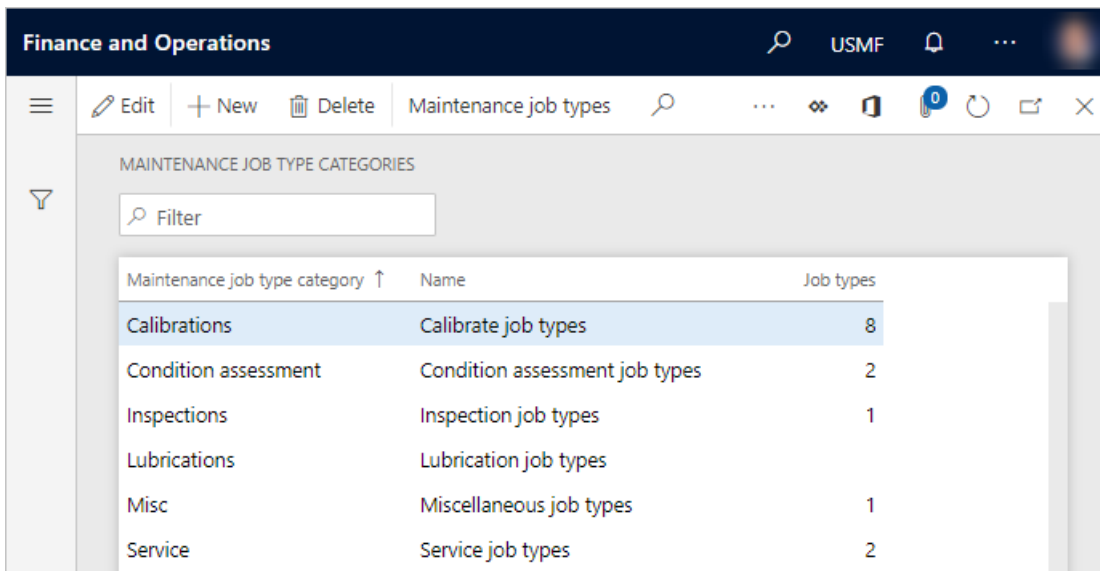

NOTE

A maintenance job type can be related to only one maintenance job type category.

Create a maintenance job type category

1. Select **Asset management > Setup > Jobs > Maintenance job type categories**.
2. Select **New**.
3. In the **Maintenance job type category** field, enter an ID for the maintenance job type category.
4. In the **Name** field, enter a name.

After you relate maintenance job type categories to maintenance job types, the **Job types** field shows the number of maintenance job types that are related to this maintenance job type category.

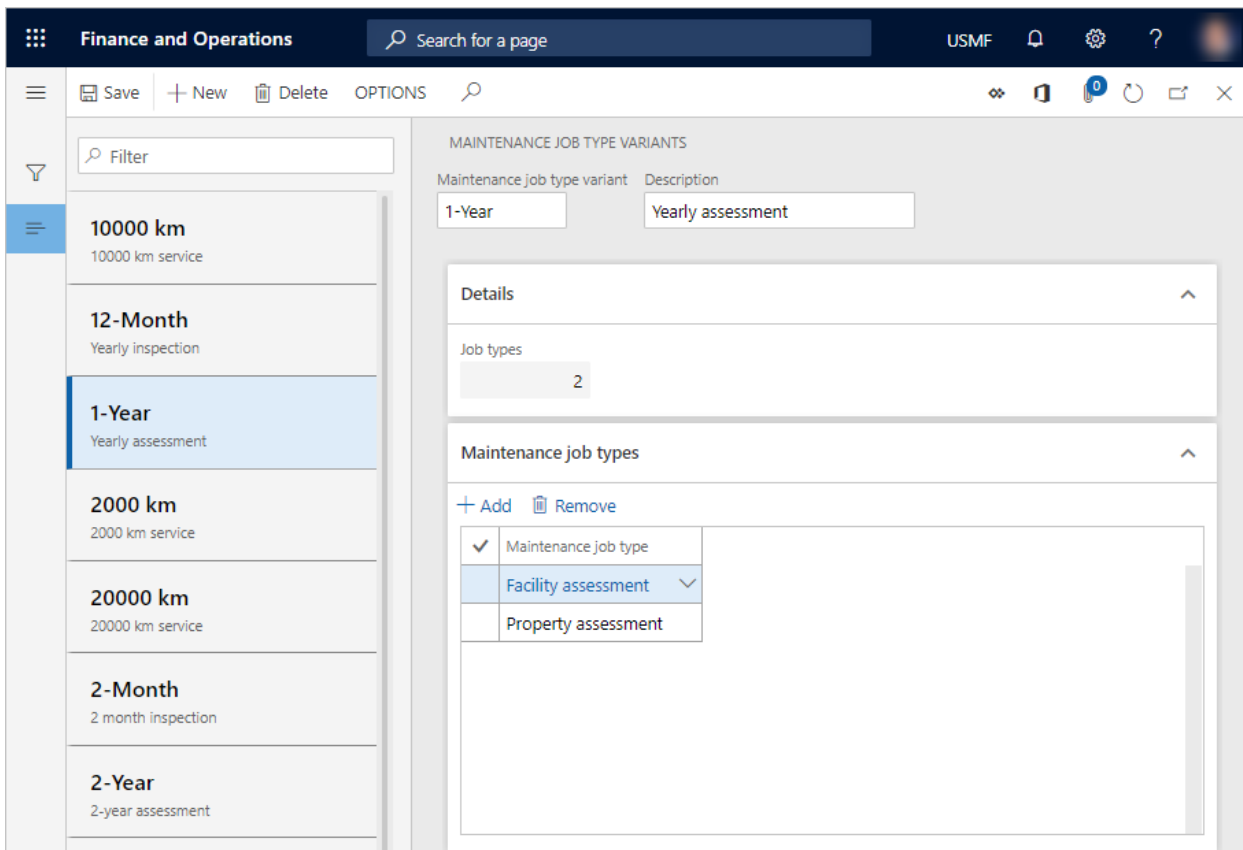

Maintenance job type category ↑	Name	Job types
Calibrations	Calibrate job types	8
Condition assessment	Condition assessment job types	2
Inspections	Inspection job types	1
Lubrications	Lubrication job types	
Misc	Miscellaneous job types	1
Service	Service job types	2

Create a maintenance job type variant

1. Select **Asset management > Setup > Jobs > Maintenance job type variants**.
2. Select **New**.
3. In the **Maintenance job type variant** field, enter an ID for the maintenance job type variant.
4. In the **Description** field, enter a description.
5. On the **Maintenance job types** FastTab, select **Add** to add a maintenance job type.
6. In the **Maintenance job type** field, select the maintenance job type.
7. Repeat steps 5 through 6 to add more maintenance job types to the maintenance job type variant.

On the **Details** FastTab, the **Job types** field shows the number of maintenance job types that have been added to this maintenance job type variant.

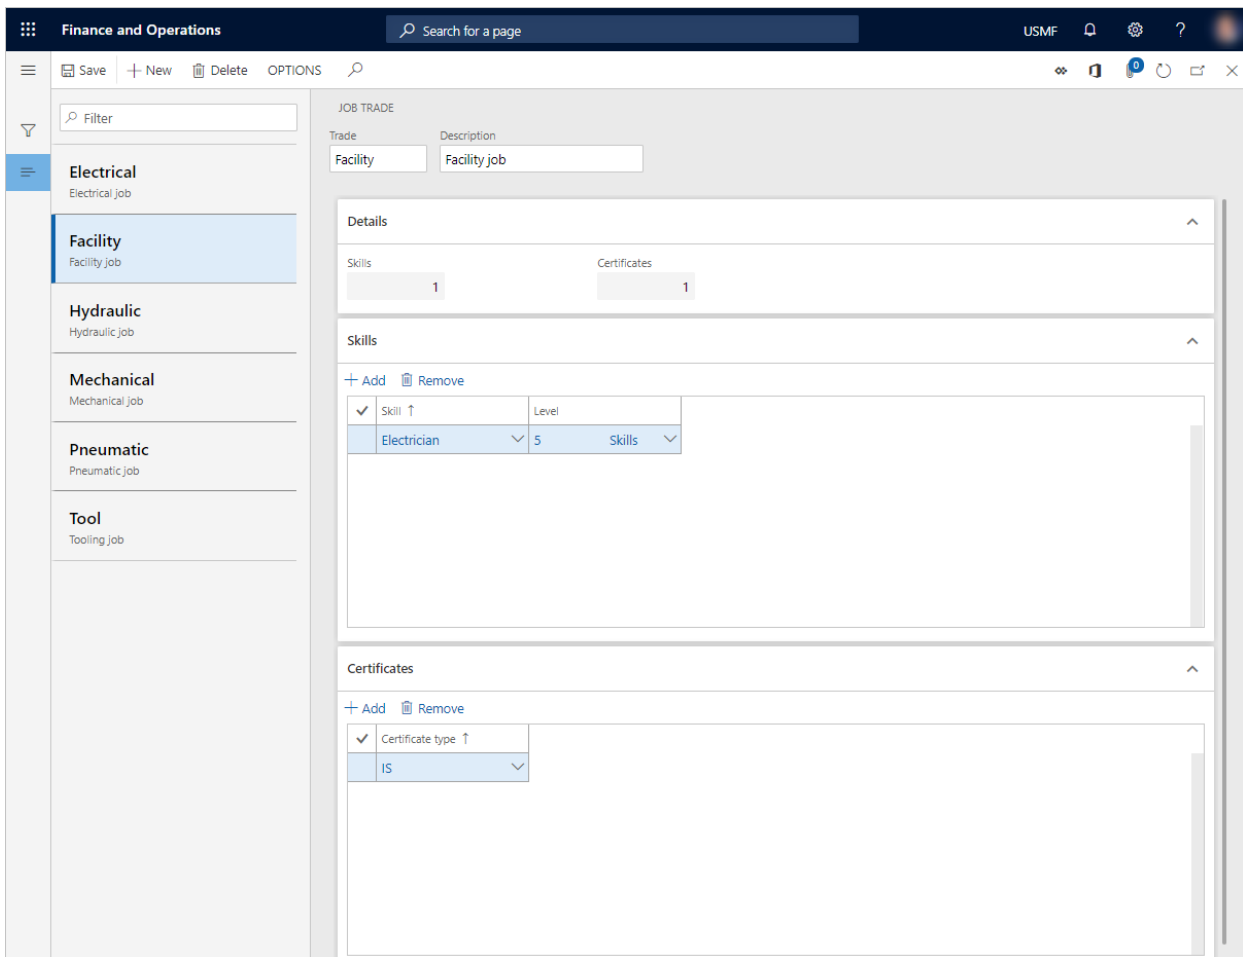

Create a maintenance job trade

1. Select **Asset management > Setup > Jobs > Maintenance job trade**.
2. Select **New**.
3. In the **Trade** field, enter an ID for the maintenance job trade.
4. In the **Description** field, enter a description.
5. On the **Skills** FastTab, select **Add** to add a new skill that should be related to the maintenance job trade.
6. In the **Skill** field, select the skill.
7. In the **Level** field, select the skill level.
8. Repeat steps 5 through 7 to add more skills to the maintenance job trade.
9. On the **Certificates** FastTab, select **Add** to add a certificate to the maintenance job trade.
10. In the **Certificate type** field, select the certificate.
11. Repeat steps 9 through 10 to add more certificates to the maintenance job trade.

On the **Details** FastTab, the **Skills** field shows the number of skills that have been added to this maintenance job trade.

On the **Details** FastTab, the **Certificates** field shows the number of certificates that have been added to this maintenance job trade.

Create a maintenance checklist variable

When you create maintenance checklist lines in the maintenance job type default, you must select a maintenance checklist type. **Variable** is one maintenance checklist type. It's used to define a possible result in a range on a maintenance checklist line that is related to a work order line. A variable lets you create a set of predefined outcomes without having to make an exact measurement.

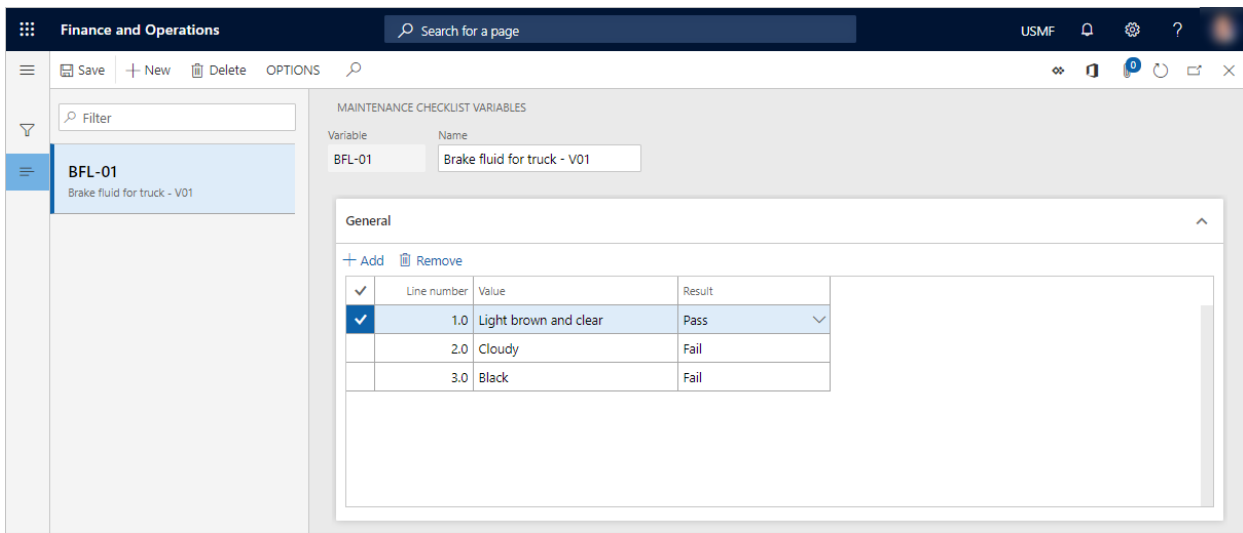

Example 1: You can measure oil level by defining three values: **Level too high**, **Level too low**, and **Level within range**. For each value, you define whether the value result is **Pass**, **Fail**, or **None**.

Example 2: You make a visual inspection of a piece of equipment to assess wear and tear.

1. Select **Asset management > Setup > Maintenance checklists > Maintenance checklist variables**.
2. Select **New**.
3. In the **Variable** field, enter an ID for the maintenance checklist variable.
4. In the **Name** field, enter a name.
5. On the **General** FastTab, select **Add** to add a line for a variable.

A sequential line number is automatically entered in the **Line number** field. After you've added all the lines, you can change the line numbers as you require. When you select line and then press the **Down arrow** key, the next number in the sequence is automatically entered on the next line.

6. In the **Value** field, enter a value description.
7. In the **Result** field, select a result for the line.

Create a maintenance checklist template

Maintenance checklist templates can be used as a common set of tasks that a worker must perform to complete a work order correctly. The templates are referenced from maintenance checklist lines on the maintenance job type default. Templates can be referenced across multiple maintenance job type default lines. Therefore, you can easily reuse a set of common maintenance checklist tasks. Examples of maintenance checklist templates include general safety instructions, and a list of items and conditions that must be checked on a specific pump or similar models of a conveyor belt.

1. Select **Asset management > Setup > Maintenance checklists > Maintenance checklist templates**.

2. Select **New**.

A template ID is automatically entered in the **Maintenance checklist template** field.

3. In the **Name** field, enter a name for the maintenance checklist template.

4. On the **Maintenance checklist lines** FastTab, select **Add** to add a template line.

A sequential line number is automatically entered in the **Line number** field. After you've added all the lines, you can change the line numbers as you require. When you select line and then press the **Down arrow** key, the next number in the sequence is automatically entered on the next line.

5. In the **Type** field, select a type for the maintenance checklist line. For each maintenance checklist type, the **Line details** FastTab shows related fields. The following values are available:

- **Text** – The line has text that describes what to do. Use this maintenance checklist type if you want a worker to check or inspect something, but you don't expect a specific (measurable) result. After you select this type, enter a name or heading in the **Name** field. In the **Instructions** field, enter a description of what must be done. If the step is mandatory for the maintenance checklist, set the **Mandatory** option to **Yes**.
- **Header** – The line is used as a heading to group the maintenance checklist lines that appear below it. This type is useful if you have several maintenance checklist lines that can be divided into specific areas. Headers provide an overview for the worker who will complete a maintenance checklist that has many maintenance checklist lines. After you select this type, enter a descriptive name in the **Name** field.
- **Template** – The line is used to make a reference to an existing template. After you select this type, enter a name for the template in the **Name** field. In the **Template** field, select the template.
- **Variable** – The line is used to define a possible result in a range. For information about how to set

up maintenance checklist variables, see the [Create a maintenance checklist variable](#) section. After you select this type, enter a descriptive name for the variable in the **Name** field. In the **Variable** field, select the variable. In the **Instructions** field, enter a description of what must be done. If the step is mandatory for the maintenance checklist, set the **Mandatory** option to **Yes**.

- **Measurement** – The line is used to record a specific measurement. You can set up the measurement that should be related to a predefined counter. After you select this type, enter a name for the template in the **Name** field. If this step is mandatory for the maintenance checklist, set the **Mandatory** option to **Yes**. If you want to use the measurement line as a counter registration, select the counter in the **Counter** field. The related **Unit** field is then automatically updated. If you've selected a counter, select the update method in the **Value** field. In the **Min. value** and **Max. value** fields, enter the allowed value range. In the **Instructions** field, enter a description of what must be done.

NOTE

Any line of the **Measurement** type that doesn't have a counter setup is treated as an independent measurement registration that there is no automatic follow-up for in Asset Management. Likewise, if the selected counter type isn't present on the asset that is related to the work order, the maintenance checklist task is treated as an independent measurement. The counter value can be changed multiple times. It isn't posted until the [work order lifecycle state](#) is changed to a state where the **Process maintenance checklist** option is set to **Yes**.

On the **Details** FastTab, the **Checks** field shows the total number of checklist lines in your template. This number includes the nested lines in any existing template that you've referenced in your template.

The screenshot shows the 'Maintenance Checklist Templates' page in Dynamics 365. The selected template is 'RUMF-00001' for 'Conveyor Belt - Model 120-122'. The 'Details' section shows 'Checks' as 2. The 'Maintenance checklist lines' table is as follows:

Line number	Type	ID	Name
1.0	Header		Inspection CB
2.0	Text		Check belt tension
3.0	Measurement	cm	Roller clearance

The 'Line details' section for the selected line shows the following configuration:

- Mandatory:** Yes (toggle)
- Unit:** cm
- Min value:** 2.00
- Max value:** 3.00
- Counter:** (dropdown)
- Update method:** Total
- Instructions:** (text area)

Create a maintenance job type

1. Select **Asset management > Setup > Jobs > Maintenance job types**.

2. Select **New**.
3. In the **Maintenance job type** field, enter an ID for the maintenance job type.
4. In the **Name** field, enter a name.

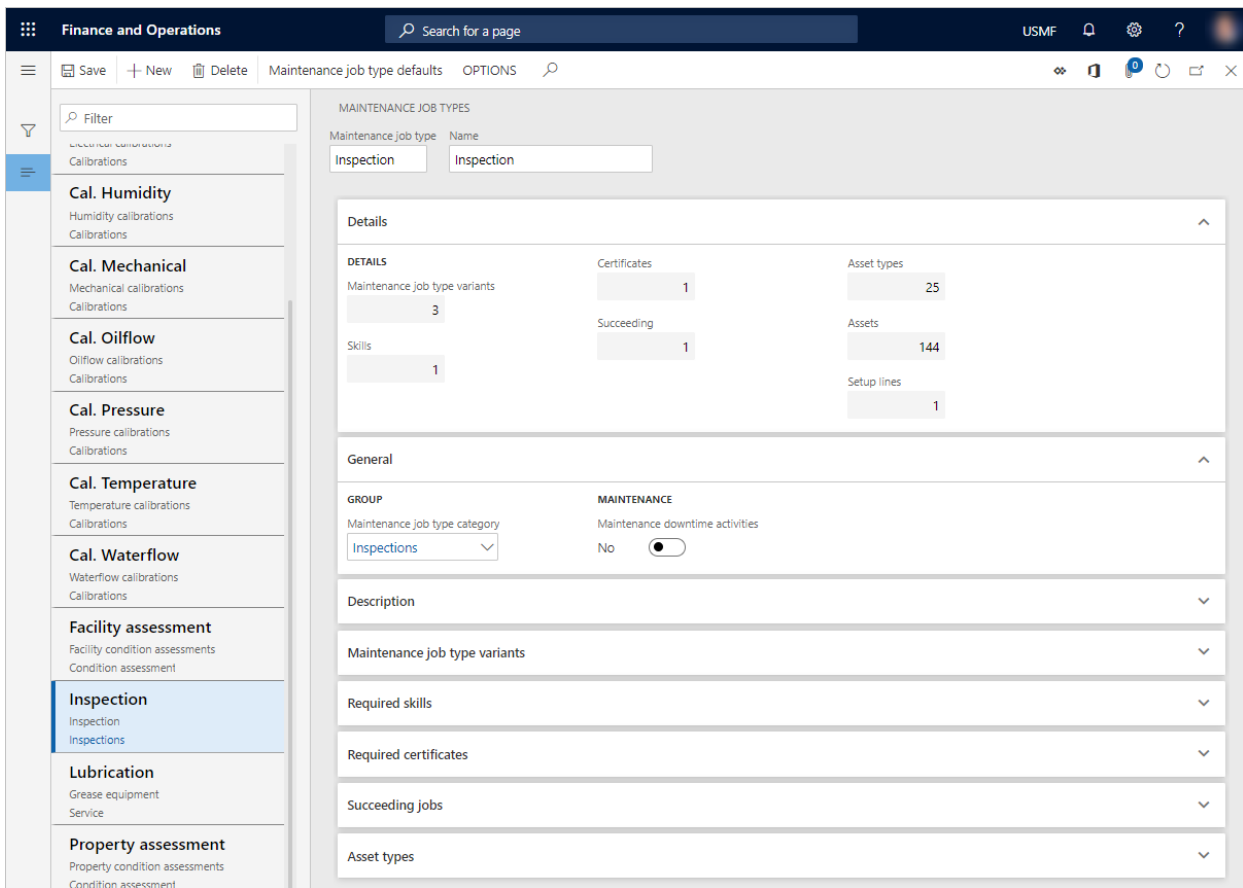

The **Details** FastTab shows an overview of the number of maintenance job type variants, skills, certificates, succeeding jobs, and asset types that have been created on this maintenance job type. The **Setup lines** field shows the number of maintenance job type default lines that have been set up on this maintenance job type. The **Assets** field shows the number of active assets that currently use this maintenance job type.

5. On the **General** FastTab, in the **Maintenance job type category** field, select a maintenance job type category.
6. Set the **Maintenance downtime activities** option to **Yes** if the maintenance job type requires a maintenance stop of the equipment before the job can be performed.
7. On the **Description** FastTab, enter a description of the maintenance job type.
8. On the **Maintenance job type variants** FastTab, you can add variants to the maintenance job type.
9. On the **Required skills** and **Required certificates** FastTabs, you can add skills and certificate requirements to the maintenance job type.
10. If a specific maintenance job type must be performed next, add it on the **Succeeding jobs** FastTab. You can also set up a maintenance job type variant and trade that are related to the maintenance job type. If the succeeding job should start a specific number of days before or after the job that uses this maintenance job type has started, enter the number of days in the **Delay by days** field. Positive numbers represent days after the start of the related job, and negative numbers represent days before the scheduled start of the related job. For example, if you enter 5, the succeeding job will start five days after the start of the job that is related to the maintenance job type. If you enter -3, the succeeding job will start three days before the scheduled start of the job that is related to the maintenance job type.

NOTE

If you add more than one maintenance job type line, the sequence of the lines indicates the order that they should be performed in. The sequence starts at the top of the list.

11. On the **Asset types** FastTab, you can add asset types to the maintenance job type.

Create maintenance job type default lines and related forecasts, maintenance checklists, tools, description, and attachments

1. Select **Asset management > Setup > Jobs > Maintenance job type defaults**.

–or–
Select **Asset management > Setup > Jobs > Maintenance job types**, select a maintenance job type, and then select **Maintenance job type defaults**.
2. Select **New**.
3. In the **Functional location**, **Asset type**, **Manufacturer**, **Model**, and **Asset** fields, select appropriate values, depending on how specific the maintenance job type default should be.
4. In the **Maintenance job type** field, select a maintenance job type if it wasn't automatically selected.
5. In the **Maintenance job type variant** and **Trade** fields, select a maintenance job type variant and a maintenance job trade as you require.
6. Select **Forecast**.
7. On the **Maintenance job type default forecast** page, you can make forecasts on hours, items, and expenses. On the relevant tabs, select **Add**, and make selections to create the required forecasts for the maintenance job type.
8. On the **Item forecast** tab, you can select inventory dimensions that should be shown on the item line. Select **Inventory > Dimensions**, select the dimensions to show, set the **Save setup** option to **Yes**, and then select **OK**.
9. On the **Item forecast** tab, select **Item where used** to see an overview of where the item on the selected line is used in Asset Management in relation to assets, maintenance job type default, spare parts, and work orders.

The **Maintenance forecast totals** FastTab shows an overview of forecast totals. This overview includes the total number of hours and forecast lines that have been created.

NOTE

To copy the forecast setup from another maintenance job type, select **Copy forecast**, and then select the maintenance job type to copy the setup from.

10. Select **Save** to save your changes.
11. Close the **Maintenance job type default forecast** page to return to the **Maintenance job type defaults** page.
12. Select **Maintenance checklist**.
13. On the **Maintenance job type defaults checklist** page, you can add maintenance checklist lines to the selected maintenance job type default. On the **Maintenance check lines** FastTab, select **New** to add a maintenance checklist line.

Line numbers are automatically entered in the **Line number** field to indicate the sequence of the maintenance checklist lines. You can edit line numbers as you require. After you've created the first maintenance checklist line, select the line, and then press the **Down arrow** key to add a line below it. Alternatively, you can select a maintenance checklist line and then select **New**. In this case, a new line is added above the selected maintenance checklist line.

14. In the **Type** field, select the line type, and then add information that is related to the maintenance checklist type. For a description of the available types and related fields, see the [Create a maintenance checklist template](#) section.

NOTE

To copy the maintenance checklist setup from another maintenance job type, select **Copy maintenance checklist**, and then select the maintenance job type to copy the setup from.

You can easily create a template from an existing maintenance checklist. You can then reuse the template across multiple maintenance checklists. The new template will be an exact copy of the active maintenance checklist. Select **Create template**, and then enter a name for the template. To replace the existing maintenance checklist with a single line that references the new template, set the **Replace** option to **Yes**. You can view the contents of the template in the **Maintenance checklist templates** details page.

15. Select **Save** to save your changes.
16. Return to the **Maintenance job type defaults** page.
17. Select **Tools**.
18. On the **Maintenance job type default tools** page, you can add the tools (resources) that should be used for the maintenance job type. Select **New**, and then select the tool in the **Resource** field.

NOTE

To copy the tool setup from another maintenance job type, select **Copy tools**, and then select the maintenance job type to copy the setup from.

19. Select **Save** to save your changes.
20. Return to the **Maintenance job type defaults** page.

21. Select **Work description**.
22. On the **Work description** page, select **Edit**, and then add a description that is related to the selected maintenance job type default, as you require.
23. Select **Save** to save the description.

If you add a work description here, it overrides any description that is set up for the maintenance job type on the **Maintenance job types** page. If you don't add a work description here, any description that is set up for the maintenance job type is used. Descriptions are automatically transferred to work orders that use the maintenance job type or maintenance job type default.

24. Return to the **Maintenance job type defaults** page.
25. To set up attachments on a selected maintenance job type default line, select **Attach documents**. Attachments that are set up on a maintenance job type default line are automatically included on work order lines that use that maintenance job type default line.
26. Select **New**, and then select a document type.
27. Upload the document or file.
28. Set the fields on the **Attachments** page. The attachment setup uses standard document setup functionality.
29. Select **Save** to save the attachment.

NOTE

Attachments on a maintenance job type default line are printed together with a work order report only if the document types of the attachments are selected on the **Document types** tab of the **Asset management parameters** page (**Asset management > Setup > Asset management parameters**). Examples of attachments include guidelines that explain how to complete a specific job or a predefined maintenance checklist (if you don't use the maintenance checklist functionality for maintenance job type default lines).

On the **Maintenance job type defaults** page, each line shows the number of forecasted hours, and also the number of lines that have been created for items, expenses, maintenance checklists, and tools. The **Assets** field shows the number of active assets that are related to the maintenance job type default line.

30. To copy a maintenance job type default to another maintenance job type default, select the maintenance job type default line to copy another setup to, select **Copy setup**, and then select the maintenance job type default to copy.
31. To view a list of the assets, maintenance plans, or maintenance rounds that currently use a maintenance job type default line, select the line, and then select **Used by**.

Maintenance job type	Maintenance job type v...	Trade	Functional location	Asset type	Manufacturer	Model	Asset	Hours	Items	Expenses	Checks	Tools	Assets	Used by
Ad hoc	Misc							1.00					144	
Cal. Air	Calibrations							1.00						
Cal. Electrical	Calibrations							1.00						
Cal. Humidity	Calibrations							1.00						
Cal. Mechanical	Calibrations							1.00						
Cal. Oilflow	Calibrations							1.00						
Cal. Pressure	Calibrations							1.00						
Cal. Temperat...	Calibrations							1.00						
Cal. Waterflow	Calibrations							1.00						
Facility assess...	Condition ass...							1.00					2	
Inspection	Inspections							1.00					144	
Lubrication	Service							1.00					36	
Property asses...	Condition ass...							1.00					14	
Service	Service							1.00					72	

When the system selects the available maintenance job type default that should be used on a work order line, the selection is based on the asset and the related asset type setup. Asset Management goes through all maintenance job type default records that are related to the maintenance job type that is related to the asset type to check for a possible match. It always checks the most specific combination first. In other words, to find the most specific combination, Asset Management first checks for a possible match for the **Trade** field. If no match is found, it checks for a match for the **Maintenance job type variant** field. If no match is found, it checks for a match for the **Maintenance job type** field, and so on (**Trade**, then **Maintenance job type variant**, then **Maintenance job type**, then **Asset**, then **Model**, then **Manufacturer**, and then **Asset type**). If no match is found, the default record where only the maintenance job type is selected is used.

A project activity ID is automatically related to each maintenance job type default line that you create. The project activity is created on the forecast project that is selected in the **Maintenance forecast project** field on the **Assets** tab of the **Asset management parameters** page. The purpose of the project activity is to manage forecasts on hours, items, and expenses in relation to work orders. Maintenance job type forecasts are automatically transferred to the work order line, and they are copied from the forecast project to the work order project that is created for the work order line. The purpose of the project activity is to manage forecasts in relation to work orders.

You can set up a batch job to update maintenance job type default references at regular intervals, or you can manually run the job. To create a batch job or run a manual update, select **Asset management > Periodic > Preventive maintenance > Update maintenance job type default references**.

Overview of maintenance job types that are related to assets

After you've created the required maintenance job type default combinations, you can use the **All assets** page to get an overview of the current maintenance job type default that is related to a specific asset. The overview shows all maintenance job type default combinations that can be used on the asset type that is selected for the asset. These combinations include combinations that have variations of maintenance job type variants and maintenance job trades.

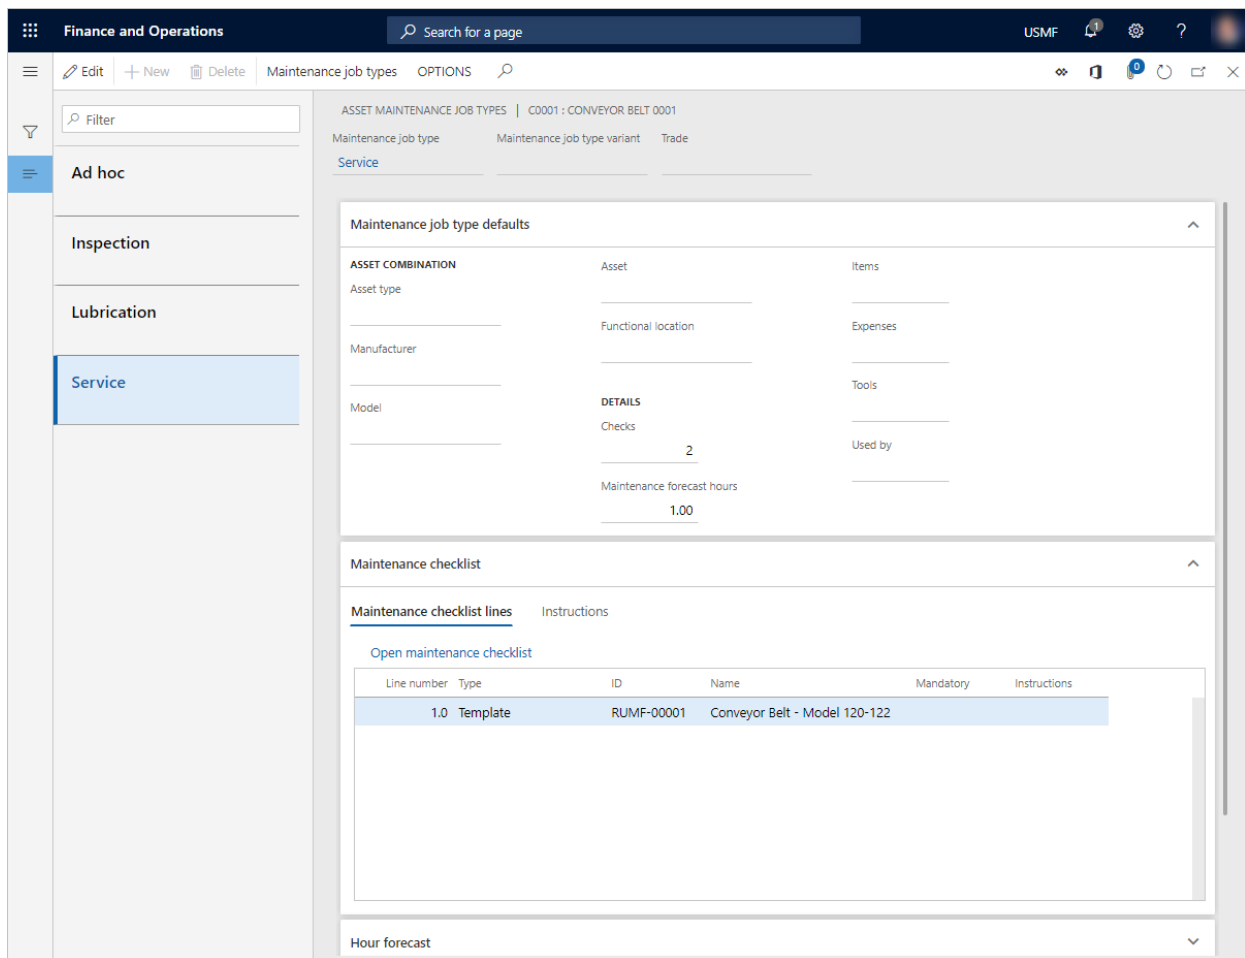

1. Select **Asset management > Common > Assets > All assets** or **Active assets**.
2. In the list, select the asset to see an overview of maintenance job type combinations for.
3. On the Action Pane, on the **General** tab, in the **Related information** group, select **Maintenance job types**.

The left pane of the **Asset maintenance job types** page shows a list of all the maintenance job type combinations that are related to the selected asset.

4. Select a maintenance job type combination to see the related setup for maintenance checklists, forecasts, and tools. The **Details** section on the **Maintenance job type defaults** FastTab shows the number of related maintenance checklists, forecasted hours, items, and so on, that are related to the selected

maintenance job type combination.

5. To view details for the selected maintenance job type, select **Maintenance job types**.

Automatic update of maintenance job type forecasts

In Asset Management, you can automatically update any changes to maintenance job type forecasts for hour costs, item costs, and expenses that have been updated in other modules. In this way, you help guarantee that your maintenance job type forecasts always use the latest cost prices.

1. Select **Asset management > Periodic > Forecast > Update maintenance job type forecast**.
2. In the **Update maintenance job type forecast** dialog box, on the **Records to include** FastTab, you can add selections for specific maintenance job types as you require. Select **Filter**, and then select **Select** to make the selections.
3. On the **Run in the background** FastTab, you can set up the automatic update as a batch job, as you require.
4. Select **OK** to start the forecast update.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work order lifecycle states

2/18/2021 • 13 minutes to read • [Edit Online](#)

Work order lifecycle states define the states that a work order can go through. Examples include **Created**, **Scheduled**, **In progress**, and **Ended**. Work order lifecycle states can be manually updated on a work order, or they can be automatically updated (for example, during work order scheduling).

The work order lifecycle states that are required for your work orders must be attached to matching project stages on the **Project management and accounting parameters** page (**Project management and accounting > Project management and accounting parameters**). You first set up project stages in Project management and accounting. You then set up work order lifecycle states and work order lifecycle models in Asset Management.

The following table describes the options in the **Work order** and **Schedule** sections on the **General** FastTab of the **Work order lifecycle state** page (**Asset management > Setup > Work orders > Lifecycle states**).

The screenshot displays the 'Work Order Lifecycle State' configuration page. On the left, a list of lifecycle states is shown, with 'New' selected. The main area is divided into sections for configuration:

- WORK ORDER**: Active (Yes), Add line (Yes), Delete (Yes), Delete line (Yes), Allow scheduling (No), Set actual start (No), Set actual end (No).
- SCHEDULE**: Ready (No), Start (No), End (No), Delete schedule lines (No).
- PROJECT**: Stage (Created), Close activities (No).
- FORECAST**: Copy hour forecast (No), Copy item forecast (No), Copy expense forecast (No).
- MAINTENANCE REQUESTS**: Lifecycle state (InProgress).
- ASSET**: Update asset BOM (No), Lifecycle state.
- WORK ORDER POOL**: Delete pool reference (No).

The **Validate** section includes:

- MAINTENANCE DOWNTIME**: No, Type (Information).
- FAULT SYMPTOM**: No, Type (Information).
- FAULT REMEDY**: No, Type (Information).
- MAINTENANCE CHECKLIST**: No.
- FAULT CAUSE**: No.
- COMMITTED COST**: No.

OPTION NAME	DESCRIPTION
Active	Set this option to Yes if the work order should be active while it's in this lifecycle state.
Add line	Set this option to Yes if work order jobs can be added to a work order that is in this lifecycle state.
Delete	Set this option to Yes if a work order can be deleted while it's in this lifecycle state.
Delete line	Set this option to Yes if work order jobs can be deleted from a work order that is in this lifecycle state.
Allow scheduling	Set this option to Yes if a work order can be scheduled while it's in this lifecycle state.
Set actual start	Set this option to Yes if the user should be prompted to select an actual start date and time for a work order when it's updated to this lifecycle state.
Set actual end	Set this option to Yes if the user should be prompted to select an actual end date and time for a work order when it's updated to this lifecycle state.
Post journals	<p>Set this option to Yes if work order journals should be automatically posted when a work order is updated to this lifecycle state. If an error occurs during journal posting, a message is shown, and the update of the work order lifecycle state is canceled. To view the journal lines for a work order, select Asset management > Common > Work orders > All work orders, Active work orders, or My active work orders, select the work order in the list, and then select Journals. This setup of automatic work order journal posting at a specific lifecycle state is the same as when you select Post journals on the Work order journals page.</p> <p>Note: If you set this option to Yes, journals are automatically posted if no approval workflow has been set up. If your company uses the journal approval setup that is configured on the Journal approval page (Project management and accounting > Setup > Journals > Journal approval), a manager or clerk must validate and post consumption registrations.</p>
Process maintenance checklist	Set this option to Yes if all attached maintenance checklists should be processed when a work order is updated to this lifecycle state. As part of this processing, any counter registrations that were made on a maintenance checklist are posted, and the result of the whole maintenance checklist is evaluated. Maintenance checklist lines that have Pass and Fail results are evaluated, and if at least one line fails, the whole maintenance checklist is marked as Failed in Asset Management.
Ready	Set this option to Yes if the work order job schedule status for all work order jobs that are created on a work order should automatically be updated to Ready when the work order is updated to this lifecycle state.

OPTION NAME	DESCRIPTION
Start	Set this option to Yes if the work order job schedule status for all work order jobs that are created on a work order should automatically be updated to Started when the work order is updated to this lifecycle state.
End	Set this option to Yes if the work order job schedule status for all work order jobs that are created on a work order should automatically be updated to Ended when the work order is updated to this lifecycle state.
Delete schedule lines	Set this option to Yes if scheduling on all work order jobs that are created on a work order that has already been scheduled should be deleted when the work order is updated to this lifecycle state. In other words, capacity reservations on the asset, the related maintenance worker, and related tools will be deleted. For example, you set this option to Yes on a work order lifecycle state that is named Estimated . Then, when a work order is rolled back to this lifecycle state because rescheduling is required, scheduling can be deleted on that work order.

Set up project stages and work order lifecycle states

1. Select **Project management and accounting > Setup > Project management and accounting parameters**.
2. On the **Project stage** tab, for each stage that you want to use, select the check box for every project type that is required for your work orders. The project types define rules about the financial tasks that are allowed. Examples of financial tasks include creating a forecast, creating estimates, and creating beginning balances.

IMPORTANT

If a project stage isn't selected for a project type, but the project stage is used for a work order lifecycle state, the work order projects won't be updated in the appropriate manner.

3. Close the **Project management and accounting parameters** page.
4. Select **Asset management > Setup > Work orders > Lifecycle states**.
5. Select **New** to create a work order lifecycle state.
6. In the **Lifecycle state** field, enter an ID for the lifecycle state.
7. In the **Name** field, enter a name.

On the **Details** FastTab, the **Lifecycle models** field shows the number of work order lifecycle models that use this lifecycle state.

8. On the **General** FastTab, in the **Work order** section, select the functions that should be available for this lifecycle state by setting the relevant options to **Yes**. For descriptions of the options, see the table earlier in this topic.
9. In the **Project** section, in the **Stage** field, select the project stage that should be related to this lifecycle state.

10. In the **Project** section, set the **Close activities** option to **Yes** if project activities that are related to each work order job should be automatically closed when the work order is in this lifecycle state.

NOTE

To find the number of the project activity that is related to a work order job, select **Asset management > Common > Work orders > All work orders, Active work orders, or My active work orders**. Open the work order, and then select the work order job. The activity number is shown in the **Activity number** field in the **Project** section on the **General** tab of the **Line details** FastTab.

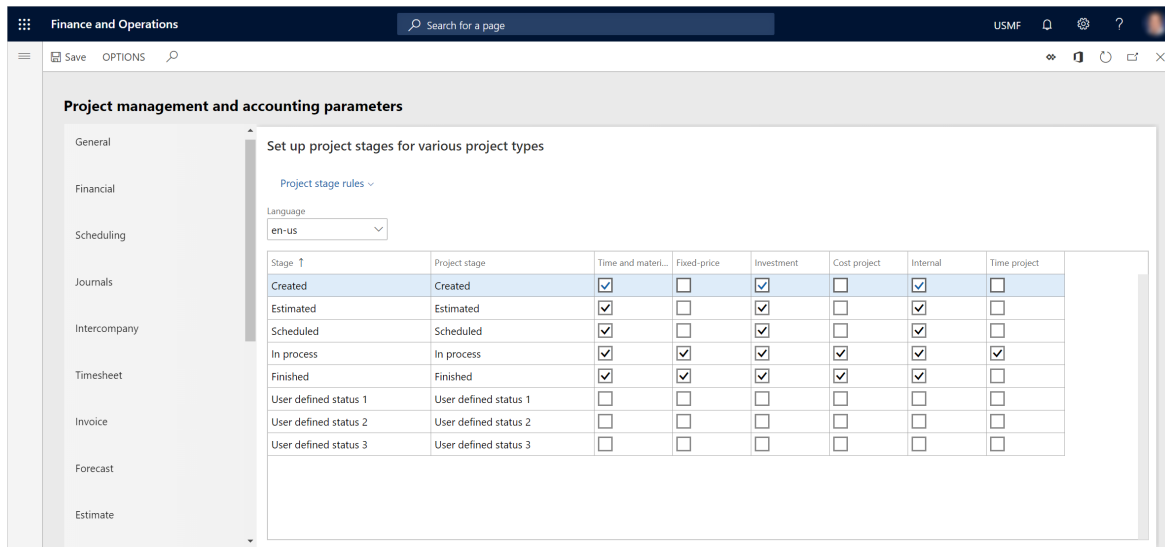

11. In the **Forecast** section, set the **Copy hour forecast, Copy item forecast, and/or Copy expense forecast** option to **Yes** if work order project forecasts should automatically be copied to work order journals when the work order is in this lifecycle state.
12. In the **Schedule** section, set one of the options to **Yes** if the schedule status for work order jobs should be updated when the work order is in this lifecycle state. For descriptions of the **Ready, Start, End, and Delete schedule lines** options, see the table earlier in this topic.

NOTE

To view schedule lines that are related to work order jobs, select **Asset management > Common > Work orders > All work orders, Active work orders, or My active work orders**. Open the work order, select the work order job on the **Work order jobs** FastTab, and view related information on the **Line details** FastTab. The **Status** field on the **Schedule** tab shows the status of the work order job. The **Status** field can be set to the following values: **Scheduled, Ready, Started, Stopped, and Ended**.

13. In the **Maintenance requests** section, in the **Lifecycle state** field, select the maintenance request lifecycle state that related maintenance requests should be updated to. This update occurs automatically. It can be done only if the maintenance request lifecycle state is selected in the maintenance request lifecycle model that is used for the maintenance request.
14. In the **Asset** section, set the **Update asset BOM** option to **Yes** if all items that are used on a work order should automatically be updated on the **Asset BOM** page when the work order is updated to this lifecycle state. This setting might be relevant if, for example, the work order lifecycle state defines the work order as completed or ended.
15. In the **Work order pool** section, set the **Delete pool reference** option to **Yes** if work orders that are in this lifecycle state should automatically be deleted from work order pools.
16. On the **Validate** FastTab, select the validation types that should be activated in this lifecycle state by setting the relevant options to **Yes**. Then, in the **Type** field for each validation type that you select, select the type of message that should be shown if mandatory fields that are related to the validation type haven't been validated. If you select **Error**, the update of the work order lifecycle state is canceled until the related mandatory fields have been updated on the work order.
 - The **Maintenance downtime, Maintenance checklist, Fault symptom, Fault cause, and Fault remedy** options are related to the options in the **Mandatory** section on the **Work order types** page (**Asset management > Setup > Work orders > Work order types**). To activate these validations, the related options must also be set to **Yes** on the work order type that is used for the work order.
 - If the **Maintenance checklist** option is set to **Yes** for the lifecycle state that a work order is updated to, validation is done to verify that maintenance checklist lines that are marked as **Mandatory** have been registered as either **Checked** or **Not applicable**. If neither of those registrations has been made on the mandatory lines, an informational, error, or warning message is shown when the work order is updated to this lifecycle state.

- If the **Committed cost** option is set to **Yes** for the lifecycle state that a work order is updated to, total amount of committed costs (that is, the total amount of expenses that the legal entity has committed to pay) are calculated for each work order job. A message is shown if the committed cost amount is more than 0 (zero). You select the types of cost commitment that are included on the **Cost commitments** FastTab on the **Cost control** tab of the **Project management and accounting parameters** page (**Project management and accounting > Setup > Project management and accounting parameters**).
- If the **Maintenance downtime** option is set to **Yes** for the lifecycle state that a work order is updated to, maintenance downtime validation is done on the asset that is related to the work order. If a maintenance downtime registration has been made, but there is no **Ended** registration, a message is shown when the work order is updated to this lifecycle state.
- If the standard project setup doesn't include all the stages that you require for your Asset Management setup, you can set up user-defined project stages on the **Project stage** tab of the **Project management and accounting parameters** page. The following illustration shows the **Project stage** tab on the **Project management and accounting parameters** page.

NOTE

If the lifecycle state that you update a work order to is inactive, journals that are related to the work order but that haven't yet been posted are automatically deleted. This behavior helps guarantee automatic cleanup of unused data. (A lifecycle state is inactive if the **Active** option for it is set to **No** on the **General** FastTab of the **Work order lifecycle state** page.)

However, if you manually set a work order so that it's inactive, journals that are related to the work order but that haven't yet been posted are **not** automatically deleted. (To manually inactivate a work order, select **Asset management > Common > Work orders > All work orders** or **Active work orders**. Open the work order, and switch to the **Header** view. On the **General** FastTab, select **Edit**, and then set the **Active** option to **No**.)

Relations among work order lifecycle models, work order types, and work order lifecycle states

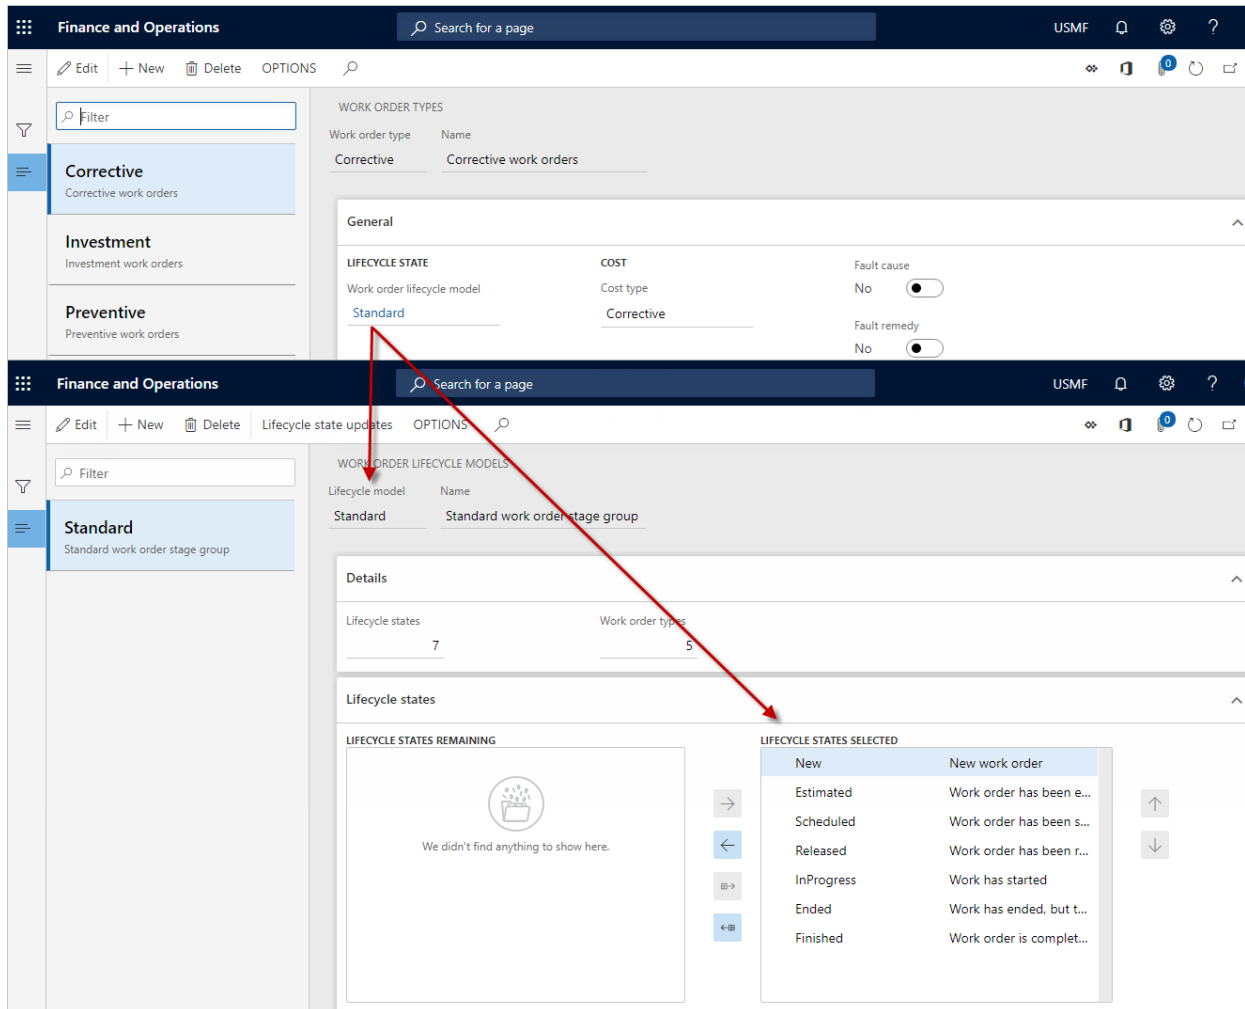

Lifecycle models refer to workflows, and lifecycle states are selected in a lifecycle model in sequential order. Lifecycle models are set up on work order types. Work order types determine the size or extent of workflows and work processes. For example, **Maintenance**, which is a standard work order type, might be related to a work order lifecycle model that has many lifecycle states. By contrast, you might have a **Corrective** work order type that is used for work orders that haven't been scheduled, or for work orders where the job is completed before the work order is made because of an urgent situation. This work order type might be related to a work order lifecycle model that has only a few lifecycle states.

The reason for using types is that when a type is defined on, for example, a work order or an asset, the related work processes (lifecycle states) are automatically defined. For more information about how to set up work order types, see [Work order types](#).

NOTE

Lifecycle states, lifecycle models, and types apply to functional locations, assets, and maintenance requests, in addition to work orders.

The following illustration shows the relation between work order types, lifecycle models, and lifecycle states.

Work order lifecycle models

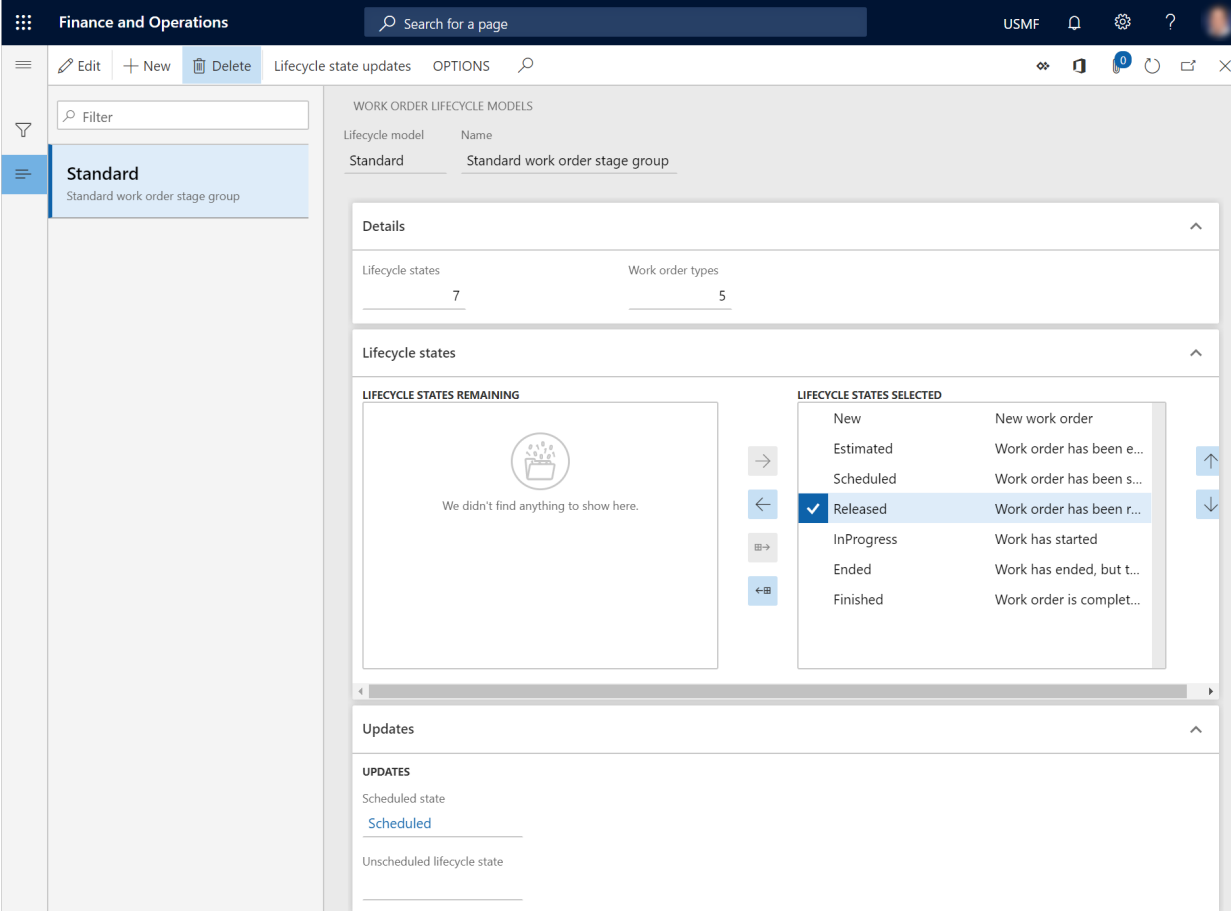

After you've created the work order lifecycle states that are required for your work orders, they can be divided into work order lifecycle models. At a minimum, you should create one standard lifecycle model.

1. Select **Asset management > Setup > Work orders > Lifecycle models**.
2. Select **New** to create a work order lifecycle model.
3. In the **Lifecycle model** field, enter an ID for the lifecycle model.
4. In the **Name** field, enter a name.

On the **Details** FastTab, the **Lifecycle states** field shows the number of lifecycle states that are selected in this lifecycle model. The **Work order types** field shows the number of work order types that use this lifecycle model.

5. On the **Lifecycle states** FastTab, select the lifecycle states that should be included in the lifecycle model:

- To include a lifecycle state in the lifecycle model, select it in the **Lifecycle states remaining** section, and then select the right arrow button  to move it to the **Lifecycle states selected** section.
 - To include all the available lifecycle states in the lifecycle model, select the **Select all available stages** button . All lifecycle states are moved to the **Lifecycle states selected** section.
 - To remove a lifecycle state from the lifecycle model, select it in the **Lifecycle states selected** section, and then select the left arrow button  to move it to the **Lifecycle states remaining** section.
6. Select **Lifecycle state updates** to define the lifecycle states that can follow a selected lifecycle state.
 7. On the **Updates** FastTab, in the **Scheduled state** field, select the lifecycle state that should always be selected for a work order that you've completed work order scheduling for, regardless of the previous lifecycle state of the work order.
 8. In the **Unscheduled lifecycle state** field, select the lifecycle state that should always be selected for a work order if work order scheduling is deleted.
 9. Save the work order lifecycle model.

The screenshot displays the 'Standard work order stage group' configuration in Dynamics 365. The interface is divided into several sections:

- Details:** Shows 7 lifecycle states and 5 work order types.
- Lifecycle states:**
 - LIFECYCLE STATES REMAINING:** Currently empty, displaying a message: "We didn't find anything to show here."
 - LIFECYCLE STATES SELECTED:** A list of lifecycle states with their descriptions:
 - New: New work order
 - Estimated: Work order has been e...
 - Scheduled: Work order has been s...
 - Released:** Work order has been r... (Selected)
 - InProgress: Work has started
 - Ended: Work has ended, but t...
 - Finished: Work order is complet...
- Updates:**
 - UPDATES:**
 - Scheduled state: Scheduled
 - Unscheduled lifecycle state: _____

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work order types

2/18/2021 • 2 minutes to read • [Edit Online](#)

Work order types are used to categorize work orders. For example, you might have work orders that are related to preventive maintenance or corrective maintenance.

A work order type defines an affiliation with a work order lifecycle model. A work order lifecycle model defines the work order lifecycle states that can be set on a work order. (Examples of work order lifecycle states include **Created**, **In Process**, and **Finished**.)

For more information about work order lifecycle states and project stages, see [Work order lifecycle states](#).

1. Select **Asset management** > **Setup** > **Work orders** > **Work order types**.
2. Select **New** to create a work order type.
3. In the **Work order type** field, enter an ID for the work order type.
4. In the **Name** field, enter a name.
5. In the **Work order lifecycle model** field, select a lifecycle model.
6. Set the **One maintenance worker** option to **Yes** if all work order jobs that are related to a work order of this type should be scheduled to the same maintenance worker.
7. In the **Cost type** field, select **Corrective**, **Preventive**, or **Investment**, as appropriate. All work order jobs on a work order must have the same cost type.
8. In the **Mandatory** section, set the relevant options to **Yes** to specify which fault-related or maintenance downtime–related information is added to a work order of this type.

NOTE

The options in the **Mandatory** section are related to the options on the **Validate** FastTab of the **Work order lifecycle states** page (**Asset management** > **Setup** > **Work orders** > **Lifecycle states**).

9. Select **Save**.

The screenshot displays the 'WORK ORDER TYPES' configuration page in Microsoft Dynamics 365 Finance and Operations. The interface includes a top navigation bar with 'Finance and Operations' and a search bar. The left sidebar shows a list of work order types: Corrective, Investment, Preventive (selected), Round, and Service. The main content area is titled 'WORK ORDER TYPES' and shows a table with columns for 'Work order type' and 'Name'. The 'Preventive' type is selected, and the 'Preventive work orders' tab is active. Below the table, the 'General' tab is expanded, showing various configuration options:

- LIFECYCLE STATE:** Work order lifecycle model is set to 'Standard'.
- COST:** Cost type is set to 'Preventive'.
- MANDATORY:** Fault symptom is set to 'No'.
- SCHEDULE:** One maintenance worker is set to 'No'.
- FAULT:** Fault cause, Fault remedy, and Maintenance downtime are all set to 'No'.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work order project setup

2/18/2021 • 6 minutes to read • [Edit Online](#)

In the **Asset management** module, a project relation is required for every work order job. The project that is associated with a work order job lets you track costs on various projects that are related to Asset Management, such as internal maintenance projects, service management projects, and investment projects.

Project setup for a work order job

When you create a work order job on a work order, the project setup in the **Project management and accounting** module and the work order project setup in the **Asset management** module determine how projects can be used for cost control on the asset that is selected on that work order job. This section describes the following parts of the project setup that is used for a work order: the parent project (project ID), project type, project activities, and financial dimensions:

- When you create a work order job on a work order, a unique project ID and a related project activity are automatically created for it. However, if several work order jobs on a work order include the same asset, the same project ID is used for them. In other words, one project ID is created for every asset on a work order.
 - The parent project (project ID) for a work order job is found in the parent project setup. (For more information about the parent project setup, see the next section.) For example, if you associate a customer or a functional location with a specific parent project, the parent project is used every time that you create work orders for that customer or that functional location. If you don't relate a specific project ID to, for example, a functional location, the next relevant parent project in the work order project setup is used.
 - A project type is required for every project ID. The project type is found in the setup of the project group setup. (For more information about the project group setup, see the next section.) If no match is found in the project group setup, the project group setup on the parent project is used.
 - The setup for requiring project activities on forecasts and journals is copied from the parent project to the work order project. If the **Hour**, **Expense**, and **Item** options are set to **Yes** for the project that is used as a parent project, a project activity is mandatory on forecasts and journals. (To access these options, select **Project management and accounting** > **Projects** > **All Projects**, and then select the project that is used as a parent project. The options are in the **Require activity on journals** section on the **Setup** FastTab.)
- Financial dimensions are copied from the asset and merged with the parent project.

The next section explains how to set up parent projects and project groups. Parent project and parent groups are used to control work orders. They are also used for reporting about work orders.

Set up work order projects

Before you start to create work orders, you must set up work order projects. The **Work order project setup** page (**Asset management** > **Setup** > **Work orders** > **Project setup**) contains two tabs: **Parent project** and **Project group**.

On the **Parent project** tab, you can set up project relations that can be used if no project is set up on the asset that is selected on the work order job. A parent project setup isn't required if your company uses asset projects. It's relevant only if you want to use work order projects instead of asset projects. In that case, you must set up at least one parent project.

On the **Project group** tab, you can set up project groups that can be associated with work order types, asset types, and assets.

Project groups can be used to create specific categories (groups) that are used for cost control. For example, by creating project groups for specific asset types or work order types, you can do detailed tracking of maintenance costs by type.

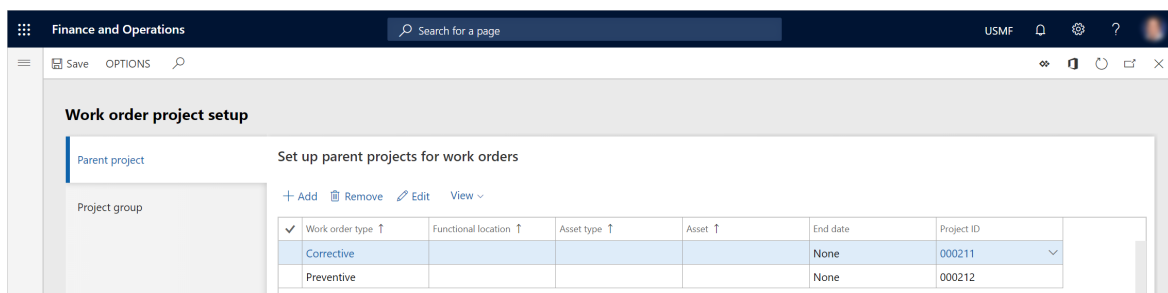

Project groups aren't mandatory. If you don't set up project groups, the parent project is used to determine the project group, and a child project is created from the parent project's project group.

The setup allows for complete integration with the **Project management and accounting** module. Therefore, you can track the costs that are related to work orders in the related projects. The following procedure describes the setup for work order projects.

1. Select **Asset management > Setup > Work orders > Project setup**.
2. On the **Parent project** tab, select **Add**.
3. In the **Work order type**, **Functional location**, **Asset type**, and **Asset** fields, select values as you require. For each line that you add, you can set just one field or multiple fields. The number of fields that you set determines the combination that is used when a project ID is selected in Asset Management.

If you select a functional location, the related child locations are automatically included. If you select an asset, you can create more work order project setup lines for the same asset, but you can select different projects for that asset.
4. In the **Project ID** field, select the project that should be related to the setup that you created in step 3.
5. If the project setup should be valid for only a limited period, select an end date in the **End date** field. Otherwise, select **None**.

By default, the start date is the date when you add the work order project to the page. It's controlled by the **Valid from** field, which is hidden by default. To show the **Valid from** field, select **View > All**. You can then use the **Valid from** field together with the **End date** field to set up a limited period of validity for the work order project.

6. On the **Project group** tab, select **Add**.
7. In the **Work order type** field, select a work order type.
8. If you want the project group association to be more specific, select an asset type in the **Asset type** field or an asset in the **Asset** field.
9. In the **Project group** field, select the project group that should be related to the work order type. For example, a work order type that is named **Preventive maintenance** might be associated with a project group that is named **Prev Maint** or **Internal**. Alternatively, an **Investment** work order type that is used for work orders that are related to investments and fixed assets might be associated with a project group that is named **Invest** or **Investment**.
10. Select **Save**.

NOTE

Every time that a work order line is created, Asset Management searches for a project group that should be related to the work order job project. The search is based on the setup that is described in this topic. Every project group has a related project type. Project groups that have the **Time and material** or **Fixed-price** project type are valid only for assets that are related to a customer account.

For parent projects and project groups, when the system selects the available work order project or project group, the selection is based on the records that you created by using the preceding procedure. Asset Management goes through records that are related to the work order project to check for a possible match. It always checks the most specific combination first. In other words, for the work order parent project, Asset Management first checks for a possible match for the **Asset** field. If no match is found, it checks for a match for the **Asset type** field. If no match is found, it checks for a match for the **Functional location** field, and so on. As you can see in the layout of the **Work order project setup** page, this behavior means that, to find the most specific combination, Asset Management checks each record from right to left for a match. If no match is found, the default record where only a project ID is selected is used. The process for finding the related project group is similar: Asset Management first checks for a possible match for the **Asset** field, then the **Asset type** field, and then the **Work order type** field. If no match is found, the default record where only a project group is selected is used.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Service level and description

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you create a work order, you might want to define the service levels for it and add a general description to it. You can create work order service levels on the **Work order service levels** page and descriptions on the **Work order description** page.

Create a service level

1. Select **Asset management > Setup > Work orders > Service level**.
2. Select **New**.
3. In the **Service level** field, enter the service level (for example, a number).
4. In the **Name** field, enter a name.

On the **Work orders** FastTab, you can define expected start and end dates and times. The fields on this FastTab define the period that work orders should be started and ended during. They are used for work orders that are manually created and work orders that are created based on maintenance requests.

5. In the **Start day** field, enter a number of days to define the period that the work order should start during. The number of days is calculated from the creation date of the work order. For example, if the work order should start when it's created, enter **0**. If the work order should start within one week after it's created, enter **7**.
6. To set a start time for the work order, in addition to a start date, set the **Set start time** option to **Yes**. Then enter the start time in the **Start time** field. If you set the option to **No**, the current time of day is used.
7. In the **End day** field, enter a number of days to define the period that the work order should end during. The number of days is calculated from the start date of the work order. For example, if the work order should end within one week of its start date, enter **7**.
8. To set an end time for the work order, in addition to an end date, set the **Set end time** option to **Yes**. Then enter the end time in the **End time** field. If you set the option to **No**, the current time of day is used.
9. Select **Save**.

The screenshot displays the Dynamics 365 interface for creating a work order service level. The top navigation bar shows 'Finance and Operations' and a search bar. The main content area is titled 'WORK ORDER SERVICE LEVELS'. It features a 'Service level' field with the value '1' and a 'Name' field with the value 'Critical'. Below this, there is a 'Work orders' section with a table of fields:

EXPECTED START		EXPECTED END	EXAMPLE
Start day	End day	Expected start	
<input type="text" value="0"/>	<input type="text" value="1"/>	7/21/2019 07:00:00 AM	
Set start time	Set end time	Expected end	
Yes <input checked="" type="checkbox"/>	Yes <input checked="" type="checkbox"/>	7/22/2019 11:00:00 PM	
Start time	End time		
<input type="text" value="12:00:00 AM"/>	<input type="text" value="04:00:00 PM"/>		

Create a description

1. Select **Asset management** > **Setup** > **Work orders** > **Descriptions**.
2. Select **New**.
3. In the **Description** field, enter the description.
4. Select **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Scheduled execution

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can use work order service levels to set up scheduled execution. (For more information about work order service levels, see [Service level and description](#).) Scheduled execution provides flexibility in work planning for maintenance workers, because you can set up more detailed or less detailed requirements for the interval that a work order should be completed during. For example, a maintenance worker who completes a job faster than expected in a production facility might be able to move on to another nearby job that was planned for the current week but not necessarily for the current day. This approach allows for optimization of worker planning and job completion.

Scheduled execution setup, which is related to work orders, can be generic or specific. You can set up generic lines that aren't limited to specific work order types, asset types, and so on. Alternatively, you can create scheduled execution lines that apply to a specific work order type, asset type, maintenance job type, and so on.

1. Select **Asset management > Setup > Work orders > Scheduled execution**.
2. Select **New** to create a scheduled execution line.
3. In the **Functional location**, **Work order type**, **Asset type**, **Manufacturer**, **Model**, **Maintenance job type category**, **Maintenance job type**, **Maintenance job type variant**, and **Trade** fields, select values as you require.
4. In the **Service level** field, select a work order service level. If you leave this field blank, you make the most generic type of scheduled execution line. For an example of a generic line, see the first record in the illustration that follows. That line enables all work orders that have no work order service level to be scheduled for a specific date and time.
5. In the **Scheduled execution** field, select the time interval.
6. Select **Save**.

Functional location ↑	Work order type ↑	Asset type ↑	Manufacturer	Model	Maintenance job type ... ↑	Maintenance job type ↑	Maintenance job type varia... ↑	Trade	Service level ↑	Scheduled execution
									5	Date and time
									10	Date
									20	Week
									30	Month

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Fault management

2/18/2021 • 3 minutes to read • [Edit Online](#)

In Asset Management, you can use the fault designer to set up fault symptoms, fault areas, and fault types on asset types. In this way, you can manage faults that are detected on assets. Additionally, fault causes and suggestions for fixing faults can be registered on a work order.

The process for fault registration and management consists of these steps.

1. Create a list of fault symptoms, fault areas, and fault types that might occur on your asset types.
2. In the fault designer, set up symptoms, fault areas, and fault types.

Here are some examples to help you understand the difference between fault symptoms, fault areas, and fault types.

Fault symptoms:

- Unbalanced voltages
- Short circuit
- Noise
- Leak
- Vibrations

Fault areas:

- Electrical
- Mechanical
- Hydraulic
- Pneumatic

Fault types:

- Faulty main stator winding
- Faulty diode
- Dirty windings
- Defective generator
- Defective sensor

Create fault symptoms

Follow these steps to create a list of symptoms that can be used in the fault designer.

1. Select **Asset management > Setup > Fault > Fault symptoms**.
2. Select **New** to create a record.
3. In the **Fault symptom** field, enter a name for the fault symptom.
4. In the **Description** field, enter a description.
5. Select **Save**.

Create fault areas

Follow these steps to create a list of areas or locations that can be used in the fault designer.

1. Select **Asset management > Setup > Fault > Fault areas**.
2. Select **New** to create a record.
3. In the **Fault area** field, enter a name for the fault area.
4. In the **Description** field, enter a description.
5. Select **Save**.

Create fault types

Follow these steps to create a list of fault types that can be used in the fault designer.

1. Select **Asset management > Setup > Fault > Fault types**.
2. Select **New** to create a record.
3. In the **Fault type** field, enter a name for the fault type.
4. In the **Description** field, enter a description.
5. Select **Save**.

Set up the fault designer

In the fault designer, you set up fault data on asset types.

1. Select **Asset management > Setup > Fault > Fault designer**.
2. In the left pane, select the type of asset to set up a fault record for.
3. On the **Fault symptom** FastTab, select **Add line**, and then, in the **Fault symptom** field, select a fault symptom.
4. On the **Fault area** FastTab, select **Add line**, and then, in the **Fault area** field select a fault area.
5. On the **Fault type** FastTab, select **Add line**, and then, in the **Fault type** field, select a fault type.
6. To quickly create combinations of all existing fault symptoms, areas, and types for the selected asset type, select **Create fault combinations**. This function is useful if you've added many fault symptoms, areas, and types. It's easier to delete the lines for any combinations that aren't relevant to the asset type than to create new lines manually.

NOTE

To copy the setup of fault symptoms, areas, and types from one asset type to the selected asset type, select **Copy from asset type**.

7. Select **Save** to save your changes.

	Damaging	Damaging type
	Harmful	Harmful type
	Hazardous	Hazardous type
	Noxious	Noxious type
	Unfortunate	Unfortunate type

Create fault causes

Follow these steps to create a list of known fault causes that can be added to a work order or a maintenance request.

1. Select **Asset management > Setup > Fault > Fault causes**.
2. Select **New** to create a record.
3. In the **Fault cause** field, enter a name for the fault cause.
4. In the **Description** field, enter a description.
5. Select **Save**.

Create fault remedies

Follow these steps to create a list of suggestions for remedy and repair that can be added to a work order or a maintenance request.

1. Select **Asset management > Setup > Fault > Fault remedies**.
2. Select **New** to create a record.
3. In the **Fault remedy** field, enter a name for the fault remedy.
4. In the **Description** field, enter a description.
5. Select **Save**.

NOTE

You can change the names of your fault symptoms, areas, types, causes, and remedies as you require. The name changes are automatically reflected in the related fault registrations.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Introduction to work orders

2/18/2021 • 4 minutes to read • [Edit Online](#)

Work orders are used to manage maintenance jobs, provide required information for them, and register consumption on them. Each work order can contain one or more work order jobs, and one or more assets can be connected to each work order. Each work order job defines a maintenance job that is scheduled on the asset.

Work orders can be created in the following ways:

- For calendar-based maintenance plans where the "Auto create" setting is turned on, automatically by using [Schedule maintenance plans](#).
- For maintenance rounds where the "Auto create" setting is turned on, automatically by using [Schedule maintenance rounds](#).
- For preventive maintenance jobs or maintenance requests, from [Maintenance schedule](#).
- Manually
- From the **All maintenance requests**, **Active maintenance requests**, or **My functional location maintenance requests** page.

NOTE

Work order jobs that are related to the same asset are related to the same project ID.

All work orders

Select **Asset management > Common > Work orders > All work orders** to open the **All work orders** list page. This page shows all work orders and some of the information that is related to each.

The illustration below shows an example of the **All work orders** list page.

Work order ID	Work order type	Description	LI	Service level	Criticality	Start datetime	Current lifecycle state	Active	All jobs scheduled to	Work order pools
JPMF-00002	Preventive	Oil leakage	1	20		7/24/2019 07:00:00 AM	Estimated	✓		
JPMF-00004	Corrective	Breakdown	1	20		7/28/2019 07:00:00 AM	Estimated	✓		1
JPMF-00005	Preventive	Rounds	1	20		7/28/2019 07:00:00 AM	New	✓		

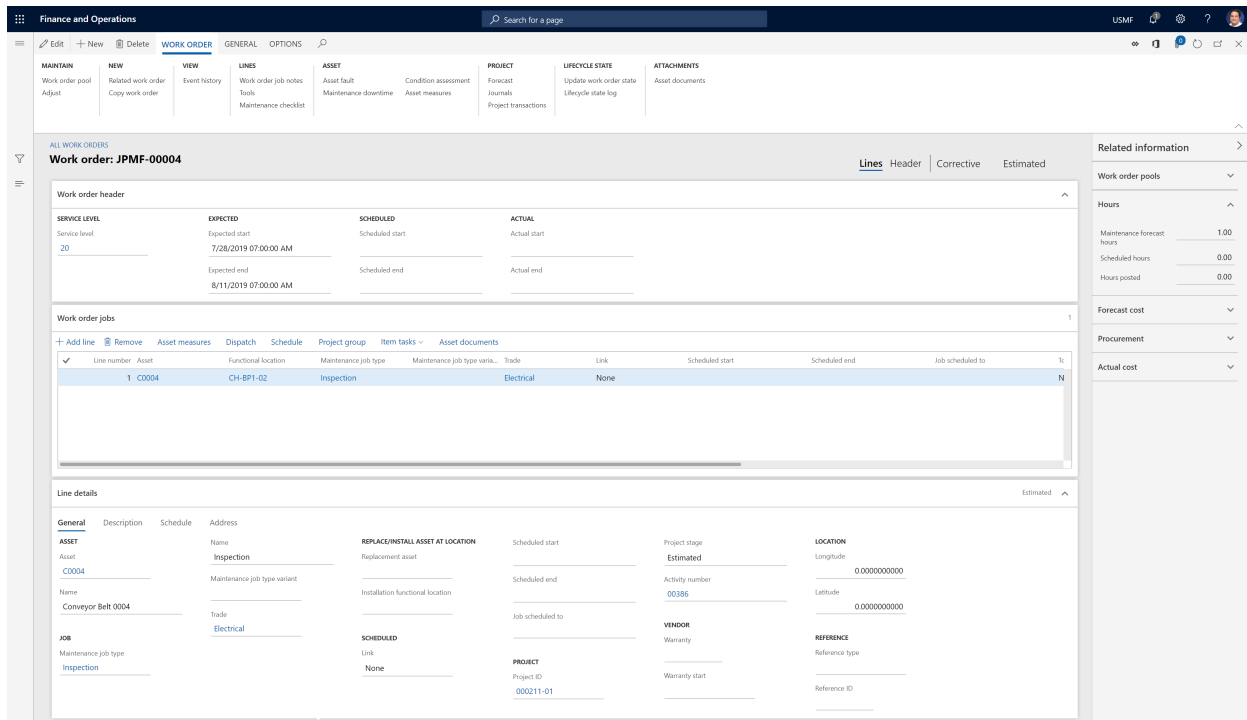

To view a list of only active work orders, select **Asset management > Common > Work orders > Active work orders**.

To view a list of work order jobs that contain assets that are installed on functional locations that you're related to as a worker, select **Asset management > Common > Work orders > My functional location work order maintenance jobs**. (The relation between workers and functional locations is set up on the **Workers** page. For more information, see [Maintenance workers and worker groups](#).)

Here are some ways that you can use the **All work orders** page:

- In the grid view, select a link in the **Work order** column to show the details view for the selected record. You can then select **Edit** to open the record for editing.
- In the details view, you view detailed information that is related to the work order.
- In the details view, select the **Lines** tab to view details of the work order job, or select the **Header** tab to view details of the work order.
- Expand the **Related information** pane on the right side of the page to view additional information that is related to the selected work order.

The illustration below shows an example of the **All work orders** details view.

