Presentation

Welcome on our Knowledge Management System platform based on the Mediawiki Long Term Service version (LTS). Mediawiki is the engine running Wikipedia, the well-known free encyclopedia on the web, as well many others.

This wiki not only serves as a demo of our solution but is also our own KMS; we have taken the opportunity to separate confidential and/restricted information from the publicly accessible information. Our solution offers not only document protected information, but we can also protect only parts of documents.

We therefore offer you the real possibility to have only **one source** of information allowing / restricting access to the information exactly as you need it.

This WIKI shows you the ability to <u>automatically create documents based on semantic content</u>, this independently of the number of source documents or the number of the different editors having created them.

You can see one sample from **this Mediawiki page** querying all documents in this wiki using a Semantic Query, offering you a table list or embedding all source documents into a new one, right on your screen.

Our solutions is **entirely based on free opensource products**. We dit put them together based on our experience to propose the best starting point possible to your requirements; we believe we already cover most of them. This solution at the contrary of most wikis embedded in other solutions like ITSM tools, ERP tools, ... is NOT limited to basic functionalities but goes way beyond and contains its own documentation for each component installed and/or configured.