The buttons on the Action Pane are organized on tabs. The following table briefly describes the buttons that are related to Asset Management:

BUTTON NAME	DESCRIPTION
Edit	Edit the selected work order.
New	Create new work order.
Delete	Delete the selected work order.
Work order pool	Add the selected work order to a work order pool, or remove it from work order pool.
Adjust	Adjust information about expected start and end, service level, responsible maintenance worker, or responsible maintenance worker group on selected work orders.
Related work order	Create a new work order related to the selected work order job. This is useful if you want to register primary and secondary work orders.

BUTTON NAME	DESCRIPTION
Copy work order	Create a new work order that is based on an existing work order.
Event history	View the registration history for the work order.
Work order maintenance job notes	Create a description on a work order, or insert notes or remarks about it. First, select Add timestamp to add your user name and a timestamp to the note. Notes are shown on the Description tab on the Line details FastTab of the Work order page.
Tools	Create a list of required tools on a work order. Tools are set up as resources in Organization administration > Resources > Resources .
Maintenance checklist	View the checklist for the asset that is connected to the work order.
Asset fault	View or register fault information on an asset. This information is used for fault management.
Maintenance downtime	Specify maintenance downtime for a work order.
Condition assessment	Register condition assessment measurements on a work order.
Asset counters	Create or view counter registrations on the asset.
Forecast	View or create forecasts on a work order.
Journals	View or create work order journals. Journal lines can be copied from forecasts.
Project transactions	View all posted transactions that are related to work orders created for the asset.
Update Work order state	Update the work order lifecycle state.
Lifecycle state log	View a log that shows the lifecycle states of the selected work order.
Asset documents	View the list of documents attached to assets that are related to a work order. These documents are set up in Asset management > Setup > Asset documents .
Schedule	Schedule the selected work orders.
Dispatch	Schedule the selected work order for one worker.
Delete schedule	Delete the scheduling for the selected work order.
Scheduled work order maintenance jobs	Open the Scheduled work order maintenance jobs list page.

BUTTON NAME	DESCRIPTION
Work order purchase requisition	Open the Work order purchase requisition list page.
Work order purchase	Open the Work order purchase list page.
Cost control	Compare budget costs and actual costs on the work order.
Hour control	Compare forecasted hours and actual hours on the work order.
Work order report	Print a work order report.
Work order consumption	Print a consumption report.

The buttons in the **Project** group on the **Work order** tab of the Action Pane are related to the functionality for forecasts, journals, and invoicing in the **Project management and accounting** module.

NOTE

To include forecasts that have been created on a work order when you run master scheduling, use the forecast model that is selected on the **Asset management parameters** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manually created work orders

2/18/2021 • 7 minutes to read • [Edit Online](#)

You can create work orders manually in two ways:

- On the **All work orders** or **Active work orders** page
- On the **All maintenance requests** or **Active maintenance requests** or **My functional location maintenance requests** page

Create work order

1. Select **Asset management** > **Common** > **Work orders** > **All work orders** or **Active work orders**.
2. Select **New**.
3. In the **Create work order** dialog, select a work order type in the **Work order type** field.
4. If required, select a **Description**.
5. In the **Asset** field, select the asset.

NOTE

When you select an asset, three tabs might be available in the **Asset** drop-down:

- **Active assets** - This tab contains a list of all assets that have an "Active" asset lifecycle state.
 - **Asset view** - This tab displays a tree view of functional locations and the assets installed on them.
 - **My assets** - This tab contains assets that are related to the functional locations that you (the worker who is signed in to the system) may be allocated to. (For information about the setup, see [Maintenance workers and worker groups](#).) If no functional locations are set up on a worker in [Maintenance workers and worker groups](#), the **My assets** tab isn't available.
6. In the **Maintenance job type** field, select a maintenance job type for the work order.
 7. If required, select **Maintenance job type variant** and **Trade**.
 8. If required, you can change the work order service level in the **Service level** field.
 9. Select **Expected start** and **Expected end** dates in the related fields.
 10. Click **OK** to create the work order.
 11. On the **All work orders** list page, you can edit the work order as you require.

Note the following points:

- In the details view on the **All work orders** list page, you can add several assets to a work order by adding lines on the **Work order maintenance jobs** FastTab. On an asset, you can select only the maintenance job types that are defined on the asset type that is selected on the asset.
- If you change an asset service level or an asset criticality after you've used the asset on a work order, the service level or criticality on the work order isn't updated accordingly. For more information about service levels and criticalities, see [Asset service levels](#) and [Asset criticality types](#).

- Criticality on a work order is recalculated every time a work order job is added to or deleted from the work order.
- In the **All work orders** details view > **Header** tab > **Schedule** FastTab, in the **Responsible group** or **Responsible** field, you can select a responsible maintenance worker group or a responsible maintenance worker. These settings can be changed while the work order is active. For example, they can be changed when the work order lifecycle state changes. The automatic selection that is made during work order creation is based on the setup on the **Responsible maintenance workers** page. If you add or remove work order jobs after you've created a work order, and if the **Responsible group** and **Responsible** fields are blank when you update the work order, Asset Management tries to find a responsible maintenance worker group or a responsible maintenance worker for a possible match on the setup page. If the **Responsible group** or **Responsible** field is already set when you update the work order, no changes are made. For more information about responsible maintenance workers and worker groups, see [Responsible maintenance workers](#).
- From the [Maintenance status](#) page, you can do a calculation to get an overview of the workload for incoming and completed work orders.
- In the details view of the **All work orders** page, on the **Line details** FastTab, you can use the **Latitude** and **Longitude** fields to add geographic coordinates for the asset that is selected on the work order job.

Create related work order

You can create a work order that is related to an existing work order. This capability is useful if, for example, you want to work with primary and secondary work orders. A new work order is based on a work order job from an existing work order.

1. Select **Asset management** > **Common** > **Work orders** > **All work orders** or **Active work orders**.
2. Select the work order to create a related work order for.
3. On the Action Pane, on the **Work order** tab, in the **New** group, select **Related work order**.
4. In the **Create related work order** dialog, in the **Work order job** field, select the work order job to create a related work order for.
5. Select a maintenance job type in the **Maintenance job type** field.
6. Select a related maintenance job type variant and trade in the **Maintenance job type variant** and **Trade** fields, as you require.
7. If this work order is the first related work order that has been created for the selected work order, follow these steps:
 - a. Select the **New work order** option.
 - b. In the **Work order type** field, select a work order type.
 - c. In the **Description**, enter a description.
 - d. In the **Service level** field, change the work order service level as you require.
 - e. In the **Expected start** and **Expected end** fields, select the expected start and end dates.
 - f. Select **OK**. The new related work order is shown on the **All work orders** list page.
8. If the work order that you're creating this related work order for already has related work orders, follow these steps to add a new work order job to an existing related work order:
 - a. Select the **Add to related work order** option.
 - b. In the **Work order** field, select the related work order to add a new work order job to.
 - c. In the **Service level** field, change the work order service level as you require.

d. In the **Expected start** and **Expected end** fields, change the expected start and end dates as you require.

e. Select **OK**. The work order job is added to the existing related work order.

The illustration below shows an example of the **Create related work order** dialog.

Work order ↑	Work order type	Description
JPMF-00002	Preventive	Oil leakage
JPMF-00004	Corrective	Breakdown
JPMF-00005	Preventive	Rounds
JPMF-00005-01	Corrective	Breakdown

NOTE

If you've set up a related work order mask in **Asset management parameters > Work orders tab > Related work order mask** field, work order IDs are created according to the mask setup. If no related work order mask is set up, the next available work order ID is used for related work orders.

Copy a work order

You can quickly create a new work order from an existing work order. This way of working with work orders differs from the creation of work orders based on [maintenance plans](#). It's useful if, for example, a work order contains many work order jobs, and the various jobs should be completed on different assets at regular intervals.

1. Select **Asset management > Common > Work orders > All work orders** or **Active work orders**.
2. Select the work order to copy content from.
3. On the Action Pane > **Work order** tab > **New** group, select **Copy work order**.
4. The work order setup from the selected work order is shown. You can edit some of the fields as you require.
5. Select **OK** to create the new work order.
6. On the **All work orders** list page, you can edit the work order as you require.

NOTE

When the new work order is created, some information is copied directly from the existing work order. Information about forecasts, tools, maintenance checklists, functional location, addresses, and scheduling isn't copied. Instead, it's initialized from the current setup in Asset Management. Therefore, if that information was changed between the time when the first work order was created and the time when you made a copy of the work order, the changes are included in the new work order. Examples include changes to forecasts and updates to maintenance checklists.

The illustration below shows an example of the **Copy work order** dialog.

The screenshot shows the 'Copy work order' dialog in the Finance and Operations system. The dialog is open over a table of work orders. The 'Copy work order' dialog has fields for 'Work order' (JPMF-00011), 'Work order type' (Preventive), 'Description' (Rounds), 'ASSET' (Service level: 20), 'Expected start' (7/28/2019 07:00:00 AM), and 'Expected end' (8/11/2019 07:00:00 AM).

Work order	Work order type	Description
JPMF-00002	Preventive	Oil leakage
JPMF-00004	Corrective	Breakdown
JPMF-00005	Preventive	Rounds
JPMF-00005-01	Corrective	Breakdown

Create a work order based on a maintenance request

1. Select **Asset management > Common > Maintenance requests > All maintenance requests** or **Active maintenance requests**.
2. Select the maintenance request to create a work order for, and click **Edit**.
3. On the Action Pane > **Maintenance request** tab > **New** group, select **Work order**.
4. In the **Work order** dialog, set the fields. If a maintenance job type has been selected in the maintenance request, you can select a different maintenance job type when you create the work order, as you require.
5. Select **OK**. A message notifies you that the work order has been created.
6. To view the work orders that are connected to a maintenance request, on the **All maintenance requests** or **Active maintenance requests** list page, select the maintenance request. Then, on the Action Pane, on the **Maintenance request** tab, in the **View** group, select **Work orders**.

The illustration below shows an example of the **Create work order** dialog.

EXPECTED

Expected start

7/21/2019 07:17:30 AM

Expected end

NOTE

If you want work orders to be created automatically, you can schedule maintenance plan jobs, or you can set up "Auto create" [maintenance plans](#) or [maintenance rounds](#) on an asset. Work orders that are created from maintenance requests on the **All maintenance schedule** list page have the maintenance job types that are selected on the maintenance requests.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance forecasts

2/18/2021 • 4 minutes to read • [Edit Online](#)

When you create a work order, you create work order jobs that have related assets and maintenance job types. When you select a maintenance job type that contains maintenance forecasts, the forecasts are automatically copied to the work order.

You might be able to add forecast lines to a work order or delete them from a work order. The setup of the work order lifecycle state, the related project type, and the stage rules that are related to the project type determine whether you can add or edit forecast lines. For more information about work order lifecycle states and related project stages, see [Forecasts, work orders, and projects](#).

1. Select **Asset management > Common > Work orders > All work orders** or **Active work orders**.
2. Select the work order in the list, and then, on the Action Pane > **Work order** tab > the **Project** group, select **Forecast**. The **Work order maintenance forecast** page shows forecast lines from the maintenance job type that is selected on the work order job.

Add an hours forecast to a work order

1. On the **Work order maintenance forecast** page, select the work order job to add a forecast to.
2. On the **Hours** FastTab, select **Add** to create a new line.
3. In the **Category** field, select a category.
4. In the **Hours** field, enter the number of forecasted hours.
5. In the **Line property** field, select the type of charge that should be used on the line.

Add an items forecast to a work order

There are three ways to add items to a work order maintenance forecast. You can create lines for items (spare parts) that aren't included on the spare parts list or the asset bill of materials (BOM), you can select spare parts from the approved spare parts list, or you can select items from the asset BOM.

- On the **Work order maintenance forecast** page, select the work order job to add a forecast to.
- On the **Items** FastTab, add items to the maintenance forecast by using the appropriate method.

To create a line for a spare part that isn't on the spare parts list or the asset BOM, follow these steps:

1. Select **Add**.
2. In the **Item number** field, select the item.
3. In the **Sales quantity** field, enter the quantity.
4. In the **Unit** field, select the unit of measure for the quantity.
5. In the **Cost price** and **Currency** fields, enter appropriate values.
6. In the **Line property** field, select a line property.
7. To change the list of dimensions that is shown on the item lines, select **Inventory > Display dimensions**, select the dimensions, and then set the **Save setup** option to **Yes**.

To add a spare part from an approved spare parts list, follow these steps:

1. Select **Add spare parts**.

2. Select the spare part, and edit the related information as you require.
3. Select **OK**.

To add an item from the asset BOM, follow these steps:

1. Select **Add BOM items**.
2. Select the item, and edit the related information as you require.
3. Select **OK**.

To get an overview that shows where the item on the selected line is used in relation to assets, maintenance job type defaults, spare parts, and work orders in Asset Management, select **Item where used**. For more information about this overview, see [Item where used](#).

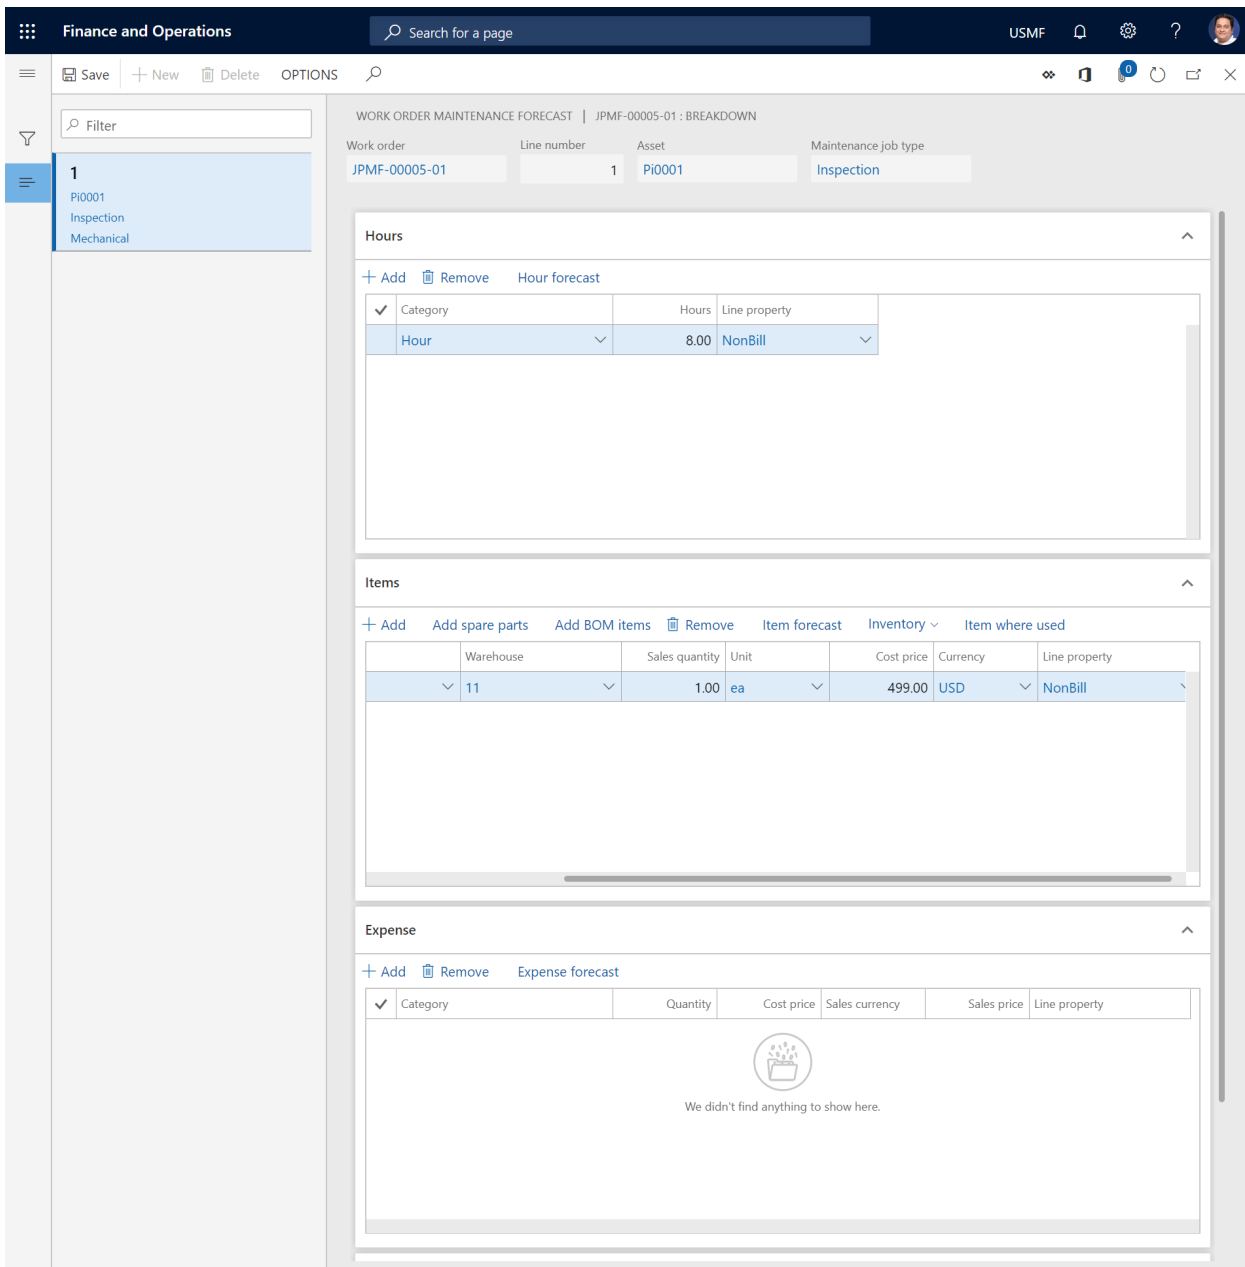

Add an expense forecast to a work order

1. On the **Work order maintenance forecast** page, select the work order job to add a forecast to.
2. On the **Expense FastTab**, select **Add** to create a line.
3. In the **Category** field, select a category.
4. In the **Quantity** field, enter the quantity.
5. In the **Cost price**, **Sales currency**, and **Sales price** fields, enter appropriate values.
6. In the **Line property** field, select the type of charge that should be used on the line.

NOTE

The **Maintenance forecast totals** FastTab shows an overview of the number of lines that have been created, for the selected work order job and for the work order, on each FastTab. It also shows the total forecasted work hours for the work order job and the work order.

The illustration below shows an example of the **Work order maintenance forecast** page.

Automatic update of work order forecasts

If hour costs, item costs, and expenses are updated in other modules in Microsoft Dynamics 365 for Finance and Operations, work order forecasts in Asset Management can automatically be updated to reflect those changes. This capability helps guarantee that the latest cost prices are always used in your work order forecasts. You can also do similar updates for [maintenance job type forecasts](#).

1. Select **Asset management > Periodic > Forecast > Update work order forecast**.
2. In the **Update work order forecast** dialog, on the **Records to include** FastTab, you can add selections regarding specific work orders or work order jobs, as you require. Click **Filter** to make the relevant selections.
3. On the **Run in the background** FastTab, you can set up the automatic update as a batch job, as you require.
4. Select **OK** to start the forecast update.

The illustration below shows an example of the **Update work order forecast** dialog.

Procurement

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Asset Management, you can get an overview of purchase requisitions and purchase orders that are related to work orders. You can also create a purchase order or a purchase requisition from a work order.

The **Work order purchase requisition** list page (**Asset management > Common > Procurement > Work order purchase requisition**) shows a list of purchase requisitions that are related to work orders. When you select a work order job on this page, you can use the buttons in the **Show** group on the **Work order purchase requisition** Action Pane tab to perform various actions:

- To open the related purchase requisition, select **Purchase requisition**.
- To open the related work order, select **Work order**.
- To get an overview that shows where the item on the selected line is used in relation to assets, maintenance job type defaults, spare parts, and work orders in Asset Management, select **Item where used**. For more information about this overview, see [Item where used](#).

The illustration below shows an example of the **Work order purchase requisition** list page.

Work order	Current lifecycle state	Line number	Maintenance job type	Functional location	Asset	Purchase requisition
JPMF-00002	Estimated	1	Inspection	CH-BP1-01-01	C0001	000031

The **Work order purchase** list page (**Asset management > Common > Procurement > Work order purchase**) shows a list of purchase orders that are related to work orders. When you select a work order job on this page, you can use the buttons in the **Show** group on the **Work order purchase** tab of the Action Pane to perform various actions:

- To open the related purchase order, select **Purchase order**.
- To open the related work order, select **Work order**.
- To get an overview that shows where the item on the selected line is used in relation to assets, maintenance job type defaults, spare parts, and work orders in Asset Management, select **Item where used**. For more information about this overview, see [Item where used](#).

The illustration below shows an example of the **Work order purchase** list page.

Work order	Current lifecycle state	Line number	Maintenance job type	Functional location	Asset	Purchase order
JPMF-00002	Estimated	1	Inspection	CH-BP1-01-01	C0001	00000100

On both the **Work order purchase** list page and the **Work order purchase requisition** list page, a symbol that is related to delivery date control appears on the right side of each line. If the symbol is an exclamation point in a red circle, delivery of the related purchase order or purchase requisition might be delayed.

For a purchase order, the date that is related to the purchase order line is used to calculate a possible delay. To view this date, on the **Purchase order** page, select the purchase order line. The date is shown in the **Confirmed delivery date** field on the **Setup** tab of the **Line details** FastTab. If the **Confirmed delivery date** field isn't set, the date in the **Delivery date** field on the **Purchase order header** FastTab is used for the calculation. One of those dates is compared to the available date on the work order or work order job, in the following order:

1. Actual start date on the work order
2. Scheduled start date on the related work order job
3. Scheduled start date on the work order
4. Expected start date on the work order

For a purchase requisition, the date in the **Requested date** field on the **Purchase requisition header** FastTab of the **Purchase requisitions** page is used to calculate a possible delay. The date in that field is compared to the available date on the work order or work order job, in the same order that is used for a purchase order.

Create a purchase order from a work order

On the **All work orders** list page, you can select a work order job, and then create a related purchase order or a related purchase requisition. In this way, you help guarantee that project relations exist between the purchase order or purchase requisition and the work order.

1. Select **Asset management > Common > Work orders > All work orders** or **Active work orders**.
2. Select the work order to create a purchase order for, and then select **Edit**.
3. On the **Work order maintenance jobs** FastTab, select the work order job to create the purchase order for.
4. Select **Item tasks > Purchase order from work order job**.
5. On the **Project purchase orders** list page, click **New**.
6. Create the purchase order.

NOTE

To create a related purchase requisition, follow the same steps. However, select **Item tasks > Purchase requisition from work order job** in step 4.

Project relation between work order and purchase order or purchase requisition

A purchase order line or purchase requisition line is related to a work order job via the work order project and the related project activity number. When you create a purchase order or purchase requisition from a work order job, the related project activity number is mandatory. If all the work order jobs in the related work order have the same maintenance job type, the project activity number is automatically entered on the purchase order or purchase requisition. If the work order jobs have different maintenance job types, you must manually enter the project activity number on the purchase order or purchase requisition.

To view or enter the activity number that is related to a purchase order line, on the **Work order purchase list** page, select the purchase order record, and then, in the **Purchase order** column, select the link for the purchase order. You can find the **Activity number** field on the **Project** tab of the **Line details** FastTab.

The illustration below shows an example of the **Purchase order** page, with focus on the **Activity number**.

The screenshot displays the Dynamics 365 Finance and Operations interface for a purchase order. The main header shows 'PURCHASE ORDER' and '0000100 : 1001 - Acme Office Supplies'. Below this, the 'Purchase order lines' table lists one line with 'Line number' 1, 'Item number' 1000, and 'Product name' Surface Pro 128 GB. The 'Line details' section is expanded to the 'Project' tab, showing fields for 'Project ID' (000212-01), 'Line property' (NonBill), 'Sales unit' (ea), 'Sales price' (0.00), 'Project category' (Projitem), 'Sales currency' (USD), and 'Sales tax' (PA). The 'Activity number' field is highlighted with a red box and contains the value '00384'. Other fields include 'Quantity' (1.00), 'Unit price' (899.00), 'Net amount' (899.00), and 'Transaction ID' (000674).

Likewise, to view or enter the activity number that is related to a work order purchase requisition line, on the **Work order purchase requisition** list page, select the purchase requisition record, and then, in the **Purchase requisition** column, select the link for the purchase requisition. You can find the **Activity number** field on the **Project** tab of the **Line details** FastTab.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manual update of asset counters

2/18/2021 • 2 minutes to read • [Edit Online](#)

Counters are used to create registrations on an asset, such as registrations about the number of hours that the asset has been in operation or the quantity that has been produced.

The counter type that is selected for a counter might be set to inherit counter values. In other words, the **Inherit asset counter values** option is set to **Yes** on the **General** FastTab of the **Counters** page (**Asset management > Setup > Asset types > Counters**). In this case, when you create a new counter line of that type, every child asset that uses the same counter type is automatically updated.

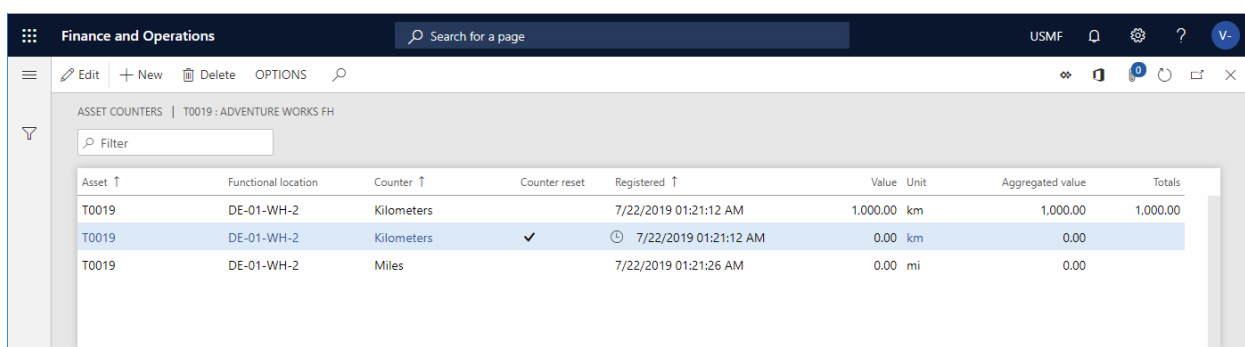

On the **All assets** page, you create hours or quantity counter registrations on an asset, based on your readings on the asset.

1. Select **Asset management > Common > Assets > All assets**.
2. Select the asset, and then, on the Action Pane, on the **Asset** tab, in the **Preventive** group, select **Counters**. The **Asset counters** page shows a list of all previous counter registrations that have been made on the selected asset.
3. Select **New** to create a registration. The asset ID is automatically entered in the **Asset** field.
4. In the **Counter** field, select the relevant counter. Only counters that are related to the asset type selected on the asset are available for selection. The related unit is automatically entered in the **Unit** field.
5. In the **Registered** field, select the date and time for the counter registration.
6. In the **Value** field, enter the number since the last counter registration. Alternatively, in the **Aggregated value** field, enter the total count number.

Note the following points:

- If you physically install a new counter on an asset, you must register the change on the asset on the **Asset counters** page. Next, you must create two registration lines that have identical timestamps. The first line must be for the counter that you're replacing. On the line that is related to the new counter, select the **Counter reset** check box. In the **Totals** field, the total count number is the sum of the counter totals of all registered values on that counter type.
- If the **Counter reset** check box is selected on an asset using a maintenance plan that has a "Once from..." or "Once reached..." interval type, the counter is still active on the new counter line, because you create a separate counter line and start over with a new counter.

The illustration below shows an example of the **Asset counters** page.

Asset ↑	Functional location	Counter ↑	Counter reset	Registered ↑	Value	Unit	Aggregated value	Totals
T0019	DE-01-WH-2	Kilometers		7/22/2019 01:21:12 AM	1,000.00	km	1,000.00	1,000.00
T0019	DE-01-WH-2	Kilometers	✓	7/22/2019 01:21:12 AM	0.00	km	0.00	
T0019	DE-01-WH-2	Miles		7/22/2019 01:21:26 AM	0.00	mi	0.00	

On the **Asset counters** page (**Asset management > Inquiries > Assets > Asset counters**), you can make

counter registrations on several assets at the same time, as you require.

NOTE

You can set up a range to define deviations in manual counter registrations. You can also specify the type of message that is shown if registrations are outside the defined range. For more information about how to set up counters, see [Counters](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Automatic update of asset counters

2/18/2021 • 2 minutes to read • [Edit Online](#)

For information about manual registration of asset counters, see [Manual update of asset counters](#). For information on how to set up asset counters, see [Counters](#).

Counter values can also be automatically updated from production registrations, based on the production hours or production quantity (that is, the quantity that is produced). This update is done on the **Update asset counters** page. You can update one or several assets by setting one parameter, **From date**. This parameter specifies the start date for production registrations (production hours or production quantities). In other words, it specifies the date that counter values should be updated from.

All assets that are related to a resource, *and* that have asset counters that are set up to be updated based on the production hours or production quantity, will be included in an automatic update. New counter values will be created.

For counters that are based on the production quantity, the count includes both the good quantity and the error quantity that are registered. If the unit that is used for production quantity registration differs from the unit that is used for the counter, the quantity is converted so that it corresponds to the counter unit.

As mentioned above, automatic counters can be updated from production registrations. Therefore, the asset for which you want to automatically update counters must be related to a resource (machine). When produced quantities or production hours have been registered on the resource, you can update the related asset counters.

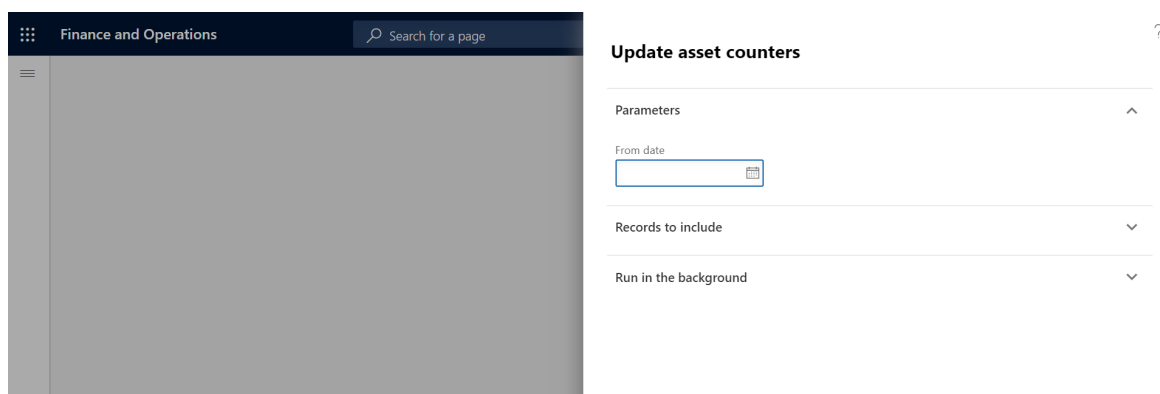

1. Select **Asset management > Periodic > Assets > Update asset counters**.
2. In the **From date** field, select the start date of the automatic update.

NOTE

The date in this field is the "work in progress" date from **Route transactions (Production control > Inquiries and reports > Production > Route transactions > Physical date field)**.

3. On the **Records to include** FastTab, you can select specific assets, asset types, or resources for the automatic update. Select **Filter**, and make the relevant selections.
4. On the **Run in the background** FastTab, you can set up the automatic update as a batch job, as you require.

The illustration below shows an example of the **Update asset counters** dialog.

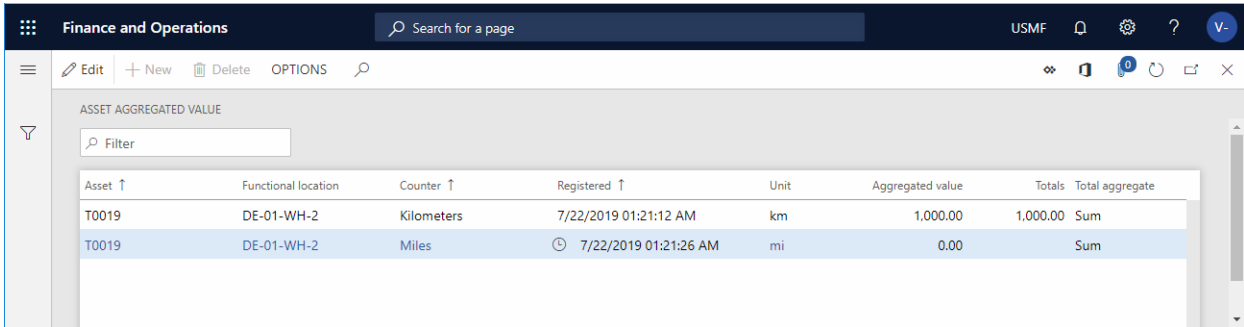

5. Select **OK**.

After the automatic asset counter update is done, you can view the counter registrations that are related to the asset on the **Asset counters** page. Select **Asset management > Common > Assets > All assets**, select the asset, and then, on the Action Pane, on the **Asset** tab, in the **Preventive** group, select **Counters**.

On the **Asset aggregated value** page, you can get an overview of the latest registration that have been made on all counter types on all assets. Select **Asset management > Inquiries > Assets > Asset aggregated value**. This page resembles the **Asset counters** page, but you can't add or edit registrations. It's for overview only.

The illustration below shows an example of the **Asset aggregated value** page.

Asset ↑	Functional location	Counter ↑	Registered ↑	Unit	Aggregated value	Totals	Total aggregate
T0019	DE-01-WH-2	Kilometers	7/22/2019 01:21:12 AM	km	1,000.00	1,000.00	Sum
T0019	DE-01-WH-2	Miles	🕒 7/22/2019 01:21:26 AM	mi	0.00		Sum

Note the following points:

- You can still create manual counter value registrations for counter types that are automatically updated. For more information, see [Manual update of asset counters](#).
- You can set up counters that are related to another counter. In this case, when a counter is updated, related counters are automatically updated at the same time. For more information about how to set up related counters, see [Counters](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance checklists

2/18/2021 • 5 minutes to read • [Edit Online](#)

Maintenance checklists are set up on maintenance job types. You fill in maintenance checklists as part of the process of completing a work order. For more information about how to set up maintenance checklists on maintenance job types on the **Maintenance job type defaults** page, see [Maintenance job type categories and maintenance job types, maintenance job type variants, maintenance job trades, and maintenance checklists](#).

When you work with maintenance checklists on a work order, you can fill in the predefined maintenance checklists that are related to maintenance job types. You can also add more maintenance checklists.

Fill in a maintenance checklist

1. Click **Asset management > Common > Work orders > All work orders** or **Active work orders**.
2. Select the work order and then, on the Action Pane, on the **Work order** tab, in the **Lines** group, select **Maintenance checklist**.
3. The **Work order maintenance job checklist** shows the checklists for all work order jobs. If the work order jobs have different maintenance job types, the maintenance checklists might differ for each work order job. Select a work order job to work with the related maintenance checklist. Details of the selected maintenance checklist line are shown on the **Line details** FastTab.
4. Complete all the maintenance checklist lines, one at a time, in the order that they appear in. You complete a maintenance checklist line by filling in the fields on the **Line details** FastTab. The information that is required to complete a line can vary, depending on the line type. For example, on a line of the **Text** type, you add a note that explains the result of your check. On a line of the **Measurement** type, you enter the counter value that you read on the equipment, and you can also add a note as you require. A maintenance checklist line of the **Header** type is used as a heading to group the maintenance checklist lines that appear below it. You don't have to fill in a header. As for all other types of maintenance checklist lines, you can add a note to a line of the **Header** type.
5. If instructions are related to a maintenance checklist line, the **Instructions** check box is selected. Read instructions for the selected maintenance checklist line in the **Instructions** field on the **Line details** FastTab.
6. When you've completed a maintenance checklist line, select the **Checked** check box on that line to mark it as completed. To discard a maintenance checklist line because it isn't relevant to the work order job, select the **N/A** check box on the line. If the **Mandatory** check box is selected on a maintenance checklist line, you must select either the **Checked** check box or the **N/A** check box.

NOTE

You can only update maintenance checklist registrations if the work order is in an [Active](#) lifecycle state.

Add a maintenance checklist line

Maintenance checklists are created from the definition on the maintenance job type default and are transferred to a work order job. As you require, you can add maintenance checklist lines to a work order job. Maintenance checklist lines that you manually add get the **Manual** reference.

1. On the **Work order maintenance job checklist** page, select the work order job to add a maintenance checklist for.
2. On the **Maintenance checklist lines** FastTab, select a maintenance checklist line. Then, to insert a new line after the selected line, press the **Down arrow** key. The next number in the sequence is automatically entered in the **Line number** field. To insert a new line before the selected line, select **Add line**.
3. On the **Name** field, enter a name for the maintenance checklist line.
4. In the **Type** field, select a type for the maintenance checklist line. The **Line details** FastTab contains related fields for each maintenance checklist type.
 - **Text** - Use this type to add a maintenance checklist line that has text that describes what must be done. For example, you can use this type if you want a worker to check or inspect something, but you aren't expecting a specific (measurable) result. After you select this type, on the **Lines details** FastTab, in the **Instructions** field, enter text that describes what must be done.
 - **Header** - A maintenance checklist line of this type is used as a heading to group the maintenance checklist lines that appear below it. This type is useful if you have several maintenance checklist lines that can be divided into specific areas. After you select this type, in the **Name** field, enter a descriptive name.
 - **Template** - This type isn't applicable when you manually add a maintenance checklist line on a work order job.
 - **Variable** - Use this type to define a possible result in a range on the maintenance checklist line. For information about how to set up maintenance checklist variables, see [Maintenance job type categories and maintenance job types, maintenance job type variants, maintenance job trades, and maintenance checklists](#). After you select this type, in the **Name** field, enter a name to describe the variable. On the **Line details** FastTab, in the **Variable** field, select the variable. In the **Instructions** field, enter text that describes what must be done.
 - **Measurement** - Use this type to record a specific measurement on the maintenance checklist line. After you select this type, in the **Name** field, enter a name for the measurement. On the **Line details** FastTab, in the **Counter** and **Unit** fields, select appropriate values. In the **Instructions** field, enter text that describes what must be done.
5. When you've finished manually adding maintenance checklist lines, fill in the lines as described in the **Fill in a maintenance checklist** section above.

NOTE

On the **Work order maintenance job checklist** page, you can't delete maintenance checklist lines that have the **Job type** reference. You can delete only maintenance checklist lines that you or other maintenance workers have manually created, and that have the **Manual** reference.

The illustration below shows an example of a maintenance checklist.

Maintenance downtime for work orders

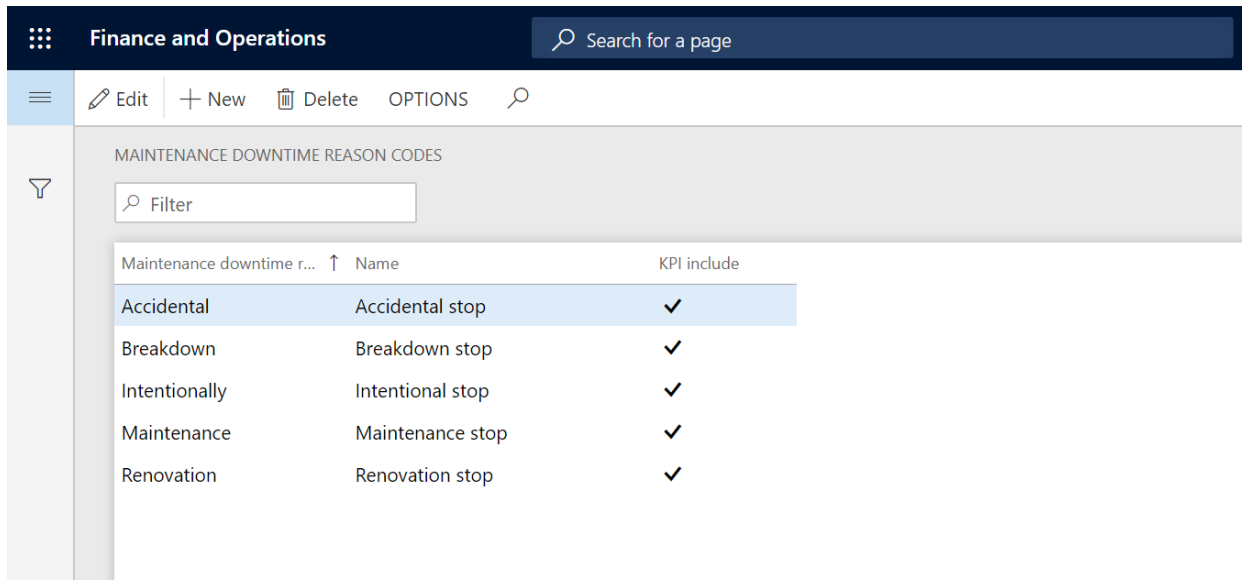

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can create maintenance downtime registrations on the asset that is selected on a work order. This capability is useful if you want to register maintenance downtime on one or more machines in the production area. You first create the maintenance downtime reason codes that you want to use, such as **Breakdown** and **Planned stop**. This step is done on the **Maintenance downtime reason codes** page. You can then create maintenance downtime registrations on the **Maintenance downtime** page and add the relevant maintenance downtime reason codes.

Create maintenance downtime reason codes

1. Select **Asset management > Setup > Work orders > Maintenance downtime reason codes**.
2. Select **New**.
3. In the **Maintenance downtime reason code** field, enter an ID for the maintenance downtime reason code.
4. In the **Name** field, enter a name.
5. Select the **KPI include** check box if the reason code should be included in calculations of key performance indicators (KPIs) for the asset. In general, planned production stops should not be included in KPI calculations, because they don't affect expected performance.
6. Select **Save**.

The illustration below shows an example of the **Maintenance downtime reason codes** page.

Maintenance downtime r...	Name	KPI include
Accidental	Accidental stop	✓
Breakdown	Breakdown stop	✓
Intentionally	Intentional stop	✓
Maintenance	Maintenance stop	✓
Renovation	Renovation stop	✓

After you've created the maintenance downtime reason codes that you want to use, you can create maintenance downtime registrations for work orders and assets.

Create maintenance downtime registrations

1. Click **Asset management > Common > Work orders > All work orders** or **Active work orders**.
2. Select the work order, and then, on the **Work order** tab, in the **Asset** group, select **Maintenance**

downtime.

3. Select **New**.
4. In the **From** and **To** fields, define the date and time interval for the maintenance downtime registration.

NOTE

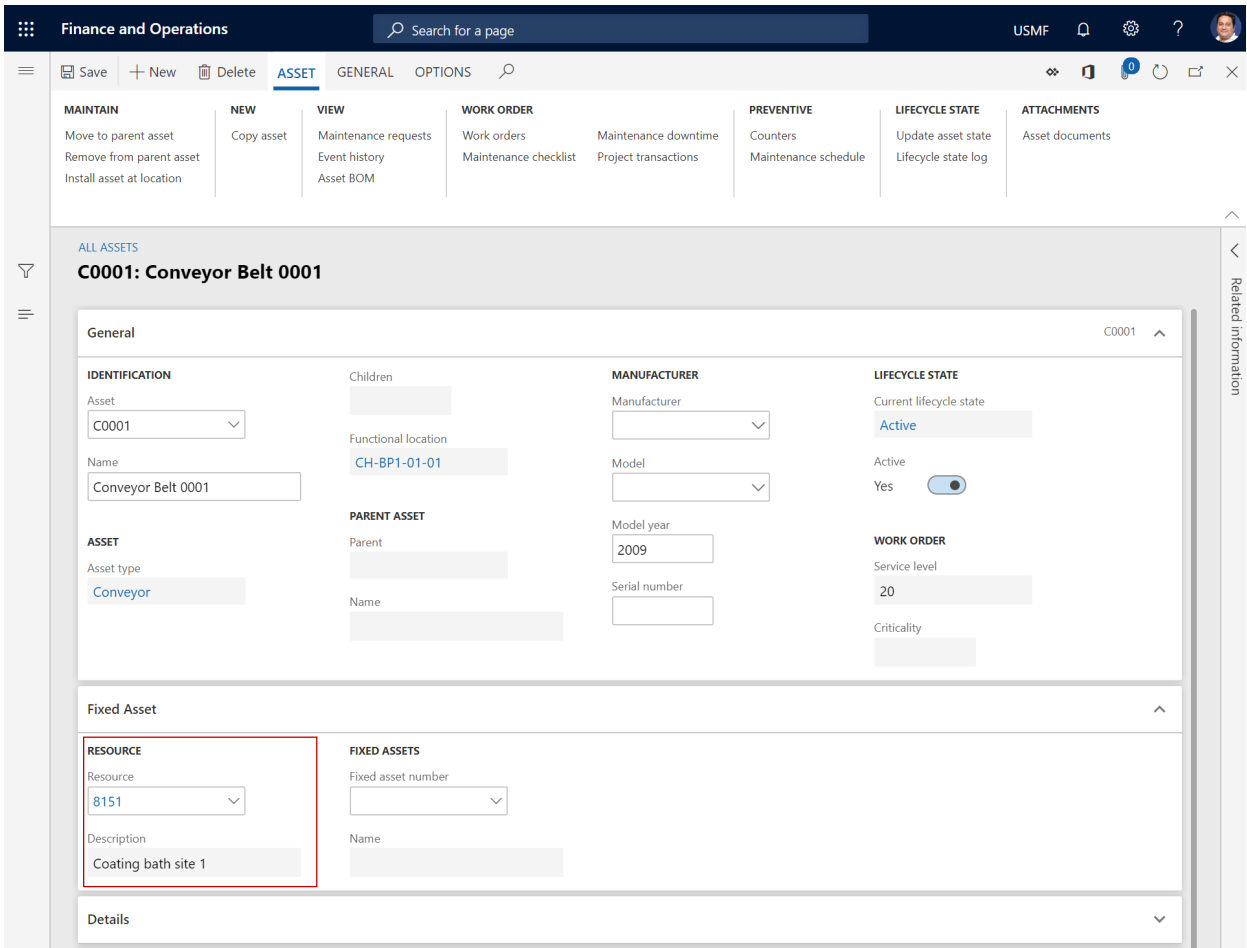

When you leave the **To** field, the duration in hours is automatically inserted in the **Duration** field.

5. In the **maintenance downtime reason code** field, select a reason code.
6. Repeat steps 3 through 5 to add more registrations.
7. Select **Save**.

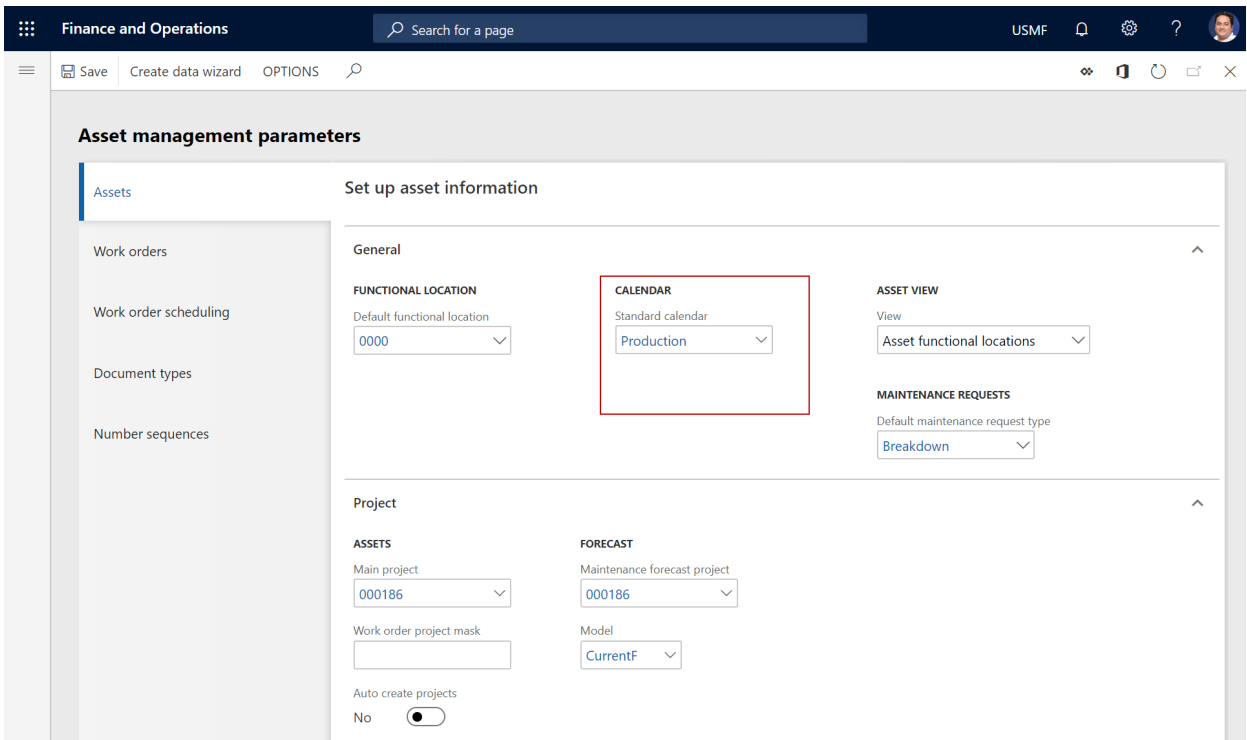

The illustration below shows an example of maintenance downtime registration.

Asset	Functional location	Work order	from ↑	to	Duration	Maintenance downtime
C0001	CH-BP1-01-01	JPMF-00002	🕒 7/23/2019 12:00:00 AM	🕒 7/24/2019 12:00:00 AM	24.00	Accidental

The calendar that is used to calculate a maintenance downtime registration depends on your selection in the setup of assets and parameters. If a resource is selected on an asset in the **Resource** field on the **Fixed asset** FastTab of the **All assets** page, the calendar that is set up for the associated resource group is used, as shown in the following illustration.

If no resource is selected on the asset, the standard calendar that is selected on the **Asset management parameters** page is used, as shown in the following illustration.

To see an overview of all maintenance downtime registrations, click **Asset management > Inquiries > Maintenance downtime**.

NOTE

All calendars that are used in the **Asset Management** module are set up in **Organization administration > Setup > Calendars > Calendars**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Add fault to work order

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can add faults that were set up in the fault designer to a work order. One or more fault records must be connected to the asset types that are used for the asset that is selected in the work order. For more information about the setup, see [Fault management](#).

1. Select **Asset management** > **Common** > **Work orders** > **All Work orders** or **Active work orders**.
2. Select the work order to make a fault registration on, and then, on the Action Pane, on the **Work order** tab, in the **Asset** group, select **Asset fault**.
3. On the **Symptoms** FastTab, select **Add line**. A sequential fault number is automatically entered in the **Fault** field.
4. In the **Fault symptom** field, select the relevant symptom.
5. In the **Fault area** and **Fault type** fields, select the appropriate values.
6. In the **Fault date** field, the current date is automatically inserted. You can select a different date as you require.
7. On the **Causes for selected symptom** FastTab, add a line to describe the cause of the issue.
8. On the **Remedies for selected symptom** FastTab, add a line to describe a possible solution to the issue.
9. Select **Save**.

The illustration below shows an example of a fault registration.

View asset faults

In the **Asset faults** list, you can get an overview of all faults registered on assets.

On the **Asset faults** list page, you can get an overview of all faults that have been registered on assets. To open the page, select **Asset management > Inquiries > Asset fault > Asset faults**.

Print asset fault report

From the **All assets** list page, you can print an asset fault report that shows all fault registrations and a graphical overview of fault statistics.

1. Select **Asset management > Common > Assets > All assets**.
2. Select the asset to print a fault report for.
3. On the Action Pane, on the **General** tab, in the **Reports** group, select **Asset fault**.
4. Enter a specific period, or select a fault type.
5. Select **OK** to print the report.

NOTE

To print a fault report for several assets or asset types, select **Asset management > Reports > Assets > Asset fault**.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work order report

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can generate a work order report that shows detailed information about one or more work orders that you select.

1. Select **Asset management > Reports > Work orders > Work order report**.
2. Select "Yes"/"No" on the toggle buttons as you require, to determine the details to be included in the report.
 - In the **Print settings** section, you can select whether to include attachments from the setup of the related maintenance job type.
3. On the **Records to include** FastTab, you can filter the contents of the report by **Work order**.
4. On the **Run in the background** FastTab, you can set up generation of the work order report as a batch job, as you require.
5. Select **OK** to generate the report.

The following illustration shows an example of how the report parameters can be set up.

Work order pools

2/18/2021 • 4 minutes to read • [Edit Online](#)

You can use work order pools to group work orders that have something in common. Here are some examples of things that you can create work order pools for:

- Work crews, for example, Maintenance Crew A or Maintenance Crew B
- Professional skills, such as electricians or plumbers
- Physical locations
- Time schedules, such as weeks or other periods

As you require, you can put one work order in multiple work order pools.

Create a work order pool

On the **All work order pools** or **Active work order pools** list page, you can get an overview of your work order pools and create new pools.

1. Select **Asset management > Common > Work order pools > All work order pools** or **Active work order pools**.
2. Select **New**.
3. In the **Pool** field, enter an ID for the work order pool.
4. In the **Name** field, enter a name.
5. Set the **Active** option to **Yes** to indicate that the work order pool is active.
6. Set the **Delete work order relations** option to **Yes** if work orders should automatically be removed from the work order pool.
7. In the **Delete lifecycle state** field, select the work order lifecycle state. For example, the work order lifecycle state for completing a work order could be set to automatically delete relations to work order pools.

You can start adding work orders to your work order pool right away.

8. On the **Work orders** FastTab, select **Add line**.
9. In the **Work order** field, select a work order. The related fields are automatically updated.
10. Repeat steps 8 through 9 to add more work orders.
11. If the work orders that you added should be done in a specific order, in the **Sort order** field, you can enter the numbers **1, 2, 3**, and so on, to specify that order.
12. To view a list of all the work orders that are included in the work order pool, on the Action Pane, on the **Work order pool** tab, in the **View work order pool related** group, select **Work orders** to open the **All work orders** list page.
13. To calculate and view capacity load for the maintenance schedule, unscheduled work orders, and scheduled work orders, on the Action Pane, on the **Work order pool** tab, in the **View work order pool related** group, select **Capacity load** to open the **Calculate capacity load** dialog.

14. To calculate and view forecasts for items (spare parts and other required items) that are related to maintenance schedule, unscheduled work orders, and scheduled work orders, on the Action Pane, on the **Work order pool** tab, in the **View work order pool related** group, select **Item forecast** to open the **Calculate item forecast** dialog.
15. To view a list of purchase requisitions that are related to the work orders in the work order pool, on the Action Pane, on the **Work order pool** tab, in the **Procurement** group, select **Work order purchase requisition** to open the **Work order purchase requisition** list page.
16. To view a list of purchase orders that are related to the work orders in the work order pool, on the Action Pane, on the **Work order pool** tab, in the **Procurement** group, select **Work order purchase** to open the **Work order purchase** list page.

NOTE

When a work order pool is no longer relevant to your work planning, set the **Active** option for that pool to **No** in the list view of the **Work order pool** page.

To delete all worker order lines, set the **Delete work order relations** option to **Yes**. This option is useful if, for example, you want to create an empty pool that you can use later for other work orders. When you're ready to use the work order pool to create new work order relations later, remember to set the **Delete work order relations** option to **No**.

The illustration below shows an example of the **Work order pool** list page.

Pool	Name	Active	Delete work ord...	Work orders
Day	Day shift	✓	✓	1
Evening	Evening shift	✓	✓	
Morning	Morning shift	✓	✓	
Night	Night shift	✓	✓	
Weekend	Weekend shift	✓	✓	

Add a work order to a work order pool

As described in the previous section, you can add work orders to a work order pool when you create that pool. You can also add work orders to a work order pool on the **All work orders** or **Active work orders** list page.

1. Select the work order, and then, on the Action Pane, on the **Work order** tab, in the **Maintain** group, select **Work order pool**.
2. Select the work order in the list, and click **Work order pool**.
3. In the **Maintain work order pool** dialog, in the **Add/remove** field, select **Add**.
4. In the **Pool** field, select the work order pool.
5. Select **OK**.

6. To put the work order that you added in a specific order in the work order pool, on the **All work order pools** or **Active work order pools** list page, select the pool, and then select **Edit**. Then, on the **Work order pool** page, on the **Work orders** FastTab, use the **Sort order** field to adjust the sort order of the work orders that are included in pool.

To remove a work order from a work order pool, repeat these steps, but select **Remove** in step 3.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Active work order maintenance jobs overview

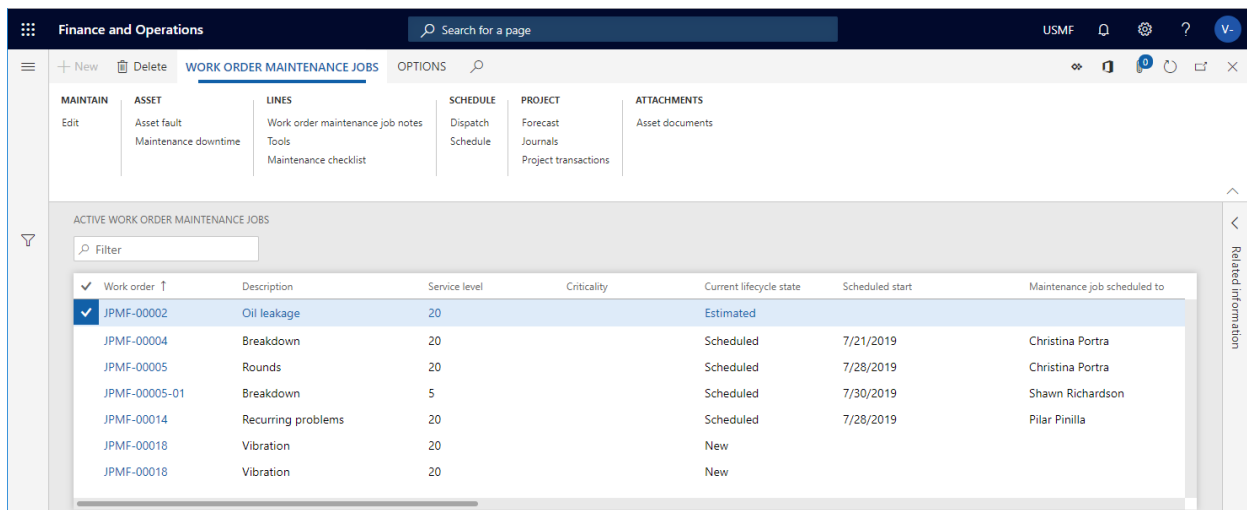

2/18/2021 • 2 minutes to read • [Edit Online](#)

On the **Active work order maintenance jobs** list page, you can get an overview of work orders, in terms of the number of work orders that have been created on specific assets, asset types, manufacturers, models, maintenance job types, and so on. By selecting a work order job and then selecting **Edit**, you can open the related work order. By selecting a work order job and then selecting one of the buttons on the **Work order maintenance jobs** tab of the Action Pane, you can view data for the work order that the work order job is related to.

To open the list page, select **Asset management > Common > Work orders > Active work order maintenance jobs**. The page lists all active work order jobs, and it also shows some of the information that is related to the work order or work order job.

In the % column, a number shows completion of the work order as a percentage. Completion is based on two calculations: posted hours compared to forecasted hours, and the number of maintenance checklists that have been completed.

The illustration below shows an example of the **Active work order maintenance jobs** list page.

Work order ↑	Description	Service level	Criticality	Current lifecycle state	Scheduled start	Maintenance job scheduled to
✓ JPMF-00002	Oil leakage	20		Estimated		
JPMF-00004	Breakdown	20		Scheduled	7/21/2019	Christina Portra
JPMF-00005	Rounds	20		Scheduled	7/28/2019	Christina Portra
JPMF-00005-01	Breakdown	5		Scheduled	7/30/2019	Shawn Richardson
JPMF-00014	Recurring problems	20		Scheduled	7/28/2019	Pilar Pinilla
JPMF-00018	Vibration	20		New		
JPMF-00018	Vibration	20		New		

For a short description of the buttons on the **Active work order maintenance jobs** list page, refer to [Introduction to work orders](#) where identical buttons are described.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Work orders and fixed assets

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, assets can be related to fixed assets, and you can create work orders for those assets. If you use this functionality, you can get a complete overview of fixed assets, related investment projects, and the costs that are registered on the investment projects in the **Project management and accounting** and **Fixed assets** modules in Microsoft Dynamics 365 for Finance and Operations.

NOTE

The **Fixed asset number** field on the work order job project is set only if **Investment** is selected as the project type on the work order job project.

The illustration below shows the relation between an investment project in the **Project management and accounting** module and a work order job project.

The screenshot displays two side-by-side views from Microsoft Dynamics 365. On the left is the 'PROJECTS' view, showing a list of projects with '000187-000041 : WO-00000060: NY-01-WH-3' selected. Below the list, the 'General' section shows 'Project ID' as '000187-000041', 'Project name' as 'WO-00000060: NY-01-WH-3', and 'Project group' as 'Investment'. The 'Project type' is set to 'Investment' and 'Project stage' is 'Created'. On the right is the 'ALL WORK ORDERS' view for 'Work order: WO-00000060'. The 'Line details' section shows 'ASSET' as 'NY-01-WH-3', 'Name' as 'New York DC Warehouse 3', and 'JOB' as 'SCHEDULED'. The 'FIXED ASSET NUMBER' is 'BUIL-000007'. A red arrow points from the 'Project ID' field in the project view to the 'Fixed asset number' field in the work order view, indicating the data flow.

The following procedure describes the relation between assets, work orders, work order job projects, and fixed assets.

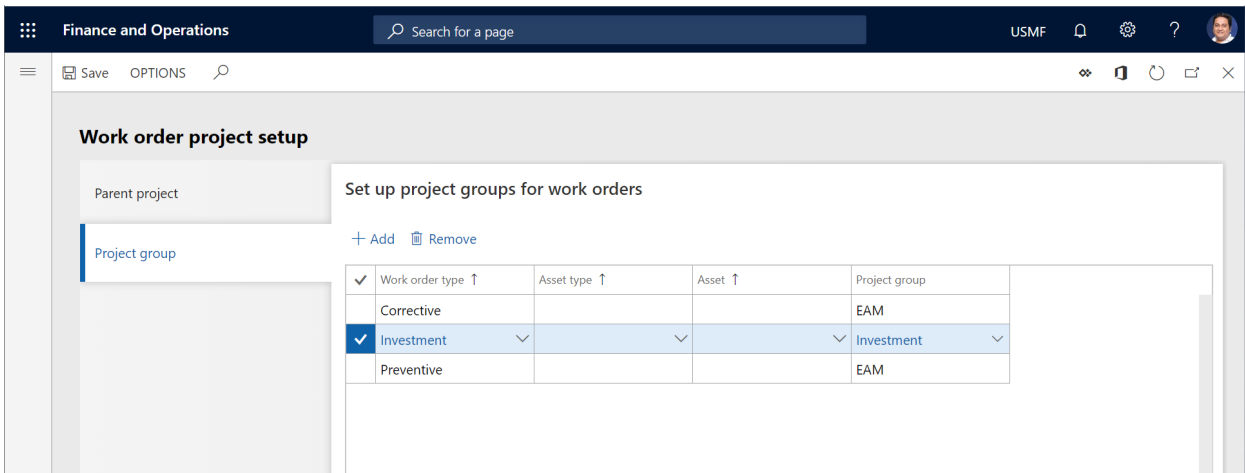

1. You create an asset that you relate to a fixed asset.

The screenshot displays the 'GENERAL' tab for asset 'DE-01: Denver Distribution Center'. The interface includes sections for 'ASSET DETAILS', 'RELATED INFORMATION', and 'REPORTS'. The main form is divided into several sections: 'IDENTIFICATION' (Asset: DE-01, Name: Denver Distribution Center), 'ASSET' (Asset type: Facility), 'CHILDREN', 'FUNCTIONAL LOCATION' (DE-01), 'PARENT ASSET', 'MANUFACTURER' (Manufacturer, Model, Model year, Serial number), 'LIFECYCLE STATE' (Current lifecycle state: Active, Active toggle: Yes), and 'WORK ORDER' (Service level: 20, Criticality). A 'Fixed Asset' section is also visible, containing 'RESOURCE' and 'FIXED ASSETS' (Fixed asset number: BUIL-000002, Name: Production Site 1). The 'FIXED ASSETS' section is highlighted with a red box.

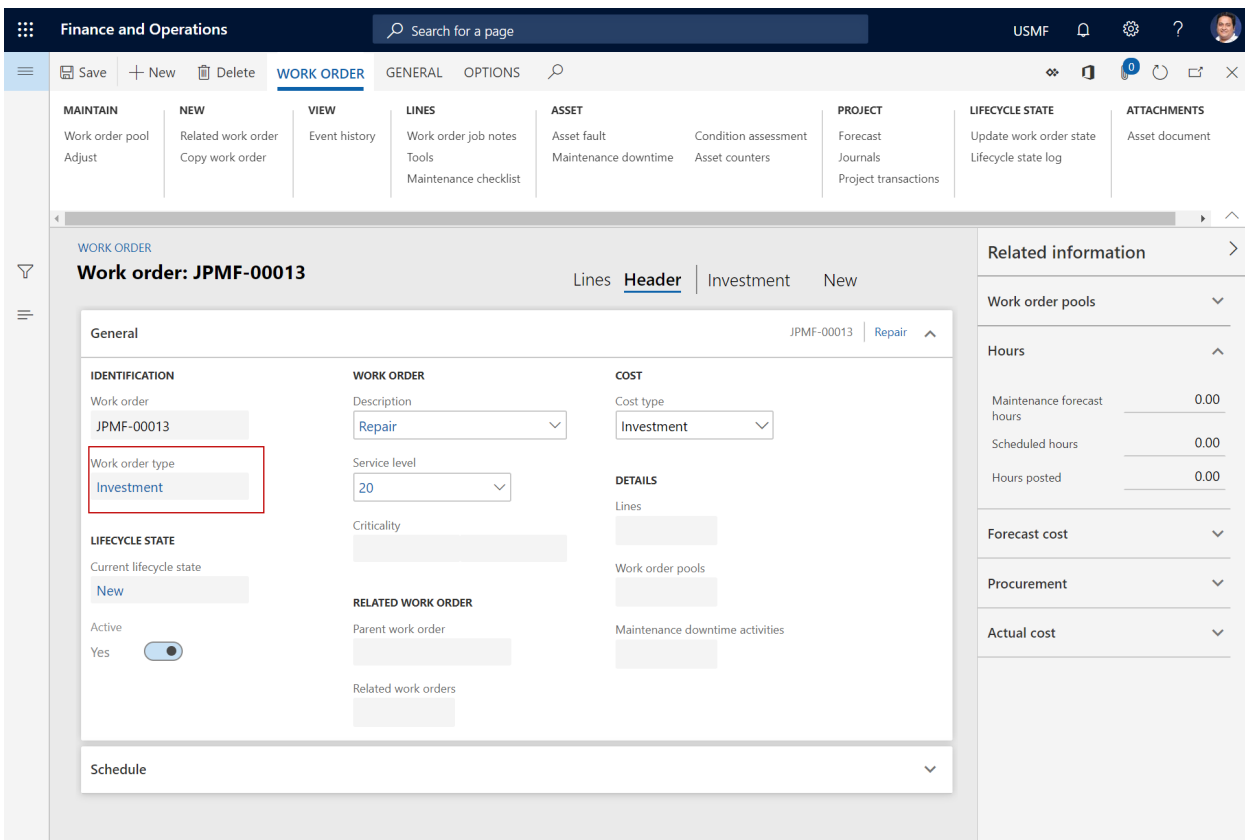

2. When you set up work order types on the **Work order types** page (Asset management > Setup > Work orders > Work order types), you create a work order type for handling investments. See also [Work order types](#).

The screenshot displays the 'WORK ORDER TYPES' page. The 'Investment' work order type is selected, and the 'General' tab is active. The form includes sections for 'LIFECYCLE STATE' (Work order lifecycle model: Standard), 'COST' (Cost type: Investment), 'SCHEDULE' (One maintenance worker: No), 'MANDATORY' (Fault symptom: No), and 'FAULT CAUSE' (Fault cause: No, Fault remedy: No, Maintenance downtime: No). The 'Investment' work order type is also visible in the left sidebar.

3. When you set up work order project groups on the **Project group** tab of the **Work order project setup** page (Asset management > Setup > Work orders > Project setup), you create a relation between the work order type that is used for investments and the project group that was created for investments on the **Project groups** page in the **Project management and accounting** module (Project management and accounting > Setup > Posting > Project groups).

- When you create a work order that is related to a fixed asset, you select the work order type that is used to handle investments, such as **Investment**.
- When the work order is created, the related work order type is shown on the **All work orders** page.

- When the work order is created, the project that is related to the work order is created on the **All projects** page in the **Project management and accounting** module (**Project management and accounting > Projects > All projects**). To view project-related information, select the link in the **Project ID** field on the **General** tab on the **Line details** FastTab in the details view of the **All work orders** page in the **Asset management** module (**Asset management > Common > Work orders > All work orders**).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Forecasts, work orders, and projects

2/18/2021 • 5 minutes to read • [Edit Online](#)

In Asset Management, integration with the **Project management and accounting** module helps optimize cost control, so that users can track costs on maintenance job type forecasts and work order jobs.

Tracking of maintenance job type forecasts requires two settings:

1. Select a project in **Asset management > Setup > Asset management parameters**, and then, on the **Assets** tab > on the **Project** FastTab, in the **Maintenance forecast project** field, select a project.
2. When you create a maintenance job type default line, an activity number is automatically created for the line on the **Maintenance job type defaults** page (**Asset management > Setup > Jobs > Maintenance job type defaults**).

Maintenance job type forecasts serve two purposes:

- You can track costs on maintenance job type forecasts in the **Project management and accounting** module.
- Forecasts are automatically transferred to a work order job project when you select a maintenance job type on a work order job.

To track costs on work order jobs, you must first set up work order projects. For more information, see [Work order project setup](#).

Work order job projects

When you create a work order job on a work order, the work order project is determined by the setup of the parent project for work orders on the **Work order project setup** page (**Asset management > Setup > Work orders > Project setup**).

Work order job projects are created by using a combination of the following work order information:

- The work order type selected on the work order
- The functional location related to the asset on the work order job
- The asset type that is related to the asset on the work order job
- The expected start and end times that are set on the work order

Some of this information might not be found on a work order. Therefore, the search for a work order parent project is done by using the available combination of data and selecting the project ID that corresponds to work order data.

For example, in the following illustration, because of the way that the **Truck Engine** asset type is set up, every work order job that is created with the **Truck Engine** asset type will be a sub-project of project ID 000186.

Finance and Operations

Search for a page

USMF

Save OPTIONS

Work order project setup

Parent project

Project group

Set up parent projects for work orders

+ Add Remove Edit View

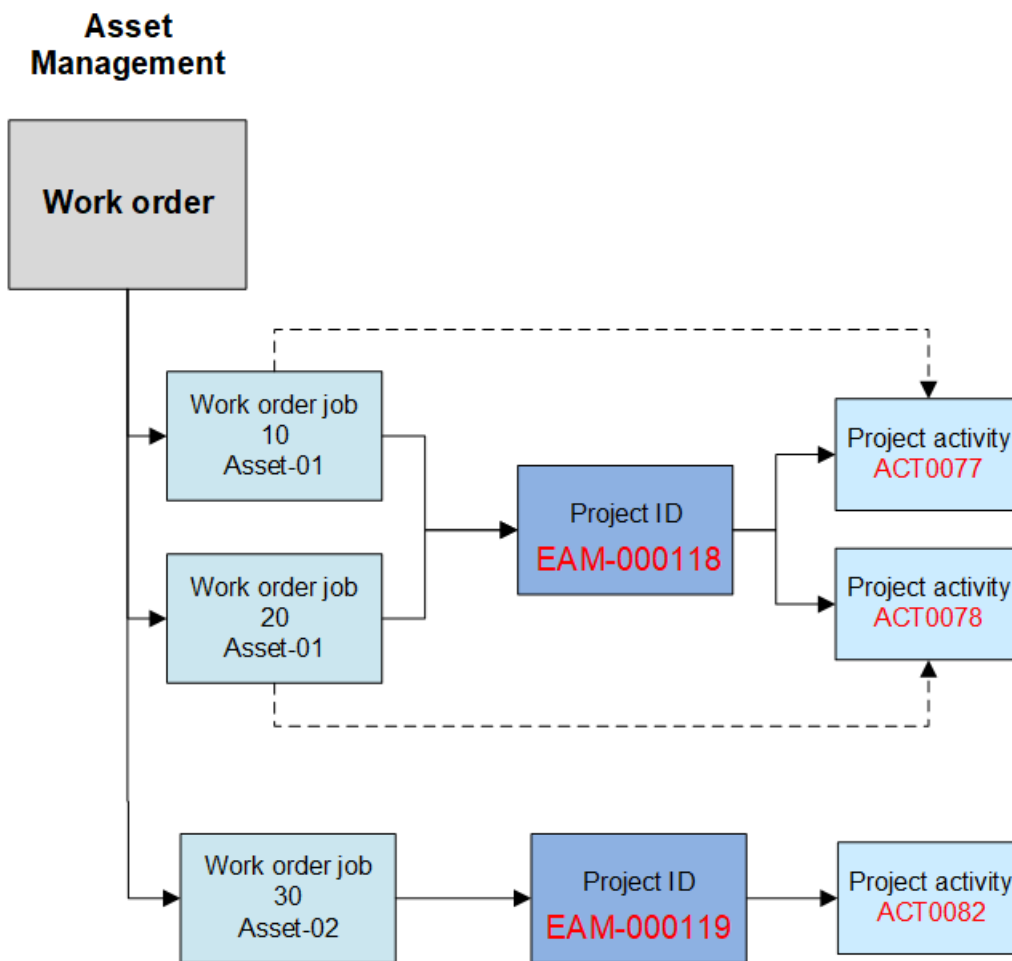

<input checked="" type="checkbox"/>	Work order type	Functional location	Asset type ↑	Asset	Valid from	End date	Project ID
	Corrective				7/21/2019	None	000211
	Preventive				7/21/2019	None	000212
<input checked="" type="checkbox"/>			Truck Engine		8/14/2019	None	000186

The purpose of the project ID on the work order job, and the related activity number, is to track costs that are related to the work order job, and the asset that is selected on it, in the **Project management and accounting** module. (To view the project ID and activity number, select **Asset management > Common > Work orders > All work orders**, and then select the work order. On the **Line details** FastTab, the **Project ID** field shows the project ID, and the **Activity number** field shows the activity number.) For more information about cost control in Asset Management, see [Cost and date control](#).

The following illustration shows a graphical overview of work order projects and related project activities.

Work order projects association

Note: Red text are examples to show dependencies.

NOTE

- A work order job in Asset Management is associated with a project activity in the Project module.
- A work order job has one maintenance job type.

When a new work order job is created on a work order, a work order project is automatically created for the job. The financial dimensions for the asset that is related to the work order job are automatically transferred to the work order project.

The project activity that is created for a work order job has related information attached to it. This information is about the maintenance job type, maintenance job type variant, and trade. It's useful if, for example, you create a purchase order from a work order (see [Procurement](#)), or if you use the **Project management and accounting** module for time registration.

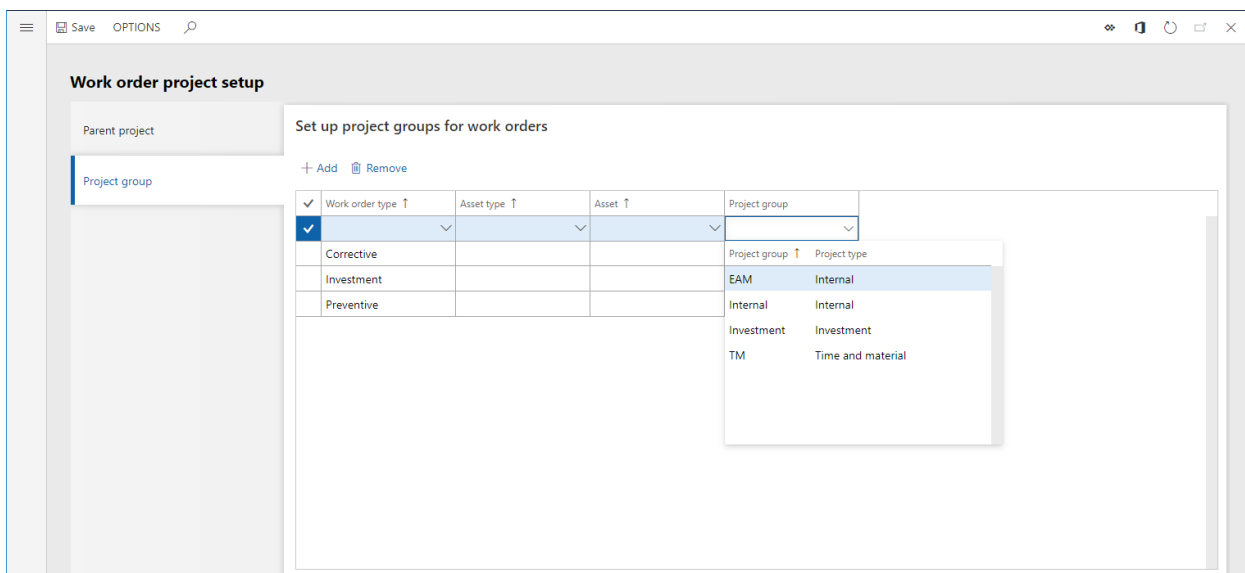

If the asset was installed on a functional location but is later installed on a different functional location, the financial dimensions that are related to the new functional location are automatically updated on the asset. Then, when you create a work order job for the asset, the work order project for the work order job automatically gets the financial dimensions that are now related to the asset. Therefore, when you use functional locations, costs can always be tracked on the functional locations that an asset was installed on at any given time. The automatic update of financial dimensions helps guarantee complete traceability of costs for project control and reporting.

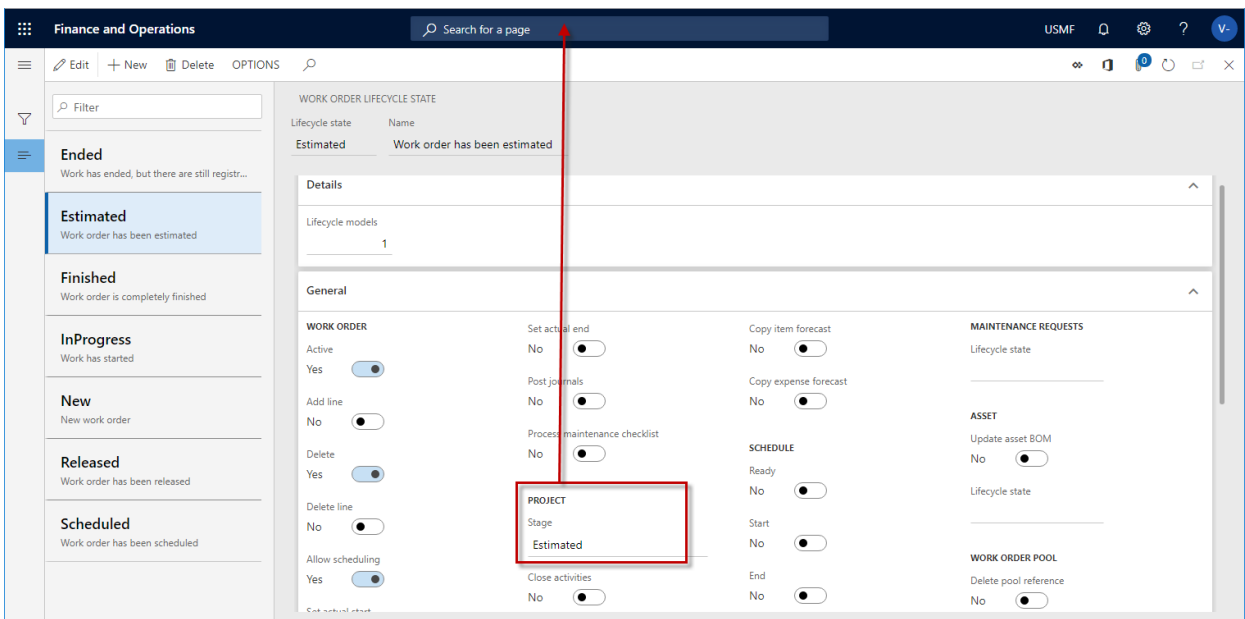

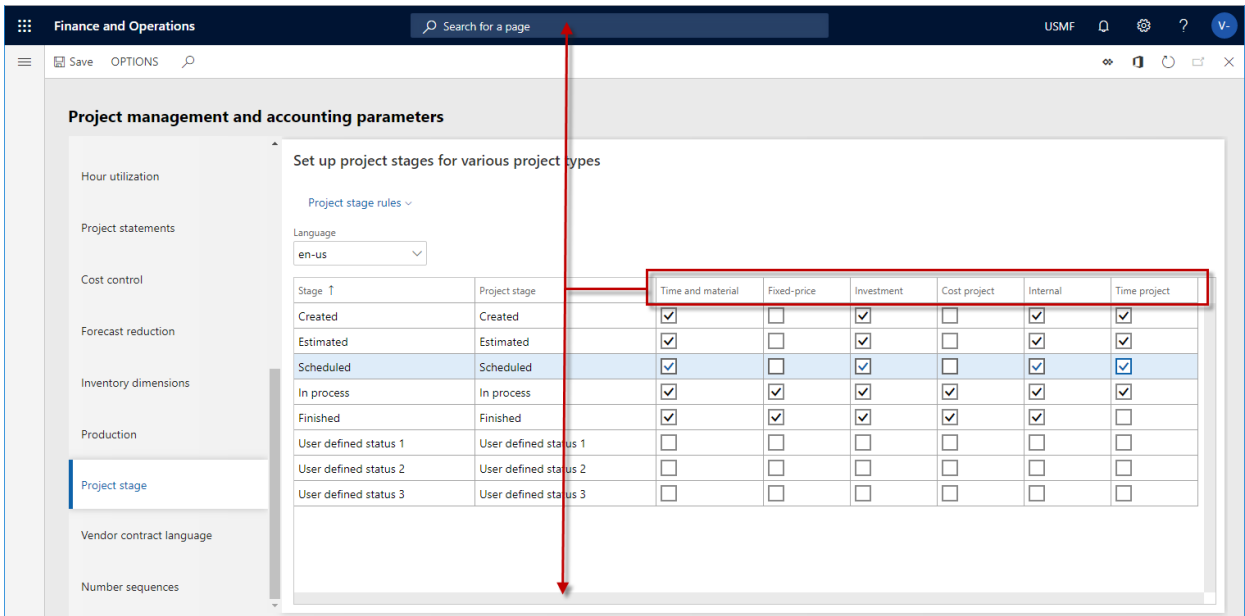

Work order projects, work order lifecycle states, project stages, and project types

To help guarantee that work order lifecycle states and related project stages on work orders are used correctly, consider the dependencies in relation to the **Project management and accounting** module:

- In the **Project management and accounting** module, project stages are set up on project types on the **Project management and accounting parameters** page.
- On the **Project management and accounting parameters** page, use the check boxes to select relevant project stages for all the project types that you will use. In the following illustrations, five stages (**Created**, **Estimated**, **Scheduled**, **In process**, and **Finished**) have been selected for the **Time and material** and **Internal** project types. Those five stages are relevant to both internal maintenance jobs and service maintenance jobs.
- In the **Asset Management** module, project types are defined by the project groups that you set up on the **Work order project setup** page > **Project group** tab (**Asset management** > **Setup** > **Work orders** > **Project setup**).
- The project groups that are set up on the **Work order project setup** page are used when you create work orders. When a work order is created, a work order project is automatically created for the work order.
- Every work order lifecycle state must have a related project stage.
- The project stage that is related to a work order lifecycle state must be defined as an active stage for the project group that is defined in the work order project. The work order project is automatically created on a work order.
- When you create a new work order, the automatic allocation of a work order project is based on the setup on the **Work order project setup** page.

The following illustrations show the associations between work order project groups, related project types, project stages, and work order lifecycle states.

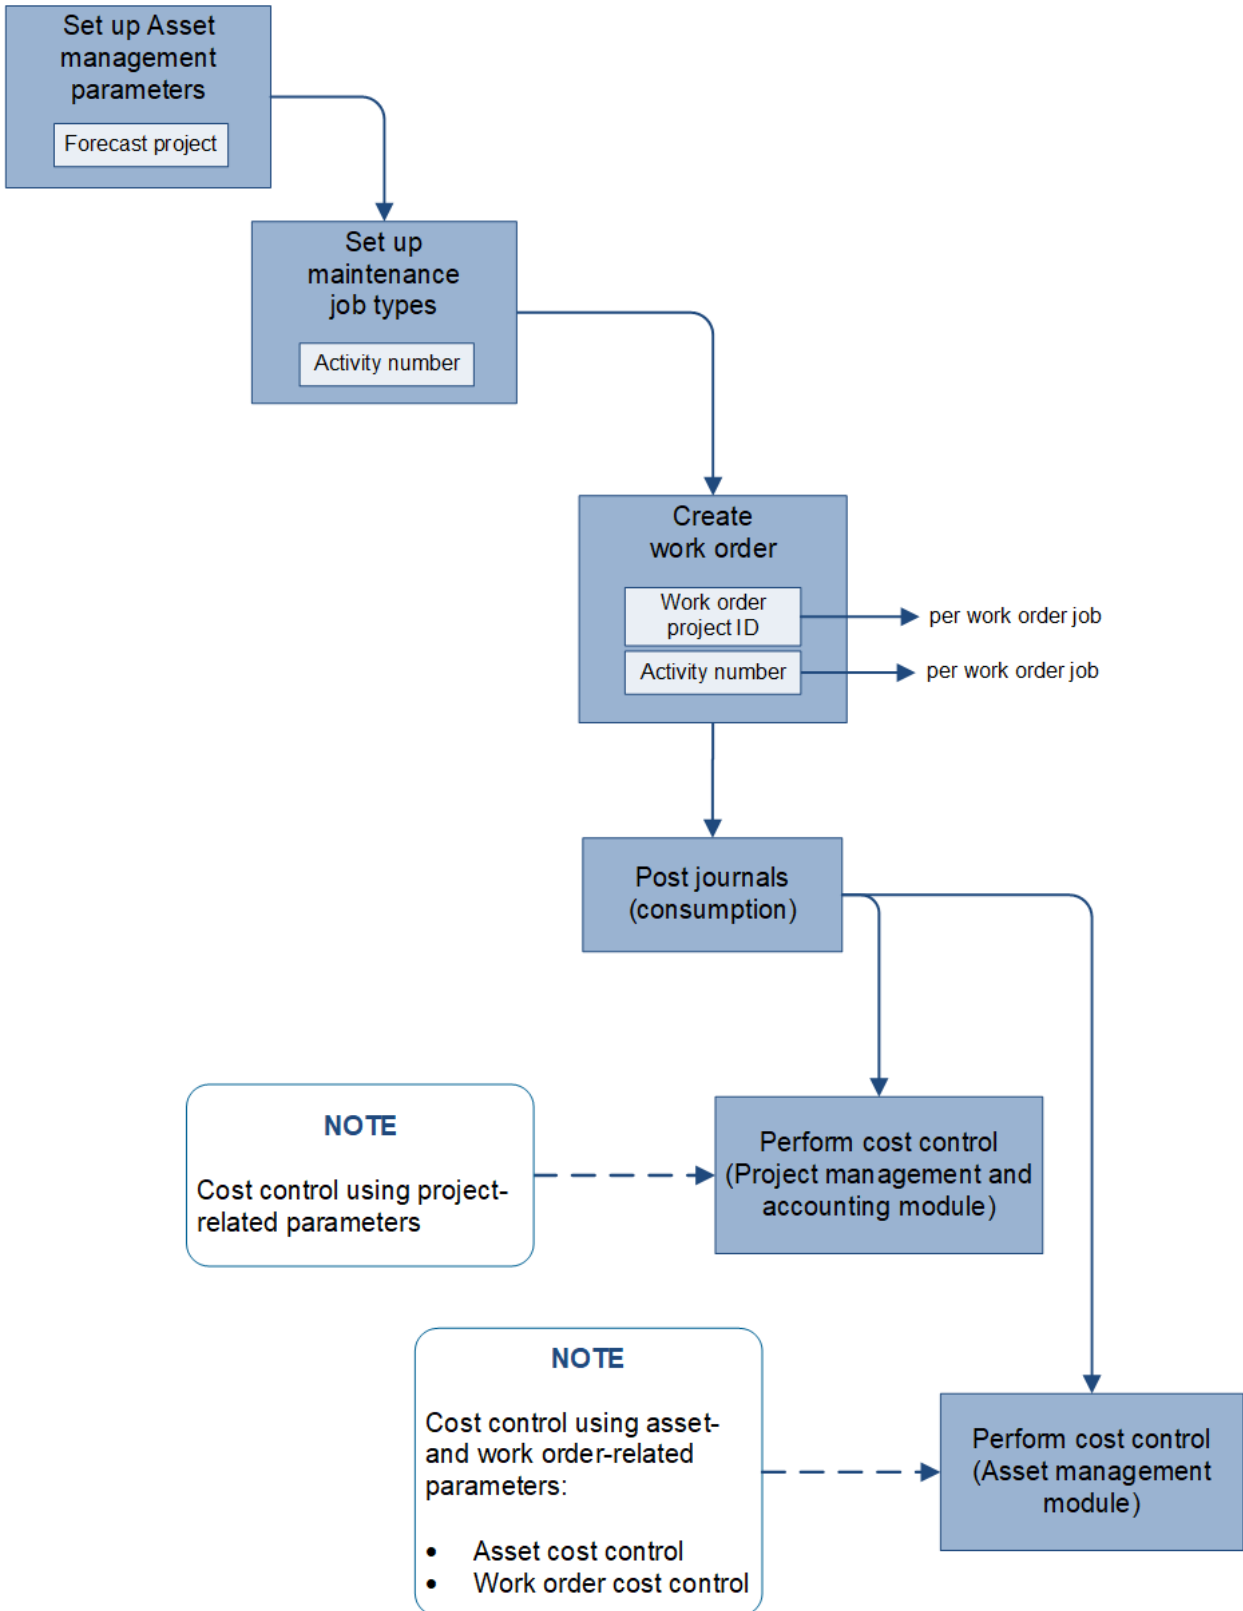

For information about how to set up work order projects, see [Work order project setup](#). For information about how to create work order lifecycle states, see [Work order lifecycle states](#).

The following illustration shows a graphical overview of the various projects that are created in the **Asset management** module to enable integration with the **Project management and accounting** module. It also shows the work processes that the projects are related to.

Bill for maintenance on customer-owned assets

2/18/2021 • 5 minutes to read • [Edit Online](#)

The *Work order billing* feature lets you create, process, and bill maintenance work that is done on assets that your customers own. This feature lets you perform the following tasks:

- Connect customers to the assets that they own.
- Select a customer and view the assets that customer owns when you create a work order.
- Set up a parent project for each customer.
- Register hours, items, expenses, and fees against the work order, and then create an invoice proposal for the customer later.

In addition, the feature provides the following functionality:

- The project contract from a customer's parent project is automatically copied to the relevant work order project.
- Asset management can now use the *fee* project transaction type on both work order forecasts and work order journals.

Turn on the customer billing feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Project management and accounting*
- **Feature name:** *Work order billing*

Example scenario

To learn how this feature works, work through the following example scenario.

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard [demo data](#) is installed. You must select the **USMF** legal entity before you begin.

You can also use this scenario as guidance for using the feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Step 1: Create a new project contract for the customer

1. Go to **Project management and accounting > Projects > Project contracts**.
2. On the Action Pane, select **New**.
3. In the **New project contract** dialog box, set the following values:
 - **Name:** *Pelican Wholesales*
 - **Funding type:** *Customer*
 - **Funding source:** *US-013 (Pelican Wholesales)*
4. Select **OK**.

Step 2: Create a new parent project for the customer

The parent project that you create here will be used when work orders for the customer are created.

1. Go to **Project management and accounting > Projects > All projects**.

2. On the Action Pane, select **New**.

3. In the **New project** dialog box, set the following values:

- **Project type:** *Time and material*
- **Project name:** *Pelican Wholesales work orders*
- **Project group:** *TM*
- **Project contract ID:** *Pelican Wholesales* (the contract that you created earlier)
- **Start date:** Select today's date.

4. Select **Create project**.

5. The new project is opened. Make a note of the **Project ID** value. You will have to enter it later.

Step 3: Create a new work order type in Asset management

1. Go to **Asset management > Setup > Work order > Work order types**.

2. On the Action Pane, select **New**.

3. A new record is added to the list. Set the following values for it:

- **Work order type:** *Service*
- **Name:** *Service work orders*
- **Work order lifecycle state:** *Standard*

Step 4: Link the customer account to the parent project

You must now link the customer account to the parent project in the project setup in Asset management.

1. Go to **Asset management > Setup > Work orders > Project setup**.

2. On the **Parent project** tab, select **Add** to add a line.

3. On the new line, set the following values:

- **Customer account:** *US-013 (Pelican Wholesales)*
- **Project ID:** Enter the project ID that you made a note of earlier.

Step 5: Link the project group and type to the work order project

You should still be on the **Project setup** page (**Asset management > Setup > Work orders > Project setup**).

1. On the **Project group** tab, select **Add** to add a line.

2. On the new line, set the following values:

- **Work order type:** *Service* (the work order type that you created earlier)
- **Project group:** *TM*

NOTE

The project contract on the work order project is always inherited from the parent project.

Step 6: Link an asset to the customer ID

1. Go to **Asset management > Assets > Active assets**.

2. In the **Filter** field, enter *VE-102*, and select to filter by **Asset**.
3. Select the asset to open its settings.
4. On the **Customer** FastTab, set the **Customer account** field to *US-013 (Pelican Wholesales)*.

The **Name** field is automatically updated to *Pelican Wholesales*.

Step 7: Create a new work order on the asset

1. Go to **Asset management > Work orders > Active work orders**.
2. On the Action Pane, select **New**.
3. In the **Create work order** dialog box, set the following values:

- **Work order type:** *Service*
- **Description:** *Repair Truck*
- **Customer account:** *US-013 (Pelican Wholesales)*
- **Asset:** *VE-102*

NOTE

The lookup shows only assets that are linked to the selected customer account.

- **Maintenance job type:** *Repair*
 - **Trade:** *Mechanic*
 - **Service level:** *4*
4. Select **OK**.

Step 8: Review the work order and start to work on it

In this section, you will work on the work order that you created in the previous section.

1. Follow these steps to verify that the parent project is the *Pelican wholesales Work order* project:
 - a. In the **Work order maintenance jobs** section, select a line.
 - b. On the **Line details** FastTab, inspect the **Project ID** value. It should be a hyphenated number in the form *<Parent-Project-ID>-<Project-ID>*. This value is a link.
 - c. Select the project ID link to open a page where you can view the parent project and project names.
2. On the Action Pane, on the **Work order** tab, in the **Lifecycle state** group, select **Update work order state**.
3. In the **Update work order state** dialog box, in the **Select** column, select the check box for the row where the **Lifecycle state** field is set to *In progress*.
4. Select **OK**.
5. In the **Lifecycle state: InProgress** dialog box, select **OK**.

Step 9: Post the hours that were spent on the work order and create a new invoice proposal

In this section, you will continue to work on the work order that you worked on in the previous section.

1. On the Action Pane, on the **Work order** tab, in the **Project** group, select **Journals**.

The **Work order journals** page appears. Here, you can register the time that you spent on the work

order.

2. On the **Hours** FastTab, select **Add line**.
3. On the new, line, set the **Hours** field to *4*.
4. On the Action Pane, select **Post journals**.
5. Close the **Work order journals** page to return to the work order.
6. On the Action Pane, on the **Invoicing** tab, select **New invoice proposal**.
7. In the **Create invoice proposal** dialog box, in the **Project transactions** section, select the **Select** check box for every line that you want to invoice.
8. Select **OK** to close the dialog box and view the new invoice proposal.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Integrate asset management with fixed assets

2/18/2021 • 4 minutes to read • [Edit Online](#)

By integrating the **Asset management** and **Fixed assets** modules, you can link fixed assets with maintenance assets. Fixed assets users can then create a maintenance asset from a new or existing fixed asset, and Asset management users can associate a maintenance asset with an existing fixed asset. This feature also makes it easy for Fixed assets users to view the costs that were posted from work orders for related maintenance assets.

NOTE

In this topic, *maintenance assets* refer to assets from the **Asset management** module, and *fixed assets* refer to assets from the **Fixed assets** module.

Set a default location for new maintenance assets that are created from fixed assets (optional)

This optional configuration lets you set a default functional location for new maintenance assets that are created from fixed assets. You typically complete this configuration just one time, if you complete it at all.

To complete the configuration, follow these steps.

1. Go to **Asset management > Setup > Asset management parameters**.
2. On the **Fixed assets** tab, in the **Functional location** field, select the default location.
3. On the Action Pane, select **Save**.

Work with integrated maintenance assets and fixed assets

This section provides a collection of procedures that show various ways that you can work with the integrated Asset management and Fixed assets features.

Associate an existing maintenance asset with a fixed asset

To associate an existing maintenance asset with a fixed asset, follow these steps.

1. Go to **Asset management > Assets > All assets (or Active assets)**.
2. Select an asset.
3. On the **Fixed asset** FastTab, in the **Fixed asset number** field, select an existing fixed asset.
4. On the Action Pane, select **Save**.

View the fixed asset that is associated with a selected maintenance asset

To view the fixed asset that is associated with a selected maintenance asset, follow these steps.

1. Go to **Asset management > Assets > All assets (or Active assets)**.
2. Select an asset.
3. On the **Fixed asset** FastTab, in the **Fixed asset number** field, select the link.

The **Fixed assets** page for the selected asset is opened. (Typically, this page is found at **Fixed assets > Fixed assets > Fixed assets**.)

View the maintenance asset that is associated with a selected fixed asset

To view the maintenance asset that is associated with a selected fixed asset, follow these steps.

1. Go to **Fixed assets > Fixed assets > Fixed assets**.
2. Select an asset.
3. On the Action Pane, on the **Asset management** tab, in the **View** group, select **Maintenance asset**.

The **Maintenance asset** page for the asset that is associated with the selected fixed asset is opened.
(Typically, this page is found at **Asset management > Assets > All assets**.)

View maintenance costs that are associated with a fixed asset

Asset management work orders can be posted for maintenance assets, and each of those work orders typically has a cost. When a fixed asset is associated with a maintenance asset, you can go directly from the fixed asset to view the related costs.

To view the maintenance costs that are associated with a fixed asset, follow these steps.

1. Go to **Fixed assets > Fixed assets > Fixed assets**.
2. Select an asset.
3. On the Action Pane, on the **Asset management** tab, in the **View** group, select **Maintenance cost**.

The **Maintenance cost** page is opened and shows the related costs.

Create a new maintenance asset for an existing fixed asset

To create a new maintenance asset for an existing fixed asset, follow these steps.

1. Go to **Fixed assets > Fixed assets > Fixed assets**.
2. Select an asset.
3. On the Action Pane, on the **Asset management** tab, in the **New** group, select **Create maintenance asset**.
(If this option is unavailable, a maintenance asset might already be associated with the selected fixed asset.)
4. Finish creating the asset as described in [Create an asset](#).

Create a new fixed asset and add a new maintenance asset for it

To create a new fixed asset and add a new maintenance asset for it, follow these steps.

1. Go to **Fixed assets > Fixed assets > Fixed assets**.
2. On the Action Pane, select **New**.
3. Finish creating the fixed asset as described in [Create a fixed asset](#).
4. On the Action Pane, on the **Asset management** tab, in the **New** group, select **Create maintenance asset**.
5. Finish creating the asset as described in [Create an asset](#).

Remove the association between two assets

In some cases, you might have to disassociate a maintenance asset from its fixed asset. For example, if you want to [create a new maintenance asset](#) from a fixed asset, you must first remove any existing association.

To remove an existing association between a maintenance asset and a fixed asset, follow these steps.

1. Go to **Asset management > Assets > All assets** (or **Active assets**).
2. Find and open the fixed asset.
3. On the **Fixed asset** FastTab, clear the value from the **Functional location** field.
4. On the Action Pane, select **Save**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Preventive maintenance overview

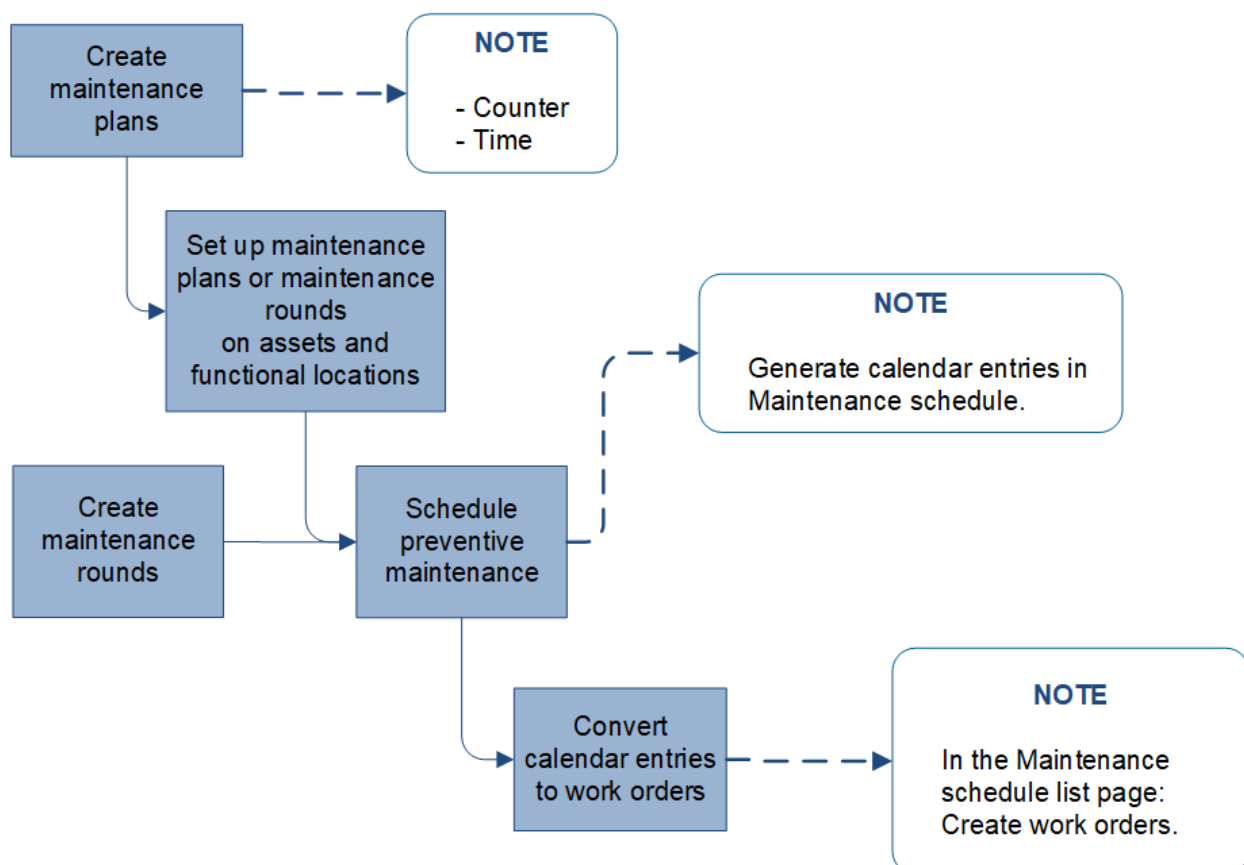

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains preventive maintenance in Asset Management. Preventive maintenance is a discipline involving planned maintenance jobs, for example, regular service, calibration, and inspections. In **Asset Management**, you can create maintenance plans and set them up on assets and functional locations. You can also set up maintenance rounds on functional locations. Maintenance plans on assets are active regardless of where the asset is installed. Maintenance plans and maintenance rounds on functional location are active for the assets currently installed at the location. Instead of setting up maintenance plans on assets, or setting up maintenance rounds on functional locations, you can create maintenance rounds that include multiple assets on which you need to perform related types of maintenance jobs in the same work routine. Maintenance rounds created from assets - instead of created on functional locations - means that you can select a number of assets for one maintenance round, which are not installed on the same functional location.

Maintenance plans are used for preventive and reactive maintenance on individual assets. Maintenance rounds are used for preventive maintenance on a group or a set of assets. Maintenance plans and maintenance rounds are used for generating work order proposals. The work order proposals are saved as maintenance schedule lines, which can be bundled and converted into work orders.

The following illustration provides an overview of the work flow from creating maintenance plans and maintenance rounds to creating work orders for assets, based on those maintenance plans and maintenance rounds.

Flow Diagram: Schedule Preventive Maintenance Work Orders

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance plans

2/18/2021 • 23 minutes to read • [Edit Online](#)

A maintenance plan defines when a pre-planned preventive maintenance job is to be carried out on an asset. Maintenance plans can be related to assets, asset types, functional locations, or functional location types, but first you create the maintenance plans to be used in your company.

A maintenance plan can have multiple maintenance plan lines. Maintenance job type and interval are specified on the maintenance plan line. There are two types of maintenance plan lines:

- Time
- Counter

Maintenance plan lines of type "Time" are used for recurring planned maintenance based on a fixed time interval. Maintenance plan lines of type "Counter" are used for planned maintenance or reactive maintenance based on asset counter registrations. A maintenance plan may include several maintenance plan lines of both types.

NOTE

If no counter values have been registered for a counter type on an asset, the maintenance plan lines are omitted.

First, you create the maintenance plans you require for your preventive maintenance jobs and select the asset types, assets, functional location types, and functional locations that should be related to each maintenance plan. Afterwards, if required, you can also add maintenance plans to an asset or a functional location, which is done in **All assets** > select asset > **Asset maintenance plans** FastTab, or **All functional locations** > select functional location > **Maintenance plans** FastTab.

If you add a maintenance plan to asset types or functional location types, it means that when you create new assets or functional locations with those asset types or functional location types, the asset or functional location will automatically be added to the maintenance plan. The start date of the relation to a maintenance plan will be the current date, which may need to be adjusted.

Set up maintenance plans

This section describes how to set up maintenance plan lines and provides examples of how they can be used.

1. Go to **Asset management** > **Setup** > **Preventive maintenance** > **Maintenance plans**.
2. Select **New** to create a new sequence.
3. Insert an ID in the **Maintenance sequence** field, and a name in the **Name** field.
4. In the **Plan date** field, insert the start date from which planning can be done on the maintenance plan. Note that time-based maintenance plan lines may have other plan dates.
5. Select "Yes" in the **Active** toggle button to activate the maintenance plan.

NOTE

If you deactivate a maintenance plan, no schedule posts will be created in the maintenance schedule when you run a schedule maintenance plan job.

6. The **Tolerance days before** and **Tolerance days after** fields relate to maintenance plan lines in which the **Suppress overlapping maintenance jobs** check box is selected (refer to step 17). The "Tolerance" fields are used to extend the interval in days in which, if several maintenance plans overlap, the most comprehensive / largest job is created as a maintenance schedule line during maintenance plan scheduling, while more frequent, overlapping jobs are omitted during maintenance plan scheduling. Insert number of days in the **Tolerance days before** field, for example "2".
7. If you have inserted a value in **Tolerance days before**, also insert number of days in the **Tolerance days after** field, for example "2".

NOTE

The example described in this and the previous step means that if several maintenance plan lines overlap, and **Suppress overlapping maintenance jobs** is selected for one or more lines, the period of omitting maintenance schedule lines is extended to a total of five days (the expected start date on the maintenance schedule line *and two days before and two days after* that date).

8. The fields in the **Details** group on the **Details** FastTab show number of maintenance plan lines set up on the maintenance plan, and number of assets and functional locations related to the maintenance plan.
9. On the **Lines** FastTab, select **Add time line** or **Add asset counter line** to create a new maintenance plan line.
10. Insert a description for the line in the **Work order description** field. The description is transferred to related work orders.
11. In the **Maintenance job type** field, select the job type to which the maintenance plan line is related.
12. In the **Maintenance job type variant** and **Trade** fields, select the variant and trade related to the maintenance job type.
13. In the **Finish within days** and **Finish within hours** fields, you can insert expected end date in days or hours. The expected end date is inserted relative to the expected start date, which is calculated when maintenance schedule lines are created. For example, you can insert "7" in the **Finish within days** field to indicate that the related job should be completed within a week from the expected start date.
14. In the **Interval type** field, select the type of interval to be used on the maintenance plan line, for example, "Repeated..." or "Once...". Refer to the [Interval types overview](#) table below for a description of the relation between interval types and line types.
15. The **Period** field only relates to time-based line types. Select the period type related to the period frequency.
16. In the **Period frequency** field, insert the number of times the line should be used for planning preventive maintenance jobs. Example: If you have created a line of type "Counter", and your counter is production quantity, and you insert the number "20000" in this field, new maintenance sequence lines are created during preventive maintenance scheduling every time you are expected to produce 20,000 more items.
17. The **Suppress overlapping maintenance jobs** check box relates to time-based as well as counter-based line types. Select the check box to delete maintenance schedule entries that are created on the same date. This is relevant if, for example, you have created a 1-month inspection line, a 6-month inspection line, and a 1-year inspection line. For the 1-year inspection you only want that inspection to be done, not the other two inspections, which would also fit in the time frame. In order to set up this example correctly, you set up the 1-year inspection line as the first line, the 6-month line as the second line, and the 1-month line as the third line, and you select the **Suppress overlapping maintenance**

jobs check box for the 1-month and 6-month lines. That way you ensure that when you reach the 1-year mark, the inspections for one month and six months are omitted, and a maintenance schedule line is only created for the 1-year inspection line.

NOTE

The example described in this step shows that the most comprehensive job, which contains the largest number of tasks, and which is not done so often, should always be inserted as the first line. The more frequent jobs are then inserted as separate lines in the order of frequency, placing the most frequent job at the bottom of the list.

18. The **Counter** field only relates to counter-based line types. Select the counter type to be used on the line. If a counter type is not active on a related asset, the maintenance plan line is omitted.
19. The **Asset counter time fence in days** field only relates to counter-based line types. Insert a number that defines how many days back counter registrations are checked when maintenance plan scheduling is done. This means how far back are data (existing counter registrations) used as basis for calculating the trend that determines how many maintenance schedule lines are created.

Example: If counter registrations are expected to be made once a month, you may insert the number '365' in this field because maintenance plan scheduling will always be based on the last 12 months and therefore create maintenance schedule lines based on the trend of the past year. On the other hand, if you insert the number '10' in this field, you expect counter registrations to be made more often, for example, on a daily basis. This means that when you schedule maintenance plan, counter registrations for the last 10 days are used as the basis for the scheduling of maintenance schedule lines.

20. The **Plan date** field only relates to time-based line types. If the maintenance plan line has another planning date than the entire maintenance plan, select a date in the **Plan date** field on the line.
21. In the **Service level** field, you can select a work order service level as a further delimitation on the maintenance plan line - to be used as a service level on work orders.
22. Select the **Auto create** check box if you want a work order to be automatically created according to the selected maintenance plan line when scheduling maintenance plans.
23. If you have selected the **Auto create** check box, you can select a work order type for the auto-created work order in the **Work order type** field. If you have selected the **Auto create** check box, and you do not select a work order type in this field, the work order type selected in **Asset management > Setup > Asset management parameters > Work orders link > Preventive work order type** field is used.
24. Use the **Season from** and **Season to** fields to create a repeated time-based maintenance plan line within a 12-month period. *Example:* Equipment used for maintaining green areas requires service each spring within a predefined period. Insert the start date of the period to be repeated in the **Season from** field.
25. Insert the end date of the period to be repeated in the **Season to** field.
26. In the **Resulting period** field, the current period to be repeated is shown. When the current period has passed, and you start a new year, the period shown in this field will be updated to reflect the next period in the repeat sequence.
27. On the **Assets** FastTab, select the assets that should be related to the maintenance plan.
28. On the **Asset types** FastTab, select the asset types that should be related to the maintenance plan.

29. On the **Functional locations** FastTab, select the functional locations that should be related to the maintenance plan. If required, you can make the setup more specific by selecting a related asset type, manufacturer, and model.
30. On the **Functional location types** FastTab, select the functional location types that should be related to the maintenance plan.

NOTE

When work orders are manually created on assets that are covered by a vendor warranty, a dialog box is shown to make the user aware of the warranty. The creation of the work order can then be canceled. The check for a warranty relation is omitted for work orders that are automatically created.

Interval types overview

INTERVAL TYPE AND DESCRIPTION	LINE TYPE: TIME	LINE TYPE: COUNTER
<p>Interval type: Repeated from plan date The count starts from the plan date used. When you schedule maintenance plans, maintenance schedule lines are created when the interval is reached.</p>	<p>The Plan date on the maintenance plan line is used. If no plan date is selected on the line, the Plan date for the maintenance plan is used. Example: If the number "3" is inserted in the Period frequency field, and "Year" is selected in the Period field, a new maintenance schedule line will be created once every 3 years.</p>	<p>The Plan date for the maintenance plan is used. If the counter has been replaced, the latest replacement date is used as the plan date.</p>
<p>Interval type: Repeated from start date The count starts from the start date on the asset relation. The date is selected in the All asset details view > Asset maintenance plans FastTab > Start date field, or in the All functional locations details view > Maintenance plans FastTab > Start date field. When you schedule maintenance plans, a maintenance schedule line is created when the interval is reached.</p>	<p>The start date of the maintenance plan line on asset or functional location is used. If that field is blank, the Plan date for the maintenance plan is used.</p>	<p>The start date of the maintenance plan line on asset or functional location is used. If that field is blank, the Plan date for the maintenance plan is used.</p>
<p>Interval type: Repeated from last work order The count starts from the actual end date and time of the latest work order that was completed on the asset with that specific maintenance job type / maintenance job type variant / trade combination. That date and time is shown in the Actual end field in the All work order details view.</p>	<p>The actual end date and time of the work order completed on the asset with that specific maintenance job type / maintenance job type variant / trade combination. If no completed work order is found, one of the dates used in the "Repeated from start date" interval type described above is used instead.</p>	<p>The actual end date and time of the work order completed on the asset <i>and</i> the maintenance job type / maintenance job type variant / trade combination. is used. If the end date and time was left blank on the work order, one of the dates used in the "Repeated from start date" interval type described above is used instead.</p>

INTERVAL TYPE AND DESCRIPTION	LINE TYPE: TIME	LINE TYPE: COUNTER
<p>Interval type: Once from plan date See description for the "Repeated from plan date" interval type above. Only difference is that this interval type is to be used only once.</p>	<p>See description for "Repeated from plan date" interval type above. This interval is typically used for a one-time maintenance or service job.</p>	<p>See description for "Repeated from plan date" interval type above. This interval is typically used for a one-time maintenance or service job. Note 1: This interval type is only relevant if the counter is replaced every time you carry out a maintenance or service job. If, for some reason, a counter has been replaced before the end of the planned interval, a new time is calculated for the job from the time of the counter replacement. Note 2: If the counter is replaced when completing the maintenance or service job, this interval type functions as the "Repeated from plan date" interval type above.</p>
<p>Interval type: Once from start date See description for the "Repeated from start date" interval type above. Only difference is that this interval type is to be used only once.</p>	<p>See description for "Repeated from start date" interval type above. This interval is typically used for a one-time maintenance or service job.</p>	<p>See description for "Repeated from start date" interval type above. This interval is typically used for a one-time maintenance or service job. Note 1 above also applies to this interval type. Note 3: If the counter is replaced when completing the maintenance or service job, this interval type functions as the "Repeated from start date" interval type above.</p>
<p>Interval type: Once reached above This interval type only relates to counters and is used for indicating an upper limit set up on the maintenance plan line. Maintenance schedule entries will have the expected start date and time of the counter registration, meaning these entries will be created with an expected start date equal to or earlier than the system date.</p>	<p>Not applicable</p>	<p>The counter interval indicates an upper limit. If that limit is exceeded when you create a counter registration, a maintenance schedule line is created when you schedule preventive maintenance.</p>
<p>Interval type: Once reached below This interval type only relates to counters and is used for indicating a lower limit set up on the maintenance plan line. Maintenance schedule entries will have the expected start date and time of the counter registration, meaning these entries will be created with an expected start date equal to or earlier than the system date.</p>	<p>Not applicable</p>	<p>The counter interval indicates a lower limit. If that limit is passed when you create a counter registration, a maintenance schedule line is created when you schedule preventive maintenance.</p>

INTERVAL TYPE AND DESCRIPTION	LINE TYPE: TIME	LINE TYPE: COUNTER
<p>Interval type: Linked from start date This interval type only creates a maintenance schedule line once. A maintenance plan can contain more maintenance plan lines using this interval type, and those lines are linked. Typically, you will create a maintenance plan that contains lines of only this interval type. Maintenance schedule lines are created by identifying the maintenance plan line that has the first expected start date and time.</p>	<p>See description for "Once from start date" above. Example: You create two lines in a maintenance plan for a service job on a car: one time-based line with a 1-year period, and one counter-based line with a 25,000 km limit. A maintenance schedule line is created for the limit that is reached first. For this line type you create the line with the 1-year period.</p>	<p>See description for "Once from start date" above. Example: You create two lines in a maintenance plan for a service job on a car: one time-based line with a 1-year period, and one counter-based line with a 25,000 km limit. A maintenance schedule line is created for the limit that is reached first. For this line type you create the line with the 25,000 km limit. Example creating two counter lines: You can also set up a maintenance plan with two linked, counter-based lines in which the first line has a limit of 10,000 items quantity produced, and the second line relates to the machine or work center requiring service after running 3,000 hours.</p>
<p>Interval type: Linked from last work order This interval type creates new maintenance schedule lines after every completed work order. A maintenance plan can contain more lines using this interval type, and those lines are linked. Typically, you will create a maintenance plan that contains maintenance plan lines of only this interval type. Maintenance schedule lines are created by identifying the maintenance plan line that has the first expected start date and time.</p>	<p>This interval type basically works as "Linked from start date" described above. Only difference is the date on which the interval type is based. The date used is the actual date and time on the latest work order completed on the asset <i>and</i> the maintenance job type / maintenance job type variant / trade combination.</p>	<p>This interval type basically works as "Linked from start date" described above. Only difference is the date on which the interval type is based. The date used is the actual date and time on the latest work order completed on the asset <i>and</i> the maintenance job type / maintenance job type variant / trade combination.</p>
<p>Interval type: Repeated on aggregated value (Counter only) When the maintenance plan is run, a scheduled maintenance line will be created each time that the accumulated value for an asset counter reaches the period frequency or an even multiple of the period frequency. (The period frequency is defined on the maintenance plan line.) For more information about how to enable and use this functionality, see the Counter-based maintenance enhancements section later in this topic.</p>	<p>Not applicable</p>	<p>Example: An hour counter is set up for asset AK-101. An asset plan line is also set up for the asset. The interval type of this line is <i>Repeated on aggregated value (Counter only)</i>, and the period frequency is <i>1000</i>. When the maintenance plan is run, a scheduled maintenance line will be generated when the aggregated value for the counter exceeds 1,000 hours. Then, when the aggregated value for the counter exceeds 2,000 hours, another scheduled maintenance line will be generated, and so on for every additional 1,000 hours.</p>

INTERVAL TYPE AND DESCRIPTION	LINE TYPE: TIME	LINE TYPE: COUNTER
<p>Interval type: Once on aggregated value (Counter only) When the maintenance plan is run, a scheduled maintenance line will be created when the accumulated value for an asset counter reaches the period frequency that is defined on the maintenance plan line.</p> <p>For more information about how to enable and use this functionality, see the Counter-based maintenance enhancements section.</p>	Not applicable	<p>Example: An hour counter is set up for asset AK-101. An asset plan line is also set up for the asset. The interval type of this line is <i>Once on aggregated value (Counter only)</i>, and the period frequency is <i>1000</i>. When the maintenance plan is run, a scheduled maintenance line will be generated when the aggregated value for the counter exceeds 1,000 hours.</p>

NOTE

When maintenance schedule lines are created for time-based maintenance plan lines, expected time is always at the start of the day. For counter-based maintenance plan lines, expected time can be anytime during the day.

Below you will find examples of the setup of time-based and counter-based maintenance plan lines:

Example 1 - Time-based maintenance plan line: A lubrication job may be set up in a fixed interval, occurring once a week. For that purpose, select "Repeated from plan date" in the **Interval type** field. See an example in the following illustration.

Line	Work order description	Line type	Maintenance job type	Maintenance job type	Trade	Finish within days	Finish within hours	Interval type	Period	Period frequency	Suppress over...
2.0	Weekly service	Time	Service	Service	Mechanical			Repeated from plan date	Day	7	<input type="checkbox"/>

Example 2 - Time-based maintenance plan line: An inspection job may be set up to be carried out approximately once a week. For that purpose, select "Repeated from last work order" in the **Interval type** field. See an example in the following illustration.

Line	Work order description	Line type	Maintenance job type	Maintenance job type	Trade	Finish within days	Finish within hours	Interval type	Period	Period frequency	Suppress over...
2.0	Weekly inspection	Time	Inspection	Inspections	Mechanical			Repeated from last work order	Day	7	<input type="checkbox"/>

Example 3 - Counter-based maintenance plan line: The following graphic illustration shows an hour counter for which a new maintenance schedule line is created each time 250 hours have passed. The interval type for this counter-based line is "Repeated from start date". The start date is the start date of the related assets in the **All assets** details view > **Asset maintenance plans** FastTab > **Start date** field, or in the **Functional location** details view > **Maintenance plans** FastTab > **Start date** field. This is an example of a *preventive* maintenance plan because the maintenance schedule line is automatically created each time the threshold (+ 250) is reached.

Counter Repeated

Repeated example: a hour counter with repeated thresholds at 250, 500, and 750 hours

Example 4 - Counter-based maintenance plan line: The following graphic illustration shows a decrease in counter value, measuring brake pad wear. A maintenance schedule line is created when a counter registration below 20 mm is created on the brake pad. The interval type for this counter-based line is "Once reached below" or "Once from last start date". This is an example of a *reactive* maintenance plan because the maintenance schedule line is not created until a measurement below 20 mm is registered.

Counter Replaced

Break pad example: Pads are replaced when height is below 20 mm. New breake pads have height 85 mm.

Example 5 - Counter-based maintenance plan line: The following graphic illustration shows a counter with a threshold of -18° Celsius. A maintenance schedule line is created when a counter registration above -18° Celsius is made. The interval type for this counter-based line is "Once reached above". This is an example of a *reactive* maintenance plan because the maintenance schedule line is not created until a measurement higher than -18° Celsius is registered.

Counter Once Reached

- When you create a new asset, and that asset uses an asset type related to a maintenance plan, the maintenance plan is automatically inserted in **All objects > Asset maintenance plans** FastTab. Also, in the **Asset type defaults**, on the **Maintenance plans** FastTab, the related maintenance plans will automatically be inserted.
- If you add or remove asset types or functional location types in **Maintenance plans**, that change will only reflect on new assets created after you made the change.
- If you add or remove assets or functional locations in **Maintenance plans**, that change will automatically be updated in **All assets > Asset maintenance plans** FastTab, or in **All functional locations > Maintenance plans** FastTab.

The following illustration shows an example of a "Truck service" maintenance plan on the **Maintenance plans** page.

The screenshot shows the 'Truck service' maintenance plan configuration in Dynamics 365. The left sidebar lists various maintenance plans, with 'Truck Serv' selected. The main area displays the configuration for 'Truck service'.

MAINTENANCE PLANS
Maintenance plan Name
Truck Serv Truck service

Details

PLANNING	SKIP TOLERANCE	DETAILS
Plan date 1/1/2016	Tolerance days before 0	Lines 2
Active Yes <input checked="" type="checkbox"/>	Tolerance days after 0	Assets 22
		Functional locations

Lines

Line	Work order description	Line type	Maintenance job type	Maintenance job type variant	Trade
1.0	20000 km service	Counter	Service	Service 20000 km	Mechanical
2.0	4000 km service	Counter	Service	Service 4000 km	Mechanical

Assets

Asset	Start date
T0001	7/17/2019
T0002	7/17/2019

Add a maintenance plan to an asset

1. Go to **Asset management > Common > Assets > All assets** or **Active assets**.

2. Select the asset on which you want to set up a maintenance plan and select **Edit**.
3. On the **Asset maintenance plans** FastTab, select **Add line** to add a maintenance plan to the asset.
4. In the **Maintenance plan** field, select the relevant maintenance plan.
5. In the **Start date** field, select the date from which planning of preventive maintenance jobs can be done.
6. Select **Save**. The **Active** field is automatically updated.

The following illustration shows an example of maintenance plans set up on an asset on the **All assets** page.

The screenshot displays the 'Asset maintenance plans' section for asset 'C0003: Conveyor Belt 0003'. The table below shows the configured maintenance plans:

Maintenance plan	Active	Start date
Conveyor Insp	Yes	7/17/2019
Conveyor Lub	Yes	7/17/2019

Counter-based maintenance enhancements

IMPORTANT

The functionality that is described in this section is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

The *Counter-based maintenance enhancements* feature introduces the following functionality:

- The option to automatically insert a counter that has a value of 0 (zero) when an asset is created. This option can be useful when you use predictive maintenance that is based on counters. When the *Counter-based maintenance enhancements* feature isn't used, counters that have a value of 0 (zero) must be manually inserted.
- The ability to configure a counter so that it's automatically reset when a work order is completed. This functionality is useful when you want to schedule maintenance based on the aggregated value since the last

work order was completed.

- A new type of maintenance plan interval that is named *Repeated on aggregated value (Counter only)*. This type triggers maintenance each time that an aggregated counter reaches a multiple of a specific value. For example, maintenance can be triggered every 10,000 hours. For more information, see the [Interval types overview](#) section earlier in this topic.
- Another new type of maintenance plan interval that is named *Once on aggregated value (Counter only)*. This type triggers maintenance when an aggregated counter reaches a specific value, such as 8,000 hours. For more information, see the [Interval types overview](#) section.

Turn on the Counter-based maintenance enhancements feature

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Asset Management*
- **Feature name:** *(Preview) Counter-based maintenance enhancements*

Create and initialize counters when an asset is created

Each time that you create an asset, related asset counters that are initialized to a value of 0 (zero) can automatically be created, provided that you set up your system and create the asset correctly.

1. Go to **Asset management > Setup > Asset types**.
2. Make sure that you have an asset type that is applicable to your planned new asset. Create an asset type as required. Make sure that all the relevant counters are selected on the **Counters** FastTab.
3. Go to **Asset management > Setup > Asset types > Counters**.
4. For each relevant counter, make sure that the **Total aggregate** field is set to *Sum*.
5. On the **All assets** page, create the asset.
6. Set the **Asset type** field to the asset type that you identified or created in step 2.
7. Finish setting up the new asset as required.
8. Go to **Asset management > Inquiries > Assets > Counters**. You should be able to find the initialized counters that are set up for your new asset.

NOTE

When initialized asset counters are created, the assumption is that the asset had never been used before it was added to the system. When the maintenance schedule is run for the first time, the calculation uses the date and the 0 (zero) counter value as a baseline for calculating future maintenance. If the asset wasn't new when it was added to the system, you can manually adjust the counter value so that it matches the actual counter value. To adjust a counter value, open the relevant asset on the **All assets** page, and then, on the Action Pane, on the **Asset** tab, in the **Preventative** group, select **Counters**. On the **Asset counters** page for the selected asset, adjust the value in the **Value** column for the initial counter record as required.

Automatically reset a counter value

You can configure the system to automatically reset a counter each time that a relevant work order reaches a selected status value.

1. Go to **Asset management > Setup > Preventive maintenance > Maintenance plans**.
2. In the list pane, select a maintenance plan. The counter reset will apply to all assets that use this plan.
3. In the **Lines** section, find an asset counter line that you want to reset a counter for, and select the **Reset counter** check box for that line. (Asset counter lines have a value in the **Counter** column. The counter that is specified in that column is the counter that will be reset for the relevant asset.)
4. Go to **Asset management > Setup > Work orders > Lifecycle states**.

5. In the list pane, select the work order lifecycle state that the relevant counter should be reset at.
6. On the **General** FastTab, set the **Reset counter** option to *Yes*.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule maintenance plans

2/18/2021 • 4 minutes to read • [Edit Online](#)

Preventive maintenance scheduling generates calendar entries on assets, based on the maintenance plans set up on the assets. You can schedule calendar entries based on selected maintenance plans, asset types, and assets.

1. Click **Asset management > Periodic > Preventive maintenance > Schedule maintenance plans**.
2. You can select a time interval in the **Period** and **Period frequency** fields.

NOTE

The **Period** and **Period frequency** fields indicate how far ahead in time you want maintenance schedule lines to be created, based on the maintenance plans you have created (time-based or counter-based). In the figure below, maintenance schedule lines (= work order proposals) are created from the current date and three months onwards.

3. Select "Yes" on the **Auto create if specified in the line** toggle button if work orders should automatically be created according to the maintenance plan line.

NOTE

If this toggle button is set to "Yes", *and* the **Auto create** check box is also selected on maintenance plan lines in **Maintenance plans**, work orders are created based on the maintenance plan lines, and maintenance schedule lines with status "Work order created" are also created. If only one option is selected (**Auto create if specified in the line** toggle button in this dialog or **Auto create** check box in **Maintenance plans** form), only maintenance schedule lines are created with status "Created". In that case, no work orders are created.

4. It is possible to generate calendar entries based on maintenance plans (time or counter), assets, asset types, functional locations, and functional location types. Click the **Filter** button and make your selections, if required.
 - Regarding scheduling of maintenance plans on functional locations: If you update the setup of asset types, manufacturers, and models on maintenance plans in **All functional locations > Maintenance plans** FastTab after you have scheduled maintenance plans, existing maintenance schedule entries related to that functional location are automatically deleted. In order to create new calendar entries, which correspond with the updated maintenance plan setup on the functional location, you must run a new maintenance plan schedule for that functional location. Read more about the setup of asset types, manufacturers, and models on functional locations in [Create functional locations](#).

Example: You want to create a maintenance plan for a specific functional location, meaning all assets set up on that functional location at any given time will be included when you schedule the maintenance plan. In that case, you create a maintenance plan and select the specific functional location, but you do NOT add any assets in the maintenance plan. The result is that when you schedule that maintenance plan, maintenance schedule lines will be created for all the assets related to the functional location at that time.

- If you make changes to asset types, manufacturers and models in **Asset types**, those changes only affect new assets that use the updated asset type. Read more about asset type setup in [Asset types](#).
5. Click **OK** to start the generation of maintenance schedule entries on assets. The generated entries will be shown in the **All maintenance schedule** list page. The following illustration shows an example of the

Schedule maintenance plans dialog.

Run in the background v

- In the **Schedule maintenance plans** dialog, you can set up batch jobs on the **Run in the background** FastTab to automatically generate calendar entries at regular intervals.
- When you schedule preventive maintenance, maintenance schedule lines with expected start date and time earlier than the system date and time will not be created.

The figure below provides a graphic illustration of a time-based maintenance plan calculation.

Regarding counter-based maintenance plans: In the figures below, two different counter registration cycles are shown. They are based on a maintenance plan set up for asset "V0001", expecting the asset (a car) to run approx. 2,000 km every month.

In the first example, the expected 2,000 km are not reached every month. According to the counter-based maintenance plan, the threshold is 2,000 km, meaning when you run a maintenance plan scheduling, a maintenance schedule line should be created each time the 2,000-kilometer threshold is reached. In example 1, there are 4 registration lines, but the 2,000-kilometer threshold is only reached once. This means that when you run schedule maintenance plans this asset, for example for a 3-month period, only one maintenance schedule line will be created.

In the next figure, 2,000 km or more are registered every month. Therefore, three maintenance lines would be created if you schedule maintenance plans for this asset for a 3-month period.

The examples described here show that all counter registrations made on an asset show a trend describing wear and tear on the asset. That trend is used as calculation basis at the time of maintenance plan scheduling.

Asset	Functional location	Counter	Counter reset	Registered	Value	Unit	Aggregated value	Totals
V0001	NY-01-WH-1	Kilometers	<input type="checkbox"/>	7/10/2018 02:19:55 PM	1,000.00	km	1,000.00	1,000.00

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance rounds

2/18/2021 • 5 minutes to read • [Edit Online](#)

In **Asset Management**, you can create maintenance rounds for various assets, on which you need to carry out a similar task at regular intervals. For example, lubrication jobs or safety inspection jobs that need to be carried out on a number of machines within the same intervals. First step is to create a maintenance round, including assets that require the same form of maintenance job. Next, you schedule the maintenance rounds. When you have completed the maintenance rounds schedule, you can see all the job records relating to the round in the **All maintenance schedule** and **Open maintenance schedule lines**.

NOTE

Maintenance rounds can also be set up on functional locations to be completed on the assets installed on the functional location at the time of creation of the round-based work order. Refer to [Create functional locations](#) for more information on the setup of maintenance rounds on functional locations.

Set up a maintenance round

1. Click **Asset management > Setup > Preventive maintenance > Maintenance rounds**.
2. Click **New** to create a new maintenance round.
3. Insert an ID in the **Maintenance round** field, and a name for the maintenance round in the **Name** field.
4. Select a start date for the round in the **Start date** field.
5. In the **Finish within days** and **Finish within hours** fields, you can insert expected end date in days or hours. The expected end date is calculated relative to the start date, which is calculated when maintenance schedule lines are created. For example, you can insert "7" in the **Finish within days** field to indicate that the related job should be completed within a week from the start date.
6. Select "Yes" on the **Auto create** toggle button if work orders should automatically be created from maintenance schedule lines that are created from this maintenance round.
7. In the **Work order type** field, select the work order type to be used on work orders created from this maintenance round.
8. In the **Service level** field, select the work order service level to be used on work orders created from this maintenance round.
9. On the **Asset lines** FastTab, click **Add** to add an asset to the maintenance round.
10. A line number is automatically inserted in the **Line number** field to indicate the sequence of the assets in maintenance round.
11. Select the asset in the **Asset** field.
12. Select the maintenance job type for the asset in the **Maintenance job type** field.
13. If required, select **Maintenance job type variant** and **Trade** related to the maintenance job type.
14. Select the recurrence (day, week, etc.) in the **Period type** field.

15. In the **Period frequency** field, insert the number of recurrences for the maintenance round. Example: If you have selected "Day" in the **Period type** field, and you insert the number "7" in this field, new maintenance round lines are created during preventive maintenance scheduling once a week.
16. Select a start date for the asset to be included in the maintenance round in the **Start date** field. This date may differ from the start date set on the maintenance round.
17. Repeat steps 9-16 to add more assets to the maintenance round.
18. On the **Functional location lines** FastTab, click **Add** to add a functional location to the maintenance round. Refer to the description of the related fields above. The same fields are available as for creating an asset line, but you can also select **Manufacturer** and **Model** for a functional location, if required. If you only select a functional location on a line, but make no selections in **Asset type**, **Manufacturer**, **Model**, **Maintenance job type**, **Maintenance job type variant** and **Trade**, all assets related to that functional location at the time of maintenance scheduling will be included in the maintenance round.
19. On the **Pools** FastTab, click **Add** to select a work order pool to be included in the maintenance round. Several work order pools can be connected to one maintenance round.
20. Save your setup.

NOTE

The **Assets** and **Lines** fields located in the **Details** group on the **Header** FastTab show the total number of assets and lines related to the selected maintenance round.

The illustration below shows an example of a maintenance round containing three assets.

Line number	Asset	Maintenance job type	Maintenance job type variant	Trade	Period type	Period frequency	Start date
1	CD006	Inspection	Inspections	2-Month	Month	2	8/19/2019
2	CD007	Inspection	Inspections	2-Month	Month	2	8/19/2019
3	CD008	Inspection	Inspections	2-Month	Month	2	8/19/2019

Schedule maintenance rounds

When you've set up a maintenance round, you run a schedule job to schedule all the jobs related to the maintenance round.

1. Click **Asset management > Periodic > Preventive maintenance > Schedule maintenance rounds**, or **Asset management > Common > Maintenance schedule > All maintenance schedule** or **Open maintenance schedule lines** or **Open maintenance schedule pools > select**

maintenance schedule line in the list > **Maintenance rounds** button.

2. In the **Period** field, select the period type to be used for the scheduling job.
3. In the **Period frequency** field, insert the number of periods to be included in the scheduling job. The start of the scheduling is the current date.
4. Select "Yes" on the **Auto create** toggle button if a work order should automatically be created on the basis of a maintenance round.

NOTE

If this toggle button is set to "Yes", and the **Auto create** toggle button is also set to "Yes" on the maintenance round in **Maintenance rounds** form, work orders are created based on the maintenance round lines, and maintenance schedule lines with status "Work order created" are also created. If only one of the **Auto create** toggle buttons is set to "Yes", in this drop-down or in **Maintenance rounds**, only maintenance schedule lines are created with status "Created". In that case, no work orders are created.

5. If required, you can select specific rounds or another start date for the schedule job. Click **Filter**, and add the rounds to be included.
6. Click **OK**.
7. You are now able to see the maintenance rounds jobs in **Asset management > Common > Maintenance schedule > All maintenance schedule** or **Open maintenance schedule lines**. If the scheduled rounds are connected to a work order pool, you also see maintenance schedule lines in **Open maintenance schedule pools**. Maintenance schedule lines created from a round have the reference type "Maintenance rounds".

The two illustrations below show a schedule job in the **Schedule maintenance rounds** dialog, and the maintenance schedule lines created in **All maintenance schedule** based on that schedule job.

8/5/2020 07:00:00 AM	C0008	Inspection	2-Month		0.00	CH-BP2-02	Maintenance rounds	CB-001

- When work orders are manually created on assets that are covered by a vendor warranty, a dialog box is shown to make the user aware of the warranty. The creation of the work order can then be canceled. The check for a warranty relation is omitted for work orders that are automatically created.
- You can set up a batch job on the **Run in the background** FastTab to schedule rounds at regular intervals.
- If a round is included in several work order pools (refer to [Work order pools](#)), one record is shown for each pool in **Open maintenance schedule pools**. This is done to optimize the filtering options for work order

pools.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance schedule

2/18/2021 • 2 minutes to read • [Edit Online](#)

The maintenance schedule contains a list of all the expected preventive maintenance plans, maintenance requests, and maintenance rounds to be carried out. Some schedule lines may have been converted to work orders.

The four maintenance schedule views are slightly different, depending on which maintenance schedule lines you want to see.

MENU ITEM	DESCRIPTION OF CONTENTS
All maintenance schedule	All maintenance schedule lines are shown.
My asset schedule	All maintenance schedule lines containing assets installed on functional locations to which you are related as a worker (set up in Maintenance workers and worker groups) are shown in this list.
Open maintenance schedule lines	Maintenance schedule lines with status "Created" - meaning they have not yet been converted to a work order or discarded - are shown in this list.
Open maintenance schedule pools	Maintenance schedule lines related to a work order pool are shown in this list.

NOTE

If a maintenance schedule line is included in several work order pools (refer to [Work order pools](#)), one record is shown for each pool in **Open maintenance schedule pools**. This is done to optimize filtering options on work order pools.

To open a maintenance schedule:

1. Click **Asset management > Common > Maintenance schedule > All maintenance schedule** or **Open maintenance schedule lines** or **Open maintenance schedule pools**.
2. To update the maintenance schedule, click **Maintenance plan** or **Maintenance rounds**.
3. You can edit a maintenance schedule line by selecting it and clicking **Edit**. For example, you can easily update the service level or the worker responsible for the job. You can only edit maintenance schedule lines that have not yet been connected to a work order.
4. You can delete a maintenance schedule line by selecting it in the list page and clicking **Delete**.
5. You can discard a maintenance schedule line by selecting it in the list page and clicking **Discard**. This function is useful if, for example, an asset has a 2,000 km maintenance plan and a 10,000 km maintenance plan. Then, you may want to discard the line created from the 2,000 km maintenance plan when it coincides with 10,000 km, 20,000 km, 30,000 km, and so on. If you discard a maintenance schedule line related to a maintenance plan, that line will never again appear when that maintenance plan is scheduled.
6. You can select a number of maintenance schedule lines in **All maintenance schedule** and click **Work order pool**, if you want all selected lines to be included in the same work order pool.

7. You can select a number of maintenance schedule lines in **All maintenance schedule** or **Open maintenance schedule lines** or **Open maintenance schedule pools** and click **Adjust schedule** if you want to make the same adjustments on several lines. You can change expected start and end dates, service level, and the responsible maintenance worker group or responsible maintenance worker related to the selected maintenance schedule lines.

- When a maintenance schedule line has been related to a work order, the work order ID will be displayed in the **Work order** field.
- In **All assets** details view > **Asset maintenance plans** FastTab, you can select maintenance plans for the asset. Later, if you delete a maintenance plan line related to an asset in **All assets**, you also automatically delete all maintenance schedule lines with status "Created" that have been created based on that maintenance plan. See also [Create an asset](#).

The illustration below shows the **All maintenance schedule** list page.

Expected start	Asset	Maintenance job type	Maintenance job type variant	Trade	Maintenance forecast	Functional location	Reference type	Reference ID	Description
7/18/2019 07:00:00 AM	CH-BP2-09	Inspection		Facility	0.00	CH-BP2-09	Maintenance requests	ITCO-00003	Packaging area light not working

Maintenance schedule cost

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can calculate budget costs on maintenance schedule lines. This is useful if you want to get an overview of expected costs, for example, costs relating to planned preventive maintenance jobs for the next year. The calculations are based on existing maintenance schedule lines of type "Maintenance plans" and "Maintenance rounds" and "Maintenance requests".

1. Click **Asset management > Inquiries > Assets > Maintenance schedule cost**.
2. In the **Maintenance schedule cost** dialog, you can select a **Financial dimension set** if you want to see costs grouped in financial dimensions.

NOTE

Financial dimension sets are set up in **General ledger > Chart of accounts > Dimensions > Financial dimension sets**.

3. You can use the **Level** field to indicate how detailed you want the maintenance schedule lines to be regarding functional locations. For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all maintenance schedule lines for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level. If you insert the number "0" in the **Level** field, you will see a detailed result showing all maintenance schedule lines on all the functional location levels to which they are related.
4. If you want to make a calculation for specific assets, click **Filter** on the **Records to include** FastTab, and select the relevant assets. If required, you can also specify an **Expected start** date for the cost calculation or select a different **Status** for the cost calculation
5. Click **OK** to start the cost calculation.
6. On the **Maintenance schedule cost** tab > in the **Group by...** Action Pane groups, click the relevant buttons to show the required detail level of the cost calculation. The selected Action Pane group buttons are highlighted. Click on a button to activate or deactivate it.
7. Click the **Calculate cost** button if you want to make a new cost calculation.

The illustration below shows the results of a maintenance schedule cost calculation.

Creating work orders

2/18/2021 • 4 minutes to read • [Edit Online](#)

After you've scheduled preventive maintenance jobs, the next step is to create work orders for them. You can complete this step by using one of the maintenance schedules. The scheduled jobs in a maintenance schedule can have different reference types, as described in the following table.

REFERENCE TYPE	DESCRIPTION
Maintenance plans	Preventive maintenance jobs that are based on the <i>Time</i> or <i>Counter</i> maintenance plan type.
Maintenance rounds	Preventive maintenance jobs that contain several assets that require a similar type of maintenance.
Maintenance request	A manually created request for maintenance or repair of an asset. This request can be converted to a work order.

Create work orders based on your maintenance schedule

To create work orders that are based on your maintenance schedule, follow these steps.

1. Open one of the following pages, depending on how you want to select schedule items for your work orders:
 - All maintenance schedule (**Asset management > Management schedule > All maintenance schedule**)
 - Open maintenance schedule lines (**Asset management > Management schedule > Open maintenance schedule lines**)
 - Open maintenance schedule pools (**Asset management > Management schedule > Open maintenance schedule pools**)
2. In the grid, select the check box for every scheduled maintenance job that you want to create a work order for. Then, on the Action Pane, select **Work order**.

The **Create work orders** dialog box appears. The **Maintenance forecast hours** field shows the total number of forecast hours for the selected lines.

3. In the **Parameters** section, specify the number of work orders that should be created. Select one of the following options:
 - **One work order per line** – Create one work order per maintenance schedule line.
 - **One work order per** – Create work orders that are grouped according to the settings of the other options that become available when you select this option.
4. In the **Work order type** field, select the work order type to use for all the work orders that you create.
5. Select **OK** to create the work orders according to your settings.

Group work order lines that are automatically created while a maintenance plan runs

IMPORTANT

The functionality that is described in this section is available as part of a preview release. The content and the functionality are subject to change. For more information about preview releases, see [One version service updates FAQ](#).

This feature lets you define rules for grouping work order lines under a single work order when the system is set up to generate work orders automatically, based on a maintenance plan. Previously, automatically generated work orders could contain only one line. However, you can now group work orders by, for example, asset, asset type, or functional location. (Manually generated work orders could already be grouped in this way, as described in the previous section of this topic.)

Enable grouping for automatically generated work orders

Before you can use this feature, it must be turned on in your system. Admins can use the [feature management](#) settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Asset Management*
- **Feature name:** *(Preview) Apply rules for grouping work orders while running a maintenance plan*

Set up grouping for automatically generated work orders

To set up grouping for automatically generated work orders, follow these steps.

1. Go to **Asset management > Setup > Preventative maintenance > Maintenance plans**.
2. For each plan where you want to generate grouped work orders, follow these steps:
 - a. Select the plan in the list pane.
 - b. On the **Lines** FastTab, make sure that the **Auto create** check box is selected on every line.
3. Go to **Asset management > Periodic > Preventive maintenance > Schedule maintenance plans**.
4. In the **Schedule maintenance plans** dialog box, in the **Period** section, specify the time horizon for the plan (how far to look ahead when finding scheduled maintenance jobs to generate work for).
5. Set the **Automatically create work order from schedule** option to *Yes*.
6. In the **Work order** section, select one of the following options:
 - **One work order per line** – Create one work order per maintenance schedule line. (This option provides the same functionality that is available when the *Apply rules for grouping work orders while running a maintenance plan* feature is turned off.)
 - **One work order per** – Create work orders that are grouped according to the settings of the other options that become available when you select this option.
7. If you want the options to apply when you run only some of your maintenance plans, on the **Records to include** FastTab, add filters as you require, just as you might do for other batch jobs in Microsoft Dynamics 365 Supply Chain Management.
8. On the **Run in the background** FastTab, set up batch and scheduling options as you require, just as you might do for other batch jobs in Supply Chain Management.
9. Select **OK** to run and/or schedule the selected maintenance plans.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Maintenance downtime activities

2/18/2021 • 6 minutes to read • [Edit Online](#)

Maintenance downtime is used to get an overview of the capacity required to carry out maintenance jobs on specific assets during a specific period. For example, you can create a maintenance downtime registration for Production line 10 in Production Hall 29-A on production site 02. The maintenance downtime registration has a start and end time indicating the period in which the assets related to the maintenance stop are not available for production.

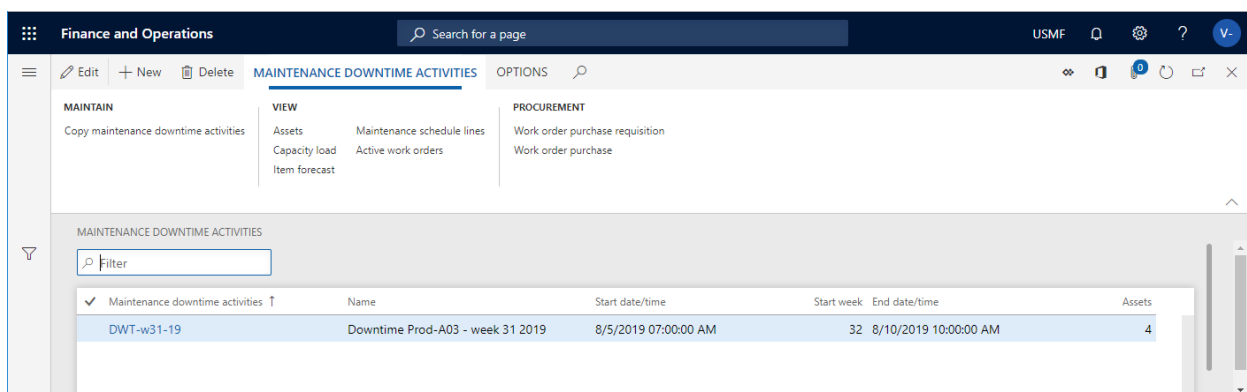

Maintenance downtime activities is an overview of maintenance schedule lines and work order maintenance jobs on related assets during a specified period. The lines related to work order maintenance jobs all have an expected start date within the maintenance stop period. You can extract useful information and make adjustments to planned maintenance jobs:

- Get an overview of required shut-down periods of production equipment (assets).
- Get an overview of planned maintenance (hours), grouped by competencies (responsible maintenance worker groups or maintenance workers), for example capacity load on electricians, smiths, or other maintenance work groups required to do the planned maintenance jobs.
- Make adjustments to maintenance schedule lines or work order maintenance jobs related to the assets, for example, change expected start and end times on a line, or select other maintenance workers to optimize the workflow for maintenance workers and maintenance worker groups.

When assets have been selected on a maintenance downtime registration, all open maintenance schedule lines and work order maintenance jobs relating to active work orders are included in the maintenance downtime registration.

Maintenance downtime activities

Click **Asset management > Common > Maintenance downtime activities > All maintenance downtime activities** to open a list of all maintenance downtime activities and see some of the information related to the activities. Click on a link in the **Maintenance downtime activities** column to open the details view. The illustration below shows an example of the **Maintenance downtime activities** list.

Maintenance downtime activities	Name	Start date/time	Start week	End date/time	Assets
✓ Maintenance downtime activities ↑					
DWT-w31-19	Downtime Prod-A03 - week 31 2019	8/5/2019 07:00:00 AM	32	8/10/2019 10:00:00 AM	4

Create a maintenance downtime activity

1. Click **Asset management > Common > Maintenance downtime activities > All maintenance downtime activities** or **Active maintenance downtime activities**.
2. Click **New**.

3. Insert an ID in the **Maintenance downtime activities** field and a name in the **Name** field.
4. Insert the period for the maintenance stop in the **Start date/time** and **End date/time** fields.
5. On the **Maintenance downtime activities assets** FastTab> click **Add line** to add assets, one at a time, to the maintenance downtime activity.
6. Click **Save** when all assets have been added. The illustration below shows an example of a maintenance downtime activity with related assets and maintenance jobs.
7. The work order maintenance jobs and open maintenance schedule lines related to the selected assets are shown on the **Resulting work order maintenance jobs** and **Maintenance schedule lines** FastTabs. On the **General** FastTab > **Work orders** group > **Maintenance forecast hours** field and **General** FastTab > **Maintenance schedule** group > **Maintenance forecast hours** field , you see the total number of hours forecasted for work order maintenance jobs and maintenance schedule lines.

The illustration below shows an example of the **Maintenance downtime activities** details view.

Maintenance Downtime Activities Details View

General

IDENTIFICATION	PERIOD	Start week	ASSETS	WORK ORDERS
Maintenance downtime activities DWT-w31-19	Start date/time 8/5/2019 07:00:00 AM	32	Assets 4	Work orders 2
Name Downtime Prod-A03 - week 31 ...	End date/time 8/10/2019 10:00:00 AM			Maintenance forecast hours 6.00
				ASSET CALENDARS Maintenance schedule lines Maintenance forecast hours 0.00

Maintenance downtime activities assets

Asset	Name	Asset type	Manufacturer	Model	Functional location
CH-BP1-01	Malting	Area			CH-BP1-01
CH-BP1-01-01	Steeping	Area			CH-BP1-01-01
C0001	Conveyor Belt 0001	Conveyor	Adatum		CH-BP1-01-01
C0004	Conveyor Belt 0004	Conveyor			CH-BP1-02

Resulting work order maintenance jobs

Expected start	Expected end	Work order	Asset	Functional location	Service level	Criticality	Maintenance job type
8/9/2019 02:00:00 PM	8/9/2019 05:00:00 PM	JPMF-00026	C0001	CH-BP1-01-01	10		Service Service
8/9/2019 02:00:00 PM	8/9/2019 05:00:00 PM	JPMF-00027	C0004	CH-BP1-02	10		Service Service

NOTE

The work order maintenance jobs and maintenance schedule lines related to the selected assets are automatically updated if new work orders or maintenance schedule lines are created after you created the maintenance downtime activity. For example, if you schedule maintenance plans or maintenance rounds on the related assets two days after the maintenance downtime activity was created, new maintenance schedule lines are automatically added to the maintenance downtime activity.

8. In **All maintenance downtime activities** > **Maintenance downtime activities** > select a maintenance downtime activity in the list and click **Capacity load** to open the **Calculate capacity load** dialog. Use this dialog to get an overview of capacity load on, for example, dates, assets, asset types, and maintenance job types. Note that the dates shown in the dialog are the start and end dates selected in

Maintenance downtime activities. This calculation includes the assets related to the maintenance downtime activity.

- In the **Calculate capacity load** dialog, edit start and end times if required, and select if you want to include work orders and maintenance schedules in the calculation. You can use the **Level** field to indicate how detailed you want the capacity load calculation to be regarding functional locations. For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all assets for a functional location, which are selected on the maintenance downtime activity, will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level. If you insert the number "0" in the **Level** field, you will see a detailed result showing all capacity load lines on all the functional location levels to which they are related.
- Click **OK** to start the calculation. The total number of hours is shown in the **Capacity load** overview. On the **Capacity load** tab > the **Group by...** Action Pane groups, click the relevant buttons to get a more detailed overview of the allocation of forecasted hours. The illustration below shows the results of a **Capacity load** calculation.

The screenshot shows the SAP Capacity Load overview for maintenance downtime activity DWT-W31-19 - DOWNTIME PROD-A03 - WEEK 31 2019. The table displays the following data:

Asset	Asset type	Functional location	Functional location type	Reference type	Maintenance job type	Hours
C0001	Conveyor	CH-BP1-01-01	Area	Work orders	Ad hoc	0.00
C0001	Conveyor	CH-BP1-01-01	Area	Work orders	Service	3.00
C0004	Conveyor	CH-BP1-02	Roller mill	Work orders	Service	3.00
CH-BP1-01	Area	CH-BP1-01	Area	Work orders	Ad hoc	0.00

- After you get an overview of the capacity load, if you want to make adjustments on work order maintenance jobs or maintenance schedule lines, return to the **Maintenance downtime activities** details view and select the lines you want to adjust on the **Resulting work order maintenance jobs** and **Maintenance schedule lines** FastTabs.
- Click the **Adjust** button and update expected start/end dates, service level, or responsible maintenance workers for the selected work order maintenance jobs or maintenance schedule lines.
- Click **OK** when you have made the required adjustments.

NOTE

Work order maintenance jobs and maintenance schedule lines that are not included in the maintenance downtime period after you have made adjustments are automatically removed from **Maintenance downtime activities**.

- In **All maintenance downtime activities** > **Maintenance downtime activities** > select a maintenance downtime activity in the list and click **Item forecast** to open the **Calculate item forecast** dialog. Use this dialog to calculate forecasts for items (spare parts and other required items) and group them to get an overview, for example, by date, asset, asset type, and maintenance job type. Note that the dates shown in the dialog are the start and end dates selected in **Maintenance downtime activities**. This calculation includes spare parts and items related to the assets that are selected on the maintenance downtime activity.
- In the **Calculate item forecast** dialog, edit start and end times if required, and select if you want to include work orders and maintenance schedules in the calculation. You can use the **Level** field to indicate how detailed you want the capacity load calculation to be regarding functional locations. For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all assets

for a functional location, which are selected on the maintenance downtime activity, will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level. If you insert the number "0" in the **Level** field, you will see a detailed result showing all capacity load lines on all the functional location levels to which they are related.

- Click **OK** to start the calculation. The total number of item forecasts is shown in the **Item forecast** overview. On the **Item forecast** tab > the **Group by...** Action Pane groups, click the relevant buttons to get a more detailed overview of the allocation of forecasted items. The illustration below shows the results of an **Item forecast** calculation.

Week	Asset	Asset type	Functional location	Reference type	Maintenance job type	Item number	Product name	Quantity	Unit
32	C0001	Conveyor	CH-BP1-01-01	Work orders	Service	C0002	Microsoft Arc™ Keyboard	1.00	ea
32	C0004	Conveyor	CH-BP1-02	Work orders	Service	C0002	Microsoft Arc™ Keyboard	3.00	ea

- You can copy assets from one maintenance downtime activity to another. In **All maintenance downtime activities**, select the **Copy maintenance downtime activities** button, and make your selections in the **From maintenance downtime activities** and **To maintenance downtime activities** fields, and click **OK**.
- In **All maintenance downtime activities**, click the **Maintenance schedule lines** button or the **Active work orders** button to open the related lists and view the lines related to the selected maintenance downtime activity.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Calculate capacity load

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can calculate capacity load on:

- maintenance schedule lines
- work orders that have not yet been scheduled
- scheduled work orders

This is useful if you want to get an overview of expected capacity load for a specific period. Calculation of capacity load can be done on all assets or selected assets. You can also make a calculation on maintenance downtime activities or work order pools.

1. Click **Asset management > Inquiries > Capacity load**, or **Asset management > Common > Work order pools > All work order pools / Active work order pools** > select work order pool in the list > **Capacity load** button, or **Asset management > Common > Maintenance downtime activities > All maintenance downtime activities / Active maintenance downtime activities** > select maintenance activity in the list > **Capacity load** button.
2. In the **Calculate capacity load** dialog, select a period for the calculation in the **Start date/time** and **End date/time** fields.
3. Select "Yes" on the **Include maintenance schedule** toggle button if you want to include maintenance schedule lines in the calculation.
4. Select "Yes" on the **Include work order** toggle button if you want to include work order jobs in the calculation.
5. You can use the **Level** field to indicate how detailed you want the capacity load lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all maintenance schedule lines and work orders for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all maintenance schedule lines and all work orders on all the functional location levels to which they are related.
6. Click **OK** to start the calculation.
7. In the **Group by...** groups, click the relevant buttons to show the required detail level of the calculation. In the screenshot below, the selected **Group by** buttons are highlighted in blue color. Click on a button to activate or deactivate it.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Calculate item forecast

2/18/2021 • 2 minutes to read • [Edit Online](#)

Just as you can make capacity load calculations, which are described in the previous section, you can also make item forecast calculations on:

- maintenance schedule lines
- work orders that have not yet been scheduled
- scheduled work orders

This is useful if you want to get an overview of expected item consumption (spare parts as well as other items required for completing work orders) for a specific period. Calculation of item forecast can be done on all assets or selected assets. You can also make a calculation on a maintenance downtime activity (**All maintenance downtime activities** or **Active maintenance downtime activities**), or on a work order pool (**All work order pools** or **Active work order pools**).

1. Click **Asset management > Inquiries > Item forecast**, or **Asset management > Common > Work order pools > All work order pools / Active work order pools** > select work order pool in the list > **Item forecast** button, or **Asset management > Common > Maintenance downtime activities > All maintenance downtime activities / Active maintenance downtime activities** > select maintenance downtime activity in the list > **Item forecast** button.
2. In the **Calculate item forecast** dialog, select a period for the calculation in the **Start date/time** and **End date/time** fields.
3. Select "Yes" on the **Include maintenance schedule** toggle button if you want to include maintenance schedule lines in the forecast calculation.
4. Select "Yes" on the **Include work order** toggle button if you want to include work order jobs in the forecast calculation.
5. You can use the **Level** field to indicate how detailed you want the item forecast lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all maintenance schedule lines and work orders for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all maintenance schedule lines and all work orders on all the functional location level to which they are related.
6. Click **OK** to start the calculation.
7. In the **Group by...** groups, click the relevant buttons to show the required detail level of the calculation. In the screenshot below, the selected **Group by** buttons are highlighted in blue color. Click on a button to activate or deactivate it.
8. Click the **Display dimensions** button if you want to see the product, storage, or tracking dimensions related to the items. Select the relevant check boxes, and click **OK**.

Maintenance worker calendar and scheduling

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you schedule work orders, you create a schedule for maintenance workers, tools, and assets. In order to schedule maintenance workers, a calendar must be set up for each maintenance worker. Maintenance workers are related to a resource, and working time calendars are set up for resources. You set up the resource and calendar in **Asset management > Setup > Workers > Workers**, which is described in [Maintenance workers and worker groups](#).

The screenshot below shows an example of a maintenance worker who is related to a resource that uses the working time calendar "Production".

The screenshot displays the SAP S/4HANA 'Workers' configuration page. The left sidebar shows a list of workers, with 'Pilar Pinilla' selected. The main area shows the configuration for 'Pilar Pinilla', including a table with 'Maintenance worker groups' (5) and 'Functional locations' (1). A red box highlights the 'General' section, which shows the 'RESOURCE' (1112) and 'SCHEDULE' (Production) fields. The description for this worker is 'Polishing worker 2'.

Calendar setup for tools and assets is not needed in relation to work order scheduling. The assumption is that tools and assets are available 24 hours a day for maintenance.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up preferred maintenance workers

2/18/2021 • 2 minutes to read • [Edit Online](#)

During work order scheduling, you can make a preference regarding which maintenance worker or worker group is allocated to complete the work order. The use of this functionality is optional, but it can help you make a choice for the most qualified maintenance worker to complete a job, based on worker skills and competencies. Only maintenance workers that are available at scheduling time will be scheduled. If a preferred maintenance worker setup matches a work order during scheduling, but the maintenance worker is allocated to other jobs, the work order will be scheduled to another available maintenance worker.

Before you can set up preferred maintenance workers, you must first set up the maintenance workers and worker groups. For a description about how to set up maintenance workers and worker groups, see to [Maintenance workers and worker groups](#).

Set up preferred workers

A preferred maintenance worker or worker group can be related to one or more of the following:

- trade
- maintenance job type variant
- maintenance job type
- maintenance job type category
- asset
- asset type

The more selections you make for the same record, the more specific your setup will be.

1. Click **Asset management > Setup > Workers > Preferred maintenance workers**.
2. Click **New** to create a new record.
3. Start by creating a "default" maintenance worker or worker group. This means that you only make a selection in the **Preferred maintenance worker group** field or the **Preferred maintenance worker** field. In the screenshot below, you see an example in the first record in which "Requests" is selected as **Preferred maintenance worker group**.

[!NOTE] The default setup will be used during work order scheduling if no other, more specific, combination matches the contents of the work order.

4. Repeat step 2 to create a new record. Make the required selections, depending on the detail level for the preferred worker or worker group.

Example: In the screenshot below, in the sixth record, the maintenance worker Shawn Richardson is selected as preferred worker. He will automatically be selected during scheduling of a work order that includes the asset "CH-BP1-03-02 and the maintenance job type "Facility assessment", if he is available at the scheduled time.

[!NOTE] Generally, when a preferred maintenance worker is selected during work order scheduling, Asset Management goes through all **Preferred maintenance workers** records to check for a possible match, always checking the most specific combination first. If no match is found, the "default" record with a selection in either the **Preferred maintenance worker group** field or the **Preferred maintenance worker** field is used.

PREFERRED MAINTENANCE WORKERS

Filter

✓	Asset type ↑	Asset ↑	Maintenance job type category ↑	Maintenance job type ↑	Maintenance job type variant ↑	Trade ↑	Preferred maintenance worker group ↑	Preferred maintenance worker
							Requests	
						Electrical	Electrical	
						Hydraulic	Hydraulic	
						Mechanical	Mechanical	
						Pneumatic	Pneumatic	
		CH-BP1-03-02		Facility assessment				Shawn Richardson
	Conveyor			Service			Electrical	

You can also set up *responsible* maintenance workers who can be selected when a maintenance request or a work order is created. You can edit the selection in **All work orders** and **All maintenance requests**, if required. For more information, see [Responsible maintenance workers](#).

During work order scheduling, different scores are calculated to determine which workers should complete the jobs related to a work order (those scores are set up in **Asset management parameters > Work order scheduling** link). If two or more preferred maintenance workers or responsible maintenance workers get the same score during work order scheduling, one worker is randomly selected. Otherwise, it is always the worker with the highest score who is allocated to complete a work order.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Schedule work orders

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic explains how to schedule work orders in Asset Management.

The required number of hours for a work order is defined by the sum of forecasted hours minus posted hours. If more time is required, the forecast must be adjusted accordingly. In **Asset management > Common > Work orders > All work orders** or **Active work orders**, you can view or edit forecasts on a work order by selecting the work order and clicking **Forecast** on the **Work order** tab. When work orders have been created and estimated, the next step complete the work orders is to allocate the required maintenance workers and tools.

Only work orders with a work order lifecycle state that allows scheduling can be scheduled. Allow scheduling is set up in **Asset management > Setup > Work orders > Lifecycle states > General FastTab > Allow scheduling** toggle button.

1. Click **Asset management > Common > Work orders > All work orders**.
2. Select the work orders you want to schedule in the list. For example, you can sort the list by **Current lifecycle state**.
3. On the **General** tab, click **Schedule**.
4. In the **Schedule work orders** dialog, you can add selections regarding expected start date and service level, if required. If the scheduling process should observe capacity limitations regarding resources already scheduled for other jobs, make sure that the **Asset**, **Tool**, and **Worker** toggle buttons are set to "Yes".

[!NOTE] If you set the **Asset**, **Tool**, and **Worker** toggle buttons to "No", existing reservations will be ignored. In the Infolog, a list of overlapping work order schedules will be shown, and you can click on the messages to open a work order and reschedule, if required.

5. To see detailed information about the scheduling process, select "Yes" on the **Verbose** toggle button. This means that detailed information about the calculated scores on the work orders and maintenance workers will be shown in the Infolog.
6. Click **OK** to start the scheduling process.
7. When scheduling is completed, an Infolog shows the number of work orders scheduled, and also more detailed information if the **Verbose** toggle button was set to "Yes".

NOTE

Work orders are scheduled in one cycle per work order, not per work order job. You can also open the **Schedule work orders** dialog directly in **Asset management > Periodic > Work orders > Schedule work orders**. Make your selections and click **OK** to start work order scheduling. It is possible to set up work order scheduling as a batch job in the **Schedule work orders** dialog > the **Run in the background** FastTab.

Example: In the figure below, the formula inserted in the **Expected start** field will generate work order scheduling for all work orders with expected start date a week from now and later. This formula may be useful when you run work order scheduling on an ongoing basis, but you want to make sure the work orders scheduled for the next 5-6 days are not rescheduled.

Run in the background v

The work order type related to work orders may set up scheduling for one maintenance worker (**Asset management** > **Setup** > **Work orders** > **Work order types** > **One maintenance worker** toggle button set to "Yes"). This means that if the work order type is used on a work order, the **One maintenance worker** toggle button is automatically set to "Yes" on the **All work orders** details page > **Header** view > **Schedule** FastTab. During work order scheduling, all work order jobs created on the work order will subsequently be scheduled to the same maintenance worker. If required, you can edit the selection on the **One maintenance worker** toggle button in **All work orders** to allow scheduling of several workers or one worker on the work order jobs.

The scheduling process in Asset Management includes several factors in the scheduling calculation:

- Calculating scores for both work orders and maintenance workers. Scores for work orders and maintenance workers are set up in **Asset management parameters**.
- Checking for matching competencies, meaning skills and certificates, required to perform the job. Skills and certificates are set up on maintenance workers in the **Human resources** module (**Human resources** > **Workers** > **Workers** > select worker in the list > **Worker** tab > **Competencies** section > **Skills** and **Certificates** buttons). Also, skills and certificates can be added to maintenance job types and maintenance job trades. Read more about competencies and maintenance job types in [Maintenance job type categories](#)

and maintenance job types, maintenance job type variants, maintenance job trades, and maintenance checklists.

Scores used in work order scheduling

Calculating scores for a work order job is based on expected start date and the service level of the work order.

Start date calculation: For every future date calculated from the expected start date, the start date score is subtracted and multiplied by the score, which is "10" in the examples below.

Criticality calculation: Criticality score multiplied by the criticality on the work order.

Service level calculation: Service level score divided by the service level on the work order.

In the examples below, the criticality score is "2", and the service level scores are "5" and "100".

Example 1:

WORK ORDER ID	EXPECTED START DATE	WORK ORDER CRITICALITY	WORK ORDER SERVICE LEVEL	CALCULATION	SCORE
WO-00010816	Tomorrow	2	20	$(-1 * 10) + (2 * 2) + 5 / 20$	- 5.75
WO-00010817	Two days from now	2	20	$(-2 * 10) + (2 * 2) + 5 / 20$	- 15.75
WO-00010818	Two days from now	3	5	$(-2 * 10) + (2 * 3) + 5 / 5$	- 13

The work orders will be scheduled in the following order: WO-00010816, WO-00010818, WO-00010817.

Example 2:

WORK ORDER ID	EXPECTED START DATE	WORK ORDER CRITICALITY	WORK ORDER SERVICE LEVEL	CALCULATION	SCORE
WO-00010816	Tomorrow	2	20	$(-1 * 10) + (2 * 2) + 100 / 20$	- 1
WO-00010817	Two days from now	2	20	$(-2 * 10) + (2 * 2) + 100 / 20$	- 11
WO-00010818	Two days from now	3	5	$(-2 * 10) + (2 * 3) + 100 / 5$	6

If the service level score is increased to '100' instead of '5', the scheduling order will be: WO-00010818, WO-00010816, WO-00010817.

The rating scores relating to calculating which maintenance workers should work on the work orders are all set up as numbers, which are added to each maintenance worker calculation during work order scheduling. The maintenance worker with the highest score is selected on the work order. Here is a short description of the maintenance worker scores:

MAINTENANCE WORKER SCORE	DESCRIPTION
Responsible worker	If the maintenance worker is selected as responsible worker on the work order, the score is added.

MAINTENANCE WORKER SCORE	DESCRIPTION
Responsible maintenance worker group	If the maintenance worker is part of the responsible maintenance worker group on the work order, the score is added.
Preferred maintenance worker	If the worker is selected as preferred maintenance worker on the asset, the score is added.
Preferred maintenance worker group	If the worker is part of the preferred maintenance worker group on the asset, the score is added.
Location	If your company uses functional locations, maintenance workers get full score if they are located on the functional location related to the asset. If the functional location of the asset has a parent location, maintenance workers on that functional location get 1/2 score. If that location also has a parent, maintenance workers on that location get 1/3 score. If that location also has a parent, maintenance workers on that location get 1/4 score, and so on. If you company uses asset location, which we do not recommend, location, area, and zone are used to calculate location scores. Workers get full score if they are located in the location and area and zone related to the asset. If worker location only matches location and area, the rating score for the maintenance worker is 2/3 of the full score. If maintenance worker location only matches location, the rating score for the maintenance worker is 1/3 of the full score.
Worker's start date	For every date that the scheduled start date is later than the expected start date, the score is subtracted.

NOTE

If a score is set to "0", that score is not calculated. This is useful if, for example, you do not want to include a responsible worker in your scheduling.

Competencies used in work order scheduling

Skills and certificate requirements can be set up on maintenance job types (**Asset management > Setup > Jobs > Maintenance job types**) and maintenance job trades (**Asset management > Setup > Jobs > Maintenance job trade**).

Maintenance job types and maintenance job trades are selected on work order jobs. If skills or certificates have been selected on a maintenance job type or maintenance job trade, and that maintenance job type or maintenance job trade is used on a work order job, only maintenance workers with matching skills and certificates are scheduled to work on the work order.

Work with scheduled work orders using a gantt chart

The **Scheduled work orders gantt chart** provides a graphical interface where you can view and reschedule your work orders.

To view and work with the gantt chart:

1. Go to **Asset management > Work orders > Scheduled work orders gantt chart**.

2. Use the drop-down lists and fields in the **Settings** section to set up which functional location, time span, and time scale to show in the gantt chart.
3. Select **Apply**.
 - The gantt chart updates to show the scheduled work orders that match your settings. Each work order is represented by a blue rectangle.
 - To reschedule a displayed work order, select and then drag it to the appropriate new date and time.
4. If you made any changes, select **Save** on the Action Pane to save them.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Dispatch work order

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can schedule one work order or work order jobs to one worker using the **Dispatch** functionality.

1. Click **Asset management > Common > Work orders > All Work orders** or **Active work orders**.
2. Select the work order in the list.
3. On the **General** tab, click **Dispatch**.
4. In the **Schedule work order** dialog, select the worker in the **Worker** field.
5. In the **Schedule hours** field, you can insert expected work hours in case expected work hours differ from forecast hours.
6. In the **Scheduled start** field, you can edit start date and time, if required.
7. If the scheduling process should observe capacity limitations regarding resources already scheduled on other jobs, make sure that the **Asset**, **Tool**, and **Worker** toggle buttons are set to **Yes**. If you want to see detailed information about the scheduling process, select **Yes** on the **Verbose** toggle button. This means detailed information about the calculated scores on the work order is shown in the Infolog.
8. Select **Yes** on the **Ignore schedule** toggle button to ignore closed days in the calendar (applies to asset, worker, and tools). Select **Yes** on the **Ignore scheduled execution** toggle button to ignore limitations that may have been selected on the work order regarding scheduling.

For information on the setup of scheduled execution, see the [Scheduled execution](#) section.

9. Click **OK**. The work order lifecycle state is automatically updated to the **Scheduled** lifecycle state specified **Asset management > Setup > Work orders > Lifecycle models**.

The figure below shows an example of dispatch selections in the **Schedule work order** dialog.

Schedule work order on specific date and time

2/18/2021 • 2 minutes to read • [Edit Online](#)

If a work order must be scheduled on a specific date *and* time, you can override the standard scheduling process in Asset Management and create a specific schedule for a work order.

1. Click **Asset management > Common > Work orders > All Work orders** or **Active work orders**.
2. In the work order list, click on the Work order ID in the **Work order** column.
3. Click **Edit**.
4. On the **Work order header** FastTab, insert start and end dates and times in the **Expected start** and **Expected end** fields.

The screenshot shows the 'Work order header' section of a software interface. At the top, it says 'ALL WORK ORDERS' and 'Work order: JPMF-00002'. Below this, there is a 'Work order header' section with two columns: 'SERVICE LEVEL' and 'EXPECTED'. Under 'SERVICE LEVEL', there is a 'Service level' dropdown menu with the value '20'. Under 'EXPECTED', there are two fields: 'Expected start' with the value '7/24/2019 07:00:00 AM' and a calendar icon, and 'Expected end' with the value '8/7/2019 07:00:00 AM' and a calendar icon.

5. On the **General** tab, click **Schedule** to use the standard scheduling process, or click **Dispatch** if you want to assign the work order to a specific worker.
6. In order to override any existing capacity reservations to ensure that the work order is scheduled in the expected period, make the selections as shown in the figure below in the **Schedule work order** dialog > **Finite capacity** section. This means that the scheduling process will ignore existing capacity reservations because the work order must start on the expected start time.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Scheduled work order maintenance jobs

2/18/2021 • 2 minutes to read • [Edit Online](#)

The **Scheduled work order maintenance jobs** page shows an overview of the work orders allocated to a resource. Work orders using resource types "Human resources", "Tool", and "Machine" are shown. For example, if a maintenance worker calls in sick, you can use this page to quickly find work orders allocated to the worker, and then allocate another maintenance worker to the job.

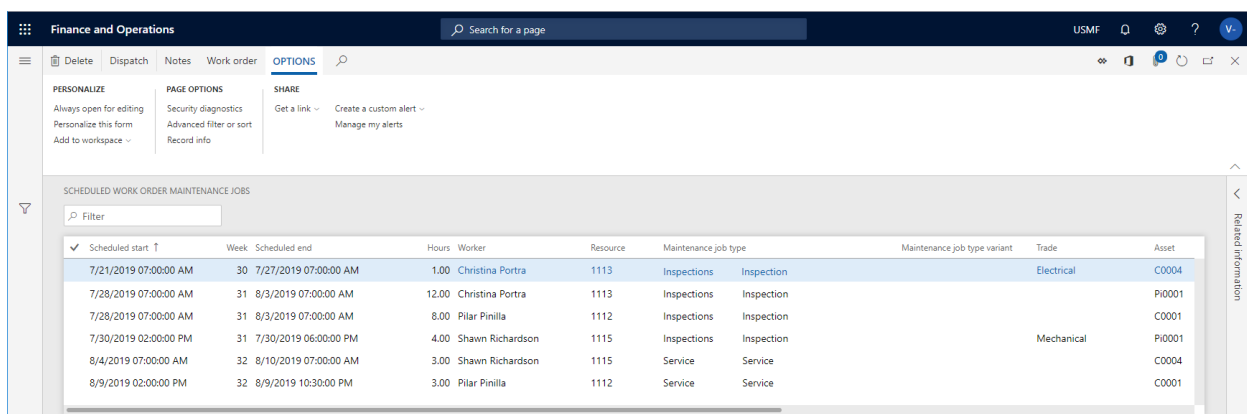

View scheduled work order maintenance jobs

1. Click **Asset management > Common > Work orders > Scheduled work order maintenance jobs**. You see a list of all work orders set to work order lifecycle state "Scheduled" or "In progress".
2. You can sort the list, for example, by maintenance worker. You can also use the filter to limit the list to display work orders allocated to a specific resource or maintenance worker.
3. You can see notes on the work order and, if required, add new notes by selecting the work order job, and then click **Notes**.
4. If you want to allocate one maintenance worker to a work order, select the work order, and then click **Work order**.
5. The **Work order** page opens. Click **Dispatch** to schedule the work order to a specific maintenance worker.

NOTE

Read more about scheduling several work orders or one work order in [Schedule work orders](#) and [Dispatch work order](#).

The following screenshot shows an example of the **Scheduled work order maintenance jobs** page.

✓ Scheduled start	Week	Scheduled end	Hours	Worker	Resource	Maintenance job type	Maintenance job type variant	Trade	Asset
7/21/2019 07:00:00 AM	30	7/27/2019 07:00:00 AM	1.00	Christina Portra	1113	Inspections	Inspection	Electrical	C0004

Calculate capacity load on scheduled work orders

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can calculate capacity load on scheduled work orders to get an overview of the work load on resources for a specific period. Calculations can be made for the following resources: Maintenance workers, worker groups, tools, and assets.

1. Click **Asset management > Inquiries > Schedule > Capacity load**.
2. In the **Calculate capacity load** dialog > **Show** field, select which load type you want to calculate: **Capacity**, **Reserved**, or **Remainder**.
3. Select **Yes** on the **Skip zero** toggle button if you do not want to show results containing zero.
4. Select the resource types for which you want to calculate capacity load by selecting **Yes** on the relevant toggle buttons: **Worker**, **Maintenance worker group**, **Tool**, and **Asset**.
5. Select the start date for the calculation in the **From date** field.
6. In the **Interval type** field, select the interval for the calculation: **Day**, **Week**, **Month**, or **Quarter**.
7. In the **Period frequency** field, insert the number of intervals you want to calculate. For example, if you have selected **Day** as the interval type, and you enter the number "5" in this field, a calculation of five days from the start date will be made.
8. Click **OK** to start the calculation.

The figure below shows the result of a calculation covering three weeks for the load type **Reserved**.

Load type	Reference number	Name	8/2/2019 (31)	8/9/2019 (32)	8/16/2019 (33)
Worker	000495	Pilar Pinilla			3.00
Worker	000496	Christina Portra	6.96		
Worker	000497	Stefan Hesse			
Worker	000498	Shawn Richardson		3.00	
Worker	000499	Miles Reid			
Worker	000500	Dana Birkby			
Worker	000501	Dan Jump			
Worker	000502	Todd Rowe			
Worker	000503	Jimmy Bischoff			
Worker	000504	Lukas Keller			
Worker	000505	Chloe Brussard			
Worker	000506	Dennis Saylor			
Worker	000507	Grant Culbertson			
Worker	000508	Nate Sun			
Worker	000509	Bill Malone			
Asset	C0001	Conveyor Belt 0001		3.00	
Asset	C0002	Conveyor Belt 0002			
Asset	C0003	Conveyor Belt 0003			
Asset	C0004	Conveyor Belt 0004		3.00	
Asset	C0005	Conveyor Belt 0005			
Asset	C0006	Conveyor Belt 0006			
Asset	C0007	Conveyor Belt 0007			
Asset	C0008	Conveyor Belt 0008			
Asset	PI0001	Pipe 0001	6.96		
Asset	PI0002	Pipe 0002			

[!NOTE] If you select the load types **Capacity** or **Remainder** for your calculation, the same result will be displayed if no reservations have been made for the resources in the selected period.

For information about how to calculate capacity load on maintenance schedule lines and not scheduled work orders, refer to [Calculate capacity load](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Register consumption

2/18/2021 • 3 minutes to read • [Edit Online](#)

When a maintenance job has been completed on a work order, the next step is to make consumption registrations and post the journals. You can make registrations on the following consumption types: Hours, items, and expenses. The different consumption types are registered and posted on the **Work order journals** page. The journal setup in **Asset Management** is used for creating and posting separate journals for hours, items, and expenses in the **Project management and accounting** module.

In some cases, you may be able to add or delete forecast lines on a work order. The setup of a work order lifecycle state, the related project type, and the stage rules related to the project type determine if you are able to add or edit journal lines. Read more about work order lifecycle states and related project stages in [Forecasts, work orders, and projects](#).

NOTE

It is possible to set up automatic posting of journals on a work order lifecycle state. Refer to [Work order lifecycle states](#) for more information.

1. Click **Asset management > Common > Work orders > All Work orders** or **Active work orders**.
2. Select the work order, and click **Journals**.
3. Click **Copy from forecast** to transfer any forecast lines that may be connected to the work order. You can select which consumption types you want to transfer.
4. If necessary, you can add more consumption lines on the relevant FastTab by clicking **Add line** and filling out data on the line.
5. Click **Validate journals** to validate the journal lines before posting.
6. Click **Post journals** to post the journal lines.
7. After you've posted the consumption journals, you can update the work order lifecycle state. For example, to indicate that the work order has been completed, you can update the lifecycle state to "Ended".
 - In the **Show** field at the top of the **Work order journals** page, select which journal lines you want to see: **All**, **Not posted**, or **Posted**. Posted journals have a check mark in the **Posted** check box.
 - When item lines are created in the work order journal, product dimensions and tracking dimensions related to the item are automatically transferred to the journal line.

The screenshot below shows an example of hour and item registrations on a work order in **Work order journals**.

Split hours on work orders with several work order jobs

If a work order contains several work order jobs, you can register work hours using the **Split hours** functionality, meaning one hour registration line can be distributed evenly on each work order job.

1. Click **Asset management > Common > Work orders > All Work orders** or **Active work orders**.
2. Select the work order and click **Journals**.
3. Select the hour registration line you want to split, and click **Split hours**.
4. In the **Split hours on work order maintenance jobs** dialog, the name of the worker who is logged in is automatically shown in the **Worker** field. If required, you can select another worker.
5. Select a category for the hour registration in the **Category** field.
6. Insert number of work hours to be split in the **Hours** field.

Split hours on work order maintenance jobs

Parameters

Worker

Hours

Category

7. Click **OK**.

Example: In the screenshot below, journal lines for a work order containing three work order jobs are shown. The first line, containing three work hours, has been split, and one work hour is registered on each work order job. After the three hour registration lines have been created, you decide what to do with the original hour registration line (the first line in the example). You can keep it as is or delete it.

+ Add line Remove Inventory Financial dimensions

Financial dimensions on consumption registrations

When you make consumption registrations, financial dimensions related to the different registration types are added to the registrations in a specific sequence.

- *Hour and Expense registrations:* First, financial dimensions from the journal header are added, if any. Next, financial dimensions from the related work order project are added. Finally, financial dimensions from the resource (worker) are added.
- *Item registrations:* First, financial dimensions from the journal header are added, if any. Then, financial dimensions from the related work order project are added. Next, financial dimensions from the site are added. Finally, financial dimensions from the item are added.

NOTE

For all three registration types, the financial dimension combination is validated, and invalid combinations are blanked. This is standard setup with other Finance and Operations apps.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create consumption reports

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you've created and posted consumption registrations on work orders in Asset Management, two reports are available to display consumption details.

Asset consumption report

When you have posted consumption on work orders, you can print an asset consumption report. The report displays hours, hour costs, item costs, and expenses posted on assets.

1. Click **Asset management > Reports > Assets > Asset consumption**.
2. In the **Asset consumption** dialog, select the parameters and detail level you want to see by selecting **Yes** on the relevant toggle buttons, and inserting a functional location level in the **Show** section.
 - You can use the **Levels** field to indicate how detailed you want the asset lines to be regarding functional locations.

For example, if you enter the number "1" in the field, and you have a multi-level functional location structure, all assets for a functional location will be shown on the top level, and therefore a line may be added up from functional locations located at a lower level.

If you enter the number "0" in the **Levels** field, you will see a detailed result showing all assets on all the functional location levels to which they are related.
 - Select **Yes** on the **Sum on all sub assets** toggle button to see sums for each sub asset in the report.
3. Select a date interval in the **Dates** section.
4. On the **Destination** FastTab, select if you want to display the report on screen, print it, or save it as a file or email.
5. If required, you can select specific assets to be displayed in the report. On the **Records to include** FastTab, click **Filter**, and add the assets you want to include in the report.
6. Click **OK** to generate the report.

Work order consumption report

When you have posted consumption on work orders, you can print a work order consumption report. The report displays hours, hour costs, item costs, and expenses posted on work orders.

1. Click **Asset management > Reports > Work orders > Work order consumption**.
2. In the **Work order consumption** dialog, select the parameters you want to include in the report by selecting **Yes** on the relevant toggle buttons in the **Show** section.
3. Select a date interval in the **Dates** section.
4. On the **Destination** FastTab, select if you want to display the report on screen, print it, or save it as a file or email.
5. If required, you can select specific work orders to be displayed in the report. On the **Records to include**

FastTab, click **Filter**, and add the work orders you want to include in the report.

6. Click **OK** to generate the report.

NOTE

You can also generate a [work order report](#), which contains more work order details.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Warranty agreements

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can set up warranty terms that can be connected to an asset or an asset type. Warranty terms are created for a specific period. Warranty can be set up to provide full coverage or partial coverage, and you can set up terms that are related to hours, expenses, and items.

The first step is to create any vendor warranty agreements that you have for your equipment. You then attach warranty agreements to assets or asset types. Vendor warranty agreements are used only for informational purposes. If vendor warranty is set up on an asset, you can see the warranty coverage period on the asset.

Create a warranty agreement

A warranty agreement can include several agreement lines to cover the warranty for work hours, expenses, and items.

1. Select **Asset management** > **Setup** > **Assets** > **Warranty**.
2. Select **New** to create a product.
3. In the **Warranty** field, enter a warranty ID.
4. In the **Name** field, enter a description.

On the **Details** FastTab, the **Assets** field shows the number of active assets that use the warranty agreement.

5. On the **Warranty lines** FastTab, follow these steps to add lines that should be included in a warranty agreement:
 - a. Select **Add line** to add a new condition to the warranty. A sequential line number is automatically entered in the **Line** field.
 - b. In the **Period** field, select the type of warranty period.
 - c. In the **Interval** field, enter a number. This field defines the number of periods that the warranty should be valid for.
 - d. In the **Percent** field, enter the coverage percentage for the warranty line. The percentage indicates how much is covered by your company.

Warranties on assets and asset types

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to set up warranties on assets and asset types in Asset Management.

Set up a warranty on an asset type

1. Select **Asset management > Setup > Asset types > Asset types**.
2. In the left pane, select the asset type to attach a vendor warranty agreement to, and then select **Asset type defaults**.
3. On the **General** FastTab, in the **Vendor warranty** field, select the agreement.

Set up a warranty on an asset

1. Select **Asset management > Common > Assets > All assets**.
2. Select the asset, and then select **Edit**.
3. On the **Vendor** FastTab, in the **Vendor warranty** section, in the **Warranty** field, select the warranty agreement.
4. In the **Warranty start** and **Warranty end** fields, select the start and end dates.

IMPORTANT

If a date is selected in the **Warranty start** field on a work order, the warranty becomes valid for the work order on that date. When you create a work order, the **Warranty start** field is automatically set to the date of creation. However, you can change the date so that it corresponds to, for example, the start date of a warranty agreement.

The screenshot displays the SAP Finance and Operations interface for a Work Order (JPMF-00014). The interface is divided into several sections:

- Navigation Bar:** Includes 'Save', '+ New', 'Delete', and tabs for 'WORK ORDER', 'GENERAL', and 'OPTIONS'. A search bar is also present.
- Work Order Header:** Shows 'Work order: JPMF-00014' and 'Lines Header | Corrective | New'.
- Table:** A table with columns: Line number, Asset, Functional location, Maintenance job type, Maintenance job type varia..., and Trade. The first row shows: 1, C0001, CH-BP1-01-01, Inspection.
- Line details:** A detailed view of the work order line, including:
 - ASSET:** Asset C0001, Name Conveyor Belt 0001.
 - JOB:** Maintenance job type Inspection, Name Inspection.
 - REPLACE/INSTALL ASSET AT LOCATION:** Replacement asset and Installation functional location dropdowns.
 - SCHEDULED:** Link (None), Scheduled start, Scheduled end, Job scheduled to.
 - PROJECT:** Project ID 000211-03, Project stage Created, Activity number 00392.
 - VENDOR:** Warranty 1 YR, Warranty start 7/22/2019 (highlighted with a red box).
 - LOCATION:** Longitude 0.000000000, Latitude 0.000000000.
 - REFERENCE:** Reference type, Reference ID.
- Related information:** A sidebar on the right with expandable sections: Work order pools, Hours (Maintenance forecast hours: 0.00, Scheduled hours: 0.00, Hours posted: 0.00), Forecast cost, Procurement, and Actual cost.

NOTE

When you create a work order for an asset that is covered by a vendor warranty, if the work order has an expected start date during the warranty period, you receive a notification about the warranty agreement. You can then cancel the work order, as you require.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create maintenance budgets

2/18/2021 • 2 minutes to read • [Edit Online](#)

Maintenance budgets are used to provide an overview of expected costs for preventive maintenance. Budget lines are calculated based on maintenance schedule lines that have an expected start date during the budget period.

Maintenance budgets are based on the cost types that are used in Asset Management: **Preventive**, **Corrective**, and **Investment**. Budget costs for investment maintenance are included for active assets that have a replacement date during the budget period and a related replacement value. Budget costs for corrective maintenance are included if a past corrective date is included in the budget calculation. In that case, corrective costs from an earlier period are calculated for the same future period that you calculate the maintenance budget for.

Create a maintenance budget

1. Select **Asset management > Inquiries > Maintenance budget > Budget**.
2. Select **Create budget**.
3. In the **Maintenance budget** field, enter a budget ID.
4. In the **Description** field, enter a description.
5. On the **Period** FastTab, in the **From date** and **To date** fields, enter the start and end dates of the budget period.
6. To include corrective budget costs that are calculated on the basis of actual costs from a previous period, in the **Corrective from date** field, enter the start date of the period that those costs should be included from.
7. Depending on the level of detail that is required in the budget, set the relevant options on the five **Group by** FastTabs.
8. Select **OK**.
9. Select **Budget lines** to open **Maintenance budget lines** page, where you can view all the budget lines that have been created for the period.
10. To approve the budget, select it on the **Maintenance budgets** page, and then select **Approve**. Then, in the **Approve budget** dialog box, select **OK**. Your name is entered in the **Approved by** field on the **Maintenance budgets** page.

NOTE

After you've approved a maintenance budget, you can't recalculate or adjust the related lines on the **Maintenance budget lines** page unless you first remove the approval. To remove the approval of a maintenance budget, select it on the **Maintenance budgets** page, and then select **Approve**. Then, in the **Approve budget** dialog box, select **OK**.

MAINTENANCE BUDGETS

Filter

Maintenance...	Description	From date	To date	Lines	Budget cost	Approved	Approved by
MBUD-001	Maintenance Budget	7/1/2019	12/31/2019	3	0.00	<input type="checkbox"/>	

You can also create a new maintenance budget by copying an existing budget. On the **Maintenance budgets** page, select the budget to copy, and then select **Copy**. This approach is useful if, for example, you've created a budget for one month and want to copy it to other months.

NOTE

The maintenance budget calculates only budget costs based on maintenance schedule lines. To calculate actual costs for the same period, you can do that calculation on the **Asset cost control** page.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Update maintenance budgets

2/18/2021 • 2 minutes to read • [Edit Online](#)

The **Maintenance budget lines** page shows all the budget lines that have been created for the budget that is selected on the **Maintenance budgets** page. (For more information, see [Create maintenance budgets](#).) You can recalculate and adjust maintenance budget lines until the maintenance budget is approved. After the budget period has passed, and costs have been posted in Asset Management, you can also update the budget lines with actual costs.

Recalculate a maintenance budget

You can recalculate a maintenance budget on the **Maintenance budget lines** page. When you recalculate a maintenance budget, the existing budget lines are deleted, and a new calculation is done.

1. On the **Maintenance budget lines** page, select **Recalculate**.
2. In the **Recalculate budget** dialog box, make the required changes for the new calculation, and then select **OK**.

New budget lines are created according to the values that you set.

Adjust budget lines

Instead of recalculating the whole maintenance budget, you can adjust selected lines that are related to budget costs.

1. On the **Maintenance budget lines** page, select the lines to update the budget cost for.
2. Select **Adjust**.
3. To add an amount to the selected lines, select the **Add cost** check box, and then enter the value in the **Add value** field.
4. To multiply the budget cost on the selected budget lines by a factor, select the **Multiply cost** check box, and enter the factor in the **Multiply value** field.

For example, if you enter 1.2 in the **Multiply value** field, you increase the budget cost on the selected lines by 20 percent. If you enter 0.7, you reduce the budget cost on the selected lines by 30 percent.

5. Select **OK**.

The selected budget lines are updated according to the values that you set in step 3 or 4.

Update actual costs

After the dates on the budget lines have passed, and actual costs have been posted in Asset Management, you can update the actual costs on the maintenance budget.

1. On the **Maintenance budget lines** page, select **Update cost**.
2. In the **Calculate actual cost** dialog box, select **OK**.

The **Actual cost** fields on the budget lines are updated if actual costs have been posted. New budget lines might be generated if new asset types have been created since you created the budget, and if those asset types have been used on assets that work orders have been created for and related costs have been posted for. New

budget lines show only actual costs, because no budget costs were calculated for them.

NOTE

To see an overview of actual costs divided into preventive, corrective, and investment costs, you can do a calculation for the same period on the **Asset cost control** page.

Manually add budget lines

On the **Maintenance budget lines** page, you can manually add a new budget line by selecting **New** and then making selections on the line. Here are some examples of situations where this approach might be useful:

- You know that refurbishment of some assets is currently in the planning phase, but related jobs haven't yet been created in Asset Management. However, you want budget costs for those jobs to be included in the maintenance budget.
- New assets or asset types have been created since you made the maintenance budget, but maintenance plans haven't yet been set up on those assets or asset types. However, you want budget costs for those asset types to be included in the maintenance budget.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost and date control

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Asset Management, you can calculate costs to get an overview of actual costs compared to budget costs on assets, functional locations, and work orders. Actual costs are based on posted transactions.

You can also make a date calculation if you want to compare scheduled start and end dates to actual start and end dates on work orders.

Cost control for assets, functional locations, and work orders

The calculations made for assets, functional locations, and work orders are almost identical. The only difference is that for assets and functional locations, you can also include sub assets and sub locations in your calculation. The date is the transaction date when the registration was recorded.

1. Click **Asset management > Inquiries > Assets > Asset cost control** or **Functional location cost control**, or **Asset management > Inquiries > Work orders > Work order cost control**.
2. In the **Asset cost control / Functional location cost control / Work order cost control** dialog, select a time range to be calculated.
3. If required, select a financial dimension set to be included in the calculation.
4. Select "Yes" on the **Skip zero** toggle button if you don't want to show results with a cost of zero.
5. You can use the **Level** field to indicate how detailed you want the cost control lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location hierarchy, all cost control lines for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all cost control lines on all the functional location level to which they are related.

6. Select "Yes" on the **Show open committed cost** toggle button if you want to include that column in the calculation.
7. Select "Yes" on the **Include sub assets** toggle button to show costs related to sub assets as separate lines.
8. If you want to limit the search, you can select specific assets / functional locations / work orders on the **Records to include** FastTab.
9. Click **OK** to start the calculation.

The figure below shows an example of the **Asset cost control** dialog.

Asset cost control

Period 6/1/2019 - 8/21...

Another way of making a cost calculation is to multi-select assets in **All assets** or **Active assets**. Then, you click the **Cost control** button on the **General** tab. In the **Asset cost control** dialog, the selected assets are automatically inserted in the **Asset** field on the **Records to include** FastTab. Click **OK**, and a cost calculation for the selected assets is shown. The same procedure can be done for functional locations in **All functional locations** or **Active functional locations**, and for work orders in **All work orders** or **Active work orders**.

Work order date control

Use this page to get an overview of expected start and end dates compared to actual start and end dates on work orders.

1. Click **Asset management > Inquiries > Work orders > Work order date control**.
2. Click **Calculate**.
3. Select a functional location in the **Functional location** field.
4. Insert the range for which you want to make the calculation in the **From date** and **To date** fields. All work orders with expected start date within the range will be included.
5. Click **OK**.
6. Click the **Group by** buttons to show the required detail level of the calculation. The selected **Group by** buttons are highlighted. Click on a button to activate or deactivate it.

Example

The screenshot below shows an example of calculation results in **Work order date control**.

- The **Avg. start delay** field shows the difference in days between scheduled start date for a work order compared to actual start date. If, for example, the actual start date was two days before the scheduled start date, "-2" will be displayed in this field.
- The **Avg. end delay** field shows the difference in days between scheduled end date for a work order compared to actual end date. If, for example, the actual end date was three days after the scheduled end date, "3" will be displayed in this field.
- The **Occurrences** fields show the number of times deviations occur in relation to scheduled and actual start date, and scheduled and actual end date on the work order.

Work order	Lifecycle state	Asset type	Maintenance job type	Avg. start delay	Occurrences	Avg. end delay	Occurrences
JPMF-00002	Estimated	Conveyor	Inspection	0.00	0	0.00	0
JPMF-00014	Finished	Conveyor	Inspection	24.00	1	18.00	1

Work hour control

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can calculate hours to get an overview of actual hours compared to budget hours on assets, functional locations, or work orders. Actual hours are based on posted transactions.

Work hour control for assets, functional locations, and work orders

The calculations made for assets, functional locations, and work orders are almost identical. Only difference is that for assets and functional locations, you can also include sub assets and sub locations in your calculation. The date is the transaction date when the registration was recorded.

1. Click **Asset management > Inquiries > Assets > Asset hour control** or **Functional location hour control**, or **Asset management > Inquiries > Work orders > Work order hour control**.
2. In the **Asset hour control** dialog, .
3. In the **Asset hour control / Functional location hour control / Work order hour control** dialog, select a period to be calculated in the **From date** and **To date** fields.
4. If required, select a **Financial dimension set** to be included in the calculation.
5. Select "Yes" on the **Skip zero** toggle button if you don't want to show results containing zero hours.
6. You can use the **Level** field to indicate how detailed you want the hour control lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location hierarchy, all hour control lines for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all hour control lines on all the functional location levels to which they are related.

7. Select "Yes" on the **Include sub assets** toggle button to show costs related to sub assets as separate lines.
8. If you want to limit the search, you can select specific assets / functional locations / work orders on the **Records to include** FastTab.
9. Click **OK** to start the calculation.
10. On the **Asset hour control** page, click the **Group by** buttons to show the required detail level of the calculation. The selected **Group by** buttons are highlighted. Click on a button to activate or deactivate it.

Example

The screenshot below shows an example of an **Asset hour control** calculation.

- The **Original budget** field shows budget hours from the work order forecast.
- The **Actual hours** field shows posted hours on work orders.
- The **Committed hours** field shows total amount of hours that your company is committed to in relation to work orders.

Period 5/1/2019 - 8/21...

Another way of making an hour calculation is to multi-select assets in **All assets** or **Active assets**. Then you click the **Hour control** button on the **General FastTab**. The selected assets are automatically inserted in the **Asset** field on the **Records to include FastTab**. Click **OK** in the **Asset hour control** dialog, and the calculation for the selected assets is shown. The same procedure can be done for functional locations in **All functional locations** or **Active functional locations**, and for work orders in **All work orders** or **Active work orders**.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset fault cost control

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can calculate costs on asset fault registrations to get an overview of actual costs compared to budget costs. Actual costs are based on posted transactions. The date is the fault date on which the symptom was recorded.

1. Click **Asset management > Inquiries > Asset fault > Asset fault cost control**.
2. In the **Asset fault cost control** dialog, select a financial dimension set to be included in the calculation, if required.
3. Select "Yes" on the **Skip zero** toggle button if you don't want to show results with a cost of zero.
4. You can use the **Level** field to indicate how detailed you want the cost control lines to be regarding functional locations.

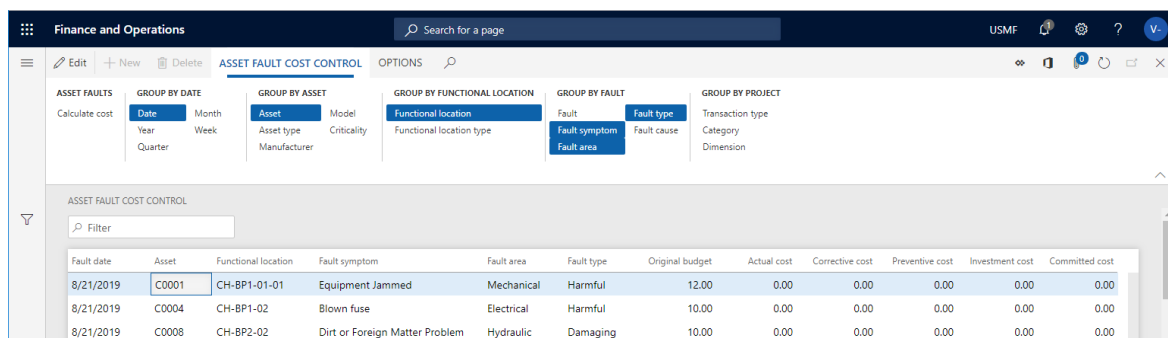

For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all asset fault cost control lines for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all asset fault cost control lines on all the functional location levels to which they are related.
5. If you want to limit the search, you can select specific assets, fault dates, and fault causes on the **Records to include** FastTab.
6. Click **OK** to start the calculation.
7. Click the **Group by** buttons to show the required detail level of the calculation. The selected **Group by** buttons are highlighted. Click on a button to activate or deactivate it.

Example

This example shows an asset fault cost control calculation.

- The **Original budget** field shows budget costs from the work order forecast.
- The **Actual cost** field shows posted costs on work orders.
- The **Committed cost** field shows total costs that your company is committed to in relation to work orders.

The screenshot shows the 'ASSET FAULT COST CONTROL' dialog in SAP S/4HANA. The 'GROUP BY' section is active, with 'Date', 'Asset', 'Functional location', and 'Fault' selected. The table below displays the results of the calculation.

Fault date	Asset	Functional location	Fault symptom	Fault area	Fault type	Original budget	Actual cost	Corrective cost	Preventive cost	Investment cost	Committed cost
8/21/2019	C0001	CH-BP1-01-01	Equipment Jammed	Mechanical	Harmful	12.00	0.00	0.00	0.00	0.00	0.00
8/21/2019	C0004	CH-BP1-02	Blown fuse	Electrical	Harmful	10.00	0.00	0.00	0.00	0.00	0.00
8/21/2019	C0008	CH-BP2-02	Dirt or Foreign Matter Problem	Hydraulic	Damaging	10.00	0.00	0.00	0.00	0.00	0.00

For information about how to set up faults, see the [Fault management](#) topic.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Asset fault analysis

2/18/2021 • 5 minutes to read • [Edit Online](#)

In Asset Management, you can analyze asset fault registrations to get an overview of the total number of faults registered during a specific period. Fault registrations can be analyzed from different perspectives, for example with focus on assets, asset types, functional locations, fault symptoms, or fault types.

1. Click **Asset management > Inquiries > Asset fault > Asset fault analysis**.
2. In the **Asset fault analysis calculation** dialog, you can use the **Level** field to indicate how detailed you want the asset fault lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all asset fault lines for a functional location will be shown on the top level, and therefore the hours on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all asset fault lines on all the functional location level to which they are related.

3. If you want to limit the search, you can select specific assets, fault dates, fault causes, and fault remedies on the **Records to include** FastTab.
4. Click **OK** to start the calculation.
5. On the **Asset fault analysis** tab, click one or more **Group by** buttons to display the detail level you want to see. Activated buttons are highlighted. Activate or deactivate buttons by clicking on them.
6. Click **Update calculations** to show your selections on the screen.

NOTE

Every time you activate or deactivate a **Group by** button, remember to click the **Update calculations** button. This is required because a large amount of data is processed as you are recalculating fault probability.

Examples

There are many ways to analyze fault registrations. This section has five examples of how different data selections can provide more insight and detail when analyzing asset fault registrations.

Group by symptoms

In the screenshot below, only the **Symptom** button is selected.

- Fault registrations have been made on three fault symptoms: "Air leak", "Blown fuse", and "Equipment jammed".
- In the **Probability %** column, all percentages add up to 100%. Probability is based on all **Symptom** registrations in this fault analysis.

ASSET FAULT ANALYSIS

Fault symptom	Symptoms	Symptom %	Probability %
Air Leak	4	33.33	33.33
Blown fuse	7	58.33	58.33
Equipment Jammed	1	8.33	8.33

Group by symptoms and time period

In the screenshot below, **Year** and **Month** are added to show how you can view fault registrations during a selected period.

- The fault symptoms are now shown as registrations per year/month.
- In the **Probability %** column, if you add all percentages for each month, they add up to 100%. Probability is based on the **Symptom** registrations in this fault analysis. If you have a large number of lines on an asset, but a large percentage stands out on a line, that would be an indication of a fault symptom to examine more closely to find a way to limit the number of registrations for that fault symptom.

ASSET FAULT ANALYSIS

Year	Month	Fault symptom	Symptoms	Symptom %	Probability %
2019	April	Air Leak	2	100.00	100.00
2019	May	Air Leak	1	50.00	50.00
2019	May	Blown fuse	1	50.00	50.00
2019	July	Air Leak	1	33.33	33.33
2019	July	Blown fuse	2	66.67	66.67
2019	August	Blown fuse	4	80.00	80.00
2019	August	Equipment Jammed	1	20.00	20.00

Group by multiple symptoms and assets

The combination of assets and an asset type is used as a basis for the calculations shown in the three screenshots below, which will increase in detail level.

Generally, the buttons in the **Group by date**, **Group by asset**, **Group by functional location** Action Pane groups, as well as the **Fault** button (Fault ID), contain periods or asset relations. The **Symptom**, **Area**, **Type**, **Cause**, and **Remedy** buttons are categorizations used in fault management to analyze asset fault registrations

and pinpoint problem areas.

Group by symptom, asset, and asset type

In the screenshot below, **Asset** and **Asset type** were added to provide more detail regarding fault registrations.

- The fault symptoms are now split up in **Asset / Asset type / Symptom** combinations.
- In the **Probability %** column, if you add all percentages for the combination of **Asset / Asset type / Symptom** respectively, they each add up to 100%. Probability is based on **Symptom** registrations in this fault analysis. If you have a large number of lines on an asset, but a large percentage stands out on a line, that would be an indication of a fault symptom to examine more closely to find a way to limit the number of registrations for that fault symptom.

The screenshot shows the 'ASSET FAULT ANALYSIS' interface. The top navigation bar includes 'Finance and Operations', a search bar, and user information 'USMF'. The main area has several tabs: 'ASSET FAULTS', 'GROUP BY DATE', 'GROUP BY ASSET', 'GROUP BY FUNCTIONAL LOCATION', and 'GROUP BY FAULT'. The 'GROUP BY ASSET' tab is selected, showing sub-tabs for 'Asset', 'Asset type', and 'Manufacturer'. The 'GROUP BY FAULT' tab is also selected, showing sub-tabs for 'Fault', 'Type', 'Cause', and 'Remedy'. Below the tabs is a table with the following data:

Asset ↑	Asset type	Fault symptom	Symptoms	Symptom %	Probability %
C0001	Conveyor	Air Leak	4	50.00	50.00
C0001	Conveyor	Blown fuse	3	37.50	37.50
C0001	Conveyor	Equipment Jammed	1	12.50	12.50
C0004	Conveyor	Blown fuse	4	100.00	100.00

Group by two symptoms, asset, and asset type

In the screenshot below, **Area** was added to **Symptom**, **Asset**, and **Asset type** to provide more detail regarding fault registrations.

- In the **Probability %** column, if you add all percentages for the combination of **Asset / Asset type / Symptom** on an asset, they each add up to 100%. Probability is based on the combination of **Symptom** and **Area** in this fault analysis. If you have a large number of lines on an asset, but a large percentage stands out on a line, that would be an indication of a fault area to examine more closely to find a way to limit the number of registrations for that fault area.

C0001	Conveyor	Air Leak	4	50.00	Hydraulic	2	50.00	25.00
C0001	Conveyor	Blown fuse	3	37.50	Electrical	3	100.00	37.50
C0001	Conveyor	Equipment Jammed	1	12.50	Mechanical	1	100.00	12.50
C0004	Conveyor	Blown fuse	4	100.00	Electrical	4	100.00	100.00

Group by three symptom, asset, and asset type

In the screenshot below, **Type** was added, and the most detailed calculation in this example is shown.

- In the **Probability %** column, if you add all percentages for the combination of **Asset / Asset type / Symptom** on an asset, they each add up to 100%. Probability is based on the combination of **Symptom, Area, and Type** in this fault analysis. If you have a large number of lines on an asset, but a large percentage stands out on a line, that would be an indication of a fault type to examine more closely to find a way to limit the number of registrations on that fault type.

Asset KPIs

2/18/2021 • 4 minutes to read • [Edit Online](#)

In Asset Management, you can calculate various Key Performance Indicators (KPIs) for assets and asset types. You use KPIs to get an overview of performance on assets in relation to, for example, uptime, downtime, repair time, and Mean Time Between Failure (MTBF).

1. Click **Asset management > Inquiries > Assets > Asset KPIs**.
2. In the **Calculate asset KPIs** dialog, you select the **Time scale** to be used in the calculation, and a period in the **From date** and **To date** fields.
3. On the **Records to include** FastTab, you can select specific assets and asset types to be included in the calculation, if required.
4. Click **OK** to start the calculation.
5. On the **Overview** FastTab, the results of the calculation are displayed in grid view. Each asset is displayed on a separate line.
6. On the **KPIs for selected line** FastTab, you see calculations for the asset selected on the **Overview** FastTab. The KPI values are categorized regarding **Time, Availability, Work orders, Maintenance, Faults, Maintenance downtime, and Cost**.

In the table below, you'll find a description of the fields on the **Asset KPIs** page.

FIELD	DESCRIPTION
Asset	Asset ID.
Total time	Total time set up in the calendar used in the calculation. If the asset is related to a resource, the related resource calendar is used. If the asset isn't related to a resource, the calendar selected in the Standard calendar field in Asset management parameters is used.
Uptime	Total time minus downtime.
Downtime	Maintenance downtime registrations made on the asset in the selected period.
Repair time	Total number of work hours consumed on repair work orders.
Availability %	Uptime divided by total time and multiplied by 100.
Number of faults	Number of fault causes registered on fault symptoms on the asset in the selected period.
MTBF	Mean Time Between Failure, which is total time divided by number of faults registered on the asset in the selected period. If number of faults is zero, MTBF is set to total time.

FIELD	DESCRIPTION
Fail rate	1 divided by MTBF.
MRT	Mean Repair Time, which is repair time divided by number of faults registered on the asset in the selected period. If number of faults is zero, MRT is set to repair time.
Number of stops	Number of maintenance downtime registrations created on the asset.
MTBS	Mean Time Between Stops, which is total time divided by number of maintenance downtime registrations. If number of maintenance downtime registrations is zero in the selected period, the MTBS value is set to total time.
Preventive cost	Costs posted on the asset related to cost type "Preventive" in the selected period. Cost types are set up on work order types.
Corrective cost	Costs posted on the asset related to cost type "Corrective" in the selected period. Cost types are set up on work order types.
Replacement value	Value defined on the asset as the replacement cost.
Asset type	Identification of the asset type selected on the asset.
Manufacturer	Identification of the manufacturer selected on the asset.
Model	Identification of the manufacturer model selected on the asset.
From date	Start date of the KPI calculation. If the asset was created after the start date selected for the calculation, the start date of the asset is shown in this field.
To date	End date of the KPI calculation. If the asset was registered as inactive before the end date selected for the calculation, the date from which the asset was no longer active is shown in this field.
Time scale	During calculation of the KPIs, you select a time scale to be used: Hours, Days, or Weeks.
Availability	Uptime divided by total time.
Work orders	Total number of work orders included in the KPI calculation.
Work order time	Total number of work hours consumed on the work orders.
Primary work orders	Number of primary work orders included in the KPI calculation.
Secondary work orders	Number of secondary work orders included in the KPI calculation.

FIELD	DESCRIPTION
Maintenance work orders	Number of maintenance work orders included in the KPI calculation. A maintenance work order is a work order with no related fault causes.
Maintenance time	Total number of work hours consumed on maintenance work orders.
Repair work orders	Number of repair work orders included in the KPI calculation. A repair work order is a work order with a related fault cause.
Reliability %	Calculation based on the expected exponential development in fault registrations on an asset meaning that, over time, the asset becomes less reliable due to wear and tear. The calculation of this KPI is based on MTBF and total time.
MTPS	Mean Time Production Stops, which is maintenance downtime divided by number of maintenance downtime registrations. If number of maintenance downtime registrations is zero in the selected period, the MTPS value is set to zero.
Total cost	Total costs posted on the asset in the selected period.
Investment cost	Costs posted on the asset related to cost type "Investment" in the selected period. Cost types are set up on work order types.

The figure below shows a screenshot of a KPI calculation for four assets.

The screenshot displays the SAP Asset KPIs report. The main table shows KPIs for four assets (C0001, C0002, C0003, C0004). Below the table, a detailed breakdown is provided for asset C0001, categorized into ASSET, SCALE, WORK ORDERS, FAULTS, MAINTENANCE DOWNTIME, and COST.

Asset	Total time	Uptime	Downtime	Repair time	Availability %	Number of faults	MTBF	Fail rate	MRT	Number of stops	MTBS
C0001	9.00	8.00	1.00	0.00	88.89	2	3.00	0.33	0.00	1	4.50
C0002	9.00	9.00	0.00	0.00	100.00		9.00	0.11	0.00		9.00
C0003	9.00	9.00	0.00	0.00	100.00		9.00	0.11	0.00		9.00
C0004	9.00	9.00	0.00	0.00	100.00	1	4.50	0.22	0.00		9.00

ASSET	SCALE	WORK ORDERS	FAULTS	MAINTENANCE DOWNTIME
Asset C0001	Time scale Days	Work orders 5	Number of faults 2	Number of stops 1
Asset type Conveyor	TIME Total time	Work order time 0.02	MTBF 3.00	MTBS 4.50
Manufacturer Adatum	9.00	Primary work orders 5	Repair work orders 2	MTPS 1.00
Model	Uptime 8.00	Secondary work orders	Repair time 0.00	COST Total cost 6.00
	Downtime 1.00		MRT 0.00	Corrective cost 6.00
DATES		MAINTENANCE	Fail rate 0.33	Preventive cost 0.00
From date 7/17/2019	AVAILABILITY Availability 0.89	Maintenance work orders 3	Reliability % 4.98	Investment cost 0.00
To date 8/22/2019	Availability % 88.89	Maintenance time 0.02		

- You can multi-select several assets in **All assets** and click the **Asset KPIs** button on the **General** tab. Then

click **OK** in the **Calculate asset KPIs** dialog to calculate KPIs for the selected assets.

- Results from a KPI calculation may or may not include [maintenance downtime registrations](#), depending on the setup and use of maintenance downtime reason codes.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Item where used

2/18/2021 • 2 minutes to read • [Edit Online](#)

You can make a calculation for a specific item to get an overview of where in Asset Management the item has been used. The results show the context in which the item has been used during its lifetime. The **Item where used** page can be opened from the main Asset Management menu, and it can also be accessed from the following pages:

- [Asset BOMs](#)
- [Spare parts on asset type defaults](#)
- [Maintenance job type categories and maintenance job types, maintenance job type variants, maintenance job trades, and maintenance checklists](#)
- [Maintenance forecast](#)
- [Procurement](#)
- [Work order purchase](#)

Make an item-where-used calculation

1. Click **Asset management > Inquiries > Item where used**, or select the **Item where used** button on one of the pages mentioned above.
2. In the **Item where used** dialog, select the item for which you want to make the calculation in the **Item number** field.
3. You can use the **Level** field to indicate how detailed you want the item lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all item lines for a functional location will be shown on the top level. Therefore, relation/quantity on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you will see a detailed result showing all item lines on all the functional location levels to which they are related.

4. In the **Include** section, select "Yes" on the toggle buttons that you want to include in the calculation.
5. Click **OK** to start the calculation.
6. On the **Item where used** tab, select the **Group by** buttons to show the required detail level of the calculation. The selected **Group by** buttons are highlighted. Click on a button to activate or deactivate it.
7. If you want to show dimensions related to the item, click **Display dimensions**, and select the dimensions to be shown.

Example

In the screenshot below, you see an example of an item-where-used calculation for item number "1000".

Maintenance status

2/18/2021 • 2 minutes to read • [Edit Online](#)

In Asset Management, you can make an overview calculation for a specific period for new, active, and completed maintenance requests, work orders, and maintenance downtime activities. You can also see the number of completed condition assessments for the same period. Use this calculation to get an overview of workload for incoming and completed maintenance requests and work orders.

Make a maintenance status calculation

1. Click **Asset management > Inquiries > Maintenance status**.
2. In the **Calculate status** dialog, select the time range that you want to make the calculation in the **From date** and **To date** fields.
3. You can use the **Level** field to indicate how detailed you want the maintenance lines to be regarding functional locations.

For example, if you insert the number "1" in the field, and you have a multi-level functional location structure, all maintenance lines for a functional location will be shown on the top level, and therefore the status on a line may be added up from functional locations located at a lower level.

If you insert the number "0" in the **Level** field, you see a detailed result showing all maintenance lines on all the functional location levels to which they are related.

4. Click **OK** to start the calculation.
5. Click the **Group by** buttons to show the required detail level of the calculation. The selected **Group by** buttons are highlighted. Click on a button to activate or deactivate it.
6. Remember to click the **Update** button to update the calculation each time you make changes by activating or deactivating **Group by** buttons, or by making a calculation for a new period.
7. Click **Status** if you want to create a new maintenance status calculation.

NOTE

The results shown in **Maintenance status** only include maintenance requests and work orders that have an actual start date and time. End date and time may be blank.

Example 1

In the screenshot below, the **Year** and **Month** buttons have been activated. With these **Group by** options selected, you get a general overview on a monthly basis of workload and throughput related to maintenance requests and work orders.

Year	Month	New maintenance requests	Maintenance requests	Ended maintenance requests	Started work orders	Work orders	Ended work orders	New stops	Maintenance downtime	Ended stops
2019	May	2	4							
2019	June		4							
2019	July	8	12	2				1		1
2019	August	3	13	1	2	2	1			

Example 2

In the screenshot below, information about functional locations has been added. Now it is possible to compare workload and throughput across functional locations, which may represent geographical locations, factories, or work areas.

Year	Month	Functional location	New maintenance requests	Maintenance requests	Ended maintenance requests	Started work orders	Work orders	Ended work orders	New stops
2019	May	CH-BP1-01-01	2	4					
2019	June	CH-BP1-01-01		4					
2019	July	CH-BP1-01-01		4					1
2019	July	CH-BP1-01-02	1	1					
2019	July	CH-BP1-02	2	2					
2019	July	CH-BP1-03-02	1	1					
2019	July	CH-BP1-08	1	1		1			
2019	July	CH-BP2-01-01	1	1					
2019	July	CH-BP2-01-03	1	1				1	
2019	July	CH-BP2-09	1	1					
2019	August						1	1	
2019	August	CH-BP1-01-01	2	6		1	1		1
2019	August	CH-BP1-01-02		1					
2019	August	CH-BP1-02	1	3					
2019	August	CH-BP1-03-02		1					
2019	August	CH-BP2-01-01		1					
2019	August	CH-BP2-09		1

Set up the Asset management mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes how to set up Microsoft Dynamics 365 Supply Chain Management and the Finance and Operations (Dynamics 365) mobile app to run an **Asset management** mobile workspace that workers can use to perform asset management tasks.

Set up maintenance worker users in Supply Chain Management

For each user that requires access to the **Asset management** mobile workspace, follow these steps.

1. In Supply Chain Management, go to **Human resources > Workers**, and make sure that a worker record exists for the user that you want to set up. Create a new worker record as required.
2. Go to **Asset management > Setup > Workers > Workers**, and make sure that the worker record that you identified (or created) in the previous step is mapped to a maintenance worker record. Create a new maintenance worker record as required, and set the **Worker** field to the worker record from the previous step.
3. Go to **Asset management > Setup > Workers > Maintenance worker groups**, and make sure that the maintenance worker record that you identified (or created) in the previous step belongs to a maintenance worker group.
4. Go to **System administration > Users**.
5. Select the relevant user in the grid.
6. On the **User Details** FastTab, set the **Person** field to the worker account that you want to associate with the current user account. This worker account should be the worker record that you identified (or created) in step 1 and mapped to a maintenance worker record in step 2.

NOTE

User permissions and security roles apply to the features of the **Asset management** mobile workspace just as they apply to the features of the Supply Chain Management user interface. Therefore, every user that you set up to access the **Asset management** mobile workspace must have the security roles that are required to perform similar operations directly in Supply Chain Management.

Publish the Asset management mobile workspace

To make asset management features available in the Finance and Operations (Dynamics 365) mobile app, you must publish the **Asset management** mobile workspace.

1. In Supply Chain Management, select the **Settings** button (the gear symbol in upper-right corner), and then select **Mobile app** on the menu.
2. In the **Manage mobile app** dialog box, find the **Asset Management** tile. If it contains the text "In metadata - not published," the workspace hasn't yet been published. If it contains the text "In metadata - published," the workspace has already been published, and you can skip the rest of this procedure.

3. Select the **Asset Management** tile, and then select **Publish** on the toolbar. After a few seconds, you should receive a notification that states that the workspace has been successfully published. Additionally, the text on the tile should change to "In metadata - published."

Install and set up the Finance and Operations (Dynamics 365) mobile app

1. Go to one of the following app stores to install the **Microsoft Finance and Operations (Dynamics 365)** app on your mobile device:
 - [For Google Android devices](#)
 - [For Apple iOS devices](#)
2. Open the Finance and Operations (Dynamics 365) app. The sign-in page should appear. In the **Sign in** field, enter your Supply Chain Management URL, or select a recent URL in the **Recent environments** list, and then tap **Connect**.

3. If you're prompted to confirm the connection, select the **I understand** check box, and then tap **Connect**.
4. On the **Pick an account** page, use your Microsoft account to sign in to the mobile application.

The **Workspaces** page appears. It lists every mobile workspace that has been published by your Supply Chain Management instance.

5. If you must change the legal entity (company), tap the Menu button (sometimes referred to as the hamburger or the hamburger button) in the upper-left corner, and then tap **Change company**.

6. On the **Workspaces** page, select the workspace that you want to work with to open it.

Work with the Asset management mobile workspace

For more information about how to work with the **Asset management** mobile workspace, see [Use the Asset management mobile workspace](#).

For more information about the Finance and Operations (Dynamics 365) mobile app, see the [Mobile app home page](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Use the Asset management mobile workspace

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic provides information about the **Asset management** mobile workspace. This workspace lets users view and create maintenance requests and work orders. Users can also view the assigned work order jobs in a calendar or list view. Assets and functional locations can also be viewed and searched for.

Overview

Asset Management is an advanced module for managing assets and work order jobs in Dynamics 365 Supply Chain Management. The **Asset management** mobile workspace lets users quickly view assigned work order jobs on the mobile device of their choice. Users can also create and manage maintenance requests, update lifecycle state, and view asset and functional location details by using their mobile device.

Specifically, the **Asset management** mobile workspace lets users perform these tasks:

- Create, view, and edit maintenance requests, take a photo or attach an existing image to the maintenance request, change the maintenance request lifecycle state.
- Create, view, and edit work orders, take a photo or attach an existing image to the work order, change the work order lifecycle state, view work order jobs.
- View assigned work order jobs in a calendar view.
- Create, view, and edit work order job, update asset counters, view maintenance checklist, view and edit work order job notes, view the tools required for the work order job.
- View or search for a specific asset or functional location.

Prerequisites

Before you can use the **Asset management** mobile workspace, your admin must set up the required user and worker accounts, and publish the workspace. For more information, see [Set up the Asset management mobile workspace](#).

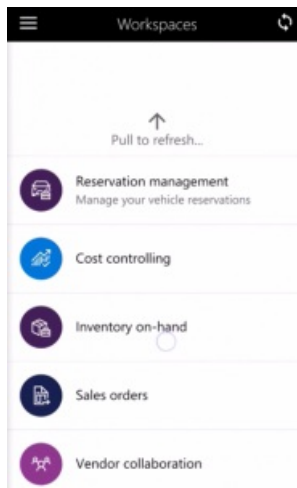

Download and install the mobile app

Download and install the Dynamics 365 for Unified Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

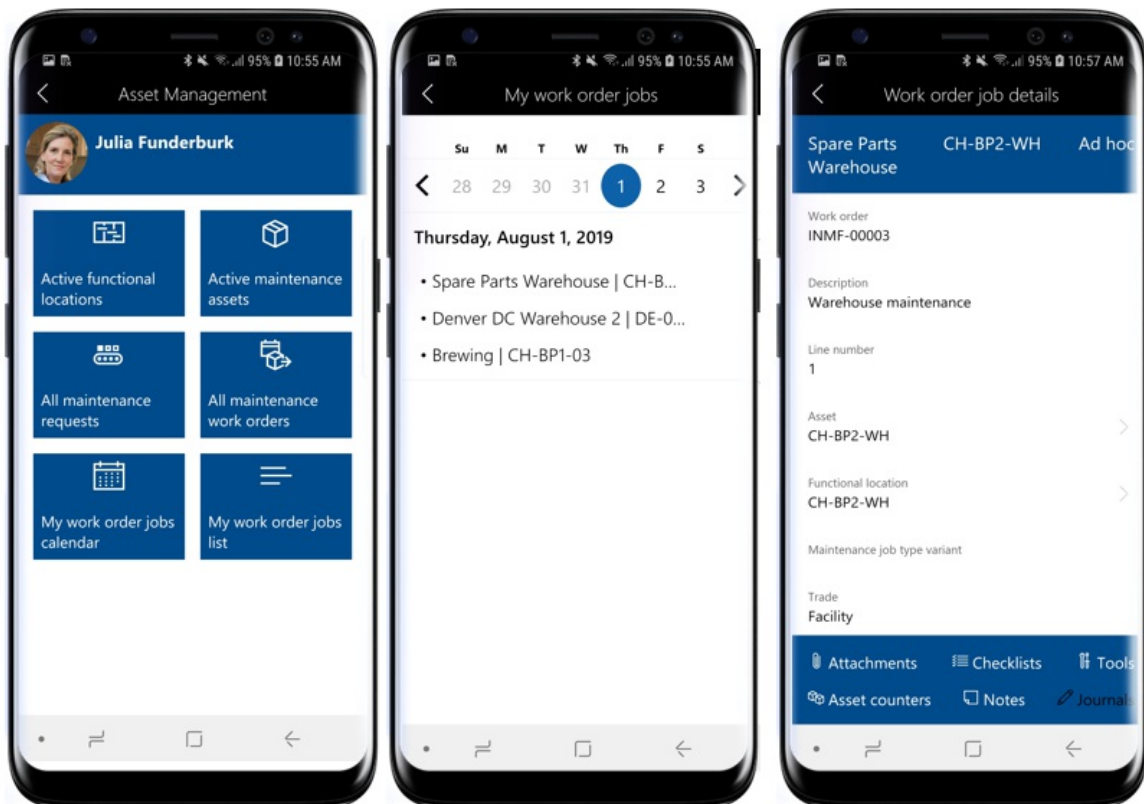

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you'll have to refresh the list of mobile workspaces.

View assigned work order jobs in calendar view

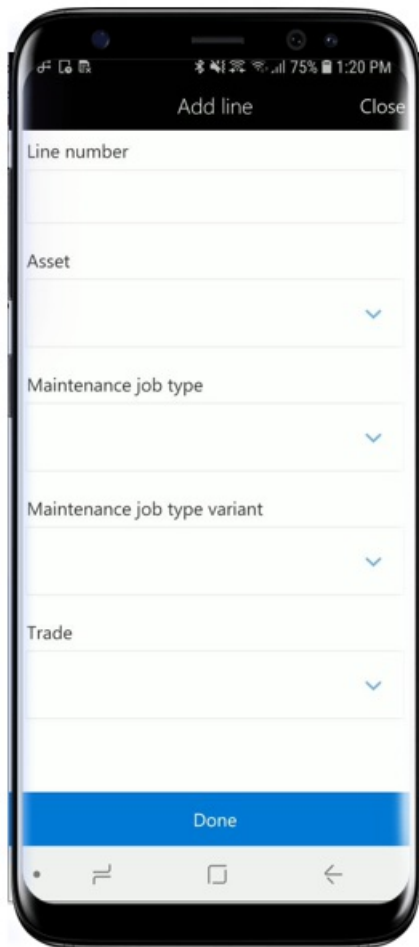

1. On your mobile device, open the **Asset management** workspace.
2. Select **My work order jobs calendar**.
3. Select the date you want to view work order jobs for. In the list, you'll see the asset ID and functional location ID for each work order job.
4. Select a work order job in the list to see job details: Asset and functional location details as well as other navigation links to view **Attachments**, **Checklists**, **Tools**, **Asset counters**, **Notes**, **Journals**.

Create a work order job

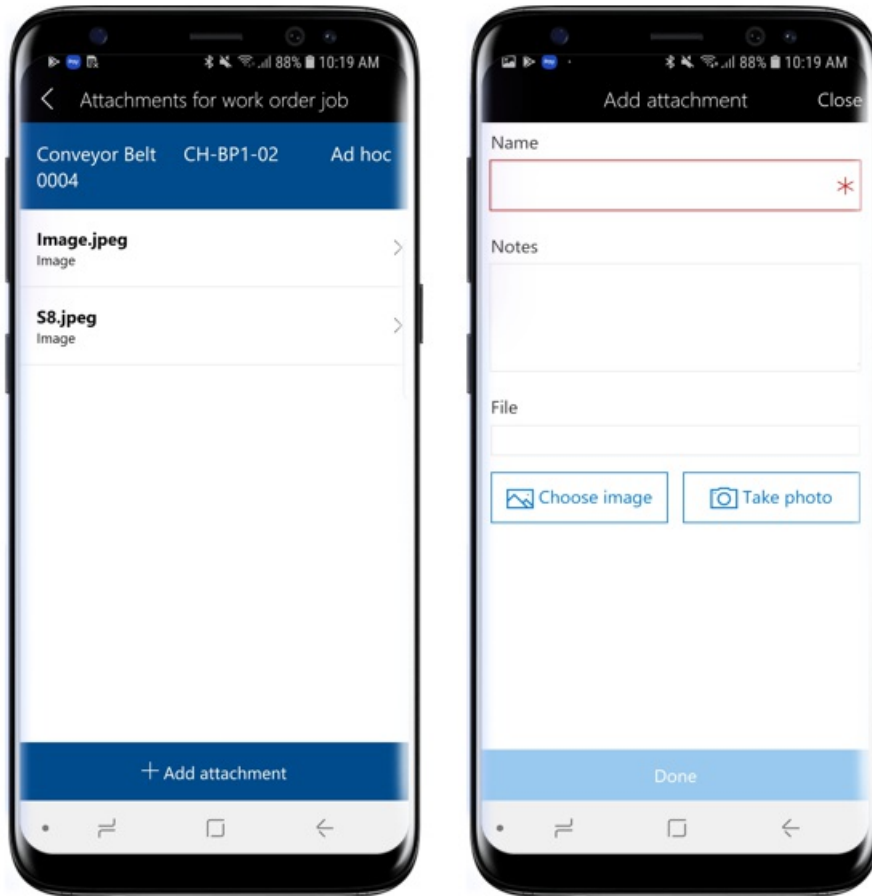

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order you want to create a new work order job for.

4. Select the **Add line** button.
5. Select the **Asset** you want to create a work order job for.
6. Select **Maintenance job type**, **Maintenance job type variant** and **Trade**.
7. Select **Done**.

Add attachment to a work order job

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to add an attachment to.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **Work order job details** page.
4. Select **Attachments** on the **Work order job details** page.
5. You'll see existing attachments on the work order job. Select **Add attachment**.
6. Enter **Name** and **Notes** for the attachment.
7. Select **Choose image** to select a photo from the mobile gallery, or **Take photo** to take a photo.
8. Select **Done**.

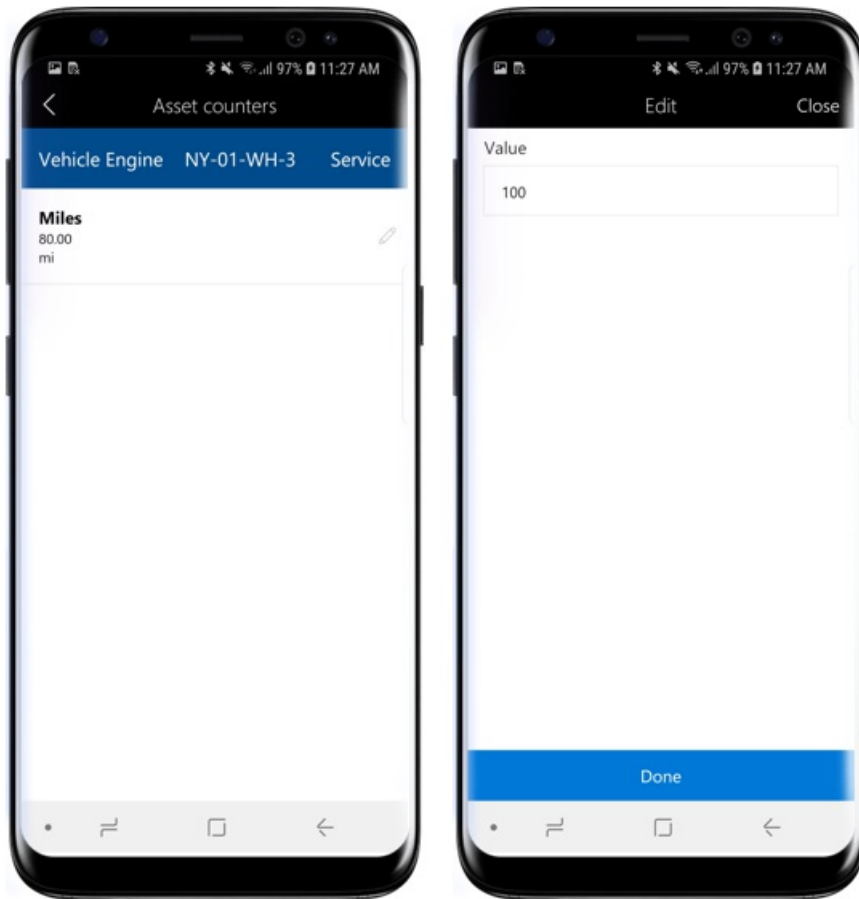

View maintenance checklist on a work order job

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to view checklists for.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.
4. Select **Checklists** on the **Work order job details** page.
5. You'll see a list of checklist lines related to the work order job. Select a checklist line to view **Instructions** and add **Notes**.
6. Select the back button (<) to return to the previous page.

View and update asset counters on a work order job

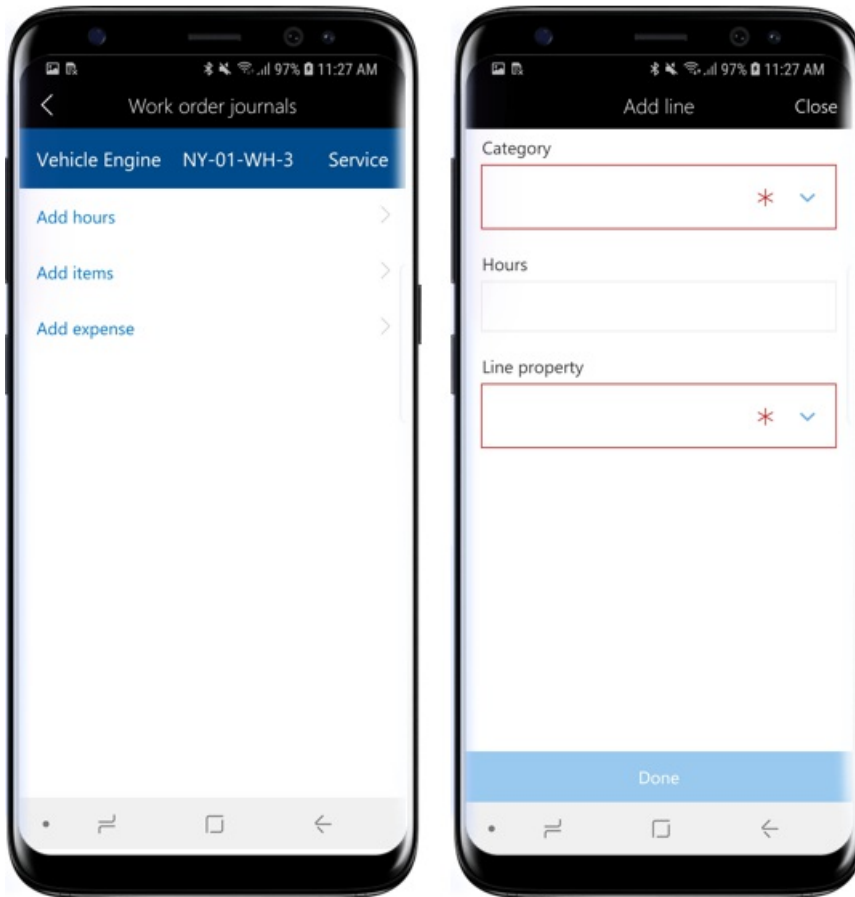

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to view asset counters for.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.
4. Select **Asset counters** on the **Work order job details** page.
5. You see a list of asset counters related to the work order job. Select the pencil icon on an asset counter line to update the counter value.
6. Enter a new counter value, and select **Done**.

Register consumption on a work order job

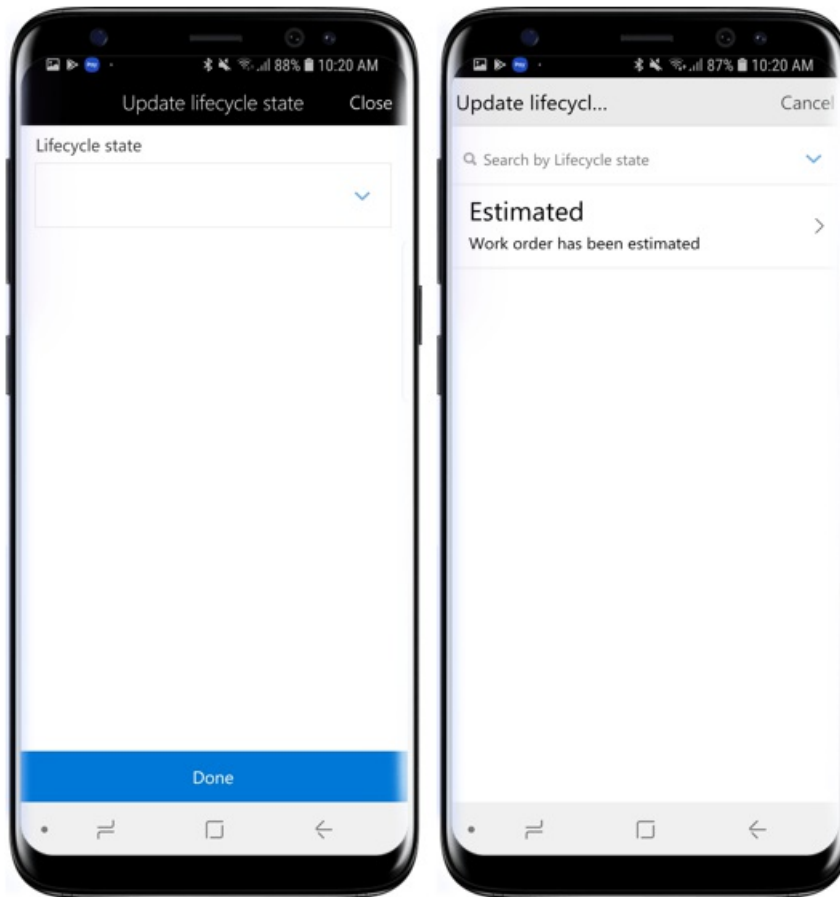

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to add consumption registrations for.
 - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.
4. Select **Journals** on the **Work order job details** page.
5. Select **Add hours** to create work hour registrations.
 - a. Select the **Category** from the lookup.
 - b. In the **Hours** field, enter the number of work hours spent on the work order job.
 - c. Select the appropriate **Line property**.
 - d. Select **Done**.
6. Select **Add items** to create item registrations.
 - a. Select the **Item number** from the lookup.
 - b. Select the **Site** from the lookup.
 - c. Enter the **Quantity** of items consumed.
 - d. Select **Done**.
7. Select **Add expense** to create expense registrations.
 - a. Select the **Category** from the lookup.
 - b. Enter the quantity for the expense registration.
 - c. Select the **Sales currency** from the lookup.
 - d. Enter the **Cost price** for the expense registration.

e. Select Done.

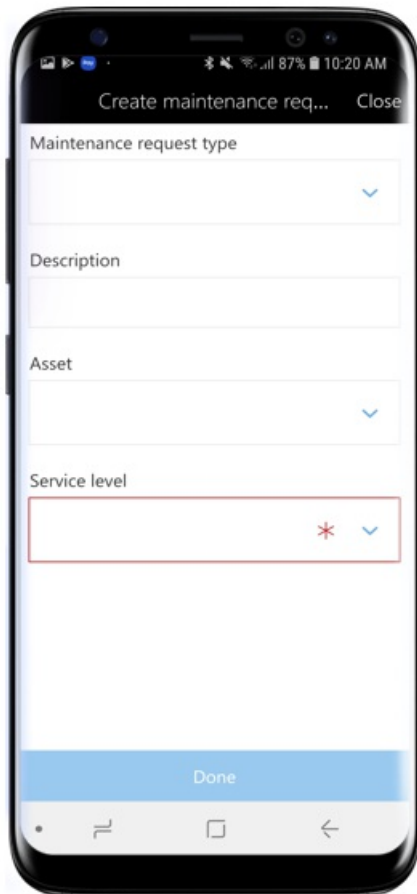

Update lifecycle state on a work order

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order you want to update lifecycle state for.
4. Select the **Update state** button at the bottom of the screen.
5. Select a new lifecycle state from the list.
6. Select **Done**.

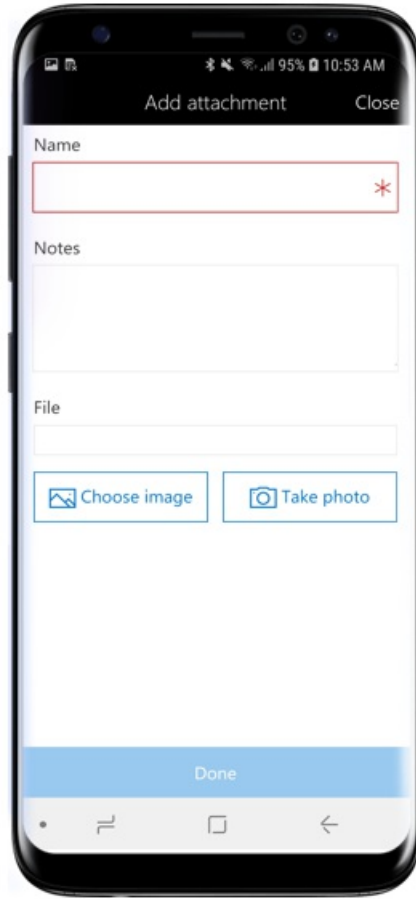

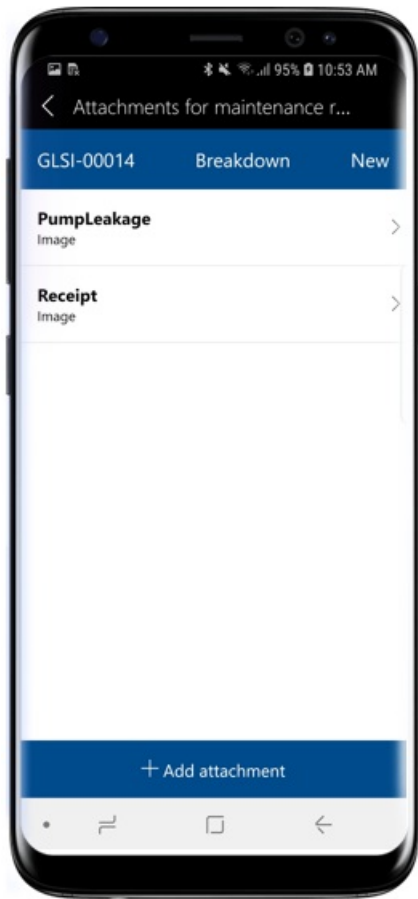

Create a maintenance request

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance requests**.
3. Select **Actions** at the bottom of the screen, and select **Create maintenance request**.
4. If number sequence is enabled for maintenance requests in **Asset management**, the **Maintenance request** field is hidden because it is automatically filled out. If the **Maintenance request** field is visible, enter a maintenance request ID.
5. Select a **Maintenance request type**.
6. Enter a **Description** for the maintenance request.
7. Select the **Asset** you want to create the request for.
8. Select the **Service level** for the maintenance request.
9. Select **Done**.

Add attachment to a maintenance request

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance requests**.
3. Select the maintenance request you want to add an attachment to.
4. Select **Attachments** at the bottom of the screen.
5. Select **Add attachments**.
6. Enter **Name** and **Notes** for the attachment.
7. Select **Choose image** to select a photo from the mobile gallery or **Take photo** to take a photo.
8. Select **Done**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Integrate Dynamics 365 Supply Chain Management (Asset management) with Dynamics 365 Guides

2/18/2021 • 3 minutes to read • [Edit Online](#)

You can integrate the **Asset management** module in Microsoft Dynamics 365 Supply Chain Management with Dynamics 365 Guides to take advantage of mixed-reality guides in your day-to-day service and maintenance workflows. If a guide is associated with an Asset Management work order, a worker who opens the work order's maintenance checklist in the Supply Chain Management (Dynamics 365) mobile app sees that a guide is available. The worker can then find and open the guide in the Dynamics 365 Guides HoloLens app.

Prerequisites

Before you can attach guides to Asset management work orders, you must complete these prerequisites:

- [Set up Dynamics 365 Supply Chain Management](#) version 10.0.9 or later.
- [Turn on dual-write for Supply Chain Management apps](#).
- [Turn on flight](#) for the **MRGuidesFeature** feature. (For production environments, you must first submit a support ticket to have your tenant added to the flying group.)
- [Turn on the following configuration keys](#) on the **License configuration** page:
 - Asset management > Asset management mixed reality
 - Mixed reality > Mixed reality guide
- [Set up Dynamics 365 Guides](#) version 200.0.0.96 or later.

Use Dynamics 365 Guides with Asset management

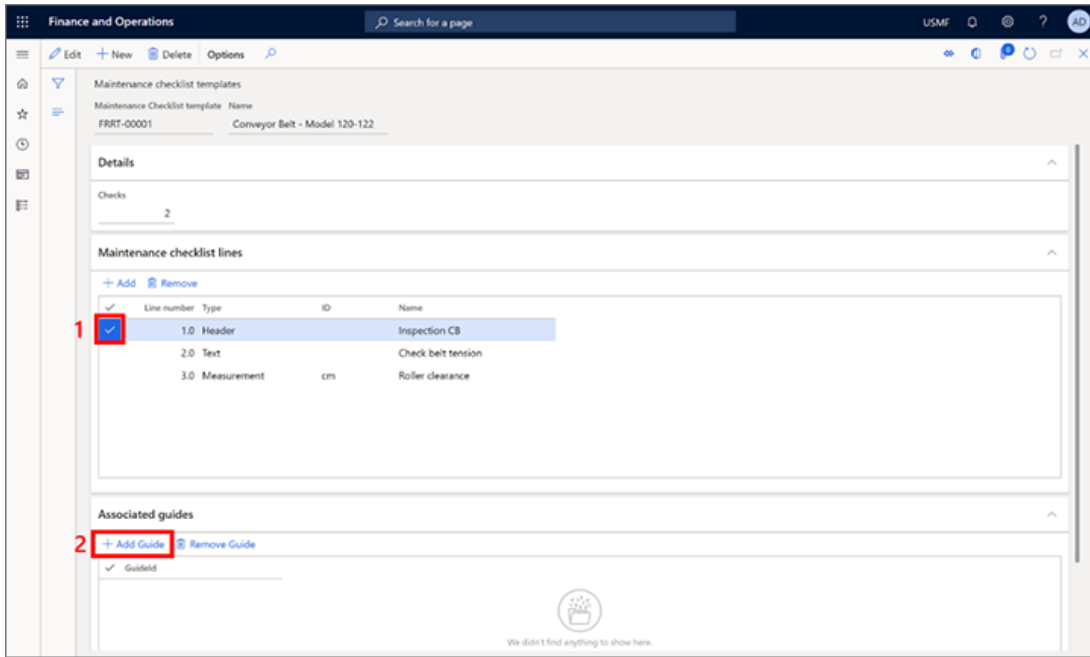

To associate a guide, you use a maintenance checklist line in Asset management. You can create the association through a maintenance checklist template, a maintenance job type, or a work order, because all three contain maintenance checklist lines. You can save time by using a template, because a template can be associated with all the maintenance job types that use it. For example, a guide that is associated with a maintenance job type is automatically associated with all work orders that specify that job type. On the other hand, a guide that is associated directly with a work order exists only for that work order.

Associate a guide with a maintenance checklist template

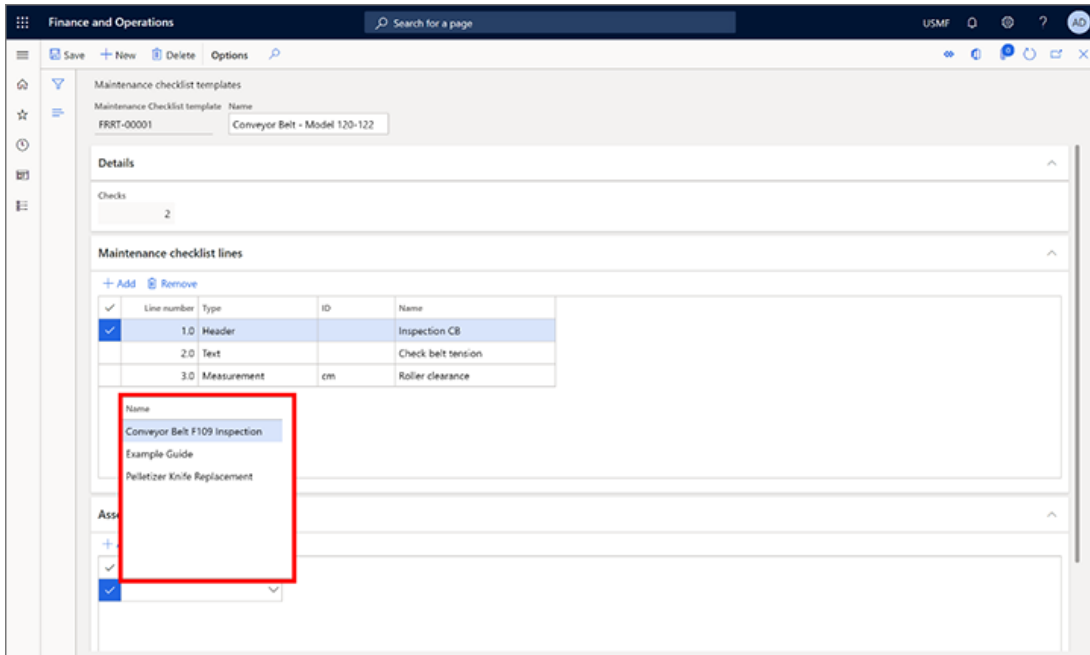

To associate a guide with a maintenance checklist template, follow these steps.

1. Create a guide by using the Dynamics 365 Guides PC and HoloLens apps. For information about how to create a guide, see the following topics:
 - [Use the PC app to create a guide](#)
 - [Use the HoloLens app to place your holograms](#)
2. In Supply Chain Management, [create a maintenance checklist template](#).
3. Associate the guide that you created with a maintenance checklist line in the new maintenance checklist template:
 - a. On the **Maintenance checklist lines** FastTab, select the line that you want to associate the guide with.

b. On the Associated guides FastTab, select Add Guide.

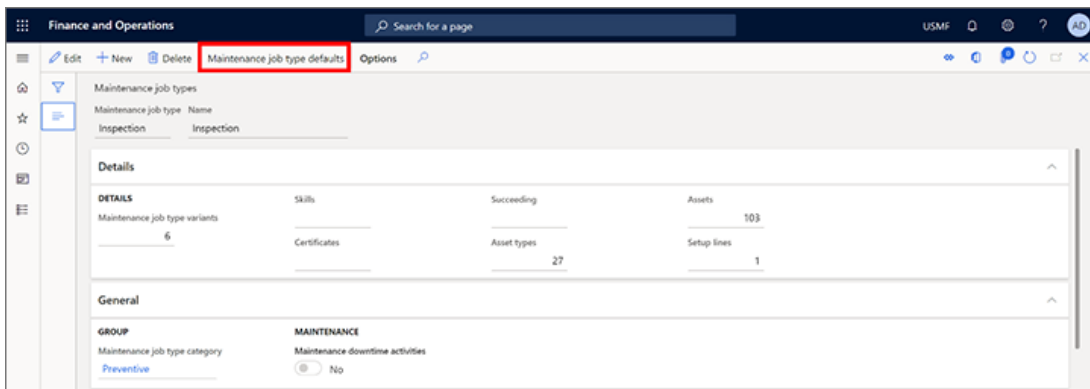

c. In the Name field, select a guide, and then select Save.

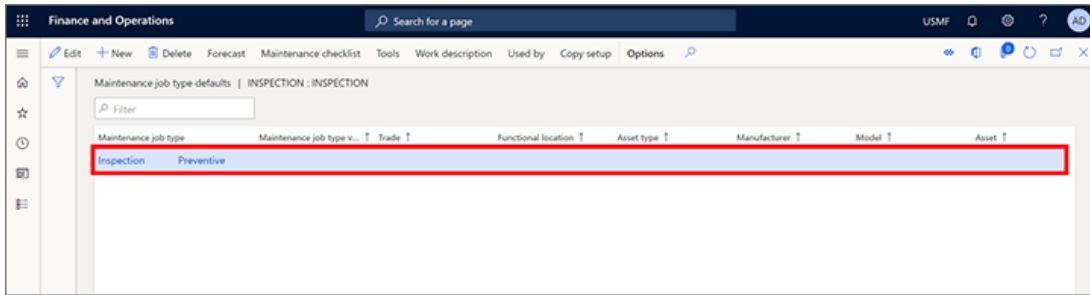

4. Associate the maintenance checklist template with a job type:

a. [Create a maintenance job type](#), or select an existing maintenance job type.

b. On the Action Pane, select Maintenance job type defaults.

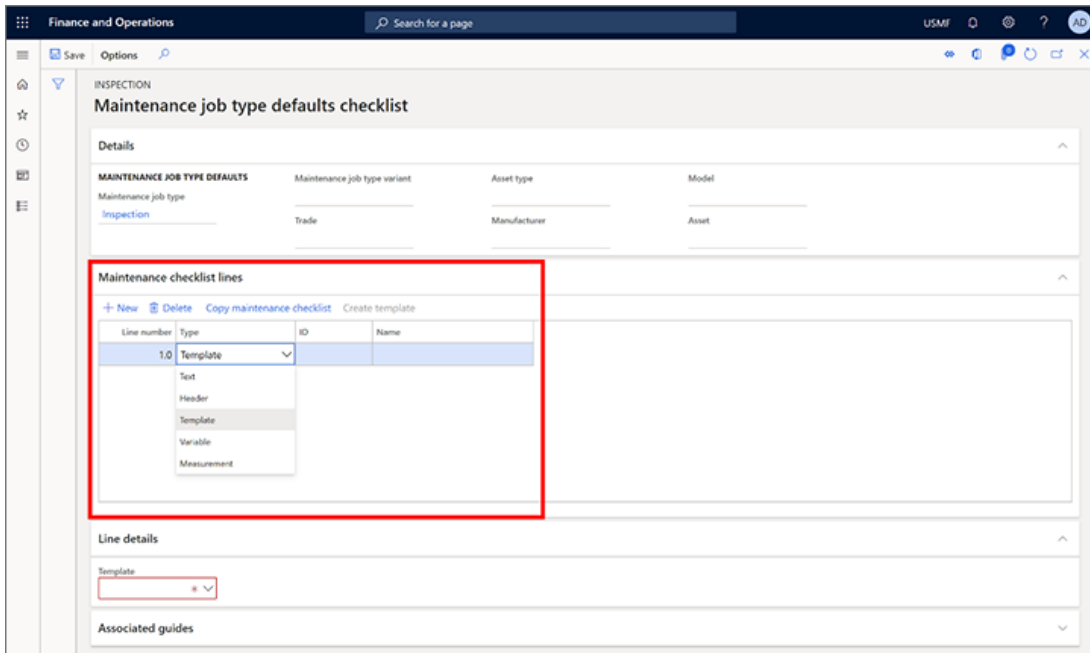

c. Create a line, and then select **Save**.

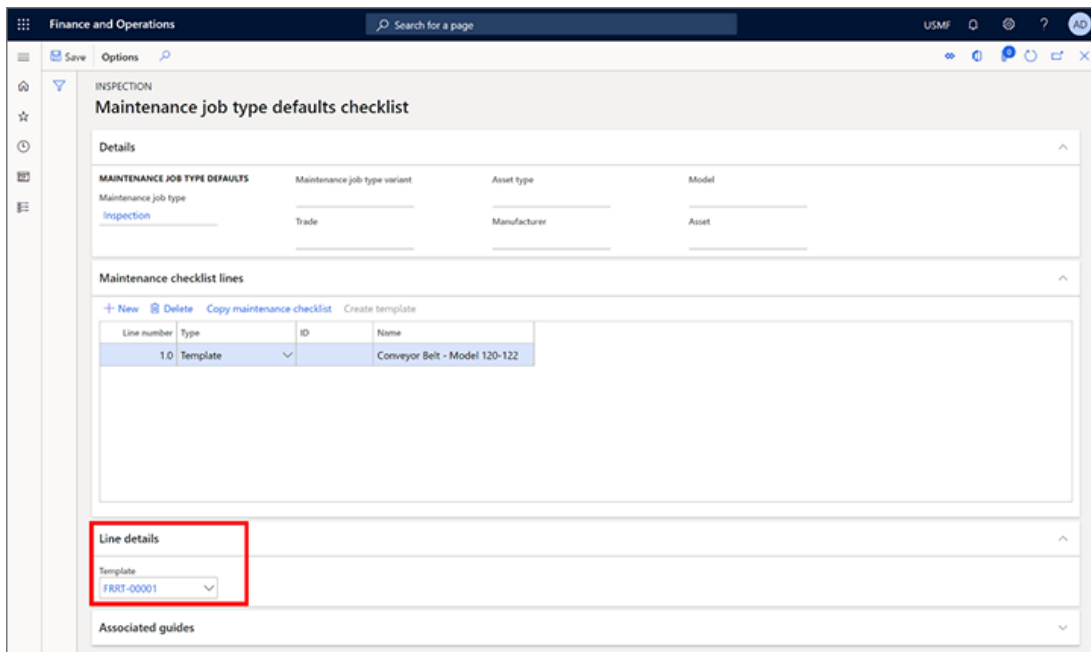

d. On the Action Pane, select **Maintenance checklist**.

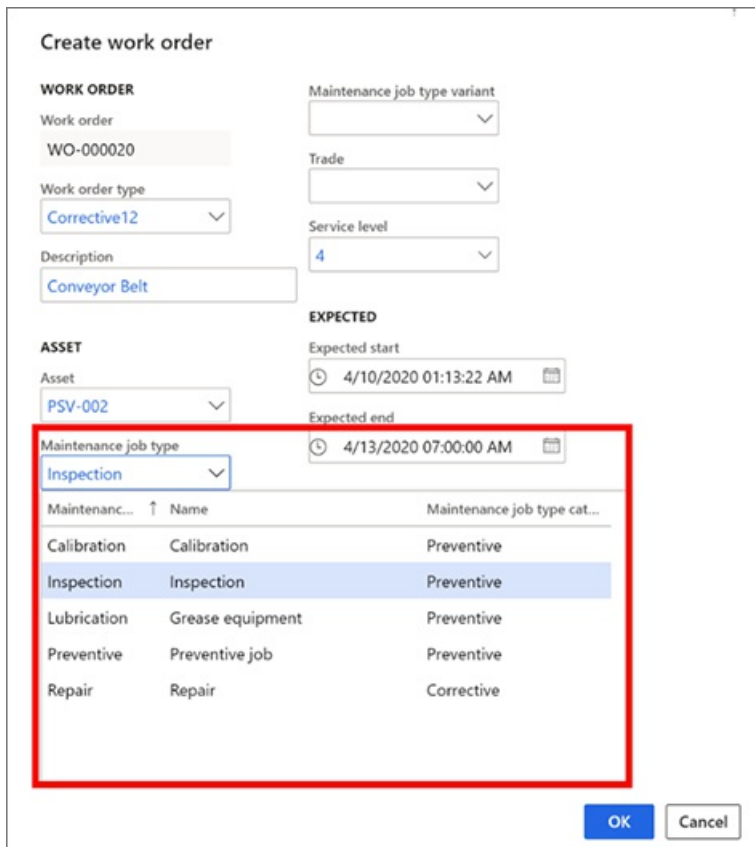

e. On the **Maintenance checklist lines** FastTab, add a line, and then change the value of the **Type** field to **Template**.

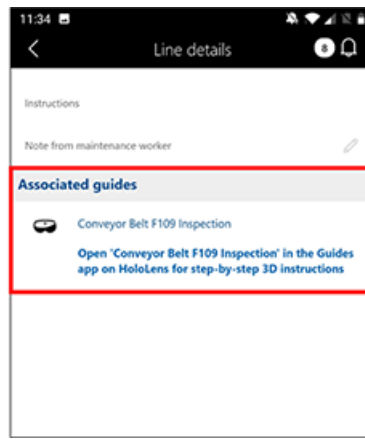

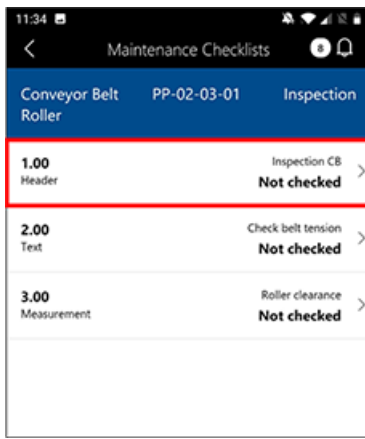

f. On the **Line details** FastTab, in the **Template** field, select the template that you associated the guide with, and then select **Save**.

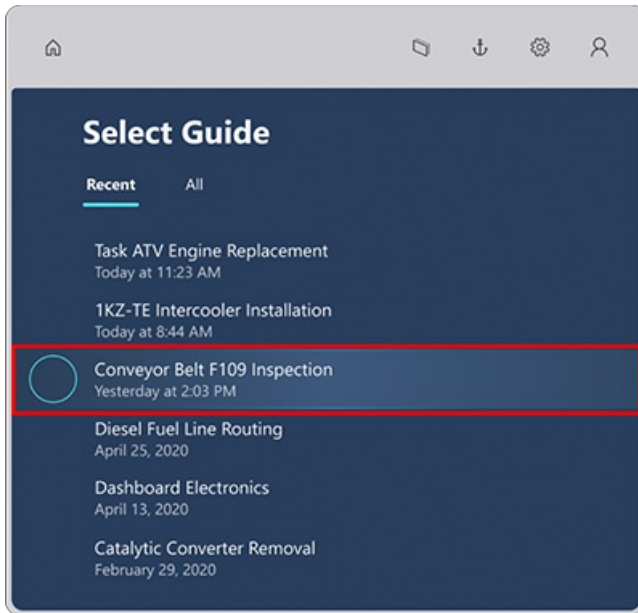

5. [Create a work order](#), and then select the maintenance job type that uses the maintenance checklist template that you associated the guide with. The guide is automatically associated with the work order.

6. View the guide that is associated with the work order and workers:
 - a. Open the [Asset management mobile workspace](#) to access the work order.
 - b. [Open the maintenance checklist](#) for the work order.
 - c. Select a checklist line to see the associated guide.

d. Open the guide on HoloLens.

NOTE

You can also associate a guide directly in the maintenance checklist of a work order or a job type.

IMPORTANT

There is a known issue where, when you associate a maintenance checklist template with a default maintenance job type, the guide that is linked to the template doesn't appear on the **Associated guides** FastTab of the **Maintenance job type defaults** page. However, the guide will appear after that job type is applied to a work order on the **Associated guides** FastTab.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Target entities

2/18/2021 • 2 minutes to read • [Edit Online](#)

In the **Data management** workspace, you can get an overview of target entities, related entity types and staging tables related to the **Asset management** module.

1. Click the **Finance and Operations** button in the upper-left corner of the screen, and click **Data management**.
2. In the **Import / Export** section, click **Data entities**.

3. On the **Target entities** page, search for "asset management" in the filter, and press Enter to see a list of the entities related to Asset management.

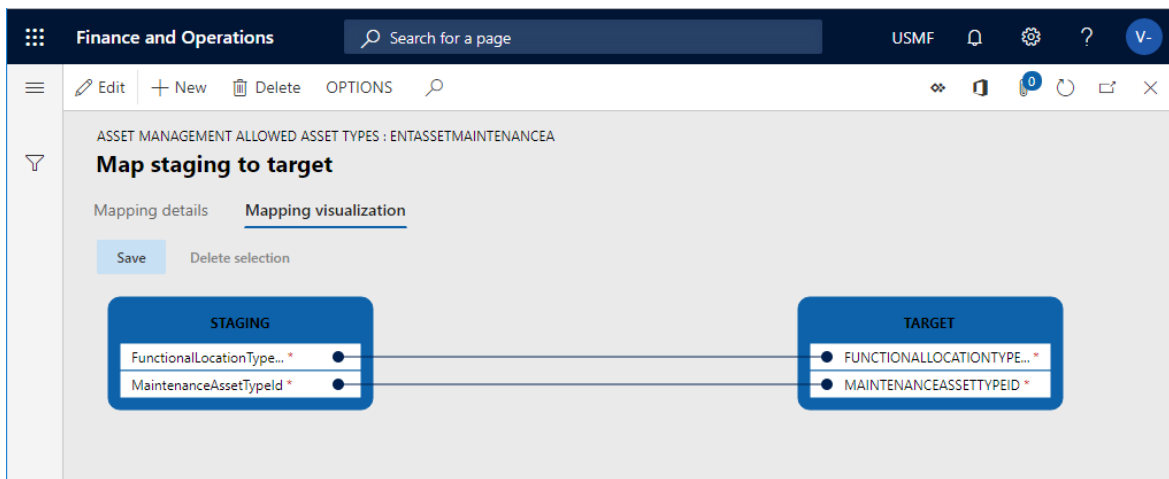

The figure below shows some of the Asset management entities.

Entity	Staging table	Target entity	Entity type	Change tracking	Type
Asset management allowed asset types	EntAssetMaintenanceAssetTypeFunctionalLocationStaging	EntAssetMaintenanceAssetTypeFunctionalLocationEntity	Entity	None	EntAssetMaintenanceAssetTypeFunctionalLoc...
Asset management asset aggregated values	EntAssetMaintenanceAssetAggregatedCounterStaging	EntAssetMaintenanceAssetAggregatedCounterEntity	Entity	None	EntAssetMaintenanceAssetAggregatedCounter...

Asset management asset documents	EntAssetMaintenanceAssetDocumentStaging	EntAssetMaintenanceAssetDocumentEntity	Entity	None	EntAssetMaintenanceAssetDocumentEntity

4. Select an entity and click **Modify target mapping**.

5. On the **Map staging to target** page, you see a list of the staging fields related to the selected entity. Click **Mapping visualization** to see a graphic overview of how staging data and target data are related.

In the figure below, a visualization of the fields related to the asset types entity is shown.

Cost accounting terminology

2/18/2021 • 8 minutes to read • [Edit Online](#)

This topic defines the key terms that are used in Cost accounting.

Allocation base

The allocation base is used to measure and quantify activities, such as machine hours that are used, kilowatt hours that are consumed, or square footage that is occupied. It's used as basis for allocating costs to one or more cost objects

Cost accounting

Cost accounting lets you collect data from various sources, such as the general ledger, sub-ledgers, budgets, and statistical information. You can then analyze, summarize, and evaluate cost data, so that management can make the best possible decisions for price updates, budgets, cost control, and so on. The source data that is used for cost analysis is treated independently in Cost accounting. Therefore, updates in Cost accounting don't affect the source data. However, when you collect cost data from various sources, and especially when you import the main accounts from General ledger as cost elements, there is data redundancy, because the same data exists in both General ledger and Cost accounting. This redundancy is required, because you use financial management for external reporting and Cost accounting for internal reporting.

Cost accounting ledger

Defined by calendar, currency, and cost element dimension, it controls processes and policies for measuring costs.

Cost entry

Cost entries are the result of a transfer via data connectors from general ledger entries, cost allocations, and posted cost entries in cost journals.

Cost object

Any type of object that is selected for cost control. Costs or revenues are either directly posted on or allocated to cost objects. Some typical cost objects are:

- Products
- Projects
- Departments
- Cost centers

Management uses cost objects to quantify costs, but also to drive profitability analysis.

Cost element

Used as a function to track and categorize costs. There are two types of cost elements: primary and secondary.

Primary cost elements represent the cost flow from financial accounting to Cost accounting. The structure typically corresponds to the profit and loss account structure in the general ledger where a cost element can correspond to a main account. Not all main accounts must be represented as cost elements, depending on business requirements.

Secondary cost elements represent the internal cost flow because these costs are only used in Cost accounting. They are used in cost roll-up rules to aggregate costs into meaningful buckets used by overhead calculation.

Cost classification

Cost classification groups costs according to their shared characteristics. For example, costs can be grouped by elements, traceability, and behavior.

- **By elements** – Materials, labor, and expenses.
- **By traceability** – Direct costs and indirect costs. Direct costs are assigned directly to cost objects. Indirect costs aren't directly traceable to cost objects. Indirect costs are allocated to cost objects.
- **By behavior** – Fixed, variable, and semi-variable.

Cost behavior

Cost behavior classifies costs according to their behavior in relation to changes in key business activities. To control costs effectively, management must understand the cost behavior. There are three types of cost behavior pattern: fixed, variable, and semi-variable.

- **Fixed cost** - A fixed cost is a cost that doesn't vary in the short term, regardless of changes in activity level. For example, a fixed cost can be a basic operating expense of a business, such as rent, that won't be affected even if the activity level increases or decreases.
- **Variable cost** - A variable cost changes according to changes in activity level. For example, a specific direct materials cost is associated with each product that is sold. The more products that are sold, the more direct materials costs there are.
- **Semi-variable cost** - Semi-variable costs are partly fixed and partly variable costs. For example, an Internet access fee includes a standard monthly access fee and a broadband usage fee. The standard monthly access fee is a fixed cost, whereas the broadband usage fee is a variable cost.

Cost control unit

The cost control unit represents the cost structure. The structure determines how cost flows in a hierarchical order between cost object dimensions and their respective cost objects.

Cost distribution

Is used to distribute cost from one cost object to one or more other cost objects by applying a relevant allocation base. Cost distribution and cost allocation differ in that cost distribution always occurs at the level of the primary cost element of the original cost and no reciprocal processing.

Cost allocation

Is used to allocate the balance of a cost object to other cost objects by applying an allocation base. Finance supports the reciprocal allocation method. In the reciprocal allocation method, the mutual services that auxiliary cost objects exchange are fully recognized. The system automatically determines the order to perform the allocations in and iterate over it. The balance of a cost object is allocated by a single allocation base. Allocations across cost object dimensions and their respective members are supported. The allocation order is controlled by the cost control unit.

Cost allocation policy

A cost allocation policy defines the amounts and quantities that must be allocated. Allocation rules include allocation source rules, which determine the costs that are allocated, and allocation targets rules, which determine where the costs are allocated. For example, all costs for facility services are an allocation source that can be allocated to various departments in an organization (that is, to allocation targets).

Cost roll-up

The purpose of cost roll-up rules is to aggregate costs into meaningful buckets. The level of aggregation is user-defined and involves the assignment of a secondary cost element. If cost roll-up is not used, every element of a

cost is allocated from one cost object to another

Cost rate policy

The cost rate is used to calculate price per cost object. To understand the elements of the price, you define cost rate policies. There are two types of cost rate: historical cost rate and planned cost rate. A historical cost rate is a calculated rate that is used as a multiplier for the allocation base of a cost object. The rate is calculated based on the cost allocations in the previous period. A planned rate is a user-defined rate.

Dimension hierarchy

There are two dimension hierarchies: categorization hierarchy and classification hierarchy. The dimension categorization hierarchy type is used for reporting purposes. It supports only the cost element dimensions. The dimension classification hierarchy type is used to define policies and for reporting purposes. It supports all dimensions, such as cost objects, cost elements, and statistical dimensions.

Data connector

Cost accounting supports integration of data from source systems via a set of data connectors. The following data connectors are available:

- Imported transactions (pre-configured)
- Dynamics 365 Finance (pre-configured)
- Dynamics AX (configuration required)

Note: The data connector Imported transactions is based on data entities.

Data provider

Most source systems can provide data that matches one or more data sources in Cost accounting. To align data from the source systems with the data source in Cost accounting, a data provider needs to be configured. The following table lists the availability of data providers per data connector and data source.

DATA SOURCES	IMPORTED TRANSACTIONS DATA CONNECTOR	DYNAMICS 365 FINANCE DATA CONNECTOR	DYNAMICS AX DATA CONNECTOR
Cost element dimension members	Yes	Yes	Yes
Cost object dimension members	Yes	Yes	Yes
Statistical dimension members	Yes	No	No
General ledger	Yes	Yes	Yes
Budget entries	Yes	Yes	Yes
Statistical measures	Yes	Yes	Yes

Formula

Formula allocation bases let you define advanced formulas to achieve the correct allocation basis. You can manually create formula allocation bases. You can use the following operators to define your formula.

SYMBOLS	TEXT
()	Parentheses
<	Smaller than
>	Larger than
+	Addition
-	Subtraction
*	Multiplication

Traditional IF statements are not supported. However, you can create statements and validate whether they are true.

STATEMENT VALIDATION	RESULT
a > b	True
a > b	False

Overhead cost

Overhead costs refer to the ongoing expenses of operating a business. They are the costs that can't be linked directly to specific business activities. Here are some examples of overhead costs:

- Accounting fees
- Depreciations
- Insurance
- Interest
- Legal fees
- Taxes
- Utilities costs

Overhead rate

Rates are defined per cost object and cost element. There are two types of rates: fiscal period and user-specified. Fiscal period rates are calculated by the overhead calculation. A user-specific rate is user-defined and can be used to allocate cost between cost objects at a predetermined rate in the overhead calculation.

Published

If you set this field to Yes, a user who is assigned one of the following roles can view the report in the Cost control workspace:

- Cost accounting manager
- Cost accountant
- Cost accountant clerk
- Cost object controller

If you set this field to No, only users who are assigned one of the following roles can view the report in the Cost control workspace:

- Cost accounting manager
- Cost accountant
- Cost accountant clerk

Statistical dimension

A statistical dimension and its members are used to register and control non-monetary entries in Cost accounting. Statistical dimension members can be used for two purposes:

- As an allocation base in policies such as cost distribution or cost allocation.
- For reporting of non-monetary consumption.

A statistical dimension is the expression of a count or sum of an activity that can be used as the basis for allocations or rate calculations. It's either created manually or imported from source systems. Examples of statistical dimensions include the number of employees, the count of licensed software on each device, power consumption of each machine, or square meters for a cost center.

Statement

Statements are views for the managers who are responsible for controlling costs. Statements are defined by a cost controller, and they provide a quick overview of actual costs, budgeted costs, and deviations. A manager can drill further into details if required. To help ensure that managers view only data that they are accountable for, data that appears in the statements is subject to access rules.

Version

Versions are used to simulate, view, and compare various outcomes. By default, all actual costs are viewed in one base version that is known as *actual*. For budgets and calculations, you can work with as many versions as you require. For example, you can import budget data into an original version and then revise the budget in a revised version. For calculations, you can create multiple versions. In these various versions, you can then create calculations by using different calculation rules that will be applied for cost allocation.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Fiscal calendars, fiscal years, and periods

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article discusses fiscal calendars, fiscal years and periods and how to utilize them for legal entities, fixed assets and budgeting.

Fiscal calendars provide a framework for the financial activity of an organization. Each fiscal calendar contains one or more fiscal years, and each fiscal year contains multiple periods. Fiscal calendars can be based on a January 1 to December 31 calendar year, or on any dates that you select. For example, some organizations select a fiscal calendar that starts on July 1 of one year and ends on June 30 of the following year.

There is no limit to the number of fiscal calendars that you can create, and no limit to the number of fiscal years that can be created for a fiscal calendar. Each fiscal calendar is independent of your organization, and can be used by multiple legal entities in the organization. For example, an organization has eight departments and each department is a separate legal entity. Five of them share the same fiscal calendar and three use different fiscal calendars. You can create one fiscal calendar for the five legal entities that share the same fiscal calendar, and then create separate fiscal calendars for the other legal entities.

Create fiscal calendars, fiscal years, and periods

You can create and delete fiscal calendars, fiscal years, and periods on the Fiscal calendars page. You can also divide existing periods and create closing periods that can be used to close a fiscal year.

A closing period is used to separate general ledger transactions that are generated when a fiscal year is closed. When the closing transactions are in one fiscal period, it is easier to create financial statements that either include or exclude different types of closing entries. If a fiscal year is divided into 12 fiscal periods, the closing period is usually the 13th period. However, a closing period can be created from any period that has a status of Open.

When you create a closing period, select a period that has a status of Open and that has the dates that you want to use. The new closing period will copy the starting and ending dates from the existing period. The original period will continue to exist. For example, you select Period 12, which is the last period in the fiscal year, and that has dates of August 1 through August 31. You enter a name for the closing period, such as Close. After you create the new closing period, you now have the original period and the closing period. Both have dates that start on August 1 and end on August 31.

Select fiscal calendars for ledgers, fixed assets, and budget cycles

Fiscal calendars are used with fixed asset depreciation, financial transactions, and budget cycles. When you create a fiscal calendar, you can use it for multiple purposes. You can select a fiscal calendar for a fixed asset book to make it a fixed asset calendar. You can select a fiscal calendar for a ledger to make it a ledger calendar. And you can select a fiscal calendar for a budget cycle to make it a budget calendar. You can use the same fiscal calendar for all of these.

Select a fiscal calendar for your legal entity

Select the fiscal calendar that you want to use for the ledger for your legal entity in the Ledger form. A fiscal calendar must be selected on the Ledger page for every legal entity. After a fiscal calendar is selected, you can set up period statuses and permissions on the Ledger calendar page for any of the periods that are part of a fiscal year.

Select a fiscal calendar for fixed assets

You can select a fiscal calendar for a fixed asset book, and that fiscal calendar will be used by the fixed assets that use the selected book. You can select from any fiscal calendar that is defined on the Fiscal calendars page.

Define budget cycle time spans

Budget cycles are the length of time during which a budget is used. Budget cycles can include part of a fiscal year or multiple fiscal years, such as a biennial budget cycle of two years or a triennial budget cycle of three years. The budget cycle time span defines the number of periods that are included in the budget cycle. To specify the budget cycle time span, use the Budget cycle time spans page.

Maintain periods for your organization

You can use the Ledger calendar page to view the details of the fiscal calendar, fiscal years, and periods used by your organization. You can also change the status of the periods and select which users can post accounting transactions to periods. For example, at the start of a new period, you might want a group of users to finish posting financial transactions in the previous period, while other groups work only in the new period.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Financial dimensions

2/18/2021 • 9 minutes to read • [Edit Online](#)

This topic explains the various types of financial dimensions and how they are set up.

Use the **Financial dimensions** page to create financial dimensions that you can use as account segments for charts of accounts. There are two types of financial dimensions: custom dimensions and entity-backed dimensions. Custom dimensions are shared across legal entities, and the values are entered and maintained by users. For entity-backed dimensions, the values are defined somewhere else in the system, such as in Customers or Stores entities. Some entity-backed dimensions are shared across legal entities, whereas other entity-backed dimensions are company-specific.

After you've created the financial dimensions, use the **Financial dimension values** page to assign additional properties to each financial dimension.

You can use financial dimensions to represent legal entities. You don't have to create the legal entities in Dynamics 365 Finance. However, financial dimensions aren't designed to address the operational or business requirements of legal entities. The interunit accounting functionality in Finance is designed to address only the accounting entries that are created by each transaction.

Before you set up financial dimensions as legal entities, evaluate your business processes in the following areas to determine whether this setup will work for your organization:

- Inventory
- Sales and purchases between financial dimensions and legal entities
- Sales tax calculation and reporting
- Operational reporting

Here are some of the limitations:

- You can use sales tax functionality only with legal entities, not with financial dimensions.
- Some reports don't include financial dimensions. Therefore, to report by financial dimension, you might have to modify the reports.

Custom dimensions

To create a user-defined financial dimension, in the **Use values from** field, select **Custom dimension**.

You can also specify an account mask to limit the amount and type of information that can be entered for dimension values. You can enter characters that remain the same for each dimension value, such as letters or a hyphen (-). You can also enter number signs (#) and ampersands (&) as placeholders for characters that will change every time that a dimension value is created. Use a number sign (#) as a placeholder for a number and an ampersand (&) as a placeholder for a letter. The field for the format mask is available only when you select **Custom dimension** in the **Use values from** field.

Example

To limit the dimension value to the letters "CC" and three numbers, enter **CC-###** as the format mask.

Entity-backed dimensions

To create an entity-backed financial dimension, in the **Use values from** field, select a system-defined entity to base the financial dimension on. Financial dimension values are then created from that entity. For example, to

create dimension values for projects, select **Projects**. A dimension value is then created for each project name. The **Financial dimension values** page shows the values for the entity. If those values are company-specific, the page also shows the company.

Activating dimensions

When you activate a financial dimension, the table is updated so that it includes the name of the financial dimension. Deleted dimensions are removed. You can enter dimension values before you activate a financial dimension. However, a financial dimension can't be consumed anywhere until it's activated. For example, you can't add a financial dimension to an account structure until the financial dimension has been activated. When you select **Activate**, all dimensions are updated and show status changes.

Translations

On the **Text translation** page, you can enter text for the selected financial dimension in various languages. On the **Main account translation** page, you can enter text for the main account in various languages.

Legal entity overrides

Not all dimensions are valid for all legal entities. Additionally, some dimensions might be relevant only for a specific period. In these cases, you can use the **Legal entity overrides** section to specify the companies that the dimension should be suspended for, the owner, and the period when the dimension is active.

Deleting financial dimensions

To help maintain referential integrity of the data, financial dimensions can rarely be deleted. If you try to delete a financial dimension, the following criteria are evaluated:

- Has the financial dimension been used on any posted or unposted transactions, or in any type of dimension value combination?
- Is the financial dimension used in any active account structure, advanced rule structure, or financial dimension set?
- Is the financial dimension part of a default financial dimension integration format?
- Has the financial dimension been set up as a default dimension?

If any of the criteria are met, you can't delete the financial dimension.

Default dimension values

You can use values from master records, such as customer and vendor, as default values in new dimensions. When the new dimensions are created, the master record ID is entered in the dimension values for those master records. For example, when you create a new customer, the customer ID is entered in the customer dimension. When you create sales orders, invoices, or other documents that require a customer ID, the existing defaulting rules are used, and the customer ID is added to the document.

This feature is controlled by a setting in the dimension. This setting is named **Copy values to this dimension on each new DimensionName created**, where **DimensionName** is the name of the dimension. By default, the feature is turned off. However, it can be turned on at any time.

If records already exist for the dimension, the master records are updated when you turn the feature on. However, existing documents and transactions aren't updated.

If you are using a template to create a master record, make sure that the template value for the master dimension is blank. For example, if you're creating customers from a template, make sure that the customer dimension in the template is blank. The customer dimension value will default from the new customer number

when you create the new customer.

Derived dimensions

You can configure a dimension so that information for other dimensions is automatically entered when you enter that dimension in a document. For example, if you enter cost center 10, a value of **20** can be automatically entered in the department dimension.

You can set up derived values on the dimensions page.

1. Select a dimension and then select **Derived dimensions**.

The **Derived dimensions** page includes a grid. The selected dimension segment is the first column in this grid.

2. Add the segments that should be derived. Each segment appears as a column.

Enter the dimension combinations that should be derived from the dimension in the first column. For example, to use the cost center as the dimension that the department and location are derived from, enter cost center 10, department 20, and location 30. Then, when you enter cost center 10 in a master record or on a transaction page, department 20 and location 30 are entered by default.

Overriding existing values with derived dimensions

By default, the derived dimension process doesn't override existing values for derived dimensions. For example, if you enter cost center 10, and no other dimension is entered, department 20 and location 30 are entered by default. However, if you change the cost center, the values that have already been established aren't changed. Therefore, you can establish default dimensions on master records, and those dimensions won't be changed by derived dimensions.

You can change the behavior of derived dimensions to override existing values by selecting the **Replace existing dimension values with derived values** check box on the **Derived dimensions** page. If this field is selected, you can enter a dimension with derived dimension values and those derived dimension values will override any values that already exist. Using the previous example, if you enter cost center 10, and no other dimension is entered, department 20 and location 30 are entered by default. However, if the values were already department 50 and location 60, the values will now be changed to department 20 and location 30.

Derived dimensions with this setting do not automatically replace the existing default dimensions values when dimension values are defaulted. Dimension values will only be overridden when you enter a new dimension value on a page and there are existing derived values for that dimension on the page.

Preventing changes with derived dimensions

When you use **Add segment** on the **Derived dimensions page** to add a segment as a derived dimension, an option is provided at the bottom of the **Add segment** page that allows you to prevent changes to that dimension when it is derived on a page. The default setting is off so it does not prevent the derived dimension values from being changed. Change the setting to **Yes** if you want prevent the dimension from being changed after it has been derived. For example, if the value for the Department dimension is derived from the value of the Cost center dimension, the Department value cannot be changed if the **Prevent changes** setting is **Yes**.

The setting does not prevent changes if the dimension value is valid but it is not listed in the derived dimensions list. For example, if Department 20 is derived from Cost center 10 and you enter Cost center 10, then you will not be able to edit Department 20. However, if you enter Cost center 20 and it is not in the list of derived dimensions for Cost center, then you can edit the Department value.

In all cases, the account value and all dimensions values will still be validated against the account structures after the derived dimensions values have been applied. If you use derived dimensions and they fail validation when used on a page, you must change the derived dimensions values on the derived dimensions page before you can use them in transactions.

When you change dimensions on the **Financials dimensions** FastTab, the dimension that is marked to prevent changes will not be editable. If you are entering an account and dimensions into the segmented entry control on a page, the dimensions are editable. However, when you move the highlight off the segmented entry control and move to another field or take an action, the account and dimensions will be validated against the derived dimensions list and the account structures to ensure that you have entered the appropriate values.

Derived dimensions and entities

You can set up the derived dimensions segments and values by using entities.

- The Derived dimensions entity sets up the driving dimensions and the segments that are used for those dimensions.
- The Derived dimensions value entity lets you import the values that should be derived for each driving dimension.

When you use an entity to import data, if that entity imports dimensions, the derived dimension rules are applied during the import unless the entity specifically overrides those dimensions.

For more information, see the following topics:

- [Define financial dimensions](#)
- [Maintain financial dimension default templates](#)

Financial dimensions and posting

2/18/2021 • 6 minutes to read • [Edit Online](#)

When you plan and set up your chart of accounts, you must consider how the various components will work together when you post a document or journal. These components include account structures, advanced rules, and balancing and fixed dimensions. This topic explains what each component is and how the components work together.

Chart of accounts and financial dimension components

A rich, rule-based system is used to define valid combinations of main accounts and financial dimension values. This section gives a brief overview of the functionality of each component and explains where you can find the component.

Account structures

An account structure is required when you set up your ledger. You must define and activate at least one account structure, and you must assign it to the ledger. The account structure must have the main account in it. You can define the order of segments that works best for the business. After the main account is defined, the system can determine the account structure that is used. By putting the main account first or near the front of a structure, you can help limit the values and also help the system apply the last known valid value as a default value. You can have up to 10 additional financial dimensions in the account structure. The account structure defines which dimension values are valid in combination with other values. It also defines whether dimension values must be entered.

Advanced rules

Advanced rules are an optional component when you set up the chart of accounts. You can add as many advanced rules as you want to an account structure. Advanced rules are often used to handle scenarios where additional financial dimensions must be tracked when specific criteria are met. For example, if you use a Travel expense account, you might want to track additional information, such as the event that the employee is traveling for. If there are multiple advanced rules, they are applied in alphabetical order, based on the names of the rules. The segments that a rule adds can be applied only after the segments of the account structure.

Balancing dimension

You can optionally define a balancing financial dimension. On the **Ledger** page, you can define the financial dimension that should be balanced. Then, whenever transactions are posted to that financial dimension, the system automatically creates and posts entries to make the financial dimension balanced.

Default/fixed financial dimensions on the main account

Default dimensions come from various places, such as master records (for example, customer or vendor records), document headers, and the main account. This topic focuses on default dimensions on the main account by legal entity. You can define whether a main account has a **Not fixed** or **Fixed** value for each financial dimension that is used across all account structures for the ledger. If a financial dimension is **Not fixed**, it uses a default value, but that value can be overwritten. This behavior applies to all default values in the system, even default values that come from master records. If a financial dimension is set to a **Fixed** value, that value is always applied, regardless of whether it came from somewhere as a default value or the user entered it.

Order in which default dimensions are applied during posting

People often have questions about the order that the various components run in. It's very important that you understand the order that default dimensions are applied in, because this behavior affects the approach that you

take to setup.

NOTE

This information applies only to the application of default dimensions in the application. If you import data by using Microsoft Excel or the Data Management Framework, the behavior differs.

Example 1

Account structure

MAIN ACCOUNT	BUSINESS UNIT	DEPARTMENT	COST CENTER
All values are allowed.	All values are allowed.	All values are allowed.	All values are allowed.

Main account

MAIN ACCOUNT	NAME	LEGAL ENTITY	DEPARTMENT
401100	Product Sales	USMF	Fixed – 022 Sales and Marketing department

The following illustration shows the fixed default dimension that is set on main account 401100.

Default financial dimensions

Specify the default dimensions for an account. When a financial dimension is fixed, the value specified for the dimension, including a blank value, will override the values on the transaction at time of post.

BankAccount	Not fixed		No default
BusinessUnit	Not fixed		No default
CostCenter	Not fixed		No default
Department	Fixed value	022	Sales & Marketing
ItemGroup	Not fixed		No default
Project	Not fixed		No default

For this very basic example, we will enter a general journal where the Department dimension is set to use the default value 023 (Operations). We will enter and post a ledger account. The following illustration shows the default financial dimension on the general ledger header.

General journals

Show

Not posted

Show user-created only

List General Setup Blocking **Financial dimensions** History

FINANCIAL DIMENSIONS

BankAccount

BusinessUnit

CostCenter

Department Operations

ItemGroup

Project

The default dimension on the journal header will cause department 023 to be applied by default on the sales account line. The following illustration shows the general journal line, where the 023 default dimension value from the header is applied.

✓	Date	Voucher	Company	Account type	Account
✓	7/27/2017	GNJL000804	USMF	Ledger	401100--023--

However, when the line is posted, the fixed dimension is applied, and the line is posted to department 022. The following illustration shows the posted voucher, where the fixed dimension is applied for the sales account.

00634 : GNJL000804

Voucher transactions

Overview General

✓	Journal number	Voucher	Date ↑	Year closed	Ledger account	Account name
	020856	GNJL000804	7/27/2017		401100--022--	Product Sales
	020856	GNJL000804	7/27/2017		110110--023	Bank Account - USD

Example 2

This example uses the same setup as the first example. However, we will add a second component and use the Department dimension as a balancing dimension. In the following illustration, **Department** is set as the balancing financial dimension for the USMF ledger.

Ledger

Description: Contoso Entertainment System U | Chart of accounts: Shared | Fiscal calendar: Fiscal | Balancing financial dimension: Department

Account structures

+ Add | Remove | Configure account structures

Account structure	Name
Manufacturing B/S	Manufacturing Balance Sheet
Manufacturing P&L	Manufacturing Profit and Loss
Statistical	Statistical

When the same journal header setup is used, and the same transaction is posted, the fixed dimension is applied first. Then the balancing logic is applied to help guarantee that every department has a balanced entry. The following illustration shows voucher transactions that include the balancing entry after the fixed dimension is applied.

00635 : GNJL000805

Voucher transactions

Overview | General

Journal number	Voucher	Date ↑	Year closed	Ledger account	Account name	Currency	Amount	As
020858	GNJL000805	7/27/2017		231500--023	Interunit Payable	USD	1,000.00	
020858	GNJL000805	7/27/2017		133500--022	Interunit Receivable	USD	1,000.00	
020858	GNJL000805	7/27/2017		401100--022--	Product Sales	USD	1,000.00	
020858	GNJL000805	7/27/2017		110110--023	Bank Account - USD	USD	1,000.00	

Example 3

In this example, we will add an advanced rule. The advanced rule specifies that if sales account 401100 and department 022 (Sales and Marketing) are used, the system should track an additional segment that is named Customer.

This example is important because of the order. The account structure is determined after the main account is entered. If you refer to the account structure setup, the system can determine that the main account, business unit, department, and cost center are relevant. At this point, the advanced rule hasn't been triggered, because fixed dimensions aren't applied until default dimensions have been applied for the journal voucher during posting. In the following illustration, the Customer segment isn't present, because the criteria for the advanced rule haven't been met.

Account	Description	Debit	Credit	Offset company	Offset account type
401100--023--			15,000.00	USMF	Ledger

Value	Description
401100	Product Sales

MainAccount: 401100 Product Sales

BusinessUnit:

Department: 023 Operations

CostCenter:

The posting won't be successful, because the fixed dimension was applied at the end of the process. Dimension validation determines that the Customer segment is required if the main account is 401100 and the department is 022. Posting can't occur because of the validation error. The following illustration shows the message that

appears after dimension validation determines that Customer is a required segment.

Message details

Posting results for journal batch number 00636

 Voucher GNJL000806

 Voucher GNJL000806

 You must select a value in the Customer field in combination with the following dimensions values that are valid:

 MainAccount 401100.

 BusinessUnit <blank>.

 Department 022.

 CostCenter <blank>.

 ItemGroup <blank>.

 Dimension values were validated with this advanced rule structure: Customer

 Reported from company accounts usmf

 Posting has been canceled.

In this example, you must overwrite the default value so that the advanced rule is triggered and you can enter the Customer segment. However, this solution isn't always possible, and some users aren't even aware of the posting rules. Therefore, it's important that you understand the order that default dimensions are applied in when you set up your chart of accounts.

To achieve what you want in this example, you can change the configuration in several ways. For example, you can create a new account structure for sales accounts and include the Customer segment in the structure. You can also add more rows in an existing account structure, and specify the main account and valid department values. Then, in the additional customer structure, you might find it useful to have a separate account structure of sales accounts where the Customer segment is present.

Additional resources

Some of the following resources refer to an earlier version of our software. However, much of the information about the application of default dimensions and many of the concepts are the same in the earlier version, and the references are still valid.

Add financial dimensions to the CFO workspace

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how to add financial dimensions to the Chief Financial Officer (CFO) workspace, so that they can be used for the ledger and budget reports. The CFO workspace has an **Overview** tab and a **Financial** tab. The reports on these two tabs are backed by two measures: `LedgerActivityMeasure` and `BudgetActivityMeasure`. There is a relation between those two measures and the `DimensionCombinationEntity` entity. Therefore, you can select dimensions.

1. In Finance, on the **Entity Store** page, update the **LedgerActivityMeasure** and the **BudgetActivityMeasure** measures.
2. In Microsoft Visual Studio, open Application Explorer, and search for **LedgerCFO**.
3. Under **Resources**, open **LedgerCFOWorkspacePBIX**.
4. When the resource opens in Microsoft Power BI desktop, select **Get Data**, select **SQL Server database**, and then select **Connect**.
5. Enter the server name, and enter **AxDW** as the database. Select **DirectQuery**, and then select **OK**.
6. Search for and select **LedgerActivityMeasure_DimensionCombination**, and then select **Load**.

TIP

In the **Fields** list, rename the table **Financial dimensions**, so that it's easy to identify.

7. Select **Manage Relationships**, and then select **New**.
8. In the first field, select **General Ledger Activities**, and then select **LedgerDimension**.
9. In the second field, select **LedgerActivityMeasure_DimensionCombination** (or **Financial dimensions** if you renamed the table). Select the **DimensionCombinationRECID** header.
10. In the **Cardinality** field, select **Many to One**.
11. Change the **Cross filter direction** value to **Single**.
12. Select both **Make this relationship active** and **Assume referential integrity**, select **OK**, and then select **Close**.

Create relationship ✕

Select tables and columns that are related.

General Ledger Activities

LedgerActivityMeasure_DimensionCombination

DIMENSIONCOMBINATIONRECID	DISPLAYVALUE	MAINACCOUNT	ACCOUNTVALUE	PARTITION

Cardinality: Many to one (*:1)

Cross filter direction: Single

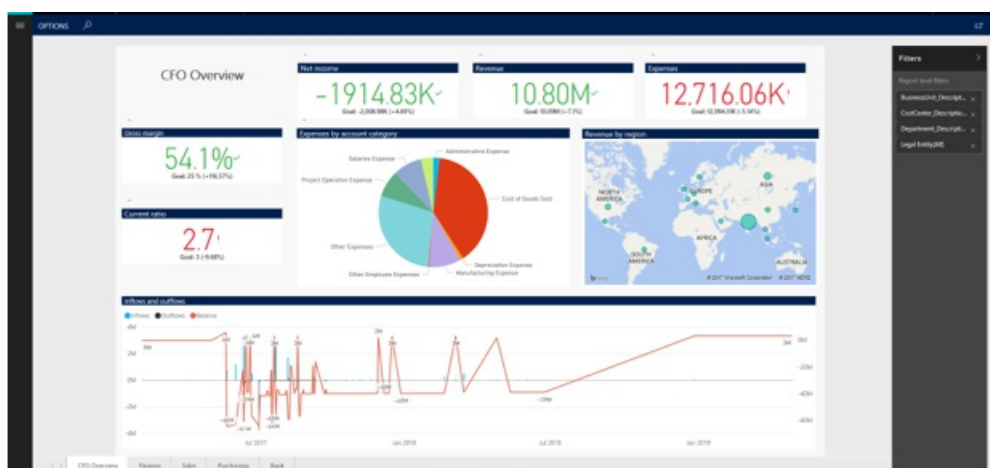

Make this relationship active

Assume referential integrity [Learn more](#)

Apply security filter in both directions

OK
Cancel

13. In the **Fields** list, you should see the table and the available financial dimensions. Drag the financial dimensions that you want to the report-level filters.
14. Save your changes.
15. In the Application Object Tree (AOT), right-click your project, and then select **Synchronize**.
16. Build your project, and then open the application to view the results.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create account structures

2/18/2021 • 2 minutes to read • [Edit Online](#)

This task guide steps through creating an account structure. The steps use demo data company USMF.

1. Go to **Navigation pane > Modules > General ledger > Chart of accounts > Structures > Configure account structures**.
2. On the **Action pane**, click **New** to open the drop dialog.
3. In the **Account structure** field, type a name to describe the purpose of the account structure.
4. In the **Description** field, type a description to specify the purpose of the account structure.
5. Click **Create**.
6. In the **Segments and allowed values**, click **Add segment**.
7. In the dimensions list, select the dimension to add to the account structure.
8. At the end of the list, click **Add segment**.
9. Repeat step 6 to 9 as needed.
10. In the **Allowed value details** section, select the segment to edit the allowed values. For example, click the **Main Account** field.
11. In the **Operator** field, select an option, such as is between and includes.
12. In the **Value** field, type a value. For example, 600000.
13. In the **through** field, type a value. For example, 699999.
14. In the **Allowed value details** section, click **Apply**.
15. Repeat step 10 to 15 as needed.
16. In the **Allowed value details** section, click **Add new criteria**.
17. In the **Operator** field, select an option, such as is between and includes.
18. In the **Value** field, type a value. For example, 033.
19. In the **through** field, type a value. For example, 034.
20. Click **Apply**.
21. In the grid, select the segment to edit the allowed values. For example, Cost Center.
22. In the **CostCenter** field, type a value. For example, 007..021.
23. In the **Segments and allowed values**, click **Add**.
24. In the **MainAccount** field, type a value. For example, 600000..699999
25. In the grid, select the segment to edit the allowed values. For example, Department.
26. In the **Department** field, type a value. For example, 032.
27. In the **CostCenter** field, type a value. For example, 086.
28. On the **Action pane**, click **Validate**.
29. On the **Action pane**, click **Activate**.
30. Click **Activate**.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Budgeting overview

2/18/2021 • 6 minutes to read • [Edit Online](#)

Almost every company that uses Financials functionality in Microsoft Dynamics 365 Finance will have to be able to create reports of budget vs. actuals. This article explains the minimum configuration that is required in order to create budgets in Finance and Operations or load them from a third-party program.

Overview

The approved budget for a legal entity is maintained in a document that is known as a *budget register entry*. The lines in a budget register entry document are known as *budget account* entries, and contain financial dimension information, dates, and the amounts of the approved budget. The budget register entry document is integrated with basic financial reports and inquiry pages where ledger actual amounts are compared to budget amounts.

There are multiple methods for creating budget register entries:

- Manually enter the document information on the **Budget register entries** page.
- Use the Microsoft Excel template that you can open by clicking the **Open in Excel** button on the **Budget register entries** page.
- Use the **Budget Account Entries** data entity in Data management to import budget register entries. You should consider using this method and turning on the **Set based **processing ****parameter when you must import many budget account entries into the system.
- If the company uses Budget planning functionality to prepare budget data, you can use the **Generate budget register entry** periodic process.

The budget register entry is considered completed when the budget balances have been updated. On the **Budget register entries** page, click **Update budget balances** for a selected budget register entry or multiple entries. After you update the budget balances, the status of the budget register entry changes to **Completed**. Completed budget register entry can't be re-opened for edits. Therefore, if the budget data must be adjusted, you must create a new budget register entry instead of correcting data in the completed budget register entry.

Configuration

When you configure budgeting, start on the **Budgeting parameters** page. On this page, you must define the budget journal, the number sequence for budget register entries, and the default behavior in the workspaces.

Next, if there are policies that govern the approval of budget register entries, based on budget type (for example, transfers or revisions), you must create budget register entry workflows on the **Budgeting workflows** page. If there are scenarios where transfers might be allowed without workflow approval, you can define budget transfer rules to support those scenarios.

On the **Budgeting dimensions** page, you must select the financial dimensions that are used for budgeting, based on the dimensions that are used in the chart of accounts. You can select all financial dimensions or a subset of them for budgeting.

Define a **budget model* that corresponds to all or some of the budgets. You can use a single budget model for all budget register entries. Alternatively, you can create separate models that are based on the budget type, the geographical location, or some other way that a budget can be classified.

NOTE

If budget control is used, you can associate only one budget model with a specific budget cycle time span.

Create *budget codes* that identify the type of budget transactions to record and any related workflow. Budget codes can support the following budget types:

- Original budget
- Transfer
- Revision
- Encumbrance
- Pre-encumbrance
- Carry-forward budget

Budget codes let you have an audit trail of approved budget modifications throughout the course of the budget cycle. If a workflow is associated with a budget code, the workflow will be enabled for all budget register entries that use that budget code, and workflow steps must be completed before the budget register entry can reach the **Completed** stage.

You can also optionally set up *budget transfer rules*. To use budget transfer rules, select **Use rules for budget transfers** on the **Budget parameters** page. When budget transfer rules are used, if a user creates a document by using a budget code of the **Transfer** type, budget balances won't be updated if the budget transfer rules are violated. For example, you can allow budget transfer documents where the expense budget is transferred between the main accounts for the Sales and Marketing department, but can prohibit budget from being transferred from or to that department unless workflow approval has been granted for that type of budget account entry.

Functionality that was introduced in Microsoft Dynamics 365 Finance version 10.0.7 (January 2020) added capability and flexibility for budget register entries. To enable these enhancements, go to the **Feature management** workspace and select **Budget register entries for quantity only** and/or **Budget register entries defaulting of amount type**.

The **Budget register entries for quantity only** feature lets you post a budget register entry with quantity-only amounts. For example, you could post a budget entry with a quantity of 32 and a price of zero, which results in an amount of zero. You can then use this quantity within the context of a financial report to determine a price per quantity. Note that no inquiries or reports were updated as part of this feature; the feature just enables you to post an amount of zero.

The **Budget register entries defaulting of amount type** feature allows the default amount type within a budget register entry to be an amount type other than expense. The budget register entry line now will default to expense when the main account type is expense; will default to revenue when the main account type is revenue; and will default to expense for all other account types.

Using workspaces and inquiry pages to track budget vs. actuals

The budget manager can review the current state of a budget in the **Ledger budgets and forecasts** workspace. The **Expense over budget** and **Revenue under budget** tabs provide a quick view of the financial dimension combinations where budget targets aren't being met or are approaching the threshold. You can personalize the budget threshold percentage and financial dimension sets that are used on those tabs by clicking **Configure my workspace**. You can click **Unit managers** to see the workers who are responsible for specific financial dimension combinations that are selected on those tabs. For example, if you see that the expense budget of the Operations department is going over the budget threshold, you can easily find and contact the Operations department manager to discuss the issue.

NOTE

The **Department manager** field on the **Organization Units** page determines which managers support specific financial dimension combinations. Click **See more** at the bottom of the tab to open the **Budget vs actuals** inquiry page for more details about budget amounts versus actual amounts.

The **Actual vs budget** inquiry page lets you drill into the details of the budget versus actual amounts. Select a line on the inquiry page, and then click **Period balances** to see budget and actual amounts spread across fiscal periods. The **Budget account entries** page provides drill-through to the details of the budget amount in budget register entries. The **General journal entries** page opens the ledger transactions that are included in the calculated **Actuals** amount.

A company that is using Budget planning functionality can create and use *budget forecasts* in the **Ledger budgets and forecasts** workspace.

Create dimensions and import dimension members

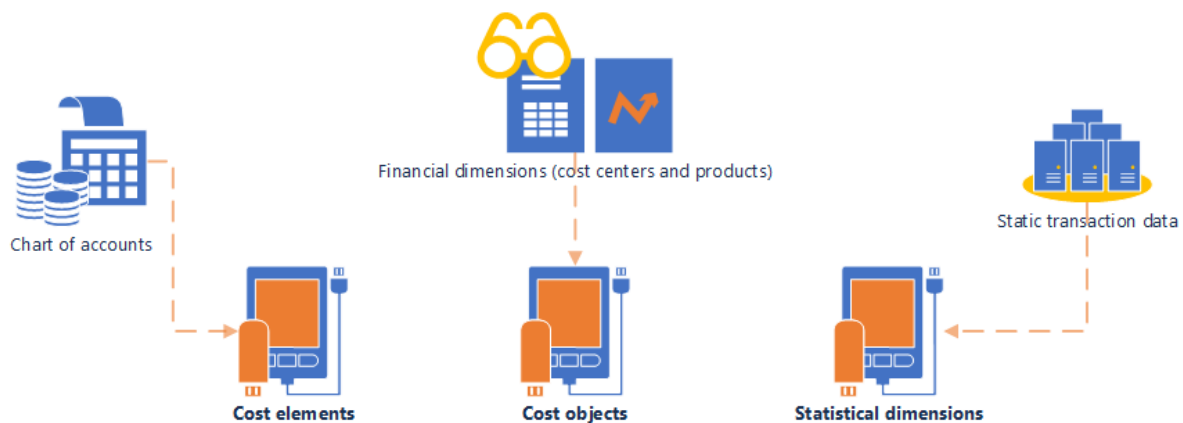

2/18/2021 • 2 minutes to read • [Edit Online](#)

Cost accounting is an independent module that requires data from other modules. This data is categorized into the following:

- Cost elements
- Cost objects
- Statistical dimensions

A **Cost element** corresponds to a cost-relevant item in the chart of accounts. A **Cost object** corresponds to any type of financial dimension, such as products, cost centers, and projects that you want to estimate, allocate costs to, or measure directly. A **Statistical dimension** and its members are used to register non-monetary entries. Statistical dimension members can be used as an allocation base in cost distribution and allocation

The following diagram illustrates the dimensions that are used in Cost accounting.

After the data is imported into Cost accounting, you can use it to build various perspectives that provide insights to managers at all levels of the organization. The following topics provide information about creating dimensions and importing dimension members.

- [Cost element dimensions](#)
- [Create cost elements](#)
- [Cost object dimensions](#)
- [Map cost element dimension members to a common set of dimension members](#)
- [Map a cost element dimension](#)
- [Statistical dimension members and statistical measure provider templates](#)

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost element dimensions

2/18/2021 • 2 minutes to read • [Edit Online](#)

As one of the core pillars in Cost accounting, cost element dimensions are used to categorize and track where costs flow to.

A cost element corresponds to a cost-relevant item in the chart of accounts. Basically, it can be any type of element at the lowest level in a business where costs can flow to. Cost elements as a concept range from ledger accounts to all cost-relevant resources. Currently, Cost accounting supports ledger accounts.

Two types of cost elements

There are two types of cost elements: primary cost elements and secondary cost elements. The following table describes the difference between the two types.

Primary cost elements	Secondary cost elements
<p>The primary cost elements represent the flow of costs from financial accounting to cost accounting. The cost element structure corresponds to the profit and loss account structure in the general ledger, where a cost element can correspond to a main account. Not all main accounts may necessarily be represented as cost elements depending on the business needs. Examples of primary cost elements include:</p> <ul style="list-style-type: none">• Costs of goods sold (COGs)• Indirect material costs• Personnel costs• Energy costs	<p>The secondary cost elements represent the flow of costs internally because these costs are created and used only in Cost accounting. They are used to secure that the source of costs can be traced. These cost elements are used in cost allocations and overhead calculations. Examples of secondary cost elements include:</p> <ul style="list-style-type: none">• Production costs• Production, material, and marketing overheads

Cost element dimensions and cost element dimension members

Cost elements are referred to as *cost element dimensions*. The individual dimension values are called *cost element dimension members*. For example, you have a US chart of accounts structure (COA) that is the base for your statutory reporting. This COA is used as the cost element dimension. The accounts, which are primary cost elements, are represented as the cost element dimension members in Cost accounting. The following screenshot shows an example of Main Accounts as the cost element dimension with its actual main accounts as the cost element dimension members.

Cost element dimension members

✓ Cost elements	Description	Type
401100	Product Sales	Primary
401200	Service Revenues	Primary
401300	Other Revenues	Primary
401400	Accrued Sales (Shipped Not Inv...	Primary
402100	Sales Adjustment Internal	Primary
402200	Intercompany Accrued Sales (Pa...	Primary
402300	Intercompany Sales - USMF/DE...	Primary
402400	Intercompany Sales - USSI/GBSI	Primary

Import cost element dimension members through data connectors

To ease the setup of cost element dimension members in Cost accounting, you can use data connectors that are either pre-built or your custom build to retrieve the primary cost elements from one or more source systems.

Implementation considerations

As cost elements represent the lowest level of cost details, you should make sure that all the cost elements required to make the managerial reporting are included when you implement the cost elements structure. It can be a challenge to find an appropriate number of cost elements for cost control. Having thousands of cost elements can make it difficult to control each cost element. As an alternative, you can group cost elements and manage cost control at an aggregated level.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create cost elements

2/18/2021 • 2 minutes to read • [Edit Online](#)

There are several ways to create cost elements in Cost accounting. This procedure shows how to create cost elements by importing main accounts via a data connector. The USMF demo company was used to create this procedure. This procedure is for a Cost accounting feature that was added in Dynamics 365 for Operations, version 1611.

Create new cost elements

1. Go to Cost accounting > Dimensions > Cost element dimensions.
2. Click New.
3. In the Name field, type a value.
4. In the Data connector for dimension members field, enter or select a value.
5. In the Description field, type a value.
6. Click Save.

Configure the data connector

1. Click Configure dimension member provider.
2. In the Chart of accounts field, enter or select a value.
 - Select Shared to use the shared chart of accounts.
3. Click New.
4. In the list, mark the selected row.
 - You can apply filters to accounts to meet your criteria.
5. In the From main account field, enter or select a value.
6. In the To main account field, enter or select a value.
7. Click OK.

Import main accounts

1. Click Import dimension members.
 - Main accounts will be imported into Cost accounting and used as cost elements.
2. Click OK.

View the imported accounts as cost elements

1. Click View dimension members.
 - View the imported ledger accounts as cost elements in your business that costs can flow to.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost object dimensions

2/18/2021 • 2 minutes to read • [Edit Online](#)

When you analyze costs, you use cost element dimensions to determine where costs flow to. You use cost object dimensions to determine where you should assign costs. This topic provides information about cost object dimensions.

A cost object can be any type of object that you want to estimate, allocate costs to, or measure directly. Typical cost objects include products, projects, resources, departments, cost centers, and geographical regions. Management uses cost objects to quantify costs and also to drive profitability analysis.

Cost object dimensions and cost object dimension members

Cost objects are known as *cost object dimensions*. After you've decided which entity the cost object dimension should refer to, you must specify the individual dimension values or import them into Cost accounting from other source systems. These individual dimension values are known as *cost object dimension members*. For example, you want to use the financial dimension that is named Cost center as the cost object dimension. To see how costs flow to the individual cost centers, you must import the cost object dimension members. In this case, the cost object dimension members are the actual cost centers, such as Sales, Production, Administration, and Geographic locations. The following screenshot shows an example of Cost Centers as the cost object dimension with its actual cost centers as cost object dimension members.

COST CENTERS

Cost object dimension members

✓ Cost centers	Description
007	Trade Shows
008	Marketing Campaign
009	Service Operations
010	Production
011	Quality Control
012	Logistics
013	Procurement
014	Administration

Import cost object dimension members through data connectors

To make the import of cost object dimension members easier, you use data connectors to retrieve the values from the entities that you want to use as cost object dimensions. You can use either the pre-built data connectors or custom data connectors that you build.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create cost objects

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create cost objects by importing the cost center financial dimension into Cost accounting via a data connector. The USMF demo company was used to create this procedure.

Create new cost objects

1. Go to Cost accounting > Dimensions > Cost object dimensions.
2. Click New.
3. In the Name field, type a value.
4. In the Data connector for dimension members field, enter or select a value.
5. In the Description field, type a value.
6. Click Save.

Configure the data connector

1. Click Configure dimension member provider.
 - Select CostCenter to import the CostCenter dimension into Cost accounting.
2. In the Dimension name field, select Cost center.
3. Click OK.

Import cost centers

1. Click Import dimension members.
2. Click OK.

View the imported cost centers

1. Click View dimension members.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Map cost element dimension members to a common set of dimension members

2/18/2021 • 2 minutes to read • [Edit Online](#)

By mapping different cost element dimension members to a common set of cost element dimension members, you merge data into a common format for analysis purposes.

If you're a global company and comply with statutory accounting requirements, you might use multiple charts of accounts. When you import cost element dimension members from different charts of accounts, you can end up with a mix of accounts. However, these accounts might actually have the same nature, and you might want to analyze and allocate costs for them by using a common format.

Map cost element dimension members to a common format

The following example shows how you, as a cost controller, can create a new cost element dimension in Cost accounting that maps cost element dimension members from the US chart of accounts structure and the French chart of accounts structure to a common set of cost element dimension members. You can then use the common set of cost element dimension members to analyze cost data from the two legal entities in a cost accounting ledger.

SOURCE: US CHART OF ACCOUNTS	SOURCE: FRENCH CHART OF ACCOUNTS	NEW COMMON SET OF COST ELEMENT DIMENSION MEMBERS
Imported cost element dimension members from the US chart of accounts	Imported cost element dimension members from the French chart of accounts	Mapping of US and French cost element dimension members to a common set
5001: Sales	5001: Sales and advertising	5000: Sales and advertising
5030: Advertising	6390: Stock purchase*	7000: Cleaning expenses
7001: Cleaning expenses	7001: Travel expense	7001: Travel expenses

*The Stock purchase French cost element dimension member isn't mapped.

Currency conversion

The various charts of accounts that you use might be set up to use different currencies. In this case, be sure to specify a currency conversion, so that cost data is processed by using the correct currency, as defined in the cost accounting ledger where the cost element dimension members are used. In the preceding example, if US dollars (USD) are used in the cost accounting ledger, you must create a currency conversion from USD to euros (EUR) to process transactions for the mapped cost element dimension members.

Update mappings at any time

You can update the mapping definitions for a cost element dimension at any time. Because mappings aren't date-effective, changes are applied the next time that you process cost transactions or run cost calculations.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Map a cost element dimension

2/18/2021 • 2 minutes to read • [Edit Online](#)

A cost controller can use this procedure to map a cost element dimension to a cost element dimension in the MXMF legal entity. This recording uses the USP2 demo data company.

1. Go to Cost accounting > Dimensions > Cost element dimensions.
2. In the list, find and select the desired record.
 - For this example, select Cost elements.
3. Click Dimension mappings.
4. Click Configure mappings from this dimension.
5. Click New.
6. In the To dimension field, enter or select a value.
 - For this example, select MXMF Cost elements.
7. Click New.
8. In the list, mark the selected row.
9. In the From dimension member field, enter or select a value.
 - For this example, select dimension member 606400 Telephone & Fax Expense.
10. In the To dimension member field, enter or select a value.
 - For this example, select dimension member 6001004 Telefono.
11. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Dimension hierarchy

2/18/2021 • 10 minutes to read • [Edit Online](#)

This topic provides information about dimension hierarchies. You use a dimension hierarchy to define the reporting structure, cost policies, and security setup in Cost accounting.

Overview

Dimension hierarchies are used in various places in Cost accounting. A dimension hierarchy lets you define the following information:

- The reporting structure that fits into the organization's requirements
- Cost policies
- The security setup

Here is an example of a dimension hierarchy.

The screenshot displays the SAP S/4HANA Cost Accounting interface. On the left is a navigation tree under 'CDS P/L' with 'Business travel' selected. The main area shows the 'Dimension hierarchy' configuration for 'Business travel'. The 'Node name' is 'Business travel'. Under 'Dimension member ranges', there is a table with one entry:

From dimension member	To dimension member
601500	601509

A dimension hierarchy can be created for the following types of dimensions:

- Cost element dimensions
- Cost object dimensions
- Statistical dimensions

NOTE

- You can create multiple dimension hierarchies for the same dimension if different perspectives are required.
- A dimension hierarchy can be associated with only one dimension.
- A dimension hierarchy can have unlimited levels in its structure. All the levels will be available in the **Cost control** workspace. When you use Microsoft Excel or Microsoft Power BI for reporting purposes, only the first 15 levels of the dimension hierarchy are exported. This limitation exists because both Excel and Power BI require a fixed schema.
- A dimension hierarchy isn't date-effective. Therefore, any change to a dimension hierarchy is immediately saved to the record, and you can't compare the before date and after date.

Dimension hierarchy type

When you create a new dimension hierarchy, you must select a hierarchy type. Go to **Cost accounting > Dimensions > Dimension hierarchies**. Click **New**, and select a dimension hierarchy type. You can select either **Dimension categorization hierarchy** or **Dimension classification hierarchy**.

Dimension categorization hierarchy

The **Dimension categorization hierarchy** type is used for reporting purposes. It supports only the cost element dimensions. When you select this type, the following rules apply:

- A dimension member can be associated more than one time in the hierarchy structure.
- You can put a cost element dimension member in different nodes by assigning a cost behavior to the leaf node.

Dimension classification hierarchy

The **Dimension classification hierarchy** type is used to define rules and for reporting purposes. It supports all dimensions, such as cost objects, cost elements, and statistical dimensions. When you select this type, a dimension member can be associated only one time in the hierarchy structure.

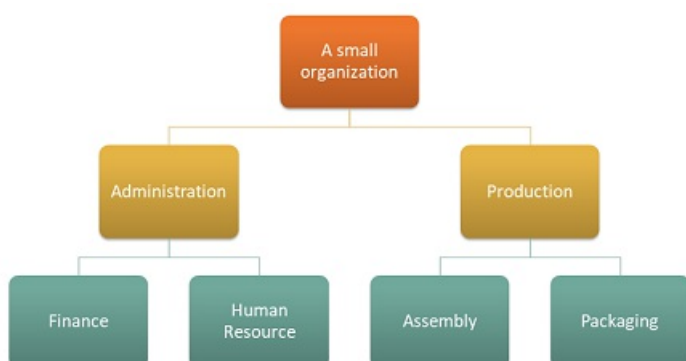

Create and maintain a dimension hierarchy

A dimension hierarchy is created as a tree structure that has node and leaf node relationships.

- A node can have 1:n subnodes.
- A node can't have both subnodes and leaf nodes assigned to it.
- A leaf node can be assigned only at the lowest level in the hierarchy.

Example

A small company has the following organization structure, where Finance and Human resources are departments under Admin, and Assembly and Packaging are departments under Production.

A cost object dimension represents all the cost centers in the organization.

- Cost object dimension
 - Cost centers

The cost object dimension that represents all the cost centers can be set up as shown here.

COST CENTERS	DESCRIPTION
CC001	HR
CC002	Finance
CC003	Tax
CC007	AR/AP
CC005	Assembly
CC006	Packaging

A cost element dimension represents all the cost elements in the organization.

- Cost element dimension
 - Cost elements

The cost element dimension that represents all the cost elements can be set up as shown here.

COST ELEMENTS	DESCRIPTION
10001	Electricity
10010	Cleaning
10011	Heating
40001	COGS

A dimension hierarchy that meets the organizational reporting requirements can be set up as shown here.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME	ACCESS LIST HIERARCHY
Organization	Cost centers	Dimension classification hierarchy	No

The dimension hierarchy for reporting can be set up as shown here.

	DIMENSION MEMBER RANGES	
Nodes	From dimension member	To dimension member
Organization		
Admin		

	DIMENSION MEMBER RANGES	
Finance	CC002	CC003
	CC007	CC007
HR	CC001	CC001
Production		
Packaging	CC005	CC005
Assembly	CC006	CC006

A dimension hierarchy that meets the policy requirement can be set up as shown here.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME
Cost behavior	Cost elements	Dimension classification hierarchy

The dimension hierarchy for the policy can be set up as shown here.

	DIMENSION MEMBER RANGES	
Nodes	From dimension member	To dimension member
Cost behavior		
Fixed cost	10001	10011
Variable cost	40001	40010

NOTE

Under **Dimension member ranges**, a node can contain 1:n dimension member ranges. You can insert dimension member IDs that don't yet exist as dimension members. This approach makes the hierarchy resilient for the future.

Copy a hierarchy

You can copy a current dimension hierarchy as the starting point for a new dimension hierarchy. This approach can be useful if you want to compare the previous dimension hierarchy to the new dimension hierarchy.

Rearrange nodes in a hierarchy

You can move a node up and down within its current level in the structure. In this way, you can rearrange the order of nodes for reporting in the **Cost control** workspace.

You move a node to a new location in the hierarchy by selecting the target node. There are two ways to move a node:

- **Move below** – Move the selected node from its current position in the hierarchy, and insert it **under** the selected target node.
- **Move after** – Move the selected node from its current position in the hierarchy, and insert it **after** the

selected target node at its level of the hierarchy.

NOTE

The order of the nodes isn't maintained when you export data to Excel or Power BI, because those tools use an alphanumeric sort order by default. You should manually rearrange the order.

Define dimension hierarchies for reporting

Dimension hierarchies are important for reporting. They let you define the specific structure that fits into the individual organization. The aggregations that are done at the node level of the dimension hierarchy let stakeholders at any level of the organization see data at any level.

Dimension hierarchies are available in the following reporting tools. This approach helps guarantee consistency in the reporting structure.

- **Cost control** workspace (Client):
 - Controlled by configuration.
- **Cost control** workspace (Mobile application):
 - Controlled by configuration.
- Excel
 - Provides the option to select specific dimension hierarchies per export definition:
 - One cost element dimension hierarchy (mandatory)
 - One cost object dimension hierarchy (optional)
 - One statistical dimension hierarchy (optional)
- Power BI:
 - All dimension hierarchies are available.

If you create reports by using Excel or Power BI, only the first 15 levels of the dimension hierarchies are exported. This limitation exists because a fixed schema is required in Excel and Power BI. If a hierarchy has more than 15 levels, the additional levels won't be exported. The normalized table contains a record for each dimension member in the hierarchy. Therefore, automated aggregation occurs. This behavior helps guarantee that the balances at any of the 15 available levels in the hierarchy are still correct.

The following example shows what a dimension hierarchy might look like in the reporting structure.

COST OBJECT DIMENSION HIERARCHY – LEVEL 1	COST OBJECT DIMENSION HIERARCHY – LEVEL 2	COST OBJECT DIMENSION HIERARCHY – LEVEL 3	COST OBJECT DIMENSION HIERARCHY – LEVEL 4	COST OBJECT DIMENSION HIERARCHY – LEVEL 15
Organization	Admin	Finance	CC002	
Organization	Admin	Finance	CC003	
Organization	Admin	Finance	CC007	
Organization	Admin	HR	CC001	
Organization	Production	Packaging	CC005	

COST OBJECT DIMENSION HIERARCHY – LEVEL 1	COST OBJECT DIMENSION HIERARCHY – LEVEL 2	COST OBJECT DIMENSION HIERARCHY – LEVEL 3	COST OBJECT DIMENSION HIERARCHY – LEVEL 4	COST OBJECT DIMENSION HIERARCHY – LEVEL 15
Organization	Production	Assembly	CC006	

Update the dimension hierarchies that are used for reporting

Over time, the dimension hierarchies that are used in the previously mentioned reporting tools will have to be updated. You can update dimension hierarchies by refreshing the client.

- **Cost control** workspace (Client)
- **Cost control** workspace (Mobile application)

Updates to dimension hierarchies are picked up every 24 hours by a pre-cached job. After the exported data is updated, the updated dimension hierarchies are available in the following tools:

- Excel
- Power BI

NOTE

To manually trigger an update of the dimension hierarchy cache, you can create a new export to Excel for the dimension hierarchy or hierarchies that must be updated.

Define dimension hierarchies for cost policies

Cost accounting consists of multiple policies where detailed rules are defined. You must define one or more dimension hierarchies for the following policies:

- Cost behavior
- Cost distribution
- Cost allocation
- Cost rollup

Dimension hierarchies make it easy to create rules. To avoid having to create rules for every dimension member, you can take advantage of the aggregations of dimension members that are provided by dimension hierarchy levels. If you have overlapping rules, you must define specific rules that the system will consider when it does the overhead calculation.

Example: Define a cost behavior policy

A new cost behavior policy is created, and appropriate dimension hierarchies are assigned to the policy, as shown here.

Cost behavior policy

POLICY NAME	COST ELEMENT DIMENSION HIERARCHY	COST OBJECT DIMENSION HIERARCHY	ACCOUNTING CURRENCY
Cost behavior	Cost behavior	Organization	USD

Rules

COST ELEMENT DIMENSION HIERARCHY NODE	COST OBJECT DIMENSION HIERARCHY NODE	FIXED PERCENTAGE	FIXED AMOUNT	VALID FROM	VALID TO
Fixed cost	Organization	100.00	0.00	1/1/2017	Never
10001	Organization	0.00	150.00	1/1/2017	Never
10001 (*)	Finance		50.00	1/1/2017	Never
Cost behavior or Variable cost (**)	Organization	0.00	0.00	1/1/2017	Never

* The variable cost node isn't required. If a cost isn't classified as a fixed cost, it must be a variable cost.

** A detailed rule is created for the combination of cost element member 10001 and all cost object members that are aggregated under the Finance hierarchy level (CC002, CC003, CC007).

The preceding rules show the flexibility that dimension hierarchies provide. By defining high-level rules, you can help minimize maintenance. You can then define detailed rules to fit into a specific business objective.

If the dimension hierarchies that are used in rules are updated, the system automatically brings the updates forward.

If a level of granularity in the rules is no longer required, the rule can be expired.

For example, a specific cost behavior rule for the Finance cost object dimension hierarchy node is no longer required. In this case, click **Expire rule** to expire the rule.

COST ELEMENT DIMENSION HIERARCHY NODE	COST OBJECT DIMENSION HIERARCHY NODE	FIXED PERCENTAGE	FIXED AMOUNT	VALID FROM	VALID TO
Fixed cost	Organization	100,00	0,00	1/1/2017	Never
10001	Organization	0,00	150,00	1/1/2017	Never
10001	Finance		50,00	1/1/2017	20/1/2017
Cost behavior or Variable cost	Organization	0,00	0,00	1/1/2017	Never

Any overhead calculation that is run after January 20, 2017, no longer considers this rule.

NOTE

The **Valid from** and **Valid to** fields are date-effective and time-effective. You can expire the rule and run a new overhead calculation on the same day.

Define dimension hierarchies for security setup

Cost accounting data should be made available to all managers who are responsible for a reporting unit. In Cost accounting terminology, a reporting unit is represented as a cost object or a set of cost objects.

Potentially, all managers will be able to access highly sensitive business data, such as revenues and margins.

Therefore, it's important that you set up security, so that managers see only the data that is relevant to them. To help control data security, you define dimension hierarchies.

- The use of dimension hierarchies applies only when the dimension value that is selected in the dimension hierarchy reference is a cost object dimension.
- Only one dimension hierarchy can be enabled per cost object dimension in the access list hierarchy.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME	ACCESS LIST HIERARCHY
Organization	Cost centers	Dimension classification hierarchy	Yes

A new **Users** FastTab is available in the hierarchy designer. Here, you can insert one or more user IDs at each node in the hierarchy.

	USERS	DIMENSION MEMBER RANGES	
Nodes	User ID	From dimension member	To dimension member
Organization	Benjamin, Claire		
Admin	April		
Finance	Alicia	CC002	CC003
		CC007	CC007
HR	Arnie	CC001	CC001
Production	David		
Packaging	Ellen	CC005	CC005
Assembly	Chris	CC006	CC006

NOTE

Cost accountants should be assigned to the top level of the hierarchy, so that they can see all entries in Cost accounting.

To enable the access list hierarchy and its security settings, go to **Cost accounting > Setup > Parameters > General**. Select the **Enable view access for cost object dimension members** parameter.

The settings for the access list hierarchy are used to control the data that is shown in the following areas:

- **Cost control** workspace (Client):
 - Data in forms that are used to drill through scenarios
- **Cost control** workspace (Mobile application):
 - Balances in cards

- Power BI:
 - Data that is shown in Power BI visualizations
 - Data Power BI visualizations that are embedded in the Dynamics 365 Finance client

NOTE

- Before the access list hierarchy can affect data in Power BI, access list hierarchy and row-level security in Power BI must be paired. For more information, see [Set up security for Cost accounting content pack](#).
- The access list hierarchy doesn't help secure the export of data to Excel. Therefore, that reporting tool should be used only by cost accountants and managers who must have full access to view the data.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create an organization report hierarchy

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to create a report hierarchy for organization reporting. The purpose of this recording is to guide you through the dimension hierarchy so that you can continue until the whole organization reporting structure is created. This recording uses the USP2 demo data company.

1. Go to Cost accounting > Dimensions > Dimension hierarchies.
2. Click New.
3. In the HierarchyTypeComboBox field, select 'Dimension classification hierarchy'.
 - Select Dimension classification hierarchy. The Dimension classification hierarchy type is used to define rules and for reporting purposes. It supports all dimensions, such as cost objects, cost elements, and statistical dimensions.
4. Click Create.
5. In the Dimension hierarchy name field, type 'Organization USP2'.
6. In the Dimension field, enter or select a value.
 - Select Cost centers.
7. Click Save.
8. Click View hierarchy.
9. Click New.
10. In the Node name field, type 'CEO'.
11. Click Save.
12. Click New.
13. In the Node name field, type 'CEO cost centers'.
14. Click Save.
15. Click New.
16. In the Node name field, type 'Region East'.
17. Click Save.
18. Click New.
19. In the list, mark the selected row.
20. In the From dimension member field, enter or select a value.
 - Select the dimension member that corresponds to the node.
21. Click Save.
22. In the tree, select 'Organization USP2\CEO\CEO cost centers'.
23. Click New.
24. In the Node name field, type 'Region West'.
25. Click Save.
26. Click New.
27. In the list, mark the selected row.
28. In the From dimension member field, enter or select a value.
 - Select the dimension member that corresponds to the node.
29. Click Save.
30. In the tree, select 'Organization USP2\CEO'.
31. Click New.
32. In the Node name field, type 'CFO cost centers'.

33. Click Save.
34. Click New.
35. In the Node name field, type 'Marketing campa'.
36. In the Node name field, type 'Marketing campaign'.
37. Click Save.
38. Click New.
39. In the list, mark the selected row.
40. In the From dimension member field, enter or select a value.
 - Select the dimension member that corresponds to the node.
41. Click Save.
42. In the tree, select 'Organization USP2\CEO\CFO cost centers'.
43. Click New.
44. In the Node name field, type 'Trade shows'.
45. Click Save.
46. Click New.
47. In the list, mark the selected row.
48. In the From dimension member field, enter or select a value.
 - Select the dimension member that corresponds to the node.
49. Click Save.
50. In the tree, select 'Organization USP2\CEO'.
51. In the Node name field, type 'CIO cost centers'.
52. Click Save.
53. Click New.
54. In the Node name field, type 'Call centers'.
55. Click Save.
56. Click New.
57. In the list, mark the selected row.
58. In the From dimension member field, enter or select a value.
 - Select the dimension member that corresponds to the node.
59. Click Save.

Access rights for cost object controllers

2/18/2021 • 2 minutes to read • [Edit Online](#)

The **Cost control** workspace is a central point where managers can view the performance of their cost objects. This workspace lets managers consume Cost accounting data even though they aren't cost accountants. For security reasons, managers should be allowed to see only the Cost accounting data that is related to the specific cost objects that they are responsible for.

There are four unique roles in Cost accounting.

ROLE NAME	LICENSE
Cost accounting manager	Activity
Cost accountant	Operations
Cost accountant clerk	Operations
Cost object controller	Team members

This topic explains how to assign the **Cost object controller** role to a manager.

When the **Cost object controller** role is assigned to a manager, the manager can perform the following tasks:

- Access the **Cost control** workspace (in the client).
 - Drill through and have view access to the pages that support the drill-through experience.
- Access the **Cost control** workspace (in the mobile application).

NOTE

The **Cost object controller** role doesn't control which cost objects the user can access and view data for. Row-level security is provided via dimension hierarchies and the Access list hierarchy.

Grant access rights

The following example shows what a dimension hierarchy can look like.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME	ACCESS LIST HIERARCHY
Organization	Cost centers	Dimension classification hierarchy	Yes

You can use the **Users** FastTab in the hierarchy designer to insert one or more user IDs on each node.

	USERS	DIMENSION MEMBER RANGES	
Nodes	User ID	From dimension member	To dimension member
Organization	Benjamin, Claire		
Admin	April		
Finance	Alicia	CC002	CC003
		CC007	CC007
HR	Arnie	CC001	CC001
Production	David		
Packaging	Ellen	CC005	CC005
Assembly	Chris	CC006	CC006

NOTE

Cost accountants should be assigned to the top level of the hierarchy, so that they can see all entries in Cost accounting.

Before the Access list hierarchy and its security settings can be applied, the **Enable view access for cost object dimension members** option must be set to **Yes** on the **General** tab of the **Cost accounting parameters** page (**Cost accounting > Setup > Parameters**).

The settings for the Access list hierarchy are used to control the data that is shown in following areas:

- **Cost control** workspace (in the client):
 - Data on the pages that are used for drill-through
- **Cost control** workspace (in the mobile application):
 - Balances in cards
- Microsoft Power BI:
 - Data that is shown in Power BI visualizations
 - Data Power BI visualizations that are embedded in the Dynamics 365 Finance client

IMPORTANT

- Before the Access list hierarchy can affect data in Power BI, the Access list hierarchy and row-level security in Power BI must be paired. For more information, see [Set up security for Cost accounting content pack](#).
- This topic shows the prerequisites that must be in place before you can use the **Cost control** workspace.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure access rights for a cost object controller

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to configure access rights for a cost object controller. This recording uses the USP2 demo data company.

Assign the cost object controller role

1. Go to System administration > Users > Users.
2. Use the Quick Filter to find records. For example, filter on the User name field with a value of 'alicia'.
3. In the list, click the link in the selected row.
4. Click Assign roles.
5. In the list, find and select the desired record.
6. Click OK.

Enable access list security

1. Go to Cost accounting > Dimensions > Dimension hierarchies.
2. In the list, find and select the desired record.
 - Select Organization.
3. Click Edit.
4. Select Yes in the Access list hierarchy field.
5. Click View hierarchy.

Assign access rights to user

1. Click New.
2. In the list, mark the selected row.
3. In the User ID field, enter or select a value.
 - Select Admin.
4. In the tree, select 'Organization\CEO\CFO\FIM'.
5. Click New.
6. In the list, mark the selected row.
7. In the User ID field, enter or select a value.
 - Select Alicia.
8. Click Save.

Enable access rights in Cost accounting

1. Go to Cost accounting > Setup > Parameters.
2. Click the General tab.
3. Select Yes in the Enable view access for cost object dimension members field.
4. Click Save.
5. Close the page.
6. Go to Cost accounting > Setup > Cost control workspace configuration.
7. Click Edit.

8. Select Yes in the Published field.

- If you select Yes, a user who is assigned one of the following four roles can see the reports in the Cost control workspace: cost accounting manager, cost accountant, cost accountant clerk, and cost object controller. If you select No, only a user who is assigned one of the following roles can see the reports: cost accounting manager, cost accountant, and cost accountant clerk.

9. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Define cost control units

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to define cost control units in the cost accounting ledger. You select the cost object dimension for which you want to control costs in the ledger. The cost object dimension members are transformed into cost objects of the cost control units. The demo data company used to create this procedure is USP2.

1. Go to Cost accounting > Ledger setup > Cost accounting ledgers.
2. In the list, find and select the desired record.
3. Click Control units.
4. Click New.
5. In the Name field, type a value.
6. In the Dimension field, enter or select a value.
7. Click Save.
8. Click New.
9. In the Name field, type a value.
10. In the Dimension field, enter or select a value.
11. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a cost accounting ledger

2/18/2021 • 2 minutes to read • [Edit Online](#)

A cost accounting ledger represents the overall reporting unit. It is defined by a cost element dimension, statistical dimension, fiscal calendar, and currency. It is agnostic to the concept of legal entities. A legal entity and its data can be associated with many cost accounting ledgers. This recording uses the USP2 demo data company.

1. Go to Cost accounting > Ledger setup > Cost accounting ledgers.
2. Click New.
3. In the Name field, type a value.
4. In the Cost element dimension field, enter or select a value.
5. In the Fiscal calendar field, enter or select a value.
6. In the Accounting currency field, enter or select a value.
7. In the Exchange rate type field, enter or select a value.
8. In the Statistical dimension field, enter or select a value.
9. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Provider templates for statistical dimension members and measure providers

2/18/2021 • 10 minutes to read • [Edit Online](#)

A statistical dimension and its members are used to register and control non-monetary entries in Cost accounting. Statistical dimension members can be used for two purposes:

- As an allocation base in policies such as cost distribution or cost allocation
- For reporting of non-monetary consumption

Statistical dimension

A statistical dimension has a unique name and a set of unique dimension members. The statistical dimension is assigned to a Cost accounting ledger ID. This relationship ties all corresponding statistical dimension members to the Cost accounting ledger. Therefore, all statistical entries will be created in the context of the Cost accounting ledger.

NOTE

A statistical dimension can be assigned to more than one Cost accounting ledger.

Here is an example of a statistical dimension.

NAME	DATA CONNECTOR FOR DIMENSION MEMBERS
Shared Statistical elements	Imported dimension members

Here is an example of a statistical dimension that has been assigned to a Cost accounting ledger.

NAME	ACCOUNTING CURRENCY	EXCHANGE RATE TYPE	FISCAL CALENDAR	COST ELEMENT DIMENSION	STATISTICAL DIMENSION
Managerial accounting	USD	Constant currency	Fiscal period	Shared Cost elements	Shared Statistical elements

Statistical dimension members

A statistical dimension member represents an entity that you want to register non-monetary measures for. These measures can be used either as an allocation base or just to report non-monetary values.

Statistical dimension members can be created manually. Alternatively, they can be imported from a file by using the Data management import/export tool.

A statistical dimension member automatically becomes a predefined allocation base. It can be used as an allocation base in policies or as input in other types of allocation bases.

Here are some examples of typical statistical dimension members.

STATISTICAL DIMENSION NAME	STATISTICAL ELEMENTS	DESCRIPTION	UNIT
Shared Statistical elements	FTE	Full time employees	Ea.
Shared Statistical elements	Electricity	Electricity consumption	kWh
Shared Statistical elements	Pack CC	Packaging Cost center	Hrs.

Statistical measure provider template

Statistical measures can originate from many kinds of sources. Dynamics 365 Finance is a great source to extract statistical measures from. You can use a statistical measure provider template to easily configure the statistical measures that you want to extract.

The definition of a statistical measure provider template is generic and can be reused in multiple statistical dimension members.

NOTE

All tables that contain financial dimensions can be used as sources for statistical measures.

Example: Count of employees per cost center

The count of employees per cost center is a statistical measure that can be used for various purposes that provide managerial insight:

- A statistical reporting measure by cost center
- An allocation base for various types of expenses
- Internal cost rates by cost center:
 - Cost by employee
 - Revenue by employee

The HcmEmployment table holds a list of all employees in the instance. This table is a global table. Therefore, the records aren't related to a specific data area ID.

Here is an example of employees in the HcmEmployment table.

NAME	COST CENTER	DESCRIPTION	WORKER TYPE
Employee 1	CC001	HR	Employee
Employee 2	CC002	FI	Employee
Employee 3	CC002	FI	Employee
Employee 4	CC003	IT	Employee
Employee 5	CC003	IT	Employee
Employee 6	CC002	FI	Contractor

When you create a **Statistical measure provider template** record, you must decide which function to use:

- **Count** – A count of records per cost object is transferred.
- **Sum** – A sum for records per cost object is transferred. (The **Sum** field and **Date** field are required.)

Using the Count function

For example, a statistical measure provider template can be set up as follows.

NAME	FUNCTION	SOURCE TABLE	SUM FIELD	DATE FIELD
FTEs	Count	HcmEmployment	Not applicable	Not applicable

You can also add one or more ranges to narrow the measures from the source table.

In this example, if you just want a count of all full-time employees (FTEs), you can add a range in the **Worker type** field. In the **Criteria** field, select **Employee** to limit the output range as follows.

Ranges

SOURCE TABLE	FIELD	CRITERIA
HcmEmployment	Worker type	Employee

Before you can get statistical measures into Cost accounting, you must establish the relation between the statistical measure provider template and the statistical dimension member. This relation is created per Cost accounting ledger and version. The relation consists of a data connector and a data provider. You can have several data connectors and data providers per statistical dimension member.

NOTE

In this example, we will create a relation only for the **Actual** version.

Go to **Cost accounting ledger > Actual version > Manage > Statistical measures** to establish the relation. For this scenario, select the **Dynamics 365 Finance – Statistical measures** data connector, because we want to extract data from Finance.

Data source

NAME	DATA CONNECTOR	STATISTICAL DIMENSION MEMBER
FTEs D365FO	Dynamics 365 Finance – Statistical measures	FTEs

Data provider configuration

STATISTICAL TEMPLATE NAME
FTEs

After the source data for the statistical measure is processed, the following statistical entries are created in Cost accounting.

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD	YEAR	PERIOD	VERSION	DATA CONNECTOR SOURCE ENTRIES
00001	Statistical entry transfer journal	Fiscal	2017	Period 1	CA ledger USMF	FTEs

Statistical entry transfer journal entries

ACCOUNTING DATE	MAGNITUDE	STATISTICAL ELEMENT	DESCRIPTION	COST CENTER
31-01-2017	1.00	FTEs	Full time employees	CC001
31-01-2017	2.00	FTEs	Full time employees	CC002
31-01-2017	2.00	FTEs	Full time employees	CC003

Statistical entries

COST OBJECT		ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC001	HR	31-01-2017	FTEs	Full time employees	1.00
CC002	FI	31-01-2017	FTEs	Full time employees	2.00
CC003	IT	31-01-2017	FTEs	Full time employees	2.00

If the FTEs predefined dimension member allocation basis is assigned as an allocation base in a cost distribution rule, the cost will be distributed by using the following allocation factor.

COST OBJECT	DESCRIPTION	MAGNITUDE	ALLOCATION FACTOR
CC001	HR	1.00	$(1/5) \times \text{Amount}$
CC002	FI	2.00	$(2/5) \times \text{Amount}$
CC003	IT	2.00	$(2/5) \times \text{Amount}$

Using the Sum function

A production cost center, CC010 (Packaging), is responsible for packaging the products before they are shipped to customers. The direct labor cost is added to the products via the bill of materials (BOM) and route. The indirect cost of running the cost center must also be allocated to the produced products. Often, the best statistical measure for such an allocation is the number of registered production hours per product within the given period.

The ProdRouteTrans table holds all production labor transactions per legal entity DataAreadID.

Here is an example of the ProdRouteTrans table.

REFERENCE	NUMBER	OPERATION	TYPE	TIME	PHYSICAL DATE	PRODUCT GROUP (FINANCIAL DIMENSION)	LEGAL ENTITY
Production order	P0001	Packaging	Time	8.00	01-01-2017	Orange juice B2B	USMF
Production order	P0001	Packaging	Time	8.00	02-01-2017	Orange juice B2B	USMF
Production order	P0002	Packaging	Time	4.00	03-01-2017	Orange juice Consumer	USMF
Production order	P0003	Packaging	Time	4.00	03-01-2017	Orange juice Consumer	USMF
Production order	P0004	Reconst.	Time	10.00	03-01-2017	Orange juice Consumer	USMF

When you create a **Statistical measure provider template** record, you must decide which function to use:

- **Count** – A count of records per cost object is transferred.
- **Sum** – A sum for records per cost object is transferred. (The **Sum** field and **Date** field are required.)

The statistical measure provider template can be set up as follows.

NAME	FUNCTION	SOURCE TABLE	SUM FIELD	DATE FIELD
Pack CC	Sum	ProdRouteTrans	Hours	Physical date

You can also add ranges to narrow the measures from the source table.

In this example, if you just want the sum of hours that are related to the CC010 Packaging cost center, you can add a range in the **Operation** field. In the **Criteria** field, select **Packaging** to limit the output range.

Ranges

SOURCE TABLE	FIELD	CRITERIA
ProdRouteTrans	Operation	Packaging

Before you can get statistical measures into Cost accounting, you must establish the relation between the statistical measure provider template and the statistical dimension member. This relation is created per Cost accounting ledger and version. The relation consists of a data connector and a data provider. You can have several data connectors and data providers per statistical dimension member.

NOTE

In this example, we will create a relation only for the **Actual** version.

Go to **Cost accounting ledger > Actual version > Manage > Statistical measures** to establish the relation. For this scenario, select the **Dynamics 365 Finance – Statistical measures** data connector, because we want to extract data from Finance.

Data source

NAME	DATA CONNECTOR	STATISTICAL DIMENSION MEMBER
Pack CC D365FO	Dynamics 365 Finance – Statistical measures	Pack CC

The system recognizes that ProdRouteTrans is a table where each record belongs to a separate legal entity. Therefore, you will be asked to select the legal entity that transactions should be imported from.

Data provider configuration

STATISTICAL TEMPLATE NAME	LEGAL ENTITY
Pack CC	USMF

After the source data for the statistical measure processed, the following statistical entries are created in Cost accounting.

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD	YEAR	PERIOD	VERSION	DATA CONNECTOR SOURCE ENTRIES
00002	Statistical entry transfer journal	Fiscal	2017	Period 1	CA ledger USMF	Pack CC

Statistical entry transfer journal entries

ACCOUNTING DATE	MAGNITUDE	STATISTICAL ELEMENT	DESCRIPTION	PRODUCT GROUP
31-01-2017	16.00	Pack CC	Packaging Cost center	Orange juice B2B
31-01-2017	8.00	Pack CC	Packaging Cost center	Orange juice Consumer

Statistical entries

COST OBJECT	ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
Orange juice B2B	31-01-2017	Pack CC	Packaging Cost center	16.00
Orange juice Consumer	31-01-2017	Pack CC	Packaging Cost center	8.00

If the Pack CC predefined dimension member allocation basis is assigned as an allocation base in a cost distribution rule, the cost will be distributed by using the following allocation factor.

COST OBJECT	MAGNITUDE	ALLOCATION FACTOR
Orange juice B2B	16.00	$(16 \div 24) \times \text{Amount}$
Orange juice Consumer	8.00	$(8 \div 24) \times \text{Amount}$

Imported statistical measures

You can import statistical measures into Cost accounting by using the Data management import/export tool.

The data entity that is used for the import is named Imported statistical measures.

NOTE

This data entity is designed to allow a maximum of five unique dimension values per entry.

The consumption of electricity is recorded in Microsoft Excel by using the predefined format of the data entity. Here is an example.

ACCOUNTING DATE	DIMENSION MEMBER NAME1	DIMENSION MEMBER NAME2	DIMENSION MEMBER NAME5	MAGNITUDE	SOURCE IDENTIFIER
31-01-2017	CC001			2,450.00	Electricity
31-01-2017	CC002			4,100.00	Electricity
31-01-2017	CC003			15,000.00	Electricity

When you've imported your data via Data management, the data will be stored in a Cost accounting staging table. Therefore, the imported data can be used in multiple Cost accounting ledgers. A reload of data isn't required.

To import the data, go to **Imported data > Data entity > Imported statistical measures**.

SOURCE IDENTIFIER	ACCOUNTING DATE	MAGNITUDE	DIMENSION MEMBER NAME1	DIMENSION MEMBER NAME2	DIMENSION MEMBER NAME5
Electricity	31-01-2017	2,450.00	CC001		
Electricity	31-01-2017	4,100.00	CC002		
Electricity	31-01-2017	15,000.00	CC003		

Before you can get statistical measures into Cost accounting, you must establish the relation between the source identifier and the statistical dimension member. This relation is created per Cost accounting ledger and version. The relation consists of a data connector and a data provider. You can have several data connectors and data providers per statistical dimension member.

NOTE

In this example, we will create a relation only for the **Actual version**.

Go to **Cost accounting ledger > Actual version > Manage > Statistical measures** to establish the

relation. For this scenario, select the **Imported statistical measures** data connector, because data has been imported from a third-party system into Cost accounting via Excel.

Data source

NAME	DATA CONNECTOR	STATISTICAL DIMENSION MEMBER
Electricity	Imported statistical measures	Electricity

Data provider configuration

IMPORT SOURCE IDENTIFIER	FUNCTION	DIMENSION1	DIMENSION2	DIMENSION5
Electricity	Sum	Cost centers		

NOTE

When you define the data provider configuration, you must specify which cost object dimensions to match against the imported transactions. After the source data for the statistical measure is processed, the following statistical entries are created in Cost accounting.

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD	YEAR	PERID	VERSION	DATA CONNECTOR SOURCE ENTRIES
00002	Statistical entry transfer journal	Fiscal	2017	Period 1	CA ledger USMF	Electricity

Statistical entry transfer journal entries

ACCOUNTING DATE	MAGNITUDE	COST ELEMENT	DESCRIPTION	COST CENTER
31-01-2017	2,450.00	Electricity	Electricity consumption	CC001
31-01-2017	4,100.00	Electricity	Electricity consumption	CC002
31-01-2017	15,000.00	Electricity	Electricity consumption	CC003

Statistical entries

COST OBJECT		ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC001	HR	31-01-2017	Electricity	Electricity consumption	2,450.00

COST OBJECT		ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC002	FI	31-01-2017	Electricity	Electricity consumption	4,100.00
CC003	IT	31-01-2017	Electricity	Electricity consumption	15,000.00

If the Electricity predefined dimension member allocation basis is assigned as an allocation base in a cost distribution rule, the cost will be distributed by using the following allocation factor.

COST OBJECT		MAGNITUDE	ALLOCATION FACTOR
CC001	HR	2,450.00	$(2,450 \div 21,550) \times \text{Amount}$
CC002	FI	4,100.00	$(4,100 \div 21,550) \times \text{Amount}$
CC003	IT	15,000.00	$(15,000 \div 21,550) \times \text{Amount}$

Allocation bases

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Allocation bases

2/18/2021 • 11 minutes to read • [Edit Online](#)

An allocation base is the basis on which Cost accounting allocates overhead costs. An allocation base can be a quantity, such as machine hours that are used, kilowatt hours (kWh) that are consumed, or square footage that is occupied. Allocation bases are mostly used to assign overhead costs to inventory that is produced. For example, an IT department allocates its expenses according to the number of computers that each department uses.

There are three types of allocation bases in Cost accounting:

- Predefined dimension member allocation bases
- Hierarchy allocation bases
- Formula allocation bases

Predefined dimension member allocation bases

The predefined dimension member allocation bases are created automatically when a dimension member of one the following types is created:

- Statistical dimension members
- Cost element dimension members

NOTE

The predefined dimension member allocation bases that are based on a cost element dimension member consider the values only from the data source provider, such as the general ledger or budget.

Example 1: Use a cost element dimension member as the allocation base

This example shows how to create a cost allocation rule to allocate cost element 10002 (Employee insurance) to the balance that is recorded on cost element 10001 (Salaries). The allocation rule is defined based on the ratio of each department's salaries to total salaries. (Review needed!)

In the general ledger, the chart of account is defined as follows.

CHART OF ACCOUNT	MAIN ACCOUNT	DESCRIPTION	MAIN ACCOUNT TYPE
Shared	10001	Salaries	Expense
Shared	10002	Employee insurance	Expense

Define a cost element dimension, and configure the data connector. After the data is imported, the following entries are created in Cost accounting.

Cost element dimension members

COST ELEMENT DIMENSION NAME	COST ELEMENT	DESCRIPTION	TYPE
Cost elements	10001	Salaries	Primary

COST ELEMENT DIMENSION NAME	COST ELEMENT	DESCRIPTION	TYPE
Cost elements	10002	Employee insurance	Primary

Predefined dimension member allocation bases

NAME	DESCRIPTION	COST ELEMENT DIMENSION
10001	Salaries	Cost elements
10002	Employee insurance	Cost elements

In the general ledger, the following entries have been posted:

- The entries that show the Salaries main account come from the Payroll system and are posted to cost centers.
- The expense for employee insurance is manually posted to a default cost center.

ACCOUNTING DATE	COST CENTER	DESCRIPTION	MAIN ACCOUNT	DESCRIPTION	AMOUNT IN ACCOUNTING CURRENCY
03-01-2017	CC001	HR	10001	Salaries	2,000.00
03-01-2017	CC002	FI	10001	Salaries	5,000.00
03-01-2017	CC003	IT	10001	Salaries	3,000.00
03-01-2017	CC099	Default cost center	10002	Employee insurance	1,000.00

After the general ledger source data is processed, the following entries are created in Cost accounting.

Cost entries

COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	COST BEHAVIOR	AMOUNT	ACCOUNTING DATE
CC001	HR	10001	Salaries	Unclassified	2,000.00	03-01-2017
CC002	FI	10001	Salaries	Unclassified	5,000.00	03-01-2017
CC003	IT	10001	Salaries	Unclassified	3,000.00	03-01-2017
CC099	Default cost center	10002	Employee insurance	Unclassified	1,000.00	03-01-2017

In this simplified example, a cost allocation rule is created to allocate cost element 10002 (Employee insurance) relative to the balance that is recorded on cost element 10001 (Salaries).

Cost distribution rule

COST OBJECT DIMENSION HIERARCHY NODE	COST ELEMENT DIMENSION HIERARCHY NODE	COST BEHAVIOR	ALLOCATION BASE
CC099	10002	Unclassified	10001

Perform overhead calculation

After cost element 10001 (Salaries) is applied as the allocation base, the result of the overhead calculation is as follows.

COST OBJECT	DESCRIPTION	MAGNITUDE	ALLOCATION FACTOR	AMOUNT
CC001	HR	2,000	$(2,000 \div 10,000) \times 1,000.00$	200.00
CC002	FI	5,000	$(5,000 \div 10,000) \times 1,000.00$	500.00
CC003	IT	3,000	$(3,000 \div 10,000) \times 1,000.00$	300.00

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD	YEAR	PERIOD	VERSION
00001	Cost distribution calculation journal	Fiscal	2017	Period 1	Overhead calculation / 01-02-2017 11:51:00 PM / Ledger /2017 / Period 1

Cost object balance journal entries

ACCOUNTING DATE	COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	COST BEHAVIOR	AMOUNT
31-01-2017	CC099	Default cost center	10002	Employee insurance	Unclassified	1,000.00

Cost entries

COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	COST BEHAVIOR	AMOUNT	ACCOUNTING DATE
CC099	Default cost center	10002	Employee insurance	Unclassified	-1,000.00	31-01-2017
CC001	HR	10002	Employee insurance	Unclassified	200.00	31-01-2017
CC002	FI	10002	Employee insurance	Unclassified	500.00	31-01-2017

COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	COST BEHAVIOR	AMOUNT	ACCOUNTING DATE
CC099	IT	10002	Employee insurance	Unclassified	300.00	31-01-2017

Example 2: Use a statistical dimension member as the allocation base

Statistical dimension members can be used as allocation bases to define policies or report non-monetary consumption by cost objects. You can manually create statistical dimension members or import them from a file by using the Data management import/export tool.

Statistical dimension members

STATISTICAL DIMENSION NAME	STATISTICAL ELEMENT	DESCRIPTION	UNIT
Statistical elements	FTE	Full time employees	Ea
Statistical elements	Electricity	Electricity consumption	kWh

When a statistical dimension member is saved, a corresponding record is created in the predefined dimension member allocation bases.

Predefined dimension member allocation bases

NAME	DESCRIPTION	STATISTICAL ELEMENT DIMENSION
FTE	Full time employees	Statistical elements
Electricity	Electricity consumption	Statistical elements

Statistical measures can come from various sources:

- Electricity consumption can be measured by meters that are installed in different areas of the company.
- Tables hold statistical measures. For example, the HcmEmployment table holds a list of all employees and the cost centers that they work for.

NAME	COST CENTER	DESCRIPTION	WORKER TYPE
Employee A	CC001	HR	Employee
Employee B	CC002	FI	Employee
Employee C	CC002	FI	Employee
Employee D	CC003	IT	Employee
Employee F	CC003	IT	Employee

NOTE

All the tables that contain financial dimensions can be used as sources for statistical measures.

Cost accounting supports a collection of statistical measures by using the following data connections:

- Data management import/export tool
- Statistical measures

To pull statistical measures from the system, a statistical measure provider template is required. For more information, see Statistical measure provider template. (Will add a link once this topic is written.)

Statistical measure provider templates

NAME	FUNCTION	SOURCE TABLE	SUM FIELD	DATE FIELD
FTE's	Count	HcmEmployment	Not applicable	Not applicable

After the statistical measure source data is processed, the following entries will be created in Cost accounting.

Statistical entries

COST OBJECT	DESCRIPTION	ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC001	HR	31-01-2017	FTE's	Full time employees	1.00
CC002	FI	31-01-2017	FTE's	Full time employees	2.00
CC003	IT	31-01-2017	FTE's	Full time employees	2.00

Here is an example of a cost distribution rule if the FTE's predefined dimension member allocation basis is assigned as the allocation base in it.

COST OBJECT	DESCRIPTION	MAGNITUDE	ALLOCATION FACTOR
CC001	HR	1.00	$(1/5) \times \text{Amount}$
CC002	FI	2.00	$(2/5) \times \text{Amount}$
CC003	IT	2.00	$(2/5) \times \text{Amount}$

You can use the Imported statistical measures data entity to import statistical measures into Cost accounting. You can also use the Data management import/export tool. In Excel, the consumption of electricity is recorded as follows.

ACCOUNTING DATE	DIMENSION MEMBER	MAGNITUDE	SOURCE IDENTIFIER
31-01-2017	CC001	2,450.00	Electricity
31-01-2017	CC002	4,100.00	Electricity
31-01-2017	CC003	15,000.00	Electricity

After the statistical measure source data is processed, the following entries will be created in Cost accounting.

Statistical entries

COST OBJECT		ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC001	HR	31-01-2017	Electricity	Electricity consumption	2,450.00
CC002	FI	31-01-2017	Electricity	Electricity consumption	4,100.00
CC003	IT	31-01-2017	Electricity	Electricity consumption	15,000.00

Here is an example of a cost distribution rule if the Electricity predefined dimension member allocation basis is assigned as the allocation base in it.

COST OBJECT	DESCRIPTION	MAGNITUDE	ALLOCATION FACTOR
CC001	HR	2,450.00	$(2,450 \div 21,550) \times \text{Amount}$
CC002	FI	4,100.00	$(4,100 \div 21,550) \times \text{Amount}$
CC003	IT	15,000.00	$(15,000 \div 21,550) \times \text{Amount}$

Hierarchy allocation bases

Cost accountants can manually create the hierarchy allocation bases by applying a cost object dimension hierarchy node to an existing allocation base. In this way, you can limit the range of the original predefined dimension member allocation basis. One predefined dimension member allocation basis can be used to create several hierarchy allocation bases. Ranges can be maintained in the cost object dimension hierarchy that is associated with the hierarchy allocation bases.

Example: Hierarchy allocation bases that are based on full-time employees in the organization

Here is an example of a cost object dimension hierarchy that can be created to describe a simplified organization.

HIERARCHY NAME	NODE LEVEL 0	NODE LEVEL 1	NODE LEVEL 2	DIMENSION MEMBERS
Organization	CEO	CFO	FICO	CC001
Organization	CEO	CFO	HR	CC002
Organization	CEO	CIO	IT	CC003

The FTE's predefined dimension member allocation basis that was created in the previous section holds the following entries.

Statistical entries

COST OBJECT	DESCRIPTION	ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC001	HR	31-01-2017	FTE's	Full time employees	1.00
CC002	FI	31-01-2017	FTE's	Full time employees	2.00
CC003	IT	31-01-2017	FTE's	Full time employees	2.00

A cost must be distributed between cost centers that report to the organization's chief financial officer (CFO). It's acknowledged that the correct allocation ratio is the number of full-time employees (FTEs) by cost center.

Hierarchy allocation bases

NAME	ALLOCATION BASE	COST OBJECT DIMENSION HIERARCHY	COST OBJECT DIMENSION HIERARCHY NODE
Number of FTEs in CFO	FTE's	Organization	CFO

A Preview function lets you validate the hierarchy allocation basis that is created, based on statistical entries in the system.

Allocation base details

COST OBJECT	DESCRIPTION	MAGNITUDE
CC001	HR	1.00
CC002	FI	2.00

Here is an example of a cost distribution rule if the Number of FTEs in CFO hierarchy allocation basis is assigned as the allocation base in it.

COST OBJECT	DESCRIPTION	MAGNITUDE	ALLOCATION FACTOR
CC001	HR	1.00	$(1/3) \times \text{Amount}$
CC002	FI	2.00	$(2/3) \times \text{Amount}$

Formula allocation bases

Formula allocation bases let you define advanced formulas to achieve the correct allocation basis. You can manually create formula allocation bases.

When you create a formula allocation base, you select which statistical dimension and cost element dimension should be the basis for the formula. All allocation bases that come from the previously selected dimensions can be used in a formula allocation base.

NOTE

Previously defined formula allocation bases can be used to define a new formula allocation base.

In formula allocation base factors, you create an alias, and associate it with either an allocation base or a constant. The aliases are then used to define the formula.

You can use the following operators to define your formula.

SYMBOLS	TEXT
()	Parentheses
<	Smaller than
>	Larger than
+	Addition
-	Subtraction
*	Multiplication

Traditional IF statements aren't supported. However, you can create statements and validate whether they are true.

STATEMENT	VALIDATION	RESULT
a > b	True	1
a > b	False	0

Example 1: A simple formula

Electricity bills often consist of two parts:

- A fixed fee for being connected to grid
- A cost that is associated with consumption per kWh

The Electricity predefined dimension member allocation basis has already been defined and holds these values.

Statistical entries

COST OBJECT	NAME	ACCOUNTING DATE	STATISTICAL DIMENSION MEMBER	DESCRIPTION	MAGNITUDE
CC001	HR	31-01-2017	Electricity	Electricity consumption	2,450.00
CC002	FI	31-01-2017	Electricity	Electricity consumption	4,100.00
CC003	IT	31-01-2017	Electricity	Electricity consumption	15,000.00

If the fixed fee must now be evenly spread over cost objects that consume electricity, you have two options for allocating the costs:

- Create a new predefined allocation base, Electricity fixed, and then apply a statistical measure of 1.00 for each cost object that consumed electricity.

- Create a formula allocation base, Electricity fixed, that takes advantage of the Electricity predefined allocation base that is already defined in the system. The benefit of this option is that data must be loaded into Cost accounting for only one Electricity statistical dimension member.

Formula allocation base

NAME	COST ELEMENT DIMENSION	STATISTICAL DIMENSION	FORMULA
Electricity fixed		Statistical elements	

Before the **Formula** field can be filled, you must specify the alias that should be used in the formula.

Formula allocation base factors

ALIAS	CONSTANT	ALLOCATION BASE
a		Electricity
b	0.01	

Note that 0 (zero) isn't supported as a constant.

Formula allocation base

NAME	COST ELEMENT DIMENSION	STATISTICAL DIMENSION	FORMULA
Electricity fixed		Statistical elements	a > b

A Preview function lets you validate the formula allocation base that is created, based on statistical entries in the system.

Allocation base details

COST OBJECT	DESCRIPTION	FORMULA	MAGNITUDE
CC001	HR	2,450.00 > 0.01	1.00
CC002	FI	4,100.00 > 0.01	1.00
CC003	IT	15,000.00 > 0.01	1.00

Here is an example of a cost distribution rule if the Electricity formula allocation base is assigned as the allocation base in it.

Cost object magnitude allocation factor

COST OBJECT	NAME	MAGNITUDE	ALLOCATION FACTOR
CC001	HR	1.00	(1/3) × Amount
CC002	FI	1.00	(1/3) × Amount
CC003	IT	1.00	(1/3) × Amount

Example 2: An advanced formula

For this example, the cost of electricity should not just follow the actual electricity that is consumed in kWh. Management wants to incorporate incentive for lowering electricity usage.

RULE	RATE
$a \leq 10000,00 \text{ kWh}$	0.75
$a > 10000,00 \text{ kWh}$	1.15

A new formula allocation base, Electricity usage, is created.

Formula allocation base

NAME	COST ELEMENT DIMENSION	STATISTICAL DIMENSION	FORMULA
Electricity usage		Statistical elements	

Before the **Formula** field can be filled, you must specify the alias that should be used in the formula.

Formula allocation base factors

ALIAS	CONSTANT	ALLOCATION BASE
a		Electricity
b	10,000.00	
c	0.75	
d	1.15	

Formula allocation base

NAME	COST ELEMENT DIMENSION	STATISTICAL DIMENSION	FORMULA
Electricity fixed		Statistical elements	$((a > b) \times ((b \times c) + (a - b) \times d)) + ((a \leq b) \times a \times c)$

A Preview function lets you validate the formula allocation base that is created, based on statistical entries in the system.

Allocation base details

COST OBJECT		FORMULA	MAGNITUDE
CC001	HR	$((2,450.00 > 10,000.00) \times ((10,000.00 \times 0.75) + (2,450.00 - 10,000.00) \times 1.15)) + ((2,450.00 \leq 10,000.00) \times 2,450.00 \times 0.75)$	1,837.50

COST OBJECT		FORMULA	MAGNITUDE
CC002	FI	$((4,100.00 > 10,000.00) \times ((10,000.00 \times 0.75) + (4,100.00 - 10,000.00) \times 1.15)) + ((4,100.00 \leq 10,000.00) \times 4,100.00 \times 0.75)$	3,075.00
CC003	IT	$((15,000.00 > 10,000.00) \times ((10,000.00 \times 0.75) + (15,000.00 - 10,000.00) \times 1.15)) + ((15,000.00 \leq 10,000.00) \times 15,000.00 \times 0.75)$	1,3250.00

Here is a closer look at the formula for CC003 (IT):

$$((15,000.00 > 10,000.00) \times ((10,000.00 \times 0.75) + (15,000.00 - 10,000.00) \times 1.15)) + ((15,000.00 \leq 10,000.00) \times 15,000.00 \times 0.75) = 13,250.00$$

$$(1 \times (7,500.00 + 5,000.00 \times 1.15)) + (0 \times 15,000.00 \times 0.75)$$

$$1 \times 7,500.00 + 5,750.00 + 0$$

Here is an example of a cost distribution rule if the Electricity fixed formula allocation base is assigned as the allocation base in it.

COST OBJECT	DESCRIPTION	MAGNITUDE	ALLOCATION FACTOR
CC001	HR	1,837.50	$(1,837.50 \div 18,162.50) \times \text{Amount}$
CC002	FI	3,075.00	$(3,075.00 \div 18,162.50) \times \text{Amount}$
CC003	IT	13,250.00	$(13,250.00 \div 18,162.50) \times \text{Amount}$

Create and assign a cost allocation policy to a cost control unit

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to create and assign a cost allocation policy and the corresponding rules to a cost control unit. This recording uses the USP2 demo data company.

Create a policy

1. Go to Cost accounting > Policies > Cost allocation policies.
2. Click New.
3. In the Policy name field, type a value.
4. In the Cost object dimension hierarchy field, enter or select a value.
 - Select Organization.
5. In the Statistical dimension field, enter or select a value.
6. Click Save.

Create allocation rules

1. Click New.
2. In the list, mark the selected row.
3. In the Cost object dimension hierarchy node field, enter or select a value.
4. In the Cost behavior field, select 'Total'.
5. In the Allocation base field, enter or select a value.
6. Click New.
7. In the list, mark the selected row.
8. In the Cost object dimension hierarchy node field, enter or select a value.
9. In the Cost behavior field, select 'Total'.
10. In the Allocation base field, enter or select a value.
11. Click New.
12. In the list, mark the selected row.
13. In the Cost object dimension hierarchy node field, enter or select a value.
14. In the Cost behavior field, select 'Total'.
15. In the Allocation base field, enter or select a value.
 - Continue until you've created all the rules.
16. Click Save.

Assign the policy to a cost control unit

1. Click Policy assignments for cost control unit.
2. Click New.
3. In the list, mark the selected row.
4. In the Valid from accounting date field, enter a date.
 - The rules are date-effective. A user or the system can expire the rules if a newer version is created.
5. In the Cost control unit field, enter or select a value.

6. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create and assign a cost behavior policy to a cost control unit

2/18/2021 • 2 minutes to read • [Edit Online](#)

Cost behavior is the classification of costs as either fixed or variable. A policy and the corresponding rules have to be assigned to a cost control unit for the policy to become effective. Use this procedure to create a policy and then assign the policy to a cost control unit.

Create a cost behavior hierarchy

1. Go to Cost accounting > Dimensions > Dimension hierarchies.
2. Click New.
3. Click Create.
4. In the Dimension hierarchy name field, type 'Cost behavior hierarchy'.
5. In the Dimension field, enter or select a value.
 - Select Cost elements.
6. Click Save.
7. Click View hierarchy.
8. Click New.
9. In the Node name field, type a value.
 - Enter Fixed cost.
10. In the tree, select 'Cost behavior hierarchy'.
11. Click New.
12. In the Node name field, type a value.
 - Enter Variable cost.
13. Click Save.
14. In the tree, select 'Cost behavior hierarchy\Fixed cost'.
15. Click New.
16. In the list, mark the selected row.
17. In the From dimension member field, enter or select a value.
 - The range of dimension members can contain gaps, but the members cannot overlap.
18. In the To dimension member field, enter or select a value.
 - The range of dimension members can contain gaps, but the members cannot overlap.
19. In the tree, select 'Cost behavior hierarchy\Variable cost'.
20. Click New.
21. In the list, mark the selected row.
22. In the From dimension member field, enter or select a value.
 - The range of dimension members can contain gaps, but the members cannot overlap.
23. In the To dimension member field, enter or select a value.
 - The range of dimension members can contain gaps, but the members cannot overlap.
24. Click Save.

Create the policy and rules

1. Go to Cost accounting > Policies > Cost behavior policies.
2. Click New.
3. In the Policy name field, type a value.
4. In the Cost element dimension hierarchy field, enter or select a value.
 - Select the policy hierarchy that you just created.
5. In the Cost object dimension hierarchy field, enter or select a value.
 - Select Organization.
6. Click Save.
7. Click New.
8. In the list, mark the selected row.
9. In the Cost element dimension hierarchy node field, enter or select a value.
 - Expand the hierarchy to select Variable cost.
10. In the Cost object dimension hierarchy node field, enter or select a value.
 - By default, the variable percentage is 100 percent.
11. Click Policy assignments for cost control unit.
12. Click New.
13. In the list, mark the selected row.
14. In the Valid from accounting date field, enter a date.
 - The rules are date-effective, and a user or the system can expire a rule if a newer version is created.
15. In the Cost control unit field, enter or select a value.
16. Click Save.

NOTE

Create and assign a cost distribution policy to a cost control unit

2/18/2021 • 2 minutes to read • [Edit Online](#)

Cost distribution rules are used to distribute costs that have been financially counted on a collective cost center. The cost accountant makes sure that the cost is distributed to the cost centers, based on the selected allocation base. A policy and the corresponding rules are assigned to a cost control unit. This task guide uses an example to show how to create a cost distribution policy and the corresponding rules.

Create a policy

1. Go to Cost accounting > Policies > Cost distribution policies.
2. Click New.
3. In the Policy name field, type a value.
4. In the Description field, type a value.
5. In the Cost object dimension hierarchy field, enter or select a value.
 - Select Organization.
6. In the Cost element dimension hierarchy field, enter or select a value.
 - Select CDS P/L.
7. In the Statistical dimension field, enter or select a value.
 - Select Statistical elements.
8. Click Save.

Create rules for the policy

1. Click New.
2. In the list, mark the selected row.
3. In the Cost object dimension hierarchy node field, enter or select a value.
 - Expand the hierarchy to select 094.
4. In the Cost element dimension hierarchy node field, enter or select a value.
 - Select Other operating expenses and then select 605110 Cleaning.
5. In the Cost behavior field, select an option.
 - Select Fixed cost.
6. In the Allocation base field, enter or select a value.
7. Click New.
8. In the list, mark the selected row.
9. In the Cost object dimension hierarchy node field, enter or select a value.
 - Expand the hierarchy to select 094.
10. In the Cost element dimension hierarchy node field, enter or select a value.
 - Select Other operating expenses and then select 605150 Rent.
11. In the Cost behavior field, select an option.
 - Select Fixed cost.
12. In the Allocation base field, enter or select a value.
13. Click Save.

Assign rules to a cost control unit

1. Click Policy assignments for cost control unit.
2. Click New.
3. In the list, mark the selected row.
4. In the Valid from accounting date field, enter a date.
 - Select September 1 in the valid fiscal year.
5. In the Cost control unit field, enter or select a value.
6. Click Save.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Create a cost rollup policy

2/18/2021 • 2 minutes to read • [Edit Online](#)

This procedure shows how to create a cost rollup policy and create rules for the policy. The demo data used to create this procedure is USP2.

Create a policy

1. Go to Cost accounting > Policies > Cost rollup policies.
2. Click New.
3. In the Policy name field, type a value.
4. In the Description field, type a value.
5. In the Cost object dimension hierarchy field, enter or select a value.
 - Select Cost rollup CC.
6. In the Cost element dimension hierarchy field, enter or select a value.
 - Select Cost rollup CC.
7. Click Save.

Create rules for the cost rollup policy

1. Click New.
2. In the list, mark the selected row.
3. In the Cost object dimension hierarchy node field, enter or select a value.
 - Select 007.
4. In the Cost element dimension hierarchy node field, enter or select a value.
 - Select Cost rollup CE.
5. In the Secondary cost element field, enter or select a value.
 - For this example, map the secondary cost element CC-007 to the cost center.
6. Click New.
7. In the list, mark the selected row.
8. In the Cost object dimension hierarchy node field, enter or select a value.
 - Select 008.
9. In the Cost element dimension hierarchy node field, enter or select a value.
 - Select Cost rollup CE.
10. In the Secondary cost element field, enter or select a value.
 - For this example, map the secondary cost element CC-008 to the cost center.
11. Click New.
12. In the list, mark the selected row.
13. In the Cost object dimension hierarchy node field, enter or select a value.
 - Select 009.
14. In the Cost element dimension hierarchy node field, enter or select a value.
 - Select Cost rollup CE.
15. In the Secondary cost element field, enter or select a value.
 - For this example, map the secondary cost element CC-009 to the cost center.
 - Continue until all cost centers are mapped to their corresponding secondary cost elements.

16. Click Save.

NOTE

Manage a data source for the cost accounting ledger

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to manage the general ledger data source for a cost accounting ledger. Before you complete this task, make sure that you play the "Create a cost accounting ledger" and "Define cost control units" task guides. This recording uses the USP2 demo data company.

1. Go to Cost accounting > Ledger setup > Cost accounting ledgers.
2. In the list, find and select the desired record.
3. Click Actual versions.
4. On the Action Pane, click Manage.
5. Click General ledger.
6. Click New.
7. In the Name field, type a value.
8. In the Data provider field, enter or select a value.
 - For this example, select Dynamics 365 Finance - General ledger entries.
9. In the Cost element dimension field, enter or select a value.
 - For this example, select Cost elements.
10. Click Save.
11. Click Configure data provider.
12. In the Legal entity field, enter or select a value.
 - For this example, select USP2.
13. Click New.
14. In the Posting layer field, select Current.
15. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Process and trace source data

2/18/2021 • 2 minutes to read • [Edit Online](#)

All data processing is run by jobs. For each job and data provider, a journal is created to document that the process has been run, and that the entries were processed in the current job. Use this procedure to set up a data source and then trace the origin of a specific cost entry. This recording uses the USP2 demo data company USP2. Before you complete this task, make sure that you play the following task guides: "Create a cost accounting ledger," "Define cost control units," and "Manage data source for the cost accounting ledger."

1. Go to Cost accounting > Ledger setup > Cost accounting ledgers.
2. In the list, find and select the desired record.
 - Select the cost accounting ledger that you created earlier.
3. Click Actual versions.
4. On the Action Pane, click Source data processing.
5. Click General ledger entry transfer journals.
6. In the list, find and select the desired record.
7. Click Journal entries.
8. In the list, mark the selected row.
9. Click Cost entries.
10. Click Source entry.
11. On the Action Pane, click Source data processing.
12. Click General ledger.
13. In the Fiscal calendar period field, enter or select a value.
 - For this example, select Fiscal 2017 Period 9.
14. Click OK.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Overhead calculation

2/18/2021 • 13 minutes to read • [Edit Online](#)

This topic describes the typical processes for calculating and allocating overhead costs.

Term definition

Overhead costs are the costs that are incurred in order to run a business, but that can't be directly attributed to any specific business activity, product, or service. Overhead costs provide critical support for the generation of profit-making activities. Here are some examples of overhead costs:

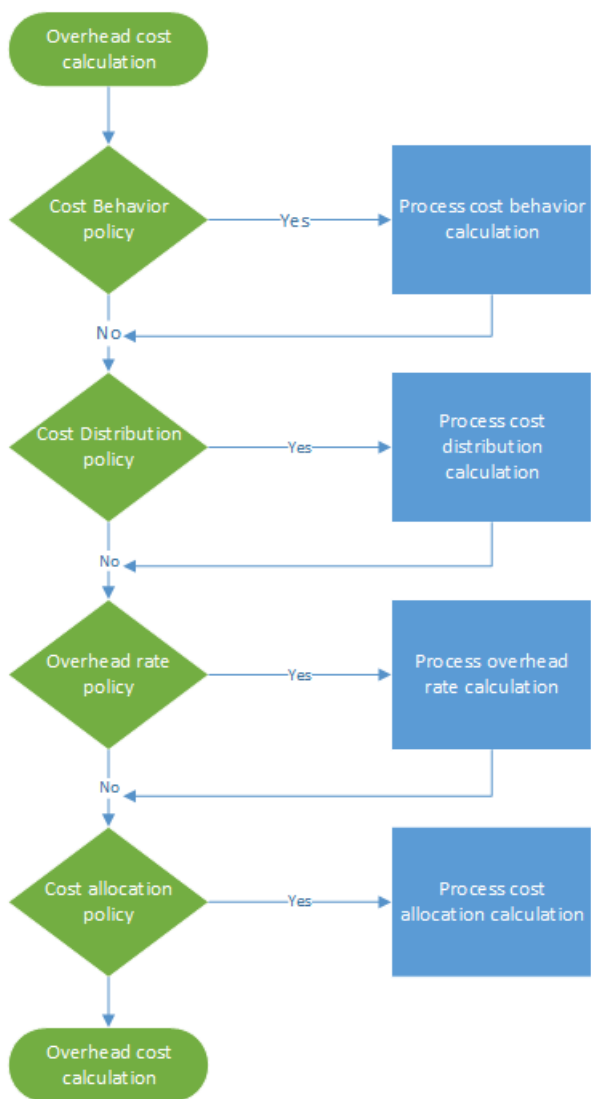

- Rent
- Electricity
- Administrative salaries

Overhead calculation overview

Overhead calculation runs the cost accounting policies in the correct order. You can run overhead calculation multiple times for the same fiscal period if cost accounting policies have been changed or specific errors have been detected. Each run of the overhead calculation is stored and receives a unique version ID that lets you compare the calculations in various versions. The cost entries that the overhead calculation generates receive an accounting date. This accounting date matches the end date of the fiscal period that is used in the calculation. The unique version ID consists of the following elements:

- Version type
- Date and time
- Cost accounting ledger
- Fiscal year
- Fiscal period

Overhead calculation is run independently of the version. Therefore, you can calculate the Budget version before the Actual version. Overhead calculation consists of four steps, as shown in the following illustration. In each step, a journal header is created that has journal entries. This journal header keeps the input data for each calculation step. Policies and rules are applied to each journal line, and cost entries are generated as output. Therefore, you always have full traceability.

Calculate and allocate the Electricity overhead cost

In Financial accounting, some costs, such as electricity, are registered as a lump sum. Therefore, detailed managerial insight isn't provided for Cost accounting. In Cost accounting, to provide correct managerial insight across all organizational units and levels, costs must flow through the organizational units. This flow must be based on either an accurate record of the consumption or a fair assessment. In the general ledger, an electricity cost can be posted as shown in the following table.

ACCOUNTING DATE	COST CENTER		MAIN ACCOUNT		AMOUNT IN THE ACCOUNTING CURRENCY
January 3, 2017	CC099	Default cost center	10001	Electricity	10,000.00

Step 1: Process the cost behavior calculation

By default, when cost entries are imported from the source data, they receive the **Unclassified** cost behavior classification in Cost accounting. By applying cost behavior policy rules, you can reclassify cost entries as either **Fixed cost** or **Variable cost**.

Define the cost behavior rule

In some cases, part of the cost is a fixed fee, and the remaining cost is based on consumption. Electricity bills often match this definition. After you pay a specific fixed fee, you pay for consumption per kilowatt hour (Kwh). For example, if the fixed cost fee is 1,000.00, here is how the cost behavior rule is defined:

- Fixed amount 1,000.00
 - $0 \leq 1,000.00 = \text{Fixed}$
 - $1000,01 < N = \text{Variable}$

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD			VERSION
00001	Cost behavior calculation journal	Fiscal	2017	Period 1	Overhead calculation / 01-02-2017 11:51:00 PM / Ledger /2017 / Period 1

Journal entries (Cost object balance journal entries)

ACCOUNTING DATE	COST OBJECT		COST ELEMENT		COST BEHAVIOR	AMOUNT
January 3, 2017	CC099	Default cost center	10001	Electricity	Unclassified	10,000.00

Cost entries

COST OBJECT		COST ELEMENT		COST BEHAVIOR	AMOUNT	ACCOUNTING DATE
CC099	Default cost center	10001	Electricity	Unclassified	10,000.00	January 3, 2017
CC099	Default cost center	10001	Electricity	Unclassified	-10,000.00	January 31, 2017
CC099	Default cost center	10001	Electricity	Fixed cost	1,000.00	January 31, 2017
CC099	Default cost center	10001	Electricity	Variable cost	9,000.00	January 31, 2017

For more information, see [Create and assign a cost behavior policy to a cost control unit](#).

Step 2: Process the cost distribution calculation

Cost distribution is used to redistribute cost from one cost object to one or more other cost objects by applying a relevant allocation base. Cost distribution and cost allocation differ in that cost distribution always occurs at the level of the primary cost element of the original cost.

Define the cost distribution rule

In Financial accounting, electricity costs are often registered as a lump sum. In Cost accounting, this approach isn't detailed enough. The variable cost should be distributed to the individual cost objects on a fair basis. The most logical allocation basis is the consumption of electricity (Kwh). A statistical dimension member that is named Electricity is created, and electricity consumption is recorded. By default, all statistical dimension members become available as allocation bases.

COST OBJECT		KWH
CC001	HR	1,000

COST OBJECT		KWH
CC002	Finance	6,000
CC003	Assembly	0

The following table shows the result when electricity consumption is applied as an allocation base for variable costs.

COST OBJECT		MAGNITUDE	ALLOCATION FACTOR	AMOUNT
CC001	HR	1,000	$(1,000 \div 7,000) \times 9,000.00$	1,285.71
CC002	Finance	6,000	$(6,000 \div 7,000) \times 9,000.00$	7,714.29
CC003	Assembly	0	$(0 \div 7,000) \times 9,000.00$	0.00

The fixed cost should be distributed evenly to the individual cost objects that have consumed electricity. You can achieve this result by using the Electricity statistical dimension member in a formula allocation base: (Electricity > 0.00) The following table shows the result when electricity consumption is applied as an allocation base for variable costs.

COST OBJECT		FORMULA	MAGNITUDE	ALLOCATION FACTOR	AMOUNT
CC001	HR	$(1,000 > 0.00)$	1	$(1 \div 2) \times 1,000.00$	500.00
CC002	Finance	$(6,000 > 0.00)$	1	$(1 \div 2) \times 1,000.00$	500.00
CC003	Assembly	$(0 > 0.00)$	0	$(0 \div 2) \times 1,000.00$	0.00

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD			VERSION

Journal entries (Cost object balance journal entries)

ACCOUNTING DATE	COST OBJECT		COST ELEMENT		COST BEHAVIOR	AMOUNT
January 31, 2017	CC099	Default cost center	10001	Electricity	Fixed cost	1,000.00

ACCOUNTING DATE	COST OBJECT		COST ELEMENT		COST BEHAVIOR	AMOUNT
January 31, 2017	CC099	Default cost center	10001	Electricity	Variable cost	9,000.00

Cost entries

COST OBJECT		COST ELEMENT		COST BEHAVIOR	AMOUNT	ACCOUNTING DATE
CC099	Default cost center	10001	Electricity	Fixed cost	-1,000.00	January 31, 2017
CC001	HR	10001	Electricity	Fixed cost	500.00	January 31, 2017
CC002	Finance	10001	Electricity	Fixed cost	500.00	January 31, 2017
CC099	Default cost center	10001	Electricity	Variable cost	-9,000.00	January 31, 2017
CC001	HR	10001	Electricity	Variable cost	1,285.71	January 31, 2017
CC002	Finance	10001	Electricity	Variable cost	7,714.29	January 31, 2017

For more information, see [Create and assign a cost distribution policy to a cost control unit](#).

Step 3: Process the overhead rate calculation

The overhead rate is used to charge one or more specific cost objects. The charge is based on a predetermined cost rate and the magnitude from the assigned allocation base.

Define the overhead rate

Cost object CC001 HR contributes to a set of internal projects. A statistical dimension member that is named HR projects is created to measure the consumed magnitude.

COST OBJECT		HOURS	
Proj 1	Project 1	3	
Proj 2	Project 2	1	

A predetermined cost rate for the cost projects contribution has been defined.

COST OBJECT		COST ELEMENT	COST BEHAVIOR	UNITS	RATE
CC001	HR	10001	Variable cost	1	10

The following table shows the result when the HR projects are applied as an allocation base.

COST OBJECT		MAGNITUDE	COST ELEMENT	ALLOCATION FACTOR	AMOUNT
Proj 1	Project 1	3	10001	$(3 \div 1) \times 10.00$	30.00
Proj 2	Project 2	1	10001	$(1 \div 1) \times 10.00$	10.00

Journal

January 31, 2017	Proj 2	Internal Proj 2	1.00

Cost entries

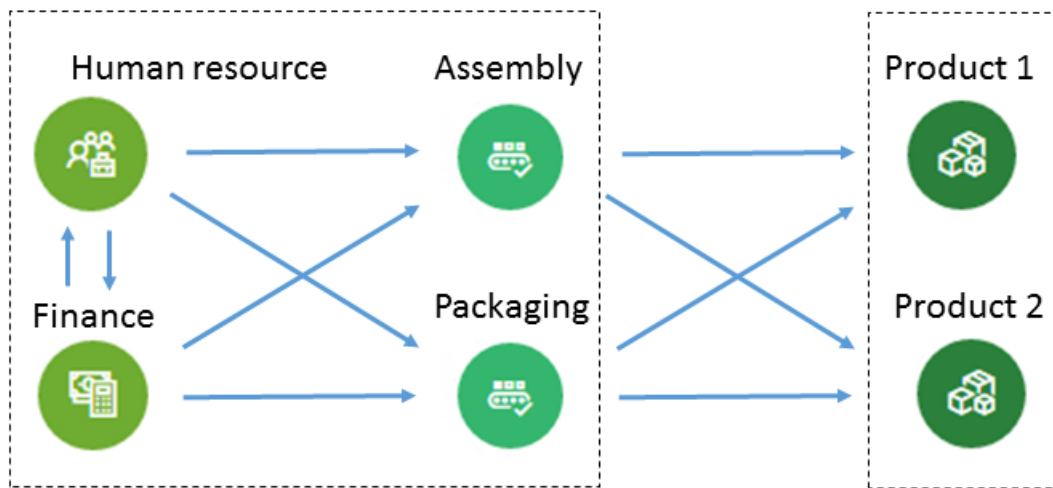

COST OBJECT		COST ELEMENT		COST BEHAVIOR	AMOUNT	ACCOUNTING DATE
CC0001	HR	10001	Electricity	Variable cost	-30.00	January 31, 2017
Proj 1	Internal Proj 1	10001	Electricity	Variable cost	30.00	January 31, 2017
CC001	HR	10001	Electricity	Variable cost	-10.00	January 31, 2017
Proj 2	Internal Proj 2	10001	Electricity	Variable cost	10.00	January 31, 2017

For more information, see [Perform overhead calculation](#).

Step 4: Process the cost allocation calculation

Allocation is used to allocate the balance of a cost object to other cost objects by applying an allocation base. Finance supports the reciprocal allocation method. In the reciprocal allocation method, the mutual services that auxiliary cost objects exchange are fully recognized. The system automatically determines the correct order to perform the allocations in. The balance of a cost object is allocated by a single allocation base. Allocations across cost objects dimensions and their respective members are supported. The allocation order is controlled by the cost control unit.

Cost object: Cost center

Define the cost allocation

Here is a simple example that explains how you can trace the flow of cost. Cost object CC001 HR contributes to several cost objects. A statistical dimension member that is named HR services is created to measure the consumed magnitude.

COST OBJECT		HR SERVICES
CC002	Finance	35
CC003	Assembly	55
CC004	Packaging	10

Cost object CC002 Finance contributes to several cost objects. A statistical dimension member that is named Finance services is created to measure the consumed magnitude.

COST OBJECT		FINANCE SERVICES
CC003	Assembly	65
CC004	Packaging	35

Cost object CC003 Assembly contributes to several cost objects. A statistical dimension member that is named Assembly services is created to measure the consumed magnitude.

COST OBJECT		ASSEMBLY SERVICES (HOURS)
Prod 1	Product 1	60
Prod 2	Product 2	20

Cost object CC004 Packaging contributes to several cost objects. A statistical dimension member that is named Packaging services is created to measure the consumed magnitude.

COST OBJECT		PACKAGING SERVICES (HOURS)
Prod 1	Product 1	80

COST OBJECT		PACKAGING SERVICES (HOURS)
Prod 2	Product 2	15

NOTE

Statistical measures such as the production hours that a product consumes can be derived from source data. For more information, see [Statistical measure provider template](#). The following table shows the result when the HR services are applied as an allocation base for total cost (fixed cost and variable cost).

COST OBJECT		MAGNITUDE	ALLOCATION FACTOR	AMOUNT	COST BEHAVIOR
CC002	Finance	35	$(35 \div 100) \times 500.00$	175.00	Fixed cost
CC003	Assembly	55	$(55 \div 100) \times 500.00$	275.00	Fixed cost
CC004	Packaging	10	$(10 \div 100) \times 500.00$	50.00	Fixed cost
CC002	Finance	35	$(35 \div 100) \times 1,245.71$	436.00	Variable cost
CC003	Assembly	55	$(55 \div 100) \times 1,245.71$	685.14	Variable cost
CC004	Packaging	10	$(10 \div 100) \times 1,245.71$	124.57	Variable cost

The following table shows the result when the Finance services are applied as an allocation base for total cost (fixed cost and variable cost).

COST OBJECT		MAGNITUDE	ALLOCATION FACTOR	AMOUNT	COST BEHAVIOR
CC003	Assembly	65	$(65 \div 100) \times (500.00 + 175.00)$	438.75	Fixed cost
CC004	Packaging	35	$(35 \div 100) \times (500.00 + 175.00)$	236.25	Fixed cost
CC003	Assembly	65	$(65 \div 100) \times (7,714.29 + 436.00)$	5,297.69	Variable cost
CC004	Packaging	35	$(35 \div 100) \times (7,714.29 + 436.00)$	2,852.60	Variable cost

The following table shows the result when the Assembly services are applied as an allocation base for total cost (fixed cost and variable cost).

COST OBJECT		MAGNITUDE	ALLOCATION FACTOR	AMOUNT	COST BEHAVIOR
Prod 1	Product 1	60	$(60 \div 80) \times (275.00 + 438.75)$	535.31	Fixed cost
Prod 2	Product 2	20	$(20 \div 80) \times (275.00 + 438.75)$	178.44	Fixed cost
Prod 1	Product 1	60	$(60 \div 80) \times (5,297.69 + 685.14)$	4,487.12	Variable cost
Prod 2	Product 2	20	$(20 \div 80) \times (5,297.69 + 685.14)$	1,495.71	Variable cost

The following table shows the result when the Packaging services are applied as an allocation base for total cost (fixed cost and variable cost).

COST OBJECT		MAGNITUDE	ALLOCATION FACTOR	AMOUNT	COST BEHAVIOR
Prod 1	Product 1	80	$(80 \div 95) \times (50.00 + 236.25)$	241.05	Fixed cost
Prod 2	Product 2	15	$(15 \div 95) \times (50.00 + 236.25)$	45.20	Fixed cost
Prod 1	Product 1	80	$(80 \div 95) \times (2,852.60 + 124.57)$	2,507.09	Variable cost
Prod 2	Product 2	15	$(15 \div 95) \times (2,852.60 + 124.57)$	470.08	Variable cost

Conclusion

In Financial accounting, a cost of 10,000.00 for Electricity is posted to a dummy cost center ID. Therefore, cost accountants will know that this cost must be allocated. In Cost accounting, the costs flow across organizational units and levels, based on the policies and rules that are applied. Each cost has been associated with an allocation base that provides the best assessment for the allocation of costs.

COST ELEMENT	COST OBJECT									TOTAL
	CC099	CC001	CC002	CC003	CC004	PROJ1	PROJ2	PROD1	PROD2	
10001 Electricity	0.00	0.00	0.00	0.00		30.00	10.00	7,770.57	2,189.43	10,000.00
Unclassified	0.00									
Fixed cost	0.00	0.00	0.00	0.00	0.00			776.36	223.64	1,000.00
Variable cost	0.00	0.00	0.00	0.00	0.00	30.00	10.00	6,994.21	1,965.79	9,000.00

NOTE

This topic shows how a primary cost element, 10001 Electricity, flows through the cost objects. Therefore, this overhead cost is allocated to the lowest level in the organization. In other words, the cost objects at the lowest level bear the cost. If you require a visual flow of the cost between the cost objects, you can use the cost roll-up policy rules to visualize the flow of the cost. For more information, see [Cost rollup policy and overhead calculation](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost rollup policy and overhead calculation

2/18/2021 • 6 minutes to read • [Edit Online](#)

Cost accounting lets you gain insight into how the cost flow relates to the products and services that are delivered within an organization. To see the cost transparency, it's crucial to achieve cost allocation between cost objects based on an appropriate allocation basis. By default, the cost allocation is achieved for the primary cost element, which is desired in some situations, but it has a few implications that should be considered.

- Auxiliary cost objects will end with a zero balance for the primary cost element after overhead calculation.
- The volume of cost entries generated by overhead calculation can be very high.
- It is not possible to track the cost flow between cost objects.

To avoid these implications, Cost accounting lets you configure cost allocation to fit into your organization managerial reporting requirements. This topic discusses how you can determine the correct level of secondary cost elements and create cost rollup rules that fit into organization reporting and cost traceability.

NOTE

You can change configurations if reporting requirements change.

Example of cost rollup policy setup

Imagine that an organization has the following structure with 4 cost centers.

Cost object dimension

COST CENTERS	DESCRIPTION
CC001	HR
CC002	Finance
CC003	Assembly
CC004	Packaging

Cost element dimension

COST ELEMENTS	DESCRIPTION	TYPE
1001	Electricity	Primary
1002	Salaries	Primary
1003	Advertising	Primary

A dimension hierarchy that fulfills the organizational reporting requirements can be set up as follows.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME	ACCESS LIST HIERARCHY
Organization	Cost centers	Dimension classification hierarchy	No

Dimension hierarchy

	DIMENSION MEMBER RANGES	
Nodes	From dimension member	To dimension member
Organization		
Admin		
Finance	CC001	CC001
HR	CC002	CC002
Production		
Packaging	CC003	CC003
Assembly	CC004	CC004

A dimension hierarchy that fulfills the policy requirement can be set up as follows.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME
Profit & Loss statement	Cost elements	Dimension classification hierarchy

Dimension hierarchy

	DIMENSION MEMBER RANGES	
Nodes	From dimension member	To dimension member
Profit & Loss statement		

	DIMENSION MEMBER RANGES	
Primary cost	10001	10003

After the general ledger entries are processed, the cost entry balance by cost object looks like this.

	COST OBJECT				TOTAL
Cost element	CC001	CC002	CC003	CC004	
1001 Electricity	100,00	200,00	6.000,00	2.000,00	8.300,00
1002 Salaries	10.000,00	10.000,00	8.000,00	6.500,00	34.500,00
1003 Advertising	0,00	4.000,00	0,00	0,00	4.000,00
	10.100,00	14.200,00	14.000,00	8.500,00	46.800,00

Statistical dimension

STATISTICAL ELEMENTS	DESCRIPTION
SE-1	HR services
SE-2	Finance services

Cost object CC001 HR is contributing HR services to several cost objects.

HR services are consumed by the following distribution of magnitude.

COST OBJECT	DESCRIPTION	HR SERVICES
CC002	Finance	35
CC003	Assembly	55
CC004	Packaging	10

Cost object CC002 Finance is contributing to several cost objects.

Finance services are consumed by the following distribution of magnitude.

COST OBJECT	DESCRIPTION	FINANCE SERVICES
CC003	Assembly	65
CC004	Packaging	35

Cost allocation polices can be set up as follows.

POLICY NAME	DESCRIPTION	COST OBJECT DIMENSION HIERARCHY	STATISTICAL DIMENSION	COST ELEMENT DIMENSION
2017	Cost allocation	Organization	Statistical elements	Cost elements

Cost allocation rules can be set up as follows.

COST OBJECT DIMENSION HIERARCHY NODE	COST BEHAVIOR	ALLOCATION BASE
CC001	Total	HR services
CC002	Total	Financial services

How cost flows between cost centers

If you want to learn how cost flows between the cost centers in the organization, you can create cost elements of the type **Secondary** for each cost center. These cost elements will then be used to transfer balances between the cost centers during the overhead calculation.

Cost element dimension members can be set up as follows.

COST ELEMENTS	TYPE	
1001	Electricity	Primary
1002	Salaries	Primary
1003	Advertising	Primary
SC-CC001	HR	Secondary
SC-CC002	Finance	Secondary
SC-CC003	Assembly	Secondary
SC-CC004	Packaging	Secondary

The dimension hierarchy **Profit & Loss statement** needs to be updated with the new dimension members so that the dimension hierarchy contains the correct data that can be used for defining reporting and policies.

Dimension hierarchy details

DIMENSION HIERARCHY NAME	DIMENSION	DIMENSION HIERARCHY TYPE NAME
Profit & Loss statement	Cost elements	Dimension classification hierarchy

Dimension hierarchy

	DIMENSION MEMBER RANGES	
Nodes	From dimension member	To dimension member

	DIMENSION MEMBER RANGES	
Profit & Loss statement		
Primary cost	10001	10003
Secondary cost	SC-CC001	SC-CC004

Create a **Cost rollup policy** where each cost center is mapped to a corresponding cost element of the type **Secondary**.

Cost rollup polices

POLICY NAME	DESCRIPTION	COST OBJECT DIMENSION HIERARCHY	COST ELEMENT DIMENSION HIERARCHY
2017	Cost flow	Organization	Profit & Loss statement

Cost rollup rules

COST OBJECT DIMENSION HIERARCHY NODE	COST ELEMENT DIMENSION HIERARCHY NODE	SECONDARY COST ELEMENT
CC001	Profit & Loss statement	SC-CC001
CC002	Profit & Loss statement	SC-CC002
CC003	Profit & Loss statement	SC-CC003
CC004	Profit & Loss statement	SC-CC004

Perform overhead calculation

Journal

JOURNAL	JOURNAL TYPE	FISCAL CALENDAR PERIOD	YEAR	PERIOD	VERSION
00002	Cost allocation journal	Fiscal	2017	Period 1	Overhead calculation / 01-02-2017 11:51:00 PM / Ledger /2017 / Period 1

The system will now apply the **Cost rollup policy** when it creates the **Cost object balance journal entries**.

Cost object balance journal entries

ACCOUNTING DATE	COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	AMOUNT
31-01-2017	CC001	HR	SC-CC001	HR	10.100,00
31-01-2017	CC002	Finance	SC-CC002	Finance	17.735,00

ACCOUNTING DATE	COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	AMOUNT
31-01-2017	CC003	Assembly	SC-CC003	Assembly	31.082,75
31-01-2017	CC004	Packaging	SC-CC004	Packaging	15.717,25

NOTE

The journal entries are created based on the rules in the **Cost rollup policy** if a policy exists. The balance displayed is the balance of the overhead calculation.

The **Cost object cost balance journal entry details** page that is accessed from the journal entries displays how the balance is obtained.

Example: The journal entry for Cost object CC002 Finance

Cost object cost balance journal entry details

COST ELEMENT DIMENSION MEMBER	DESCRIPTION	AMOUNT
1001	Electricity	200,00
1002	Salaries	10.000,00
1003	Advertising	4.000,00
SC-CC001	HR	3.535,00

Cost entries generated by the Overhead calculation

COST OBJECT	DESCRIPTION	COST ELEMENT	DESCRIPTION	AMOUNT	ACCOUNTING DATE
CC001	HR	SC-CC001	HR	-10.100,00	31-01-2017
CC002	Finance	SC-CC001	HR	3.535,00	31-01-2017
CC003	Assembly	SC-CC001	HR	5.555,00	31-01-2017
CC004	Packaging	SC-CC001	HR	1.010,00	31-01-2017
CC002	Finance	SC-CC002	Finance	-17.735,00	31-01-2017
CC003	Assembly	SC-CC002	Finance	11.527,75	31-01-2017
CC004	Packaging	SC-CC002	Finance	6.207,25	31-01-2017

After the **Overhead calculation** is completed, you can report the results using tools such as Microsoft SharePoint Workspace, Excel, or Power BI.

View reporting in Excel

The dimension hierarchies allow you to view data at different aggregation levels.

Here is an example of a Power Pivot reporting in Excel.

PROFIT & LOSS STATEMENT	COST OBJECT				TOTAL
	CC001	CC002	CC003	CC004	
Primary cost	10.100,00	14.200,00	14.000,00	8.500,00	46.800,00
1001	100,00	200,00	6.000,00	2.000,00	8.300,00
1002	10.000,00	10.000,00	8.000,00	6.500,00	34.500,00
1003	0,00	4.000,00	0,00	0,00	4.000,00
Secondary cost	-10.100,00	-14.200,00	17.082,75	7.217,25	0,00
SC-CC001	-10.100,00	3.535,00	5.555,00	1.010,00	0,00
SC-CC002	0,00	-17.735,00	11.527,75	6.207,25	0,00
SC-CC003	0,00	0,00	0,00	0,00	0,00
SC-CC004	0,00	0,00	0,00	0,00	0,00
Total	0,00	0,00	31.082,75	15.717,25	46.800,00

Using **Cost rollup policy** and **Cost elements of the type secondary** allows you to leave the primary cost per cost object for internal reporting as the primary cost that remains after **Overhead calculation**.

If the same example had been performed without creating the **Cost rollup policy**, the reporting result would be as shown below. The cost flows correctly but the traceability and insight into how cost flows between the cost centers are lost.

PROFIT & LOSS STATEMENT	COST OBJECT				TOTAL
	CC001	CC002	CC003	CC004	
Primary cost	0,00	0,00	31.082,75	15.717,25	46.800,00
1001	0,00	0,00	6.207,75	2.092,25	8.300,00
1002	0,00	0,00	22.275,00	12.225,00	34.500,00
1003	0,00	0,00	2600,00	1.400,00	4.000,00
Secondary cost	0,00	0,00	0,00	0,00	0,00
SC-CC001	0,00	0,00	0,00	0,00	0,00
SC-CC002	0,00	0,00	0,00	0,00	0,00

PROFIT & LOSS STATEMENT	COST OBJECT				TOTAL
SC-CC003	0,00	0,00	0,00	0,00	0,00
SC-CC004	0,00	0,00	0,00	0,00	0,00
Total	0,00	0,00	31.082,75	15.717,25	46.800,00

Depending on the reporting and traceability requirements in your organization, you can determine the correct level of secondary cost elements and create cost rollup rules that fit your needs.

The clear separation between **Cost allocation** and **Cost rollup policies** provides the flexibility to make continuous updates without affecting each other.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost control workspace

2/18/2021 • 9 minutes to read • [Edit Online](#)

The **Cost control** workspace is a central point where managers who are responsible for controlling a cost object or a set of cost objects within a dimension or across dimensions (for example, cost centers and product groups) can access reports. The reports in the workspace are fully managed by cost accountants, so that the layout and data that are used for reporting can be consistent across the whole organization.

Cost control workspace configuration

Cost accountants can define as many report configurations as they require for the desired data composition or layout. A report configuration consists of six sections, each of which contributes to either the selection of the targeted data composition or the layout.

To configure a cost control workspace, click **Cost accounting > Setup > Cost control workspace configuration**.

General

On the **General** FastTab, you can create a unique report layout. The name of the report will be a unique identifier that users will be able to recognize in the **Cost control** workspace. You can also specify whether the report should be shared or kept internal for cost accountants.

FIELD	DESCRIPTION
Name	Enter a unique name for the layout.
Description	Enter a detailed description.
Published	<p>If you set this field to Yes, a user who is assigned one of the following roles can see the report in the Cost control workspace:</p> <ul style="list-style-type: none">• Cost accounting manager• Cost accountant• Cost accountant clerk• Cost object controller <p>If you set this field to No, only users who are assigned one of the following roles can see the report in the Cost control workspace:</p> <ul style="list-style-type: none">• Cost accounting manager• Cost accountant• Cost accountant clerk

Data filtering

On the **Data filtering** FastTab, you define the data foundation for the report. Users of this report will see values on the report after source data has been processed.

FIELD	DESCRIPTION
Cost accounting ledger	The Cost accounting ledger that the report is based on. The value is derived from the Cost control unit field.

FIELD	DESCRIPTION
Cost control unit	The value that you select determines the cost accounting ledger and cost objects that this report will be based on.
Statistical dimension hierarchy, Cost element dimension hierarchy	<p>A Cost control workspace configuration record can report either non-monetary or monetary values, but not in the same layout. Select a value in the Cost element dimension hierarchy field to report monetary values. Select a value in the Statistical dimension hierarchy field to report non-monetary values. The dimension hierarchy record that you select determines the structure of the reporting and aggregation levels.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] To view non-monetary and monetary values side by side, you can export data to Microsoft Excel for the Microsoft Power BI content pack.</p> </div>
Cost object dimension hierarchy	Select the dimension hierarchy of the cost object dimension that suits the purpose of the reporting that you're defining.
Budget original version	Select the budget version ID that acts as the original budget in the context of this report.
Budget revised version	Select the budget version ID that acts as the revised budget in the context of this report.

Assign calculation records

The overhead calculation performs several calculation steps on the source data, such as cost behavior classification, cost distribution, and cost allocation. Multiple overhead calculations can be done for the same fiscal period, in case missing source data is discovered or rules must be updated. Each overhead calculation is saved with a unique ID. The cost accountant can select a specific overhead calculation ID. Users of the report, such as managers, will see the results of the overhead calculation in the **Cost control** workspace.

FIELD	DESCRIPTION
Fiscal calendar period	<p>Select the fiscal calendar period to assign an overhead calculation ID to.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] The fiscal periods that are listed in the field come from the fiscal calendar that is associated with the cost accounting ledger.</p> </div>
Actual version	Select the appropriate overhead calculation ID.
Budget version	Select the appropriate overhead calculation ID.
Revised budget version	Select the appropriate overhead calculation ID.

Fiscal periods per column

On the **Fiscal periods per column** FastTab, the cost accountant decides which fiscal period should be shown in the report layout.

The values in the selected columns will be multiplied by the selected values on the **Fiscal periods per column** FastTab.

FIELD	DESCRIPTION
Current period	<p>The balance of the current fiscal period is shown.</p> <div data-bbox="823 331 1422 495" style="border: 1px solid gray; padding: 5px;"> <p>[!NOTE] By default, the current period is determined by the session date. In the Cost control workspace, a specific fiscal period can be selected. The selected value then represents the current period.</p> </div>
Previous period	<p>The balance of the previous fiscal period is shown. The following formula is used: Current fiscal period – 1</p> <div data-bbox="823 703 1422 866" style="border: 1px solid gray; padding: 5px;"> <p>[!NOTE] By default, the previous period is derived from the session date. In the Cost control workspace, a specific fiscal period can be selected as the current period. Previous period will then be recalculated accordingly.</p> </div>
Year to date	<p>The for the year to date is shown. The following formula is used: YearToDate (Current fiscal period)</p> <div data-bbox="823 1077 1422 1272" style="border: 1px solid gray; padding: 5px;"> <p>[!NOTE] By default, the current period is determined by the session date. In the Cost control workspace, a specific fiscal period can be selected. The selected value then represents the current period, and the Year to date value will be updated accordingly.</p> </div>

FIELD	DESCRIPTION
Year to date average	<p>The average for the year to date is shown. The following formula is used: $(\text{YearToDate} [\text{Current fiscal period}]) \div (\text{Count} [\text{Current fiscal period}])$</p> <p>Example</p> <ul style="list-style-type: none"> • Statistical dimension member: Full time employees • Current date: 3-21-2017 • Period: Fiscal period 1, Fiscal period 2, Fiscal period 3 • Magnitude: 10, 10, 12 <p>In this case, Year to date average = $(10 + 10 + 12) \div 3 = 10.67$</p> <p>The Year to date average value can be calculated for cost element dimension members and statistical dimension members.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] By default, the current period is determined by the session date. In the Cost control workspace, a specific fiscal period can be selected. The selected value then represents the current period, and the Year to date and Year to date average values will be updated accordingly.</p> </div>

Columns to display for costs

On the **Columns to display for costs** FastTab, the cost accountant decides which columns the report layout should contain. There are three categories: Fixed cost, Variable cost, and Unclassified cost.

FIELD	DESCRIPTION
Fixed cost	<p>This column type shows the fixed cost, based on the selected overhead calculation ID.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] This column type will show a balance only when an overhead calculation ID is selected for the fiscal period.</p> </div>
Variable cost	<p>This column type shows the variable cost, based on the selected overhead calculation ID.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] This column type will show a balance only when an overhead calculation ID is selected for the fiscal period.</p> </div>
Fixed + variable cost	<p>This column type shows the fixed cost and variable cost, based on the selected overhead calculation ID.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>[!NOTE] This column type will show a balance only when an overhead calculation ID is selected for the fiscal period.</p> </div>

FIELD	DESCRIPTION
Total cost	<p>This column type shows the total cost (unclassified cost, fixed cost, and variable cost).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>[!NOTE] The column type will show the balance at all times.</p> </div>
Unclassified cost	<p>This column type shows the unclassified cost.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>[!NOTE] This column can be used to validate whether all costs have been correctly classified by the overhead calculation, or whether the cost behavior rules must be adjusted.</p> </div>

Columns to display for budgeted costs

On the **Columns to display for budgeted costs** FastTab, the cost accountant decides which columns should be shown for the selected budget versions. Individual selections can be made for the original and revised budget.

NOTE

Because the following fields behave in the same manner for original budget and revised budget, they will be explained only one time.

FIELD	DESCRIPTION
Budget	<p>Budget balances will be shown per the selected columns.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>[!NOTE] The balances will be based on the budget versions that are selected on the Data filtering FastTab.</p> </div>
Budget variance	<p>Calculate and show the difference between budget and actual. The following formula is used: Budget balance – Actual balance</p>
Budget variance in %	<p>Calculate and show the difference in percentage between budget and actual. The following formula is used: (Budget balance – Actual balance) ÷ Budget balance</p>
Variance period threshold	<p>Set a threshold for the variance in monetary amount for the current period. If the threshold is exceeded, the line will be highlighted in red in the Cost control workspace.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>[!NOTE] This field applies only to the cost elements that represent expenditures.</p> </div>

FIELD	DESCRIPTION
Variance year threshold	Set a threshold for the variance in monetary amount for the year. If the threshold is exceeded, the line will be highlighted in red in the Cost control workspace.
Variance threshold %	Set a threshold for the variance in percentage. If the threshold is exceeded, the line will be highlighted in red in the Cost control workspace.

[!NOTE]
The same percentage threshold applies to the current period and year.

Cost control workspace

The **Cost control** workspace is designed as a web report. Therefore, all managers who are responsible for a cost object can be granted access as described in [Define access rights for cost object controllers](#).

The list of reports that are available for users, such as managers, is controlled by the setting of the **Published** option on the **Cost control workspace configurations** page.

Node name	Current period (total)	Current period (total - budget)	Current period (budget variance)	% Current period (budget variance)	Year to date (total)	Year to date (total - budget)	Year to date (budget variance)	% Year to date (budget variance)
CDS P/L	0.00	0.00	0.00	0.00	0.02	0.02	0.00	0.00
Total Cost	0.00	0.00	0.00	0.00	0.02	0.02	0.00	0.00
Personnel costs	9,912.24	9,900.00	-12.24	-0.13	48,592.66	48,592.59	-190.16	-0.39

Business travel	32,187.35	27,300.00	-4,887.35	-17.90	130,148.85	106,242.50	-23,906.35	-22.50
Consumables	494.23	459.38	-34.85	-7.59	2,072.17	1,866.95	-205.22	-10.99
Fee & Services	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Office expenses	235.23	196.36	-38.87	-19.80	951.14	764.17	-186.97	-24.47
Operating taxes	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Other operating expenses	296.59	309.48	12.89	4.17	1,199.26	1,204.42	5.16	0.43
Other personnel expenses	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Other expenses	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Secondary cost allocations	-41,126.64	-38,165.22	4,961.42	-13.00	-183,064.06	-158,580.52	24,483.54	-15.44
Cost center allocation	55,608.40	60,042.13	4,433.73	7.38	268,967.31	284,782.25	15,814.94	5.55
Product group allocation	-98,735.04	-98,207.35	527.69	-0.54	-452,031.37	-443,362.77	8,668.60	-1.96

A manager can select the fiscal calendar period to view. The session date is used to determine the default current period.

The values in the fiscal calendar period are determined by the report name and the fiscal calendar that is selected for the cost accounting ledger that is associated with the report name on the **Cost control workspace configurations** page.

In the cost object dimension hierarchy, users can select the aggregation level at which balances should be shown. By enabling access-level security, you control the permissions, so that users can select only the hierarchy levels that they have been granted access to. Therefore, they can see only the aggregated balances that they have been granted access to.

Add or remove columns

Users can customize the columns on a report to fit their requirements.

View details

Users can drill into the details behind the balances that are shown in the workspace. If users select a cost element dimension hierarchy node, and then click **View details**, the **Cost element details** dialog box shows detailed information for the node.

A grid shows each cost element that is associated with the cost element dimension hierarchy node, and its

values. The columns that appear in the grid match the workspace settings.

Two charts show a summary of actual versus budget and budget variance by period.

Cost element details for Other operating expenses

Cost entries			Current period Total	Current period Total - Budget	Current period Budget variance	Current period Budget variance %	Year to date Total	Year to date Total - Budget	Year to date Budget variance	Year to date Budget variance %
✓ Dimension member			21.46	22.39	0.93	4.15	86.77	87.14	0.37	0.42
Cost elements	605110	Cleaning Expense	21.46	22.39	0.93	4.15	86.77	87.14	0.37	0.42
✓ Cost elements	605150	Rent Expense	275.13	287.09	11.96	4.17	1,112.49	1,117.28	4.79	0.43

Users can click **Cost entries** to drill down into the entry details as required.

Cost entries											
Filter	Fiscal calendar period	Period start	End date	Version							
Cost object	Accounting date 'Y'	Debit	Credit	Amount	Cost element dimension member	Cost behavior	Version				
USP2	Cost center co... Cost centers 010	Production	5/31/2017	275.13	275.13	Cost elements 605150	Rent Expense	Fixed cost	Overhead calculation / 5/10/2017 07:3044 pm / USP2 / 2017 / Period 5		
USP2	Cost center co... Cost centers 010	Production	5/31/2017	287.09	287.09	Cost elements 605150	Rent Expense	Fixed cost	Overhead calculation / 5/10/2017 08:0111 pm / USP2 / Original budget / 2017 / Period 5		

For example, rent is an expenditure that is distributed to cost centers. A user who wants to understand the rent cost that their cost center must carry can drill down to see how rent has been calculated.

If users click **Allocation base** on the **Cost entries** page, a dialog box appears. Users can then assign the allocation base to the rule and view the corresponding statistical measures that are registered for the period.

In the following example, the allocation base is of the **Formula allocation base** type, and the formula is shown. The factors that define the formula are listed. Additionally, a grid shows the calculation that is done per cost object.

Allocation base

Allocation base: Rent
Formula: (d'b) = (a*c)

Formula allocation base factors

Formula allocation base factor	Office area
c	Office area
d	Production area
a	0.75
b	0.25

Allocation base details

Cost object	Formula	Magnitude
USP2 Cost cent... Cost cent... 017 Mall	(875.00 * 0.25) + (0.75 * 125.00)	312.50
USP2 Cost cent... Cost cent... 016 Super	(470.00 * 0.25) + (0.75 * 30.00)	140.00
USP2 Cost cent... Cost cent... 015 Outlet	(90.00 * 0.25) + (0.75 * 19.00)	36.75
✓ USP2 Cost cent... Cost cent... 010 Production	(0.00 * 0.25) + (0.75 * 25.00)	18.75

NOTE

Can you tell us about your documentation language preferences? [Take a short survey.](#)

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Configure cost control workspace parameters

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use this procedure to configure the Cost control workspace so that managers at various levels in an organization can gain insight into their cost objects, such as cost centers and product groups. The USP2 demo company was used to create this recording.

1. Go to Cost accounting > Setup > Cost control workspace configuration.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. Select Yes in the Published field.
 - If you set this option to Yes, users who are assigned one of these roles can see the report in the Cost control workspace: cost accounting manager, cost accountant, cost accountant clerk, or cost object controller. If you set this option to No, only users who are assigned one of these roles can see the report in the Cost control workspace: cost accounting manager, cost accountant, or cost accountant clerk.
6. Expand the Data filtering section.
7. In the Cost control unit field, enter or select a value.
8. In the Budget original version field, enter or select a value.
9. In the Cost element dimension hierarchy field, enter or select a value.
10. In the Cost object dimension hierarchy field, enter or select a value.
11. Expand the Assign calculation records section.
12. Click New.
13. In the list, mark the selected row.
14. In the Fiscal calendar period field, enter or select a value.
15. In the Actual version field, enter or select a value.
16. Expand the Fiscal periods per column section.
17. Select Yes in the Current period field.
18. Expand the Columns to display for costs section.
19. Select Yes in the Fixed cost field.
20. Select Yes in the Variable cost field.
21. Select Yes in the Total cost field.
22. Click Save.
23. Close the page.
24. Go to Cost accounting > Workspaces > Cost control.
25. Select a statement to see fixed, variable, total, and unclassified costs for the selected fiscal periods.
26. In the Fiscal calendar period field, enter or select a value.
27. In the Cost object dimension hierarchy node field, enter or select a value.
 - After you've selected a Cost object dimension hierarchy, expand the Cost element dimension hierarchy to see the desired cost values. For example, you can expand the hierarchy to Manufacturing overhead to see the value.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Set up security for the Cost accounting analysis Power BI content

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how you can propagate the access-level security in Cost accounting to row-level security in Microsoft Power BI. This functionality helps guarantee that users see only Power BI data that they are granted access to.

Overview

The **Cost accounting analysis** Microsoft Power BI content uses Power BI row-level security to limit a user's access. Security is based on the access-level organizational hierarchy that is set up in the Cost accounting parameters. For more information about the **Cost accounting analysis** Power BI content, see [Cost accounting analysis Power BI content](#).

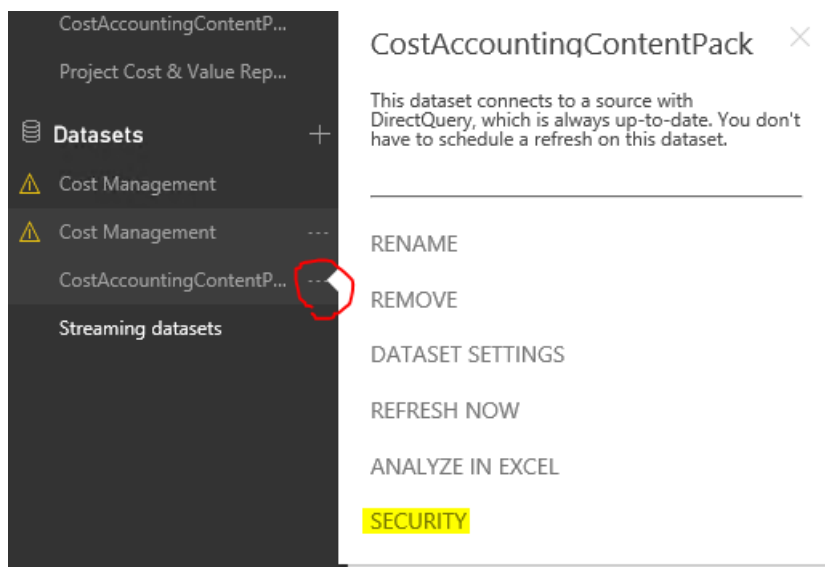

Setup

To propagate access-level security to Power BI, the owner of the Power BI content must follow these steps.

NOTE

The user who publishes the **Cost accounting analysis** Power BI content automatically becomes the owner. Only an owner can set up security in Power BI. Additionally, until an owner adds other users on PowerBI.com, no one except the owner can see any data in the **Cost accounting analysis** Power BI content.

1. Publish the definition file to Power BI.
2. Sign in to PowerBI.com.
3. Find the dataset for the **Cost accounting analysis** Power BI content.
4. Open the security page.

5. The **Cost object controller** role is already created. Add other members who are part of the Cost accounting access-level organizational hierarchy.

Row-Level Security

Cost accountant (1)

Cost object controller (1)

Members (1)

People or groups who belong to this role

Enter email addresses

Add

AX Administrator User ×

Users who are added to the **Cost object controller** role will see only the data that they are allowed to see, according to the definition in the Cost accounting access-level organizational hierarchy.

NOTE

Row-level security applies to tiles and reports that are embedded from Power BI.

Updating security

If updates are made to access-level security in Cost accounting, and you want Power BI to reflect those updates, you must update the entity store for the **Cost accounting analysis** Power BI content. After you complete the entity store update you must update the artifacts on PowerBI.com. For more information about how to do an entity store update, see [Power BI integration with Entity store](#). The owner of the **Cost accounting analysis** Power BI content must also do an entity store update if new users are granted access to the organizational hierarchy. Additionally, the owner must add the new users to the **Cost object controller** role on PowerBI.com, so that row-level security is applied for them.

Disabling security

We assume that your organization wants to restrict data access. If, for some reason, the security parameters are disabled when you run Cost accounting, the owner must add users to the **Cost accountant** role in Power BI instead. If you change security from an enabled state to a disabled state, it's a good idea to remove users from the **Cost object controller** role. And vice versa if you re-enable security. Users can belong to both roles. Joint access is the union of both roles. In the case of the **Cost accounting analysis** Power BI content, users who have joint access have unrestricted data access. If your goal is to apply restricted access, users must be assigned only to the **Cost object controller** role. These row-level security updates take effect immediately. Affected users should refresh their browsers.

Additional resources

To learn more about Power BI row-level security, see [Manage security on your model in Power BI](#).

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost accounting analysis Power BI content

2/18/2021 • 6 minutes to read • [Edit Online](#)

This topic describes what is included in the **Cost accounting analysis** Microsoft Power BI content. It explains how to access the Power BI reports, and provides information about the data model and entities that were used to build the content.

Overview

The **Cost accounting analysis** Power BI content is intended for cost controllers or anyone who is responsible for performing cost control of an organization. It includes the key metrics, such as cost, magnitude, and cost rate by actual cost, budget cost, and flexible budget cost. It uses transaction data from the **Cost accounting** module and provides an aggregate view of costs for the whole organization in one reporting currency. Managers can filter the data by cost objects to perform cost control of their organizational units, even if the organization can have several legal entities.

Because the **Cost accounting analysis** content highlights variances between the actual costs and budgeted costs, managers can be notified about positive and negative trends for their operational units. Managers can drill down to the cost element hierarchies or individual cost elements. In this way, managers can gain detailed insight into how cost variances have occurred, and then take effective action.

The **Cost accounting analysis** content lets cost accountants analyze how cost flows through the cost objects of the whole organization.

To learn more about Cost accounting, see [Cost accounting home page](#).

By defining access-level security in Cost accounting and combining it with row-level security in Power BI, you can grant all cost object owners access to the **Cost accounting analysis** Power BI content. All data in the visualizations will then be filtered based on the access level that is controlled in Cost accounting. To learn more about access-level security and row-level security, see [Set up security for the Cost accounting analysis Power BI content](#).

Accessing the Power BI content

You can find the **Cost accounting analysis** Power BI content in the Shared assets library in Microsoft Dynamics Lifecycle Services (LCS). For more information about how to download the content and implement it in your organization, see [Power BI content in LCS from Microsoft and your partners](#).

Be sure to download the **Cost accounting analysis** content that applies to the version of Microsoft Dynamics 365 that you're using.

NOTE

KB 4011327 is a prerequisite for this Power BI content. After you sign in to LCS, you can access the KB here at <https://fix.lcs.dynamics.com/issue/results/?q=kb4011327>.

Metrics that are included in the Power BI content

The content includes a set of report pages. Each page consists of a set of metrics that are visualized as charts, tiles, and tables. The following table provides an overview of the visualizations in the **Cost accounting analysis** Power BI content.

REPORT PAGE	CHART	TITLE
Cost control by fiscal period	Actual cost and Budget cost by Cost element hierarchy level	Actual cost vs Budget cost
	Budget variance by Cost element hierarchy level	Actual cost rate vs Budget cost rate
	Top 10 Budget variance in percentage by Cost element	Actual magnitude vs Budget magnitude
Cost control by Year to date	Actual cost and Budget cost by Calendar Year Period	Actual cost vs Budget cost
	Budget variance by Calendar Year Period	Actual cost rate vs Budget cost rate
	Top 10 Budget variance in percentage by Cost element	Actual magnitude vs Budget magnitude
Cost rate by fiscal year	Actual cost rate by Cost behavior	Actual cost rate vs Budget cost rate
	Actual cost rate, Budget cost rate variance, Budget cost rate percentage and Budget cost rate by Cost element hierarchy level	Actual magnitude vs Budget magnitude
	Budget variance by Cost element hierarchy level	
	Top 10 Budget variance in percentage by Cost element	
Flexible budget by fiscal period	Actual cost, Budget cost and Flexible budget cost by Cost element hierarchy level	Actual magnitude vs Budget magnitude
	Budget variance and Flexible budget variance by Cost element hierarchy level	Actual cost vs Flexible budget cost
	Actual cost, Budget cost and Flexible cost by Cost behavior and Cost element hierarchy level	Actual cost rate vs Flexible budget cost rate
Cost statement by fiscal period	Actual cost by Cost element hierarchy level and Cost object dimension member name	
	Actual cost by Cost object dimension member name and Cost element dimension member name	

Understanding the data model and entities

The following data is used to fill the report pages in the **Cost accounting analysis** Power BI content. This data

is represented as aggregate measurements that are staged in the Entity store. The Entity store is a Microsoft SQL Server database that is optimized for analytics. For more information, see [Power BI integration with Entity store](#).

The following key aggregate measurements are used as the basis of the content.

ENTITY	KEY AGGREGATE MEASUREMENT	DATA SOURCE FOR DYNAMICS 365	FIELD	DESCRIPTION
Cost accounting entries	SUM(Amount)	CAMDATAAggregate dCostEntry	Amount	The amount in the Cost accounting ledger currency.
Statistical entries	SUM(Magnitude)	CAMDATAAggregate dStatisticalEntry	Magnitude	

The following table shows how the key aggregate measurements are used to create several calculated measures in the content's dataset.

MEASURE	HOW THE MEASURE IS CALCULATED
Actual cost	CALCULATE('Cost accounting entries'[Measure], 'Transaction versions'[ISSOURCEVERSIONBUDGET_VALUE] = 0)
Budget cost	CALCULATE('Cost accounting entries'[Measure], 'Transaction versions'[ISSOURCEVERSIONBUDGET_VALUE] = 1)
Budget cost variance	[Budget cost] - [Actual cost]
Budget variance percentage	IF([Budget cost] = 0, blank(), [Budget variance] / [Budget cost])
Actual magnitude	CALCULATE('Statistical entries'[FullMagnitude], 'Transaction versions'[ISSOURCEVERSIONBUDGET_VALUE] = 0)
Budget magnitude	CALCULATE([FullMagnitude], 'Transaction versions'[ISSOURCEVERSIONBUDGET_VALUE] = 1)
Statistical budget variance	[Budget magnitude] - [Actual magnitude]
Statistical budget variance percentage	IF([Budget magnitude] = 0, blank(), [Statistical budget variance] / [Budget magnitude])
Actual cost rate	IF([Actual magnitude] = 0, BLANK(), [Actual cost] / [Actual magnitude])
Budget cost rate	IF([Budget magnitude] = 0, BLANK(), [Budget cost] / [Budget magnitude])
Budget cost rate variance	[Budget cost rate] - [Actual cost rate]
Budget cost rate variance percentage	IF([Budget cost rate] = 0, blank(), [Budget cost rate variance] / [Budget cost rate])
Fixed budget cost	CALCULATE([Budget cost], 'Cost accounting entries'[COSTBEHAVIOR] = 1)

MEASURE	HOW THE MEASURE IS CALCULATED
Variable budget cost	CALCULATE([Budget cost], 'Cost accounting entries'[COSTBEHAVIOR] = 2)
Fixed flexible budget cost	[Fixed budget cost]
Variable flexible budget cost	IF([Budget magnitude] = 0, BLANK(), ([Variable budget cost] / [Budget magnitude]) * [Actual magnitude])
Flexible budget cost	[Fixed flexible budget cost] + [Variable flexible budget cost]
Flexible budget variance	[Flexible budget cost] - [Actual cost]
Flexible budget variance percentage	IF([Flexible budget cost] = 0, BLANK(), [Flexible budget variance] / [Flexible budget cost])
Flexible budget cost rate	IF([Actual magnitude] = 0, BLANK(), [Flexible budget cost] / [Actual magnitude])
Flexible budget cost rate variance	[Flexible budget cost rate] - [Actual cost rate]
Flexible budget cost rate variance percentage	IF([Flexible budget cost rate] = 0, BLANK(), [Flexible budget cost rate variance] / [Flexible budget cost rate])

The following key dimensions are used as filters to slice the aggregate measurements to achieve greater granularity and provide deeper analytical insights.

ENTITY	EXAMPLES OF ATTRIBUTES
Cost accounting ledgers	Cost accounting ledger
Cost control units	Cost control unit name
Cost element dimensions	Cost elements dimension name, Cost element dimension member name, Cost element dimension member description
Cost object dimensions	Cost object dimension name, Cost object dimension member name, Cost object dimension member description
Statistical dimensions	Statistical dimension name, Statistical dimension member name, Statistical dimension member description
Cost object dimension hierarchies	Cost object dimension hierarchy name, Cost object dimension hierarchy level, Cost object dimension hierarchy tree
Cost element dimension hierarchies	Cost element dimension hierarchy name, Cost element dimension hierarchy level, Cost element dimension hierarchy tree
Statistical dimension hierarchies	Statistical dimension hierarchy name, Statistical dimension hierarchy level, Statistical dimension hierarchy tree
Transaction versions	Version name

ENTITY	EXAMPLES OF ATTRIBUTES
Fiscal calendars	Calendar, Calendar description
Fiscal years	Calendar year
Fiscal periods	Calendar year period

Cost controlling mobile workspace

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic provides information about the **Cost controlling** mobile workspace. This workspace lets cost center managers view information about cost center performance anytime and anywhere.

This mobile workspace is intended to be used with the Finance and Operations mobile app.

Overview

The **Cost controlling** mobile workspace provides an instant view of the current performance of cost centers by comparing actual costs against the budgeted costs. You can drill down to the status of individual cost elements.

For example, an employee receives an invitation to an international conference, but the organization must cover all the travel expenses. The employee asks their manager whether they can attend the conference. The manager opens the **Cost controlling** mobile workspace on their mobile device to see whether there is budget for the employee to attend the conference.

Data security

The data in the **Cost controlling** mobile workspace is secured through user credentials. Cost center managers are allowed to see data only for their own cost center. The access-level security is managed in the **Cost accounting** module.

Cost accountants define the configuration of the **Cost controlling** mobile workspace in the **Cost accounting** module. After the workspace is published to the mobile app, it's available in the app. Therefore, all cost center managers in the organization can view data in the same format.

Actions, views, and links

The **Cost controlling** mobile workspace provides the following actions, views, and links:

- **Actions:**

- Use **Select configuration** to select a layout.
- Use **Select cost object** to select the cost centers to filter data on.

NOTE

The cost centers that appear in the list depend on the access that is granted in the **Cost accounting** module.

- **Views:** Based on the actions that are selected and the configuration in the **Cost accounting** module, you can view the following information on the cards:

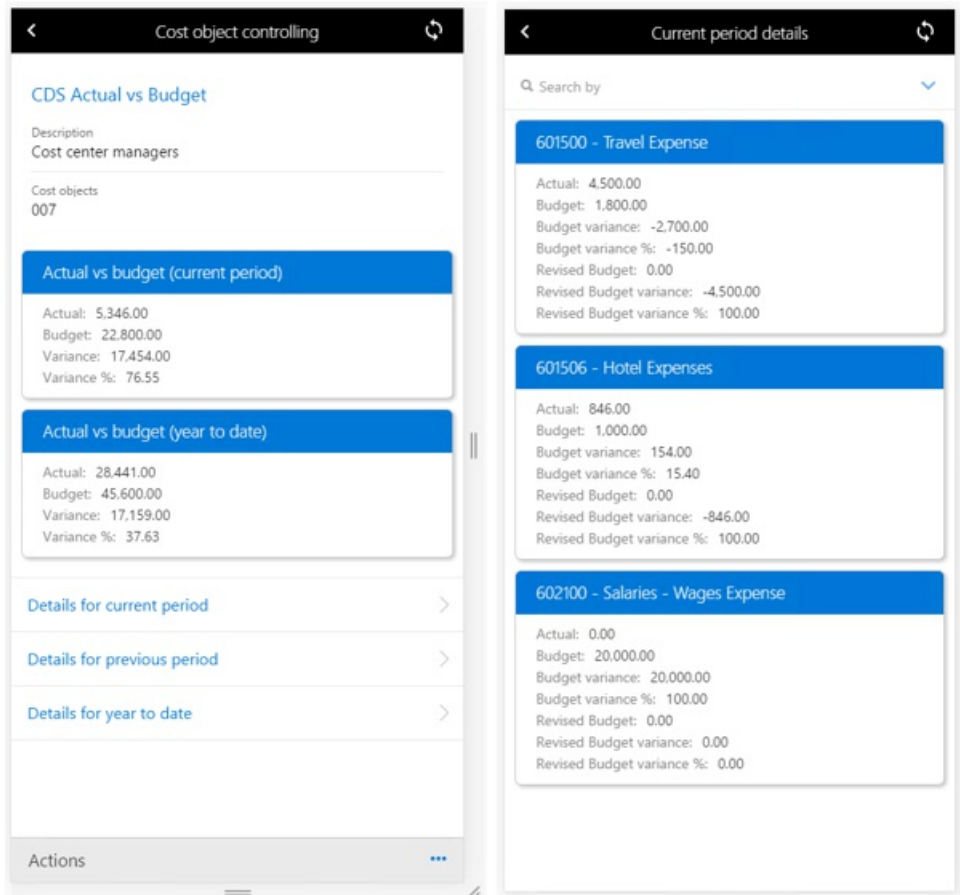

- Actual vs budget (current period)
- Actual vs revised budget (current period)
- Actual vs budget (previous period)
- Actual vs revised budget (previous period)
- Actual vs budget (year to date)
- Actual vs revised budget (year to date)

The following amounts are shown on every card: Actual, Budget, Variance, and Variance %.

- **Links:**

- Details for current period
- Details for previous period
- Details for year to date

When you select a link, a card is shown for each cost element. The following amounts are shown on every card: Actual, Budget, Budget variance, Budget variance %, Revised budget, Revised budget variance, and Revised budget variance %.

Prerequisites

The prerequisites differ, based on the version of Microsoft Dynamics 365 that has been deployed for your organization.

Prerequisites if you use Microsoft Dynamics 365 Finance

If Finance has been deployed for your organization, the system administrator must publish the Cost controlling mobile workspace. For instructions, see [Publish a mobile workspace](#).

Prerequisites if you use version 1611 with Platform update 3 or later

If version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

PREREQUISITE	ROLE	DESCRIPTION
--------------	------	-------------

PREREQUISITE	ROLE	DESCRIPTION
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the Cost controlling mobile workspace. To implement KB 4013633, your system administrator must follow these steps. <ol style="list-style-type: none"> 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS). 2. Install the metadata hotfix. 3. Create a deployable package that contains the SCMMobile model, and then upload the deployable package to LCS. 4. Apply the deployable package.
Publish the Cost controlling mobile workspace.	System administrator	See Publish a mobile workspace .

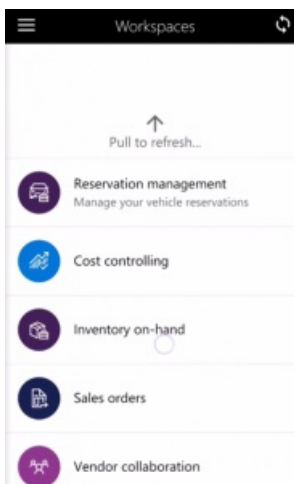

Download and install the mobile app

Download and install the Finance and Operations mobile app:

- [For Android phones](#)
- [For iPhones](#)

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.

View the performance of your cost center by using the Cost controlling mobile workspace

1. On your mobile device, select the **Cost controlling** workspace.

2. Select **Cost object controlling**.
3. Select **Actions**.
4. Select **Select configuration** to select a cost controlling layout.
5. Select **Done**.
6. Select **Actions**.
7. Select **Select cost object** to select the cost centers that you've been granted access to.
8. Select **Done**.
9. View the overall performance of your cost center.
10. Select the **Details for current period** link.
11. View the performance of individual cost elements.
12. You can also search for specific cost elements.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Cost management home page

2/18/2021 • 2 minutes to read • [Edit Online](#)

[Cost management \(video\)](#) lets you work with the valuation and accounting of raw materials, semi-finished goods, finished goods, and work-in-progress assets. It is the process of defining, managing, and reporting [Inventory accounting](#) and [Manufacturing accounting](#).

You can define cost policies in the following areas:

- [Predetermined cost](#)
- [Inventory accounting](#)
- [Manufacturing accounting](#)
- [Indirect cost accounting](#)
- [Ledger integration](#)

For example, you can define which inventory valuation methods, such as [FIFO](#), [Weighted average](#), [Standard cost](#), or [Moving average](#) that you want to apply to products in the [Item model group](#) in Inventory accounting.

You can access Inventory accounting and Manufacturing accounting from the **Cost administration** and **Cost analysis** workspaces. These workspaces provide a comprehensive overview of the current status, key performance indicators (KPIs), and detection of deviation.

Manufacturing accounting lets you handle [Job order costing](#) in production orders and batch orders, as well as [Backflush costing](#) in lean manufacturing.

The [Cost management Power BI content](#) provides managerial insight into inventory and work-in-progress (WIP) inventory, and how cost flows through them by category over time. The information can also be used as a detailed supplement to the financial statement.

Prerequisites for standard costs overview

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic describes the basic steps for using standard costs. Subsequent steps depend on the company's operations. For example, the steps differ for a nonmanufacturing environment, a manufacturing environment that doesn't use routings, and a manufacturing environment that uses routings.

To set up standard costs, follow these steps.

1. Create an item model group for standard costs.

Use the **Item model groups** page to create a new group for standard costs, and assign an inventory model of **Standard cost**. The identifier for the item model group should be meaningful, such as **Std Cost**. Select the check boxes to indicate that the group should allow financial negative inventory, and that it should post physical inventory and financial inventory. This standard cost group will be assigned to items.

2. Define ledger accounts that are related to standard cost variances.

Use the **Chart of accounts** page to define ledger accounts that are related to standard cost variances. These ledger accounts must be defined before they can be assigned on the **Posting** page. The ledger accounts can reflect item groups and cost groups.

3. Assign ledger accounts to item postings that are related to standard cost variances.

Use the **Posting** page to assign the ledger accounts that are related to standard cost variances. You can specify a variance's ledger account by item (or item group) and by cost group (or cost group type), or you can specify that the ledger account applies to all items and all cost groups. These options correspond to cost relations for tables, groups, and all.

Before you define the item posting rules, use the **Transaction combinations** page to enable cost relations (for tables, groups, and all).

4. Define inventory parameters that are related to standard costs.

- Use the **Inventory accounting** tab on the **Inventory accounting policies setup > Parameters** page to define two cost control parameters that are related to standard costs.
 - In the **Cost breakdown** field, select **None** or **Sub ledger**. If you select **Sub ledger**, the cost breakdown is an *active* cost breakdown. An active cost breakdown is critical for calculating, retaining, and viewing cost group segmentation across a multilevel product structure for standard cost items. When the cost breakdown is active, you can report and analyze inventory, work in process (WIP), and cost of goods sold (COGS) per cost group in a single-level, multilevel, or total format. When the cost breakdown is active, if you activate a manufactured item's cost, the cost group segmentation will be stored in the item's cost record.
 - If you select **None**, cost group segmentation won't be maintained for standard cost items. In other words, a manufactured item's standard cost will be calculated and maintained as a single amount, without cost group segmentation. The cost contributions of manufactured components will be aggregated into the single amount.
- In the **Variances to standard** field, select **Summarized** or **Per cost group**. If you select **Per cost group**, you can identify purchase price variances and production variances by cost group. You can also identify the four types of production variances: the lot size, quantity, price, and substitution variances. If you select **Summarized**, you can't identify variances by cost group, and you can't identify the four types

of production variances. You can just view a summarized production variance.

- The policy about variance to standard works independently of the cost breakdown policy. In other words, you can select a cost breakdown policy of **None** and select variances per cost group, so that production variances by cost group will still be captured.

5. Create costing versions for standard costs.

Use the **Costing version setup** page to create one or more costing versions for standard costs. Each costing version must be designated by a costing type of **Standard cost** and must allow content to include cost data.

6. Prepare an existing customer to use standard costs.

Customers who want to change their existing items to a standard cost inventory model must use the **Standard cost conversions** page.

Standard cost conversion overview

2/18/2021 • 10 minutes to read • [Edit Online](#)

This article provides a process overview to help you set up and run a standard cost conversion. The steps listed are intended to be completed after you've completed the prerequisites for a standard cost conversion.

Use the **Standard cost conversions** page to convert the inventory model for a batch of selected items from an actual costing approach to a standard costing approach. The conversion process involves a prerequisite inventory close, several steps during a transition period, which is defined by a transition start date and a planned conversion date, and then the conversion and an associated inventory close.

- Inventory close before the transition period – An inventory close represents a prerequisite step because it settles an item's open transactions using the old valuation method. During the transition period, you can enter and post backdated transactions, such as invoices, so that you can close the previous period. The inventory close date must be one day before the transition start date to ensure a clean break from the old valuation method.
- Conversion steps during the transition period – Use the **Standard cost conversions** page to create a conversion record that also contains the user-defined identifier for a new costing version. You identify the items that require conversion, and then enter the items' pending standard costs in the new costing version. You perform a check of the selected items to identify issues that might prevent conversion, resolve the issues, and then perform another check. After the items have successfully passed the checks, you change the status of the conversion record to **Ready**. On the planned conversion date, you perform the conversion and optionally include an inventory close. An item's inventory movements during the transition period are posted and valued according to the old inventory model. Then, after the conversion is successfully completed, the inventory movements are revalued to standard cost.
- Inventory close before the conversion – The inventory close can be included as part of the conversion on the planned conversion date, or it can be performed as a separate step before the conversion.

After the conversion process is successfully completed, the inventory model for each item is based on standard cost, and the item's standard cost is enabled. Subsequent inventory transactions will be valued at the item's standard cost. In addition, the system converts the item's physical inventory transactions for receipts and issues to standard cost based on the conversion date. The system also converts the item's financial on-hand inventory to standard cost, and posts the difference in value as an inventory revaluation. Any transactions that occur after the conversion are valued at the item's standard cost. You cannot enter backdated transactions before the conversion date, because an inventory close must be performed one day before the conversion date. A conversion can only be performed if an inventory close was performed one day earlier. This inventory close cannot be canceled.

1. Define a standard cost conversion record and the associated costing version

Use the **Standard cost conversions** page to create a conversion record. You can create a new conversion record only when existing conversion records have been completed. The duration of the planned transition period is defined by the transition start date and the planned conversion date. A planned transition period can be as short as one day. A planned transition period helps to ensure that the conversion process has enough time to complete all its steps. An inventory close must be performed on a date that is one day before the transition start date, to help ensure that settlements are completed before you start the conversion process. To make sure that the transition start date and inventory close date are correctly aligned, you can either change the transition start date to one day after an existing inventory close or perform an inventory close. When you enter a

conversion record, you also enter a user-defined identifier for a new costing version that will contain the standard costs for converted items. The costing version is generated automatically when you save the conversion record.

2. Review and change the new costing version for the conversion record

The new costing version is dedicated to the conversion record, as the **Conversion** costing type indicates. The dedicated costing version is similar to a costing version for standard costs and contains the item cost records for items that are associated with the conversion record. The dedicated costing version for a conversion record has the following settings, which you should review and modify on the various tabs as required:

- **Costing type:** This field should be set to **Standard cost**.
- **Version:** The identifier reflects the information that is entered on the conversion record for the costing version ID.
- **Name:** By default, the name is blank. You can optionally enter a name.
- **Block:** This field should be set to **No**. You can enter cost records into the costing version until you change the status of the conversion record to **Ready**. A status of **Ready** indicates that the selected items have been checked, and that changes to cost records should not be permitted.
- **Block activation:** This field should be set to **Yes**. You can't manually activate a pending cost record in the dedicated costing version. Activation occurs when you perform the conversion.
- **From date:** The from date reflects the planned conversion date that is entered on the conversion record.
- **Site:** Leave this field blank, so that cost records can be entered for any site.
- **Allow price type field group:** Set this field to **Yes**, so that only cost price records can be entered.
- **Fallback principle:** This field is set to **None**. Change the fallback principle to **Active** if you require cost information that has been activated in other costing versions. For example, cost information about components, cost categories, and indirect costs might be required in order to calculate the costs of manufactured items.
- **Fallback costing version:** Leave this field blank.

Item cost information in the dedicated costing version can be maintained only from the **Standard cost conversions** page. You can't use the **Costing version setup** page or the **Costing version maintenance** page to calculate costs for the costing version during conversion. However, you can use these pages to maintain the dedicated costing version after you've completed the conversion process.

3. Identify the items to convert to standard cost

Use the **Standard cost conversions** page to identify the individual items that should be converted to standard cost. You can add multiple items by using the **Add items to standard cost conversion** page. In general, you should include all manufactured items in a single conversion record to help ensure that costs are calculated correctly.

4. Enter or calculate the pending standard cost for each item that is being converted

Use the **Item price** page to enter pending standard costs in the dedicated costing version for purchased items and transfer items. Cost records are site-specific, and an item's pending costs must be entered for every site. Use the **Item price** page to calculate pending standard costs for manufactured items. A manufactured item's pending costs should be calculated for every manufacturing site, unless the site represents a transfer site. In this case, the pending costs should be entered manually. Some items might have color, size, or configuration product dimensions. On the **Standard cost conversions** page, the **Use cost price by variant** check box shows the standard cost for every combination of product dimensions. When this check box is cleared, you must enter only

a pending cost for the item.

5. Check and resolve any issues for the items that are being converted

Use the **Standard cost conversion checks** report to identify issues for the items that are being converted. If an item doesn't have any issues, its status in the conversion record is changed to **Checked**. If an item has issues, you must resolve the issues and then run the report again until the item's status is changed to **Checked**. If you can't resolve an item's issues in a timely manner, you can optionally delete the item from the conversion record and then convert the item later.

6. Change the status of the conversion record to Ready

When the status of the conversion record is changed to **Ready**, the system performs a final check before it runs a standard cost conversion. The status is changed to **Ready** only if the following conditions have been met:

- Every item in the conversion record has a status of **Checked**.
- An inventory close was performed on a date that is one day before the transition start date. To make sure that the transition start date and inventory close date are correctly aligned, you can either change the transition start date to one day after an existing inventory close or perform an inventory close.

7. Back up the database before conversion

The backup lets you restore the database if errors are encountered during the conversion.

8. Perform the conversion when the conversion record has a Ready status

The conversion process requires that an inventory close be performed on a date that is one day before the planned conversion date. This requirement helps ensure that back-dated transactions can't be entered during the transition period. If an inventory close hasn't yet been performed, you will be asked if you want to perform it as part of the conversion process. The conversion process handles one item at a time. It starts with the lowest items in a product structure, based on the item's low-level code. When an item has been successfully converted, its status in the conversion record is changed to **Converted**. If the conversion process is interrupted, any items that haven't been successfully converted will still have a status of **Checked**. Successful completion of the conversion process has the following effects:

- The status of the conversion record is changed from **Ready** to **Completed**, and the status of each selected item is changed from **Checked** to **Converted**.
- The item model group for converted items is changed so that it reflects a new group that has a standard cost inventory model.
- The standard costs for the converted items have been enabled in the dedicated costing version.
- The costing type of the costing version is changed from **Conversion** to **Standard cost**, and the costing version is now like other costing versions for standard costs.

9. Validate and reconcile the inventory values for the converted items

The **Variance analysis statement** report lets you analyze revaluation variance and the **Inventory value** report lets you view inventory value on a specific date.

- Analyze revaluation variances. Use the **Variance analysis statement** report to view inventory revaluation variances for the converted items. You can also use the **Standard cost transactions** page to view the inventory revaluation transactions for the converted items that have inventory.

- Analyze the inventory value before the transition start date. Use the **Inventory value** report to view inventory values for the converted items. For the To date for the report, use a date that is one day before the transition start date.
- Analyze the inventory value before the conversion date. Use the **Inventory value** report to view inventory values for the converted items. As the To date for the report, use a date that reflects one day before the conversion date.
- Analyze the inventory value on the conversion date. Use the **Inventory value** report to view inventory values as of the conversion date. Both the From date and the To date for the report should match the conversion date. The report selection criteria should reflect the converted items.
- Analyze back-dated inventory movements. Use the **Inventory value** report to view back-dated inventory movements that were entered after the conversion. The From date and the To date for the report should correspond to the transition start date and the conversion date, minus one day. The report selection criteria should reflect the converted items. The report shows inventory movements that were made at standard cost during the transition period.

Prerequisites for a standard cost conversion

2/18/2021 • 3 minutes to read • [Edit Online](#)

This topic discusses tasks to perform before you run a standard cost conversion.

Before you run a standard cost conversion, follow these steps:

1. Define an **item model group** for standard costs. Use the Item model groups page to create an item model group that uses a standard cost inventory model. When setting up a standard cost conversion, you assign this item model group to the items that are being converted.
2. Assign a **cost group** to each item.
 - The cost group that is assigned to a purchased item can act as the basis for assigning ledger accounts that are related to standard costs. This can include assigning ledger accounts for purchase price variances. In a manufacturing environment, the cost group that is assigned to purchased components also provides cost segmentation in the calculated costs of a manufactured item.
 - The cost group that is assigned to a manufactured item can act as the basis for assigning ledger accounts that are related to standard costs, such as assigning ledger accounts for production variances.
3. Assign a **standard order quantity** to a manufactured item when it has constant costs. The standard order quantity for a manufactured item acts as an accounting lot size for amortizing, or prorating, constant costs. These can include setup times in routing operations or a constant component quantity in a bill of material (BOM).
4. Assign **general ledger accounts** that are related to standard costs, especially the revaluation variance. Use the **Posting** page (**Inventory management > Setup**) to assign general ledger accounts that are related to standard costs. As a minimum for the standard cost conversion process, you must assign the account for the revaluation variance for all items and all cost groups. Use the **Chart of accounts** page to define the general ledger accounts that will be needed for standard costs. Use the **Transaction combinations** page to enable cost relations (for tables, groups, and all) before you define the item posting rules.
5. Define the inventory parameters that are related to standard costs. Use the **Number sequences** tab on the **Inventory and warehouse management parameters** page to assign a number sequence to revaluation vouchers. A revaluation voucher is generated when the standard cost conversion creates a change of an item's inventory value. Use the **Inventory and warehouse management parameters** page to define Cost Control parameters (on the **Inventory accounting** tab) to define two parameters that are related to standard costs.
 - Use the **Cost breakdown** field to select No or Sub ledger. The selection of Sub ledger is termed an active cost breakdown. An active cost breakdown is very important for calculating, retaining, and viewing cost group segmentation across a multilevel product structure for standard cost items. When the cost breakdown is active, you can report and analyze the following in a single level, multi-level, or total format:
 - a. Inventory
 - b. Work in process (WIP)
 - c. Cost of goods sold (COGS) per cost group

An active cost breakdown means that if you enable a manufactured item's cost, the result will be stored in the cost group segmentation in the item's cost record. If you put no value in the **Cost**

breakdown field, the cost group segmentation will not be maintained for standard cost items. That is, a manufactured item's standard cost will be calculated and maintained as a single amount without cost group segmentation, and the cost contributions of manufactured components will be aggregated into the single amount.

- Use the **Variances to standard** field to select summarized or per cost group. The selection of per cost group enables you to identify purchase price variances and production variances by cost group. This also enables you to identify the four types of production variances (the lot size, quantity, price, and substitution variances). If you select summarized, you cannot identify variances by cost group, and you cannot identify the four types of production variances. You can only view a summarized production variance. The policy about variance to standard is independent of the cost breakdown policy. That is, you can select a cost breakdown policy of none, and select variances per cost group, so that production variances by cost group will still be captured.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Manage standard cost updates

2/18/2021 • 4 minutes to read • [Edit Online](#)

Updates to standard cost data can be managed by using two different approaches - the one-version approach or the two-version approach.

The one-version approach uses a single costing version that contains all cost records. These records include the original costs and all cost updates.

The two-version approach uses one version that contains records of the original costs and a second version that contains records of all cost updates. A primary advantage of the two-version approach is the clear delineation and tracking of cost updates in a separate costing version, without affecting the original costing version. The two-version approach can be used to identify multiple incremental updates, where each incremental update has a separate costing version that contains the incremental cost records.

Example

The following example illustrates how the one-version and two-version approaches can be used for updating standard costs in a manufacturing environment. For example, updates that reflect new items or error corrections. Assume that a single costing version represents the standard costs for the current year. The identifier for this version is 2020-STD. Version 2020-STD contains the current active costs for all items. Additionally, it contains all routing-related cost categories and overhead calculation formulas that were known at the start of the year 2020. 2020-STD is the original costing version.

- **One-version approach to cost data updates** – In the one-version approach, the original costing version 2020-STD contains all cost records. Cost updates are recorded in 2020-STD and set to a status of Pending. The pending costs can be manually entered for new purchased items, or they can be calculated for a manufactured item to reflect corrections. When the one-version approach is used, the BOM calculations do not require a fallback data source because all active costs are contained in the costing version. After the pending costs become active, the original costing version 2020-STD will again contain all the current active costs.
- **Two-version approach to cost data updates** – The two-version approach requires an additional costing version that contains only the cost updates. The identifier for this version is 2020-STD-CHANGES. Cost updates are recorded in 2020-STD-CHANGES and are set to a status of Pending. With the two-version approach, the BOM calculations of pending costs for manufactured items require a fallback data source. This is because the additional costing version 2020-STD-CHANGES contains only a subset of cost data. The fallback can be expressed as the active costs or as the costing version 2020-STD, because both identify the source of cost data when it is not included in 2020-STD-CHANGES. After the pending costs become active, the costing version 2020-STD-CHANGES will contain the current active costs that reflect the updates, whereas the original costing version 2020-STD will not be affected. When the two-version approach is used, blocking policies for the original costing version should be set up to prevent updates. Identical blocking policies should be set up for the additional costing version, except for the specified from-date and the selective use of blocking policies to allow for updates. The specified from-date should be updated with each batch of changes to reflect the scheduled activation date.

This example used one additional costing version for managing updates throughout the year 2020. More than one additional costing version can be used, such as a separate version for each batch of updates. When more than one additional costing is used, the fallback must be expressed as the active costs, because the active costs are spread over multiple costing versions.

Financial dimensions for the standard cost revaluation

Activating a new standard price will typically revalue the on-hand inventory value by standard cost revaluation transactions. Usually, the financial dimensions of the item are then posted on the transactions. However, if you would like to control whether and how the financial dimensions are posted, use [feature management](#) to turn on the feature named *Options of defaulting financial dimensions for inventory standard cost revaluation*. After enabling this feature, go to **Cost management > Inventory accounting policies setup > Parameters** and set the new **Origin of financial dimension** drop-down list to one of the following values:

- **None** – No financial dimensions are posted on the revaluation transactions. If your account structure includes a required financial dimension, the revaluation process will still run, but it will create accounting entries that have no financial dimensions. In this case, users will receive a warning message first, so they can cancel the revaluation if necessary.
- **Table** – The financial dimensions of the item are posted on the revaluation transactions. This is the default setting and is consistent with the original system behavior without turning on the feature *Options of defaulting financial dimensions for inventory standard cost revaluation*.
- **Posting** – The financial dimensions of the transaction that is being revalued are posted on the revaluation transactions. By default, the financial dimensions from the original transaction's inventory account will be used for both the inventory account and the revaluation account.

Restrictions on costing versions for standard costs

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the restrictions that apply to a costing version for standard costs.

The following restrictions help guarantee adherence to standard costing principles:

- Charges must be included in an item's cost. The charges for a manufactured item represent the amortized constant costs in the bill of materials (BOM) and route information. Therefore, the charges must be included in the unit cost. The charges for a purchased item are also included in the item's unit cost.
- Calculation of standard costs for manufactured items must be based on the cost records in a costing version for standard costs. Alternative sources of cost data can be used only with a costing version for planned costs, such as purchase price trade agreements for purchased items. Alternative sources of cost data are defined by the BOM calculation group.
- BOM calculations must be performed in a single-level explosion mode.

The item cost data for standard costs can be copied to another costing version that contains standard costs or planned costs. However, the item cost data for planned costs can't be copied to a cost version that contains standard costs, because the restrictions that are listed earlier in this topic don't apply to planned costs.

Information used in BOM calculations with standard costs

2/18/2021 • 6 minutes to read • [Edit Online](#)

Bills of material (BOM) calculations use data from several sources to calculate the standard costs of a manufactured item. The sources include information about items, bills routings, indirect cost calculation formulas, and the costing version.

The purchased item information that is used in a standard cost BOM calculation includes the following:

- Cost – A purchased item's costs are maintained as site-specific cost records in a costing version for standard costs. Each cost record has an effective date, and the BOM calculation date determines which cost record will be used. For example, a BOM calculation with a future calculation date might use a cost record with a pending status and a future effective date.
- Cost group – The cost group that is assigned to a purchased item provides the basis for cost segmentation in the calculated costs of a manufactured item.
- Warning conditions that are embedded in the item's BOM calculation group enable the BOM calculation to identify potential problems. This can be when the purchased item has a zero cost, a zero quantity in a BOM, or an out-of-date cost record. The applicable warning conditions can be overridden when initiating a BOM calculation.

The manufactured item information that is used in a standard cost BOM calculation includes the following:

- Standard order quantity for inventory – The item's standard order quantity for inventory, acts as the default accounting lot size for amortizing constant costs in a BOM calculation. The accounting lot size will also reflect the order quantity multiple if it is specified.
- Warning conditions that are embedded in the item's BOM calculation group enable the BOM calculation to identify potential problems. One example could be that the manufactured item does not have a BOM or route. The applicable warning conditions can be overridden when initiating a BOM calculation.

The bill of material information that is used in a standard cost BOM calculation includes the following:

- BOM version – The BOM version that is assigned to the manufactured item has effective from and to dates, and a status for approved and active. The bill version can be company-wide or site-specific, and it can optionally reflect quantity breakpoints.
- BOM line item quantity – A component typically has a variable quantity required, but it can be a constant. The component quantity is typically expressed for producing one parent item, but it may be expressed per 100 or per 1000 to handle decimal precision issues. The component quantity can also be calculated based on measurements.
- BOM line item scrap – A component can have a variable or constant quantity for planned scrap.
- BOM line item valid dates – A component can have valid from and to dates.
- BOM line item type of production – The costing lot size for amortizing constant costs will reflect the BOM calculation quantity and a make-to-order explosion mode, because the BOM calculation assumes that the manufactured component will be produced to the exact quantity instead of its standard order quantity.
- Sub-BOM for a manufactured component – A manufactured component can optionally have a specified BOM version, which would be used instead of the item's current active BOM version in a BOM calculation.
- Sub-route for a manufactured component – A manufactured component can optionally have a specified route version, which would be used instead of the item's current active route version in a BOM calculation.
- Operation number and the impact of operation scrap percentages – The operation number links a

component to a specific operation, and operations can have a scrap percentage. The linkage enables BOM calculations to account for scrap percentages and cumulative scrap percentages across multiple operations on the component's required quantity.

- Ignore BOM line item in cost calculations – A component can be ignored for BOM calculation purposes.

The operations resource information that is used in a standard cost BOM calculation includes:

- Hourly costs – The hourly costs that are associated with an operations resource are expressed as cost categories that are assigned to set up time and run time. These cost categories should be identified for resource groups and operations resources. The hourly costs that are associated with a cost category can be site-specific or company-wide.
- Per unit costs – Some manufacturing environments assign operations resource costs per unit of output, which would be expressed as a different cost category for quantity. For example, the quantity-related costs can reflect piece rates for labor, or a paint manufacturer may assign operations resource costs per gallon of output.
- Overriding operations resource information on routing operations – The resource information about cost categories will be inherited by operations, where it can be overridden. BOM calculations will use the cost category information that is specified on the routing operations.
- Cost group for a cost category – The cost group that is assigned to a cost category provides cost segmentation in the calculated costs of a manufactured item. For example, different cost groups might be used to segment the calculated costs that are associated with machines and labor or with setup and run time.

The route information that is used in a standard cost BOM calculation includes:

- Route version – The route version that is assigned to the manufactured item has effective from and to dates, and a status for approved and active. The route version must be site-specific, and it can optionally reflect quantity breakpoints.
- Routing operation time – The time can be specified for runtime and setup time. The hourly time is typically expressed for producing one parent item, but it may be expressed per 100 or per 1000 to handle decimal precision issues.
- Routing operation time for secondary resources – A secondary resource has the same operation number as the primary resource, and the same routing operation time. For example, an operation might require a machine as the primary resource and labor and tools as secondary resources.
- Routing operation scrap percentage – BOM calculations will account for scrap percentages and cumulative scrap percentages across multiple operations. This applies to the required time for routing operations and the required quantity for components that are linked to operation numbers.
- Cost categories for a routing operation – Operations resource information about cost categories will be inherited by operations, where it can be overridden. BOM calculations will use the cost category information that is specified on the routing operations.

The manufacturing overhead information that is used in a standard cost BOM calculation includes:

- Surcharge – A surcharge calculation formula reflects a percentage of value, such as 100 percent, that is tied to a specific cost group, such as labor.
- Rate – A rate calculation formula reflects an amount per unit, such as USD 10.00 per hour, that is tied to a specific cost group, such as labor.
- Time-based versus material-based overhead – The manufacturing overhead can be tied to routing operations or material components.

The costing version information that is used in a standard cost BOM calculation includes:

- Costing type – The costing version must contain standard costs. Several restrictions apply to BOM calculations that use standard costs. For example, these restrictions specify that miscellaneous charges must be included in unit costs and that the BOM calculation explosion mode must be single level.

- Mandated fallback principle – The costing version can mandate the use of a fallback principle, such as using a specified costing version or the active cost records. The mandated fallback principle typically applies to a costing version that represents the incremental updates in a two-version approach for cost updates.
- Blocking flag for pending costs – A blocking flag can prevent BOM calculations of the pending cost for manufactured items.
- Specified from-date – The specified from-date will act as the default calculation date for all BOM calculations that involve the costing version.
- Specified site – A specified site will limit BOM calculations to the single site.
- Content of the costing version must include costs – The content must include costs. It can optionally include sales prices in order to calculate suggested sales prices for manufactured items.

Several sources of information can be specified when initiating a BOM calculation. This includes the site, the calculation date, and the costing version.

Update standard costs in a manufacturing environment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides guidance about how to update standard costs in a manufacturing environment.

Updates can reflect new items, cost categories, or indirect cost calculation formulas. They can also reflect corrections and cost changes. The type of update affects the steps that you must complete to update standard costs, as illustrated in the following cases:

- Enter expected standard cost changes for purchased items, and then change the status of the item cost records to **Active** on the appropriate date. However, don't recalculate the costs of manufactured items that use the purchased items.
- Enter standard costs for a new purchased item, but don't recalculate the costs of manufactured items that have a bill of materials (BOM) version that contains the new purchased item as a component.
- Correct or change the cost of a purchased item, or change the cost group that is assigned to a purchased item, and calculate the cost for all manufactured items that have a BOM version that contains the purchased item as a component.
- Change the cost for a cost category, and calculate the cost for all manufactured items that have a route version that contains routing operations that use the cost category.
- Change the cost categories that are assigned to routing operations or the cost group that is assigned to cost categories. Then calculate the cost for all manufactured items that have a route version that contains routing operations that use the cost category.
- Change an indirect cost calculation formula, and calculate the cost for all manufactured items that are affected by the change.
- Change or add a manufacturing site for a manufactured item, and calculate the item's manufactured cost for the site.
- Calculate, or recalculate, the cost for a manufactured item, and recalculate the cost for all manufactured items that have a BOM version that contains the manufactured item as a component.
- Calculate costs for a new manufactured item, based on its defined, approved, and active BOM and route information.

Each case requires careful consideration about how to update standard costs.

Update standard costs for a new manufactured item

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article provides guidance for updating standard costs for a new manufactured item.

The following guidelines assume that you use a two-version approach to update standard costs. In this approach, one costing version contains the standard costs that were originally defined for the frozen period, and the second costing version contains the incremental updates that pertain to the new manufactured items. The incremental updates are entered as cost records in the second costing version, and eventually they are enabled. The two-version approach requires that you define a second costing version. Here are the guidelines for defining this costing version:

- Assign a costing type of **Standard cost**.
- Assign a significant identifier that indicates the contents of the costing version, such as **2016-UPDATES**.
- In the **Allow price types** field group, make sure that **Cost price** is set to **Yes**.
- Allow cost records to be entered for all sites (that is, leave the **Site** field blank). If you enter a site, cost records can be entered only for that site.
- Use a fallback principle of **Active**.

To add new manufacturing items throughout the frozen period, follow these steps.

1. Use the **Costing version setup** page to enable cost records to be entered into the second costing version that contains the incremental updates. Prevent the activation of pending costs, where activation is allowed after pending costs have been completely and accurately defined. Indicate a blank from-date as a policy in the costing version, and then enter the from-date when you enter each cost record. The from-date should represent a date before the new items are purchased or manufactured.
2. Use the **Item price** page to enter cost records for new purchased items. For each cost record, enter the costing version that contains incremental updates, and use a from-date that comes before the expected manufacturing date for new manufactured items.
3. Calculate the cost of new manufactured items by using the **Calculation** page. Open the **Calculation** page from the **Costing version maintenance** page, and then select the costing version that contains the incremental updates. Use the selection criteria to specify the new manufactured item and any one of its manufactured components. In a multilevel product structure, you might also have to specify any parent item that contains the new manufactured items as a component. Enter a from-date for the bill of materials (BOM) calculation that corresponds to the start of manufacturing for the new manufactured items. The from-date should be in the effective dates for the item's BOM version and route version. **Note:** A missing cost record can indicate a new manufactured item. BOM calculations can be limited to items that have missing costs.
4. Verify the completeness and accuracy of the calculated costs for new manufactured items. Use the **Complete** page to review the calculated costs for each item cost record, and also review any Infolog warning messages. Alternatively, use the **Calculation** page to review the calculated costs.
5. Use the **Costing version setup** page to change the blocking flag to allow activation of the pending cost records in the second costing version.
6. Use the **Activate prices** page (which you open from the **Costing version maintenance** page) to enable all pending cost records in the second costing version. You can also enable the pending cost records for individual items by clicking the **Activate** button on the **Item price** page.
7. Use the **Costing version setup** page to change the blocking flags in the second costing version to prevent additional data maintenance. The blocking policies prevent the entry of new pending costs and the activation of pending costs.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Update standard costs in a non-manufacturing environment

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides guidance for updating standard costs in a non-manufacturing environment.

The following guidelines assume that you use a two-version approach to update standard cost. In this approach, one costing version contains the standard costs that were originally defined for the frozen period, and the second costing version contains the incremental updates. Each update is entered as a cost record that is enclosed in the second costing version, and eventually it's enabled. An alternative, one-version approach uses the set of standard costs that was originally defined. The two-version approach requires that you define a second costing version. Here are the guidelines for defining this costing version:

- Assign a costing type of **Standard costs**.
- Assign a meaningful identifier that indicates the contents of the costing version, such as **2016-UPDATES**.
- Make sure that the content includes cost records.
- Allow cost records to be entered for all sites. If you specify a site, cost records can be entered only for that site.
- Indicate a fallback principle of **None**. The fallback principle applies only to cost calculations for manufactured items.

To correct, adjust, or update standard costs for new items, follow these steps.

1. Use the **Costing version setup** page to enable cost data to be entered into the second costing version. Optionally, prevent the activation of pending costs, so that activation will be allowed after pending costs have been completely and accurately defined. You can also optionally enter a date in the **From date** field. As a general guideline, use the date when you intend to enable the incremental updates. Alternatively, leave the **From date** field blank for the costing version, and then enter a date in the **From date** field for each cost record.
2. Use the **Item price** page to enter updates as item cost records that are enclosed in the second costing version.
3. Use the **Item prices** report to verify the completeness and accuracy of the item cost records that are enclosed in the second costing version.
4. Use the **Costing version maintenance** page to change the blocking flag to allow activation of the pending cost records that are enclosed in the second costing version.
5. Use the **Activate prices** page (which you open from the **Costing version maintenance** page) to activate all pending item cost records that are enclosed in the second costing version. You can also activate the pending cost records for individual items by clicking the **Activate pending price** button on the **Item price** page.
6. To prevent additional data maintenance, use the **Costing version setup** page to change the blocking flags that are enclosed in the second costing version. The blocking policies will prevent the entry of new pending costs and the activation of pending costs.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Prepare to maintain standard costs for manufactured items

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic describes the steps for preparing to maintain costs for manufactured items. The steps for manufactured items differ slightly from the steps for purchased items.

Policies that are assigned to manufactured items can affect the cost calculations for the parent manufactured items. To prepare to maintain costs for manufactured items, follow these steps.

1. Assign an item model group to the manufactured item.

The item model group identifies that standard costs will be used.

2. Assign an item group to the manufactured item.

The item group contains ledger accounts that apply to the manufactured item. The ledger accounts for a manufactured item that has a standard cost inventory model include several production variances, the cost change variance, and the inventory cost revaluation.

3. Assign the inventory unit of measure to the item.

The item's costs are always expressed in the item's inventory unit of measure.

4. Don't assign a cost group to the manufactured item unless the item will be treated as a purchased item.

5. Assign a bill of materials (BOM) calculation group to the manufactured item.

The item's BOM calculation group defines warning conditions that apply. In that way, when a BOM calculation is done, warning messages can be generated about possible sources of calculation errors. For example, a warning message can identify when an active BOM or route doesn't exist. The BOM calculation group contains a stop explosion policy that indicates when a manufactured item should be treated as a purchased item.

6. If the manufactured item has constant costs, assign a standard order quantity to it.

The standard order quantity is an accounting lot size for amortizing constant costs. Examples of constant costs include setup times in routing operations and a constant component quantity in the BOM.

7. Define the BOM for the manufactured item.

One or more BOM versions can be defined for the manufactured item. Verify that the versions that you want have been marked as approved and active, and that they have the effective dates that you want. The BOM version can be company-wide or site-specific.

8. Define the routing for the manufactured item.

One or more route versions can be defined for the manufactured item. Verify that the versions that you want have been marked as approved and active, and that they have the effective dates that you want. The route version must be site-specific.

If you want to use routing information for costing purposes, additional preparation steps are required. For example, the cost categories that are assigned to routing operations must be correct and completed.

Costing versions overview

2/18/2021 • 4 minutes to read • [Edit Online](#)

This article provides information about costing versions, how to maintain them, and the types of data that you can include in them. The primary purpose of a costing version is to contain cost records about items, cost categories, and calculation formulas for indirect costs.

A costing version can serve one or more purposes, depending on the data that the costing version contains. The primary purpose of a costing version is to contain cost records about items, cost categories, and calculation formulas for indirect costs. A costing version can contain a set of standard cost records or a set of planned cost records that are based on the costing type that is assigned to the costing version.

Costing versions for standard or planned costs

Standard costs

A costing version can support a standard cost inventory model for items, where the costing version contains a set of standard cost records about items and manufacturing processes. Cost data about manufacturing processes is expressed in terms of the cost categories for routing operations and the calculation formulas for manufacturing overheads.

Planned costs

A costing version can contain a set of planned cost records about items and manufacturing processes. A costing version that contains planned costs is often used to support cost calculation simulations, such as simulations of the effect that cost changes to purchased materials or manufacturing processes has on the calculated costs of manufactured items. The item cost records for planned costs can also be used to support an actual cost inventory model by providing the initial values for item costs. These values include the calculation of planned costs for manufactured items.

Entering costs

Data maintenance for cost records in a costing version involves entering costs for purchased items and for items that are transferred between sites. Additional data maintenance for manufacturers involves entering costs for cost categories that are associated with routing operations, entering calculation formulas for the indirect costs that reflect manufacturing overhead, and calculating costs for manufactured items.

The item cost data in a costing version consists of one or more cost records for each item. When an item cost record is first entered, it has **Pending** status and an intended effective date. When you activate the item cost record, the status is updated to **Active**, and the effective date is updated to the activation date. Different item cost records can reflect different sites, effective dates, or statuses. When you calculate costs for manufactured items for a future date, the bill of materials (BOM) calculation uses cost records that have the relevant effective date, regardless of whether the status is **Pending** or **Active**. An item's current active cost record is used to estimate production order costs and to value inventory transactions under a standard costing inventory model. The maintenance of cost records for cost categories and indirect cost calculation formulas resembles the maintenance of item cost records.

Two blocking policies for a costing version determine whether pending costs can be maintained and whether the pending cost can be activated. Use the blocking policies to permit data maintenance, and then use them to prevent data maintenance for cost records in a costing version.

A costing version can also contain data about item sales prices or purchase prices for BOM calculation purposes.

Item sales prices for BOM calculations

The main reason for including data about sales prices is to retain a manufactured item's calculated sales price. The calculated sales price can then be analyzed to determine how components, routing operations, and overhead contribute to the cost and sales price.

A secondary reason for including data about sales prices is to define the sales price records for component items. These records can then be used to calculate the sales price of manufactured items. You first define the sales price model that is embedded in a BOM calculation group, and assign the BOM calculation group to purchased items. Then, when you perform BOM calculations that use planned costs, you select the cost price model of the BOM calculation group.

Otherwise, the sales price records for items are used only as reference information, regardless of whether the records are manually entered or calculated. By activating an item's sales price record, you can update the item's base sales price. However, the base sales price isn't site-specific and can be manually overridden. The item's base sales price is used as a default sales price on sales orders and sales quotations.

Item purchase prices for BOM calculations

The main reason for enabling purchase price data is to define purchase price records for component items, so that these records can be used to calculate the costs of manufactured items. The item purchase price records must be manually entered.

To enable purchase price content, you first define a BOM calculation group that contains a cost price model for the item's purchase price, and assign the BOM calculation group to purchased items. You then use a cost price model for the BOM calculation group when you perform BOM calculations that use planned costs to calculate the sales price of manufactured items.

The purchase price records for items are also used as reference information. By changing the status of an item's purchase price record from **Pending** to **Active**, you can update the item's base purchase price. However, the base purchase price isn't site-specific and can be manually overridden. The item's base purchase price is used as a default purchase price on purchase orders.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Costing sheets

2/18/2021 • 3 minutes to read • [Edit Online](#)

Setting up the costing sheet involves two objectives. As the first objective, you define the format for displaying cost of goods sold information about a manufactured item or production order. The formatted display is termed a costing sheet. As the second objective, you define the basis for calculating indirect costs. The costing sheet setup builds on the cost group feature for displaying information and for the indirect cost calculation formulas. The two objectives of costing sheet setup are described in this article.

A costing sheet is the formatted display of information about the cost of goods that are sold for a manufactured item or a production order. When you set up a costing sheet, you define the format for the information and also define the basis for calculating indirect costs. The costing sheet setup builds on the cost group features for displaying information and for the formulas that are used to calculate indirect cost. Here is more information about the two objectives of costing sheet setup:

- **Define the format for the costing sheet.** The user-defined format for a costing sheet identifies the segmentation of costs that contain a manufactured item's cost of goods sold. For example, the information about an item's cost of goods sold can be segmented into material, labor, and overhead, based on cost groups. These cost groups are assigned to items, cost categories for routing operations, and indirect cost calculation formulas. The format for the costing sheet typically requires intermediate totals when multiple cost groups have been defined. For example, multiple cost groups that are related to material can be aggregated. The definition of a costing sheet format is optional, but a costing sheet format must be defined if indirect costs will be calculated.
- **Define the basis for calculating indirect costs.** Indirect costs reflect manufacturing overhead that is associated with the production of a manufactured item. An indirect cost calculation formula can be expressed as either a surcharge or a rate. A surcharge represents a percentage of value, whereas a rate represents an amount per hour for a routing operation. A cost group defines the basis for the calculation formula, such as a 100-percent surcharge for a labor cost group or a USD 50.00 hourly rate for a machine cost group. If you want to define a calculation formula and its cost group basis, the costing sheet setup requires that you identify the cost group that represents the overhead, and select whether a surcharge or rate approach is used.

Each calculation formula must be entered as a cost record. The cost record consists of a specified costing version, a surcharge percentage or a rate amount, the cost group basis, a status, and an effective date. When a cost record is first entered, it has **Pending** status and an effective date. When you activate the cost record, the status is updated to so that the record is the current active record, and the effective date is updated to the activation date. The cost record can also specify a site for a site-specific calculation formula. Alternatively, you can leave the **Site** field blank to indicate that the calculation formula is a company-wide formula. The cost record can optionally consist of a specified item or item group when the calculation formula has been marked as a per-item formula.

The current active cost records for indirect cost calculation formulas are used to estimate production order costs. They are also used to calculate actual costs that are related to actual consumption of time and material. Pending cost records are used in bill of materials (BOM) calculations for a future date.

Two blocking policies for a costing version determine whether pending costs can be maintained, and whether the pending cost can be started. Use the blocking policies to permit data maintenance, and then to prevent data maintenance for the cost data in a costing version.

After you define the costing sheet format and calculations for indirect costs, you must perform a separate step to validate and save the information. The costing sheet represents a company-wide format for consistently

displaying information about the costs of goods sold.

The costing sheet is displayed as part of the **Calculate item cost** page. The costing sheet can be displayed for a manufactured item's calculated cost record on the **Item price** page or for an order-specific calculation record on the **BOM calculation results** page. It can also be displayed as part of the **Price calculation** page for a production order.

Simulate cost changes by using a costing version for planned costs

2/18/2021 • 3 minutes to read • [Edit Online](#)

This article explains how you can simulate the effects of cost changes on a manufactured item's calculated costs by using a separate costing version for planned costs.

You can simulate the effects of cost changes on the calculated costs of a manufactured item by using a separate costing version for planned costs. Use this separate costing version to enter pending cost records that reflect incremental cost changes, and to calculate the cost impact on manufactured items. Because the Active costs fallback principle will be used in the bill of materials (BOM) calculations, only the incremental cost changes must be entered.

Guidelines for defining the simulation costing version

Use the following guidelines when you define the costing version for simulations:

- Assign a costing type of **Planned costs**.
- Assign a meaningful identifier for the costing version, such as **Simulation**.
- Make sure that the content includes cost records.
- Allow the entry of cost records. Don't block the entry of pending costs.
- Allow the entry of cost records for all sites. If you specify a site, you will limit the entry of cost records to that site.
- Prevent the activation of pending costs. Only pending costs must be entered for cost records in the simulation costing version.
- Don't enter a "from" date. A calculation date will be entered for each BOM calculation that uses the simulation costing version.
- Specify a fallback principle of **Current active**. The fallback principle enables incremental cost changes to be entered for simulation purposes but uses the current active costs as the source for all other cost records. We assume that all current active costs exist for all other cost records.
- Specify a cost price model of **Version cost price**, but don't restrict calculations. For example, the simulations can also use the **BOM calculation group** cost price model to indicate the source of cost contribution data for purchased items.
- Specify an explosion mode of **Multilevel**, but don't restrict calculations. The simulations can use other explosion modes.

Costing versions

The following scenarios illustrate how the simulation costing version is used to simulate the impact of cost changes. Before you enter a simulated cost change, delete the pending cost records in the simulation costing version, so that you have a clean starting point. Use the **Item price** page to view and delete the pending cost records that are related to item prices and cost category prices.

- Simulate the cost change for a purchased item. For example, the cost change might reflect an expected increase or decrease in the cost of critical purchased materials. To define the different cost for a purchased item, use the **Item price** page to enter a pending cost record in the simulation costing version.
- Simulate the cost change for a cost category. For example, the cost change might reflect an expected increase or decrease in labor rates, or in the hourly rates for operations resources. To define the different cost for a

cost category, use the **Cost category price** page to enter a pending cost record in the simulation costing version.

- Simulate the cost change in an indirect cost calculation formula. For example, the cost change might reflect an expected increase or decrease in manufacturing overhead. To define the change in an indirect cost calculation formula, use the **Costing sheet setup** page to enter a pending cost record in the simulation of costing version, and to validate and save the change.

After you enter the simulated cost changes, calculate the costs for manufactured items that are affected by the cost changes. Use the **Calculation** page for the simulation costing version, and identify the selected manufactured items that will be affected by the cost changes. The BOM calculations apply to all manufactured items unless you select specific items. Alternatively, you can use the BOM calculation option for where-used updates. View the item cost records in the simulation costing version to analyze how the simulated cost changes affected the costs of the selected manufactured items. Use the **Item price** page and the **Calculate item cost** page to view and analyze the costs.

Compare item prices storage report

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to run a **Compare item prices storage** report and make the output available digitally, either as an interactive page in Dynamics 365 Supply Chain Management, or as an exported document in any of several formats.

When you view the report in your browser, columns and aggregate balances are dynamically adjusted, depending on your configured layout. You can sort the results, filter them, drill down into the data, and more.

Report results are stored in the **Compare item prices** data entity, which lets you filter and export the results to a format such as CSV or Microsoft Excel.

The **Compare item prices storage** report is helpful in cases where the output contains many lines. For example, the output will contain many lines if you have more than 40,000 items holding a pending item price in the costing version.

Enable compare item prices storage

Before you can use this feature, you must enable it on your system. Administrators can use the [feature management](#) settings to check the feature status and enable it if needed. Here, the feature is listed as:

- **Module** - Cost management
- **Feature name** - Compare item price storage

Generate a Compare item prices storage report

Follow these steps to generate and store a **Compare item prices storage** report:

1. Go to **Cost management > Inquiries and reports > Predetermined cost reports > Compare item prices storage**.
2. Select **New** to open the **Compare item prices** pane. Set the following options to define which prices to compare in your report:
 - On the **Parameters** FastTab, give the report a unique **Name** and use the fields in the **Pending prices to compare** and **Prices used for comparison** sections to define which prices and dates to compare.
 - On the **Records to include** FastTab, set up filters and constraints to define which data to include in the report.
 - On the **Run in the background** FastTab, set up how, when, and the frequency at which you want to generate the report.

NOTE

This report is always executed as part of a batch job.

3. Select **OK** to apply your settings and close the pane.
4. After the batch job is completed, it will be listed on the **Compare item prices storage** page. You may need to refresh the page to see the report.

Explore the Compare item prices storage report

After you've generated a report, you can view and explore it at any time as follows:

1. Go to **Cost management > Inquiries and reports > Predetermined cost reports > Compare item prices storage**.
2. Select a report from the list.
3. Do one of the following:
 - Select **Overview** to get an overview of your report results.
 - Select **View details** to get a more detailed view of your report
4. After the selected view opens, you can do the following:
 - Select almost any column heading to sort or filter the table by values in that column, just as with most standard forms in Supply Chain Management. Note, you can't sort or filter the **Net change price %** column because it's a calculated field.
 - Select **Dimension display** to open a pane where you can choose which dimension column to include on the form. Set **Save setup** to **Yes** if you'd like to save these settings so they will be preserved the next time you open the report. Select **OK** to apply your settings and close.
 - Select any row in the form and then select **View details** to see more information about the selected item. You'll be able to drill down into the data from here.
 - Select any row in the form and then select **View comparison chart** to see an interactive graphical representation of your results as they relate to your selected item. You can explore these results by selecting various graphical elements in the chart and chart legend.
 - Select any row in the form and then select **View calculation details** to see more information about calculations related to the selected item. You'll be able to drill down into the data from here.

Export the Compare item prices storage report

Each report that you generate is stored in the **Compare item prices** data entity. You can use the standard data management features of Supply Chain Management to export data from this entity to any supported data format, including CSV or Microsoft Excel.

The following is an example of how to export a **Compare item prices storage** report:

1. Go to **System administration > Workspaces > Data management**.
2. Select the **Export** button in the **Data management** section.
3. The **Export** page opens, which you'll use to set up your export job. Start by giving your job a **Group name**.
4. In the **Selected entities** section, select **Add entity** to open a dialog box where you can set the following options:
 - **Entity name** - Select **Compare item prices**.
 - **Target data format** - Choose the format that you want to export to.
5. Select **Add** to add the new row and then select **Close** to close the dialog box.
6. Usually you'll export one report at a time. To do this, set up a **Filter** for the row you just added to the **Inquiry** pane. This will let you define which reports from the **Compare item prices** entity that you want to include in your export. Set the following filter options to export a single report:
 - On the **Range** tab, select **Add** to add a new row.
 - Set **Table** to **Compare item prices**.

- Set **Derived table** to **Compare item prices**.
 - Set **Field** to the field that you want to filter by. Usually you'll use **Execution name** or **Execution time**.
 - Set **Criteria** to the value from your selected field that you want to look for (either the name of the report or the time the report was generated).
 - If necessary, add more rows to the **Range** table until you have uniquely identified the report that you're looking for.
7. Select **OK** to save your settings and close.
 8. Select **Save** to save your export setup.
 9. Open the **Export options** tab and select **Export now** to generate the export file.
 10. The **Execution summary** page opens, where you can see the status of your export job and a list of entities that were exported. Select the **Compare item prices** entity listed in the **Entity processing status** area and then select **Download file** to download the data exported from that entity.

For more information about how to use data management to export data, see [Data import and export jobs overview](#).

Cost objects

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about costs objects, and explains how costs and quantities are accumulated. A cost object is an entity that costs and quantities are accumulated for. A cost object entity can be either a product or product variants, such as variants for style and color.

Cost objects

The **Cost objects** page lists all cost objects that are registered on a product. The cost objects are defined by data from the following sources:

- Product
- Product dimension group
- Storage dimension group
- Tracking dimension group

Note: A cost object represents a cost element of the **Direct material** type only. A cost object and an inventory object differ in the way that a cost object is defined by the inventory dimensions that are selected for financial inventory. For example, an item has the following configuration:

- **Site:** Physical inventory = Yes, Financial inventory = Yes
- **Warehouse:** Physical inventory = Yes, Financial inventory = No
- **Batch No.:** Physical inventory = Yes, Financial inventory = No

The following table shows what is a cost object and what is an inventory object.

OBJECT TYPE	ITEM NUMBER	SITE	WAREHOUSE	BATCH NO.
Cost object	x	x		
Inventory object	x	x	x	x

Accumulation of costs and quantities

- The value in the **Value** field is a sum of the following values:
 - Physical cost amount
 - Financial cost amount
 - Adjustments
- The value in the **Quantity** field is a sum of the following values:
 - Received
 - Deducted
 - Posted quantity
- The **Average unit cost** field is a calculated field. The value is calculated by dividing the **Value** value by the **Quantity** value.

Note: The ****Include physical value**** parameter has no effect on the preceding calculations.

Cost entries

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about cost entries and when they are created. A cost entry is a record that registers the quantity and cost of a given event.

Cost entries are aggregations of inventory transactions that are recorded on active financial inventory dimensions.

Examples

Example 1: No cost entries are created

A transfer journal event is registered. The event transfers one piece of item A from location A to location B. The Location inventory dimension isn't considered part of the cost object. Therefore, the event creates two inventory transactions and no cost entries.

Example 2: Cost entries are created

A transfer journal event is registered. The event transfers one piece of item A from site 1 to site 2. The Site inventory dimension is considered part of the cost object. Therefore, the event creates two inventory transactions and two cost entries.

Example 3: One cost entry is created

A product receipt event is registered for a purchase order. The event registers 100 pieces of item A at a unit cost of 10.00 U.S. dollars (USD). Because item A uses a serial number to track the purpose of inventory management, a unique serial number is created for each item that is received. Therefore, the event creates 100 inventory transactions and one cost entry.

Cost entries page

The new **Cost entries** page lets you view and control registrations of quantities and costs. This page complements the **Inventory transaction** and **Inventory settlement** pages. Records are registered in chronological order for an event. Therefore, you can quickly find and control the accumulated costs of a specific event or all events that are related to a document. Here is an example:

- A product receipt event is registered for item A. One hundred pieces are received at a unit cost of 10.00 USD.
- A few days after the invoice event is registered, the cost increases to 11.00 USD. Therefore, the total amount is 1,100 USD. A second voucher is created to account for the difference of 100 USD.
- A few days later, a miscellaneous charge of 15.00 USD to cover the transportation cost is registered on the purchase order.

VOUCHER	DATE	REFERENCE	NUMBER	LOT ID	QUANTITY	AMOUNT
00001	01-01-2015	Purchase order	100001	0000101	100.00	1000.00
00002	20-01-2015	Purchase order	100001	0000101		100.00
00003	31-01-2015	Adjustment	100001	0000101		15.00

The **Cost entries** page enables filtering by document ID and document date.

NOTE

Cost entries are available only for [cost objects](#) or released products.

Cost groups

2/18/2021 • 3 minutes to read • [Edit Online](#)

Cost groups provide the basis for segmenting and analyzing cost contributions in a manufactured item's calculated cost, such as the cost contributions for material, labor, and overhead. Cost group segmentation has several synonyms within manufacturing environments, such as cost breakdown, cost decomposition, or cost classification.

Cost group segmentation has several synonyms within manufacturing environments, such as cost breakdown, cost decomposition, or cost classification. Cost group segmentation can serve several purposes. Here are some examples:

- It can segment costs for different types of material, such as ingredients and packaging material for a canned goods product, based on the cost groups that are assigned to items.
- It can segment costs for different types of operations resources, such as different types of labor or machines, based on the cost groups that are assigned to cost categories that are related to operations resources and routing operations.
- It can segment costs for setup time and run time in routing operations, based on the cost groups that are assigned to cost categories that are related to the routing operations.
- It can segment costs for different types of overhead, such as labor-related and machine-related overhead, based on cost groups that are assigned to indirect costs in the costing sheet setup.
- It can act as the basis for calculating various types of manufacturing overhead in the costing sheet setup. This overhead can include different types of overhead that are related to routing information about operations resources, or information about setup time and run time. Manufacturing overhead can also be related to cost contributions of component material, reflecting a lean manufacturing philosophy that eliminates the need for routing information.

Cost group segmentation applies to a manufactured item's calculated cost, regardless of whether that cost was based on standard costs or planned costs. The **Summary** page displays this segmentation by cost group, by level, or by both cost group and level.

The ability to retain cost group segmentation across multiple levels in a product structure is known as *splitting*. Splitting applies only to manufactured items that use a standard cost inventory model. If splitting isn't used, the cost of a manufactured component is treated as a material cost contribution. The inventory parameter for cost breakdown by subledger indicates that cost group segmentation will be retained across multiple levels in standard cost calculations. By contrast, if a policy has no levels, cost group segmentation applies only to a single-level calculation. For example, the **Cost rollup by cost group** page displays the cost group segmentation across multiple levels for standard cost items.

Cost group segmentation can also apply to variances for a standard cost item. A second inventory parameter defines whether variances are identified by cost group or just summarized.

A cost group can be assigned a cost group type and a behavior for supplemental segmentation purposes.

- **Cost group type** – Each cost group must be assigned a cost group type to indicate that the cost group applies to direct material, direct manufacturing, or direct outsourcing, or to designate it as indirect or undefined. A cost group that is designated as direct material can be assigned to items. A direct manufacturing cost group can be assigned to cost categories. A direct outsourcing cost group can be assigned to a product type of service, so that you can classify costs that are associated with the service purchase to subcontracting activities. An indirect cost group can be assigned to indirect costs for surcharges or rates. A cost group that is designated as undefined can be assigned to items, cost categories, or indirect

costs. The assignment of a cost group type serves several purposes. First, it constrains the ability to assign a cost group and to view a list of applicable cost groups. Second, it provides supplemental segmentation for reporting purposes. Third, it can be used to assign ledger accounts for variances.

- **Behavior** – Each cost group can optionally be assigned a behavior to indicate that the cost group applies to fixed costs or variable costs. A cost group that has a null value for behavior is treated as a variable cost. The assignment of a behavior serves only a reporting purpose. For example, costs can be displayed with segmentation of fixed and variable costs on the costing sheet and on the **Cost rollup by cost group** page. If you assign a profit setting percentage to each cost group, the bill of materials (BOM) calculation provides a suggested sales price, based on a cost-plus-markup approach.

NOTE

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

FIFO with physical value and marking

2/18/2021 • 9 minutes to read • [Edit Online](#)

First in, First out (FIFO) is an inventory model in which the first acquired receipts are issued first. Financially updated issues from inventory are settled against the first financially updated receipts into inventory, based on the financial date of the inventory transaction.

When you use FIFO, you don't have to use the FIFO rule. Instead, you can mark inventory transactions so that a specific item receipt is settled against a specific issue. We recommend a periodic inventory closing when you use the FIFO inventory model. The following examples show the effect of using FIFO in three configurations:

- FIFO without the **Include physical value** option
- FIFO with the **Include physical value** option
- FIFO with marking

FIFO without the Include physical value option

In this example, the item model group isn't marked to include physical value. The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 2 at a cost of USD 10.00 each.
- 2b. Inventory financial receipt for a quantity of 2 at a cost of USD 10.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 20.00 each (running average of financially updated transactions).
- 5b. Inventory financial issue for a quantity of 1 at a cost price of USD 15.00 each (running average of financially updated transactions).
- 6. Inventory close is performed. Based on the FIFO method, the first financially updated issue will be settled against the first financially updated receipt. An adjustment of USD -5.00 will be made on the issue transaction.

The new running average cost price reflects the average of the financially updated transactions. The following illustrations shows the effects of the FIFO inventory model on this series of transactions when the **Include physical value** option isn't used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

FIFO with the Include physical value option

If the **Include physical value** check box is selected for an item on the **Item model group** page, the system uses both physical and financial receipt transactions to calculate the running average cost price. Where applicable, the system also makes adjustments to the physically updated issue transaction. When the **Include physical value** check box is cleared, inventory close with the FIFO inventory model makes settlements only to transactions that are financially updated. The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each.
- 7. Inventory close is performed. Based on the FIFO method, the first financial issue transaction will be adjusted or settled against the first updated receipt, either financial or physical.

Transaction 5b will be settled against receipt transaction 1b. There will be an adjustment of USD –11.25 to this issue transaction. The new running average cost price reflects the average of the financially and physically updated transactions, USD 27.50. The following illustration shows the effects of the FIFO inventory model on this series of transactions when the **Include physical value** option is used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

FIFO with marking

Marking is a process that lets you link, or mark, an issue transaction to a receipt transaction. Marking can occur either before or after a transaction is posted. You can use marking when you want to be sure of the exact cost of inventory when the transaction is posted or the inventory close is performed. For example, the Customer Service department accepted a rush order from an important customer. Because this order is a rush order, you must pay more for this item in order to fulfill your customer's request. You must make sure that the cost of this inventory item is reflected in the margin, or cost of goods sold (COGS), for this sales order invoice. When the purchase order is posted, the inventory is received at a cost of USD 120.00. If this sales order document is marked to the purchase order before the packing slip or invoice is posted, the COGS will be USD 120.00, not the current running average cost for the item. If the sales order packing slip or invoice is posted before the marking occurs, the COGS will be posted at the running average cost price. Before inventory close is performed, these two transactions can still be marked to each other. When a receipt transaction matches an issue transaction, the valuation method that is defined in the item model group is disregarded, and the system settles these transactions to each other. You can mark an issue transaction to a receipt before the transaction is posted. You can do this from a sales order line on the **Sales order details** page. You can view the open receipt transactions on the **Marking** page. You can also mark an issue transaction to a receipt after the transaction is posted. You can match or mark an issue transaction for an open receipt transaction for an inventoried item from a posted inventory adjustment journal. The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.

- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 is marked to inventory receipt 2b before the transaction is posted. This transaction is posted at a cost price of USD 20.00 each.
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each.
- 7. Inventory close is performed. Because the financially updated FIFO transaction is marked to an existing receipt, these transactions are settled against each other, and no adjustment is made.

The new running average cost price reflects the average of the financially and physically updated transactions, USD 27.50. The following illustration shows the effects of the FIFO inventory model on this series of transactions when marking between issues and receipts is used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as 1a. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

Include physical value

2/18/2021 • 2 minutes to read • [Edit Online](#)

You use the Include physical value check box on the Inventory model FastTab of the Item model groups page to specify whether physically updated transactions are considered when the running average cost price is calculated for an item.

The **Include physical value** check box has the following values.

VALUE	RESULT
Selected	Both physically updated transactions and financially updated transactions are used to calculate the running average cost price.
Cleared	Only financially updated transactions are used to calculate the running average cost price.

The check box has slightly different effects, depending on the inventory model that you use.

- If you select the **Include physical value** check box when you use the FIFO (First in, first out), LIFO (Last in, first out), or LIFO date inventory model, inventory close also makes adjustments to physically updated transactions.
- If you don't select the **Include physical value** check box when you use these inventory models, inventory close makes settlements only to financially updated transactions.
- When you use the weighted average or weighted average date inventory model, inventory close settles only financially updated transactions, regardless of whether you select the **Include physical value** check box.

Example 1 You've selected the **Include physical value** check box and receive the following purchase orders:

- A purchase order for a quantity of 2 and a cost price of USD 10.00 that has been packing slip–updated.
- A purchase order for a quantity of 3 and a cost price of USD 12.00 that has been invoice–updated.

In this case, the running average cost price will be $USD\ 11.20 = (2 \times 10 + 3 \times 12) / (2 + 3)$, because both physically updated transactions and financially updated transactions are used to calculate the cost price.

Example 2 You haven't selected the **Include physical value** check box, and the cost price on the item setup is USD 10.00.

- You receive a purchase order for a quantity of 20 and a cost price of USD 12.00 that has been packing slip–updated.

When a sales order is posted, the posted cost amount is USD 10.00, because the running average cost price won't include physically posted transactions.

NOTE

For comparison, if you select the **Include physical value** check box for this item, when a sales order is posted, the posted cost amount will be USD 12.00.

Inventory object values

2/18/2021 • 2 minutes to read • [Edit Online](#)

This article provides information about how the values of an inventory object are calculated.

A new functionality that is named **physical quantity** lets you see the values of a specific inventory object.

A cost object represents the entity level where inventory accounting is performed. For more information about cost objects, see [Cost objects](#).

To see the values of a specific inventory object, click **Physical quantity** on the **Cost object** page. Here is how the value of an inventory object is calculated:

Inventory object.Value = Cost object.Average unit cost × Inventory object.Quantity

The following example shows how the values of an inventory object and a cost object are calculated. Two product receipt events are registered on item A:

- Product receipt 1: Quantity = 100 pcs., Amount = \$1,000.00, Site = 1, Warehouse = 11, Batch No. = B1
- Product receipt 2: Quantity = 50 pcs., Amount = \$800.00, Site = 1, Warehouse = 11, Batch No. = B2

The following table shows the calculation result for a cost object. You can view the result on the **Cost object** page.

OBJECT TYPE	ITEM NUMBER	SITE	QUANTITY	INVENTORY UNIT	VALUE	AVERAGE UNIT COST
Cost object	A	1	150	Pcs.	\$1800.00	\$12.00

The following table shows the calculation result for an inventory object. You can view the result by clicking **Physical quantity** on the **Cost object** page.

OBJECT TYPE	ITEM NUMBER	SITE	WAREHO USE	BATCH NO.	QUANTIT Y	INVENTO RY UNIT	VALUE	AVERAGE UNIT COST
Inventory object	A	1	11	B1	100	Pcs.	\$1200.00	\$12.00
Inventory object	A	1	11	B2	50	Pcs.	\$600.00	\$12.00

LIFO Date with physical value and marking

2/18/2021 • 9 minutes to read • [Edit Online](#)

Last in, First out Date (LIFO Date) is an inventory model based on the LIFO principle. Issues from inventory are settled against the last receipts into inventory based on the date of the inventory transaction. By using LIFO Date, if there is no receipt before the issue, the issue is settled against any receipts that occur after the date of the issue. Several issues on the same date may be settled in the order of last issue, last receipt.

When you use the Last in, First out Date (LIFO Date) inventory model, if there is no receipt before the issue, the issue is settled against any receipts that occur after the date of the issue. Several issues on the same date can be settled in the order of last issue, last receipt. When you use LIFO Date, you don't have to use the LIFO Date rule. Instead, you can mark inventory transactions so that a specific item receipt is settled against a specific issue.

We recommend a periodic inventory closing when you use the LIFO Date inventory model.

The following examples show the effect of using LIFO Date in three configurations:

- LIFO Date without the **Include physical value** option
- LIFO Date with the **Include physical value** option
- LIFO Date with marking

LIFO Date without the Include physical value option

In this example, the item model group isn't marked to include physical value. The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical issue for a quantity of 1 at a cost price of USD 15.00 (running average of financially updated transactions).
- 4b. Inventory financial issue for a quantity of 1 at a cost price of USD 15.00 (running average of financially updated transactions).
- 5a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 6. Inventory close is performed. Based on the LIFO Date method, the last financially updated issue will be settled against the last financially updated receipt by date. An adjustment of USD 5.00 will be made on the issue transaction. These transactions will be settled against each other.

The new running average cost price reflects the average of the financially updated transactions at USD 15.00.

The following illustration shows the effects of the LIFO Date inventory model when the **Include physical value**

option isn't used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

LIFO Date with the Include physical value option

You can select the **Include physical value** check box for an item on the **Item model groups** page. In this case, the system uses both physical and financial receipt transactions to calculate the running average cost price. Where applicable, the system also makes adjustments to the physically updated issue transaction. When the **Include physical value** check box is cleared, inventory close that uses the LIFO Date inventory model makes settlements only to transactions that are financially updated.

In this example, the item model group is marked to include physical value.

The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical issue for a quantity of 1 at a cost price of USD 18.33 each (running average of financially updated transactions).
- 4b. Inventory financial issue for a quantity of 1 at a cost price USD 18.33 each (running average of financially updated transactions).
- 5a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 6. Inventory close is performed. Based on the LIFO Date method, the last updated issue will be adjusted or settled against the last updated receipt by date. These transactions will not be settled by each other,

because the financial receipt transaction is adjusted to a physical update transaction. Instead, only an adjustment of USD 6.67 will be made on the issue transaction.

The new running average cost price reflects the average of the financially updated transactions at USD 20.00.

The following illustration shows the effects of the LIFO inventory model when the **Include physical value**

option is used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

LIFO Date with marking

Marking is a process that lets you link, or mark, an issue transaction to a receipt transaction. Marking can occur either before or after a transaction is posted. You can use marking when you want to be sure of the exact cost of inventory when the transaction is posted or the inventory close is performed.

For example, the Customer Service department accepted a rush order from an important customer. Because this order is a rush order, you will have to pay more for this item in order to fulfill your customer's request. You must make sure that the cost of this inventory item is reflected in the margin, or cost of goods sold (COGS), for this sales order invoice.

When the purchase order is posted, the inventory is received at a cost of USD 120.00. If this sales order document is marked to the purchase order before the packing slip or invoice is posted, the COGS will be USD 120.00, not the current running average cost for the item. If the sales order packing slip or invoice is posted before the marking occurs, the COGS will be posted at the running average cost price.

Before inventory close is performed, these two transactions can still be marked to each other.

For example, a receipt transaction is marked for an issue transaction. In this case, the valuation method that is defined in the item's item model group is disregarded, and the system settles these transactions against each other.

You can mark an issue transaction to a receipt before the transaction is posted. You can do this from a sales order line on the **Sales order details** page. You can view the open receipt transactions on the **Marking** page.

You can also mark an issue transaction to a receipt after the transaction is posted. You can match or mark an issue transaction for an open receipt transaction for an inventoried item from a posted inventory adjustment journal.

The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 is marked to inventory receipt 2b before the transaction is posted. This transaction is posted with a cost price of USD 20.00 each.
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each.
- 7. Inventory close is performed. Because the financially updated First in, First out (FIFO) transaction is marked to an existing receipt, these transactions are settled to each other, and no adjustment is made.

The new running average cost price reflects the average of the financially and physically updated transactions at USD 27.50.

The following illustration shows the effects of the LIFO inventory model when marking between issues and

receipts is used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as 1a. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.

- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

LIFO with physical value and marking

2/18/2021 • 9 minutes to read • [Edit Online](#)

Last in, First out (LIFO) is an inventory model in which the last (newest) receipts are issued first. Issues from inventory are settled against the last receipts into inventory based on the date of the inventory transaction.

In the Last in, First out (LIFO) inventory model, the last (newest) receipts are issued first. Issues from inventory are settled against the last receipts into inventory, based on the date of the inventory transaction. When you use LIFO, you don't have to use the LIFO rule. Instead you can mark inventory transactions so that a specific item issue is settled against a specific receipt. We recommend a periodic inventory closing when you use the LIFO inventory model.

The following examples show the effect of using LIFO in three configurations:

- LIFO without the **Include physical value** option
- LIFO with the **Include physical value** option
- LIFO with marking

LIFO without the Include physical value option

In this example, the item model group isn't marked to include physical value. The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 20.00 each (running average of financially updated transactions).
- 5b. Inventory financial issue for a quantity of 1 at a cost price of USD 20.00 each (running average of financially updated transactions).
- 6. Inventory close is performed. Based on the LIFO method, the last financially updated issue will be settled against the last financially updated receipt. An adjustment of USD 10.00 will be made on the issue transaction.

The new running average cost price reflects the average of the financially updated transactions, USD 15.00. The following illustration shows the effects of the LIFO inventory model on this series of transactions when the **Include physical value** option isn't used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unit price.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

LIFO with the Include physical value option

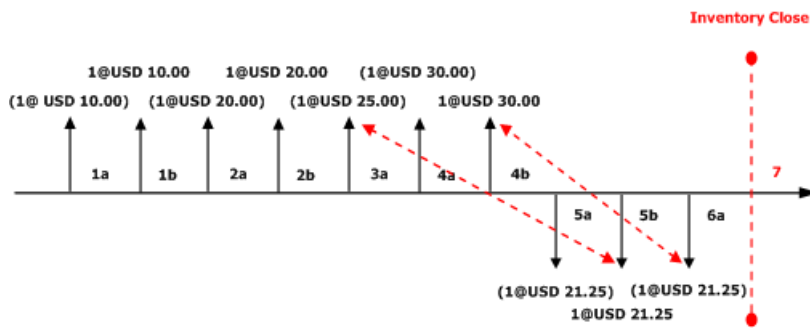

If the **Include physical value** check box is selected for an item on the **Item model groups** page, the system uses both physical and financial receipt transactions to calculate the running average cost price. Where applicable, the system also makes adjustments to the physically updated issue transaction. When the **Include physical value** check box is cleared, inventory close with the LIFO inventory model makes settlements only to transactions that are financially updated.

The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each.
- 7. Inventory close is performed. Based on the LIFO method, the last issue transaction will be adjusted or settled against the last updated receipt.

Transaction 6a will be adjusted to receipt transaction 4b. The system won't settle these transactions, because the receipt is updated physically but not financially. Instead, only an adjustment of USD 8.75 will be posted to the physical issue transaction. Transaction 5b will be adjusted to physical receipt transaction 3a. The system won't settle these transactions, because they aren't both financially updated. Instead, only an adjustment of USD -3.75 will be made to this issue transaction. The new running average cost price reflects the average of the financially and physically updated transactions, USD 20.00.

The following illustration shows the effects of the LIFO inventory model on this series of transactions when the **Include physical value** option is used.

Key to the diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unit price.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

LIFO with marking

Marking is process that lets you link, or mark, an issue transaction to a receipt transaction. Marking can occur either before or after a transaction is posted. You can use marking when you want to be sure of the exact cost of inventory when the transaction is posted or the inventory close is performed. For example, the Customer Service department accepted a rush order from an important customer. Because this order is a rush order, you must pay more for this item in order to fulfill your customer's request.

You must make sure that the cost of this inventory item is reflected in the margin, or cost of goods sold (COGS), for this sales order invoice. When the purchase order is posted, the inventory is received at a cost of USD 120.00. If this sales order document is marked to the purchase order before the packing slip or invoice is posted, the COGS will be USD 120.00, not the current running average cost for the item. If the sales order packing slip or invoice is posted before the marking occurs, the COGS will be posted at the running average cost price.

Before inventory close is performed, these two transactions can still be marked to each other.

You can mark an issue transaction to a receipt before the transaction is posted. You can do this from a sales order line on the **Sales order details** page. You can view the open receipt transactions on the **Marking** page.

You can also mark an issue transaction to a receipt after the transaction is posted. You can match or mark an issue transaction for an open receipt transaction for an inventoried item from a posted inventory adjustment journal.

The illustration that follows shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.

- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 is marked to inventory receipt 2b before the transaction is posted. This transaction is posted with a cost price of USD 20.00 each.
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each.
- 7. Inventory close is performed. Because the financially updated FIFO transaction is marked to an existing receipt, these transactions are settled against each other, and no adjustment is made.

The new running average cost price reflects the average of the financially and physically updated transactions, USD 27.50.

The following illustration shows the effects of the LIFO inventory model on this series of transactions when marking between issues and receipts is used.

Key to diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unit price.
- An inventory transaction value that is enclosed in parentheses indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value that isn't enclosed in parentheses indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the order of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by red diagonal dashed arrows that go from a receipt to an issue.

Moving average

2/18/2021 • 8 minutes to read • [Edit Online](#)

Moving average is a perpetual costing method based on the average principle, where the costs on inventory issues do not change when the purchase cost does. The difference is capitalized and is based on a proportional calculation. The amount that remains is expensed.

When you use moving average, inventory settlements and inventory marking are not supported. Inventory close does not affect products that have moving average as the inventory model group, and it does not generate any settlements between the transactions.

The following are prerequisites when you use moving average cost as a costing method.

1. On the **Item model groups** page, set up an item model group that has **Moving average** selected in the **Inventory model** field.

NOTE

By default, when **Moving average** is selected, the **Post physical inventory** and **Post financial inventory** fields are also selected.

2. On the **Posting** page, assign accounts to the **Price difference for moving average**. You use the **Price difference for moving average** account when cost has to be proportionally expensed. This occurs in following two scenarios:
 - There is a difference in cost between a purchase receipt and the purchase invoice because there is a difference between the original inventory quantity and the current on-hand quantity.
 - The transactions bring the inventory from negative to zero, and there is a difference between the transaction cost and the current moving average cost.
3. On the **Posting** page, assign accounts to the **Cost revaluation for moving average** accounts on the **Inventory** tab. You use the **Cost revaluation for moving average** account when you want to adjust the moving average cost for a product to a new unit price.
4. On the **Released products** page, assign the moving average item model group to the product.

NOTE

The inventory close process only closes the accounting period. It does not affect products that have moving average assigned to them as an item model group.

Convert to the moving average costing method

Products can be converted to use the moving average inventory valuation method. This type of conversion is usually done at the end of the year, after the last month of the current year is closed. It is done by using the product's current costing model. You can change your inventory costing method from a costing method that is based on average cost or standard cost to a method that is based on moving average.

If you are changing your costing method from a standard costing method to a moving average method, you have to complete the following tasks:

1. Make adjustments to get inventory quantities and values down to 0 (zero).

2. After the inventory value and quantity are 0 (zero), change the item model group to moving average.
3. Make adjustments to get the quantity and value back into inventory.

You cannot change your inventory costing method from a moving average method to a First in, First out (FIFO) method, a Last in, First out (LIFO) method, or a weighted average method.

NOTE

Converting from standard cost to moving weighted average is a manual process.

The following examples illustrate the effect of using the moving average costing method. There are four configurations:

- Purchase order and proportionally expensed cost difference
- Moving average product and inventory adjustment
- Moving average with production
- Moving average with a backdated transaction

Purchase order and proportionally expensed cost difference

With moving average, the product's cost is determined by the purchase receipt. When the purchase invoice is posted, if there is a difference in cost between the purchase receipt and the purchase invoice, the difference is proportionally adjusted to the current products in stock, and any remaining amount is expensed.

In this example, a purchase order is created and received at one cost, and the purchase invoice is posted with a different cost.

1. Create a purchase order for a quantity of 2 and a unit price of 10.00.
2. Create a purchase receipt of the product.
3. Create a sales order for a quantity of 1 and a unit price of 10.00.
4. Create a purchase invoice for a quantity of 2 and a unit price of 12.00.

The difference in unit price, 2.00, is posted to the Price difference for moving average account when the purchase invoice is posted. The reason is that two products were purchased for a cost of 20.00. One of the products was sold for a unit price of 10.00. The purchase invoice was posted at a unit price of 12.00 with a quantity of 2. The unit price of the product cannot be posted at 14.00.

Moving average product and inventory adjustment

If you need to adjust the moving average cost of a product, inventory adjustments are allowed as of today's date. You cannot backdate an inventory adjustment to correct the moving average cost of a product. You cannot have the cost flow through subsequent transactions.

In this example, the moving average cost is adjusted for a product.

1. Select the product that you want to adjust the moving average cost for.

NOTE

The **Revaluation for moving average** page examines the inventory available for a product. The product selected has a posted quantity of 1, a posted a value of 12.00, a posted unit cost of 12.00, and a unit cost of 12.00.

1. Update the **Unit cost** field to 16.00. The system calculates the remaining fields.
2. The adjustment is posted.

NOTE

You can only adjust the moving average cost as of today's date.

On the **Settlements for voucher** page, you can see an adjustment of 4.00 posted to the Cost revaluation for moving average account.

Moving average with production

Moving average supports produced items. If you plan to use moving average in a production environment, select **Use estimated cost price** on the **Production control parameters** page. This means that the cost price that is calculated during estimation is used instead of the actual BOM calculation cost price.

Moving average with a backdated transaction

Backdated transactions are assigned the current moving average cost, and the product's physical quantity is updated, but the product's moving average cost is not affected. In this moving average example, a backdated transaction for a moving average product is posted.

1. Create an inventory adjustment for the moving average product for a quantity of 1 and a cost of 20.00.
2. The inventory transaction history for the product would resemble the following:
 - An inventory transaction of 1, a cost of 16.00, a posting date of January 15, and a transaction date of January 15.
 - An inventory adjustment of 1, a cost of 20.00, a posting date of January 1, and a transaction date of January 15.
3. Post the adjustment.

On the **Inventory transactions** page, you can see that 4.00 is expensed as the current moving average for the product is 16.00. You can post in the past, but the difference in cost is expensed, so the moving average cost is not affected.

Negative inventory balances

Transactions are handled differently depending on whether the new on-hand quantity after the transaction is negative, zero, or positive.

New balance is negative or zero

If the new on-hand quantity is negative or zero, the transaction is costed at the current average costs. If there is a difference between the purchase price and the current average costs, it's posted to **Price difference for moving average**.

New balance is positive

If the new on-hand quantity is positive after the transaction, the transaction is split into two parts and costed differently, as summarized in the following table.

PART	DESCRIPTION
Quantity from negative to zero	Inventory uses the current moving average cost of the item rather than the transaction cost for that portion of the receipt quantity that increases the on-hand balance from negative to zero. The difference between the transaction cost and the current moving average cost is posted to Price difference for moving average .

PART	DESCRIPTION
Quantity from zero to positive	Inventory uses the transaction cost for that portion of the receipt quantity that increases the on-hand balance from zero to positive.

Inventory value report

In this moving average example, the inventory value report is printed to support the current moving average calculation for a product. The Inventory value report can print the transactions in chronological order, together with the cost to support the moving average cost calculation of a product. The report displays the moving average cost for the product. In the **Inventory value reports** dialog box, a date interval allows you to select the **Transaction time** or the **Posting date** to sort the report by. The **Posting date** option is how the report is traditionally printed. The **Transaction time** option is the actual date that the transaction is reported and the moving average cost for the product is updated. You can print the Inventory value report by using the **Transaction time sorting** option if you want to see the moving average cost calculation over time. The following table displays the transactions for the product that the report is printed for when the **Transaction time sorting** option is used.

TRANSACTION TIME	DATE	TRANSACTION TYPE	QUANTITY	AMOUNT	AVERAGE UNIT COST
	October 1	Beginning balance	0	0.00	0.00
October 8	September 28	Backdated receipt	1	16.00	16.00
October 3	October 3	Purchase receipt	2	20.00	12.00
October 5	October 5	Sales order	-1	-10.00	13.00
October 7	October 7	Purchase invoice		2.00	14.00
October 8	October 8	Moving average revaluation		4.00	16.00
	October 31	Total	2	32.00	16.00

NOTE

You cannot reconcile the general ledger with inventory by using the **Transaction time sorting** option. The report must be printed by using the **Posting date** option.

Moving average fallback cost sequence

2/18/2021 • 2 minutes to read • [Edit Online](#)

One way that you can calculate the cost of your inventory is by using a *moving average*. Up to three cost values can be associated with each inventory item:

- **Last issue** – The last issue cost that was assigned before inventory went negative
- **Active cost** – The latest cost that was activated in a costing version
- **Item price** – The cost that is specified for the released product

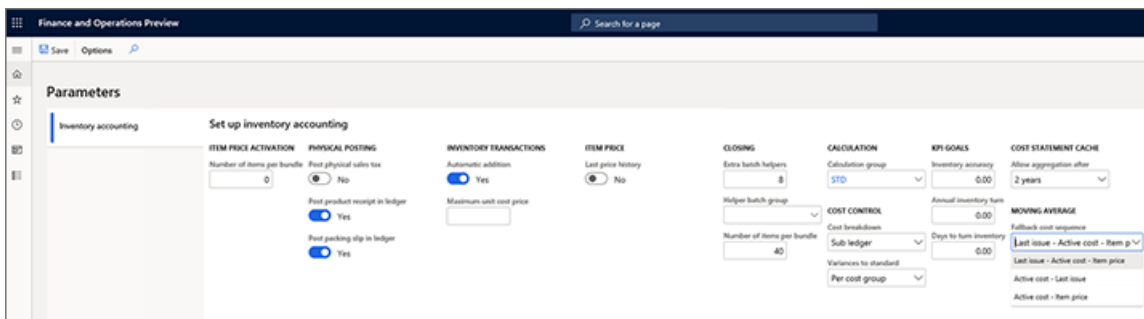

To determine which of these cost values should be used in moving average calculations, the system uses a *fallback cost sequence* to establish the order of preference for the values. If the preferred cost value isn't available, the system uses the next-preferred value, and so on.

In previous versions of Microsoft Dynamics 365 Supply Chain Management, the system used a fixed fallback cost sequence (*Last issue – Active cost – Item price*). In version 10.0.11, this sequence is still the default sequence. However, you can also turn on a feature that lets you select among three available fallback cost sequences. This feature can be especially useful for organizations that regularly use negative inventory values.

To make the selector for the fallback cost sequence available, you (or an admin) must use [Feature management](#) to turn on the feature that is named *Moving average fallback cost sequence*.

To select the fallback cost sequence for moving average calculations, follow these steps.

1. Open the **Parameters** page.
2. On the **Inventory accounting** tab, in the **Moving average** section, set the **Fallback cost sequence** field to one of the following values:
 - **Last issue – Active cost – Item price** – This sequence is the default sequence. It's the same sequence that is used if the *Moving average fallback cost sequence* feature isn't turned on.
 - **Active cost – Last issue**
 - **Active cost – Item price** – Organizations might experience performance issues if they use business processes where inventory regularly goes negative and, at the same time, the transaction volume is high. This setting can help mitigate those performance issues.

Physical and financial updates

2/18/2021 • 2 minutes to read • [Edit Online](#)

This topic provides an overview of which types of transactions increase or decrease inventory quantities.

Inventory transactions can be physically updated and financially updated in Dynamics 365 Supply Chain Management. Some types of physical and financial transactions increase inventory quantities, whereas others decrease the quantity.

Physical increases

When a physical transaction is posted, the status of the transaction record is **Received**. The following transactions are considered physical increases:

- Purchase order receipt
- Sales order packing slip return
- Reporting a production order as finished
- By-product on a production order picking list

Financial increases

When a financial receipt transaction is posted, the status of the transaction record that increases the quantity is **Purchased**. The following transactions are considered financial increases:

- Vendor invoice
- Sales order invoice for a return
- Production order costing
- Positive quantity inventory journals, such as movement, profit and loss, counting, bill of materials, and transfer

Transactions that increase quantity

Transactions that increase quantity are posted at the running average cost price. The calculated running average cost price is based on the cost of each of these transactions for each inventory dimension that is being tracked financially. For information about running average cost prices, see [Running average cost price](#).

Transactions that decrease quantity

The calculated running average cost price is used when a transaction that decreases quantity is posted, regardless of the inventory model that is associated with that inventory. The transaction that decreases quantity must not have been marked to another transaction before it was posted. If the physical on-hand inventory becomes negative, the inventory cost that is defined for the item on the **Item** page is used.

NOTE

If multisite functionality is enabled, this cost will instead be the inventory cost that is defined for a site on the **Default order settings** page.

Physical issues vs. financial issues

When a physical issue transaction is posted, the status of the transaction record is **Deducted**. The following transactions are considered physical issues:

- Production order picking list journal
- Sales order packing slip
- Purchase order packing slip return

When a financial transaction is posted, the status of the transaction record is **Sold**. The following transactions are considered financial issues:

- Ending a production order
- Sales order invoice
- Vendor invoice return
- Negative quantity inventory journals, such as movement, profit and loss, counting, bill of materials, and transfer

Transactions that decrease quantity are posted at the running average cost price. Therefore, the inventory close procedure is required in order to settle issue transactions to receipt transactions, based on the inventory model that is assigned to each item.

Running average cost price

2/18/2021 • 4 minutes to read • [Edit Online](#)

The inventory close process settles issue transactions to receipt transactions, based on the inventory valuation method that is selected in the item's item model group. However, before inventory close is run, the system calculates a running average cost price that is typically used when issue transactions are posted.

The system estimates this running average cost price for an item by using the following formula:

Estimated price = (Physical amount + Financial amount) ÷ (Physical quantity + Financial quantity)

Using the running average cost price

The following table shows when the system posts inventory transactions by using the running average cost price, and when it uses the cost price that is defined on the item master record instead.

CONDITION	THE SYSTEM USES THE ESTIMATED RUNNING AVERAGE COST PRICE	THE SYSTEM USES THE COST PRICE THAT IS DEFINED ON THE ITEM MASTER
Both the numerator* and denominator** are positive.	Yes	No
The numerator*, denominator**, or both are negative.	No	Yes
The denominator** is 0 (zero).	No	Yes

* Numerator = (Physical amount + Financial amount) ** Denominator = (Physical quantity + Financial quantity)

Note: If the **Include physical value** option isn't selected for an item, the system uses 0 (zero) for both the physical amount and the physical quantity. For information about this option, see [Include physical value](#).

Avoiding pricing amplification

On rare occasions, the system prices several issues before it has enough receipts to base the price on. This scenario can cause estimates of the running average cost price to be overly inflated. However, there are steps that you can take to avoid pricing amplification, or to reduce its impact when it does occur. **Scenario** The following transactions occur for an item that you've selected the **Include physical value** option for:

1. You financially receive a quantity of 100 at USD 100.00.
2. You financially issue a quantity of 200.
3. You physically receive a quantity of 101 at USD 202.00.

When you examine the estimated running average cost price for the item, you expect a cost price of USD 1.51. Instead, you find an estimated running average of USD 102.00, which is based on the following formula:
Estimated price = $[202 + (-100)] \div [101 + (-100)] = 102 \div 1 = 102$ This pricing amplification occurs because, when 200 items are issued financially in step 2, the system must price 100 of the items before it has any corresponding receipts. This situation causes negative inventory. The system then estimates a unit price of USD 1.00, as we might expect. However, when the corresponding 100 receipts arrive, they are at a unit price of USD 2.00 each.

Note: Although the issues create negative inventory, inventory is positive when the issue price is calculated.

Therefore, the running average cost price is used instead of the price on the item master. At this point, the system has an inventory value offset of USD 100.00. Although that offset was built up over 100 pieces, where there was a unit offset of USD 1.00 each, we now have only one piece in inventory. Therefore, the offset of USD 100.00 is allocated to this one piece. The result is the overly inflated estimated cost price.

Note: For comparison, notice that if steps 2 and 3 are reversed in the scenario, 200 items will be issued at a unit price of USD 1.51, and one piece will remain at a unit price of USD 1.51. Because this pricing amplification scenario can occur when negative inventory is involved, it's difficult to avoid in the following cases:

- You must estimate issue prices on the on-hand value and quantity.
- You must adjust the on-hand value and quantity on issues and receipts.
- Your business model allows you to send out, or price, more pieces than you have.
- You must accept any receipt value and quantity that are submitted to you.

However, if your business model allows for the following practices, they can help you avoid the negative quantities that make the pricing amplification scenario possible:

- If you select the **Include physical value** option for an item, clear the **Physical negative inventory** check box on the **Item model groups** page.
- If you do *not* select the **Include physical value** option for an item, clear the **Financial negative inventory** option on the **Item model groups** page.

Additionally, consider that the maximum offset in your physical inventory value is limited by the number of physical transactions, and the difference between physical and financial prices. Provided that all physical transactions are eventually updated financially, the physical value can't rise to extreme levels. Finally, note that the amplification effect decreases significantly when the accumulated offset is spread out over several on-hand pieces instead of just one.

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Track running average cost per inventory dimension

2/18/2021 • 2 minutes to read • [Edit Online](#)

An inventory dimension group is attached to every inventory item. Therefore, the running average cost price of an item is calculated based on the selected inventory dimensions that are being tracked financially.

There are three types of inventory dimensions: product, storage, and tracking. Product dimensions include configuration, size, and color. Product dimensions are always tracked financially. Storage and tracking dimensions include site, warehouse, location, inventory status, license plate, batch number, and serial number. You can decide which storage and tracking dimensions are tracked financially.

Example 1

If the storage dimension group that is attached to the item is financially tracked by warehouse, the running average cost price is calculated per warehouse. The following purchase orders have been invoiced:

- A purchase order for a quantity of 2 at a cost price of USD 10.00 has been invoiced for warehouse GW.
- A purchase order for a quantity of 3 at a cost price of USD 12.00 has been invoiced for warehouse GW.
- A purchase order for a quantity of 5 at a cost price of USD 15.00 has been invoiced for warehouse MW.

The running average cost price for warehouse GW is USD 11.20, and the running average cost price for warehouse MW is USD 15.00. A sales order invoice is posted for warehouse GW. The value of the inventory and the cost of goods sold (before inventory close is run and without marking) is USD 11.20. Another sales order is posted for warehouse MW. The value of the inventory and the cost of goods sold (before inventory close is run and without marking) is USD 15.00.

Example 2 If the storage dimension group that is attached to the item is financially tracked by warehouse, and the tracking dimension group is financially tracked by batch number, the running average cost price is calculated for each batch.

Note: We recommend that you always view the cost price for all financial dimensions that are being tracked. The following purchase orders have been invoiced:

- A purchase order for a quantity of 2 at a cost price of USD 10.00 has been invoiced for warehouse GW and batch AAA.
- A purchase order for a quantity of 3 at a cost price of USD 12.00 has been invoiced for warehouse GW and batch AAA.
- A purchase order for a quantity of 2 at a cost price of USD 15.00 has been invoiced for warehouse GW and batch BBB.

The running average cost price for warehouse GW and batch AAA is USD 11.20, and the running average cost price for warehouse GW and batch BBB is USD 15.00.

Weighted average date

2/18/2021 • 13 minutes to read • [Edit Online](#)

Weighted average date is an inventory model that is based on the weighted average principle. For the weighted average principle, issues from inventory are valued at the average value of the items that are received into inventory for each day in the inventory closing period.

When you run an inventory closing by using weighted average date, all daily receipts are settled against a virtual issue. This virtual issue holds the total received quantity and value for that day. The virtual issue has a corresponding virtual receipt that the issues will be settled against. Therefore, all issues receive the same average cost. The virtual issue and virtual receipt can be considered a virtual transfer that is known as the *weighted average inventory closing transfer*.

If only one receipt has occurred on or before the date, you don't have to value the average. Because all issues are settled from that receipt, the virtual transfer won't be created. Likewise, if only issues occur on the date, there are no receipts to value the average from, and the virtual transfer won't be created. When you use weighted average date, you can mark inventory transactions so that a specific item receipt is settled against a specific issue. In this case, you don't use the weighted average date rule. We recommend a monthly inventory closing when you use the weighted average date inventory model.

The following formula is used to calculate the weighted average date costing method:

$$\text{Weighted average} = \frac{[Q1 \times P1] + [Q2 \times P2] + [Qn \times Pn]}{Q1 + Q2 + Qn}$$

During inventory close, the calculation is performed every day through the closing period, as shown in the following illustration.

Inventory transactions that leave the inventory, such as sales orders, inventory journals, and production orders, occur at an estimated cost price on the date of posting. This estimated cost price is also referred to as the running average cost price. On the date of inventory close, the system analyzes the inventory transactions for previous periods, previous days, and the current day. This analysis is used to determine which of the following closing principles should be used:

- Direct settlement
- Summarized settlement

Settlements are inventory close postings that adjust the issues to the correct weighted average as of the closing date.

Note: For more information about settlements, see the article about inventory close. The following examples illustrate the effect of using weighted average with five configurations:

- Weighted average date direct settlement when the **Include physical value** option isn't used
- Weighted average date summarized settlement when the **Include physical value** option isn't used

- Weighted average date direct settlement when the **Include physical value** option is used
- Weighted average date summarized settlement when the **Include physical value** option is used
- Weighted average date when marking is used

Weighted average date direct settlement when the Include physical value option isn't used

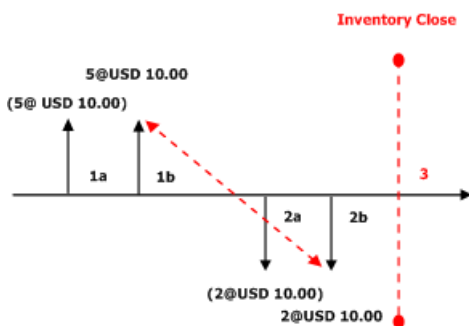

The current version uses the same direct settlement principle that was used for weighted average in earlier versions. The system settles directly between receipts and issues. The system uses this direct settlement principle in specific situations:

- One receipt and one or several issues have been posted in the period.
- Only issues have been posted in the period, and the inventory contains on-hand items from a previous closing.

In the following scenario, a financially updated receipt and issue have been posted. During inventory close, the system settles the receipt directly against the issue, and no adjustment to the cost price is required on issue.

The following illustration shows these transactions:

- 1a. Inventory physical receipt is updated for a quantity of 5 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt is updated for a quantity of 5 at a cost of USD 10.00 each.
- 2a. Inventory physical issue is updated for a quantity of 2 at a cost of USD 10.00 each.
- 2b. Inventory financial issue is updated for a quantity of 2 at a cost of USD 10.00 each.
- 3. Inventory close is performed by using the direct settlement method to settle the inventory financial receipt to the inventory financial issue.

Key to the illustration:

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above or below each vertical arrow, the value of the inventory transaction is specified in the form *Quantity@Unit price*.
- If an inventory transaction value is enclosed in parentheses, the inventory transaction is physically posted into inventory.
- If an inventory transaction value isn't enclosed in parentheses, the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by dashed red arrows that go diagonally from a receipt to an issue.

Weighted average date summarized settlement when the Include physical value option isn't used

Weighted average is based on the principle that all receipts in a closing period are summarized into a new inventory transfer transaction. This transaction is known as *weighted average inventory closing*. All the receipts for the day are settled against the issue of the newly created inventory transfer transaction. All issues for the day are settled against the receipt of the new inventory transfer transaction. If the on-hand inventory is positive after the inventory close, the on-hand inventory and the value of the inventory are summarized on the new inventory transfer transaction receipt. If the on-hand inventory is negative after the inventory close, the on-hand inventory and the value of the inventory are the sum of individual issues that haven't been fully settled.

In the following scenario, several financially updated receipts and issues have been posted during the period. During inventory close, the system evaluates every day to determine how each day should be treated by closing.

The following illustration shows these transactions:

Day 1:

- 1a. Inventory physical receipt is updated for a quantity of 3 at USD 15.00 each.
- 1b. Inventory financial receipt is updated for a quantity of 3 at USD 15.00 each.
- 2a. Inventory physical issue for a quantity of 1 at a running average cost of USD 15.00.
- 2b. Inventory financial issue for a quantity of 1 at a running average cost of USD 15.00.

The system will use the direct settlement approach for day 1.

Day 2:

- 3a. Inventory physical issue for a quantity of 1 at a running average cost of USD 15.00
- 3b. Inventory financial issue for a quantity of 1 at a running average cost of USD 15.00

The system will use the direct settlement approach for day 2.

Day 3:

- 4a. Inventory physical issue for a quantity of 1 at a running average cost of USD 15.00
- 4b. Inventory financial issue for a quantity of 1 at a running average cost of USD 15.00
- 5a. Inventory physical receipt for a quantity of 1 at USD 17.00 each
- 5b. Inventory financial receipt for a quantity of 1 at USD 17.00 each

Inventory close is performed. The direct settlement must be used, because there are multiple receipts that cross multiple days.

- 7a. A weighted average inventory close transaction financial issue is created at for a quantity of 2 at USD 32.00 to summarize the settlements of all inventory financial receipts to date that haven't been closed.
- 7b. A weighted average inventory close transaction financial receipt is created as the offset to 7a.

The system generates and posts the summarized inventory transfer transaction. Additionally, the system settles all the receipts for the day and on-hand inventory for previous days against the summarized inventory transfer issue transaction. All the issues for the day are settled against the summarized inventory transfer receipt transaction. The weighted average cost price is calculated as USD 16.00. The issue will have an adjustment of USD 1.00 to adjust it to the weighted average cost. The new running average cost price is USD 16.00.

The following illustration shows this series of transactions, and the effects of using the weighted average inventory model and the summarized settlement principle, but without using the **Include physical value** option.

Key to the illustration

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above or below each vertical arrow, the value of the inventory transaction is specified in the form *Quantity@Unit price*.
- If an inventory transaction value is enclosed in parentheses, the inventory transaction is physically posted into inventory.
- If an inventory transaction value isn't enclosed in parentheses, the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by dashed red arrows that go diagonally from a receipt to an issue.
- Solid red diagonal arrows show the receipt transactions being settled to the issue transaction that is created by the system.
- The solid green diagonal arrow represents the offsetting system-generated receipt transaction that the originally posted issue transaction is settled to.

Weighted average date direct settlement when the Include physical value option is used

The current version uses the same direct settlement principle for weighted average date that is used in earlier versions. The system settles directly between receipts and issues. The system uses this direct settlement principle in specific situations:

- One receipt and one or several issues have been posted in the period.
- Only issues have been posted in the period, and the inventory contains on-hand inventory from a previous closing.

If you select the **Include physical value** check box for an item on the **Item model group** page, the system uses physically updated receipts when it calculates the estimated cost price, or running average. Issues are posted based on this estimated cost price during the period. During the inventory close, only financially updated receipts will be considered in the weighted average calculation.

Weighted average date summarized settlement when the Include physical value option is used

If you select the **Include physical value** check box for an item on the **Item model group** page, the system uses physically updated receipts when it calculates the estimated cost price, or running average. Issues are

posted based on this estimated cost price during the period. During the inventory close, only financially updated receipts will be considered in the weighted average calculation. Weighted average settlement is based on the principle that receipts in a closing period are summarized into a new inventory transfer transaction that is known as *weighted average inventory closing*. All the receipts for the day are settled against the issue of the newly created inventory transfer transaction. All issues for the day are settled against the receipt of the new inventory transfer transaction. If the on-hand inventory is positive after the inventory close, that on-hand inventory and the value of the inventory are summarized on the new inventory transfer transaction (receipt). If the on-hand inventory is negative after the inventory close, the on-hand inventory and the value of the inventory are the sum of individual issues that haven't been fully settled.

Weighted average date when marking is used

Marking is a process that lets you link an issue transaction to a receipt transaction. Marking can occur either before or after a transaction is posted. You can use marking when you want to be sure of the exact cost of the inventory when the transaction is posted or when the inventory close is performed.

For example, your Customer Service department accepted a rush order from an important customer. Because this is a rush order, you will have to pay more for this item to meet your customer's request. You must make certain that the cost of this inventory item is reflected in the margin, or cost of goods sold (COGS), for this sales order invoice. When the purchase order is posted, the inventory is received at a cost of USD 120.00. The sales order document is marked to the purchase order before the packing slip or invoice is posted. The COGS will then be USD 120.00 instead of the current running average cost for the item. If the sales order packing slip or invoice is posted before the marking occurs, the COGS will be posted at the running average cost price. Before inventory close is performed, these two transactions can still be marked to each other. When a receipt transaction is marked to an issue transaction, the valuation method that is defined in the item's item model group will be disregarded. Instead, the system settles these transactions to each other.

You can mark an issue transaction to a receipt before the transaction is posted. You can do this from a sales order line on the **Sales order details** page. You can view the open receipt transactions on the **Marking** page. You can mark an issue transaction to a receipt after the transaction is posted. You can match or mark an issue transaction for an open receipt transaction for an inventoried item from a posted inventory adjustment journal. The following illustration shows these transactions:

- 1a. Inventory physical receipt for a quantity of 1 at a cost price of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost price of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost price of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost price of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost price of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost price of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost price of USD 30.00 each.
- 5a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 is marked to the inventory receipt 2b before the transaction is posted. This transaction is posted at a cost price of USD 20.00.
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25.
- 7. Inventory close is performed. Because the financially updated transaction is marked to an existing receipt, these transactions are settled to each other, and no adjustment is made.

The new running average cost price reflects the average of the financially and physically updated transactions at USD 27.50. The following illustration shows this series of transactions, and the effects of using the weighted average date inventory model and marking.

Key to the illustration:

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above or below each vertical arrow, the value of the inventory transaction is specified in the form *Quantity@Unit price*.
- If an inventory transaction value is enclosed in parentheses, the inventory transaction is physically posted into inventory.
- If an inventory transaction value isn't enclosed in parentheses, the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated by a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label *Inventory Close*.
- Settlements that are performed by inventory close are represented by dashed red arrows that go diagonally from a receipt to an issue.

Weighted average with physical value and marking

2/18/2021 • 16 minutes to read • [Edit Online](#)

Weighted average is an inventory model based on the weighted average principle, where issues from inventory are valued at the average value of the items that are received into inventory during the inventory closing period, plus any on-hand inventory from the previous period.

When you run an inventory closing, all receipts are settled against a virtual issue, which holds the total received quantity and value. This virtual issue has a corresponding virtual receipt from which the issues are settled. In this manner, all issues get the same average cost. The virtual issue and receipt can be seen as a virtual transfer, which is named the weighted average inventory closing transfer.

If there is only one receipt, all issues can be settled from it and the virtual transfer will not be created.

When using weighted average, you can mark inventory transactions so that a specific item receipt is settled against a specific issue, instead of using the weighted average rule.

We recommend a monthly inventory closing when you use the weighted average inventory model.

The weighted average inventory costing method is calculated by the following formula:

- $\text{Weighted average} = (Q1 * P1 + Q2 * P2 + Qn * Pn) / (Q1 + Q2 + Qn)$

Inventory transactions leaving the inventory issues. This includes sales orders, inventory journals, and production orders, occur at an estimated cost price on the posting date. This estimated cost price is also referred to as running average. At the time of inventory close, the system will analyze the inventory transactions for previous and current periods and determine which of the following closing principles should be used.

- Direct settlement
- Summarized settlement

Settlements are inventory close postings that adjust the issues to the correct weighted average as of the closing date. The following examples illustrate the effect of using weighted average with five different configurations:

- Weighted average direct settlement without the Include physical value option
- Weighted average summarized settlement without the Include physical value option
- Weighted average direct settlement with the Include physical value option
- Weighted average summarized settlement with the Include physical value option
- Weighted average with marking

Weighted average direct settlement without Include physical value

The direct settlement principle is the same used for weighted average in earlier versions. The system will settle directly between receipts and issues. The system uses this direct settlement principle in certain specific situations:

- One receipt and one or several issues has been posted in the period
- Only issues have been posted in the period and the inventory contains on-hand items from a previous closing

In the scenario in the following sections, a financially updated receipt and issue have been posted. During inventory close, the system will settle the receipt directly against the issue, and no adjustment to the cost price is needed on issue. The following transactions are illustrated in the graphic.

- 1a. Inventory physical receipt updated for a quantity of 5 at USD 10.00 each
- 1b. Inventory financial receipt updated for a quantity of 5 at USD 10.00 each
- 2a. Inventory physical issue updated for a quantity of 2 at USD 10.00 each
- 2b. Inventory financial issue updated for a quantity of 2 at USD 10.00 each
- 3. Inventory close is performed using the direct settlement method to settle the inventory financial receipt to the inventory financial issue.

The following diagram illustrates this series of transactions with the effects of choosing the Weighted average inventory model and the direct settlement principle without the Include physical value option.

Key to diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value enclosed in brackets indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value without brackets indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated with a new label.
- Each vertical arrow is labeled with a sequential identifier, such as *1a*. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label Inventory Close.
- Settlements that are performed by inventory close are represented by dotted red arrows going diagonally from a receipt to an issue.

Weighted average summarized settlement without the Include physical value option

Weighted average uses the settlement principle that all receipts within in a closing period are summarized into a transaction called Weighted average inventory closing. All the receipts for the period will be settled against the issue of the newly created inventory transfer transaction. All issues for the period will be settled against the receipt of the new inventory transfer transaction. If the on-hand inventory is positive after the inventory close, that on-hand inventory and value of the inventory are summarized on the new inventory transfer transaction (receipt). If the inventory on-hand is negative after the inventory close, the on-hand inventory and value of the inventory is the sum of individual issues that have not been fully settled. In the scenario below, several financially updated receipts and one issue have been posted.

During inventory close, the system will generate and post the summarized inventory transfer transaction and settle the receipts for the period against the summarized inventory transfer issue transaction. All the issues posted for the period will be settled against the summarized inventory transfer receipt transaction. The

weighted average is calculated to be USD 15.00. The issue was originally posted with an estimated cost price of USD 14.67. Therefore, an adjustment of negative USD 0.33 will be created and posted on the issue. As of the inventory closing date, the on-hand inventory is 3 pieces with a value of USD 45.00.

The following transactions are illustrated in the graphic below:

- 1a. Inventory physical receipt updated for a quantity of 2 at a cost of USD 11.00 each.
- 1b. Inventory financial receipt updated for a quantity of 2 at a cost of USD 14.00 each.
- 2a. Inventory physical receipt updated for a quantity of 1 at a cost of USD 12.00 each.
- 2b. Inventory financial receipt updated for a quantity of 1 at a cost of USD 16.00 each.
- 3a. Inventory physical issue updated for a quantity of 1 at a cost of USD 14.67 each (running average).
- 3b. Inventory financial issue updated for a quantity of 1 at a cost of USD 14.67 each (running average).
- 4a. Inventory physical receipt updated for a quantity of 1 at a cost of USD 14.00 each.
- 4b. Inventory financial receipt updated for a quantity of 1 at a cost of USD 16.00 each.
- 5. Inventory close is performed.
- 6a. "Weighted average inventory close transaction" financial issue is created to sum the settlements of all the inventory financial receipts.
- 6b. "Weighted average inventory close transaction" financial receipt is created as the offset to 5a.

The following diagram illustrates this series of transactions with the effects of choosing the Weighted average inventory model and the summarized settlement principle without the Include physical value option.

Key to diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value enclosed in brackets indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value without brackets indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated with a new label.
- Each vertical arrow is labeled with a sequential identifier, such as 1a. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label Inventory Close.
- Settlements that are performed by inventory close are represented by dotted red arrows going diagonally from a receipt to an issue.
- Red arrows illustrate the receipt transactions being settled to the issue transaction created by the system.
- The green arrow represents the offsetting system-generated receipt transaction to which the originally posted issue transaction is settled

Weighted average direct settlement with the Include physical value option

The parameter Include physical value works differently with the weighted average inventory model than in earlier versions of the product. Select the Include physical value box for an item in the Item model group form. Then the system will use physically updated receipts when calculating the estimated cost price, or running average. Issues will be posted based on this estimated cost price during the period. During the inventory close, financially updated receipts only will be considered in the weighted average calculation. We recommend a monthly inventory close when you use the weighted average inventory model. In this weighted average direct settlement example, the item model group is marked to include physical value.

The following transactions are illustrated in the graphic below:

- 1a. Inventory physical receipt updated for a quantity of 1 at a cost of USD 11.00 each.
- 1b. Inventory financial receipt updated for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt updated for a quantity of 1 at a cost of USD 15.00 each.
- 3a. Inventory physical issue updated for a quantity of 1 at a cost of USD 12.50 each (running average cost, since the physical receipt value is taken into consideration).
- 3b. Inventory financial issue updated for a quantity of 1 at a cost of USD 12.50 each (running average cost, since the physical receipt value is taken into consideration).
- 4. Inventory close is performed. During inventory close, the system will disregard all inventory transactions that have been only physically updated. Instead, the direct settlement principle will be used because only one financial receipt exists. An adjustment of USD 2.50 will be posted to the inventory transaction that has been financially issued as of the inventory closing date. After inventory close, the on hand inventory will be a quantity of 1 with a running average cost price of USD 15.00.

The following diagram illustrates this series of transactions with the effects of choosing the Weighted average inventory model and the direct settlement principle with the Include physical value option.

Key to diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value enclosed in brackets indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value without brackets indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated with a new label.
- Each vertical arrow is labeled with a sequential identifier, such as 1a. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label Inventory Close.

- Settlements that are performed by inventory close are represented by dotted red arrows going diagonally from a receipt to an issue.

Weighted average summarized settlement with the Include physical value option

The Include physical value parameter works differently with weighted average than in earlier versions. Select the Include physical value box for an item in the Item model group page. Then the system will use physically updated receipts in the calculation of estimated cost price, or running average. Issues will be posted based on this estimated cost price during the period. During the inventory close financially updated receipts only will be considered in the weighted average calculation. We recommend a monthly inventory close when you use the weighted average inventory model. In this weighted average summarized settlement example, the inventory model is marked to include physical value.

The following transactions are illustrated in the graphic below:

- 1a. Inventory physical receipt updated for a quantity of 2 at a cost of USD 11.00 each.
- 1b. Inventory financial receipt updated for a quantity of 2 at a cost of USD 14.00 each.
- 2. Inventory physical receipt updated for a quantity of 1 at a cost of USD 10.00 each.
- 3a. Inventory physical receipt updated for a quantity of 1 at a cost of USD 12.00 each.
- 3b. Inventory financial receipt updated for a quantity of 1 at a cost of USD 16.00 each.
- 4a. Inventory physical issue updated for a quantity of 1 at a cost of USD 13.50 each (running average cost, since the physical receipt value is taken into consideration).
- 4b. Inventory financial issue updated for a quantity of 1 at a cost of USD 13.50 each (running average cost, since the physical receipt value is taken into consideration).
- 5a. Inventory physical receipt updated for a quantity of 1 at a cost of USD 14.00 each.
- 5b. Inventory financial receipt updated for a quantity of 1 at a cost of USD 16.00 each.
- 6. Inventory close is performed. During inventory close, the system will disregard all inventory transactions that are updated only physically. The summarized settlement principle will be used because only one financial receipt exists. An adjustment of USD 1.50 will be posted to the inventory transaction that has been financially issued as of the inventory closing date. After inventory close, the on-hand inventory will be a quantity of 3 with a running average cost price of USD 15.00.
- 7a. "Weighted average inventory close transaction" financial issue is created to sum the settlements of all the inventory financial receipts.
- 7b. "Weighted average inventory close transaction" financial receipt is created as the offset to 5a.

The following diagram illustrates this series of transactions with the effects of choosing the weighted average inventory model and the summarized settlement principle without the Include physical value option.

Key to diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.

- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@Unitprice.
- An inventory transaction value enclosed in brackets indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value without brackets indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated with a new label.
- Each vertical arrow is labeled with a sequential identifier, such as 1a. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label Inventory Close.
- Settlements that are performed by inventory close are represented by dotted red arrows going diagonally from a receipt to an issue.
- Red arrows illustrate the receipt transactions being settled to the issue transaction created by the system.
- The green arrow represents the offsetting system-generated receipt transaction to which the originally posted issue transaction is settled

Weighted average with marking

Marking is a process that lets you link, or mark, an issue transaction to a receipt transaction. Marking can occur either before or after a transaction is posted. You can use marking when you want to make sure of the exact cost of the inventory when the transaction is posted or when the inventory close is performed.

For example, your Customer Service department accepted a rush order from an important customer. Because this is a rush order, you will have to pay more for this item to service your customer's request. You must be certain the cost of this inventory item is reflected in the margin, or cost of goods sold (COGS), for this sales order invoice.

When the purchase order is posted, the inventory is received at a cost of USD 120.00. For example, this sales order document is marked to the purchase order before the packing slip or invoice is posted. Then COGS will be USD 120.00 instead of the current running average cost for the item. If the sales order packing slip or invoice is posted before the marking occurs, the COGS will be posted at the running average cost price.

Before inventory close is performed, these two transactions can still be marked to each other.

A receipt transaction is marked to an issue transaction. Then, the valuation method selected for the item's item model group will be disregarded and the system will settle these transactions to each other.

You can mark an issue transaction to a receipt before the transaction is posted. You can do this from a sales order line in the Sales order details page. The open receipt transactions are viewed in the Marking page.

You can mark an issue transaction to a receipt after the transaction has been posted. You can match or mark an issue transaction for an open receipt transaction for an inventoried item from a posted inventory adjustment journal.

The following transactions are illustrated in the graphic below:

- 1a. Inventory physical receipt for a quantity of 1 at a cost of USD 10.00 each.
- 1b. Inventory financial receipt for a quantity of 1 at a cost of USD 10.00 each.
- 2a. Inventory physical receipt for a quantity of 1 at a cost of USD 20.00 each.
- 2b. Inventory financial receipt for a quantity of 1 at a cost of USD 20.00 each.
- 3a. Inventory physical receipt for a quantity of 1 at a cost of USD 25.00 each.
- 4a. Inventory physical receipt for a quantity of 1 at a cost of USD 30.00 each.
- 4b. Inventory financial receipt for a quantity of 1 at a cost of USD 30.00 each.

- 5a. Inventory physical issue for a quantity of 1 at a cost price USD 21.25 (running average of financial and physical updated transactions).
- 5b. Inventory financial issue for a quantity of 1 is marked to the inventory receipt 2b before the transaction is posted. This transaction is posted with a cost price of USD 20.00.
- 6a. Inventory physical issue for a quantity of 1 at a cost price of USD 21.25 each.
- 7 Inventory close is performed. Since the financially updated transaction is marked to an existing receipt these transactions are settled to each other and no adjustment is made.

The new running average cost price reflects the average of the financially and physically updated transactions at USD 27.50.

The following diagram illustrates this series of transactions with the effects of choosing the Weighted average inventory model with marking.

Key to diagram

- Inventory transactions are represented by vertical arrows.
- Receipts into inventory are represented by vertical arrows above the timeline.
- Issues out of inventory are represented by vertical arrows below the timeline.
- Above (or below) each vertical arrow, the value of the inventory transaction is specified in the format Quantity@"Unitprice".
- An inventory transaction value enclosed in brackets indicates that the inventory transaction is physically posted into inventory.
- An inventory transaction value without brackets indicates that the inventory transaction is financially posted into inventory.
- Each new receipt or issue transaction is designated with a new label.
- Each vertical arrow is labeled with a sequential identifier, such as 1a. The identifiers indicate the sequence of inventory transaction postings in the timeline.
- Inventory closings are represented by a red vertical dashed line and the label Inventory Close.
- Settlements that are performed by inventory close are represented by dotted red arrows going diagonally from a receipt to an issue.

Inventory close

2/18/2021 • 5 minutes to read • [Edit Online](#)

As part of the process to settle issue transactions with receipt transactions, you can also choose to have the general ledger updated to reflect the adjustments that have been made.

The inventory close process settles issue transactions to receipt transactions, based on the inventory valuation method that is selected in the item's item model group. As part of the settlement process, you can specify that the general ledger should be updated, so that it reflects the adjustments that have been made. However, until inventory close or recalculation has been run, issue transactions are posted at the calculated running average cost price.

After inventory close, you can no longer post in periods that are before the inventory closing date that you set, unless you reverse a completed inventory close process. For example, if inventory close is run for the period that ends on January 31, you can't post transactions that have a date that is earlier than January 31.

Items in inventory are assigned to one of two inventory types: item or service. Inventory close performs the same functions for both types. However, for service items, inventory close still settles issues to receipts.

How often the inventory close process is run varies by company. However, transaction volume should help determine how often you decide to run inventory close. In general, most companies run inventory close as part of their month-end close and reconciliation procedures.

Inventory recalculation and the general ledger

If adjustments to inventory and the general ledger are required during a month or other inventory period, you can run inventory recalculation instead of inventory close. Inventory recalculation makes adjustments but doesn't make settlements to inventory transactions.

During inventory recalculation, on-hand inventory is adjusted, inventory transactions are adjusted, and inventory recalculations and inventory closes are run. These tasks affect any ledger account that is linked to the original inventory transaction.

Example

When you create a purchase order from a sales order, the general ledger accounts that are used for the original sales order are updated. Even if the ledger accounts for the item group that is assigned to the item were changed after the sales order was posted, and an inventory recalculation created an adjustment amount, the adjustment amount is posted to the original ledger accounts. The adjusted amount isn't posted to the new ledger accounts that are assigned to the item.

After the update is completed, you can review the ledger voucher that is posted because of one of these tasks.

1. On the **Closing and adjustment** page, on the **Overview** tab, select the update to review.
2. Click **Details**, and then select **Voucher**.

Effects of the inventory close process on the general ledger

Several of the tasks that you can perform on the **Closing and adjustment** page cause an update to general ledger. For example, the general ledger is updated when you make inventory on-hand adjustments, make inventory transaction adjustments, run inventory recalculation, and run inventory close.

The ledger accounts that are updated because of these tasks are linked to the original inventory transaction. For

example, if a sales order is settled to a purchase order, the general ledger accounts that were used for the original sales order are adjusted. This behavior occurs even if the ledger accounts for the item group that is assigned to the item have changed since the sales order was posted. After inventory close creates a settlement amount, the settlement amount is still posted to the original ledger accounts, not to the new ledger accounts that are assigned to the item. The general ledger might also be updated if you reverse an inventory close.

NOTE

- Inventory close is a required step in the month-end closing procedure for all inventory models except moving average. You will be warned if you try to close a financial period without first performing the inventory close as of the period end date.
- Before you run the closing procedure, you can view a list of items that can't be settled during the update.
- We recommend that you run inventory close during off-peak hours, to distribute computing resources more evenly.

The inventory close log

After the inventory close process has been completed, a message in the message center might inform you that a unit cost price might be incorrect because a transaction could not be fully settled.

Before this message is shown, the system reports the item number and the affected transaction. The message informs you that the cost amount that is used for this transaction wasn't updated because of the inventory close. This message appears when a transaction of the issue type can't be settled.

During the inventory close process, the system checks each financial dimension to see whether there are more issues than receipts up to the specified closing date. This type of imbalance can occur when an inventory transaction from a purchase order isn't fully posted financially, either because the vendor invoice hasn't been received, or because bill of materials (BOM) components that are included in a production on a higher level aren't financially posted. (The sub-production isn't cost-calculated.) In this case, the subsequent close won't adjust all issues to the correct cost price, because not enough receipt information is available.

For each run of the closing procedure, the system indicates whether a log that contains the warnings is stored and can be viewed.

If you receive many warnings in the message, we recommend that you perform the following actions:

- Update receipts financially.
- Advance the closing date.
- Reevaluate the business procedures.

In some circumstances, you might not be able to do anything about the warnings. For example, if marking is used, and the marked purchase order has a financial date that is after the closing date, the closing date can't be changed.

Reversing a completed inventory close

Occasionally, you might have to reverse a completed inventory close to return settlements to the state that they had before adjustments were made. When you reverse a completed inventory close, inventory is reopened to enable posting in the period that the inventory close covers. Related changes might also be made in the general ledger. After you've finished making adjustments, you can run inventory close again for the period that you're working with.

NOTE

Only the last inventory period that was closed can be reopened. To reverse an earlier inventory close, you must reverse each subsequent inventory close one at a time, starting with the most recent close.

Adjust on-hand inventory cost values

2/18/2021 • 2 minutes to read • [Edit Online](#)

Use the Adjustment of on-hand inventory page to adjust the cost value of the on-hand inventory quantities after an inventory close process is run.

You can use the **Adjustment of on-hand inventory** page to adjust the cost value of on-hand inventory quantities after an inventory close process is run. **Note:** To open the **Adjustment of on-hand inventory** page, on the **Closing and adjustment** page, select the record of a completed inventory close process, and then click **Adjustment > On-hand**. **Example:** You have the following transactions in February:

- February 1: An inventory financial receipt for a quantity of 2 at a cost of USD 10.00
- February 5: An inventory financial receipt for a quantity of 1 at a cost of USD 13.00
- February 19: An inventory financial issue for a quantity of 1 at a running average cost of USD 11.00

This item was set up with the first in, first out (FIFO) inventory model, and inventory close was performed as of February 28. The financial issue transaction of USD 11.00 will be settled against the financial receipt that is dated February 1, and an adjustment of USD 1.00 will be made. The following inventory receipts will then contain open inventory quantities:

- February 1: A quantity of 1 at a cost of USD 10.00
- February 5: A quantity of 1 at a cost of USD 13.00

To set the cost of these two items to USD 15.00, use the on-hand adjustment option to adjust the open on-hand quantities as of the last inventory close period. **Note:** The posting date of the on-hand adjustment transaction will be the date of the last inventory close. This date can't be modified.

NOTE

Can you tell us about your documentation language preferences? [Take a short survey](#).

The survey will take about seven minutes. No personal data is collected ([privacy statement](#)).

Inventory value storage report

2/18/2021 • 5 minutes to read • [Edit Online](#)

This topic explains how to run an **Inventory value storage** report and make the output available digitally, either as an interactive page in Microsoft Dynamics 365 Supply Chain Management or as an exported document in any of several formats.

When you view the report in your browser, columns and aggregate balances are dynamically adjusted, depending on the layout that you've configured. You can sort the results, filter them, drill down into the data, and more.
